MARWĀNIDS, a Muhammadan dynasty in Diyār Bakr, founded by the Kurd chief Bādh, who had begun his career as a shepherd and then took to brigandage With the help of a body of men similarly inclined, he seized the town of Ardjish in Armenia with other strongholds on the Armenian frontier After the death of the Būyid ʿAdud al-Dawla (372 = 983), he invaded the province of Diyār Bakr and captured Āmid, Maiyāfārikīn and Nasibin The armies, which Samsām al Dawla sent against him, were defeated and al Mawsil also passed into his hands But when he tried to seize the capital, Baghdād (Safar 373 = July—Aug 983), he suffered a complete defeat and had to abandon al-Mawsil After vain attempts to retake this town, he took the field again in 380 (990—991) but was defeated by the Hamdānids, the lords of al-Mawsil, and fell in the battle Abū ʿAlī al Hasan b Marwān, his sister's son, then married his widow and thus came into possession of the lands conquered by Bādh and continued the war against the Hamdānids whom he twice defeated After the murder of Abū ʿAlī in 387 (997—998) in Āmid, his brother Mumahhid al-Dawla Abu 'l-Mansūr succeeded him The third brother Nasr al-Dawla Abū Nasr Ahmad at first attempted to dispute his authority but without

success In 402 (1011—1012) Abu 'l-Mansūr was poisoned by one of his generals, whereupon Abū Nasr was recognised as lord of Diyār Bakr During his rule of fifty years, peace and quiet as a rule prevailed, and poets and learned men found a hospitable welcome at his court In 433 (1041—1042) the Ghuzz [q v] who had invaded Mesopotamia in the previous year, raided Djazīrat Ibn ʿOmar, but Sulaimān, son of Abū Nasr, succeeded in outwitting and capturing their leader whereupon the others dispersed, they soon returned however and continued their plundering, although Abū Nasr released their chief and gave them a considerable sum to induce them to withdraw They then occupied al-Mawsil, which was completely sacked while the emīr there, Karwāsh b al-Mukallad [q v], saved himself by flight In 435 (1044) he finally succeeded in driving out the Ghuzz whereupon they withdrew to Diyār Bakr and thence to Ādharbāidjān When the Saldjūk Sultan Toghrul Beg in 448 (1056—7) advanced against Djazīrat Ibn ʿOmar, Abū Nasr gained him over by gifts and a friendly relationship was established between them Abū Nasr died in 453 (1061—1062) aged over 80 He was succeeded by his son Nizām al-Dawla Nasr, who had however to go through a hard struggle with his brother Saʿīd The former was victorious in Maiyāfārikin, while the latter had to be satisfied with Āmid In 463 (1070—1071) Nasr submitted to the Saldjūk Sultān Alp Arslān After Nasr's death (472 = 1080) his son Mansūr was recognised as his successor Soon afterwards the Saldjūks overthrew the Marwānid dynasty In 478 (1085—1086) Ibn Djahīr, Malik-Shāh's vizier, and his son Zaʿīm al-Ruʾasāʾ Abu 'l-Kāsim conquered the towns of Āmid, Maiyāfārikīn and Djazīrat Ibn ʿOmar and then brought the whole province of Diyār Bakr under the rule of the Saldjūks Mansūr, the last Marwānid, died in Muharram 489 (Dec 1095—Jan 1096) in Djazīrat Ibn ʿOmar

MĀRYĀ, a tribe in the Western zone of Eritrea They are — for the most part — shepherds and inhabit the middle valley of the ʿAnsabā river in the district of Karan Their tribe is formed by two sections of nobles Māryā Kayih "the Red Māryā" and Māryā Sallim "the Black Māryā", and the families of the vassals The "Red" Māryā have been traditionally in a lower position than the "Black" and they were obliged to pay on certain occasions special gifts to the "Black" as, for instance, when the chief of the "Black" died The vassals were practically divided between the Red and the Black as every family of them lived under the patronage of the chief of a noble family Both the paramount chiefs of the noble sections had some particular rights over all the vassals of the noble families of their sections as they had, for instance, the power to order that every vassal may give to them the same gift as to his individual patron or to oblige the patrons to pay, as a duty to the highest representative of the tribe, the tenth part of every gift or duty of their vassals

The Māryā claim to be descendants of a warrior, Māryā, born from Saho stock, who emigrated with seventeen soldiers to the borders of the ʿAnsabā and was received there as a guest by the natives But, afterwards, the sons of Māryā had so greatly increased that they were able to occupy the whole land and to subdue the native tribes who became their vassals These natives, who are called *tigrāy* on account of their origin, were really Abyssinians and Bedja However, the Māryā and their vassals to day speak only the Tigrē language, and the Saho, as the Bedja, has been wholly forgotten

The Māryā were Christians but, about half a century ago, they were converted to Islām Even their clans (as the ʿAd Te-mikāʾēl, a section of the "Red") and their ancestors till recent generations bore Christian names In any case, Islāmic law has gradually gained great influence, among the Māryā, and this has been from many points of view a real profit to the population, as the laws of Islām may moderate in a good way the ancient rough customs which strongly assured the privileges of the nobles and their mastery on the vassals As a matter of fact, in the hereditary law, the prevalent right of the first born son and the exclusion of the daughters from the succession of their father's estates became gradually disused on account of the Islāmic influences In the same way, the custom of declaring slaves those vassals who could not pay their debts to the nobles and the great differences, in the penal law, as to the punishment of crimes perpetrated by the nobles or by the vassals, had already been diminished after the conversion of the Māryā to the Islām, when the occupation of Eritrea by Italy caused the complete abrogation of those rules

MARYAM, Mary The Arabic form of the name is identical with ܡܪܝܡ and *μαριάμ* which are used in the Syriac and in the Greek Bible in the New as well as in the Old Testament In the latter it corresponds to the Hebrew מִרְיָם This name, like other ones with the same suffix, such as ʿAmram, Bilʿam, points to the region between Palestine and Northwestern Arabia as its home According to Muslim interpretation the name means "the pious" (*al-ʿābida*, cf the commentaries on sūra iii 31) It occurs frequently in the Kurʾān in the combination [ʿĪsā] Ibn Maryam "[Jesus] the son of Mary" (sūra ii 81, 254, iii 31 *sqq*, iv 156, 169, v 19, 50, 76, 82, 109, 112, 114, 116, ix 31, xix 35, xxiii 52, xxxiii 7, xliii 57, lvii 27, lxi 6, 14), no father being mentioned, because, according to Muslim tradition also, ʿĪsā had no earthly father In the majority of these passages ʿĪsā is clearly regarded as the higher of the two Yet Maryam's place is important from a dogmatical as well as from a historical point of view

Maryam is mentioned in the Kurʾān, from the oldest parts down to the later Madīnese sūras

To the first Makkan period belongs sūra xxiii 52 "And we made the son of Maryam and his

mother a sign, and we made them abide in an elevated place, full of quiet and watered with springs" Here is possibly the first allusion in the Kur'ān to the virgin birth This idea is accentuated in sūra xix 20, where Maryam gives the spirit (i e the angel) who announces to her the birth of a male child, this reply "How should I have a male child, no human man having touched me?" In sūra lxvi 12 the conception is ascribed to this divine spirit (cf Luke i 34 *sq* Then said Mary unto the angel, How shall this be, seeing I know not a man? And the angel answered and said unto her, The Holy Ghost shall come upon thee, and the power of the Highest shall overshadow thee)

The virgin birth is also mentioned in sūra lxvi 12 (Madinian) "And Maryam bint ʿImrān who kept her body pure Then we breathed into it from our spirit She acknowledged the truth of the words of her Lord and of his book and she belonged to the obedient"

A third mention of the annunciation and the virgin birth is in sūra iii 37 "When the angels said, O Maryam, verily Allāh has elected and purified thee and elected thee above the women of all created beings O Maryam, be obedient unto thy Lord and prostrate thyself and bow down with those who bow down" (cf Luke i 28) Maryam is indeed reckoned as one of the four best women that ever existed, together with Āsiya [q v], Khadīdja [q v] and Fāṭima [q v] (Ahmad b Hanbal, *Musnad*, iii 135), and the chief of the women of Paradise (Ibn Hanbal, iii 64, 80)

According to tradition the annunciation took place in the following way Djibrīl appeared to Mary in the shape of a beardless youth with a shining face and curling hair, announcing to her the birth of a male child She expressed her amazement, but, on the angel's reassuring answer, she complied with the will of God

Thereupon the angel blew his breath into the fold of her shirt, which she had put off When the angel had withdrawn, she put on the shirt and became pregnant The annunciation took place in the cavern of the well of Silwān, whither Maryam had gone, as usual, to fill her pitcher, she was then 10 or 13 years of age, and it was the longest day of the year In Christian tradition also the voice of the angel was heard by Maryam for the first time when she had gone to fill her pitcher According to a different tradition ʿĪsā's spirit entered Maryam through her mouth (Tabarī, *Tafsīr*, vi 22)

A second important dogmatical feature is that Maryam belongs to the Trinity according to the Kur'ān A glimpse of this conception is given in sūra v 79 "al-Masīh, the son of Maryam, is an Apostle only, who was preceded by other Apostles, and his mother an upright woman, and both were wont to take food" This verse is apparently meant as a refutation of the Christians who venerated ʿĪsā and his mother as divine persons, elevated above human needs With this verse may be compared sūra iv 169 "O people of the book, beware of exaggeration in your religion and say of Allāh nothing but the truth ʿĪsā b Maryam is only the Apostle of Allāh and His word, which He conveyed unto Maryam, and a spirit that came forth from Him Believe, therefore, on Allāh and his Apostles and say not 'three' Beware of this, this will be better for you Allāh is but one God" etc

Clearer is sūra v 116 "And when Allāh said, O ʿĪsā b Maryam, hast thou said to the people, Take me and my mother as two Gods besides Allāh? He answered Far be it, that I should say to what I am not entitled If I should have said it, Thou wouldst know it" etc

The commentaries also describe the Trinity as consisting of Allāh, ʿĪsā and Maryam Al-Baidāwī, however, admits that in sūra iv 169 there could be an allusion to the Christian doctrine of one God in three hypostasies Father, Son and Holy Ghost

The question how Muhammad had come to conceive of Maryam as one of the persons of the Trinity, has often been asked Maracci has made a reference to Epiphanius, *Adv Haereses*, Haeres lxxviii, § 23, where this author speaks of women in Arabia who venerated Mary as God, and offered to her cakes, from which the heresy is often called that of the Collyridians Sale, in his *Preliminary Discourse*, p 45, mentions the Mariamites, who worshipped a Trinity consisting of God, Christ and Mary, referring to a passage in the work of al-Makīn It may, however, be that Muhammad's conception was not influenced by any sect, but by the veneration of which Mary was the object in the Church itself Or it may be an inference due to the identification of ʿĪsā with the Holy Ghost (cf sūra iv 169 as translated above), which made a vacant place in the Trinity, which Mary seemed entitled to occupy A different explanation is attempted by Sayous, *l c*, p 61 (see *Bibliography*)

A comparatively large place is occupied in the Kur'ān by the story of Maryam and ʿĪsā Many of the features narrated agree, partly or wholly, with narratives in the apocryphal Gospels Sūra xxiii 52 (see above) mentions the elevated place that was prepared for ʿĪsā and his mother It is not clear which tradition is here alluded to According to St Luke i 39, Mary went to the mountains to visit Elisabeth In the *Protevangelium Jacobi* (chap xxii, Syriac text, p 20) it is Elisabeth who flees together with John to a mountain, which opens to protect them against their persecutors The Muslim commentators mention Jerusalem, Damascus, Ramla, Egypt as being possibly meant by the "elevated place" Maracci thinks of Paradise

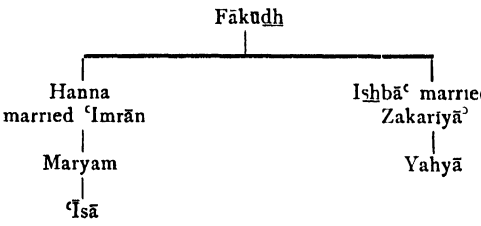
In two passages of the Kur'ān there is a fuller narrative of ʿĪsā's birth and what is connected with it, viz in sūra xix (which bears the title of Maryam), vs 1—35, and in sūra iii 31—42

Sūra xix opens with the story of Zakarīyā' and Yahyā (vs 1—15), on this follows the story of Maryam and ʿĪsā (vs 16—34) Sūra iii 31—42 contains *a* the birth of Maryam, *b* the annunciation of Yahyā (vs 33—36), *c* the annunciation of ʿĪsā (vs 37—41) The comparison of sūra xix with sūra iii makes it probable that Muhammad became acquainted with the story of the birth of Maryam later than with those of Yahyā and ʿĪsā

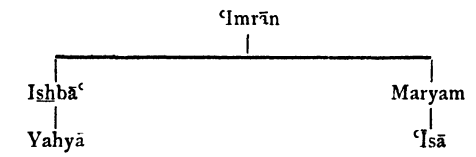
a The birth of Maryam This story goes back to a Christian tradition corresponding closely with that which is contained in the *Protevangelium Jacobi* and *De nativitate Mariae* Mary's father is called ʿImrān in the Kur'ān, Ioachim in Christian tradition, Ibn Khaldūn (*Ibar*, ii 144) is also acquainted with the name Ioachim It has been supposed that the name of ʿImrān, which apparently corresponds with the Biblical ʿAmram, the father of Moses, as well as the fact that Maryam is called

a sister of Hārūn (sūra xix 29), is due to a confusion between the two Biblical Maryam's Sale, Gerock and others think such a confusion improbable At any rate Muslim tradition assures us that there is a distance of 1,800 years between the Biblical ʿAmram and the father of Mary

ʿImrān's wife, ʿĪsā's grandmother, is not mentioned by name in the Kurʾān In Christian as well as in Muslim tradition she is called Hanna It is only in Muslim tradition that her genealogy is worked out She is a daughter of Fākūdh and a sister of Ishbāʿ, the Biblical Elisabeth



According to a different genealogy Ishbāʿ and Maryam were sisters, daughters of ʿImrān and Hanna (Masʿūdī, *Murūdj*, i 120 *sq*, Tabarī, *Tafsīr*, iii 144)-



ʿImrān and Hanna were old and childless One day the sight of a bird in a tree, which was feeding her young, aroused Hanna's desire for a child She prays God to fulfil her desire and vows, if her prayer should be heard, the child to the temple She had however forgotten that, according to the Jewish law, it would be impossible, to accomplish her vow, if she should give birth to a female child (cf *Protev Jacobi*, chapters iii, iv, Syriac text, p 4) Compare with this Sūra, iii 31 "How the wife of ʿImrān said, O my Lord, I have vowed to Thee what is in my womb Now accept [this vow] from me, Thou art the hearing, the knowing And when she had given birth to the child, she said, O my Lord, I have given birth to a female child and I have called her Maryam"

Then the Kurʾān relates how she invoked on behalf of Maryam and her posterity Allah's protection from Satan On this verse is based the well known *hadīth* "Every child that is born, is touched (or stung) by Satan and this touch makes it cry, except Maryam and her son" (Bukhārī, *Anbiyāʾ*, *bāb* 44, *Tafsīr*, Sūra 3, b 2, Muslim, *Fadāʾil*, trad 146, 147, Ahmad b Hanbal, *Musnad*, ii 233, 274 *sq*, 288, 292, 319, 368, 523) This tradition is used in support of the impeccability (*ʿisma*) of ʿĪsā, Maryam and the Prophets in general (cf al-Nawawī *ad* Muslim, *l c* and al-Baidāwī *ad* sūra iii 31)

The Kurʾān further relates (vs 32) that the child grows up in a chamber in the temple (*miḥrāb*, cf the κοιτῶν in *Protev Jac*, vi, Syr text, p 5 *sq*) under the divine grace and under Zakariyāʾ's care According to Muslim tradition, ʿImrān had died before the birth of Maryam, and Zakarīyāʾ claimed authority over her on account of his being her uncle, the rabbis did not recognise his claim, his right was proved by an ordeal, consisting in the parties throwing their pens or arrows in a river, the only one that floated was that of Zakarīyāʾ Sūra iii 39 refers to this Christian tradition knows of an ordeal only in the case of Joseph, who, because a dove comes forth from his staff, is recognised as Maryam's guardian

As often as Zakariyāʾ enters Maryam's *miḥrāb*, he finds her being provided with food in a miraculous way (vs 32) This feature also belongs to Christian tradition (*Protev Jacobi*, chap viii, Syr text, p 7) The person of Joseph is not mentioned in the Kurʾān In Muslim tradition he takes care of Maryam, his cousin, because Zakarīyāʾ is no longer able to do so, on account of old age Maryam stays however in the temple, which she leaves during her monthly period only According to Christian tradition, Joseph takes her into his house when she attains to womanhood, lest she should defile the temple

b The annunciation of Yahyā See this art and ZAKARĪYĀʾ

c The annunciation and birth of ʿĪsā The more detailed narrative is that of sūra xix 16 *sqq* Maryam retires to "a place situated eastward", where she hides herself behind a curtain The commentaries do not know whether a place to the east of Jerusalem is meant, or the eastern part of her house, to which she retires every month It is said that this is the origin of the *kibla* of the Christians

In vs 17—21 the story of the annunciation is given (cf above), followed by that of ʿĪsā's birth, which, according to some Muslim traditions, followed the conception either immediately or very soon The pains of childbirth came upon Maryam when she was near the trunk of a palm "She said, would to God I had died before this, and had become a thing forgotten, and lost in oblivion And he who was beneath her [i e the child, or Djibrīl, or the palm] called to her, saying, Be not grieved, God has provided a rivulet under thee, and shake the trunk of the palm and it shall let fall ripe dates upon thee, ready gathered And eat and drink and calm thy mind" This story may, perhaps, be considered as a parallel to the Christian tradition in which it is related that, during the flight to Egypt, the babe Jesus ordered a palm in the desert to bow down in order to refresh Mary by its dates, whereupon the palm obeyed and stayed with its head at Mary's feet, till the child ordered it to stand upright again and to open a vein between its roots in order to quench the thirst of the holy family (Apocryphal Gospel of Matthew, chap xx) The Kurʾān goes on (vs 26) "And when thou seest any man, say, I have vowed a fast unto the Merciful, so I may not speak to any man to-day" The commentaries say, this was meant to avoid importunate questions This feature is not in Christian tradition, yet in the *Protevangelium Jacobi* it is said (chap xii, Syr text, p 11) that Mary, who was then 16 years of age, hid herself from the Israelites According to Muslim tradition, she stayed in a cavern during forty days "Then she brought him", continues the Kurʾān (xix 28), "to her people, carrying him They said, O Maryam, now thou hast done a strange thing O sister of Hārūn, thy father was not a bad man, neither was thy mother a harlot Then she pointed to the child" Then the child begins to speak, one of the wellknown

miracles ascribed to ʿĪsā The "very shameful calumny" which the Israelites brought forth against Maryam, is also mentioned in sūra iv 155

As to the words "O sister of Hārūn" (cf above), it may be added that, according to the commentaries, this Hārūn was not Moses' brother, but one of Maryam's contemporaries, who was either a wicked man, with whom she is compared in this respect, or her pious brother

A legend about loaves of bread which Maryam gave to the Magi, is mentioned by al Masʿūdī, iv 79 *sq*

The flight to Egypt is not mentioned in the Kurʾān, unless the "elevated place" (sūra xxiii 52, cf above) should be an allusion to it According to Muslim tradition which is acquainted with it, the abode lasts 12 years After the death of Herod the holy family returns to Nāsira

After his alleged death ʿĪsa consoles his mother from heaven According to others it was Mary Magdalene The stories of the *Transitus Mariae* have not obtained a place in Muslim tradition Instead of these, there is a narrative of how Maryam went to Rome in order to preach before Māiūt (Nero), accompanied by John (the disciple) and Shimʿūn, the coppersmith When Shimʿūn and Tadāwus (Thaddaeus ?) were crucified with their heads downward, Maryam fled with John When they were persecuted the earth opened and withdrew them from their persecutors This miracle was the cause of Mārūt's conversion

MARZUBĀN, Arabic form of the title of provincial governors in the Sāsānian empire, especially of the "wardens of the marches", the "markgraves" The word is derived from *marz* which still means in Persian a frontier district (Horn, *Grundriss der neupersischen Etymologie*, p 218) and is found in Pehlevi in the form *marzpān* (in the *Kār-nāmak*, cf H S Nyberg, *Hilfsbuch des Pehlevi*, i, Upsala 1928, p 54) which suggests a north Irānian origin (cf Lentz, *Z I I*, iv 255, 295), as we find alongside of *marz* also *mardj* in Persian (Horn, *loc cit*) The title is not found, however, before the Sāsānian period and in the great inscription of Paikuli, the wardens are called *bitakhsh* (Arm *bdeashkh*), also a north Irānian title (Herzfeld, *Paikuli*, Berlin 1924, p 155, cf also Marquart, *Ērānšahr*, p 165 *sq*) In Syriac we find the forms *marzbānā* and *marzabānā* (Payne Smith) and the Armenian has *marzpan* and *marz(a)van* (Hubschmann, *Armenische Grammatik*, p 193) Persian finally has kept the word as *marzbān*, *marzabān* or *marzawān* (cf e g the *Burhān-i Kāṭiʿ*)

It is from Arab sources that we are more particularly informed of the duties of the *marzubān* Al Yaʿkūbī (*Taʾrikh*, ed Houtsma, i 201) says that it was the title of the *raʾīs al-balad*, while the four great divisions of the empire were governed by *pādhghōspān* The historians al Tabarī and al-Balādhurī tell us of the different *marzubān* encountered by the Arabs in their conquests (cf the list of provinces ruled by a *marazubān*, drawn up by Balādhurī, and given by Noldeke in *Gesch d Perser und Araber*, Leyden 1879, p 446) In this period we find these governors acting independently of any higher authority and concluding truces and treaties They sometimes retained their offices after the Arab conquest Under the Sāsānians the *marzubān* were far from having such an independent position We sometimes find them acting as generals under the command of the *spāhbad* (e g Joshua Stylites, ed Wright, p 61)

Although the title gradually fell into disuse, Muslim Persia still retained the word, used in its original sense of "warden of the marches" It is frequently found in literature (cf Saʿdī, *Bustān*, ed Graf, p 73) On the other hand after the Sāsānian period, *marzubān* and its variants became a proper name (in Arabic sometimes *al-Marzubān*) among Muslims and also among Parsīs (cf the names of the copyists of Pahlavi manuscripts, cf especially Justi, *Iranisches Namenbuch*, s v *Marzpān*)

MARZUBĀN B Rustam, a prince of the Bāwand dynasty of Tabaristān [q v] regarded as the original author of the *Marzubān-nāma*, a work in Persian prose containing a series of short stories and fables of a moral and didactic character This book is known in two versions in elegant Persian of the xiiith century, the author of one of which was Saʿd al Dīn al Warāwīnī, he dedicated it to Abu 'l-Kāsim Rabīb al-Dīn, vizier of Uzbek b Muhammad b Ildegīz, Atābeg of Ādharbāidjān from 1210 to 1225 These dates give us probable limits for the composition of the book The other version is the work of Muhammad b Ghāzī al-Malatyawī, secretary and later vizier of Rukn al-Dīn Sulaimānshāh, Saldjūk of Rūm, who reigned from 1192 to 1204 It is called *Rawdat al-ʿUkūl* and differs a good deal in form and contents from the other, which is called the *Marzubān nāma*

In the preface by Saʿd al-Dīn al Warāwīnī we are told that the original work had been written in the language of Tabaristān and the ancient *Pārsī*, the popular language, but that thanks to him this valuable work had been given a new life after 400 years (p 6 and 33 of Mīrzā Muhammad Kazwīnī's edition) In the first chapter Marzubān b Sharwīn, descendant of Kayūs, brother of the Sāsānian king Anushirwān, is mentioned as *wādiʿ-i*

kitāb. The *Rawdat al-ʿUkūl* on the contrary attributed the original book to a descendant of the Ziyārid Kābūs b Washmgīr and says simply that it is written in a coarse style Apart from these, there are very few references to the book in Persian literature The author of the *Kābūs-nāma* (composed in 1082) says that the grandmother of his mother was the daughter of the prince Marzubān b Rustam b Sharwīn, author of the *Marzubān-nāma* Ibn Isfandiyār in his *Taʾrīkh i Ṭabaristān* (written in 1216) speaks of the *Iṣfahbad* Marzubān b Rustam b Sharwīn Parin as the author of the *Marzubān-nāma*, a work which is in every way better than the book of *Kalīla wa-Dimna* He adds that this same Marzubān composed a *dīwān* in Tabarī verse called the *Nīki-nāma* (cf *An abridged Translation of the History of Tabaristān*, by E G Browne, Leyden 1905, p 86), finally the Persian bibliographer Ridā Kuli Khān in the *Farhang i Nāsiri* speaks of the *Marzubān-nāma* as having been written by Marzubān b Rustam and dedicated to (*mansūb ba*) the emīr Kābūs Shams al-Maʿālī, in the *Madjmaʿ al-Fusahāʾ* the same author incidentally mentions the *Marzubān-nāma*

These very incomplete and sometimes contradictory statements have caused Mirzā Muhammad Kazwīnī to suggest that the individual who gave the book its name was Marzubān, son of the "king" of Tabaristān, Rustam b Shahriyār b Sharwīn b Rustam b Surkhāt, a descendant of Bāw, son of Kayūs, brother of Anushirwān This genealogy is based on Ibn Isfandiyār's work and seems more probable than that given by Schefer (*Chrest pers*, II, p 194), who thinks that Marzubān was the son of Rustam b Surkhāt (d 895) The date of Rustam b Shahriyār b Sharwīn, who was in all probability the father of Marzubān, is only known from a coin of the year 355 (966) (H L Rabino, *Mazandarán and Astarabad*, London 1928, *G M S*, N S VII, p 135) Marzubān must have therefore flourished about 1000 A D, i e during the period of the Persian renaissance

In the first chapter of the *Marzubān-nāma* Marzubān is described as the brother of the reigning "king" (perhaps Dārā b Rustam, who reigned for 8 years, cf Rabino, *loc cit*) who begged to be allowed to live a life of seclusion and to compose a book containing "wise counsels and useful directions for the conduct of life in this world" In this connection he has a disputation with the king and his vizier in the course of which he relates several anecdotes The other chapters continue in the same style Several of the fables and anecdotes are found in other books just as we find similar stories in the book of *Kalīla wa Dimna* and in the *Arabian Nights* The collection therefore belongs to an essentially Persian literary type, which has had considerable influence on Arabic literature Since its contents have not been examined for comparison, it would be too hazardous to express an opinion on its relation to similar collections and popular Persian stories It is very possible that a number of the stories are of Indian origin On the other hand, we ought perhaps not to credit the statement that originally it was written in the Tabarī dialect, for then we should have to believe that the two authors of the new recension knew this dialect, about which however, we only have the notes in the *Taʾrīkh-i Ṭabaristān* of Ibn Isfandiyār Perhaps the reference is to a text in archaic Persian like the probable language of the *Khudāi-nāmak* which Firdawsī used (cf Noldeke, *Geschichte des Artachsîr i Pâpakân*, Gottingen 1879, p 27) and the source of a poem like *Wīs u-Rāmīn*, a text which no longer pleased the taste of the literary connoisseurs of the XIIth century

The *Marzubān-nāma* was published by Mīrzā Muhammad Kazwīnī in 1908 (*G M S*, VII) from a manuscript in the British Museum (Or 6476) with the help of two other MSS in the same collection, one in the Bibliothèque Nationale and another sent from Persia The Paris manuscript had already been used for the publication of extracts from the *Marzubān-nāma* in Ch Schefer's *Chrestomathie persane*, Paris 1885, p 172—199 The *Rawdat al-ʿUkūl* is represented by a manuscript in Leyden (cf M Th Houtsma, *Eine unbekannte Bearbeitung des Marzbān nāme*, *Z D M G*, III 359—392) and another in Paris Mirzā Muhammad has given extracts from it in the preface to his edition There is also an Arabic version of the same work from the pen of Ibn ʿArabshāh, based on a Turkish version of Saʿd al-Warāwinī's recension, this Arabic text was lithographed at Cairo in 1278

Bibliography The philological data have been collected by Mirzā Muhammad Khān in the preface of his edition, Schefer's observations (p 194—211) are to be utilised with caution Cf also H Ethé, *Neuperische Litteratur*, in *Grundriss d Iran Phil*, II 328 *sqq* and E G Browne, *A Literary History of Persia*, II 115, 489 (J H KRAMERS)

MASʿĀ [See SAʿY]

MASAGAN [See MAZAGHĀI]

MASCARA, a town in Algeria (department of Oran), 50 miles S W of Mostaganem and 60 S E of Oran Its position is 35° 26′ N Lat and 8′ E of Greenwich It lies on the southern slope of the Beni Shūgran range, called by the Arabs Sharīb al-Rīh and is built on the edge of a ravine at the bottom of which runs the Wād Sīdī Tūdjman on the other side of which to the N W lies the native faubourg of Bāb ʿAlī Mascara commands the plain of Eghris, which measures 25 to 30 miles from W to E and 10 to 12 miles from N to S and is one of the most fertile regions of Algeria The natives have grown cereals here from the earliest times and the Europeans have introduced tobacco and created vineyards, the produce of which is celebrated It is the market for a region, becoming more and more prosperous, and by the census of 1926 had 30,669 inhabitants of whom 16,630 were natives

Mascara is of considerable antiquity According to Bakrī (*Masālik*, transl de Slane, rev by Fagnan, p 160), it included among its inhabitants people who came from Tihert (Tiaret) some of whom went and settled at Ifgan, a day's journey S E, when this town was founded by Yaʿlā b Muhammad, son of Sālih the Ifrānid, in 338 (949—950 A D) Ibn Hawkal (*Description de l'Afrique*, transl de Slane, *Journ As*, 1842) and Idrīsī (transl de Goeje, p 96) mention Mascara as a large well watered village rich in fruits The Almohads seem to have built a fortress there The Ziyānids of Tlemcen kept a governor and a garrison there Leo Africanus (Bk IV, ed Schefer, vol III, p 34) notes the importance of the market which was held at Mascara "one of the towns of the Beni Rasi" (Banū Rāshid) where one could buy, along with cereals in large quantities, cloth and articles of

harness manufactered in the country The rulers of Tlemcen drew considerable revenues from it 40,000 pistoles, according to Marmol (*Africa*, vol ii, p 356)

The Turks established themselves at Mascara in the xvi^th century and placed a garrison there In 1701 they made it the capital of the beylik of the west, which had hitherto been Mazūna in Dahra The beys lived there till Oran was reoccupied by the Algerians in 1792 During this period, Mascara, which had hitherto only been an insignificant place, began to look like a regular town The beys built two mosques and a madrasa, a wall and a kasba and brought in a water-supply The manufacture of burnuses and *hā'iks*, celebrated throughout the Regency, enriched the inhabitants This prosperity began to decline after the beys left Mascara and especially after the risings, which broke out in the province of the west in the beginning of the xix^th century The Darkāwī Ben Sherīf seized the town in 1805 and held it for a time In 1827 it was attacked by the marabout Muhammad al-Tidjānī Supported by the Hāshim he gained possession of the faubourg of Bāb ʿAlī but was killed by the Turks when preparing to storm the town itself At the end of Turkish rule, ʿAbd al-Kādir [q v] who had been proclaimed Sultān by the tribes of the plain of Eghris, established his seat of government at Mascara, but rarely lived there An expedition, in the month of December 1836 led by Marshal Clauzel, occupied Mascara which the French abandoned next day, after burning down part of it The emīr returned to the town and held it till May 30, 1841, when a column under Bugeaud occupied it finally for the French Mascara, then half in ruins, had only a population of 2,840 inhabitants

Architecture

A Origin of the Mosque

The word מסגדא is found in Aramaic, the earliest occurrence being in the Jewish *Elephantine Papyri* (ed Sachau, pl 32, ed Ungnad, N° 33, Cowley, *Aramaic Papyri of the fifth Cent B C*, N° 44), also frequently in Nabataean (*Corp Inscr Semit*, ii 161, 1, 176, 185, 188, 190, 218, cf, Schwally, *Z D M G*, lii, 1898, p 134, Lidzbarski, *Handbuch d nordsem Epigr*, p 152, 328, Cooke, *North Semitic Inscriptions*, p 238) The word formed from סגד "to prostrate oneself" seems to mean in Nabataean a stele, a sacred pillar, although the meaning "place of worship" has also been suggested In the *Elephantine Papyri* where it is sworn by במסגדא ובענתיהו both meanings are possible The Syriac ܡܣܓܕܐ and ܡܣܓܕܐ (cf the Lexica) is like the Amharic *masgéd* derived from the Arabic, while the Ethiopic *mĕsgād* "temple, church" is perhaps a genuine formation from the verb (which is certainly borrowed from the Aramaic cf Noldeke, *Neue Beitrage z sem Sprachw*, p 36) The Arabic *masdjid* may have been formed independently from the corresponding verb, which also undoubtedly comes from the Aramaic, probably the above mentioned Aramaic substantive was simply taken over, although no links can be shown between the Nabataean inscriptions and the Kur'ān

The word in any case can hardly have been formed by Muhammad himself from its specific connection with divine service ("place where one *sadjada* or prostrates oneself")

1 The Meccan period

The word is used in the Kur'an especially of the Meccan sanctuary (*al-Masdjid al-harām*, Sūra ii 139, 144, 145, 187, 192, 214, v 3, viii 34, ix 7, 19, 28, xvii 1, xxii 25, xlviii 25, 27), according to later sources, this was already the usage in the Meccan period (cf Ya'kūbī, ed Houtsma, i 285, 12) According to tradition the term *al-Masdjid al-aksā* (Sūra xvii 1) means the Jerusalem sanctuary (according to Schrieke, *Isl*, vi 1 *sqq*, cf Horovitz, *ibid*, ix 159 *sqq*, the reference is rather to a place of prayer in heaven), and in the legend of the Seven Sleepers *masdjid* means a tomb-sanctuary probably Christian, certainly pre Muhammadan (Sūra xviii, 20) The word is also applied to pre Islāmic sanctuaries, which belong to God and where God is invoked, although Muhammad was not always able to recognise the particular cult associated with them It is undoubtedly with this general meaning that the word is used in this verse of the Kur'ān "If God had not taken men under his protection, then monasteries, churches and places of prayer (*salawāt*) and *masādjid* would have been destroyed" (Sūra xxii 41) The word is also used in a *hadīth* of an Abyssinian church (Bukhārī, *Salāt*, bāb 48, 54, Muslim, *Masādjid*, Tr 3) and in another of Jewish and Christian tomb-sanctuaries (Bukhārī, *Salāt*, bāb 55, Muslim, *Masādjid*, Tr 3) Even Ibn Khaldūn can still use the word in the general meaning of a temple or place of worship of any religion (*Mukaddima*, *fasl* 4, 6 at the end) There is therefore no question of a word of specifically Muslim creation This is in entire agreement with Muhammad's original attitude to earlier religions Just as Abraham was a Muslim, so David had a masdjid (Tabarī, i 2408, 7 *sqq*)

To the Prophet the Meccan sanctuary always remained the principal mosque, known as *Bait Allāh* even before the time of the Prophet It was a grave charge brought against the Kuraish in the Meccan period that they drove the believers out of *al-Masdjid al-harām* (Sūra ii 214, v 3, viii 34, xxii 25, xlviii 25), which was considered all the more unjust as they worshipped the true lord of the sanctuary To the true God belonged *al-masādjid* (Sūra lxxii 18, Meccan), it is therefore an absurdity for the godless to prevent the wor-

ship of God in "God's own mosques" (Sūra ii 108) The result was that it was revealed in the year 9 "It is not right for polytheists to frequent the mosques of God" (Sūra ix 17 *sq*) and the opponents of the new religion were therefore excluded from the sanctuary The *Sīra* agrees with the Kur'ān, that the sanctity of *al-Masdjid al harām* to which Muhammad had been used from childhood was always regarded by him as indisputable Like other Meccans, he and his followers regularly made the *tawāf* around the Ka'ba and kissed the Black Stone (e g Ibn Hishām, p 183, 12 *sqq*, 239, 8, 251, 15), it is frequently stated that he used to sit in the masdjid like his fellow citizens, alone or with a follower or disputing with an opponent (Ibn Hishām, p 233, 16, 251, 15, 252, 14, 259, 260, 294, 18 *sq*) It is related that he used to perform the salāt between the Yaman corner and the Black Stone, apparently from the narrator's context very frequently (Ibn Hishām, p 190, 9 *sqq*) After his conversion, 'Umar is said to have arranged that believers performed the salāt unmolested beside the Ka'ba (Ibn Hishām, p 224, 13 *sq*, 17 *sq*), How strongly Muhammad felt himself attached to the Arab sanctuary is evident from the fact that he took part in the traditional rites there before the Hidjra (Sūra cviii, 2), in the year 1, one of his followers, Sa'd b Mu'ādh, took part in the pilgrimage ceremonies and in the year 2 he himself sacrificed on the 10th Dhu 'l-Hidjdja on the musallā of the Banū Salima He therefore, here as elsewhere, retained ancient customs where his new teaching did not directly exclude them But when an independent religion developed out of his preaching, a new type of divine service had to be evolved

In Mecca, the original Muslim community had no special place of worship The Prophet used to perform the salāt in secret in the narrow alleys of Mecca with his first male follower 'Alī and with the other earliest Companions also (Ibn Hishām, p 159, 166, 13 *sqq*) The references are usually to the solitary salāt of the Prophet, sometimes beside the Ka'ba (Ibn Hishām, p 190, 9 *sqq*), sometimes in his own house (Ibn Hishām, p 203, 6 *sq*) That the believers often prayed together may be taken for granted, they would do so in a house (cf Ibn Hishām, p 202) Occasionally also 'Umar is said to have conducted the ritual prayer with others beside the Ka'ba (Ibn Hishām, p 224) because 'Umar was able to defy the Kuraish When the Prophet recited in the mosque the revelation, later abrogated, recognising al Lāt, al-'Uzzā and Manāt, according to the legend, not only the believers but also the polytheists present took part in the *sudjūd* (Tabarī, i 1192 *sq*) Abū Bakr is said to have had a private place of prayer (*masdjid*) in Mecca in his courtyard beside the gate, the Kuraish, we are told, objected to this because women and children could see it and might be led astray by the emotion aroused (Ibn Hishām, p 246, Bukhārī, *Salāt*, B 86, *Kafāla*, B 14 etc, *Mazālim*, B 22)

In the dogma taught by Muhammad a sanctuary was not a fundamental necessity Every place was the same to God and humility in the presence of God, of which the ritual prayer was the expression, could be shown anywhere, hence the saying of the Prophet that he had been given the whole world as a masdjid, while earlier prophets could only pray in churches and synagogues (Wākidī, transl Wellhausen, p 403, *Corpus juris di Zaid b 'Alī*, ed Griffini, p 50 and clxxix, Bukhārī, *Salāt*, B 56, *Tayammum*, B 1, Muslim, *Masādjid*, Tr 1) and also the saying "Wherever the hour of prayer overtakes thee, thou shalt perform the salāt and that is a *masdjid*" (Muslim, *Masādjid*, Tr 1) That he nevertheless remained firmly attached to the traditional sanctuary of the Ka'ba, produced a confusion of thought which is very marked in Sūra ii 136 *sqq* When in Medīna he was able to do as he pleased, it must have been natural for him to create a place where he could be undisturbed with his followers and where they could perform the ritual *salāt* together

2 The Foundation of the Mosque in Medīna

According to one tradition the Prophet came riding into Medīna on his camel with Abū Bakr as *ridf* surrounded by the Banū Nadjdjār The camel stopped on Abū Ayyūb's *finā'* Here (according to Anas) the Prophet performed the *salāt*, and immediately afterwards ordered the mosque to be built and purchased the piece of land from two orphans, Sahl and Suhail, who were under the guardianship of Mu'ādh b 'Afrā', for 10 dīnārs, after declining to accept it as a gift, he lived with Abū Ayyūb until the mosque and his houses were completed During this period he performed the salāt in courtyards or other open spaces (Bukhārī, *Salāt*, B 48, Muslim, *Masādjid*, Tr 1, Ahmad b Hanbal, *Musnad*, iii 212 above, Ibn Hishām, p 336, Tabarī, i 1258 *sq*, Mas'ūdī, *Murūdj*, iv 140 *sq*) According to this tradition, the building of the mosque was intended by the Prophet from the first and the choice of the site was left to the whim of his mount According to another tradition the Prophet took up his abode with Abū Ayyūb, but during the first period of his stay in Medīna he conducted the salāt in the house of Abū Umāma As'ad, who had a private masdjid, in which he used to conduct salāts with his neighbours The Prophet later expressed the desire to purchase the adjoining piece of ground and he bought it from the two orphans, who, according to this tradition, were wards of As'ad (Balādhurī, *Futūh al-Buldān*, ed de Goeje, p 6, cf Wustenfeld, *Gesch d Stadt Medīna*, p 60) The site was covered with graves, ruins (*khirab*, also *harth*, Tabarī, i 1259, 17, 1260, 1, cf Ah mad b Hanbal, *Musnad*, iii 212, 7, perhaps due to an old misreading) and palm trees and was used as a place for keeping camels (and smaller domestic animals, Bukhārī, *Wudū'*, B 66) The site was cleared, the palms cut down and the walls built The building material was bricks baked in the sun (*labin*) (Ibn Hishām, p 337, Bukhārī, *Salāt*, B 62, 65, according to one tradition they were baked at the well of Fātima, Wustenfeld, *Stadt Medīna*, p 31), in places it was a courtyard surrounded by a brick wall on a stone foundation with three entrances the gateposts were of stone On the *kibla* side (i e the north wall) at first left open, the stems of the palm-trees which had been cut down were soon set up as columns and a roof was put over them of palm leaves and clay On the east side two huts of similar materials were built for the Prophet's wives Sawdā' and 'Ā'isha, their entrances opened on to the court and were covered with carpets they were later increased so that there were nine

little houses for the Prophet's wives When the *kibla* was moved to the south, the arbour at the north wall remained, under this arbour called *ṣuffa* or *zulla* the homeless Companions found shelter (Bukhārī, *Ṣalāt*, B 48, 62, Wüstenfeld, *Medina*, p 60 *sq*, 66, Diyārbakrī, *Ta'rīkh al-Khamīs*, Cairo 1302, 1 387 *sqq*, on the *ṣuffa*, p 387 in the middle, 391 after the middle, cf L Caetani, *Annali dell' Islām*, 1 377 *sq*) In seven months the work was completed (Wustenfeld, *Medina*, p 59), according to others in the month of Safar of the year 2 (Ibn Hishām, p 339, 18 *sq*) The mosque was very simple It was really only a courtyard with a wall round it, the *ṣuffa* already mentioned supplied a shelter on the north side, while on the south side, later the *kibla* side, an arbour was probably built also, for the Prophet used to preach leaning against a palm-trunk and this must have been on the *kibla* side How large the arbours were cannot be ascertained The mosque was the courtyard of the Prophet's houses and at the same time the meeting-place for the believers and the place for common prayer

According to the sources, it was the Prophet's intention from the very first to build a mosque at once in Medīna, according to a later tradition Gabriel commanded him in the name of God to build a house for God (*Khamīs*, 1 387 infra), but this story is coloured by later conditions It has been made quite clear, notably by L Caetani (*Annali dell' Islām*, 1 432, 437 *sqq*) and later by H Lammens (*Moʿâwia*, p 8, note 5, 62 etc, do, *Ziâd*, p 30 *sqq*, 93 *sqq*) that the earliest masdjid had nothing of the character of a sacred edifice Much can be quoted for this view from *Hadīth* and *Sīra* (cf *Annali dell' Islām*, 1 440) The unconverted Thakīfīs were received by the Prophet in the mosque to conduct negotiations and he even put up three tents for them in the courtyard (Ibn Hishām, p 916, Wākidī-Wellhausen, p 382), envoys from Tamīm also went freely about in the mosque and called for the Prophet, who dealt with them after he had finished prayers (Ibn Hishām, p 933 *sq*, Wāḳidī-Wellhausen, p 386) Ibn Unais brought to the masdjid the head of the Hudhailī Sufyān, threw it down before the Prophet and gave his report (Ibn Hishām, p 981 *sq*, Wākidī Wellhausen, p 225) After the battle of Uhud the Medina chiefs spent the night in the mosque (Wāḳidī-Wellhausen, p 149) The Awsīs tended their wounded here (*ibid*, p 215 *sq*, Tabarī, 1 1491 *sq*), a prisoner of war was tied to one of the pillars of the mosque (Bukhārī, *Ṣalāt*, B 76, 82, cf 75) Many poor people used to live in the *ṣuffa* (Bukhārī, *Salāt*, B 58), tents and huts were put up in the mosque, one for example by converted and liberated prisoners, another by the Banū Ghifār, in whose tent Saʿd b Muʿādh died of his wounds (*ibid*, B 77, *Usd al-Ghāba*, II 297) People sat as they pleased in the mosque or took their ease lying on their backs (Bukhārī, *ʿIlm*, bāb 6, *Salāt*, bāb 85, Ibn Saʿd, 1 124, 14), even so late as the reign of ʿUmar it is recorded that he found strangers sleeping in a corner of the mosque (*Kāmil*, p 118, 15 *sqq*), the Prophet received gifts and distributed them among the Companions (Bukhārī, *Ṣalāt*, bāb 42), disputes took place over business (*ibid*, bāb 71, 83) and in general people conducted themselves as they pleased Indeed, on one occasion some Sudanese or Abyssinians with the approval of the Prophet gave a display with shield and lance on the occasion of a festival (do, *Ṣalāt*, bāb 69, *ʿIdain*, bāb 2, 25, *Djihād*, bāb 81) and on another a stranger seeking the Prophet, rode into the mosque on his camel (do, *ʿIlm*, bāb 6) So little "consecrated" was this, the oldest mosque, that one of the *Munāfikūn*, ejected for scoffing at the believers, could call to Abū Aiyūb "Are you throwing me out of the *Mirbad Banī Thaʿlaba*?" (Ibn Hishām, p 362, 10 *sq*)

All this gives one the impression of the head quarters of an army, rather than of a sacred edifice On the other hand the mosque was used from the very first for the general divine service and thus became something more than the Prophet's private courtyard Whatever the Prophet's intentions had been from the first, the masdjid with the increasing importance of Islām was bound to become very soon the political and religious centre of the new community The two points of view cannot be distinguished in Islām, especially in the earlier period The mosque was the place where believers assembled for prayer around the Prophet, where he delivered his addresses, which contained not only appeals for obedience to God but regulations affecting the social life of the community (cf Bukhārī, *Salāt*, bāb 70, 71), from here he controlled the religious and political community of Islām Even at the real old sanctuaries of Arabia, there were no restrictions on what one could do, what distinguished the mosque from the Christian church or the Meccan temple was that in it there was no specially dedicated ritual object At the Kaʿba also people used to gather to discuss everyday affairs and also for important assemblies, if we may believe the *Sīra* (Ibn Hishām, p 183 *sq*, 185, 1, 229, 8, 248, 257, 19) Here also the Prophet used to sit, strangers came to visit him, he talked and they disputed with him, people even came to blows and fought there (Ibn Hishām, 183 *sq*, 185 *sq*, 187 *sq*, 202, 19, 257, 259, *Chron d Stadt Mekka*, ed Wustenfeld, 1 223, 11) Beside the Kaʿba was the *Dār al-Nadwa*, where important matters were discussed and justice administered (*ibid*, see index) From the Medīna mosque was developed the general type of the Muslim mosque It depended on circumstances whether the aspect of the mosque as a social centre or as a place of prayer was more or less emphasised

3 Other Mosques in the time of the Prophet

The mosque of the Prophet in Medīna was not the only one founded by Muslims in his lifetime and according to tradition not even the first, which is said to have been the mosque of Kubāʾ In this village, which belonged to the territory of Medīna (see Wüstenfeld, *Geschichte der Stadt Medina*, p 126), the Prophet on his Hidjra stopped with the family of ʿAmr b ʿAwf, the length of his stay is variously given 3, 5, 8, 14 or 22 days According to one tradition, he found a mosque there on his arrival, which had been built by the first emigrants and the Anṣār and he performed the salāt there with them (see Wustenfeld, *op cit*, p 56, Balādhurī, *Futūh al-Buldān*, p 1, Diyārbakrī, *Ta'rīkh al-Khamīs*, Cairo 1302, 1 380 *sq*) According to another tradition, the Prophet himself founded the mosque on a site, which belonged to his host Kulthūm and was used as a *mirbad* for drying dates or according to others,

to a woman named Labba, who tethered her ass there (Wüstenfeld, *Medina*, p 131, Ibn Hishām, p 335, Tabarī, 1, 1260, 6, Ibn Sa'd, 1 1, 6, Mas'ūdī, *Murūdj*, iv 139, Diyārbakrī, *Khamīs*, 1 381, *al-Sīra al-Halabiya*, Cairo 1320, 11 58 *sq*) Out of this tradition arose a legend based on the story of the foundation of the principal mosque in Medina The Prophet makes (first Abū Bakr and 'Umar without success, then) 'Alī mount a camel and at the place to which it goes builds the mosque with stone brought from the Harra, he himself laid the first stone, and Abū Bakr, 'Umar and 'Uthmān the next ones (*Khamīs*, 1 381) The Prophet is said to have henceforth visited the mosque of Kubā' every Saturday, either riding or walking and the pillar is still shown beside which he conducted the service (Bukhārī, *Fadl al Ṣalāt fī Masdjid Makka wa 'l-Madina*, bāb 2, 4, Muslim, *Hadjdj*, tr 94, *Khamis*, 1 382, Balādhurī, p 5) We are occasionally told that he performed his salāt on the Sabbath in the mosque at Kubā' when he went to the Banū Nadīr in Rabī' I of the year 4 (Wākidī-Wellhausen, p 161)

It is obvious that the customs and ideas of the later community have shaped the legend of this mosque The only question is whether the old tradition that the mosque was founded either by the Prophet himself or even before his arrival by his followers is also a later invention We thus come to the question whether the Prophet founded or recognised any other mosques at all than that of Medina L Caetani, in keeping with his view of the origin of the mosque, is inclined to deny it, pointing to the fact that there was later an obvious tendency to connect mosques everywhere with the Prophet and that Sūra ix 108 strongly condemns the erection of an "opposition mosque" (*M al-Dirār*) The Kur'ān passage is as follows "Those who have built themselves a masdjid for opposition (*dirār*) and unbelief and division among the believers and for a refuge for him who in the past fought against God and his Prophet, and they swear we intended only good God is witness that they are liars! Thou shalt not stand up in it, for verily a masdjid which is founded on piety from the first day of its existence has more right that thou shouldest stand in it, in it are men who desire to purify themselves and God loveth those who purify themselves" (Sūra ix 108—109) According to tradition this was revealed in the year 9, when the Prophet was on the march to Tabūk, the Banū Sālim said to him that they had built a mosque to make it easier for their feeble and elderly people, and they begged the Prophet to perform his salāt in it and thus give it his approval The Prophet postponed it till his return, but then this revelation was announced, because the mosque had been founded by *Munāfikūn* at the instigation of Abū 'Āmir al-Rāhib, who fought against the Prophet According to one tradition (so Ibn 'Umar, Zaid) the "mosque founded on piety" was that of Medina from which the people wished to emancipate themselves, according to another (Ibn 'Abbās) the reference was to that of Kubā', Abū 'Āmir and his followers were not comfortable among the Banū 'Amr b 'Awf and therefore built a new mosque According to some traditions it was in Dhū Awān The Prophet however had it burned down (Tabarī, 1 1704 *sq*, Ibn Hishām, p 357 *sq*, 906 *sq*, Ibn Sa'd, 1 1, 6, Wākidī-Wellhausen, p 410 *sq*, Tabarī, *Tafsīr*, xi 17 *sqq*, Wüstenfeld, *Medina*, p 131, *al-Sira al-Halabiya*, ii 60, Balādhurī, p 1 *sq*, Muslim, *Hadjdj*, tr 93) If the connection with the Tabūk campaign is correct, the *Masdjid al Dirār* is to be sought north of Medina, the "mosque founded on piety" would then be the mosque of Medina rather than that of Kubā' which lies to the south of it There is in itself nothing impossible about the rejection in principle of any mosque other than that of Medina We should then have to discard the whole tradition, for, according to it, the Prophet is at first not unfavourably disposed to the new mosque and his wrath, according to the tradition, arises from the fact that it had been founded by a refractory party But as a matter of fact there are indications that a number of mosques already existed in the time of the Prophet, for example, the verse in the Kur'ān "in houses, which God hath permitted to be built that His name might be praised in them, in them men praise Him morning and evening, whom neither business nor trade refrain from praising God and performing the salāt and the giving of alms" etc (Sūra xxiv 36 *sq*) If this revelation, like the rest of the Sūra, is of the Medina period, it is difficult to refer it to Jews and Christians, and this utterance is quite clear "Observe a complete fast until the night and touch thou them (i e women) not while ye are in the mosques" (Sūra ii 183) This shows that there were already in the time of the Prophet, several Muslim mosques which had a markedly religious character and were recognised by the Prophet

That there were really public places of prayer of the separate tribes at a very early date is evident from the tradition that the Prophet in the year 2 offered his sacrifice on the 10th Dhu 'l-Hidjdja on the Musallā of the Banū Salima In addition there are constant references to private *masādjid* where a few believers, like Abū Bakr in Mecca, made a place for prayer in their houses and where others sometimes assembled (Bukhārī, *Salāt*, bāb 46, 87, *Tahadjdjud*, bāb 30, cf also *Adhān*, bāb 50)

B Origin of Mosques after the time of the Prophet

1 Chief Mosques

What importance the Medina mosque had attained as the centre of administration and worship of the Muslims is best seen from the fact that the first thought of the Muslim generals after their conquests was to found a mosque as a centre around which to gather

Conditions differed somewhat according as it was a new foundation or an already existing town Important examples of the first kind are Basra, Kūfa and al-Fustāt Basra was founded by 'Utba b Nāfi' as winter-quarters for the army in the year 14 (or 16 or 17) The mosque was placed in the centre with the *Dār al-Imāra*, the dwelling of the commander-in-chief with a prison and *Diwān* in front of it Prayer was at first offered on the open space which was fenced round, later the whole was built of reeds and when the men went off to war the reeds were pulled up and laid away Abū Mūsā al-Ash'arī, who later became 'Umar's Wālī, built the edifice of clay and bricks baked in the sun (*labin*) and used grass

for the roof (Balādhurī, p 346 *sq*, 350, *B G A*, v 187 *sqq*, Yāḳūt, *Muʿdjam al-Buldān*, i 642, 6–9, cf Tabarī, i 2377, 14 *sqq*) It was similar in Kūfa which was founded in 17 by Saʿd b Abī Wakḳās In the centre was the mosque and beside it the *Dār al-Imāra* was laid out The mosque at first was simply an open quadrangle, *ṣaḥn*, marked off by a trench round it The space was large enough for 40,000 persons It seems that reeds were also used for building the walls here and later Saʿd used *labin* On the south side (and only here) there was an arbour, *zulla*, built (cf Balādhurī, p 348, 1 *suffa*) The *Dār al Imāra* beside the mosque was later by ʿUmar's orders combined with the mosque (Tabarī, i 2481, 12 *sqq*, 2485, 16, 2487 *sqq*, 2494, 14, Yāḳūt, *Muʿdjam*, iv 323, 10 *sqq*, Balādhurī, p 275 *sqq*, cf *Annali dell' Islām*, iii 846 *sqq*) The plan was therefore an exact reproduction of that of the mosque in Medīna (as is expressly emphasised in Ṭabarī, i 2489, 4 *sqq*), the importance of the mosque was also expressed in its position and the commander lived close beside it There was no difference in al-Fusṭāṭ, which, although there was already an older town here, was laid out as an entirely new camp In the year 21, after the conquest of Alexandria, the mosque was laid out in a garden where ʿAmr had planted his standard It was 50 *dhirāʿ* long and 30 broad Eighty men fixed its *kibla*, which however was turned too far to the east, and was therefore altered later by Kurra b Sharīk The court was quite simple, surrounded by a wall and had trees growing on it, a simple roof is mentioned, it must be identical with the above mentioned *zulla* or *suffa* ʿAmr b al-ʿĀṣī lived just beside the mosque and around it the *Ahl al-Rāʾya* Like the house of the Prophet, the general's house lay on the east side with only a road between them There were two doors in each wall except the southern one (Yāḳūt, *Muʿdjam*, iii 898 *sq*, Makrīzī, *Khiṭaṭ*, iv, Cairo 1326, p 4 *sqq*, Ibn Dukmāk, *K al-Intiṣār*, Cairo 1893, p 59 *sqq*, Suyūṭī, *Husn al-Muḥādara*, i 63 *sq*, ii 135 *sq*, cf *Annali dell' Islām*, iv 554, 557, 563 *sqq*) We find similar arrangements made in al-Mawṣil twenty years earlier (Balādhurī, p 331 *sq*)

In other cases the Muslims established themselves in old towns either conquered or surrendered by treaty, by the treaty they received a site for their mosque (e g Balādhurī, p 116, 14, 147 2) But the distinction between towns which were conquered and those which were surrendered soon disappeared and the position is as a rule not clear Examples of old towns in which the Muslims established themselves are al-Madāʾin, Damascus and Jerusalem — In al-Madāʾin Saʿd b Abī Wakḳās after the conquest in 16 distributed the houses among the Muslims and Kisrā's *Iwān* was made into a mosque, after Saʿd had conducted the *Ṣalāt al-Fath* in it (Ṭabarī, i 2443, 15 *sq*, 2451, 7 *sqq*) In Damascus which was occupied in 14 or 15 by capitulation, according to tradition, the Church of St John was divided so that the eastern half became Muslim from which Muslim tradition created the legend that the city was taken partly by conquest and partly by agreement (Balādhurī, p 125, Yāḳūt, *Muʿdjam*, ii 591, Ibn Djubair, *Riḥla*, p 262, *J A*, ser 9, vii 376, 381, 404) As a matter of fact however, the Muslims seem to have laid out their own mosque here just beside the church [cf DAMASCUS], and close beside it again was the *Khadrāʾ*, the commander-in-chief's palace, from which a direct entrance to the *maḳṣūra* was later made (*B G A*, iii 159, 4) Conditions here were therefore once more the same as in Medīna But the possibility of an arrangement such as is recorded by tradition cannot be rejected, for there is good evidence of it elsewhere, in Ḥimṣ for example, the Muslims and Christians shared a building in common as a mosque and church, and it is evident from al-Istakhrī and Ibn Ḥawḳal that this was still the case in the time of their common authority, al-Balkhī (309 = 921) (*B G A*, i 61, 7 *sq*, ii 117, 5, iii 156, 15), and a similar arrangement is recorded for Dabīl in Armenia (*B G A*, i 188, 3 *sq*, ii 244, 21, cf iii 377, 3 *sq*)

There were special conditions in Jerusalem The Muslims recognised the sanctuary there, as is evident from the earlier Kibla and from Sūra xvii 1 (in the traditional interpretation) It must therefore have been natural for the conquerors, when the town capitulated, to seek out the recognised holy place Indeed we are told that ʿUmar in the year 17 built a mosque in Jerusalem on the site of the temple of Solomon (F Baethgen, *Fragmente syr u arab Hist*, p 17, 110, following Īshōʿdenah, metropolitan of Basra after 700 AD, cf for the viiith century Theophanes quoted by Le Strange, *Palestine under the Moslems*, 1890, p 91 note) That the *Kubbat al Sakhra* [q v] which the Mosque of ʿUmar replaced, stands on the old site of the Temple is undoubted How he found the site is variously recorded [cf AL-KUDS] The building was, like other mosques of the time of ʿUmar, very simple Arculf who visited Jerusalem about 670 says "The Saracens attend a quadrangular house of prayer (*domus orationis*, i e *masdjid*) which they have built with little art with boards and large beams on the remains of some ruins, on the famous site where the Temple was once built in all its splendour" (*Itinera Hierosolymitana*, ed P Geyer, 1898, p 226 *sq*, transl by P Mickley, in *Das Land der Bibel*, ii/2, 1917, p 19 *sq*) It is of interest to note that this simple mosque, like the others, was in the form of a rectangle, in spite of its simple character it could hold 3,000 people, according to Arculf

As late as the reign of Muʿāwiya we find a new town, Kairawān, being laid out on the old plan as a military camp with a mosque and *Dār al-Imāra* in the centre (Yāḳūt, *Muʿdjam*, iv 213, 10 *sqq*) As Balādhurī, for example, shows, the Muslim conquerors even at a later date always built a mosque in the centre of a newly conquered town, at first a simple one in each town, and it was a direct reproduction of the simple mosque of the Prophet in Medīna It was the exception to adapt already existing buildings in towns But soon many additional mosques were added

2 Tribal mosques and Sectarian mosques

There were mosques not only in the towns When the tribes pledged themselves to the Prophet to adopt Islām, they had also to perform the ṣalā; It is not clear how far they took part in Muslim worship, but if they concerned themselves with Islām at all, they must have had a Muslim place of meeting Probably even before Islām they had, like the Meccans, their *madjlis* or *nādī* or *dār shūrā*, where they discussed matters of general importance (cf Lammens, *Moʿāwia*, p 205, *Ziād*

b. Abīhi, p 30 *sqq*, 90 *sq*, *Le Berceau de l'Islam*, p. 222 *sqq*) As the mosque was only distinguished from such places by the fact that it was also used for the common *ṣalāt*, it was natural for tribal mosques to come into existence Thus we are told that as early as the year 5 the tribe of Sa'd b Bakr founded mosques and used *adhān* (Ibn Sa'd, I/II 44, 7, not mentioned in Ibn Hishām, p 943 *sq*, Tabarī, I 1722), it is also recorded of the Banū Djadhīma who lived near Mecca that they built mosques in the year 8 and introduced the *adhān* (Wākidī-Wellhausen, p 351) How far one can rely on such stories in a particular case is however uncertain A late writer like al-Diyārbakrī says of the Banū 'l-Mustalik that they *aslamū wa-banū masādjida* (*Ta'rīkh Khamis*, II 132, 20, cf *Annali dell' Islam*, II 221), in the early sources this is not found Nor is the story, told by Ibn Sa'd at all probable, that envoys from the Banū Hanīfa received orders to destroy their churches, sprinkle the ground with water and build a mosque (Ibn Sa'd, I/II 56, 11 *sqq* while Ibn Hishām, p 945 *sq*, Tabarī, I 1737 *sqq* and Balādhurī, p 86 *sq* say nothing about it) But that there were tribal mosques at a very early date is nevertheless quite certain The mosque at Kubā' was the mosque of the tribe of 'Amr b 'Awf (Ibn Sa'd, I/I 6, 6 and cf above) and according to one tradition, the Banū Ghanm b 'Awf were jealous of it and built an opposition mosque (Balādhurī, p 3, Tabarī, *Tafsīr*, I 21 infra) A Companion, who had taken part in the battle of Badr, 'Itbān b Malik, complained to the Prophet that he could not reach the masdjid of his tribe in the rainy season and wanted to build a mosque for himself (Bukhārī, *Ṣalāt*, bāb 46, Muslim, *Masādjid*, bāb 47) The Prophet himself is said to have visited the masdjid of the Banū Zuraik (Bukhārī, *Diihād*, bāb 56—58) and in the masdjid of the Banū Salima during the prayer, there was revealed to him Sūra II 139, which ordered the new *kibla*, wherefore it was called *Masdjid al Kiblatain* (Wüstenfeld, *Medina*, p 62)

The tribal mosque was a sign that the independence of the tribe was still retained under Islām Indeed we hear everywhere of tribal mosques, for example around Medīna that of the Banū Kuraiza, of the Banū Hāritha, of the Banū Zafar, of the Banū Wā'il, of the Banū Harām, of the Banū Zuraik, said to have been the first in which the Kur'ān was publicly read, that of the Banū Salima etc (see Wüstenfeld, *Gesch d Stadt Medina*, p 29, 37 *sqq*, 44, 50, 57, 136 *sqq*), the "mosque of the two Kiblas" belonged to the Banū Sawād b Ghanm b Ka'b b Salima (Wustenfeld, *Medina*, p 41) This then was the position in Medīna the tribes had usually their own mosques and one mosque was the chief mosque This was probably the position within the Prophet's lifetime, for in the earliest campaigns of conquest, mosques were built on this principle 'Umar is said to have written to Abū Mūsā in Basra telling him to build a mosque *li 'l-djamā'a* and mosques for the tribes, and on Fridays the people were to come to the chief mosque Similarly he wrote to Sa'd b Abī Wakkās in Kūfa and to 'Amr b al-'Āsī in Misr On the other hand in Syria where they had settled in old towns, they were not to build tribal mosques (Makrīzī, *Khiṭaṭ*, IV, Cairo 1326, p 4 infra) It is actually recorded that the tribes in each *khitta* had their own mosques around the mosque of 'Amr in al-Fustāt (cf Ibn Dukmāk, p 62 infra *sq*) and even much later a tribal mosque like that of the Rāshida was still in existence (Makrīzī, *Khiṭaṭ*, IV 64, 4 *sqq*) Even in the chief mosque, the tribes had their own places (*ibid*, p 9, 12 *sq*) We have similar evidence from the 'Irāk In Basra for example there was a Masdjid Banī 'Ubād (Balādhurī, p 356, 2), one of the Banū Rifā'a (*B G A*, VII 201, 16), one of the Banū 'Adī (*ibid*, V 191, 4) and one of the Ansār (cf Goldziher, *Muhammedanische Studien*, I 77, note 5), in Kūfa we find quite a number such as that of the Ansārī (Tabarī, II 284, 13 *sq*), of the 'Abd al-Kais (*ibid*, II 657, 2, 9), of the Banū Duhmān (*ibid*, p 670, 4), of the Banū Makhzūm (*ibid*, p 734, 19), of the Banū Hilāl (*ibid*, p 1687, 8), of the Banū 'Adī (*ibid*, p 1703, 4), of the Banū Dhuhl and Banū Hudjr (*ibid*, p 532, 8 *sq*), of the Djuhaina (*ibid*, p 533, 8), of the Banū Harām (*ibid*, III 2509, 10) and the 'Absīs even had several masādjid (Balādhurī, p 278, 12 *sq*, s also p 285 and Goldziher, *loc cit*)

During the wars these tribal mosques were the natural rallying points for the various tribes, the mosque was a madjlis, where councils were held (Tabarī, II 532, 6 *sqq*) and the people were taught from its minbar (*ibid*, p 284), battles often centred for this reason round these mosques (e g Tabarī, II 130, 148, 6, 960) "The people of your mosque", *ahl masdjidikum* (*ibid*, p 532, 19,) became identical with "your party" Gradually as, new sects arose, they naturally had mosques of their own, just as Musailima before them is said to have had his own mosque (Balādhurī, p 90, 4 from below, Ibn Hanbal, *Musnad*, I 404 infra) Thus we read later of the mosques of the Hanbalis in Baghdād, in which there was continual riot and confusion (Hilāl al-Sābī, *Kitāb al-Wuzarā'*, ed Amedroz, p 335) It sometimes happened that different parties in a town shared the chief mosque (*B G A*, III 102, 5 *sqq*) but as a rule it was otherwise In particular the Sunnīs and Shī'īs as a rule had separate mosques (cf Mez, *Die Renaissance des Islams*, p 63) It sometimes even happened that Hanafīs and Shāfi'īs had separate mosques (Yākūt, *Mu'djam*, IV 509, 9, cf *B G A*, III 323, 11) These special mosques were a great source of disruption in Islām and we can understand that a time came when the learned discussed whether such mosques should be permitted at all But the question whether one might talk of the *Masdjid Banī Fulān* was answered by saying that in the time of the Prophet, the *Masdjid Banī Zuraik* was recognised (Bukhārī, *Salāt*, bāb 41, cf *Diihād*, bāb 56—58 and Tabarī, *Tafsīr*, XI 20 after the middle of the page)

3 Adaptation to Islām of Older Sanctuaries, Memorial Mosques

According to the early historians, the towns, which made treaties with the Muslims, received permission to retain their churches (Balādhurī, p 121, in the middle, Tabarī, I 2405, 2407) while in the conquered towns the churches fell to the Muslims without any preamble (cf Balādhurī, p 120 infra) Sometimes also it is recorded that a certain number of churches were received from the Christians, e g fifteen in Damascus according to one tradition (*ibid*, p 124, 8, otherwise p 121, cf *J A*, 9 Ser, VII 403) It is rather doubtful whether the process was such a regular one, in any case the Muslims in course of time appropriated

many churches to themselves With the mass conversions to Islām, this was a natural result The churches taken over by the Muslims were occasionally used as dwellings (cf Tabarī, i 2405, 2407), at a later date it also happened that they were used as government offices, as in Egypt in 146 (Makrīzī, iv 35, cf for Kūfa, Balādhurī, p 286) The obvious thing, however, was to transform the churches taken into mosques It is related of ʿAmr b al-ʿĀṣi that he performed the ṣalāt in a church (Makrīzī, iv 6) and Zaid b ʿAlī says regarding churches and synagogues, „Perform thy ṣalāt in them, it will not harm thee" (*Corpus iuris di Zaid b ʿAlī*, ed Griffini, N⁰ 364) It is not clear whether the reference in these cases is to conquered sanctuaries, it is evident, in any case, that the saying is intended to remove any misgivings about the use of captured churches and synagogues as mosques The most important example of this kind was in Damascus where al Walid b ʿAbd al Malik in 86 (705) took the church of St John from the Christians and had it rebuilt, he is said to have offered the Christians another church in its stead (see the references above, B 1, and also *J A*, 9 Ser, vii 369 *sqq*, Quatremere, *Hist Sult Maml*, ii/1 262 *sqq* and the article DAMASCUS) He is said to have transformed into mosques ten churches in all in Damascus It must have been particularly in the villages, with the gradual conversion of the people to Islām, that the churches were turned into mosques In the Egyptian village there were no mosques in the earlier generations of Islam (Makrīzi, iv 28 *sq*, 30) But when al-Maʾmūn was fighting the Copts, many churches were turned into mosques (*ibid*, p 30) It is also recorded of mosques in Cairo that they were converted churches According to one tradition, the Rashida mosque was an unfinished Jacobite church, which was surrounded by Jewish and Christian graves (Makrīzī, iv 63, 64) and in the immediate vicinity al-Ḥākim turned a Jacobite and a Nestorian Church into mosques (*ibid*, p 65) When Djawhar built a palace in al-Kāhira, a *dēr* was taken in and transformed into a mosque (*ibid*, p 269), similar changes took place at later dates (*ibid*, p 240) and synagogues also were transformed in this way (Masdjid Ibn al-Bannāʾ, *ibid*, p 265) The chief mosque in Palermo was previously a church (Yākūt, *Muʿdjam*, i 719) After the Crusades several churches were turned into mosques in Palestine (Sauvaire, *Hist de Jerus et d'Hebron*, 1876, p 77, Quatremere, *Hist Sult Maml*, i/ii, 40)

Other sanctuaries than those of the "people of the scripture" were turned into mosques For example a Masdjid al Shams between Hilla and Kerbelāʾ was the successor of an old temple of Shamash (see Goldziher, *Muh Stud*, ii 331 *sq*) Not far from Istakhr was a Masdjid Sulaimān which was an old "fire-temple", the pictures on the walls of which could still be seen in the time of Masʿūdī and al-Makdisī (ivth century) (Masʿūdī, *Murūdj*, iv 77, *B G A*, iii 444) In Istakhr itself there was a djāmiʿ, which was a converted fire-temple (*ibid*, p 436) In Masisa, the ancient Mopsuhestia, al-Mansūr in 140 built a mosque on the site of an ancient temple (Balādhurī, p 165 *sq*) and the chief mosque in Dihlī was originally a temple (Ibn Battūta, iii 151), as to Ṭāʾif cf Abū Dāwūd, *Ṣalāt*, bāb 10 Thus in Islām also the old rule holds that sacred places survive changes of religion. It was especially easy in cases where Christian sanctuaries were associated with Biblical personalities who were also recognised by Islām, e g, the Church of St John in Damascus and many holy places in Palestine One example is the mosque of Job in Shēkh Saʿd, associated with Sūra xxi 83, xxxviii 40, here in Silvia's time (fourth century) there was a church of Job (Masʿūdī, i 91, Baedeker, *Palast u Syrien*⁷, 1910, p 147)

But Islām itself had created historical associations which were bound soon to lead to the building of new mosques Even in the lifetime of the Prophet, the Banū Sālim are said to have asked him to perform the salāt in their masdjid to give it his authority (see above A 3) At the request of ʿItbān b Malik the Prophet performed the salāt along with Abū Bakr in his house and thereby consecrated it as a musallā, because he could not get to the tribal mosque in the rainy season (Bukhārī, *Salāt*, bāb 47, *Tahadjdjud*, bāb 36, Muslim, *Masādjid*, tr 46, a similar story in Bukhārī, *Adhān*, bāb 47, *Tahadjdjud*, bāb 33 is perhaps identical in origin) After the death of the Prophet, his memory became so precious that the places where he had prayed obtained a special importance and his followers, who liked to imitate him in everything, preferred to perform their salāt in such places But this tendency was only an intensification of what had existed in his lifetime, and so it is not easy to decide how far the above stories reflect later conditions Mosques very quickly arose on the road between Mecca and Medina at places where, according to the testimony of his Companions, the Prophet had prayed (Bukhārī, *Salāt*, bāb 89, Wākidī-Wellhausen, p 421 *sqq*), the same was the case with the road which the Prophet had taken to Tabūk in the year 9 (Ibn Hishām, p 907, Wākidī-Wellhausen, p 394, there were 19 in all, which are listed in *Annali dell' Islām*, ii 246 *sq*) Indeed wherever he had taken the field, mosques were built, for example on the road to Badr, where according to tradition Abū Bakr had built a mosque (Wākidī-Wellhausen, p 39, also Wüstenfeld, *Medina*, p 135) The mosque of al Fadikh was built on the spot where the Prophet had prayed in a leather tent during the war with the Banū Nadir in the year 4 (Wākidī-Wellhausen, p 163, Wüstenfeld, *Medina*, p 132) He is said to have himself built a little mosque in Khaibar during the campaign of the year 7 (Diyārbakrī, *Taʾrīkh al-Khamis*, ii 49 *sq*, cf *Annali dell' Islām*, ii 19) Outside Ṭāʾif a mosque was built on a hillock, because the Prophet had performed the salāt there during the siege in the year 8, between the tents of his two wives, Umm Salama and Zainab (Ibn Hishām, p 872, *sq*,, Wākidī Wellhausen, p 369), in Liyya the Prophet is said to have himself built a mosque while on the campaign against Ṭāʾif (Ibn Hishām, p 872, Wākidī-Wellhausen, p 368 *sq*) Mosques arose in and around Medina, "because Muhammad prayed here" (Wustenfeld, *Gesch d Stadt Medina*, p 31, 38, 132 *sqq*) It is obvious that in most of these cases later conditions are put back to the time of the Prophet, in connection with the "war of the Ditch" we are told that "he prayed everywhere where mosques now stand" (Wākidī-Wellhausen, p 208) Since, for example, the Masdjid al-Fadikh is also called Masdjid al Shams (Wustenfeld, *Medina*, p 132) we have perhaps here actually an ancient sanctuary

Mosques became associated with the Prophet in many ways In Medina, for example, there was the Masdjid al-Baghla where footprints of the Prophet's mule were shown in a stone, the Masdjid al-Idjāba where the Prophet's appeal was answered, the Masdjid al-Fath which recalls the victory over the Meccans, etc (see Wustenfeld, *Medina*, p 136 *sqq*) In Mecca there was naturally a large number of places sacred through associations with the Prophet and therefore used as places of prayer The most honoured site, next to the chief mosque, is said to have been the house of Khadīdja, also called Mawlid al Sayyida Fātima, because the daughter of the Prophet was born there This house, in which the Prophet lived till the Hidjra, was taken over by ʿUkail, ʿAlī's brother, and bought by him through Muʿāwiya and turned into a mosque (*Chroniken d Stadt Mekka*, ed Wustenfeld, i 423, iii 438, 440) Next comes the house in which the Prophet held his first secret meetings This was bought by al-Khaizurān, mother of Hārūn al Rashīd, on her pilgrimage in 171 and turned into a mosque (*Chron Mekka*, iii 112, 440) She also purchased the Prophet's birthplace, *Mawlid al-Nabī*, and made it into a mosque (*ibid*, i 422, iii 439) If Muʿāwiya really bought the Prophet's house from his cousin, it was probably the right one, but the demand for places associated with the Prophet became stronger and stronger and we therefore find more and more places referred not only to the Prophet, but also to his Companions Such are the birthplaces of Hamza, ʿUmar and ʿAlī (*Chron Mekka*, iii 445), the house of Māriya, the mother of the Prophet s son, Ibrāhīm (*ibid*, i 447, 466) who also had a mosque at Medina (Wustenfeld, *Medina*, p 133) There were also a Masdjid Khadidja (*ibid*, i 324) and a Masdjid ʿĀʾisha (*ibid*, iii 454), a Masdjid of the "granted appeal" in a narrow valley near Mecca, where the Prophet performed the *salāt* (*ibid*, iii 453), a Masdjid al-Djinn, where the Djinn overheard his preaching (*ibid*, i 424, iii 453), a Masdjid al-Raʾya, where he planted his standard at the conquest (*ibid*, ii 68 infra and 71 supra, iii 13, 453), a Masdjid al-Baiʿa where the first homage of the Medinese was received (*ibid*, i 428, iii 441) In the Masdjid al-Khaif in Mina is shown the mark of the Prophet's head in a stone into which visitors also put their heads (*ibid*, iii 438) Persons in the Bible are also connected with mosques, Adam, Abraham and Ismāʿīl with the Kaʿba, beside which the *Makām Ibrāhīm* is shown and in ʿArafa there is still a Masdjid Ibrāhīm (*ibid*, i 415, 425) and another in al-Zāhir near Mecca (Ibn Djubair, *Rihla*, 1907, p 112) To these memorial mosques others were later added, e g the Masdjid Abī Bakr, Masdjid Bilāl, the Mosque of the Splitting of the Moon (by the Prophet) etc (s Ibn Djubair, *Rihla*, p 114 *sqq*, *B G A*, iii 102 *sq*, Snouck Hurgronje, *Mekka*, ii 27, al-Batanūnī, *al-Rihla al-Hidjāziya* ², Cairo 1329, p 52 *sqq*)

In al-Hidjāz the Muslims thus acquired a series of mosques which became important from their association with the Prophet, his family and his Companions, and made Muslim history live On the other hand, in lands formerly Christian, they took over sanctuaries which were associated with the Biblical history which they had assimilated (see Le Strange, *Palestine*, passim) Other mosques soon became associated with Biblical and Muslim story The mosque founded by ʿUmar on the site of the Temple in Jerusalem was, as already pointed out, identified as *al-Masdjid al-Aksā* mentioned in Sūra xvii 1 and therefore connected with the Prophet's night journey and the journey to Paradise The rock is said to have greeted the Prophet on this occasion and marks in a stone covering a hole are explained as Muhammad's footprints (sometimes also as those of Idrīs, cf Le Strange, *Palestine*, p 136, al-Batanūnī, *Rihla*, p 165, Baedeker, *Palestine*, 1910, p 52 *sq*, cf Yaʿkūbī, ed Houtsma, ii 311) The name *al-Masdjid al Aksā* was used throughout the early period for the whole Harām area in Jerusalem, later partly for it, and partly for the building in its southern part (*B G A*, v 100, Sauvaire, *Hist Jerus Hebron*, p 95, 121, cf Le Strange, *Palestine under the Moslems*, p 96 *sq*) Then there were the mosques which had specifically Muslim associations, like the Masdjid of ʿUmar on the Mount of Olives where he encamped at the conquest (*B G A*, iii 172)

In Egypt not only was an old Christian sanctuary called Maʿbad Mūsā (Makrīzī, iv 269), but we are also told, for example, that the Mosque of Ibn Tūlūn was built where Mūsā talked with his Lord (Makrīzī, iv 36), according to al Kudāʿī there were in Egypt four Masādjid of Mūsā (Ibn Dukmak, ed Vollers, p 92), there was a Masdjid Yaʿkūb wa-Yūsuf (*B G A*, iii 200) and a Joseph's prison, certainly dating from the Christian period (Makrīzī, iv 315) There was also a Mosque of Abraham in Munyat Ibn al-Khasīb (Ibn Djubair, p 58) The chief mosque of Sanʿā' was built by Shem, son of Noah (*B G A*, vii 110) The old temple near Istakhr mentioned above was connected with Sulaimān (Masʿūdī, *Murūdj*, iv 77, Yākūt, i 299) In the mosque of Kūfa not only Ibrāhim but one thousand other prophets and one thousand saints, described as *wasī*, are said to have offered their prayers, here was the tree Yaktīn (Sūra xxxvii 146), here died Yaghūth and Yaʿūk, etc (Yākūt, iv 325, also Ibn Djubair, p 211 *sq*) and in this mosque there was a chapel of Abraham, Noah and Idrīs (Ibn Djubair, p 212), a large number of mosques were associated with Companions of the Prophet What emphasis was laid on such an association is seen, for example, from the story according to which ʿUmar declined to perform the *salāt* in the Church of the Resurrection in Jerusalem, lest the church should afterwards be claimed as a mosque

4 Tomb Mosques

A special class of memorial mosques consisted of those which were associated with a tomb The graves of ancestors and of saints had been sanctuaries from ancient times and they were gradually adopted into Islām In addition there were the saints of Islām itself The general tendency to distinguish places associated with the founders of Islām naturally concentrated itself round the graves in which they rested In the Kurʾān, a tomb masdjid is mentioned in connection with the Seven Sleepers (Sūra xviii 20) but it is not clear if it was recognised As early as the year 6, the companions of Abū Basīr are said to have built a mosque at the place where he died and was buried (Wāḳidī-Wellhausen, p 262) The Prophet is also said to have visited regularly at al-Baḳīʿ in Medina the tombs of the martyrs who fell at Uḥud and paid reverence to them (*ibid*, p 143)

Whatever the exact amount of truth in the story, there is no doubt that the story of the tomb-mosque of Abū Baṣīr is ante-dated The accounts of the death of the Prophet and of the period immediately following reveal no special interest in his tomb But very soon the general trend of development stimulated an interest in graves which led to the erection of sanctuaries at them The progress of this tendency is more marked in al-Wākidī, who died in 207 (823), than in Ibn Ishāk who died in 151 (768)

The collections of Ḥadīth made in the third century contain discussions on this fact which show that the problem was whether the tombs could be used as places of worship and in this connection whether mosques could be built over the tombs The ḥadīths answer both questions in the negative, which certainly was in the spirit of the Prophet It is said that "Salāt at the graves (*fi 'l-makābir*) is *makrūh*" (Bukhārī, *Ṣalāt*, bāb 52), "sit not upon graves and perform not salāt towards them" (Muslim, *Djanā'iz*, tr 33), "hold the salāt in your houses, but do not use them as tombs" (Muslim, *Ṣalāt al-Musāfirin*, tr 28) On the other hand it is acknowledged that Anas performed the salāt at the cemetery (Bukhārī, *Ṣalāt*, bāb 48) We are also told that tombs cannot be used as *masādjid* (Bukhārī, *Ṣalāt*, bāb 48, *Djanā'iz*, bāb 62) On his deathbed the Prophet is said to have cursed the Jews and the Christians because they used the tombs of their prophets as *masādjid* Ḥadīth explains this by saying that the tomb of the Prophet was not at first accessible (Bukhārī, *Ṣalāt*, bāb 48, 55, *Djanā'iz*, bāb 62, *Anbiyā'*, bāb 50, Muslim, *Masādjid*, tr 3), as a matter of fact its precise location was not exactly known (*Djanā'iz*, bāb 96) The attacks in Ḥadīth insist that tomb-mosques are a reprehensible Jewish practice "When a pious man dies, they build a masdjid on his tomb" etc (Bukhārī, *Ṣalāt*, bāb 48, 54, Muslim, *Djanā'iz*, bāb 71) Although this view of tomb-mosques is still held in certain limited circles (cf Ibn Taimīya, the Wahhābīs), the old pre-Islāmic custom soon also became a Muslim one The expositors of Ḥadīth like al-Nawawī (on Muslim, *Masādjid* tr 3, lith Dihlī 1319, i 201) and al-ʿAskalānī, (Cairo 1329, i 354) explain the above passages to mean that only an exaggerated *taʿzīm* of the dead is forbidden so that tombs should not be used as a kibla, otherwise it is quite commendable to spend time in a mosque in proximity to a devout man

The name given to a tomb-mosque is often *kubba*, a word which is used of a tent (Bukhārī, *Djanā'iz*, bāb 62, *Hadjdj*, bāb 64, *Fard al-Khums*, bāb 19, *al-Diizya*, bāb 15, Tarafa, *Dīwān*, vii 1), but later came to mean the dome which usually covers tombs and thus became the general name for the sanctuary of a saint (cf Ibn Djubair, *Riḥla*, p 114, 115, cf Dozy, *Supplement*, s v) *Makām* also means a little chapel and a saint's tomb (v Berchem, *Corpus Inscr Arab*, i, N° 72, etc , cf index) The custom of making a *kubba* at the tomb of a saint was firmly rooted in Byzantine territory, where sepulchral churches always had a dome (Herzog-Hauch, *Realenzyclopädie*[3], x 784) The usual name however for a tomb-sanctuary was *mashhad*, this is applied to places where saints are worshipped, among Muslim tombs particularly to those of the friends and relations of the Prophet (v Berchem, *Corpus Inscr Arab*, i, N° 32, 63, 417, 544, Makrīzī, iv, p 265, 309 *sqq*) but also to tombs of other recognised saints, e g Mashhad Djirdjis in Mawsil (Ibn Djubair, *Riḥla*, p 236) etc

The transformation of the tombs of the Prophet and his near relatives into sanctuaries seems to have been a gradual process Muḥammad, Abū Bakr and ʿUmar are said to have been buried in the house of ʿĀ'isha, Fāṭima and ʿAlī lived beside it ʿĀ'isha had a wall built between her room and the tombs to prevent visitors carrying off earth from the tomb of the Prophet The houses of the Prophet's wives remained as they were until al-Walīd rebuilt them He thought it scandalous that Ḥasan b Ḥasan b ʿAlī should live in Fāṭima's house and ʿUmar's family close beside ʿĀ'isha's home in the house of Ḥafṣa He acquired the houses, had all the houses of the Prophet's wives torn down and erected new buildings The tombs were enclosed by a pentagonal wall, the whole area was called *al-Rawda* "the garden", it was not till later that a dome was built over it (Wustenfeld, *Medina*, p 66 *sqq*, 72 *sq*, 78 *sqq*, 89) In the cemetery of Medīna, *al Bakiʿ*, a whole series of *Mashāhid* came to be built where tombs of the family and of the Companions of the Prophet were located (*ibid*, p 140 *sqq*, Ibn Djubair, *Riḥla*, p 195 *sqq*) It is often disputed whether a tomb belonged to one or the other (e g Ṭabarī, iii 2436, 2 *sqq*) Such tomb mosques were sacred (*mukaddas*, Ibn Djubair, *Riḥla*, p 114, 13, 17), they were visited *li 'l-baraka* The name al-Rawda of the Prophet's tomb became later applied to other sanctuaries (Ibn Djubair, *Riḥla*, p 46, 16, 52, 11) Separate limbs were revered in some mosques, like the head of al-Ḥusain in Cairo, which was brought there in 491 from ʿAskalān (ʿAlī Pāshā Mubārak, *al-Khiṭat al-Djadida*, iv 91 *sqq*, cf Sauvaire, *Hist Jerus Hebr*, p 16), his head was also revered for some time in the *Mashhad al-Raʾs* in Damascus (according to Ibn Shakir, *J A*, 9th ser, vii 385)

Gradually a vast number of Muslim tombs of saints came into existence, and to these were added all the pre-Islāmic sanctuaries which were adopted by Islām No distinction can therefore be drawn between tomb-mosques and other memorial mosques It was often impossible to prove that the tomb in question ever really existed In the Mashhad ʿAlī for example, ʿAlī's tomb is honoured but Ibn Djubair leaves it in doubt whether he is really buried there (*Riḥla*, p 212) and many located his grave in the mosque at Kūfa and elsewhere (Masʿūdī, *Murūdj*, iv 289, v 68, *B G A*, ii 163) In ʿAin al-Bakar near ʿAkkā there was also a Mashhad ʿAlī (Yākūt, iii 759) and also in the Mosque of the Umaiyads (Ibn Djubair, p 267), on this question cf *B G A*, iii 46 Names frequently become confused and transferred In Mecca between Ṣafā and Marwa there was a Kubba, which was associated with ʿUmar b al-Khaṭṭāb but Ibn Djubair says that it should be connected with ʿUmar b ʿAbd al-ʿAzīz (*Riḥla*, p 115, 11 *sqq*) In Djīza there was a *Mashhad Abī Hurairа*, where the memory of this Companion of the Prophet was honoured, it is said to have been originally the grave of another Abū Hurairа (Makrīzī, i 335, 19) Wherever Shīʿīs ruled, there arose numerous tomb-mosques of the *Ahl al-Bait* In Egypt Ibn Djubair gives a list of 14 men and five women of the Prophet's

family, who were honoured there (*Rihla*, p 46 *sq*) Islām was always creating new tombs of saints who had been distinguished for learning or asceticism or miracle-working, e g the tomb of al-Shāfiʿī in Cairo and Ahmad al-Badawī in Tantā There were mosques, chiefly old established sanctuaries, of Biblical and semi-Biblical personages like Rūbīl (Reuben) and Āsiya the wife of Pharaoh (*ibid*, p 46) In and around Damascus were a number of mosques, which were built on the tombs of prophets and unnamed saints (Ibn Djubair, *Rihla*, p 273 *sqq*) In Palestine could be seen a vast number of tombs of Biblical personages (cf Le Strange, *Palestine under the Moslems*, Index and Conder in *Palestine Explor Fund, Quarterly Statement*, 1871, p 89 *sqq*), usually mosques with a kubba

After the sanctuaries of persons mentioned in the Bible came those of people mentioned in the Kurʾān For example, outside the Djāmiʿ in ʿAkkā was shown the tomb-mosque of the prophet Sālih (Nāsir i Khusraw, *Sefer-Nameh*, ed Schefer, p 15, 1 = 49), and in Syria that of his son (Ibn Djubair, p 46), that of Hūd was also shown near ʿAkkā (*Sefer-Nameh*, p 16, 5 = 52), farther east that of Shuʿaib and of his daughter (*ibid*, p 16, 12 = 53), the tomb of Hūd was also pointed out in Damascus and in Hadramawt (Yākūt, ii 596, 16), then we have peculiarly Muslim saints like Dhu 'l-Kifl, the son of Job (*ibid*, p 16, 4 = 52) Then there are the sanctuaries of saints who are only superficially Muslim but really have their origins in old popular superstitions, like al-Khadir who had a *mashhad* in Damascus (Yākūt, ii 596, 9), or a saint like ʿAkk, founder of the town of ʿAkkā, whose tomb Nasir-i Khusraw visited outside the town (*Sefer-Nameh*, p 15, 6 from below = 51) Such tombs were much visited by pious travellers and are therefore frequently mentioned in literature (on Mashāhid of the kinds mentioned here in the ʿIrāk, see *B G A*, iii 130, for Mawsil etc, *ibid*, p 146) In this way ancient sanctuaries were turned into mosques and it is often quite a matter of chance under what names they are adopted by Islām (cf Goldziher, *Muh Studien*, ii 325 *sqq*) It therefore sometimes happens that the same saint is honoured in several mosques Abū Huraira, who is buried in Medīna, is honoured not only in the above-mentioned tomb mosque in Djīza but also at various places in Palestine, in al-Ramla and in Yubnā south of Tabariya (Khalil ed-Dâhiry, *Zoubdat Kachf el-Mamâlik*, ed P Ravaisse, p 42, 1 from below, *Sefer-Nameh* of Nāsir-i Khusraw, ed by Ch Schefer, p 17, 1 from below = 59, Yākūt, iii 512, 20, iv 1007, 12, cf *Symbolae Osloenses Fasc Supplet*, ii [1928], 31) The tomb of the Prophet Jonah is revered not only in the ancient Niniveh but also in Palestine

Just as the kubba under which the saint lay and the mosque adjoining it were sanctified by him so vice-versa a kubba and a mosque could cause a deceased person to become considered a saint It was therefore the custom for the mighty not only to give this distinction to their fathers but also to prepare such buildings for themselves even in their own lifetime This was particularly the custom of the Mamlūk sultāns, perhaps stimulated by the fact that they did not found dynasties in which power passed from father to son Such buildings are called *kubba* (van Berchem, *C I A*, i, N° 82 *sqq*, 95, 96, 126, 138 etc), exceptionally *zāwiya* (*ibid*, N° 98), frequently *turba* (*ibid*, N° 58, 66, 88, 106, 107, 116 etc), the formula is also found "this *kubba* is a *turba*" (N° 67), the latter word acquired the same meaning as masdjid, partly saint's grave and partly sacred site (cf Ibn Djubair, *Rihla*, p 114, 196), but this word does not seem to be used of ordinary tomb-mosques, although the distinction between these and mosques in honour of saints often disappeared In these kubbas the regular recitation of the Kurʾān was often arranged and the tomb was provided with a *kiswa* The mausoleum might be built in connection with a great mosque and be separated from it by a grille (Yākūt, iv 509, 6 *sqq*)

5 Mosques deliberately founded

In the early period the building of mosques was a social obligation of the ruler as representative of the community and the tribes Very soon a number of mosques came into existence, provided by individuals In addition to tribal mosques, as already mentioned, there were also sectarian mosques and prominent leaders built mosques which were the centres of their activity, for example the Masdjid ʿAdī b Hatim (Tabarī, ii 130), the Masdjid Simāk in Kūfa (*ibid*, i 2653), the Masdjid al Ashʿath etc As old sanctuaries entered Islām, the mosque received more of the character of a sanctuary and the building of a mosque became a pious work, there arose a hadith, according to which the Prophet said "for him who builds a mosque, God will build a home in Paradise", some add "if he desires to see the face of God" (*Corpus juris di Zaid b ʿAli*, ed Griffini, N° 276, Bukhārī, *Salāt*, bāb 65, Muslim, *Masādjid*, tr 4, *Zuhd*, tr 3, Makrizi, iv 36) Like other sanctuaries, mosques were sometimes built as a result of a revelation in a dream A story of this kind of the year 557 is given by al Samhūdī for Medina (Wustenfeld, *Medina*, p 91 *sq*), and a similar one of a mosque in Damascus (*J A*, Ser 9, vii 384), a mosque was also built out of gratitude for seeing the Prophet (*al-Madrasa al-Sharifiya*, Makrīzi, iv 209) It was of course particularly an obligation on the mighty to build mosques Even in the earliest period, the governors took care that new mosques were built to keep pace with the spread of Islām (cf Balādhurī, p 178 *sq*) About the year 1000 the governor of Media, Badr b Hasanawaihi, is said to have built 3,000 mosques and hostels (Mez, *Die Renaissance des Islāms*, 1922, p 24) The collections of inscriptions, as well as the geographical and topographical works, reveal how the number of mosques increased in this way

In Egypt, al-Hākim in the year 403 had a census taken of the mosques of Cairo and there were eight hundred (Makrīzī, iv 264), al Kudāʿi (d 454 = 1062) also counted the mosques and his figure is put at 30,000 or 36,000 (Yākūt, iii 901, Ibn Dukmāk, ed Vollers, p 92, Makrīzī, iv 264) which seems quite a fantastic figure (there is probably a *wa* lacking before *alif* i e 1,036) Ibn al Mutawwadj (d 730) according to al-Makrīzī counted 480, and Ibn Dukmāk (about 800) gives in addition to the incomplete list of djāmiʿs a list of 472 mosques, not including madāris, khānakāhs etc, the figure given by Makrīzī is smaller The fantastic figure of 30,000 for Baghdād is found as early as Yaʿkūbī (*B G A*, vii 250) It is also an exaggeration when Ibn Djubair was told in

Alexandria that there were 12,000 or 8,000 mosques there (p 43) In Basra where Ziyād built 7 mosques (*B G A*, v 191), the number also increased rapidly, but here again an exaggerated figure (7,000) is given (*B G A*, vii 361) In Damascus, Ibn ʿAsākir (d 571 = 1176) counted 241 within and 148 outside the city (*J A*, Ser 9, vii 383) In Palermo Ibn Hawkal counted over 300 and in a village above it 200 mosques In some streets there were as many as 20 mosques within a bowshot of one another, this multiplicity is condemned everyone wanted to build a mosque for himself (Yākūt, i 719, iii 409, 410) As a matter of fact, one can almost say that things tended this way, Yaʿkūbī mentions in Baghdād a mosque for the Anbarī officials of the tax-office (*B G A*, vii 245) and several distinguished scholars practically had their own mosques It occasionally happened that devout private individuals founded mosques In 672 Fadj al-Dīn built a mosque and a separate chamber in which he performed the ṣalāt alone and meditated (Makrīzī, iv 90) The mosques thus founded were very often called after their founders, and memorial and tomb-mosques after the person to be commemorated Sometimes a mosque is called after some devout man who lived in it (Makrīzī, iv 97, 265 *sqq*) and a madrasa might be called after its head or a teacher (*ibid*, iv 235, Yākūt, *Udabāʾ*, vii 82) Lastly a mosque might take its name from its situation or from some feature of the building

6 Al-Musallā

In addition to the mosques proper, al-Makrīzī mentions for Cairo 8 places for prayer (*muṣallā*) mainly at the cemetery (iv 334 *sq*) The word musallā may mean any place of prayer, therefore also mosque (cf Sūra, ii 119, cf Makrīzī, *Khiṭaṭ*, iv 25, 16, do, *Ittiʿāẓ*, ed Bunz, p 91, 17, Yākūt, *Muʿdjam*, iv 326, 3—5) or a particular place of prayer within a mosque (Tabarī, i 2408, 16, Bukhārī, *Ghusl*, bāb 17, *Ṣalāt*, bāb 91) In Palestine, there were many open places of prayer, provided only with a miḥrāb and marked off, but quite in the open (cf for Tiberias, *Sefer-Nāmeh*, transl Schefer, p 36) It is recorded of the Prophet that he used to go out at the two festivals (*al-Fiṭr* and *al-Aḍḥā*) to the place of prayer (al-musallā) of the Banū Salima A lance which the Negus had presented to al Zubair was carried in front of him and planted before the Prophet as *sutra* Standing in front of it, he conducted the salāt, and then preached a khutba without a minbar to the rows in front of him (Tabarī, i 1281, 14 *sqq*, Bukhārī, *Ḥaiḍ*, bāb 6, *Ṣalāt*, bāb 90, *ʿĪdain*, bāb 6) He also went out to the musallā for the *ṣalāt al-istiskāʾ* (Muslim, *Istiskāʾ*, tr 1) This Musallā was an open space and Muhammad is even said to have forbidden a building on it (Wustenfeld, *Medina*, p 127 *sqq*) This custom of performing the salāt on a musallā outside the town on the two festivals became *sunna* There is evidence of the custom for several towns In Medīna however, a mosque was later built on the musallā (*ibid*, p 128 *sq*) which also happened in other places An early innovation was the introduction of a minbar by Marwān (*ibid*, p 128, Bukhārī, *ʿĪdain*, bāb 6) When Saʿd b Abī Wakkās built a mosque in Kisrā's Īwān in al-Madāʾin, at the festival in the year 16 it was expressly stated that it was *sunna* to go out to it Saʿd, however, thought it was a matter of indifference (Tabarī, i 2451) Shortly after 300 a musallā outside of Hamadhān is mentioned (Masʿūdī, *Murūdj*, ix 23) There was al Musallā al-ʿAtīk in Baghdād, here a dakka was erected for the execution of the Karmatian prisoners (Tabarī, iii 2244 *sq*, cf 1659, 18), in Kūfa, several are mentioned (*ibid*, ii 628, 16, 1704, 8, iii 367, 8 *sq*), two in Merw (*ibid*, ii 1931, 2, 1964, 19, cf *Sefer-Nāmeh*, transl Schefer, p 274), one in Farghāna (*B G A*, ii 393, 11) In Tirmidh, the musallā was within the walls (*B G A*, ii 349, 18) which also happened elsewhere (*ibid*, 378, 6 *sq*) In Cairo the two festivals were celebrated on the Musallā Khawlān (a Yemen tribe) with the khatīb of the Mosque of ʿAmr as leader according to al-Kudāʿī the festivals were to be celebrated on a musallā opposite the hill Yahmūm, then on al Musallā al Kadīm where Ahmad b Ṭūlūn erected a building in 256 The site was several times changed (Makrīzī, iv 334 *sq*, cf *B G A*, iii 200, 14 *sq*) In 302, 306 and 308 the *ṣalāt al-ʿīd* was performed for the first time in the Mosque of ʿAmr (Makrīzī, iv 20, 8 *sqq*, *Husn al Muḥāḍara*, ii 137 infra, Ibn Taghribirdī, ii 194, 9 *sqq*) Ibn Battūta notes the custom in Spain (i 20) and Tunis (i 22) and also in India (iii 154) Ibn al Hadjdj (d 737) says that in his time the ceremonies still took place on the musallā but condemns the *bidʿa*'s associated with them (*Kʿ al Madkhal* ii, Cairo 1320, p 82 *sqq*) It is also laid down in Muslim law, although not always definitely (see Juynboll, *Handbuch d islām Ges*, 1910, p 127, I Guidi, *Il Muḥtasar*, 1, 1919, p 136) The custom seems in time to have become generally abandoned In the ninth century the Masdjid Āksonkor was expressly built for the khutba at the Friday services and at festivals (Makrīzī, iv 107, 17)

C The Mosque as the Centre for Divine Service

1 Sanctity of the Mosque

The history of the mosque in the early centuries of Islām shows an increase in its sanctity which was intensified by the adoption of the traditions of the church and especially by the permeation of the cult of saints The sanctity already associated with tombs taken over by Islām was naturally very soon transferred to the larger and more imposing mosques The expression *Bait Allāh* "house of God", which at first was only used of the Kaʿba came now be applied to any mosque (s *Corpus inscr Zaid b ʿAlī*, N⁰ 48, cf 156, 983, *Chron Mekka*, ed Wustenfeld, iv 164, v Berchem, *Corpus Inscr Arab*, i, N⁰ 10, l 18, Ibn al-Hādjdj, *Kʿ al-Madkhal*, i 20, 23, ii 64, 68, cf *Bait Rabbihi*, *ibid*, i 23, 73, ii 56) The alteration in the original conception is illustrated by the fact that the Mamlūk al-Malik al Ẓāhir Baibars declined to build a mosque on a place for tethering camels because it was unseemly, while the mosque of the Prophet had actually been built on such a place (Makrīzī, iv 91, Abū Dāwūd, *Ṣalāt*, bāb 22)

In the house of God the Miḥrāb and the Minbar (see below) enjoyed particular sanctity, as did the tomb, especially in Medīna (Bukhārī, *Fadl al Ṣalāt fī Masdjid Makka wa ʾl-Madīna*, bāb 5) The visitors sought *baraka*, partly by touching the tomb or the railing round it, partly by praying

in its vicinity, at such places "prayer is heard" (*Chron Mekka*, III 441, 442) In the Masdjid al-Khaif in Minā the visitor laid his head on the print of the Prophet's head and thus obtained *baraka* (*ibid*, III 438) A mosque could be built on a site, the sanctity of which had been shown by the finding of hidden treasure (Makrīzī, IV 75) There were often places of particular sanctity in mosques In the mosques at Kubā' and Medīna, the spots where the Prophet used to stand at prayer were held to be particularly blessed (Balādhurī, p 5, Bukhārī, *Ṣalāt*, bāb 91, Wustenfeld, *Medina*, p 65, cf 82, 109) In other mosques, places where a saint had sat or where a divine phenomenon had taken place e g in the Mosque of ʿAmr and in the Azhar Mosque (Makrīzī, III 19, 52) or the Mosque in Jerusalem (Makdisī, *B G A*, III 170) were specially visited Pious visitors made *tawāf* [q v] between such places in the mosque (Makrīzī, IV 20) Just as in other religions we find parents dedicating their children to the service of a sanctuary, so we find a Muslim woman vowing her child or child yet unborn to the mosque (Bukhārī, *Salāt*, bāb 74, Makrīzī, IV 20) The fact that mosques, like other sanctuaries, were sometimes founded after a revelation received in a dream has already been mentioned (B 5)

This increase in sanctity had as a natural result that one could no longer enter a mosque at random as had been the case in the time of the Prophet In the early Umayyad period, Christians were still allowed to enter the mosque without molestation (cf Lammens, *Moʿâwia*, p 13 *sq*, Goldziher, in *W Z K M*, VI 100 *sq*) Muʿāwiya used to sit with his Christian physician, Ibn Uthāl, in the mosque of Damascus (Ibn Abī Usaibiʿa, I 117) According to Ahmad b Hanbal, the *Ahl al-Kitāb* (or *Ahl al-ʿAhd*) and their servants, but not polytheists, were allowed to enter the mosque of Medīna (*Musnad*, III 339, 392) At a later date entrance was forbidden to Christians and this regulation is credited to ʿUmar (Lammens, *op cit*, p 13, note 6) A strict teacher of morality like Ibn al-Hādjdj thought it unseemly that the monks who wove the mats for the mosques should be allowed to lay them in the mosque (*Madkhal*, II 57) Conditions were not always the same In Hebron, Jews and Christians were admitted on payment to the sanctuary of Abraham until in 664 (1265) Baibars forebade it (Quatremère, *Hist Sult Maml*, I/II 27)

According to some traditions, a person in a state of ritual impurity could not enter the mosque (Abū Dāwūd, *Tahāra*, bāb 92, Ibn Mādja, *Tahāra*, bāb 123) and in any case only the pure could acquire merit by visiting the mosque (Muslim, *Masādjid*, tr 49, *Corpus iuris di Zaid b ʿAlī*, N° 48), and in a later period it is specially mentioned that the *wudūʾ* cannot be undertaken in the mosque itself (*Madkhal*, II 47 infra) nor could shaving (*ibid*, p 58 *sq*)

It is always necessary to be careful not to spit in a mosque, although some traditions which are obviously closer to the old state of affairs say, "not in the direction of the ḳibla, only to the left!" (Bukhārī, *Ṣalāt*, bāb 33 *sq*) The custom of taking off one's sandals in the mosque is found as early as the time of Abū ʿUbaida (second century) (Yāḳūt, *Udabāʾ* V 272, 13 *sq*) and according to *al-Madkhal* (see below) is also mentioned by Abū Dāwūd Al-Tabarī puts the custom back to the time of ʿUmar (I 2408) That it is based on an old custom observed in sanctuaries is obvious (cf on the history of the custom, F Cumont, *Fouilles de Doura Europos*, 1926, p 60 *sq*) The custom however seems not to have been always observed In the VIIIth century in the Mosque of the Umayyads the shoes were taken off only in the *maksūra*, because the floor was covered with mats, but in 827 an Egyptian superintendent ordered that the mosque should only be entered with bare feet (*J A*, ser 9, VII 211, 217) The visitor on entering should place his right foot first and utter certain prayers with blessings on the Prophet and his family (which Muhammad is said to have done!) and when he is inside perform two rakʿa's (Bukhārī, *Salāt*, bāb 47, *Tahadjdjud*, bāb 25, Muslim, *Ṣalāt al Musāfirīn*, tr 12 *sq*, Tabarī, III 2464, 2532) Certain regulations for decent conduct came into being, the object of which was to preserve the dignity of the house of divine service Public announcements about strayed animals were not to be made, as the Beduins did in their houses of assembly, and one should not call out aloud and thereby disturb the meditations of the worshippers (Bukhārī, *Ṣalāt*, bab 83, Muslim, *Masādjid*, tr 18, more fully in *Madkhal*, I 19 *sqq*) One should put on fine clothes for the Friday service, rub oneself with oil and perfume oneself (Bukhārī, *Djumʿa*, bāb 3, 6, 7, 19) as was also done with *tīb* for the Hadjdj (Bukhārī, *Hadjdj*, bāb 143)

A question which interested the teachers of morality was that of the admission of women to the mosques That many did not desire their presence is evident from the hadīth that one cannot prevent them as there is no *fitna* connected with it, but they must not be perfumed (Muslim, *Salāt*, bāb 29, Bukhārī, *Djumʿa*, bāb 13, cf *Chron Mekka*, IV 168) Other hadīths say they should leave the mosques before the men (al-Nasāʾī, *Sahw*, bāb 77, cf Abū Dāwūd, *Salāt*, bāb 14, 48) Sometimes a special part of the mosque was railed off for them, for example, the governor of Mecca in 256 had ropes tied between the columns to make a separate place for women (*Chron Mekka*, II 197 infra) According to some, women must not enter the mosque during their menstruation (Abū Dāwūd, *Tahāra*, bāb 92, 103, Ibn Mādja, *Tahāra*, bāb 117, 123) In Medina at the present day, a wooden grille shuts off a place for women (al-Batanūnī, *al-Riḥla al-Hidjāziya*, p 240) At one time the women stood at the back of the mosque here (Yāḳūt, *Udabāʾ*, VI 400) In Jerusalem there were special *maḳṣūra*s for them (*B G A*, V 100) Ibn al-Hādjdj would prefer to exclude them altogether and gives ʿĀʾisha as his authority for this

Although the mosque became sacred it could not quite cast off its old character as a place of public assembly and in consequence the mosque was visited for many other purposes than that of divine service Not only in the time of the Umayyads was considerable business done in the mosques (Tabarī, II 1118, cf Lammens, *Ziād*, p 98) which is quite in keeping with the hadīth (Bukhārī, *Ṣalāt*, bāb 70 *sq*) which, actually found it necessary to forbid the sale of wine in the mosque (*ibid*, bāb 73), but a writer in the VIIIth century, Ibn al-Hādjdj, records with disapproval that business was done in the mosques women sit in the mosques and sell thread, in Mecca hawkers even call their wares in the mosque The list given by

this author gives one the impression of a regular market-place (*Madkhal*, II 54) Strangers could always sit down in a mosque and talk with one another (see *B G A*, III 205), they had the right to spend the night in the mosque, according to some, however, only if there was no other shelter available (*Madkhal*, II 43 infra, 49 supra, see below D 1b) It naturally came about that people also ate in the mosque, this was quite common, and regular banquets were even given in them (e g Makrīzī, IV 67, 121 *sq*, cf in Hadīth Ibn Mādja, *Aṭ'ima*, bāb 24, 29, Ahmad b Hanbal, II 106, 10 from below) Ibn al-Hādjdj laments that in al-Aksā people even threw the remains of their repast down in the mosque, animals were brought in, and beggars and water-carriers called aloud in them etc (*Madkhal*, II 53 *sq*) It is even mentioned as a sign of the special piety of al-Shīrāzī (d 476 = 1083) that he often brought food into the mosque and consumed it there with his pupils (Wustenfeld, *Der Imâm Schâfi'î*, III 298) Gradually the mosques acquired greater numbers of residents (see D 2b) In the Azhar Mosque it was the custom with many to spend the summer nights there because it was cool and pleasant (Makrīzī, IV 54) This was the state of affairs about 800 A H Similar conditions still prevail in the mosques

2 The Mosque as a Place of Prayer Friday Mosques

As places for divine service, the mosques are primarily "houses of which God has permitted that they be erected and that His name be mentioned in them" (Sūra, XXIV 36), i e for His service demanded by the law, for ceremonies of worship (*manāsik*), for assemblies for prayer (*djamā'āt*) and other religious duties (cf *Chron Mekka*, IV 164) The mosques were *ma'ābid* (Makrīzī, IV 117, 140) In Medīna after a journey, the Prophet went at once to the mosque and performed two rak'a's, a custom which was imitated by others and became the rule (Bukhārī, *Salāt*, bāb 59 *sq*, Muslim, *Salāt al-Musāfirīn*, tr 11, Wāḳidī–Wellhausen, p 412, 436) In this respect, the mosque played a part in public worship similar to that of the Ka'ba in Mecca at an earlier date and the Rabba sanctuary in Ṭā'if The daily salāts, which in themselves could be performed anywhere, became especially meritorious when they were performed in mosques, because they expressed adherence to the community A *ṣalāt al-djamā'a*, we are told, is twenty or twenty-five times as meritorious as the salāt of an individual at home or in his shop (Muslim, *Masādjid*, tr 42, Bukhārī, *Salāt*, bāb 87, *Buyū'*, bāb 49) There are even hadīths which condemn private salāts "Those who perform the *ṣalāt* in their houses abandon the *sunna* of their Prophet" (Muslim, *Masādjid*, tr 44, but cf 48 and Bukhārī, *Ṣalāt*, bāb 52) If much rain falls, the believers may, however, worship in their houses (Bukhārī, *Djum'a*, bāb 14) In this connection a blind man was given a special *rukhṣa*, it is particularly bad to leave the mosque after the *adhān* (Muslim, *Masādjid*, tr 45) It is therefore very meritorious to go to the mosque, for every step one advances into the mosque, he receives forgiveness of sins, God protects him at the last judgment and the angels also assist him (Muslim, *Masādjid*, bāb 49–51, Bukhārī, *Ṣalāt*, bāb 87, *Adhān*, bāb 36, 37, *Djum'a*, bāb 4, 18, 31, *Corpus iuris di Zaid b 'Alī*, N° 48, 156, 983)

This holds especially of the Friday salāt (*salāt al-djum'a*), which can only be performed in the mosque and is obligatory upon every free male Muslim who has reached years of discretion (cf Juynboll, *Handbuch*, p 86, Guidi, *Sommario del Diritto Malechita*, I 125 *sq*) According to Ibn Hishām (p 290) this salāt, which is distinguished by the *khuṭba*, was observed in Medīna even before the Hidjra This is hardly probable and besides is not in agreement with other hadīths (see Bukhārī, *Djum'a*, bāb 11) but the origin of this divine service, referred to in Sūra lxii 9, is obscure The assemblies of the Jews and Christians on a particular day must have formed the model (cf Bukharī, *Djum'a*, bāb 1) Its importance in the earlier period lay in the fact that all elements of the Muslim camp, who usually went to the tribal and particular mosques, assembled for it in the chief mosque under the leadership of the general The chief mosque, which for this reason was particularly large, was given a significant name They talk of *al-Masdjid al a'zam* (Tabarī, I 2494, II 734, 1701, 1702, Kūfa, Balādhurī, p 5, Tabarī, *Tafsīr*, XI 21, centre, *ibid* also *al-Masdjid al-akbar*, Medīna, cf *al-Masdjid al-kabīr*, *B G A*, VII 245) or *Masdjid al-Djamā'a* (Yākūt, III 896, al-Fustāt, also Tabarī, II 1119, Ibn Kutaiba, *Ma'ārif*, ed Wustenfeld, p 106), *Masdjid li 'l-Djamā'a* (Makrīzī, IV 4), *Masdjid Djāmi'* (Balādhurī, p 289, Madā'in, Yākūt, I 643, 647, Basra), then *Masdjid al-Djāmi'* (Yākūt, III 899, IV 885, *B G A*, II 298, 315, 387, VII 110 etc) As an abbrevation we find also *al-Djamā'a* (Yākūt, I 400, Ibn Battūta, IV 343, cf *Masdjidī al-Djamā'a*, Balādhurī, p 348) and especially *Djāmi'* As the *khuṭba* was the distinguishing feature, we also find *Masdjid al-Khutba* (Makrīzī, IV 44, 64, 87), *Djāmi' al-Khutba* (*ibid*, IV 55) or *Masdjid al-Minbar* (*B G A*, III 316 for *Djāmi'*, l 8)

Linguistic usage varied somewhat in course of time with conditions In the time of 'Umar there was properly in every town only one Masdjid Djāmi' for the Friday service But when the community became no longer a military camp and Islam replaced the previous religion of the people, a need for a number of mosques for the Friday service was bound to arise This demanded mosques for the Friday service in the country, in the villages on the one hand and several Friday mosques in the towns on the other This meant in both cases an innovation, compared with old conditions, and thus there arose some degree of uncertainty The Friday service had to be conducted by the ruler of the community, but there was only one governor in each province, on the other hand, the demands of the time could hardly be resisted and, besides, the Christian converts to Islām had been used to a solemn weekly service

As to the villages (*al-kurā*), 'Amr b al 'Āṣi in Egypt forbade their inhabitants to celebrate the Friday service for the reason just mentioned (Makrīzī, IV 7) At a later period then the khutba was delivered exceptionally, without minbar and only with staff, until Marwān in 132 introduced the minbar into the Egyptian *kurā* also (*ibid*, p 8) Of a mosque in which a *minbar* had been placed, we are told *djū'ila masdjidan li 'l-a'yāa* (Tabarī, I 2451) and a village with a minbar is called *karya djāmi'a* (Bukhārī, *Djum'a*, bāb 15, cf *Madina Djāmi'a*, *B G A*, II 321), an idea which was regarded by Bukhārī (d 256 = 870)

as quite obvious In introducing minbars into the Egyptian villages, Marwān was apparently following the example of other regions In the fourth century, Ibn Hawkal mentions a number of *manābir* in the district of Istakhr (*B G A*, ii 182 *sqq*) and a few in the vicinity of Marw (*ibid*, p 316) and in Transoxania (*ibid*, p 378, cf p 384), and al-Makdisī does the same for other districts of Persia (*B G A*, iii 309, 317) and he definitely says that the kurās of Palestine are *dhāt manābir* (*ibid*, p 176, cf i 58), Balādhurī (p 331) also uses the name minbar for a village mosque built in 239, in general, when speaking of the kurās, one talks of *manābir* and not of *djawāmi*ᶜ (cf *B G A*, i 63) Later however the term Masdjid Djāmiᶜ is used for a Friday mosque (Ibn Djubair, p 217) The conditions of primitive Islām are reflected in the teaching of the Hanafīs, who only permit the Friday service in large towns (cf al Māwardī, *al Ahkām al-sulṭāniya*, ed Enger, p 177)

As to the towns, the Shāfiᶜīs on the other hand have retained the original conditions, since they permit the Friday service in only one mosque in each town (cf UJUMᶜA and *op cit*, p 178 *sq*), but with the reservation that the mosque is able to hold the community The distinction between the two rites was of importance in Egypt When in 569 Ṣalāh al-Dīn became supreme in Egypt, he appointed a Shāfiᶜī chief kādī and the Friday service was therefore held only in the Hākim mosque, as the largest, but in 665 (1266) al-Malik al-Zāhir Baibars gave the Hanafīs preference and many mosques were therefore used as Friday mosques (Makrīzī, iv 52 *sq*, al Suyūtī, *Husn al-Muhādara*, ii 140, Quatremère, *Hist Sult Maml*, i/ii 39 *sqq*) During the Umaiyad period and to some extent in the ᶜAbbāsid period, the number of *djawāmiᶜ* in the towns were still very small The geographers of the third and fourth centuries in their descriptions of towns as a rule mention only "the djāmiᶜ" Ibn al-Fakīh, c 290 (903), sometimes says *masdjid djāmiᶜ wa-minbar*, *B G A*, v 304–306, also *minbar* simply, p 305 In keeping with the oldest scheme of town planning, it was very often in the middle of the town surrounded by the business quarters (*B G A*, ii 298, 325, iii 274 *sq*, 278, 289, 314, 316, 375, 376, 413, 426, 427 etc, Nāsir-i Khusraw, ed Schefer, p 35, 41, 56) and the *dār al imāra* was still frequently in the immediate vicinity of the chief mosque (*B G A*, ii 298, 314, iii 426)

Istakhrī mentions as an innovation in Islām that al-Hadjdjādj built a djāmiᶜ in al-Wāsit on the west bank, although there was already one on the east bank (*B G A*, i 82 *sq*, cf iii 118, vii 322) Ibn Djubair (*Rihla*, p 211 *sq*) mentions only one djāmiᶜ in Kūfa, called *Masdjid al Kūfa* by Ibn al Fakīh, although he also mentions other mosques (*B G A*, v 173, cf 174, 183 and iii 116) In Basra where Yaᶜkūbī (278 = 891) already mentions 7,000 mosques (*B G A*, vii 361), al Makdisī (375 = 985) gives 3 *djawāmiᶜ* (*B G A*, iii 117) In Sāmarrā', among many mosques, there was one djāmiᶜ (*B G A*, vii 258, 259), which was later replaced by another (*ibid*, p 260 *sq*), al-Mutawakkil also built one outside the original town (*ibid*, p 265, see also P Schwarz, *Die ᶜAbbāsiden-Residenz Sāmarrā*, 1909, p 32) In Baghdād, Yaᶜkūbī (278 = 891) mentions only one djāmiᶜ for the eastern town and one for the western (*B G A*, vii 240, 245, 251, 253, the almost contemporary Ibn Rosta just mentions the old western town and its djāmiᶜ, *ibid*, p 109) although he gives the fantastic figures of 15,000 mosques in the east town (*ibid*, p 254) and 30,000 in the west (or in the whole town ?, *ibid*, p 250) After 280 there was added the djamiᶜ of the eastern palace of the caliph (Mez, *Renaissance*, p 388 quoting al Khatīb al Baghdādī, *Taᵓrīkh Baghdād*, a private djāmiᶜ of Hārūn al-Rashīd in the *Bustān Umm Mūsā* is mentioned by Ibn al-Kiftī, *Taᵓrikh al-Hukamā*ᵓ, ed Lippert, p 433 infra) These 3 *djawāmiᶜ* are mentioned about 340 (951) by Istakhrī (*B G A*, i 84), who also mentions one in the suburb of Kalwādhā Ibn Hawkal in 367 (977) mentions the latter and also the Djāmiᶜ al-Barāthā (*B G A*, i 164 *sq*, of 329, Mez, *loc cit*), a fifth was added in 379, a sixth in 383 (Mez, p 389), thus al Khatīb al Baghdādī in 460 (1058) gives 4 for West Baghdād, 2 for the east town (cf Le Strange, *Baghdad*, p 324) Ibn Djubair in 581 (1185) gives in the east town 3, and 11 *djawāmiᶜ* (*Rihla*, p 228 *sq*) for the whole of Baghdād For Cairo, Istakhrī gives two djāmiᶜ the ᶜAmr and Tūlūn Mosques (*B G A*, i 49) besides that in al-Karāfa, which was regarded as a separate town (cf Ibn Rosta [c 290 = 903], *B G A*, vii 116 *sq*) Al-Makdisī, who writes (375 = 985) shortly after the Fātimid conquest, mentions the ᶜAmr and Tūlūn mosques, the new mosque in al Kāhira (al-Azhar), also one in al Djazīra, in Djīza and in al-Karāfa (*B G A*, iii 198—200, 209, the djāmiᶜ in al Djazīra, also Djāmiᶜ Mikyās [cf Makrīzī, iv 75], is mentioned in an inscription of the year 485, see van Berchem, *Corpus*, i, N° 39) As these places were all originally separate towns, the principle was not abandoned that each town had only one djāmiᶜ The Fātimids however extended the use of Friday mosques and, in addition to those already mentioned, used the Djāmiᶜ al-Hākim, al Maks and Rāshida (Makrīzī, iv 2 *sq*) Nāsir i Khusraw in 439 (1047) mentions in one passage the *djawāmiᶜ* of Cairo, in another seven for Misr and fifteen in all (ed Schefer, p 134 *sq*, 147) This was altered in 569 by Ṣalāḥ al-Dīn (see above) but the quarters, being still regarded as separate towns, retained their own Friday mosques (cf for the year 607 in al-Karāfa Makrīzī, iv 86)

After the Friday service in Egypt and Syria was freed from restriction, the number of *djawāmiᶜ* increased very much Ibn Dukmāk (about 800) gives a list of only eight *djawāmiᶜ* in Cairo (ed Vollers, p 59—78), but this list is apparently only a fragment (in all he mentions something over twenty in the part of his book that has survived), al-Makrīzī (d 845 = 1442) gives 130 *djawāmiᶜ* (iv 2 *sqq*) In Damascus, where Ibn Djubair still spoke of "the djāmiᶜ", al-Nuᶜaimī (d 927 = 1521) gives twenty djawāmiᶜ (*J A*, ser 9, vii 231 *sqq*), and according to Ibn Battūta, there were in all the villages in the region of Damascus *masādjid djāmiᶜa* (i 236) The word djāmiᶜ in Makrīzī always means a mosque in which the Friday service was held (vi 76, 115 *sqq*) but by his time this meant any mosque of some size He himself criticises the fact that since 799 the *salāt al-djumᶜa* was performed in al-Akmar, although another djāmiᶜ stood close beside it (iv 76, cf also 86)

The great spread of Friday mosques was reflected in the language While inscriptions of the viiith century still call quite large mosques *masdjid*, in

the ninth most of them are called *djāmiᶜ* (cf on the whole question, van Berchem, *Corpus*, i 173 *sq*), and while now the madrasa begins to predominate and is occasionally also called djāmiᶜ (see below, F 4), the use of the word masdjid becomes limited While, generally speaking, it can mean any mosque (e g Maḳrīzī, iv 137, of the Mu aiyad mosque), it is more especially used of the smaller unimportant mosques While Ibn Dukmāk gives 472 masādjid in addition to the djawāmiᶜ, madāris, etc, al-Makrīzī only gives nineteen, not counting al-Karāfa, which probably only means that they were of little interest to him Djāmiᶜ is now on the way to become the regular name for a mosque of any size as is now the usage, in Egypt at least In Ibn al-Hādjdj (d 737) *al djawāmiᶜ* is occasionally used in this general meaning in place of *al-masādjid* (*Madkhal*, ii 50) Among the many Friday mosques one was usually distinguished as the chief mosque, we therefore find the expression *al-djāmiᶜ al-aᶜzam* (Ibn Battūta, ii 54, 94, cf the older *al-masdjid al aᶜzam*, *ibid*, p 53) The principal djāmiᶜ decided in such questions as the beginning and ending of the Fast of Ramadān (*Madkhal*, ii 68)

3 Other religious activities in the Mosque

„The mentioning of the name of God" in the mosques, was not confined only to the official ritual ceremonies Even in the time of the Prophet, we are told that he lodged Thakīfī delegates in the mosque so that they could see the rows of worshippers and hear the nightly recitation (Wākidī–Wellhausen, p 382) Although this story (which is not given in Ibn Hishām, p 916) may simply be a reflection of later conditions, the recitation of the Kur'ān must have come to be considered an edifying and pious work at quite an early date In the time of al-Makdisī the *kurrā'* of Nīsābūr used to assemble on Fridays in the djāmiᶜ in the early morning and recite till the *duhā* (*B G A*, iii 328), and the same author tells us that in the Mosque of ᶜAmr in Egypt the *a'immat al-kurrā'* sat in circles every evening and recited (*ibid*, p 205) In the time of Ibn Djubair, there were recitations of the Kur'ān in the Umaiyad mosque after the *Salāt al-Subh* and every afternoon after the *Ṣalāt al-ᶜAsr* (*Riḥla*, p 271 *sq*) Besides the recitation of the Kur'ān there were praises of God etc, all that is classed as *dhikr*, and which was particularly cultivated by Sufiism This form of worship also took place in the mosque The *Ahl al-Tawhid wa 'l-Maᶜrifa* formed *madjālis al-dhikr*, who assembled in the mosques (al-Makkī, *Kūt al-Kulūb*, i 152) In the Mosque of the Umaiyads and other mosques of Damascus, *dhikr* was held during the morning on Friday (Makrīzī, iv 49) In the *Masdjid al-Aksā* the Hanafis held *dhikr*, and recited at the same time from a book (*B G A*, iii 182) In Egypt, Ahmad b Tūlūn and Khumārawaih allowed twelve men quarters in a chamber near the minaret to praise God, and during the night four of them took turns to praise God with recitations of the Kur'ān and with pious *kasīdas* From the time of Salāh al-Dīn an orthodox *ᶜakīda* was recited by the mu'adhdhins in the night (*ibid*, iv 48) Ibn al-Hādjdj demands that the recitation of the Kur'ān aloud should take place in a mosque for the special purpose (*masdjid madjhūr*) as otherwise pious visitors are disturbed (*Madkhal*, ii 53, 67) Mosques and particularly mausoleums had as a rule regularly appointed reciters of the Kur'ān In addition there was, e g in Hebron and in a mosque in Damascus, a shaikh who had to read Bukhārī (or also Muslim) for three months (Sauvaire, *Hist Jerus Hebr*, p 17, *J A*, ser 9, iii 261) In Tunis, al-Bukhārī was read daily in a hospital (Zarkashī, transl Fagnan, *Rec Soc Arch Constantine*, 1894, p 188)

Sermons were not only delivered at the *salāt al-djumᶜa* In the ᶜIrāk, even in al-Maḳdisī's time, one was preached every morning, according to the *sunna* of Ibn ᶜAbbās (*B G A*, iii 130), it was said Ibn Djubair, in the Nizāmīya in Baghdād, heard the Shāfiᶜī *ra'is* preach on Friday after the ᶜ*asr* on the minbar His sermon was accompanied by the skilled recitation of the *kurrā'* who sat on chairs, they were over twenty in number (Ibn Djubair, p 219—222) In the same way, the calls of the mu'adhdhins to prayer to the Friday khutba were delivered to a musical accompaniment (see below, II 4) The unofficial sermons, which moreover were not delivered in mosques alone, were usually delivered by a special class, the *kussās* (plur of *kāṣṣ*) (on these cf Goldziher, *Muh Stud*, ii 161 *sqq*, Mez, *Die Renaissance des Islāms*, p 314 *sqq*, and the article KISSA) The kussās, who delivered edifying eddresses and told popular stories, were early admitted to the mosques

Tamīm al-Dārī is said to have been the first of these, in Medina in the caliphate of ᶜUmar before the latter's decease, he used to deliver his orations at the Friday salāt and under ᶜUmar he was allowed to talk twice a week in the mosque, in the reign of ᶜAlī and of Muᶜāwiya the kussās were employed to curse the other side (Makrīzī, iv 16 *sq*) In the Mosque of ᶜAmr in Cairo by the year 38 or 39, a *kāṣṣ* was appointed, named Sulaim b ᶜItr al-Tudjībī, who was also kadī (*ibid*, iv 17 wrongly Sulaimān, Kindī, *Governors and Judges*, ed Guest, p 303 *sq*) There are other occurrences of the combination of the two offices (Ibn Hudjaira [d 83], Kindī, p 317, Khair b Nuᶜaim in the year 120, *ibid*, p 348, cf *Husn al-Muhādara*, i 131, Djbr, according to Thawba b Nimr, *Husn*, i 130 infra, Ibrāhīm b Ishāk al Kārī [d 204], Kindī, p 427, see also Makrīzī, iv 18) which shows that the office of kāss was quite an official one There is also evidence of the employment of kussās in the mosque of the ᶜIrāk in the ᶜAbbāsid period (Yākūt, *Udabā'*, iv 268, v 446) The kāss read from the Kur'ān standing and then delivered an explanatory and edifying discourse, the object of which was to instil the fear of God into the people (Makrīzī, iv 18) Under the Fātimids also, kussās were appointed to the mosques, for example, in 403 the imām undertook the office in the Mosque of ᶜAmr (Makrīzī, iv 18 infra) and the rulers had also a *kāṣṣ* in the palace The kussās were called *aṣḥāb al-karāsī*, because they delivered their discourses on the *kursī* (al-Makkī, *Kūt al Kulūb*, i 152, Ibn al Hādjdj, *Madkhal*, i 159, cf Makrīzī, iv 121) Their discourse was called *dhikr* or *waᶜz* or *mawᶜiza*, whence the kāss was also called *mudhakkir* (*B G A*, iii 205) or *wāᶜiz* Specimens of their discourses are given by Ibn ᶜAbd Rabbihi (*al-ᶜIkd al-farid*, Cairo 1321, i, p 294 *sqq*) It was not only the appointed officials who delivered such discourses in the mosque Ascetics made

public appearances in various mosques and collected interested hearers around them (cf e g Makrīzī, iv 135) In the Djāmiʿ al-Karāfa, a whole society, the Banū Djawharī, delivered waʿz discourses on a kursī for three months on end, their servant collected money in a begging-bowl during the discourse and the shaikh distributed some of it among the poor (*ibid*, iv 121)

The *kasas* was completely taken over by popular Sūfīism and later writers would hardly reckon, as al-Makkī does, the "story-tellers" among the *mutakallimūn* (*Kūt al-Kulūb*, i 152) The whole system degenerated to trickery and charlatanry of all kinds, as may be seen in the Makāma literature (cf thereon Yākūt, *Udabāʾ*, vi 167 *sq* and see also Mez and Goldziher, *op cit*) Al-Makrīzī therefore distinguishes between *al-kasas al-khāssa*, the regular and seemly edifying discourse in the mosque, and *al-kaṣas al-ʿāmma*, which consisted in the people gathering round all kinds of speakers, which is *makrūh* (Makrīzī, iv 17) Others also have recorded their objections to the *kussās* Ibn al-Hādjdj utters a warning against them and wants to forbid their activities in the mosque completely, because they deliver "weak" narratives (*Madkhal*, i 158 *sq*, ii 13 *sq*, 50) He says Ibn ʿUmar, Mālik and Abū Dāwūd rejected them and ʿAlī ejected them from the masdjid of Basra It is of little significance that al-Muʿtadid in 284 forbade them to sit in the mosques and forbade people to gather round them, for he issued a similar interdict against the *fukahāʾ* and the reasons were evidently political (Tabarī, iii 2165), it was for political reasons also, but with a very different motive, that ʿAdud al-Dawla forbade their appearing publicly in Baghdād shortly before 400, because they increased the tension between Sunnīs and Shīʿīs (Mez, *op cit*, p 319) As late as 580 the *wuʿʿāz* still flourished in the mosques of Baghdād, as is evident from the *Rihla* of Ibn Djubair (p 219 *sqq*, 224), and in the ninth century there was in the Azhar mosque a *madjālis al-waʿz* as well as a *halak al-dhikr* (Makrīzī, iv 54)

When Ibn al-Hādjdj denounces speaking aloud in the mosque, it is in the interest of the pious visitors who are engaged in religious works and meditation *Iʿtikāf* [q v], retirement to a mosque for a period, was adopted into Islām from the older religions

The word *ʿakf* means in the Kurʾān the ceremonial worship of the object of the cult (Sūra vii 134, xx 93, 97, xxi 53, xxvi 71, cf *Hāshimiyāt*, ed Horovitz, p 86, 15) and also the ritual stay in the sanctuary, which was done for example in the Meccan temple (Sūra ii 119, xxii 25) In this connection it is laid down in the Kurʾān that in the month of Ramadān believers must not touch their wives "while ye pass the time in the mosques" (*ʿākifūn fi ʾl-masādjid*, Sūra ii 183), an expression which shows, firstly that there were already a number of mosques in the lifetime of the Prophet and secondly that these had already to some extent taken over the character of the temple The connection with the early period is evident from a hadīth, according to which the Prophet decides that ʿUmar must carry out a vow of *iʿtikāf* for one night in the *Masdjid al-Harām* made in the Djāhilīya (Bukhārī, *Iʿtikāf*, bāb 5, 15 *sq*, *Fard al-Khums*, bāb 19, *Maghāzī*, bāb 54, *Aimān wa ʾl-Nudhūr*, bāb 29) It is completely in keeping with this that the Prophet, according to the hadīth, used to spend ten days of the month of Ramadān in *iʿtikāf* in the mosque of Medīna (Bukhari, *Iʿtikāf*, bāb 1, *Fadl Lailat al Kadar*, bāb 3), and in the year in which he died as many as twenty days (*ibid*, *Iʿtikāf*, bab 17) During this period the mosque was full of booths of palm branches and leaves in which the *ʿākifūn* lived (*ibid*, bāb 13, cf 6, 7) The Prophet only went to his house for some very special reason (*ibid*, bāb 3) This custom was associated with the asceticism of the monks The faithful were vexed, when on one occasion he received Safīya in his booth and chatted for an hour with her (Bukhārī, *Fard al Khums*, bāb 4, *Iʿtikāf*, bāb 8, 11, 12) According to another tradition, his *iʿtikāf* was broken on another occasion by his wives putting up their tents beside him and he postponed his *iʿtikāf* till Shawwāl (Bukhārī, *Iʿtikāf*, bāb 6, 7, 14, 18) According to Zaid b ʿAlī, the *iʿtikāf* can only be observed in a chief mosque (*djāmiʿ*) (*Corpus iuris di Zaid b ʿAlī*, N⁰ 447) During the early period, it was one of the initiatory rites for new converts In the year 14, ʿUmar ordered the retreat (*al-kiyām*) in the mosques during the month of Ramadān for the people of Medīna and the provinces (Tabarī, i 2377) The custom persisted and has always been an important one among ascetics "The man who retires for a time to the mosque devotes himself in turn to salāt, recitation of the Kurʾān, meditation, *dhikr* etc" says Ibn al-Hādjdj (*Madkhal*, ii 50) There were pious people, who spent their whole time in a mosque (*akāmū fihi*, Makrizi, iv 87, 97), of one we were told that he spent his time in the *manāra* of the Mosque of ʿAmr (*iʿtakafa*, *ibid*, p 44) Al-Samhūdī says that during the month of Ramadān, he spent day and night in the mosque (Wustenfeld, *Medina*, p 95) Saʿd al-Dīn (d 644) spent the month of Ramadān in the Mosque of the Umaiyads without speaking (Ibn Abī Usaibiʿa, ii 192) Nocturnal vigils in the mosque very early became an established practice in Islām According to Hadīth, the Prophet frequently held nocturnal salāts in the mosque with the believers (Bukhārī, *Djumʿa*, bāb 29) and by his orders ʿAbd Allāh b Unais al-Ansārī came from the desert for twenty-three successive nights to pass the night in his mosque in rites of worship (Ibn Kutaiba, *Maʿārif*, ed Wustenfeld, p 142 *sq*) Out of this developed the *tahadjdjud* [q v] salat, particularly recommended in the law and notably the *tarāwih* salāts [q v] In Dihlī on these occasions women singers actually took part (Ibn Battūta, iii 155)

During the nights of the month of Ramadān there were festivals in the mosques and on other occasions also, such as the New Year, sometimes at the new moon, and in the middle of the month The mosque on these occasions was illuminated, there was eating and drinking, incense was burned and *dhikr* and *kirāʾa* performed

The Friday Salāt was particularly solemn in Ramadān, and in the Fātimid period, the caliph himself delivered the khutba (see Makrīzī, ii 345 *sqq*, Ibn Taghrībirdī, ii/1, ed Juynboll, p 482—486 and ii/11, ed Popper, p 331—333) The mosques associated with a saint had and still have their special festivals on his *mawlid* [q v], they also are celebrated with *dhikr*, *kirāʾa* etc (cf Lane, *Manners and Customs*, ch xxiv *sqq*) The saint's festivals are usually local and there

are generally differences in the local customs In the Maghrib for example in certain places the month of Ramadān is opened with a blast of trumpets from the manābir (*Madkhal*, II 69)

The mosque thus on the whole took over the role of the temple The rulers from ʿUmar onwards dedicated gifts to the Kaʿba (*B G A*, V 20 *sq* and *GI*, s v *Shamsa*), and as in other sanctuaries we find women vowing children to the service of the mosque (Bukhārī, *Salāt*, bāb 74, Makrīzī, IV 20) *Ṭawāf* was performed, as at the Kaʿba, in mosques with saints' tombs as is still done, e g in Hebron, Mudjīr al-Dīn sees a pre-Islāmic custom in this (Sauvaire, *Hist Jerus et Hebron*, p 5) Especially important business was done here In times of trouble the people go to the mosque to pray for help, for example during drought, for which there is a special salāt (which however usually takes place on the *muṣallā*), in misfortunes of all kinds (e g Wustenfeld, *Medina*, p 19—20, Makrīzī, IV 57), in time of plague and pestilence, processions, weeping and praying with Kurʾāns uplifted, were held in the mosques or on the *musallā*, in which even Jews and Christians sometimes took part (Ibn Taghrībirdī, II/II, ed Popper, p 67, Ibn Battūta, I 243 *sq*, cf Quatremere, *Hist Sult Maml*, II/I 35, 40, II/II 199) or for a period a sacred book like Bukhārī's *Sahih* was recited (Quatremere, *op cit*, II/II 35, al-Djabartī, *Merveilles Biographiques*, French transl, VI 13) In the courtyards of the mosques in Jerusalem and Damascus in the time of Ibn Battūta solemn penance was done on the day of ʿArafa (I 243 *sq*), an ancient custom which had already been introduced into Egypt in the year 27 by ʿAbd al-ʿAzīz b Marwān (*kuʿūd* after the *ʿAsr*, cf Kindī, *Wulāt*, p 50) Certain mosques were visited by barren women (Wustenfeld, *Medina*, p 133) An oath is particularly binding if it is taken in a mosque (cf Joh Pedersen, *Der Eid bei den Semiten*, p 144), this is particularly true of the Kaʿba, where written covenants were also drawn up to make them more binding (*ibid*, p 143 *sq*, *Chron Mekka*, I 160 *sq*) It is in keeping with this idea of an oath that Jews who had adopted Islām in Cairo had to take oaths in a synagogue which had become a mosque (Makrīzī, IV 265) The contract of matrimony (*ʿakd al nikāh*) also is often concluded in a mosque (San tillana, *Il Muhtasar*, II 548, *Madkhal*, II 72 infra, Snouck Hurgronje, *Mekka*, II 163 *sq*), and the particular form of divorce which is completed by the *liʿān* [q v] takes place in the mosque (Bukhārī, *Ṣalāt*, bāb 44, cf Joh Pedersen, *Der Eid* etc, p 114)

It is disputed whether a corpse may be brought into the mosque and the *ṣalāt al-djanāza* performed there According to one hadīth, the bier of Saʿd b Abī Wakkās was taken into the mosque at the request of the Prophet's widow and the salāt held there Many disapproved of this, but ʿĀʾisha pointed out that the Prophet had done this with the body of Suhail b Baidāʾ (Muslim, *Djanāʾiz*, tr 34, cf also Ibn Saʿd, I/I 14 *sq*) The discussion on this point is not unconnected with the discussions regarding the worship of tombs In theory this is permitted by al-Shāfiʿī, while the others forbid it (see Juynboll, *Handbuch*, p 170, I Guidi, *Il Muhtaṣar*, I 151) The matter does not seem to be quite clear, for Kutb al-Dīn says that only Abū Hanīfa forbids it, but he himself thought that it might be allowable on the authority of a statement by Abū Yūsuf (*Chron Mekka*, III 208—210) In any case, it was a very general practice to allow it, as Kutb al-Dīn also points out ʿUmar conducted the funeral salāt for Abū Bakr in the Mosque of the Prophet and ʿUmar's own dead body was brought there, later it became a general custom to perform the ceremony in Medīna close to the Prophet's tomb and in Mecca at the door of the Kaʿba, some even made a sevenfold *tawāf* with the corpse around the Kaʿba This was for a time forbidden by Marwān b ʿAbd al Hakam and later by ʿUmar b ʿAbd al ʿAzīz (Kutb al-Dīn, *loc cit*, Wustenfeld, *Medina*, p 77) The custom was very early introduced into the Mosque of ʿAmr (Makrīzī, IV 7, 1 *sqq*) That later scholars often went wrong about the prohibition is not at all remarkable, for it is not at all in keeping with the ever increasing tendency to found mosques at tombs Even Ibn al-Hādjdj, who was anxious to maintain the prohibition, is not quite sure and really only forbids the loud calling of the *kurrāʾ*, *dhākirīn*, *mukabbirīn* and *murīdīn* on such occasions (*Madkhal*, II 50 *sq*, 64, 81) When a son of Sultān al-Muʾaiyad died and was buried in the eastern kubba of the Muʾaiyad mosque, the khatīb delivered a khutba and conducted the salāt thereafter and the *kurrāʾ* recited for a week at the grave, while the amīrs paid their visits to the grave (Makrīzī, IV 240, 2 *sqq*) In Persia, it was the custom for the family of the deceased to sit in the mosque for three days after the death and receive visits of condolence (*B G A*, III 440 infra)

4 Mosques as Objects of Pilgrimage

As soon as the mosque became a regular sanctuary it became the object of pious visits This holds especially of the memorial mosques associated with the Prophet and other saints Among them three soon became special objects of pilgrimage In a hadīth the Prophet says "One should only mount into the saddle to visit three mosques al-Masdjid al-Harām, the Mosque of the Prophet and al-Masdjid al-Aksā" (Bukhārī, *Fadl al Salāt fi Masdjid Makka wa 'l-Madīna*, bāb 16, *Djazāʾ al-Said*, bāb 26, *Sawm*, bāb 67, Muslim, *Hadjdj*, tr 93, *Chron Mekka*, I 303) This hadīth reflects a practice which only became established at the end of the ʿUmaiyad period The pilgrimage to Mecca had been made a duty by the prescription of the Hadjdj in the Kurʾān The pilgrimage to Jerusalem was a Christian custom which could very easily be continued, on account of the significance of *al Masdjid al Aksā* in the Kurʾān This custom became particularly important when ʿAbd al-Malik made it a substitute for the pilgrimage to Mecca (Yaʿkūbī, ed Houtsma, II 311) Although this competition did not last long, the significance of Jerusalem was thereby greatly increased Pilgrimage to Medīna developed out of the increasing veneration for the Prophet In the year 140 Abū Djaʿfar Mansūr on his hadjdj visited the three sanctuaries (Tabarī, III 129) and this became a very usual custom Mecca and Medīna however still held the preference Although those of Mecca and Jerusalem were recognised as the two oldest (the one is said to be 40 years older than the other, Muslim, *Masādjid*, tr I, *Chron Mekka*, I 301), the Prophet however is reputed to have said "A salāt in this

mosque is more meritorious than 1,000 salāts in others, even the *al-Masdjid al-Harām*" (Bukhārī, *Fadl al-Ṣalāt fi Masdjid Makka wa 'l-Madīna*, bāb 1, Muslim, *Hadjdj*, tr 89, *Chron Mekka*, 1 303) The hadīth is aimed directly against Jerusalem and therefore probably dates from the Omaiyad period According to some, it was pronounced because someone had commended performing the salāt in Jerusalem, which the Prophet was against (Muslim, *loc cit*, Wākidī–Wellhausen, p 349) The three mosques however retained their pride of place (Ibn Khaldūn, *Mukaddima*, *fasl* 4, 6, Ibn al-Hādjdj, *Madkhal*, II 55), and as late as 662 (1264) we find Baibars founding *awkāf* for pilgrims who wished to go on foot to Jerusalem (Quatremère, *Hist Sult Maml*, 1/1, 248)

Although these three mosques officially hold a special position, others also are highly recommended, e g the mosque in Kubā' [see AL-MADĪNA] A salāt in this mosque is said to be as valuable as an *'umra* or two visits to the mosque in Jerusalem (Diyārbakrī, *Khamīs*, 1 381 *sq*) Attempts were also made to raise the mosque of Kūfa to the level of the three 'Alī is said to have told some one who wanted to make a pilgrimage from Kūfa to Jerusalem that he should stick by the mosque of his native town, it was "one of the four mosques" and two rak'a's in it were equal to ten in others (*B G A*, v 173 *sq*, Yākūt, *Mu'djam*, IV 325), in another tradition, salāts in the provincial mosques are said to be generally worth as much as the pilgrimage (Makrizī, IV 4), and traditions arose about the special blessings associated at definite times with different holy places of Islām (*B G A*, III 183) and especially about their superior merits (*B G A*, v 174) The Meccan sanctuary, however, always retained first place, which was marked by the Hadjdj It was imitated by al-Mutawakkil in Sāmarrā' he built a Ka'ba as well as a Minā and an 'Arafa there and made his amirs perform their hadjdj there (*B G A*, III 122)

D Equipment of the Mosque

1 The Development of the Edifice

Except in the case of Mecca the earliest mosques as described above (B 1) were at first simply open spaces marked off by a *zulla* The space was sometimes, as in al Fustāt, planted with trees and usually covered with pebbles, e g in Medīna (Muslim, *Hadjdj*, tr 95, Balādhurī, p 6) and al-Fustāt (Makrīzī, IV 8, Ibn Dukmāk, IV 62, Ibn Taghrībirdī, 1 77) which was later introduced in Basra and Kūfa the courtyards of which were otherwise dusty (Balādhurī, p 277, 348) These conditions could only last so long as the Arabs retained their ancient customs as a closed corporation in their simple camps The utilisation of churches was the first sign of a change and was rapidly followed by a mingling with the rest of the population and the resulting assimilation with older cultures

'Umar made alterations in the mosques in Medīna and in Mecca also He extended the Mosque of the Prophet by taking in the house of 'Abbās, but like the Prophet, he still built of *labin*, palm-trunks and leaves and extended the booths (Bukhārī, *Salāt*, bāb 62, Balādhurī, p 6) In Mecca also his work was confined to extending the area occupied by the mosque He bought the surrounding houses and took them down and then surrounded the area with a wall to the height of a man, the Ka'ba was thus given its *finā'* like the mosque in Medīna (Balādhurī, p 46, *Chron Mekka*, 1 306 *sq*, Wustenfeld, *Medina*, p 68 *sq*) 'Othmān also extended these two mosques but introduced an important innovation in using hewn stone and plaster (*djass*) for the walls and pillars For the roof he used teak (*sādj*) The booths, which had been extended by 'Omar, were replaced by him by pillared halls (*arwika*, sing *rwāk*) and the walls were covered with plaster (Bukhārī, *Salāt*, bāb 62, Balādhurī, p 46, Wustenfeld, *Medina*, p 70 *sq*) Sa'd b Abī Wakkās is said to have already taken similar steps to relieve the old simplicity of the barely equipped mosque in Kūfa The *zulla* consisted of pillars of marble adorned in the style of Byzantine churches (Tabarī, 1 2489, Yakūt, IV 324)

This was little in keeping with the simple architecture of the original town, for Basra and Kūfa had originally been built of reeds and only after several great fires were they built of *labin* (see above bāb 1, cf Ibn Kutaiba, *Ma'ārif*, ed Wustenfeld, p 279) As to Kūfa, Sa'd by 'Omar's orders extended the mosque so that it became joined up with the *Dār al-Imāra* A Persian named Ruzbeh b Buzurdjmihr was the architect for this He used bricks (*ādjurr*) for the building, which he brought from Persian buildings and in the mosque he used pillars which had been taken from churches in the region of Hīra belonging to the Persian kings, these columns were not erected at the sides but only against the Kibla wall The original plan of the mosque was therefore still retained although the pillared hall, which is identical with the *zulla* already mentioned (200 *dhirā'* broad), replaced the simple booth and the materials were better in every way (Tabarī, 1 2491 *sq*, 2494) Already under the early Caliphs we can therefore note the beginnings of the adoption of a more advanced architecture

These tendencies were very much developed under the Omaiyads Even as early as the reign of Mu'āwiya, the mosque of Kūfa was rebuilt by his governor Ziyād He commissioned a pagan architect, who had worked for Kisrā, to do the work The latter had pillars brought from al Ahwāz, bound them together with lead and iron clamps to a height of 30 *dhirā'* and put a roof on them Similar halls, built of columns (here like the old booth in Medīna called *suffa* Tabarī, 1 2492, 14, but also *zulla*, plur *zulāl* Tabarī, II 259 *sq*) were added by him on the north, east and western wall Each pillar cost him 18,000 dirhams The mosque could now hold 60,000 instead of 40,000 (Tabarī, 1 2492, 6 *sqq*, cf 2494, 7, Yākūt, *Mu'djam*, IV 324, 1 *sqq*, Balādhurī, p 276) Al Hadjdjādj also added to the mosque (Yākūt, IV 325 *sq*) Ziyād did similar work in Basra Here also he extended the mosque and built it of stone (or brick) and plaster and with pillars from al-Ahwāz, which were roofed with teak We are told that he made *al-suffa al-mukaddima*, i e the *kibla* hall, with 5 columns This seems to show that the other sides also — as in Kūfa — had pillared halls He erected the Dār al-Imāra close to the kibla side This was taken down by al-Hadjdjādj, rebuilt by others, and finally taken into the mosque by Hārūn al-Rashīd (Balādhurī, p 347, 348 supra, 349, Yākūt, 1 642, 643) In Mecca also in the same period

similar buildings were erected Ibn al Zubair and al-Hadjdjādj both extended the mosque, and Ibn al-Zubair was the first to put a roof on the walls, the columns were gilt by ʿAbd al-Malik and he made a roof of teak (*Chron Mekka*, i 307, 309) The Mosque of ʿAmr was extended in 53 with Muʿāwiya's permission by his governor Maslama b Mukhallad to the east and north, the walls were covered with plaster (*nūra*) and the roofs decorated, it is evident from this that here also the original booth of the south side was altered to a covered hall during the early Omaiyad period A further extension was made in 79 in the reign of ʿAbd al-Malik (Makrizī, iv 7, 8, Ibn Dukmak, iv 62) Thus we find that during the early Omaiyad period and in part even earlier the original simple and primitive mosques were some extended, some altered The alteration consisted in the old simple booth of the Mosque of the Prophet being gradually enlarged and transformed into a pillared hall with the assistance of the arts of countries possessing a higher degree of civilisation In this way what had originally been an open place of assembly developed imperceptibly into a court, surrounded by pillared halls Very soon a fountain was put in the centre of the court and we now have the usual type of mosque The same plan is found in the peristyle of the houses and in the arthrion of a basilica like that of Tyre (Herzog-Hauch, *Real-encyclopadie*[3], x 780)

The great builders of the Omaiyads, ʿAbd al Malik and his son al-Walid I, made even more radical progress The former entirely removed the original mosque in Jerusalem and his Byzantine architects erected the Dome of the Rock as a Byzantine building (cf Sauvaire, *Jerus et Hebron*, p 48 *sqq*) Al-Walīd likewise paid equally little attention to the oldest form of mosque, when, in Damascus, he had the church of St John transformed by Byzantine architects into the Mosque of the Omaiyads As al Makdisi distinctly states, they wanted to rival the splendours of the Christian churches (*B G A*, iii 159) The new mosques, which were founded in this period, were therefore not only no longer simple, but they were built with the help of Christians and other trained craftsmen with the use of material already existing in older buildings Al Hadjdjādj, for example, used materials from the surrounding towns when building his foundation of Wāsit (Tabarī, iii 321, Balādhurī, p 290) Columns from churches were now used quite regularly (e g in Damascus Masʿūdī, *Murūdj*, iii 408, Ramla *B G A*, iii 165, cf Balādhurī, p 143 *sqq*, for Egypt see Makrizī, iv 36, 124 *sq*) Sometimes remains of the older style remained alongside of the new In Irānshahr, al Makdisi found in the chief mosque wooden columns of the time of Abū Muslim along with round columns of brick of the time of ʿAmr b al-Laith (*B G A*, iii 316) The building activities of al Walīd extended to al-Fustāt, Mecca and Medina (cf *B G A*, v 106 *sq*) where no fundamental alterations were made, but complete renovations were carried out With these rulers, the building of mosques reaches the level of the older architecture and gains a place in the history of art There is also literary evidence for the transfer of a style from one region to another In Istakhr, for example, there was a djāmiʿ in the style of the Syrian mosques with round columns, on which was a *bakara* (*B G A*, iii 436 *sq*, cf for Shīrāz, p 430) Al-Walid also rebuilt the Mosque of the Prophet, in part in the Damascus style (*B G A*, iii 80, Kazwīnī, ed Wüstenfeld, ii 71)

This revolution naturally did not take place without opposition any more than the other innovations, which Islām adopted in the countries with a higher culture which it conquered After the Mosque of the Prophet had been beautified by Christian architects with marble, mosaics, shells, gold etc and al-Walīd in 93 was inspecting the work, an old man said "We used to build in the style of Mosques, you build in the style of Churches" (Wustenfeld, *Medina*, p 74) The discussions on this point are reflected in hadīths When ʿOmar enlarged the Mosque of the Prophet, he is reported to have said "Give the people shelter from the rain, but take care to make them red or yellow lest you lead the people astray", while Ibn ʿAbbās said "You shall adorn them with gold as the Jews and Christians do" (Bukhārī, *Salāt*, bāb 62) Ibn ʿAbbās here takes up the Omaiyad attitude and ʿOmar that of old-fashioned people, according to whom any extension or improvement of the *zulla* was only permissible for strictly practical reasons The conservative point of view is predominant in Hadith It is said that extravagant adornment of the mosques is a sign of the end of the world, the works of al Walid were only tolerated from fear of the *fitna* (Ibn Hanbal, *Musnad*, iii 134, 145, 152, 230, 283, al Nasāʾī, *Masādjid*, bāb 2, Ibn Mādja, *Masādjid*, bāb 2) The lack of confidence of pious conservatives in the great mosques finds expression in a hadith, according to which the Prophet (according to Anas) said "A time will come over my *umma* when they will vie with one another in the beauty of their mosques, then they will visit them but little" (al ʿAskalānī, *Fath al Bārī*, i 362) In the Fikh, we even find divergence from the oldest quadrangular form of the mosque condemned (Guidi, *Il Muḥtasar*, i 71) Among the types which arose later was the "suspended" (*muʿallak*) i e a mosque situated in an upper storey (e g in Damascus, *J A*, ser ix, vol v 409, 415, 422, 424, 427, 430)

2 Details of the Equipment of the Mosque

a The Minaret (see also MANĀRA)

The earliest primitive mosques had no minaret When the *adhān* call was introduced, Bilāl is said to have summoned the faithful in Medina to the early salāt from the roof of the highest house in the vicinity of the mosque (Ibn Hishām, p 348, Wustenfeld, p 75), on the day of the conquest of Mecca, the Prophet instructed Bilāl to utter the call to prayer from the Kaʿba, according to al-Azrakī, from the roof (*Chron Mekka*, i 192, cf Ibn Hishām, p 822) During the early days of Islām, the muʾadhdhin did not however utter his summons from an elevated position (cf below G 2 d) It is doubtful in the first place when the minaret was introduced, and in the second whether it was adopted into Islām, expressly for the call to prayer

The Omaiyad caliph al-Walid (86—96) undoubtedly had considerable importance for the history of the minaret, although even earlier in 84 (703) Sīdī ʿUkba in Kairawān had been built by Hassān b Nuʿmān with a minaret (so according to Bakrī H Saladin, *La Mosquée de Sidi Okba*, 1899, p 7, 19) There was also a minaret in the

Omaiyad mosque in Damascus At the present day, the mosque has 3 minarets as was the case in the time of Ibn Djubair, who mentions two on the west and one in the north (*Riḥla*, p 266), while Ibn Battūta also says there were three and adds that one was in the west, another in the east and another in the north (i 203), which agrees with present day conditions One of the earliest authorities, Ibn al-Faḳīh (d 289 = 902), however mentions only one minaret (*mi'dhana*) and says that in the days of the Greeks it had been a watch-tower (*nāṭūr*), which belonged to the church of St John and was left standing by al-Walīd (*B G A*, v 108, 5) Al Makdisī (d 375 = 985) mentions only one minaret, which was above the Bāb al-Farādis, when he calls it a *manāra muhdatha* (*B G A*, iii 159) he may perhaps mean a renovated minaret (cf Le Strange, *Palestine under the Moslems*, p 229) and besides, his description does not exclude the existence of other minarets The tradition that the minaret of the Omaiyad mosque was taken over from the predecessors of the Muslims long survived, for Yāḳūt, who mentions the east and west minarets, says that the western belonged to a fire-temple and a flame used to be visible on it (*Mu'djam*, ii 596) and according to Ibn Battūta, the east and west minarets had been built by the Byzantines while only the north one was built by the Muslims (i 203 *sq*, a story also given by al-Bosrāwī [d 1003 = 1594] quoting Ibn ʿAsākir [d 571 = 1176], see *J A*, ser 9, vii 423, Quatremère, *Hist Sult Maml*, ii/i 273) In Mecca also, al-Walīd built turrets (*shurrāfat*, *Chron Mekka*, i 310), sometimes minarets (as is evident from *ibid*, p 310, 311) They were later increased so that Kutb al-Dīn mentions 7 minarets (*ibid*, iii 424—426) According to al-Samhūdī, he also built in Medīna 4 towers but Sulaimān b ʿAbd al-Malik, in the year 97 had the southwestern tower taken down, because the shadow of the mu'adhdhin from it fell upon him, when he was in the house of Marwān b al-Hakam While al-Samhūdī says that there were no minarets in Medīna before al-Walīd, he asserts on the other hand that ʿOmar had already built towers in the four corners of the mosque (Wustenfeld, *Medina*, p 75, cf Ibn Battūta, i 272) In the time of Ibn Djubair (in 580) there were still only 3 minarets there (*Riḥla*, p 195) It was not until 706 that Muhammad b Kalā'ūn rebuilt the fourth minaret (Wustenfeld, *op cit*, p 76)

After the time of al-Walīd, minarets became more and more numerous In Ramla his brother Hishām built a beautiful minaret (*B G A*, iii 165, 6) For the mosque in Jerusalem Ibn ʿAbd Rabbihi about 400 mentions 4 minarets (*ʿIḳd*, Cairo 1331, iv 274 *sq*) which Mudjīr al-Dīn claims to go back to the time of al-Malik (Sauvaire, *Hist Jérus et Hebron*, p 125) Ibn Hawkal (367 = 977) expressly notes of the Djāmiʿ in Fārayāb in Khurāsān that it did not have a minaret (*B G A*, ii 321) and he seems to consider it *biḍaʿa* to build two minarets (*ibid*, p 13 *sqq*) Apart from the isolated reference by al-Samhūdī to ʿOmar's building activities, to which very little importance can be attached, it is probable from this evidence that al-Walīd was the first to introduce the minaret into Syria and the Hidjāz That he introduced it into Islām itself, is however not certain According to Balādhurī (d 279 = 892), Ziyād in Basra, where he was governor in 45, built the minaret of stone, when he built the mosque of brick (p 348) This seems to suggest that there was already a minaret there According to the Egyptian historians, Maslama b Mukhallad in al-Fustāt by Muʿāwiya's orders in 53 built a tower at each corner of the mosque of ʿAmr (*sawmaʿa*), which had not been done before (Makrīzi, iv 7 *sq*, 44, Ibn Taghrībirdī, i 77) The staircase leading up to the minaret was originally outside the mosque, but was later put inside it Maslama is said to have introduced the minaret into other mosques in al Fustāt (i e in all except those of Tudjīb and Khawlān, cf Makrīzī, iv 44, Ibn Taghrībirdī, *loc cit*) How old this story is, cannot be ascertained, but the view often put forward that al-Walid was the first to introduce the minaret (cf Schwally, in *Z D M G*, lii, 1898, p 143—146), is in any case not certain

There are three names in common use for the minaret *Ma'dhana* or *mi'dhana*, "place of the *adhān* call", which is in general use in Egypt and Syria at the present day, is frequently found in literature and inscriptions (*B G A*, iii 225, 15, v 108, 5, Makrīzī, iv 13, 10, 20, 4, 6, and *pass*, Ibn A Usaibiʿa, ii 204, 2 from below, v Berchem, *Corpus*, i, N° 25, 63, 88, 89, 90 and others from the viiith century onwards) *Sawmaʿa*, specially used in North Africa (Marçais, *Les Monuments arabes de Tlemcen*, 1903, p 45), is frequently found (Ibn Djubair, *Riḥla*, p 91, 100, 145, 195, 266, Ibn Battūta, i 203, 272, ii 2, 12, 13, Makrīzī, iv 7 *sq*, Ibn Taghrībirdī, i 77) This word means also cloister or cell and in the older literature is used as the equivalent of *dair* (Sūra xxii 41, Ibn Hishām, p 115, Bukhārī, *al ʿAmal fi 'l-Salāt*, bāb 7, *Mazālim*, bāb 35, *Anbiyā'*, bāb 48, *B G A*, ii 154, Makrīzi, iv 389, Ibn al-Fārid, *Tā'iya* v 561) *Manāra* is the most usual word in literature (Makrīzī, iv 7 *manār*, cf v Berchem, *Corpus*, i, N° 63, *K al-Madkhal*, ii 63, 67) This word has the same meaning as Syr *mᵉnārtā* but is probably an analogous, independent formation The word means light, position in which a light is put (Imru'ulkais, *Diwān*, 148, 37, Abū Dhu'aib, *Diwān*, ed Bell, i 60, *B G A*, vii 132), also lighthouse (*B G A*, iii 177, Kindi, *Wulāt*, p 64, Ibn Djubair, *Riḥla*, p 41) *Manār(a)* also means a boundary stone or a signpost (*ʿalam*, *Lisān*, vii 99, 1 from below, Kais al-Rukaiyāt, p 37, 7, 70, 2, Ibn Saʿd, ii/i, 135, *Fragm Hist Arab*, ii 12 and *Gl*) or a watch tower (Tabarī, i 864, 878), the boundary stones of the *haram* area, for example, are called *Manār al Haram* (*B G A*, ii 25) and Abraha was called *Dhu 'l-Manār*, because he put up signposts (*Lisān*, vii 105, 11, Djawharī, *Ṣaḥāḥ*, i 410), obelisks are also called *manāra* (*B G A*, vii 117, 20, 118 1) The derivation of the last named *manār* from *miliarion* (Fraenkel, *Fremdworter*, p 283) is little likely and still less probable is a derivation from a Persian building for fire-worship (v Berchem in E Diez, *Churasanische Baudenkmaler*, i [1908], 113 *sqq* who distinguishes rather ingeniously between *manāra* "light" from *nūr* and *manār* "fire-tower" from *nār*) Probably there is only a single word in question and the signposts received their name from the watch-tower (note that *ʿalam* also is used of the minaret Ibn ʿArabshāh, *Vita Timuri*, ed Manger, 1767, iii 704) There are a number of references to the existence on the coasts of a series of *manā'ir* and each *manāra* gave warning by light-signals of the movements of the enemy (*B G A*, iii 177) According to al-Balādhurī

(p 128 *manāzir*), this was already the custom in ʿOmar's time and was in all probability an inheritance from the Byzantines Similar watch-towers (*sēmantêrion*) were used inland in the Byzantine period e g in the eastern Hawrān, and the Persians had similar towers on their frontiers (*manāra* Tabarī, i 864, 878), a similar *manāra* in the ʿIrāk is described by Ibn Djubair (p 210, cf *B G A*, v 176), in the Maghrib also, fort-like towers are called manara, e g in Tunis and Gabes (al-Idrīsī in 706—708, *J A*, ser 4, xx [1852], 99, 144) That these towers used fire signals is very probable and Musil gives evidence of this custom for the Edom territory (*Arabia Petraea*, ii 2, 232) In the viiith (xivth) century again al-ʿUmarī (*Taʿrīf bi 'l-Mustalah al-sharīf*, Cairo 1312, p 199 *sq*) refers to the use of a series of heights and towers for light-signals, including the *Maʾdhanat al-ʿArūs*, one of the minarets of the Omaiyad mosque of Damascus (on the whole question see R Hartmann, in *Z D M G*, lxx, 1916, p 486, 505, *Memnon*, iii 221, *Isl*, i 388 *sq*) It is obvious that the tower of the mosque was given the name *manāra* from its resemblance to similar watch towers and it is possible that its use for fire-signals was more general in earlier times In Fās the hours of prayer were indicated by lamps from the minarets (*J A*, ser 11, xii, 1918, p 341)

This does not however answer the question why the minaret was introduced into Islām From what has been said above it is probable that the minaret was introduced specially for the *adhān* call According to Ibn al Fakīh and others, it was incorporated in the Mosque of the Omaiyads, simply because it was already there as a part of the church (cf above), this agrees with de Vogue's observation that the use of towers in churches and the larger public buildings in Syria in the ivth and vth century was common (*La Syrie centrale*, i 57) The tower in the mosque of Basra is thought to be an original church tower (cf Diez, *Die Kunst der islamischen Völker*, p 19 *sq*) This indicates that the minaret in Syria became part of the mosque in a purely architectural way But after its introduction, it was soon used as a place in which the muʾadhdhin could stand, which must have been an obvious thing to do This did not happen at once however From Tabarī and others we can see that the call to prayer at a much later date could still be uttered in the street, and al-Farazdak (d about 110 = 728) who refers to the existence of *manār al-masādjid* (*Kāmil*, p 481, *Aghānī*, 2nd ed Cairo, xix 18) also speaks of muʾadhdhins on the city wall (Tabarī, ii 1302, *Nakāʾid*, p 365, see J Horovitz, in *Isl*, xvi, 1927, p 253, 255) with which we may compare the tradition that the Prophet considered whether he ought to permit the call to prayer to be uttered on the fortifications of Madīna (*ʿalā ātām al-Madīna*, cf Ibn Saʿd, i 7)

It is however by no means impossible that the minaret may have arisen elsewhere in a different way If we can trust the account by al-Makrīzī and others (see above), the minaret was introduced into Egypt by Muʿāwiya's orders as a corner tower Here it was at once used in a way which recalls the dwelling-towers of ascetics It was used for the adhān, but not only for the five calls to prayer but also for vigils, in which the muʾadhdhins repeated litanies (Makrīzī, iv 44 middle) and its architect, Maslama b Mukhallad, used it for the *iʿtikāf* (*ibid*, p 44) An ascetic who died in 469 lived in the *manāra* of the Mosque of ʿAmr (Yākūt, *Udabāʾ*, iv 274) This suggests the meaning of minaret expressed by the word *ṣawmaʿa* (cf also Makrīzī, iv 7, 8) as a saint's cell According to one source, rather late however, al-Walīd is said to have found a monk in the tower of the church of St John who lived in the *sawmaʿa* there (cf *J A*, ser 9, vii, p 189, Quatremère, *Hist Sult Maml*, ii/1 264) This use of the minaret was kept up during the golden age of Islām Thus Ibn Djubair records that he saw in the west minaret of the mosque of the Omaiyads cells for devout Maghribīs and in the topmost chamber, where al Ghazālī had lived in *iʿtikāf*, there was now a *zāhid* (*Rihla*, p 266, 18 *sqq*), Ibn Tumart also lived there (Yākūt, *Muʿdjam*, ii 596, 17 *sq*) and ʿAbd al-Latīf also found another devotee living there (Ibn Abī Uṣaibiʿa, ii 204, 2 from below) According to al-Makrīzī, the Egyptian minaret was not introduced in a purely architectural way, but even from his account it appears most likely to be Syrian in origin

If the minaret did not have a single origin, it is improbable that a single type of tower served as the model for it Ziyād is said to have built the minaret in Basra of stone The quadrangular Syrian Omaiyad type (*B G A*, iii 182), which was taken over from the church-tower, was also of stone In Egypt, on the other hand, according to al-Makrīzī, minarets for many centuries were only built of brick and the earliest stone minarets in this country were not built till shortly before 700 in al-Mansūrīya and al-Ākbughāwīya (Makrīzī, iv 224) In North Africa where the Omaiyad, Syrian type was introduced, a round minaret of brick in 7 stories with pillars was built in ʿAbbasiya south of Kairawān in 184 (800) (Yākūt, *Muʿdjam*, iv 119) Ibn al-Hādjdj condemns minarets of his time as being built too high It is interesting to note as throwing a light on what was considered *bidʿa* that he regards the round form as the old and genuine one (*Madkhal*, ii 61 below) — For literature see Fraenkel, Schwally, v Berchem, R Hartmann, Horovitz quoted above, Doutté, in *R Afr*, iv, 1900, p 339 *sqq*, J H Gottheil, in *J Am O S*, xxx, 1909—1910, p 132—154, K A C Creswell, in *Burlington Magazine*, xlviii, 1926, p 134—140, 252—258, 290—296

b The Chambers

The old mosque consisted of the courtyard and the open halls running along the walls these were called *al-mughaṭṭā* (*B G A*, iii 82, 158, 165, 182) because they were roofed over When we are told that in Palestine, except in Jericho, towers were placed between the mughattā and the courtyard (*ibid*, p 182), this seems to suggest that the halls were closed, which would be quite in keeping with the winter climate of this region The halls were particularly extensive on the *kibla* side, because assemblies were held here The space between two rows of pillars was called *riwāk*, pl *arwika* or *riwākāt* (*B G A*, iii 158, 159, Makrīzī, iv 10, 11, 12, 49) Extension often took the form of increasing the number of the *arwika* In some districts a sail-cloth was spread over the open space as a protection from the sun at the time of the service (*B G A*, iii 205, 430)

The courtyard was called *ṣahn*. The open space around the Kaʿba is called *Fināʾ al-Kaʿba*

(*Chron Mekka*, I 307, Ibn Hishām, p 822, cf *Fināʾ Zamzam* Yākūt, *Ubadāʾ* VI 376) Fināʾ is also the name given to the open space around the mosque (Maḳrīzī, IV 6) Trees were often planted in the courtyard e g in the mosque of ʿAmr (see B I, when we read in Makrīzī, IV 6 that it had no *ṣaḥn*, this probably means that this space, planted with trees, between the covered halls was very narrow) In Medina, at the present day, there are still trees in the *Rawda* (Batanūnī, *Riḥla*, p 240), in Ibn Djubair's time there were 15 palms there (*Riḥla*, p 194) Other mosques in Cairo had trees growing in them (Makrīzī, IV 54, 64, 65, 120, in al-Masdjid al Kāfūrī, there were as many as 516 trees *ibid*, p 266) as is still the case to-day In other cases the court was covered with pebbles (see above D 1), but this was altered with a more refined style of architecture Al-Makdisī mentions that this was only found in Tiberias, out of all the mosques in Palestine (*B G A*, III 182) Frequently, as in Ramla, the halls were covered with marble and the courtyard with flat stone (*ibid*, p 165) In the halls also the ground was originally bare or covered with little stones, for example in the mosques of ʿAmr until Maslama b Mukhallad covered it with mats (see below) The floor of the Mosque of ʿAmr was entirely covered with marble in the Mamlūk period (Makrīzī, IV 13 *sq*, cf in Shirāz Ibn Battūta, II 53) But in the mosque of Mecca, the *ṣaḥn* is still covered with little stones (Batanūni, *Riḥla*, p 99 below), 400 dinārs used to be spent annually on this (*Chron Mekka*, II 10 *sq*) In Medina also little pebbles were used (Ibn Djubair, *Riḥla*, p 190, Ibn Battūta, I 263)

There were not at first enclosed chambers in the halls A change in this respect came with the introduction of the *maḳṣūra* [q v] (on this word cf Quatremère, *Hist Sult Maml*, I/1, p 164, note 46) This was a box or compartment for the ruler built near the miḥrāb Al-Samhūdī gives the history of the maḳṣūra in Medina (Wustenfeld, *Medina*, p 71 *sq*, 89 *sq*) The traditions all agree that the maḳṣūra was introduced to protect the ruler from hostile attacks According to some men, ʿOthmān built a maḳṣūra of *labin* with windows, so that the people could see the imam of the community (*ibid* and Makrīzī, IV 7) According to another tradition, Marwān b ʿAbd al-Hakam, governor of Medina, after an attempt had been made on him by a Yamanī in the year 44, was the first to build a maḳṣūra of dressed stone with a window (Balādhurī, p 6 below, Tabarī, II 70) Muʿāwiya is then said to have followed his example Others again say that Muʿāwiya was the first to introduce this innovation He is said to have introduced the *maḳṣūrāt* with the accompanying guard as early as the year 40 or not till 44 after the Khāridjī attempt (Tabarī, I 3465, 9, *B G A*, V 109, 3, Makrīzī, IV 12, 11 *sqq*), according to one story because he had seen a dog on the minbar (Baihaḳī, ed Schwally, p 393 below, cf on the whole question H Lammens, *Moʿāwiya*, p 202 *sqq*) This much seems to be certain, that the maḳṣūra was at any rate introduced at the beginning of the Omaiyad period and it was an arrangement so much in keeping with the increasing dignity of the ruler that, as Ibn Khaldūn says, it spread throughout all the lands of Islām (*Mukaddima*, Cairo 1322, p 212 *sq*, *faṣl* 37) The governors built themselves compartments in the principal mosques of the provinces, e g Ziyād in Kūfa and Basra (Balādhurī, p 277, 348) and probably Kurra b Sharīk in al-Fustāt (Makrīzī, IV 12) In Medina, we are told that ʿOmar b ʿAbd al-ʿAzīz as governor (86—93) raised the maḳṣūra and built it of teak, but al-Mahdī had it taken down in 160 and a new one built on the level of the ground (*ibid*, p 7, Wustenfeld, *op cit*, Balādhurī, p 7 centre) We are further told that in 161, al-Mahdī prohibited the *makāsīr* of the provinces and al Maʾmūn even wanted to clear all the boxes out of the *masādjid djāmiʿa*, because their use was a *sunna* introduced by Muʿāwiya (Makrīzī, IV 12, Yaʿkūbī, ed Houtsma, II 571) But this attempt did not succeed On the contrary, their numbers rapidly increased In Cairo, for example, the Djamiʿ al-ʿAskar built in 169 had a maḳṣūra (Makrīzī, IV 33 *sqq*) and the mosque of Ibn Tūlūn had a maḳṣūra beside the miḥrab which was accessible from the Dār al-Imāra (*ibid*, p 36, 37, 42, Ibn Taghrībirdī, II 8, 14) The maḳṣūra was found in the larger mosques In the Djāmiʿ al-Kalʿa, Muḥammad b Kalāʾūn in 718 built a maḳṣūra of iron for the Sultān's salāt (Makrīzī, IV 132) According to Ibn Khaldūn, the *maḳṣūra* was an innovation of Islām's own The question must however be left open, whether in its introduction and development there may not be some connection with the boxes of the Byzantine court, at least, for example, when the Turks in the Yeshil Djāmiʿ in Brussa put the Sultān's box over the door (R Hartmann, *Im neuen Anatolien*, p 27)

Although the maḳṣūra was introduced with the object of segregating the ruler and was therefore condemned by the strict as contrary to the spirit of Islām (e g *Madkhal*, II 43 *sq*), *makāṣīr* were probably introduced for other purposes Ibn Djubair mentions three in the Mosque of the Omaiyads the old one built by Muʿāwiya in the eastern part of the mosque, one in the centre, which contained the minbar, and one in the west where the Hanafis taught and performed the salāt There were also other small rooms shut off by wooden lattices, which could be sometimes called *maḳṣūra* and sometimes *zāwiya* As a rule, there were quite a number of zāwiya connected with the mosque which were used by students (*Riḥla*, p 265 *sq*) We find the same state of affairs in other mosques

While the groups of the kurrāʾ, the students, the lawyers etc had originally to sit together in a common room, gradually the attempt was made to introduce separate rooms for some of them Small compartments were either cut off in the main chamber or new rooms were built in subsidiary buildings In the former case we get the already mentioned *makāsīr* or *zawāya* Ibn al-Hādjdj says that a madrasa was often made by the simple process of cutting off a part of a mosque by a balustrade (*darbazīn*) (*Madkhal*, II 44) Thus in the halls of the Mosque of ʿAmr there were several compartments for teaching, which are called maḳṣūra and zāwiya, in which studies were prosecuted (Makrīzī, IV 20, 16, 25) In the Azhar Mosque a *Maḳṣūrat Fāṭima* was made in the time of the Fāṭimids, where she had appeared, and the emīrs in the following period made a large number of such *makāsīr* (*ibid*, p 52, 53) In the Aḳṣā Mosque about 300 A H, there were three maḳṣūras for women (*B G A*, V 100) These divisions might be a nuisance at the great Friday assemblies and this is why al-Mahdī wanted to remove them in 161 from the masādjid al-djumāʿāt (Tabarī, III 486),

and Ibn al-Hādjdj condemned them as works of the *mulk* and numbers them like other embellishments with the *ashrāt al-sāʿa* (*Madkhal*, ii 43 *sq*)

The muʾadhdhins not only lived in the minarets, where, at any rate in the Tūlūnid period they held vigils (Makrīzī, iv 48) They had rooms (*ghuraf*, sg *ghurfa*) on the roof and these rooms in time came to be numerous (*ibid*, p 13, 14) All kinds of rooms were put in subsidiary buildings, for the khatīb (*ibid*, p 13), for judges, for studies, etc In addition there were dwelling-houses, not only for the staff but also for others As already mentioned, devout men used to take up their residence in the mosque for a considerable period for *iʿtikāf* and any one at any time could take up his quarters in the mosque, he could sleep there and make himself at home It therefore came quite natural to the devout to reside permanently in the mosque Ascetics often lived in the minaret (see above), a *zāhid* lived on the roof of the Azhar mosque, others made themselves cells in the mosque, as a shaikh in Nasibīn did (Ibn Djubair, *Rihla*, p 240, cf in Harrān, p 245) and as happened in Salāh al-Dīn's time in the mosque of the Omaiyads (Ibn Abī Usaibiʿa, ii 182) It was however very usual for them to live in the side rooms of the mosque, as was the case for example, in the Mosque of the Omaiyads (Ibn Djubair, p 269, Ibn Battūta, i 206) In particularly holy mosques like that in Hebron, houses for *al muʿtakifūn* were built around the sacred place (Sauvaire, *Hist Jerus et Hebron*, p 11 *sq*) and also beside the *Masdjid Yūnis* at the ancient Nimiveh (*B G A*, iii 146) Kitchens were therefore erected with the necessary mills and ovens and cooked food (*djashisha*) and 14–15,000 loaves (*raghīf*) were daily distributed to those who stayed there and to visitors (Sauvaire, p 20 *sq*, cf Quatremère, *Hist Sult Maml* i/i, 231) Bread was also baked in the mosque of Ibn Tūlūn (Quatremère, *op cit*, i/i, 233) and kitchens were often found in the mosques (for al-Azhar, see Djabartī, *Merveilles*, iii 238 *sq*, Sulaimān Rasad, *Kanz al-Djawhar fi Taʾrikh al-Azhar*, p 71 *sqq*, 107 *sqq*) Those who lived in and beside the mosque were called *mudjāwirūn* (cf *B G A*, iii 146, for Jerusalem, Nāsir i Khosraw, p 82, 91, for Mecca, Ibn Djubair, p 149, for Medina, Ibn Battūta, i 279, where we learn that they were organised under a *kaddim*, like the North Africans under an *amīn* in Damascus, Ibn Djubair, p 277 *sq*) They were pious ascetics, students, and sometimes travellers The students generally found accommodation in the madāris but large mosques like that of the Omaiyads or al-Azhar had always many students who lived in them The name of the halls *riwāk*, plur *arwika*, was later used for these students' lodgings (cf v Berchem, *Corpus*, i 43, note 1, perhaps Makrīzī, iv 54, 23) Strangers always found accommodation in the mosques (cf C 1) In smaller towns it was the natural thing for the traveller to spend the night in the mosque and to get food there (Yākūt, iii 385, al-Kifṭī, *Taʾrikh al Hukamāʾ*, ed Lippert, p 252) Travellers like Nāsir-i Khosraw, Ibn Djubair, Ibn Battūta, al ʿAbdarī (*J A*, ser 5, iv, 1854, p 174) were able to travel throughout the whole Muslim world from one mosque to the other (or *madrasa* or *ribāṭ*) The traveller could even leave his money for safe keeping in a mosque (*Safar-nāma*, p 51) Large endowments were bequeathed for those who lived in the mosques (Ibn Djubair, *op cit*, Ibn Taghrībirdī, ii/ii, 105 *sq*)

In later times the rulers often built a lodge or pavilion (*manzara*) in or near the mosque (Makrizi, ii 345, iv 13, cf on the word Quatremère, *Hist Sult Maml*, ii/ii, 15)

There was often a special room with a clock in the mosques, this also is probably an inheritance from the church, for Ibn Rosta (290 = 903) talks of similar arrangements in Constantinople (*B G A*, vii 126 supra) Ibn Djubair (p 270) describes very fully the clock in the Mosque of the Omaiyads (cf *J A*, ser 9, vii 205 *sq*) It was made in the reign of Nūr al-Dīn by Fakhr al-Dīn b al-Sāʿāti (Ibn Abī Usaibiʿa, ii 183 *sq*, an expert was kept to look after it *ibid*, p 191) There was a clock in the Mustansiriya in Baghdād (Sarre and Herzfeld, *Arch Reise*, ii 170) and the Mosque of ʿAmr also had a *ghurfat al-sāʿāt* (Makrizi, iv 13, 15) In the Mosque of Ibn Tūlūn is still kept a sundial of the year 696 (1296–1297, cf v Berchem, *Corpus*, i, N° 514) but the clocks were usually mechanical (see also Dozy, *Supplement*, s v *mīnādjāna* and on the clock generally E Wiedemann, in *Nova Acta der K Leop Carol Akad*, vol C, Halle 1915) In the Maghrib also we find mosque clocks, e g in the Būʿanāniya (*J A*, ser 11, xii 357 *sqq*)

The very varied uses to which the mosques were put resulted in their becoming storehouses for all sorts of things In 668, the Mosque of the Omaiyads was cleared of all such things, in the court yard there were for example stores for machines of war and the zāwiya of Zain al ʿAbidīn was a regular khān (*J A*, ser 9, vol vii 225 *sq*)

c Mihrāb [q v]

Whether the Prophet considered it necessary to erect an indicator of the direction of prayer in Medina may be considered doubtful According to tradition, when the revelation of the alteration of the *kibla* came to him, he turned round in the middle of the prayer without further investigation (Wustenfeld, *Medina*, p 41, 62, Tabari, *Tafsir*, xi 25 centre, Muslim, *Masādjid*, tr 2) On the musallā however and on journeys he used a spear, which was stuck in the ground right in front of him, but this *sutra* [q v] was not intended so much to give the direction as to be a substitute for the wall, to mark off the area of the worshipper, it could therefore also be an animal or some living thing (Bukhārī, *Salāt*, B 18, 80, 90—92, Muslim, *Salāt*, tr 46, Zurkāni on *Muwaṭṭāʾ*, i 283, Abū Dāwūd, i 69, Ahmad b Hanbal, *Musnad*, ii 106) At the present day the mihrāb is often called *kibla* (and as early as Ibn Taghri birdī, i 351, Yākūt, i 642)

In al-Fustāt ʿAmr is said to have ascertained the kibla very carefully with the help of many others (Makrīzī, iv 6 supra, *B G A*, viii 359, Ibn Taghribirdī, i 75 *sq*) But we are not told how it was indicated, probably by a pole or something of the kind The kibla was however too far to the east, so that during the prayer the worshippers turned more to the south At first they were probably content with the direction, roughly correct, in keeping with a hadīth of Abū Huraira, according to which the kibla in general lies between east and west (Tirmidhī, *Mawākit al-Salāt*, p 139, Makrizi, iv 24) The first mosque in Isfahān was built where Abū Mūsā had performed the salāt, and a brick placed in position

by him was taken as the *kibla* (*B G A*, vii 200) But later the problem was tackled seriously Makrīzī mentions the different solutions of it in Egypt (iv 21—33) Al Azhar had the ḳibla accurate, the *mahārīb al-sahāba*, i e that of the Mosque of ʿAmr and those of the mosques in Djīza, Bilbīs, Alexandria, Kūs and Assuan were too far to the east, that of the Mosque of Ibn Tūlūn was found by a committee to be 14 daradj too far west, those of the villages too far west The direction was ascertained from the stars Many however followed the kibla of Syria In the transformation of churches into mosques, frequent under al Maʾmūn, their orientation from east to west was decisive The door on the east side as a rule was made the miḥrāb (Makrīzī, iv 30)

The word *miḥrāb* before and after the beginning of Islām meant in the first place a palace or a part of one (Imruʾulkais, p 52, 33, South Ar, *Mufaddalīyāt*, p 21, 13, Persian, Buhturi, *Ḥamāsa*, p 404, 4, Kais al Ruḳaiyāt, p 2, 5, 49, 2), also women's apartment (ʿOmar b Rabīʿa, p 136, 9, 247, 2, Makrīzī, iv 378, 14), secondly a niche where a bust stood, e g before Islām (Ibn Kutaiba, *ʿUyūn al-Akhbār*, p 356) and for the Muslim period (*Hudhailitendīwān*, p 90, 14, Buhturi, *Ḥamāsa*, p 692), especially of a niche with an image of a Christian saint (ʿOmar b Rabīʿa, p 262, 9) Perhaps the part of the palace, called miḥrāb in the above examples is simply a niche with a throne in it (cf esp *Mufaddalīyāt*, p 21, 13) The same use of the word is found in the Kurʾān In Sūra xxxviii 20, it means the part of the palace where the king is, xxxiv 12, most probably a place where images are put, and in 32 *sq*, xix 12, a temple or rather a cell in a temple where one prays At a still later date we find expressions like *miḥrāb al-madhbah*, apparently a name for the apse in the church behind the altar (*J A*, ser 9, vii 189) *Miḥrāb* has been derived from *ḥarba* "spear" and from South Arabic *mikrāb*, Ethiop *mekuerāb* "temple" but the etymology is not certain (see on the whole question Fraenkel, *Fremdworter*, p 274, Rhodokanakis, in *W Z K M*, xix, 1905, p 296—298, Prätorius, in *Z D M G*, lxi, 1907, p 621 *sq*, Noldeke, *Neue Beitrage z sem Sprachw*, p 52, note 2, Lammens, in *J A*, ser xi, vi 247, Becker, *Islāmstudien*, i 492 *sqq*, J Horovitz, in *Isl*, xvi, 1927, p 260 *sqq*)

If the word miḥrāb means the niche placed in the mosque in the direction of prayer, this connects quite well with the usual usage of the word All are agreed that the miḥrāb did not originally belong to the mosque and that it was taken over from the church finds confirmation in Muslim literature (see Lammens, *Ziād*, p 33, note 7, 94, note 1) and it is evident that the innovation found its way into the mosque by a purely architectural way The miḥrāb became the place where the imām stood during the salāt It may therefore be assumed that it was one of the principal niches in the church, which was taken over into the mosque, it may have contained the bishop's throne or the image or picture of an important saint

There is no unanimity as to the date when the miḥrāb was introduced into the mosque Muʿāwiya is occasionally mentioned (*B G A*, v 109, 2) as a rule, however, and probably with greater right, al-Walīd His governor ʿOmar b ʿAbd al-ʿAzīz is said to have introduced it into Medina (Wüstenfeld, *Medina*, p 74, *B G A*, iii 80, 17 however takes it for granted that ʿOmar b ʿAbd al-ʿAzīz only revived it), similarly his governor Kurra b Sharīk (90—96) is recorded to have introduced the prayer niche (*miḥrāb muḍjawwaf*) into Egypt (Makrīzī, iv 6, 14, 9, 9, Ibn Dukmāḳ, iv 62, 12 *sq*, Ibn Taghrībirdī, i 76, Suyūṭī, *Husn al-Muḥāḍara*, ii 135 *sq*) Only occasionally is Muʿāwiya's governor Maslama b Mukhallad (47—62) or ʿAbd al-ʿAzīz b Marwān (65—84) mentioned as having introduced this innovation (Makrīzī, iv 6) It therefore seems not to be wrong when one of the *maḥārīb* in the Mosque of the Omayyads is described as the oldest in Islām But it is an anachronism to call it *miḥrāb al-ṣaḥāba* and attribute it to Muʿāwiya (Ibn Djubair, p 265, Ibn Baṭṭūṭa, i 203) The miḥrāb is however said not yet to have come into general use in the second century (see Lammens, *Ziād*, p 94, note 1), on the other hand, Tabarī presupposes a *miḥrāb* in the Muslim sense as early as David (Tabarī, i 2408, 7, 12, *B G A*, ii 112, 10 *sq*, other prophets also had their miḥrābs in Jerusalem, *ibid*)

In the larger mosques there were usually several miḥrābs, used by the different madhāhib, in the mosque of ʿAmr, for example (according to Ibn Taghrībirdī, i 79), in Hebron (Sauvaire, *Hist Jerus et Hebron*, p 17), in the mosque of the Omayyads (*J A*, ser 9, vii 213 *sqq*, Ibn Djubair and Ibn Baṭṭūṭa as above) They might be of wood, but as a rule they were built of masonry or put on pillars They were often highly ornamented In the miḥrāb of al-Walīd, a looking-glass that had belonged to ʿĀʾisha is said to have been placed (Kazwīnī, ii 71) A Fāṭimid adorned a miḥrāb in the mosque of ʿAmr and one in the Azhar mosque with a silver girdle which weighed 5,000 dirhams (Makrīzī, iv 52)

The general objections to adorning mosques were also applied to the miḥrāb A ḥadīth is said to have forbidden this as an inheritance from the churches, it is compared with the altars (see Lammens, *Ziād*, p 33 note 7), but even a puritan like Ibn al-Ḥādjdj does not reject the miḥrāb in principle, he only condemns its adornment (*Madkhal*, ii 48) In fact the miḥrāb was held in special respect as the most important part of the mosque which found expression in the erection of a kubba over it (e g Makrīzī, iv 91, cf v Berchem, *Corpus*, i, N° 79) The special importance of the miḥrāb is shown from the fact that its position was occasionally revealed in dreams, e g in Kairawān (Yāḳūt, iv 213) and in the Mosque of Ibn Tūlūn, here the Prophet appeared to Aḥmad b Tūlūn and showed him the miḥrāb and the spot was surrounded by ants (Makrīzī, iv 39) In the principal mosque of Sanʿāʾ there was a prophet's tomb under the miḥrāb (*B G A*, vii 110), which recalls Christian altars As the most sacred part of the mosque, the miḥrāb is compared not only with Christian altars, but the word is used of the sacred place of prayer in any sanctuary, e g in the pre-Christian temple, which stood on the site of the later mosque of the Omayyads (*J A*, ser 9, vii 371) In Palestine, in keeping with this idea, very many miḥrābs are said to have been the miḥrābs of Biblical personalities (see Sauvaire, *Hist Jer et Hebr*, p 42, 76, 96 *sq*., 102, Le Strange, *Palestine*, Index)

d Mınbar [q v]

In contrast to the mihrāb, the *mınbar* was ın troduced ın the time of the Prophet himself The word, often pronounced *mımbar* (cf Brockelmann, *Grundrıss*, ı 161), comes from the root *n-b-r* "high", it could be derived from the Arabic quite easily with the meaning "elevation, stand", but is more probably a loanword from the Ethiopic (Schwally, *Z D M G*, lıı, 1898, p 146—148, Noldeke, *Neue Beıtrage z sem Sprachw*, 1910, p 49) Its case is therefore somewhat similar to that of masdjid It means "seat, chair" (e g *Chron Mekka*, ıı 8, *Aghānī*², Cairo, xıv 75) and is used, for example, for saddle (Tabarī, *Gloss*) and of a litter (*Aghānī*, xıı 158, cf Schwally) It is therefore identical with *maḏılis* (Bukhārī, *Djumᶜa*, B 23), with *sarīr* (*Kāmil*, p 20, *Aghānī*, ıı 3), *takht* or *kursī* (*Usd*, ı 214, cf also Becker, *Kanzel*, p 8) The use of the word for the pulpit is in keeping with its history

When the *khaṭīb* [q v] spoke among the Arabs, he usually did so standing (cf *Mufaḍḍalīyāt*, ed Lyall, xcı ²³, Djāhız, *Bayān*, Cairo 1332, ı 129, ıı 143) frequently beating the ground with bow and lance (*ibid*, ı 198, Labīd, 7, 15, 9, 45), or he sat on his mount as did e g Kuss b Sāᶜida (*Bayān*, ı 25, 31, ıı 141) The Prophet did both of these things In ᶜArafa he sat on his camel during his *khuṭba* and on other occasions, when addressing the community during the early period, even as late as the day of the capture of Mecca, he stood (cf Sūra lxıı 11) The people sat on the ground around him (Bukhārī, *Djumᶜa*, B 28, *ᶜIdain*, B 6) In the mosque in Medina he had a particular place, as is mentioned in the stories of the introduction of the minbar Sometimes, we are told, he stood beside a tree or a palm tree (Bukhārī, *Manākib*, B 25, ed Krehl, ıı 400), as a rule however, beside a palm-trunk (*djidh*ᶜ, so Ibn Saᶜd, ı/ı 9, 10, 11, 12) and on a few occasions beside one of the pillars (Bukhārī, *Manākib*, B 25, ed Krehl, ıı 401, Diyārbakrī, *Khamīs*, ıı 75) This is undoubtedly the original tradition the Prophet stood beside one of the palm-tree trunks used as pillars in the mosque For "beside" (usually *kāma ılā*, Bukhārī, *Buyūᶜ*, B 32) ᶜ*inda*) "up" (*kāma ᶜalā*, already in Bukhārī, *Djumᶜa*, B 26) is sometimes found later and for the column or trunk, we find a stump on which he sat

Various passages record how the minbar was introduced, notably the following Ibn Saᶜd, ı/ı 9—13, Bukhārī, *Salāt*, B 18, 64, 91, *Djumᶜa*, B 26, *Buyūᶜ*, B 32, *Hıba*, B 3, *Manākib*, B 25, Muslim, *Masādjıd*, tr 10, s also Wensinck, *Handbook*, s v *Pulpit*, *Usd al Ghāba*, ı 43 infra, 214, Wüstenfeld, *Medina*, p 62 *sq*, Ibn Battūta, ı 275 *sq*, the whole material is in Diyārbakrī, *Khamīs*, ı 129, ıı 75 *sq* and *Sırat al-Halabī*, ıı 146 *sqq* The details are variously given The minbar, we are told, was built of tarfā wood or tamarisk from the woods near Medīna, the builder was a Byzantine or a Copt and was called Bākūm or Bāḳūl, but the names Ibrāhīm (*Usd*, ı 43), Maimūn, Ṣabāh, Kulāb, Mīnā [see KHAMĪS] are also given He was a carpenter, but a slave of the wife of one of the Ansār or (Bukhārī, *Hıba*, B 3) of the Muhādjırūn Others say he belonged to al-ᶜAbbās The suggestion is sometimes credited to the Prophet and sometimes to others The palm-trunk is said to have whined like a camel or a child when the Prophet mounted his new seat but was calmed by stroking and kind words from the Prophet Most stories take it for granted that the minbar was primarily intended for the *khuṭba*, in some it is added that the object was to enable the large assembly to hear him (Ibn Saᶜd, ı/ı 10, 11) We are told also that the Prophet performed the salāt on it and, during the *sudjūd*, he came down from it He also took care that the people could see his salāt and follow him (Bukhārī, *Ṣalāt*, B 18, *Djumᶜa*, B 26) This last tradition however presupposes the later custom of standing upon the minbar (note that the same idea of the palm-stump occurs in *Djumᶜa*, B 26)

In this connection it is interesting to note a tradition in Ibn al Athır, according to which the Companions asked the Prophet to take up a raised position as many *wufūd* were coming (*Usd al-Ghāba*, ı 43) Another tradition is in keeping with this, according to which the Prophet, when he was visited by a man named Tamīm, stood on a *kursī* and addressed him from it (*ibid*, p 214, cf Lammens, *Moâwıa*, p 204, note 5) Here we have a seat of honour on which the ruler sits This is undoubtedly in keeping with the character of the minbar, while the raised seat was in general use among the northern Semites the Arabs usually sat on the ground, often leaning against a saddle The raised seat was the special mark of the ruler or, what is the same thing, of the judge We are told that Rabīᶜa b Mukhāshın was the first to sit on a *mınbar* or *sarır* when acting as judge (*Aghānī*, 2nd Cairo ed, ıı 3, Makrīzī, ıv 6 *sq*) Al-Hadjdjādj, for example, when he addressed the people (hardly in the mosque) sat on a chair which belonged to him (*kursī lahu* Tabarī, ıı 959) and when he tried and condemned his enemies, a *sarır* was erected for him (*ibid*, p 1119), in the same way a *kursī* was placed for Yazīd when he issued his orders for a battle (*ibid*, p 1107, see also Becker, *Kanzel*, p 8)

If tradition usually suggests that the minbar was introduced exclusively for the khutba, this seems to be a somewhat one-sided view The minbar was primarily, as Becker was the first to point out, the throne of the mighty Prophet in his capacity as a ruler In keeping with this is the tradition that it was introduced in the year 7, 8 or 9 (Tabarī, ı 1591, *Khamīs*, ıı 75, *Usd al-Ghāba*, ı 23) The Prophet used it for the publication of important announcements, for example, the prohibition of wine That he should also make his public speeches to the community from the new seat was only natural His khutbas however were not confined to the Friday service and he could still deliver a khutba without a minbar, e g at the festival on the musallā, where Marwān was the first to put up a minbar (Bukhārī, *ᶜIdain*, B 6) and beside the Kaᶜba after the capture of Mecca (Ibn Hishām, p 823)

The Prophet's minbar is often called *aᶜwād* from its material (Bukhārī, *Salāt*, B 64, *Djumᶜa*, B 26) It consisted of two steps and a seat (*maḏılis Khamīs*, ıı 75, Bukhārī, *Djumᶜa*, B 23, *makᶜad* Tabarī, ı 1591) After the time of the Prophet, it was used in the same way by Abū Bakr, ᶜOmar and ᶜOthmān (see below) Its significance as a throne is seen from the fact that in the year 50 Muᶜāwıya wanted to take it to Syria with him, he was not allowed to do so but he raised it by 6 steps At a later date, ᶜAbd al

Malik and al Walid are said to have wanted to take the Prophet's minbar to Damascus (Tabarī, ii 92 *sq*, *Khamis*, ii 75, Yaʿkūbī, ed Houtsma, ii 283, *B G A*, v 23 *sq*, Wustenfeld, *Medina*, p 63) In the time of the Prophet, it stood against the wall so that a sheep could just get past (Bukhārī, *Salāt*, p 91) In the time of al-Makdisī, in the centre of the Mughattā there was pointed out the position of the old minbar, above which Muʿāwiya was said to have built his new one (*B G A*, iii 82, cf ii 26 and Kazwīnī, ed Wustenfeld, ii 71) According to some hadīths, it was over the *hawd* of the Prophet (Bukhārī, *Salāt fī Makka*, B 5, *Fadāʾil al-Madina*, B 5, 12 and *pass*) At a later date, new minbars were erected in the mosque (see Wüstenfeld, *Medina*, p 64, 96)

That the Omaiyads should have a minbar of their own was natural, they sat on it, just as their predecessors had done (cf Goldziher, *Muh Stud*, ii 42) Muʿāwiya took it with him on his journey to Mecca (*Chron Mekka*, i 333), he also had it taken to the festivals on the musallā (Yaʿkūbī, ed Houtsma, ii 265), just as Marwān used to do in Medīna (see above), it was therefore still portable and indispensable for the sovereign, when he wished to make a public appearance as such In Ibn Djubair's time, the *minbar al khutba* in Damascus was in the central maksūra (*Rihla*, p 265) According to Ibn Khaldūn, Muʿāwiya was the first in Islām to use the throne (*sarir, minbar, takht, kursi*) but he is clearly not referring to the minbar of the mosque (*Mukaddima*, Cairo 1322, p 205 *sq*, *fasl*, 3, N° 37)

The minbar taken to Mecca by Muʿāwiya remained there till the time of al-Rashīd, when the latter visited Mecca on his hadjdj in the year 170 or 174 a *minbar mankūsh* with 9 steps was presented to him by the emīr of Egypt and the old one was put up in ʿArafa At a later date, al-Wāthik made minbars for Mecca, ʿArafa and Minā (*Chron Mekka*, i 333, iii 114) The Meccan minbar was a portable one It usually stood beside the *makām* but was put beside the Kaʿba during the khutba (Ibn Djubair, p 95, 97, cf *Chron Mekka*, iii 429) According to al-Batanūnī, this custom was kept up until Sultān Sulaimān Kānūnī (926—974) built a marble minbar, north of the *makām* (*al Rihla al-Hidjāzīya*, p 100)

It seems at first to have been doubtful whether *manābir* should be put up in the provinces or not According to al-Kudāʿī, ʿAmr had a minbar made in al-Fustāt but ʿOmar ordered him to take it away he was not to raise himself above the Muslims so that they would have to sit below his heels (Makrīzī, iv 6 *sq*, Ibn Taghribirdī, i 76, Suyūtī, *Husn al-Muhādara*, i 63, ii 135) The idea obviously was that the throne belonged to the caliph alone After ʿOmar's death however, ʿAmr is said to have used a minbar (Makrīzī, iv 8, 27) It stood there till Kurra b Sharik rebuilt the mosque During the rebuilding it was put in the Kaisārīya, which was used as a mosque, only when the mosque was completed in the year 92, did Kurra put up a new minbar Tradition however is uncertain The minbar removed by Kurra perhaps dated from ʿAbd al-ʿAzīz b Marwān, who had taken it from a church or had been presented with it by the Nubian King (Makrīzī, iv 8, Ibn Taghribirdī, i 78) Kurra's minbar remained till 379 when the Fātimid vizier Yaʿkūb b Killis replaced it by a gilded one A large new minbar was placed in the mosque of ʿAmi in 405 by al-Hākim (Makrizi, iv 8, Ibn Taghribirdī, i 78 *sq*)

We hear of no objections in other places to the manabir in the amsār In al-Madāʾin as early as the year 16 Saʿd erected a minbar in the mosque improvised in the Iwān of Kisrā (Tabarī, i 2451, 9) In Basra, Abū Mūsā put up a minbar in the middle of the mosque This was however found inconvenient because the Imām had to cross from the minbar to the kibla "over the necks" of the (seated) believers Ziyād then placed the minbar against the south wall (Yākūt, i 642) On the other hand, we are told that ʿAbd Allāh b ʿAbbās (governor of Basra 36—40) was the first to mount the minbar in Basra (Djāhiz, *Bayān*, i 179) When Ziyād had to fly from Basra he saved the minbar which he put up in his Masdjid al Huddān (Tabarī, i 3414 *sq*) The minbar was the symbol of the ruler and the governor sat upon it, as representative of the ruler It therefore formed a feature of the Masdjid al-Djamāʿa, where the community was officially addressed In the year 64 therefore, there were minbars in all the provinces In this year homage was paid to Marwān b al Hakam not only in the capital but in the other manābir in the Hidjāz, Misr, Shaʾm, Djazīra, ʿIrāk, Khurāsān, and other amsār (*B G A*, viii 307) Special mention is made of the fact that Tabariya had no minbar

In the first century and beginning of the second, we find the wālī in the smaller towns, delivering the *khutba* standing, with the staff only But in 132 the governor ʿAbd al Malik b Marwan had *manābir* put up in the kurā of Egypt (Makrīzī, iv 8, 17 *sqq*, Ibn Taghribirdi, i 350 *sq*) When the khutba became purely a divine service and the ruler was no longer the khatib [q v], the minbar became the pulpit of the spiritual preacher and every mosque in which the Friday service was celebrated was given a minbar At the same time, i e after al-Rashid, the change was gradually completed and the preacher spoke, standing on the pulpit Hadiths therefore came into existence, according to which the Prophet used to deliver two khutbas on Friday, standing "just as is done to day" (Bukhārī, *Djumʿa*, p 27, 30 and ʿOmar, *ibid*, p 2)

The minbar was thus now quite analogous to the Christian pulpit It is very probable that this latter also influenced its form We have already noted above, of a minbar in the mosque of ʿAmr, that it was said to be of Christian origin The same thing came to be said of the Prophet's minbar (Wustenfeld, *Medina*, p 63) Muʿāwiya made the Medīna minbar larger, while the one brought by him to Mecca had only 3 steps and was of course portable We again hear of portable minbars later, which did not exclude their being large (cf above on the minbar of Mecca) Thus the manābir in al Maghrib are said to have been portable Ibn al Hādjdj regards this (the oldest) custom as *bidʿa* and therefore ascribes it to al-Hadjdjādj (*Madkhal*, ii 47, 13 *sqq*) The oldest minbars were all of wood There is however one hadith which says that the Prophet had a *kursī* of wood with iron legs made for the reception of Tamīm (*Usd*, i 214, 8 from below, cf Lammens, *Moʿâwia*, p 273, note 3), it is however uncertain what relation this had to the minbar A minbar of iron was made as early as the Omaiyad period (Ibn Taghribirdī, i 78, 8 *al-minbar al-hadīd* probably correct in

spite of Becker, *Kanzel*, p 10, note, cf 79, 4, see below), and also of stone (Goldziher, *Muh Stud*, II 42, note 5 with a reference to Ibn Hadjar), later they were also built of bricks (Wüstenfeld, *Medina*, p 64, 96) As a rule the minbar stood against the kibla wall beside the mihrāb Al-Mahdī had tried to reduce the *manābir* to their original small size (Tabarī, III 486, 12, Makrīzī, IV 12, 13 *sqq*), but he could not arrest the development In the larger mosques several *manābir* were even built Ibn al Fakīh about 300 A H already mentions 5 minbars in the mosque in Jerusalem (*B G A*, V 100, 8 *sq*) In the Sultān Hasan mosque in Cairo 4 were planned and 3 erected when a minaret fell down in 762 and diverted attention to other work (Makrīzī, IV 117, 18 *sq*)

The importance, which the minbar already had in the time of the Prophet, caused special reverence to be paid to it and the sanctity of the mosque was concentrated round this and around the mihrāb The governor of Kūfa Khālid b ʿAbd Allāh al-Kasrī (105—120) received a letter of censure from the caliph because he had prayed for water on the minbar (*Kāmil*, p 20, 15 *sqq*) A false oath taken on or beside the minbar of the Prophet led to hell absolutely (Ibn Saʿd, I/1 10, 3 *sq*, 12, 19 *sq*, Ibn Hanbal, *Musnad*, II 329, cf Johs Pedersen, *Der Eid*, p 144, 147) Legends grew up which represented the Prophet seeing into the future from the minbar (Bukhārī, *Djumʿa*, bāb 29) and being able to follow the battle of Muʾta from it (cf Wākidī—Wellhausen, p 311, Ibn Hishām, p 796) and also telling how his prayers on the minbar were specially efficacious

Just as the Kaʿba was covered (*kasā*) so was the same thing done to the minbar ʿOthmān is said to have been the first to cover the minbar of the Prophet with a *katīfa* (*Khamīs*, II 75, 1 from below) Muʿāwiya did the same thing when he had to give up his attempt to abolish it (*ibid*, p 76, 4, Tabarī, II 92, 4) It was not quite the same thing when al Hākim rediscovered the already mentioned iron minbar and covered it with gilt leather because it was covered with dirt (read *kadhar*) i e rust (Ibn Taghribirdī, I 79, 5 *sq*) Under the ʿAbbāsids a new *kiswa* was sent every year for the minbar of the Prophet from Baghdād, the Sultāns later did not renew it so frequently (Wüstenfeld, *Medina*, p 64) We find other references to the covering of the minbar on special occasions (Ibn Djubair, p 149, 16) Ibn al Hādjdj (*Madkhal*, II 74) demands that the imām should put a stop to the custom of putting carpets on the minbar — (On the question of the minbar see C H Becker, *Die Kanzel im Kultus des alten Islām*, *Noldeke-Festschrift*, I 331—351 = *Islāmstudien*, I 450—471, Caetani, *Annali dell' Islām*, I 533, 739, II 68 *sq*, 87, 213 *sq*, H Lammens, *Moʿawia*, p 63, 204—208, 273, J Horovitz, in *Isl*, XVI, 1927, p 257—260)

e Dakka

In the larger mosques there is usually found near the minbar a platform to which a staircase leads up This platform (*dakka*, popularly often *dikka*) is used as a seat for the muʾadhdhins when pronouncing the call to prayer in the mosque at the Friday service This part of the equipment of a mosque is connected with the development of the service (cf below under H 4 and C H Becker, *Zur Geschichte des islamischen Kultus*, III, 1912, p 374—399 = *Islāmstudien*, I 472—500, E Mittwoch, *Zur Entstehungsgeschichte des islamischen Gebets und Kultus*, *Abh Pr Ak W*, 1913, Phil-Hist Cl, N° 2) The first adhān-call is pronounced from the minaret, the second (when the khatīb mounts the minbar) and the third (before the salāt, *ikāma*) in the mosque itself These calls were at first pronounced by the muʾadhdhin standing in the mosque At a later date raised seats were made for him

Al-Halabī records that Maslama, Muʿawiya's governor in Egypt, was the first to build platforms (here called *manābir*) for the calls to prayer in the mosques (*Sira Halabīya*, II 111 below) This story however, given without any reference to older authorities, is not at all reliable It seems that a uniform practice did not come into existence at once In Mecca the muʾadhdhins for a time uttered the second call (when the preacher mounted the minbar) from the roof As the sun in summer was too strong for them, the emīr of Mecca, in the reign of Hārūn al Rashīd, made a little hut (*zulla*) for them on the roof This was enlarged and more strongly built by al-Mutawakkil in 240, as his contemporary al Azrakī relates (*Chron Mekka*, I 332 *sq*) The position in the mosque of ʿAmr in Cairo was similar Here also the *adhān* was uttered in a chamber (*ghurfa*) on the roof and in 336 there is a reference to its enlargement (Makrīzī, IV 11) As late as the time of Baibars, when the many chambers were removed from the roof of the Mosque of ʿAmr, the old *ghurfa* of the muʾadhdhin was left intact (*ibid*, p 14, cf al Kindī, *Wulāt*, ed Guest, p 469, note 2) In the Mosque of Ibn Tūlūn the adhān was pronounced from the cupola in the centre of the *sahn* (Makrīzī, IV 40) Al-Makdisī records in the fourth century as a notable thing about Khurāsān that the muʾadhdhins there pronounced the adhān on a *sarīr* placed in front of the minbar (*B G A*, III 327) The *dukkān* "platform" in front of the minbar in the mosques of Shahriastān must have had the same purpose (*ibid*, p 357)

In the VIIIth century, Ibn al-Hādjdj mentions the dakka as a *bidʿa* in general use, which should be condemned as it unnecessarily prevents freedom of movement within the mosque (*Madkhal*, II 45 above) In the year 827 a *dakka* in the mosque of al-Hākim is mentioned (Makrīzī, IV 61), the dakkas mentioned in inscriptions from Cairo all date from the period before and after 900 A H Ibn al-Hādjdj mentions that in addition to the large dakka used for the Friday service there was sometimes a lower one for ordinary salāts (*Madkhal*, II 46 *sq*) and says that in the larger mosques there were several dakkas on which muʾadhdhins pronounced the adhān in succession so that the whole community could hear it (*tablīgh*, *ibid*, p 45 *sq*) Lane also mentions several *muballighs* in the Azhar Mosque (*Manners and Customs*, Everyman's Library, p 87, note 2)

f Kursī, Kurʾāns and Relics

In the mosques there is usually a kursī, that is a wooden stand with a seat and a desk The desk is for the Kurʾān, the seat for the *kāss*, or reader, *kārīʾ* Ibn Djubair attended a divine service in Baghdād at which a celebrated preacher spoke from the minbar, but only after the *kurrāʾ*, sitting on *karāsī* had recited portions of the Kurʾān (*Rihla*, p 219, 222) The *wāʿiz*, often identical with the kāss sat on a *kursī* made of teak (Ibn Djubair, p 200, Yākūt, *Udabāʾ*, II 319, Makrīzī, IV 121),

sometimes he spoke from the minbar to which the wāʿiz often had access (cf Ibn Djubair see Mez, *Renaissance des Islams*, p 320) The kussās are called by al-Makkī *aṣḥāb al-karāsī* which is in keeping with this (*Kūt al-Kulūb*, i 152, quoting *K al-Madkhal*, i 159) Several karāsī are often mentioned in one mosque (cf for the Mosque of ʿAmr, Makrīzī, iv 19) Whether the karāsī mentioned for the earlier period always had a desk cannot be definitely ascertained The karāsī with dated inscriptions given by van Berchem in his *Corpus* all belong to the ixth (xvth) century (N⁰ 264, 302, 338, 359bis, 491) According to Lane, at the Friday service while the people are assembling, a kārī' on the kursī recites the 18th Sūra up to the *adhān* (*Manners and Customs*, p 86) The same custom is recorded by Ibn al-Hādjdj and condemned because it has a disturbing effect (*K al-Madkhal*, ii 44, middle)

The Kur'ān very soon received its definite place in the mosque like the Bible in the church (cf Bukhārī, *Salāt*, bāb 91 they prayed at a pillar beside *al-muṣḥaf*) According to one tradition, ʿOthmān had several copies of his Kur'ān sent to the provinces (e g Noldeke Schwally, *Gesch d Qor*, ii 112 *sq*), al Hadjdjādj, a little later, is said to have done the same thing (Makrīzī, iv 17) The mosques had many other copies beside the one kept on the kursī Al-Hākim put 814 *maṣāḥif* in the Mosque of Ibn Tūlūn, where the founder had already put boxes of Kur'āns (Makrīzī, iv 36, 40, cf *Husn al Muhādara*, ii 138) and in 403 he presented 1,289 copies to the Mosque of ʿAmr, some of which were written in letters of gold (Makrīzī, iv 12, *Husn al Muhādara*, ii 136) Even earlier than this there were so many that the kādī al-Hārith b Miskīn (237—245) appointed a special *amīn* to look after them (al Kindī, *Wulāt*, p 469), there are still a very large number in the Mosque of the Prophet (see Batanūnī, *Rihla*, p 241 above) Of particular value was the *Mushaf Asmāʾ*, belonging to the Mosque of ʿAmr, prepared by ʿAbd al-ʿAzīz b Marwān, later bought by his son and afterwards by his daughter Asmāʾ, her brother left it in 128 to the mosque and it was used for public readings (see its whole history in Makrīzī, iv 17 *sq*) Besides it, another copy was for some time also used for reading, which was said to have lain beside ʿOthmān, when he was killed and to have been stained with his blood, but this one was removed by the Fātimids (*ibid*, p 19) In the time of Ibn Battūta, a Kur'ān for which the same claims were made was kept in Basra (ii 10) On New Year's Day when the Fātimid caliphs used to go in procession through the town, the Caliph at the entrance to the Mosque of ʿAmr took up in his hands a mushaf said to have been written by ʿAlī and kissed it (Ibn Taghrībirdī, ii/1, p 472 middle), it was perhaps the *Mushaf Asmāʾ* In Syria, Egypt, and the Hidjāz, in the fourth century, there were Kur'āns which were traced back to ʿOthmān (*B G A*, iii 143, cf ii 117) One of the Kur'āns made for ʿOthmān was shown in the Mosque of the Omaiyads in Damascus in the time of Ibn Djubair It was produced after the daily salāts and the people touched and kissed it (*Rihla*, p 268) It was brought there in the year 507 from Tiberias (Dhahabī, *Taʾrīkh*, Haidarābād, 1337, ii 25) Other Kur'āns of ʿOthmān were shown in Baghdād and Cordova (see Mez, *Renaissance des Islams*, p 327) and Ibn Djubair saw another in the Mosque of the Prophet, it lay in a desk on a large stand, here called *mihmal* (*Rihla*, p 193, cf thereon Dozy, *Supplement*, s v) The Fādilīya Madrasa also had a *Mushaf ʿUthmān*, bought by the Kādī al Fādil for 30,000 dīnārs (Makrīzī, iv 197) and there is one in Fās (*Archives Marocaines*, xviii, 1922, p 361) Valuable Kur'āns like these had the character of relics and belonged to the *khizāna* of the mosque They were often kept in a chest (*ṣandūk*) (Ibn Djubair, *op cit*, for *al-muṣḥaf*, Bukhārī, *Salāt*, bāb 95, Muslim has *al ṣandūk*, see al-ʿAskalānī, *Fath al-Bārī*, i 385), also called *tābūt* (Ibn Djubair, p 104) In the Kaʿba, Ibn Djubair saw two chests with Kur'āns (p 84, 3) Ibn al-Fakih mentions 16 chests with Kur'āns in the Jerusalem mosque (*B G A*, v 100) In the mosques there were also *sanādik* for other things, such as lamps (Makrīzī, iv 53, Wüstenfeld, *Medina*, p 82 = Ibn Djubair, p 194), a *tābūt* for alms (*K al-Madkhal*, ii 44, *infra*), for the *bait al māl* or the property of the mosque (see below) There were also chests for rose wreaths (*Madkhal*, ii 50) which were in charge of a special officer In the Mosque of ʿAmr there was a whole series of *tawābīt* (Makrīzī, iv 9)

The Kur'āns were not the only relics to be kept in the mosques Bodies or parts of the bodies of saints (cf B 4, C 1) and other *āthār* were kept and revered in mosques the rod of Moses, (in Kūfa, Yākut, iv 325, previously in Mecca, see Goldziher, *Muh Stud*, ii 361), the Prophet's sandals (in Hebron, *B G A*, v 101, also in Damascus, where the Ashrafiya Madrasa had his left and the Dammāghiya his right sandal, *J A* ser 9, iii 271 *sq*, 402), his cloak (in Adhruh, *B G A*, iii 178), hair from his beard (in Jerusalem among other places, Batanūnī, *Rihla*, p 165) and many other things (see Goldziher, *Muh Stud*, ii 358 *sqq*, Mez, *Renaissance d Islams*, p 325 *sq*) These relics were often kept in valuable reliquaries The head of Husain was buried in a *tābūt* in his mosque in Cairo (Ibn Djubair, p 45) There was a black stone like that in the Kaʿba in a mosque in Shahrastān (*B G A*, iii 433)

On the other hand, pictures and images were excluded from the mosques, in deliberate contrast to the crucifixes and images of saints in churches, as is evident from Hadīth (Bukhārī, *Salāt*, bāb 48, 54, *Libās*, bāb 71, Muslim, *Masādjid*, tr 3, cf on the question Becker, *Christliche Polemik und islamische Dogmenbildung*, *Z A*, xxvi = *Islāmstudien*, i 445 *sqq*) It is of interest to note that in the earliest period, Saʿd b Abī Wakkās had no scruples about leaving the wall paintings in the Īwān of Kisra at Madāʾin standing, when it was turned into a mosque (Tabarī, i 2443, 2451) The case was somewhat different, when, before the chief mosque in Dehli which had been a Hindu temple, two old copper idols formed a kind of threshold (Ibn Battūta, iii 151) although even this is remarkable (cf Snouck Hurgronje, *Verspreide Geschriften*, ii 451 *sqq* = *Z D M G*, lxi, 1907, p 186 *sqq*) In some circles the opposition to pictures extended to other relics also Ibn Taimīya condemned the reverence paid to the Prophet's footprint, which was shown, as in Jerusalem, in a Damascus mosque also (Quatremère, *Hist Sult Maml*, ii/ii 246)

g Carpets

Carpets were used to improve the appearance of the mosques The custom of performing the

salāt upon a carpet is ascribed by Hadīth to the Prophet himself Anas b Mālik performed the salāt with him in his grandmother's house and the Prophet used a cloth or mat (*ḥaṣīr*), which had become black through wear, as a rule, he used a mat woven of palm leaves, *khumra* (Bukhārī, *Ṣalāt*, bāb 19, 20, 21, *Haid*, bāb 30, Muslim, *Masādjid*, tr 47, Ahmad b Hanbal, *Musnad*, iii 145) In any case, it is clear from Balādhurī that the salāt was at first performed in the mosque simply in the dust and then on pebbles (Balādhurī, p 277, 348, cf al-Zurḳānī, *Sharḥ ʿala 'l-Muwaṭṭaʾ*, i 283 *sq*) Later, when the halls were extended, the ground, or the paving, was covered with matting

The first to cover the ground in the Mosque of ʿAmr with *ḥuṣur* instead of *ḥasbāʾ* was Muʿāwiya's governor Maslama b Mukhallad (Maḳrīzī, iv 8, *Husn al Muḥāḍara*, ii 136, Ibn Taghrībirdī, i 77) The different groups which frequented the mosque (cf above) had their places on particular mats when a kādi (middle of the third century) ejected the Shāfiʿīs and Hanafīs from the mosque, he had their husur torn up (al-Kindī, *Wulāt*, p 469) Ibn Ṭūlūn covered his mosque floor with ʿAbbadānian and Sāmānian mats (Maḳrīzī, iv 36, 38) For the mosque of al-Ḥākim in the year 403, al-Ḥākim bought 1,036 *dhirāʿ* of carpeting for 5,000 dināRs (Maḳrīzī, iv 56, cf for al-Azhar, *ibid*, p 50) In the year 439 in the Mosque of ʿAmr, there were ten layers of coloured carpets one above the other (Nāṣir-i Khosraw, ed Schefer, p 31 [text], p 149 [transl]) In the Mosque at Jerusalem 800,000 dhirāʿ of carpets were used every year (*B G A*, v 100) In the Mosque in Mecca they were renewed every Ramadān (*B G A*, v 100) On ceremonial occasions the minbar was also draped with a carpet (*sadjdjāda*, q v), in Medina, the minbar and the sacred tomb was always covered like the Kaʿba in Mecca (Wustenfeld, *Medina*, p 83, cf Quatremere, *Hist Sult Maml*, II/i 91) and some, especially the teachers, had their skins (*farwa*), in some cases also a cushion to lean upon The doors were also covered with some material (Makrizī, iv 56) On feast-days, the mosques were adorned with carpets in a particularly luxurious fashion (see Ibn Taghrībirdī, II/i 483) The Puritans rejected all this as *bidʿa* and preferred the bare ground (*Madkhal*, ii 46, 49, 72, 74, 76) as the Wahhābīs still do

h Lighting

Where evening meetings and vigils were of regular occurrence, artificial lighting became necessary Al Azrakī gives the history of the lighting of the Meccan Mosque The first to illuminate the Kaʿba was ʿUkba b al-Azrak, whose house was next to the Mosque, just on the *Makām*, here he placed a large lamp (*miṣbāḥ*) ʿOmar, however, is said previously to have placed lamps upon the wall, which was the height of a man, with which he surrounded the mosque (Balādhurī, p 46) The first to use oil and lamps (*kanādīl*) in the mosque itself was Muʿāwiya (cf *B G A*, v 20) In the time of ʿAbd al-Malik, Khālid b ʿAbd Allāh al-Kasrī placed a lamp on a pillar of the Zemzem beside the Black Stone, and the lamp of the Azrak family disappeared In the reign of al-Maʾmūn in 216 a new lamp-post was put up on the other side of the Kaʿba and a little later two new lanterns were put up around the Kaʿba Hārūn al-Rashīd (268—271) placed ten large lamps around the Kaʿba and hung two lanterns on each of the walls of the mosque (*thurayyāt*, cf Ibn Djubair, *Riḥla*, p 149, 150, 155, 271, v Berchem, *Corp Inscr Arab*, i, N° 506) Khālid al-Kasrī had the *masʿā* also illuminated during the pilgrimage and in 219 the torches called *nafātāt* were placed here and ʿOmar b ʿAbd al-ʿAzīz ordered the people, who lived in the streets of Mecca, to put up lamps on the 1st Muharram for the convenience of those visiting the Kaʿba (*Chron Mekka*, i 200–202, cf 458 *sq*) In 253 Muhammad b Ahmad al Mansūrī erected a wooden pole in the centre of the *ṣaḥn* and *kanādīl* on ropes were hung from it This was however very soon removed (*ibid*, ii 196 *sq*) About 100 years later, al-Makdisī saw around the Tawāf wooden poles on which hung lanterns (*kanādīl*) in which were placed candles for the kings of Egypt, Yemen, etc (*B G A*, iii 74) Ibn Djubair describes the glass *kanādīl*, which hung from hooks in the Meccan Haram (*Riḥla*, p 103) and lamps (*mashāʿil*) which were lit in iron vessels (*ibid*, p 103, cf p 143) Similar silver and gold *kanādīl* were seen by him in Medina (*ibid*, p 192 at the top, see also Wustenfeld, *Medina*, p 83 *sqq*) According to al-Fakih (before 300), 1,600 lamps were lit every evening in Jerusalem (*B G A*, v 100) and in the next century al-Makdisī says that the people of Palestine always burn *kanādīl* in their mosques, which were hung from chains as in Mecca (*B G A*, iii 182) The illumination was thus very greatly increased In the year 60, when Ibn Ziyād was searching for his enemies in the mosque of Kūfa, the lamps were not sufficient, and large torches had to be used in searching the pillared halls (Tabarī, ii 259 *sq*) This, like what has already been said about Mecca, shows out of what modest beginnings this part of the mosque's equipment developed

In the time of the ʿAbbāsids, lamps and lanterns were part of the regular furniture of the mosque Al-Maʾmūn is said to have taken a special interest in this He ordered lamps to be put in all the mosques, partly to assist those who wanted to read and partly to prevent crime (Baihaki, ed Schwally, p 473) For this purpose, the *kanādīl*, already mentioned, hung on chains were used, as at the building of the mosque of Ibn Ṭūlūn (Makrīzī, iv 36, 38), in the Azhar Mosque and elsewhere, they were often of silver (*ibid*, p 56, 63) Golden *kanādīl* were also used and were of course condemned by Ibn al-Ḥādjdj (*Madkhal*, ii 54) as ostentatious At the same time, candles (*sham*ʿ or *shamaʿ*) were used in large numbers, the candlesticks (*atwār*, sing *tawr*) often being of silver (Ibn Djubair, *Riḥla*, p 45, 151, 194, cf Wustenfeld, *Medina*, p 95, 100) About 400, large candelabra were made in Egypt, which from their shapes were called *tannūr*, stoves Al Ḥākim presented the Mosque of ʿAmr with a *tannūr* made out of 100,000 dirhams of silver, the mosque doors had to be widened to admit it He also gave it two other lamps (Suyūṭī, *Husn al-Muḥāḍara*, ii 136 infra, cf Nāṣir-i Khosraw, ed Schefer, p 51 [text], p 148 [transl], Ibn Taghrībirdī, ed Popper, II/ii, p 105) In the Mosque of al-Ḥākim, in addition to lamps and candle lanterns, he also put 4 silver *tanānīr* and he made similar gifts to the Azhar and other mosques the lamps were of gold or silver (Makrīzī, iv 51, 56, 63, cf Ibn Taghrībirdī, II/ii 105) The *tanānīr* and other lanterns could also be made of copper (see v Berchem,

Corpus, 1, N° 502, 503, 506, 507, 511), as, for example, the celebrated candelabrum of the Mosque of Mu'aiyad (Makrīzī, iv 137) which was made for the mosque of Hasan but sold by it (*ibid*, p 118)

This great interest in the lighting of the mosque was not entirely based on practical considerations Light had a significance in the divine service and Islām here, as elsewhere, was taking over something from the Church When, in 227, the caliph was on his deathbed, he asked that the salāt should be performed over him with candles and incense (*bi 'l-shamᶜ wa 'l bukhūr*) exactly after the fashion of the Christians (Ibn Abī Usaibi'a, i 165, cf ii 89) The dependence of Islām on Christianity is also seen in the story that ᶜOthmān, when he was going to the evening salāt in Medina, had a candle carried in front of him, which his enemies condemned as *bidᶜa* (Yaᶜkūbī, ed Houtsma, ii 187) The Shiᶜa bias does not affect the significance of this story A light was used particularly in the mihrāb, because it represented the holy cell, to which light belongs (cf Sūra xxiv 35) Then, in Mecca, lamps were placed before the imāms in the mihrābs and there were considerable endowments for such mihrāb lamps (Ibn Djubair, *Rihla*, p 103, 144) Light, as was everywhere the custom in ancient times, was necessary in mausoleums and the documents of endowment show that a large number of oil lamps were used in this way (cf e g the document for al Malik al Ashraf's mausoleum, v Berchem, *Corpus*, 1, N° 252) But in the mosque generally the use of lights had a devotional significance and lamps might be endowed for particular individuals (cf *B G A*, iii 74, quoted above) The lamps so given by al-Hākim were therefore placed in the mosques with great ceremony, with blasts of trumpets and beating of drums (Ibn Taghrībirdī, ii/ii 105)

On ceremonial occasions a great illumination was therefore absolutely necessary In the month of Ramadān, says Ibn Djubair, the carpets were renewed and the candles and lamps increased in number, so that the whole mosque was a blaze of light (*Rihla*, p 143), on certain evenings trees of light were made with vast numbers of lamps and candles and the minarets were illuminated (*ibid*, p 149—151, 154, 155) In the Mosque of the Prophet in the time of Samhūdī, forty wax candles burned around the sacred tomb, and three to four hundred lights in the whole mosque (Wustenfeld, *Medina*, p 100) On the *mawlid al nabī*, says Kutb al-Dīn, a procession went from the Kaᶜba in Mecca to the birthplace of the Prophet with candles, lanterns (*fawānīs*) and lamps (*mashāᶜil*, see *Chron Mekka*, iii 439) In the haram of Jerusalem, according to Mudjīr al-Dīn, 750 lamps were lit by night and over 20,000 at festivals (Sauvaire, *Hist Jerus et Hebron*, p 138) In the dome of the Sakhra in 452 a chandelier and 500 lamps fell down (*ibid*, p 69), at the taking of the town in 492 (1099) the Franks carried off 42 silver lamps, each of 3,600 dirhams, 23 lamps of gold and a *tannūr* of 40 *ritl* of silver (*ibid*, p 71) It was similar and still is in Cairo and elsewhere in the Muslim world For the *latlat al-wukūd* in the Mosque of ᶜAmr, 18,000 candles were made for the Mosque of ᶜAmr and every night eleven and a half kintār of good oil were used (Makrīzī, iv 21 and more fully ii 345 *sqq*) The four "nights of illumination" fell in the months of Radjab and Shaᶜbān, especially *Nuṣf Shaᶜbān* (Quatremère, *Hist Sult Maml*, ii/ii 131, cf also Snouck Hurgronje, *Mekka*, ii 77) Quite recently (1908) electric light has been introduced into the Mosque of the Prophet (al-Batanūnī, *Rihla*, p 245 *sq*)

[On the question in general see Clermont-Ganneau, *La lampe et l'olivier dans le Coran*, in *Recueil d'Archeologie Orientale*, viii, 1924, p 183–228, on the copper candelabra see A Wingham, *Report on the Analysis of various examples of Oriental Metal-Work etc in the South Kensington Museum* etc, London 1892, F R Martin, *Altere Kupferarbeiten aus dem Orient*, Stockholm 1902, on glass lamps see G Schmoranz, *Altorientalische Glass-Gefasse*, Vienna 1898, v Berchem, *C I A*, i 678 *sqq*, Max Herz Bey, *La Mosquee du Sultan Hasan* (*Comite de Conservation des Monuments de l'Art Arabe*), 1899, p 8 *sqq*, see also the Bibliography in *Isl*, xvii, 1928, p 217 *sqq*]

i Incense

According to some traditions, even the Prophet had incense burned in the mosque (Tirmidhī, i 116, see Lammens, *Moᶜāwia*, p 367, note 8) and in the time of ᶜOmar, his client ᶜAbd Allāh is said to have perfumed the mosque by burning incense while he sat on the minbar The same client is said to have carried the censer (*midjmar* cf Lammens, *loc cit*) brought by ᶜOmar from Syria before ᶜOmar when he went to the salāt in the month of Ramadān (A Fischer, *Biographie von Gewahrsmannern* etc, p 55, note) According to this tradition, the use of incense was adopted into Islām very early as a palpable imitation of the custom of the Church In keeping with this is the tradition that in al Fustat as early as the governorship of ᶜAmr, the mu'adhdhin used to burn incense in the mosque (ᶜAbd al-Hakam, p 132, cf *Annali dell' Islam*, iv 565) The Sakhra Mosque had incense burned in it during the consecration ceremony (Sauvaire, *Hist Jerus et Hebron*, p 53)

Under the Omaiyads, incense was one of the regular requirements of the mosque (*tib al masdjid* Tabarī, ii 1234, 10) Muᶜāwiya is named as the first to perfume the Kaᶜba with perfume (*khalūk*) and censer (*tatyaba B G A*, v 20, 12) It became the custom to anoint the sacred tombs with musk and *tib* (*Chron Mekka*, i 150, 10, Ibn Djubair, *Rihla*, p 191, 9) Baibars washed the Kaᶜba with rose-water (Makrizi, iv 96, 14) Incense, as well as candles, was used at burials (cf de Goeje, *Z D M G*, 1905, p 403 *sq*, Lammens, *Moᶜawia*, p 436, note 9) Al-Muᶜtasim's desire to be buried with candles and incense (*bukhūr*) exactly like the Christians (Ibn Usaibiᶜa, i 165, 12 *sq*, cf above) shows that they were aware that the custom bore much the same relation to the Christian usage, as the mosque building did to the church The consumption of incense in the mosques gradually became very large, especially at festivals (see for the Fātimids Ibn Taghribirdī, ii/i, 484, 12, ii/ii, ed Popper, p 106, 3, Makrīzi, iv 51, on vessels for holding incense see the Bibliography in *Isl*, xvii, 1928, p 217 *sq*)

j Water-Supply

Nothing is said of a water-supply in connection with the oldest mosques The Mosque of Mecca occupied a special position on account of the Zemzem well In the early days of Islām, two basins (*hawd*) are said to have been supplied by it, one behind the well, i e just at the side of the mosque for *wudū'* and one between the well

and the *rukn* for drinking purposes, the latter was moved nearer the well by Ibn al-Zubair In the time of Sulaimān b ʿAbd al-Malik, a grandson of ʿAbd Allāh b ʿAbbās for the first time built a *kubba* in connection with the Zemzem (*Chron Mekka*, 1 299) At the same time, the governor Khālid al-Kasrī laid down lead-piping to bring water from the well of al-Thabīr to the mosque, to a marble basin (*fiskiya*) with a running fountain (*fawwāra*) between the Zemzem and the rukn, probably on the site of the earlier *hawd* It was intended to supply drinking water in place of the saltish water of Zemzem, but a branch was led on to a *birka* at the Bāb al-Safā, which was used for ritual ablutions The people, however, would not give up the Zemzem water and immediately after the coming to power of the ʿAbbāsids, the provision for drinking-water was cut off, only the pipe leading to the *birka* being retained (*ibid*, 1 339 *sq*) In Ibn Djubair's time, there was, in addition to the Zemzem, a supply of water in vessels and a bench for performing the *wudū*ʾ (*Rihla*, p 89) Khalid's plan, arrangements for ablutions at the entrance and a running fountain in the sahn, seems to have been a typically Omaiyad one and to have been introduced from the north Such fountains were usual in the north, not only in private houses, but also for example in the *aithrion* (*atrium*) surrounded by pillars, which, from Eusebius's description, formed part of the church of Tyre (see Hauch in Herzog–Hauch, *Realanzyclop f prot Theol u Kirche*[3], x 782)

The usual name for the basin, *fiskiya* (in Egypt now *faskīya*) is *piscina*, which in the *Mishna* and in Syriac takes the form *piskīn* (see Levy, *Neuhebr u chald Worterbuch*, iv 81[b], Fraenkel, *Fremdworter*, p 124, *fiskina*, found in al Azraki, *Chron Mekka*, 1 340 is probably due to a slip) At the same time, however, *birka* or *sikāya* or *sihridj* which probably comes from the Persian (cf Fraenkel, *op cit*, p 287) or the old Arabic *hawd* are also used The arrangements for ablutions were called *matāhir* or *mayādiʾu*, sing *miʾdaʾa* (now usually *mida*), "place for *wudū*ʾ" The accommodation in Mecca just mentioned was later extended Ibn Djubair mentions a building at al-Zāhir, 1 *mil* north of Mecca which contained *matāhir* and *sikāya* for those performing the minor *ʿumra* (*Rihla*, p 111)

In Medīna, Ibn Djubair mentions rooms for *wudū*ʾ at the western entrance to the mosque (*Rihla*, p 197, 13 *sq*, cf the plan in al-Batanūnī, *Rihla*, facing p 244) At the same time Ibn Zabāla mentions seventeen receptacles for water in the sahn in the year 199, probably for drinking water, later (viiith century) a large basin surrounded by a railing is mentioned in the centre of the court It was intended for drinking purposes, but became used for bathing and was therefore removed Baths and latrines were built anew by al-Nāsir's mother (Wüstenfeld, *Medina*, p 99 *sqq*)

In Damascus, where every house, as is still the case, was amply supplied with water, Yākūt (d 626 = 1229) found no mosque, madrasa or khānakāh which did not have water flowing into a *birka* in the *ṣahn* (Yāḳūt, ii 590) Ibn Djubair describes the arrangements in the Mosque of the Omaiyads In the sahn, as is still the case, there were three kubbas The centre one rested on four marble columns, and below it was a basin with a spring of drinking-water surrounded by an iron grille This was called *kafaṣ al-māʾ* "water cage" North of the *ṣahn* was a Masdjid al-Kallāsa in the sahn of which there was again a *ṣihridj* of marble with a spring (Ibn Djubair, *Rihla*, p 267) There was also running water in an adjoining *mashhad* (p 269), in the khānakāh and madrasa (p 271), and in a hall beside the living apartments there was again a kubba with a basin (*hawd*) and spring water (p 269) There were also *sikāyāt* against the four outer walls of the mosque, whole houses fitted up with lavatories and closets (p 273), a century earlier, we are told that at each entrance to the mosque there was a *miʾdaʾa* (*B G A*, iii 159) The whole arrangements correspond exactly to those made by Khālid al Kasrī in Mecca in the Omaiyad period and must therefore date from the Omaiyads

It was the same in other Syrian and Mesopotamian towns In Sāmarrāʾ, al-Mutawakkil built in his new djamiʿ a *fawwāra* with constant running water (*B G A*, vii 265) In Nasibin, the river was led through the *sahn* of the mosque into a *sihridj*, there was also a sihridj at the eastern entrance with two *sikāyāt* in front of the mosque (Ibn Djubair, *Rihla*, p 239) In Mawsil in the mosque, which dated from the Omaiyad period, there was a spring with a marble cupola over it (*ibid*, p 235) In Harrān, there were in the sahn three marble kubbas with *biʾr* and drinking water (*ibid*, p 246), in Haleb two (*ibid*, p 253) In Kūfa there were three hawd with Euphrates water in front of the Djāmiʿ (*ibid*, p 212) but in the mosque in a zāwiya a domed building with running water (Yākūt, iv 325, 326, here called *tannūr*, cf *B G A*, v 173, Ibn Djubair, p 89, 267) It was the same in Āmid (Nāsir-i Khosraw, ed Schefer, p 28) and in Zarandj in Sidjistān (*B G A*, ii 298 *sq*) The principal mosques of the ʿIrāk had *mayādiʾu* at the entrances, for which, according to a remarkable note by Makdisī, rents were paid (*B G A*, iii 129, read *karāsīʾ*, cf *mastaba* Ibn Djubair, p 89) In Palestine also, in al-Makdisī's time, there were conveniences for ablutions at the entrances to the djawāmiʿ (*matāhir B G A*, iii 182, *Mayādiʾu ibid*, 1 58) and in Sanʿāʾ in the fourth century, beside each mosque, there was water for drinking and for *wudū*ʾ (*B G A*, vii 111) In Persia also, it was the custom to have a *hawd* in front of the mosque (*B G A*, iii 318) and there was drinking-water in the mosque itself on a bench (*kursī*) in iron jars into which ice was put on Fridays (*ibid*, p 327) Not only at the Zemzem well but also in the mosques of the ʿIrāk, men were appointed whose duty it was to distribute drinking-water (Ibari, iii 2165) — The regular custom, therefore, was to have at the entrance to, or in front of the mosque, conveniences for *wudū*ʾ, in the court of the mosque itself a fountain as the traditional ornament and for drinking water It was the exception for the *wudū*ʾ to take place in the mosque itself

In Egypt at first the Mosque of Ibn Tūlūn was arranged similarly to the Syrian mosques In the centre of the sahn there was a gilt dome, supported by sixteen marble columns and surrounded by a railing This upper storey was supported by nineteen marble columns and below was a marble basin (*kaʿa*) with a running fountain (*fawwāra*), the *adhān* was called from the dome (Makrīzī, iv 37, the description is not quite clear) People complained that there were no arrangements for washing (*miʾdaʾa*) there Ibn Tūlūn replied that

he had not made them because he had concluded the mosque would be polluted thereby He therefore made a *mi'da'a* with an apothecary's shop behind the mosque (*ibid*, p 38, 39, *Husn al-Muḥādara*, ii 139, Ibn Taghrībirdī, II/1 10) This suggests that previously in Egypt the washing arrangements had been directly connected with the mosque After the fire of the year 376, the *fawwāra* was renovated by al ʿAzīz (Maḳrīzī, iv 40), in 696 again by al-Lādjīn, whose inscription still exists (*C I A*, 1, N° 16) A new *mi'da'a* was built in 792 beside the old one on the north, outside the mosque (Maḳrīzī, iv 42)

The Mosque of ʿAmr first got a *fawwāra* in the time of al-ʿAzīz In 378—379 his vizier Yaʿkūb b Killis installed one in the cupola, already in existence for the *bait al-māl* Marble jars were put there for the water (probably drinking-water) (Makrizī, iv 9, 11, cf *Husn al-Muḥādara*, ii 136, Yāḳūt, iii 899) A new water basin was installed by Salāh al Dīn beside his manzara in the mosque The water was led to the *fawwārat al-fiskīya* from the Nile This was prohibited in the reign of Baibars al-Bundukdārī (658—676) by the chief kādī, because the building was being affected by it (Makrizī, iv 14, *Husn al-Muḥāḍara*, ii 137) The emīr, who restored it, brought the water for the *fiskīya* from a well in the street (Makrīzī, iv 15)

Like Ibn Tūlūn, the Fātimids do not seem to have considered the mi'da'a indispensable For the Azhar Mosque had originally no mi'da'a as late as al Hākim's wakf document for the provision of mi'da'a, money is given only with the provision that something of the kind should be made (Makrīzī, iv 51, 54) At a later date we hear of two mi'da'a's, one at the adjoining Akbughāwīya (*ibid*, p 54) On the other hand, there was already a fiskiya in the centre of the court, but whether it had existed from the first is not known It had disappeared, when traces of it were found in 827 in laying-out a new *sihridj* (*ibid*, p 54) The *fiskīya* of the Mosque of al-Hākim was not erected by the founder Like that of the Mosque of ʿAmr, it was removed in 660 by the kādī Tādj al-Dīn but after the earthquake of 702, it was again rebuilt and provided with drinking-water from the Nile (*ibid*, p 56, 57) and again renovated after 780 (*ibid*, p 61) A small mi'da'a, later replaced by another, was in the vicinity of the entrance (*ibid*, p 61) Other Fātimid mosques had basins in the sahn, which were supplied from the Nile and from the Khalīdj (*ibid*, p 76, 81, 120)

The traditional plan was retained in the period following also For example, we know that the emīr Tūghān in 815 placed a *birka* in the centre of the Djāmiʿ Āksunkur which was covered by a roof supported by marble pillars and supplied by the same pipe as the already existing mi'da'as (Makrizī, iv 107, cf 124, 138, 139 etc) At the ceremonial dedication of mosques, it was the custom for the patron to fill the *birka* in the sahn with sugar, lemonade or other sweet things (e g al Mu'aiyadī, in 822 Makrīzī, iv 139, Madrasat Djamāl al-Dīn in 811 *ibid*, p 253, another in 757 *ibid*, p 256)

The importance of the birka of the mosque, as a drinking-place, diminished as pious founders erected drinking fountains everywhere (cf for Mecca *Chron Mekka*, ii 116–118, also *B G A*, iv 211, s v *hubb*, p 258, s v *sabīl*) and especially when it became the custom to build a sabīl with a boy's school in part of the mosque (see below, E 4 end) A *hawd* for watering animals was also sometimes built in the vicinity of the mosque (Makrīzī, iv 76) Sometimes also the birka of the sahn was used for washing In the year 799 the emīr Yelbughā made arrangements for this in the Aḳmar mosque so that one could get water for *wudū'* from taps from a birka put up in the sahn (Makrīzī, iv 76) Makrīzī condemns this addition, but only because there was already a mi'da'a at the entrance and the sahn was too small for the new one (*ibid*) and not on grounds of principle, and it was only because the wall was damaged that the emīr's gift was removed in 815 (*ibid*, p 77) The custom of using the water supply of the sahn for *wudū'* survived in many places in Egypt The arrangements were therefore usually called *mi'da'a* or rather *mēdā* (which is not found in the inscriptions) If they had taps, they were called *hanafīya*, according to Lane's suggestion because the Hanafīs only permitted ablutions with running water or from a cistern 10 ells broad and deep (*Lexicon*, s v, cf *Manners and Customs*, Everyman's Library, p 69, cf on the question Max Herz, *Observations critiques sur les bassins dans les Ṣahns des Mosquees*, *B I E*, iii/7 1896, p 47—51, do, *La Mosquee du Sultan Hasan*, p 2, Herz wrongly dates the modern usage from the Turkish conquest in 1517) In quite recent times the *mi'da'a*'s have often been moved outside to special buildings Ibn al Hādjdj condemns bringing water into the mosque, because the only object is for ablutions and ablutions in the mosque are forbidden by "our learned men" (*Madkhal*, ii 47 *sq*, 49), like shaving, ablutions should be performed outside the mosque in keeping with the Prophet's saying *idj'alū maṭāhirakum ʿalā abwābi masādjidikum* (*ibid*, ii 58) It was in keeping with this principle that in earlier times the *mi'da'a* was usually put at the entrance and the barbers took up their places before the entrance (cf the name *Bāb al-Muzaiyinīn* "The Barbers' Gate" for the main entrance to the Azhar mosque) Mi'da'a's were also to be found in hospitals, thus the "lower hospital" was given two in 346, one of which was for washing corpses (Ibn Dukmak, p 99 infra)

E The Mosque as a State Institution

1 The Mosque as a political centre Its relation to the Ruler

It was inherent in the character of Islām that religion and politics could not be separated The same individual was ruler and chief administrator in the two fields, and the same building, the mosque, was the centre of gravity for both politics and religion This relationship found expression in the fact that the mosque was placed in the centre of the camp, while the ruler's abode was built immediately adjacent to it, as in Medina (and in al-Fustāt, Damascus, Basra, Kūfa) We can trace how this *dār al-imāra* or *kaṣr* (so for Kūfa Tabarī, ii 230 *sq*, *kasr al imāra ibid*, p 234) with the growth of the mosque gradually became incorporated in it in al-Fustāt and Damascus and was replaced by a new building The tradition remained so strong that in Cairo, when the new chief mosque Djāmiʿ al-ʿAskar was being planned in 169, a *Dār Umarā' Miṣr* was built beside it with direct access to the mosque (Makrīzī, iv 33

sq) and when Ibn Ṭūlūn built his mosque, a building called the *Dār al-Imāra* was erected on its south side, where the ruler, who now lived in another new palace, had rooms for changing his dress, etc, from which he could go straight into the maḳsūra (*ibid*, p 42)

The ᶜAbbāsids at the foundation of Baghdād introduced a characteristic innovation, when they made the palace the centre of the city, the ca se was similar with Fāṭimid Cairo, but Sulaimān b ᶜAbd al Malik in Ramla had already built the palace in front of the mosque (Balādhurī, p 143) Later rulers who no longer lived just beside the mosque, had special balconies or something similar built for themselves in or beside the mosque Ṣalāh al Dīn built for himself a *manzara* under the great minaret of the mosque of ᶜAmr (Maḳrīzī, iv 13, *Husn al-Muḥāḍara*, ii 137) and just to the south of the Azhar mosque the Fāṭimids had a *manzara* from which they could overlook the mosque (Makrīzī, ii 345)

The caliph was the appointed leader of the salāt and the khatīb of the Muslim community The significance of the mosque for the state is therefore embodied in the minbar The installation of the caliph consisted in his seating himself upon this, the seat of the Prophet in his sovereign capacity When homage was first paid to Abū Bakr by those who had decided the choice of the Prophet s successor, he sat on the minbar ᶜOmar delivered an address, the people paid homage to him and he delivered a khutba, by which he assumed the leadership (Ibn Hishām, p 1017, Tabarī, i 1828 *sq* , *K al-Khamīs*, ii 75, Yaᶜkūbī, ii 142), it was the same with ᶜOmar and ᶜOthmān (*ibid*, p 157, 187)

The khutba, after the glorification of God and the Prophet, contained a reference to the caliph's predecessor and a kind of formal introduction of himself by the new caliph It was the same in the period of the Omaiyads and ᶜAbbāsids (see for al-Walīd Ṭabarī, ii 1177 *sqq* , al-Amīn *ibid*, iii 764, al-Mahdī *ibid*, iii 389, 451, 457, cf on this question also Bukhārī, *Aḥkām*, bāb 43) The minbar and the *khutba* associated with it was still more important than the imāmate at the salāt, it was *minbar al-mulk* (*Ḥamāsa*, ed Freytag, p 656, v 4) According to a ḥadīth, the Prophet carried the little Ḥasan up to the minbar and said, "This my son is a chieftain" etc (Bukhārī, *Manāḳib*, bāb 25) This reflects the later custom by which the ruler saw that homage was paid to his successor-designate, this also was done from the minbar (cf *khuṭba yawm al-djumᶜat li 'l-Muᶜtaḍid bi-wilāyat al-ᶜahd*, Tabarī, iii 2131) The Fāṭimid caliph showed honour to a distinguished officer by allowing him to sit beside him on the minbar (*Husn al-Muḥāḍara*, ii 91), in the same way Muᶜāwiya allowed Ibn ᶜAbbās to sit beside him *ᶜalā sarīrihi* (Ibn Abī Usaibiᶜa, i 119) but whether the reference is to the minbar is perhaps doubtful The *baiᶜa* could also be received by another on behalf of the caliph but it must be accepted on the minbar Thus the governor of Mecca in 196 accepted on the minbar homage to ᶜAbd Allāh b Maᵓmūn and the deposition of Muhammad b Hārūn (Tabarī, iii 861 *sq* , cf for al-Mahdī *ibid*, p 389) There are other cases in which the solemn deposition of a ruler took place on or beside the minbar (*Aghānī*, 2nd ed Cairo, i 12, Wüstenfeld, *Medina*, p 15) Even at a much later date, when spontaneous acclamation by the populace was no longer of any importance, the ceremonial installation on the minbar was still of importance (Makrīzī, iv 94) It had become only a formality but still an important one Homage was paid to the ᶜAbbāsid caliphs in Egypt in the great *īwān* of the palace or in a tent in which a minbar had been put up, and similarly to the sultāns whose investiture was read out from the minbar (cf Quatremere, *Hist Sult Maml*, i/i 117, 149 *sqq*, 183 *sqq*) If one dreamt that he was sitting on the minbar, it meant that he would become sultān (*ibid*, ii/ii 103) — The ᶜAbbāsid caliph had however long had his own throne after the old Persian fashion in his palace (*al-Tādj fī Akhlāk al-Mulūk*, ed Ahmad Zakī, Cairo 1914, p 7 *sqq*) and so had the Fāṭimids (Ibn Taghrībirdī, ii/i 457) and the Mamlūks (Quatremere, *op cit*, i/i 87, cf 147) When later we find mention of the *kursī 'l-khiṭāfa* (v Berchem, *Corpus*, i, N⁰ 33), *sarīr al mulk* (*Chron Mekka*, iii 113), *sarīr al salṭana* (Makrīzī, ii 157, cf *al-sarīr*, royal throne *B G A*, ii 282, 285, *kursī* similarly cf Ibn ᶜArabshāh, *Vita Timuri*, ed Manger, ii 486) or *martabat al mulk* (Quatremère, *op cit*, i/ii 61), the reference is no longer to the minbar This does not mean that the ruler could no longer make public appearances in the mosques thus in 648 Muᶜizz Aibak regularly gave audiences in *al-madāris al-ṣāliḥīya* (Quatremère, *Hist Sult Maml*, i/i 17) and memorial services for Baibars were held a year after his death in several mosques, madāris and khawānik in Cairo (677 = 1278, *ibid*, i/ii 164 *sq*)

The caliph spoke chiefly from the minbar of the capital, but when he made the pilgrimage he also spoke from the *manābir* in Mecca and Medina (cf e g Ṭabarī, ii 1234, Yaᶜkūbī, ii 341, 501, *Chron Mekka*, i 160) Otherwise in the provinces, the governor stood in the same relation to the mosques as the caliph in the capital He was appointed "over salāt and sword" or he administered "justice among the people" and the salāt (Ṭabarī, iii 860), he had "province and minbar" under him (*ibid*, ii 611), *al wilāyāt wa 'l-khutba* (*B G A*, iii 337) Speaking from the minbar was a right which the caliph had delegated to him and it was done in the name of the caliph ᶜAmr b al-ᶜĀṣī therefore refused to allow people in the country to hold *djumaᶜ* except under the direction of the commander (Makrīzī, iv 7) This point of view was never quite abandoned The khutba was delivered "in the name of" the caliph (*ibid*, p 94) or "for" him (*li ibid*, p 66, 74, 198, Ibn Taghrībirdī, ii/i 85 *infra*, *B G A*, iii 485 *supra*) and in the same way an emīr delivered a khutba "for" a sultān (Makrīzī, iv 213, 214). The sultān did not have the "secular" and the caliph the "spiritual" power, but the sultān exercised as a Muslim ruler the actual power which the caliph possessed as the legitimate sovereign and had formally entrusted to him During the struggles between the different pretenders, there was thus a confession of one's politics if one performed the salāt with the one or the other governor (Ṭabarī, ii 228, 234, 258, *Chron Mekka*, ii 168) The pretenders disputed as to whether the one or the other could put up his standard beside the minbar (Tabarī, iii 2009)

Like the caliph, the governor also made his formal entry into office by ascending the minbar

and delivering a khutba, this was the symbol of his authority (e g Tabarī, ii 91, 238, 242, *Chron Mekka*, ii 173, cf *Hamāsa*, p 660, v 2—3, Djāhiz, *Bayān*, iii 135) After glorifying God and the Prophet, he announced his appointment or read the letter from the caliph and the remainder of his address, if there was a war going on, was exclusively political and often consisted of crude threats The khutba was not inseparably connected with the Friday service The commander-in chief could at any time issue a summons to the salāt and deliver his khutba with admonitions and orders (see Tabarī, ii as above and p 260, 297 *sq*, 298, 300, 863, 1179) and it was the same when he left a province (*ibid*, p 241), a governor, who could not preserve his authority with the khutba, was dismissed (*ibid*, p 592)

Since war was inseparably associated with early Islām and the mosque was the public meeting-place of ruler and people, it often became the scene of warlike incidents While the governor in his khutba was issuing orders and admonitions relating to the fighting, cheers and counter-cheers could be uttered (*ibid*, p 238) and councils of war were held in the mosque (Tabarī, i 3415, ii 284, Balādhurī, p 267) Soon after his election ʿAbd al Malik asked from the minbar who would take the field against Ibn al-Zubair and al Hadjdjādj shouted that he was ready to go (*Chron Mekka*, ii 20) After the battle of the Camel, ʿAlī sent the booty to the mosque of Basra and ʿĀʾisha looked for another mosque (Tabarī, i 3178, 3223) Rowdy scenes occasionally took place in mosques (Kindī, *Wulāt*, p 18), Ziyād was stoned on the minbar (Tabarī, ii 88), one could ride right into the mosque and shout to the governor sitting on the minbar (*ibid*, p 682), fighting often took place in and beside the mosque (*ibid*, p 960, 1701 *sqq*, Wustenfeld, *Medina*, p 13 *sq*) Some times for this reason, the governor was surrounded by his bodyguard during the salāt or on the minbar or even clothed in full armour (al-Walīd Tabarī, ii 1234, Yaʿkūbī, ii 341, al-Hadjdjādj Tabarī, ii 254) Salāt and sword were thus closely associated in reality

It thus came to be the custom for the enemies of the ruler and his party to be cursed in the mosques This custom continued the old Arab custom of regular campaigns of objurgation between two tribes but can also be paralleled by the Byzantine ecclesiastical anathematisation of heretics (cf Becker, *Islāmstudien*, i 485 *Gesch d islām Kultus*)

The first to introduce the official cursing of the ʿAlids from the minbar of the Kaʿba is said to have been Khālid al-Kasrī (*Chron Mekka*, ii 36) The reciprocal cursing of Omaiyads and ʿAlids became general (cf Tabarī, ii 12, 4 *sq*, *Aghānī*, 2nd edition Cairo, x 102, Ibn Taghrībirdī, i 248, see also Lammens, *Moʿâwia*, p 180 *sq*) Like the blessing upon the ruler, it was uttered by the *kussās* (Makrīzī, iv 16), it was even recorded in inscriptions in the mosque (Ibn Taghrībirdī, ii/i, ed Popper, p 63, 64, cf also Mez, *Renaissance*, p 61) As late as 284, al-Muʿtadid wanted to restore the anathematisation of Muʿāwiya from the minbar but abandoned the idea (Tabarī, iii 2164) Anathemas were also pronounced on other occasions, for example, Sulaimān had al-Hadjdjādj (*Chron Mekka*, ii 37) and al-Muʿtamid Ibn Tūlūn solemnly cursed from the manābir (Tabarī, iii 2048, 5 *sqq*) and other rulers had Muʿtazilī heretics cursed from the pulpits (see Mez, *op cit*, p 198, cf against Ibn Taimīya Quatremere, *Hist Sult Maml*, ii/ii 256) Ibn Battūta describes the tumultuous scene with thousands of armed men uttering threats in a mosque in Baghdād when a Shīʿī khatīb was on the minbar (ii 58)

It was very natural to mention with a blessing upon him the ruler in whose name the Friday khutba was delivered Ibn ʿAbbās, when governor of Basra, is said to have been the first to pronounce such a *duʿāʾ* over ʿAlī (Ibn Khaldūn, *Mukaddima*, *faṣl* 37, end), it is not improbable that the custom arose out of the reciprocal objurgations of ʿAlids and Omaiyads, the *kuṣṣāṣ*, who had to curse the ʿAlids in the mosques, used to pray for the Omaiyads (Makrīzī, iv 17) Under the ʿAbbāsids, the custom became the usual form of expressing loyalty to the ruler (Ibn Taghrībirdī, ii/i 151) After the caliph, the name of the local ruler or governor was mentioned (*ibid*, p 156, 161), even in Baghdād in 369 by order of the caliph al-Tāʾiʿ, the actual ruler ʿAdud al Dawla was mentioned in the *duʿāʾ* (Ibn Miskawaih, vi 499, Cairo 1915, p 396) and the Būyids, according to al Makdisī, were generally mentioned in the khutba even in the remotest parts of the kingdom (this is evident from the above-mentioned expression *khuṭba lahū*, for which we also find *ʿalaihi* see *B G A*, ii 20, iii 337, 338, 400, 472, 485, cf Glossary, s v) There is also evidence that prayers used to be uttered for the heir-apparent (Makrizī, iv 37, *Kitāb al-Wuzarāʾ*, ed Amedroz, p 420) Under the Mamlūks also, the sultan's heir was mentioned (Quatremère, *Hist Sult Maml*, ii/i 101, ii/ii 3) Under the Fātimids, it was even the custom to call *salām* upon the ruler from the minaret after the *adhān al fadjr* (Makrizi, iv 45), this also took place under the Mamlūks (e g in 696 = 1297, when Ādjīn was elected Quatremere, *Hist Sult Maml*, ii/ii 45) The prayer for the sovereign in the khutba did not find unanimous approval among the learned (see Snouck Hurgronje, *Verspreide Geschriften*, ii 214 *sq*)

In general, the mosque, and particularly the minbar, was the place where official proclamations were made, of course as early as the time of the Prophet (Bukhārī, *Salāt*, bāb 70, 71), ʿOthmān's bloodstained shirt was hung upon the minbar (Tabarī, i 3255), messages from the caliph were read from it (*ibid*, iii 2084) Al Walid announced from the minbar the deaths of two distinguished governors (Ibn Taghrībirdī, i 242), the results of battles were announced in khutbas (Yākūt, i 647, *al-ʿIkd al-farīd*, ii, Cairo 1321, p 149 *sq*) In the Fātimid and ʿAbbāsid periods also proclamations, orders, edicts about taxation etc by the ruler were announced in the principal mosque (Tabarī, ii 40, iii 2165, Ibn Taghrībirdī, ii/ii 68, Makrizi, *Ittiʿāz*, ed Bunz, p 87 *supra*, Quatremère, *Hist Sult Maml*, i/ii 89, ii/ii 44, 151), documents appointing the more important officers were also read upon the minbar (Kindī, *Wulāt*, p 589, 599, 603, 604, etc *pass*, Makrīzi, ii 246, iv 43, 88), frequently the people trooped into the mosque to hear an official announcement (Kindi, *Wulāt*, p 14, cf Dozy, *Gesch d Mauren in Spanien*, ii 170)

After the position of the caliph had changed, tradition was so far retained that he still delivered the khutba in the principal mosque on special occasions,

particularly at festivals Thus the Fāṭimid al-ʿAzīz preached in the mosque of al-Ḥākim on its completion (Makrīzī, iv 55) and in the month of Ramadān he preached in the three chief mosques of Cairo, one after the other (*ibid*, p 53, cf 61 *sq* , Ibn Taghrībirdī, II/1 482 *sqq* , exceptionally also in al-Rāshida Makrīzī, iv 63) The ʿAbbāsid caliph also used to preach at festivals (e g al-Rādī Yākūt, *Udabāʾ*, ii 349 *sq*), it was the exception when a zealot like al Muhtadī (255) followed the old custom and preached every Friday (Masʿūdī, *Murūdj*, viii 2) Even the caliph *fainéant* in Egypt preached occasionally (Makrīzī, iv 94, Quatremere, *Hist Sult Maml*, II/1 138 *sq*) Although the mosque lost its old political importance in its later history, it has never quite lost its character as the place of assembly on occasions of public importance This is evident from al-Djabartī's history and even quite recently large meetings have been held in the mosques of Egypt on questions of nationalist politics

2 The Mosque and public administration

The actual work of government was very early transferred from the mosque into a special *dīwān* or *madjlis* (see Tabarī, *Gl*, s v) and negotiations were carried on and business frequently done in the *kaṣr al-imāra* (cf Tabarī, ii 230 *sq*) But when financial business had to be transacted at public meetings, the mosque was used, of this there is particular evidence from Egypt Here the director of finance used to sit in the Mosque of ʿAmr and auction the farming out of the domains, with a crier and several financial officers to assist him Later the Dīwān was transferred to the Djāmiʿ Aḥmad b Ṭūlūn but even after 300 A H we find Abū Bakr al-Madharāʾī sitting on such occasions in the Mosque of ʿAmr Under the Fāṭimids the vizier Yaʿkūb b Killis used first the *dār al-imāra* of the Mosque of Ibn Ṭūlūn (see above), later his own palace and afterwards the caliph's kaṣr was used (Makrizi, i 131 *sq*) In the same way, in the reign of Muʿāwiya, the Coptic churches were used and the taxation commission took up their offices in them (*Papyrus Erzherzog Rainer, Führer durch die Ausstellung*, N⁰ 577), and Ibn Rosta (c 290 = 903) says that the officials in charge of the measurement of the Nile, when they noticed the rising of the river, went at once to the chief mosque and announced it at one *halka* after another, at the same time scattering flowers on those seated there (*B G A*, vii 116)

The connection with administration was also seen in the fact that the treasure-chest, the *bait al-māl* (identical with the *tābūt*, Kindī, *Wulāt*, p 70, 117) was kept in the mosque In al-Fustāt Usāma b Zaid, the director of finance, in 97 and 99 built in the Mosque of ʿAmr a *kubba* on pillars in front of the minbar for the *bait al-māl* of Egypt A drawbridge was placed between it and the roof In the time of Ibn Rosta (c 300) it was still possible to move about freely below the kubba but in 378—379 al-ʿAzīz put up a running fountain below it (*B G A*, vii 116, Makrīzī, iv 9, 11, 13, *Husn al-Muḥādara*, ii 136, Yākūt, iii 899) Al Kindī records an attempt to steal the chest in 145 (*Wulāt*, p 112 *sq*) In the disturbed years about 300, the walī al Nūsharī closed the mosque between the times of salāt for the safety of the chest, which was also done in Ibn Rosta's time (Kindī, *Wulāt*, p 266, *B G A*, vii 116) New approaches to the Bait al-Māl were made in 422 from the khizāna of the mosque and from the Dīwān (Maḳrīzī, iv 13)

In Kūfa, the *buyūt al amwāl*, at least during the early period, were in the Dār al Imāra (Tabarī, i 2489, 2491 *sq*), in the year 38 during the fighting, it was saved from Basra and taken with the minbar to the Mosque of al Huddān (*ibid*, p 3414 *sq*) In Palestine, in the chief mosque of each town, there was a similar arrangement to that in the Mosque of ʿAmr (*B G A*, iii 182) In Damascus the *bait al-māl* was in the most western of the three kubba's in the court of the Mosque of the Omaiyads, it was of lead and rested on 8 columns (*B G A*, iii 157, Ibn Djubair, p 264, 267, Ibn Battūta, i 200 *sq*), it is still called *kubbat el-khazne* ("treasure cupola", earlier *kubbat ʿĀʾisha*) (cf Baedeker, *Palastina und Syrien*) In the time of the two travellers mentioned, the kubba only contained property of the mosque Ibn Djubair saw a similar kubba in the chief mosque of Harrān and says that it came from the Byzantines (p 246) In Ādharbāidjān also by the time of Istakhrī, the Syrian custom had been everywhere introduced (*B G A*, i 184), in Īrānshahr in the centre of the court, there was a building with marble columns and doors (*B G A*, iii 316) which perhaps points to a similar statement of affairs and in Armenia it is recorded that the *bait al māl* was kept in the Djāmiʿ in the time of the Omaiyads as in Miṣr and elsewhere (*B G A*, ii 241) The kubba was usually of lead and had an iron door Ibn al-Ḥādjdj considers it highly illegal to shut off a dīwān in a mosque, which is the same as forbidding entrance to it This shows that the custom still survived in his time

Ibn Djubair's remark about Harrān suggests that here again we have an inheritance from Byzantium It was probably the building belonging to the *piscina* (cf above) that the Muslims put to a practical use in this way For the Byzantines had the treasury (*sakellē*) in the palace and it is doubtful if the treasure-chambers of the church (*skenophylakion*) were built in this way (cf Franz Dolger, in *Byzantinisches Archiv*, Heft 9, 1927, p 26, 34)

3 The Mosque as a court of justice

That the Prophet used to settle legal questions in his mosque was natural (see Bukhārī, *Aḥkām*, bāb 19, 29 etc , cf *Ṣalāt*, bāb 71, *Khuṣūmāt*, bāb 4), but he could also deliver judgments in other places (*ibid*, pass) In Ḥadīth, it is recorded that some ḳādis of the earlier period (Shuraih, al-Shaʿbī, Yaḥyā b Yaʿmar, Marwān) sat in judgment beside the minbar, others (al Ḥasan, Ḍurāʿa b Awfā) on the open square beside the mosque (Bukhārī, *Aḥkām*, bāb 18) The custom had all the better chance of survival, as churches were used in the same way (Joshua Stylites, ed Wright, ch 29, cf Mez, *Renaissance*, p 223) Sitting in judgment was primarily the business of the ruler but he had to have assistants and Abū Bakr's kādī is mentioned as assisting ʿOmar (Tabarī, i 2135) and a number of judges appointed by ʿOmar are mentioned (*B G A*, vii 227) In the reign of ʿOthmān, ʿAbd Allāh b Masʿūd is said to have been judge and financial administrator of Kūfa (Ibn Kutaiba, *Maʿārif*, ed Wustenfeld, p 128) On the other hand, we are told that ʿAbd Allāh

b. Nawfal, appointed by Marwān in 42, was the first kādī in Islām (Tabarī, iii 2477), it is recalled that in the year 132 the ḳādī of Medīna administered justice in the mosque (*ibid*, p 2505) In Basra, we are told that al-Aswad b Sarī^c al Tamīm immediately after the building of the mosque (i e in the year 14) worked in it as kādī (Balādhurī, p 346) In the early period ^cOmar wanted to choose a kādī, who had been already acting as a judge before Islām (Kindī, *Wulāt*, p 301 *sq*, *Husn al-Muhādara*, ii 86) Even the Christian poet al-Akhtal was allowed to act as arbiter in the mosque of Kūfa (see Lammens, *Mu^câwia*, p 435 *sq*)

In al-Fustāt, as early as 23 or 24 A H by command of ^cOmar, ^cAmr b al-^cĀsī appointed a ḳādī named Kais (*Husn al-Muhādara*, ii 86, Kindī, *Wulāt*, p 300 *sq*) The kādī held his sessions in the Mosque of ^cAmr but not exclusively there The ḳādī Khair b Nu^caim (120—127) held his sessions sometimes before his house, sometimes in the mosque and for Christians on the steps leading up to the mosque (Kindī, *Wulāt*, p 351 *sq*) A successor of his (177—184) invited Christians who had lawsuits into the mosque to be heard (*ibid*, p 391), of another judge (205—211) it is recorded that he was not allowed to sit in the mosque (*ibid*, p 428) It seems that the kādī could himself choose where he would sit A judge, officiating in the year 217, sat in winter in the great pillared hall turning his back towards the ḳibla wall and in summer in the sahn near the western wall (*ibid*, p 443 *sq*) During the Fātimid period, the subsidiary building on the north east of the Mosque of ^cAmr was reserved for the judge This judge, called from the year 376 onwards *kādī 'l-kudāt* (cf *Husn al-Muhādara*, ii 91, Kindī, *Wulāt*, p 590), sat on Tuesday and Saturday in the mosque and laid down the law (Makrīzī, ii 246, iv 16, 22, cf Kindī, *Wulāt*, p 587, 589, cf *Sefer-Nāme*, transl Schefer, p 149)

In Ya^cḳūbī's time in Baghdād, the judge of the east city used to sit in its chief mosque (*B G A*, vii 245), in Damascus the vice-kādī in the fourth century had a special riwāḳ in the Mosque of the Omaiyads (*B G A*, iii 158), and the notaries (*al-shurūṭiyūn*) also sat in the Mosque of the Omaiyads at the Bāb al-Sā^cāt (*ibid*, p 17) In Nisābūr, every Monday and Thursday, the *madjlis al-hukm* was held in a special mosque (*ibid*, p 328) In course of time the judge was given a *madjlis al-hukm* of his own (cf *Husn*, ii 96) and in 279 al Mu^ctadid wanted to forbid the ḳādīs to hold sessions in the mosques (Ibn Taghribirdī, ii/i 87 *supra*, perhaps however we should read *kāṣṣ* see Goldziher, *Muh Stud*, ii 164, note 4) Justice was also administered in the *dār al-^cadl* (Quatremère, *Hist Sult Maml*, ii/ii 79) But the administration of justice did not at once lose all connection with the mosque Under the Fātimids, the custom had been introduced that the kādī should hold sittings in his house, but Ibn al-^cAwwām, appointed just after 400 A H, held them either in the Djāmi^c at the Bait al-Māl or in a side-room (Kindī, *Wulāt*, p 612, cf Ibn Taghribirdī, ed Popper, ii/ii, p 69, Kalkashandī, *Subh al-A^cshā*, iii 487 for 439 = 1046, see Nāsir-i Khosraw, ed Schefer, p 51, text, p 149, transl) In Mecca, the *dār al-kādī* was in direct connection with the mosque (Ibn Djubair, p 104) In the viiith century Ibn Battūta attended a court presided over by an eminent jurist in a mosque (madrasa) in Shīrāz (ii 55, 63, cf also *al-Madkhal*, ii 54 *infra*), and in Damascus the Shāfi^cī chief ḳāḍī held his sessions in the ^cĀdilīya Madrasa (so Ibn Khallikān, Quatremère, *Hist Sult Maml*, ii/i 22, cf also for Egypt *ibid*, p 87, ii/ii 253), the vice kādīs sat in the Zāhirīya Madrasa (Ibn Battūta, i 218) The judgment might even be put into execution in the madrasa (*ibid*, p 220) During the Mamlūk period in Egypt, we occasionally find a small mosque being used as a madjlis for judges (Makrīzī, iv 270, Ibn Dukmāk, p 98 *supra*), Ibn Khaldūn held legal sittings in the Madrasa al-Ṣālihīya (*^cIbar*, vii 453)

A muftī, especially in the large mosques, was also frequently appointed, he sat at definite times in a *halka li 'l fatwā*, e g in Cairo (al-Kazwīnī, *Husn al-Muhādara*, i 182, Djalāl al Dīn, *ibid*, p 187), in Tunis (Zarkashī, *Chronicle*, transl Fagnan, *Rec Mem Soc Arch Constantine*, vol xxi, 1895, p 197, 202, 218, 248) In Baghdād Abū Bakr al-Dīnawarī (d 405) was the last to give fatwās in the Mosque of al-Mansūr according to the madhhab of Sufyān al-Thawrī (Ibn Taghrībirdī, ed Popper, ii/ii, p 120)

F The Mosque as an Educational Centre

1 Islāmic studies in the Mosque to the end of the Fātimid period

The new studies stimulated by Islām were from their nature associated with the mosque The learning by heart and the understanding of the Kur'ān formed the starting-point and next came the study of Hadīth, by which the proper conduct for a Muslim had to be ascertained The Prophet was often questioned on matters of belief and conduct, in or outside the mosque (Bukhārī, *^cIlm*, bāb 6, 52, 23, 24, 26, 46) After the death of the Prophet, his Companions were consulted in the same way and scientific study began with the collection and arrangements of hadīths, as has been shown, notably by Goldziher This process is reflected in the hadiths themselves According to them, even the Prophet in his lifetime was asked about hadīths (*ibid*, bāb 4, 14, 33, tr 9, 51, 53), the Prophet sits in a mosque surrounded by a *halka* and instructs his hearers, the latter repeat the hadīths three times until they have learned them (*ibid*, bāb 8, 30, 35, 42) The necessity of *^cilm* is strongly emphasised and the *talab al-^cilm* is recommended, a man is held up as a model because he undertook a month's journey for the sake of a single hadīth (*ibid*, bāb 19–22, cf Goldziher, *Muh Stud*, ii 32 *sq*, 175 *sq*) Jewish influence is perhaps to be recognised when learning is compared with the drinking of water (Bukhārī, *^cIlm*, bāb 20, cf *Proverbs*, xviii 4, *Pirkē Abōth*, i 4, 11) and the teachers are called *rabbāniyūn* (Bukhārī, *^cIlm*, bāb 10) A special class of students, *Ahl al-^cIlm*, was formed who spread the knowledge of traditions throughout Muslim lands (*ibid*, bāb 7) They collected people around them to instruct them in the most necessary principles of the demands of Islām, ^cAbd Allāh held one of these *maw^ciza* every Thursday, only once a week, in order not to tire the people (*ibid*, bāb 12) In this simple form of instruction which was indistinguishable from edifying admonitions lay the germ of Islāmic studies The teacher *dhakkara* his hearers, elsewhere it is called *fakkaha* or *allama* and the knowledge imparted is

ʿilm or *ḥikma* (*ibid*, bāb 15) Such knowledge was imparted to the tribes by the Prophet (*ibid*, bāb 25) or by teachers sent to them In the year 17, ʿOmar sent teachers of the Kurʾān in all directions and ordered the people to appear every Friday in the mosque The complicated nature of the subjects of study resulted at the principal centres of Islām in the formation not only of a guild of teachers but of a regular system of instruction The typical scholar, in addition to the *kārīʾ*, was the *muḥaddiṯ* (*ibid*, bāb 29) although new branches of study were soon added as a result of contact with lands with older cultures, notably linguistic studies and in this connection the study of the old poetry, philosophical and speculative studies, logic, etc The learned man of the old period was also called *fakīh* (*Husn al-Muḥāḍara*, i 131, Ṭabarī, ii 1183, 1266, *Aghānī*, viii 89, Ibn Saʿd, v 167 etc) Even after the new branches of learning were added to the older studies, the mosque remained the chief centre of instruction This may have been facilitated by the fact that in the old Christian countries it had been the custom for studies to be prosecuted in connection with monasteries and churches (on the university connected with the Church of the Apostles in Constantinople cf A Heisenberg, *Grabeskirche und Apostelkirche*, ii, 1908, p 17 *sqq*)

We hear of a madjlis for educational purposes in the Medīna mosque in the first century A H (*Aghānī*, i 48, iv 162 *sq*) Yazīd b Abī Habīb sent by ʿOmar b ʿAbd al ʿAzīz as muftī to Egypt (d 128), is said to have been the first to teach in Egypt (*Husn al-Muḥāḍara*, i 131), he is mentioned along with another as teacher of al Laiṯ (Kindī, *Wulāt*, p 89) and the latter, upon whose pronouncements fatwā's were issued had his halka in the mosque (*Husn*, i 134) ʿOmar II had before this sent al-Nāfiʿ, the Mawlā of Ibn ʿOmar, to Egypt to bring them the *sunan* (*ibid*, p 130) He also sent an able reciter of the Kurʾān to the Maghrib as kādī to teach the people *kirāʾa* (*ibid*, p 131) Education was arranged for by the government by allowing suitable people to give instruction in addition to their regular office From the very first, education in Egypt was closely connected with admonition to right living The first teachers in the mosques were the *kuṣṣās*, as a rule kādīs, whose discourses dealt with the interpretation of the Kurʾān and the proper conduct of divine service (cf C 3) Their *mawʿiza* was the direct continuation of the moral instruction given by the old Companions (cf Bukhārī, *ʿIlm*, bāb 12) The instruction started in the mosque of ʿAmr was continued for centuries In the third century A H, al-Shāfiʿī taught various subjects here every morning till his death (240) (*Husn al Muḥāḍara*, i 134, Yākūt, *Udabāʾ*, vi 383) It was after his time that the study of fiḳh came markedly to the front and the great teachers used at the same time to give fatwās (cf *Husn*, i 182 ʿAbd Allāh al-Kazwīnī, d 315 i 183 ʿAbd al-Rahmān al-Rāzī, d 339) In the year 326 (938), the Shāfiʿīs and Mālikīs had each 15, the Hanafīs 3 groups in the mosque of ʿAmr (Ibn Saʿīd, ed Tallquist, p 24) The Mālikī Muhammad al-Naʿṣālī (d 380) had so many hearers that the class occupied the area which 17 pillars included (*Husn*, i 207) In the fourth century, al-Maḳdisī mentions the groups (*halak*) of *fukahāʾ*, *kurrāʾ* and *ahl al-adab wa ʾl-ḥikma*, who sat in the mosque (*B G A*, iii 205, cf for the fifth century Nāsir-i Khosraw, ed Schefer, p 50 [text], p 148 [transl]) He also mentions that the followers of Abū Hanīfa held meetings in the Masdjid al-Aksā with *dhikr*, which here must mean something like lectures, where they read out of a volume and the *fukahāʾ* used to sit in the mosques of Palestine generally, to teach between the salāts (*B G A*, iii 182) In the third century, Ibn al-Fakīh tells how the *fukahāʾ* sit in the mosques of Sidjistān, Balkh and Herāt, while the people crowd around them (*ibid*, ii 317) The *madhāhib* which later lost their importance had also their study-circles in the mosques For example al-Maḳdisī says that the Dāwūdiya had study-groups in Fārs (iii 439) and the Awzāʿiya had even a madjlis in the mosque of the Omaiyads (*ibid*, p 179)

Arabic philological studies were ardently prosecuted in the mosques The interest of the early Arabs in rhetoric survived under Islām, the fakīh Saʿīd b al Musaiyab (d 95) (cf Ṭabarī, ii 1266) discussed Arabic poesy in his madjlis in the mosque in Medīna, but it was still thought remarkable that poems should be dealt with in a mosque (*Aghānī*, i 48, iv 162 *sq*) In the year 256, al-Ṭabarī by request dictated the poems of al-Ṭirimmāh beside the Bait al-Māl in the Mosque of ʿAmr (Yākūt, *ʿUdabāʾ*, vi 432 *infra*) In the chief mosque of Basra, the *Ashāb al ʿArabīya* sat together and were visited by Hamad b Salama (d 167 or 169) while he made Hasan al-Basrī give lessons (*ibid*, iv 135) In Granada we hear of a nahwī who gathered many pupils around him in the djāmiʿ (Maḳḳarī, ii 254) In Tunis in the viiith century, the Maḳāmas of al Harīrī were actually read in the Djāmiʿ Zaitūna (Zarkashī, transl Fagnan, *Rec Soc Arch Constantine*, 1894, p 111) In Baghdād al-Kisāʾī gave his lectures in the mosque, which bears his name and the pupils used to take their places in front of him after the morning salāt (Yākūt, *Udabāʾ*, iv 243 *sq*) About 200 A H we hear of lectures on *tafsīr* in the principal mosque of the same town (*ibid*, vii 105) At the same time, the study of Hadīth still retained its importance (Wustenfeld, *Schāfiʿī*, iii 362) The Mosque of al-Mansūr remained the most distinguished school, the goal of all the learned (Yākūt, *Udabāʾ*, i 246 *sq*) When a traveller came to a new town, he could go to the djāmiʿ in the confidence that he could attend lectures on Hadīth there (*B G A*, iii 415, in Sūs) In Mecca, for example, al Shāfiʿī lectured (Yākūt, *Udabāʾ*, vi 391), in Medīna Ibn Ishāk, who died in 234 (*ibid*, p 400, 401) In Damascus we hear of some one who lectured on *kirāʾa* (*Husn*, i 182) and of another, Abū Ṭāhir al Iskandarānī (d 359) who lectured on Hadīth in the same place (*ibid*, i 183) Teachers went from one town to another Makī b Abī Ṭālib came from Kairawān to Misr, Mecca and Kurtuba, in the last named place he put up in two riwāks of the chief mosque, where he lectured on *kirāʾa*, afterwards in another mosque, and he was much sought after on account of his *ʿilm* (Yākūt, *Udabāʾ*, vii 174) At quite an early date we read of special apartments (which were certainly also lecture-rooms) for authorities on the Kurʾān, for, according to al-Wākidī, ʿAbd Allāh b Umm Maktūm lived in Medīna in the *Dār al-Kurrāʾ* (*Husn al-Muḥāḍara*, ii 142)

As is evident from the examples quoted, studies were not only prosecuted in the chief mosques but also in other mosques In Egypt, not only

the Mosque of ʿAmr but also the chief mosques of later date were important centres of study As soon as the Mosque of Ibn Tūlūn was founded, a pupil of al-Shāfiʿī began to lecture in it on Hadīth (*Husn al-Muhādara*, II 139) During the Fātimid period this was continued In the year 361 (972), the Azhar Mosque was finished Soon afterwards, the new Shīʿī Kādī, ʿAlī b al-Nuʿmān, lectured in it on Fikh according to his school, in 378 al-ʿAzīz and his vizier Yaʿkūb b Killis founded 35 lectureships and in addition to their salaries, the lecturers were given quarters in a large house built beside the mosque (Makrīzī, IV 49, Sulaiman Rasad al-Hanafi, *Kanz al-Djawhar fī Taʾrīkh al-Azhar*, p 32 *sqq*) Immediately after the foundation of the Mosque of al-Hākim, the *fukahāʾ* gave lectures (*tahallaka* Makrīzī, IV 55) in it In the Fātimid Mosque of al Akmar, also founded in 519, teaching was carried on from the very first (*ibid*, p 77)

We can therefore say definitely that mosques were from the beginning through the centuries educational institutions, that learned men occasionally used to live in mosques and that under the Fātimids and probably much earlier, there were special houses for the learned teachers The mosque therefore corresponded to church, town hall and school and sometimes hostel It was, then, a public place of assembly for the town Nāsir i Khosraw in 439 (1047) gives a vivid picture of the activity in the Mosque of ʿAmr which was visited by 5,000 people daily, teachers, Kurʾān reciters, students, strangers, scribes, who drew up bill of exchanges and contracts etc (ed Schefer, text, p 50 and transl, p 148) It was therefore an exception when the Sakhra Mosque was open only on Mondays and Fridays (Sauvaire, *Hist Jerus et Hebr*, p 54) which happened with very few other sanctuaries, and also unusual for the mosque only to be opened for prayer, as sometimes happened out of consideration for the safety of the *bait al-māl* The people demanded unrestricted access to the mosque at all times (cf Makrizi, IV 54)

2 Special Educational Institutions

In the descriptions of the larger mosques the libraries are often mentioned These collections were gradually brought together from gifts and bequests, and it was a common thing for a scholar to give his books for the use of the *Muslimin* or *Ahl al-ʿIlm* (e g al-Khatīb al Baghdādi Yāḳūt, *Udabāʾ*, I 252, cf IV 287) Many other libraries were semi-public These often supplemented the libraries of the mosques, because they contained books in which the mosques were not much interested, notably on logic, falsafa, geometry, astronomy, music, medicine and alchemy, the latter were called *al-ʿulūm al-kadima* (Ibn Abī Usaibiʿa, I 113, uses this already for the pre-Islāmic period) or *ʿulūm al awāʾil* (on them see Goldziher, in *Abh Pr Ak W*, 1915, Phil Hist Kl, N⁰ 8, Berlin 1916) The academy, *Bait al-Hikma*, founded by al-Maʾmūn (198—202) in Baghdad, deserves first mention It recalls the older academy founded in Gundēshāpūr, to which Mansūr had invited Gorgios b Gabrīʾēl as head of the hospital, he also translated works from the Greek (Ibn Abī Usaibiʿa, I 123 *sq*) In the new academy there was a large library, and it was extended by the translations which were made by men qualified in the above-mentioned fields, there was also an astronomical observatory attached to the institution in which there were also apartments for the scholars attached to it (*Fihrist*, ed Flügel, p 243, cf Ibn al Kiftī, *Taʾrikh al-Hukamāʾ*, p 98) When the caliph al-Muʿtadid (279—289) built himself a new palace, he had apartments and lecture-rooms in an adjoining building for men learned in every science, who received salaries to teach others (Makrīzī, IV 192, 2 *sqq*, *Husn al Muhādara*, II 142)

Private individuals of wealth continued benefactions on these lines ʿAlī b Yahyā, who died in 275 and was known as al-Munadjdjim, had a palace with a library, which was visited by those in search of knowledge from all lands, they were able to study all branches of learning in this institution, called *Khizānat al-Hikma*, without fee, astronomy was especially cultivated (Yāḳūt, *Udabāʾ*, V 467) Al Munadjdjim also presented a whole library to Fath b Khākān (*ibid*, p 459, *infra*, on al Sūlī's library, see *ibid*, VII 136, II *sqq*) In Mawsil, Djaʿfar b Muhammad al-Mawsilī (d 323) founded a *dār al ʿilm* with a library in which students worked daily at all branches of knowledge and were even supplied with free paper The founder lectured on poetry in it (*ibid*, II 420) In the fourth century al-Makdisī visited in Shirāz a large library founded by ʿAdud al-Dawla (367—372) to which people of standing had access The books were arranged in cases and listed in catalogues, and the library (*khizānat al-kutub*) was administered by a director (*wakil*), an assistant (*khāzin*) and an inspector (*mushrif*) (*B G A*, III 449, cf a little later Yāḳūt, *Udabāʾ*, V 446, 12 *sq*) In the fourth century, a certain Ibn Sawwār founded both in Basra and in Rām-Hurmuz a large *dār al-kutub* with stipends for the scholars who worked in it, in Basra a shaikh used to hold classes (*majālis*) on Muʿtazili *kalām* (*B G A*, III 413, 18) In al Raiy, there was at the same time, a *bait al-kutub* with over four hundred camel loads of books, which were catalogued in a ten volume *fihrist* and included many Shīʿi works (Yāḳūt, *Udabāʾ*, II 315, 9 *sqq*) In the year 383, the vizier Sābūr b Ardashīr founded a *dār al-ʿilm* in Karkh with a large library for scholars (Ibn Taghribirdi, ed Popper, p 51, 16 *sq*, Ibn al Athīr, IX, Cairo edition, p 35, 7)

Many of the libraries had a strongly, but by no means exclusively, Shīʿa character As to the *ʿulūm al awāʾil*, the ʿAbbāsids, as already mentioned, were interested in them and the Omaiyad Khālid b Yazīd b Muʿāwiya studied alchemy and medicine along with Hadīth (Ibn Taghribirdi, I 246, 5, Yāḳūt, *Udabāʾ*, IV 165) But the connection between the Shīʿa systems and Hellenistic science of which we have evidence, for example in the Ikhwān al-Safā, perhaps caused a greater interest to be taken in this branch of knowledge among the Shīʿīs than among the Sunnīs In Cairo, the Fātimids founded similar institutions in the interests of the Shīʿa In their palace, they had a library which was said to be the largest in Islām It had about 40 rooms full of books and all branches of knowledge were represented, they had for example 1,200 copies of al-Tabarī's History and 18,000 books on the "old learning" (Makrīzī, II 253—255) The vizier Yaʿkūb b Killis founded an academy with stipends for scholars and spent 1,000 dīnārs a month on it (Yahyā b Saʿīd, ed Tallquist, fol 108a, Ibn Khallikān, *Wafayāt*, Cairo 1310, II 334, cf Makrīzī, IV 192, 21) It was

ershadowed by the "House of Knowledge" (*dār ʿilm* or *dār al-ḥikma*) founded by al-Ḥākim in 5 (1005) It was at the northern end of the st palace and contained a library and reading- om as well as rooms for meetings and for classes brarians, assistants, with their servants administered and scholars were given allowances to study re, all branches of learning were represented — ronomy, medicine etc in addition to the specially Islāmic subjects Al Ḥākim built similar intutions in al-Fustāt (Maḳrīzī, II 334 *sqq*, according Ibn Duḳmāḳ, ed Vollers, p 80, 5 *infra*, there ll existed in his time [about 800] a building lled the *Dār al-ʿIlm* in al-Fustāt) In the year 5, al-Sanbadī saw in Cairo a library with ,00 books on astronomy, handasa and falsafa n al-Kiftī, p 440, 13 *sq*) We do not learn ry much of the subjects taught there but occsionally hear of someone who lectured on Arabic ilology in it (Kindī, *Wulāt*, p 610, 15) But e whole institution was closely associated with ʿa propaganda, which is obvious from the fact at it was administered by the *Dāʿī 'l-Duʿāt* o held conferences with the learned men ere every Monday and Thursday (Makrīzī, IV 6, Kalḳashandī, *Ṣubḥ al-Aʿshā'*, III 487), occsionally he was a kādī (Kindī, *Wulāt*, p 600,) A similar missionary institute (*dār 'l daʿwa*) is built in Ḥalab in 507 by the emīr Fakhr al-ulk (Ibn Taghrībirdī, ed Popper, p 360, 17) e may assume that these buildings were also ranged for the performance of the ṣalāt

With the *dār al-ḥikma*, Islām was undoubtedly ntinuing Hellenistic traditions Al-Makrīzī men ns a *dār al-ḥikma* of the pre Islāmic period, here the learned men of Egypt used to work 377, 4), Ibn Abī Uṣaibiʿa, also mentions prelāmic seminaries in Egypt where Hellenistic arning was cultivated (*dār al-ʿilm*, I 104, 16, , Athens is also called *dār ḥikmat al-Yūnāniyīn* *G A*, II 135, 14) and the similarity with the lexandrine *Museion*, which was imitated in Perimon and Antioch, for example, is apparent (John H Walden, *The Universities of Ancient Greece*, ew York 1919, p 48—50) Al Ḥākim's institution as closed by the vizier al Afdal on account of olitical and religious disputes but shortly afterards (517 = 1123) reopened by the vizier al-Maʾmūn another building, south of the east palace (Makrīzī, 313, 337, 17 *sqq*) But it was now considerably naller During the famine in the reign of al-ustanṣir, the library was plundered In 461 (1068) eye-witness saw twenty-five camels carrying ooks from the palace library (Makrīzī, II 254, Wustenfeld, *Fātimidenchalifen*, p 261) The stitute was finally closed with the end of the ātimid dynasty (567 = 1171) Salāh al-Dīn had l the treasures of the palace, including the ooks, sold over a period of ten years Many ere burned, thrown into the Nile, or thrown ito a great heap, which was covered with sand that a regular "hill of books" was formed and e soldiers used to sole their shoes with the fine ndings The number of books said to have disosed of varies from 120,000 to 2,000,000 but any were saved for new libraries The Kādī Fādil is said to have procured 120,000 volumes Maḳrīzī, II 253—255, Abū Shāma, *Kitāb al-awḍataīn*, Cairo 1287, I 200, 268) Salāh al-Dīn so allowed anyone interested to take what he ked from the *ḵẖizānat al-kutub* in Halab for example (Yāḳūt, *Udabā'*, VII 20) These attacks on libraries did not mean they were tired of books as Yāḳūt (*Udabā'*, V 389) suggests, but was only one expression of the reaction against the Shiʿis

3 Origin and spread of the Madrasa

While the institutions called the *Dār al-ʿIlm* developed in Fātimid countries into centres of Shiʿa propaganda, the madrasa grew up in the east out of similar Sunnī institutions It is interesting to note that in 400, al-Ḥākim built a Sunnī *dār al-ʿilm* in Cairo In it lived two Mālikī scholars, who gave instruction and gathered round them men learned in ḥadīth and fikh (Ibn Taghrībirdī, ed Popper, II/II, p 64, 105, 106, al-Dhahabī, *Duwal al-Islām*, Ḥaidarābād, 1337, I 186) As the instruction (see the first reference) was given in the Djāmiʿ, the institute must have been connected with a mosque, probably that of ʿAmr It owed its existence however only to a passing fancy and after three years, the institution was abolished and the two learned teachers executed With the growing strength of the Sunna, especially in the Shāfiʿī and Ḥanafī form, many educational institutions arose in the east which had a pronounced Sunnī character, the Sunna in the fourth century wanted to have influence with the other schools (*B G A*, III 323, 365, 415) Many teachers built houses of their own, where they dictated ḥadīths and held lectures on fikh, e g a teacher who died in Merw in 420 (Wüstenfeld, *Imâm Schâfiʿî*, II 232) Abū Ḥātim al Bustī born in 277 (890) founded in his native town a school with a library with apartments and allowances for the maintenance of foreign students (*ibid*, p 163) In Āmul, al-Rūyānī (d 502) built a school, he himself taught in the mosque, also in al Raiy (III 245) In Ṭabarān a school was built for al-Ḥātimī (d 393 = 1003) (*ibid*, II 202) In Baghdad, al-Ismaʿīlī (d 396 = 1006) founded two lectureships in fikh studies, one of which was filled by al-Isfarā'īnī, who otherwise lectured in the Mosque of Ibn al-Mubārak, and the other by al-Bāfī (*ibid*, p 204, cf p 217) The philologist and ḥiḏjā'-poet al Zawzanī who died in 463 lived with other learned men in a madrasat al-Suyūrī (Yāḳūt, *Udabā'*, VI 409)

In Nīsābūr especially, where studies were vigorously prosecuted in the mosque (e g Wustenfeld, *Schâfiʿî*, III 236) many such institutions arose Thus a special school was built for the Shāfiʿī fikh-scholar al-Sā'igh al-Nīsābūrī (349 = 960, *ibid*, II 156, cf 160) Abū ʿAlī al-Ḥusainī (d 393) himself founded a school in which to teach Ḥadīth and it was attended by 1,000 scholars (*ibid*, p 203) Ibn Fūrak (d 406, *ibid*, p 216) did the same and in the year 437 Abu 'l-Ḳāsim al-Kushairī (*ibid*, III 284) and for Rukn al-Dīn al-Isfrā'īnī (d 418 = 1027) a school was built which surpassed all others (*ibid*, II 229) As early as the fourth century, we thus find al Maḳdisī praising the very fine *madāris* of Iṣṭaḵẖr (*B G A*, III 315) In the first half of the fifth century, there were four especially famous madāris in Nīsābūr al-Madrasa al-Baiḥakīya, founded by al-Baiḥakī (d 384), when he became a teacher in Nisābūr in 441 (Wüstenfeld, *Schâfiʿî*, III 270, al-Suyūtī is therefore wrong in ascribing its foundation to before the birth of Nizām al-Mulk [in 408], see *Ḥusn*, II 141), al-Saʿīdīya founded by the emīr Naṣr b Subuktakīn (governor of Nīsābūr in 389)

and one built by Abū Sa'd Ismā'īl al-Astarābādī and another built for the teacher Abū Ishāk al-Isfarā'īnī A Nizāmīya was also built here by Nizām al-Mulk for the Imām al-Haramain al Djuwainī (Makrīzī, iv 192, *Husn al-Muhādara*, ii 141 *sq*) It was an event of great importance when Nizām al Mulk (456—485, vizier of the Saldjuk sultāns Alp Arslān and Malik Shāh) founded the celebrated Nizāmīya Madrasa in Baghdād, the building was begun in 457 and on the 10th Dhu 'l-Ka'da 459 (Sept 1067) it was consecrated It was founded for the Shāfi'ī teacher Abū Ishāk al-Shīrāzī, but he at first refused to accept the call, because the ground on which it was built was said to have been acquired illegally, and Abū Nasr Ibn al-Sabbāgh therefore held the office for the first twenty days (*ibid*, and Wustenfeld, *Schâfi'î*, iii 297, Ibn Khallikān, *Wafayāt*, Cairo, i 143 *sq*)

The Muslim historians are in some doubt about the history of the madrasa Nizām al-Mulk is given the credit of having founded it, but al-Makrīzī and al-Suyūtī point out that *madārıs* were already in existence before him and mention the four above-named, but, as we have seen, even they were not innovations Al-Subkī thinks (says al-Suyūtī) the new feature was that Nizām al-Mulk endowed scholarships for the students But this again was nothing new as we have already seen But the enthusiasm and energy of Nizām al Mulk meant the beginning of a new period of brilliance for the Madrasa The sultān and men of high rank were now interested in it and the type evolved by Nizām al Mulk, a school in which the students were boarded, became the prevailing one after his time We may presume that the older schools also had a place for prayer in them, i e they resembled mosques The type of school known to us is built as a complete mosque Since even the older mosques containing living-rooms which were frequently used by students, there is no difference in principle between the school and the ordinary mosque, only the schools were especially arranged for study and the maintenance of students This character is expressed by the name *madrasa*, plural *madārıs*, it is a genuine Arabic formation from the word *darasa*, "to read", "to study", taken from Hebrew or Aramaic (Sūra lxviii 37 and elsewhere, *Hāshimīyāt*, ed Horovitz, p 53, 18, *Aghānī*, xiv, 2nd Cairo ed, p 78, cf *dārasa* "to teach" Bukhārī, *Bad'u 'l-Wahy*, bāb 5 and elsewhere, "to study" *Kāmil*, ed Wright, p 171), where *Bait Midrās* is used of a Jewish school (Bukhārī, *Djizya*, bab 6, Ibn Hishām, p 383, 388), it is therefore an analogous formation to Masdjid (cf also Fleischer, *Klein Schriften*, ii 122 *sq*, Noldeke, *Neue Beitrage z sem Sprachw*, p. 38)

In the time of Nizām al-Mulk and immediately afterwards, the madrasa spread in the 'Irāk, Khurāsān, al-Djazīra etc He was not content with the two he founded in Nīsābūr and Baghdād There was also a *Madrasa Nizāmīya* in Balkh (Wustenfeld, *Schâfi'î*, iii 240), in Mawsil (*ibid*, p 319), in Herāt to which al-Shāshī (d 485 = 1092) was called from Ghazna and in Merw (Yākūt, iv 509) Ibn al Sabbāgh, who had to give up his position in favour of al-Shīrāzī, received a promise from Nizām al-Mulk that he would build a madrasa for him in Baghdād, but the death of this scholar prevented this being done (in 477, *ibid*, p 304) The great vizier's rival Tādj al-Mulk (d 486 = 1093) in Baghdād founded a *Madrasa Tādjīya* (*ibid*, p 311) In Nīsābūr, other madrasas were founded at the same time, for example one by al-Manī'ī who died in 463 (*ibid*, p 277) and a Shatībīya (*ibid*, p 327) In Marw, al-Sam'ānī who died in 484 taught in a Shāfi'ī madrasa (*ibid*, p 321, cf above) In Marw al-Rudh, Ahmad al-Manī'ī (d 512) built a madrasa (*ibid*, p 326)

The prosperity of the madāris stimulated by Nizām al-Mulk in the fifth century survived for a long time in the east In the sixth century Ibn Djubair (580 = 1184) mentions some thirty madāris, all in the eastern part of the town, the most notable being the Nizāmīya, renovated in 504 (*Rihla*, p 229) In 631 (1234), the caliph al-Mustansir founded the magnificent Mustansirīya as a school for the four rites, each with a teacher and seventy five students and a teacher for Kur'ān and one for Hadīth, as well as a physician Attached to it were a library, baths, hospital and kitchens, there was a clock at the entrance, beside it was a garden where the caliph had a pavilion (*manzara*) from which he could survey the whole building (cf Le Strange, *Baghdad*, p 266 *sq*, Wüstenfeld, *Akademien der Araber*, p iv and 29)

The Nizāmīya and the Mustansirīya survived the destruction of Baghdād by Hūlāgū and both are mentioned at the beginning of the viiith century by Ibn Battūta (ii 108 *sq*) and the building of the latter still exists Ten others are known of the viiith—ixth century including the Madrasat 'Abd al-Kādir al Djilānī (688 = 1286), Madrasat Abi Hanīfa (of about the same date) and al-Mirdjānīya (758 = 1357), all still in existence, which were founded for Shāfi'īs, Hanafīs and for the study of Kur'ān and Hadīth Besides these three there still exist seven madrasas founded in Baghdād in the xviith and xviiith centuries (L Massignon, *Les Medresehs de Bagdâd*, *B I F A O*, vii, 1909, p 77–86, the inscriptions, do, in *M I F A O*, xxxi, 1912) Although the Tatars in 699 (1300) destroyed many madāris (Quatremère, *Hist des Sult Maml*, ii/ii 163 *sq*), Ibn Battūta shows that in the eighth century there were still flourishing schools in the east In Wāsit there was a madrasa which specialised in *tadjwīd al-Kur'ān*, it had three hundred rooms for foreign students (ii 3) In Tustar, the sultān expended one-third of the revenues on madrasas and monasteries (ii 31) and in Shīrāz and other Persian towns he also found madrasas (ii 62 and *pass*) For Nīsābūr, he mentions four madāris beside the chief mosque (iii 80), according to Hāfiz Abrū (c 820 = 1417), this town still had eight madāris under the 'Abbāsids and he mentions seventeen in which Shāfi'ī fikh was taught (*Sefer Nameh*, ed Schefer, p 281) For Marw, Yākūt about 600 mentions, in addition to the Nizāmīya, the school founded by Abū Sa'īd Muh b Mansūr al-Mustawfī (d 494), also the 'Amidīya and the Khātūnīya (iv 509) I arge madāris were still being built in Persia in the xviiith century and they are still to be found there in modern times (E G Browne, *A Year amongst the Persians*², 1916, p 104, 217 *sq*) Although the institution had for long a Sunnī tendency, it could of course be taken over by the Shi'īs without any difficulty In 728 (1328) in Mashhad 'Alī, Ibn Battūta found a large Shī'a madrasa (i 415) The Mongols also built madāris, e g Karaka Khān, the descendant of Čingiz Khān (Quatremère, *Hist Sult Maml*, i/i 56) Hūlāgū's mother built two madrasas in Bukhārā

where 1,000 students studied daily in each (*J A*, ser 4, xx 389) The period of greatest prosperity of the madāris in Central Asia was under the Timūrids, notably in Samarkand, where Timūr built a djāmi' "in the Indian style", and his wife a madrasa (Ibn 'Arabshāh, *Vita Timuri*, ed Manger, 1767, p 444 *sqq* , see also Diez, *Kunst der islam Volker*, p 99 *sq*)

In the towns of Mesopotamia and Syria the movement spread from the fifth century onwards Nūr al-Dīn b Zangī founded madāris for Shāfi'īs in Damascus, Halab, Hamā, Hims, Ba'albek (*J A*, ser 9, iii, p 428, cf 488, Makrīzī, iv 192) Kamāl al-Dīn (d 572) founded a madrasa in Mawsil, two in Nasībīn and one in Damascus (Wustenfeld, *Schâfi'i*, p 317) Takī al Dīn, the nephew of Salāh al-Dīn, built a madrasa in al-Ruhā (Makrīzī, iv 195, 14) Ibn Djubair who travelled from 578 (1183) to 587 (1191) mentions two in Nasībīn (p 240), one in Harrān (p 247) and a large Hanafī madrasa in Halab and four or five others (p 253), three in Hamā (p 257), one in Hims (p 258), about twenty in Damascus notably the great al-Nūrīya (p 283, 8 *sq*, 284, 4) and six or more in Mawsil (p 236, 1 *sq*), a madrasa in the last-named town was built in two stories with a Dār al Hadīth on the ground floor (Ibn Abī Usaibi'a, i 204, in the year 585)

The development in Damascus was of particular importance Information about this is contained in the *Tanbīh al-Tālib wa Irshād al-Dāris* of Muhyi 'l-Dīn al-Nu'aimi (d 927 = 1521), the synopsis of which by 'Abd al-Bāsit al-'Ilmawī (d 1059 = 1549) has been published by Sauvaire (*J A*, ser 9, iii—vii), the substance had already been given by Fleischer from Mukhā'il Meshāka (*Kl Schriften*, iii 306 *sqq* = *Z D M G*, viii, 1854, p 346 *sqq* , cf iii, 1849, p 123, there are a few differences in points of detail between Fleischer's and Sauvaire's publications) A *Dār al-Kur'ān*, the Rishā'īya, was founded here about 400 (*J A*, ser 9, iii 262) and the first madrasa for fikh studies was the Hanafī Sādirīya, which was founded beside the Mosque of the Omaiyads by Shudjā' al-Dawla Sādir in 491 (1097) (*ibid*, iv 266), next came, sometime before 520, the likewise Hanafī Tarkhānīya (*ibid*) and in 514 the Shāfi'ī Aminīya founded by the Atābeg Amīn al-Dawla (*ibid*, iii 395), then the Hanbalī Sharifīya founded by a scholar who died in 536 (iv 467), the Hanafī Khātūnīya built *extra muros* by a princess in 526 (*ibid*, p 254), the Hanbalī 'Omarīya founded by a shaikh who died in 528 (*ibid*, p 473, cf Fleischer, *Kl Schr*, iii 328) The two rulers Nūr al-Dīn b Zangī (541–569 = 1146—1163) and Salāh al-Dīn (570–589 = 1174–1193) displayed a munificent activity in this direction as did their emīrs and relatives Nūr al-Dīn founded a *dār al hadīth*, the Nūrīya (*ibid*, iii 280), and the following Shāfi'ī madāris al-Salāhīya (*ibid*, p 414), al-'Usrūnīya (*ibid*, p 428), al-'Imādīya (*ibid*, p 430), al Kallāsa (*ibid*, p 439), and he began the building of the 'Ādilīya (completed by al Sālih, *ibid*, p 423), and as a Hanafī madrasa, the large and small Nūrīya (*ibid*, iv 388, 291) In his reign an emīr also built the Asadīya for Shāfi'īs and Hanafīs (*ibid*, iii 387), another emīr a Shāfi'ī Mudjāhidīya inside and another outside the town (*ibid*, p 440), of Hanafī madāris, an emīr al-Dukākī built two, al-Balkhīya and al-Nāshīya (*ibid*, iv 245 *sq*), a slave of Nūr al-Dīn's, the Raihānīya in 565 (*ibid*, p 259), an emir the Mu'īnīya in 555 (*ibid*, p 281), a lady built a Hanbalī madrasa with a *dār al-hadīth*, the 'Ālima (*ibid*, p 477), a Hanbalī Shaikh, who died in 596, the Musāmirīya (Fleischer, *op cit*, p 329) Salāh al Dīn rebuilt the Shāfi'ī Kallāsa, which had been burned down (*J A*, ser 9, iii 439) and himself founded the Mālikī Salāhīya and and a Mālikī zāwiya in the Mosque of the Omaiyads (*ibid*, iv 460 *sq*) There were also built in his reign a *dār al-hadīth* by the Kādī al-Fādil (*ibid*, iii 277), a madrasa for Shāfi'īs and Hanafīs, the 'Ādhrawīya, by his daughter or brother's daughter in 580 (*ibid*, p 425), six Shāfi'ī madāris (*ibid*, p 391, 399 *sq* , 403, 435, 442), some five Hanafī including one founded by his (previously Nūr al-Dīn's) wife (*ibid*, iv 256, 266, 277, 284 *sq*) This building activity was continued into the seventh to ninth centuries so that al Nu'aimī can give the following totals seven *dār al-Kur'ān*, sixteen *dār al-hadīth* (one the Kūsiya, is not given in Fleischer), three for both Kur'ān and Hadīth, sixty Shāfi'ī (two of them also for Hanafīs, in Fleischer, Nrs 16 and 30 are not given), fifty two Hanafī (two of them also for Shāfi'īs, in Fleischer, one of them, the Dammāghiya, is not given it appears among the Shāfi'ī as Dabbāghiya), four Mālikī and ten Hanbalī madāris (in Fleischer, one of the two Diyā'īya is not given, on the other hand he has the Musāmirīya), also three *madāris al-tibb*, all of which belong to the seventh century The founders were mainly rulers and emīrs, but also included merchants and quite a number of men of learning, and a few women also As in the east, especially in earlier times, a madrasa was often founded for a particular scholar (*ibid*, iii 400, 488) and one sometimes finds a learned man handing over his house to be a madrasa (al-Dawla'īya, *ibid*, p 403, cf 439, iv 470) According to Mikhā'il Meshāka, in his time (1848) these madāris had practically all disappeared or were used as dwelling-houses, because their endowments had disappeared and there were only five left in his time (Fleischer, *op cit*, p 307—311)

Salāh al-Dīn introduced the madrasa into Jerusalem In 585 (1189) he endowed the Khānakāh Salāhiya, in 587 the Zāwiya Khatanīya south of al Aksā for a particular scholar and in 588 he turned the Church of St Anna into the Salāhīya Madrasa, in 589, 583 and 598 emīrs built similar institutions and in the seventh—ninth centuries a whole series of them came into existence According to Mudjir al-Dīn (d 927 = 1521), there were thirty-one madāris and monasteries (which were in part used in the same way as madāris) in direct connection with the Haram area or near it, and sixteen at some distance Of these some forty are especially called *madrasa*, one a *dār al-Kur'ān* and one a *dār al-Hadīth* (Sauvaire, *Hist Jerus et Hebr*, 1876, p 139 *sqq* , v Berchem, *Corpus*, ii 1, cf for Salāh al Dīn Ibn Khallikān, *Wafayāt*, ii, Cairo 1310, p 402 *sq*) In Hebron there was also a madrasa, that of al-Malik al-Nāsir (Sauvaire, *op cit*, p 23)

Next to Nizām al-Mulk, Salāh al Dīn has the greatest reputation as a builder of madrasas He owes this mainly to the fact that his great activity as a builder lay in countries, which became of great importance in the Muslim world, Syria with Palestine, and Egypt Even before the fall of the Fātimids he had founded in the year 566 in the vicinity of the Mosque of 'Amr, the Nāsirīya

for Shāfiʿīs and the Kamhīya for Mālikīs, for Shāfiʿīs also the Sharafīya (called after its head also Madrasa Zain al-Tudjdjār) and notably the great Salāhīya or Nāsirīya (for the identity of the two cf Makrīzī, iv 251, with *Husn al-Muhādara*, ii 142 *sq*) beside al-Shāfiʿī's mausoleum, he also built a madrasa beside the Mashhad al-Husain and in 572 a Hanafī madrasa, the Suyūfīya, and he turned the house of an emīr named Saʿd al Suʿadā into a khānakāh (*Husn al-Muhādara*, ii 141 *sq*, Makrīzī, iv 192 *sqq*, Ibn Khallikān, ii 402 *sq*) Those around him emulated this activity His vizier the Kādī 'l-Fādil in 580 built the Fādilīya for Shāfiʿīs, Mālikīs and for *ikrāʾ* (Makrīzī, iv 197), a brother the Saifīya (*ibid*, p 199), another, al-Malik al-ʿĀdil, the Madrasat al ʿĀdil (*ibid*, p 195), his nephew Taki al-Dīn built in Cairo the Manāzil al-ʿIzz or Takawīya for Shāfiʿīs (*ibid*, p 194, Ibn Dukmāk, p 93) and two others in the Fayyūm (Makrīzī, iv 195) Other emīrs and their relatives followed his example (*ibid*, p 196, 199 *sq*) and even a merchant, al-Arsūfī, founded a madrasa in 570 (*ibid*, p 194) Ibn Djubair, who travelled through Egypt in the time of Salāh al Dīn, speaks of several madrasas in Alexandria (*Rihla*, p 42) and particularly of one beside al-Shāfiʿī's tomb, which looked like a whole town (*ibid*, p 48)

During the period of the Ayyūbids and Mamlūks the number of madāris increased to an extraordinary degree In the street called Bain al Kasrain there were two long rows of madāris on the site of the old Fātimid palace in Cairo (cf P Ravaisse, in *M M A F*, i, 1889, p 409 *sqq*, pl 3) As a rule, the madrasa was in the street in line with the houses Ibn Dukmāk mentions that in Cairo only two stood isolated (p 98) Al-Nuʿaimī and Ibn Dukmāk describe several madaris (and masādjid) as *muʿallaka* i e above the ground-floor Ibn Battūta, who travelled at the beginning of the eighth century, found madāris even in quite small towns, e g in Dimyāt, Munyat b Khasīb, Kinā, Kūs, Asnā (i 65, 96, 106, 108) Ibn Dukmāk (p 92–99) about 800 gives a list of twenty four madāris, this is obviously very incomplete, on the other hand, it contains nine names, not given by al-Makrīzī This author (d 845 = 1442) mentions 73 madāris, fourteen for Shāfiʿīs, four for Mālikīs, ten for Hanafīs, three for Shāfiʿīs and Mālikīs, six for Shāfiʿīs and Hanafīs, one for Mālikīs and Hanafīs, four for all four rites, two exclusively used as *dār al-hadīth*, while the rite of twenty-five is not mentioned and four remained unfinished Of these madāris, according to him, about thirteen were founded before 600, twenty in the seventh century, twenty nine in the eighth century and two after 800 To the two schools of Hadīth (al Kāmilīyā of the year 622 and al-Kharūbīya of about 780, see iv 201, 211 *sq*) is to be added the Marāghīya mentioned by Ibn Dukmāk (p 99) A notable feature is the decline of the Hanbalīs and in contrast to Damascus the large number of schools which included all four rites The first Egyptian madrasa to include all four rites was the Sālihīya, founded in 640—641 by al-Malik al-Sālih (Makrīzī, iv 209 *sq*) probably on the model of the Mustansirīya

In Salāh al Dīn's time, the madrasa was also introduced into the Hidjāz In the year 579, the governor of ʿAden built in Mecca a madrasa for the Hanafīs and in the following year a Shāfiʿī madrasa was also founded there (*Chron Mekka*, ii 104) Up to the beginning of the ninth century, eleven madāris are mentioned (*ibid*, p 104—107) but others were added (*ibid*, iii 177 *sq*, 211 *sq*, 225 *sq*, 351 *sqq*, 417) In the xvinth century they ceased entirely to be used for their original purpose (see Snouck Hurgronje, *Mekka*, ii 229 *sqq*) *Madāris* were also built in Medīna (Wüstenfeld, *Medīna*, p 58, 98, 112)

In Asia Minor, madrasas spread under the Saldjūks, the oldest known date from the seventh century In Konya for example there were the Sirčalī Madrasa of the year 640 (1242—1243), Karatai Madrasa 649 (1251—1252) and Indjeminārelī Madrasa 674 (1274—1276) (Cl Huart, *Konia*, 1897, p 156, 160, 178, Fr Sarre, *Reise in Kleinasien*, 1896, p 48 *sq*, 51 *sq*, R Hartmann, *Im neuen Anatolien*, 1928, p 106 *sqq*) In Siwās three madāris date from the year 670 (1271–1272) namely the Sāhibīya or Gok Madrasa, founded by Fakhr al-Dīn, that of Muzaffar Barūdjirdi and that of Shams al-Dīn Muhammad The first mentioned is probably identical with the *Dār al Tadris* described by Ewliyā, which contained eighty rooms in two stories (see v Berchem, *Corpus*, iii/1, p 18 *sqq*, 26 *sqq*, 31 *sqq*) In Diwrigī, a madrasa has been built in the Djāmiʿ Ahmad Shāh erected in 626 (1228—1229) (*ibid*, p 71 *sq*, 80) About 733 (1333) Ibn Battūta found madāris all over Asia Minor, even in quite small towns (ii 260, 267, 269, 283, 296 *sq*, 340, 343, etc) Building activity was continued under the Ottomans (cf Huart, *Konia*, p 59, 92, 109, Sarre, *Reise in Kleinasien*, index, R Hartmann, *op cit*, p 24 *sq*)

According to the *Kirtās*, the madrasa was brought to North Africa as early as the time of Salāh al Dīn, for we are there told that the Almohad Yaʿkūb b Yūsuf (580—595 = 1184—1199) built mosques, hospitals and madrasas in Ifrikiya, the Maghrib and al Andalus (Tornberg, *Annales Regum Mauritaniae*, Upsala 1843, i 143), but no exact details are given to corroborate this statement The Maghribī madrasas were exclusively Mālikī In Tunis, many madāris were erected under the Hafsids (625–941 = 1228—1534), the oldest being the Madrasat al-Maʿrad about 650 In the Chronicle of Tunis (Zarkashī, in *Chronique des Almohades et des Hafçides*, transl E Fagnan, in *Rec Not et Mem Soc Arch Const*, xxi, 1895, see index) eleven are mentioned including the Madrasat ʿUnk al-Djamal of 742 (1344), the Midrasat Ibn Tāfiradjīn, founded by a learned man in 766 (1364), the Madrasa Shammāʾīya (before 734 = 1333, see *op cit*, p 105, 106, 221), Madrasat Belhalfawīn in 796 (1393) (*ibid*, p 183), and six of the ninth century (see *op cit*, index, cf also Marçais, *Manuel d'Art Musulman*, ii 500, N° 2) Ibn Battūta mentions at the beginning of the eighth century the Madrasat al-Kutubiyīn (i 20) There is no trace of madrasas of the Almohads and the statement in the *Kirtās* regarding them does not agree with the other sources The first madrasa in the Maghrib was, according to Ibn Marzūk, *Musnad*, the Madrasa al-Saffārīn built by the Marīnid Abū Yūsuf Yaʿkūb b ʿAbd al-Hakk (656–685 = 1258–1286) in Fās in 684 [also called al-Halfāʾīyīn, see the edition by Lévi-Provençal, in *Hespéris*, v, 1925, p 34 (Arabic) = p 44 (French)] In Fās, we are told by the same source, Abū Saʿīd (720–731) and his son Abu 'l-Hasan (731—749) built several madrasas the M al-Madīna al-Baidāʾ (= M Dār al-Makhzin in Fās Djadīd) in 721 (1321), the M

al-Ṣihrīdj in 723 (1321), the M al-ʿAttārīn in 725 (1325) later called M al-Wādī and in 747 (1346–1347) M Misbāh after the teacher, the next Marīnid Abū ʿInān (749—759) built in 756 (1385) the Bū'anānīya (Tornberg, *Annales Reg Maur*, i 280 *infra*, Ibn Marzūk, in *Hesperis*, v 34 and 68, Ed Pauty, *ibid*, iii, 1923, p 515 *sqq*, Bel, *Inscriptions de Fès*, in *J A*, ser 11, x, 1917, xii, 1918, Marçais, *Manuel d'Art Musulman*, ii, 1927, p 465 *sqq*) These Marīnid madāris are all still in existence No longer in existence is the M al-Lebbādīn (Bel, *J A*, ser 11, x 148), the M al-Ṣihrīdj consisted of a larger and a smaller madrasa, the latter is now the M al-Shāʿīyīn (*ibid*, p 215 *sq*) Others were built under the Sharīfs, notably the M al Sharrātīn in the xiᵗʰ (xviiᵗʰ) century, now the largest in Fās (*ibid*, p 114, Bel writes Shaghghatīn) In other towns also Abu 'l-Hasan built madāris in Tāzā Miknāsa, Salā (742 = 1340), Tandja, Sabta, Ānfā, Āzammūr, Āsfī, Āghmāt, Marrākash, al-Kasr al-Kabīr, al-ʿUbbād near Tilimsān (747 = 1346—1347), Tilimsān and al-Djazā'ir (Ibn Marzūk, *Hesperis*, v 35 and p 69) That of Miknāsa was completed by the son of Abu 'l-Hasan, Abū ʿInān, who was a great builder of schools (Ibn Battūta, i 84) In Tilimsān, the Ziyānid Abū Hammū Mūsā I had already built a mosque in 710 (1310) and before 737 Abū Tāshifin founded the similar institute, which bore his name (Marçais, *Monuments arabes de Tlemcen*, do, *Manuel d'Art Musulman*, 1927, ii 483, 515)

In Spain according to Ibn Saʿīd (viiᵗʰ = xiiᵗʰ century), there were no madrasas, instruction was given in the mosques (al Makkarī, ed Dozy, i 136), but in the following year, however, a large madrasa was founded in Granada by the Nasrid Yūsuf Abu 'l Hadjdjādj in 750 (1349) (Almagro Cardenas, in *Boletin de la Real Acad de la Hist*, xxvii 490, Marçais, *op cit*, p 517)

According to Ibn Saʿīd, men of learning were held in high esteem in al-Andalus, the Marīnids in the Maghrib also built madrasas in their enthusiasm to further learning The traveller al-ʿAbdarī (688 = 1289), however, found no interest in learning in Tilimsān, al-Djazā'ir or Constantine (with one exception), it was only in Tunis that he found any enthusiasm (*J A*, ser 5, iv, 1854, p 154, 157, 158, 161, 169) This is certainly connected with the fact that the madrasa had just then been introduced into Tunis But not even the madrasas brought about any deepening of interest in study in the west Ibn Khaldūn (808 = 1406) testifies to the spread of madrasas in Tunis and the Maghrib but laments the decline in education In al-Andalus, Muslim culture was dying out and after the decline of Kurtuba and Kairawān, education in the Maghrib was on a low level, while the old schools in the ʿIrāk were no longer of importance, Cairo was a centre of learning to which all made their way and studies also flourished in Persia (*Mukaddima*, Cairo 1322, p 342—344, *faṣl* 6, N⁰ 2) This decline in interest in learning soon became general The learning of the time lacked vitality and international scholarship was affected by political conditions In 1517 A D, Leo Africanus says that the lecture rooms in Cairo were large and pleasant but the numbers who attended them were small Some still studied fikh, but very few the arts (*Descr de l'Afr*, iii 372, in *Rec de Voy et de Doc*, ed Schefer, Paris 1896—1898) In Egypt, interest in the specialised madrasa decreased considerably and the great builder of the xiiᵗʰ (xviiiᵗʰ) century, the emīr Katkhudā, still built madrasas, but his real interest was in the mosque (see below) Lane only mentions the Azhar Mosque as an important centre of study in Cairo The development in Mecca was similar, where in modern times studies are only prosecuted in the mosque (Snouck Hurgronje, *Mekka*, i 17, and cf above) On education and the madrasa in general cf also F Wustenfeld, *Die Akademien der Araber und ihre Lehrer*, Gottingen 1837, Kremer, *Kulturgeschichte*, 1877, ii 479 *sqq*, Hanebeig, *Abhandlung uber das Schul- und Lehrwesen der Muhammedaner im Mittelalter*, 1850, v Berchem, *Corpus Inscr Arab*, i 252—269, G Gabrieli, *Manuale di Bibliografia Musulmana*, i, 1916, p 109 *sqq*

4 Development of the Madrasa and similar Institutions

a Madrasa, Masdjid and Djāmiʿ

There was, as already mentioned, no difference in principle between the madrasa and other mosques Even after the introduction of madāris, the regular mosques remained schools as before Ibn Battūta, who travelled in the eighth century, in the period when madāris flourished most, attended lectures on Hadīth not only in the Djāmiʿ of Shirāz but also in the Djāmiʿ Mansūr in Baghdād (ii 83 110) In Damascus in 580, Ibn Djubair refers to rooms in the Mosque of the Omayads, which were used for Shāfiʿī and Mālikī students, who received considerable stipends (*idjrā'*, *maʿlūm*) and among them were many *Maghārība*, the mosque had large endowments (*marāfik*) for strangers and *ahl al talab* (*Rihla*, p 266 supra, 272 supra), Ibn Battūta also speaks of the *halakāt al tadrīs* of this mosque in the different sciences (i 212) In Egypt in the time of al Makrīzī (ninth century), there were 8 rooms for fikh studies in the Mosque of ʿAmr and before 749 there were over 40 *halakāt* in it (Makrīzī, iv 20, 21) In the Mosque of Ibn Tūlūn after its renovation in the reign of Lādjīn (696—708) courses of fikh, according to the four madhāhib, and other studies were arranged (*ibid*, p 41, cf Quatremère, *Hist Sult Maml*, ii/ii 47 *sqq*) and in 767 an emīr appointed 7 teachers in Hanafī fikh there (Makrīzī, iv 42) In al-Azhar in the seventh century and later after the earthquake of 702 many lecture-rooms with paid teachers were built (*ibid*, p 52), likewise in the Mosque of Hākim, where, after the earthquake, lectureships in fikh for each madhhab and for Hadīth were founded with salaries for the teachers and scholarships for the students (*ibid*, p 57) In Fātimid mosques, like the Djāmiʿ al Zāfir and the Djāmiʿ Maks built by al Hākim, Mamlūk emirs founded new lectureships (*ibid*, p 66, 81) and not only in the Mashhad al-Husaini but also in the Mashhad al Nafīsī were studies carried on in the eighth century (*Husn al-Muhādara*, i 195, Muhyi 'l-Dīn)

When a particular room was set apart for teaching purposes in a mosque, this was often called a madrasa, for example 6 of the Damascus madāris were in the Mosque of the Omayads the Shāhīnīya, Ghazālīya, Kūsīya, ʿIzzīya, Safīnīya, Munadjdjā'īya, of which the first and third were also known simply as *halka* (*J A*, ser 9, iii 410, 432, 437, iv 262, 270, 481, others vii 230), al-Hākim's Mā'ikī madrasa was

in the Mosque of ʿAmr (see above) and Ibn Duḳmāk (p 100 *sq*) mentions 8 zawāyā in this mosque, which were endowed for *tadrīs* The madrasas were often also built close beside the large mosques so that they practically belonged to them This was the case in Mecca (*Chron Mekka*, II 104 *sqq*, cf Ibn Battūta, I 324), in Damascus where there was a Shāfiʿī madrasa beside the western gate, Bāb al Barīd (Ibn Djubair, p 271), in Nisābūr (Ibn Battūta, III 80) and in Cairo where al-Madrasa al Taibarsīya in 709 and al-Ākbughāwīya about 730 were built so close to the Azhar Mosque that they had common walls and windows in them, which was specially permitted by a fetwā, they were afterwards completely incorporated in the Mosque (Makrīzī, IV 223 *sq*) In Fās, the chief madrasas are arranged round the great mosque al Karawīyīn and the same arrangement is found in Marrākash (Pauty, in *Hesperis*, 1923, p 515 *sqq*, 523)

If the madrasa, as a building, had little independence, its character as a home for students and place of instruction was very marked But even where it was quite an independent institution, the distinction between madrasa and ordinary mosque was very slight, all the less as sermons were also preached in the madrasa In the fifth century the minbar had already been introduced into a large number of mosques In the Nizāmīya in Nīsābūr, services were held as soon as it was finished (by ʿAbd al-Rahīm Wustenfeld, *Schâfiʿî*, III 285) and the Nizāmīya in Baghdād had a minbar (Ibn Djubair, p 219) A problem was however raised by the fact that these madāris were Shāfiʿī and this school held that only one mosque in a town could celebrate the Friday service, unless the town was of very considerable size and we are definitely told that al-Djuwainī conducted the Friday service in the madrasa in Nīsābūr although he was also khatīb at the Maniʿī mosque (Wustenfeld, *Schâfiʿî*, III 251) In Egypt from 569 to 665 there was only one Friday khutba, but after this time there was usually a minbar in the larger madrasas The caliph actually preached in the madrasa built by Kalāʾūn (678–689, Makrīzī, IV 221) The minbar for the djumʿa in many mosques is expressly mentioned, e g the Hidjāzīya 761 (*ibid*, p 222 *sq*), the Bakrīya 776 (*ibid*, p 236), the Zamānīya 797 (*ibid*, p 241), the Djāʾī (*ibid*, p 249) The Sāhibīya, which had not a minbar at first, was given one in 758 and was henceforth used for the Friday service (*ibid*, p 205) In Fās the mixed type of djāmiʿ and madrasa was found in the Būʿanānīya (Bel, *J A*, ser II, XII 339)

It was only natural that the *madrasa* should also be called *masdjid* (cf Ibn Djubair, p 48, II with line 19, 20) Ibn al-Hādjdj in the VIIIth century still wants to distinguish between *masdjid* and *madrasa* and to give more importance to the former (*Madkhal*, II 3, 48) The distinction remained however quite an artificial one and this is also true of the distinction between *madrasa* and *djāmiʿ* The name madrasa was decided by the main object of the institution and the special style of the building The name djāmiʿ was only given if the Friday service was held in it Thus, as late as 772, we find the emīr Būbakrī building a madrasa and opposite it a djāmiʿ, but in the year 815, the madrasa was given a minbar and used as a djāmiʿ (Makrīzī, IV 235 *sq*) If these two uses of the building are equal) either name may be used (cf the double name in an inscription of the emīr Mukbil van Berchem, *Corpus*, I, N⁰ 201) In some cases a Friday mosque can be said to be in the madrasa (Ibn Battūta, II 39) The great Djāmiʿ Hasan begun in 757 was also one of the largest madāris in Cairo (Makrīzī, IV 117 *sq*) and on the other hand, the Djāmiʿ Khatīrī in Būlāk built in 737 and the Djāmiʿ Aslam founded in 746 were educational institutions (*ibid*, p 106, 111, *Husn al Muḥādara*, I 192) In the ninth century the Djāmiʿ al-Muʾaiyadī was the most important new madrasa in Cairo (Makrīzī, IV 139) The same variation in nomenclature is often found in this century (cf v Berchem, *Corpus*, I, N⁰ 235, 248, 253, 262) On the other hand Makrīzī, in the ninth century, only uses masdjid as a name for quite insignificant mosques (IV 263 *sqq*, where 19 masādjid are mentioned) In the XIIth century the emīr Katkhudā built 18 large mosques and many smaller ones and his interest in the furtherance of learning was specially displayed in his buildings at the Azhar mosque, which had developed at the expense of the specialist madāris (al-Djabartī, *Merveilles Biographiques*, III 230 *sqq*, Sulaimān Rasad, *Kanz al-Djawhar fī Taʾrīkh al-Azhar*, p 74 *sq*), for the similar situation in Mecca cf above

The connection between mausoleum and mosque was also found with the madrasa The tomb of the founder was placed in Nūr al-Dīn's madrasa in Damascus (Ibn Djubair, p 284, 4 *sq*) and during the Mamlūk period it was the regular custom for the founder of a madrasa to be buried under a kubba in it

b Monasteries

A close connection arose between the monastery and the madrasa As already mentioned, it was quite a common thing for devout men to live permanently in the mosque e g in the minaret or somewhere else on the roof or in subsidiary buildings or in a cell in the mosque Such a cell which can be used for teaching or for meditation is called *zāwiya*, lit corner (Ibn Djubair, p 240, 245, 266, Makrizī IV 20, cf Greek γωνία, see Dozy, *Supplement*, s v) Pious ascetics however had retained from the older religion the custom of living in special monasteries e g in Djawlān in the fourth century (*B G A*, I 188), Muslim historians trace these back to the time of the Companions (Makrīzī IV 272 *sq*) In the fourth century ascetics and Sūfis, especially the Karrāmīya [q v] or Kirāmīya (cf Mez, *Renaissance*, p 273), had quite a number of monasteries (*khawānik*, also *khuwānik*, sing *khānakāh*) in Farghāna, Marw al-Rūdh, Samarkand Djurdjān, Tabaristān etc (*B G A*, III 323, 365) in Jerusalem and in Egypt also the Kirrāmīya had their monasteries in which they held *dhikr* (*ibid* p 179, 182, 202)

The distinction between *khānakāh* and *ribā* (plur *rubut*) is one of origin rather than fact Ribāt was simply a dwelling for men who waged the *djihād* on the frontier but the word was also used by the Sūfīs who waged a spiritual *djihād* (cf Makrīzī, IV 292 *sq*) There was a *ribāt* in the Maghrib in the fourth century in the Wād Salā (*B G A*, II 56) When Ibn Marzūk says that they had only two *rubuṭ* of the eastern kind (in Safī and Salā, *Hespéris*, V 36, 71), it is doubtful whether he means an establishment of Sūfīs or of ghāzīs In the Vth (XIth) century there were several military *rubut* on the river Niger, from

which the Almoravids originated From the xvth century onwards many were built in Morocco against the Spaniards and Portuguese *Mahris* is the usual word for *ribāṭ* (see Bel, *J A*, ser 11, ix, 1917, p 325, N° 1) In the east in the fourth century, rubat are frequently mentioned, which probably had a military character (*B G A*, iii 303, 354,415) The original distinction between *khānakāh* and *ribāt* is never quite forgotten, as late as the beginning of the eighth century we find *ribāṭ* used of a barracks (Makrizī, iv 276) Ibn Battūta says that the word *khānakāh* had not reached the west, here the old Arabic term *zāwiya* was used (Ibn Battūta, i 71, *khānakāh* however in Ibn Marzūk, *Hesperis*, v 35 *sq*) Usually we find the three terms used without any definite distinction being made between them (*sawma'a* also seems to be used in the *Asrtās* of a Muslim monastery, see Tornberg, *Annales*, p 143, cf p 18), for all three names are applied to Sufi monasteries, which also take in strangers, i e are used as hospices

Ibn Battūta mentions many monasteries in the ʿIrāk and Persia Beside the tomb of al Rifāʿi, not far from Wāsit was a ribat, which he calls *riwāk*, where "thousand of poor men", i e Sufis, lived (ii 4) In al Lūr especially, he found a vast number of monasteries, the sultān there built 460 *zawāyā* and spent $^1/_3$ of his revenues on them and the madāris (ii 31)

For Syria, Ibn Djubair testifies to the flourishing monasteries which were often regular palaces and he says that the names *khānakāh* and *ribāt* are used indiscriminately (p 243, 271, 284), the word *khānakāh* sounded strange to him as a westerner, as to Ibn Battūta (p 284) Nevertheless al-Nuʿaimī distinguishes the three terms and mentions 29 khawānik, 23 rubut and 26 zawāyā The oldest khānakāh mentioned by him (Duwaira) was founded for a learned man who died in 401 (Sauvaire, in *J A*, ser 9, v 269, 377, 387 *sqq*)

It was similar with Egypt The first khānakāh was built by Salāh al-Dīn in 569 in Cairo (al-Sālihīya, originally called Dār Saʿid al-Suʿadā Makrizī, iv 273), the next in the seventh century by Baibars al Bundukdārī, who also founded new monasteries in Syria (*ibid*, p 282, 298) Of *khawānik*, al Makrizī mentions 22 (Ibn Dukmāk only one), of the sixth century one, seventh one, eighth 18, ninth one Of rubut 12 (Ibn Dukmāk 8), of the seventh century 9, of the eighth one, besides 5 on al-Karāfa Of zawāyā 26 (Ibn Duḳmāk, 9), these were mainly outside the town and were obviously quite small, often being simply the house, later the tomb of some devout man The oldest dated from the sixth century In Jerusalem also Salāh al-Dīn built a *khānakāh* (v Berchem, *Corpus*, ii, p 87 *sqq*) Among the khawānik, zawāyā and rubut in this city the last named seem to have been specially intended as hostels for pilgrims (*ibid*, p 197 *sqq*, see also Sauvaire, *Jerus et Hebron*, index) In Mecca 50 rubut are mentioned, the oldest dated from 400 (*Chron Mekka*, ii 108—115) At places of pilgrimage, the monasteries played an important part as hostels but even in other places they also gave accommodation to strangers Ibn Battūta on his travels usually stayed in them (he calls them *zawāyā*) but he also lodged in madāris, which were generally used as hospices (cf Quatremère, *Hist Sult Maml*, ii/ii 35, note) Some of these institutions were convents for single women (Makrīzī, iv 293 *sq*)

The main object of monasteries, however, was to afford Sūfis a home and place for their devotional exercises In the khānakāh of Baibars founded in 706, 400 Sūfīs were maintained (Makrizī, iv 276 *infra*) and in the khānakāh Siryākūs 100 (*ibid*, p 285) They were given lodging, food, clothing and money, there were often baths attached to them The building was arranged for *dhikr* exercises, and also for salāts so that it was a kind of mosque Ibn Djubair mentions a ribāt on the summit of Abū Kubais in which there was a mosque (p 108) A ribat may be actually called a masdjid (Makrīzī, iv 294, cf *khānakāh* and *masdjid*, p 282 and the term *masdjid al ribāt* Ibn ʿArabshāh, *Vita Timuri*, ed Manger, iii 880) The monastery founded by Salah al Din was actually given a minaret in 780 (*mi'dhana*) and it is recorded that people used to wear sandals to walk in the *sahn* (Makrīzi, iv 275 *infra*) Sometimes only the occupants of the monastery are admitted to the salāt (*ibid*, p 277 Khānakāh Baibars) There was therefore an imām on the staff of the khānakāh (*ibid*, p 287) Like other sanctuaries the monasteries sometimes preserved relics, the Ribāt al-Athār, for example, preserved a piece of iron and wood which had belonged to the Prophet (*ibid*, p 295) We sometimes find a khānakāh built close to a large mosque like the khānakāh of Akbughā beside the Azhar Mosque (*ibid*, p 292, cf p 289 Kūsūn) or the founder built a masdjid for the Friday salāt beside the monastery (Siryāḳūs, *ibid*, p 285) The occupants of the Sālihiya Khānakāh took a prominent part in the Friday service in the mosque of Hākim (*ibid*, p 274) At a later date, we find the monasteries themselves arranged for the Friday salāt This was the case with the Ribāt al Afram, which in 663 was given a minbar for the Friday and festival khutbas (*ibid*, p 297) and al-Muʾaiyad made a house, that had been begun before he came to the throne, into a *djāmiʿan wa-khānakāh* (*ibid*, p 134 *infra*) just as *vice versa* a djāmiʿ could be built with living-rooms for Sūfīs, e g the Djāmiʿ al Bāsitī (beginning of the ixth century, like the preceding, *ibid*, p 140 *infra*) and in the viith century, the Djāmiʿ Shaikhū (before the building of his khānakāh, *ibid*, p 113) Baibars al-Bundukdārī was buried in his khānakāh and the monasteries had as a rule tombs, either of the founder, or of devout men who had lived in them

The development of the monastery is therefore quite analogous to that of the madrasa, the one institution merges into the other, because learning and manifestation of piety are inseparable in Islām Learning was also cultivated in the monasteries, at the present day, we find students living in a monastery and attending lectures in a madrasa Some scholars lectured on Hadīth in their rooms in a monastery (*ibid*, p 294, 295, 303) but instruction was also arranged for in some monasteries just as in the madāris ʿAbd al-Latif (d 629 = 1231) lectured in a ribāt in Baghdād on *uṣūl, hadīth*, etc (Ibn Abī Usaibiʿa, ii 203) and a Ribāt al-Khātūnī is mentioned here, which had a library (Ibn al Kifti, ed Lippert, p 269) There are other references to libraries in monasteries (see for Marw Yāḳūt, iv 509) In Khānakāh Shaikhū founded in 756, an extensive course of lectures, Fikh according to all four Madhāhib, Hadīth and

Ikrā' (Maḳrīzī, iv 283), was given In the Ribāt al-Āthār in the eighth century, instruction was given in Shāfi'ī Fiḳh (*ibid*, p 296) and in the Djāmi' al-Fakhrī built in 821, arrangements were made for students as well as for Sūfīs (*ibid*, p 136), the Hanafī madrasa al-Djamālīya (730) was also a khānaḳāh (*ibid*, p 238 *supra*), they had a common director

In the eighth and ninth century this combination of the two institutions became quite frequent, for example in the Nizāmīya in Cairo of the year 757 (v Berchem, *Corpus*, i 242 *sqq*), in the mausoleums of Barsbāi 835 (*ibid*, p 365 *sq*, cf Ibn Iyās, ii 21, 22, 41), of al-Malik al-Ashraf Ināl, 855—860 (*ibid*, N° 271 *sqq*) and of Ḳā'it Bāi 879 (*ibid*, p 431 *sqq*) The same institution thus came to be given different names (cf *ibid*, p 172 *sqq*) and al-Suyūṭī deals with the khawānik under the madāris In the east, Ibn Battūta found the same relationship, for example in Shīrāz and in Kerbelā' (ii 78 *sq*, 88, 99) and this is what he means when he says the Persians call the zāwiya madrasa (ii 30, 32) In the west, he lauds his own sovereign, who had built a splendid zāwiya in Fās (i 84), here also learning and Sufiism were associated (see the quotation in Dozy, *Supplement*, s v *zāwiya*) and the zāwiya still plays an important part in North Africa (see Depont and Coppolani, *Les Confreries Religieuses Musulmanes*, Algiers 1897, El-Hachaichi, *Voyages au Pays des Senoussia*, transl Serres and Lasram, Paris 1912) Cf on the monasteries v Berchem, *C I A*, i 163 *sqq*, 174 *sq*

c Hospitals

We commonly find, e g in Ibn Djubair and al-Makrīzī, the hospital, *bīmāristān*, *māristān*, *mūristān*, mentioned in close connection with the madrasa, probably because it was administered by learned men and as a rule also contained a medical school Al-Walīd is said to have been the first in Islām to build a hospital, in the year 88 (Makrīzī, iv 258 *sq*, *B G A*, v 106) In Cairo in 259 or 261 (i e before the mosque) Ibn Ṭūlūn built a hospital for the poor At the same time he installed a dispensary behind the mosque and a physician used to sit here to be consulted every Friday According to al Makrīzī, his māristān (called in Ibn Dukmāk, p 99 the "upper") was the first in Egypt, this probably means the first free public hospital, it is improbable that this Hellenistic institution did not already exist in Egypt (Makrīzī, iv 38, 39, 258, *Husn*, ii 139) Al-Makrīzī (iv 259 *sqq*) mentions in addition to this hospital in Cairo the *Māristān Kāfūr* (in 346, perhaps identical with that called the "lower" by Ibn Dukmāk, p 99), al-Maghāfir (232–247), al-Mansūrī (682), al-Mu'aiyadī (821) To these must be added the two which Salāh al-Dīn maintained in Miṣr and Kāhira (Ibn Djubair, p 51, 52, cf Ibn Khallikān, Cairo 1302, ii 402 *sq*) In Damascus Ibn Djubair found two hospitals, one of them the *Bimāristān al-Nūrī* (p 283, 284, cf Ibn Khallikān, ii 403) He also mentioned one in Nasībīn (p 240), in Harrān 2 (p 247), in Halab 1 (p 253), in Hamā 1 (p 257), in Baghdād he refers to a number without particularising them but we know of hospitals here from the third century and in 304 Sinān b Thābit was director of the hospitals of Baghdād, he was responsible for the foundation of three more (Ibn al Kifṭī, ed Lippert, p 193, cf *Kitāb al-Wuzarā'*, ed Amedroz, p 21 and on the whole question Mez, *Renaissance*, p 326 *sq*) There was a hospital attached to the great Mustanṣirīya madrasa (Le Strange, *Baghdad*, p 268)

As regards the teaching of medicine, Ibn Abī Usaibi'a shows (i 103 *sqq*) that it was continued without interruption in Islām for example, he mentions 'Abd al-Malik b Abdjar, who was in charge of the medical school in Alexandria, and after the conquest adopted Islām At a later date, the chief medical schools were in Antākiya and Harrān, among other places (i 116 *infra*) For a long period most of the physicians were Christians (cf also *B G A*, iii 183) Teaching was usually given in connection with the hospitals The head physician collected the students around him whom he trained (*kharradja*) and they assisted him (e g the Georgios, summoned from Gundēshāpūr to Baghdād by Manṣūr Ibn Abī Usaibi'a, i 124) Kalā'ūn had a lecture-room installed in his hospital, the Manṣūrī, where the *ra'is al-aṭibbā'* lectured on medical science (Makrīzī, iv 260), instruction was also given in the great al-Bīmāristān al-Nūrī in Damascus (Ibn Abī Usaibi'a, ii 192) Lectures on medicine (*ṭibb*) were sometimes also given in the mosques but in this case it was for the most part a theoretical science closely connected with philosophy Ibn al-Haitham (d c 430) lectured on *ṭibb* in the reign of al-Ḥākim (*ibid*, ii 90) and when Lādjīn restored the mosque of Ibn Ṭūlūn he also endowed lectureships on this subject (Makrīzī, iv 41, which shows that *tibb* should be read in Quatremère, *Hist Sult Maml*, ii/ii 47) *Ṭibb* could also be studied in a madrasa, for example, al-Djīlī, who died in 641 lectured on it in the 'Adhrāwīya in Damascus (Ibn Abī Usaibi'a, ii 171) At the same time there were special *madāris al-ṭibb*, thus in the seventh century three were built in Damascus (*J A*, ser 9, iv 497—499, Fleischer, *Kl Schr*, iii 329) The teachers in them could also be physicians at the hospitals (Ibn Abī Usaibi'a, ii 266)

d Children's Schools

These were older than Islāmic science, since at the very beginning of Islām, reading and writing were taught in Arabia In Medina the teachers were often Jews (see Balādhurī, p 473 *infra*, cf the name *rabbānī* for the teacher Sūra, iii 73, v 48, 68, Bukhārī, *'Ilm*, bāb 10, Ya'kūbī, ed Houtsma, ii 243), but ability to write was not so common here as in Mecca (cf on the question Noldeke–Schwally, *Gesch d Qorāns*, i 15 *sq*, Goldziher, *Muh Stud*, i 110 *sq*) After the battle of Badr, several captured Meccans were released to teach writing in Medīna (*Kāmil*, ed Wright, p 171, cf Goldziher, *op cit*, p 111, Sprenger, *Leben Muh*, iii 131) After the capture of Kaisārīya, the prisoners were settled in al Djurf and some were employed in the school (*kuttāb*) (Balādhurī, p 142) Another contemporary of 'Omar's, Djubair b Haiya, who was later an official and governor, was a teacher (*mu'allim kuttāb*) in a school in Ṭā'if (Ibn Ḥadjar, *Iṣāba*, Cairo 1323, i 235) Mu'āwiya, who had acted as the Prophet's amanuensis took a great interest in the education of the young They learned reading, writing, counting, swimming and a little of the Kur'ān and the necessary observances of religion Famous men like al-Ḥadjdjādj and the poets Kumait and Ṭirimmāh are said to have been schoolmasters (Lammens, *Mo'āwia*, p 329 *sqq*, 360 *sqq*) The main subject taught was *adab*, so that the schools of the children were called *madjālis al-adab* (*Aghānī*, xviii, 2nd Cairo ed, p 101), and the teacher was called

mu'addib (e g Makrīzī, iv 223, cf Yākūt, *Udabā'*, iv 272, vii 105), also *mu'allim* (Bukhārī, *Diyāt*, bāb 27, Yāḳūt, iii 410, Ibn Baṭṭūṭa, i 213), in modern times *fikīh* (s Lane, *Manners and Customs*, *Everyman's Library*, p 61) The teacher was as a rule held in little esteem, perhaps a relic of the times when he was a slave, but we also find distinguished scholars teaching in schools, thus Dahhāk b Muzāhim who died in 105 or 106, the exegist, traditionist and grammarian, had a school in Kūfa, said to have been attended by 3,000 children, where he used to ride up and down among his pupils on an ass (Yakūt, *Udabā'*, iv 272 *sq*) As language was of the utmost importance, we find a Bedouin being appointed and paid as a teacher of the youth in Basra (*ibid*, ii 239) Schools spread during the Omaiyad period They were found in Khurāsān and instruction was also given at home in the houses (see Haneberg, *Schul- und Lehrwesen*, p 4 *sq*) Under the Fātimids, there was a boys' school in the palace where the youth of the upper classes was prepared for the Caliph's service (Makrīzī, ii 209—211) It is natural to find a children's school also attached to the mosque, but education became probably more and more centred round the Kur'ān In the Mosque of the Omaiyads children were taught (Ibn Battūta, i 213, Ibn Djubair, p 272) and the teachers had special rooms at the north door of the mosque (Ibn Djubair, p 271) In Palermo most of the numerous mosques were also used for teaching the Kur'ān (*ibid*, p 332), according to Yākūt (iii 410), there were no less than 300 teachers here, but, he adds, because they were exempt from military service, but in the fourth century Ibn Hawkal counted 300 *katātīb* in Palermo, the teachers of which were held in high esteem (*B G A*, ii 87)

To this day children are taught in the sahn of the Azhar Mosque In the sixth century there were also many independent schools In Cairo, Ibn Djubair found a large number of schools mainly for orphans and poor children and the teachers and pupils were maintained by the Sultān (p 52) and in Damascus he saw a similar large institution (p 272) In Jerusalem Ṣalāh al-Dīn built a school (v Berchem, *Corpus*, II/1, 108 *sq*) Ibn Djubair says that in these eastern countries, the Kur'ān was only taught orally (by *talkīn*) while writing was practised with poems etc, out of respect for the Kur'ān (*Rihla*, p 272) This did not hold generally however At a later date (xiiith century) we are told that a pipe was led from a school in the Azhar Mosque to the tomb of the founder so that his grave could be watered by the water in which the slates, on which sentences from the Kur'ān had been written, were washed (Sulaimān Rasad, *Kanz al-Djawhar fī Ta'rikh al-Azhar*, Cairo 1320, p 73) As a rule the school was placed close to the mosque and beside a drinking fountain During the Mamlūk period, nearly every founder of a madrasa built in connection with it a similar institution for orphans and poor children, who received free instruction and sometimes also maintenance in it (see Makrīzī, s v *madāris*, *passim*) The object of one such school beside the mosque of Ibn Tūlūn is thus defined by Lādjīn as "to teach the orphans of the Muslims to recite the Book of God, the Exalted and also for other works pleasing to God and the various kinds of piety" (Makrīzī, iv 41) Elsewhere it is often said to be "to teach them the Kur'ān" In the Maghrib also, the children only learned the Kur'ān, i e to recite it, while in Andalus they also learned reading and writing (*kitāb*), poems and a little grammar In Ifrīkīya they learned, beside the Kur'ān, some Hadīth and a little of other sciences (Ibn Khaldūn, *Mukaddima*, p 447 *sq*, *fasl*, vi 32)

The children's school is called *maktab* (e g Yākūt, *Udabā'*, iv 272, Makrīzī, iv 41, 201) or *kuttāb* (Bukhārī, *Diyāt*, bāb 27, Balādhurī, p 142, Makrīzī, iv 197, 240), those founded for poor children *kuttāb sabīl* or *maktab sabīl* (cf e g Makrīzī, iv 53, 117, 199, 201) The word *sabīl* characterises the school as a public benevolent institution, cf the expression "she made a *maktab li 'l-sabīl*" (*ibid*, p 223, of Kalā'ūn's hospital, *ibid*, p 260, s also Dozy, *Supplement*, s v, Quatremère, *Hist Sult Maml*, I/i, 229 note and *B G A*, iv 211, 258) — Cf on elementary education Goldziher, Art *Education*, in Hastings, *Encycl of Rel and Ethics*, Mez, *Renaissance*, p 177 *sq*, Lane, *Manners and Customs*, Snouck Hurgronje, *Mekka*, ii 144 *sqq*

5 Libraries

In Mecca, as well as in Medīna, there were large collections of books in the mosques (Ibn Djubair, p 89, 193, on modern conditions in Medīna, see Batanūnī, *Rihla*, p 254 *sq*) The Djāmi' Zaitūna in Tunis had a large library (*Rec Soc Arch Constantine*, 1894, p 287) The Nizāmīya in Baghdād had a library of which al-Isfarā'inī (d 488) was librarian (Wustenfeld, *Shāfi'ī*, iii 314) The Mustansirīya was better supplied in this respect than any other madrasa (*Chron Mekka*, iii 174) In Marw there were in the sixth century 10 public endowed libraries in the mosques and madāris, two of them in the chief mosque, one of the latter containing about 12,000 volumes (Yākūt, iv 509) Among the madāris in Cairo, the Fādilīya was particularly well endowed in this respect, it contained 100,000 volumes (Makrīzī, iv 197), these were acquired by al-Kādī al Fādil from the Fātimid Academy (Shihāb al-Dīn Abū Shāma, *K al-Rawdatain*, Cairo 1287, i 200, 268, Makrizi, ii 253 *sqq*) and in Kalā'ūn's hospital there were according to Ibn Taghribirdī (II/i 482), 100,000 volumes from the same library These libraries were often broken up and portions put in other madāris During the famine of 694, the students of the Fādilīya sold the valuable books for a loaf a volume (Makrīzī, iv 197, cf also p 252) In Syria, Asia Minor (v Berchem, *Corpus*, III/i 26 *sqq*) and in the Maghrib also (*J A*, ser II, x 109 *sqq*, *Hesperis*, v 35) and elsewhere, libraries formed part of the endowments of the madāris With the decline in interest in learning many of these libraries became neglected What survived has often been collected and placed in new libraries, as for example in Cairo in the Royal Library since 1891 for Damascus see Habīb al-Zayāt, *Khazā'in al Kutub fī Dimashk wa-Dawāhihā* (Cairo 1902)

6 The subjects taught and the methods of instruction

As already explained, in the earliest period the principal subjects studied in the mosque were Kur'ān and Hadīth to which was added the study of the Arabic language In Bukhārī (*K al-'Ilm*)

ʿilm still means Hadīth but, with the development of the systems of law and theology, these were also taught in the mosques In the mosque of al-Mansūr in Basra, al Ashʿarī heard al Djubbāʾī expound the Muʿtazila *kalām* (Wustenfeld, *Schâfiʿī*, p 131), closely connected with this was methodology (*al-Mudhākara wa ʾl-Nazar*, cf Yākūt, *Udabāʾ*, vi 383) But many different subjects could also be taught Al Khatīb al Baghdādī, who taught in Mansūr's Djāmiʿ in Baghdād, lectured on his history of Baghdād (Yākūt, *l dabāʾ*, i 246 *sq*) Philosophy proper however disappeared from the mosques In Spain, we are told, *falsafa* and *tandjīm* were only cultivated in secret, as those who studied them were branded as zindīk, even stoned or burned (Makkarī, ed Dozy, i 136) The madāris were mainly established to teach the established systems of fikh and originally each school was intended to represent only one madhhab Where the four madhāhib are represented in one school one can talk of four madāris, e g *al-Madāris al-Sālihiya* (Makrīzī, iv 209, 282, also *al-Madārasatān*, because it was divided by the street, p 209, cf v Berchem, *C I A*, i 104, note 1) The custom, often occurring before Nizām al-Mulk's time of founding a *Dār al-Hadīth* was also continued after him Al Makrīzī mentions two of them in Cairo al-Kāmilīya, founded in 622 by al Malik al-Kāmil (iv 211 *sq*) and al-Khatūbīya, founded in 785 (*ibid*, p 201) The former was restored in 1166 again as a hadīth school (v Berchem, *C I A*, i, N⁰ 61) Before al-Malik al Kāmil, Nūr al-Dīn (d 599) had founded the Nūrīya in Damascus as a *Dār al-Hadīth* (Makrīzī, iv 211, cf *J A*, ser 9, iii 280), when al-Makrīzī says this was the first built on the earth he must be corrected In Damascus many similar schools were built 16 are mentioned, and 3 Kurʾān and Hadīth schools besides (*J A*, ser 9, iii 271 *sqq*, Fleischer, *Kl Schriften*, iii 318 *sq*, 329 differs slightly)

The ordinary madāris however included other subjects beside the study of fikh alone Special mention is made of *nahw* (al-Ṣāhibiya, Makrīzī, iv 205) In the Nizāmīya in Baghdād and in other madāris in the east, philological studies were prosecuted (cf Yākūt, *Udabāʾ*, vi 409, v 423 *sq* and iv 253, but it must be an anachronism when Sulaimān b ʿAbd Allāh is said to have taught philology in 403 in the Nizāmīya in Baghdād) In 604 (1207) al-Malik al-Muʿazzam built beside the Ṣakhra mosque a *Madrasa nahwīya*, exclusively for Arabic linguistic studies (Sauvaire, *Hist Jer et Hebr*, p 86, 140) and schools for special subjects were not rare (cf Subkī, *Muʿīd*, ed Myhrmann, p 153) In addition to those in Makrīzī, there are frequent references to *kirāʾa* (often *al kirāʾāt al sabʿ*), *hadīth*, *tafsīr* and *miʿād* (devotional exercises cf thereon Quatremere, *Hist Sult Maml*, ii/ii 47) Al-Subkī mentions, in addition to the special Hadīth schools, also *Madāris al-Tafsīr* and *Madāris al-Nahw* (*Muʿīd al-Niʿam*, ed Myhrmann, p 153)

In his *Mukaddima* (*fasl* 6, N⁰ 4 *sqq*), Ibn Khaldūn gives a survey of the divisions of Islāmic studies They are divided into *ʿulūm tabiʿiya* and *naklīya* The former are based on observation by the senses and deduction and are therefore also called *falsafiya* or *ʿaklīya*, the latter are dependent on revelation by the "legitimate determiner" (*al-Wādiʿ al-Sharʿi*), are therefore based on special communication The *ʿulūm naklīya* therefore comprise all branches of knowledge which owe their existence to Islām, namely *Kurʾān*, i e *tafsīr* and the seven *kirāʾāt* (N⁰ 5), *hadīth* with the sciences auxiliary to it, including *al-nāsikh wa l-mansūkh*, *mustalah al-hadīth* (N⁰ 6), *al-fikh* with special emphasis on *al farāʾid*, the law of inheritance (N⁰ 7—8), *usūl al fikh* with the principles of law including methods of deduction on the differences between the madhāhib (No 9), *al kalām*, theology, which is *naklīya* in as much as it is really a further development of *imān* which comes under the head of religious duties, but is *ʿaklīya* in its nature since it is entirely based on abstract proofs (N⁰ 10), *al-tasawwuf*, something like practical theology (N⁰ 11), *taʿbīr al-ruyā*, interpretations of visions (N⁰ 12)

Linguistic sciences come next to the study of Kurʾān and Hadīth (cf N⁰ 4, 37 beginning), which are divided into 4 parts *al nahw*, *al-lugha*, *al bayān*, *al adab* (N⁰ 37), and in the last named category comes the whole study of Arabic literature

The *ʿulūm ʿaklīya* are variously classified, usually into 7 main sections (N⁰ 13) and are *al-mantik*, logic, which is the foundation of all others (N⁰ 17), *al arithmātikī*, arithmetic, including *hisāb* etc (N⁰ 14), *al handasa*, geometry (N⁰ 15), *al-haiʾa*, astronomy (N⁰ 16), *al-mūsīki*, the theory of tones and their definition by number etc (see N⁰ 13), then there is *al tabiʿiyāt*, the theory of bodies at rest and in motion, — heavenly, human, animal, plant and mineral, among its subdivisions, special mention is made of *al-tibb*, medicine, and *al-falāha*, agriculture (N⁰ 18—20, cf N⁰ 29) The seventh main head is *ʿilm al ilāhiyāt*, metaphysics (N⁰ 21) Magic, talismans, mysterious properties of numbers etc also form branches of Muslim learning (N⁰ 22 *sqq*)

As above remarked, medicine was not only taught in special schools but also in the mosques, about 600 A H, ʿAbd al-Latīf lectured in the Azhar Mosque but it is not quite clear whether his instruction in *tibb* was also given there (Ibn Abi Usaibiʿa, ii 207) and in any case the "philosophical sciences" in particular were cultivated in the mosques Another division which still prevails, developed, that into principal sciences, those having a definite aim (*makāsid*) and instrumental sciences (*ālāt* or *wasāʾil*) To the former belong *kalām*, *al-akhlāk al dinīya* (ethics, practically the same as *tasawwuf*), *fikh*, *usūl al fikh*, *Kurʾān* (*tadjwīd* and *tafsīr*), *hadīth* The latter comprise linguistics, (*sarf*, *maʿānī*, *bayān*, *badīʿ*) and in addition metrics and prosody (*ʿarūd*, *kāfiya*), logic (*mantik*) including the theory of proof (*ādāb al-bahth*), probably the same as the older *mudhākara* and *nazar*, mathematics (*hisāb* and *djabr*), *mustalah al hadīth* (cf Mustafā Bairam, *Risāla*, Cairo 1902, p 20, Snouck Hurgronje, *Mekka*, ii 200 *sqq*) There are no hard and fast lines drawn When in 1162 Ahmad Pasha came to Cairo as governor, no shaikh in the Azhar could give answers to simple questions on mathematics and astronomy, because they only knew as much arithmetic as sufficed to deal with questions raised by the law of inheritance, a very few studied these subjects privately The Pasha pointed out that astronomy was necessary for the study of religious duties, to settle the times and seasons (al-Djabartī, *Merveilles Biographiques*, ii 110 *sqq*, cf also A Sprenger, *Die Schulfächer und die Scholastik der Muslime*, *Z D M G* xxxii, 1878, p 1—20)

The method of teaching was by lectures which had to be learned by heart afterwards (*talkīn*) The first task was to learn the Kur'ān by heart and then acquire as many traditions as possible The hadīth was repeated three times so that the student could remember it (Bukhārī, *ʿIlm*, p 30) Lecturing soon became dictation (*imlāʾ*), when the student wrote down what was said, except in the case of the Kur'ān (approved Bukhārī, *ʿIlm*, bab 34, 36) The method was the same for linguistic or literary subjects as for Hadīth, Tafsīr, etc The philologists not only used to dictate their grammatical works, as for example Ibn Duraid (Wüstenfeld, *Schafiʿi*, p 127) or ʿAmr b ʿAbd al-Wāhid (d 344) who dictated from memory 30,000 folios on *lugha* (Yākūt, *Udabāʾ*, vii 26) but also the text of the poets, like al-Tabarī, who lectured on *al Tirimmāh* in the Mosque of ʿAmr in 256 (*ibid*, vi 432) Abū Bakr b al-Anbārī (d 327 or 328), who dictated in one part of the mosque and his father in another, knew by heart 300,000 *shawāhid* for the Kur'ān and 120 commentaries on verses of the Kur'ān with their isnāds (*ibid*, vii 73) Dictation was specially important in the case of Hadīth, as the exact establishment of the text was the first necessity It is therefore always said "he dictated Hadīth" (*Husn al-Muhādara*, ii 139, Wüstenfeld, *Schafiʿi*, p 210, 224, 248, 257, 287 etc , Ibn Kutlūbughā, *Tabakāt al-Hanafiya*, ed Flügel, p 51, Yaḳūt, *Udabāʾ*, i 246) The position of a teacher is therefore *madjlis al-imlāʾ* (*ibid*, ii 243, vii 74), and his *famulus* among the students is *al-mustamlī* (cf *ibid*, vi 282, vii 74) Problems of fikh were also dictated (so Abū Yūsuf, Ibn Kutlūbughā, ed Flügel, N⁰ 249)

Instruction frequently began immediately after the salāt and the students performed the salāt along with the teacher The class (*dars*) began with the recitation of the Kur'ān by a *kāriʾ*, with blessings on the Prophet, and other religious formulae (*Madkhal*, i 56, cf Mez, *Renaissance des Islams*, p 172 *sq*) At the present day, the teacher as a rule simply pronounces the *basmala* himself Dictation alone was not everywhere the custom In time, there came to be so many copies of the chief texts that the students were able to get copies for themselves The text was in this case read aloud and the teacher gave his comments and emendations on the text (Yākūt, *Udabāʾ*, i 255) It was only natural that the dictation of texts was first abandoned in philology, it is said to have been dropped as early as the fourth (tenth) century (Mez, *Renaissance*, p 171 with a reference to Subkī, *Tabakāt al-Shāfiʿiya*, iii 259, Suyūtī, *Muzhir*, i 30) This does not mean that dictation was completely abandoned for the teacher still made his pupils write down his comments, for example Muhammad b ʿAbd al-Rahmān (d 584) dictated a commentary on Harīrī (Yākūt, *Udabāʾ*, vii 20), and the method of having a text read aloud, while the lecturer explained any remarkable phrases was used as early as by the teacher of Hadīth, Ibn Kaisān (d 299, *ibid*, vi 282) At the present day, either the teacher or his famulus reads the text to be expounded from printed copy

Cooperation between teachers and taught by questioning one another has always been an important feature of method Ibn Khaldūn laments that so few teachers in his time understand the correct methods of teaching (*turuk al-taʿlim*) They put difficult questions at once to the pupil instead of which the *talkin* must be arranged systematically, so that it is always combined with exposition and it is a fundamental principle that the pupil should not mix the different subjects In Spain and North Africa in particular in his time, the instruction was not particularly good, and they laid too much stress on learning by heart (*hifz*) (*Muḳaddima*, p 342, 443 *sq*, 445 = *fasl* 6, N⁰ 2, 29, 30, cf Subkī, *Muʿid al-Niʿam*, ed Myhlmann, p 151 *sq*) Mechanical learning by heart is recognised for the Kur'ān It is therefore regularly said "he dictated and expounded" (e g Wustenfeld, *Schâfiʿi*, p 220, 326) When the above mentioned Ibn Kaisan expounded hadīths, he also asked his hearers about their meaning (Yākūt, *Udabāʾ*, vi 282) Vice versa, the class was at liberty to catechise the teacher Al-Shāfiʿī used to sit in his great halka in Mecca and say "Ask me what you want and I will then give you information on the Kur'ān and *sunna*" (*ibid*, vi 391, cf *B G A*, iii 379) The teacher was sometimes overwhelmed with questions (Yākūt, *Udabāʾ*, v 272) Ibn Djubair saw written questions being handed to a teacher in the Nizāmiya in Baghdād (p 219 *sq*) Both practices are still in vogue and even in large classes the student may interrupt with questions Ibn al Hādjdj condemns irregular interruptions of the lecture (*Madkhal*, i 57)

7 The Teachers

The name for a teacher is *mudarris* (also used in the pre Muhammadan period Ibn Abī Uṣaibiʿa, i 104), *ustādh* is a kind of honorary title (see Yākūt, *Udabāʾ*, i 113, 209, ii 271, v 353, 354, 358, 448) and is still in use and applied also to students There were a very large number of teachers in the great mosques In the madrasa at first only one was appointed, for example in the Nizāmiya in Baghdād (see above), in the first of those founded by Salāh al Dīn in Cairo (al-Nāsiriya Makrizī, iv 193) and in many others A madrasa frequently took its name from a distinguished teacher (e g the Ghaznawīya in Cairo Makrīzi, iv 235, the Sharifiya, originally the Nāsirīya *ibid*, p 193, M Ibn Rashik *ibid*, p 195, cf Masdjid al Kisāʾī in Baghdād) In the larger madāris, however, several teachers were appointed, Salāḥ al-Dīn appointed 4 lectures to the Kamhīya in Cairo (*ibid*, p 193 *sq*), in this case a definite number (20) of students was allotted to each teacher (cf *Chron Mekka*, ii 105 *sq*)

It is easily understood that the conditions in the older mosques, where every one could come and go, were freer than in the madāris, which were built for particular teachers and students There was certainly no official recognition of the teachers in the earliest period After text books had come into use, the certificate of qualification was the *idjāza*, and so it has remained to modern times Any one who had studied with a teacher could get permission from him to teach from the book, which he had copied out and studied from his dictation, the teacher wrote this permission (*idjāza*) in the book (e g Yākūt, *Udabāʾ*, i 253, ii 272) A teacher could also give an *idjāza ʿāmma*, which permitted the individual concerned to teach from all his works (Ibn Battūta, i 251) In Damascus, Ibn Battūta was given quite a number of these "diplomas" (i 251—253) It was the usual thing for a travelling scholar to collect numerous *idjāzāt*,

thus ʿAbd al-Latīf had certificates of this kind from teachers in Baghdād, Khurāsān, Egypt and Syria (Ibn Abī Usaibiʿa, II 202) As late as about 1700 we find al-Nābulusī acquiring *idjāzāt* on his travels (*Z D M G*, XVI 690) There were special formulae for the *idjāza* for *tadrīs* and *futyā* (al-Kalkashandī, *Ṣubh al-Aʿshā*, XIV 322 *sq*) Some scholars only gave occasional lectures ʿAbd al-Wāhid (d 494) lectured on Hadīth every Friday in the Nizāmīya (Wüstenfeld, *Schâfiʿî*, p 287) and originally this was the case in the Azhar Mosque (see above)

The caliph al-Kādir, in his earlier days, used to lecture every Friday in a mosque in Baghdād (*ibid*, p 233) Some scholars only dealt with a very limited subject, thus one was appointed to the Nizāmīya to lecture on Bukhārī's *Sahih* because he had attended lectures on this from a celebrated teacher (*ibid*, p 288) There were however many learned men who devoted themselves mainly to teaching and taught several subjects Thus al-Shāfiʿī began his *halka* immediately after the *salāt al-ṣubh* and taught students of the Kurʾān, at sunrise the students of Hadīth came to him and heard his comments, later in the day he lectured on method (*mudhākara wa 'l-nazar*), at the *duhā* the *ahl al ʿArabīya* came to him and he lectured on *ʿarūd*, *nahw* and *shiʿr* He went off at midday (Yākūt, *Udabāʾ*, VI 383) About 300 A H we find Ibn Kaisān lecturing for the best part of the day on a number of subjects in somewhat the same order (*ibid*, VI 282), others lectured from early morning till late in the evening (*ibid*, VII 176, Ibn Abī Usaibiʿa, II 207 *supra*) and pious teachers even spent the night in the mosque in prayer (Wüstenfeld, *Schâfiʿî*, p 258) Sometimes a young teacher began by dictating hadīth and later received a post with a wider scope in a mosque (*ibid*, p 239)

The distinction between teacher and taught was not absolute, any one could have an *idjāza* in one subject, while he was still a student in others and even men of ripe scholarship attended the lectures of notable teachers This led students to travel from one seat of learning to another, just as they used to travel in early days to collect hadīths (Bukhārī, *ʿIlm*, p 7, 19, 26) All the biographies of learned men give examples of this, the old Hellenistic custom was thus continued (cf J W H Walden, *The Universities of Ancient Greece*, New York 1910) and royal courts still played the same part, at them learned guests received donations, which enabled them to appear as teachers in the mosques (e g Ibn Battūta, II 75 *sqq*, Ibn Khaldūn, *Kitāb al-ʿIbar*, Būlāk 1284, VII 452, Ibn Abī Usaibiʿa, II 205, cf Mommsen, *Romische Geschichte*, V 589) Distinguished scholars were of course much visited by lovers of learning, of one of the latter, it is said *ruhila ilaihi* or *ilaihi kānat al-rihla* "they used to travel to him" (Yākūt, *Udabāʾ*, VII 174, *Husn al Muhādara*, I 207, cf p 141) 4—600 *fukahāʾ* had gathered round a teacher in the Maghrib in the time of Ibn al Hādjdj (*Madkhal*, II 5) Sometimes a scholar attended another's class to try him with questions (see e g for al-Bukhārī Brunnow–Fischer, *Chrestomathie*, p 103) and disputations often took place in which the pupils used to support their teacher very vigorously If the stranger was recognised, the teacher might receive him with marks of honour (al-Akhfash at al-Kisāʾī's Yākūt, *Udabāʾ*, IV 243 *sq*) As in the Christian universities of Europe, public disputations were held in the mosques, in which considerable feeling might be displayed, e g in the disputations in the Rusāfa mosque in Baghdād between Ibn Suraidj (d 306 = 918) and the son of Dāwūd al-Zāhirī in which the former was victorious (Wustenfeld, *Schâfiʿî*, p 110 *sq*) The teachers of the Nizāmīya also used to hold disputations (*ibid*, p 309) Celebrated teachers were not only visited by other scholars When (about 300) Ibn Kaisān was lecturing, about 100 horses etc used to stand outside the mosque because prominent men were listening to him (Yākūt, *Udabāʾ*, VI 282) The teachers made up the class of "the turban wearers" (*muʿammam*, *mutaʿammim*, *arbāb al-ʿimāma*, *aṣhāb al-ʿimāma*, see Makrīzī, II 246, Quatremère, *Hist Sult Maml*, I/I, 244 *sq*, II/II 266, Dozy, *Supplement*, II 169a), in eastern Andalus, they did not wear the *ʿimāma*, but this was exceptional (Makrizi, I 137) The Kadi Abū Yūsuf (d 82) is said to have settled the dress worn by learned men (Ibn Kutlūbughā, ed Flügel, N° 249)

In spite of all this flexibility a certain stability developed in the teaching staff of the mosques This was connected with the question of pay It was for long in dispute whether it was permitted to accept payment for giving instruction In the collections of Hadīth, the practice is both supported and condemned and it is said that the teacher may accept money, but not demand it, and avaricious teachers are strongly condemned There are continual references to people who gave lectures without payment (Bukhārī, *Idjāza*, bāb 16, Abū Dāwūd, *Buyūʿ*, bāb 36, Ibn Mādja, *Tidjārāt*, bāb 8, cf Goldziher, *Muh Stud*, II 181 *sq*, Art *Education*, N° 3–4 in Hastings, *Encycl of Rel and Ethics*, Lammens, *Moʿawia*, p 360 *sq*, *J A*, 1901, p 143, Wustenfeld, *Schafiʿi*, p 295, Mez, *Renaissance*, p 176) The custom of the older Jewish scholars of exercising a handicraft was not common among the Muslims but was found occasionally Among men of learning we find shoe makers, locksmiths, sandal-makers (Wustenfeld, *Schâfiʿî*, p 227, 231, 267, cf also Mez, *Renaissance des Islam*, p 179) It was the rule however for the teacher to be paid for his work This might be quite a personal donation from a prince or other rich man, for example al-Tabarī was given a sum of money when he taught in the Mosque of ʿAmr (Yākūt, *Udabāʾ*, VI 428, cf the remarks above on wandering scholars), it was as a rule however a regular salary which was paid out of endowment, so that the position was a regular professorial chair (see under G), this was especially the case in the madāris The salaries of the teachers (*maʿlūm*, also *djawāmik*, sg *djamakīya*, see Dozy, *Supplement*, s v) varied considerably, according to the endowment The lecturer in the Suyūfīya received 11 dīnārs a month (Makrīzī, IV 196) but in another of Salāh al-Dīn's schools, the Salāhīya or Nāsirīya, the pay was much higher, the principal teacher received 40 dīnārs (of $13\frac{1}{3}$ dirhams) a month and 10 dīnārs as principal, along with 60 *ritl* of bread and two beasts of burden, to bring water from the Nile (*ibid*, p 251) In the Djamāl al-Dīn madrasa, each teachers got 300 dirhams a month (*ibid*, p 253) The teachers also received donations in kind on special occasions, in the other Nāsirīya school they received sugar and meat every month at the festivals (*ibid*, p 222),

in the Hidjāzīya on ʿId al-Fitr different kinds of bread and biscuit (*kaʿk* and *khushkunānik*), at the feast of sacrifice meat and in Ramadān food was prepared for them (p 243) According to al Makrīzī, learned men might have 50 dīnārs a month in all in addition to allowances in kind (iii 364) On ceremonial occasions, they often were given special marks of distinction, such as gifts in money and robes of honour

The men of learning were organised in a gild How the organisation worked in detail is not known At the end of the third century we find the institution of the *riʾāsa* established in Egypt While Yazīd b Habīb (d 128) is called *fakih Misr wa shaikhuhā* and *saiyidunā wa-ʿālimunā* and ʿUbaidallāh b Abī Djaʿfar (d c 135) *fakih zamānihi* (*Husn*, i 131), it is said of a series of scholars beginning with ʿAbd al Rahmān b al Kāsim (d 191), Ashhab b ʿAbd al-ʿAzīz (d 204), ʿAbd Allāh b ʿAbd al Hakam (d 214 or 215) that they had *al-riʾāsa* in Egypt (*Husn*, i 133 *sq*) which seems to mean that they belonged to an organisation The position is also called *riʾāsat al-ʿilm*, as, for example, with reference to Yūnus (d 264) (*ibid*, i 136) When the *madhāhib* arose, each school had its own *raʾis* in the district The formulae for this was *intahat ilaihi ʾl riyāsa fi madhhab mālik*, e g of Ibn al-Mawāz (d 281), and others (*Husn*, i 136, Ibn Taghribirdī, ii/ii 116), for the Shāfiʿis e g Isfarāʾīnī, died 406 (Ibn Taghribirdī, ii/ii 121 *sq*, cf *Husn*, i 196, Ibn Djubair, p 219, 220), for the Hanafis e g al-Karkhī, died 340 (Ibn Kutlūbughā, N⁰ 115, cf N⁰ 11, 13, Ibn Taghribirdī, ii/ii 116), for the Hanbalis al Barbahārī (d 329) (Ibn Maskawaih, i, Cairo 1905, p 260) Besides *raʾis* we find other names like *Imām al-Hanafiya bi-Baghdād* or *bi-Khuʿāsān* or *Shaikh Aṣhābinā bi-mā waraʾ al-Nahr* (Ibn Kutlūbughā, N⁰ 67, 96, 196, cf *Shaikh al Hanafiya* Ibn Taghribirdī, ii/ii 116, *Shaikh al-Mālikiya fi Waktihi Husn*, i 209) With such names it is not always clear whether they are simply epithets like *Imām Waktihi*, *Imām ʿAsrihi* (Ibn Kutlūbughā, N⁰ 206, 217), *Ustādh Zamānihi* (*Husn*, i 141), *Raʾs fi ʿIlm al-Kalām* (*ibid*, N⁰ 192), *Saiyidunā* (*ibid*, N⁰ 50), "the teacher of the Hanbalis and their Fakīh" (Ibn Taghribirdī, ii/ii 114) There is also evidence of the Riyāsa within the special subjects, e g *Shaikh al-Kurrāʾ bi Misr* (*Husn*, i 230), *Riyāsat al-Hadith bi-Misr* (*ibid*, i 163 al-Rashīd), *Riyāsat al-Fatwā* (Quatremère, *Hist Sult Maml*, ii/ii 27), *Riyāsat al-Ikrāʾ wa ʾl-Iftāʾ* in Alexandria (*Husn* i 210) The physicians of a district had their *Raʾis al-Aṭibbāʾ* (Makrīzī, iv 237, Ibn Abī Usaibiʿa, ii 86, 247), a Kādī was appointed in 684 (1285) chief of the physicians (Quatremère, *op cit*, ii/i 81) There was also a *Raʾis al-Muhandisin* (Makrīzī, iv 224) *Shaikh al-Islām* is found as a title of honour for a scholar, e g in the viiith, viiith, ixth century (*Husn*, i 143, 205, Quatremère, *op cit*, ii/i 68, note, ii/ii 270, 280 Ibn Taimīya), probably also used earlier (Mez, *Renaissance*, p 179), while *Shaikh al Shuyūkh* means the most distinguished leader of the Sūfīs (Makrīzī, iv 285)

It is not clear what real importance the organisation of teachers had in the earlier period In different districts there was a principal director of the organisations, a *raʾis al-ʿulamāʾ*, in Medīna (Ibn Djubair, p 200, 5), in Baghdād (*ibid*, p 220, 12), in Cairo and Upper Egypt (*Husn*, i 141, 143, 191), also called *raʾis al riʾasā* (Ibn Abī Usaibiʿa, ii 204, Yākūt, *Udabāʾ*, i 248) Every madhhab had its *raʾis* for the district (*Husn*, i 148, 21, Yākūt, iv 512) The chief raʾīs could interfere in the activities, for example, of the teachers of Hadīth (Yākūt, *Udabāʾ*, *loc cit*) He is probably identical with the *nakib al-nukabāʾ*, without whose permission the caliph would not admit a teacher to the Mosque of al-Mansūr in 451 (*ibid*, i 246 *sq*) This shows that the head of the gild of learned men even then could exact influence on the appointment of new teachers Whether appointments were made after an examination we do not know The right of lecturing was in any case limited in this way in practice, but a systematic set of regulations hardly existed ʿAbd al-Latīf lectured in the Masdjid al-Hādjib Luʾluʾ, being paid by the Kādī al-Fādil and afterwards in the Azhar, paid out of the Bait al Māl (Ibn Abī Usaibiʿa, ii 205, 207), but what his relation to the gild of teachers was is not known In later times the chief of the learned men in Cairo and Mecca had great influence, because he decided who should be admitted into the gild of teachers and also controlled salaries (see G 2ᵃ)

The teacher had his particular place in the mosque, often beside a pillar this was his *madjlis*, which was inherited by his successors, al-Buwaitī was *khalifatu ʾl-Shāfiʿī fi halkatihi* (*Husn al-Muhādara*, i 135, cf 181 infra, 182, Makrīzī, iv 5, Yākūt, *Udabāʾ*, iv 135, Wüstenfeld, *Schāfiʿī*, p 239) The outward appearance of the class did not alter through the centuries His hearers sit in a circle (*halka* the listeners *tahallakū* Makrīzī, iv 49, 17 *sq*, cf on the word Quatremère, *Hist Sult Maml*, i/ii 197 *sqq*) on the ground before the lecturer The teacher sits on a carpet (*sadjdjāda*, cf Yākūt, *Udabāʾ*, i 254) or skin (*farwa*) This was described as a symbol of his dignity in his *waṣīya* (al ʿUmarī, *Taʿrif*, p 134) It is quite irregular for any one to teach standing (Yākūt, *Udabāʾ*, v 424, 8, for the other view see Bukhārī, *ʿIlm*, bāb 45) On the other hand, we often find in large audiences that the teacher has a raised seat (for the older period see Ibn Battūta, i 212) Ibn al-Hādjdj condemns this because the teacher must not raise himself out of the circle of his hearers, he even wants to reject the use of the skin and carpet as effeminate (*Madkhal*, i 96 *sq*)

It was not the custom for teachers, to live in the mosque Of course a teacher, like any other pious individual, could stay in the mosque and even have a room there, al-Ghazālī for example lived in the mosque of the Umaiyads, where Ibn Djubair saw his room and Ibn Battūta mentions a teacher, al-Kermānī, who lived on the roof of the Azhar Mosque (i 92, cf also Ibn Abi Usaibiʿa, ii 204) But these were exceptions, al ʿAzīz built a dwellinghouse for the teacher in the Azhar near the mosque (Makrīzī, iv 49) The earlier madāris founded by Nizām al-Mulk had often lodgings for the teacher, especially as the teacher sometimes made his lodging his classroom and this is also found later Thus al-Khadjudī, who died in 543 (1149) lived in the Baihakīya (Wustenfeld, *Schāfiʿī*, p 307) and in the Salāhīya the head of the college had his home within the buildings (Ibn Djubair, p 48) Shams al-Dīn (d 637) lived in Damascus in the ʿĀdilīya where he taught fikh (Ibn Abī Usaibiʿa, ii 171, cf also p 260) This must also have been the case in other madāris But in any

case many teachers lived outside, which is evident from the fact that not a few taught in several places (of the many examples see for the fourth century, Wustenfeld, *Schâfi'ī*, p 187, later *Husn al-Muḥādara*, i 148, 185—187)

Of the teachers many were also kādīs (as in their day were the kussās, who were in a way the predecessors of the teachers see above) Thus the Fātimid kādī 'Alī b Nu'mān read Shī'a fikh shortly after the conquest in the Azhar mosque and later another member of this family of kādīs also taught there (Kindī, *Wulāt*, p 600), in the same way the kādīs taught in Baghdād (Wüstenfeld, *Schâfi'ī*, p 235) We find the chief kādīs especially teaching in the madāris In the Sālihīya in Cairo, the Hanbalī chief kādī taught (Makrizī, iv 209, another chief kādī Quatremère, *Hist Sult Maml*, ii/1 135), in the Mansūrīya also a chief kādī (Makrizi, iv 219), in the Nāsirīya the chief kādīs of the Mālikīs, Hanbalīs and Hanafīs (*ibid*, p 222, see also Manāzil al-'Izz, p 194, al-Djamalīya, p 238 etc , for Mecca *Chron Mekka*, ii 105 *sq*) The kādīs frequently were able to accumulate a considerable number of offices The chief kādī Ḳādī Ibn Bint al A'azz (c 700) had 17 offices (Quatremère, *Hist Sult Maml*, ii/1 137 *sq*) The teacher could also be a muftī (e g Yākūt, *Udabā'*, iv 136)

When a teacher dies, in modern times it has been the custom to mourn 3 days in the Azhar mosque, with recitation near his pillar and the recitation of the Kur'ān on the minbar, while the teaching is interrupted (Mustafā Bairam, *Risāla*, p 65) This is an old custom When al-Shīrāzī died, his pupils sat in silence for 3 days in the Nizāmīya and the madrasa was closed for a whole year, after al-Djuwainī's death also, no lectures were given for a year, his desk was destroyed and his pupils broke their inkwells and pens (Wüstenfeld, *Schâfi'ī*, p 252, 301)

Alongside of the teacher proper, a repeater (*mu'īd*) was often appointed, usually two for each teacher His duty was to read over with the students the lecture after the class and explain it to the less gifted students The celebrated fakīh al-Bulkīnī began as a repeater with his father-in-law in the Kharrūbīya (Makrīzī, iv 202), it was also possible to be an independent teacher in one school and a repeater in another (al Nasir, d 669, *Husn al-Muḥādara*, i 189) When Ibn Khallikān became old, he put the teaching in his madrasa into the hands of repeaters (Quatremere, *Hist Sult Maml*, i/ii 182) The Salāhīya, which ought to have had 4 teachers with 2 repeaters, was run for 30 years by 10 repeaters and no teachers (Makrīzi, iv 251, cf also p 210, Subkī, *Mu'īd al-Ni'am*, p 154 *sq*, Kalkashandī, *Ṣubh al A'shā'*, v 464 and Haneberg, *Schul- und Lehrwesen der Muhammedaner*, p 25, Wüstenfeld, *Die Akademien der Araber und ihre Lehrer*, 1837)

8 The Students

Every one was absolutely free to join a *halka* in the mosques in order to hear a teacher Al-Makdisī for example tells us that the learned men of al-Fārs used to sit from early morning till midday and from 'Asr to Maghrib for the common people (*fī 'l-'awāmm*) (*B G A*, iii 439) But as soon as the teachers developed into a regular class of society, the students (*ṭalaba*, *ṭullāb*, sg *ṭālib*) who were systematically training in the Muslim sciences also became a recognised section of the community Together with the teachers, they formed the guild of the educated, *aṣḥāb al 'imāma* (now *ahl al 'imme* in Egypt) They were able to select their teachers as they pleased, the most celebrated teachers had therefore large numbers of students The Mālikī Imām Muhammad al-Na'ālī in Egypt (d 380) had so large a class that they occupied the area around 17 pillars in the mosque (*Husn al Muḥādara*, i 207) and al-Isfarā'inī (d 406) in the Masdjid b al Mubārak had a close of 3—700 (Wüstenfeld, *Schafi'ī*, p 217) Some students heard a large number of teachers, Ibn Hamakān (d 405) attended lectures of no fewer than 470 teachers in Basra (*ibid*, p 215) Many never finished studying for they could always find new teachers to study under up to their old age, even if they themselves also taught (cf above) The ambitious would only study under great teachers (*dārasa 'alā*) and therefore travelled about the Muslim world a great deal (cf *B G A*, iii 237) This travelling, partly as teacher and partly as student (cf Wüstenfeld, *Schâfi'ī*, p 121), for the sake of *talab al-'ilm* was long kept up in Islām Ibn Khaldūn regards it as necessary and says that in his time, when learning in the Maghrib was at a low level, very many Maghribis used to go to study in Egypt and Syria (*Mukaddima*, *fasl*, 6—7, N° 2, 34) and down to the present day the Azhar has attracted students from the whole world of Islām

The student *kara'a 'alā* his teacher, in Fikh studies *tafakkaha 'alā* (Ibn Kutlūbughā, p 10, 11, 12, 14, 18, 54 etc) or *kara'a 'l-fikh 'alā* (*ibid*, p 12) When the student had completed his teacher's course, the teacher declared his knowledge mature in the particular subject (*kharraja lahu fī* Yākūt, *Udabā'*, iv 255, 17) and the student was able to regard himself as perfect in it (*takharraja 'alaihi ibid*, p 244 or *bihi fī Husn al Muḥādara*, i 163, 7 from below, 192, 209, 212, Ibn Taghribirdi, ii/1 122, *B G A*, iii 237, Ibn Kutlūbughā, ed Flugel, p 44, Yāḳūt, iv 512) The relation of student to teacher is patriarchal and the student kisses his hands This does not prevent quarrels breaking out and in such cases the teachers might be treated very disrespectfully (cf Sulaimān Rasad, *Kanz al-Djawhar*, p 141 *sqq*, 192 *sqq*)

The madāris introduced an innovation into the relationship of teacher to student, when a definite number of students (as a rule twenty, see above) was allotted to a particular teacher Instruction was thus organised on more systematic lines But even then irregular students were also admitted (cf Ibn Abī Usaibi'a, ii 168) In Ibn Khaldūn's time the period of study for students in the madrasa in Tunis was five years, but in the Maghrib sixteen (*Mukaddima*, *fasl* 6, N° 2 = p 343 of the Cairo edition of 1322) But it was only in quite modern times that the instruction was really properly organised Ibn al-Hādjdj complains that students go from one mosque to another except when the new teacher is more learned (*Madkhal*, ii 3, 9 *sq*)

We hear exceptionally of women students, one was a member of al-Shāfi'ī's madjlis (*Husn al-Muḥādara*, i 181, *infra*) In the early centuries it cannot have been unusual, for it is several times mentioned in hadīths, which reserve special days for women (Bukhārī, *'Ilm*, bāb 32, 36, 50)

It is now the custom in the Azhar mosque to have no lectures on Fridays and Thursday afternoons and also in Fās (Péretié, in *Archives Marocaines*, xviii 301) From Ibn Hādjdj, we learn that the custom was already known in his time for he protests against it and only allows the forenoon to be used for purification etc (*Madkhal*, ii 13 below the middle), the time after the Friday salāt is particularly suitable for studies This agrees also with the general practice, in the Azhar mosque after its foundation instruction was given at this very time (Makrīzī, iv 49, 17 *sq* , cf Yākūt, *Udabā'*, vii 198) On the other hand it has always been a common practice to close the shops on Fridays, as al Makdisī mentions for Egypt for example (*B G A* , iii 205), Ibn Battūta for Khwārizm (iii 4) In al-Azhar in addition to the period already mentioned, holidays are given on festivals and various mōlid's during the months of Sha'bān, Ramadān and the first half of Shawwāl and also forty five days of the hot season, when the usual holidays do not fall in it

Many of the students have always been poor Bukī b Mukhallad (d 276) held up to his pupils, as an example, one who lived only on cabbage leaves thrown to him, and another who sold his trousers to buy paper (Yākūt, *Udabā'*, ii 370) The student could, like any one else, live in the mosque (*ibid*, i 255, 5 in the minaret of the Omaiyads, about 400) Charity took an interest in them The learned caliph al Kādir (363—381) sent food from his table every day, which was distributed among those who lived in the mosques (Mez, *Renaissance*, p 11, 297 *sq* , from Ibn al-Djawzī), and the vizier Ibn al Furāt, who was executed in 312 gave an endowment of 20,000 dirhams for *tullāb al hadīth* (*K al-Wuzarā'*, ed Amedroz, p 201 *sq*)

In the *madāris*, students were offered lodging and certain allowances in addition In the Suyūfīya, founded by Salāh al Dīn, the students received stipends according to their *tabakāt*, after the teacher had received 11 dīnārs monthly (Makrīzī, iv 196) In another madrasa they received 3 *ritl* of bread daily and 30 dirham fulūs monthly (*ibid*, p 253) On special occasions they were given meat, sugar etc (*ibid*, p 222, cf for Fās *Arch Maroc aines*, xviii 289) With increasing interest in the madrasa, interest was also taken in those studying in other mosques In the mosque of Ibn Tulūn in 767, the emir Yalbughā revived the school with 7 Hanafī teachers and the students received 40 dirhams and 1 *irdabb* of wheat monthly (Makrīzī, iv 42) The Azhar from its restoration by Salār after the earthquake in 702 had lecture-rooms and dwelling apartments continually added to it In 818 there were in all 750 poor students in the Mosque of different nations, each in its own riwāk They received stipends and food, bread and halāwa (*ibid*, iv 54) Kā'it Bāi among others (872—901) built lodgings for Syrian and Turkish students and in the twelfth century the emir Katkhudā extended not only the large lecture rooms but renovated the lodging for Meccan and Sūdānese students and built new hostels with a kitchen for those from Upper Egypt There were at this time several kitchens connected with the mosque (cf still the name of the eastern door *Bāb al-Shurba* "Gate of Soup"), and Katkhudā during the month of Ramadān gave them many gifts in kind, and increased the daily ration of bread (*djarāya*) for them (see down to about 820 Makrīzī, iv 49—55 and to the present day Sulaimān Rasad al-Zaiyātī, *Kanz al Djawhar fi Ta'rikh al Azhar*, to Katkhudā cf al Djabartī, *Merveilles Biographiques*, iii 238—246, cf for Fās *Arch Maroc* , xviii 289) Shortly before 'Uthmān Katkhudā had built a home for the blind in connection with the Mosque In the nineteenth century Muhammad 'Alī built a new students' hostel and his successors have imitated him (see Sulaimān Rasad, *Kanz al Djawhar* etc , p 76, 86, 96, 112)

A student living in a mosque is called *mudjāwir* (Makrīzī, iv 54), a word which is also applied to Meccan pilgrims (Ibn Djubair, p 122) and to anyone living in a mosque (see above) The students' apartments are divided into *arwika*, usually according to nations, a word which is derived from the fact that they originally lived in the colonnades (cf above) Each *riwāk* is under a shaikh Many students live in khānakāh's, other in private houses When Lane was in Egypt, the teachers usually had students as boarders In Fās at the present day, the students in a madrasa themselves choose a *mukaddim*, who acts as door keeper and supervisor, they have at the same time a *nāzir* (*Arch Maroc* , xviii 288, 298) With lodging in the Azhar Mosque goes a small sum of money, at most about £ 1 monthly, in addition to the daily ration of bread, which however is shared by others, about 3,000 in number Troubles often break out in these students' hostels (cf Sulaimān Rasad, *Kanz al-Djawhar*, p 175—196) and the Azhar has played a prominent part in political movements since the World War (on teaching methods, teachers and students, see also 'Alī Pasha Mubārak, *al-Khitat al-djadīda*, iv 26 *sqq*)

9 Recent Reforms in Education

When intercourse between the Muslim world and Europe became active, the decline in Islāmic studies above mentioned was already far advanced On the one hand it resulted in the planning of new educational institutions on the European model, on the other in the reformation of the old system of education in the mosques

In India in the xviiith century education was given in the mosques as in other Muslim countries, except that Persian played a considerable part alongside of Arabic (cf *Report on the State of Education in Bengal*, Calcutta 1835, *Second Report* etc , 1836) In 1782 Warren Hastings founded the Calcutta Madrasah with a reformed system of education in order to train officials, it was imitated by other madāris When in 1837 Persian was abolished as the language of the law courts, the madāris only retained significance mainly as religious institutions Other institutions arose of more markedly English character, like the Anglo-Oriental College in Aligarh in 1875 (cf Th Morison, *The History of the Muhammadan Anglo Oriental College Aligarh*, Allāhābād 1909, *R M M* , ii , 1907, p 380 *sqq*) and the Islamic College in Lahore etc This led to new reforms in the madāris In the Calcutta Madrasa an Anglo-Persian Department was instituted Conferences were held in 1907–1908, 1909–1910 and 1912, and on July 31, 1914 the *Reformed Madrassah Scheme* was promulgated English was to be learned in the reformed madāris and Muslim studies to be based on modern text-books, only the Calcutta Madrasah retained a department, the Arabic department, where the old Islāmic education, although

somewhat modernised, was still given The education in the madrasas is linked up with the new universities in Calcutta and elsewhere (*Calcutta University Commission*, 1917—1919, *Report*, Calcutta 1919, I/i 143—187, V/ii 60—70) In 1922 there were already 14 universities of which five were founded after 1919 (*Oriente Moderno*, ii, 1922, p 60, on earlier discussions on the foundation of a university see *R M M*, xxi 1912, p 268 *sqq*) The older universities, founded on the model of that of London, are those of Calcutta 1857, Madras and Bombay 1857, Lahore 1882, Allāhābād 1887 (*R M M*, vi 4, on Chiefs' Colleges, *ibid*, p 1—51, ix 44—81) The essential feature of the reforms is the new method of instruction, the systematic organisation of the courses, which are concluded by examinations, and the creation of a qualified body of competent teachers

Inspired by the same spirit, if not so thorough, were the reforms which were carried through at the capital of Islāmic studies, the Azhar in Cairo without the assistance of a European power In 1872 an examination for those beginning teaching was instituted and the ordinance expanded by new regulations in 1885, 1888 and 1895 The principal could however appoint teachers without examination The students had to be registered so that unworthy persons should not share the stipends On June 4, 1895, a council of five members was appointed to prepare reforms They dealt with the finance and organisation In 1896 the mosque-schools in Tanṭā, Damietta, and Dassūk and in 1903 those of Alexandria were put under the Azhar On July 1, 1896 (supplemented in 1897 and 1898) examinations for students were arranged, history, geography and mathematics were introduced as voluntary subjects and it was forbidden to read glosses and super-commentaries in the first four years The driving power in the council was one of its members, Muhammad ʿAbduh, but he retired in 1905 The Khedive ʿAbbās II Hilmī in 1908 and in 1911, after several commissions had been working at the subject, promulgated a new law which is still (1928) practically in force The administration of the Azhar Mosque and the institutions connected with it (particularly other mosques and the Kādī School) were reorganised The organisation is based on the old organisation of the staff with the principal as head of the ʿulamāʾ and the heads of the madhāhib as members of the committee of management New subjects were instituted, such as *akhlāk* in combination with the *sīra*, history, especially Muslim, geography, natural history, chemistry, mathematics, drawing, hygiene, education Instruction is given in three divisions, each of which is estimated to cover 5 to 7 years To obtain admission a student must be 10—17 years of age, be able to read and write and know the Kurʾān by heart (by the law of 1911 he was allowed to learn half of it in his first six months in the Mosque, but this was abolished in 1921) Each year ends with the examination in the month of April, the final examination of the first section enables the successful candidate to teach in elementary schools, that of the second to obtain an appointment in certain offices or as *imām* or *khaṭīb* in the mosques, by the examination, the candidate obtains the highest degree of *ʿālim*, and can become a teacher in the Azhar, or judge or council in the Sharīʿa courts By new laws of 1921, 1923 and 1924, the examinations were reformed and the relationship to the Kāḍī School, Dār al-ʿUlūm and other educational institutions reorganised so that in the Azhar, a *kism al-takhaṣṣuṣ* for *Fikh*, *Tafsīr*, *Hadīth*, *Tawhīd*, *Manṭik*, *Wadʿ*, *Bayān*, *Akhlāk*, Islāmic history and practical courses in teaching and court practice were instituted When by the law of Aug 26, 1927, a university was founded with faculties of arts, law, science, and medicine (cf *Oriente Moderne*, v, 1925, p 110 *sq*, 434—436, vii, 1927, p 627 *sqq*), the question of education in the mosque again came up and a new commission on Nov 27, 1927 was charged to consider new proposals (for the reforms of Egyptian institutions see P Arminjon, *L'enseignement, la doctrine et la vie dans les universités musulmane d'Egypte*, 1907, Mustafā Bairam, *Risāla*, 1902, Sulaiman Rasad al-Zaiyāti, *Djawhar fī Taʾrikh al-Azhar*, 1320, p 147 *sqq*, *Aʿmāl Madjlis Idārat al Azhar*, Cairo 1323, anonymous, but by ʿAbd al Karīm Salmān, cf *al Manār*, xxv, 1324 p 703, *Commission de la Reforme de l'Université d'El Azhar, Projet de Reforme presente par Muh. Pacha Said*, Cairo 1911, and the official regulations, Johs Pedersen, *al Azhar*, Copenhagen 1922, p 65 *sqq*, A Sékaly, in *Revue des Études Islamiques*, i, 1927, p 95 *sqq*, 465 *sq*, ii, 1928, p 47 *sqq* etc, *Oriente Moderno*, v, 1925, p 113 *sq*, vii, 1927, p 634) In Morocco the ruler in 1844 introduced European subjects into the Madrasa in Fās Djadīd (whence its name *Madrasat al-Muhandisīn*), these innovations did not become permanent but in 1916 the madāris in Fās and Rabat were reformed (Bell, in *JA*, ser 11, x 152, Péretié, in *Arch Maroc*, xviii, 1912, p 257 *sqq*, see for Tunis *R M M*, iii 385)

Since the World War, throughout the world of Islām, particularly in Turkey, very far reaching reforms in education have been introduced the results of which cannot yet be surveyed

G The Administration of the Mosque

1 Finances

The earliest mosques were built by the rulers of the various communities and the members of the community did all the work necessary in connection with the primitive mosques The later mosques as a rule were erected by rulers, emirs, high officials or other rich men in their private capacity and maintained by them The erection of the mosque of Ibn Tūlūn cost its builder 120,000 dīnārs, the Mosque of Muʾaiyad 110,000 (Makrīzī, iv 32, 137, 138) The upkeep of the mosque was provided for by estates made over as endowments (*wakf*, *habs*) (cf thereon besides the Fikh books I Krcsmárik, *Das Wakfrecht*, *Z D M G*, xlv, 1891, p 511—576, E Mercier, *Le code du hobous ou ouakf selon la législation musulmane*, 1899) In the third century we thus hear of houses which belonged to the mosques and were let by them (*Papyrus Erzherzog Rainer*, *Führer*, N⁰ 773, 837) and Ibn Tūlūn handed over a large number of houses as an endowment for his mosque and hospital (Makrīzī, iv 83) This custom was taken over from the Christians by the Muslims (see Becker, in *Isl*, ii 404) According to Makrīzī, estates were not given as waḳf endowments until Muhammad Abū Bakr al-Mādharāʾī (read thus) bequeathed *Birkat al-Habash* and *Suyūṭ* as endowments (about 300 A H), this was however cancelled by the Fātimids again (*ibid*) Al-Hākim made large endowments not only for his own,

but also for mosques previously in existence, such as the Azhar, al-Hākimī, Dār al ʿIlm and Djāmiʿ al Maḳs and Djāmiʿ Rāshida, the endowments consisted of dwelling houses, shops, mills, *ḳaisārīya* and *ḥawānīt*, and the document (*ibid*, p 50 *sq*) specifies how and for what purposes the revenues are to distributed Baths were also given as endowments for mosques (*ibid*, p 76 for 529, cf 81 of the year 543) Salah al Dīn granted lands to his madāris in 566, for example, a *ḳaisārīya* to the Kamhīya and a *daʿa* in al-Fayyūm and the teachers received wheat from al Fayyūm and in the same year he endowed the Nasirīya with goldsmiths' shops and a village (*ibid*, p 193 *sq*, cf an other document p 196 *sq*) During the Mamlūk period also, estates were given as endowments (for documents of this period see van Berchem, *C I A*, i, N⁰, 247, 252, 528, Moberg, in *M O*, xii, 1918, p 1 *sqq*, *J A*, ser 9, iii 264—266, ser 11, x 158 *sqq*, 222 *sqq*, xii 195 *sqq*, 256 *sqq*, 363 *sqq*) They were often a considerable distance apart the mosques in Egypt often had estates in Syria (v Berchem, *C I A*, i, N⁰ 247, Makrīzī, vi 107, 137) Not only were mosques built and endowed but already existing ones were given new rooms for teachers, minbars, stipends for Kur'ān reciters, teachers etc There were often special endowments for the salaries of the imām and the mu'adhdhins, for the support of visitors, for blankets, food etc (see Ibn Djubair, p 277 with reference to the Mosque of the Umayyads) The endowments and the purpose for which they might be used was precisely laid down in the grant and the document attested in the court of justice by the kadī and the witnesses (cf Makrīzī, iv 50, 196 *infra*) The text was also often inscribed on the wall of the mosque (cf *ibid*, p 76, the above mentioned inscriptions amongst others Documents from Tashkent see *R M M*, xiii, 1911, p 278 *sqq*) Certain conditions might be laid down, e g in a madrasa that no Persian should be appointed there (Makrīzī, iv 202 *infra*) or that the teacher could not be dismissed or some such condition (v Berchem, *C I A*, i, N⁰ 201), that no women could enter (*J A*, ser 9, iii 389), that no Christian, Jew or Hanbalī could enter the building (*ibid*, p 405), etc Endowments were often made with stipulations for the family of the founder or other purposes That mosques could also be burdened with expenses is evident from an inscription in Edfū of the year 797 (1395) (v Berchem, *C I A*, N⁰ 539) If a mosque was founded without sufficient endowment, it decayed (e g Makrīzī, iv 115, 201, 203) or the stipends were reduced (*ibid*, p 251), but in the larger mosques as a rule the rulers provided new endowments According to al-Māwardī, there were also special "Sultān-mosques" which were directly under the patronage of the caliph and their officials paid from the Bait al-Māl (*al-Aḥkām al-Sulṭānīya*, ed Enger, p 172 *supra*, 176 *supra*)

Just as the Bait al Māl of the state was kept in the mosque, so was the mosque's own property kept in it e g the *ḳanz* or *ḵhizānat al Kaʿba*, which is mentioned in ʿOmar's time and may be presumed to have existed under his predecessors (Balādhurī, p 43 *supra*, *C M*, i 307, ii 14) The *Bait Māl al Djāmiʿ* in Damascus was in a kubba in the sahn (*B G A*, iii 157, Ibn Djubair, p 267, Ibn Baṭṭūta, i 201, cf for Medīna Wustenfeld, *Medīna*, p 86) Rich men also had their private treasure chambers in the mosque (see E 2) as used to be the case with the Temple (see E Schurer, *Gesch d jud Volkes*⁴, ii, 1907, p 322–328, F Cumont, *Fouilles de Doura-Europos*, 1926, p 405 *sq*)

2 Administration

As Imām of the Muslim community, the caliph had the mosques under his charge This was also the case with the sultān, governor or other ruler who represented the caliph in every respect The administration of the mosques could however not be directly controlled by the usual government offices By its endowment the mosque became an object *sui generis* and was withdrawn from the usual state or private purposes Their particular association with religion gave the kādis special influence and on the other hand the will of the testator continued to prevail These three factors decided the administration of the mosque but the relation between them was not always clear

a Administration of the separate mosques

The mosque was usually in charge of a *nāzir* or *walī* who looked after its affairs The founder was often himself the *nāzir* or he chose another and after his death, his descendants took charge or whoever was appointed by him in the foundation charter In the older period the former was the rule and is said to have applied especially in the case of chief mosques, if we may believe Nāsir i Khosraw, according to whom al-Hākim paid the descendants of Ibn Ṭūlūn 30,000 dīnārs for the mosque and 5,000 for the minaret and similarly to the descendants of ʿAmi b al ʿĀsī 100,000 dīnārs for the Mosque of ʿAmi (*Sefer-Nāma*, ed Schefer, p 39 and 146, 40 and 148) In 378 we read of an administrator (*mutawallī*) of the mosque in Jerusalem (Makrīzī, iv 11) In the case of mosques and madāris founded during the Mamlūk period, it is often expressly mentioned that the administration is to remain in the hands of the descendants of the founder e g in the case of a mosque founded by Baibars (Makrīzī, iv 89), in the Djāmiʿ Maks when the vizier al-Maksī renovated it (*ibid*, p 66), the Ṣāhibiya (*ibid*, p 205), and the Ḳarāsunḳurīya (*ibid*, p 232) etc, so also in the Badrīya in Jerusalem ("to the best of the descendants", cf v Berchem, *C I A*, ii/1 129) Other cases are also found Sometimes an emir or official was administrator e g in the Mu'ayyad (Makrīzī, iv 140), the Taibarsiya (*ibid*, p 224), the Azhar, (*ibid*, p 54 *sq*) or the Mosque of Ibn Ṭūlūn (Kalḳashandī, *Ṣubḥ al-Aʿshā'*, xi 159—162) In Djamāl al Dīn's madrasa, it was always the *kātib al-sirr* (Makrīzī, iv 256), in the Khanakāh of Baibars the *ḵhāzindār* and his successors (v Berchem, *C I A*, i, N⁰ 252), but it was more frequently a kādī, for example in the mosque of Baibars just mentioned, the Ḥanafī kādī was to take charge after the descendants (Makrīzī, iv 89), in the Ākbughawiya, the Shāfiʿī kādī was appointed but his descendants were expressly excluded (*ibid*, p 225) In the Mosque of the Umayyads during the Mamlūk period, the Shāfiʿī chief kādī was as a rule the nāzir (Kalḳashandī, iv 191) and in the Nāsir mosque in Cairo (*ibid*, xi 262—264) In this city we find during the Mamlūk period that emīrs and kādis alternately acted as nāzirs in the large mosques (e g the Mosque of Ibn Ṭūlūn

Maḳrīzī, iv 42) Cases are also found however in which descendants of the founder unsuccessfully claimed the office of nāẓir (Makrīzī, iv 218, 255) This was the result of the increasing power of the kādīs (see below) In the madāris the nāẓir was often also the headmaster, the two offices were hereditary (*ibid*, p 204 the Sāhibīya al-Bahā'īya, p 238 *supra* the Djamālīya) In Tustar a descendant of Sahl as nāẓir and teacher conducted a madrasa with the help of four slaves (Ibn Battūta, ii 25 *sq*)

The Nāẓir managed the finances and other business of the mosque Sometimes he had a fixed salary (in Baibars' Khānaḳāh 500 dirhams a month v Berchem, *C I A*, i, N° 252, in the Dulāmīya in Damascus in 847 only 60 dirhams a month *J A*, ser 9, iii 261), but the revenues of the mosque were often applied to his personal use His control of the funds of the mosque was however often limited by the central commission for endowments (see below) The nāẓir might also see to any necessary increase of the endowments He appointed the staff and he fixed their pay (cf e g Makrīzī, iv 41) He could also interfere in questions not arising out of the business side of administration for example the emīr Sawdūb, the nāẓir of the Azhar in 818 ejected about 750 poor people from the mosque He was however thrown into prison for this by the Sultān (*ibid*, p 54) Generally speaking the nāẓir's powers were considerable In 784 a nāẓir in the Azhar decided that the property of a mudjāwir, who had died without heirs, should be distributed among the other students (*ibid*, p 54) In Mecca, according to Kutb al Dīn, the *Nāẓir al-Harām* was in charge of the great festival of the mawlid of the Prophet (12th Rabī' I) and distributed robes of honour in the mosque on this occasion (*C M*, iii 439) In the Azhar, no nāẓir was appointed after about 1100 but a learned man was appointed Shaikh al Azhar, principal and administrator of the mosque (Sulaimān Rasad al-Laiyātī, *Kanz al Djawhar fī Ta'rikh al Azhar*, p 123 *sqq*) Conditions are similar in Mecca (Snouck Hurgronje, *Mekka*, ii 235 *sqq*, 252 *sq*)

As we have seen, kādīs were often nāẓirs of mosques This was especially the case in the madāris, where the kādīs were often teachers (cf Makrīzī, iv 209, 219, 222, 238, etc), the kādīs were particularly anxious to get the principal offices in the large schools (cf Kalḳashandī, xi 235) Their influence was however further increased by the fact that, if a nāẓir qualified by the terms of the founder's will no longer existed, the kādī of the madhhab in question stepped into his place (cf *Z D M G*, xlv, 1897, p 552) By this rule, which often gave rise to quarrels between the different kādīs (e g Maḳrīzī, iv 218 the Ẓāhirīya), a kādī could accumulate a large number of offices and "milk the endowments" (*ibid*, iii 364) Sometimes their management was so ruthless, that the schools soon declined (e g the Sāhibīya and the Djamālīya Maḳrīzī, iv 204 *sq*, 238) They also exercised influence through the committee of management of the mosque

b Centralisation in the Management of the Mosques

The large mosques occupied a special position in the Muslim empire, because the caliph had to interest himself particularly in them especially those of Mecca and Medina where the rulers and their governors built extensions and executed renovations (cf *C M*, i 145, iii 83 *sqq*) During the 'Abbāsid period, the ḳādī occasionally plays a certain part in this connection, for example al-Mahdī (158—169) presented the ḳādī with the necessary money to extend and repair the Meccan mosque (*C M*, i 312, ii 43) In 263, al-Muwaffaḳ ordered the governor of Mecca to undertake repairs at the Ka'ba (*ibid*, ii 200 *sq*) In 271 the governor and the kādī of Mecca co operated to get money from al Muwaffak for repairs and they saw the work through (*ibid*, iii 136 *sq*) In 281, the ḳādī of Mecca wrote to the vizier of al-Mu'tadid about the Dār al-Nadwa and backed up his request by sending a deputation of the staff there (*sadana*) The caliph then ordered the vizier to arrange the matter through the ḳādī of Baghdād and a man was sent to Mecca to take charge of the work (*C M*, iii 144 *sqq*)

The importance of the ḳādī was based primarily on his special knowledge in the field of religion A zealous kādī like al-Hārith b Miskīn in Cairo (237—245) forbade the *kurrā'* of a mosque to recite the Kur'ān melodiously, he also had the *maṣāḥif* in the mosque of 'Amr inspected and appointed an *amīn* to take charge of them (Kindī, *Wulāt*, p 469) After the building of the Tūlūnid mosque, a commission was appointed under the Kādī 'l-Kudāt to settle the ḳibla of the mosque (Makrīzī, iv 21 *sq*) But it a quite early date they also obtained a say in the management of the funds The first kādī to lay his hands on the *aḥbās* was Tawba b Namir al Hadramī, while hitherto every endowment had been administered by itself by the children of the testator or some one appointed by him, in 118 Tawba brought about the centralisation of all endowments and a large diwān was created for the purpose (Kindī, *Wulāt*, p 346) How this system of centralisation worked is not clear at first, but it was carried through under the Fātimids

Al-Mu'izz created a special *dīwān al-aḥbās* and made the chief kādī head of it as well as of the *djawāmi' wa 'l-mashāhid* (Makrīzī, iv 83 and 75, cf Kindī, *Wulāt*, p 585, 587, 589, according to whom al-'Azīz specially appointed the chief kādī over the two djāmi's), and a special *bait al māl* was instituted for it in 363, a yearly revenue of 150,000 dirhams was guaranteed, anything left over went to form a capital fund All payments were made through this office after being certified by the administration of the mosques (Makrīzī, iv 83 *sq*) The mosques were thus administered by the kādīs, directly under the caliph The *dīwān al-birr wa 'l-ṣadaka* in Baghdād (Mez, *Renaissance*, p 72) perhaps served similar purposes

Al-Ḥākim reformed the administration of the mosques In 403 he had an investigation made and when it proved that 800 (or 830) had no income (*ghalla*), he made provision for them by a payment of 9,220 dirhams monthly from the Bait al-Māl, he also made 405 new endowments (of estates) for the officials of the mosque (Maḳrīzī, iv 84, 264) Under the Fātimids, the ḳāḍīs used to inspect all the mosques and mashāhid in and around Cairo at the end of Ramadān and compare them with their inventories (*ibid*, p 84) The viziers of the Fātimids, who also had the title ḳādī did much for the mosques (Djawhar, Ya'kūb b Killis, Badr al-Djamālī cf v Berchem, *C I A*, i, N° 11, 576, p 631)

Under the Ayyūbids, conditions were the same as under the Fātimids The *diwān al-ahbās* was under the kādīs (Maḳrīzī, iv 84) Salāh al-Dīn gave a great deal to the mosques, especially the madāris (cf above) 20,000 dirhams a day is a figure given (*ibid*, p 117) When Ibn Djubair says that the sultān paid the salaries of the officials of the mosques and schools of Alexandria, Cairo and Damascus (p 43, 52, 275), he must really mean the Dīwān already mentioned

The same conditions continued for a time under the Mamlūks In the time of Baibars, for example, the chief kādī Tādj al-Dīn was *nāzir al-ahbās* He caused the Mosque of ʿAmr to be renovated and when the funds from the endowments were exhausted, the Sultān helped him from the Bait al-Māl (Maḳrīzī, iv 14), after conferring with experts, the chief kādī forbade a water-supply brought by Salāh al-Dīn into the mosque (*ibid*, p 14, Suyūṭī, *Husn al-Muhādara*, ii 137) In 687 the chief kadī Fakr al-Dīn complained to Kalāʾūn that the ʿAmr and Azhar mosques were falling into ruins, while the *ahbās* were much reduced The Sultān would not however permit their restoration but entrusted the repairs of the mosques to certain emīrs, one to each (Makrīzī, iv 14, 15) This principle was several times applied in later times and the emirs frequently gained influence at the expense of the kādis Thus after the earthquake of 707 (1303) (cf thereon Quatremère, *Hist Sult Maml*, ii/ii, 214 *sqq*), the mosques were allotted to emirs, who had to see that they were rebuilt (Makrizī, iv, 15, 53) From the middle of the seventh century, we often find emīrs as administrators of the chief mosques The kādi had however obtained so much authority that he was conceded "a general supervision of all matters affecting the endowments of his madhhab" (al-ʿUmarī, *Taʿrīf bi 'l Muṣṭalah al-Sharīf*, p 117, cf *Z D M G*, xlv, p 559), according to this theory the kādī could intervene to stop abuses In Syria in 660 (1262) Ibn Khallikān became kādī over the whole area between al ʿArish and the Euphrates and superintendent of wakfs, mosques, madrasas etc (Quatremere, *Hist Sult Maml*, i/i 170)

Sulṭān Baibars reformed these endowments and restored the office of *nāzir al awkāf* or *nāzir al-ahbās al mabrūra* or *n djihāt al-birr* (Kalkashandi, iv 34, 38, v 465, ix 256, xi 252, 257 *sqq*, cf Khalīl al-Zāhirī, *Zubdat Kashf al Mamālik*, ed Ravaisse, p 109) According to al Makrizī, the endowments were distributed among the Mamlūks in three departments (*djihāt*) 1 *djihāt al-ahbās*, managed by an emīr, the Dawādār this looked after the lands of the mosques, in 740 in all 130,000 faddān, 2 *djihāt al-awkāf al hukmiya bi Miṣr wa 'l-Kāhira*, which administered dwelling houses, it was managed by the Shāfiʿī *Kādī 'l-Kuḍāt*, with the title *Nāzir al-Awkāf* This department came to an end in the time of al-Malik al-Nāsir Faradj because an emīr supported by the opinion of the Hanafī chief kādī, spent a great deal and misused the funds, 3 *djihāt al-awkāf al-ahliya*, comprised all the endowments which still had particular nāzirs, either descendants of the testator or officials of the Sultān and the ḳādī The emīrs seized their lands and Barḳūḳ, before he became Sulṭān, sought in vain to remedy the evil by appointing a commission The endowments in general disappeared somewhat later because the ruling emīrs seized them (Maḳrīzī, iv 83—86) In modern times, as a rule, endowments in Muslim lands have been combined under a special ministry

To be distinguished from the administrators of the mosque is the *nāzir* who is only concerned with the supervision of the erection of mosques Any one could be entrusted with the building of a mosque (e g Makrīzī, iv 92) Under the Mamlūks there was also a clerk of works, *mutawallī shadd al ʿomāʾir* or *nāzir al-ʿimāra* he was the overseer of the builders (*ibid*, p 102, see *Zubdat Kashf al Mamālik*, ed Ravaisse, p 115, cf p 109, v Berchem, *C I A*, i 742 *sq*, 751)

The caliph or the ruler of the country was in this, as in other matters, supreme As we have seen, he intervened in the administration and directed it as he wished He was also able to interfere in the internal affairs of the mosque, if necessary through his usual officers In 253 (867) after the rising in the Fayyūm, the chief of police issued strict orders by which it was forbidden to say the *basmalah* aloud in the mosque the number of prayers in the month of Ramadān was cut down, the *adhān* from the minaret forbidden etc (*Papyrus Erzherzog Rainer*, *Führer*, N° 788) In the year 294, the governor ʿIsā al-Nūshārī had the mosque of ʿAmr closed except at the salāts because the Bait al Mal was kept in it, which however produced protests from the people (Makrizī, iv 11, Kindī, *Wulāt*, p 266, *B G A*, vii 116) Many similar examples could be mentioned, especially during periods of unrest In 821 the nāʾib in conjunction with the kādis revised the budget of the Mosque of the Omayyads and made financial reforms (*J A*, ser 9, vii 220) The adhān formulae were laid down in edicts by the ruler (Makrīzī, iv 44, 45) In the year 323, the vizier in Baghdād had a man whipped who had recited a variant text of the Kurʾān in the mihrāb, after he had been heard in his defence in the presence of the ḳādīs and learned men (Yākūt, *Udabāʾ*, vi 300) The importance of the sovereign in connection with the mosque depended on his personality As a rule he recognised the authority of the regular officials When for example al-Khatīb al Baghdādī asked the Caliph al-Kāim for authority to read Hadīth in the mosque of al-Mansūr, the latter referred the question to the *nakīb al-nukabāʾ* (Yākūt, *Udabāʾ*, i 246 *sq*, cf Wustenfeld, *Schāfiʿī*, iii 280)

The consecration of the mosque was attended by certain ceremonies When for example the midday service was conducted for the first time in the Djāmiʿ al Sālih in Cairo, a representative from Baghdād was present (Makrīzī, iv 81) At the consecration of the Mosque of Ibn Tūlūn, the builder gave al-Rabīʿ b Sulaimān, a pupil of al Shāfiʿī, who lectured on Hadīth there, a purse of 1,000 dīnārs (Suyūṭī, *Husn al-Muhādara*, ii 139) Al Makrīzī describes the consecration ceremony at several mosques In the M al Muʾayyad the Sultān was present seated on a throne surrounded by his officers, the basin of the sahn was filled with sugar and halwa, the people ate and drank, lectures were given, then the salāt was read and khutba delivered and the Sultān distributed robes of honour among the officials of the Mosques and Sūfīs (Makrīzī, iv 139), similarly at the Ẓāhirīya (p 662, were poems were also recited cf Quatremère, *Hist Sult Maml*, i/i, p 228 *sq*), Madrasat Djamāl al-Dīn, p 811, al Sarghitmishīya, p 757 (Makrīzī, iv, p 217 *sq*, 253, 256)

H The Personnel of the Mosque

1 The Imām

From the earliest days of Islām, the ruler was the leader of the salāt, he was *imām* as leader in war, head of the government and leader of the common salāt The governors of provinces thus became leaders of the *ṣalāt* and heads of the *kharādj* and when a special financial official took over the fiscal side, the governor was appointed *ʿala 'l-salāt wa 'l-harb* He had to conduct ritual prayer, especially the Friday salāt on which occasion he also delivered the khutba If he was prevented, the chief of police, *sāhib al shurta*, was his khalīfa (cf Makrīzī, iv 83) ʿAmr b al ʿĀṣi permitted the people of the villages to celebrate the two festivals, while the Friday divine service could only take place under those qualified to conduct it (who could punish and impose duties, *ibid*, p 7) This was altered under the ʿAbbāsids The caliph no longer regularly conducted the salāts (after the conquest of the Persians Makrīzī, iv 45), and ʿAnbasa b Ishāk, the last Arab governor of Egypt (238—242), was also the last emīr to conduct the salāt in the djāmiʿ An imām, paid out of the *bait al-māl*, was now appointed (*ibid*, p 83), but the governor still continued to be formally appointed *ʿala 'l salāt* Henceforth the ruler only exceptionally conducted the service, for example the Fātimids on ceremonial occasions, especially in the month of Ramadān (Ibn Taghrī birdī, ed Juynboll, ii 482 *sqq* , Kalkashandī, *Subh al Aʿshā'*, iii 509 *sqq*), in many individual mosques probably the most prominent man conducted the service, according to the Hadīth, the one with the best knowledge of the Kur'ān and, failing him, the eldest should officiate (Bukhārī, *Aḏhān*, bāb 46, 49)

The imām appointed was chosen from among those learned in religious matters, he was often a Hāshimid (Mez, *Renaissance*, p 147), he might at the same time be a kādī or his nā'ib (see Kindī, *Wulāt*, p 575, 589, Ibn Battūta, i 276 *sq*) During the salāt he stood beside the mihrāb, al-Makdisī mentions the anomaly, that in Syria one performed one's salāt "in front of the imām" (*B G A* , iii 202), he could also stand on an elevated position, on one occasion Abū Huraira conducted the *ṣalāt* in the Meccan mosque from the roof (Bukhārī, *Salāt*, bāb 17) In Mecca, in Ibn Djubair's time, each of the four recognised madhāhib (with the Zaidīs in addition) had an imām, they conducted the salāt, one after the other each in his place, in the following order Shāfiʿīs, Mālikīs, Hanafīs and Hanbalis, they only performed the salāt al-maghrib together, in Ramadān they held the *tarāwih* in different places in the mosque, which was also often conducted by the kurrā' (*Riḥla*, p 101, 102, 143 *sq*) This is still the case, very frequently one performs the salāt, not after the imām of his own madhab (Snouck Hurgronje *Mekka*, ii 79 *sq*) In Jerusalem according to Mudjīr al-Dīn the order was Mālikīs, Shāfiʿis, Hanafīs, Hanbalīs, who prayed each in their own part of the Haram, in Hebron the order was the same (Sauvaire, *Hist Jer et Hebron*, p 136 *sq*) In Ramadān extraordinary imāms were appointed (*ibid*, p 138)

When the imām no longer represented a political office, each mosque regularly had one He had to maintain order and was in general in charge of the divine services in the mosque In al-Makdisī's time the imām of the Mosque of ʿAmr read a djuz' of the Kur'ān every morning after the salāt (*B G A* , iii 205) It was his duty to conduct every salāt, which is only valid *fī djamāʿa* He must conform to the standards laid down in the law, but it is disputed whether the salāt is invalid in the opposite case According to some, the leader of the Friday salāt should be a different man from the leader of the five daily salāts (Māwardī, *al Ahkām al-Sultāniya*, ed Enger, p 171 *sqq* , Ibn al-Hādjdj, *K al Madkhal*, ii 41, 43 *sqq* , 50, 73 *sqq* , al-Subkī, *Muʿid al Niʿam*, ed Myhrman, p 163 *sq* , for hadīths s Wensinck, *Handbook*, p 109 *sq*) Many cherished misgivings against payment being made for religious services and quoted in support of their view a saying of Abū Hanīfa (*B G A* , iii 127)

2 The Khatīb

The development of this office is analogous to that of imām When the ʿAbbāsid caliph no longer delivered khutbas regularly, a man learned in religious matters was appointed to the office of khatīb [see D 1 and the article KHAṬĪB] It could be pointed out that the Prophet himself had a khatīb namely ʿUtārid b Hadjib (Djāhiz, *Bayān*, i 178) and sermons outside the Friday service had in any case become quite usual Thus Hasan al-Basri was already a noted preacher (*ibid*, p 190) Later it sometimes happened that a general like Djawhar himself acted as imām at the salāt, while the khutba was left to a learned man (Makrīzī, iv 44) As the khatīb in theory represented the ruler, he uttered a blessing upon him, to this extent the office had a political significance The caliph was blessed and the heir-apparent and the king of the country (cf above D 1) When the caliph himself preached, he also pronounced a prayer for himself (Yākūt, *Udabā'*, ii 349 *sq*) and the Fātimids mentioned their fathers The sermons gradually became quite stereotyped, Ibn Battūta (i 348) praises the khatīb in Mecca, because he gave a new sermon every Friday A kādi was frequently chosen as khatīb and a chief kādī could some times preach in a large mosque (Kindī, *Wulāt*, p 589, Makrizī, iv 132, Ibn Djubair, p 156, according to Quatremere, *Hist Sult Maml*, ii/ii 25, a kādī was for the first time appointed khatīb in 694 [1925] in Damascus) The khatīb could also be a "witness" (Hilal al Sābi, *K al-Wuzarā'*, ed Amedroz, p 421 *infra*) or hold another office like that of *kātib al-sirr* (Makrīzi, iv 137, 138, 139, 140), in the last mentioned case the office was hereditary, which we also find elsewhere (*ibid*, p 9, 98, Suyūtī, *Husn al Muhādara*, i 185 al-ʿIrāki) The khatīb had frequently a khalīfa In the Rāshida mosque, where in 414 two khatībs were deliberately appointed, they both preached at the same time on the minbar (Makrīzī, p 63 *sq*) Later we find in the larger mosques a number of khutabā' being appointed who relieve one another

In Mecca the khatīb was a particularly imposing figure In his black robe, trimmed with gold, and turban with tailasān, he went up to the minbar between two black banners carried by mu'adhdhins, while a servant walked in front of him cracking a whip, after he had kissed the Black Stone, the chief mu'adhdhin went quickly in front of him with the sword with which he girded him on the minbar (Ibn Djubair, p 95 *sq* , Ibn Baṭṭūta, i 376 *sqq*)

The whip (*farkaʿa* Ibn Djubair, p 96, 97, 144, 156, Ibn Battūta, i 376, 379, 390, 394, see *B G A*, iv, s v) is also used as he goes out and on other occasions The black was the colour of the ʿAbbāsids, it was also used in Egypt (Ibn Djubair, p 50) The Fātimid khatīb wore a cap (*kalansuwa* Makrīzī, iv 44, 22 *sq*) The dress of the khutabāʾ varied with time and country (cf *ibid*, p 90, *B G A*, iii 129, 416, Ibn al Hādjdj, *Madkhal*, ii 73) In Mecca there were celebrations when a young man became a khatīb (Ibn Djubair, p 149)

Very frequently the khatīb and the imām were one individual, especially in the smaller mosques, but sometimes also in larger ones (Yākūt, *Udabāʾ*, vii 174, 179, Makrīzī, iv 124) Ibn al-Hādjdj even regards this as the normal thing (*K al-Madkhal*, ii 59, 60, 73, 74), s also al-Subkī, *Muʿīd*, p 160 *sq* and the article KHATĪB

3 Kāss and Kārīʾ

On these see C 3 Sometimes, in the later usage *wāʿiz* is used of the official speaker, very like khatīb (cf Ibn Battūta, iii 9), while al kāss is only applied to the street story-teller (al-Subkī, *Muʿīd al-Niʿam*, p 161 *sq*) The *kurrāʾ* are also frequently appointed to madrasas and particularly to mausoleums (Makrīzī, iv 223, Yākūt, iv 509, Subkī, *Muʿīd*, p 162, v Berchem, *C I A*, i, N° 252)

4 The Muʾadhdhin

According to most traditions, the office of muʾadhdhin was instituted in the year 1, according to others only after the *isrāʾ*, in the year 2, according to some weak traditions while Muhammad was still in Mecca At first the people came to the salāt without being summoned Trumpets (*būk*) were blown and rattles (*nāķūs*) used or fires lit after the custom of Jews, Christians and Mādjūs ʿAbd Allāh b Zaid learned the adhān formula in a dream, it was approved by the Prophet and when Bilāl proclaimed it, it was found that ʿOmar had also learned the same procedure in a dream (Ibn Hishām, p 357 *sq*, *Khamīs*, i 404 *sq*, Bukhārī, *Adhān*, bāb 1, Zurkānī, i 121 *sqq*) There are also variants of the story, e g that the Prophet and ʿOmar had the vision, or Abū Bakr or seven or fourteen Ansār, according to some, the Prophet learned it at the *miʿrādj* from Gabriel, wherefore the introduction of the *adhān* is dated after the *isrāʾ*, among the suggestions made, the hoisting of a flag is mentioned (*Sira Halabiya*, ii 100 *sqq*) Noteworthy is a tradition which goes back to Ibn Saʿd, according to which at ʿOmar's suggestion at first a *munādi*, Bilāl, was sent out who called in the streets *al-ṣalāta djāmiʿatan* Only later were other possibilities discussed, but the method already in use was confirmed by the dream, only with another formula, the one later used (*Khamīs*, i 404, *Sira Halabiya*, ii 100 *sq*) According to this account, the consideration of other methods would be a secondary episode and probably the tradition in general represents a later attitude to the practices of other religions But in Islām other methods were certainly used In Fās, a flag was hung out in the minarets and a lamp at night (*J A*, ser 11, xii 341) The flag is also found in the legend of the origin of the practice

The public crier was a well known institution among the Arabs Among the tribes and in the towns important proclamations and invitations to general assemblies were made by criers This crier was called *Munādī* or *Muʾadhdhin* (*Sira Halabiya*, ii 170, Lammens, *La Mecque*, p 62 *sqq*, 146, do, *Berceau*, i 229 note, do, *Moʾâwia*, p 150) *Adhān* therefore means proclamation, Sūra ix 3, and *adhdhana*, *muʾadhdhin*, Sūra vii 70 "to proclaim" and "crier" *Munādī* (Bukhārī, *Fard al-Khums*, bāb 15) and *Muʾadhdhin* (*ibid*, *Ṣawm*, bāb 69, *Salāt*, bāb 10 = *Djizya*, bāb 16, *Sīra Halabiya*, ii 270) are names given to a crier used by the Prophet or Abū Bakr for such purposes Official proclamations were regularly made by criers (cf Tabarī, iii 2131, 3) Sadjāh and Musailima used a muʾadhdhin to summon the people to their prayers (Tabarī, i 1919, 1932, cf *Annali dell' Islām*, i 410 *sq*, 638 *sq*) It therefore was a very natural thing for Muhammad to assemble the believers to common prayer through a crier (*nādā li'l* or *ila 'l-salāt*, Sūra v 63, lxii 9), the summons is called *Nidāʾ* and *Adhān*, the crier *Munādī* (Bukhārī, *Wudūʾ*, bāb 5, *Adhān*, bāb 7) and *Muʾadhdhin*, the two names are used quite indiscriminately (e g *ibid*, *Wudūʾ*, bāb 5, Tabarī, ii 297 *sq*) *Munādī 'l-Salāt*, *B G A*, iii 182, 12, also *Sāʾih* "crier" is used (Tabarī, iii 861, *Chron Mekka*, i 340)

In these conditions, it was very natural for the crier in the earliest period to be regarded as the assistant and servant of the ruler, he is his muʾadhdhin (Ibn Saʿd, i 7, Muslim, *Salāt*, tr 4, Makrizī, iv 43, etc, cf Tabarī, ii 1120) ʿUmar sent to Kūfa ʿAmmār b Yāsir as emīr and ʿAbd Allāh b Masʿūd "as *muʾadhdhin* and *wazir*" (*B G A*, v 165), he is thus the right hand of the ruler Al Husain had his *munādi* with him and the latter summoned to the salāt on al Husain's instructions (Tabari, ii 297, 298, cf Ibn Ziyād, *ibid*, p 260 and in the year 196 the *ʿāmil* in Mecca, *ibid*, iii 861, 13, also *Chron Mekka*, i 340) During the earliest period, the muʾadhdhin probably issued his summons in the streets and the call was very short *al ṣalāta djāmiʿatan* (Ibn Saʿd, i 7, 7, *Chron Mekka*, i 340, Tabarī, iii 861, cf also in the year 196, *Sira Halabiya*, ii 101, *Khamīs*, i 404 *sq*) This brief summons was, according to Ibn Saʿd, also used later on irregular occasions (i 7 *sqq*, cf the passage in Tabarī) Perhaps also the summons was issued from a particular place even at a quite early date (see D 2a) After the public summons the muʾadhdhin went to the Prophet, greeted him and called him to prayer, the same procedure was later used with his successor when he had come, the muʾadhdhin announced the beginning of the salāt (*akāma 'l salāt* cf Bukhārī, *Wudūʾ*, bāb 5, *Adhān*, bāb 48, *Sira Halabiya*, ii 104 *sq*, Makrīzī, iv 45) The activity of the muʾadhdhin thus fell into three sections the assembling of the community, the summoning of the imām and the announcement of the beginning of the salāt With time changes were made in all three stages

The assembling of the community by crying aloud was not yet at all regular in the older period During the fighting, Ibn Ziyād in the year 60 called his munādī with threats to the evening salāt in the mosque and when after an hour the mosque was full he had the *ikāma* announced (Tabarī, ii 260) When a large number of mosques had come into existence, the public call to prayer had to be organised lest confusion arose, and the custom

of calling from a raised position became general after the introduction of the minaret While previously the call to prayer had only been preparatory and the *ikāma* was the final summons, the public call (*adhān*) and the *ikāma* now formed two distinct phases of the call to prayer Tradition has retained a memory of the summoning in the streets, now completely fallen into disuse, when it tells us that ʿOthmān introduced a third adhān, a call in al-Zawrāʾ, which was made before the call from the minaret this call however was transferred by Hishām b ʿAbd al-Malik to the minaret (Bukhārī, *Djumʿa*, bāb 22, 25, *Sīra Halabiya*, ii 110, Ibn al-Hādjdj, *Madkhal*, ii 45) This may be evidence of the gradual cessation of the custom of summoning the community by going through the streets Ibn Battūta, but this is exceptional, tells us that the muʾadhdhins in Khwārizm still fetched the people from their houses and those who did not come were whipped (iii 4 *sq*), which recalls Wahhābī measures When exactly the Sunnī and in distinction to it the Shīʿī formula, finally developed can hardly be ascertained [see ADHĀN] The call *hayya ʿala 'l-falāh* is known from the time of ʿAbd al-Malik (65–85) (Akhtal, ed Salhānī, p 254, see Horovitz, in *Isl*, xvi, 1927, p 154, on *takbīr* see *ibid*, on *adhān* formulae see further *Sīra Halabiya*, ii 105 *sq*) At first the call was only made at the chief mosque, as was the case in Medīna and Misr (Makrīzī, iv 43 *infra*) but very quickly other mosques were also given muʾadhdhins their calls were sufficiently audible in the whole town The chief mosque retained this privilege, that its muʾadhdhin called first and the others followed together (Makrīzī, iv 43 *infra*, 44)

The summoning by the imām in Medīna was therefore quite a natural thing The custom, at first associated with the ruler's mosque, was not observed in Medīna only (see for ʿOthmān and ʿAlī Tabarī, i 3059 *sq*) but was also usual under the Omayyads The formula was *al-Salām ʿalayka ayyuha 'l-Amir wa-Rahmatu 'llāh wa Barakātuhu*, *hayya ʿala 'l-Ṣalāt*, *hayya ʿala 'l-Falāh al-Ṣalāt*, *yarhamuka 'llāh* (Makrīzī, iv 45, *Sīra Halabiya*, ii 105) After the alteration in the adhān and the greater distance of the ruler from the mosque, to summon him was no longer the natural conclusion to the assembling of the community In the ʿAbbāsid period and under the Fātimids there was a survival of the old custom, in as much as the muʾadhdhins ended the adhān call before the *salāt al-fadjr* on the minarets with a salām upon the caliph This part of the muʾadhdhin's work was thus associated with the first adhān call When Salāh al-Dīn came to power, he did not wish to be mentioned in the call to prayer, but instead he ordered a blessing upon the Prophet to be uttered before the adhān to the *ṣalāt al-fadjr*, which after 761 only took place before the Friday service A muhtasib ordered that after 791 in Egypt and Syria at each adhān a salām was to be uttered over the Prophet (Makrīzī, iv 46, *Sīra Halabiya*, ii 110) Ibn Djubair relates that in Mecca after each salāt al maghrib, the foremost muʾadhdhin pronounced a duʿāʾ upon the ʿAbbāsid Imām and on Salāh al-Dīn from the Zemzem roof, in which those present joined with enthusiasm (p 103) and according to Makrīzī, after each *salāt* prayers for the Sultān were uttered by the muʾadhdhins (iv 53 *sq*) Another relic of the old custom was that the trumpet was sounded at the door of the ruler at times of prayer, this honour was also shown to ʿAdud al-Dawla in 368 by order of the caliph (Ibn Maskawaih, vi 499, Cairo 1315, p 396)

The *ikāma* always remained the real prelude to the service and is therefore regarded as the original adhān (Bukhārī, *Djumʿa*, bāb 24 *sq*) In the earliest period it was fixed by the arrival of the ruler and it might happen that a considerable interval elapsed between the summoning of the people and the *ikāma* (cf Tabarī, ii 260, 297 *sq*) The times were later more accurately defined, one should be able to perform 1—3 salāts between the two calls (Bukhārī, *Adhān*, bāb 14, 16) Some are said to have introduced the practice of the muʾadhdhin calling *hayya ʿala 'l-salāt* at the door of the mosque between the two calls (*Sira Halabiya*, ii 105) From the nature of the case the *ikāma* was always called in the mosque, at the Friday service, it was done when the imām mounted the minbar (Bukhārī, *Djumʿa*, bāb 22, 25, *Sīra Halabiya*, ii 110, Makrīzī, iv 43) while the muʾadhdhin stood in front of him This muʾadhdhin, according to some, ought to be the one who called the adhān upon the minaret (*Sira Halabiya*, ii 109), while Ibn al-Hādjdj ignoring the historical facts only permits the call from the minaret (*Madkhal*, ii 45) In Tunis, the *ikāma* was announced by ringing a bell as in the churches (Zarkashī, transl Fagnan, in *Rec Soc Arch Constantine*, 1894, p 111 *sq*) A similarity to the responses in the Christian service is found in the fact that the call of the muʾadhdhin, which contains a confession of faith, is to be repeated or at least answered by every one who hears it (Bukhārī, *Djumʿa*, bāb 23), this is an action which confers religious merit (Ibn Kutlūbughā, *Tabakāt al-Hanafiya*, ed Flugel, p 30) It is possible that we should recognise in this as well as in the development of the formulae the influence of Christians converted to Islām (cf Becker, *Zur Gesch d Islam Kultus*, in *Isl*, iii, 1912, p 374 *sqq* and *Islamstudien*, i 472 *sqq* who sees an imitation of the Christian custom in the ikāma in general, on the possibility of Jewish influence see Mittwoch, in *Abh Pr A W*, 1913, Phil -Hist Cl 2)

The muʾadhdhin thus obtained a new importance His work was not only to summon the people to divine service, but was in itself a kind of religious service His sphere of activity was further developed In Egypt we are told that Maslama b Mukhallad (47—62) introduced the *tasbīh* This consisted in praises of God which were uttered by the muʾadhdhins all through the night until *fadjr* This is explained as a polemical imitation of the Christians, for the governor was troubled by the use of the *nawākis* at night and forbade it during the adhān (Makrīzī, iv 48) In the time of Ahmad b Tūlūn and Khumārawaih, the muʾadhdhins recited religious texts throughout the night in a special room Salāh al Dīn ordered them to recite an *ʿakīda* in the night adhān and after 700 *dhikr* was performed on Friday morning on the minarets (*ibid*, p 48 *sq*, *Sira Halabiya*, ii 111) In Mecca also the muʾadhdhins performed dhikr throughout the night of the first Shawwāl on the roof of the kubba of the Zemzem well (Ibn Djubair, p 155, 156, cf for Damascus Makrīzī, iv 49) Similar litanies are kept up in modern times as well as a special call about an hour before dawn (*Ebed*, *Tarhim* see Lane, *Manners and Customs* [Everyman's Library],

p 75 *sq* ; cf p 86, Snouck Hurgronje, *Mekka*, ii 84 *sqq*)

The original call of the mu'adhdhin thus developed into a melodious chant like the recitation of the Kur'ān Al-Makdisī tells us that in the fourth century in Egypt during the last third of the night, the adhān was recited like a dirge (*B G A* , iii 205) The solemn effect was increased by the large number of voices In large mosques, like that of Mecca, the chief mu'adhdhin called first from a minaret, then the others came in turn (*Chron Mekka*, iii 424 *sq* , Ibn Djubair, p 145 *sqq* , cf *B G A* , vii 111, 1 *sqq* , *et supra*) But in the mosque itself the *ikāma* was pronounced by the mu'adhdhins in chorus on the dakka (see D 2e) erected for this purpose, which is also traced to Maslama In the third and fourth centuries we hear of these melodious recitations (*tatrīb*) of the mu'adhdhins on a raised *podium* in widely separated parts of the Muslim world (Ṣan'ā', Egypt, Khurāsān *B G A*, iii 327, vii 111, the expression *al-mutala''ibīn*, "the musicians", if correct, probably refers to the mu'adhdhins *B G A* , iii 205, cf also Kindī, *Wulāt*, p 469, for Fārs we are expressly told that the mu'adhdhins call without *tatrīb B G A* , iii 439, 17) Sometimes in large mosques they were stationed in different parts of the mosque to make the imām's words clear to the community (*tabligh*) The singing, especially in chorus, like the *tabligh*, was regarded by many as *bid'a* (Kindī, *op cit* , *K al-Madkhal*, ii 45 *sq* , 61 *sq* , *Sīra Halabīya*, ii 111) In other ways also the mu'adhdhins could be compared to deacons at the service The khatīb on his progress to the minbar in Mecca was accompanied by mu'adhdhins and the chief mu'adhdhin girded him with a sword on the minbar (Ibn Djubair, p 96 *sq*)

The new demands made on the mu'adhdhins necessitated an increase in their number, especially in the large mosques The Prophet in Medīna had two mu'adhdhins, Bilāl b Ribāh, Abū Bakr's *mawlā* and Ibn Umm Maktūm, who worked in rotation 'Othmān also is said occasionally to have called the adhān in front of the minbar (i e the ikāma) (Makrīzī, iv 43) It is therefore regarded as commendable to have two mu'adhdhins at a mosque (Muslim, *Ṣalāt*, tr 4, cf Subkī, *Mu'id*, p 165) Abu Mahdhūra was also the Prophet's mu'adhdhin in Mecca Under 'Omar, Bilāl's successor as mu'adhdhin was Sa'd al-Karaz, who is said to have called to prayer for the Prophet in Kubā' (Makrīzī, *op cit* , cf *Sīra Halabīya*, ii 107 *sqq*) In Egypt under 'Amr, the first mu'adhdhin in al-Fustāt was Abū Muslim he was soon joined by nine others The mu'adhdhins of the different mosques formed an organisation, the head (*'arīf*) of which, after Abū Muslim, was his brother Shurahbīl b 'Āmir (d 65), during his time Maslama b Mukhallad built minarets (Makrīzī, iv 44)

The office of mu'adhdhin was sometime hereditary The descendants of Bilāl were for example mu'adhdhins of the Medina Mosque in al Rawda (Ibn Djubair, p 194), we also find in Medīna the sons of Sa'd al-Karaz officiating (Ibn Kutaiba, *Handb d Gesch* , ed Wustenfeld, p 132, 279), in Mecca the sons of Abū Mahdhūra (*ibid* , p 278, *Sīra Halabīya*, ii 106), in Basra, the sons of al-Mundhir b Hassān al-'Abdī, mu'adhdhins of 'Ubaid-allāh b Ziyād (Ibn Kutaiba, p 279), it is however possible that this was really the result of a system of guilds of mu'adhdhins In the djawāmi' of the Maghrib in the eighth century each had regularly four mu'adhdhins who were stationed in different parts of the mosque during the salāt (*K al Madkhal*, ii 47 *supra*), but there were often quite a large number In the Azhar mosque in the time of al-Hākim there were fifteen, each of whom was paid two dīnārs a month (Makrizi, iv 51) Ibn Battūta found seventy mu'adhdhins in the Mosque of the Omaiyads (i 204) About 1900, in Medina there were in the Mosque of the Prophet fifty mu'adhdhins and twenty-six assistants (Batanūni, *Rihla*, p 242) Blind men were often chosen for this office, Ibn Umm Maktūm for example was blind (Bukhārī, *Adhān*, bab 11, *Sīra Halabīya*, ii 104, cf Lane, *op cit* , p 75) The Prophet is said to have forbidden the Thakif to pay a mu'adhdhin (Wākidī Wellhausen, p 383) 'Othmān is said to have been the first to give payment to the mu'adhdhins (Makrīzī, iv 44) and Ahmad b Tūlūn gave them large sums (*ibid* , p 48) They regularly received their share in the endowments, often by special provisions in the documents establishing the foundations

The mu'adhdhins were organised under chiefs (*ru'asā'* Makrizī, iv 14) In Mecca the *ra'is al-mu'adhdhinin* was identical with the *mu'adhdhin al-Zamzamī* who had charge of the singing in the upper story of the Zemzem building (*Chron Mekka*, iii 424 *sq* , Ibn Djubair, p 145, cf Snouck Hurgronje, *Mekka*, ii 322) The ra'īs was next to the Imām but subordinate to him, in certain districts, it was the custom for him to mount the pulpit during the sermon with the imām (when the latter acted as khatīb) (*K al-Madkhal*, ii 74, correct above p 928, l 31 *sq* in keeping with this) The position which they originally occupied can still be seen from the part which they play in public processions of officials, e g of the *Kādi 'l-Kudāt*, when they walk in front and laud the ruler and his vizier (Makrīzī, ii 246)

Closely associated with the mu'adhdhin is the *muwakkit*, the astronomer, whose task it was to ascertain the kibla and the times of prayer (Subkī, *Mu'id*, p 165 *sq*), sometimes the chief mu'adhdhin did this (Snouck Hurgronje, *Mekka*, ii 322)

5 Servants

According to Abū Huraira, the Mosque of the Prophet was swept by a negro (Bukhārī, *Salāt*, bāb 72, cf 74) The larger mosques gradually acquired a large staff of servants (*khuddām*), notably *bawwāb*, *farrāsh*, and water carriers (cf e g v Berchem, *C I A* , 1, N° 252) In Mecca there have always been special appointments, such as supervisor of the Zemzem and guardian of the Ka'ba (*sādin*, pl *sadana*, also used of the officials of the mosque Makrīzī, iv 76, cf Ibn Djubair, p 278) In Ibn Battūta's time the servants (*khuddām*) of the Mosque of the Prophet were eunuchs, particularly Abyssinian, their chief (*shaikh al-khuddām*) was like a great emir and paid by the Egyptian–Syrian government (i 278, 348), cf the title of an emīr of the year 798 *shaikh mashā'ikh al-sāda al-khuddām bi 'l-haram al sharīf al nabawī* (v Berchem, *C I A* , 1, N° 201) In the Mosque of Jerusalem about 300 A H , there were no less than 140 servants (*khādim B G A* , v 100), others give the figure 230 (Le Strange, *Palestine*, p 163) and according to Mudjīr al Dīn, 'Abd al Malik appointed a guard of three hundred black slaves here, while the actual menial work was done by

certain Jewish and Christian families (Sauvaire, *Hist Jer et Hebr*, p 56 *sq*)

In other mosques superintendents (*kaiyim*, pl *kawama*) are mentioned, a vague title which covered a multitude of duties thus the Madrasa al-Madjdiya had a kaiyim who looked after the cleaning, the staff, the lighting and water-supply (Makrizi, iv 251), the Azhar Mosque had one for the mi'da'a, who was paid twelve dinars (*ibid*, p 51) and also 4 kawama, who were paid like mu'adhdhins (two dinars a month) and are mentioned between them and the imams, probably supervisors of the staff (*ibid*, p 51) In other cases a *kaiyim al-djami'*, sometimes a kadi, is mentioned, who is apparently the same as the imam, the khatib or some similar individual of standing (*ibid*, p 75, 121, cf 122, cf Ibn Djubair, p 51) A *mushrif*, inspector, is also mentioned, e g in the Azhar (Makrizi, iv 51)

II

The Mosque in the Dutch East Indies

In the Dutch East Indies, two kinds of mosque have to be distinguished, the mosque for the Friday service — these alone are called mosques (*masigit*, also *masdjid*) — and simple houses of prayer This second category is found all over the country, especially in smaller villages and owes its origin, partly to private initiative and partly to public efforts, they have native names (*langar* [Javan], *tajug* [Sum], *surau* [Malay]) The *langar*, or whatever it may be called, of the village is a centre at which the *salat* can be performed, but it also serves other purposes of general interest The upkeep of the building is the affair of the community and in particular one of the tasks of the religious official of the village The upkeep of the other langars, erected by private individuals, is left to them The building stands on its own site and is maintained by the founder or his descendants The owner cannot however refuse admission to strangers who desire to use it for the *salat* or as shelter the night Such private chapels are always found beside the Muhammadan seminaries (Jav *pasantren*) We sometimes find that these langar are endowed as *wakf* (Jav Mal *wakap*) The village langar on the other hand has a more public character

The mosques, i e the *masdjid djami'*, are found in larger places usually in those which are also centres of administration Their erection and maintenance is regarded as a duty of the Muslim community, every one contributes his share in materials, work or money, according as he is requested and is able to do When a new mosque is to be built, not only is the site necessary for the building railed off, but also that for the dwellings of the staff and other people, whose piety induces them to seek a dwelling place near the mosque, here they find the spot, where in their opinion they can be best benefitted by the atmosphere of their faith, spiritually and socially This mosque area, at least the mosque itself and its immediate neighbourhood, is popularly regarded as *wakap* although the conditions necessary to make it an endowment in the sense of the *shari'a* are not fulfilled In *wakap* affairs, the shari'a is regarded as authoritative and not affected by common law

Each mosque has its own staff, of the size it requires, in the large mosques there may be 40 or more In Java and Madura, they form a regular hierarchy, this holds also for the relation of the larger and smaller mosques to each other A mosque serves the requirements of a definite area, the staff of the mosque at the chief place in a smaller district is subordinate to that of a larger one and so on up to the capital of a regency (which is the highest native administrative unit) At each mosque a superintendent is appointed and the head of the mosque at the capital of the regency is regarded as head of all the mosque officials in the whole district On the other islands the native, political organisation is less developed, the hierachy of the secular power therefore less influenced by it Generally speaking the personnel of the mosque is the same everywhere, the more the secular hierarchy is graded, the more noticeable is the classification of the personnel of the different mosques into various ranks, but we always find one recognised as the head of the staff

The superintendent of a mosque in Java and Madura bears the general name *pan[h]ulu* His main duty is to see that the Friday service is held, he can act as imam at it himself but usually he leaves this to someone else Besides him there are a large number of other officials, whose names usually are taken from the Arabic and whose duties are very varied, among them however we find the *ketib* (Jav Ar *khatib*) He delivers the sermon, but this also can be done by some one else The maintenance of the building is also the duty of the superintendent The expenses have to be met from the money collected by the staff, of which he has control (see below)

In Java and Madura generally, and very often elsewhere, the superintendent of a mosque is also an official, i e he is the legal authority who is present at the marriage ceremony, sometimes he acts as *wakil* of the *wali* He is also authorised to give in marriage women who have no blood-relative to act as walī, in this capacity he is called *wali hakim* Marriages are concluded in the mosque, it is exceptional for the pan[h]ulu to perform the marriage ceremony in person, he usually leaves this to one of his subordinates People of high rank marry in the house, on these occasions the pan[h]ulu himself acts The same holds *mutatis mutandis* of *talak* and *rudjū'*, these also are reported to the pan[h]ulu and recorded by him along with marriages in a register

In smaller centres, where there are only langar (chapels) there is an official, who assists the villagers in matters of Muhammadan law, he belongs to the village administration and may be regarded as the lowest rank of the mosque hierarchy, people desirous of matrimony apply to him, he accompanies them to the mosque of the district to which his village belongs, he also acts for the pan[h]ulu as *'amil* of the *djakat* (*zakat*) and *pitra* (*zakat al fitr*) (see below) From this capacity comes the name he bears in some parts of the country *amil*

The appointment of the mosque officials (as distinct from the village officials in whose cases the local customary law is followed) is not done everywhere in the same way In Java and Madura, it is in the hands of the native chiefs who are also the highest state officials, on the other islands of the East Indian Archipelago, in so far as Islam prevails on them, the wishes of

the Muslim community are more or less respected, the secular authorities however exert a great influence

The revenues of mosque officials come from various sources donations, freewill offerings, in cases where their services are required — at religious festivals, burials, etc — need only be mentioned The chief source of revenue is the so-called marriage fees, less from *djakat* and *pitra*, these are administered and distributed by the superintendent of the mosque As already mentioned the mosque and its accessories have to be maintained out of the income Neglect of this duty has induced the chiefs in Java and Madura to intervene and form a special fund, the so-called mosque fund for this purpose This was arranged as follows a certain percentage of marriage fees and of the *djakat* and *pitra* was set aside, the chiefs took charge of these funds The revenues of the mosque officials earmarked in this way were however only a small fraction of the total, the greater part, perhaps $^4/_5$ or more, remained at the disposal of the officials This same procedure is found here and there on other islands but is not general

The Dutch government maintains a neutral attitude to Islām, in all business matters of the mosque also It takes no part in the building or restoration of mosques, only very exceptionally does it give a contribution in money for such purposes This was done for example in Kuta Radja (Atjeh), where the chief mosque, which had been destroyed during fighting, was rebuilt from government funds in 1881 But this act of the authorities was not appreciated by the Muslim population, in general, the government officials only see that no compulsion is used to procure materials or funds for the building or maintenance of mosques

With the end of the XIXth century the Colonial administration began to pay some attention to the regular organisation of the staffs of the mosques, primarily in Java and Madura Their measures aimed at maintaining things as they were and at getting rid only of abuses and such customs as had proved to be a burden on the people

Djakat and *pitra* are regarded as "freewill offerings" by the colonial authorities, the native chiefs and village authorities were therefore forbidden to interfere with them It is left to the individual to give them or not, he is also free to give his gifts to whom he pleases The giving of djakat varies very much with places and persons and is smallest in Central Java It is concerned almost entirely with agricultural produce, especially with the staple product and even then it rarely happens that the legal quantity is given In practice the djakat, where it is levied, is collected by the village mosque officials and handed over to the pan[h]ulu, he then distributes it in a certain proportion among his subordinates The proceeds go almost entirely to the staff of the mosque and the village officials, firstly because they are *ʿāmil* and secondly because they consider themselves *fakir* and *maskin*, they have, as they say, no means of livelihood like other people

Pitra is paid regularly, it happens very frequently with this "donation" that it is paid direct to those entitled to it and not through the officials Nevertheless a considerable portion goes the same way as the djakat

The government confined itself to seeing that the djakat and pitra collected by the Pan[h]ulu, was distributed as it ought to be according to custom but this was not always done

Marriage, *talāk* and *rudjūʿ* have been regulated by a colonial law The pan[h]ulu or his deputy was confirmed in his already mentioned functions as an official with legal standing At the same time, others than the appointed pan[h]ulu were forbidden by the secular authority to perform marriages The registration of marriages, *talāk* and *rudjūʿ* was improved The fees and their distribution among the staff were fixed according to local custom Every effort is made to keep these as low as possible Similar regulations were later promulgated for the other islands

As to the funds of the mosques, it was ascertained that there was more money in them than was required for the maintenance of the building and that they were being used for other purposes than the traditional ones This caused the government to place the funds of the mosques under the joint control of European and native authorities This holds particularly of Java and Madura, but wherever else the mosque had funds, these were retained

The regulations promulgated for Java and Madura have recently been attacked by Muslims, they wanted as far as possible to withdraw everything relating to marriage from government interference The intervention of the government is now (since 1929) limited to the fact that parties who wish to enter into matrimony have to report themselves to a registrar *Talāk* and *rudjūʿ* have also to be reported to him The marriage ceremony may be performed by others, but they are under the control of the registrar, this last method is now the exception, the majority continue to go to the district officer

In one other respect the mosque has come under the control of government regulations In Muslim districts of the East Indian Archipelago hardly a mosque is built without the consent of the local secular authority Although it does not have to give its approval expressly, no work will be begun until the plan is approved In Java and Madura the chiefs have long held themselves entitled to decide on the question whether a new mosque should be erected, though they justified this claim by saying among other things that a new mosque, if not desired by the entire community, may easily lead to jealousy and disputes about the validity of the Friday service etc, which might result in general unrest

The custom of making the site of a mosque *wakaf* — or at least regarding it as such, — results in it being impossible to use such pieces of ground for public purposes, even if it is long since the mosque buildings had been removed from them

These and other difficulties induced the government to require the approval of the chiefs for the building of new mosques on Java and Madura and also that the sites should become *wakf* It was however expressly laid down that there can be no possible question of interfering with the religious requirements of the Muslims, the chief can only refuse his consent in the public interest

The law of the Dutch Indies demands the presence of the *pan[h]ulu* or some one with similar functions, at the courts for Muslim natives and also when a native appears as accused or plaintiff

in a court, to assist the court as adviser An endeavour is made to get the most suitable people as advisers they are officially appointed It was found to be desirable to combine this office and that of the administrator of the mosque in the one individual, and this is now the usual practice The influence of the government on the appointment of the personnel of the mosque, which otherwise is reserved for the chief, has thus been increased, especially as in the appointment of the assistant[s] of the *pan[ḥ]ulu*, the ability of acting as adviser is also taken into account

The bonds which connect the personnel of the mosque and the secular authority are thus fairly close, — in the opinion of some too close In recent years the effort has been made in nationalist Muslim circles, to loosen or even break all secular connections in the fulfilment of religious duties One way of doing this is to get private individuals to found mosques with the help of similar-minded people This is quite possible in the conditions described and is still done

III

Architecture

The mosque with an open quadrangle was the natural form for the hot southern lands of Islām, and is simply a continuation of the many types of pillared halls and chambers which were to be found all over the near east, beginning with the Egyptian temples and coming down to the apadanas of the Persians and the stoas of the Greeks, of which of course only the latter influenced the development of the early Muslim mosque This consists of a courtyard or quadrangle (*ṣaḥn*) usually very large which is surrounded by cloisters (*riwāḳ*) which are either connected by flat beams, or more usually by arches and covered by a flat roof At the kibla side the riwāks were deeper so that the rows of worshippers could find shelter from the sun The supports were at first very often columns taken from ancient buildings and where these were not obtainable, were of wood or brick The pillared hall at the kibla side was called *al-īwān al-ḳiblī* or *īwān* A portion of the *īwān* was shut off by a railing and reserved for princes and priests On the quadrangle side of the īwān is a podium (*dikka*) supported by pillars and reached by a staircase or ladder, this is for the officials of the mosque, who repeat the words of the imām during the service to make them audible on all sides At the end of the īwān the *miḥrāb* is set into the middle of the wall and beside it is the *minbar* In the centre of the court is a well, originally intended for ritual ablutions but these were as a rule performed in rooms specially set apart for the purpose

These mosques with open quadrangle were built in the first century A H on a large scale, as they were primarily intended to be mosques for the troops, whence they were called *ʿaskar* mosques The Djāmiʿ Ibn Tūlūn in al Katai, Cairo is a comparatively well preserved specimen of one of these ʿaskar mosques It was built in 264—267 (876—879) and measures 466 × 383 feet and its court is 300 feet square The principal īwān had originally five rows of pillars but has now only four since the first one fell down, the others had two rows each, which are connected by pointed arches, parallel to the walls, thus still following the type of the Hellenistic agora The piers are built of brick and into the corners are let small columns Between the pillars are pointed arches and ornamental windows with little pillars at the sides Similar windows with stucco gratings pierce the outer walls The roof, most of which is now modern, was made of palm trunks with sycamore planks nailed over them In front of the *miḥrāb* was a *maḳṣūra* for the ruler This *maḳṣūra* was as here usually distinguished by its cupola In the later mosques of this kind an aisle of some width led through the pillars up to the *maḳṣūra*, usually through the naves of the *īwān* so that an aisle was created for a ceremonial procession by the ruler into the mosque In the Djāmiʿ Ibn Tūlūn as in the ʿaskar mosques of the third (ninth) century in general there are no transepts as yet so that the succession of pillars is quite uniform The *miḥrāb* projects out as the wall juts out a little here and the niche has two steps cut into the wall and then projects in a semi circle Two marble pillars are built into the angles formed by the projection of the niche, which have been taken from older Christian buildings The white stuccoed surfaces of the walls are ornamented along the upper margins and archivolts with decorative strips of carving, which were originally painted The interiors of the arches were also originally decorated but are now for the most part whitewashed Immediately below the roof on a wooden frieze runs a Kūfic inscription two miles long with sūras from the Kurʾān, the letters of which are cut out of wood and nailed on to the boards The mosque has a battlemented wall, which again was surrounded on three sides by a second outer wall so that the whole area was square in shape and the outer courtyards put some distance between the quadrangle of the mosque and the surrounding streets The outer walls of these early army mosques were turreted like a fortress with round projecting towers even though not intended for defence This was not the case with the Mosque of Ibn Tūlūn On the minaret, which stood outside the mosque among the outer buildings on the north side and like the mosque itself was restored under the Mamlūk Sultān Ladjin, cf the article MANĀRA Similar mosques for the troops were built in all the garrison towns of the young empire, like Basra, Kūfa, Baghdād, Samarra, Rakka, in Cairo, Kairawān and elsewhere

The type of mosque with quadrangle and piers or columns was however by no means limited to the mosques for the troops but was general in the early centuries of Islām and survived much longer than this, just as the early Christian basilica had done Many pillared mosques, the foundation of which dates back to the early centuries A H are still in use, like the mosque of the Umayyads in Damascus, the great mosque of Sīdī Uḳba in Kairawān, many mosques in the Maghrib, where they have frequently remained faithful to this type down to the present day, the Djāmiʿ al-Azhar and others in Cairo In towns that are cold in winter, the

ḥarām was shut off by doors and windows from the quadrangle as in the pillared mosques in Konya, Sīwās and Turkish towns, but also in Damascus and Córdoba

The Domed Mosque The great mosques built on piers — in so far as they were not simply army mosques — were primarily used for the Friday service in the larger cities In addition to these, there were in every town several smaller mosques either for the use of the separate quarters or for special purposes For these also in Egypt and the lands of the Maghrib the type of piered mosque with open quadrangle persisted while in Mesopotamia, the lands of the Caucasus and Persia, suiting the ruder climate and undoubtedly stimulated by the influence of the Christian churches the closed domed mosque became the type Some of these mosques (e g in Werāmīn) reveal with their combination of a long building and a dome such a striking similarity to the older, mainly Nestorian, churches that M Dieulafoy and van Berchem comprised them under a type to which they gave the name "mosquée église" Typical mosques of this kind with a central domed chamber and internal piers are to be found in Tabrīz, Fīrwān, Diyār Bakr etc It was only under the Ottomans in Asia Minor that the domed mosque attained the next stage in its development and it reached its zenith — not by chance — where the similar Christian style of church architecture had reached its final development, namely in Constantinople

Madrasa The foundation for the further development of the mosque with a great open quadrangle, as perfected under the Saldjūks in the east, was the type of madrasa which had in the meanwhile been evolved [cf the articles MADRASA and ARCHITECTURE] The ideal plan of a madrasa is an open court with vaulted cloisters opening on a central quadrangle in the centre of the four façades, i e at the intersection of the axes This plan however only became regular in Persia and we only find a few specimens exceptionally in Cairo On both sides of these four īwāns are the cells and dwelling apartments of the teachers and pupils usually in two stories In contrast to the pillared mosque with an open court, which arose out of a Hellenistic Mediterranean type of building, the model for the development of the eastern madrasa, which combined both school and monastery, was on the one hand the Indian Buddhist monastery and on the other the Khurāsān īwān, while the madrasa of Syria, Egypt and the Maghrib was influenced by native types of mosque and house The Turkish peoples, as representatives of the Sunna and its propaganda through the madrasa, before they invaded Persia and became Muslims, were mainly under the influence of Buddhism and Nestorian Christianity, which survived much longer in Turkestān and the Tarīm basin than in Persia and still was very important as late as the xiiith century A D, as is evident from the narrative of William of Rubruck The Turks before they adopted Islām had, among the Buddhists and Nestorians, become acquainted with the missionary side of religion This seems to explain the prominent part later played by them as propagandists of Islām in Persia and Asia Minor It must have seemed to them that the most suitable centre of propaganda was the same type of building as that used by the Nestorians and Buddhists, namely the monastery The Buddhist monasteries which were courtyards with cells built round them, numbered hundreds in Central Asia They are as a rule oblong quadrangles with cells built round them and a stūpa in the centre and several large rooms for meetings In Persia, under the influence of these buildings, the type of quadrangle and cells with 4 īwāns in the form of a cross became established as the ideal scheme of a madrasa That this plan which was architectonic in origin was also the practical ideal for the fourfold doctrine of the Sunnis, was a fortunate combination, which in some large state madrasas became of practical significance

The Persian Mosque-Madrasa The quadrangle surrounded by cells with four īwāns of the Persian Madrasa was now combined with the old piered mosque and the result was a very happy combination the mosque-madrasa (as we Europeans call it) The important result of this combination was from the architectonic point of view the monumental quadrangle with cells, which now replaced the old courtyard with pillars or piers which was no longer architectonically satisfactory and was also foreign to the spirit of Persian architecture But with this transformation of the quadrangle a change was brought about in the spiritual aspect of the mosque It symbolised the transformation which had meanwhile taken place internally and externally in Islām from a combative, conquering religion organised on military lines into a spiritual attitude to life controlled by theologians and men of learning The fighting, however, which was still conducted by military forces, and the conquests had now become more or less the private business of the secular rulers, above whom was the religious propaganda of the Muslim clergy The most instructive example of this penetration of the older type of mosque by the Persian quadrangle surrounded with cells is the Masdjid-i Djum^ca in Isfahān This mosque, like all the Friday mosques in Persia was originally built as a pillared mosque and had been frequently enlarged At the present day, as the plan shows, it consists of colonnades which have in course of centuries been added to one another from time to time A great deal of wood must have been built into its framework, since Yākūt tells as that during the siege of Isfahān by the Saldjūk Tughril Beg (442 = 1050/1051) the mosque was destroyed to obtain wood From the contemporary accounts that have been handed down, we further learn that the Saldjūk Sultān Malik Shāh when the mosque was completely restored by his orders began with roofing the walls of the courtyard He is credited with building the southern īwān The other three īwāns are over their present form of later origin By covering over this huge quadrangle, the courtyard, the only characteristic architectural feature of the mosque, received the necessary unity and importance (Around it, this mosque, like most Friday mosques, was completely surrounded by bazaars which made any external development impossible the quadrangle was therefore all the more important) The rows of cells had here no longer any practical significance as dwellings but became an architectural feature Behind the southern īwān, directed towards Mecca, a large domed hall was built as a sanctuary, in the south wall of which were the miḥrāb and pulpit Here the solemn Friday service was held Thus the Friday mosque was created of the type which became general in Īrān and Turkestān Mosques and madrasas were frequently combined with mausoleums [cf the article ARCHITECTURE]

The Mosque building in the early period Muhammad left no instructions as to how future mosques were to be built so that the earliest mosques varied considerably and we can hardly talk of a fully developed type before the third (ninth) century The Prophet's house in Medīna, where he performed the salāt with his faithful followers and instructed them, was a *dār* of the usual local type quite unsuitable as a model for the future mosque It consisted of a courtyard surrounded by a brick wall with living rooms and outhouses along the inner wall As was usual and still is in every house of this kind in Arabia and other tropical lands, palm trunks were put up in the courtyard and a flat roof of palmleaves put over them and covered with a layer of clay This is how the earliest accounts would lead us to picture the Prophet's house In the courtyard was a reception tent furnished with fine carpets and materials, for Muhammad did not despise the nomadic luxuries and comforts of his people (cf H Lammens, *Fatima et les filles de Mahomet* and *do*, in *J A*, 1915, p 238 *sqq*) Around this establishment of the Prophet, his wife and daughters, lay the court in which his friends and followers used to assemble for the daily prayer and which thus became the first quadrangle of the first mosque The use of a typical Arabian courtyard arranged in this way as a masdjid however gives us no idea of the future imposing building For half a century, it is true, they were content with this primitive mosque, during the patriarchal period of the first four caliphs, out of respect for the Prophet's mosque, but the first Omaiyad caliph Walīd I who in transforming the church of St John in Damascus into the Mosque of the Omaiyads had acquired experience "in matters of building" and connections with builders, on the occasion of his pilgrimage to Medīna in 90 (709) ordered the primitive mosque which had served the purpose so far, to be removed so that an entirely new building could be erected on its site, which was extended For this purpose, as Samhūdī tells us, he asked the Byzantine emperor for skilled workmen and shells for the ornamentation, which were sent to him "The walls and columns of the new mosque were built of large hewn stones of equal size and bound with plaster, ornamentation in shell and marble was carried out and the roof built of palm wood and covered with gold paint" Instead of the early primitive mosque, Walīd had thus given the Medīnese a substantial pillared mosque, like the first mosques which he had built in Syria with the help of Byzantine artisans from pillars plundered from Hellenistic colonnades and Christian churches It was only in this Hellenicised form that the mosque of Medīna could have influenced the further development of the mosque in so far as we can speak of such influence at all (It was given its present form by the Mamlūk Sultān Kā'it Bey in 888 = 1483) The ordinary Arab village mosque is different in appearance It has retained the form of the Arab pre islāmic *muṣallā* This "place of salāt" was and still is a long hall supported by pillars, open on one side without a courtyard and having no *miḥrāb* and *minbar*

The lack of any generally binding or recognised rules or tradition is shown by the varying form of the mosque in the early centuries A H The earliest mosque of the general ʿAmr in Fustāt of 21 (642) was an enclosed rectangular hall without a courtyard, with a *kibla* which was not yet marked by a *miḥrāb* The first mosque in Basra was, like the whole city of encampments, built of reeds so that it could be taken down with the camp In the year 16 or 17 A H Abū Mūsā, the newly appointed governor of Basra, built a mosque of unbaked brick and clay with a roof of grass It was only under the Omaiyad governor Ziyād that a mosque was built of brick and plaster with a roof of teak and pillars, which came from the quarries of Ahwāz on the Kārūn river The first mosque in Kūfa on the other hand of 17 A H was "a covered hall which had no side wings nor buildings behind it" (Tabarī), before it was an open square "and so, continues Tabarī, were all the mosques except the *Masdjid al-Harām* (i e Mecca), out of respect for the sanctity of the latter, it was not copied in the other mosques" This mosque also was rebuilt by Ziyād, governor for the first Omaiyad Muʿāwiya I (41–62 = 661–680) For it he had plans drawn up by Mazdaean architects "Uno degli architetti gli fece un disegno sul modello degli edifizi eretti dai rei sassanidi, ossia un vasto colonnato con tetto e chiuso ai lati" (cf *Annali dell' Islām*, III, § 47, p 857) When, on the other hand, the conquerors found buildings in towns which were suitable for masdjids from the point of view of space, they utilised them In al Madāʾin, for example, the old twin city of Seleuceia–Ctesiphon, the *iwān* of the white palace was used as a place of assembly for the Friday salāt, and the pictures of men and animals in it were not destroyed In Syria, however, the churches were turned into mosques by changing the orientation from east to south and placing a quadrangle in front of them In this way the building of the mosque of any place in the early centuries A H was adapted to the traditions in existence and where there were no buildings, as in the newly founded camp cities, it was on every occasion a problem for the governor requiring much consideration In spite of this uncertainty, as one can deduce from the descriptions, they were more inclined, even as early as the first century A H, to the type of pierced mosque with a quadrangle, to which all the prototypes as well as the climate pointed

Development of the Masdjid and the Madrasa in the different countries

Syria As the place of residence of the first dynasty of the young Muslim empire and a land of ancient culture, Syria was naturally destined to build the first substantial mosques and to influence early developments This influence it exercised on the one hand indirectly through the Syrian mosque built by Walīd in Medīna, next to Mecca the most sacred and most visited city of Islām, on the other hand, the Mosque of the Omaiyads in Damascus, as we know from Arabic sources, was taken as a model as far away as Córdoba The earliest centre of Muslim building was Jerusalem, which the Omaiyads endeavoured to play off against Mecca Beside the rotunda of the *Kubbat al Sakhra* on the Harām al Sharīf, the sacred rock of which was to supplant the Kaʿba, ʿAbd al-Malik used the parts still standing of Justinian's Church of the Virgin to built the *Djāmiʿ al-Aḳṣā* (finished in 83 = 702) According to de Vogué's plan, this building, later often restored or rebuilt, was a pil-

lared hall with three naves, of necessity oriented to the south with the mihrāb in the long axis At a later date the transept with the dome and four side naves was added The Mosque of the Omaiyads in Damascus arose out of the rebuilding of the Church of St John, which had been built on this site by Theodosius out of the pillars and other stones of the Antonine temple of Jupiter We must assume that Walid had the pillars of the basilica moved so that three equal naves were built These were crossed in the centre by a transept, which led up to the mihrāb and had a dome over its centre The rich decoration with mosaics was a suggestion from Syria and was probably done by Syrian workmen (plan and history of these buildings in Diez, *Die Kunst d islam Völker*, p 14 *sqq* of the first and p 32 *sq* of the second edition, with references to the literature) The mosque of Damascus was the first to have a transept, the prototype of which Thiersch no doubt rightly finds in the chalke of Byzantium (*Pharos*, p 214), which frequently appears again in Syria and Northern Mesopotamia The great mosque of Aleppo was also built after the plan of the Omaiyads with a transept, as the latter can hardly have been added until the rebuilding of 365 (976) (pictures in Saladin, *Manuel*, p 85) The mosque of ʿĪsā in Ephesus, finished in 777 (1375), and the mosque of Diyār Bakr are northern outposts of this type, the influence of which can also be often traced in Cairo and the Maghrib

Alongside of these principal mosques in Syria a series of smaller mosques arose, partly out of ancient temples (Aleppo, Hamā, Homs, Baʿalbekk, Tripolis, al-ʿUmtāya), partly built out of material available from Christian buildings (Ramla, Kusair, al-Hallābāt, Bosrā) Some of these mosques may have been pre-Omaiyad foundations, certainly the Mosque of ʿOmar in Basra All these mosques, except Kusair al-Hallābāt, have the same type of quadrangle with halls around it, two or more being on the kibla side, without transept The development of these halls varies however, as a result of local tradition or the material available (e g the naves of Christian churches) They are as a rule vaulted with pointed arches but sometimes have gable roofs and thus, along with their closed façades, in front of which we exceptionally have a bowered corridor, bear a western or northern stamp in keeping with the ruder climate The later Syrian mosques under the Aiyūbids and Mamlūks differ very much in their plans The Mosque of Firdaws in Aleppo, for example, has a small pillared court and a broad nave, with a row of five small domes, as the harām besides various side rooms, cf M v Berchem and E Fatio, *Voyage en Syrie* (*M I F A O*, Cairo 1914, 2 vols)

Madrasas in Syria A very complete study of the madrasa in Syria and Egypt by K A C Creswell (*The Origin of the Cruciform Plan of the Cairene Madrasas*, *B I F A O*, 1920) has brought some clearness into the question of its typical form etc After an examination of eight madrasas built before 1270 A D, the plans of which can still be traced in Aleppo, Damascus and Hamā, Creswell shows that the symmetrical plan was unknown in Syria and that there was no regular scheme in the arrangement of the rooms, but it depended on the site available A typical specimen is the always correctly oriented mosque a nave of three vaulted rooms with three pointed arched doors to the court, a *liwān* on the court, rows of cells in the rest of the court and usually two tomb cupolas usually flanking the mosque, the rest of the area is occupied by rooms Madrasas used by two rites had two liwāns Of the 80 madrasas counted by al ʿIlmawī in Damascus in the xvith century (*J A*, ser 9, vol III—IV), 33 were Hanafī, 31 Shāfiʿī, 9 Hanbalī, 1 Mālikī, 6 used by Shāfiʿīs and Hanafīs Creswell's investigation shows that in Syria there was not one madrasa of all four rites nor a cruciform one, a result, which suggests new deductions for the Egyptian madrasas

Arabia The indigenous form of the masdjid in Arabia is a large hall formed of chambers with pillars and arches The author found such oratories, more correctly to be described as musallās, in Manāma on Bahrain (picture in Diez, *K d isl V*, p 46) These praying chambers, open to the street without a courtyard, have no furniture, not even a minbar or mihrāb The latter was foreign to Arabia and in the larger masdjids its place was taken simply by a slab of stone with some adornment But these pillared halls were only a more substantial form of the local native masdjid of palm trunks, which could probably often be found in the simple villages of the interior and whose sanctified precursor was the Masdjid al-Nabawī in Medina built in this fashion Alongside of this type of mosque which was indigenous to Arabia we find imported forms, like the masdjid in Medina (see above), of slight importance from the archaeological point of view Mention may be made of the ruins of a mosque near Manāma of 740 (1339/1340) described in an inscription as *mashhad al-sharīf dhu 'l-mināratain*, with old pillars of teak of the fourth (tenth) century, the Shiʿa form of the creed on this as well as the inscriptions on the kibla stones of the xivth century mark it as a Shiʿa edifice (cf Diez, *Eine schiitische Moscheeruine auf der Insel Bahrayn*, in *Jahrb d asiat Kunst*, II, 1925)

ʿIrāk and Mesopotamia The earliest settlements of the conquering Arabs in the ʿIrāk were primitive camps built of reeds, equally primitive were the earliest mosques Sāsānian buildings were used for the purpose in conquered cities, like Ctesiphon A pillared mosque was early built in Kūfa (17 A H) which Tabarī describes and which was rebuilt as early as the beginning of the Omaiyad period by "Persian builders" in the form of a completely enclosed pillared hall (see above) In the capital of the caliphs also, as a result of its complete destruction by Timūr nothing worthy of note has survived We know however that the Friday Mosque of al-Mansūr (149 = 766) was built of pillars of teak with capitals of wood and a flat roof A wooden dome over the *maksūra* is probable It was rebuilt under Hārūn in 192—193 (808) Al-Muʿtadid began to enlarge it after the return of the troops from Samarra (280 = 893) (cf Sarre-Herzfeld, *Arch Reise*, II, 134 *sqq* with plan) Outside of Baghdād the unlimited space available permitted great mosques for the soldiers to be systematically planned, as in Rakka and Samarra, these were the great piered mosques of the third (ninth) century, which were copied in the Mosque of Ibn Tūlūn in Cairo Of the three large old mosques in Mōsul, that of the Omaiyads has completely disappeared, according to Yākūt's description it was "completely vaulted, with alabaster slabs" This seems to be the origin of that type of piered mosque

with vaulted arches which was later further developed by the Saldjūks and Ottomans (see below) The Mosque of Nūr al Dīn (541—569 = 1146—1173) or Djāmiʿ al-Kabīr was also vaulted from the first (with cross-vaulting) on piers (543 = 1148) and on its rebuilding in 566—568 (1170—1172) was not given cupolas The third Mosque of al-Mudjāhid, Khidr Ilyās, has been completely modernised Smaller mosques of the vith (xiith) century like the Djāmiʿ Nabī, Djirdīs have single domed chambers as praying-rooms

In Baghdād the following madrasas were built under the ʿAbbāsids the Shāfiʿī Nizāmīya in 459 (1066), the Tādjīya in 482 (1089), the Hanafī Tutushīya in 508 (1114), the Nāsirīya, c 600 A H and the Mustansirīya about 630 A H Only the latter is still in existence and is used as a customs warehouse (sketch-plan in Sarre and Herzfeld, *Arch Reise*, ii 161) Of remarkable oblong shape (86 × 210 feet) it has six līwāns, a large vaulted hall, rows of cells and side-rooms Besides the four rites this, the first state madrasa, also accommodated a *dār al-hadīth* and a *dār al-Kurʾān* If the Mustansirīya was not planned in a strictly symmetrical way with four līwāns at the intersection of the axes, it nevertheless incorporated the same idea and may therefore have stimulated the development of the next type In Mōsul there were several Hanafī madrasas

Egypt The type of pillared mosque imported from the ʿIrāk under Ibn Tūlūn prevailed in Cairo along with the pillared mosque down to the Mamlūk period It is the regular rule that the large military and Friday mosques always have piers, the smaller mosques intended for the people of the quarter have pillars Some of the latter however were on occasion also used as Friday mosques The rows of piers were always parallel to the Kibla wall and connected by arches, a natural result of the rectangular form of the piers, which had to run parallel to the rows of worshippers In the pillared mosques the naves might also be perpendicular to the Kibla wall, without inconveniencing the worshippers The Cairo mosques of this group are

The Mosque of ʿAmr Ibn al-ʿĀs in Fustāt, which received its present form as a result of repeated rebuilding and additions to the above mentioned hall of the year 21 (642) (cf E K Corbett, *The History of the Mosque of Amr at Old Cairo*, *J R A S*, 1890)

The Mosque of Ahmad Ibn Tūlūn of 263—265 (876—879, for a description see above, cf E K Corbett, *The Life and Works of Ahmad Ibn Tūlūn*, *J R A S*, 1891, p 527—562)

The Mosque of al-Azhar of 359-361 (970-972) on pillars the first Mosque of Fātimid Cairo, remarkable for the central nave, broader than usual with two domes (*seldjuka*) probably borrowed from the Maghrib and unusual here, also for its stilted pointed arches which henceforth became frequent in Cairo, finally for the rich decoration of the plaster in the arches, which were recently cleaned (They will be published by S Flury in Creswell's great work on the architecture of Cairo) The Azhar has long been used as a *Dār al-Funūn* (state madrasa)

The Mosque of Hākim, a piered mosque of the year 380—403 (990—1012), with valuable decorations on the plaster and inscriptions and two unwalled, historically important manāras [q v] (cf M v Berchem, *Notes d'Archéologie Arabe*, *Monum et Inscr Fatimites*, *J A*, 1891, reprint, p 23)

The Mosque of al Akmar, a small pillared mosque historically important for its façade built by Abū ʿAlī al-Mansūr al-ʿĀmir (495-524), finished 519 (1125), restored by Barkūk in 799 (1396—1397) and given a manāra which was removed in 815 (1412) (cf M v Berchem, *l c*, *J A*, 1891, reprint, p 81)

The Mosque of al-Fakihānī, built by the Fātimid caliph al-Zāfir in 543 (1148-1149), completely restored in the Ottoman period

The Mosque of al-Sālih Talāʾiʿ outside the Bāb el-Zuwēle, built about 550 (1160) A smaller pillared mosque of the usual type, which was sometimes used as a Friday Mosque (cf M v Berchem, *l c*, reprint, p 3 *sqq*, pictures in R L Devonshire, *Some Cairo Mosques and their Founders*, London 1921, p 1—10)

The Mosque of al Zahir Baibars of the year 665—667 (1266—1269), a mosque with piers of brick, built for the troops with a very strong stone wall and three portals jutting out like the Mosque of al-Hākim The six rows of columns in the haram are crossed by a transept with a dome of three naves breadth in diameter before the mihrāb Porticoes with double naves surrounded the court

The Mosque of Sultān Muhammad al Nāsir on the citadel, of the year 718—735 (1318—1335) on pillars

The Mosque of Amīr al Mās (Shāiʿ Hilmīya) of 730 (1329—1330)

The Mosque al Mardānī of 739- 740 (1338—1340) on pillars

The Mosque of Amīr Aksunkur of 747—748 (1346—1348) on pillars

The Mosque al Muʾaiyad of 819—823 (1416—1420)

Of pillared mosques in Egypt outside Cairo we may mention the Mosque of "St Athanasius" and the Mosque of the "Thousand Pillars" in Alexandria the plans of which were recorded by the French expedition (*Description de l'Egypte*, *Antiquites*, v, reproduced in Thiersch, *op cit*, p 224) Shortly before the arrival of the French, Alexandria still had 88 mosques, 46 of which were large Practically nothing of these is left at the present day The two above mentioned were pillared mosques and particularly the second, also called the "Mosque of the Seventy", with its līwāns of equal depth on all sides (only the northeastern one has 4 instead of 5 rows of pillars) the arches of which always run parallel to the outer walls, i e palm-like, continue the type of the Hellenistic pillared agora or the gymnasion as Thiersch has pointed out The same type predominated in the towns of the Delta The second, later type of mosque in Egypt was decisively influenced by the madrasa, to which we may now turn our attention As Creswell has shown, the Egyptian madrasa was by no means always cruciform, as was usually supposed previously It is also distinguished from the Syrian type and cannot be at once said to have been introduced from Syria It is true that the first madrasa for all four rites in Cairo was built by Sālih Nadjm al-Dīn Aiyūb, but this Sālihīya was a building divided into two halves and cannot be considered as the original of the later type (641 = 1243—1244) The first cruciform madrasa with 4 līwāns in Cairo was the Zāhirīya which was built on the site of a part of the old Fātimid palace which was cleared for this purpose and consecrated in

660 (1263) The south līwān belonged to the Shāfiʿīs, the north to the Hanafīs, lectures on Hadīth were given in the east līwān and in the west līwān the seven ways of reading the Kurʾān were taught (Makrīzī, *Khiṭaṭ*, II) While the Ṣālihīya held all four rites but was not cruciform, the Zāhirīya was cruciform but did not accommodate all four rites The Nāsirīya of 695 (1295–1296) was the first madrasa of the rare type which, cruciform and accommodating all four rites, allotted a līwān to each Maḳrīzī also mentions a large number of other madrasas of one or two rites which have completely disappeared but probably were of different forms, as the existing madrasas and ruins show One great difference in principle between the Syrian and Cairene madrasas was the installation of the mosque In Syria this was always a broad chamber with a central dome and two tunnel vaults but in Cairo one of the līwāns was always used as a mosque and with this object was furnished with a miḥrāb The Egyptian madrasas also always had minarets, which was the exception in Syria Creswell's assertion that the cruciform mosque is of Cairene origin, although it remained the exception, therefore will hardly find acceptance Timūr and his successors certainly did not get the design for their numerous cruciform madrasas from Cairo but followed the old Khurāsānian tradition It remains to be seen whether future excavations in Nishābūr, Tūs and other towns of Khurāsān will supply further information on this point Creswell gives a chronological list of the madrasas of Cairo mentioned by Makrīzī and others, which were built between 566—811 (1170—1408), these number 55, 26 of which are still in existence Two of these are devoted to all four madhhabs, the Madrasas of Sultān Ḥasan 757–764 (1356—1363) and of Djamāl al-Dīn of 811 (1408) (Creswell, *loc cit*, p 44) Further details of these madrasas will be found in Creswell, *op cit* and in Diez, *Kunst d isl V* 2, p 118–125 Here we shall just mention the most celebrated building of this kind in Cairo, the tomb mosque-madrasa of Sultān Ḥasan It belongs to the group of buildings which contain several places of worship and are devoted to all four rites, the school līwāns of which were however outside the central court at the four corners of the building, quite separate from one another The four līwāns had therefore only an architectural significance In keeping with the Cairo tradition, the kibla līwān was made much larger and arranged as a masdjid

With this adaptation of the madrasa for use as a mosque, the foundations were laid for the further development of the mosque during the period of the Circassian Mamlūks when it may be described as a transformed and roofed madrasa As a rule we can distinguish in it three compartments, the Kibla līwān, a central chamber sunk a step lower occupying the place of the former open courtyard and a room at the back, as a rule a smaller one Of little importance from the architectural point of view, these small mosques were elaborately decorated and formed fine specimens of the decorative art of Cairo The tomb mosque of Kāʾit Bey of 880 (1475), the mosques of Kishmā al-Ishāḳī of 885–886 (1480—1481), of the Āmir Akhōr of the year 908 (1503) and of al-Ghūrī of the year 908—910 (1503—1504) are building of this group The Ottoman domed mosques from 935 (1528) follow the Turkish tradition

The Maghrib (North Africa and Spain) The typical mosque of the Muslim west is the mosque with courtyard, on pillars or columns It was only under Turkish rule that the domed mosque became established in those parts of North Africa affected by it The rows of pillars run, as a rule, perpendicular to the Kibla wall from which however they are separated by a transept The axis of the latter is a continuation of the axis of the central nave which is always broader Of the rows of pillars in the axis the two or three outermost ones are continued over the court and form the arcades, of which the inner entrance side of the court has as a rule only one The beginning and end of the central nave are as a rule marked by a dome The western mosques are given their characteristic features by the horseshoe and bulbous arch (a mixture of the horseshoe and the pointed arch) The miḥrāb of the western mosques is as a rule a pentagonal niche considerably deeper than the eastern semi-circular one The oldest surviving large mosques in the west are in Kairāwān, Tunis and Córdoba (since the expulsion of the Church)

The foundation of the Great Mosque of Kairawān like that of ʿAmr in Cairo goes back to the first century A H but like that in Cairo also retains nothing from its founder ʿUḳba b Nāfiʿ except the name By 76 (695) the original masdjid was rebuilt, and later enlarged but in 221 (836) it was completely taken down by the Aghlabid Ziyādat Allāh and rebuilt and in the third (ninth) century again enlarged on two occasions In spite of many later restorations, the mosque has retained the form it was given in the third (ninth) century Seventeen naves on pillars run perpendicular to the Kibla wall from which however they are separated by the transept The central nave is broader and flanked by double columns and marked externally by two domes It may be noted as a special feature that the first two travées of the harām seem to be one with the court arcades while the part behind was shut off by doors The arcades of the court rest on pillars with double columns in front of them, which with their bulbous arches give the court its special charm The Djāmiʿ Zaitūna in Tunis was built as early as 114 (732) by the Omaiyad governor Ibn al-Habhāb but entirely rebuilt in 250 (864), in spite of many internal restorations, it has in the main retained to the present day its old form of the end of the ninth century In Spain we have from the Omaiyad period the (former) Mosque of Córdoba It was built by ʿAbd al Rahmān I (138—172 = 756—788) and several times extended by his successors until the harām contained 19 naves each with 35 pillars The special feature of this mosque is the double storied arrangement of its rows of arches, a bold innovation, which does not seem to have been imitated elsewhere Recent investigations have revealed the original floor of the mosque at a much lower level, which is decorated with mosaic This would alter the proportions The horseshoe arch taken over from the Visigoths was varied in the clover leaf and indented arch and these arches were imitated in the Maghrib (mosques of Algiers, Tlemcen etc) The domes swelling into various shapes were frequently imitated in Kairawān and Córdoba The mosques of Sūs (236 = 850) and Sfax (235 = 849) were founded in the Aghlabid period but the latter was completely restored in the tenth century. The rise of

the Fāṭimid empire in North Africa (297 = 909) brought about a new development of mosque building The mosque of the new Shīʿī capital Mahdīya in Tunis however corresponds completely to the preceding Aghlabid type A novelty however is the use of cross vaulting which henceforth we find frequently, first of all in the two mosques of Monastir and in the new part of the Great Mosque of Sfax Of the great pillared mosque of the Kalʿa of the Banī Hammād, the minaret of which still stands and was mentioned in the article MANĀRA, it is only possible to reconstruct the ground plan, which had 13 naves with 8 travées (cf Blanchet, *Nouvelles archives de Missions*, vol xviii, p 13 *sqq* and De Beylie, *La Kalaa des Beni Hammâd*, p 77 *sqq*) A second mosque of the Banī Hammād has been destroyed in Bougie but it is evident from an old description that it belonged to the type of Kairawān (De Beylie, *op cit*, p 102—104)

Mosques of the Almoravids (448–541 = 1056–1147) and Almohads (524–667 = 1120–1267) The great mosques in Algiers and Tlemcen, the Kutubīya in Marrākesh and the mosque in Tinmāl are pillar mosques with bulbous arches On the other hand the Mosque of Hasan in Rabāt, now completely destroyed, the largest mosque of the Maghrib, stood on round pillars (610 × 465 feet, begun 539 = 1196–1197) A noteworthy feature is the mausoleum behind the miḥrāb in the mosque of Tlemcen, which now becomes frequent in the Maghrib (but seems not to have been unknown in eastern Islām, as the plan of the madrasa of Khargird shows, cf Diez, *Churasan Baudenkmaler*, p 73)

Marinids in Morocco (1195—1470), successors of the Almohads (xiiith—xivth century) a large mosque in Tāza, Morocco, piers, broad central nave and transversal nave, finished in 693 (1294) A large mosque in Auyda on the Algerian-Moroccan frontier (696 = 1296) Sidi bel-Hasan in Tlemcen (696 = 1296), a small mosque with onyx columns, and Awlād al-Imām in Tlemcen (710 = 1310), small, but richly decorated The great Mansūra mosque in Tlemcen (736 = 1336), a very regular building, thirteen naves on onyx columns, a broad central nave, a three naved transept, a maksūra in the centre, a polygonal miḥrāb with mausoleum behind Sidi bū Medyen of al-Awbād (739 = 1339) and Sidi al-Halwī (754 = 1353), both in Tlemcen, small, the former on piers, the second on columns with slightly modified horseshoe arches with a wide span Shella (harbour of Rabāt), Necropolis of the Marinids, a tomb-mosque (739 = 1339) (plan in Marçais, *Manuel*, ii, p 498) Around Tlemcen are several small mosques of the xivth century

Mosques of the Hafsids in Tunis, xiiith—xivth century Mosque of the Kasba in Tunis, built by the founder of the Hafsid dynasty Abū Zakarīyā Yahyā I (625—647 = 1228—1249), finished in 633 (1235) Pillars with chaptrels, supporting horseshoe arches in the quadrangle and cross vaulting, the usual form of roof in Ifrīkiya from the tenth century (cf Sfax etc) is similar The Mosque of al-Hawā of the xiiith century is similar

Mosques in Morocco under the Sharīfs 951—1311 (1544—1893)

In Morocco preference was given to the old Almohad type of mosque as exemplified in the Kutubīya The Bāb Dukkāla 965 (1537) and Muasiyn 976 (1562) mosques in Marrākesh have seven naves at right angles to the kibla, and a transept along the kibla wall Innovations seem to be, in addition to the broader central nave, that the two outside naves left and right along the side walls were broader and a dome was placed at each of the four corners of the mosque A second transept on the court side of the Harām seems to be exceptional, as in the Bāb Dukkāla The mosque of the Kasba of Marrākesh dates from a foundation of the Almohad al-Mansūr After the explosion of 1574 it was rebuilt and in the xviiith and xixth centuries repeatedly restored (cf the monograph by H Basset and Terrasse) The mosques of al Kairawiyīn and Mūlāy Idrīs in Fēs have likewise been restored

Mosques in Algeria under Turkish rule (1518) In addition to the two mosques which date from the Almoravid period, the Great Mosque 490 (1096) and the M Sidi Ramdān in Algiers, only two other mosques of the old type are believed to exist, all the others, over 100 in number, are Turkish The oldest Turkish mosque is ʿAlī Bitshnūn (1622), now Nôtre Dame des Victoires This building had a large central dome, which is surrounded by small domes It is noteworthy that the square minaret was not ousted by the Turkish type All the later mosques of Algeria show variations of this type, except the "Mosque on the Fish-Market" 1070 (1660) the plan of which recalls those of the Jesuit churches of the xvith century, it may however owe nothing to them but derive from Byzantine-Turkish models

Mosques in Tunis under the last Hafsids and Turks (from 1534) Under the last Hafsids the venerable Djāmiʿ Zaitūna was again restored, enlarged and given its present portico and the outer gallery of arcades The oldest Turkish mosque is Yūsuf Dāʿī (1610–1637) It is significant that it is built after the old Tunisian type on pillars with cross-vaulting, as are the later M of Hammūda Bey finished in 1067 (1654) and several mosques of the xviiith and xixth centuries The Turkish style (Ahmedīya in Constantinople) represented by the Sidi Mahiez (second half of the xviith century) remains the exception in Tunis

The medersa in the Maghrib Medersas were first introduced into the western lands of Islām by the Almohads but nothing of these seems to have survived The oldest medersas date from the xiiith—xivth centuries The Marinids in Maghrib al-Aksā were particularly active in building and encouraging medersas, which, as in Syria and Egypt, were also state institutions This evolution of the medersa was apparently a result of the Sunnī, particularly Mālikī, revival under the Marīnids (1195—1470) Al-Saffārīn, the oldest medersa in Fēs, built by the great warrior and champion of the faith Yakʿūb Yūsuf (685–706 = 1286—1306) of the Marīnids who also built Shella (see above), was the prototype of all the later medersas in the extreme Maghrib An angular gateway, such as is usually only found in private houses leads into a court with a central basin and the cells A domed chamber with a pentagonal miḥrāb adjoins it On the analogy of the tombs, it is called kubba Adjoining it reached by a corridor is a *miḍaʾa*, with a basin in the centre for ablutions and latrines These three main parts of the building, *ṣaḥn*, *kubba* and *miḍaʾa* and usually

a separate minaret, are found continually in a number of variations, usually dependent on the space available, which Marçais, *op cit*, ii 504, divides into three groups In Fēs in addition to those mentioned there are other seven medersas of the xivth century With the medersas of Meknes, Sale, Taza and al-Awbād in Tlemcen we have in all eleven medersas of the Marīnids extant (cf the list in Marçais, *op cit*, ii 504 *sqq*) The most imposing and finest medersa in Fēs is the Bū ʿAnānīya, founded by Abū ʿAnān, 749–759 (1348–1358) With its masdjid of two transepts at the end of the square court and two domed chambers in the central axis of the court it recalls the mosque of Hasan in Cairo with its īwāns The façades on the court display the wealth of wall adornment usual in the Maghrib tiles, stucco moulding and stalactites

Medersas of the xvith–xixth centuries in Morocco The Medersa of Ben Yūsuf in Marrākesh is regarded as the largest in the Maghrib and stands on the site of an originally Almoravid (?) and next Marīnid Medersa Abu 'l-Hasan The plan seems to be old and in its regularity recalls the *al Hīrī* type of Arab palace and the palaces of the Omayyads and ʿAbbāsids built in this style in the desert (plan in Marçais, *op cit*, ii, p 702) The Medersa al-Sharrātīn in Fās, begun in 1670, shows a similar plan but is smaller and simpler

Medersas of the xvith–xixth centuries in Tunis In the xvth century the Hafsids built a number of medersas here Of the Turkish, the most interesting is the Medersa Bashīya of ʿAlī Pasha (1740–1755) a court with cells, masdjid on pillars and *mīdaʾa*, but, like the Egyptian madrasas, it has also the tomb of the founder and a public fountain In Tunis, probably as the result of Egyptian or Oriental influence, it is common to find medersas and mosques associated with the tomb of the founder The three varieties distinguished in Egypt by van Berchem, mosque-mausoleum, madrasa-mausoleum and monastery-mausoleum were also built in Tunis

Saldjūk empire in Rūm, Armenia and Georgia In Saldjūk Anatolia (470–700 = 1077–1300) the three types of pierced mosque, the court-īwān madrasa and domed madrasa are to be distinguished The pierced hall was used as the large public mosque On account of the colder climate the open courtyard with pillars was not found here The pillars were sometimes of wood (Ḳshref Rūm Djāmiʿ), usually however of stone The flat wooden roof rested directly on the piers or on the arches which connected them, which run sometimes parallel, sometimes perpendicular to the kibla wall The Ulū Djāmiʿ in Wān has a vaulted roof resting on pillars, a system later often used in the Ottoman empire Of more importance architecturally are the smaller (mosque-)madrasas, which played a prominent part in the Saldjūḳ empire, but they fell far behind the Persian madrasas in impressiveness and harmonious development The model for the evolution of the īwān-madrasa was the Mesopotamian-Anatolian *ṭarma* house From the latter came the bowers along the sides of the court which were placed in front of the Iwān and the rows of cells The combination of school and mausoleum in which the builders, usually high officers of state, were interred, was the rule The domed madrasa consists of a domed hall with a water basin in place of the open court with living rooms, a lecture-room and a mausoleum adjoining it The external ornamentation of these Saldjūk madrasas and mosques is confined to the gateways The façades of the gates, irrespective of the material used elsewhere in building (brick or moulding), were always covered with slabs and the portals then ornamented with strips of decoration or inscriptions, fantastic looking candelabra of palmettes (Diwrigi), bundles of rods and convolutions in low and high relief and thus one of the highest points in Muslim decorative art was attained The iwāns along the court, interiors of the comparatively low domes (which here usually bridge over the corners on triangular consoles), the friezes on the wall and the mihrābs are frequently adorned with glazed brick and mosaic friezes in a style which in pattern and colour is readily distinguished as an independent pattern from the Persian decoration Here we find geometrical network patterns, which were not usual in Persia and a colour scheme which receives its special character from the much used black, alternating with bright and dark blue, although other colours are also found The following is a list of the most important buildings, so far as they are known I Pierced mosques Mosque of ʿAlā al-Dīn in Konya, completed 616 (1209–1210), Djāmiʿ Kebīr in Siwās, xiith—xiiith cent, citadel mosque 576 (1180–1181) and great mosque 679 (1280–1281) in Diwrigī, Eshref Rūm (Eski) Djāmiʿ, xiiith century, in Beyshehir, Ulū Djāmiʿ in Egerdir, xiiith century (?), Ulū Djāmiʿ in Caesarea (Cappadocia), mosque of Minučehr 464—495 (1072—1100) in Ānī (with octagonal Manāra), Ulū Djāmiʿ in Wān, xiith—xiiith century — 2 Court īwān madrasas Sirdjely Madrasa 641 (1243—1244), Gök Madrasa, Barudjirdīya and Tjifte Mināre, all 670 (1271—1272) in Siwās, Khātūnīya, 783 (1381—1382) in Karāmān, Ibrāhim Bey Madrasa, xiiith—xivth century in Akserai, Ijifte Minareli, xiiith–xivth century in Erzerum — 3 Domed madrasas Karatai Madrasa 649 (1251) in Konya, Indje Minareli 650—684 (1252—1285) in Konya, Enirge Djāmiʿ 657 (1258) in Konya, Tāsh Madrasa 613 (1216) and 659 (1260) in Akshehir, Sultān Wālide xiiith and xvth century in Sayid-i Ghāzī

The mosque of the Turcoman ruler ʿĪsā I (1348—1390) in Ayasoluk (Ephesus) is an exception in Asia Minor, it was finished in 777 (1375—1376) and its architect is said to have been ʿAlī b al-Dimishkī The interior is modelled on the mosque of the Omayyads in Damascus, the walls however are in the Turkish style of that period, as developed in the provinces of the Atābegs The west façade is closely related to the façades of the mosque of Hasan in Cairo, which also drew inspiration from Northern Mesopotamia

The Ottoman empire The Ottoman Turks further developed the types of mosque built by their predecessors, the Saldjūks A second very important factor in the development was their expansion into Europe and the new model, the Byzantine domed churches, especially the Hagia Sophia in Constantinople Here three main types of mosque may again be distinguished the pierced hall, the cruciform domed mosque and the central or great domed mosque The first and third were

commonly used for Friday mosques and mosques for the people, while the second type was reserved for the Sultān's Friday service and religious instruction, and was more used for private mosques The Ottoman pıered hall mosque is distinguished from the Saldjūk, principally by its vaulting, rows of cupolas over the piers The court is limited to a hypaetral water-basin of the same size as the dome above it The Ulū Djāmi' in Brussa for example is an unadorned pillared hall, rectangular in shape with five aisles each with four domes in a row The second group of four pillars in the central aisle was originally uncovered (now it has a glass dome) and contains the basin for ablutions, the rudiments of a court The domes of the five aisles rise one above the other to the central row The most important buildings of this group are Ulū Djāmi' 1370—1420 in Brussa, Uč Sherefeli Djāmi' 889–893 (1484–1487/8) in Adrianople, Ulū (Eski) Djāmi' ca 1403—1420 in Adrianople, Ulū Djāmi' xvth century (?) in Manissa (Magnesia on Sipylos), Djumaya in Filibe (Philippople), old mosque (now museum) 882 (1477–1478) in Sofia, Sindjirli Koyu Djāmi' ca 1500, Ahmad Pasha Djāmi' by Sinan ca 1555 and Piale Pasha Djāmi' 1573, all in Constantinople, Eski Wālide in Scutari ca 1570 The pıered hall as an unmixed form became extinct in the xvith century The Hekīm Oghlu Djāmi' in 1734 in Constantinople is a mixture of the latter with the great dome The origin of the cruciform domed mosque is rightly sought by Wulzinger in the Saldjūk madrasas with courtyards which come in time to be covered over with a dome The centre which lies somewhat below the level of the rest, is occupied by a square roofed with a dome, again the rudiments of the former courtyard, and still often containing a fountain The Kibla chamber is vaulted with a barrel or dome, the praying chambers to right and left are either like Iwāns open towards the centre or have barrel-vaulting The similarity of these mosques to Byzantine churches (in plan, not in structure) is involuntary and lies in the system On the other hand, the open pıered outer court (*khiyāl*) may go back to Byzantine stimulation These outer courts however are very general in the east to give shade The most important buildings of this type are according to Wulzinger's list (*op cit*, p 186) Mosque of Murād I (1359—1389) in Brussa, fin end of xivth century, two storied, Mosque of Bāyazīd I Yildirim (1389—1403), fin after 1402, Yashil-Djāmi' in Brussa, fin 1423, Mosque in the Koimesis church in Isnik, beg of xvth century, Nilufer Khātūn 'Imāret, end of xivth century, Piruz Bey Djāmi' in Milas, fin 797 (1394), Mosque of Murād II (1421–1451), fin 1447 in Brussa, Mosque of Murād II in Adrianople, 'Imāret Djāmi' in Philippopolis 1359, Mosque of Hamza Bey before 1451 in Brussa, Ghāzī Michal Djāmi' ca 1400 in Adrianople The great domed mosque developed out of the more primitive single domed mosque which was very common throughout Asia Minor and Turkey as the simple village mosque, private mosque etc and continued to survive (In Ayasoluk alone 14 small single domed mosques can be counted) This type of building was also used for the numerous turbes The following are more important single domed mosques outside Constantinople Yashi 'l-Djāmi' 794 (1392) and Mahmūd Čelebi Djāmi' about 1400 in Isnik, Masdjid of Khodja Yadygyar beg 1369 in In-Önü, Masdjid of Elias Bey fin 806 (1404) in Balāt (Milet) The development of the great domed mosque from this type took place in part through combination with cruciform domed types, but its aim was however the elimination of all minor domes which at first it had for constructional reasons to put at the sides A Gabriel's table gives a good idea of the different variations He gives the mosques of Constantinople, which number 42 (with Scutari), under six main types (*Les Mosquees de Constantinople*, in *Syria*, vii, 1926, p 352—419)

A Square or oblong halls with one or more domes, sometimes flanked by secondary domed chambers Mahmūd Pasha Djāmi' 868 (1464), Murād Pasha Djāmi' 870 (1466), Dāwūd Pasha Djāmi' 890 (1485), 'Atīk 'Alī Pasha Djami' 902 (1497), Sultān Selim Djāmi' 926 (1520)

B Quadrangular single domed halls (continuing the list just given of the not yet very large single domed mosques from the city area of Constantinople) Firūz Agha Djāmi' 896 (1491), Djezeri Kāsim Pasha Masdjid 921 (1515), Khāsseki Khurem Djāmi' 946 (1539), Mehmed Agha Djāmi 993 (1585), Činili Djāmi' 1050 (1640), Nūri 'Othmānīya Djāmi' 1169 (1755), Ialeli Djāmi' 1177 (1763), Wālide Djāmi' 1287 (1870)

C Square hall with a central dome, usually supported by two half domes Sultān Bāyazīd Djāmi' 906 (1500), Sultān Sulaiman Djāmi' 957–964 (1550—1557), Kilidj 'Ali Pasha Djāmi' 988 (1580)

D Square hall with a central dome supported by four axial half domes Shāhzāde Djāmi' 955 (1548), Sultān Ahmad Djāmi' 1026 (1617), Yeñi Walid Djāmi' 1120 (1708), Sultān Mehmed Djāmi' 867 (1463), reconstructed 1180 (1767), variants oblong hall with a central dome supported by three half domes Iskele Djāmi' in Scutari 954 (1547)

F Oblong hall with six domes of equal size (old type of people's mosque, cf above) Zindjirli Kuyu Djāmi' ixth (xvth) century, Piale Pasha Djāmi' 981 (1573)

F Oblong hall with central dome and aisles

Group *a* Central dome with square plan and pendentives Bali Pasha Djāmi' middle of xth (xvith) century, Mihrimāh Djāmi' middle of xth (xvith) century, Zal Mahmūd Pasha Djāmi' 958 (1551)

Group *b* Central dome on octagonal basis Ibrāhīm Pasha Djāmi' 958 (1551), Rustam Pasha Djāmi' middle of xth (xvith) century, Eski 'Alī Pasha Djāmi' 994 (1586), Yeñi Wālide Djāmi' 1120 (1708) in Scutari, A'zāb Kapu Djāmi' 985 (1577), Aiyūb Sultān Djāmi' founded ixth (xith) century, rebuilt xiith (xviiith) century, Nishāndji Mehmed Pasha Djāmi' 992 (1584)

Group *c* Central dome on hexagonal basis Ahmad Pasha Djāmi' 962 (1555), Sukūl or Mehmed Pasha Djāmi' 979 (1571), 'Atik Wālide Djāmi' 991 (1583) in Scutari, Djerāh Pasha Djāmi' 1002 (1594), Hakīm Oghlu 'Alī Pasha Djāmi' 1147 (1734)

A survey of this list shows that the type given under *A* is also the earliest This was directly linked up with that in use in the older capital Brussa and already being built in Konya in the xiiith century (Kara Tai Madrasa, Yildirim and Yashil Djāmi') which seems to be continued in the Mahmūd and Murād Pasha Djāmi' But already the original Sultān Mehmed Djāmi' (rebuilt in the xviiith century)

which forms a striking anachronism in Gabriel's list under *D* with its date 1463 (only the second modern Mehmedīya of 1767 belongs properly there), had made the first important step towards a single great chamber (cf Agha Oghlu's reconstructed plan in Diez, *Kunst d isl Volker*, 2nd ed, p 105) and this plan was repeated for the ʿAtīk ʿAlī Pasha Djāmiʿ, while the Dāwūd Pasha Djāmiʿ of 1485 had already used another variation (cf the plans in Gabriel, *op cit*) This in brief is the historical development of the Constantinople mosque from the Anatolian Saldjūk-Ottoman type The next important step to the gigantic domed mosques of Constantinople given under *D* was completed by the greatest of Ottoman architects Sinān (1489—1588) step by step in the Shāhzade Djāmiʿ, the Sulaimānīye and the Selīmiye (1567–1574) in Adrianople His guiding idea was, by thrusting the pillars of the domes as far back into the walls as possible, to get a single domed chamber of the largest possible dimensions, no longer interrupted by pillars, Sinān achieved this end in the Selimīye in Adrianople

Persia, Turkestān and Afghānistān, Old mosques or remains of them have not survived in Persia, as in Egypt, the Maghrib and Syria, except perhaps for a few old parts still standing in the great complex of buildings, that forms the Friday Mosque of Isfahān or in the old Friday Mosque of Shīrāz We know however from literary sources that at the beginning of the ʿAbbāsid period large mosques were built everywhere in the towns and some must have existed even earlier Abū Muslim, the celebrated general and ʿAbbāsid propagandist, built mosques in Merw and Nishābūr The latter was built on pillars of wood and similar structures are occasionally mentioned in Persia (e g at Rubāt in the province of Djurdjān, Sīrāf on the Persian Gulf etc) In the ninth century, however, greater use began to be made of columns of brick or stone or marble columns taken from older buildings where they could be obtained, as in Istakhr at Persepolis ʿAmr b al-Laith (265—287 = 878—900), the second ruler of the Saffārid dynasty, renovated the Friday Mosque in Nīshābūr and among other mosques built the Djāmiʿ ʿAtik in Shīrāz, both mosques with columns of brick, of which parts are still standing in Shīrāz The Friday Mosque of Balkh destroyed by the Mongols in 1220, is said to have had splendid pillars, as Ibn Battūta records An old mosque on piers of the fourth (tenth) century has survived in the remote desert town of Naiyin, east of Isfahān, and enables us to make deductions about the architecture of mosques in the early period in Irān The harām consists of eleven barrel-vaulted aisles running perpendicular to the ḳibla wall, of which the central one is broader than the others The court is flanked by four-aisled riwaks which run parallel to the kibla wall, only the wall of the entrance has an arcade The plan is therefore similar to that of the mosques of the Maghrib It is built on columns or piers of different forms The part around the mihrāb is richly ornamented in stucco and has bands of inscriptions around it (cf H Viollet and S Flury, *Un monument* etc, *Syria*, II, 1921) How securely the piered hall, as the type of Friday Mosque, maintained itself in the Sunnī east, is seen from the rebuilding of Timūr's great mosque in Samarḳand after his return from his raid on India in 1410, a mosque with columns, which was directly connected with the madrasa of Bibi Khanum, but has now completely disappeared The mosque had 460 columns of hewn stone, each seven ells in height The vaulting was covered with large beautifully carved and polished slabs of marble There was a minaret at each of the four corners of the mosque The door was of bronze and the walls were covered inside and outside with inscriptions in relief (according to Sharīf al-Dīn ʿAlī Yazdī) How far there was any Indian influence here cannot now be ascertained In any case, the īwān and mihrāb court became established in Persia in the fifth (eleventh) century and as the above described Friday Mosque in Isfahān shows, became blended with the pillared court The great Mosque of Herāt (cf Niedermayer-Diez, *Afghanistan*, p 55 and figg 149—153) shows a similar mihrāb court adapted to the (probably older) piered halls In the completely new buildings of the Timūrid and Safawid period, the piered hall completely disappeared and the harām is extended by a central dome with vaulted halls at the side, when the kibla īwān itself does not fulfil the purpose The mosque of the great sanctuaries in Kūm Mashhad, Kerbelāʾ, the Masdjid-i Shāh in Isfahān and many other urban mosques of Persia are built on this plan Only in Eastern Khurāsān, as in the Turbat i Shaikh Djam, does the old piered mosque survive but with vaulted arches and a large dome in the centre of the harām, all of which betrays Indian influence (cf the plan in Diez, *Churasanische Baudenkmäler*, p 79)

Of the already characterised type of domed mosques may be mentioned the "Blue Mosque" in Tabrīz and the Masdjid-i Shāh in Mashhad, both similar in plan with a large central dome and two flanking minarets The former was built during the reign of the Turkoman ruler Djihān Shāh (1437—1467), the latter by Amīr Malik Shāh, the architect being Ahmad b Shams al-Dīn Muhammad Tabrīzī (cf *JRAS*, 1910, p 1131) The Tabrīz mosque had a chapel leading from the domed area with a second smaller dome Both domes were decorated with tiles, the larger with white tendrils on a green ground, the smaller with white stars on a black ground (Tavernier) Only fragments survive of the Blue Mosque, which show how splendidly it was once decorated, on the other hand, the Masdjid-i Shāh in Mashhad is still standing, although the dome has lost its decoration To this group belong also the mosque on the citadel mound of Eriwān, the mosque of Shaikh Lutf Allāh in Isfahān, the Kāliyān mosque used as a royal private mosque and the public Mosque of 1611 in Bukhārā, both with high entrance īwāns and without a court At largely attended common prayer, the people assemble in front of such mosques This is particularly the case in Turkestān, for the īwān and niches were simply very large mihrābs and nothing further was necessary In Balkh also there is a similar, formerly domed mosque probably intended for the ruler with a towering īwān (xvth century) (cf Niedermayer-Diez, *Afghanistan*, figg 204—205) Besides these large main types, there were and are in these lands of eastern Islām hundreds of smaller mosques in the towns and villages, which sometimes show very interesting structures Thus in Djādjarm in the Isfarāʾin steppe (northern Persia) there is a mosque with a small

open court and domed chamber in front of the mihrāb, and two triple yoked aisles, probably a reminiscence of Nestorian churches (cf Diez, *Churas Bdkm*, p 83) We also find everywhere small masdjids, which are simply little oratories, where the people can promptly worship at the proper time flat-roofed large halls on wooden pillars, which are frequently richly carved in Turkestān, Afghānistān (Kābul) and Central Asia (Kashmīr etc)

The Madrasa in Persia, Turkestān and Afghānistān Shāfi'ī madrasas were built in the 'Abbāsid period in Nīshābūr (where Hāfiz Abrū counted 17), Merw, Bukhārā, Āmol, Tūs and other towns Nasr, brother of Mahmūd of Ghazna, is said to have built the first state madrasa Under the Saldjūks, Nizām al Mulk, vizier of Alp Arslān and of Malik Shāh, built three state madrasas in Nīshābūr, Tūs and Baghdād None of these pre-Timūrid madrasas in Persia has survived, unless the ruined īwān in Khārgird is what is left of a madrasa, which is very probable (cf Diez, *op cit*, p 71 *sq*) The ruins of the Timūrid period however give us a picture of the Persian madrasa of the golden period of Muslim Persian architecture The madrasa in Khārgird near Khāf close to the Afghān frontier, completed in 848 (1444—1445), still shows a pure unmixed madrasa design a quadrangular court with four barrel-vaulted large īwāns, equal in size, at the intersection of the axes, each flanked by two or, with the upper storey, four cells, four vaulted corner-chambers, a narthex-like outer building, consisting of three successive domed chambers, low confined mihrāb façades with low flanking towers at the corners The walls, especially of the court, were adorned with rich tiled mosaic, the walls of the domed chambers with ornamental frescoes (cf Diez, *Churas Baudkm*, p 72—76, pl 31–34) In contrast to the low façade of Khārgird built by a West Persian (Shīrāz) architect are the Turkestān madrasas with their high īwāns, characteristic of the east in general, and gateways especially In Samarkand we have the three Rigistān madrasas Shīr Dār (c 1610), Tillya Kārī (c 1610?) and Ulūgh Beg (c 1434), also the Madrasa Bibi Khanūm (about 1410) built by Timūr, all large courtyards with mihrāb courts and domed chambers, usually four minarets at the surrounding walls In Bukhārā, the Madrasa Mīr Arab of the end of the xvith century is related to the Madrasa Shīr Dār Of the madrasas in Herāt, e g the celebrated Ekklaussiya, nothing has survived, nor do we have anything left of the madrasa of Turbat-i Shaikh Djām in Eastern Khurāsān (cf Diez, *op cit*, p 78) A ruin architectonically interesting is the state madrasa founded in the xviith century by Malik Hamza, the Gumbaz-i Surkh at Kal'a-i Fath in Sidjistān (cf Tate, *Seistan*, fig p 78) The cells are vaulted with the typical Persian house and bazaar domes The last fine Persian madrasa is the Mader-i Shāh Sultān Husain in Isfahān built by the Safawid Shāh of this name (1694—1722) The tiled decoration of the court is among the finest of its kind that has survived in Persia (cf Sarre, *Pers Bdkm*, and Diez, *Kunst d isl Volker*, p 106—107) The dome still shows the original glazed tiles with foliage patterns dark blue and white, changing to black stalks and and yellow leaves on a turquoise blue ground

India In India the history of Muslim architecture so far known does not go beyond the xiiith century The two earliest mosques of which the ruins still survive, the mosques of Adjmir and of Dehli, are large covered courts, built of pillars taken from Jaina temples The domes on eight pillars found in all Jaina temples are here found ranged in rows The richly sculptured pillars were simply cleared of any figures on them before being used Vaulting on square piers continued in use after there were no more pillars to plunder (mosques in Kulbarga and Bidjāpūr) For the rest, Indo-Muslim mosque architecture developed in different ways according to varied traditions and local conditions In towns completely islāmised like Mandu on the Narbada, the capital of the sultānate of Mālwā founded by Dilāwar Shāh at the beginning of the xvth century, or Djawnpur near Benares, which was founded by the sultān of Dehli in 1359, Muslim places of worship show a marked synthesis of Hinduistic tradition with the rigid forms of Muslim symbolism Similarly in the Muslim towns of Gudjārāt, in Ahmadābād, Cambay, Dholka, Mahmūdābād, Muslim sacred architecture developed out of the local Hindu art so that the demands made by Islām on the shape of a mosque, such as an entrance īwān and minaret, were carried through by purely Indian means and only the arch gave the building a Muslim stamp In Bengal again, where the curved bamboo roof prevailed, mosques were built with curved roofs from the bricks in use there, as is shown, notably by the ruins in Gaur on the Ganges Instead of glazed tiles, the walls were generally adorned with richly ornamented slabs of stone South of the Vindhya range also, in the Deccan and in South India local schools of architecture grew up according to the same general principles In Ahmadnagar, Golkonda, Kulbarga, Bidār, Awrangābād and other capitals of Muhammadan principalities, the building of mosques was much cultivated Architectonically, the most important city was Bidjāpūr, the capital of the state of the same name, which became independent in 1490 under Yūsuf 'Ādil Shāh and survived down to the xviith century, when its great period of building culminated in the gigantic dome of the mausoleum of 'Ādil Shāh The mosque of Bidjāpūr (second half of the xvith century) consists of a pierced hall with small domes over each group of four piers and a large dome in the centre In the Moghul period little change was made in this mixture of Hindu and Muslim methods, although the Persian elements are often more marked The huge mosque with courtyard built by Akbar in Fathpur Sīkrī has the usual plan with slight variations The Great Mosque of Agra built by Akbar still shows little Indian pavilions on the tops of the cornices It was only under his successors that a Puritan reaction set in, which finds its fullest expression in the mosques of Dehli and Lahore The process of assimilation thus attained its end

China and Indo-China From the Maghrib to the Pamirs and southeast of them the general character of the country, plains and deserts, linked the peoples of Islām together by certain common features, which also secured the mosque its uniformity of structure in the early centuries In China where Islām was only the religion of a few isolated groups of immigrants the mosque soon adapted itself to the well marked Chinese style of architecture and the mosques of the south and western

provinces, where Islām has established itself in places, are not distinguished externally from the Chinese temples or yamen and internally only by the absence of idols which are replaced by the miḥrāb and minbar Exceptions are the mosques in the seaports, where the colonies of Muslims kept up steady intercourse with the home of Islām and the mosques were at the same time built by native architects This holds for example of the mosques of Ts'iuan-tscheu, province of Fu kien, the Zaitūn of mediaeval writers, which was built in 400 (1009—1010) and restored in 710 (1310—1311) by an architect, a native of Jerusalem, who came from Shīrāz, as the inscription testifies This mosque which is built of hewn stone consists of a hypostyle hall, such as we find in Asia Minor (e g Sīwas) and has bulb shaped niches (cf G Arnaiz and M v Berchem, *Memoires sur les antiquites musulmanes de Ts'iuan Tcheou, T'oung Pao*, vol xii, 1911) The mediaeval chief mosque of Canton also followed the western tradition and even has a minaret, which is never seen on the mosques of the interior The same holds of mosques in Burma and the Indian Archipelago They are usually built of wood and adapted to the native architecture

Bibliography The works quoted under MANĀRA will also serve for Mosque and Madrasa Special works are quoted in the text For the Maghrib the new, excellent *Manuel d'art musulman* of G Marçais was mainly used, which deals only with the Maghrib (2 vols, Paris 1927)

(ERNST DIEZ)

AL **MASDJID AL-AḲṢĀ**, the mosque built on the site of the Temple in Jerusalem The name means "the remotest sanctuary" and is first found in the Kur'ān, Sūra xvii 1 "Praise Him who made his servant journey in the night from the holy place to the remotest sanctuary, which we have surrounded with blessings to show him of our signs"

As was explained in the article ISRĀ' [q v], the older exegesis refers this verse to the journey to heaven [cf MI'RĀDJ] and sees in the name al Masdjid al-Aksā a reference to some heavenly place (cf *Sidrat al Muntahā*, Sūra liii 14)

This explanation had however in time to give way to another, according to which the expression is a name of Jerusalem This explanation is connected with Muhammad's "journey in the night" (*isrā'*) The combination of the *isrā'* and *mi'rādj* thus gives the story of the Prophet's journey by night to the Masdjid al-Aksā (Jerusalem) and his journey following it from Jerusalem to the heavens

The question arises how Jerusalem came to have this name among the exegists of the Kur'an According to Schrieke [cf ISRĀ'] it is a result of the Omaiyad tendency to glorify Jerusalem at the expense of the holy land of Islām Horovitz has challenged this explanation (in *Islām*, cf the *Bibl*) In any case, Jerusalem was from very early times regarded in Islām as a sacred place, the original Kibla, which, although abandoned in favour of Mecca, still retained its sanctity as may be seen, for example, from the fact that 'Omar had a Masdjid built on the site of the Temple [see AL-KUDS, ii, p 1097]

The name al-Masdjid al-Aksā is now particularly attached to the mosque in the south of the Temple area, which according to some was originally a church built by Justinian [cf AL-KUDS, ii, p 1096b] According to late Arab writers the mosque was built by the caliph 'Abd al-Malik (785—805), a statement which might simply mean that Justinian's church was rebuilt On this compare AL-KUDS, ii, p 1098 *sqq* where the further history of the mosque is given

For a picture of the site and the mosque see Pl v to the article AL-KUDS, plan and description of the interior in *Travels of Ali Bey*, London 1816, ii 214 *sqq*, Baedeker, *Palastina und Syrien*[7], p 54 *sqq*

AL **MASDJID AL-ḤARĀM**, the name of the Mosque of Mecca The name is already found in the pre-Muhammadan period (Horovitz, *Koranische Studien*, p 140 *sq*) in Kais b al-Khatīm, ed Kowalski, v 14 "By Allāh, the Lord of the Holy Masdjid and of that which is covered with Yemen stuffs, which are embroidered with hempen thread" (?) It would be very improbable if a Medina poet by these two references meant anything other than the Meccan sanctuary The expression is also fairly frequent in the Kur'ān after the second Meccan period (Horovitz, *op cit*) and in various connections it is a grave sin on the part of the polytheists that they prohibit access to the Masdjid Harām to the "people" (Sūra ii 214, cf v 3, viii 34, xxii 25, xlviii 25), the Masdjid Harām is the pole of the new kibla (Sūra ii 139, 144), contracts are sealed at it (Sūra ix 7)

In these passages *masdjid harām* does not as in later times mean a building but simply Mecca as a holy place, just as in Sūra xvii 1 Masdjid Aksā [q v] "the remotest sanctuary" does not mean a particular building

According to tradition, a salāt performed in the Masdjid al-Harām is particularly meritorious (Bukhārī, *al-Ṣalāt fī Masdjid Makka*, bāb 1) This masdjid is the oldest, being forty years older than that of Jerusalem (Bukhārī, *Anbiyā'*, bāb 10, 40)

This Meccan sanctuary included the Ka'ba [q v], the Zemzem [q v] and the Maḳām Ibrāhīm [see KA'BA], all three on a small open space In the year 8, Muhammad made this place a mosque for worship Soon however it became too small and under 'Umar and 'Uthmān, adjoining houses were taken down and a wall built Under 'Abd Allāh Ibn al-Zubair, the Umaiyad and 'Abbāsid caliphs, successive enlargements and embellishments were made Ibn al Zubair put a simple roof above the wall Al-Mahdī had colonnades built around, which were covered by a roof of teak The number of minarets in time rose to seven Little columns were put up around the Ka'ba for lighting purposes The mosque was also given a feature which we only find paralleled in a few isolated instances this was the putting up of small wooden buildings, or rather shelters for use during the salāt by the imām, one for each of the four orthodox rites The fact that one of these maḳāms might be more or less elaborate than another occasionally gave

rise to jealousies between the Hanafis and the Shāfi'īs. Ultimately the ground under the colonnades, which was covered with gravel was paved with marble slabs, in the matāf around the Ka'ba as well as on the different paths approaching the matāf

The mosque was given its final form in the years 1572—1577, in the reign of the Sultān Selīm II, who, in addition to making a number of minor improvements in the building, had the flat roof replaced by a number of small white-washed cone-shaped domes

A person entering the mosque from the Mas'ā or the eastern quarters of the town, has to descend a few steps The site of the mosque, as far as possible, was always left unaltered, while the level of the ground around — as usual in oriental towns and especially in Mecca on account of the Sēl — gradually rose automatically in course of centuries (cf Snouck Hurgronje, *Mekka*, i 18—20)

The dimensions of the Harām (interior) are given as follows (al-Batanūnī, *Rihla*, p 96) N W side 545, S E side 553 feet, N E side 360, S W side 364 feet, the corners are not right angles, so that the whole roughly represents a parallelogram

Entering the matāf from the eastern side, one enters first the Bāb Banī Shēba, which marks an old boundary of the masdjid Entering through the door, the Makām Ibrāhīm is on the right, which is also the Makām al-Shāfi'ī, and to the right of it is the minbar On the left is the Zemzem building As late as the beginning of the xix^th^ century, there stood in front of the latter, in the direction of the northeast of the mosque, two domed buildings (*al-Kubbatain*) which were used as store-houses (*Chron d Stadt Mekka*, ii 337 *sq*) These Kubbas were cleared away (cf already Burckhardt, i 265), they are not given in recent plans

Around the Ka'ba are the makāms for the imāms of the madhhabs, between the Ka'ba and the south-east of the mosque, the makām (or musallā) al Hanbalī, to the south west the makām al-Mālikī, to the north-west the makām al-Hanafī The latter has two stories, the upper one was used by the mu'adhdhin and the muballigh, the lower by the imām and his assistants Since Wahhābī rule has been established, the Hanbalī imām has been given the place of honour The makām al-Hanafi stands on the site of the old Meccan council-chamber (*dār al-nadwā*) which in the course of centuries was several times rebuilt and used for different purposes The matāf is marked by a row of thin brass columns connected by a wire The lamps for lighting are fixed to this wire and in the colonnades

The mosque has for centuries been the centre of the intellectual life of the metropolis of Islām This fact has resulted in the building of madrasas and riwāks for students in or near the mosque, for example the madrasa of Kā'it Bey on the left as one enters through the Bāb al-Salām Many of these wakfs have however in course of time become devoted to other purposes (Burckhardt, i 282, Snouck Hurgronje, *Mekka*, i 17) For the staff of the mosque cf SHĒBA (BANŪ), Burckhardt, i 287—291

MAṢHAF. [See MUSHAF]

MASHAFĪ, GHULĀM HAMADĀNĪ B WALĪ MUHAMMAD, a distinguished Urdū poet, was born in Lucknow but went to Dihlī in 1190 (1776), where he applied himself to the cultivation of Urdū poetry His house was resorted to by the eminent poets of the capital In 1201 (1786) he returned to Lucknow and spent the rest of his life there under the patronage of Prince Sulaimān Shikōh, son of Shāh 'Ālam He died in 1240 (1824) He is the author of several *Diwāns* in Persian and Hindustānī, and of biographies of Urdū poets, called *Tadhkira-i Hindī* He also wrote another *Tadhkira* of Persian poets who flourished in India from the time of Muhammad Shāh (1131—1161 = 1719—1748) to the reign of Shāh 'Ālam (1173—1221 = 1759—1806) entitled *'Ikd Thuraiyā*, and a historical work in verse which he entitled *Shāh Nāma*

(M HIDAYET HOSAIN)

MĀSHĀ'ALLĀH, the son of Ath(a)rī or Sāriya, a celebrated astrologer, who along with Nawbakht fixed the day and hour for the foundation of Baghdād by order of al-Mansūr According to the *Fihrist*, he was a Jew whose original name was Mishā (a corruption of Manasshī, i e Manasseh), whether he later adopted Islām and for this reason took the name Māshā'allāh is not recorded The date of his birth is unknown, but it can hardly be later than 112 (730) He is said to have died in 200 (815)

In numerous works Māshā'allāh covered the whole field of astrology, and also the making and uses of astronomical instruments There has only survived in Arabic fragments of a treatise on the prices of various wares which was translated into Latin under the title *Mesahallae Libellus de Mercibus* Many of his astrological works were translated into Latin by Johannes Hispalensis and others and later printed Hebrew versions are also known It may be safely assumed that Arabic originals will still be found in eastern libraries The critical study of the Latin translations existing in manuscript and printed form is most desirable in view of the early date of the author

AL-**MASĪḤ**, the Messiah, in Arabic (where the root *m-s-ḥ* has the meanings of "to measure" and "stroke") it is a loanword from the Aramaic where משיחא was used as a name of the Redeemer

Horovitz (*Koranische Untersuchungen*, p 129) considers the possibility that it was taken over from the Ethiopic (*masīh*) Muhammad of course got the word from the Christian Arabs In Arab writers we find the view mentioned that the word is a loanword from Hebrew or Syriac Ṭabarī (*Tafsīr* on Sūra III 40 vol III, p 169) gives only purely Arabic etymologies, either with the meaning "purified" (from sins) or "filled with blessing" Horovitz, *op cit*, calls attention to the occurrence of the word in inscriptions, proper names and in the old poetry

In the Kur'ān the word is first found in the Meccan sūras, *a* alone Sūra IV 170, IX 30, *b* with Ibn Maryam Sūra V 19, 76, 79, IX 31, *c* with ʿĪsā b Maryam Sūra III 40, IV 156 None of these passages make it clear what Muhammad understood by the word From Sūra III 40 "O Maryam, see, Allāh promises thee a word from Him, whose name is al-Masīh ʿĪsā b Maryam" one might suppose that al-Masīh was here to be taken as a proper name Against this view however is the fact that the article is not found with non-Arabic proper names in the Kur'ān

In canonical Ḥadīth, al Masīh is found in three main connections *a* in Muhammad's dream, in which he relates how he saw at the Kaʿba a very handsome brown-complexioned man with beautiful locks, dripping with water, who walked supported by two men, to his question who this was the reply was given al-Masīh b Maryam (Bukhārī, *Libās*, bāb 68, *Taʿbīr*, bāb 11, Muslim, *Īmān*, trad 302), *b* in the descriptions of the return of ʿĪsā [q v], *c* at the Last Judgment the Christians will be told "What have you worshipped?" They will reply "We have worshipped al Masīh, the Son of God" For this they shall wallow in Hell (Bukhārī, *Tafsīr*, Sūra IV, bāb 8, *Tawhīd*, bāb 24, Muslim, *Īmān*, trad 302)

In Ḥadīth also we frequently find references to al Masīh al-Kadhdhāb and al-Masīh al-Dadjdjāl, see the article AL DADJDJĀL

Bibliography given in the article

(A J WENSINCK)

MASKAT, a seaport on the Gulf of ʿOmān, on the east coast of Arabia in 23° 37′ 26″ N Lat and 56° 15 26″ East Long Maskat is the only harbour between ʿAden and the Persian Gulf, which ships of any size can enter and next to ʿAden and Djidda, the best harbour in the Peninsula The port is of considerable importance from its position commanding the entrance to the Persian Gulf It lies at the end of a horse-shoe-shaped bay 900 fathoms long and 400 broad which is enclosed and sheltered from the winds by multi coloured rocks of volcanic origin, devoid of any vegetation Behind the white town rises a series of extensive ranges of mountains on the highest of which, the Djabal Akhdar, 9,000 feet high, snow occasionally lies in winter time On the slopes we even find the Muscatel vine growing which is said to have been introduced by the Portuguese The harbour is very busy, in the middle on the shore stands the sultān's palace, at the south end the offices of the British political agent On either side the town is flanked by an old Portuguese fort, Marānī and Djallālī The chapel in one of them bears the date 1588 The bazaar consists of low buildings and is of little importance The mosques are remarkable for the absence of the usual tall minarets

The climatic conditions are by no means favourable With al-Hodeida and Djidda, Maskat is one of the hottest towns in the world In 1912 the maximum temperature was 45½° C, the minimum 17½° C, the rainfall varies between 75 and 150 mm The high temperatures are caused mainly by the hot winds which at certain periods in the summer months usually blow from the Arabian desert and from the rocky hills for several hours in the night From November to the middle of March the weather is however quite pleasant, but one must beware of malaria and fever

Maskat plays a considerable part as centre of trade with the nearer east There are regular communications with India, Persia, East Africa and Mauritius The ships of quite a number of steamship companies call regularly at Maskat, e g the British India Steam Navigation Company on the route from London to India, the Bucknall Steamship Company and the Strick Line to Basra, the West Hartlepool Steam Navigation Company on the ʿAden-Basra route, the Hamburg America Line monthly to the harbours of the Persian Gulf, the Arab Steamers Ltd on the Bombay-Basra route, and the Compagnie Russe de Navigation a Vapeur et de Commerce In 1912—1913 the total tonnage entering the port was 98 steamers with 127,885 tons and 63 sailing vessels with 5,021 tons and leaving it 86 steamers of 90,803 tons and 30 sailing ships of 2,379 tons The ships in question were mainly British (86 73 %) Maskat has a regular postal service with the rest of the world instituted by the British, as well as a cable connection which the Indian Government has laid to Djashk The population, which changes a good deal, is about 10,000 souls, primarily Arabs but there are also Persians, Hindus, Indian Muslims, Beludjis and a few Europeans settled here, mainly traders

Maskat was at one time a flourishing centre of the silk and cotton trade but in recent years this has almost been destroyed by Indian and American competition The gold and silver work done by Indians here is famous, notably richly ornamented swords and daggers The imports of Maskat in 1912—1913 were valued at £ 463,551 and the exports at £ 301,477 The former were mainly arms and munitions, cereals, dyes, precious metals, pearls, foodstuffs, textiles, tobacco, building materials, enamel, glass and porcelain, ironmongery, perfumes and soaps, the latter camels, horses and asses, weapons, cereals, dried and salt fish, dates, lemons and pomegranates, *wars* and dragon's blood, pearls, melted butter (*ghī*), mussels, mother-of-pearl and tortoise-shell, textiles, hides and leather The chief importer was India, then Belgium, England and ʿAden, the exports went mainly to India, the Arabian coast, England, Persia, America and Zanzibar

According to local tradition Maskat was founded at an early period by Himyar colonists A Sprenger has identified Maskat with the κρυπτὸς λιμήν of Ptolemy, VI 7, 12 As the harbour has only a narrow entrance on the north and is enclosed on

the east by rocky heights, it is, as a matter of fact, easy for sailors to overlook it, and the name "the hidden" would be quite appropriate Al-Muḳaddasī (*B G A*, iii 93 *sq*) who mentions the port of al-Maskat, says that it is the first place which the ships from Yemen reach and is a fine town, rich in fruits Ibn al-Fakīh al Hamadhānī (*B G A*, v 11) says of Maskat that it is the very end of ʿOmān, about 200 parasangs from Sīrāf, the starting point for ships sailing to India and to Kūlūmalī, a month's journey beyond it Ships take in water here and Chinese ships pay 1,000 dirhams for it, the other 10—20 dinārs Idrīsī briefly mentions Maskat as a densely populated town, Ibn al-Mudjāwir is fuller (in A Sprenger's *Post und Reiserouten*, p 145 *sq*) and tells us that Maskat was originally called Maskat — so also Niebuhr, p 296 — and that it is a considerable centre of trade with Africa and the east coast of the Persian Gulf, whence the wares are forwarded to Sidjistān, Khurāsān, Transoxania, Ghawr and Zābulistān In the beginning of the xvith century A D, Maskat, whose history had hitherto been that of ʿOmān, attracted the attention of European powers In 1506, Albuquerque appeared before the town and demanded that it should submit to the Portuguese At the first the people seemed to be peacefully inclined and willing to accept his terms, but this attitude changed and the Portuguese admiral decided to attack and destroy the town Forty large and small ships and many fishing-vessels and the Imām's arsenal were destroyed, the mosque pulled down and the town burned The Portuguese fortified the place and in 1527 built two forts, Marīnī and Djallālī, and factories, the present buildings of these names were however only built after the union of Portugal with Spain in 1580 by direct instructions from Madrid The Portuguese had not an easy position here They were frequently attacked by the surrounding tribes and in addition by the Turks, in 1526 a rising in Maskat was put down by Lopo Vaz, the governor of India In 1550 a Turkish fleet under Pīr Bey appeared before Masḳat, attacked the town and took it by storm after eighteen days' bombardment The Portuguese commander and 60 men were carried off to be Turkish galley-slaves, but in 1553 the Portuguese succeeded in destroying the Turkish fleet and re establishing their sway in the Persian Gulf Maskat was now fortified as a naval base But after 1631 Portuguese prestige began to decline rapidly At the end of 1649, Maskat was attacked by the Imām's army and had to surrender on January 23, 1650, as relief came too late The town now lost much of its former importance, although under Dutch influence its commerce was still considerable Towards the end of the xviith century it attained an unenviable notoriety as a nest of pirates, in 1737 it was taken by the Persians, who were driven out by Ahmad b Saʿūd, the founder of the dynasty still ruling in Maskat, who was elected imām in 1741 Since 1793 Maskat has been the capital of the sultānate of ʿOmān After 1797 the French began to be influential in Maskat, the town played a prominent part as a base for attacking India in Napoleon's grandly conceived plan for destroying England's power, we need therefore not be surprised that England also soon paid increased attention to the town In January 1800, Capt John Malcolm was sent to Maskat by the Indian government and concluded a treaty with the Sultān by which an earlier agreement with the East India Company was ratified and an agent of the company established at Masḳat In 1807 and 1808 the French made treaties with the Sultān and also sent a consular agent to Maskat The town flourished under this sultān, Saʿīd b Sultān, and became a centre for commerce with the Persian Gulf Maskat repelled an attack of the Wahhābīs with the assistance of the English in 1809, but in 1833 it became tributary to them The change from sailing to steamships brought about a decline in the importance of the town In 1863 Palgrave describes Masḳat as an important harbour with 40,000 inhabitants, but in 1895, Bent puts the population at only 20,000 and at present it can hardly be more than 10,000 In 1833 however, the sultān was able to negotiate a commercial treaty with the United States, followed by a similar one with England in 1839, in 1844 France and Maskat drew up a commercial treaty by which France obtained the privilege of the most favoured nation and French subjects were given full freedom to trade in Maskat The independence of Maskat, although expressly stated in the Anglo-French declaration of 1862, was however little more than nominal, for England, who had several times come forward to protect the sultānate, had through her political agent considerable control over the sultān In connection with the slave trade, which England was endeavouring to suppress, the sultān of Maskat had bound himself in various ways to England and in 1854 even ceded to England the Khūryān-Mūryān Islands of which France was endeavouring to obtain possession When Sultān Saiyid Saʿīd died in 1856, his kingdom was divided between his two sons Thuwainī and Madjid of whom the former received Maskat, while the latter was given Zanzibar which had belonged to Maskat since the end of the xviiith century This division was negotiated by England through Lord Canning, the Viceroy of India In 1861 Zanzibar was declared independent, but it had still to pay an annual tribute to Maskat, which England in 1873 undertook to pay in compensation for various concessions of the sultān of Masḳat in connection with the suppression of the slave trade so long as the sultān fulfilled his pledges and showed friendship for England This readiness to meet the English was also seen in a telegraph agreement of 1864 In 1891 Sultān Faisal concluded a treaty of friendship, commerce and navigation with England in which the Sultān bound himself and his successors not to cede, sell or let land except to England The French opposed this and in 1894 succeeded in obtaining a coaling station five miles S E of Maskat England raised objections and quoted the treaty with the sultān although France in the treaty of November 17, 1844, had secured the right to acquire land Diplomatic negotiations finally brought about a settlement, by which France gave up the coaling station in the Gulf of ʿOmān, and in compensation was lent half the coal depots of Mukallā As France in 1916 again lent this coaling station to the English, the dispute was finally settled in favour of the English A second *contretemps* was similarly settled, although for a time it caused grave diplomatic negotiations The French consul of Masḳat and Zanzibar had given French papers and flags to a number of ships belonging to ʿOmān The captains of these who often traded in slaves and smuggled arms, resisted the jurisdiction of their sovereign, the

sulṭān of Masḳat, and when the latter took steps to deal with them they were protected by France The affair finally became so serious that in 1903 there appeared to be danger of a conflict between England and France, but in 1905 the question was submitted to the Hague Tribunal which decided that only those sailing-vessels which had received the French flag before January 2, 1892, had the privilege renewed and licences later issued were cancelled as invalid, in so far as they were not given to French protéges of 1863 As, in 1917, only 12 ʿOmān sailing-vessels still carried the French flag, this privilege of France must soon die out It was only natural that the active smuggling of weapons from Maskat not only to Persia and Afghānistān but also into the interior of Arabia, should cause anxiety to England The flourishing trade in arms was put down in 1912 by the establishment of a depot for the sale of arms under government control, which alone could sell arms It is true that the smugglers have now migrated to Birk, Shabʿam and Ruʾais, but the great decline in the import of arms into Maskat is best shown by the statistics of the year 1912—1913 when in the first half year 147,391 lbs of arms were still imported while in the last five months the total was only 36,667 In 1913, the new ruler Sultān Taimūr, who succeeded his father on October 4 and was recognised by England and France on November 15, 1913, met with serious opposition from the tribes in the south of ʿOmān, who declared themselves independent under an imām whom they chose themselves It is only England's power that keeps these rebels from Maskat and thus secures the existence of the dynasty, whose rule has long been quite nominal

(A GROHMANN)

MASLAMA IBN ʿABD AL-MALIK, son of the second Marwānid caliph "His chivalrous figure seems to have made a vivid impression on the popular imagination, one might think he came out of a popular romance" (C H Becker) Few of the Marwānid princes were so active and gifted in so many diverse directions He lived long enough to give proof that he was not unworthy of the high hopes placed upon him His gifts earned him the confidence of all the Marwānid rulers, to whom he was a Nestor whose counsels were always heeded, from ʿAbd al Malik to Hishām, not even excepting ʿOmar II, who was not at all favourably inclined to the sons of ʿAbd al-Malik, nor the hysterical Yazīd II nor the criminal and fanatic Walīd II, who wept at his loss He had been carefully educated by his father ʿAbd al-Malik His long career as a military leader revealed his personal courage and his knowledge of the art of war A man of good counsel and excellent judgment, versed in literature, a patron of poets and an accurate critic of their merits, adored by his men, Maslama made use of his exceptional position to be a protector of all the oppressed, to maintain the unity and cohesion at the heart of his dynasty, which was threatened by the absurd law of seniority which regulated the succession to the throne

The chance of birth — his mother was a slave-girl — prevented him from rising higher Walīd I gave his brother Maslama the task of conducting the military operations against the Greeks Henceforth — with a few short intervals — he was to hold the office of commander in-chief of the Arab armies, in which he frequently had under him his nephew, the able and valiant ʿAbbās [q v], son of the caliph Walid In the year 91 (709–710) he succeeded his uncle Muhammad as governor of Armenia, a province not completely subdued, which required a military man to rule it He also governed the *djund* of Kinnasrīn [q v], another frontier province continually exposed to the attacks of the enemy He never spent much time in civilian appointments, for which his soldierly spirit seemed less adapted and in which the independent character of the Marwānid prince usually came into conflict with the central power

His first campaign was marked by the capture of the important fortress of Tyana (Tuwāna) the rigorous winter of the high Anatolian plateaus did not interrupt the operations of this long siege, in which the assailants suffered great hardships [for the chronology see AL-ʿABBĀS IBN AL-WALĪD] The dismantled town remained deserted, a serious loss for the Byzantines Their enemies now held both slopes of the Cilician Taurus, the gateway to Anatolia Under Maslama's directions, his nephew ʿAbbās in the next two or three years completed the conquest of mountainous Isauria In 93 (712) the fortress of Amasia was taken and Maslama entered Galatia through Armenia This opened up the road to Constantinople In 98 he laid siege to the capital The attack dragged on and caused unspeakable sufferings in the Arab army Contemporary writers blame for their failure the lack of foresight and insufficient diplomatic skill in the commander-in chief ʿOmar II recalled the besiegers to Syria and sent Maslama to the ʿIrāk against the Khāridjīs Yazīd II sent his brother to put down the rebellion of Yazīd b Muhallab [q v] in the ʿIrāk After the death of this rebel (102 = 720), Maslama became governor of the two ʿIrāḳs Before this, he had very opportunely persuaded the caliph not to modify the order of succession to the disadvantage of Hishām Yazīd was not long in finding fault with his brother, especially as he neglected to send him the taxes of his immense eastern vice-royalty He recalled him to Syria, where Maslama endeavoured to combat the influence of favourites on this weak sovereign Returning to the army in 108 he conquered Caesarea in Cappadocia The following years were marked by Maslama's great campaign in Armenia and the land of the Khazars After partial successes in which the country was laid waste, the stubborn resistance of the natives and the Turkish tribes forced him to retire The retreat was a disastrous one with great difficulty Maslama succeeded in bringing back the remnants of his army to Arab territory by sacrificing all his baggage and equipment (115 A H) His intervention to support the claims of Walīd b Yazīd [q v], heir presumptive to Hishām, compromised him at court He died before this caliph and seems to have taken with him to his grave the fortune of the Marwānids, for they rapidly declined after his time

(H LAMMENS)

MAṢMŪDA (the broken plural *Masāmida* is also found), one of the principal Berber ethnic groups forming a branch of the Barānis

If we set aside the Masmūda elements mentioned by al Bakrī in the neighbourhood of Bone, the post Islāmic Masmūda seem to have lived exclusively in the western extremity of the Maghrib, and as far back as one goes in the history of the interior of Morocco, we find them forming with the Sanhādja [q v], another group of Barānis Berbers, the main stock of the Berber population of this country Indeed from the first Arab conquest in the seventh century to the importation of the Hilālis by the Almohad Sultān Yaʿkūb al-Mansūr in 1190, it was the Masmūda who inhabited the great region of plains, plateaus and mountains, which stretches from the Mediterranean to the Anti Atlas to the west of a line from N E to S W passing through Miknāsa (Meknās) and Dimnāt, the only parts of this territory which were not occupied by them were three small Sanhādja enclaves the Sanhādja of Tangier, of the valley of the Wargha and of Azammūr To the north and to the west, the land of the Masmūda was bounded by the Mediterranean and the Atlantic To the east and south it was bounded by the lands of the Sanhādja To the north were the Sanhādja of the region of Tāzā and those of

Wargha, in the centre, the Zanāga or Sanhādja of the Central Atlas, to which should be added the Zanāta of Fāzāz, to the south, the Haskūra, the Lamṭa and the Gazūla

It was from the presence of this Masmūda bloc, extending continuously from Sūs to the Mediterranean, that eastern Morocco generally must have received the name of Sūs, a name found for example in Yākūt (cf *Muʿdjam*, s v *Sūs*) who distinguishes a Hither Sūs (capital Tangier) and a Farther Sūs (capital Tarkala [1]) separated from the other by two months' journey It is also to this racial unity that are due the legends according to which all the N W corner of Morocco was once inhabited by the people of Sūs (*ahl Sūs*) Before the coming of the Hilālī Arabs, the Masmūda peoples were divided into three groups

1 In the north, from the Mediterranean to the Sabū and Wargha, the Ghumāra [q v]

2 In the centre from the Sabū to the Wādi Umm Rabiʿ, the Baraghwāta [s BERGHAWATA]

3 In the south, from the Wādī Umm Rabiʿ to the Anti-Atlas, the Masmūda in the strict sense of the word

Like the majority of the Barānis, who in this respect are a contrast to the Butr, who are inclined to be nomads, the Masmūda were all settled, for if, in one passage, Ibn Khaldūn mentions two nomad tribes, the Lakhs and the Zaggan as forming part of the Masmūda confederation of the Hāha, he also points out that they were tribes of the Lamta, i e of the nomadic Sanhādja, who finally became incorporated in the Dhawū Hassān, Maʿkilī Arab nomads of Sūs Ibn Khaldūn further makes special mention of the fortresses and fortified villages (*maʿākil wa husūn*) of the Masmūda who lived in the mountains of Daran or the Great Atlas Other Arab historians and geographers mention the many little towns (*karya*) in the plains occupied by the Dukkāla or the Baraghwāta, a pastoral and agricultural people, but these were gradually ruined and destroyed in the course of the fighting which went on without interruption in their country from the establishment of the Zanāta principalities of Shālla, Tādlā and Aghmāt the Almoravid and Almohad conquests, repeated campaigns against the heretical Baraghwāta, the Hilālī occupation, the struggle between the Almohads and the Marīnids, the rivalry between the Marīnid kingdom of Fās and that of Marrākush and lastly the wars with the Portuguese Exterminated as heretics, dispossessed of their lands and driven from them by the Arab or Zanāta nomads brought into their territory, transported to a distance (region of Fās) by the Wattāsid sultāns, for whose taste they showed too little hostility to the Portuguese, the central Masmūda, the original inhabitants of the Azghar, of Tāmasnā and of the land of the Dukkāla finally disappeared, their place was taken by nomads, Hilālī Arabs (in the north, in Habt and Azghār, the Riyāh, in the south, the Djusham, Sufyān, Khulṭ, Banū Djābir) and the Berbers (Zanāta Hawwāra), in the xvɪth century the coming to power of the Saʿdian dynasty brought about the immigration of Maʿḳil Arab tribes to the same region ʿAbda, Ahmar, Rahāmina, Barābish, Wadāya, Awlād Dulaim, Zuʿair, etc

From the xvɪth century onwards, as a result of the occupation of their central plains by the Arabs, Hilālī then Maʿḳilī, the Masmūda only survived in the mountainous regions which formed the northern and southern extremes of their old domains

The Masmūda of the north (or *Masmūdat al Sāhil* "M of the shore" of *al-Bayān*) were chiefly represented by the Ghumāra group [q v] But, alongside of them, we find two small groups having the same racial origin

a The Masmūda of the Straits, settled between the district of Ceuta, which belonged to the Ghumāra and that of Tangier, a Sanhādja country It was they who gave their name to the fortified port of Kasr Masmūda, also called Kasr al-Madjāz, the modern al-Kasr al-Saghīr Their presence here is attested in the tenth century, for it was while fighting here against them that Hā-Mīm, the prophet of the Ghumāta, was slain, al-Bakrī (xɪth century) knows them in the same area corresponding to that of the modern Andjra

b Al-Bakrī mentions another group of Masmūda (tribe of the Assāda) settled in the land lying between al-Kasr al-Kabir and Wāzzān, there is still a small Masmūda tribe between these two towns

The Masmūda of the south, who inhabited the lands between the Wādi Umm Rabiʿ and the Anti-Atlas, were divided into two groups those of the plain and those of the mountain

a The Southern Masmūda of the plain lived to the north of the Great Atlas The chief tribes were the Dukkāla, the Banū Māgir (around Safi), the Hazmīra, the Ragrāga and the Hāha (to the south of the lower course of the Tānsīft) The chief town in this region was Safi (Ar *Āsfī*), for the town of Azemmūr [q v] and the *ribāt* of Tit [q v] were in the enclave of Sanhādja, beside the port of Safi, we must also mention that of Kūz (the *Agoz* of the Portuguese) at the mouth of the Tānsīft, which gave Aghmāt access to the sea and had a *ribāt*, and that of Amagdūl (the *Mogador* of the Portuguese) which served the district of Sūs Besides these three centres, there were, as in Tāmasnā, a large number of fortified little towns (*karya*) many of which survived down to the xvɪth century, the Portuguese chroniclers, Leo Africanus and Marmol have preserved for us many names of these places which have now disappeared their very memory being lost, the local hagiographic collections and notably the *Kitāb al Tashawwuf* of al Tādilī (xɪɪɪth century) have preserved a good deal of valuable information on this subject At the present day all the country to the north of the Atlas is arabicised and if the old Berber element has not completely disappeared, it is at least overwhelmed by Arabs of whom the majority seem to be of Maʿkilī origin The Hāha alone, between Mogador and Agadir, have remained almost intact and have retained the use of the Berber language

b The Southern Masmūda of the mountains occupied the Great Atlas (*Djabal Daran*), the massif of Sirwā (and Sirwān) and the Anti-Atlas or mountains of the Nagisa (Berb In Gist)

In the Great Atlas, the Masmūda extended to the east as far as the upper course of the Tānsīft (a pass called Tīzi n Telwet) From east to west, the following were the chief groups the Galāwa, the Hailāna (or Ailāna), the Warika and the Hazradja, near Aghmāt, the Assādan, including the Masfiwa, the Māghūs and the Dughāgha or Banū Daghūgh, the Hintāta, including the Ghaighāya, the people of Tīn-Mallal, on the upper course of the river of Naffīs, the Sauda or Zauda, in the lower valley of the Asif al-Māl, the Gadmīwa and

lastly in the west, the Ganfīsa, the chief tribe of which was the Saksāwa or Saksīwa

The massif of Sīrwā and the high valley of the Wādī Sūs were inhabited by the Banū Wāwazgīt and the Saktāna The N E part of the Anti Atlas was occupied by the Hargha

Farther to the south, the Sūs, properly so-called, was inhabited by heterogeneous elements of Masmūda origin (al-Idrīsī, *akhlāṭ min al-Barbar al-Maṣāmida*) Describing the road leading from Tārūdant to Aghmāt, al-Idrīsī mentions between Tārūdant and the land of the Hargha, four tribes the names of which, corrupted by the copyists, are unfortunately hardly identifiable

Besides these highlanders, who were strictly Masmūda, we must mention the Haskūra (or Hasākira) These were highlanders of Sanhādja origin, brethren of the Lamta and Gazūla, who led a nomadic existence to the south of the Great Atlas and the Anti-Atlas The Haskūra were settled in the high valley of Tānsīft and the Wādī al-ʿAbid, on the two slopes of the mountain range which links the Great Atlas, the home of the Masmūda, with the Central Atlas, the home of the Zanāga (= Sanhādja) of Tādlā, their chief tribes were the Zamrāwa, the Mughrāna, the Garnāna, the Ghudjdāma, the Fatwāka, the Mastāwa, the Hultāna, and the Hantīfa, who, according as they lived on one slope or the other, belonged to the Haskūrat al-Kibla (H of the south) or to the Haskūrat al Dill (H of the north) Ibn Khaldūn, who calls attention to the Sanhādja origin of the Haskūra, adds that, as a result of their taking up the Almohad cause, it became customary to associate them with the Masmūda tribes, but that they never enjoyed the same privileges as these latter

History In 682, ʿUkba b Nāfiʿ marched against the Masmūda of the Atlas with whom he fought several battles On one occasion he was surrounded in the mountains and owed his safety solely to the help given him by a body of Zanāta In the same year he attacked and took the town of Naffīs which was occupied by "Rūm" and Berbers professing Christianity Thence he went to Iglī, a town of Sūs which he also took

Legend adds that he even thrust his way to the Atlantic where he rode his horse into the water, calling God to witness that there were no more lands for him to conquer This first submission of the Masmūda does not however seem to have lasted after the departure of ʿUkba In 707, Mūsā b Nusair had to reconquer Morocco, he in person took Darʿa and Tāfilālt and sent his son to the conquest of Sūs and the land of the Masmūda

In 732 ʿUbaid Allāh b al-Habhāb was appointed governor of the Maghrib, he appointed his son Ismāʿīl as assistant to the governor of Morocco and gave him particular charge of the district of Sūs

In 735, the same ʿUbaid Allāh sent Habīb, grandson of ʿUkba, to make an expedition into Sūs against the Masmūda and the Sanhādja (Massūfa) Later the latter's son ʿAbd al-Rahmān al Fihrī (d 745) becoming semi-independent governor of the Maghrib occupied Iglī and built a camp there, the remains of which could still be seen in al Bakrī's time It is to the same governor that is attributed the making of the wells which supply the road from Tāmdalt to Awdāghast via Wādān, through the modern Mauritania

The land of the Masmūda then disappears from history till the ninth century The conquests of Idrīs I did not extend in the south beyond the Tāmasnā and the Tādla But in 812 Idrīs II made an expedition against the town of Naffīs, on his death in 828, his son ʿAbd (or ʿUbaid) Allāh obtained as his share of the kingdom, Aghmāt, Naffīs, the lands of the Masmūda and of the Lamta as well as Sūs Al-Bakrī records that some of his descendants ruled as lords of Naffīs and among the Banū Lamās, not far from Iglī Other Idrīsids, descendants of Yahyā b Idrīs, were at this time lords of Darʿa

With the decline of Idrīsid power in the tenth century, the Masmūda again became independent and were ruled by elected chiefs or *imghāren* (= Arabic *shuyūkh*), al Bakrī tells us that those of Aghmāt were appointed by the people for a term of one year When at the end of the tenth century, Zanāta principalities became established in Morocco (at Fās, Shālla and Tādlā), Maghrāwa established themselves at Aghmāt, but all we know of them is that they were attacked by the Almoravids In 1057, after receiving the submission of Sūs and of the Masmūda (Zauda, Shafshāwa, Gadmīwa, Ragrāga and Hāha), the Almoravid chief ʿAbd Allāh b Yā-Sīn took Aghmāt, the last Maghrāwa ruler of which, Iagūt b ʿAlī, fled to Tādlā His wife, the famous Zainab, who was one of the Nafzāwa, finally became the wife of Yūsuf b Tāshfīn whom she initiated into the fine art of diplomacy

From 1057 Aghmāt was the capital of the Almoravids till 1062, when Yūsuf b Tāshfīn founded Marrākush [q v] In 1074 the same ruler, having divided his empire among several governors, gave his son Tamīm the governorship of Marrākush, Aghmāt, of the Masmūda and of Sūs, then of Tādlā and Tāmasnā

The Masmūda seem to have remained subject to the Almoravids till the rebellion in 1121 provoked by the *mahdī* Ibn Tūmart [q v] of the tribe of Hargha, who, supported by ʿUmar Intī, shaikh of the Hintāta, and by ʿAbd al Muʾmin [q v], brought about the foundation of the Almohad dynasty [q v] The history of the Masmūda is henceforth involved with that of the dynasty which they brought to power and which was to last till 1269 The Masmūda, together with the Almohad dynasty, thus contributed to the rise of the Hafsids [q v], who ruled over Ifrikiya from 1228 to 1574, through the descendants of Abū Hafs ʿUmar Intī, shaikh of the Hintāta

During the first half of the XIIIth century, the power of the Almohads, routed by the Christians of Spain at the battle of Hisn al-ʿUkāb (las Navas de Tolosa) in 1212 and vigorously attacked in Morocco by the Banū Marīn, soon began to decline The Masmūda of the Atlas, indifferent to the fate of the dynasty, took advantage of its plight to regain their independence It was the tribes of the Hintāta and the Haskūra, which in 1224 at the proclamation of al-ʿĀdil assumed the leadership in the movement, frequently allied with the Hilālī Arabs of the plains, Sufyān and Khult, we find them fighting in all the civil wars and supporting various pretenders to the throne

When in 1269, the Marīnids had definitely crushed the Almohads, the Masmūda retained a certain amount of independence and lived more or less in submission to the central power, ruled by chiefs chosen from the great local families Awlād Yūnus among the Hintāta, Awlād Saʿd Allāh among the Gadmiwa, among the Saksāwa, ʿUmar b Haddū

was an independent chief who went so far as to claim the Berber title *agellīd* (= king) In Sūs the Banū Yaddar founded an independent principality which lasted from 1254 till about 1340 As to the Haskūra, the power among them was exercised by the Banū Khattāb

Down to the xv^th^ century, except during the first half of the reign of the Almohad dynasty of which they had been the principal supporters, the Masmūda of the Atlas were hardly ever under the direct rule of the Moroccan government, only the tribes of the plains, Dukkāla and Hāha in a position of inferiority as a result of their geographical situation, were able to offer less resistance and had to submit The later dynasties, Sa'dian and 'Alawī, were no better able to subdue the Masmūda of the highlands, but instead of gathering round local chiefs with temporal power, the latter now placed themselves under the leadership of holy men with religious prestige

In the beginning of the xvi^th^ century, the land of the Masmūda was in a state of anarchy Some *aṣḥyāḳḥ* of the tribe of the Hintāta held the lands of Marrakush, the most famous was Abū Shantūf, to the south of Tānsift, the xiv^th^ century saw the rise of the warlike group of the Ragraga, in the xv^th^ century, the power of the mystic al Djazūlī [q v] spread among the Hāha In the adjoining country of Dar'a, the Sa'dian dynasty was rising, which after occupying Sūs imposed its domination on the whole of Morocco

But it did not however succeed in subjecting completely the highlanders of the Atlas The powerful Ahmad al-Mansūr himself had to fight against a pretender who had proclaimed himself king of the Saksāwa

After the death of al Mansūr, the Atlas and Sūs were all under the authority of local religious leaders of whom the most important were to be found among the Hāha and in Tāzarwālt (family of Ahmad U Mūsā)

It was the 'Alawid Sultān Mawlāy Rashīd who restored Sūs and the Atlas to the Moroccan empire The only episode to note is the constitution in Tāzarwālt, by a marabout Saiyidī Hishām of a kind of independent kingdom, the capital of which was Ilīghet and which lasted from the end of the xviii^th^ century till 1886

Henceforth the Masmūda disappear from history The Atlas remained more or less independent, according to the degree of power of the ruling sovereigns, but all the important events in the region took place among the Hāha or in Sūs [q v] The French occupation found the old Masmūda grouped, since the death of the 'Alawid Sultān Mawlāy al Hasan, into three bodies each under the authority of a local family the Glāwa in the east, the Gundāfa in the centre, and the Mtugga in the west The only one now in existence is the Glāwa, as a result of the disappearance of their leaders, the two others were recently broken up

The name Masmūda, still preserved in the north Morocco in the name of a little tribe of al-Kasr al-Kabīr, seems to have completely disappeared in the south, where the former Masmūda peoples, continuing to talk Berber, bear the name of *Shulūh* (French *Chleuhs*, q v) It may even be asked if the name Masmūda, which is found so often in the Arab historians and geographers, was ever in regular use among the peoples to whom they apply it, it is, indeed, suggestive that it is not found in the long lists of ethnics given in the *Kitāb al-Ansāb*, published in the *Documents inedits d'Histoire Almohade*

Sociology The Masmūda of the Atlas lead a settled life, living by a little agriculture and breeding a poor type of cattle, they live in villages or hamlets of stonehouses with clay roofs Ibn Khaldūn notes the existence among them of numerous little strongholds and fortified villages (*ma'ākil wa-huṣūn*), the ancestors of the modern *tighremts* and *agādirs* There were no towns among the mountains, Tīn Mallal, famous for the mosque where Ibn Tūmart was buried, was never a town Before the Almoravid ruler Yūsuf b Tāshfīn founded Marrākush in 1062, built moreover in the plains out of reach of the highlanders, whom it was to control, the only urban centres in the district were situated at the foot of the Atlas on its lowest slopes The principal towns were in the north, the double town of Aghmāt [q v] and that of Naffīs on the river of the same name, in the south, in Sūs, Igli and Tārūdant, as places of less importance we may mention in the north, Shafshāwa (mod Shīshāwa), Afifan and Tamarūrt, in the east, among the Hāha and in the borders of Sūs Tadnast The great trade-routes which traversed the region started from Aghmāt for the port of Kūz (at the north of the Tānsift), Fās (via Tadlā), Sidjilmāssa (through the land of the Hazradja and the Haskūra), and Sūs (via Naffīs, the land of the Banū Māghūs and Igli, no doubt using the pass now called Tizi-n-Test) Al-Bakrī particularly mentions the industry and application and the thirst for gain, characteristic of the Masmūda of the Atlas and of Sūs The principal products of the country were fruits (nuts and almonds), honey and oil of argan (*hargān, argān*), a tree peculiar to the country, of which there were regular forests among the Hāha The Masmūda could cast and work iron and also copper, which they exported in the form of ingots or "loaves" (*tāngūlt*), they also worked and chased silver jewellery In Sūs also the cultivation of the sugar cane enabled sugar to be made

From the intellectual point of view, the Masmūda seem to occupy a place of first rank among the Berbers Each of their three principal groups has produced a reforming prophet, the author of sacred works in the Berber language Hā-Mīm of the Ghumāra, Sālih b Tarīf of the Baraghwāta, Ibn Tūmart of the Masmūda of the Atlas It may also be noted that, Sūs is one of those few districts in which books were written in Berber down to a quite recent date (cf H Basset, *Essai sur la litterature des Berbères*, p 73—81)

As regards religion, the Masmūda were converted to Islām in the viii^th^ century by 'Ukba b Nāfi', who left his comrade Shikār among them to teach the new religion The latter died among them and was buried on the banks of the Tānsift where his tomb is still venerated The place is now called Ribāt Saiyidī Shīkar near the confluence with the river of the Shīshāwa The Mosque of the town of Aghmāt of the Hailāna was founded at the beginning of the eighth century in 704

Ibn Khaldūn describes the Masmūda of the Atlas as being attached to Islām from the first conquest, in which they differed from their brethren of the north, the Baraghwāta and the Ghumāra, who remained faithful to their heretical beliefs At the beginning of the eighth century, several

of them accompanied Tārik on his conquest of Spain, the best known of these was Kuthayyir b Waslās b Shamlāl, of the tribe of the Assāda, who settled in Spain and was the grandfather of Yahyā b Yahyā, one of the *ruwāt* of the *Muwaṭṭa'*, many others also settled in Spain and their descendants played important parts under the Omayyads

In the eleventh century however, al-Bakrī notes Rāfidī heretics among the Masmūda, these were the Banū Lamās settled to the north of the Hargha and the town of Igli In this district he also mentions the existence of idolators who worshipped a ram perhaps we have here a relic of the cult of the god Ammon among the ancient Berbers The towns however formed important centres of Muslim culture, the influence of which was felt not only by the Masmūda of the district but also by the Sanhādja of the adjoining deserts Lamta and Gazūla We know that it was in the town of Naffīs, with Wāggāg b Zallū, a learned jurist of Lamta origin and a pupil of Abū 'Imrān al-Fāsī of al-Kairawān, that in 1039 Yahyā b Ibrāhim al-Gudālī recruited 'Abd Allāh b Yā-Sīn al-Gazūlī who was the promoter of the Almoravid movement For the Almohad period al-Tādilī's hagiographic collection, entitled *Kitāb al-Tashawwuf* shows us the land of the Masmūda of the south full of wonder-working saints Later the tribe of the Ragrāga, settled on the lands now occupied by the Shayādima, was the cradle of a movement at once religious and warlike, the details of which are little known but the memory still alive In the first half of the xviith century, religious activity seems to be concentrated in the south of Sūs, in Tāzarwālt where the descendants of the saint Sayyidī Ahmad U-Mūsā carved themselves out an independent marabout principality

AL-MAṢMUGHĀN, a Zoroastrian dynasty whom the Arabs found in the region of Dunbāwand (Damāwand) to the north of Rayy

The origins of the Masmughāns The dynasty seems to have been an old though not particularly celebrated one as is shown by the legends recorded by Ibn al Fakīh, p 275—277, and in al-Bīrūnī, p 227 The title of masmughan is said to have been conferred by Farīdūn upon Armā'il, Bēwarāsp's former cook (Zohāk), who had been able to save half the young men destined to perish as food for the tyrant's serpents Armā'il (according to Yākūt, ii 606, a Nabataean, a native of the Zāb) showed to Farīdūn in the mountains of Dailam and Shirriz, a whole nation of these refugees, which caused Farīdūn to exclaim *was mānā kata āzād kardi* which is explained to mean "What a large number of people of the house (*ahl baitin*) thou hast saved!"

The first historical reference to a masmughān is found in Tabarī's (i 2656) account of the taking of Rayy by Nu'aim b Mukarrin in the time of the caliph 'Omar [according to Ibn al-Athīr in the years 18, 21 or 22, Marquart however puts these events as late as 98 (716—717)] The King of Rayy, Siyāwakhsh b Mihrān b Bahrām-Čōbīn, had received reinforcements from the people of Dunbāwand, but when he was defeated, the masmughān of Dunbāwand made peace at once with the Arabs and received honorable terms (*'alā ghairi nasrin wa lā ma'ūnatin*) promising an annual payment of 200,000 dīnārs The charter given by Nu aim was addressed "to the masmughān of Dunbāwand, Mardān-shāh, to the people of Dunbāwand, of Khwār, of Lāriz (Lārijān) and of Shirriz" This gives us an idea of the extent of the sway of the masmughān His possessions included the country round Mount Damāwand [q v] and stretched down the plains as far as the east of Rayy The district of Dunbāwand [*Dubā-wand, (the land occupied by) the * Dubā clan ?] did not form part of Tabaristān The Arabs mention it along with Rayy (Tabarī, i 2653—2656, Mukaddasī, p 209, Ibn al Fakih, p 275—277), but as we have seen at the time of the conquest, Rayy and Dunbāwand were under different dynasties The old capital of Dunbāwand may have been at Mandān where, according to Ibn al-Fakīh, Armā'il had built a wonderful house of teak and ebony, which in the reign of Hārūn al-Rashīd was taken to pieces and transported to Baghdād In the Arab period there were two towns in Dunbāwand Wimā and Shalanba (the latter is marked on Stahl's map to the south of the modern town of Damāwānd, which lies on the slopes of Mount Damāwand) According to Yākūt, the masmughān's principal stronghold was called Ustūnāwand or Djarhud This should be sought above the village of Reinà, which must correspond to the old Karyat al-Haddādin (Ibn al-Fakih's story of the shops [*hawānīt*] in which worked the smiths, the noise of whose hammers exorcised the enchained Bēwarāsp must refer to the chambers carved out of the rock near Reinā, cf Crawshay Williams, *Rock-Dwellings at Reinah*, *J R A S*, 1904, p 551, 1906, p 217)

An attempt made by Abū Muslim in 131 to conquer the masmughān was a disastrous failure his general Mūsā b Ka'b was attacked by the masmughān's men and on account of the difficult nature of the country (*li-dīki bilādihi*) was forced to return to Rayy (Ibn al Athīr, v 304, cf Hāfiz Abrū in Dorn, *Auszuge*, p 441)

The principality was not conquered until 141 In this period there were dissensions in the family of the masmughān Abarwīz b al-Masmughān, quarrelled with his brother and went over to the caliph al Mansūr who gave him a pension (Tabarī, iii 130) The *Kitāb al-'Uyūn wa 'l-Hadā'ik*, p 228, testifies to his bravery in the rising of the Rāwandiya and calls him "al Masmughān Mālik b Dīnār, malik of Dunbāwand" This Abarwīz (or Mālik) had enjoyed considerable influence, for, according to Ibn al-Fakīh, the appointment of 'Omar b 'Alā as commander of the army sent against Tabaristān was made on the advice of Abarwīz who had known him since the trouble with Sunbādh (on the partisans of this "Khurramī" in Ṭabaristān cf Mas'ūdī, *Murūdj*, vi 188) and with the Rāwandiya

In the year 141, the brother of Abarwīz who occupied the throne of Dunbāwand was at war with his father-in-law, the ispahbad Khurshīd of Tabaristān, but when he heard that the forces sent by al-Mansūr were on their way to Tabaristān, he hastened to effect a reconciliation with his adversary (Tabarī, iii 136, Ibn al-Athīr, v 386)

The stories of the campaign against Tabaristān directed by al-Mahdī by order of his father al-Mansūr are very contradictory as is shown by their very detailed analysis in Vasmer, *op cit* After the defeat of the ispahbad, the Arabs conquered the masmughān and captured him and his daughters Bakhtariya (?) and Simyr (? or Shakla) Of these princesses one became the wife of Mahdī b Mansūr and the other the *umm-walad* of ʿAlī b Raita According to a story in Ibn al-Fakīh, p 314, Khālid b Barmak (Vasmer, *op cit*, p 100, thinks that his expedition was sent especially against the lord of Dunbāwand) sent the masmughān and his wife and his two daughters to Baghdād, but in another passage, p 275, the same writer says that the masmughān obtained *amān* from Mahdī b Mansūr and came down from the mountain of al-ʿAirain (?) He was taken to Raiy and there Mahdī ordered him to be beheaded

After the death of the masmughān, the people of these mountain regions lapsed into barbarism (*hawziya*) and became like wild beasts (Tabarī, iii 136) According to Ibn al-Fakih (p 276) however, the descendants of the masmughān (= Armāʾil ?) were still well known

Spiegel's and Marquart's hypotheses Yākūt i 244 interprets *masmughān* as *kabīr al-maǧūs* "the great one of the magi" (*mas*, "great", N W Iranian form) Spiegel thought of connecting this dynasty with the prince priests of Raiy, whose existence is known from a well known passage in the Avesta (*Yasna*, ix 18, transl Darmesteter, i 170, cf Jackson, *Zoroaster*, p 202—205) In spite of Marquart's criticisms, who says it is impossible to quote the authority of Avestan traditions which relate to much earlier state of affairs, Spiegel's suggestion is still of interest We have certainly to deal with vague memories and not with actual facts In the time of the Arab conquest the descendants of Bahrām-Čōbīn were ruling in Raiy, but the Arabs (Tabarī, i 2653—2656) installed there a certain al-Zainabī, son of Kūla and father of al-Farrukhān It remains to be seen if this family of Zainbadī, "whom the Arabs call al-Zainabī" (Balādhurī, p 317) is connected with Dunbāwand Their stronghold in Raiy was called ʿĀrīn (?) which resembles the name of the mountain al ʿAirain from which the last masmughān came down (cf the note by de Goeje in Ibn al Fakih, p 275) Marquart wanted to connect the masmughāns of the Bāwanid dynasty, the eponymous ancestor of which Bāw, a descendant of Kayūs, brother of Khusraw I, is said to have lived in the time of the later Sāsānians This Bāw was a man of piety and after the fall of Yazdagird III had retired to his father's fire-temple Marquart regards him as a "magus" and identifies him with the father of the Christian martyr Anastasius, who bore this name (Βαῦ) and was a "master of magian lore" Lastly he quotes the fact that the Bāwanids appeared in 167 only after the disappearance of the masmughān (after 141) as if to continue their line Unfortunately several details of the ingenious argument are not accurate our sources (Ibn Isfandiyār, Zahīr al-Dīn p 204–205) give not the slightest suggestion that Bāw belonged to the priestly caste According to Ibn Isfandiyār (transl Browne, p 98), his grandfather's temple was at Kūsān, which Rabino, p 160, locates a little distance west of Ashraf i e quite remote from Dunbāwand The passage in Tabarī, iii 1294, which Marquart quotes to prove the occurrence of the name Masmughān among the Bāwanids refers to the cousin of Māziyār of the Kārinid dynasty, which is quite different from the Bāwanids (cf below)

The Kārinid masmughāns It is curious that neither Ibn Isfandiyār nor Zahīr al-Dīn speak of the dynasty of the masmughān of Dunbāwand, perhaps because they do not include this region in Tabaristān proper On the other hand, they mention a masmughan (madmughān > *mazmughān) Walash, who was the marzubān of Miyān-du rūd (Zahir al-Din, p 42 says that this canton was near the Sārī between the rivers Kalārud and Mihribān and that on the east it adjoined Karatughān, Miyān-du rūd is thus quite close to where Rabino puts Kūsān!) This masmughān Walāsh (Ibn Isfandiyār, p 101, Zahir al Din, p 42) lived in the time of Djamāspid Farrukhān the Great (709—722 ?) and belonged to the elder branch of the Kārinids descended from Zarmihr b Sūkhrā (We do not know why Justi, p 430, takes this Walāsh to be the son of the last masmughān of Dunbāwand ?) The Kārinid Wandād Hurmuzd (of the younger line, descended from Kārin, brother of Zarmihr) in his rising against the caliph (cf Mahdī, p 158–169 ?) had combined with the ispahbad Shārwīn (772—797) and the masmughān Walāsh of Miyān-du-rūd This latter (Ibn Isfandiyār, p 126, Zahir al Din, p 155) seems to have been one of the successors of the masmughān Walāsh mentioned above

Under 224 (838) Tabarī (iii 1294) mentions a cousin of the Kārinid Māziyār, who was called Shāhriyār b al Masmughan According to this, al Masmughān would be identical with Wandād Ummīd, uncle of Māzyār (cf Justi, p 430) On the other hand under the year 250 (864), Tabari, iii 1529, mentions a Māsmughān (*sic*) among the allies of the ʿAlid Hasan b Zaid Ibn Isfandiyār, p 165 calls him Masmughān b Wandā Ummīd One must either suppose there is an error in Tabarī's genealogy or admit that the title of masmughān was borne both by Wandā-Ummīd and his son, but the form of the designation of the latter (ماصمغان with the article) would rather show that the title had become a simple proper name (Browne is wrong in translating "*the* Masmughān")

To sum up then Alongside of the masmughāns of Dunbāwand, we have the masmughāns of Miyān-du-rūd These *marzubān*, if we may rely on Zahir al-Dīn, belonged to the Zarmihrid branch of the dynasty of Sūkhrā (Sāsānian governor of Tabaristān descended from Kārin, son of the famous smith Kāwa) Later we find the title (or proper name!) of masmughān recurring in the younger branch of the line of Sūkhrā (the Kārinid branch), which occupied a position in Tabaristān subordinate to the Bāwandid ispahbads (Zahīr al-Dīn, p 154, 14)

MĀSSA (Berber *Māsset*), the name of a small Berber tribe of Morocco of Sūs, settled some 30 miles south of Agadir at the mouth of the Wādī Māssa, the latter is probably the *flumen masatat* mentioned by Pliny the Elder (v 9) to the north of the *flumen Darat*, the modern *Wādī Dar'a*, and the *Masatas* of the geographer would correspond to the modern *ahl Māssa*

The name Māssa is associated with the first Arab conquest of Morocco according to legend, it was on the shore there that, after conquering Sūs, 'Ukba b Nāfi' drove his steed into the waves of the Atlantic calling God to witness that there were no more lands to conquer on the west In any case, Māssa appears very early as an important religious and commercial centre Al-Ya'kūbī (end of the third = ninth century) notes that the harbour was a busy one and mentions a *ribāt* already renowned, that of Bahlūl Al-Bakrī and al-Idrīsī mention the harbour of Māssat, al-Bakrī emphasises the fame of the *ribāṭ* and the importance of the fairs held there Ibn Khaldūn devotes several passages in his *Kitāb al-'Ibar* to the *ribāṭ* of Māssa, where according to popular belief the expected Mahdī or Fātimid was to appear, this belief induced many devout people to go and settle in this ribāt and also sent many adventurers there to raise rebellions

Towards the end of the xv^th^ century, the religious movement begun by al-Djazūlī made Māssa one of the great *zāwiya*'s of Sūs In the middle of the ix^th^ (xv^th^) century Leo Africanus describes Māssa as a group of three little towns surrounded by a stone wall in the middle of a forest of palm-trees, the inhabitants were agriculturists and turned the rising of the waters of the Wādī to their advantage Outside the town on the seashore was a very venerated "temple", from which the Mahdī was to come, a peculiar feature of it was that the little bays in it were formed of ribs of whalebone the sea actually throws up many cetaceans on this coast and ambergris was collected here, local legend moreover says that it was on the shore of Māssa that Jonah was cast up by the whale

After the fall of the Sa'dians, the development of the Marabout principality of Tāzarwālt again made Māssa a commercial centre The port was frequented by Europeans but it was soon supplanted by that of Agadir The rapid decline of the principality of Tāzarwālt and the steadily increasing influence of the central Moroccan power finally destroyed almost completely any religious and economic importance of Māssa

Bibliography Ibn Khaldūn, *Prolégomenes*, transl de Slane, II 201—202, Leo Africanus, *Description de l'Afrique*, ed Schefer, I 168, R Basset, *Relation de Sidi Brahim de Massat*, Paris 1883, R Montagne, *Une tribu berbère du Sud Marocain Massat*, in *Hespéris*, IV, 1924, p 357—403 (G S COLIN)

MAS'ŪD ABŪ SA'ID, the eldest son of Sultān Mahmūd of Ghazna, was born in the year 388 (998) In 406 (1015—1016), Sultān Mahmūd nominated him his heir-apparent, and two years later made him governor of Herāt In 411 (1020), at the command of his father, he led an expedition to Ghūr and reduced the north western part to submission Shortly after this, he was disgraced and sent as a prisoner to Multān but he was soon taken back into favour and was reinstated in his government at Herāt When the province of Raiy was conquered in 420 (1029) Sultān Mahmūd placed it under Mas'ūd who, after subjugating the outlying parts, conquered Hamadhān and Isfahān from their Buwaihid ruler, 'Alā' al Dawla b Kākawaih, in the beginning of 421 (1030), and was making preparations for further conquest when news arrived of the death of his father and the succession to the throne of his brother Abū Ahmad Muhammad Mas'ūd hurried to Ghazna to claim the throne In the meantime the army tired of Muhammad, deposed him and had the *khutba* said in the name of Mas'ūd Muhammad was blinded and sent to the fort of Mandīsh, and Mas'ūd ascended the throne in Shawwāl 421 (October 1030), about 5 months after the death of his father The Caliph al-Kādir bi'llāh conferred on him the titles of Nāsir Dīni 'llāh, Hāfiz 'Ibād 'llāh and Zahīr Khalifati 'llāh

In 422 (1031), Sultān Mas'ūd sent an army to punish 'Isā, the ruler of Mukrān, for his rebellion 'Isā was defeated and put to death, and his brother named Abu 'l-Mu'askar was placed on the throne In 424 (1032—1033), Mas'ūd laid siege to a fort named Sarasti in the southern Kashmīr hills, took it by assault and returned to Ghazna in the spring After this he attacked Tabaristān, as the ruler of that country, named Abū Kālindjār, had adopted a hostile attitude, and captured Astarābād Abū Kālindjār was forced to offer submission and to promise to pay annual tribute About the end of 426 (October 1035), Ahmad b Niyāltigīn, the governor of Lahore, rebelled Mas'ūd sent against him one of his Hindū generals who was defeated and slain in battle He then sent another Hindū general named Tilak, who defeated Ahmad and forced him to fly to Sind where he was drowned while attempting to cross the river Indus About the end of 427 (October 1036), Mas'ūd led an expedition to India, took the forts of Hānsī and Sonīpat and returned to Ghazna, leaving his son Madjdūd as the governor of the Pundjāb In 430 (1038—1039), Mas'ūd crossed the Oxus to punish Pūrtigīn, son of 'Alitigīn, ruler of Bukhārā, for his hostility, but before he could accomplish anything he received news that the Saldjūks were advancing to Balkh to cut off his retreat, and he immediately returned to Khurāsān

Early in his reign, Sultān Mas'ūd had been called upon to deal with the Saldjūks whose power had considerably increased during the period of disturbance following the death of Sultān Mahmūd They raided Herāt as early as 422 (1031) but were repulsed with heavy loss at Farāwah and forced to take refuge in the Balkhān Mountains This however did not stop their activities, and by 423 (1033—1034) they had started to make systematic incursions into Khurāsān In Sha'bān 426 (June 1035) Mas'ūd sent against them two of his generals the Hādjib Baktrghdī and Husain 'Alī b Mīkā'īl who inflicted a crushing defeat on them, but while the Ghaznawid troops were engaged in plundering the camp of their vanquished foes, a body of the Saldjūks under Dāwūd issued from the hills, fell upon their disorderly ranks, and made fearful slaughter among them Husain 'Alī was taken prisoner, and

Baktoghdī managed to escape Instead of marching against the Saldjūḳs, Mas'ūd wasted his time in a fruitless expedition to India in 427, as stated above, and the result was that they became bolder and more powerful In 428 (1036—1037), they captured Balkh, but retired to Marw at the approach of Sultān Mas'ūd, and sued for peace Mas'ūd gladly consented to it, but it was only a shampeace and when Mas'ūd started on his return march to Ghazna, the Saldjūks fell upon his rear and put many of his soldiers to death Mas'ūd turned round and took terrible revenge for this treachery The Saldjūks redoubled their efforts against the Sultān, and won over the people of Sarakhs, Nasa and Bāward to their side Mas'ūd now personally took the field against them The Saldjūks advanced to meet him under their leader Tughrīl The two armies met at Dandānakān on 8th Ramadān, 431 (May 23, 1040) Mas'ūd fought bravely but being deserted by his generals and finding himself surrounded on all sides by the enemy, he fought his way out of the field of battle and managed to reach Ghazna in safety

The Saldjūks had evidently become too strong for him, and he resolved to withdraw to India, possibly with a view to gaining a respite and preparing a large army there to retrieve his affairs He left Ghazna with all his treasure, and accompanied by his captive brother Abū Ahmad Muhammad At Ribāṭ i Mārikalah, shortly after crossing the river Indus, his slaves rebelled against him, plundered his treasure, and, being joined by the rest of the army, they seized Mas ūd and acclaimed the blind Muhammad as their sovereign Mas'ūd was sent as a prisoner to a fort where he was put to death on 11th Djumādā I, 432 (January 17, 1041) His reign had lasted 10 years and three months

Mas'ūd was a man of strong build and great physical strength He was brave and generous, but he lacked the wisdom of his father, and early in his reign, he lost the co operation of his officers by foolishly attempting to bring about the ruin of the old servants of the House on the advice of his young and ambitious courtiers, and demanding the return of the money which Muhammad had distributed among them at the time of his succession to the throne Mas'ūd was a great lover of learning, and numerous scholars had assembled at his court, one of whom was the famous Abū Raihān al-Bīrūnī who dedicated some of his greatest works to him Several poets sang his praises and were given munificent rewards He adorned his capital with beautiful buildings, and the New Palace with its magnificent throne was one of the wonders of the times

Bibliography Abu 'l-Fadl Baihaḳī, *Ta'rīkh-i Mas'ūdī*, ed Morley, Gardīzī, *Zain al Akhbār*, ed M Nazim, in *Browne Memorial Series*, i , Ibn al-Athīr, *al Kāmil*, ed Tornberg, ix 261—333, *Ta'rīkh-i Firishta*, ed Bombay, p 68—77 (M Nazim)

MAS'ŪD b Mawdūd b Zangī, 'Izz al-Dīn Abu 'l-Fatḥ (or Abu 'l-Muzaffar), lord of al Mawṣil Mawdūd [q v] died in 565 (1170), he was followed by his son Saif al-Dīn Ghāzī [q v] as Atābeg of al-Mawsil When the latter came into conflict with Saladin [q v] in 570 (1175) he gave his brother Mas'ūd command of the troops sent to relieve Halab, which was being besieged by Saladin After Saladin had left Halab and seized the citadel of Ḥimṣ, Mas'ūd, who had in the meanwhile attached the Halabīs to his side, attacked him but was defeated in Ramaḍān 570 (April 1175) at Kurūn Hamat Saif al-Dīn died on 3rd Ṣafar 572 (Aug 11, 1176), or according to another less authenticated statement in 576 (began June 29, 1180), and Mas'ūd then became lord of al-Mawṣil To this in 577 (1181 1182) was added Halab, which his cousin al Malik al Ṣalih [q v] bequeathed to him shortly before his death, but Mas'ūd did not hold it very long On the advice of the influential emīr Mudjāhid al Dīn Kaimāz, he ceded his new possessions to his brother 'Imād al-Dīn Zangī who gave him Sindjār in exchange, and in Muharram 578 (May 1182) the latter occupied Halab Soon afterwards, Saladin took Edessa, al-Rakḳa, Sarūdj and Nasibīn, and in Radjab (November) of the same year he appeared before al Mawsil but could not take it by force, so he retired in the following month and turned his attention to Sindjār After he had taken this town, he forced 'Imād al-Dīn to capitulate (Ṣafar 579 = June 1183) In 581 (1185) Saladin again attacked al-Mawsil but had once more to retire with his object unachieved After the capture of the town of Maiyāfāriḳīn, he made a third attempt to take al Mawsil, and encamped at some distance from the town but fell ill and was taken to Harran In spite of this, 'Izz al-Dīn did not dare to oppose him any longer but began negotiations Saladin declared himself ready to make terms, and in Dhu 'l-Hidjdja 581 (March 1186) peace was made on condition that 'Izz al-Dīn recognised the suzerainty of Saladin and gave him Shahrazūr with the lands behind the Zāb 'Izz al-Dīn died in al-Mawsil on Sha'bān 27 or 29, 589 (Aug 28 or 30, 1193) after designating his son Nūr al Dīn Arslān Shāh as his successor The Arabic historians pay him as high a tribute as they do to his father Mawdūd

MAS'ŪD b Muhammad Abu 'l Fatḥ Ghiyāth al Dīn, a Saldjūḳ ruler in the 'Irāḳ (529—547 = 1134—1152) Like Muhammad's other sons, Mas'ūd, when quite a child, was entrusted to an atābeg to be educated, namely the celebrated emīr Mawdūd and when the latter was murdered, Ak Sonkor and Aiaba Djuyūsh Beg acted successively as Mas'ūd's tutors The latter, an ambitious emīr, in the beginning of Mahmūd's reign tried to secure the sultānate for his protégé, then an eleven-year-old boy, but the attempt failed, in an encounter with Mahmūd's troops he was put to flight and Mas'ūd as well as his wazīr, the famous Arab poet al-Tughrā'ī [q v], were taken prisoners (514 = 1120) On the fate of the poet see the article on him Mas ūd was pardoned and later given Gandja by his brother (1130) After Mahmūd's death (525 = 1131), his son Dāwūd was at first recognised as sultān but Sandjar decided that Mas'ūd's brother Tughrīl should be sultān Mas'ūd soon made peace with Dāwūd, after some fighting near Tabrīz, and sought to obtain from the caliph al-Mustarshid that the latter should mention him in the khuṭba in

Baghdād The caliph, who had been approached with the same object by another brother of Mas'ūd named Saldjūk and his atābeg Karadja, found himself forced to accede to both by having Mas'ūd's name mentioned first, followed by that of Saldjūk He also collected his forces to go in alliance with them against Sandjar, but when he arrived in Khānikīn, he withdrew so that Mas'ūd and Saldjūk had to continue the struggle against their uncle alone and they were routed by him near a hill called Pandj Anghusht in the neighbourhood of Dīnawar (1132) Sandjar however allowed Mas'ūd to return unhindered to Gandja and at the end of the same year Mas'ūd found an opportunity to go to Baghdād where Dāwūd also now was Both princes were received by the caliph in public audience and given robes of honour and other tokens of esteem Homage was paid to Mas'ūd as sultān and to Dāwūd as heir apparent Thereafter he fought with varying fortune against his brother Tughril and after the latter's premature death (528—529 = 1134) was generally recognised as sultān Anusharwān b Khālid, the caliph's vizier, now was given the office of vizier to the sultān Soon afterwards however, a number of Turkish emirs became dissatisfied with Mas ūd because they had felt themselves insulted by the advancement of Kara Sonkor, the powerful emir of Ādharbāidjān, and were able to win the caliph over to their party In the hope that Dāwūd would join him, he went with some 7,000 horsemen towards Hamadhān, where Mas'ūd then was, but when the sultān's troops met him at Dāimarg, his own men left him in the lurch or even went over to Mas ūd so that he and his vizier and other high officials were taken prisoners (529 = 1135) The sultān, it is true, treated him with deference, and began to discuss terms of peace, but he did not release him He took him with him to Marāgha, where in the same year (cf the various dates given Weil, *Gesch der Chalifen*, iii 231, note 4) he was murdered by a number of fidā'is The murderers were apparently hired by the sultān, on the advice of Sandjar, who had been stirred up against the Caliph by Dubais [q v] The latter, who was also with Mas'ūd, was soon afterwards treacherously slain by him These deeds of violence naturally made a very bad impression Dāwūd and Saldjūk began again to bestir themselves, the new caliph al Rāshid bi'llāh, a son of al-Mustaishid, adopted a hostile attitude and other Turkish emirs, notably Zangī, the lord of al Mawsil, began to be insub ordinate, in a word, anarchy soon prevailed every where But when Mas'ūd returned to Baghdād with his troops they all retired Mas ūd thereupon had the caliph, who had escaped with Zangī to al-Mawsil, deposed by a fatwā of the kādīs and jurists and approved the appointment of al-Muktafī (530 = 1136) After peace had in this way been to some extent restored, Mas'ūd thought he might now devote himself to his pleasures and remained the whole year of 1137 in Baghdād in comparative inactivity, without allowing his leisure to be disturbed by a demonstration by the mob of the capital, which was intended to remind him that it was his duty to wage war upon the unbelievers Once again several Turkish emirs rebelled and tried to bring Dāwūd to the front again, among them the most dangerous were 'Abd al-Rahmān b Tughanyerek, lord of Khalkhāl, and particularly the prince Mingubars, whom Sandjar after Karadja's death had sent to Fārs and who was vigorously supported by his deputy in Khuzistān, Buzāba Mas'ūd, it is true, sent troops against them under Kara Sonkor but they had to retire, and a battle was only fought when Mas'ūd himself came up, at Kurshanbe near Hamadhān (532 = 1138) The sultān was at first victorious and put Mingubars, whom he had captured, to death, but when his troops were scattered plundering the enemy's camp, Buzāba fell suddenly upon them so that he and Kara Sonkor had narrow escapes and some twelve of the emirs with him were captured and all put to death by Buzāba Fortunately for Mas'ūd, Buzāba did not pursue him, but was content with occupying Fārs, the sultān was also able to make peace with Dāwūd, and the deposed caliph was murdered in Isfahān on Ramadān 25, 532 (June 6, 1138) The sultān's position however was not one whit better, for the different provinces of the empire were in the hands of powerful emīrs, who not only paid no heed to the sultān, but occasionally appeared in open rebellion against him in the name of various Saldjūk princes whose atābegs they were The most powerful of these was still Kara Sonkor who began a war on Buzāba to avenge his son, who had been murdered by the latter When he approached, however, Buzāba withdrew into an inaccessible citadel and when Kara Sonkor retired, he took prisoner the prince Saldjūk whom he had appointed to rule over Fārs and then continued to rule in Fārs as atabeg of two sons of Mahmūd, Malikshāh and Muhammad After the death of Kara Sonkor, who died in 535 of a broken heart after the great losses he suffered in the terrible earthquake in Gandja in 533 (1138), Čawlī al Djāndār took his place and like his predecessor was generally attached to Mas'ūd Buzāba's attempt along with another emir named 'Abbās [q v], who had gained an influential position in al Rayy, to put the sultān's youngest brother Sulaimān on the throne therefore failed Mas'ūd invited this prince to come to him and when he came he was imprisoned in spite of the sultān's promise Čawlī died in 541 (1146) in the same year as Zangī and in the following year 'Abd al Rahmān and 'Abbās were disposed of by assassination so that Buzāba alone remained of the enemies of Mas'ūd Buzāba now set out for Hamadhān to attack the sultān, but not far from this city was taken prisoner in a fierce battle and executed (542 = 1147) The princes Muhammad and Malikshāh who were with him escaped Mas'ūd afterwards sent for the latter, gave him his daughter in marriage and designated him his successor In these negotiations the sultān followed the advice of his favourite beg Arslān b Balangarī, best known by the title Khāssbeg, who in this way disposed of all his rivals, but at the same time aroused great discontent so that even the aged Sandjar came once more to al Rayy to remonstrate with his nephew (544 = 1149) But all this was in vain, and when in 547 (1152) Mas'ūd died, Khāssbeg put Malikshāh upon the throne, when in a short time the latter showed himself quite incapable, he sent for Muhammad, who had Khāssbeg treacherously murdered

Bibliography in the article SELDJUKS — Ibn Khallikān's article on Mas'ūd (Būlāk edition 1299, ii 531) is of no importance

(M Th HOUTSMA)

MAS'ŪD B SA'D B SALMĀN, a poet in Arabic and Persian, was born in Lāhore His father

remained for a considerable time in the service of the kings of Ghazna and had become the possessor of great wealth and lands in Lāhore and other parts of India After his father's death these lands were confiscated by the Governor of Lāhore and Mas'ūd was compelled to proceed to Ghazna to demand justice, but there also his enemies were able to put him to more troubles and bring against him a false accusation, which caused him to be imprisoned He at last through the recommendation of Mas'ūd b Sultān Ibrāhīm was permitted to return to India and take possession of his estate When Saif al-Dīn Mahmūd b Sultān Ibrāhim came in India as viceroy, Mas'ūd attached himself to this prince as courtier and panegyrist and became one of the special favourites of his court But again, a false charge being brought against him, he once more fell upon evil days and loss of fortune It was maliciously reported in 492 (1098) to Sultān Ibrāhīm b Mahmūd that his son Saif al-Dīn Mahmūd intended to go to 'Irāk to Malikshāh This report so much aroused the indignation of the Sultān that he ordered his son with all his courtiers to be arrested and put to prison Our poet for the next ten years remained a prisoner But on the intercession of Abu 'l-Kāsim Khāss, the Sultān pardoned him and released him from prison He returned to India and was again placed in possession of his father's lands and dignity

He died in 515 (1121) He is the author of two dīwāns, one in Arabic and the other in Persian

(M HIDAYET HOSAIN)

AL **MAS'ŪDĪ**, ABU 'L-HASAN 'ALĪ B AL-HUSAIN, Arab historian and geographer and one of the most versatile authors of the fourth century A H Information about his life can only be gleaned from occasional references in his works, as his activity lay outside the lines of the regular schools of learning, he gets little mention from their representatives The author of the *Fihrist* regards him as a Maghribī According to his own statement however, he was born in Baghdād and descended from an Arab family which could trace its ancestry to a Companion of the Prophet While still quite young he travelled through Persia where he spent part of 305 (915) in Istakhr Next year he went to India and visited Multān and al Mansūra He went by Kanbaya and Saimūr as far as Ceylon, joined some merchants on a voyage to the China Sea and back to Zanzibar from which he returned to 'Omān We again find him travelling along the southern shore of the Caspian Sea and in 314 (926) at Tiberias in Palestine In 332 (943) he visited Antioch and the Syrian frontier towns and after a brief visit to his native province of Basra, he was staying in Damascus in 334 (945) Afterwards he seems to have lived sometimes in Syria and sometimes in Egypt He was in al Fustāt in 336 (947) and 344 (955) and he died there in Dumādā II 345 (956) or 346

His restless life is reflected in his literary activity His travels were certainly stimulated not by thirst for adventure but by a strong desire for knowledge But this was superficial and not deep He never went into original sources, as did al-Bīrūnī later, but contented himself with superficial enquiries and accepted tales and legends without criticism Nevertheless we owe him a good deal of valuable information about the lands on the periphery of Islām His method of presenting his material has the same faults as his scholarship He is never able to finish a subject he has begun but continually diverges from his theme His literary activity, in addition to philology and theology in the narrower sense, touched on almost all the fields of interest of his time, particularly natural philosophy, ethics and politics as well as heresiography His works, a list of which is given by de Goeje in the preface to the *Kitāb al-Tanbih*, p vi, are for the most part lost because they were not of general interest Posterity was only interested in him as a historian In the year 332 (943) he began his great history of the world *Kitāb Akhbār al-Zamān wa man abādahu 'l-Hidthān min al-Umam al-mādiya wa 'l Ādjyāl al-khāliya wa 'l Mamālik al-dāthira*, which is said to have filled 30 volumes Burckhardt's statement (*Travels in Nubia*, p 527) that twenty volumes of it are preserved in the Aya Sofia in Constantinople has unfortunately not been confirmed Only a single volume, the first of the work, which A v Kremer obtained in Aleppo, is preserved in Vienna (see v Kremer, *S B W A*, 1850, p 207—211, Flugel, *Die arabischen u turkischen Hss der K K Hofbibliothek*, ii, N° 1262, another MS of the same part is in Berlin, see Ahlwardt, N° 9426) The work begins with the creation and after a brief geographical survey discusses the non-Muslim peoples and goes fully into the legendary history of Egypt He reproduced extracts from this work in the *Kitāb al awsat* of which one volume perhaps survives in Oxford (see Uri, *Catalogus codd MSS or*, i 666) The substance of these two works he gave in briefer form in the *Murūdj al Dhahab wa Ma'ādin al-Djawāhir*, which he finished in Djumādā I, 336 (Nov -Dec 947) but revised in 345 (956) In addition to the manuscripts used for the Paris edition, a number of others are in existence, e g in the Ambrosiana (*R S O*, iv 97), in Fez (*Fihrist Masdjid al-Karawiyin*, N° 1298) and Mōsul (Dāwūd, *Makhtūtāt al-Mawsil*, p 122, N° 22, p 173, N° 32), printed as Maçoudi, *Les prairies d'or* (the more correct translation would be "Gold-washings", see Gildemeister, *W Z K M*, v 202), *Texte et Traduction* par C Barbier de Meynard et Pavet de Courteille, 9 vols, Paris 1861–1877, Būlāk 1283, Cairo 1313, on the margin of Ibn al-Athir, Būlāk 1303, of Makkari's, *Nafh al-Tīb*, vol 1—3, Cairo 1302 A synopsis of the *Murūdj al-Dhahab* down to the fall of the Omayyads was made by Ibrāhīm al-Abshīhī in 1118 (1706) (MS Vienna, Flugel, N° 807) Another synopsis of which it has still to be ascertained whether the two works on which it is based were not also used in addition to the *Murūdj*, with a continuation down to the year 638 (1248) was composed by Abū 'Abd Allāh Muhammad b 'Alī al-Shātibī of Tāza in Morocco under the title *al-Djumān fī Mukhtaṣar Akhbār al-Zamān* (wrongly ascribed by de Sacy, *N E*, ii, 1787 to Makkarī, MS Gyangos, 64, fol 31—195, see Asin Palacios, *Escatologia*, p 374, other MSS in Cairo and

Damascus see M Kurd 'Alī, *R A A D*, iii 239—242) An anonymous synopsis of his *magnum opus* with special reference to travellers' tales from the Indian Ocean with additions from the *Kitāb 'Adjā'ib al-Hind* of Rāmhurmuzī, as well as from the legends of Egypt, entitled *Kitāb Akhbār al-Zamān wa 'Adjā'ib al Buldān*, or *Mukhtaṣar al-'Adjā'ib wa 'l Ghara'ib* is preserved in several MSS in Paris (see Carra de Vaux, *J A*, ser 9, vol vii, p 133—144) Towards the end of his life, Mas'ūdī composed a survey of his whole literary activity and supplemented it where necessary from new sources in the *Kitāb al-Tanbih wa 'l-Ishrāf* (ed de Goeje, in *B G A*, viii, Leyden 1894, additions to these in a Leipzig MS, *Z D M G*, lvi, 223—236, see Carra de Vaux, *Maçoudi, le livre de l'avertissement et de la revision*, French transl, Paris 1897)

MASYĀD, a town in Northern Syria on the eastern side of the Djabal al Nusairiye The pronunciation and orthography of the name varies between the forms *Masyād*, *Masyāf* (in official documents and on the inscriptions mentioned below of the years 646 and 870 A H), *Maṣyāt* and *Maṣyāth* (on the interchange of *f* and *th* see Rescher, *Z D M G*, lxxiv 465, Praetorius, *Z D M G*, lxxv 292, Dussaud, *Topographie hist de la Syrie*, p 143, note 4, 209, 395, note 3) The variants *Maṣyāb* (Yākūt, *Mu'djam*, ed Wustenfeld, iv 556), *Maṣyāh* (Khalil al-Ẓāhirī, *Zubda*, ed Ravaisse, p 49) and *Maṣyāt* (al Nābulusī, in v Kremer, *S B Ak Wien*, 1850, ii 331) are no doubt due to mistakes in copying (van Berchem, *J A*, Ser 9, ix [1897], 457, note 2) At a later period, the pronunciation *Miṣyāf*, *Misyād* became usual (al-Dimashkī, ed Mehren, p 208, al Kalkashandī, *Subh al A'shā'*, Cairo, iv 113, Ibn al-Shihna, Bairūt, p 265, cf *Mesyāf* on v Oppenheim's map in *Petermanns Mitteilungen*, lvii [1911], ii, Taf 11) The name is perhaps a corruption of a Greek Μαρσύα (= Μασσύα) or Μάρσυου κώμη, which presumably lay on the *Marsyas amnis*, the boundary river of the Nazerini (ancestors of the Nusairis? Plinius, *Nat Hist*, v 81) (cf Pauly Wissowa Kroll, *Realencyklopadie*, xiv, Col 1985 *sq*, s *Marsyas*, N° 3)

A number of ancient pillars and capitals built into the gates of the fortress (some reproduced in G L Bell, *Syria The Desert and the Sown*, p 217—220) are its only remains of antiquity An old Roman road (*rasif*) from Hamā to the west passed the town (according to Miss Bell, *loc cit*)

Masyād is not mentioned in the early middle ages, the first mention of the fortress is probably in a Frankish account of the advance of the Crusaders in 1099 *pervenimus gaudentes hospitari ad quoddam Arabum castrum* (*Anonymi gesta Francorum et aliorum Hierosolymitanorum*, ed Hagenmeyer, 1890, p 418 with note 29, Dussaud, *Histoire et religion des Nosairis*, Paris 1900, p 21, note 4) When in 503 (1109—1110), the Franks advanced on Rafanīya, Tughtakīn set out to relieve it, by the terms of the peace concluded between them, the Franks bound themselves to abandon all designs on Masyāth and Hisn al Akrād and in compensation these two places and Hisn Tūfān were to pay them tribute (Sibt b al Djawzī, *Mir'āt al Zamān*, in *Rec Hist Or Crois*, iii 537) Before 521 (1127) the fortress was in possession of a branch of the Mirdāsids, who sold it to the Banī Munkidh After the Nusairī citadels of Kadmūs and al-Kahf had fallen into the hands of the Ismā'īlīs in 527 (1132—1133), the latter also seized the fortress of Masyāf in 535 (1140—1141), by outwitting the commandant Sunkur, a mamlūk in the service of the Banī Munkidh of Shaizar, who was surprised and slain (Abu 'l-Fidā', *Mukhtasar fī Akhbār al-Bashar*, in *Rec Hist Or Crois*, i 25, Ibn al Athīr, *Kāmil*, *ibid*, i 438, al Nuwairī, Cod Leyden 2m, f 222b, in van Berchem, *J A*, 1897, p 464, note 1) Masyād now became the residence of the Syrian 'Master' of the sect (as we may call him, with van Berchem, to distinguish him from the Grand Master in Alamūt), known as *Shaikh al-Djabal* After the Master (*Mukaddam*) Abū Muhammad had gathered round him the members of the sect in the hills of Kadmūsiya, about 557 (1162) Rāshid al-Dīn Sinān [q v] appeared in Syria, as envoy from the Persian Grand Master, took over command of the Assassins [q v] there and displayed his unusual organising ability, by raising the sect to be a well equipped and dreaded force, the terror of the Crusaders Saladin, who wanted to punish them for two attempts on his life, invaded the land of the Ismā'īlīs in Muharram 572 (July–Aug 1176), laid it waste and laid siege to Sinān in Kal'at Masyāf Through the mediation of Saladin's uncle Shihāb al-Dīn al-Hārimī, lord of Hamā, Sinān however succeeded in obtaining Saladin's forgiveness, in the beginning of August, he went with his army to Hamā (Abu'l Fidā' and Ibn al-Athīr, in *Rec Hist Or Crois*, i 47, 626) Shortly before he raised the siege of Masyād (about the 1st Safar), he received from Usāma b Munkidh, who was in Damascus, a letter containing a panegyric of his great patron (Derenbourg, *Vie d'Ousâma*, Paris 1893, p 400 *sq*) Rāshid al Dīn died in 588 (Sept 1192) The Syrian Masters, as the official epithet *al-Dunyā wa'l-Dīn* henceforth regularly borne by them shows, were raised by him to a position with power and privileges equal to those of sovereign rulers (van Berchem, *op cit*, p 470) While Sinān had completely emancipated himself from the suzerainty of the headquarters of the sect in Alamūt, in 608 we find the old conditions completely restored (Abū Shāma, *al-Dhail fi'l-Rawdatain*, in van Berchem, *op cit*, p 475 *sqq*, note 1) According to an inscription in the inner gate of the castle (van Berchem, *J A*, 1897, p 482 = van Berchem–v Oppenheim, *Beitrage z Assyriol*, viii/1, p 17, N° 18), this building was restored by the Syrian Master Kamāl al-Dunyā wa'l-Dīn al-Hasan b Mas'ūd under the suzerainty of the Grand Master of Alamūt 'Alā' al-Dīn Muhammad III (618—653) The reference is probably to the al Kamāl, who according to al-Nasawī (*Hist du Sultan Djelal al-Dīn Mankobirti*, ed Houdas, p 132) was for a period before 624, governor in Syria for the grand master of the Ismā'īlīs It is uncertain whether the commandant (*mutawallī*)

Madjd al Dīn, who received in 624 the ambassadors of Frederick II (Hamawī in Amari, *Bibl arabico sicula*, App II, p 30) was one of the Masters (van Berchem, *JA*, 1897, p 501, note 1) About 625/6 and still in 635, Sirādj al Dīn Muzaffar b al Husain was Syrian Master (Nasawī, *op cit*, p 168, inscription of al-Kahf, ed van Berchem, *op cit*, p 488) A Persian from Alamūt, Tādj al Dīn, was in 637 *mukaddam* of the Syrian Ismāʿīlīs (Ibn Wāsil, *Geschichte der Ayyūbiden*, Paris, MS Ar 1702, f 333b in van Berchem, p 466, note 2) As Tādj al Dīn Abu'l-Futūḥ he appears in an inscription in Masyād of Dhu'l-Kaʿda 646 (Feb–March 1249), according to which he had built the city wall of Masyāf and its south gate The commander of the fortress under him was ʿAbd Allāh b Abi 'l-Fadl b ʿAbd Allāh (inscriptions A and B in van Berchem, *JA*, 1897, p 456 = van Berchem–v Oppenheim, *Beitr z Assyr*, *op cit*, N⁰ 19) Probably it was Tādj al Dīn to whom the Dominican monk Yvo the Breton, a member of an embassy sent by Louis IX to the "Old Man of the Mountains" in May 1250, sent a naive and fruitless appeal for his conversion (Jean de Joinville, *Hist de St Louis*, ed Wailly, p 246 *sqq*, van Berchem, *JA*, 1897, p 478—480) In the time of the Master Ridā' al Dīn Abu'l Maʿālī in 658 (1260) the Tatars seized and held the fortress for a time, but after the victory of the Egyptian Sultān Kutuz at ʿAin Djālūt, they abandoned it About two years later Baibars began to interfere in the affairs of the Ismāʿīlis and to demand tribute from them He very soon deposed the Master Nadjm al-Dīn Ismāʿīl and appointed his son-in law Sārim al Dīn Mubārak in his place and took Masyād from him When the latter returned there, Baibars had him seized and brought to Cairo, where he was thrown into prison Nadjm al Dīn was again recognised as Master for a brief period and then his son Shams al-Dīn, before the Sultān definitely incorporated Masyād in his kingdom in Radjab 668 (1270) (Abu 'l-Fidā', in *Rec hist or crois*, i 153, Mufaddal b Abi 'l-Fadā'il, *Gesch d Mamlūkensultane*, ed Blochet, in *Patrol Orient*, xiv 445, van Berchem, *JA* 1897, p 465, note 2)

Masyād presumably at first belonged to the "royal province of fortunate conquests" the capital of which was Hisn al-Akrād, then to Tarābulus (after its capture in 688) It was later separated from this province and added to the niyāba of Dimashk to which it still belonged in the time of Kalkashandī (*Ṣubh al Aʿshā*, Cairo, iv 113, 202, 235) about 814 (1412) Khalīl al-Zāhiri (*Zubdat Kashf al-Mamālik*, ed Ravaisse, p 49) includes Masyād with Hamā (about 850) Under Egyptian rule the position of the lands of the Ismāʿīlīs with Masyād as capital was to some extent exceptional (Gaudefroy Demombynes, *La Syrie à l'Époque des Mamelouks*, Paris 1923, p 182, N⁰ 3)

Abu 'l Fidā' (about 720 = 1320) described Masyād as an important town, with beautiful gardens through which streams flowed, it had a strong citadel and lay at the eastern base of the Djabal al-Lukkām (more accurately Djabal al Sikkīn) about a farsakh north of Bārin and a day's journey west of Hamā (not Hims, as Le Strange, *Palestine*, p 507 erroneously says, Abu 'l-Fidā', *Geogr*, ed Reinaud, p 229 *sq*) As a result of its high situation, it has a more temperate climate than the low ground on the Nahr al-ʿĀsī, the young Usāma in 516 (1122—1123) brought to Masyād the wife and children of the emīr of Shaizar, his uncle ʿIzz al Dīn Abu 'l ʿAsākir Sultān, from the heat of Shaizar which was causing the emīr anxiety about their health (Derenbourg, *Vie d'Ousâma*, p 43)

Ibn Battūta passed through Masyād in 756 (1355) and al-Nābulusī in 1105 (1693—1694) The latter mentions that the governor of the town then was a certain Sulaimān of the tribe of Tanūkh An inscription of Masyād of Ramadān 870 (April–May 1466) contains a decree about taxes of the Sultān al Malik al Zāhir Khushkadam (van Berchem-v Oppenheim, *Beitr z Assyr*, vii, p 20, N⁰ 23 N⁰ 22 is perhaps of the same Malik al Zahir) Of a later date are two inscriptions of an emīr Mustafā b Idrīs, one of the year 1203 (1788–1789) relating to the building of a well (*sabil*) (*op cit*, p 21, N⁰ 24), the other (N⁰ 25) of 1208 (1793—1794) to the building of the house of the Ismāʿīlī emīrs

The Ismāʿīlis lived constantly in open or secret enmity with the Nusairīs, although various tribes of the latter had offered their services to the Ismāʿīlī Masters, for example as early as 724 (1324) to Rāshid al Dīn (Guyard, *Un grand maître des Assassins au temps de Saladin*, *JA*, p 1877, p 165, Dussaud, *Histoire et Religion des Noṣairîs*, p 80) A number of Nusairīs of the tribe of Raslān, whom the emīr of Masyād had allowed to settle in the town under their Shaikh Mahmūd, in 1808 murdered the emir, his son and about 300 Ismāʿīlīs and seized the town The other inhabitants, who had sought refuge in flight, applied for protection to Yūsuf Pāshā, the governor of Damascus He sent a punitive expedition of 4–5,000 men against the Nusairīs, Masyād had to be surrendered by the Banī Raslān after three months' stubborn resistance and the fugitive Ismāʿīlis returned to Masyād in 1810 (Dussaud, *op cit*, p 32, Burckhardt, *Reisen in Syrien*, p 258) In 1812 Burckhardt estimated the population of Masyad at 250 Ismāʿīlī and 30 Christian families The population since then seems to have diminished still further Burckhardt and Lammens found many houses in the town in ruins and large gardens within its walls According to Burckhardt, the land east of the town is a desert moor, while in the north at the foot of the hills the citadel stands on a high steep rock on the west side is a valley, in which the inhabitants grow wheat and oats The town, which lies on the slope of a hill is about half an hour's walk, in circumference Three older gates have been incorporated in the present more modern walls The mosque is in ruins The citadel has an outer wall from which the inner defences are reached by a vaulted passage (G L Bell, *Syria The Desert and the Sown*, p 218) The old citadel is for the most part destroyed, only a few buildings have been roughly restored and in parts are still inhabited

MAṬĀLIʿ [See MATLA]

MATAMMĀ, a town in the Eastern Sūdān (province of Kassala, district of Gallabat) Matammā has a remarkable importance as a market on the Sūdāno-Ethiopic frontier near the route of the caravans between the Abyssinian region of Lake Tānā and Khartūm Its economic value has greatly increased on account of the development of agriculture in the Anglo-Egyptian Sūdān and the new survey of Lake Tānā as a possible reservoir of water to extend irrigation in the Sūdān and Egypt and by this means to increase and intensify the culture of the cotton which is the principal source of prosperity in those countries

Matammā is famous in the recent history of Ethiopia because the Emperor (*Negusa Nagast*) Yohannes IV was defeated and killed in the neighbourhood of this town by the so-called Darāwīsh of the Sūdānese Mahdī, March 10, 1889 A D (1st *maggābit* 1881 of the Abyssinian era) The Emperor was preparing an expedition against Shawā to oblige Menilek, King of that country, to recognise definitely his vassallage to the Ethiopian Crown But, when he was informed that a corps of Darāwīsh had advanced as far as the frontier and that the zone of Lake Tānā with the ancient capital, Gondar, was menaced by the fanatic followers of the Mahdī, he came back to the Northern regions with his army, and met the Darāwīsh at Matammā After a strenuous fight the Emperor Yohannes IV himself was killed and the Abyssinians were defeated The Darāwīsh cut the head of Yohannes and sent it to the Mahdī as a sign of their victory

The battle of Matammā however had no greater value for the Mahdī's followers than a successful razzia they retreated to the Sūdān after pillaging some neighbouring countries and did not occupy any territory of Ethiopia On the contrary, Matammā caused the end of the Northern Abyssinian dynasties, and the southern region — the Shawā kingdom — became the political centre of the Empire, when in the same year, 1889 A D, King Menilek proclaimed himself Emperor (*Negusa Nagast*) as a descendant of the Salomonic dynasty

The death of the Emperor Yohannes as a martyr during the battle against the Muslims, hereditary enemies of the Christian Abyssinians, has been celebrated in many songs and poems The following is a very interesting example of the Abyssinian poetry in recent times

"The Emperor Yohannes was a fool,
and we all despise him!
They said to him "Reign in the middle of the country!"]
He answered "I will be the keeper of the frontier!"]
The Emperor Yohannes was a liar!
He said "I do not like drink"
And we have seen him drinking
a drink which causes the head to turn around!"]

(The last verses allude to the head of the Emperor sent to the Mahdī by the Darāwīsh)

MATGHARA, the name of a Berber tribe belonging to the great family of the Butr, they were related to the Zanata and brethren of the Matmāta, Kūmya, Lamāya, Saddīna, Madyūna, Maghila etc, with whom they form the racial group of the Banū Fātin Like the other tribes belonging to this group, the Matghara originally came from Tripolitania the most eastern members of the Matghara, however, known to al-Bakrī and Ibn Khaldūn were those who lived in the mountainous regions along the Mediterranean from Milyāna and Tenes to the north of Undja (port of Tāhahrīt), those of the western part of this zone were allied with the Kūmya, their mountain rose not far from Nadrūma and the fortress of Tāwunt was on their territory

Three sections had reached the western Maghrib as early as the eighth century and there formed an important bloc These were

1 The Matghara of Fās and the couloir of Tāzā, al-Bakrī observes that the source of the Wādī Fās was on their territory, in the region where Leo Africanus still mentions the *Sūk al khamis* of the Matghara "fifteen miles west of Fās"

2 The Matghara of the Middle Atlas in the Djabal Matghara which Ibn Khaldūn locates S E (*kiblī*) of Fās and which Leo Africanus says is five miles from Tāzā (to the south?) The reference then is to the mountain region now occupied by the Ait Wārāin, an important section of the latter, the Ait Djellidāsen, represents the Banū Gallidāsan

whom al-Bakrī gives as a section of the Matghara, settled near Tenes in Algeria We still find among the Ait Wārāin several sections of the Imghilen who represent the Maghīla, brethren of the old Matghara

In al-Bakrī's time (v^th = xi^th century) these two sections of the Matghara had as neighbours in the west, the Zawāgha of Fāzāz and of Tādlā

3 The Matghara of the oases of the Sahara settled in the region of Sidjilmāssa and in the town itself, in which they constitute the main element of the population, in the region of Figīg, in Tuwāt, Tāmantīt and as far away as Wāllan (Ouallen)

At the beginning of the Arab conquest, the Matghara are represented by Ibn Khaldūn as settled and living in huts built of branches of trees (*khasās*), those of the Sahara lived in fortified villages (*kuṣūr*) and devoted themselves to growing dates In the time of Leo Africanus, the Matghara of the Central Atlas occupied about fifty large villages

Like other peoples belonging to the group of the Banū Fātin, the Matghara took an active part in the events at the beginning of the Arab conquest and weakened themselves considerably in the fighting As soon as they had become converted to Islām, a number of bodies of Matghara went over to Spain and settled there Later like their brethren, the Matmāta, they adopted the principles of the Sufriya, one of their chiefs, Maisara, provoked the famous schismatic rising of 740, which was the beginning in Morocco of the Baraghwāta heresy In a list of the tribes which adopted this heretical teaching we find the Matmāta and Matghara of the Central Atlas, as well as the Banū Abī Nasr, the modern Ait Bū Nsar, the eastern section of the Ait Wāiāin

With the rise of Idrīs, the chief of the Matghara, Bahlūl, declared himself at first a supporter of the caliph of Baghdād, Hārūn al-Rashīd, then rallied to the new dynasty Later and down to the xvii^th century, the Matghara of the Central Atlas do not seem to have played any part in politics, they retained their independence at least From the xvii^th century, they seem to have been supplanted on their territory by invaders from the south As to the Matghara of the shore, settled in the region of Nadrūma, their alliance with the Kūmya gained them considerable political importance, when the latter became supporters of the Almohads It was at this period that they built the fortress of Tāwunt They then rallied to the Marīnids but this brought upon them the wrath of the ruler of Tlemcen, the celebrated Yaghmurāsan, who finally crushed them

Ibn Khaldūn uses the form *Madghara* instead of *Matghara*, in Moroccan texts of late date we also find Madghara

Bibliography al-Bakrī and al Idrīsī, *indices*, Ibn Khaldūn, *Kitāb al-ʿIbar*, transl de Slane, i 237—241, Leo Africanus, *Description de l'Afrique*, ed Schefer, ii 54 and 342, iii 71 and 225 (G S Colin)

MATHAL (a, pl *amthāl*) is originally by etymology, like the Eth *mesl*, *messālē*, Aram *mathlā* and Hebrew *māshāl* (see O Eissfeldt, *Der Maschal im Alten Testamente*, *Beihefte zur Z A T W*, xxiv, Giessen 1913), simile, comparison, as popular sayings commonly appear in this form, the term was applied to them in general and thus obtained the general sense of proverb and popular saying The fondness for similes and allusions, which is common to all primitive cultures, survived among the Semites and especially among the Arabs with great tenacity and therefore plays an important part, even in the higher forms of literature The simplest form of metaphor usually draws parallels between man and beast Of a sleepless man, one says *bāta bi-laylat ankada* (or *ankadha*) "he spent the night like a hedgehog" (Abū Hilāl al-ʿAskarī, *Madjmaʿ al Amthāl*, on the margin of Maidānī, Cairo 1310, i 109, 15, *Lisān al-ʿArab*, iv 437) and with the downrightness beloved by the Arabs the good example and educative influence of a leader or father is described as *bāla himārun fa 'stabāla ahmiratan* or *bāla fādirun fa-bāla djafruhu* (al-Maidānī, *Madjmaʿ al-Amthāl*, Cairo 1310, i 64, 65) The comparison to animals is also used to indicate veiled mockery of unpleasant social conditions as *al-bughāthu fi ardinā yastansiru* "here among us the sparrow plays the falcon" (al-ʿAskarī, i 193, 20) Such proverbs are sometimes developed into regular fables (see Brockelmann, *Fabel und Tiermarchen in der ältern arab Litteratur*, *Islamica*, ii 96—128) Among them we find much that is common to all nations, which it is hardly ever possible to trace back to a single source (cf the discussion on the „goat and knife' *Z D M G*, xlvi 737 *sqq*, xlvii 86 *sqq*), unless the origin is as well known as that of the two bulls from the *Kalila wa-Dimna*, which is given by al ʿAskarī, i 47, 16 *sqq* and therefore ʿAlī cannot have applied it to his relationship to ʿOthmān

But the circumstances of everyday life also provide material for similes which usually take the form *afʿalu min*, as in those which al-ʿAskarī and al-Maidānī quote at the end of each chapter of their collections of proverbs arranged in alphabetical order Even quite banal happenings may pass into proverbs (*fa-sārat* or *dhahabat mathalan* or *durība bihi 'l-mathalu*, as so many Arabic stories end), like the story of Kuʿais of whom we know no more than that his aunt once gave him as a suiet, and never redeemed him (al-Mufaddal b Salama, *al Fākhir*, ed Storey, p 24, N° 61), or the story of the poor woman selling butter of whom a rogue took advantage after inducing her to hold two skins of butter firmly together in her hands (*al-Fākhir*, p 70, N° 147) But the memory of important historical events is also perpetuated in proverbial sayings, like that of the fratricidal war between the Bakr and Taghlib provoked by Basūs (*al Fākhir*, p 76, N° 157), al-Mufaddal in his *al-Fākhir*, p 217—231, and al Maidānī, ii 38—47, therefore give the most notable battles of the Arabs in their lists of proverbs and proverbial allusions Many incidents of the Muslim period have attained equal renown, like Muʿāwiya's exclamation of joy on hearing that al Ashtar had been poisoned (see above, i 504, al Maidānī, i 8, 19) or the memory of the fine voice of the two singers of the bon vivant Caliph Yazīd b ʿAbd al Malik (al Maidānī, i 137, 12) It is however not always epoch-making events that are handed down to posterity in this way, like the stormy night in the time of the Caliph al-Mahdī, which provoked him and his retinue to do such penance (al-Maidānī, i 176, 12), or the story of the defeat and fall of the Khākān, apparently that chief of the Khuttal, whom Asad b ʿAbd Allāh conquered in the year 119 (737), which, according to Tabarī, ii 1616, made a great sensation at the court of Hishām, while Mufaddal in *al-Fākhir*, p 80, 11 *sqq*, refers it to the fighting

against the Khazars, but the historians record no event of the kind among them, or the story of Muʿāwiya's ambassador to the Emperor of Byzantium (Ibn Kutaiba, *ʿUyūn*, p 238, and the proverb ʿAskarī, i 76, 11 *sqq*, Maidānī, ii 72, 4) Such historical memories are frequently preserved in the form of allusions like the famous *ṣaḥifat al-Mutalammis* and the *ḏjaṣṣ Simmār* Many problems of this kind are of local origin, like the allusion to the two equally poor asses of the man from Hīra (Maidānī, i 72, 16) or to the Meccan dandy (Maidānī, i 127, 11), such proverbial allusions are particularly numerous from Medīna (*ibid*, i 168, 6, 173, 20, 261, 18, 264, 2, 280, 25 298, 1), but we also have them from Basra (*ibid*, i 145, 16 and 30, a parallel from Kūfa in Djāhiz, *K al-Hayawān*, v 153, 13), Kūfa (*ibid*, i 192, 15, as a nest of Shiʿīs), Wāsit (*ibid*, i 97, 9) and Hims (*ibid*, i 190, 21) Men celebrated for particular qualities, as in other lands, are frequently commemorated among the Arabs in proverbial sayings, but the popular imagination very often invents the representative of such virtues, when Hātim has to share the reputation for liberality with the Iyādī Kaʿb b Māmā and Harim b Sinān (ʿAskarī, i 223 *sqq*, Maidānī, i 123 *sqq*), this is due to tribal rivalry There are therefore various typical representatives of fidelity (ʿAskarī, ii 251 *sqq*, Maidānī, ii 231 *sqq*), of perspicacity (Maidānī, i 219 *sqq*), and also of stupidity (Dugha *al-Fākhir*, p 24, N° 58, Maidānī, i 147, Shawla *al-Fākhir*, p 71, N° 148, Gothamites of Arabia, the people of al-Hadjar Maidānī, i 178, 19, Abū Ghabshān and others in Maidānī, i 146 *sqq*, 150 *sqq*), the best known is Djuhā, around whom have crystallised the stories of a wandering rogue in the Adab literature (cf Schwally, *Z D M G*, lvi 237) [1]), but we also have the Omaiyad governor of the ʿIrāk, Yūsuf b ʿOmar al-Thakafī (Maidānī, i 99, 31) Memories of Penelope seem to have found their way to Arabia in completely perverted form ("stupider than the woman who continually undid her weaving", which is found as early as Kurʾān, xvi 94, cf ʿAskarī, i 283, 7, Maidānī, i 172, 5) and of Sisyphus "greedier than he who turned the rock" (Maidānī, i 297, 17), among the typical representatives of stupidity and greed respectively

But among Arabic proverbs there are not a few the meaning and origin of which had already been quite forgotten at the time they were put on record, so that Arab writers invented all kinds of explanation for them from pseudo history, with a particular fondness for the Amalekites, not infrequently a choice is given of several stories, as for the "naked warner" (Maidānī, i 31, 20), "the gatherer of acacia shoots of the tribe of ʿAnaza" (*ibid*, i 49, 21, 288, 17), "the repentance of al Kusaʿī" (*al-Fākhir*, p 74) We also find widely disseminated motives, as in the story of Khuzāfa which the Prophet is said to have told his wives (*al-Fākhir*, p 137, N° 280) In many cases the learned editors have gone so far as to invent stories because they passed over the simplest explanation as too easy Thus the saying *hidʾā, hidʾā, waraʾaki bunduka* probably only means "Hawk, hawk, the ball (which was shot from the bow before the invention of fire-arms) is behind you", which Abū ʿUbaida refers to a children's game, al-Kalbī and al Sharkī however take *Hidʾā* and *Bunduka* as names of South Arabian tribes who had fought with one another (*al Fākhir*, p 38, N° 93) Similarly the same writers invent stories of the time of the Amalekites in which *Himār* is a proper name to explain *tarakuhu ḏjawfa himārin*, which al-Asmaʿī rightly takes literally (*al-Fākhir*, p 12, N° 18)

The number of proverbs is naturally very large in which maxims of life, often very trivial, are laid down, they include some which owe their origin to social conditions in Arabia, like "assist thy brother whether he is right or wrong" (*al-Fākhir*, p 119, N° 259) They also include much that is the common property of all nations, the origin of which can rarely be demonstrated, as in the Arabic pendant to the definitely Roman *Res venit ad triarios* in al-ʿAskarī, ii 32, 16 The subject can only be touched on here To the references given by the writer in *Ostas Zeitschrift*, viii 66 *sqq* we may add a few Arabic parallels to our proverbs "Walls have ears" (Maidānī, i 57, 21), "Speak of an angel and you hear his wings" (*ibid*, p 57), "Hammer and anvil" (*ibid*, p 58 18), "A liar must have a good memory" (*ibid*, i 49, 13), "Festina lente" (*ibid*, i 87, 21), "Out of the frying pan into the fire" (*ibid*, ii 25, 9), "To fall between two stools" (*ibid*, ii 64, 7), "To be on tenter hooks" (ii 74, 18), "Hoist with his own petard" (ii 168, 11), "A bird in the hand is worth two in the bush" (*ʿuṣfūrun fi 'l kaffi khaiṛun min kurkiyin fi 'l-ḏjawwi* al Hamadhānī, *Rasāʾil*, Bairūt 1890, p 44, 3)

Among sayings which are international in character those disseminated by religious communities occupy a special position It is of course not an accident, but is quite in keeping with the importance, which is becoming more and more evident, of Christianity for the intellectual life of ancient Arabia, that New Testament sayings are common among Arabic proverbs, notably from the Sermon on the Mount, like Mt 7,2 = Maidānī, ii 67, 17, Mt 7,15 = Maidānī, i 192, 23, Mt 7,16 = Maidānī, i 34, 8, 336, 31, ii 182, 4, ʿAskarī, i 68, Mt 9,24 = Maidānī, ii 113, 23, Mt 17,3 = Maidānī, ii 67, 26, Mt 23,24 = Maidānī, ii 259, 16, Gal 6,7 = Maidānī, ii 73, 12 On the other hand, except for a few echoes of Proverbs and Eccles in which the origin is uncertain, the only one from the Old Testament is Maidānī, i 228, 20, which looks like a quotation from Deut 32,15 From Christian legend we have also the proverbial martyrdom of Djurdjus (*al-Fākhir*, p 256, N° 517) and the story of the Seven Sleepers which appears in various forms (*al-Fākhir*, p 109, 239, Maidānī, ii 196, 14, Kālī, *Amālī*, i 61, cf *M S O S*, v 228) On the other hand, of Old Testament figures we find only Noah once in a late proverb, probably native to Mōsul (Maidānī, ii 250, 11) The Mandaean Creator-deity Fitahil must have gone into the proverb Maidānī, ii 62 *sq*, from the verse of Ruʾba quoted there, to whom it was welcome, like other foreign matter, to give an appearance of learning (see Ahlwardt, *Der Diwan des Ruʾba*, xv) Later tradition also associated with Lukmān [q v], the wise hero of Arab antiquity, sayings attributed to Ahikar and common to many nations

Although the proverb is from its nature anonymous, learned tradition often tries to find authors Many proverbial sayings are therefore attributed

1) The *Nawādir Djuhā al-Kubrā*, ed Hikmet Bek Sharif, Cairo 1346 (1928) are for the most part from the Turkish Nasraddīn

to the Prophet and his Companions The *Amṯhāl al-Nabī*, which circulated outside the canonical collections of Tradition were collected by Ibn Khallād al Rāmhurmuzī (*Fihrist*, p 155) and Abū Hilāl al-ʿAskarī, al-Maidānī accuses the latter of being uncritical and quotes in his preface as an example of genuine Hadīth the parable of the good and bad companion in Bukhārī, *Sahīh* (ed Krehl, ii 17) This does not prevent him however from putting in his collection a series of sayings of the Prophet, as his predecessors had done, and at the end of his book compiling a special chapter of them, which also includes sayings of the first Caliphs Special popularity was always enjoyed — not only among Shīʿīs — by sayings attributed to ʿAlī Ibn Kutaiba in his *ʿUyūn al-Akhbār*, in the fifth book, *K al-ʿIlm wa 'l-Bayān* (cod Kopr, fol 155b), already uses a collection of this kind, such as was current in various recensions (anonymous in *al-Tuhfa al bahīya*, Stambul 1302, p 107—114), e g in alphabetical order by ʿAbd al-Wāhid b Muhammad al-Āmidī, about 510 (1116), entitled *Ghurar al-Hikam wa-Durar al-Kalim*, lith Bombay 1280 and also edited in Persian and Turkish (s i 299, and also W Yule, *Apophthegms of Alee the son of Aboo Talib* [*Matlūb kull Tālib*] *with an early Persian paraphrase and an Engl translation*, Edinburgh 1832, *Sad Kalima'i Mawlā'i Muttakiyān Amir al-Mu'minīn*, Teherān 1304, *Nathr al-La'ālī*, the second coll in Fleischer, with Turk paraphrase by Muʿallim Nādjī entitled *Amthāl ʿAlī*, Stambul 1313, with Turk comm by Nasīb entitled *Rishta'i Diawāhir*, Stambul 1257)

Numerous also are the proverbs which have a metrical form, while it is impossible to say whether the poets, in whose *Dīwāns* they are, originated the idea or only gave it its form Al Sukkarī (*Fihrist*, p 78) and ʿUyaina b al-Minhāl (*ibid*, p 48, 108) collected such *abyāt sā'ira* A fine collection has been made by al-Ibshīhī in the *Kitāb al-Mustatraf*, Cairo 1320, i 27 *sqq* Among such metrical sayings are some by the greatest poets of the pagan period like Tarafa (*al-Fākhir*, p 254, 509, al-Maidānī, i 161), Imraʾalkais (ʿAskarī, i 255 = Maidānī, i 133), Lebīd (ʿAskarī, i 37) and by later poets like al-Farazdak (*al-Fākhir*, p 250, N⁰ 496, al-ʿAskarī, ii 46) and Mutīʿ b Iyās, whose two palms of Hulwān (ʿAskarī, i 297, 452, Maidānī, i 297) are famous From a misunderstanding of a verse of Farazdak's in which the way to ʿUnsulain is mentioned (Maidānī, i 38, quoted by Yākūt, iii 736), this verse became typical of taking the wrong way Al-Mutanabbī's verses that have passed into the language have been collected by Ismāʿīl al-Tālakānī, d 385 = 995 (Yākūt, *Irshād*, vi 501—518, Suyūtī, *Bughyat al-Wuʿāt*, p 35), in *al-Amthāl al sā'ira min Shiʿr al-Mutanabbī* (*Fihrist*, Cairo², iii 23)

Proverbs excited the interest of the learned from the very beginning of Arabic literature, historians and philologists emulated one another in collecting and explaining them Thus we find among the sources of the works that have survived to us the old historians and genealogists like al-Sharkī b al-Kutāmī (Wustenfeld, *Geschichtschreiber*, N⁰ 23) and ʿAwāna b al-Hakam (*ibid*, N⁰ 27) and Abu 'l Yakzān (*ibid*, p 36, *al Fākhir*, p 253), the two former very often as authorities for Hishām b al-Kalbī, to whom with the great monographist Muhammad b Habīb (Wüstenfeld, N⁰ 59), Zubair b Bekkār (*ibid*, p 61) and al-Madāʾinī (*ibid*, p 47), we owe most of the legendary and historical material Almost all the philologists of note have devoted special works to the subject To their interest in language is to be ascribed the fact that the limits of the scope of the subject are extended to include phrases and idioms which have really nothing to do with the proverb and, as for example *laʿanahu 'llāhu* (*al-Fākhir*, p 7), do not seem to require explanation, but we owe, for example, to al-Mufaddal the interesting note that it had become a habit with some Syrian Arabs to use the Greek φησιν, "says he" The oldest work of the kind that has survived is the *Kitāb al-Amthāl* of al-Mufaddal al-Dabbī († 170 = 786), pr Stambul 1300 The next oldest, that of Abū ʿUbaid al-Kāsim b Sallām al-Harawī (d about 223 = 837), is preserved in a number of Stambul MSS (s Rescher, *Z D M G*, lxiv 517, N⁰ 43, *M S O S As*, xiv 6, *M O*, vii 123), and in the Escurial (Derenbourg, Lévi-Provençal, N⁰ 1757), also the commentary by ʿAbd Allāh al-Bakrī (d 487 = 1094), *ibid*, N⁰ 526 and I ālelī, N⁰ 1795, printed as N⁰ 1 of the *al-Tuhfa al-bahīya*, Stambul 1302, p 2—16, on the other hand, the work dealt with by E Bertheau in his Diss, Gottingen 1836 (s Freytag, *Arabum Proverbia*, iii, vii — xi) is much more recent The *Kitāb al-Fākhir* of al-Mufaddal b Salama, a pupil of Ibn al-Aʿrābī (d 231), has been edited by C A Storey for the "De Goeje Foundation", Leyden 1915 The specially numerous proverbs of the form *afaʿlu min* were collected by Hamza al-Isfahānī (d between 450–460 = 960—970) in a work which only survives in a unique MS in Munich (see Mittwoch, in *M S O S As*, 1909, p 33 *sqq*), which was much used by later writers, and copied word for word by al-Maidānī for the corresponding section of his book Abū Hilāl al-ʿAskarī (d after 395 = 1005) compiled the *Djamharat al-Amthāl*, extant in several MSS in Stambul (see Rescher, *Z D M G*, lxiv 513, *M F O B*, v 501, *M S O S As*, xiv 36) and printed at Bombay in 1306—1307 as well as on the margin of Maidānī (Cairo 1310), in which an attempt was made for the first time to annotate each proverb from the philological and historical point of view, excluding all post classical material, to which Hamza had allotted considerable space Al-Maidānī [q v] collected the material compiled by his predecessors in his *Madjmaʿ al-Amthāl* and expanded each section by an appendix on modern proverbs This has since then been regarded as the standard work on the subject and not even Zamakhsharī's *Kitāb al-Mustakṣā fi 'l-Amthāl*, although also much read (to the MSS mentioned in *G A L*, i 292, xiv may now be added the following in Stambul, *M S O S As*, xiv 15, *R S O*, iv 708, *M O*, vii 97, 102, 123, also Āghā, N⁰ 991, Dāmādzāde, N⁰ 1557, Scutari, *Z D M G*, lxviii 58, Brussa, *ibid*, p 50, Mōsul, Dāwūd, *al-Makhtūtāt al-Mawsiliya*, p 329, 37 Cairo, *Fihrist*², iii 355), could according to Hādjdjī Khalīfa, N⁰ 11421, permanently affect its popularity Al Māwardī's [q v] book, like the different collections of sentiments made by al-Zamakhsharī, was from the first intended to deal rather with the literature than with the language of the people

It was not till the xixth century that interest in the east was again aroused in proverbs under the influence of European scholarship Almost all works on modern Arabic dialects contain collections of proverbs (cf the lists which could of

course now be very much extended in A Fischer, *MSOS As*, i 198—199 and E Littmann, *Arabic Proverbs collected by Mrs A P Singer*, Cairo 1913, p ix), in addition to the works by modern Orientals there quoted we may mention Ibrāhīm Sarkīs Lubnānī, *al-Durra al-yatīma fi 'l Amthāl al-kadīma*, Beirūt 1871, Mahmūd Ef ʿOmar al-Bādjūrī, *Kitāb Amthāl al mutakallimīn min ʿAwāmm al-Misrīyīn (alladhi kadidamahu fi 'l-Muʾtamar al-ʿilmī al-thāmin bi-Bilād al-Sudd wa 'l-Norwedj min Mamālik Ūrūbā Sanat 1889 mil)*, Cairo 1311, Tāhir b Sālih al-Djazāʾirī (cf M Kurd ʿAlī, in *RAAD*, viii 576—596, 666—679), *Ashar al Amthāl*, Cairo 1338, cf O Rescher, *Ethnologisches im arabischen Spruchwort*, *Isl*, ii 98–101, iii 178

(C Brockelmann)

AL-MATHĀNĪ, a term of uncertain meaning which occurs twice in the Kurʾān, namely in Sūra xv 87 "and we have brought thee seven of the *mathānī* and the noble Kurʾān", and Sūra xxxix 24 "Allāh sent down the most beautiful recital, a book which is in harmony with itself, *mathānī*, at which the skin of those who fear their Lord creeps"

The interpretation of the word is made more difficult by the fact that in the latter passage it seems to mean the Kurʾān itself, in the former, on the other hand, something similar to the Kurʾān

In Tabarī (*Tafsīr*, xiv 32 *sqq*, cf xxiii 124 *sq*) we find the following opinions

a Mūsā was given six out of the seven *mathānī*, two were lost when he broke the tablets The seven *mathānī* are like seven long sūras, i e ii–vii and a seventh, on the identity of which there is a difference of opinion, it is either Sūra x or viii and ix combined

b The seven *mathānī* mean the *Fātiha* which contains six verses These with the *basmala* in the beginning make seven It is called the *mathānī*, i e repetitions, because it is repeated in the salāt's at each *raʿka* This explanation is supported by quoting the term *mutashābih* ("in harmony with itself") which immediately precedes the word *mathānī* in Sūra xxxix 24

c The *mathānī* means the Kurʾān in general

Hadīth hesitates among these interpretations *a* (Tirmidhī, *Tafsīr*, Sūra ix, trad 1, cf Bukhārī, *Adhān*, bāb 106) and *b* (Bukhārī, *Tafsīr*, Sūra i, bāb 1, Sūra xv, bāb 3, *Fadāʾil al-Kurʾān*, bāb 9, Tirmidhī, *Tafsīr*, Sūra xv, trad 3, 4, Nasāʾī *Iftitāh*, bāb 26)

Nor is there any unanimity in explaining the form *mathānī* Baidāwī on Sūra xxxix 24 gives as the singular *muthannan*, *muthnan* or *muthnin* Zamakhsharī gives *mathnā* The latter form is found in the Kurʾān (Sūra iv 3, xxxiv 45, xxxv 1) and in Hadīth (Bukhārī, *Salāt*, bāb 84, *Witr*, bāb 1, *Tahadjdjud*, bāb 10, Muslim, *Musāfirīn*, trad 145—148, Tirmidhī, *Salāt*, bāb 206 etc) as a distributive, meaning "occurring in pairs" This meaning however would not be at all suitable for *mathānī*

Geiger (*Was hat Mohammed aus dem Judenthume aufgenommen?*, p 57 *sq*) has already compared the Hebrew *mishnā* (Aram *mathnīthā*) According to him then *mathānī* would mean the Kurʾān itself as a whole His suggestion is approved by Noldeke-Schwally (*Geschichte des Qorāns*, p 114 *sq*) Attention might further be called to the fact that *mishnā* means a single law as well as the whole codex and from this could be derived the double meaning of *mathānī* (separate verses and the whole Kurʾān), a derivation which could be supported by the parallel double meaning of the word Kurʾān (single revelation and all revelation as a whole)

Sprenger (*Das Leben und die Lehre des Mohammad*, Berlin 1861, i 463 *sq*) explains the word from the Hebrew *shānā* "to repeat" and the conception from Sūra xxxix 24, from which it would appear that the *mathānī* are part of the stories of punishment This view has been adopted by D H Muller, *Die Propheten in ihrer ursprunglichen Form*, i 43, 46, note 2, H Grimme, *Mohammed*, ii 77, N Rhodokanakis, in *W Z K M*, xxv 66 *sq*, J Horovitz, *Koranische Untersuchungen*, p 26 *sq* This would imply that, at least when Sūra xv 87 was revealed, there were seven of these legends of punishment

Early evidence of the use of the word outside of the Kurʾān is found in a poem of Abu 'l-Aswad al-Duʾalī (text and transl by Noldeke, in *Z D M G*, xviii 236 *sq*, cf thereon Bevan, in *J R A S*, 1921, p 584 *sq*, Horovitz, *op cit*) Here the *mathānī* are mentioned along with the *Miʾūna*, "the seven versed" along with the "hundred versed" sūras of the Kurʾān The exact content of these groups is unknown

In conclusion it may be mentioned that Goldziher (*Z D M G*, lxi 866 *sqq*) has called attention to a term *mathnāt*, which occurs in non-canonical tradition and is obviously a new formation modelled on the Hebrew *mishnā*

(A J Wensinck)

MATHNAWĪ, a form of poetry in which each *bait* (verse) is normally a self-contained whole, grammatically complete and with the two *misrāʿs* (hemistichs) rhyming with one another and not — except accidentally — with the verses that follow In Persian, Turkish, Turkī and Urdu, poetic compositions of any length dealing with epic, romantic, ethical or didactic themes are of the mathnawī form, which probably originated in Persia Dawlatshāh (ed E G Browne, p 29) relates a tradition that in the time of the Dailamite ʿAdud al-Dawla (d 372 = 982) there was still to be found inscribed on the palace at Kasr-i Shīrīn a *bait* in "Old Persian" having the two hemistichs rhyming There would appear to be no pre Islāmic Pahlawī verse of the kind extant, and the mathnawī form may be merely a development or expansion of the *matlaʿ* of the *kasida* or *ghazal* However that may be, in the oldest fragments of Muslim Persian literature that have come down to us, there are examples of the mathnawī as of the other forms of verse Of these fragments the oldest belong to the work of Abū Shukūr of Balkh, who is said, probably on that account, to have invented the *genre* They appear to be parts of a series of narrative mathnawīs (cf Asadī's *Lughat i Furs*, ed P Horn, p 29 of the Persian, and also p 22 *sq*) Alongside of them are to be found sufficient portions of the work of Rūdagī (a later contemporary of his), to indicate that he also used the same form

for a translation of the *Kalīla u-Dimna* (Asadī, *op cit*, p 19 *sqq* and Dawlatshāh, p 31) There is also a couplet in the *hazadj* metre indicating an erotic mathnawī (Asadī, p 48, cf Ethé, *Rudagī*, in *N G W Gott*, 1873, p 735 *sqq*)

The first complete poem that has survived of the *genre* is the *Shāh-nāma*, begun by Dakīkī and completed by Firdawsī Actually, apart from the arrangement of the rhyme, it is not of the regular mathnawī type More characteristic is Firdawsī's *Yūsuf u-Zalīkhā*, composed in the same metre (the *mutakārib*) It begins with a number of introductory sections of which the first is in praise of Allāh and the rest are headed respectively, "In praise of the Prophet", "In description of the king of Islām", "On the cause of the revelation of the Sūra of Joseph", "On the reason for setting down this narrative", etc Then comes the story proper, commencing with the description of Jacob's working for Rachel and pursuing its way through the various episodes of Joseph's career until he becomes treasurer to the house of the vizier Poti phar, whose wife Zalīkhā falls in love with the youth When he refuses her advances she denounces him for wizardry to her husband Here is introduced the often illustrated incident of the Egyptian ladies who, at a feast to which they had been invited by Zalīkhā, catch sight of Joseph and are so astounded by his beauty that, without being conscious of what they are doing, they peel the skin from their hands instead of keeping their knives for their oranges Then comes the account of the imprisonment of Joseph, the events that lead to his release and exaltation, the confusion of the wicked brethren, the repentance of Zalīkhā, her rejuvenescence and marriage to Joseph, and the death of Jacob

A contemporary of Firdawsī's, ʿUnsurī, is credited with a mathnawī romance which has not survived *Wāmik u-Adhrā* What purports to be a version of the story is given in a Turkish mathnawī by Lāmiʿī (d 940 = 1533), according to which, Wāmik, a priest in a fire-temple, is described as having fallen in love with Adhrā, a maiden devoted to the cult They are forced to part, Adhrā going to the frozen regions of the North and Wāmik to the torrid lands of Ethiopia They pine away in separation, and dying are turned into stars The maiden becomes *Virgo* holding *Spica* in her hand, while Wāmik becomes *Arcturus* The story bears marks of being of Pahlawī origin, the Arabic names being only translations

Of mathnawīs which have survived there follow chronologically two works of Nāsir-i Khusraw, namely the *Rawshanāʾī-nāma* and the *Saʿādat-nāma*, two ethico-didactic poems written in the *hazadj* metre After them in time is usually put the romance of *Wīs u-Rāmīn*, ascribed by ʿAwfī to Fakhr al-Dīn Gurgānī (d 440 = 1048), who is said to have derived it from the Pahlawī In the version which has come down to us (ed W N Lees, Calcutta 1865), we have a tale of passion unrestrained, which Pizzi (*Poesia Persiana*, II 88) characterizes as a vulgar product of India in Akbar's time In the tale, Wīs or Wīsa, the wife of Mōbad, king of Merw, has for her paramour her husband's brother Rām or Rāmīn, who proves unfaithful to her but in the end marries her after Mōbad has been killed If the work is genuine, it marks a step in the differentiation of the romantic from the epic mathnawī, being composed in the *hazadj* and not the *mutakārib* metre which had hitherto been common to both

The true creator of the romantic mathnawī is Nizāmī of Gandja, who, after beginning with the composition in that form entitled the *Makhzan al Asrār* — a collection of ethical and religious maxims interspersed with anecdotes, — wrote in succession the four other works which form his *Khamsa* or *Pandj Gandj* This quintet provided the model for all subsequent mathnawī writers Strictly speaking, only the second, third and fourth of them are romances, namely (a), the *Khusraw u-Shīrīn*, the story of the love of the Sāsānian prince Khusraw Parwīz for the Christian princess Shīrīn, who is also loved by the mighty builder and engineer Farhād, and of the latter's betrayal and tragic end, (b), the *Laylā u-Madjnūn*, the scene of which is laid in the desert and which shows the two lovers prevented from union by the hatred of their families for one another, and (c), the *Haft Paykar*, which has Bahrām Gūr as its hero and consists of seven tales, each told to the king by one of his seven favourite wives The *Sikandar nāma*, which forms the fifth of the group, treats of the life of Alexander in epic style, but with a mystical touch in the later passages which makes him a prophet as well as a conqueror Each of the five mathnawīs is prefaced by introductory sections similar to those in Firdawsī's *Yūsuf u Zalīkhā*, with the necessary changes for the names of patrons etc and with a further section headed "On the *miʿrādj* of the Prophet" added in the works which follow the *Khusraw u-Shīrīn* Every imitator of Nizāmī's mathnawīs copies him in this respect as in others, so that even the xviiith century Judaeo-Persian *Danīāl nāma* (by Khwādja Bukhārī, British Museum, MS Or 4743) has this introductory matter, though Moses is substituted for Muhammad in the section devoted to the Prophet

The chief imitators of Nizāmī are, in Persian, Djāmī, in Turkish, Shaikhī with his *Khusraw u Shīrīn* and Fudūlī with his *Laylī u Madjnūn*, in Turkī, Mīr ʿAlī Shīr Nawāʾī with his *Khamsa*, and in Urdu, Amīn with a *Yūsuf u-Zalīkhā*, Tadjallī with a *Laylā u Madjnūn*, etc (cf G de Tassy, *Auteurs Hindoustanis*, Paris 1885, p 30 *sqq*)

The Mathnawī *par excellence*, i e the *Mathnawī-i Maʿnawī* of Djalāl al-Dīn Rūmī, is in a class by itself, being a long medley of the doctrines of Sūfīism combined with parables, allegories, and pseudo-historical narratives It is without the preliminary sections characteristic of the romantic mathnawī

Arabic contains no poems of the mathnawī *genre*, but poems having the two *miṣrāʿ*s of each *bait* rhyming together independently of the rest are known The arrangement of the rhyme is known as *muzdawidja* Short specimens translated from Persian are quoted in Thaʿālibī's *Yatīmat al-Dahr* (iv 23), and there are longer compositions, metrical grammars, by Harīrī (*Mulhat al-Iʿrāb*) and by Muhammad b Mālik (*Kitāb al-Alfīya*) (for both of which see de Sacy, *Anthologie Arabe*, p 134 *sqq* and 145 *sqq* of the Arabic text and p 325, 356 of the notes)

The metres normally associated with the *mathnawī* form are those used by the masters in their compositions, *viz*, in addition to those mentioned above, the *sarīʿ* and *khafīf* used by Nizāmī for *Makhzan al-Asrār* and the *Haft Paykar* respectively,

and the *ramal*, used by Ḏjalāl al-Dīn Rūmī in his *Maṯnawī* and by Farīd al Dīn ʿAṭṭār in the *Manṭik al-Ṭair*

Bibliography in addition to the works quoted above, cf Ethé, in the *Grundriss d iran Philologie*, F Rückert, *Grammatik, Poetic und Rhetorik der Perser*, ed W Pertsch, Gotha 1874, E J W Gibb, *History of Ottoman Poetry*, and Aga Ahmad ʿAlī, *Haft Āsmān* (*Bibliotheca Indica*), Calcutta 1873

(R Levy)

MATHURĀ, name of a city, situated in 27° 31′ N latitude and 77° 41′ E longitude, and of a district of the same name in Northern India The site of the city was of importance in the Buddhist period, as is proved by the numerous inscriptions and pieces of sculpture that have been found there In later Hindu times it attained sanctity as the reputed birthplace of the god Krishṇa and the temples erected there acquired great wealth and reputation In 1017 Mahmūd of Ghazna [q v] captured the city and levelled all the temples to the ground, there is no further record of the city until the reign of Sikandar Lodī, Sultān of Dihlī (1488–1516), who destroyed all the temples that existed in Mathura in his time The city was practically refounded in the reign of Akbar, who visited the sacred site and gave permission for the erection of four temples, the ruins of which still exist In 1669 Awrangzēb destroyed a vast temple that had been built in the reign of Ḏjahāngīr and changed the name of Mathurā to Islāmābād, but like many other Muhammadan designations of towns in India it failed to displace the original name of the city With the break-up of the Mughal empire after the death of Awrangzēb, Mathurā suffered from the political confusion in which all the country between Dihlī and Āgra was involved, and at one time or an other passed into the hands of the Ḏjāts, the Marathas and finally the British

In the centre of the modern city stands the mosque erected in 1661 by ʿAbd al-Nabī Khān, who was appointed governor of Mathurā by Awrangzēb in 1659 The Muslims number 13,475 out of a total population of 56,666 (in 1921)

al-MATĪN [See Allāh]

MAṬLAʿ, Maṭāliʿ, ascension Two kinds of ascension are distinguished

1 Ascension in the sphaera recta R — Modern astronomers use the expression right ascension for all points of the heavens, the older astronomers only for those of the ecliptic The right ascension R is found by drawing a circle of declination which is perpendicular to the equator through the corresponding points of the ecliptic. With us and as a rule with the Arabs the right ascension of the arc of the equator is between the beginning of Aries, the vernal equinox and the intersection of the circle of declination with the equator Many Arab astronomers calculate the ascension R' from the beginning of Capricorn, then $R' + 90°$ gives the degree of the equator which rises at the time at which the corresponding degree of the ecliptic culminates The ascertainment of this is, according to Suter, of importance for certain astrological purposes If in fig 1, the point A or the star S of the ecliptic rises above the horizon, the point B of the equator, the poles of which are P and P', rises at the same time, γB is therefore the ascension of the arc γA of the ecliptic in the sphaera recta

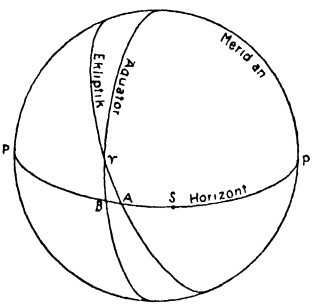

Fig 1

One also talks of the ascension of a sign of the zodiac, it is the arc of the equator which rises contemporaneously with the 30° of this sign The longitude of the ascension generally varies with the different signs, but from time to time is the same for those which are similarly situated at the beginning of Aries or of Libra, and for those which are at the beginning of Capricorn or of Cancer

The *maṭāliʿ* in the sphaera recta are therefore so important (for astronomical purposes also) because in stereographic projection they give the curves corresponding to the degrees of the ecliptic, according to which the ecliptic, which is projected as a circle, is to be divided on the astrolabe

Tables for the right ascensions have been prepared by numerous Muslim scholars, e g by Muhammad b Mūsā al-Khwārizmī, al-Battānī, al-Bīrūnī etc

If the point being observed does not lie on the ecliptic, the *maṭāliʿ* are those of the degrees of the equator, which run at the same time as the star through the centre of the heavens i e the upper meridian (*tatawassaṭ*), quite in keeping with the modern definition

The ascension in the sphaera recta is called *maṭāliʿ* (often with the addition of *al-burūḏj* = the sign of the zodiac) *fi ʾl-Falak al-mustakīm* (M in the sphaera recta), *M li ʾl-Burūḏj fī Khaṭṭ al-Istiwāʾ*, *M al-Burūḏj bi-Khaṭṭ al Istiwāʾ*, *M fī Mawḍiʿ Khaṭṭ al-Istiwāʾ*, *M al-Kura al-mustakīma*, *M al-Kura al muntaṣiba* or *fi ʾl-Kura* etc, *M al-istiwāʾīya* and *al-falakiya*

If one calculates from the degree of Capricorn, the right ascension is also called *maṭāliʿ al kubba* (i e *Kubbat al-Ard*, "M of the dome", namely of the dome of the earth)

2 The ascensio obliqua (fig 2) of a point A in the ecliptic at any point is the curve $\gamma\ B$ of the equator the poles of which are P and P', between the beginning of Aries and the horizon

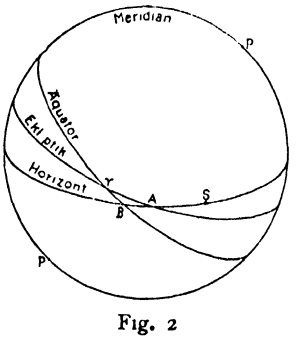

Fig. 2

at the moment in which this point rises (for any particular star S substitute "star" for "point of the ecliptic", it is often also made to begin at Capricorn)

Tables for the ascensio obliqua can only be given for particular places as they differ from place to place The ascensio obliqua however can easily be calculated from the ascensio recta

The ascensio obliqua is called *Matāliʿ al-Balad*, *M al-Buldān*, *M al Iklim* (of the clime), *M fi 'l-Balad*, *M fi 'l-Iklim*, *M al baladiya*, *M al-ufkīya*, *M fi 'l Afluk al mā'ila*, *M al-Burūdj fi 'l-Kura al mā'ila*, *M al-Shuruk* We may also note the terms *M al Nazir* and *M al-Wakt*

Ascensio recta might perhaps be translated direct or spherical ascension and ascensio obliqua by local ascension

Arab astronomers, following Ptolemy, have proposed the following formulae for the ascensio obliqua If ε is the plane of the ecliptic, δ the declination of the point A on the ecliptic, a_1 its right ascension and r the number of parts (usually 60) into which the radius is divided (with the later Arabs and modern astronomers $r = l$) then according to al Khʷārizmī and al-Battānī, we have

$$\sin a_1 = \frac{\sin \delta}{\cos \delta} \frac{\cos \varepsilon}{\sin \varepsilon} r = \text{tg ctg}$$

The ascensio obliqua a_2 is for the latitude ϕ

$a_2 =$ ascensio recta $(a_1) +$ arc $(\sin \frac{\sin \phi}{\cos \phi} \frac{\sin \delta}{\cos \delta}) =$

$a_1 \pm \arcsin (\text{tg } \phi \text{ tg } \delta)$ At the same time it is to be observed that al-Khʷārizmī (d about 850) and al-Battānī, who published his book before 900, give the formula with sine and cosine, while Habash al Hāsib, who made his observations between 825 and 835, uses tangents and cotangents

To ascertain the ascension, the above formulae are used if tables are not available But one can also use one of the many apparatus which are made for the mechanical solution of such problems The simplest of these is the armillary sphere (see Nolte quoted in KURA) and the globe with the arm (see Schnell quoted in KURA) as in both cases the heavens can be used as the largest circles There are also the monographic methods, in which projections of the sphere of heavens are used, as in the astrolabe (s J Frank, *Die Verwendung des Astrolabs nach al-Khʷārizmī*, *Abhandl zur Gesch. der Naturwissensch* etc, Heft III, 1922), the universal plane, the Zarkālī plane (see an article to be published later by Mittelberger), Werner's meteoroscope (*Joannis Verneri de Meteoroscopis*, publ by J Würschmidt, *Abhandlungen zur Gesch d Mathematik*, Heft XXIV/II, 1913) and the *mu kanṭara* quadrants. On the sine quadrants, the system of lines which enable the sine and cosine to be read off, the above formulae can be obtained with the help of the latter (on the quadrants see P Schmalzl, *Zur Geschichte des Quadranten bei den Arabern*, Munich 1929)

Along with the matāliʿ, the *maghārib* also were ascertained If one is observing, not the rising but the setting points, the corresponding curves are called *maghārib* (a table for the latter is given by al-Bīrūnī in the Masʿūdic Canon)

Addendum Among the Greeks and Arabs and European astronomers of the XIIIth–XVIth century σφαῖρα means 1 the globe or geometrical sphere, 2 the space between two surfaces of two concentric spheres, a shell of a sphere, 3 the circle which corresponds to the assumed path of a heavenly body, i e the ecliptic, the epicyclus, the eccentric circles – The Arabic *kura* has only the first meaning, the word *falak* the second and third, the second in the theory of Ibn al-Haitham (see al-Kharakī) The sphaera recta, *al-falak al mustakīm* is the sphere of the heavens, i e for the inhabitants of the equator, in the Latin translation of the tables of al-Khʷārizmī (table 59) it is said of the ascension in the sphaera recta "horoscopus secundum terram Arin" (Arin is a corruption of Azin-Udjain = Ujjayinī in Sanskrit, which was erroneously taken to be the *kubbat al-ard*, dome of the earth, the centre of the equator and of the inhabited world) At all places which do not lie on the equator, there is a sphaera obliqua so that these are innumerable

Bibliography Ptolemy, *Almagest*, ed Heiberg, *passim*, *al-Battānī Opus astronomicum* etc, ed C A Nallino, H Suter, *Die astronomischen Tafeln des Muhammed Ibn Mūsā al Khʷārizmī* etc [cf also AL-KHʷĀRIZMĪ] and numerous works on astronomy — (I am much indebted to Prof Nallino for a number of suggestions) (E WIEDEMANN)

MAṬMĀṬA, the name of a Berber tribe, belonging to the large family of the Butr, and brethren of the Matghara, Kūmya, Lamāya, Saddīna, Madyūna, Maghīla, etc They formed with them the ethnic group of the Banū Fātin who, like all the other Butr, seem to have had their original home in Tripolitania

Our chief source of information about the Matmāta are al-Bakrī and Ibn Khaldūn As with the majority of the Butr Berbers, three principal divisions can be distinguished

1 Elements settled in the eastern Maghrib not far from their original home these are the modern Matmāṭa in Southern Tunisia, some 30 miles S W of Gābes

2 Elements which have settled in the Central Maghrib first in the plateaus of the Sersū, in the N E of Mindās, then having been driven out of this territory by the Zanāta Banū Tūdjīn, they sought refuge in the mountainous massif of of Wānsharīs (the modern Ouarsénis)

3 Elements which have migrated as far as Morocco In the fourth (tenth) century we find them in the country of the modern Kabdāna (to the S E of Melilla) and in the upper valley of the Moluya at Amaskūr Ibn Khaldūn also mentions a little isolated group settled on the mountain

which bears their name between Fās and Ṣufrūy, here must also have been some of them in the ouloir of Taza for a place between Fās and Taza till bears their name Finally we owe to al-Idrīsī he record of the most western body the Matmāṭa of Tāmasnā

The Matmāta played a fairly important part in he early centuries of Islām Those of the central Maghrib had adopted Abādī doctrines, being conquered by the Sanhādja and Zanāta, many of them migrated to Spain The most famous member of his people was Sābik b Sulaimān, the famous Berber geneaologist, so frequently quoted by Ibn Khaldūn

Bibliography al Bakrī and al-Idrīsī, *Indices*, Ibn Khaldūn, *Hist des Berbères*, transl de Slane, I 246—248 (G S COLIN)

MATN (A), a term with different meanings (cf the lexica, s v), of which that of text, especially that of the text of a tradition, deserves to be mentioned here

Matn occurs in the sense of text already in pre-Islāmic poetry and is used in this sense in Arabic literature up to the present day It denotes especially the text of a book as distinguished from its oral explanation or its written or printed commentary

In connection with traditions matn denotes the contents as distinguished from the chain of traditionists who handed it down (*isnād*)

Bibliography Goldziher, *Muhammedanische Studien*, II 6 *sqq* (A J WENSINCK)

MATRAH, a town on the Gulf of ʿOmān, two miles west of Masḳat on the east coast of Arabia The town, which has about 14,000 inhabitants, is the starting point for caravan traffic into the interior of Arabia and, next to Maskat, the most important commercial centre in ʿOmān The town is beautifully situated in fertile surroundings, has a good harbour, easily entered but little sheltered, from which Maskat can be reached in an hour by boat The sultāns of ʿOmān used to have wharves for shipbuilding here and the textile industry was not unimportant (spinning and weaving) A fort built by the Portuguese still stands as a memorial of their rule in ʿOmān According to Wellsted, the town used to have 20,000 inhabitants

MĀTURĪDĪ, ABŪ MANṢŪR MUḤAMMAD B MUḤAMMAD B MAḤMŪD AL ḤANAFĪ AL MUTAKALLIM AL-MĀTURĪDĪ AL-SAMARḲANDĪ is the titular head of the Māturīdite School of theology which, with the Ashʿarite School, form orthodox Sunnite Islām The two Schools are equally orthodox, but there has always been a tendency to suppress al-Māturīdī's name and to put al-Ashʿarī forward as the champion of Islām against all heretics except in Transoxiana (*Mā warāʾ al-Nahr*) where his School has been, and is, the dominant, representing the views of *ahl al-sunna wa ʾl-ǧamāʿa* Next to nothing is known of al Māturīdī's life, but he died at Samarkand in 333 (944), a contemporary of al-Ashʿarī who died a little earlier about 330 (941), while al Ṭaḥāwī [q v], another contemporary, died in Egypt in 331 All three represented the movement, which must have been very widely spread, to defend orthodox Islām by the same weapons of logical argument with which the Muʿtazilites had attacked it Māturīd or Māturīt is a locality (*mahall*, *karya*) in Samarḳand Its geographical reality and the identity of Abū Mansūr al-Māturīdī are assured by the article Māturītī in the *Ansāb* of al-Samʿānī (fol 498b, l 4, cf also Barthold, *Turkestan down to the Mongol Invasion*, *GMS*, p 90, notes 9 and 10, p 267, note 5, and the Russian references there) The books of Ḥanafite *Ṭabakāt* give the names of his teachers, but to us they are names only (see Ibn Ḳuṭlūbughā [ed Flugel, N⁰ 173] and Flugel's *Hanefiten*, p 274, 293, 295, 298, 313) The Saiyid Murtaḍā in his little treatise on Māturīdī, inserted in his commentary on the *Iḥyāʾ* (II 5—14), complains that he has found only two biographies and that both are short (*ʿala ʾl ikhtiṣār*) Even Yāḳūt in his *Muʿǧam* has no mention either of him or of Māturīd Ibn Khaldūn in his sketch of the origin and history of *Kalām* (*Mukaddima*, transl de Slane, III 55 *sqq*, ed Quatremere, III 38 *sqq*) has no place for him and speaks only of Ashʿarī and the Ashʿarites For Ibn Ḥazm (d 456 = 1064, *Fiṣal*, ed Cairo 1320, II 111) the orthodox opponent of al-Ashʿarī is Abū Ḥanīfa and he has no mention of al-Māturīdī Similarly Shahrastānī (d 548 = 1153, *Milal*, transl Haarbrucker, I, p 159, text on margin of Ibn Ḥazm, I 188) gives the views of Abū Ḥanīfa but does not mention Māturīdī Abū Ḥanīfa, he says, inclined to the Murdjiʾites and his followers were even called the Murdjiʾites of the Sunna, meaning, apparently, a form of Murdjiʾism consistent with orthodoxy Similarly the Saiyid Murtaḍā (*loc cit*, p 13 foot) says that the Muʿtazilites claimed Abū Ḥanīfa for themselves and rejected his authorship of one book because it was too flatly against their positions The truth evidently was that Abū Ḥanīfa (d 150 = 767) was the first to adopt the methods of the Muʿtazilites and apply argument to the foundation of the Faith Also, from the beginning, his standing was so high that it was simply impossible to call him a heretic This status continued in the Māturidite School

All this goes back to the time before *kalām* had become a technical term and when *fikh* meant both theology and canon law, with the difference that theology was called "the greater *fikh*" (*al-fikh al-akbar*, see article KALĀM above, vol II, p 672*b*) That was the title of one of Abū Ḥanīfa's books and we have a commentary on it ascribed to Māturīdī (Ḥaidarābād 1321), the only writing assertedly by him apparently in print This does not occur in the two exactly similar lists which we have of his books (Saiyid Murtaḍā, p 5, Ibn Ḳuṭlūbughā, p 43) 1 *Kitāb al-Tawḥīd*, 2 *Kitāb al-Makālāt*, 3 *Kitāb Radd Awāʾil al-Adilla li ʾl Kaʿbī*, 4 *Kitāb Bayān Wahm al-Muʿtazila*, 5 *Kitāb Taʾwīlāt al Kurʾān* Of these only the last is given by Brockelmann, I, p 195, 4, the biographers praise it highly The others suggest only anti-Muʿtazilite polemic (for al Kaʿbī see Horten, *Philosophische Systeme*, by index) As a matter of fact it is only in one MS of the com-

mentary on the Fiḳh Akbar that this work is ascribed to al Māturīdī

How the theological school of Abū Ḥanīfa came to be known as that of al Māturīdī we do not know The epithet *al-mutakallim*, applied to al Māturīdī, may mean that he was the theologian of the school of Abū Ḥanīfa as opposed to those who were canon lawyers (*fukahā'*) But the two tendencies to accept him and to suppress him still continue The *ʿAḳā'id* of one of his followers, al-Nasafī, fortified with the commentary of al-Taftāzānī, an Aš̲ʿarite, is the theological text-book of the last two years of the Azhar course and is a final authority in Egypt Yet when Muhammad ʿAbdū, the late Chief Muftī of Egypt, a regenerator and reformer of Islām, put his views of the development of Muslim theology and of its final position into a course of lectures at Beirūt (*Risālat al-tawhīd Expose de la religion musulmane, traduite de l'Arabe* by B Michel and Moustapha ʿAbdel Razik, Paris 1925) he showed himself a Māturīdite with no mention of al-Māturīdī

The differences between the two Schools are commonly reckoned as thirteen in number, six, a difference in idea (*maʿnawī*) and seven in expression (*lafẓī*) (for them in detail see the Saiyid Murtadā, p 8 *sqq* and Abū ʿUd̲hba, *al-Rawda al-bahiya*, Haidarābād 1904) They have been studied by Goldziher in his *Vorlesungen*, p 110 *sqq*, and by Horten in his *Philosophische Systeme*, p 531 *sqq* It is frequently said that these points of difference are slight, but that is not so The moral position of Abū Ḥanīfa is as plain in them as in his canon law Al-Aš̲ʿarī was concerned only to maintain the absoluteness of Allāh's will, that he could do anything, and that a thing was "good" because he willed it Future rewards and punishments, therefore, had no "moral" basis But Abū Ḥanīfa, and after him al-Māturīdī and his School, recognizes that man possesses free will (*iḵẖtiyārī*) actions for which he is rewarded and punished No explanation is attempted of this fundamental antinomy of predestination and free-will, they are stated side by side as equal, if contradictory, facts Similarly, while Abū Ḥanīfa admits that evil deeds are by the will (*irāda*) of Allāh — otherwise they could not happen — he cannot bring himself to say that they are by the "good pleasure" (*riḍwān*) of Allāh Further, the Māturīdite School admits the doctrine of "assurance of salvation" and the Aš̲ʿarite does not A Māturīdite may say, "I am a believer, assuredly" (*ḥaḳḳan*), but an Aš̲ʿarite must say, "I am a believer if Allāh wills" Because, then, of this essential difference in human and moral feeling the School of al-Māturīdī has steadily penetrated the School of al-Aš̲ʿarī and even the professed Aš̲ʿarite at the present time is, to a greater or less extent, a Māturīdite

Bibliography has been given in the article But cf article KALĀM throughout

(D B MACDONALD)

AL-MĀʿŪN, title of Sūra cvii taken from Vs 7 where *māʿūn* denotes the *zakāt*

MAWĀLĪYĀ, MAWWĀL, means a kind of popular song Tradition says that this genre of poetry was invented by the people of Wāsiṭ, but that it was the people of Baghdād who after improving it made it fashionable It is said that when Hārūn al-Rashīd had the most prominent Barmecides massacred, he forbade for lamentations them One of the slaves of D̲jaʿfar, so well-known from the *Arabian Nights*, composed in everyday language an elegy on her old master and at the end of each strophe she said *yā mawālīyā* "O my masters!" Whence the name of this kind of poetry

From the point of view of metre, the mawwāl, a popular form from *mawālīyā* or *mawālīyā*, is a song in the *basīṭ* metre (first *ʿarūd*) of which the last verse of each hemistich is *fāʿilun, fiʿlun* or *fiʿlān*

In its primitive form, the mawwāl consisted of strophes, each of four hemistichs rhyming with one another Later it was somewhat altered the strophe contained five hemistichs in which the first, second, third and fifth, but not the fourth rhymed together or it contained seven hemistichs of which the first, second, third and seventh had the same rhyme and the fourth, fifth and sixth rhymed together

The red mawwāl is used for war-songs while the green mawwāl is used for love-songs In all cases the mawwāl must be in the popular dialect and make use of alliteration

MĀ WARĀ' AL-NAHR (Arab) "that which (lies) beyond the river", the name for the lands conquered by the Arabs and subjected to Islām north of the Amū-Daryā [q v] The frontiers of Mā warā' al-Nahr on north and east were where the power of Islām ceased and depended on political conditions, cf the statements of the Arab geographers on Mā warā' al-Nahr in G Le Strange, *The Lands of the Eastern Caliphate*, Cambridge 1905, p 433 *sq*, W Barthold, *Turkestan (G M S*, N S, V, London 1928), p 64 *sqq* The phrase Mā warā' al-Nahr passed from Arabic literature into Persian As late as the ninth (XVth) century, Ḥāfiẓ I Abrū [q v] devotes a special chapter (the last) to Mā warā' al Nahr in his geographical work Under the influence of literary tradition, the phrase Mā warā' al-Nahr was used down to quite recent times in Central Asia itself (Bābur, *G M S*, I, Index, the Özbeg Muh Sālih, *Srav Knižka Samark Oblasti*, V 240 *et pass*)

although to the people of Central Asia the lands in question were on their side of and not across the river (W BARTHOLD)

AL MĀWARDĪ, ABU 'L-HASAN ʿALĪ B MUHAMMAD B HABĪB, a Shāfiʿī fakīh, who on the conclusion of his studies taught in Basra and Baghdād and after holding the office of chief kādi at Ustuwā near Nīsābūr, settled permanently in Baghdād Here he often acted for the caliph al-Kādir (381—422 = 991—1031) in his negotiations with the Būyids, who then ruled al-ʿIrāk, when the Būyid Djalāl al-Dawla in 429 (1037—1038) asked the caliph al-Muktadī to grant him the title of shahānshāh (*malik al mulūk*), he expressed his objections in a *fatwā* and thus earned the enmity of the Būyid He died an 30th Rabīʿ I 450 (May 27, 1058) at the age of 86

His works are said to have been collected and edited only after his death by one of his pupils The following have survived 1 *Tafsīr al-Kurʾān* or *Kitāb al-Nukat wa 'l-ʿUyūn*, MSS in Rampur (s *Journ As Soc Bengal*, N S, II, xli), Fez (*Fihrist Masdjid al-Karawīyin*, N⁰ 215) and Stambul (Kilič ʿAlī, N⁰ 90), 2 *K al-Hāwī al kabīr fi 'l-Furūʿ*, MSS in the Brit Museum Or 5828, s Ellis and Edwards, *Descr List*, p 22, Cairo (*Fihrist*, III 215) and Stambul (Sulaimānīya, N⁰ 436), 3 his most celebrated work, dealing with constitutional law in purely theoretical fashion, disregarding the political conditions of the time (s A v Kremer, *Culturgeschichte*, I 396, M Hartmann, *Unpolitische Briefe aus der Turkei*, p 242), entitled *K al-Ahkām al-Sultānīya*, *Constitutiones politicae*, ed R Enger, Bonn 1853, pr Cairo 1298, 1324, 1327 Translations *Publiek en administratief regt van den Islam met een in leiding over de toepasselykheid van dat regt in Nederlandsch-Indie* door S Keizer, 's-Gravenhage 1862, *Les constitutions politiques, trad et commentees d'apres les sources orientales* par le compte L Ostorog, Paris 1900—1906, *Les statuts gouvernementaux ou regles de droit public et administratif trad et comm* par F Fagnan, Algiers 1915, cf H F Amedroz, *The Mazalim jurisdiction*, *JRAS*, 1911, p 635—674, 4 *K Nasīhat al-Mulūk*, MS in Paris, de Slane, N⁰ 2447, 3, 5 *K Tashīl al Nazar wa Taʿdjīl al-Zafar*, on politics and the art of government, MS in Gotha, s Pertsch, *Verz*, N⁰ 1872, 6 *K Kawānīn al-Wizāra*, Ms in Vienna, Consularakademie, Krafft, p 475, entitled *Kānūn al Wazīr wa-Siyāsat al-Mulk*, MS formerly in Landberg's possession, s Goldziher, *Abh zur Philologie*, II, note p 14 (the *K al Wizāra* in Stambul, Top Kapu 2405, 3 is however, according to Rescher, *ROS*, IV 710 perhaps only a part of N⁰ 4), 7 *K aʿlām al-Nubūwa*, MS in Berlin, Ahlwardt, N⁰ 2527, Cairo, *Fihrist*, I 270, pr Cairo 1319, 1330 (cf Diez, *Denkwurdigkeiten von Asien*, II 382, Schreiner, in *Kohuts Semitic Studies*, p 502—513), 8 *K Adab al-Kādī*, MS in Stambul, Sulaimānīya, N⁰ 381, 9 *K al-Amthāl wa 'l-Hikam*, a collection of 300 traditions, 300 wise sayings and 300 verses in 10 *fasl* to 30 proverbs in Leyden, s *Catalogus*, I, N⁰ 382, 10 *K* (*al-Bughya al-ʿulyā fī*) *Ādāb* (*Adab*) *al-Dunyā wa 'l-Dīn*, a work still much read, pr Stambul 1299, Cairo 1309, 1310, 1315, 1327, 1328, 1339, on the margin of al-Āmulī's *Kashkūl*, Cairo 1316, in India 1315 Uwais Wafāʾ b Dāwūd al-Arzandjānī Khānzāde wrote a commentary entitled *Minhādj al-Yakīn*, pr Stambul 1328 A synopsis was prepared by Ibn Liyūn a teacher of the vizier Lisān al-Dīn b al-Khatīb (d 776 = 1376), Madrid, N⁰ 427 An anonymous synopsis entitled *K Maʿrifat al-Fadāʾil* is in the Escurial, s Derenbourg, II 748

(C BROCKELMANN)

MAWDŪD, ABU 'L-FATH, SHIHĀB AL DAWLA WA-KUTB AL-MILLA, ruler of Ghazna, was born about 412 (1021—1022) In Muharram 432 (September 1040) he was appointed to the government of Balkh with Khwādja Abū Nasr Ahmad b Muhammad as wazir A few months later, his father Sultān Masʿūd was deposed and Muhammad, son of Sultan Mahmūd, was raised to the throne On learning news of this, Mawdūd left Balkh, took possession of Ghazna, and spent the winter in making preparations for a struggle for the throne with Muhammad At the end of the winter, Muhammad marched from India to take Ghazna and Mawdūd advanced to meet him A fierce battle took place on 3rd Shaʿbān, 432 (April 6, 1041) near Dunpūr or Dīnawar (modern Ḥathābād on the Peshāwar Kābul route) in which Mawdūd was victorious Muhammad, all his sons except ʿAbd al Rahim, Sulaimān b Yūsuf, and Nūshtigīn of Balkh were taken prisoners and executed Mawdūd returned to Ghazna in triumph, but he was not yet the undisputed master of the kingdom His brother Madjdūd, governor of Multan, was advancing on Ghazna by way of Lahore, but three days after his arrival at Lahore, he died mysteriously on the morning of 10th Dhu 'l-Hidjdja, 432 (August 11, 1041)

In 435 (1043—1044) Sukhpāl, alias Nawāsa Shāh, son of Djaipāl of the Hindūshāhiya dynasty of Waihand, formed a confederacy with some Hindū Rādjās and laid siege to Lahore Sukhpal was killed in action, and after his death the Rādjās quarrelled among themselves, raised the siege and retired to their respective kingdoms The Muslims followed them in pursuit and laid siege to the fort of Sonipat where one of the confederates named Dipāl Haryāna had taken refuge The fort was captured and given up to plunder but Dīpāl managed to escape About 5,000 Muslims who had been imprisoned in the fort were released The victors next attacked another Rādja, called Tābat Bālrī by Ibn al Athīr, took his fort and returned to Lahore with immense booty These victories restored for some time the waning prestige of the Ghaznawids in Upper India

It was the ambition of Mawdūd to restore the greatness of his empire by conquering the provinces which his father had lost to the Saldjuks In Muharram 435 (August 1043) he attacked Khurāsān but was defeated by Alp Arslān b Dāwūd In the following month the Ghaznawid troops retrieved their reputation by inflicting a defeat on the Saldjuks near Bust, but in spite of this reverse they became so powerful that Mawdūd found it difficult to overcome them single-handed After protracted negotiations, he secured the assistance of the ruler of Isfahān and the Khān of Turkistān, and marched towards Balkh to join forces with the Khān of Turkistān, but he had not gone far

when he was taken ill with colic and was forced to return to Ghazna where he died on 20th Radjab, 441 (December 18, 1049), at the age of 29 years

Mawdūd was a good ruler and was famous for his generosity *Paikān-i Mawdūdī* (the Arrow of Mawdūd) is called after him It is stated that in his wars he used golden arrows so that if the victim was killed, the gold in the arrow would pay for his funeral, and if he was only wounded, it would defray the expenses of his treatment He was a skilful general, and his premature death put an end to all hopes of crushing the power of the Saldjuks

MAWDŪD b 'Imād al-Dīn Zangī, Kuṭb al-Dīn al A'radj, lord of al-Mawṣil After the death at the end of Djumādā II 544 (Nov 1149) of his elder brother Saif al-Dīn Ghāzī I [q v], Mawdūd was recognised as lord of al Mawṣil through the influence of the powerful vizier al-Djawād [q v] and of the commander in chief of the army Zain al-Dīn 'Alī A number of emirs negotiated with the third brother, Nūr al-Dīn Mahmūd, who lived in Halab, and seized the town of Sindjār, and Mawdūd began preparations for war The vizier however, who feared not only Saladin but also the Franks, succeeded in dissuading him, whereupon Nūr al-Dīn handed over Sindjār to his brother and was given Hims and al Rahba instead On other questions also Mawdūd followed his vizier's advice, al-Djawād however fell into disgrace and in 558 (1163) he was thrown into prison and replaced by Zain al-Dīn Kūčik In the next year Mawdūd joined forces with his brother Nūr al-Dīn in a war against the Franks, and in Ramadān (Sept 1164) the latter defeated the Christian forces and stormed Kal at Hārim According to the most usual statement, Mawdūd died on 22nd Dhu 'l Hidjdja 565 (Sept 6, 1170) aged about forty He is described by the Oriental historians as a just and benevolent ruler He was succeeded in al-Mawṣil by his son Saif al-Dīn Ghāzī II

(K V Zetterstéen)

MAWḲIF (a), *nomen loci* from *w-k f* "to stand" Of the technical meanings of the term two may be mentioned here

a the place where the *wukūf* [q v] is held during the pilgrimage, viz 'Arafāt [q v] and Muzdalifa [q v] or Djam'. In well known traditions Muḥammad declares that all 'Arafāt and that all Muzdalifa is mawḳif (Muslim, *Ḥadjdj*, trad 149, Abū Dāwūd, *Manāsik*, bāb 56b, 64 etc, cf *Handbook of Early Muh Tradition*, s v *'Arafa*) Snouck Hurgronje (*Het mekkaansche feest*, p 150 = *Verspreide Geschriften*, i 99) has conjectured that these traditions were intended to deprive the hills of 'Arafāt and Muzdalifa of their sacred character, which they doubtless possessed in pre-Islāmic times

b the place where on the day of resurrection several scenes of the last judgment will take place, cf al Ghazālī, *al Durra al-Fākhira*, ed Gautier, p 577, 683, 12, 813, cf *Kitāb Ahwāl al-Kiyāma*, ed M Wolff, p 65 *sqq*

(A J Wensinck)

MAWLĀ (a), a term with different meanings (cf *Lisān al-Arab*, xx 289 *sqq*) of which the following may be mentioned

a Tutor, trustee, helper In this sense the word is used in the Kur'ān, Sūra xlvii 12 "God is the mawlā of the faithful, the unbelievers have no mawlā" (cf sūra iii 143, vi 62, viii 41, ix 51, xxii 78, lxvi 2) In the same sense mawlā is used in the Shi'ite tradition, in which Muhammad calls 'Alī the mawlā of those whose mawlā he is himself According to the author of the *Lisān*, mawlā has the sense of *walī* in this tradition, which is connected with Ghadīr al-Khumm [q v, cf C van Arendonk, *De opkomst van het Zaidietische imamaat*, p 18, 19] It may be observed that it occurs also in the *Musnad* of Ahmad b Hanbal (i 84, 118, 119, 152, 330 *sq*, iv 281 etc)

b Lord In the Kur'ān it is in this sense (which is synonymous with that of *saiyid*) applied to Allāh (sūra ii 286, cf vi 62, x 31), who is often called *Mawlānā* "our Lord" in Arabic literature Precisely for this reason in Tradition the slave is prohibited from calling his lord mawlā (Bukhārī, *Diihād*, bāb 165, Muslim, *Alfāẓ*, trad 15, 16)

It is not in contradiction to this prohibition that Tradition frequently uses mawlā in the sense of "lord of a slave", e g in the well known *hadīth* "Three categories of people will receive twofold reward and the slave who fulfils his duty in regard to Allāh as well as to his lords" (Bukhārī, *'Ilm*, bāb 31, Muslim, *Aimān*, trad 45)

Compositions of mawlā and suffixes are frequently used as titles in several parts of the Muslim world, e g *mawlāy(a)* (*moulāy*), "my Lord" (especially in North Africa and in connection with saints), *mawlawī* (*mollā*), "Lordship" (especially in India and in connection with scholars or saints)

The term mawlā is also applied to the former lord (patron) in his relation to his freeman, e g in the tradition "Who clings to a (new) patron without the permission of his (legal) mawlā, on him rests the curse of Allāh" (Bukhārī, *Diizya*, bāb 17, Muslim, *'Itk*, trad 18, 19)

c Freed slave, e g in the tradition "the mawlā counts as the people to whom he belongs" (Bukhārī, *Farā'id*, bāb 24, etc) In this sense mawlā, or rather the plural *mawāli*, is frequently used in Arabic literature The evolution of the idea as well as the position and the aspirations of the *mawālī* have been expounded by von Kremer (*Culturgeschichte des Orients unter den Chalifen*, ii 154) and by Goldziher (*Muhammedanische Studien*, i 104 *sqq*), by the latter especially in connection with the *shu'ūbiya* [q v] On the position of the

mawālī in the law of inheritance law of the art MĪRĀTH

Bibliography in the article, also Doutte in *RHR*, xli 30 *sqq*, Littmann, in *NGW*, 1916, p 102 (A J WENSINCK)

MAWLAWĪ [See MAWLĀ]

MAWLAWĪYA (Turkish pronunciation Mewlewīya), Order of Derwishes called by Europeans Dancing or Whirling Derwishes

1 Origin of the Order Its name is derived from *mawlānā* ("our master"), a title given *par excellence* to Djalāl al-Dīn al-Rūmī (e g by the Turkish writers Sa'd al Dīn and Pečewī, cited below), of which the Persian equivalent was according to the *Manākib al-'Ārifīn* (translated by Huart as *Les Saints des Derviches Tourneurs*, Paris 1918—1922) bestowed on Djalāl al-Dīn [q v] by his father, with whom this hagiography commences According to the same authority (i 162), his adherents adopted the name *Mewlewī*, and indeed copyists of the *Mathnawī* of the years 687 and 706 A H thus designate themselves (Nicholson's ed, i 7 and iii 11), yet Ibn Battūta, who visited Konia after the latter date, asserts that they were styled Djalālīya, and the word Mawlawī seems to be used occasionally in the *Manākib* in the sense of "scholar", which it ordinarily has in India This work asserts that one Badr al-Dīn Guhartāsh (a historical personage, since he is mentioned in Ibn Bibi's chronicle of the Seldjūks of Asia Minor) built a college at Konia for the children of Djalāl al Dīn's father, which was inherited by Djalāl al-Dīn The *Manākib* (by Shams al-Dīn Ahmad al-Aflākī, 718–754 A H), however, so seems with anachronisms and extravagances that its statements must be used with great caution

The European name is taken from the ritual of the *dhikr*, in which the derwishes revolve, using the right foot as a pivot, to the tune of various instruments Djalāl al-Dīn is said to have claimed that he had elevated the practice, but denied that it was an innovation (*Manākib*, ii 79) Certainly "dancing" (*rakṣ*) is mentioned as a Sūfī practice in works earlier by some centuries than Djalāl al-Dīn's time, often with severe condemnation The historian Sakhāwī (*al Tibr al-Masbūk*, p 220) in recording an edict issued in 852 against the practice in Egypt cites verses by one of "the earliest Sayyids" in which the Sūfīs who perform it are compared to apes and are bitterly reproached

Dancing is indeed a natural accompaniment of music (*Aghānī*, x 121) or poetry (*Irshād al-Arīb*, v 131, ii), but the whirling of the derwishes would seem to have for its purpose the production of vertigo rather than the presentation of an idea in rhythm Of the various reasons which have been assigned for it the most interesting is that recorded in the *Manākib* (i 190) as the excuse of Djalāl al-Dīn, viz that it was a concession to the pleasure-loving inhabitants of Asia Minor, who might thereby be drawn to the true faith The theory that the whirling was a reproduction of the motions of the celestial bodies is found in his *Mathnawī* (ed Nicholson, iv 734), and the same view is offered in the much earlier *Risāla* of Ibn Tufail (Cairo 1922, p 75), where its hypnotic effect is emphasized The saints in the *Manākib* are represented as able to maintain the exercise for many days and nights continuously, but the actual *dhikr* lasts only about an hour, with some intermission

2 Relations with other Orders Although the earlier mystics, such as Djunaid, Bistāmī and Hallādj are mentioned in the *Manākib* with profound reverence, the treatment of founders of orders who came near Djalāl al-Dīn's time is very different 'Abd al Kādir of Djīlān is ignored, Ibn 'Arabī mentioned with contempt, and Rifā'ī with severe condemnation Hādjdjī Bektāsh is represented as having sent a messenger to inquire into the proceedings of Djalāl al-Dīn, and to have acknowledged the supremacy of the latter At a later period the rivalry of the Mawlawī with the Bektāshī Order became acute

It has been shown by F W Hasluck (*Christianity and Islam under the Sultans*, Oxford 1929, ii 370 *sqq*) that the environment wherein the Mawlawī Order originated was favourable to Christians, and that throughout its history it has shown itself tolerant and inclined to regard all religions as reconcilable on a philosophic basis He suggests that the veneration of the Muslims of Konia for the supposed burial place of Plato (in a mosque which was once the church of St Amphilochius) may have been intentionally favoured by the Mawlawī derwishes, or possibly their founder, as providing a cult which Muslim and Christian might share on equal terms In three other sanctuaries of Konia, one of them the mausoleum of Djalal al-Dīn himself, he found evidence of a desire to provide an object of veneration to the adherents of both systems It is not, however, easy to accept his inference that some sort of religious compromise on a philosophic basis was devised between the Seldjūk Sultān 'Alā' al Dīn, Djalāl al Dīn, and the local Christian clergy It appears from the *Manākib* that the Order was frequently exposed to persecution from the *fukahā'* in consequence of the music and dancing, and they found an analogy in Christian services to the employment of the former They are credited in recent times with having impeded the massacres of Armenians

3 Spread of the Order The *Manākib* attributes its propagation outside Konia to Djalāl al-Dīn's son and second successor, Sultān Bahā' al Dīn Walad who "filled Asia Minor with his lieutenants" (ii 262) It would however appear from Ibn Battūta's narrative (ii 282) that its following was not in his time extensive outside Konia, and was confined to Asia Minor The story told after Sa'd al-Dīn by v Hammer (*GOR*, i 147) and others, that as early as 759 (1357) Sulaimān son of Orkhān received a cap from a Mawlawī derwish at Bulair, has been shown by Hasluck (ii 613) to be a fiction The historians make no allusion to any importance attaching to the Mawlawī chief when Murād I took Konia in 1386, but when the city was taken by Murād II in 1435, peace was negotiated according to Sa'd al-Dīn (i 358) by Mawlānā Hamza, but according to Neshrī (quoted *ibid*) by a descendant of Mawlānā Djalal al-Dīn al-Rūmī, 'Ārif Čelebi "who united all the glories of worth and pedigree, and possessed mystic attainments", the rebellious vassal supposed that a holy man of the family of the Mawlā would inspire more confidence The same person performed a similar service in 1442 (Sa'd al-Dīn, i 371) According to V Cumet (*La Turquie d'Asie*, i 829) Selim I when passing through Konia in 922 (1516) in pursuit of the Persians (?) ordered the destruction

of the Mawlawīkhāna, at the instance of the Shaikh al-Islām, and though this command was repealed, the moral and religious authority of the head of the Order was gravely compromised That the saints of Konia were highly reverenced in the Ottoman Empire later in the sixteenth century appears from the list of graves visited by Saiyid ʿAlī Kapūdān in 1554, which commences with those of Djalāl al Dīn, his father and his son (Pečewī's History, 1283, i 371) In 1634 Murād IV assigned the *kharādj* of Konia to the Čelebi Yet the first reference to "dancing derwishes" in Constantinople which Hasluck produces, is from the time of the Sultān Ibrāhīm (1640—1648) Cuinet mentions three Mawlawīkhāna of the first rank and one Tekye of the second in Constantinople and the neighbourhood, he gives the names of the saints whose tombs they contain, without dates He mentions seven other Mawlawikhāna of the first rank, at Konia, Manissa, Karahisār, Baharīya, Egypt (Cairo ?), Gallipoli and Brusa, and as the more celebrated of the second rank that of Shamsī Tabrīzī at Konia, and those in Medina, Damascus and Jerusalem To these Hasluck adds Tekye at Canea (Crete), founded about 1880, Karaman, Ramla, Tatar (in Thessaly), and possibly Tempe (for one in Smyrna see *M W*, 1922, p 161, for one in Salonica see the work of Garnett, and for one in Cyprus that of Lukach cited below) It would seem then that the Order was confined to the limits of the Ottoman Empire, and indeed to its European and Asiatic territories

By a decree of Sept 4, 1925 all the Tekye in Turkey were closed, and the library of the Mawlawīkhāna of Konia was transferred to the Museum of the city (*Oriente Moderno*, 1925, p 455, 1926, p 584)

4 Political importance of the Order Reference may be made to Hasluck's work (ii 604 *sq*) for refutation of the stories uncritically reproduced by Cuinet and some less authoritative writers In these "the Shaikh of the Mawlawī becomes first the legitimate successor by blood of the Seldjūk dynasty, and finally the real Caliph!" Hasluck supposes these tales to be based on the supposed "traditional right" of the Mawlawī Shaikh to gird the new Sultān with a sword This right cannot be traced earlier than 1648, and appears to have obtained recognition in the nineteenth century It would seem that reforming Sultāns used the Mawlawī Order as a make-weight against the Bektāshīs, who supported the Janissaries, and then against the ʿUlamāʾ, who supported the treatment of the Muslim community as a privileged community against the *dhimmīs* In recent times the Sultāns ʿAbd al-ʿAzīz and Mehmed Reshād were members of the Order

5 The ritual of the Order has been described by numerous travellers, e g J P Brown, *The Dervishes*, 1868, p 198–206, 1927, p 250–258, V Cuinet, *loc cit*, p 832, Garnett and Lukach in the works cited, M Hartmann, *Der islamische Orient*, 1910, iii 12, S Anderson, *M W*, 1923 The attire consisted of a cap called *sikke*, a long sleeveless skirt called *tennūre*, a jacket with sleeves called *deste-gul*, a waistband called *elif-lām-end*, and a cloak with sleeves called *khirḳe*, thrown over the shoulders (in Lukach's description [Cyprus] "a violet gown worn over a dark green cassock") The instruments employed according to the last writer (dealing with Konia) are six reed-flute, zither, rebeck, drum, tambourine, and one other Cuinet enumerates four, of which three agree with the above, the last being *halīle*, vulgarly *zil*, a sort of small cymbal Brown enumerates three, flute, violin, and kettle-drum Those mentioned in the *Manākib* are rendered by Huart, *flûte*, *violon* and *tambour de basque* The service in Konia according to Lukach was held twice a month after the Friday prayer, in Constantinople, where there were several *tekye*, they were held more frequently to enable the members of different *tekye* to join in,

6 Administration of the Order The head of the Order, resident at Konia, had the titles *Mullā Khunkār*, *Hadret-i Pīr*, *Čelebi Mullā*, and *ʿAzīz Efendi* A list of persons who have held the office is given by Hartmann (*loc cit*, p 193) after the *Hakāʾik i Adhkār-i Mawlānā*, making 26 in all down to 1910, this list appears to be imperfect, and the *Celebi* whom Lukach found in Konia was uncertain whether he was the 39th or the 40th The head of the establishment at Manissa counted as second in authority Cuinet enumerates seven officials subordinate to the *Čelebi* at Konia, but the names of several seem seriously mutilated Others mention a secretary (*wekil*) An account of the discipline which those who would enter the Order had to endure is given by Huart (*Konia, la Ville des Derviches Tourneurs* Paris 1897) They had to perform menial service for 1001 days, divided into periods of 40, when this was over, they were clothed in the uniform of the *tekye*, assigned cells, and instructed in the exercises of the Order, and they had to remain thus occupied till they believed themselves able to enter into relation with the Deity by means of whirling, meditation, and music

Bibliography see especially the works of Brown, Cuinet, Hartmann, and Hasluck, cited above, Lucy M Garnett, *Mysticism and Magic in Modern Turkey*, London 1912, H C Lukach, *The City of Dancing Derwishes*, London 1914, S Anderson, in *M W*, 1923, p 188—191 (D S Margoliouth)

MAWLID (A) or Mawlūd (pl *mawālid*), time, place and celebration of the birth of any one, particularly of the Prophet Muhammad (*Mawlid al-Nabi*) From the moment when Islām in its attitude to Muhammad abandoned the lines laid down in the Kurʾānic view of him and began to bring his personality within the sphere of the supernatural, the scenes among which his earthly life had been passed naturally began to assume a higher sanctity in the eyes of his followers Among these, the house in which he was born, the *Mawlid al-Nabi*, in the modern Sūk al Lail in Mekka, the history of which is preserved principally in the chronicles of the town (ed Wustenfeld, i 422), does not seem at first to have played a part of any note It was al Khaizurān (d 173), the mother of Hārūn al-Rashid, who first transformed it from a humble dwelling-house to a place of prayer As they did to the tomb of the Prophet in Medina, the pious now made pilgrimages also to his mawlid to show their reverence for it and to receive a share of its blessings (*li 'l-tabarruk*) In time also the reverence in which the house was held found expression in its development in a fitting architectural fashion (Ibn Djubair, ed Wright, p 114, 163, on the present state of the house Snouck Hurgronje, *Mekka*, i 106, ii 27)

Records of the observation of the birthday of

the Prophet as a holy day only begin at a late date, according to the generally accepted view, the day was Monday the 12th Rabīʿ I The story which Wüstenfeld originated, according to which the pious Shāfiʿī Karadjī (d 343) observed this day by breaking his fast upon it, which he only did on one other occasion, the *ʿId al Fitr* (*Abh G W G*, xxxvii, N° 126), does not seem to find any confirmation in the sources and is in contradiction to the general custom of fasting on Monday, as this day plays a special part in the life of Muhammad as the day of his birth, of his Hidjra and of his death (Ghazālī, *Ihyāʾ* [Būlāḳ], i 363 and *pass* On the Jewish origin of fasting on Monday, see Wensinck, *Mohammed en de Joden*, p 126) But that on this day a special celebration was arranged, as distinct from private observation, one first learns for Mecca, where one would expect it earliest from the local traditions, from Ibn Djubair (d 614, *Travels*, p 113), who however is obviously referring to a custom which has already been a considerable time in existence The essential feature of the celebration is however only a somewhat considerable increase in the number of visitors to the Mawlid house which was exceptionally open the whole day for this purpose This visit and the ceremonies associated with it (*mash* etc) are carried through entirely in forms which are characteristic of the older Muslim cult of saints

But just as the later cult of the Prophet cannot be put on a level with the reverence shown to other holy men, so new and special forms developed for his birthday celebrations, which in spite of minor differences in time and place show the same general features everywhere and are comprised under the name *Laila al Mawlid* or briefly *Mawlid al-Nabī* An anticipation of the Mawlid celebration is found in Egypt as early as the middle and later Fāṭimid period During the period of office of the vizier al-Afdal (487—515), we hear that the "four Mawālid" were abolished but a little later revived in all their old glory (Makrīzī, *al Khiṭaṭ*, i 466, for the description of the festival i 433 *sqq*) The celebration still took place in broad daylight and participation was practically limited to the official and religious circles of the city There were not yet any preliminary celebrations, but we already have a solemn procession of all the dignitaries to the palace of the caliph, in whose presence — he sits, covered with a veil on one of the balconies of the palace — the three *khutabāʾ* of Cairo (cf above, ii, p 928) in succession deliver a religious address, during which a special ceremonial is observed As to the matter of the discourses, we only know that they were like those delivered on the nights of the illumination so that they presumably dealt mainly with the occasion of the celebration It is interesting to note that the mawlid ceremonies here are not confined to that of the Prophet but the mawlids of ʿAlī, Fāṭima and even that of the reigning Caliph, the *Imām al-hādir*, are similarly observed As in the fundamental idea of these celebrations (*Mawlid al-Imām al-hādir*!), Shīʿa influence can also be traced in separate elements of it It had not yet come to be a festival of the common people in the time of the Fāṭimids This no doubt explains why — except in Maḳrīzī and Kalḳashandī, the great historians of Fāṭimid Cairo — there is hardly any reference to these celebrations in the literature emanating from Sunnī circles, not even when writers like ʿAlī Pasha Mubārak are dealing with features peculiar to Cairo and deal very fully with the history of the Mawlid festival

The memory of these Fāṭimid mawālid seems to have almost completely disappeared before the festivals in which Muslim authors unanimously find the origin of the Mawlid, the Mawlid which we find first celebrated in Arbela in 604 by al-Malik Muzaffar al-Dīn Kokburī, a brother-in-law of Saladin The fullest account is given by a somewhat later contemporary, the great historian Ibn Khallikān (d 681) on whom later writers continually base their statements (e g al-Suyūṭī, *Husn al-Maḳṣid* [Brockelmann, *G A L*, ii 157] and others) The personality of this ruler, his period so disturbed by the turmoil of the Crusades, and his milieu to which Ibn Khallikān calls special attention, lead us to suggest marked Christian influence in the development of this celebration, his close relations with the Ṣūfī movement on the other hand suggest the possibility of influence of quite a different nature This is clear from the description of the celebrations Preparations are begun long before and people come in from remote districts The prince takes special care that the visitors are housed in splendid wooden ḳubbas specially built and they are entertained with music, singing and all kinds of amusements (shadow-plays, jugglers etc) The streets of the town were for weeks as busy as on the occasion of an annual fair On the eve of the Mawlid night a torchlight procession took place from the citadel of the town to the khānkah, led by the prince after the maghrib salāt Next morning the whole populace assembled in front of the khānkah, where a wooden tower had been erected for the ruler and a pulpit for the *wāʿiz* From this tower the prince surveyed not only the crowd assembled to hear the address but also the troops summoned to be reviewed on the adjoining maidān We are told nothing of the substance of the address On its conclusion the prince summoned the distinguished guests up to the tower to give them robes of honour The people were then feasted at the prince's expense in the maidān, while the notables were entertained in the khānkah The following night was spent by the prince like so many of the Sūfīs in *samāʿ* (Ibn Khallikān, Būlāk 1299, ii 550 *sqq*)

In contrast to the Fāṭimid celebrations, what is specially striking here is the large share taken in the festival by the Ṣūfīs and the common people, a circumstance which is all the more notable, as it is probably in this association with Ṣūfism that we have the reasons for the later great popularity of the mawlid At the same time the torchlight procession, really foreign to Muslim sentiment, and borrowed from contemporary Christian customs at festivals deserves our attention, it is not found at the celebration in Cairo which was purely a day ceremony, while the lavish entertainment of all present, especially with sweets, and the addresses are found in both cases In this remarkable ceremonial, we seem really to have the foundation of all Mawlid celebrations With the great political and religious movement, which we may call Saldjūk reaction, the Mawlid reached Egypt in Saladin's time, where it is significant that Ṣūfism very quickly took deep roots, thus preparing the way for an observance like the Mawlid, which is essentially kept up by popular religious sentiment

The observance of the festival spread sooner

or later from here to Mecca where its old form was transformed Its further progress was along the coast of North Africa to Ceuta, Tlemcen and Fās to Spain but it also went eastwards to India, so that ultimately the whole Muslim world is united on this day in a ceremonial, frequently of unprecedented splendour, but alike everywhere in its main features We have innumerable descriptions of the festival from all parts of the Muslim world, most fully for Mekka (*Chroniken*, ed Wustenfeld, iii 438 *sq* , Ibn Ḥaḏjar al Haitamī, *Mawlid* [Brockelmann, *G A L* , ii 389], for modern times Snouck Hurgronje, *Mekka*, ii 57 *sqq*), where the celebrations have always been famous, for Egypt (Muh Tawfīk al-Bakrī, *Bait al Ṣiddīk*, Cairo 1323, p 404 *sqq* , Lane, *Manners and Customs*[5] [1871], ii 166 *sqq*) and the Indies (Snouck Hurgronje, *Achehnese*, i 207, do , *Verspreide Geschriften*, ii 8 *sqq* , Herklots, *Qanoon e Islam* [1832], p 233 *sq* , Goldziher, *Culte des saints* [1880], p 13, here it is frequently not the birth but the death of the Prophet that is commemorated) The Turkish element in Islām also has not resisted the advance of the celebration of the Mawlid (Turk *Mewlūd*) Since Sultān Murād III introduced it in 996 into the Ottoman empire, it has enjoyed increasing popularity Since 1910 it has been celebrated as a national festival Accurate descriptions of the festival as celebrated in the older period of the court of Constantinople (Mouradgea d'Ohsson, *Tableau general*, Paris 1787, i 255 *sqq*, *G O R* , viii 441) clearly reveal its relationship with the festivals of a more popular nature in other lands of Islām

One element in particular is very prominent, and that is the most characteristic one of the later celebrations, namely the recital of *mawlid*'s i e panegyrical poems of a very legendary character, which start with the birth of Muhammad and praise his life and virtues in the most extravagant fashion The origin of these addresses is already to be found in the religious addresses in Fātimid Cairo and in Arbela and perhaps in part at least goes back to the sermon usual at Christian festivals The *K al-Tanwīr fi Mawlid al-Sirādj*, which Ibn Dihya composed during his stay in Arbela at the suggestion of Kokbūrī was already famous as a *mawlid* at this period (Brockelmann, *G A L* , ii 310) It was not till later times however that mawlids became a predominant element in the celebration, along with torchlight processions, feasting and the fairs in the street, ever increasing in size In Mecca, for example, at the present day they form the main feature of the celebration in the mosque, among the pious they are the most popular evening entertainment for days before the celebration and teachers interrupt their lectures in order to deliver mawlids to the students and the people on the streets and in the coffee houses find edification and entertainment in listening to them The number of such mawlids is quite considerable Beside the famous but not very popular *Bānat Su'ād* of Ka'b b Zuhair of the older period, the *Burda* and the *Hamziya* of al-Busirī and their numerous imitations, there are a whole series of regular mawlids, some of which are intended to instruct like that of Ibn Ḥaḏjar al Haitamī, others purely edifying like a shorter version of it, and notably that of Ibn al-Ḏjawzī (*G A L* , i 503) and al-Barzandjī (*G A L* , ii 384) In addition to those in Arabic, there are a great many mawlids in Turkish (Irmg Engelke, *Suleymān Tschelebi's Lobgedicht*, 1926) It is significant of the part played by these poems, that they have passed from the mawlid celebrations to other festivals, so that the word has actually become a name for "festival" and particularly "feast" (*'azīma*, cf Snouck Hurgronje, *Mekka*, ii 147, 154 and *pass* , Becker, in *Isl*, ii, 1911, p 26 *sqq*) Quite apart from any festivals, the recitation of mawlids is popular, in Palestine for example in fulfilment of a religious vow (T Canaan, in *Journ of the Pal Or Soc*, vi, 1926, p 55 *sqq* , cf also the introductory anecdote in the mawlid alleged to be by Ibn al 'Arabī [*G A L* , i 441]) Like the substance of these mawlids, the form is also very regular Prose and poetry alternate, interrupted frequently by appeals to utter blessings on the Prophet Dhikrs are usually added at the end

The Mawlid as the finest expression of reverence for Muhammad has found almost general recognition in Islām, as fulfilling a religious need of the people and as a result of the strength of the Ṣūfī movement This must not however blind us to the fact that at all times there has also been vigorous opposition to it This is found as early as the festival of Arbela (al-Suyūti, *Husn al Maksid*) The celebration is a *bid'a*, a religious innovation, which is in sharp contradiction to tradition Even ardent advocates of the festival confess this and the strictly orthodox, who adhere to the sunna, reject it most emphatically But, as in so many other things, practice has here proved stronger than dogmatic theory Once the festival had been thoroughly established in the religious life of the people, it was bound in time to find approval as an element of the *idjmā'* Its supporters found it easy to get this *bid'a* legitimated, in theory at least, as a *bid'a hasana* When the festival had been accepted by the consensus of the community, the essential thing had been done and legitimate ground for opposition had been removed While the opposition thus finds itself reduced to combatting the outer forms of the festival and its developments, its supporters are never tired of calling attention to the merit that lies in feeding the poor, in the more frequent reading of the Kur'ān and mawlids, and in expressions of joy over the birth of the Prophet and all that the day brings with it It is significant of the character of the opposition that the opponents object to those very forms which show the influence of Ṣūfīism (dancing, *samā'*, ecstatic phenomena etc) or Christianity (processions with lights etc) The most interesting document of this feud is a *fetwā* by al-Suyūtī (d 911, Brockelmann, *G A L*, ii 157 *Husn al-Maḳṣid fi 'Amal al Mawlid*) which gives a brief survey of the history of the festival, then discusses the pros and cons very fully and concludes that the festival deserves approval as a *bid'a hasana*, provided that all abuses are avoided Ibn Ḥaḏjar al-Haitamī in his *Mawlid* and Kutb al-Dīn (*Chroniken der Stadt Mekka*, iii 439 *sq*) take the same view, while Ibn al-Ḥādjdj (d 737) as a more strict Mālikī condemns it most vehemently (*A' al-Madkhal* [1320], i 153 *sqq*)

Although the height of this struggle was apparently reached in the eighth—ninth century, it did not completely die down in later years, indeed it received new life with the coming of the Wahhābīs The cult of the Prophet is in such contradiction in their fundamental principle, the restoration of the ideal purified primitive Islām, that we can understand that they should completely

disapprove of this, the most popular and most splendid expression of it In doing this, they are only putting into action the protests of the extreme Hanbalī Ibn Taimīya (d 728), the famous precursor of their movement, against innovations which are contrary to the sunna (Ibn Taimīya against the holding of *khatmas* in the Mawlid night *Fatāwā* [Cairo 1326], i 312) Similar ideas are still found to-day even where Wahhābism is rejected, notably in the school which Goldziher calls "Kulturwahhābismus", founded by the celebrated Muhammad ʿAbduh (d 1905), who in connection with the worship of saints condemns the Mawlid also, in the periodical *al-Manār* (Goldziher, *Richtungen der islam Koranauslegung*, p 369 *sqq*)

In the reverence shown to other Muslim saints, the Mawlids also play a great part Although the success of an appeal to a saint does not depend on particular days, yet certain days and birthdays in particular are regarded as particularly favourable These celebrations are often connected with places, to which a certain sanctity had been attached from pre-Islāmic times (the Mawlid of Shaikh Hasan al Badawī in Tanta Goldziher, *Muh Stud*, ii 338 *sq*) There are also Mawlids of nameless saints In the derwish orders, next to that of the Prophet, the Mawlid of the founder is held in particular popularity ʿAlī Pasha Mubārak (*Khitat Djadida*, i 90, iii 129 *sqq*) mentions a large number of such festivities in modern Cairo, the characteristic features of which, he says, are the brilliant illumination of the town, the ceremonial procession (*Mahfil*, at the *Mawlid al Nabī mawkab*, cf P Kahle, in *Isl*, vi, 1916, p 155 *sq*) and the great feasts One cannot now imagine the popular religion of Egypt without these feasts

Bibliography Besides the works already mentioned Muh Tawfik al-Bakrī, *Bait al Suddik*, Cairo 1323, p 404 *sqq*, al Sakhawī, *al Tibr al masbūk*, Būlāk 1896, p 13 *sq*, numerous Mawlid texts are given in the *Verzeichn der arab Hs der Kgl Bibl zu Berlin* Of special value is the Mawlid of Abu 'l-ʿAbbās b ʿAbd Allāh al-Ilakhmi of Ceuta (Brockelmann, *G A L*, i 366), J–J L Bargès, *Complement de l'histoire des Beni-Zeiyān*, 1887, p 47 *sqq*, *Description de l'Egypte*, Paris 1826, xiv 196 *sqq*, A Mez, *Renaissance d Islāms*, 1922, p 403, Goldziher, *Vorlesungen uber den Islam*[2], 1925, p 257 (H FUCHS)

AL-**MAWṢIL** [See MOSUL]

MAWSIM (A, from the root *w-s-m* "to stigmatise"), market, festival In this sense the term is used in *hadīth*, especially in connection with the markets of early Arabia, such as those which were held in ʿUkāz, Madjanna, Dhu 'l Madjāz, ʿArafa, etc (Bukhārī, *Hadjdj*, b 150, *Tafsīr*, sūra 2, b 34) At these markets the worst elements of Arabia gathered (*al-mawsim yadjmaʿ raʿāʿ al-nās*, Bukhārī, *Hudūd*, b 31) Advantage was also taken of these assemblies to make public proclamations and inquiries, e g in order to regulate the affairs of deceased persons (Bukhārī, *Khums*, b 13, *Manākib al-Anṣār*, b 27) As the pilgrimage was at the same time one of the chief markets of early Arabia, the term *mawāsim* is often combined with it (*mawāsim al-hadjdj*, Bukhārī, *Hadjdj*, b 150, *Buyūʿ*, b 1, Abū Dāwūd, *Manāsik*, b 6) Upon this basis the term mawsim has developed chiefly in two directions, it has acquired the general meaning of (religious) festival (Dozy, *Supplement*, *s v*) and that of season In the Lebanon mawsim denotes the season of the preparation of silk (Bistānī, *Muhīt*, s v)

In India and in European terminology referring to these parts of the world, it has acquired the meaning of season in connection with the weather-conditions special to those regions, such as the regularly returning winds and rainperiods *Monsoon*, *mousson*, *moesson* and other corruptions of the term are found in this literature

Bibliography apart from the works mentioned in the art cf *Lisān al-ʿArab*, xvi 123 *sqq*, Wellhausen, *Reste arabischen Heidentums*, Berlin 1897, p 84 *sqq*, 246, Yule and Burnell, *Hobson-Jobson* ed Crooke, London 1903, s v *monsoon* (A J WENSINCK)

MAWWĀL [See MAWĀLIYA]

MAWZŪNA, a small silver coin struck by the Sharīfs of Morocco in the eighteenth and early nineteenth century It was the smallest silver piece and equivalent to 24 copper fulūs or a quarter dirham Another name for the mawzūna was *ūdja* In 1911 (1330) copper coins of the value of 10, 5, 2 mawzūnāt were issued, the mawzūna being now the equivalent of a centime On recent issues the name mawzūna has disappeared and its place is taken by *sentīm*

(C Brockelmann)

MAZAGAN (old Arabic name *al-Buraidja*, "the little fortress", modern Arabic name *al Djadīda* "the new"), a town on the Atlantic coast of Morocco, 7 miles S E of the mouth of the Wādī Umm Rabiʿ Its population in 1926 was 19,159, of whom 14,141 were Muslims and 3,385 Jews

Some writers think that Mazagan was built on the site of the Ῥουσιβίς λιμήν of Ptolemy, or *Portus Rutubis* of Pliny The texts however do not say that there was ever a town there, but only a roadstead frequented by ships The situation seems to have remained unchanged throughout the middle ages As to the name Mazagan, it seems to appear for the first time in al Bakrī (eleventh century A D) This geographer, enumerating the ports of Morocco on the Atlantic coast, mentions a Marifen (de Slane's reading), which should undoubtedly be emended to Mazighan, a form attested by Idrīsī (xiith century) The same place-name is found in a manuscript collection of edifying anecdotes relating to the great saint of Azammūr Sīdī Abū Shuʿaib, who also lived in the twelfth century Mazighan appears here as a fishing village between Azammūr and the ribāt of Tīt [q v] The proximity of these two fairly important towns prevented it from developing The roadstead is marked on a whole series of European planispheres and portalans of the xivth and xvth centuries (publ by Ch de La Roncière, *Decouverte de l'Afrique au Moyen Age*, 1925) which give the forms Messegan (1339 and 1373), Maseghan (1367), Mazagem, intermediate between Mazighan and the Mazagão of the Portuguese The latter, from the end of the xvth century, used to come to the harbour of Mazagan for cargoes of the grain of Dukkāla to supply the capital In 1502, a squadron commanded by a Portuguese gentleman, Jorge de Mello, caught by a storm in the Straits of Gibraltar was driven to Mazagan and landed there The Portuguese installed themselves in a deserted tower there to defend themselves against a possible attack by the inhabitants Jorge de Mello soon returned to Portugal and obtained the king's permission to build a fortress at Mazagan Although the story of these events is only recorded by writers of the xviiith century, it must be in keeping with the facts, for letters patent of king Dom Manuel dated May 21, 1505, give Jorge de Mello the captaincy of the castle which he is authorised to build at his own expense at Mazagan He did not however make use of his privilege for, when on Aug 27, 1513 the Portuguese army sent to take Azammūr under the command of the Duke of Braganza landed at Mazagan, there was neither town nor fortress there except the old ruined tower (*al-Buraidja*) The difficulty of entering the port of Azammūr led the Portuguese to establish a more accessible base at Mazagan During the summer of 1514 under the direction of the architects Diego and Francisco da Arruda, a square castle flanked by towers at each of the four corners was built One of these bastions was formed by the old tower, al Buraidja, the name of which survived among the natives as that of the Portuguese town This early castle still exists almost in its entirety Particularly striking is a magnificent subterranean hall, the vaulting of which is supported by 25 pillars It was probably, rather than a salle d'armes, a huge granary built to hold the contributions in grain paid by the tribes subjected to the Portuguese protectorate It was at a later date used as a cistern to hold supplies of drinking-water for the garrison, when the place blockaded by rebellious tribes had no longer any taxes in grain to collect, which happened in 1541 For ten years before, the situation of the Portuguese stations on the coast, in view of the religious and anti-foreign movement stirred up by the coming and successes of the Saʿdian Sharifs, had been so bad that the king of Portugal thought of abandoning several of his fortresses The taking of the fort Santa Cruz on the Cape of Guer (Agadīr) by the sharīf (March 12, 1541) was a warning John III decided to evacuate Safi and Azammūr and to concentrate on Mazagan, a more favourable and more easily defended position, all the Portuguese forces he wanted to leave in the south of Morocco The operation was carried through in the autumn (before Nov 6) From the month of April onwards the work of putting the town in a state of defence had been going on The work was actually pushed on during the last months of the year (1541) under the direction of the great architect João da Castilho, who used plans prepared by an Italian engineer, Benito of Ravenna This was when the walls of Magazan were built as they still stand to-day

In retaining Mazagan the Portuguese wanted to keep a base on the coast to secure protection for the route to India They also hoped that the fortress would serve them as a base for the conquest of Morocco, when a favourable conjuncture should arise, which however never happened In fact for the more than two hundred years in which the Portuguese retained it, the possession of Mazagan only served them as a pretext to obtain from the Pope bulls of Crusades, which supplied the Popal Treasury with appreciable revenues The tribes kept the town so closely blockaded that the inhabitants could not go outside its walls without military protection The collection of wood and the cultivation of a few gardens, continually devastated by the natives, gave rise to continual skirmishes The Muslims of the country around had built two little towns, a few miles from Mazagan, Fahs al Zammūrīyīn and Fahs Awlād Duwaiyib, where they entrenched themselves to keep up the blockade and where the devout, desirous of acquiring merit from participation in the holy war, used to come to discharge a few shots at Mazagan

Badly supplied by sea, often a prey to famine and epidemics, the garrison and population however lived in sufficient security under their powerful walls, against which the tribes could do nothing On several occasions however, they had to resist vigorous attacks In April 1562 Muhammad, son

of the Sa'dian Sultān, 'Abd Allāh al-Ghālib bi'llāh, at the head of a vast horde of tribal warriors laid siege to Mazagan Two assaults were repulsed and the besiegers lost heart On Aug 4, 1623, the place, attacked by 3,000 Muslims during the absence of the governor, who was led into an ambuscade, owed its safety to his wife who ordered the gates to be shut, organised the defence, distributed arms to the whole population, women as well as men, and sent them on to the walls During the disorder which accompanied the decline of the Sa'dian dynasty, the governors of Mazagan seem to have succeeded in raising the blockade and resuming relations to some extent with the tribes The *mudjāhid* Sīdī Muhammad al-'Aiyāshī, to put an end to this, attacked the Portuguese in 1639 and inflicted some losses on them Mawlāy Ismā'īl, occupied with the siege of Ceuta, never seriously tried to take Magazan The honour of retaking it belonged to his grandson Sīdī Muhammad b 'Abd Allāh The Sultān came to besiege it in person at the end of Jan 1769 The place held out successfully for five weeks but, the order to abandon it having arrived from Lisbon, the governor surrendered on honourable terms The garrison and civilian population returned to Portugal with their arms and possessions On abandoning Mazagan on March 10, 1769 the Portuguese exploded mines there which did great damage, the sultān entered a ruined town which he repopulated in part but it remained in so miserable a state that it was called *al-Mahdūma* "the ruined", until, in the reign of Sīdī Muhammad b Hishām, in 1240 (1824—25) it was restored by Sīdī Muhammad b al-Taiyib, kā'id of Dukkāla and Tāmasna, who gave it the name of *al-Djadīda* by which it is generally known to Muslims

MĀZANDARĀN, a province to the south of the Caspian Sea bounded on the west by Gīlān, on the east by the province of Āstarābād (q v, formerly Gurgān)

The name If Gurgān to the Īrānians was the "Land of the Wolves" (*vəhrkāna*), the region to its west was peopled by "Māzainian dēws" (Bartholomae, *Altir Worterbuch*, col 1169 under *māzainya daēva*) Darmesteter, *Le Zend-Avesta*, II 373, note 32, thought that Māzandarān was a "comparative of direction" (**Mazana tara*, cf SHŪSH and Shūshtar) but Nöldeke's hypothesis is the more probable (*Grundr d iran Phil*, II 178) who thinks that Māzan-dar = "the gate of Māzan" was a particular place, distinct from the part of the country known as Tapuristān [A village of Mesderan (?) is marked on Stahl's map 12 km south of Fīrūzkūh!] In any case the name Māzandarān seems to have no connection with τοῦ Μασσωράνου ὄρους which according to Ptolemy, VI, ch V, was situated between Parthia and Areia (Harī-rūd) and was connected by Olshausen (*Mazdoran und Mazandaran*, *Monatsberichte Ak Berlin*, 1877, p 777—783) with Mazdūrān, a station 12 farsakhs west of Sarakhs, cf Ibn Khurdādhbih, p 24, Mukaddasī, p 351 [cf however the late source of 881 (1476) quoted by Dorn, *Melanges asiat*, VII 42]

The Avestan and Pahlavi quotations given by Darmesteter, *loc cit*, show to what degree the people of Māzandarān were regarded by the Persians as a foreign group and little assimilated According to the *Bundahish*, XV 28, transl West, p 58, the "Māzandarān" were descended from a different pair of ancestors to those of the Īrānians and Arabs The *Shāh nāma* reflects similar ideas (cf the episode of Kai-kā'ūs' war in Māzandarān and esp Vullers ed, I, p 332, V 290 the war is waged against Ahriman, p 364, V 792—793 Māzandarān is contrasted with Īrān, p 574, V 925 the bestial appearance of the king of Māzandarān)

Among historical peoples in Māzandarān are the Tapyres (Τάπυροι), who must have occupied the mountains (north of Simnān), and the Amardes (Ἀμαρδοί), who according to Andreas and Marquart have given their name to the town of Āmol (although the change of *rd* to *l* is rather strange in the north of Persia) These two peoples were defeated by Alexander the Great The Parthian king Phradates I (in 176 B C) transplanted the Mardes (Amardes) to the region of Χάραξ (Khwār to the east of Warāmin) and their place was taken by the Tapyres, whose name came to be applied to the whole province

The Arabs only know the region as Tabaristān (< Tapurstān, on the Pahlavi coins) The name Māzandarān only reappears in the Saldjūk period Ibn al-Athīr, X 34, in speaking of the distribution of fiefs by Alp Arslān in 458 (1065) says that Māzandarān was given to the emīr Inandj Baighu Ibn Isfandiyār, p 14, and Yākūt, III, p 502, 9, think that Māzandarān as a name for Tabaristān is only of fairly modern origin (in Arabic ?) but according to Zakarīyā Kazwīnī, p 270, "the Persians call Tabaristān Māzandarān" Hamdallāh Mustawfī distinguishes between Māzandarān and Tabaristān In his time (1340) the 7 *tuman* of the "wilāyat of Māzandarān" were Djurdjān, Mūrūstāk (?), Āstarābād, Āmol and Rustamdār, Dihistān, Rūghad and Siyāh-rustāk (?), on the other hand the *diyār-i Kūmis wa-Tabaristān* included Simnān, Dāmghān, Fīrūzkūh, a town of Damāwand, Firrīm etc We find a similar distinction in Khwāndamīr, ed Dorn, p 83

Geography The actual extent of Māzandarān (Rabino) is 300 miles from east to west and 46 to 70 miles from north to south Except for the strip along the coast — broader in the east than the west — Māzandarān is a very mountainous country The main range of the Elburz forms barriers parallel to the south of the Caspian, while the ridges running down to the sea cut the country up into a multitude of valleys open on the north only The principal of the latter ridges is the Mazār-čūb, which separates Tabaristān from Tunikābun The latter is bordered on the south by the chain of the Elburz in the strict sense, which

separates it from the valley of the Shāhrūd (formed by the waters of the Alamūt and Talaḳān and flowing westward into the Safīd-rūd)

To the east of Mazār-čūb, a number of ranges run out of the central massif of the Elburz 1 to the east the chain of Nūr which cuts through the Harāz-pey and 2 to the S E the southern barrier which forms the watershed between the Caspian and the central plateau Between the two, rises in isolation the great volcanic cone of Damāwand (9,900 feet)

To the east of Damāwand the southern barrier rejoins the continuation of the Nūr and the new line of the watershed of eastern Māzandarān is marked by the ranges of Band-i-pey, Sawād-kūh, Shāh-mīrzād (to the south of Simnān), of Hazār-djarīb (to the south of Dāmghān), of Shāh-kūh (to the south of Shāhrūd) etc

The rivers of Māzandarān are of two kinds A hundred short streams run straight down into the sea from the outer mountains of Māzandarān Much more important are the rivers which rise in the interior and after draining many valleys form a single great river when they break through the last barrier Such are (from west to east) the Sardābrūd, the Čālūs, the Harāz pey, which drains the region of mount Damāwand and then runs past Āmol, the Bābol (the river of Bārfrūsh), the Tālār (river of ʿAlīābād), the Tīdjn (river of Sārī) and the Nīkā (or Aspneyzā) which flows from east to west, its valley forms a corner between the southern chain (cf above) and the mountains which surround the Gulf of Astarābād on the north

The historical geography of Māzandarān is still full of difficulties although Vasmer's very full study has considerably reduced their number The matter is complicated by the fact that certain well-known names are used in different periods for more or less identical districts

The eastern frontier of Māzandarān (Tabaristān) in the strict sense, with Astarābād (Djurdjān) seems to have always run near Kulbād (on the river Kirrind, cf Ptolemy Χρίνδοι) where there used to be a wall (*djar-i Kulbād*) which barred the narrow strip of lowland between the Gulf of Astarābād and the mountains, cf Ibn Rusta (p 149) who speaks of the brick wall (*ādjurr*) and of the Gate of Tamīs through which travellers had to pass (cf Ibn al-Fakīh, p 303) To the west the town of Shālūs (Čālūs) was situated on the frontier of Dailam (Ibn Rusta, p 150 *fi nahwi 'l-ʿaduw*) but later the valley of the Sard-āb-rūd (Kalārdasht) seems to have been annexed to Tabaristān Farther west the coast of Tunikābun was governed sometimes with Māzandarān and sometimes with Gīlān

The Arab geographers distinguished between the plain (*al-sahliya*) and the mountains (*al djabaliya*) of Tabaristān (Istakhrī, p 211, 271) The important towns of Tabaristān were in the lowlands Āmol, Nātil, Shālūs (Čālūs), Kalā (Kalār), Mīla, Tardjī (Tūdjī, Bardjī?), ʿAin al-Humm, Māmtīr (= Bārfurūsh), Sārī, Tamīsha (cf Istakhrī, p 207, cf Mukaddasī, p 353) The principal town (*madīna*) of Tabaristān in the time of Yaʿkūbī, p 276, still was Sāriya [*q v*], but in the time of Masʿūdī, *Tanbīh*, p 179, Istakhrī, p 211, and Ibn Hawkal, p 271, the principal town (*kaṣaba*) and the most flourishing one in Tabaristān was Āmol (larger than Kazwīn)

The mountain area was quite distinct and its connection with the plain is not very clear in the Arabic texts, cf the confused summary in Istakhrī, p 204 Tabarī, iii, 1295 under the year 224 (838) distinguishes three mountains in Tabaristān 1 the mountain of Wandā-Hurmuz in the centre (*wasat*), 2 that of his brother Wandāsandjān (*sic*) b Alandād b Kārin and 3 that of Sharwīn b Surkhāb b Bāb Now according to Ibn Rusta, p 151, (the Kārinid) Wandā Hurmuz lived near Dunbāwand On the other hand, the same writer, p 149, says that during the rule of Tabaristān by Djarīr b Yazīd, Wandā-Hurmuz had bought 1,000 djarīb of domain lands (*ṣawāfī*) outside the town of Sārī These *alf djarīb* seem to correspond to the region round the sources of the rivers Tīdjin and Nikā which in Persian is called Hazār djarīb Later, the lands of Wandā Hurmuz included the greater part of eastern Māzandarān *Wandāspdjān seems to have ruled over the greater part of Māzandarān for his capital Muzn was the rallying point from which expeditions set out against Dailam Finally the mountain of Sharwīn comprised the S E part of Māzandarān, for according to Ibn al Fakīh, p 305, it was close to Kūmis

In the time of Istakhrī, the three divisions of the mountains specified are the mountains of Rūbandj, of Fādūsbān and of Kārin "They are high mountains (*djibāl*) and each of them (*djabal*) has a chief"

Rūbandj, according to Ibn Hawkal, lay between Raiy and Tabaristān Barthold, *Očerk*, p 155 emends the name to *Rūyandj and identifies it with Rūyān Ibn Rusta, p 149 says that Rūyān, near the lands of Raiy, did not form part of Tabaristān but formed a special *kūra* with the capital Kadjdja which was the headquarters of the Wālī (cf Kačarustāk in the *bulūk* of Kudjūr) According to this, *Rūyand = Rūyān is to be located in the S W part of Māzandarān (north of Teherān) In the Mongol period, Hamdallāh Kazwīnī, p 160, is the first to mention Rustamdār (on the Shāh-rūd) As Vasmer, *loc cit*, p 122—125, has shown, Rustamdār later included all western Māzandarān between Sakhtasar (Gīlān) and Āmol

Rustamdār therefore included Rūyān, without the two terms being completely synonymous

Djibāl Karīn had only one town Shahmār, a day's journey from Sārıya The local chiefs of the dynasty of Kārin lived in the stronghold of Firrīm which must have stood on the western branch of the river Tīdjin, which later flows past Sārī The modern *bulūk* of Firrīm is in the Hazār-Djarīb (more accurately in its western half which is called Dudānga) According to Ibn Isfandiyār, p 95, the possessions of the Kārinids included the mountains of Wandā ummid (*ibid*, p 25, the water supply of the mosque of Āmol came from this mountain), Āmol, Lafūr (on the eastern source of the river Bābul which runs to Bārfurūsh) and Firrīm, "which is called Kūh i Kārin" According to Yākūt, iii 283, the lands of the Kārinids included Djibāl Sharwīn (cf above) which l'timād al-Saltana, *Kitāb al-Tadwin*, p 42, identifies with Sawād-kūh i e the sources of the Tālār (river of ʿAlīābād between Āmol and Bāifurūsh), the pass leading to Sawād kūh is still called Shalfīn < Sharwīn

The Djibāl Pādūspān (فادوسپان long wrongly read قادوسپار) lay a day's journey from Sārī The district had no cathedral mosque, the chief lived in the village of Uram (Ibn Hawkal, p 268, 17 Uram-khāst, Ārum) As Vasmer has shown p 127–130, this must be sought on the middle course of the rivers of Bārfurūsh and ʿAlīābād (to the north of Lafūr and near Shīrgāh)

Bibliography B G A, s v Dailam, Tabaristān, Āmol, Sārıya etc Ibn al-Fakīh, p 301—314, in particular gives very detailed information about Tabaristān Masʿūdī, *Murūdj al-Dhahab*, index, Idrīsī, transl Jaubert, ii 169, 179–180, 333, 337–338 (of little originality), Zakariyā Kazwinī, *Āthār al-Buldān* (clime iv) Āmol, p 190, Bilād al-Dailam, p 221, Rūyān p 250, Tabaristān, Yākūt, cf Dorn, *Auszuge*, 1858, p 2—45, where are collected all the articles relating to Tabaristān [but the text of Wustenfeld's edition is preferable], Hamdallāh Kazwīni, *Nuzhat al Kulūb*, G M S, p 159 and 161, Dorn, *Auszuge aus 14 morgenl Schriftstellern betreffend d Kaspische Meer*, *Melanges Asiatiques*, vi, p 658, vii, p 19—44 and 52—92, cf also the historical bibliography European works Spiegel, *Eran Alterthumskunde*, 1871, i 64—74, Dorn, *Caspia*, 1875 (a mass of rather undigested information), Geiger, *Ostiranische Kultur*, 1882, index, Brunnhofer, *Vom Pontus bis zum Indus*, Leipzig 1890, p 73—93 Alburs and Mazanderan (the author seeks to explain Iranian geography from Sanskrit texts), Barthold, *Istor -geogr obzor Irana*, St Petersburg 1903, p 158—161, Pers transl, Teherān 1930, p 289–295, I e Strange, *The Lands of the Eastern Caliphate*, p 368—376, Vasmer, *Die Eroberung* etc

History The local dynasties of Māzandarān fall into three classes 1 local families of pre-Islāmic origin, 2 the ʿAlid saiyids and 3 local families of secondary importance

I At the coming of the Sāsānian dynasty, the king of Tabaristān and of Padashwārgar (Marquart, *Ērānšahr*, p 130 "the district opposite the region of Khwār", Farshuwādgar is a misreading of the name, which is also found in the *Bundahish*, xii 17) was Gushnasp, whose ancestors had reigned since the time of Alexander In 529—536 Tabaristān was ruled by the Sāsānian prince Kayūs, son of Kawāt Anūshirwān put in his place Zarmihr, who traced his descent from the famous smith Kāwa. His dynasty ruled till 645 when Gīl Gaubāra (a descendant of the Sāsānian Djamāsp, son of Pērōz) annexed Tabaristān to Gīlān These families, on whom their coins might throw some light (cf below), had descendants ruling in the Muslim period

The Bāwandids (who claimed descent from Kayūs) provided three lines the first 45—397 (665—1007) was overthrown on the conquest of Tabaristān by the Ziyārid Kābūs b Washmgir, the second reigned from 466 (1073) to 606 (1210) when Māzandarān was conquered by Muhammad Khwārizmshāh, the third ruled from 635 (1237) to 750 (1349) as vassals of the Mongols The last representative of the Bāwandids was slain by Afrāsiyāb Culāwī

The Kārinids (in the Kūh i Kārin) claimed descent from Kārin, brother of Zarmihr (cf above) Their last representative Māzyār [*q v*] was put to death in 224 (839)

The Pādūspānids (Rūyān and Rustamdār) claimed descend from the Dābūyids of Gīlān (their eponym was the son of Gīl Gaubāra, cf above) They came to the front about 40 (660) and during the rule of the ʿAlids were their vassals Later they were vassals of the Būyids and Bāwandids, who deposed them in 586 (1190) The dynasty, restored in 606, survived till the time of Timūr, one of its branches (that of Kāwūs b Kayūmarth) reigned till 975 (1567) and the other (that of Iskandar b Kayūmarth) till 984 (1574)

II Alongside of these native dynasties the ʿAlids were able to establish themselves, principally in Tabaristān In 250 the people of Rūyān, rebelling against the governor, sent to Rayy for the Zaidī Saiyid Hasan b Zaid, a descendant of the Caliph ʿAlī in the sixth generation This (Hasanid) branch ruled in Tabaristān till 316 (928) The Husaimid branch ruled from 304 to 337 (?) Another dynasty of Marʿashī saiyids ruled in Māzandarān between 760 (1358) and 880 (1475) The founder of this dynasty was Kiwām al-Dīn, a descendant of ʿAlī in the twelfth generation A third family of Murtadā'ī saiyids is known in Hazār Djarīb between 760 and 1005 A H

III The noble families who enjoyed considerable influence, mainly in their fiefs, are very numerous Rabino mentions the Kiyā of Čulāw (at Āmol, Talakān and Rustamdār) between 795 A H and 909 A H, the Kiyā Djalālī of Sārī in 750—763, the house of Rūzafzūn of Sawādkūh between 897 and 923, the Dīw in the period of Shāh Tahmāsp in certain parts of Māzandarān, the Banū-Kā'ūs between 857 and 957, the Banū-Iskandar between 857 and 1006 and the different princes of Tamisha, of Miyāndurūd, of Lāridjān, of Māmtīr, of Lafūr etc

Besides this confusion of feudal dynasties, a series of conquerors from outside has ruled in Māzandarān the Arabs (their expeditions began in 22 = 644, the final conquest took place under al-Mansūr in 141—144 [cf the article TABARISTĀN], the dates and facts given are very contradictory as Vasmer has shown), the Tāhirids, the Saffārids, the Sāmānids, the Ziyārids, the Ghaznawids, the Saldjūks, the Khwārizmshāhs, the Mongols, the Sarbadārs, Timūr and his descendants, the Safawids Shāh Ismāʿīl sent an expedition to Māzandarān in 923 (1517) but it was under Shāh ʿAbbās that the land was definitely incorporated in Persia in 1005 (1596) This monarch claimed hereditary

rights there from the connection of his family with the Sayyid Kiwām al Dīn Marʿashī (*Ālam-ārā*, Teherān, p 354) Farahābād was founded in 1020 (1612) and in the next year Ashraf was built with its famous palaces

The coins of Māzandarān The question whether the Sāsānians struck coins in Māzandarān is still an open one and can only be settled when the groups of letters that mark the mints on Sāsānian coins have been properly explained According to the so far insufficient attempts to explain them, the letters *A M* found from the time of Firūz onwards are an abbreviation for Āmul, but this explanation is quite without proof

The Dābwaihids and the earlier Arab governors of Tabaristān struck in the second (eighth) century coins of the type of the Sāsānian drachms of Khusraw II, on the obverse, with the bust of the ruler, his name is given in Pahlavi characters and on the reverse is the fire-altar with its two guardians and on the right the mint *Tpurstan* and on the left the year in the Tabaristān era (began on June 11, 652) These silver coins average in weight 1 90 grammes = 29 3 grains and are hemidrachms Of the Dābwaihid rulers, Ferkhwān, Dātbūrdjmatūn and Khūrshīt are mentioned upon them The coins of the first bear the years 60—77 (711—728), of the second 86—87 (737—738) and of the third 89—115 (740—766), these dates enable us to correct the chronology given by the historians On some coins with the name Khūrshīt, earlier students read the dates 60—63 but this is to be explained by the similarity of *shast* and *dehsat* in the Pahlavi script and these coins are really of the years 110 sqq The assumption of a Khūrshīd I, who reigned in the sixties of the Tabaristān era (Mordtmann), is thus quite unfounded As Khūrshīd died in 144 A H = 110 Tabaristān era, and there are coins with the names of Arab governors earlier than the year 116 Tab, it must be assumed that the Arabs continued to strike coins in the name of the earlier ruler of the land for a period after the conquest of Māzandarān, just as they did after the conquest of Persia under the Caliph 'Omar

The earlier coins struck by Arab governors of Tabaristān bear the name Khālīt (Khālid b Barmak, 116—119) and Umar ('Omar b al-'Alā, 120—125) in Pahlavi From 122 the name of the governor is given in Kūfic also and afterwards in this exclusively ('Omar, Sa'īd, Yahyā, Djarīr, Sulaimān) In the years 130 and 140, there frequently appear on the coins names which seem to have belonged to some other officials, as the names of governors given for this period by historians are different Anonymous coins were also struck The issue of these coins with Sāsānian types ended in the year 143 Tabaristān era (794, anonymous) but we have a coin of 161 (812) on the obverse of which in place of the king's head — as earlier on the coins of the governor Sulaimān (136—137) — there is a rhombus with the puzzling Arabic letters *bh* and on the margin al-Fadl b Sahl Dhu'l-Riyāsatain (in Arabic) is named, on the reverse, instead of the altar with its guardians are three parallel designs like fir branches, between them an inscription in four lines giving the Muḥammadan creed in Kufic and the date and mint in Pahlavi (Tiesenhausen, *Zap vost otd arch obshč*, ix 224)

We know dirhams of Tabaristān mint of the Caliphs of the years 102 (Lavoix), 147 (Brit Mus with the name of the governor Rawh), 190—192, copper coins of the years 145 and 157 (Zambaur, *Numism Ztschr*, xxvi, the latter with the name of 'Omar b al 'Ala) At a later date, coins were struck there by the dā'īs of the 'Alids ('Āmul, 253 AR, 306 AV and AR), the Būyids and Ziyārids (Āmul, Sāriya and Firrīm), the Bāwandids (Firrīm, 353—367, 401 AR), sometimes by the Sāmānids, (Āmul AV 341, AR 302, 353—357) still later by the Hūlāgūids, Serberdārs, Timūrids (Āmul, Sārī) and Shāhs of Persia (Āmul, Sārī, Tabaristān, Māzandarān) In Āmul anonymous copper coins were struck from the xvith century onwards On several pieces of this period the mint Tabaristān occurs As these are all very rare, the issue must have been an occasional one The dates are not preserved on any specimens More common are copper pieces of the value of 4 kāzbekī (18—22 grammes = 280—340 grains) with the lion and sun and mint Māzandarān, which belong to the xviiith century During the Russian occupation of Gilān in 1723—1732, to meet the shortage of currency provoked by the financial crisis in Russia at this time, Persian copper coins were overstruck with a Russian die (double eagle) and circulated in the occupied provinces in place of Russian money These coins are often called Māzandarān pieces but this is not correct, as only Gilān and not Māzadarān was occupied

MAZĀR-I SHARĪF, a town in Afghānistān, south of the Āmū-Daryā [q v] In the middle ages it was the site of the village of Khair, later called Khodja Khairān, 14 miles east of Balkh On two different occasions, in the vith (xiith) century after 530 (1135—1136) in the time of Sultān Sandjar [q v], and in 885 (1480—1481) in the reign of the Timūrid Sultān Husain, the tomb of the caliph 'Alī was "discovered" here and its genuineness declared to have been proved A place of pilgrimage (*mazār*) at once arose around the tomb with a considerable market, the second

tomb which is still standing (the first is said to have been destroyed by Čingiz-Khān), was built in 886 (1481—1482) The *mazār* does not seem to have been of any particular importance during the time of the Özbegs and is hardly mentioned although several Özbeg Sultāns were buried there In the first half of the XIXth century, the place is usually simply called *mazār* by travellers, the name *Mazār i Sharīf* seems only to have arisen within the last hundred years ʿAbd al-Karīm Bukhārī (ed Schefer, p 4) does not mention Mazār at all among the towns of Afghānistān, in 1832 when A Burnes passed through it, it was a little town with about eight hundred houses In 1866, the Afghān governor Nāʾib ʿĀlim Khān, a Shiʿī, chose Mazār i Sharīf as his residence, since then Mazār-i Sharīf has been the capital of Afghān Turkistān In 1878 it was described by the Russian general Matweyew as one of the best towns in Northern Afghānistān with about 30,000 inhabitants (Kostenko, *Turkestanskiy Kray*, II 157)

Bibliography On the first discovery of the tomb of the text of Abū Hāmid al-Andalusī al-Gharnātī (*G A L*, I 477, where the name is different), in *J A*, ccvii, 1925, p 145 *sqq*, on the second Khwāndamīr, *Habīb al Siyar*, lithography of Tihran, III 260 *sq*, C E Yate, *Northern Afghanistan*, Edinburgh and London 1888, p 279 *sqq* (W BARTHOLD)

AL-**MAZĀTĪ**, a name borne by over twenty Abādī writers or men celebrated for their piety, among whom may be mentioned Abu 'l Rabīʿ Sulaimān b Yakhlaf al-Mazātī, a pupil of Abū ʿAbd Allāh Muhammad b Bakr Celebrated for his learning and his virtues, he spent all his life in study and teaching and died in 474 (June 11, 1081—May 31, 1082) in a little town of the Banū Wislū (ويسلو), a clan of the tribe of Mazāta, which in those days occupied the lands between Gabes and the south of Tripoli He wrote a book on the principles of law (*uṣūl*) entitled *al Muthaf*

Bibliography Abu 'l-ʿAbbās Ahmad b Saʿīd al Shammākhī, *Kitāb al Siyar*, Cairo 1301, p 412, 592 (MOH BENCHENEB)

MAZDAK, the apostle of a religion, which was founded two centuries before him by Zarādusht, son of Khurrakhān, but spread in Persia only after his propaganda, it had great political influence in the country in the time of Kawādh (488—531 A D with an interregnum) The latter adopted it and even made arrangements for putting its teaching into practice but after his restoration he put Mazdak and a large number of his followers to death The best known feature of his teaching was the endeavour to remove every cause of covetousness and discord among men, and thus to purify religion, by making women and possessions common property

It is not possible to reconstruct from the sources the Mazdakī doctrine in detail nor to settle its relations with the other religions or sects of Persia The main features will be indicated here

The sources Detailed narratives of the reign of Kawādh and some important references to Mazdak and his teaching will be found in the contemporary Syrian and Byzantine writers (Joshua Stylites, Agathias, Procopius, Malala, Theophanes) In Pahlavī literature there are few references to Mazdak The bulk of our information about Mazdak and his relations with Kawādh come to us from Arab and Persian writers and go back mainly to the *Khwadāīnāmagh* or Royal Sāsānian Chronicle, of which the best known Arabic version was that of Ibn al-Muḳaffaʿ Baron Rosen has shown that the other Arabic versions were not all dependent on this one, some of them having been prepared directly from the original Some compilers also inserted historical or legendary episodes taken from other Pahlavī works and others attempted to harmonise different narratives and did a certain amount of retouching in their reconstruction of the original The Persian and Arab writers who had these different versions or compilations at their disposal only very rarely mention their sources and endeavour in turn to reconcile the statements made Noldeke has already distinguished two "Hauptquellen" for the various Arabic and Persian narratives (the first followed by Ibn Kutaiba and Eutychius and a part of Tabarī, the second by al-Yaʿkūbī and another part of Tabaīī) Christensen in his fundamental study thinks he can distinguish four lines of the tradition of the *Khwadāīnāmagh* found by the Arab and Persian authors in the different versions or editions of it Noldeke's two "Hauptquellen" correspond to the first two, a third is represented by al-Dinawarī (Noldeke thinks his story is a harmonising of the two "Hauptquellen") and the *Nihāyat al-Irab fī Akhbār al-Furs wa 'l-ʿArab* (*J R A S*, 1900, p 195 *sq*), the fourth presents features of its own, some of which are legendary in character and are found again in the *Siyāsat-Nāma* of Nizām al Mulk, which is independent of the *Khwadāīnāmagh* The common source of all these legendary features would be, according to Christensen, the Book of Mazdak, a Pahlavī work of fiction (like the *Kalila wa-Dimna*), which enjoyed great popularity and was translated into Arabic by Ibn al-Mukaffaʿ and into Arabic verse by Abān b ʿAbd al Hamīd al Lāhikī The elements of this fourth line of tradition are, according to Christensen, found in the *Kitāb al Aghānī*, al Thaʿālibī, Firdawsī, al-Birūnī, Ibn al-Athīr and Abu 'l-Fidāʾ Some references in al Masʿūdī and al Khwārizmī can also be traced to the book of Mazdak

Independent traditions would also be preserved elsewhere, for example by the Arabs of al-Hīra Al-Shahrastānī's notes (to which some critics deny any historical value) might go back to books of the sect now lost These are not found elsewhere and their immediate source was Muhammad b Hārūn Abū ʿĪsā al-Warrāk, a Zoroastrian converted to Islām The source of the notices in the *Fihrist* is not known (it calls the Mazdakīs Zoroastrians), the Persian work of the XVIIth century called *Dabistān-i Madhāhib*, is probably a mere compilation of no value, from sources already mentioned and the pretended Mazdakī book *Dīsnād*, which it quotes, is not genuine

Doctrine The fact that the majority of these sources emphasise the social aspect of the Mazdakī reforms and do not mention special doctrines or beliefs of the sect (some like the *Fihrist* and Ibn al-Athīr connect it with Mazdaeism) has convinced the majority of Orientalists who have studied this subject (e g Noldeke, Nicholson, v Wesendonk) that the reforms must be considered as a social movement which aimed at purifying the Mazdaean religion a communist system of which the precepts regarding women and property and those of an ascetic nature (like the prohibition of slaughtering

animals and eating their flesh) had however a religious aim, and were clearly distinguished by this character from modern social communism

Christensen, in his work already quoted, comes to the contrary conclusion that Mazdakism was above all a religious movement and that its social precepts were originally a very secondary feature, it was, he says, a reform of Manichaeism, already preached by Zarādusht, two centuries before Mazdak Christensen supports his argument by two well known passages in Malala, of which the first deals with the doctrines propounded at Rome under Diocletian by the Manichaean Bundos in opposition to official Manichaeism

This Bundos is supposed to have afterwards gone to Persia and spread his doctrine there, which was called τῶν Δαρισθενῶν (from the Pahlavī form *dērist-dēnān* = followers of the orthodox faith) The other passage calls king Kawādh ὁ Δαρδάσθενος (an inaccurate form for ὁ Δαρίσθενος), an epithet which contains an allusion to the Mazdakī faith A popular form دردس دردس is said to be the origin of the very corrupt forms of this surname, which are found in the Arabic texts and are due to the similarity of certain Arabic letters (al Thaʿālibī translates it "may his beard fall" which presupposes a form دردان اس ردس) Christensen thinks these links sufficient to identify Zarādusht with Bundos (Bundos would be an honorific title of the reformer, "the venerable", from the Pahlavī *bundagh*, *bundagh*) and defines Mazdakism as a Manichaean ὀρθοδοξία

This theory is supported by al-Shahrastānī's resumé, which gives us, along with the general character of the religious history of Iran, the best argument for this thesis, and those who hold the other view are forced to deny any force to the evidence of this historian of sects Christensen also concludes that it is with good reason that the Byzantine historians call the Mazdakīs Manichaeans but it must be added that their classification of a doctrine so little known in the west (where on the other hand Manichaeism was well known and was, so to speak, the typical heresy of Persia) is not of much value

According to al Shahrastānī's exposé, Mazdak's system resembled that of Mani, except that he said that the dark spirits did not act of their own will and without restraint (*bi 'l-kaṣd wa 'l-ikhtiyār*), but blindly and by chance (*bi 'l khabṭ wa 'l-ittifāk*), that mixture is produced also *bi 'l-khabṭ wa 'l-ittifāk* and liberation will be produced *bi 'l khabṭ wa 'l-ittifāk* In this connection we must remember that the same author in his survey of the Manichaeans tells us that the views of the Manichaeans on the cause of mixture were divided and that some of them said that it was produced *bi l-khabṭ wa 'l-ittifāk* the opposite of what was laid down in the original cosmogony Other Muslim writers allude to this point in dispute among the dualist sects al Muṭahhar b Tāhir al Maḳdisī says, for example, that mixture *bi 'l-khabt wa 'l-ittifāk* is taught by the Sabians, a name which is sometimes applied to the Manichaeans All this gives the impression that the mention of the Mazdakī teaching in this connection is quite in keeping with the conditions of polemic among dualists Perhaps the practical teachings of Mazdakism should be connected with the doctrine of mixture *bi 'l-khabt wa 'l ittifāk*

Al-Shahrastānī also gives from another source other details on Mazdakī cosmogony (the four forces, which surround the object of worship as court dignitaries surround the king of Persia, the seven viziers, the twelve spiritual beings, the three elements, the director of good and of evil), details which have their parallels in other gnostic and dualist cosmogonies, which should be studied with their names from the point of view of the latest studies on Irānian syncretism

Al-Shahrastānī finally alludes to certain cabalistic speculations on the letters of the supreme name and mentions Mazdakī sects (like the Abū Muslimīya) still in existence in his time in Persia and as far away as Soghdiana

We may conclude that it is at least premature to deny all connection between Manichaeism and Mazdakism, it seems that rather than put the question in the form of a rigid alternative between Mazdaean or Manichaean influence, it would be better to regard Mazdakism as a form of gnosis upon which two powerful religious forces have exerted an equal influence, the official religion and the Manichaean heresy, and some other elements also (just as Manichaean gnosticism owes much to the national religion)

In any case, the feature which appears most clearly from the sources and which struck contemporaries was the general body of Mazdakī precepts with communist and humanitarian tendency and especially those which relate to community of women and property and were actually put into practice for a short time The ascetic prescriptions are quite in keeping with a gnostic character of the sect (the prohibition of slaughtering animals and eating their flesh) which with communist teachings would be the elements forming the path to gnosis and liberation

The presence of an ascetic strain in Mazdakism, as in Manichaeism, is probable The people naturally seized on these principles and eagerly attempted to put them into practice on a large scale Thus excesses resulted which, at least in origin, were very far from the intentions of the reformer and the élite of his adherents This explains also why the religious character of the sect was forgotten and memory of its social teachings retained Whether the founder and his leaders also abandoned themselves to the excesses of which the sources accuse them, one cannot say, we know that very frequently the initial good faith of reformers is disturbed by contact with reality

It was natural to give a more practical value to this body of teaching, if we regard Mazdakism as a Puritan reform remaining within the Mazdaean religion and not becoming an independent religion

Contemporary sources also tell us of a bishop elected by the Mazdakīs, named, according to Malala, Indarazar (which Noldeke connects with the Pahlavī word *andarzgar* = to advise, cf the *ispasagh* or *episkopos* of the Manichaeans) who was slain with the other Mazdakīs on the day of the massacre, according to Christensen, it is possible to identify him with Mazdak

During the persecution which followed the massacre, all the Mazdakī books were destroyed The Persian work of the seventh century, *Dabistān-i Maḏhāhib* quotes a book called *Dīsnād* which is usually regarded as a forgery all the notices of the sect professing to come from this book are

taken from the text of al Shahrastānī and other sources, like the rest of the book The Book of Mazdak which enjoyed a great popularity and was translated in Arabic by Ibn al-Muḳaffa' and into Arabic verse by Ābān b 'Abd al-Hamīd al-Lāhiḳī was a work of entertainment and not of religious teaching (cf above)

History of the Mazdakī movement in the reign of Kawādh — The Massacre We know very little about the life of Mazdak (also written Mazdak) His father was called Bāmdādh (a Persian name like Mazdak) and according to Tabarī, they came from a town بلخ which Christensen is inclined to identify with Mādharāyā Istakhr and Tabriz are mentioned as the birthplace of the reformer According to some sources, he had been a Zoroastrian priest (*mōbaḏh*), al-Bīrūnī who sometimes follows a romantic tradition (cf above), calls him *mōbaḏhān mōbaḏh*! The details of his doctrine are not known but it is certain that he developed and spread the teaching of his precursor Zarādusht of Pasā, who lived two centuries before him It is evident that the disturbed condition of Persia after the victories of the Hephtalites facilitated the spread of revolutionary doctrines, but it is difficult to see why the king (whose reign began in 488) became a convert to the new faith (and this is a question which also puzzled the ancients), and how he became connected with Mazdak

The necessity of crushing the power of the nobility and higher clergy which he found annoying may have caused the king to use for his own ends a sect which aimed at destroying the privileges of these classes Noldeke (who thinks Kawādh was a man of strong will) credits him with this plan Christensen (who had accepted this thesis) now sees in the allusions of some of the sources proof of the sincerity of Kawādh (whom, as he says, the contemporary sources do not credit with a "Machiavellian character") Kawādh, he thinks, was moved primarily by religious motives and was attracted by the religious element in the new teaching, while ready to take advantage of any political advantages that the sect might be likely to gain for him In any case it is evident that in his wars he was not restrained by any humanitarian prejudices, although one Arabic source with a hostile bias says that the king as a *zandīḳ* feared to spill blood Christensen likes to compare his attitude with regard to Mazdakī morality with that of Constantine with regard to Christian teaching In any case it is difficult to give a verdict on Kawādh, in view of the varying prejudices of the sources and the tradition of the time of Khusraw which in general tends to elevate the figure of Anūsharwān at the expense of the others There were numerous conversions among the upper classes, proselytising among the common people was facilitated by the wretched conditions in which they lived and of course also by the nature of the teaching which in every age has seduced the masses Mazdakism thus became a remarkable force and permeated all the machinery of government The practical effect of the king's favour was seen in the measures alluded to in contemporary sources, but we do not know to what degree they realised the Mazdakī ideal, either as regards community of women (perhaps this was only an extension of regulations already existing in the Sāsānian code?) or community of property (only taxes on the rich?) But what is certain is that Khusraw at the beginning of his reign had to take important steps to remedy the disastrous results to property and the organisation of the family, such abuses were however not the direct result of the legal measure adopted by Kawādh but rather of the violent application of communism which was a later development

The philo Mazdak policy of the king and the growing power of the sect provoked a revolution in the palace and Kawādh was dethroned and imprisoned Djāmāsp, his brother, was put on the throne in his stead Kawādh succeeded in escaping and took refuge with the Hephtalites and regained his kingdom with their assistance (498 or 499) In the meanwhile, in spite of the dethronement of the king, the sect had grown more and more and its power became disquieting The people, urged on by their leaders and more alive to the practical advantages than to the religious elements of the reform, naturally abandoned themselves to all sorts of excesses and disorder broke out everywhere The estates of the nobles were plundered, the women carried off, which, with a horror of communist principles, explains the violent language used by contemporary and Arabic and Persian sources against the sect All this must have frightened the king on his return Having revenged himself on his principal enemies immediately on his restoration, he now found it necessary to come to an agreement with the majority of the nobility and clergy in order to face the war with Byzantium Prince Khusraw seeing his rights to the succession threatened by the activities of the sect, which, taking advantage of its power, was endeavouring to secure the election of Kawādh's eldest son Padhashkhwār Shāh (Phthasuarsan) It is also said (in the sources of the fourth line, cf above) that Khusraw was eager to avenge himself on Mazdak, who had refused to take as his wife the mother of Khusraw (offered to him by Kawādh in recognition of the principles of the sect) until the prince humbled himself before him Khusraw, who had already begun to display his remarkable political abilities, must have had considerable influence with his father, who was persuaded to have Mazdak and his followers massacred, after inviting them en masse to the court on the pretext that a theological disputation was to be held (or according to another story, for the public proclamation of Padhashkhwār Shāh as heir to the throne) The massacre took place in 528 or at the beginning of 529 Arab writers wrongly put it at the beginning of the reign of Khusraw, this exploit earned him the title of Anūsharwān The number of slain is unknown Kawādh died in 531 and after him Khusraw took special steps to restore order in the ownership of property and in the social organisation which had been upset by the application of communism The surviving Mazdakīs were persecuted in a bloodthirsty fashion and their books burned

Mazdakism after the massacre It is not probable that Mazdakism disappeared with the persecution, perhaps the survivors sought refuge in the mountains, in different parts of Persia where we later find sects (e g the *Khurramīya*) whom Muslim writers do not hesitate to connect with the Mazdakīs Nizām al-Mulk, who in his manual on the art of government attributes great political importance to a knowledge of the various sects, is very clear on this point According to some

orientalists Mazdakī elements can be discovered in Bāṭinism and Ismāʿīlism But the whole question of the relations between these sects (of which very often insufficient is known) and the old Persian religious forms must be examined thoroughly with a knowledge of the progress made in the study of Irānian gnoses and syncretisms It cannot be dealt with here, cf the articles ISMĀʿĪLĪYA, KHURRAMĪYA, MUBAIYIDA, MUHAMMIRA, MUḲANNAʿ, RĀWANDĪYA, SINBĀD etc

MĀZIN, the name of several Arab tribes who are represented in all the great ethnic groupings of the Peninsula, this finds typical expression in the anecdote recorded in *Aghānī*, VIII 141 (= Yāḳūt, *Irshād*, II 382—383), according to which the Caliph al-Wāthiḳ asked the grammarian Abū ʿOthmān al-Māzinī, who had come to his court, to which Māzin he belonged — if to the Māzin of the Tamīm, to those of the Kais, to those of the Rabīʿa or to those of the Yemen

The first are the Māzin b Mālik b ʿAmr b Tamīm (Wüstenfeld, *Geneal Tabellen*, L 12), the second, the Māzin b Mansūr (D 10) or the Mazin b Fazāra (H 13), the third, the Māzin b Shaibān b Dhuhl (C 19), the last, the Māzin b al-Nadjdjār, a clan of the Khazradj Ansār (19, 24) But alongside of these, many other tribes and clans bore this name The *Djamharat al Ansāb* of Ibn al-Kalbī gives no less than seventy, of whom the best known are the Māzin b Saʿd b Dabba (Ibn Kutaiba, *K al-Maʿārif*, ed Wüstenfeld, p 36, more accurately according to the *Djamhara*, MS Br Mus, Add 23, 297, fol 114r Māzin b ʿAbd Manāt b Bakr b Saʿd b Dabba, not given in the *Tabellen*), Māzin b Saʿsaʿa b Muʿāwiya b Bakr b Hawāzin (Ibn Kutaiba, p 42, *Tabellen*, H, 14), Māzin b Raith b Ghatafān (H, 10), Māzin b Rabīʿa b Zubaid or Māzin Madhhidj (7, 18), Māzin b al-Azd (11, 11) The large number of tribes named Māzin and their distribution over the whole of Arabia makes the hypothesis that we have here a single tribe that had been broken up into small sections impossible and we are led to suppose that the name Māzin, is a descriptive rather than a proper name, since the verb *mazana* means to "go away", one might suppose that Mazin originally meant "the emigrants" and was used in a general way of any ethnic group which became separated from its own tribe and was incorporated in a strange tribe This etymology, like almost all those of the names of Arab tribes, is of course only a hypothesis

The sources give a certain number of geographical and historical references to different tribes called Māzin, but they are generally very scanty, none of these tribes having attained sufficient importance to make it independent of the larger body to which it was attached We have a few details about the Māzin b al-Nadjdjār, a fairly important group of Madinese Khazradj (on the part played by them at the beginning of Islām see Caetani, *Annali dell' Islam*, Index to Vols I—II), as well as about the Māzin b Fazāra who took part as members of the tribe of the Dhubyān, in the war of Dāhis and al-Ghabrāʾ (cf DHUBYĀN, and *Aghānī*, XVI 27) Ibn Maiyāda, himself a Dhubyānī, directed a violent satire against them at the end of the first century A H (*Aghānī*, II 90, 102) As to the Māzin b Shaibān b Dhuhl, to whom the grammarian Abū ʿOthmān belonged, we know from the anecdote above quoted that in their dialect, *m* (initial ʾ) was pronounced like *b* (*baʾsmuka* for *maʾsmuka*, what is thy name ʾ), a peculiarity which does not seem to be recorded of the dialect of other Rabīʿa Lastly the Māzin b al-Azd, whom tradition makes migrate to the north, changed their name to Ghassān [*q v*] under which they became celebrated

It is only of the Māzin b Mālik b ʿAmr b Tamīm that we have fairly full information Legend, which has developed with unusual detail around the sons of Tamīm [*q v*] gives Māzin a part in the story of his uncle ʿAbd Shams b Saʿd b Zaid Manāt b Tamīm's fight against al-ʿAnbar b ʿAmr b Tamīm (cf al Mufaddal b Salama, *al-Fākhir*, ed Storey, p 233 and the references given in the note) This tribe of Māzin never left the great group of the ʿAmr b Tamīm to which it belonged and dwelled with them in the lands in the extreme N W of Nadjd, their headquarters were around the well of Safārī near Dhū Kār (*Nakāʾid*, ed Bevan, p 48, note to line 17, Yāḳūt, III 95, Bakrī, p 724, l 1, 787—788), their principal subdivisions were the Banū Hurḳūs, Khuzāʿī, Rizām, Anmār, Zabīna, Uthātha and Raʾlān In the Djāhilīya, the Māzin followed their parent tribe and we find them sharing in the

wars of the latter, in rotation with the other Tamīmī tribes they held the office of *ḥākim* at the fair of ʿUkāz (*Nakāʾiḍ*, p 438) At the coming of Islām, their chief was Mukhārik b Shihāb, also known as a poet (cf especially al Djāhiz, *Bayān*, II 171, al-Kālī, *Amālī*, III 50, Ibn Hadjar, *Isāba*, Cairo 1325, VI 156) Without being particularly zealous partisans of the new religion, they did not take part in the *ridda* with the other Tamīmī tribes (11 A H) and they even drove away the messengers sent them by the prophetess Sadjāḥ [*q v*] and made one of them prisoner, the Taghlibī al-Hudhail b ʿImrān, the latter waited for his revenge till the troubled period that followed the murder of the Caliph ʿOthmān (35 = 656), of which he took advantage to ravage the district of Safārī, but the Māzin met him and slew him and threw him into the well (Tabarī, I 1911, 1915, cf *Aghānī*, XIX 145—146, transl in Caetani, *Annali dell' Islām*, X 552—553, in the last passage the expedition against the Safārī appears to be independent of the events of the *ridda*)

At a later date, the Māzin settled in large numbers, like the rest of the Tamim, in Khurāsān and took part in the conquest of Central Asia, among the Māzinīs who distinguished themselves there were Shihāb b Mukhāriḳ, son of the chief already mentioned (Tabarī, I 2569, 2707), Hilāl b al-Ahwaz, who in 102 (720) slew the members of the family of Yazīd b al-Muhallab after the defeat of the latter (Tabarī, II 1912–1913), ʿUmair b Sinān, who killed the Persian chief Rutbīl (Ibn al-Kalbī, *Nasab al-Khail*, p 30, note to lines 3–4) We also find many of the Banū Māzin among the *kuwwād* of the ʿAbbāsid army in the time of the rising against the Umaiyads But a no less number went to swell the ranks of the Khāridjīs, the celebrated chief of the Azrakīs, Katarī b al-Fudjāʾa [*q v*], belonged to the Māzinī clan of Kābiya b Hurḳūs

Very few of the remarkable number of poets produced by the Tamīm belonged to the Māzin We may note however Hilāl b Asʿar of the Omaiyad period (*Aghānī*, II 186), Mālik b al-Raib, poet and brigand, contemporary of al-Hadjdjādj (*Aghānī*, XIX, 162—169, Ibn Kutaiba, *al-Shiʿr wa 'l-Shuʿarāʾ*, ed de Goeje, p 205—207 etc), Zuhair b ʿUrwa al-Sakb (*Aghānī*, XIX 156, the few verses that we have by him, often quoted, are also attributed to his father, ʿUrwa b Djalham, and even to ʿAbd al-Rahmān b Hassān b Thābit cf *Mufaddaliyat*, ed Lyall, p 249, note *y*) Lastly it may be mentioned that the Māzin have given to Arab philology two of its most illustrious masters Abū ʿAmr b al-ʿAlāʾ (*q v*, d 154) and al-Nadr b Shumail whose genealogies are given in Wüstenfeld, *Tabellen* (L)

Bibliography Wustenfeld, *Register z d geneal Tabellen*, p 291, Ibn Kutaiba, *K al-Maʿārif*, ed Wüstenfeld, p 36—42, Ibn Duraid, *K al-Ishtikāḳ*, ed Wüstenfeld, p 124—126, 171, 211, 258, Ibn al Kalbī, *Djamharat al-Ansāb*, ms Brit Mus, Add 23, 297, fol 90 v—92 r, and *passim* (G Levi Della Vida)

MAZYADĪS, a Muḥammadan dynasty in al-Hilla The Banū Mazyad belonged to the tribe of Asad and lived west of the Tigris, from Kūfa to Hīt In the southeast, on the Khūzistān frontier, the Banū Dubais had settled When Abu 'l-Ghanāʾim Muhammad b Mazyad, who was related to the Banū Dubais, slew one of their chiefs with whom he had quarrelled, a war broke out between the two tribes (401 = 1010–1011) Abu 'l-Ghanāʾim fled to his brother Abu 'l-Hasan ʿAlī, the latter set out against the Banū Dubais with an army, but was defeated and Abu 'l-Ghanāʾim fell in the battle In 403 (1012—1013), ʿAlī was recognized as emīr by the Būyid Sultān al Dawla In Muharram 405 (July 1014), he undertook a campaign against the Banū Dubais, to revenge himself for the defeat he had suffered and slew Hassān and Nabhān, the sons of Dubais, but in Djumādā of the same year (Oct –Nov 1014) he was routed by their brother Mudar After ʿAlī's death in Dhu 'l-Kaʿda 408 (March–April 1018), his son Dubais succeeded him The latter's brother al-Mukallad with the help of Turkish mercenaries in Baghdād, endeavoured to seize the power for himself, but order was soon restored and al-Mukallad went to al-Mawsil to the ʿUḳailids In a few years Dubais became involved in war with Karwāsh b al-Mukallad [q v] and he had also troubles within his borders In the war between the two Būyids Abū Kālīdjār and Djalal al-Dawla, the former was supported by Dubais and the latter by al-Mukallad After the defeat of Abū Kālīdjār in 421 (1030), al-Mukallad with the help of the Banū Khafādja and the troops of Djalāl al Dawla invaded his brother's territory Dubais had to take to flight and the land was laid waste Peace however was soon arranged Dubais was allowed to retain his lands but had to pay Djalāl al-Dawla a considerable sum The third brother Thābit allied himself with al-Basāsīrī, the military governor of Baghdād, and in 424 (1032—1033) they advanced against Dubais The latter sent an army to meet them, but his troops were routed and he himself had to take to flight After receiving reinforcements he advanced against Thābit, they met at Djardjarāyā and after a fierce battle, Dubais had to cede a part of his possessions while al-Basāsīrī, who arrived too late to take part in the battle, returned to Baghdād In Radjab 446 (Oct –Nov 1054) the Banū Khafādja invaded the country but were soon driven out with the help of al-Basāsīrī Two or three years later war broke out between al-Basāsīrī who was joined by Dubais, and the Saldjuk Sultān Toghrīl Beg and his follower Kuraish b Badrān [q v] Dubais died in Shawwāl 474 (March–April 1082) at the age of 80 His son Mansūr succeeded him but died in Rabīʿ I, 479 (June–July 1086) In the reign of his son and successor Sadaka [q v] the power of the Mazyadīs spread over almost the whole of the ʿIrāk At first he was a stout supporter of Barkiyārūk [q v], in 494 (1100—1101) however he turned to his brother The towns of Hīt, Wāsit, Basra and Tal rīt fell successively into his hands but, as the commander appointed by Sadaka in Basra did not prove fit for his task, Muhammad seized the suzerainty of the town and installed a new governor In Sadaka's reign the capital al-Djāmiʿān was extended and fortified, and given the name of al-Hilla (495 = 1101—1102) His steadily increasing power however aroused Muhammad's misgivings and in spite of long negotiations, a rupture finally occurred between them At the end of Radjab 501 (Febr –March 1108) Muhammad himself set out from Baghdād against Sadaka A section of the Arabs allied with him fled and Sadaka fell in the battle His son Dubais was taken prisoner but the latter's two brothers escaped and were only able to return home after Muhammad's death

(511 = 1118) In 529 (1135) he was treacherously murdered [cf the article DUBAIS] and succeeded by his son Ṣadaḳa In the war between Sulṭān Masʿūd and his nephew Dāwūd, Sadaka declared for the former After Masʿūd's victory, the troops scattered to seek booty and several emīrs including Ṣadaḳa were surprised and captured by the enemy and at once put to death (532 = 1137—1138) Sadaḳa's brother Muhammad was thereupon recognised as lord of al-Hilla In 540 (1145—1146) however, the third brother ʿAlī went to al-Hilla, because he was afraid of the Sultān and drove out Muhammad After he had taken the town, he drove back the Sultān's troops and it was not till 542 (1147—1148) that Salārkerd, one of Masʿūd's generals, was able to expel ʿAlī but in the same year he was defeated by the latter and had to abandon the town In 544 (1149—1150) ʿAlī endeavoured to induce the caliph al Muktafī to abandon Masʿūd but, as the caliph refused and summoned the Sultān to his help, ʿAlī had to submit and the rebels who had joined him dispersed ʿAlī died in the following year and al Hilla was given as a fief to Salārkerd by Masʿūd On Masʿūd's death in 547 (1152), the town fell into the hands of Masʿūd Bilāl, the commander of Baghdād, the latter however was driven out by the caliph's troops who occupied al-Hilla When in 551 (1157) Sultān Muhammad took the field against al-Muktafī [q v], they had to withdraw and Muhammad put a garrison in the town The Mazyadīs submitted to his deputy but in 558 (1162—1163) the caliph al Mustandjid sent an army against them which put an end to their power 4,000 men were slain and the remainder outlawed so that they were scattered in all directions

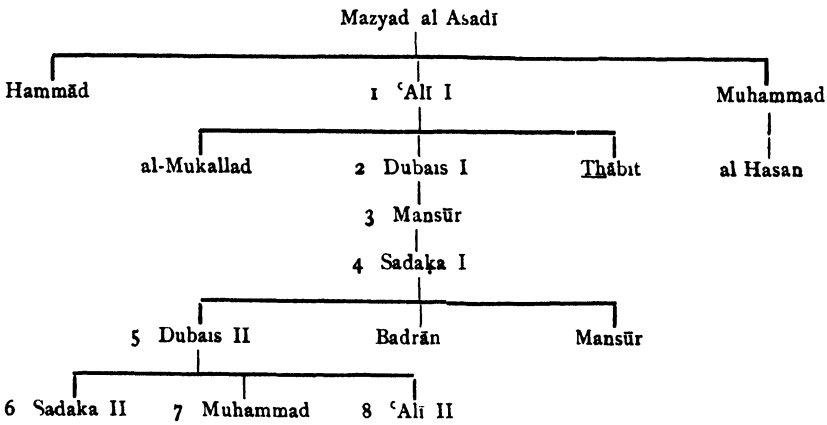
MĀZYĀR, [Balādhurī gives the form Māyaz dıyār <* Māh-yazd-yār], the last of the Kārınıd rulers of Tabarıstān, leader of the rising against the caliph al Muʿtasım

Origins The Kārın-wand dynasty claimed descent from Kārın b Sūkhrā, whom Khusraw Anūshırwān had established in Tabarıstān and who was descended from the legendary smith Kāwa, who saved Faıldūn The hereditary fief of the dynasty was the "mountain of Kārın" [or of Windād Hurmuz], Tabarī, in 1295 The capital of this region was probably Lapūra (cf Lafūr on the eastern source of the river Bābul which later runs through Bārfurūsh) The Kārın-wand were subordinate to the Bāwandid *ispahbads* (capital Fırrım) The genealogy of the Kārınids given by Zahīr al-Dın, p 167 and 321 is fantastic The first Kārınid known is Windād-Hurmuz (138—190 =

Genealogical Table of the Mazyadīs



755—805 ?) who raised a coalition of local chiefs against the Arabs (the Bāwandid Sharwīn, [the] Māsmughān Walāsh of Mıyāndurūd, the Pādūspān Shahrıyār b Pādūspān) and defeated the generals sent by the caliph al-Mahdī (first Sālim Farghānī, then Fırāsha, Ibn Isfandıyār, p 128 Zahır al-Dın, p 155—159) Windād-Hurmuz had to submit to Hādī, the son of the Caliph, and accompany him to Baghdād Soon he returned to his native mountains and resumed an independent attitude (*ibid*, p 160) According to Ibn al Faḳīh, p 304, Windād Hurmuz came to the court of Hārūn al-Rashid, who appointed him *ispahbad* of Khurāsān He died in the reign of al-Maʾmūn His son and successor was Kārın (a contemporary of the Bāwandid Shahrıyār) According to Ibn Isfandıyār, p 145, he accompanied al-Maʾmūn on his campaign against the Byzantines but this does not agree with the dates given for his successor

According to Zahīr al Dın, p 321, Māzyār b Kārın ruled for 30 years (194—224 = 809—839) but on p 167 the same writer says that his (tyrannical!) government lasted 7 years (217—224) Tabarī, in 1015, under the year 201, speaks of the conquests in Tabarıstān of ʿAbd Allāh b Khurdadhbah (sic!) as a result of which the Bāwandid Shahrıyār b Sharwīn had to leave the mountains and Māzyār b Ḳārın was sent to al-Maʾmūn According to late sources,

Shahriyār b Sharwīn had deprived Māzyār of his possessions Māzyār sought refuge with his cousin Windā Ummīd b Windād-aspān, who handed him over to Shahriyār Māzyār however managed to escape, sought refuge with al Ma mūn and became a Muslim, assuming the name Muhammad After the death of Shahriyār (210 = 825, Ṭabarī, iii 1093), Māzyār, returning to Ṭabaristān, slew Shāpūr b Shahriyār and seized the mountain (Ṭabarī, *ibid*) [Ibn al-Fakih's story, p 305—306, about the "son of Sharwīn b Shahriyār", whom Māzyār assassinated treacherously seems to refer to Shāpūr, to allay the suspicions of his victim, Māzyār had built a mosque in Firrīm] Māzyār assisted the Arab governor Mūsā b Hafs b ʿOmar b al-ʿAlā' to subjugate the mountain of Sharwīn and al-Ma'mūn appointed him governor of Tabaristān, Rūyān and Dunbawand with the rank of *ispahbadh* (Balādhurī, p 229, Ibn al-Fakīh, p 309) At this time (Yaʿḳūbī, *Historiae*, ii 582), Māzyār boasted the title of *Dhū l Dhulān*, *ispahbadh ispahbadhān Bishwār-Khurshād* (read *Patishwār-gharshāh*), *Muhammad b Kārin*, *muwālī* (sic) *amir al-mu'minīn* (i e "ally" instead of *mawlā* "client") When Mūsā b Hafs died, Māzyār paid no heed to his son Muhammad b Mūsā Complaints against Māzyār were taken to Baghdād by the Bāwandids and by devout Muslims But as al-Mamūn was setting out against the Byzantines (expedition of 216—218?) Māzyar felt himself free from any control In his turn he charged Muhammad b Mūsā with intriguing with the ʿAlids and on this imaginary pretext besieged Amul The town capitulated at the end of 8 months Māzyār executed his enemies and imprisoned all the notables, including Muhammad b Mūsā, first at Rūd bast and then in his principal stronghold of Hurmuzd-ābād To judge from Tabarī, iii 1289—1292, the place must have been in the valley of the Ṭālār, above Uram (Ārum) at a distance of 8 farsakhs from Āmul and from Sārī [cf the article MĀZANDARĀN]

In the sixth year of the reign of al-Muʿtasim (218—227), Māzyār openly rebelled (Balādhurī, p 229 *kafara wa-ghadara*) The Tāhirid ʿAbd Allāh, governor of Khurāsān, had denounced to the Caliph the "misdeeds, tyranny and apostacy" of Māzyār When al-Muʿtasim's ambassador arrived, Māzyār would not listen to him Ibn Isfandiyār, p 152, even accuses him of having conferred honours "on Bābak, Mazdak and other Magians who had ordered the destruction of the mosques and the obliteration of all traces of Islām"

Māzyār's schemes It is difficult to reconstruct Māzyār's programme from the sources, which are hostile to him, but the narratives of contemporary witnesses which Tabarī, iii 1268—1303, gives under the year 224 contain a number of curious and important details

The extension of Mazyār's power (after the assassination of the Bāwandid Shāpūr and the occupation of the mountain of Sharwīn) had brought him into conflict with the Ṭāhirids to whom he refused to pay *kharādj* It may be noted that Māzyār's very title "ispahbadh of Khurāsān" (this variant is given in Yaʿḳūbī, *B G A*, vii 276) must have been displeasing to the Tāhirids On the other hand the celebrated Afshīn, who after his victory over Bābak was at the height of his glory, coveted Khorāsān He therefore secretly encouraged Māzyār's resistance to his rivals and according to Ṭabarī, iii 1269, played upon his sentiments as a man of noble Iranian blood (*yastamīluhu bi 'l-dahkanati*)

From the national point of view, Māzyār could recall the precedent of his grandfather Windād-Hurmuz to whom late sources attribute the organisation of the massacre of the Arab garrisons Māzyār, who came out of "the mountain" where he had only an almost unknown town (Istakhrī, p 206 al Asahmār?) must have looked askance at the urban elements of the great towns of the "plain" among whom Arabs and their clients (*abnā'*) predominated The landowning class was certainly hostile to him, as in order to weaken and even exterminate them, he had relied on the support of the peasants Māzyār's actions were certainly very violent, for ten centuries later, Zahīr al Dīn, p 167, quotes the proverb "so and so has done an injustice such as not even Māzyār could have done"

Coming out in open rebellion (probably before the year 224 under which Balādhurī and Tabarī relate the dénouement) Mazyar had homage paid to himself, took hostages and levied kharādj at once The doings of his governor Surkhāstān in Sārī are characteristic He transferred all the inhabitants of Sārī to Āmul, where he shut them up in a fort, as to the people of Āmul, he took 20,000 of them away into the mountains of Hurmuzd ābad (cf above) The walls of Sarī, Āmul and Tamīsa were razed to the ground "to the sound of fifes and drums"

Māzyār had given orders to the peasants to attack and plunder their masters (Tabarī, iii 1269) The next passage (iii 1270) seems to indicate that a cadastral survey was ordered (*amara an yumsaha 'l balad*) and the lands were let out, the rental being 30% (of the produce) As to Surkhāstān, he collected 260 nobles (*abna 'l-kuwwād*), the bravest he could find, and on a pretext "that the *abnā'* were favourable to the Arabs and to the ʿAbbāsids", handed them over as dangerous individuals to the peasants, who slew them at his suggestion He even tried to provoke a massacre of all the imprisoned landowners, saying to the peasants "I have already handed over to you the houses of the landowners and their wives", but this time the peasants refrained from following his advice

The later sources retain the usual accusation of apostacy against Māzyār ("he once more assumed the girdle of Zoroastrianism", says Ibn Isfandiyār, p 150 quoting the kādī of Āmul) Baladhurī, p 229 and Ibn al Fakīh, p 309 also say that Māzyār "renounced the faith and committed treason", but this point is more obscure in Tabarī, where it only occurs in the list of charges made against Afshīn, iii 1311 (transl in Browne, *Lit Hist of Persia*, i 334) The tone of the letter which Māzyār had addressed to his representatives, *ibid*, iii 1381, is respectful to the Caliph, in form at least But there is no smoke without fire, if we may believe the authors who mention the existence in Tabaristān of a *Māzyārīya* sect connected with the *Khurramiya* [q v] or *Muhammira* [q v] (i e followers of Bābak) Cf al-Baghdādī (d in 429), *Fark bain al-firak*, p 251—252, Tāhir al-Isfarāʾīnī (d in 451), *Tabṣīr fi 'l dīn* [quoted in Flügel, *Bābek*, *Z D M G*, 1869, p 533] and Samʿānī, *G M S*, fol 501a

Māzyār's end ʿAbd Allāh b Tāhir sent against Māzyār his uncle Hasan b Husain to operate from the direction of Djurdjān as well as

Haiyān b Djabala, who went with 4,000 horses via Kūmis towards Djabal al-Sharwīn (= Sawādkūh), cf the article MĀZANDARĀN) At the same time the caliph al Mu'taṣim sent considerable forces under the command of Muhammad b Ibrāhīm who entered Rūyān (western Tabaristān) by Shalamba and Rudhbār (Tabarī, iii 1264) Mansūr b Hasan, "lord of Dunbāwand", attacked from Raiy while Abu 'l-Sādj advanced via Lārīz and Dunbāwand

The Arabs very skilfully exploited the rivalries and enmities in the entourage of Māzyār First of all his nephew Kārin b Shahriyār (his representative in the mountain of Sharwīn = Sawādkūh) went over to Haiyān, who marched on Sārī and began to negotiate with Māzyār's brother Kūhyār In the meanwhile Surkhāstān's army which occupied the Tamīsha front dispersed and allowed Hasan b Husain to advance Kūhyār, who had been promised Māzyār's place, submitted to Hasan Māzyār seems to have lost his courage when he found himself surrounded by the Arabs and betrayed by his follower He trusted Kūhyār, who had promised him the *amān*, and came with him to Hasan (Tabarī, iii 1288—1291, dramatic story by an eye-witness) but Hasan did not even acknowledge his greeting Māzyār was handed over to Muhammad b Ibrāhīm and sent to Sāmarrā Here he was confronted with Afshin and seems to have denounced the latter The caliph ordered him to be given 400 lashes, under which he died and his body was exposed beside that of Bābak in 224 = 839

Kūhyār's treachery served him little He was slain as a traitor by his cousin Shahriyār b Māsmughān who commanded the Dailamīs in the service of Māzyār

Surkhāstān was betrayed by the soldiers after the defeat at Tamīsha and the other of Māzyār's generals, al-Durrī, who was fighting against Muhammad b Ibrāhīm on the Rūyān front, died while attempting to reach Dailam (Tabarī, iii 1300)

Bibliography Ya'kūbī, ed Houtsma, i 514, ii 582, Balādhurī, p 229, Tabarī, iii 1268—1303, — among his authorities were Muhammad b Hafs al-Thakafī al-Tabarī (perhaps related to the Arab wālī Mūsā b Hafs?) and 'Alī b Sahl Rabban "the Christian" [author of the *Firdaws al-hikma*, ed Siddīkī, Berlin 1928], whom Māzyār employed as his scribe, cf the *Fihrist*, ed Flügel, p 299, Tabarī is the source of the later epitomists *Kitāb al-'Uyūn*, ed de Jong-de Goeje, p 399—405, Ibn Miskawaih, vi, ed de Goeje, p 502—516, 522—525, Ibn al-Athīr, vi 351—359, 362—364, 366 etc Cf also Ibn Rusta, p 276, Ibn al Fakīh, p 304, 305—306, 309—310, Mas'ūdī, *B G A*, vii 137, Yākūt, ii 608, iii 284, 490, 506, Ibn Isfandiyār, transl Browne, p 14—154, Zahīr al Dīn, index (these two last local sources do not know Tabarī and contain a number of quite legendary stories), Weil, *Gesch d Chalifen*, ii 321—325, Justi, *Iran Namenbuch*, p 201–202 (bibliography), Marquart, *Ērānšahr*, p 334

(V MINORSKY)

MECCA.

I

On the eve of the Hidjra It is with the birth of Muhammad — between 570–580 AD — that Mecca suddenly emerges from the shadows of the past and thrusts itself upon the attention of the historian The geographer Ptolemy seems to know it under the name Macoraba, but it must have been in existence long before his time Mecca was probably one of the stations on the "incense route", the road by which the produce of the East especially valuable perfumes, came to the Mediterranean world It owes its importance to its position at the

Intersection of great commercial routes The town that had grown up around the well of Zamzam and the sanctuary of the Ka'ba was advantageously placed at the extreme ends of the Asia of the whites and the Africa of the blacks, near a breach in the chain of the Sarāt, close to a junction of roads leading from Babylonia and Syria to the plateaus of the Yemen, to the shores of the Indian Ocean and the Red Sea By the latter it was in communication with the mysterious African continent What advantages were offered by this situation at the boundary between civilisation and barbarism, at the point of contact of two societies, brought together by necessities more pressing than political ambitions or the quarrels of race and religion! This was the part played by the Palmyrans, situated between the Romans and the Parthians It demanded an adaptability and diplomatic skill beyond the ordinary The two societies were frequently at war, it required wits to deal tactfully with them But if the position had its risks, it had the advantage of being able to fix the price for its services to the belligerents In the delicate role of intermediary and broker between two world, the strength of will of the Ishmaelite and the tenacity that lay beneath his apparent complaisance assured his success from the first Civilisation and barbarism might conclude peace for a time or be at war, he was able to trade on their agreement or exploit their dissensions with equal satisfaction to himself Ambiguous and amphibious, the Meccan was able to have a foot in both camps without it being possible to discern where his sympathies really lay

At an early date we see the Meccans opening negotiations with the states adjoining Arabia They obtained from them safe conducts and capitulations, permitting the free passage of their caravans This is what their chronicles call the "guarantee of Caesar and of Chosroes" They also concluded agreements with the Negus of Abyssinia, with the principal shaikhs of Nadjd the *kail*'s of the Yemen, with the phylarchs of Ghassān and of Hira In the negotiations with the Greeks and Persians the principal of the "open door" was not admitted Commercial transactions were carried through at posts on the frontier or in towns specially designated for the purpose In Palestine these were the ports of Aila and Ghazza and perhaps also Jerusalem In Syria, Bosrā was their principal outlet, their great market

Sūra cvi 2 mentions as a permanent institution "the double caravan of winter and summer" The *nassāba*, genealogists, record the names of the Kuraish chiefs who had succeeded in obtaining by negotiation permits to trade The countries open to commerce in this way were called *wadjh*, direction, *matdjar*, region of trade There were innumerable restrictions, limiting the extension of the privilege Eastern governments did not permit free trade Distrustful of merchants even when her own subjects, Byzantium showed herself still more

suspicious of foreigners, especially Bedouins, a slippery race which filled her with an unconquerable distrust The latter had therefore to make heavy sacrifices, to pay onerous taxes, to pay continual customs-dues and tolls or to hand over hostages before negotiations could be begun Mecca was not inspired by principles any more broad-minded, she took care to recompense herself from foreign traders and to levy various charges upon them, tithes, charges for permits to stay in the country, to travel about and to trade Tithes had to be paid before entering Mecca There was also, as at Palmyra, a "departure" tax or tax on exportation In short, foreign merchants were entangled in a very intricate fiscal system, whether they settled in Mecca or only passed through it, especially those who did not obtain the *ḏjiwār* or guarantee of a local clan or notability

The population About the time of the Hidjra, the people of Mecca claimed descent from a common ancestor They called him Kuraish or Fihr, sometimes also al-Nadr surnamed Kuraish The origins of the Kuraish were humble and little is known of them They formed one of the less wealthy branches of those who went back to the main stock of the Kināna [q v] At first they led a miserable existence in the wild mountains around the sacred territory of Mecca A condottiere from the northern Hidjāz, Kusaiy, is said to have installed them by force of arms in Mecca, which he took from the control of the tribe of Khuzāʿa [q v] Some ten main clans can be distinguished among them Hāshim, Umaiya, Nawfal, Zuhra, Asad, Taim, Makhzūm, ʿAdī, Djomah and Sahm These occupied mainly the centre of the town, the bottom of the valley, al-Bathāʾ, where the water of the well of Zamzam accumulated, the hollow where the Kaʿba stood Their living in this neighbourhood earned them the epithet of *Abṭaḥī*, *Biṭāḥī* or *Kuraish al-Biṭāḥ* This central quarter of the town was regarded as that of the aristocracy and of the oldest Kuraish families Among these ten groups, some owe to Islām a renown hitherto denied them Such were the Taim and the ʿAdī, rendered illustrious by the caliphs Abū Bakr and ʿUmar Other clans more vaguely connected with the eponymous ancestor were thrust towards the outskirts of Mecca, on the lower slopes or in the gorges (*shiʿb*) of the hills which dominate the town They were called the "Kuraish of the outskirts" (*Kuraish al-Ẓawāhir*) Held in less consideration than their fellow-tribesmen of the Bathāʾ, these suburbans had the advantage of being distinguished from them by their bravery They supplied the Kuraish community with its best soldiers and never failed to cast this up to the Meccans "of the centre"

Government and Administration It is not easy to discover definite indications of this There must however have been a rudimentary system of archives in which to preserve treaties of alliance and commerce, and later the equivalent of an office to take charge of the collection of taxes on foreign traders Nowhere do we find any explicit allusion to the working of such administrative organisations A tradition records the existence of purely honorary offices with no jurisdiction But it does not agree either upon the number (ten or six) nor upon the functions of these offices I imagine it was invented to satisfy the vanity of the great families The only allusion to it is in the verses of a Medinese poet, Hassān b. Thābit· The office of "pavilion and reins" has nothing to do — as has been supposed — with the art of war This dignity, which was an ancient one and no longer understood, was a memory of the ritual processions held in pagan Arabia The *kubba* was simply the pavilion or portable tabernacle, containing the fetish of the tribe and solemnly carried on the back of a camel The chiefs and notables took turns at holding the reins of the animal bearing this precious burden It is taking nothing from the glory of Khālid b al-Walīd to say that he had not a monopoly of this privilege Behind the legend of the Meccan dignities, we perceive the intention of glorifying the cradle of the Prophet In giving it administrative institutions, an attempt was made to conceal the modest beginnings of the Hāshimīs and no less those of Abū Bakr and ʿUmar The onerous office of *iṣ̱ṭnāk*, which had to pay compensation for murder and injury, was far beyond the financial resources of the modest citizen called Abū Bakr The entrusting to ʿUmar of the *safāra* or diplomatic missions cannot be reconciled with his extreme youth and plebeian origin

I have elsewhere, for lack of a better term, called Mecca "a merchant republic" If Abū Sufyān is called "Shaikh and chief of the Kuraish", several of his contemporaries are given equally high sounding titles There is not the slightest reason to think that he was a kind of Kuraish doge The manner in which the events of the first eight years of the Hidjra are recorded produces the fallacious impression that he held the power in Mecca in his hands In reality he was only the ablest and most intelligent of his peers, the chiefs of the Kuraish clans As al-Fāsī pertinently observes, all were equal "no one exercised authority unless delegated or kindly permitted to do so by them" Did their chiefs constitute a regular official body? Yes, says tradition Mecca is even said to have had a kind of Senate or Grand Council, the *dār al nadwa* It met only in extraordinary circumstances Usually however, we find that it is in the *madjlis*, family groups or clubs, the *Nādī Kawm* opening on the square of the Kaʿba — the forum and bourse of the town — that affairs of general interest were dealt with

The Kurʾān cannot conceive of authority without a council of notables, without the *malaʾ* This institution is so frequently mentioned in the Kurʾān that the Prophet must have seen it working before his eyes We think then that Mecca was ruled by the oligarchy of the *malaʾ*, the equivalent in the town of the *madjlis* of the nomad tribe This was an assembly of the chiefs of the wealthiest and most influential families This is why Umaiyads and Makhzūmīs are most usually mentioned as composing the *malaʾ* Neither election nor birth could necessarily open the way to a seat on it, but rather the fame of services rendered, the prestige of ability and wealth Thus it welcomed to its counsels the very wealthy Ibn Djudʿān, a member of the humble clan of Taim An assembly of elders or if you like of senators, in conformity with the principle of seniority among the Arabs its authority, purely moral, was limited to advising, studying, looking ahead and giving to the merchant community the benefit of the experience of its conscript fathers In the absence of any coercive

powers, persuasion was the only force it had to make its wishes obeyed Hence the importance of eloquence in a milieu like this, where every family and every clan claimed autonomy The cause of peace was in continual conflict with their claims Without infringing their prerogatives, the *mala'* was able to exert moral pressure when the general good required it The system recalls, though remotely, the organisation of Palmyra and of Venice

Site and climate In the form of an elongated crescent with its points turned towards the flanks of the Ku'aiki'ān, the town was hemmed in by a double range of bare and steep hills The centre of this ill-ventilated couloir coincided with a depression in the soil The early town occupied the bottom of this, this was the *wādī*, the valley, the *baṭn Makka*, the hollow of Mecca The centre, the lowest part of this depression, was called *al Baṭḥā'* (cf above) Some buildings in this quarter were so close to the Ka'ba that in the morning and in the evening their shadows were merged in that of the sacred edifice Between these houses and the Ka'ba [q v] a narrow esplanade (*finā*) lay below the level of the surrounding soil This open area formed the primitive *masdjid*, a sanctuary open to the heavens The pre-Islāmic *Baṭḥā'* knew no other The ends of the little streets opening on this open space were called the "gates of the haram or of the masdjid" The so-called gates or openings took their names from the clans settled around the Ka'ba Thus one regularly spoke of the "gate of the Banū Djumah" The walls of their houses served to mark the boundaries of the masdjid It was on the ground floor of the buildings facing the sides of the Ka'ba that the *madjlis* or *nādī* of the chief families met, those that formed the *mala'* (cf above)

In the suburbs (*ẓawāhir*), and at a later date in the ravines (*shi'b*) which had been dug by erosion out of the flanks of the hills, was a confusion of poor houses, low and ramshackle hovels The unpleasant features of a town of this kind are obvious The geographer Makdisī has summed these up strikingly "suffocating heat, deadly winds, clouds of flies" The continual difficulty was the dearth of water The population was dependent on the variable output of the Zamzam There were other wells mainly outside the town Those inside had a doubtful reputation The scarcity of drinking-water is evident from the amount of precaution taken, when some thousands of pilgrims had to be supplied In such deplorable conditions one can imagine what suffering the long days brought, *ramdā' Makka* "the burning of Mecca", why the great families preferred to send their children to be brought up in the desert, why the *Sīra* only incidentally mentions the plague of Mekka (*waba' Makka*) Smallpox is mentioned only in connection with the enemies of the Prophet

Rains are few and far between Droughts sometimes last for four years But when the winter season is wet, the rains may sometimes attain an unheard-of degree of violence To the east of Mecca a rocky wall raises its steep barrier, a succession of strata and summits merging into the chain of the Sarāt These jagged hills collect on their flanks the surplus rains of the monsoon which brings fertility to the Yemen All along these slopes, where no shrub interrupts the fall — at the bottom of each a *sail* is formed — the cataracts augmented by all these tributaries fall into the hollow of Mecca, *baṭn Makka*, of which the Ka'ba occupies the bottom The waters rush to this depression they force a passage through the "gates of the masdjid" and flow over the area around the sanctuary They fill it and rise to attack the Ka'ba Before the Hidjra, the Kuraish syndicate seems to have paid no heed to the flooding or said they were powerless to prevent it Efforts made by the caliphs yielded "only mediocre results"

This is why the misdeeds of the *sail* fill the annals of Mecca On several occasions their violence has overthrown the Ka'ba and turned the court of the great mosque into a lake As a result of the floods, epidemics broke out The deposit of filth brought by the waters polluted the wells bodies left unburied formed centres of epidemic infection The annalists avoid dwelling on this, troubled by the tradition which says that the plague never reaches Mecca The absolute sterility of the soil brought another scourge, that of famine The slightest irregularity in the convoys of grain from Syria or the Sarāt was enough to cause it It continues to figure along with the ravages of flood and plague in the monotonous annals of the town

Economic life and finance On examining closely the picturesque literature of the *Sīra* and *Ḥadīth*, one receives the impression of business, of intense activity bursting out of the narrow and sterile valley of Mecca The Kur'ān only strengthens this impression All his life the Prophet retained the impress of his Kuraish education and training This fundamentally mercantile character is revealed at every turn

Writing and arithmetic! One is amazed at their importance in the economic life of the town Relying on the Kur'ānic epithet *ummī*, i e pagan, gentile, and on biassed writers like al-Balādhurī, it has been held that, except for some fifteen individuals mentioned by name, all the pre-Hidjran Kuraish were illiterate Alongside of the "book" of accounts, the scales always figure in the Meccan shops not so much to weigh goods as to verify and check payments of all kinds including cash Now, coins were not plentiful on the Meccan market, they were supplemented by the precious metals, ingots of gold and silver, by *tibr*, gold dust Only the scales could determine the value In the more delicate cases, recourse was had to the services of a *wazzān* or professional weigher

It would be difficult to imagine a society in which capital enjoyed a more active circulation The *tādjir*, business man, was not engaged in hoarding, in gathering wealth into his strong boxes He had a blind faith in the unlimited productivity of capital, in the virtue of credit Brokers and agents, the bulk of the population lived on credit The sleeping partnership was much in favour (*mudāraba*), especially the "partnership for the half", which supposes 50 % participation in the profits by the sleeping partners Thanks to the development of these institutions the humblest sums could be invested, down to a gold dīnār or even a *nashsh* or half dīnār Such a flexible organisation stimulated even the humblest to take his share in commercial enterprises

The coins brought to Mecca were of very different kinds the *denarius aureus* of the Byzantines

and the silver drachm of the Sāsānids and Himyars These pieces often worn, rudely engraved, very unequal in weight and format, came from the most varied mints Only the money-changer had the requisite flair, the eye sufficiently trained to deal with the confusion of currencies, to determine accurately the standards, values, and the kinds in circulation In addition there were the complications caused by the difference of standard and the oscillations of exchange The Byzantine provinces, Syria and Egypt, were among the *ahl al dhahab* or countries with a gold standard Babylonia was *ahl al-warik*, a land with a silver, the Sāsānian, standard On the eve of the departure of the caravans for Syria, there were regular battues in search of dīnārs The Meccan *tādjir* was not distinct from the financier His first article of trade was money When occasion arose, he invested his capital in business, in the organisation of large caravans To the leaders of the caravan, to the traders and to the factors, he advanced the funds necessary for their operations

Primarily a clearing house, a banking town, Mecca had customs and institutions peculiar to this kind of transaction and to finance Sometimes it is *ribā*, usury, in all its ugliness dīnar for dīnār, dirham for dirham, i e 100% interest To the condemnation of *ribā* in the Kur'ān, the Kuraish objected that they saw in it only "a kind of sale" (Kur'ān ii 276), of letting out capital for a rent Speculation too was rampant, on the rates of exchange, the load of a caravan which one tried to buy up, the yield of the harvests and of the flocks and lastly the provisioning of the town Fictitious associations were formed and sales were made on which loans were borrowed "Every Arab", says Strabo, "is either a trader or a broker" In Mecca, says the hadith "he who was not a merchant, counted for nothing" In setting out on a military expedition the citizens always took merchandise along with them This is what they did when going to relieve the Badi caravan The first thing the Meccan *muhādjirūn* did on arriving in Medina was to ask the way to the market-place The women shared these commercial instincts Abū Djahl's mother ran a perfumery business The activities of the *tādjira* Khadidja are celebrated Hind [q v], the wife of Abū Sufyān, sold her merchandise among the Kalbīs of Syria Like their husbands the Meccan women had financial interests in the caravans On the return of the convoys they gathered round Abū Sufyān to know what their money and their contributions had earned and to get their share of the profits

The caravans The organisation of a caravan was the subject of interminable palavers in the *nādī* around the Ka'ba Its departure and return were events of public interest The whole population was associated with it En route it remained in continual communication with the metropolis through Beduins met on the journey or special couriers Abū Sufyān sent one of these messengers to describe the critical position of the Badr caravan It cost him 20 dīnārs, an enormous sum, but one proportionate to the value of the convoy in which Mecca had 50,000 dīnārs invested The Meccan caravans were of considerable size Neither horses nor mules appeared in them The number of camels on occasion rose to 2,500 The men (merchants, guides [*dalīl*] and guards) varied from 100 to 300 The escort was strengthened on approaching areas infested by bandits (*ṣa'lūk*) or when traversing the territory of hostile tribes The Badr caravan may be taken as typical We do not know of another in which the capital invested attained such an amount The greater part was supplied by the important Umaiyad firm of Abū Uhaiha, i e the family of Sa'īd b al-'Ās This firm had formed a company of the family, adding to their own considerable reserves the contributions of its sleeping partners To their 30,000 dīnārs the other Umaiyad houses added 10,000 Four-fifths of the capital of the Badr caravan was therefore of Umaiyad origin We can understand why the direction and supreme control of the convoy was entrusted to Abū Sufyān, who was personally interested in the enterprise

In the first place a caravan from Mecca carried skins and leather, sometimes also the *zabīb* of Ta'if, a kind of currant, then ingots of gold and silver partly from the mines of the Banū Sulaim and *tibr*, gold dust from Africa The texts frequently call it *latīma*, i e a convoy laden with perfume and rare spices Of the perfumes, the most esteemed came not from the Hidjāz, but from southern Arabia, the "land of frankincense", or even from India and Africa To these might be added aromatic gums and medicinal drugs, like the senna of Mecca, all objects of small bulk and purchased at higher prices by the luxury of the civilised countries

From the Yemen the Meccan caravans brought back the products of India, the silks of China, the rich *'adanī* cloths, so called from 'Aden Besides gold dust, the main exports of Africa were slaves and ivory From Africa Mecca recruited her labourers and her mercenary soldiers, the *Ahābīsh* or Abyssinians In Egypt and in Syria, the Kuraish traders bought luxury articles, products of the industry of the Mediterranean, mainly cotton, linen or silk stuffs and cloths dyed in vivid purple From Bosrā and the Sharāt (Syria) came arms, cereals and oil, much appreciated by the Beduins The pace of the caravan was slow but the articles transported, leather, metals, scented woods, feared neither damage nor the delays of long journeys The expenses were confined to the hire of the animals, the payment of the escort, the tolls and presents to the chiefs of the tribes With such an economical organisation, the profits of 100% attested by our authors were quite usual This was the case with the caravan of Badr "each dīnār having brought back a dīnār" Two years after this brilliant affair, the Companions of the Prophet who had sought refuge in Medīna were able to carry out as profitable a transaction in the same field "since each of their dirhams gained a second dirham", that is to say a profit of 100% again

Fortunes in Mecca We can now imagine how money had gradually accumulated in the chests of the Meccan financiers, who were naturally of a saving disposition This explains Pliny the Elder's ill-humour when he recalls "the millions of sesterces which the Arabs take annually from the Roman Empire giving nothing in return, *nihil invicem redimentibus*" (*Hist Natur*, vi 28) This last statement is an exaggeration, but it should be remembered that the Meccan caravan carried only articles of high value, and that with regard to the Empire the Arabs were mainly importers, so that the trade balance was always very much

in their favour The 30,000 dīnārs invested by the one house of Abū Uhaiha in the Badr caravan suggests that H Winckler is quite right when he tells us to think of the Palmyra of Zenobia if we wish to get an idea of the financial capacity of Mecca The fortunes of the Makhzūmīs were no less than those of their Umaiyad rivals The Taimī ʿAbd Allāh b Djudʿān must have been a millionaire if the poet thought of comparing him to Caesar The principal organisers of the Badr caravan were also millionaires The thousands of dīnārs subscribed by them did not even represent all their fortune Other portions of their capital were out at interest or put in other speculations Among other millionaires we may mention the Makhzūmīs Walīd b al-Mughīra and ʿAbd Allāh, father of the poet ʿUmar b Abī Rabīʿa

Next to these representatives of high finance come the well-to-do Meccans, like ʿAbd al Rahmān b ʿAwf who had a capital of 8,000 dīnārs and al-Hārith b ʿĀmir and Umaiya b Khalaf Of the latter two, the first had 1,000 and the second 2,000 dinārs in the Badr caravan Lastly there were the small traders brokers and shopkeepers who formed the petite bourgeoisie of the town To their commerce a number added the supervision of some industry like ironwork or carpentry The most typical representative of this class is given us by the future caliph Abū Bakr, a *bazzāz*, retailer of cloth He belonged like Abū Djudʿān to the plebeian clan of Taim, rich in men and women of initiative, like ʿĀʾisha, daughter of Abū Bakr He seems to have had a capital of 40,000 dirhams ʿAbbās, the uncle of the Prophet, is also mentioned among the rich bankers of Mecca, but we have no details about him The other Hāshimīs lived in circumstances bordering on poverty Those Meccans most certainly must have been wealthy who paid without a murmur the enormous ransoms demanded for their relatives after the defeat of Badr After this sacrifice — it cost them not less than 200,000 dirhams — the Meccan chiefs gave up their share of the profits in the Badr enterprise — some 25,000 dīnārs — to prepare for the revenge They did this *taiyibu 'l-anfus* "with a good heart", with the easy grace of opulent financiers, used to running the risks of speculations on a large scale One touching detail is recorded They refused to touch the modest shares of the small contributors This example shows how at Mecca, "the strong", *ahl al-kuwwa* (Wāḳidī), i e the patricians, were able in critical circumstances to realise a spirit of solidarity and of sound democracy

Mecca before the Hidjra had neither ships nor a port It was only exceptionally that foreign ships cast anchor in the little bay of Shuʿaiba off a desert shore It was here that the Byzantine ship was wrecked, the wood of which went to build the terrace of the Kaʿba It was to Shuʿaiba that the first Muslim emigrants for Abyssinia went, no doubt on hearing that two merchant ships had touched there More rarely sailings took place from the desolate shore of Djidda, which was nearer Mecca From the time of ʿUthmān, Djidda took the place of Shuʿaiba and became the port of the Kuraish metropolis When Muḥammad settled in Medīna and cut their communications with Syria, the Meccan leaders never thought of taking to the sea but resigned themselves to the enormous detour through al-Nadjd The creation of an Arab navy was the work of the caliph Muʿāwiya

2 After the Hidjra We need not rehearse the events of the first eight years of the Hidjra They are summed up in the struggle with the Prophet This struggle and the *ridda*, the surrender of Mecca, were fatal to its economic prosperity One after the other, the great families migrated to Medīna, now the capital of Islām This tendency increased under the first three caliphs, who made their headquarters among the Ansār ʿAlī definitely left Arabia to settle in Kūfa Richly endowed by the state, the leading Koraish, becoming generals and governors of provinces, lost interest in commerce No more is heard about caravans or fairs in the Hidjāz It was only at the period of the pilgrimage that Mecca became alive again and saw the caliphs reappear at the head of the pilgrims The conquest of the ʿIrāḳ dealt the last blow to the economic decline of western Arabia The Indian trade resumed its old route by the Persian Gulf and the valley of the Euphrates Direct communication was established by land with the markets of the middle east

Umaiyad period The situation improved with the coming of the Umaiyad dynasty Muʿāwiya took an active interest in his native town He erected buildings there and developed agriculture in the environs, dug wells and built dams to store up the water Under his successors, especially the Marwānids, Mecca became a city of pleasure and ease, the rendezvous of poets and musicians, attracted by the brilliant society formed by the sons of the Companions of the Prophet Many people returned to live in Mecca after making their fortunes in the government of conquered provinces Contact with foreign civilisations had made them refined and fastidious They had become accustomed to baths, a luxury which presupposes an abundant water-supply Water had to be procured from the hills of the Sarāt Khālid al-Kasrī's [q v] name is associated with this undertaking which changed the aspect of the town To meet the scourge of flood, the caliphs ʿUmar and ʿUthmān had called in the aid of Christian engineers, who built barrages in the high lying quarters They also secured the area round the Kaʿba by making dykes and embankments The Umaiyad caliphs continued and completed these works They dug a new bed along the course of the *sail* and endeavoured to break its violence by barriers built at different levels Their great anxiety was to protect the depression of the Bathāʾ where the Kaʿba stood The skill of the engineers of the period did not succeed in overcoming the topographical difficulties nor in averting the ravages of the winter rains, regular cloudbursts They were frustrated by the steep slope of the ground, still further aggravated by the unusual shape of the Baṭhāʾ, a basin with no outlet The houses on the bank of the *sail* were taken down and the alleys adjoining the Kaʿba removed Each modification of the old plan meant the sacrifice of more buildings These clearances in time changed the traditional aspect of Mecca, where the *sail* continued to sow destruction

Along with these precautions against flooding an endeavour was made to enlarge the exiguous court around the Kaʿba Islām aspired to possess a temple in keeping with its worldwide claims Successive expropriations begun by ʿUmar and finished

by Walīd I prepared an esplanade The plan of the great mosque [cf AL-MASDJID AL-HARĀM] with its galleries, a vast courtyard with the Kaʿba in the centre, is the work of the Umaiyad caliph He had the assistance of Christian architects from Syria and Egypt to carry it out The important governorship of the Hidjāz with its three cities, Medīna, Mecca and Ṭāʾif, could in principle be given only to a member of the ruling family Among the most celebrated of these Umaiyads may be mentioned Saʿīd b al-ʿĀs and the two future caliphs, Marwān b al-Hakam and ʿUmar b ʿAbd al-ʿAzīz When no Umaiyad was available the choice fell upon an official of tried capacity like Hadjdjādj and Khālid al-Kasrī At first they were given Ṭāʾif and then transferred to Mecca It was only after this probation that the three towns were entrusted to them But even then the centre of government remained in Medīna, which under the Umaiyads eclipsed Mecca by its political importance and by the fact that it was the home of the new Muslim aristocracy

Under Yazīd I, the rising of ʿAbd Allāh b al-Zubair [q v] brought Syrian troops to Mecca The rebel had made his headquarters in the court of the great mosque A scaffold of wood, covered with straw, protected the Kaʿba The carelessness of a Meccan soldier set it on fire Ibn al Zubair rebuilt the edifice and included the Hidjr within it [see KAʿBA] When Hadjdjādj had overthrown the Zubairid anti-caliph, he restored the Kaʿba to its former dimensions which have since remained unaltered In 747 a Khāridjī rebel from the Yemen seized Mecca without meeting opposition He was soon defeated and slain by the troops of the caliph Marwān II In 750, Mecca passed with the rest of the caliphate under the rule of the ʿAbbāsids

Bibliography Very detailed in H Lammens, *La Mecque à la veille de l'hegire* (extract from *Melanges de l'Univ St Joseph de Beyrouth*, ix, fasc 3) The oriental and western biographies of the Prophet should also be consulted, *Kitāb al-Aghānī*, vol 21, *passim*, Azrakī and Fāsī, in *Chroniken der Stadt Mekka*, ed Wüstenfeld, vol 1 and 2, Ibn ʿAbdrabbihi, *al-ʿIkd al farīd*, vol ii, the *Muʿdjam* of Bakrī and of Yāḳūt, ed Wustenfeld, Balādhurī, *Futūh al-Buldān*, ed de Goeje, Bukhārī, *Sahīh*, Burckhardt, *Voyages en Arabie* (transl Eyriès), vol 3, Caetani, *Annali dell' Islām*, Djāhiz, *Tria opuscula*, ed van Vloten, p 61 etc, Gaudefroy-Demombynes, *Le pèlerinage a la Mekke*, Paris 1923, Hassān b Thābit, *Dīwān*, ed Hirschfeld, Ibn Duraid, *Kitāb al-Ishtikāk*, ed Wüstenfeld, Ibn Hishām, *Sīrat al-Rasūl*, ed Wustenfeld, Ibn Saʿd, *Kitāb al-Ṭabakāt*, ed Sachau, H. II

1 Mecca under the ʿAbbāsids down to the foundation of the Sharīfate (750–961)

Although the political centre of gravity in Islām now lay in Baghdād, this period at first presents the same picture as under Omaiyad rule The *Haramān* are as a rule governed by ʿAbbāsid princes or individuals closely connected with them (*Die Chroniken der Stadt Mekka*, ed Wustenfeld, ii 181 *sqq*) Sometimes Mecca and Ṭāʾif were under one ruler, who was at the same time leader of the Hadjdj, while Medīna had a separate governor of its own

Arabia had however from the first century A H contained a number of ʿAlid groups, who, as was their wont, fished in troubled waters, lay in wait as brigands to plunder the Hadjdj caravans and from time to time hoisted their flags when they were not restrained either by the superior strength or by the bribes of the caliphs We find al-Mansūr (136—156 = 754—774) already having trouble in Western Arabia Towards the end of the reign of al-Mahdī (156—169 = 774—785) a Hasanid, Husain b ʿAlī, led a raid on Medina, which he ravaged, at Fakhkh near Mecca, he was cut down with many of his followers by the ʿAbbāsid leader of the Hadjdj The place where he was buried is now called al-Shuhadāʾ It is significant that he is regarded as the "martyr of Fakhkh" (Tabarī, iii 551 *sqq*, *Chron Mekka*, i 435, 501 *sq*)

Hārūn al-Rashīd on his nine pilgrimages expended vast sums in Mecca He was not the only ʿAbbāsid to scatter wealth in the holy land This had a bad effect on the character of the Meccans There were hardly any descendants left of the old distinguished families and the population grew accustomed to living at the expense of others and were ready to give vent to any dissatisfaction in rioting This attitude was all too frequently stimulated by political conditions

In the reign of al-Maʾmūn (198—218 = 817—833) it was again ʿAlids, Husain al-Aftas and Ibrāhīm b Mūsā, who extended their rule over Medīna, Mecca and the Yemen (Tabarī, iii 981 *sqq*, *Chron Mecca*, ii 238), ravaged Western Arabia and plundered the treasures of the Kaʿba How strong ʿAlid influence already was at this time is evident from the fact that Maʾmūn appointed two ʿAlids as governors of Mecca (Tabarī, iii 1039, *Chron Mecca*, ii 191 *sqq*)

With the decline of the ʿAbbāsid caliphate after the death of Maʾmūn, a period of anarchy began in the holy land of Islām, which was frequently accompanied by scarcity or famine It became the

regular custom for a number of rulers to be represented at the Hadjdj in the plain of ʿArafāt and to have their flags unfurled, the holy city was rarely spared fighting on these occasions The safety of the pilgrim caravans was considerably affected, it was very often ʿAlids who distinguished themselves in plundering the pilgrims

The ʿAlid cause received an important reinforcement at this time by the foundation of a Hasanid dynasty in Tabaristān (Tabarī, iii 1523—1533, 1583 *sq*, 1682—1685, 1693 *sq*, 1840, 1880, 1884 *sq*, 1940) In Mecca the repercussion of this event was felt in the appearance of two Hasanids (*Chron Mekka*, i 343, ii 10, 195, 239 *sq*), Ismāʿīl b Yūsuf and his brother Muhammad, who also ravaged Medīna and Djidda in the way that had now become usual (251 = 865—866)

The appearance of the Karmatians [q v] brought still further misery to the country in the last fifty years before the foundation of the sherīfate (Tabarī, iii 2124—2130) Hard pressed themselves at the heart of the empire, the caliphs were hardly able even to think of giving active support to the holy land, and, besides, their representatives had not the necessary forces at their disposal From 916 onwards the Karmatians barred the way is the pilgrim caravans In 930, 1,500 Karmatian warriors raided Mecca, massacred the inhabitants by the thousand and carried off the Black Stone to Bahrain It was only when they realised that such deeds were bringing them no nearer their goal — the destruction of official Islām — that their zeal began to relax and in 950 they even brought the Stone back again Mecca was relieved of serious danger from the Karmatians The following years bear witness to the increasing influence of the ʿAlids in western Arabia in connection with the advance of Fātimid rule to the east and with Būyid rule in Baghdād From this time the Meccan ʿAlids are called by the title of Sharīf which they have retained ever since

2 From the foundation of the Sharīfate to Katāda (c 350—598 = 960—1200)

a The Mūsāwīs The sources do not agree as to the year in which Djaʿfar took Mecca 966, 967, 968 and the period between 951 and 961 are mentioned (*Chron Mekka*, ii 205 *sqq*) ʿAlids had already ruled before him in the holy land It is with him however that the reign of the Hasanids in Mecca begins, who are known collectively as sharīfs, while in Medīna this title is given to the reigning Husaimids

The rise and continuance of the Sharīfate indicates the relative independence of Western Arabia in face of the rest of the Islāmic world from a political and religious point of view Since the foundation of the Sharīfate, Mecca takes the precedence possessed by Medīna hitherto

How strongly the Meccan sharīfate endeavoured to assert its independence, is evident in this period from two facts In 976 Mecca refused homage to the Fāṭimid caliph Soon afterwards the Caliph began to besiege the town and cut off all imports from Egypt The Meccans were soon forced to give in, for the Hidjāz was dependent on Egypt for its food supplies (Ibn al-Athīr, *Kāmil*, viii 491, *Chron Mekka*, ii 246)

The second sign of the Sharīfs' feeling of independence is Abu 'l-Futūh's (384—432 = 994—1039) setting himself up as caliph in 1011 (*Chron Mekka*, ii 207, Ibn al-Athīr, *Kāmil*, ix. 233, 317) He was probably induced to do this by al-Hākim's heretical innovations in Egypt The latter however was soon able to reduce the new caliph's sphere of influence so much that he had hurriedly to return to Mecca where in the meanwhile one of his relatives had usurped the power He was forced to make terms with al-Hākim in order to be able to expel his relative

With his son Shukr (432—453 = 1039—1061) the dynasty of the Mūsāwīs, i e the descendants of Mūsā b ʿAbd Allāh b Mūsā b ʿAbd Allāh b Hasan b Hasan b ʿAlī b Abī Ṭālib came to an end He died without leaving male heirs, which caused a struggle within the family of the Hasanids with the usual evil results for Mecca When the family of the Banū Shaiba (q v , the Shēbīs) went so far as to confiscate for their private use all precious metals in the house of Allāh, the ruler of Yemen, al Sulaihī (*Chron Mekka*, ii 208, 210 *sqq*, Ibn al-Athīr, *Kāmil*, ix 422, x 19, 38), intervened and restored order and security in the town This intervention by an outsider appeared more intolerable to the Hasanids than fighting among themselves They therefore proposed to al-Sulaihī that he should instal one of their number as ruler and leave the town

He therefore appointed Abū Hāshim Muhammad (455—487 = 1063—1094) as Grand Sharīf With him begins the dynasty of the

b Hawāshim (455–598 = 1063–1200), which takes its name from Abū Hāshim Muhammad, a brother of the first Sharīf Djaʿfar, the two brothers were descendants in the fourth generation from Mūsā II, the ancestor of the Mūsāwīs

During the early years of his reign, Abū Hāshim had to wage a continual struggle with the Sulaimānī branch, who thought themselves humiliated by his appointment These Sulaimānīs were descended from Sulaimān, a brother of the Mūsā II above mentioned

The reign of Abū Hāshim is further noteworthy for the shameless way in which he offered the suzerainty, i e the mention in the *khutba* as well as the change of official rite which is indicated by the wording of the *adhān*, to the highest bidder i e the Fātimid caliph or the Saldjūk sultān (*Chron Mekka*, ii 253, Ibn al-Athīr, x 67) It was very unwelcome to the Meccans that imports from Egypt stopped as soon as the official mention of the Fātimid in the khutba gave way to that of the caliph The change was repeated several times with the result that the Saldjūk, tired of this comedy, sent several bodies of Turkomans to Mecca

The ill feeling between Sultān and Sharīf also inflicted great misery on pilgrims coming from the ʿIrāk As the leadership of the pilgrim caravans from this country had gradually been transferred from the ʿAlids to Turkish officials and soldiers, Abū Hāshim did not hesitate occasionally to fall upon the pilgrims and plunder them (*Chron Mekka*, ii 254, Ibn al-Athīr, x 153)

The reign of his successor is also marked by covetousness and plundering The Spanish pilgrim Ibn Djubair, who visited Mecca in 1183 and 1185, gives hair raising examples of this. Even then however the Hawāshim were no longer absolutely their own masters, as over ten years before, the Ayyūbid dynasty had not only succeeded to the Fāṭimids in Egypt but was trying to get the whole of nearer Asia into their power

Saladın's brother, who passed through Mecca on his way to South Arabia, abandoned his intention of abolishing the sharīfs but the place of honour on the Hadjdj belonged to the Aiyūbuds and their names were mentioned in the khutba after those of the ʿAbbāsid caliph and the sharīf (Ibn Djubair, p 75, 95) The same Aiyūbid in 1186 also did away with the Shiʿī (here Zaidī, for the Sharīfs had hitherto been Zaidīs) form of the *adhān* (*Chron Mekka*, II 214), had coins struck in Saladın's name and put the fear of the law into the hearts of the sharīf's bodyguard, who had not shrunk from crimes of robbery and murder, by severely punishing their misdeeds — A further result of Aiyūbid suzerainty was that the Shāfiʿī rite became the predominant one

But even the mighty Saladın could only make improvements in Mecca He could abolish or check the worst abuses but the general state of affairs remained as before

3 The rule of Katāda and his descendants down to the Wahhābī period (c 1200—1788)

In the meanwhile a revolution was being prepared which was destined to have more far-reaching consequences than any of its predecessors Katāda, a descendant of the same Mūsā (see above) from whom the Mūsāwis and the Hawāshim were descended, had gradually extended his estates as well as his influence from Yanbuʿ to Mecca and had gathered a considerable following in the town According to some sources, his son Hanzala made all preparations for the decisive blow on the holy city, according to others, Katāda seized the town on the 27th Radjab when the whole population was away performing a lesser *ʿumra* in memory of the completion of the building of the Kaʿba by ʿAbd Allāh b al-Zubair, which was celebrated on this day along with the festival of Muhammad's ascension to heaven However it came about, Katāda's seizure of the town meant the coming of an able and strongwilled ruler, the ancestor of all later sharīfs He steadfastly followed his one ambition to make his territory an independent principality Everything was in his favour, that he did not achieve his aim was a result of the fact that the Hidjāz was once again at the intersection of many rival lines of political interest

Katāda began by ruining his chances with the great powers, he ill-treated the son of the Aiyūbid al-Malik al ʿĀdil (540—615 = 1145—1218) in brutal fashion (*Chron Mekka*, II 263) He roused the ire of the caliph by his attitude to pilgrims from the ʿIrāk He was able however to appease the latter and the embassy he sent to Baghdād returned with gifts from the caliph The caliph also invited him to visit Baghdād According to some historians, however, the sharīf turned home again before he actually reached Baghdād On this occasion, he is said to have expressed his policy of the "splendid isolation" of the Hidjāz in verse, as he did in his will in prose (see Snouck Hurgronje, *Qatādah's Policy of Splendid Isolation* etc in *Bijdr*)

On the other hand, Katāda is said to have vigorously supported an Imām of Hasanid descent in founding a kingdom in the Yemen After the reconquest of this region by a grandson of al-ʿĀdil, the Aiyūbids of Egypt, Syria, and South Arabia were mentioned in the khutba in Mecca along with the Caliph and Sharīf

Katāda's life ended in a massacre which his son Hasan carried out in his family to rid himself of possible rivals (*Chron Mekka*, II 215, 263 *sqq*, Ibn al-Athīr, *Kāmil*, XII 262 *sqq*) The Aiyūbid prince Masʿūd however soon put a limit to his ambition and had Mecca governed by his generals On his death however power again passed into the hands of the sharīfs, whose territory was allowed a certain degree of independence by the rulers of the Yemen as a bulwark against Egypt

About the middle of the XIIIth century the world of Islām assumes a new aspect as the result of the advent of persons and happenings of great importance In 1258 the taking of Baghdād by Hūlāgū put an end to the caliphate The pilgrim caravan from the ʿIrāk was no longer of any political significance In Egypt power passed from the Aiyūbids to the Mamlūks, Sultān Baibars (658—676 = 1260—1277) was soon the most powerful ruler in the lands of Islām He was able to leave the government of Mecca in the hands of the sharif, because the latter, Abū Numaiy, was an energetic individual who ruled with firmness during the second half of the XIIIth century (1254—1301) His long reign firmly established the power of the descendants of Katāda

Nevertheless the first half century after his death was almost entirely filled with fighting between different claimants to the throne ʿAdjlān's reign also (1346—1375) was filled with political unrest, so much so that the Mamlūk Sultān is said on one occasion to have sworn to exterminate all the sharifs ʿAdjlān introduced a political innovation by appointing his son and future successor Ahmad co-regent in 1361 by which step he hoped to avoid a fratricidal struggle before or after his death

A second measure of ʿAdjlān's also deserves mention, namely the harsh treatment of the Muʾadhdhin and Imām of the Zaidīs, this shows that the reigning sharifs had gone over to the predominant rite of al Shāfiʿī and forsaken the Zaidī creed of their forefathers

Among the sons and successors of ʿAdjlān special mention may be made of Hasan (1396—1426) because he endeavoured to extend his sway over the whole of the Hidjāz and to guard his own financial interests carefully, at the same time being able to avoid giving his Egyptian suzerain cause to interfere

But from 1425 he and his successors had to submit to a regular system of control as regards the allotment of the customs

From the time of Hasan, in addition to the bodyguard of personal servants and freedmen, we find a regular army of mercenaries mentioned which was passed from one ruler to another But the mode of life of the sharifs, unlike that of other Oriental rulers, remained simple and in harmony with their Arabian surroundings As a vassal of the Egyptian Sultān the sharīf received from him every year his *tawkīʿ* [q v] and a robe of honour On the ceremonies associated with the accession of the sharifs see Snouck Hurgronje, *Mekka*, I 97 *sq*

Of the three sons of Hasan who disputed the position in their father's lifetime, Barakāt (I) was chosen by the sultān as co-regent, twenty years later, he succeeded his father and was able with slight interruptions to hold sway till his death in 1455 He had to submit to the sultān sending a permanent garrison of 50 Turkish horsemen under an emīr

to Mecca This emīr may be regarded as the precursor of the later governors, who sometimes attained positions of considerable influence under Turkish suzerainty

Mecca enjoyed a period of prosperity under Barakāt's son Muhammad (*Chron Mekka*, II 341 *sqq* , III 230 *sqq*), whose reign (1455—1497) coincided with that of Kā'itbey [q v] in Egypt The latter has left a fine memorial in the many buildings he erected in Mecca

Under Muhammad's son Barakāt II (1497—1525) who displayed great ability and bravery in the usual struggle with his relatives, without getting the support he desired from Egypt (*Chron Mekka*, II 342 *sqq* , III 244 *sqq*), the political situation in Islām was fundamentally altered by the Ottoman Sultān Selīm's conquest of Egypt in 1517

Although henceforth Constantinople had the importance for Mecca that Baghdād once had and there was little real understanding between Turks and Arabs, Mecca at first experienced a period of peace under the sharīfs Muhammad Abū Numaiy (1525—1566) and Hasan (1566—1601) Under Ottoman protection the territory of the sharīfs was extended as far as Khaibar in the north, to Halī in the south and in the east into Nadjd Dependence on Egypt still existed at the same time, when the government in Constantinople was a strong one, it was less perceptible, and vice versa This dependence was not only political but had also a material and religious side The Hidjāz was dependent for its food supply on corn from Egypt The foundations of a religious and educational nature now found powerful patrons in the Sultāns of Turkey

A darker side of the Ottoman suzerainty was its intervention in the administration of justice Since the sharīfs had adopted the Shāfi'ī madhhab, the Shāfi'ī Kādī was the chief judge, this office had also remained for centuries in one family Now the highest bidder for the office was sent every year from Constantinople to Mecca, the Meccans of course had to pay the price with interest

With Hasan's death a new period of confusion and civil war began for Mecca In the language of the historians, this circumstance makes itself apparent in the increasing use of the term *Dhawī* for different groups of the descendants of Abū Numaiy who dispute the supremacy, often having their own territory, sometimes asserting a certain degree of independence from the Grand Sharīf, while preserving a system of reciprocal protection which saved the whole family from disaster (Snouck Hurgronje, *Mekka*, I 112 *sqq*)

The struggle for supremacy, interspersed with disputes with the officials of the suzerain, centred in the xviiith century mainly around the 'Abādila, the Dhawī Zaid and the Dhawī Barakāt

Zaid (1631—1666) was an energetic individual who would not tolerate everything the Turkish officials did But he was unable to oppose successfully a measure which deserves mention on account of its general importance The ill-feeling between the Sunnī Turks and the Shī'ī Persians had been extended to Mecca as a result of an order by Sultān Murād to expel all Persians from the holy city and not to permit them to make the pilgrimage in future Neither the Sharīfs nor the upper classes in Mecca had any reason to be pleased with this measure, it only served the mob as a pretext to plunder well-to-do Persians As soon as the Turkish governor had ordered them to go, the Sharīfs however gave permission as before to the Shī'īs to take part in the pilgrimage and to remain in the town The Sharīfs likewise favoured the Zaidīs, who had also been frequently forbidden Mecca by the Turks

The further history of Mecca down to the coming of the Wahhābīs is a rather monotonous struggle of the Sharīfan families among themselves (Dhawī Zaid, Dhawī Barakāt, Dhawī Mas'ūd) and with the Ottoman officials in the town itself or in Djidda

4 The Sharīfate from the Wahhābī period to its end The Kingdom

Although the Wahhābīs [q v] had already made their influence perceptible under his predecessors, it was Ghālib (1788—1813) who was the first to see the movement sweeping towards his territory like a flood, but he left no stone unturned to avert the danger He sent his armies north, east and south, his brothers and brothers-in-law all took the field, the leaders of the Syrian and Egyptian pilgrim caravans were appealed to at every pilgrimage for help, but without success In 1799 Ghālib made a treaty with the emīr of Dar'īya, by which the boundaries of their territories were laid down, with the stipulation that the Wahhābīs should be allowed access to the holy territory Misunderstandings proved inevitable however and in 1803 the army of the emīr Sa'ūd approached the holy city After Ghālib had withdrawn to Djidda, in April Sa'ūd entered Mecca, the inhabitants of which had announced their conversion All kubbas were destroyed, all tobacco pipes and musical instruments burned, and the *adhān* purged of praises of the Prophet

In July, Ghālib returned to Mecca but gradually he became shut in there by enemies as with a wall In August the actual siege began and with it a period of famine and plague In February of the following year, Ghālib had to submit to acknowledging Wahhābī suzerainty while retaining his own position

The Sublime Porte had during all these happenings displayed no sign of life It was only after the Wahhābīs had in 1807 sent back the pilgrim caravans from Syria and Egypt with their mahmals, that Muhammad 'Alī was given instructions to deal with the Hidjāz as soon as he was finished with Egypt It was not till 1813 that he took Mecca and there met Ghālib who made cautious advanced to him Ghālib however soon fell into the trap set for him by Muhammad 'Alī and his son Tusun He was sent to Salonika, where he lived till his death in 1816

In the meanwhile Muhammad 'Alī had installed Ghālib's nephew Yahyā b Sarūr (1813–1827) as sharīf Thus ended the first period of Wahhābī rule over Mecca, and the Hidjāz once more became dependent on Egypt In Mecca, Muhammad 'Alī was honourably remembered because he restored the pious foundations which had fallen into ruins, revived the consignments of corn, and allotted stipends to those who had distinguished themselves in sacred lore or in other ways

In 1827 Muhammad 'Alī had again to interfere in the domestic affairs of the sharīfs When Yahyā had made his position untenable by the vengeance he took on one of his relatives, the viceroy deposed the Dhawī Zaid and installed one of the 'Abādila,

Muhammad, usually called Muhammad b ʿAwn (1827—1851) He had first of all to go through the traditional struggle with his relatives Trouble between him and Muhammad ʿAlī's deputy resulted in both being removed to Cairo in 1836

Here the sharīf remained till 1840 when by the treaty between Muhammad ʿAlī and the Porte the Ḥiḏjāz was again placed directly under the Porte Muhammad b ʿAwn returned to his home and rank Ottoman suzerainty was now incorporated in the person of the wālī of Djidda Friction was inevitable between him and Muhammad b ʿAwn, the latter's friendship with Muhammad ʿAlī now proved of use to him He earned the gratitude of the Turks for his expeditions against the Wahhābī chief Faisal in al-Riyāḍ and against the ʿAsīr tribes His raids on the territory of Yemen also prepared the way for Ottoman rule over it

In the meanwhile the head of the Dhawī Zaid, ʿAbd al-Muttalib (1851–1856), had made good use of his friendship with the grand vizier and brought about the deposition of the ʿAbādila in favour of the Dhawī Zaid ʿAbd al-Muttalib however did not succeed in keeping on good terms with one of the two pashas with whom he had successively to deal In 1855 it was decided in Constantinople to cancel his appointment and to recall Muhammad b ʿAwn ʿAbd al-Muttalib at first refused to recognise the genuineness of the order, and he was supported by the Turkophobe feeling just provoked by the prohibition of slavery Finally however, he had to give way to Muhammad b ʿAwn, who in 1856 entered upon the Sharifate for the second time, this reign lasted barely two years Between his death in March 1858 and the arrival of his successor ʿAbd Allāh in October of the same year took place the murder of the Christians in Djidda (June 15) and the atonement for it (cf DJIDDA, and Snouck Hurgronje, *Een rector der mekkaansche universiteit*, in *Bydragen t d Taal-, Land- en Volkenkunde van Ned-Indie*, 5e volgr, deel II, p 381 *sqq*, 399 *sqq*)

The rule of ʿAbd Allāh (1858—1877) who was much liked by his subjects, was marked by peace at home and events of far-reaching importance abroad The opening of the Suez Canal (1869) meant on the one hand the liberation of the Ḥiḏjāz from Egypt, on the other however more direct connection with Constantinople The installation of telegraphic connections between the Ḥiḏjāz and the rest of the world had a similar importance The reconquest of Yemen by the Turks was calculated to strengthen the impression that Arabia was now Turkish territory for ever

The brief reign of his popular elder brother Husain (1877—1880) ended with the assassination of the sharīf by an Afghān The fact that the aged ʿAbd al-Muttalib (see above) was sent by the Dhawī Zaid from Constantinople as his successor (1880—1882) gave rise to an obvious supposition

Although the plebs saw something of a saint in this old man, his rule was soon felt to be so oppressive that the notables petitioned for his deposition (Snouck Hurgronje, *Mekka*, I 204 *sqq*) As a result in 1881, the energetic ʿOthmān Nūrī Pasha was sent with troops to the Ḥiḏjāz as commander of the garrison with the task of preparing for the restoration of the ʿAbādila ʿAbd al-Muttalib was outwitted and taken prisoner, he was kept under guard in one of his own houses in Mecca till his death in 1886

Othmān Pasha, who was appointed walī in July 1882, hoped to see his friend ʿAbdilāh, one of the ʿAbādila, installed as Grand Sharīf alongside of him ʿAwn al Rafīḳ (1882—1905) was however appointed (portrait in Snouck Hurgronje, *Bilder aus Mekka*, p) As the wālī was an individual of great energy, who had ever done much for the public good and ʿAwn, although very retiring, was by no means insignificant, nay even tyrannical, trouble between them was inevitable, especially as they had the same powers on many points, e g the administration of justice and supervision of the safety of the pilgrim routes After a good deal of friction ʿOthmān was dismissed in 1886 His successor was Djamāl Pasha, who only held office for a short period and was succeeded by Safwat Pasha Only Ahmad Rātib could keep his place alongside of ʿAwn and that by shutting his eyes to many things and being satisfied with certain material advantages After ʿAwn's death ʿAbdilāh was chosen as his successor He died however before he could start on the journey from Constantinople to Mecca ʿAwn's actual successor was therefore his nephew ʿAlī (1905—1908) In 1908 he and Ahmad Rātib both lost their positions with the Turkish Revolution

With Husain (1908—1916—1924), also a nephew of ʿAwn's, the last sharīf came to power But for the Great War his sharifate would probably have run the usual course The fact that Turkey was now completely involved in the war induced him to declare himself independent in 1916 He endeavoured to extend his power as far as possible, first as liberator (*munḳidh*) of the Arabs, then (June 22, 1916) as king of the Ḥiḏjāz or king of Arabia and finally as caliph Very soon however, it became apparent that the Sultān of Nadjd, ʿAbd al-ʿAzīz Āl Saʿūd, like his Wahhābī forefathers, was destined to have a powerful say in the affairs of Arabia In Sept 1924 his troops took Ṭāʾif and in October Mecca King Husain fled first to ʿAkaba and from there in May 1925 to Cyprus His son ʿAlī retired to Djidda Ibn Saʿūd besieged this town and Medina for a year, avoiding bloodshed and complications with European powers Both towns surrendered in December 1925

Since January 1926, Ibn Saʿūd has been king of the Ḥiḏjāz, the official title of his kingdom now is Ḥiḏjāz, Nadjd and dependencies A political unit has thus been formed which covers a larger area than the sharīfs ever ruled and possesses greater internal strength than has been seen in Arabia since the end of ʿAbbāsid power

By the organisation of the Nadjd warriors (*iḵhwān*) as agriculturists also, by the maintenance of a strict discipline among the Beduins, by the creation of a military police, which is held in awe, a security has been created such as Arabia has perhaps never known and secure foundations laid for traffic, especially of the pilgrims

With the representatives of foreign governments in Djidda the king maintains friendly relations Recently several states have raised their consulates there to the rank of an embassy Treaties have been concluded with a number of states

By making use of modern technical skill, the king is endeavouring to counteract the natural poverty of the land The automobile has become of importance for the pilgrim traffic, agricultural machinery is being imported and cisterns built to hold the rain water A project for examining the

ground to prospect for minerals has been drawn up as well as a plan for a quay in the harbour of Djidda

Wahhābism — or as they prefer to call it in Arabia Islām according to the Hanbalī rite — is the state religion But it has advanced cautiously in comparison with its attitude at the beginning of the xixth century The external symbols of veneration for saints and the dead have been removed, Muhammad's tomb in Medīna has however been spared The maḥmal [q v] no longer comes to the ḥadjdj, the new covering for the Kaʿba is made every year in Mecca The pilgrim traffic again shows high figures and even Shiʿīs are admitted again to the pilgrimage

The religious and economic life of the city has from the earliest times centred round the pilgrimage (cf the article ḤĀDJDJ) and the Mosque (cf AL-MASDJID AL-ḤARĀM) The character of Mecca as the metropolis of Islām is reflected in the great variety of its population Besides the original Meccan nucleus we have numerous Arab elements — among which the Ḥadramīs are particularly prominent on account of their energy — and colonies of foreigners from all parts of the Muslim world who have out of worldly or religious motives taken up their abode permanently in the capital Among these, special mention must be made of those from the Malay Archipelago who are known collectively as Djāwa, with them it is exclusively religious motives that have caused them to take up permanent residence in Mecca

Even at the present day, slaves mainly African, form an important element in Meccan society Abyssinian slave girls have always been highly esteemed as concubines The slave market however is no longer of the importance it once was Freed men rise from the slave caste and their dwellings, huts put together of every conceivable material, are on the outskirts of the city

Artisans are, or at least down to the end of the xixth century were, organised in gilds Among these gilds that of the pilgrim guides (*mutawwif*, q v), who have agents in Djidda and outside Arabia, is the most important, it lives entirely on the pilgrim traffic

This is true in a way of the whole population, which has arranged to let houses to the pilgrims for a considerable portion of the year By the eighth month, tens of thousands of these visitors are in the town Their number increases till the twelfth In Muharram, Mecca resumes its usual appearance

During the last few hundred years — except for the first Wahhābī period — the cult of saints in Mecca has steadily increased Numerous places have sacred memories of Muhammad and his family, the most prominent *muḥāḍirūn* and later saints, numerous ḳubbas were built over their graves and hawls and mōlids were celebrated in their honour The Wahhābīs have done away with a great deal of this, how much is not exactly known.

Mecca is the seat of the government, although the king's residence is in Riyād The official gazette *Umm al Ḳurā* appears weekly There are also printing presses, which mainly print Wahhābī or Hanbal literature

List of the Sharīfs of Mecca (ca 961—1916)

a Mūsāwīs (ca 961—1061)

Djaʿfar ca	ca 961—ca 980
ʿĪsā	ca 980—994
Abu 'l-Futūḥ	994—1039
Shukr	1039—1061

b Sulaimānīs or Banū Abi 'l-Ṭayyib, from 1061, at constant feud with the

c Hawāshim (1063—1200)

d Katāda and his descendants (1200—1916)

Katāda	1200—1221
His sons	till 1254
Abū Numayy I	1254—1301
His sons	till 1346
ʿAdjlān	1346—1375
His sons	till 1396
Hasan I	1396—1426
Barakāt I	1426—1455
Muhammad	1455—1497
Barakāt II	1497—1525
Abū Numayy II	1525—1566
Hasan II	1566—1601
His sons	till 1631
Zaid	1631—1666
Saʿd I	1666—1672
Dhawī Barakāt	1672—1684
Saʿd II	1684—1704
Dhawī Barakāt	1704—1711
Dhawī Zaid	1711—1770
Sarūr	1773—1788
Ghālib	1788—1813
Yahyā b Sarūr	1813—1827
Muhammad	1827—1851
ʿAbd al Muttalib	1851—1856
Muhammad	1856—1858
ʿAbd Allāh	1858—1877
Husain I	1877—1880
ʿAbd al-Muttalib	1880—1882
ʿAwn al-Rafīk	1882—1905
ʿAbdilāh	1905
ʿAlī	1906—1908
Husain II	1908—1916 as Sharīf, till 1924 as King

(A J WENSINCK)

MEDEA, a town in Algeria (department of Algiers), 60 miles S of Algiers, in 36° 15′ 50″ N Lat and 2° 45′ E Long (Greenwich) Medea lies at an altitude of 3,070 feet on the northern border of the mountainous massif which divides the high plateaus from the Mitidja Down to the French occupation, it could only be reached by a bridle-path over the Muzaia pass (3,270 feet) The building of a road through the gorges of the Chiffa, alongside of which a railway now runs, has made access to it easier The town itself is built at the foot of slopes covered with vineyards which yield wines of superior quality and orchards in which, as a result of the temporate climate, fruit trees grow very well In the neighbourhood a number of European villages have grown up in which the cultivation of cereals is combined with that of the vine There is also a fairly busy market but it is losing in importance since the railway has been extended to Djelfa at the southern end of the high plateaus The population (census of 1926) is 13,816 of whom 2,225 are Europeans, almost all French and 11,591 natives

Medea occupies the site of the Roman settlement of Lambdia, on the ruins of which Boluggin b Zīrī in the tenth century built the modern town The district in which it was built was, according to Ibn Khaldūn (*Berbères*, transl de Slane, ii 6), inhabited by the Sanhādja tribe of Lemdia, whence no doubt the name Lemdani taken by natives of Medea Of the history of the town itself we know hardly anything Leo Africanus (Bk iv, ed Schefer, iii 66) and following him Marmol (*Africa*, ii 394) only tell us that after having belonged to the sultāns of Tlemcen who kept a garrison there, it passed into the hands of the sultāns of Tenes, and then of the Turks when the Barbarossas established themselves in Algiers Under Hasan Khair al Dīn, Medea became the capital of one of the three provinces (beyliks) of the Regency, the beylik of the south or of Titteri, to which at a later date was added the lower valley of the Sebau in Kabylia Down to about 1770 we therefore find the bey of this province living alternately at Medea and Bordj-Sebau It was not till this date that, the region of Sebau having been incorporated in the Dār al-Sultān governed by the dey, the bey of Titteri settled permanently at Medea where he was in a better position to control the nomadic tribes of the plateaus He had however no authority over the inhabitants of the town itself, who were under the authority of a *hākim* appointed by the agha of Algiers The population, which did not exceed 4,000—5,000 among whom were many Kulughlis and Turks retired from the service, became wealthy through its trade with the south Caravans brought thither the produce of the Sahara and also negro slaves who were sold to the citizens of Algiers

During the years which followed the capture of Algiers, the French on several occasions (Nov 1830—May 1831—April 1836) occupied Medea, without taking permanent possession ʿAbd al-Kādir however placed a bey in it and had his ownership of it recognised by the treaty of the Tafna [cf ʿABD AL-KĀDIR] The outbreak of hostilities again between the Emīr and the French led to the final occupation of Medea by the latter on May 17, 1840

MEDINA. The Arabic word *madīna* "town" [cf AL-MADĪNA] has survived in Spain in a number of place names The principal are Medina de las Torres in the province of Badajoz, Medina del Campo and Medina de Rioseco, in the province of Valladolid, Medina de Pomar, in the province of Burgos, Medinaceli, in the province of Soria and Medina-Sidonia, in the province of Cadiz The Arabic place-names Madīnat Walīd and Madīnat al-Faradj correspond to Valladolid [q v] and to Guadalajara respectively (from the second Arabic name of this town *Wādī 'l Ḥidjāra*) [cf above ii 177, and it may be added that the town took its name from a known individual, Mālik b ʿAbd al-Rahmān Ibn al-Faradj, according to Ibn al-Khatīb, *Ihāta*, MS in the Escorial, i 189]

(E LÉVI-PROVENÇAL)

MEDINACELI, a little town in the N E of Spain on the railway from Madrid to Saragossa, about halfway between these two towns, some 3500 feet above sea-level on the left bank of the Jalón In the Muslim period it was called *Madīnat-Sālim*, which is not to be confused with *Madīnat Ibn al Salīm* or Ibn Salīm, in the Seville district (Idrīsī, *Descr de l'Espagne*, 174/208 and note 5, 177/215), the modern Grazalema in the province of Cadiz

The Arab geographers give brief descriptions of Medinaceli According to Idrīsī, it was a large town built in a hollow with many large buildings, gardens and orchards Abu 'l Fidā' says that this town was the capital of the Middle March (*al-thaghr al-awsat*), Yākūt adds that Tarik [q v] found the town in ruins at the conquest of Spain but it was repopulated under Islām and became a prosperous town

Through its geographical position, Madīnat Sālim was of considerable strategic importance for the Umayyads from the fourth century onwards It was on many occasions, as the last stronghold on Muslim territory, the point from which forces assembled at Cordova finally started for expeditions against the Christians of the N E of the Peninsula and to which they retired Though somewhat decayed down to the reign of ʿAbd al-Rahmān III al-Nāsir, it was rebuilt, if we may believe the detailed evidence of a chronicler quoted by Ibn ʿIdhārī, in 335 (946) this ruler put the work in charge of his client, the general Ghālib, and all the garrisons of the country lent their aid in the work This Ghālib remained governor of Medinaceli and all the Middle March until the power was seized by al-Mansūr Ibn Abī ʿĀmir [q v] It was in Medinaceli that this famous *ḥādjib* died on 27th Ramadān 392 (Aug 10, 1002) on returning from his last expedition against Castille In the following century Medinaceli was frequently taken by the Christians and retaken by the Muslims, before being finally incorporated in the Kingdom of Castille

MEDJELLE (A *madjalla*) Under this name ie Civil Law Code of Turkey, is enerally known it is an abbreviation of *Medjelle-i hkām-i ʿadlīye* The elaboration of this Civil Code ook place between 1869 and 1876 and was a art of the legislative programme of the Tanzīmāt] v] It had been preceded by a Penal Code 1858) and a Commercial Code (1861), but, while iese two codifications had been based in a large ieasure on the laws of European countries, the Iedjelle was a codification of that part of Hanafite *kh*, which treats of obligations (*muʿāmalāt*) he codification was done by a commission of even members, having as president Ahmad Djewet Pasha [q v] In a preliminary report (*madjalla*), dated 18 Dhu 'l-Hidjdja 1285 (April 1, 869), this commission explains the reasons why codification of this matter had become necessary he newly instituted secular tribunals (*nizāmiye*) ad often to deal with matters of common civil aw, but the judges did not know much, as a ule, about *fikh*, it had, therefore, been thought ise to appoint the president of the so-called eligious tribunal at the same time president f the secular tribunal This, however, did not rove satisfactory and so it was necessary to put he main points of the law of obligations into a ode that could be more easily consulted than the oluminous fiḳh-books Among the previous endeaours to bring Hanafite law into this form the comission mentions expressly Ibn Nudjaim (q v, he biography of this jurist is to be found at the nd of the first part of the Cairo edition of 1334 f his *al Bahr al-rāʾik* [communication of Dr C an Arendonk]) The editors have followed as rule those opinions of Hanafite doctors, which re most in harmony with the exigencies of modern ife and business It is, however, expressly stated hat the Introduction (*mukaddime*) and the first ook have been approved by the Shaikh al-Islām nd other prominent jurists

Though the different parts were successively anctioned by Imperial *khaṭṭ* (with the formula *rūdjūbindje ʿamel oluna*), the Medjelle cannot be aid to have had an exclusive authority in the natter regulated The judges were perfectly free to orm their own opinion as a result of the study of the Hanafite law books and this liberty was really used

The *mukaddime* of the Medjelle contains in 100 articles a number of principles (*kawāʿid*) as already elaborated by Ibn Nudjaim and his school, then follow sixteen books (*kitāb*), beginning with the *Kitāb al Buyūʿ*, the last four books deal with process matters The whole has 1,801 articles The first part of each book gives definitions of the technical law terms used, and most of the articles are followed by examples taken from the collections of *fetwās* The Introduction and the first book obtained the imperial sanction on the 8th Muharram 1286 (April 20, 1869) and the last two books on the 26th of Shaʿbān 1293 (September 16, 1876)

The text of the Medjelle is to be found in the big code collection *Dustūr* (the introduction and book I–VIII in vol I, book IX–XIV in vol III, and books XV and XVI in vol VI) It has been published several times with a commentary, as the *Medjelle-i Aḥkām-i ʿadliye sharḥi* by H M Diyā' al-Dīn (Der-i Seʿādet 1311) and a work under the same title by the in his time famous jurist ʿĀṭif Bey (Der-i Seʿādet, in different parts from 1328 to 1339, most parts had a second and the first part a third edition), the latter commentary, however, does not go beyond art 1448 A full French translation is found in G Young, *Corps de Droit Ottoman*, vol VI, Oxford 1906, p 170—446

Since the Great National Assembly has adopted, on February 17, 1926, a new civil code (*Kānūn-i medeni*, cf *Oriente Moderno*, VI 134 *sqq*), which is substantially the Swiss civil code, the authority of the Medjelle has disappeared

(J H Kramers)

MEDJIDIYE In February 1844 (Muharram 1260) in the reign of ʿAbd al-Medjid the Turkish coinage was entirely re-organised on European models and this currency is known as the Medjidiye The name Medjidiye was also given to the largest silver piece in the new coinage the 20 piastre piece of this new issue, it weighed 372 grains (24 08 grammes) (J Allan)

MEHEDIA [See al-Mahdiya]

MEHEMET, MEHEMMED, MEHMED [See Muhammad]

MEHMED PASHA [See Karamānī Mehmed Pasha]

MEHRĪ [1]), the language of the Mahra country in Southern Arabia, which with Shhawrī (spoken in the mountains northeast of Zafār) and the dialect of the island of Sokotra forms a separate branch of South Semitic, the relation of this branch to the now extinct languages found in the inscriptions of the Sabaeans, Minaeans and Hadramawtans has not yet been accurately defined Mehrī itself as a spoken language in South Arabia is seriously threatened by the steady advance of northern Arabic The Mahra people are already almost all bilingual and their native idiom is very much influenced, especially in vocabulary, by northern Arabic, for example, of its old numerals it has preserved only the first ten, all higher numbers have been replaced by the northern Arabic forms It is therefore not always easy to distinguish with certainty old words which are also found in northern Arabic from later borrowings

As regards phonetics, the Mehrī consonants are in general agreement with Arabic and Ethiopic Of the laryngals the loss of *ʿain*, which still sur-

1) In this article the author's system of transliteration is retained for philological reasons

vives in Shhawrī, is characteristic of Mehrī The uvular plosive *k* seems always to be voiced, of the palatals the *g*, which still survives in Shhawrī, is always liquified, as in northern Arabic, to *ǧ* The case of the sibilants is particularly characteristic The original Semitic *s* seems to have been preserved as such, but in many words, as in northern Arabic, the original Semitic *śh* has coalesced with it This sound, which is preserved in Shhawrī as well as in Canaanite and Aramaic, has often been replaced by *h* in genuine Mehrī words, initially for example in *hima* (he) "heard" (compare *mishma* "ear-muscle") and medially in *nehā* "forgotten", in the final position it may be dropped, as in *ṭey* "a little goat", *herē* "head" But when we find alongside of *huda* "to obstruct" *suda* "to carry over, to come to an agreement", which is connected with the Arabic *sadīd* "straight, correct", the latter can only be regarded as borrowed from the Arabic This *s* however is also found in words like *labes* (he) "put on" and in the pronoun of the third pers fem *se, sen*, etc, in which any such borrowing is highly improbable, these must therefore belong to a dialect for which the phonetic law *śh*—*h* did not hold The primitive Semitic *śh* has also survived where a following *t* was assimilated to it, even when the consequent doubling was dropped, as in the prefix to the causative reflexive *śha* A primitive Semitic sound seems also to have survived in the *shin*, to which Jahn has given the name "lateral", and which is transliterated in the Vienna texts by *s*, it corresponds etymologically to the Arabic *shin*, and therefore to the *śin* in Canaanite and old Aramaic Whether the position of articulation was exactly the same cannot of course be decided, but the description of the sound as "lateral" probably means the same as the pronunciation with flattened tongue which is assumed for Canaanite and Aramaic Among the dentals we find alongside of *d* and *t* also the fricatives *dh* and *th* in native as well as loanwords, but in both groups the fricative pronunciation has frequently been dropped, e g in the case of *dh* regularly in the demonstratives, alongside of *thelāthe miye* 300, we have *telatīn* 30 In *ser* "behind" *s* appears instead of the *th* in the Arabic *athar* "track", probably under the influence of *r*, like *śh* in the Eth *ashar* instead the of **asar* which we should expect So also in the case of *z*, the fricative has in many cases become a plosive *t* under conditions still to be explained, as in *tohr* "noon", *ataim* "great" = Arabic *zuhr*, *ʿazīm* The voiced *d* has a lateral articulation differing from the Arabic In the labials, as in Arabic, the voiceless fricative *f* corresponds to the voiced explosive *b* Of the liquids, *n*, when in proximity to velars and palatals, is frequently more nasal than in Arabic *L* and *r* before consonants frequently lose their own sound and merge in the preceding vowel, as *matigh* "slain" from *ltgh* = *ktl*, *yaghdās* "he carries her" from *ghdl* (by dissimilation in *līat* "night", *kallēt* "every night"), *karn* > *kōn* "horn", *karś* > *kōś* "belly"

The vowels are frequently prefaced with the laryngal fricative instead of the laryngal plosive, i e we often have *hā* for *hamza* As in Ethiopic and probably also in primitive Semitic, only two short vowel sounds, *a* and *e*, are distinguished, while of long vowels we have *ā*, *ū* and *ī* The old diphthongs are contracted to *ē* and *ō* These basic vowels are however more strongly affected than in Arabic by the predominant articulation o consonants The distinction between *a* and *e* i thus frequently obliterated Stress brings abou the disappearance of short vowels in unaccente syllables and lengthens them in accented ones whereby *a*, if it is not retained by laryngals o emphatic (i e pharyngalized) consonants, become *ō* (which often passes into *ū*), open sounds ad joining it however become *ē*, *ī* (*imāla*) Assimilatio of vowels in adjacent syllables is frequent Origina long vowels after laryngals and emphatic consonant become *au*, *ou* and *ai*, *ei*

Of the phenomena of sound-shifting an sound-change in combination, a characteristi feature is the tendency, paralleled in the vowe assimilation just described, to bring voiced an unvoiced sounds into agreement (Jahn, *Grammatik* p 8) On this is based the transformation of Arabi *ākharu* "of others", the root of which poeti language retains in *wākhar* "to be delayed", int *ghāher* with metathesis of the initial sound (*hamz* being replaced by *h*) (cf *mghōie* "thereupon' while the *ghair* of the Arabic, which Bittner *Studien*, I 15 compares with this, is to be regarde as distinct) The tendency to the assimilation o *n* is, as in Arabic, usually counteracted by th necessity of maintaining the verbal system Althoug the disappearance of vowels produced by stres sometimes produces double consonants initially, thi is frequently avoided at the end of words by th insertion of an epenthetic vowel, e g *ared* alongsid of *ard* "earth" Such additional syllables are foun medially also before sonants as in the subj *yidele* (*yikteb*), after laryngals as in *yihakēm* and velar as in *yikhabēz*, *yaghazēl*, etc Dissimilation, especiall between sonants (*ṣanēb* "idol" from *sanam*, *zubōn* < *zamān* "time", Hein, p 117, 25), haplology as i **tadīt* > *tit*, *tait* "one" (fem) and strong metathese like *katala* > *katōgh* "he slew", *shamā(t)* > *hemet* > *hētem*, *hitem* "heavens" also contribute to giv the Mehrī vocabulary its special features

The pronoun has preserved very archaic forms The first personal pronoun *ho*, *hu* can probabl not be equated (as Bittner, *Studien*, III 7 suggests to *kū* in Accadian *anāku*, as the change *k* > *h* i not found elsewhere in Mehrī, but must be connecte with the primitive Semitic *ʾā* (with aspiration o the initial vowel — see above) It is also improbabl that the 2nd pers pronoun sg *het*, plur m *ten* f *tin*, should preserve in the singular, with ass milation of the *n*, the initial syllable *ʾan* found i the other Semitic languages, but reject it in th plural It is perhaps more probable that the initi sound of the 2nd pers has been assimilated t that of the 1 and 3 The 1 plur *nhā* reveals corruption of the primitive Semitic *ʾnhnu* Th 3 pers has alone among Semitic languages pre served the original difference in the initial sound m *he*, f *se*, plur m *hem*, f *sen*, on the othe hand, the double distinction through the vowel has been dropped Among the suffixes may b noted the distinction of genders, found also i some North Semitic dialects, in the 2 pers m *k*, f *śh*, with palatalisation from *kt*, as in Shhawi *shibdit* (Muller, in 113, 14) and Sok *shibdeh* (Mulle II 227, N⁰ 2), "liver" In place of the suffixe the independent pronouns may also be used wit the genitive particle as *mōl di-hō*, "my farm' *hārʾawn lehēt*, "thy sheep"

The demonstrative pronouns end in th sg in *d* (in place of *dh*) and distinguish th

genders as in Arabic, m *dă*, f *dĭ*, in plur comm *lă*, they are further combined with (*m*)*e* to m *dōm*(*e*), f *dim*(*e*), pl *lŏm*(*e*), with *k* to m *dāk* f *dik*, pl *lĕk*, or with both elements to m *dākem*(*e*), f *dikem*(*e*), pl *lākem*(*e*), in the basic form both genders when unstressed sometimes coincide in *de*, in the combined form in *dekme* The basic form, reduced to *da*, *de*, *di* without distinction of gender, pl *la*, *le*, *li*, serves also as a relative In the interrogative besides the personal *mōn* "who ?", we have the neuter *hĕ* < *'at* "what ?"

Of the numerals, as already mentioned, only the first ten have survived "One" in the basic form *hād* is only used as an indefinite "any one", otherwise it has been driven out by the relative phrase **dhād* > *tād*, the fem takes the ending of the nomina unitatis (see below), which by analogy has been transferred to 2 and the other numerals except 4 and 5, perhaps under the influence of *themenit* 8, which follows the regular phonetic law, from **tadīt* we get by haplology *tīt*, *tait* The numeral 2 agrees in its stem with the Aram *thrū* (like *bei* > *habi* "son" with *bar*), the ending *ū* from *ā* is the old dual ending of the nominative In 3 the initial letter, as in Sabaean and Ethiopic, is dissimilated (from the final) to *s* and the final has become a plosive *selit*, the feminine form after dropping the *l* (see above) has dissimilated the final *th* of the stem to *f*, becoming *safait* 4 *arba*ᶜ loses in the feminine the unaccented first syllable *ibōt* 5 loses the last radical, weakened to *h*, in the masculine the basic form *'khamish* has through vowel assimilation become *khaime* through *khimih*, the feminine shows the feminine ending *ō*, to which the vowel of the stem is assimilated *khomō* 6 and 7 change the initial *sh* to *h*, while the final *dth* of 6 as in Arabic by mutual synthesis becomes *tt* *hit*, 7 following phonetic laws in *hōbaᶜ*, f *hibeyt* 9 loses its initial sound, which had already lost its vowel in the unaccented syllable *saᶜ* f *sait* 8 and 10 show, following regular phonetic laws, in *themōne*, f *themenīt*, m *ōser*, f *asrit*

Among the nouns, the most noteworthy for their form are those which were originally monosyllabic, they are found throughout with the prefix *ha* (*ha*) as in *habi* alongside of *bei* (see above) "son", a new formation (differently Bittner, i 28, 5), following *habit* alongside of *bort* "daughter", *hamū* "water", *hayūm*, *heyūm*, *hiūm* "day, sun" alongside of *yimō* "to day", *halliu* alongside of *lelet* (*het*, *kallēt* see above) "night" *Heib* "father" and *heid* "hand" are therefore not to be equated directly with *ab* and **'d* with *h* for *h* instead of *hamza*, as it is found in *hām* "mother", but we must recognise in them as well the prefixed syllable which is found also before some nouns which are triliteral in the other Semitic languages, like *heiē* "head" = **raʾsh*, *hanōf* "soul", which Bittner explained by metathesis, *hinē* "vessel" = Ar *inā*, *hanōb*, pl *hanīōb* "great, elders" = Ar *nāb*, pl *'anyāb* "old she-camel, head of a family", *hanid* (Shh *nīd*) "water-skin" = Hebr *nōd*, Accad *nādu* In *bi hu wōdi* "in a valley" (Muller, iii 24, 5) this syllable (here assimilated only to the beginning of the next word) serves as an indefinite article, which has lost its significance in the above words and become a component of the stem, so that it also appears in the plur *habūn* etc, but originally however must have been identical with the numeral *had*, which is still used as an indefinite pronoun *Hadīd* "uncle" and *haddīt* "aunt", *hitheyl* "fox" *thaᶜl* show the *ha* weakened to *ha* A Embeï, in *Zeitschr f ag Spr u Alt*, ii 118, 138, compares these nouns with the as similated stems with prefixed *h* in Egyptian discussed by Sethe, *ibid*, xlvii 80, note 2

Of other nominal forms we need only mention the diminutives, sometimes with internal formation similar to Ar *kuwaitil* (see Rhodokanakis, *Zur Formenlehre*, p 5), as, for example, *tawafēl* "little child", sometimes also with the ending *ān*, which here always appears as *ēn* under the influence of the diphthong of the basic form *kutail* (Rhodokanakis, *ibid*), *wukatēn* "short time"

The feminine ending *at* takes the accent in nominatives with short stem vowel and therefore appears as *āt*, *ōt*, or with assimilation to close front vowels as *ēt*, as in *rahmāt* "rain", *saghfōt* "leaf", *hadyiret* "chamber", after long stem vowels however, it is unaccented, as in *alōmet* "flag", *fkhaidet* "tribe", *dyiridet* "palm-wood", especially in loanwords from the Arabic, while in true Mehrī words the vowel in the unaccented syllable usually disappears and the vowel of the now closed root syllable is abbreviated, as in *haft* (= Yemen *hāfe*) "town, village", *sust* "worm", *dayeft* "meal", at the same time showing assimilation of the final consonants *dytt* (from *dyid*) "good" (fem), *kanett* (from *kanūn*) "small" (fem)

Another feminine ending *i*, which still occasionally appears unsupported in Arabic and Aramaic, is here found, as in most Semitic languages, only in combination with the usual ending *t* as a regularly accented *īt*, e g in the participles, and again in simple noun-stems, corresponding to the masc ending *ōne*, e g *tebiōne*, f *tebiīte*, in the derivative stems like *mesafire*, f *mesfiraīte*, *meftekere*, f *meftekiīte* with from the masculine transference of *e* < *i*, and also in the feminines by signification derived from the masc like *kelbit* "bitch", *habrit* "daughter" (see above), *bālīt* "lady" from *bāl*, *shrifit* "noble lady" from *shrīf* The endings of the nomina unitatis likewise end in this way in *bidait* "egg" from *bid*, *limit* "citron" from *lim*, *sefit* "hair" from *sīf* (alongside of the usual ending as in *khabezōt* "bread", *nakhlet* "date palm"), as in Tigrē and Tigiña, these are really feminines of adjectives of relation, which in their original meaning preserve the full form *iyet* (see Rhodokanakis, *op cit*, p 6, 7)

Of the dual only a trace remains in *thiū* 2, perhaps however also in the ending *i* of nouns before this numeral, like *kaishi thiū*, if this is not simply an epenthetic vowel before the double consonant *Ghaseieyen*, borrowed from the Arabic *al-ᶜasrain*, takes the meaning "period after the *ᶜasr*", from this is formed on the model of *fenōwen* "before", *ghasiōwen* "at the time before the *ᶜasr*"

The sound plural of the masculine with the ending *īn* (*ain*, *ein*), before suffixes *i*, is still in use to a greater extent than in Arabic The plural of adjectives of relation in *iyin* is still found alongside of the contracted form *īn*, frequently in names of trades like *hammaliyin*, *seiyafiyin* (Rhodokanakis, *op cit*, p 9) The ending of the fem pl is *ōt*, sometimes *ōten*, which does not, as Bittner thought, maintain the nunation, which survives in Mehrī (as in modern Arabic and in Hebrew and Ethiopic) only in adverbs The suffixed syllable is the plural ending of the masc in unaccented syllables (*Grundr*, i 442), just as the fem sg *it* takes the masc

ending *e* (see above), or it may be, as Rhodokanakis (*op cit*, p 8) suggests, the other plural ending *ān*, as in Accad *kullatān* "all" In the formation and use of the broken plural, Mehrī adopts a mean between Arabic and Ethiopic Characteristic are a number of formations from plurals of the plural, such as are found also in Arabic, e g *sarik* "a piece of wood", plur **sirāk*, then **sarāyik* and and thence *seryak* (Rhodokanakis, p 11 *sqq*) Double plurals also arise through the addition of the masc pl ending *īn* in *rtaheīn* "wind", *dhembīn* "tails", *sehmīn* "bows", to which the original plurals *rtāh*, *dhenōb*, *shūm* are then taken as singulars (Rhodokanakis, p 9), and again with vowel reduction after the accented syllable in *kilebten* "bitches", *habanten* "daughters", in which however Rhodokanakis (p 15) sees the ending *ān*

The case-inflections, except for a few remains of the accusative in some adverbs, have completely disappeared The genitive is expressed by the simple juxtaposition of two nouns, more frequently by the relative, sometimes with a demonstrative suffix, as in *djeldeh de ghodeb hibre di bagrēt* "the skin of the steer, the young of the cow", Hein, p 15, 16, alongside of *hebre tiwīt* "the young of the ewe", *ibid*, p 3, 17

Determination and indetermination are never indicated Nunation only survives in some adverbs, like *fenōwen* "in front", *ghairen* "behind", *mghōren* "later"

The prepositions of Mehrī are for the most part new formations, some of uncertain origin Of the old Semitic prepositions, only *bi* (*ba*, *b-*), *bein*, *bād* "after", *le* < *ʿalā* and *tlā*, and *min* have survived, *ka*, *ke* has come to mean "with" The place of *li* has been taken by *ha*, *he*, which Bittner traces to the first syllable of **tlā*, but this is not very probable The other prepositions have been replaced by words indicating place, like *fenōwen*, *fenē* "before", *ser* (properly "track") "behind", *tewál*, *tuwul* "at" (properly a Ṭ-nomen connected with Arabic *waliya* "to be near", rather than with Syriac *lewāth*, as Bittner considers), *nkhali* "below" (properly "depression"), but Sokotrī, *nhet*, Muller, III 54 *infra*), or parts of the body, like *birek* "in" (lit "in the bosom", Christian) and *tar*, *ṭair* "upon" (properly "back")

The verb distinguishes from the simple form, which is found in the active as *ketōb* "wrote" and stative as *libes* "was clothed", an intensive which has however dropped the doubling and thus coincides with the purposive, and a causative with the prefix *ha*, which in the imperfect also sometimes has the same form as the intensive (e g *hemrōd* "to tend a sick person", impf ind *yihemrōd*, subj *yihamrad*, but *hasalāh* "to remedy", impf ind *yihaṣōlah*, subj *yihaṣalah*) The causative has very often a passive sense, like the simple intransitive verb, with which it often coincides as an inner causative To each of these stems there is a reflexive with inserted *t* to the simple verb in double form as *katteb* or *katateb*, or with assimilation to the vowels of the simple verb *ktetōb*, to the intensive *ktōteb*, to the causative from the simple form *shaghfūr* "to beg pardon", to the purposive stem *shhākem* "to go to law", *shdjēdel* "to quarrel"

In contrast to the perfect (quoted above as the normal form), which expresses a fact as such, there is an imperative in the active *tebēr* "break", in the stative *lebōs* "put on", in the intensive *sōfer* "travel", in the causative *hakteb* "cause to write", in the reflexive *ktīteb*, *ktetōb*, *ktōteb*, in the caus refl *shaghfer* and *shhākem* From these imperatives is formed the affective mood (Bittner's subjunctive), like *yitbēr* "that he crush", *yilbōs* "that he put on", *yisōfer* "that he travel", *yihakteb* "that he write", *yiktīteb*, *yiktetōb*, *yiktōteb*, *yishaghfer*, *yishhākem* Next there is expressed the progressive aspect, which presents the action as in progress, often with limitation to the present and future, a form which doubles the second radical in the simple verb but, as in the intensive, has replaced the reduplication by lengthening the vowel as in *yitōber* "he crushes", so also in the causative *yihakōteb*, but in the intensive and sometimes in the reflexive shows an ending corresponding to the Arabic energicus, as in *yisáferen* "he travels", refl *yiktetīben* and *yiktáteben*, caus refl *yishhākemen* In the intransitive simple verb, the affective mood serves also to indicate that an event is happening at the present time (as a so called indicative), on account of the relations of the intrans to the caus and refl already referred to this formation, but now for the indicative only, is transferred to these forms in *yihaktōb* (alongside of *yihakōteb*), *yishaghfōr* and *yiktetōb* (from *katteb*)

In the so called perfect in active verbs, the stress remains on the second syllable of the stem with the exception of the 3rd fem sg, the ending of which *ōt*, as in the noun, attracts the emphasis to itself (*teberōt*) The 3rd pl has lost the endings and replaces them only in the masc by *em*, which comes from the pronoun The consonantal terminations have lost their vowels, but the double consonant at the end of a word is separated by the insertion of an epenthetic vowel only before the sonant *n* of the 1st pers plur (*tebōren*), before other terminations the vowel of the stem remains short As in Ethiopic the initial of the 2nd pers is assimilated to that of the 1st (*-k*), as in the suffix, the 2nd fem sg appears in the palatalised form *sh* The intransitives with the exception of the 3rd fem sing retain the stress on the first syllable of the stem, the vowel of which is assimilated to that of the second (*tiber*) In the intensive the lengthening of the *a* to *ō* is found only in the forms which do not add a termination

In the imperative in the transitive simple verb as well as in the causative there is no distinction of gender in the singular In the intransitive form however, the vowel of the second accented syllable of the stem was assimilated to the feminine ending *t*, so that even after it was dropped the distinction between m *tebōr* and f *tebīr* was retained, similarly in the reflexive *ftehōm*, *ftehim*

Accordingly, in the intensive and its reflexive and in the causative reflexive the distinction of gender is expressed also by changing the accented vowel m *sōfer*, f *sifer*, m *ntōbeh*, f *ntibeh*, m *shkhālef*, f *shkhaylef* In the plural the genders are distinguished by the endings in *-em*, f *-en* In the intransitive simple form however, the vowel change is transferred from the singular to the plural, m *tebōrem*, f *tebīren* and in the reflexive of the scheme *ktetōb*, with peculiar change of function m *ktetībem* (assimilation to the indic imp *yiktetīben*, pl *yiktetībem*), f *ktetōben* The same change of function is also found in the perf of the causal 3 m pl *haktībem*, f *haktōb*

Out of the imperative arises the so-called subj.

of the impf by means of the same personal prefixes as in all Semitic languages and with the endings *ī* for the 2nd sg f and m *-em*, f *-en* for the plural of the 2nd and 3rd pers In the corresponding indicative the distinction of gender is expressed in the second person by internal vowel change, m *tetōber*, f *tetīber* and on the addition of the plural endings the short vowel (*yiteberem* etc) is restored In the intransitive simple verb the moods are not distinguished, the genders of the 2nd pers sg are distinguished by the same vowel change as in the imperative, this vowel change is also transferred to the plural (m *tetbōrem*, f *tetbɔren*) and with exchange of functions also to the 3rd pers (m *yitbīrem*, f *tetbōren*) In the intensive, distinction of gender in the second person is expressed only in the singular (subj *tesōfer*, f *tesifer*, indic m *tesafɔren*, f *tesifɔren*), before the endings, the vowels are short and the mood endings give way to the plural endings so that the 3rd pers f sg and pl are the same *tesaferen*

The participles are in the simple form active *tebrōne*, f *tebrite* (see above), pass *metbīr*, in the derivative stems as in e g intensive *mekatebe*, f *mekatebite*, caus *mehaktebe*, f *mehaktebīte*, in the passive they follow the model of the simple verb, *makẖazáis* "despatched" (in the intensive only when borrowed from the Arabic like *meqaddem* "chief")

The infinitives are in the simple verb of the form *tiber* (more rarely like *ghādel* "to carry", *mirīd* "to be ill") or *dabyūṭ* "to take" (frequently with med lar), with prefix, like *māmūl* "work", or with ending like *ghafirōn* "to forgive", in the intensive *tebrid* "to cool down", in the causal and the reflexives with the ending *ōt* (*ūt*) as in Eth *haktebōt*, *ktethōt*, *shaghferōt*

In the verbs with laryngal as second radical, the perfect is e g *ḏjehēm* "he went", it is therefore, as in Ethiopic, the intransitive scheme with the type of the transitive making itself felt, the imperfect is therefore inflected as in the intransitives without distinction of mood As a first radical, a laryngal frequently produces intrusive syllables, as in subj *yihakēm* "let him judge" *Hamza*, arising out of *ʿain* as first radical, acts in the same way, e g *yaʾanāf* "let him become hard" (cf Arabic *ʿanafa*, not Hebrew *ʾānaf* as Bittner suggested), while an original *hamza* disappears, as in *yāmer* "let him say" As a second radical *ʿain* disappears, but keeps *a* in the perfect of the simple verb unchanged, as *ṭān* "thrust (past tense) with the lance" In the verbs with third *ʿain*, unlike Ethiopic, trans and intrans formation is distinguished in the simple verb, whereby the perf of the trans coincides with the intensive (*dōfa* "he paid" like *ḏjōma* "he collected"), the intransitives distinguish the moods of the imperf exactly like the transitives

In the verbs with first wāw, the primitive Semitic formation of the biliteral stem is dying out It is true we still find the imperative *zēm* "give" with the subj *yizēm* and *kēb* "come in" with the subj *yikēb*, but *kēb* is already limited to the feminine and the masc *wekōb* formed from it, we have besides the reduplicated imperatives *zem-zēm*, *kebkēb*, as well as *dakadēk* and *shakashēk* "to load", and with vowel lengthening *thākẖ* "to calm" and *ḏjeyb* "to be necessary" In secondary formations the *w* disappears from the root in some forms of the reflexive, like *watkẖaf* "to go in the afternoon", imp ind *yitkẖōf*, subj *yitakẖf*, inf *takẖf* and *watkat* "he awakened", imp ind *yetkōt*, subj *yeteket*, inf *teketen* For the rest the first *wāw* verbs inflect regularly, and the few first *yā* verbs follow them

The third *hamza* verbs very often coincide with the third-*wāw* and third-*yā* In the transitives in the simple form we have *ū* throughout and in the in transitives *ī*, which in the perfect in the forms with consonant endings merges with the stem, e g *ksū* "he found", but 2 m and 1 c *kusk* and *sīm* "he saw", but *sink* In the 3rd plur m besides the original *ksūcm*, we have also *ksīum* with secondary vowel differentiation, and with a new formation on the model of forms like *kuskem* also *kusem* In the imper and subj the form of the third-*yā*, like *ksē*, *yikse* has predominated, in the indic the unaccented final vowels disappear except in the 2 f sg (*tekeysi*) The denominative *bīrū* "to bear" from *bei* "son" follows completely the strong paradigm *tibir*, only the *i* of the 2 sg f is also found in the 3rd, e g *tibiru*, alongside of *tibrou* and *tiberū* (Muller, iv 31, 24) In the derivative stems only the 3rd m sg of the perf in the caus (*haksū*) and its refl (*shaksū*) is formed after the trans simple verb, in all other forms the paradigm of the third-*yā* is followed (*kōsi*, *ktōsi*, *katsi* etc) But the final vowel is lost in the imperative always and in the subj of the reflexive sometimes (*katir* "hide thyself", subj *yikatīr*, but *ghatir* "speak", subj *yighatīr*), and both forms lose it regularly in the causative and its reflexive (*hebd*, *yihebd*, sometimes with lengthening *heyder* "get up", *yiheyder*, *shidh* [Jahn, p 113, 25] "give heed", *yishidah*)

The medial *ū* and *ī* verbs are, as in Ethiopic, to a great extent assimilated to the plan of the strong verbs, *iā* and *wāw* being treated as consonants Only in the simple form of the med *ū* is the old Semitic inflexion retained in principle But the old form *imūt* (frequently *yimōt*) has become indicative, and a new subj has been formed with vowel change, *yimēt*, followed by the imperative *mēt* As in the intransitives, the ending of the 2nd sg f reacts on the stem in the indicative *temit*, whence also the fem plur *temīten* to the m *timōtem*, and the 3rd pers with these reversed *yimitem*, *temōten* In the perf *mōt* < *māta* is retained but abbreviated before consonant suffixes, as *metk*, the participle from it is *metōne* But the pass part is quite strong in formation as *makẖwif* "feared" Some verbs, probably formed from nouns, follow the strong paradigm throughout the simple form, like *tawos* "to be finished", *hawwel* "to be mad" This is always the case in the reflexive of the base, e g *šetwek* "to long for home" and in the causative, as *hadwōi* "turned" and its reflexive, e g *shhowōb* "warmed himself", as well as in the med *yā* verbs e g *seyōi* "travelled" The intensive stem shows a peculiar formation, e g *awīd* "returned", impf 1 ind *yeʾawiden*, subj *yeʾawīd*, imp *awīd*, part *maʾawide*, inf *awōdet* (from the simple verb, elsewhere however like *taʾawīr*) and *ayit* "called aloud" following the formation of the doubled verbs

The biliteral roots with short vowel (the so-called med gem or doubled verbs) have retained the primitive Semitic inflection with doubling of the second radical only in the perfect of the simple form, in addition the consonantal endings take an epenthetic vowel 3rd m *temm* "was at an end"

f *temmōt*, 2nd m *temmek* etc But the vowel of the stem changes without regard for the meaning *hass* "thought of", *ṣiss* "crept" (spider), *hudd* "stopped", *zull* "lost the way", *ghott* "covered", *dobb* "crept" The imper and subj follow the pattern of the strong verb, e g *temēm*, *yitmēm* The indicative however is *yitmōm* (*yifelūl*) This is a new formation on the analogy of the med *ū*, like *yimōt yimēt* The simple form **yitammem* had avoided the threefold repetition of the same sound just as the intensive has done, by forming in the perf *temīm*, and imperf *yit(e)mimen*, subj *yitmīm* (with assimilation to the vowels of the inf *tetmim*[a]) The causative of the simple form follows in the perf *hatmōm* and ind and impf the strong paradigm e g *yihatmōm*, while in the subj the succession of similar consonants is avoided, as in Aramaic, by doubling the first radical *yihátttem*, and in the imper *hattem* and part *mahattame* The causative of the intensive however follows its formation, e g perf *hatmim*, etc The reflexive of the simple form replaces in the perf (after the model of *katteb*) the repetition of the second radical by doubling the *t* *fattak* "was released", but in other respects follows the pattern of the strong verb e g ind *yiftekūk*, subj *yiftakl*, imp *ftakl*, part *meftakke*, inf *ftakkōt* The causative reflexive follows the same pattern but with doubling of the 2nd radical in the subj and part *shemdūd*, "he attained", ind *yishemdūd*, subj *yishemmed*, part *meshemmide*

The suffixes are added to the 3rd pers sg m of the perf with the "binding vowel" *ī*, which as in the similarly constructed forms of the Syr imperf (e g *nekteliw*) may have been an originally independent particle, which in Arabic is expanded to *iyā*, cf e g *ghabris* "he met her" with *ghabōr* Only before the 2nd pers sg m suffix, *ū* appears instead for unknown reasons This *ī* may also appear in association with the element *t* found in North Semitic (Hebrew *ʾōth*, *ʾēth* etc), probably abbreviated from the verb *ʾatā* "to come", which with the 2nd pers sg m *tūk* also shows *tīk* These independent suffixes however may also appear after all the other verbal forms, which otherwise take the suffixes direct or with an epenthetic vowel

The vocabulary shows the closest affinity, apart from later borrowings, to northern Arabic, but possesses, in addition to many characteristic new formations like *khō* "mouth" (cf Arab *khawkhat* "air hole"), many old words which otherwise survive only in outlying regions, like *fām* "foot" as in Punic, instead of the phonetically inconvenient *rigl*, so also *thiwīt*, *tiwīt*, Sok *teten*, *tee*, Müller, IV 170, 22, 1, 2, "sheep" = Fg Aram and Mand *tēthā* (see Lidzbarski, *Eph*, III 256, *Johannesbuch*, II 215 note), *fakhre* "together", cf Accad *pakhāru* "to assemble" The language of the Beduins and that of poetry has in addition many special features, particularly in its vocabulary

MEKNES (Ar Miknās and Miknāsat al-Zaitūn), a town in Morocco, one of the residences of the Sultān The old French name *Maquinez* or *Miquinez* has not prevailed against the form inspired by the ethnic

Situated in 5° 39′ W Long (Greenw) and 33° 53′ N Lat at an average height of 1,700 feet above sea level, Meknes is 80 miles east of Rabat and 40 west of Fās It occupies the centre of the transitional zone which lies between the Middle Atlas, 30 miles to the south, and the Sebū It commands the exit towards the Gharb of the depression ("south Rifan pass") which separates the massif of the Zarhūn from the plateau of el-Hādjeb At Meknes intersect the roads from Rabat to Fas, from Tāfilalt through the land of the Beni Mgīld and Azrū, from Marrākush through the Tādlā Meknes at the present day is economically connected with Knitra

The temperature rarely exceeds 30° C or falls below 5° The rainfall (491 mm in 1920) is remarkably equal from one year to the other The excellent water supply of the plain of Meknes and the quality of its light soil, resting on a subsoil of permeable limestone, make it one of the best agricultural districts of Morocco

The population at the last census was 30,000, of whom 19,000 were Muslims and 6,000 Jews Canal in 1902 put it at 20,000 of whom 9,000 were Būkheis and 5,000 Jews

Meknes is built on the flank of a mountain spur The ruins of the *Kaṣba* of Mawlāi Ismāʿīl lie to the S E of the native town, and give to the old town, surrounded by walls of clay, a considerable extension, of which the *mdina* itself only covers about a fifth Beyond the ravine dug out by the Wādi Bū Fekran the European town has been laid out and is being built The appearance of the native town, dominating this ravine and placed upon a verdant plateau, is striking The houses of the *mdīna*, often substantial, are always very simple There are only fifteen or so houses of an artistic interest They date for the most part from the reigns of Sultāns Muhammad b ʿAbd al Raḥmān and Mawlāi al Hasan The suburbs of the town look like the streets of a country village The sūks, which lie between the Madrasa

Bū ʿInania and the Djāmiʿ al-Nadjdjārin (sūks of the jewellers, carpenters and curiosity shops), have no remarkable features except the covered *kaisariya* [q v] the booths of which were ornamented a few years ago with shutters of painted wood The *mellāh* [q v] of Meknes is to the south of the *mdina*, it seems to have been here since the reign of Mawlāi Muhammad b ʿAbd Allāh A new *mellāh*, three times the extent of the old one, has been occupied since 1925 The *mdina* of Meknes is one of those which have retained their native character most unaffected Only one artery, the Rouāmzīn street, is accessible to European trade and traffic The centre of the town's activity is the Hedim square In the evening the story-tellers and buffoons, who usually call themselves shorfā' of Mawlāi ʿAbd al-Kadir al-Gilānī, are surrounded by a crowd, the animation of which is exceeded only by that which fills the Djamaʿ al Fnā at Marrākush To the S E lie the vast ruins of the *kasba* of Mawlāi Ismāʿil They now reveal nothing but chaos and disorder The only buildings still kept in repair are the Djenān b Halima, out of which the Direction de l'Agriculture has made a charming garden, and the Dar al Baidā' which is now a school for native officers In the Dār al-Makhzen live the last surviving women of the family of Mawlāi al-Hasan and sometimes it is used as a royal residence Begun at the end of the xviith century this palace was built in several periods The Bāb Dār al Makhzen dates from 1889 In the ruins of the Dār Kbira live the families of the Hasanī shorfā', near the abode of the nakib of the shorfā', Mawlai Kabir b Zidān To the Djamaʿ al Akhdar mosque the kādis, shorfā' and principal officials go every Friday and on the occasion of solemn prayers In the old Agdāl of Mawlāi Ismāʿil, among waste lands, in ostrich farm, the origin of which goes back to Mawlāi ʿAbd Allāh, has been laid out, beside an experimental garden Farther on there is a horse breeding establishment The remainder is nothing but ruins The visitor goes along miles of massive walls and finds enormous ruins the Heri el Mansūr used as a stable and storehouse for forage, the stables, the granary and the ornamental water left to go to ruins

There is very little industry in Meknes carpentry and particularly weaving, already noted by al-Idrīsi The most notable artistic industries are the many coloured embroideries of large irregular point lace and painted wood The public services endeavour to keep going these trades, in which purely Berber influence is more and more marked European competition is severely affecting, it Meknes as elsewhere, some classes of artisans, like the tailors, smiths and potters The building trades, on the other hand, are flourishing Sūks are held outside the town and are attended by the country people the Sūk of the Bāb Djdīd, before the gate on which the heads of rebels used to be placed for the edification of the tribes, the Sūk al-Khamīs and that of the Lanterns There is no native commercial house of any importance The market of Meknes does not extend beyond the environs of the town it exports nothing except in years of abundant harvest The region was already famed in the tenth century for its fruits, its vines, its gardens and its vegetables The mills, four or five of which are still working, date from the same period Since the French occupation, colonisation has developed considerably The colonists, most of whom have come from Algeria, cultivate mainly wheat, of which they are obtaining increasing yields The cultivation of the vine is increasing each year The region of Mawlāi Idris is one of the principal centres of olive growing in Morocco (400,000 trees), 330 farms are laid out in the district, covering 85,000 hectares Official colonisation which has now disposed of almost all the reserved lands has been out-distanced since 1927 by private colonisation The native farms (130,000 hectares) tend to disappear from the plain and to confine themselves to mixed farming in the mountains Prospecting for minerals has only been done piecemeal, traces of petroleum have been found beside Petitjean and of lead in the Central Atlas

The government of Meknes, which is a *makhzaniya* town, is in the hands of a *bāshā* He is also *bāshā* of the Buākheirs, who have retained a relic of their past greatness in a special statute and down till 1912 provided the garrison of the town (800 men according to Le Chatelier) The *nakib* of the Hasani shorfā' exercises a jurisdiction independent of that of the bāshā In the administrative organisation of the protectorate, Meknes has been made the capital of a very considerable area It was from it that the military operations in the Central Atlas were directed Although this active part is now over, Meknes is still a military command, and its administrative region, although greatly reduced, still stretches to Midelt Situated in the centre of Morocco at the junction of important roads, Meknes is marked out as one of the strong places of the country in the future a military camp is being laid out at el Hādjeb

The population of Meknes consists of many distinct elements Shorfā', Būākhers, Berbers and Jews The Idrisid shorfā', who have played their part in the history of the town and retain privileges (of the numerous descendants of Mawlāi Idris, only the families residing in Fās and Meknes are allowed to share in the income of the zāwiya of Fās) and the Hasani shorfā', who have many privileges of their own, form a kind of aristocracy, generally penurious The Būākhers, descendants of the *ʿabid* of Mawlāi Ismāʿil, up till 1912 formed an unreliable element, which was always a nucleus of trouble Since that date they have been taking up the trades of mat makers and farriers They live close to the town of old kasbas and gardens which belong to the Makhzen, and in the old kasba of Mawlāi Ismāʿil in the Bāb Mrāh quarter Their houses, roofed with thatch, look like African encampments But it is the Berber (*Brābcr*) element which predominates at Meknes and gives it its desire for independence, a feature of which has for centuries been a jealousy of Fās It is the Berbers of the mountains who give it its tone, when they come down to the town their women give colour to the streets of the *mdina* with their short skirts, their leather gaiters and their wide brimmed hats The Berber elements of the plain are much more mixed, having undergone many vicissitudes since the day when Mawlāi Muhammad b ʿAbd Allāh inaugurated the policy, considerably practised by his successors, of transferring tribes A considerable part of the population of Meknes consists of floating elements who come, usually between harvests, to work as artisans These immigrants almost all come from the south, from Tāfilālt in particular (potters, tanners and porters),

om Sūs (grocers), from Tūāt (oil-makers), from
ıgīg and Darᶜa (masons) The Rīfans and Jbāla
ıpply most of the agricultural labourers A small
ımber of Fāsīs, who have in recent years merged
to the population of the town, are cloth-merchants,
d-clothes-dealers and shoemakers

Jews form a quarter of the native population
oucauld estimated the *mellāḥ* of Meknes to be
alf that of Fās Chénier remarked on its prosperity
has increased since his day as elsewhere and
ıe position of the Jews is greatly improved since
ıe establishment of the French Protectorate

Religious life From the presence of the
lrīsid and Hasanid shorfāᵓ, the proximity of the
nctuary of Mawlāi Idrīs and the religious event
the celebrations of his *mūsem* (class *mawsim*,
v) every year, Meknes is one of the most im
›rtant centres of sharīfism At the same time for
ıe Berber population it is a centre of marabout
tes of the most elementary kind All the brother-
›ods that have zāwiyas in Morocco are represented
ı Meknes The most important are those of the
ādirīya, Tīdjānīya, and especially Hmādsha and
ıe largest, the ᶜIsāwa, to which half the population
e attached Meknes, whose patron saint is Sīdi
Iuhammad b ᶜIsā and which contains his tomb
nder the *kubba* erected by Mawlāi Muhammad
ᶜAbd Allāh, is the capital of the order This
ınt came here at the end of the xvth century
is teaching at first met with a vigorous resistance,
hich he overcame so completely that, when the
›vernor of the town sought to take steps against
ım, the people protected him Before his death
ᵓ acquired an estate, constituted it *ḥubūs* and
t it aside as a cemetery It is still used and many
en of religion are buried there The celebration
his *mūsem* on the first day of the *mūlūd* (*mawlid*)
stival is the great event of the year The pre-
ıarations for it begin forty days before and become
l-absorbing ten days before the festival On the
ıy before or the preceding day delegations flock
ı from all parts of Morocco, following the traditional
›utes The most generous hospitality is given to
ıe pilgrims by the descendants of Shaikh al Kāmil,
ho have the *mkāba* (Brunel) The excesses com-
ıitted on the occasion of this pilgrimage have
een frequently described Many other special cults
re observed in Meknes Bū Zekrī is the patron
f the graziers, and Mawlāi Idrīs of the Zarhūn is the
atron of the tanners, weavers and butchers (Mas
gnon) There is even the cult of a living holy
ıan, Mawlāi Ahmad Wazzānī As it was his
ıstom to sit in the public way in a very simple
›stume, he was in 1917 granted clothes and a
ubba at the request of Mawlāi Yūsuf The *kubba*
at the entrance to a dispensary and the admirers
f the saint come there daily to keep him company

History We know nothing certain about the
ıstory of the region in the Roman period nor in
ıe centuries which followed The most advanced
oman stations were on the slopes of the Zarhūn
ıarding the plain, out of which the warriors of
ıe Central Atlas might debouch, and perhaps
ırowing out a screen as far as the plateau of
l-Hādjeb

We do not know at what date the people here
ad their first contact with Islām, nor even if it
ras not till the Hilālī invasion that Islām became
ecurely established here The Berber tribes of
he Sāᵓis and Sebū made the most of the fertility
f their country A tradition records that a fire
destroyed the gardens there in 917 It was at this
period that the country was covered, from Tāzā
to Meknes, by the migration of a Znāta tribe, the
Miknāsa, a section of whom, who received the
name of Miknāsa al-Zaitūn to distinguish them
from the Miknāsa Tāzā, who lived farther to the
east, established themselves securely in the plain
The Idrīsids met with a vigorous resistance from
the Miknāsa They always found in them opponents
whom they could not overcome in spite of several
campaigns, and who were the medium of Umaiyad
intervention

The *Kirtās* records that a governor of the district,
al Mahdī b Yūsuf al-Kezanī, having joined Yūsuf
b Tāshfīn, was assassinated by the tribesmen, but
the terrified citizens hastened to disown the murder
At this date a few villages stood on the site of
Meknes One cannot say at what date, perhaps in
the tenth century, they were grouped together to
form the *Tacadart* mentioned by Idrīsī (*Tagrart*,
according to the *Kitāb al-Istibsār*) The population
seems to have been more numerous in the Almoravid
period than later, and prosperous Enclosed by a
wall, Meknes looked like a pleasure resort, with
its gardens, cultivated fields, its mosques, its baths
and water channels

The Miknāsa vigorously opposed the Almohad
onslaught When passing through this region in
1120—21, Ibn Tūmart preached here but he was
not well received Twenty years later, ᶜAbd al-
Muᵓmin laid siege to Meknes but it was not he
who took it He left it to enter Fās, leaving the
conduct of siege in the hands of Yahyā b Yaghmur
The *Kirtās* says the siege lasted seven years
The town fell in 1150 It was plundered, the
defences dismantled, a part of its wealth confiscated
and all its garrison put to death, except the governor
Yadder b Ulgūt, who is said to have gone over
to the Almohads before the surrender in order to
save his head On the site, or beside the ruins,
Meknes rapidly rose again under the shelter of
the fortifications built by the Almohads At the
end of the century, it had regained some importance
and the mosque of al-Nadjdjārīn was finished This
is the oldest monument in Meknes in 1756—
1757 Muhammad b ᶜAbd Allāh had it restored
and built the present minaret The Almohads
brought water hither from Tadjenna, five miles
away In 1182 the *khuṭba* was said in five different
places in Meknes and there were six gates in the
wall which surrounded the town

In the course of the following century, the intrigues of the Banū Marīn [q v] disturbed the country, where the fighting that accompanied the fall of the Almohads was particularly lively In 1231—1232, al-Maᵓmūn had to intervene against the Banū Fāzāz and Meklāta, who were ravaging Meknes In 1236—1237, as a result of the Marīnid success in the battle in which al-Saᶜīd's son was slain, Abū Bakr entered the town This occupation was only temporary but the Almohad restoration was not secure In 1245—1246, the governor left there by al-Saᶜīd was slain in a rising in the town in favour of Abū Zakarīyāᵓ the Hafsid Al Saᶜīd again returned victorious, causing Yahyā b ᶜAbd al-Hakk to fly to Tāzā The Marīnid had only two years to wait, after the death of the Almohad governor, he returned to Meknes to occupy it definitely

The first period of greatness for Meknes dates from the Marīnids They set out to make it beautiful

like Rabat and Fās Abū Yūsuf moved from Fās Djdīd to Meknes, which owed to him a ḳasba and a mosque (1276) Abū 'l-Hasan improved its water supply, built bridges on the road to Fas and began the *Madrasa Djadida* which Abū ʿInān was to finish It bears the latter's name and is still the most notable building in Meknes, in spite of the indiscreet restorations carried out in 1917–1922 Other madrasas, ʿAttārīn and Filāla, were built by the Marinids

During this period the political organisation of the country was developing in quite a different direction The Idrīsid shorfā', having assisted the Marīnids to gain power, prepared to take advantage of the organisation which the latter had given them Thus the foundations were laid for the movement which was to end in the partition of Morocco in the last years of the xvth century into practically independent divisions The shorfā' were numerous in Meknes When the weakening of the Marīnids and the decline of their prestige made it possible, they supplied leaders History has preserved the name of Mawlāi Zaiyān The Wattasids only once intervened, it appears, when at the beginning of the xvith century Masʿūd b al Nāsir, having rebelled against Muhammad al-Bortugālī, found an asylum at Meknes The Sultān besieged the town and took it, then installed his brother al-Nāsir al-Kiddīd there, who however did not prove faithful to him The few years of independence enjoyed by Meknes were not particularly glorious They mark, however, an epoch in the history of the town destined at other periods to be only the prey of anarchy or the plaything of a tyrant

The rise of the brotherhoods of the xvth century found a favourable soil among the Miknāsa The zāwiya Djazūliya was established there, as in other places in Morocco A few years later, Muhammad b ʿIsā was teaching there

Meknes was thus well prepared to welcome the Saʿdians When Muhammad al Shaikh approached in 1548 he entered the town without much trouble The Marinid al-Nāsir al-Kasrī is said to have agreed to hand over the town in return for the liberty of his father Ahmad Bū Zekrī, and the marabouts to have demanded the conclusion of such an agreement Muhammad al Shaikh however took a sufficiently sure method to establish his authority, when the Khatīb Abu 'l-Hasan ʿAlī b Harzūz began to preach against him, he had him scourged to death When he returned two years later, he was welcomed with gifts The estimates of travellers of this time put the population of the town at 6—8,000 hearths It was the only town in the region The Saʿdians took little interest in Meknes which never attracted their attention The country was well in hand and the Berber tribes peaceful to such a degree that the road from Marrākush by the Tādlā was regularly used It was the practice to make Meknes the residence of one of the sons of the Sultān There was however no important command attached to it Leo Africanus credits it with a revenue equal to half that of the viceroyalty of Fās, which is astonishing Under Ahmad al-Mansūr, Abu 'l-Hasan ʿAlī lived there and then after the second partition, Zīdān and, lastly Mawlāi al Shaikh, but as a prisoner in the last years of his father's life

The civil war which broke out on the death of al-Mansūr placed Meknes at the mercy of the Berber risings and marabout intrigues Mawlāi ʿAbd Allāh b al-Shaikh lived by brigandage and often found a refuge in al-Kasr al-Kabir In 1619, his brother Muhammad defeated him near Meknes Al-Ifrānī mentions for the next year the rising of an individual who called himself the Sharīf Amghār In the midst of this disorder an authority gradually made itself felt, that of the zāwiyas, and especially the Zāwiya of Dilā' In 1640—1641, Muhammad al-Hādjdj was even able to seize the sovereign power and get himself recognised by Fās and Meknes after his victory over Mawlāi Muhammad al Shaikh b Zidan He gained over the Berber tribes, and Mawlāi al-Rashīd in 1666 found the Banī Mtir against him, allied with the Dilā'ī Abū ʿAbd Allāh, and he had to fight them again in 1668

Mawlāi al-Rashīd seems to have been interested in Meknes, the Kasba of which he restored In burying him in the mausoleum of al-Madjdhūb, Mawlāi Ismāʿīl said he was fulfilling the last wishes of the deceased But the most important event was that al Rashīd sent Mawlāi Ismāʿīl to Meknes The latter lived before his accession in the Almohad kasba, as a landed proprietor managing his estates In his choice of a capital, we see the attraction of a rich district like this He wished it to be in his own image and realised his desire For fifty years Meknes was simply the framework for his splendour, the scene of his extravagances

He at once decided to build himself a palace and at once a grandiose scheme was projected He began by clearing a space The houses adjoining the Almohad wall east of the town were destroyed and their owners forced to carry the debris off to a site which has retained the name of Hedim, then to rebuild on a site which the sharif enclosed by a wall to the N W of the *mdina* The site which he chose for himself was also separate from the town His palace was built, and one even more splendid for his women This first edifice, Dār Kbira, was finished in 1679 It was a series, without intelligible plan, of riyāds embellished with fountains, paved with marble, surrounded by galleries which were supported by columns of marble, the apartments opened on to three galleries The sovereign's palace was in two suites, that of his ladies in four and larger than his His four wives and his favourites were equally splendidly housed The other concubines, of whom he had 500 of all nations, were housed in rooms along the passage At the end was a common hall, on a higher level, which gave a view over the gardens through iron grilles The reception pavilions were planned on the same scale, one of them had forty rooms The palace contained in all 45 pavilions and twenty kubbas The whole was surrounded by a crenelated wall pierced by twenty gates It was triple in the N E with a road round it and it could be defended equally well against the interior of the kasba The bastions supported batteries of guns and mortars The women being subject to rigorous confinement and Mawlāi Ismāʿīl being very meticulous in the performance of the duties of religion, a mosque was set aside for them Another had been begun in 1672, communicating with the town by the Bāb ʿIsi Lastly the palace with its dependencies contained four mosques, two are still in use, the Djāmiʿ al-Akhdar and in the quarter of the mews, very broken down, the Djāmiʿ al Ruwā To the south was a garden, the area of which is equal to that of the present *mdina*, an

orchard in which olive trees predominated Farther on were the stables to which the Sultān admitted only picked horses, to the number of 1,200 two parallel rows of arcades about 100 feet apart In the centre ran running water Each animal had its stall and a shelter for its equipment Opposite was a storehouse, the *ḥerī*, which supported a supplementary palace with twenty pavilions Between the palace and the stables was the granary, forty feet high and big enough it was said, to contain the whole harvest of Morocco At the side was a pond for irrigation purposes and also subterranean reserves of water in case of a siege

The buildings did not stop here To the south west of the town lay a city of pleasure, Madīnat al Riyād, where the officials had palaces, where Mawlāy Ismāʿīl himself had his mosque, his madrasa, his hammām, his fondaks and the offices of the umanāʾ of the Treasury, with the shops of the Sharīfan tailors In 1732–1733 Mawlāy ʿAbd Allāh on returning from an unsuccessful expedition into the Sūs, had the Madīnat al-Riyād destroyed by Christian slaves There is nothing left of it to-day except the Bāb al-Khamīs, dated 1667, one of the finest and best proportioned gates in the city

Lastly a site was reserved for the troops To the west of Meknes a large *duwwār* was settled with *ʿabīds* and their families To the east of the Dār al-Makhzen, five *kasbas* for the 130,000 men of the *gīsh* were gradually incorporated in the great kasba

After fifty years of unorganised but superhuman effort, the buildings were not yet completed It was in 1731—1732 that Mawlāy ʿAbd Allāh finished the surrounding wall and the Bāb Mansūr, the most finished example of the Ismāʿīlian gate, ponderous, of proportions by no means perfect but imposing, of which the Bāb al Bardaʿīn and the Bāb al Nuār are the two other finest examples at Meknes at the present day This name of a renegade, Mansūr al-ʿEuldj, was no doubt that of a keeper of the gate Mawlāy Ismāʿīl directed all the operations himself During the first twenty four years of his reign he never spent twelve months on end at Meknes But he returned there after each expedition, in proportion as his ambition and his power increased, his despotism and the needs of his government, his army and his family grew, his scheme became more and more grandiose, the work done was found unsatisfactory, modifications were made, buildings taken down and the work began all over again The result certainly was sumptuous and imposing but also odd and varied

All the country helped in the work Mawlāy Ismāʿīl collected materials wherever he could Volubilis, Chella, Marrākush were plundered If he destroyed al Badiʿ, it was perhaps out of jealousy of Saʿdian work, or perhaps simply to get material Like Ahmad al Mansūr, he procured marble from Pisa One day when a corsair ship had stranded near Tangier he ordered the Ghumāra to bring the cannon from it by unaided manual labour When he died the columns of marble which were still on their way were left at the roadside

Labour was recruited by similar means The Sultān imposed days of labour on the tribes, levied forced labour as he pleased, sent his ministers to the workshops, but relied mainly on renegades and Christian slaves who were his permanent workmen From 1680 the work was pushed on frantically All the Christians in Morocco were collected there The Trinitarians of Fās joined them The slaves were at first housed in sheds near the building yards, then they were moved to the Dār al-Makhzen, then to near the stables, under the arches of a bridge, where their lot was particularly miserable, finally to the interior of a ruined *bordj*, east of the town along the north wall of the Dār al Makhzen They were able to organise themselves a little there, to build themselves a church, to have chapels, a convent and infirmaries A pharmacist monk made up a medicine, the "Christian decoction', this was the means by which humane relations were established with the natives, even with the dwellers in the palace Their last historian has reduced the number of Christian prisoners in the service of Mawlāy Ismāʿīl to its real figure they did not as a rule reach a thousand and the Sultān, in the course of over fifty years, himself killed only one hundred and nine (Kochler)

The emperor revealed in his palaces his extravagance and his cupidity, he accumulated wealth as he did buildings, but only to hide it The consuls and ambassadors who came to negotiate the ransom of captives he received with a mixture of buffoonery and splendour Frequent mention is made of the cruelty and the terror which this ruler inspired, he loved to torture his women and cut off heads to show his skill His amusements were of a similar character, he liked to shoot with his kāʾids at the deer in his menageries then to finish them off with spear thrusts "Let us avert our eyes from all these horrors which make nature shudder", says Chénier Following his example his household inspired terror in the town He had six hundred children, a nursery of slaves, "who might have had a happier lot if he had loved them as much as his horses" On the approach of any of them, "every one hid all that he might take a fancy to", and the *ʿabīd* in their turn, negroes robed in bright colours, went about bullying, in the name of their master at first and then in their own

All his work was to collapse at his death, but he was able to keep it up in his lifetime From the troubles that broke out when he disappeared from the scene, one can judge of the energy of this man of eighty who maintained order among his horde of negroes and in this country destined by God to anarchy The kasba of Zarhūn, the kasba of Azrū in the middle of the Central Atlas, defended Meknes on North and South He was also able to preserve it from other scourges, when an epidemic of plague broke out, the *ʿabīd* were simply given orders to kill any people who came from Fās

Mawlāy Ismāʿīl was buried like his brother in the mausoleum of Sīdī ʿAbd al Rahmān al-Madjdhūb, a moralist saint of the xvith century His sons, the rebel Mawlāy Muhammad, killed at Tārūdānt in 1706, and Mawlāy Zīdān in 1707, had already joined Mawlāy Rashīd In 1859 the ashes of Mawlāy ʿAbd al Rahmān were also deposited there

On the death of Mawlāy Ismāʿīl, the Būākhers and the soldiers of the *gīsh* stirred up a palace war which lasted twenty years Mawlay ʿAbd Allāh lost and regained his throne six times But however great this danger was, the other threat was still more disturbing, having got rid of the garrisons of the Ismāʿīlian kasbas, the Berbers, armed, came down from the mountains The problem for the sultāns was to choose the lesser evil, they

declined to disband the *ʿabīd* and in the struggle which naturally arose between these and the Berbers relied more on the former The civil war extended to the tribes of the plain and the garrisons of Fās, especially the Ūdāya, pretenders stirred up the flames, readily giving the signal to plunder and, in the rivalries of races and tribes, easily finding a party to support them Gradually the Bukhers sank in misfortune It was in vain that Mawlāy ʿAbd Allāh and his sons expended the treasure of Mawlāy Ismāʿīl for them The worst of it for Meknes was that every one ended or began by plundering it

Muḥammad b ʿAbd Allāh almost re established order and restored to the town its past glory He did a great deal for it, his palace of Dār al Baḍāʾ, the severe architecture of which, not without charm, can still be seen in a part of the olive grove of al-Hamriya, in the Kasba, he built the Djāmiʿ al-Anwar and in the *madīna*, the minaret of the Djāmiʿ al-Nadjdjārīn, the kubba of Sīdī Muḥammad b ʿĪsā, and several mosques (al-Azhar, al-Baidāʿīn, Bāb Miāh, Berrīma and Sīdī Bū ʿUthmān) It was he who made the 12,000 books of the library of Mawlāy Ismāʿīl *ḥubūs* for the benefit of all the mosques of Morocco As regards the tribes his policy was to break them up He transplanted many of them and tried several repressive measures The end of his reign was marked by the success of the Berbers whose attacks had been resumed about 1775

Soon nothing was to be left of the work of Mawlāy Ismāʿīl The Christian community lost its Franciscan mission in the reign of Mawlāy Yazīd and did not survive the persecution of this sharīf The earthquake of 1755 had destroyed their church, convent and hospice The renegades, who had gathered together at Kasba Agurāy, were gradually absorbed

The Berber crisis was again acute from 1811 Communication with Fās was continually being cut and it was something to boast of for the sultān to go out of Meknes Mawlāy Slimān (Sulaiman), who had undertaken to restore the Kasba and rebuild the bridges on the road to Fās and who would have liked to get rid of the Būkheir, decided to settle in Fās His walls were his only defence at Meknes, which was blockaded by the tribes Mawlāy ʿAbd al Raḥmān, whom Delacroix saw there and who built a *kubba* in Djenan b Hulima, left the Berbers in semi independence and at last disbanded the *ʿabīd* without even granting those who remained in Meknes the character of Makhzen troops His son carefully avoided all quarrels

Mawlāy al-Ḥasan revived the tradition of the great sultāns and made his authority felt He was able to enter Meknes after his accession only by crushing the power of the tribes In 1879 he conducted a campaign against the Benī Mtir In 1887 he forced his way through the country of the Benī Mgild in his campaign against the Nūn On his death the Berbers regained their independence If they retained their kāʾids it was because the latter cast off their allegiance to the Makhzen After the fall of Mawlāy ʿAbd al-ʿAzīz, Meknes recognised all the competitors in succession It was Meknes that proclaimed ʿAbd al-Ḥafīẓ, who had come via the Berbers of Tādlā in 1908, in 1909 it summoned the sharīf al Kattānī and in 1911 rallied to Mawlāy Zain It was in this year that General Moinier entered Meknes and two years later Colonel Henrys under the direction of General Lyautey pacified the Benī Mtir country

MELLĀH, the name given to the quarter in Moroccan towns which the Jews are compelled to inhabit Being *ahl al dhimma*, the Jews have a right to the special protection of the government which allots them a particular quarter to live in, situated very often quite close to the citadel (*kaṣaba*) where the governor of the town resides Moreover, the sovereigns and governors liked to have at hand "their" Jews who were frequently of use, to them as clever diplomatic

agents and often gave them valuable financial support All the towns of Morocco, even the large ones, did not necessarily have a *mellāh* Thus at Tangier there are certain quarters particularly inhabited by Jews but they are not set aside for them and we also find Muslims there As to Rabat, its present *mellāh* was established only in 1808 by Sultān Mawlāy Sulaimān, formerly the Jews lived together in the al-Buhaira quarter (el-Bhēra) where there were also Muslims When he founded Fās in 805, Idrīs II compelled the Jewish refugees who flocked into the capital to reside in the northern part of the ʿAdwat al-Kaiawīyīn (Aghlān quarter as far as the gate called Bāb Hisn Saʿdūn), this was undoubtedly the first Moroccan ghetto, and the present *Fondak el-Ihūdī* ("the Jew's warehouse") apparently preserves its memory But at the end of the xiiith century the Marinid [q v] dynasty, wishing to create a new capital, founded alongside of "Old Fās" (*Fās al-Bālī*) "New Fās" (*Fās al Djadīd*) or "White City" (*al-Madīnat al-Baidāʾ*) In the first half of the xivth century, the town of Hims was built close beside Fās and at first occupied by the Ghuzz archers who formed a part of the regular Marinid army, after the suppression of this force in 1320, Hims became the quarters of the Christian mercenaries, whom we find there in 1361 Later, probably at the beginning of the xvth century, and no doubt as the result of massacres, the Jews of Old Fās were ordered to settle in Hims, this town was built on a site known as *al-Mallāh*, the "salt spring", or "salt marsh", and the new ghetto became known by this name From a proper, this became a common noun, and passed from Fās to the other towns of Morocco as the name for the quarter assigned to the Jews The etymology proposed by Dozy in his *Supplement* (*al-mallāh* < *al-mahalla* "quarter") is therefore to be rejected, as are the explanations as "salted, accursed land", or "quarter of the Jews who were forced to salt the heads of decapitated rebels" In Morocco instead of *el-mellāh*, in speaking, the expression *el messūs* (class *al-masūs*) is often used by anti phrasis, lit the "not-salted"

The *mellāh* of Fās is therefore the oldest in Morocco in every way For a long time it was also the most important, in the middle of the xith century, al Bakrī says that Fās is the town with most Jews in the Maghrib, which has given rise to the proverbial saying *Fās balad bi-lā nās* "Fas, a town where there are no people (worth mentioning)" But the constitution of Marrākush in 1063 resulted in the foundation in southern Morocco of a new Jewish centre which was to attract to it the Jewish and pseudo-Jewish peoples of the Atlas The term *el mellāh* however appears for Marrākush only in the second half of the xvith century (cf E Fagnan, *Extraits inedits relatifs au Maghreb*, p 409) At the present day the *mellāh* of Marrākūsh and the Jewish town of Mogador form the most important Jewish centres of Morocco

The name *el mallāh* is peculiar to Morocco, there, however, it is applied not only to the Jewish quarter in a town but also to little mountain villages exclusively inhabited by Jews At Tlemcen the term *derb el-yhūd* (class *darb al-yahūd*) is used, at Constantine *esh shāraʿ* and in Algiers, Tunis and Tripoli *el-hāra*

On the interior organisation of the present day Moroccan *mellāh* see E Aubin, *Le Maroc d'aujourd'hui*, Paris 1904, p 367—372, J Goulven, *Les mellahs de Rabat Sale*, Paris 1927, p 99—107, the article *Morocco* in the *Jewish Encyclopaedia*

(GEORGES S COLIN)

MELILLA (in modern Arabic *Mlilya*, Berber *Tāmlilt*, "the white", in the Arab geographers *Malila*), a seaport on the east coast of Morocco on a promontory in the peninsula of Gelʿīya at the end of which is the Cape Tres Forcas or the Three Forks (*Rās Hurk* of the Arab geographers, now *Rās Werk*)

Melilla probably corresponds to the *Rusadir* of the ancients (cf *Rhyssadir oppidum et portus* [Pliny, v 18], *Russadir Colonia* of the Antonimian Itinerary) Leo Africanus says that it had belonged for a time to the Goths and that the Arabs took it from them, but in reality we know nothing of the ancient history of the town

It is only at the beginning of the tenth century that Melilla appears in the Muslim history of Morocco In 930, the Umayyad Caliph of Spain, ʿAbd al Rahmān al-Nāsir li-Dīn Allāh succeeded in detaching from the Fātimids the famous Miknāsa chief Mūsā b Abi 'l-ʿĀfīya, who had established his authority over the basin of the Moluya and the district of Tāzā, having seized Melilla, al-Nāsir built ramparts around it and gave it to his new ally, who thus had at his command a base of defence (*maʿkil*) against the Fātimids of Ifrīkiya and a port which made communication with Spain easy Later on, the descendants of his son, al-Būrī b Mūsā, rebuilt the town, which remained one of the strongholds of the Miknāsa in Morocco down to the time of the decline of the power of the tribe, who were definitely defeated and scattered by the Almoravid Yūsuf b Tāshfīn in 1070

But the Miknāsa must have abandoned it before their dynasty was crushed by the Almoravids, for al Bakrī shows us that by 1067 a descendant of the Hammūdid Idrisids of Spain had been summoned to Melilla and recognised as ruler by the people of the district

At the period when al Bakrī wrote (1068) Melilla was a town surrounded by a wall of stone, inside was a very strong citadel, a great mosque, a *hammām* and markets The inhabitants belonged to the tribe of the Banū Wartadī (or B Wartardā), a branch of the Sanhādja group of the Battūya Melilla had a harbour which was accessible only in summer It was the terminus of a trade route which connected Sidjilmāsa with the Mediterranean through the valley of the Moluya and Agaisif (French *Guercif*) The trade must have been considerable, the principal exports were no doubt those mentioned by Leo Africanus iron from the mines of the mountains of the Banū Saʿīd and honey from the Kabdāna country, we may also add pearls which were taken from oysters found in the harbour itself Al-Bakrī notes that the inhabitants made money by granting protection to merchants The environs of the town were occupied by the Banū Wartadī (who also occupied the stronghold called Kulūʿ Gāret), the Matmāta, the Ahl Kabdān, the Marnīsa of the "White Hill" (*al Kudyat al-baidāʾ*) and the Ghassāsa of the massif which ends in Cape Tres Forcas (*Djabal Hurk*) All this region was then independent and had no political

link with the kingdom of Fās or that of Nakūr

But in 1080 the Almoravid sovereign Yūsuf b Tāshfīn took Melilla and added its territory to the Almoravid empire In 1141—1142, in the course of the Almoravid pursuit of the Almohads, a body of the latter set out from Tāmsāmān to lay siege to Melilla, which was taken and plundered In 1272, the Marinid Sultān Yaʿḳūb took Melilla from the Almohads and Ibn Khaldūn simply mentions it as a fortified place It seems in fact that these three captures of the town had destroyed its commercial importance to the advantage of another town on the west coast of the peninsula of the Gelʿīya Ghassāsa also called al-Kudyat al-baidāʾ, the *Alcudia* of the Portolans, in the xiiith century it is this latter town that appears as the Mediterranean port of Fās and Tāzā, and it was through it that political and commercial relations with eastern Spain and Italy (Genoa and Venice) were carried on

Læo Africanus says that in 1490, hearing that an attack on it was planned by the Spaniards, the inhabitants abandoned the town and fled to the mountains of the Battūya, to punish them for this the Wattāsid Sultān had the town burned down, when in Sept 1497 the Spaniards arrived they were thus able to disembark without resistance and occupied the town, abandoned and half destroyed The occupation of Melilla enabled the Spaniards to attack the port of Ghassāsa by land and it was taken in April 1506 The Moroccans recaptured it in 1533 but the dangerous proximity of Melilla henceforth deprived it of importance The commercial activity of this region was moved further west to the port of al Mazimma (Spanish Alhucemas, Fr Albouzème), and the centre of Muslim resistance in this part of Morocco was henceforth the strong hold of Tāzūtā, which after having been the capital of the Marinid fief of the Banū Wattās became that of a practically independent leader of a holy war After passing into the hands of the Spaniards, Melilla was continuously besieged by the Muslims, mainly by the forces of the leaders of holy war established at Tāzūtā and at Mdjāu (the *Meggeo* of Leo Africanus) Occupied by the Christians, the town naturally became one of the places in Morocco in which Muslim pretenders and rebels found asylum and support against the central power, especially at the beginning of the Saʿdian dynasty In 1549, it sheltered the dispossessed Wattāsid Abū Hassūn, "king" of Bādis, in 1550 it welcomed with his family the Mawlāy ʿAmar, "king" of Debdū It was from Melilla that in 1595, the pretender al-Nāsir b al Ghālib bi'llāh set out against his uncle Sultan Ahmad al-Mansūr

Later Melilla only appears in history in connection with sieges which it had to suffer sieges by Mawlāy Ismāʿīl in 1687 and 1695, siege in 1774 by Mawlāy Muhammad b ʿAbd Allāh, Spanish-Moroccan war of 1893 (Sidī Waryāsh affair) From 1903 to 1908 the region of Melilla was the scene of struggles between the pretender al Djīlālī al-Rūgī, established in the *kaṣba* of Selwān, and the troops of the Sultān ʿAbd al-ʿAzīz, defeated and receiving no support, the latter had to take refuge in Spanish territory and be repatriated Still more recently in 1921, the same district witnessed the sanguinary battles between the Spaniards and the Rifans under ʿAbd al-Karīm (Anwāl disaster) Melilla is for Spain a "place of sovereignty" like Alhucemas, Peñon de Velez and Ceuta Before the establishment of the French protectorate, Melilla, constituted a free port, was the landingplace for all the European merchandise (cotton, sugar, tea) intended not only for eastern Morocco but also for the Saharan regions of Morocco and Oranie It has now lost much of its commercial importance

MENDEREZ, the name of two rivers in western Anatolia

1 Buyuk Menderez (called by al-ʿUmarī Menderos, by Pīrī Reʾīs, Mendiraz or Mendiroz), the ancient Maeander, the Mandra of the Crusaders It rises in the district of Germiyān in a little lake, the Huweiran Golu (Sāmi) above Diner (according to Abū Bakr b Bahrām in a spring called Buñar bashī, a day's journey from Homa), flows past Homa at some distance off, then through the plain of Ishḳlī and the kazās of Baklan and Čal In the kazā of Čarshamba (capital Bulladan) it is joined by the Banaz Čai (called Murād Dagh Suyu in Abū Bakr b Bahrām whose statement that it flows past Ishḳlī is wrong), which rises in the Murād Dagh and flowspast Banaz Farther down its course, in the plain of Denizli, it receives the Čürük Su, the ancient Lycus Fl Farther on a ruined bridge called Demirtash Kopriisü marked the frontier between the two old liwās of Germiyān and Aidīn, according to Abū Bakr a warm spring rising in its foundations had contributed to the destruction of this bridge

In the territory of Aidīn the Buyük Menderez flows past at a distance the villages of Ortakčī, Nazilli, Sultānhisār, Koshk and Guzelhisār Aidīn, breaks up into several arms in the plain of Balat (Palatia, the ancient Miletus) and feeds a lake full of fish (al-ʿUmarī) there, which is now called Bafa Deñizi (Lake of Palatia, the ancient *κόλπος Λατμικός*) A little below Balat, it enters the sea

Al-ʿUmarī who, generally speaking, is inaccurately informed about its course (he puts Deñizli and Birgi on it, i e brings the Cayster into its basin and makes it flow into the Black Sea) compares the Maeander for its size at low level with the Nile, in flood however with a sea According to him, it is navigable and the people on its banks sail from its mouth on military or commercial enterprises Western writers also speak of the trade borne on the Maeander in the late middle ages The main centre of trade on the Maeander and also on the land routes through the valley was Palatia (Balat, the ancient Miletus), in later times, however, the caravan route down the Maeander valley ended in Scalanuova (Kush Adasi)

2 Kücük Menderez, the ancient Caystrus The central part of its course runs in a wide plain on the northern edge of which is Birgi, on the southern edge Tire, the old capital of the *liwā* of Aidīn A little below Ayasolugh, the ancient Ephesus, it enters the sea

In the middle ages the centre of trade with the hinterland reached by the Cayster was Altoluogo (from *Ἅγιος Θεόλογος*), the ancient Ephesus (Turk Ayasolugh, now called Seldjuk), later Scalanuova (Kush Adasi) In the Ottoman period Smyrna attracted all the trade of the Aegean Sea with the Anatolian hinterland The caravan routes which

came down the river valleys opening on the Aegean thus ended in Smyrna, just as at the present day the railways which utilize these valleys start from Smyrna

MENF [See Manūf]

MENGŪČEK (Mangūdjak), a Turkish emir, who after the capture of Romanus Diogenes in 1071 A D seized various places in the north-east of Asia Minor and transmitted his power to his descendants We find them in Erzindjān, Koghonia (Colonia, Kara-Hisār Sharkī) and Diwrigi (cf the genealogical table in von Zambaur, *Manuel de Genealogie* etc, p 146) Little is known of their history It is incidentally mentioned in Michael Syrus (ed Chabot, iii 205) that Ibn Mangūdjak, being threatened by the Ortukid Balag, made an alliance with Theodore Gabras, the Byzantine commander of Trebizond, but was taken prisoner in battle along with the latter (1118) He was, however again released by the Danishmandid Emīr Ghāzī, whose daughter he had married, while the Greek had to pay a heavy ransom His name is not mentioned but, from the genealogical statements in the inscriptions of his descendants, he was called Ishāk The same story is given elsewhere but not so fully Better known is his grandson Fakhr al-Dīn Bahramshāh, who ruled for many years in Erzindjān and died in 622 (1225) To him the celebrated poet Nizāmī dedicated his poem, *Makhzan al Asrār*, which was composed in 1198 or 1199 He was on the best of terms with the Saldjūks of Konya, with whom he was connected by marriage, but when these relations were altered under his son ʿAlā al Dīn Dāwūd shāh, the rule of the Mandjukids was ended At the end of 625 (1128) he was forced to cede Erzindjān to Kaikobād, and his brother Muzaffar al-Dīn Muhammad who ruled in Koghonia met a similar fate A collateral line established in Diwrigi and ruling there in the name of the Saldjūks held out for a few more years, perhaps till the coming of the Mongols into these regions in 675, only a few scraps of information about this line have been gleaned from inscriptions and coins

(M Th Houtsma)

MENTEŠHE-ELI, a little principality in Anatolia The boundaries of the territory of the Menteshe oghlu's [q v] are given by Munedjdjim-bashī (cf Fr Babinger, *G O W*, p 234 *sq*) in his *Ṣahāʾif al-Akhbār* (Stambul 1285) as marked by Mughla, Balāt, Boz Üyuk, Milās, Bardjin, Marin, Čine, Tawās, Boināz Makri, Godjaïz, Foča and Meimene They thus correspond approximately to those of the ancient Caria The origin of the name is uncertain, but it can confidently be asserted that the opinion, presumably first put forward by F Meninski (*Lexicon*, iv 737) and till quite recently upheld, that the district takes its name from the Myndus (Μύνδος in Strabo) of the ancients is not worthy of credence Several of the places above mentioned play a not unimportant part as centres of scholarship and literature in the earlier period of Ottoman intellectual life Thus in the time of the Menteshe-oghlu Mehemmed (775—777) a certain Mahmūd b Mehemmed of Bardjin composed a *Bāz nama* which was published by J v Hammer Purgstall under the title "*Falkneiklee*" (Pest 1840) from the Milan MS and rightly described as one of the earliest documents of the Ottoman language In many of these places there were academies where an active intellectual life flourished, so that the share of the district of Menteshe in Ottoman literature is strikingly large

(Fr Babinger)

MENTEŠHE-OGHLULARĪ, a petty dynasty in Anatolia The princes of Menteshe first appear in history after the break up of the Seldjūk empire The founder of the family is said to have been a certain Menteshe Beg b Behāʾ al-Dīn Kurdī He had his court at Milās (Mylasa) in the ancient Caria, and not far from it his stronghold Païčīn (Petsona) His descendants also lived in Milās until they moved their court to Miletus The son of Menteshe was Urkhān Beg, who is known from an inscription on a building in Milās and from Ibn Battūta who visited him in 1334 in Milās (cf Ibn Battūta, *Voyages*, ed Defremery, Paris 1854, II, 278 *sqq*) Urkhān's successor was his son Ibrāhim, who built a mosque in Mughla in 745 (1344) and left two sons, Ahmed Ghāzī and Mehemmed The second succeeded him in 755 (1354), but succumbed in the struggle for the throne to his brother Ahmed, who took Eski Hisār in 755 (1354), in 777 (1375) founded an academy at Bardjin and at the end of Djumādā II, 780 (Oct 1378) completed the Ulu Djāmiʿ in Milās Ahmed Ghāzī died in Shaʿbān 793 (July 1391) and was succeeded by his nephew Ilyās The Ottomans had in his reign already taken possession of several principalities in the neighbourhood of Menteshe eli, such as that of the Germian-eli [q v] and of the Hamid eli [q v], and now seriously threatened the existence of the Menteshes Immediately after the accession of Ilyās Beg, Bāyazīd I, who had just become Sultān, deprived the lords of Menteshe of the last vestige of independence They sought refuge with the ruler of Sinope, Bāyazīd Koturum, and later with the conqueror of the Ottomans, Timūr I enk Ilyās Beg, who built a mosque in Miletus, regained possession of Menteshe-eli in 1402 On 24 July 1403, he concluded a treaty with the Count of Crete, Marco Falieri (publ by Mas Latrie, at the end of his essay, *Commerce d'Ephese et de Milet moyen âge* in the *Bibl de l'Ecole des Chartes*, Ser v Vol vi Paris 1864, p 226 *sqq*) and with

the admiral Sei Pietro Civrano on 17th Oct 1414 (cf *Diplomatarium Veneto-Levantinum*, II 305, 293 and W Heyd, *Histoire du commerce du Levant*, II 353 *sq*) The reign of Ilyas Beg, filled with fighting and difficulties of all kinds, ended in 824 (1421) when his lands passed to the Ottomans Mehemmed I had struck coins as early as 818 (1415) on which he calls himself lord of Menteshe Among the children of Ilyās Beg, mention is made of Lāth Beg, but the shadowy part he played is quite uncertain The year 829 (1426) saw the end of the princes of Menteshe A certain Balaban was appointed as Ottoman governor of Menteshe-eli and henceforward the district forms a part of the Ottoman empire The chronology of the dynasts of Menteshe is still uncertain and essential points have still to be cleared up, which will require a systematic study of the many monuments in Menteshe eli with their important inscriptions, especially in Milās, Miletus, Bardjin, Mughla, etc

The following genealogical table shows the relationship of the various princes and is based on coins and inscriptions

Hīdjdj Behā' al-Dīn Kurdī,
Governor of Sīwās under the Seldjuks

Menteshe

Shudjā' al Dīn Dirkhān
(c 730 = 1330)

Ibrāhīm
(c 745 = 1344)

Tādj al Dīn Ahmed Ghazi — Mehemmed
777 (1375), d 793 (1391) — 755 (1354)

Muzaffar al-Dīn Ilyās
I 793 (1391)
II 805—24 (1402—21)

Lāth — Uwais — Ahmed — Fātima
824 (1421) — d 823 (1420)

MERDAWIDJ [See Mardāwidj]

MERIDA, Ar Mārida, from the Latin *Emerita*, a town in the southwest of Spain, in the modern province of Badajoz, where it is the capital of a *partido*, on the right bank of the Guadiana Now somewhat decayed, it has only 11,150 inhabitants It is on the Madrid-Badajoz railway and is also connected by rail with Cáceres in the north and Seville in the south

The ancient capital of Lusitania, *Augusta Emerita*, was founded in 23 B C and under the Roman empire attained remarkable importance and prosperity Numerous remains of Roman buildings still testify to the position it held in the Iberian peninsula in those days a bridge of 64 arches, a circus, a theatre, and the famous aqueduct of *los Milagros*, of which there are still standing ten arches of brick and granite Merida under the Visigoths became the metropolis of Lusitania and according to Rodrigo of Toledo was fortified and strongly defended, which explains why the Muslim conquerors led by Mūsa b Nusair [q v] had some difficulty in taking it The Arab leader on landing in Spain in Ramadān 93 (June 712) first took Medina-Sidonia and Carmona, then Seville He next laid siege to Merida, before which he stayed for several months, but the inhabitants in the end capitulated and the town surrendered on 1st Shawwāl 94 (June 30, 713) From Merida, Mūsā b Nusair continued his advance to Toledo

Under the Arab governors, Merida seems to have very soon become a rallying point for a large number of rebels of Berber and Spanish origin It was there that Yūsuf al Fihrī endeavoured to organise a movement against that organised for his own benefit by 'Abd al-Rahmān al-Dākhil in 141 (758) At a later date, a Berber named Asbagh b 'Abd Allāh b Wānsūs rebelled there against al-Hakam I in 190 (805) and the emir of Cordova had for the next seven years to undertake summer campaigns against him before bringing him to reason Another rebellion broke out in Merida in 213 (828) and the town had to be besieged in 217 and again in 254 (868) In the reign of Emīr 'Abd Allāh it was the headquarters of 'Abd al-Rahmān b Marwān al Djillikī (the Galician), an Arabic name which concealed that of a Christian nationalist leader Merida definitely returned to its allegiance in the reign of 'Abd al-Rahmān III al-Nāsir when it submitted in 316 (928) to the *kā'id* Ahmad b Alyas

From the XIth century, Merida began to decline in favour of Badajoz, especially when the latter town became the capital of the independent little kingdom of the Aftasids [q v] It remained in the hands of the Muslims till the beginning of the XIIIth century In 1228 it was retaken by Alfonso IX of Leon but never recovered its former importance

The Arab geographers who mention Merida, describe its Roman ruins in detail, they also mention the Muslim citadel, the foundation inscription of which has been preserved It was built in 220 (835) by the governor 'Abd Allāh b Kulaib b Tha'laba by order of the Umaiyad Emīr 'Abd al Rahmān II

(E LÉVI PROVENÇAL)

MERĪNIDS (BANŪ MARĪN), a Berber dynasty, which ruled over the extreme Maghrib (Morocco) from the middle of the xiiith to the middle of the xvth century

The first references we have to the Banū Marīn show them living a nomadic life in the Sahara between Figuig [q v] and Tāfilālt [q v] Like the other groups who claimed to be Zenāta, they must have been driven to the west by the nomad Arab Banū Hilāl in the second half of the xith century Like their brethren, the Banū ʿAbd al-Wād, whose lands adjoined theirs, they had attempted in 1145 to resist the conquest of the Central Maghrib by the Almohads and had been defeated While the Banū ʿAbd al-Wād entered the service of the conquerors, the Banū Marīn took refuge in the desert The weakening of the Almohad empire gave them a chance to take their revenge In the course of their periodic movements in the valley of the Muluya, they learned of the weakness of the defences of the extreme Maghrib, the best forces of which were engaged in Spain, and the Banū Marīn therefore made a formidable razzia northwards in 613 (1216) This was the first stage of the conquest which was to proceed step by step for 53 years It was continued next year by the crushing of the Banū Riyāh Arabs, who lived in the plains of the west, and by a first fiscal exploitation of the country The Almohads, paralysed by dynastic feuds, made no serious thrust in return until 27 years later, when the Banū Marin were defeated by the troops of the caliph al Saʿīd (642 = 1244) After a forced check, the conquest was resumed with more method by the *amīr* Abū Yahyā b ʿAbd al-Hakk He endeavoured to increase his military forces by granting lands to groups of his kinsmen and taking into his service foreign mercenaries, and he made every effort to capture towns To achieve this end and to gain a moral support which he lacked, the *amīr* claimed to be the mandatory of the Hafsids [q v], the Almohads of Ifrīḳiya He further declared himself the protector of the holy men, who were venerated by the people It was thus that he took possession of Meknes, Fās, Tāzā, Rabat and Sale Finally the help he gave the Almohad pretender Abū Dabbūs enabled the *amīr* Abū Yūsuf Yaʿkūb, Abu Yahyā's successor, to annex Marrākesh, which marked the completion of the Marīnid conquest (669 = 1269)

Inheriting this area of the western Muslim world, which had been the very heart of the great Almohad empire, the Merīnids also inherited the traditions of those they had dispossessed and their dreams of hegemony in Spain and Barbary

As in the time of the Almoravids and Almohads, Spain was for the Maghribis the sacred land of martyrs for the faith Not only did the dynasty send there its troublesome sons, princes whose presence in the Maghrib might be inconvenient and who formed the corps of volunteers of the faith, but several sultāns fought there in person Abū Yūsuf, whose resumption of the holy war was his one great scheme, his successor Abū Yaʿkūb, and Abu 'l Hasan, who saw the failure of these oversea expeditions

In crossing the Strait, Abū Yūsuf fulfilled his dearest vow but he was also answering the reiterated appeals of the Banu 'l Ahmar of Granada, who were tired of enduring the exactions and insults of the King of Castille He was received there as a saviour and at once undertook a plundering expedition Don Nuño de Lara, endeavouring to capture the loot taken from the Christians, sustained a heavy defeat near Ecija and was himself slain (674 = 1275) Very few other pitched battles are mentioned in these wars of the Merīnids in Spain, but almost daily razzias into Christian territory The Muslims destroyed or carried off the crops and stocks and they took prisoners who were sold as slaves in the Maghrib The relations between the Sultāns of Fās and of Granada, by no means warm at the time of the landing in Spain, became decidedly hostile when Abū Yūsuf claimed the ownership of the town of Tarifa [q v] as a base for his future operations in the Peninsula Ibn al-Ahmar appealed to the King of Castille for help against the encroachments of his rescuer An alliance was formed between Christians and Muslims of Spain which Yaghmorāsan, sultān of Tlemsen, soon joined The latter undertook to prevent or impede any further crossings of the Moroccan ruler into Andalusia

The entente with the Christians did not however prevent the latter from continuing the task of the Reconquista In 709 (1309) they took Gibraltar and the Sultān of Granada appealed again to the Maghribī Sultān Abu 'l-Hasan sent his son ʿAbd al-Malik who recaptured Gibraltar (733 = 1333) ʿAbd al Malik having been killed, Abu 'l Hasan sent a large army on ships supplied by the ports of Ifrikiya and himself landed near Tarifa This town was in the hands of the Christians He tried to take it but was routed by the combined forces of Alfonso XI of Castille and Alfonso IV of Portugal This disaster of 1340 and the taking of Algeciras by the King of Castille finally discouraged the Merīnid sultān Neither he nor his successors again made attempts in Spain

If circumstances prevented the Merīnids from reviving against Christianity the glories of the wars of the Almohads, they were able to devote themselves to regaining the great African empire of their predecessors and they succeeded in doing so for a comparatively short time That empire, as is well known, covered in addition to the kingdom of the Merīnids, that of the ʿAbd al-Wādids of Tlemsen and that of the Hafsids of Tunis [q v] The kingdom of Tlemsen was that most directly threatened by the ambitions of the sultāns of Fās Causes of quarrel were numerous between these neighbouring and related dynasties To old rivalries, dating from the days when the two clans were nomads, had been added the competition of two adjoining states each seeking to extend their frontiers

The ʿAbd al-Wādids very soon lost hope of annexing territory in the west If, as we have seen, they were a thorn in the side of the Merīnids who desired to cross into Spain, this policy was of brief duration Very soon they had to confine themselves strictly to the defensive On many occasions, the kingdom of Tlemsen was invaded and the Tlemsenians shut up within their walls For example for eight years and three months, from 698 (1299), they were blockaded, during which period the Merīnids established a permanent camp which became the town of al-Mansūra [q v] in addition to numerous other works of circumvallation, Tlemsen however did not fall till later In 737 (1337) Abu 'l-Hasan took it, he and his son Abū ʿInān were to hold it for 22 years For these two princes, whose reigns mark the apogee of the dynasty, Tlemsen was only a first stage towards Ifrīḳiya The dream of recreating the empire of the Almohads was to be realised by annexing the Hafsid kingdom

Constant relations, in which each hoped to gain some advantage, united the two states of east and west, Banū Hafs and Banū Marīn To a contemporary observer like the Egyptian al ʿUmarī, the Banū Marīn alone counted as a military power, but the Banū Hafs, descendants of the Almohad caliphs, had a prestige which the Banū Marīn could not claim in spite of the title of *Amīr al-Muʾminīn* which Abū ʿInān arrogantly assumed This explains why, from the very first, the Banū Marīn in annexing the towns of the Maghrib declared themselves mandatories of the sovereigns of Tunis and why they married Hafsid princesses On their side, the Banū Hafs did not think it wise to refuse their daughters, they dealt tactfully with the Moroccan sultāns, who might be useful in protecting them against the sultāns of Tlemsen In a word, they hoped to see the Merīnids attack central Maghrib but not to become complete masters of it, which would directly expose Ifrikiya to the attacks of the conquerors

This is what actually happened in 1347 Taking advantage of the usurpation of the throne of Tunis and of the troubles which followed it, Abu 'l Hasan invaded Ifrīkiya and sought to impose his authority there as in his own kingdom The situation here however was very different from what he was familiar with in the Maghrib In Ifrīkiya, the Arabs were still very strong Abu 'l-Hasan came to grief against the Arab tribes united against a foreign master and near Kairawān they inflicted a disastrous defeat on him in Muharram 749 (April 1348) This disaster even endangered the position of the Marīnids in the Maghrib itself An attempt by Abū ʿInān, son of Abu 'l Hasan, to reconquer Ifrīḳiya proved fruitless

In spite of the collapse of Marīnid aims, the period of these two last sultāns was nevertheless one of the greatest in the history of Muslim Barbary, one of those which has left us most memorials of its magnificence

The Merīnids were vigorous builders In 1276, Abū Yūsuf had founded New Fās, west of the old town, to make it his official capital, but it was during the first half of the XIVth century that the greatest building activity was displayed The majority of those that have come down to us date from this period Works of considerable artistic value, they are at the same time evidence of the military activity and religious ardour of the Banū Marīn, like the ramparts and the mosque of al-Mansūra, the walls and necropolis of Chella, the medersas of Fās and Sale, the different buildings erected near Tlemsen around the tomb of the great ascetic Sīdī Bū Madyan Piety in the form of mysticism was the dominating note in the intellectual life of the Maghrib We must however not forget that the court of Fās was frequented by men like ʿAbd al-Rahmān b Khaldūn, Ibn al Khatīb and Ibn Battūta, who have left a name in the field of literature and profane learning

The failure of the attempts upon Ifrīḳiya and the disaster at Kairawān may be taken as the beginning of the decline of the Merīnids As a result of these military failures, the troops stationed in some parts of the Maghrib had to be withdrawn The passes of the Atlas being no longer guarded, the Arabs of Sūs and Tāfilālt, excited by the rumours from Ifrīḳiya, began to display their turbulent spirit The tribes who paid taxes now paid only at longer and longer intervals under the threat of expeditionary forces sent against them There was still a graver cause of decline the power of the viziers vastly increased An aristocracy of high officials related to the royal family handed down offices from father to son, backed by powerful clans, and ended by acquiring the power to nominate the new sovereigns To keep them in tutelage, they used to choose for the throne a minor or a weakling. When the Sultān displayed some desire to rule in person, they did not hesitate to dethrone or asssassinate him Thus in 762 (1361) Abū Sālim was decapitated by a soldier of the Christian militia, his successor Tāshfīn, an idiot, was deposed and replaced by Abū Zaiyān, who was found strangled and drowned in a reservoir

In the midst of these palace revolutions the unity of the kingdom was destroyed We find the prince who governs Sidjilmāsa fighting with the sultān reigning at Fās The vizier who has control of the legitimate sovereign has pretenders against him, who end by dividing up the country among them Marrākesh fights against Fās At one time, the traditional enemies of the dynasty, the ʿAbd al-Wādids of Tlemsen, endeavour to profit by the occasion to resume the aggressive policy of Yaghmorāsan But Tlemsen was itself too weakened to attain success Besides, it was attacked in the rear by the Arabs of the Central Maghrib, instigated from Fās One of the shaikhs of the Suwaid Arabs is called the "friend and patron of the Marīnid dynasty" The Banū Marīn had another means of neutralizing Tlemsen, this was to support pretenders of the ʿAbd al-Wādid family To sum up, in spite of the weakness of the Banū Marīn, the Banū ʿAbd al Wad, whose lands had for the most part passed into the hands of the Arabs, cut a still sadder figure and could not resist when attacks from the west were resumed From 1389 all the sultāns of Tlemsen ruled under the suzerainty of Fās

But grave events were to turn the attention of the Merīnids from the affairs of the Central Maghrib In 1401, King Henry III of Castille landed in Barbary to take vengeance for outrages of the Muslim corsairs and destroyed Tetwān This attack, which produced considerable commotion in the Maghrib, and the taking of Ceuta by the Portuguese in 818 (1415), provoked a vigorous campaign by the religious element The threat from abroad, combined with its weakness in meeting this critical

situation, brought about a series of troubles under which the dynasty succumbed In 823 (1420) after the assassination of the Sultān Abū Sa'īd, the Merīnids gave place to the Banū Wattās

MERSĪNA, an Anatolian sea-port on the south coast of Asia Minor

Mersīna, the port and capital of the former sandjak of the same name (with an area of 1,780 sq m) in the wilāyet of Adana [q v] on the south coast of Anatolia, is 40 miles from Adana, to which a railway runs The name Mersīna comes from the Greek *myrsini* (μυρσίνη), myrtle, because this tree grows in large numbers in this region The regularly built town, founded only in 1832, with about 21,171 inhabitants (1927) is only of importance as a port for the export of silk, corn and cotton The climate is very unhealthy in summer The old name of Mersīna was Zephirium, in the vicinity (8 miles S W) lie the ruins of Soloi or Pompeiopolis The town which is quite modern is of no Muslim historical interest

Bibliography V Cuinet, *La Turquie d'Asie*, ii 50 *sq* (Fr Babinger)

MERTOLA, Ar *Martūla* and *Mirtūla*, a little town in the south of Portugal on the Guadiana, 35 miles above and north of the mouth of this river, at its junction with the Oeira This place, the *Myrtilis* of the Romans, was of some importance in the Muslim period It was in the district of Beja and according to Yākūt was the best defended stronghold in the whole of the west of the Peninsula At the end of the ninth century it was the headquarters of an independent chief, 'Abd al-Malik b Abi 'l-Djawād, who was in alliance with the lords of Badajoz and Ocsonoba and held his own against the Cordovan emīr 'Abd Allāh

Bibliography Idrīsī *Description de l'Afrique et de l'Espagne*, ed Dozy and de Goeje, text p 175, 179, transl p 211, 217, Yākūt, *Mu'djam al Buldān*, ed Wustenfeld, iv 714, Ibn 'Idhārī, *al-Bayān al-mughrib*, ii, text p 140, transl p 223 (E Lévi-Provençal)

MĒRWĀRA, a British district in Rādjputāna, lying between 25° 24′ and 26° 11′ N and 73° 45′ and 74° 29′ E, has an area of 641 sq miles and a population (1901) of 109,459 The local name of the district is Magra, or "hills" Beyond the fact that between 1138 and 1232 (1725 and 1816), several unsuccessful attempts were made by Rādjpūts and Marāthas to subdue the country, the history of Mērwāra is a blank up to 1234 (1818), when the British appeared on the scene The District was at one time an impenetrable jungle, inhabited by outlaws and fugitives from surrounding states The population known under the name of Mērs originally comprised a mixture of castes, Čandēla Gudjars, Bhātī, Rādjpūts, Brahmans and Minas It is said that Nisāldēw, the

Čauhān King of Adjmīr, subdued the inhabitants and made them drawers of water in the streets of Adjmīr The country has made much progress under the British rule

Bibliography *Imperial Gazetteer of India*, xvii 309—311, *Rajputana District Gazetteers*, vol i (Ajmer 1904)

(M Hidayet Hosain)

MERZIFŪN, also called Mārsiwān, a town in the Anatolian wilāyet of Siwas [q v] and in the sandjak of Amasia [q v] at the beginning of the fertile plain of Sulu Owa, with 11,334 inhabitants (in 1927), of whom the Armenians have had to migrate, which produces a good deal of wine and makes some cotton Merzifūn before the World War was the centre of activity of the Protestant missions in this region and contained the Anatolia College The town most probably occupies the site of the ancient Phazemon (Φαζημών) in the district of Phazemonitis, the name is probably a development of Φαζημών Ibn Bibī (cf *Recueil de textes relatifs à l'histoire des Seldjoucides*, ed M Th Houtsma, iv, Leyden 1902, p 292, 12) also gives the form مارزمون. Little is known of the early history of the town in the Muslim period It belonged to the kingdom of the Dānishmandids [q v] and when in 1393 Bāyazīd I drove the ruler of Siwas, Mīr Ahmad, out of the country, the land of "Marsvani", as the Bavarian traveller Hans Schiltberger (cf *Hans Schiltbergers Reisebuch*, ed V Langmantel, Tubingen 1885, p 12) called it, passed to the Ottoman empire Merzifūn plays a notable part in the history of Ottoman culture as the birth-place and scene of the activities of learned men and authors (cf A D Mordtmann, *Anatolien*, ed F Babinger, Hanover 1925, p 88) In Merzifūn there used to be a number of dervish monasteries (cf Ewliyā Čelebi, *Siyāhetnāma*, ii 396 infra, where several are mentioned) Of special interest are the mosques, mainly converted from Byzantine churches, including the so called Eski Djāmi', on the walls of which Christian paintings could until recently be seen (cf V Cuinet, *La Turquie d'Asie*, i 761) and the mosque of Murād II, both on the market-place The saint locally reverenced was Pir Dede Sultān, said to be a pupil of Hādjdjī Bektash (Ewliyā, *op cit*, ii 396) In A D Mordtmann's time (1852) the "whole Turkish population" consisted of shaiīfs, i e descendants of the Prophet

MESḤHED (al-Mashhad), capital of the Persian province of Khurāsān (q v, ii, p 966), the greatest place of pilgrimage for the Shī'īs in Persia It lies 3,000 feet above sea level in 59° 35′ E Long (Greenw) and 16° 17′ N Lat in the valley from 10 to 25 miles broad of the Keshef-Rūd, which runs from N W to S E This river, also called Āb i Meshhed (the "river of Meshhed"), rises about 12 miles N W of the ruins of Tus [q v] in the little lake of Česhme i Gīlās (cf Fraser, *op cit*, p 350, Khanikoff, *op cit*, p 110, Yate, *op cit*, p 315) and joins the Herī (Harī)-Rūd (q v, and cf I e Strange, *op cit*, p 407 *sq*) about 100 miles S E of Meshhed on the Russo Persian frontier Meshhed lies about 4 miles south of the bank of the Keshef Rūd The hills which run along the valley rise to 8,000 or 9,000 feet at Meshhed

In consequence of its high situation and proximity to the mountains, the climate of Meshhed is in the winter rather severe, in the summer, however, often tropically hot, it is regarded as healthy

Meshhed may in a way be regarded as the successor of the older pre Muhammadan Tūs [q v], and it has not infrequently been erroneously confounded with it

The fact that Tūs is the name of both a town and a district, together with the fact that two places are always mentioned as the principal towns of this district, has given rise among the later Arab geographers to the erroneous opinion that the capital Tūs is a double town consisting of Tābarān and Nūkān, e g Yākūt, iii 560, 5 (correct at iv 824, 23) and in the *Lubāb* of Ibn al-Athīr [q v] quoted by Abu 'l-Fidā' (*op cit*, p 453) Kazwīnī (*Āthār al-Bilād*, ed Wustenfeld, p 275, 21) next made the two towns thought to be joined together into two quarters (*mahalla*) This quite erroneous idea of a double town Tūs found its way into European literature generally Sykes (*J R A S*, 1910, p 1115—1116) and following him Diez (*Churasanische Baudenkmaler*, Berlin 1918, i 53 *sq*) have rightly challenged this untenable idea The older Arab geographers quite correctly distinguish between Tābarān and Nūkān as two quite separate towns Nūkān, according to the express testimony of the Arabic sources, was only 1/4 parasang (*farsakh*) or one Arabic mile from the tomb of Hārūn al-Rashīd and 'Alī al-Ridā (see below) and must therefore have been very close to the modern Meshhed The ruins of Tābarān-Tūs and Meshhed are about 15 miles apart

As to Nūkān (often wrongly vocalised Nawkān) it is sometimes called more precisely (e g Yākūt, iii 153, 21) Nūkān Tūs, and occasionally (e g Istakhrī = *B G A*, i 257, 3, Hamd Allāh al-Mustawfī, *op cit*, p 151, 2—3) included with Sanābādh The distance between these two towns is put at an Arabic mile (Yākūt, iii 153, 21) or what is practically the same, 1/4 *farsakh* (e g Istakhrī, *op cit*, Ibn Hawkal in Abu 'l-Fidā', *op cit*, p 451) Nūkān must have lain to the east and northeast of the modern Meshhed and a small part of it is the northeastern quarter of the latter town

In Nūkān or in the village of Sanābādh belonging to it two distinguished figures in Muslim history

were buried within one decade the caliph Hārūn al-Rashīd and the ʿAlid ʿAlī al-Ridā b Mūsā

When Hārūn al-Rashīd was preparing to take the field in Khurāsān, he was stricken mortally ill in a country house at Sanābādh where he had stopped, and died in a few days (193 = 809) The caliph, we are told (Tabarī, *op cit*, III 737, 13—17), realising he was about to die, had his grave dug in the garden of this country mansion and consecrated by Kurʾān-readers

The three available accounts differ at first sight as to the house in which Hārūn spent his last hours Two of them are given by Tabarī according to the first (III 736, 17—18; 737, 4) it was on the estate of Djunaid b ʿAbd al-Rahmān that the caliph stopped, the second story (III 735, 15—16, 738, 14—15) says that Hārūn lived in the mansion of Humaid b Abī Ghanm A third story in Yākūt (III 560) says that the tombs of Hāiūn and of ʿAlī al-Ridā were in one of the gardens of the house of Humaid b Kahtaba Now there is not the slightest doubt that the references to the house (*dār*) of Humaid b Kahtaba and to that of Humaid b Abi Ghanm are to the same place Humaid b Kahtaba must be the same person as Humaid b Abī Ghanm, they are both described as of the tribe of Taiy

As to Tabarī's second story, which substitutes a *dār* b ʿAbd al-Rahmān for a *dār* Humaid, it may be observed that Djunaid b ʿAbd al-Rahmān held the office of governor of Khurāsān under the Omaiyads (caliphate of Hishām) from 111 to 116 (729–734) (on him cf above I 1109 *sq*, II 357b, Weil, *op cit*, I 629—631, E v Zambaur, *op cit*, p 47) Djunaid probably resided as a rule not in Nīshāpūr or Tūs but in the palace at Sanābādh which he had probably built One of his successors, Humaid, also chose to live here and seems to have enlarged the place This would explain how our sources call the same house the house of Djunaid and of Humaid Perhaps the estate became the property of the ʿAbbāsids on the death of Humaid

About 10 years after the death of Hāiūn, the caliph al-Maʾmūn on his way from Merw spent a few days in this palace Along with him was his son-in-law ʿAlī al-Ridā b Mūsā, the caliph designate, the eighth imām of the Twelvers The latter died suddenly here in 203 (818), the actual day is uncertain (cf Strothmann, *Die Zwölfer-Shīʿa*, Leipzig 1926, p 171) On ʿAlī al-Ridā and his death cf above I 296, 298b, III 222a, Weil, *op cit*, p II 225b, Fraser, *Narrative of a Journey into Khorasan* (London 1825), p 449—451 (gives the story current in Meshhed of the imām's death), Yate, *op cit*, p 340—342, Sykes, *The Glory of the Shia World*, London 1910, p 235—238, W Jackson, *op cit*, p 265—266

It was not the tomb of the caliph but that of a highly venerated imām which made Sanābādh (Nūḳān) celebrated throughout the Shīʿa world, and the great town which grew up in course of time out of the little village actually became called *al-Mashhad* (Meshhed) which means "sepulchral chapel" (primarily of a martyr belonging to the family of the Prophet) Cf on the conception of Mashhad, III 323 and v Berchem in Diez, *Churasanische Baudenkmäler*, i (Berlin 1918), p 89—90 Ibn Ḥawḳal (p 313) calls our sanctuary simply Mashhad, Yāḳūt (III. 153) more accurately al-Mashhad al-Riḍawī = the tomb-chapel of al-Ridā, we also find the Persian name *Meshhed-i mukaddas* = "the sanctified chapel" (e g in Hamd Allāh al-Mustawfī, p 157) As a place-name Mashhad first appears in al-Muḳaddasī (p 352), i e in the last third of the tenth century About the middle of the XIVth century the traveller Ibn Baṭṭūta (III 77) uses the expression "town of Mashhad al-Ridā" Towards the end of the middle ages the name Nūḳān, which is still found on coins in the first half of the XIVth century under the Ilkhāns (cf Codrington, *A Manual of Musalman Numismatics*, London 1904, p 189), seems to have been gradually ousted by al-Mashhad or Meshhed At the present day Meshhed is often more precisely known as Meshhed-i Ridā, Meshhed-i mukaddas, Meshhed-i Tūs (so already in Ibn Battūta, III 66) Not infrequently in literature, especially in poetry, we find only Tūs mentioned, i e New Tūs in contrast to Old Tūs or the proper town of this name, cf e g Muhammad Mahdī al-ʿAlawī, *Taʾrīkh Tūs aw al Mashhad al-Ridāwī*, Baghdād 1927, p 3

The history of Meshhed is very fully dealt with in the work of Muḥammad Hasan Khān Sanīʿ al-Dawla entitled *Maṭlaʿ al-Shams* (3 vols, Teheran 1301—1303) The second volume is exclusively devoted to the history and topography of Meshhed, for the period from 428 (1036) to 1302 (1885) he gives valuable historical material On this work cf Yate, *op cit*, p 313—314 and E G Browne, *A History of Pers Lit*, Cambridge 1924, IV, p 455—456 The *Maṭlaʿ al-Shams* forms the chief source for the sketch of the history of the town in Yate, p 314—326 Cf also the chronological notes in Muhammad Mahdī al-ʿAlawī, *op cit*, p 13—16

The importance of Sanābadh–Meshhed continually increased with the growing fame of its sanctuary and the decline of Tūs Tūs received its death blow in 791 (1389) from Mīrānshāh, a son of Timūr When the Mongol noble who governed the place rebelled and attempted to make himself independent, Mīrānshāh was sent against him by his father Tūs was stormed after a siege of several months, sacked and left a heap of ruins, 10,000 inhabitants were massacred (see Yate, *op cit*, p 316, Sykes, in *J R A S*, 1910, p 1118 and Browne, *op cit*, III, p 190) Those who escaped the holocaust settled in the shelter of the ʿAlid sanctuary Tūs was henceforth abandoned and Meshhed took its place as the capital of the district

As to the political history of Meshhed it coincides in its main lines with that of the province of Khurāsān [q v] Here we shall only briefly mention a few of the more important events in the past of the town Like all the larger towns of Persia, Meshhed frequently saw risings and the horrors of war within its walls To protect the mausoleum of ʿAlī al-Ridā in the reign of the Ghaznawid Masʿūd [q v], the then governor of Khurāsān erected defences in 1037 In 1121 a wall was built round the whole town which afforded protection from attack for some time In 1161 however, the Ghuzz [q v] succeeded in taking the place, but they spared the sacred area in their pillaging We hear of a further visitation by Mongol hordes in 1296 in the time of Sultān Ghāzān [q v] Probably the greatest benefactors of the town and especially of its sanctuary were the first Tīmūrid Shāh Rukh (809—850 = 1406—1446, see vol IV. 265 *sq*) and his pious wife Djawhar-Shādh

With the rise of the national Ṣafawid dynasty v], a new era of prosperity began for Meshhed he very first Shāh of this family, Ismāʿīl I (907–30 = 1501—1524, q v), established Shiʿism as e state religion and, in keeping with this, care r the sacred cities within the Persian frontier, pecially Meshhed and Kumm, became an important ature in his programme as in those of his suc- ssors Pilgrimage to the holy tombs at these aces experienced a considerable revival In Mesh- d the royal court displayed a great deal of ilding activity In this respect Ṭahmāsp I, Ismāʿīl I's ccessor (930—984 = 1524—1576, q v), and the eat Shāh ʿAbbās I (995—1037 = 1587—1627, v) were especially distinguished

In the xvɪth century the town suffered consider- ly from the repeated raids of the Ózbegs Jzbek) In 1507 it was taken by the troops the Shaibānī Khān [cf SHAIBĀNIDS], it was not l 1528 that Shāh Tahmāsp I succeeded in re- lling the enemy from the town again Stronger alls and bastions were then built and another attack the same Ózbeg chief was foiled by them in 1535 ut in 1544 the Ózbegs again succeeded in entering e town and plundering and murdering there he year 1589 was a disastrous one for Meshhed he Shaibānid ʿAbd al-Muʾmin after a four months' ege forced the town to surrender The streets of the wn ran with blood and the thoroughness of the llaging did not stop at the gates of the sacred ea Shāh ʿAbbās I who lived in Meshhed from ,85 till his official ascent of the throne in Kazwīn 1587 was not able to retake Meshhed from the zbegs till 1598

At the beginning of the reign of Tahmāsp II v] in 1722 the Afghān tribe of Abdālī [q v] vaded Khurāsān Meshhed fell before them, but 1726 the Persians succeeded in retaking it after two months' siege Nādir Shāh [q v] (1736— 47) had a mausoleum built for himself in Meshhed After the death of Nādir Shāh civil war broke it among the claimants to the throne, in the urse of which the unity of the Persian empire as broken The whole eastern part of the king- om of Nādir Shāh, particularly Khurāsān (except e district of Nīshāpūr), passed in this period of rsian impotence under the rule of the vigorous fghān Shāh Ahmad Durrānī An attempt by arīm Khān Zand to reunite Khurāsān to the st of Persia failed Ahmad defeated the Persians id took Meshhed after an eight months' siege in 67 (1753), cf above 1, p 169b, 202b, 203b hmad Shāh and his successor Tīmūr Shāh left āh Rukh in possession of Khurāsān as their ssal, making Khurāsān a kind of buffer state tween them and Persia As the real rulers how er, both these Afghān rulers struck coins in eshhed (cf above 1, p 202b)

Otherwise the reign of the blind Shāh Rukh, hich with repeated short interruptions lasted for arly half a century, passed without any events special note It was only after the death of mūr-Shāh (1207 = 1792) that Agha Muhammad hān, the founder of the Kādjār dynasty, succeeded taking Shāh Rukh's domains and putting him death in 1210 (1795) and thus ending the paration of Khurāsān from the rest of Persia f above, 1, p 204a) The death soon after- ards of Agha Muhammad (1211 = 1796) enabled ādir, who had escaped to Herāt, to return to eshhed and take up the reigns of government again A siege of his capital by a Kādjār army remained without success, but in 1803 Fath ʿAlī Shāh was able to take it after a siege of several months when Nādir's funds were exhausted

From 1825 Khurāsān suffered greatly from the raids of Turkoman hordes and the continual feuds of the tribal leaders (cf Conolly, *op cit*, 1 288 and Yate, *op cit*, p 53) To restore order the crown prince ʿAbbās Mīrzā entered Khurāsān with an army and made Meshhed his headquarters He died there in 1249 (1833)

The most important political event of the xixth century for Meshhed was the rebellion of Hasan Khān Sālār, the prince governor of Khurāsān, a cousin of the reigning Shāh Muhammad-i ʿAbbās For two years (1847—1849) he held out against the government troops sent against him At the time of the accession of Nāsir al-Dīn (1848) Khu- rāsān was actually independent It was only when the people of Meshhed, under pressure of famine, rebelled against Sālār that Husām al-Saltana's army succeeded in taking the town

In 1911 a certain Yūsuf Khān of Herāt declared himself independent in Meshhed under the name of Muhammad ʿAlī Shāh and for a period disturbed Khurāsān considerably with the help of a body of reactionaries who gathered round him This gave the Russians a pretext for armed intervention, and on March 29, 1912, they bombarded Meshhed in gross violation of Persia's suzerain rights and many innocent people, citizens and pilgrims, were slain This bombardment of the national sanctuary of Persia made a most painful impression in the whole Muslim world Yūsuf Khān was later captured by the Persians and put to death (cf F G Browne, *The Press and Poets of Modern Persia*, Cambridge, 1914, p 124, 127, 136, Sykes, *History of Persia*, London 1927, ii 426—427)

Meshhed is now the centre of eastern Persia, the capital of the province of Khurāsān which, since its eastern part was taken by the Afghāns in the xviiith century, is barely half its former size (cf Le Strange, *op cit*, p 383 *sq*, *Isl*, xi, 108 *sq* and above, ii 966) In the middle ages it was not Tūs, Meshhed's predecessor, but Naisābūr (modern Persian Nīshāpūr) that was the capital of this extensive and important province A royal prince has usually been governor since the fall of the Nādirids Since 1845 the lucrative and influential post of Mutawallī-Bāshī, the controller or treasurer of the sanctuary of the Imām, has usually been combined with the governorship (cf Yate, *op cit*, p 322)

The only plan — not very accurate — of Mesh- hed known to me is that of Colonel Dolmage (cf Curzon, *op cit*, 1 151, note 2, 160) and was made about 1870 It is published in MacGregor, *op cit*, 1 284 The plan of the town is an ir- regular oblong with its longer axis running from N W to S E Its circumference is according to the most reliable calculations about 6 miles, the greatest breadth about a mile, and the length not quite two miles measured along the main street Khiyābān which runs right through the town

Like most Persian towns Meshhed is enclosed by a great girdle of walls, which gives it a very picturesque appearance The lines built to stiffen the defences, namely a small moat with escarpment before the main wall and a broad ditch around outside, are now in ruins and in places have completely disappeared

The citadel (*ark*) in the southwest part of the town is directly connected with the system of defences It is in the form of a rectangle with four great towers at the corners and smaller bastions The palace begun by ʿAbbās Mīrzā but finished only in 1876, with its extensive gardens, is connected with the fortress proper, now fallen into disrepair (cf Yate, *op cit*, p 327) It is used as the governor's residence The whole quarter of government buildings which, according to MacGregor, occupies an area of 1,200 yards, is separated from the town by an open space, the Maidān-i Tōp (Cannon Place) which is used for military parades

There are six gates in the city walls

The town is divided into six great and ten smaller quarters (*mahalla*) (see Yate, *op cit*, p 328) The six larger bear the names of their gates, see al Mahdī al-ʿAlawī, *op cit*

The principal street which divides the whole town into two roughly equal halves, the Khiyābān, is a creation of Shāh ʿAbbās I who did a great deal for Meshhed (1587—1627, see Yate, *op cit*, p 319, cf the pictures in Sykes, *The Glory of the Shia World*, p 231) This street, a fine promenade, is, being the main thoroughfare, filled all day with a throng of all classes and nationalities, including numerous pilgrims, and caravans of camels and asses, the bustle is tremendous, especially in the middle of the day

The canal, which flows through the Khiyābān in a bed about 9 feet broad and 5 feet deep is fed, not from the Kesheh Rūd (see above) which runs quite close to Meshhed, as it has too little water, but from the Česhme i Gīlās already mentioned, which used to provide Tūs with water When this town had been almost completely abandoned, Shīr ʿAlī, the vizier of Sultān Husain b Mansūr b Bāikarā (1468—1506, on him see above, ii 343, i 594[a]), at the beginning of the xvi[th] century had the water brought from this source to Meshhed by a canal 45 miles long, thus sealing the ruin of Tūs, cf Yate, *op cit*, p 315, al-Mahdī al-ʿAlawī, *op cit*, p 13

The making of this canal (see Yate, *op cit*, p 315, Mahdī al-ʿAlawī, p 13) contributed essentially to the rise of Meshhed, for the greater part of its inhabitants rely on it for water, although after entering the town, the canal becomes muddy and marshy (which was often a subject of satire, cf ʿAbd al-Kaīm, *op cit*, p 74), and use it for drinking, washing and religious ablutions without hesitation There are also large and deep reservoirs before the main gates The water is saline and sulphurous and therefore has an unpleasant taste (cf Conolly, i 333—334, Khanikoff, p 105, Curzon, i 153)

The sacred area divides the principal street into two parts the Bālā (= Upper) Khiyābān in the N W and the Pāʾīn (= Lower) Khiyābān in the S E, of which the former is about 3 times as as long as the latter The sacred area covered by the sanctuary of the Imām al-Ridā is usually called Bāst (cf above, i 709) The name Haram-i Sharif or Haram-i Mukaddas or Haram-i al Ridāwī (al-Ridā's Haram) is often also applied to it, frequently it is called simply, "Imām" as in Persia as in the ʿIrāk this title is applied also to a building or piece of ground sacred to an Imām The Bāst, a rectangle 900 feet × 700 feet in area, is in the lower half of the Khiyābān With its courts, mosques, sanctuaries, madrasas, caravanserais, bazaars, dwellinghouses etc it forms a town by itself, a wall around it cuts it off completely from the rest of Meshhed The main entrances from the Khiyābān are two great doors on north and south, but they are barred by chains so that no vehicle or riding-beast can enter, for the ground of the Bast is holy and may only be trodden on foot Animals which get in by accident become the property of the administration of the Imām The Bāst also has the right of asylum (whence the name *Bast*) Debtors who take refuge in it are safe from their creditors, criminals can only be handed over by order of the Mutawallī-Bāshī, which is now usually done after three days In the whole of the sacred area strict discipline is maintained by its own police, there is a special prison for thieves (see the plan in Yate, p 332, N[o] 75, cf also Conolly, i 263, Khanikoff, p 98, Bassett, *op cit*, p 224, Curzon, i 153—154, Massy, *op cit*, p 1006, Yate, p 334)

Entrance to the Bast is strictly forbidden to all non-Muslims In earlier times the rule does not seem to have been so strict, for Clavijo (see *Bibl*) in 1404 was able to visit the sepulchral chapel of the Imām al-Ridā In the xix[th] century Fraser (1822, 1833), Conolly (1830), Burnes (1832), Ferrier (1845), Eastwick (1862), Vámbéry (1863), Colonel Dolmage (in the sixties) and Massy (1893) visited the sacred area Only Fraser, Conolly, Dolmage and Massy actually entered the sepulchral chapel itself Vámbéry and Massy were dressed as Muslims while the others retained their European dress Except Dolmage, all these travellers have given more or less full descriptions of the sacred area The full and accurate description given by Sykes in the *J R A S*, 1910, p 1130—1148 and in the *Glory of the Shia World* is based on information supplied by the attaché to the British Consulate, Khān Bahādur Ahmad Dīn-Khān (cf *J R A S*, 1910, p 1113 and *The Shia World*, p 111, see also Curzon, i 154 *sq* and Mahdī al-ʿAlawī, p 17—22)

The most detailed plan of the Bāst is in the already mentioned *Matlaʿ al Shams* of Sanīʿ al-Dawla (1885), also given in Yate, *op cit*, p 332 A plan on a somewhat smaller scale was prepared by the Persian architect Muʿāwin-i Sanāʿya (cf Sykes, *Glory of the Shia World*, p 240) and was published by Sykes in the *J R A S*, 1910, p 1128 and in *Glory of the Shia World*, p 100 The latter differs in details not inconsiderably from Sanī al-Dawla's plan, which is right we have not the means of telling

The history of the sanctuary of ʿAlī al-Ridā is pretty well known from inscriptions and literary sources (cf especially the references in Yate, *op cit*, p 317 *sq*, Sykes, *J R A S*, 1910, p 1130 *sq* and Mahdī al-ʿAlawī, p 14 *sq*) According to local legend, Alexander the Great built a wall around the site as he foresaw in a dream that it was destined to be the tomb of a saint (cf Fraser, *Narrative*, p 449, Sykes, *op cit*, p 1130) As early as the second half of the tenth century, as Ibn Hawkal tells us (*B G A*, ii 313), the ʿAlid sanctuary had a strong wall built around it, within which devout men who wished to lead an ascetic life (*iʿtikāf*, q v) took up their abode The almost contemporary account of al-Muhallabī in Abu 'l-Fidā', p 452 is similar A few decades later, Sultān Mahmūd of Ghazna (998—1030) as a result of a dream enlarged the

buildings of the tomb and provided a new wall around them (see Sykes, p 1130) The sanctuary at a later date seems to have fallen somewhat into decay for about a century later it was restored by the Saldjūk Sultān Sandjār [q v] out of gratitude, local tradition says, for the miraculous cure effected on his sick son there (see Fraser, *op cit*, p 451, Napier, *JRGS*, xlvi [1876], p 80 *sq*, Sykes, *op cit*, p 1141—1142 and in *Glory of the Shia World*, p 238 *sq*) It is to this event that an inscription of 512 (1118) inside the chamber of the tomb refers (see it in Sykes, p 1140—1141 and cf Mahdī al-ʿAlawī, p 18) There is also a second inscription (in Sykes, p 1142—1143) which records a restoration undertaken in 612 (1215) The existence of these two inscriptions, the oldest in Meshhed, shows that the Mongols of Čingiz-Khān when they swept over Khurāsān in 1220, if they may have plundered the sanctuary, spared the buildings We hear of another restoration of the buildings in the reign of Sultān Ūldjāitū Khudābanda (1304—1316, cf Sykes, *JRAS*, 1910, p 1132, Mahdi al ʿAlawī, p 18) From the middle of the xivth century we have the somewhat fuller description of the sanctuary of ʿAlī al-Ridā by Ibn Battūta (ii 77—79) Timūr's son Shāh Rukh (1406—1446) and his wife Djawhar Shādh did a great deal for the Haram The latter built the splendid mosque to the south of the tomb which still bears her name The Dār al-Siyāda, the fine hall west of the tomb, and the adjoining chamber, the Dār al-Huffāz, are also due to this queen Under Timūr's grandson Sultān Husain Bāikarā (1469—1506) [q v], the vizier Shir ʿAlī erected the southern part of the Sahn i Kuhna, "the old court", with the imposing portico, see the inscription reproduced in Sykes, p 1133

With the coming to power of the Safawids a new and brilliant era dawned on Meshhed The rulers of this dynasty vied with one another in the development and adornment of the sanctuary of ʿAlī al-Ridā, which they raised to be the religious centre of their kingdom In this respect Tahmāsp I, ʿAbbās I, ʿAbbās II and Sulaimān I deserve special mention Tahmāsp I (1524—1576) erected a minaret covered with gold in the northern part of the Sahn-i Kuhna, adorned the dome of the tomb with sheets of gold and put a golden pillar on the top of it The Özbegs carried off this rich adornment on their raid in 1589 ʿAbbās I the Great did most of all the Safawids (1587—1627) for Meshhed ʿAbbās II (1641—1666) devoted his attention mainly to the further decoration of the Sahn-i Kuhna The inscription published in part by Sykes, p 1133 (cf also Khanikoff, p 103) was written by the master hand of Muhammad Ridā ʿAbbāsī (on him cf Sarre and Mittwoch, *Zeichungen den Riza Abbassi*, Munich 1914, p 15—16) Sulaimān I (1666—1694) devoted special attention to the restoration of the dome of the Imām's tomb, see Mahdī al-ʿAlawī, p 19 (cf also Yate, p 343, Sykes, p 1137)

Foreign potentates also gave great gifts to the ʿAlid sanctuary in the Safawid period, such as the Emperor Akbar of India who made the pilgrimage to Meshhed in 1695 (cf Yate, p 319) and in 1512 the Kutb Shāh of the Dekkan

It was Nādir Shāh (1736–1747) who did most for the town of Meshhed in the xviiith century Although a very strict Sunnī, he devoted a considerable part of the enormous wealth which he had brought back from his Indian campaign to the embellishment of the great Shiʿa place of pilgrimage He restored thoroughly the southern half of the Sahn-i Kuhna built in the reign of Sultān Husain Bāikarā He decorated the portico richly and covered it with sheets of gold so that it is still called "Nādir's Golden Gate" after him In 1730, before his accession to the throne, Nādir erected a minaret covered with gold in the upper part of the Sahn, as a counterpart to that erected by Tahmāsp I on the north side of the "old court" Cf on Nādir Shāh's activities at the sanctuary of al-Ridā Muhammad ʿAlī Hazīn *Taʾrīkh Ahwāl Shaikh Hazīn* (*Memoirs*, ed Balfour, London 1831, p 272)

The rulers of the Kādjār dynasty of the xixth century, Fath ʿAlī (1797—1834), Muhammad Shāh (1834–1848) and Nāsir al-Dīn (1848–1896), faithfully followed in the footsteps of their predecessors, as regards attention to the Imām's sanctuary

In spite of the number of times which the ʿAlid sanctuary has been plundered in course of time, it still has countless treasures within its buildings and puts in the shade, as regards this wealth and the extent of its buildings and courts, all the other great Muhammadan sanctuaries, except perhaps Mecca, but including the much admired Nadjaf and Kerbelā'

A detailed and accurate description of the Haram and an account of its architectural history based on its present state cannot be given because the strict prohibition of admission to members of other faiths has prevented non-Muslim scholars from examining thoroughly and reproducing the buildings Relying on descriptions of the sacred area prepared by Europeans and Orientals and on the valuable data contained in inscriptions (the latter were first noted by Khanikoff, p 103—104, the more important were published by Sykes assisted by Khān Bahādur Ahmad Dīn, in *JRAS*, 1910, p 1131 *sq*), we can assume with considerable probability that, except the tomb proper, which in its present form (excluding the later dome) according to the inscription (512 = 1118), dates from the beginning of the xiith century, only insignificant remains of the earlier mediaeval period have survived The Haram in its present form is in the main a creation of the last 500 years, as is briefly outlined in the above short historical sketch of the sanctuary

The dome of the tomb with its various annexes rises in the centre of the sacred area and is bounded on the north and east by two great rectangular courts, the Sahn-i Kuhna and the Sahn i Naw, while in the south it is adjoined by the extensive buildings of the Djawhar Shādh mosque

The most popular entrance to the East and the one preferred by pilgrims is the gateway in the Bālā-Khiyābān barred by a chain The road runs for 250 yards through this street filled with shops and ends at a great gateway through which the Sahn-i Kuhna, the "old court" is entered Its northern part dates from the time of Shāh ʿAbbās I, while the southern is as old as the second half of the xvth century (reign of Sultān Husain Bāikarā) but was completely restored by Nādir Shāh Four great towers with niche like halls (hence called *aiwān*) admit to the court The simplest are the west and east towers built by ʿAbbās I, the former has the clock tower, while the platform of the latter is used as *nakkāra-khāne* i e "music-

house", where, according to an old Persian custom, found in other royal cities, sunrise and sunset are greeted with music From the east gate one reaches the eastern exit of the Bast through the Bazar of the Pā'īn-Khiyābān Much more impressive from the architectural point of view are the northern gateway built by ʿAbbās II and especially the southern gateway of the court, "Nādir's Golden Gate", Nādir Shāh's most splendid achievement and the most imposing building of the whole Haram At each of the two great gates stands a minaret 100 feet high, the upper part of which is covered with gold, the builder of the northern gate was Tahmāsp I and of the southern Nādir Shāh Nādir built in the centre the famous octagon of "Nādir's Well" covered by a gilt baldachin (*Sakkā-Khāne i Nādiri* = "Nadir's water carrier-house"), it was hewn out of a huge block of white marble which the Shāh had brought at great expense from Herāt The walls of the court are pierced by two rows of alcoves, the lower of which is occupied by artisans, schools and dwellings of the servants of the mosque, while the higher officials of the Imām occupy the upper storey The whole courtyard which has a length of about 100 yards and a breadth of 70, is paved with dark Meshhed stones (cf below) which are also to some extent tombstones For pictures of the Sahn-i Kuhna with clock tower and Nādir's Well see above, iii 384, pl 15, Yate, p 340, 346, Sykes, *Glory of the Shia World*, p 241, picture of Nādir's Golden Gate in Yate, p 328 and Sykes, *op cit*, p 245

Nādir's golden gateway leads southwards into the area of the holy tomb, the sepulchral chamber with the halls and rooms surrounding it Strictly speaking, it is only this nucleus of the whole sacred area that should be called *Haram* or *Haram-i Mukaddas* or *Haram-i Mubārak*, terms often extended to the whole Bast The names *al-Rawda al-Mutahhara* and *Āstāne* = the (holy) threshold, are also used After passing through the Golden Gate one enters the *Dār al-Siyāda*, built by Djawhar Shādh, the finest hall in the sacred quarter Hung on a wall here is a round dish said to be that on which the poisoned grapes were offered to ʿAlī al-Ridā The pilgrim can see into the sepulchral chamber through a silver grille from the Dār al-Siyāda Turning to the southeast one enters a smaller, more simply decorated chamber, the *Dār al-Huffāz*

Adjoining the Dār al-Huffāz in the north is the dome of the Mausoleum of the Imām The interior of the sepulchral chamber (see the picture in Sykes, *op cit*, p 251), an almost square area, 30 × 27 feet, is, as there are no proper windows, lit by the dim light from golden lamps and chandeliers and furnished with the greatest splendour The tomb itself is in the N E corner and surrounded by three beautiful grilles, one of which, dated 1747, is said to come from the mausoleum of Nādir Shāh now destroyed ʿAbbās I gave the top of the tomb with its gold covering In a projection at the foot of the tomb, Fath ʿAlī Shāh placed a false door of gold inlaid with jewels (picture in Sykes, *op cit*, p 255) In niches in the wall behind glass are kept very valuable votive offerings (jewelled arms, etc, mainly gifts of the ruling house) On the wall are the two inscriptions already mentioned of 512 (1118) and 612 (1215) of which the first is the earliest known example of the so-called round hand (*thuluth*) in Arabic epigraphy (cf v Berchem in Diez, *Churasan Baudenkmäler*, i 97, note 8) These enable us to place the building of the present chamber in the beginning of the xiiᵗʰ century, while the dome 65 feet high covered with sheets of gilt copper was built only in 1607 by ʿAbbās I and renovated in 1675 by Sulaimān I, according to inscriptions on its outside As the thread of tradition regarding the site of the Imām's grave can hardly have been broken, it may be assumed practically with certainty that the present dome is built on the true site There is no longer any trace of Hārūn's grave, it probably was in the centre of the mausoleum, whence the tomb of the ʿAlid who died later was put in a corner of the same place

Of the other chambers and isolated buildings belonging to the system of the Haram proper, we shall only mention here the *Gumbad* (domed tomb) of Allāh Wardī Khān, which lies to the N E and takes its name from its builder, a famous general of ʿAbbās I (cf Conolly, i 271, Sykes, *The Glory of the Shia World*, p 266, see also the picture in Diez, *Persien Islam Baukunst in Churasan*, p 54)

Leaving the sacred chamber by the eastern door one reaches, after traversing two adjoining rooms, the "Golden Gate" of Nāsir al-Dīn, which leads into the New Court (*Ṣahn i Naw*), its northside is bounded by the Pā'īn Khiyābān Fath ʿAlī Shāh began this court in 1818 His two successors continued the building, which was completed in 1855

If one turns southwards from the Dār al-Siyāda already mentioned, one soon enters the area of the charming mosque endowed by Sultāna Djawhar Shādh and bearing her name Like the Sahn-i Kuhna this older court, an oblong running N to S about 100 yards long and 90 broad, is broken in the middle of each of its four sides by an arched hall (*aiwān*), while the unbroken parts of the walls have rows of alcoves fitted up as dwellings The largest and finest of these four aiwāns of the mosque, the Aiwan-i Maksūra in the south (for *Maksūra* = stall, cf iii, p 336), is used for prayers, in it is a wooden pulpit in which the Mahdī will one day show himself to the faithful The entrance hall is covered by a blue dome which surpasses that on the tomb of the Imām in height and width, and is flanked by two high minarets covered with blue glass tiles The centre of the court is occupied by the *Masdjid-i Pīr-i Zan* = "Mosque of the Old Woman", a square unroofed area surrounded by a wooden balustrade around which runs water in a deep stone channel

The Djawhar Shādh mosque is the noblest and finest building in the sacred area, cf the opinions of Fraser, *Narrative*, p 447, Vámbéry, *Meine Wanderungen* etc, p 322 and Sykes, *JRAS*, 1910, p 1145 — Pictures of the mosque in Sykes, *The Glory of the Shia World*, p 263, Yate, p 344 (*Aiwān i Maksūra* and *Masdjid-i Pīr-i Zan*), Diez, *Persien Islam. Baukunst*, p 45–48

Of the various small sanctuaries which the pilgrim visit in the Haram, only two need be mentioned here, the Ziyārat Kadam-i Mubārak or Sharīf = "the place of pilgrimage of the blessed or excellent foot" also called *Djā-i Sang i Čahār pā* = "place of the foot-stone" (see the plan in Yate, p 332, N⁰ 16), a circular space covered by a dome (east of the north aiwān of the Djaw-

har Shādh mosque), in which reverence is paid to a dark grey oval-shaped stone said to contain an impression of ʿAlī al-Ridā's foot (cf Massy, *op cit*, p 1003—1004) The second noteworthy feature of the Bāst is a tall stone pillar, out of which a water basin has been roughly hewn It is said to have fallen into the Bāst as a shapeless block from heaven (see Massy, *op cit*, p 1002)

Inside of the sacred area are the richest and busiest bazars of the town, the most richly endowed madrasas, the most profitable caravanserais and the most popular baths These are all, like the dwelling houses there, the absolute property of the Imām, the ʿAlid buried here, i e of the ecclesiastical authorities who administer the sanctuary on his behalf The whole Bast belongs exclusively to them This dead hand however has still more possessions in land, buildings, canals (*kanāt*, q v), in all the provinces of Persia, especially in the immediate and more distant vicinity of Meshhed To the vast sums which these properties yield in produce and rents, are to be added the considerable payments for funerals and tombs, the gifts of pilgrims etc There is also considerable expenditure, the payment of a considerable number of higher officials and of a large number of lower officials and servants, the maintenance of many pilgrims, the cost of repairs, lighting, decoration of the sanctuaries etc The income of the Haram in course of time has naturally varied Towards the end of the Safawid period it is said to have been about £ 15,000 while at the time of Fraser's first visit (1822), as a result of the troubled times, it had sunk to £ 2,000—2,500 (Fraser, *Narrative*, p 456) Later travellers, like Basset (1878) and Curzon (1889), estimated the annual revenues of the Imām at £ 16,000 to £ 17,000 (without revenues in kind), for the last decade of the xixth century Massy (p 1106) and Yate (p 344) give £ 20,000 Ibrāhīm Beg's estimate (*op cit*, p 43) of £ 40,000 is certainly much too high

At the head of the administration of the Haram there has been from early times a Mutawallī-Bāshī, who must be a layman In view of the very influential position which this official occupies in his capacity as head of the greatest Persian sanctuary and treasurer of a very considerable estate, it is only natural that an appointment to such a position of trust is regarded as a very special honour As it was not uncommon for disputes about the limits of their respective spheres of authority or other matters to arise between the holder of this office, the representative of ecclesiastical power, and the governor of Khurāsān, the clerical element has since the middle of the xixth century been subordinated to the civil power by giving the office of Mutawallī-Bāshī to the governor of the time (see Yate, p 322, 344) This very lucrative double office — the Mutawallī-Bāshī gets 10 % of the revenues of the Haram — is as a rule only held for a few years by the same individual

The Mutawallī-Bāshī is assisted by a staff of higher officials (*mutawallīs*) He has further at his command the varied hierarchy of the sacred area, among whom the *mudjtahids* [q v], who have a thorough knowledge of religious law and are men of great prestige and influence, occupy the first place Next comes a regular army of lower clerics (*mullās*) who conduct the services, teach in the schools and guide the rites of the pilgrims, not a few of them make a living by supplying official documents sealed with the seal of the Imām (see the picture in Sykes, *Glory of the Shia World*, p 278) which deal among other matters with the answering of petitions made by the pilgrims at the sacred tomb (cf Khanikoff, p 99) On the administration of the sanctuary of Meshhed cf Fraser, *op cit*, p 455—456, Curzon, i 162–164, Massy, p 1006 and especially Yate, p 344–346

As we know from mediaeval Arabic sources, pilgrimage to the tomb of ʿAlī al-Ridā began at an early date We occasionally hear also of royal visits from the xith century onwards

As to the number of pilgrims who visit Meshhed annually we have different estimates for the xixth century but as exact figures can hardly be kept and the numbers vary greatly, they can only claim reliability to a very limited extent While Yate (p 334) gives the annual number for the last decade of the xixth century at 30,000, earlier travellers, except Marsh (1872 20—30,000) give much higher figures, e g Bellew (1872) 40–50,000, Ferrier (1845) 50,000, Khanikoff (1858) and Eastwick (1862) over 50,000, Curzon 1889 even gives 100,000, but this is certainly too high The numbers go up considerably when special religious ceremonials are going on, e g at the anniversary of ʿAlī al-Ridā's death (cf the pictures in Diez, *Persien* etc, p 46) and during the first third of the month of Muharram at the *Taʿziya* [q v] in memory of the tragedy of Kerbelā We have a full description of the Muharram festival of the year 1830 from Conolly (see his *Journey* etc, i 267—284, 335—336) and a shorter one of 1894 by Yate (*op cit*, p 144—148), cf also the illustrations in Yate, p 146 and the drawing by the painter ʿAlī Ridā ʿAbbāsī of a Meshhed pilgrim at the time of the Muharram festival in Sarre and Mittwoch, *Zeichnungen des Riza Abbasi* (Munich 1914), Plate i (thereon p 23, 49 and *Isl*, ii 216 *sq*)

Every pilgrim who arrives has a right to free maintenance for three (according to Vámbéry six) days In the sacred quarter, south of the Bālā Khiyābān (see the plan in Yate, p 332), there is a special kitchen used exclusively for pilgrims, which gives out 5—600 free meals every day (cf Vámbéry, *op cit*, p 323, Goldsmith, *Eastern Persia*, i 364 and Curzon, i 162)

On the ceremonies which the pilgrims have to perform at their visit to the tomb of ʿAlī al-Riḍā, we have accounts by Massy, *op cit*, and the notes supplied by Khān Bahādur Ahmed al-Din Khān in Sykes, *JRAS*, 1910, p 144–45 and in the *Glory of the Shia World*, p 240 *sq* Special mention may be made of the three circumambulations (*tawāf* [q v]) of the tomb and the cursing of all enemies of the imām three times, especially the Caliphs Hārūn and Maʾmūn

Every pilgrim who has performed the pilgrimage to ʿAlī al Ridā's grave in the prescribed fashion is entitled to call himself *Meshhedī*

Meshhed occupies first place among all the places of pilgrimage in Persia Among the great sanctuaries of the Muslim world, Meshhed stands seventh in the view of Shīʿa theologians, coming after, not only Mecca and Medīna, but also the four specifically Shīʿa sanctuaries of the ʿIrāḳ, Nedjef, Kerbelā, Sāmarrā and Kāẓimain, in this order (cf Sykes, *The Glory of the Shia World*, p xiii) According to a version current in Shīʿa

circles which Curzon (i 150) gives, Meshhed is entitled to the sixth place, coming between Kāzimain as fifth and Sāmarrā which is put seventh

The longing of every Shī'ī to find a last resting place in the shadow of one of the beloved Imāms caused extensive cemeteries to be laid out at an early date at the great centres of pilgrimage Thousands of corpses are brought every year to Meshhed, mainly of course from Persia, but also from all the Shī'a lands, particularly India, also Afghānistān and Turkestān Nowhere in the whole of Persia are there so many tombs as at Meshhed As the ground of the cemeteries must be used over and over again, the graves change their occupants every few years Fine solid tombstones are not used, but simply rough blocks of granite or soapstone from the quarries of the neighbourhood (cf also Conolly, i 343—4 and Khanikoff, p 105) Graves within the sacred quarter itself are naturally most desired Every available space there is used for the purpose, the pavingstones in the courtyards are often tombstones for the dead below The fees for graves within the Bast, which vary with the distance from the Mausoleum of 'Alī al Ridā, bring a not inconsiderable revenue to the authorities

Of the large cemeteries (*makbaras*) outside the Bāst the most important is the Makbara Katl i Gāh ("place of the killing") lying north of the sacred area East of it is that of Saiyid Ahmad in which three children of the seventh Imām, Mūsā al-Kāzim, are buried (cf Mahdi al-'Alawi, p 8) In the Pā'īn Khiyābān quarter is the Makbara Pir-i Pālāndūz S E of the citadel is the cemetery of Gumbad i Sābz ("green dome") which takes its name from a half ruined mausoleum there, now inhabited by dervishes (cf Yate, p 328, Mahdī al-'Alawī, p 9)

In the Nūkān quarter is the Makbara Shāh-zāde Muhammad (see Mahdī al 'Alawī, p 8) We may also mention that outside the Nūkān gate on the site of the old town of Nūkān (see above), are visible the remains of a gigantic cemetery on which, according to Sykes (*J R A S*, 1910, p 1116), there may be found stone sarcophagi with inscriptions carved upon them dating from 760 to 1099 (1359—1688)

Outside of Meshhed a good half hour's journey to the south, on rocky ground is the cemetery of Mīrzā Ibrāhīm al-Ridawi (see Mahdī, *op cit*, p 8) and still further from the town, 3 miles north of it, that of Khwādja Rabī' (cf Sykes, *op cit*, p 1124 and Ibn Sa'd, vi 127 *sq*) According to the popular view, he was a Sunnī in spite of his relations with 'Alī and is therefore in a way regarded as the patron of the Sunnīs in Khurāsān, of whom those who live in Meshhed are usually buried near his tomb Rabī''s mausoleum is one of the most interesting in the whole of Khurāsān it is a large octagonal building crowned by a dome but now it is in a half ruined condition

Meshhed is the centre of Muslim theological and legal studies in Persia A number of colleges (*madrasas*) there are devoted to teaching these subjects Lists of them with dates are given by Fraser (p 456—460) who mentions 14 of the present 16 madrasas, also by Khanikoff (p 107) who gives 13, and by Mahdī al-'Alawī (p 9—12) The latter observes that there were 20 older colleges, of which he gives 15, and a number of more modern ones, Fraser also gives brief notes on the possessions of the various madrasas and the clerics (*mullās*) attached to them Yate (p 329—330) simply mentions six of the best known From these lists, which supplement one another in welcome fashion, we get the names of 20 colleges From the dates of foundation we find that the oldest of the madrasas still standing in Meshhed is the Madrasa Dūdar, which was built in 823 (1420) by the Timūrid Sultān Shāh Rukh and restored by Sulaimān I Under the same ruler was built the Parīzād Madrasa which was completely remodelled by Sulaimān I From the time of 'Abbās II date the two almost contemporary colleges Khairāt Khān (1058 = 1649) and Mirzā Dja'far (1059 = 1650) The majority of the older colleges, no fewer than nine in number, date from the time of Sulaimān I, who also restored some buildings (1666—1694) As to the Kādjārs, one was founded in the reign of Fath 'Alī Shāh and two in that of Nāsir al Dīn, who also restored two that had fallen into ruins

From the artistic point of view, the finest is the Madrasa of Mīrzā Dja'far which was built and richly endowed in 1059 (1650) by a Persian of this name who had made a fortune in India It is generally regarded as the third finest building in Meshhed, next to the Mausoleum of 'Alī al-Ridā and the Djawhar Shādh Mosque In its plan, with vaulted halls and courtyard with niches, and its rich decoration, it follows the style of the courts and mosques of the sacred area above described, typical of the ecclesiastical architecture of Persia (cf above, iii 439, 447 *sq* and also Fraser, p 466—467) Not only the Madrasa of Mīrzā Dja'far but also other richly endowed colleges, like that of Pā'īn-Pā (both of the time of Sulaimān I) owe their origin to Persians who had made fortunes in India (cf on the foundation of the two last named colleges Fraser, p 457–459, Sykes, *The Glory* etc, p 267—269) The most esteemed colleges are in the Bast, namely the three already mentioned as the oldest, Dūdar, Parīzād and Khairāt-Khān, also Bālāsar and 'Alī Nakī Mīrzā Others, like the above mentioned Mirzā Dja'far Madrasa and the Mustashār Madrasa have doors communicating with the Sahn i Kūhna of the Haram quarter

Students also live in the madrasas, their maintenance being provided for by pious endowments While in Khanikoff's time (1858) there were no outstanding teachers there and the number of students was small, the reputation of the Meshhed colleges went up again in the second half of the xixth century so that Sykes (*The Glory* etc p 267 *sq*) in 1910 puts the attendance at 1,200 students, who came from Persia, India and other Shī'a regions The student who wishes to take a higher theological training after the nine years' course at Meshhed must go to Meshhed 'Alī (Nedjef, q v) and attend the lectures of the teachers there, who are the first authorities on Shī'a theology

We have no details of the libraries of the Meshhed colleges Of the rich Fādil-Khān Madrasa, Fraser only says (p 457) that it has a valuable library The administration of the Haram also has a large and valuable collection of books (on its location see the plan in Yate, p 332, N° 65 and cf N° 29), founded in the first half of the xvth century by Sultān Shāh Rukh The treasures accumulated under him and his successors were for the most part lost when Meshhed was sacked by

the Özbegs under ʿAbd al-Muʾmin Khān (1589, cf Yate, p 318, Sykes, *The Glory* etc, p 239, cf also Herzfeld, in *Ephemeris des Orientales*, 1926, N° 28, p 7—8) A thorough examination of the manuscripts here might give valuable results

In this connection we may mention the activity of the Meshhed printing presses (newspapers etc), which began with the last decade of the xixth century, see thereon Browne, *The Press and Poetry of Modern Persia* (Cambridge 1914), p 348 (Index, s v Meshed), Browne, *Literary History of Persia*, iv, Cambridge 1928, p 223, 489, Mahdī al-ʿAlawī, p 12

Meshhed is remarkably rich in mosques which are built in the sacred area, at cemeteries and at separate tombs, and are connected with madrasas and other buildings of a religious character

Here we may also mention the Musallā which stands outside the town, 1/2 mile from the Pāʾīn Khiyābān gate on the Herāt road It is a hall (*aiwān*) about 30 feet high which opens into a gigantic arch about 60 feet high

However picturesque Meshhed may look from outside, the impression one gets on entering it is far from pleasing, excepting the Bāst which forms a separate enclave Except for the already described broad main street (Khiyābān), there are only narrow dark alleys the level of which is almost always considerably above that of the inner courts of the houses of brick, so that they can only be entered by long gloomy passages (cf Khanikoff, p 304, Yate, p 328)

As to the population of Meshhed, — the permanent residents, excluding the many pilgrims, — it was at its highest in the reign of Nādir Shāh, who frequently held his court here and in every way contributed to the prosperity of the town At that date Meshhed had not less than 60,000 inhabitants But the half century of turmoil which followed the reign of Nādir Shāh brought about a great decline in the town so that only 3,000 houses were reckoned there in 1796 (cf Yate, p 330) In the xixth century began a slow but steady rise Truilhier in 1807 estimated the number of houses at 4,000, Fraser in 1822 at 7,700 with 25–30,000 inhabitants Conolly (1830) and Burnes (1832) estimate 40,000 inhabitants, Ferrier (1845) and Khanikoff (1858) at 60,000 In 1874 Khurāsān suffered a terrible famine and 24,000 in Meshhed alone died of starvation (see Goldsmid, i 361) Baker is too high in putting the figure at 80,000 in 1873 and Curzon too low at 45,000 for 1889 Meshhed at the present day is said to have 100,000 inhabitants (see Mahdī al ʿAlawī, p 4), it is in any case the third largest town in Persia

The permanent population of Meshhed is a rather mixed one, in consequence of the great influx of pilgrims and the commerce which was very great at least in an earlier period, many foreigners (Turkomans, Afghāns, Indians etc) settled in Meshhed Except for a very small section, all the Muslims of the town are Shīʿīs The small number of Sunnīs are mainly Afghāns and Turkomans We have already mentioned that the Masdjid-i Shāh and the Maḳbara Khwādja Rabīʿ are used by the Sunnīs The number of Christians is infinitesimal and is confined to a few Armenian traders and the personnel of English and Russian consulates established in 1889.

Nādir Shāh settled 100 Jewish families in Meshhed whom he had transplanted from Kazwīn After his death their position became a miserable one, especially after the catastrophe which overwhelmed them in 1839 When in this year, during the celebration of the Muslim Kurbān festival, a Jewess on medical advice placed her hand, which was suffering from an eruption, in the bowels of a freshly slain street dog, the Muhammadans took this for an insult to their religious observances The excited mob, seizing the excuse, fell upon the Jewish quarter, plundering and murdering as they pleased and destroyed the synagogue The surviving Jews had to adopt Islām These Jewish converts are called Djadīd, more fully Djadīd al-Islām = "new comers to Islām", because their forced conversion is of recent date The change of faith was only an external one, it is true that these Djadīd to avert suspicion regularly attend the mosque, but not a few of them are said to observe their old rites in secret The number of Judeo-Muslims in Meshhed at the present day who are small traders, physicians, etc, was put by Bassett (1878) at 300 families, by Yate at 200 On the Jews of Meshhed and their persecution in 1839 cf Truilhier, p 273, Conolly, i, p 304—308, J Wolff, *Narrative*, p 177, 394—396, Ferrier, p 122—123, J J Benjamin (see *Bibl*), p 189–190, Vámbery, *Wanderungen*, p 324–325; Bassett, p 230—233, Yate, p 322

The clerical element is strong in the Muslim population, everywhere one sees mullās, tolbas (students) and dervishes The town swarms with sayyids (alleged descendants of ʿAlī) among whom the Ridawīs, who claim descent from ʿAlī al-Ridā, enjoy special privileges Meshhed is not only one of the most fanatical cities in the whole Muslim world but also one of the most immoral in Asia Prostitution, the so-called pilgrim marriage (Pers *ṣīghe*, cf MUTʿA and iv, p 353ᵃ, 355ᵃ), sanctioned by the Imāmī group of the Shīʿa, flourishes here Most pilgrims take advantage of this institute of temporary marriage (cf Khanikoff, p 98, Curzon, i 164—165, Ibrāhīm Beg, p 45, Yate, p 419, Allemagne, iii 86—87)

The people of Meshhed are described as very superstitious, see especially Bassett, p 228 *sq* and the *Meshhed Stories* in Conolly, i 316—318 Many stories are told of miracles wrought in the ʿAlid sanctuaries see Fraser, p 451—452, Bassett, p 426—427, Massy, p 992—993, 1002, Yate, p 325, 337

The population of the town lives partly by catering for pilgrims and partly on local industries and commerce

The industries, once very flourishing, have now declined The famous manufacture of sword blades, introduced by a colony of workers transplanted by Tīmūr from Damascus, has now almost entirely disappeared (cf Truilhier, p 275, Fraser, p 124, Ferrier, p 468, Curzon, i 166)

A speciality of Meshhed is the manufacture of decorated vessels (household utensils, like jugs, pots, dishes etc) out of serpentine and dark grey soapstone (Meshhed stone), from the quarries 1 1/2 hours south of Meshhed This stone industry is old and the Arabic sources of the middle ages mention it as native to the district of Tūs and especially to the town of Nūkān (the predecessor of Meshhed), cf *B G A*, i 258, ii 313, iii 324, 326, al Muhallabī in Abu 'l Fidāʾ, p 452, Abū Hamīd al-Ghanātī, in *J A*, 1925, p 203, Yākūt, iv 824 and cf G Le Strange, *op cit*,

p 389 For the xixth century cf Truilhier, p 274–275, Fraser, p 469, Ferrier, p 124, Bellew, p 366—367, Baker, p 184, MacGregor, i 291–292, Bassett, p 234, Curzon, i 167

The celebrated turquoise mines east of Nīshāpūr (about $1^1/_2$ days' journey distant, cf FIRŪZEH and Le Strange, *op cit*, p 368, Fraser, p 409–420, Ferrier, p 106—107, Khanikoff, p 90–92, Bassett, p 216—217, Yate, p 399—408) at one time were of special significance in Meshhed's trade and industry Meshhed was the centre of the turquoise trade, for the whole output of these mines came to it and they were controlled by Meshhed merchants The turquoises were sorted in Meshhed and put into commerce there Now however, the finest specimens are usually sent directly abroad from the mines and only pieces of inferior quality come to Meshhed, to be worked there by the still very stilled stone cutters into ornaments and souvenirs for pilgrims On the turquoise industry of Meshhed cf Truilhier, p 274, Bellew, p 367, Goldsmid, i 365, Baker, p 184

Weaving is another important industry in Meshhed The carpets produced here were at one time of immensely greater value than those of the present day, which are produced in factory fashion The modern shawls of Kashmīr style are especially prized and known as Meshhedī, as are the velvets, which in Fraser's time were regarded as the best in Persia On weaving in Meshhed cf Fraser, p 468, Ferrier, p 124, Goldsmid, i 365, Baker, p 184–185, Curzon, i 167, Ibrāhīm Beg, p 47, Schweinitz, p 27—28, Allemagne, iii 110

Until the second half of the xixth century, Meshhed was one of the first emporia of Eastern Irān At the intersection of important caravan routes, it was the entrepôt for the trade of Central Asia and especially of Afghānistān Since however Russia has become established in Turkistān and built the Transcaspian railway, Meshhed's through trade has much declined Nevertheless the town must still be described as an important centre of traffic and trade, not least on account of the numerous pilgrim routes that lead to it Meshhed is 150 miles from the Russian railway station of Ashkābād [q v], the capital of the Transcaspian area, there is a good road between the two towns

For the housing of the numerous pilgrims and other strangers who come to Meshhed, a considerable number of caravanserais are available In Fraser's time (1822), there were at least 25—30 such places in use, apart from some that had been abandoned and allowed to fall into ruins (see Fraser, *Narrative*, p 460) Khanikoff (p 107–108) gives 16, four of which, intended for pilgrims only, were inside the Bāst, of these latter the oldest is the Sultān Caravanserai, built by Tahmāsp I, others date from Sulaimān I

As to descriptions of Meshhed by Europeans we owe the first full description to Fraser (1822), Conolly (i 260) and Burnes (ii 78) both say it is thoroughly reliable Valuable notes on the town are given by Conolly, Ferrier, Khanikoff, Eastwick, MacGregor, Bassett, O'Donovan, Curzon, Massy, E Diez, and especially by C E Yate and Sykes, each of whom spent several years (1893–1897 and 1905–1912 resp) in Meshhed as British Consul General for Khurāsān — Ruy Gonzales de Clavijo (1404), *Embassy to the Court of Timur*, ed C R Markham (Hakluyt Society, vol xxvi, London 1859), p 109—110, Truilhier (1807), in *Bulletin de la Societe de Geogr*, vol ix, Paris 1838, p 272–282, J B Fraser (1822), *Narrative of a Journey into Khorasan in the years 1821—1822*, London 1825, p 436—548, A Conolly (1830), *Journey to the North of India*, London 1834, i 255—289, 296—368, A Burnes (1832), *Travels into Bokhara*, London 1834, ii 76—87, J B Fraser (1833), *A Winter's Journey from Constantinople to Teheran*, London 1838, i 213—255, J Wolff, *Narrative of a Mission to Bokhara in the years 1843—1845* [3], London 1846, p 177—196, 386—408, J P Ferrier (1845), *Caravan Journeys and Wanderings in Persia* [2], London 1857, p 111—133, J J Benjamin, *8 Jahre in Asien und Europa* [2], Hanover 1858, p 189—190, N de Khanikoff (1858), *Memoire sur la partie meridionale de l'Asie centrale*, Paris 1861, p 95—111, N de Khanikoff, *Meched, la ville sainte et son territoire*, in *Le Tour du Monde*, Paris 1861, N⁰ 95—96, Eastwick (1862), *Journal of a diplomat's three years residence in Persia*, London 1864, ii 190—194, H Vámbéry (1863), *Reise in Mittelasien* [2], Leipzig 1865 (1873), p 248—258, identical with H Vámbéry, *Meine Wanderungen und Erlebnisse in Persien*, Pesth 1867, p 313—327, H W Bellew (1872), *From the Indus to the Tigris*, London 1874, p 358—368, Fr John Goldsmid (and Evan Smith, 1872), *Eastern Persia*, London 1876, i 356—366, H C Marsh (1872), *A ride through Islam* etc, London 1877, p 96—112, V Baker (1873), *Clouds in the East*, London 1876, p 177—194, C M MacGregor (1875), *Narrative of a Journey through the province of Khorasan*, London 1879, i 277—309, ii 4, J Bassett (1878), *Persia, the Land of the Imams*, London 1887, p 219—247, E O'Donovan (1880), *The Merw Oasis*, London 1882, i 478—502, ii. 1—14, A C Yate, (1885, brother

MESHHED ʿALĪ [See Nedjaf]

MESHHED ḤUSAIN (Kerbelā'), a place of pilgrimage west of the Euphrates about 60 miles S S W of Baghdād on the edge of the desert (Yākūt, *Muʿdjam*, ed Wüstenfeld, iv 249) It lay opposite Kasr Ibn Hubaira (al-Istakhrī, *B G A*, i 85, cf al-Balādhurī, *Futūh*, ed de Goeje, p 287, al-Maḳdisī, *B G A*, iii 121)

The name Kerbelā' is probably connected with Aram Karbelā (Daniel, 3, 21) and Assyr Karballatu (a kind of headdress) (G Jacob, *Turkische Bibliothek*, xi 35, note 2) It is not mentioned in the pre-Arab period

After the taking of al-Hīra, Khālid b al-Walīd is said to have encamped in Kerbelā' (Yākūt, iv 250) On the Āshūrā' day (10th Muharram) 61 (Oct 10, 680) the Imām Husain b ʿAlī (cf ii, p 339) on the march from Mecca to the Irāḳ, where he intended to enforce his claims to the caliphate, fell in the plain of Kerbelā' in the district of Nīnawā (al-Ṭabarī, iii 2190, Yākūt, iv 870, now according to Massignon Khaimat Kāʿa, according to Musil Ishān Nainwa) in a battle with the troops of the governor of al-Kūfa and was buried in al-Hā'ir (Yākūt, ii 188 *sq*, al-Tabarī, iii 752, E Herzfeld, cf above, ii, p 221)

The place where the decapitated body of the Prophet's grandson was interred (on the fate of the head which was cut off and sent to Damascus to Yazīd I, cf van Berchem, *Festschrift, Ed Sachau gewidm*, Berlin 1915, p 298—310), called Kabr al-Husain, soon became a celebrated place of pilgrimage for the Shīʿis (cf art Shīʿa)

As early as 65 (684—685) we find Sulaimān b Surad going with his followers to Husain's grave where he spent a day and a night (al-Ṭabarī, ed de Goeje, ii 545 *sq*) Ibn al-Athīr (*Taʾrīkh*, ed Tornberg, v 184, ix 358) mentions further pilgrimages in the years 122 (739—740) and 436 (1044—1045) The priests of Meshhed Husain at quite an early date were endowed by the pious benefactions of Umm Mūsā, mother of the Caliph al-Mahdī (al-Tabarī, iii 752)

The Caliph al Mutawakkil in 236 (850—851) destroyed the tomb and its annexes and had the ground levelled and sown, he prohibited under threat of heavy penalties visiting the holy places (al-Ṭabarī, iii 1407, Hamd Allāh al-Mustawfī, *Nuzhat al-Kulūb*, ed Le Strange, p 32) Ibn Hawḳal (ed de Goeje, p 166), however, mentions about 977 A D a large *meshhed* with a domed chamber, entered by a door on each side, over the tomb of Husain, which in his time was already much visited by pilgrims Dabba b Muhammad al Asadī of ʿAin al-Tamr, supreme chief of a number of tribes, devastated Meshhed al-Hā'ir (Kerbelā') along with other sanctuaries, for which a punitive expedition was sent against ʿAin al-Tamr in 369 (979—980) before which he fled into the desert (Ibn Miskawaih, *Taḏjārib al-Umam*, ed Amedroz in *The Eclipse of the Abbasid Caliphate*, ii 338, 414) In the same year, the Shīʿī Būyid ʿAdud al-Dawla (cf above, i 143) took the two sanctuaries of Meshhed ʿAlī (= al-Nadjaf) and Meshhed al-Husain (M Hairi) under his special protection (Ibn al-Athīr, viii 518, Hamd Allāh al-Mustawfī, *loc cit*)

Hasan b al-Fadl, who died in 414 (1023—1024), built a wall round the holy tomb at Meshhed al-Husain (Ibn Taghribirdī, *Nudjūm*, ed Popper, ii 123, 141), as he also did at Meshhed ʿAlī (Ibn al Athīr, ix 154)

In Rabīʿ al awwal 407 (Aug/Sept 1016), a great conflagration broke out caused by the upsetting of two wax candles, which reduced the main building (al-Kubba) and the open halls (al Arwika) to ashes (Ibn al-Athīr, ix 209)

When the Saldjūk Sultān Malik Shāh came to Baghdād in 479 (1086—1087) he did not neglect to visit the two Meshheds of ʿAlī and al-Husain (Ibn al-Athīr, x 103) The two sanctuaries at this time were known as al-Mashhadān (al-Bundarī al-Isfahānī, *Tawārikh al-Saldjūk*, ed Houtsma, in *Recueil des textes* , ii 77) on the analogy of the duals al-ʿIrāḳān, al-Basratān, al-Hīratān, al-Misrān etc

The Ilkhān Ghāzān in 1303 visited Kerbelā' and gave lavish gifts to the sanctuary He or his father Arghūn is credited with bringing water to the district by leading a canal from the Frāt (the modern Nahr al-Husainīya) (A Noldeke, *Das Heiligtum al-Husains zu Kerbelā'*, Berlin 1909, p 40)

Ibn Battūta (ed Defrémery and Sanguinetti, ii 99) visited Kerbelā' in 727 (1326—1327) from al-Hilla and describes it as a small town which lies among palm groves and gets its water from the Frāt In the centre is the sacred tomb, beside it is a large madrasa and the famous hostel

(*al-ʿawwiya*) in which the pilgrims are entertained Admission to the tomb could only be obtained by permission of the gate-keeper The pilgrims kiss the silver sarcophagus, above which hang gold and silver lamps The doors are hung with silken curtains The inhabitants are divided into the Awlād Rakhīk and Awlād Fāyiz, whose continual feuds are detrimental to the town, although they are all Shīʿīs

About the same date, Hamd Allāh al Mustawfī (*op cit*) gives the circumference of the town as 2,400 paces, he mentions there also the tomb of Hurr Riyā (b Yazīd), who was the first to fall fighting for Husain at Kerbelā'

The Ṣafawid Shāh Ismāʿīl I (d 930 = 1524) made a pilgrimage to al Nadjaf and Meshhed Husain

Sultān Sulaimān the Magnificent visited the two sanctuaries in 941 (1534—1535), repaired the canal at Meshhed al-Husain (al Husainīya) and transformed the fields which had been buried in sand into gardens again The Manārat al-ʿAbd (see below), formerly called Engusht-i Yār, was built in 982 (1574—1575) Murād III in 991 (1583) ordered the Wālī of Baghdād, ʿAlī Pasha b Alwand, to build or more correctly restore a sanctuary over the grave of Husain Soon after the capture of Baghdād in 1623, ʿAbbās the Great won the Meshheds for the Persian empire Nādir Shāh visited Kerbelā' in 1743, while he is credited with gilding the dome in Meshhed ʿAlī, he is also said to have confiscated endowments intended for the priests of Kerbelā'

The great prosperity of the place of pilgrimage and its large number of inhabitants is emphasised on the occasion of the pilgrimage of ʿAbd al-Karīm, a favourite of Nādir Shāh Radīya Sultān Bēgum, a daughter of Shāh Husain (1694—1722), presented 20,000 nādirīs for improvements at the mosque of Husain

The founder of the Kādjār dynasty, Agha Muhammad Khān, towards the end of the xviiith century, presented the gold covering for the dome and the manāra of the sanctuary of Husain (Jacob in A Noldeke, *op cit* p 65, note 4)

In April 1801, in the absence of the pilgrims who had gone to al Nadjaf, 12,000 Wahhābīs under Shaikh Saʿūd entered Kerbelā', slew over 3,000 inhabitants there and looted the houses and bazaars In particular they carried off the gilt copper plates and other treasures of the sanctuary and destroyed the shrine But after this catastrophe contributions poured in for the sanctuary from the whole Shīʿī world

After a temporary occupation of Kerbelā' by the Persians, Nedjīb Pasha in 1843 succeeded by force of arms in enforcing the recognition of Turkish suzerainty over the town, the walls of the present old town were now for the most part destroyed The governor Midhat Pasha in 1871 began the building of government offices, which remained incomplete, and extended the adjoining market place (references for the history of Meshhed Husain are given in A Noldeke, *op cit*, p 35–50)

At the present day with over 50,000 inhabitants, Kerbelā' is the second largest and perhaps the richest town of the ʿIrāk It owes its prosperity not only to the great number of pilgrims who visit the tomb of Husain, but also to the fact that it is the most important starting point for the Persian pilgrim caravans to al-Nadjaf and Mecca, and through its situation on the edge of the alluvial plain it is an important "desert port" for trade with the interior of Arabia

The old town with its tortuous streets is surrounded by modern suburbs About half to three quarters of the citizens are Persians, the remainder Shīʿī Arabs The most important tribes among them are the Banī Saʿad, Salālme, al-Wuzūm, al-Tahāmze and al-Nāsirīye The Dede family is the richest for constructing the Nahr al-Husainīya it was rewarded with extensive estates by Sultān Selīm

The name Kerbelā' strictly speaking only applies to the eastern part of the palm gardens which surround the town in a semi-circle on its east side (Musil, *The Middle Euphrates*, p 41) The town itself is called al-Meshhed or Meshhed al-Husain

The sanctuary of the third Imām lies in a court yard (*ṣahn*) 354 × 270 feet in area, which is surrounded by *liwāns* and cells Its walls are decorated with a continuous ornamental band which is said to contain the whole Kurʾān written in white on a blue ground The building itself is 156 × 138 feet in area The rectangular main building entered by the "golden outer hall" (picture in Grothe, *Geogr Charakterbilder*, pl lxxviii, fig 136) is surrounded by a vaulted corridor (now called *ḏjāmiʿ*, A Noldeke, *op cit*, p 20, 3) in which the pilgrims go round the sanctuary (*tawāf*) (Wellhausen, *Reste arab Heidentums*², p 109—112) In the middle of the central domed chamber is the shrine (*ṣandūka*) of Husain about 6 feet high and 12 long surrounded by silver *mashrabīya* work, at the foot of which stands a second smaller shrine, that of his son and companion-in-arms ʿAlī Akbar (Masʿūdī, *Kitāb al Tanbih*, ed de Goeje, *B G A*, viii 303)

"The general impression made by the interior must be called fairy like, when in the dusk — even in the daytime it is dim inside — the light of innumerable lamps and candles around the silver shrine, reflected a thousand and again a thousand times from the innumerable small crystal facets, produces a charming effect beyond the dreams of imagination In the roof of the dome the light loses its strength, only here and there a few crystal surfaces gleam like the stars in the sky" (A Noldeke, *op cit*, p 25 *sq*)

The sanctuary is adorned on the Kibla face with magnificent and costly ornamentation Two manāras flank the entrance A third, the Manārat al-ʿAbd, rises before the buildings on the east side of the *Sahn*, south of it the face of the buildings surrounding the court recedes about 50 feet, on this spot is a Sunnī mosque Adjoining the *Sahn* on the north side is a large medrese the courtyard of which measures about 85 feet square with a mosque of its own and several *miḥrābs* (on the present condition of the sanctuary cf A Noldeke, *op cit*, p 5—26, on its history p 35–50 and on its architectural history, p 51—66)

Abut 600 yards N E of the sanctuary of Husain is the mausoleum of his half brother ʿAbbās On the road which runs westward out of the town is the site of the tent of Husain (*Khaimagāh*) The building erected there (plan in Noldeke, pl vii, photograph in Grothe, pl lxxxviv, fig 145) has the plan of a tent and on both sides of the entrance there are stone copies of camel saddles

On the desert plateau (*hammād*) west of the town stretch the graves of the devout Shīʿīs North of the gardens of Kerbelā' lie the suburbs, gardens

and fields of al-Bkēre, N W those of Kurra, S those of al-Ghādhirīya (Yākūt, III 768) Among places in the vicinity, Yākūt mentions al-ʿAkr (III 695) and al Nawāyih (IV 816)

A branch line diverging north of al-Hilla connects Kerbelā' with the Baghdād–al-Basra railway Caravan roads lead to al-Hilla and Nadjaf The sanctuary of Husain still has the reputation of securing entrance to Paradise for those buried there, wherefore many aged pilgrims and those in failing health go there to die on the holy spot

MESHHED-I MIṢRIYĀN, a ruined site in Transcaspiana (Turkmenistān), N W of the confluence of the Atrak and its right bank tributary the Sumbar, or more exactly, on the road which runs from Čat at right angles to the road connecting Čikishlar with the railway station of Aydīn

The ruins are surrounded by a wall of brick and a ditch and have an area of 320 acres The old town, situated in the steppes which are now peopled by Turkomans, received its water from a canal led from the Atrak about 40 miles above Čat Near the latter place the canal diverged northwards from the river, crossed the Sumbar by a bridge and finally followed an embankment 6 feet high on which the bed of the canal was 12 feet broad

The ruins of a fine mosque can still be seen, the gateway of which, decorated with faience, has an inscription according to which this *īwān* was built by ʿAlāʾ al-Dunyā wa 'l-Dīn Ghiyāth al-Islām wa 'l-Muslimīn Zill Allāh fi 'l-ʿĀlamīn Sulṭān Muḥammad b Sultān Takish Burhān Amīr al-Muʾminīn The Khwārizmshāh Muhammad in question reigned 1200—1220 On one of the two towers (minarets ?) is written *bismillāh barakatun min Allāh mimmā amara bihi Abū Djaʿfar Ahmad b Abi 'l-Agharr ṣāhib al-ribāt, aʿazzahu 'llāhu ʿAmal ʿAlī R* (?) The identity of this Ahmad is unknown but the title "lord of the ribāt" which he gives himself, confirms the fact that M -Misriyān was a frontier fortress (*ribāt*) Near the east gate stood another white mosque

Tradition (Conolly) ascribes the destruction of Misriyān to the "Kalmuk Tatars" The appearance of the Kalmuks in these regions may be dated about 1600

The name Meshhed i Misriyān (variants Mestorian, Mest-Debran, Mest-Dovran, Mastan) is obscure, unless Mestorian is to be explained as *Nestoriyān "Nestorian Christians", it may be recalled that during his campaign in the Čōl (*صول), to the east of the Caspian, Yazdagird II persecuted the Christians (Hoffmann, p 50, Labourt, *Le christianisme aans l'Empire Perse*, 1904, p 126)

The site of the ruins (to the north of Djurdjān) is given the name Dihistān in Muslim sources, which recalls the name of the old Scythian people Daha who led a nomadic life on the Atrak (Greek Δάαι and Δάσαι, cf Tomaschek in Pauly-Wissowa, *Real-Encycl* ², IV , col 1945) From the Dahian clan of the Parnoi was descended the Arshakid dynasty which imposed its authority on the Parthians (cf Minorsky, *Transcaucasia, J A* , 1930, July–Sept , p 56)

The basin of the Atrak (the ancient Σάριος) is at the extreme limit of the lands described in the classical and Muhammadan geographers The sources mention several settlements in Dihistān but in a somewhat confusing fashion As the analysis by Hoffmann and by Barthold has shown, a distinction must be made between 1 the settlement on the sea-shore, 2 the town of Dihistān and 3 the ribāt Dihistān

1 The first of these was built on a promontory (*dakhla*) behind which ships could shelter Marquart, *Ērānšahr*, p 130, reads the name concealed in the variants in Istakhrī, p 219, note *b*, as "Dihistān Bayāsīn" which he connects with the district of Bayāsān mentioned (in Djurdjān !) by Tabarī, II 1330, Balādhurī, p 337 and Ibn Khurdādhbih, p 35 The *Hudūd al-ʿĀlam* mentions a peninsula of Dihistān-Sur on the coast of Dihistān This سر may be an echo of the name of the Turkish (?) princes صل or صول (Hoffmann, p 281) who attacked Djurdjān from the north (Ibn al-Athir, III 22) Lastly Tabarī, II 1325, locates an island of Buhaira 5 farsakhs from Dihistān Barthold identifies all these names with the cape of Hasan-Kuli which shelters the bay into which the Atrak flows [Cf also the article TŪRĀN, on the Diz i Alānān mentioned in the *Shāh nāma*].

A difficulty is raised by Istakhrī (p 219) who puts at 50 farsakhs and p 226 at 6 *marhala* (each of $8^2/_3$ farsakhs) the distance between Abaskūn (at the mouth of the river Djurdjān, now Gümüsh-täpä [1]) and the cape of Dihistān in question If we follow this double indication literally, we ought (with Hoffmann, p 279, who reads the name "Dihistān-*Tabāshīr") to move the cape of Dihistān considerably to the north, in the bay of Krasnowodsk, which is certainly a very important place In this case the cape would be a different one from Buhaira = Hasan Kuli (Hoffmann, p 278)

2 The town of Dihistān, according to the middle Persian list of the towns of Erān, was founded by a certain Narsahē the Arshakid (Marquart, *Ērānšahr*, p 73) and according to the *Nuzhat al-Kulūb*, p 166, by the Sāsānid Kubād b Fīrūz According to Mukaddasī, the town of Dihistān was called Akhūr Tabarī locates (the river of) Djurdjān and, as we have seen, 5 farsakhs from Buhaira This latter distance is by the way less than the actual distance between Hasan-Kuli and Meshhed-i Misriyān

3 The ruins of Meshhed-i Misriyān (as the inscription on the mosque suggests [1]) must correspond to the ribāt of Dihistān which Mukaddasī, p 358 (cf also p 312, 367, 372) mentions distinct from Akhūr This ribāt situated on the borders of the steppes had fine mosques and rich markets Relying on Yāḳūt, i 39, Barthold thinks that in the xiith century the ribāt (and not Akhūr to the east of the Djurdjān-ribāt road) was the capital of the district of Dihistān

MESĪḤĪ (originally ʿĪsā), an important Ottoman poet of the time of Bāyazīd II Born in Prishtina (northern Albania), he came as a youth to Constantinople where he became a *softa* (theological student) and distinguished himself as a calligrapher In the end he won the favour of the grand vizier Khādim ʿAlī Pasha [q v] and became his diwān-secretary But his irregular life and carelessness in the performance of his duties frequently irritated his patron (ʿAlī Pasha called him *Shehr oghlanī*) He held his post, however, till the death of ʿAlī Pasha in 917 (1511) in battle against the Shīʿī rebels under Shāh Kūlī Mesīḥī wrote an elegy on his death, full of the deepest emotion

His attempts to find a new patron failed He had to be content with a miserable fief in Bosnia where he soon died in 918 (1512), poor and forgotten and still quite young

According to Ahmad Pasha [q v] and Nedjātī (d 914 = 1509), Mesīḥī was regarded as the third great Ottoman poet and the greatest lyric poet before Bāḳī He is a most artistic and original figure His output was not extensive, but of lasting influence His *Dīwān* has not yet been printed, a fate common to nearly all important Turkish poets In his lyric poems he is above the average of contemporary poets In addition to the grace and delicacy of his diction, there is a certain novelty in his style New images and pictures are introduced with great boldness, perhaps a result of his Albanian blood The best known of his poems, in Europe is his Ode to Spring (*murebbeʿa*) which Sir William Jones published with a Latin translation *Poeseos Asiaticae commentariorum libri sex*, Leipzig 1774 and has been repeatedly reprinted (by Toderini, by Wieland in the *Deutsche Merkur*, by J von Hammer etc) His *Dīwān* is also of importance linguistically, for it bears the stamp of the Rumelian dialect

Mesīḥī's most original work is his *Methnewī*, *Shehr-engīz* (the "Thriller of the Town"), which is also the most original work in Turkish literature down to Mesīḥī's time It is original in subject also, as it did not have a Persian model It introduced quite a new style of poem, which was frequently imitated *Shehr-engīz* represents the first attempt at humorous verse in Turkey, and its language is very close to the spoken speech Here Mesīḥī could write Turkish to his heart's content, while in other forms he had to use the learned jargon He laments in one passage that without Persian and Arabic there would be no room for him as a poet, even if he had come down from heaven

Shehr engīz is a burlesque catalogue of the beautiful "boys" of Adrianople — it is interesting to note that they are all Muhammadan — and became popular on account of its unaffected language

As a product of his activity as a secretary, we have also a collection of *inshāʾ*, elegant specimens of epistolary style, not without historical interest, entitled *Gul-i Ṣad Berg* (the hundred-leaved rose) I have a manuscript of this work, which seems to be rather rare, of 991 (1583) entitled *Inshāʾ-i Mesīḥī*

METĀWILA [See MUTAWĀLĪ]

MEWLĀNĀ HUNKʿĀR, a title of the head of the Mawlawī Order [see MAWLAWĪYA] The second word is the Turkish form of the Persian *khudāwandgʿār*, the equivalent of *mawlā*, which according to Aflākī (*Saints des Derviches Tourneurs*, i 59) was bestowed on Djalāl al-Dīn by his father Sāmī in his Turkish Lexicon states that the word, besides being used for "Sultān", "King", is applied to certain saintly personages, in such combinations as *pīr hunkʿār* or *mullā hunkʿār* The underlying idea of such a title is probably that the saint has had committed to him the government of the world, if he choose to undertake it, an idea elaborated by Ibn ʿArabī (*Futūhāt Makkīya*, i 262, ii 407), who regards such a saint as the true *khalīfa* The title *celebi* is more generally recognized as that belonging to the head of the Mawlawī Order (Sāmī, *loc cit*, p 510*a*)

(D S MARGOLIOUTH)

MEZZOMORTO, an Ottoman Grand Admiral whose real name was HĀDJDJĪ HUSEIN PASHA

Hādjdjī Husein Pasha, known as Mezzomorto, i e "half dead" because he was severely wounded in a naval battle, came from the Balearic Islands, if A de la Motraye's statement (*Voyages*, The Hague 1727, i 206) that he was born in Mallorca is right He probably spent his youth sailing with corsairs on the seas off the North African coast He first appears as a desperate pirate in the summer of 1682 in the Barbary States When France was preparing to deal a decisive blow at the pirates of Algiers, whose arrogance had passed all bounds, he was handed over as a hostage to the French after the bombardment of Algiers, but managed to return there, to strike down with his own hand, in a mutiny of the mercenaries which he had stirred up, the Dey of Algiers Baba Hasan, who was ready to make peace and to fight his way to the head of the state (summer of 1683, cf Zinkeisen, *G O R*, v 51 *sq*) Husein Reʾīs in the following year concluded with Louis XIV of France a truce for a hundred years, which however was only of brief duration His own rule over Algiers was not long either (till 1688, cf A Bernard, *L'Algerie*, Paris 1929, p 159) About ten years later, in Muharram 1107 (Aug 1695), Husein Reʾīs, who had already distinguished himself as commander of a galleon (*kālʿūn kapudānī*), was appointed Grand Admiral of the Ottoman fleet (*kapudān-ı deryā*) in succession to ʿAmūdjazāde Husein Pasha, who was appointed governor of Adana after the taking of Chios He owed his promotion to his skilful seamanship at the capture of Chios where he distinguished himself in the battle with the Venetian fleet (spring of 1695) In 1697 Husein Pasha inflicted a disastrous defeat on the Venetian Captain General Alessandro Molino off the island of Lemnos, and in the following year in a naval fight on July 6 with Molino's successor, Giacomo Cornaro, near Mytilene it was very doubtful whether the Crescent on the Lion of St Mark gained the victory (cf Zinkeisen, *G O R*, v 183, from the account by the *inquisitore* Garzoni in his *Istoria della Repubblica di Venezia*, Venice 1705, p 644 *sqq*, 691 *sqq*, 748 *sqq* and 775 *sqq*) Ottoman authorities and the historian Rashīd (fol 231, cf J v Hammer, *G O R*, vi 635) credit the victory to the Ottomans In 1113, Mezzomorto was dismissed from his rank and replaced by ʿAbd al-Fattāh Pasha He retired to Chios, where his adventurous life came to an end in the same year on the 13th Safar 1113 (July 20, 1701, according to Safwet, *op cit*), on the 14th Safar 1114 (1 e July 9, 1702) according to others J v Hammer, *G O R*, vi 766 and vii 624, gives the date as 15th Rabiʿ 1113 (Aug 20, 1701) One of these dates is probably that of his dismissal

Bibliography In addition to the references in the text cf Safwet Bey, *Kapudān Mezemorta Husein Pasha*, Stambul 1327, Admiralty Press, 129 pp small 8°, reprint from the periodical *Djerīde-ı bahrīye*, documents and original sources relating to Mezzomorto, cf F Babinger, *G O W*, p 397 *sq*, H D Grammont, *Histoire d'Alger sous la domination turque*, Paris 1887, E Plantet, *Correspondance des deys d Alger avec la cour de France*, Paris 1890 (FR BABINGER)

MIʾDHANA [See MANĀRA]

MIDHAT PASHA, Ottoman statesman, twice grand vizier

Midhat Pasha was born in Stambul in Safar 1238 (beg Oct 18, 1822), the son of Hādjdjī ʿAlī Efendi-Zāde Hādjdjī Hāfiz Mehemmed Eshref Efendi, a native of Rushčuk The family seem to have been professed Bektashīs and Midhat Pasha also had a leaning towards them His earliest youth was spent in his parents' home at Widdin, Lofča (Bulgaria) and later in Stambul, where his father held judicial offices In 1836 he was working in the secretariat of the grand vizier and later he filled confidential posts in various governorships (including two years in Damascus), in 1844 he came to Konya and in 1849 became second, in 1851 first secretary to the Council (*medjlis-ı wālā*) In 1854 the grand vizier Kıbrızlī Mehemmed Pasha gave him the difficult task of pacifying the provinces of Adrianople and the Balkans and clearing them of robber bands Here he displayed for the first time his special talents for administration, which were not unnoticed by the Porte and soon afterwards brought him the appointment of governor of the Danube districts (Widdin, Silistria) In 1858 he spent six months travelling for study in western Europe, including Vienna, Paris, Brussels and London In 1861 he was appointed governor (*wālī*) of Nish and Prizren with the rank of vizier, where he earned distinction by his pacification of the country, so that, when the new organisation of wilāyets was carried out in 1864, he was given the model province, Danube-Bulgaria (*Tūna Wilāyetī*) During his four years' governorship, he raised the province to a level rare in Turkey, although it was only under his successor that the people learned to thank him for it He built schools and educational institutes everywhere, created funds to make advances to and support useful undertakings, built hospitals, granaries, roads (2,000 miles) and bridges (1,400) and improved communications in every way As he required money for all these progressive undertakings, which the government could not give him and he would not raise by abuse of taxation, he raised the necessary funds by "voluntary contributions" from the people The Bulgars, with whom for nationalist reasons he had no sympathy, suffered not a little from the enterprising spirit and unrestrained love of work of the young governor who, of unbending will and inexorable severity, was of a nature not attractive, but rather arrogant and conceited At the same time he was quite modern in his views and had no scruples about

introducing absolute equality between Christians and Muslims in his province He proceeded ruthlessly against agitators and rebels, dismissed incompetent officials and brought extortionists to book His most rigorous steps were directed against the Russian Pan Slav intrigues, the leaders of which he ruthlessly hanged Although in a few years he made the Danube province the richest in Turkey without it costing the state a piastre, in 1869 Midhat Pasha, who had incurred the hostility of the Russians, was deprived of his office and sent to remote Baghdād as governor and commander of the vith Army Corps Midhat Pasha was not dismayed, but went to work with renewed energy to develop his new governorship He laid roads, started horse tramways, built a technical school, founded a savings bank, instituted regular steamship traffic on the Tigris between Baghdād and several harbours on the Persian Gulf and urged the building of a "Euphrates railway" Under the pretext that he had taken part in a conspiracy against the Sultān, Midhat Pasha, who had already earned the gratitude of the Baghdād province and also won Nedjd for the Ottoman empire, was summoned to Stambul where his enemy, the grand vizier Mahmūd Nedīm Pasha, had chosen him for the office of wālī of Adrianople Instead of this, on the fall of his rival, Midhat Pasha was appointed grand vizier on Aug 1, 1872, only to be dismissed on October 19 It was clearly shown that his real strength lay in provincial administration All possible elements combined to bring about his fall Sultān ʿAbd al ʿAzīz could not endure him because he opposed his mad whims, the Old Turks regarded him as an infidel because he planned his measures regardless of dogmatic objections, he was most unpopular with the Russians because he had taken sharp measures to deal with the Slav Bulgar intrigues Midhat Pasha retired into private life as *persona ingrata* In the grand vizierate of Esʿad Pasha, he became minister of justice on March 15, 1873 and held this office still under his successor Shīrwānī-zāde Mehemmed Rushdī Pasha till Sept 29, 1873 In the following October, the governorship of Salonika was given to him which he only accepted with reluctance and held for barely three months On Feb 17, 1874 he was again dismissed and retired once more to private life He used the leisure thus forced upon him to work out the schemes which he later unfolded and which meant a decisive change in the orientation of the Ottoman empire In August 1875 his old enemy Mahmūd Nedīm Pasha, who had again received the imperial seals, appointed him minister of justice but by November he had handed in his resignation, which was accepted The empire was then in a state of complete confusion risings, famine, an empty treasury and a half mad sultān Midhat Pasha then composed his famous memorandum of March 9, 1876, which was to have such momentous results On May 20, 1876 he entered the cabinet of the grand vizier Müterdjim Mehemmed Rüshdī Pasha as minister without portfolio In the night of May 30, Sultān ʿAbd al-ʿAzīz was deposed and Murad V raised to the throne of his fathers On July 15, a proclamation issued in the name of the new sovereign used for the first time the word "constitution" Midhat Pasha was the soul of the new movement and he worked ardently with a few kindred spirits to give Turkey a constitution Sultān Murād V became insane and was replaced by his brother ʿAbd al-Hamīd, on December 18, 1876 Midhat Pasha became grand vizier for the second time, and five days later, the constitution was solemnly proclaimed The reactionary party and a powerful camarilla never ceased its endeavours to bring about the fall of Midhat Pasha and to bring his progressive schemes to nought Under the pretext of high treason he was dismissed on Feb 5, 1877 and banished to Europe He was put upon a steamer and went via Rome and Paris to England He was only permitted to return in 1878 and then only to Crete In November 1878 under pressure from England, he was appointed governor-general of Syria In 1880 he was transferred to Smyrna as governor Here ʿAbd al-Hamīd's wrath overwhelmed him In May 1881 he was arrested and brought to Stambul The ludicrous charge of having caused the assassination of Sultān ʿAbd al ʿAzīz was brought against him Midhat Pasha was condemned to death but the sentence was not carried out He was banished for life to Tāʾif in Arabia After repeated attempts to poison him, he was strangled on April 10, 1883 (Radjab 29 1301) in prison In this tragic fashion ended the life of one of the most notable and best statesmen of Turkey, perhaps the most important administrator that the Ottoman empire has produced in modern times Midhat Pasha had a son, ʿAlī Haidar Midhat Bey, who after his death conducted a campaign to clear his memory and wrote a very full life of his father

Bibliography The main source for the life of Midhat Pasha is the work of his son ʿAlī Haidar Midhat Bey, which appeared in 2 vols entitled *Midhat Pasha, Hayāt i siyāsiyesī, khidmātī, menfā hayātī* at Stambul in 1325 (1909) (vol 1 *Tabṣire-i ʿIbret*, vol 2 *Mirʾāt-i Hairet*, Hilāl press) — He had previously published *The Life of Midhat Pasha By his son Ali Haydar Midhat*, London 1903, xii and *Midhat-Pacha, sa vie — son œuvre Par son fils Ali Haydar Midhat Bey*, Paris 1908, xxiii A kind of translation of these works is Yūsuf Kamāl Bey Hatāta, *Mudhakkirāt Midhat Bāshā* Cairo 1331 (cf F Babinger, *G O W*, p 395 note) Of the wealth of literature on Midhat Pasha we may mention Leouzon-le-Duc, *Midhat Pacha*, Paris 1877, Benoît Brunswick, *La verite sur Midhat Pacha*, Paris 1877, A Clician Vassif Effendi, *Son Altesse Midhat Pacha, Grand Vizir*, Paris 1909, vii , *Un horrible assassinat commis sur l'ordre special du Sultan Abdul Hamid II Assassinat de Midhat Pacha d'après les documents officiels de la Jeune Turquie, publ par le Comite Ottoman d'Union et de Progres* Geneva 1898, also *Midhat Pasha we-Dāmād Mahmūd Pasha Hadretinin Sulṭān ʿAbd ul-Hamīdin Emrile Kaifiyet Shehādetlerī*, Geneva 1314 (1896), Thurayyā Rifʿat, *Midhat Pashanin Kātilleri*, Stambul 1324, of importance for the political ideas of Midhat Pasha are his own publications *Feryād we-Fighānlar*, Stambul 1326 political apologia, *Ahwāl al-Dawla al-ʿothmānīya al siyāsiya bi 'l-Nazar ila 'l-Mādi wa 'l-Hāl wa 'l-Istikbāl La Turquie, son passe, son avenir Taʾlif Midhat Bāshā wa kad tardjamahā* Khalīl Efendi al Khūrī, Bairūt 1879, thereon Mehemmed Rüshdī, *Midhat Pashanin Wasiyet-Nāmesī we Shehādetī*, Stambul 1325 — Of European works on the life and work of Midhat Pasha may be mentioned [A D Mordtmann sen], *Stambul und das moderne Turkenthum*, New Series

Leipzig 1878, p 82 *sqq* , [Gg Dempwolff], *Serail und Hohe Pforte*, Vienna 1879, p 237 *sqq* , Carl v Sax, *Geschichte des Machtverfalls der Turkei*, Vienna 1908, p 375 *sqq* But the western sources have mainly to be used with caution, as the very varying statements about his origin, date and place of birth show

(Fr Babinger)

MIDILLÜ, Turkish form for Mytilene, name of the island of Lesbos, which in the middle ages had already taken the name of its capital The island is about 650 sq m in area and has two large gulfs, the Gulf of Kalloni (Kalānia) and that of Jeros (Kelemia)

When the Muslims first became acquainted with the island, it belonged to the Byzantine empire Its conquest in the reign of the emperor Alexios Comnenos in 484 (1091) by the Emīr of Smyrna, Tzachas, father-in-law of the Seldjūk Kïlïdj Arslān I b Sulaimān, was only temporary After the conquest of Constantinople by the Latins (1204), the island passed for a time to the Venetians In 1355, the emperor John Palaeologos, on the marriage of his sister with the Genoese Francesco Gattilusio, granted the island to the latter as a fief It belonged to this family when Mehmed II the Conqueror took Constantinople in 1454 The islands of the Aegean had to pay tribute to the Turks, to which the Gattilusio in the hope of retaining their position readily agreed, and when the grand vizier Hamza Pasha in 1456 anchored off Lesbos on the voyage to Rhodes, the prince Dorino Gattilusio sent rich gifts to the Turkish commander through the historian Ducas After the death of Dorino, his son and successor Domenico sent an embassy under the same Ducas to try to gain the good graces of the Sultān, but the Turks imposed rather harsh conditions In 1458 Domenico was slain by his brother Nicolas who had escaped from Lemnos and the latter seized the island On the pretext that he had given shelter to the pirates who harassed the Asia Minor coast and had committed other acts hostile to the Sultān, Mehmed in 1462 set out against Lesbos The grand vizier Mahmūd Pasha conducted the siege of the capital It was taken after 27 days' bombardment and the Sultān received the surrender of the island in person (ʿĀshik Pasha Zāde, ed Giese, Leipzig 1929, p 156 *sq* , Hādjdjī Khalīfa, *Tuhfat al-Kibār fi Esfār al Bihār*, Constantinople 1141 [1728–1729], fol 6b, Hammer, ii 15, 67, Zinkeisen, ii 226, 239 *sqq*) A mosque in the citadel of Midillü was built by Fātih, cf Newton, i 117, Koldewey, p 11

Attempts of the Venetians under Orsato Giustiniani (1464) to take the island from the Turks failed (v Hammer, ii 83 *sq*) An expedition against the island in 1500 of the allied French and Venetian fleets was thwarted by the Turkish forces (v Hammer, ii 327, Hādjdjī Khalīfa, *op cit*, fol 10a) Since that date the island had been in undisturbed possession of the Turks until during the Balkan War it was handed over to the Greeks on Nov 24, 1912 and finally conceded to them by the Peace of London of May 30, 1913, although with certain reservations by Turkey

The island, the largest in the Archipelago, belonged to the "wilāyet of the Archipelago" (*Djezā'ir-i Bahr-i sefid*) and formed in it the sandjak of Midillü with 5 ḳazā's Midillü (with the capital, in the east of the island), Pilemar (= Plomary, in the south), Molowa (= Molivo, the ancient Methymna, in the north), Sighri in the west of the island, and lastly the Junda Islands (Moskonisi) east of Midillü, cf Sāmī, *Kāmūs al-Aʿlām*, col 1894, 4243, Cuinet, *La Turquie d'Asie*, i 449–472, cf also Suleimān Fa'ik, *Rehba i Deryā*, i (Stambul 1299), p 55—59 — According to Baedeker 1914, the island had 140,500 inhabitants of whom $^{6}/_{7}^{th}$ were Greeks and $^{1}/_{7}^{th}$ Muhammadans

Bibliography On the island in ancient times and most of the questions connected with it, see the very full article by Bürchner on *Lesbos* in Pauly-Wissowa-Kroll, xii (1925), col 2107—2133

A full description for the earlier Turkish period is given by the Turk Pīrī Re'īs in his *Bahriye* written in 1521 this section has been translated by Maximilian Bittner in Paul Kretschmer, *Der heutige Lesbische Dialekt* (= *Schriften der Balkankommission*, iii/1), Vienna 1905, col 579—584 and in my ed of the *Bahrīye* of Pīrī Re'īs (Berlin and Leipzig 1926), chap ix *Midillu*, text p 21—26, transl p 32—42 — The most important later descriptions are those by Pococke, *Description of the East*, ii/ii , London 1745, Newton, *Travels and Discoveries in the Levant*, London 1865, i 37 *sqq* , A Conze, *Reise auf der Insel Lesbos*, Hanover 1865 and R Koldewey, *Die antiken Baureste der Insel Lesbos Im Auftrage des Kaiserlich-Deutschen Archaologischen Instituts untersucht und aufgenommen*, Berlin 1890 This book gives details of early explorations of the island and accurate maps on a larger scale of sections of it

MIḎJMARA, the censer, from *ḏjamra*, "glowing coal", the Arabic name for the constellation of the Altar which lies south of the Scorpion (θυτήριον in Aratus, *ara* in Cicero, Manilius etc) or censer (θυμιατήριον in Ptolemy, *turibulum* in Geminus)

Bibliography al-Kazwīnī, ed Wustenfeld, i 41, L Ideler, *Untersuchungen uber den Ursprung und die Bedeutung der Sternnamen*, Berlin 1809, p 280, A Haubei, *Planetenkinderbilder und Sternbilder*, Strassburg 1916, p 193–199 (J Ruska)

MIḎRĀR Banū [See Sidjilmāsa]

MIHNA (a), noun derived from the root *m-h n*, appearing in the Arabic verb *mahana*, "to smooth", and in some Aethiopic derivations, trial (e g the trials to which the prophets and especially the family of Muhammad, the ʿAlids, are exposed in this world, cf Goldziher, *Vorlesungen*, p 212 *sq* , 261), inquisition In the latter sense it is usually applied to the Muʿtazilite inquisition and persecution extending from 218—234 (833—848) On the viiith form of the verb, *imtahana*, "to torture", cf especially Quatremere, *Histoire des sultans mamlouks*, i/ii , p 81, note 101

The first Muʿtazilite inquisition was instituted towards the end of his reign by the ʿAbbāsid caliph al Maʾmūn (q v , 198—218 = 813—833), who was a Muʿtazilite by conviction, especially with regard to the creation of the Kurʾān [cf the articles al kurʾān and muʿtazilites] He sent a letter to the governor of Baghdād, Ishāk b Ibrāhīm, ordering him to cite before him the ḳādī's under his jurisdiction in order to test them with regard to their opinion on the Kurʾān (Tabaī, iii 1112 *sqq* , transl by Patton, *op cit* , p 57—61 , *Kitāb Baghdād*, p 338 *sqq* , cf Abu 'l-Maḥāsin, i 636

sqq, *Fragmenta Hist Arab*, p 465) Those who declared their opinion in conformity with that of the caliph, should cite the legal witnesses under their jurisdiction and institute a similar inquisition

This letter was sent to the provinces In Egypt little was done At Kūfa the general feeling was against yielding to the order of the caliph In Damascus, the latter, probably on his way to Asia Minor, personally conducted the testing of the doctors of the town

In a second letter he ordered Ishāk b Ibrāhīm to send to him seven of the leading theological authorities of Baghdād, that he might test them himself The name of the chief champion of the orthodox view, Ahmad b Muhammad b Hanbal [q v], which was at first in the list, was cancelled at the instance of the chief kādī Ahmad b Abī Du'ād [q v], the most vigorous advocate of the miḥna under al-Ma'mūn and his successors Among the seven who were summoned to the court was Muhammad b Sa'd [q v], the secretary of al Wāḳidī [q v], and author of the *Kitāb al-Tabakāt* All of them gave way to the pressure, assented to the view forced upon them and were sent back to Baghdād, where Ishāk b Ibrāhim had them repeat their confession before the theologians (Tabarī, iii 1116 *sq*, *Kitāb Baghdād*, p 343 *sqq*) The success of the caliph moved him to cling to the method inaugurated by him In a third letter which is interwoven with theological arguments (Tabarī, iii 1117 *sqq*, Patton, *op cit*, p 65 *sqq*) he enjoined Ishāk b Ibrāhīm to test all the kādis under his jurisdiction, who in their turn should test all witnesses and assistants in matters of law Ishāk b Ibrāhīm cited before him a number of the most notable doctors of Baghdād (Tabarī, iii 1121 *sqq*, Patton, *op cit*, p 69 *sqq*), among them Ahmad b Hanbal The result of the test was that some of them yielded and others remained steadfast, Ahmad b Hanbal belonged to the group of the latter

In a fourth letter to Ishāk b Ibrāhīm (Tabarī, iii 1125 *sqq*, Patton, *op cit*, p 74 *sqq*), the caliph discussed the attitude of each of the doctors in connection with his character and way of life, and ordered those who had given unsatisfactory answers to be sent to his camp in Tarsūs After a further examination by Ishāḳ b Ibrāhīm two of them only remained steadfast, Ahmad b Hanbal and Muhammad b Nūh They were sent to Tarsūs as prisoners On the way thither the report of the caliph's death reached them They were sent back to Baghdād, Muhammad b Nūh died before he had reached the capital

Ahmad b Hanbal remained in prison Although he was urged to make use of *takīya* [q v] as others had done, he stuck to his attitude Cited before al-Ma'mūn's brother and successor al-Mu'tasim (218—227 = 833—842), there originated lively debates on the nature of the Kur'ān and other theological subjects between him, the caliph, Ahmad b Abī Du'ād and others, which lasted three days No change, however, being brought about in Ahmad's attitude, he was scourged at the order of the caliph, and afterwards, from fear of an insurrection (for Ahmad was very popular), set free Little more is heard of the miḥna under al-Mu'tasim (Abu 'l-Mahāsin, i 649, Patton, p 113), who had neither the interest nor the training of his predecessor in theological matters

His son al-Wāthiḳ bi'llāh (227—232 = 842—847) who succeeded him, returned to the methods of al-Ma'mūn (Abu 'l Mahāsin, i 683, Patton, p 115 *sqq*), although it is said that he had restrained his father from prosecuting the miḥna any farther He ordered the governors of the provinces to test the notables under their jurisdiction Little is known of the consequences of this order Ahmad b Hanbal in the meanwhile had become a favourite teacher, when, however, he heard of the renewed activity of Ahmad b Abī Du'ād he refrained of his own will from teaching, and was henceforth left alone

Al-Wāthiḳ personally intervened in the trial of one person of note, the theologian Ahmad b Nasr b Mālik al-Khuzā'ī who had moreover taken part in a conspiracy (Weil, ii 341, Patton, p 116 *sq*, cf Tabarī, iii 1343 *sqq*, de Goeje, *Fragmenta hist arab*, p 529 *sqq*) Questioned about the Kur'ān, al-Khuzā'ī replied that he believed it to be the word of God The trial had not proceeded much farther, when the caliph put an end to it and personally made an attempt to behead his victim, in which he did not succeed without the assistance of some one more skilled than himself (Sha'bān 231 = 846)

Other persons of note who remained steadfast under al-Wāthiḳ were Nu'aim b Hammād and the well known Abū Ya'kūb Yūsuf b Yahya 'l-Buwaitī, the pupil of al-Shāfi'ī and editor of some of his works (Patton, p 119) Both died in prison As an instance of the fanaticism of Ahmad b Abī Du'ād it is related that, when in 231 (846) it was proposed to ransom 4,600 Muslim prisoners from the Byzantines, he proposed to abandon those who would not admit the creation of the Kur'ān, this was actually done (Tabarī, iii 1351 *sqq*, *Fragm hist arab*, ii 532, Abu 'l-Mahāsin, i 684, Patton, p 120) It is said that al-Wāthiḳ gave up his Mu'tazilite views before his death The miḥna continued to exist during the first years of the reign of his successor al Mutawakkil (232—247 = 847—861), but in 234 this caliph stopped its application and forbade the profession of the creation of the Kur'ān on pain of death

MIHR, the seventh month of the Persian solar year which runs from Sept 17 to Oct 16 and therefore begins the autumn Mihr is also the name of the 16th day of each month To distinguish between the month Mihr and the day, the former is called *Mihr Māh* and the latter *Mihr Rūz* On the 16th Mihr, the day when Mihr Māh and Mihr Rūz coincide, called *Mihr-gān*, one of the great feasts begins, which is also called Mihrgān and lasts till the 21st of the month The first day of the feast is called *Mihr-i ʿāmma*, the general Mihr, the last *Mihr-i khāṣṣa*, the special, proper Mihr The associations of this feast partly relate to the beginning of autumn, partly to the sun, whose name the month indeed bears, and partly to heroic legend Mihrgān is the feast of Feridūn's accession after his victory over Dahhāk On the rites observed at the feast see the sources mentioned below

Bibliography Ginzel, *Handbuch d math u techn Chronologie*, i, § 67 *sqq*, al-Bīrūnī, *Āthār*, ed Sachau, p 42, 43, 70, 222 *sqq*, Vullers, *Lexicon persico-latinum*, s v مهرگان, al-Kazwīnī, *ʿAdjā'ib al-Makhlūkāt*, ed Wüsten feld, p 81 *sq* (M Plessner)

MIHR-I MĀH SULṬĀN, daughter of Suleimān the Magnificent Mihr-i Māh (sometimes also written Mihr u māh cf Karačelebi-zāde, *Rawdat ul-Ebrār*, p 458) was the only daughter of Suleimān the Magnificent [q v, as well as F Babinger, in *Meister der Politik*, ii², Berlin 1923, p 39—63] While still quite young she was married to the grand vizier Rustem Pasha (cf F Babinger, *G O W*, p 81 *sq*) in the beginning of December 1539 (cf J H Mordtmann, in *M S O S*, Year xxxii, Part 2, p 37), but the marriage does not seem to have been a happy one She used her enormous wealth — St Gerlach in 1576 estimated her daily income at not less than 2,000 ducats (cf *Tagebuch*, Frankfurt 1674, p 266) — for many pious endowments Among these the most important were the two mosques built by her, one in Stambul at the Adrianople gate (*Edirne Kapusu Djāmiʿi*, cf Ewliyā, *Seyāhet nāme*, i 165, Hāfiz Husein, *Hadikat al Djawāmiʿ*, i 24 and J v Hammer, *G O R*, ix 50, N° 1) and the other (*Mihr-i Māh Sulṭān Djāmiʿi*, cf Ewliyā, *op cit*, i 472 *sq*, Hāfiz Husein, *op cit*, ii 186 and J v Hammer, *G O R*, ix 128, N° 741) near the landing-stage in Scutari The second was the work of the great architect Sinān [q v] who built it in 954 (1547) and also erected a palace for Mihr-i Māh in Scutari near this mosque After her husband's death (July 8, 1561) Mihr-i Māh Sultān intervened in political matters on several occasions, for example she continually urged upon her father that the conquest of Malta should be one of the main undertakings of the Holy War and offered to equip 400 galleys for this campaign at her own expense She was still alive at the reconciliation with her brother Selīm and his accession The correct date of her death, Jan 25, 1578 is given only by Gerlach, *Tagebuch*, p 449, the date in Karačelebi-zāde, *op cit*, p 458, namely Dhu 'l-Kaʿda 984 (Jan 20—Feb 18, 1577), is a whole year out She was buried beside her father in his *turbe* (tomb mosque) in Stambul From her marriage with Rustem Pasha two sons and a daughter ʿĀ'isha Khanum were born, the latter married the grand vizier Ahmed Pasha

Bibliography In addition to the references in the text, cf Mehemmed Thuraiyā, *Sidjill-i ʿothmānī*, i 83, J v Hammer, *G O R*, iii 393, 425 and pass, a description of the circumcision festivals of her sons Djihāngīr and Bāyazīd is given in the Turkish MS, N° 34, fol 43a *sqq* in the Pruss State Library (cf W Pertsch, *Verzeichnis*, 66) (Fr Babinger)

MIHRĀB (see also MASDJID I, D, c) Derivation of the niche The mihrāb niche has been given a twofold origin by Orientalists and historians of art from the Christian apsis and the Buddhist niche "Tout ce qui reste de la basilique dans le sanctuaire de la mosquée c'est la qibla, sorte d'abside atrophie" says M v Berchem in his *Notes d'archeologie arabe* (*J A*, vol xvii, 1891, p 427) The introduction of the niche mihrāb into the mosque is no doubt rightly ascribed to the Omaiyads, who were the first to build mosques of any size, under the influence of the Christian architecture of their lands The simple Arabian and Persian village mosques have no niches even at the present day According to tradition, Walīd I, when he visited the mosque built for him with the help of Byzantine masons in Medīna, was reproached with having built the mosque in the style of Christian churches (Wustenfeld, *Geschichte der Stadt Medina*, *Abh G W Gott*, ix, 1861) When ʿOmar b ʿAbd al-ʿAzīz in his Syrian buildings had the kibla made in the form of a niche, he provoked the opposition and anger of the zealots on account of the similarity which was thus produced between the mosques and churches H Lammens has collected a number of references, in which the mihrāb is roundly asserted to be copied from the Christians and to have become naturalised only with difficulty and not till the second century (*Ziyād*, p 94, note 1 quoted by C H Becker, *Zur Geschichte des islamischen Kultus*, *Islamstudien*, p 493) Perhaps the custom of placing several niches in the kibla wall of large mosques was also a gesture against the appearance of imitating the Christian custom On the other hand it should not be forgotten that the semicircular niche was one of the most widely disseminated forms of ornament in Mediterranean architecture and its adoption was much more natural than an imitation of the much larger Christian apsis The derivation of the mihrāb from the Buddhist or Hindu niche for idols has as much or as little in its favour as the other For it was only exceptionally that the Indian idol stood in a niche, but regularly it was in a separate quadrangular cell The separate phenomenon of the eastern polygonal mihrāb developed by the Turkish peoples, which was brought by the Seldjūks and other Turkish peoples to Asia Minor and is found in Mesopotamia from the end of the xiiith century can only be explained satisfactorily as a deliberate creation of its makers As the heart of the house of worship, the mihrāb forms the culminating point in the equipment of the mosque, and as the carrier of the varied forms of decoration and continually changing systems of Muslim decorative art through the centuries is of considerable importance in the history of art As a barometer of culture and art the mihrāb, if properly read, shows the prevailing tendency of art and its changes as a result of social changes The writing of its history is a task for the future and it can only be outlined here

History The kibla was originally indicated not by a niche but by some mark such as a strip of paint or a flat stone marked in some way. Ac-

cording to Abū Huraira, it was introduced into the first mosque of the Prophet in Medina "Instead of a miḥrâb or prayer niche a block of stone directed the congregation, at first it was placed against the northern wall of the mosque and it was removed to the southern when Mecca became the Kiblah" (R F Burton, *Personal Narrative of a Pilgrimage to Mecca and Medina*, 1874, II 72) The oldest mosque of ʿAmr in Fustāt of 21 (642) had no niche, but the kibla, accurately calculated, was marked (Corbett, *JRAS*, 1890, p 757–800) The Arabian use of slabs to indicate the kibla instead of a niche survived, alongside of the miḥrāb and in spite of it, for several centuries within and without Arabia The mosques in Arabia proper are still unknown and only a few buildings on the borders enable us to draw some conclusions The ruins of the xith—xiith century on Bahrain (Diez, *Eine shiitische Moscheeruine auf der Insel Bahrein*, *Jahrb d asiat Kunst*, 1925, II Halbband) and the mosque of Kisimkazi on Zanzibar (*JRAS*, 1922, pl III) show examples of a type later well known Such slabs of stone or stucco were frequently built into the front pillars of the harām down to the xiiith century to indicate the kibla They are to be found in Mōsul (Herzfeld, *Arch Reise*, II 277, 280) and they would certainly have been found in Baghdād for example had the old mosques survived there They gave the caliph and his representatives the opportunity, so limited in Islām, of perpetuating their names and boasting themselves helpers of Islām by presenting such flat miḥrābs Examples are the richly ornamented stucco slab presented by the vizier al-Afdal in the name of the Caliph al Mustansir (485 = 1092) to the mosque of Ibn Tūlūn and its counterpart ordered by Sultān Lādjin (696—698 = 1296—1298) (illustr in F Flury, *Die Ornamente der Hakim- und Ashar Moschee*, 1912, pl XVI) When Muslim architecture is deliberately developed on a grand scale however we find the miḥrāb in the viiith century as a semicircular shell shaped niche flanked by pillars, and this is the form that has survived essentially with local variations to the present day

Mesopotamia The oldest example here is the miḥrāb of the Djāmiʿ al-Khāssakī in Baghdād It consists of a single marble block 5′ 4″ inches high and 3′ 1″ broad with a semi-circular niche in it 12′ deep The columns have spiral grooves in them and Corinthian-like capitals upon which the horseshoe shaped shell is directly placed without an abacus The niche, otherwise smooth, has in the central axis a perpendicular strip of ornament as its sole decoration, which is quite devoid of any structural function and is quite in the textile-like style of later Islamic decoration Herzfeld supposes that this miḥrāb was brought by water about 145 A H for the newly founded Baghdād from North Syria or Diyār Bakr and suggests for this and similar miḥrābs of Northern Mesopotamia, the similar niches in Christian churches as models (*Isl*, I 35 *sqq*) The Khāssakī type of miḥrāb is found again in the walls of Āmid, which were built in 297 (910) by al-Muḳtadir (M v Berchem, *Inschriften aus Syrien* etc, coll by Frh von Oppenheim, De Beylie, *Prome et Samarra*, fig 42, v Berchem-Strzygowski, *Amida*, fig 12, 292, pl III *sq*) The change to the pointed arch however took place here probably by the tenth century, certainly in the xiith A D Instead of the semicircular we find also flat niches cut out in the form of a rectangle e g in the tomb of a holy man in Abū Huraira (Sarre-Herzfeld, *Arch Reise*, I 133 *sq*) The use of stucco, which is so easily worked, hastened the development of the form of the niche in the xiiith century In the mausoleum of the Forty Faithful (al-Arbaʿīn) in Takrīt there is a stucco miḥrab of 660 (1261—62) with a stepped arch in profile The tomb of Zainab in Sindjār of about 657 (1288) contains a richly decorated stucco miḥrāb completely covered with ornaments and scrolls (*Arch Reise*, p 308 *sq*, pl IV) This wealth of decoration may in turn have reacted on the niches of stone, as the rich miḥrāb of the great mosque of 543 (1148) and other niches in Mōsul show (*Arch R*, pl V XCI XCIII) In contrast to Persia, stone remained the usual material here We now find twisted little pillars with vase bases and vase capitals, zigzag arches and richly fluted bands with plumed fulcations (miḥrāb of Badr al-Dīn in Mōsul) The Hellenistic mussel-shell, so far as it still survives, lost its naturalism by turning the sphincteral structure into ornament The rectangular frame of the arch of the niche completed the adaptation of an originally Hellenistic type to the oriental spirit of architecture In the vacant field below the conch we here frequently have a mussel shell carved in relief We find variations like the flat rectangular niches with the base of the couch protruding as in the Djāmiʿ al ʿOmarīya (*Arch R*, pl CXXXV) When however we find in Pandjah ʿAlī in Mōsul in 686 (1287) i e under the Ilkhān Arghūn, a polygonal miḥrāb with stalactite canopy, we have apparently eastern, Seldjūk influence, which produced the abstract stereometric crystallisation of the details and general form Their seeming structural function is taken from the flanking pillars by direct continuation around the arch Finally we may mention the occurrence of corner miḥrābs in Mesopotamia when the kibla demanded it and it was not possible to orient the whole building properly Such exceptions were confined to sepulchral domes (Mashhad Imām ʿAwn al-Dīn in Mōsul cf Herzfeld, *Arch R*, pl CXXXV)

Syria The Mosque of the Omaiyads in Damascus has twelve miḥrābs in all (cf the plan by A Dickie, supplemented by C Watzinger and K Wulzinger, *Damaskus, Die islamische Stadt*) If systematically studied, they would probably give a conspectus of the development of the miḥrāb in Syria Only the principal miḥrāb appears, at least in its architectonic development, if not in its embellishment to go back to the time of the foundation of the mosque The other niches were put up mainly in the xivth century and later (*J A*, 1890, ser VII, p 185) The two favourite styles of decorating the walls in use among Byzantine workmen under Walid were *opus sectile* and glass mosaic They must have been used almost exclusively for the early mosques along with carved mouldings The description by Ibn Djubair, who visited the mosque in 580 (1184) i e not till after the first great fire of 461 (1069), gives us an idea of the miḥrāb as it then was, probably still predominantly Omaiyad The miḥrāb wall was covered with marble slabs, the arch of the niche had inscriptions in gilt letters on a blue ground, probably in mosaic, and had a quadrangular frame The wedges between arch and frame were decorated with the famous "vineyard of Walid", as we may safely assume, in mosaic The vaulting of the niche was probably adorned in the same way The frame

of the mihrāb was crowned by a miniature arcading, a motive which with others was taken to Spain (see below) and above this the wall was adorned with views of celebrated towns and trees in mosaic, the Kaʿba in the centre Remains of these mosaics still survive and the mosaics discovered a few years ago in the mosque by the French give us an idea of the splendour of their colouring The mihrāb destroyed in the fire of 1893 had a miniature arcading (illustr in Saladin, *Manuel*, fig 35), it had also an arch encircling it above, which also suggests an Omaiyad origin (According to Marçais, *La mosquee d'el Walîd à Damas et son influence sur l'architecture musulmane d'Occident*, *R A*, I., where the dependence of the mosque of Cordova on that of Damascus is discussed, in Damascus all arches were originally horseshoe-shaped — and as in the rebuilding — arranged in two stories as we see from old descriptions) Of the mihrāb of the Djamiʿ al-Aksā we know that it was covered with marble in 583 (1187) by order of Saladin It has a wide niche formed of segments, with a pointed arch The two sets of pillars with acanthus capitals are earlier than Saladin (Saladin, *op cit*, fig 28) Le Bon mentions two peculiar mihrāb niches in the transept of the mosque (*La civilisation arabe*, p 148 and fig 68) Under the Aiyūbids the use of interlacing patterns in stone was popular in Northern Syrian architecture They are sometimes rectilinear, sometimes rounded interlacings of textile origin which were used on the fronts of doors and prayer niches either in profile or as bands of stone in alternating colours The decoration of the mihrāb thus received a remarkable stimulus, as the prayer niches of the Madrasa al-Sultānīya and the Djāmiʿ and Madrasa al Firdaws of 633 (1235), both in Aleppo, and the mihrāb restored by Baibars of the Kubbat al-Silsile in Jerusalem, shew (picture in Creswell, *The Works of Sultan Baibars*, *B I F A O*, pl xxvi, pl 28, 29) Another peculiarity of the Syrian mihrāb is the occasionally found adornment of the vaulting of the niche with — it is true very rounded — views of buildings and trees in opus sectile, as an example of which we may take the mihrāb of the great mosque of Tripoli founded in 693 (1294) (pict in *M I F A O*, vol xxv 1909, pl 5) The later Syrian mihrābs continued the traditional encrusting with different coloured marbles to which Turkish influence added the stalactitic conch

Egypt The principal mihrāb of the oldest mosque that has survived in Cairo, the mosque of Ahmad b Tulūn, is thought to be the original one in its general structure The mosaic frieze with inscription at the level of the capitals and the marble covering below belong either to the restoration by Kalāʾūn or more probably to that of Lādjīn Thus a type was created in Cairo in the middle of the third century which is characterised by the double stepping of the niche with two pillars on each side, in this case taken from old Christian buildings and by the stilted pointed arch and rectangular frame, this form became the Egyptian model In place of the Mesopotamian conch, the top of the niche was smooth and probably, as in Kairawān, painted The narrow top continued through the Fāṭimid period while the double recess of the niche with pillars gives all later Cairene miḥrābs their character A stucco mihrāb of the fourth (tenth) century, only the upper third of which has survived in its original form, of which there is a copy in the Arab Museum, had the same structure with two pairs of pillars The conch was imposed later (Flury, *Ein Stuckmihrâb des IV (X) Jahrhunderts*, *Sarre-Festschrift*, 1925, *Jhb d as K*) The stucco mihrāb of the sepulchral mosque of Diiyūshī on the Mukattam in Cairo, a century later (478 = 1085) and particularly richly decorated, has a similar niche with a high pointed top (pict in Flury, *Ornamente loc cit*, pl. xvii, Springer, *Hdbch d Kg*, vi, fig 400) It is to be assumed that the original mihrābs of the Fātimid mosques of Hākim and al Azhar also belonged to this group The al-Akmar mosque, completed in 519 (1125) introduced a new motif in its façade, which was much imitated in Cairo, the placing of a row of ribs like the corrugation of a shell along the top of the niche The stucco mihrāb already mentioned, a copy of which is in the Arab Museum, must have been embellished about this time by a mussel shell The mihrāb in the sepulchral chapel of Shadjarat al-Durr [q v] the widow of Sultān Sālih Nadjm al Dīn Aiyūb of c 648 = 1250 (fig in R L Devonshire, *Some Cairo Mosques*, London 1921, p 32) shows this fashion in a much more decided and more advanced mugharnasised stage Such variations were however the exception On the other hand the stucco mihrāb survived down to the Mamlūk period Creswell, for example, ascribes the stucco mihrāb on the outside of the north wall of the mosque of ʿAmr, rebuilt by Sultān Baibars, to the time of Baibars on grounds of style (658—676 = 1260—1277) (*The Works of Sultan Baibars*, *B I F A O*, xxvi 1926) The splendour of the exceedingly thick stucco ornamentation in relief is here increased by the *mugharnat* in the miniature arcading of the upper part of the niche Stucco decoration thus reached its last effective possibilities With the Mongol invasion of Syria, Syrian influence on Egyptian art was renewed (Cairo also benefited by the taking of Mōsul by the Mongols in 653 = 1255 and the resultant migration of the celebrated coppersmiths of Mōsul to Cairo, where from this time on the art of the metal-worker flourished, cf Creswell, *op cit*, p 182) Syrian influence also brought the Syrian mihrāb overlaid with marble slabs and stone mosaic to Egypt, where it drove out the other types and became predominant The oldest prayer niches of this new kind appear in the buildings of Kalāʾūn at the end of the viith (xiiith) century The flanking double pillars give them their Gothic grace and elevation The arches are usually composed of alternating coloured wedge shaped stones serrated in various ways The walls of the niches are decorated with mosaic in geometric patterns between miniature arcading and the conch vaulting overlaid with light and dark strips of colour alternating (often zigzag) Exceptionally we also find glass mosaic, as in the masdjid of the Mūristān of Kalāʾūn Under the late rulers of the Circassian Mamlūks the decoration of the niche reached its height The inlaying was done with all kinds of costly materials such as mother-of-pearl, turquoise, agates, ivory (Madrasa of Abū Bakr b Muzhir and al Ghūrī cf Briggs, *Muh Arch*, fig 119 and 127)

A small group by itself is formed by the three portable mihrābs of the vith (xiith) century from al-Azhar, Saiyida Rukaiya and Saiyida Nafīsa which are now preserved in the Arab Museum

Maghrib The history of the miḥrāb in the

western lands of Islām begins with the prayer niche in the great mosque of Ḳairawān It was not the direct model for the later miḥrābs — this was reserved for the portal of the library of this mosque — but with its wide semi-circular niche and the slightly rounded but still pointed arch it forms the transition to the western form of miḥrāb The pillars of mottled red and yellow stone rest on late antique bases and support pseudo-Byzantine porphyry capitals the abacuses of which are decorated with Kūfic inscriptions The wall of the niche is covered with marble slabs, some perforated, some carved in relief, the frames of which also bear inscriptions Behind is a recess The vaulting of the niche still shows traces of having been painted with vine tendrils arranged in circular patterns, which remind one of Mshattā (pictures in G Marçais, *Coupole et plafonds de la Grande Mosquée de Kairouan*, 1925, pl viii) The frieze separating the recess and the vaulting of the niche, and the surrounding walls are covered with the famous lustre tiles made, some in Baghdād and some by a Baghdād artist in Tunis, and presented in 281 (844) by Ibrāhīm b Aghlab This remarkable miḥrāb of the early period, when Islām was still in search of a style, thus combines all that the empire could produce in decoration, sculpture, painting, both richly brightened by gold and shining tiles The fully developed western style is found a century later in the miḥrāb of the Mezquita in Cordoba This miḥrāb, built by Ḥākim II about 970, consists of an isolated heptagonal space 12 feet broad and 23 to 26 feet high One side is formed by the wall containing the door The floor and walls are covered with rectangular pieces of white marble, above are a frieze of inscriptions and the cornice, on which a richly carved niche wall with clover leaf arch on marble pillars with gilt capitals forms the upper part, which again terminates in an inscribed frieze and is covered by a single piece of marble in the shape of a mussel shell In the inscription on the outer wall the artist is mentioned "the work of Badr b. al-Khaiyān" The historically important part here is the entrance wall to this chamber, which consists of a horseshoe-arch gateway with rectangular frames and miniature arcading at the top This form of wall, which now becomes typical for miḥrābs and portal walls in most lands of the Maghrib and shows its own course of development, has been traced to the portal wall of the library of the great mosque in Kairawān as the earliest model, or both go back to a common Syrian original (cf Marçais, *Manuel*, i 264 *sq*) In Cordoba we meet with a special shape of the miḥrāb recess, the origin of which is doubtless different from that of the niche and goes back to an original with special functions connected with the cult of relics and of the dead According to tradition, a relic of the Prophet was actually preserved in this space and the believers used to pay reverence to it in a sevenfold circumambulation A quite singular, similar, isolated miḥrāb is found in the madrasa in Khargird, Khurāsān (cf MASDJID and below PERSIA) (Whether here we have the influence of the *pradakshina* of the Indian cult of relics cannot be settled The circumambulation of altars, tombs of saints, and other sacred objects was of course a widespread custom in northern lands also) Horseshoe-arches, multiple rectangular border and miniature arcade are the typical elements of the henceforth canonical miḥrāb wall The wedge-shaped stones of the horse-shoe arch are not serrated in complicated fashion, as in Egypt and Syria, but usually alternate in colour and are all smooth, as in Cordoba, or alternately smooth and carved in relief In Cordoba the spandrils are still filled with palm-branches and acanthus-like tendrils in relief and the two borders decorated with Kūfic inscriptions (cf R Amador de los Rios, *Inscriptiones arabes de Cordoba*, Madrid 1892) The niches of the miniature arcading with clover-leaf arches are covered with mosaic (pict in E Kühnel, *Maurische Kunst K d O*, pl 13, 14) The wall of the pentagonal miḥrāb niche in the great mosque of Tlemsen of about 1135 A D is similarly formed (pict in Kühnel, *op cit*, pl 24) But we already find here in the spandrils the isolated rosettes which first appear on the miḥrāb of the Aljaferia in Saragossa of the second half of the eleventh century (pict in Marçais, *Manuel*, fig 215) The miḥrāb wall of the Almohad mosque in Tinmāl in the Atlas (1153 A D shows, instead of the tendrils, a woven pattern such as is often found on carpets (pict in Marçais, *op cit*, fig 216), and in place of the miniature arcading we have round arched windows alternating with flat niches A divergence from the canonical type is found in the miḥrāb of the mosque in Tozeur built in 590 (1194) in the oasis of Djerid (pict in Marçais, *op cit*, fig 218) It has a double arch and profuse ornamentation, on the wall of the niche also Marçais explains the divergence by saying that the mosque was built by a conqueror of Almoravid descent in the Almohad period by workmen from Andalus The niche bears the stamp of hurried improvisation The miḥrāb here reproduced, in the Sīdī Okba mosque in the Siban oasis at Biskra which is considered the oldest mosque in Algeria, may be regarded as an example more in the popular tradition, therefore particularly interesting The date is unknown The decoration belongs to the field of *Kleinkunst* Under the dynasties which succeeded the Almohads from the xiii—xvi th century the Cordoba type remains the model in principle Only the proportions are more slender, the horseshoe arches more elegant and, instead of the miniature arcading, windows with coloured glass in a stucco framework have become naturalised The isolated miḥrāb chambers have given place to semicircular or polygonal niches Examples are the *mahārib* of the mosques in Taza, Sīdī bel Hasan and al-ʿUbād in and near Tlemsen, in Fās and the Hamrā of Granada, the latter covered with mosaic (pict. in Marçais, *op cit*, fig 336—338 and P Ricard, pl x, xi) In Tunis of the xv—xviii th century also the miḥrāb with flat round niche and horseshoe arch of alternately coloured and ornamented stones and rectangular frame continued to predominate The plinths are regularly covered with marble or tiles, while the niche vaultings are fluted like a mussel shell

Persia, Turkestan, Afghānistān The two earliest prayer niches in Persia, so far as is kown, are in the mosque at Nāyin, east of Isfahān, of the ix—x th century A D (Viollet and Flury in *Syria*, 1921, pl xxx and S Flury, in *Syria*, 1930) and in the *Iwān* at Khargird, Khurāsān, of the xi—xii th century (Diez, *Churasanische Baudenkmäler*, pl 30)

In spite of their different ornamentation, these

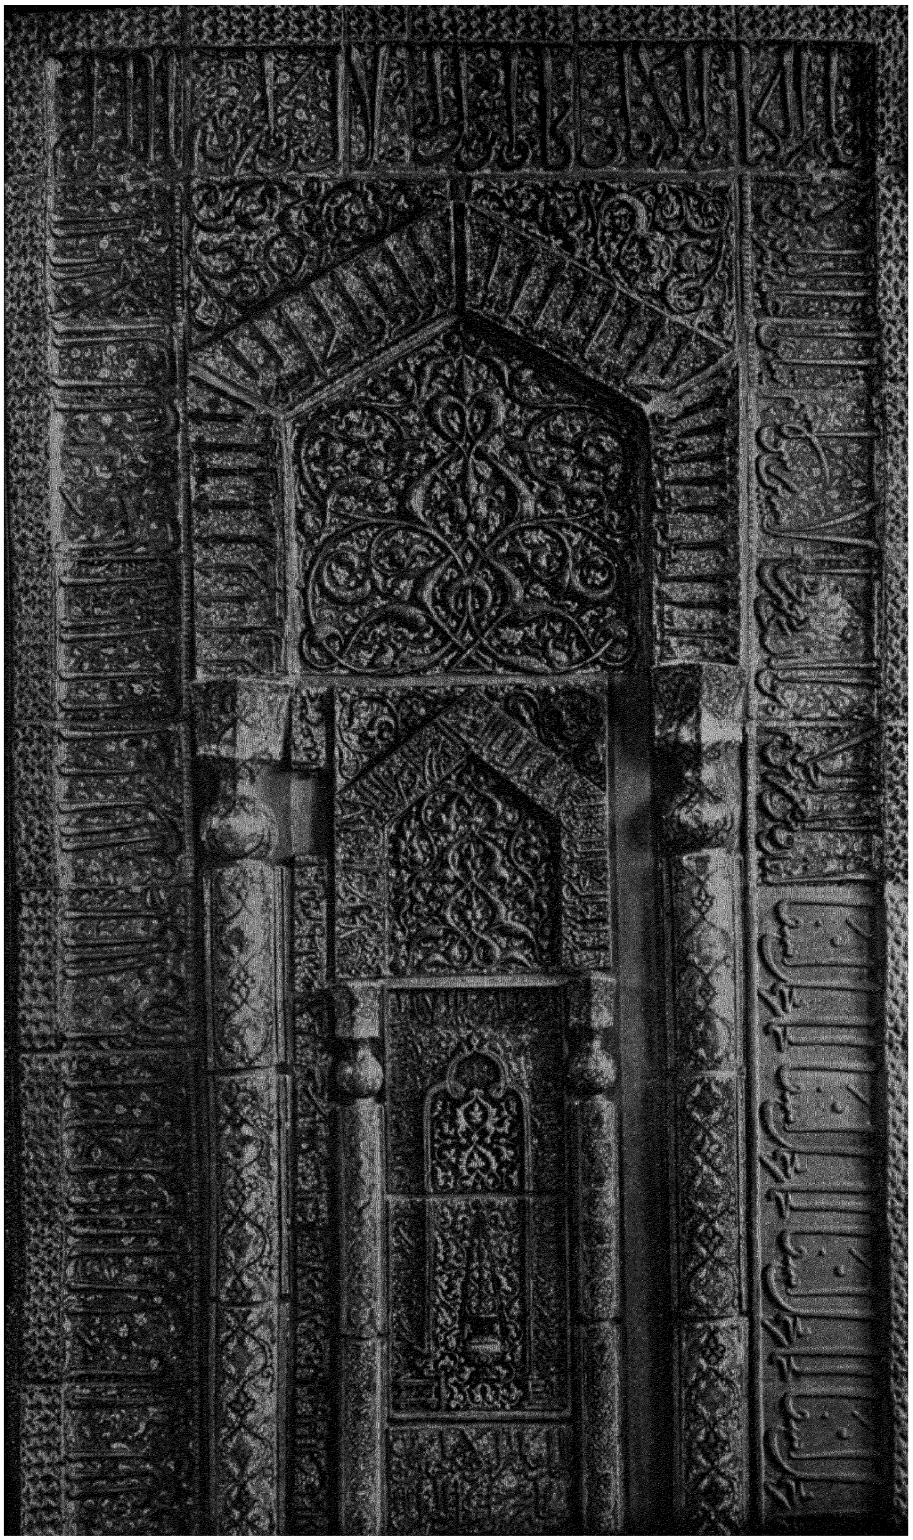

Fig. 10. Persian frieze with lustre decoration.

two stucco miḥrābs are very similar Both are rectangular niches flanked by inset $^3/_4$ pillars with leaf capitals, with pointed conches diagonally set and thickly decorated with tendrils in a rectangular frame The back wall under the conch presents a repetition of the architecture of the niche so that we have a niche in a niche In Persia therefore, if Flury is right in his early dating, perhaps as early as the third (ninth) century, a rich double framed style of miḥrāb had been developed, which lasted down to the xivth century, as is shown by the next surviving monument of this group, the stucco miḥrāb in the Masdjid-i Djum^{c}a in Isfahān of 710 (1310) (Diez, *K d Isl Volker*, p 109, 2nd ed , p 85) In the interval however the decoration, at first purely floral, had become mainly epigraphic, a transition that can be followed step by step from the xith century The stucco miḥrāb of the mosque of Djuyūshi on the Mukattam in Cairo of 478 (1085) is also of importance for this sequence of development (pict in Flury, *Ornamente* etc , pl xvii)

But in Persia a second type developed alongside of the stucco miḥrāb, the miḥrāb decorated with lustre faience, with which this part of the decoration of the mosque and with it Persian faience reached its zenith The lustre miḥrāb of Kāshān of 624 (1226) in Berlin (pict in Springer's *Kunstgeschichte*, vi 438) and a similar niche from Warāmīn in the possession of the firm of Kelekian (*Cat of the Exhib of Persian Art*, London 1931) may be quoted as examples These miḥrabs show the same double niches as their stucco counterparts but are flatter, more framework than niche In place of the curved arch, the canopy is a rectilinear gable, a change in shape probably mainly due to the material The colours are predominantly a light blue ground with letters in dark blue relief and decorations in brown lustre By the combined effect of the colours and the profuse ornamentation, these miḥrābs have a truly fairylike suggestion and reach the highest ideal of Islāmic decorative art The miḥrāb assumed a new form in the Timūrid period Instead of the semi-circular or flat rectangular niche we now find under Turkish influence the polygonal — pentagon constructed out of an octagon — of larger dimensions than previously, broader and deeper The ornamentation proceeds parallel with the usual Timūrid wall decoration In the same way the plinth is covered breast high with polygonal tiles and the walls above usually with flat miniature arcading, which pass into vaulted mugharnat painted or covered with tiles Finally the frames and the scrolls of inscription filling them are frequently inlaid with that finely executed tile-mosaic which forms the glory of Timūrid architectural ornament As examples may be mentioned the miḥrābs in the praying chambers of the madrasa in Khargird (Diez, *Chur Baudenkmäler*, pl 33, 1), the miḥrāb of Ziyāret Abī Walīd near Herāt (Niedermayer Diez, *Afghanistan*, fig 174), the splendid prayer niche in the mosque of Djawhar-Zāde in Mashhad (Diez, *K d isl Volker*, v fig 146 and 108) all of the ixth (xvth) century The miḥrāb in the splendid medrese in Herāt, now destroyed, must have been similar to that in Meshhed, here reproduced, having been founded by the same princess and probably built by the same architect (cf above iii p 387^{b}) In the Ṣafawid period, we find alongside of miḥrābs with mosaic and mugharnat also painted niches, which show intertwining tendrils standing out in white from a brick red ground Miḥrābs like this are to be seen in the ruins of the Musallā outside Isfahān and in Reshhār, Khurāsān (fig Diez, *Chur Baudenkmaler*, pl 22, 3) They seem to have been very widely disseminated. It may be mentioned in conclusion that in place of a prayer niche in the *Kibla-iwān* of the Timūrid madrasa in Khargird, there is a rectangular windowless chamber, accessible by a doorway through the *iwān* The similarity with the miḥrāb chambers frequently found in the Maghrib is remarkable and is discussed under Spain

India No mosques earlier than the xiiith century have survived in India In the mosques of the xiiith—xvith centuries the prayer niches are built in Indian fashion, that is to say flanked by decorated Indian pillars and adorned with Indian ornamentation The gable-shaped panels over the niches are particularly ornamental The wall of the niches is usually adorned in relief with a lotus rosette and a pendant vase out of which grow tendrils Numerous niches of this kind are to be found in mosques of Gudjarat and Ahmadābād of the xivth—xvith centuries An Indian peculiarity is the placing of three to five, sometimes even seven miḥrābs in the kibla wall in keeping with the architectonic units of the main building, each marked by a dome (Djāmi^{c} Masdjid in Bharoch, and Champanir, Gudjarat etc) There are also mosques with miḥrāb chambers, which we can assume with Havell to be adaptations of the former cells for idols (Dholka, Gudjarat, Khans Masdjid and Ahmadābād) It is therefore not impossible that isolated miḥrāb chambers outside of India, as in Khargird, Persia, or even in the Maghrib, should be traced to Indian influence, although this feature is not found in the earliest mosques in Adjmīr and Dehli In Gudjarat however these chambers might have been used as miḥrābs in the oldest mosques and provinces with a sea coast and international trade may have had influence abroad (cf *Arch Survey of India, Western India*, vol vi , vii , Gudjarat, Ahmadābād) When Persian influence began to be felt under the Moghul emperors, the Indian elements gradually disappeared from the miḥrābs and their place was taken by the polygonal niche in the wall incrusted with coloured marble Under Akbar Indian detail still survived The arches of the miḥrāb of the great mosque in Fathpur Sikrī, for example, are edged with a lacework of carved palmette friezes, the material is stone but the inlay work imitates the Persian tiled miḥrābs (pict in V A Smith, *A History of Fine Art in India* and Diez, *K d isl Volker* p 229 and p 141) In the court mosques of Agra and Dehli we find dazzling white marble miḥrābs with coloured intarsia of flowers The most splendid miḥrāb in India and indeed in all the lands of Islām is the niche of the Friday mosque in Bidjāpūr, the former capital of the ^{c}Ādil Shāhs in the Dekhan The only rival that it can ever have had is Walīd's miḥrāb in Damascus Framed by a gigantic arch resting on double pillars, the pentagonal niche recess constructed out of an octagon goes deep into the wall on whose surfaces the motif of the niche is three times repeated The central of the three niche areas is mystically marked by a gilt eight-pointed star as the real ḳibla In gigantic letters of gold the two sacred names Allāh and Muhammad in the spandrils of the arch impress themselves on the hearts of the worshipper, and chime in

afresh in the drumshaped flanking pillars, which in Bīdjāpūr decoration are frequently used as conventional ornament but are here of structural importance Manāras and sepulchral domes crown the structure and their principal motive is again a niche in the centre This imposing decoration is carried out in shallow relief and is painted with red, blue and black colours heightened with gold In the rectangular fields on both sides and in the arches are inscriptions on bands and in medallions of which we give Cousens translation of one because it sums up Muslim philosophy in a nutshell

"Place no trust in life it is but brief"
"There is no rest in this transitory world"
"The world is very pleasing to the senses"
"Life is the best of all gifts but it is not lasting"
"Malik Ya'kūb, a servant of the mosque and the slave of Sultān Muhammad, completed the mosque"
"This gilding and ornamental work was done by order of the Sultān Muhammad 'Ādil Shāh, 1045" (1636 A D)

Asia Minor, Armenia and Turkey The mihrāb took a development quite of its own among the Seldjūks of Rūm Instead of the descendant of the high, Hellenistic round niche, we find here a prayer niche which rather resembles a hearth and is probably to be explained as an adaptation of the prayer carpet to this form of building The appearance of these niches, which are thus of no structural significance, is however made up for by their stereometrically crystallised cone-shaped vaulting formed of cells The Turkish art of the Seldjūks brought as its dowry to the art of the Muslim world the Mugharnat, the suggestion of which, it in turn owed to Buddhist art, for the Seldjūks came from Central Asia where Buddhist art had long prevailed During the short period of Seldjūk architecture in Asia Minor, the xiiith century, the form of the niches remained unaltered They are low rectangular shallow niches with pillars built in without bases, which bear rhombohedral crystal bodies as capitals and come to a point with the conical cells of the vaulting The spandrils and frames are inlaid with the usual Seldjūk white, blue and black tile mosaic (pict in Loytved, Sarre, Springer-Kuhnel and Diez, *op cit*)

The most important change undergone by this early Turkish mihrāb in Ottoman architecture was the raising of the supporting niche to its full height The niche assumed polygonal form, i e it has three or five surfaces constructed out of the octagon, such as we find in India and Persia from the xvith century, it was however raised higher and looks more slender and regularly ends in a mugharnat cone The decoration consists mainly of marble and Turkish tiles A moulded trinfoil frieze formed the usual framework for the whole The combination of Byzantine and early Turkish elements, the hard forms and a certain rationalism in execution give these mihrābs that cold appearance which is peculiar to Ottoman art

Worthy of mention is the splendid miḥrāb of the Ulū Djāmi' in Wān in the Persian style with mosaics of glazed brick terracotta reliefs and inscriptions, a niche with a mugharnat (xiith—xiiith centuries, pict in Bachmann, *Kirchen und Moscheen in Armenien*, pl 62)

Bibliography The references given under MANĀRA and MASDJID apply also to MIHRĀB The mihrāb has not yet had separate studies devoted to it The following works have been specially used here F Sarre and E Herzfeld, *Archäologische Reise*, 4 vols, E Herzfeld, *Die Genesis der islamischen Kunst und das Mschatta-problem* (for the Khāssakī Mihrāb), in *Isl*, 1, M v Berchem and J Strzygowski, *Amida*, H Viollet und S Flury, *Un monument des premiers siècles de l'hegire en Perse*, in *Syria*, 1921, S Flury, *La mosquee de Nâyin*, in *Syria*, 1930, do, *Die Ornamentik der Hakim und Ashar Moschee*, Heidelberg 1912, do, *Ein Stuckmihrâb des IV (X) Jahrh* (*Jahrb d as Kunst*, 1925), E Diez, *Eine schiitische Moscheeruine auf Bahrein* (*Jahrb d as Kunst*, 1925), do, *Die Kunst der isl Volker*, *Handbuch d Kunstwissenschaft*, do, *Churasanische Baudenkmaler*, K A C Creswell, *A brief Chronology of the Muhammadan Monuments of Egypt to A D 1517*, *B I F A O*, xvi, do, *The Works of Sultan Bibars in Egypt*, *B I F A O*, xxvi, P Ravaisse, *Sur trois mihrâbs en bois sculpte*, *Mem Inst Egypt*, ii 1889, G Marçais, *Manuel d'art musulman*, 2 vols, 1926, E Kuhnel, *Maurische Kunst*, *K d Orient*, vol ix, H Saladin, *La mosquee de Sidi Okba à Kairouan*, G Marçais, *Coupoles et plafonds de la Grande Mosquee de Kairouan*, J H Loytved, *Konia*, *Inschriften der seldschuqischen Bauten*, C Gurlitt, *Die Baukunst Konstantinopels*, *Arch Survey of India*, *Western India*, vols vi and vii, H Cousens, *Byapur, a Guide to its Ruins*, Poona 1923 (E DIEZ)

MIHRĀN, the name given by Muslim writers to the Indus (Sanskrit *Sindhu*), called by the Greeks Σίνδος and Ἴνδος, by the Romans *Sindus* and *Indus*, and by early Muslim writers *Āb i Sind* (the Water of Sind) The name is more particularly applied to the lower reaches of the river, after it enters Sind Pliny writes of "Indus, incolis Sindus appellatus"

The Indus rises in 32° N and 81° E, receives the Kābul river almost opposite to Ātak, and the Pandjnad, the accumulated waters of the five rivers of the Pandjāb, just above Mithankot Near Kashmor, in 28° 26′ N and 69° 47′ E, the river enters Sind, and below Bakkar is locally known as *Daryā*, "the Sea" It falls into the Arabian Sea in 23° 58′ N and 67° 30′ E Its drainage basin is estimated at 372,700 square miles and its length at a little over 1,800 miles

The courses of the Indus and its tributaries have undergone, even in historical times, extensive changes of which it is impossible to give details in this article, and which have misled historians who have disregarded them They have been minutely and elaborately described in *J A S B*, vol lxi (1892) by the late Major H G Raverty, who has illustrated his scholarly monograph by a series of admirable maps (T W HAIG)

MIHRGĀN [See MIHR]

MIHRĪ KHATUN (originally Mihr-i Māh), an important Turkish poetess of the end of the xvth and beginning of the xvith centuries She belonged to Amasia, which produced a number of poets, and spent her whole life there She was one of the family of Pīr Ilyās Her father was a kāḍī and wrote poetry under the *makhlaṣ* of Belāī She inherited from him her poetic gifts and also

received from him the poetic and theological training ascribed to her by Ewliyā

Not much is known of her life This is in part to be explained by the reticence of the East regarding women That in the East boys rather than girls are sung of in love songs is due not so much to a preponderancy of paederasty as to a disinclination to talk of women at all She died in 912 (1506) Her tomb in Amasia is a place of pilgrimage She belonged to the literary circle of prince Ahmad, the second son of Sultān Bāyazīd, who was governor of Amasia in 886–918 (1481–1512) Of a circumcision festival in the konak of the prince in 911 (1505), it is recorded that Mihrī was the chief of the poets present

In spite of the love affairs credited to her and sung by her (with Iskender, son of Sinān Pasha, with Mu'aiyad-zāde [born 860 = 1456] and others), the Turkish biographers emphasize besides her beauty her virgin life, in spite of the glowing fervour with which she described her nights of love Her nature was evidently not quite clearly understood by the *tezkeredjī* Contrary to the Oriental custom, Mihrī remained unmarried in spite of many wooers It is not improbable that the experiences described by her are not quite inventions but evidence of her passionate nature which drove her to unfettered love Mihrī's great merit is that she did not suppress her femininity, so that in her poems she reveals a truly womanly soul In this respect, she is the most personal among Turkish poetesses

As a woman she found it doubly difficult, in view of the restrictions on her sex at the time, to win a place as a poet, as the study of the Persian poets was absolutely necessary for this The energy with which she managed to achieve her aim is remarkable Her chief model was Nedjātī (d 914 = 1509), the most important poet of the period, with whom she tried to compete Most of her pieces are written in Nedjātī's manner She is not very original, but very few Turkish poets are In language and in images she is conventional But her freshness, directness and passionate feeling, in which no other poetess equals her, are remarkable Her eloquence and brilliant style were proverbial

She left a *Dīwān* (edition in preparation by Martinovitch) and several treatises in rhyme A number of her poems have been made accessible to us by Smirnow According to Ewliyā's statement (in MSS, not in the printed text), she also composed *risāla*'s on *fikh* and *farā'id*

MĪKĀL, the archangel Michael [cf MAIKĀ'IKA], whose name occurs once in the Kur'ān, viz in sūra ii 92 "Whosoever is an enemy to Allāh, or his angels, or his apostles, or to Gabriel or to Michael, verily Allāh is an enemy to the unbelievers" In explanation of this verse two stories are told According to the first, the Jews, wishing to test the veracity of the mission of Muhammad, asked him several questions, on all of which he gave the true answer Finally they asked him who transmitted the revelations to him When he answered, Gabriel, the Jews declared that this angel was their enemy and the angel of destruction and penury, in opposition to Michael whom they said to be their protector and the angel of fertility and salvation (Tabarī, *Tafsīr*, i 324 *sqq*) — According to the second story, °Umar once entered the synagogue (*midrās*) of Madīna and asked the Jews questions concerning Gabriel They gave of that angel as well as of Michael an account similar to the one mentioned above, whereupon °Umar asked What is the position of those two angels with Allāh? They replied Gabriel is to His right and Michael to His left hand, and there is enmity between the two Whereupon °Umar answered If they have that position with Allāh, there can be no enmity between them But you are unbelievers more than asses are, and whosoever is an enemy to one of the two, is an enemy to Allāh Thereupon °Umar went to meet Muhammad, who received him with the words Gabriel has anticipated you by the revelation of "Whosoever is an enemy" etc (sūra ii 92, Tabarī, *Tafsīr*, i 327, Zamakhsharī, p 92, Baidāwī *ad* sūra ii 91)

We do not know of any Jewish traditions which ascribe to Gabriel a hostile attitude towards the Jews For the statements regarding Michael as communicated above, there is sufficient literary evidence In Daniel xii 1 Michael is called the great prince, the protector of the people of Israel, cf *Targum Canticum*, viii 9 "Michael, the lord of Israel", Daniel x 13, 21 where Michael is said to have protected the Jews against the kings of Persia and Greece, further 1 Enoch xx 5 where he is called the protector of the best part of mankind, *Testamentum Levi*, xv 6, *Test Dan*, vi 2

In *Vita Adae et Evae*, chap xii *sqq*, it is Michael who orders Satan and the other angels to worship Adam Although the story is mentioned several times in the Kur'ān [cf IBLĪS], there is no trace in Muslim literature of the role ascribed to Michael in *Vita Adae et Evae*, the only mention of Michael in the Muslim legend is that he and Gabriel were the first to worship Adam, in opposition to Iblīs who refused to do so (al Kisā'ī, p 27)

Neither does Muslim literature seem to have preserved other features ascribed to Michael in Jewish Apocrypha (mediator between God and mankind, 1 Enoch xl 9, *Test Dan*, vi 2, 3 Baruch, xl 2), or in the New Testament (Ep Jude, vs 9 Michael disputing with the devil about the body of Moses, Revelation xii 7 *sqq* Michael and his angels

fighting against the dragon and the final discomfiture of the latter) Perhaps a faint recollection of Michael as the protector of mankind (the Jews, the Christians) may be found in the tradition according to which Michael has never laughed since the creation of Hell (Ahmad b Hanbal, iii 224) Further, however, Michael is rarely mentioned in *hadīth* (Bukhārī, *Bad' al-Khalk*, b 7, where he, together with Mālik, the guardian of Hell, and Gabriel, appears to Muhammad in a dream, Nasā'ī, *Iftitāh*, b 37 where Michael incites Gabriel to urge Muhammad to recite the Kur'ān according to seven *ahruf*)

al Ya'kūbī mentions a story of which we have no counterpart in Jewish or Christian literature either, which is not amazing, the story bearing an outspoken Shī'ite tendency One day Allāh announced to Gabriel and Michael that one of them must die Neither however was willing to sacrifice himself in behalf of his partner, whereupon Allāh said to them Take 'Alī as an example, who was willing to give his life on behalf of Muhammad (the night before the *hidjra*, Ya'kūbī, ii 39)

Michael is further mentioned by name as one of the angels who opened the breast of Muhammad before his night journey (Tabarī, ed de Goeje, I, 1157—59, Ibn al-Athīr, ed Tornberg, ii 36 *sq*), and as one of those who came to the aid of the Muslims in the battle of Badr (Ibn Sa'd, II/1 9, 18)

In the text of the Kur'ān as well as in a verse cited by Tabarī (ed de Goeje, I, 329), the form of the name is Mīkāl as if it were a *mif'āl* form from *wakala* (Horovitz) A direct reminiscence of the Greek, probably also of the Hebrew and Aramaic, forms of the name is to be found in the tradition preserved by al-Kisā'ī (p 12), which calls Mīkhā'īl the attendant of the second heaven, in contradistinction to Mīkā'īl, who is the guardian of the sea in the seventh heaven (p 15) Other forms of the name are Mīka'īl, Mīkā'īl, Mīka'īl, Mīkā'īn and Mikā'īll It is hardly necessary to say that in the magical use of the names of the archangels that of Mīkā'īl is on the same level as that of his companions (e g Zwemer, *The Influence of Animism on Islam*, p 193, 197)

(A J Wensinck)

MĪḲĀT (A, *mif'āl-form* from *w-k-t*, plural *mawākīt*) appointed or exact time In this sense the term occurs several times in the Kur'ān (sūra ii 185, vii 138, 139, 154, xxvi 37, xliv 40, lvi 50, lxxviii 17)

In *hadīth* and *fikh* the term is applied to the times of prayer and to the places where those who enter the *haram* are bound to put on the *ihrām* For the latter meaning of the term cf IHRĀM, i

Although some general indications for the times at which some *salāts* are to be performed occur in the Kur'ān (cf sūra ii 239, xi 116, xvii 80, xxiv 29) it may be considered above doubt that during Muhammad's lifetime neither the number of the daily *salāts* nor their exact times had been fixed and that this happened in the first decades after his death

A reminiscence of that period of uncertainty may be preserved in those traditions which apply a deviating nomenclature to some of the *salāts* The *salāt al-zuhr* e g is called *al-hadjīr al-ūlā*, the *salāt al-maghrib*, *'ishā'*, the *salāt al 'isha'*, *'atama*, the *salāt al fadjr*, *ghadāt* (Bukhārī, *Mawākīt al Salāt*, bāb 13, 19) In other traditions the term *al-'atama* as applied to the *salāt al 'isha'* is ascribed to the Beduins and prohibited (Muslim, *Masādjid*, trad 228, 229, Abū Dāwūd, *Hudūd*, bāb 78, Ahmad b Hanbal, *Musnad*, ii 10 etc), cf on the other hand Bukhārī, *Mawākīt*, bāb 20, Muslim, *Salāt*, trad 129 etc, where the term *'atama* is used without censure

From some traditions so much may be gathered, that the — or at least some of the — Umaiyads showed a predilection for postponing the times of the *salāt* (Bukhārī, *Mawākīt*, b 7, Muslim, *Masādjid*, trad 166, 167, al-Nasā'ī, *Imāma*, b 18, 55, Zaid b 'Alī, *Madjmū' al-Fikh*, N° 113).

In opposition to this a *salāt* in due time is declared the best of works (Bukhārī, *Djihād*, b 1, *Mawākīt*, b 5, Muslim, *Īmān*, trad 138, 139, Tirmidhī, *Salāt*, b 13, *Birr*, b 2) In other traditions this is said of a *salāt* at its earliest time (Tirmidhī, *Salāt*, b 13)

This early state of things is reflected in several respects in a tradition according to which 'Umar b 'Abd al-'Azīz once postponed one of the *salāts* and was rebuked for this by 'Urwa b al Zubair, who related to him that al-Mughīra b Shu'ba had once been rebuked for the same reason by Abū Mas'ūd al-Ansārī, on account of the fact that Gabriel himself had descended five times in order to perform the five *salāts* at their exact times in the presence of Muhammad Thereupon 'Umar admonished 'Urwa to be careful in his statements (Bukhārī, *Mawākīt*, b 1, Muslim, *Masādjid*, trad 166, 167, al-Nasā'ī, *Mawākīt*, b 10)

Some early groups of traditions affect to reproduce reminiscences of the practice in Madina in Muhammad's time

a The *salāt al-zuhr* was performed at noon, when the sun was beginning to decline (Bukhārī, *Mawākīt*, b 11),

b the *salāt al 'asr* when the sun was shining into 'Ā'isha's room, no shadows being yet cast there (Bukhārī, *Mawākīt*, b 13, Muslim, *Masādjid*, trad 168) After this *salāt* people had still time to visit the remotest parts of the town, while the sun was still "alive" or "pure" (Bukhārī, *Mawākīt*, b 1, 13, 14, 18, 21),

c the *salāt al maghrib* was finished at a time when people could still perceive the places where their arrows fell down (Bukhārī, *Mawākīt*, b 21),

d the *salāt al-'ishā'* was sometimes postponed till a late hour, sometimes till the first third of the night had passed (Bukhārī, *Mawākīt*, b 11, 20, 21, 24),

e the *salāt al-fadjr* was performed by Muhammad at a time when a man could discern his neighbour (Bukhārī, *Mawākīt*, b 13), but the women on their way home could not yet be recognised (Bukhārī, *Mawākīt*, b 27)

In a second layer of traditions these general indications are specified by the mention of the first and the last limits allowed for the different

prayers (cf e g Muslim, *Masādjid*, trad 176, 177) On one day Muhammad performed

a the *ṣalāt al ẓuhr* when the sun began to decline,

b the *ṣalāt al-ʿaṣr* when the sun was still high, white and pure,

c the *ṣalāt al maghrib* immediately after sunset,

d the *ṣalāt al-ʿishā'* when the twilight had disappeared,

e the *ṣalāt al-fadjr* at daybreak

On the following day Muhammad performed

a the *zuhr* later than the day before,

b the *ʿaṣr* later than the day before, the sun being still high up,

c the *maghrib* before the twilight had disappeared,

d the *ʿishā* when the first third of the night had passed,

e the *fadjr* when sunrise was near (*asfara bihā*)

In a tradition communicated by al-Shāfiʿī (*Kitāb al-Umm*, 1 62) the fixing of the mawākīt just mentioned is ascribed to the example of Gabriel (cf Zaid b ʿAlī, *Madjmūʿ al Fikh*, N° 109) These mawākit have for the most part passed into the books of *fikh* We cannot reproduce all details here The following scheme may suffice

a zuhr from the time when the sun begins to decline till the time when shadows are of equal length with the objects by which they are cast, apart from their shadows at noon The Hanafites alone deviate in one of their branches in so far as they replace the ultimate term by the time when the shadows are twice as large as their objects In times of great heat it is recommended to postpone the *zuhr* as late as possible,

b *ʿaṣr* from the last time allowed for *zuhr* till before sunset According to Mālik the first term begins somewhat later,

c *maghrib* from the time after sunset till the time when the red twilight has disappeared Small deviations only, in connection with a predilection for the first term,

d *ʿishā'* from the last term mentioned for the *ṣalāt al-maghrib* till when a third, or half of the night has passed, or till daybreak,

e *fadjr* from daybreak till before sunrise

Side by side with these mawākīt we find in the books of Tradition and of Law the times on which it is not allowed to perform prayer, viz sunrise, noon, and sunset (Bukhārī, *Mawākīt*, b 30—32, Muslim, *Salāt al-Musāfirīn*, trad 285—294, cf al-Nawawī's commentary for controversies regarding this point, and further Wensinck, *A Handbook of Early Muh Trad*, p 192a) According to ʿĀ'isha it is only forbidden to await sunrise and sunset for prayer (Muslim, *Musāfirīn*, trad 296) In Makka prayer is allowed at all times (Bukhārī, *Hadjdj*, b 73, Tirmidhī, *Hadjdj*, b 42)

(A J WENSINCK)

MĪKHĀʾĪL ṢABBĀGH, an Arabic author born of Catholic parents in Akko in 1784, was educated in Damascus and then came to Egypt Here he joined the French army of Napoleon's expedition, had to leave the country with them and came to Paris The State printing works employed him as a proof-reader and the Bibliotheque Nationale as a copyist of Oriental manuscripts, his irregular habits prevented him leading a comfortable or settled existence, although de Sacy and his pupils appreciated his thorough knowledge of his mother tongue He himself only used it to compose kasidas in the old style in praise of great men of the period and to make some money thereby For example in 1805 he addressed a poem to the Grand Juge when he visited the printing works, in 1805 to Pope Pius VII, in 1810 to Napoleon on his marriage in 1811 to the King of Rome, in 1814 to Louis XVIII These poems were printed at the government press, that to Pius VII with a Latin translation by de Sacy, that to Louis XVIII with a French one by Grangeret de Lagrange He also published a work on carrier pigeons entitled *Kitāb Musābakat al Bark wa 'l Ghamām fī Sucāt al-Hamām La colombe messagère, plus rapide que l'eclair, plus prompte que la nue*, par M S traduit de l'Arabe en Français par Silv de Sacy, Paris 1805, based on the preceding *Die blitzgeschwinde Briefpost, oder sinnreiche Kunst des Orients, Tauben zum Bestellen der Briefe abzurichten*, nach dem Arab des M S Herborn 1806, *Beschreibung der Kunst der Taubenpost, welche seit der Zeit der Erlosung gebraucht wird*, aus dem Arab von Dr Th J K Arnold, Frankfurt 1817, *La colomba messagiere ratta piu del lampo*, trad di S A Cataneo, Mailand 1822, *Die Brieftaube schneller als der Blitz*, aus dem Arab von C Loper, Strassburg 1879 — He left in manuscript a history of the Arab desert tribes of Syria, a history of Syria and Egypt and, important for its lexicographical information *al-Risāla al tāmma fī Kalām al ʿĀmma wa 'l-Manāhidj fī Ahwāl al Kalām al dāridj*, M S 's Grammatik der arab Umgangssprache in Syrien und Agypten, nach der Münchener Hs herausg von H Thorbecke, Strassburg 1886

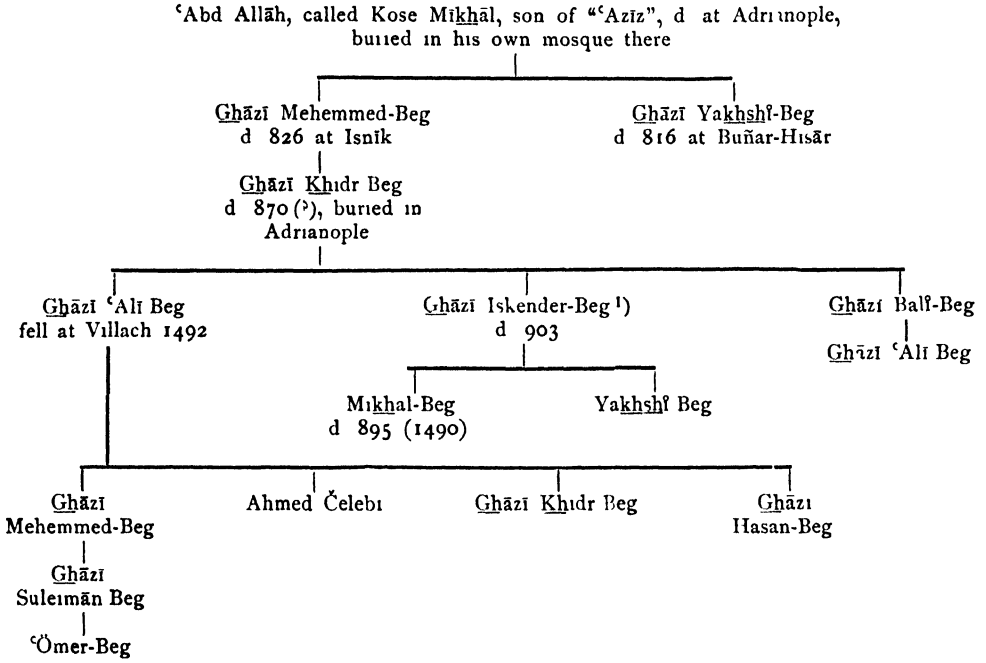
(C BROCKELMANN)

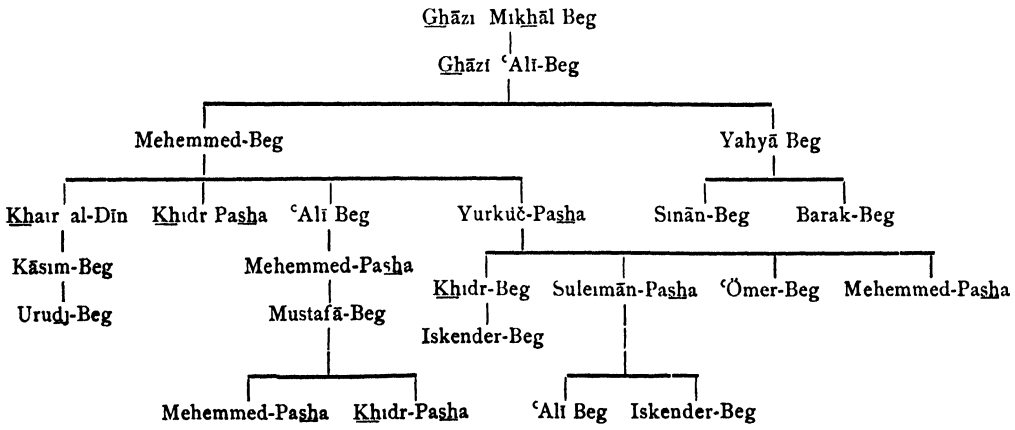
MĪKHĀL-OGHLU, an old Ottoman noble family This family traces its descent to the feudal lord Kose Mīkhāl ʿAbd Allāh, originally a Greek (cf F-A Geuffroy in Ch Schefer, *Petit traicte de l origine des Turcqz par Th Spandouyn Cantacasin*, Paris 1696, p 267 *L'ung desdictz Grecz estoit nomme Michali Dudict Michali sont descenduz les Michalogli*), who appears in the reign of ʿOthmān I as lord of Chirmenkia (Khirmendjik) at the foot of Olympus near Edrenos, and later as an ally of the first Ottoman ruler earned great merit for his share in aiding the latter's expansion (cf J v Hammer, in *G O R*, 1 48, 57, following Idrīs Bitlīsī and Neshrī) Converted to Islām, Kose Mīkhāl appears again in the reign of ʿOthmān's son Urkhan The rank of commander of the *akindjī*'s [q v] became hereditary in the family of Kose Mīkhāl,

which is even said to have been related to the royal house of Savoy and of France (cf Paolo Giovio *Michalogli di sangue Turchesco e per via di donna si fa parente del Duca di Savoia e del Re di Francia*, in this case Mīkhāl [Μιχαήλ] alias Kose Mīkhāl must have been descended from the Palaeologi, cf J v Hammer, *G O R* i 582), and along with the Malkoč-oghlu (properly Malkovic, i e Markovic), the Ewrenos-oghlu [q v], Timūrtash-oghlu [q v] and Turakhan oghlu [q v] was among the most celebrated of the noble families of the early Ottoman empire Kose Mikhāl, called ʿAbd Allāh, died in Adrianople and was buried in the mosque founded there by him in the western Yildirim quarter As Adrianople was certainly not conquered till 1361 (see F Babinger, in *M O G*, ii 311) he must therefore have lived into the reign of Murād I What J H Mordtmann has said in the article GHĀZĪ EWRENOS [q v] would therefore be true about his remarkably long life Kose Mikhāl had two sons, namely Mehemmed Beg and Yakhshī (Bakhshī ?) of whom only the former acquired some renown He was vizier under Mūsā Čelebi and a close friend of Sheikh Bedr al Dīn of Simaw [q v] Under Mūsā he was Beglerbeg of Rūmelī, and died in 825 (1422) at Isnik at the hand of the judge Tādj al Dīn-oghlu and is said to have been buried at Plevna in Bulgaria (cf Ewliyā Čelebi, *Siyāhet-*

The following genealogical table shows the order of succession of the Mīkhāl oghlus



According to the genealogy published by Ismāʿīl Hakkī, *Kitābeler* (Stambul 1345 = 1927), p 25 which is based on a *Silsilenāme* in the Ewkāf-office, *Wakfiye Defterī*, N° 247, in Sīwās, the genealogy of the Mikhāl-oghlus is as follows



If we compare the article Yurkūč Pasha in Mehemmed Suraiyā, *Sidjill-i ʿosmānī*, iv 652, where the descendants of this general are given, we get a different picture of the genealogy

1) According to Mehemmed Thuraiyā, *Sidjill-i ʿothmānī*, iv 101, Iskender-Beg had four sons, ʿAlī, Mehemmed, Khidr and Suleimān This must be wrong and the genealogy is as above

nāme, iii 305), after being previously (816 = 1413) detained as a state prisoner in the prison of Bedewī Čardak near Tokat His son was Khidr-Beg who distinguished himself in the wars of Murād II's reign He died in 870 (1465) and was buried at Adrianople beside his ancestor Kose Mīkhāl Khidr Beg seems to have had three sons, namely Ghāzī ʿAlī Beg, Ghāzī Iskender Beg and Ghāzī Balī Beg, of whom only the first two are of any historical importance Ghāzi ʿAlī Beg in 1461 distinguished himself in the battle against Vlad see J v Hammer, ii 64), in 1473 ravaged the lands of Uzun Hasan (*ibid*, ii 118), invaded Hungary in 1475 (*ibid*, ii 144) with his brother Iskender Beg, in 1476 (*ibid*, ii 156) was in command of the *akindjī*'s before Scutari in Albania and appears once again in Transylvania (*ibid*, ii 172), in the next 13 years nothing is heard of him In 1492 he seems to have met his death at Villach in Carinthia, defeated by Count Khevenhüller, although other sources mention him at a still later date According to them, he died in Plevna His brother Iskender Beg in 1476 commanded the light cavalry at the siege of Scutari, as *sandjakbeg* of Bosnia 880, 885 and 890) (J v Hammer, *G O R*, ii 156), in 895 (1490) in the Karamānian campaign, in which he lost his son, the governor of Kaisarīya Mikhāl Beg (see J v Hammer, *G O R*, i 300), who was taken prisoner and sent to Egypt He seems to have lived till 903 (1498) The military exploits of Ghāzī ʿAlī Beg were celebrated by Sūzī Čelebi (d 930 = 1530 at Prizren, cf F Babinger, *G O W*, p 34 *sq*) in a long epic, said to have been 15,000 couplets) fragments of which have recently been discovered (one in Berlin, MS Or N° 1468 containing 1,700 *bait* and the other in Agram, South Slav Academy of Sciences, Coll Babinger, N° 535, 1, with 212 *bait*) In some sources a Mehemmed Beg, who was distinguishing himself at that time is described as a fourth son of Ghāzī Khidr Beg, in others however, he appears as the son of Ghāzī ʿAlī Beg, which is not at all probable, if he really was twice governor of Bosnia, namely as early as 897 1492) and again in 949 (1542) and did not die till 950 (1543) The family of the Mīkhāl-oghlu now begins to fall into the background About the middle of the xvii^th^ century an Ahmed Beg is again mentioned, perhaps as the last of the Mikhāl-oghlu holding the hereditary office in the family of leader of a body of *akindjī*'s (see J v Hammer, *G O R*, iii 293), and lastly a Khidr Pāshā is mentioned in history as a descendant of Kose Mikhāl (see J v Hammer, *G O R*, iv 512) The family at a later date had estates in Bulgaria (around Ihtiman, cf Ewliyā Čelebi, iii 390 and C Jireček, *Das Fürstenthum Bulgarien*, Vienna 1891, p 138 and Philippopolis, *ibid*, p 379 *sq*) and survived down to modern times As we learn, however, from the *Sālnāme* of Adrianople for 1309, p 82 *sqq*, the Mikhāl-oghlus had already at an early date large states around Adrianople They had the country round Buñar-Hişār, Tirnovo, Kīrk Kilise and Wize as a hereditary fief The Anatolian district of Mikhālidj (Μιχαηλίτζη, Μιχαλικίου in Chalkondyles, i 225, cf Ewliyā Čelebi, v 293 *sq*, W Tomaschek, *Zur historischen Topographie von Kleinasien im Mittelalter*, in *S W A W*, *Phil-hist Kl*, vol cxxiv, Vienna 1891, p 95 and J H Mordtmann, in *Z D M G*, vol lxv, 1911, p 101) seems to be connected with the family of the Mīkhāl-oghlu

Bibliography The well-known histories of J v Hammer, Zinkeisen, Jorga Under the title *Ahwāl-i Ghāzī Mikhāl* (pr Stambul 1315, cf F Babinger, *G O W*, p 35, note 1) Nuzhet Mehemmed Pasha published a work glorifying a Kose Mīkhāl and his descendants — Al A Olesnickij in Agram is preparing an edition of the work of Sūzī Čelebi and at the same time a history of the Mikhāl-oghlus (Fr Babinger)

MIKNĀS [See Meknes]

MIḲYĀS, any simple instrument for measuring, e g the pointer on a sundial, in Egypt the name of the Nilometer, i e the gauge on which the regular rise and fall of the river can be read To get an undisturbed surface, the water was led into a basin, in the centre of this stood the water gauge, a column on which ells and fingers were carefully measured off The level of the water was ascertained by an official daily and proclaimed by criers

Originally the rising of the Nile was measured by the gauge (*al-raṣāṣa*) According to Ibn ʿAbd al Hakam, al-Kudāʿī, and others, Joseph, the son of Jacob, built the first Nilometer at Memphis, at a later date, the "aged Dalūka" built Nilometers in Ahmīm and Ansinā (Antinoe) These were the Nilometers in use throughout the Greek period till the conquest of Egypt by ʿAmr b al-ʿĀs The latter erected a Nilometer at Assuan and a second at Dendera Others were built in the reigns of Muʿāwiya and ʿAbd al-ʿAzīz Finally the Caliph al-Mutawakkil had a large Nilometer built and instead of the Christian officials appointed Abu 'l-Raddād to look after it, and the office remained hereditary in his family down to the time of al-Makrīzī (d 1442)

The ancient Egyptians are said to have drowned a virgin in the Nile at the beginning of its rise as a sacrifice ʿAmr compelled the Nile to rise and fall at God's command by means of a writing which he threw into the water

MĪLĀD (A) According to some Arabic lexicographers the meaning of this term is time of birth in contra-distinction to *mawlid* which may denote also "place of birth" The latter is the usual term for birthday, especially in connection with the birthday of Muhammad and Muslim saints [cf the art Mawlid], milād denotes also Christmas For other special meanings cf Dozy, *Supplement aux dictionnaires arabes*, *s v*

Bibliography the Arabic lexicons (A J Wensinck)

MILAS, the ancient Mylasa, capital of Caria and famous in antiquity for its sanctuaries of the Carian Zeus (in mediaeval and modern western sources Milaso, Milaxo, Melaso, Melaxo), a town in S W Anatolia, 15 miles from its seaport, Kulluk (on the Gulf of Mendelia) It is the capital of the ḳazā of the same name in the wilāyet of Mughla (formerly the sandjak of Men-

teshe) and has 7,346 inhabitants (census of 1928) compared with 7,261 (of whom 3,200 were Greeks who were removed by the exchange of 1922, 739 Jews, who still flourish, and 71 foreigners) in 1908 (*Sālnāme Aidın*, of 1326 A H)

Milas lies on a low eastern spur of the Sodra Dagh (Gr St Elias) in the centre of a very fertile plain surrounded on all sides by hills, and watered by the Sarī Čay which flows round the Sodra Dagh on north and west The road to the sea however does not follow this marshy water course but crosses the hills south of the Sodra Dagh, here commanded by the once powerful mediaeval fortress of Pečin (three miles S of Milas) The bay itself was in the middle ages defended by the island citadel of Asīn Kal'esi (Judeich, Iasos, *Athen Mitteil*, xv 139) and later by a castle at the harbour built by Mehemmed II (Pirī Re'īs, *Bahrīye*, ed P Kahle, chap 21) At Milas met the old, and although difficult, only roads to the west to the important mediaeval port of Balāt (Miletus), to the north into the fertile plain of Karpuzlu Ovvasī and Čine and into the Maeander valley, and eastward to Mughla, the other important town of the district This and its protected situation near the sea within a broad fertile plain destined the town to be once more a capital when the region again attained political independence under the Turkish dynasty of the Menteshe [q v]

The region first passed temporarily under Turkish rule when, after the victory of the Seldjūks at Mantzikert in 1071 the western Anatolian coast with Nicaea, Smyrna and Ephesus and even islands like Samos and Rhodes were occupied by the Turks Although we have no definite information about Milas itself we know that the monks of the neighbouring Latmos had to leave their monasteries on account of the Turks (in 1079, cf Th Wiegand, *Milet*, III/1 185) But Byzantine rule was soon restored It was only when the centre of the imperial government was withdrawn to Constantinople after the victory over the Latins in 1261 that this region finally passed into Turkish hands When and how the final conquest took place we do not exactly know Melanudion, which with Milas formed a theme from the period of the Comnenoi (W Tomaschek, *Zur hist Topographie Kleinasiens im MA*, Vienna 1891, *Abh d Ak d W*, p 38), and is therefore to be located in the neighbourhood of Milas and was Byzantine till 1273 at least, was again taken for a time from the Turks of Menteshe in 1296, so that it must have been occupied by them a few years before (Wiegand, *op cit*) That Menteshe is called Σαλπάκις (= Sāhil Bāgi, Emīr al-Sawāhil) in Pachymeres (i 472, ii 211, Bonn ed), in Sanudo (Hopf, *Chron gréco-romaines*, p 145) Turquenodomar (read Turqmenodomar = "Turkoman of the sea") suggests a conquest from the sea There is no longer any record at this period of the bishopric of Milas, which as a church of the eparchy of Caria (see G Parthey, *Hieroclis Synecdemus et notitiae graecae episcopatuum*, p 32, 112 etc) was under the metropolis of Stavrupolis which still existed in the xivth century (A Wächter, *Der Verfall des Griechentums in Kleinasien im XIV Jahrh*, p 34 *sqq*) (Stavrupolis, the ancient Aphrodisias, at the village of Gere, twenty miles west of Denizli)

Milas appears as the capital of the principality of Menteshe about 1330 in al-'Umarī (ed Taeschner, p 21, ملاس, corrupted from ملاس, while Fōkeh = Phocaea which appears as a capital in the Genoese report, *ibid*, p 47 is probably an error of the writer and is not to be corrected to Mughla) and in Ibn Battūta (ed Defremery and Sanguinetti, ii 278 *sqq*) also, who here enjoyed the hospitality of the Akhī gild (on a *Futūwetnāme* written in Milas at the end of the xivth century see Taeschner, in *Islamica*, iv 40) and admires the wealth of the town in gardens and orchards and gives the name of the lord of the country as Shudjā' al-Dīn Urkhan b Menteshe, whom he visited in his capital Pečin, not far away The Menteshe built very little in Milas as they were engaged in embellishing their residence It is noteworthy that the two mosques of this period lie outside the old town, still largely enclosed in its old walls, one to the south, in the Hādjdjī Ilyās quarter, the little Salāh al Dīn Djāmi' with outer court and stepped minaret, built under Urkhan Bey in 1330, the other just outside the walls to the east, the mosque of Ahmed Ghāzī built in 1378, which with its entrance in the narrow side (without an outer court) and the stepped minaret built above it (Ismā'il Hakkī, *Kütabeler*, Istanbul 1929, fig 47) looks as if it had once been a church (cf Wulzinger, *Die Piruz-Moschee zu Milas*, in *Festschr d Techn Hochschule in Karlsruhe*, 1925, p 10 of the reprint) The minbar of this mosque also dated 780 (1378) is now in the Činili Kiosk in Constantinople From the position of these mosques, it may be deduced that the old town remained in the occupation of the Christians, who still held the most of it in quite recent times The only mosque in the old town, just in its centre, and in the highest part of it, the Bulend Djami', seems also to have been a church and was probably used by the garrison, if it is old The medrese of Khodja Bedr al Dīn, which dates from the period of the Menteshe, unfortunately cannot be exactly dated (*Rev Hist*, v 58)

Milas received its first important building from the first Ottoman governor Fīrūz, whom Bāyazīd I appointed over Menteshe ili (*Dusturnāme-i Enweri*, ed Mükrimin Hilal, Istanbul 1928, p 88) after the conquest (792 = 1390) (the date given by most Turkish sources is supported by Bāyazīd's confirmation of the Venetian privileges for Balāt of May 21, 1390, *Diplomatarium Veneto-Levantinum*, Venice 1899, ii, N° 134) The Menteshe who fled to Egypt (*Dusturnāme*, *l c*) was probably the prince of the house ruling in Balāt, while the senior Ahmed Ghāzī may have held out in Milas and Pečin till July 1391 (according to his tombstone he died in Pečin in Sha'bān 793 as *shahīd*) In 1394 Fīrūz built to the north of the old town and outside of it a splendid mosque in the style of the Brusa private mosques (cf Wulzinger's monograph) Ottoman rule was interrupted by Timūr who passed through Milas on his return from Smyrna in the winter after the battle of Angora (1402) (Ducas, p 76, Bonn ed), for about twenty years by the restoration of the former dynasty This last period of the Menteshe-oghlu has left no memorials in Milas or Pečin The Ottoman commanders then made their headquarters in Pečin, after which this kazā of the Menteshe sandjak was long called (Abū Bakr b Bahrām in Hādjdjī Khalīfa, *Djihān numā*, p 638, i e the second half of the xviith century) and only moved

to Milas at a later date, when a magnificent official residence was erected, with defensive towers, and is still partly inhabited

From the second half of the xviith century we have Ewliyā's description of the town (in the unprinted vol ix of his *Siyāhet nāme*, MS Beshīr Agha, N° 452, fol 51) He says the town had 4 mosques, 3 masdjids and two large khāns At this time the garrison was still in Pečin He praises the gardens of the town but rightly describes the climate as unhealthy Among the products he mentions tobacco, with which Milas supplied the whole of Anatolia Among the holy places mentioned by him, we may note that of Shaikh Shushterī because it probably belongs to the Baba al-Shushterī met here by Ibn Battūta Ewliyā's description of the old ruins is much exaggerated, although he saw a good deal more than now exists Pococke (*Travels*, ii /2, ch 6) at the end of the eighteenth century was still able to sketch a temple of Augustus and Roma here All that now survives in addition to the town walls is the Balta Kapu (a Corinthian gateway with the Carian double-axe) and a mausoleum called Gümushkesen (filigree worker) (Choiseul-Gouffier, *Voyage dans l'Empire Ottoman*, i 234 *sqq*, pl 85—92) In the adjacent village of Shaikh Koy is the *turbe* of Shaikh Bedr al Dīn b Shaikh Kāsim, who died at Brusa in 884 (1479) and is buried here, a *khalīfa* of Saiyid Muhammad al-Bukhārī (see *Rev Hist*, v 311 *sqq*), on the site of a church of St Xene, who died here (*Bull de Corr Hell*, xiv 616 *sq*)

The capital of the Menteshe, already mentioned several times, Pečin (Gr Petsona) consists of an imposing citadel built over ancient foundations and Byzantine masonry and an extensive town lying south of it The citadel with its walls and towers crowns a steep rock that rises out of the southern end of the plain of Milas (Ismā'īl Hakkı, fig 40) and is accessible only at the south side by a great door flanked by a tower adorned with lions carved upon it Inside the fortress, where there now is a miserable little village, the only architectural remains are the foundations of a church Opposite to the entrance to the citadel, on a plateau surrounded by walls, some of which still stand, lie the palace and its annexes, now mostly in ruins All that survives is the charming mediese, built of stone, of Ahmed Ghāzi of 777 = 1375 (Ismā'īl Hakkī, fig 51—54) In the *līwān*, the arch of which is flanked in the spandrels by reliefs of lions holding flags, the founder is buried (see above), opposite the medrese stands a mosque built by Urkhan Bey in 732 (1332), in ruins except for the gateway of Byzantine doorbeams and fragments of ambos (the inscription is given in Ewliyā), probably the one that Ibn Battūta saw being built on his visit to Pečin (Bardjīn) There is also a mosque and medrese, a bath and a palatial serai, all in ruins Exceptionally finely carved tombstones give the names of important people who lived here down to the xvth century Ewliyā, who still found about one hundred houses here, thought there must once have been a great town here Pečin is mentioned by Kalkashandī, *Ṣubḥ al-A'shā*, viii 18, as the possession of a certain Emīr Mūsā, lord of Balāt and Bardjīn (بردجين) (which is known from a coin in the collection of J H Mordtmann) A native of Bardjīn was Mahmūd b. Mehmed, who about the middle of the xivth century dedicated his "Book of the Falconer" (*Bāzname*) written in Turkish to a Menteshe-oghlu (v Hammer, *Falknerklee*, Vienna 1840, Thúry, *Torok nyelvemlekek a XIV sz*, p 29) On October 17, 1414 in Pezona the Menteshe oghlu Ilyās Bey concluded a treaty with the Venetians (*Diplomatarium Veneto-Levantinum*, ii, N° 166)

Bibliography In addition to the works mentioned in the text V Cuinet, *Turquie d'Asie*, iii 666 *sqq*, Ch Texier, *Asie Mineure*, Paris 1872, p 648, Heyd, *Gesch d Levantehandels im MA*, i 584 (Fr ed, i 535) I was unable to consult the work mentioned by Hasluck, *Christianity and Islam*, ii 596 entitled I Koukoulis, Τὰ Νέα Μύλασα, in Ξενοφάνης, iii 448 *sqq* For the Muslim inscriptions see A Tewhid, in *Rev Hist* (Constantinople), ii 761, iii 1146, also Hāfiz Kadrī (*ibid*, v 57, 308) and Ismā'īl Hakkī, *Kitabeler*, Istanbul 1929, p 155 *sqq*

(P WITTEK)

MILK (A), possession, property The word is not found in the Kur'ān, but is in regular use in legal terminology The double meaning of the word shows that the usual distinction in our legal language between the conceptions of possession and property are not found in the *fikh* There is, it is true, a special term for the actual power over a thing, what we call possession in the narrower sense, namely *yad*, lit "hand", but the distinction between a judicial ownership and the actual control is not found in Muslim jurisprudence and there is not a word for property which takes into account the actual ownership, either from the positive or the negative point of view As a result we find, for example, that the ownership of a thing passes directly by an agreement if this was intended, even if the thing in question is not at once handed over On the other hand, not only things but also rights can be owned

The following are excluded from the possibility of being property and subject to legal regulations 1 useless things (e g wild animals), 2 things the use of which is prohibited by religion (e g wine grapes), 3 things which are ritually impure or have become polluted to such an extent that they cannot be purified (e g swine, dung etc) so long as they are not essential parts of a pure or permitted thing If such things, however, are acquired, one talks not of *milk* but of *ikhtiṣāṣ*, a special claim upon them, legal transactions relating to such things have a special vocabulary of their own

Kamāl al-milk is a necessary preliminary for the property of an owner being liable to *zakāt* [q v]

Bibliography The articles 'ABD, BAI', MĀL, SHIRKA, TIDJĀRA and the literature there given, Juynboll, *Handleiding* (1930), § 60 and the references there given, al Ghazzālī, *al Wadjīz*, i 85 *sq*

(M PIESSNER)

MILLA (A), religion, rite However obvious it may be to connect this word with the Hebrew and Jewish- and Christian-Aramaic *milla*, *mella*, "utterance, word", it has not been satisfactorily proved how and where it received the meaning which is taken for granted in the Kur'ān religion or rite Nor is it known whether it is a purely Arabic word or a loanword adopted by Muhammad or others before him (Nöldeke, *Z. D M G*, lvii 413 seems to hold that it is Arabic for he refers to the 4th form *amalla* or *amlā* "to dictate") In the Kur'ān it always means (even in

the somewhat obscure passage, Sūra xxxviii 6) "religion" and it is used of the heathen religions (vii. 86 *sq*, xiv 16, xviii 19) as well as of those of the Jews and Christians (ii 114), and of the true religion of the fathers (xii 38) The word acquired a special significance in the Medīna sections where the Prophet in his polemic against the Jews speaks of "Abraham's *milla*", by which he means the original revelation in its purity, which it was his duty to restore (ii 124, iii 89, xvi 124, xxii 77 *sq*, cf iv 124, vi 162, xii 37) Muslim literature follows this Kur'ānic usage but the word is not in frequent use With the article, *al-milla* means the true religion revealed by Muḥammad and is occasionally used elliptically for *ahl al-milla*, the followers of the Muhammadan religion (Tabarī, iii 813, 15, 883, 4), just as its opposite *al-dhimma* is an abbreviation for *ahl al dhimma*, the non-Muhammadans who are under the protection of Islām, e g, Ibn Sa'd, iii/1, 238, 21, cf also the derivative *millī* opposed to *dhimmī*, client (Baihaḳī, ed Schwally, p 121 infra)

Bibliography Noldeke, *Orientalische Skizzen*, p 40, *Z D M G*, lvii 413, Tabarī, ed de Goeje, *Glossar*, s v, Snouck Hurgronje, *Het Mekkaansche Feest*, p 30 *sqq* (F BUHL)

MĪM, 24th letter of the Arabic alphabet, with the numerical value of forty On different forms of the letter cf ARABIA, plate I In some dialects of Southern Arabia and of tribes coming from that region, mim was and is used as the article of determination, side by side with *l* A well known tradition is put into the mouth of a man from Southern Arabia in the following form *Laisa min am-birri am ṣiyāmu fi 'm-safar* Cf Ibn Ya'īsh, ed Jahn, ii 1331, Landberg, *Etudes sur les dialectes de l'Arabie meridionale*, ii/ii 281—290 (A J WENSINCK)

MINĀ, later often pronounced *Munā*, a place in the hills east of Mecca on the road from it to 'Arafa [q v] The distance between the two is given by Muḳaddasī as one parasang, while Wavell calls it five miles and says the continuation to 'Arafa is nine miles Minā lies in a narrow valley running from west to east, 1,500 paces long according to Burckhardt, surrounded by steep barren granite cliffs On the north side rises a hill called Thabīr Travellers from Mecca come down into the valley by a hill path with steps in it, this is the *'Akaba* [q v] which became famous in connection with Muhammad's negotiations with the Madinians The town consists of stone houses of fair size which form two long streets Close beside the 'Akaba is a rudely hewn short pillar leaning against a wall this is the "great djamra" or the "'Akaba djamra", at which the pilgrims cast stones [cf DJAMRA] A little to the east in the middle of the street is the "middle djamra" also marked by a pillar and lastly at a similar distance the third (the so called "first djamra") As one approaches the east end of the valley, there is on the right of the road a square mosque surrounded by a wall, the Masdjid al-Khaif, which was rebuilt by Saladin and in 874 (1467) reconstructed by the Mamlūk Sultān Kā'it Bey Along the west side of the surrounding wall is a colonnade with three rows of pillars, but there is none on the other sides It was different earlier, for Ibn Rusta (c 300 A H) tells us that the mosque had 168 pillars of which only seventy-eight supported the west wing The north side of the wall is pierced by several doors In the centre of the court of the mosque is a little domed building with a minaret built over a fountain There is another dome over the colonnade on the west side (see the illustrations, ii 256)

The most striking feature of Minā is the very great difference, noted already by Mukaddasī, between the quiet and empty streets of the greater part of the year and the tremendous throng and bustle of the pilgrimage month when, as Wavell says, half a million people with heavily laden beasts of burden hope to cover nine miles in the period between sunrise and 10 a m Every spot in the valley is then covered with tents in which the pilgrims spend the night Mukaddasī talks of fine houses built of teak and stone (among them was a frequently mentioned Dār al-Imāra), and large stone buildings are still to be found in Minā, but these are usually empty and are only let at the pilgrimage to the more wealthy pilgrims and even among these many prefer to live in tents This depopulation of the city has been a subject for discussion among the legists, for some held that this circumstance enables Minā and Mecca to be regarded as one city (*miṣr*), a view which others reject But another circumstance must have contributed to prevent a permanent settlement of the town, which is also true of other places on the pilgrims' route, namely the incredible filth and dreadful stench which is caused by such masses of humanity at the Hadjdj Complaints are made even of the uncleanness of the Masdjid al-Khaif and at Minā there are further the decomposing remains of the countless animals sacrificed

The Hadjdj ceremonies in Minā date back to the old pagan period [cf HADJDJ], for Muhammad, as usual in taking over old customs, contented himself with cutting out the too obviously pagan elements, the result being that we can no longer reconstruct the old forms with certainty The old poets make only passing references to them (cf DJAMRA), that they were similar to the Muslim practices is evident, for example, from an interesting passage in the Medīna poet Kais b Khatīm (ed Kowalski, N° 4, p 1 *sqq*) where there is a reference to the "three days in Minā" and where we further learn that the festival held there offered an occasion for entering into and carrying on love affairs The stone throwing is certainly very ancient, its significance is quite unintelligible in Islām, although it is doubtful if there were already three heaps of stones in the pre-Islāmic period [cf DJAMRA] It is also clear that the ceremonies in Minā formed the conclusion of the Hadjdj even in ancient times Muhammad however made some serious alterations here, for he inserted a visit to Mecca before the stay in Minā, whereby the ceremony first received its legitimate Muhammadan character, but the old elements remained the important factors, for the Hadjdj ends not in Mecca but, as before, in Minā, to which the pilgrims return after the digression to Mecca A survival of the pagan period probably exists in the slaughtering place preferred by the majority on the southern slopes of Thabīr "the place of sacrifice of the ram" (cf Sūra xxxvii 101 [illegible]), as its association with the story of Abraham probably enabled an old pagan sacred spot to be adopted into Islām From Burton's description it is a square rocky platform reached by a few steps. Muḥammad himself did not directly forbid the use

of the pagan place of slaughter, but deprived it of its importance by saying that all Minā is a place of sacrifice a clever procedure which he also followed at ʿArafāt and Muzdalifa

According to the law of Islām, the pilgrims who arrive in Mecca on the 8th Dhu 'l-Ḥiḏjdja should leave this town in time to be able to perform the mid-day ṣalāt in Minā and remain there till sunrise on the 9th and only then go on to ʿArafāt The majority however do not do this but go on the 8th straight on to ʿArafāt where they arrive in the evening After performing the ceremonies of the pilgrimage in ʿArafāt and Muzdalifa [q v], they go before sunrise on the 10th to Minā to celebrate the day of the great sacrifice (*yawm al-adhā* or *yawm al-nahr*) (in contrast to the pre-Islāmic practice, which was to start only after sunrise) Here the concluding rites are gone through, the slaughtering, the clipping of the hair and nails and the lapidation There is not complete agreement on the order of these ceremonies, which one tradition (Wāḳidī, transl Wellhausen, p 429) makes Muhammad declare to be quite irrelevant The modification of the stone throwing is noteworthy, for on the day of sacrifice it is only done at the ʿAḳaba heap, while on the three following days each pilgrim daily throws seven little stones on all three heaps (cf the illustrations above, II 256 and Burton, II 205) The conclusion of the whole pilgrimage is the three Minā or *tashrīk* days, the 11th, 12th and 13th Dhu 'l-Ḥiḏjdja (cf above, II 199 and the article TASHRĪK) They are days of rejoicing which are celebrated with great jubilation, illumination and the firing of shots All the pilgrims however do not wait for these three days but set off on their return journey before then

MINARET [See MANĀRA]

MINBAR (A), pulpit [cf MASDJID] On the origin of the form of the minbar the reader may be referred to C H Becker's exhaustive study *Die Kanzel im Kultus des alten Islam* (*Noldeke Festschrift* and *Islamstudien*) Becker refers to the earliest historical statement which says that the Prophet in the year 7 A H made his minbar on which he used to preach to the people, it had two steps and a seat (*makʿad*) The minbar was therefore originally a raised seat or throne On the morning after the death of the Prophet, after stormy disputes, Abū Bakr took his seat on the Prophet's minbar in a solemn assembly and received the general homage here The later caliphs followed this tradition, as did the governors, who ascended the pulpit on their accession to office and on their resignation The minbar in the early period was therefore not at all specially associated with worship but was the seat of the ruler in the council The pulpit only gradually grew out of it with the development of public worship According to Becker, the date of the change from the ruler's or judge's seat to the simple pulpit coincides with the end of the Omaiyad dynasty In 132 A H all the mosques in the provinces of Egypt were provided with minbars, about the same period probably in the other lands of Islām also At the beginning of the ʿAbbāsid period the minbar was already a pulpit exclusively The first tendency to its use as a pulpit is seen by Becker in the introduction of the minbar into the divine service at the Musallā in Medīna, which is ascribed to Muʿāwiya or to his governor The Prophet did not have a minbar at the Musallā and nothing but divine service could have been held there

The typical form of the minbar as a pulpit, which is placed to the right of the miḥrāb and of the spectator, is an erection on steps with a portal with or without a door at the entrance to the steps and a ciboriumlike canopy to the platform This form is peculiar to the minbar of wood, which is the most usual The variants in stone and brick are more simple and frequently are only a bare platform reached by three to five steps The fine series of minbars of wood begins with that most famous of all in the history of art, the minbar in the great mosque in Kairawān On the occasion of the extension of the mosque by Ibrāhim II Ibn Aghlab (261—289 = 874—902) it is said to have been brought with the lustre tiles of the miḥrāb wall from Baghdad and set up It is made of plane tree wood and is in the canonical minbar shape with a staircase — here of 17 steps — to the preacher's platform. The pulpit, however, has not yet the stylized structure of the later wooden minbar It has not the portal nor the canopy at the top Its composition of about 200 carved panels and narrow strips of unequal size, is simply a primitive agglomeration of profuse ornamentation, still very nomadic in feeling, such as would hardly ever have been found in Baghdād, and even in Kairawān can scarcely be regarded as original Saladin has pointed out that the pulpit must have been restored after Kairawān had been sacked by the troops of the Fāṭimid Mustansir Abū Tamīm in 441 (1049) In any case it has several times suffered damage and undergone restoration so that its present general appearance cannot be dealt with critically until we have a thorough monograph based on exact investigation on the spot The ornamentation must, as Kühnel observes, be regarded as Omaiyad (Springer's *Kunstgeschichte*, VI 385)

The vine branches of the frame-strips and the panels filled with floral patterns and leaves resemble the decoration at Mshattā' [q v] and some of the geometrical patterns, which are of all imaginable combinations, are already found on the shafts of

pre-Islāmic columns in Diyār Bakr (cf van Berchem-Strzygowski, *Amida*) The archaistic combination of designs on the minbar has no connection with the decoration which since Sāmarrā we call ʿAbbāsid We have here a phenomenon comparable to Mshattā' since here also ornamentations from different sources are combined to form a general scheme whose common denominator is formed by the formal quality of the chiaroscuro common to them all We do not even know how long the nucleus of these carved strips and latticed panels may have previously existed in Baghdād and they may have there belonged to an Omaiyad minbar before the pieces were brought to Kairawān and supplemented by copies and additions of local workmanship

The few pulpits that have survived from the Fātimid period follow the Syro-Egyptian style of woodwork of the period with their system of frames filled with foliage The tendrils were prevented from over-running the whole surface by being placed within small polygonal areas which were grouped together in cassettes (Kühnel, Springer's *Kunstgeschichte*, vi 406) The wooden mihrāb of the xiiᵗʰ century from Cairo illustrated in the article MIHRĀB illustrates this style, which is also represented by the minbar made in 1091 A D for the mosque in ʿAskalān and now in Hebron, and by the pulpit of 1155 A D in the mosque of ʿAmr in Kūs on the upper Nile

During the Fātimid period the pulpit developed its canonical form as represented in the minbar of the Masdjid al Aksā in Jerusalem, which was gifted in 1168 A D by Nūr al-Dīn to Aleppo and later taken by Saladin to Jerusalem (Saladin, *Manuel*, fig 28) It henceforth appears with the door way and the domed canopy The main decorative motives are 8-pointed stars and the polygonal and star-shaped subsidiary panels show carving in relief inlaid with ivory and mother-of-pearl Of the minbar of Sultān Lādjīn in the mosque of Ibn Tūlūn of the year 1269 A D little more is left than the framework, while the panels are preserved in the Arab Museum in Cairo and in the South Kensington Museum (cf *Descriptive Catalogue of the Arab Museum*, Cairo) That wooden minbars were sometimes copied in stone is shown by the stone pulpit in the mosque-madrasa of Sultān Hassān (757—764 = 1356—1363) The mukarnas on the door case and soon after found on the dome also, here as in the mihrāb goes back to Turkish influence transmitted through Syria Like the mihrāb, the minbar also attained its finest workmanship in Cairo under the second Mamlūk dynasty in the xvᵗʰ century and later No essential alteration was later made in its canonical form and its embellishment remained standardised and varied only in details. A fine example of this fully developed Cairo type is in the South Kensington Museum According to the inscription, it was presented by Kā'it Bey (1468—1495) and has finely carved ivory panels and traces of painting on the wooden parts The usual star pattern is replaced by a smooth surface. The gilt onionshaped dome with its finial and crescent on the stalactite cornices are, as Briggs observes, characteristic of the period (Briggs, *Muham Archit in Egypt and Palestine*, p 217)

After the Turkish conquest, the general deterioration in craftsmanship in Cairo affected the minbar also, but exceptions, like the finely-worked pulpit of the mosque of al-Burdaini, however show that the good old tradition still survived. Hakam II's minbar in Cordoba has not survived but from the descriptions of the Arab writers it must have been a peculiarly valuable piece of work, for according to al-Makkarī it cost 35,705 dinars It could be moved on wheels and contained the caliph ʿOmar's Kur'ān In the mosque of ʿAlā' al Dīn in Konya is a minbar of hazelwood, according to an inscription on the posts supporting the upper part, the work of an artist of Akhlāt of the year 550 (1155) Two inscriptions on the door of the pulpit mention Sultān Masʿūd I (510—551 = 1116—1156) and Kilidj Arslān II (551—584 = 1156—1188) (cf J H Loytved, *Konia* and F Sarre, *Seldschukische Kleinkunst*, p 27 *sq*, pl vi—viii) Inscriptions from the Kur'ān decorate the frames of the balustrades of the steps The pulpit is of the traditional Syro-Egyptian form, but is, however, distinguished from them by its vigorous structure Polygons and star shaped panels fill the sideframes, together with the same tendril patterns symmetrically interwoven, as we find naturalised in all the eastern lands of Islām from the beginning of the eleventh century (detailed illustration in Sarre, *op cit*, fig 24)

In Persia and Afghānistān all the old minbars seem to have been destroyed during the Mongol invasion On the other hand, the minbar illustrated here in the mosque of Djawhar Shāh Agha in the sanctuary of the Imām Rida in Meshhed which was built about 840—850 (1436—1446) is original in ornamentation and an example of the Timūrid minbar The structural motive is thrust into the background by the profuse covering of small pentagonal and star shaped wooden panels with tendrils carved in relief after the style of the contemporary tiles, the effect is that of a carpet Nothing is known of old minbars in Turkestān In India, pulpits were built almost exclusively of stone Many, some of them richly carved, still exist in the Muslim provinces and towns of India The pavilion on four pillars, common and popular in India, which gives a charm to buildings for Muslim worship as a decorative finish to the roof, was also used here for the stone minbar Indeed one might even wonder whether this originally Indian structure was carried by the Eastern Turks to Central Asian lands and adopted by them for the minbar Minbars with such canopies are frequently found in the mosques of the province of Gudjarat and in Ahmadābād (cf these volumes in the *Arch Survey of India*, *Western India*) The mosque of Hilāl Khān Kādī of 1333 A D in Dholka, for example, has a stone minbar with seven steps and a canopy on pillars on the roof, but no entrance gate The triangular side walls are divided into square areas which are carved in relief (*Arch Survey of India*, *Western India*, vol vi, Gudjarat, pl xxviii, xxx) In Haidarābād, the Muslim state of the south, on the other hand, the minbars are more simple and heavier, and have no canopy (cf illustration from Osmanābād)

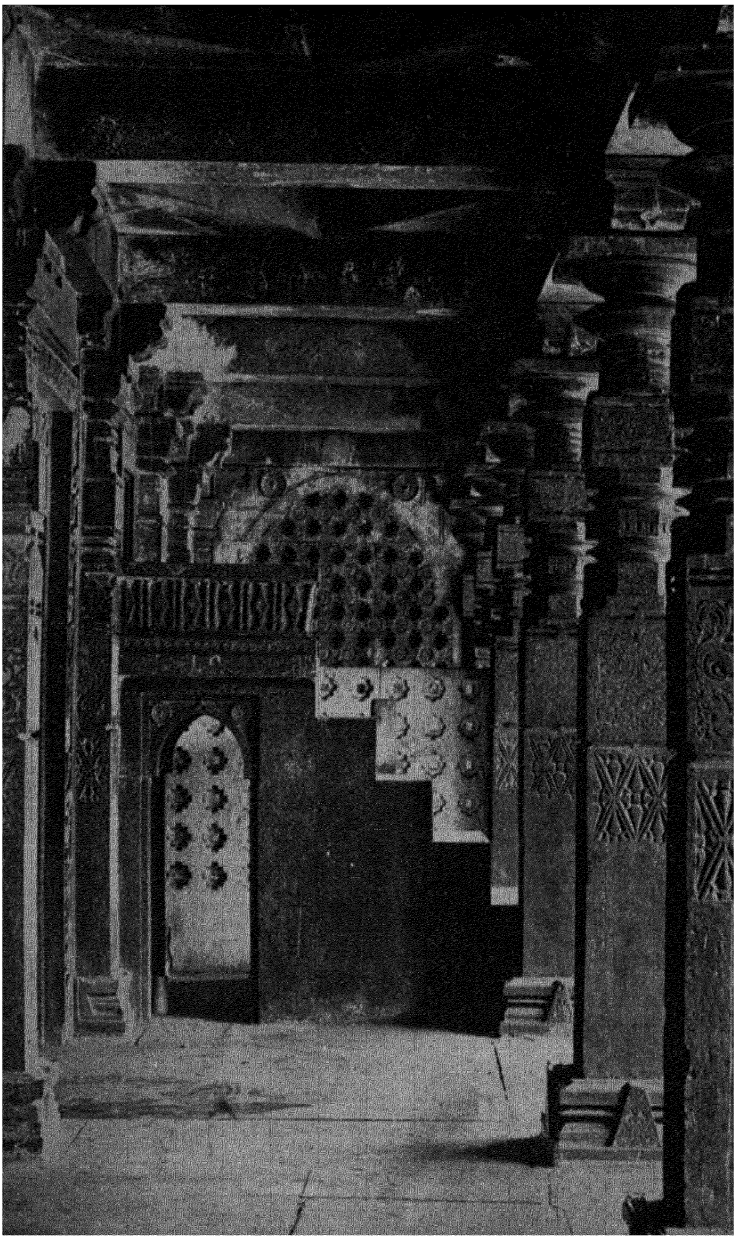

Fig. 2. Minbar in the Parenda Mosque in ʿUthmānābād.

MINṬAḲA or MINṬAḲAT AL-BURŪDJ also MINṬAḲA FALAK AL-BURŪDJ or (more rarely) NIṬĀḲ AL-BURŪDJ means, like the technical term FALAK AL-BURŪDJ most frequently used in scientific literature, the circle (*mintaka*) of the twelve signs of the zodiac ("towers", Greek πύργοι), then the zone of the ecliptic formed of the twelve signs each covering 30°

The Kur'ān contains references to *mintaka* in three different passages, viz

Sūra xv 16 "We have placed towers (*burūdj*) in the heavens and adorned them for the spectators"

Sūra xxv 61 „Blessed be he that placed towers (*burūdj*) in the heavens and who placed a lamp in them and a light-giving moon"

Sūra lxxxv is entitled *al-Burūdj* and verse 1 "By the heavens with its towers (*burūdj*)"

Babylonia may with great probability be assumed to be the original home of the zodiacal circle The period of its origin cannot be fixed with certainty the first attempts at a grouping of the constellations on the path of the sun and the planets, however, date from before the period of Hammurabi and in any case into the third millenium B C Almost all the names familiar to us are already found in Sumerian inscriptions The Boghaz-Koi list of about 1300 B C gives all the signs of the zodiac with the exception of Leo and Libra

The only pictorial representation of the starry heavens of the early Muslim period, the fresco on the dome of Kusair ʿAmra shows the ecliptic as a broad band, along which are arranged the twelve *burūdj*, it also shows the pole of the ecliptic and the 12 (ecliptical) degrees of longitude, as well as the equator and a series of parallel circles The peculiarity of the arrangement of the heavens with considerable southern latitudes shown beyond the equator on the hemispherical inner surface of the dome results in the equator and ecliptic not being shown as the largest circles The method of representing the separate constellations on the fresco, especially the mintaka, is, broadly speaking the same as that on the Atlas Farnese (N B It should be noted that the fresco of Kusair ʿAmra represents the heavens reflected as in a mirror)

The twelve Burūdj Preliminary Note The names of the *burūdj* are given in Arabic literature with many variations those quoted below are the most usual With the fixed stars a distinction is made between those which form the outline of a constellation (*Kawākib min al-ṣūra*), i e the essential stars and such as "go beyond the constellation" (*ḵẖāridj al-ṣūra*) and are regarded as only being loosely connected with it, i e the unessential stars

The account here given is based in its main features on the statements in the first part of al-Kazwīnī's *Cosmography*

1 *al-Ḥamal* or *al-Kabsh*, the Ram (*Aries*) It consists of 13 essential stars, 5 unessential lie in its immediate vicinity, its fore-part is turned to the west and its hind-part to the east It has its face on its back The two bright stars on the horn (*β* and *γ*) are called *al Sharaṭāni* or *al-Nāṭiḥ* ("the butter"), they form at the same time the first of the 28 stations ("mansions") of the moon (*manāzil*) According to another reading the name *al-Nāṭiḥ* is given to the unessential star *α* Arietis situated above the figure of the Ram. The three stars *ε*, *δ* and *ρ* Arietis form the second station of the moon and are called *al-buṭain* ("little paunch")

2 *al-Thawr*, the Bull (*Taurus*) 32 essential and 11 unessential stars; its forepart faces the east The bright star at the point of the northern horn (presumably *β* Tauri) is also included in the Waggoner (Auriga) as well as in the Bull. *α* is called *al-Dabarān*, *ʿAin al-Thawr*, *Tālī 'l-Naḏjm*, *Hādī 'l-Naḏjm* and *al-Fanīḳ* ("large camel"), while the Hyades which surround it are called *al-Kilāṣ* (the "young camels") The Pleiades are called *al-Thuraiyā*, *κ* and *υ* together *al Kalbāni* ("the two dogs" of *al-Dabarān*) The Pleiades form the third, *al-Dabarān* and the Hyades together the fourth station of the moon

3 *al-Taw'amāni* or *al Djawzā'*, the Twins (*Gemini*) 18 essential and 7 unessential stars The Twins are in the form of two men whose heads are turned to the northeast and feet to the southwest Castor and Pollux (*α* and *β*) are called *al-Dhirāʿ al mabsūta*, they form the seventh station of the moon *γ* and *ξ* are called *al-Hanʿa*, together with three other stars of the Twins they form the sixth station of the moon The name of *η* and *μ* Geminorum is *al-Baḵẖāti*

4 *al Saratān*, the Crab (*Cancer*) 9 essential and 4 unessential stars *ε* Cancri with *γ* and *δ* form the eighth station of the moon and have the peculiarly Arab name of *al-Nathra* ("the cartilage of the nose") or in keeping with the *Almagest*, *al-Maʿlaf* (= *praesepe*) The star *β* on the south hind foot is called *al-Taraf* ("the extremity") *ξ* Cancri and *λ* Leonis form the ninth station of the moon, *al-Tarf* ("the glance")

5 *al Asad*, the Lion (*Leo*) 27 essential and 8 unessential stars, he is conceived of as looking to the west *α* (Regulus), *γ*, *ζ* and *η* are called *al Djabha* ("Forehead of the Lion") and form the tenth station of the moon, *δ* and *θ* are the eleventh station of the moon, *al-Zubra* ("back-hair" or "mane of the Lion") or *Kāhil al Asad* *β* Leonis is called *Kunb al-Asad* or as the twelfth station of the moon *al-Sarfa* According to another reading, the name *Kunb al-Asad* is given to small stars in the vicinity of *al-Sarfa*

6 *al-ʿAdhrā'* (only in the catalogue of fixed stars taken from the *Almagest*), the Virgin (*Virgo*) or *al-Sunbula*, the ear of corn 26 essential and 6 unessential stars, the head of the Virgin lies south of *β* Leonis, her feet west of *α* and *β* Librae The five stars in the shoulders *β*, *η*, *γ*, *δ* and *ε* Virginis, form the thirteenth station of the moon *al-ʿAwwā'*, *α* Virginis forms the fourteenth station of the moon, *al-Simāk al-aʿzal* or *al-Sunbula* (cf *Spica*) which name is applied to the whole constellation of the Virgin (N B The name *Sāk al-Asad* for *α* Virginis is not quoted as a name of the fourteenth station of the moon) The fifteenth station of the moon consists of the stars ϕ_1, *ι*, *κ* and *λ* on the left foot, it is called *al-Ghafr*

7 *al-Mīzān*, the Scales (*Libra*) 8 essential and 9 unessential stars *α* and *β* Librae on the pans of the balance form the sixteenth station of the moon which is called *al-Zubānā* or *Zubāniyā al-ʿAkrab* ("claws of the Scorpion") (cf Sumerian ZI BA AN NA, Akkadian *Zibanîta* as the name of the constellation *Libra*)

8. *al-ʿAkrab*, the Scorpion 21 essential and 3 unessential stars, it has its head to the west and its tail to the east *β*, *δ* and *π* Scorpii mark the seventeenth station of the moon *al-*

Iklīl, α the eighteenth station of the moon *Ḳalb al-ʿAḳrab*, λ and υ the nineteenth station of the moon *al-Shawla* ("Sting of the Scorpion") The stars σ and τ to the right and left of *Kalb al-ʿAkrab*, are called *al-Niyāt*

9 *al-Rāmī*, the Archer (*Sagittarius*) or *al-Kaws*, the Bow or *al-Sahm*, the Arrow 31 essential and no unessential stars, the face with bow and arrow is turned to the west, the hind-part of the horse's body to the east (The fresco on the dome at Kusair ʿAmra on the other hand shows the upper part of the body of the archer turned towards the hind-part of the horse's body, and aiming with the bow over this to the west The stars γ (on the point of the arrow), δ (on the bow-grip) ε (at the south end of the bow), η (on the right fore-foot) are called *al-Naʿām al-wārid*, σ (on the left shoulder), ϕ (on the notch of the arrow), τ (on the shoulder blade) and ζ (under the shoulder) *al-Naʿām al-ṣādir* Both constellations together form the twentieth station of the moon, *al-Naʿāʾim* μ and λ Sagittarii on the northern bend of the bow are called *al-Ẓalīmāni*, α (on the knee), and β_1 β_2 (on the shin-bone) are together called *al-Suradāni* The space almost void of stars at π Sagittarii marks the twenty first station of the moon, *al-Balda* or *Baldat al-Thaʿlab*

10 *al-Djady*, the Goat (*Capricornus*) 28 essential, no unessential stars the figure is conceived of as looking to the west α and β on the eastern horn form the twenty-second station of the moon *Saʿd al-Dhābiḥ* γ and δ on the tail are called *al-muḥibbāni*

11 *Sākib al-Māʾ* or *al-Sāḳī*, the water-carrier (*Aquarius*) or *al-Dalw*, the pail 42 essential and 3 unessential stars, the head of Aquarius points to the N W, the feet S E α and o on the right shoulder are called *Saʿd al-Malik* or *Saʿd al-Mulk* The two (or three) stars on the left hand (μ, ν or μ, ν, ε) form the twenty-third station of the moon *Saʿd al-Bulaʿ*, β and ζ on the left shoulder together with c_1 and c_2 Capricorni form the twenty-fourth station of the moon *Saʿd al-Suʿūd* The four stars γ, ζ, π and η on the right fore-arm and the right hand are called *Saʿd al-Akhbiya* and form the twenty-fifth station of the moon

12 *al-Samakatāni*, the two Fishes (*Pisces*) or *al-Hūt*, the Fish 34 essential and 4 unessential stars, the figure is conceived as two fishes, the western in the south of the back of Pegasus, the eastern in the south of Andromeda The two fishes are connected by a band of stars al-Kazwīnī does not mention any outstanding stars

It is evident, then, that by far the greater part of the 28 *manāzil* fall into the area of the 12 *burūdj* and form part of them Only the following four do not belong to them N⁰ 5 *al-Haḳʿa* (λ, ϕ_1, ϕ_2 Orionis), N⁰ 26 *al-Fargh al-awwal* (α, β Pegasi), N⁰ 27 *al-Fargh al-thānī* (γ Pegasi, α Andromedae), N⁰ 28 *Batn al-Hūt* or *al-Rishāʾ* (a large number of stars forming a fish in the neighbourhood of β Andromedae)

The zodiacal figures N⁰ 1, *al-Hamal*, N⁰ 4, *al-Saraṭān*, N⁰ 7, *al-Mīzān* and N⁰ 10, *al-Djady* are known together as *Burūdj munkalība*, Greek ζώδια τροπικά, N⁰ 2, *al-Thawr*, N⁰ 5, *al-Asad*, N⁰ 8, *al-ʿAkrab* and N⁰ 11, *al-Dalw* under *Burūdj thābita*, ζώδια στερεά, N⁰ 3, *al-Djawzāʾ*, N⁰ 6, *al-ʿAdhrāʾ*, N⁰ 9, *al-Rāmī* and N⁰ 12, *al-Samakatāni* under *Burūdj Dhawāt al-Djasadain*, ζώδια δίσωμα (i e "Signa bicorpora", "Double figures" Twins, Virgin and Ear of corn, Archer with Horse's body and the two Fishes)

al Kazwīnī gives from Ptolemy the extent of the Mintaḳa as 486 259 $721^1/_7$ *Mīl*, the length of each *Burdj* as 39 388 $310^2/_3$ *Mīl*, and the breadth as 1 322 $943^1/_3$ *Mīl*

Mintaka in Astrology

Muthallathāt

By *al-muthallathāt* (sg *al-muthallatha*) are meant in Arab astrology the Greek τρίγωνα, Lat *trigona* or *triquetra*, which in the middle ages were usually translated by *triplicitates*

The twelve signs of the zodiac are here arranged in threes at the angles of four intersecting equilateral triangles of which one is allotted to each of the four elements Each triangle is given two of the seven planets as its rulers (*rabb*, pl *arbāb*, Greek οἰκοδεσποται οι τριγωνοκράτορες), one for the day and another for the night, a third is associated with the two others as "companion"

The arrangement is as follows

1 *Muthallatha* — Element Fire

Zodiacal sign *al-Hamal*, *al-Asad* and *al-Rāmī* (N⁰ 1, 5 and 9)
Ruler by day *al Shams* (Sun), by night *Mushtari* (Jupiter)
Companion *Zuhal* (Saturn)

2 *Muthallatha* — Element Earth

Zodiacal sign *al Thawr*, *al-ʿAdhrāʾ* and *al-Djady* (N⁰ 2, 6 and 10)
Ruler by day *Zuhara* (Venus), by night *al-Kamar* (Moon)
Companion *Mirrīkh* (Mars)

3 *Muthallatha* — Element Air

Zodiacal sign *al-Djawzāʾ*, *al-Mīzān* und *al-Dalw* (N⁰ 3, 7 and 11)
Ruler by day *Zuhal* (Saturn), by night *ʿUtārid* (Mercury)
Companion *Mushtarī* (Jupiter)

4 *Muthallatha* — Element Water

Zodiacal sign *al-Saratān*, *al-ʿAkrab* and *al Samakatāni* (N⁰ 4, 8 and 12)
Ruler by day *Zuhara* (Venus), by night *Mirrīkh* (Mars)
Companion *al-Kamar* (Moon)

The distribution of the *Muthallathāt* has been settled since the time of Ptolemy (τετράβιβλος)

Wudjūh or *Suwar* By dividing each *burdj* into three we get 36 decans each of 10°, which in Arabic are called *wudjūh* (sing *wadjh*), *suwar* (sing *sūra*) or *dardjān* (from the Indian *drekkāna*, a loanword from the Greek) or *dahadj* (Pers), in Greek δεκανοί or πρόσωπα, in mediaeval Latin *facies*, more rarely *decani* The astrological significance is the same as with the Greeks, who in their turn go back to Egyptian models The decans are not mentioned in Ptolemy *al Ṣuwar* means properly the *paranatellonta* of the Babylonian Teukros, the constellations which rise at the same time as the separate decans according to his list Abū Maʿshar and other Arab authors took over the list of the *paranatellonta* from Teukros un-

altered, but not the astrological interpretations associated with them

Buyūt The Greek οἶκοι or τόποι, Lat *domicilia* or (mediaeval) *domus*, are called in Arabic *buyūt* (sg *bait*) The sun and moon are each ruler (*ṣāḥib*, *rabb*, Greek οἰκοδεσπότης [cf above *muthallathāt*]) over one sign of the zodiac, each of the other five planets rules over two signs at the same time, according to the following scheme, also already laid down in the τετράβιβλος

Lion — Sun Crab — Moon		Archer Fishes	} Jupiter
Scales Bull	} Venus	Goat Water carrier	} Saturn
Scorpion Ram	} Mars	Virgin Twins	} Mercury

The *buyūt* from the Lion to the Goat are day-houses, the rest night-houses If a planet is in its day-house during the hours of day or in its night-house at night, it is credited with particularly powerful astrological influence

Sharaf and *Hubūṭ* By *sharaf* (pl *ashrāf*) we understand the ὕψωμα of the Greeks, *sublimitas* of Pliny, *altitudo* of Firmicus Maternus, *exaltatio* in mediaeval Latin, *hubūṭ* is the Greek ταπείνωσις, ταπείνωμα, more rarely κοίλωμα, class Lat *directio*, med Lat *casus*

A planet attains its maximum astrological influence in its *sharaf*, its influence is least in the *hubūt*, i e the point in the heavens diametrically opposite the *sharaf* on the circle of the ecliptic

Planet	*Sharaf*	*Hubūt*
Sun	Ram 19°	Scales 19°
Moon	Bull 3°	Scorpion 3°
Saturn	Scales 21° (20°)	Ram 21°
Jupiter	Crab 15°	Goat 15°
Mars	Goat 28°	Crab 28°
Venus	Fishes 27°	Virgin 27°
Mercury	Virgin 15°	Fishes 15°

The only inaccuracy in the list of exaltations, already fixed in ancient times, is giving 20° instead of 21° to the Scales for Saturn, which however goes back to a very old error, it is also found in Pliny, Firmicus and in the Hindu astronomer Varāha-Mihira

al-Balʿamī assumed that at the time of the creation of the world the planets were in their *ashrāf*

Various Arab writers since Abū Maʿshar also ascribe exaltations and dejections to the nodes of the moon (*ʿakdāni* or *ʿukdatāni*, scil *al kamar*) ascending node (*raʾs*) as *sharaf* the Twins 3°, and as *hubūt*, the Archer 3°, *vice versa* to the descending node (*dhanab*) as *sharaf* the Archer 3°, as *hubūt* the Twins 3° This allocation is not known to the Greek astrologers

Hudūd Each of the five planets (excluding the sun and moon) possesses in each of the 12 *buyūt* a sphere of influence covering several degrees (Arab *hadd*, pl *hudūd*, Greek ὅριον, Lat *fines*, med Latin *terminus*) which has the same astrological significance as the planet itself and can represent it at any time in horoscopes On the distribution of these spheres of influence within the zodiacal circle opinions differed widely and unanimity could never be attained Ptolemy added one more to the Egyptian and Chaldaean divisions already in existence (The various systems are fully expounded in the τετράβιβλος, i 20, fol 43 Boll has studied this question very fully in *Neues zur babylonischen Planetenordnung*, *Z A*, xxxviii [1913], p 340 *sqq*) The Arab astrologers used almost exclusively the Egyptian system, which makes the different spheres of very unequal sizes

Mintaka in Astronomy

The Mintaka is, as in the Greek astronomy, the fundamental basis for all calculations It is divided into 360° degrees (*dju²*, pl *adjzā'* or *daradja*, coll *daradj*, pl *daradjāt*), each degree into 60 minutes (*dakika*, pl *dakā'ik*), each minute into 60 seconds (*thāniya*, pl *thawāni*), each second into 60 thirds (*thālitha*, pl *thawālith*) and so on

The points of intersection of the ecliptic with the equator (*dā'ira* or *falak muʿaddil al-nahār*) define the two equinoxes (*al-iʿtidālāni*), the points of the greatest northerly and southerly declination the two solstices (*al-inkilābāni*) The position of a fixed star or planet with respect to the Mintaka is defined by giving its longitude (*tūl*, pl *atwāl* or in al Battāni *al-djuz' alladhi fihi al kawkab*) and latitude (*ʿard*, pl *ʿurūd*) The longitudes are numbered from the vernal point (*al-nuktat al rabiʿiya*) The axis erected perpendicular to the plane of the ecliptic meets the sphere of the fixed stars in the two poles of the ecliptic (*kutbā dā'irat al-burūdj*)

On Arab star-maps and -globes, we frequently find a mixed ecliptical and equatorial system of coordinates used (cf the remarks above on the fresco on the dome at Kusair ʿAmra), which consists of ecliptical circles of longitude through the poles of the ecliptic and equatorial parallel circles

Precession (in al-Battāni *Harakat al kawākib al-thābita*, in later authors more precisely *Mubādarat nuktat al iʿtidāl*) Among the Arab astronomers supporters were found for the theory of Ptolemy, who explained the precession as a continual revolution of the whole heavens around the pole of the ecliptic with a period of 36,000 years, as well as for that handed down by Theon of Alexandria (Thāwun al-Iskandarāni) from older sources, according to which the process of the precessions consisted of an oscillation to and from around the "nodes of the path of the sun" The greatest amount of the precession according to this theory is 8° west or east of the nodes, the retrogression amounts to 1° in 80 years so that the whole phenomenon repeats itself after 2,560 years The latter theory found particular approval in India and was further developed there Thābit b Kurra gave an explanation for it which at the same time took into account the (more suspected than observed) diminution in the obliquity of the ecliptic and calculated the length of the period at 4171½ years al-Battāni attacked and refuted this oscillation hypothesis of Theon and of the *Aṣḥāb al-tilsamāt* (ἀποτελεσματικοί), on a basis of new and comparative observations he found that the precession amounted to 1° in 66 years, which corresponds to a period of 23,760 years, which is roughly 10% too small The very accurate estimate of 1° in 70 years is also occasionally, if rarely, given in Arabic literature, according to E Zinner, *Geschichte der Sternkunde*, p 289

Obliquity (*Mail falak al-burūdj*, very frequently *al-mail kulluhu* or *al-kullī* in contrast to *al-mail al djuz'ī*, "declination of the separate points in the Mintaka", cf. al-Aghzāwī, p 21) The pro-

blem of estimating the obliquity of the ecliptic was during the classical period a centre of interest for the Muslim astronomers As a first attempt at an exact estimate in the Muslim period, Ibn Yūnus (ch ix, p 222 of the Leyden Codex or of the Paris Codex, N° 2475) mentions an observation of the period between 778 and 786 which gave the value $\varepsilon = 23° 31'$ We have an unusually large number of observations of later dates (For details see Nallino's notes on al Battānī's *Opus Astronomicum*, i 157 *sqq*)

al-Battānī in his observations used a parallactic ruler (triquetrum, *idāda ṭāwīla*) as well as a finely divided wall quadrant (*ḥibna*) He ascertained with these instruments in al-Raḳḳa the smallest zenith distance of the sun at 12° 26′, the greatest at 59° 36′, this gave $\varepsilon = \frac{47° 10'}{2} = 23° 35'$ This value is at the basis of all al Battānī's calculations and tables and has been adopted by many other Arab astronomers

The question whether the amount of obliquity remains constant at all times or is subject to a secular diminution was answered in different ways by different students As a matter of fact the degree of accuracy of observation was not sufficient to settle this point and the old Hindu value of $\varepsilon = 24°$, on which these investigations were often based, was based not on observations but only on a statement of Euclid's according to which astrologers of his time used to estimate the obliquity as a fifteenth part of the circumference of the circle

The following table gives a survey of the Arab values for the obliquity of the ecliptic (cf Nallino, *al-Battānī*, *Opus Astronomicum*, *loc cit*) The column "average obliquity" gives by Bessel's formula

$$\varepsilon = 23° 28' 18'' 0 - 0'' 48\,368\ t - 0'' 000\,002\,722\,95\ t^2 \quad (t = \text{years after } 1750)$$

the true values calculated for the periods in question The years given in brackets are only approximate, i e not given by the authors themselves

(Willy Hartner)

MINICOY, a coral island in the Arabian Sea midway between the Laccadive and the Maldive Islands, it belongs like the former to the Ālī Rājā of Cannanore but ethnographically and geographically has more claim to be attached to the Maldive group It is six miles long but very narrow, being only $1\frac{3}{4}$ square miles in area The population is about 3,000 The people, who are probably of Singhalese origin, have been Muhammadans since the xivth century The language is Mahl but the Arabic character is used They are strictly monogamous A girl's consent is required for her marriage and she brings no dowry, but receives presents from the bridegroom The women go unveiled There are three castes in the island The inhabitants all live in one village which is divided into ten quarters in each of which the men and women are separately organised with their own headmen and headwomen All work on land is done by women The men are sailors and fishermen Most of the island's food supply has to be imported The chief exports are cocoanuts, coir, cowries and dried fish The important position held by women in Minicoy has suggested its identification with Marco Polo's "Female Island" (ed Yule, ii 404)

Comparative table of the Arab values for the Obliquity of the Ecliptic

Observer	Place	Year	Obliquity observed	Average obliquity	Error
Eratosthenes	Alexandria	(230 B C)		23° 43′ 45″	+ 7′ 35″
Hipparchus	Rhodes	(130 B C)	23° 51′ 20″	42′ 57″	+ 8′ 23″
Ptolemy	Alexandria	(140 A D)		41′ 10″	+ 10′ 10″
Tabulae Probatae (*al-Zīdj al-mumtaḥan*)	Baghdād	829	33′	35′ 41″	— 2′ 41″
Other observers under al-Ma'mūn	Damascus	832	33′ 52″	35′ 40″	— 1′ 48″
Banū Mūsā	Baghdād	(860)	35′	35′ 26″	— 0′ 26″
al-Battānī	al-Rakka	(880)	35′	35′ 17″	— 0′ 17″
Banū Amādjūr	?	(918)	35′	35′ 0″	0′ 0″
'Abd al-Rahmān al-Sūfī	Baghdād?	(965)	33′ 45″	34′ 35″	— 0′ 50″
Abu 'l-Wafā'	Baghdād	987	35′	34′ 25″	+ 0′ 35″
Widjān b Rustam al-Kūhī	Baghdād	988	51′ 1″	34′ 25″	+ 16′ 36″
Ibn Yūnus	Cairo	1001	34′ 52″	34′ 19″	+ 0′ 33″
al-Bīrūnī	Ghaznī	(1019)	35′	34′ 10″	+ 0′ 50″
Alphonsinian Tables	Toledo	(1250)	32′ 29″	32′ 19″	+ 0′ 10″
Ibn al-Shāṭir	Damascus	(1363)	31′	31′ 25″	— 0′ 25″
Ulugh Beg.	Samarḳand	(1437)	30′ 17″	30′ 49″	— 0′ 32″

MINŪČIHRĪ, ABŪ 'L-NADJM AḤMAD B YAʿḲŪB, Persian poet, nicknamed *Shaṣt-galla* = "sixty-herds", because of the wealth he accumulated in horses and cattle, but some say the name should be read *Shast-kul* or *Shast-kula* i e "crooked-thumb" He was a native of Damghān, calling himself "Dāmghānī" in his verse although Dawlatshāh says he came from Balkh He was a younger contemporary and imitator of ʿUnsurī [q v], but he is considered to have excelled his model in poetic power After completing his studies under Abu 'l-Faradj of Sīstān (d circa 392 = 1002) he enrolled himself in the service of the Amīr Minūčihr b Kabūs b Washmgir, ruler of Djurdjan and vassal of Mahmūd of Ghazna, and from the name of this first patron he took his *takhallus* Presumably through the influence of ʿUnsurī he later became attached to Mahmūd's entourage of literary men at Ghazna, and wrote *kaṣīdas* in praise of his new patron and of his sons Muhammad (who reigned for less than a year) and Masʿūd who succeeded to the Ghaznawid throne The latter was assassinated in 432 (1041), and Minūčihrī did not long survive him (Riẓā-kulī Khān, *Madjmaʿ al-Fusahā'*, i 543, says he died in the same year and quotes ʿAwfī as having called him "short lived") In his work Minūčihrī shows himself to be a skilled versifier, displaying a clever felicity of rhyme and very often a refreshing simplicity and straightforwardness of language Also he did not hesitate to use new forms for his verse, and he is the earliest Persian writer we know of to have used the strophic form of the *musammat*, which, as used by him, consists of a series of *misrāʿs* or *stichoi*, in groups of six All six may rhyme together, or only five, in the latter case the last line rhymes with the last lines of the other strophes In spite of his qualities as a versifier, Minūčihrī cannot be regarded as a great poet, even for his day His themes, — wine, love, springtime and the virtue of patrons — are of the stock pattern, and his *kasidas* are deliberately moulded on the Arabic form, with all its artificialities In flattery of his patrons he is as servile as any in the whole range of Persian panegyrists and his conceit of himself as it appears in his work is sometimes ludicrous in its effect (cf N⁰ 48 in Biberstein Kazimirsky's edition, Paris 1886)

Bibliography works quoted above and Ethé, in *Grundriss d iran Philologie* A Tihrān ed of the *Dīwān* was published in 1297 A H (R LEVY)

MĪR, a Persian title abbreviated from the Arabic *amīr* and approximating in meaning both to it and to the title *mīrzā* [q v] (For the dropping of the initial *alif*, cf Bū Sahl for Abū Sahl etc) Like *amīr* the title is applied to princes (Minūčihrī, ed Biberstein-Kazimirski, 1886, p 96, speaks of Masʿūd, Sulṭān of Ghazna, as "Mīr"), but it is also borne by poets and other men of letters (e g Mīr ʿAlī Shīr, Mīr Khwānd, Mīr Muhsin, cf the following art) In India, Sayyids sometimes call themselves by the title As a common noun, it is used as an equivalent of *ṣāhib*, e g *mīr pandj*, *mīr ākhwūr* In Turkish there was derived from it the colloquial adjective *mīrī* ("belonging to the government"), which gave rise to *al-mīrī* ("the government") in the colloquial Arabic of ʿIrāḳ (R LEVY)

MĪR, the poetical designation of Mīr Muhammad Takī b Mīr ʿAbd Allāh, was a native of Akbarābād After the death of his father he went to Dihlī during the reign of Shāh ʿĀlam (1173—1221 = 1759—1806) and became a pupil of Sirādj al-Dīn ʿAlī Khān Ārzū In 1190 (1776) he left Dihlī for Lucknow, where he spent the remaining portion of his life He is recognised to be the most eminent poet of the Urdū language He died at Lucknow in 1225 (1810) when he was nearly 100 years old He is the author of six *dīwāns* which have been repeatedly printed in India, and a biography of Urdū poets, entitled *Nukāt al-Shuʿarā'*

Bibliography Shīfta, *Gulshan i Bīkhār*, fol 167—176, Āzād, *Āb-i Hayāt*, Lahore 1913, p 203–241, Karīm al-Dīn, *Taʾrīkh-i Shuʿarāʾ i Urdū*, Dihlī 1848, p 115—120 (M HIDAYET HOSAIN)

MĪR AMMĀN [See AMMĀN]

MĪR DJUMLA [See MUHAMMAD SAʿĪD]

MIʿRĀDJ (A), originally ladder, later "ascent", especially Muhammad's ascension to heaven In the Kurʾān, Sūra lxxxi 19–25 and liii 1–12, a vision is described in which a heavenly messenger appears to Muhammad and Sūra liii 12–18 deals with a second message of a similar kind In both cases the Prophet sees a heavenly figure approach him from the distance but there is no suggestion that he himself was carried off It is otherwise with the experience alluded to in Sūra xvii 1 "Praise him, who travelled in one night with his servant from the Masdjid al-Harām to the Masdjid al-Aksā, whose surroundings we blessed, in order to show him our signs" That Muhammad is meant by the "servant" is generally assumed and there is no reason to doubt it (Schrieke, *Islam*, vi 13, note 6, Bevan, *Z A T W*, xxvii 53 *sq*), that the Masdjid al Harām is the Meccan sanctuary is certain from Kurʾānic usage (Horovitz, *Koran Unters*, p 140), but what is the Masdjid al Aksā? According to the traditional explanation, but not the only one recognised in Hadīth (see Schrieke, *op cit*, p 12, 14 and above, s v ISRĀʾ) it would mean Jerusalem, but how could Muhammad, who in Sūra xxx 1 speaks of Palestine as *adna 'l ard*, call a sanctuary situated in Jerusalem *al-masdjid al akṣā*? The age of this explanation is not quite certain, perhaps it was already known to ʿUmar b Abī Rabīʿa (ed Schwarz, xci) and Abū Sakhr (*Lieder der Hudhailiten*, ed Wellhausen, cclxiv 24), but even these belong only to the Umayyad period (contrary to Lammens, *Sanctuaires*, p 72, this is true also of Abū Ṣakhr, who according to *Aghānī*, xxi 94 was a partisan of the Banū Marwān and panegyrist of ʿAbd al Malik) Muhammad probably meant by al-Masdjid al Aksā a place in heaven, such as the place in the highest of the seven heavens in which the angels sing praises of Allāh and we would then have in Sūra xvii 1, evidence from the Prophet himself about his nocturnal ascension into the heavenly spheres (Schrieke, *op cit*, p 13 *sqq*, Horovitz, *Isl*, ix 161 *sqq*), testimony which is however content with the mention of the experience itself and says nothing about its course The question

of the possibility of an ascent to heaven is several times touched on in the Kurʾān In Sūra xl 38 Firʿawn gives Hāmān orders to build a palace so that he can reach the cords of heaven and climb up to the god of Mūsā (cf also Sūra xxviii 3) In Sūra lii 38, the calumniators are asked whether they had perchance a ladder (*sullam*) so that they could hear the heavenly voice and in Sūra vi 35 the consequences are considered which the signs brought by the Prophet with the help of a ladder to heaven might have on his hearers The old poets also talk of ascending to heaven by a ladder, as a means of escaping something one wants to avoid (Zuhair, *Muʿallaka*, p 54, Aʿshā, xv 32)

Hadīth gives further details of the Prophet's ascension Here the ascension is usually associated with the nocturnal journey to Jerusalem, so that the ascent to heaven takes place from this sanctuary We also have accounts preserved which make the ascension start from Mecca and make no mention of the journey to Jerusalem In one of these the ascension takes place immediately after the "purification of the heart" (see Bukhārī, *Ṣalāt*, bāb 1, *Hadjdj*, bāb 76, *Manākib*, bāb 42, Ahmad b Hanbal, *Musnad*, iv 207, v 143, Tabarī, ed de Goeje, i 1157 *sq*) In the last mentioned passage we read "When the Prophet had received his revelation and was sleeping at the Kaʿba, as the Kuraish used to do, the angels Gabriel and Michael came to him and said With regard to whom have we received the order? Whereupon they themselves answered With regard to their lord Thereupon they went away but came back the next night, three of them When they found him sleeping they laid him on his back, opened his body, brought water from the Zamzam well and washed away all that they found within his body of doubt, idolatry, paganism and error They then brought a golden vessel which was filled with wisdom and belief and then his body was filled with wisdom and belief Thereupon he was taken up to the lowest heaven" The other versions of the same story show many additions and variants, according to one, for example, Gabriel came to Muhammad through the roof of his house which opened to receive him, according to another, it was Gabriel alone who appeared to him and there are many similar variants All these versions however put Muhammad's ascension at an early period and make it a kind of dedication of him as a Prophet, for which the purification of the heart had paved the way Ethnographical parallels (Schrieke, *op cit*, p 2—4) show other instances of a purification being preliminary to an ascension Similar stories are found in pagan Arabia (Horovitz, *op cit*, p 171 *sqq*) and also in Christian legends (*op cit*, p 170 *sqq*) Another story (Ibn Saʿd, i/i 143) says that the ascension took place from Mecca although it does not associate it with "the purification of the heart" which it puts back to the childhood of the Prophet [cf HALĪMA]

How did it come about however that this, obviously the earlier, tradition of Mecca as the starting point of the ascension was ousted by the other which made it take place from Jerusalem? The localisation of the Kurʾānic Masdjid al-Aksā in Jerusalem is by some connected with the efforts of ʿAbd al-Malik to raise Jerusalem to a place of special esteem in the eyes of believers (Schrieke, *op cit*, p 13, Horovitz, *op cit*, p 165 *sqq*, do, in *Islamic Culture*, ii 35 *sqq*) and in any case it cannot be proved that this identification is older than the time of ʿAbd al Malik It might all the easier obtain currency as Jerusalem to the Christians was the starting point of Christ's ascension and from the fourth century Jesus's footprint had been shown to pilgrims in the Basilica of the Ascension, as now, perhaps as early as the time of ʿAbd al-Malik, that of their Prophet was shown to Muslim pilgrims (Horovitz, *op cit*, p 167 *sq*) The idea of the "heavenly Jerusalem" may have had some influence on the development of the *isrāʾ* legends, when Muhammad meets Ibrāhīm, Mūsā and ʿĪsā in Jerusalem, the presence of these prophets in the earthly Jerusalem is not at once intelligible, but it loses any remarkable features if Bait al-Makdis (Ibn Hishām, p 267) from the first meant the "Heavenly Jerusalem" (Horovitz, *op cit*, p 168, another explanation cf ii 604) Perhaps also the phrase *alladhī bāraknā hawlahu* was taken to support the reference to Jerusalem, when these words occur elsewhere in the Kurʾān they refer to sites in the holy land (Lammens, *op cit*, p 72, note) While the stories quoted above only say that Gabriel took the Prophet up to the heights of heaven, but are silent as to how, others add that a ladder (*miʿrādj*) was used for the ascent (see Ibn Hishām, p 268, Tabarī, *Tafsīr*, xv 10, Ibn Sʿad, i/i 143), this ladder was of splendid appearance, it is the one to which the dying turn their eyes and with the help of which the souls of men ascend to heaven The ladder is probably identical with Jacob's ladder in Genesis, xxviii 12, the Ethiopic Book of Jubilees, xxvii 21 calls this *maʿāreg* and Sūra lxx 3, 4 calls Allāh *Dhu 'l-Maʿārid̲j* "to whom the angels and the spirit ascend" (*taʿrudj*) According to Sūra xxxii 4, the *amr* rises to Allāh, according to Sūra lvii 4 and xxxiv 2, Allāh knows "what descends from heaven and what ascends to it", and in Sūra xlii 32 there is a reference to steps (*maʿārid̲j*) in the houses of men Muhammad therefore already knew the word, which is presumably taken from Ethiopic (Horovitz, *op cit*, p 174 *sqq*) Among the Mandaeans also the ladder (*sumbilta*) is the means of ascending to heaven (*Ginza*, transl Lidzbarski, p 49, 208, 490) and there are parallels to the ladder of the dead in the mysteries of Mithras (see Andrae, *Die Person Muhammeds*, p 45, Wetter, *Phos*, p 114, note 2), the Manichaean *ʿamūd al-sabh* (*Fihrist*, p 335, 10) by means of which the dead man is taken to the sphere of the moon is a more distant parallel (Bevan, *op cit*, p 59)

Just as the miʿrādj is associated with the ascension, so Burāk is originally connected with the night journey to Jerusalem, it found its way however at an early date into the legend of the ascension (see Bukhārī, *Manākib*, bāb 42, Ahmad b Hanbal, *Musnad*, iv 207, v 387, Tabarī, *Tafsīr*, xv 12) The prophets earlier than Muhammad had used Burāk as their steed (Ibn Hishām, p 263, Diyārbakrī, *Taʾrīkh al-Khamīs*, i 349), in particular Ibrāhīm (ʿAdjdjādj, ed Ahlwardt, xlv 48—52, Tabarī, *Tafsīr*, xv 5, Thaʿlabī, *ʿArāʾis*, p 63, Halabī, i 369) This idea of one animal used by the different prophets is borrowed, according to the Midrashic statement, late it is true (*Yalkūt* on Zachariah, ix, N° 875, *Pirkē de R Eliʿezer*, xli), the ass which Abraham rode (Genesis xxii 3) is the same as that used by Zipporah and her sons (Exodus, iv 20) and is that on which

the Messiah will make his entrance (cf also Ibn Saʿd, I/II 176) The recollection that this steed was an ass survives in Muslim tradition so that Burāḳ is described as "smaller than a mule and larger than an ass" (Bukhārī, *Manāḳib*, bāb 43, similarly Ibn Hishām, p 264, Ibn Saʿd, I/I 143) Ibn Saʿd already describes Burāḳ as a female beast and, as early as a story attributed by Ibn Ishāḳ to al-Hasan al Basrī, Buraḳ is given wings (Ibn Hishām, *loc cit*) Thaʿlabī seems to be the first who speaks of Burāk's human face (in Halabī, I 370), in the miniatures dealt with fully by Arnold, *Painting in Islam*, p 118 *sqq*, al-Burāḳ usually has a woman's head

At the gate of each of the seven heavens through which he wanders with the Prophet, Gabriel is asked for his own name and that of his companion (Bukhārī, *Salāt*, bāb I, Tabarī, *Tafsīr*, xv 4, *Annales*, ed de Goeje, I 1157) After he gives these he is next asked if Muhammad has already been sent as a prophet (*awakad buʿitha ilaihi*, correction for the original *awakad buʿitha* found in Tabarī, *Annales*, I 1158, see Snouck Hurgronje, *Isl*, VI 5, note 4), this also indicates that the ascension originally belonged to the period immediately after his call (Schrieke, *op cit*, p 6) In each heaven they meet one of the earlier messengers of God, usually Adam in the first, Yahyā and ʿĪsā in the second, Yūsuf in the third, Idrīs in the fourth, Hārūn in the fifth, Mūsā in the sixth and Ibrāhīm in the seventh heaven, there are also variations und Adam appears as judge over the spirits of the dead (Andrae, p 44 *sq*, Schrieke, p 17, Ahmad b Hanbal, *Musnad*, v 143, cf *Apoc Mosis*, p 37) Of the other messengers of God we are only told — in addition to being given a description of their personal appearance — that they greeted Muhammad, Mūsā is an exception who expressly says that Muhammad is higher in the esteem of Allāh than himself and that the number of his followers surpasses his own (Tabarī, *Tafsīr*, xv 11) On another occasion, Muhammad engages in a conversation with Mūsā after Allāh had imposed upon him 50 salāts a day as obligatory prayers for the faithful On Mūsā's advice, Muhammad asks several times for an alleviation and each time Allāh grants it, but when Mūsā says 5 salāts are still too many, the Prophet refuses to ask for less (on *Genesis*, xviii 23 *sqq* as the prototype of this episode, cf Goldziher, *Studien*, I 36, Schrieke, p 19, Andrae, p 82) According to some versions, Mūsā dwells in the seventh heaven and the conversation seems to be more natural there To the ascension belong the visits to paradise and to hell Paradise according to many versions is in the seventh heaven, according to others in the first, in some it is not mentioned at all The statements about its rivers are contradictory (Schrieke, p 19, cf above KAWTHAR), the *Sidrat al-Muntahā* is usually placed in the seventh heaven (Bevan, p 59, Schrieke, p 18) In one description hell is put below the first heaven (Ibn Hishām, p 269, Tabarī, *Tafsīr*, IV 10) According to another, the place of punishment of the damned is on the way between heaven and earth and Muhammad sees it on his journey to the Bait al-Makdis (Ṭabarī, xv 101, also Ahmad b Hanbal, *Musnad*, I 257, II 353, III 120, 182, 224, 231, 239) On the punishment in hell cf Schrieke, p 17, Andrae, p 44, Horovitz, p 173, Reitzenstein, *Das mandäische Buch der Grösse*, p 81 *sqq*, Lidzbarski, *Johannisbuch*, p 98 *sqq*, *Ginza*, p 183

That Muḥammad appeared before Allāh's throne in the seventh heaven and that the conversation about the obligatory prayers took place there, is already recorded in the oldest stories (see above) but only rarely do they extend the conversation between Allāh and the Prophet to other subjects (Ṭabarī, xxvii 26, *Musnad*, IV 66 as a dream, Andrae, p 70) But objection was raised to the assertion that Muhammad on this occasion saw Allāh face to face (Andrae, p 71 *sqq*), and the question was also raised at an early date whether the ascension was a dream or a reality, whether only the soul of the Prophet was carried up or also his body (Caetani, *Annali*, Intr § 320, Andrae, p 72, Bevan, p 60, Schrieke, p 13, note 1)

The Hadīth contains, besides these, other details which Asin (*Escatologia*, Madrid 1919, p 7—52, do, *Dante y el Islam*, Madrid 1927, p 25—71) has discussed In developing the story of the Prophet's ascension Muhammadan writers have used models afforded them by the Jewish and Christian Apocalypses A few features may also come from the Parsees from the Arda Viraf, cf the works already mentioned by Andrae, Bevan, Schrieke, Horovitz and W Bousset, in *A R W*, IV 136—169

Later accounts (Chauvin, *Bibliographie*, XI 207 *sqq* Asin, *Escatologia*, p 53 *sqq*, do, *Dante* etc, p 72 *sqq*, Nallino, in *R S O*, VIII 802) collect and systematise the material scattered in the older sources, they only increase the matter without however increasing the depth of its thought Among the Miʿrādj-books which have become popular in modern times that of al Ghaitī may be mentioned (this is the correct form, see Nallino, *op cit*, p 813) on which Dardīr (d 1201) wrote a *hāshiya*, also that of Barzandjī (d 1179) In the non-Arab lands of Islām, Persian, Turkish, Hindustānī and Malay versions of the legend have contributed to its dispersion (see Chauvin, *loc cit*)

The ascension of the Prophet later served as a model for the description of the journey of the soul of the deceased to the throne of the divine judge (Asin, *Escatologia*, p 59 *sq*), for the Sūfīs however, it is a symbol of the rise of the soul from the bonds of sensuality to the heights of mystic knowledge Ibn al-ʿArabī thus expounds it in his work *Kitāb al Isrā' ilā Makām al-Asrā* (Asin, p 61 *sqq*, Andrae, p 81 *sq*), and in his *Futūhāt*, II 356–375 he makes a believer and a philosopher make the journey together but the philosopher only reaches the seventh heaven, while no secret remains hidden from the pious Muslim (Asin, p 63 *sqq*) Abu 'l-ʿAlā' al-Maʿarrī's *Risālat al-Ghufrān* is a parody on the traditional accounts of the Miʿrādj (Asin, p 71 *sqq*) Asin in his two books quoted has dealt with the knowledge of Muslim legends of the ascension possessed by the Christian middle ages and their influence on Dante In a separate work (*La escatologia musulmana en la divina comedia*, Madrid 1924) he has collected and discussed the literature produced by his *Escatologia* down to 1923

According to Ibn Saʿd, I/I 147 the *isrā'* took place on the 17th Rabiʿ I, the ascension on the 17th Ramadān For centuries however, the night before the 27th Radjab — a date also significant in the history of Mecca (see Snouck Hurgronje, *Mekka*, II 71) — has been regarded by the pious as the *Lailat al-Miʿrādj*, and the eve is like the *Mawlid al-Nabī* devoted to reading the legend of the feast

(see al-'Abdarī, *Madkhal*, 1 143 *sqq*, Herklots, *Qanoon e Islam*[2], p 165, Lane, *Manners and Customs*, London 1896, p 474 *sq*, Snouck Hurgronje, *The Achehnese*, 1 219, Asin, *Escatologia*, p 97)

MĪRĀNDJĪ, whose full name was Mīr Muhammad b Kāḍī Sā'in dātā b Kādī Kalandar, commonly called Miyān Mīr or Miyāndjī, born 938 (1531) in Siwastān, Sind He traced his origin to the caliph 'Umar and spent the last 60 years of his life in great sanctity at Lāhūr He died in 1045 (1635) But according to the *Bādshāh-Nāma* of 'Abd al-Hamīd, 1 330, his death took place in 1044 (1634) Shāh Djahān repeatedly visited the saint and Prince Dārā Shikūh erected a splendid dome over his tomb The Prince also wrote a work called *Safīnat al-Awliyā'* in which he described fully the lives of this Indian saint and his disciples

Bibliography *Safīnat al-Awliyā'* p 70, *Khazīnat al Asfiyā'*, p 154, 'Abd al Hamīd, *Bādshāh-Nāma*, 1 329, Rieu, *Cat Persian MSS British Museum*, 1 358

(M Hidayet Hosain)

MĪRĀN MUHAMMAD SHĀH I, of Khāndesh, was the eleventh prince of the Fārūkī dynasty He belonged to the younger branch of that line, which had taken refuge in Gudjarāt, and his ancestors had lived in that kingdom and had married princesses of the Muzaffarī family until Mahmūd I of Gudjarāt had, on the extinction of the elder branch of the Fārūkīs, placed 'Ādil Khān III, Muhammad's father, on the throne of Khāndesh Muhammad, who was, through his mother, the great-grandson of Mahmūd, and the grandson of his son, Muzaffar II, succeeded his father in Khāndesh in 1520, and in 1527 incautiously intervened in the cause of 'Alā' al-Dīn 'Imād Shāh of Barār by aiding him against his enemy, Burhān Nizām Shāh I of Ahmadnagar He was defeated and driven back into Khāndesh, but succeeded in persuading his uncle, Bahādur of Gudjarāt, to intervene, and with him invaded the kingdom of Ahmadnagar The campaign was only partially successful, but Muhammad was indemnified by Burhān I for his losses He accompanied his uncle in the campaign which ended, in 1531, in the capture of Māndū and the annexation of Mālwa to Gudjarāt, and on Bahādur's death in 1537, was summoned, in his mother's right, to the throne of Gudjarāt, but died on his way to Ahmadābād

MĪRĀTH (A), inheritance (pl *mawārith*), *mūrith* legator, *wārith* heir

1 The law of inheritance (*'ilm al-farā'id*, "the science of dispositions", i e of the quotas laid down in accordance with Sūra IV 16, which is called after its most important and most difficult part) is one of the branches of Muhammadan law in which Muhammad more deeply modified earlier practice by legislation Although the Kur'ānic regulations are fairly detailed, the task of deducing all necessary conclusions from them, to which lawyers turned with particular enthusiasm, gave rise to a great mass of traditions and considerable divergences of opinion on questions not expressly decided in the Kur'ān In the law of inheritance we can also still trace fundamental old Arabian pre-Islāmic features

2 In the period before the rise of Islām, in keeping with the patriarchal system prevailing among the Arabs, the estate of a deceased tribesman went, if he died intestate, to the nearest male relative(s), the order of succession in which these relatives, the so called *'asaba* (corresponding to *agnati*), were called upon to inherit survives systematised in its order in the Muslim law of inheritance (cf below) Minors were, as incapable of bearing arms, excluded from the succession as were female relatives widows also were not entitled to inherit, and originally no doubt themselves formed a part of the estate, a view which survived in the levirate marriage usual among the Arabs, to which Sūra IV 23 (cf below) refers in forbidding it There is no evidence of any preferential treatment of the first-born, which we find elsewhere in Semitic law This, the original legal position, had by Muhammad's time most certainly altered somewhat in favour of women, in cases where the deceased left no male relatives his daughters seem frequently to have obtained the estate but woman had by no means equal treatment with man, as is clear from Muhammad's regulations In addition to these principal heirs the pre-Islāmic Arabs had also secondary heirs who correspond to the later so-called quota-heirs (*dhawu 'l-farā'id*) and received a part of the estate, the bulk of which went to the *'asaba* From Kur'ān II 176 and IV 37 which confirm this arrangement, we can see that these included the parents, the "relatives" — apparently so far as they were not *'asaba* — and the so called confederates (*halif*, plur *hulafā'*) the settlement of the portions falling to them was done in accordance with Sūra II 176 — at least in part — according to the last will of the testator

3 Muhammad modified this system considerably in details, the main point being the improvement in the treatment of women as in his innovations with regard to the laws of family life generally [cf TALĀK], at the same time there is a clear endeavour to fix in legal form the practice which had varied considerably in heathen times The main lines of the system and the general conceptions as above briefly outlined were retained by the Prophet One provision which had been made under special circumstances he was not able later to keep in force, immediately after the *Hidjra*, he had ordered that those who migrated with him (the *muhādjirūn*) and the believers in Medīna (the *ansār*) should regard themselves as brethren and therefore able to inherit from one another, while all bonds of relationship between the *muhādjirūn* and their relatives left in Mecca, even if they were believers, were to be regarded as broken (Sūra VIII 73, with the limitation imposed in VIII 76), but this was expressly revoked by Sūra XXXIII 6 Tradition regards this fraternization as a special case of confederacy (*halif*dom, cf above, section 2) For the rest, Muhammad in his first Medīna period confirmed the system of secondary heirs and the whole general practice in regard to inheritance (cf *ibid*, Sūra II. 176 is probably to be dated in Ramadān of the year 2, and IV 37, of which the first view in

al-Baidāwī is undoubtedly the right one, cannot be much later), that in ii 176 he expressly makes the fair treatment of the secondary heirs a duty, already reveals the direction which later ordinances were to take Connected with this is the probably contemporary ii 241 *sqq* which secures the wife, if she survives her husband, a legacy of maintenance for a year Not much later, about the year 3, is Sūra iv 23 "Ye, who are believers, are not permitted to inherit women against their will", this is a prohibition against the *ʿaṣaba* forcing the widow of the deceased into a levirate marriage and generally assuming the position of *walī* over her which belongs only to her male relatives, this is not meant as a regular legal ordinance but is part of Muhammad's endeavour to improve the position of women [cf TALĀK] Very soon after the battle of Uhud, when numerous Muslims had fallen, we have — as a result of it — the final Kur'ānic ordinance of Sūra iv 8—18 "To the men belongs a share of what their parents and relatives leave, and to the women belongs a share of what their parents and relatives leave — whether it be much or little — as a definite share 9 If the relatives (not entitled to inherit), the orphans and the poor are present at the division, give them some of it and speak kindly to them (verses 10 *sq* go on to deal with the treatment of orphans) 12 Allāh commands you, as regards your children, as follows to the boy belongs as much as the share of two girls, if however there are (only) girls (and) more than two, two thirds of the estate belongs to them and if there is one (girl) to her belongs the half And the parents shall each have a sixth if (the legator) had children, and if he had no children and (only) his parents inherit from him, his mother shall have a third If however he have brothers, his mother shall have a sixth (All this) after deducting any bequests he may have made or a debt Ye know not whether your parents or your children be of greater use to you (This is) an ordinance of Allāh and Allāh is all knowing and wise 13 To you belongs the half of the estate of your wives, if they have no children, but if they have children you shall receive a fourth of their estate — after deducting any bequest that they may have made or any debt 14 To them belongs a fourth of your estate, if you have no children, but if you have children an eighth of your estate belongs to them — after deducting any bequest that you may have made or any debt 15 If distant relatives inherit from a legator, male or female, and he has a brother or a sister, each shall have a sixth, but if there are more, they shall have a third among them after deducting any bequest which he may have made or debt, 16 Without prejudice (this is) an ordinance of Allāh Allāh is all-knowing and gracious" (Verse 17 *sq* contain promises and threats) As the settlement of the succession in indirect lines left questions undecided, Sūra iv 175 supplemented the above „They ask thee for a decision Say Allāh gives you the following decision for remoter kindred if a man die childless and have a sister, half of what he has is hers and if she die childless, he is her heir, if there be two sisters, two-thirds of the estate belongs to them, but if there be both brothers and sisters, the brother shall have as much as two sisters " The object of these regulations is simply to supplement the law regarding the rights of the *ʿaṣaba*, they are not a reorganisation of the whole law Each of the persons named is therefore only allotted a definite portion The remainder, and this is as a rule the major portion, of the estate falls as before to the *ʿaṣaba* There is a distinct tendency to give female relatives half the share of male relatives of the same degree, even in the case when there are daughters but no sons (and correspondingly sisters but no brothers), they do not receive all that would belong to the sons or brothers, but as regards a few smaller portions the two sexes rank equally The quotas here given abolished the testamentary settlement of the portions usual in the heathen period, which was still approved by Sūra ii 176, this is the historical starting point for the tradition — early interpreted in another sense — that a legacy in favour of the heirs is not valid Sūra ii 241 *sq* (cf above) is probably rightly regarded as abrogated by the settling of the widow's portion in tradition. There is a slight difficulty in interpretation only in iv 15, but there can be no doubt that this verse refers to half-sisters on the mother's side, as indeed it has always been interpreted, the text of Ubai' even inserts an addition to this effect (cf Noldeke-Bergsträsser, *Geschichte des Qorans*, ii 85, 93, note 5) The verse iv 175 on the other hand refers to full sisters, how the Kur'ān wished half-sisters on the father's side to be dealt with, is difficult to say In iv 12 "more than two" (girls) is to be interpreted, as the sense requires, as "two and more", similarly, in the case in which the mother is allotted a third of the estate, it is presumed that the father gets the other two thirds

4 The full details which tradition is able to give regarding the causes of the revelation of the regulation of the law of inheritance are not historical, on internal grounds all we can say is that it took place soon after the battle of Uhud (cf above, section 3) The numerous *ḥadīth*s which simply repeat the Kur'ānic regulations may be neglected here Tradition can only record very few actual divergences from the prescriptions of the Kur'ān one of these is that a woman received back as her inheritance a slave whom she had presented to her mother and who represented the latter's whole estate (in a parallel case it is a man who has given his mother a garden, by this alteration the divergence is disposed of) According to another story, the Prophet is said to have laid it down that the wives of the *muhādjirūn* should inherit the houses of their husbands, according to the wording, it cannot have been a temporary arrangement which was abolished by the final settlement While nothing can be quoted in favour of the first *ḥadīth*, the second, which does not seem to be intended as a foundation for any legal clause, may have a grain of historical truth in it

5 The prescriptions of the Kur'ān are supplemented and developed in countless traditions among which a comparatively large number relate not decisions of the Prophet himself, but of his Companions (we may cite Ibn Hanbal, iv 279 *sq* as a typical mixed form), in reality they must not for a moment be regarded as fact, but only as anonymous evidence of the first developments of the Kur'ānic law of inheritance At this stage of development it is already firmly established that an unbeliever cannot inherit from a Muslim, the right of a Muslim to inherit from an unbeliever is finally also denied, although there is some opposition to this view, on the question

of inheritance of a *murtadd*, unity was not attained Excluded from the right of inheritance is also one who has killed the legator, according to one view always, according to another only if the slaying was deliberate (with *ʿamd*, cf article KATL) That a slave has no right of inheritance is taken for granted Legal relationship is necessary for the right of inheritance, thus illegitimate children or those whose paternity has been disputed by *liʿān* [q v] have no legal claim on the estates of their father and his relations The patron (*mawlā*, q v) is included among the *ʿasaba*, who are placed in the order which had been handed down from the pre-Islāmic period and continued to hold good the patron and the manumitted slave inherit from one another and according to one view, the same right is granted to the *mawlā*, meaning the man before whom the person concerned has adopted Islām After the *mawlā* come — although some oppose this — the *dhawu 'l-arhām*, i e persons related to the legator in the female line, whose representative is usually the *khāl* or maternal uncle In case all these heirs should not exist, the fellow-tribesmen are named The law in Sūra iv 14 is also extended to the widow whose husband dies before the consummation of the marriage, on the question what should be the share of two daughters, we have the answer two-thirds, doubtless in keeping with the sense of Sūra iv 12, but also that based on the literal interpretation (the half), finally half brothers on the father's side, about whom the Kurʾān lays down nothing definitely, are excluded from inheriting by full brothers With certain modifications which occur again in the later teaching, a son's daughters are treated like daughters and grandparents like parents, but this regulation only won recognition after opposition and varying practice in details Here arises the problem of the different shares of the grandfather along with the brothers when he appears with them as *ʿaṣaba*, which goes back to his varying position in the series (cf below sect 6*b*), along with other views we find quoted also the one that later prevailed but it does not seem to be the earliest The Kurʾān lays it down that before dividing the estate the amount of any legacies and debts should be deducted, and in early times — probably in literal interpretation of the Kurʾanic passages — the legacies often were given preference to debts, after some opposition the opposite teaching prevailed The *diya* [q v] to be paid for a slain man was in itself subject to the usual laws as part of his estate, but in early times the wife was not allowed a share in the *diya* of her slain husband, which goes back to old Arab conceptions of the family, the other view ultimately prevailed In addition there are numerous, often contradictory, views on separate points which show the eager interest taken in the matter The interest taken in early Islām in the law of inheritance is reflected in Hadīth, there are traditions in which the Prophet orders the law of inheritance to be taught and learned, calling it "the half of knowledge" on account of its difficulty and expressing the fear that this subject, so difficult to remember, might in time disappear from the memory of his community

6 The law of inheritance attained its full development in the system of *fikh*, the following are its principles according to the Shāfiʿī teaching (for the most important divergences in the other schools cf. below sect 7).

a The law of intestacy in general. According to Muslim law, there is no fusion between the property of the legator and that of the heir The creditors of the estate can therefore only assert their claims against the estate, on the other hand, the heirs have no claim on the estate until all debts are paid The *fikh* has therefore no special teaching on the rejection of legacies, the different ways of succeeding to an inheritance, etc In addition to pledges entered into by the deceased, the debts of the estate include the funeral expenses and the religious duties omitted by the deceased so far as they consist of concrete things (e g unpaid *zakāt*) or can be atoned for by payment (e g neglected fasts [*ṣawm*]) or can be carried through at the expense of the estate by a deputy (e g the *hadjdj* omitted without good reason), in the opinion of a minority of Shafiʿī legists, omitted salāts may also be included in these After the debts any legacies have to be paid [cf WASIYA], the remainder passes to the heirs A necessary condition for inheriting is that the heir has survived the testator, in doubtful cases, when persons who would inherit from one another have died without its being certain which died first, as a rule no inheritance passes between them (this decision is already found in Tradition, there was a very old difference of opinion on the point) The heir must also have existed when the testator died, only in the case where a man leaves a pregnant widow or *umm al walad*, is a child's share reserved for the unborn child (Tradition is not agreed on this point) If a man is missing long enough to be considered dead, the kādī can declare him "presumably dead" at the request of the heirs after investigating the circumstances, the heirs thus receive the right to take possession of the estate for the time Excluded from succession are the following one who has caused the death of the deceased, the *murtadd*, an unbeliever from the succession to a Muslim and vice versa, the *harbī* (the unbelieving member of a state with which the Muslim stands in no treaty relation) and the slave As in old Arab law the succession of the *ʿasaba* is the basis of the law of inheritance in the case of an intestate, the *ʿaṣaba* are the usual heirs, inheritance by others is only an exception from the general rule, on the order of succession among the *ʿaṣaba* cf under *b* The *ʿasaba* receive the whole estate after the deduction of the portions set aside for the quota-heirs by the Kurʾān (cf under *c*) If there are no *ʿaṣaba*, that portion of the estate which remains after the deduction of the portions of the quota-heirs goes to the state treasury (*bait al-māl*, a notable change from the view found in traditions — cf section 5 —, even ʿOmar II is said to have decided otherwise, cf al-Dārimī, *Farāʾid*, bāb 56), it being presumed that this is administered according to law for the benefit of the Muslims, otherwise the Kurʾānic quota-heirs receive the remainder of the estate in proportion to their quota by the so called law of reversion, with the exception of the widower or widow if they are not also at the same time blood-relations of the deceased (here also as in the case of the exclusion of the widow from sharing in the *diya* of her slain husband, the basis is the old Arab family law) Only if there are neither *ʿaṣaba* nor quota-heirs and the state treasury is not being administered in accordance with the law are the *dhawu 'l-arhām* — i e persons related to the deceased in the female line as well as those

female relatives who cannot be quota-heirs — called upon to inherit (there are two theories regarding their order of succession) If there are none of these relatives, any Muslim may take possession of the estate, if he is capable and ready to administer it for the general good of Muslims

b Rights of the *ʿaṣaba* The *ʿaṣaba* are called upon to inherit in the following order which in essentials already existed in the pre-Muhammadan period 1 The male descendants of the legator in the male line, a nearer excluding the more distant relatives from the succession 2 The nearest male relative in the ascending male line with the provision that the father, but not the grandfather (and remoter ascendant), of the deceased inherits before his brothers, the grandfather shares with the brothers (cf below) 3 The nearest male relative in the male line in the descendants of the father first the full brother, then the half-brother on the father's side, then the descendants of the full brother, then those of the half brother on the father's side 4 The nearest male relative in the male line among the descendants of the grandfather (as under 3) etc , 5 lastly the *mawlā*, i e the patron (or patroness), if the deceased was a freed man, and then his *ʿaṣaba* — The brothers of the deceased inherit only with the grandfather as *ʿaṣaba* in equal shares with him, but if there are more than two brothers there, the grandfather receives one-third of what is to be divided between him and the brothers If there are also quota heirs, the grandfather is allowed in addition at least a sixth of the estate (which he would inherit as a quota-heir, cf below *c*) He can then choose the most favourable of the three arrangements This rule seems to be a compromise between the two earlier contradictory views that the grandfather excluded the brothers or *vice versa* was excluded by them (cf above section 5) — Female *ʿaṣaba* If the deceased left sons as well as daughters they inherit jointly, the share of a son being twice as large as that of a daughter (according to Sūra iv 12) while the quota allotted to the daughters (*ibid*) is dropped, as is intended by the spirit of the Kurʾānic law The daughter who inherits along with a son is therefore also called *ʿaṣaba* and in order to distinguish her from the male *ʿaṣaba*, the *ʿaṣaba bi-nafsihi* ("*ʿaṣaba* by themselves"), she is called *ʿaṣaba bi 'l-ghair*[i] ("become *ʿaṣaba* through another") The daughter of a son of the legator is similarly treated, inheriting along with the son of a son, and the full sister who inherits along with a full brother (by Sūra iv 175), finally it applies also to the half-sister on the father's side who inherits with a half-brother on the father's side (the grandfather makes the full sister as well as the half-sister on the mother's side *ʿaṣaba bi 'l-ghair*[i]) — If the full sister and the half-sister on the father's side inherit along with a daughter of the deceased or of a son, they do not receive their Kurʾānic quota (Sūra iv 175) which in this case goes to the daughter or son's daughter (according to Sūra iv 12), but the rest of the estate after deduction of all quotas that have to be paid, they are in this case therefore called *ʿaṣaba maʿa 'l-ghair*[i] ("inheriting with one another as *ʿaṣaba*")

c Rights of the quota-heirs (*dhawu 'l-farāʾiḍ*, cf the article FARĀʾIḌ) The regulations in this connection are in general based on literal interpretation of the Ḳurʾānic regulations It is true that here only the daughters, parents, husband and wife, and brothers and sisters are allotted a quota but (with some limitations) the rules holding for the daughters have been extended to the daughters of the son and those for the parents to the grandparents, in addition, a distinction has been made among the sisters between the full sister, the half-sister on the father's side and the half-sister on the mother's side The total number of quota-heirs has thus been raised to twelve 1 The daughter is entitled to half the estate, two or more daughters get two-thirds, but if daughters inherit along with sons, their claim to the quota drops and sons and daughters receive the whole after deduction of the quotas to be paid, in this case the daughter's share is half a son's 2 The daughter of a son is subject to the same rules as a daughter, inheriting along with the son of a son she receives half as much as he as *ʿasaba bi 'l ghair*[i] As the son's daughter is related to the son through him, she is excluded from participation when a son of the legator inherits A daughter on the other hand does not exclude a son's daughter from the succession, as however daughters and son's daughters together have only two-thirds of the estate as their quota, a son's daughter has only a sixth if there is one daughter, and nothing if there are two or more, unless she inherits in these cases along with a son's son as *ʿasaba bi 'l ghair*[i] 3 The father's quota is always a sixth of the estate, in addition he appears as *ʿasaba* and receives as his quota also any residuum of the estate after deducting all quotas, unless male descendants of the legator inherit jointly with him 4 The paternal grandfather (in default of him, the remoter ascendants) also receives one sixth of the estate as his quota but is excluded by the father, he also appears as *ʿaṣaba* (like the father) if there are no male descendants nor father of the deceased But if in addition to him there are also brothers of the legator, he appears with them as *ʿaṣaba* (on the share which falls to the grandfather in this case and in the case where there are also quota heirs cf above *b*) 5 The mother by Sūra iv 12, receives one-sixth of the estate if there are children, son's children or two or more brothers or sisters of the legator, otherwise a third (on the meaning of the Kurʾānic rule cf above, in practice the father in this case as a rule receives two-thirds, i e according to the scheme, one sixth as quota-heir and the rest as *ʿaṣaba*, on the exceptions cf below under *d*) 6 The quota of the grandmother is always a sixth, from this the mother's mother is excluded by the mother, and the father's mother by the father and mother, all other female ascendants of the legator rank equally with the grandmothers on both sides if there is no father and mother, so far as they are not related to the deceased by a male descendant not entitled to inherit (therefore for example the mother of the maternal grandfather inherits nothing) 7 A full sister receives half, two or more such sisters receive together two-thirds of the estate (Sūra iv 175) Along with a full brother or grandfather she becomes *ʿaṣaba bi 'l-ghair*[i] and receives the half of the brother's share (Sūra iv 175) Along with the daughter or son's daughter she becomes *ʿaṣaba maʿa 'l-ghair*[i] (cf above *b*), sons, sons' sons and the father exclude her from succession She has a claim to the quota only when the legator has died without leaving de-

scendants or male ascendants 8 The treatment of the half-sister on the father's side in general corresponds to that of the full sister, along with a half-brother on the father's side or the grandfather, she becomes *ʿaṣaba bi 'l-ghairi*, with the daughter or son's daughter *ʿaṣaba maʿa 'l-ghairi* (cf above *b*), sons, sons' sons, father and full brothers exclude her from the succession Full sisters exclude her only in so far as two or more full sisters receive together two thirds of the estate, so that nothing is left for the half sisters, if however the half sister inherits along with one full sister they receive together two thirds, the full sister getting a half and the half-sister a sixth, unless she in these cases inherits along with a half brother on the father's side as *ʿaṣaba bi 'l-ghairi* (i e the same rule as with daughters and sons' daughters, cf above) 9 and 10 The rights of the half-brother on the mother's side and of the half-sister on the mother's side are based on Sūra iv 15 each of them receives a sixth, two or more together share a third among them, they are excluded from the succession by descendants and male ascendants 11 By Sūra iv 13 the widower receives half of the estate, but only a quarter if there is a son or son's child, it is indifferent whether these are his wife's or his own descendants 12 The widow, by Sūra iv 14, receives the half of what a widower would receive under the same circumstances, if the deceased leaves more than one widow they share equally the quota allotted to the widow During the *ʿidda* (period of waiting, q v) after a revocable *talāk* a man and woman are still regarded as man and wife for purposes of inheritance

d Exceptions from the general rules Although the quota-heirs can never all inherit together and in particular the collateral relatives are excluded from their quotas by those in the direct line, the number of qualified quota-heirs may sometimes be so large that the sum of their shares is larger than the whole estate, in this case their shares are proportionately reduced [cf ʿAWL] Otherwise, the occurrence of a number of heirs makes no change from the main rules necessary, except in a few particular cases which have special names, these are cases in which, if the main rules were strictly carried through, the inheritances would be in a proportion to one another which would be contrary to the law, e g in the case of the so-called *gharībatān* if some one dies leaving a husband or wife and both parents, the mother would receive in this case a third, the father's share however, which is usually two-thirds (cf above *c* 5), would be here reduced by the quota either of the widow i e a quarter or of the widower, i e the half and thus reduced to five twelfths or to a sixth, according to tradition, it was ʿOmar who decided in this case that father and mother should share, in the proportion of two to one, what remains after deducting the portion of the widow or widower, an arrangement which is doubtless in the spirit of the Kurʾānic rule Another case, the so-called *mushtarraka*, is that in which a wife leaves her husband, her mother, two or more half-brothers ou the mother's side and also one or more full brothers, as the quotas in this case make up the whole estate, nothing would be left for the full brothers as *ʿaṣaba*, and they are more closely related to the legator than the half-brothers, in this case, which is also said to have been decided by ʿOmar, the law lays down that the full brothers have the same rights as the half-brothers so that all inherit in equal shares the third originally set aside for the half-brothers On a third case of this kind cf AKDARĪYA

7 The most important points of difference among the *madhāhib*, including the early legists, are the following It is unanimously agreed that an unbeliever cannot inherit from a Muslim nor a Muslim from an unbeliever, but Saʿīd b al-Musaiyib and Ibrāhīm al-Nakhaʿī] recognised the right to inherit in the latter case Unbelievers who belong to different religions cannot inherit from one another according to Mālik and Ibn Hanbal, but they can according to Abū Hanīfa and al-Shāfiʿī There are three views regarding ability to inherit from the *murtadd* according to Mālik, al Shāfiʿī and Ibn Hanbal his whole estate goes to the state treasury, according to Abū Yūsuf and al-Shaibānī it goes to his Muslim heirs, according to Abū Hanīfa what he has made while a Muslim goes to his Muslim heirs, but what he made after his apostacy goes to the treasury If a legator has been deliberately (with *ʿamd*) and illegally slain, his slayer, it is unanimously agreed, is excluded from inheriting Abū Hanīfa, al Shāfiʿī and Ibn Hanbal, but not Mālik, also exclude one who has killed him without design (with *khaṭaʾ*, q v) One who is a slave to some degree can, according to Abū Hanīfa, Mālik and al Shāfiʿī, neither inherit nor bequeath, according to Ibn Hanbal, Abū Yūsuf, al-Shaibānī and al-Muzanī he can inherit or bequeath in the proportion he is free According to Abū Hanīfa and Ibn Hanbal, if there are no *ʿaṣaba* and quota-heirs, the *dhawu 'l-arhām* inherit, according to Mālik and al Shāfiʿī (cf above 6 *a*) as well as Zuhri, al-Awzāʿī and Dāwūd al-Zāhirī, in this case the treasury steps in If there are only quota heirs, according to Mālik and al-Shāfiʿī the remainder goes to the treasury, according to Abū Hanīfa and Ibn Hanbal however also to the quota heirs, according to Saʿīd b al-Musaiyib the maternal uncle inherits along with the daughters The relationship of *mawlā*, which is produced by some one attaching himself to the tribe (usually on the adoption of Islām by a non Arab, cf above, sect 5) and which results in the patron becoming surety for the *diya* [q v] of the client, does not, according to the usual view, give any right to inherit Ibrāhim al-Nakhaʿī and Abū Hanīfā take the opposite view but hold but it may be dissolved at any time by either side so long as the patron has not paid a *diya* for his client The paternal grandmother is not excluded from the succession by the father, according to Ibn Hanbal only, in his view, in this case she inherits a sixth either alone or shared equally with the mother Among female ascendants, according to Mālik, only the mothers of the two grandmothers inherit, likewise their mothers and so on, but according to Abū Hanīfa also the mothers of all male ascendants and their mothers again, and so on, both views are quoted by al-Shāfiʿī, but the latter is best known and has established itself in the *madhhab* According to Mālik and al-Shāfiʿī, the female ascendants on the father's and mother's side share in equal portions the sixth allotted to the grandmother who is nearer of the two to the legator According to Abū Hanīfa, however, the nearer female ascendant on the father's side excludes the remoter on the

mother's side from the succession Whichever of the two sides is entitled to inherit a quota inherits, according to Mālik and al-Shāfiʿī, only on ground of "stronger" relationship, according to Abū Hanīfa and Ibn Hanbal on ground of both respects (this case, particularly frequent in the marriages of the Parsees, has been decided in various ways in Tradition, cf al-Dārimī, *Farāʾiḍ*, bāb 42), in the case of two cousins on the father's side, of which one is also the brother on the mother's side, the latter, it is unanimously agreed, receives a sixth and the remainder falls to the two as *ʿasaba* in equal portions, while Abū Thawr and al-Hasan of Basra make him inherit the whole The estate of a child, whose paternity has been disputed by *liʿān*, as well as that of an illegitimate child, passes in default of other heirs, according to Abū Hanīfa, entirely to the mother (a third as Kurʾānic quota and the remainder as quasi-*ʿaṣaba*), according to Mālik and al-Shāfiʿī the mother receives a third as Kurʾānic quota and the remainder goes to the treasury, according to one view transmitted from Ibn Hanbal the *ʿasaba* of his mother are regarded as his *ʿasaba*, and receive the remainder, the other view corresponds to that of Abū Hanīfa In the special case of the so-called *musharīaka*, Mālik's view agrees with that of al-Shāfiʿī (cf above 6 *d*), this is also the opinion of al-Zuhrī and of Saʿīd b al-Musayyib and others, according to Abū Hanīfa and his fellows, Ibn Hanbal and Dāwūd al-Zāhirī, the full brothers actually receive nothing

8 *a* The law of the Imāmīs (Twelver-Shīʿīs) as regards inheritance is based on the same principles as that of the Sunnīs but in its practice shows a number of features of its own, which already can for the most part be traced in the traditions, i e in the earliest post-Kurʾānic development Among the divergences — apart from differences in terminology and presentation — are the classing of the *ʿaṣaba* and the *dhawu ʾl arḥām* together into one group of relatives, which is divided into three classes 1 the ascendants in the first degree and the descendants, 2 the other ascendants and the descendants of the ascendants of the first degree, 3 the maternal and paternal uncles and aunts Each of these classes excludes the following ones from the succession and within the two categories of the two first classes the relative of the nearest degree excludes all others of a remoter degree of relationship, i e for example the daughter excludes the son's son, within the third class a distinction is made between the uncles and aunts of the legator and their descendants, the uncles and aunts of his parents, and their descendants etc, and here also the member of a nearer degree excludes those of a remoter degree Within the same grade all full relatives (male or female) exclude all relatives on the father's (not the mother's) side, i e full sisters exclude half brothers, the relatives on the mother's side are excluded only from a share in the residuary estate by all other relatives of the same degree If relatives whose relationships with the legator is traced through several persons inherit jointly, the proportion of their shares is settled by the (hypothetical) shares of the persons through whom they are related to the deceased If, for example, paternal and maternal uncles inherit together, the former divide two thirds of the estate (i e the father's hypothetical share), the latter a third (i e the mother's hypothetical share), correspondingly, son's children and daughters children, children of brothers and children of sisters, and ascendants on the mother's and father's side The rules applying to the brothers and sisters of a legator are also applied to his father's brothers and sisters and so on, if the latter are called upon to inherit, if, for example, father's full brothers and sisters (uncles and aunts), and father's brothers and sisters on the mother's side exist together, the latter are not excluded by the former but receive a third (if there is only one, a sixth) which is divided equally among them (Sūra IV 15), and the former receive the remaining two-thirds (or five sixths as the case may be) of which each uncle gets twice the share of an aunt, the process is similar when their children take the place of uncles and aunts, the grandfather (and if the case arises the remoter ascendants) also inherits equally with the brothers of the legator Within similar groups the male inherits double as much as the female, so far as there are no special regulations to the contrary (cf above), for the rest the male relative on the father's side is not specially privileged before the others, as among the Sunnīs Besides these heirs by blood, there are "heirs for special reasons", i e the husband and the patron (*mawlā*), namely 1 a patron who has released the legator from slavery, 2 a patron before whom the legator has become a Muslim, or who has pledged himself to pay the *diya* for him, 3 the *imām*, who here takes the place of the state treasury and who, as the general protector of all Muslims, is entitled to inherit in the last resort — In both main groups there are simple heirs and such as have a claim to a Kurʾānic quota If the estate does not suffice to satisfy all the quotas, the shares are correspondingly reduced to the paternal relatives only, never to the maternal What is left over after satisfying the quotas is given to relatives by blood according to the above rule, but if there are no blood relatives entitled to inherit, the quota heirs, with the exception of the husband or wife, receive the residuum also by the residuary law (cf however above), if there are no heirs by blood the patrons come in, in the order given, so that the *imām*, i e the treasury, inherits only in the last resort — These general rules are sufficient to cause the distribution of an estate to look very different among the Shīʿīs from among the Sunnīs But there are in addition differences in detail, of which the most important are the following The Muslim can inherit from the unbeliever (and apostate), even the remotest Muslim heir of an unbeliever has a preference over all non-Muslim heirs, unbelievers of all sects inherit from one another, the succession of the heirs to the estate of an apostate who was born a Muslim begins from his apostacy The accidental killing of a legator does not exclude the slayer from inheriting If the sole existing heir is a slave, he is purchased at the expense of the estate (his owner cannot refuse to sell him), thus becomes free and inherits what is left, if the parents of the legator are slaves, they must in all cases be purchased at the expense of the estate, according to some the children also (this is disputed) and according to others every heir (this has not been accepted) The part-slave inherits to the degree in which he is free One who has a claim to an inheritance from two sides inherits on both grounds Of the estate of a child whose paternity has been disputed by *liʿān*, the mother receives a third as the Kurʾānic quota

and the remainder as quasi ʿ*asaba*, according to the more usual view, according to the other the remainder goes to the *imām* There are no legal relationships between an illegitimate child and his ascendants (including his mother and her relatives), only between him and his descendants, if there are none, the estate goes to the *imām* In the special case of the so called *gharībatān* (cf above 6 *d*), there is no divergence from the general principles — On the whole then the Shīʿa law of inheritance represents an independent systematisation of the common principles found in the Kurʾān and Tradition but diverging further from the old Arab pre Islāmic principles, whether and how far it the Sunnī system already presupposes (as has been proved for the Zaidīs, cf Bergstrasser, *O L Z*, vol xxv, p 124) has not yet been investigated

b On the law of the Shīʿī Zaidīs cf Strothmann, *Isl*, vol xiii, p 36 *sqq*

c The most important peculiarities of the law of inheritance among the Khāridjī Ibādīs are the following the paternal grandfather inherits as quota-heir a sixth of the estate if there are descendants of the legator, otherwise he inherits as ʿ*asaba*, thus excluding the brothers, just as he himself is excluded by the father The grandmother is only excluded by the mother Female descendants, like husband or wife, have no right to the residuum Manumission confers no rights of inheritance, freedmen, negroes, Indians, Abyssinians or Nubians can inherit from another if there are no other heirs (cf above, sect 5) If there are no heirs at all, the estate is given away in charity The special case of the so called *mushāraka* is settled as among the Shāfiʿīs (cf above 6 *d*) — The dependence of this system on the Sunnī is apparent

9 The law of inheritance, as a branch of family law and as possessing a peculiarly religious character from its very full regulation in the Kurʾān, has always been one of the chapters of Muslim law most carefully observed in practice [cf ʿĀDA and SHARĪʿA] As in the long run it must lead inevitably to the splitting up of even the largest estates, various endeavours have been made to avoid this result, which was considered undesirable A plan, frequently adopted, was to constitute considerable portions of the estate religious endowments [cf WAḲF] the proceeds of which could be disposed of by the grantor as he pleased, but most endowments in course of time became much broken up Another way adopted in the Dutch Indies is, in keeping with the local ʿ*āda*, to admit only a portion of the actual estate to division among the heirs, we also frequently find an estate divided already in a lifetime by gift or friendly arrangement, and not infrequently some member of the family, according to circumstances, simply takes over the estate and obligations of the deceased, lands here are taken out of the control of Muslim law So far only a very few Indian modernists (notably Khuda Bukhsh) have dared to criticise the Muslim law of inheritance and demand its abolition It is the general practice of Muslim lands and is used by the *sharīʿa* tribunals, which also undertake the distribution of the estate, a thing too difficult for a layman to attempt The Muslim law of inheritance is also applied to members of other creeds, when they come with problems to be settled to the Sharīʿa tribunals, which often happens in Muslim countries

(JOSEPH SCHACHT)

MIRDĀS B UDAIYA, Khāridjī leader in Basra, killed in 61 (680—681) He belonged to the Rabiʿa b Hanzala b Mālik b Zaidmanāt (called Rabiʿa al-Wustā, *Nakāʾid*, ed Bevan, p 185, 5 = 699, 11, *Mufaddalīyāt*, ed Lyall, p 123, 12, 772 8), a branch of the tribe of Tamīm which supplied so many leaders to the Khāridjī movement His father was called Hudair b ʿAmr b ʿAbd b Kaʿb and Udaiya was his mother's or grandmother's, name, she belonged to the tribe of Muhārib b Khasafa (Ibn Duraid, *Kitāb al-Ishtikāk*, ed Wustenfeld, p 134, Ibn Kutaiba, *Kitāb al-Maʿārif*, ed Wustenfeld, p 209, Tabarī, Mubarrad, Balādhurī, cf *Bibl*) He is often called by his *kunya* Abū Bilāl

His brother ʿUrwa b Udaiya had been one of the instigators of the Khāridjī movement of secession at the battle of Siffīn, he himself had taken part in the movement and had fought against the Caliph ʿAlī at al-Nahrawān (38 A H), after this defeat he gave up all political activity although, like his brother, he remained faithful to his old opinions, but he declared himself against armed insurrection, political assassination (*istiʿrād*) and the participation of women in the Khāridjī movement These moderate views, which Mirdās retained till the end of the caliphate of Muʿāwiya and which caused the extremists to class him among the *kaʿada* (quietists) of the Khāridjīs, made it all the more remarkable when he came out openly and actively against the excesses of the governor of Basra, ʿUbaidallāh b Ziyād, in his repression of Khāridjism A woman named al-Baldjāʾ or al Bathdjāʾ (the latter form, given by Ibn al-Athīr from al Balādhurī, seems to be wrong) had been cruelly martyred by the governor Mirdās's indignation was so aroused that he left Basra with 40 of his followers and went to al-Ahwāz on the Fārs frontier, where he held out for a long time without committing any of those acts of fanaticism usual among the Khāridjīs and confined himself to imposing a levy equal in value to the pension

(ʿaṭā') which was legally due to him and his companions (60 A H) ʿUbaidallāh b Ziyād sent against Mirdās the Kilābī chief Aslam b Zurʿa (this is the best authenticated form, al-Tabarī in the first of the two versions which he quotes has Ibn Hisn, al-Dīnawarī Aslam b Rabīʿa, Yākūt Maʿbad b Aslam) at the head of 2,000 men They met near a village called Āsak (or Midjās, according to a verse quoted by Yākūt, IV 712—713) but the Khāridjīs, in spite of their greatly inferior number, defeated him In the following year, a second expedition of 4,000 men under the Tamīmī ʿAbbād b Akhdar was organised by Ibn Ziyād, he found the Khāridjīs encamped in front of Darābdjird It was a Friday and the two parties agreed to finish their prayers before fighting But the government troops, breaking the oath they had sworn, fell upon the Khāridjis while they were still praying and massacred them Mirdās's head was cut off and taken to Ibn Ziyād

This episode, insignificant in itself, provoked a tremendous reaction throughout the ʿIrāḳ in view of the fame which the piety and moderation of Mirdās had brought him His death was promptly avenged by ʿAbīda b Hilāl, who was later to become one of the leaders of the Azraḳī rising, and it was in the name of Mirdās that Khāridjīs rebelled again on the death of the Caliph Yazīd I (65 A H) The heroism and death of Mirdās were sung by several poets, notably the famous ʿImrān b Ḥittān [q v], his memory was cherished for long in Khāridjī circles and especially in ʿOmān, the centre of the Sufriya (al-Mubarrad, p 533, l 14 = *Aghānī*, XVI 154) The latter, whose intransigeance is much less marked than that of the Azraḳīs, may rightly regard Mirdās as their predecessor (cf Haarbrucker, *asch-Scharastâni's Religionspartheien und Philosophen-Schulen*, II 406, from the *Kitāb al Tabṣīr fi 'l-Dīn* of Shahfūr b Ṭāhir al-Isfarāʾīnī [Brock , I 387]), on the other hand, the Muʿtazilīs held that Mirdās had only rebelled under compulsion (*munkiran*) and the Shīʿīs even denied that he was a true Khāridjī (al-Mubarrad, p 560—561)

Mirdās's brother, ʿUrwa b Udaiya, does not seem to have taken part in the insurrection, but this did not save him from persecution by Ibn Ziyād, who had him arrested and executed shortly after the death of Mirdās, the version which puts his execution before the rising of Mirdās in 58 A H (Tabarī, II 185) is less probable

Bibliography The fullest and most complete account is that of al-Mubarrad, *al-Kāmil*, ed Wright, p 584—596, without indication of source, al-Balādhurī, *Ansāb al Ashrāf*, Constantinople MS ʿĀshir Efendi, p 386ᵛ—387ᵇ, is very close to but not identical with al-Mubarrad's and quotes a large number of verses He also omits the *isnād* Al-Tabarī, *Annales*, ed de Goeje, II 186—187, 390—391 relies on two sources, Wahb b Djarīr and an anonymous one, of which the former does not seem very reliable and the latter follows al-Mubarrad and al-Balādhurī, but is much shorter, Yāḳūt, *Muʿdjam al-Buldān*, ed Wustenfeld, I 61—62 (cf also II 434, l 1) seems to have used an independent source Ibn al-Athīr, *al-Kāmil*, ed Tornberg, III 428—430, IV 81–82 harmonises al-Tabarī and al-Balādhurī, and follows al Mubarrad, p 592 for the death of ʿUrwa, al-Dīnawarī, *al-Akhbār al ṭiwāl*, ed Guirgass, p 278—279 knows the episode, but wrongly attributes it to the Azraḳīs (sic !) and does not even mention Mirdās — Cf also Wellhausen, *Die rel-pol Oppositionsparteien* (*Abh G W Gott*, phil-hist Kl, N J V, 2, 1901), p 25—27 (G LEVI DELLA VIDA)

MIRDĀSIDS, an Arab dynasty in Syria The Mirdāsids took their name from the leader of the Bedouin tribe of the Kilābīs, Sālih b Mirdās We know nothing of Mirdās himself On Sālih cf the art and on his successor Shibl al-Dawla, the art , for the other members of the dynasty cf HALAB

In the beginning of the fifth (eleventh) century the Kilābis migrated from the ʿIrāk to the region of Aleppo In 414 (1023) their leader Sālih took the town The dynasty, at first so strong, gradually became so feeble that its last representative Sābik exchanged the town in 472 (1079) in spite of his brothers' protest for a few smaller towns with the then powerful Bedouin chief Muslim b Kuraish

The importance of the Mirdāsids, the second last Arab ruling family of Syria, lies in the fact that they successfully defended the northern province of Aleppo by arms and policy against the Byzantines and Turks Lane-Poole gives the genealogy in his *Muhammadan Dynasties*, London 1894, Shibl al-Dawla Nāsir (2) had also a son Mubārak and Rashīd al Dawla Mahmūd (4) had also sons Shabīb and Waththāb

Bibliography given in the article (M SOBERNHEIM)

MIRJAM [See MARYAM]

MĪR KHĀWAND, historian, author of the *Rawdat al-Ṣafā'* ("Garden of Purity") He was son of Burhān al Dīn Khāwand Shāh, native of Transoxiana, and, apparently, of Bukhārā He lived much in Herāt and died there on June 22, 1498, aged 66 His work is a universal history in seven volumes, beginning with the Creation and ending at the death of Sultān Husain of Herāt in 1505 The last volume, however, is really the work of his grandson, Khwāndamīr [q v] His work is not so interesting as his grandson's *Habīb al-Siyar*, for it is a compilation and wants the personal note The style too is bombastic, and there is little historical criticism But it is a work of great industry and has a high reputation in the East It was lithographed in Bombay 1848, in Tihrān 1852, a Turkish translation appeared at Constantinople in 1842, partial translations were made by Jenisch, Mitscharlik, Wilken, Vullers, Shea (O T F series), Rehatsek (T F series), Jourdain and Silvestre de Sacy (*Journal des Savans*, 1837)

Bibliography Quatremère (*Journal des Savans*, 1843, p 127, 170), Rieu, *Cat Pers MSS British Museum*, I 87, Elliot-Dowson, IV 127 (and the authorities quoted there, p 132 *sq*), Ethé (s v Mirkhond), *Enc Brit*, 11th ed , vol XVIII (H BEVERIDGE)

AL-**MIRRĪKH,** the planet Mars The etymology of the name is unknown The sphere of Mars is the fifth sphere of the planets It is bounded on the inner side by the sphere of the sun and on the outer side by the sphere of Jupiter, and its breadth is according to Ptolemy (XX 376) 998 miles Its period of revolution is estimated at 1 year, 10 months and 22 days In about 17 years, after 9 revolutions, Mars comes back to the same spot in the heavens, it spends about 40 days in each sign of the zodiac and covers about 40

minutes each day It is said to be one and half times the size of the earth

Astrologers call Mars *al Nahs al-aṣghar*, the minor misfortune It is the planet, which next to Saturn is credited with the most ominous omens and effects, war, revolutions, death, conflagration etc The character of those born under Mars is in keeping with this

Bibliography al-Kazwīnī, *ʿAdjāʾib al-Makhlūkāt*, ed Wustenfeld, i 26, A Hauber, *Planetenkinderbilder und Sternbilder*, Strassburg 1916, passim, *Rasāʾil Ikhwān al-Safāʾ*, Section iii, iv (J RUSKA)

MĪRZĀ or MIRZĀ, a Persian title, from *Mīr-zāda* or *Amīr-zāda*, and originally meaning "born of a prince" (cf *Malik zāda* and *Farhang-zāda*, which occur in Saʿdī etc) The title, in addition to bearing its original significance, was also given to noblemen and others of good birth, thus corresponding to the Turkish Āghā Since the time of Nādir Shāh's conquest of India it has been further applied to educated men outside of the class of *mullās* or *ʿulamāʾ* In modern times the title is placed after the name of a prince, and before the name of other persons bearing it e g *Husain Mīrzā* "Prince Husain", whereas *Mīrzā Husain* is practically equivalent to "Mr Husain" (R IEVY)

MĪRZĀPŪR, a district (and town) in India in the Benares division of the Central Provinces area 5,240 square miles The population is nearly 1,100,000 of whom barely 7% are Muhammadans The latter show a tendency to increase in proportion to the Hindus, owing to their greater vitality, containing as they do a smaller proportion of the very poor The district is however a stronghold of Hinduism, and Islām makes little progress by conversion Nothing is known of the early history of the district It was occupied by Radjputs in the eleventh century A D and in the next century passed into the power of the Muslim rulers of Djawnpūr Down to the Moghul conquest, the district played an important part in the military history of India, as it contained the great stronghold of Čunār which guarded the gateway of the east

At Rasulpur near Ahraura is the tomb of a Muslim martyr called Saiyid Ashrāf ʿAlī which is a place of pilgrimage Near the gateway of the fort of Bijaigarh is shown the tomb of Saiyid Zain al-ʿĀbidīn, the saint who miraculously took the stronghold for Sher Shāh The town of Čunār contains two mosques at one of which are preserved garments said to have belonged to Hasan and Husain The tomb of the Afghān saint Shāh Kāsim Sulaimānī (1545—1606) with those of his family forms a group of buildings of architectural interest His festival is celebrated on the 17th—21st Djumādā I

Mīrzāpūr city is the capital of the district of the same name It has a population of 80,000 of whom a sixth are Muslims It is a Moghul foundation dating from late in the xviith century in the xviiith and early xixth centuries it attained great prosperity as a trading centre, being at the junction of important roads and at the highest point on the Ganges reached by the larger ships In 1864 the opening of the East India Railway left the town isolated, since then it has declined, as the railway now carries the trade with which it used to deal

Among the mosques is one founded in the middle of the xixth century by a Muslim lady named Ganga Bibi who also left funds to build a sarai The town contains the celebrated Hindu shrine of Vindhesvarī, much visited by pilgrims and formerly held in special veneration by Thugs

Bibliography D L Drake-Brockman, *District Gazetteer of Mirzapur*, Allahabad 1911 (J ALLAN)

MĪRZĀ TAKĪ KHĀN, *Amīr i Nizām* or *Amīr i Kabīr*, was born at Farāhān of humble parents, his father having been first the cook and then the steward of the *Kāʾim Makām*, Mīrzā Abu 'l-Kāsim, who ended his life as the first minister of Muhammad Shāh Kādjār (1834–1848) In 1829, as a young menial, Takī khan accompanied the Persian Commander in-Chief on the Mission which was sent to St Petersburg after the murder at Tihrān of the Russian ambassador Grebaiodoff On his return to Persia after this visit to Europe, he was promoted to be a *mirzā* or writer, and subsequently was advanced to the rank of khān By the time his master and patron died the young official had achieved distinction enough to be made wazir responsible for the army in Ādharbāidjan Still further honours came, when, during the negotiations at Erzerūm for the settling of outstanding disputes between Persia and Turkey, he was sent to represent his own country in place of the Mushīr al Dawla, who had fallen ill after his appointment as plenipotentiary On the conclusion of the Treaty of Erzerūm, Mirza Takī returned to Tihrān and was then commissioned to accompany the young Wali ʿAhd, Nāsir al-Dīn Mirzā, to Tabriz, to which the latter was sent as governor of Ādharbāidjān In 1848, Takī Khān's master became Shāh, and on the way back to Tihrān he appointed his lieutenant to the post of Prime Minister It is said that either modesty or prudence caused him to refuse the title of Sadr-i Aʿzam which is bestowed on the holders of the office, but, in any event, he contented himself with the less imposing one of *Amir i Nizām*, which he had held in Ādharbāidjan as Commander-in Chief As a mark of the royal favour he was given the sister of the Shāh in marriage, and found in her a wife who displayed the utmost devotion to him for the short remainder of his life

In office he had the rare distinction in Persia of being inamenable to bribery, and he had a regard for his country which led him to resent interference from foreign powers in its affairs Moreover, recognizing the reactionary influence of the *ʿulamāʾ*, he attempted in such ways as were open to him to counteract their activities He reorganised the army in spite of attempts by his enemies to rouse certain sections of the troops into revolt against him, he made efforts to improve the fiscal system of the country and he had some success in making the provincial treasuries self-supporting Trade, both internal and external, was encouraged by him, and it was he that equipped Tihrān with the fine bazars which it now has As has been indicated, his period of office was not a peaceful one In 1850 occurred the execution of the "Bāb" [*q v*] at Tabrīz, the revolts of the Bābīs at Yazd and Zindjān and the execution of the "Seven (Bābī) Martyrs" at Tihrān The risings were put down with great cruelty, and in consequence an attempt was made by the Bābīs on the life of the Amīr-i Nizām, whom they regarded as responsible Almost from the begin-

ning of his period of office he had aroused by his influence over the Shāh the jealousy of the latter's mother and of possible rivals, and their secret attacks were helped by his overbearing character In November 1851 his enemies succeeded in securing his dismissal, after which the ill-judged attempt of the Russian ambassador to give the fallen minister his protection roused the anger of the Shāh who ordered him to retire in disgrace to Kāshān There, on January 9, 1852, he met his death at the hands of the sovereign's farrāsh-bāshi

Bibliography Lady Sheil, *Glimpses of Persia* (London 1856), p 201 *sq*, 248—252, R G Watson, *History of Persia* (London 1866), p 364—404, Muhammad Taki, *Ta'rikh-i Kādjāriya* (Tihrān n d not paged), part III, folios 13b, 14a, 26 (R I EVV)

MISĀHA (science of measurement, plane and solid geometry) is the name given by the Arabs to the science of comparing magnitudes and its methods In the wider sense it covers the measurement of all things which can or need be measured, mainly lengths, areas, volumes, weights and numbers, in particular however, the *'ilm al-misāha* deals with geometry, with definitions of solids and geometrical figures as well as the laying down of rules for the calculation of lengths, areas and volumes of the different figures in elementary plane and solid geometry The conception *misāha* therefore includes only a portion of what we call measurement in the wider sense, or practical or technical geometry (i e the measurement of things having length, breadth and volume), in particular it excludes mensuration in the narrow sense, geodesy The Arabs possessed special treatises dealing with the problems of geodesy They therefore make the same distinction between theoretical and applied measurement, which had developed among the Greeks from the time of Aristotle and is most clearly expressed by Hero in his *Metrica* and *Dioptra*

The definitions given by the Arabs themselves of the conception *misāha* are very varied Some authors give a very wide one (e g al-'Umawi "Measurement consists in ascertaining an unknown quantity by means of a known one The result gives the amount of the unknown quantity in units of the quantity used for measuring"), most of them mean by it the measurement of length, area and volume Al-Shinshawri makes a clear distinction between direct measurement, "the test of coincidence" (*tatbīk*), and indirect measurement by calculating from certain formulae

We find treatises on geometry throughout the whole period in which the Arabs acted as the transmitters of the ancient culture with which they had become acquainted, from the earliest beginnings of their literary activity at the beginning of the ninth century A D to the decline of Arab mathematics about 1600 The purpose of such works was to give the future surveyor, architect or soldier the necessary equipment, the theoretical foundation for his profession Three groups of these treatises can be distinguished according to their method of treatment

a those which are quite like our modern collections of formulae, are made as brief as possible, give only the usual methods of calculation and contain no examples (e g that of Ibn al-Banna'),

b those which contain examples, completely worked out, illustrating the process of calculation (e g that of al Baghdādī),

c those which only contain a series of fully worked out problems, and are a kind of exercise book (e g that of Abū Bakr)

On the method of exposition in these works it should be noted that we cannot of course speak of mathematical formulae in our sense of the word among the Arabs They, especially the eastern Arabs, had no language of mathematical formulae, it was only late among the western Arabs and probably only in the field of algebra that a technical language was developed The rules for measuring were always written out fully in words, sometimes even the figures occurring in the text

The matter of the works on *misāha*, especially the larger ones, as a rule comprises introductory remarks, rules for calculating areas and volumes and the most important lengths found on them, and occasionally also practical exercises

A Introductory remarks These are as a rule

1 Definition of the term misāha

2 Explanation, description and systematic classification of the geometrical figures to be discussed

3 Definition and list of the most common units of measurement

B Rules for calculation

I Plane surfaces (and the lengths occurring on them)

1 Quadrilaterals (square, rectangle, rhomboid trapezium, trapezoid, quadrilateral with salient angle)

2 Triangles (equilateral, isosceles, scalene, right angled, acute-angled and obtuse angled)

3 Polygons (regular, irregular, "drumshaped figure" (*mutabbal*), "hollow figure" (*mudjawwif*) "stepshaped figure" (*mudarradj*)

"Drumshaped" and "hollow" figures are formed by the combination of two congruent trapeziums in such a way that in the former the shorter, in the latter, the longer parallel sides coincide, a number of varieties are distinguished The stepshaped figure is formed by placing together a number of rectangles of the same length but different breadth, in which the proportions of the breadths form an arithmetical progression

4 Circle, segments of a circle (semi circle, segment, sector, circumference) and related areas (horseshoe or crescent [*hilāli*], egg shape, bean-or lentil shaped, or oval figures)

The crescent is formed by the subtraction of two segments of circles of different radius with a common chord egg shape and bean-shape by the addition of two congruous segments which in the egg-shape are less, in the bean shape greater than the semi circle The area of the oval (ellipse) is given by Savasorda as $^1/_4\ (a + b)^2\ \pi$

II Solids (and the areas, especially superficies, and lengths that occur on them)

1 Prism (ordinary straight and oblique prism, square column, rectangular column, dice, triangular prism, obliquely cut prism, *corpus simile domui* in Abū Bakr as translated by Gerard of Cremona)

2 Cylinder

3. Pyramids (straight and oblique pyramids, sections of pyramids)

4 Cones (straight and oblique cone, section of cone)

5 Sphere and section of a sphere, hemisphere, segment, sector and zone

6 Regular and semi-regular bodies (the five Platonic and two Archimedean are treated at any length only in al-Kāshī)

7 Other bodies [cylindrical vault (*azāḏ* and *ṭikān*, the only difference between them is the length) hollow dome (*kubba*), roof-shape (*corpus simile caburi* in Abū Bakr), wreaths and discus (hollow cylinder), terrace-shaped figures]

C Practical exercises

These are generally speaking rare in works on *misāha* We frequently find exercises in dividing fields modelled on Hero and Euclid Savasorda has a number of exercises on fields on slopes, in hollows and on summits and on the calculation of the heights of hills, al-Hanbalī has some on the measurement of inaccessible pieces of ground, the depth of wells and breadth of rivers Of other problems may be mentioned, for example, the calculation of the number of pieces of stone or bricks required to build a house or a roof, the ascertainment of the height of a wall

It must not however be supposed that the subject matter as above described is fully contained in any work on misāha The individual works differ in subject matter according to the inclinations and abilities of their authors, just as our text-books of geometry do at the present day We find works planned on a very comprehensive scale (by al-Hanbalī and al-Kāshī), alongside of very brief ones, often dealing only with portions of the subject (e g the anonymous Berlin MS N⁰ 5954 which contains only formulae for calculating plane surfaces), or even only a single problem (like the treatise by al-Shinshawrī) We therefore often find expositions which are only put into works on geometry in order to show the author's special knowledge or results of his research in a particular field

Among remarkable examples of this kind are the insertion by Djamshīd al Kāshī in a work on *misāha* of a treatment of regular and some semi-regular bodies (the calculation worked out by him in sexagesimal fractions to the fifths is so accurate that it only begins to differ from the correct figure in the tenth decimal place), the formulae for the area of a surface given by al-Umawī $F = \sqrt{a\,b\,c\,d}$ for trapezoids with a right angle and his improvement of Hero's formulae for the segments of a circle, the formula for an arc given by al-Karkhī, the formula $d^2 = {}^1/_9\,[n(n-1)+6]\,a^2$ where d is the diameter of the circle around a regular polygon of n sides of length a given by the same author and al-Baghdādī (the same formula is found in Nemorarius and Regiomontanus and attributed by the latter to the Hindus, it is however, so far as we know, not found in any Hindu mathematical work yet published), also the application of algebra to geometry by Abū Bakr and Ibn al-Bannā' The former uses the algebraical solution for problems of areas in order to show the application of equations of the first and second degree to the six cases distinguished by al-Khwārizmī, the latter uses combinatorial analysis to investigate the different possibilities of stating the problem

The methods of calculating the volume are the same as we find among the Greeks and Egyptians When it is not a question of matter that has been taken over from them, in which case the formulae are directly adopted, the obtaining of results is purely inductive and empirical Al-Karkhī for example for the volume of a sphere gives, in addition to the formulae d^3 $({}^{11}/_{14})^2$, on the method of obtaining which he says nothing, also d^3 $({}^{28}/_{45})$ which he gets by comparing the weight of a cube of wax with the weight of a sphere, which is made out of the cube of wax and whose diameter is equal to the edge of the cube al-Baghdādī deals with a method of ascertaining the volume from the weight and specific gravity al-Kashī knows the method of immersion of Archimedes mentioned by Hero The direct method of measuring the length of areas by laying a thread along them is still recommended as the most reliable by al-Karkhī and Bahā' al-Dīn It is evident that such methods must lead to approximative results and formulae of approximation, the typical feature of practical geometry, continue to be used by the Arabs in measuring long after they obviously knew of their inaccuracy Ibn Mammātī criticises the usual formulae for the area of a triangle ${}^1/_2\,(a+b)\,{}^3/_4\,c$ and ${}^1/_2\,(a+b)\,{}^2/_3\,c$, al-Baghdādī the formula for a quadrilateral ${}^1/_2(a+c)\,{}^1/_2(b+d)$ which comes from the Egyptians

The reasons for the long survival of such rules are partly that the formulae gave in practice quite useful results and partly that the practical men who were concerned with measurement in the exercise of their trade wanted values easy to calculate rather than great mathematical accuracy and took no note of slight errors, especially if they thereby avoided calculations with roots For similar reasons and in keeping with the traditional practice, almost all works of *misāha* give no scientific geometrical proofs of the accuracy of the formulae they quote Only the book of the Jew Abraham Savasorda, who may be reckoned among the western Arabs, gives logically worked out proofs in any number, we occasionally find references to early mathematicians (especially Euclid) in Ibn al-Bannā' and Ibn al-Hanbalī Probably inspection was quite sufficient (ʿAbd al ʿAzīz for example draws plane figures in a network of squares each of one unit and counts the squares and their parts within this area) or a simple demonstration in some form or a calculation to prove the correctness of the procedure, which was frequently illustrated also by examples completely worked out

A further peculiarity of Arabic authors was to give formulae which agree completely in substance in different algebraical forms The Berlin MS N⁰ 5954 gives for example for the calculation of the section of the hypotenuse q in the right angled triangle the following formulae $q = {}^1/_2\,[a + (c^2 - b^2)\;a] = {}^1/_2\,[a + (c+b)\,(c-b)\;a] = {}^1/_2\,[a + (c+b)\;\frac{a}{c-b}] = {}^1/_2\,[a^2 + (c^2 - b^2)]\;a$ This differentiation was probably only intended to give as many forms as possible of the relations between the known and unknown magnitudes so as to afford the practical man a choice of different correct formulae of which one might suit the special case better than another

The sources of Arab geometry are to be sought among the Greeks and Hindus The form and

substance of the rules are almost entirely Greek, especially in the older authors Hero's "elaborations" in particular, which in turn go back to Egypt, seem to have been the model for Arab works on geometry To Egypt may be traced the prefacing of a metrological section (found in many books on *misāha*), the problems on dividing fields, the formula for the trapezoid, the special name for the upper side of a quadrilateral (*raʾs al-ʿarīd*) Hindu are the values for π in al-Khwārizmī, the formula $\sqrt{a\,b\,c\,d}$, for the quadrilateral inscribed in a circle, the terms are, perpendicular from the summit of an arc and chord, the marking of lengths in Hindu figures, the use of algebra to solve geometrical problems (equations, method of double error, combinatorial analysis) The chief teachers were however the Greeks, whose achievements the Arabs generally speaking never surpassed, the requirements of practical mensuration gave them no new problems and practical geometry remained down to quite modern times elementary, the majority of the problems of which had been finally settled long ago by the Greeks

The services of the Arabs to geometry lie less in the extension of the field by ascertaining new, hitherto unknown facts, although in the misāha works we do find a series of new and novel rules, than in their enrichment of this science by new methods of calculation and teaching and especially in their preserving the inheritance of the ancients and handing it down to the western world Although Hero's geometry first became known in northwestern Europe through Roman surveyors, it was mainly the Arab sources which gave new life to this subject which had become stagnant in its old form Arabic original works were made accessible to the west in Latin translations Leonardo of Pisa in his *Practica geometrica*, which remained a standard work for three centuries, depended closely on Savasorda, who most probably owed a great deal to Abū Bakr as there are striking similarities between the *Liber embadorum* and the *Liber mensurationis*, down to late in the xvith century we continually come across writings on practical geometry, which in form and content show to what originals they go back

Bibliography a I Manuscripts Arabic authors translated into Latin 1 *Liber in quo terrarum et corporum continentur mensurationes Ababuchri* (author presumably Abū Bakr, † 1055, cf H Suter, *Die Mathematiker und Astronomen der Araber* etc, *Abhdlg z Gesch d math Wissensch*, xlv, 10 Heft, 1900, N⁰ 224), Cambridge, Univ Library, Mm ii 18, fol 69ᵛ—76ᵛ, 2 *Liber Saydi abuothmi* (author presumably Zaid Abū ʿOthmān, † 1052, Suter, N⁰ 222), do, fol 76ᵛ—77ʳ, 3 *Liber aderameti* (author presumably ʿOmar al-Hadramī, † 1057, Suter, N⁰ 227), do, fol 77ʳ—77ᵛ

II Arabic works (the titles are given as translated by F Wiedemann and J Ruska) 1 Ibn al-Djiyāb (c 1150) "Records of the measurement of surfaces", Escurial, old N⁰ 924, fol 1ᵃ—70ᵇ, 2 ʿImād al Dīn al-Baghdādī († 1335, Suter, N⁰ 494), "Work on the science of measurement and the sharing of difficulties", Berlin 5976, fol 17ᵃ—26ᵃ, 3 Ibn al-Bannāʾ († 1339–1340, Suter, N⁰ 399), "Treatise on the doctrine of measurement, Berlin 5945, fol 70ᵇ—73ᵃ, 4 anonymous, "Treatise on the principles of the doctrine of measurement" (written in 1358), Berlin 5953, fol 56ᵇ—59ᵃ, 5 anonymous, "Treatise on the doctrine of measurement", Berlin 5954, fol 85ᵇ—95ᵇ, 6 Djamshid b Masʿūd al Kashi († 1436—1437, Suter, N⁰ 429), "Keys for the calculator in the science of arithmetic", Berlin 5992, fol 27ᵃ—48ᵇ, 7 Yaʿish b Ibrāhim al-Umawī (c 1490, Suter, N⁰ 453), "Abolition of difficulties in measurement", Berlin 5949, fol 73ᵃ—79ᵃ, 8 Ibn al-Hanbalī († 1563, Suter, N⁰ 464), "Marks of beauty in the problems of geometry", Paris 2474, fol 1ᵃ—53ᵃ, 9 ʿAbd Allāh al Shinshawri († 1590–1591, Suter, N⁰ 472), "Comfort to the eyes in measuring the vessel which holds two kulla", Berlin 5951, fol 1—12, Gotha 1078, 1 and 1079

MISʿAR B MUHALHIL ABŪ DULAF AL-KHAZRADJĪ AL-YANBŪʿĪ, an Arabic poet who lived at the court of the Sāmānid Nasr II b Ahmad (301—331 = 913—942) and in 331 was sent by him to conduct a Chinese embassy back to their land and on his return visited India He later gained the favour of the Būyid vizier al-Sāhib al-Tālkānī (so al Samʿānī, *Ansāb*, fol 363ᵇ) Ismāʿīl b ʿAbbād (d 385 = 995) To him he devoted a long kasida on the thieves' dialect of the Banū Sāsān, which his patron so much admired that he himself wrote a commentary upon it (extracts in Thaʿālibī, *Yatima*, iii 176—194) The dates of his birth and death are nowhere exactly given To his long journeys he alludes in his verses quoted by Thaʿālibī, *op cit*, iii 174 The only authentic information has been preserved by the author of the *Fihrist*, on p 346, 30 *sqq* (where *wa-kāna dhawwālatan* is of course not to be translated as Flügel does [note 182] "there was a rumour current" but "he was a great traveller") he gives his account of a temple in Mukrān said to be of gold, and on p 350, 15 *sqq* a description of the capital of China A comparison of these with the corresponding account of his journey attributed to Abū Dulaf in Yākūt, *Muʿdjam*, iii 457, 20 *sqq*, 451, 55 *sqq* shows that the latter is a late falsification (cf Marquart in the *Festschrift* for Sachau, p 292) This is confirmed by an internal criticism of his statements The first country to be entered after leaving Muslim territory is, he

says (Yāḳūt, III 449, 7), al-Khargāh, I e as Marquart, *S B B A*, 1912, p 492 has recognised, the Persian translation of the Turkish name for Kāshghar, Ordukänd Of this kingdom of the Boghrākhāns however, this author (p 447 *sqq*) talks as if it belonged to the tribe of Boghiāč, whose ruler was a descendant of 'Alī, as the East Turkish legend of Satok Boghrā Khān says of his grandson The story is therefore compiled from various sources Marquart (Sachau, *Festschrift*, p 271—272) has also recognised that the alleged ruler of Sadjistān whom the author claims (*op cit*, p 458, 4) to have met, Abū Dja'far Muhammad b Ahmad b Laith, son of Bānūi, a sister of Ya'kūb b Laith, is identical with Khalaf b Ahmad son of Bānū, a granddaughter of 'Amr b Laith, who was taken prisoner by Mahmūd of Ghazna in 1002—1003 and died in 1008 The geographical information given by the compiler is therefore quite unreliable in detail His story is also preserved in the second version of Kazwīnī's *Cosmography* in the Gotha Mss 1506 (Moller, N° 2316) and has been edited from it by Schlozer

Bibliography al-Tha'ālibī, *Yatīmat al Dahr*, III 174—194, F Wustenfeld, *Des Abu Dolef Misar Bericht uber die turkischen Horden*, *Zeitschr fur vergl Erdkunde*, I Jahrg, vol 2, Heft 9, Magdeburg 1842, *Abu Dolaf Misaris ben Mohalhal de itinere suo asiatico commentarius*, ed C Schlozer, Berlin 1845, W Grigorieff, *Ob arabskom putesestvennikya X jaka Abu Dolef i stranstwowanii ego no srednei Asii*, in *Žurnal ministerstwa narodnago prasvjacenu*, vol clxiii/2 (1872), p 1—45

MISBAHA [See Subha]

MISKĪN, poor, a loanword which has shown remarkable vitality It goes back to the Assyrian *muskenu*, "poor" (in the Laws of Hammurabi it is a name for a class between those enjoying full citizenship and slaves, according to L W King freemen who do not belong to the ruling race) In the meaning "poor" it has passed into Aramaic (*meskin*), Hebrew (*miskēn*), North Arabic (*miskīn* or, against analogy, *maskin*), into Southern Arabic and Ethiopic (*meskīn*) It has passed from Arabic into Italian as *meschino* and into French as *mesquin* In Arabic, on the analogy of the form *mif'īl*, it is usually of common gender but the feminine form *miskina* is also found with plural *miskīnāt* Muhammad often uses the word in the Kur'ān in the list of persons whom it was a duty for believers to support As in Sūra IX 60 it is found alongside of *fukarā'*, commentators and jurists have felt that some distinction must be made between the two They usually explain *miskīn* as needy, but not absolutely without possessions like the *fukarā'*, and refer to Sūra XVIII 78, where there is a reference to poor people who possess a ship among them How uncertain this is, is however evident from the fact that the Mālikīs in opposition to the Shāfi'īs take the other view and regard the *miskīnūna* as the most needy, cf also the various definitions collected by Lane *Dhū Matraba* in Sūra XC 16 does not help us From the meaning "poor" gradually developed that of "base, miserable", also in the moral sense, cf e g Ibn Sa'd, III/1 6 ult where Abū Sufyān's wife Hind is called *al-Miskina* On the other hand, the word can mean "humble" as in the words attributed to Muhammad "Let me live as a *miskīn* and die as a *miskīn* and include me among the *miskīnūna*"

(Fr Buhl)

MISR, *a* a proper name denoting the eponym of Egypt, the ancestor of the Berbers and the Copts In accordance with the Biblical genealogy (Genesis x 1 *sqq*) Misr is called the son of Ham, the son of Nūh The Biblical origin of the pedigree appears clearly in the form Misrā'im or Misrāim (cf Hebrew *Miṣraim*) which is found side by side with Misr

In some genealogies between Hām and Misr there is inserted Baisar, a name of which the origin is unknown to me

There exists, however, also quite a different genealogy, according to which Misrām is a son of Tablil, one of the early heroes (*djabābira*), who ruled Egypt after the Deluge

Bibliography al Tabarī, *Ta'rīkh*, ed de Goeje, I 217, al Ya'kūbī, *Ta'rīkh*, ed Houtsma, I 210, al-Mas'ūdī, *Murūdj al Dhahab*, Paris ed, II 394, Ibn Khurdādhbih, *B G A*, VI 80, Ibn al-Athīr, *al-Kāmil*, ed Tornberg, I 58, al-Suyūtī, *Husn al-Muhādara*, Būlāk, p 15, Muh 'Abd al-Mu'tī al-Manūfī, *Kitāb Akhbār al Duwal*, Cairo 1311, p 5,

b a proper name denoting Egypt as a country It may be supposed that Misr was already the name of Egypt among the Arabs in pre-Islāmic times as it is used in the Kur'ān (e g sūra X 87, XII 21, 100, XLIII 50), where the Biblical form Misraim does not occur It has remained the Arabic name of Egypt [q v] up to the present day

c a proper name denoting the capital of Egypt, i e at present and since its foundation Cairo, which with its full name is called Misr al-Kāhira [cf Cairo] Misr occurs, however, already as the name of the city or the cities situated southwest of later Cairo, when the name had been transferred to this city, the name Misr al-kadima (Old Misr) clung to the old settlement, situated between the mosque of 'Amr and the right bank of the Nile (cf Butler, *Babylon of Egypt*, p 16)

In the period between the Arab conquest and the foundation of Cairo the name Misr is regularly applied to the settlement just mentioned (Ibn Khurdādhbih, *B G A*, VI 247, 251, Ibn Rosteh, *B G A*, VII 115 *sqq*, al-Bukhārī, *Fard al Khums*, bāb 13, Abū Dāwūd, *Tahāra*, bāb 74) We are, however, not able to decide which of its parts (Babylon, Fustāt or the Tūlūnid capital) is especially denoted by it It may be supposed that the combination of Fustāt Misr "Fustāt in Egypt" (cf e g Mas'ūdī, *Tanbīh*, *B G A*, VIII 358, Makrīzī, *Khitat*, I 285 opposes Fustāt Misr to *ard Misr*) forms the link between the application of the name Misr to the country and to the capital After the conquest of Egypt by the Muslims there were two settlements only on the right bank of the Nile where it divides, viz Babylon and Fustāt The papyri never mention Misr as the name of either of these settlements Yet in the latter part of the seventh century A D the application of the name Misr to one or to the other or to both

must have begun, as is attested by John of Nikiu who at least once uses Mesr as the name of a city, where he speaks of "the gates of Mesr" (p 25) In other passages Mesr appears as the name of the country (p 201, 209)

The statement that the name Miṣr as the name of a town arose after the Muslim conquest only, is in opposition to Butler, who maintains that at least since the age of Diocletian there existed on the right bank of the Nile, to the South of the later Babylon, a city called Miṣr (cf Butler, *Babylon of Egypt*, p 15, do, *The Arab Conquest*, p 221 note) Caetani (*Annali*, A H 19, § 47) has already pointed to the fact, that the traditions concerning the Arab conquest of Egypt do not give the slightest credit to the existence of a city bearing the name of Miṣr Butler's reference to the Synaxary proves nothing, as this work was composed many centuries after the conquest — The Coptic name of Babylon was Keme

Bibliography A J Butler, *The Arab Conquest of Egypt and the Last thirty Years of the Roman Dominion*, Oxford 1902, do, *Babylon of Egypt*, Oxford 1924, Maspero and Wiet, *Materiaux pour servir a la geographie de l'Egypte*, in *M I F A O*, vol xxxvi, p 168 *sqq*, *Chronique de Jean eveque de Nikiou, texte ethiopien publie et trad par H Zotenberg*, Paris 1883, register

d a common noun, denoting a town, it is used especially in connection with the capitals of the provinces in the times of the conquests, e g in the tradition "The *amṣār* will be conquered at your hands" (Abū Dāwūd, *Djihād*, bāb 28) Basra and Kūfa are often called "the two miṣrs" (Bukhārī, *Hadjdj*, bāb 13, Yākūt, *Muʿdjam*, iv 454) Further any town may be called miṣr (e g Bukhārī, *Dhabāʾih*, bāb 2 *Adāhi*, bāb 15, *Idaīn*, bāb 25, Tirmidhī, *Nikāh*, bāb 32 etc) This miṣr is a genuine Semitic word, cf *Iṣān al-ʿArab*, s v and the Jewish Aramaic *miṣi*, *mesrānā*, which have the same meaning, viz that of a house or a field as an exactly delineated and demarcated territory (cf J Levy, *Chaldaisches Worterbuch*, do, *Neuhebraisches-talmudisches Worterbuch*)

It may be supposed that the geographical name Miṣr (cf above, *a*—*c*) comes from the same root and has originally a meaning akin to that of the common noun (A J Wensinck)

MISRĀʿ, a term in Arabic prosody applied to a hemistich or half line (*baīt*), the first hemistich is called *ṣadr* and the second *ʿadjuz* Each has two, three or four feet, *tafʿila* or *djuz*ʾ The last foot of the first hemistich is called *ʿarūd* and the last of the second *darb* As a general rule, and in the first verse of a poem, the *ʿarūd* foot should have the same measure (*tasrīʿ*) and rhyme (*takfiya*) as the *darb* foot

(Moh Ben Cheneb)

MIṢRĪ [See Niyāzī]

MIṢṢĪS, arab al Maṣṣīṣa, a town in Cilicia on the Djaihān

In antiquity it was called Μόψου ἑστία a name, which (like that of Μόψου κρήνη in the Cilician passes) is derived from the cult of the legendary seer Mopsos (cf Meyer, *Gesch d Altert*, I/II ², § 483) In ancient times, the town was chiefly famous for its bishop Theodorus (d 428), the teacher of Nestorius and friend of the suffragan bishop and inventor of the Armenian alphabet, Mashtʿocʿ (Peeters, *Revue des Etudes Armen*, ix, Paris 1929, p 210, on him cf e g al Masʿūdī, *Tanbīh*, ed de Goeje, p 152, Mich Syr, transl Chabot, ii 3, Barhebraeus, *Chron eccles*, ed Abbeloos-Lamy, i 133, Theophanes, *Chron*, ed de Boor, i 77, 19, 96, 4) In the reign of Justinian a synod was held in Mopsuhestia in June 550 to see that his name was removed from the diptychs of the bishops (Mansi, *Acta Concil*, ix, col 275–289, Hefele, *Konziliengeschichte*, ii ², 832–834) At a later date the name of the town was usually written Μομψουεστία (pronounced Mobsuhestia?, cf *Append ad Petri Siculi hist Manuch*, ed Gieseler, p 63, 1, Wilh Schulze, *Zeitschr f vergl Sprachforsch*, xxxiii, new series, xiii, 1895, p 372, references in Gelzer to Georg Kypr 819, Syr Mompsuhestia Noldeke, *W Z K M*, iii, 1889, p 356, Severus Antioch, *Epist*, v 6, ed Brooks, p 338, Arab Mābsubastiyā in Ibn Khurdādhbih, ed de Goeje, p 99) As early as the end of classical times we already find the popular forms *Mompsistea* (Tab Peut), Byzant Μαμίστα (Michael Glykas, *Annal*, Bonn Corpus, p 570, 4, Anna Komnena, ed Reifferscheid, ii 140, 5, in al-Idrīsī, ed Gildemeister in *Z D P V*, viii 24 *Mānistrā*, the Byzantine work on "Towns with later altered names" ed Burckhardt, Hierokles, *Synekdem*, Leipzig 1893, p 62, Appendix I, N⁰ 29, wrongly says Καστάβαλα Κιλικίας ἡ νῦν Μάμιστα, the former is rather the modern Budrūm Kalʿe), Masista (Theodosius, *De situ terrae sanctae*, c 32, ed Geyer in *Corp Script Eccles Lat*, xxxix 150, 6), i e Syriac Masīstā (*Notitia Antiochena*, ed Rahmānī, *I fasti della chiesa patriarcale Antiochena*, Rome 1920, p v, *Byzant Ztschr*, xxv 74, 81), from which the Arabic al-Massīsa, Armen Msis and Turk Missīs or Missis have arisen

The emperor Heraclius is said to have removed the inhabitants and laid waste the district between Antioch and Mopsuhestia on the advance of the Arabs, in order to create a desert zone between them (al-Ṭabarī, i 2396, al-Balādhurī, ed de Goeje, p 163 between al-Iskandarūn and Tarsūs), and under the Omaiyads all the towns taken by the Arabs from al Massīsa to the fourth Armenia (Malatya) are said to have been left unfortified and uninhabited as a result of the inroads of the Mardaites (Theoph, ed de Boor, i 363, 17) According to Abu 'l-Khattāb al-Azdī (in al Balādhurī, p 164), the Arabs conquered al Massisa and Tarsūs under Abū ʿUbaida, according to others under Maisara b Masrūk, who was sent by him and who thereafter advanced as far as Zanda (in 16 = 637 Caetani, *Annali dell' Islām*, iii 805, § 311) Muʿāwiya on his campaign against ʿAmmūriya in 25 A H found all the fortresses abandoned between Antākiya and Tarsūs (see above) According to the *Maghāzī Muʿāwiya* he himself destroyed all the Byzantine fortresses up to Antākiya in 31 (651—652) on his return from Darawlīya (Δορύλαιον in Phyrgia) (al Balādhurī, p 164 *sq*) After the Syrian rebellion against ʿAbd al-Malik, the emperor Constantine IV Pogonatos in 65 (684–685 A D) advanced against the town and regained it (al Yaʿkūbī, ed Houtsma, ii 321) Yahyā b al-Khakam in 77 marched against Marḏj al-Shahm between Malatya and al Massīsa (al-Yaʿkūbī, ii 337) It was only in 84 (703) that ʿAbd al-Malik's son ʿAbd Allāh retook the town and had the citadel rebuilt on its old foundations (Balādhurī, p 165, Yaʿḳūbī, ii 466, Wāḳidī in Tabarī, ii

1127, Ibn al-Athīr, ed Tornberg, iv 398, Theophan, *Chron*, ed de Boor, p 372, 4, Mich Syr, transl Chabot, ii 477, Elias Nisiben, *Opus chronolog*, ed Brooks, p 156, transl, p 75, *Script Syri, chronica minora*, ed Guidi, p 232, transl, p 176, under 1015 Sel year, Weil, *Gesch d Chalifen*, i 472) In the following year, he installed a garrison in the fortress, including 300 specially picked soldiers, and built a mosque on the citadel hill (Tall al-Hisn), a Christian church was turned into a granary (*huryun, huryā = horreum, horrea*, al-Balādhurī, p 165, Ibn al-Shihna, ed Bairūt, p 179) To the same event no doubt refers the wrongly dated reference in the *Chronicle* of the Armenian Samuel of Ani of the year 692 A D to the fortification with strong walls of the town of "Mamestia, i e Msis" by the Muslims under ʿAbd al-Malik (*Ratio temporum usque ad suam aetatem presbyteri Samuelis Aniensis*, in Euseb Pamphil, *Chron*, ed A Mai and I Zohrab, Mediolani 1818, App p 57, Alishan, *Sissouan*, p 286) Every year from 1,500 to 2,000 men of the corps (*tawāliʿ*) of Antākiya used to winter in the town According to Michael Syrus (transl Chabot, iii 478), ʿAbd al-Malik died in 1017 Sel (705 A D) in al-Massīsa

ʿUmar II is said to have intended to destroy the town and all the fortifications between it and Antioch and to have been either prevented by his own death (Balādhurī, p 167) or dissuaded by his advisers, according to this version, he then had a large mosque built in the suburb of Kafarbaiya in which there was a cistern with his inscription It was called the "Citadel Mosque" and kept up till the time of al-Muʿtasim (al-Balādhurī, p 165, but Kafarbaiya was probably not really built till the time of al Mahdī or Hārūn al-Rashīd, [see below] Yazīd b Djubair (Ἄξιδος ὁ τοῦ Χουνεί) in 704 A D attacked Sis (τὸ Σίσιον κάστρον, in al-Tabarī and Ibn al Athir Sūsana in the Nāhiya of al-Massīsa) but was driven off by Heraclius, the emperor's brother (Theophan, ed de Boor, p 372, 23 A M 6196, according to al Tabarī, ii 1185, and Ibn al-Athīr, iv 419, wrongly not till 87 A H) Hishām built the suburb (*al-Rabad*), Marwān II the quarter of al-Khusūs east of the Djaihān, which he surrounded with a wall with a wooden door and a ditch The bridge of Djisr al-Walīd between al-Massīsa and Adhana, 9 *mīl* from the former, was built in 125 (742—743 A D) and restored in 225 (840) by al-Muʿtasim (al-Balādhurī, p 168, Yākūt, *Muʿdjam*, ed Wüstenfeld, ii 82, Safī al-Dīn, *Marāṣid*, ed Juynboll, i 255) In the first half of the viiith century the caliphs al-Walīd II and Yazīd III brought the gipsy tribe of the Zutt, who had been deported to Basra by Muʿāwiya in 670 A D, and settled them with great herds of buffalo in the region of al-Massīsa in order to fight the plague of lions in the district of the Djabal al-Lukkām (al-Balādhurī, p 168, De Goeje, *Bijdrage tot de Geschiedenis der Zigeuners*, 1875, p 17—22)

The first ʿAbbāsid, Abu 'l-ʿAbbās al-Saffāh, on his accession strengthened the garrison by 400 men, to whom he gave lands, the same estates were later allotted to them by al-Mansūr The latter in 139 (756—757) restored the wall, which had been damaged by an earthquake in the preceding year, and increased with 8,000 settlers the much diminished population of the town, which he called al-Maʿmūra (al-Balādhurī, p 166, Ibn al Athīr, v 382, Yākūt iv 579, s v *al-Maʿmūriya*, Ibn Shihna, p 179) On the site of a heathen temple he built a large mosque which far surpassed the mosque of ʿUmar in size When ʿAbd Allāh b Tāhir was governor of Maghrib (i e 211 = 826), it was enlarged by al-Maʾmūn Al Mansūr increased the garrison to 1,000 men and settled in the town the inhabitants of al-Khusūs, Persians, Slavs and Christian Arabs (Nabataeans), whom Marwān had transplanted thither (see above), and gave them allotments of land It is probably that to the same event the story refers that Sālih b ʿAlī, when in the ʿAbbāsid period the inhabitants of al-Massīsa, harassed by the Byzantines, resolved to migrate, sent Djabrʾil b Yahyā al-Badjalī al-Khurāsānī in 140 (757—758) to rebuild the town and settle it with Muslim inhabitants (al-Balādhurī, p 166 according to al-Tabarī, ii 135 in the year 141) Under al-Mahdī the garrison was increased to 2,000, in addition there was the Antākiya corps of almost the same size which wintered here regularly until Sālim of Burullus became their wālī and increased the garrison by 500 men instead There is a brief reference in the Syriac inscription of ʿEnesh to a raid by al Mahdi to the Djaihān (Syr Gihōn) in 780 A D (1091 Sel, Chabot, in *J A*, ser ix, xvi, 1900, p 287, Pognon, *Inscr semit de la Syrie et de la Mesop*, p 148—150, N⁰ 84) Hārūn al Rashīd built Kafarbaiya or according to another story, altered the plans for this suburb prepared by al-Mahdī and fortified it with a ditch, he also built walls which were only completed after his death by al-Muʿtasim In 187 (803) an earthquake laid waste the town (al Tabarī, iii 688) In the following year, the Byzantines invaded and pillaged the region of al Massīsa and ʿAin Zarba and carried off the inhabitants of Tarsūs into captivity, whereupon Hārūn al-Rashīd attacked and defeated them (Mich Syr, iii 16) According to al Tabarī (iii 709) and Ibn al Athir (vi 135), the Byzantines in 190 (806) invaded ʿAin Zarba and Kanīsat al-Sawdāʾ and took prisoners there, but the people of al-Massīsa regained all their loot from them If, as it seems, the curious story in the Byzantine chroniclers (Theoph, *Chron*, ed de Boor, p 446, 18, Georg Kedren, Bonn Corpus, ii 17) that in 771—772 (A M 6264) Ἀλφαδαλ Βαδινάρ, i e al-Fadl b Dinār, who had 500 Byzantine prisoners with him, lost 1,000 men and all his booty through a sortie of the Μομψουεστεῖς refers to the same events, the latter would appear to be wrongly reported and wrongly dated

On the 13th Hazīran 1122 Sel (811 A D) the walls and many houses in the town and three adjoining villages fell in a great earthquake, near al Massīsa the course of the Djaihān was dammed for a week so that the boats lay on the dry bed (Mich Syr, iii 17) In 198 (813—814) Thābit b Nasr al Khuzāʿī was fighting in the Syrian marches of al Massīsa and Adhana (Yaʿkūbi, ii 541) On his campaign into Bilād al-Rūm, al-Maʾmūn passed through al-Massīsa and Tarsūs in Muharram 215 (March 830, (al-Tabarī, iii 1103, Ibn al-Athīr, vi 294, Abu 'l Fidāʾ, *Annales Muslem*, ed Reiske, ii 152, Weil, *Gesch d Chal*, ii 239) In revenge the emperor Theophilos in 216 (831) raided the lands around these two towns and slew or took prisoner 2,000 men (al-Tabarī, iii 1104, Ibn al-Athīr, vi 295)

After the emperor's campaign against Zibatra (837 A D) in which he also defeated the Μομψουεστῖται (Const Porphyrog, *De caerim*, ed

Bonn, p 503, Vasilev, *Vizantiya i Arabi*, in *Zapiski ist filol fak imp S-Ptbg Univ*, čast lvi, 1900, p 88 *sq*, note 4), al Muʿtasim bi 'llāh in the following year attacked ʿAmmūrīya, his general Bashīr commanded a part of the army which included the Massīsa contingents (Mich Syr, iii 96) In 245 (859) the town was again visited by an earthquake which destroyed many places in Syria, Mesopotamia and Cilicia (al-Yaʿkūbī, iii 1440) The Caliph al Muʿtadid after restoring order in the Thughūr al-Shāmiya (287 = 900) returned from al-Massīsa via Hunduk al Hussain, al-Iskandarīya and Baghrās to Antākiya, Halab and al Raḳḳa (al Tabarī, iii 2198—2200, al Funduk, a place in the Thughūr near al-Massīsa Yākūt, iii 918, Safī al-Dīn, *Marāṣid*, ii 365)

When in 292 (904—905) the Byzantine Andronicus invaded the district of Marʿash, the people of al Massīsa and Tarsūs met him but were defeated and lost their leader Abu 'l-Riḍjāl b Abi Bakkāi (al-Tabarī, iii 2251, Ibn al Athīr, vii 371, Vasilev, *Zap ist-fil fak imp S-Ptbg Univ*, cast lvxi, 1902, p 154, note 2)

In 344 (955—956) the Hamdānid Saif al Dawla was visited by horsemen from the frontier towns of Tarsūs, Adana and al Massīsa and with them an envoy from the Greek king who concluded a truce with him (al-Nuwairī and Kamāl al-Dīn in Freytag, *Z D M G*, xi, p 192, Ibn Ẓāfir al-Azdī, *Kitāb al-Duwal al Munkatiʿa*, transl Vasilev, *op cit*, Prilożen, p 86) Defeated by Leo Phocas in 349 (960) in the pass of al Kučuk, Saif al-Dawla spent the night in al-Hawānit and returned to Halab via al Massīsa (Kamāl al-Dīn in Freytag, *op cit*, p 196, Yahyā b Saʿīd, *Taʾrikh*, ed Kračkovskiy-Vasilev, in *Patrol Orient*, xiii, 1924, p 782)

In 352 the emperor Nicephoros took Adana, the inhabitants of which fled to al-Massīsa, and sent the Domesticus John Tzimisces (Yānis b al-Shimshkīk al-Dumistik) against this town The latter besieged it for several days but had to withdraw as his supplies were running short, and after laying waste the country round burned the adjoining al Mallūn (Μαλλός) at the mouth of the Djaihān (Yahyā b Saʿīd, *op cit*, p 793 *sq*) The emperor himself came again in Dhu 'l Kaʿda 353 (Nov 964) to the marches (al Thaghr) and besieged al-Massīsa for over 50 days but had again to abandon the siege owing to shortage of supplies and retired to winter in Kaisarīya Finally the town was stormed by John Tzimisces (Arm Kuir Žan) on Thursday the 11th Radjab 354 (July 13, 965) The inhabitants set it on fire and fled to Kafarbaiya After a desperate struggle on the bridge between the two towns the Greeks took this suburb also and carried off all the inhabitants into captivity (Yahyā b Saʿīd, *op cit*, p 795, Ibn al-Athīr, viii 408—411, Abu 'l-Fidāʾ, *Ann Musl*, ed Reiske, ii 482 *sq*, Mich Syr, iii 128, Elias Nisiben, ed Brooks, p 218, transl p 106, Georg Cedren, ed Bonn, ii 362, Leon Diakon, ed Bonn, p 52 *sq*, Mattʿeōs Urhayecʿi, ed Dulaurier in *Rec hist crois*, *Docum Arm*, i 5, Stepʿan Asołik of Taron, *Armen Gesch*, transl H Gelzer and A Burckhardt, Leipzig 1907, p 134, 24) They were, to the number of 200,000, it is said, led past the gates of Tarsūs, which at that time was being besieged by the emperor's brother Leo, to terrify the people of the town (Ibn Shihna, *Rawdat al-Manāzir*, in Freytag, *Z D M G*, Elias Nisiben, *op cit*) The gates of Tarsūs and of al-Massīsa were gilded and taken as trophies to Constantinople, where one set was put in the citadel and the others on the wall of the Golden Gate (Georg Cedren, ii 363)

The town remained for over a century in the hands of the Byzantines, the Emperor Basil II Bolgaroktonos stayed for six months in the region of al-Massīsa and Tarsūs before going to Armenia after the death (March 31, 1000 A D) of the Kuropalates Davitʿ of Tajkʿ to take possession of his lands by inheritance (Yahyā b Saʿīd, *Taʾrikh*, ed Rosen, p 39, in *Zap Imp Akad Nauk*, xliv, St Petersburg 1883) In 1042 the Armenian prince Aplgharib, son of Hasan and grandson of Khačʿik of the house of the Arcrunians, was sent by the emperor Constantine Monomachos as governor to Cilicia (St Martin, *Mem sur l'Arm*, i 199) In 1085 A D Philaretos Brachomios, who was appointed in Constantinople perhaps Sebastos (Mich Syr, iii 173) or at least Kuropalates (Mich Attal, Bonn ed, p 301) and whose ephemeral kingdom comprised the land from Tarsūs to Malatya, Urfa and Antākya, held al Massīsa (Mich Syr, *loc cit* Laurent, *Byzance et Antioche sous le curopalate Philarete*, *Rev des Et Arm*, ix, 1929, p 61—72) Shortly before the arrival of the Crusaders, the Seldjūk Turks took Tarsūs, al-Massisa, ʿAin Zarba and the other towns of Cilicia (Mich Syr, iii 179) About the end of Sept 1097 the Franks under Tancred, who had been invited thither from Lambron by Ōshin III, took the town which was stormed after a day's siege the inhabitants were slain and rich booty fell into the hands of the victor (Albert Aquens, iii 15 *sq*, in Migne, *Patrol Lat*, clxvi, col 446 *sq*, Radulf Cadom, *Gesta Tancredi*, c 39 *sq*) William of Tyre describes al Massīsa on this occasion (iii 21, in Migne, *Patrol Lat*, cci, col 295) "*Erat autem Mamistra una de nobilioribus eiusdem provinciae civitatibus, muro et multorum incolatu insignis, sedet optimo agro et gleba ubere et amoenitate praecipua commendabilis*" Count Baldwin, who had quarrelled with Tancred, followed him along with the admiral Winimer of Boulogne and encamped in a meadow near the Djaihān bridge, Winimer left him there and went with his fleet to al-Lādhikīya, while the two rivals had a desperate fight, after which Baldwin withdrew to the east (Albert Aquens, iii, c 15, 59, in Migne, *op cit*, col 446, 472) Tancred followed him, after he had imposed on the city "*plus paternas quam principis leges*" (Radulf Cadom, c 44) The Byzantine general Tatikios, who had joined the Crusaders to take over their conquests in name of the emperor, left them in the lurch in the beginning of Feb 1098 at the siege of Antākiya and ceded to Bohemund the town of Tursol (Tarsūs), Mamistra and Addena (Adana) (Raymond of Agiles, in Bongars, *Gesta Dei per Francos*, Hanover 1611, p 146, 5) Bohemund only took possession of the towns of Tarsūs, ʿAin Zarba and al Massīsa in August (Will of Tyre, vii 2) After the town had again fallen to the Greeks for a period Tancred again took it in 1101 (Rad Cad, c 143), but had to hand it over with Tarsūs, Adana and ʿAin Zaiba to Bohemund on his return from captivity in 1103 (Will of Tyre, vii 2, in Migne, *op cit*, col 379) In the following year however, Longinias, Tarsūs, Adana and Μάμιστα were regained for Byzantium by the campaign of the general Monastras (Anna Comnena, Ἀλεξίας, ed Reifferscheid, ii 140, 5, who apparently did not recognise the identity of Μάμιστα with Μόψου

ἐστίαι which she mentions several times) In the treaty between Bohemund and the emperor Alexios of Sept 1108 the town was promised to the former (Anna Comnena, *op cit*, II 218), Tancred having taken it in the preceding year with 10,000 men from the Byzantine general, the Armenian Aspietes (Anna Comnena, II 147) At this time, of the quarters of the town one (probably Kafarbaiya) was in ruins (Anna Comnena, *op cit*) Baldwin of Burg and Joscelin of Courtenay, who allied themselves against Tancred with Kogh Vasil of Kaisūm, were supported by the latter with a detachment of 800 men and a body of Pečenegs, who were stationed in al-Massīsa as Greek mercenaries (Matt'ēos Uṙhayec'i, transl Dulaurier, p 266 *sq* = *Rec Hist Crois*, *Doc Arm*, I 86) The great earthquake of 1114 destroyed the town like many others in Cilicia and Syria (Smbat, in *Docum Arm*, I 614)

Under the Frankish patriarchate of Antioch, Mopsuestia-Mamistra was separated from the ecclesiastical province of Anazarbos and made an autocephalous metropolis (Michael Syrus, III 191, recensions of the *Notitia Antiochena* of the Crusading period, MS of Chalki [now in Leningrad, Russ Publ Library, MS Gr 716, cf Beneševič, *Byz-Neugriech Jahrb*, V, 1927, p 103, note], ed Papadopoulo-Kerameus, in Ἑλλην Φιλολ Σύλλογ, Μαυρογορδ Βιβλιοθ, Constantinople 1884, p 65 ὁ Μουμψοεστίας ἀπεσπάσθη ἀπὸ τοῦ θρόνου Ἀναζάρβης καὶ ἐτάγη αὐτοκέφαλος, cf cod Paris suppl grec 1226, ed Nau, *R O C*, 1909, p 215, Vatic gr 1455, ed Gelzer, *Byz Ztschr*, I, p 250, N° 165 and pass) The ἐνορία Μοψουεστίας stretched (according to a work on the boundaries of the Antiochene dioceses, ed Papadopoulo-Kerameus, *op cit*, p 67) from Seleucia in Syria and Adana ἀπο τοῦ μεγάλου Ξηροποταμοῦ (now Ozerlu or Rabat Çaï?) ἑως τοῦ μεγάλου ποταμοῦ Φυσῶν The latter is undoubtedly identical with αὐτὸς ὁ μέγας ποταμὸς Ἀδανας, the Saihān, for the name Djaihān (probably first found in the 'Umaiyad court poet 'Adī b al-Rikā' c 710 A D Noldeke, *Z D M G*, xliv, 1890, p 699 *sq*) and Saihān for Pyramos and Saros are no doubt derived from the names of the Biblical rivers Gīhōn and Pīshōn (*Gen*, II 11) (wrongly explained from the Persian Djihān in Cousin, *Kyros le Jeune en Asie Mineure*, Nancy 1904, p 278, 1)

In 1132/33 the Rupēnid Łevon I (Λεβούνης), son of Constantine, took the town (Arm Msis, Mises, Mamestia or Mamuestia from the Greeks (Cinnamos, I 7, III 14, Smbat Sparapet *Chronicle*, in *Docum Arm*, I 615) The brother of the emperor John II Comnenos went to him and Łevon gave his sons his daughters as wives with the towns of al-Massīsa and Adana as dowries But when they quarrelled he took back from the Greeks all that he had given them, and Isaac had to flee with his sons to Sultān Mas'ūd (Michel Syr, II 230) Łevon, falling through treachery into the hands of Raymond of Poitiers, had to cede (1136—1137) al-Massīsa, Adana and Sarvantik'ar (now Sawuran Kal'e?), but regained his liberty in a couple of months, he very soon retook these towns (*Docum Arm*, I 152 *sq* = *Chron de Matthieu d'Édesse*, transl Dulaurier, p 457, Smbat, *op cit*, p 616) The emperor John in 1137 (1448 Sel) had his revenge on Łevon He invaded Cilicia, took Tarsūs, Adana and al Massīsa, seized Łevon himself with his wife and children and took them to Constantinople, where Łevon subsequently died (Ibn al-Athīr, XI 35, Michael Syrus, III 245, Gregor presbyt, *Forts d Chronik des Matt'ēos*, transl Dulaurier, p 323, cf *Docum arm*, I, p xxxii, I and 153, 4, Will of Tyr, XIV 24, Rohricht, *Gesch d Kgr Jerusalem*, p 211) John installed Coloman (*Calamanus*), son of Boris and grandson of king Coloman of Hungary, as governor of Cilicia (Will Tyr, XIV 24, XIX 9, in Migne, *Patr Lat*, CCI, col 603, 756, a "*Dux Ciliciae*" mentioned in *Regum et principum epistolae*, N° 24, in Bongars, *Gesta Dei per Franc*, p 1182, l 46 and *passim*) When the emperor John died at Mardj al-Dibādj on April 8, 1143 (Will of Tyr, XV 22 *sq*, Rohricht, *Gesch d Kgr Jerus*, p 228, 4), his successor Manuel I Comnenos had his body brought by boat from Mopsuestia down the Pyramos to the sea and taken by sea to the capital (Niketas Choniat, *Man Komn*, I, Bonn ed, p 67)

Thoros II, the son of Łevon who had escaped home from his confinement in Constantinople, was again able to cast off the Byzantine yoke When in 1151 he took Msis and T'il (Tall Hamdūn) from the Byzantines (Smbat, in *Doc Arm*, I 619) and made their general Thomas prisoner, the emperor Manuel in the following year sent against him with 12,000 cavalry Andronicos Comnenos, whom he had appointed governor of Tarsūs and al Massīsa (Gregor presbyt, in *Doc Arm*, I 167 = Matth Edess, transl Dulaurier, p 334, Smbat, *Chron*, in *Doc arm*, I 619) Andronicos, who did not recognise Thoros as ruler of Asia Minor, advanced against al Massīsa but was surprised by the Armenians and put to an ignominious flight with his 12,000 men Thus not only the town, which was very well supplied with provisions and military material of all kinds, fell into his hands, but also a great part of Cilicia (Gregor presbyt, transl Dulaurier, p 334—336 = *Doc Arm*, I 167 *sqq*, Smbat, *op cit*) The emperor, himself too weak to avenge the insult, twice induced by gifts the Sultān Kīlīdj Arslān II (Gregor wrongly Mas'ūd) of Kōniya to attack Thoros The Sultān, who on the first occasion (1153 A D) was content with the defeat of the Armenian and the return of the lands taken from the Greeks, again attacked al Massisa, 'Ain Zarba and Tall Hamdūn (Arm T'ilin Hamtunoy) in 1156 but could do nothing against them and had finally to retire after heavy losses (Gregor, *op cit*, p 338 = *Doc Arm*, I 171)

The emperor Manuel himself passed through Cilicia in 1159 with a large army to the assistance of the Crusaders Thoros had already retired to Vahka in the desolate mountains (*Armen Rhymea Chron*, in *Doc Arm*, I 505) when the emperor entered al-Massisa at the beginning of November, but he did no injury to any one there (Gregor, transl Dulaurier, p 353 *sq* = *Doc Arm*, I 187) The Frankish kings led by Baldwin came to pay homage to him in the town or on the adjoining *pratum palliorum* (as Will of Tyre, XIII 27 translates Mardj al Dibādj) where his court was held in camp for 7 months (Gregor, transl Dulaurier, p 358, Rohricht, *Gesch d Kgr Jerusal*, p 298) Thoros was also able with great tact to become reconciled with him, and on acknowledging Byzantine suzerainty and ceding several towns in Cilicia, was recognised as "Sebastos" of Msis, Anazarbos and Vahga (*Doc Arm*, I 186, Smbat, *ibid*, p 622) His brother Mleh, who attempted his life while out hunting between al-Massīsa and

Adana, was banished by Thoros and given by Nūr al-Dīn the town of Kūrus (Kyrrhos, Smbat, *loc cit*) After the death of Thoros of Msis (1168–1169, Smbat, p 623), Mleh (Arab Malīh b Līwun al-Armanī) succeeded him and at first ruled only over the district of the passes (*Bilād al-Durūb*) In 1171 he surprised Count Stephen of Blois at Mamistra and plundered him (Will of Tyre, xx 25—28) In 568 (1172—1173), supported by troops of his ally Nūr al-Dīn, he took from the Greeks Adana, al-Massīsa and Tarsūs (Ibn al-Athīr, xi 255, Kamāl al-Dīn, transl in Rohricht, in *Beitrage z Gesch d Kreuzzuge*, i, Berlin 1874, p 336)

When Mleh's successor Rupēn III fell through treachery into the hands of Bohemund of Antioch, his brother Łevon (II) obtained his release in 1184 by ceding al-Massisa, Adana and Tall Hamdūn (Tell) and paying 3,000 dīnārs, immediately afterwards, Rupēn retook these strongholds from the Franks (Mich Syr, iii 397, *Doc arm*, i 394)

Het'um, the nephew of the Catholicos Grigor IV and son of Č'ortvanēl of Tarōn, who came to Cilicia in 1189 with his brother Shahinshah, received from Łevon II (1185—1219) his niece Alice, daughter of Rupēn III, in marriage and the town of Msis, but died in the same year (Smbat, in *Doc arm*, i 629, Marquart, *Sudarmenien und die Tigrisquellen*, Vienna 1930, p 481 *sq*) The Emperor Frederick Barbarossa in 586 (1190) was about to go to Syria via Tarsūs and al-Massisa when he met his tragic end in the Kalykadnos (alleged [?] letter of the Armenian Catholicos in Ibn Shaddād, in *Rec Hist Orient des Crois*, iii 162) a portion of his army thereupon went to Antioch via Tarsūs, *Mamistra* and *Thegio* (Hisn al-Mukhalkab, not *Portella*, the Syrian passes, with which Rohricht, *Gesch d Kgr Jerus*, p 530, 4, identifies it)

Wilbrand of Oldenburg who visited the East in the train of Duke Leopold VII of Austria and Steiermark and the Teutonic Grandmaster Hermann von Salza, came in the beginning of 1212 to *Mamistere* which he describes as follows (Wilbr, c 18, ed Laurent, *Peregrinatores*, Leipzig 1864, p 175) „*Haec est civitas bona, super flumen sita, satis amoena, muram habens circa se turritum, sed antiquitate corrosum, paucos in quodam respectu habens inhabitatores, quibus omnibus rex illius terrae imperat et dominatur*" In the vicinity lay „*quoddam castrum quod erat de patrimonio beati Pauli sed nunc temporis possidetur a Graecis*" „*In hac civitate* [Mamistere] *habetur sepulchrum beati Pantaleonis Ipsa vero distat a Canamella* (cf Tomaschek, *S B Ak Wien*, 1891, app viii, p 71) *magnam dictam*" Łevon II granted the republics of Genoa and Venice the privilege of having their own trading centres in al-Massisa, which could be reached by ship from the sea before the mouth of the Djaihān became silted up (Alishan, *Sissouan ou l'Armeno-Cilicie*, p 287) The attempt of Raymund Rupēn of Antioch to seize the throne of Armenia after Łevon's death in 1219 failed, he was, it is true, able to take Tarsūs and attack al-Massisa but he was taken prisoner by Constantine of Barżrberd and died in prison in 1222 (*Doc arm*, i 514, Rohricht, *Gesch d Kgr Jerus*, p 741 *sq*)

For a century the Rupēnids ruled almost undisturbed in the town Their glory reached its height under the splendour-loving Het'um I (1219–1270) Here were held the annual festivals of the Church at which numerous princes and nobles used to gather down to the last and difficult years of the king Here was held the brilliant ceremony at which his 20 year old son Łevon was dubbed knight Hither the king brought the seat of government after the destruction of Sīs (Alishan, *Sissouan*, p 287 *sq*)

Baibars sent a punitive expedition against Het'um in 664 (1266) under al-Malik al Mansūr of Hamā, who advanced as far as Kal'at al-'Amūdain and into the district of Sis, while Saif al Dīn Kilā'ūn took al Massīsa, Adana, Ayās and Tarsūs (al-Makrīzī, *Hist d Sult Maml*, transl Quatremere, i/ii 34 *sq*, Abu 'l-Fidā', *Annal Musl*, ed Reiske, v 18, al-Nuwairī, in Weil, *Gesch d Chal*, iv 56) Three years later (1269), the district of al-Massisa was visited by an earthquake (al-Suyūti, in *Doc arm*, ii, 1906, p 772, note f) Baibars (Arm *Pntukhtar* = Arab *Bunduk dār*) himself in 673 (spring of 1275) took the field against Łevon III, son of Het'um, laid waste the whole of Cilicia as far as Korikos and stormed al Massīsa and Sīs, the former on 26th March The inhabitants were massacred, almost all the houses burned and the great bridge destroyed (Armen Kandarayn Msisay, i e Kantarat al-Massīsa, cf al-Makrīzī, i/ii 123 *sq* with note 154, Mufaddal b Abi 'l-Fadā'il, *Gesch d Mamlūkensultane*, ed Blochet, in *Patrol Orient*, xiv 389, Barhebraeus, *Chron syr*, ed Bedjan, p 531, 6, Smbat, *Chronik*, in *Doc arm*, i 653, Rohricht, *Gesch d Kgr Jerusalem*, p 967, van Berchem, *C I A*, i 688, note 2) When in 697 (1297—1298) an army under the emirs Saif al-Dīn Kipčāk, the Nā'ib of Dimashk, Fāris al-Dīn Ilbeki al-Sāki al-Zāhiri, the Nā'ib of Safad, Saif al Dīn Bizlār al-Mansūrī and Saif al-Dīn 'Azāz al-Sālihī invaded the land of Sīs, al-Massīsa is not specially emphasised among the unimportant places taken like Tall Hamdūn, Hammūs (Humaimis), Kal'āt Nadjma, al Massīsa, Sirfandikār, Hadjar Shughlān, al-Nukair and Zandjfara (al-Makrīzī, ii/ii 60–65, Mufaddal, *op cit*, p 602, al-Nuwairi, in Blochet, *ibid*) In 1322, the Egyptians crossed the Djaihān by a bridge of boats, got behind the Armenians who had retired to Msis and inflicted a severe defeat upon them, among those who fell are mentioned the barons Het'um of Djiknoc', his brother Constantine, Wahram Lotik, Ōshin, the son of the marshal, along with 21 knights and many men (Smbat's Continuator, in *Doc arm*, i 668) This authority also mentions a raid by an Egyptian force against al Massīsa (Mamuestia), Adana, al-Mallūn (Mlun) and Tarsūs in 1334—1335 (*Doc arm*, i 671, Tomaschek, *S B Ak Wien*, 1891, part viii, p 68) The last Egyptian invasion took place in 823 (1373—1374) Among the towns destroyed were Sīs, Adana, al-Massīsa and 'Ain Zarba, and Łevon IV had to surrender in 1375 after a siege of nine months in Ghaban (*Doc arm*, i 686, note 3) The town thus passed nominally into the *Futūhāt al-Djahānīya* of the Mamlūk empire, it had, it is true, by now sunk into insignificance and it is not mentioned, for example, among the towns taken by Shahsuwār in 1467 (Alishan, *Sissouan*, p 290)

Armenian sources mention 8 archbishops of the town from 1175 to 1370 (1175—1206 David, 1215 Johannes, 1266 Sion, 1306 Constantine 1316 John, 1332 Stephen, 1342 Basil, 1362—1370 unnamed, cf Alishan, *op cit*, p 290) Michael Syrus knows only Job of about 800 A D (*Chron*, transl.

Chabot, III 23 *sq*, 451, N° 27) and the Frankish writers from 1100 onwards Bartholomaeus, before 1234 Radulphus and in the years from 1162–1238 three or four more unnamed bishops (Albert Aquens, IX 16, Will of Tyre, XIV 10, Le Quien, *Oriens Christianus*, III 1198—1200, Rohricht, *Gesch d Kgr Jerusal*, p 42, 202) On account of the many Egyptian invasions the Latin archbishopric was removed to Ayās by Pope John XXII in 1320 (Alishan, *Sissouan*, p 290)

After the fall of the kingdom of Little Armenia, the power of the Ramadān-Oghlu and Dhu 'l-Kadr-Oghlu gradually spread in Cilicia Selim I on his campaign against Egypt in 922 (1516) and on his return also preferred to keep to the east of their land (Taeschner, *Anatol Wegenetz*, II 32) Missīs has been Ottoman since that year, in which the decisive battle was fought on Mardj al-Dābik

In Kafarbaiya a khān was built for caravans passing through in 1542 and restored in 1830 by Hasan Pasha The Djaihān bridge became useless in 1736 when the central arch collapsed, in 1766 this was repaired but it was blown up in 1832 on the retreat of the Turkish troops from the fighting at Bailān in order to hold up the advance of Ibrāhīm Pasha's pursuing army As late as the middle of the XIXth century it could only be crossed by an improvised wooden footbridge

In modern times Missīs is mentioned only by eastern pilgrims and travellers who as a rule only spent a short time there Thus it was visited in 1432 by the Burgundian Bertrandon de la Brocquiere ("*Misse-sur-Jehan*"), in the XVIth century by P Belon, 1682 the Mecca pilgrim Mehmed Edib, 1695 the Armenian Patriarch of Antiochia Makarios, 1704 Paul Lucas, 1736 Chevalier Otter, 1766 the Dane Carsten Niebuhr, 1813 Macd Kinneir, 1834 Aucher Eloy, 1836 Colonel Chesney, 1840 Ainsworth, 1853 Victor Langlois, whose reports were exhaustively used by Carl Ritter (*Erdkunde*, XIX 66—115) The "Merges Galles" visited by Ludwig von Rauter on July 8, 1568, is not (as in Rohricht Meisner, *Deutsche Pilgerreisen nach dem hl Lande*, 1880, p 434, note 43) al-Massisa, but Merkez Kal'esī on the Bāb Iskandarūn (Cilic -Syr passes) Somewhat fuller descriptions of the modern Missīs and its ancient and mediaeval ruins were given in the XIXth century by Langlois, Alishan and at the beginning of the XXth by Cousin (see *Bibliography*)

The stretch of the Baghdād railway from Dorak south of the Taurus via Adana and Missīs to Ma'mūra at the foot of the Amanos was opened on April 27, 1912 As a station on the railway (the station is actually $1^1/_2$ miles N W of the place) the town gained a certain strategic importance in the Cilician campaign of the French in 1919—1920 (1919 settlement of about 1,2—1,500 Armenians, May 27–28, 1920 futile Turkish blockade of the garrison there, about a company strong, end of July withdrawal of the troops to Adana, cf E Bremond, *La Cicilie en 1919—1920*, in *Rev Étud Arm*, Paris 1920, I, p 311, 360, 363, 365) After the Turkish occupation the newly settled Armenians were probably exterminated in the usual way The importance of the town has now passed to the neighbouring Djihān

According to the Arab geographers, al-Massīsa lay on the Djaihān (Πύραμος, sometimes confused by the Byzantine authors with the Σάρος, Arab Saihān, with which it seems to have had at one time a common mouth George Cedren, II 362, Anna Comn, II 147), I—2 days' journey from Baiyās and one from 'Ain Zarba and Adhana, 12 *mil* from the Mediterranean coast The sea could be seen from the Friday mosque in the town, in front of the town lay a beautiful fertile plain (the ancient Ἀλήιον πεδίον) Al-Massīsa lying on the right bank was connected with Kafarbaiya by an ancient stone bridge built by Constantius and restored by Justinian The country round was rich in gardens and cornfields, watered by the Djaihān According to Yākūt, the town originally had a wall with 5 gates and Kafarbaiya, one with 4 gates A speciality of the town were the valuable fur-cloaks exported all over the world Ten miles from al Massisa, which is somewhat inaccurately placed by Ibn Khurdādhbih, Yākūt and others on the Djabal al Lukkām (Amanos), was the plain of Maidj al-Dībādj, which is often mentioned in the records of the fighting between the Mamlūks and Little Armenia (probably the "*ager Mopsuestiae*" on which Cicero encamped *ad fam*, III 8) In it, N E of the town on the road to Sīs, was the fort of al-'Amūdain (al-Makrīzī, ed Quatremère, II/II 61, cf Kal'at al 'Āmudain in Abu 'l-Fidā', *Ann Musl*, ed Reiske, V 18, located by Alishān, *Sissouan*, p 225 *sq* too far east in "Hémétié Kaléssi") A field of Mardj al-Atrākhūn is also mentioned near al-Massisa (Yākūt, IV 487, Safī al-Dīn, *Marāṣid*, III 74) Tall Hāmid, a strong fortress of the Thughūr al Massīsa, corresponds to the modern Hāmidiye, now called Djihān (*Z D M G*, XI 191, 200, Yākūt, I 866, Safi al-Dīn, *Marāsid*, I 211, Ibn al Shihna, Beirūt ed, p 339) There also was Tall Hūm (Yākūt, I 867, *Marāsid*, I 211, Ibn al Shihna, *ibid*, exact site unknown) Al-'Ain at the foot of the Djabal al-Lukkām, over which went the Darb al-'Ain pass, was also one of the forts of al-Massisa (Yākūt, III 756, *Marāṣid*, II 293), on the frontier against Halab lay Būka (q v, cf van Berchem, *Voyage en Syrie*, I, p 257, 8) Hisn Sinān (al-Balādhurī, p 165, Yākūt, III 155) is probably also to be sought near al-Massīsa A pass called Thanīyat al 'Ukāb, to be distinguished from that of the same name near Damascus, was in the region of al-Massīsa (Yākūt, I 936, *Marāsid*, I 230) Even the remote fortress of Samālū (on its site cf Tomaschek, *Festschrift f H Kiepert*, p 144) was sometimes reckoned in the Syrian Thughūr and located near al-Massisa and al-Tarsūs (Balādhurī, p 170 Dhamālū, Yāḳūt, III 416, *Marāsid*, II 167, Byzantine το κάστρον Σημαλούς) al-Safsāf on the present Sugudlī-sū (*Z D M G*, XI 180, Reiske on Abu 'l-Fidā', *Annal* II 649, note 76 according to Hādjdjī Khalifa "Hisn Safsaf, that is Sogud") is also reckoned by Yākūt (III 401) to the marches of al Massīsa Not far from the town was a Syrian monastery, Gawikāth (mentioned about 1200 A D Barhebr, *Chron eccles*, ed Abbeloos-Lamy, I 624, in Alishan, *Sissouan*, p 295 Djokhath, probably identical with *Joacheth*) The neighbouring fortress of Adamodana (now Tumlu-Kal'e) and Cumbetefort ("*in territorio Meloni*", I e of Mlun, Arabic al-Mallūn) were according to Wilbrand of Oldenburg (*op cit*) about 1212 in the possession of the Teutonic Order (*Allemani*) The Venetians had a church in al Massīsa (*Gestes des Chiprois*, in *Doc arm*, II 831) Armenian authors mention there the churches of St Sarkis, Thoros and Stephan (Alishan, p 288 *sq*)

The present Miṣṣīṣ, (frequently also written Missīs,

cf Taeschner, *Turk Bibl*, xxii, pl 16 and 17), is an insignificant village lying on almost exactly 37° N Lat (piet in Alishan, p 283), which is stretches along the heights of the right bank of the Djihān čai A stone bridge with nine arches (in Baedeker, *Konstantinopel*, 1914, p 303 wrongly "five arched") the foundations of which are in part ancient (piet in Alishan, *Sissouan*, p 289, Lohmann, *Im Kloster zu Sis*, p 15), leads to the left bank where pieces of walls and inscriptions still mark the site of the ancient Mopsuhestia Here lay the medieval Kafarbaiya, while this form is the one in general use in Arabic texts and in modern authors, al-Idrīsī (transl Jaubert, ii 133) and Hādjdjī Khalīfa (*Djihānnumā*, Constantinople 1145 [1732], p 602) have Kafarbinā (Taeschner, *Turk Bibl*, xxii, p 145, 1), as Langlois (*Voyage*, p 462) and others apparently heard on the spot The name is unknown there now (Heberdey-Wilhelm, *Denkschr Ak Wien*, xliv part vi, p 11 *sq*, the Turkish General Staff map in the German version of July 1918, Sheet Adana, calls the two halves of the town "Misis Nahijesi" and "Huranije") According to Ibn al-Shihna (Bairūt ed, p 179), Kafarbaiya was also called "Little Baghdād"

Missis lies where the river emerges from a gorge with walls of yellow loess at which the last foothills of the highlands between the Saihān (now Saihūn) and Djaihān (now Djihān-čai) in the N W and the Djabal Nūr (Nūr Dāgh, 2,200 feet, piet in Alishan, p 284), a part of the Djabal Missis (*Stadiasm mar magn* Πάριον ὄρος), in the southeast meet This ridge, which takes its name from the town, lying in the centre of the Cilician plain on the left bank of the lower Djaihān and linked up with the Amanos in the east, is celebrated, particularly in the Djabal Nūr, for its rich flora, which was studied by the Austrian Theodor Kotschy on 24th–26th April 1859 On account of its medicinal herbs, Ibn al-Rūmiya in his commentary on the book of Dioscurides says that many writers took al-Massīsa to be the city of the wise Hippocrates (Ibukrāt) who, however, according to others, belonged to Hims (Mufaddal b Abi 'l-Fadā'il, in *Patrol Orient*, xiv 393, Ibn al Shihna, Bairūt, p 180)

Near the mouth of the Djaihān, which at one time was navigable for small ships up to al-Massīsa, lay al Mallūn, the site of which is not known (Μαλλός, now rather Bebelī than Karatash, cf R Kiepert, *Form orb antiqu*, viii, text p 19[a]) The Frankish writers also speak of a "*portus de Mamistra*" (Raimundus de Aiguilers, *Historia Francor qui ceperunt Iherusalem*, c xi, cf *Doc arm*, i, p xlvi, note 1), probably on the "*fauces fluminis Malmistrae*", where al Idrīsī mentions the place al Busā (*Z D P V*, viii 141, Tomaschek, *S B Ak Wien*, cxxiv, 1891, fig viii, p 69 writes al Būsā)

MISWĀK (A), a term denoting the tooth-brush as well as the tooth-pick The more usual term is *siwāk* (plural *suwuk*) which means also the act of cleansing the teeth Neither of the two terms occurs in the Kur'ān In Hadīth miswāk is not used, *siwāk*, on the other hand, frequently In order to understand its use, it is necessary to know that the instrument consists of a piece of smooth wood, the end of which is incised so as to make it similar to a brush to some extent The piece of wood used as a tooth pick must have been smaller and thinner,

as appears e g from the tradition in which it is related that Muhammad one day received a visitor and kept the tooth-pick "at the end of his tongue" (Mir, *Ṭahāra*, trad 45)

Concerning Zaid b Khālid it is related that he used to sit in the mosque keeping the tooth-pick behind his ear, "just as a writer will keep his pen" (Abū Dāwūd, *Ṭahāra*, bāb 25, al-Tirmidhī, *Ṭahāra*, bāb 18) When Muhammad was in his last hours, there entered a man with a piece of wood fit for a *siwāk*, ʿĀʾisha took and chewed it, so as to make it smooth (Bukhārī, *Maghāzī*, bāb 83)

In general Hadīth emphasises the value attached by Muhammad to the *siwāk* When he entered his house, his first movement was towards it (Muslim, *Ṭahāra*, trad 43, Abū Dāwūd, *Ṭahāra*, bāb 27) His servant ʿAbd Allāh b Masʿūd has received the epithet of *ṣāḥib al-siwāk* "he who used to take care of Muhammad's *siwāk*" (Bukhārī, *Faḍāʾil al-Ṣaḥāba*, bāb 20) When Muhammad awoke at night, he cleansed his mouth by means of the *siwāk* before he washed himself and performed night prayer (Bukhārī, *Aḏhān*, bāb 8, *Wuḍūʾ*, bāb 73, *Tahaǧǧud*, bāb 9, Abū Dāwūd, *Ṭahāra*, bāb 30, Muslim, *Ṭahāra*, trad 46, 47) When fasting, Muhammad also made use of the *siwāk* (Ahmad b Hanbal, iii 445, 446)

The miswāk is chiefly used before *wuḍūʾ* as a preparation before the *ṣalāt* It is said that this was the practice of Muhammad (Muslim, *Ṭahāra*, trad 48) who attached so great a value to it, that he would have declared it obligatory before every *salāt*, were it not that he feared thereby to over burden his community (Bukhārī, *Aḏhān*, bāb 8, Muslim, *Ṭahāra*, trad 42, Abū Dāwūd, *Ṭahāra*, bāb 25, Tirmidhī *Ṭahāra*, bāb 18) In one tradition it is said, as a matter of fact, that the obligatory use of the *siwāk* before every *salāt* was introduced by Muhammad as a compensation for the abolition of the obligatory *wuḍūʾ* before every *salāt* (Abū Dāwūd, *Ṭahāra*, bāb 25) In another tradition (Nasāʾī, *Ǧumʿa*, bāb 66) the use of the *siwāk* is called obligatory before the Friday-service

The appreciation of the miswāk which appears from all these traditions culminates in the fact that it belongs to the customs of the "natural religion" (*fitra* Abū Dāwūd, *Ṭahāra*, bāb 29) or to the ordinances of the Apostles (Tirmidhī, *Nikāḥ*, bāb 1)

Nevertheless Fikh does not declare the use of the miswāk obligatory in any case There is general agreement on this point According to some traditions, however, the Ẓāhirites did declare the use of the miswāk obligatory before the *salāt*, but these traditions are not generally accepted According to Fikh the use of the miswāk is recommended at all times, especially in 5 cases in connection with the *ṣalāt*, under all circumstances, in connection with the *wuḍūʾ*, with the recitation of the Kurʾān, after sleep, and as often as the mouth has lost its freshness, e g after long silence

According to the school of Shāfiʿī the use of the miswāk is blamable (*makrūh*) between noon and sunset at the time of fasting, for the nasty smell (*khalūf*) of the faster's breath is beloved by Allāh (cf Nasāʾī, *Ṭahāra*, bāb 6)

It is recommended to use a miswāk of *arāk*-wood of medium hardness, neither too dry nor too moist, to cleanse the palate as well as all sides of the teeth, beginning from the right side of the mouth, moving the miswāk upwards and downwards in order not to hurt the alveoles

MITʿA [See MUTʿA]

MITHKĀL (A), the weight of a thing, this is the meaning of the word in the Kurʾān, a particular weight for weighing precious metals, jewels, drugs, etc, probably the oldest unit in the Arab Troy system The mithkāl corresponds to the Roman solidus of the Constantinian system which the Arabs adopted in Syria ʿAbd al Malik took it over for his unit of gold when he reformed the currency in 77 (696) His dīnār weighed a mithḳāl of 65 5 grains (4 25 grammes), hence mithḳāl is used as a synonym for dinār The silver dirham weighed $^{7}/_{10}$ of a mithkāl and the mithḳāl contains 24 kirāts Slight variations in weight are found in the different parts of the diferent parts of the Muhammadan world

Bibliography See the bibliographies to the articles DĪNĀR and HABBA (J ALIAN)

MIʿWADH [See HAMĀʾIL]

MIʿZAF, MIʿZAFA (A, plur *Maʿāzif*) Among the various classes of musical instruments dealt with by Arabic, Persian and Turkish writers on music is one which embraces those with "open strings" (*awtār mutlaka*) such as the lyre or cithara, harp, psaltery and dulcimer Among them are instruments grouped as *maʿāzif* Nowadays, this term refers to all stringed and wind instruments (*M F O B*, vi 28) but in the Middle Ages it had a more restricted meaning and stood for "instruments of open strings" Al-Djawharī (d ca 1003) and al-Saghānī (d 1261) define them as "musical instruments which you beat upon as in the ʿūd (lute), *tunbūr* (pandore) and the like", meaning by this that *maʿāzif* were played with the fingers or plectrum in the same way as the ʿūd and *tunbūr* were The *Tāǧ al-ʿArūs* includes the tambourine among the *maʿāzif*, but it is an erroneous deduction from the saying of ʿUmar, *marra bi-ʿazfa duffin* ("he passed by the sounding of the *duff*"), which has misled many writers (cf Sachs, *Reallexikon der Musikinstrumente*, s v) The author of *Mafātih al-ʿUlūm* (xth cent) states that the *miʿzafa* was "a stringed instrument belonging to the people of al-ʿIrāk" (p 237), whilst al Mutarrizī (xiith cent) says that the *miʿzaf* was "made by the people of al Yaman", a provenance which Ibn Khurdādhbih (d 912) also gives the instrument (al-Masʿūdī, viii 93) A more precise classification is allowed by al-Shalāhī who includes the *miʿzaf* among barbitons (*barābit*) and lyres (*lasirān*), which agrees with our oldest authority, al-Laith b al-Muzaffar (viiith cent), who says that both *miʿzaf* and *miʿzafa* were terms given to "an instrument of many strings", whilst al-Fārābī (d 950) specifically denominates *maʿāzif* as instruments of "open strings" (Kosegarten, *Lib cant*, p 77, 110) In the *Kitāb al-Aghānī* the *miʿzafa* is rarely placed in the hands of the minstrels, probably because it was of inartistic merit One performer on the instrument, Muhammad b al-Hārith b Baskhīr (ixth cent), was asked sarcastically if it were a rat-trap (*Aghānī*^{2}, x 153)

Tradition avers that *maʿāzif* were "invented" by Dilāl the daughter of Lamak, who was of the

seventh generation from Adam (al-Masʿūdī, viii 89) Since there was a *hadīṯ* condemning *maʿāzif* as signs of the end of the world (al-Tirmiḏhī, ii 33) it is quite likely that the *fukahāʾ* thought it consistent with policy to make Dilāl or Dalāl ("error, destruction") the originator of these *malāhī* or "forbidden pleasures" On the other hand, we read that "David the Prophet had a *miʿzafa* on which he used to play when he recited the psalms" (*ʿIkd al Farīd*, iii 189), which was an echo of the Jewish tradition that he was an adept on the *kinnōr* (I Samuel, xvi 16, 23) The name may be a survival from the days of belief in sympathetic magic The voice of the *ḏjinn* was termed the *ʿasf*, and the spiritual world could be conjured by the sounds of the *miʿzaf* In Islāmic times musicians claimed that their music was inspired by the *ḏjinn* The Greek μάγαδις was an instrument of the same class as the *miʿzaf* It was of Lydian origin and the name is suspiciously like the Semitic one

Lyre and cithara Although we see these instruments in the hands of the ancient Semites on the monuments they do not appear to have had acceptance among the musicians of Islāmic times except with the *fallāhīn*, unless the seven-stringed *wanaḏj* (= *zanaḏj*) of Khuiāsān was such an instrument (al-Masʿūdī, viii 90) Both words are of Greek origin and they appear in Arabic as *lūr* and *kiṯāra* generally In Palestine and Egypt to-day, a primitive type of lyre is known under the name of *tunbūra barbarīya* or *kitāra* (*kissara*) *barbarīya* Villoteau (*Descr de l'Egypte, etat mod*, i 918) and Saint Saens (Lavignac, *Ency de la musique*, i 528) have shown that much of the ancient Greek method of lyre-playing still obtains in the modern Egyptian *kitāra* playing It is worthy of notice that the Arabic word for striking the *kiṯāra* strings is *harraka*, and this is practically identical with the Greek κρέκω

Harp Whilst we possess an actual example of a Sumerian harp with the sound-chest below the strings, this type does not seem to have had any vogue with the Arabs or Persians in artistic music, and is only found among the peasantry In Palestine and Upper Egypt to-day it is called the *tunbūra sūdānī* and *nanga* The harp with the sound-chest above the strings has been a far more important instrument with the Semites and is to be found in the Assyrian sculptures (cf the Assyr word *sanaku* and the Ethiopic *sanko*) That extremely chatty Turkish writer Ewliyāʾ Čelebī says that this instrument, which the Persians called the *čang*, was "invented" by Pythagoras to solace Solomon (*Travels*, i/ii 227), and even al Shalāhī says that it was of Byzantine (*Rūmī*) origin (fol 15) Yet Ibn Khurdādhbih and al-Djawharī show that it was peculiar to the Persians and, indeed, the type may be found on the Sāsānian sculptures (Ker Porter, *Travels*, ii 175) The Arabs called it the *ḏjank* and/or *ṣanḏj* (cf al-Djawālīḳī, ed Sachau, p 97) It may be that the *ḏjank* and *ṣanḏj* were different types of harp, the Persian and Arabian There were certainly two types, the straight sound-chest and the crooked In the *Mafātīh al-ʿUlūm* the Byzantine *salbāk* (σαμβύκη) and *lūr* (λύρα) are likened to the *ḏjank* and *sanḏj* respectively Among the Arabs the *ḏjank* is mentioned as early as al-Aʿshā Maimūn (d ca 629) Al-Fārābī devotes a section in his *Kitāb al-Mūsīkī* to *maʿāzif*, *ḏjunūk* and/or *ṣunūḏj*, and other instruments "in which there is made to every note, according to its state, a solitary string", and he shows them strung with both fifteen (diatonic) and twenty-five (chromatic) strings (Kosegarten, *l c*) Both Ibn Sīnā (d 1037) and Ibn Zaila (d 1048) deal with the *ṣanḏj*, whilst in the *Kanz al-Tuhaf* (xivth century) and the works of Ibn Ghaibī (d 1435) the *čang* is fully described The oblique sound-chest was 109 cm long, and the handle (*dasta*) 81 cm long From the sound-chest to the horizontal bar below twenty-four or twenty-five strings of goat's hair were stretched, being fastened to metal pegs (*malāwī*) Some players even used thirty five strings so as to embrace the scale of the Systematists The face of the sound-chest was of skin, but the remainder of the frame-work was of vine or plum tree wood The handle was placed under the left arm (cf the pictures in MSS) and the fingers of both hands were used in performance, plectra (*zakhmāt*) being fastened to the finger tips Nowadays the harp has fallen into complete desuetude among the Arabs and Turks Even among the Persians it has become rare, and in its modern form it was little different from the occidental instrument (Adviellc, *La musique chez les Persans*, p 13), whilst the instrument shown by Kaempfer (xviith century) under this name was a zither In 1638 Ewliyāʾ Čelebī found only twelve players of the *čang* in Constantinople because, he said, it was a difficult instrument to play (*Travels*, i/ii 234) At this time the Turkish *cang* had forty strings, and a very large instrument of the xvith (not xviith) century is given by Engel (*Mus instr in the South Kensington Museum*, p 59)

Although the "humped back" of the *cang* or *ḏjank* became a favourite theme for poets, and it was certainly the best known type, yet an instrument with a "straight back" was also to be found A more pronounced "hump" existed in a type mentioned by Ibn Ghaibī and called, probably on account of this feature, the *agrī* It was strung similarly to the *cang* but had a wooden instead of a skin face on the sound-chest, and its tuning-pegs were also of wood

A Byzantine harp called the *salbāk* (erroneously written *salyāk*, *shalyāk* [cf the art SHALYĀK, which clashes with the opinion of the present writer, Red], or *salbān* in most dictionaries and MSS) was also known to the Arabs It was actually a survival of the old Greek σαμβύκη, and is described in the *Mafātīh al-ʿUlūm* as "an instrument of the Greeks (*Yūnāniyūn*) and Byzantium (*Rūm*) resembling the *ḏjank*" (p 236) According to Ibn Khurdādhbih it had twenty-four strings (al-Masʿūdī, viii 91, cf Farmer, *Byzantine musical instruments in the ninth century*, p 4 *sq*) Ibn Sīnā classes it with the *ṣanḏj* among the instruments with "open strings" stretched across a space

Psaltery In describing those instruments with "open strings" stretched across a surface, both Ibn Sīnā and Ibn Zaila mention a particular type named the *ʿankā* Whilst the name suggests a "long necked" instrument, the details given of strings of different lengths but identically situated bridges (*hamilāt*), compel one to recognize in it a trapezoidal psaltery, one species of which was known later as the *kānūn* The word *ʿankā* also stood for "phoenix", and we know that the Greeks of old had an instrument called the φοίνιξ This

may account for both the instrument and the name among the Arabs It is not mentioned however, after the xiᵗʰ century

The *kānūn* [q v], the present-day psaltery of the Arabs and Turks, is said by Ibn Ghaibī to have been invented by Plato, although the instrument as known in the xᵗʰ century is attributed to al-Fārābī (Ibn Khallikān, *Biog Dict*, iii 309) The word itself is derived from the Greek κανών Although the instrument is delineated in the various MSS of the Syriac lexicon of Bar Bahlūl (xᵗʰ century) sub "kithara", yet the name *kānūn* is not given It is mentioned in the *Thousand and One Nights* (ed Macnaghten, 49ᵗʰ and 149ᵗʰ nights), and in one place is designated the *kānūn miṣrī* ("Egyptian psaltery") In Spain it was particularly favoured and al-Shakundī (d 1231) includes it among the Andalusian instruments manufactured at Seville (al-Makkarī, *Analectes*, ii 143—144) In the Persian *Kanz al-Tuhaf* and in Ibn Ghaibi it is described in detail The shallow, flat, trapezoidal sound chest, 9 cm deep, was made of vine or plum tree wood The lengths of the bass and treble sides were 81 and 40 5 cm respectively, whilst the oblique side was 74 25 cm It was mounted with sixty four strings (seventy-two ? in Ibn Ghaibī), arranged trichordally Although the *kānūn* has fallen into disuse in Persia, it is still a great favourite in the Maghrib, Egypt, Syria and Turkey, where it is to be found strung trichordally with from fifty-one to seventy five strings

A rectangular type of psaltery of greater compass was the *nuzha* It was invented by Ṣafī al-Dīn ʿAbd al-Muʾmin (d 1294) and a design is sometimes to be found in his *Kitāb al-Adwār* (see Farmer, *Arabic musical mss in the Bodleian Library*, frontispiece) Its features are also fully discussed in the *Kanz al-Tuhaf* and by Ibn Ghaibī Its dimensions were 74 25 × 54 cm, whilst the depth of the sound-chest was 27 cm 108 strings were mounted on the instrument

Dulcimer Ibn Sīnā and Ibn Zaila describe an instrument with "open strings" played on with beating rods (*maṭārik*) which is called the *sanǧ sīnī* ("Chinese *sanǧ*") This is clearly the dulcimer, later to be generally known as the *sinṭir* or *santūr* (also written *ṣantūr*, *sintir* and *ṣanṭīr*), a word derived immediately from the Aramaic, but probably finally traceable to the Greek ψαλτήριον Indeed, it is invariably found in the hands of Jews and Greeks It is of similar structure to the *kānūn*, but with two of its sides oblique instead of one The strings, which are mounted dichordally in Egypt, are of metal and are beaten with sticks (*maḍārib*) instead of plectra as in the *kānūn* We find it mentioned by Ibn Khaldūn (d 1406) and al-Haithamī (d 1563), but its popularity was but fitful among the Arabs In the xviiiᵗʰ century it is doubtfully acknowledged by Russell (i 152) and Niebuhr (*tympanon*) In Egypt, both Villoteau and Lane show that it was only to be found in the hands of Jews, Greeks and other foreign residents, whilst native writers like Musharḳa and Darwīsh Muhammad make no mention of it To day it is practically unknown in Syria and Fgypt In the Maghrib it is unnoticed by Host, Christianowitsch and Salvador-Daniel, and although it is dealt with by Delphin and Guin, it is scarcely known to-day In Persia however, it obtained greater recognition In the xviiiᵗʰ century it is mentioned by Chardin, but not by Kaempfer, whilst Adrielle in the xixᵗʰ century gives both a design and a description In Turkey, whilst the word is registered in the xviiᵗʰ century by Meninski, it is not mentioned by Hādjdjī Khalīfa nor described by Ewliyāʾ Čelebī, in their lists of Turkish musical instruments In the next century however, it is recognised by Toderini, and to-day the *santūr* is one of the most esteemed instruments in the country, where it may be seen in two forms the *santūr turkī* and the *santūr fransīz* The former, exclusively used by the Jews, has 160 strings grouped in fives, giving thirty two notes, a two octave chromatic scale The latter, which is confined to the Turks, was introduced from the West about the middle of the last century by a certain Hilmī Bey It is mounted with 105 strings, also grouped in fives, which are placed on the sound chest in the Occidental way

AL-**MĪZĀN**, the balance, is the nomen instrumenti from *wazana* "to weigh", which means to weigh in the ordinary sense and also to test the level of, like the Latin *librare* Here we shall discuss

1 The various instruments used for weighing in the ordinary sense, brief notes are added on the ascertainment of specific gravities 2 Levelling instruments

1 BALANCES

The steelyard (*al karastūn*, q v) has already been dealt with, the general principles of the balance are also discussed in that article — The usual balance with two arms of equal length had the same shape among the Muslims as in ancient times and at all periods in the west, this we know from extant specimens and illustrations in various works, notably in al Khāzinī, in a manuscript of al Kazwīnī with reference to the constellation Libra (fig 1), in a manuscript of Harīrī, in the *Ajāʾib al ʿAkbarī* of Abu 'l-Fadl (fig 2) In the beautiful manuscript from which Ch Schefer published the *Sefer Nameh* of Nasīr-i Khusraw,

on p 88 in the illustration of the Masdjid al-Aksā there is a balance labelled *terazu* (*Sefer Nameh, Relation du voyage de Nassiri Khosrau*, ed Ch

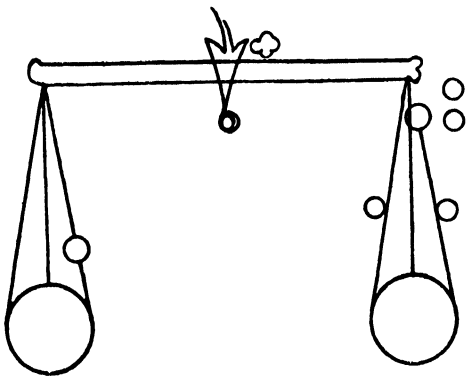

Fig 1

Schefer, *Publications de l'ecole des langues orientales vivantes*, II ser, I, Paris 1881) The common balance is called *mizān* but in the Kur'ān we also

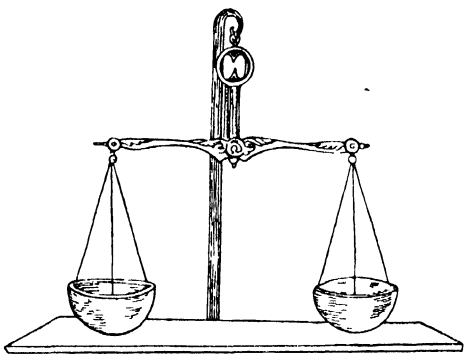

Fig 2

find *kusṭās*, which, according to al-Tha'labī, is a loanword Other names are *shāhin*, which does not only mean the beam and tongue of the balance and is contrasted by the *Ikhwān al-Safā'* to the *kabbān* (steelyard), also *taris* from the Persian *tarāzū*, then *mihmal* for scales for gold and *kubba* for beam and tongue *Mindjam* means the tongs and also the beam According to J Ruska, *habbāba* seems to be used for scales (for gold) On the expressions connected with *karastūn*, see that article Al Makdisī mentions Harrān as a place where balances were made, in his work *Ahsan al-Takāsīm fī Ma'rifat al-Akālim*, p 141, in this town many very skilful mechanics were engaged in making astronomical instruments The accuracy of the balances made in Harrān was proverbial

The Arabs devoted special attention to the construction of balances used to identify metals and jewels from their specific gravity, to distinguish false from genuine and pure and to ascertain the composition of alloys of two metals by the use of the principle of Archimedes They called these balances *mizān al-mā'*, "water" (hydrostatic) balances Of makers of these, al-Khāzinī (c 1100, q v) mentions Sanad (Sind) b 'Alī (c 250 = 864), Muhammad b Zakariyā al Rāzi († 320 = 932—933), Ibn al 'Amīd († 359 = 969—970), Yuhannā b Yūsuf (perhaps al-Kass, d c 370 = 980—981), Ibn Sīnā († 428 = 1037), Ahmad al-Fadl al-Massāh (the "measurer", also mentioned by al Bīrūnī without the "Massāh"), Abū Hafs 'Omar al-Khayyāmī (as the celebrated mathematician is never called Abū Hafs, it is doubtful whether he is the individual mentioned by al-Khāzinī) The balances made by these men are still fairly simple as only two, or at most three, scales were used in them A contemporary of al-Khāzinī, namely Abū Hākim al-Muzaffar Ibn Ismā'īl al Asfizārī (d before 515 = 1121) added two more scales, these and other improvements made the scales much more convenient to use Of him al-Baihakī says (E Wiedemann, *Beitr*, xx, *Einige Biographien nach al Baihakī*, in *S B P M S Erlg*, xlii, 1910, p 17) "He constructed the balance of Archimedes with which one ascertains forgeries The treasurer of the great sultān feared that his frauds would thus be discovered He therefore broke the balance and destroyed its parts Al Muzaffar died of grief as a result" Al-Khāzini then took up al-Muzaffar's work and made the balance a

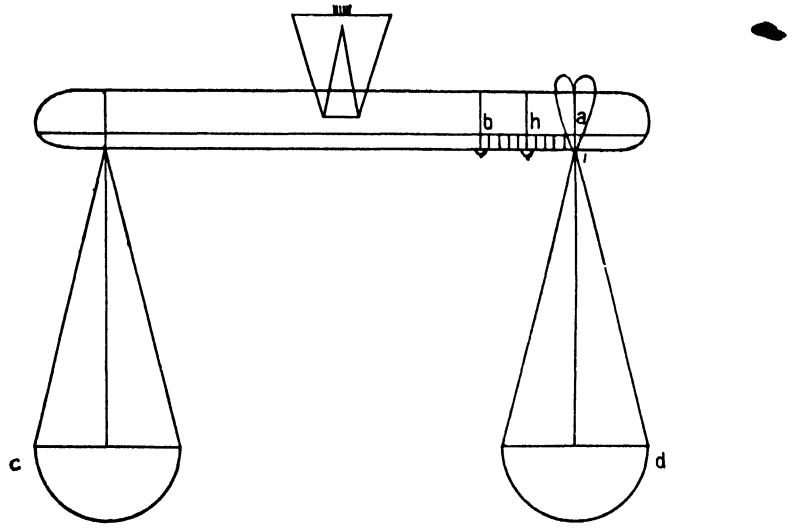

Fig 3

most accurate means of measuring, he called it the universal balance, *al-mīzān al ḏjāmiʿ* But, no doubt in memory of his predecessor, he called his book *Kitāb Mīzān al-Hikma*

In the physical (*ṭabīʿī*) balance of Muhammad b Zakarīyā al-Rāzī (fig 3), it goes back to Greek models, e g of Archimedes (fig 4, cf al-Khāzinī, *op cit*)

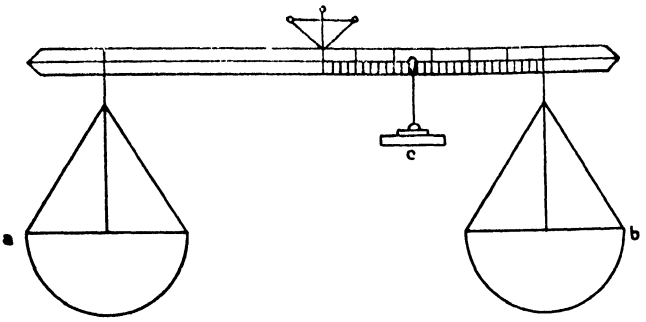

Fig 4

For special purposes such as the examination of gold and silver and their alloys, many contrivances were made with balances and the movable scales and running weights on the beams, for example

Here we shall describe somewhat more fully the "balance of wisdom" [1]) of al-Khāzinī

Al-Khāzinī gives the beam *A* of the balance (fig 5) a thickness of six cm and a length of

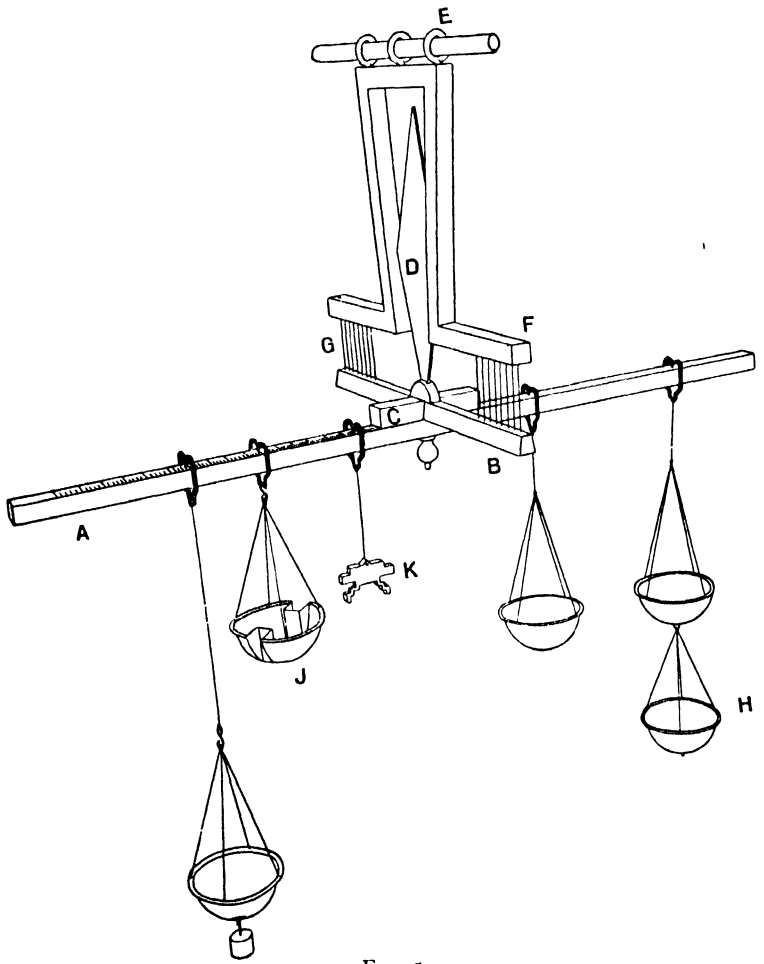

Fig 5

1) H Bauerreiss (*Zur Geschichte des spez Gewichtes im Altertum und Mittelalter*, Dissertation, Erlangen 1913) has reconstructed the "balance of wisdom", as nearly as possible following the data of the original Reproductions are in Erlangen and the German Museum in Munich The illustration is taken from a photograph In the original right and left are reversed

two m In the centre it is strengthened by an additional piece *C*, obviously intended to avoid any bending at this point A cross-piece *B* (*ʿarīḍa*) is let in here Corresponding to it is a similar cross-piece *F* on the lower part of the tongs, in which moves the tongue *D*, itself about 50 cm long The upper cross-piece *E* is hung by rings to a rod which is fastened somewhere Pegs or small holes are placed at exactly opposite places of the cross-pieces *B* and *F* to which threads are tied or drawn through The friction at an axis is thus avoided, which, in view of the great weight of the beam, is quite considerable The knob visible below the beam under its centre is used to secure the tongue to the beam or to take it out in order to adjust it evenly The tongue has for this purpose a peg at the foot which goes through a hole in the beam Al Khāzinī also observes that one could also take shorter beams but then all the other dimensions must be proportionately smaller The beam is divided not on one side only, as in the illustration, but on both The scales are hung on very delicate rings of steel (*ghurāb* "ravens") the points of which fit into little niches on the upper surface of the beam Five scales are used in ascertaining specific gravities, i e in investigating alloys and examining precious stones Of these the scale *H* (fig 5ª) is called the cone-shaped or *al hākim*, the judge, as it is used to distinguish false from true It goes into the water and in order to meet with less resistance in sinking is cone shaped and pointed below The scale *J* is called the winged (*muḏjannah*, fig 5ᵇ and 5ᶜ, side and top view) It has indented sides so that it can be

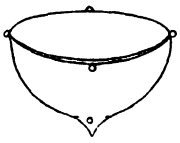

Fig 5ª

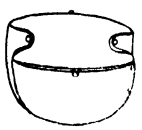

Fig 5ᵇ

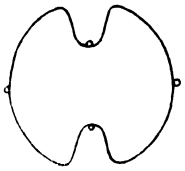

Fig 5ᶜ

brought very close to the adjoining scales It is also called the movable (*munakkal*) There is also a movable running weight *K* (*al rummāna al satyāra*) which serves, if necessary, to adjust the weight of the lighter beam, it is therefore also called the *rummāna* of the adjustment (*al taʿdīl*) The other scales are used to hold weights Al-Khāzinī attained an extraordinary degree of accuracy with his balance This was the result of the length of the beam, the peculiar method of suspension, the fact that the centre of gravity and axis of oscillation were very close to each other, and of the obviously very accurate construction of the whole Al-Khāzinī himself says that when the instrument was weighing 1,000 mithkāls, it could show a difference of 1 habba = $^1/_{68}$ mithkāl, i e about 75 centigrammes in 4,5 kilogrammes We thus have accuracy to $^1/_{60\,000}$

Al-Khāzinī used his scales for the most varied purposes Firstly for ordinary weighing, then for all purposes connected with the taking of specific gravities, distinguishing of genuine (*ṣamīm*) and false metals, examining the composition of alloys, changing of dirhams to dīnārs and countless other business transactions In all these processes the scales are moved about until equilibrium is obtained and the desired magnitudes in many cases can at once be read on the divisions on the beam

False balances That as early as the time of Muhammad balances showing false weights were used for fraudulent purposes is shown by various passages in the Kurʾān (Sūra xxvi 182, vii 13, xvii 37) We read for example "Weigh with the just (or upright, *mustakīm*) balance" Al-Djawbarī (middle of the xiiith century, cf E Wiedemann, *Beitrage*, iv, *Über Wagen bei den Arabern*, in *S B P M S Erlg*, vol xxxvii, 1905, p 388) describes two such arrangements In the one the beam of the balance consisted of a hollow reed closed at the ends in which there was some quicksilver, by a slight inclination of the beam this could be made to flow as desired to the side of the weights or of the articles and thus make the one or other appear heavier A balance like this was used in Cairo in the time of E W Lane by a dishonest police inspector (*muhtasib*) In the second pair of scales the tongue was of iron and the merchant had a ring with a magnetic stone By bringing the ring close to it the balance went down to right or left

The balance or the principles applying to it were used for many purposes besides weighing Contrivances turning on an axis in which sometimes one and sometimes the other side becomes lighter or heavier, especially by the admission or release of water, were used to produce automatic movements, they are often called *mīzān* (cf e g the writings of the Banū Mūsā and of al-Djazarī, e g in F Hauser, *Über das Kitāb al-Ḥiyal Das Werk über die sinnreichen Anordnungen der Banū Mūsā*, Abh 2, *Gesch der Naturwissenschaften und Med*, Heft II, 1922, E Wiedemann and F Hauser, *Über die Uhren im Bereich der islamischen Kultur*, in *Nova Acta der Kais Leop-Carol Akademie*, vol c, 1915, N⁰ 5 and other passages) In the hour balance used to measure time, a container filled with sand or water is hung at one end of a lever poised with arms equal and has a hole in the bottom The equilibrium disturbed by the gradual loss of sand or water is compensated for by weights which move along the other arm From their weight and position one can calculate the time that has passed (E Wiedemann, *Beitrage*, xxxvii *Über die Stundenwage*, in *S B P M S Erlg*, xlvi, 1914, p 27, a full description is given by Prof F Hauser in E von Bassermann-Jordan, *Die Geschichte der Zeitmessung und der Uhren*)

Most artisans also describe as "scales" *al mistara*, i e ruler, *al-barkaz*, the compasses, *al-kūniyā*, set square and level, as they serve to show lapses from the straight etc — *Mikyāl*, ell, *shāhin*, *kubbān* are "scales" with which one measures whether things are correct or over measure in business transactions (*Rasāʾil Ikhwān al-Ṣafāʾ*, Bombay 1305, i/ii 128)

For a few further meanings of *al-mīzān* see Dozy, *Supplément*, s v *wazana* — In mathematics the balance is used to elucidate certain mathematical processes The steelyard is used to illustrate the inversed relation the weights are in inverse proportion to the length of the arms (cf e g Th Ibel, *Die Wage im Altertum und Mittelalter*, in *Programm Forchheim*, 1905—1906, p 93, *Rasāʾil*

Ikẖwān al-Ṣafā', Bombay 1305, I/II 10 and other places) Al-Bīrūnī uses the balance to explain the procedure in solving equations (*al-ǧabr wa 'l-muḳābala*) (*Kitāb Tafhīm* etc, Berlin, N° 5665, fol 9b) The method of the double error is also called the "process with the use of the beam"

One knows whether a number is divisible by nine by casting out the nines to do this one adds up the figures in a number and takes away 9's from the total until 9 or another number is left, the number left is called *mizān* The word *mīzān* also means testing the correctness of any calculation (cf Bahā' al-Dīn, *Khulāṣāt al-Ḥisāb*, ed G H F Nesselmann, Berlin 1843)

In magic squares the sum of the largest and smallest figure is called *al-mīzān*, it is half the total of the vertical row, horizontal row or of the diagonals (G Bergsträsser, *Zu den magischen Quadraten*, in *Isl*, XIII, 1922, p 223)

Alchemy is often called *'ilm al-mīzān*, the science of the scales, or of accurate measurement, as in the preparation of the elixir etc the choice of the right proportion of the ingredients is an important matter

Among other uses of the word *mīzān* may be mentioned that a tree on a boundary near Bāniyās at the source of the Jordan was called "tree of the balance" (*mīzān*) We may also note that on the day of judgment a balance with a very long beam will be erected (on it cf e g M Wolff, *Muhammadanische Eschatologie*, Leipzig 1872, text, p 81, transl, p 148 and al-Ghazālī, *al-Durra al-fākẖira fī Kashf 'Ulūm al Ākẖira*, ed L Gautier, Leipzig 1878, text, p 67, transl, p 79)

Specific Gravity We have already mentioned that the "balance of wisdom" and other scales were used to test the purity of metals etc and to ascertain the composition of alloys we shall now briefly discuss the work of the Arabs on this subject Two magnitudes have to be considered The weights of equal volumes are compared, which corresponds to an investigation of the specific gravities[1]), al-Bīrūnī, for example, takes hemispheres of the different metals or rods of equal size and compares their weights, or the volumes of equal weights are compared by finding those of any weights and then comparing the specific volumes (i e the volumes of the unit of weight) For these measurements one used either methods based on the principle of Archimedes, according to which a body loses in a liquid as much weight as the volume of the fluid displaced by it, or one measures the fluid displaced by the body itself For this purpose al Bīrūnī constructed a cone-shaped vessel (*al-ālat al-makẖrūṭīya*) [fig 6] This vessel is filled with water until it begins to run out by a pipe at the side, then a definite mass, as large as possible, of the substance (weight P_1) is weighed, as is the scale P_2 placed under the outlet pipe The substance is then put in the vessel and the pan with the water displaced weighed (P_3), so that from P_3-P_2 we get the volume of water corresponding to the mass P_1, which is then calculated by al Bīrūnī for a weight of 100 mithkāls As almost always,

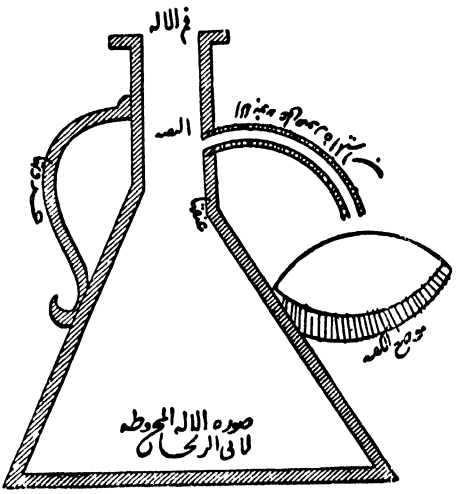

Fig 6

in ascertaining the specific gravity the Arabs rely on the ancients, particularly on the work of Menelaus "on the artifice by which one ascertains the quantity of each of a number of mixed bodies", *Fī Ḥila allatī yu'rafu bi hā Miḳdār kull wāḥid min 'Idda Aǧsām mukẖtalita* (from the Escorial MSS) and *Ma'rifat Kammīyat Tamayyuz al-Aǧrām al-mukẖtalita* (according to Ibn al-Kiftī, p 321, Professor Dr Wurschmidt is giving an edition of this work in *Philologus*) In al Bīrūnī's work, Archimedes himself is mentioned and a certain Manātiyūs (according to Noldeke, probably Μαντίας) The Muslims however did not slavishly take over the statements of the ancients Al-Bīrūnī, for example, emphasises that one can ascertain the composition of an alloy of two components but not of one of three, as Menelaus says Among the Muslims it was certainly al Biruni who did most in this field, in his work "on the relations which exist between metals and jewels in volume" (*Makāla fi 'l Nisab allatī bain al-Filizzāt wa 'l Ǧawāhir fi 'l-Haǧm*, cf also al-Bīrūnī, *Chronology*, text, p xxxxiv), which still exists, and also in another work, which only survives in fragments quoted by al-Khāzinī Al-Bīrūnī was induced to compose the first named by the difficulties encountered by goldsmiths in ascertaining the quantities of metals necessary to copy a given article As predecessors he mentions Sanad b 'Alī, Yuhannā b Yūsuf, Ahmad al-Fadl al-Bukẖārī So far as we know he was followed and his results were used by Abū Hafs 'Omar al-Khayyāmī (see above), al-Asfizārī (see above), al-Khāzinī (see above), Fakẖr al-Dīn Muhammad Ibn 'Omar al-Rāzī († 1210, Suter, N° 328), and Abu 'l-Fazl Allamī, Eliyā Misrākẖī, a work ascribed to Plato which was composed in the time of Bāyazīd by a slave of a son of Sinān, a Turkish work by al-Ghaffarī, and a Persian by Muhammad b Mansūr (on these works, as on mineralogical literature in general, see E Wiedemann, *Beiti*, XXX *Zur Mineralogie des Islam*, in *S P M S Erl*, XLIV, 1912, p 205) We must also mention the study by Abū Mansūr al-Nairīzī who is not to be confused with the commentator on Euclid, and the work on the measurement of bodies which are compounded of

1) It is to be noted that expressions like specific gravity and specific volume, which refer to the unit of weight and the unit of volume are not found among the Arabs Al-Bīrūnī, for example, gives the amount of water displaced by 100 mithkāls of various substances corresponding to their volume and the weights of the metals which have the same volume as 100 mithkāls of gold and in the case of other substances the same volume as 100 mithkals of blue *yākūt*

other substances, in order to ascertain the unknown amounts of the separate constituents *Minbar fī Misāhat al-Adjsām al-mukhtalita li 'stikhrādj Mikdār madjhūlihā* by Samū'īl b Yahyā b ᶜAbbās al-Maghribī al-Andalusī (d 1174–1175 at Maghāra, s Ibn al-Kiftī, p 209, Suter, N° 302)

The statements on specific gravities refer to *A* Metals gold, mercury, bronze (*sifr*), copper, brass (*shibh*), iron, tin (*rasās*), lead (*usruf* and *usrub*) *B* Precious stones blue *yākūt*, red *yākūt*, ruby, emerald, lapis lazuli, pearl, coral, cornelian, onyx and rock crystal *C* Other substances Pharaonic glass, clay from Siminyān, pure salt, salt earth (*sabakh*), sandarach, enamel (*mīnā*), amber, pitch, wax, ivory, bakkam wood, willow wood

The weights of equal volumes of liquids and the volumes of equal weights of liquid are sometimes found directly, sometimes ascertained with the araeometer of Pappus The former magnitude plays an important part in the liquids used in every day life like oil and wine The second was of more scientific interest It is especially interesting that the Arabs found that hot water and hot urine had a larger volume than equal weights cold They also knew that ice had a larger volume than the same weight of water

The facts ascertained with the araeometer of Pappus for fluids refer to cold fresh water, hot water, ice (does not properly belong to this connection), sea water, vinegar, wine, sesame oil, olive oil, cow's milk, hen's egg, blood of a healthy man, warm and cold urine

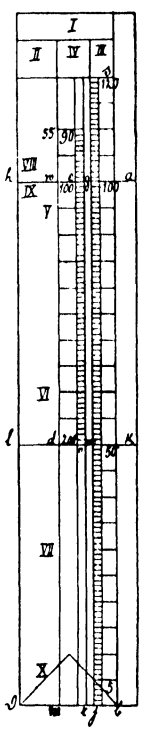

Fig 7

Fig 7 shows the araeometer reconstructed by H Bauerreiss from al-Khāzinī *X* is a massive cone used to make the instrument heavy There are inscriptions corresponding to the Roman numerals For details the reader may be referred to H Bauerreiss's article — The principle that floating bodies of the same weight sink in water to the same depth finds application in a juristic trick cited in the *Kitāb al Hiyal fi 'l-Fikh* of Abū Hātim al-Kazwīnī The weight of a camel is ascertained by putting it in a boat and noting how deep the boat sinks The camel is then replaced by iron weights until the boat sinks to the same level (cf J Schacht in G Bergsträsser, *Beitr zur semitischen Philologie und Linguistik*)

In medical works and treatises on weights and measures, figures are given for the weights of equal volumes of wine, oil and honey (cf Bauerreiss, *op cit*)

So far as it is a question of particular bodies, the values as ascertained by the Arabs agree very well with those obtained by modern science and even surpass in accuracy those obtained by it up till the beginning of the last century

Bibliography This is given in the article AL-KARASṬŪN

2 LEVELLING (*wazana*, to weigh, corresponding to the Latin librare)

The Arabs certainly adopted a large number of methods of levelling and testing levels from other peoples, either the Byzantines or the Persians The statements in Ibn Wahshīya (see below) about the making of canals etc agree with those of Vitruvius, who in turn drew on Greek sources The Arabs learned partly from Greek works, for example we are told that according to Philemon (according to M Steinschneider Philon), the incline in canals must be at least 5 1,000, but they also utilized data gained from the practical experience of land owners, canal builders etc Whether the Arabs were acquainted with the standard works of Hero on this subject, the *Metrica* and the "On the Dioptra" (Hero, *Opera omnia*, ed H Schone, III, Leipzig 1903), is not known, for no corresponding title is found in the biographical or bibliographical works But the writing mentioned in the *Fihrist* "On the use of the astrolabe" may have dealt with geodetic problems Many problems in the Arabic sources are very similar to those dealt with in the work "On the Dioptra", only the Arabs use the astrolabe or quadrant instead of the dioptra Whether one or other of the methods described below was discovered independently by the Arabs and by whom, cannot be established from the authors on the subject, who were mainly practical men They are described in the most different places

In levelling, one is faced with two problems firstly to make a surface exactly level and horizontal or to place a rod or a surface exactly perpendicular, and secondly to ascertain the point on the same level as a given one, or to ascertain the difference in height between two points

I A surface is made level and horizontal in the following way

A ruler with a straight edge is moved over the surface and one sees whether it touches it everywhere so perfectly that light penetrates nowhere between ruler and surface, in this case the surface is perfectly smooth (al-Shīrāzī, see below)

That the ruler itself is straight is ascertained by seeing if a thread stretched along it and fastened to it at one end can be lifted the same height from the ruler along its whole length Whether three rulers are straight is tested by putting them side by side and exchanging their sides (Ibn Yūnus, in K Schoy, see below)

To examine if a surface was perfectly horizontal, the following tests were adopted

1 Water is poured over the surface and it is observed whether this flows equally in all directions, this is one of the most usual methods The same plan is given by Proclos in his *Hypotyposis* (ed K Manitius, Leipzig 1909, p 50, 51) According to him, one pushes supports in under a level surface on all sides till it shows no slope anywhere, this is the case when water poured on it remains standing without running to one side

2 An object which can roll is placed on one side, if it does not roll off but only oscillates, the surface is horizontal (al Shīrāzī, see below)

3 Water is poured into a plate or dish (*djafna*, fig 8) with an edge which is parallel to the surface and of the same height all the way round,

Fig 8

and it is observed whether the water comes exactly up to the edges on all sides (Ibn Luyūn, see

below). An exactly straight ruler is laid on the plate and one looks over this

Ibn Sīnā (Cod Leidensis, N° 1061) in order to test whether the upper surface of the base of a theodolite is horizontal, makes a cavity in it with exactly perpendicular walls, pours water in and proceeds as in the case of the plate To test whether a large ring is absolutely smooth, al-ʿUrdī used a process which he called *al-afādain* This is not a ready made instrument but an apparatus to be put together from case to case The ring to be tested is first of all placed exactly horizontal with the ground by means of the level (fig 9) Inside the ring on its concave side a circular

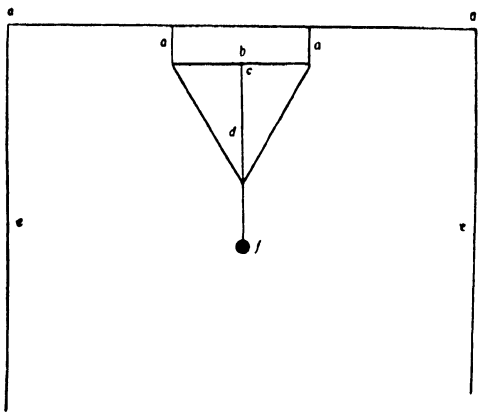

Fig 9

In the original the rod is at *e*, the rope at *a*, *b c murḏjikāl*, it is a triangle of wood, at *d* thread, at *f ṯhakkāla*, weight

gutter of potter's clay is built Its outer edge comes up to the level of the surface of the ring while its inner edge is a little higher The gutter is filled with water and some light ashes are scattered on it If the water flows over the ring the depressions in the ring are filled with it, while the ashes remain on the raised parts of it The inequalities in the surface of the ring are thus brought out (fig 10) Al-ʿUrdī em-

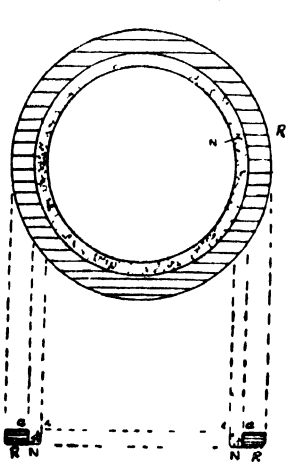

Fig 10

phasises that the test must be made in absolute calm

Al-ʿUrdī also used the same method in order to see that the outlets for water in a distribution system at Damascus were all of the same level In the centre of the reservoir he put a gutter like this and deepened or raised the bottoms of the channels running out of it until the water from the gutter spread equally over the channels which revealed any inequalities (fig 11) Cf H J Seemann, in *S B P M S Erlg*, lx, 1928, p 49, 81 and J Frank, in *Zeitschr f Instrumentenkunde*, xlviii, 1929

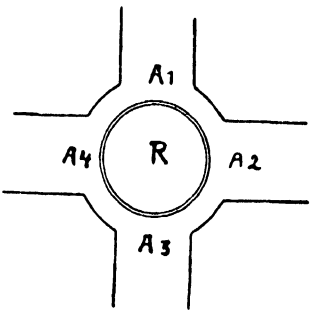

Fig 11

4 A plumb line (*ṣhākūl*, *bulḏ*, *balad* [from βόλις], *ṯhakkāla*) is dropped from the apex (fig 12) of a isosceles triangle, made for example of wood, with

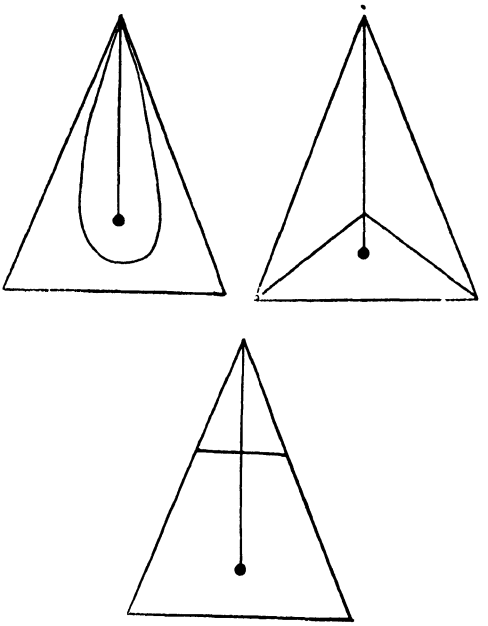

Fig 12

its perpendicular marked, a piece is sometimes left open in the centre of the under side for the weight of the plumb line If the plumb line coincides with the perpendicular, the surface is horizontal (the figures go back to al-Shīrāzī and al-Khalkhālī) Such drawings have led to the erroneous idea that Muslim students were already acquainted with the pendulum (cf E Wiedemann, in *Verhdl d d phys Ges*, 1919, p 663, the apparatus is called *al-fādin* [e g in al Shirāzī, al ʿUrdī, see below], Dozy, *op cit*, also *al kādin*)

In the architect's balance (fig 13), according to Ibn Luyūn or al-Tighnārī (see below), a quadrangular piece of wood is placed on the beam *a a* to be

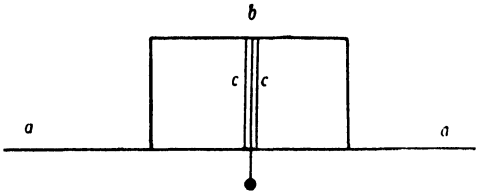

Fig 13

examined, in the middle of it, a perpendicular line *b a* is drawn before which a plumb-line is hung, according to the original figure, it seems to be two parallel lines between which the plumb-line hangs

Al Marrākushī (see below) has described a more perfect form (fig 14) In the figure *a b*, *a c* and *d e* are rods, and *a b* = *a c* and *a d e* is an equilateral triangle, *d e* is pierced in the centre A plumb-line

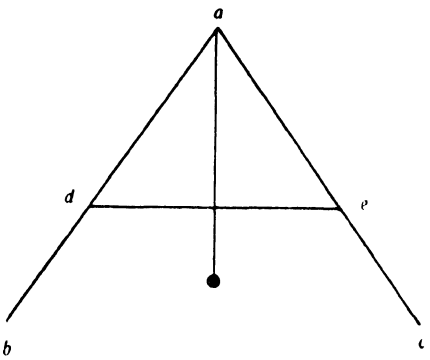

Fig 14

is hung from *a* through the hole If the surface on which *b* and *c* are put is horizontal, the thread of the plumb line goes through the centre of the hole

Whether the levels and other similar instruments are themselves correct, whether for example the plumb-line from the apex to the base is perpendicular, is tested in this way After the plumb line comes to rest in one position of the level, the latter is put in various positions on some horizontal surface, particularly in one perpendicular to the first, and in one in which left and right have places exchanged If the plumb-line always comes to rest the level is correct but if it only does so in the former case the error can be corrected by adjusting the position of the surface and that of the level

The level here described is usually called *kūnīya* (*γωνία*), the word, however, is also used for the wooden set square, as used by carpenters (s *Mafātīh al-ʿUlūm*, ed v Vloten, p 255) and land surveyors like Abu 'l-Wafāʾ (s *Abhandlungen zur Geschichte der Naturwissenschaften und Medizin*, Heft iv, 1922, p 98) A synonym is according to al-Shīrāzī (*Nihāyat al-Idrāk fī Dirāyat al-Aflāk*, *Mak* 2, chap 13) *afadan* From the same root we have in Ibn Wahshīya (Cod Leidensis, N° 1279, p 527) *fawdān*, in Dozy (*Supplement*, ii, p 246) *fādin* and *fādim* Connected with this is *fawdān*, dual of *fawd*

Sometimes one finds it stated that levelling is done with the *shākūl*, e g in al-Battānī (ed Nallino, text, 1903, p 137) *mawzūn bi 'l shākūl*, and an exactly similar statement is made by Ibn Sīnā (Cod Leidensis, N° 1061) A set square is either brought up to the plumb line and a perpendicular dropped on the surface from it, or the *shākūl* is used for the level, the essential part of which is the plummet

On larger surfaces, such as roofs, etc, a long rod (*kubtāl* = cubitale) is first of all laid down and on it the apparatus for testing the level is placed, this is called *mizān al-izur* (or *al bannāʾin* of the architects, cf Ibn Luyūn, see below)

5 At the apex of a threesided pyramid built on a surface by 3 rods of equal length, a plumb-line with a sharp point in the plummet is hung This ought to hang over the centre of the surface (al-Khāzinī, see below)

6 On the apexes *A* and *B* (fig 15) of two sharp pointed tetrahedra of equal height *A I H K*, and *B L M N*, a rod of some length *A B* is laid

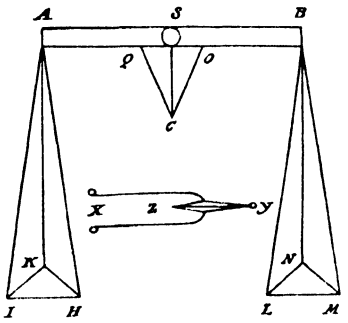

Fig 15

on which is fixed a triangle with a plumb line hanging from it or an arrangement such as is already described for the scale-beam If the plumb-line or the tongue comes to rest, the rod and therefore the surface is horizontal (al-Marrākushī, see below)

The necessity of making surfaces exactly level continually crops up in building, and also in putting up astronomical instruments, and in constructing the Indian circle with which the meridian and then the direction of the *kibla* is ascertained In this case the level surface is usually not prepared on the ground but on a firm foundation, perhaps of stone The construction for the Indian circle is already described in the *Hypotyposis* of Proclos (*loc cit*) in the same way as by the Arabs

We now deal with the tests used to see if a thing is perpendicular

1 The simplest method is to hang a plumb-line beside it In the case of level perpendicular surfaces, this must touch it all the way down if its point of suspension is on it This method is always recommended in working with the quadrant (s also below)

2 If the point of suspension is a little in front of the surface the thread must be equidistant from it all the way down

3 In the side of the gnomon, a perpendicular rod, often with a cone-shaped top, Ibn Yūnus (see below) cut out a groove which ended in a hemispherical cavity In the groove a thread is hung from the top of the gnomon with a ball shaped weight If this comes to rest in the hollow, the gnomon is perpendicular

4 The gnomon is moved backwards and forwards (turned about on its foot *mukbil wa-mudbir*), its shadow must only move so far on the level surface, on which it stands, as is in keeping with the movement of the sun during the turning (Ibn Yūnus, see below)

5 A circle is described at the foot of the rod and a pair of compasses used to test whether the distance of the top of the gnomon is the same from all points of the circle

8 Ibn Sīnā drills a small hole through the gnomon parallel to its base, puts it in a vessel with a horizontal bottom which is filled with muddy water and examines whether the surface exactly coincides with the level of the hole

7 In order to examine whether a level surface is standing exactly perpendicular, two exactly equal parallelepipedal blocks of wood (fig 16) are placed on it, L_1 and L_2, one above the other From the upper edge of L_1 a plumb line is hung, one watches whether its thread exactly touches L_2, the best plan is to place a very thin ruler between L_1 and the plummet and test the position of the thread with respect to L_2 (al-Marākushī, see below)

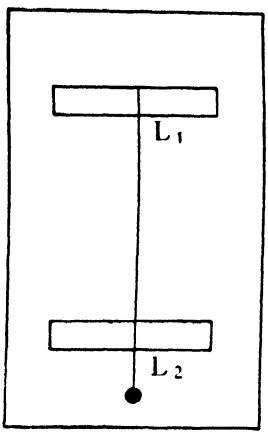

Fig 16

II In order to ascertain the difference in height between two points s_1 and s_2 which are at a distance a from one another, as is necessary in making a canal for example, one looks horizontally from s_1 with an apparatus which is at a height h from the ground to a vertical rod at s_2 and ascertains the height h_1 at which the point observed is above the ground A mark can be made on it (in modern mensuration, the rod at s_2 has divisions marked on it) The difference in height is h_1-h According to fig 19, the Arabs, like Hero, seem to have used something similar Ibn al ʿAwwām (see below) uses a square board on which are marked a number of circles touching one another, which are distinguished by different colours or have different centres In order to place the rods absolutely perpendicular, plumb lines are hung beside them (fig 17)

The horizontal line of vision is obtained in various ways

1 A rod (e g an ell long) with square sides is put up in such a way that the upper surface appears horizontal to the eye and one looks along this surface

2 The rod (*kubṭāl*) is put on the above mentioned dish or plate (fig 8) and one looks along it

3 At the end of the rod nails are fastened at the same height and their heads are pierced and one looks through the holes

4 For a rough examination, one can put, at the two places, two tube-shaped bricks which for convenience may be made each out of two half-pipes (Ibn al-ʿAwwām, see below)

5 An astrolabe is put in a horizontal place such as the edge of a well or on its cover and one looks through the eyepiece

Other methods of ascertaining differences of level are as follows

1 An assistant is sent from the higher position to the lower holding a rod of a known length l vertically until one sees just the end of it, if h then is the level of the eye, $l-h$ is the difference in height If the distance is too great for the top of the rod to be distinguished, a light is put on it, for example a lighted candle and the observation is made by night

2 If it is a question of ascertaining whether a place outside a well is lower than the level of water in the well, the distance of the latter from the surface of the ground or from the edge is ascertained by letting a rod and thread down with a shining heavy object at the end and used in calculation

Two apparatuses, closely connected with each other, are the following

3 To a rod (fig 17) the triangle with the plumb-line is attached To its two ends two threads with weights at the ends are attached, a and b

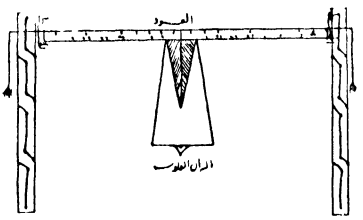

Fig 17

Two posts 1 and 2 are erected at the points, the difference in level of which is to be ascertained The one thread is fastened to the end of the lower post 1 and the other hung along and over the post 2 until its weight comes to rest The amount of shifting of the thread measures the difference in height (al Khāzinī, see below)

4 The *murdjikāl* (the bat, fig 18) consists of an equilateral triangle with a plumb line which hangs from the middle of one side The triangle is suspended by this side Two rods, an ell in length, are erected 10 ells apart, a rope is passed from the top of one to the top of the other and by two threads $a\,a$ the *murdjikāl* is suspended in its centre If the plumb-line goes through the apex of the triangle, both places are on the same level, if not, one is raised by putting stones below it for example, but the end of the rope can, as in 3, be moved along (Ibn Luyūn, see below)

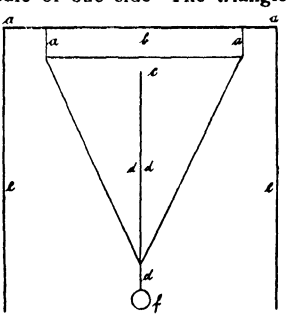

Fig 18

5 In the Paris manuscript N⁰ 2468, an unknown author describes 3 apparatuses for levelling (fig 19a–c) In the first (*al mashhūr*, the known) a rod of wood an ell in length is bored through its entire length and tongs with a tongue suspended from its centre (fig 19a) Through the hole a rope some 15 ells long is drawn which is fastened to the two vertical rods already mentioned The second apparatus (fig 19b *al-shabīha*, the similar) corresponds to the *murdjikāl* only the two threads $a\,a$

are replaced by rings which are put over the long rope *a a* The third arrangement (fig 19c *al-anbūb*, the pipe) is also mentioned by al-Karkhī

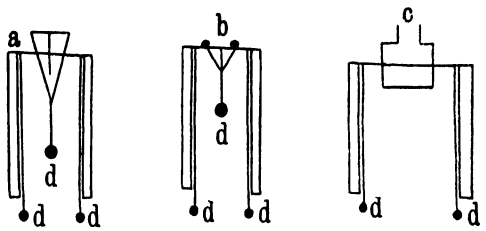

Fig 19a Fig 19b Fig 19c

(From the Paris MS Nr 1417
a *is the known*, b *the similar*
c *the pipe*, d *the weight)*

and Bahā' al-Dīn but not described, it probably corresponds to our canal level, a communicating pipe filled with water, such as is very fully described by Heron (*Dioptra*, p 197 and *loc cit*), but he gives it no particular name, probably because it is associated with a dioptra On the plumb-line of the figure is written *thakkāla* (cf E Wiedemann, *Beitr*, xxxv, see below)

Tighnārī mentions another instrument called *mizān al kat'*, Ibn Wahshiya (see below) one of brass called *kafar* or *kakaı* Neither are described however Arab authors who give full descriptions of Arab instruments are the following

1 Ibn Wahshīya (or Abū Tālib al Zaiyāt, † 870) in *Kitāb al Falāha al Nabatiya*, in "the Book of Nabatean Agriculture" (cf H Schmeller, in *Abhandlungen zur Gesch der Naturwissensch und Medizin*, Erlangen 1922, Heft VI, p 36) His data are supplemented by those of numerous commentators

2 al Khāzinī (c 1100) in the *Kitāb Mizān al-Hikma*, cf Th Ibel, *Die Wage im Altertum u Mittelalter*, Diss Erlangen 1908, p 159 *sqq*

3 Ibn al-'Awwām (c 1130) in *Kitāb al Falāha* (cf E Wiedemann, *Beitrage*, x, see below)

4 Abū 'Othmān b Iuyūn (c 1348) in *Kadjaz fi 'l-Falāha*, deals with levelling ground etc, and gives notes on al-Tighnārī and others (cf E Wiedemann, *Beitrage*, x 317 and Dozy, *Supplement*, ii 302 and 579)

5 Bahā' al Dīn al-'Āmilī, *Fssenz der Rechenkunst*, ed F Nesselmann (1547—1622, s E Wiedemann, *Beitrage*, x 319)

Full details of levelling are given in the astronomical books in discussing the ascertainment of the meridian, e g in Kutb al Dīn al-Shīrāzī (d 1311, cf E Wiedemann, in *Zeitschr fur Physik*, vol x, 1922, p 267), al Khalkhālī etc Many books on the astrolabe give information on the subject in discussing surveying problems, e g al Bīrūnī (cf E Wiedemann, *Beitrage*, xviii 59 *sqq*)

I give once again the names of the levelling instiuments

mīzān, *mizān al-bannā'īn*, *mīzān al kat'*, *mīzān al-izur*, *kubtāl*, *kūnīya*, *fādin*, *kādin*, *afādain*, *djafna*, *murdjikāl*, *kakar*

I know of no comprehensive treatise on levelling in connection with canal building etc in the early Muslim period For the literature see my *Beitrage*, iii 229, xviii 26 and H Schmeller, *loc cit*, p 41 — For knowledge of these matters in ancient times see C Merkel, *Die Ingenieurtechnik im Altertum* and H Diels, *Antike Technik*², Leipzig 1920

(E Wiedemann)

MIZMĀR means literally "an instrument of piping" In the generic sense it refers to any instrument of the "wood wind" family, i e a reed-pipe or a flute In the specific sense it refers to a reed pipe (i e a pipe played with a reed) as distinct from a flute, as we know from Ibn Sīnā (d A D 1037) who describes the *mizmār* — a reed-pipe — as an instrument "which you blow into from its end which you swallow", as distinct from an instrument like the *yarā'* — a flute — "which you blow into from a hole" Ibn Zuila (d 1048) writes similarly but substitutes the Persian word *nāy* for the Arabic word *mizmār* In Ibn Sīnā's Arabic treatise *al Nadjāt* we read of the *mizmār*, but in the identical passage in his Persian *Dānish nāma* the word is *nāy* Further, the *Mafātīh al-'Ulūm* says, "the *mizmār* is the *nāy*" (p 236) For the present purpose, "wood-wind" instruments (*mazāmīr*) may be divided into 1 reed-blown types, and 2 pipe-blown types Among the former we have single reed-pipes of the clarionet, oboe, and saxophone types, as well as double reed-pipes, the bagpipe, and the *chêng* Among the latter we have the flute and recorder, as well as the panpipes

a Reed-blown types — Single reed-pipes occur in ancient Semitic art and literary remains (Lavignac, i 35 *sq*) Hoary gossip attributes the "invention" to the Persians (al-Mas'ūdī, *Murūdj*, viii 90), whilst Djamshīd himself is claimed to have been the actual "inventor" (Ewliyā Čelebi, i 641) With Islāmic peoples, reed-pipes are found with a conical or cylindrical tube (*unbūb*) pierced with finger-holes (*thukūb*), and played with a single or double beating reed (*kaṣaba*, *kaṣhṣha*) Among the Arabs of the vth century, the *mizmār* finds a place at convivial

parties (*Mufaḍḍaliyāt*, xvii), and in the viiith century it is one of the martial instruments of the Jewish tribes of al-Ḥiḏjāz (*Aghānī*, ii 172) When Islām came, an anathema was placed on reed-pipes mainly, it would seem, on account of the female reed-pipe player (*zammāra*) who, as was common in the East, was looked upon as a courtesan, and, indeed, the terms *zammāra* and *zāniya* became almost synonymous It is improbable that the Prophet Muhammad could have referred to a reed-pipe (*mizmār*) in the well known *ḥadīth* in praise of the chanting (*kirā'a*) of Abū Mūsā al-Ash'arī The reference was rather to "a *mazmūr* (Hebr *mizmōr* "psalm") from the *mazāmīr* of the House of David" (cf my *Hist of Arabian music*, p 33) In early days, what the Arabs called the *mizmār*, the Persians called the *nāy*, and the latter distinguished the flute by the name *nāy narm* (soft *nāy*) Later they called the reed-pipe the *nāy siyāh* (black *nāy*) and the flute the *nāy safīd* (white *nāy*) because of the colour of the instruments About the beginning of the ixth century, a musician at the 'Abbāsid court named Zunām invented a reed-pipe which was named after him the *nāy zunāmī* or *zunāmī* (*Tāḏ al-'Arūs*) What the invention was we can only conjecture It may have been the cylinder used for altering the pitch of the instrument, or perhaps it was the introduction of a conical tube (see my *Studies*, p 79, 82) At this period we have no information whether the various reed-pipes had cylindrical or conical tubes or whether they were played with single or double beating reeds The word *zunāmī* was accorded little recognition in the East, whatever favour the invention itself found In the West, where the name eventually became vulgarized into *zullāmī*, it became the most important reed-pipe not only in Spain as we know from al-Shakundī (d 1231, al-Makḳarī, *Moh Dyn*, i 59), but also in the Maghrib (Ibn Khaldūn, ii 353) It became the *xelami* of the Spaniards (see also Schiaparelli, s v)

The *mizmār* (= *mizmār wāḥid*) is described and delineated by al Fārābī (d 950) It had eight holes for fingering, giving a complete octave He also describes a smaller reed-pipe called the *suryānai* (Kosegarten, p 95, Land, p 122, D'Erlanger, p 262) One special feature of this instrument was called the *sha'īra* In the *Mafātīḥ al-'Ulūm* (p 237) we read "The *sha'īra* of the *mizmār* is its head, and it is that by which it is made narrow and wide [in compass]" It was actually the cylinder inserted into the head of the instrument which lowered the pitch when required (see my *Studies*, p 82), a device called later the *tawk* (*Kanz al Tuḥaf*) or *fasl* (Villoteau) It was called the *sha'īra* perhaps on account of the button at the top of the cylinder which was turned round The word *suryānai* came to be modified into *surnāy* and then *surnā* Popular etymology opined that the word was derived from *sūr* "fête" and *nāy* "reed", but this form only appears in the lexicons (*Burhān-i kāti'*) Some moderns even write *şūrnāy* The *surnāy* found its way into martial music as early as the beginning of the ixth century (*Aghānī*, xvi 139 the text has *surnāb*)

In the xith century, Ibn Zaila shows how, by devices in the fingering and embouchure, other notes were obtained on the reed-pipe (Pers *nāy*) In the Persian *Kanz al-Tuḥaf* (xivth cent) the *mizmār*, also called the *nāy siyāh*, is both described and delineated More valuable is the explanation of the actual making of the beating reed with which the instrument was played, from which we learn that it was a double reed In the next century a Turkish author Aḥmad Ughlū Shukrullāh copied extensively from this work (Lavignac, i 3012) Ibn Ghaibī (d 1435) says that all the notes could be obtained on the *zamr siyāh nāy* by accomodating the fingering and the embouchure The smaller instrument, the *surnā*, was defective in the upper octave he says A similar type of reed-pipe to the latter called the *balabān* is also mentioned by him Ewliyā Čelebī says that it came from Shīrāz In the Muhammad b Murād Treatise (xvth cent) we learn that the *nāy aswad* (= *nāy siyāh* = *mizmār*) was 27 cm long

With the Turks, the Persian word *surnā* had been altered to *zūrnā* and the term had become common to both the *zamr* (= *mizmār*) and *surnā* in the East Ewliyā Čelebī (xviith century) mentions among the Turkish reed pipes of his day the *kabā zūrnā* or *'aḏjami zūrnā*, the *'arabi zūrnā*, the *aşafī zūrnā*, and the *shihābi zūrnā* (a Moroccan reed pipe) He also speaks of the *kurnāta* which, he says, was an English invention (i 642) If this is the same as the *kurnaita*, it was the clarionet, an instrument which Denner is said to have "invented" about 1690, which is after its mention by Ewliyā Čelebi The Persians still continued to call their reed pipe the *surnā*, and a xviith century design of the instrument is given by Kaempfer Both Russell in Syria (i 155) and Villoteau in Egypt (i 356 *sq*) refer to several kinds of reed-pipes in use in the xviiith century

The latter delineates these and describes them fully They are three, the *kabā zūrnā* or *zamr al-kabīr*, the *zamr* or *zūrnā*, and the *zūrnā ḏjurā* or *zamr al sughaiyir*, the first being 58 3 cm and the last 31 2 cm in length The modern instrument is also delineated by Lavignac, p 2793, Sachs, p 428 For specimens see Brussels, Nrs 122, 355, 357, New York, N° 1331

In the West also we find a new name, or instrument, the *ghaita* or *ghāyta* [q v] It is said to have been introduced by the Turks (Delphin and Guin, p 48) but the name is mentioned by Ibn Battūta (d 1377) who likens the Mesopotamian *surnāy* to the Maghriban *ghaita* (ii 126) There are, however, two kinds of *ghaita*, one — a cylindrical tube blown with a single reed, and another — a conical tube blown with a double reed This may explain why *ghaita* does not always equate with *surnāy* and *mizmār* in the West (*Tadhkirat al-Nisyān*, p 93, Muhammad al Saghīr, p 34) The cylindrical tube instrument is known in Egypt as the *ghita* For details see Bū 'Alī, p 103, Delphin and Guin, p 47 For specimens and designs see Host, p 261, tab xxxi, Brussels, N° 351, New York, Nrs 402, 2824, Lavignac, p 2921

A reed-pipe that became quite famous in Western Europe was the *būk* played with a reed The original *būk* [q v] was a horn or clarion, and was made of horn or metal Pierced with holes for fingering, and played with a reed, a new type of instrument, somewhat similar to the modern saxophone, was evolved In the xth century, this *būk* was "improved" by the Andalusian Caliph al-Hakam II (*Bibl de autores Españ*, li 410) Ibn Khaldūn, who describes it, says that it was the best instrument of the *zamr* family (ii 353) Ibn Ghaibī,

in his holograph MS in the Bodleian Library, writes *bāk*, but adds, "also called *būk*", but the latter remark has been deleted It appears to be delineated in the *Cantigas de Santa Maria* (Riaño, fig 41, b)

Another interesting instrument is the *ʿIrākiya* or *ʿIrākya*, which may have been the forerunner of the European *rackett* It has a cylindrical pipe and is played with a double reed It is probably the descendant of the *Nāy al-ʿIrāki* that al-Ghazzālī (d 1111 A D) speaks of It is delineated and fully described by Villoteau (1 943 *sq*) Examples are given at Brussels, N⁰ 124, New York, N⁰ 2861

With Islāmic peoples, reed-pipes belong to outdoor music Just as we see them in the *Alf Laila wa-Laila* as being essential to folk, ceremonial, processional, and martial music, so they are today, and probably have always been

Double reed-pipes Ibn Khurdādhbih says that the Persians "invented" the double reed pipe called the *diyānai* (al Masʿūdī, *Murūdj*, viii 90), the earliest instrument of this type that we know by name in Arabic literature, although it appears in the viiith century frescoes at Kusair ʿAmrā (Musil, pl xxiv) It has been suggested that the word should be *dūnāy*, but *diyānai* is also given by al-Farābī (see my *Studies*, p 57), who describes and delineates the instrument which, he says, was also called the *mizmār al-muthannā* or *muzāwadj* The two pipes were of equal length and each was pierced by five finger-holes, which gave an octave between them Probably the instrument known in the Middle Ages as the *zammāra* (vulg *zummāra*) was actually the old *diyānai*, although it merely equates with *fistula* in the *Glossarium Latino-Arabicum* (xiith century) and the *Vocabulista* (xiiith century) As early as the xiiith century we read of the *mawsūl* in Egypt (al-Makrīzī, i/i 136) The name itself means "joined" (see my *Studies*, p 78), and it was doubtless a double reed-pipe Since the xviiith century at least, *zummāra* has been the name for this instrument in the East (cf Niebuhr, 1 145), and Lane (p 367) describes and delineates it It has cylindrical tubes and is played with single beating reeds It is to be found with a varying number of finger holes and is named accordingly (Sachs, p 433) In the Maghrib it is called the *makrūn* and *makrūna* (Lavignac, p 2793 *R A*, 1866), whilst in Syria it is given a vulgarized or metathetical form of the old *muzāwadj* (cf Sachs, p 257, Dalman, *Pal Divan*) For specimens and descriptions see Brussels, Nrs 115–118, New York, Nrs 2167, 2633, and *Z D P V*, 1927, p 19 Specimens in my collection range from 18 to 43 cm in length

Another type of double reed pipe has only one pipe pierced with finger holes, whilst the other serves as a drone This also carries the name of *zummāra* when the two pipes are of the same length (cf Niebuhr, 1 145) When the drone pipe is longer than the chanter pipe it is known as the *arghūl* (*arghūn*, Mushārka, p 29, *ʿarkūn*, Lavignac, p 2812) in modern times (cf Freytag, *Chrest Arab*, 1834, p 34) in Egypt and Syria Villoteau (1 962) gives a detailed description with scales and designs of three sizes, 107, 82 6 and 38 6 cm in length (In South Kensington Museum there is one 144 cm long) Like the preceding instrument it is played with single beating reeds The drone pipe is furnished with additional tubes (*ziyādāt*) which are affixed to lower the pitch In Syria the smaller type of *arghūl* is named the *mashūra*, a most significant name, in spite of it being ignored in the lexicons Lane (p 367) figures a six finger-holed instrument which, he says, was used at *dhikrs*, and by Nile boatmen For specimens see Brussels, Nrs 342—346, *Z D P V*, 1927, pl 2

Bagpipe An ancient instrument in the Orient Just prior to Islām we have it figured on Sāsānian sculptures (Ker Porter, *Travels*, ii, pl 64) We do not know its ancient Semitic name, but Ibn Sīnā and Ibn Zaila mention it as the *mizmār al-djirāb*, describing it as being played by "an artificial contrivance" Although Niebuhr (1 146) calls it the *zummārat al kirba*, and Lane, p 386 names it the *zummāra bi-sukn*, the more general term used in Arabic speaking countries is *zukra*, although we find *mizawid* used in Tunisia (Von Hornbostel, p 4) The word *zukra* is given variations by some European writers as in the *zūkkara* of Villoteau (1 970) and the *sukkara* of Rouanet (Lavignac, p 2812) In Persia, the bagpipe has long been known as the *nāy anbān* and *nāy mashk* or *mashkak* (*Burhān i kāṭiʿ*) from whence the Hindūstānī name *mashk* or *mushuk* (Tagore, p 24, Day, p 151) In Turkey, the older word was *ṭūlum*, *tulūm* or *tulūm* (Meninski, Sachs, cf Ewliyā Čelebī, 1 642 *tulūm dūdūk*), but *ghaidā* would appear to be equally popular, and this name is to be found throughout the Balkan countries (cf Arab *ghaita*, Span *gaita*, Engl *wayghte*)

The bagpipe used by Islāmic peoples is generally equipped with a chanter pipe (with five or six finger holes) and mouthpiece, but rarely with a drone pipe The chanter, terminating in a horn bell (Schallstück), is often double, a feature which was probably the original reason for the term *zummāra* being used with the bagpipe The woodwork is sometimes inlaid with metal, whilst another feature is the adornment of the instrument with tassels, beads, shells, and other frippery Designs may be found in Niebuhr (tab xxvi) and Sachs (p 434), and actual specimens in Brussels, N⁰ 372

Instrument of free reeds The Chinese *cheng* is such an instrument Probably it was not used by Islāmic peoples although known to them The *cheng* is described in the *Mafātīh al-ʿUlūm* as follows "The *mustak* is a musical instrument of the Chinese It is made of compounded tubes (*anābīb*), and its name in Persian is *bīsha mushta*" (p 237) We get a little more information from Ibn Ghaibī who informs us that the *cubčik* or *mūsīkār i khatāy*, was made of tubes of reed joined together It was blown through a tube and the notes were obtained by finger-holes For description and designs see Van Aalst, *Chinese Music*, p 80

b Pipe-blown types — The flutes of the Arabs, Persians and Turks, unlike those of Western Europe, are played vertically, a current of air being blown across the orifice (*manfakh*) at its head Ewliyā Čelebī (1 623, 636, 642 read فوال not فرال) is not sure whether it was Pythagoras or Moses who "invented" the first instrument of this type, the shepherd's flute, called the *kawāl* (cf *καυλός*) Ibn Khurdādhbih says that it originated with the Kurds (al-Masʿūdī, viii 90), and Ibn Ghaibī (*Sharh al Adwār*) says that this instrument was the *nāy abyad* (white *nāy*) We know from Ibn al-Aʿrābī (d 846) that the Arabs called

this flute or reed-pipe the *shiyā'* A characteristic of the Arab flute was its length, hence the ancient Greek proverb which likened a talkative person to an Arabian flute (*Menandri Fragm*)

In the early days of Islām, the Arabs called their flute the *kussāba* (later modified into *kaṣaba*), and this is the name used by the poets al-A'shā (d 629) and Ru'ba b al 'Adjdjādj (VIIIth century) These terms fell into desuetude in the East when Persian musical influences were at their height The Persians called their flute the *nāy narm* (soft *nāy*) so as to distinguish it from the *nāy* proper and the *surnāy*, which were reed-pipes, and so the Arabs of the East called their flute the *nāy*, although in the West the old word *kusṣāba* or *kaṣaba* was retained Another term for the flute in early days, perhaps a different kind, was *yarā'* (*Mafātīh al-'Ulūm*, p 236), and in the XIth century *Glossarium Latino-Arabicum* it equates with *calamaula* In the XIIIth century it was still a common name with Safī al-Dīn 'Abd al-Mu'min (p 9) in the East, and with al Shakundī in the West (al-Makkarī, I 59, read *yarā'* not *barā'*) In the contemporary *Vocabulista in Arabico* it (*yarā*) agrees with *fistula* The words *hara'a* and *hara'a* (al-Djawharī, al-Fīrūzābādī) would appear to be vulgar forms of *yarā'*

Whilst the diminutive *kasība* (*kuṣaiba*) sometimes occurs in reference to a small flute, *shabbāba* and *shabāb* (*√shabba* "to grow up") were the more general terms used in 'Irāk (*Ikhwān al-Safā'*, I 97), Egypt (al Makrīzī, I 136), Spain (al Shalābī, *Voc in Arab*), and the Maghrib (Ibn Khaldūn, II 352) It became the *exabeba* of Western Europe Another name for a small flute was *djuwāk*, and this word also found a place with the Latins as the *joch* (Du Cange) In Persia, the small flute was called the *pīsha* (*Kanz al-Tuhaf*), hence the Balkan *piscou* and *pisak*

We read of the *nāy* in the *Aghānī* (IX 71) but we cannot be sure whether it was a flute or a reed-pipe Al-Fārābī (Kosegarten, p 45) ignores the flute (*nāy*) and says that it was inferior (*ukhrā*) to the *mizmār* (reed-pipe), but it soon gained wide recognition in chamber music probably by reason of *ṣūfī* appraisement and the *dhikr* of the *darwīsh* Safī al-Dīn 'Abd al Mu'min (d 1294) describes the *nāy* with eight holes for fingering, the thumb-hole at the back being called the *shudjā'* ("vehement"), its name revealing its function In the Persian *Kanz al-Tuhaf* (XIVth cent) we find two very small flutes mentioned, but in the *Sharh al-Adwār* (XVth cent) we find that the *nāy abyad* was normally 63 cm long Five larger sizes are given, the longest being 99 cm, with two smaller sizes, the limit being 31 5 cm Ibn Ghaibī also registers several varieties including the *nāy bamm* of 67 5 cm approximating in pitch to the *bamm* string of the lute, and the *nāy zīr* of 33 75 cm approximating to the *zīr* string Ewliyā Čelebī (XVIIth cent) gives the names of a number of Turkish flutes (I 623) including the *shāh manṣūr*, the *dāwūdī*, and the *bol-āheng* Villoteau (I 954) describes and delineates the Egyptian instruments of the late XVIIIth century The largest, 77 cm long, was the *nāy shāh* (= *shāh nāy*), and the smallest, 48 8 cm long, was the *nāy djuraf*, the *kiraft* of modern Syria (Mushārka, p 29) Other flutes named by him are the *nāy kushuk*, the *nāy sufurdja* (? *supurda*), the *nāy mutlak*, and the *nāy husainī* In Turkey the *supurda* is the smallest flute used in chamber music (Lavignac, p 3019) Turkish and Egyptian flutes are usually well made, with a head to support the lips In Palestine and the Maghrib they still retain, more or less, a primitive appearance, and although the seven holed flute is common (Christianowitsch, pl 2), the five and six holed instrument has acceptance (Delphin et Guin, p 45 *Z D P V*, 1927, pl 1) In the Maghrib the flutes in the orchestras still retain the name of *kasaba* (vulg *kaṣba*), and they are generally about 40 cm long, whilst the *djuwāk* or *shabbāba* (*shabāb*) is smaller In the interior, longer flutes like the *ghiblī* and *sudāssi* may be found Delphin and Guin give an account of these

The recorder, or flûte a bec, also found favour in the East This is the Arabic *nāy labak* (mouth *nāy*), the Persian *sūt*, the Turkish *dūduk*, and the Hindūstānī *alghūza* As early as the *Ikhwān al Safā'* and the *Mafātīh al-'Ulūm* (Xth cent) we read of the *saffāra*, which was doubtless a flûte a bec (see my *Studies*, p 83) Villoteau (I 951) says that it was an instrument of this type in his day in Egypt The *dūduk* or *dūdūk* is mentioned by Ewliyā Čelebī in nine different species (I 642), and is also mentioned by Hādjdjī Khalīfa (I 400) The *shāhīn* would appear to have been a small three-holed recorder such as was common with pipe and tabor players in Mediaeval Western Europe It was played with the fingers of one hand, the other hand being used for beating the *tabl* or drum, hence the phrase in al Ghazzālī "the *shāhīn* of the drummer (*tabbāl*)"

Panpipes are also common to the folk Both Pythagoras and Moses are credited by Ewliyā Čelebī (I 624, 636) with the "invention" of the *mūsikār* or panpipes Although the word stands for "a composer of melodies" in the *Mafātīh al-'Ulūm* (see also Meninski), it referred to a musical instrument in the XVth century (*N E*, XIV 312) A contemporary writer, Ibn Ghaibī, says that "the *mūsikār* is one of the [wind instruments with] free pipes Its notes are determined by size [of pipes] The longest have the low notes, and the shortest the high notes" We find the instrument called *mūsikāl* (*Farhang i Shu'ūrī*) whilst Hādjdjī Khalīfa (I 400) has *mithkāl*, and Toderini (I 237) *mescal*, which probably gave birth to the Roumanian *muscal* The term *mūsīkāl* survived up to modern times (Villoteau, I 963), but the more general word used today (Mushārka, p 29) is *djanāh* (Pedro de Alcala [1503] mentions a harp by this name, but perhaps he confused the name with *djank*) Russell (*The Natural History of Aleppo*, I 156) writing in Syria in the XVIIIth century says that panpipes were to be found with from three to twenty-three pipes Kaempfer, p 743, delineates a XVIIth century Persian instrument

The names of instruments in the *mazāmīr* group in Arabic are legion Many of those not mentioned in this article are regional and are of folk origin, their source being often discernable, such as in the *zamdjara* and *zamkhar*, to name only two More interesting however, are the older words like *hunbūka*, *nakīb* and *zanbāk* The first two occur in al-Fīrūzābādī (d 1414), and *nakīb*, which equates with *mizmār*, reminds us of the much debated passage in *Ezekiel*, XXVIII 13 *Zanbak* occurs in in al-Azharī (d 981) and even earlier (cf Lane) The Greek σαμβύκη and the Latin *sambuca* were stringed instruments, and Isidore of Seville's *sambuca* as a "wood-wind" instrument has long been

suspect, but since *ẓanbak* is to be found in Arabic equating with *ẓammāra* and *mizmār* there would appear to be good reason for accepting Isidore of Seville

(H G Farmer)

MIZWĀR, a arabicised form of the Berber *amezwār*, he who precedes, he who is placed at the head, equivalent to the Arabic *mukaddam* and like this frequently has in North Africa the meaning of chief of a religious brotherhood (*ṭarīka*, q v), the superintendent of a *zāwiya* [q v] or the chief of a body of *shorfā* (q v, dialect form from the class plur *shurafāʾ*) In those districts of the Maghrib, where the old Berber organisation has survived, mainly in the Great Atlas and Central Atlas, *amzwār* is sometimes the equivalent of *anflūs*, the political adviser to a body, cf R Montagne, *Les Berbères et le Makhzen dans le Sud du Maroc* (Paris 1930, p 222)

The term *mizwār* (or *mazwār*) is early found in the histories of the Maghrib in connection with Almohad institutions There it means the head of a faction and the corresponding office seems at this time to be often confused with those of *ḥāfiz* and *muhtasib* [q v] In the time of the Muʾminid Caliph Abū Yūsuf Yaʿḳūb [q v] al-Mansūr, each of the twenty-one Almohad tribes had two mizwārs "one for the first rank of the hierarchy, i e the earliest recruits of the Almohads, and an other for those who had joined them later (*ghuzāt*)" (*Kitāb al-Ansāb*, in E Lévi-Provençal, *Documents inedits d'histoire almohade*, Paris 1928, p 70, cf also p 63—64 and M Gaudefroy-Demombynes, introduction to the translation of the *Masālik al-Abṣār* of Ibn Fadl Allāh al-ʿUmarī, Paris 1927, p xxxvi)

At the present day, *mizwār* is in constant use in Fās for the *nakīb* [q v] of the principal Sharīfan groups who live in this capital

(E Lévi-Provençal)

MŌBEDH, a Persian word which passed into Arabic in the form موبذ or مؤبذ, we also find in Arabic the Persian plural, *mōbedhān*, but usually combined with *mōbedh* in the expression *mōbedhān mōbedh*, which means "chief of the *mōbedh*s", "grand *mōbedh*" It is also found alone (*mōbedhān*) standing for *mōbedhān mōbedh* The Arabic plural is *mawābidh* The word is derived from the Pehlevi *magupat*, which means "chief of the *magi*" and therefore indicates a priestly office, according to al-Masʿūdī, *Kitāb al-Tanbih wa 'l-Ishrāf*, *B G A*, vii 103, the word would mean *ḥāfiz al dīn* and be derived from *mu* = "religion" and *badh* = "protector", and according to al Yaʿḳūbī (*Taʾrīkh*, i 207) *ʿālim al-ʿulamāʾ* In Armenian texts the word is rendered by *mogpet*, in the Greek acts of martyrs by μαυπτάς μαυπτάς μαύπτης μαύπτης μάπτα, in Syriac and especially in the acts of the Persian martyrs not only by ܡܘܒܕܐ, but also by ܡܘܗܒܕܐ, in one passage (Hoffmann, *Auszuge*, p 88, cf below), the word ܡܘܗܒܕܐ is used immediately before ܡܘܒܕܐ ܡܘܒܕܐ The Syriac has also *rēsh mgūshē* or *rēshā damegūshē* corresponding to the Greek ἀρχίμαγος ἀρχιερεὺς τῶν μάγων We have no satisfactory information regarding the functions of the *mōbedh*s, we know more about those of the chief of the *mōbedh*s or *mōbedhān mōbedh* The information given below relates to the Sāsānian period, a period in which the clergy were reorganised and which is reflected in the Arabic and Persian Muslim sources

In the later *Avesta* we find references to the sacerdotal organisation but the names do not agree with those of the Sāsānian period, for example the principal office, that given in the Sāsānian period to the *mōbedhān mōbedh*, is called *Zarathustrotema*, and had judicial functions like the chief of the *mōbedh*s The term *magupat* is only found in the Pehlevi commentaries on the *Avesta*

The sources from which we can extract information about the *mōbedh*, and the *mōbedhān mōbedh* or chief of the *mōbedh*s, are of course Pehlevi or go back to Pehlevi texts Among the former which have come down to us is the *Bundahishn* which among other things contains a list of *mōbedhān mōbedh*, the *Ardā Wīrāf Nāmak*, the *Kārnāmak-i Artakhshir-i Pāpakān* (transl by Noldeke in the *Benfey-Festschrift* = *Beitrage zur Kunde der indogermanischen Sprachen*, iv , 1878, and by Pagliaro in *L'Epica e il Romanzo nel Medio Evo persiano*, Florence 1927, a part of the text 1—3 is reprinted in the *Hilfsbuch fur das Pehlevi* by Nyberg), the *Mātikān-i hazār Dāte-*

stān, a legal work studied by Bartholomae in *Zum sasanidischen Recht*, *Sitzungsber d Heidelb Akad d Wissensch*, 1922, is valuable for our knowledge of the judicial functions of the *mōbedh*s and *mōbedhān mōbedh*, a few short moral treatises preserving traces of law (cf Pagliaro in *R S O*, x, 1925, p 468—577) etc The numerous references to the *mōbedh*s and the *mōbedhān mōbedh* which we find in Persian and Arabic sources come from lost Pehlevi sources or Arabic and Persian versions of them Thus the *Book of Kings* especially in the latter part contains some information about the *mōbedh*s but nothing very full or precise about their functions, the matter of the *Shāhnāma* is taken, as we know, from a Persian prose version of the *Khwadāināmagh* The version which we have of the letter of Tansar (publ and transl by Darmesteter in *J A*, 1904, 1) gives very interesting information about the Sāsānian hierarchy and also about the *mōbedh*s, it comes from a Pehlevi document which, according to Christensen, goes back not to the time of Ardashīr but rather to that of Khusiaw the Great (cf *Empire des Sasanides*, 111—112, and more recently *Abeïsam et Tansar*, in *Acta Orientalia*, x 43 *sqq*)

The numerous writers in Arabic and Persian whose works give us notes on the *mōbedh*s derive their matter, as regards Persia, from information supplied directly by contemporary *mōbedh*s or grand *mōbedh*s, from Pehlevi works translated into Arabic (especially the translations of Ibn al Muḳaffaʿ) which no longer exist, such as the *Khwadāināmagh* and the *ʿĀʾin-nāma* or "book of offices" (*Kitāb al Rusūm*, cf below) Of great importance is the *Kitāb al-Tādj* or *Akhlāk al-Mulūk* by al Djāhiz (cf H Gabrieli, in *R S O*, x [1928], p 232—308) and others written by al-Djāhiz himself and the *Kitāb al Mahāsin wa 'l-Addād* which is attributed to him, very important also are the works of the historians, chroniclers, geographers and polygraphers or men of letters like al-Yaʿkūbī, Ibn Kutaiba, al-Dīnawarī, al-Tabarī, al Masʿūdī, Hamza al-Isfahānī, al-Thaʿālibī, al-Nuwairī, al-Shahrastānī, etc

Of course all these sources bear different relations to the Pehlevi originals or to one another and they differ greatly in value, apart from the fact that they frequently combine legendary matter with accurate statements, e g some concerning certain of the functions of the *mōbedh*s

Information of value can also be extracted from Syriac, Greek (especially Acts of Martyrs) and Armenian (historians etc) sources

Even by combining all these sources it is not possible to give a precise account of the office of *mōbedh* in the Sāsānian ecclesiastical hierarchy as laid down in the organisation of the kingdom attributed to Ardashīr (cf *Kitāb al-Tādj*, p 23—30) nor to follow its developments (cf the letter from Tansar, al-Masʿūdī, *Tanbīh*, p 103—104 and *Murūdj*, II 156, al-Yaʿkūbī, *Historiae*, I 202, al Shahrastānī, ed Cureton, p 193, transl Haarbrucker, I 292) Nothing definite can be deduced from the Parsi hierarchy of the present day as the ecclesiastical organisation has profoundly changed But we may assume that high priests regularly called *mōbedh*s were given the task of supervising in the different divisions of the empire (one might say dioceses) the very varied work of the hereditary clergy, the *magi*, who had so great an influence over the lives of the Persians, that is to say not only the very elaborate ceremonies of worship, the sacrifices, the care of the pyres, but also the cure of souls and the education of the people These *mōbedh*s and their chief (cf below) were like all priests the repositories of learning, profane as well as sacred (cf *Tanbīh*, p 97, where there is an allusion to the unbounded knowledge of the *mōbedh*s and *hērbedh*s) and the Arab writers must also have obtained information from *mōbedh*s (cf Inostranzev, *Études sassanides*, p 10) The *mōbedh*s had also judicial functions (cf below), in the Acts of the martyrs they appear vested with executive power, but since courts of inquiry were composed of lay officers and priests, it is probable that this power was exercised by the whole college or by delegation It is also certain that the title of *mōbedh* is not applied exclusively to these heads of administrative divisions or dioceses (of whom it is nevertheless characteristic) because at the court of the king, according to the sources, especially the *Shāhnāme*, there were many high priests called *mōbedh*s or *hērbedh*s who formed a kind of council around the grand *mōbedh* (cf below) or who had other special offices Gradually the name *mōbedh* must have come to mean, as at the present day, a priest fully qualified to do everything in connection with worship The other terms for Persian priests seem to refer rather, either to their dignity (e g *dastūr*) or to functions occasionally performed by them [cf ZOROASTRIANISM] *Rat* and *magupat* are sometimes put on the same level The relation of the *mōbedh* to the other degrees of the hierarchy like the *hēr bedh*, another office (perhaps teacher) having supervision over a body of priests, is not clear Al-Masʿūdī says in the *Tanbih*, p 103, that *herbedh*s were lower in rank than *mōbedh*s

At the head of the hierarchy of priests were no doubt the *hērbedhān hērbedh* or chief of the *hēr bedh*s and the *mōbedhān mōbedh* or chief of the *mōbedh*s Tansar, the writer of the famous letter, is called by the *Dēnkart hērbedhān hēr bedh*, according to Darmesteter "chief of the religion", while al-Masʿūdī (*Tanbīh*, p 99) calls him better the *mōbedh* of Ardashīr Indeed it is quite certain from our sources that the supreme head of the ecclesiastical hierarchy was the chief of the *mōbedh*s (*mōbedhān mōbedh*) who was also the first dignitary of the court, all the power of the Zoroastrian clergy which constituted a state within the state was concentrated in this pontiff Al Masʿūdī in the *Tanbīh*, p 103, says of his rank that it was almost equal to that of a prophet

In accounts of the ceremonial of the Sāsānids, he is always given first place and he frequently appears surrounded by a council of high priests, *hērbedh*s or *mōbedh*s Besides all the functions which he exercised as head of the clergy, i e the supervision of the whole religious life of the country, the settlement of theological questions, of problems of ecclesiastical policy, the appointment and dismissal of ecclesiastical officials, he had others which we must outline Christensen thinks he can deduce from several sources (letter of Tansar, al Masʿūdī, *Tanbih*, p 103—104, Yaʿkūbī, *Historiae*, p 1—202), that four or five high officials formed with the king a kind of ministry, the composition and number of members of which perhaps changed from time to time but which always included the *mōbedhān mōbedh* (cf e g the *Shāhnāme*, ed Mohl, VI 223 where the *mōbedh* is called the king's vizier) But he was also supreme judge as head of the *mōbedh*s of the administrative divisions, as the latter were the

judges of higher degree in their respective areas It is evident from the studies of Bartholomae on Pehlevi legal texts (and especially on the *Mātīkān-ī hazār Dātestān*, cf *Zum Sasanidischen Recht*, p 34, etc) that in the different districts there were judges of first instance and of two degrees (*kas* lower, *mas* higher), above whom was the *mōbedh* of the district The supreme judge was ultimately the *mōbedhān mōbedh* whose final sentence could not be disputed For the judicial functions of the *mōbedh*s it is interesting to consult the acts of the Persian martyrs in Syriac and Greek (cf Hoffmann, *Auszuge aus syrischen Akten persischer Martyrer*, Leipzig 1880, the texts of Bedjan, etc, in *Patrologia Orient*, etc) The Arab writers also give us a pretty clear idea, especially as regards the *mōbedhān mōbedh*, for example in Tabarī, i 952, Noldeke, *Gesch d Perser und Araber*, p 230, the *mōbedhān mōbedh* in advising the king in the matter of the son of Dhū Yazan, lays particular stress on the young man's right to have his prayer granted, al-Masʿūdī, *Murūdj* (ii 156) and *Tanbīh*, p 103, calls him *kādī 'l kudāt*, in the *Murūdj* also (ii 211) we are told in connection with the abuses of Hurmuz son of Khusraw that, having abolished the jurisdiction of the *mōbedh*s, the good old tradition and the ancient laws fell into desuetude In al-Thaʿālibī, *Hist Pers*, p 506–7, we find two answers which are interesting in this connection, they were given by the *mōbedhān mōbedh* to the king, who had consulted him with regard to the sentence of death to be pronounced against his chief wife and his cook, in the *Kitāb al-Tādj*, p 78 it is related that king Kawādh full of admiration for a subtle answer given by the *mōbedh* exclaimed "It is with justice that kings have given you the first place and that they have entrusted you with the control of jurisdiction!"

Some Arabic sources also allude to the court of justice which was held on the occasion of the great festivals of the *Nawrūz* and the *Mihrdjān* (e g *Kitāb al Tādj*, p 159—63, *al Mahāsin wa 'l-Addād*, p 359—65, al-Bīrūnī, *al-Athār al bākiya*, ed Sachau, p 215—219, 222—223, *Siyāset-nāma*, ed Schefer, p 38—40, etc) According to these stories, the people on those days had the right to bring any complaint against the king before a commission of which the grand *mōbedh* was the most important member, the first complaint was judged by the grand *mōbedh* who thus had the right to condemn the king, the latter having pronounced a formula of submission, kneeling before him The complaints that followed were judged by the king According to al-Nuwairī, the *mōbedh* also offered to the king on these ceremonial occasions a basket of fruits over which he had uttered a prayer Tansar's letter (*J A*, 1904, p 544—545) informs us that in the procedure laid down by Ardashīr for designating the heir to the throne the grand *mōbedh* played the most important part, that is to say he proclaimed the new heir chosen by divine inspiration should it happen that the other dignitaries summoned to deliberate with him were not in agreement The position of the grand *mōbedh* as intimate councillor and mentor of the king who placed complete confidence in him (he is often called "councillor of the king") is very clear in the *Shāhnāma* as well as in the Arabic and Persian sources (cf al-Thaʿālibī p 504—505, al-Masʿūdī, *Murūdj*, ii 171 where Bahrām son of Bahrām, son of Hurmuz, addresses the grand *mōbedh* "Thou, support of religion, councillor of the king and the man who directs his attention to affairs of state neglected by him") According to al-Masʿūdī, *Tanbīh*, p 104, only the *mōbedh*s and a few other high officials of state possessed a copy of the *Gāhnāme* or register of offices, a very large book, forming part of the *Ā'īn-nāma* (an *Ā'īn-nāma* was translated by Ibn al-Muḳaffaʿ with the title *Kitāb al-Rusūm*)

Among the details which are preserved in the sources about the grand *mōbedh*, we are told that he was one of the three who shared the king's table in time of war when the royal meals were very frugal, and that when a victory was won, he along with other dignitaries pronounced a discourse (*Kitāb al Tādj*, p 173—174) A very marked feature in the sources is the wisdom of the grand *mōbedh* and indeed of all the *mōbedh*s (cf below) In the *Shāhnāme* (we pick out only a few of the more interesting episodes) the Byzantine ambassador who was, the grand *mōbedh* tells Khusraw, of the school of Plato, puts seven questions to the *mōbedh* which he answers (Mohl, vi 3 *sqq*) and thus excites the admiration of the king In this story, as usual, the grand *mōbedh* appears surrounded by other priests called *mōbedh*s or *hērbedh*s as the case may be, and he is also given the title *dastūr* Cf also the questions put by the grand *mōbedh* to Khusraw Anūsharwān (Mohl, vi 394 *sqq*) and the assembly of the *mōbedh*s under the presidency of the grand *mōbedh* to put questions to Hormuz son of Anūsharwān (*ibid*, p 424—430) Another passage (Mohl, vi 442 *sqq*) describes the heroic piety of the grand *mōbedh* who consoles a high official, a victim of king Hurmuzd, and is poisoned by the latter The grand *mōbedh* is also represented as interpreting the language of birds (cf also al-Masʿūdī, *Murūdj*, ii 169—170 the dialogue of the owls denouncing the cruelty of king Bahrām son of Bahrām son of Hormuz [276—293 A D]), and in al-Ṭabarī (i 965, Noldeke, p 250) he explains the invasion of jackals in the reign of Khusraw as a punishment for the impiety of the land

The story is very well known among the Arabs of the dream of the grand *mōbedh* in the night of the birth of the Prophet and his interpretation of other marvellous happenings of the same night (al-Ṭabarī, i 982 *sqq*, Noldeke, p 253, *Annali dell' Islām*, i 150), Hamza al-Isfahānī (ed Gottwaldt, p 27) quotes a list of Sāsānian kings drawn up by the *mōbedh* Bahrām son of Mardānshāh (Noldeke, p 401)

In religious discussions the steps to be taken against heretics, in the persecutions and inquisitions against the Christians, the *mōbedh*s and the grand *mōbedh* are always most prominent (Hoffmann, *Auszuge*, texts of Bedjan, *Patrologia Orient* etc) Cf also the articles MAZDAK, ZINDĪK

A list of grand *mōbedh*s of the Sāsānian period and of *mōbedh*s contemporary with the last editors of the book is found in the *Bundahishn*, ch 33 (Christensen, *Empire des Sasanides*, p 35) The first grand *mōbedh* appointed by Ardashīr was, according to Tabarī (Noldeke, p 9), a man named *Pahr* (?) The *mōbedhān mōbedh* Āturpāt i Zartushtān lived, according to the Pehlevi sources, 150 years and was grand *mōbedh* for 90 Elisée (Langlois, ii 230) mentions a grand *mōbedh*, who had the honorific title of Hamakdēn ("he who knows all religion") on account of his vast theological learning, this title seems to have been often given to the

mōbedhs A number of names of grand *mōbedhs* are given in various sources, among them the Acts of the Martyrs in Syriac, Greek and Armenian, some are also preserved on the seals published by Herzfeld in his work on the monument of Paikuli Mazdak was according to some texts *mōbedh* or even grand *mōbedh* In Ibn al-Faḳīh, p 216, we have a description in verse of pictures representing with other dignitaries "their *mōbedh* and their *hērbedh*" who judges ignorantly and iniquitously On the *zamzamah* cf the article ZOROASTRIANISM and Goldziher, *Muhammedanische Studien*, i 170 and al-Ḏjāhiz, *Bayān*, ed Sandūbī, Cairo 1927, iii 7, on the *Shu'ūbiya* It is known that the Zoroastrian clergy played an important part in the *Shu'ūbiya* movement (Inostranzev, *Études sassanides*, St Petersburg 1909, p 10—15)

After the Muhammadan conquest the importance of the grand *mōbedh* and of the *mōbedhs* diminished in proportion as Islām spread, our sources of course continue to mention them and Arab writers give information obtained directly from *mōbedhs* (al-Ṭabarī, i 2874, year 31 A H , mentions the *mōbedh* who advised the governor Māhawaihi not to kill king Yazdagird, al-Mas'ūdī, *Kitāb al-Tanbih*, p 104 gives the name of the *mōbedh* of all Persia in 345 A H etc)

The organisation of the Parsis at the present day is different, *mōbedh* means a priest qualified to perform all the offices of worship This, however, is beyond the scope of this article

Bibliography in addition to the works mentioned in the article see especially Th Noldeke, *Geschichte der Perser und Araber zur Zeit der Sasaniden*, Leyden 1879, A Christensen, *L'Empire des Sassanides*, *D Kgl Danske Vidensk Selsk Skrifter*, 7 Raekke, Copenhagen 1907, Chr Bartholomae, *Zum sasanidischen Recht*, iv, *Sitzungsber d Heidelb Akad d Wissensch*, 1922, A Pagliaro, *Tracce di diritto sāsānidico nel trattatelli morali Pehlevici*, in *R S O*, x, 1925, p 468—477, F Gabrieli, *Etichetta di corte e costumi Sāsānidi nel Kitāb Aḫlāq al-Mulūk di al-Ǧāhiz*, in *R S O*, xi, 1928, p 292—305 (MICHELANGELO GUIDI)

MODON, a town in the Morea on the south-west point of Messenia, about 20 miles N W of Cape Akritas, opposite the island of Sapienza at the foot of Mount Tomeus Modon is frequently mentioned in ancient times under the names Μεθώνη and Μοθώνη, from the latter comes the Italian name of the town, Modon, under which it has been known since the middle ages in Europe In the middle ages it was of much greater importance than in antiquity The good harbour of the town, sheltered by cliffs of varying heights, has long been a haven of refuge and of supply for ships going from the west to the Levant Hence pilgrims frequently mention the town and their accounts of their travels even contain maps

The Arab Idrīsī, in his geographical work finished in 548 (1153) for Roger II of Sicily, enumerates many seaports and towns on the mainland of Greece Among these is Modon of which he records that it is a fortified town and has a citadel which commands the sea (*Geographie d'Edrisi*, ed A Jaubert, Paris 1846, p 305) By the treaty of 1199 with the Byzantine emperor Alexius III, Venice was allowed to trade freely in Modon The town had suffered severely at the hands of the Venetians in 1125 and again of the Normans in 1146 but was recovering again slowly After the taking of Constantinople by the Crusaders (1204) and the division of the lands which had previously formed the Byzantine empire, Modon fell to the Venetians, under whose rule it remained for nearly three centuries It is this period that marks the golden age of the town, which, carefully administered by her merchant princes, developed a new prosperity and became an important and secure centre for trading with Egypt and Syria, while previously it had often been a nest of pirates In the xv^th^ century the population of Modon was a mixed one of Greeks, Jews, Albanians, Turks, Gipsies and Western Europeans The Turks of the neighbourhood reared swine which they sold to the townspeople According to some sources, at the end of the xv^th^ century five thousand swine were exported annually from Modon to Venice About the same time a settlement of gipsies in Modon is mentioned, who came from Gyppe, a district about forty miles from Modon, from which they said they had fled — for the sake of the Christian faith — and were seeking refuge in all lands with a letter of recommendation from the Pope (cf *Die Pilgerfahrt des Ritters Arnold von Harff*, ed E v Groote, Cologne 1860, p xxviii, 67 *sq* , *Z D P V*, xvii, 1894, p 144) The fact is, however, that the gipsies of Modon after 1500 went over *en masse* to Islām, about the end of the xviii^th^ century were again mainly Christians, outwardly at least, after 1715 again became Muslims and finally after 1821 became Christians again

During the second half of the xiv^th^ century the population of Modon increased considerably for many Christians and Jews of the Peloponnesus, seeking to escape the Turkish yoke, took refuge here While the town itself was immune, the country round, which was flat, suffered a great deal from the Turks Thus for example about 1480, the Turks raided this plain and destroyed by fire the olive-trees there In the last decades of the xv^th^ century, the Venetian republic had much anxiety about Modon and her other possessions in the East, which the Turks had long coveted In 1499 the Admiral Antonio Grimani was ordered by his government to see to the defence of Modon against the Turks In July of this year, the Turkish fleet came to the vicinity of Modon and soon afterwards several naval encounters with the Venetian fleet took place In a naval battle fought on Aug 8, 1499, outside Modon, the heroic Venetian Andreas Loredano, governor of Corfu, was taken by the Turks and put to death Another Venetian admiral, Melchior Trevisano, was now entrusted by the Venetian republic with the defence of Modon and her other possessions in the East At the same time the republic endeavoured to make peace with Turkey, but the negotiations broke down in face of the impossible conditions laid down by Bāyazīd II Among other things he insisted on the surrender of Modon In the meanwhile on March 23, 1500, the Turks had occupied Merona, a little town near Modon Marcus Gabriel, the commander of Modon, had previously, on February 18, 1500, reported to the Venetian government the great straits of the town According to his report, the garrison was not sufficient to defend the town against the Turks, and for a successful defence it would require four thousand trained men, in addition to artillery, arms, munitions and gunpowder, which the town lacked In spite of her difficult financial

situation, Venice managed to provide the town with money, troops and artillery But the Turkish fleet again appeared before Modon while Bāyazīd II advanced on the town by land at the head of a well equipped army An attempt by the Venetian fleet under Admiral Hieronymus Contarini to raise the blockade on July 24, 1500 failed with heavy losses The Turkish fleet, according to the Venetian admiral, had very good artillery In the meanwhile famine had broken out in the garrison so that they could hold out no longer Four Venetian galleys were able to steal through the Turkish fleet into the harbour and bring the garrison food, munitions and men, but this could not avert the fate of the town After a siege of twenty-eight days during which the town was bombarded by heavy artillery, the Turks stormed it On Sunday, August 9, 1500, the Venetian garrison had to yield to this onslaught

The lot of the surviving garrison and other inhabitants of the town was a hard one They were either massacred in most inhuman fashion or sent into slavery Very few of them succeeded in escaping But the number of people captured did not come up to the expectation of the Turks, because the Venetian authorities had earlier sent thousands of old men, women and children from Modon to Crete and Zante Among those who fell at the capture of the town was the Roman Catholic bishop of Modon, Andreas Falcus, a number of prominent Venetians and high officials of other origin When the news of the capture of Modon by the Turks reached Venice, it was plunged into deep mourning This is reflected in a letter which the Doge Augustino Barbarigo sent on September 7 to the Pope and several European rulers with reference to the catastrophe The sole consolation of the Venetians was the deceitful hope that their fleet might succeed in retaking Modon The Venetian Senate at once saw to the settlement of a number of the refugees from Modon in Cephalonia Sultān Bāyazīd II regarded the conquest of Modon, at the fortifications of which he was rightly amazed, as a gift from God When he entered the town as a victorious conqueror, it had already been partly consumed by fire which had been begun by the defenders themselves The fugitives from Modon, who had taken refuge in Zante, watched the flames that were destroying their homes burn for several days Sultān Bāyazīd II promoted the first janissary to leap over the walls of Modon to the rank of Sarak-bey He had two towers built of the skulls of the fallen and massacred Christians and turned the cathedral of the town, the venerable church of St John, into a mosque On August 14, 1500, he went to the new mosque to return his thanks in prayer He then saw to the resettlement of Modon, the walls of which were rebuilt By imperial decrees, each Peloponnesian village had to send five families to become permanent settlers in Modon, the revenues of which were allotted to Mecca After a brief stay, Sultān Bāyazīd left his new conquest He took with him as a prisoner the last Venetian defender of the town, Marcus Gabriel, whose life he had spared with the intention of using him for his own purposes later The historian Safā'ī, a native of Sinope, wrote some time before 1521 an account of the taking of Lepanto (Naupactos) and Modon (*Fethnāme-i Anabakhlī we-Moton*) The brief description of the capture of Modon written by Munshi Seiyid Mehmed also gives details of the sultān's treatment of the town (cf F Babinger, *G O W*, Leipzig 1909, p 49)

In 1531 the Knights of St John endeavoured to take Modon from the Turks and to establish themselves there To do this they equipped a small fleet under the command of the Abbot Fra Bernardo Salbiati, a nephew of Pope Clement VII Two Greeks employed in the harbour of Modon and Johannes Skandalis, a Greek from Zante, whose father was a customs officer in Modon, were to assist the enterprise The fleet, led by Salbiati with two merchant ships, which also concealed soldiers, sailed for Sapienza The warships were hidden in the vicinity of this island, while the two merchant ships under the guidance of Johannes Skandalis, made for the harbour of Modon Permission to land was given without trouble to the crews of the two ships, who gave themselves out to be some merchants and some janissaries, and they were allowed to spent the night in the tower at the harbour Johannes Skandalis and his little body of followers then succeeded in overpowering the Turkish guard at the tower and taking nearly the whole town The rest of the Turkish garrison shut themselves in the palace which had once housed the Venetian governors of the town, and offered a stubborn resistance In order to overcome the Turkish garrison the warships hidden at Sapienza were necessary These now came up, although very late, and bombarded the town with their guns Scarcely had they begun when a strong Turkish fleet appeared The Knights and John Skandalis therefore abandoned Modon but not without carrying off some sixteen hundred prisoners

The years 1532—1534, during which a Spanish force in the service of Charles V occupied the adjoining Coroni, were a critical period for the Turks in Modon But after this, it was left in peace for a considerable period The *Travels* of Ewliyā Čelebi who visited the Morea in 1667 to 1668 contain valuable notes on Modon and its vicinity, while Hādjdjī Khalīfa (d 1658) contains nothing essential

During the war which broke out in 1684 between Turks and Venetians in which Germans, Poles and Russians also shared as allies, Modon with the whole of the Morea was restored to the Venetians General Francesco Morosini in 1686 broke the resistance of the Turkish garrison with the help of Greek and German troops and secured it for the Adriatic republic The chief mosque of the city, i e the old cathedral, was once more dedicated to Christian worship Only in 1699 after the peace of Carlowitz, did the Turks recognise the Venetian claim to Modon Venice now did her utmost to restore the city which, with its commerce, had much declined during the Turkish occupation Of the seven administrative divisions (*camera*) into which the Venetians had divided the Morea, the third was that of Modon This district was again divided into four areas (Fanari, Arcadia, Navarino and Modon) From a Venetian record of September 29, 1690, giving the results of a census by the Venetian officials, we see that the district of Modon had been depopulated to an incredible degree The 218 villages detailed in this list were inhabited by only 11,202 souls Modon itself, including the citadel, had only 236 inhabitants of whom some must have been Muhammadans A large number of villages which at the turn of the xviith—xviiith centuries belonged to the district of Modon, have

Turkish names, some of which survive to this day These villages were originally fiefs granted to Turks whose names in time passed to the village (cf S P Lambros, in *Deltion*, publication of the Historical and Ethnological Society of Greece, vol II, 1885, p 686—710, pl VII, thereon Ἱστορικὰ Μελετήματα, Athens 1884, p 114 *sqq*, Pier' Antonio Pacifico, *Breve descrizzione corografica del Peloponneso o' Morea*, Venice 1704, p 125 *sqq*)

After the conquest by Morosini whose services to Modon are commemorated in inscriptions still in existence, the town remained for some nineteen years under Venetian rule In 1715 the grand vizier ʿAlī Kumurtzi with the help of a number of Greeks took not only Modon but almost the whole of the Morea from the Venetians in a very short time The Venetian garrisons of Navarino and Coroni as well as the inhabitants abandoned them when the Turkish army approached in the summer of 1715, in order to take refuge in Modon, which was much more strongly fortified Soon afterwards the Turkish fleet and army began the siege of the town After a brief resistance Modon surrendered voluntarily After the capture of the town the grand vizier ordered a general slaughter of the Christians Many in the district thereupon adopted Islām in order to save life and property in this way The Turks who had formerly owned property in Modon or the neighbourhood were allowed by imperial edict to resume possession of it The peace of Pessarowitz (1718) finally ceded Modon to Turkey The town recovered from the catastrophe of 1715 From 1725 onwards a busy trade developed between Modon and the lands of North Africa, especially Algeria and Tunis, this trade had existed previously but not to the same extent Modon played a certain part during the war between Turkey and Russia in 1768—1774 The Russian vice-general Georg Vladimir Dolgoraki in 1769 with 500 Russians, 150 Montenegrins and 100 Greeks (mainly Mainotes) besieged Modon The Turkish garrison of Modon consisted of 800 janissaries and a large number of Turks of the town and vicinity able to bear arms The walls of the citadel were in good condition, and the supply of food and munitions ample The siege lasted a long time, the fighting was conducted mainly by the artillery on both sides The Russians had also two warships co operating on the sea At the end of May 1769, Turks and Albanians from the interior of the Morea came to the help of the besieged who undertook a valiant sortie, when they learned of the approach of help In the battle that now developed the Russians suffered heavily They were forced to abandon most of their artillery and to escape to Navarino, from which they sailed with the rest of the Russian army and a few Greek notables A few years later, the Turks in Modon were still displaying the guns which they had taken from the Russians in 1769 According to reliable sources, the Turkish population of Modon about 1820 was four to five hundred fighting men About the same time ʿAlī Agha was prominent among the Turks of the town for his wealth and in other respects also The vicinity of Modon was almost exclusively inhabited by Greeks who cultivated the land, which mainly belonged to the Turks, and were despised by them as contemptible menials During the Greek War of Independence of 1821—1827, all the attempts of the Greeks to take the town failed At the end of March 1821, a Peloponnesian force led by the orthodox patriarch of Methone, named Gregory, and other notables, besieged Modon and the adjoining towns of Koroni and Neokastron The besiegers were joined in the spring by Greeks from the Ionian islands and later by Philhellenes from Europe On May 18, 1821, Greek ships, under the captains of the Speziots, Nikolaou Mpotasis and Anastasiou Koladrutsos blockaded Modon But neither the Turkish garrison nor the armed Turkish civilians in the town were the least dismayed On the contrary, they undertook raids in all directions and did their best to impede the progress of Greek emancipation Many fierce encounters took place between the Turks of Modon and their besiegers In July 1821, Turkish ships re provisioned Modon but they were not successful in their attempt to reprovision Neokastron, the garrison of which was in dire straits from want of food and even water On August 8, 1821, the Turks of Modon decided to attempt the relief of their compatriots in Neokastron, who had in the meanwhile been forced to capitulate to their Greek besiegers On the road between Modon and Neokastron a battle was fought on August 8, 1821, in which the valiant chief Constantine Pierrakos Mawromichalis, a member of a notable Mainote family, fell On the same day, the Greeks took Neokastron, but they gradually abandoned the siege of Modon The town was able to continue to hold out, only, however, with the frequent help of the Turkish fleet

When Ibrāhīm Pasha, the adopted son of Mehemmed ʿAlī, undertook to suppress the Greek rising and to pacify the Morea, Modon and its neighbourhood formed his main base There he landed troops on February 24, 1825, and dug entrenchments Modon became an important base for Ibrāhīm Pasha's operations On October 8, 1828 the town was taken from him by the French General Maison Not before 1833 the French left and Modon has since then belonged to the Greeks

MOGADOR, a town in Morocco on the Atlantic coast The Bay of Mogador, protected against the north winds by the rocky promontory on which the town is built, against those from the west by an island about 1,000 yards in length, forms a natural harbour which, although not large and inaccessible for ships of large tonnage, has however the merit of being accessible at all seasons, an advantage which secures it a favourable place among the anchorages of the Atlantic coast of Morocco which is, generally speaking, inhospitable This favoured situation was taken advantage of at a very early period In spite of the lack of precision in the sources, it is probable that we should seek at Mogador the site of one of the five Phoenician colonies founded by Hanno (vth century) The island seems to have been known as the island of Hera or of Juno Pliny records that at the end of the first century B C the king Juba II founded purple dye works on the *Purpurariae Insulae*, islands in the Ocean, "opposite the Autololes", a Getulic people who lived in the north of the High Atlas Getulic purple, which was celebrated at Rome, was supplied by the molluscs abundant on this coast It is only at Mogador that we find an island and islets which can be identified as the *Purpurariae Insulae*, but no archaeological discovery has yet been made to confirm the deductions made from the ancient geographers

In the xith century of the Christian era, according to al Bakrī (who finished his book in 1068), Amogdul, a very safe anchorage, was the port for all the province of Sūs We see in the name that of a local saint, Sīdī Mogdūl, still venerated in this region, whose tomb is on the bank near the mouth of the Wādi 'l-Ksob It is however possible that the saint, of whom we know nothing, gets his name from an old Berber place-name Mogador is only a Spanish or Portuguese transcription of Mogdūl, through the forms Mogodul, Mogodor, which we sometimes find in the texts The harbour and the island bear the name Mogodor or Mongodor on a series of portolans of the xivth and xvth century (publ by Ch de la Roncière, *La Découverte de l'Afrique au Moyen-âge*, 1925) but there was not a town here, when in Sept 1506, the king of Portugal Dom Manuel I commanded a gentleman of his court, Diogo d'Azambuja, to build a fortress here which was called *Castello Real* of Mogador Built with great difficulty in face of the hostility of the natives, the Portuguese stronghold did not long resist them While at Safi and Santa Cruz of Cape Guer (Agadir), the state of anarchy in which the tribes lived favoured the rapid progress of the Portuguese, it seems that at Mogador they came up against strong resistance probably organised by the old Berber marabout body of the Ragrāga The garrison had to remain blockaded in Castello Real, revictualled with difficulty from Portugal and Madeira, until in October or November 1510, the tribes were strong enough to seize the fortress in circumstances which we do not know

A sketch of the xviiith century and plans of the xviiith leave no doubt as to the site of Castello Real It was situated, not at the mouth of the Wādi 'l-Ksob, where is now shown an alleged Portuguese fort which however only dates from the end of the xviiith century, but on the shore of the northern passage opposite the island, on the rocky point which supports the mole west of the present harbour Sometimes abandoned, sometimes more or less restored by the rulers of Morocco, who from time to time kept a small garrison there, the old Portuguese castle survived till 1764 or 1765 and was only destroyed when the town was built

In spite of the lack of success of the Portuguese attempt, this privileged situation continued to attract the envy of European nations At the beginning of the xviiith century, Spain, fearing that Moroccan, Algerian or even European corsairs would establish themselves at Mogador, thought of seizing it herself to protect the route to the Indies At the same time, English agents were thinking of making Mogador a base against Spain The Sultāns Mawlāy Zaidān in 1611—1612 and his son ʿAbd al-Malik in 1628 drew up a scheme to fortify the place to prevent foreigners from establishing themselves there This was the time when in France Richelieu and Père Joseph were drawing up schemes for a colonial policy The Chevalier de Razilly in 1626 suggested to them the occupation of Mogador and the organisation of a factory and fisheries there He had it reconnoitred in 1629 but found it impossible to take it by surprise

In spite of so many projects and attempts against it, the island and the shores remained practically deserted Ships however frequented the roadstead It was through Mogador that in the first quarter of the xviiith century, the greater part of the trade between Marrākush and Holland took place Later, in the time of Mawlāy Ismāʿīl, the harbour was mainly used as a refuge for corsairs who came there to rest and repair their vessels

In 1751, Sīdī Muhammad b ʿAbd Allāh, then *khalīfa* of his father for the district of Marrākush, desiring to develop commercial relations between his subjects and Europe, ceded the island of Mogador to a Danish company, which however preferred to establish a centre at Agadir and was not successful there A few years later on becoming sultān and having made Marrākush his capital, Sīdī Muhammad decided himself to found a town at Mogador and to conduct all the commerce of

the south of his kingdom through it, to the greater benefit of the royal treasury, which would obtain not only the customs from this increased trade but also profit by the rents of the buildings, most of which had been built by the sovereign and were his private property The harbour also served as a base for the corsairs who, through the menace they offered to the fleets of Europe, forced the Christian nations to conclude treaties with the sultān by which he received valuable presents and even sums of money In order to populate the town and start business in it, he demanded that European consuls and merchants should settle there and have houses built at their own expense

By 1760 he had begun work but it is from the autumn of 1764 that the foundation of the town really dates, it was given the name al-Suwaira (Souira), the little fortress, by which it is known to the natives, the name Mogador is only used by Europeans We also find a Berberised form (*Tasurt*) The sultān went in person to choose and distribute the sites for the buildings He had asked the English to send him an architect They sent him a French "engineer", a native of Avignon, called Nicolas Cournut, who had made the plans for the fortifications of some places in Roussillon He was an adventurer who, after working in France as a contractor, had entered the English service during the Seven Years' War He was living at Gibraltar where he entered Sīdī Muhammad's service The sultān did not gain much by his services and sent him back to France at the beginning of 1767 None of the present buildings in Mogador can be attributed with certainty to Cournut, for after him a number of European architects and masons worked for the sultān, notably a Genoese architect who built the battery called the *skāla* situated on the western rampart facing the sea Mogador owed to its builders the narrow streets, massive gateways and bastions of European type, the like of which cannot be found in other Moroccan towns and which give it quite a specific character Sīdī Muhammad also built outside the town a country palace which still stands half buried in sand opposite the little village of Diyābāt

The dreams of the sultān were only imperfectly realised The merchants, attracted to Mogador by the promise of a reduction in the export duties on goods, were soon undeceived when they saw that the sovereign did not keep his promises but constantly imposed new burdens on trade The prosperity of Mogador remained insignificant under Sīdī Muhammad and declined under his successors The situation of the town, a long way from great cities and main roads, made it frequently used in the xixth century as a political prison and compulsory place of residence for high officials in disgrace Mogador remained however the starting place for the caravans to Sūs, Mauritania and the Sūdān and has retained from this position a certain commercial importance, to which the opening of the port of Agadir to commerce will now do considerable harm

On August 15, 1844, after the battle of Isly, a French squadron commanded by the Prince de Joinville, who had just bombarded Tangier, came and bombarded Mogador It was intended to make an impression on Sulṭān Mawlāy ʿAbd al Rahmān by striking at a town which belonged to him personally and from which he drew considerable revenues A three hours' bombardment silenced the batteries, the French army then disembarked on the island, the garrison of which, entrenched in the mosque, made a vigorous defence until the next morning On August 16, a detachment of 600 men went to spike the guns, throw the gunpowder into the sea and destroy the last defences of Mogador The town, which had suffered very little from the French shot, but had been evacuated by the inhabitants, was burned and plundered by the tribes of the country round (Shiyādma and Hāha)

Mogador is now the headquarters of a *contrôle civile* It had 18,401 inhabitants at the census of 1926 The Jewish element is particularly large, numbering 7,730

The extremely temperate climate is remarkably equable, but it is spoiled by the wind which blows almost incessantly, laden with the sand from the neighbouring dunes

MOGHUL [See MUGHAL]

MOHUR, an Indian gold coin The name is the Persian *muhr*, which is a loanword from the Sanskrit *mudrā*, seal or die The earliest occurrence of the word on coins is on the forced currency of Muhammad b Tughlak where it has the literal meaning of "sealed" or "stamped" By the xvith century it had come to be used as a popular rather than precise name for gold coins in general

Very little gold had been issued in India for two centuries before the reign of Akbar One of his reforms was the issue of an extensive coinage in gold In addition to many pieces which had only a brief circulation, he revived the old gold tanka [q v] of the Sultāns of Dehlī on a standard of 170 grains (11 02 grammes) to which he gave the name *muhr* That the name at first could be applied to any gold coin is shown by Djahāngīr's reference in his *Memoirs* (transl A Rogers, *O T F*, vol xix , p 10) to muhrs of 100, 50, 20, 10, 5 and 1 tola After the numismatic experiments of Akbar and Djahāngīr, only one gold piece was struck, occasionally with subdivisions so that the general name acquired a particular meaning, especially among the English merchants in India Mohurs continued to be struck to the end of the Mughal Empire and by the states into which it broke up in the xviiith and xixth centuries Akbar and Djahāngīr issued

square as well as round pieces and the former also struck a few *mihrābī* pieces, so called from their shape Of the numerous large denominations recorded by Abu 'l-Fazl and Djahāngīr, only 5 muhr pieces of Akbar and of Djahāngīr are known to exist

As the silver rupee was the standard coin of India the value of the mohur fluctuated with the price of gold In the latter half of the xviiith and early xixth centuries, the East India Company endeavoured to make gold the standard of India and issued mohurs (called gold rupees in Bombay) with the legends of the Mughal Emperor None of their attempts to keep gold and silver in currency at a fixed rate were successful When in 1835 a uniform currency was introduced for British India a gold mohur or 15 rupee piece with English types was struck in name of William IV but never attained general circulation, this was the last attempt to restore the mohur to circulation The mohurs occasionally seen of Victoria of 1861, 1862 and other dates are patterns

MOKHĀ, a small seaport on the Arabian coast of the Red Sea in 13° 19′ 50″ N Lat and 43° 12′ 10″ East Long (Greenwich)

The once imposing town lies on a small bay between two promontories with forts on each about one and a half miles apart The wall which surrounds the town in a semicircle is pierced by four gates In the north the Bāb al Hamūdīya leads to the citadel of the town and to a tongue of land which runs out into the sea, in the east roughly in the centre of the wall is the Bāb al Shādhilī through which the fort of al Barūdh is reached and to the east the road to al Taʿizz from it, while the road to al-Hodeida runs north via Bēt al-Fakih In the south the Bāb al Sundūl admits to the fort of al-Bahēr and the road to ʿAden, in the west through the Bāb al-Bahr the harbour is reached, its stone breakwater is now much decayed This also holds of the wall which connects the city-gates Seen from the sea the town, which covers an area of about half a square mile, still looks very fine, the white mass of houses stands brightly out from the dark blue waters of the Red Sea But as one approaches, the damage which wars, dilapidation and turbulent times have done to the often sore tried town, is apparent, the houses are for the most part deserted, while the inhabitants, consisting of Arabs, Sōmālīs, Danākil, Jews and a few Parsees, have settled in huts outside the town East of the Bāb al Shādhilī, for example, there is a large group of huts, inhabited by Arabs, south of this another group belonging to Sōmālīs, while farther south and on the other side of the Wādi 'l-Kebīr is the Jewsh quarter (Kāʿ al-Yahūd) In the north lies the great cemetery and a white-washed mosque which contains the tomb of the patron saint of the town, Shaikh ʿAlī b ʿUmar al-Shādhilī, in the east of the town is a second important mosque with a minaret 118 feet high, which forms a landmark visible from a considerable distance, along with several smaller ones The country round is barren Drinking water is brought by a conduit from the Mawzāʿ twenty-four miles to the north The population has varied considerably in the last hundred years In 1824 it was 20,000, in 1878—1879 5—8,000, in 1882 it was put at 1,500 inside the town and in 1901 it had sunk to about 400

al-Mokhā is briefly mentioned by al Hamdānī in connection with al-Mandab as lying in the land of the Banū Madjīd, al-Masʿūdī also refers to it briefly in his geographical work The Portuguese gave the town the name by which it has become known in Europe Moca P Manoel d'Almeyda calls it *Moquá* in his *Historia geral de Ethiopia a alta por B Ithesar Tellez* (Coimbra 1660)

About 850 years ago Mokhā was an insignificant village, but rapidly grew in importance when Shaikh Shādhilī discovered the peculiar qualities of the coffee bean and introduced the habit of drinking coffee In 1513 Alfonso Albuquerque found Mokhā still a modest place but by 1610 it had become the most important port for trade with Abyssinia, and England was endeavouring to trade with it while the Dutch had a factory here Coffee was the chief article of export along with other specialities of the Yemen, and received its name from the town As late as 1763 Niebuhr found the town very prosperous, but the capture of ʿAden by the English put an end to its prosperity ʿAden and al Hodeida attracted all the trade of Southern Yemen Under Turkish rule Mokhā was a kadā in the sandjak of Taʿizz but its trade was insignificant In 1916 for example, only about £ 10,000 worth of coffee was sent to ʿAden There is a minimum of industrial activity and that only to supply local needs Indigo dyeing and the manufacture of spirits may be mentioned, the latter is in the hand of Jews Mokhā is connected by telegraph with Sanʿā' (via Taʿizz), al Hodeida (via Zabīd), Shaikh Saʿīd and Perim Mokhā has acquired a new importance by the creation of the imāmate of al Yemen and is now beginning to share the trade with al-Hodeida

MOLLĀ [See MAWLĀ]

MOLLĀ KHUSRAW [See MUHAMMAD B FARĀMARZ]

MOMBASA (ممباسة, anciently Mvita), an island and town on the east coast of Africa, in I at 4° S, Long 39° E The island, about 3 miles in length from north to south and nearly the same distance from east to west, is remarkably compact in shape and is so placed in the deep inlet formed by the converging of several creeks as to be almost entirely surrounded by the mainland, only presenting its south-eastern angle

to the Indian Ocean This peculiarity of its situation suggested to the late W E Taylor the derivation of the name Mvita (the "Curtained Headland") from *(n)ta* "point" The more usual derivation from *vita* "war" seems inadmissible on phonetic grounds, another explanation connects it with *fita* "hidden", either from its hidden position, or from the inhabitants, as it is said, having hidden themselves in the bush during a raid from Pate

The town of Mombasa is situated at the eastern end of the island and, being the terminus of the Uganda railway and the only port of the colony, is of considerable commercial importance The population, according to the latest information available, is something over 44,000, of whom 26,906 are classed as "Africans" (i e the permanent residents, mostly Swahili, and a floating contingent of labourers belonging to other tribes) The remainder includes 7,523 Arabs, 7,556 Indians, 1000 Europeans, and a proportion of "other races" The Arabs, Swahili and many of the Indians are Moslems, the two former chiefly Sunnī of the Shāfi'ī sect, though a few of the older men belong to the Ibādīya There are several mosques, very plain buildings, as a rule, and devoid of minarets, the *mu'adhdhin* stands on the flat roof to give the call to prayer The largest and most imposing of these structures is that belonging to the Khōdjas

The origin of Mombasa is involved in some obscurity It is certain that Arab trading stations existed on the East African coast at the beginning of the Christian era, and we learn from the *Periplus of the Erythraean Sea* that the traders frequently married native women This indicates a fairly early origin for the Swahili race The first permanent settlements, however, seem to have been post-Islāmic 69 (689) is given as the date for the settlement of Pate, and, as Lamu is said by native tradition to have been founded by colonists sent out by 'Abd al-Malik b Marwān (A D 684–705), these two towns were no doubt contemporary There is no mention of Mombasa in the traditions of Lamu or Pate, at this period, except for a statement made to the late Captain Stigand (*Land of Zinj*, p 29), that 'Abd al-Malik sent out Syrians, who "built the cities of Pate, Malindi, Zanzibar, Mombasa, Lamu and Kilwa" Other authorities place the founding of Kilwa much later, viz 365 (976) The *Chronicle of Kilwa* states that 'Alī b Hasan of Shīrāz, the founder and first "Sultān", installed one of his sons as ruler of Mombasa, no doubt the first of the "Shīrāzī Shaikhs", the last of whom was deposed by the Portuguese It would appear that Mombasa was for some time under the suzerainty of Kilwa, but how far the "King of the Zanj" described by Idrīsī and, later, by Ibn Sa'īd as residing at Mombasa, was independent, is not clear The names of the twelve tribes (called indifferently *kabila* or *ṭā'ifa*) said by native authorities to make up the Swahili population indicate a composite origin and possibly a late one, as the bulk of the people came from settlements already founded It is possible that the Wamvita (who either take their name from the city or gave theirs to it) go back to the alleged foundation under 'Abd al-Malik, but against this is the assertion, repeatedly made, that the Wachangamwe, Wakilindini and Watangana are the *tatfa tatu*, "the three" — i e the three aboriginal — "tribes" Some native authorities give these three as "Kilindini", separate from Mombasa Changamwe is a village on the mainland, a mile or two from the crossing at Makupa, Kilindini (now important as the principal harbour for steamers from Europe) is at the western end of the island Tradition says that Kilindini was a city before Mombasa existed, and, in fact, the jungle near the present port contains numerous ruins of uncertain date, which, so far as I know, have not yet been competently examined Tangana is on the island of Mombasa, now included in the town The remaining tribes are those of Kilifi[1]) (a town to the north of Mombasa, its inhabitants are said to have come from "Shīrāzi", either Shīrāz in Persia or a town of the same name in Tanganyika Territory, a colony from the original Shīrāz), Pate, Paza (or Faza, in the island of Pate), Shaka (a Persian settlement near the mouth of the Tana), Mtwapa (between Mombasa and Takaungu), Jomvu (on the creek known as Port Tudor), the Wagunya (the people on the mainland north of the Lamu archipelago) and the Wakatwa (the Somali) Another account omits this last name and substitutes that of the Wamalindi Krapf (*Dictionary*, p 240) mentions a tradition that the town was built (not on the present site, but at the place known as Kwa Mashekh, a little to the north) by one Shehe Mvita, whose tomb was pointed out to him, but it seems probable that this eponymus was invented to account for the name When that of Mombasa was introduced we have no information, but it was used by the Arab geographers as far back as the xiith century It is mentioned, as already stated, by Idrīsī Ibn Sa'īd speaks of "a great estuary" to the west of Mombasa, by which must be meant the creek now known as "Port Tudor", and says it is distant about one degree from Malindi Ibn Battūta, who spent one night there, on his way to Kilwa, describes it as "a large island, two days' journey by sea from the Sawahil country It possesses no territory on the mainland They have fruit trees on the island, but no cereals, which have to be brought to them from the Sawahil Their food consists chiefly of bananas and fish The inhabitants are pious, honourable and upright, and they have well-built wooden mosques" This would imply that the coast opposite Mombasa was not reckoned as part of the Sawahil Present day Swahilis restrict the term "Swahilini" to the strip of coast between Malindi and Lamu, which they look upon as the cradle of their race and this might be taken as intended by Ibn Battūta, but for his reference to cereals being brought from "Sawahil", which would place it in the south, since the dhows laden with millet come up from that quarter with the S W monsoon (cf Taylor, *Aphorisms*, § 128)

The first European to reach Mombasa was Vasco da Gama, who touched there, April 7, 1498, but did not land, owing to the real or suspected treachery of the Arab pilot sent by the Shaikh He went on to the rival state of Malindi and established friendly relations with its ruler, who hoped to find in him an ally against Mombasa Mombasa — after the city had been repeatedly destroyed, in whole or in part, by Almeida in 1505, by Nuno da Cunha in 1528 and by Continho in 1589 — was rendered tributary to the Portuguese in or about 1590, after the adventurer Mīr 'Alī Bey had induced the Shaikh to tender his allegiance to the Turkish Sultān and had been

1) In these names of places, I omit the *wa-*, which is the prefix indicating plurality of persons

driven off by Contınho's fleet At the same time occurred the ınvasion of the Zımbas, an unıdentıfied trıbe who had spread desolatıon on theır march north-eastward, "probably from some localıty on or near the West coast" (cf Theal, ı 352) From Mombasa they passed on to Malındı, where the Portuguese garrıson, wıth the help of natıve allıes, effectually resısted them, and, ıf not exterminated, they ceased to exıst as a trıbe The fort, stıll ın exıstence, was erected between 1593 and 1595, and Mombasa was held by the Portuguese for some sıxty years The last Shīrāzī Shaıkh, Shaho Mshaham b Hısham, was deposed and the Shaıkh of Malındı, Ahmad, ınstalled ın hıs stead wıth the tıtle of Sultān Immıgratıon from Portugal was encouraged, but ın 1615 the settlers, apart from the garrıson, only numbered 50 (cf Strandes, p 173) In 1605, a convent of Augustınıan monks was founded, whıch, wıth other ecclesıastıcal establıshments, was under the jurısdıctıon of the Archbıshop of Goa tıll 1612 In that year a separate dıocese of Mozambıque was created Shaıkh Ahmad dıed ın 1609 and was succeeded by hıs son Hasan, whose treatment by the Portuguese authorıtıes ranks among the scandals of Colonıal hıstory He was fınally murdered, at the ınstıgatıon of the governor, De Mello Pereıra (1615) Hıs son, Yūsuf, aged seven, was sent to Goa to be educated and there baptızed by the name of Geronımo Chıngulıa After an ınquıry held at Lısbon ın 1618, the hıghest ecclesıastıcal trıbunal ın Portugal pronounced Hasan ınnocent and decreed that Yūsuf should be restored to hıs ınherıtance In 1630 he was sent home and ınstalled as Sultān, contınued for a tıme to profess Chrıstıanıty, but, beıng accused of apostasy because he had been seen prayıng at hıs father's tomb and apprehensıve of beıng sent to Goa (the seat of the Inquısıtıon), revolted, openly declared hımself a Moslem and massacred all the Portuguese ın Mombasa (cf Faria y Sousa, vol III, IV, I, p 391) Hıs example was followed by Tanga, Mtangata and some other towns (1631) Mombasa was besıeged for three months by F de Mowra, wıth a fleet from Goa, but wıthout success Yūsuf, however, probably seeıng that he would be unable to hold out permanently, retreated to Arabıa after dısmantlıng the fort and destroyıng the town The new governor, Seıxas de Cabreıra, subdued the revolted towns and repaıred the fort, as recorded ın the ınscrıptıon stıll legıble above the gateway The Portuguese rule becomıng more and more oppressıve, the Coast Arabs appealed ın or about 1660 to Sultān b Seıf al Ya'arubī, Imām of 'Omān, who had already expelled the Portuguese from Maskat He took Mombasa after a long sıege and varıous operatıons, and though ıt was retaken shortly afterwards, the power of Portugal was already on the wane, and Seıf b Sultān again captured Mombasa ın 1698 and ınstalled Nasr b 'Abd Allāh al-Mazrui as governor Internal quarrels and a revolt against thıs governor laıd the town open to a last Portuguese attack, ın 1728, when Luıs de Mello Sampayo seızed ıt, wıth the help of Bwana Tamn Mknu (Abū Bakr b Muhammad), Sultān of Pate Thıs occupatıon lasted but a short tıme and was termınated by another massacre, probably that commemorated ın the tradıtıon recorded by Taylor (*Aphorısms*, § 401) A perıod of anarchy ensued, whıch became so ıntolerable that not only the "Twelve Trıbes" of Mombasa but the chıefs of the pagan Wanyıka on the maınland, appealed to Seıf b Sultān for help. He sent three shıps and appoınted a governor In 1739 thıs office was held by Muhammad b 'Othmān al-Mazrui, the first of a lıne who became practıcally ındependant rulers of Mombasa When the Ya'arabī Imāms wore ousted by the Al Bū Saıdı, the Mazrui refused to recognıse the new dynasty They were left undısturbed for a consıderable tıme, but the more energetıc polıcy pursued by Sa'īd b Sultān (1804—1856) ınduced them to seek Brıtısh protectıon ın 1823 Thıs was provısıonally granted by Captaın Owen, but wıthdrawn three years later, as the Home government refused to sanctıon ıt Sa'īd fınally gaıned possessıon of Mombasa ın 1837, when the leadıng Mazrui were captured by treachery and deported to Bander 'Abbās From that tıme tıll the establıshment of the Brıtısh protectorate ın 1890, Mombasa remaıned subject to the Saıyıd (now called Sultān) of Zanzıbar, who ındeed retaıns a certaın jurısdıctıon over the ten-mıle strıp of coast leased from hım by the Brıtısh East Africa Company ın 1887 The prıncıpal event ın ıts hıstory sınce that date ıs the rısıng of the Mazrui ın 1895, coıncıdent wıth, but not caused by the proclamatıon of the Brıtısh protectorate over the maınland terrıtory, whıch was taken over from the Company by the Imperıal Government Sınce then the completıon of the Uganda Raılway and the harbour works al-Kılındını have notıceably changed the character of Mombasa, whıch ıs now a flourishıng seaport, much frequented by European shıppıng

The dıalect of Swahılı spoken at Mombasa was consıdered by the late W E Taylor "the truly central" language, "the best fıtted for accurate statement and grave dıscussıon", though that of Zanzıbar has now attaıned a wıder currency The art of poetry was, tıll recently, much cultıvated there, the best known of the natıve poets are Muyaka b Mwınyı Hajı, Mwalımu Sıkujua (dıed 1891), and Hemedı b Muhammad b Ahmad al-Mambassı, who was stıll lıvıng durıng the last decade of the XIXth century (sınce deceased), Muhammed b Ahmad, 'Abd Allāh Borashıdı, Mwınyı Mugwama

(A WERNER)

MONASTIR (pronounced *Mnestīr*, *Mestīr*, ethnic *Mestīrī*), a town in the Sāhel, the eastern coast of Tunisia, on the site of the ancient Ruspina at the end of a cape which runs out to the south-east of Sūsa The Arabic name raises a problem which is not yet solved The name clearly conceals the Greek word *μοναστήριον* which suggests that there was an important Christian monastery here at one time This is however a pure hypothesis, supported by no text, although Tissot (*Geographie comparée de la province d'Afrique*, II 165—166) seems to take it for granted If on the other hand we remember that the Arab Monastir from the end of the eighth century was a great Muslim monastery and probably the first to be founded in the west, it is tempting to accept the explanation (suggested by Sī Hasan ʿAbd al-Wahhāb) that the name was given to the Muslim foundation by the Greeks of the country or Berbers speaking Greek, still Christians or recently converted to Islām

It was in 180 (796) that Harthama b ʿAiyān, who ruled the province of Ifrīkiya in the name of the ʿAbbāsid caliph Hārūn al Rashīd, founded the *ribāt* of Monastir This fortified monastery attained considerable importance in Western Islām A century after its foundation, *hadīths* were quoted which proclaimed its great importance and promised the highest rewards to those who came there to fight the infidel or to prepare themselves for the holy war The Prophet foreseeing the foundation of al-Monastīr is said to have said "On the coast of Ifrīkiya, there is one of the gates of Paradise which is called al-Monastīr, one enters it by the grace of God's mercy and leaves it by the effect of his pardon", or again "He who keeps watch in the frontier town of al-Monastīr for three days has the right to Paradise" (cf Abu 'l ʿArab, *Classes des savants de l'Ifrīqiya*, transl Ben Cheneb, 5, 7, 9, 14, 15, Ibn ʿIdhārī, *Bayān*, transl Fagnan, I 1) In the XIth century al-Bakrī gives a description of Monastir, the substance of which is taken from al-Warrāk (d 973) and which is not quite clear to us It is a large fortress (*kasr*), he says, which contains a quarter (*rabadh*) of considerable size In the middle of this quarter stands a citadel (*hisn*) which contains suites of rooms, oratories and castles (*kisāb*) of several stories To the south of this citadel is a great court (*sahn*) with *kubbas*, called *kibāb djāmiʿ*, around which women who wish to devote themselves to religion come to live It seems that the "fortress" was the town itself with its ramparts, still known by the name, common in Tunisia, of *bled* Outside the *bled* is the quarter also encircled by ramparts and turrets in which we have the *ribāt* This occupies the north-east angle of this "faubourg", its walls and high tower called *nadhur* dominate with their proud silhouette the shore and the country round To the south is a courtyard with tombs, here no doubt we have to locate the abodes of the pious women mentioned by al-Warrāk The interior of the *ribāt* shows traces of frequent attention and repairs which makes its plan singularly complicated We can however perhaps recognise the general arrangements of which the *ribāt* of Sūsa, founded twenty-five years later, gives us a clearer scheme on a smaller scale a central rectangular court surrounded by two storeys of cells On the first floor on the south side, the cells are replaced by a hall for prayer of no great height, very simple with cradle vaulting It is probably the same as is mentioned by al-Bakrī "On the first storey is a mosque where there is always a *shikh* of great virtue and merit, who has the direction of the community" The signal tower, circular in plan, occupies almost the same position as that which dominates the *ribāt* of Sūsa In addition to the dwellings of the marabouts there are reservoirs, baths and "Persian mills" in the monastery Every year a great fair was held at Monastir on the ʿĀshūrā' day when the pious began their temporary withdrawals from the world Some, however, shut themselves up for life and devoted themselves entirely to prayer and the defence of the lands of Islām The people of Kairawān supplied them with provisions, in itself a pious work

The ninth century was undoubtedly the golden age of the *ribāt* of Monastir Its importance however must have diminished somewhat as a result of the foundation in 821 of the *ribāt* of Sūsa, which was the starting point for the expedition to Sicily Al-Bakrī would regard the *ribāt* of Monastir as a dependency on that of Sūsa It was nevertheless, as well as the land around it, an auspicious place We can date to about 1000 A D the building of the Great Mosque, close to the *ribāt*, and that of the little mosque of the Saiyida, both of which have preserved *mihrābs* of a very curious transitional style It is probable that the "Lady" whose tomb has given its name to the oratory of the Saiyida was a princess of the family of the Zīrids of Kairawān Monastir was, especially after the Hilālī invasion (middle of the XIth century), the St Denis of the Sanhādja rulers According to al-Idrīsī (XIIth century), the dead were brought there by boat (the roads were by no means safe at this time) from the town of Mahdīya The tombs of this period are numerous in the cemetery in which the patron saint of Monastir, Sīdī al Māzarī, is buried

Although Monastir did not play a great part in history after this period, the town and the *ribāt* continued to be an object of care to various Tunisian dynasties From the Hafsid al-Mustansir (1260) date the two gates of the *bled* Bāb al-Darb and Bab al-Sūr As to the *ribāt*, one of the gates was rebuilt by the Hafsid Abū Fāris in 828 (1424), another dates from 1058 (1648) and is the work of the Turks

Monastir is at the present day a town of some 7,000 inhabitants Three little islands, one of which contains a number of puzzling artificial caves, shelter the roadstead outside, which is frequented by a considerable number of ships at the tunny and sardine fishing season

MONTENEGRO (Turk KARA DAGH, Serbo-Croat CRNA GORA) is in its heart a steep rocky citadel, the interior of which is difficult of passage and much cut up orographically and hydrographically, it has only a gateway in the south from Lake Skutari and in the north from the Herzegovina, these two gateways are connected by a corridor, the valley of the Zeta This route which, as the main line of communication, has been the scene of fierce fighting between the natives and invaders and is also the dividing line between western and eastern Montenegro or Crna Gora in the narrow sense, the oldest part of the modern state on the one hand and the eastern districts called Brda on the other, is formed by the undulating plain of Zeta on the lower course of the Morača, which flows into Lake Skutari, by its right tributary the Zeta, the large but little fertile basin of the Nikšic and the depression of the Duga passes Crna Gora and an adjoining strip of the Brda running north and south belong to the most desolate and poorest parts of the Dinaric or Illyrian limestone region which runs along the Adriatic, the forests of which, still existing down to modern times, have been sacrificed to get pasture land, lime, charcoal and tar (C Patsch, *Historische Wanderungen im Karst und an der Adria*, I, Vienna 1922, p 28) and which, with a poor water supply, have only a little arable land in little hollows and cups on their cold rocky highlands, on which we also have the few little villages and towns of which Cetinje at the eastern foot of the Lovcen (5,750 feet) with 5,473 inhabitants is the largest It is not till we come east of the Brda to the valleys of the Piva and Tara with their deep ravines, which join to form the Drina on the northern frontier, and on the Lim, around the massif of the Durmitor (7,200 feet) and Kom (8,000 feet), where the soil is of gravel, that we have favourable conditions with a regular water supply, extensive forests of pine and other woods, rich meadows which enable cattle to be reared in large numbers, in many places in this region bread is dearer than meat A very small fruit-growing region is the alluvial plain of Crnnica, the "garden of Montenegro" which lies around Virpazar on the north-western shores of Lake Skutari, which is full of fish, with a Mediterranean climate and vegetation, which is also found in the narrow strip of land along the Karst river Crnoyevića Riyeka, to the north

I The oldest known inhabitants of the country were the Illyrian tribes of the Docleates and Labeates, of whom the former lived in the wilds of Montenegro and the latter in the Mediterranean area around Lake Skutari down to the coast After the destruction in 168 B C of the Illyrian kingdom of the Ardiae whose last capital was Skutari, to which they, along with the Herzegovina, Southern Dalmatia and Northern Albania, had belonged, they came under the rule of the Romans and later formed part of the province of Dalmatia In the first century A D we find the two tribal areas replaced each by a town organised on Roman lines with the old tribal territories attached to them, but ill defined Doclea, at the corner formed by the junction of the Morača and Zeta, and Scodra, now Skutari, which latter, in the division of Dalmatia under Diocletian, became the capital of the *provincia Praevalitana* or *Praevalis* and has maintained a dominating position almost down to the present time [cf SKUTARI] Doclea, on the other hand, is representative for Montenegro of the economic and cultural decline of south west Europe since ancient times In spite of the step-motherly nature of the country, we know from the ruins of public and private buildings bleaching in the miserable desert of the Karst and from epigraphic evidence that it was once a prosperous city with considerable trade with the interior across Lake Skutari and on the Boyana which flows out of it (Patsch, in Pauly-Wissowa, *Realenzyklopädie der klass Altertumswissenschaft*, V 1251 *sqq*) It suffered severely in 395 when the Balkans suffered so much at the hand of the Teutons at the time of the migration of the Visigoths, but in spite of the plundering of the Adriatic territory which followed at other hands also, it was still the see of a bishop in 602, in the period when the towns of the peninsula were finally destroyed as a result of the raids of the Avars and Slavs and the permanent settlement of the latter, who having no understanding of town life, retained in their new homes their traditional poor and primitive mode of life, for the most part in family groups settled on the land and mainly engaged in cattle-rearing

II Its situation and tradition, from traces in place names, remnants of the old population and the city walls, now much decayed, preserved for the ruined town of Doclea which hitherto had held the position later occupied by Montenegro, its old ecclesiastical position — there is a record of a bishopric of Doclea subordinate to the Greek metropolitan of Durazzo — and seem also to have given it a military and political preponderance, since the little Slav state which later grew up here bore after it the name of Dioclia, Slav Dioklitiya down to the XIIth century This originally comprised only southern Montenegro and the stretch of territory called Krayina along the west bank of the Lake Skutari The littoral itself (with Cattaro, Budua, Antivari and Dulcigno) and Northern Albania, with many Roman towns like Skutari and Drivasto, remained Byzantine on the contrary, as part of the theme (province) of Dyrrachion down to the XIth century, while eastern and northern Montenegro belonged to Serbia and the north west to the principality of Travunia (capital Trebinye)

Of the early obscure pre-history of Dioclia all that we have is a Byzantine seal of a ruler of probably the tenth century Πέτρου ἄρχοντος Διοκλία[ς], the country was then not only ecclesiastically and culturally but also politically under Greek influence like the larger Slav Adriatic states From 1000 A D our information is fuller, if not absolutely reliable

Prince John Vladimir, a figure much obscured by legend, is inextricably associated with the last efforts of the Western Bulgar state First a prisoner, then the son-in-law of the Czar Samuel (d 1014), he was murdered (drowned in Lake Prespa) by the last Czar John Vladislav (1015—1018) in the Bulgar capital Remembered in Montenegro as a saint by Christians and Muslims alike, he now rests in the monastery of Shen Jon near Elbassan in Central Albania

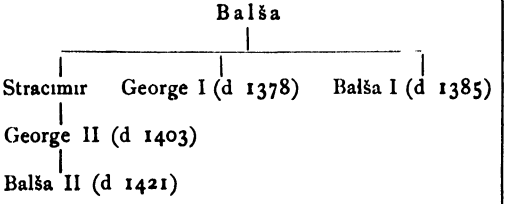
In the years that followed, Byzantium, after the Bulgars, its opponents for centuries, had been finally disposed of by the Emperor Basil II Bulgaroktonos in 1018, being again in possession of the greater part of the Balkan Peninsula, enforced its suzerainty to the northwest also Diocli a under three able rulers not only survived this danger but attained an importance never reached by Montenegro itself in its best days Prince Stephan Voyislav — it is not known in what relationship he stood to John Vladimir — in spite of great opposition from the Byzantines (1036—1042) obtained Travunia (see above), Zachlumia adjoining it (on the central and lower Narenta), almost the whole Adriatic coast between the Narenta and Boyana along with Cattaro and Antivari as well as Northern Albania with Skutari and established the still existing Latin bishopric in Antivari, out of political hostility to Byzantinism His son Michael was the first to take the title of king, the choice of his son Constantine Bodin as Bulgar Czar by rebels in Macedonia (1073) ended however in a — temporary — humiliation of Diocli a Michael and Bodin, who succeeded his father presumably in 1082, made an alliance with the Normans in Italy and supported Robert Guiscard in his fighting in the west of the Balkan peninsula (1081—1085) with Alexius I Comnenus Bodin succeeded at the same time in extending his rule over Bosnia also (then practically only the territory on the lower course of the Bosna, the Vrbas and the Narenta) and Serbia or Raszia (in the modern north and eastern Montenegro, the sandjak of Novi Pazar, S W Serbia and S E Bosnia) The kingdom of Diocli a attained its greatest extent with the conquests of Stephan Voyislav — but only for a brief period Bodin's good fortune faded away After the restoration of Byzantine rule on the Adriatic, reprisals were begun (1085—1094) under the personal direction of the emperor Alexius The king was defeated, the links that bound the various parts of his kingdom together were loosened and quarrels broke out within the royal family itself In 1096 Bodin could still receive Crusaders in his capital Skutari Provencals under Raymond of Toulouse, who had marched through Dalmatia and probably through the Zeta valley (cf above) and were making for Durazzo in order to reach Constantinople from there by the old Via Egnatia After this we have no certain information about him and his successors All that is certain is that Diocli a was driven from the coast and out of Northern Albania by the Byzantines and became tributary to them, while Serbia, which had hitherto been politically insignificant in comparison, began to expand at the expense of Diocli a under the Grand Župan Vlkan, Bodin's governor, and his successors, especially after the Byzantine empire fell steadily into decline from 1180 onwards The Grand Zupan Stephan Nemanya, a native of Diocli a, deprived it of the former possessions of Diocli a in Northern Albania and on the coast from the eastern shore of Lake Skutari to Cattaro, disposed of the last Diocli an prince Michael in 1189, and united his territory with Serbia From the xiith century the old name of the country was replaced by that of the river Zeta (Latin Zenta, Genta)

III Under Nemanya's dynasty Zeta (with Northern Albania and the coast) remained for 170 years under Serbia and was frequently governed by princes, repeatedly by heirs to the throne Widows of kings also had estates on this sunny strip of coast A benefactress of the land as a builder was Helena (d 1314), the French wife of Stephan Uroš I (1243—1276) She had the towns on Lake Skutari restored, which had suffered severely from the Mongol storm which in 1242 had swept southwards along the Adriatic, and built and repaired numerous churches and monasteries in the predominantly Roman Catholic territory around the Lake and on the coast which was under the bishops of Antivari and numerous suffragan bishops, including also the great Benedictine Abbey of Ss Sergius and Bacchus on the Boyana (now the ruins of Kisha e Shirjit), at which there was an important trading centre with much visited animal markets St Sava (d 1236) created an Eastern Greek bishopric for the Zeta on the island of Prevlaka on the Gulf of Cattaro, the land also had many well endowed monasteries of this creed on the islands in the Lake Skutari (like Vranyina), and what fertile soil existed elsewhere belonged for the most part to monasteries in Serbia, on Athos and in Jerusalem, granted by the, in this respect, extravagant Serbian ruler The population received a considerable admixture, now completely absorbed, by the immigration of Wallachians and Albanians

A grave danger to Serbia was the power of the nobles, which had increased out of all proportion as a result of the constant feuds in the royal family When after the death of the Czar Stephan Dušan (d 1355) a general collapse of the great but only loosely knit state began, the centrifugal forces led in Zeta also (1360) to the formation once more of an independent principality by the brothers Stracimir, George and Balša, sons of Balša, a nobleman of Wallachian origin, to whom the government of the country was entrusted

IV The break-up of Serbia took place just at the time when the Ottomans were vigorously extending their power in the Balkan peninsula Their victories at Čirmen on the Marica (1371) and at Kosovo ("field of the blackbird", 1389) destroyed the independence of the petty Serbian states in Macedonia and reduced Serbia itself to the district of the Morava, where it however not only maintained itself till 1459 but, as a result of the Turkish defeat at the hands of the Mongols at Angora (1402), was able for a time to rise to considerable power again In spite of the danger which threatened Zeta also, George and Balša exhausted their strength in continual feuds with their neighbours over pieces of land, and in the reign of George II the turbulent nobles, among whom the most prominent were the Crnoyević or Gyuraševi ć between Budna, Cattaro and the lower Moraca, broke the kingdom up into little baronies The result was that when the Ottomans under Khair al Din entered Albania from Macedonia, Balša in 1385 lost a battle and his life north of Valona, and George II after fighting with varying

fortune, realising his own weakness, handed over his Albanian possessions in the south and east of Lake Skutari as far as Tuzi (S E of Podgorica) for an annual pension of 1,000 ducats (1396) to Venice, who thus became till 1479 the southern defender of Zeta against the Ottomans George retained Dulcigno, Antivari and Budna for himself as well as the lands west and north of Lake Skutari



But even this reduced territory found no peace Under Balša II, the last of his warlike but unimportant house, two long and trying wars with Venice were fought during the second, the prince died (1421) and left his lands to the despot (Duke) of Serbia, Stephan Lazarević, who lost Dulcigno to the republic

V The second period of Serbian rule very soon alienated the sympathy with which it was at first received and had to fight increasing difficulties caused by the influential Crnoyevic (see above) In addition there was an inroad by the Turks in 1430 and the demands of Venice The latter took Antivari and Budua and appointed the woiwod Stephan Crnoyevic its salaried governor in the little mountain country now quite cut off from the coast, he (1455) induced the people to take the oath of fealty to the republic in the island monastery of Vranyina (cf above) The end of Serbia (1459) seemed to secure Venice complete possession of the lands round Lake Skutari, but soon afterwards the Ottomans surrounded this land on all sides, for the conquest of Bosnia (1463) was followed (1466) by the annexation of the Herzegovina and of the present Northern Montenegro as far as Nikšic, which then belonged to it

Like Stephan Crnoyevic (d 1465) his son Ivan (1465—1490) who called himself Gospodar Zetski (lord of Zeta), was also a vassal of Venice, who gave him so little support in the wars with Muhammad II over Upper Albania that, after the evacuation of Skutari (1479), he had to fly to Italy, and Zeta was occupied by the Turks, which was the beginning of their long rule here The contest for the throne after the Sultān's death (1481) induced Ivan to return and renew the struggle, which however ended in 1482 with the recognition of Turkish suzerainty His youngest son Staniša, a hostage in Constantinople, adopted Islām in 1485, and took the name Skender Beg Ivan, also called Ivan Beg — his country was also known as Ivanbegovina — resided in Cetinje where he built a small monastery in 1484—1485, to which the Eastern Greek bishop of Zeta (see above) moved The state suffered from the great independence of the tribes, who had strong separatist tendencies, like the Nyegušı, Biyelice, Ozrinici, and Ćeklići, each formed a political entity with a well-defined territory, its own chief chosen for life, courts, tribal and family feuds, blood vengeance, etc , institutions which survived in Montenegro down to the xixth century and existed in the north Albanian highlands until quite recently

Not even the greatest submissiveness earned for Ivan's elder sons, at constant enmity with one another, the goodwill of the Turks George (1490–1496) who introduced the printing-press into Cetinje and in 1493–95 printed beautiful Cyrillic ecclesiastical works, died in Asia Minor in exile Stephan (1496—1499) was interned in Skutari, where he is said to have ended his days as a monk On the other hand in 1514, a separate sandjak with capital Žablyak (to the north of Lake Skutari) was created for the Muslim Staniša Skender Beg Crnoyević out of Zeta, which had been incorporated in the sandjak of Skutari The latter did not deny his descent, he was also tolerant in matters of religion, used his Slav mother-tongue in his correspondence and was in regular communication with Venice, although their relations were occasionally overclouded, in Venice Božidar Vuković of Podgorica (d 1540) and others from 1519 printed Cyrillic ecclesiastical works Skender Beg's title Sandžak Crnogorski naturalised the name Crna Gora for the country, which we find as early as 1435 and as Montenegro in 1496 for the highlands above Cattaro In 1528 all notices of this remarkable Montenegrin Turkish ruler cease Crna Gora again becomes a kādilīk of the sandjak of Skutari

Montenegro under Turkey, under the unassuming ecclesiastical suzerainty of the bishop or Vladika of Cetinje chosen by the tribal chiefs, formed five nāhiyas or districts in the shape of a small triangle between Cattaro, Podgorica and the N W end of Lake Skutari, which in 1614 contained 90 villages with 3,524 houses and 8,027 men capable of bearing arms, of whom however only 1,000 had guns The poll-tax was readily paid and they shared in the wars of the Porte against Venice and in suppressing rebellions in the adjoining lands, such as the closely related Brda, which had much more desire for independence This long stereotyped monotony did not change till 1688 when the Montenegrins with the Vladika Visarion placed themselves under the protection of Venice, whose lands marched with those of the Turks, and who since the failure of the siege of Venice had been fighting with the Turks from 1684 to the peace of Carlowitz (1699) After the failure of his first attacks Sulaimān Pasha, Sandjak of Skutari, as a punishment destroyed Cetinje in 1692 with the support of a number of Montenegrin tribes

VI The process of liberation thus begun found vigorous support in the warlike Vladika Danilo I Petrovic Nyeguš (1697—1735) [1]) after whom the dignity of bishop became hereditary in the family, and its holder gradually increased his importance at the expense of the tribal chiefs In 1711 an embassy from Peter the Great introduced relations with Russia, which however were only occasionally of benefit to the land Even in the joint war on the Porte which immediately followed, Montenegro was left in the lurch at the peace of the Pruth (1711) The protection which fugitive Montenegrins found in Dalmatia was used in 1714 as a pretext by Turkey for declaring war on Venice In the same year Nu'mān Pasha Koprulu laid waste Montenegro entirely, Cetinje which had been rebuilt in 1704 being once more destroyed As a result of the peace of Passarowitz (1718) more peaceful conditions

1) The story that all Muhammadans in Montenegro who would not be baptised or leave the country were put to death as partisans of Turkey on Christmas Eve 1707 is however a patriotic fable.

began to prevail except for the almost daily guerilla fighting on the frontiers Danilo took advantage of the peace to build up the country again after the overthrow of the Turkish administration, with the help of Venetian subsidies, so far as the poverty and the intractable nature of the people permitted In 1724 Cetinje was rebuilt

Under his incapable successor Sava Petrovic Nyeguš (1735—1782), there was a complete relapse into the previous barbarism no authority, clan and blood feuds, murders No one dared to leave his house unarmed The whole people lived by murder and robbery In addition there were secret conspiracies with the Turks against their own countrymen, abject appeals to Venice and journeys of appeal to St Petersburg, notably that of the able but powerless episcopal coadjutor Vasiliye (d 1766)

In the general distress the Vladika only thought of enriching himself Some relief was afforded Montenegro in 1767 by the south Slav Ščepan Mali (Little Stephen), the Lažni (false) Czar, who was accepted as the Czar Peter III murdered in 1762, and received such general recognition, out of respect for Russia, that in spite of his unmasking by the mission of prince Yuryi Volodimirovič Dolgorukiy (1769), he was tolerated by Russia also until he was murdered by a servant in 1773 Able, unselfish, strict and just, he restored for a time unwonted order and security

There was no considerable war with Turkey for a long period All the more serious then were the relations with the suzerain in the reign of Peter I the Saint (1782—1830) The hereditary wazīr of Skutari, Kara Mahmūd Pāšhā Bushatli, taking advantage of tribal feuds, laid waste the whole country in 1785, forced it to pay the poll-tax again and burned down Cetinje During the Austro-Russo-Turkish war of 1787—1792, there were only trifling encounters, for which in 1795 Kara Mahmūd Pāšhā again threatened serious reprisals He was however defeated in 1796 at Slatina and later killed in the great battle of Kruse, his head was long preserved as a trophy in Cetinje, in keeping with the Montenegrin head hunting custom which had become a regular practice in war The consequence was that the tribes of Biyelopavlići and Piperi, in the Brda east of the Zeta valley, joined Montenegro

A welcome and more profitable change were the wars of 1806 - 1808 and 1813—1814 in alliance first with the inhabitants of the Bocche di Cattaro and the Russians, later with the English against the French, who had occupied Dalmatia under General Marmont after the peace of Pressburg (1805) Numerous ruins stretching as far as Ragusa still testify to the thirst of the Montenegrins for destruction and plunder even on Christian soil

Peter I, a cultured ecclesiastic educated in Russia, full of good intentions, endeavoured throughout his life by legislative (1798 and 1803) and personal effort to unite his people, raise their moral tone and avert distress by introducing the potato, but in spite of great patience he met with bitter hostility, contributed to also by Russia which, only after being appealed to for a long time, in 1799 granted 1 000 ducats a year for public purposes but did not pay it regularly

The first ruler over the Montenegrins, Gospodar Crnogorski i Brdski, was Peter II (1830—51), a highly gifted man of the world, bishop only in name, one of the greatest of Serbian poets and also of unbending vigour which did not hesitate at severe punishments and death sentences The Radonyic family which claimed secular (*guvei nadur*) power for itself had to leave the country Supported by Russia from 1837 by a grant of 9,000 ducats yearly and occasional gifts of grain, and on this account more highly esteemed by his covetous countrymen, he concentrated the government in his own hands The powers of the tribal chiefs were restricted A senate of 12 regularly paid members under the presidency of the Vladika henceforth formed the supreme governing body and court of justice its authority was enforced by well-paid troops stationed throughout the country, the *Gvardiya*, in addition to whom the head of the state had a bodyguard, *Peryanici* The building of the first public school and a small state printing press in the capital, the purchase of two cannons and the building of a powder mill, show the small scale of the state but mark the desire for progress The innovations, and still more poverty and a great increase of population, as in earlier times led to the emigration of numerous families to Serbia and Russia

Foreign politics were mainly characterised by troubles on the Austrian frontier, continual fighting, celebrated in song, with the neighbouring Muhammadans, especially in the Herzegovina, which was then ruled by ʿAlī Pāšhā Rizvanbegovic (d 1851) as a practically independent sovereign, under whom Smail Aga Čengic (d 1840) distinguished himself in the fighting

VII Centralisation and reforms generally formed the programme of the next two reigns, which was firmly and successfully carried through in spite of much opposition Under Danilo II (1852—60) the clan system was dealt a shattering blow, when the chiefs were replaced by captains of princely birth and legislation regulated by the code of 1855 His accession however marks the close of a period in as much as a hereditary secular power now replaced a theocracy Danilo renounced his spiritual rank and with the approval of Russia and Austria had himself proclaimed Knyaz i Gospodar Crne Gore i Brda The attempt of the Porte to obtain by force under Serdar Ekrem ʿOmar Pāšhā in 1852—1853 recognition of her suzerainty thus threatened was vigorously opposed by Austria after giving ample assistance in 1853 through Feldmarschalleutnant Count Leiningen's mission to Constantinople During the Crimean War (1853—1856) Danilo remained neutral to the discontent of his people On the other hand, he became involved in a war in 1858 because he supported the rebels in the Herzegovina, this ended in the defeat of the Turks in the valley of Grahovo (north of Risano) and in an enlargement of Montenegrin territory in 1859 In 1860 the ruler, who had previously had to put down conspiracies, some led by relatives, was murdered in Cattaro by a Montenegrin emigrant

His able nephew Nikola I (1860—1918, d March 1, 1921) who had been educated in Trieste and in France, son of the doughty Woiwod Mirko (d 1867), completed the building of the state By long steady work, first as an absolute and from 1905 as a constitutional ruler, and by very skilfully managing foreign relations, he created out of the ill-famed, unfertile, rocky little country a kingdom which was enlarged by the addition

of fertile valleys with its own sea coast, good communications and post routes, a busy economic life, modest prosperity increased by emigration to America, more law abiding and secure since the institution of the civil code of 1888, with a good system of education and a well organised soldiery with modern equipment to be reckoned with in Balkan questions Relationship by marriage, notably with the courts of Russia and Italy, gave reflected glory to the pretty little capital of Cetinje which had also become a centre of culture, 1910 crowned the work by raising Montenegro to be a kingdom

While interested great powers, notably Russia, gave grants of money, arms, munitions, etc , which were readily accepted and also requested, this development was conducted mainly at the expense of Turkey, with whom three wars were waged at longer intervals in addition to minor friction in 1869—1870, 1872, 1874—1875, 1895, 1898, 1911, 1912 The first (1862), a combined attack by Derwish Pāshā from the north and Serdar Ekrem ʿOmar Pāshā from the south in the Zeta valley as a reprisal for the support given to the rising led by Luka Vukalovic in the eastern Herzegovina, forced Nikola by the threat to Cetinje to conclude an unsuccessful peace in Skutari The second war was declared in 1876 by Montenegro in alliance with Serbia in order to profit by the new insurrection in the Herzegovina which had begun in the summer of 1875 in Nevesinye His victory over Muktar Pāshā at Vrbica and at Bileca and the defeat of Serbs were followed by a truce and the intervention of Russia in 1877 Sulaimān Pāshā succeeded at heavy cost in fighting his way out of the Herzegovina through the Zeta valley into Albania, but in 1877 Nikola took Niksic and Antivari and in 1878 Dulcigno The Treaty of Berlin (July 13, 1878, Articles 26—33) recognised the independence of Montenegro and granted it, after cutting down very much the terms of the preliminary peace of San Stefano, a broad ring of land around the original land of Montenegro with Antivari, Nikšic, Banyani, Piva, Kolašin, Spuž, Podgorica, Žablyak and the district of Gusinye The latter, as a result of the opposition of the Albanians, was exchanged for Dulcigno in 1880 The area was increased from 4,366 to 9,080 square kilometres with over 200,000 inhabitants, including 12,500 Catholic Albanians, there was on the other hand a considerable emigration of Muslims from the new territories

The third war with Turkey was the first Balkan War, which Montenegro began on Oct 8, 1912, before its allies, Serbia, Bulgaria and Greece, but while the sandjak of Novi Pazar and Upper Albania were easily occupied, Skutari, the main objective, was only taken after a long siege and with the help of treachery on April 23, 1913 After the allies had quarrelled among themselves, Montenegro also took part in the second Balkan War against Bulgaria By the peace of Bukarest (Aug 10, 1913) it received the south-western half of the sandjak of Novi Pazar (with Plyevye, Biyelo Polye and Berane), the greater part of the Metohia plain (with Peć and Gyakova), the valley of Gusinye and lands round Lake Skutari, increasing its area by 5,937 square kilometres to 15,017 square kilometres, with 437,000 inhabitants

In the Great War, king Nikola reluctantly declared war on Austria-Hungary on Aug 5, 1914 After the capture of the Lovćen (see above) the Montenegrins laid down their arms unconditionally on Jan 16, 1916 and the country, which had gone back a great deal since 1912, was administered by an Austrian military general-gouvernment The king went first to Italy, then to France, never to return again, for after the War he was deposed along with his sons on Nov 29, 1918 by an assembly in Podgorica on the charge of treachery

(C PATSCH)

MOORS, a rather vague name still applied in the XIXth century to certain elements in the Muslim town population of various countries and especially to the inhabitants of the Mediterranean ports of North Africa The word, presumably of Phoenician origin, corresponds to the ancient local name of the natives of Barbary reproduced by the Romans as *Μαῦροι*, *Mauri* and by the Greeks as *Μαυρούσιοι* (Strabo, VII 825) The term *Mauri* used by the Romans in a general way for the Berbers passed into Spain in the form *Moro*, and it was by the name of Moros that the people of the Iberian peninsula throughout the whole period of Muslim rule knew the Arab conquerors and arabicised Berbers who had come to settle in Spain from the other side of the Strait of Gibraltar The name Moros passed into various European languages French *Maures*, English *Moors*, German *Mauren* At the time of the "Reconquista" the name Moriscos was applied in Spain to these Muslims (usually crypto-Muslims) who had remained in the country until their final expulsion in 1610 The Moriscos went mainly to North Africa, where they were known to the natives as *Andalus* while Christian travellers gave them the general name of Moors

In modern times the Moors to the European were therefore the urban population of the North African ports, irrespective of the proportion of immigrants from Spain Since then the word has been generally used with the meaning Muslim of the towns of the western end of the Mediterranean (cf such expressions in "Moorish bath", "Moorish coffee" etc)

The name Moors has also been given to the Arab or Berber peoples, pure or mixed with negro blood, who live to the north in the Senegal in the province to which the French now give the ancient name of Mauritania (see below), and to the offspring of the marriages of Arabs from South Arabia and Cingalese who form an important Muslim colony in Ceylon (c 200,000)

(E LÉVI PROVENÇAI)

The land of the Moors is MAURITANIA or Mauretania This name which has been derived either from a Phoenician word *Mauharim* "the Westerns" or with more probability from the name of a tribe living before the Christian era in North Africa, was applied in ancient times to northern Morocco (Mauretania Tingitana) and to the north west of Algeria (Caesarean Mauretania) At a later date, by extending the application, Europeans have given the general name of Moors to the Arabo-Berber peoples of Mediterranean and Saharan Africa Then gradually they came to distinguish out of this mass the groups with which they came more frequently into contact (Tripolitans, Tunisians, Algerians, Moroccans), so that the name Moors came to be limited to the people of Spanish (Muslim), Jewish or Turkish origin of North Africa and particularly to the nomads of the western Sahara, who traverse what Ahmad al-Shinḳīṭī (in *al-Wasiṭ*, Cairo 1329 A H) calls the "land of Shinḳīṭī", from the name of its chief village, this country is bounded, says the author, by the Atlantic Ocean, the valley of the Sāḳiat al-Hamrā', the plain of Ibn Haiba (plain of the Brākna) on the right bank of the Senegal and by the two towns of Walāta and Na'ma (Nema), if, like him, we take into account all inhabited areas, we ought to extend it to the east as far as the meridian of Timbuktu

Mauritania, which now forms one of the eight colonies of French West Africa, is only a part of this vast area It lies to the north of the Senegal between this river, the Atlantic Ocean and the marigot of Karakoro, to the north and east, a frontier settled by agreements separates it from the Spanish Sahara (June 27, 1900, Oct 3, 1904, Nov 27, 1912) and from the territories of the south of Algeria (agreement of June 7, 1905) and from the French Sūdān (decree of 23rd April, 1913) It has an area of 835,000 square kilometres, 289,000 inhabitants, the density of population being 0 34

Except for the banks of the Senegal, the country is steppe or desert, and only suitable for stock rearing To be brief, it is a military frontier district depending on the north the more favoured lands of the Senegal rather than a country suitable for development by colonisation

I GEOGRAPHY

A semi-circular range of hills of no great height, worn by erosion but often difficult of access, starts as it were out of the ocean to the south of the Rio de Oro and reaches the middle course of the Senegal after running round the contours of an ancient gulf of the quaternary period The Adrār Tmar and the Tāgant separated by the depression of the Khat form as it were the cornerstones of this system and are continued to the north-west in the "petrified sea" (a plain scattered over with rocky islets) of the Tiris and by the arêtes of the Adrār Sutuf, to the south by the Rgaiba and Asaba

The interior of this gulf consists almost entirely of sands, brought from the desert by the predominating north east winds The dunes in the south are all fixed and are called "dead", in the north they are "alive" and constantly changing Like the other dunes of the western Sahara they run in the direction of the wind, N E–S W, and are separated from one another by contours of firmer soil along which traffic can go

The Shamamah is a plain, formed of lands of alluvial origin, along the lower Senegal and as such particularly suitable for cultivation, as we go up the river it is known as Litama and then as Gidimaka Other plains, those of the Brākna and the Gorgol, are more remote from the river, they contain permanent pools of water to which their girdles of high trees gave a characteristic appearance (*tāmurt*) To the north of the Shamamah and the land of the Brākna stretches a series of dunes among which may be mentioned those of Amatlish The couloir of the Inshiri continued by that of the Amsaiga separates the latter from the similar ranges, the Akshar and the Azefal, which stretch to the Tiris, they are difficult to cross, but between them the Tijirit supplies an easy route Beyond to the north-west, the Tasiast and the Swīḥel al-Abyad are great plains of denudation

On their convex face, the Adrār and Tāgant are prolonged to the north in the massif of the Kudiat Ijjel and by that of the Zemmur, separated by the Tizel-kaf, towards the north-east by the cliffs of the Dhar Adrār and the Hank and by the plateau of the Eglab, which stretches to the

great sand-dunes of the Igidi, to the east by the Dhar Tishit which runs to Walata Between these lines of rock, great ridges of moving dunes make passage difficult but provide good pasturage for the flocks, these are from north to south, the Erg al-Hamami, the Makteir, the Waran, the Adafer and the Aukar Lastly, to the north of all these masses of sand, the Ghallaman, Karet and Yetti are "tanezrufts" without water, of hard and flat soil, which run as far as the Hammada of the Dra

The coast consists of dunes and plateaux with numerous *sebkhas* or salt lakes There is usually a large sand-bar, nevertheless the sea, which is very rich in fish, gives a livelihood to a population of fishermen

The Sahara in the proper sense of the word hardly extends beyond a line marked by Cape Timiris, Mejriya (Moudjeria), the northern bank of the Tāgant (depression of Khat), the southern margin of the Adafer and Walata It is especially dry on both sides of the Adrār to the west in the region of Port Etienne and in the dunes bordering on the Timis, and especially to the east where to the north of Walata, the Mraya, Djuf and the western part of the Erg Shesh, still almost unknown, form a waterless no man's-land, this district is visited only by antelopes, gazelles and ostriches, and by the Nmadi, hunters who can manage to go for days without water and live like their game on green stuffs

To the south of the line above given, the steppe gradually changes to forest as we near the river The climate is very hot, the influence of the sea is not felt beyond a score of miles inland Subtropical rains fall as far as the north of the Adrār

II POPULATION

At the earliest period to which the chronicles and native traditions go back, Mauritania seems to have been peopled by negroes Later, in the course of centuries, it received various immigrations of Berbers, especially Sanhādja and Zanata, Arabs and probably also of Jews The Sanhādja came first, certainly before the Hidjra, later the development of Trans-Saharan commerce brought to the few towns that had been built, merchants of varied origin (Arabs, Berbers, Zanāta, Nafūsa, Lwāta, Nafzāwa, etc), at different periods also, Jews came there to seek refuge from persecutions, the last of which drove them out of Tuāt at the end of the xv^th^ century, lastly the Arabs belonging to the Ma'ḳil group in their turn invaded the country from the xv^th^ century onwards, bringing with them more Zanāta or driving them in front of them

The Jews have been completely absorbed into the Berbers (they form, it is believed, the foundation of the caste of smiths, *ma'allemīn*) or into the Fula, so that it is not possible to estimate their numbers at the present day The negroes, who have been gradually driven towards the river, are now represented by approximately 36,000 Tuculors (Takrūr), 21,600 Sarakole and 13,000 Wolof, Fula and Bambara The Arabo-Berber Moors number about 216,000

III HISTORY

a Prehistory Such researches as have been made in Mauritania, notably in the Adrār and in the Aukar, have revealed there, as throughout the Sahara, the existence of important prehistoric sites, if it is not possible to date them, they are at least evidence of a very early population whose utensils seem to connect them with the negroes These conclusions are further confirmed by the native chronicles and traditions, and perhaps we ought to connect with these remote inhabitants of the country the *Bafur*, to whom the Moors attribute the creation of the palm-groves of the Adrār and who are said to have built a town, the "city of the dogs", on the site of the present Azuggi, ten miles N W of Atar What seems probable in any case is that these black Mauritanians were more or less subjects of the first kingdoms known to the southwest of the desert that of Takrūr, which ruled Senegalese Futa, that of Ghana, the capital of which was on the site of the modern Kumbi, 100 miles S W of Walata and that of Diara which succeeded them and ruled the whole of the western Sūdān To the north, the lands of the negroes no doubt marched with the lands in which the Sanhādja and Znāga Berbers led a nomadic life in the south of Morocco

b The Sanhādja invasion We do not know at what date the Sanhādja invaded Mauritania, but it was certainly a very early one It is possible that expeditions by the Arab emirs to al-Maghrib al-Aksa, beginning in the latter years of the seventh century, which marked the first contact of the Sanhādja with Islām, may have driven them to the south but their first incursions into the Timis, into the Adrār and to the Tāgant were probably much earlier Their conquest of the country, it is true, seems to have been fairly slow and it was not, it appears, till the xi^th^ century that they succeeded in reaching the banks of the Senegal for the first time

c The first Sanhādja kingdom At the beginning of the ninth century, a certain number of Sanhadja tribes (among them the Lemtūna, the Guddāla and the Beni Wāret) occupied the Adrār, with their advanced posts in the Tāgant, and made raids into the Hawd (Hodh) against the negro Soninke empire of Ghana The Lemtūna supplied them with chiefs at this time, and one of them, Tilutan (d in 836 or 837), succeeded in imposing his authority on all the Berbers and making twenty negro kings pay tribute to him The chief towns of his dominion were Azuggi and especially Audaghust, forty miles N E of the site of the modern Kifah (Kiffa) Audaghust seems to have been founded in the seventh century by the Soninke and its fame as a centre of trans-Saharan trade brought it a large foreign population, already in part converted to Islām Berbers of different branches and Arabs In spite of this brilliant start, this Lemtūna dynasty lasted only a short time and disappeared in 919 Each tribe then led an independent existence and the emperors of Ghana were able to extend their power towards the Tāgant and to take Audaghust at the end of the tenth century

d The second Sanhādja kingdom Towards 1020, the chiefs of the various Sanhādja tribes agreed to combine again as in the time of Tilutan and thus to resist the encroachments of the Soninke The power was placed in the hands of a Lemtūnī called Tarsina, who seems to have been the first really Muslim Znāgī ruler He went to Mecca and his enthusiasm as a new convert led him to a holy war on the negroes, in which he lost his life (1023) His son-in-law Yahyā b

Ibrāhīm of the tribe of the Guddāla succeeded him, according to the custom which made the supreme command go to the two tribes alternately Like Tarsīna, he was a zealot and on returning from the pilgrimage, he brought from Morocco a holy man, ʿAbd Allāh b Yāsīn, to whom he entrusted the task of educating his brothers, who were still very ignorant of the principles of Islām The saint was at first well received by the Sanhādja and he made them build the town of Aiet-nenna near the site of the modern Tishit But soon his commands appeared too difficult for the nomads, who rebelled against him He sought refuge with his disciples in a *ribāt* or fortified monastery on an island in the ocean (sometimes identified with Tidra) and they were henceforth known as the *al Murābitūn* (the men of the *ribāṭ*), a word which has been corrupted in Europe to Almoravids under which name they have become famous

e The Almoravids Their reputation for sanctity spread very rapidly and attracted many disciples to them When ʿAbd Allāh had gathered around him a sufficiently large body of men, he led them against their rebellious brethren and against the negroes In a few years they subdued the whole of the western Sahara, from Tafilalt and the Dra to the Senegal In 1050, Yahyā b Ibrāhīm died, and Yahyā b ʿUmar, chief of the Lemtūna, became the political head of the confederation, ʿAbd Allāh b Yāsīn remaining the religious chief While the first recaptured and plundered Audaghust, the second attempted the conquest of the Maghrib But soon they were both slain, Yahyā in a rising in the Adrar in which the negroes of the Takrūr tried in vain to help him, and ʿAbd Allāh in fighting the Barghawāta heretics of the plains of Morocco Abū Bakr, brother of Yahyā, was then for some time supreme chief of the Almoravids, then to gratify his ambitious nephew Yūsuf b Tāshfīn he handed over to him his conquests in North Africa, keeping only to himself the sovereignty of the south He devoted himself to a holy war against the negroes and to their conversion to Islām He succeeded in driving them back towards the river and in taking Ghana in 1076 and the capital of the Takrūr in 1080, extending his teaching, the tradition says, as far as the lands of a Mandingo prince of the Upper Niger He was slain in the Tāgant in 1087 and his death marked the break up of the Sanhādja confederation in Mauritania, each tribe regained its independence

f The Tashumsha and the negro reaction Between this date and the end of the xivth century we know very little of the history of Mauritania We only suspect that the influence of the negro kingdom of Mali must have extended up to the Adrār and Tāgant and that a new Marabout Berber element formed by the Tashumsha of Sūs, came and settled in the country

The Tashumsha seem to have at first taken up the mantle of the Almoravids and to have made themselves the champions of the *djihād* against the negroes But after a few successes, they were driven back from the region of the river and fell back upon the Tiris and Adrār, where they gave up fighting and devoted themselves to study and religious devotions The successes of the negroes then became serious Wolofs, Soninkes and Tuculors recaptured a whole part of Mauritania and might perhaps have succeeded in subjecting the Berbers, who were exhausted by their campaigns of conquest in the Mediterranean region, if the coming of the Maʿkil Arabs had not checked them

g The Maʿkil invasion It is not possible to date this new invasion exactly, it is, however, certain that it was not a single effort It went on almost down to the nineteenth century with little groups filtering into the Sanhādja encampments and at length submerging them

Setting out from Egypt, the Maʿkil passed along the northern border of the desert and reached the Ocean to the south of Morocco in the first half of the xiiith century They then entered the service of the Marīnid rulers of Fās, who used them to keep in subjection the provinces beyond the Atlas and to collect taxes These undisciplined nomads very soon took advantage of their privileged position Measures had to be taken against their brigandage and their threats to overrun Morocco, and military expeditions were sent against them Either as a result of these reprisals, or because they were called in by the Sanhādja to help them against the negroes, or because a year of drought drove them in search of new pasturage, some of them, belonging to the confederation of the Dwi Hasan or Beni Hasan, went down towards Mauritania But the chronicles do not say why In any case, having helped to drive the negroes back towards the river, supported by the Zanāta Kunta who came from Tuāt at the same time as the first of them, they reduced to vassalage the Sanhādja of Upper Mauritania (Ijjel and Zemmūr) in the xvth century, Western Mauritania, Wadan and Tāgant in the xviith and the Adrār and Lower Mauritania in the xviiith century Throughout the long period from the xvth century to the present day, we find the authority in the hands of a certain number of Udāya tribes the Ulād Rizg, the Mghāfra Ulād Mbārk, the Brākna, the Trārza and the Ulād Yahyā b ʿUthmān Other Beni Hasan also went south, but barely reached Mauritania The Ulād Dlim have always remained in the desert zone and the Brābish seem to have passed some years a little to the north of the Senegal before migrating to the region of Timbuktu

h The Maʿkil and the Sultāns of Morocco From their first sojourn in the south of Morocco, these Maʿkil long retained the character of Makhzen tribes, under the Saʿdians and ʿAlawis, many of them supplied contingents to the *gīsh* tribes This status gave their migration southwards the appearance of a conquest in name of the Sultāns This was no doubt the legal justification of the tribute which they exacted from the conquered Beduins, it also explains why the rulers of Fās or Marrākesh sometimes claimed as theirs the territory of Mauritania, why they sent several expeditions there in the xviith and xviiith centuries, why they granted investiture to certain chiefs and lastly why the author of *al Wasīt*, after consulting several learned men, thought that the "land of Shingīt" should be included with the Maghrib and not with the Sūdān

i The Sanhādja reaction Whatever was the actual success of the Arab conquests in Mauritania, it were not effected without violent reaction on the part of the Sanhādja The poverty of the Tashumsha, the negro danger and the looseness of links between the various bodies of invaders facilitated the settlement of the early Arab invaders But the tyranny of the Maʿkil towards the Berbers

brought them in the xviiith century to such desperation that a general rising broke out in the form of an attempted restoration of the Almoravids led by Nāsir al Dīn, a marabout descendant of the Lemtūna This individual, who camped in western Mauritania, first preached a holy war there against the negroes, being sure of re-uniting the various contingents against the traditional enemy Then having given the troops sufficient training in a campaign which brought them across the river to plunder the left bank, he turned openly against the Arabs This was the celebrated "War of Babbah", in the course of which the Arabs were held in check for thirty years, but in the end quarrels within the Sanhādja ranks destroyed their strength and in 1674 the defeat at Tīn Yefdad doomed them to vassalage

In much the same way in 1745 the Ideïshilli Berbers of the Adrār had to bow before the Maʿkil and at the end of the xixth century we find them again rising against the Arab amīr and assassinating him Finally in the Tāgant, the Sanhādja Iduʿaïsh well led by their chief Muhammad Shein regained their independence at the end of the xviiith century They almost succeeded in seizing the Adrār in 1892, drove the Zanāta Kunta out of the Tāgant and extended their power to the Senegal, under the able rule of amīrs who are still reigning and claim to be true descendants of the Almoravids

j The rule of the amirs All over, from the xviiith century, the political situation of the tribes became stabilised, and regular little nomad states seem to have been formed, usually under Arab chiefs Thus we now find the dynasty of the Ulād Ahmad b Daman ruling among the Trārza with distinguished sovereigns like ʿAlī Shandura (1703–1727) who, supported by Sultān Mawlāi Ismaʿīl, delivered his tribe from Brākna domination, and especially Muhammad al-Habīb (1827–1860) whose long reign is marked by the first Moorish resistance to European penetration Among the Brākna also, the Ulād ʿAbd Allāh amirs played a preponderating role after the war of Babbah and their possessions extended from the Tāgant to the Ocean Later, and particularly from the xixth century, their power declined, in spite of the brilliant reign of Ahmaddu I (1818—1841), and their desperate resistance to the advance of the French caused them to disappear from the political scene In Adrār the Ulād Yahyā b ʿUthmān also furnished great leaders Ahmad uld Muhammad (1871—1891) who was able to keep his turbulent subjects at peace with their neighbours and who tried to develop trans-Saharan commerce, and Ahmad uld Sīdi Ahmad (1891—1899) who by his military successes earned the title of "amīr of war" Lastly in the person of Bakar uld Sweid Ahmad, a descendant of Muhammad Shein, the Tāgant produced the greatest Moorish ruler of the xixth century

The rule of these amīrs was continually beset with great difficulties, produced by their rivalries, the lack of discipline, rebellion and intrigues among their subjects, by the warlike raids of the negroes, and particularly by the efforts of Europeans to establish their rule on the Atlantic coast and on the banks of the river

k European rivalries on the coast of Mauritania It was in the first half of the xvth century that the Portuguese visited the coast of Mauritania and the north of the Senegal for the first time At the instigation of the Infante Henry the Navigator, expeditions followed which brought back slaves, gold and gums After João Fernandez had gone to Wadan in the eastern Adrār, where he spent some months among the Sanhādja in 1446, a permanent settlement was founded in 1448 on the island of Arguin, which afforded excellent conditions of security From there the Portuguese endeavoured to extend their power into the interior and to command the great caravan routes which led from the Sūdān to Morocco, to them are attributed the fortresses, now in ruins, near Wadan and at Azuggi But if it is certain that for a short time they extended their relations as far as the capital of the negro empire of Mali on the Upper Niger, it seems that they did not own factories for any length of time except on the coast

The trade of Arguin flourished for two centuries in the hands of the Portuguese, then of the Spaniards and it extended as far as Lower Mauritania through Portendik (corruption of "Port d'Addi" from the name of an emīr of Trārza), a not very good roadstead where barter was carried on The French at a later date established themselves at the mouth of the Senegal (1626), the Dutch at war with Spain took Arguin in 1638, which the English took from them in 1665 and a struggle for influence began among these three nations which lasted for a century Arguin and Portendik continually changed hands, while France developed her trade along the Senegal by building factories Finally the Treaty of Versailles (Sept 3, 1783) recognised her exclusive sovereignty over the Atlantic coast from Cape Blanc to the mouth of the Salum The wars at the beginning of the xixth century brought the English back there for a time, and it was only in 1817, three years after the treaty of Paris, that France definitely took possession of the country Arguin and Portendik had in the meantime been almost completely ruined as a result of these vicissitudes

l The French conquest Down to 1857 England retained the right to trade at Portendik, which allowed the Trārza chiefs and in particular Muhammad al-Habīb to play off against one another the two nations who seemed to threaten her independence, and thus to gain a footing on the left bank of the Senegal The position of the Europeans with regard to the natives was however difficult and trade with them was permitted only on payment of heavy customs dues It was only in 1854 with the appointment of Faidherbe as governor of Senegal that a more vigorous policy was introduced into Lower mauritania In four years he reduced Walo on the left bank to submission and drove the Moors out of it and forced the emīrs of Trārza and Brākna to sign a treaty, which if it did not abolish the customs, at least recognised that France had a right of suzerainty over the peoples living near the river and guaranteed freedom of trade there

For nearly fifty years, these treaties were respected and the Moorish chiefs, too much occupied in maintaining peace among their subjects and in defending themselves from the intrigues of pretenders, no longer thought of coming into conflict with French troops, commercial agreements were made which extended as far as with the Iduʿaïsh of the Tāgant and one treaty was even made with the emīr of the Adrār This period also saw a great deal of exploration of the interior, after

Mungo Park (1795—1796), Caillié (1825), Caille (1843) and Panet (1850), Vincent, Bu al-Mugdad, Bonnel, Aliun Sal, Mage, Fulcrand, Aube, Soleillet, Quiroga and Cervera, Douls, Soller, Fabeit, Donnet, Blanchet, Gruvel and Chudeau contributed to our knowledge of this country and prepared the way for its occupation

In the last years of the XIXth century the troubles of which Lower Mauritania was the centre finally had repercussions on the trading centres on the river which became daily more serious The insecurity hampered commerce and in proportion as the memory of the vigorous policy of Faidherbe became obliterated, maraudeis ravaged the country down to the left bank of the river, right into the administered country The conquest of Mauritania had to be planned in order to protect effectively the colony of Senegal and with this object an endeavour was made to use the influence of the marabouts, tired of a perpetual warfare, of which too often they bore the expense The diplomatic action of M Coppolani, Commissaire Général of the government since 1902, judiciously supported by police operations, brought about the occupation of the Trārza country in 1903, of the Brakna country in 1904 and of the Tāgant in 1905

This rapid advance, however, was checked before the anti-foreign propaganda of a marabout of the Hawd, Mā' al 'Aīnīn, son of Muhammad Fādil, who after spending a long period in Upper Mauritania, had been settled for some years at Smara near Sagiat al-Hamrā' His prestige as a magician, supported by the veneration shown him by the Moroccan sultāns, was not long in winning him the support of the greater number of the Moorish tribes and especially of those of the Adrār, the emir of which had been brought up in his entourage At his instigation, Coppolani was assassinated and a cousin of the Sultān Mawlāi Idrīs came to lead the *ǧihād* in Mauritania A success gained by him at Nyamilan led to nothing, but on the return of a delegation of Moorish chiefs who had gone to seek help from the sovereign of Morocco, a general offensive was begun against the French troops (1908) To put an end to an agitation which threatened to become dangerous, Colonel Gouraud conquered the Adrār in 1909 and his victory was completed in 1910 by the death of Mā' al-'Aīnīn and in 1912 by the capture of Tishit and joining up with the troops of the Hawd The conquest of Mauritania by the French was thus practically completed The march of el-Heiba, son of Mā' al-'Aīnīn, on Marrākesh in 1912 revived some inclination to rebel among the Moors, but the destruction of Smara in 1913 checked this, and France now only had to secure the protection of her colony from raiders from the Sahara

IV SOCIAL AND ECONOMIC LIFE

The negroes are settled agriculturists who have their villages mainly in the Shamamah and the Gorgol and in the main they belong rather to Senegal than to Mauritania

The Moors have a few villages (the principal are Atar, Shingiti, Wadan, Tijigja, Tishit) with palm groves and a few farms in the Adrār, the Tāgant and the Dhar They are great nomads who live under cone-shaped tents of camel skin and follow the rainfall with their flocks Those who wander in the zone of the steppes oscillate between the river and the desert, except the Trārza of western Mauritania, who, on account of the dryness of their country, move over a much greater area and sometimes even reach Tiris and Adrār Sutuf The people of the Adrār go down as far as Tāgant, and on the north at one time were in contact with the Tekna of the south of Morocco around the Sagiat al-Hamrā' Their supply of meat is very scanty and it is not an exaggeration when Psichari calls them "the most wretched of mankind"

Their groups have been much gradated by the constant influx of Moroccans Before French rule, the *Hasan*, pure Arabs, formed the noble and warrior class who protected the encampments and lived by cattle-rearing and marauding The *Zwaya* or marabouts, generally Sanhādja or Zanāta Berbers, paid an annual sum called *ghafer* to the Hasan for their security, they were likewise breeders of cattle, but also included among them merchants and men of letters who were regular travelling universities, the more or less open practice of sorcery served them as a means of defence against the exactions of the Hasan The *Znāga* or tributaries (*lahma*), Sanhādja Berbers, were the exploited The feudal dues which they paid to the Arabs (*horma*) did not always exempt them from periodical payments to the marabouts nor from arbitrary sums levied upon them by one or the other They were in part agriculturists The *Haratin*, freed slaves, formed tribes of serfs, usually better treated than the preceding Finally the Hasan and the marabouts owned numerous slaves in which they did a busy trade On the fringe of all these groups, the *Ma'llemin*, the griots (*iggaun*) and the *Nmadi* were respectively the workmen, poets and singers and hunters who supplied the encampments of eastern Mauritania with meat

The barriers between these castes were in theory rigid A certain number of marabouts, however, and even of Znāgas succeeded in escaping from Arab tutelage, like the Idu'aish of the Tāgant, and devoted themselves to the adventurous life of the Nmadi hunter (*geimer*) just as "penitent" Hasan sometimes adopted the pious life of the Zwaya (*Tiyab*)

French administration has left this traditional organisation intact, only suppressing slavery, it has, however, checked the abuses of the Hasan by putting a stop almost everywhere to the payment of the hormas and ghafers

Economic Life Mauritania has only one port, Port-Etienne, on the peninsula of Cape Blanc, it is, however, only a fishing centre The course of the Senegal is used as far as Podor in the dry season, as far as Bakel in the winter months No road has yet been made, but the important points are linked up by automobile or caravan services The telephone is in use only in the south, but its place is taken by the wireless, which connects Mauritania with Dakar, Casablanca, Agadir, Bamako and Timbuktu

The principal source of wealth of the country is stock-breeding 51,000 camels, 3,800 horses, 239,000 cattle, 2,000,000 goats and sheep, 66,000 asses The abundant game (antelope, gazelle, ostriches, guinea fowl and bustards) supplies further food for the inhabitants Among agricultural products, special mention may be made of the date-palms in the north (3,000 tons of date a year), along the river and in a few favoured valleys of

the plateaus, millet, rice, maize, wheat and barley In the south gum is a traditional article of export (1,250—2,500 tons a year)

The natural resources of the country have hardly been investigated as yet We may mention, however, the salt of the Sebkhet Ijjel, which has for long supplied the caravans to the south, along the coast a few salt-pans are worked by the Moors The annual export is 4,700 tons

Industry is in a very rudimentary stage and confined almost entirely to the manufacture of leather goods which form the equipment of the cameleer and the furniture of his tent Fishing supplies the encampments near the coast

A certain number of caravans transport merchandise from the north to the south along the coast and through the Adrār and Tāgant to the trading centres on the river and the Sūdān They take with them animals, gums, salt, dates, ostrich feathers, skins and leather, and bring back cloth, arms, powder, candles, sugar, tea, spices and cereals, and supply the markets of Atar, Shingiti, Wadan and Tijigja As a result of the insecurity in the desert there is no longer any regular trans-Saharan trade

V POLITICAL LIFE

The negroes are ruled by their village headmen and chiefs of districts The Moors are grouped in tribes under the authority of a shaikh assisted by a council of notables or *djemā'a* Sometimes several tribes are combined in a hereditary amīrate, the ruler of which surrounds himself with a regular court generally recruited from among the Znāga or Harātīn The shaikh or amīr is practically all-powerful, only the right to judge in civil matters is not completely his, the kādīs exercise it The amīr further reserves to himself a kind of right to supervise their judgments through the intermediary of his private kādī who forms a court of appeal

The French administration has been superimposed on this traditional organisation A Lieutenant-Governor, residing at St Louis, on the right bank of the river, is the head of the colony and is assisted by a military commandant, an inspector of administrative affairs, a secretary for military and political affairs, a secretary for finance and a department of public works The local administration carried out by administrators or officers is divided into eight districts (Trārza, Brākna, Gorgol, Gidimaka, Assaba, Tāgant, Adrār and Baie du Lévrier) and seventeen sub-divisions or administrative posts It controls the native administrative and judicial organization

The Moors pay the Kur'ānic taxes (zakāt and 'ashur) from which their riding-camels and gums alone are exempt The negroes pay a poll-tax and a tax on cattle Indirect contributions are paid by the markets, the salt-pans, the carrying of arms, the exploitation of the woods and ferries The Budget for Mauritania for 1930 was 14,623,000 francs

VI LANGUAGE

The language spoken in Mauritania is Arabic, the *hasania* or language of the *beidān*, the "whites" Some 7,000 Znāga in the south have retained a Berber dialect related to that of the dialects of southern Morocco At Wadan and Tishit, the language *azair* (Azer) which is a form of Soninke is now spoken only by a few individuals Lastly the negroes of the river have retained their own language

VII RELIGIOUS AND INTELLECTUAL LIFE

History does not tell us what was the religion of the Sanhādja before their conversion to Islām, we can only think that they had to some extent been influenced by a monotheistic faith like Judaism or even Christianity Their first contact with Islām probably dates from 'Ukba b Nāfi''s expedition to the south of Morocco (681), but it is certain that their real conversion was much later and can hardly have been earlier than the energetic proselytising campaign of 'Abd Allāh b Yāsin

At the present day all the inhabitants of Mauritania are Muslims of the Mālikī rite, but many of them and more particularly the warriors and the Nmadi have only a very superficial acquaintance with their religion and take little interest in it, superstitions and sorcery further corrupt their Islām almost everywhere, revealing the primitive state of the people and negro influence Islām is not really known and practised, except among the tribes of marabouts, among the latter, a mystical tradition and a fairly advanced culture have always made themselves felt and for this reason they play in Moorish society the part of a kind of sacerdotal body such as is found nowhere else in the Muslim world of the west This is no doubt a remote consequence of the Almoravid movement, revived for a time in the war of Babbah, and of the peculiar situation of these Muslim nomads, who have here long been the advance-guard of the white race, face to face with the negro fetish-worshippers of the Senegal and Sūdān Perhaps, like Renan and Psichari, we ought also to give credit to the influence of *religiosite* of the desert In any case in thus assuming a kind of sacred character and surrounding it with a magic prestige, certain Berbers have had a regular revenge of their amour propre on the pride of race of the Arab invaders and have opposed to their tyranny and brigandage a defensive weapon which has not been without effect

The principal brotherhoods of Mauritania are those of the Tidjānīya and of the Kādirīya, their influence extends into the lands of the negroes The first are represented by the Ida u 'Alī of the Trārza, of the Tāgant and of the Adrār, who claim to be shorfā' and say they came from Tabelbala at the beginning of the xivth century Since the early years of the xixth century they have been connected with the branch of the Tidjānīya in Fās The second are much more numerous and influential, they have several branches, that of the Bekkāya dates from the xvth—xvith centuries and is represented from the bend of the Niger to the Tāgant and Adrār by the tribe of the Kunta About a century ago it received fresh impulse in a new "path" and its autonomy in Lower Mauritania was secured by the great prestige of the Shaikh Sidiya, of the Ulud Biri (d 1924) We may also mention the branch of the Fādilīya, founded in the early years of the xixth century, which enjoyed particular fame some 20 years ago under the direction of Mā' al-'Ainīn and his brother the Shaikh Sa'd Bū These two branches have lost their importance since the deaths of these famous individuals Lastly the Kādirīya are still represented by the some 600 members of the

Ghudfiya brotherhood, whose practices are regarded as heretical by the other Muslims

Shingiṭi, benefiting by its situation on the routes of the caravans which came from western Morocco or Sebkhet Ijjel down to the Hawd or the Senegal was at one period an intellectual centre, the reputation of which extended to all the western Sahara and to the Sūdān We see this in the fact that it was able to give its name to all the Moorish tribes (*Shenāgiṭa*) and to the territory in which they led their nomadic life and that the tradition of the country makes it one of the "seven holy cities" of Islām It has now lost its old prestige In the xvith century the fame of the medersas of Timbuktu must have offered serious competition to it At the present day Shingiti is seriously threatened by the sands of the Waran and its trade is much reduced Atar is assuming an increasing importance, the insecurity and eccentric development of North Africa and the Sūdān have led to the almost complete disappearance of the trans-Saharan trade by which it lived and in particular, as is natural in a land of nomads, it has been rather under tents and particularly in the marabout encampments of western Mauritania that intellectual culture has developed Universities have been created there where the teaching of the Kur'ān, theology, law, grammar and logic still flourishes Some of them have known outbursts of glory under famous teachers, who have sometimes created schools of mystic initiation, like those directed by the Shaikh Sidiya, Mā' al-'Ainīn or Sa'd Bū or like that of the Ahl Muhammad Sālem, which is a kind of university in the Tiris which produces almost all the jurists of Mauritania

A whole original literature has been able to develop Kur'ānic matter, Hadīth, law according to Sidi Khalīl and his commentators, are its essential elements, with the doctrines of the Sūfis and their mysticism But historical studies have also had and still have their eager followers, especially among the tribe of the Ulād Daman (Trārza) Lastly poetry is held in honour among all the tribes, warrior and marabout alike, and supports a whole caste of troubadours, the griots, who enjoy the favour of the courts of the emīrs

Bibliography A complete bibliography of Mauritania is given in *Actes du VIIème Congres de l'Institut des Hautes Etudes Marocaines* (*Hesperis*, vol xi, Paris 1930) Cf also the collections in the *Bulletin du Comite d'Etudes historiques et scientifiques de l'A O F*, in the *Revue du Monde Musulman*, in the *Bulletin au Comite de l'Afrique Française* and in *La Geographie* — Only the more important studies need be mentioned here Ahmad al-Shingītī, *al-Wasīt* (monography of Mauritania), Cairo 1329 (1911), *Annuaire du Gouvernement Géneral de l'A O F*, Paris 1912 *Notice sur la Mauritanie*, R Basset, *Mission au Senegal*, vol i *Étude sur le dialecte Zenaga*, *Notes sur le Hassania*, *Recherches historiques sur les Maures*, Paris 1909, Général Faidherbe, *Le Zenaga des tribus senegalaises*, *Contribution à l'étude de la langue berbère*, Paris 1877, Cdt Gillier, *Les populations de la Mauritanie*, in *Rev des Tr coloniales*, Nov —Dec 1924, Jan —Feb and March—April 1925, do, *La pénétration en Mauritanie*, Paris 1926, A Gruvel and R Chudeau, *A travers la Mauritanie occidentale* (*de Saint-Louis à Port-Etienne*), Paris 1909—1911, J Hamet, *Chroniques de la Mauritanie sénégalaise*, Paris 1911, P Marty, *Etudes sur l'Islam Maure*, *Cheikh Sidia*, *les Fadelia Les Ida ou Ali*, Paris 1916, do, *L'Emirat des Trarzas*, Paris 1919, do, *Etudes sur l'Islam et les tribus maures Les Brakna*, Paris 1920, do, *Tentatives commerciales anglaises à Portendik et en Mauritanie*, in *Rev de l'hist des colon franç*, 1922, L Massignon, *Mauritanie*, in *Annuaire du Monde musulman*, 3rd ed, 1929, *La Mauritanie*, in *Notices publiees par le Gouvernement General de l'A O F à l'occasion de l'Exp colon de Marseille*, Corbeil 1907, G Poulet, *Les Maures de l'Afrique occidentale française*, Paris 1904, E Psichari, *Les voix qui crient dans le desert*, Paris 1919, F Richet, *La Mauritanie*, Paris 1920

MORĀDĀBĀD (Murāddābād), a district in the Rohilkhand division of the United Provinces of India and also the chief town in it The district has an area of about 2,300 square miles and a population of 1,200,000 of whom over 420,000 are Muhammadans Nothing is known of the early history of the district In the Muhammadan period it was successively ruled by the Sultāns of Dehlī, from whom it was occasionally taken by the Sultāns of Djawnpūr, the Moghuls, the Rohillas, and the Nawābs of Oudh until it was ceded to the British in 1801

Morādābād is the principal town in the district, it is situated on the Delhi-Bareilly road and on the main line of the Oudh-Rohilkhand railway It has a population of 75,000 of whom over half are Muslims The town is a Moghul foundation of the second quarter of the xviith century Its founder was Rustam Khān who also built the Djāmi' Masdjid, as an inscription testifies, in 1632 The town takes its name from Murād Bakhsh, son of Shāh Djahān It rapidly ousted Sambhal from its place as the chief town of the district Its industries are flourishing (chiefly textiles and brass work) It was a mint of the Moghul Emperors and also of Ahmad Shāh Durrānī during his invasion of India in 1760 Sambhal is a very ancient site but has lost much of the importance it possessed in mediaeval times It has an old mosque, an interesting example of Pathan architecture which has even been claimed as a converted Hindu temple It is said to have been built by Bābur but it is undoubtedly earlier Amroha is the great Muhammadan centre of the district, the majority of its population being Shaikhs and Saiyids The chief saint of the Saiyids is Sharaf al-Dīn Shāh Wilāyat, a descendant of the tenth Imām, who came here about 1300 His tomb is still shown here The Djāmi' Masdjid is a Hindu temple converted into a mosque in the reign of Kaikubād It is much visited by pilgrims, mainly Hindus who seek relief from mental diseases through the power of Sadr al Dīn, a former *mu'adhdhin* of the mosque, whose virtues are still believed to be efficacious There are over a hundred other mosques in the town

(J ALLAN)

MOREA is the usual name in mediaeval and modern times for the peninsula of the Peloponnesus which was regarded in ancient times as the citadel of Greece The name Morea is first found in 1111 A D in the subscription to fol 143r of the Greek manuscript Brit Mus Add

28816 (cf M Vogel—Y Gardthausen, *Die griechischen Schreiber des Mittelalters und der Renaissance*, Leipzig 1909, p 28, 466, and also *Byzantinisch-Neugriechische Jahrbucher*, ix 72) Originally the name Morea did not apply to the whole Peloponnesus but only to the outer mountains of Ichthya and the lands around them as well as the whole district of Elis Reliable references show us that even in the xivth century the place-name Morea was equivalent to Elis, later the name became gradually extended to the whole Peloponnesus and with this meaning it is still used not only by the Greeks but also by other peoples of east and west

Alongside of the original form Morea (ὁ Μορέας, with synesis Μορείας, Μοριὰς) we find other divergent forms in Greek literature ἡ Ἀμουρέα, ἡ Ἀμούρεα, ὁ Ἀμέρεας, ὁ Μορίας, ὁ Μορία, ἡ Μόρα, ἡ Μορέα In eastern sources of the mediaeval and modern period along with the predominant form *Amorea* (mainly in Latin Italian documents of the xiiith—xivth century), *Amoree* (particularly in documents of the xvth—xvith century), *la Morea* (properly Italian), *la Moree* (French) we also find *Amouree*, *la Mouree* (in French documents as early as the xiiith century) The origin of all these forms is to be traced to an inaccurate separation of the article from the noun *la Morea–Amorea*

In Muhammadan texts we find seven main forms of the name Morea = Peloponnesus *Lamureia*, *Lamoreia*, *Almora*, *al-Mora*, *Moria*, *Mora* and *Moreh* The first five are properly Arabic, the last Arabic Turkish There are however Arabic texts, which have the old classical name of the peninsula although with certain variants (cf below)

As to the derivation of the name Morea, it has puzzled students greatly for centuries Some scholars of the xvith century wanted to connect the name with Moors (Ital *Mori*) These were said to have settled in the Peloponnesus at one time This derivation of the place-name, which has even been adopted by modern scholars, agrees neither with historical tradition nor with philological laws At one time the suggestion put forward by Emerson (*History of Modern Greece*, i 60) and adopted by Fallmerayer found many supporters it connected Morea with the Slav word *more* = sea This view has been challenged by Kopitar (*Wiener Jahrbucher der Litteratur*, i [1830], 111—120) and again by Zinkeisen and Hopf as decidedly "misleading and fanciful" and rejected by several later Greek and Slavonic scholars At the present day it is generally thought that Morea is derived from the Greek word μορέα = "mulberry-tree", as Prof G N Hatzidakis (in the periodical Ἀθηνᾶ, vol v, 1894, p 230, 401, 549, Γλωσσολογικαί Μελέται, Athens 1900, p 29 *sqq*) has brilliantly shown on the basis of philological arguments In Elis where — as already mentioned — the name Morea, now applied to the whole of the Peloponnesus for some centuries, first appeared, the planting of the fields with mulberry-trees is said to have been very common in the middle ages These trees were indispensable for the silk industry which was at one time very flourishing in the Peloponnesus and no less in Patras Authors of the Empire (Pliny, *Hist nat*, xix 4, Pausanias, vii 5, 2, vi 26, 4, vii 21, 7) also tell us that Elis in those days produced βύσσον, i e a material related to silk In any case, as early as the xvith century, the Greeks thought that the place-name Morea was connected with the mulberry-tree This is evident for example from Joh Leunclavius (*Annales Sultanorum Othmanidarum a Turcis sua lingua scripti*, 1596, p 63) "Nomen ipsum (= Moreas) derivant Graeci nunc ab arbore *moro* quod tota regione scilicet arbor haec frequens est"

In the mediaeval Muslim writers there is a confusion between *Amureia* = Amorion in Phrygia and *Iamureia* = Moreas, Peleponnesus But *Ammure(i)a* [or *Amure(i)a*, *Amuri(i)a*, *Amori(i)a* etc] in Abu 'l-Kāsim Firdawsī can only be Amorion, which used to be described as the capital and "eye of the kingdom" of the Rūm In the geographical tables of Nasīr al-Dīn al-Tūsī (middle of the xiiith century) and of Ulugh Beg, Amureia should rather be identified with Amorion than with Morea = Peloponnesus (cf P Karolidis, in *Wissenschaftliches Jahrbuch* [Ἐπετηρίς] *der Universitat Athen*, iii 1909, p 288—297, A Hantzis, in *Byzantinisch-Neugriechische Jahrbucher*, ix, 1931, p 65 *sqq*) In the little map by the Arab Idrisi, of the year 1192 A D, *Belobūnes* = Peloponnesus is given (i e the old classical name of the peninsula) On the other hand, we find *Moria* = Morea = Peloponnesus (i e its mediaeval and modern name) in the Arabic geographical table of the Paris MS 2214, which is supposed to contain the cosmography of Ibn Saʿid of the year 1276 A D based for the most part on Idrīsī (1154 A D, cf K Miller, *Mappae Arabicae*, i, Stuttgart 1926)

The Muhammadan peoples really only became acquainted with the Morea in the xiiith century A D Hellenistic culture was long extinct there and Christianity had become predominant At the end of the fourth century (395 A D), Alaric had laid almost the whole of the Morea waste and destroyed many towns and sanctuaries famed in ancient times About two centuries later, c 589 A D, the Avars (a Turkish nomadic people) allied with Slav tribes are said to have invaded the Morea and settled permanently It should be expressly noted that it is only late and tendencious sources which tell us this What scholars of the xixth century put forward as a historical fact, namely that an independent Avar or Avar-Slav Kingdom, intractable to Byzantine or Greek Christian influence, existed in the western half of the Morea for 218 years (589—807), must be relegated to the realms of fable (cf E Curtius, *Peloponnes*, i, Gotha 1851, p 86) It is certain, however, that considerable ethnological changes took place in the middle ages in the Morea In the viiith century in the reign of the Byzantine emperor Constantine V (741—775), if not earlier, numerous Slav tribes had pushed their way into the Morea, which had been much depopulated from 746 by a terrible pestilence This epidemic had also made great gaps in the population of Constantinople, which Constantine V is said to have endeavoured to fill with people from the Morea, this imperial edict must have further contributed to reduce the Greek element in the peninsula It may be assumed that the Slavs who at this time were settling mainly in Arcadia and Messenia, Elis and Laconia, sought and found new homes in the Morea, which had been favoured by nature with a milder climate, not only as hostile robber hordes but also as peaceful colonists from the north

According to Schafarik (*Slavische Altertumer*, German transl by Wuttke, vol ii, p 192), the spread of the Slavs over the Morea can be fixed

between 746 and 799 Nevertheless there can be no question of a complete slavisation of the country nor of a complete annihilation of the Greek element in it — as Fallmerayer and his followers hold The immigrant Slavs in Greece proper cannot have been very numerous They were really nomad herdsmen and peasants, who settled here and there in the open country Their level of culture much have been very low On the other hand, the Hellenic element in Greece proper and no less in the Morea had always had control of the coasts and of the towns and fortresses in the interior, and it was moreover strong enough as regards culture to assert itself through the centuries and even to leave its mark on the foreign Slavs The Slav settlers often caused trouble to the Byzantine government, so that the latter found themselves forced to send expeditions against them For example in 783 A D the Athenian empress Irene ordered the Patriarch Staurakios to punish the Slav tribes of the Morea and the rest of the mainland of Greece He appears to have had numerous troops at his command and was able to carry out his task satisfactorily in a few months He subdued the Slavs and forced them to pay an annual tribute to the imperial treasury He returned to Constantinople with many prisoners and considerable booty and celebrated a triumph in the Hippodrome there

After some time, the Slavs again rose in the Morea against Byzantine authority They became a great danger and even threatened the towns on the coast Supported by Saracens from Africa, the Slavs in 807 (805 by another reckoning) blockaded Patras from the land The citizens of this important town defended themselves bravely in spite of a shortage of provisions, water and other supplies When the help sought from the imperial strategos in Corinth did not come, the citizens of Patras made a vigorous sortie They put the enemy to flight and drove them far from their town Greek superstition seems to have ascribed the victory won at Patras over the Slav hordes to St Andrew, the patron saint of the town Nothing is recorded of the fate of the Saracen allies of the Slav besiegers of Patras It is supposed that it was they who ravaged not only Patras but also Rhodes and other islands by the caliph's order in 807 A D With the defeat at Patras the strength of the Slavs of the Morea was broken It is true that they again and again attempted to win their independence of the Byzantines by force of arms but without success In 850 A D , the doughty Byzantine general Theoktistos Bryennios subdued all the Slav districts of the Morea as far as the mountains on the Taggetos and Parnon, where two rebel Slav tribes, the Ezerites and Melinges, had settled These two tribes survived longest, sometimes as vassals of the Byzantines and sometimes as their open enemies As early as the ninth century A D began the conversions of the Slavs to Christianity to which is due also their gradual hellenisation The intermixture of the Greek Moreotes (Turk Moralis) with the Slavs undoubtedly contributed considerably to the former process

The Normans in Sicily in the following period disturbed not only the coasts of the mainland of Greece but also the interior of various Balkan provinces of the Byzantine empire The Norman king Roger II in his campaign in 1146 against Greece sailed round the Morea and occupied without a blow — after successfully storming the strongly fortified Malvasia — Corinth, celebrated for and prosperous from its trade and industries It was for this same king, that the Arab Idrīsī composed his *Nuzhat al-Mushtāk*, finished about 1153 A D According to this work, Morea (*Belbonesh*), a flourishing and prosperous island of the Mediterranean, had 13 large and important towns, many citadels or fortified places and villages Of the towns of the Morea Idrīsī mentions the following among others Corinth, "a large and populous city", Batia (= Patras), "situated on a promontory", has a "famous" church (of the apostle St Andrew), Arcadia (= the ancient Kyparissia), "a large and thickly populated town", whose harbour is visited by many ships, Irouda (= Navarino) with "a very commodious harbour", Motonia (= Modon, q v), "a fortified town", it was protected by a fort which commanded the sea, Coronia (= Koron), "a little town" with a citadel commanding the sea, el Kedemona (= Lacedaemonia, the mediaeval Sparta), "a flourishing and important town, six miles from the sea", Maliassa (= Monembasia, Malvasia), "a town defended by a very high citadel commanding the sea, from which the island of Crete can be seen", Argho (= Argos), "a famous place and beautiful country", Anaboli (= Nauplia, Napoli de Romania) According to Idrīsī, Morea (the extent of which he puts at 1,000 miles) is connected with the mainland "only by an isthmus, the length of which is six miles" (= Hexamilion, cf below) Only small ships could be taken through the isthmus from the Gulf of Corinth into that of Saron, ships of larger size had to sail all round the peninsula of Morea The confusion in Idrīsī between the promontary of Malea and Tainaron is not peculiar in mediaeval works Idrīsī's statements are not based to any extent on his own observations (cf *Geographie d'Edrisi*, transl by A Jaubert, ii , 1840, p 122 and also Th I uc Fc Tafel, *De provinciis regni byzantini liber secundus Europa*, Tubingen 1845, p 27 *sqq*)

We get much and varied information supplementing the Arab geographer's account of the Morea from various xiith century sources, e g the *Travels* of Benjamin of Tudela (d 1173) who starting from Saragossa visited the Greek east and other lands in order to become acquainted with the Jewish diaspora

The conquest of Constantinople by the Latins in 1204 and the resulting division of the Byzantine empire, which had now collapsed, had a great influence on the future of the Morea Boniface of Montferrat in 1204 founded the kingdom of Thessalonica in Macedonia which he took in exchange for Asia Minor allotted to him by treaty By a comparatively slight effort he and his followers were able from Thessalonica to conquer within a year a great part of the mainland of Greece as well as the Morea Two knights, William of Champlitte, Count of Champagne, and Godfrey of Villehardouin the younger, may be regarded as the men who brought the Morea under Frankish rule When William of Champlitte had to leave the Morea in 1209, Godfrey of Villehardouin continued the work of conquest alone and organised the Frankish administration of the country which was henceforth known as the principality of Achaia to Europeans Soon after the Frankish occupation of the country, it was reorganised on western lines But the feudal system did not find

its way into the Morea only after 1204 It had already existed in the country in the time of the Comneni

The Frankish rulers built new citadels and forts in the plains and on the mountains, most of which survived into the period of Turkish rule A number of fiefs which were formed by the Franks in 1205 became after the middle of the xvth century hereditary possessions of the Ottomans

It must also be pointed out that the Venetians after the Fourth Crusade had secured important trading centres and depots on the Morea The Republic in this way acquired the province of Lacedaemonia, Kalabryta, Modon and Patras, and in the case of the last two seaports, some of the surrounding country including the possessions of a number of distinguished families of the Byzantine aristocracy During this period, Venice succeeded in extending her territory and commercial influence and privileges further in the Morea and even in taking possession of the whole of it (cf below) The fourth prince of Achaia (Morea), William of Villehardouin (1245—1278), the second son of the above-mentioned Godfrey, had vigorously completed the conquest of the country In 1245 he forced Monembasia, which had so far remained independent in alliance with the Greek kings of Nicaea, to capitulate under certain conditions The same ruler also conquered a number of Morean tribes who had shown themselves hostile to Frankish rule and who played a prominent part in later times when the Turks occupied the country To keep in check the wild tribes of Zaconia and Laconia, William II of Villehardouin in 1249 built near the ancient Sparta, on a hill jutting out in front of the Taygetos, Mysithra (Mystra), the fortress of the same name A Frankish Byzantine town soon grew up around this fortress which became a centre of art and classical studies The town of Mystra was destined to be the capital of the later despots of the Morea, and even in the period of Turkish rule it did not completely lose its old importance Frankish rule in the Morea, which reached its zenith under William II, was destined to suffer a severe reverse within his reign In October 1259 a fierce battle was fought between Castoria and Monastiri (Pelagonia) at Longos Vorilla In this battle fought the armies of the Despot of Epirus Michael Angelos and of the king of Nicaea and later Byzantine emperor Michael VIII Palaeologos As a result of treachery on the part of an illegitimate son of the despot Michael Angelos, the Sebastokrator Johannes, the troops and allies of the former suffered a reverse Even William II of Villehardouin sought safety in flight only to be shortly afterwards enticed from his hiding-place and captured He was not released till 1262, after taking the oath of vassalage to the Byzantine emperor and ceding him four important fortresses of the Morea Mystra, Maina, Geraki and Monembasia, as well as a considerable part of Laconia The Byzantines thus gained important bases in S E Morea from which they were able to reconquer the whole peninsula, which was all the more necessary as William II of Villehardouin only kept his pledge of fealty for a short time

Relations between the Muslim peoples and the Morea now became closer At the end of 1262 the Sebastokrator Constantine, a step-brother of the Emperor Michael VIII Palaeologos, landed in the Morea at the head of a large army which consisted mainly of Macedonians and Turks This step-brother of the Emperor came to the Morea as administrator of the Byzantine lands there and occupied all the citadels which William of Villehardouin had been forced to cede in order to secure his release The Byzantine governor took up his residence in Mystra Soon afterwards open war broke out between the Franks and Byzantines To strengthen the latter there landed at Monembasia in the spring of 1263 a new Turkish army corps of 5,000 (according to others 3,000) mercenaries in the service of Michael VIII Palaeologos, led by two men named Malik and Shalik We have no accurate record of the origin and descent of these Turkish chiefs who, so far as we know, were the first to appear in the Morea They must have been either Saldjūks or Turks of other descent who had no shame about selling their services to Christian rulers The Turkish mercenaries under Malik and Shalik contributed greatly to the successes which the Sebastokrator Constantine gained over the Franks at the beginning of 1263 Along with Greeks, mainly from Zaconia and other provinces of the east, Slavs from the Morea, Dasmuls (of Greek-Frankish descent), the Turkish mercenaries attacked from Laconia Flis, which was the capital of the Frankish principality The bands of Malik and Shalik then pressed into the highlands of Skorta Here they ravaged at their will With the approval of the Sebastokrator Constantine, they plundered the country, carried off and slaughtered the cattle In these circumstances the Skortinians were forced to pay homage to the Byzantine emperor and to operate with his army against the Franks Constantine's army, composed of so many different racial stocks, occupied the market town of Veligosti (near Megalopolis) and burned it, without however being able to take its citadel, they then conquered Kalabryta and burned the famous Latin monastery of Isova But soon afterwards they suffered a terrible defeat not far from Olympia

In the spring of the year following (1264), the Sebastokrator Constantine continued the war on the Franks He had no success and also quarrelled with his Turkish allies, whose pay was six months in arrears Malik and Shalik at once left him with their men for this reason and retreated undisturbed to the district of Karytaina Constantine tried to win them over again but they went to William of Villehardouin who accepted their assistance There upon Malik and Shalik with their followers went over to the camp of the, as they thought, generous Frankish leader in the conviction that the latter would keep his word By the accession to the Franks of this Turkish force, the tide was turned in their favour The Turkish chiefs who were inspired by an ardent desire to avenge themselves in battle on their false employers, now advised William II of Villehardouin's knights to meet the imperial Byzantine army on the frontiers of Messenia and Arcadia While the Frankish-Turkish army was going through the pass of Makryplagi (between Megalopolis and Kalamata, i e the line of the modern railway), they were attacked by an ambush of the Byzantine army, whose leader was no longer the Sebastokrator Constantine but the strategos Alexius Phylis, Makrenos and Alexius Kabellarius Twice the vanguard of the Frankish-Turkish force led by Anselm de Toucy had to give way before the numerous Byzantines who occupied the heights of the pass of Makryplagi, but finally they won the

hotly contested summit of the pass, from which they ousted the enemy The Turks under Malik and Shalik followed up and completed the victory The leaders of the army so disastrously defeated sought refuge in the neighbouring caves of Gaidiki where they were besieged by the Turks The latter took the caves and led their occupants prisoners to William II of Villehardouin The latter thereupon ordered the Turks to raid and plunder the districts of Morea previously occupied by the Byzantines, notably the districts of Zaconia, Helos, Vatika and Monembasia

After the battle in the Makryplagi pass came the news that Skortinians had again taken up arms against the Franks and stormed the fortress of Buchelet (Araklovon) and Karytaina As the valiant Godfrey Brunères, Baron of Karytaina, who had always been able to keep the turbulent Skortinians in check, was no longer in the Morea, William II of Villehardouin ordered the Turkish leader Malik and his men to go to Skorta to put down the rising Terrified by the ravages and cruelties of the Turkish mercenaries, the surviving Skortinians submitted to the Prince of the Morea and begged for mercy which was granted them

The *Chronicle of the Morea*, which has survived in four languages (Greek, French, Catalan and Italian), is the only source which tells us of the activities of the Turkish mercenaries in the Morea (1262—1265) The same *Chronicle* adds that the Turks in 1265 sought permission to leave the Morea and to be allowed to return to their Asiatic home Malik took his leave in the friendliest fashion from the Prince of the Morea and began his journey home The *Chronicle* however specially mentions that individual Turks preferred to settle in the Morea They were baptised and married morean women About the first half of the xivth century, there were still descendants of Malik's followers there, baptised Turks settled in Elis It is natural to think that the modern villages in N W Morea of Maliki (Demos Vuprasion) and Turkochori (= "village of the Turks", Demos Tritaias) owe their names to the Turkish settlers in the time of William II of Villehardouin This prince gave two of Malik's followers who remained in the Morea the rank of knighthood and even granted them fiefs According to the Catalan version of the *Chronicle of the Morea*, Malik himself married a noble Frankish lady, a widow, through the intermediary of William II of Villehardouin It is a historical fact that Turkish-Moreote relations date from the second half of the xiiith century After the death of William II in 1278 we find a reference to estates which this prince had given to his Turkish allies and which were occupied about 1280 by the soldiers of Galerano d'Ivry, who acted for a time as governor of the Morea for Charles of Naples and Sicily Charles I and his immediate successors in rule over the Morea had not infrequently Turkish warriors in their service From the beginning of the xivth century it not infrequently happened that Muhammadan pirates from Asia Minor raided and plundered the coastlands of the Morea Sometimes they had allies of the Christian faith, notably Catalans

About the middle of the xivth century, an important change took place in the administration of the Byzantine possessions in the Morea The Emperor Johannes Kantakuzenos in 1349 created an appanage for his second son out of these lands which he called the despotate of Mystra and which lasted till the Ottoman conquest (1349—1380) In this period fell the rule of the first despot of Mystra, Manuel Kantakuzenos the second son of the Emperor He assisted the Franks of the Morea to ward off the Turkish attacks, which had reduced the once flourishing Corinth and the country round to such misery that the Corinthians in 1358 were forced to send an urgent appeal for assistance to their sovereign, the titular Emperor of Constantinople and prince of Achaia, Robert II The latter gave a ready ear to their appeal On April 23, 1358, he gave the Florentine Grand Seneschal Niccolo Acciajoli and his descendants the extensive district of Corinth as a hereditary barony The princely family of the Acciajoli survived in the Morea and on the mainland of Greece for two centuries, during which they had much to do with Muslim peoples A series of circumstances, including the irruptions of the Turks as early as the middle of the xivth century and the advance of the Ottomans, whose strength was steadily increasing, brought numerous Albanians to Greece The first despot of Mystra, Manuel Kantakuzenos, had them settled in various deserted regions where they became distinguished as warriors, agriculturists and as huntsmen Thus we find them in Arcadia and Laconia where they seem to have come in large numbers Later another 10,000 Albanian families were peacefully settled by another despot of Mystra, namely Theodoros I Palaeologos (1384—1407), son of the Byzantine Emperor John V According to reliable sources, these 10,000 families left Thessaly and Acarnania with their cattle and goods and chattels on account of the Turkish raids and for other reasons and reached the isthmus There they pitched their camp and sent messengers to Theodore I with the request that they might be allowed to settle in his Morean territory Theodore I acceded to their request and allowed them to spread over a considerable portion of the Morea The story of G Bosio (*Dell' istoria della Sacra Religione et illustrissima Militia di S. Gio Gerosolimitano*, vol II, Rome 1594 p 126–129) to the effect that the Turks had occupied Patras by 1378 and conquered the Morea shortly before must be relegated to the realm of fable About this time, there were again great changes in the Morea The Company of Navarre, which in 1380 had entered the service of the titular Emperor Jacob de Baux of Constantinople and prince of Achaia and were seeking their fortune on Greek soil, became after the death of the Emperor in Tarso in 1383 absolute masters of a great part of the Morea In 1386 the Company made Captain Pierre de St Exupery (Bordo of S Superan) their leader The latter was able to extend his power and influence in the Morea by inciting the Turks and also the Greek archons against Theodore I During the period 1396–1402 he even bore the title of hereditary prince of Achaia (which was given him instead of money by king Ladislaus of Naples) Sometime before, a vigorous and enterprising Florentine, Nerio I Acciajoli (Sept 29, 1394), had been playing an important part on the mainland of Greece This man, a nephew of the Niccolo I Acciajoli, already mentioned, had acquired considerable territory in the Morea, partly by inheritance and partly by purchase

Shortly before his death he attained the height of his glory when he was appointed by king

Ladislaus of Naples as hereditary Duke of Athens and the lands belonging to it In 1389 the Venetians occupied the important fortress of Nauplion and set about the conquest of Argos The despot of Mystra, Theodoros I Palaeologos, the son-in-law of Nerio I Acciajoli, at his father-in law's instigation anticipated the Venetians and occupied Argos As a result, hostilities broke out among the Christian states, which could end only to the advantage of the Turks The despot of Mystra replied to the demands of Venice to give up Argos by saying he could only do so with the Sultān's approval Later the Venetians joined up with the Navarrese Through treachery Bordo of S Superan succeeded in taking Nerio I Acciajoli prisoner on Sept 10, 1389 The latter remained for nearly a year in the hands of the leader of the Navarrese but in the end obtained his freedom

An epoch making event was the great battle on the field of the blackbird (June 15, 1389) at Pristina, which decided Turkish rule for centuries in the Balkans A Turkish army appeared in the Morea at the end of 1392 under Ewrenos Beg in order to aid, at their request, the Navarrese against the despot of Mystra The Turks thereupon occupied a number of strongholds in the peninsula Nerio I Acciajoli, who had been appointed governor of the Morea, now pledged himself to pay tribute to Sultān Bāyazīd and to be his vassal After the death of Nerio I Acciajoli, a fatal quarrel broke out between his sons-in-law Theodore I of Mystra and Charles Tocco, during which the Turks won important successes on the mainland of Greece The fear of the danger from the Turks probably induced Charles Tocco and Theodore I to make up their quarrel After long negotiations with the Greek national party in Athens, who hated the Latins, Turkish forces under the Pasha Timurtash entered Attica from Thessaly At the end of 1394 or in the first seven weeks of 1395, the Venetians occupied Athens including the Acropolis, after driving back the Turkish besiegers Theodoros prepared to advance against the Turks on the isthmus The latter, however, defeated on Sept 28, 1396 at Nicopolis the flower of the chivalry of Hungary, Germany, and France and thus laid the foundations for their dominion over the lands below the Danube Bāyazīd thereupon decided to attack the remnants of the Byzantine empire as well as the little principalities of the mainland of Greece He therefore sent his generals Yaʿkūb, Pasha of Rumelia, and the already mentioned Ewrenos Beg with an army of 50,000 men to cross the isthmus again Yaʿkūb occupied Argos, Ewrenos Beg at the same time fell upon the Venetian possessions in Messenia The prince of Achaia, Bordo of S Superan, and Theodoros I of Mystra found themselves forced as a result of the Turkish successes to pay tribute to the Porte Laden with incalculable booty the armies of Yaʿḳūb Pasha and Ewrenos Beg returned across the isthmus and in 1397 even occupied Athens for a brief period In addition to Greek sources, Turkish writers record that the "city of the wise", as Athens is frequently called in Muslim works, was taken by Sultān Bāyazīd's men (cf J H Mordtmann, in *Byzant-Neugriech Jahrb*, IV [1923], 346 *sqq*) As a result of his troubles, especially the Turkish raids, Theodoros I of Mystra became utterly tired of his position He therefore resolved to sell his towns and citadels to the knights of St John of Rhodes, who after negotiations readily purchased Corinth, Kalabryta and Mystra in the years 1400—1402 But they could not establish themselves permanently in the Morea, for the Greek national party in the country, especially in Mystra, rebelled against the sale, which the Sultān, the suzerain of Theodoros of Mystra, also declined to recognise Theodoros therefore cancelled the sale and compensated the knights partly in money and partly by ceding the county of Salona and the barony of Zituni Theodoros I had been able to take these lands from the Ottomans after their defeat at Angora in 1402

Sultān Sulaimān I (1403—1411) abandoned any claim to suzerainty over the Morea At this time the influence and power of the Venetian colonies in the Morea were increasing In 1407 the Venetians occupied Lepanto In the following year, they seized Patras and the country round it and from these two strongholds which lay opposite one another, the so called little Dardanelles, they were able to keep in check the Turkish pirates who made the Gulf of Corinth unsafe At an earlier date, the Albanian family of Spata had settled in Lepanto and had occasionally made common cause with the Turks Patras at this time was ruled by the archbishop Stephan Zaccaria in name of the Pope As he suffered a great deal from the Turks, he pledged the town and the country round it with the Venetians The latter also occupied the seaport of Astros in Zaconia They restored the fortifications of Nauplia and other strongholds in their possession The Republic of St Mark in 1406 and 1411 concluded treaties with Sultān Sulaimān I, by virtue of which they secured their colonies in the Morea and the East generally But in the reign of Murād II (1421—1451) danger again threatened from the Turks The Venetians were however able to take the necessary measures for the defence of their possessions in the Morea In the districts of Nauplia and Argos as well as in their flourishing Messenian colonies they settled numerous Albanians who loved fighting In Corinth and Attica also the Albanians were welcomed by the Acciajoli The Albanian element was therefore very strongly represented in the Morea in the first half of the xvth century, later they spread to the islands around the Morea In the wars of the Greeks and Venetians against the Ottomans, the Albanians frequently distinguished themselves, on the other hand, their morals left much to be desired To this day we still can find descendants of these Albanian colonists in the Morea and in the adjoining territories

After the battle of Angora, at the time when Frankish power in the Morea was declining, the Byzantines vigorously resumed their efforts to reconquer the whole peninsula Theodoros I of Mystra had previously wanted, with Venetian support, to erect on the isthmus a great bulwark against the Turks which would make access to the Morea impossible for them Manuel II Palaeologos again took up Theodoros's plan and began to put it into execution with vigour Not far from Corinth on the isthmus, which was usually called "Hexamilion" in the middle ages, he built a wall 24 stadia long from sea to sea with castles at each end and in the middle and no less than 153 strong towers[1] besides deep ditches The building material was taken from older walls and defences In the course of 25 days (April 8—May 3, 1415), i e at a most rapid rate, the great wall was completed which, like the

isthmus itself, was called "Hexamilion", the greatest hopes were built upon it, but they soon proved deceitful The Turks usually called the wall *Gez-mehissar* In 1416, Manuel II left the Morea after reimposing his suzerainty upon the prince of Achaia Centurione II Zaccaria and humbling several Greek and Albanian archons, some of whom he carried off with him to Constantinople

The peaceful relations which had existed between the Byzantines and the Ottomans under Sulaimān I and Bāyazīd suddenly ceased when Murād II ascended the throne In 1423 he ordered the celebrated Pasha Turakhān to clear up the small states With an army of 25,000 men, which was joined by the Duke of Attica Antonio I as the Sultān's vassal, Turakhān set out from Thessaly to obey his master's orders The celebrated Hexamilion wall proved an insufficient bulwark against the onslaught of the Janissaries Turakhān had the most of it destroyed and advanced into the Morea The despot Theodoros II of Mystra could scarcely have checked the Ottoman flood which swept into his land, plundering and murdering Mystra, Lontari, Gardiki (on the Makryplagi pass) and other Byzantine and Latin towns fell into Turakhān's hands But he suffered one serious reverse The Moreotes caught a portion of his army in the pass of Ionsari, where they were victorious and took much booty or, to be more accurate, recaptured their own property In the Arcadian town of Tavia (the modern Dawia, on the road from Tripolitza to Wytina), the Albanians assembled and chose one of themselves as their leader and decided to attack Turakhān on his way back from the south In the battle that followed, the Albanians did not stand their ground but fled Turakhān pursued them and slew many besides taking some 800 prisoners These he put to death and, according to the Turkish practice, built towers of their skulls Heavily laden with plunder, Turakhān returned soon afterwards across the isthmus to Thessaly He had however in 1423 not yet completed Murād's order to subdue the Christian states of the Morea

Soon after the withdrawal of the Ottomans, Manuel II Palaeologos besought Murād II for peace and concluded a treaty with him, by which the despot of Mystra was to pay an annual tribute of 100,000 hyperpyra to the Sultān and further to declare his readiness to give up the Hexamilion wall Venice, whose colonies in the Morea had suffered much from Turakhān's raid in 1423 and were continually troubled by Muslim pirates, recommended all the Christian powers interested to form a united front This appeal for unity, however, fell on deaf ears The various Christian rulers of the Morea quarrelled among themselves in spite of the critical times and even took up arms against one another The Albanian inhabitants followed their own inclinations entirely and even began separatist movements of a political nature

It is remarkable that the Greek political consciousness was strengthened in the Morea in this period of political confusion Mystra became the centre of a kind of renaissance and a centre of learning and study of classical antiquity In this period there appeared in the Morea a great scholar who was a philosopher of the Platonic school and also a fervent patriot of radical tendencies in social and political reforms He was Georgios Gemistos or as he called himself "Plethon" His teaching was of a mystical nature It was directed against Christianity, indeed against every positive religion His followers who are said to have been numerous, formed a secret society Plethon (d between Feb 1449 and July 1450) had also lived in Brussa where he had as a teacher a Jew named Elissaios, who rejected Christianity, Judaism and Islām as the positive religions In the reign of Sultān Bāyazīd, he was burned at the stake as a heretic about 1390 It is supposed that the teaching of Plethon and the secret society thus formed was suggested by a similar school of thought in old Turkey, that of the "akhis" (cf Fr Taeschner, in *Isl*, xviii [1929], 236—243, *Islamica*, iv [1929], 1 *sqq*, *Byzantinisch-Neugriechische Jahrbucher*, viii [1929—1930], 100—113 and Nikos A Bees, *ibid*, vii [1928—1929], 237) Plethon's works were disseminated not only in the Christian west and Greek east but also among the Turks The MS Enderum 1896 in the library of the Top Kapu Serai contains an Arabic translation of a fragment of Plethon's chief work *Nomo* This translation is said to have been made by order of Sultān Mehmed II and is anonymous (cf Ahmad Zekī Pasha, *Sur une Traduction de Yemistos [Plethon]*, in *Bull de l'Inst d'Egypte*)

The son and successor of the Byzantine Emperor Manuel II, Johannes Palaeologos (1425—1448), concluded a treaty with Murād II The Turkish danger now threatened the Morea more seriously than ever Since Nov 1427 the despot Constantine Palaeologos had been ruling there Alongside of this vigorous, enterprising and self-sacrificing ruler (afterwards Byzantine emperor), we find at this time also his brothers Thomas and Demetrius as princes in the Morea They had less ability and strength of character and facilitated the conquest of the peninsula by the Turks The three brothers, especially Constantine, succeeded in bringing the whole Morea except the Venetian colonies under Greek rule, but there was no unity among them In 1429—1430 Constantine took Patras, which at this time was held by the archbishop and clerical prince Pandolf Malatesta as a vassal of Murād II The Sultān protested but Constantine was able to dispose of the claims of the Sultān and his advisers by a skilful ambassador This envoy was Georgios Phrantzes, whose chronicle is an exceedingly important source for Greek and Turkish history in the xvth century In 1431 Turakhān again reached the northern frontier of the Morea to destroy the Hexamilion wall a second time, for it had been restored by the Palaeologos The first care of Constantine who now ruled over the greater part of the Morea and cherished ambitious plans, had been to restore the defences of the isthmus His aim was to unite the Morea with the mainland of Greece and if possible to found a Greek national state In the west a new league had been formed against the Turks by Pope Eugenius IV, Venice and Hungary At the same time the rising of the Albanians under Skandarbeg roused a strong feeling against the Turks and encouraged the Christians Constantine Palaeologos who at the request of the Pope, Venice and Hungary had joined their league against the Ottomans in 1444, crossed the isthmus with a well equipped army to invade the mainland of Greece He had considerable success He forced the Duke of Athens Nerio II Acciajoli, who was a vassal of the Sultān, to recognise his suzerainty and to pay an annual tribute He occupied many towns (including Thebes, Livadia, Zituni and Lidoriki) and encouraged the Christians of the Pindus to take up arms against

the Turks of the Thessalian plain An Albanian clan settled in Phthiotis, whose autonomy had been recognised by the Sultān, joined the victorious Palaeologos The latter also occupied the little town of Witrinitza (on the Gulf of Corinth) which the Turks had ceded to the Venetians He installed a chief of the Pindus Wallachians who lived in Panar (at the foot of the Ithome mountains)

The battle of Barna (Nov 10, 1444) brought a change in the Balkans which was fateful also for the Morea The Turks reinforced once again turned their attention to the south Nerio II Acciajoli of Athens found favour with Murād II after most humbly promising to be his vassal and to pay the usual tribute In order to save their colonies in the Morea, the Venetians also made a treaty of peace with the Turks soon after the battle of Barna It thus came about that the Palaeologoi were left to face the Turkish onslaught quite isolated, a danger which they apparently did not clearly realise After Nerio II Acciajoli had again recognised Turkish suzerainty, Constantine Palaeologos with a large force invaded Attica and besieged Athens The consequence was that Nerio II Acciajoli turned for assistance to Murād II The latter demanded that Constantine should evacuate not only Attica but also all the Turkish territory which Constantine had seized in the course of 1444 on the mainland of Greece and in southern Thessaly Constantine replied to Murād II through his ambassadors that he would keep the lands he had won Murād II was furious at this manly attitude of Constantine II Incited by Nerio II and Turakhān, the Sultān resolved on a campaign into the Morea By his command powerful Turkish forces were assembled in 1446 at Serres in Macedonia from Europe and Asia Constantine Palaeologos and his brother Thomas also raised a very large army for that time which was assembled on the isthmus In the winter of 1446, Sultān Murād II led his army from Macedonia to the isthmus, without meeting opposition He encamped at Mingiae (the modern Μυίγες) and began to get his artillery and other arms ready On his able picked staff was the experienced old Turakhān who, as already mentioned, had been twice in the Morea and therefore knew the country and the people According to the historian Chalcocondyles (ed Darké, II 114), Sultān Murād's camp on the isthmus was the best organised that had ever been known A bloody battle developed for the gateway to the Morea The Turks with their artillery bombarded the Hexamilion wall for days A Serbian Janissary succeeded in leaping over the wall under the eyes of the Sultān and others followed him The defenders so far as they were not killed by the Janissaries took to flight in a panic The wall was thus in the hands of the Turks, who entered the Morea either through the gates or through the breaches their guns had made In the *Chronicle* of Georgios Phrantzes the date of the capture of the Hexamilion wall, the "last bulwark of liberty in Greece", is given as Dec 10, 1446 The *Chronicum breve* of Joannicinus Cartanus gives Dec 14, 1446, a date which has been accepted as correct by most modern historians

The brothers Constantine and Thomas endeavoured to collect the scattered and flying troops, but in vain The brothers therefore fled into the interior of the Morea Sulṭān Murād II ordered Turakhān to pursue the Palaeologoi with 1,000 men and he himself with his army marched along the south coast of the Gulf of Corinth towards Patras He burned the lower town, laid waste the country as far as Clarentza and then turned eastwards to Corinth In the meanwhile Turakhān had returned from his pursuit of the Palaeologoi with much booty and many prisoners The Palaeologoi now began to negotiate for peace with the Sultān They declared themselves ready to cede the lands in Greece proper and in Thessaly which they had acquired in 1444 and to pay an annual tribute On these conditions the Sultān left them in possession of their lands in the Morea The Emperor John VIII Palaeologos died on Oct 3, 1448, and on Jan 6, 1449 his brother Constantine, the despot of the Morea, was solemnly hailed as Byzantine Emperor in the Metropolitan church in Mystra Of course he ascended the throne with the permission of Murād II, whose tributary he was An event of importance in the history of the world soon afterwards took place on the Bosporus On May 29, 1453, Constantinople was taken by the Turks, the valiant Constantine died defending the city and thus the line of Byzantine emperors came to an end When his brothers Thomas and Demetrius heard of the fall of Constantinople they sent envoys to Muhammad II asking to be allowed to retain their lands in the Morea, on payment of the usual tribute After many humiliations, their request was granted them The remainder of the period of Palaeologoi rule was a brief one and their authority only nominal In 1453 30,000 Albanians in the Morea rebelled against the Palaeologoi In July 1454 Venice sent Vettore Capello to the Morea, to settle certain business of the republic and at the same time to make peace between the Palaeologoi and the Albanians But their effort failed In the meantime Muhammad II had ordered Turakhān's second son ʿOmar to intervene in the Morea on behalf of the Palaeologoi (end of 1453) He succeeded in putting down the Albanians The Palaeologoi were now able to enjoy their lands as vassals of the Sultān For a few years they paid their tribute regularly, then they refused it with various excuses At the same time they endeavoured to form alliances with western rulers against the Turks, a thing to which the Sultān could not remain indifferent

The rule of the Palaeologoi was gradually approaching its end The west scarcely troubled itself about the brothers of the last Byzantine emperor, who were not united and yet had to gather their last forces against the Turks When a fleet belonging to the Pope Callixtus III appeared in the Aegean, Thomas Palaeologos took courage and announced his refusal of tribute to Muhammad II Already the latter had received no tribute from the Palaeologoi for the past three years in spite of repeated warnings He therefore thought it was time to settle matters himself in the Morea and to teach his rebellious vassals a lesson In the middle of May 1458, Muhammad II came to the Morea with a large army, laid siege to Tarsus, a village in two parts N W of Nemea and N E of the Lake of Pheneos, and forced it to capitulate The citadel of Rupeli in Arcadia, to which many Greeks had fled with their women and children, surrendered after two days' stubborn defence Muhammad II turned from Arcadia to N W Morea Patras, the headquarters of Thomas Palaeologos, was abandoned

by its citizens The garrison left in its citadel did not dare to offer resistance The Sultān treated the town of Patras very generously By July 1458 Muhammad II had reached Corinth after taking Bostitza (Aegion) on the way On Aug 6, 1458, its commanders left the citadel to negotiate its surrender with the Sultān The loss of Corinth to the Turks seriously alarmed the Palaeologoi The negotiations for peace, which were now begun, were conducted by Mathaios Asanis The Sultān then made peace with the despots of Morea but the price was a high one In the beginning of the autumn of 1458, Muhammad II left the Morea to return to the north via Athens, which shortly before had passed into his hands The sources do not agree regarding his activity in the Morea in this year As a rule, Muhammad's campaign in the Morea in 1458 is regarded, by modern historians also, as one of destruction It is true, he was generous to the people of Patras and left the Corinthians unharmed after taking their city He carried off however a large number of Christians to Constantinople and its neighbourhood These settled there as artisans and peasants and formed the productive element in the capital of the Ottoman empire

In the year 1458 Muhammad II for administrative purposes combined his possessions in the Morea with Thessaly and placed the newly constituted province under the governorship of Turakhān's son ʿOmar The Sultān had hardly left the country when the Palaeologoi again began to stir up trouble Muhammad therefore deprived ʿOmar of his office in Thessaly and the Morea and decided to go in person to the Morea again in order to be done with the Palaeologoi once and for all and make the whole peninsula a Turkish province Demetrius Palaeologos was not the man who could defend and save Mystra He did shut himself up in the citadel with the intention of defending it, but very soon surrendered it to the Turks Demetrius after many adventures died as the monk Dorotheos in Adrianople in 1470 (cf Th Spandugino, *I Commentari di de l'Origine de' principi Turchi*, Florence 1551, p 43 *sq*) After disposing of Demetrius, the Sultān turned his attention to his brother Thomas After the Turks had occupied Mystra he had not dared to do anything to defend his lands He was rather seeking to leave a way open to escape from the Morea, if necessary One town after the other fell almost without resistance into the hands of the Ottomans Thomas Palaeologos embarked with his family at Porto Longo (at Navarino) for Corfu, which he reached on July 28, 1460 but went on 3 months later to Rome where he died on May 12, 1465 After the disappearance of his chief opponents, Muhammad II continued his victorious march from Messenia to Northern Morea He left the Morea towards the end of summer 1460 The plan which he had decided on when he entered the Morea, was practically carried through Except for a few places, the peninsula was now Turkish territory Zaganos Pasha was installed as governor of the Morea by the Sultān and entrusted with the reorganisation of the peninsula, which had become much depopulated and was a great deal poorer economically In 1458 and again in 1460 Muhammad II combined the Morea with Thessaly for administrative purposes This union was later dissolved As early as the xvth century we already find the Morea a sandjak by itself with 109 ziamets and 342 timar Down to about 1570, the residence of the governor was by turns in Corinth, Londari or Mystra, then in Nauplion and in 1786—1821 in Tropolitza (cf below) The division of the country under Turkish rule, usual from the middle of the xviith century, into 22 or 25 provinces or beyliks is partly suggested by nature and partly a survival of the older Byzantine organisation

There is no doubt that the Turks introduced their own feudal system after their occupation of the Morea The Turkish-Muslim element in the country was thus able to expand Even during the first period of Turkish rule (1458—1687), other factors contributed to this, like the immigration into the Morea of Muslims from other parts of the Ottoman empire, the conversion of Christian Moreotes to Islām, the carrying off of Christian women into Turkish harems, etc While in the north of the Balkan Peninsula and in Asia Minor, countless Christians had adopted Islām either voluntarily or under compulsion, the Christian element in the Morea at the time of the Turkish conquest was morally strong enough to remain in the mass faithful to the Christian religion Comparatively few Moreotes became Muslims, and these were principally Albanians, who always adopted Islām more readily (cf thereon C Jirelek, *Studien zur Geschichte und Geographie Albaniens im Mittelalter*, Budapest 1916) As in Asia Minor, Bosnia, Crete etc, so in the Morea also members of the nobility and middle classes, especially those of Frankish origin, had adopted Islām in order to retain possession of their estates There were also in the Morea crypto-Christians, as well as people whose Islām was very superficial These were usually called *murdat* (impure) in the Morea These superficial Muslims, who continued to retain much that related to Christian worship, lived mainly in what is now the province of Olympia and were almost all exterminated during the Greek War of Liberation (cf the articles by Photios Chrysanthopoulos-Photakos in the Athens periodical Εβδομάς, vol II, 1886, p 1) The Barduniots were also for the most part superficially Muslims As to the survival of the Greek Moreote element, there are theories current in modern literature which can hardly be right It is said for example that Sultān Muhammad II's ordinance regulating the relations of the Christian subjects to the Ottoman empire benefitted also the Christian Moreotes But it is wrong to credit Muhammad II with any such ordinance (cf Fr Giese, in *Isl*, XIX, 1931, p 264 *sqq*) It is however a historical fact that the Greek Orthodox Church contributed a great deal to maintain the Christian element in the Morea as in the East generally The Christian clergy of the Morea were frequently able to maintain a privileged attitude towards the Turkish officials and thus to further the interests of their co-religionists The Christian Moreotes were also often cleverly able to avoid having their children taken by the Turks for the Janissaries The Christians of the Morea held this, the "blood tax", to be the greatest degradation they suffered under the Turkish yoke and a dreadful disgrace to their race After the death of Sultān Sulaimān the Magnificent (1566), the lot of the Christian Moreotes gradually became worse Ownerless lands were confiscated by the Sultān and given to his soldiers or allotted to the mosques as *wakfs* or given to private individuals as gifts During the

long period of Turkish rule in the Morea, the largest and best part of the land was in Turkish hands As a rule, Christians were not allowed to own large estates The peasants had to pay over annually the fifth of the produce of the land and pay all kinds of annual taxes, were never sure of their property nor even of their wives and children, and suffered unspeakably in every way from arbitrary Turkish rule

In view of the abuses of the Turkish authorities, the Christian Moreote preferred to abandon the fertile regions and retire to barren lands and into the mountains, where he could breathe more freely and more easily escape the despotism of his rulers and shape his course of life a little more pleasantly We thus find that within the period 1460—1821 the mountains of the Morea were predominantly inhabited by Christians Of the factors which contributed to the survival of Greek culture in the Morea during Turkish rule special stress must be laid on the political concessions which were made to them by the Ottomans These lay mainly in the freedom to govern their own communities Greek local government, as we find it during Turkish rule, is said to have been a continuation of old Greek institutions In the period from 1715 to 1821, if not earlier, the freedom of the Greek community was not infrequently limited by the Turkish authorities They interfered indirectly in the appointment of local officials and made propaganda for their favourites It even happened that the Kodjabashis, through the influence of the Turks, were not only appointed for a number of years, but were also able to hand down their offices to children and grandchildren Undoubtedly, those Moreotes were better off who lived in towns or villages which were allotted to the sacred places of Islām or to members of the Ottoman imperial family The town of Dimitzana in Gortynia for example was originally a *wakf* of Mecca under the protection of the Sultan's mother

The peace between their Turkish rulers and Christians could only be external In the Morea also there were the so-called "Klefts" who would not submit to the existing government and took up arms against it Against them the Turks used the Armatoli force, a gendarmerie of Christians organised on military lines In the period from 1715–1821 the Turks for the security of the country built watchhouses (*derbent*) in which a garrison was stationed to watch those who passed, especially at the passes The Derbenekia (*kučuk derbent*) between Corinth and Argos and the Derbenia of Lontari, the passes between Arcadia and Messenia (Makriplagi, cf above) were all very important The Mainotes in their wild mountains felt little of the Turkish yoke which weighed heavily on the rest of the Morea The Mainote tribes who were distinguished for their valour, were from 1460 to 1821 in constant rebellion against every foreign power The Porte found itself forced to recognise officially the independence of Maina, in return for which the Mainotes were to pay tribute, but did not always do so Although the Christians in the Morea were exempt from military service, the warlike spirit which they had so often displayed in the Frankish period continued to survive An eloquent testimony to their love of freedom was the fact that they continually took up arms against their Turkish oppressors, sometimes alone, sometimes with allies

For a long period after the year 1460, when Sultān Muhammad II had made the greater part of the Morea a province of his empire, this land became the scene of desperate fighting between Turks and Venetians, in which the latter had the majority of the Christian population on their side The great champion of the Christians, Skanderbeg [q v], the leader of the Venetian mercenaries, died in 1468 Two years later, Turkish rule over Euboea was firmly established and they could record further successes in the Morea

In the spring of 1499 a new war between Venice and Turkey broke out On Aug 29–30, 1499, Lepanto had to surrender to the Turks In 1500 Sultān Bāyazīd II ordered Yaʿkub Pasha to blockade Modon with his fleet, while he himself set out by land from Constantinople with a well-equipped army for the Morea On Aug 9, 1500 (according to Hādjdjī Khalīfa on 14th Muharram 916), Modon [q v] fell after a long siege in the presence of the Sultān Bāyazid II turned the cathedrals at Modon and Koron into mosques and offered up thanks in them and gave these towns to Mecca as *wakf*s He then paid attention to the defences of the newly acquired towns and to the repopulation of Modon In 1502–1503 Venice concluded a treaty of peace with Turkey in which she surrendered her Messenian colonies and also Maina, which had in the meanwhile been taken by a son of Krokondilos Kladas in name of the Republic In 1532 the Morea became the scene of notable battles The emperor Charles V had decided to intervene in the Morea A considerable fleet assembled in Messina in June 1532 The Pope and the Knights of St John, the Genoese and the Sicilians also showed a readiness to join in the expedition, the leader of which was the Genoese Andreas Doria (Turkish Andrevinius) After repeated and costly attacks, the allies succeeded in taking a considerable part of the lower town of Koron The Turks who had retired into the citadel of Koron were forced to capitulate From Koron Andreas Doria turned his attention to Patras, which also capitulated He then returned with rich booty Sulaimān I, who was now on the throne, gave the sandjak of the Morea to Muhammad Beg, a son of Yahyā Pasha and commissioned him to reconquer the fortresses taken by Andreas Doria Sulaimān I declared war on Venice in 1537 Kāsim Pasha, the sandjak-beg of the Morea, was commissioned to conquer the Venetian colonies in the Morea Nūr al-Dīn Barbarossa had inflicted several defeats on Venice in her colonies, and she had besides every reason to complain of her allies, the Pope Paul III and the Emperor Charles V In the summer of 1540 Venice made peace with Sulaimān I in order to save what was left of her possessions The majority of the Venetian colonies in the East, including Nauplion and Monembasia, was the price paid The Turks endeavoured to populate once more their new possessions in the Morea About 1550, there were about 42,000 Christian families in the whole Morea We know nothing definite of the Muslim population at this time It may be assumed however that, then as later, Muslims were in a minority Even when Ottoman power was at its height, the oppressed Moreotes, always desirous of liberty, rose against their oppressors In the xviiith century the lot of the Christians in the Morea is said to have been unbearable Two Turkish sources of the xviiith century are of considerable importance for the history of the Morea These are the "Survey of

the World" (*Ḏjihān-numā*) of Hādjdjī Khalīfa (d Oct 1657) and the Travels (*Siyāhet-nāme*) of Ewliyā Celebī, who visited the Morea in 1668 and 1670 There is no fuller work on the Morea than the latter among Muslim sources Ewliyā Čelebī's narrative was based on personal observation and enquiry and is distinguished by a vividness of description and to some extent by a tendency to exaggerate In the treatment of the Morea, given in his vol viii, it is hardly possible to trace his literary sources What he tells us about Muslim buildings and religious orders is of importance, and his account of the Christians is also of value He naturally takes the Ottoman point of view (cf Ewliyā Čelebī, *Siyāhat-nāmesi*, vol viii, Stambul 1928, Fr Babinger, *G O W*, p 219 *sqq*, Fr Taeschner, in *Isl*, vol xviii, 1928, p 299 *sqq*) When Ewliyā Čelebī visited the Morea, various Muslim orders and corporations had settled there They included *futuwwa* brotherhoods, dervish orders, some of which were anti-Islāmic, and Shīʿī Bektashīye The existence of such brotherhoods, which were widely disseminated in the Greek east from the xvth century, can be proved for the Morea as late as 1828 (cf F W Hasluck, *Christianity and Islam under the Sultans*, vols i—ii, Oxford 1929)

At the end of 1683 another coalition against the Porte was formed by Venice, Poland, Germany, Russia and the Pope Francesco Morosini was appointed by his government to begin operations against the Turks as speedily as possible He was given command of the allied naval forces After 42 days of fighting by land and sea, Koron was stormed by Morosini In the period from the late summer of 1685 to July 1686 Morosini, Count Otto Wilhelm von Konigsmark and Hannibal von Degenfeld took from the Turks Old and New Navarino, Kalamata, Modon, Zarnata, Passava, Celefa and Vitilo as well as other fortified places in southern Morea The Serʿasker Ismāʿīl Pasha was defeated in several battles and had to retire to the interior of the Morea Hasan Pāshā, who was in Maina, negotiated with Morosini and surrendered voluntarily The Turkish garrisons of many towns, on the other hand, offered a desperate resistance It cost the Venetians and their allies much time and heavy sacrifices to take Nauplion The capture of the latter contributed a great deal to increase their confidence By the end of 1687 Morea up to Monembasia was Venetian Continual Turkish raids, however, continued to disturb the security of the peninsula By the peace of Carlowitz (Jan 26, 1699), the Porte had to cede the Morea to Venice The seas of the Morea and of the mainland of Greece were now open to Turkey as well as to Venice For the last period of Venetian rule in the Morea (1669—1715 or 1718), the reader may be referred to L Ranke, *Zur venetianischen Geschichte*, Leipzig 1878, p 277—361 The services of Venice to the peninsula in the period 1688—1714 must not be underestimated, especially as she had found it at a very low level

The occupation of the Morea by the Venetians now attracted the attention of western scholars to the celebrated peninsula The Turkish empire, which had been able to profit a good deal by the troubles in Europe at the beginning of the xviiith century, resolved at the end of 1714 to reconquer the Morea Many Greeks felt that the Venetians had not respected their rights in religious and family matters, were hostile to their own government and even wanted the Turks back again (cf De la Montray, *Voyage*, vol i, p 462) Except for a few larger towns which offered a resistance, the land was easily taken by the Turks and so the Morea once again became Turkish The history of this conquest was written by several contemporary writers

The peace of Passarowitz (June 10, 1718) ceded Morea finally to the Turks We are most fully informed about their rule from 1718 to 1821 The extant sources, especially in Greek, enable us to study the period to the smallest detail After 1715 many Christians again adopted Islām A census taken in 1720 gave 60,000 male Christians of 11 years of age and over The Muhammadan inhabitants are said to have been in the minority at this time On the other hand, the Turkish element increased in the period 1769—1780 while the number of Christians diminished considerably, as did the total number of the population From 1715 to ca 1780 the Morea was governed by a Pasha, the Moriowalesi, who had three *tughs* and the title of *wazīr*, his period of office was indefinite He was usually assisted by two other Pashas, who were under him and were granted two *tughs* A change was made in 1780 From this date to 1821 the government of the Morea was no longer given to a particular Pasha but to a simple *muhaṣṣil* of the Porte, who was however given the title of Pashā The higher offices were held by a *mukabeledjī*, a *defterkehaya* and a Christian dragoman Under the official system of administrative divisions, the Morea was divided into 22 districts In this period Christian local autonomy gained more strength After the many disappointments they had suffered from the western powers, the Moreotes now looked to Russia to liberate them from the Turkish yoke From the time of Peter the Great the bonds between Greeks and Russians had been growing stronger In the middle of the xviiith century, Russian propaganda increased very much among the Orthodox of the Balkans Under Catherine II, the Russians easily succeeded, with the help of Greek agents, in stirring up Greek notables and clergy in the Morea to rebel against the Turks Among these the most distinguished was the influential and wealthy Panayotis Mpenakis of Kalamata This secret propaganda did not escape the Turks By 1767—1768 the Christians were preparing for rebellion On Oct 15, 1768, Turkey declared war on Russia Russian fleets, whose equipment left much to be desired, appeared in the Mediterranean On Feb 17, 1770, Theodoros Orloff landed at Vitylo and received a warm welcome from the Mainotes, but as the ships had neither sufficient men, guns or munitions, the first enthusiasm of the Greeks soon died down On July 21, 1774, a treaty of peace was concluded at Kučük Kainardji between Russia and Turkey Full religious liberty and other concessions were granted to the Christian subjects of the Turks About three months later, the Porte granted a general amnesty to the Christians of the Morea and resolved to clear the land of Albanian bandits After 1770 the Porte had confiscated a number of Christian estates in the Morea and granted them to mosques and ʿimārets By the treaties of Küčük Kainardji and Kainali Kanak (10th March 1779), the Turks now promised to return these or to compensate their owners, but the promises were not kept Nevertheless, the Moreote

Christians benefited considerably by the treaties between Russia and Turkey, this was not however the case with the treaties later concluded (June 10, 1783 and Dec 29, 1791) The right given the Christians of the Morea to trade under the Russian flag contributed to their economic expansion in the period 1775—1821 Intellectual relations between western Europe and the Greeks of the Morea became closer and closer after 1790 A new generation grew up among the Greeks of the Morea and other provinces Since the peace of Paris of 1815, the Moreotes and other Greeks had become convinced that only their own efforts could relieve them of the Turkish yoke Careful preparations were made in anticipation of the right moment In the spring of 1821 open rebellion broke out among the Greeks of the Morea, when the Turkish governor Khurshīd Pāshā was besieging the rebel ʿAlī Pāshā at Yanina Soon after the beginning of the rising, in which a prominent part was played by Theodoros Kolokotronis of a famous Kleft family, the Moreotes were masters of the lowlands and even occupied several strongholds At the end of 1824 however, the Porte commissioned Ibrāhīm Pāshā, the adopted son of Mehmed ʿAlī of Egypt, to put down the Greek rising Ibrāhīm Pāshā landed his forces in Messenia He was able to restore Turkish rule over most of the Morea, but he failed to put down the Greek rebellion In the meanwhile, philhellenism had made progress in Europe and America, and it thus came about that the cabinets of Europe began to take an interest in the question of Greek freedom On July 6, 1827, England, France and Russia concluded a treaty in London, by which the Morea and other parts of the Greek mainland were to form an independent principality but to pay tribute to the Porte The Turks insisted on their point of view and declined the intercession of the great powers as regards the rebel Greeks On Oct 20, 1827, the combined fleets of the above mentioned powers destroyed the Turko Egyptian fleet at Navarin On Jan 18, 1828, Johannes Kapodistrias came to Nauplion, having been elected President of the Greek Free State by the National Assembly at Troezene On Aug 6, 1828, England concluded a treaty with Mehmed ʿAlī of Egypt for the evacuation of the Morea by the Egyptian troops French troops, led by General N J Maison, soon afterwards landed in Messenia by order of Charles X to drive the Turko Egyptian troops out of the Morea In the autumn of 1828 Ibrāhīm Pāshā withdrew to Egypt after turning the Morea into a heap of ruins during his $3^1/_2$ years in the Peninsula After long diplomatic negotiations, much quarrelling among the great powers and disagreement between the Moreotes and the other Greeks, Prince Otto, the second son of the philhellene Ludwig of Bavaria, landed at Nauplion on Feb 6, 1833 as the first king of Greece Henceforth the Morea formed a part of the kingdom of Greece During the rising of 1821—1827 and later, many Moreote Muslims adopted Christianity To this day, many buildings and inscriptions and especially place names recall the days when the Morea was under the Crescent

MORISCOS, (Moriscoes), the name given in Spain to the Muslims who remained in the country after the capture of Granada by the Catholic Kings, Ferdinand and Isabella, on Jan 2, 1492 and the dethronement of the last ruler of the Nasrid dynasty

It is mainly from Spanish sources that we learn the history of the Morescoes down to their final expulsion from Spain Arabic texts relating to them are very rare the only record at all detailed is that of the Maghribī al-Makkarī, a contemporary of the exodus of the Morescoes, in his *Nafh al-Ṭīb*

In proportion as the Spanish "reconquest" proceeded, groups of Muslims gradually increasing in

number found themselves under Christian rule These Muslims for the most part remained attached to their religion and the largest bodies of them were in Aragon and the district of Valencia, they kept up relations with their co-religionists of the kingdom of Granada But the latter were suddenly placed in the same position with the fall of the capital of the Nasrid kingdom The treaty for the capitulation of Granada contained, it is true, a large number of clauses safeguarding the liberty and property of Muslims, granting freedom for their beliefs and for the practice of the Muslim religion But these clauses were not long respected and very soon attempts were made to convert the people of Granada under the stimulus of the Cardinal de Cisneros and the Archbishop Hernando of Talavera Cisneros in particular began his work in 1499 he tried persuasion at first, then he tried to withdraw from circulation by burning them as many Arabic books as possible dealing with different branches of Muslim learning His efforts did produce a few voluntary converts, but also caused a rising which began in Granada itself in the Albaicin quarter (*al Baiyāzīn*) and soon spread throughout the hilly country of Alpujarras (*al-Bushārāt*, q v) between the southern slopes of the Sierra Nevada and the Mediterranean, and spread to the towns of Almeria, Baza and Guadix and the Serranía of Ronda The result was in 1501 the promulgation of a law which gave Muslims a choice between leaving Spain and adopting Christianity It does not seem however to have been strictly applied and the Morescoes of the kingdom of Granada, retiring to the mountains, enjoyed practical independence for over half a century

But this first edict brought about the conversion of the majority of the Muslims of Castille As to the Morescoes of Aragon, in spite of a few restrictions on their status they were not much disturbed and orders were given to this effect to the Inquisition Nevertheless in the early years of the XVIth century we find the Muslims of Albarracín, Teruel and Manises being converted en masse The reaction became stronger, encouraged by Joan the Foolish, then by Charles I In 1526 the Moriescoes of Valencia received their order of expulsion The situation remained somewhat confused down to 1556, a date at which a series of vexatious measures were decided upon in Madrid and began to be applied against the Morescoes who still remained in Spain the use of the Arabic language was forbidden them, it was in any case losing ground daily, even among the communities which remained Muslim, they were also ordered to abandon their worship, their costume and to modify their manner of life This time the Morescoes of Granada and Alpujarras did not hesitate to rebel openly The rising once again started in the Albaicin of Granada in 1568 and spread to the mountains, it was at first led by an individual named Ibn Umaiya, the Abenhumaiya of the Spanish chroniclers and afterwards by ʿAbd Allāh b ʿAbbō (Abenaboo) It took costly expeditions to put down this movement, and the war lasted for several years, conducted successively by the Marquis of Mondéjar and Don John of Austria

The final decree of expulsion was not issued by Philip II although he had the intention of doing so in 1582 It was Philip III who signed it in 1609 and in this and the following years, a large number of Morescoes — estimated at half a million — had to cross the sea without hope of returning Islām was definitely uprooted from Iberian soil

According to the Arab authors, the great exodus at the beginning of the XVIIth century was a most cruel hardship for the Morescoes A large number died on their enforced journey Many went to France, from which they tried to reach Muslim lands A few colonies of Muslims from Spain settled in Egypt and Constantinople But the majority went direct from Spanish ports to North Africa, their nearest refuge, where they were known as *Andalus* and where they were not always welcomed, at least in Morocco, with open arms The principal settlements were those at Salé and Rabāt on the one hand and Tetwān on the other, where their descendants still form the most prosperous and most industrious section of the population The *Andalus* of the seaports of the Atlantic coast of Morocco soon began to devote themselves to piracy the celebrated Moroccan corsairs were almost all Morescoes, who had retained the use of the Spanish language On the other hand, the Moroccan Sultāns organised corps of picked troops from the *Andalus* and they played a prominent part under the Saʿdians, especially in the conquest of the Sūdān There was also very soon a large colony of Morescoes in Fās In Algeria, a number settled in the towns of Tlemcen, Oran and Algiers At Tunis they were well received by the Dey ʿUthmān they settled together in two quarters which took their name (cf TUNIS, IV , p 886) Those who had not been town-dwellers settled in little villages which soon became prosperous and still have a characteristic Spanish look Such are the villages of Solimān, Grombālia, Djedeida, Zaghwan, Teburba, Testur and Galʿet el Andles (*Kalʿat al-Andalus*)

Bibliography The two oldest Spanish sources are L del Marnol Carvajal *Historia de la rebelion y castigo de los moriscos del Reyno de Granada*, Malaga 1600, F M de Guadalajara y Xavier, *Memorable expulsion y justissimo destierro de los moriscos de España*, Pampeluna 1613 Among more recent studies we may mention A L Rochau, *Die Moriscos in Spanien*, Leipzig 1853, F Janer, *Condicion social de los moriscos en España*, Madrid 1857 (Fr transl by J G Magnabal, Paris 1859), R Contreras, *Nuevos datos sobre la guerra y expulsion de los moriscos*, in *Revista de España*, 1879, lxviii 185—209, M Danvila y Collado, *La expulsion de los moriscos españoles*, Madrid 1889, L Dollfus, *Morisques et Chretiens de 1492 à 1570*, in *R H R* , xx , 1889 Nov , P Boronat y Barrachina, *Los moriscos españoles y su expulsion*, Valence 1901 , H C Lea, *The Moriscos in Spain, their conversion and expulsion*, Philadelphia 1901 , F Valladar, *Los moriscos granadinos*, in *La Alhambra*, Granada 1909, xii 343—346, P Longas, *Vida religiosa de los moriscos*, Madrid 1915, B Sanchez Alonso, *Fuentes de la historia española*, Madrid 1919, N° 3312—3342, H de Castries, *Les sources inedites de l'histoire du Maroc, Ière serie, France,* vol iii , Paris 1911, 187 *sqq* , A González Palencia, *Historia de la España musulmana*, Barcelona 1925, p 95—98

(E LÉVI-PROVENÇAL)

MOROCCO, a country and Muslim state of northern Africa The name (Spanish *Marruecos*, French *Maroc*) is a corruption of Marrākush, the largest town in southern Morocco [see the article MARRĀKUSH]

1 Geography

Morocco occupies the western part of Barbary, it corresponds to the Maghrib al-Aḳsā of the Arab geographers [see the article MAGHRIB] Lying between 5° and 15° W longitude (Greenwich) on the one hand and between 36° and 28° N latitude on the other, it covers approximately an area of between 500,000 and 550,000 square kilometres On the North it is bounded by the Mediterranean, on the West by the Atlantic and on the South by the Sahara On the eastern side it stretches to the Tell and to the plateau of Oran The boundary which separates it from Algeria is quite conventional and fixed definitely only on the northern side, for a length of 80 miles, from the mouth of the Wādī Kīs to Thenyet al-Ṣāsī

Although Morocco forms one with the northern part of Africa it is chiefly oriented to the West It is, one might say, the Atlantic slope of Barbary, it is nevertheless a continental country The coast does not lend itself to a maritime population, the Mediterranean coast is steep and inhospitable, the Atlantic coastline straight and lacking in natural shelters The estuaries of the rivers are of very little value because of the sandbars which obstruct their entrances The geological structure is somewhat complicated Below the folds of the primary age, of which there still exists much eroded evidence covered by secondary deposits, have risen strata contemporary with the Alps The actual relief which has resulted from these movements of the earth's surface and from these successive modifications consists of folded mountain chains, plateaux and plains The chains are two in number, the Rīf and the Atlas The Rīf is the continuation from the other side of the Strait of Gibraltar of the Baetican Cordillera [cf RĪF] The Atlas chain forms the backbone of Morocco It breaks into the High Atlas oriented West-North-East, linked by the volcanic massif of Ṣirwā to the Anti-Atlas which lies more to the South, and also to the Middle Atlas running in a diagonal line from the South-West to the North-East, as far as the country of the outer foothills of the Rīf, from which it is separated by the corridor of Tāzā [see the article ATLAS] From these different chains stretch plateaux Those of the east connect the High Atlas to the Saharan Atlas of Algeria, those of the West gradually descend towards the Atlantic Amongst the latter some are only the vestiges of the primary layer raised and eroded, others are composed of sedimentary deposits of varying origins

In consequence of the oblique orientation of the middle Atlas, which gradually draws away from the coast, the plains, which occupy in Morocco a more important place than in the rest of Barbary, lie mainly on the Atlantic side They are composed of two series, the one stretching diagonally from the mouth of the Wādī Tensīft to that of the Muluya (the sub-Atlantic plains, the plain of Sebū, the corridor of Tāzā, the plain of the lower Muluya) The other stretches to the foot of the High Atlas (Hawz of Marrākush) and disappears in the heart of the middle Atlas

Climate The climate of Morocco has been defined as "an Atlantic variety of the Mediterranean climate" (Gentil) This however must not be taken to apply to the whole of the country, the different regions differ as much in regard to temperature as in the distribution of rain On the Atlantic coast the climate is relatively mild in winter and cool in summer, only small differences are recorded between the coldest month and the warmest (5°7 at Mogador and 10° at Rabat) In the interior on the other hand, the seasonal variations and even the daily ones increase the farther one goes inland They become excessive in character in eastern Morocco where the climate is distinctly continental The rainfall is equally lacking in uniformity Brought by the West and S-W winds, the rains are abundant in the autumn, the winter and the beginning of spring but they are very rare during the summer The Atlantic coast has everywhere a copious rainfall although the quantity which falls decreases as one goes from North to South (Tangier 32 inches, Casablanca 16 inches) It also enjoys the benefit of an atmosphere which is saturated with moisture even in summer The interior is not so well served The rains diminish in quantity from West to East The mountain massifs always form an exception They condense the moisture in the form of rain and even snow which, although it is by no means perpetual, nevertheless covers the high summits of the Atlas mountains until the beginning of the summer Eastern Morocco on the other hand, isolated by the barrier of the Middle Atlas, is not subject to oceanic influences and only receives, except in the immediate neighbourhood of the Mediterranean, rare and irregular downfalls of rain

The flora reveals in striking fashion these variations of climate Forests of evergreen oak, of oak and of cedar clothe the peaks of the High and the Middle Atlas and of the Rīf The cork tree is found in extensive forests in the massifs of the Zaʿīr and Zayān and as far as the region of the Atlantic (forest of the Maʿmūra) The thuya and the arganier (a tree peculiar to the S-W of Morocco) are already more disseminated Poplars, willows, elms and tamarisks form a fringe of verdure along the wādīs The olive tree is met almost everywhere in its wild state But, as the rain-fall decreases, the forest gives place to scrub where the jujube tree and the mastic abound, then to prairie and steppes The prairie, which hardly goes beyond the limits of the maritime plain, is the home of plants which are used for fodder and of bulbous plants The steppe is the home of shrubs and bushes (artemisia, drin, alfa) which are adapted to a dry soil and to extreme variations in temperature The steppes cover a part of the interior plains of Western Morocco and practically the whole of Eastern Morocco, where they extend to the neighbourhood of the Mediterranean As regards the desert, it is devoid of vegetation in the *hammāda* [see ṢAHARĀ]', although the oases form spots of verdure in the midst of the general desolation

Hydrography The structure of the country and the relative abundance of rainfall affect the hydrography Morocco is much richer in running streams and in subterranean waters than any other country in Northern Africa Wādīs (weds) are here more numerous, their courses are longer and their volume larger A number of them even deserve the name of rivers The waters flow in three different

directions towards the Atlantic, towards the Mediterranean and towards the basin of the Sahara The Atlantic rivers are in all respects the most important They can be divided into three groups those of the North (Lūkkos and Sebū), those of the centre (Bū Ragrag and Umm al-Rabīʿ), and those of the South (Tensift and Sūs) The Lūkkos drains the districts of the Gharb, the Sebū, those of the Middle Atlas, of the Zarhūn, and the southern slope of the Rīf On emerging from the mountains it takes numerous turns and windings across the alluvial plain and reaches the ocean after a course of 300 miles Although subject to considerable variation in volume, according to the season, it never dries up completely It is even navigable in its lower course The Bū Ragrag and the Umm al-Rabīʿ run for a part of their course through the Central Plateau, the Moroccan "Meseta" The irregularity of their courses makes them useless for navigation The Tensīft, to the North of the High Atlas, the Wādī Sūs to the South, which are much less in volume approach more nearly to the classic type of wādī of Northern Africa The watercourses of the Sahara (Wād Gīr, Wād Zīz, Wād Darʿa) diminish in volume as they go farther away from the mountains and end by disappearing in the sand The Darʿa alone reaches the Atlantic, but it only flows intermittently in its lower course [see the article DARʿA] As for the Mediterranean rivers, they are only torrents with violent and rapid floods The Muluya alone forms an exception It collects water from the slopes of the Middle Atlas but only reaches the sea in much diminished volume on account of the loss it suffers in crossing the steppes

Although the common characteristics of all the countries of Barbary are found in Morocco, the greater or less differences in relief, the differences in climate, the peculiarities of vegetation bring in their train a diversity more marked than in Algeria or Tunisia The combination of these different elements determines the existence of regions which differ the one from the other in their configuration, their resources, the density and manner of existence of their population We may distinguish six such regions Northern Morocco, the basin of the Sebū, Central Morocco, the country of the Atlas, Eastern Morocco, and Moroccan Sahara

Northern Morocco Northern Morocco comprises a mountainous zone (the mountains of the Rīf properly so-called which are to the North-West continued in the "domes" of the Djebāla as far as the Strait of Gibraltar) and regions less rugged in character which to the South East and the West form the transition into the adjoining countries The mountains, split into deep ravines by the courses of the wādīs, for the most part only leave between their last escarpment and the sea-shore a narrow strip, or a few bays enclosed between the rocky promontories A few cuttings which run across the ranges afford communication between the two watersheds The Rīf, therefore, must seem to be a world very little accessible to influences from without Arab influence has scarcely grazed it The population has always vigorously opposed the political measures of the sultāns as well as the attempts of Europeans to settle themselves there Crowded into a limited territory, since the highest parts of the mountains are useless, the Rīfans find their chief means of subsistence in the cultivation of vegetables and fruits A number of them gain from temporary emigration an addition to their resources They are not nomadic but inhabit villages perched on the slopes Towns are represented only by Shafsāwān and Wazzān, religious and commercial centres, situated the one on the northern side and the other on the southern side of the Djebāla Towards the South-East, plains interspersed with mountain masses extend as far as the Muluya The lack of rain gives to these plains (Salwān, Gāret) the aspect of steppes more fitted to a pastoral life than to agriculture and a settled life Towards the West the low-lying coastland, still a very narrow border at the strait of Gibraltar, increases gradually from the North to the South between the Atlantic coast and the last slopes of the Djebāla This district commonly called the Gharb is a corridor It still keeps in this respect its historical significance, but its economic value is diminished by the stagnation of its waters in the hollows in the flat bottoms of the valleys, and by the insecurity resulting from the proximity of the warlike tribes of the high mountains A few townships have however succeeded in establishing themselves, either at the crossing of roads such as al-Kasr al-Kabīr [q v] or in proximity to the coast like Ceuta, Tangier and Tarache [see the articles TĪTTĀWĪN, CEUTA, TANGIER, al-ʿARĀʾISH]

The valley of the Sebū The valley of the Sebū lies between the Rīf, the Middle Atlas, Moroccan Meseta and the Atlantic The situation of the region, the abundance and variety of its natural resources makes it of exceptional value The Sebū links up the whole of it Through its tributary the Innāwan, the valley of which leads to the pass of Tāzā, it makes communication with the rest of Barbary easy The mountain masses there (Zerhūn, Zālagh, mountains of Gerwān) offer no inseparable obstacles to communication The high plains of Sāʾis and Meknes are contrasted with the lower plains of the Shrārda and the alluvial plains of the lower course of the Sebū The influence of the Atlantic is felt far into the interior and combines with the numerous streams that flow into the Sebū and its tributaries and the subterranean waters to promote the development of all forms of vegetation Forests cover the higher slopes of the mountains, fruit trees flourish on the sunny slopes and cereals on the high plains, the *merdja*, temporary marshes produced by the Sebū, in its lower course are used for grazing until they are sufficiently dry to be of use to agriculture This combination of circumstances, so auspicious for human habitation, has made the valley of the Sebū a centre of intensive settlement The most diverse ethnic elements have settled together and mixed there All types of habitation are found as well as all degrees of attachment to the soil from a nomadic to settled town life Human activities are displayed in the most varied forms (grazing, agriculture, arboriculture, commerce, industry) The country villages, douars of "nuwālas" in the plains, villages of houses of clay in the mountains, are numerous, the towns are flourishing Mawlāi Idrīs is the sacred city of Morocco, Sefrū on the borders of the plain of Sāʾis and the high limestone plateau lives by trading with the people of the mountains and the industry of its weavers and makers of slippers Fās and Meknes are among the great cities of Morocco

The first of these towns has remained to this day the political, religious, intellectual and economic centre of Morocco It has resisted all the usual

causes of decline From all time the ownership of the high plains of the Sebū has been bitterly contested Their possession has been the condition for the establishment and survival of the dynasties which have succeeded one another in Morocco Their political significance and role in history cor responds very exactly to their geographical position and economic value

Central Morocco Between the valley of the Sebū, the ranges of the Atlas and the Atlantic, covering about a quarter of habitable Morocco, lies the region called by the geologists the Moroccan Meseta It includes districts of very different character, the only feature uniting them being the possession of a common substratum, the Hercynian paenoplain covered almost everywhere by sedimentary horizontal formations Differences of structure and of climate distinguish clearly the various parts the Atlantic plain, the plateaux of the centre, and the interior plain of the Hawz The maritime plain lies along the Ocean from Rabat to Mogador Very narrow at its northern and southern ends, it broadens near the centre (Dukkāla, Shāwīya) to a width of 50 miles To the rains and the constant moisture from the vicinity of the Atlantic, the abundance of running streams and subterranean waters, the natural fertility of the soil further adds to the conditions for prosperity The *tīrs* or black lands which run in an unbroken line behind the coast from the Bū Ragrag to Tensift are admirably suited for the growth of cereals The rural population, almost everywhere settled, is therefore considerable The land of the Dukkāla has 40 people to the square kilometre, a density very much greater than that of the other districts of Morocco The towns of the coast, Salé, Rabat, Casablanca, Mazagan, Azemmūr, Safi, Mogador [q v], benefit by the richness of the hinterland The exportation of agricultural produce has at all times been a branch of commerce, and has been much developed since the settlement of Europeans there While facility for communications and the continental relations with the valley of the Sebū opened the plain to Arab influences, the ports of the coast maintained contact with abroad and permitted the infiltration of European influences

The interior is much more broken The ground rises gradually up to a height of 2,000–2 500 feet The predominant formation is plateaux terminating on the north in the very old massifs of the Za'īr and Zayān, which are really mountains in character, in the south in the equally old but less elevated massif of the Rahāmna These plateaux deeply cut into by the course of the Umm Rabī' overlook on the west side the lowlying coastlands from the top of cliffs, and slope gently on the S E to the plain of Tādlā This is a depression, over 120 miles in length, running to the north into the heart of the Middle Atlas where it terminates in a cul de sac, while it broadens greatly in its southern part A low pass enables communication to be made between the Tādlā and the Hawz of Marrākush, a basin shut in by the High Atlas in the south, the Middle Atlas in the east, the Djbīlāt in the north and the hills of the Shiyādma in the west The economic value of this inner region is very unequal On the mountains of the north the rains and streams support forests and the natives devote themselves to cattle-rearing The plateaux of the centre covered with a surface of limestone have great stretches of bare rock and cultivation is barely possible The Tādlā is no better favoured except in the zone adjoining the Atlas, watered by torrents descending from the mountains The plain of the Hawz would also suffer disastrously from drought, if human industry had not averted this danger An ingenious system of irrigation has transformed the country round Marrākush into a vast palmgrove and resulted in a particularly dense population (100 to the square kilometre) Comparatively large towns (Amīsmīz, Demnāt, Tāmaslūhet) and especially Marrakush [q v] have been enabled to rise and prosper Between this region, already half Saharan, and the high lying plains of the Sebū, the plateaux of the centre and the mountains of the north which come down to within a short distance of the shore, interpose a barrier which the attitude of its inhabitants makes still more difficult to cross The Zayān, the Za'īr, the Zemmūr, over whom the authority of the Makhzen has never been very securely exercised, have more than once cut direct communication between Fās and Marrākush These two cities have been at different periods the capitals of distinct and even hostile kingdoms

The region of the Atlas In spite of the marked differences between the different elements of the Atlas, the whole region nevertheless has general characteristics of its own Between Atlantic Morocco on the one hand and Saharan Morocco on the other, the Atlas lies as an almost continuous barrier Only the few transverse fractures in the Middle Atlas permit passage between the basin of the Sebū and the Saharan oases, while in the High Atlas valleys running right into the heart of the massif give access to passes opening on the valleys of Sūs and the Wādī Dar'a Moister and colder, the Middle Atlas is covered with forests which are denser and more extensive than those of the High Atlas Both however are great watersheds From the Middle Atlas come the great rivers of the Atlantic slope (Sebū, Gīgū, Umm Rabī', Wādī 'l 'Abīd), from the High Atlas the Tasā'ut and the Tensift The lands of the Atlas are nevertheless poor The high mountains offer little to support mankind Human activities are found mainly in the zones of contact between the mountains and the plains (*dīr*) of the Middle Atlas and in some specially favoured valleys of the High Atlas Except in the Middle Atlas, where the nomadic mode of life results in the exodus in the bad season of the inhabitants who lead a pastoral life, and on the plateaux of the High Atlas on the Atlantic side (Hāha, Shiyādma) the inhabitants of which are mainly engaged in cattle-rearing, the natives are settled They live in villages perched on the slopes and terraces between wādis or scattered along the valleys There is nothing approaching a town in size These regions, defended by the nature of the country, have almost completely escaped outside influence they are still almost exclusively the domain of Berber tribes (Berāber in the Middle Atlas and Shluh in the High Atlas) The customs and institutions peculiar to this people [cf BERBERS] have survived to a greater extent here than in any other region of North Africa In particular their political organisation is still most rudimentary municipal republics administered by a *djamā'a* in the Middle Atlas, feudal lordships ruled in patriarchal and despotic fashion by a few powerful families in the High Atlas The people of these regions have also always opposed vigorously the

central power, the authority of the Makhzen over the Berbers of the High Atlas has never been exerted except through the local chiefs As to the tribes of the Middle Atlas they have retained to the present day almost complete independence Even the most vigorous sultāns have never succeeded in forcing them into obedience for any length of time

Eastern Morocco Eastern Morocco may be described as the continuation of the Central Maghrib of which it has the distinctive characteristics In it, as in Oranie, we have a *tell* zone and a zone rising by successive stages up to 6,000 feet The upper valley of the Muluya separates them from the Middle Atlas The monotony of these vast spaces is only broken by the outcrops of *gūr*, flat beds of rocks cut up by erosion and by the depressions of the shott [q v] Beaten by the winds, exposed to the rigours of an extreme climate, these lands are only fit for the pastoral life led by the nomads who raise sheep The valley of the Muluya is no better favoured, except in the vicinity of the Atlas, where villages surrounded by vineyards with a settled population are found along the tributaries of the river As to the Tell, hills of no very great height (the most important being that of the Benī Snāssen which does not exceed 5,000 feet) divide it up into compartments occupied by plains (plains of the Awlād Mansūr, on the coast, of the Trifa, of the Angād which in the south reaches the cliffs in which the high plateaux end) The dryness of the climate frequently gives these plains a steppe-like character, only the western part of the plain of the Angād with a fertile and well watered soil lends itself to cultivation The nomads come here to procure grain But this region owes its importance less to its natural resources than to its situation on the natural route between Atlantic Morocco and the rest of Barbary Udjda [q v] which commands the passage, has thus been enabled to escape various causes of decay that have threatened it A border district, eastern Morocco has always been a disputed region, a march for which the lords of Tlemcen and Fās have contended The authority of the latter was never solidly enough established here to impose itself on the settled inhabitants of the mountains and on the nomads of the plateaux and plains Down to the French occupation the country was left to anarchy and disorder

The Moroccan Sahara The Moroccan Sahara is the N W corner of the Sahara There we find the general characteristics of this desert region [cf SAHARĀ²] Only the parts adjoining the Atlantic and the threshold of the mountains offer favourable conditions for man In the plain of Sūs [q v] shut in between the Atlas and the Anti-Atlas, the rivers and the irrigation canals enable shrubs to grow The Darʿa, Zīz and Gīr are in their upper courses fringed by a thin border of cultivated land, pasturage, vineyards, and in their middle course assure the growth of palmgroves of which the best known, if not the most prosperous, is that of Tāfilālt [q v] The richness — only relative it is true — of these oases is in contrast with the desolation of the rocky plateaux (*hammāda*) which form the greater part of the Moroccan Sahara These natural conditions determine the mode of life of the inhabitants Some lead a nomadic life and drive their flocks up and down the plateaux, others are permanently settled on the Sūs, in the high valleys and in the oases Sūs contains numerous villages and even towns (Āgādīr, Tiznīt, Tārūdānt), the oases have a settled population in the *ḳṣūr* Those of Tāfilālt, Tamgrūt, Bū Dnib and Figīg carry on a certain amount of commerce between Atlantic Morocco and the Sahara But this very circumstance has prevented them escaping as completely as the lands of the Atlas from the political and intellectual influence of Western Morocco, especially Tāfilālt where considerable groups of Arab *shorfā* have been long established in the midst of Berber populations But, although the present dynasty actually came from Tāfilālt, the people of this region have frequently escaped Sharīfan authority

Begun in the last years of the xixth century, methodically pursued since the French occupation, the scientific exploration of Morocco is not yet completed From the results so far attained one thing is clear the lack of uniformity in the country Thus its geography may explain to some extent the historical development of the country

II History

Morocco before Islām Morocco, like the other parts of North Africa, has probably been inhabited from a very remote period We know, however, nothing definite about its earliest inhabitants The traces which they have left, weapons and tools of chipped flint, pottery, rock paintings, some of which represent animals of the quaternary period, now extinct, megalithic monuments identical with those found all round the Mediterranean basin, give us no information in this respect At most, we may suppose that the primitive population consisted of emigrants from southern Europe, the Sahara and perhaps from Egypt The fusion of these diverse elements gave birth to a race, the members of which, frequently different in type and physical features, were united by a community of language The ancient writers called them Libyans and Moors They were the ancestors of the present Berbers [q v]

The first historical fact known, and that only imperfectly, is the appearance in the xiiith century B C of the Phoenicians on the Moroccan coast The sailors of Tyre and Sidon built factories there, where they exchanged goods of eastern origin for local products (cattle, wool, hides) and slaves But Phoenician influence was exercised mainly through the intermediary of Carthage when it in turn had become the metropolis of a great maritime empire The Carthaginians rebuilt the ruined factories and added new ones In the middle of the fifth century, Hanno in the course of his celebrated "periplus" established on the Atlantic coast seven colonies of which one was at the mouth of the Sebū Rusaddir (Melilla), Septem (Ceuta), Tingis (Tangier), Lixus (Larache), Sala (Salé) were the principal Carthaginian establishments It does not seem, however, that Carthage sought to extend her power into the interior She was content no doubt to conclude treaties with the native chiefs and to recruit mercenaries from the country Morocco remained independent, but the tribes who inhabited it were not organised into states, except perhaps in the east, where ancient writers mention in the period of the Punic Wars the existence of a kingdom of Mauretania or Marusia, extending along both banks of the Muluya

The destruction of the Carthaginian empire hardly altered this state of affairs For two centuries Rome administered only the "Province of Africa" directly and left the other regions of Barbary in the hands of native chiefs under a more or less severe protectorate Northern Morocco shared the fate of Mauretania down to the annexation of this kingdom in 42 A D The region to the east of the Muluya formed part of Caesarean Mauretania The lands stretching from the Muluya to the ocean formed Mauretania Tingitana, an imperial province governed by a procurator When the empire was reorganised by Diocletian, it was attached to Spain

Roman Morocco never covered more than a small portion of the modern Morocco On the Atlantic coast, it barely extended beyond the mouth of the Bū Ragrag, and in the interior to the massif of the Zarhūn The plateaux and sub-Atlantic plains and the mountains of the Rif, Middle and High Atlas escaped the authority of Rome It was the same with the Sahara The expedition of Suetonius Paulinus, who in 41 A D advanced as far as the wādī Gīr, remained an isolated incident

To defend herself against the rebellions of her own subjects and to protect the country from Berber inroads, Rome had to keep in Tingitana an army of ten thousand men, to build strategic roads and to establish fortified posts on the sides of the triangle Sala, Zarhūn, Tingis With the exception of Volubilis, the importance of which has been revealed by its ruins, methodically excavated in recent years, and which was undoubtedly a centre of influence of Roman culture on the people of the interior as well as a military base, the towns were all on the coast They were Lixus and Tingis raised to the rank of "*coloniae*", and Ceuta They owed their prosperity mainly to trade with Spain to which were exported oil and wheat, the two main products of the country On the whole, however, Rome's influence on Morocco was superficial and has left little trace

Without any really firm hold on the country, weakened by native risings and by the quarrels between the donatists and the orthodox, Roman rule was to collapse suddenly at the beginning of the fifth century Germanic invaders, the Vandals, came from Spain and in 429 A D conquered without opposition Tingitana which they gave back a few years later to the Romans Soon afterwards the western empire disappeared and the natives seized the opportunity to become independent The Byzantines, who in the sixth century destroyed the Vandal kingdom, were content to re-occupy the two strongholds of Ceuta and Tangier The rest of Morocco was in the hands of the Berbers The latter were divided into a large number of tribes, of whom the principal were the Ghomāra on the Mediterranean coast, the Barghawāta [q v] on the Atlantic coast between the strait of Gibraltar and the mouth of the Sebū, the Miknāsa, in the central district, the Masmūda, on the western slope of the High Atlas and on the coast from the Sebū to the Sūs, the Haskūra between the Sūs and the Dar'a, the Lamta and Lamtūna on the left bank of the Dar'a These Berbers were all of Sanhādja stock, some professed Christianity or Judaism but the majority still followed the old nature worship The Arab conquest brought them a new religion Islām

The Introduction of Islām The Arabs appeared in the extreme Maghrib at the end of the viith century A D Tradition relates that Sidi 'Okba, the founder of Kairawān, in 684—685 undertook an expedition which carried him as far as the shores of the Atlantic Ocean This raid, however, if it ever took place, was too transitory to have any permanent results But at the beginning of the following century, Mūsā b Nusair [q v] who had just completed the conquest of Ifrikiya, took Tangier, installed a governor there and set himself to conquer and convert the natives He succeeded without much trouble Attracted by the hopes of gain, the Berbers adopted Islām and enrolled themselves in the armies which were invading Spain They were not long, however, in

rising against the Arabs Dissatisfied with the share allotted them of lands taken from the Christians in the Peninsula, and exasperated by the exactions of the governors of Tangier, they took up arms in 740 on the call of the porter Maisāra [q v] The rebellion was both religious and political in character With the same readiness with which they had adopted Islām, the Berbers adopted Khārid̲jī doctrines from the east, teachings which also appealed to their equalitarian tendencies and to their spirit of independence The army sent from Syria to establish order was destroyed on the banks of the Sebū (742) and the extreme Maghrib was lost at one stroke to the caliph and to orthodoxy Berber principalities were organised in the Rīf [see SIDJILMĀSA], in the west, the Barg̲hawāta [q v] recognised the authority of a certain Sālih, founder of a rival religion to Islām, who had composed a Kur'ān, that is a sacred book, in Berber None of these little states was strong enough to impose its authority on the others and to collect all the Berber tribes under one rule

It looked for a time as if the Idrīsid dynasty [q v] were to play this part Idrīs I and his successor Idrīs II, actually enforced their authority over the greater part of the tribes of northern Morocco and successful expeditions extended their kingdom from the shores of the Mediterranean to the High Atlas and from the Atlantic to beyond Tlemsen Ardent champions of Islām, they imposed their religion on those peoples who did not yet practise it or who had abandoned it after once adopting it The conversion of the extreme Maghrib to Islām is their work much more than that of the Arab conquerors Zealous defenders of orthodoxy, in spite of their ʿAlid origin, they fought the Khārid̲jīs with the same vigour but did not, however, succeed in completely extirpating the heresy It is not without good reason that legend has transformed these rude warriors into saints, the one Idrīs I, patron saint of Morocco, the other Idrīs II, the patron saint of the city of Fās [q v] which he had founded The building of this city had enduring results It gave northern Morocco a religious, political and economic centre which it had lacked since the disappearance of Roman rule Favoured by its position, Fās prospered rapidly It survived all causes of decline, even the collapse of the Idrīsid power

The Idrīsids indeed rapidly declined The various groups which had recognised the authority of the founders of the dynasty were not long in casting it off and fighting with one another These rivalries were taken advantage of by the Fātimids of Ifrīkiya and the Umaiyads of Spain, who during the tenth century A D disputed the possession of the extreme Maghrib With the assistance of the Miknāsa, the Umaiyads in the end remained masters of the country They were in their turn ousted by the Maghrāwa [q v], whose chief Zīrī b ʿAtīya, abandoning the cause of the Umaiyads, seized Fās where his descendants ruled for three quarters of a century

The Almoravids and the Almohads The extreme Maghrib seemed to be condemned to anarchy and to be broken up among small factions when the Almoravid invasion came [cf ALMORAVIDS] After having first of all subjected all the lands south of the High Atlas, then established themselves solidly on the northern slopes, at the foot of which Yūsuf b Tashfīn founded Marrākush [q v] in 1062, these Saharan hordes turned to the centre, east and north of Morocco, sweeping everything before them Fās, Tangier, the Rīf, Oran and Ténès fell before them The Berber principalities of the Maghrāwa, the Barghawāta and Banū Ifren disappeared In less than twenty years, Yūsuf b Tashfīn became sole master of the extreme Maghrib as far as Algiers To these territories, already vast, was soon to be added half of Spain Summoned by the Muslim emīrs who were threatened by the king of Castille, Yūsuf b Tashfīn checked the Christian advance at Zallāka (1086), then dispossessed the petty Muslim rulers to his own advantage Morocco was thus extended across the Straits of Gibraltar as far as the Ebro and to the Balearic Islands The fortunes of the Almoravids were, it is true, as ephemeral as they were brilliant In contact with Andalusian civilization, the Saharans rapidly became decadent The rigid orthodoxy, which had been their strength, relaxed, they in their turn were regarded as infidels, "anthropomorphists" (*mud̲jassimūn*), whom it was lawful and even meritorious to fight It was in the name of orthodoxy that the Masmūda and the Hintāta of the High Atlas under the leadership of Ibn Tūmart and ʿAbd al Mu'min entered into the struggle against the Almoravids

This struggle ended in the displacement of the Almoravids by the Almohads [see ALMOHADS and ʿABD AL MU'MIN] In seven years (1139—1146 A D) ʿAbd al-Mu'min conquered all Morocco, Sid̲jilmāsa, Oran, Tlemsen, and Ceuta fell one after the other into his hands Next came the turn of Sale, Fās, and finally of Marrākush, the gates of which were opened to him by the treachery of the Christian mercenaries Muslim Spain was also conquered with the exception of the Balearic Islands Even in Africa, the Hammādid kingdom of Bougie was conquered in 545—546 (1151—1152) A few years later (554—555 = 1159—1160) a new expedition led ʿAbd al-Mu'min into Ifrīkiya and secured him possession of the interior and of the coast, which he took from the Normans of Sicily who had occupied it some time before Morocco in the strict sense of the word was now merely a province in the vast Berber empire The unification of these territories under one ruler had important consequences for the Maghrib It facilitated the diffusion in North Africa of the Hispano-Moorish civilization, which was to be perpetuated in Morocco after it had disappeared from the Peninsula itself Further it brought into the extreme Maghrib a new ethnic element the Arab ʿAbd al-Mu'min, as well as his successors, on several occasions deported Hilālī tribes from the Central Maghrib and Ifrīkiya, where they continually created unrest, to the sub-Atlantic plains where other groups of Arabs joined them of their own free will

The Almohad empire was too vast, it comprised regions of too different a nature, peoples too foreign to one another to last long united The Almohad caliphs were powerless to restrain the separatist tendencies which revealed themselves on all sides In the first half of the XIIIth century A D, the Almohad empire broke up Ifrīkiya and the Central Maghrib recovered their independence, local dynasties set up in Tunis (Hafsids) and Tlemsen (ʿAbd al Wādids) The extreme Maghrib ended by slipping away from the descendants of ʿAbd al-Mu'min who were replaced by the Merīnids [q v]

The Merīnids Berbers of Zanāta stock, driven by the Hilālī Arabs on to the plateaux of Oran and into the central valley of the Muluya, the Banū Merīn had at first entered the service of the Almohads, then turned against them, when the power of the dynasty began to decline By repeated razzias they made themselves masters of almost all northern Morocco After the death of the caliph al-Saʿīd, who had been able to arrest their progress for a time, their leader Abū Yahyā (1243—1258) seized Fās, Meknes, Rabat and Sidjilmāsa The capture of Marrākush (1269) by Abū Yūsuf, successor of Yahyā, marked the final triumph of the Merīnids Heirs of the Almohads, the first Merīnids endeavoured to reconstitute the empire of their predecessors In Spain, they enforced their authority on the Muslims of Andalusia In Africa, they endeavoured to take the central Maghrib from the ʿAbd al-Wādids They were successful when Tlemsen, besieged seven times in sixty years, finally fell into the hands of Sultān Abu 'l-Hasan (1337 A D) Ten years later, the same ruler took Bougie, Constantine and Tunis, but his hold on these was very insecure At the end of barely a year, Abu 'l-Hasan, defeated by the Arabs, found himself forced to abandon Ifrīkiya, the Hafsids returned to Tunis and the ʿAbd al-Wādids to Tlemsen, while the sultān's own son Abū ʿInān rose against him in Morocco Attaining to power, Abū ʿInān renewed his father's efforts He re occupied Tlemsen and Tunis, it is true, but could not retain them (1360 A D) The Hafsids and ʿAbd al Wādids recovered their kingdoms almost at once

Separatist tendencies thus triumphed and on this occasion in a most definite fashion The extreme Maghrib, the history of which had hitherto been so often that of Barbary, began to live its own life The Merinid kingdom, while its boundaries in the east were still vague and changing, already corresponded roughly to modern Morocco and the Merinids may be regarded as the first strictly Moroccan rulers Lacking the religious prestige of their predecessors, they endeavoured to secure the moral authority which they lacked by taking as their patron saints the apostles of Islām in the Maghrib The cult of Mawlāi Idrīs in the XIVth and particularly the XVth century assumed an importance which it has retained to the present day No less characteristic is the development of intellectual life and the arts The Hispano-Moorish civilisation never flourished more brilliantly in Morocco than in the Merinid period The rulers attracted to their court the poets, men of letters and lawyers of the Iberian Peninsula and of the Maghrib The university of al Karawiyīn attracted students from all the lands of the western Muslim world Fās, which the Merinids, abandoning Marrākush and Rabat, the capitals of their predecessors, chose as their royal residence, was given splendid buildings by them, palaces, mosques and madrasas It was at the same time a commercial city in which African and Spanish merchants mixed with Christian traders

This brilliant exterior, however, was quite deceptive Merīnid Morocco was never able to organise itself on a solid basis The central power was very weak and did not succeed in imposing its authority everywhere The accession of each sultān was an occasion for outbreaks The pretenders who arose always found supporters readily, either among the Arabs or the Berbers Powerless in the interior, the sultāns were no more fortunate in their enterprises against their neighbours of the Central Maghrib or against the kings of Granada Their prestige and their authority could not survive these checks The Merinids in the strict sense disappeared from the scene in 1465, after the assassination of the sultān by an Idrīsid sharīf The Banū Wattās, descended from a collateral branch, the chief of whom seized the power in 1470, had themselves a wretched existence Their kingdom broke up into a large number of independent little groups, principalities at Fās and Marrākush, Berber republics in the Atlas, Marabout fiefs in the Rīf, the Gharb and in Darʿa and Sūs The sultāns were quite powerless to prevent this decomposition

The Christian offensive and the revival of Islām Of all the causes which combined to enfeeble and discredit these rulers, the principal was undoubtedly their impotence against the offensive of the Christians against the Maghrib In 1415 the Portuguese took Ceuta, in 1465 al Kasr al-Saghīr, in 1471 Tangiers They thus secured themselves a base of operations in the north while by the occupation of Asīlā and Anfā (Casablanca, q v) they secured a footing on the Atlantic coast In the early years of the XVIth century, they built fortified posts at Santa Cruz (Agādīr) and Mazagan [q v] and took by force of arms Safi and Azemmūr [q v] Holding all places of importance except Larache [see AL-ʿARĀ'ISH] they brought under their protectorate all the lands near the coast (Shawiya, Hāha, Dukkāla), forced the natives to pay them tribute and to hand over to them strategic points up to the environs of Marrākush Their expeditions had no other aim than plunder, no other result than to exasperate the inhabitants who saw their towns destroyed, their douars burned, their women and children massacred or sold as slaves

Menaced in the west by the Portuguese, Morocco was threatened in the east by the Spaniards also The latter completed the *reconquista* by the taking of Granada (1492) Thus free to go further afield, and still fired with the religious enthusiasm of Ximenes, they too went over to fight the Muslims on African soil The occupation of al-Marsā al-Kabīr (1507) and of Oran (1509) and the establishment of a Spanish protectorate over the kingdom of Tlemsen constituted a serious danger to the Muslims of Morocco

The threat from the Christians produced an awakening of religious sentiment This renaissance of Islām in the XVth and XVIth centuries, the results of which are still to be felt at the present day, is beyond question the great event in the history of Morocco since the Idrīsid period The way for it had, moreover, been prepared by the Sūfī teachings imported from the east and by the development of the brotherhoods in which the adepts of these doctrines were organized It also found a favourable soil owing to the persistence of maraboutism among the Berbers The *bahlūl* or the charlatan, who had always been an object of public consideration, became readily identified with the shaikh, the possessor of the *baraka* Co-operating with one another, these pious individuals became the religious leaders of the people of Morocco They strengthened orthodoxy, excited the zeal of the faithful, preached the holy war, and led the defenders of the faith into battle The ascendancy

which they exercised, the wealth they accumulated in their zāwiyas, made them independent of the sultān They thus became temporal leaders also, all the more readily as the sovereigns could not fulfil their office of defenders of Islām owing to lack of energy and also of means The activity of these religious leaders was always of a local nature, it was only effectively exercised within a limited area and did not extend over the country generally The religious solidarity thus established, the kind of common conscience thus created, did not put a check to the political decline until the time when the Sa'dian shorfā took direction of the movement and exploited it for their own benefit

The Sharīfian dynasties A The Sa'dians [q v] The Sa'dian shorfā benefited by the prestige which the religious awakening had restored to the descendants, real or presumed, of Fātima, the daughter of the Prophet Coming from Arabia at the end of the XIVth century and settling in the valley of the wādī Dar'a, while another branch of the family settled at Tāfilālt (Hasanī or 'Alid shorfā), they were not long in acquiring a considerable influence over the tribes of the south Thus they were naturally led to support the people of the south, who were exposed to the attacks of the Portuguese of Santa Cruz In 1511, the sharif of Tāgmādāret, requested by the Muslims to put himself at their head against the Christians, agreed to do so Supported by the marabouts who gave him valuable assistance, he began hostilities against the Portuguese The holy war regularly waged secured to his sons, Ahmad al-A'radj and Muhammad al-Mahdī, the possession of the whole of southern Morocco up to the Umm al Rabī' The intervention of the Merīnid sultān in the quarrels which broke out between the two brothers only resulted in his own downfall being hastened Muhammad al-Mahdī took Fās in 1550, the foiling of an attempt to restore the Merīnids in 1554, with the help of the Turks of Algiers, secured the definite triumph of the Sa'dians

The coming of the Sa'dians meant a regular reconstitution of Morocco Muhammad al-Mahdī and his successors imposed their authority on the whole country, protected it against foreign foes and increased the extent of their territory by distant conquests They finally triumphed over the difficulties created by the Turks of Algiers, and at the battle of al-Kasr al-Kabīr in 1578 arrested a counter-offensive of the Portuguese Ahmad al-Mansūr (1578—1610) occupied Timbuktu [q v] and destroyed the Askia empire of Gao For half a century the Moroccans were masters of the Western Sūdān, from the banks of the Senegal as far as Bornū The plunder taken on this campaign of conquest enabled the sultān to keep a splendid court, the hierarchy of which was modelled on the Ottoman court, and to adorn his capital Marrākush with magnificent monuments

To the same period also belongs the organisation of the makhzen [q v] The early Sa'dians had relied for support on the Arab tribes of the south To these al Mansūr added the Arab tribes of the region of Tlemsen and Udjda driven into Morocco by the Turkish conquest These *shrāga*, as they were called, received lands around Fās in return for the military service they were forced to give Reinforced by a regular army formed of renegades, Spanish Moors and negroes, trained by Turkish deserters, the makhzen provided the sultān with the means of preserving order and levying taxes, it was thus the essential instrument of sharīfian government and tended to become the government itself

This instrument proved sufficient in the hands of an energetic ruler but was inefficacious in weaker hands and in moments of crisis The Sa'dians very soon found this out The tendencies to disruption which had been held in check by the energy of al-Mansūr broke out again on his death The dispute for the throne set his sons against one another One of them, Zaidān, ended by triumphing over his rivals but could not prevent the break-up of the empire Larache was occupied by the Spaniards, Fās cast off sharīfian authority The Andalus of Rabat and Salé [q v], enriched by their piracy, formed an independent republic Finally the Sa'dians, although they had owed their elevation to the religious movement, now found the marabouts rising against them Delivered from the restraints which the distrust of al Mahdī and his successors had placed upon them, the latter began to gain more and more hold over the people and contributed to the ruin of the sharīfian authority Sūs was in the control of one of them, Sīdī 'Alī, Tāfilālt was under the Hasanī shorfā, the Gharb under al-'Aiyāshī, leader of the "volunteers of the faith" In the centre, the power of the marabout of Dilā' (a zāwiya on the upper course of the Wādī 'l-'Abīd) increased Muhammad al-Hādjdj, their leader, victorious over the Sa'dians and over al-'Aiyāshī, lord of Salé and Fās, seemed on the point of founding a new Berber empire from the Atlantic to the Muluya Incapable, in spite of the support given them by the English and Dutch, of disposing of their adversaries, the Sa'dians now held only Mairākush and its immediate environs The last representative of the dynasty died in 1660, assassinated by the shaikh of the tribe of Shabbānāt

B The Hasanī Shorfā The disintegration of Morocco was arrested by the coming of the Hasanī Shorfā The latter had taken advantage of the disorder to assert their authority in Tāfilālt, then by expeditions, which partook of the nature of brigandage as much as of warfare, they had conquered eastern Morocco One of them, Mawlāi Muhammad, had even tried, without success, it is true, to take Fās from the Dilā'is His successor Mawlāi al-Rashīd (1660–1672) was more successful He took Fās, disposed of Ghailān, an adventurer who had established himself securely in the Gharb, destroyed the zāwiya of Dilā', reconquered Marrākush, thus rebuilding as it were piece by piece the sharīfian empire Installed by force of arms, the new dynasty recognised the necessity of securing the moral prestige which their origin could not give them They therefore sought to attract to their side the sharīfian families They heaped favours on the shorfā of Wazzān, whose patronage was a guarantee even for the rulers

The work begun by Mawlāi al-Rashīd was continued and brought to a successful conclusion by his successor Ismā'īl (1672–1729) During the first fifteen years of his reign, he did not cease to wage war on the rivals who disputed the districts of Marrākush and Sūs with him While fighting his enemies, he was engaged in building up an army which would work his will To the makhzen formed by the Shrāga and Ūdāya he added a body of black slaves, the 'Abīd al-Bukhārī (Būākher), the property

of the sultān, their children were specially trained for military service The number of effectives in this corps by the end of the reign numbered one hundred and fifty thousand men The sultān was thus able to reduce to obedience the Berbers of the Atlas and the upper Muluya Defeated and disarmed, the latter were kept in control by garrisons placed in kasbas built at the exits to the valleys or commanding the lines of communication The notables whom the sultān had taken into his service or united to himself by matrimonial alliances forced their tribesmen to live in peace The *bilād al-makhzen*, i e the country where tribute was regularly paid, extended over almost the whole of the extreme Maghrib The pacification of the interior did not cause Mawlāi Ismāʿīl to forget the obligations imposed on every Muslim ruler to fight the infidels He therefore continued the holy war against the Christians of the coast He recaptured al Mahdiya, Larache, Asīlā, and Tangier, evacuated by the English in 1684, but could not take Ceuta from the Spaniards in spite of a siege or rather uninterrupted blockade for seventeen years He was no more successful in his enterprise against the Turks of Algiers, who disputed with the Moroccans the possession of the plains of eastern Morocco and the *ḳṣūr* of southern Oran The expeditions which he directed against the Algerians ended in failure, and the lower course of the Muluya continued to be the boundary of the sharīfian empire In spite of his lack of success here, Mawlāi Ismāʿīl is nevertheless the great figure of the Hasanī dynasty, the model the Moroccan sultāns have set themselves to the present day Morocco, however, remained what it was before, i e an aggregation of different groups, the cohesion of which depended on the personal energy of the sovereign The processes of administration were in no way altered, the sharīf enforced obedience by drastic executions, he squeezed his subjects to the utmost to get the money necessary for the building of his capital Meknes [q v], the palaces of which were built by the forced labour of the natives and of Christian slaves

On the death of Mawlāi Ismāʿīl, a reaction set in For thirty years his sons fought with one another The real masters of the situation were the ʿAbīd who made and unmade sultāns as they pleased One of them, Mawlāi ʿAbd Allāh, was proclaimed and deposed six times He succeeded, however, in triumphing over his competitors by playing the Berbers off against the ʿAbīd, the importance of whom gradually diminished with the wars The remedy, however, was not much better than the disease This period was for Morocco one of misery and ruin The authority of the sharifs emerged much weakened from it

Mawlāi Muhammad (1757—1792) succeeded, however, in restoring it Inheriting the energy and vigour of his grandfather Ismāʿīl, he brought the rebel Berbers back to their allegiance, and by the taking of Mazagan in 1769 destroyed the last trace of Portuguese power on the Atlantic coast Convinced, on the other hand, that the weakness of the central power was mainly due to a lack of financial resources, he endeavoured to procure money by encouraging the development of foreign trade He inaugurated a mercantile policy, concluded treaties of commerce with Denmark, Sweden, England, and France and endeavoured to attract foreign merchants to his kingdom by founding for them the town of Mogador [q v] in 1764 Heavy taxes, however, severely impeded the progress of this policy Morocco remained a poor country and did not open itself, as had been hoped, to European penetration It also remained in a perpetual turmoil Under Mawlāi Yazīd (1792—1794) the country was once more handed over to anarchy Mawlāi Slīmān (Sulaimān) (1794—1822), after at first being able to restore order, had to spend the last ten years of his reign in putting down the continual risings of the Berbers of the middle Atlas, in the course of one of these expeditions he actually fell into the hands of the rebels This rebelliousness caused the sultān much misgiving, he also wanted to prevent the infiltration of foreign and anti-Muslim influences which he believed would aggravate it He forbade his subjects to leave the country and restricted to a minimum their intercourse with Christians The diplomatic and consular agents were relegated to Tangier, and access to the interior was made almost impossible for Europeans His successors followed his example Down to the end of the xix^th^ century, Morocco was more rigorously closed than it had been in the time of the Merinids and Saʿdians and even in the early days of the Hasanī sharīfs In spite of this systematic isolation, the sultāns had nevertheless to face the same difficulties as Mawlāi Slimān and had no more success than he in overcoming them

For half a century the domestic history of Morocco was a series of rebellions which the sovereigns had great difficulty in suppressing The regions remote from the centre, Rīf, Tāfīlālt, Figīg, eastern Morocco, escaped the authority of the makhzen In the very heart of the country, the Berbers cut communications between Fās and Marrākush, forcing the sultāns when they wanted to move from one capital to the other to make a great detour by Rabat The empire broke up more and more Mawlāi al-Hasan (1873—1894) postponed for a few years the inevitable collapse His reign resembled that of Mawlāi Ismāʿīl At the head of his army, the artillery of which had been reorganised by a French military mission, he was continually in the field raiding the rebels and tearing down kasbas He re-established order in the region of Udjda, forced the people of Sūs to recognise his ḳāʾids, reduced to obedience the Zaʿīr and Zayān, endeavoured to extend the makhzen country by expeditions against the independent Berbers, endeavoured to develop his influence in the Saharan regions and to restore his authority in Tuāt But he died before completing his task and all had to be begun again

Morocco and the Christian powers The situation was the more critical that the fate of Morocco could no longer be a matter of indifference to the European powers It increased the cupidity of some and aroused the cupidity of others In spite of their desire for isolation, the sultāns had not been able to break every link with Europe They had also to take account of the proximity of Spain, established for three centuries in the „presidios" of the Mediterranean coast, and of the French who had replaced the Turks in Algeria [q v] The conquest of the old Regency, destroying all the sharīfs' hopes of extension eastwards, had caused great irritation in Morocco ʿAbd al-Kādir [q v] found followers among the peoples of this country and support hardly disguised on the part of the makhzen This hostile

attitude resulted in the Franco-Moroccan war of 1844 The sharīfian army was crushed at the battle of Isly, the ports of Tangier and Mogador bombarded The moderation of France alone enabled the makhzen to come fairly well out of this unfortunate escapade Henceforth the relations between France and Morocco remained peaceful, although the impotence of the sharīfian government to guarantee security on its borders forced France to military demonstrations like the B Snāssen campaign (1859) and the wādī Gīr expedition (1870) Spain in turn being unable to obtain satisfaction from the attacks directed against her garrisons decided also to resort to arms The campaign of 1859—1860, ended by the victory of O'Donnell, revealed the military weakness of Morocco The treaty of Tetwān (1860) granted to Spain, along with some trifling territorial aggrandisement, an indemnity of 100,000,000 reals To pay this debt, the sharīfian government had to raise a loan in London on the security of the Moroccan customs and to accept the control of European commissioners For the first time foreigners intervened in the domestic administration of the empire The breach thus made was continually enlarged The exercise of the right of protection, the erection of a lighthouse on Cape Spartel, served as a pretext for diplomatic negotiations and for the extension of international control European ambitions were not dissimulated In order to protect itself against them, the makhzen tried to play one off against the other and confined itself to granting, as it did at the conference of Madrid (1880), concessions devoid of all practical significance Mawlāi al-Hasan excelled in this difficult game and the vizier Bā Ahmad, who directed affairs during the early years of the reign of ʿAbd al-ʿAzīz, Mawlāi al-Hasan's successor, displayed no less skill Morocco was thus the object of a very keen struggle for influence England wanted to maintain her economic preponderance along with the control of the Strait, France wanted to ensure the security of her Algerian possessions and of the roads leading to the Saharan oases occupied in 1901 —1902, Spain appealed to her "historic rights", Germany lastly was preparing to seize the opportunity to acquire openings for her commerce and emigrants

The Moroccan crisis and the establishment of the French protectorate Such a position could not last The imprudences of Sultan ʿAbd al-ʿAzīz precipitated the crisis The whims of the sovereign and his immoderate desire for European innovations displeased the stricter Muslims The modifications in the fiscal policy made by the *tartīb* disturbed the people already taxed to the utmost Rebellion broke out everywhere A pretender, the *rūgī* Bū Hamāra, rose in the region of Tāzā and routed an army sent against him It was in vain that France by the agreements of 1901 and 1902 endeavoured to organise the activities of the makhzen against the rebels and to postpone the inevitable catastrophe On the failure of this effort, France decided to arrange with England and Spain to settle the Moroccan question and prevent the dismemberment of the empire In return for recognition of the protectorate *de facto* exercised by England in Egypt and the granting to Spain of a sphere of influence in northern Morocco, these two powers recognised the right of France to act as her interests best demanded France hastened to propose to the sultān a plan for reforming the sharīfian administration The intervention of Germany prevented its realisation On March 31, 1905, William II landed at Tangier and in a sensational speech posed as the defender of the independence of the sultān On the advice of the German representative, ʿAbd al-ʿAzīz appealed for the constitution of an international conference to study the reforms to be introduced into the Maghrib The conference met at Algeciras (Jan 15—April 7, 1906) and affirmed the three principles of the sovereignty of the sultān, the territorial integrity and economic freedom of Morocco It did not, however, settle the Moroccan question The two international bodies which it decided to set up, the police for the ports and the state bank, both capable of being of great service, could not take the place of the general reforms necessary for the salvation of the empire Disorders continued, acts of hostility against Europeans in Morocco itself and acts of brigandage on the frontiers increased in number Not being able to obtain satisfaction for outrages on its subjects, the French government ordered the occupation of Udjda and Casablanca in 1907 The country was then pacified around these two centres and order restored in eastern Morocco and in the Shawīya to the great benefit of the natives themselves The Spaniards in their turn for similar reasons intervened in 1908 in the adjoining region of Melilla and after a severe campaign in 1909 occupied Salwān and a number of strategic points

During this period war broke out between ʿAbd al-ʿAzīz and his brother Mawlāi ʿAbd al-Hafīz, proclaimed sultān at Marrākush and then at Fās Supported by the anti-foreign party, the pretender was victorious All the powers, including France and Spain, recognised him, after he had promised to respect the agreement of Algeciras, the international treaties and all the engagements entered into by his predecessors France and Spain announced their intention of not prolonging their occupation of sharīfian territory The Franco Moroccan agreements of March 4, 1910, and the Hispano Moroccan of Nov 19 of the same year, stipulated that the occupation should cease as soon as the makhzen should have a force sufficient to guarantee the security of life and property and peace within its frontiers This settlement seemed all the more desirable as there had been occasional friction between France and Germany which had only been smoothed over with great difficulty, the most serious being the affair of the deserters from Casablanca in Sept 1908 A disquieting state of tension remained between these two powers, although France had endeavoured to give satisfaction to Germany in signifying, by the agreement of Feb 8, 1909, her willingness not to impede the economic freedom nor hinder the development of German interests

The aggravation of the situation in the interior hastened the denouement The sultān's rule was no more effective than that of his predecessors, the exactions of the sharīfian agents in the spring of 1911 provoked a rising of the Arab and Berber tribes in the region of Fās, Besieged in his capital and on the point of succumbing, the sultān appealed to the French They decided to send an expeditionary force to the help of the sultān but ordered its commander to avoid any injury to the independence of the sultān and any occupation of new territory Vigorously commanded by General

Moinier, the military operations had the desired effect Fās was relieved on May 21, and after certain police operations necessary to secure the peace of the district, the expeditionary force returned to the coast But, while the danger was thus banished from the interior, unexpected complications resulted Spain, taking advantage of the occasion to take possession of the sphere of influence reserved for her by the agreement of 1904, established herself in Larache and al-Kasr Germany, feeling the moment was decisive, claimed compensation in her turn and sent a warship to Agādīr This demonstration provoked the greatest alarm in France and in Europe generally In the end, however, a peaceful settlement was reached After four months of difficult negotiations, the agreement of Nov 4, 1911 put an end to the dispute Germany abandoned all political claims to Morocco and admitted with certain reservations, chiefly of an economic nature, the principle of the French protectorate There was no longer any obstacle to the establishment of this régime, which the sultān accepted by the treaty of March 30, 1912 This diplomatic document stipulated the maintenance of the sovereignty of the sultān, the representation of and protection by French diplomatic and consular agents of Moroccan subjects and interests abroad, the carrying out, with the collaboration of and under the direction of France, of a number of administrative reforms, judicial, financial and military, intended to "give the sharīfian empire a new régime, while safeguarding the traditional prestige and honour of the sultān, the practice of the Muslim faith and the institutions of religion"

The French protectorate now extends over the whole of Morocco, but the Spanish sphere of influence enjoys by the agreement of Nov 27, 1912 complete autonomy from the administrative and military point of view, while Tangier and its environs form an international zone, the status of which is not yet definitely regulated

The establishment of the protectorate was to have had as its first result the restoration of the authority of the sharīf, whose support was essential for the carrying out of the reforms This could only be attained by a considerable effort The central power was weaker than it had ever been at the time when the conclusion of the protectorate treaty put an end to the crisis The *bilād al-makhzen* was almost non existent France had to conquer Morocco for the sultān The name of Marechal Lyautey, appointed High Commissioner and Resident General, will remain inseparable from the history of the pacification of Morocco, like that of Bugeaud in the history of the conquest of Algeria Very difficult in itself, for it brought the French into contact with warlike tribes, some of whom had never recognised the authority of the makhzen, the task was further complicated by events abroad Order had hardly been restored around the chief towns, Fās, Meknes, Marrākush and communication restored between eastern and western Morocco, when the War of 1914 broke out For a moment it was feared that the French were going to abandon the interior and fall back on the coast, but the progress of the pacification of the country was only slowed down, not interrupted All the conquered positions were retained and the rebels held on all fronts The counter-offensives of the rebels in the Tāzā corridor, along the Middle Atlas and in Sūs were crushed The War finished, the offensive was resumed to reduce the districts still unsubdued (Middle Atlas, south of the High Atlas, upper valley of the Muluya) Three years of difficult fighting (1921—1924) ended in the occupation of "all Morocco of value", i e those regions of economic, political or military importance The Rīfan offensive in 1925, however, threatened to compromise all the success achieved A Rīfan chief, ʿAbd al Karīm, had gathered around him the greater part of the tribes of northern Morocco and inflicted serious reverses on the Spaniards and forced them to abandon a portion of the territory which they had occupied Crossing the Spanish zone, he invaded the valley of the Wargha and threatened Fās The resistance of the posts echelonned along the frontier gave reinforcements time to reach the scene of hostilities Checked in the autumn, the Rīfan advance was definitely crushed in the spring of 1926 thanks to the combined action of France and Spain At the moment of writing, the conquest may be regarded as completed only a few tribes of the Central Atlas and of the oases of the Sahara have not yet been reached by the French, but their reduction is only a matter of time

The administrative reorganisation has kept pace with the pacification The old machinery has been retained but submitted to a control which guarantees the natives against abuse of their power and excesses by the agents of the makhzen Technical services have been created to give the country the works necessary for its economic life The remarkable results obtained in all fields have been facilitated by the influx of European immigrants and capital Morocco seemed condemned to vegetate Now it is being completely transformed A new epoch is beginning, very different from any that have preceded it

III POPULATION

a Total population and density It is difficult to fix with any precision the total population of Morocco The attempts made at a census in recent years in the parts subject to the sharīfian makhzen enable, it is true, comparatively accurate estimates to be made for the greater part of the country and corroborate for most districts the estimates made by European travellers before the establishment of the French protectorate But the parts of the sharīfian empire still outside the authority of the makhzen and those whose southern boundaries are not exactly known have not been seriously investigated from this point of view, and until they have been scientifically studied it will not be possible to estimate the total population of Morocco to within a few hundred thousands

The total usually given is 5,000,000, of whom a tenth, 500,000, are in the zone of the Spanish protectorate This population is very unequally distributed and its density varies with geographical conditions The most thickly populated part is that of the plains of western Morocco between the massif of the Djbāla in the north and the Great Atlas in the south Gharb, Shāwīya, Tādlā, Dukkāla and ʿAbda The density of the population also varies with the fertility of the soil The population of this region is estimated at two fifths of the total The mountainous regions, Djbāla, Rif, Middle Atlas are not thickly populated, as we might have expected from the comparatively dense population of Kabylia, in another mountainous region of North Africa As to the Sahara zone, outside the belts of oases in the Wādī Gīr, the Wādī Zīz (Tāfilālt) and the Wādī Darʿa (Dra), it is very sparsely inhabited

b Elements of the population The population of Morocco consists for the most part of Berbers and Arabs, the former being the older element and the latter invaders As to the Berbers, who do not seem to be a homogeneous race and whose origin is obscure, see the separate article on them As to the Arabs, they are in a minority, but it is often difficult to attribute an exact ethnic origin to certain tribes or confederations, so much have the Arabs and Berbers become mixed since the Muslim conquest, and intermingled either by peaceful or warlike methods It will be more prudent and will give a more accurate result if we distinguish in Morocco between those who speak Arabic and those who speak Berber (see below VII LANGUAGES) The former live entirely in the plains, while with the exception of the massif of the Djbāla, the inhabitants of the mountains speak Berber

1 Berbers Three main groups may be distinguished among the Berbers of Morocco in the north the Rīfans and the Benī Znāsen, in the centre the Znāga (Sanhādja) and the Brāber (*Barābir*), who form the population of the Middle Atlas, the third group is that of the Shlūh [cf the article SHILLUH] who occupy the western part of the High Atlas and of the Anti-Atlas, as well the plain of Sūs In addition to these main groups, we may mention the Djbāla, arabicised Berbers, to the N W of Fās, and the Harātīn (plur of the Arabic *harṭānī*), who seem to be regarded as an intermixture of Berbers and Sūdānese and form the basis of the settled population of the zone of the Saharan oases

2 Arabs The early invasions at the time of the Muslim conquest do not seem to have appreciably modified the ethnology of the country Down to the xiiith century A D, the country districts of Morocco were almost completely Berber, it was the great Almohad ruler ʿAbd al Muʾmin [q v] who was the first to introduce into Morocco Hilālī Arab tribes hitherto settled in the Central Maghrib or in Ifrīḳiya, these importations, continued by the successors of this prince and by the Merīnid dynasty, soon drove the Berber element into the mountains or absorbed and arabicised it Evidence of such assimilation is still found in the fact that tribes with clearly Arab names contain sections whose names show their Berber origin

These Arab tribes, who are all settled in the

plain, may be divided into two main ethnic groups the Banū Hilāl [q v] and the Maʿḳil The latter occupies almost exclusively the valley of the Upper Muluya as well as the lands south of the Atlas The Banū Hilāl occupy the sub-Atlantic plains and the steppes of Eastern Morocco

3 Jews There are about 150,000 Jews in Morocco, mainly living in the towns There are also a considerable number among the tribes of the Great Atlas They also form the principal element in the population of the two little towns of Debdū and Demnāt [q v] The origin of the earliest elements in this Jewish population is obscure it is difficult to ascertain whether they were Jews who had migrated from Palestine or were judaicised Berbers The modern element is made up of Jews who fled from Spain to Morocco in the xvith century The former call themselves *phlishtim* (Palestinians) and are called *forasteros* (foreigners) by the Spanish immigrants, who are practically all settled in the towns of the coast and are rapidly becoming europeanised

4 Miscellaneous elements The negroes, of whom there are considerable numbers in Morocco, do not however form a distinct group there In the north we find many, who are almost all of slave origin The predilection of the townsmen of Morocco for black concubines, noted for their domestic virtues, has brought into the population, especially in bourgeois circles, a very considerable amount of negro blood To the south of the Atlas in the oases, the intermarriage of negroes and Berbers has produced the Haratīn Finally the negroes of the Sūdān, since the Middle Ages, have always been esteemed as mercenaries to form the imperial guards, especially since the taking of Timbuktu by the armies of the Saʿdian Sultān Ahmad al-Mansūr [q v]

Large numbers of Muslims from Spain, whether of Arab origin or descendants of Christian inhabitants of the Peninsula, have contributed to form the population of the towns at various times Cordovans banished by al-Hakam I at the beginning of the third century A H after the "revolt of the suburb" and Muslims expelled from Spain at the "Reconquista"

We must not omit the influence that may have been exercised on the population of Morocco by Europeans (renegades, who had adopted Islām, mercenaries recruited outside Morocco and settled in the country), and finally we may note that frequently the sultāns have purchased women for their harems in Constantinople

IV Social and Economic Life

a Country The population of Morocco, although for the most part rural, nevertheless has a larger proportion of town-dwellers than Central Barbary and, like the rest of North Africa, might be divided into nomadic and settled, this division does not at all coincide with that into Arabs and Berbers, there are still nomadic Berbers, while certain Arab tribes are becoming settled on the lands which they cultivate

It has been shown that the nomadic or settled life of the country-people in North Africa does not depend, as was long thought, on ethnic factors, but is entirely conditioned by geographical considerations It is the rule for dwellers in the mountains to be settled while the people of the desert steppes, forced to move about in search of pasture for their flocks, are nomads There are however means between these two extremes and especially in Morocco, where we find many semi-nomads, who move only short distances, principally on the borders of the various mountains of the centre and south But generally nomadism is the outcome of pastoral migration and its geographical area is in direct relation to the rainfall and therefore to the nature of the vegetation

It is in eastern Morocco, in the steppes which lie to the east of the Muluya, and to the south of the Great Atlas, towards the Sahara, that we find the principal groups of nomads in Morocco In eastern Morocco, we may mention among the large tribes which lead a nomadic life the confederation of the Benī Gil, between Bergent and Figīg, on the other side of the Atlas, the Ait Seddrāt, the Ait Djallāl, the Īdā-ū-Blāl, the Ait-ū-Mrībet, lastly to the south of the Darʿa (Dra) country, the Rgiba, the Shkārna and the Awlād Dlīm As to the semi nomads, we find them, outside the Middle Atlas, in the great plains of the Gharb, in the north, the Rhāmna and the Shyādma, in the south, where a pastoral life has not yet completely disappeared before a more settled state of society

Nevertheless Morocco is, of the three countries of Barbary, that which has in its rural population the largest proportion of settled people, of fixed habitat and living not only in tents but also in houses The latter are rarely found isolated in the country, but on the contrary are grouped into villages of more or less importance and more or less near one another, according to the density of the population

The type of dwelling varies with the district In the mountains we find houses built of unbaked bricks or stone with a gabled thatch or a flat flat roof In the plains, the tent predominates, more or less fixed to the spot, and with it we find more and more the hut of branches with a conical roof called *nuwwāla* In the Saharan oases, the population collects within a walled area or *ksūr* (sg *kṣar*, from the class *kaṣr*), these conglomerations sometimes possess the elements of town life The villages are called duar (*duwwār*) in the plains, and *dshar* in the mountains In some hill regions we find survivals of cave-dwelling

b Town Among the towns of his country, the Moroccan distinguishes a certain number that he definitely regards as cities (*hadarīya*) These are Fās, Rabat-Sale and Tetwan, which have been more than others subjected to the influence of Spanish culture It must however be noted that in the majority of the other towns we can still find traces of the existence of colonies formed by Muslims from Spain, especially from the xvth century onwards The population of the non *hadarīya* towns is found to be composed of rustic elements but little urbanised This is the case with Udjda and Mazagan (country Beduins) and also with Tangier (countrymen from the hills) Marrākush and Meknes owe their special urban character to the fact that as capitals they have contained the courts of two Sharīfian dynasties, both of Beduin origin, they are *makhzanīya* towns in which the standard of civilisation does not reach the refinement of the *ḥaḍarīya* Spanish towns The ports Tangier, Larache, Mazagan, Safi and Mogador were for long the only points of contact between Morocco and European influences, politically as well as commercially Lastly in the mountains,

little towns like Shefshāwen, Wazzān, Sefrū, Debdū, Demnāt owe their existence to political reasons The two first were founded as bulwarks against the Portuguese advance in northern Morocco in the XVIth century Demnāt and Debdū are mainly Jewish towns As to Sefrū, it seems probable that it is a survival of an old Berber town We may also mention as towns of secondary importance, on the Mediterranean coast, Ceuta, completely europeanised for several centuries, on the Atlantic coast Arzila (Asaïlā), Casablanca, which owes its origin to the little port of Anfā, Azemmūr, Agādīr In the interior, al Kasr al-Kabīr (el Ksar, Spanish spelling Alcazarquivir), Tāzā, Tārūdānt Several ancient towns have now disappeared, e g Nakūr and Bādis on the Mediterranean, Tīt to the south of Mazagan, the two Aghmāt and Ïnmallal to the south of Marrākush and several others, descriptions of which have been given by the geographers like al-Bakrī, al-Idrīsī and Leo Africanus

As a rule, the Moroccan town is grouped round a citadel or *kasaba* (pop *kaṣba*) which is the seat of authority Under the protection of the citadel lies the *mellāh* or Jewish quarter All around spreads the town proper or *mdīna* with its great mosque, markets and *kaisariya* [q v] It is surrounded by a rampart (*sūr*) beyond which there are usually the suburbs more or less rural in character The town itself is divided into quarters (*hauma*) with streets (*zanka*), alleys (*darb*) and squares (*rahba*)

c Economic Life The country people, whether settled or nomadic, who form at least four fifths of the population of Morocco, live on the land, either by agriculture or stock-raising, most often combining the two Those in the highlands grow cereals (wheat, barley), certain leguminosae (broad beans, chick-peas, vetches) and fruit-trees They also exploit their forests in a very primitive fashion (thuyas, cedars) The people of the plains devote themselves mainly to cereals and the rearing of cattle, sheep, camels, horses and asses In the oases of the south, the population cultivates the date-palm and understands the art of irrigating the land

The rural industries are very primitive They are limited to supplying the necessary implements of agriculture, and weaving wool into the material for garments, tents and carpets The Berbers of Sūs show a certain aptitude at metal working (arms and jewels) Sūs no longer exports the cane-sugar and copper, which formed considerable articles of trade under the Sa'dians

Each tribe has a certain number of markets (*sūk*) which are held in the open country and bear the name of the day on which they are held It is in the *sūk* that the peasant sells his produce and buys the manufactured articles that are brought by the merchants from the towns Cereals are preserved in siloes (*matmūra*), in the Great Atlas and to the south of it we find fortified storehouses, which belong to the community and are called *āgādīr*

It is in the towns that we find industrial activity concentrated Each trade, which originally formed a gild (*hanṭa*), is grouped in one street which bears its name In it the articles are made and sold The stocks are kept in the fonduks (Ar *fondak*) which correspond to the khān and wakālah of the east Some products, like grain, oil, coal, wool, are sold in special places called *rahba* The monopolies of exporting (*sāka*) corn and hides established by the sultāns at the end of the XIXth century have now been abolished Several European products have become of the first necessity in Morocco and form the subjects of an important traffic cotton goods, tea and sugar and candles For the history of the weights, measures and coins in use in Morocco before the establishment of the protectorate see the works by Massignon and Michaux-Bellaire quoted in the *Bibliography* The very vivid picture drawn by Leo Africanus of the commercial and industrial activity of Fās in the Middle Ages is still very valuable

The Jews, who devote themselves specially to certain trades that flourish in larger centres (goldsmiths, embroiderers), also play an important part as brokers The citizens of Fās, who have a large number of converted Jews among their number, had almost a monopoly of the import trade of Morocco, especially from England, and for this reason had little colonies in the sea-ports

The Berbers of Sūs like to settle in the towns as grocers (*bakkāl*) and having made their fortunes return to the country Since the war of 1914—1918 a large number of them have migrated to France as labourers and they settle in groups, according to their original tribes, in the suburbs of certain large industrial towns

V Political Organisation

It is only at rare intervals and for short periods that Morocco has been entirely under the authority of the sultān whence the distinction between the territory subjected to the government (*bilād al-makhzen*) and the territory unsubjected (*bilād al-ṣaiba*) As a rule, the makhzen territory included the towns, valleys and plains The mountains, on the other hand, remained more or less independent, according to the degree of power possessed by the sovereign For further details cf the article MAKHZEN

Outside the towns the population is grouped into tribes (*kabila*) Several are sometimes grouped together under a common name, without however being a confederation in the strict sense of the word, this is the case with the Ghumāra in the north, the Hāha, the Dukkāla, the Shāwīya in the south The tribe is subdivided into sections (*rub'*, *khums*, *fakhdha*), which are subdivided into sub-sections comprising a certain number of villages of tents or houses

The tribes who own the sultān's sway are governed by a *kā'id* appointed by the makhzen His duty is to allot and levy the taxes, to raise contingents of soldiers and keep good order He has under his command a *shaikh* for each section under whom are the *mukaddam* of the sub-sections

For the distinction between *makhzen*, *djaish* (vulg *gīsh*) and *nā'iba* tribes see the article MAKHZEN

In the tribes not subject to the makhzen, political activity is confined to the *djamā'a*, i e an assembly of men able to bear arms The *djamā'a* deals with all the business of the tribe, civil, criminal, financial and political It administers justice following local custom (Arabic *'urf*, Berber *izref*) It elects a *shaikh* (Berber *amghār*) who is only an agent to carry out its decisions Alongside of the *djamā'a* of the tribe, there are *djamā'as* of the sections and sub-sections but their powers are limited

All the tribes of the *bilād al-saiba* are divided into opposing factions or *laff* When a tribe of

a certain *laff* is attacked, those neighbouring tribes who belong to the same faction take up arms and come to its assistance

In the towns, the makhzen is represented by a governor whose official title is *kā'id* but in certain large towns he is often called *bāshā* The title of *'āmil* has been sometimes given to the governor of Udjda The *kā'id* of the town, generally speaking, has the same powers as the *kā'id* of the tribe and acts as judge in case of any violation of the law He has an assistant or *khalīfa* Alongside of him, the *muhtasib* supervises the corporations, fixes their average prices and looks after public morals

The *kā'id* has under his orders the *mukaddam* of the quarter and his police (*mkhāznīya*) carrying out his instructions Among the officials sent by the makhzen to each town may also be mentioned the *nādir* or inspector of endowments (*hubūs*), the trustee of vacant inheritances (*wakil al-ghurabā'*, popularly *bū-mwāreth* = *abu 'l-mawārith*), the collector of local taxes and market-dues (*amīn al-mustafād*) Lastly in the harbour and frontier towns, the customs are collected by officials called *umanā'* (sg *amīn*)

Justice is administered by the *kā'id* or by the *kādī*, as the case may be The latter deals with questions of personal law, official reports on the cases are drawn up by the *'udūl* In technical cases he appeals to experts master masons, agriculturalists, veterinary surgeons (*mwālin en-nadar*, *arbāb et turka*, *fallāh*, *baitār*) The legal opinions (*fatwā*) given by eminent jurists on the same question being often contradictory, the Sharīfian government has recently created a court of appeal (*madjlis al-isti'nāf*) at Rabat

Landed property takes a number of different forms In the first place, there are the state-domains, they are either managed directly by the makhzen (crown-lands) or they are allotted to *gīsh*-tribes in return for the military service for which they are liable, others of these lands may be granted in temporary or definite ownership to private individuals by imperial edict (*zahīr* or *tanfīdha*)

The *hubūs* lands may be urban or rural In the towns, they not infrequently cover half the area They are let out under special conditions which give the tenants special privileges, *meftāh* and *gzā* (class Ar *djazā'*) In the country, the *hubūs* lands consist mainly of fields and orchards In all cases, the revenue from these lands is set aside for the maintenance of buildings of a religious character or of public utility (mosques, colleges, schools, fountains) and for the payment of the officials attached to these establishments

In Morocco, there are vast tracts of land which are not the property of any one individual, either as a result of the insecurity prevailing or of the sparsity of the population These lands belong undivided to the whole tribe, they are called common lands (*blād al-djmā'a*)

Lastly, lands which have come to belong to private individuals (*mulk*) by inheritance or purchase have their character confirmed by a certificate of ownership (*mulkīya*)

The old Muslim imposts (*zakāt* and *'ushr*) have recently been merged into a single tax, the *tertīb* In addition to this tax, from which the state draws the essential part of its revenues, we may mention the duties levied at the gates of towns and in the markets (*maks*), unpopular with the people and not countenanced by religion, and the urban tax on buildings (*darība*) In addition to these, the main taxes, there is the *hadīya* or present offered to the sultān on the occasion of the three great Muslim festivals The *djizya* or poll-tax paid by non Muslims and the *nā'iba* or payment for exemption from military service by certain Arab tribes have been abolished

VI Religious Life

a The Berbers before Islām For lack of documents it is difficult to get any accurate idea of the religious beliefs and practices of the Berbers of Morocco, before their conversion to Islām and it is only from the survival of animistic cults which can still be observed in the country, that we can guess what the primitive religion was The figures on two carved stones found in Morocco seem to be evidence of the existence of a solar worship On animistic practices surviving in modern Islām in Morocco see below *d* Islām in Modern Morocco

b Conversion to Islām At the time of their invasion, the Arabs found that in the districts around the towns the people were more or less under the influence of Jewish and Christian teachings, but there is little doubt that they did not practise these religions in their true form It will be more correct to think of them as professing Judaism or Christianity rather than as real Jews or Christians It seems evident that these influences had prepared the Berber population around the mountains to adopt the new monotheistic religion, which the invaders imposed upon them The two earliest invasions, that of 'Ukba b Nāfi' in 640 and that of Mūsā b Nusair in 711, could result only in a very partial and superficial islāmisation, for very few Arab elements remained in the country Islām, a town religion, was for long confined to larger centres The Berbers generally became converted in the hope of escaping the exactions of the conquerors, but when the latter wanted to treat them simply as tributaries, they did not hesitate to apostatise, on seven different occasions, if we may believe the Arab historians One thing is certain, that while remaining Muslims, they were not long in trying to cast off the authority of the caliphs of Baghdād by adopting the heterodox doctrines of the Khāridjīs [q v and the article AL-SUFRĪYA] The Berbers of Morocco went even further when new local religions arose among them more or less based on Islām, with their own prophets and Kur'āns After the attempt at rebellion by the Berber of Tangier, Maisara [q v], which was quickly suppressed, the Barghawāta recognised as their prophet one of their number, Sālih b Tarīf, who gave them a religion and a Kur'ān in the Berber language This religion, the progress of which was opposed by the early Moroccan dynasties, seems only to have been finally exterminated by the Almohad rulers of the xiiith century This Barghawāta movement was the most lasting, we also note that which was created by Hā-Mīm (d 313 A H) among the Ghumāra, near Tetwan

In spite of these reactions, Islām, having become the official religion of increasingly powerful dynasties, gradually gained ground and penetrated slowly into the Berber mountains, but it is only from the death of 'Abd al-Mu'min, who destroyed the religion of the Barghawāta and put an end to the rule of the "anthropomorphist" (*mudjassimūn*) Almo-

ravids, that we can date the complete unification of Islām in Morocco Till then, Islām had had in Morocco champions who were soldiers rather than theologians, and who after forcing the people to adopt Islām at the point of the sword, were little fitted to instruct them in it It required a Berber of the Great Atlas, Ibn Tūmart [q v], a theologian who had been educated in the east, to come back to his country and to secure the devoted support of a mass of followers in order to found the movement, which was political as well as religious, of the Almohads [q v] or "preachers of *tawhīd*" [q v]

If the Almohad reformation was only temporary in Morocco, it was nevertheless strong enough while it lasted to obliterate in the country all trace of schism or heresy and to establish thoroughly in it the school of Mālik b Anas [q v] which it still follows

c Evolution of Moroccan Islām From the time of the fall of the Almohad dynasty, Moroccan Islām rapidly acquired features of its own Islām, defeated in Spain, was gradually driven out of it, then attacked in Morocco itself by the Christians of the Peninsula The western frontier of the *Dār al-Islām* was brought back to its own territory and then thrust farther back Islām in Morocco, attacked by Christianity and forced to *djihād*, became an active principle It required all the moral forces of the country, even those of which the orthodoxy seemed doubtful, in order to utilise them, it did not hesitate to absorb them by covering them with a more or less superficial veneer of orthodoxy It was at this period that the cult of dead and living saints, and to a certain point Sharīfism, which had hitherto only existed alongside of Islām in Morocco, were adopted into it and received a kind of official recognition from the makhzen

Before the Marīnids, Islām had required the constant assistance of the temporal power to maintain itself and advance From the time of this dynasty, sprung from a Berber nomad tribe, the roles are inverted, it is now the sovereigns who utilise Islām to increase their own power, and try to monopolise it by creating official colleges for religious instruction (*madrasa*), the first of these (*Madrasat al Saffārīn*) was founded in 679 (1280) by the Sultān Abū Yūsuf at Fās, the capital of the dynasty, which made it the great centre of Muslim culture in Western Barbary [cf FĀS] The immediate successors of the Marīnids, the Banū Wattās, established in the same town the cult of their founder Idrīs II The mausoleum in which he is said to be buried was henceforth an object of great veneration He is the earliest in date and the most important of the innumerable canonised Muslims who are the objects of a regular cult in Morocco, even on the part of the religious leaders and the aristocracy When the cult of Idrīs was established, his descendants — more or less authentic — claimed the title of sharīf and soon played a preponderating part in Moroccan society, as a political and moral influence The power of the Idrīsid *shorfā* was soon reinforced by that of other shorfā descended from ʿAlī through al-Hasan and this is the origin of the two great groups of sharīfs in Morocco, the Idrīsid and the ʿAlid To the latter belong the two Sharīfan dynasties, the Saʿdian and Fīlālī, the latter still in power From the moment of their accession to the throne, the influence of the shorfā on the destinies of the country became more and more preponderant

The phenomenon of sharīfism is closely connected on the other hand with the development of religious brotherhoods [cf the article ṬARĪKA] Although we find evidence of their existence at the end of the Almohad dynasty (Hudjdjādj, Māghirīyūn, Amghārīyūn), it is only as a result of al Djazūlī's (q v, d 1645 A D) campaign in favour of a *djihād* against the Portuguese, that we find the principles of the brotherhoods, as we know them to day, first coming into existence

d Islām in Modern Morocco Here we will only give a survey of the principal points of detail in which the people of Morocco differ from the rest of the Muslim community as regards the practice of their religion With the exception of a few isolated groups, still little studied, who are credited with heterodox or heretical practices (Zkāra, in the neighbourhood of the Bnī Znāsen, in eastern Morocco, Bdādwa, in the Gharb, not far from al-Ksar al-Kabīr), all the Muslims of Morocco are Sunnīs and since the Almoravid period have followed the Mālikī rite, which prevailed in the west over that of al-Awzāʿī It is in the towns that the population observes most strictly the duties of religion The Bedouins of the plains and the Berbers of the mountains are rather lukewarm Muslims The Djbāla, however, between Fās and Tangier, are very devoted to Islam, show great piety, and Kurʾānic studies are very much in favour with them, it is from them that are recruited a great number of schoolmasters who practise their calling in the plains [cf SHARṬ] It is also practically only among the hillmen of the north and south that we find a mosque in every village

In spite of the great distance they have to traverse, the Moroccans like to accomplish the canonical pilgrimage A considerable number settle in the east (there are Moroccan colonies in Alexandria and Cairo), the importance of these colonies had even induced the Sultān ʿAbd al-Azīz to appoint a Moroccan consul, *amīn al-Maghāriba*, for Egypt

In addition to the two canonical festivals of Islām (*ʿīd kabīr* and *ʿīd ṣaghīr*), the Moroccans celebrate the festival of the birth of the Prophet (*mūlūd*, class *mawlid*) and that of ʿĀshūrāʾ (10th Muharram) The *mūlūd*, established in Morocco by the Marinids, has become a kind of national festival, since the accession to power of sovereigns claiming descent from the Prophet, this festival in Morocco almost surpasses in importance the two canonical feasts

The peculiarities just mentioned would not be sufficient to give Moroccan Islām a special character, nor would its religious brotherhoods, if the latter were confined to the practices of religion or exaltation of the faith and to satisfying the need for an elevated mysticism among their adepts These religious brotherhoods are fairly numerous Tidjānīya, Darkāwa, Taiyibīya Tuhāma, Kattānīya [q v] etc But alongside of these brotherhoods, whose members are almost exclusively recruited from the literate or well to do classes of the towns and country, there are popular brotherhoods in considerable numbers, in which preoccupation with religion gives place to charlatanish practices and sanguinary displays Such are the Djilāla, the ʿIsāwa, the Hmādsha, the Dghūghīya Some of these brotherhoods recruit their members ex-

clusively from a particular class of society, thus the *rmā* (class *rumāt*) is a brotherhood of marksmen, and the Gnāwa, a negro brotherhood All these brotherhoods have this feature in common that their founder has become a famous saint (*walī*)

The cult of saints is highly developed in Morocco and undoubtedly was so before the introduction of Islām, which found itself obliged to tolerate it There are however very different categories of saints, from the venerated patron saint of a capital or of a district to the local holy man whose name is forgotten, between whom comes the *sayyid* whose tomb is marked by a *kubba* (chapel surmounted by a dome), more or less elaborate The more humble saints are recognised by the circular wall (*hawṭ*) which surrounds their tombs

These venerated individuals, male and female, have attained sanctity by very different ways, some in their lifetime, by their learning, devotion, asceticism, miraculous powers (*baraka*), sometimes even by more or less mystic mania (*madjdhūb*), the others, after their deaths, have been distinguished by miracles, apparitions etc The warrior in the holy war (*djihād, ribāt*), slain fighting against the infidel is frequently beatified — hence his name of *murābiṭ* (pop *mrābet* — French and English "marabout") But the early significance of this term was frequently lost sight of and the term *murābiṭ* came to be generally applied to saints, who never took part in a *djihād* in their lifetime *Murābiṭ* thus came into general use as a synonym of the other words used for saint in Morocco *walī*, *sayyid*, *sālih* But it is the only one applied to the descendants of a saint, who possess the *baraka* of their ancestor Among the Berbers, the saint is called *agurram* The names of great saints have *mawlāy* prefixed, the others the title *sidī*, while women saints of Berber origin are called *lālla*

The saint to whom sanctuaries are most frequently dedicated — modest though they are (*makām*, *khalwa*) — was not a native of the country but the famous patron saint of Baghdād, ʿAbd al Kādir al Gilānī, popularly called al-Djilālī, who undoubtedly never visited Morocco But the saint whose cult is surrounded with the greatest splendour is the famous Mawlāy Idrīs, founder and patron saint of Fās Among the other great Moroccan saints may be mentioned Mawlāy ʿAbd al-Salām Ibn Mashīsh, patron of the Djbāla, buried on the Djabal al ʿAlam, Mawlāy Abū Salhām, in the Gharb, Mawlāy Abu 'l Shitā' al-Khammār (Mawlāy Būshshtā), in the north of Fās, Sidī Muhammad b ʿIsā, patron of Meknès and founder of the brotherhood of the ʿIsāwa, Mawlāy Abū Shuʿaib (Būshʿib), at Azemmūr, Mawlāy Abū Ya azzā (Būʿazzā), in the Tādlā, Sidī Abu 'l-ʿAbbās al Sabtī (Sīdī Bel-ʿAbbès), born at Ceuta and patron of Marrākush All these and others less famous are the subjects of a hagiographical literature which will be dealt with later

Devotion to individuals canonised in their lifetime or after their death is in Morocco not confined to Muslims The Jews have also their saints, relatively as numerous as the Muslim saints Some of the Jewish saints have acquired a reputation so great that even Muslims revere their tombs e g those of the Rabbī ʿAmrān in Azjen, near Wazzān and of Rabbī Ben Zmīro at Safi On the other hand, the Jews of Morocco show a special reverence for certain of the great Muslim saints of the country

The area, surrounding the tomb of each of the principal saints is sacred (*hurm*) and hence regarded as an inviolable asylum, among the best known are the *hurm* of Mawlāy Idrīs in Fās and that of Mawlay ʿAbd al-Salām b Mashīsh in the mountains of the northwest These pieces of ground are the exclusive property of the families who are descended or claim to be descended from the saint They are exempt from state taxes, more than that, the descendants of the saints have the right to levy for their own benefit certain special dues, by a privilege officially recognised by the sultān The levying of these dues is not the only way by which the saint's chapel benefits his descendants The principal source of revenue is the offerings of pilgrims when visiting the tomb, this is the *ziyāra* In general once a year, there is a kind of patronal festival at the tomb of the saint which is called *mūsem* (class Ar *mawsim*), a vast crowd, some of them from a considerable distance, gather there to pay their devotions to the *sayyid* and to see the display of fireworks given in his honour On this occasion the offerings flow in and are shared among themselves by the saint's descendants

In these circumstances, it is usual for every sanctuary of any importance to be regularly organised The chapel which contains the tomb and the buildings attached to it, an oratory and guesthouse, is called the *zāwiya* It is superintended by a *mukaddam* who collects and distributes the revenues These do not come entirely from the *ziyāra* The *zāwiya* often owns lands, sometimes extensive, which are let out and the profits shared with the tenants They are called *ʿazīb* and the tenants are called *ʿazzāb* These farms, sometimes acquired by purchase, often come from bequests or donations (*hubūs*) from pious private individuals

We can thus see how certain famous and wealthy *zāwiyas* may exert a moral and political influence in the country round them, independent of their religious influence The latter is however also very important The great Moroccan zāwiyas are centres of orthodoxy and give life and vigour to Islām in the country Some are centres of mysticism and they are always centres of religious instruction This explains the enviable position occupied in Moroccan society by any group of descendants of a famous saint, or of marabouts If their ancestor had, in addition to the virtues for which he was canonised, the honour to be a descendant of the Prophet, they are at the same time shorfā, which further increases their material privileges The descendants of a saint who was not a sharīf try to claim this origin for him by inventing more or less fictitious genealogies The marabouts who have in this way "infiltrated" into the social category of the shorfā are very numerous in Morocco A Moroccan *zāwiya* is not only a centre of hagiolatry, it is also in the majority of cases a body of shorfā and the centre of a religious brotherhood or of a branch of one, or of a secondary order affiliated to a brotherhood The *zāwiya* itself may have offshoots Many of the establishments of this name are daughters of a mother *zāwiya* and are sometimes at a considerable distance from it

Hagiolatry, religious brotherhoods and sharīfism thus form three special aspects of Islām in Morocco, which are profoundly intermingled, and it is diffi-

cult to study them separately For a detailed account of the principal families of *shorfā* in Morocco of genuine sharīf origin or simply marabouts see the article SHORFĀ Here we shall only mention the principal ones whose origin is considered authentic by the Moroccan genealogists They are descended from al-Hasan and ʿAbd Allāh al-Kāmil through the latter's three sons, Idrīs, Muhammad al Nafs al Zakīya and Mūsā al-Djawn The descendants of Idrīs or Idrīsids, are subdivided into Djūtīyūn (Shabihīyūn, ʿImrānīyūn, Tālibīyūn, Ghālibīyūn), Dabbāghiyūn, Kattānīyūn, ʿAlamīyūn (descendants of Mawlāi ʿAbd al-Salām Ibn Mashīsh, buried on the Djabal al-ʿAlam, whence their name, and are themselves divided into Shafshāwanīyūn, Raisūnīyūn, Rahmānīyūn and Lihyānīyūn) The descendants of Muhammad al-Nafs al-Zakīya are the shorfā of Sidjilmāsa or Fīlāla (Filāliyūn, *nisba* from Tāfilālt), i e those of the reigning Sharīfian dynasty, lastly, the descendants of Mūsā al Djawn are the shorfā Kādirīyūn, who take their name from the great saint of Islām ʿAbd al-Kādir al-Gilānī We also find in Morocco, but in small numbers, Husaimid shorfā, also descended from ʿAlī through al-Husain, the brother of al Hasan, these are the shorfā called Sikillīyūn and ʿIrāķīyūn, who came from Andalus The great marabout families are that of the Nāsirīya from Tāmgrūt in Darʿa, the Sharkāwa [q v] in Tādlā, the Darkāwa and Wāzzānīyūn to the northwest of Fās The shorfā Wāzzānīyūn (sharifs of Wezzān), whose chief is also head of the great brotherhood of the Taiyibīya-Tuhāma (cf above), have for long played a considerable part in politics and have been the object of particular attention from the makhzen Even more than the other representatives of the great marabout families, they have in fact rendered great services to the central power by using for its benefit the great moral and political influence which they possess among that part of the population, which is lukewarm or hostile to the makhzen They have mediated in the most successful fashion between the sultān and the unsubjected body of the people

The shorfā are thus at the head of Moroccan society Some have assumed the power, others are the auxiliaries of the ruler, who in return shows them great deference We shall see that they have occupied a very high place in the intellectual life of Morocco since the end of the middle ages Lastly sharifism, an important social factor, has been able still further to strengthen itself by the support which maraboutism has brought it, by incorporating itself in it, and the religious brotherhoods which very frequently spring directly from it

e Survivals of Berber cults The cult of saints, accepted and even recognised, as we have seen above, by Islām, is in Morocco much earlier than the introduction of this religion Indeed, alongside of saints of note, there are others who are essentially popular, in the country as well as in the towns In the large cities like Fās, the great saiyids venerated by all classes of society rub shoulders with humble marabouts whose names show clearly their popular origin, these are Sīdi 'l-Mukhfī (Rev the Hidden One), Sīdī Amsa 'l-Khair (Rev Good Evening) or Sīdī Kādī Hādja (the reverend gentleman who procures what is wanted) and notices are given of them by hagiographers like the author of the *Salwat al-Anfās* (cf E Lévi-Provençal, *Les Historiens des Chorfa*, p 383 *infra*) The humble, often anonymous *khalwas*, which abound in Morocco, undoubtedly are to be connected with earlier mythical individuals, already worshipped in the same place before the coming of Islām Besides this devotion to popular saints, there are the animistic cults, which we see everywhere in Morocco observed by the lower classes of the population worship of high places, of caves, springs, trees and rocks These cults are now being seriously studied and the results will perhaps enable us to reconstruct without too great risk of error, the type of religion practised by the Berbers before the introduction into their land of the three great monotheistic religions

It is hardly possible to separate from these animistic cults that of Mawlāi Yaʿkūb in Morocco, who always has a *kubba* beside thermal springs whose curative virtues are recognised

Survivals of paganism in every case completely foreign to orthodox Islām may be found everywhere in Morocco, they are hardly distinguishable from what one finds in other parts of Barbary The rites which accompany birth and the ceremonies connected with it (giving of the name and circumcision), marriage and death are now beginning to be well known They constitute practices quite foreign to the prescriptions of the Sunna but they are not regarded by those who follow them as in any way heterodox

It is especially in the life of the country people that we see most clearly traces of pre-Islāmic practices Many of them are strangely like agricultural customs of the Romans The Moroccan peasant has retained the use of the Julian calendar, no doubt introduced into the country by the Romans, it is of course much more suitable for the needs of agriculture than the Muslim lunar calendar The names of the months are retained in their Latin form with little change January is *yennāir* from the Latin *ianuar(ius)* The beginning of the solar year in Morocco is the occasion of a festival celebrated, especially in the country, under the name of *hāgūza*, the festival of the summer solstice (*ʿansra*) is also celebrated and on that day it is usual to have fireworks Similarly the agrarian rites, which are still scrupulously observed by the peasants of Morocco, are completely foreign to the canonical prescriptions of Islām They are mainly ceremonies of inauguration (of death and rebirth of the land, first day of labour, first day of harvest), rites to protect the crops from the evil eye, or to preserve the *baraka* which they contain while standing, finally special rites to secure rain and good weather These various ceremonies, to which ethnographers like Biarnay and Westermarck have already devoted detailed studies to which the reader may be referred, are sometimes closely linked up with ceremonies prescribed by Islām, thus the different pagan rites for producing rain (carnival processions, a large spoon dressed in women's clothes and solemnly carried round) do not exclude the worship of saints specially noted as rain-makers like Mawlāi Būshshtā', nor the celebration of the orthodox ceremony of *istiskā'*

It is also in the worship of spirits (*djinnī*, pop *djinn*, plur *djnūn*) that we find ceremonies of a strongly Islāmic stamp associated with quite profane rites This cult is especially practised by the lower classes of society, and in the towns

particularly by women The djinns are regarded as supernatural powers, who have to be conciliated to avert their evil influence or fought when one is attacked by them The rites which deal with them are either propitiatory or intended to overcome harm done In spite of the many sacred formulae of Islām, which are found in the celebration of these two kinds of rites, one gets a strong impression of paganism from them, they undoubtedly remain practically what they were before the introduction of Islām into Morocco

Bibliography For the general bibliography of Morocco down to 1891 cf R L Playfair and R Brown, *A Bibliography of Morocco from the earliest times to the end of 1891*, London 1893 A very complete annual bibliography of Morocco has been given since 1921 in *Hesperis*, publ by the *Institut des Hautes Etudes Marocaines de Rabat* (bibliography begun by MM P de Cenival and C Funck-Brentano) Cf also the learned and the popular periodicals dealing with Morocco, *Archives Marocaines*, *Archives Berberes*, *Hesperis*, *l'Afrique française*, *France Maroc*, *Bulletin de l'Enseignement public au Maroc*, also the monographs of the *Section Sociologique du Maroc* entitled *Villes et tribus du Maroc* — Here we shall only give in alphabetical order the essential works dealing with sections iii, iv, v and vi, E Aubin, *Le Maroc d'aujourd'hui*, Paris 1907, H Basset, *Essai sur la litterature des Berberes*, Algiers 1920, do, *Le Culte des Grottes au Maroc*, Algiers 1920, do and E Lévi-Provençal, *Chella, une necropole merinide*, Paris 1923 (iv, legends and cultes), A Bel, *Coup d'œil sur l'Islam en Berberie*, Parts 1920, A Bernard, *Le Maroc*[6], Paris 1921, do and P Moussard, *Arabophones et berberophones au Maroc*, in *Annales de Geographie*, Paris 1924, p 267—282, S Biarnay, *Notes d'ethnographie et de linguistique nord africaines*, Paris 1924, J Bourrilly and E Laoust, *Stèles funeraires marocaines*, Paris 1927, R Brunel, *Essai sur la confrerie religieuse des Aissaoua au Maroc*, Paris 1926, L Brunot, *La mer dans les traditions et les industries indigenes à Rabat et Sale*, Paris 1921, Budgett Meakin, *The land of the Moors*, London 1901, do, *The Moors*, London 1902, do, *Life in Morocco*, London 1905, O Depont and J Coppolani, *Les confreries religieuses musulmanes*, Algiers 1867, E Doutté, *Notes sur l'Islam maghribin*, *Les Marabouts*, Paris 1900, do, *Merrakech*, Paris 1905, do, *Magie et religion dans l'Afrique du Nord*, Algiers 1909, do, *En tribu*, Paris 1914, J Drummond Hay, *Le Maroc et ses tribus nomades*, Paris 1844, J Erckmann, *Le Maroc moderne*, Paris 1885, de Foucauld, *Reconnaissance au Maroc (1883—1884)*, Paris 1888, Gaillard, *Une ville de l'Islam Fes*, Paris 1905, M Gaudefroy-Demombynes and L Mercier, *Manuel d'arabe marocain*, Paris n d (introduction), J Goulven, *Les Mellahs de Rabat-Sale*, Paris 1927, G Hardy and L Brunot, *L'enfant marocain*, Paris 1925, L Justinard, *Les Chleuh de la banlieue de Paris*, in *Revue Etudes Islamiques*, Paris 1928, p 477—480, E Laoust, *Mots et choses berberes*, Paris 1920, do, *Noms et cerémonies des feux de joie chez les Berbères du Haut et de l'Anti-Atlas*, in *Hesperis*, Paris 1921, N Larras, *La population du Maroc*, in *la Géographie*, Paris 1906, p 337—348, Doctoresse Légey, *Essai de folklore marocain*, Paris 1926, do, *Contes et legendes populaires du Maroc*, Paris 1926, A R de Lens, *Pratiques des Harems marocains*, Paris 1925, E Lévi-Provençal, *Les Historiens des Chorfa*, Paris 1922, do, *Notes d'hagiographie marocaine*, Paris 1920, G Marçais, *Les Arabes en Berbérie du XI*ème *au XIV*ème *siecles*, Paris 1913, L Massignon, *Le Maroc dans les premieres annees du XVI*ème *siecle*, *Tableau geographique d'après Léon l'Africain*, Algiers 1906, do, *Enquête sur les corporations musulmanes d'artisans et de commerçants au Maroc*, Paris 1925, E Michaux-Bellaire, *Maroc*, in *Nouveau Dictionnaire de Pedagogie*, Paris 1911, p 1230—1240, do, *Les Confreries religieuses au Maroc*, Rabat 1923, do, *Conferences* (*A M*, vol xxviii), Paris 1928, do, in *Archives Marocaines*, *passim*, I Milliot, *Les terres collectives au Maroc*, Paris 1922, do, *Demembrements du Habous*, Paris 1918, E Montet, *Les confreries religieuses de l'Islam marocain*, Paris 1902, do, *Le culte des saints dans l'Afrique du Nord et plus specialement au Maroc*, Genova 1909, A Mouliéras, *Le Maroc inconnu*, Oran Paris 1895—1899, S Nouvel, *Nomades et sedentaires au Maroc*, Paris 1919, P Odinot, *Le monde marocain*, Paris 1926, M L Ortega, *Los Hebreos en Marruecos*, Madrid 1919, V Piquet, *Le Maroc*, Paris 1920, do, *Le peuple marocain*, Paris 1925, Quedenfeldt, *Division et repartition de la population berbere au Maroc* (transl Simon), Algiers 1904, P Ricard, *Maroc* (Guides Bleus), Paris 1919, *Rif et Jbâla*, Paris 1926, G Salmon, in *Archives marocaines*, *passim*, de Segonzac, *Au cœur de l'Atlas*, *Missions au Maroc* (*1904—1905*), Paris 1910, N Slouchz, *Etude sur l'histoire des Juifs au Maroc*, Paris 1905, do, *Hebraeo-Phéniciens et Judeo Berberes*, Paris 1908, Ubach and Rackow, *Sitte und Recht in Nordafrica*, Stuttgart 1923, T H Weir, *The Shaikhs of Morocco*, Edinburgh, 1904, E Westermark, *Sul culto dei santi nel Marocco*, Rome 1899 (XIIème Congres Int Or, vol iii, part 1, p 151—178), do, *Marriage ceremonies in Morocco*, London 1914 (Fr transl by J Arin, *Les ceremonies du mariage au Maroc*, Paris 1921), do, *Ritual and Belief in Morocco*, London 1926

VII LINGUISTIC SURVEY

Two languages are spoken in Morocco Berber and dialects of Arabic Berber is the oldest language attested in Morocco and we have no evidence of an earlier language being used, as to Arabic, it was introduced by the Muslim conquest of the viith and viiith centuries But until the arrival in Morocco of the Banū Hilāl and of the Sulaim (xiith century), it seems that Arabic, the language of an essentially urban culture, was spoken mainly in the towns while the country people continued to talk Berber, it was only after the occupation of the plains by the Arab tribes that their language spread there With the exception of the region of the Jbāla to be mentioned later, the highlands of Morocco alone have remained faithful to the Berber language, while the towns and lowlands are at the present day almost completely Arabic speaking

In his *Annuaire du Monde Musulman*[3] (p 162) L Massignon gives a proportion of 60 % of Berber speakers (3,200,000 to 2,200,000) A Bernard

thinks this exaggerated and reduces it to 40 % (cf. *Arabophones et Berbérophones au Maroc*, 1924, p 278)

A Berber

1 Berber dialects According to the works of E Destaing, the Berber dialects of Morocco can be divided into two main groups

The first is the northern group which includes the dialects of the Rīf, those of the Bni Znāsen and of the Berber speaking tribes of the neighbourhood and those of the Ait Seghrūshshen, Marmūsha, Ait Warain etc to the north of the Middle Atlas These dialects are characterised phonetically by their strong tendency to spirantisation of the dentals and palatals In comparing these dialects with those which in Algeria the natives call *Znātiya*, E Destaing has been led to describe the group as the group of Zanāta dialects

The second or southern group includes, according to the same author, the remainder of the Berber dialects of Morocco, he distinguishes two sub-groups

a that of the *Tamazight*, the dialect spoken by the Brāber of the Central Atlas, from the vicinity of Meknes to the edge of the Great Atlas, the dialects of the north are also distinguished from those of the south It is with this sub group that we should connect the dialect of the Sanhādja d-es-Srāir, an important highland confederation to the northeast of Fās, and perhaps also the language of the sections of the Ghumāra who still speak Berber

b Sub-group of the *Tashelhīt*, the dialect once spoken by the Masmūda of the Great Atlas and by the Shlūh (usual French orthography *Chleuhs*) of Sūs and the Anti-Atlas

The three groups of Moroccan Berber dialects seem to correspond very exactly to the three main ethnic divisions of the Berbers of the country Zanāta in the N E, Sanhādja Zanaga in the centre and Masmūda in the south Going back to the old division of the Berbers given by Ibn Khaldūn, E Destaing proposes to make the first group correspond to the Butr tribes and the two others to the Barānis tribes

For the bibliography of Berber studies see the list of works given by E Laoust at the beginning of his *Mots et Choses Berberes*, Paris 1920, p xvii, since that date see the Moroccan bibliography annually published by *Hesperis* A map showing the division of Morocco between Arabic and Berber is given in the articles by A Bernard and P Moussard, *Arabophones and Berberophones au Maroc* (in *Annales Soc Geogr*, vol 33, Paris 1924) For the north, there is a more accurate map by R Montagne and Pennes published at the end of the *Manuel de berbère marocain* (*dialecte rifain*) by Justinard (Paris 1926)

There is no evidence of the existence of another language before Berber in Morocco Very few of those "Libyan" inscriptions have been found which, although they are not yet read, are admitted to be in old Berber, one was found in the Roman ruins of Tamuda, a few miles S W of Tetwān, and is preserved in the museum of the latter town Other Libyan inscriptions have been found in the region of Petitjean

The earliest evidence of the use of Berber in Morocco is given by the *Geography* of al Bakrī (xith century) who says that the prophet Hā-Mīm, killed in 927 A D, had given the Berbers a Kur'ān written "in their own language" This can only refer to their Berber speech, the same author tells us that the Baraghwāta had also a Berber Kur'ān from their prophet Sālih (d in 750) For the beginning of the Almohad period, a passage in *Documents inédits d'histoire almohade*, p 67, says that at this time Berber was spoken on the Umm Rabī^{c} It is in the same work that we find the earliest recorded phrases in Moroccan Berber (*Tashelhīt* dialect) transcribed in Arabic characters (cf p 26, 30, 36, 38, 39, 67, 117)

Ibn Khaldūn seems to have been the first to interest himself in the creation of a scientific system of transliteration of Berber into Arabic characters Using certain graphic methods used by specialists in *tadjwīd*, he invented compound characters to render sounds peculiar to Berber (*g*, *z* [*z* emphatic] and *ȝ*) Unfortunately Ibn Khaldūn, who in his *Mukaddima* gives interesting chapters on the urban and Beduin Arabic dialects, does not seem to have devoted any attention to the Berber language, one of the few passages to be noted in his book, as far as Morocco is concerned, is his reference to the existence of Berber speaking peoples among the Sanhādja tribes settled in the valley of the Waigha and around the fortress of Amargū (cf *Histoire des Berberes*, ed de Slane, text, 1, p 273, l 11) For the beginning of the xvith century, Leo Africanus (p 28) gives us more detailed information The five Berber ethnic groups (Sanhādja, Masmūda, Zanāta, Hawwāra and Ghumāra) have a special language which they call *aquel amarig* (= *awal amazigh*), i e "noble language" (cf the present name of the *Tamazight* dialect) (ed Schefer, 1) Berber was still the language of a part of the Ghumāra, for, he says, Arabic is used by almost all the people (*op cit*, 1 29) It even looks as if the Shāwiya ("Soava") of the Lāmasnā still spoke Berber ("African language") like all the other Shāwiya of North Africa with the exception of some who lived to the south of Tunis (*op cit*, 1, p 83)

We have to come down to the Danish Consul G Host, in the xviiith century, to find the first Moroccan Berber vocabulary collected from a *tāleb* of "Lamenart", a place probably in the region of Agadir (cf *Efterretninger om Marokos og Fez*, Copenhagen 1779, p 128—133)

2 Berber literature of Morocco Although Berber was the language of the Moroccan dynasties who followed between the Idrīsids and the Sa^{c}dians, it does not seem that, contrary to what was done in Egypt for the Turkish of the Mamlūks, Berber was made the subject of grammatical studies in Morocco, nor that it was used for the purpose of literary expression A passage in the *Kirtās* recalls the fact that khutbas were pronounced in Berber in the great mosque of Fās but the text of them has not been preserved The celebrated Almohad reformer Ibn Tūmart is said to have composed in Berber theological and legal treatises which have now disappeared The Berber Kur'āns of the Ghumāra and Baraghwāta have also disappeared although al-Bakrī has fortunately preserved some extracts in an Arabic translation The only texts which we now have are translations of or commentaries on religious works of the type of the *Risāla* of al Kairawānī or of the *Mukhtaṣar* of Khalīl, all these Berber texts come without exception from Sūs, whether because this region

had a more advanced culture or its dialect with a more occlusive consonant system and clearer vowel system was better suited than others for transcription in the Arabic alphabet The Moroccan Berbers have a large stock of fables, legends, songs of love, war and work etc , many of which have already been collected by French and German students of Berber (on Berber literature, written and oral cf Henri Basset, *Essai sur la litterature des Berbères*, Algiers 1920)

Among Arab authors the Berber language is *ʿadjamīya*, the non-Arab language, *barbarīya*, Berber, *raṭāna*, "jargon", in the *Documents inedits d'histoire almohade* we several times come across the expression *al lisān al gharbī*, "the Moroccan language" In Moroccan Arabic, Berber is usually called *esh shelha*

B Arabic

The Arabic dialects The Arabic language was introduced into Morocco in at least two stages first in the eighth century at the time of the first Muslim conquest, then in the xiith at the coming of the Banū Hilāl and the Sulaim Down to the coming of the latter, who were brought to Morocco by the Almohad ruler Yaʿkūb al-Mansūr, Arabic seems to have been spoken almost exclusively in the large towns of the north, where it was used by a considerable Arab population who enjoyed a double prestige, religious and political It was the language of religion and law From the towns Arabic spread among the people of the surrounding country, and al Idrīsī (*Description de l'Afrique et de l'Espagne*, text p 79, transl p 90) already notes that in the xiith century the Berber tribes of the southern hinterland of Fās (Banū Yūsuf, Fandalāwa, Bahlūl, Zawāwa, Maggāsa, Ghaiyata and Salālgūn) spoke Arabic

It is this linguistic influence exerted by the towns on the country around them that explains the arabicisation of the mountainous country of the Jbāla (plur of *jeblī*, "highlander") while the rest of the Moroccan highlands remained Berber speaking The land of the Jbāla, in the wide sense, stretches in the form of a crescent from Tangier to Taza It was surrounded by a cordon of towns Nakūr, Bādis, Tīgisās, Tetwān, Ceuta, al Kasr al Saghir, Tangier, Azila, al-Kasr al-Kabīr, Basra, Azdjen, Banū Tāwudā, Walili, Fās, and Taza, which were the only ports or markets available for the tribes of the region, besides, the massif itself was traversed by the most important commercial routes of Northern Morocco the roads from Fās to Tangier, to Ceuta, to Bādis, to Nakūr and to Ghassāsa, it was therefore natural that being subject to the direct and indirect influences of the towns, the highlands of Jbāla should be the first region of Morocco to be arabicised The process was further favoured by several other factors 1 the existence in the mountains of numerous large villages, almost towns, which became secondary centres of Kurʾānic culture, 2 the settlement almost everywhere in the xth century among the Jbāla of Idrīsid sharīfs who, driven from Fās by Mūsā b Abi 'l-ʿĀfiya al-Miknāsī, founded independent principalities in the mountains, which became centres of Muslim urban culture, 3 the tribes of the Jbāla furnished a considerable part of the contingents which went to wage the holy war in Spain and returned home after being more or less arabicised by contact with the great Muslim towns of Andalusia, 4 lastly the rebellions and civil wars which so frequently disturbed Muslim Spain, the emigrations or expulsions caused by the progress of the Christian reconquest, brought to Africa, from the rising at Cordova (in 814) down to the xvith century, an important element which settled in the region of the Jbāla either in the towns around the mountains or in the villages of the highlands (resettlement of Tetwān, foundation of Shafshāwan) bringing there along with the Arabic language, the prestige of their cultural, intellectual and material superiority

This rapid sketch of the spread of the Arabic language in Morocco explains why, after studying the question, three categories of Arabic dialects have been distinguished

a Urban dialects, *b* highland dialects, *c* Beduin dialects, and we may add *d* the Jewish dialects

a Urban dialects In Morocco not all the town dialects are "urban dialects" There are towns like Casablanca, Mazagan, Safi and Mogador (and to a certain degree Miknās and Marrākush) the population of which is entirely or for the most part of rural origin and where the absence of an old nucleus of town dwellers has not enabled them to become urbanised The Moroccans however distinguish quite clearly such places from towns with a really urban culture, more or less influenced by Andalusian culture The principal towns with urban dialects are Fās, Rabat-Salé, Tetwān, Taza, al-Kasr al-Kabīr, Tangier, Wazzān and Shafshāwan also have urban dialects but these are much contaminated by the surrounding highland dialects Miknās and Marrākush have been influenced by the Beduin elements introduced by the *makhzen* groups into the dialects of these two old capitals It is interesting to note the case of Azemmūr where the old town (Azemmūr al Hadar) has an urban dialect, while the new town, which has in recent years grown up beside it around the sanctuary of Mawlāy Abū Shuʿaib (*vulgo* Bū Shʿaib), uses a Berber dialect The urban dialects of Morocco form one group with those of the western part of the Central Maghrib, notably with those of Tlemcen, Nedroma and Algiers Their phonetic characteristics are the loss of the interdentals of the classical language, the affricative pronunciation (*ts*) of *tāʾ*, the frequent attenuation of *kāf* to *hamza* In Fās, *b*, *m*, *k*, *g* and *djim* assimilate the *lām* of the article and are treated as "solars", the simple *djim* is pronounced like the French *j* (= Persian ژ), but when it is geminated, it gives *jj* in Fās and *dj* in Tangier The *rāʾ* is often pronounced very close to the French uvular *ɣ*

As peculiarities of the dialect of Fās, we may note the construction *ketbetto* "she has written it" for *ketbet* + *o*, and the use of an invariable relative *di* representing the old dialectal *dhū* Tangier and Tetwān have a preposition *n-*, "to" which is used before nouns (*n ed dār* "to the house") but not before suffixed pronouns To translate "of", Marrākush uses *t-*, the dialect of this town uses certain Berber adverbs *ashku* "because", *hellı* "only"

All the urban dialects use the characteristic prefix of the present indicative *ka-* in the north, *ta-* in the south Fās uses one almost as much as the other

b Highland dialects These are at least as well known as those of the towns In 1920 I published notes on that of the Tsūl and the

Brānes in the north of Taza, in 1922, E Lévi-Provençal published texts, prefaced by a grammatical sketch, of the dialects of the middle valley of the Wargha, since then I have had an opportunity of studying those of the Bni Hōzmar (near Tetwān), of the Mestāsa (near Bādes) and of the Ghzāwa (near Shafshāwan)

The highland dialects are of course more differentiated than the urban dialects The tribes which use them belong to two political clans probably originally of different racial origin the Ghumāra, the old inhabitants, and the Sanhādja, the invaders In the present state of our knowledge it does not seem possible to make the dialects coincide with political or racial boundaries, but we can nevertheless recognise two main groups of highland dialects

1 The northern dialects, extending from the Straits of Gibraltar to the south of Shafshāwan and embracing in the east the confederation of the Ghumāra, 2 the southern dialects, from Wazzān to Taza, used by two great classes of tribes first, the Sanhādja tribes of the valley of the Wargha Sanhādja of the Central Wargha, Sanhādja of the Sun and of the Shade, of Mosbāh and of Gheddo, secondly, the Butr tribes, more or less closely related to the Zanāta and occupying the lands north of the region of Taza Mernīsa, Brānes, Tsūl, Maghrāwa and Meknāsa It seems to be a historical fact that these Zanāta and Sanhādja peoples only settled in their present habitats long after the first Arab conquest, the Sanhādja of the Central Wargha certainly now occupy lands which before the Almoravid period were peopled by the Ghumāra We should therefore regard these southern highland dialects as younger than those of the northern group The slight differences noted between the two groups may then be due to two main causes 1 an evolution of the neighbouring urban dialects which would have taken place during the period between the arabicisation of the Ghumāra and that of the Sanhādja-Zanāta, 2 the non-identity of the Berber substrata

To the two main groups Ghumāra and Sanhādja-Zanāta, we may perhaps add two little islands in the south the highlanders of the region of Sefrū to the south of Fās (Bhālil, Bni Yāzgha etc), and the Ghiyyāta to the south of Taza, they probably constitute the last vestiges of a continuous Arabic-speaking bloc which stretched to the south of the Fās-Taza corridor, the existence of which in the xiith century we know from al-Idrīsī

Phonetically, the Moroccan highland dialects are characterised by the profound changes undergone by the Arabic consonantal system as a result of the spirantisation of the dental and post palatal occlusives. We find the interdentals *th* and *dh*, which do not represent the classical interdentals, *tā'-thā'* and *dāl-dhāl* have given in these dialects *t* and *d* respectively, which remain occlusive only at the beginning of the word or after a consonant or geminated, but after a vowel we have *th* and *dh* *bent* "daughter", plur *bnāth*, after a vowel also *kāf* is pronounced as a spirant like the *χ* of modern Greek The representative of the group ظ-ض of the classical language is usually *d*, sometimes hardened to *t*, but among the Ghumāra we have *dh* (= emphatic *dhāl*) The sound *tsh* is fairly common The short vowels are commoner than in the towns, many of the short vowels *ĭ* and *ŭ* of the classical language are preserved, this is how we find a considerable number of imperfects *ĭR*¹ *R*² *uR*³ and a few *ĭR*¹ *R*² *ĭR*³

As to morphology, the fem personal suffixes *-a* (< *-hā*) and pl *-em* (< *-hum*) are characteristic they are the complement of the series begun by the masc *-u*, *-o* (< *-hu*) Among the northern Jbāla we find the use of a suffix *-esh* making the plural it seems really to be a borrowing from Latin The dual, reserved for names of parts of the body which occur in pairs and for names of various measurements (of weight, length, volume and time) is in *-āyen* *shahrāyen* "two months", *yiddāh* "his hands" The relative, pronoun and adjective, is *d* The classical construct state (*idāfa*) is very rare and is only found in a few stereotyped phrases it is in general replaced by analytical constructions in which the preposition *d* "of" is used, expressing possession as well as the material of a thing

Almost everywhere the prefixes of the 2nd pers com and of the 3rd pers fem of the aorist are *de-* (and not *te-*) *dekteb* "thou writest, she writes" The passive participle of hollow verbs is often of the type *mefʿāl* *mebyāʿ* "sold", *mehwās* "filled up" Finally we may note a few traces of a passive of the form *fʿāl yefʿāl kbāṭ* "to be taken" As evidence of conservatism, we may mention that in these dialects we have the word *fā* "mouth" which seems to have disappeared since old Arabic

Just as the urban dialects of Morocco may be linked with a number of urban dialects of Algeria, so have the highland dialects of Morocco correspondents in the latter country W Marçais, who is the first to have isolated and described this group of Maghribī dialects and prefers to use the name of "parlers villageois" for them, classes along with the dialects of the Moroccan Jbāla two other similar groups, also characterised by the defacement of the Arabic consonant system (liquidation, affrication, spirantisation), by the use of turns of syntax and structural forms taken from Berber and by the juxtaposition in the vocabulary of Arabic elements sometimes strangely archaic and very abundant Berber elements These are firstly the Oran group of the Tiāra in the country which extends from Lalla Maghnīya to the sea, a mountainous country traversed by the roads connecting Tlemcen, the capital of the Banū ʿAbd al Wād, with the ports of Hunain and Arshgūn It is with the dialects of the Trāra that the dialects of these Moroccan Jbāla show most agreement

The second group, which differs more, is that of the highland dialects of Eastern Kabylia, a mountainous region of the department of Constantine, traversed by the roads connecting Constantine with the ports of Djidjelli and Collo, this was also the old habitat of the Kutāma, whom their support of the Fātimid movement must have caused to be rapidly arabicised Alongside of these three groups of highland dialects (Jbāla, Trāra, Eastern Kabylia), W Marçais classes a fourth in the villages of the Tunisian Sāhel, which lie in the coast zone traversed by the roads which connect Kairawān with the ports of Sūs, Mahdīya and Monastir These Tunisian dialects, of which that of Takrūna, studied by W Marçais, is a specimen, are however much arabicised and hardly seem to have been subjected in their phonetics, morphology, syntax and vocabulary to the profound

Berber influences which characterise the first three groups

In spite of their divergencies, which are due mainly to pronunciation and to the local use of words and phrases corresponding to two very distinct forms of culture, the urban dialects and the highland dialects cannot be either historically or linguistically separated The fundamental disparity is that which exists between the urban and highland group and the Bedouin group It is the townsmen who have taught the highlanders to speak Arabic, but the urban dialects, used by individuals whose intellectual activity is greater, have evolved more rapidly They are also more sensitive to external influence, literary and political These facts added to the predominance of Berber blood in the highlands suffice to explain why the dialects of the Jbāla still seem coarse and quaint to the townsmen On the other hand, the towns have been frequently repopulated, wholly or in part by people from the neighbouring hills All this explains the family resemblance which the linguist finds between the dialects of the towns and those of the hills, perhaps the latter, being more conservative, are also the more interesting for the history of the language W Marçais regards them as valuable representatives of the Arabic spoken in the country district of the Maghrib before the coming of the Banū Hilāl and the Sulaim (cf W Marçais, *Textes arabes de Takrouna*, vol i, preface, p xxviii)

The principal features which are common to the urban-highland group and which distinguish it from the Bedouin group are the following

— loss of the classical interdentals,
— pronunciation of *kāf* as *k* or *hamza* (and not *g* as among the Beduins),
— tendency to the syllabic grouping $R^1\ R^2\ e\ R^3$, when R^2 is not a laryngal nor a sonant,
— rarity of the construct state,
— suffix of the 3rd pers masc sing in *-u*, *-o* (and not *-ah*, as among the Beduins),
— relative rarity of the addition of personal suffixes, but regular use of the analytical phrase with *dyāl ed-dār dyāl ī*, "my house",
— diminutive of $R^1\ R^2\ e\ R^3$ becomes $R^1\ R^2$ *iyye* R^3 *kliyyeb*, "little dog",
— diminutive of adjectives of the types $R^1\ R^2\ e\ R^3$ (< class *afʿal*) and $R^1\ R^2\ ī\ R^3$ becomes $R^1\ R^2\ ī\ R^2\ e\ R^3$ *hmimer*, "a little red", *kbīber*, "a little large",
— plural of the adjectives $R^1\ R^2\ e\ R^3$ (< class *afʿal*) becomes $R^1\ ū\ R^2\ e\ R^3$ *kōhal*, "black" (plur),
— reductions of the plurals $C^1\ C^2\ ā\ C^3\ ī\ C^4$ to $C^1\ C^2\ ā\ C^3\ e\ C^4$ *mfātah*, "keys",
— use of a verbal prefix to mark the indicative present *ka-* or *ṭa* in the towns and *la-*, *ka-*, *a-* in the hills,
— in the singular of the perfect, the feminine person is in general used for the masculine e g *ktebti*, "thou hast written" (m), whence we find in Rabat for the plural, an analogous form *ktebtiu*, "you have written"
— in the vocabulary, *shhāl*, "how much?", *dāba*, "now", *lkā* (*rka*, *kka*), "to do", are characteristic,
— in the imperfect of the defective verbs, the plural is formed on analogy of the singular *yebkāu*, "they remain", *yebkīu*, "they weep"

c Beduin dialects These are in Morocco the dialects of the plains the Atlantic plain from Arzila to Mogador with its continuations into the interior, the valley of the Mulūya, the plateaus of eastern Morocco and the region of the Moroccan Sahara (Wād Ghīr, Wād Zīz etc), they are still little known, only that of the Hawwāra of Sūs has been studied, but only in Europe and from authorities who had already travelled a good deal elsewhere That of the Dukkāla of the north (Ūlād Bū ʿAzīz, Ūlād Fredj), have myself examined it corresponds in almost all its details to the dialect of the Ūlād Brāhīm of Saida (Oranie) on which W Marçais has written a monograph There is no doubt that on examination one can divide the Bedouin dialects into groups characterised by more or less conservatism, should those of the Maʿkil perhaps be separated from those of the Banū Hilāl? Perhaps a distinction should also be made between the dialects of the purely Arab tribes and those of the Atlantic regions where powerful Berber tribes (Hāha, Ragrāga, Dukkāla, Baraghwāta) have been arabicised and more or less submerged by the Bedouins It should be remembered that in the historical period the latter have been infinitely less stable than the tribes of Berber origin (speaking Arabic or Berber), whether because they were taken to form the *gīsh*, which guards each large towns (environs of Fās, Meknes, Rabat-Sale and Marrākush) or because they were transported far from their original homes as a measure of repression (case of the Shrārda), the Arab tribes of the Atlantic plains have become much broken up and mixed The Bedouin dialects which have most chance of having preserved their original character are those of the tribes of the Saharan steppes who have remained relatively stable and intact Bnī Gil, Mhāya, Dhwī Mnīʿ, Ūlād Djrīr etc In any case, the following are the main characteristics of these dialects firstly the *kāf* is pronounced as *g* (= *kāf maʿkūda*), and it is already this pronunciation which for Ibn Khaldūn characterises the Bedouin dialects of his time The *thāʾ*, *dhāl* and *dād zāʾ* are retained with their interdental value The short vowels are indistinct the sound *ĭ* is almost completely absent and many short unaccented vowels sound practically like a labial *e* Characteristic are the appearance of an extremely short transitional vowel of *u* character, which is developed after *k*, *g*, *kh* and *gh* placed before a consonant or an *ā*, e g *kŭbār*, "great" (plur), *ɣŭʿed*, "he sits down", *khŭrāfa*, "tale", *ghŭzāl*, "gazelle", *shkwāra*, "saddle bag", *ṛugʷāg*, "thin" (plur), a similar sound is found after *bb*, *ff*, *mm* and *kk*, *gg*, *kk*, *kh-kh*, e g *lughrubbʷa*, "the crows", *nuffʷākha*, "a blow", *rummʷān*, "pomegranate", *sukkwār*, "sugar", *shukkwa*, "piece (of cloth)", *nukhkhʷāl*, "sound", by analogy the combinations *mw* and *fw* when the *w* corresponds to a classical *wāw*, are reduced to *mm* and *ff*, e g *lemmʷīdaʿ*, "the (little) place", *leffwād*, "the entrails"

The retention of the accent on the first syllable causes "projected" syllabic forms *yekteb*, "he writes", plur *yekketbu*, *meghgheṛbi*, "Moroccan", *mukkahla*, "musket", *beggerti*, "my cow"

The personal suffix of the 3rd pers masc is *-ah* The dialectal preposition translating "of" is *ntāʿ* or *tāʿ*, from the classical *matāʿ*, according as the word before it is feminine or plural, this preposition becomes *ntāʿt* (*tāʿt*) or *ntāuʿ* (*tāuʿ*)

It does not seem that the Beduin dialects know the use of the verbal prefix indicating the indicative present In the plural personal forms of the defective verb, there is a reduction of the diphthong *glū yéglū*, from the verb *glā* "to fry", *nsū-yensū*, from the verb *nsā* "to forget"

We may also note the use of a preposition *lī-*, "to" *gāl-līna*, "he told us"

From the point of view of vocabulary, some words are characteristic of Beduin dialects *dār-ıdīr*, "to make, do", *ba ıbı*, "to wish", *yemta*, "when", *yāmes*, "yesterday", *dha ı wek*, *dhurk*, "now", from the classical *dha'l-wakt* We may add the particle *wāsh* used to indicate interrogation *wāsh sheft flān* ?, "have you seen so and so ?" and the phrase *ma tlā-sh ıdjı*, "he no longer comes"

d Jewish dialects The Jews who emigrated from Spain have as a rule retained the use of an archaic Spanish, many have also learned Arabic for business reasons Alongside of the Spanish Jews, we have in the Berber highlands and in the towns of the interior Moroccan Jews of unknown origin whom the former call *forasteros* (Span "foreigners"), according to the district, they speak Berber or Arabic, but in the towns their dialects have not yet been studied They have a literature in an Arabic dialect written in Hebrew characters (and called, certainly wrongly Judaeo Arabic) *piyyutim*, songs at family festivals (cf Tadjouri, in *Hesperis*, III, 1923, p 408—420), satirical songs and songs dealing with real happenings, some of these texts have been printed at Fās and Constantine, a newspaper written in an Arabic dialect and printed in Hebrew characters called *al-Hurrīya* "The Liberty" has been published at Tangier for a number of years

e Relations of the linguistic groups of Morocco to one another Morocco appears to the philologist a wonderful field for the study of the influence of the substratum on an imported language, since the language of the substratum, i e Berber, is still alive alongside of the Arabic and quite well known The results of the examination are very meagre the phenomena actually ascribable to the action of the substratum alone are infinitesmal, this may, however, be due to the fact that Arabic, a Semitic language, and Berber, a proto-Semitic language, are not sufficiently differentiated

From the phonetic point of view, there is hardly any sound change found in the highland dialects of the arabicised Berbers, for which a corresponding change cannot be found in the dialectal phenomena of old Arabic, only, perhaps their tendency to spirantisation should be connected with the identical tendency observed in the northern Berber dialects found in the confines of the Jbāla country

If we consider the morphology, we see that in the highland dialects the verb has lost feminine forms of the plural of the old Arabic, which still survive in some Beduin dialects and are still found in Berber A Berber origin has been sought for the use of the verbal prefix indicating the present of the indicative, but similar prefixes are found in Egypt and in Syria where there are very different substrata

Certainly Berber is the scheme *ta- — -t* which forms nouns indicating trades (*ta-bennaī-t*, "trade of a mason") and names of abstract qualities (*ta hrāmī-t*, "roguery"), it is however curious to note that in modern Berber, this scheme has not this significance and is only used to form the feminine and secondarily the diminutive

In the syntax of the highland dialects, we find indisputable traces of Berber influence plural treatment of singulars applied to liquids (water, urine), phrases translated or stereotyped, e g *ḫā ın Kaddūr*, "Kaddūr's brother", with retention of the Berber particle indicating belonging to, *-ın*

But it is in the vocabulary that the Berber substratum makes its influence most felt Whether surviving in the highland dialects or borrowed in the Beduin dialects, many of the terms relating to country life are Berber (names of plants, animals, rocks, agricultural implements and tools), they have often retained in Arabic the Berber pseudo-article *a-*, which, still felt to have its original value, makes them unfit to take the Arabic article also, alongside of the singular in *a-*, we usually have a Berber plural in *a—ān* also retained It is curious by the way but intelligible to find in the highland dialects words of Arabic origin with the Berber article These must be Arabic words borrowed and berberised at a time when the Jbāla still spoke Berber and which have been retained just as they were in their Arabic dialect after being arabicised, e g *a-hfır*, "ditch", plur *a-hefrān*, in Tangier the nave of the mosque is called *a-blāt*, at Rabat two words imported from Europe have a Berber form *a-skīf*, "the sultān's boat" and *a tāy*, "tea"

Some Berber words have survived in the administrative language of the Makhzen *afrāg*, "a wall of cloth surrounding the sultān's camp", *agdāl*, "a pasture reserved for the sultān's animals", *azfel*, "lash to punish the guilty", *mezwār*, "syndic (*nakıb*) of the sharīfs"

The Beduin dialects naturally contain much fewer Berber elements than the urban dialects and still less than the highland dialects, their rustic vocabulary nevertheless made numerous borrowings from the technical vocabulary of the previous Berber tillers of the plains

Within the Arabic area, the highland and urban dialects have borrowed a certain number of terms relating to the rural activities of the Beduins, they are as a rule revealed by the pronunciation of *kāf* as *g* The Beduin dialects in their turn borrow from the towns their words relating to a more advanced culture, but, for economic, political and, to a certain extent, aesthetic reasons, they give more than they borrow

Some words, which are used in the urban and highland dialects as well as by the Beduin dialects but are unknown to the Spanish and Maltese dialects, are perhaps of "Hilālī" origin, the principal seem to be *ʿaud*, "horse", *hallūf*, "boar" and *shāf-ıshūf*, "to see"

In addition to the Berber and Arabic elements, the Moroccan vocabulary contains a fairly important number of European loanwords They come from the vocabulary of a higher culture and relate to the flora (in cultivation or its products), to agriculture, to food and dress, to furniture and housing, sometimes even to parts of the body There are Greek or Latin borrowings of the oldest period, Romance or Spanish for later periods, but neither their meaning nor their phonetic treatment enables us always to be able to date accurately the time of their introduction and their origin

These "European" loanwords are naturally found in larger numbers in Northern Morocco, which

has been more subject to Mediterranean influences which, through refugees from Spain, have been felt as far as the northern part of the Middle Atlas The Beduin dialects have escaped these influences (cf 1 Simonet, *Glosario de voces ibericas y latinas usadas entre los Mozarabes*, Madrid 1888, 2 Schuchardt, *Die romanischen Lehnworter im Berberischen*, Vienna 1918, 3 G S Colin, *Etymologies magribines*, in *Hesperis* [1926 and 1927], 4 A Fischer, *Zur Lautlehre des Marokkanisch-arabischen* [chap II, III and *Excurs*], Leipzig 1917)

Between the two extremes marked by the most conservative Beduin dialects and the most characteristic highland dialects lies a whole gamut of intermediate varieties, which are in the transitional stages, they include the highland dialects whose characteristic features have been reduced through contact with the plains of the southern periphery of the massif of the Jbāla, as well as certain dialects of Beduin type used in the Atlantic plains, notably in the non-*hadrīya* towns "But however extensive and deep may have been the interpenetration of the two types, it has not abolished their fundamental unlikeness" (W Marçais)

In spite of the profound differences which separate them, the highland and Beduin dialects of Morocco (and of the Maghrib) agree in one essential and characteristic morphological feature the forms sing *n—*, plur *n—u* in the first persons of the aorist Now this fact is attested in the XIIth century for Almoravid Spain and Norman Sicily, i e in languages from which Hilālī influence is clearly excluded, it is also found in Maltese, it must then be admitted that the two groups of dialects have independently brought about this innovation, which seems to have remained exceptional in the dialects of the east The two groups agree also in the loss of short vowels in open syllables, this phonetic peculiarity is also found in many eastern dialects, but it is curious that it has become general in the Maghrib while the dialects of Spain and Egypt do not have it

It is in the *Documents inedits d'histoire almohade* that we find the first information about Moroccan Arabic [use of *bāsh*, "in order that", *mtā*ᶜ, "of", first persons of the aorist in *n—* (sing), *n—u* (plur)], but we have to wait till D de Torres to find a few phrases transcribed (cf French transl, Paris 1636, p 241, 323, 339) Mouette, who was captured at sea by the Moors in 1670 and was for a long time a prisoner, has left us a *Dictionnaire arabesque* in French and Moroccan, in transcription (cf *Relation de la Captivite* , Paris 1683, pp 330—362) The first grammatical notes were collected by Host (cf *Efterretninger* , 1779, ch 8, p 202—210), who has also given us a Berber-Danish-Moroccan Arabic vocabulary (*op cit*, p. 128—133) It is to Fr de Dombay that we owe the first monograph on Moroccan dialects, which is also the first serious contribution to the study of Arabic dialects, the dialect which he deals with is that of Tangier (*Grammatica linguae mauro arabicae*, Vindobonae 1800) Since then, there have been a number of studies for works before 1911 see the bibliography given by W Marçais in his *Textes arabes de Tanger*, p 207—213, for later works see the bibliography in *Textes arabes de Rabat* by L Brunot (now in the press)

2 Literature of the Arabic dialects Like all popular literatures, the literature of the Arabic dialects of Morocco is essentially poetical The only texts in prose are those which have been collected recently by European students of dialects

In the Arabic poetry of Morocco two periods must be distinguished the first extending down to the beginning of the Saᶜdian dynasty, the first known texts are those which Ibn Khaldūn gives at the end of his *Mukaddima* among the specimens of the poetry of the towns To these we may add a mass of poems composed in honour of the Prophet (*Mawlidīyāt*) of which numerous collections exist in manuscript Leo Africanus (ed Schefer, II, p 130) says that under the Marinids, poets used to compose verses in "vulgar African" on the Mawlid and also on erotic subjects These poems were recited in the presence of the sultān, who gave prizes to the winners of the competition From this group cannot be separated the poems which accompany classical Moroccan music, "Andalusian" music, many of which must have been composed in Morocco, these were collected and classified by al Hāᵓik, a musician of Spanish origin who had settled in Tetwān All these poems belonging to this first period are written in the Spanish Arabic dialect, which after the great success of the Cordovan Ibn Kuzmān (XIIth century) became the classical language of the new poetic genre called *zadjal*, which had this in common with the *muwashshah* that, while employing like it new metres, its prosody was based like the classical metre on the quantity long or short of the syllables, but the *zadjal* differed from the *muwashshah* in that it was written in the Spanish dialect and not in the classical language

The main characteristics of the poetry of the Moroccan dialects of the first period are attention to the quantity of each syllable as in Latin and the use of the Spanish dialect

The second period, on the other hand, is distinguished by a system of prosody founded exclusively on the number of syllables in each verse (as in French) and by the use of a special language called *melhūn*, a kind of κοινή adapted to literary purposes, based on the Moroccan dialect but influenced partially by the Beduin dialects, it seems moreover that this poetry is of Beduin origin and it was under the beduinising dynasties of the Saᶜdians and ᶜAlawids that it arose and flourished

The first known author of a *kasīda* written in *melhūn* appears in the XVIth century he was Abū Fāris ᶜAbd al ᶜAzīz al Maghrāwī, who was one of the poets of the Saᶜdian Sultān al-Mansūr al Dhahabī (1578–1602) His fame is still great and is preserved in the proverb *Kull twil khāwī, ghēr en-nekhla u lmeghrāwī* „Nothing that is long is of interest except the palm-tree and al-Maghrāwī" Other poets followed him It was at this time that the saint ᶜAbd al Rahmān al-Madjdhūb al Dukkālī (d in 1569) wrote his mystic *rubāᶜiyyāt*, but many of the verses now attributed to him are apocryphal After these we have the poets from Tlemsen, an important centre of *melhūn* poetry, first Saᶜīd b ᶜAbd Allāh al Mindāsī al-Tilimsānī, author of the celebrated *ᶜAkīkiya*, who left his native town to live at the court of the first ᶜAlawid Sultāns Muhammad b al-Sharif (d in 1664) and al-Rashīd (d in 1672), a pupil of al-Mindāsī, Ahmad b al-Turaikī, banished from Tlemsen in 1672 by the Turks, also came to settle in Morocco among the Bni Znāsen But we have to come down to the XVIIIth and especially the XIXth century for the coming of a whole school of poets writing in *melhūn* The three principal centres of literary activity were Fās, Meknes and

Marrākush The subjects treated are most varied love poems, mystic, erotic and satirical (discussion between a white woman and a negress, between a townswoman and a Beduin woman etc), political (on the occasion of the French conquest and the establishment of the protectorate), didactic (manufacture of powder, target-shooting, falconry) poems or burlesques (parodies of khutbas declaimed by the students at their fêtes)

Among the numerous authors we may mention Si Muhammad b Sulaimān, Si al-Tihāmī al-Madaghrī, al-Gandūz, al-Hunsh, we owe humorous kasidas to Si al-Madanī al-'Iurkumānī of Marrākush, Si Kaddūr al-'Alamī buried at Meknes specialised in mystical and ethical poetry The Darkāwī Muhammad al-Hairāk of Tetwān (d 1845) also wrote mystical kasīdas in *melhūn* which are collected at the end of the lithographed edition of his *Dīwān* (Tunis 1331, Fās, n d) At the beginning of the xxth century, al-Sa'dānī of Fās was composing political kasīdas

Melhūn poetry has completely replaced poetry in the Spanish dialect, it constitutes a very vigorous branch of literature, much in favour with all classes of society, we frequently find almost illiterate authors, and people say that their talent is a poetic gift given by God (*mawhūb*), on the other hand, even the rulers have not disdained this popular poetry and one of the last 'Alawid Sultāns, Mawlāy 'Abd al-Hafiz, wrote numerous kasīdas in *melhūn* which have been collected in a *Dīwān* lithographed at Fās

Alongside of this men's poetry, there are the songs of the women (songs of women working at the mill, songs of gleaners, songs of family fêtes, lullabies), the children's songs which are often strangely conservative, epigrams and proverbs [cf A Fischer, *Das Liederbuch eines marokkanischen Sangers*, Leipzig 1918, C Sonneck, *Chants arabes du Maghreb*, Paris 1902 (Nrs 5, 6, 11, 12, 13, 14, 74, 84, 85, 88, 89, 94–97, 115 and 116 are Moroccan), E Lévi-Provençal, *Un chant populaire religieux du Djebal Marocain*, in *Revue Africaine*, 1918, H de Castries, *Les gnomes de Sidy Abd er Rahman el-Medjedoub*, Paris 1896, on the poetry *melhūn* in general, cf Abū 'Alī al-Ghawthi, *Kashf al-Kinā' 'an Ālāt al-Simā'*, Algiers 1904, p 49—93, S Biarnay, *Notes d'ethnographie et de linguistique nord africaines*, Paris 1924 (songs of women and children), L Brunot, *Proverbes et dictons arabes de Rabat*, in *Hesperis*, 1928 (with Moroccan bibliography of the subject)

III Other Languages A sketch of the languages of Morocco which only took account of Berber and Arabic dialects would be incomplete, for three other elements of secondary importance have to be considered

a Classical Arabic, the official language is used only in writing, for sermons, lectures and conferences, it is never the language of conversation But as religious studies are considerably developed in the towns (especially Fās) and also among the Jbāla (Kur'ānic studies and especially *kirā'āt*), many words of classical Arabic have been introduced into the popular dialect by the educated classes The phonetic peculiarity to notice in borrowed classical words is the retention of the short vowels of the classical language, as a result of the process of elongation, e g classical *dahīr*, plur *dahā'ir*, "decree of the sultān", borrowed by the popular dialect in the form *dāhīr*, whence a dialect plural *dwāhar* Several Kur'ānic expressions or phrases of exegesis hence passed into everyday language as adverbs *bellāti* "guilty" (taken from Kur'ān vi 153), *b-et-tāwīl* "slowly", lit "in commenting on", *wa kīla* "perhaps" Morocco, as a whole being little arabicised, seems incapable of borrowing a part of the classical vocabulary and adapting it to its own dialect Its borrowings from classical Arabic almost always look like borrowings from a foreign language

b Spanish was the only language spoken by many of the Muslims of Spain, who in the xvth century and especially in the xvith took refuge in Morocco, mainly at Tetwān and Rabat-Sale Mouette, who was taken a prisoner to Morocco in 1670, says that Spanish was as common there as Arabic, his remark is probably true only of the towns already mentioned The descendants of these emigrants from Spain later learned Arabic and forgot Spanish, under the influence of Islāmic culture Not having been subject to the latter influence, the Jews of Spanish origin still speak an archaic Spanish, sprinkled with Arabic terms moulded to the flexions of Latin morphology

c At the present day, in the palace of the sultān, many servants of both sexes still speak Sūdānese dialects, but these seem to have had no influence on the Arabic dialects of Morocco No trace has so far been found of the existence in Morocco of secret languages, one could hardly put in this category the argots of certain guilds (butchers) nor those of the students, the originality of which consist simply in transposing certain letters of each word of the ordinary language and in the addition of certain prearranged syllables

(Georgfs S Colin)

VIII Intellectual Life

More especially since the end of the middle ages, Morocco has occupied a place by itself, often important, in the history of Muslim civilisation From the point of view of intellectual life, it was for long under the tutelage, more or less marked, of neighbouring countries, and it was only from the time it became an independent state with well-defined frontiers that it began to show independence in this respect also The great activity at the centres of learning in Arab Spain down to the end of the xiiith century had undoubtedly an influence in Morocco, but it was after the return of the Iberian Peninsula to Christianity, that, owing to the migration of refugees from Spain to Morocco, where there happened to be ruling princes anxious to further Islāmic studies, it was able to preserve the last and only centres of study in the Muslim west In any case, in spite of the relatively large number of scholars which it has produced in various branches of *'ilm*, this country is far from having inherited in the eyes of the rest of Islām the reputation and intellectual prestige, which Spain enjoyed when it was a Muslim country However, it may be said that the towns of Morocco have always held in recent centuries a large proportion of men of letters, much attached to their traditional culture Lastly, it may be noted that this culture, to the end of the xixth century at least, never allowed the slightest place for modern sciences, the study of which, if it has gradually become more or less established in the Muslim east, has never interested the west

The characteristic feature of this culture, which

is essentially founded on religion, is that it has remained unchanging In this country, where only a few years ago tradition strictly regulated all acts of public and private life, it is not surprising that the intellectual ideal has always remained the same It has already been remarked that the Moroccan *fakīh* of to-day, whether he be magistrate, teacher, or official of the Sharīfian government, possesses the same stock of knowledge as a *fakīh* of the periods of the Marīnids or Sa'dians The same instruction has been given him and by the same methods He has received first of all an elementary education in the Kur'ānic school [see MAKTAB], he has learned the Kur'ān by heart, often completely, and some of the elements of grammar Next he became a student (*tālib*), and the *ṭalab al-'ilm*, which he studied, is governed by no rules or programmes other than the traditional ones He first of all studied the "mother works" (*ummahāt*), compendia made to be memorised readily, on theology and grammar (usually the *Murshid al-Mu'in* of Ibn 'Āshir and the *Adjurrumīya*) It was only then that he entered upon a more thorough study of more advanced texts, usually commentaries (*sharh*) or glosses (*hāshiya*) on works (*matn*) of established reputation and exclusively Islāmic in character The whole trend of his studies is toward a better knowledge of theology and law

The result is that in most cases in Morocco men of learning are almost entirely jurists and that they differentiate between purely Islāmic sciences (*'ulūm*) and profane learning (*funūn*) with some contempt for the latter We understand also why the part played by Morocco in Arabic literature is primarily in the domain of subjects directly connected with the Kur'ān and the Sunna, theology, law and *usūl*

The centres of learning have varied with periods and historical circumstances The early ones seem to have been the points nearest to Spain, Ceuta and Tangier The foundation of Fās and the building in this city of the great Mosque of the Kairawānīs (*Djāmi' al-Kaṛawīyin*) facilitated the establishment of a centre of culture in the interior A little later, Marrākush, the capital of the Almoravids and of the Almohads, became by desire of its rulers the centre of attraction for Maghribī scholars and even for a certain number from Spain But it is from the Marīnid dynasty, who saw in the development of educational centres in Morocco a means to make themselves popular in the country and to acquire prestige in the eyes of the Muslim world, that the rise of Fās as an intellectual centre dates it was the metropolis of learning in the country from the xivth century Not only did the Marīnid princes make it the political capital but by the foundation of a series of colleges or madrasas (in Morocco *medersa*) around the Djāmi' al-Karawīyin and mosque of New Fās, they were able to attract to this city a host of students from all parts of the country and to give it the renown for learning, which it still jealously claims to-day In the Marīnid period, madrasas were also multiplied outside Fās Meknes, Salé and Marrākush had their own, which shows that regular education was given in these towns

In addition to the part played by the madrasas, there was the activity of the zāwiyas, directly connected with the development of maraboutism and sharīfism in the country in the period when the Spaniards and Portuguese were trying to establish themselves in Morocco in the xvith century The *zāwiyas*, religious centres, headquarters of the *djihād*, naturally became centres of teaching At the time when Fās could only with difficulty keep its character as the principal centre of learning in the country, the zāwiyas, in which teaching was carried on, became more and more numerous, e g the zāwiya of al-Dilā' in the Middle Atlas, the zāwiya of Tāmgrūt in the land of Da'ra and the zāwiya of Wazzān in the north The most famous scholars were frequently either heads of brotherhoods or *shorfā*, who taught in the mother-house of their order

We do not intend here to give a detailed sketch of the Arabic literature of Morocco, but will be content with a few general indications and names distinguishing where possible, between Islāmic and profane sciences

It was not till the Muslim west adopted the Mālikī rite that Morocco began to produce work in the domain of *'ilm* in close accord, as already mentioned, with the school of Spain In this period of intellectual dependence, the relations between the two countries were continued and the Maghribi students down to the xiiith century considered a sojourn in Cordova, Murcia or Valencia necessary to finish their course The east did not yet seem to exert the attraction that it did later At this period, besides, the islāmisation and arabicisation of the Berber masses was still too recent Only a few names may be mentioned for this early period, Darrās b Ismā'īl, of whom much that is recorded is legendary, the famous reformer Ibn Tūmart [q v], creator of the Almohad movement and author of several *risāla* or *'akīda* on his teaching, the kādī 'Iyād [q v], born at Ceuta in 476 (1083), d at Marrākush in 544 (1149), author of numerous works on Muslim learning, of which the most famous are the *Kitāb al Shifā'* and the *Mashārik al-Anwār* with a collection of biographies of learned Mālikīs, entitled *al-Madārik*

During the modern period, on the other hand, the number of learned Moroccans becomes more and more considerable The best known are for *kirā'āt* Ibn Barrī (eighth century A H), Ibn Fakhkhār (ninth century), the scholar of Meknès Ibn Ghāzī († 919), 'Abd al-Rahmān Ibn al-Kādī († 1082), 'Abd al-Rahmān b Idrīs Mandjra († 1179), Muhammad b 'Abd al-Salām al-Fāsī († 1214), for *hadīth* Yahyā al Sarrādj († 808), Sukkain al-'Āsimī († 956), Ridwān al-Djinwī († 991), Muhammad b Kāsim al Kassār († 1012), Idrīs al-'Irākī († 1228), for *fikh* Abu 'l Hasan al-Sughaiyir, commentator of the *Mudawwana*, al Djazūlī [q v] and Ahmad Zarrūk (ninth century) commentators of the *Risāla* of Ibn Abī Zaid al-Kairawānī, al-Wansharīsī († 995), al-Mandjūr († 995), Ibn 'Āshir († 1040), Maiyāra († 1072), for phi-lology al Makkūdī († 807), Ibn Zakrī († 899) Their works have for the most part been recorded and will be found detailed either in Brockelmann, *G A L* or in Bencheneb's work on the individuals mentioned in the *Idjāza* of 'Abd al Kādir al-Fāsī Only a small number have found a place in eastern libraries, but on the other hand, they all form the foundations of the collections of manuscripts formed and preserved in the imperial palaces and mosques of Morocco

Some Moroccan scholars have written works on *adab* or collections of poems, in addition to books of a strictly Muslim character None of

them can claim any great originality and purely literary dīwāns are rare Poetry, as a rule — when it is not didactic (*urdjūza*) —, is religious or mystic At the courts, there were always a few literary men maintained by the princes, who were the panegyrists, often very lurid, of their patrons

It is at the courts also, especially from the XIVth century, that we find the few historians who have given us original chronicles or compilations Their works, planned on a singularly curious conception of history, have nevertheless the merit of giving us the only detailed information about the political history of the country in the period of the author or immediately preceding it Those which date from the Middle Ages are however much the best The kind of work not only did not improve later, but became simply dry chronicles in which events are related in a brief and colourless fashion

The early historians of Morocco — if we except the Berber genealogists about whom we do not know very much — are contemporaries of the Almoravid dynasty A little later, the Almohads find a historian in the person of a companion of the Mahdī Ibn Tūmart, Abū Bakr al-Baidhāk al-Sanhādjī, the interest of whose memoirs contrasts strikingly with many later chroniclers Alongside of the work of al-Baidhāk may be placed the chronicles of Ibn al Kattān and of ʿAbd al-Wāhid al-Marrākushī as of high value But it was in the Marīnid period that the historian found most favour in Morocco Leaving out Ibn Khaldūn, whom Morocco is not the only one to claim, we may mention Ibn ʿIdhārī, a scholar of Marrākush, to whom we owe a history of North Africa and Spain, the *Bayān al Mughrib*, that of Ibn Abī Zarʿ, author of a history of Fās and the Moroccan dynasties, *Rawd al Kirtās*, Ibn Marzūk, author of the *Musnad*, a monograph on the sultān Abu 'l-Hasan ʿAlī, Ibn al-Ahmar of the family of the kings of Granada, author of the *Rawdat al-Nisrīn* Under the Saʿdians, the principal historians were al-Fishtālī, al-Ifrānī, author of the *Nuzhat al-Hādī*, finally under the ʿAlawids, al-Zayyānī and Akensūs

Geography is represented in modern Moroccan literature only in the form of *rihlas* or accounts of the travels of pilgrims, in which the description of the country passed through only occupies an insignificant place Nevertheless, the geographer al Idrīsī [q v] and the great traveller Ibn Battūta were of Moroccan origin

The biographical literature of Morocco is considerable The collections of *manākib* [q v] of saints, monographs dealing with families of *shorfā* or religious brotherhoods are abundant, especially in the modern period There are also collections by town or century, some of which are of a certain interest, even from the point of view of history All these biographies have been surveyed in E Lévi-Provençal, *Les Historiens des Chorfa* The most notable biographers down to the middle of the XIXth century are Ibn ʿAskar, author of the *Dawhat al Nāshir*, Ibn al-Kādī, author of the *Durrat al-Hidjāl* and the *Djadhwat al-Iktibās*, the historian al Ifrānī, author of the *Safwāt man intashar*, and al-Kādirī, author of the *Nashr al-Mathānī* and the *Iltikāt al-Durar*

As to medicine and natural science, Morocco down to the XIVth century was closely dependent on Spain. The physicians of the Almoravid and Almohad princes were from Spain, like Ibn Bādja (Avenpace), Ibn Tufail and the celebrated Ibn Rushd (Averroes) and Ibn Zuhr (Avenzoar) In the modern period, we find at the courts of the sultāns several physicians of Moroccan origin who have left works The chief were, in the Saʿdian period Abū Muhammad al-Kāsim al Wazīr al Ghassānī, in the ʿAlawid period Ibn Shukrūn, ʿAbd al Wahhāb Adarrāk, Ahmad al-Daraʿī, ʿAbd Allāh b ʿAzzūz al Marrākushī, Ahmad Ibn al-Hādjdj and ʿAbd al Salām al ʿAlamī Finally two famous Moroccans studied the exact science of the XIIIth century Abū ʿAlī al-Hasan b ʿUmar al Marrākushī, author of a treatise on astronomical instruments, part of which has been translated by Sédillot, and Ahmad Ibn al Bannāʾ, to whom we owe several works on arithmetic, geometry, algebra, astronomy, astrology and alchemy

At the end of the XIXth century, the reign of Mawlāī al Hasan was marked by a kind of renaissance in Muslim studies in Morocco, particularly characterised by the need which writers felt of getting their works printed to make them more widely known The lithographic presses of Fās acquired a certain importance at this time and began to publish texts which had hitherto circulated only in manuscript A little later, there appeared at Fās the three volumes of the *Salwat al Anfās* of Ahmad b Djaʿfar al-Kattānī [q v], an excellent biographical dictionary of the celebrities of the northern capital At the same time, there was published in Cairo the great Moroccan history of Ahmad b Khālid al-Nāsirī al-Salawī [q v] entitled *Kitāb al-Istiksā li Akhbār Duwal al-Maghrib al-aksā*

The establishment of the French protectorate in Morocco and the remarkable spread of French civilisation in the large towns have already profoundly modified the intellectual ideals of the younger generation in Morocco It is however still too early to foretell the orientation that Arabic literature will take in this country in the years to come

MORÓN, Arab MAWZŪR, a little town in the south of Spain, on the right bank of the Guadaira and at the foot of the Sierra de Morón to the S W of Cordova and S E of Seville It was in the Muslim period the capital of a *kūra*

or district and an agricultural centre with numerous olive groves At the beginning of the tenth century, it was one of the centres of resistance of the famous rebel ʿUmar b Hafsūn, its citadel was taken by the troops of ʿAbd al Rahmān III in 311 (923) In the next century during the period of the petty kingdoms of the *reyes taifas*, Moión was the capital of a little Berber dynasty, the Banū Dammar, Abādīs from the region of Gabes in Tunisia The first member of the dynasty to declare his independence in 433 (1041) was Muhammad b Nūh, his father Nūh b Abī Tarīd had lived at Morón from 1013 without actually recognising the government of Cordova Muhammad b Nūh soon excited the jealousy of the ʿAbbādid of Seville al-Muʿtadid who made an attempt on his life He died in 449 (1057) His son Manād ʿImād al Dawla, who succeeded him, was soon besieged in Morón by al Muʿtadid and in return for life and liberty surrendered the town in 458 (1066) Moión and its territory were annexed to the kingdom of Seville and henceforth shared the fate of the capital

MOROS [See Moors]

MOSTAGANEM (Mustaghānim), a coast town in Algeria, eight miles E of the mouth of the Shelif (5′ E long [Greenwich]) does not occupy the site of any known ancient town There is no natural harbour here, two capes, not particularly well marked (Kharuba and Salamander), leave vessels without protection against winds from the north and west It is therefore not as a port that al-Bakrī (xiᵗʰ century) mentions Mostaganem for the first time He describes it as a town situated "not far from the sea" (it is less than a mile away) living on the produce of its rich territory, notably the cotton plantations From this time onwards it was surrounded by a wall which strengthened its natural defences The old town occupies a triangular plateau formed by the sharp bend of the ʿAin Sefra and the wall runs along the top of the ravine On the point of this natural stronghold, the Almoravid Yūsuf b Tāshfīn is said to have built in 1082 a fortress which was later called Burdj al-Mahāl, from the name of one of the tribes of the neighbourhood, and is now a prison Like the other towns of the coast, Nedroma or Algiers, Mostaganem was probably given a small Almoravid garrison Thus strengthened, the town would serve as a place of refuge against an attack from the sea and one could keep at a distance the Berber tribes of the hinterland, who belonged for the most part to the Maghrāwa confederation It must thus have developed to some extent In the middle of the xiiᵗʰ century, Idrīsī tells us that it had bazaars and baths, he emphasises the abundance of the water which irrigated the gardens and orchards and drove mills

The name of Mostaganem does not figure in history throughout all this period when the Almohads in theory held the central Maghrib The decline of the Almohads enabled the Maghrāwa to become completely masters of the country In 1267 and 1271 the Zaiyānid sultān of Tlemsen Yaghmorāsān reduced these turbulent tribes and incorporated their lands in the empire which he had founded In 680 (1281) he entrusted the government of Mostaganem to one of his cousins, al-Zāʾim b Yahyā, a descendant of one of the collateral branches of the family of the Banū Zaiyan, in spite of the lack of confidence he had in those relatives whom he had deprived of the throne These fears proved well founded Al-Zāʾim, having roused the Maghrāwa to rebel, declared himself independent Yaghmorāsān had to march on Mostaganem, he blockaded the town strictly and the rebel surrendered after obtaining permission to cross to Spain

Like all the coast region, Mostaganem in 735 or 736 (1335—1336) passed to the Merīnid Abu 'l-Hasan, who was engaged in the siege of Tlemsen In 742 (1340) the victorious sultān built a mosque in Mostaganem We have an inscription attesting this foundation of the interregnum of the Moroccan princes Regained by the sultāns of Tlemsen, the town suffered disastrously from their weakness The Sowaid Arabs of the great Zoghba confederation became undisputed masters of the whole district Mostaganem led a precarious existence Leo Africanus at the beginning of the xviᵗʰ century says that it occupied only a third of its former area He credits it with 1,500 hearths, however, tells us of the weavers and of the roadstead to which ships from Europe came He says the river runs "through the city", which shows that in addition to the old stronghold on the left bank there were now quarters on the right bank In the Turkish period we know of two suburbs Tidjīt (the New) and Matmor (the Silo) In 1516 Khair al-Dīn [q v] considerably strengthened its defences Shaw at the beginning of the xviiiᵗʰ century speaks of the citadel (the Fort of the East ?) which, built on a height, commanded the town and vicinity In 1830 the garrison consisted of some hundreds of Turks and Kuloghlis The French took them into their service and put them under the command of the Kāʾid Ibrāhīm Distrusting the loyalty of the latter and thinking he had an agreement with the Medjāher, an unsubdued tribe of the neighbourhood, General Desmichels occupied the town in 1833 The troops whom he stationed there were attacked by ʿAbd al Kādir The vexatious results of the treaty signed by Desmichels with the Emīr forced Clauzel to retake Mostaganem (1835) Under Bugeaud, Mostaganem became the point of disembarkation and the centre of operations against ʿAbd al Kādir It was there that in 1847 the first battalion of Algerian Tirailleurs (Turcos) was raised, and the town has since been an important centre for recruiting native troops

Mostaganem has developed considerably since the early days of the French occupation, it has now over 27,000 inhabitants Its harbour, which owes nothing to nature, has been improved by two jetties which still afford only a rather mediocre shelter to shipping

MOSTAR, the capital of the Herzegovina in the kingdom of Jugoslavia, one hundred miles S W of Sarayevo, on the Sarayevo–(Mostar–) Dubrovnik railway By the new (Oct 3, 1929) division of Jugoslavia into nine banats, Mostar passed to the coast banat, the capital of which is Split (Spalato) The picturesque town lies two hundred feet above sea-level on both banks of the Neretva (Narenta) between the slopes of the Podvelež and the Hum The old quarters of the town (Konak, Čarshya etc) are in the east, the new in the west In 1929, the number of inhabitants was 18,038 (in 1921 a little more 18,176) Mostar covers an area of 16 square kilometres, has 2,916 houses, 33 mosques, 2 Serbian Orthodox and one Roman Catholic church Mostar has a district muftī and a sharī'at judge (*kādī*) Its trade is considerable as is its production of fruit, wine and tobacco The climate is warm and windy

In the time of the Roman empire, there was a colony in the plain of Mostar, which was destroyed during the period of migrations In the centuries following, the immigrant Slavs conquered the Zahumlye district with its capital Blagay (near the modern Mostar) According to the Dalmatian writers Orbini and Luccari (both at the beginning of the xviith century), the new town of Mostar was founded in 1440 by Radivoy Gost, a vassal of Stefan Vukčic Kosača, afterwards Duke of St Sava In historical documents the earliest mention is in 1452 of the two forts on the Neretva bridge (*do castelli al ponte de Neretua*), the name of the town itself is not found till 1499

It was only after the Turkish conquest of the Herzegovina (1483, cf v Hammer, *G O R* ², 1 628), which resulted in the decline of Blagay that the new settlement began to develop rapidly, first as an important strategic point in the Neretva valley, then as a prosperous commercial town in addition Since it grew up around a wooden bridge, it was called simply *Most* (bridge), *Mostici* or *Mostar*, properly *Mostari* (plur, "the bridgers") This "place of the bridge" was by 1522 the residence of the Turkish sandjakbeg of the Herzegovina, who had previously lived in Foča According to Hādjdjī Khalīfa, the crossing of the Neretva was exceedingly dangerous the wooden bridge, being on chains, had no piers and swung so that "one only crossed it in fear of death" The inhabitants therefore petitioned Sultān Sulaimān to have a stone one built in its place The architect sent by the Sultān, the celebrated Sinān [q v], is said to have declared it impossible to build a bridge at this spot, whereupon a local architect built the fine bridge which crosses the river in a single bold arch, thirty yards in length and sixty feet high This is said to have been done in 974 (1566—1567) The two Turkish chronograms given by Ewliyā Čelebī قدرت كمرى and ال كحدكى كوبرى دن كچرر سلام actually give this date This bridge not only gave Mostar its name but formed its chief sight, as it still is The French traveller A Poullet in 1658 says that its "*fabrique est plus hardie, sans comparaison, & des plus d'etendue que n'est pas celle de Realte à Venise, quoy qu'elle y sort estimee vne merueille*" (cf *Glasnik zemaljskog muzeja u Bosni i Hercegovini* (hereafter quoted as *Gl z m*), xx [1908], 49) A modern traveller regards the old bridge at Mostar as the finest in the whole world (R Michel, *Fahrten in den Reichslanden Bilder und Skizzen aus B und der H* [Vienna and Leipzig, 1912], p 31) In his earlier book on Mostar he describes this bridge as a "crescent in stone" The building of the bridge was often ascribed to the Romans and indeed its foundations perhaps date from them but the modern bridge undoubtedly dates from the Turkish period and "is the work of Dalmatio-Italian architects" (J de Asboth, *An official tour through Bosnia and Herzegovina* [London 1890], p 257)

Ewliyā Čelebī visited Mostar in 1075 (1664—1665) and gives in his diary a number of details about the town, e g that it has fifty-three *mahallas*, three thousand and forty solidly built houses of stone, three hundred and fifty shops and forty-five mosques Of the latter he mentions eight by name 1 Old mosque in the Čarshya, built in 878 (1473), 2 Hādjdjī Mehmedbeg mosque, built in 965 (1557), 3 Masdjid of Hādjdjī 'Alīāghā in the Čarshya, built in 1016 (1607), 4 Defterdār-pasha mosque, built in 1017 (1608), 5 Koskī (قوصقى) Mehmedpasha mosque, built in 1027 (1617), 6 Ibrāhīmāghā, built in 1044 (1634), 7 Rūznāmedjī Ibrāhim-Efendi-mosque and 8 Hādjdjī 'Alī mosque For the two latter mosques neither the chronogram nor the year of building is given The finest and largest of all is the mosque of Hādjdjī Mehmed Bey, which is usually called "Karagyozbegova džamiya" The monograph, quoted below, by Peez gives the names of twenty seven mosques and twenty-six vakufs (*wakf*) and in each case he mentions whether their foundation records are preserved or not

It the course of the xviith and xviiith century Mostar was several times threatened by Venetian troops (1652, 1693, 1717) At a late date (1763), the Herzegovina was incorporated in the wilāyet of Bosnia and Mostar was only the residence of the musellim This lasted till 1832, when the land was again made a wilāyet and Mostar became the headquarters of the newly appointed Herzegovinian wazīr 'Alī Pasha Rizvanbegovic

During the Turkish period Mostar produced a number of men of note in Turkish and Muslim literature and learning Of poets we may note 1 Diyā'ī (d 972 = 1564), 2 Derwīsh Pasha (Bayezidagić, 1599 and in 1601 governor of Bosnia), 3 his son Ahmedbeg Sabūhī and 4 Ahmed Rushdī (born 1047 = 1637) The following learned men were natives of Mostar 1 'Alī Dede b Mustafā (d 1007 = 1598), 2 Mustafā Aiyūbīzāde, called Sheyuyo (d 1119 = 1707), Muftī of Mostar, commentator of various works, 3 Ahmed Efendi Mostārī (Mostarac, d 1190 = 1776), whose fetwās (*Fetāwā-i Ahmed*) were very popular in Bosnia, and 4 Mustafā Ṣidkī (Karabeg), Muftī of Mostar (murdered

in 1878), whose comprehensive *Ḥāshiya ʿalā Mirʾāt al-Uṣūl* was printed in Sarajevo (1316)

A few days after the murder of the last-named, Mostar was taken without resistance by the Austrian troops (Aug 5, 1878) and on Oct 5, 1908, annexed to the Danube monarchy, in which it remained till 1918 During these forty years (1878–1918) Mostar was frequently the centre of Muslim (and of Serbian Orthodox) opposition to the government In Mostar originated also the Muslim agitation for autonomy in religious affairs (cf 1, p 760), which went on for ten years (1899—1909) The leader of the movement, ʿAlī Fehmī Džabić, the then muftī of Mostar, had to escape to Constantinople at the end of January 1902, where he was appointed professor of Arabic literature in the University, in which capacity he published among other things his book *Husn al-Ṣaḥāba fī Sharḥ Asḥʿār al Ṣaḥāba* (Constantinople 1324) In connection with the struggle for religious autonomy, there was published (from 1906) the Muslim political paper *Musāwāt* (in spite of its Arabic title written in the Serbo Croat language) Shortly before the World War, a Muslim family paper *Biser* ("Pearl") (from 1912) was started in Mostar and a *Muslimanska biblioteka* (Muslim Library) which attained thirty volumes

Since the dissolution of the Austro-Hungarian Monarchy in 1918, Mostar has belonged to Jugoslavia

MŌṢUL (AL-MAWṢIL), the capital of Diyār-Rabīʿa [q v] on the west bank of the Tigris, opposite the ancient Niniveh

Whether the town already existed in antiquity is unknown E Herzfeld (*Archäol Reise*, ii 207, 259) has suggested that Xenophon's Μέσπιλα reproduces its old name and that we should read *Μέσπιλα (= *Mawṣil*), but against this view we have the simple fact that this town lay on the east bank of the Tigris (F H Weissbach in Pauly Wissowa, *R E*, xv, col 1164)

The Muslims placed the foundation of the town in mythical antiquity and ascribed it to Rēwand b Bēwarāsp Adjdahāk According to another tradition, its earlier name was Khawlān The Persian satrap of Mōsul bore the title Būdh-Ardashīrānshāh, so that the official name of the town was Būdh-Ardashīr (Le Strange, *Eastern Caliphate*, p 87, Herzfeld, *op cit*, p 208) Lastly Bar Bahlūl says that an old Persian king gave it the name Bih-Hormez-Kowādh (G Hoffmann, *Auszuge aus syr Akten pers Martyr*, p 178)

As the metropolis of the diocese of Āthūr, Mōsul took the place of Nineveh whither Christianity had penetrated by the beginning of the second century A D Rabban Īshōʿ-yahbh called Bar Kūsrā about 570 A D founded on the west bank of the Tigris opposite Nineveh a monastery (still called Mār Īshʿyā) around which Khusraw II built many buildings This settlement is probably the fortress mentioned in the Syriac chronicle edited by Guidi as Hesnā ʿEbhrāyā (according to Herzfeld, "citadel on the opposite bank") (Noldeke, *S B Ak Wien*, cxxviii, fasc ix, 1893, p 20, Sachau, *Chronik von Arbela*, chap iv, p 48, 1, Herzfeld, *op cit*, p 208) which later was developed into a town by the Arabs (*Chronicle of Seʿert*, at the end)

After the taking of Nineveh by ʿUtba b Farkad (20 = 641) in the reign of ʿOmar b al-Khattāb, the Arabs crossed the Tigris whereupon the garrison of the fortress on the west bank surrendered on promising to pay the poll-tax and obtained permission to go where they pleased Under the same caliph, ʿUtba was dismissed from his post as commander of Mōsul and Harthama b ʿArfadja al Bārikī succeeded him The latter settled Arabs in houses of their own, then allotted them lands and made Mōsul a camp city (*miṣr*) in which he also built a Friday Mosque (al Balādhurī, ed de Goeje, p 332) According to al-Wākidī, ʿAbd al-Malik (65—86) appointed his son Saʿīd as governor of al Mawṣil while he put his brother Muhammad over Armīniya and al-Djazīra According to al-Muʿāfa b Tāʾūs on the other hand, Muhammad was also governor of Ādharbāidjān und al-Mawṣil, and his chief of police Ibn Ṭalīd paved the town and built a wall round it (al-Balādhurī, *op cit*) His son Marwān II is also described as a builder and extender of the town, he is said to have organized its administration and built roads, walls and a bridge of boats over the Tigris (Ibn Fakīh, ed de Goeje, p 128, Yākūt, *Muʿdjam*, ed Wustenfeld, iv 682—684) The foundation of a Friday Mosque was also ascribed to him Mōsul became under him the capital of the province of al-Djazīra

After Mutawakkil's death the Khāridjī Musāwir seized a part of the territory of Mōsul and made al Hadītha his headquarters The then governor of Mōsul, the Khuzayī ʿAkaba b Muhammad, was deposed by the Taghlibī Aiyūb b Ahmad who put his own son Hasan in his place Soon afterwards the ʿAzdī ʿAbd Allāh b Sulaimān became the governor of al-Mawṣil The Khāridjīs took the town from him and Musāwir entered into possession of it Muʿtamid appointed the Turkish general Asātagīn governor of the town, but in Djumādā I 259 the latter sent his son Azkūtagīn there as his

deputy The latter was soon driven out by the citizens of the town who chose Yahyā b Sulaimān as their ruler

Haitham b ʿAbd Allāh whom Asātagīn then sent to Mōsul had to return after achieving nothing The Taghlibī Ishāḳ b Aiyūb whom Asātagīn sent with 20,000 men against Mōsul, among whom was Hamdān b Hamdūn, entered Mōsul after winning a battle, but was soon driven out again

In 261 the Taghlibī Khidar b Ahmad and in 267 Ishāk b Kundādj was appointed governor of Mōsul by Muʿtamid A year after Ishāḳ's death, his son Muhammad sent Hārūn b Sulaimān to Mōsul (279), when he was driven out by the inhabitants he asked the Banū Shaibān for assistance and they besieged the town with him The inhabitants led by Hārūn b ʿAbd Allāh and Hamdān b Hamdūn after an initial victory were surprised and defeated by the Shaibānis, shortly afterwards Muhammad b Ishāk was deposed by the Kurd ʿAlī b Dāwūd

When Muʿtadid became caliph in 279, Hamdān (the grandfather of Saif al-Dawla) managed to make himself very popular with him at first, but in 282 he rebelled in Mōsul When an army was sent by the caliph against him under Wasīf and Nasi, he escaped while his son Husain surrendered The citadel of Mōsul was stormed and destroyed and Hamdān soon afterwards was captured and thrown into prison Nasr was then ordered to collect tribute in Mōsul and thus came into conflict with the followers of the Khārid̲jī Hārūn, Hārūn was defeated and fled into the desert In place of Tuk tamīr, who was imprisoned, the Caliph appointed Hasan b ʿAlī governor of Mōsul and sent against Hārūn, the main cause of the strife, the Hamdānid Husain who took him prisoner in 283 The family thus regained the caliph's favour

When after the subjection of the Khārid̲jīs, raiding Kurds began to disturb the country round Mōsul, Muktafī again gave a Hamdānid, namely Husain's brother Abu 'l Haid̲jāʾ ʿAbd Allāh, the task of bringing them to book, as the latter could rely on the assistance of the Taghlibīs settled around Mōsul, to whom the Hamdānids belonged Abu 'l-Haid̲jāʾ came to Mōsul in the beginning of Muharram 293 and in the following year subdued the Kurds whose leader Muhammad b Bilāl submitted and came to live in Mōsul

From this time the Hamdānids [q v] ruled Mōsul, first as governors for the caliph, then from 317 (Nāsir al-Dawla Hasan) as sovereign rulers

The ʿUkailids who followed them (386—489) belonged to the tribe of the Banū Kaʿb Their kingdom, founded by Husām al Dawla al-Mukallad, whose independence was recognised by the Būyids, extended as far as Tāʾūk (Dakūkā), al-Madāʾin and Kūfa In 489 (1095—1096) Mōsul passed to the Saldj̲ūks

The town developed considerably under the Atābeg ʿImād al-Dīn Zangī who put an end to Saldj̲ūḳ rule in 521 (1127—1128) Mōsul, which was for the most part in ruins was given splendid buildings by him, the fortifications were restored and flourishing gardens surrounded the town Under one of his successors, ʿIzz al-Dīn Masʿūd I, Mōsul was twice unsuccessfully besieged by Saladin (1182 and 1185 A D), after the conclusion of peace ʿIzz al Dīn however found himself forced to recognise Saladin as his suzerain

The town was at this time defended by a strong citadel and a double wall, the towers of which were washed on the east side by the Tigris To the south lay a great suburb, laid out by the vizier Mud̲jāhid al Dīn Kāʾimāz (d 595) From 607 his son Badr al-Dīn Luʾlu' [q v] ruled over Mōsul first as vizier of the last Zangids and from 631 as an independent ruler In 642 he submitted to Hūlāgū and accompanied him on his campaigns, so that Mōsul was spared the usual sacking When however his son Malik Sālih Ismāʿīl joined Baibars against the Mongols the town was plundered in 660 (1261—1262), the ruler himself fell in battle (van Berchem, *Festschrift f Th Noldeke*, 1906, p 197 *sqq*)

The Mongol dynasty of the Djalāʾir succeeded the Ilkhāns in Baghdād and Sultān Shaikh Uwais in 766 (1364—1365) incorporated Mōsul in his kingdom The world conqueror Timūr not only spared Mōsul but gave rich endowments to the tombs of Nabī Yūnus and Nabī Djirdjis, to which he made a pilgrimage, and restored the bridge of boats between Mōsul and these holy places

The Turkoman dynasty of the Aḳ Koyūnlū whose founder Bahāʾ al Dīn Karā ʿOthmān had been appointed governor of Diyār Bakr by Timūr, was followed about 920 (1514—1515) by the Persian Safawids After long fighting the Ottomans in 1047 (1637—1638) finally took the town from them In 1077 (1667) it was visited by a serious earthquake, in 1156 (1743) besieged by Nādir Shāh Afshār and heroically defended by Christians and Muslims It was then under a Pasha of the local family of the ʿAbd al-Djalīl who had ruled the town for a long period, fairly independent of the Porte In the XIXth century Mōsul was an unimportant provincial town of the Turkish empire After the World War the wilāyet of Mōsul after long negotiations was placed in the mandated territory of ʿIrāk The town has now about 70—90,000 inhabitants

The Arab geographers compare its plan to a headcloth (*tailasān*), i e to an elongated rectangle Ibn Hawkal who visited Mōsul in 358 (968–969), describes it as a beautiful town with fertile surroundings The population in his time consisted mainly of Kurds According to al Makdisī (c 375 = 985—686), the town was very beautifully built Its plan was in the form of a semi circle The citadel was called *al-Murabbaʿa* and stood where the Nahr Zubaida canal joined the Tigris (now Ičkalʿa or Bāsh Tābiya?, cf Herzfeld, *op cit*, p 209) Within its walls were a Wednesday market (*Sūḳ al-Arbaʿāʾ*) after which it was sometimes called The Friday Mosque built by Marwān stood on an eminence not far from the Tigris to which steps led up The streets in the market were for the most part roofed over Al-Makdisi (*op cit*, p 136) gives the eight main streets of the town (discussed in Herzfeld, *op cit*, p 209) The castle of the caliph (*Kasr al-Khalifa*) stood on the east bank, half a mile from the town and commanded Niniveh, in the time of al Makdisī it was already in ruins, through which the Nahr al-Khawsar flowed

Ibn Djubair visited Mōsul on 22nd–26th Safar 580 (June 4—8, 1184) Shortly before, Nūr al Dīn had built a new Friday Mosque on the market-place At the highest point in the town was the citadel (now Bāsh Tābiya), it was known as *al-Hadbāʾ* "the hunch-backed" and perhaps as the synonymous *al-Dafaʾā* (G Hoffmann, *Auszuge aus*

syr Akten pers Märtyr, p 178 *sq*, E Herzfeld, *op cit*, p 210), and according to al Kazwīnī was surrounded by a deep ditch and high walls The city walls which had strong towers ran down to the river and along its bank A broad highway (*shārī*ᶜ) connected the upper and lower towns (the north-south road called *Darb Dair al-Aᶜlā*ʾ) In front of the walls suburbs stretched into the distance with many smaller mosques, inns and baths The hospital (*māristān*) was celebrated and the great covered market (*kaisarīya*)

Most houses in Mōsul were built of tufa or marble (from the Djebel Maklūb east of the town) and had domed roofs (Yākūt, *op cit*) Later Mōsul was given a third Friday Mosque which commanded the Tigris and was perhaps the building admired by Hamd Allāh al Mustawfī (c 740 A H)

The site of the ancient Nineveh (Arabic *Ninawai*) was in al Makdisī's time called Tall al-Tawba and was said to be the place where the prophet Yūnis stayed when he wished to convert the people of Nineveh There was a mosque there around which the Hamdānid Nāsir al Dawla built hostels for pilgrims Half a mile away was the healing spring of ᶜAin Yūnis with a mosque beside it, perhaps also the Shadjarat al-Yaktīn, said to be planted by the Prophet himself The tomb of Nabī Djirdjīs, who according to Muslim legend had suffered martyrdom in Mōsul (cf 1, p 1046 *sq*), was in the east town, also that of Nabī Shith (Seth, cf Herzfeld, *op cit*, p 206 *sq*)

Mōsul takes its name from the fact that a number of arms of the river there combine to form a single stream The town lies close beside the Tigris on a spur of the western steppe-plateau which juts out into the alluvial plain of the river Close beside its walls are quarries in which the plaster for the buildings and for the mortar is obtained The site of the town, almost three square kilometres in area enclosed by the already mentioned wall and the Tigris, slopes from the old fortress gradually to the south To the southeast stretch, as in the middle ages, the suburbs surrounded by fertile plains A little above the spot where the wall joins the river on the south-east is the bridge of boats All the old buildings and even the court of the Great Mosque lie, according to E Herzfeld's investigations, below the level of the streets in which the accumulation of mounds of debris from houses is a result of a thousand years of continuous occupation

MOZARABS, the name given in the middle ages to those Christians who lived in districts under Muslim rule and bore the stamp of Spanish Moorish culture The word comes from the Arabic *mustaᶜrib*, the meaning of which is exactly that of the Spanish *mozárabe*, the Arabic form itself is found in documents in the archives of mediaeval Spain

We know that in principle at the time of conquest the new subjects of the Muslim conquerors could either adopt Islām or continue to profess their own faith, in the latter case falling into the category of tributaries (*dhimmī*, q v) The early Arab rulers of Spain showed considerable tolerance in this connection and the treaties of capitulation were definite on this point, at least if we may judge by one of them of which the text has been preserved and which was concluded between the Visigoth Theodemir, lord of the district of Murcia [q v], and ᶜAbd al-ᶜAzīz b Mūsā b Nusair This attitude of Spanish Islām to the Christians hardly altered in the centuries following until the coming of the Almoravids and Almohads It is true there were occasional anti-Christian reactions under the first Umayads which found vent in persecution But these persecutions seem to have been dictated by political considerations rather than by the fanaticism of individual rulers The Christian communities of the large towns were the most active nurseries of the nationalist movements which broke out in Spain mainly in the ninth century Among the most important we may mention that led by the Mozarab ᶜOmar b Hafsūn [q v], which passed far beyond the limits of a purely religious movement At Cordova in particular a few illuminati had to be sent to the scaffold because they insulted the religion of the Prophet The Muslim judges seem to have sentenced them to the supreme penalty with considerable reluctance and the central authorities took the initiative in summoning a council, so that the church itself put a stop to the demonstrations of certain mystics like Eulogio and Alvaro

In any case in the tenth century the Mozarabs of the caliphate were living in harmony with all classes of Muslim society and were themselves considerably influenced by Arab culture They spoke Arabic, just as the Muslims spoke the Romance language, and were acquainted with Islāmic literature The reciprocal influences were therefore considerable and were to continue so till the end of the middle ages

As regards administration, the Christian communities of Muslim Spain under the Umayads were under the direct authority of officials chosen by themselves from their own number and appointed with the approval of the Muslim authorities Their head, who is sometimes given the Latin title of *defensor* or *protector*, was most frequently called Count (*Comes*, Sp *Conde*, Ar *kūmis*) The taxes which the Christians had to pay were collected by an agent called *exceptor* To settle their differences they had a special judge (Ar *kādī ʾl-naṣārā* or *kādī ʾlᶜadjam*, Lat *censor*) who administered the Visigothic code (*Liber Judicum*, later the *Fuero Juzgo*)

The Christian communities of Cordova and Seville were among the most important but were less important than that of Toledo, which was during the caliphate the residence of the metropolitan (*maṭrān*) of Spain The clergy were under bishops (*uskuf*) Public worship was celebrated

in the churches, there were monasteries (*dair*) with monks (*rāhib*) in the neighbourhood of the larger towns for example that of Armilāt (Guadimellato) near Cordova

The history of the Mozarabs of Spain is of course closely connected with the political history of Islām in Spain and with the "reconquista" But its development is mainly interesting as throwing light on the peculiar culture of Moorish Spain which remained alive even after the fall of Muslim power The recent publication of a considerable number of documents from the archives of the cathedral of Toledo mainly of the xiith and xiiith centuries enables us to estimate how great was the arabicisation of all classes in reconquered Spain, which we find influencing civil, military and economic institutions and even ecclesiastical ritual (Mozarab rite) It is similarly to the Mozarab communities and their representatives who went to the north of the Peninsula that we must attribute the origin of a special art, Mozarab art, directly derived from Cordovan art and characterized by almost regular use of the horse-shoe arch and the vault

Bibliography The fundamental work, although sometimes slightly tendencious, is that of F J Simonet, *Historia de los Mozárabes de España*, Madrid 1903 We must also give a high place to the notable work of A González Palencia, *Los Mozárabes de Toledo en los siglos XII y XIII*, 4 volumes, Madrid 1926—30 Cf also R Chábas, *Los Mozarabes de Valencia*, Valence 1891, R Dozy, *Histoire des Musulmans d'Espagne*, 2nd ed, Leyden 1931 (principally book II), M Gómez Moreno, *Iglesias mozárabes, arte español de los siglos IX—XI*, Madrid 1919, A Gonzalez Palencia, *Historia de la España musulmana*, Barcelona 1925, E Lévi Provençal, *L'Espagne musulmane du Xème siecle, Institutions et vie sociale*, Paris 1932, p 31—37, R Menendez Pidal, *La España del Cid*, Madrid 1929, p 98 *sqq*, F Pons Boigues, *Apuntes sobre las escrituras mozarabes toledanas*, Madrid 1897, E Saavedra, *La mujer mozarabe*, Madrid 1904

MSHATTĀ, a ruined palace in Transjordania

Description of the building The ruins of al-Mshattā (the winter camp) lie east of the Jordan about 130 miles south of Damascus and 25 east of the northern shore of the Dead Sea, near the Darb al-Hadjdj, the pilgrims' road from Damascus to Medīna and Mecca It consists of a rectangular outer wall, defended by towers at the corners, each side being 157 yards long The entrance gateway is in the centre of the south side and is flanked by two pentagonal half-towers rising out of an octagonal base, across which runs as far as the next round towers the long frieze 16 feet high and over 45 yards long, which has for the most part been taken to Berlin and which made Mshattā a world-famous monument of early Muslim architecture and decorative art and a much discussed centre of interest in Oriental archaeology The building of the whole area within the wall was planned in three sections of which however only the central one was carried through, at least in part This again is divided into three parts the entrance area, the central rectangular open court and the royal residence The plan by B Schulz (cf *Jahrbuch d preuss Kunstsammlungen*, vol xxv, 1904) shows a gateway and an entrance hall, both of which were intended to be vaulted, and a series of surrounding rooms, of which the oblong room to the right of the entrance has been said by Herzfeld and others to be a mosque because it has a niche in it which is taken to be a mihrāb Only the foundations of the walls of this part however are still standing In the large quadrangular court on the western side is a waterbasin built of brick and traces of a second one mentioned by Tristram on the opposite side, so that Schulz thought there were originally intended to be four for the sake of symmetry The palace consists of a great hall with three aisles, a domed chamber and the living rooms at the sides The walls are about five feet high, of blocks of limestone and above that of brick (21 × 21 and 27 × 27, 65 cm thick) The rooms at the sides to the left and right of the great hall with its three aisles, are all barrel-vaulted, the smaller vaultings still exist and, like the relieving arches of the doors, are remarkable for their pointed arches Schulz was able with certainty to reconstruct the façade which had fallen and was still lying on the ground It consisted of three round arches on pillars corresponding to the three aisles The hall was divided into three sections by pillars of which a few shafts and a Corinthian capital with painting and remains of gilding have been found Holes and gutters at the bases and on the shafts suggested to Schulz that the columns had originally been taken from another building and used again here The horizontal termination of the façade also shows that this hall was intended to have a flat, and not a basilical roof, or actually had one To give it its height the two supporting rows of pillars had a second story of pillars placed upon them, an arrangement usual in Syrian architecture also The quadrangular hall of audience and ceremonial, entered from the oblong hall by a second door, was covered by a dome and three half domes of brick, all of which have collapsed Dovetailing on the inside of the surrounding wall shows that it was intended to build on to the sides of the palace dwellings for soldiers and other retainers On the evidence of these projections from the wall, Schulz has prepared his reconstruction of the plan of these wings The quadrangular surrounding walls with the round towers had barely been half built when the half-finished work was stopped The principal motive of the great frieze at the part of the wall containing the main gateway is a zigzag pattern in high relief which forms 44 half triangles These triangular areas are, wherever the frieze was finished, thickly covered with tendrils in low relief In the centres of the pairs of interlocking perpendicular and suspended triangles, bosses are set in high relief decorated with acanthus rosettes The socket of the frieze is in the form of a modified Attic base consisting of a plinth and two toruses The border which frames the frieze at the sides and above consists of a leaf kyma at the foot and a second larger crowning it According to Schulz's photograph, before the frieze was removed, the half left of the door up to the main border was finished but the right half only up to half height the of the frieze

The patterns of foliage in the fields of the triangles show great variety Here we follow the scheme of the official publication in the *Jahrb*

d preuss Kunstsammlungen, xxv (1904), pl viii The triangles A and B have within circles vines with birds picking grapes, in the apex of triangle A there is also a Chinese fabulous animal with a human head such as was very popular in Chinese sepulchral plastic art In C the circles are interlaced and lotus flowers appear in addition to the vine-tendrils In D—I the vines which are here more realistic grow out of vases which are flanked by lions and winged griffins, buffaloes, panthers, lynxes and gazelles also relieve the foliage In triangle J the tendrils grow straight out of the ground, this area also has the remarkable addition of men picking the grapes Triangle I is the first right of the door and is the last to contain animals The areas of the triangles of the right half show a quite different style M—T have, it is true, still vines but of the greatest, lace-like delicacy and closeness of pattern which varies from triangle to triangle U and V lastly are filled with palm-leaves and cone-shaped figures instead of vines and crowned with spirals
