RANUNCULA'CEÆ (Ranunculus, one of the genera [illegible] unknown in hot countries, except at considerable elevations They are of great importance, in consequence of their usually poisonous qualities, as evinced by aconite and hellebore in particular, which are the roots of several species Some of them are objects of beauty, as the larkspurs, ranunculus, anemone, and pæony A few are simply astringent, as the coptis or gold thread of North America The plants of this order are readily known by having an indefinite number of stamens separate carpels, exstipulate [illegible] an [illegible]

RANZ DES VACHES (Germ Kuhreigen) The name of the simple and beautiful melody which the Swiss herdsmen are in the habit of playing on the Alpine horn, and sometimes of singing, when they drive out their herds to the mountains It consists of a few simple intervals, and has a beautiful effect in the echoes of the Swiss mountains The natives regard it almost with rapture, and are said to be seized with irrepressible longings to return to their native country when they hear it played in a foreign land

RAPE (Lat raptus) [illegible] well known and detestable [illegible] women This offence has been most properly viewed by all legislators as one of the gravest character, and has been usually visited with the highest penalties The accusation of rape, it is true, is one that may be easily made, and is, no doubt, sometimes preferred in cases where consent has been given The proof, therefore, should be clear in proportion to the enormity of the crime, but when proved it is one that should very rarely indeed escape the utmost vengeance of the law Capital punishment for this offence was abolished in 1841

RAPE An Anglo-Saxon territorial division, of which the etymology is uncertain Sussex is the only county divided into rapes, each containing three or four hundred These subsisted as military divisions at the time when Domesday Book was compiled They were formerly under the superintendence of 'rasse reeves," subordinate to the sheriff of the county

RAPE A plant belonging to the [illegible] (*Brassica rapa* Linn) cultivated in [illegible], which are crushed for oil, and sometimes for its leaves, which are fed off by sheep In Belgium another species or variety of Brassica is cultivated for these purposes, called *colza*, the *Brassica oleifera* of De Candolle

RAPHE (Gr ραφη *a suture*) In Botany the vascular cord communicating between the nucleus of an ovule and the placenta when the base of the former is removed from the base of the ovulum

RAPHE In Anatomy a term applied to parts which look as if they had been sewed or joined together

RA'PHIDES (Gr ραφις) Certain needle-like transparent bodies found lying in the tissue of plants They were formerly thought to be peculiar organs, but are now known to be the crystals of various salts

RAPIO'RES (Lat raptor, *a robber*) Rapacious birds or raveners The name of the order of birds called *Accipitres* by Linnæus and Cuvier, including those which live by rapine and are characterized by a strong, curved, sharp edged, and sharp pointed beak, and robust short legs with three toes before and one behind, armed with long strong crooked talons

RAREFACTION In Physics, an augmentation of the intervals between the particles of matter, whereby the same number of particles occupy a larger space The term is chiefly used in speaking of the aeriform fluids, the terms *dilatation* [illegible] in speaking of solids and liquids Rarefaction is caused by diminishing the pressure, and hence the air becomes rarefied at elevations above the general level The limits to which rarefaction may be carried are not known, but it has been proved by experiments with the air-pump, that air may be rarefied so as to occupy a volume 13 000 times greater than it occupies under the ordinary pressure

RASKO'LNIKS (Russ raskolo, *a division*) The name of the [illegible] and most important body of dissenters from the Greek church in the Russian dominions They designate themselves Starowerzi, or *the Orthodox*, but differ from the Greek church only in the outward forms of religion and in maintaining a more strict ecclesiastical discipline This body was formerly subjected to persecution, but it is now treated with comparative toleration, though its members are still excluded from the service of the state Their number is said to be about [illegible]

RASORES (Lat rado, *I scratch*) Gallinaceous birds, or scratchers The name of an order of birds, including those which have strong feet, provided with obtuse claws for scratching up grains, &c and the upper mandible vaulted, with the nostrils pierced in a mem-

branous space at its base, and covered by a cartilaginous scale *See* GALLINACEÆ

RAT The name of a large destructive and very prolific species of the genus *Mus* (*Mus decumanus* Linn) Introduced into the British Islands from Asia, not, as is commonly believed, from Norway It has spread over all [illegible] ie expense of the old Bri [illegible] rat" (*Mus rattus*, Linn) *See* MUS

RA'TCHET, in Clock and Watch Work, is the name given to an arm or [illegible] one extremity of which abuts against the teeth of a *ratchet wheel*, and the other extremity is either freely jointed to a reciprocating driver for the purpose of communicating a continuous motion to the wheel, or is attached to a fixed centre to [illegible] the wheel against reverse motion In the former case it is also called a *click* or *pawl*, the latter a *detent*

RATCHET WHEEL A wheel having teeth formed like those of a saw, against which the ratchet abuts *See* RATCHET

RATE OF A SHIP, in the Royal Navy The navy is divided into three classes Rated ships, commanded by captains, sloops and vessels, by commanders, and the third class by lieutenants Rated ships are divided into six classes —1st, all three-deckers, 2d, two deckers, having 700 men and upwards (war establishment), 3d, [illegible] 4th, ships having from [illegible] from 400 to 250 men, 6th, ships having under 2[illegible] men

Rate of sailing of a Vessel is measured by the *log*, which see Various plans have been proposed for this purpose by various forms of the log itself, by the rise of water in tubes communicating with the sea and (by Captain Burney) by the pressure upon a body towed astern and pulling on a spring But the violence and irregularity in the pull, and the uncertainty [illegible] the resistance have probably combined to set aside [illegible] plan, and [illegible] because [illegible] velocity, would show very small changes of velocity for the same reason, however, the mean result shown in a heavy sea would be too great A certain and simple method of ascertaining the velocity at any instant, with precision, is one of the most important desiderata to[illegible] [illegible] naval science

RATHOLITE In Mineralogy a species of garnet found in Sweden, accompanied by calcspar and hornblende

RATIFICA'TION (Lat ratum, *determined*, facio *I make*) The solemn act by which a competent authority [illegible] [illegible] terminated by such [illegible] given by governments to treaties contracted by their representatives In French law ratification is defined [illegible] what has been done or [illegible] s a person on attaining his majority, ratified [illegible] in his minority And ratification is either express or tacit, the latter resulting by implication, from his silence for [illegible] [illegible] jority

RATIO (Lat [illegible] is defined by Euclid (*Elements*, book v def 3) to be 'a mutual relation of two *magnitudes* of the same kind to one another in respect of *quantity*" This definition has been much criticised Dr Barrow (*Lectiones Math*) calls it a metaphysical definition, inasmuch as it is not properly a mathematical definition, since nothing in mathematics depends on it, or can be deduced from it, and supposes that Euclid had probably no other design in making it [illegible] [illegible] It has been remarked, that [illegible] language, if not quite synonymous with [illegible] is a signification only a little more general, [illegible] as above rendered is either [illegible] meaning Dr Simson supposes it [illegible] of some unskilful editor Leslie (*Elements of Geometry*) ingeniously supposes that the Greek word πηλικοτης, which is usually translated *quantity* may have reference to *multitude* or number, as well as to magnitude, and that Euclid's definition may be rendered as follows —"Ratio is a certain mutual habitude [illegible] with respect [illegible] Wallis (*Opera M* [illegible] 5) translates the same word by [illegible] which refers to the number of times the one [illegible] is contained in the other Dr Peacock (*Algebra* [illegible]) remarks that there is no geometrical definition of ratio by which the equivalence of different modes of representation may be ascertained as necessary consequences, and for this reason, ratios in geometry are only considered in connection with each other as [illegible] or not constituting a proportion In [illegible] algebra, a ratio may be defined as the fraction whose numerator is the antecedent, and denominator the consequent of the ratio, and hence, in those sciences [illegible] identified with the theory [illegible] For a [illegible] of what has been written on the subject of geometrical ratios, see *Camerer's Euclid*, Excursus ad lib v Berlin, 1825)

RATION In the Army a portion of food and ammunition, &c, distributed to each soldier for his daily maintenance The rations of officers vary according to [illegible] [illegible] in their pay

RATIONAL In Arithmetic and Algebra, an expression in finite terms, or one in which no extraction of a root is left, or, at least, none such indicated, which cannot be actually performed by known processes The contrary of these are called *surd* or *irrational* quantities. Thus 2, [illegible] are rational [illegible] and $\sqrt{2}$, $\sqrt[3]{4}$, &c, are irrational [illegible] because their values can only be approximately and not accurately assigned

RATIONAL HORIZON In Geography the plane passing through the centre of the earth parallel to the *sensible horizon* of the place to which it is referred *See* HORIZON,

RATIONALISM The interpretation of scripture truths upon the principles of human reason, which has become famous in the present day by the theological systems to which it has given birth in Germany The history of the progress of the opinions of the reformed churches of that country may be found in Dr Pusey's essay upon this subject He conceives the polemical discussions which prevailed throughout those communities in the 17th and first half of the following century to have prepared the way for the reception of the low views of Christianity as a moral system which were derived from the writings of the concealed or avowed deists of this [illegible] Herbert, Tyndal, Morgan, Toland, &c, and [illegible] which they were reviewed by the sincere but [illegible] [illegible] From the middle of the last century [illegible] in Germany a succession of divines — Baumgarten, Michaelis, Semler, Eichhorn Paulus, Bretschneider &c —who have endeavoured either to affix a lower and more human character to the invisible operations of God upon men through Christianity or to reduce the accounts which we have of the foundation of our religion to the mixture of truth and error natural to fallible men They have questioned the genuineness of almost all the separate parts of Scripture and the accuracy of all their supernatural narratives The discredit into which these theologians appear to have fallen arises in a great measure, from the inability they have shown to produce a connected and consistent system of religion upon the low ground which they have taken up Of later years a much more spiritual conception of the nature of scripture promises and Christian assistances is observable in the writings of German divines, under the operation of which their theological criticism has already assumed a more dignified and exalted tone The sensation created by Strauss's *Life of Christ*, the latest and in some respects the most remarkable production of the Rationalist school may probably have aided in this reaction (See the article 'Rationalismus' in the *Conv Lexicon* The English reader may consult the writings of Mr Hugh Rose and Dr Pusey on the subject of German rationalism, *Atkinson's Law of Universities in Germany*, *Hawkins's Germany*, and two articles in the *Church of England Quarterly Review*, Oct 1837, and Jan 1838)

RATLINES Small horizontal lines or ropes extended over the shrouds thus forming the steps of ladders for going up and down the rigging and masts To *ratline* the rigging is to fix these ratlines

RATTANS or CANES The long slender shoots of a prickly bush (*Calamus rotang*, Linn), one of the most useful plants of the Malay peninsula and the Eastern islands They are exported to Bengal, to Europe and above all to China where they are consumed in immense quantities For cane-work they should be chosen long, of a bright pale yellow colour, well glazed, and of a small size, not brittle or subject to break They are purchased by the bundle which ought to contain 100 rattans, [illegible] [illegible] bent together, and tied in the middle In China they are sold by the picul, which contains from 9 to 12 bundles Such as are black or dark-coloured [illegible] short, or from which the glazing flies off on their being bent, should be rejected When stowed as dunnage, they are generally allowed to pass free of freight (*Milburn's Orient Com &c*) The imports into this country are very considerable (See *Com Dict*)

RATTLESNAKE One of the most deadly of poisonous serpents is so called, on account of the peculiar rattling instrument which it carries at the extremity of the tail, and which is formed of several horny flattened rings loosely attached together, which move and rattle whenever the animal shakes or alters the position of the tail These rings increase in number with the age of the animal, and it is asserted it acquires an additional one at each casting of the skin The generic name of the rattlesnake, *Crotalus* (from the Greek κροταλον a rattle), relates to the above-mentioned peculiarity Two species are well distinguished, viz the *Crotalus horridus* of the United States, and the *Crotalus durissus* of Guiana The genus is peculiarly American In common

with the boa, the rattlesnakes have simple transverse plates beneath the body and tail Their muzzle is hollowed by a little round depression behind each nostril The habits of the rattlesnake are sluggish, they move slowly, and only bite when provoked, or for the purpose of killing their prey They feed principally upon birds, rats, squirrels, &c, which it is believed they have the power [illegible]

RATTLESNAKE ROOT The root of the *Polygala Senega*, a stimulant said to have proved a serviceable remedy in cases of the bite of the rattlesnake

RA'VELIN, in Military Works, is a detached work composed of two embankments [illegible] It is raised before the curtain work, serving to cover it and [illegible] direct fire of the enemy [illegible] to a bridge it is called a [illegible] field fortification

RAY, *Raia* (Lat radius *a ray*) A genus of cartilaginous [illegible] their horizontally [illegible] ly, which is chiefly composed of the immense pectoral fins, the jointed and branched rays of which diverge like the rays of a fan, and support a broad duplicature of the skin which is continuous anteriorly with that of the side of the flattened head, whence the name of the genus The *Raiæ* of Linnæus are now divided into many subgenera of which the sting ray, eagle ray, electric ray, fire flare, skate, &c are the respective types

RAY In Optics, a beam of light propagated in a straight line from some luminous point A ray of white light may be divided by refraction into a number of distinct rays of different colours *See* REFRACTION

RA'YAH The designation by the Turkish government of its non-Mohammedan subjects, who pay the capitation tax Under Bajazet I the taxable Rayahs in Turkey in Europe were numbered at 1,112,000, under Selim, the late sultan 1,337,000

RAZE'E (Fr) The term used for any vessel cut down to an inferior class, as a 74 to a frigate, &c By razeeing, the draught of water is diminished while the centre of gravity is lowered, and the qualities of the vessel have generally, though not invariably been improved

REACH That portion of the length of a river in which the stream preserves the same direction

REACTION A term used in Mechanics to denote the reciprocality of force exerted by two bodies which act mutually on each other, or the general fact collected from observation, that any two bodies repelling or attracting each other are made to recede or approach with equal momenta Newton's third law of motion is that reaction is always contrary and equal to action or that the mutual actions of two bodies are always equal, exerted in opposite directions' In the mathematical consideration of mechanics, this principle must be assumed as a necessary axiom or law, and, in fact, as is remarked by Dr Young (*Nat Phil*), there would be something peculiar and almost inconceivable in a force which could affect unequally the similar particles of matter, or in the particles themselves, if they could be supposed of such different degrees of mobility as to be equally moveable with respect to one force and unequally with respect to another The principle may, therefore, as justly be termed a necessary law as an experimental fact

READER In Ecclesiastical matters one of the five inferior orders in the Romish church In the church of England, a reader is a deacon appointed to do divine service in churches and chapels of which no one has the cure There are also readers (priests) attached to various eleemosynary and other foundations

REAL *See* MONEY

REA'LGAR Red sulphuret of arsenic It is found native, and is composed of 38 arsenic + 16 sulphur

REA'LISM, in Philosophy [illegible] according as it is used in contradistinction to *nominalism*, in the former case relating to the theory of perception, in the second to the theory of abstraction and generalization For the first, see PERCEPTION, and IDEALISM, for the second, SCHOLASTIC PHILOSOPHY, THOMISTS, SCOTISTS and NOMINALISTS

REAL PRESENCE *See* TRANSUBSTANTIATION

REAL PROPERTY Real property is commonly said to consist in "lands, tenements, and hereditaments," of which terms the last is, in fact, coextensive with the term real property itself, expressing the same thing by the quality which the logicians would term its *differentia* viz that it descends to the heir wherever held in perfect right thus distinguished from all other species of full property, which, if possessed in equally absolute right, descend to the executors or administrators of the party Hereditaments are either corporeal or incorporeal, the first being land and its visible adjuncts recognized by the law as [illegible] whatever is [illegible] the [illegible]

corodies (pensions charged on ecclesiastical property, now obsolete), annuities charged on land, and rents reserved out of lands and tenements The quality of the property which the man may possess in those objects included under the term real (technically called his estate) may vary in *tenure* or in *degree* *See* FREEHOLD, COPYHOLD, FEE SIMPLE, &c

REAM A quantity of paper, consisting generally of twenty quires of twenty four sheets each, but what is called the printer's ream contains 21½ quires, or 516 sheets *See* PAPER

REAPING Cutting down corn or pulse with a sickle, hook, or scythe, or by a reaping machine These operations are more advantageously performed when the corn or pulse is not quite ripe, than when it is thoroughly ripe, because in the latter case the seeds are apt to drop out in the process of handling, turning, and drying

REAR The 3d or last division of a fleet, commanded by a rear admiral

REAR GUARD That part of an army, a regiment, or battalion which marches after the main body *Rear rank* signifies the last rank of a battalion, when drawn up in open order

REA'SON (Lat ratio) That particular faculty in man of which either the exclusive or the more intense enjoyment distinguishes him from the rest of the animal creation Like most of the terms in the science of mind, that of reason has been employed in a great variety of significations Dugald Stewart takes it in its widest sense, and comprises under it all the operations of the intellect upon the materials of knowledge which are furnished in the first instance by sense and perception Its office is to distinguish the true from the false, right from wrong, and to combine means for the attainment of particular ends According to this definition, therefore, the province of reason is coextensive with the range of human activity, and it directs itself to the three supreme objects of desire to man,—the good, the beautiful, and the true Mr Hume, however, withdraws the discernment of right and wrong, and of the beautiful and its contrary, from the domain of reason, and, on the other hand also denies the certainty of the truth which it enunciates and limits its convincing force merely to a certain weight of probability Locke's usage of the term, again partaking as it does of the general looseness of his phraseology is very different In one passage reason is declared to be [illegible] about the means, and rightly applies [illegible] the certain agreement or disagreement of two ideas, or their probable connection But in another place, it is said to be conversant with certainty alone, while the discovery of what, as probable enforces a contingent assent or opinion is ascribed to an especial faculty which is called the judgment Bird, on the other hand confines the latter term to the apprehension of intuitive truth, but agrees so far with Locke as to make it one part of reason, whose other part is [illegible] On the whole, [illegible] Locke the terms reasoning and reason were nearly if not quite, equivalent But reasoning and deduction are evidently not the source either of the dignity or the authority of the human intellect The discursive faculty can never establish any other than a conditional truth, which predisposes some anterior and pre-established verity as its basis and verification If there [illegible] something primary [illegible] all reasonings might [illegible] foundation the discursive process would proceed into infinity and its conclusions be, as Hume asserts that they are without any power to enforce assent But there are unquestionably in the human mind certain necessary and universal principles, which shining with an intrinsic light of evidence, are themselves above proof, but the authority for all mediate and contingent principles That which is thus above reasoning is the reason In [illegible] the terms reason and [illegible] and are so used by Stewart, [illegible] philosophy of Kant a broad distinction has been drawn between them Reason is the principle of principles, either speculatively verifies every special principle, or practically determines the proper ends of human action Approximately it may be called the sum of what in Scotch philosophy has been denominated the laws of man's intellectual constitution The understanding on the other hand is coextensive with the very [illegible] of reason [illegible] that which conceives of sensible objects under certain general notions, which again it compares one with another, or with particular representations of them, or with the objects themselves [illegible] generalization [illegible] judgment, and the understanding, when it enunciates its conceptions, becomes also the faculty of judging If the truth of a proposition which is not identical, or the enunciation of a primary truth, cannot be immediately certain. To prove it, recourse must be had to other propositions

previously admitted, the understanding, that is, must deduce one judgment from another, and so becomes the discursive faculty or reasoning Further in discovering these mediate truths, and in the regular and methodical disposition of them for the purpose of conclusion, as well as in the selection of means for the accomplishment of its ends it exhibits itself as a power of adaptation

By adopting this distinction between understanding, much of the difficulty involved in the consideration of instinct will be removed Instinct is defined to be a natural impulse in animals, by which they are led to certain actions necessary to the continuation of the individual and of the species, and enabled to perform them unerringly independent of instruction or experience To the determination is added the power and without a view to the end which their actions will effectuate But these words, while they apply to the instinctive principle as it shows itself in animals, do not belong to it in its highest That in other cases, the spontaneity of the animal operates unconsciously, is fully established by experience The solitary wasp does not itself feed upon flesh, and it cannot know that a larva is to issue from the egg which it is placing in the sand, but yet it deposits in the same hole with it the exact number of green worms that is sufficient for the sustenance of the wasp-worm until, being transformed into a fly, it will be capable of finding food for itself In other cases, it is impossible to deny the presence of judgment and design It is essential to the well-being of the animal that the nest should be built of mud-bait, which, by means of the gluten which proceeds from its body covers itself with pieces of straw or wood and of gravel or light shells, that it should maintain itself in equilibrium with the water in which it lives To accomplish this when its coating is too light it is observed to add a piece of gravel, and a piece of wood when it is too heavy The former cases may be regarded as instinctive the latter as instinctive Although we may be constrained to assign understanding and intelligence to the operations of the inferior animals, they are manifestly destitute of reason However exquisite may be the construction of the bee's cell, it is impossible to ascribe to it a knowledge of the principles of its construction The bee is born architect prior to and independently of all instruction and experience, is perfect in its works, and chooses its means with an unerring certainty But the whole through every part is adapted to the mind, while the means it employs are as various as the individuals, and seldom the best and most appropriate Again, the acts of the inferior animals are solely subservient to the continuation of the individual or the propagation of its kind, whereas the works of the rational animal fall short of perfection in many respects and are rendered still more difficult by a voluntary combination of the beautiful with the simply useful and necessary

REBATE (Fr rabattre) In Architecture the groove recess, or channel, sunk on the edge of any piece of material

REBEC A Moorish word, signifying a stringed instrument somewhat similar to the violin, having three strings tuned in fifths, and played with a bow It was introduced by the Moors into Spain It appears to have been much used at the revival of learning Hence Byron, speaking of Seville says

Nor here war's clarion, but love's *rebec* sounds

Milton, in *Il Penseroso*, calls it "sad rebec"

REBELLION CIVIL In Scottish Law, by a peculiar fiction a charge on letters of horning to pay or perform in terms of his obligation is accounted a rebel, by reason of his disobedience to the king's command contained in the writ The penal consequences formerly attaching to this contempt of the law were abolished by 20 Geo 2 c 50

REBELLION, THE GREAT The revolt of the Long Parliament against the authority of Charles I in English History, is commonly so denominated Nevertheless, as arbitrary and unconstitutional acts were undoubtedly committed on both sides during the struggle which preceded the actual resort to arms, a constitutional lawyer may consider it questionable whether the parliament may be more justly said to have rebelled against the king, or the king against the state The question is very fairly discussed by Mr Hallam, in his *Constitutional History of England* The commencement of the rebellion may be dated from the votes of the two houses concerning the militia Feb 1642 by which they endeavoured to seize on the military power of the realm, immediately after which the king left London for the north of England and after a series of unsuccessful negotiations (*see* CHARLES I) first took up arms, the king's standard was set up August 25 and the civil war was ended by the submission of the king to the Scots in April, 1646 The period of the rebellion is, however, extended, in ordinary language, so as to include the Commonwealth or Protectorate down to the restoration of Charles II in May, 1660

RE'BUS An antiquated species of ingenuity, a great favourite with our ancestors, being an enigmatical representation of a name or thing by using figures for words or parts of words thus an eye, and a ton or barrel, represent the family name of Eyton, an instance of a rebus by the bye of device, as they very commonly are See Device In heraldry, a coat of arms alluding to the name of the bearer (otherwise called *arms pariantes*) is also called a rebus, *e g* three trouts for Troutbeck, three cups for Butler, &c The term is said to be derived from an annual practice of the priests of Picardy, which consisted in presenting to the people of their vicinity on the first day of Carnival in certain years, entitled "Dies *de quibus*"

REBUTTER In Law, the fifth stage of the pleadings in a suit, or the plaintiff's answer to the defendant's rejoinder *See* PLEADING

RECEPTACLE, in Botany, has four different significations —1 That part of a flower upon which the carpella are situated, or, in other words, the apex of the peduncle or summit of the floral branch, of which the carpella are the termination 2 The axis of the theca of *Trichomanes* and *Hymenophyllum*, among ferns 3 That part of the ovarium from which the ovula arise and which is commonly called the placenta And, 4 That part of the axis of a plant which bears the flowers when it is depressed in its development, so that, instead of being elongated into a rachis, it forms a flattened area, over which the flowers are aggregated in corymbus

RECESSION OF THE EQUINOXES *See* PRECESSION

RECESS OF THE EMPIRE In History, the name given in judicial language to the decrees of the German diet They are thought to have been so termed from being pronounced at the time when the diet was about to 'recede,' or separate See DIET

RECHABITES A religious order among the ancient Jews instituted by Jonadab, the son of Rechab, from whom they derived their name It comprised only the family and posterity of the founder who was anxious to perpetuate among them the nomadic life, and with this view prescribed to them several rules, the chief of which were —to abstain from wine, from building houses, and from planting vines These rules were observed by the Rechabites with great strictness (See Jer xxxv 6) In recent times a branch of the body called *tee-totallers* has assumed the name of Rechabites

RECIPE The symbol ℞ at the head of a medical prescription, "take" Dr Paris astrological symbol of Jupiter a planet under the ascendency of which herbs were often collected

RECIPROCAL from the division of unity by any number Thus, ½ is the reciprocal of 2, and conversely 2 is the reciprocal of ½

RECIPROCAL FIGURES in Geometry are two figures of the same kind (triangles, parallelograms, prisms, pyramids, &c) so related that two sides of the one form the extremes of an analogy of which the *means* are the other

RECIPROCAL PROPORTION is when, of four terms taken in order the first has to the second the same ratio which the fourth has to the third, or when the first has to the second the same ratio which the reciprocal of the third has to the reciprocal of the fourth In works of arithmetic the case which give rise to this class of relations is called Inverse Proportion, or the Rule of Three Inverse

RECITATIVE (Lat recitare, *to recite*) In Music, a species of singing differing but little from ordinary speaking used in operas, &c to express some passion, to relate a story, or to execute any short design, and though written in time the performer may alter the parts of the measure as he thinks most suitable to produce certain effects, those that accompany him being dependant on his pleasure

RECKONING In Navigation, the estimated place of a ship, calculated from the rate as determined by the log, and the course as determined by the compass, the place from which the vessel started being known An elegant and ready method for solving this problem has been recently given by Professor Gill of New York, in the first number of his *Mathematical Miscellany*, much more accurate than the method usually given by writers on navigation (*See* NAVIGATION) *Dead reckoning* means the same as *reckoning*, due allowance being made for drift, lee-way currents &c

RECLINATION (Lat reclino, *I repose*), in Dialling, is the angle which the plane of the dial makes with a vertical plane which it intersects in a horizontal line

RECLUSI The common title of a class of religious persons *See* INCLUSI

RECOGNIZANCE In Law, an acknowledgment of

a debt upon record By a fiction of law, the obligation which a party enters into before a court of record or magistrate duly authorized, with condition to do some particular act,—as to appear at the assizes keep the peace, &c ,—is in the form of a recognizance, the party acknowledging himself to be indebted to the king, the plaintiff, &c , with condition that the obligation shall be void on performance of the thing stipulated

RECOI'L, in Artillery, is the rebound or resilience of a piece of ordnance when discharged This has been employed for the determination of the explosive [illegible] oes not appear [illegible] GUNNERY [illegible] Monks of the [illegible] ule The first separation from the original body seems to have taken place towards the end of the 14th century, when some [illegible] returning to stricter discipline as [illegible] the rule of Brothers of the Observance [illegible] from these originated the Recollets (living in a state of *recollection*, or reclusion), first established in Spain by the Count de Belalcazar, about 1484, and afterwards introduced [illegible] they acquired the possession of [illegible] in France, during the [illegible]

RECORD Literally an authentic account of any fact or transaction in writing, contained in rolls of parchment, wood, or any other durable substance, and preserved in a court of record *See* ARCHIVES

RECORD In Law, the authentic testimony in writing, contained in rolls of parchment, of the judgment of a superior court, and of the other proceedings in a case [illegible] —judicial records, [illegible] offices or inquisitions found, records made by conveyance or consent as fines, recoveries, or deeds enrolled (*See* COURT) Trial by record is used where a matter of record is pleaded in any action, as a [illegible] &c , and the opposite party pleads "nu [illegible] that there is no such record existing On this issue is joined, which can be tried only by inspection of the record

RECORDA'RI FA'CIAS LOQUE'LAM In Law, a writ to remove proceedings out of an inferior court to the King's Bench or Common Pleas It is directed to the sheriff, commanding him to make a record of the plaint and other proceedings, and then to send up the cause It is the common mode by which an action of replevin is transferred from the sheriff's to the superior courts

RECO'RDER The chief judicial officer of a borough or city, exercising within it in criminal matters the jurisdiction of a court of record, whence his title is derived This jurisdiction is now made uniform in extent throughout all boroughs, and is rendered equal to that of the quarter sessions of a county Recorders were formerly chosen without restriction by the corporations with which they were connected, but by the existing municipal system the appointment is vested in the crown, and the selection is confined to barristers of five years [illegible]

RECORDER The name of a musical instrument somewhat resembling the flageolet, formerly in use in this country It had a peculiarly pleasing tone, hence Milton speaks of

> ——— The Dorian mood
> Of flutes and soft recorders

The etymology of the term is involved in great obscurity

RECO'VERY, or COMMON RECOVERY In Law (*see* FINE), a mode of assurance in the form of a fictitious action, by means of which conveyances were made by various tenants possessed of limited rights in real property (by tenants in tail more particularly) The effect of a common recovery duly suffered was to raise an absolute bar, not only of all estates tail, but of all estates in remainder and reversion expectant on such estates tail, and to give the recoverer a fee simple absolute A common recovery, however, did not bar a springing use, or an executory devise A common recovery also avoided all charges, leases, and incumbrances made by those in reversion or remainder By 3 & 4 W 4 c [illegible] w mode of [illegible] tituted for [illegible]

RE'CTANGLE In Geometry, a right-angled parallelogram W [illegible] it becomes a *square* The area of a rectangle is numerically expressed by the product of the two numbers which express the lengths of its adjacent sides, and hence the term [illegible] of a straight line, whose length is equal to a portion of a curve It is effected by the integral calculus

If the curve be entirely in one plane, the length of the arc is $\int \sqrt{dy^2 + dx^2}$, or if it be a curve of double curvature, its length is $\int \sqrt{dx^2 + dy^2 + dz^2}$ In the former case, the equation of the curve being single will give a value of dy or dx, as may be found most convenient and this being substituted in the above formula and the expression integrated between the specified limits the actual length is obtained In the second case the equations upon two of the planes of projection being given, the values of dy and dz can be obtained in terms of dx [illegible] the values of y and z in [illegible] being made, the process is the same as before *See* INTEGRAL CALCULUS

It will, however, very rarely happen that the rectification can be obtained in finite terms, as the substitutions generally introduce radical expressions into the differential, which are hardly ever so connected with the rational parts as to be susceptible of a finite integral, and hence it has been an object with mathematicians to transform the expressions into others, the successive terms of which are so related as to diminish at a very rapid rate In this case, the approximation to the value of the arc is [illegible] The first curve which [illegible] Mr Neile [illegible] later the same curve was rectified by Van Heureat, in Holland

RECTIFICATION A Chemical [illegible] a second or more frequently rep [illegible] 'rectified spirit of wine," means spirit which has been redistilled, and by which it is to a great extent freed from wa [illegible]

'NEAR FIGURE, in Geometry, is a figure bounded by straight lines

RE'CTOR (Lat rector ecclesiæ, *ruler of the church*), is a person who hath the charge and care of a parish church The other rector is a layman, or a college or corporate body (*see* art TITHES) He is bound to provide a vicar to serve the church in his place, and to allow the small tithes, or a sufficient stipend, for his maintenance The term *rector* is also employed in Scotland to designate the head master of a public school or academy

RECTRI'CES (Lat rectrix, *a guide*) The name of the tail feathers of a bird, which, like a rudder, direct its flight

RE'CTUM (Lat *straight*) The last portion of the large intestines, so named from an erroneous notion of the old anatomists that it was straight

RECU'MBENT (Lat recumbo, *I lie down*) In Zoology, when a part is leaning or reposing upon any thing

RECU'RRENT NERVES Two branches of nerves from the *par vagum*, in the cavity of the thorax, are so called, they are distributed to the muscles of the larynx and pharynx

RECU'RRING DECIMALS, or CIRCULATING DECIMALS, in Arithmetic, are decimals which arise from the expansion of a fraction whose denominator includes one or more prime numbers, as factors, different from 2 or 5, and not included in the numerator In this case the same figures are continually repeated in the same order Thus, $\frac{2}{11} = 181818$, &c , $\frac{1}{7} = 1428571428571$, &c , *ad infinitum* Their value can always be found by taking one of the periods for a numerator, and as many nines for the denominator as there are figures in the period, and reducing the resulting fraction to its lowest terms Thus, $\frac{142857}{999999}$ being so reduced, is found equal to $\frac{1}{7}$

Recurring decimals were first noticed by Dr Wallis, but their properties have not been extensively investigated

RECU'RRING SERIES In Algebra, a series in which the coefficients of the successive powers of x are [illegible] coefficients [illegible] $a + (a+1)x + (2a+2)x^2 + (3a+3)x^3 + (5a+5)x^4 +$ is a recurring series, th [illegible] of the coefficients of [illegible] of the terms of such a series can always be exhibited in a finite form (See Euler, *Introductio in Analysin Infinitorum*, *Institutiones Algebræ*, &c

RECUSANTS [illegible] History, a term applied to those who refused to acknowledge the king's supremacy as head of the church, chiefly Papists

RED One of the primary colours *See* CHROMATICS

RE'DAN In Fortification, a kind of rampart placed in advance of the principal works to defend the least protected parts The redan usually consists of a rampart of earth, and it is the simplest kind of field fortification *See* FORTIFICATION

RED BOOK The name given to a book containing the names of persons in the service of the state The *Red Book of the Exchequer* is an ancient record, in which are registered the names of all those that held lands *per baroniam* [illegible] the time of Henry II

RE'DDLE A soft argillaceous mineral deeply tinged [illegible] The best specimens, used as [illegible] from Germany

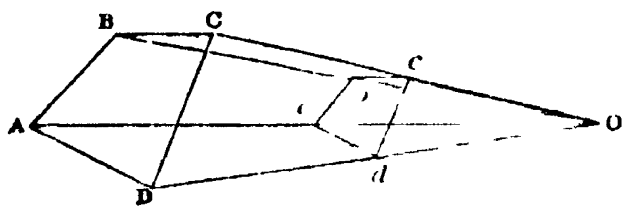
REDE'MPTORISTS A religious order founded in Naples by Liguori in 1732, and revived in Austria in 1820 They are bound by the usual monastic vows, and devote themselves to the education of youth and the propagation of Catholicism They style themselves members of the order of the Holy Redeemer (il Santo Redemptore) whence their name, but they are also often called *Liguorists*, from the name of their founder

RED LEAD An oxide intermediate between the [illegible] lead *See* LEAD and MINIUM

[illegible] sandstone *See* GEOLOGY

[illegible] The peroxide of mercury, obtained by the decomposition of nitrate of mercury by heat *See* MERCURY

REDOU'BT In Fortification, a te[illegible] nearly every kind of work intended to [illegible] positions, as also to works constructed within others to prolong their defence, or to detached works used to secure some piece of ground which would be useful to the besiegers, and thereby create delay in offensive operations



REDU'CING SCALE A scale used by surveyors [illegible] to roods and acres by inspection

[illegible] The process of converting a metallic oxide into metal by expelling its oxygen In some cases it is effected simply by heat, but generally by the joint action of heat and some deoxidizing agent upon the large scale, charcoal is almost always resorted to

REDUCTION In Arithmetic the changing of quantities from [illegible] to another

REDUCTION OF FIGURES, in Practical Geometry, consists in describing figures similar to the given ones, but of different (generally smaller) dimensions The pentagraph and the proportional compasses are the readiest and most accurate methods of performing these reductions, but in the absence of these, many different methods are taught in works of practical geometry The simplest is here annexed

Let A B C D be the figure to be reduced, and *a b* be

the line which is homologous to A B At a convenient place on the paper draw *a b* parallel to A B and equal to the reduced line Draw A *a* B *b* meeting in O and from O draw lines to all the other angles of the figure, then draw *b c* parallel to B C, *a d* parallel to A D &c, and join the last two points Then *a b c d* is the reduced figure sought

If the proposed figure be curvilinear inscribe any polygon within it, and draw the similar polygon as above directed, then trace the curve through the angles of the polygon

REDU'NDANT HYPERBOLA A line of the third order, having three pairs of asymptotic branches Its properties may be seen in *Newton's Enumeratio*

REEF in Navigation signifies to diminish the surface of the sails on the increasing of the wind Sails attached to yards are reefed at the head Strong horizontal bands of canvass, from three to six feet apart extend across the sails these are called *reef bands*, and there are usually four in each topsail and two in the foresail and mainsail The reef band is commonly pierced with two holes in each cloth (or breadth of canvass) in the sail, through each hole are drawn two *reef points* —short pieces of flat rope, each having an eye in one end, and hung one before and the other abaft the sail, each passing through the eye in the end of the other The sail [illegible] lowered and trimmed to the wind so as to shake [illegible] of the reef band are drawn up towards the *yard arm* by the ropes called *reef tackles*, the men then going out upon the yard, which they lean over while their feet are supported by the *foot ropes* gather up the loose canvass of the sail till they reach the reef band, which they keep extended [illegible] the *earings* are *passed* or secured [illegible] being passed first, they [illegible] the two reef points of each pair together over the yard, and [illegible] the surface having been thus diminished by the depth of one reef Gaff sails are reefed at the foot The sail being lowered enough to slack the canvass, the earing which is on the after leech is brought or hove down to the bo[illegible] *reef pendant*, the men [illegible] reach the foot of the sa[illegible] the yard is not lowered, as in reefing the courses, the sail is partly clued up for reefing

REEF, or CORAL REEF, is also applied to a chain of rocks in various parts of the ocean lying near the surface *See* GEOLOGY

REEL A lively dance peculiar to Scotland, generally written in common time of four crotchets in a bar, but sometimes in gig time of six quavers

REEL An angler's implement attached to the but of the rod, for the purpose of winding in the line when a fish is hooked The barrel of the reel should be of sufficient diameter to wind in quickly, as a fish is often lost by not being able to bring him rapidly within reach of the landing net, especially where, as in fly-fishing, a great length of line has been thrown out

REFINER In Engraving a word which denotes the passing of the graver into those incisions of the plate, so as to deepen them, where the aquafortis has not bitten in sufficiently

RE-E'NTERING ANGLE In Fortification, the angle of a work whose point turns inwards towards the defended place

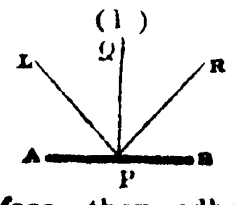
REEVE (Ang. Sax. [illegible] *Reve, præpositus*) A word of a very [illegible] composition of so[illegible] [illegible] shire-reeve, the governor of a shire or county, borough reeve port-reeve, &c

REEVE The Sea term for putting a rope through a block or any hole through which it is intended to run

REFECTION (Lat. reficio, *I restore*) In the language of Ecclesiastical communities, a spare meal sufficient only to maintain life, whence the hall in convents where meals are taken is termed *refectory*

REFECTORY (Lat. refectorium) In Architecture, an apartment wherein meals are taken

REFERENDARIES In the early monarchies of Europe after the fifth century, public officers charged with the duty of procuring executing and despatching diplomas and charters The office of great referendary, in the French monarchy, became merged in that of chancellor

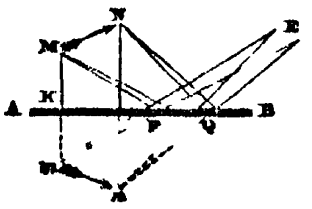


REFLECTING CIRCLE An astronomical instrument for the measurement of angles by reflection (*See* SEXTANT) The term is also applied to a surveying instrument invented by Sir Howard Douglas, which combines the advantages of the Hadley's quadrant and the protractor The object of it is to protract or lay down on the plan the angles measured with the instrument from the instrument itself without any intermediate step or even a register of their values The advantage of such an instrument must be obvious in military surveys where expedition is important while accuracy is thereby far more efficiently insured than by the old and more tedious process It is also advantageously used in forming general sketches of a country

REFLEX (Lat. reflecto *I bend back*) In Painting, the illumination of one body or a part of it, by light reflected from another body The foundation of the law of *reflex* depends upon the knowledge that every body in light reflects that light to a certain degree, in the same way that flame does The stronger in colore, the light on the body the stronger will be the *reflex*, distances being equal Again the more directly the light falls on a body, the more influence it will have in imparting a reflex

REFLEXION, in Mechanics denotes the rebound or regressive motion of a body from the surface of another body against which it impinges In Natural Philosophy, the term is applied to the analogous motions of light, heat, and sound, when turned from their course by an opposing surface The laws of the reflexion of light form the branch of science called *catoptrics*, those of the reflexion of sound are sometimes called *cataphonics* See SOUND

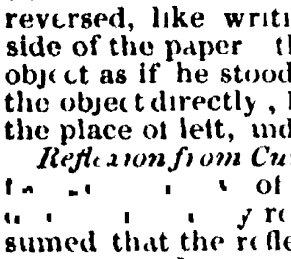
The simplest view which can be taken of the mechanical action whereby reflexion is produced is to assimilate it to that which takes place when an elastic body impinges on another body which it cannot move out of its place If light, heat, and sound are propagated by the pulses of an elastic medium the same theory will apply to them, and it is to be remarked, that in all cases of reflexion the change of motion which takes place follows precisely the same laws as that which is produced by the impact of two elastic bodies



Reflexion of Light —When we consider only the *direction* of the ray of light after being reflected from a polished surface and leave its *quantity* or *intensity* out of view, the laws of reflexion are extremely simple Suppose A B (fig 1) to be a smooth polished surface, or mirror, and a ray of light proceeding in the direction I P to impinge on the surface at P, and to be reflected from it in the direction P R Through the point P draw P Q a normal or [illegible] surface, then, adhering to the de[illegible] most writers on optics, the angle I P Q [illegible] *the angle of incidence*, Q P R *the angle of reflexion*, the plane in which are the two straight lines L P and P Q is called *the plane of incidence*, and the plane determined by Q P and P R *the plane of reflexion* Now the two general [illegible] reflexion [illegible] lines L P, P Q, and P R, are in one plane and the angle

of [illegible] and on the [illegible] true, whatsoever surface, or the origin [illegible] experience offers no exception to them whatever, and all the phenomena of reflexion from mirrors or polished surfaces, whether plane or having any regular curvature, are readily deduced from [illegible] consequences

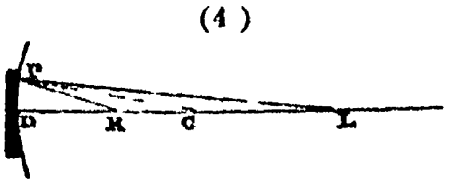
Reflexion from Plane Mirrors To determine the path of the reflected rays, and the formation of images by plane mirrors, suppose M N (fig 2) to be an object placed before the plane reflecting surface A B, and the eye to be situated at E The rays of light which proceed from the point M, and are reflected to the eye at F, will impinge on the mirror at P, and appear to come from a point *m*, which, in respect of the plane A B, is symmetrical with M, that is to say, placed in the straight line which is drawn from M perpendicular to the surface, and at the same distance from A B on the opposite side For let M K be the perpendicular and let it be continued till it meet the prolongation of I P in *m*, then, from the equality of the angles of incidence and reflexion, the angles M P K and E P B (which are the complements of those angles) are equal, hence M P K = K P *m*, and the two right angled triangles K P M and K P *m* having also a common side, are every way equal, whence K *m* = K M In like manner the rays which issue from N, and are reflected to E, will appear to proceed from a point *n* symmetrical with N, and as the same thing is evidently true with respect to every other point of the object a perfect image *m n* of the object will be formed on the opposite side of the mirror and at the same distance It will be observed that the image is not properly speaking reversed, like writing looked at through the opposite side of the paper the spectator sees the same side of the object as if he stood in front of the mirror and viewed the object directly, but in the reflected image, right takes the place of left, and left of right



(2)

Reflexion from Curve Surfaces - [illegible] the [illegible] of reflexion to [illegible] the [illegible] ly reflected from a curve surface it is assumed that the reflexion takes place at each point of the surface in the same manner as it would from a plane touching the curve surface at that point, and the problem therefore becomes that of determining the direction of the normal at the given point, for when the direction of the incident ray and of the normal at the point of incidence, are both known, the plane of the reflected ray and the position of the ray in that plane are both given The mirror may be concave or convex, and the incident rays may be parallel or divergent

Let D (fig 3) be the centre of a concave mirror, D C its axis, C the centre of curvature at D, and assume the semidiameter of the mirror D I to be small in comparison of its radius of curvature C D Now suppose a ray of light I P parallel to the axis to fall on the mirror at P, then if we draw P C, and make the angle C P R = C P L or P C D P R will be the direction of the reflected ray, for by the nature of curvature C P is a normal to the surface the arc D P being small But on the hypothesis of D P being small we have also R P = R D, and by reason of the equal angles R P C and R C P, R P = R C therefore R D = R C, or R is a given point and, [illegible] all the rays which fall on the mirror p[illegible] (D) are reflected into the same point R From this property the point R, which bisects the radius C D is called *the principal focus* of the mirror, or *the focus of parallel rays* See Focus

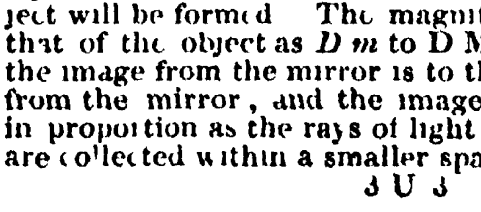


(3)

If the reflecting surface were a portion of a paraboloid, then all rays parallel to the axis would be accurately reflected into the focus at R whatever the extent of the surface might be, but, on account of the practical difficulty of grinding and polishing curve surfaces of any other form than the spherical, the concave and convex mirrors required for optical purposes are always spherical

Suppose, next, the rays to diverge from a point in the axis of the mirror Let L (fig 4) be the luminous point, C the centre of curvature, and P R the reflected ray To find the point R, let I = L P C = R P C, and let R, C, L denote respectively the acute angles at the points indicated by these letters We shall then have obviously, R − I = C and I + L = C, whence L + R = 2C Now, since D P is supposed to be an arc of a small number of degrees, D P may be regarded as a straight line perpendicular to L D, and since the angles R, C, L are also small, we may substitute for the arcs to which they respectively correspond their trigonometrical tangents, namely, $\frac{P D}{D R'}$ $\frac{P D}{D C'}$ $\frac{P D}{D L}$ Hence, if we assume D L = *p*, D R = *q*, D C = *r*, the radius of curvature, the above equation R + L = 2 C will become

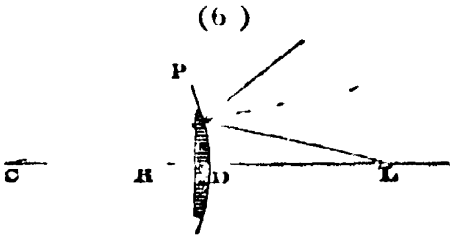
(4)



$$\frac{1}{p} + \frac{1}{q} = \frac{2}{r},$$

which gives the relation between *p* and *q*, *r* being a constant quantity for the same mirror If, therefore, L be a given point, then *p* has a given value and *q* is also determined, so that all rays diverging from the point L, and falling on the mirror, are reflected into the point R As the two quantities *p* and *q* enter symmetrically into the equation, each being expressed in terms of the other by the same formula, the points R and L are interchangeable, that is, if R be taken as the radiating point, then I is the focus of the reflected rays Hence L and R [illegible] *conjugate points*, or *conjugate foci*

Since the reciprocals of *p* and *q* always make up the same sum when one of those quantities increases the other diminishes, and *vice versâ* If, therefore, L approaches towards C, R will also approach towards C (the origin being supposed at D) and they will ultimately coincide at that point, so that rays issuing from C would be reflected back on itself If L recede from C, then R recedes from C or approaches D Suppose L to be at an infinite distance, in this case $\frac{1}{p} = 0$, and the equation gives $q = \frac{1}{2} r$, or D R = $\frac{1}{2}$ D C, so that R becomes the *principal focus* as it evidently ought, for when L is at an infinite distance, the rays L P are parallel to the axis

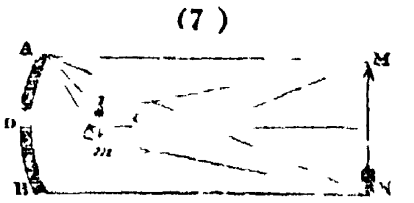


It is evident from the above equation that so long as *p* and *q* have the same sign, that is, so long as L and R are on the same side of the mirror, each of those quantities must be greater than $\frac{1}{2} r$ Suppose the radiating point I to be placed between D and C (fig 5), and let D L or *p* become less than $\frac{1}{2} r$ In this case, *q* must become negative, that is to say, the rays which emanate from L must become divergent after [illegible] same direction as if they diverged from [illegible] R on the opposite side of the mirror, and of which the distance *q* from D is determined by the equation $\frac{1}{p} - \frac{1}{q} = \frac{2}{r}$ This point R′ is called the *virtual focus* of the reflected rays

(5)

The same construction and equation (with the proper changes of sign) apply equally to convex and concave mirrors Let I (fig 6) be the luminous point from which diverging rays fall on the convex mirror P D, of which C is the centre of curvature Denoting, as before D L, D R and D C, by *p*, *q* and *r* respectively, and assuming the constant *r* to be positive, then by exactly the same reasoning as above, we shall find the equation

(6)



$$\frac{1}{q} - \frac{1}{p} = \frac{2}{r}$$

In this case, *p* and *q* increase or decrease simultaneously and if we suppose *p* to increase to infinity, or the incident rays to become parallel, then we have again $q = \frac{1}{2} r$, so that, for parallel rays the conjugate focus is at the middle of the distance between D and C When the mirror is convex, the conjugate focus is always the virtual focus

From what has now been shown it is easy to see in what manner images are formed by concave or convex mirrors Let M N (fig 7) be an object placed before a concave mirror A B, beyond its centre of curvature C On tracing the path of the rays M A, M D, M B, after reflexion, they will all be found to meet in the point *m* and those which proceed from N will in like manner be found to meet in *n*, whence rays diverging from every point of the object between M and N will meet, after reflexion, in a point situated between *m* and *n*, and in this manner an inverted image *m n* of the object will be formed The magnitude of the image is to that of the object as *D m* to D M, or as the distance of the image from the mirror is to the distance of the object from the mirror, and the image will be more brilliant in proportion as the rays of light coming from the object are collected within a smaller space If the object were

(7)

placed at *m n*, then an enlarged image would be formed at M N It is on this principle that reflecting telescopes and microscopes are constructed *See* TELESCOPE, MICROSCOPE

Intensity of reflected Light — It has now been shown that the path of the reflected light can be determined in all cases with proper precision when the form of the reflecting surface is known In the case of direct light when the question is to determine the quantity or proportion of the light which is thrown off by reflection by an opposing surface The following laws, however, have been established by experiment — 1st, The quantity of light regularly reflected increases with the angle of incidence, but does not vanish entirely when that angle becomes 0 2d It depends both on the nature of the medium through which the light is passing when it falls on the reflecting surface and on that of the substance on which it falls 3d, Bodies of different natures, placed in the same circumstances, reflect very different proportions of the incident light

On this subject a great number of experiments have been made by Bouguer, Lambert, Wollaston, Mr Potter, and others The results of [illegible] are given by Bouguer — When a beam of light, the intensity of which is represented by 1000 falls upon water so as to make an angle of 0° 30′ with the surface, the intensity of the reflected light is represented by 721, at an angle of 15° with the surface, by 211, at an angle of 30°, by 65, and at an angle from 60° to 90°, by 18 Of 1000 rays falling upon a surface of glass, and making an angle of 5° with the surface, 543 are reflected, 300 when the angle is 15°, [illegible] when 60°, or above Of 1000 rays fall [illegible] surface of black marble, 600 are reflected when the angle with the surface is 3° 15′, 156 when 15°, 51 when 30°, 23 when 60° and upwards Mercury and the metals exhibit a rapid diminution Of 100 incident rays 75 are reflected when the angle with the surface is very small, and about 60, or more than half, when the angle approaches to 90°, or the incident ray is nearly perpendicular to the surface (*Traité d'Optique* See also the *Edinburgh Journal of Science* for 1830 and 1832)

In order to produce reflexion in a less degree, the only indispensable [illegible] light pass from one medium to another having a different refractive power In passing through a perfectly homogeneous medium, no reflexion takes place, but whenever there is a change of medium (and this change may occur in the same substance by an inequality of density in the different parts, or a different arrangement of the particles), more or less reflexion takes place at the surface which separates the two media Thus in passing through the atmosphere, the solar light undergoes an infinite number of partial reflexions before it arrives at the earth, as every successive thin stratum of air, by reason of its increasing density, forms, as it were, a different medium *See* REFRACTION, ASTRONOMICAL

If any surfaces could be formed of so perfect a polish as to reflect the whole of the incident light, the eye would be unable to distinguish them, and, unless by coming in actual contact with them, we should have no reason to suspect their existence Bodies are only visible in consequence of rays irregularly reflected from their surfaces meeting the eye, for rays which are regularly reflected only show the luminous points from which they emanate, and not the surfaces on which they fall If the lunar surface were as perfectly polished as a globule of pure mercury, the moon would present to us only a reflected image of the sun *See* LIGHT, OPTICS

REFORM ACT In Politics *See* PARLIAMENT

REFORMA'TION An important era in political [illegible] when the doctrines and usages [illegible] then dominant throughout the western states of Christendom, were first successfully called in question This event is commonly dated from the year 1517, when Luther began to oppose the pope and condemned the sale of indulgences Mosheim assigns to it the date 1520, when Luther was excommunicated

Prior to the Reformation, the pope claimed of divine right and exercised, absolute authority over the whole Christian church with the exception of those states and provinces in which the Eastern or Greek church was established Not only was his authority regarded as supreme on subjects of doctrine and discipline, but his decisions were considered as infallible; and whoever ventured to question or gainsay them was treated as a heretic, and was liable to such canonical censures and temporal penalties as the canon law determined Of course, the [illegible] Christian church under the see of Rome His holiness, also, laid claim to supremacy even in temporal things throughout the wide range of his religious authority; though the exercise of this supremacy was not always quietly submitted to; nay, was sometimes resisted with success He regarded all parts of the world not inhabited by Christians as uninhabited, and gave full power to those Christians who might occupy them to make war on the inhabitants, and the countries, if conquered, were parcelled out according to his sovereign pleasure But while the absolutism claimed by the Roman pontiff was [illegible] to arouse jealousy and opposition, which, indeed, it did, in some degree, in different places and at various times, these feelings were greatly increased by several other causes such as the immoral lives of the clergy; the facilities by which their immoralities were pardoned, the exorbitant wealth of the church, the great personal immunities of ecclesiastics, and their encroachments on the jurisdiction of the laity These and similar circumstances, which the invention of the art of printing and the revival of learning had tended more thoroughly and widely to disclose, gradually prepared the public mind for that reformation of religion of which in this article we intend briefly to give an account

Without minutely mentioning the frequent, but comparatively feeble opposition to which the absolutism in [illegible] the church had, in various periods, given rise, it may suffice here to confine ourselves to an account of that course of opposition, in the 16th century, which terminated in the Reformation

According to the doctrine of the Romish church, all the good works of the saints over and above those necessary for their own justification, are deposited, together with the infinite merits of Jesus Christ, in one inexhaustible treasury The keys of this treasury were committed to St Peter, and his successors the popes, who may open it at pleasure, and by transferring a portion of this superabundant merit to any particular person for a sum of money, may convey to him either the pardon of his own sins or a release for any one in whose happiness he is interested from the pains of purgatory Hence the origin (which took place in the 14th century) of the sale of *indulgences* Pope Leo X under pretence of raising contributions towards [illegible] the church of St Peter at Rome, granted, in 1517, the right of promulgating those indulgences in Germany, together with a share in the profits arising from the sale of them, to the archbishop of Magdeburg, who as his chief agent for retailing them in Saxony, employed Tetzel, a Dominican friar, of dissolute morals, but of great activity and energy of character Tetzel, assisted by the monks of his order, executed the commission with great zeal, but with little discretion or decency, and, by disposing of them at a very low price, carried on for some time an extensive and lucrative traffic among the credulous and ignorant The princes and nobles were irritated at seeing their vassals drained of their wealth to replenish the treasury of a profuse pontiff Men of piety regretted equally the corruptions of the church and the delusions of the people Even the most unthinking were shocked at the scandalous behaviour of Tetzel and his associates But it was reserved to Martin Luther, formerly a monk of the [illegible] professor of Theology [illegible] to attack the errors, and the abuses of those [illegible] indulgences, and to shake the foundations of the papal see itself What were the motives which first induced this distinguished person to oppose this traffic cannot now be ascertained The traffic was not a novelty, as it had been practised throughout Christendom for several centuries Some writers have imagined, though with what justice is not evident, that his opposition was founded in jealousy because this gainful trade had not been conferred on the Augustinians, to whom he belonged, but on the Dominicans, a rival order But, whatever were his motives, his opposition at first was confined simply to the sale of indulgences His memorable theses, ninety-five in [illegible] against this practice were affixed to the doors of [illegible] Wittenberg 31st October 1517, while [illegible] inveighed bitterly against the irregularities [illegible] of the monks who published indulgences, as well as against the abuse itself The sentiments [illegible] his theses he proposed not as points [illegible] but merely as subjects of inquiry and [illegible] day on which the learned were invited to [illegible] either in person or by writing and to the whole he subjoined solemn protestations of his high respect for the apostolic see, and of his implicit obedience to its authority No opponent appeared at the time prefixed Meanwhile the theses [illegible] with astonishing rapidity, [illegible] with the greatest avidity, and [illegible] ss of the man who had ventured to attack the plenitude of papal power Meanwhile Tetzel, in opposition to Luther, published counter-theses at Frankfort on the Oder, Eckius, a celebrated divine of Augsburg endeavoured to refute Luther's notions, and Prierias a Dominican friar, master of the sacred palace and inquisitor-general, wrote against him with uncompromising virulence But this

opposition was of little or no avail Luther supported his views by arguments founded on reason or derived from scripture, and his cause was found daily to gain strength

[illegible] of [illegible]

the dispute that was thus raging in Germany, and at at first despised it as a mere monkish squabble But the tidings of Luther's rapid success, and the clamours of the ecclesiastics for aid and vengeance, at length roused him from his apathy, and induced him to take prompt steps to put a stop to the spread of heresy On the 21st Aug 1518, he summoned Luther to appear at Rome within sixty days, before the auditor of the chamber and the inquisitor-general Prierias, who had written against him, whom he empowered jointly to examine his doctrines and to decide concerning them This was evidently an unjust tribunal by which the decision was to be made, and through the influence of Frederick the elector of Saxony, who was favourable to the new doctrines, and of others, and by a submissive letter written to the pope by Luther himself, his holiness agreed to refer the hearing and determination of the cause to his legate in Germany, Cardinal Cajetan a Dominican, eminent for scholastic learning

The reformer accordingly appeared before Cajetan, who, after some discussion, commanded him to retract his opinions, but Luther, with that intrepidity of mind which was his grand characteristic, declared that he could not, with a safe conscience, renounce opinions which he believed to be true, nor should any consideration induce him to do what would be so base in itself, and so offensive to God The result was, that Luther, who with his friends, suspected that even the imperial safe-conduct would not be able to protect him from the legate's power and resentment, was induced to withdraw secretly from Augsburg and return to Wittenberg, previously to which, however, he prepared a solemn appeal from the pope ill informed at that time concerning his cause, to the pope when he should be better able to judge respecting it (*Seckendorf, Comment* lib i p 14, *Luther Opera*, i p 160) But so impatient were Luther's enemies at Rome that even before the sixty days had expired, he was there condemned as a heretic, and Leo in several of the briefs and letters, had stigmatized him as a child of iniquity, and as given up to a reprobate mind But Luther, convinced that his views were agreeable both to scripture and reason was not to be deterred from teaching and promulgating his opinions both from the pulpit and through the press, and as every step taken by the court of Rome against him convinced him that Leo would soon proceed to the most violent measures he had recourse to the only expedient in his power in order to prevent the effect of the papal censures He appealed to a general council, which he affirmed to be the representative of the Catholic church and superior in power to the pope, who, being a fallible man might err as St Peter, the most perfect of all his predecessors had erred As opposition against him increased and as the controversy advanced Luther's views began to expand, and in his disputation with Eckius he went so far as to question the supremacy of the pope over the church, as well as the doctrines of purgatory auricular confession, and absolution, and he about the same time published several treatises, in which he more openly expressed his dissent Luther may now be said to have embraced the fundamental tenet which now characterizes all sects of Protestants, and which was subversive of the slavish obedience in points of doctrine and discipline which had hitherto been paid to the holy see, namely that scripture is the only rule of faith and manners, and that this rule is to be interpreted by the exercise of private judgment A step was at this period (June 1520) taken by the court of Rome fatal to the object which it had in view The pope issued a bull condemning, as heretical and offensive to pious ears, forty-one propositions extracted out of Luther's works, all persons were forbidden to read his works on pain of excommunication, those who possessed copies of them were commanded to commit it to the flames and he himself if he did not within sixty days publicly recant his errors and burn his works, pronounced a heretic, excommunicated, and delivered unto Satan, and all secular princes required under pain of incurring the same censure, to seize his person, that he might be punished as his crimes deserved

This sentence, while it did not disconcert or intimidate [illegible] his [illegible] the new doctrines In some countries [illegible] obstructed the promulgation of the bull, in others, the persons who attempted to publish it were insulted, and the bull itself was torn in pieces and trodden under foot [illegible]

tone, and declared the pope to be that man of sin, or Antichrist, whose appearance is foretold in the New Testament He declaimed against his tyranny and usurpations, and exhorted all Christian princes to shake off such an ignominious yoke Nor did he stop here As Leo had, in execution of the bull, appointed Luther's works to be burnt at Rome the latter, by way of retaliation, assembled all the members of the university of Wittenberg, and with great pomp, in presence of a vast number of spectators, cast the volumes of the canon law, together with the bull of excommunication, into the flames; and his example was imitated in several cities of Germany This took place on the 10th of December, 1520, and on the 6th of the ensuing month the pope launched a second bull against him, by which Luther was finally expelled from the communion of the church Thus separated from all connection with the see of Rome, Luther applied himself more assiduously than ever to the study of the word of God as the only standard of theological truth, and while he was thus enabled to attack with the greater success most of the peculiar papal doctrines, both theological and ecclesiastical, he exposed at the same time, the immoral and secular lives of the clergy, and thus laid the foundation of that reformation of religion which at first he never contemplated but which has been characterized "as a revolution in the sentiments of mankind, the greatest as well as the most beneficial that has happened since the publication of Christianity" (*Robertson's Charles V*, 8vo ed vol ii p 12)

A spirit of inquiry having, by means of Luther's preaching and publications and the violent procedure of the court of Rome been excited in the public mind, the progress of the reformed doctrines was rapid and general and threatened to embrace the whole of Germany, notwithstanding the Emperor Charles V co operated with the pope to check and destroy them Luther, too, was protected, from various motives, not merely by the Elector of Saxony, but by many other princes, and the new views were adopted and sedulously propagated by Melanchthon Carlostadius, and other eminent men. Erasmus, too though he did not long follow in the same course as the German reformer, and ultimately wrote against some of his views, yet discovered and exposed, with great learning and ability many errors both in the doctrine and worship of the Romish church, and may be considered as his auxiliary in the work of reformation

Under such circumstances it was that the imperial diet at Worms was held, January, 1521, to which the different princes were invited, in order to concert the most proper measures for checking the progress of those new and [illegible] the peace [illegible] their ancestors An attempt to condemn him in his absence was frustrated by a majority of the members of the diet, and Luther, under a safe-conduct, was summoned to appear before them He did not hesitate to attend, but neither threats nor entreaties could induce him to retract any of his opinions, or to consent to their being tried by any other rule than the word of God He was allowed to leave the city in safety, but an edict was published in the emperor's name, after his departure, putting him under the ban of the empire The circumstances, however, in which Charles was placed, — the commotions in Spain and the wars in Italy and the Low countries, together with the prudent precaution of the Elector of Saxony in concealing Luther in the castle of Wartburg, all concurred in preventing the edict being carried into effect During his confinement his opinions continued to gain ground, and the [illegible] of Wittenberg ventured on an alteration [illegible] established forms of public worship, by abolishing the celebration of private masses and by giving the cup as well as the bread to the laity in administering the sacrament of the Lord's Supper In a short time, however, the new views were condemned by the university of Paris, and a refutation of them was attempted by Henry VIII of England But neither of these intimidated Luther He published animadversions on both with as much virulence as if he had been dealing with an ordinary adversary

Meanwhile an attack no less violent occasioned by a similar cause, was made on the Romish church in Switzerland The Franciscans being intrusted with the sale of [illegible] executed their commission with [illegible] and rapacious which had rendered the Dominicans so odious in Germany But they were met and opposed (1518) by Zuinglius, a man not inferior to Luther himself in zeal and intrepidity, and who advanced with perhaps more daring and rapid steps to overthrow the whole fabric of the established religion Notwithstanding that the universities of Cologne and Louvain pronounced his doctrines to be erroneous, the cantons of Zurich, Berne, Basil, and Schaffhausen embraced his opinions Several conferences were at different times held between the Roman Catholics and the "Evangelicals," as the followers of Zuinglius

were called, and all of them tended to the spread of the reformed faith After a conference held at Berne in 1528, the council of that canton considering the result to be in favour of the Evangelicals published ten theses, which embodied the substance of the Reformation in Switzerland, and most of the leading principles contained in them are acknowledged by the reformed churches generally, however widely they may differ [illegible] some abstruse points

[illegible] German reformers were at first unacquainted with the proceedings of each other, though both were animated by the same spirit, and, in different places, pursuing a similar object. But, while they both resisted and exposed the usurpations and errors of the Romish church, and generally agreed in their sentiments, they entertained very [illegible] and thus was sown the seed [illegible] have since agitated the reformed churches The chief subject of dispute between the two reformers was concerning the manner in which the body and blood of Christ were present in the Eucharist Luther and his followers, though they rejected the papal belief of transubstantiation, were nevertheless of opinion that the body and blood of Christ were really present in the Lord's Supper, in a way which they could not pretend to explain Zuinglius and his adherents repudiated the doctrine and taught that the bread and wine used at the Eucharist were no more than external symbols to excite the remembrance of Christ's sufferings in the minds of those who received it Both parties maintained their opinions with equal obstinacy, and as this dispute threatened to retard the great work of reformation, and to bring discredit on its adherents, the Landgrave of Hesse invited Luther [illegible] several of the most eminent of their [illegible] to a conference at Marburg, in order to promote unanimity and peace After a disputation of four days, however, neither of the contending parties could be persuaded to abandon their views But as both agreed in their sentiments not only as to the popish hierarchy but as to the fundamental principles of Christianity they parted in Christian charity though not in brotherhood, agreeing to refrain from open controversy

The struggle between the Roman Catholics and the reformers still raged in Germany At the diet of the empire held at Spires in 1526 the emperor's ambassadors used their utmost endeavours to suppress all disputes about religion and insisted on the vigorous execution of the sentence which had been pronounced against Luther and his followers at Worms This attempt was successfully resisted by the majority of the members, and it was at last unanimously agreed to present an address to the emperor entreating him to call a general council without delay and that the princes of the empire should in the meantime be allowed in their respective dominions to manage religious matters as they should think proper These resolutions proved favourable to the cause of the Reformation and gave an impetus to the expression of the public voice The war in which at this time the emperor was engaged with the pope gave a decided advantage to the friends of the reformed [illegible] increased their number At a diet, however held [illegible] place in 1529 the power which had been given to princes of managing ecclesiastical affairs until the meeting of a general council was revoked by a majority of votes, and every change declared unlawful that should be made in the established religion before the determination of the approaching council was known After many ineffectual remonstrances and arguments six princes of the empire and thirteen imperial cities "protested" [illegible] sion Hence arose the denomination o[illegible] Pr[illegible]," a term at first applicable only to the Lutherans, but now common to all who have separated from the church of Rome

As the reformed doctrines in Germany had not yet been reduced to a system, the Elector of Saxony ordered Luther and other divines to commit to writing the leading articles of the [illegible] along with the principal points on which [illegible] om the church of Rome In compliance with this order, Luther delivered to the elec[illegible] which had been agreed [illegible] hence called the Articles [illegible] of the sentiments of the reformers was enlarged and rendered more minute and perspicuous by Melanchthon who performed the task with equal ability and elegance

In 1530 Charles convoked a diet of the empire at Augsburg and directed the reformers to lay before it an account of their tenets in German and Latin The work prepared by Luther and Melanchthon was presented to the diet, hence called the Confession of Augsburg, or [illegible] which was read aloud by the chan-

[illegible]

of the errors and superstitions of the papal faith But after much disputation, not only was it rejected, but the diet published a decree condemning most of the peculiar tenets held by the Protestants and forbidding any person to protect or tolerate such as taught them, enjoining a strict observance of the established rites, with other articles equally galling and tyrannical But the Protestants were now too powerful a body, and their views had assumed so completely the form of a system that they were not easily dismayed On the contrary, they assembled at Smalcalde, where they concluded a treaty of mutual defence, both religious and political, against all aggressors, and formed the Protestant states of the empire into one regular [illegible] In the year 1530, was the Reformat[illegible] established in Germany, first, by the publication of the Confession of Augsburg, and, second, by the league of Smalcalde, which made that creed the bond of union of a powerful political confederacy

It may here be mentioned that the followers of Zuinglius, or Sacramentarians, as they were sometimes called, presented their confession of faith on the part of four cities, Strasburg, Memmingen, Lindau, and Constance, [illegible] by the Confession of Strasburg, or *Confe[illegible]* The reformed cantons of Switzerland were not allowed to join the league of Smalcalde, inasmuch as they refused to sign the Confession of Augsburg, and thus the Swiss Evangelicals or Sacramentarians continued distinct from the Lutherans (as they still do), though they joined in a separate league with the city of Strasburg and the Landgrave of Hesse, who adopted their views The Helvetic Confession of Faith, founded on the articles of Berne already referred to was finally published in 1532 The reformed doctrines had early spread to Geneva, and John Calvin, or Calvin of that city after the death of Zuinglius carried them farther than the Swiss Protestants had done He abolished all festivals except Sabbath discarded all church ceremonies, used leavened bread for the sacrament and taught the doctrines of predestination and election in all their rigour (See PRESBYTERY in this work) Calvinism thus became the third great branch of the Reformation, Luther and Zuinglius being respectively at the head of the other two The systems of Zuinglius and Calvin, however, gradually merged together and they may now be considered as one, having the same confession of faith

It would exceed the bounds to which we must necessarily confine ourselves in this article were we to trace the history of the Reformed faith after the treaty of Smalcalde that treaty among other results (such as confere[illegible] councils particularly the celebrated [illegible] in 1540) gave rise to a war between the emperor and the Protestants But the peace of Augsburg, in 1555, terminated those and similar calamities which had so long agitated the empire The following are the leading articles of that peace namely, that the Protestants who followed the Confession of Augsburg should in future be free from the jurisdiction of the pope and from the authority and superintendence of the bishops that all the inhabitants of the German empire should be at perfect liberty to judge for themselves in all matters, religious and ecclesiastical, that all persons whatever be their religious opinions should enjoy equal civil rights and privileges,—in other words, that a complete toleration in religious matters should obtain, and that all those who should persecute any person under [illegible] pretences should be declared and treated as [illegible] on the empire, invaders of its liberties and disturbers of its peace Thus was the Reformation finally established in many parts of Germany as it exists without any very marked change either as to its extent or its principles, at the present day The conditions on which this desirable object was obtained were honourable to both parties, both Catholic and Protestant and, generally speaking, to the German character This happy state of things was broken many many years after by the thirty years' war (1619—48), but the treaty of Westphalia, which terminated this war, confirmed the articles of the peace of Augsburg, and extended its benefits to the Calvinists as well as to the Lutherans Equal religious rights and privileges were extended to all, as is still happily the case

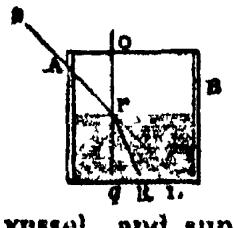
While these events were taking place in Germany and Switzerland, the spirit of inquiry, which had been evoked so signally in these countries, spread, and roused most of the nations of Europe to a greater or less extent from their mental inactivity or superstitious credulity the doctrines of the Reformation found their way partially into France, also into Spain and Italy Prior to Luther's death (1546) these doctrines had made many converts in the Netherlands, and in the time of Philip II the "Seven United Provinces" which separated from the rest, proclaimed liberty of conscience, and adopted the tenets of Calvinism, to which they have ever since adhered

About the year 1556, the Lutheran creed was adopted

as the state religion in Denmark and Norway This creed was propagated in Sweden soon after Luther's rupture with the church of Rome, by Olaus Petri one of his disciples Both Lutheranism and Calvinism early gained an extensive footing in Poland, which they still retain To Hungary and Transylvania a similar remark applies The history of the Reformation in the British empire is well known, and need not be detailed here Though the Protestant episcopal church is the established religion in Ireland, more than three fourths of the people of that country retain their hereditary attachment to the papal creed Altogether, not more than a

faith,—the two great exceptions being Turkey, where Mohammedanism is established, and the east of Europe where the Greek church is, is the predominant religion in almost all the British

Independently of the truth or falsehood of the doctrinal and other points on which the reformed church dissents from that of Rome, the Reformation was the cause of many interesting and important advantages It burst the fetters by which the human mind had previously been bound, and restored it to liberty It made religion an object of the understanding, and not of the eye, of the heart rather than of the memory "On the whole, the Reformation has been unquestionably good to Europe, it has purified religion and promoted the intellect, and by spreading the love of liberty" (*Dunham's Hist of the European Nations* 2) It has contributed to improve even the church of Rome itself both in science and in morals The desire of equalling the reformers in those talents which had procured them respect, the necessity of acquiring the knowledge requisite for defending their own tenets, or refuting the arguments of their opponents, together with the emulation natural between two rival churches engaged the Roman Catholic clergy to apply themselves to the study of useful science which they cultivated with such assiduity and success that they have gradually become as eminent in literature as they were, in some periods infamous The same principle occasioned a change no less considerable in the morals of the Romish clergy Many of them have in consequence been distinguished for all the accomplishments and virtues which can adorn their profession, and differ greatly from their predecessors before the Reformation both in their maxims and in their conduct" (*Ranke's Hist of Germany during the Ref, Hist of the Great Reformation in Germany and Switzerland* by D'Aubigné, F Paul, *Hist of the Council of Trent* &c)



REFORMATION JUBILEE OF 1835 The two hundredth anniversary of the introduction of the Reformation at Geneva was solemnized under this title in August, 1835 The canton, since the Congress of Vienna having become "mixed" in religion the government took no part in this festival the expenses of which were defrayed by voluntary subscription Invitations were sent to the Protestant clergy of all countries, both Lutheran and Calvinist, to attend its solemnization 61 were present from France, 12 from [illegible] 3 from North America The account of this [illegible] was published under the title of *Jubilé de la Reformation de Genève*, Geneva 1835

REFORMED CHURCH, comprises in a general sense all those bodies of Christians that have separated from the church of Rome since the era of the Reformation but it is applied in a restricted sense to those Protestant churches which did not embrace the doctrines and discipline of Luther, and more particularly to the Calvinistic churches on the Continent

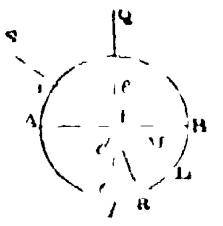
REFRACTION (Lat refractus *broken*) In Mechanics, the change of direction which takes place in the motion of a body when it passes obliquely out of one medium into another of different density The term is chiefly applied to the deviation from their rectilinear course of the rays of light in passing through transparent substances

REFRACTION OF LIGHT The deviation of a ray of light from its original path in entering a medium of a different density This change of direction, which takes place at the surface of separation of two media, is the ultimate fact from which many of the most interesting phenomena of light receive their explanation The laws by which it is regulated, and the investigation of the consequences of those laws form the branch of natural philosophy usually termed *Dioptrics*

(1) The phenomenon may be observed

[illegible] of light [illegible] point S [illegible] a small [illegible] vessel A B, then, the vessel being empty, the light will fall on the bottom at a point L in the same straight line with S and A Now let water be poured into the vessel, and suppose the beam of light to fall on the surface of the water at P, then it will be seen that the light no longer continues its course in the same straight line but is bent or *refracted* at P and proceeds through the water in a straight line P R, more nearly perpendicular to the surface A similar deviation takes place in all cases in which light passes from one transparent medium into another, but [illegible] the angle R P L, or the amount of the [illegible] varies according to the nature of the two [illegible], and the degree of obliquity with which the incident ray falls on the surface of separation

Through P draw Q P *q* a normal to the surface, then S P Q is *the angle of incidence*, R P *q* is *the angle of refraction*, and the following laws are found to be observed in all cases —



1 The refracted ray P R is in the same plane with S P and P Q, that is, with the incident ray and the perpendicular to the surface at the point of incidence

2 The incident ray S P and the refracted ray P R are always on opposite sides of the perpendicular Q P *q*

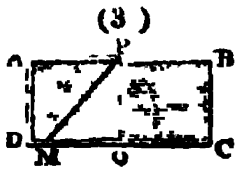
3 Whatever be the inclination of the incident ray to the surface, the sine of the angle of incidence has to the sine of the angle of refraction a constant ratio

These three laws, which hold good for curve surfaces as well as for planes, enable us to determine the path of the refracted ray with mathematical precision when the form of the surface and the nature of the refracting medium are both known The two first are easily verified, and have been known from the days of Ptolemy The third, which is very remarkable, was first enunciated in the *Dioptrics* of Descartes, published in 1637, but the discovery belongs to Willebrod Snell, professor of mathematics at Leyden, who died at an early age in 1626 Snell, indeed, made no mention of the sines of the two angles, but the relation which he affirmed to subsist is identical with the law as stated by Descartes Through P (fig 2),

(2)

the point of incidence, as a centre, let a circle be described meeting the incident ray in I and the refracted in R, and through R draw R M perpendicular to the surface A B, meeting P L in M, draw also R *c*, M *d*, T *e*, respectively perpendicular to Q *q* Now the proposition affirmed by Snell was, that for every inclination of S P to the surface the line P R is to P M in a constant ratio But P R = P I, and P I P M T *e* M *d* or as I *c* R *c*, therefore T *e* is to R *c* in a constant ratio and these are obviously the sines of incidence and refraction respectively to the same radius D [illegible] the law of the sines, made no mention [illegible] to be inferred that he himself was the discoverer of the property in question, which, in fact, is usually ascribed to him by the French authors It is, however by no means certain (though asserted by various writers) that Descartes was acquainted with what had been done by Snell, as the work of the latter existed only in manuscript when the *Dioptrics* made its appearance

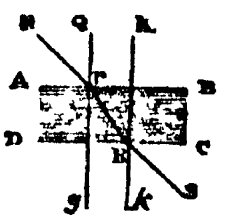
Let *i* denote the angle of incidence, *r* the angle of refraction and let *n* be the constant ratio of the sines in passing from a given medium A into another given medium B, we have then, by the third law above stated, sin *i* = *n* sin *r* for every value of *i* The quantity *n*, which is constant for the same two media, is greater than unity when the refracting power of the first medium A is less than that of the second B and *vice versâ* Its value must be determined in every case by experiment, and as it is relative to both media, it is convenient for the purpose of comparing the refractive powers of different substances to refer them all to some common medium A, usually assumed to be an absolute void, and in this case the quantity *n* is called the principal index of refraction of the medium B or simply *the index of refraction*. We have therefore this definition —



The index of refraction of any transparent substance is the ratio of the sine of incidence to the sine of refraction, when light passes from a vacuum into the substance

As there is no known substance of such a nature that light entering [illegible] the angle of [illegible], the index of refraction is always greater than unity Of all known substances, that which possesses the greatest refractive power is chromate of lead, for which the index of refraction is 3, hence in the equation sin *i* = *n* sin *r*, all the values of *n* which have yet been experimentally determined lie between 1 and 3

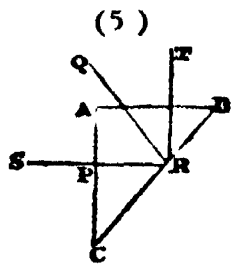
From the formula sin *i* = *n* sin *r* some remarkable consequences are readily deduced Suppose *i* to have its greatest value, namely 90°, in which case the incident ray becomes parallel to the surface of the medium We have then sin *i* = 1, and the formula becomes 1 = *n* sin *r*, whence sin *r* = 1 — *n*, which is the limiting value of *r*. In the case of water the index of refraction *n* = 1 336 (or nearly $\frac{4}{3}$), and the arc whose sine is the reciprocal of this quantity is 48° 27′ 40″, consequently light cannot enter water more obliquely than under an angle of 48° 28′



Thus, suppose a vessel A B C D (fig 3) to be filled with water, and a part of the surface A P to be covered over; then on drawing a line P M making with the perpendicular P Q an angle M P Q = 48° 28′, the part A P M D will remain in perfect darkness however the uncovered part of the surface P B may be illuminated

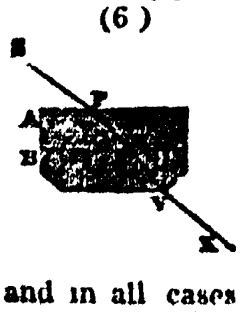
(3)

It is a principle in optics, that if a ray of light passes from a point A to a point B after any number of refractions or reflexions, a ray will pass from B to A by following the same course in an opposite direction From this it follows that if a ray of light S P (fig 4) falling on the exterior surface A B of a medium is refractured into the direction P R, then on arriving at the interior surface C D it will suffer another refraction and escape from the medium in the direction R s making with K k (the perpendicular to C D at R) the angle s R k equal to the angle S P Q With respect to the surface C D, P R K becomes the angle of incidence, and k R s the angle of refraction, and if we suppose the ray to pass from the medium into a vacuum, and n to be the index of refraction of the medium, we have $\sin i = \frac{1}{n} \sin r$



(4)

Now since n is greater than unity, r is greater than i, and if we suppose those angles to increase until r, or the angle k R s, becomes a right [illegible] Then $\sin r = 1$, and we have $\sin i = 1 - n$ for [illegible] value of i, beyond which the ray will not leave the surface at R, for if $\sin i$ be greater than $1 - n$, it follows that $\sin r$ must be greater than unity, which is impossible Hence it follows that if the ray P R fall upon the interior surface making with the normal K R an angle greater than $1 - n$ it will not leave the medium, but be reflected internally from R



This property admits of various practical applications For ordinary glass the value of n is about $\frac{3}{2}$ so that in passing from glass to air we have $\sin i = \frac{3}{2} \sin r$ Now let i increase until $r = 90°$, then $\sin i = \frac{2}{3}$, whence $i = 41° 49′$, which therefore is the limiting value of the angle of incidence when light passes from glass into air Let A B C (fig 5) be a triangular glass prism having the angle at A a right angle, and the sides A B and A C equal, so that B and C are each angles of 45°, and conceive a ray of light S P to fall perpendicularly on the surface A C at P This will continue its course through the glass in a straight line until it meets the side B C in R making with R Q (the normal to B C) the angle of incidence S R Q = 45° But this angle being greater than 41° 49′, the ray will not leave the medium but be reflected at the interior surface in the direction R T which [illegible] are equal, will be perpendicular to S P, and the ray will fall perpendicularly upon the surface A B and pass through it without refraction The prism thus produces the same effect as a diagonal mirror placed in the plane B C

(5)

When the index of refraction for each of two media has been determined, the refraction which takes place in passing from the one medium to the other is also known, the constant ratio of the sines of incidence and refraction being, in this case, the ratio of the [illegible] of the two media Let m be the index of refraction for the medium A, and n the index for the medium B, then, in passing from A into B, we have $\sin i = \frac{n}{m} \sin r$ Thus, the index of refraction for water is 1 336, and for amber 1 547, therefore in passing out of water into amber the constant ratio of the sines of incidence and refraction will be 1 158, the quotient which arises from the division of 1 547 by 1 336 An immediate consequence of this is, that when a ray of light enters a medium after having passed successively through several others, the path of the ray in the last medium will be the same as if it had entered that medium directly under the same angle of incidence as that by which it entered the first and if the media are bounded by parallel surfaces the direction of the ray after escaping from the last surface will be parallel to its primitive direction Thus, let the ray S P (fig 6), entering the medium A at P, be refracted into the direction P R, and on entering the second medium B be again refracted into the direction R V, the path of the ray V X after leaving the second medium will be parallel to S P, provided the surfaces at P and V are parallel, and in all cases the ray will emerge at V under the same angle of obliquity as it entered the first surface at P

(6)

The principles which have now been laid down are sufficient to enable us to compute the path of a ray of light through any diaphanous substance, or through different substances in succession, when the index of refraction belonging to each substance is known The [illegible] (from *Brewster's Optics*, *Cab Cyclopedia*, [illegible] the indices of refraction for the greater part of the substances which have yet been examined

TABLE of the Refractive Powers of Solid and Fluid Bodies.

	Index of Refraction.		Index of Refraction.

Nitrous oxide	1 000505	Oxygen	1 000272
Hydrocyanic acid	1 000491	Hydrogen	1 000138
Muriatic acid	1 000449	Vacuum	1 000000

In the preceding remarks light has been regarded as a homogeneous substance, all the parts of which have the same index of refraction This however, is not the case, refraction never takes place without a separation of the differently coloured rays so that for every transparent body the index of refraction changes with the colour of the light The numerical values of the indices, given in the above table, correspond to the yellow or green rays which occupy the middle of the dispersed pencil For the different refrangibilities of the primary rays, see CHROMATICS DISPERSION SPECTRUM

Double Refraction — The phenomena and laws of refraction which have yet been considered, belong to those cases in which a single refraction takes place on the entrance of light into a different medium, or in which a pencil of light on entering a refracting medium continues to form a single pencil and to afford a single image of the object from which it proceeds There are, however, a multitude of substances which, either in their natural state or under accidental circumstances, exercise a peculiar influence on light causing it, in its passage through them, to follow two distinct paths, forming with each other an angle of greater or less amount Such substances are called [illegible] *ces*, and the phenomenon itself [illegible]

The substances or media which produce only single refraction belong to one or other of the four following classes — 1 Gases and vapours 2 Fluids 3 Substances which have passed from the liquid to the solid state so rapidly as to prevent the molecules from taking a regular crystalline arrangement for example, glass glue, &c, gums, resins &c 4 Crystals whose primitive form is the cube, regular octahedron, or rhomboidal dodecahedron all of which belong to the tessular system of Mohs All the substances in the salts precious stones crystals not belonging to the above-named forms, all bodies belonging both to the animal and vegetable kingdoms, in which [illegible] the [illegible] and [illegible], &c, in general all bodies unequally compressed, or which have not the same structure in all directions, separate the light which they refract into two distinct pencils, which

pursue separate courses, and are governed by totally different laws

Iceland spar (carbonate of lime), having its faces made smooth either by cleav [illegible] be laid [illegible] white paper over a black spot O, then, on looking through the crystal, two spots will be seen, one at O, and the other at F On turning the crystal round on its axis, but always keeping the same face on the [illegible] O, will remain invariable, while the other, F, will appear to describe a circle about O If instead of a round spot the object viewed be a straight line, then, on looking through the crystal, a double image of the line will be seen, one passing through O, and the other through F On turning the crystal as before, it will be seen that the distance between the two lines varies, but that they always remain parallel to each other, and that in the course of a complete revolution of the crystal about its axis there are two positions in which the images will coincide, and two other positions midway between the former in which they will attain a maximum distance These phenomena show that a ray of light S I, on entering the face of the crystal at I, is separated by refraction into two pencils, I O and I F, and it is found that on emerging from the crystals the two pencils make the same angle with the surface, and continue their course in a direction parallel to each other and to the incident ray S I

If we cause a beam of solar light to fall on the crystal, and examine the paths of the two pencils, it will be found that I O follows the laws of ordinary refraction, the sine of incidence [illegible] fraction in a constant ratio, and the [illegible] the same plane with the incident ray and the normal to the surface at the point of incidence hence I O is called the *ordinary* pencil But I E is found to follow an entirely different law, and is therefore called the *extraordinary* pencil If, for example the incident ray S I is perpendicular to the face of the crystal, the ordinary refraction does not take place, the angle of incidence being zero, but in this case the angle of refraction of the [illegible] I E, is 6° 12′, and it is not in the same plane with the normal and the incident ray

From a careful examination of the phenomena it is also found that although a ray of light falling on the face of the crystal is refracted [illegible] there is one particular direction [illegible] which the incident ray undergoes only the ordinary refraction This direction is parallel to A X, the shorter axis of the crystal, and is called the *axis of double refraction* It is therefore, to be observed that the axis of double refraction of a crystal is not a fixed line, but a determinate direction with reference to the faces of the crystal, every line parallel to A X [illegible] axis of double refraction In some crystals the extraordinary ray is refracted *towards* the axis A X, in others it is refracted *from* it In the first case the axis is called a *positive* axis of refraction, in the second it is called a *negative* axis

In the crystal we have now been considering (Iceland spar), there is only one direction in which the double refraction does not take place but in many other crystals there are two directions which have this property In examining the phenomena of double refraction in a great number of crystallized substances, Sir David Brewster found that all those crystals whose primitive and simplest form has only one axis of figure, or one pre eminent line about which the figure is symmetrical have only one axis of double refraction The primitive forms which have only one symmetrical axis of figure are the following —

1 The rhomb with an obtuse summit, as Iceland spar, tournaline, quartz, &c
2 The rhomb with an acute summit, of which form are corundum, sapphire, ruby, cinnabar, and arseniate of copper
3. The regular hexaedral prism, as emerald, beryl, arseniate of lead, &c
4 Octohedron with square base, as zircon, oxide of tin, prussiate of potash, &c
5 Right prism with square base, as arseniate of potash, phosphate of magnesia, &c

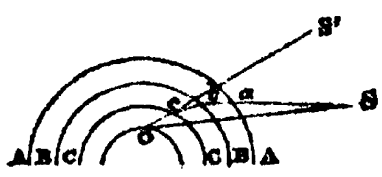
In all [illegible] and in the primitive forms to which they del[illegible] A X is the axis of figure and of double refraction, and it is the only direction in which there is no double refraction (See *Brewster's Optics*, p 149)

The property of [illegible] double refraction was discovered [illegible] in 1815, and he found that it belonged to all crystals, whether chemical bodies or mineral substances, which are included in the prismatic system of Mohs, or whose primitive forms are,

1 A right prism, base a rectangle
2 A right prism, base a rhomb.
3 A right prism, base an oblique parallelogram.
4 Oblique prism, base a rectangle
5 Oblique prism,
6 Oblique prism, [illegible]
7 Octohedron, base a rectangle
8 Octohedron, base a rhomb

In all these forms there is no axis about which the crystal is symmetrical

In all cases of crystals with two axes of double refraction, both the pencils are refracted according to the laws of extraordinary refraction In a substance called analcime Sir D Brewster found there were several planes along which if the incident ray passes it will not suffer double refraction, whatever be the angle of incidence Each of these planes, therefore, may be considered as containing an infinite number of axes of double refraction, or lines in which there is no double refraction. No other substance has yet been found possessing the same property (*Optics*, p 155)



Another very remarkable property is, that in crystals which have only one axis of double refraction the axis has always the same position, being, in fact, in all cases, the axis of symmetry, but in crystals which have two axes of double refraction, [illegible] according to the colour of [illegible] Herschel, to whom this d[illegible] crystals of Rochelle salts the inclination of the two axes for violet light is 56°, while for red light it is about 76° In other crystals, as nitre, the inclination of the two axes is [illegible] violet than for the red rays, but in all ca[illegible]ich joins the extremities of the axes for all the rays is a straight line

The property of double refraction was discovered by Bartholin, in 1669, and was first explained by Huygens on th[illegible] of the propagation of light by means of an[illegible] In The phenomena have been studied with great assiduity in modern times, and, in fact, the investigation of their laws forms one of the principal parts of physical optics, and has mainly contributed towards the establishment of the now generally received theory of undulation Newton does not appear to have paid much attention to the subject, and his theory of emission does not very readily accommodate itself to the explanation of the phenomena, though it must be owned that the supporters of that theory have succeeded, by means of certain arbitrary hypotheses in constructing mathematical formulæ which represent the greater part of the known facts For the complete explanation of all the phenomena, the undulatory theory requires two postulates, or assumptions —1 That the vibrations of the ether take place *transversely* or in the direction perpendicular to the visual ray, and 2 That the elasticity of the medium is unequally developed in the interior of the refracting crystal The first of these assumptions is analogous to what takes place when a blow is given to a cord tightly stretched, the motion is communicated rapidly in the direction of its length while the vibrations are at right angles to that direction With respect to the second assumption, the facts which are known respecting the constitution of crystals render it exceedingly probable, *d priori* All diaphanous bodies which refract light only in a single direction, and according to the Cartesian law, are found to have the same tenacity and the same elasticity in all directions, and their linear dilatations by heat are also the same, but it has been established that with respect to all crystallized substances, which possess the property of double refraction, the elastic force with which they resist compression is greater in certain directions than in others, and also that the linear dilatation corresponding to the same increase of temperature varies with the direction in which it is measured These facts prove that the matter of the crystal possesses an elasticity [illegible] direction, and it is natural to suppose that the other [illegible] must have the same property On these two assumptions [illegible] and unequally developed [illegible], Fresnel has constructed a mathematical theory of double refraction from which all the phenomena which have yet been observed are deduced as simple corollaries (See *Sir J Herschel's Treatise on Light*, *Ency Metropol*, *Airy's Mathematical Tracts*, 2d ed, Poullet, *Elémens de Physique*)

REFRACTION, ASTRONOMICAL Refraction, in Astronomy, [illegible] correction of the celestial [illegible] caused by the refraction of the rays of light in their passage through the earth's atmosphere

It is found by [illegible] that the refractive power of a gas, or aeriform [illegible] is proportional to its density Now the earth's atmosphere is not a medium of uniform density, but of a density continually diminishing as the distance from the earth is increased For the purpose of illustration, the atmosphere may be regarded as composed of a great but finite number of concentric strata, each having a uniform density gr[illegible] of the stratum by which it is enveloped, but less than

that of the stratum which it envelopes Hence on entering each successive stratum the light must undergo a slight deviation from its rectilinear course, and the amount of all these deviations constitutes the phe-

C C, represent the bound-

proceeding from the star S to enter the highest stratum A A obliquely at *a* If no deviation took place, the ray would continue to advance in the same straight line S *a*, but in consequence of entering a denser medium it is refracted, according to the law of Descartes, into a direction, *a b*, more nearly per- the spherical stratum At *b* a greater density, and is refracted into the direction *b c*, still approaching the perpendicular to the surface On arriving at *c* the phenomenon is repeated, and the ray is bent from the direction *b c* to O the ray S O at O the star will appear in the direction S O. Hence the star will appear to have suffered an elevation S' O S, which is the difference between its true and apparent elevations is the *astronomical refraction* become infinitely successive stratum will become infinitely small, and the path of the ray instead of being a polygon will be a curve which, according to the laws of refraction in the same vertical plane

Since the ratio of the sines of incidence and refraction is constant it is evident that the total effect will be the greatest when the luminous rays enter the atmospheric strata with the greatest obliquity, that is to say when the object is seen in the horizon At the zenith there is no refraction, in descending from the zenith to the horizon it continually increases, according to a certain law which may be determined theoretically if the refractive power of atmospheric air at a given density and temperature the dilatation of air by heat and also the law of the variation of the density and temperature in ascending into the higher regions of the atmosphere are supposed to be known At a medium density and at the temperature of melting ice, Biot and Arago found by experiment that for any altitude exceeding 10° above the horizon the law of atmospheric refraction is represented by the formula $r = 60'' 6 \tan (Z - 3 25 \times r)$ in which r is the refraction corresponding to a given zenith distance Z Bradley had given the formula $r = 57'' \tan (Z - 3 25 r)$ From either of these it appears that the increase of refraction is nearly proportional to the tangent altitudes the expression

The following table given by Mr Ivory (*Phil Transactions* for 1838, part 2) shows the amount of refraction at different zenith distances the temperature being 50° of Fahrenheit and the height of the barometer 30 inches The correction (omitting some small terms) for the actual temperature and barometric pressure is obtained by multiplying the tabular refraction by $\frac{1}{1 + c\,(t - 50)} \cdot \frac{b}{30}$, where b is the observed height of the barometer reduced to the fixed temperature of 50° Fahr t the temperature of the air on the same scale, and $c = 002183$

Zenith Distance	Refraction	Zenith Distance	Refraction
10°	10 30″	82°	394 8″
20	21 26	83	441 42
30	33 72	84	50 86
40	48 99	85	593 96
45	58 36	85½	646 21
50	69 52	86	707 43
55	83 25	86½	779 92
60	100 85	87	866 76
65	124 65	87½	971 03
70	159 16	88	1101 35
75	211 70	88½	1262 6
80	320 19	89	1466 8
81	363 79	89½	1729 5

The existence of astronomical refraction was known at an early period, though its amount and laws have only been ascertained in recent times Ptolemy, in his book on *Optics*, remarks that in consequence of refraction a star is brought nearer the zenith, and that the effect is greater in the case of a low than a high star, but as no mention is made of the subject in the *Almagest*, it was not then regarded as an element of astronomical calculation Similar notions appear in the *Optics* of Alhazen Walther was the first who began to estimate the effects of refraction near the horizon, and Tycho Brahe constructed, from observations, the first table He supposed the horizontal refraction to be 34′, which is very near the truth (its mean amount being 33′), but he supposed it vanish at the altitude of 45°, though its mean amount that altitude appears, by the preceding table, to be near 1 minute Dominic Cassini gave an empirical formula f computing the refraction at any altitude but the solution of the problem on true principles was first undertaken and successfully accomplished by Newton though h results did not represent the observations, in consequence of the imperfect knowledge which then existed respecting the physical constitution of the atmosphere

REFRACTION TERRESTRIAL The atmospherical refraction, which has just been explained, is the effect produced by the whole atmosphere on a body placed entirely beyond it, but as the density of the atmosphere varies with the height, it is evident that the apparent place of any object placed on a different level from that of the observer must be affected in a greater or less degree by refraction Whether the rays of light come from a more elevated object, and consequently pass from a rarer into a denser medium, or from an object depressed below the horizon of the observer, and consequently pass from a denser into a rarer medium, they are equally bent downwards, and consequently the apparent place of the object is raised This refraction between terrestrial objects is called *terrestrial refraction*, and the density of the air near the surface of the earth liable to great irregularities from being irregularly heated its effects give rise to many very remarkable phenomena Among these are *looming* or *mirage*, the *fata morgana* (see the terms), and horizon of distant ob the atmosphere are invisible Sometimes in consequence of the rarefaction of the air in the neighbourhood of surface of water or of a building or of the earth itself distant object appears to be depressed instead of being elevated, and occasionally it is at once both depressed and elevated so as to appear double in which case one of the images is generally seen in an inverted position, as a reflexion had taken place In very exact observations in geodetical surveys it is found that the refraction is not always confined to the same vertical plane but sometimes produces a deviation amounting to a few seconds laterally

REFRACTIVE POWER in Optics is the degree of influence which a diaphanous body exercises on the light which passes through it For the measure of this influence modern writers generally adopt the square of the index of refraction diminished by unity or $n^2 - 1$, where n denotes the principal index of refraction (See REFRACTION) The reason of this is founded on certain dynamical considerations regarding the physical cause of refraction According to the Newtonian theory of emission the velocity of light is accelerated on entering a denser medium by reason of the increased molecular attraction, and the law of refraction is explained by supposing the index of refraction of any substance to be the ratio of the velocity of light in that substance to its velocity in a vacuum Thus let u denote the velocity of light in a vacuum and v its velocity while passing through a diaphanous substance, then $v - u = n$, or since $\sin - \sin r = n$, the sine of incidence is to the sine of refraction inversely as the velocity in a vacuum to the velocity in the medium Now the increment of the *vis viva* or the excess of the square of the new velocity above that of the former, is $v^2 - u^2$, and the ratio of this to the square of the former is $(v^2 - u^2) \div u^2$, which is the same as the ratio of $n - 1$ to unity

According to the undulatory theory, the velocity of light is diminished on entering a denser body In this case, $u^2 - v^2$ is the loss of *vis viva*, and the ratio $(u^2 - v^2) \div v^2$ or $n^2 - 1$ to 1 is the ratio of *vis viva* which is lost to that which is retained In either case, the ratio $n - 1$ to 1 forms the measure of the *refractive power* of the substance of which n is the index of refraction

Some modern authors employ the phrase *absolute refractive power* to denote the ratio of the refractive power of a substance (as above defined) to its density, that is to say, the ratio $(n^2 - 1) \div D$ where D stands for the density of the body Sir Isaac Newton (*Optics*, p 247) calls this the 'refractive power of a body in respect of its density,' and as it is a consequence of the theory of emission that the refractive power must be proportional to the density the ratio $(n^2 - 1) \div D$, according to the theory, is constant for the same medium, that is to say its numerical value depends only on the nature of the medium, and is independent of its condition, so that liquid and its vapour ought to have the same absolute refractive power, which is contradicted by the experiments of Arago and Petit

The French authors use the term *puissance réfractive* to denote the refractive power, or the number $n^2 -$ while they express the *absolute refractive power*, or the ratio $(n^2 - 1) \div D$, by the term *pouvoir réfringent* It is convenient to have different terms to express two things which are totally different, at least in their numerical measures Thus hydrogen gas has a smaller index of refraction, and consequently a smaller refractive power

than any other substance, but its *absolute refractive power*, or *pouvoir refringent*, is greater than that of any other substance (For a table of the values of the ratio $(n^2 - 1)$ D for a considerable number of different substances see *Brewster's edition of Cab Cyclopædia*)

REFRAIN [illegible] a song, &c *See* BURDEN

REFRANGIBILITY in Optics, is the disposition of the rays of light to be refracted or bent in passing obliquely from one transparent medium into another, but the term is chiefly used to denote the degree of that disposition possessed by the differently coloured rays *See* REFRACTION SPECTRUM

REFUGE, CITIES OF Six cities appointed, according to the words of Moses, under the Jewish dispensation (Deuteron xix 2 9), for the safety of those who had caused the accidental death of any one If a deliberate murderer fled to one of these cities, the elders of the city were to deliver him "into the hands of the avenger of blood." The cities are enumerated in Joshua, chap xx

REFUGÉE A name which has been given in history and political phraseology indiscriminately to persons who flee from religious or political persecution in their own country, and take refuge in another It was originally applied to the French Protestants (refugies) who found an asylum in this country, and among various Continental nations, after the revocation of the Edict of Nantes by Louis XIV

REGALIA (Lat rex, *a king*) In Politics, the privileges, prerogative, and right of property, belonging in virtue of office, to the sovereign of a state The latter class of objects are most commonly termed *regalia minora*, as, in some countries, wrecks strays and newly-formed land &c, in England, forfeitures &c while the former are known by the epithet *majora Regalia* in English Heraldry, the royal insignia crowns sceptres, globes, crosses, &c used at the coronation also the crown jewels *Regalia* of the church, the privileges which have been conceded to it by kings, sometimes the patrimony of a church

REGARDANT (Fr) In Heraldry literally looking behind, applied to any animal whose face is turned towards the tail in an attitude of vigilance

REGATTA (Ital) A word used originally by the Venetians to signify a grand fete in which the gondoliers contested for superiority in rowing their gondolas, but the term has been adopted into all the languages of modern Europe, in which it signifies a brilliant species of boat race In England festivities of this species are almost of weekly occurrence during the summer season

REGEL or RIGEL A star of the first magnitude, [illegible] left heel of the constellation Orion

REGENERATION In Theology the new birth of man unto [illegible] the abolition of the original [illegible] similar language was used respecting the admission of proselytes to the privilege of Judaism so, also, in other religions The Sanskrit name for a Brahmin is said to signify 'twice born,' and Tertullian says that the heathens used baptism in their mysteries, 'in regenerationem.' When our Saviour admonished Nicodemus not to marvel at his words Ye must be born again, he added, with reference, doubtless to the doctrines already taught among the Jews, Art thou a master of Israel, and knowest not these things? (John, iii 10) That baptism is a sign [illegible] as expressed in the 27th Article of the [illegible] is admitted by nearly all Christians (Rom vi 4 11, Tit iii 5, John iii 5) But whether the new birth to which allusion is made in these solemn passages actually takes place by and through baptism whether baptism, duly administered by those authorized is in itself an "opus operatum," in the language of the schools, or whether the regeneration spoken of is the condition of our salvation takes place after, and independent of baptism, by the operation of the Spirit on the inner man—this is a question on which Protestants have never agreed among themselves, and which divides our church at this day The former is the commonly received or Catholic doctrine, and has been so from very early times, as far as we can conclude from the language of the fathers and ancient forms of the church But it does not appear to be positively declared by the Church of England, though inferred from various passages in the baptismal service

REGENT (Lat rego, *I govern*) The person who exercises the powers of a sovereign during the absence, incapacity, or minority of the latter In most hereditary governments the maxim is, that this office belongs to the nearest relative of the sovereign capable of undertaking it, but this rule is subject to many limitations The kings of France exercised at various periods the power of fixing, by ordinance or will, the regency, in case of their decease leaving issue under age, and also the period of their son's majority Nevertheless, these wills have been at various times disregarded in favour of what was esteemed the principle of the monarchy Thus, the testament of Louis XIII, by which he declared his wife future regent, but limited her power in the essential prerogative of the choice of a council, was set aside as to this particular and she was appointed regent with full prerogatives The testament of Louis XIV, as to a regency during the minority of Louis XV, was set aside by the parliament of Paris immediately after his death In England, the right to appoint the regent is now fully recognized to belong to parliament although in 1788, on the occasion of the illness of George III much discussion took place as to the absolute right which some supposed to inhere in the heir apparent The regency, in the event of the demise of the present sovereign leaving issue, is vested by act of parliament in her Majesty's consort

REGENT MASTERS, or REGENTS In the English Universities, a term borrowed from the ancient usages of the University of Paris In that institution graduates in the faculties within a certain period after their degree, had the privilege, which they were bound to exercise of giving public lectures (docendi, legendi, regendi scholas) The same custom was adopted at Oxford and Cambridge, although the regent masters were at an early period succeeded in the performance of this office by the established professors The regents still form the governing body of the universities, in the convocation and [illegible] of [illegible]

REGICIDE (Lat rex, *king*, and cædo, *I kill*) The offence of slaying a king or other sovereign The early Greek republics, unaccustomed to the legitimate rule of monarchs, saw, in the occasional subjugation which they underwent from successful partisans, a mere usurpation, or tyranny, and tyrannicide was with them only the slaying of a public enemy And the hatred which attached itself in the minds of the Roman people to the royal name and authority made them regard the acts of the elder and younger Brutus, even to the latest days of the republic, and long after the establishment of the empire as virtuous and honourable Hence the perverted morality on this peculiar subject which continues to prevail, more or less even to the present day as false in logic as contrary to the plain rules of conscience, for it is obvious that to each individual, a wealthy or powerful oppressor, who commits injuries against him and his friends for which the law can give him no redress, is just as fair a subject for illegal vengeance as a king to any member of the community Yet no one ever sought seriously to set up the right of assassination in such cases, as Buchanan, Languet Mariana and others have done in that of kings English history has three notorious instances of kings (Edward II Richard II and Edward V) murdered by powerful and rebellious subjects But France, above all other countries is fertile in examples of regicide, effected or attempted by private individuals under the influence of religious and political fanaticism Henry III and IV both fell by the hands of Roman Catholic zealots The reader will find in the Discourse of Père Mathieu on the Death of the latter (lately republished in *Cimber, Archives curieuses*) a singular example of the fanaticism of cruelty in the way of retaliation, excited, and not unnaturally by the repetition of such monstrous and desperate acts But the savage execution of Ravaillac did not deter Damien in the reign of Louis XV, from attempting the life of the king from the same motives The assassination of the Duke de Berri and the repeated attempts on the life of Louis Philippe from political enthusiasm, show but too plainly that the morbid passions which actuate [illegible] of Sweden by Ankarstrom is perhaps, the most deliberate instance of this crime on record, for the criminal, though rancorous and determined, was no zealot It must be added that the application of the term regicide to the members of the commission which sat in judgment on Charles I, and to the majority of the convention which condemned Louis XVI, is a violation of that moral sense which judges unerringly of actions, whatever the character of their conduct might be, it was altogether different from assassination, and to confound Vane or Carnot with Ravaillac and Fieschi, under a similar designation, can serve no ends but those of temporary party malice

REGIMENT (Lat rego *I rule*) A body of troops consisting (if infantry) of several battalions, or (if cavalry) of several squadrons, under the command of a colonel The British army consists, at present, of three regiments of horse guards [illegible] regiment of cavalry, of which four are heavy dragoons, five light dragoons, four hussars, and four lancers, three regiments of foot guards, divided into the grenadier guards, the Scots fusiliers, and the Coldstream guards, and ninety-nine regiments of infantry, exclusive of the royal regiment of artillery, and the royal corps of marines Many of the regiments in the British army are distinguished by the name of the counties or districts where the men were originally enlisted Thus the 3d regiment is called the

East Kent regiment, the 6th, the Royal Warwickshire, &c &c. No rule is established with regard to the number of men of which a regiment should consist both in England and on the Continent this point is settled either by the exigencies of service in time of war, or the principles of economy in time of peace In the British army, the three regiments of horse guards consist at present each of 32 officers, 53 non-commissioned officers, 351 privates, and 274 horses The ordinary cavalry regiments have each at an average 27 commissioned officers, 31 non-commissioned officers, 304 privates, and 283 horses The grenadier regiment of guards consists of three battalions, and has 96 officers, 177 non-commissioned officers, and 2080 privates The other two regiments of [illegible] and have each officers [illegible] and 1280 privates The [illegible] consists of nine battalions having 41 [illegible] commissioned officers and men, exclusive of the horse brigade the engineers, and sappers and miners (*Stat of the Brit Empire*, vol ii p 433)

REGISTER, LORD, or LORD CLERK REGISTER A Scottish officer of state who has the custody of the archives, hence also termed custos rotulorum He was of old the principal clerk of the kingdom, from whom other clerks derived their authority The office was formerly at pleasure, but since 1777 for life Salary 1200*l* a-year He is assisted in his duties by a resident deputy

REGISTRY OF BIRTHS, MARRIAGES AND DEATHS Down to the year 1836, in consequence of the defects of the system of registration, no complete or accurate information could be obtained as to the amount of births, marriages, and deaths throughout England, but at that period the necessity of having it superseded by a better system was admitted, which was finally accomplished by the act 6 & 7 Will 4 c 80

This act, passed in pursuance of the recommendation of a committee of the House of Commons on parochial registers 1833, [illegible] tration of births deaths and marriages [illegible] Wales To give effect to [illegible] under the superintendence of an officer resident in London, and there also a central place of deposit is provided for certified copies of all parochial registers with ready means of finding any entry in them It is provided that in every case of *birth* the following circumstances shall be recorded — viz the time and place of birth, the name (if any) and sex of child, name and surname of father, name and maiden surname of mother, rank or profession of father, the signature, description, and residence of the informant, and also the baptismal name of child if added after registration of birth In every case of *death* the register is to record the time and place of death, the name and surname sex, age, and rank or profession of the deceased, *the cause of death*, and the signature, description and residence of the informant In all cases the entries must be signed by the informant, and also by the registrar, who discharges this duty without any immediate expense to the parties requiring registration, his remuneration being derived from moderate fees paid out of the poor s rates The insertion of the cause of death, along with the period of [illegible] and occupation of the deceased [illegible] of the utmost importance to medical science, and to the improvement of vital statistics

The central office in London for the deposit of certified copies of registers, and the general supervision and conduct of the business of registration, is called the General Register Office It is presided over by a registrar-general appointed under the great seal having under him an assistant registrar, chief clerk, and a numerous body of subordinate clerks From this office communications [illegible] all [illegible] registrars of births and deaths, [illegible] riages who all act within their respective districts under [illegible] registrar general, in whom is vested [illegible]

There are upwards of 600 superintendent registrars who may each appoint a deputy, with the approval of the registrar general Each superintendent registrar [illegible] to which he is appointed, which [illegible]

There are upwards of [illegible] who may each appoint a deputy [illegible] guardians or of the poor law [illegible] registrar is appointed to some one of the registrars' districts, into which the whole of England and Wales has been divided and he must reside in that district, and register *all* births and deaths that occur in it

Marriages are registered, 1st, By clergymen of the established church of whom about 12,000 have been furnished with books for this purpose 2dly, By registrars of marriages of whom there were, on the 1st of January, 1840, about 1000; these last are appointed by the superintendent registrars, and register marriages solemnized in their presence in registered places of worship, or in the superintendent registrar's office 3dly, By the registering officers of Quakers And 4thly, By the secretaries of synagogues

The clergymen and the various officers, amounting in all to about 19,000 to whom the business of registration is committed are bound to make quarterly deliveries of *certified copies* of all entries in their respective registers during the previous quarter, to the superintendent registrars of the district to which they respectively belong, and these certified copies are transmitted by the superintendent registrars to the registrar-general. The certified copies are made on separate leaves of paper of a uniform size and peculiar texture, having a distinguishing water-mark On being received at the general register office in London (whither they are sent by post), they are carefully examined, and any defects being noted are made the subject of communication with the person from whom [illegible] ther to furnish [illegible] They are then arranged, paged, and inserted in books for reference

Alphabetical indexes of births, deaths, and marriages are prepared and kept in the general register office, and any person, on payment of 1*s*, may search these indexes for any entry, and on finding it may, if he wish, obtain for 2*s* 6*d*, a stamped copy of such entry, which will be "received as evidence of the birth, death, or marriage to which the same relates, without any further or other proof of such entry" There are separate alphabetical indexes for the births, the deaths, and the marriages in each quarter The registrar-general is bound to furnish, once a year one of the principal secretaries of state with a *general abstract account* of the births, deaths, and marriages registered during the foregoing year to be laid before parliament The first of these was prepared in 1838 They have since been continued with various improvements and in a statistical point of view, the sound accurate, and judicious information which they embody cannot be too highly appreciated (*Stat of the Brit Empire*, vol i pp 410—430)

The act 6 & 7 Will 4 c 86 does not extend to Scotland and the Scotch registers of births, marriages, and deaths are so exceedingly defective that, except in a very few parishes they are good for nothing In Ireland the act 7 & 8 Vict c 81 provides for the registration of marriages but the registers of births and deaths in Ireland are if possible in a still worse state than in Scotland Some steps should be taken to place these portions of the empire on a level with England

REGISTRY OF DEEDS, in Law, exists in England only in certain districts, in the three ridings of Yorkshire, and in Middlesex it is established by act of parliament It does not extend to copyhold estates, or to leases not exceeding twenty-one years in possession The intention of the registry was to give notice to purchasers of incumbrances existing on estates But its value in this respect is materially lessened by the prevalence of the equitable doctrine of *notice*, namely, that where a party is either actually or constructively, aware of incumbrances not registered, he is bound by such knowledge

REGISTRY OF SHIPS *See* SHIPS, REGISTRY OF

REGIUM DONUM (Lat *royal gift*) An annual grant of public money in aid of the maintenance of the Presbyterian clergy in Ireland It was instituted by William III in 1690 and remodelled in 1790 The stipends are paid to ministers both of the "Synod of Ulster" and "Seceding Synod," the two principal divisions of the sect

REGIUS PROFESSORS The name given to those professors in the English universities whose chairs were founded by Henry VIII In the Scotch universities, in [illegible] regius professors who have been appointed by the crown

REGLET (Lat regula) In Architecture *See* FILLET

REGRATING *See* FORESTALLING

REGRESSION [illegible] In Astronomy, the *regression of the nodes* is the motion of the line of intersection of the orbit of the moon with the ecliptic, which is retrograde, or contrary to the order of the signs This motion of the nodes of the lunar orbit takes place with considerable rapidity, the whole revolution being accomplished in about 18½ years The nodes of the planetary orbits also regress on the ecliptic, but, in the case of the planets, the regression is extremely slow, that of the nodes of Mercury, which is the most rapid, amounting only to about 42 seconds of a degree in a solar year *See* NODE, PLANET

REGULAR BODIES *See* PLATONIC BODIES

REGULAR FIGURES, in Geometry, are equilateral and equiangular polygons Circles can be described within and about such figures but such figures can be described by geometrical methods only in particular cases General expressions for the radii of the circles

described within and about them (r and R), and for their areas and ratios (which however be given in terms of π). The [illegible] if $u°$ represent the nth part of 180°, we shall have, a being the side, $R = \frac{1}{2} a \operatorname{cosec} u°$, $r = \frac{1}{2} a \cot u°$, area $= \frac{1}{4} n a^2 \cot u°$

Tables of the values of cosec $u°$ and cot $u°$, computed from these expressions, may be seen in most works on [illegible] the values of n as far as 12 (See *Hutton's Mensuration*).

REGULARS In the Roman Catholic Church, those that profess and follow a certain rule of life, and observe the three vows of poverty, chastity, and obedience, are so called

REGULA'TOR In Machinery, a general name for any contrivance of which the object is to produce the uniform movement of machines The regulators most commonly applied are the *fly* and the *governor*, for which see the respective terms

The regulator of a watch is the spiral spring attached to the balance This ingenious contrivance, the invention of Hooke, has contributed as much to the improvement of watches as the pendulum to the improvement of clocks

In a paper published in the *Memoirs of the Royal Astronomical Society*, vol xi, the present Astronomer Royal has investigated the mathematical problem of the motion of the regulator applied to the clock-work by which motion is given to large equatorial telescopes For this purpose absolute uniformity of motion is of very great importance The construction usually adopted, in this country at least, depends on the same principle as that of the governor of the steam-engine Two balls suspended from the upper part of a vertical axis by rods of a certain length, are made to expand by the rotatory velocity of the axis, and when the expansion reaches a certain limit, a lever is pressed against some revolving part, whereby a friction is produced which immediately checks the velocity Now the uniformity of the rotatory motion of the spindle depends upon the assumption, that if upon the whole the retarding forces are equal to the accelerating forces the balls will move in a circle and in no other curve But this assumption is incorrect, for the balls may move in a curve differing insensibly from a circle; and, in some instances Mr Airy observed the balls to revolve in an ellipse of considerable eccentricity When this takes place the rotatory motion of the spindle becomes exceedingly variable This injurious effect may be partly counteracted by [illegible] apparatus so that the revolutions [illegible] or very quick, the former method has the effect of giving greater smoothness of motion, but the second insures more completely that the object observed shall remain steady in the field of the telescope

REGULUS In Chemistry The old chemists designated several of the brittle or inferior metals by this term when freed from impurities and obtained in their metallic state it is thus that they speak of *regulus of antimony of bismuth* &c

REHABILITATION, in Foreign Criminal Law is [illegible] he has lost by [illegible] a pardon from the king is said to rehabilitate a witness labouring under *infamia juris* In France persons condemned to imprisonment or compulsory labour may demand their rehabilitation five years after the expiration of their penalty the demand is considered by the cour royale of the district, and pronounced upon by the king in his privy council Various singular forms were attached to the process of rehabilitation in ancient times There are extant letters of Charles VI given in 1383, permitting a criminal whose hand had been cut off for homicide to replace it by another made in such fashion as he may choose

REHEARSAL The recital in private of an opera, oratorio, or, in short, any dramatic work, previously to public exhibition

REIN DEER (Germ rennthier) *Cervus tarandus*, Linn A large species of *Cervus* with branched, recurved, round antlers, the summits of which are palmated These antlers are remarkable for the size of the branch which comes off near the base, and is directed forwards, called the brow-antler, and which is said to be used by the animal to clear away the snow from the hidden lichens which constitute the food of the rein-deer during the long and severe winter of Greenland, their native clime As the female also possesses antlers of similar form, but smaller upon the whole than those of the male, their function as instruments to obtain food is rendered more probable, since in the deer which do not [illegible] These appendages [illegible] and forward [illegible]

The length of the [illegible] that of the head is fifteen inches They are well clothed with hair, which becomes thicker, longer, and of a whiter colour in the winter season, at which time the male has a white beard, like the goat The rutting season is at the beginning of winter, and the hind [illegible] one, rarely two calves in May or June

The rein-deer is swift of foot, sharp-sighted, has an acute smell and hearing It is more cautious and timid in herds than when solitary It can swim well, and often crosses lakes and rivers

The flesh of the rein-deer, which is held in great esteem by the Greenlanders, is usually eaten raw, or dried with the smoke of the *lichen nivalis* The blood is boiled with berries mixed with the fat, which is also preserved separately and used as lard The half-digested contents of the paunch of the rein-deer is the Greenlander's prime luxury, nor is the trail rejected The hide of the rein-deer supplies the Greenlander with a beautiful material for his tent, his clothing, his bedding The bones and antlers are worked into implements for domestic use, for fishing and hunting The tendons are split into threads

The Greenlanders likewise use the spare hides of the rein-deer as an article of barter

REINECKE (The Fox) The name of a celebrated popular German epic poem, which, during the latter part of the middle ages and the early centuries of modern times, enjoyed an almost European reputation It became first known through the medium of a Low German version in the 15th century, and it has, with few interruptions, ever since involved the German literati in discussions as to its origin, which are yet apparently far from being settled It contains a humorous and satirical account of the adventures of Reinecke (the fox) at the court of King Nodel (the lion), exhibits the cunning of the former, and the means which he adopted to rebut the charges preferred against him, and the hypocrisy and lies by which he contrived to gain the favour of his sovereign, who loaded him with honours The king the officers of his court, and all his subjects are represented, as in *Æsop's Fables*, under the names of the animals best suited to their respective characters, and the poem is an admirable satire on the intrigues practised at a weak court The most successful versions of this poem are those of Goethe, in hexameters, of Soltau, in the measure of the original, and the more recent attempt of Ortlepp This poem appears, in some form or other, to have been known throughout Europe For full information respecting it the reader may consult Meon (*Roman du Renard* Paris 1826), and the *Reinhart Fuchs* by Jacob Grimm (Berlin, 1834)

REINFORCE, in Artillery, is that part of a gun nearest to the breech, made stronger to resist the explosive force of the powder *See* GUN

REINFORCE RINGS are flat hoop-like mouldings on the reinforces on the side nearest the breech There are usually two, the second being rather smaller than the first

REIS-EFFENDI The name given to one of the chief Turkish officers of state He is chancellor of the empire and minister of foreign affairs, in which capacity he negotiates with the ambassadors and interpreters of foreign states

REITERS (Germ reuters, *riders*) The German cavalry of the 14th and 15th centuries were so called, especially in France during the religious wars, in which they served on the Protestant side At that period they were lightly armed and carried a long sword and carbine

REJOINDER In Law, the fourth stage in the pleadings in an action being the defendant's answer to the plaintiff's replication The next allegation of the plaintiff is called *surrejoinder* *See* PLEADING

RELAIS In Fortification, a narrow walk of four or five feet wide, left without the rampart to receive the earth which may be washed down and prevent its falling into the ditch It is sometimes for greater security palisaded

RELAPSE (Lat relabor, *I fall back*), is applied, in Ecclesiastical Law, to a heretic who falls back into an error which he has abjured

RELATION, INHARMONIC In Music, a term [illegible] is introduced which was [illegible]

RELEASE [illegible] Law, signifies, properly speaking a discharge of a right *e g* 1 A release of land is a discharge or conveyance of a man's right in lands and tenements to another that has some former estate in possession, on which principle the common mode of conveyance by lease and release is founded, *i e* releasing all the right of the releasor to a party already in possession under a lease for a year 2 A release of a right of action, which may be pleaded in bar (*See* PLEADING) A release "of all demands" discharges all sorts of actions, rights, titles, conditions, executions, appeals, covenants, contracts, [illegible] recognizances, &c

RELICS [illegible] the Romish Church, are the remains [illegible] or of their garments, &c, which are supposed to be held in veneration and are considered in many instances to be endued with miraculous powers They are preserved in the churches, to which they are often the means of attracting pilgrimages,

and in very ignorant times and places have been actually made objects of adoration The virtues which are attributed to them are defended by such instances from scripture as that of the miracles that were wrought by the bones of Elisha (2 Kings, xiii 21)

RELIE'F, in Feudal Law, is derived from the Latin relevare, *to take up*, because the tenant, by payment of the relief, was said to take up the fief which had fallen to the lord by the death, &c of his predecessor "The heir," says Blackstone, "when admitted to the feud which his ancestor possessed, used generally to pay a fine or acknowledgment to the lord in horses, arms, money, or the like for such renewal of the feud, which was called a relief, because it raised up and re-established the inheritance or, in the words of the feudal writers, 'incertam et caducam hæreditatem relevabat'" Reliefs, together with the other incidents of feudal tenure were abolished in England by stat 12 Car 2 *See* FEUDAL SYSTEM

RELIEF In Architecture, the projection of a figure or ornament from the ground or plane on which it is sculptured In Sculpture, when the whole of the figure stands out, the work is denominated *alto-rilievo*, when only half out, *demi-rilievo*, and when its projection is very small it is called *basso rilievo*

RELIEF *Rilievo* In Sculpture that species of sculpture in which the figures are engaged on or rise from a ground There are three sorts of *rilievo*, — *basso-rilievo*, in which the figures or other objects have but small projection from the ground on which they are sculptured, *mezzo rilievo*, in which the figures stand out about half their natural proportions the other half appearing immersed in the ground, and lastly *alto-rilievo* in which the figures stand completely out from the ground being attached to it only in a few places and in others worked entirely round like single statues such are the metopæ of the Elgin marbles in the British Museum which marbles also in the Panathenaic procession exhibit some exquisite examples of basso rilievo

RELIEF SYNOD A respectable body of Presbyterian dissenters in Scotland whose ground of separation from the established church was the violent exercise of lay patronage which obtained in the latter Though patronage, or the appointment of clergymen to church benefices by presentations had been established by act of parliament in 1712, yet a minority of the clergy were opposed to that measure, at least to the intrusion of a minister into a parochial charge contrary to the sentiments of the people The majority of the church however, entertained different views and rigorously enforced the provisions of the act of 1712 With this state of things the people generally but particularly in rural districts were dissatisfied, and hence the origin of the Secession church, and the Relief *See* BURGHERS

The origin of the Relief may be dated in 1752 Six of the ministers of the Presbytery of Dunfermline having refused, contrary to the express authority of the General Assembly of the Church of Scotland to assist at the admission of Mr Richardson to the parish of Inverkeithing (the people being unwilling to receive him as their pastor), were summoned before this venerable court for contumacy They pleaded conscientious scruples, but this representation had no effect on the assembly, and, as an example to the church one of the six recusants was peremptorily deposed from the office of the ministry, while the remaining five were suspended Mr Gillespie minister of Carnock, the individual deposed, still claimed his pastoral relation to his flock, and though deprived of the use of the parish church preached in the fields, attended not merely by his former hearers, but by many others attracted by the peculiar circumstances of the case A chapel was afterwards built for him in the neighbouring town of Dunfermline, where he continued to preach till his death, and to oppose the law of patronage in the church Mr Gillespie for a few years stood alone, but in consequence of the violent settlement of a clergyman in the town of Jedburgh, the great body of the people of that place, forsaking the established church, gave a call (1759) to Mr Thomas Boston, minister of a neighbouring parish, to be their pastor Mr Boston, for whom they erected a chapel, accepted the invitation and withdrew from the church of Scotland Owing to exactly similar circumstances, the people of the parish of Kilconquhar in Fifeshire, followed the example set them in Jedburgh, and chose Mr Collier to be their minister On the 22d of November, 1759, Mr Gillespie and Mr Boston, with a lay elder from each of their congregations, met in a presbyterian capacity at Colinsburgh, in the last-mentioned parish, to induct Mr Collier to his charge On the evening of the same day these three ministers met and agreed to [illegible] gained accession to their number [illegible] to those which we have already detailed, and at length formed themselves into a synod, which at this date (1851) embraces eleven presbyteries, including 116 congregations being, in point of numbers and influence, the third ecclesiastical body in Scotland The founders of the Relief professed to differ from the established church on no point other than the right of patrons to appoint ministers against the inclinations of the people This still constitutes the leading characteristic of the sect, but on this they have engrafted voluntary church principles, or are hostile to the principle of a national church, or to state endowments of religion The Secession and Relief have been long engaged in considering overtures made mutually to each other for forming a union of [illegible] The Relief Synod have a professor of [illegible] own connection (*Smith's Hist Sketches of the Relief Church*, *Hutchison's Compendious View of the Synod of Relief*, *Adam's Relig World Displayed* vol iii p 223—32, *M'Kerrow's Hist of Secession* v i p 319—21 326—28)

RELIEVING TACKLES Temporary tackles attached to the end of the tiller in bad weather to assist the helmsman, and in case of accident happening to the tiller ropes They are also strong tackles from the wharf to which the ship is hove down, passed under her bottom and attached to the opposite side to assist in righting her afterwards, as well as to prevent her from oversetting entirely

RELIQUARY A receptacle for the relics venerated in Roman Catholic churches The difference between a *reliquary* and a *case* (Fr châsse) used for the same purpose is that the former is smaller in dimensions, and contains only small fragments, the latter in many instances entire bodies

REMAINDER The difference of two quantities left after the less is subtracted from the greater

REMAINDER A *remainder* in Law, is a future estate in lands tenements or hereditaments, limited to arise after the determination of another estate, as if land be granted to A for twenty years and afterwards to B and his heirs for ever B has a remainder in fee An estate in reversion is the residue left in the grantor, to commence in possession after the determination of some particular estate granted out by him as if A being seised in fee-simple gives to B and his heirs male of his body (thus creating an estate tail) on the failure of such heirs male the land given reverts to A, who therefore, prior to such failure has an estate in reversion in the lands Remainders are either *vested* or *contingent*, vested or *executed* where the estate is invariably fixed to remain to a determinate person after the preceding estate (called the *particular* estate) is spent In this case, the remainder man has a present interest, to be enjoyed *in futuro* Contingent remainders otherwise called *executory* are defined to be where the estate in remainder is limited to take effect either to an uncertain person, or upon an uncertain event so that the particular estate may chance to be determined and the remainder never take effect The doctrines of law with reference to these estates have gradually been moulded into a system so intricate and replete with the most refined distinctions, that it would be impossible to give a cursory view of this branch of our jurisprudence An instance of a vested remainder is to be found in the example before cited of an estate granted to one party for a term of years, and afterwards to another in fee-simple A contingent remainder limited to an uncertain *person* is where for instance, there is an estate to A for life and afterwards to B's eldest son (the unborn) [illegible] of future possible [illegible] tion by way of remainder or executory devise (as a grant of a contingent remainder by will) shall be good which is to take effect after the determination of a life or lives in being and 21 years (the period of minority) afterwards An instance of a contingent remainder limited on an uncertain event is where land is given to A for life, and in case B survives A then to B in fee

The particular estate which precedes (in legal language *supports*) a vested remainder may be either of years, or of freehold to support a contingent remainder it must necessarily be of freehold

REMBLAI (Fr) A term used in Fortification to denote the earth or materials used in filling up a trench or excavation It is opposed to *deblai*, which denotes the materials excavated

REMEMBRANCERS Officers of the Court of Exchequer, who perform various functions, the chief of which is to put the judges of that court in remembrance of [illegible] the king [illegible], —the king's remembrancer, the lord treasurer's remembrancer, and the remembrancer of first fruits, but the duties of the second of these officers were merged in the first by 3 & 4 Will 4 c 99

REMIGES (Lat remigo, *I row*) The quill feathers of the wings of a bird, which, like oars, propel it through the air

REMIPEDS *Remipedes* (Lat. rema, *an oar*, pes, *a foot*) The name of an order of Coleopterous insects, in-

[illegible] ch have tarsi adapted for swimming [illegible]

REMITTENT FEVER Any fever which suffers a [illegible] in its violence during the twenty four hours, but without entirely leaving the patient is called a *remittent*, it differs from a [illegible] there never being a total absence of fever These fevers are most common in autumn, and they vary in degree from extreme mildness to alarming violence and are both inflammatory and malignant The remittent fever of children, or, as it is often called the *infantile* [illegible] is generally symptomatic either of worms in the intestines, or of a foul state of bowels arising from inattention to diet, or from the indigestible trash which children frequently indulge in the tongue is very foul, the head aches, the belly is tumid, food is loathed, the child is drowsy all day, but restless and often delirious at night, and the bowels torpid A proper system of purging is the most essential part of the treatment in these cases, and under it the symptoms, though often [illegible] called with camomile and [illegible] by infusion of senna and aperient salts, are the principal remedies, and saline draughts and diluents in the intervals If bilious diarrhœa ensue, with vomiting the irritability of the stomach must be allayed by effervescing salines, and that of the bowels by very mild opiates, if the head is much affected, cold and evaporating lotions may be used Good air, thorough ventilation, and light farinaceous diet, with the above treatment, generally effect a cure, but the disorder is often very obstinate, and continues for three weeks or a month The *yellow fever*, or bilious remittent of hot climates and especially of the West Indies, is another form of this fever it appears to be produced by marsh miasma In all these fevers particular symptoms occasionally present themselves which require particular modes of treatment, and this must also be modified according to the inflammatory malignant nervous, or intermittent form which they may assume or pass into

REMONSTRANTS In Ecclesiastical History See ARMINIANS

REMPHAN An idol worshipped by the Israelites while in the wilderness, according to the language of St Stephen as recorded in the Acts, 'Ye took up the tabernacle of Moloch and the star of your god Remphan' [illegible] quotes the [illegible] of your Moloch and Chiun, your images Chiun and Remphan are therefore the same and both are thought to be personifications of Sirius the Dog star (*Enc Brit*) Chiun is supposed by some to be the same word as Chan or Khan Chagan Konig, 'king", Remphan or Raiphan, "high or exalted light"

RENAL GLANDS There is a glandular body upon each kidney of a somewhat triangular shape small in the adult but in the fœtus longer than the kidney, it is called the renal, or supra-renal, gland or capsule it has no excretory duct and its use is unknown

RENDERED In Architecture See RENDERED AND SET

RENDERED AND FLOATED In Architecture plastering of three coats on brickwork

RENDERED AND SET In Architecture a term used to denote plastering of two coats on naked brick or stone work If the work is to be of three coats, it is called *roughing in* *Pricking up* is the first of three-coat plaster on lath or on brickwork that has been previously rendered The materials for rendering and pricking up are the same

RENDERED FLOATED, AND SET FOR PAPER In Architecture, plastering of three coats, the first being lime and hair upon brickwork, the second, the same compound, with the addition of a little more hair and then *floated* with a long rule, the third *fine stuff* mixed with white hair

RENNET, or RUNNET The prepared inner membrane of the calf's stomach, which has the property of coagulating the albumen of milk and converting it into *curd and whey*

RENT (Lat reditus, Fr [illegible] terres) In Political Economy, and in [illegible] the sum paid by the farmers or lessees of lands to the landlords

In order to acquire clear and correct ideas with respect to the nature and origin of rent, it is necessary to discriminate between the sources whence it usually arises, that is, between the portion paid for the use of the natural and inherent powers of the soil, and the portion paid for the use of the buildings, fences, drains, roads, and other improvements made upon the soil Two farms may be naturally of about equal goodness, and equally well situated, but if little or no capital have been laid out on the one, while a great deal has been judiciously laid out on the other, they will let for very different sums It is usual, no doubt, to class all sums derived from land, whatever may be their origin, under the common name of rent, but it is obviously necessary, in an inquiry of this sort, to distinguish between the sums paid for the use of the land, and those paid for the use of the improvements, if there be any, made upon it Landlords are, for the most part capitalists as well as owners of the soil, and the sums paid to them by their tenants for the use of the capital expended upon the soil, though included under the term rent, are substantially and in fact profits, and depend wholly on the circumstances by which they are governed *Rent really, therefore, consists of that portion of the gross sum paid for land, that is, paid for the use of the natural and inherent powers of the soil, or that would be paid for the land supposing it to be in a state of nature, and without any improvement upon it* The owners of the soil receive this portion of their gross income not because they are capitalists, but because they are landlords And we shall now briefly endeavour to exhibit the origin of this payment, or of rent, in the scientific and restricted sense of the term

Origin of Rent — On the first settling of any country abounding in large tracts of unappropriated land, rent, in the sense now explained, is unknown, and for this obvious reason, that no person will pay rent for what may be procured in unlimited quantities for nothing In such countries, rent only begins to appear when the best of the unappropriated lands have become private property, and been occupied Suppose, however, this comes to be the case and that the population has increased, so that the demand for raw produce can no longer be supplied by the culture of the best lands under these circumstances, it is plain either that population must become stationary, or that the price of raw produce must rise so as to enable inferior lands to be cultivated No advance short of this will procure another bushel of corn, and competition will not, as will be immediately seen allow prices to rise permanently above this level Under the circumstances supposed, the inhabitants have but one alternative If they pay a price sufficient to cover the expense of cultivating secondary lands, they will obtain additional supplies, if they do not, they must be without them

Suppose now, that the price rises so as to pay the expense of raising corn on soils which, in return for the same expenditure that would produce 100 quarters on lands of the first quality, will only yield 90 quarters, it is plain it will then be indifferent to a farmer whether he pay a rent of ten quarters for the first quality of land, or farm the second quality which is unappropriated and open, without paying any rent If the population went on increasing lands which would yield only 80 70, 60, 50, &c quarters in return for the same expenditure that had raised 100 quarters on the best lands, might be successively brought under cultivation And when recourse has been had to these inferior lands, the corn rent of those that are superior would plainly be equal to the difference between the quantity of produce obtained from them and the quantity obtained from the worst quality under tillage Suppose for example, that the worst quality cultivated yields 60 quarters then the rent of the first quality will be 40 quarters, or 100 — 60, the rent of the second quality will in like manner, be equal to the difference between 90 and 60, or 30 quarters, the rent of the third quality will be equal to 80 — 60, or 20 quarters, and so on, the produce raised on the land last cultivated or by means of the capital last applied to the soil, being all the while sold at its necessary price or at that price which is sufficient merely to cover the cost of its production, including therein the ordinary rate of profit on the capital of the cultivators If the price were above this level agriculture would be [illegible] profitable business and tillage would be [illegible] extended if on the other hand, the price fell below this level, capital would be withdrawn from the soil, and the poorer lands thrown out of cultivation Under such circumstances it is clear that rent could not enter into the price of that portion of the necessary supply of produce raised by means of the capital last applied to the soil. Its price is exclusively made up of wages and profits The proprietors of the superior lands obtain rent, but this is the necessary result of their greater fertility The demand cannot be supplied without cultivating inferior soils, the produce of which must necessarily sell for such a price as will afford the ordinary rate of profit to their cultivators This price will, however, yield a surplus over and above the ordinary rate of profit to the cultivators of the more fertile lands, and it *is this surplus that forms rent*

In so far therefore, as rent is a return for the use of the soil and [illegible] of land or on improvements, it results not [illegible] from the necessity of resorting as population increases, to soils of a decreasing degree of fertility, or of applying capital to the old land with a less return It varies inversely as the produce obtained by means of the capital and labour employed in cultivation; increasing when the profits of agricultural labour diminish, and diminishing when they increase Profits are at their maximum in countries like Australia, Indiana, and Illinois, and generally in all situations in

which no rent is paid, and the best of the good lands only are cultivated, but it can be said that rents have attained their maximum so long as capital yields any surplus in the shape of profit

A quarter of wheat may be raised in Kent or Essex, or in the Carse of Gowrie, for a *fourth* or a *fifth* part, perhaps, of the expense necessary to raise it on the worst soils in actual cultivation in other parts of the country. The same article cannot, however, have two or more prices at the same time and in the same market. And it is plain that if the price be no [illegible] producers of the wheat raised on the worst soils will cease bringing it to market, and the required supply will no longer be obtained while if the price exceed this sum, fresh capital will be applied [illegible] competition will soon sink [illegible] is, to such a sum as will afford the common and ordinary rate of profit to the raisers of that portion of the required supply which is produced under the most unfavourable [illegible]

It is plainly, therefore, the same thing to the consumers whether, in an advanced stage of society, the excess of return over the cost of production on superior lands belong to a non-resident landlord or an occupier. It must belong to the one or the other. Corn is not high because rent is paid, but rent is paid because the demand [illegible] without cultivating soils of a diminished degree of fertility as compared with the best. Suppose there is in any country an effectual demand for ten millions of quarters of corn, that nine millions may be raised upon lands that yield a high rent, but that it is necessary to raise the other million on inferior lands which yield no rent, but only common and average rate of profit to the cultivators. Under these circumstances, it is clear that the relinquishing of the rents payable by the cultivators of the superior lands would be no boon to the cultivators of those that are inferior. It would not lessen their expenses, that is, it would not lessen the capital and labour employed by them in the production of that portion of the [illegible] and unless it did this [illegible] the demand not to decline that it could lower prices. Although therefore landlords were to give up the whole of the rents, their doing so would have no influence over prices. Such an act would turn farmers into landlords and landlords into beggars, but there its effect would stop. But the case is entirely different when the cost of production varies. If it diminish the competition of the producers will infallibly sink prices in the same proportion. If it increase no supplies will be brought to market, unless the price rise to a corresponding level. In no case, therefore, whether the demand be great or small, whether it be for one thousand or one million quarters, can the price of raw produce ever permanently exceed or fall below the sum necessary to pay the cost of producing that portion of the required supply that is raised on the worst land, or by means of the last capital laid out on the soil.

It has been objected to this theory that though it may apply in unappropriated countries like New Holland it will not apply in countries like England, where land is universally appropriated, and where it is alleged, the worst qualities always yield some small rent to the proprietor.

It may be observed of this objection, that even if it were well founded it would not practically affect the conclusions previously established. There are in England and Scotland vast tracts of land which do not let for 6*d* an acre, but to cultivate them would require an outlay of many thousands of pounds, and the rent would consequently bear so small a proportion to the expenses of production as to become altogether evanescent and inappreciable.

There can be no doubt, however, that there is in this and most other countries a great deal of land which yields no rent. [illegible] and Russia [illegible], and yet no one presumes to say that the laws and [illegible] govern rent in them are different from those which govern it in England and France. The poorest lands are always let in immense tracts. If it were attempted to let particular portions of these tracts separately no one would offer for them, but they appear to yield rent, because, though they really fetch nothing, the more fertile spots with which they are intermixed may, in most cases, be let for a larger or smaller rent. But though every rood of land in Britain paid a high rent, it might still be truly affirmed that such rent did not enter into the price of raw produce. The rent of a country consists of the difference, or the value of the difference, between the produce obtained [illegible] agency of the capital first applied to the land [illegible] is last applied to it. It would, as already seen, be exactly the same thing to a cultivator whether he paid a rent of ten quarters to a landlord for land yielding, with a certain outlay, 100 quarters of corn, or em[illegible] [illegible] person, it is obvious, would ever resort to those of inferior fertility, and, under such circumstances, the largest population might be supported on the smallest extent of land. But, such is not the law under which food is obtained, and the fact, that in the progress of society wastes are brought under cultivation, proves that additional capital and labour can be employed on the old land with the same advantage to the old land. The state of a country may be such, the demand for agricultural produce may be so great, that [illegible] same thing, [illegible] employed on land which yields only the ordinary rate of profit, whether it be employed on old or new land. And that there is every where a very large amount of capital employed in such a manner, is a fact of which there cannot be any doubt whatever. The owners and occupiers of land are influenced by the same principles in the employment of their capital and labour that influence other men. Like them they endeavour, in prosecuting their own interest, so to adjust the capital they employ that the last quantity laid out may yield the common and ordinary rate of profit, neither more nor less. Suppose, for example, that a landlord occupies a farm which he might let for 200*l* a year, producing, with a certain outlay of capital, 300 quarters of wheat. If the farm be managed with the requisite skill and attention, the wheat should at an average, sell for so much money as is equivalent to the rent, the expense of labour and the profit on the capital employed. Suppose now, that the landlord finds that by laying out additional capital on the farm it may be made to yield 10, 20, 50 or 100 quarters more, he will make the outlay provided the additional produce yield the ordinary rate of profit. He will not wait before commencing the improvement until prices rise to a still higher elevation. It will be quite enough to induce him immediately to set about it, that they are such as afford a fair prospect of realizing the usual return on the capital to be expended. He will in fact act exactly as the merchant or manufacturer acts who sends another ship to sea, or builds another cotton mill whenever he supposes that the capital so embarked will yield customary profits. And supposing that the farm is let to a tenant, he, it is obvious, will do the very same thing as the proprietor if he obtain so much more profit as will over and above the usual return suffice to [illegible] to the termination of h[illegible] this additional capital depends entirely on the circumstance of prices being such as will repay his expenses and profits, for he knows he will have no additional rent to pay. Even at the expiration of his lease the fact of an additional capital having been employed would not occasion any rise of rent unless in so far as some portion of it, by being permanently incorporated with the soil, may increase its productive powers, and were his landlord to require more rent because a greater moveable capital had been employed he would cease to employ it, since by the supposition he gets only the same profit he might get by employing it in any other department of industry.

If we reverse the previous suppositions and suppose that the owner of a farm finds that owing to a fall in the price of corn the capital employed in its cultivation does not yield the common and ordinary rate of profit he will then acting on the same principle that led him in the other case to increase the capital on the farm, withdraw a part or it may be the whole of such capital and supposing it to be let the rent would be proportionally reduced at the end of the lease, or sooner.

It is not to be supposed that we mean to affirm that these results follow immediately and without any difficulty, on a rise or fall of prices, on the contrary they take place only by degrees, and are often productive, on the one hand of peculiar advantages, and, on the other of peculiar sacrifices. But in purely theoretical inquiries, or such as have the establishment of principles for their object, such accidental circumstances may be overlooked, and it may, [illegible] be said that the last portion of capital [illegible] yields only the common and average rate of profit. If, on the one hand, it were to yield *more*, fresh capital would be drawn to [illegible] that whether the last quality of land taken into cultivation yield rent or not the last capital applied to the land yields only the common and average rate of profit, and, consequently, the price of the produce which it yields, and which determines the price of all the rest, is totally unaffected by rent.

It is farther said by those who have cavilled at this

theory, that it [illegible] bad land as the cause of rent [illegible] demand of the [illegible] being the rise of price consequent upon this increased demand that occasions the cultivation of bad lands, and the payment of a rent for those that are superior This, however, is at best more verbal trifling The demand of the population for corn elevates its price to such a height as is necessary to obtain the required supply, and may, therefore, be truly said to be the cause of its being produced, but rent [illegible] peculiar circumstances under which [illegible] produced Were it not that it is most frequent [illegible] supplies of corn, to [illegible] fertility, or to apply capital, with a less return, to the old land, rent would be altogether unknown, nor, though the demand for corn were increased in a tenfold proportion, would prices be permanently elevated It does, therefore, seem to be logically, as well as substantially correct, to affirm that the decreasing fertility of the soil is the immediate cause of rent, and that its amount is determined by the extent to which bad land is cultivated or good land forced

This analysis of the nature and causes of rent discovers an important distinction between agricultural, and commercial, and manufacturing industry In manufactures, the worst machinery is first set in motion and every day its powers are improved by new inventions, and it is rendered capable of [illegible] with the same [illegible] be assigned to the quantity of improved machinery that may be introduced as a million of steam engines may be constructed for the same or rather for a less proportional expense than is required for the construction of one, competition never fails to reduce the price of manufactured commodities to the sum for which they may be purchased, according to the least expensive method of production

In agriculture, on the contrary, the best machines or best soils are brought first into use, and recourse is afterwards had to inferior soils, or those requiring a greater expenditure to make them yield the same supplies It is true that improvements in the construction of farming implements, the discovery of more efficient manures and the introduction of more prolific crops and improved [illegible] in a high degree the [illegible] proportionally reduce the price of raw produce, but a fall of price, though permanent in manufactures, is only temporary in agriculture When the price of corn is reduced all classes obtain greater quantities than before in exchange for their products or their labour, hence the rate of profit, and consequently the accumulation of capital are both increased, and this increase by causing a greater demand for labour and higher wages leads in the end to an increase of population and a further demand for raw produce and an extended cultivation Agricultural improvements obviate sometimes for a lengthened period the necessity of having recourse to inferior soils, still however this effect cannot be permanent The stimulus which they at the same time give to population, and the natural tendency of mankind to increase up to the means of subsistence, is sure, in the long run to raise prices, and, by forcing recourse to poor lands, rents also

In illustrating this important distinction between agriculture and manufacturing industry Mr Malthus has set the theory of rent in a striking point of view 'The earth' he observes, "has been sometimes compared to a vast machine, presented by nature to man for the production of food and raw materials, but to make the resemblance more just, as far as they admit of comparison, we should consider the soil as a present to man of a great number of machines, all susceptible of continued improvement by the application of capital to them, but yet of very different original qualities and powers

"This great inequality in the powers of the machinery employed in procuring raw produce forms one of the most remarkable features which distinguishes the machinery of the land from the machinery employed in manufactures

"When a machine in manufactures is invented which will produce more finished work with less labour and capital than before, if there be no patent, or as soon as the patent is over, a sufficient number of such machines may be made to [illegible] the whole demand, and to supersede [illegible] the old machinery The natural [illegible] of [illegible] would be withdrawn from the market

"[illegible] on the [illegible] works of man, and we find by experience that these gifts have very different qualities and powers The most fertile lands of a country, those which, like the best machinery in manufactures, yield the greatest products with the least labour and capital, are never found sufficient to supply the effective demand of an increasing population The price of raw produce therefore naturally rises till it becomes sufficiently high to pay the cost of raising it with inferior machines and by a more expensive process, and, as there cannot be two prices for corn of the same quality, all the other machines, the working of which requires less capital compared with the produce, must yield rents in proportion to their goodness

"Every extensive country may thus be considered as possessing a gradation of machines for the production of corn and raw materials including in this gradation not only all the various qualities of poor land, of which a very large territory has generally an abundance, but the inferior machinery which may [illegible] good land is further and [illegible] produce As the price of raw produce continues to rise, these inferior machines are successively called into action, and as the price of raw produce continues to fall, they are successively thrown out of action The illustration here used serves to show at once the necessity of the actual price of corn to the actual produce, and the different effect which would attend a great reduction in the price of any particular manufacture and a great reduction in the price of raw produce" (*Inquiry into the Nature and Progress of Rent*, p 37)

It appears therefore, that in the earlier stages of society, and when only the best lands are cultivated, rent is unknown The landlords, as such, do not begin to share in the produce of the soil [illegible] to cultivate lands of an inferior [illegible] apply capital to the superior lands [illegible] turn Whenever this is the case, rent begins to be paid, and it continues to increase according as cultivation is extended over poorer soils, and diminishes according as these poorer soils are thrown out of cultivation Rent, therefore, depends exclusively on the extension of tillage It is high where tillage is widely extended over inferior lands, and low where it is confined to the superior descriptions only But in no case does rent enter into price, for the produce raised on the poorest lands of a country, or by means of the capital last applied to the culture of the soil determines the price of the entire crop, and this produce yields only the common and average rate of profit

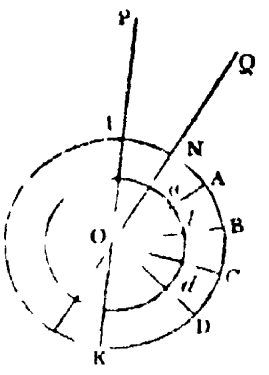
Influence of Situation on Rent—In the previous statements we have to simplify the consideration of the question, omitted to notice the influence of situation on rent It is plain, however that this is a very important element in determining its amount, and that difference of situation has precisely the same sort of influence over rent as differences of fertility Thus, suppose two farmers employ equal quantities of capital, as 5000 quarters each, in the cultivation of farms of the same goodness,—the one situated in the immediate vicinity of London, and the other in Yorkshire, and suppose, farther, that London is the market to which the produce of both farms is sent and that the cost of conveying corn from Yorkshire to London is 5*s* a quarter under these circumstances, if the gross produce of each farm were 1000 quarters, of which the landlord received one fifth part, or 200 quarters, as rent, the farm near London would fetch 50*l* a year more than the farm in Yorkshire For, as the corn raised in the districts adjacent to London is not adequate for its supply, its price in the city must suffice to pay those who bring any portion of the necessary supplies from the greatest distance as well for the expenses of carriage as for those of production, and the farmer in the immediate vicinity, who gets this increased price for his produce, will have to pay a proportional increase of rent, in the same way that the occupier of good land has to pay an increased rent, when inferior lands are taken into cultivation

It would, on many accounts, be desirable readily to distinguish between that portion of the gross rental of a country which is to be considered as rent, properly so called, or as the remuneration paid to the landlords for the use of the natural powers of the soil, and that portion which is the return to or the interest upon the capital laid out upon houses, fences, drains, roads, and other improvements But how [illegible] and [illegible] by all practical men that [illegible] make such a distinction with any thing approaching to accuracy No two of the most expert agriculturists, supposing them to be desired to resolve the gross rental of a single improved farm into its constituent parts, would arrive at the same result Improvements become so much blended with the natural powers of the soil, that the influence of the [illegible] be separated from that of the other, and the [illegible] value of the two that can be estimated No doubt can, however, be entertained by any one who reflects for a moment on the vast sums, the many hundreds, or rather thousands of millions, that have been laid out upon the soil of Great Britain, that the payment made to the landlords for the use of its natural powers is inconsiderable, [illegible] with that made to them on account of improvements;

and hence the inequality and mischievous operation of taxes on rent Two landlords receive equal rents from their estates, but the rent of one is principally a consequence of natural fertility, while that of the other is derived principally from outlays of capital What, then could be more unfair than to subject them both to the same equal tax? And yet the amount of their rents is the only criterion to which recourse could be had in fixing the amount of the tax, for all the tax collectors in the world could not separate between what was really rent, in the scientific sense of the term and what was interest on capital Such a tax would oppose the most effectual obstacle to improvements Instead of carrying capital from other employments to the land it would henceforth be carried from the land to them The object would not then be to have an estate look well, but to have it look ill, and it may be said of estates as of individuals,

Pauper videri Cinna vult, et est pauper

The effects that were formerly produced by the *taille*, and that are now produced by the *contribution foncière* in France, and the fluctuating land taxes imposed in other countries abundantly confirm the truth of this statement Their influence has been most disastrous



The theory of rent explained in this article was first promulgated and satisfactorily established in a tract on the corn laws, published at Edinburgh in 1777 by Dr James Anderson, a native of Hermandston in Mid Lothian, editor of the *Bee* and other publications But notwithstanding the clear and able manner in which he explained the theory and its ingenuity and importance, his elucidations do not appear to have attracted the least attention, and seem indeed to have been completely forgotten So much so was this the case, that when in 1815, Mr Malthus and Sir Edward West published tracts explaining the nature and origin of rent they were universally believed to be the authors of the theory Although, however, there is, we believe, no doubt as to their originality, still they were merely the expositors of a theory that had been clearly and ably explained above forty years previously to the publication of their tracts

RENT, in Law, is defined "a certain profit issuing yearly out of lands and tenements corporeal not necessarily, although by English usage generally consisting in money There are at common law three kinds of rents 1 Rent-service, having some incident of feudal service connected with it for which the landlord might distrain of common right 2 Rent-charge, where the owner of the rent had no future interest or reversion expectant on the land, as where one having parted with his land reserved a rent, with a clause of distress in the deed by which the land was *charged* with the payment of the rent 3 Rent seck, *redditus siccus*, which was rent reserved by deed without a clause of distress But the common remedy of distress was extended to all the divisions of rent by 4 G 2 c 28 (*See* DISTRESS) The ordinary remedy by action is in *debt* for the breach of an express contract, or *covenant* may be brought for the breach of a covenant to pay rent And these actions may be brought at any time within twenty years after the cause of action shall have accrued A 'fee farm-rent' is a rent issuing out of an estate in fee The common term "rack-rent' has no particular legal acceptation, and merely means a rent at or near the full value of the premises demised

REPE'AT In Music, a character 𝄇 denoting the repetition of the part which it bounds It is sometimes expressed by dots against the bar, and sometimes by the words *Da Capo*

REPEATING CIRCLE In order to diminish the effect of errors of graduation, and to obtain more accurate measurements by means of comparatively small and therefore portable instruments, a method of observing was invented, or rather brought into use, by Borda, which is now [illegible] in geodetical operations It consists in moving the telescope successively over portions of the graduated limb corresponding to the angle to be measured, and reading only the multiple arc, may be advantageously applied to circular instruments destined for very different purposes as, for example, to an instrument for the measurement of the zenith distances of stars or terrestrial objects, or the distance of two trigonometrical stations, in which case it is simply called a *repeating circle*, to a reflecting circle used for observations at sea, when it becomes a *repeating reflecting circle*, or to a theodolite, when it becomes a *repeating theodolite*

For the purpose of giving an idea of the principle of this method, we borrow the following illustration from Sir J Herschel —"Let P Q be two objects, which we may suppose fixed for purposes of mere explanation, and let K I be a telescope [illegible] O, the common axis of two circles A M L [illegible] A B C of which the former A M L, is absolutely fixed in the plane of the objects,

and carries the graduations freely moveable on the axis The telescope is attached permanently to the latter circle, and moves with it An arm, O *a* A, carries the index or vernier, which reads off the graduated limb of the fixed circle This arm is provided with two clamps, by which it can be temporarily connected with either circle, and detached at pleasure Suppose now the telescope directed to P Clamp the index O A to the *inner* circle, and unclamp it from the outer, and read off, then carry the telescope round to the other object Q In so doing the inner circle, and the index arm which is clamped to it, will also be carried round over an arc A B on the graduated limb of the outer equal to the angle P O Q Now clamp the index to the *outer* circle, and unclamp the inner, and read off [illegible] P O Q [illegible] error that of graduation, and that of observation, both of which it is our object to get rid of To this end transfer the telescope back to P *without* unclamping the outer circle, then having made the bisection of P, clamp the arm to *b* and unclamp it from B, and again transfer the telescope to Q by which the arm will now be carried with it to C over a second arc B C equal to the angle P O Q Now again read off, then will the difference between this reading and [illegible] one measure *twice* the angle P O Q affected with [illegible] observation, but only with the same error of graduation as before Let this process be repeated as often as we please (suppose ten times), then will the final arc A B C D read off on the circle be ten times the required angle, affected by the joint errors of all the ten observations, but only by the same constant error [illegible] which depends on the initial and final readings alone Now the errors of observation when numerous tend to balance and destroy one another so that, if sufficiently multiplied their influence will disappear from the result There remains then only the constant error of graduation which comes to be divided in the final result by the number of observations and is therefore diminished in its influence to one tenth of its possible amount, or to less if need be' (*Astronomy Cab Cyc* p 105)

When the repeating circle is used for measuring zenith distances it is constructed so as to be capable of being turned round on a vertical pivot, the direction of which passes through its centre and to which its plane is parallel and also of turning in its own plane about a horizontal axis The instrument being placed in the same vertical plane with the star, the telescope is directed to the star and the bisection made, the telescope which carries the verniers with it is then firmly clamped to the circle and the circle turned round 180° in azimuth about the vertical pivot If the circle be now kept fast, the telescope unclamped and carried round till the star is again bisected it is plain that the arc of the limb passed over by the verniers in consequence of this motion of the telescope will be double the zenith distance of the star The same process is repeated as often as may be thought necessary For the purpose of geodetical measurements the circle is usually furnished with two telescopes, one on the face and the other on the back, and so placed that the optical axes of both are exactly in the plane of the circle The circles used by Mechain and Delambre in the operations connected with the measurement of the French arc of meridian, were about 4-tenths of a mètre (nearly 16 inches) in diameter and were divided into arcs equivalent to about 32 sexagesimal seconds, which were subdivided into tenths by the verniers

The merit of first applying the ingenious principle of repetition to angular measurements belongs to Tobias Mayer, but it was Borda, as above stated, who first brought the instrument into general use

For a description of the repeating circle, its adjustments and the method of using it see Biot, *Astronomie Physique* tome i, Delambre, *Astronomie*, or *Base Metrique* tome i, Puissant, *Traité de Géodésie*, *Raper's Practice of Navigation*, &c The comparative advantages and defects of the instrument are very clearly stated in a paper by Troughton in the first volume of the *Memoirs of the Royal Astronomical Society*

REPE'TITIONS Applications to the surface of the body which [illegible] inwards

REPETITIONS POWER [illegible]

RE'PENT (Lat repo, *I creep*), in Zoology, is used in the same sense as creeping, and is applied to those animals which move with the body close to the ground, either without the aid of legs, or by means of more than four pairs of short legs

RE'PETEND In Arithmetic, that part of a *recurring decimal* which recurs continually and [illegible] called a simple repetend when there is but one figure as 2.33 and [illegible], and a compound repetend when there

are more figures than one in the repeating period, as 029029 . . ad inf It is usual to mark the first and last figures of the period by dots placed over them, thus the repeating decimal 0.0294 = 3, and 029

REPLE'VIN, *n* [ ] An action of tort, in which the plaintiff seeks the recovery of goods illegally distrained *See* ACTION

[illegible] In Law, the third stage in the [illegible] the plaintiff's answer to the defendant's plea *See* PLEADING

REPO'SE (Lat repono, *I lie down*) In the Fine Arts, the absence of that agitation which is induced by the scattering and division of a subject into too many unconnected parts, in which case a work is said to want repose Where repose is wanting from this cause, "the eye" says Sir Joshua Reynolds, "is perplexed and fatigued, from not knowing where to rest, where to find the principal action, or which is the principal figure, for where all are making equal pretensions to notice, all are [illegible]

REPRESENTATION (Lat representatio) In Politics, the part performed by a deputy chosen by a constituent body to support its interests and act in its name on a public occasion Thus a plenipotentiary represents the sovereign or the state which delegates him at a foreign court But the most ordinary use of the word is to express the principal function of the delegate of a constituency in a [illegible] Representation, in this sense, was unknown to political systems of the ancients, and seems to have originated in the necessities and usages of feudal times the lord not being able to levy aid from his vassals without their consent it became customary for these to delegate powers to individuals from among their numbers to attend his summons and confer with him respecting the aid required Hence in our own country the representation of county freeholders by knights, of communities by their chosen burgesses in parliament The most complete early model of a representative feudal assembly is to be found in the parliament of the Sicilies under the Suabian kings, but England is the only country in which it has expanded regularly into a legislature

The chief question in political science regarding the system of representation is, how far each delegate represents the opinions of the local body which sends him and is bound to act in obedience to their directions This was unquestionably the early notion of representation But the constitutional principle of English statesmen has been in general very different It is that each member represents not the local body, but the entire nation The ties which bind him to his constituents are altogether subordinate to those which attach to him in general character He is bound to sacrifice not only the wishes but the immediate and local interests of the body which sends him if they are in opposition to the general good of the country The most popular and best known exposition of this doctrine is perhaps to be found in Burke's famous speech to the electors of Bristol It follows as a corollary, that constituencies act unconstitutionally in demanding pledges of candidates for their representation as to the part which they are to take on particular questions But this, like other rules of constitutional conduct, must not be pressed too far Constituencies as well as representatives are bound to use their powers for the general good of the nation, and there may be occasions although rarely, on which those powers are best used by taking security of the representative that his conduct, on some very important and critical questions will be in accordance with what they deem the national view (See *Bentham's Rationale of Representation*)

REPRESENTATION In Painting and the other Arts, the transference to a plane of a solid mass, or the appearance of an object to the eye

REPRIE'VE (From the Fr reprendre, *to take back*) In Law the suspension of the execution of sentence on judgment in a criminal case for a certain time Reprieve at the will of the judge is arbitrary, and the latter has power to give it where he is dissatisfied with the verdict, in order to give time to apply to the crown for a pardon Reprieve is also [illegible], as a woman capitally convicted has a right to a reprieve during pregnancy, or when a party becomes insane between [illegible] execution

REPRISALS, LETTERS OF In National Law, the capture of property belonging to the subjects of a foreign power in satisfaction of losses sustained by a citizen of the capturing state (*See* LETTERS OF MARQUE) Letters of reprisal are grantable by the law of nations, where the subject of one state has been oppressed or injured by the subjects of another, and where justice has been refused on application by letters of request The mode of serving out letters of marque and reprisal in time of truce was regulated by statute 4 Hen 5 c 7, but has been long disused The power of granting letters of marque and reprisal is sometimes given by proclamation of the king in council to the lords of the admiralty

REPRISES In Law, deductions or payments out of the value of lands, such as rent charge or annuities

REPROBATION in Theology is a term commonly applied to the supralapsarian tenet of the consignment of all mankind to eternal punishment, with the exception of those whom God has arbitrarily selected for eternal happiness *See* ELECTION, PREDESTINATION

REPRODU'CTION (Lat reproduco, *I reproduce*) This word in Physiology, is sometimes used for generation, but it signifies properly the power which a fully developed organized being possesses to push forth and form anew parts of the body which have been cut off Vegetables possess this faculty in an eminent degree and animals have the power of reproduction in proportion as they resemble vegetables in the simplicity of their organization, thus the freshwater polype *Hydra viridis*, when divided into many pieces, reproduces all its characteristic organs out of each piece Worms and other Annelides can reproduce many segments of the body Snails can push forth new horns, and reproduce even a great part of the head Lobsters and spiders thus gain new claws or legs Newts and lizards reproduce their tails

REPTATION A mode of progression by advancing successively parts of the trunk which occupy the place of the anterior parts which are carried forwards, as in serpents also applied to the slow progression of those animals whose extremities are so short that the body touches the ground

REPTILES, *Reptilia* (Lat repo *I creep*) The name of a class of cold-blooded Vertebrate animals, including all those which have lungs and a heart composed of two auricles and one ventricle Those which retain their gills during the whole or a part of their existence are termed *Batrachians* or *Amphibia* the latter name Linnæus applied to the whole group, as well as to certain true fishes (*See* AMPHIBIANS, CHELONIANS, SAURIANS, OPHIDIANS and BATRACHIANS) Cuvier characterizing the class of reptiles as defined by him well observes, that as it is from respiration that the blood derives its heat and the muscular fibre its susceptibility of nervous irritation, the blood of reptiles is cold, and the muscular energy less than that of quadrupeds and much less than that of birds Thus we find their movements usually confined to crawling and swimming, for though at certain times several of them jump and run with considerable activity, their habits are generally lazy, their digestion excessively slow and their sensations obtuse In cold or temperate climates almost all of them pass the winter in a state of torpor Their brain, which is [illegible] small, is not so essentially requisite [illegible] of their animal and vital faculties as to the members of the two first classes their sensations seem to be less referred to a common centre for they continue to live and to exhibit voluntary motions long after losing their brain, and even after the loss of their head A communication with the nervous system is also much less necessary to the contraction of their fibres and their muscles preserve their irritability after being severed from the body much longer than those of the preceding classes their heart continues to pulsate for hours after it has been torn away, nor does its loss prevent the body from moving for a long time

The smallness of the pulmonary vessels permits reptiles to suspend the process of respiration, without arresting the course of the blood thus they dive with [illegible] and remain longer under water than either [illegible] or birds

No reptile hatches its eggs The young Batrachians on quitting the egg have the form and branchiæ of fishes and some of the genera preserve these organs even after the development of their lungs

The quantity of respiration in reptiles is not fixed, like that of the Mammalia and birds, but varies with the proportion of [illegible] compared to that of [illegible] Batrachians respire more than frogs &c, and hence a much greater difference of sensibility and energy [illegible] than can exist between one of the Mammalia or other, or between birds *See* ERPETOLOGY

REPU'BLIC (Lat respublica, *commonwealth*) That form of government in which the supreme power is vested in the people A republic may be either an aristocracy or a democracy the supreme power, in the former, being consigned to the nobles or a few privileged individuals, as was formerly the case in Venice and Genoa, while, in the latter it is placed in the hands of rulers chosen by and from the whole body of the people, or by their representatives assembled in a congress or national assembly The free towns of the Continent, Hamburg, Frankfort, Lubeck, and Bremen, are instances of this latter form of [illegible] but the most perfect example of it is to be found in the United States, and in some of the South American confederations In Switzerland, aristocracy is blended with democracy in the form of government Of the French Republic it is too soon to hazard any opinion

REQUE'ST, LETTERS OF In Ecclesiastical Law, an instrument by which the regular judge of a cause waives or remits his own jurisdiction, under the provisions of the statute of Citations 23 H 8 c 9, in which event the jurisdiction of the appellate court attaches

RE'QUESTS, COURT OF An ancient court of equity, inferior to the Court of Chancery, of which the lord privy seal was chief judge, taken away by 16 & 17 C 1 c 10 2 The Court of Conscience, or of Requests, [illegible] of small debts, was erected [illegible] jurisdiction between citizens and freemen in cases of debt or damages under 40*s*, extended in the reign of G 3 to 5*l* The local courts instituted in many parts of the kingdom for the recovery of small debts by summary process are hence called popularly Courts of Requests But the establishment and extension of the County Courts for the recovery of debts under 50*l* will it is presumed, ultimately supersede every other court in the kingdom established for similar purposes

RE'QUIEM (Lat) In the Roman Catholic Church, a mass performed for the repose of the souls of deceased persons It is so called from the prayer commencing "Requiem aternam dona iis Domine" The term is also applied to grand musical compositions performed on solemn occasions in honour of deceased civil or ecclesi[illegible] T[illegible]quiems composed by Mozart, [illegible] well known

RESCRIPTS (Lat *rescribo, I write back*) In the Civil Law, answers of popes and emperors to questions in jurisprudence proponnded to them officially Those of the Roman emperors constitute one of the authoritative sources of the civil law

RESCUE In Law in the more general sense, a species of resistance against lawful authority, as, by delivering one arrested out of the hands of those who have legal custody of him In a more restricted application, the term rescue means the taking away and setting at liberty, against law, any distress taken for rent, or services, or damage feasant

RESEDACEÆ (Reseda [illegible] A natural order of herbaceous or [illegible] ens, inhabiting Europe and Asia There are but three genera belonging to it, and of these but one species, the common *mignonette*, a Barbary plant, now an universal favourite for the sake of its peculiar fragrance, is the only species possessing any interest except to the botanist

RESERVOIR (Fr) A tank, or pond, in which water [illegible] is chiefly supplied with water by springs collected in a magnificent reservoir seven miles distant from the city The term is also applied to a place where water is collected and preserved for the more regular supply of a fountain or drinking trough in seasons when it is not naturally abundant

RE'SIDENCE OF CLERGYMEN ON THEIR BENEFICES, is enjoined by the common law of England, as well as by the canon law and many statutory provisions These last are now consolidated by 1 & 2 Vict c 106 Under that act, an incumbent is considered to be non resident if he is absent for one or more periods exceeding in the whole three calendar months in each year, and will be liable to the penalties unless he has obtained a licence for non-residence from the bishop, or is within any of the statutory exemptions The licence may be given where there is no house or fit place of residence [illegible] convenient house described [illegible] the act will be within three miles of the church, or within two of the chief [illegible] city market [illegible] who may not, however, be absent on account of their residence and performance of duty elsewhere for more than five months Licences for absence from the benefice may also be granted by the bishop, on petition, for a few other causes incapacity of mind or body, the dangerous illness of a wife or child, part of the family — in which case the licence is only for six months, and requires the archbishop's renewal, and in case a house convenient for residence cannot be procured within the benefice The penalties are fixed in a [illegible] fixtures of portions of the value of [illegible] be proceeded for in the bishop's court The bishop may also proceed by monition and sequestration

RE'SIDUE In Law, the remainder of a testator's estate after payment of debts and legacies If this remainder be bequeathed to any one, he is styled the residuary legatee If a legatee dies before the testator, the legacy is a lost or *lapsed* legacy and sinks into the residue and this provision of the law is extended to devises of real property by 7 G 4 and 1 Vict c 26 (the Wills Act) s 25 *See* LEGACY, WILL

RE'SIN (Gr ῥητίνη, from ῥέω, *I flow*) A proximate principle common in the vegetable kingdom, the ultimate components of which are carbon oxygen and hydrogen There are many varieties of resin Their general characters are fusibility [illegible], solubility in alcohol, insolubility in [illegible] into two distinct portions by the act[illegible] of hot alcohol They are valuable as ingredients in varnishes and several of them are [illegible] medicine They are often naturally blended with mucilaginous gum, in which case they constitute the series of *gum resins* The specific gravity of the resins varies between 1 0 and 1 4 They become negatively electric by friction The commonest resin in use, [illegible] distilling turpentine. [illegible] resin remains in the still

RESI'STANCE, in Mechanics, denotes generally a [illegible] to another force, so as to destroy [illegible] Resistance is sometimes considered as of two kinds, active and passive, the active [illegible] responds to the useful [illegible] the passive that which belongs to the inertia of the machine Thus, in raising water from a well, the active resistance to the force employed is measured by the quantity of water which is raised, and the passive resistance by the force required to overcome the weight of the bucket and the rope, the friction of the pulley on its axle &c

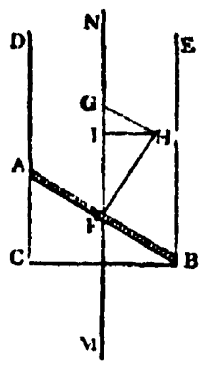
RESISTANCE OF FLUIDS In Hydrodynamics, the force with which a solid body moving through a fluid is resisted or retarded Of all the different kinds of resistance which manifest themselves among bodies, there is none of greater importance than this, on account of [illegible] MICS) The Newtonian theory of the resistance of fluids, which is given in the second book of the *Principia*, is founded on the assumption of the perfect intermobility of the particles of the fluid and the equal propagation of pressure in all directions These are, indeed, the characteristic properties of fluidity, nevertheless, the results of the mathematical theory differ so widely in many cases from actual experiment, that some philosophers have called in question the accuracy of the principles from which they are derived The theory however, notwithstanding its defects, furnishes some propositions of great practical use and, indeed forms the groundwork of all our knowledge on the subject We shall here give a general view of its leading principles

It is evident that a solid body, in moving through a fluid, must communicate a motion to the fluid particles with which it successively comes in contact Now, the quantity of motion communicated to the fluid is necessarily equal to that which is lost by the solid and may therefore be taken as the measure of the resistance To determine this quantity of motion let us conceive a cylindrical or prismatic body terminated by a plane perpendicular to its axis to be propelled through a non elastic fluid in the direction of its axis, so that the particles of the fluid strike against the plane perpendicularly and let A denote the area of the anterior surface of the body, ϱ the density of the fluid and v the velocity of the motion, during the small interval of time dt Then the space described by the body in the time dt is $v\,dt$, the volume of the fluid displaced in that time is $A\,v\,dt$, the mass of the fluid displaced is $\varrho\,A\,v\,dt$, and the momentum or quantity of motion imparted to the fluid is $\varrho\,A\,v\,dt \times v = \varrho\,A\,v^2\,dt$ Let R denote the resistance of the fluid, we have then

$$R = \varrho\,A\,v^2\,dt \qquad (1)$$

From this equation it appears that the resistance upon a plane surface moved perpendicularly through a non-elastic fluid at rest is proportional to the density of the fluid, to the area of the plane, and to the square of the velocity

We may deduce from equation (1) a measure of the force of resistance by comparing it with the pressure of gravity Let h denote the height from which a heavy body must fall in order to acquire the velocity v and let [illegible] $2gh$, and [illegible] this in equation (1), we get



$$R = 2\varrho\,A\,h \times g\,dt \qquad (2)$$

Now since g is the velocity generated by gravity in one second $g\,dt$ is the velocity generated in the time dt, and since $2\varrho\,A\,h$ expresses the mass of a prism of the fluid, having A for the area of its base and $2h$ for its altitude, $2\varrho\,A\,h \times g\,dt$ is the quantity of motion which the prism would acquire by the free action of gravity in the time dt, in other words, its weight We have, therefore, this proposition *The direct resistance of an unelastic fluid on any [illegible] a column of the [illegible] its altitude twice [illegible] ocity with which the surface moves* [illegible] Let W be the weight of the unit of [illegible], we have then

$$R = 2\,W\,A\,h \qquad (3)$$

The above measure of the force of resistance is deduced

on the supposition that the direction of the motion is perpendicular to the plane If the shock is received obliquely, the resistance will be greatly diminished Let

A B represent the profile of the plane, and M N the direction of the motion of the plane in stagnant water, or of a vein of fluid D C B E striking against the plane, supposed to be fixed Let F be the intersection of M N with A B, and draw B C perpendicular to M N Now, if A denote the area of the given plane A B, v the velocity of the motion, and R the direct resistance due to the velocity v (that is, the resistance which the plane would sustain if placed perpendicularly to M N), then (1) we have $R = \varrho A v^2 d t$ On F N take F G, to represent R This force F G may be resolved into two, F H perpendicular and H G parallel to A B, of which the latter produces no effect on the plane, hence the resistance is diminished, by reason of the oblique impact in the ratio of F H to F G, or of sin i to 1 (i denoting the angle of incidence A F N) But again, the absolute resistance is also proportional to the number of filaments which strike the plane, and it is obvious that the number which would strike it in the oblique position A B is less than the number which would strike it if directly opposed to the stream, in the ratio of B C to B A, or of sin i to 1 Compounding this with the former ratio, the total diminution of resistance is as sin $^2 i$ to 1, that is to say, the absolute resistance or pressure in the direction F H perpendicular to the plane is R sin $^2 i$

It still remains to find the effective impulse or resistance in the direction of the motion Draw H I perpendicular to M N The force in the direction F H may be resolved into F I and I H, of which the effective part is F I Hence the effective impulse is to the absolute oblique impulse as F I to F H or as sin i to 1, consequently the effective impulse on the plane in the direction M N is R sin $^3 i$ Let this be denoted by R′, we have then

$$R' = R \sin^3 i = \varrho A v^2 d t \times \sin^3 i \qquad (4)$$

If we denote by A′ the area of the projection of the plane A B upon a plane perpendicular to M N we have $A' = A \cos A B C = A \sin i$, and since $\varrho v^2 d t = 2 W h$, the above formula becomes, by substitution,

$$R' = 2 W A' h \sin^3 i \qquad (5)$$

From this last formula the effective oblique impulse in the direction of the stream upon any plane surface is easily computed For other surfaces than planes it is necessary to find an expression for the resistance on the differential element of the surface which may be regarded as coinciding with its tangent plane, and the sum of all the [illegible] surface of revolution we have

$$d A' = 2 \pi y d y \text{ and } \sin^2 i = \left(\frac{d y}{d z}\right)^2,$$

therefore,

$$R' = 4 \pi W h \int y \frac{d y^3}{d z^2}$$

Numerous experiments have been made for the purpose of ascertaining how far this theory of the resistance of fluids agrees with the actual facts or for forming an empirical theory for the guidance of the engineer Of the details of these experiments our limits will not permit us to give an account, but the principal experimenters and works to which we refer [illegible] Sir Isaac Newton (*Principia*, Book ii), Mariotte (*Traité des Mouvemens des Eaux*), Gravesande (*System of Natural Philosophy*), D Bernoulli and Krafft (*Comment Petropol*), Borda (*Mém de l'Acad des Sciences de Paris*, 1763 and 1767), Condorcet, D'Alembert and Bossut, by order of the French government in 1775 Bossut (*Hydrodynamique*), Du Buat (*Principes d'Hydraulique*), Robins (*Gunnery*), D [illegible] (*Traité de la Manœuvre des Vaisseaux*, Vince (*Phil Trans*), Hutton (*Tracts*), Beaufoy (*Nautical and Hydraulic Experiments*), Russel (*Trans of the Royal Society of Edin* vol xiv) &c The general results of the experiments may be stated as follows —

I The force of resistance on bodies moving in fluids is proportional to the square of the velocity at least within the limits of 2 to 10 feet per second This is in accordance with the theory

II The direct resistance on [illegible] at the same velocities is nearly in the [illegible]

III The resistances on surfaces moving obliquely do not by any means vary in the ratio of the squares of the sines of the angles of incidence, especially when the incidence is very oblique, and for such motions the theory must be entirely abandoned

The above results are, however, considerably modified by various circumstances, of which the principal are the following —

1 The form of the body The Newtonian theory takes account only of the anterior surface of the body, but it was clearly established by the experiments of Du Buat that the form of the hinder part is not less efficacious in modifying [illegible] having its prow and [illegible] plunged horizontally into a stream, will require, in order to keep it immoveable, a force in the direction of its axis equal to the difference of the real pressures exerted on its prow and poop If the fluid is at rest, this difference will be nothing, because the opposite dead pressures are equal, but in a stream there is superadded to the dead pressure [illegible] is employed in turning them into the trough behind the body, and consequently there is less pressure on the posterior surface than if the body were at rest in stagnant water, so that the body is impelled backwards This force is called by Du Buat the *non-pressure*, by Beaufoy the *minus pressure* Now, the whole impulse to be withstood if the body is in a stream, or the resistance to be overcome if it moves in stagnant water, is the sum of the active pressure on the fore part and the non pressure on the hinder part and this does not depend solely on the form of the prow and poop, but also, and perhaps chiefly, on the length of the body The non-pressure on a cube was found by experiment to be reduced to a fourth part, by making the length of the body triple of the breadth The mere lengthening of a ship, without changing the form of the prow or poop, increases the speed

2 Another circumstance which modifies the general results is the velocity of the body It was ascertained, by Mr Russel's experiments on canal boats, that the resistance does not follow the ratio of the squares of the velocities, excepting when the velocity is small and the depth considerable, but that the increments of the resistance are greater than those due [illegible] as the velocity approaches t [illegible] the depth of the fluid, and that immediately after passing this limit the resistance suffers a sudden diminution, and becomes much less than that due to the square of the velocity In a canal about five and a half feet deep this limit (which is the velocity of the wave generated by the motion of the body) was found to be from 11 to 12 feet per second, or [illegible] hour

3 A third c[illegible] the theory is the adhesion of the molecules of the fluid, which is most sensible when the motion is slow and the body small and very long In such cases, it becomes necessary to add a term depending on the first power of the velocity

4 The resistance is also influenced by the depth of the body under the surface of the water When the body is near the surface the resistance is greater than when it is at the depth of six feet When a body floats the fluid is heaped up, as it were, before the anterior surface, by which the resistance is increased

5 In elastic fluids, as the density increases with the pressure, the density of the fluid before the anterior surface increases with the velocity, and the increments of the resistance are greater than in the ratio of the square of the velocity In this case also we may conceive a velocity so great that the pressure on the posterior surface becomes negative as in the case of a cannon ball projected with a velocity greater than that with which air rushes into a vacuum When this takes place the fluid is not even in contact with the posterior surfaces of the ball and the character of the resistance is wholly changed *See* PROJECTILES

6 When a body moves in a fluid a portion of the fluid adheres to the body and accompanies it in its motion, whereby the form of the moving body is altered and the resistance increased The quantity of fluid thus dragged along is independent of the velocity, and was estimated by Du B[illegible] [illegible] in water [illegible] to 1 to 1 6 It [illegible] that the quantity [illegible] proportional to the bulk of the moving body Mr Baily (*Phil Trans* 1832) gives, as the mean results of his experiments on pendulums swinging in air the ratio 1 to 1 846 as the increase of the displaced fluid from this cause and remarks that the quantity appeared to depend on the form as well as magnitude of the moving body, but not on its weight or specific gravity This circumstance which considerably modifies the resistance though made known by Du Buat in 1786, was overlooked by other experimenters, until rediscovered by Bessel in 1826 when engaged on experiments to det[illegible] seconds' pendulum

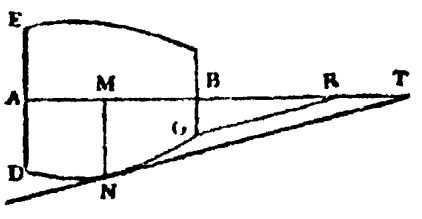
From the [illegible] it be inferred that the resistance R opposed to any body moving through a fluid considered as a pressure of so many pounds weight, will be expressed by an equation of this form,

$$R = (m + n) W A h,$$

where W is the weight in pounds of the unit of volume of the fluid (one cubic foot), A the area of the greatest transverse section of the body expressed in square feet, h

the height in feet due to the velocity so that $h = v^2 - f$ and m and n numerical coefficients constant for bodies of similar figure but variable for bodies of different figures and to be determined by experiment for each kind of body, m having reference to the impulse and pressure on the anterior surface and n to the non pressure on the posterior part The following are a few of the cases for which values of m and n have been found

When a thin plate is directly opposed to the impulse of a stream, the value of $m + n$ appears to increase with the area If A is equal to a tenth of a square foot, $m + n = 1\ 4$, and if A = 1 square foot, $m + n = 1\ 9$ The value of $m + n$ for surfaces of larger dimensions has not been sufficiently determined For a prismatic body terminated by two planes, the pressure against the anterior force remains constant, but the non pressure, or value of n, diminishes as the length increases For a cube held fast in a stream, Du Buat found $m + n = 1\ 46$, and for a prism whose length was from three to six times the square root of its face, $m + n = 1\ 34$ But when the bodies moved in still water, he found, as for the thin plate, $m + n = 1\ 43$, for the cube, $m + n = 1\ 17$, and for the prism, $m + n = 1\ 10$



By means of these values the actual resistances are readily computed for each body, when the velocity is given Suppose the velocity to be 3 feet per second and the opposing surface in each case to be 1 square foot For $v = 3$, we have $h = 9 - 64 = 1406$ With respect to W, the weight of an imperial gallon of water, at temperature 62° and under the mean pressure, is 10 lbs avoirdupois, but an imperial gallon contains 277 27 cubic [illegible] stagnant water with a velocity of 3 feet per second, the absolute resistances in each case are as under —

For the thin plate $R = 1\ 43 \times 62\ 3 \times 1406 = 12\ 5$ lbs
For the cube $R = 1\ 17 \times 62\ 3 \times 1406 = 10\ 2$
For the prism $R = 1\ 10 \times 62\ 3 \times 1406 = 9\ 6$

The effect produced by the addition of a poop or prow was also determined by Du Buat The addition of a poop to a prismatic body whose length is four or five times its breadth only diminishes the resistance by a tenth part But when a prow consisting of two equal vertical planes making with each other an angle of 60°, was added the resistance was reduced to about a half On giving the prow the form of a semicylinder, the resistance was also reduced about a half The section of the prow being a triangle whose height was double the base or breadth of the prism, the resistance was reduced to two fifths In general a prow having a curved surface produces a greater diminution of the resistance than one of equal magnitude terminated by plane surfaces

For a sphere moving in water or in air with a moderate velocity, the experiments give $m + n = 0\ 6$, but this [illegible] in the [illegible] in the model of a ship moved in the direction of its axis gave $m + n = 0\ 16$ This may be considered as the value corresponding to the solid of least resistance For the effect with which solid bodies resist an effort tending to break or crush them see STRENGTH OF MATERIALS, and for the resistance of the atmosphere on a projectile, see GUNNERY, PROJECTILE

RESI'STANCE, SOLID OF LEAST In Mechanics the solid whose figure is such that in its motion through a fluid it sustains the least resistance of all others having the same length and base, or, on the other hand being stationary in a current of fluid offers the least interruption to the progress of that fluid In the former case, it has been considered the best form for the stem of a ship, in the latter, the proper form for the pier of a bridge The determination of the curve whose revolution gives the body having this property is a problem which is solved by the ordinary methods of maxima and minima when the law of resistance is assumed On the hypothesis that the resistance is proportional to the square of the velocity, Newton gave the following construction — Let a curve D G be so taken that if from any point N in it an ordinate N M be drawn perpendicular to the axis A B, and from a given point G the line G R be drawn parallel to the tangent N T at N, cutting the axis in R, then if $M N \cdot G R = G R^3 - 4\ B R \cdot B G^2$, the solid generated by the revolution of this curve about the axis A B will be the solid of least resistance (*Principia*, lib ii prop 34)

RI'SOLU'TION (Lat resolutio) In Medicine and Surgery, this term implies the cessation or dispersion of inflammatory action without the formation of an abscess or mortification

RESOLUTION In Music, the writing out of a canon or fugue in partition from a single line

RESOLUTION OF A DISCORD The descent by a tone or a semitone, according as the mode may require, of a discord which has been heard in the preceding harmony

RESOLUTION OF EQUATIONS The finding the values which the unknown quantity or quantities must have, so as to fulfil the conditions expressed in the proposed equation, viz of rendering the aggregate value of all the positive terms equal to the aggregate value of all the negative terms These values are called the *roots of the equation* *See* EQUATION

RESOLUTION OF FORCES *See* RESULTANT

RESOLUTION, or SOLUTION, in Mathematics, is the orderly enumeration of the things to be done to obtain what is required in a problem A problem may be divided into three parts, — the proposition, the resolution, and the demonstration

RE'SONANCE (Lat resonans) In Music, the returning of sound by the air acting on the bodies of stringed musical instruments

RESPIRA'TION (Lat respiro, *I breathe*) The function by which the nutrient circulating fluid of an organized body is submitted to the influence of air, for the purpose of changing its properties The great end which appears to be answered by respiration is the removal of carbon, in the form of *carbonic acid*, from venous blood This gas is accordingly found in the air which is expired from the lungs, and the blood, having lost its carbonic acid, at the same time loses its dingy hue, and acquires the florid red which characterizes arterial blood It has been shown by Dr Stevens that a peculiar attraction exists (not chemical) between oxygen and carbonic acid, which [illegible] nce of which [illegible] s it were, out [illegible] in the cellular structure of the lungs, while at the same time, a portion of oxygen, probably equal in bulk to that of the emitted carbonic acid, is absorbed by the blood, and contributes to its arterial characters The change from the arterial to the venous state, and consequently the formation of carbonic acid, appears to take place in the capillary junctions of the artery and vein, but how it is there effected we know not

From the quantity of carbonic acid emitted from the lungs in a given time, it has been attempted to ascertain the quantity of carbon which is thus thrown off, but the usual estimates upon this subject which place it at about 12 ounces in the 24 hours, are probably overrated, inasmuch as that quantity of carbon is more than exists in the food daily taken into the stomach If we average it at 6 ounces, it will probably be nearer the truth, and 6 ounces of charcoal are equal to 22 ounces of carbonic acid gas Besides carbonic acid, there is also a quantity of aqueous vapour thrown out with the expired air, this is probably chiefly produced by the superficial exhalents of the lungs, but it may also be partly derived from transpiration from the blood It has not been satisfactorily ascertained whether nitrogen is taken up by the blood as well as oxygen though experiments have rendered it probable that a portion of that component of the atmosphere is also absorbed

RESPIRATION OF PLANTS *See* BOTANY

RESPIRATOR An instrument fitted to cover the mouth over which it is retained by proper bandages It is constructed of a series of flattened silver or gilt wires, over and between which the air passes and repasses in the act of respiration and of speaking It is presumed that the warm air emitted from the lungs imparts its excess of temperature to the small metallic bars and that these in their turn impart heat to the cold air drawn through them at each inspiration, so that in this way the low temperature of the external air in cold weather is mitigated before it reaches the lungs, and its supposed noxious influence prevented When a handkerchief is tied over the mouth [illegible] the nose the extre [illegible] external air [illegible] before it reaches the lungs

RESPONDENTIA In Mercantile Law, a species of contract, which differs from bottomry, in that the loan is effected on the security of the freight, and not on that of the ship itself *See* BOTTOMRY

REST In Music, a pause or interval of time, during which there is an intermission of the voice or sound A rest may be for a bar, or more than a bar, or for a part of a bar only

RESTITU'TION, WRIT OF, in Law, lies where judgment has been reversed, to restore to the defendant what he has lost It can properly only be granted where the party cannot be restored by the ordinary course of law Restitution of goods [illegible] to the common law, but [illegible] it By the statute 7 & 8 G 4 c 29 s 57, it is now in the power of the court to award a writ of restitution of goods and chattels, and to restore them in a summary manner, where a thief or fraudulent taker has been indicted on the part of the owner and convicted Such restitution cannot be granted of a valuable security, where the property has passed into other hands by a bonâ fide trans-

action But a writ of restitution will reach goods stolen, although they have been sold in market overt Restitution can be had from the person in possession of the goods at the time of and after the felon's conviction

RESTORATION THE In English History is applied by way of eminence to the accession of Charles II to the throne after an interregnum of eleven years and four [illegible] memoration of the restoration of the monarchical form of government in these realms

RESULTANT, in Dynamics, is the force which *results* from the *composition* of two or more forces acting upon a body When the two forces act upon a body in the same line of direction, the resultant is equivalent to the sum of both; when they act in opposite directions, the resultant is equal to their difference, and acts in the direction of the greater If the lines of direction of the two forces are inclined to each other, then, on taking in each direction from the point where they intersect a straight line to represent each of the forces respectively, and constructing a parallelogram of which these lines are the sides, the resultant is represented both in intensity and direction by the diagonal [illegible] ssing through the point of intersection [illegible] this resultant with a third force, a new resultant will be obtained, and in this manner the resultant of any number of forces may be determined *See* COMPOSITION OF FORCES

RESURRECTION (Lat resurgo *I rise again*) The history of the resurrection of our Saviour is detailed in the separate narration of each of the four Evangelists and is also referred to and insisted on in the Acts of the Apostles, and in every one of the Epistles The importance of this history as an evidence of the truth of Christianity, is pointed out in a peculiar manner by Paley (*Evidences*, part 2 ch 8), namely that it was alleged from the beginning by all the propagators of Christianity and relied on as the great test of the doctrines which they taught, consequently, if the fact be untrue they must all have been either deceivers or deceived in a point on which it is morally impossible they could be so

RESUSCITATION (Lat resuscitare *to arouse*) This term is generally used to signify the restoring to animation of persons apparently dead The first and principal object in these cases is to aerate the blood by the artificial introduction of fresh air into the lungs, and to restore the natural function of respiration the lungs therefore, must be inflated, and proper stimulants applied when necessary, among these in cases of drowning and of apparent death from exposure to cold friction and warm bath are eminently important after hanging, the vessels of the brain often require to be unloaded by venesection in the jugular vein Electricity is sometimes resorted to, but generally hopelessly In all these cases no time should on any account be lost, as every thing depends upon *prompt* treatment as well as upon *proper* means and many lives have been lost for want of immediate aid, and skill in applying it The attempts to restore suspended animation should not be given up till unequivocal proofs of death are manifest (See DROWNING) The details of the management of different cases of apparent death are too extensive to come within our limits upon this subject the reader may advantageously consult *Taylor's Elements of Medical Jurisprudence*

RETAINER In old English Law a servant not dwelling in the master's house or employed by him in any distinct occupation but wearing his *livery* (i e hat, badge, or suit), and attending on particular occasions an important relic of the times of private warfare The giving liveries, or *retaining* this class of servants, was forbidden by many statutes with little effect The statutes themselves were repealed by 3 Car I c 1, but the usage had nearly ceased

RETAINER, or RETAINING FEE In the language of the Bar, a fee given to a counsel to secure his services, or rather, as it has been from engaging them [illegible] case expected to come on A *general* retainer is given by a party desirous of securing a priority of claim on the counsel's services for any case which he may have in any court which that counsel attends The effect of it is merely this, that if a counsel having a general retainer receive a special retainer on the other side, he cannot accept it until twenty-four hours after notice shall have been given of its arrival to the party so generally retaining him, when, if he does not receive a brief or a special retainer from the [illegible] The same word in its strict [illegible] the engagement of an attorney [illegible] enhances the [illegible] law between them

RETARDATION The act of hindering the free progress of a body and ultimately therefore, stopping it It arises from the opposition of the medium *in* which the body moves, or from the friction of the surface *upon* which it [illegible] See FRICTION, RESISTANCE

RETE MUCOSUM (Lat) The soft and apparently fibrous matter, or layer, situated between the cuticle and the cutis, it is the seat of the colour of the skin It is black in the negro, and the colouring matter is of such a nature as to admit of being bleached by the action of chlorine

RETIARIUS *Retiariæ* (Lat rete, *a net*) In Entomology, those spiders are so called which spin a web or net to entrap their prey

RETIARIUS (Lat rete, *a net*) The name of a class of Roman [illegible] in a peculiar way The retiarius was [illegible] a trident and net, with no more covering than a short tunic, and with these implements he endeavoured to entangle and despatch his adversary, who was called secutor (from sequi, *to follow*), and was a [illegible] and sword

RETICULE, [illegible] Zoology, when a surface has a number of minute impressed lines which intersect each other in various directions, like the meshes of a net

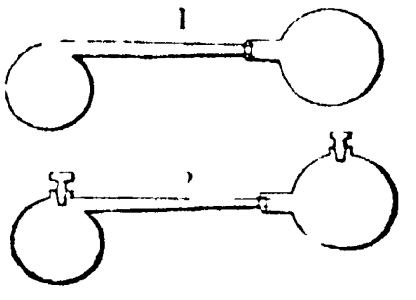
RETICULATED WORK In Architecture, that wherein the stones are square and laid lozengewise, resembling the meshes of a net This species of masonry is scarcely ever practised in the present day, but it was very common among the ancients

RETICULATUS, *Reticulata* (Lat reticulum, *a net*) The name of a section of Lithophytes, comprehending those in which the polype cells have a reticulate disposition on the surface of expanded plates

RETICULE In a telescope, a network of some fine fibres crossing each other at [illegible] field of view into a series of [illegible] been long used for observations on the quantity of the enlightened parts of a luminary during eclipses, and is found, under most circumstances, well adapted for the purpose when placed in a convenient position in respect [illegible] The term reticule is [illegible] kind of net-work, but now of every description of materials, used by ladies

RETICULUM (Lat) The name of the "honeycomb bag," or second cavity of the complex stomach of the Ruminant quadrupeds, so called because of the reticulate or honeycomb-like disposition of the mostly hexagonal cells which occupy its inner surface

RETINA (Lat rete) The pulpy expansion of the [illegible] of the eye it is the seat of vision



RETINASPHALTUM or RETINITE (Gr ρητινη, *resin*, and ασφαλτος *bitumen*, or *retinite*) A substance discovered by Mr Hatchett, associated with Bovey coal, and which has since been found in other coal strata When digested in alcohol it yields a portion of resin, and asphaltum remains, it appears therefore, to be a substance intermediate between resin and bitumen, and renders it probable that bitumens are of resinous origin

RETINITIS Inflammation of the retina

RETIPEDS *Retipedes* (Lat rete, and pes, *a foot*) The name given by Scopoli to one of the divisions of a binary arrangement of birds including all those which have the skin of the tarsi divided into small polygonal scales

RETIRED FLANK In Fortification, a flank having an arc of a circle with its convexity turned towards the place

RETORT A chemical vessel employed in a variety of distillations It is generally made of glass or earthenware, and sometimes is provided with a stopper so placed above the bulb as to enable substances to be introduced into it without soiling the neck, in this case it is called a *tubulated* retort A *receiver* is usually annexed to it for the purpose of collecting the products of distillation Fig 1 represents a plain retort and receiver, in fig 2 both are tubulated

RETOUCH [illegible] &c, a verb used [illegible] hand to a work which he had theretofore considered in a finished state

RETRACE In Painting &c, a verb used to denote the renewal of the outline of a drawing

RETRENCHMENT *See* FORTIFICATION

RETROCEDENT A term applied in Medicine to those diseases which move about from one part of the body to another, as *retrocedent gout*, when it leaves the toe for the stomach

RETROGRADATION [illegible] parent motion of a planet of the signs, or when the planet appears to move westward [illegible] the fixed stars *See* PLANET

RETURN in Law, in its most usual signification, is applied to writs The return to a writ is, properly speaking a recital by the sheriff or other officer to whom

it was directed of what he has done in execution of it; as, for example, in cases of civil process, that the defendant cannot be found (technically called non est inventus), has no goods within the sheriff's bailiwick (nulla bona) and so forth This is indorsed on the writ, and the writ is then delivered into the court whence it issued on the "return day," or day when the writ is returnable The remedy against the sheriff for a false return is by action on the case The return of members of parliament is, strictly speaking, the return by the sheriff, or other returning officer of the writ addressed to him, certifying the election in pursuance of it *See* PARLIAMENT

RETURN In Architecture a projecture in a building or wall is said to return when it projects in a different or oblique direction

REVEILLE (Fr *reveiller au matin*) The name given to the practice prevalent throughout all the European armies of beating the drum at daybreak, to awake the soldiers and put a stop to the challenging of the sentries The equivalent tune played on the bugle in the evening to summon the soldiers within their barracks, is called the *retreat*

REVELATION, in a theological sense, is a communication of truth made by God to man, but it is understood that those truths only are revealed which are communicated by direct and special means, that is, by divine inspiration Such fragments of the divine will and economy as are taught men by their own faculties and instincts are distinguished under the term *natural religion*

REVELS, MASTER OF THE, or LORD OF MISRULE The name of an officer formerly attached *pro tempore* to royal and other distinguished houses whose duty it was to preside over the Christmas entertainments This office was first permanently instituted in the reign of Henry VIII, and appears to have gone out of fashion towards the end of the 17th century

REVENDICATION A term of the civil law, signifying a claim legally made to recover property by one claiming as owner The right of property must, generally [illegible] of revenue corporeal [illegible]

REVENUE [illegible] the income of a state derived from the customs excise, taxation and other sources, and [illegible] national expenses [illegible] showing the revenue and expenditure of Great Britain will be found in the Parliamentary Papers printed every session

REVEREND (Lat reverendus) A title of respect given to the clergy In Roman Catholic countries the members of the different religious orders are styled *reverend* In England deans are [illegible] *reverend* and archbishops [illegible] the principals of the universities and the moderator of the General Assembly for the time being are styled *very reverend*

REVERSE In Numismatics, the opposite to the obverse or face of the coin or medal *See* OBVERSE, NUMISMATICS

REVERSION, in Law is defined to be the residue of an estate in lands tenements or hereditaments left in the grantor, to commence in possession after the determination of some particular estate granted by him

REVERSION OF SERIES, in Algebra is a method of expressing the value of an unknown quantity which is involved in an infinite series of terms, by means of another series of terms involving the powers of the quantity to which the proposed series is equal Thus, if the proposed series be

$$z = a x + b x^2 + c x^3 + d x^4 + \text{ad inf} \qquad (1)$$

and if we assume

$$x = A z + B z^2 + C z^3 + D z^4 + \text{ad inf} \qquad (2)$$

the original series will be reverted on determining the coefficients A B C D &c

The ordinary method consists in substituting the last series (2) and its powers for x and its powers in the series (1), and equating the coefficients, whereby the values of A B, C, D, &c are obtained But this method, though given by Newton, by whom the problem was first proposed, becomes unmanageable after a few steps, and is moreover defective, inasmuch as it does not show the connection of the coefficients, nor the law by which they are formed A general formula was given by Arbogast (*Calcul des Derivations*), whereby they may be continued with comparatively little trouble to almost any extent The values of the first four coefficients are,

$$A = \frac{1}{a}, \quad B = -\frac{b}{a^3}, \quad C = \frac{2b^2 - ac}{a^5},$$

$$D = -\frac{5b^3 - 5abc + a^2 d}{a^7}$$

(See also *Woodhouse's Principles of Analytical Calculation*, arts 72 and 73; and the *Penny Cyclopedia*, where the values of the coefficients are given to eleven terms)

REVERSION, REVERSIONARY PAYMENTS In the doctrine of Annuities, a reversion is a payment which is not to be received, or a benefit which does not begin, until the happening of some event as the death of a person now living Payments which are received at the end of a specified period of time are called *deferred payments*

The present value of a sum of money to be received on the death of an individual of a given age depends evidently upon the chances which the individual has of surviving each future year of age, combined with the interest of money The method by which the value is calculated, from an observed or assumed law of mortality, has been explained under the term ASSURANCE, and for the sake of facilitating calculations of this kind which are of very frequent occurrence in the affairs of life, extensive tables have been published, computed from various hypotheses of mortality, and at different rates of interest Such tables are usually exhibited in the form of Annuity Tables, from which the solutions of all questions relating to assurances and reversions are easily deduced *See* ANNUITY and ASSURANCE

Let A denote the value of an annuity of 1*l* on a life of a given age V the present value of 1*l* to be received at the end of the year in which the life fails (the year being supposed to commence with the day on which the annuity is payable), r the rate of interest, and $v = 1 - (1 + r)$, then

$$V = v(1 + A) - A, \text{ or } V = v - (1 - v) A$$

Suppose, for example that on the death of A, whose present age is fifty-five the sum of 5000*l* is to revert to B or his assigns and that B proposes to sell his interest in this reversion, and let it be proposed to calculate the sum which he ought now to receive allowing the purchaser interest at the rate of 4 per cent per annum In the table given under the term ANNUITY the value of an annuity of 1*l* on a male life aged fifty five is 11 0392 At 4 per cent we have $r = 04$, and $v = 1 - 1\ 04$, therefore $V = \frac{12\ 0392}{1\ 04} - 11\ 0392 = 5370$ This is the value of the reversion of 1*l* consequently $5000l \times 5370 = 2685l$ is the sum which B should receive for his reversionary interest

When the reversionary benefit consists of an annuity to commence upon the death of an individual and to continue for a term of years certain its value is found by computing the value of the annuity for the assigned period and proceeding as in the above example, but when it consists of an annuity commencing upon the death of one individual, and terminable upon the death of another, it becomes necessary to have recourse to tables of annuities on joint lives Thus if A becomes entitled upon the death of B to an annuity of 1*l* for the remainder of his life the present value of the reversion or of A's interest is equal to B — A B, where B denotes the present value of the annuity on the life of B, and A B the value of the annuity on the joint lives of A and B, that is to continue only so long as both remain alive

The four following rules give the solution of all the cases of reversionary annuities which can arise when three lives are concerned and it is seldom that a case occurs in practice involving a greater number It is to be observed that the two letters A B standing together denote as above the value of an annuity on the joint lives of A and B, B P that of an annuity on the joint lives of B and P A P Q that of an annuity on the joint continuance of the three lives A P Q, and so on Let R be the value of the reversionary annuity in each case

1 On a single life A, after the longest of two lives P and Q, R = A — A P — A Q + A P Q

2 On the longest of two lives A, B after a single life P, R = A + B — A B — A P — B P + A P B

3 On a single life A, after two joint lives P, Q, R = A — A P Q

4 On two joint lives A, B, after a single life P, R = A B — A B P

When reversionary benefits are contingent on lives failing in an assigned order as for instance an annuity to be received upon the death of A provided he die while B is living, the formula becomes more intricate, and could scarcely be explained without [illegible] inconsistent with the nature of this [illegible] formation on the subject see the Treatises of *Baily* [illegible] We may remark, however, [illegible] with this subject may be greatly [illegible] of an appropriate notation for examples of which see *De Morgan's Essay on Probabilities*, *Cabinet Cycl*, and *Hardy's New and General Notation for Life Contingencies* (1840), in which last work the solutions of all the cases of annuities and assurances which can arise, when not more than three lives are concerned, are arranged in a convenient table

REVE'TEMENT In Fortification, a strong wall of brick or stone [illegible] round the lower part of the rampart, to [illegible] and prevent it from falling into the ditch, as well as [illegible]

REVIEW [illegible] is assumed, by the [illegible] for periodical publications consisting of a collection of critical essays The *Journal des Savans*, commenced at Paris in 1665 by M de Sallo is commonly cited as the first review properly so called The most distinguished modern journals under the name of review in France are, the *Revue Encyclopédique* the oldest of them (now extinct), the *Revue Française*, and *Des Deux Mondes*, and the *Revue Britannique*, which consists of translations from the English In England the *Monthly Review* (established in 1749) was the [illegible] its kind The establishment of the *Edinburgh Review* in 1802, followed by that of the *Quarterly* in 1809, may be said to have commenced a new era in criticism from that time reviews have been adopted as the organs for conveying the opinions of sects and parties in religion and politics, as well as in literature All the leading works of this description (the *Edinburgh Quarterly*, *Westminster*, *British Quarterly*, *North British*, *Church of England*, and *Dublin*) now appear quarterly, or nearly so The management of reviews in England is in the hands of an editor, whose name, however, does not appear, the publisher being the party responsible The articles are also always anonymous the *Westminster* only, some time ago, adopted the practice of putting the initials of contributors, or initials assumed by them, at the foot of their papers All these reviews adhere to their designation, the articles admitted being in the form of *reviews* on some work or works specified at the head, [illegible] fact, the latter are often not even noticed [illegible] writer, his remarks being more in the form of a general essay than of a review In this way they serve the purpose of affording governments or political parties the means of making statements of facts or declarations of opinion, which do not involve them in the difficulties of direct responsibility and yet are generally understood to convey their sentiments The pay of writers in reviews is various, depending not only on the means of the review, but on the rules adopted by particular editors, for some have thought proper to equalize their rate of remuneration, others to retain in their own hands the power of estimating contributions according to their supposed value The French 'revues' are conducted on a different plan Articles in general have the name of the contributor attached, and the form of a "review" is not preserved tales, poetry, essays on the politics of the day, &c, [illegible]

But besides [illegible] established in the other European states, and in America, but this species of publication has taken the deepest root in Germany, where reviews may be said without exaggeration to appear daily, though none of them possess the influence of our *Edinburgh* or *Quarterly Review* The *Gottinger Gelehrte Anzeige* which is the oldest still exists and maintains a high character for ability and impartiality

REVIEW In Military language an inspection of the appearance and regular disposition of a body of troops assembled for that purpose

REVISE *See* CORRECTING

REVI'VOR, BILL OF, in Law, is a continuance of an original bill in a court of equity, when by death some party to it has become incapable of prosecuting or defending a suit or a female plaintiff has incapacitated herself by marriage from suing alone A bill "of revivor and supplement" continues a suit upon an abatement [illegible] arisen from some event subsequent [illegible] the suit

REVOCA'TION, POWER OF In Law, a power contained in a voluntary deed of conveyance to uses by which the grantor retains the liberty to revoke the uses granted by the deed Voluntary estates made with power of revocation are held fraudulent under stat 27 Eliz c 4 as against purchasers

RI'VOLUTE (Lat revolvo, *I roll back*) In Zoology, when a part is rolled outwards or backwards

REVOLU'TION In Politics, a word of somewhat indefinite meaning, but usually denoting an extensive change in the political constitution of a country accomplished [illegible] illegal means [illegible] is applied by way of eminence to the year 1688, universally regarded as the great era of English liberty, — when William III and Mary acceded to the throne on the forced abdication of James II

REVOLUTION In Geometry, the motion of a point or line about a centre

REVOLUTION, in Astronomy, is used to signify the period in which a planet, satellite, or comet returns to the place in its orbit from which [illegible]

REVOLUTION, FRENCH ERA OF THE In Chronology, this was substituted for the Christian era in all public acts and documents, by a decree of the National Convention in 1793, and fixed at the 22d September, 1792, the day of the foundation of the French republic It was abolished by Napoleon, and the Christian era restored in 1806

REX SACRO'RUM In Roman History, a priest appointed after the expulsion of Tarquin to superintend [illegible] had always been performed by [illegible] *Liv* ii 2)

RHABDOLOGY (Gr ῥάβδος, *a rod*, and λογος, *a* [illegible] given by Napier to a method of performing [illegible] a set of [illegible]

RHAB'DOMANCY (Gr ῥάβδος, and μάντεια, *prophecy*) Properly, divination by a rod or wand Some persons have been believed to be endowed by nature with a peculiar sense or perception, by which they are enabled to discover things hid in the earth, especially metals and water But a more prevalent opinion has been, that the discovery of these substances might be effected by means of a divining rod The divining rod is a branch of a tree, generally hazel, forked at the end, and held in a particular way, by the two ends, in the hands of the adept, and supposed to indicate the position of the substance sought by bending towards it with a slow rotatory motion, the adept, according to modern practice, being placed in contact with some metallic or other magnetic substance The art is said to be occasionally practised in the south of France and Italy, under the names of metalloscopy, hydroscopy, &c Campetti, an Italian, in the beginning of the present century, excited much attention by his professed powers of rhabdomancy

RHAMNA'CEÆ (Rhamnus, one of the genera) A natural order of arborescent or shrubby Exogens, inhabiting all parts of the world excepting the arctic regions The berries of various species of *Rhamnus* are violent purgatives, while the fruit of some, as the jujube, is harmless and eatable *Rhamnus frangula* yields the best kind of charcoal for gunpowder From the berries of *R infectorius* and others a yellow dye is obtained, but in general the species are neither useful nor ornamental They are all small-flowered polypetalous or apetalous plants, with four or five stamens alternating with the lobes of the calyx

RHAMPHA'STOS (Gr ῥαμφος *a beak*) The name of a genus of Scansorial bird (*Toucans*) in the system of Cuvier, distinguished by an enormous beak, nearly as thick and as long as the body in some species The compensation by which this disproportionate beak is rendered manageable and portable is an extremely light and cellular structure internally It is arcuated near the extremity, and in old toucans is irregularly indented along the edges The toucans are distinguished from the hornbills by the scansorial modification of their feet, in which two toes behind are opposed to two in front, and by their long, narrow, and ciliated tongue They are confined to the hot climates of America, where they live in small flocks feeding on fruit, insects, and the eggs and callow [illegible] other birds

RHAPO'NTIC IN A substance obtained from the *Rheum rhaponticum* in the form of yellow scales, insoluble in cold water and in ether and tasteless and inodorous It dissolves in 24 parts of boiling water, and in 2 of absolute alcohol

RHA'PSODIST (Gr ῥαπτω, *I sew or string together*, ᾠδη, *a song*) A class of persons who are said to have flourished in the age of Homer, whose occupation it was to compose or commit to memory poems, which they recited for the amusement of their auditors It has been supposed that by means of persons of this class the poems of Homer were preserved till the invention of [illegible] *Odyssey* by those who deny the individuality of Homer But the fact of the existence of such a class with higher pretensions than to the faculty of making short extemporaneous effusions is highly doubtful, as it rests mainly on the assumed fact that the art of writing was unknown in Ionia in the Homeric age

RHEA (Gr ῥεω, *I flow*) In Classical Mythology, [illegible] Cœlus and Terra, wife of Saturn, and mother [illegible] Juno Pluto &c She is frequently confounded with Ops, Terra, and Cybele For the particulars of her history, see SATURN

RHEA The name of a genus of Struthious birds, of which the three-toed ostriches of South America are the representatives

RHE'IN An inodorous bitterish substance of a yellow colour, obtained by gently heating powdered rhubarb with 8 parts of nitric acid of the sp gr 1 37, evaporating to [illegible] syrup, and diluting with cold water.

RHETORIC (Gr ῥητορικη [illegible] τεχνη *the rhetorical art*, [illegible] In the widest sense in which the [illegible] used by modern writers, the art of prose composition generally In the most restricted [illegible] of oratory, or of ad- [illegible] intermediate sense, in [illegible] employed, the art of

arg mentative compo ition This comes nearest to the ssification w ich Aristotle, the earliest extant writer of a formal treatise on subject when he def and employing topics topics or means of persuasion under three heads First, those which arise from the character of the orator himself, e the character in which, by what must be termed rhetorical artifice, he places himself before his hearers It is obvious that a speaker addressing an assembly, who is known by them to be actuated by honest motives and to understand the subject on which he speaks, advances by the mere possession of these adventitious attributes a long way towards the end and aim of oratory, viz persuasion Hence it is that Aristotle presents, as one of the chief branches of rhetoric, the art by which the speaker or writer, as it were, invests himself with these attributes, and thus ensures a more favourable reception to his argument The art of moving the passions by the use of such arguments and representations as are proper to in Aristotle s arrangement, to In his second division he treats of argument itself, considered with respect to its of form, and hence ancillary to or division of the subject exhibits the modes of persuasion arising from style, arrangement, delivery and action, and to this third branch writers who have treated of rhetoric in its more limited sense have usually confined themselves

As the work of Aristotle is the first so it is the only whom the art was much more diligently cultivated than among the moderns Public speaking was of infinitely greater importance in the classical commonwealths than in any modern state even in our own, where most sedulously studied and most valued it is but a subsidiary accomplishment The true momentum of decision that which convinces or dissuades lies in the pen of the writer rather than the voice of the orator, and whilst in the Grecian republics assemblies were actually swayed by oratory to determine on a particular course of action, its principal use now appears to be to arraign to vindicate or to explain the actions of individuals French oratory from the nature of its subject is and always was confined within narrow limits Probably pulpit oratory in modern Europe in society, answers most nearly to the classical notion of rhetoric, and had it ever been subjected to systematic rules, would have been found most nearly to conform to those which the ancients have left us Among the Romans oratory did not begin to be cultivated as a science until just at the period when its political importance was about to cease Rhetoric under the Roman empire was taught as a regular science, but its practical display was confined to the orators of the forum among whom the art gradually declined from the tendency of the civil law, during the last period of its development to conduct all process by written rather than oral method On the other hand the rules of declamations vogue during the decline of Roman literature and of panegyrical harangues The study of rhetoric in this perverted writing, schools of the Roman empire Some of the early Christian writers, especially Tertullian afford evident tokens of having acquired the art of composition under such discipline See ELOQUENCE

RHEU'MATISM (Gr *ρευματισμος*) A painful affection of the joints, attended and also affecting the muscular, textures It is occasionally accompanied by fever when it constitutes *acute rheumatism*, or *rheumatic fever*, in which case the joints are much swollen and excessively painful, the pulse frequent, but seldom hard, the perspiration usually abundant and acid, the tongue extremely foul and the bowels costive, headach is seldom complained of, and delirium very rare In this form of the disease its translation or metastasis to the heart is not uncommon The treatment consists in occasional venesection, in the use of purgatives and sudorifics and occasionally of tonics, more especially cinchona calomel and opium are also largely, and often very successfully employed *Chronic rheumatism* is not in general attended by any very re habits, when the health has been broken by previous disease or over exertion of body or mind Opium, especially in the form of Dover's powder, is generally necessary in this disorder to procure rest The bowels should be kept moderately active by warm purges, and tonics and alteratives cautiously administered A course of sarsaparilla is often extremely serviceable colchicum has been also tried but with most uncertain success

RHINOCEROS (Gr *ρις, a nose, κερας, a horn*) The name of a genus of Pachydermatous mammals, charac of the remarkable recurved horny process which rises from its upper mandible

RHINSBURGERS The name which sprung up in Holland in the seem to have separated from the church for the mere sake of separation, for they held all its doctrines, but rejected all discipline, no other profession being required from its members than a belief that Christ is the Messiah, and that the scriptures are inspired They allowed of no priests any member (women alone excepted) might preach and expound in their meetings, which were held in so called *colleges of piety* At one period they had formed eighteen of these in different towns, but from the large licence of the interpretation of scripture which they enjoyed several ran into enthusiasm, and having no principle of cohesion they soon fell to pieces, and are now completely extinct

RHIPIPTERANS *Rhipiptera* (Gr *ριπις, a fan, πτερον, a wing*) A name proposed by Latreille to supersede that of *Strepsiptera* by which Kirby designated a new order of insects which he had discovered The new name has nothing to recommend it since it signifies a character founded on the to other orders of insects

RHIZANTHS (Gr *ριζα, a root, ανθος, a flower*) A class of plants occupying a station between sexual and asexual species, and appearing to be an intermediate form of organization between Endogens and the lower orders of vegetation They agree with the former in the presence of sexes, and in their flowers having sometimes a ternary structure, but they have scarcely any spiral vessels and their seeds appear as far as they have been examined to consist of a mass of spores without a special embryo In their succulent texture in their colour, often in their putrid odour when decaying in the sporuliferous seeds and in their parasitical habits these plants resemble *Fungaceæ*, while in their flowers and sexes they accord with *Aroideæ*, or similar Endogens They are in all cases parasites and destitute of proper leaves, in lieu of which some of them have scales imbricated over their stems their parasitical habits, some are of the flowers of *Rafflesia arnoldi* are as much as nine feet in circumference

RHIZOMA In Botany See ROOTSTOCK

RHIZOSTOMES, *Rhizostoma* (Gr *ριζα* and *στομα a mouth*) A genus of *Medusæ* including those which have the absorbing orifices of their nutrient canals of small size and situated in great numbers on the branches of arms or peduncles extending from the centre of the inferior surface of the disk

RHODIUM (Gr *ροδον a rose*, on account of the rose-red colour of some of its salts especially of the chloride, when dissolved in water) A metal discovered in 1803 by Wollaston associated with palladium in the ore of platinum It is of a whitish colour very difficult of fusion, and very hard Its specific gravity is about 11, and its equivalent about 52 It has been used for the points of metallic pens

RHOMBOID In Geometry a quadrilateral figure which has its opposite sides equal When its angles are right angles it is called a *rectangle*

RHOMB SPAR A crystalline magnesian carbonate of lime

RHOMBUS In Geometry a plane figure bounded by four equal straight When its angles are right angles it becomes a square

RHONCUS (Gr *ρογχος*) A rattling or wheezing sound the term is chiefly applied to sounds occasioned by certain morbid states of respiration, as indicated by the stethoscope

RHUBARB The root of the *Rheum palmatum*, and perhaps some other species, cultivated in China for the supply of the drug market The varieties of rhubarb known in commerce under the names of Russian, Turkey, and Indian rhubarb are all derived from one source, but the select pieces are sold under the name of Russian and Turkey rhubarb, and those of somewhat inferior quality as East Indian To judge of the quality of rhubarb it should be cut or broken, when good it is of a mottled reddish or brownish red colour, that which is very pale or very dark coloured, and either so soft as to be spongy or hard and stony in texture, is bad Rhubarb is a valuable article of the materia medica, being an aperient, and at the same time a tonic and astringent The average dose of powdered rhubarb is twenty grains, which after its purgative operation leaves a certain astringent effect upon the bowels, hence its use in diarrhœa from two to five grains operates as a tonic and is very useful in some forms of dyspepsia A mixture of one part of rhubarb with two of powdered sulphate of potash is an excellent aperient for children It is oc- usion, but the powder plain, or peppermint, water, or in the form of pill.

RHUMB A circle on the earth's surface making a given angle with the meridian of the place, marking the direction of any object through which it passes The divisions on the compass card are called rhumbs. *See* MERCATOR'S CHART

RHUMB LINE In Naval Affairs, the track of a ship which cuts all the meridians at the same angle, called also the *loxodromic curve* This being the simplest curve, is the route universally pursued, but a ship sailing on this curve never looks direct for her port until it comes in sight *See* LOXODROMIC CURVE

RHYME (Gr *ῥυθμος*, *measure*, or Germ reim) In Poetry, [illegible] syllables [illegible] European languages There are rhymed verses in the Latin classical poets, where the jingle seems intentional, and more distinct examples of it in the fragments of Roman [illegible] which have come down to us But [illegible] the decay of the Latin language, when accent was substituted for metre in the rhythmical arrangement of the verse, rhyme made its way into the composition of church hymns &c It has been attempted, but with little success to deduce this innovation from the Goths, and from the Arabians, but the former, like the old Teutonic races probably used alliteration but no rhyme in their verses, and the latter could not have influenced European literature until a period long after that in which rhyme first appears A rhyme in which the final syllables only agree (*strain*, *complain*) is called a male rhyme, one in which the two final syllables of each verse agree the last being short (*motion ocean*), female, and the latter is sometimes extended in Italian poetry to three syllables (*fa more immemore*) when the verse is called *sdrucciolo* In English such a licence is hardly permissible except in burlesque poetry (see *Hudibras* and *Don Juan* for instances) By the strict rules of French prosody, the male and female species of rhymes must be alternately used however intricate the disposition of the verse may be, although the last short syllable is generally mute or very slightly sounded Rhymes which extend not only beyond the three last syllables but through the whole structure of the lines, are used in Arabian and Persian poetry Rhymes in which the consonants of the last syllable in each verse are identical (*dress address*) are vicious in English but rather admired in French poetry One more singularity of English poetry deserves notice while from the irregularity of our spelling many syllables rhyme with each other, although widely dissimilar in orthography (*woo pursue*), there are on the other hand rhymes which speak to the eye and not to the ear, i.e. in which the orthography of the rhyming syllables is the same, but the pronunciation different, as *wind*, *find*, *gone*, *alone* In the following triplet of Dryden, —

[illegible]
And thy blest Saviour's blood discharge the mighty sum —

it will be seen that the first and third lines rhyme in a [illegible] the last syllables are different [illegible] and second rhyme to the eye only, and not to the ear This is a licence only rendered admissible by precedent

RHYNCHOPHORUS *Rhyncophora* (Gr *ῥυγχος a beak* and *φερω I carry*) The name of a family of Coleopterous insects, comprehending those which have the head prolonged in the form of a snout or proboscis

RHYTHM (Gr *ῥυθμος*) The consonance of measure and time in poetry prose composition and music, and by analogy in dancing Each verse or each period may be considered as a whole within which the poetical rhythm is regular and exact within certain limited variations, the rhetorical less perfect, and the pleasure derived from it rather matter of taste and experience than of rule Those parts which receive the ictus or stress of the rhythm are termed *arsis* (elevation), the remainder form the *thesis* (depression), the former is frequently denoted to the eye by the accent marked when in a foreign or unknown word we wish to direct the voice in pronunciation to employ the correct emphasis The smallest rhythmical division is the foot, by which every union of arsis and thesis is understood A short syllable is an original unit of time, a long syllable contains two units The number of feet enumerated in classical writers on metre amount to twenty-eight, including all the varieties which may be formed out of two, three, or four syllables, long and short [illegible] two to eight units of time *See* FOOT, METRE

RIAL A gold coin current in the reigns of Henry VI and Elizabeth under the former its value was 10*s*, under the latter 15*s*

RIBS In Architecture [illegible] timbers to which, in an arched or coved [illegible] laths are nailed

RIBS A term for the timbers of a ship which spring from the keel, as the ribs of an animal from the back bone.

RIBS In Anatomy, the lateral appendages of a vertebra, especially when developed so as to encompass the trunk In the human subject there are twelve ribs

RICE *See* ORYZA

RICE PAPER This substance is said to be a membrane of [illegible] tree (*See* ARTOCARPUS) [illegible] small pieces, dyed of various colours, and is used as a material for painting upon, and for the manufacture of several fancy and ornamental articles It is sometimes erroneously stated to be prepared from rice (See Brewster, *Edinb Journ of Science*, vol ii)

RICINIC ACID One of the products obtained by distilling castor oil at a high temperature

RICKETS *See* RACHITIS

RICOCHET FIRING, in Gunnery, is a mode of firing with small charges from pieces of ordnance elevated at small angles, as from 3° to 6° It is a very destructive method, as the rebound causes the shot or shell to pass along a great space almost upon the ground, [illegible] it meets with in its way The word [illegible] is the sort of motion which is familiarly called ducks-and-drakes as applied to a flat stone thrown on the surface of the water under a very small angle

RIDEAU In Fortification, a small elevation of earth extending itself [illegible] to cover a camp from the [illegible] or to give other advantage to a post

RIDER A term used to signify any addition to manuscripts or other documents, inserted after their completion

RIDGE [illegible] in [illegible]

RIDING [illegible] three divisions of the county of York are so termed by a corruption of the Saxon word *thriding* or *trading* (third part)

RIDOTTO (Ital) A favourite public Italian entertainment consisting of music and dancing, held generally on fast eves

RIFLE GUNS Muskets or pieces of ordnance, whose barrels instead of being a clear cylinder inside, are furrowed with spiral channels The object is to give the ball a rotatory motion about an axis, in consequence of which it preserves its direction with much greater certainty than when fired from the common clear barrel *See* GUN

A body of men armed with rifles are called riflemen, but the term is most frequently applied to the military corps called the [illegible] and one battalion of the British army, which [illegible] are armed with rifles

RIG The peculiar manner of fitting the masts and rigging to the hull of any vessel, thus schooner rig ship rig, &c imply the masts and sails of these vessels without regard to the hull

RIGGING The system of cordage by which the masts are supported, and the sails extended or taken in The [illegible] is divided into *standing rigging* and *running* [illegible] It consists of the *pendants*, short strong ropes first put over the lower mast heads, and having thimbles for hooking tackles to the *shrouds*, *stays*, and *backstays* The lower rigging implies that of the lower masts, the topmast rigging that of the topmast, and so on The size strength number of ropes, &c of the rigging, are all matters determined by experience A complete description of rigging is to be found in the well known work of Darcy Lever

RIGGING LOFT The room or rooms in which the rigging is prepared

RIGHT In Geometry, a term sometimes used synonymously with straight, as *right line*, but generally as opposed to oblique Thus, a *right angle*, the angle formed by [illegible] lines perpendicular to each other, or in [illegible] *right cone*, *cylinder*, *prism*, *pyramid*, &c, figures whose sides are perpendicular to the plane of the base

Right angled Triangle A triangle having one right angle

Right-angled Triangle In Numbers A favourite speculation of the Platonic school of mathematicians was to find rational numbers which should designate the sides of a right-angled triangle Pythagoras gave the formulæ n, $\frac{n^2-1}{2}$, and $\frac{n^2+1}{2}$, where n is odd Plato gave $2n$, n^2-1 and n^2+1, where n is either odd or even Various other forms have been given by subsequent writers The determination of such sets of formulæ forms a branch of [illegible] Analysis

RIGHT In Geography, the position of the sphere when the equator cuts the horizon at right angles

RIGHT ASCENSION, in Astronomy, is the angle at the pole of the equator formed by two great circles, one of which passes through the first point of Aries, and the other through a celestial body, and is consequently measured by the arc of the equator intercepted between those circles *Right ascension* and *declination* are the

two co ordinates to which the positions of celestial objects are referred

RIGHT, DIVINE *See* DIVINE RIGHT

RIGHT OF PRO'PERTY (Lat jus proprietatis, Fr droit de proprieté) In Political [illegible] the right which states, bodies of individuals, and individuals have to the exclusive use and enjoyment of such lands, natural powers, and products as have been appropriated or set apart for any peculiar purpose

Origin of this Right — It would occupy the reader's time to no good purpose were we to state the different theories that have been advanced by jurists and writers on public law to account for the origin of this right * This, indeed, appears to us to be sufficiently obvious All the rude products furnished by nature have to be appropriated, and not one in a thousand, perhaps, of these products is, in its natural state, capable either of supplying [illegible] Hence the [illegible] appropriation of natural products, but in fashioning and preparing them so as to be useful, and hence, also, the origin of the right of property

If a number of individuals be set down together on the shore of an unoccupied and unappropriated island abounding with natural products, such as game, trees laden with fruit, &c, each will have quite as good a right as another to take the game or the fruit But those who do so, or who have through their skill and industry appropriated a portion of the common stock, will obviously be entitled to the exclusive use of such portion We shall not undertake to decide whether there be or be not a principle inherent in man that at once suggests to every individual that it is his duty not to interfere with what has been produced or appropriated by the labour of others, it is sufficient for us to know that the briefest experience would point out to every one the necessity of respecting this principle If A climb a tree and bring down fruit which as soon as he comes to the ground is taken from him by others he will not again engage in any similar undertaking till he be well assured that he shall be permitted exclusively to profit by what has been obtained through his sole exertions nor will others engage in any such undertaking without a similar assurance No doubt, therefore the right of property has had a very remote origin The necessity for its establishment is so very obvious and urgent that it must have been all but coeval with the formation of societies All have been impressed with the reasonableness of the maxim which teaches that products acquired by the *labour* of a man's body and the *work* of his hands should be considered as exclusively his own Even among the rudest savages the principle of *meum* and *tuum* is recognized, the bows and arrows of the huntsman and the game he has killed being regarded by him as his own, and his right to their exclusiv[illegible] The right of [illegible] rfected only by degrees, and is necessarily limited and adapted to the state of society at the time Thus among hunters the *feræ naturæ* on which they subsist not being bred under the care or inspection of individuals, are so long as they run wild in the forest, the common property of the tribe, and only become the property of individuals after they have been appropriated or caught by their labour or ingenuity As society advances the right of property expands The modern Tartars like the ancient Scythians estimate their wealth by the number of their cattle Their right to the animals which they have domesticated and reared is deemed sacred and inviolable, but the pasture grounds belong like the hunting grounds of the Indians to the whole society, and as the flocks are driven from one place to another, the grounds may be successively depastured by the cattle of every different individual The moment, however that men begin to renounce the pastoral for the agricultural mode of life a right of property in land began to be established The soil cannot be cultivated its fertility cannot be increased, nor can it be made to produce those crops which yield the largest supplies of food and other necessary accommodations, without continuous labour, and persevering attention

——— Pater ipse [illegible]
Haud fa nem [illegible]

[illegible] property in land Nothing, it is [illegible] any one to engage in a laborious employment, he would neither domesticate wild animals, nor clear and cultivate the ground, if, after months and years of toil, when his flocks had become numerous, and his harvests were ripening for the sickle, a stranger were allowed to rob him of the produce of his industry The utility, or rather necessity, of enacting [illegible] regulations, that should secure to every [illegible] peaceable enjoyment of the produce he had raised, and of the ground he had cultivated and improved, is, indeed, so very obvious, that it suggested itself to the first legislators [illegible] Book of Job places those who removed their neighbours' landmarks at the head of his list of wicked men, and the early Greek and Roman legislators placed these marks under the especial protection of the god Terminus and made their removal a capital offence (*Goguet, de l'Origine des Lois* lib i art 2) Society may thus be said to have grown out of [illegible] property in land "Had not," says Mr Justice Blackstone, a separate property in lands as well as moveables been vested in some individuals the world must have continued a forest, and men been mere animals of prey Whereas now, so graciously has Providence interwoven our duty [illegible] the [illegible] he hath scattered [illegible] as well over the face of the earth as within the bowels of it, and intersected every land with navigable rivers, and given others [illegible] had to civil society, which brought along with it a long train of inseparable concomitants, — states, government, laws, punishments and the public exercise of religious duties Thus connected together, it was found that a part only of society was sufficient to provide, by their manual labour, for the necessary subsistence of all, and leisure was given to others to cultivate the human mind, to invent useful arts, and to lay the foundation of society" (*Comment* book ii cap 1)

It is obvious, from what has now been stated that the law of the land is not as Dr Paley has affirmed, the real foundation of the right of property It has a much more remote and more solid foundation It grows out of the circumstances under which man is placed, and could not be overthrown or set aside without depopulating the earth and throwing mankind back into primæval barbarism The obvious utility of securing to each individual the peaceable enjoyment of the land he has enclosed and cultivated, and of the produce raised or acquired by his labour has undoubtedly formed the irresistible reason that has induced every people to make the right of property a part of the law of the land and to guard it by the strongest sanctions The security of property is, in truth the principal foundation on which society rests Until property had been publicly guaranteed men must have looked on each other as enemies rather than as friends The idle and improvident are always desirous of seizing on the earnings of the laborious and frugal, and if they were permitted to prosecute their attacks, they would by generating a feeling of insecurity, effectually check both industry and accumulation and sink all classes to the same level of hopeless misery as themselves The security of property is, if possible, still more necessary to accumulation than to production No man ever denies himself an immediate gratification when it is within his power unless he think that by doing so, his present forbearance will obtain for him a greater accession of comforts and enjoyments or that it will obviate some probable and considerable evil at a future period Where the right of property is vigilantly protected an industrious man who gains as much by one day's labour as is sufficient to maintain him two is not idle the second day, but accumulates the surplus produce above his wants as a capital, the increased consequence and enjoyments which the possession of capital brings along with it being in the great majority of cases, more than sufficient to counterbalance the desire of immediate gratification But, wherever property is insecure, we look in vain for the operation of the principle of accumulation 'It is plainly better for us," is then the invariable language of the people, to enjoy while it is in our power, than to accumulate property which we shall not be permitted to use and which will expose us to the depredations of those who exist only by the plunder of their more industrious neighbours"

The security of property is violated not merely when a man is deprived of the power of peaceably enjoying the fruits of his industry, it is also violated, and perhaps in a still more unjustifiable manner when he is prevented from using the powers with which nature has endowed him in any way, not injurious to others, he may consider most for his own advantage Of all the species of property which a man can possess, the faculties of his mind and powers of his body are most particularly his own He should, therefore, be permitted to enjoy, that is, to use or exert, these powers at his discretion And hence the right of property is as much infringed upon when a man is interdicted from engaging in a particular branch of business, as it would be were he unjustly deprived of the produce he had raised Every monopoly which gives to a few individuals the exclusive power of carrying on certain branches of industry is thus, in fact, established in direct violation of the property of every one else It prevents them from using their natural capacities, or powers, in the manner they may consider best, and as every man who is not a slave is justly held to be the best, and indeed only judge, of what is advantageous for himself, the principles of natural law

* The learned and curious reader may consult Puffendorff, lib iv c 4–6

and the right of property are both subverted by his exclusion from any employment In like manner, the [illegible] to force [illegible] in a particular way The property of a landlord is violated if he be compelled to adopt any system of cultivation, even supposing it were [illegible] he [illegible] is [illegible] to accept a lower interest for his stock than he might have obtained, and the property of the labourer is violated whenever he is obliged to engage in any particular occupation It follows, too, that every restraint on the freedom of commerce is an infringement of the right of property If I, the lawful [illegible] property is as much invaded as if I were debarred from making any direct use of the article Had this circumstance been adverted to, it is probable the restrictive system would not have made quite so much progress as it has done

Effects of the Insecurity of Property — The finest soil, the finest climate, and the finest intellectual powers, can prevent no people from becoming barbarous, poor and miserable, if they have the misfortune to be subjected to a government which does not respect and support the right of property All those vast and fruitful countries, comprising the fairest portion of the earth that stretch from the Black Sea to the Persian Gulph, and from the western shores of Morocco to the confines of China, once the seat of the most renowned empires, of arts and civilization are now through the want of security and freedom become the most deplorable spectacles of extreme misery "No care" says Mr Kinneir speaking of some of the most fertile provinces of Asia Minor "is taken to improve the land, nor can this be matter of surprise, when we reflect that the farmer is liable to be turned out at a moment's warning and is certain of being taxed or rather plundered, in exact proportion to the yearly produce of his farm It is not, indeed uncommon should there be a prospect of a plentiful harvest for the crops upon the ground to be seized by the pacha at a low valuation, and then put up to the highest bidder" (*Journey in Asia Minor &c* p 52) The same intelligent traveller observes in speaking of Syria, that the Grand Seignior is the lord of the soil and the *miri* or capitation tax is regularly paid into the public treasury The pachas derive their revenues from levying arbitrary contributions in money and in kind upon the merchants citizens villagers and cultivators of the land This unjust and uncertain mode of taxation is rendered still more afflicting by the manner of collecting it The troops and followers of the pacha a licensed banditti, disperse themselves over the country and villages, where they live at free quarters, and for every piastre that is received by their master at least three have been exacted from the unfortunate proprietor Under such a system neither agriculture commerce arms arts, nor sciences can ever make the least progress, and it is deeply to be lamented that no successful effort has hitherto been made to wrest so noble a country from those who are so unworthy to possess it (*Ibid* p 174)

Had it been possible for arbitrary power to profit by the lessons of experience it must long since have perceived that not only the wealth of its subjects but its own, would be most effectually increased by maintaining the security of property We [illegible] Turkey and Persia to establish [illegible] to secure to each individual the unrestrained power of disposing of the fruits of his labour and to substitute a regular plan of taxation in the room of the present odious system of extortion and tyranny, industry would gradually revive, capital and population would be augmented, and a moderate land tax or reasonable duties on a few articles in general demand would bring a much larger sum into the coffers of the treasury than all that is now obtained by force and violence The *stated* public burdens laid on the Turks Persians, &c, are light compared with those imposed on the English, Dutch and French But the latter know that when they have paid the taxes due to government they will be permitted peaceably to enjoy or to accumulate the residue of their wealth, whereas the subjects of eastern despotisms have, generally speaking no security that, the moment after they have paid their stated contributions, the pacha, or one of his satellites, may not strip them of every additional farthing they possess! Security is the foundation the principal element, in every well digested system of finance When maintained inviolate, it enables a country to support without much difficulty, a very heavy load of taxes, but where there is no security, where property is a prey to rapine and spoliation, to the attacks of the needy, the powerful, and the profligate, the smallest burdens are justly regarded as oppressive, and uniformly exceed the means of the impoverished and dispirited inhabitants

Power of [illegible] *operty* — T [illegible] of property [illegible] not only [illegible] should have the power freely to dispose of it during his lifetime, but also that he should have power to bequeath it to others in the event of his death *Nihil enim tam conveniens est naturali æquitate*, say the Roman jurists, *quam voluntatem Domini volentis rem suam in alium transferre, ratam haberi* (*Instit* lib ii [illegible]) It is evident that the being enabled to bestow our property on those who occupy the chief place in our affections must have a powerful effect in stimulating industry When a man is assured that he is not labouring for strangers that the fruit of his industry will not fall into the hands of an unknown successor, but will descend to his children or his friends he finds, as it were, his existence indefinitely extended, and continues with unimpaired energy to exert himself for the benefit of those who are to perpetuate his family and name and whose welfare perhaps, is as dear to him as his own The power of bequeathing property connects the future with the present, without it, no undertaking would be entered upon which did not promise an adequate return during the lifetime of the projector But in civilized societies the plans of the capitalist are not circumscribed by the brief duration of human life He plants forests by which he can never expect to be enriched, he raises edifices fitted and intended to outlive many generations, and executes innumerable improvements, of which posterity alone can reap the benefit And he does all this because he is permitted to name his successors, to transmit his property and effects to those with whom he is connected by the ties of kindred, affection or gratitude, and in whose welfare he feels a deep interest.

Numerous difficult and important questions have, however to be decided in framing regulations as to the bequeathing of property by will, and as our purpose at present is merely to point out the principle on which the power is conceded we shall defer the notice of the conditions which should limit its exercise to the article SUCCESSION LAW OF

Property in Wild Animals — It is clear from what has been previously stated and from the nature of the thing, that nothing can be made property unless it be susceptible of appropriation, and on this ground, it has sometimes been objected to the game laws that they have made a property of that which being incapable of appropriation should belong to the community, or to the captors In support of this view of the matter the rule of the Roman Law has been appealed to where it is laid down — *Feræ igitur bestiæ, et volucres et pisces, et omnia animalia quæ mari cælo et terra nascuntur, simul atque ab aliquo capta fuerint, jure gentium statim illius esse incipiunt, quod enim ante nullius est, id naturali ratione occupanti conceditur* (*Instit* lib ii tit i § 12) But it is distinctly laid down in the same article whence we have borrowed this paragraph that the proprietor of an estate has full power to prohibit any one from entering upon it to kill wild animals Without this proviso, there would not, in fact be any such thing as a real property in land and this is in truth, all that is meant when it is said that game is property A partridge or hare is mine so long as it remains on my estate but the moment it transfers itself to the estate of another it becomes the property of the owner of such estate Poachers are punished not because they have killed wild animals but partly and principally because in doing so they invade the right of property by killing it without leave on lands belonging to other parties, on which they had no right to enter, and partly because they have not paid the tax demanded by government from all who kill game

It is sometimes indispensable for the interests of society to appropriate the whole or a portion of the landed property of one or more individuals to some public purpose, as the formation of a road, a canal, &c But property should never be wantonly taken for such purposes, nor till the advantages to be obtained by its cession have been fully established before some competent tribunal, and when this has been done, full compensation should in every case be given to those who are thus called upon to give up their property for the promotion of the public interests

Inconveniences of a Community of Goods — Those schemes of policy that have been founded or projected either upon the principle of a communion of goods, or of an equal partition of the land among the different families belonging to the society, are bottomed on the most erroneous views, and would, if they could be acted upon, be an effectual bar to every improvement Those who have advocated these schemes, struck with the evils arising from the violations of private property to which the ill-regulated cupidity of some and the wretchedness of others are perpetually giving birth, seem to have thought that the crimes and disorders that were thus occasioned might be advantageously and completely got rid of by abolishing the right of property and obliging men to labour in common, and giving each in

idual an equal share of the produce raised by the nt labour of all They imagined that they would, in s way, eradicate that selfishness which was so fruitful source of mischief, that as no one could be either her or poorer than his neighbour, no one would be object of envy or attack, and that the principal rces of discord and crime being thus dried up men ers, and be But these pectations are wholly inconsistent with the nature of n, and cannot, therefore, be realized We might as ll attempt to eradicate the feelings of hunger, and thirst as of self-interest and if we could eradicate we should eradicate the principle which impels man labour, which prompts him to contrive, invent, and ass. There is plainly nothing blameable in our presence of ourselves to others The desire of aggrandizent becomes injurious only when proprietors and others endeavour to advance their own interests by acting ustly by their fellow-men, for, otherwise, it is the rce of all that is most advantageous to society And s mainly for the purpose of obviating this abuse, and protecting every one in the enjoyment of his property, t governments have been instituted *Hanc enim ob sam*, says Cicero, *maxime ut sua tuerentur, res-blicæ civitatesque constitutæ sunt Nam etsi duce uræ congregabantur homines tamen spe custodiæ um suarum urbium præsidia quæ rebant*

t is idle, therefore to think that the feelings of self-erest can ever be eradicated from the human breast that the adoption of the system of those who propose establish a communion of labou would be to give the principle of ection from what it takes when left to itself to der it a source of idleness and poverty, instead of our and wealth Suppose you have a community of housand individuals who live and labour in common this, as in all similar cases, it would be obvious to ry individual that if on the one hand, he made any usual exertions either of body or mind he would reap y the thousandth part of the advantages derivable n them, while, on the other hand it must be equally ious, that if he contrive to avoid performing his due re of work, or obtain more than his fair proportion its produce, he will be the *sole* gainer Under such umstances, it is clear not only that society could se no farther progress, but that it must gradually, not very slowly, retrograde The principle of self rest would not be annihilated, on the contrary it uld be as strong as ever, but inasmuch as no one ld henceforth expect to advance himself by industry nuity or frugality a regard for his own interest uld teach him to follow an opposite course and would llibly prompt him to labour as little and to consume as much as possible The evils produced by h a system would be so intolerable that it could not ontinued But if it were we should instead of the ustry invention and wealth produced by the establishment of private property and the consequent efforts ndividuals to advance themselves in the scale of society, have universal idleness indifference, and the most ct misery We should purchase an exemption from se crimes and disorders incident to an advanced stage ociety and which the adoption of good laws and a lant system of police go far to repress by the annihilation of every thing that raises civilized man above condition of the savage and by subjecting all classes he plague of universal poverty

Inconveniences of Agrarian Laws — The attempt to d a society upon an agrarian law or upon the principle of maintaining an equal division of land amongst different families of the society is as much opposed he nature of things as a communion of goods, but the system in other respects as advantageous as it he reverse it could not be maintained for any considerable period Though the first settlers of an unpied country were to adopt this plan, it would, in than a dozen years, be wholly subverted and there uld be the greatest inequality in their fortunes This uld arise from differences of strength talent, and con, from the varying numbers and conduct of children, the other unforeseen accidents and occurrences h are always affecting the circumstances of individuals It is absurd to suppose that an equality of con n could be maintained notwithstanding the operation of such powerful causes of derangement, without rting to the most atrocious system of tyranny, withequalizing the number of children, and abstracting a ion from the industrious and frugal to ow improvident But it is unnecessary to dwell on such crude absurdities The division of rich and poor is not, as some shallow sophists uld seem to suppose, artificial, it is as much rt of the order of Providence as the distinction of sexes Inequalities in the talents of the physical mental powers and dispositions of different individuals, and of the different circumstances under which they happen to be placed, and efforts to obliterate this distinction by encroaching on the rights of property, and enacting agrarian laws, or laws of a similar tendency, is to attempt to accomplish what is in its nature impracticable, at the expense of great and certain mischief and inconvenience

RIGHT, PETITION OF A declaratory enactment passed by the parliament of 1628, to which this name was given by the framers, who were desirous to imply by it that the franchises therein specified were not newly acquired, and that the law was merely explanatory of the ancient constitution It was calculated to protect the subject against forced loans, benevolences, taxes imposed without consent of parliament, arbitrary imprisonments, &c Much delay and some evasion took place before Charles I could be induced to give the royal assent to this measure

RIGHTS, BILL OF *See* BILL OF RIGHTS

RIGIDITY In Mechanics a resistance to change of form In all theoretical investigations respecting the application of forces through the intervention of machines, those machines are assumed (except cords) to be perfectly rigid so far as the forces employed are able to affect their integrity of form and structure Rigidity is often in the arts, called *stiffness*, and is opposed to flexibility

The rigidity of cords or the difficulty with which they are bent into any given curve, is the chief cause of the loss of power arising from their employment in machines The law of their loss of force may be thus expressed — The resistance arising from the stiffness of cords is as the weights which stretch the cords multiplied by the thickness of the cords and divided by the radii of curvature of the surfaces over which they pass It is, however necessary to state that experiments exhibit great discrepancies with this theoretical law

RIGORISTS In Ecclesiastical History, a name sometimes given to the extreme Jansenist party (See *Mosheim* vol v p 221 transl ed 1790)

RIMOSE (Lat rima *a cleft*) In Zoology when the surface of an animal or part resembles the bark of a tree having numerous minute narrow, and nearly parallel excavations which run into each other

RINFORZANDO (It *strengthening* In Music, a direction to the performer denoting that the sound is to be increased It is marked thus <, when the sound is to be diminished (*diminuendo*) this mark > is used

RING In Geometry the figure enveloping a sphere which moves with its centre always in a given curve most commonly a circle For the principal properties of this solid see Hachette *Geometrie Descriptive*

The term is also sometimes applied to designate the area of the space between two concentric circles

RING BONE In Farriery a callus growing in the hollow circle of the little pastern of a horse, just above the coronet

RING OF SATURN *See* SATURN

RINGS FAIRY This name is given to irregular circles in pastures and lawns on which *Agarics* spring up and which become much more verdant than the surrounding grass They are caused by the growth of the spawn of the *Agaric* which a common centre, and bears the fructification which is what appears above ground only at the circumference The verdure of the grass where these fungi grow seems to be caused either by their manuring the ground when they decay or by the nitrogen they give off, which is an active stimulant to vegetation The appellation of *fairy rings* was given to this phenomenon from their being regarded as the places where the fairies held their nocturnal revels

RING SAIL A small and light sail set on a mast on the taffrail Also a studding sail set upon the gaff of a fore and aft sail

RINGWORM This disease appears in circular patches upon the neck forehead or scalp, it begins with clusters of little pustules, which form scabs, leaving a red pimply surface and destroying the roots of the hair as it proceeds which it does if not prevented over the greater part of the head It is most common in children of a feeble flabby habit, but as it is communicable by contagion, it generally spreads rapidly in schools and families by the frequent contact of the heads of children, or by the use of the same caps, combs, towels &c, so that when it once appears the affected boys should be strictly removed from the others The treatment consists in shaving the head, and using frequent and regular ablutions in the first instance, sponging the part with weak soap and water, when the scabbing begins, other applications must be used, the selection of which must entirely depend upon the degree of irritation and other circumstances Solutions of nitrate of silver, sulphate of copper, iodide of potassium, or of iron, pitch and tar ointments, petroleum and naphtha, mercurial ointments of different kinds, and various others are used so numerous indeed are the remedies to which recourse has been had, that the obstinacy of the part, and the chronical and obstinate is the disease, that it is impossible to lay down any mode of treatment which can be considered

as approaching to a specific Except in particular cases no internal medicine has appeared to be of use

RI'OT, in Law, is said to be a tumultuous disturbance of the peace by three persons or more assembling together of their own au hority in order to assist each other against any one who shall oppose them in the execution of a private purpose, and afterwards executing the same in a violent and turbulent manner A rout is said to be a disturbance of the peace by persons assembled together to do a thing, which, if executed, would make them rioters, and making some motion towards that object, an unlawful assembly, a similar disturbance by persons who neither execute their purpose, nor make any actual motion towards the execution of it

RIPIE'NO (It *full*) In Music, a term signifying full, and is used in compositions of many parts, to distinguish those which fill up the harmony and play only occasionally from those that play throughout the piece

RIPPLE MARKS The peculiar undulated marks, which the receding waves leave on the sea beach, and which are occasionally found in some of the older strata of rocks, and are considered as announcing a similar action at a remote period The wind blowing over a sandy district sometimes occasions a similar appearance

RITORNE'LLO (It *a return*) In Music, properly a short repetition, such as that of an echo or of the last words of a song especially if such repetition be made after a voice by one or more instruments But by custom this word is now used to denote all symphonies played before the voices begin and which seem to prelude or introduce what follows

RI'TUAL (Lat ritus *a rite*) A book in which the different rites or services of the church are contained

RI'VER (Lat rivus) In Physical Geography an inland current of water, formed within a certain portion of the earth's surface by the confluence of brooks small streams or mountain torrents, and discharging itself into the ocean a lake marsh or other river There are few subjects in physical geography which present so wide a field for speculation as rivers whether we regard them in an historical, political economical or scientific point of view They are associated with the earliest efforts of mankind to emerge from a state of barbarism, but they are no less serviceable to nations which have reached the acmé of civilization In the earliest ages they were regarded with veneration, and became the objects of a grateful adoration surpassed only by that paid to the sun and the host of heaven Nor is this surprising, for in countries where the labours of the husbandman and shepherd depended for a successful issue on the falling of periodical rains, or the melting of the collected snows in a far distant country, such rivers as the Nile, the Ganges, and the Indus were the visible agents of nature in bestowing on the inhabitants of their banks all the blessings of a rich and spontaneous fertility, and hence their waters were held sacred and they received and to this day retain, the adoration of the countries through which they flow But it is by countries which have already made progress in civilization (to which indeed they largely contribute) that the advantages of rivers are best appreciated in their adaptation to the purposes of navigation, and in their application to the useful arts Like the veins and arteries of the human body which convey life and strength to its remotest extremities, rivers vivify, maintain, and excite the efforts of human industry, whether we regard them near their source as the humble instruments of turning a mill in their progress as facilitating the transport of agricultural or manufacturing produce from one district to another, or as enriching the countries at their mouths with the varied products of distant lands This has been so admirably expressed by Pliny that we cannot refrain from embodying his words in our pages 'The beginnings of a river' he says, 'are insignificant and its infancy is frivolous it plays among the flowers of a meadow, it waters a garden, or turns a little mill Gathering strength, in its youth it becomes wild and impetuous Impatient of the restraints which it still meets with in the hollows [illegible] is restless and fretful, quick in [illegible] in its course Now it is a roaring cataract, tearing up and overturning whatever opposes its progress, and it shoots headlong down from a rock, then it becomes a sullen and gloomy pool, buried in the bottom of a glen Recovering breath by repose, it again dashes along, till, tired of uproar and mischief, it quits all that it has swept along, and leaves the opening of the valley strewed with the rejected waste Now quitting its retirement [illegible] the world, journeying with more [illegible] through cultivated fields, yielding to circumstances, and winding round what would trouble it to overwhelm or remove It passes through the populous cities, and all the busy haunts of man, tendering its services on every side, and becomes the support and ornament of the country Increased by numerous alliances, and advanced in its course, it becomes grave and stately in its motions, loves peace and quiet, and in majestic silence rolls on its mighty waters till it is laid to rest in the vast abyss"

Most large rivers have their origin in very elevated mountains, or [illegible] of which chief [illegible] For full information on the various points involved in this subject [illegible] "Rivers" in the *Encyclopædia Londinensis*, we must confine our remarks to some of their most striking peculiarities, — *periodical inundations*, *occultations*, and *reappearance*

The *periodical inundations* of rivers depend on great falls of rain in mountainous regions or on the melting of snows in the neighbourhood of their source The period depends on the return of these seasons in different places Within the tropics the rainy season occurs usually about the time when the sun passes the meridian towards the tropics, and continues until his return to the same place The rise of the Orinoco commences in May its inundation begins in June, and the waters return to their channel in September, from which time they decrease until April of the succeeding year In the Lower Mississippi, whose inundations begin in March, and are at their height in June, are found those enormous rafts of driftwood (formed during the inundations), which sometimes extend for ten or twelve miles in one mass, rise and fall with the stream, yet have a luxurious vegetation on their summits The great rivers of Asia — the Ganges the Indus the Tigris, and Euphrates — have also their periods of inundation, depending on the circumstances determining the setting in of the rains on the mountains in which they originate In the Ganges the waters begin to increase in April, and at the end of July the country, for an hundred miles along its banks, presents the appearance of a vast lake interspersed with insulated villages and woods But of all inundations, those of the Nile are the most celebrated, nor is it possible to find any where among terrestrial objects a more striking instance of the stability of the laws of nature, than the periodical rise and fall of this mighty river We know by the testimony of antiquity that the inundations of the Nile have been the same with respect to their season and duration for three thousand years Indeed, their certainty regulates the public revenue, for when by means of nilometers it is ascertained that the waters promise an unusually prosperous season the taxes are proportionally increased Shortly after the commencement of the rains of Abyssinia in June the river begins to rise, and attains its greatest height in August At Cairo the greatest rise is twenty-eight feet but in the valley of the Nile with a mean breadth of three or four leagues it is only four feet It decreases gradually until the following May and as soon as the waters are within their usual channel the soil, moistened and enriched by the sediment deposited from the inundation is diligently cultivated by the natives Pliny thus speaks of the inundation — Justum incrementum est cubitorum 16, minores aquæ [illegible] recedendo [illegible] dant sitiente Utrumque reputat provinciæ In duodecim cubitis famem sentiant in tredecim etiamnum esurit quatuordecim cubita hilaritatem afferant quindecim securitatem sexdecim delicias" (*Hist Nat* lib v 9)

The [illegible] *reappearance* of some rivers have attracted every age nor has any satisfactory explanation been yet assigned for this extraordinary phenomenon In the Memoir of the Abbé Guettard the phenomenon in question is accounted for by the spongy nature of the soil through which such rivers flow thus the Guadiana, one of the largest rivers in Spain, suddenly disappears in the marshes near the village of Castillo de Cerera, and after pursuing a subterraneous course for twelve or fourteen miles bursts again into day Limestone districts afford many specimens of this phenomenon, one of the most striking of which is the occultation of the Rhone near the gorge called the *Perte* There are also some curious instances in Derbyshire and Yorkshire But no country surpasses Greece in the number of its subterraneous streams the peculiarities of which are often clothed in splendid mythological fictions by her ancient bards The waters of many valleys in the Peloponnesus have no other outlets than ζερεθρα, or chasms, which engulph them, such are the outlets of the valleys of Lerna Mantinea, Asæa, Stymphalus, Peneus, &c A familiarity with such phenomena, and a poetical temperament, readily led the ancient Greeks to conceive still more distant secret communications, and the imagination which peopled every grove, and animated every stream with presiding deities could easily reconcile itself to the story of the river god Alpheus, who was said to pursue his favourite nymph Arethusa beneath the bed of the ocean from Greece to the shores of Sicily (*Traill's Physical Geography*)

We subjoin, from Dr Traill's valuable Treatise on Physical Geography, a table showing the length of the course of twenty two of the principal rivers of the

world, and the area of their respective basins, together with their proportional lengths in English miles, a calculation which has been obtained by measuring them by lines being the distance between the most remote sources of the Thames which is assumed as unity, and its embouchure at the Nore

Rivers.	Length	Length in English Miles	Proportional Magnitude of Basin	Area of Basin in English Miles
Europe				
Thames	1	180	1	5,500
Rhine	4⅜	810	12½	70,000
Loire	4	720	8⅝	48,000
Po	2½	400	5	27,000
Elbe	4½	820	9	50,000
Vistula	4⅜	760	13½	76,000
Danube	9⅝	1750	56	310,000
Dnieper	7⅝	1390	36	200 000
Don	7⅝	1350	37	205,000
Asia.				
Wolga	14	2520	94	520 000
Euphrates	9⅝	1750	42	230 000
Indus	11½	2070	72½	100 000
[illegible]	10	1800	76	420,000
Kur, or [illegible] eat River (Persia)	21½	3870	138	760 000
Amur (Chinese Tartary	16	2880	164	900 000
Lena Asiatic Russia	13½	2430	174	960 000
Obi ditto	15	2700	236	1,300,000
Africa				
Nile	18½	2330	90	500 000 uncertain
America				
St Lawrence, including lakes	22½	4050	109	600 000
Mississippi	19	3420	249	1 368,000
Plata	13½	2430	225	1,240 000
Amazon, not including Araguay	22¾	4095	395	2 177,000

For an account of the phenomena of the Australian rivers, which, in apparent contrariety to the laws of nature in other parts of the world become narrower the further they flow from their source, see the *Geog Dict*, art "Australia"

RIVER In Hydraulics, a current of water flowing in an open channel The velocity of a current of water flowing in an open channel depends on the volume of water, the form of the channel and its inclination and the determination of the relations subsisting among these three quantities is a problem of great practical importance the solution of which must be derived partly from experiment and partly from the general theory of the motion and resistance of fluids

If water, whether flowing in pipes or open channels suffered no resistance from the solid matter with which it comes in contact the velocity would depend solely upon the accelerating force of gravity and at any point of the channel would be in proportion to the square root of the difference of level between that point and the source But this velocity, if not constantly impeded would soon become enormous and render rivers the immediate instruments of devastation and ruin to the earth The Rhone, for example which receives its principal waters at an elevation of 900 feet above the level of the sea would enter the bay of Marseilles with a velocity of 164 miles in an hour, such being the velocity due to a heavy body falling from a height of 900 feet Even the Thames, which has a descent of only 100 feet, would acquire a velocity of 54 miles in an hour

The forces which tend to impede this constantly increasing velocity depend upon the quantity of surface exposed to friction and the velocity of the stream Let l denote the length of a portion of the stream through which the velocity and the form of the channel remain the same, and c the length of the line of intersection of the channel with a vertical plane perpendicular to the stream (*i e* the perimeter or boundary of the transverse section *minus* the superficial breadth), then the surface exposed to friction is represented by $c\,l$ With respect to the velocity, it is found by experiment that the resistance is expressed by a function of the velocity made up of two parts one depending on the velocity simply, and the other on its square Denoting, then, the friction or resistance by f, and the mean velocity by v, and assuming m and n two coefficients, to be determined by experiment, the resistance may be expressed by this formula —

$$f = (m\,v + n\,v^2)\,c\,l$$

Now the force which opposes the velocity is the resistance, and the force which tends to accelerate it is the component of the weight in the direction of the slope, and as the velocity of the portion under consideration is regarded as uniform, these two forces must be equal to each other Let a denote the area of the transverse section of the stream, then the bulk is $a\,l$ and its weight $g\,a\,l$, the resolved part of which in the direction of the slope is $g\,a\,l \sin i$, where i is the inclination of the surface to the horizon We have, therefore, $f = g\,a\,l \sin i$, or $(m\,v + n\,v^2)\,c\,l = g\,a\,l \sin i$, whence for any length l for which the area of the section, the slope, and form of the channel remain unchanged, we have $(m\,v + n\,v^2)\,c = g\,a \sin i$

If we assume $R = a \div c$ (the area of the section divided by the length of its boundary diminished by the [illegible] This quantity R is what is usually called the *radius* of the section, and sometimes the *hydraulic depth* It is the depth which the river would take if it flowed in a rectangular channel whose breadth is equal to the bottom and sides of the actual bed

The constants m and n have been determined experimentally by Prony (*Récherches Physico-Mathématiques sur la Théorie des Eaux Courantes* Paris 1804) On reducing his measures to English feet and rejecting the term $m\,v$, which is small in comparison of $n\,v^2$, the formula becomes

$$v = 109\,53 \sqrt{R \sin i}$$

Eytelwein (*Handbuch der Mechanik fester Korper und der Hydraulik* Berlin 1801) gives $v = 94\,87 \sqrt{R \sin i}$ As a sufficiently near approximation, we may assume $v = 100 \sqrt{R \sin i}$, and if we denote the fall in feet each mile by h, we shall have $\sin i = h \div 5280$, and the formula will become on reduction $v = \frac{11}{8} \sqrt{R\,h}$ nearly This gives the velocity in feet per second To find the velocity in miles per hour, we must multiply by 3600, and divide by 5280 which gives $v = \frac{15}{16} \sqrt{R\,h}$, a formula found to be sufficiently conformable to experiments

From the above formula the mean velocity v is given, when R and h are determined, or [illegible] of the three quantities the mean [illegible] hydraulic depth and the fall, is determined in terms of the other two It is necessary to observe that the velocity is not the same in all the parts of the section of the stream The filaments of water in contact with the bottom and sides of the channel are arrested by the friction, and in their turn retard the filaments next above them in consequence of their adherence or viscidity, so that the filaments which suffer the least retardation are those at the surface and nearest the middle of the stream On the other hand the hydrostatic pressure tends to give the greatest velocity to the filaments which are deepest under the surface By the combination of these two causes the greatest velocity in an open channel of a symmetrical form is at the middle, and at a small depth under the surface

The mean velocity which has been denoted by v is that which when multiplied by the area of the transverse section gives the total quantity of water which passes through the section in a given time Du Buat found that the greatest velocity is to the mean velocity of the whole section in the ratio nearly of 5 to 4, so that if the greatest velocity is experimentally determined, we may assume the mean velocity to be 4-5ths of the quantity given by the experiment It was found by Du Buat that if from the square root of the velocity in the middle of the stream expressed in *inches per second*, unity be subtracted, the square of the remainder gives the velocity at the bottom

Since the mean velocity of a river is proportional to the square root of the hydraulic depth (the inclination remaining the same) it follows that on contracting the channel the velocity will be increased When a river receives a permanent addition the first effect is to increase the velocity whereby the attrition on the sides and bottom is also increased, and the sides being generally of softer materials, the consequence is that the width and sometimes, though more rarely, the depth, is increased until the resistance is again equal to the accelerative force and the velocity becomes uniform

It is frequently of great importance to determine the whole quantity of water furnished by a river or, as it is called, the *discharge* For this purpose the figure of the bed must be accurately determined, which may be done by soundings This also gives the area of the section, and consequently the hydraulic depth The velocity at the surface may be determined by means of a float, or at a small depth under the surface by the instrument called *Pitot's tube* (see the term), or by measuring the force of the current by means of a dynamometer

See, in addition to the works above quoted, Bossut, *Traité d'Hydrodynamique*, Navier *Leçons sur l'Application de la Mécanique*, Belidor, *Architecture Hydraulique*

RIVOSE (Lat rivus, *a brook*) In Zoology, when the surface of an animal or part is marked with furrows which do not run in a parallel direction, and are rather sinuate

RIXDOLLAR (A corruption of Germ reichsthaler, or *dollar of the empire*) A silver coin of different values [illegible] see MONEY

ROACH The curve, or arch, which is generally cut

in the foot of some square sails, from one clue to the other, to keep [illegible]

ROAD, or ROADSTEAD A place of anchorage A vessel when at anchor is termed a roadster, in contradistinction to another under sail

ROADS, are pathways formed through a country, by which passengers and commodities may travel, or be transported, with more or less facility and expedition, from one place to another Roads are of various kinds, according to the state of civilization and wealth of the country through which they are constructed, and ac- [illegible] people, carried in direct lines over the natural surface of the country, passable only by foot passengers or packhorses, to the comparatively perfect modern road, carried on an artificial causeway, and reduced to a nearly level surface at enormous expense by means of vast excavations [illegible] viaducts tunnels, [illegible] skill and ingenuity of the civil engineer

Advantages of Roads — There is no expedient which more powerfully conduces to the advancement of a people in civilization or to the extension of their prosperity and national wealth, than the construction of good roads, connecting the various centres of commerce and of industry about which they may have collected themselves The invention of printing the expedient of money, the adoption of a uniform system of weights and measures, would severally be ineffectual, or productive of advantages of a very limited extent if the intercommunication of those whose feelings and ideas are expressed and conveyed in print, and among whom money is made to circulate, and whose commerce is stimulated and facilitated by the uniform module of quantity supplied by weights and measures were not facilitated and expedited by the means of conveyance supplied by roads Without roads the interchange of advantages, moral intellectual and physical, which now takes place in all highly civilized countries between the rural and the urbane population, could not be maintained, without them indeed large towns or cities could not continue to exist The supply of the population collected in such places with the various products of [illegible] to their physical existence, could no [illegible] on the other hand, would the rural population affording that supply be benefited by a return in exchange of the refinements of the town, and the various articles of luxury and necessity obtained by commerce from every part of the globe

But roads are not less necessary for the advancement of agriculture itself than for the due maintenance of the necessary relations between the towns and the country Without the aid of roads, it would be impossible to apply those arts to the soil by which increased powers of production are given to it Without roads the various kinds of manure by which the scientific farmer knows how to raise augmented crops could not be transported to his fields from the place, often distant and difficult of access where such manures are found Roads may then, in fact be considered as a system of veins and arteries by which all those principles necessary for the maintenance of the prosperity of a country are kept in circulation

History of Roads — The importance of roads to the welfare of nations was not unknown to the ancients The senate of Athens, the government of the Lacedemonians the Thebans, and other states of Greece bestowed much care upon them, but, as might naturally be expected the first great advances in the art of intercommunication by roads were due to a people essentially commercial The invention of paved roads is traced to the Carthaginians Rome ever awake to the advantages to be gained from [illegible] conquered people followed in the steps of the Carthaginians and vastly extended and improved their processes in the construction of roads

The Via Appia the Via Aurelia and the Via Flaminia were the first great monuments of the Roman people in this department of art Under Julius Cæsar the capital of the empire was made to communicate with all the chief towns by paved roads, and during the last African war, a road of this kind was constructed from Spain through Gaul to the Alps After this these great lines of communication were extended through Savoy, Dauphine, and Provence, through Germany, every part of Spain through Gaul [illegible] Asia Hungary, Mœsia and to the mouths of the Danube Neither did the interposition of seas obstruct the labours and the enterprise of this great people The lines of communication thus constructed to the shores of the continent of Europe were continued at corresponding points of the neighbouring islands and continents Sicily, Corsica, Sardinia England, Africa, and Asia were accordingly intersected and penetrated by roads, [illegible] on of the great European lines [illegible] were not mere paths prepared [illegible] set of horses and the wheels of carriages, formed upon the natural surface of the ground, but were constructed on principles in some respects as efficient as those which modern engineering has supplied forests were opened, mountains excavated, hill [illegible] valleys filled up, chasms and rivers bestridden by bridges, and marshes drained, to an extent which would bear no mean comparison to the result of the [illegible] of recent times

English Roads — The first roads of artificial construction [illegible] were those [illegible] by the Romans while it was a Roman province [illegible] and [illegible] road was carried through the country [illegible] and another nearly at right angles to it east and west These main lines were supplied with branches, extending in every direction which the conquerors found it expedient to render accessible to their arms The Roman road called Watling Street commenced from Richborough in Kent, the ancient Ruterpiæ, and being carried through London in a north-westerly direction, was continued to Chester The road called Ermine Street commenced from London, and passing through Lincoln was carried thence through Carlisle into Scotland The Foss Way passed from Bath, in a direction north-east, and joined the Ermine Street The road called Ikenald extended from Norwich, in a southward direction, to Dorsetshire

The example thus afforded by their conquerors was not followed by the Britons, who, unconscious of the many advantages attending facilities of intercommunication, relapsed into the barbarous neglect of roads, and while the Roman ways were allowed to fall into decay, new roads were not constructed For many centuries, such intercourse as was maintained between the various parts of this country took place almost exclusively by rude paths, capable of being passed on foot, or at best by horses, carried over the natural surface of the ground in straight directions from place to place Hills were surmounted valleys crossed and rivers forded, in the same manner as the savages of the most remote wilds of America now communicate with each other, or with the settlers It was not till the reign of Charles II that any attempt was made by the legislature to improve the roads of the country In the 16th year of the reign of that monarch, the first turnpike-road was established by law whereon toll was taken It passed through Hertfordshire Cambridgeshire and Huntingdonshire It was not however, till about a century from the present time, that any great or effectual attempts were made to establish a system of good roads through the country Till nearly the middle of the last century, most of the goods were conveyed from place to place in Scotland on packhorses Oatmeal, coals, turf, and even straw and hay, were conveyed in this way, but in carrying goods between distant places it was necessary to employ a cart, as all that a horse could carry on his back was not sufficient to defray the cost of a long journey The time that the carriers usually required to perform their journeys seems now almost incredible the common carrier between Selkirk and Edinburgh a distance of thirty eight miles, required a fortnight for his journey, going and returning The road for a considerable extent lay along the bottom of the district called Galt Water, the bed of the stream when not flooded, being the tract chosen as the most level and easiest to travel in

Nor were the means of travelling between large towns much better In 1678, a contract was made to establish a coach between Edinburgh and Glasgow, a distance of forty-four miles This coach was to be drawn by six horses, and the journey between the places, to and from, was engaged to be completed in six days [illegible] as late as the year 1750, the stage coach from Edinburgh to Glasgow took a day and a half to make the journey

In the year 1763, there was but one stage coach between Edinburgh and London, which started once a month from each place and took a fortnight to perform the journey At the present time after the lapse of not so much as eighty years there are seven coaches daily start from each of these cities for the other, besides several steam ships of enormous magnitude, which sail weekly from each place supplying all the accommodation and luxury [illegible] common [illegible] hours If each of the coaches be estimated as conveying ten passengers daily, the coaches alone would thus convey daily between these cities about 140 passengers, or above 4000 monthly If an equal number be estimated as conveyed by the steam ships, we should have the present intercourse in passengers between London and Edinburgh amounting to about 8000 monthly, whereas, in 1763, the number conveyed by stage coaches between these places monthly could not have exceeded [illegible] five and by all the means of conveyance then existing probably did not exceed fifty

It happens that the line of road now occupied by the Liverpool and Manchester Railway and its branches, and travelled daily by thousands [illegible] at a speed of twenty five miles an hour, [illegible] was, in the year 1770, travelled over by Mr Arthur Young, who has left us in his [illegible] of the state of the roads at the [illegible] the whole

range of language terms sufficiently expressive to describe this inferior road Let the most seriously disposed of all travellers who have ever journeyed, post or otherwise, this country road, find this would be the case, for a thousand to one they break their necks, or their limbs, by overthrows or breakings-down They will here meet with ruts, which I actually measured four feet deep, and floating with mud only from a wet summer What, therefore, must it be after a winter? The only mending it receives is tumbling in some loose stones, which serve no other purpose than jolting a carriage in the most intolerable manner These are not merely opinions, but facts, for I actually passed three carts broken down in these eighteen miles of execrable memory" With the exception of a few rare instances of important roads, constructed under special acts of parliament, the roads of England have not been constructed on any scientific principle, and are, in most cases, nearly coincident with the foot and horse paths adopted by the early inhabitants of the country These rude paths having been formed at an early period, the only roads of communication between the chief towns were gradually improved, so as to be capable of being travelled over by wheel carriages The natural surface [illegible] of grass or [illegible] cut up [illegible] from their excavation thrown into the valleys, or the roads were carried round them, at a later period fences were added, and thus, by slow degrees, the old horse path grew into the modern road How far removed from a truly good and scientific line of communication such a road must be, will be apparent to any one who considers what the principles ought to be on which a road should be laid down and constructed

The Art of Road-making —When it is proposed to construct a line of road extending between two places, the engineer upon whom such a duty devolves first makes himself well acquainted with the surface of the country lying between the two places so as to obtain an acquaintance with the face of the country somewhat approaching to that which would be supplied by a superficial model of it, which would exhibit all its inequalities and undulations of surface He is then to select what he considers all circumstances being taken into account, the best general route for the proposed road But previously to laying it out with accuracy it is necessary to make an instrumental survey of the country along the route thus selected, taking the levels from point to point throughout the whole distance, and making borings in all places where excavations are required, to determine the strata through which such cuttings are to be carried, and the requisite inclinations of the slopes or slanting sides as well of the cuttings as of the embankments to be formed by the material thus obtained It is also requisite in the selection of the route for the proposed road, to have regard to the supply of materials not only for first constructing it but for maintaining it in repair, thus the position of gravel pits and quarries in the neighbourhood of the proposed line and the modes of access to them, should be well ascertained

The results of such an investigation should be reduced to a plan and section, the plan of the road being on a scale not less than 66 yards to an inch, and the section not less than 30 feet to an inch

The loss of tractive power, and danger to travellers [illegible] it especially necessary [illegible] imposed upon the inclination of [illegible] line of road on which much traffic is carried on As, however, this reduction of hills in a country where much inequality of surface exists is attended with a considerable outlay of capital, the engineer will have to balance the cost of constructing a road having the best possible inclinations against the advantages to be obtained in the permanent working of the road, and if the expected traffic be not such as to yield advantages proportionate to the capital absorbed, greater rates of inclination must be allowed to the hills with a view to diminish the extent of the works and to render the expense of constructing the road proportionate to the traffic expected upon it

A dead level, even where it can be obtained is not the best course for a road, a certain inclination of the surface facilitates the drainage, and keeps the road in a dry state There is a certain inclination, depending on the degree of perfection given to the surface of the road, and on the structure of the carriages worked upon it, which cannot be exceeded without serious loss of tractive power, this inclination or acclivity is that in descending which at a uniform speed the traces slacken, or which causes the carriage to press upon the horses the limiting inclination with which this effect does not take place is called the *angle of repose*

On all acclivities less steep than the angle of repose, a certain amount of tractive force is necessary in the descent as well as in the ascent, and the mean of the two drawing forces, ascending and descending, is equal to the force along a level road Thus, on such acclivities as much power is gained in the descent as is lost in the ascent, [illegible] so as to impede their action, and their power is expended in checking the descent of the load, or, if this effect be prevented by the use of any form of drag or break, then the power expended on such drag or break corresponds to an equal quantity of mechanical power expended in the ascent, for which no equivalent is obtained in the descent

On well-constructed roads, with carriages such as now are generally used in England, the angle of repose may be taken at about one in thirty-six, and this is consequently an acclivity which ought not to be exceeded on roads over which much traffic is carried

The expedients by which the requisite inclinations are obtained on common roads are the same as those which are resorted to in the construction of railways *See* RAILROADS

The exact course of the road and the degree of its ac- [illegible] secondly, it should be hard, and the goodness of the road will be exactly in the proportion of the degree in which these qualities can be imparted to it, and permanently maintained upon it An [illegible] gineers until a very recent [illegible] smoothness of surface alone was sufficient for the perfection of a road and that, provided it could be made sufficiently durable, it was unimportant how soft or yielding the coating of the road might be This error, into which among others, Macadam himself fell, was based upon a neglect of one of the most important circumstances to be considered in the construction of a road The main object to be attained by all roads is the diminution of the resistance which a [illegible] power Other things being [illegible] apparent that this resistance would be diminished by increasing the smoothness of the road surface But roughness or unevenness of surface is not the only cause of resistance to the tractive power if two roads have their surfaces equally smooth and even but one is soft and elastic, so as to yield under the pressure of the wheel recovering its form as the wheel advances and the other is hard and unyielding, the resistance to the tractive power will be greater on the soft and yielding road than on the hard and unyielding road and this augmentation of resistance will be in proportion to the softness of the surface That this would be the case, admits of immediate demonstration on mechanical and mathematical principles, but, without resorting to these, it must be sufficiently apparent from the results of the most common experience A surface of velvet may be as smooth and even as a surface of ice, but if an ivory ball be rolled on the latter it will continue its motion much longer than on the former In fact, the wheels of a carriage in passing along a soft road sink into its surface as the ball would sink into the pile of the velvet and [illegible] in virtue of its elasticity the surface of the [illegible] the velvet may recover its smoothness after the pressure has been removed from it, still a resistance will be offered to the drawing or impelling power, which would not be produced by a hard and unyielding surface equally smooth

Macadamization — This process, which has received its name from Macadam to whose labours the improvement of the roads of England within the last half century owes so much, consists [illegible] broken with a hammer [illegible] uniform size This method, however is one which was long practised in various parts of Europe When the stones of which the road crust is to be formed are broken to the proper magnitude and form, they are spread over the surface of the road in a layer of 3 or 4 inches thick After this has been consolidated by carriages working upon it or by rollers, another layer of broken stones of equal depth is laid upon it, it is consolidated in like manner, and thus one layer is laid over another until an artificial crust is formed of broken stones of sufficient thickness to give the requisite strength to the road

A coating or road crust thus formed might be constructed on any substratum whatsoever, and a smooth and apparently good road would be obtained It was the practice of Mr Macadam to disregard the nature of the substratum, and he maintained that if it was not such a bog as would not allow a man to walk over it, he would even prefer it to a hard bottom

Telford's System — The improvement in road-making which consisted in a due attention to the substratum or foundation of the road, so as to give increased facility to the tractive power by [illegible] yielding, is due to the late Mr Telford [illegible] a description of the method of constructing such a road practised by that eminent engineer

Upon the level bed prepared for the road materials a bottom course or layer of stones is to be set by hand, in form of a close firm pavement The stones set in the

mal bile of the road should be 7 inches in depth, at 9 feet from the centre the depth should be 5 inches, at 12 feet, 4 inches, and at 15 feet, 3 inches, the entire width of the road being 30 feet These stones are to be set on their broadest edges lengthwise across the road, and the breadth of the upper edge should not exceed 4 inches All the irregularities of the upper part of this pavement are to be broken off by hammers, and all the interstices to be filled with stone chips firmly wedged or packed by hand with a light hammer, so that, when the pavement is finished, its cross section shall have a convexity of surface of about 4 inches in the centre above the extreme

6 inches, 4 must be first put on and worked down by carriages and horses over the whole of the road, care being taken constantly to rake in the ruts until the surface has become firm and the crust consolidated After this, the remaining 2 inches of stone may be put on, the whole of this stone, forming 6 inches of crust, is to consist of pieces broken as nearly as is practicable into a cubical form and of such size as to pass through a ring of 2½ inches in diameter The spaces on each side of the middle 18 feet are to be coated with broken stone or well-cleansed strong gravel up to the level of the footpath or other boundary of the road so as to make the whole convexity of the road 6 inches in the middle above the

materials thus

with a coating 1½ inch deep of good gravel, free from clay or earth

Such was the method practised by Mr Telford in the construction of great main roads such as that between Holyhead and Shrewsbury In the streets of towns, and other places where roads have to bear a still heavier traffic, such a road as that above described is found to be subject to a superficial wear, so rapid as to produce an intolerable quantity of dust in summer and of mud in winter In such places recourse has been generally had to pavement The first object to be secured for a durable pavement, as well as in other roads is to secure a good foundation The best method is to lay a foundation of gravel or broken stone the bed of which should be formed with a convexity sloping towards each side by a fall of about 1 in 50 After the materials for such foundation stone is put on the street should be open for carriages to pass over it until it is consolidated all ruts being carefully raked in The same process should be repeated with each successive layer, until a sufficiently solid foundation is obtained for the pavement On this foundation a pavement formed of blocks of stone is laid, the blocks being 10 inches in depth, from 10 to 15 inches in length, and from 6 to 8 inches in width Such is the structure which is requisite for the streets which are the main thoroughfares of a great city, a pavement with less strength of foundation, and formed of smaller blocks of stone, being used for the streets of less intercourse

The many inconveniences produced in the great thoroughfares of London such as Oxford Street Holborn Fleet Street the Strand, &c, by reason of the rapid wear of every kind of pavement hitherto adopted a suspension of the intercourse during the frequent repairs, the dust in summer and the mud in winter produced by a surface of broken stones, and the intolerable noise produced by every species of stone pavement have lately excited much inquiry as to the possibility of a road having sufficient strength for

sufficient durability to prevent the inconvenience of the frequent suspension of intercourse by the necessity of repairs, and presenting a surface which, while it would be free from the noise of a stone pavement, would not be attended with the inconvenience of dust and mud produced by a surface of broken stone This problem was supposed to be in a great degree solved by the adoption of a pavement of wood A short piece of Oxford Street was thus paved in the beginning of 1839 After a trial of several months

out the

pavement was adopted in several other thoroughfares of London The idea of a wooden pavement is not new In the northern parts of Germany and in Russia such pavements have been long in use, some of the main streets of Petersburgh and Vienna have long been paved in this manner A few years ago a series of experiments were made at New York, to determine the best description of paving for a street One of the methods adopted was a tesselated pavement, formed of hexagonal blocks of pine wood, measuring 6 inches on each side of their transverse section, and 12 inches in depth From the manner in which the timber is cut its fibres are vertical, and therefore the tendency to wear from vertical pressure is small The blocks are coated with pitch or tar, forming a smooth upper surface

Various methods were adopted for laying the wood pavements of London, but though every process that ingenuity could devise has been attempted, none of them have been found to answer the purposes of the public, and there appears, on the whole, to be sufficient to justify a well-grounded expectation that, however desirable, wood pavements will never supersede any others for the great thoroughfares of towns

Concerning the formation of roads of various kinds, their drainage, fencing, their management, repairs, &c, much might be said, but the limits which must be imposed on this article compel us to refer the reader for these details to Sir Henry Parnell's *Treatise on Roads* See also the *Encyclopédie*, article "Chemin," Bergier, *Histoire des Grands Chemins de l'Empire Romain*, *Annales des Ponts et Chaussées*, Anderson's *Commerce*, M'Culloch's *Treatise on Commerce*, *Library of Useful Knowledge*, Mr Telford's *Reports*

ROASTING, in Chemical Metallurgy, means the protracted application of heat to metallic ores, below their

generally resorted to to expel volatile matters, especially sulphur, arsenic, carbonic acid, water, &c

ROB A term of Arabic origin, applied by old pharmaceutical writers to thin extracts or inspissated juices

ROBBERY (from the Germ rauben, *to rob*), in Law, is defined a felonious taking of money or goods of any value from the person of another, or in his presence, against his will, by violence or putting him in fear, and this, whether the fear be of injury to the person's property or character But it is necessary that the fear be of immediate injury not of some future injurious results, and then the money must, generally speaking be taken immediately upon the threat made, and not afterwards given from fear of consequences But the *extortion* of money by threat to accuse of an infamous crime was made robbery by 7 & 8 G 4 c 29 The law on the subject is now collected in the recent statute 1 Vict c 29, and robbery is capital only when the robber "at the time, or immediately before or after," stabs, cuts, or wounds any person

ROBES, MASTER OF THE An officer in the

this office which has always been one of great dignity, is performed by a lady, who enjoys the highest rank of the ladies in the service of the queen

ROC or RUKH The well known monstrous bird of Arabian mythology, of the same fabulous species with the simurg of the Persians In the notes to vol iii of Mr Lane's edition of the *Arabian Nights' Entertainments* are some curious extracts from the writers of old voyages of that nation, showing that the tale was either founded on, or supported by the wonderful accounts of travellers Even Sinbad's well known adventure, when his crew broke the roc's egg and were attacked in consequence by the enraged pair of birds is borrowed from the serious narration of Ibn-El-Wardee The roc is also described by Marco Paulo (Marsden's transl, p 707) The size of this famous monster is, of course, described with all the luxuriance of oriental imagination Ibn-El-Wardee makes one of its wings 10 000 fathoms long Mr Lane appears to think that this extravagant fiction was suggested by the condor, but the size and power of that bird are

the common accounts The

seems a better archetype of the rukh In a drawing from an illuminated Persian MS which Mr Lane has copied, the roc, or rather simurg which is represented as performing the slight

with

and

Persian mythology it is the phœnix of

age of 1700 years (See the note to *Southey's Thalaba*)

ROCELLIC ACID An acid obtained from the *Rocella tinctoria*

ROCHELLE SALT The tartrate of soda and potassa It is a double salt, composed of 2 equivalents of tartaric acid (66 × 2) = 132 1 equivalent of potassa = 48, and 1 of soda = 32 Its crystals, which are large and

72 of water

ROCK See GEOLOGY

ROCK CORK A variety of asbestos which see

ROCK CRYSTAL A common mineralogical term applied to crystallized silica it is also called *quartz*

ROCKET In the Military Art a very destructive species of fire-work the best kind of which was invented by the late Sir William Congreve, and called after him The body of the machine is cylindrical, the head conical It is filled with very inflammable materials, on the combustion of which, as in the common sky rocket, the body is impelled forward with a continual acceleration

ROCKING LOGGING STONES See GEOLOGY

ROCK SALT Common salt found in masses or beds in the new red sandstone, as in Cheshire and elsewhere See GEOLOGY

ROCK SHELLS The common name of certain Uni-

valves, characterized by the long straight canal which terminates the mouths of their shells *See* MUREX

ROCKWORK In Architecture, masonry wrought in imitation of rough stone, in various arrangements, and chiefly used in basements of buildings

ROCKWORK, in Gardening, is applied to a quantity of stones, fragments of rock, or even vitrified bricks, piled together in such a manner as to form a nidus for the growth and display of alpine plants When the pieces of rock are of such forms as can be connected together so as to [illegible] of stratification, that mode of arranging them must be adopted, and the soil and plants may be placed in vertical, oblique, or horizontal fissures or on ledges, according to the lines of stratification When, however, as is most frequently the case, land or water-worn stones are used, they may be distributed over a mound of earth, not uniformly, but in groups with smooth surfaces of soil between in the manner that may be observed in nature, where stones of different sizes are seen rising out of the surface of a green hill or hillock When agglutinated masses of vitrified bricks are used, either alone or mixed with land stones of different sizes, they may be distributed over a mound, or along a bank of soil, in such a manner as to produce a varied surface, without attempting to imitate nature, and with interstices between them for inserting the plants Imitations of conical hills, caverns, precipices and even the Alps, on a small scale have been made in rockwork but these, and all other imitations of nature, require to be designed and directed by the eye and mind of an artist In general the piles of stone called rockwork, in botanic and flower gardens, might with more propriety be called heaps of stones

ROD A measure of length otherwise called a *pole* It is 5½ yards, or 16½ feet, and four of these make the *Gunter's chain*

RO'DENTS, *Rodentia* (Lat rodo *I gnaw*) The name given by Cuvier to the *Glires* of Linnæus an order of Unguiculate Mammals comprehending those which have two long chisel shaped incisors in each jaw, and no canines but a vacant interspace between the incisors and the molars, the lower jaw is articulated by a longitudinal condyle, in such a way as to allow of no horizontal motion except from back to front, and *vice versa* as is requisite for the action of gnawing The molars also have flat crowns, whose enamelled eminences are always transverse so as to be in opposition to the horizontal motion of the jaw, and to increase the power of trituration The genera in which these eminences are simple lines and the crown is very flat are more exclusively frugivorous, those in which the eminences of the teeth are divided into blunt tubercles are omnivorous while the small number of such as have no points more readily attack other animals, and approximate somewhat to the Carnaria The form of the body in the Rodentia is generally such that the hinder parts of it exceed those of the front, so that they rather leap than walk In some of them this disproportion is even as excessive as it is in the kangaroos In the whole of this class the brain is almost smooth, and without furrows, the orbits are not separated from the temporal fossæ which have but little depth, and the eyes are altogether lateral The inferiority of these animals is visible in most of the details of their organization Those genera, however which possess stronger clavicles have a certain degree of dexterity, and use their fore feet to convey their food to the mouth

[illegible] A term that has passed into [illegible] from Rodomont a boisterous character in the *Orlando Furioso*,—signifying a boastful [illegible]

[illegible] osseous fishes which are developed simultaneously and in great numbers are so called

ROESTONE A granular limestone, or oolite, which see. See also GEOLOGY

ROGA'TIONS (Lat *rogo, I ask*) In the Ritual public supplications or litanies were anciently so termed until the latter designation began to supersede every other (Palmer, *Orig Liturgicæ*, vol i p 270) In the Calendar, the three Rogation days are the Monday Tuesday and Wednesday next before Ascension day

ROGUE'S YARN A yarn of a different twist and colour from the rest, and inserted in the royal cordage, to identify it in case of its being stolen

RO'LLERS The name given by seamen to unusually heavy waves, which set in upon a coast or island without wind They are frequent at Ascension

RO'LLING, in Mechanics, is when all the parts of the surface of one body come into successive contact with those of another, and under such conditions as that at every instant the portion of the two surfaces which *have been* in contact [illegible] When this condition is not fulfilled [illegible] said to slide upon the other The [illegible] rolling is much less than in that of sliding, and hence the advantage of wheels to all kinds of carriages *See* FRICTION

ROLLING In Naval language, the lateral oscillation of a vessel This motion, which is often very great when the vessel is running before the sea, endangers the masts, strains the sides and loosens the decks at the waterways, it is also liable to cause the guns to break adrift When the centre of gravity is too low, the oscillations begin and end violently The changes in the stowage necessary to modify the nature or extent of the roll are made by seamen from experience not knowledge

ROLLING PENDULUM A cylinder caused to oscillate in small spaces on a horizontal plane Its mathematical [illegible] but it has been applied [illegible]

ROLLING PULLEY [illegible] pulley hooked to the weather quarter of a yard, and to a lashing or strap round the mast near the slings or parral of the yard, the object of it is to keep the yard constantly over to leeward thereby depriving it of play and friction when the ship rolls to windward

ROLLS, MASTER OF THE A high officer of the Court of Chancery, second only to the lord chancellor He is appointed by the crown by letters patent, and holds his office for life The master of the rolls administers justice in a separate court called the Rolls He has the power of hearing and determining originally the same matters as the lord chancellor, excepting cases of lunacy and bankruptcy, but all orders and decrees pronounced by the master of the rolls must be signed by the lord chancellor before they are enrolled The master of the rolls is also the chief of the twelve masters in Chancery and chief clerk in the Petty Bag Office he is the keeper, also of all the records of the Court of Chancery after the decrees and orders have been enrolled, and on that account he was anciently styled *guardien des rolles* The master of the rolls ranks immediately after the chief justice of the King's Bench his salary, by the stat 6 Geo 4 c 84, is 7000*l* a year

Before the passing of the act 3 & 4 W 4 c 94 the master of the rolls did not hear motions, pleas or demurrers, and whatever was presented for his decision, other than the hearing of causes was brought before him by petition By the above-mentioned act however, this was altered and motions pleas and demurrers are now heard by him in the same manner as by the other equity judges By the act 1 & 2 Vict chap 94 entitled 'An Act for the better Custody of the Public Records' the master of the rolls for the time being is entrusted with the custody both of the public records and those of the common law courts and Court of Exchequer

ROMAN ALUM An alum extracted from the volcanic rocks of the Solfaterra near Naples it crystallizes in opaque cubes and appears to contain more alumina than the common octoedral alum

RO'MAN ARCHITECTURE *See* ARCHITECTURE

RO'MAN CATHOLICS ROMANISTS OR PAPISTS The names by which Protestants designate the members of the large and ancient church which regards the bishop or pope of Rome as its infallible spiritual head, and assumes to itself the title of the Catholic or universal A rapid review of the external fortunes of this system as connected with the holy see will be found in the article PAPACY, the principal doctrines also by which it is distinguished are detailed under the several heads (*See* TRANSUBSTANTIATION, MASS PENANCE PURGATORY, &c) It will be sufficient in this place to point out the general [illegible] which have been erected

II Romanists [illegible] that the Scriptures is not sufficient for its own interpretation The books which compose the canon of the New Testament are they conceive, desultory and incomplete, being many of them written for special occasions, at a period considerably later than the foundation of the religion in various districts in some of which whole generations of believers may have passed away without having seen or heard of their precious contents It is not to be supposed, however, that doctrines so important as those shadowed forth in the Epistles of St Paul or the Gospel of St John, could have been left untaught to the churches which flourished before their publication or beyond their reach It must be admitted therefore, they argue, that the first preachers of Christianity must have been commissioned and instructed to deliver these same doctrines orally; and it is affirmed that several important doctrines are imperfectly developed in Scripture, and would not be understood, except for some such illustration by the way, the result of which is conveyed in the creeds of the first centuries It is also affirmed that the practice of the primitive church, the infallibility of which is assumed, authenticates various articles of Roman belief, of which only very slight hints are to be found in Scripture, and such, perhaps, as would [illegible] ed but for this very evidence from [illegible] of argument is admitted also by [illegible] facts alleged [illegible] article of belief without pointing out some support ground for it in Scripture, although the only shadow of

proof of this kind is in some cases to be found nowhere but in the writings which Protestants esteem apocryphal But while Protestants may refer to the practice of the primitive church, and the traditions which must have circula
of the
times,
witnesses to consider any one system *deduced therefrom* as infallibly right The Romanists, on
taching more importance to this kind
labouring under the same difficulty in discriminating between genuine and corrupt traditions, take refuge in the idea of a spiritual head of the church, an authorized interpreter of tradition, an infallible expounder of the faith,
St Peter at Rome,
main
have been advanced from this source have always been those of the Catholic Church, and always authentic In later times, however, a question has been much agitated respecting the relative authority of popes and councils, the superiority of each has been maintained by different classes of theologians, and it is certain that in some cases the decisions of popes have been ultimately reversed by councils It is clear that there cannot be anywhere an authority competent to settle the question, but it is believed that the opinion now generally acquiesced in is, that the two are co-ordinate powers, and that infallibility resides in the decrees of a *pope in council*

ROMA'NCE In literature, a work of fiction in prose or verse, containing the relation of a series of adventures, either marvellous or probable A tale confined to the latter class of events has, indeed, been considered to be more strictly designated by the term *novel* (*See* NOVEL) But as our nomenclature for works of fiction is not very precise or accurate, the name romance is very frequently used to comprehend both

The term romance is derived from the class of languages in which such fictitious narratives in modern times were first widely known and circulated These were the tongues derived from the Latin Italian Spanish French, which were all Roman dialects in contradistinction to the European languages of Teutonic origin But the 'langue Romane' more properly signifies the dialect of southern France, Catalonia, &c, of which the Provençal was a variety

The famous *Milesian Tales* of antiquity are thought to have been, in classical times the class of writings nearest approaching to our modern romances All the original Greek compositions of this kind have perished But we have, in the *Golden Ass* of Apuleius a Latin imitation of these, written in the later times of the Roman empire It contains a series of wonderful adventures, sorceries transformations love religion &c, and although it has been asserted that the romance, in its proper sense was unknown to the ancients it would be difficult to say in what respect except the total absence of chivalrous sentiment which is of modern growth, this curious fragment differs from those later inventions which we have agreed to call by that name

The same may be said and with even greater strictness of the Greek pastoral romances, a class of works appr
period, of which the famous *Daphnis and*
is the first known specimen They contain narratives of amours adventures &c, usually intermixed with some supernatural interference, and they have th
of a modern novel — a pair of lovers by whom the
heroine whose attachment is generally brought to a happy termination

The earliest modern romances were collections of chivalrous adventures, chiefly founded on the lives and achievements of the warlike adherents of two sovereigns, one of whom perhaps had only a fabulous existence, while the annals of the other have given rise to a wonderful series of fables — Arthur and Charlemagne These romances were metrical compositions in that branch of the modern French language termed the *langue d'oil*, which prevailed throughout the north of France, and especially in Normandy Besides these, a great variety of smaller tales, some chivalrous some marvellous some simply ludicrous, termed *fabliaux* exist in the same language The date of these compositions extends from the 12th to the 15th centuries

From the hands of these rhymers the tales of chivalry passed first into those of prose compilers who reduced them into a form
resembling that of our modern romance The French prose romances of chivalry, still confined to the same classes of subjects, belong to the 14th and 15th centuries
in two different countries to two
works of imagination In Italy, the poets termed Romanzieri taking the adventures of the knights of Charlemagne as their subject, transferred the rude conceptions of their predecessors into one of the most finished and enchanting forms of poetry to which modern fancy has given birth Boiardo, in the latter half of the 15th century was the first of these poets, and the names of Pulci Ariosto and Tasso, three of the greatest in Italian literature, grace their long catalogue In Spain and Portugal a new
was called
resembles in character the French romances of chivalry, but narrates the exploits of a new and entirely imaginary hero *Amadis* was finished, and a long list of similar romances added to it, by subsequent Spanish and Portuguese writers In these, while adventures became more and more marvellous, the fanciful spirit of chivalry was more and more carried into wild exaggeration They became, however, so popular as to be transplanted into most European languages, and even in France to supersede the heroic tales of Arthur and Charlemagne They declined with the advance of a better taste in literature after the art of printing had been for some time introduced, and were finally driven out of fashion by the wit of Cervantes, whose *Don Quixote* is aimed in great measure
them

Meanwhile, a new species of fiction had acquired vogue in Italy, to which
This was the amorous
Decameron of Boccaccio contains the earliest, and by far the most popular collection The stories were derived from many originals, but especially from the *fabliaux*, of which mention has been already made The Italian Novellieri are extremely numerous, but their compositions are always short, and would, in our modern language be designated by the term *tale*, rather than novel or romance They flourished in the 15th and 16th centuries From these, again, was derived the comic satirical tale of Spain,
and longer class of composition of which *Lazarillo de Tormes* and *Guzman d'Alfarache* are the best known specimens But in these which were also caricatures of the chivalrous romances a long course of independent exploits of the hero formed the substance of the work, and not a story possessing an individual point and interest

Don Quixote of which the first part was published in 1609 was the joint result of the romances of chivalry, which it was intended to ridicule, and of the romances of low life of whose character it contains a large intermixtu
(Cervantes had more in view, perhaps
of his writing), than the direct delineation of manners and occurrences, such as we now expect in a novel, yet it may be fairly said that his immortal work is the first of its kind in which human nature is brought on the stage alike unadorned and undegraded neither exaggerated by the ridiculous costume of chivalry, nor lowered by the familiar buffoonery of a comic tale While therefore, it has been the source of numerous imitations in its satirical character, its wide popularity has produced much more lasting effects in another manner it gave the first example of a work of fiction in which the grave and gay events of life might be mingled together and in which, also, the views and sentiments of the author might be conveyed through the medium of fictitious personages and events.

On the other hand the chivalrous romance had been seized, at an earlier period, by a very different genius from that of Cervantes, and applied to another object The fictions of Rabelais (the *Histories of Gargantua and Pantagruel*) cannot be termed romances, but their popularity was so great, that France was inundated for more than a century afterwards with Rabelaisian tales, and many of the elements of the modern low romance, comic hyperbole, eccentric humour, and much freedom and grossness of delineation, have been undoubtedly derived to us from Rabelais and his admirers Swift and Sterne were both essentially imitators of this singular genius

In the 17th century, Le Sage naturalized the Spanish romance in France His works present a singular mixture of different styles, although all derived from the same country In *Gil Blas* for example (if that work be not actually of Spanish origin), we have something of the humour of *Don Quixote*, the form as well as much of the substance of *Guzman d'Alfarache*, &c, and much intermixture of
of love and intrigue which, coming originally from the Italian novellieri, had acquired
passing through the hands
is, moreover, a touch of French taste and philosophy such as afterwards, when mixed with satire gave birth to the modern philosophical tale or romance, of which Voltaire's writings contain the best known specimens

After Le Sage, a new class of romances suddenly grew into fashion in France, the heroic,
from an earlier source, the pastor
century Of these, the *Clelie* ar
Mademoiselle Scudery
popular examples, although they have long ceased to be read This species of composition was, in fact, a revival of the old chivalrous romance, without its supernatural marvels, but with even greater exaggeration of sentiment Its temporary success is rather to be attributed to a caprice of fashion than to the natural progress of taste It was not, however,

wholly without its use as it called back some degree of sentiment and high feeling into the romance which was in danger of degenerating wholly into comic cant

During the 18th century, the romance and novel enjoyed a popularity both in England and France, which threw all other species of fictitious literature into the shade It would be impossible to continue [illegible] the various species which grew into vogue by the success of distinguished writers in each respective branch In England Richardson transferred into ordinary life somewhat of the refined sentiments which distinguished the heroic romance, and thus formed the basis of the modern English novel, properly so called or novel of manners His *Pamela* appeared in 1740, his last work, *Sir Charles Grandison*, in 1753 Fielding and Smollett, about the same time, revived the old comic romance, adapted to English scenes and characters Sterne did the same by the humorous or Rabelaisian style of writing but added an intermixture of pathos which had certainly never been joined before with [illegible] To these four writers Goldsmith added his *Vicar of Wakefield* confessedly an independent original almost all the English fictitious prose literature of the last century which is not imitated from foreign works may be said to owe its existence In France Marivaux, Prévost and with a worse taste than theirs, the younger Crebillon formed the national manner in this class of writing for some time Their productions have much of the same character with those of Richardson, but a far lower tone of morality and less life like description But the popularity of the famous *Nouvelle Heloise* gave a new turn not only in France but over Europe to the public taste in this branch of writing Marivaux and Prevost may be said to have been Rousseau's models, as to the externals of his great romance, but its tone and sentiment are peculiarly its own In France, after many inferior imitators Madame de Stael the first of female novelists must be classed as the best and latest disciple of the school of Rousseau In Germany his style had even greater success, and he may be said to have called into life at once the taste and the power of that people and literature for fictitious composition Wieland Kotzebue Goethe (*Sorrows of Werther* and *Wilhelm Meister*) are all though with much originality of their own essentially followers of Rousseau La fontaine and many other inferior writers more direct imitators

In our own times while the novel of manners continues to maintain its empire in popular estimation another species of romance—the historical—has likewise acquired [illegible] which even more [illegible] The historical romance in which fictitious scenes and personages are made to serve as vehicles for the historical portraiture of past times had, especially in Germany been cultivated with success before the writings of Sir Walter Scott but it is to his adoption of this branch of composition and the extraordinary talent which he devoted to it that its present popularity and universal imitation are entirely owing

ROMANCE'RO In Spanish the general name for a collection of the national ballads or *romances*, so called from the Roman or Romanic tongue which in the early part of the middle ages seems to have been the common appellation of all the dialects spoken from the Alps to the western extremity of the Mediterranean The *Romancero General*, the most celebrated of these collections was published in 1604 14

ROMANE SQUE (Fr) In Painting appertaining to fable or romance In historical painting it consists in the choice of a [illegible] than one founded on fact The [illegible] from *romantic*, because the latter may be founded on truth, which the former never is

Romanesque, in Literature is applied to the common dialect of Languedoc and some other districts in the south of France, which is a remnant of the old *Romance* language, now nearly extinct This term must not be confounded with *Romaic*, which is used to signify the [illegible] of modern Greece

RO'MAN ORDER *See* COMPOSITE ORDER

RO'MAN SCHOOL This school of painting, which, like the Florentine, addressed itself to the mind, is formed upon antique models Its style was poetical, embellished with all the grander pathos, and freedom from common matters, that the happiest imagination could conceive In touch its masters were easy, correct in drawing, learned and full of grace In composition it is sometimes whimsical, yet always elegant The heads of the figures are always drawn with great respect to truth and expression and it exhibits great intelligence in contrasting attitudes It is in colouring that it displays the greatest marks of negligence, whilst in draperies it is eminently successful At the head of this school was Raffaelle, and among its other principal masters were Giulio Romano, Zuccaro, M A Caravaggio, Baroccio, Andrea Sacchi (perhaps the best colourist of this school)

ROMA'NTIC, ROMANTICISM By *romantic* is [illegible] the wonderful and [illegible] beautiful which [illegible] Antiquity was a stranger to this feeling nor had the classic languages any term to express it The Germans

Almost all authors concur in the difficulty of giving a precise signification to the term *romantic* The *Dictionnaire de l'Academie Francaise* says, "Le romantique est un genre [illegible] On dit encore des [illegible] qui blessent les [illegible] regles de composition et de style établies par l'example des auteurs classiques" This definition, though far from being precise, is perhaps the best that has hitherto been given, and instead of attempting to rival it, we shall content ourselves with placing it before the reader

The term *romanticism*—an offshoot of romantic—is of recent invention, and is applied chiefly to the fantastic and unnatural productions of the modern French school of novelists, at the head of which are Victor Hugo, Balzac, "George Sand" &c, and their imitators in France and other countries

ROMAN VITRIOL Sulphate of copper, or blue vitriol

ROMANZIE'RI In Italian Literature, a series of poets who took for the subject of their compositions the chivalrous romances of France and Spain, and, with one or two exceptions only those relating to the exploits of Charlemagne and his fabulous Paladins The earliest of these poets flourished in the latter end of the 15th century Bojardo although not absolutely the first in order of time is considered as having laid the groundwork, in his *Orlando Innamorato*, of the edifice of fiction raised by his successors Pulci in the [illegible] was the first who allied the romantic [illegible] of chivalry with light and humorous satire Berni remodelled the work of Bojardo Ariosto in the *Orlando Furioso* carried this species of poetry to the highest degree of perfection These are the four principal Romanzieri but many other poets of the same school flourished until the end of the 16th century Tasso composed one of his early poems (*Il Rinaldo*) on the common model In the beginning of the 18th century the Abate Lorti-guerra compiled his *Ricciardetto* a poem of a semi burlesque character intended originally as a parody but completed as a serious composition, and thus closes the list of the Romanzieri All these poets adopted the ottava rima invented by Boccaccio (*see* OTTAVA RIMA) In their poems the thread of the main narration is frequently interrupted by a multiplicity of minor adventures and intrigues, and this complication of plot appears to have constituted one of the characteristic features of the chivalrous epic In most of them (from the time of Pulci) each book begins with a sort of prologue more or less connected with the subject which follows and these prologues form perhaps the greatest charm of the poem of Ariosto effecting the transitions from one subject to another by means of some touch of pathetic or elevated reflections or of light humour and playful satire generally in the form of an address to the supposed audience the poem being framed on the model of a tale recounted by a minstrel to an assembly of knights and ladies

ROMA'NZOFFITE A mineral from Finland of a brown colour, it is a triple silicate of lime, alumina, and iron

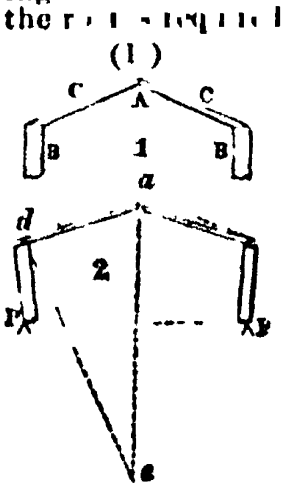
RONDEAU (Fr) In French Poetry a little poem of thirteen verses, divided into three unequal strophes, with two rhymes (eight lines masculine and five feminine, or *vice versa*) The two or three first words of the first verse serve as the burden and recur in that shape after the eighth and thirteenth verses There are also double rondeaux and single rondeaux, the latter an obsolete, but easier kind of verse In Music the term *rondeau* is applied to a light air in which the first strain forms the burden and as such is frequently repeated It is also written *rondo*

RO'NDEL In Fortification, a small round tower, erected in some particular cases at the foot of the bastion

ROOD (Ang Sax rode, *beam*, used for the Cross) The crucifix, sometimes also the image of a saint, was so called in old English churches Roods were set in shrines or tabernacles and the place where they stood was called the rood-loft, which was commonly over or near the passage out of the body of the church into the chancel They were all ordered to be taken down in 1548 (Burnet, *Hist of the Reformation*, vol ii book i), but restored for a short time under Queen Mary (*Archæologia*, vol i)

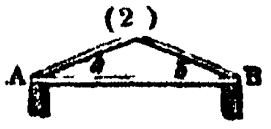
ROOD A square measure, the fourth part of a statute acre, and equal to 40 perches or square poles

ROOF In Architecture, the [illegible] of a building containing the timber work [illegible] of slate lead tile or other material Carpenters, however, restrict their use of the word [illegible]



The inclination of the sides [illegible] the species of covering to be the same in all, depend very

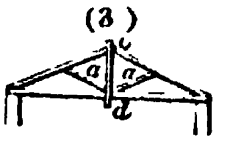
much on the temperature of the country to which it is to be adapted In the southern countries of Europe roofs do not require much elevation, whilst as we proceed [illegible] with greater pitch In the warm, [illegible] buildings require nothing more than a terrace for their covering, but in the temperate climates, wherein the latitude exceeds 42 degrees, experience shows that the flat covering of a building cannot be practised with any expectation of durability The rains of hot climates are violent, whilst the cold temperate climates are searching In the more northern latitudes the moisture, the driving nature of the rain, and, in addition, the duration of the snow on the roofs, require, it is obvious, a more considerable inclination Such materials as lead, copper, zinc, and the like, which, supposing them one piece, as, in fact, when used, they ought to be, are not fair examples from which to draw inferences in the theory whereof we speak, for, if well executed, they must either of them be considered as one homogeneous piece but in the case of tiles, [illegible] is far different With [illegible] of this subject, we will [illegible] the inclination of a roof to be zero at the equator if we add to it an inclination of three degrees for every climate from the equator to the polar circle, each climate being taken at 2° 42′ 30″, we obtain results which show that the roofs and pediments of temples of antiquity must have been well studied in that useful point of view which regarded their durability and impenetrability by rain The *Encyc Met* we believe to have been the first instrument of promulgating this curious theory, and believing in it as we do, we can, if it be not true only use the Italian saying, "si non è vero, è ben trovato" The theory would give an inclination to roofs at Athens of 16½ degrees, and they are very nearly so inclined, the temple of Minerva being 16 degrees and that of the temple of Pretheus 15½ degrees In Rome, according to this theory the inclination of a roof, and consequently pediment, should be 22 degrees, and experience finds it varying from 23 degrees to 24½ The advocates for the propriety of strictly copying Greek forms and details under the latitude of London will, if they have studied the æsthetics of the art, find no little difficulty in establishing their doctrines, after weighing this matter impartially But our limits prevent further observation, we will merely subjoin a table conformable to the theory —



Place	Latitude to nearest Minute	Length of longest Day	Inclination of Roof supposing Covering to be Roman Tiles
Carthagena	37° 36	14h 12m	19° 12
Palermo	38 7	14 18	19 18
(Latitude of Athens is 38°)	}	-	(see above)
Lisbon	38 42	14 50	20 0
Madrid - -	40 25	15 0	21 0
Naples -	40 50	15 2	21 12
Rome - -	41 54	15 10	22 0
Paris -	48 50	16 6	27 36
London -	51 31	16 34	30 24
Amsterdam -	52 22	16 44	31 24
Edinburgh -	55 57	17 32	36 12
Petersburgh -	59 56	18 44	43 24

A roof, as respects its construction involves some knowledge of mathematics Of the general principles on which its proper construction depends we shall here subjoin some account The obvious mode of covering a building with a greater or lesser inclination of the sides of the roof as required by the climate, is to place two equal rafters C C upon the walls B B as in the subjoined diagram (fig 1) meeting at the apex A, where we will suppose them so connected with a hinge as to be inseparable, but capable of descending by their gravity, as shown in No 2 The walls are considered as solid masses, moveable on points P If the walls be not of sufficient weight the thrust that will be exerted on them by the tendency of the rafters to spread at their feet will throw the walls out of an upright, as in No 2, and the whole assemblage will be destroyed By the laws of mechanics it is known that the horizontal thrust thus acting on the walls is proportional to the length of a line *de* drawn at right angles to the rafter, intersecting a vertical line drawn from the apex, which it is manifest must increase as the roof becomes flatter To counteract the thrust above mentioned nothing more is necessary than to tie together the feet of the rafters, as in the following diagram [illegible] *beam* If the extent be not very great, the rafters may be kept from spreading by a minor

(1)



(2)

tie, as at *a b*, called a *collar* Beyond certain lengths or spans however, it will occur to the reader that a tie-beam will itself have a tendency to bend or sag, as the workmen call it, in the middle, [illegible] contrivance becomes n [illegible] diagram below (fig 3), marked *c d* this is called a *king post*, or more properly *king piece*, inasmuch as it does not perform the office of a post, but rather of a tie, for it ties up the beam to prevent its bending If the rafters be so long as to be liable to bend, two pieces *a a* called *struts*, are introduced, which, having their footing against the sides of the king post, act as posts to support or *strut up* the rafters at their weakest points The piece of framing thus contrived is altogether called a *truss* It is obvious that by means of the upper joints of the struts we obtain more points of support (fig 4), or rather suspension, and that but for the compressibility of the timber, there would be no limit to the space which a roof might be made to cover This compressibility takes place at those points where the fibres of the wood are pressed at right angles, or nearly so, with their direction, and many ways are adopted for avoiding this inconvenience There is a species of roof, dependent in construction on the principles we have just described, which we shall here briefly notice, and whereof the following is a diagram (fig 5) This roof has three points of [illegible] A, B A the posts A A [illegible] *queen posts*, the collar A B A is here a *straining piece*, instead of a tie, as it was in the example of ties first noticed, its operation being exactly the reverse of a tie The *curb* or *mansard* roof is one in which a story is obtained, as may be seen in the annexed diagram (fig 6) Its principles are the same as those already mentioned, and do not here require further notice In the execution of roofs the expense of trussing every pair of rafters would be unne- [illegible] would be expedient, it is therefore the custom to place these *principal* parts of a roof at certain intervals, which, however should never exceed ten feet The rafters which are actually trussed are called *principal rafters*, and by the intervention of the *purlins* A in the diagram (fig 7) are made to bear the smaller or common rafters, which are notched down on it These common rafters are received by or pitch upon a plate B called a *pole-plate*, and the principal rafters, which fall on the tie beam, are ultimately borne by the wall-plate C When beams, in either roofs or floors are so long that they cannot be procured in one piece, two pieces to form the required length are *scarfed* together, by indenting them at their joints and bolting them together, of which practice two modes are here subjoined (fig 8)

(7)

(8)

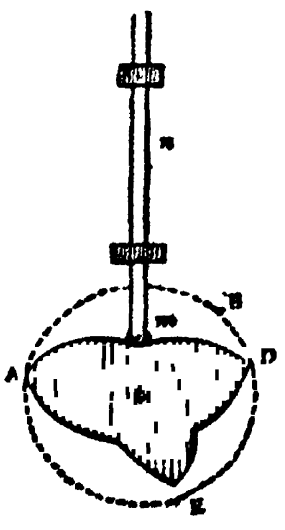
ROOK The name of a well-known species of crow (*Corvus frugilegus*, Linn), resembling in size and colour the carrion crow but differing in having the base of the bill whitish and scurfy, and bare of feathers. 'This," says Montague "is acquired by the bird's habit of thrusting its bill into the ground after worms and various insects The rook is content with feeding on the insect tribe particularly the larvæ of the cock-chaffer and while following the plough to remove from the newly-made furrow this destructive grub, it more than repays the husbandman for the grain which it may afterwards pick up The rook is gregarious at all seasons resorting constantly to the same trees every spring to breed when the nests may be seen crowded one over another upon the upper branches It lays four or five eggs much like those of the crow, of a greenish colour spotted and blotched with dusky After their young have taken wing, they all forsake their nest-trees, returning to them again in October to roost, but as winter comes on, they generally select more sheltered places at night in some neighbouring wood, to which they fly off together' (Montague *Ornithological Dictionary*) The wood or grove of tall trees in which rooks congregate and build their nests, is called a rookery

ROOT In Arithmetic, a number which being multiplied into itself any number of times produces another number, called a *power*, of which power the original number is the root The root takes the name of the power whose root it is Thus, it is called the *square root*, if the power is a square, the *cube root*, if the power is a cube, and so on

Root That part of the central axis of a plant which is formed by the descending fibres, and whose function is

to attract liquid food from the soil in which it is mingled It differs from the stem in not having leaves or buds upon its surface, and in its tendency to burrow under ground, retreating from light nevertheless some kinds of roots are exclusively formed in air and light, as in the ivy, and other such plants

ROOT OF AN EQUATION, in Algebra, signifies the value of the unknown quantity which enters into the equation *See* EQUATION



ROO'TSTOCK In Botany, a prostrate rooting thickened stem, which yearly produces young branches or plants It is common in *Iridaceæ* and Epiphytous *Orchidaceæ* [illegible] h the root [illegible] of it

[illegible] a) A large and important natural order of plants, the species of which are for the most part inhabitants of the cooler parts of the world They are in some cases trees, in others shrubs, and in a great number of instances herbaceous perennial plants, scarcely any are annuals No natural orders contain more species of general interest, in the beauty of their flowers or their perfume there is the rose itself, and various species of the genera *Rubus*, *Spiræa*, *Potentilla*, *Geum*, and *Pyrus* The apple, pear, plum, cherry, peach, nectarine apricot, and similar valuable fruits are the produce of others The white thorn, with all its numerous exotic allies, belongs to the genus *Cratægus* As medicinal plants, some are of considerable importance The root of *Potentilla reptans*, *Geum urbanum*, and others, is powerfully astringent, the bark of *Prunus coccomilia* has some reputation as a febrifuge, an Abyssinian plant called *Brayera anthelmintica* has energetic vermifugal qualities, and finally, prussic acid is obtained from the leaves and seeds of the almond peach, plum, and other related species This important assemblage of plants is distinguished by having several petals, separate carpels, distinct, perigynous numerous stamens, alternate leaves, and an exogenous mode of growth

RO'SARY (Lat rosarium *a rose-bed*) A Roman Catholic devotional practice, which consists in reciting 15 times the Paternoster, or Lords Prayer, and 150 times the Ave Maria or angelical salutation, but as the computation is made by means of beads the string of beads used for this purpose has acquired the popular name of a rosary The rosary is thus three times the ordinary chaplet It is instituted in honour of the fifteen principal mysteries in the life of our Saviour and the Virgin Mary Some have attributed its institution to St Dominic, [illegible] x part 2 c 4) giv [illegible] of the Rosary falls on the first Sunday in October Its name was changed by Gregory XIII from that of St Mary of the Victory given by Pius V on its original institution in honour of the battle of Lepanto, which took place on that day

ROSE (Lat rosa) In Botany, the English name for the well-known and universally cultivated flower of the genus *Rosa* (*See* ROSACEÆ) It would occupy too much space to point out even cursorily the various ceremonies in which this flower plays a distinguished part, suffice it to say, that in the earliest ages it was regarded with even more favour than at the present times and both at public and private festivals was considered an indispensable ingredient (See the *Damen Lexicon*) In architecture, the sculptured representation of this flower is found in the centre of each face of the abacus in the Corinthian capital, and is called the rose of that capital Roses are also used to decorate the caissons in the soffits [illegible]

ROSE ENGINE In Mechanics an appendage to the turning lathe, by which a surface of wood or metal, as a watch-case is engraved with a variety of curved lines The assemblage of these lines presenting some resemblance to a full-blown rose is called by the French *rosette*, and hence the engine by which the ornament is produced is called a rose engine The mechanism by which the figures are produced is sometimes called a *camb*, and may be described as follows "A wheel upon the axle C turns uniformly in the direction A B D E A rod *m n* moves in guides, which only permit it to ascend and descend perpendicularly Its extremity *m* rests upon a path or groove raised from the face of the wheel, and shaped into such a curve that as the wheel revolves the rod *m n* shall be moved alternately in opposite directions, through the guides, with the required velocity The manner in which the velocity varies will depend on the form given to the groove or channel raised upon the face of the wheel;

and this may be shaped so as to give any variation to the motion of the rod *m n* which may be required for the purpose to which it is to be applied " (*Lardner's Mechanics, Cab Cyclopedia*, p 250)

The purpose of the machine is therefore to convert a uniform rotatory movement into a varied rectilinear and alternating movement It is also used in machinery for spinning and for lace making

ROSEMARY (Lat rosmarinus *sea dew*) is the name given to a small evergreen [illegible] of the Labiate order, which inhabits rocky hills in the neighbourhood of the Mediterranean, and which is commonly cultivated in our gardens It has very narrow green leaves turned back at the edge and hoary underneath The flowers are of a dull leaden blue, or even white It has been employed in infusion as a remedy for headache, and is extensively employed [illegible] the growth [illegible] green colour to these preparations It is also said to be one of the ingredients in Eau de Cologne Narbonne honey is also said to owe its peculiar flavour to bees feeding on the blossoms of the rosemary The grey [illegible] rich with dew drops, on the rocky coasts of [illegible] are said to justify the singular name that has been given to the plant It is the λιβανωτὶς στεφανωματικὴ of Dioscorides

ROSE-NOBLE A gold coin of the value of 6*s* 8*d*, first coined in the reign of Edward III

ROSEO'LA, called from its rose colour a *rash*, frequently symptomatic of different febrile complaints, of disordered stomach and bowels of teething and of any constitutional irritation Acidulated drinks, mild aperients and sudorifics, and strict attention to the diet, with caution against the application of or exposure to cold so as to cause a retrocession, are the principal points to be attended to

ROSES, FESTIVAL OF A rural festival of some parts of France, in which the best-behaved maiden of the town or village (called *La Rosiere*) is annually crowned with roses in the church whither she is conducted with great pomp by the villagers These festivals were originally celebrated on the 8th of June at Salency a village of Picardy under Louis XIII, but they were afterwards introduced into Surene near Paris whence they extended to many other places, and have latterly even penetrated to Moravia The Persians have also an annual festival of roses which consists of bands of youth parading the streets with music and offering roses as the Italians during the carnival *confetti* to all they meet for which they receive a trifling gratuity

ROSES WHITE AND RED In English History, the well-known feuds that prevailed between the houses of York and Lancaster are so called from the emblems adopted by their respective partisans, the adherents of the house of York having the white those of Lancaster the red rose as their distinguishing symbol These wars originated with the descendants of Edward III and after extending over a period of more than eighty years during which England formed an almost uninterrupted scene of bloodshed and devastation were finally put an end to by the victory of Henry Tudor, earl of Richmond, over Richard III in 1485, the victor uniting in his own person the title of Lancaster through his mother and that of York by his marriage with the daughter of Edward VI Since that period the rose has been the emblem of England as the thistle and shamrock (see those terms) are respectively the symbols of Scotland and Ireland

ROSETTA STONE (so called from Rosetta, a village of Egypt where it was discovered by the French) The name given to the celebrated stone now in the British Museum which has played so distinguished a part in all modern hieroglyphical researches It is a piece of black basalt three feet in length, and about two feet and a half in breadth and contains parts of three different sculptured inscriptions one in sacred characters, or, as they are termed, *hieroglyphics*, the second in enchorial characters (*i e* in those of the country or in modified conventional hieroglyphics), and the third in Greek From the last, or Greek inscription, it appears that the inscriptions are either entirely or substantially identical, and form a royal decree which was ordered to be sculptured in the languages above specified The inscriptions are a good deal mutilated, particularly the hieroglyphical, but they are still sufficiently distinct to allow the hieroglyphical and enchorial characters to be compared with each other and the Greek As the discovery of this stone presented to the learned the first opportunity of viewing the Greek in juxtaposition to the Egyptian language, great hopes were entertained that a key would thereby be obtained to the [illegible] of the numerous monuments of ancient Egypt It would appear, however, from the investigations of Dr Young and Champollion, whose attention has been deeply engrossed with this subject, that the Greek does not faithfully represent the enchorial text, but gives merely its substance According to the Greek inscription, the stone was erected in the reign of Ptolemy Epiphanes

(A C 1941) whose benevolence it describes, and enumerates his victories and the principal political transactions of his reign See Hutchinson's

ROSICRUCIANS A sect of visionary speculators who existed in Germany about the beginning of the 17th century They ascribed indeed a much higher antiquity to themselves, but it is probable that if any body of philosophers who adopted this title ever existed in reality, they were the alchemists, fire philosophers, or Paracelsists of the 16th century, who adopted this mode of giving vogue and fashion to their tenets Germany was inundated with tracts, from 1600 to 1630 purporting to come from supporters or from enemies of this sect, in which their opinions and intentions are canvassed, but generally in a wild and unintelligible manner From one of these, a *Treatise on the Laws of the Rosicrucians*, by Ritter von Maier (1618), we learn that the fraternity had six fundamental laws —1 That their chief end and object was to cure the sick without fee or reward 2 That in travelling they were to change their habits and dress, so as to accommodate themselves to those of the countries in which they sojourned 3 To meet once a year on a certain day and at a certain place, kept secret from the rest of the world 4 To fill up vacancies in their body by electing fresh members 5 To use the letters R C as their common symbol 6 That the fraternity should remain undivulged for one hundred years from its foundation It appears probable that the device of the rose issuing out of the cross which was the same with Martin Luther's seal, was adopted for the purpose of attracting the notice of the religious the rose was explained to represent the blood of Christ It would appear from these laws that some species of secret Freemasonry was intended, and the Rosicrucians have been by some connected with the Freemasons, but there is in point of fact, no evidence that any such society existed at all, and the name and other circumstances were probably only the device of some alchemists who usually conveyed their own notions under cover of symbolical language Andrea, a German scholar is stated in the *Conversations Lexicon* to have been the original propagator of the reports concerning the Rosicrucian society The Rosicrucians have been also connected in various ways, by public opinion with the Cabalists Illuminati, &c, and the division of spiritual beings inferior to the angels into sylphs and gnomes which furnished Pope with the machinery of the *Rape of the Lock* is of Rosicrucian or Cabalistic origin It is found in that singular work, the *Comte de Gabalis* which obtained a sudden popularity in the beginning of the last century in which the author professes himself a member of the Rosicrucian fraternity (See Mosheim, *Eccl Hist* vol v)

ROSIN *See* RESIN

ROSTE'LLUM (Lat rostrum) An elevated and rather thickened portion of the stigma of Orchidaceous plants, from which the peculiar gland separates by which the pollen masses of some species of that order are eventually held together It was formerly supposed to be the point through which impregnation is effected, but this is now known to have been an error

ROSTELLUM The name of the mouth of the louse and similar Apterous insects, in which the ordinary trophi are replaced by an exarticulate retractile tube from which a retractile siphuncle is protruded The uncinated proboscis of the tape-worms (*Tæniæ*) is also so called

ROSTER, in Military affairs, is applied to the plan or table by which all military duty is regulated

RO'STRULUM (Lat dim of rostrum) In Entomology is the name of the oral instrument of the flea and other *Aphaniptera*, in which the ordinary trophi are replaced by a bivalved beak, between the valves of which there are three lancet shaped instruments

ROSTRUM (Lat) Literally the prow of a ship, but metaphorically applied to the pulpit or pleading place in the Roman forum which was decorated with the prows of vessels taken from the enemy (See *Niebuhr's Roman History*)

ROT A term applied to a well-known disease peculiar to sheep It is often called *great rot*, and *hydrophic rot*, &c, but it is more popularly known by the single term of rot Many causes have been assigned for it, as the *Fasciola hepática*, or fluke worm, some particular plants eaten as food, ground eating, snails, and other ingesta but as most of the supposed deleterious herbs have been tried by way of experiment and have failed to produce the disease so it is attributable to some other cause Neither is there satisfactory reason to suppose that the fluke worm is the original cause of it, but a consequence, since we know that the biliary vessels of other animals, as horses, asses, &c contain them and above all, because that they are not always present in the rotted subject From long experience, and the almost invariable effect produced by a humid state of atmosphere, soil, and product, we are warranted in concluding these are the usual exciting agents perhaps the saturated food itself is sufficient to do it The morning dew has been supposed equal to it Bakewell, when his sheep were past service, used to rot them purposely, that they might not pass into other hands This he always readily did by overflowing his pastures. But great differences of opinion exist as to the quantity, form, and varieties of moisture productive of this fatal disease It is said that land on which water flows, but does not stagnate, will not rot, however moist, but this is contradicted by the experience of Bakewell, who used merely to flood his lands a few times only to rot his sheep It is also said they are safe from rot on Irish bogs, salt marshes, and spring-flooded meadows, which experience seems to verify It is also said that the very hay made from unsound land will rot, but this wants confirmation When salt marshes are found injurious, it is only in years when the rain has saturated or rather super saturated such marshes That putrid exhalations unaccompanied with moisture can occasion rot wants confirmation also, for these commonly go together, and it is difficult to separate their effects It is not, perhaps, the actual quantity of water immediately received by land, but the capacity of that land to retain the moisture, which makes it particularly of [illegible] qualities

The signs of [illegible] are sufficiently familiar to persons about sheep They first lose flesh, and what remains is flabby and pale, they also lose their vivacity The naked parts, as the lips, tongue, &c, look livid, and are alternately hot and cold in the advanced stages The eyes look sad and glassy, the breath is fetid, the urine small in quantity and high coloured and the bowels are at one time costive, and at another affected with a black purging The pelt will come off on the slightest pull in almost all cases The disease has different degrees of rapidity, but is always fatal at last This difference in degree occasions some rotted sheep to thrive well under its progress to a certain stage, when they suddenly fall off, and the disease pursues the same course with the rest Some graziers know this crisis of declension, as it has been called and kill their sheep for market in the immediate nick of time with no loss In these cases, no signs of the disease are to be traced by ordinary inspectors, but the existence of the flukes, and still more a certain state of liver and of its secretions, are characteristic marks to the wary and experienced

The treatment of rot is seldom successful unless when it is early commenced, or when of a mild nature A total change of food is the first indication and of that to a dry wholesome kind all the farinæ are good as the meals of wheat barley oats peas, beans, &c Carrots have done good, mixed with these broom, burnet, elder, and melilot, as diuretics have also been recommended, but it is necessary to observe that there is seldom any ventral effusion but [illegible] complaint As long as the [illegible] the cure may be hoped by a simple removal of the cause, which has been shown to be a variable temperature, with excessive moisture of pasturage, which may also be aided by such remedies as assist the action of the biliary system Salt acts in this way, and thus salt mashes are good salt may also be given in the water Salt appears the principal ingredient in Flesh's patent restorative for sheep; for it states it to be composed of turpentine, sal ammoniac turmeric, quicksilver, brimstone, *salt* opium, alkanet root, bark antimony, camphor, and distilled water, but of this medley none of the articles can be in sufficient quantity to prove useful but the salt In the more [illegible] when the liver has become [illegible] dient to rub the belly of each sheep with half a drachm of mercurial ointment every other day for a week Give also the following every morning —Watery tincture of aloes, half an ounce, decoction of willow bark four ounces, nitric acid, twenty-five drops (*Loudon's Ency of Agriculture*)

ROT In Timber *See* DRY ROT

ROTA'TION (Lat rota *a wheel*) In Mechanics, the motion of a solid body about an axis Rotatory motion is distinct from progressive motion though both are frequently found to coexist in the same body The planets, for example, at the same time that they have a progressive motion in their orbits, revolve also about axes passing through their respective centres of gravity It is the rotatory motion of the earth about its axis which produces the alternations of day and night, and a slow but constant change of position in that axis, arising from the attraction of the sun and [illegible] gives rise to the astr[illegible] precession of the equinoxes

The determination of the circumstances of the rotation of a planet about its axis is a problem of physical astronomy, not less interesting or important than that of the planet's motion in its orbit It was, in fact, long considered as the more difficult problem of the two, but, according to the methods of modern analysis, both form a part of the same theory, and their solutions are deduced from the same general equations of motion

In relation to practical mechanics, the problem of rotation is also of great importance, inasmuch as it comprehends the methods of computing the performance of

machines, the forces necessary to overcome their inertia, a[illegible] relations and most advantageous disposi[illegible] several parts, in order that the required e[illegible] produced by the smallest expenditure of [illegible] jury to the machine itself [illegible] to the motion of bodies about axes, the terms *moment* [illegible] *angular velocity*, are of consta[illegible] fore important to keep in view the exact meaning of those terms

The *moment of a force* exerted in turning a body about an axis, is the product obtained by multiplying the force into the perpendicular from the axis upon the line of its direction; or it is the force multiplied into the leverage. Thus, if F be the force supposed to act in a plane perpendicular to the axis, and h a line drawn from the axis perpendicular to the direction of the force, the moment of the force is Fh. But as force is measured by the velocity which it communicates to a [illegible] this is usually expressed by MVh, where V is the velocity which the force F communicates to the mass M, when directed to its centre of gravity, in the time which is assumed as unity.

The *moment of inertia* of a body in respect of a given axis, is the sum of all the products obtained by multiplying each element into the square of its distance from the axis. Thus, if m be one of the constituent elements of the body, and r the distance of m from the axis, then the moment of inertia is $\Sigma r^2 m$, the summation denoted by Σ being extended to every element m. *See* MOMENT.

The different particles of a solid body revolving about an axis move with a velocity proportional to their respective distances from the axis, and the velocity of the particle whose distance from the axis is unity is the *angular velocity* of rotation. If this be denoted by ω, then the velocity of a particle whose distance from the axis is r will be $r\omega$.

These definitions being premised, we may now state a few of the more remarkable properties of rotatory motion. If the motion is produced by impulse, and the moving body is not acted upon by accelerating forces so that the velocity is uniform, the fundamental theorem (which is easily deduced from the property of the lever) is,

$$\text{angular velocity} = \frac{\text{moment of impelling force}}{\text{moment of inertia}}$$

In the case of a body turning about a fixed axis, it is supposed that the impelling force acts in a direction perpendicular to the plane passing through the axis of rotation and the point at which the force is applied. If the impelling force is not perpendicular to this plane, it must be resolved into two parts, one of which is perpendicular to the plane, and the other parallel to it; and it is only the former part which tends to produce rotation, the latter being destroyed by the resistance of the axis.

When all the different particles of a body are acted upon by accelerating forces (as in the case of a pendulum drawn aside from the position of rest and abandoned to the action of gravity), the angular velocity becomes a variable quantity, and is expressed by this formula,

$$\frac{d\omega}{dt} = \frac{\text{moment of the impelling forces}}{\text{moment of inertia}},$$

where $d\omega$ is the element of the velocity, and dt the element of the time. The moment of the impelling forces is computed from this expression, $\Sigma m v h$, where m is the mass of an element of the body, h its distance from the axis of rotation, and v the velocity due to the accelerating force. From the above formulæ, it is obvious that the computation of the moment of inertia must enter into every question connected with rotatory motion.

Principal Axes. — Generally speaking, any change which is made in the position of the axis about which a body revolves must be accompanied with a change in the moment of inertia. Hence, if a point (which is not the centre of gravity) be taken in a solid body, all the axes which pass through that point (and they may be infinite in number) will have different moments of inertia, and there must exist one in respect of which the moment is a maximum, and another in respect of which it is a minimum. Those axes in respect of which the moment of inertia is a maximum or minimum are called the *principal axes of rotation*.

If for any point taken in a solid body, we proceed by the usual methods of maxima and minima to find the position (relatively to the principal lines of the body) of that line or axis about which the moment of inertia is the greatest or least possible, the analysis leads to a cubic equation, of which all the three roots are real. Hence, for every point of a body, however irregular, there are *three* principal axes. Further examination shows that these axes form a system of straight lines at right angles to each other. One of them is such that the moment of inertia with respect to it is the least possible; with respect to another, the moment is the greatest possible; and although with respect to the third the moment is not, strictly speaking, the greatest or least, yet it possesses this characteristic of maxima and minima, that its differential coefficient is nothing, or its value is not affected by a very small change in the position of the axis.

If the form and structure of the revolving body be such that the moments of inertia about two of the principal axes are equal, then every line in the plane of those axes passing through their points of intersection will be a [illegible] spheroid of revolu[illegible] the principal axes, the two others are in the plane of the equator, and consequently equal, and it is obvious from the symmetrical form of the body that every equatorial diameter will have the same moment of inertia, or be a principal axis. If all three principal axes are equal, as in the case of a sphere when the point in which the axes meet is the centre, then every line passing through the same point is a principal axis. From this it follows that with respect to any point taken in a solid body there are either three principal axes, or else an infinite number.

It is a property of the principal axes, that if a body begins to revolve about any one of them it will continue to revolve about the same axis uniformly and perpetually, unless the motion is deranged by the action of a disturbing force. The centrifugal forces about a principal axis exactly counterbalance each other, and the axis remains unmoved without the aid of any support. There is, however, an essential difference in this respect between one of the axes and the two others. If a body begins to revolve about an axis very near to one of the axes for which the moment of inertia is the greatest or least possible, the axis of actual rotation will continue to oscillate about that principal axis, never deviating from it beyond certain narrow limits, and the angular velocity will only suffer small periodic alterations; but if the body begins to revolve about an axis which is very near to the intermediate principal axis, the axis of rotation will deviate from the principal axis indefinitely, and the velocity of rotation will not remain constant. Hence the rotation about two of the principal axes is stable, about the third unstable.

When a solid body revolves about a fixed axis, there are certain points in the body having determinate situations with respect to the axis of rotation and centre of gravity, which on account of their remarkable properties, require to be distinguished. Thus, in computing the effects of machinery, it is often necessary to determine the situation of the point at which if the whole mass of the revolving body were concentrated the rotatory effect would remain unaltered. This point is called the *centre of gyration*. The *centre of oscillation* of a body suspended by an axis is the point at which if all the matter were collected the oscillations would be performed in the same time. The *centre of percussion* is the point at which if the body encountered an immoveable obstacle the motion would be arrested without producing any strain on the axis. For the properties of these centres and the method of computing their positions, see CENTRE.

Motion of a Body entirely free. — If a body is retained by no fixed point, but is at liberty to move in any direction, and if a force be applied to it in a direction which passes through its centre of gravity, all the points of the body move forward in straight lines parallel to each other and to the direction of the impelling force. But if the direction of the force does not pass through the centre of gravity, the body will acquire two motions — one progressive, and the other rotatory, and these two motions are entirely independent of each other, that is to say, each is performed exactly in the same manner as if the other did not exist. The progressive motion is the same as if the direction of applied force had passed through the centre of gravity, and the rotatory motion communicated to the body is the same as if the centre of gravity had been a fixed point. In consequence of this property the general problem of determining the motions of a body subjected to the action of given forces resolves itself into two, of which the first is to determine the motion of the centre of gravity of the moving body, and the second to determine at every instant the position of the axis and the velocity of rotation.

In the solution of the latter problem the following elegant theorem, first given by Euler, is of important use. — When a [illegible] centre of [illegible] the body revolve about another axis also passing through its centre of gravity, the body will revolve about neither, but on a third axis, which lies in the same plane with the other two, and so situated as to divide the angle which they contain into two parts, such that the sines of the parts are to each other in the inverse ratio of the angular velocities with which the body would have revolved about the said axes respectively. It is evident that this conclusion will hold good if the angular motions about both axes are impressed simultaneously, and as the velocity about the new axis may in like manner be compounded with another velocity about a different axis, it follows that if several angular motions about given axes are impressed on a body at the same time, the position of

the resultant axis and the velocity of rotation may be readily computed

If the primitive axes are at right angles to each other, then the square of the resultant is equal to the sum of the squares of the component velocities about the primitive axes These properties form the theory of the composition of rotatory motion For their demonstration the reader may be referred to *Airy's Mathematical Tracts*, "Precession" and "Nutation," or to the article "Rotation," in the new edition of the *Encyclopædia Britannica*

The principal application of the theory of the rotation of bodies entirely free is to the planets, and particularly the earth It is to be observed, however, that the change which is continually taking place in the position of the terrestrial axis of rotation is only in respect of fixed points in space, for it can be shown that since the earliest recorded astronomical observations, the position of the poles of rotation on the earth's surface has undergone no alteration whatever

The principal works on the subject are *Euler's Theoria Motus Corporum Solidorum*, 1765, Vince, *Phil Trans*, 1780, Frisi, *Opera*, tom ii, 1783 *Atwood's Treatise on the Rectilinear Motion and Rotation of Bodies*, 1784, *Landen's Mathematical Memoirs*, 1789, Laplace, *Mecanique Celeste*, Lagrange, *Mécanique Analytique*, Poisson, *Traité de Mécanique*, &c

ROTATION OF CROPS In Agriculture and Gardening, it is found that the same annual crop cannot be advantageously cultivated on the same soil for more than one or two years, and hence one kind of crop is made to succeed another And the number of cultivated crops being limited, when the whole course has been gone through once it is again repeated, and hence the origin of the word *rotation* But as the same number and kind of crops are not always grown in regular succession but a change is frequently made according to general principles the term used in that case is *succession of crops* The principle on which the succession of crops is founded is that every kind of plant not only extracts nourishment from the soil but exudes into it excrementitious matter which is found injurious to that species though it may prove nutritious to another species As a general principle of guidance in determining the succession of crops it is considered advantageous that a crop cultivated for its leaves or roots should succeed one cultivated for its ripened seeds, that the cereal grasses should be succeeded by leguminous plants, taprooted plants or plants bearing tubers by fibrous rooted plants, and plants which form a compact covering on the surface, such as corn and legumes sown broadcast by plants which only partially cover the surface such as crops grown in rows sufficiently wide to admit of cultivation between It may also be adopted as a rule, that where land is to be subjected to a crop of the same plants for a number of years, as in permanent pasture the plants composing the crop should be of several different kinds by which means the excrementitious deposit of one species becomes the nutriment of another Hence the propriety of sowing clover, ribwort and other taprooted dicotyledonous herbage plants [illegible]

ROTATORIUS, *Rotifera* (Lat rota, *a wheel*) Wheel animalcules See ROTIFERS

ROTIFERS, *Rotifera* (Lat rota and fero, *I carry*) The name of a class of highly organized Infusorial animals, outwardly distinguished by certain ciliated appendages at the anterior part of the body which seem to move in a rapid rotatory manner, and by their superior size They are commonly termed 'wheel animalcules'

ROTTENSTONE An earthy mineral found near Bakewell in Derbyshire, in Wales and at Albany in New York [illegible] and consists according to R P [illegible] carbon, and 4 silica It resembles tripoli

ROUBLE A Russian silver coin of different values It was first struck at Moscow in 1654 Catherine II caused some gold coins to be struck with this name, but they are no longer current See MONEY

ROUE In the *beau monde*, a person devoted to a life of pleasure and sensuality, but not so completely vitiated in his character and manners as to be excluded from society The term is said to have been first used in this sense by Philip of Orleans the regent of France

ROUGE A species of lake prepared from the dried flowers of the *Carthamus* [illegible] Rouge is the only cosmetic which [illegible] hout ultimate injury to the complexion

ROUGH CAST In Architecture, the plastering of walls with mortar and fine gravel, left rough without any [illegible]

ROUGHING IN See RENDERED AND SET

ROUGH STUCCO In Architecture, stucco floated an [illegible] degree with water

ROUND [illegible] operty of a circle, sphere, or right cylinder, and indeed of any solid of revolution, though [illegible] confined to the sphere and cylinder

ROUNDEL In Heraldry, an ordinary in the form of a circle It is improper to say a roundel or, gules, &c., describing it by its tincture unless first, in case of counterchange, secondly where the roundel is of fur, or of equal tinctures, as a roundel ermine, a roundel checky of or and azure, &c, otherwise, roundels have distinguishing names, according to their tinctures A roundel or is called a *bezant* [illegible] ns of the Greek or Byzantine empire a [illegible] a *plate*, gules, a *torteau*, a kind of cake, azure, *hurt*, a species of flower; vert *pomme*, [illegible] purpure, *golpe* A field or charge, with [illegible] roundels, is said to be *bezanty*, *platy* &c according to the tincture

ROUNDELAY In Poetry, is properly a short poem of thirteen verses, eight in one rhyme, and five in another. *See* RONDEAU

ROUND HEADS A nickname given to the Puritans at the time of the civil wars by the Cavaliers, from the close black skull-cap [illegible] gown to the ears, which was then worn by [illegible] persons or more probably, from the custom that prevailed among them of wearing the hair closely cut to the head

ROUND ROBIN (Fr rond ruban) A phrase originally derived from a custom of the French officers, who, on signing a remonstrance to their superiors, wrote their names in a circular form, so that it might be impossible to ascertain who had headed the list It is now used to signify any act by which a number of individuals bind themselves to pursue a certain line of conduct

ROUND TABLE, KNIGHTS OF THE The name given to the famous order of knights that existed in England under the reign of King Arthur, by whom it was founded The members of this order are said to have been forty in number, and derived their name from a huge round marble table round which they were accustomed to sit Their adventures form the [illegible] of much of the early romantic poetry and [illegible] land, and our own times have been peculiarly fertile in clearing away much of the obscurity in which the well-known names of Tristram, Lancelot, and other members of this order were enveloped Sir W Scott's labours in this field are too well known to require any remark (See *Schlegel's History of Literature*, which gives a masterly sketch of the influence of the Round Table on the romantic poetry of that and succeeding ages)

ROUP A Scotticism for auction

ROW To propel a boat by oars Rowing is reckoned the most favourable application of human strength, the whole force is however not effective on the oar, as the part inside the actual fulcrum, which is in the water, acts as a backwater Some nations take short strokes, which they rise up in making, the English prefer a long stroke sitting which to say the least saves much exertion As the theory of rowing involves the resistance of fluids, it is necessarily defective

ROYAL In Naval affairs, the sail above the top-gallant sail The term *royal* is also applied, in artillery, to a kind of small mortar

ROYALISTS The name applied originally to the adherents of the Bourbon family after the revolution of 1792 but now in common use to designate the party attached to the claimants of the Spanish and Portuguese thrones

ROYAL OAK *Robur Carolinum* In Astronomy, a constellation formed by Halley in the southern hemisphere See CONSTELLATION

ROYALS The name given by way of eminence to the *first* regiment of foot in the British service it is supposed to be the oldest regular corps in Europe (*James's Military Dict*

RUBEFACIENTS (Lat rubefacio, *I make red*) Substances which when applied to or rubbed upon the skin induce a redness or blush upon the part, not followed by blister

RUBELLITE Red schorl or tourmaline There is a magnificent group of [illegible] Brit h Museum from the cab [illegible] Mr Greville

RUBEOLA The measles This disease is preceded by fever, with swelling and inflammation of the eyes, an [illegible] and about the fourth day there is an [illegible] red points, perceptible to the touch, which continues for four or five days, and then goes off with desquamation of the cuticle, but the fever, cough, soreness of the eyes and irritable state of bowels are apt to continue for some time after the entire disappearance of the eruption The most alarming cases are those in which the inflammatory symptoms and fever run very high, and which sometimes require bleeding, or blisters and cupping upon the chest, or in which there is a putrid tendency with a dark livid colour

RUBEZAHL The name of a famous spirit of the Riesengebirge in Germany who is celebrated in innumerable sagas, ballads, and tales, and represented under the various forms of a miner, hunter, monk, dwarf, giant &c He is said to aid the poor and oppressed, and shows benighted wanderers their road, but wages incessant war with the proud and wicked The origin of the name is obscure (See the *Tales of Musæus*)

RU'BICEL A term applied to the Brazilian ruby

RU'BRIC (Lat ruber, *red*) In the language of the old copies of manuscripts and of modern printers, any writing or printing in red ink The date and place on a title page being frequently in red ink, the word *rubric* has come to signify the false name of a place on a title page Many books printed at Paris bear the *rubric* of Genoa, London, &c But the most common use of the word is in ecclesiastical matters In MS Missals, the directions prefixed to the several prayers and offices were written or printed in red ink, and hence, the *rubric* familiarly signifies the order of the liturgy, in Roman Catholic countries as well as in England

RU'BY A crystallized gem of various shades of red, found chefly in the sand of rivers in Ceylon, Pegu, and Mysore Among lapidaries, the scarlet-coloured is sometimes called *spinelle ruby*, the pale or rose red, *balass ruby*, and the yellowish red, *rubicelle* It is inferior in value and beauty to the red sapphire, or oriental ruby of the jewellers It consists of 83 alumina, 9 magnesia, and 7 or 8 chromic acid, the latter gives its colour

RUDDER A heavy flat piece or frame of wood, hung upon the stern post by means of pintles and gud- [illegible] The rudder is [illegible] the tiller which enters the rudder head In vessels drawing much water the rudder is deep and narrow, in flat bottomed vessels, it is shallow and broad When carried to a considerable breadth, as in the Chinese vessels it is pierced with holes which preserves an increased leverage with a diminished direct resistance from the water

When the rudder is broken off by the ship getting aground, or by a heavy sea, a temporary one is made by a topmast and other spars placed parallel, and loaded at the bottom with pigs and ballast, and confined to the stern post by hawsers leading on each side of the keel

RUDDER COAT A covering of tarred canvass loosely put round the rudder head to keep the water from entering by the aperture, while it admits of the rudder being turned freely round

RUDDER PENDANTS Strong pieces of rope ending in chains, by which the rudder, if unshipped, is held to the ship's quarter

RUDDER SHOCK A piece of wood fitting between the head of the rudder and the rudder hole to prevent the play of the rudder in case of the tiller being removed

RUDE'NTURE (Fr) In Architecture, the rope or staff with which the lower parts of the flutings of columns are often filled *See* CABLING

RUDIA'RIUS (Lat) The term applied to a discharged gladiator The word is derived from the staff (*rudis*) which was given him in token of his dismission

RUDO'LPHINE TABLES A set of astronomical tables computed by Kepler, and founded on the observations of Tycho Brahe They were called the *Rudolphine Tables* in honour of Rudolph II, emperor of Bohemia who, upon the death of Tycho in 1601 conferred upon Kepler the title of imperial mathematician and undertook to defray the expenses of their preparation Owing to various causes the work was not completed until 1627, when the tables were published at Ulm They are the first that were ever calculated on the hypothesis that the planets move in elliptic orbits and they contributed greatly to the progress of modern astronomy For a detailed account of this very remarkable production, see Delambre, *Astronomie Moderne* tom i p 557

RUFF The name of the male of the *Machetes pugnax*, which is distinguished at the breeding season by a ruff or tuft of wide spreading feathers projecting behind the eyes and from the upper part of the neck The female is called the *reeve* *See* MACHETES and TRINGA

RULE, in Arithmetic, denotes a certain prescribed series of numerical operations, adapted to discover from the given conditions to which an unknown number is subjected what that number is They are generally distinguished by particular names, according to the purposes for which they are given, or the particular nature of the business for which they are required, as the rules of interest, the rules of fellowship, &c

RULE In a monastic sense, a system of laws or regulations by which monasteries and other religious houses are governed, and which the monks nuns, and novices vow at their entrance to observe *See* ORDERS, MONASTIC

RULE In Law, an order of one of the three superior courts of common law Rules are either general or particular, the former being such orders relating to matters of practice as are laid down and promulgated by the court for the general guidance of the suitors the latter are such orders as are confined to the particular case in reference to which they have been granted *See* COURTS OF LAW, and PLEADING

RULE OF THREE, in Arithmetic, is the rule by which when three numbers are given a fourth is to be found, so that the four shall be in direct or inverse proportion as the case may require

RULES In the Fine Arts, those laws and maxims founded on the general and fundamental truths of nature by which artists are guided in their compositions

RULES, BRASS Pieces of brass of different thicknesses made letter high, to print with They are made in lengths of fourteen inches, but of late years lengths half as long again have been made One of the edges is bevelled so as to print a fine line, and when a thicker line is required the bottom edge is placed uppermost, which is the full thickness of the brass, by this means lines of different thicknesses are obtained, and also double lines, a thick one and a fine one, when required. They are used for column lines in table work, to separate matter that requires to be distinct, and to be placed round pages

In cases where diagrams are required, and there is no engraver within reach, they may be formed by a clever workman with brass rule Of late years many ingenious and elaborate imitations of architectural drawings of buildings, with pillars, &c have been made with brass rule, and in this department of art Mr Ebenezer Parkes, of Fetter Lane, has displayed great skill and ingenuity

RULE, CARPENTER'S A folding ruler, generally used by carpenters and other artificers, having a variety of scales adapted to facilitate the calculations of most frequent occurrence by inspection Sometimes it has a sliding piece in one of its legs by which its use is greatly extended *See* SLIDING RULE

RULE, GAUGING is a rule adapted in the same manner to discover the contents of casks and other vessels It is used by the officers of excise in surveying the articles in the process of manufacture liable to duties *See* GAUGING

RUM A spirituous liquor distilled from the fermented juice of the sugar cane or from molasses Its flavour is due to the presence of a peculiar volatile oil its average proportion of alcohol fluctuates between 50 and 56 per cent The rum consumed in the United Kingdom is entirely the produce of the West Indies, and to a great extent of Jamaica, and for this preference it is indebted partly to its superior quality, and partly to its being protected against rum of East India produce by a differential duty of 6*s* per gallon, the duty on West India rum being 9*s* that on East India rum being 15*s* per gallon The quantity of rum entered [illegible] for the years 1839-40, averaged 2 [illegible], the duty on it for the three years 1837 38-39, averaged 1 372 540*l*, and in 1840 the gross amount was 1 154 544*l* The consumption of rum in this country has long been gradually declining

RU'MEN (Lat) The name of the paunch or first cavity of the complex stomach of the Ruminant quadrupeds

RU'MINANTS *Ruminantia* (Lat rumino, *I chew the cud*) The name given by Cuvier to the *Pecora* of Linnæus an order of Ungulate Mammals including those which have a complicated stomach of four cavities so disposed as to allow of rumination and a cloven hoof

RUMINA'TION (Lat rumino) The act by which food once chewed and swallowed is a second time subjected to mastication Digestion is always preceded by this action in the order of Mammals, hence called 'Ruminants,' [illegible] in any other animal The [illegible] of the Ruminant is specially organized for rumination, consisting of four distinct cavities all of which communicate with a muscular canal at the termination of the œsophagus Hard, solid or coarsely masticated food, passes from the beginning of the muscular canal into the first cavity of the stomach called the *rumen*, or paunch Water is received into the second cavity, called the *reticulum*, and almost exclusively occupies the honeycomb cells of that cavity, it is gradually mixed with the coarsely divided food which is undergoing mastication in the rumen When this is sufficiently advanced, a portion of the mass is received into the muscular canal at the termination of the œsophagus, it is there moulded into a ball and propelled by a rapid and inverted action of the muscles of the gullet into the mouth where it is more perfectly masticated, mixed with fluid, and again swallowed It now passes directly into the third stomach, called the *psalterium* from the broad leaf like plates of membrane with which it is occupied Here the superfluous fluid, which otherwise might have too much diluted the gastric [illegible] and passes [illegible] or [illegible] called the *abomasus* In the camel tribe, water cells are developed at the sides of the rumen, in addition to those of the reticulum, and the psalterium is not separated by any contraction from the abomasus

RUMP PARLIAMENT In English History, after the dissolution of Richard Cromwell's parliament, and his own demission of the protectorate, a council of officers, at whose head were Desborough, Lambert, and others having seized [illegible] visable to call [illegible] the Long Parliament, which had been dismissed by Oliver It

was assembled in May, 1659; and consisted of little more than seventy members those who had been excluded not [illegible] This body soon be- [illegible] and Royalist parts of the nation, and by its own assumption of power displeased the officers who had called it again into being It acted, however, with some vigour and determination, and defeated a variety of royalist conspiracies, but having ventured so far as to cashier Lambert and others of the leading officers, the troops again surrounded Westminster Hall, and expelled it, on the 13th October in the same year But Fleetwood, [illegible] the army, being unable to keep [illegible] government, the officers once [illegible] ament to sit again, which it did on the 26th of December It once more assumed absolute authority, but General Monk took part against it On his invitation a good many of the excluded members went to the house (Feb 21) and thus placed the Independents, who had hitherto ruled it, in a minority, [illegible] its former acts, the parliament [illegible] its nickname from being, as it were the remnant and fag-end of the old Long Parliament and was treated by the nation with general contumely and derision But it cannot be denied that, utterly unable as it was to command the divided nation, it showed boldness and vigour in its conduct, which, with a little more popularity, would probably have ensured great successes Vane and Hazlerig were [illegible]

RUNCINATE (Botany, hooked back, or curved in a direction from the apex to the base, as the lobes of the leaf of the dandelion

RUNES (Germ Runen), are properly the signs or letters of the ancient alphabet peculiar to the northern nations (Germans and Scandinavians) Schlegel deduces this alphabet from the Phœnicians (*Lectures on Ancient and Modern Literature*) Others have supposed it to have been derived from that of the Hebrews, but it originally consisting only of sixteen letters has been urged as an argument against this hypothesis The runen inscriptions found in Germany (especially Northern Saxony) are thought by some to have tokens of an origin somewhat different from the Scandinavian (*Grimm on the German Runes* 1821) The antiquity of both has been much disputed Of those found in Gothland it is said that the oldest are not earlier than A D 1200 the latest 1449 1300 stones with Runic inscriptions have, it is said been discovered in Sweden, many in Denmark, none in Lapland or Finland Runic staves are massive sticks, generally of willow inscribed with Runic characters [illegible] of magical import (See *Conv Lexicon*)

RUPEE A coin of different values, current in different parts of the East Indies See MONEY

RUPIA (Gr ῥυπος) An eruption of flattish vesicles succeeded by an ill-conditioned [illegible] which concretes into thin scabs easily [illegible] and regenerated, they generally occur as a consequence of poor diet and weak habit of body Light nutritious food, tonics, and alteratives are the remedies

RUPTURE See HERNIA

RURAL ECONOMY The general management of territorial property, either by the proprietor or his agent On a small scale the agent is termed a bailiff or farm servant, and on a large scale a land steward or factor The duties of the latter are to collect the rents, and see that the different clauses in the leases by which the tenants hold their lands are fulfilled and of the former, to cultivate the land in such a manner as to produce the greatest profit, or to fulfil the intentions of the proprietor as to the kind of produce which he considers it desirable to obtain See AGRICULTURE

RUST, in its ordinary acceptation, is the reddish peroxide which is found on the surface of iron when exposed to moisture

RUST In Horticulture See MILDEW

RUSTIC (Lat rus) In Architecture, a term applied to work jagged out into an irregular surface Work also which is left rough, without tooling

RUTACEÆ (Ruta, one of the genera) A natural order of plants, composed principally of trees and shrubs inhabiting the warmer parts of the world, seldom of herbaceous plants The species are sometimes very ornamental, especially those belonging to the genera *Correa*, *Boronia*, and *Diosma*. Some, as the common rue, the bucku plant, &c, are remarkable for having a powerful, peculiar, unpleasant odour, and antispasmodic quality, and a few have a febrifugal bark The *Dictamnus albus*, or *Fraxinella*, is extremely fragrant, and gives off an inflammable vapour

RUTILITE. (Lat. rutilus, *red*) Native oxide of titanium

RYACOLITE (Gr. ῥυαξ, *a stream*, and λιθος, *a stone*) A name given to glassy felspar

RYE (Ger *roggen*; Du *rogge* according to some, is a native of Crete, but it is very doubtful if it be found wild in any country It has been cultivated from time immemorial, and is considered as coming nearer in its properties to wheat than any other grain It is more common than wheat in many parts of the Continent, being a more certain crop, and requiring less culture and manure It is the bread corn of Germany and Russia In Britain it is now very little grown, being no longer a bread corn, and therefore of less value to the farmer than barley oats, or peas

RYOTS (Arab *a subject*) The name given to the cultivators of the soil in Hindostan Their social condition presents many singular and interesting features, to some of which we shall here advert In all eastern countries the rulers may be said to be the proprietors of the soil, but in India the *cultivators* have a perpetual, hereditary, and transferable right of occupancy, so long as they continue to pay the share of the produce of the land demanded by the government The value of this right of occupancy to the rural population depends on the degree of resistance which they have been able to oppose to the exactions of arbitrary governments In Bengal and the adjacent provinces of India, from the peculiarly timid character of the inhabitants, and the open and exposed nature of the country, this resistance has been trifling indeed, and consequently the value of the right of occupancy in the peasant, or ryot, has been proportionally reduced This, also, may be considered, though with some modifications, as being nearly the condition, in this respect, of the inhabitants of every part of the great plain of the Ganges, comprising more than half the population of Hindostan But where the country is naturally difficult, the people have been able more effectually to resist the encroachments of the head landlord, or state and to retain a valuable share in the property of the soil This has been particularly the case along the ghauts as in Bednore Canara, Malabar, &c, the inhabitants of which provinces not only lay claim to a right of private property in the soil, but have been generally ready to support their claim by force of arms There can be no question, indeed that the same modified right of property formerly existed every where, and it is indeed impossible that otherwise the land should ever have been reclaimed from the wilderness But in those parts of India which could be readily overrun by a military force, the right of property in the soil has long been little else than the right to cultivate one's paternal acres for behoof of others the cultivators reserving only a bare subsistence for themselves

Under the Mogul emperors the practice in Bengal was to divide the gross produce of the soil, on the *métayer* principle into equal shares, whereof one was retained by the cultivator, the other going to government as rent or tax The officers employed to collect this revenue were called *zemindars*, and in the course of time their office seems to have become hereditary It may be remarked that in Persian, zemindar and landholder are synonymous, and this etymology, coupled with the hereditary nature of their office which brought them exclusively into contact with the ryot or occupier, as well as with [illegible] led many to believe that the zemindars were [illegible] the owners of the land, and that the ryots were their tenants This, however, it is now admitted on all hands was an incorrect opinion The zemindars in reality were tax-gatherers, and were, in fact obliged to pay to the government *nine tenths* of the produce collected from the ryots, retaining only one tenth as a compensation for their trouble, and, so long as the ryots paid their fixed contribution, they could not be ousted from their possessions, nor be in anywise interfered with

But notwithstanding what has now been stated, the perpetual or zemindary settlement, established by Lord Cornwallis in Bengal, in 1793, was made on the assumption that the zemindars were the proprietors of the soil His lordship, indeed, was far from being personally satisfied that such was really the case, but he was anxious to create a class of large proprietors, and to give them an interest in the improvement and prosperity of the country It is clear however, that this wish could not be realized without destroying the permanent rights of the ryots, for, unless this were accomplished, the zemindars could not interfere in the management of their estates The interests of the zemindars, and the rights of the ryots, were plainly irreconcileable, and it was obvious that the former would endeavour to reduce the latter to the condition of tenants at will But this necessary consequence was either overlooked or ineffectually provided against The zemindars became, under condition of their paying the assessment or quit-rent due to government, proprietors or owners of the land. The amount of the assessment was fixed at the average

RYSTIDOSIS (Gr ῥυσις, *a furrow*) A disease of the eye, in which the cornea appears shrunk and puckered It is produced by a wound, or by a deficiency of the aqueous humour, which happens from old age or fevers, or occasionally from the action of an extremely arid atmosphere After death it is produced by the evaporation of the aqueous humour through the cornea, and the consequent shrinking of that membrane.

of what it had been for a few years previously, and it was [illegible] and invariable at that amount. [illegible] to arrear with government, his estate might be either sold or resumed

That the assessment was at the outset, and still is too high cannot well be doubted; and it must ever be matter of regret that the settlement was not made with the ryots or cultivators, rather than with the zemindars, but, notwithstanding these and other defects, the measure was, on the whole, a great boon to India Until the introduction of the perpetual system into Bengal, the revenue was raised in it, as it continues to be in the rest of India down to the present day, by a variable as well as a most oppressive land-tax We all know what a pernicious influence tithe has had in this country, but suppose that, instead of amounting to 10, tithe had amounted to 50 per cent of the gross produce of the soil, it would have been an effectual obstacle to all improvement, and the country would now have been in about the same state as in the days of Alfred, or of William the Conqueror

In France, Italy, and other parts of Europe, where the *métayer* system is introduced, the landlord seldom or never gets half the produce, unless he also furnish the stock and farming capital, and, in most cases, the seed But in India neither the government nor the zemindars do any thing of the sort they merely supply the land, which is usually divided into very small portions mostly about six, and rarely amounting to twenty-four acres A demand on the occupiers of such patches for half the produce is quite extravagant, and hence the excessive poverty of the people, which is such as to stagger belief Still, however, the perpetual system is vastly preferable in principle, and also in its practical influence to any other revenue system hitherto established in India It set limits to fiscal rapacity, and established, as it were a rampart beyond which no tax-gatherer dared to intrude The enormous amount of the assessment, and the rigour with which payment was at first enforced, ruined an immense number of zemindars But their lands having come into new and more efficient hands a better system of management was introduced, and the limitation of the government demand gave a stimulus to improvement unknown in any other part of Hindostan This, in fact, was the grand desideratum A land-tax, that may be increased should the land be improved is all but certain to prevent any such improvement being made This has been its uniform operation in every country in the world that has had the bad fortune to be cursed with such a destructive impost But a heavy land-tax, provided it be fixed and unsusceptible of increase, is no bar to improvements, unless in so far as it tends to deprive the proprietors and occupiers of land of the means of making them There is, in such a case no want of security, and the cultivator is not deterred from attempting improvements, or of bringing superior enterprise and industry to operate on his estate by the fear that the tax will, in consequence, be increased

The truth of what is now stated has been fully evinced in Bengal during the last twenty or thirty years, for both the population and the land revenue of that part of our Indian empire have greatly increased A great deal of waste land has been cultivated and various works have been undertaken that would not be so much as dreamed of in any other part of our empire in the East But with all this, there has been but little if any, improvement in the condition of the people of Bengal under our government They, in fact are practically excluded from at least all direct participation in the benefits resulting from the limitation of the assessment They have merely exchanged one taskmaster for another It is their landlords who have been the great gainers The occupiers still, generally speaking hold under the *métayer* principle, paying half or even more of their produce as rent, so that their poverty is often extreme, and their condition not infrequently inferior even to that of the hired labourer, who receives the miserable pittance of two annas, or about 3*d* a day as wages

It seems however as if here were [illegible] attending the government of India [illegible] talents and the best intentions [illegible] legislate for that [illegible] most pernicious projects [illegible] carried into effect by Lord Cornwallis in Bengal was keenly opposed by Lord Teignmouth, Colonel Wilkes, Mr Thackeray, Sir T Monro, and others, whose opinions on such subjects are certainly entitled to very great respect, and it would seem that the Board of Control became, at length, favourable to their views In consequence of this change of opinion it was resolved to introduce a different system under the superintendence of its zealous advocate, Sir Thomas Monro, into the presidency of Madras, or Fort St George This new system has received the name of the *ryotwar* settlement It proceeds on the assumption that government possesses the entire property of the soil, and may dispose of it at pleasure no middlemen or zemindars are interposed between the sovereign and the cultivators, the ryots being brought into immediate contact with the collectors appointed by government to receive their rents It is impossible for us to enter into the details of this system which are completely developed [illegible] we beg to refer the reader to Hamilton's account of it in the *Encyc Brit*, art "India, British"

RY'TINA (Gr *ῥυτις, a furrow*) The name of a genus of herbivorous Cetaceans, of which a species inhabiting the coasts of Kamschatska (*Rytina stelleri*), with a wrinkled and furrowed integument, is the type

S.

S A sibilant articulation, found in all the languages of which we have any knowledge S may be regarded as a species of semivowel, from its forming a kind of imperfect sound without the aid of any of the vowels, and from its peculiar quality of being able to be sounded before all the consonants, it has been termed by grammarians *suæ potestatis litera* It is susceptible of numerous interchanges both in the ancient and modern languages As an abbreviation, S is used for *socius, societas, south, solo*, &c

SA'BAISM, or SABE'ISM (From the Heb zaba, *lord*, whence Sabaoth &c, or *army, the host of heaven*) The religion which has for its objects of worship the sun, moon, and other heavenly bodies This belief prevailed in very remote ages in the Asiatic countries between the Euphrates and the Mediterranean, and Chaldæa the native land of astronomy, was its most celebrated seat Many allusions are made to this species of worship in the Old Testament, especially in the invectives of the prophets against the various forms of idolatry borrowed by the Jews from their heathen neighbours (See *Sale's Preliminary Discourse to the Koran*) There is a valuable memoir on the Sabaism of the ancient Persians by Foucher, *Mem de l'Ac des Inscr* vol xxv p 100 See also *Russell's Connexion of Sacred and Profane History*, vol i

SABA'OTH A Hebrew word, signifying hosts or armies It occurs in the New Testament as a designation of the Almighty (the Lord of Sabaoth)

SABA'SIA In ancient Mythology, festivals in honour of various divinities entitled Sabasii here, in of which term is not clear Mithras the sun, is called Sabasius in ancient monuments whence the word seems to have some connection with the root of Sabaism (see above), but Bacchus was also thus denominated, according to some, from the Sabæ a people of Thrace and the nocturnal Sabasia were celebrated in his name Jupiter *Sabazius* is thought to be the same as *Jehovah*, the Phœnician word tsebaoth signifying kids as the Greek αἴξ a goat But there is probably, some more general oriental meaning which has not yet been reached

SABBATA'RIANS In Ecclesiastical History, various sects have been so called, particularly a subdivision of the Anabaptists in the 16th century, who observed the Jewish sabbath The *Sabbatians* of the 4th century were followers of Sabbatius, a Novatian bishop, who attempted to introduce some Jewish observance into the church They are said to have had the singular peculiarity of abhorring the use of the *right* hand, whence they were called Ἀριστεροι or left-handed

SA'BBATH A Hebrew word signifying *rest*, applied by the Jews to the seventh day of their week (our Saturday) on which they were commanded to abstain from all manner of work, because "in six days God created the heavens and the earth, and rested the seventh day" The universal practice of the Christian church from the earliest period in conformity to what may be gathered from some passages in the Acts of the Apostles, has set apart the first day of the week (Sunday) for the especial worship of God, in memory of the resurrection of our Lord on that day The obligation upon which the observance of Sunday rests has been placed upon different grounds The most prevalent opinion supposes the commandment given to the Jews originally to be of universal obligation, as far as the observance of one day in seven But there have been many divines in all ages who have held that all the formal obligations of Judaism, as well those of the commandments as those of the Levitical law, were abrogated on the advent of our Saviour, and consider the consent of the church and the practice of the Apostles to be the only sufficient authority for this observance It is upon this principle that the Continental churches hold themselves justified in indulging in all sorts of worldly recreation on Sundays, after the services of public worship are concluded Archbishop Whately has recently drawn attention to the subject by his able arguments against the popular opinions on which the observance of the Sabbath is made to rest

The name *Sabbatarians* was given to some early sects of [illegible] Christians, who insisted on the observance of the Sabbath (Saturday) under the new dispensation

SABBA'TICAL YEAR Every seventh year among the Jews so called because on that year the land was allowed to rest and the people were supported by the tripled produce of the year preceding (Exod xxiii 10 Levit xxv 3 20)

SABE'LLIANS Heretics of the 3d century, followers of Sabellius, whose system [illegible] doctrine of the Trinity by [illegible] sole person, and the Son [illegible] emanations from him Thus they compared the Divinity to the sun, of which the Father would be analogous to the substance, the Son to the light, and the Holy Ghost to the heat This scheme has been known in later times as that of the Modal Trinity, and some divines of the orthodox English church have found themselves entangled in it, when attempting to explain accurately the mysterious doctrine to which it refers On the other hand, their opponents have been led inadvertently in some cases, to make too formal a distinction of the Three Persons, and have thereby subjected themselves to the charge of Tritheism (See *Mosheim*, transl ed 1790, vol i p 305)

SA'BIANS A Christian sect, also called Christians of Saint John, thought by some to be the remnant of the Jewish Hemerobaptists found in Persia and Arabia, principally at Basra (See *Mem de l'Ac des Inscr* vol xii, and *Mosheim*, vol iv)

SA'BLE A small quadruped allied to the martin-cat, celebrated for the fineness and rich colour of its fur of which the hairs turn with equal ease in every direction A single skin of the darker colour though not above four inches broad has been valued as high as 15*l* The sable (*Mustela zibellina* Linn) is principally a native of the northern regions of Asia it is hunted and killed for the Russian market either by a single ball a blunt arrow, or traps, by exiles or soldiers sent for that purpose in the deserts of Siberia The skin is in the highest perfection from November to February A nearly allied animal, called the 'fisher,' inhabits North America, and is similarly sought after and destroyed for its fur

SABLE In Heraldry, black derived, probably from the fur of the animal sable One of the colours or tinctures employed in blazonry It is equivalent to diamond among precious stones Saturn among planets In engraving it is represented by vertical and horizontal lines [illegible] each other

SACCHARIC ACID (Lat saccharum *sugar*) An uncrystallizable acid product formed along with oxalic acid during the action of nitric acid on sugar

SACCHAROID (Lat saccharum, and Gr εἶδος *form*) A texture resembling that of loaf sugar, is said to be [illegible]

SACCHAROMETER (Lat saccharum and Gr μέτρον *a measure*) An instrument for determining the specific gravity of brewers and distillers worts

SACCHARUM See SUGAR

SACCHOLACTIC ACID (Lat saccharum and lac *milk*) An acid obtained by digesting sugar of milk in nitric acid It is identical with that obtained from gum and termed *mucous acid*

SA'CER MO'RBUS (Lat *sacred disease*) One of the [illegible] nated

SACK (Fr *vin sec*, from which the term is generally supposed to be derived) A Spanish wine of the dry kind The important part which it plays in Shakspeare is well known Falstaff calls it *sherry sack* which means sherry sack, so called says Blount in his *Glossographia* from Xeres a sea town of Cordubia where that kind of sack is made At a later period sack seems to have been used as a general term for all kinds of sweet wines, and it has been conjectured that, instead of being a corruption of the French *sec*, as above noticed it derives its name more probably from a common practice of the Spaniards of putting their sweet wines into *sacks* made of goat skins and thus transporting them from one place to another

It may be interesting to observe, that the term *sack* in the sense of a *bag*, is found in all the European and many Asiatic languages

SACKBUT A wind instrument of the trumpet species, but differing from the common trumpet in form and size It is of low or bass pitch, and is drawn out or shortened by the means of sliders, according to the acuteness or gravity of the tone to be produced It is, in fact, the trombone of the Italians

SA'CRAMENT (Lat *an oath*) The military oath taken by every Roman soldier, by which he swore to obey his commander and not desert his standard

SACRAMENT In Theology a word which does not occur in scripture, nor possesses any exact equivalent there, but employed very early by writers in theology to signify certain distinctive ceremonies of the Christian faith Our Saviour appointed the baptism of believers as an initiatory rite, he also commanded the observance of the supper of the Lord to be held in remembrance of him These, then, are the badges by which Christian men are known, and by which they make profession of their belief The expressions of scripture moreover, with which the appointment of the ceremonies is attended have been [illegible] and [illegible] much controversy concerning them The one called the second birth the other is said to be the communion of the body and blood of our Saviour Christ, and the mysteries which seem to be concealed under these terms have been made the subjects of various interpretations According to the general consent of ancient orthodoxy the sacraments have in themselves a peculiar [illegible] The Romish church is accused of holding the extreme opinion that this grace is conferred *ex opere operato*, by the mere act the recipient remaining passive, that they fail of operation only where he is under the influence of positive sin, but that the administration of the Eucharist to a dying man unconscious of the whole proceeding, would have the same effect as if he received it in the most holy frame of mind The English church requires the worthy acceptation of the person himself, as is expressly stated, with a tacit reference to this superstitious notion, in its twenty fifth article It guards at the same time, against the idea very [illegible] churches abroad and [illegible] words with which the article begins —"Sacraments ordained of Christ be not only *signs* or *tokens of Christian* men's profession, but rather they be certain sure witnesses and effectual signs of grace and God's will towards us, by the which he doth work invisibly in us and doth not only quicken, but also strengthen and confirm our faith in him"

The question as to the number of such ceremonies must be settled by the definitions of a sacrament which theologians shall propound It is agreed that a sacrament is a federal rite, instituted by Christ or the Apostles, with a direct appointment of *matter* by which some interior meaning is signified and the *form* of manner of its application This definition is conceived by Protestants to restrict the number to two only the Romanists extend it to seven adding to Baptism and the Lord's Supper Confirmation Penance, Orders, Matrimony, and Extreme Unction

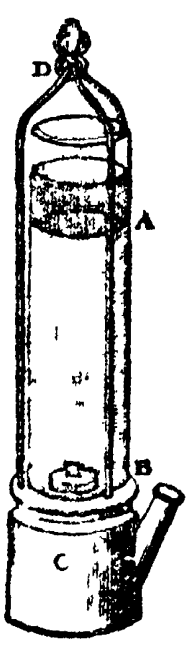
SA'CRED WAR The most remarkable known by this name in classical history is that which commenced with the seizure of Delphi by the Phocians, B C 357, and was ended by the conquest of the Phocians by Philip of Macedon B C 346, according to the chronology of Clinton (*Fasti Hellenici*)

SA'CRIFICE Generally any offering made to the Deity but more properly that of a victim upon an altar, accompanied by customary ceremonies and forms of prayer with the idea of gratifying God and averting his displeasure In the scriptures we meet with offerings, both of fruits and of animals antecedent to any command or institution of God, such as those of Cain and Abel, of Noah and the Patriarchs many of which, nevertheless, are described as acceptable to him In the Levitical Law, however sacrifices are ordained by divine appointment, and a question arises as to the probability of a similar command having been in fact given to our first parents The universality of the practice undoubtedly requires either the supposition of an original revelation, or the discovery of a common principle impelling all men alike to the adoption of what at first sight seems to militate against our ideas of reason and the absurdity of which has, we know been represented in the strongest light by the sages of all nations at a certain period of the intellectual development of each Those divines who consider the appointment to have emanated directly from God conceive it to have been, from the first typical of the last and greatest sacrifice —that of our Saviour on the cross It may fairly be asked of those who look for logical reasons for all divine appointments whether upon human principles it is not [illegible] that the sacrifice [illegible] been predetermined the notion should be familiarized to us first by ordaining a previous practice, or that, the practice existing and having a meaning of its own in all minds, the new revelation should be accommodated to our notions by adopting that very practice for its foundation? If, on the other hand, we follow the general current of modern opinion upon this subject, and inquire for some general principle of our nature to account for the universal reception of the ideas, we may discover it perhaps in the perpetual sense of obligation with which the enjoyment of prosperity is properly accompanied, and which in some minds takes the form of [illegible] the devotion to the giver [illegible] which we are ourselves gratified, and in others becomes an uneasy scruple, and suggests the voluntary surrender of a part with a view to the more secure enjoyment of the remainder

SACRILEGE (Lat *sacrilegium*) The profanation of anything or place consecrated to the service of God.

SACRISTY (Lat *sacer sacred*) In Architecture,

an apartment attached to a church, in which the consecrated vessels of the church, and the garments in which the [illegible]



SACRUM [illegible] pelvis, articulated to the last lumbar vertebra, and firmly united on each side to the hip bones, below, the *os coccygis* is attached to it It probably derives its name from having been offered by the ancients in sacrifices In young subjects it is composed of five or six pieces united by cartilage but in more advanced age it becomes one bone

SADDER A work in the modern Persian tongue, comprising a summary of various parts of the *Zendavesta*, or sacred books of the ancient Persians (which see) The authority and character of the Sadder are supposed to be very small some attribute it to the Parsees, and give it an antiquity of several centuries, others consider it a more modern forgery (See *Mem de l'Ac des Insc* vol xxxviii)

SA'DDLE In Sea Language, a lump of wood acting as a seat or rest to the heel of a boom, and shaped accordingly

SA'DDUCEES A peculiar sect of religionists among the Jews It is remarked that during the time that prophets are recorded to have arisen among the Jews, there is no account of the existence of any sects among them they frequently fell away into total idolatry, but whenever recalled from that corruption, they appear to have reverted in a body to the pure religion of their ancestors, and never to have been separated in religious distinctions among themselves The most ancient sect was that of the Sadducees whose founder, Sadok, lived about 250 years B C He appears to have restricted the providence of God to the distribution of the temporal rewards and punishments which form the main feature of the old dispensation In the time of our Saviour his followers entirely rejected the doctrine of a resurrection They were assimilated also to the Epicureans in maintaining the perfect freedom of human actions, and like those pagan philosophers were few in number and only of the highest and most literary classes They were distinguished also from the Pharisees by the rejection of traditions and by strict adherence to the written law alone (See *Milman's Hist of Christianity* vol i p 75 211)

SAFETY LAMP A lamp invented by Sir H Davy which is so constructed as to burn without danger in an explosive atmosphere Flame may be considered as vapour or aeriform matter in a state of intense ignition, the temperature therefore of flame is always very high It is however independent of its luminosity, for some of the dimmest flames, those of pure hydrogen gas and of alcohol for instance are those which are hottest, and that this is so may be shown by projecting into them finely powdered substances such as magnesia or lamp black, or by holding in them fine platinum wire when the intensity of their temperature is rendered evident by those substances becoming white hot And whenever flames emit much light they derive that property from the presence of finely divided matter diffused through them thus, the intense brilliancy of the flame of phosphorus appears to depend upon the particles of incombustible phosphoric acid diffused through it, and the bright light emitted by a gas flame depends upon finely divided charcoal, which is ignited by the gas and at the same time burned The correctness of this *theory of flame* is shown by the circumstance of its being extinguished by cooling, and this is best effected by causing it to pass through a piece of fine wire gauze, which when held [illegible] of the flame extinguishes [illegible] he inflammable vapour or [illegible] or carbon pass through but in passing are so far cooled as to be extinguished, they may however, be re[illegible] above the wire [illegible] merely acts by its cooling power, is shown by the flame passing through it when it acquires a white heat or when its meshes are not fine enough to exert a due cooling power, it is also found that very hot flames such as that of hydrogen, will pass through tissues which are impervious to flames of a lower temperature, such as that of a common candle or a gas flame (*See* FLAME) The application of these principles to the con[illegible] [illegible] — [illegible] rounded by a cylinder of wire gauze A B (doubled at A where it is to become hottest, and protected by the stout wire frame D), and burns within it, the air having free ingress and egress When it is immersed in an explosive atmosphere, such as that of a coal mine infested by fire damp, the inflammable gas enters from without and burns *in* the cage, but, in consequence of the cooling power of the wire gauze, no flame can pass *outwards* so as to ignite the surrounding atmosphere the miner, therefore, is warned of his danger by the [illegible] of the lamp As [illegible] the external [illegible] but upon the approach of the fire damp the flame is more or less enlarged, and in the most explosive condition of the surrounding air the cylinder appears filled with a blue lambent flame, which flickers within it, the wick of the lamp appearing for the time extinguished It is, however, rekindled as the air becomes more pure; or should the fire damp greatly predominate, it may be entirely extinguished Before this happens, however, the miner is duly apprised of his danger, and has time to retreat (See *Davy on the Safety Lamp*)

SAFFTY VALVE *See* STEAM ENGINE

SA'FFLOWER The dried flowers of the *Carthamus tinctorius*, or bastard saffron, used as a dye stuff, and in the preparation of the [illegible]

SAFFRON The [illegible] the *Crocus sativus* The stigmata of this purple crocus are of a deep orange colour and when in quantity have a peculiar and very characteristic odour, they are used in medicine, chiefly as a rich yellow or orange colouring matter Saffron is now chiefly imported from the south of Europe, especially Spain, it was formerly cultivated in this country in the vicinity of [illegible] in Cambridgeshire [illegible] petals of other [illegible]

SAGA The general name of those ancient compositions which comprise at once the history and mythology of the northern European races Their language is different from the modern Danish, Swedish, and Norwegian and is more powerful and expressive than either of these later dialects Of the mythological sagas the most famous are the saga of Regnar, Lodbrok, the Hervarar saga, the Voluspa saga and the Wilkina saga The historical are very numerous, the Jomsvikingia saga and the Kaflinga saga comprehend much of the early annals of Norway and Denmark, the Eyrbiggia saga is the chief historical document of ancient Iceland It is, however to be remembered, that the chief object of the relators is the interest of the narrative, so that as mere histories they are of imperfect value Many of them are collected in the great work of Snorre Sturleson called *Heimskringla* The most classical period of these compositions is considered by antiquaries to fall within the 12th and 13th centuries

SAGAPENUM A fetid gum resin brought from Persia and Alexandria probably the produce of a species of *ferula* It is occasionally used in medicine as a nervine and stimulating expectorant Its odour somewhat resembles that of assafœtida but it is much weaker

SA'GGER A clay used in making the pots in which earthenware is baked, and which are called *saggers* or *seggers*

SAGGING TO LEEWARD A Nautical term denoting the movement by which a ship makes considerable lee-way

SAGITTA (Lat *arrow* or *dart*) One of Ptolemy's 48 constellations in the northern hemisphere *See* CONSTELLATION

SAGITTA A term used by the older writers on trigonometry to denote the *versed sine* of an arc, from its resemblance to an arrow standing on the chord of the double arc

SAGITTA'RIUS (Lat *the Archer*) One of the twelve constellations of the zodiac It is represented on celestial globes and charts by the figure of a centaur in the [illegible] arrow from his bow

SAGITTAL (Lat sagitta, *an arrow*) In Zoology a part of an animal is so called when it is triangular and hollowed out at the base, with posterior angles

SA'GO A species of feculæ or starch obtained from the cellular substance of an East Indian palm tree, the *Sagus farinifera* It is usually granulated, and known in the trade under the name of *pearl sago*

The tree, when at maturity is about 30 feet high, and from 18 to 22 inches in diameter Before the formation of the fruit the stem consists of an external wall about 2 inches thick, the whole interior being filled up with a sort of spongy medullary matter When the tree attains to maturity, and the fruit is formed, the stem is quite hollow Being cut down at a proper period, the medullary part is extracted from the trunk, and reduced to a powder like sawdust The filaments are next separated by washing The meal is then laid to dry, and being made into cakes is baked and eaten For exportation, the finest sago meal is mixed with water, and the paste rubbed into small grains of the size and form of coriander seeds This is the species principally brought to England, for which market it should be chosen of a reddish hue, and readily dissolving in hot water into a fine jelly Within these few years, however, a process has been invented by the Chinese for refining sago, so as to give it a [illegible] so cured is in the highest [illegible] markets It is a light, [illegible] It is sent from the islands [illegible] where it is granulated [illegible] by the Chinese The export

trade to Europe and India is now principally confined to that settlement (*Ainslie's Mat Indica*, *Crawfurd's East Archip* vol i pp 383—393, vol iii p 348, *Bell's Review of the Commerce of Bengal, &c*)

The consumption of sago has undergone an almost incredible increase within the last twenty years, which is wholly ascribable to the reduction in the interval of the oppressive duties by which the article was formerly loaded — (*Papers published by the Board of Trade*)

SAGUM The military dress of the Roman magistrates and dignitaries, a cloak fastened at the breast with a clasp The same name was given to the ordinary dress of several barbarous nations Thus Tacitus says of the Germans *paludamentum vestagum*, and Varro and Diodorus Siculus present us the costume of the Gauls

SAHLITE In Mineralogy a variety of augite from the silver mine of Sahla in Sweden

SAIL A surface obtained by canvass, mat, or other material, by the action of the wind on which, when extended, the vessel is moved A sail extended by a yard hung (*slung*) by the middle and balanced, is called a *square sail* a sail set upon a gaff or a stay, is called a *fore and aft sail*, which terms refer to the position of the yard, gaff, or stay, when the sail is not set The upper part of every sail is the *head* the lower part the *foot*, the sides in general are called *leeches*, but the weather or side edge of any but a square sail is called the *luff*, and the other edge the *after leech* The upper two corners are *earings*, but that of a jib is the *head*, the lower two corners are in general *clues*, the weather clue of a fore and aft sail, or of a course while set, is the *tack* The edges of a sail are strengthened by a rope called the *bolt rope* The ropes at the upper and lower edges are the head and foot ropes of the sail The canvass or sail-cloth is made in *bolts*, and the qualities are numbered from No 1 which is the strongest, and is used for storm sails, to No 8, which is used for the smallest sails, as small studding sails &c, which the seamen commonly call *flying kites* The cloths in a square sail are seamed vertically, in a fore and aft sail they are parallel to the after leech In this way the strain of the sheet diffuses itself over the canvass both along and across the cloths Discussions have, however, arisen as to the best mode of seaming When a seam opens, the sail often splits Captain Cowan took out a patent for *horizontal* seaming, he remarks (*Essay on the Construction of Sails &c*) that such sails when they split remain full and are less liable to blow away, and that they also were found to last much longer The plan, however has not been approved *Diagonal* seaming which has also had its advocates is defective in principle, for it must bring the strain of a sheet either on a single cloth, or entirely across the stitches

Sails take their names from the mast, yard or stay upon which they are stretched Thus the principal sail extended upon the main mast is called the *main sail*, the next above, which stands upon the main top mast is the *main-top-mast sail*, above which is the *main-top-gallant sail*, and above all, the *main royal* In like manner, there are the *fore sail*, the *fore top sail*, the *fore-top-gallant sail* and the *fore royal*, and similar appellations are given to the sails supported by the *mizzen* or after mast The *main-stay sail main top-mast stay-sail* &c, are between the main and fore masts, and the *mizzen stay sail mizzen top-mast stay-sail* &c are between the main and mizzen masts Between the foremast and bowsprit are the *fore stay-sail*, the *fore-top-mast stay-sail*, the *jib*, and sometimes a *flying jib* and *middle jib* Square sails extended by yards under the bowsprit and jib-booms are called *sprit sails*, and the *studding sails* are those which are extended upon the different yards of the main mast and fore mast

To *make* sail, is to set sail To *shorten* sail is to take in some sail To *loose* sails, is to spread or hang out the sails that had been furled to air them or for the purpose of setting afterwards To *strike* sail, is to lower the yard or gaff of a sail when set, in token of salute

The common theory of sails which assumes the impact of columns of air is radically defective, for it is a fact familiar to sailors that the reef points, or any light stuff by accident in the same situation, hang vertically in the hollow of the sail, as in a calm, thereby proving that the sail is filled with a mass of air, quiescent or nearly so, and maintained in a state of statical pressure, whereas if the common theory were true, the points would lie flat to the canvass, as weeds are pressed against the bank of a stream Hence it follows that (as practical men believe who have not mixed with their practice the fragments of imperfect theories) there is a certain extent of hollow or *belly* which increases the effect of the sail It of course adds to the effect of sails to wet them, by swelling the threads and closing the pores this practice is often resorted to in chase

SAILING In Navigation, the art of directing a ship on a given line laid down in a chart It is called *plane sailing* when the chart is constructed on the supposition that the earth's surface (or rather the surface of the ocean) is an extended plane, and *globular sailing*, when the chart is a globular chart, or constructed on the supposition that the earth is a sphere See NAVIGATION

SAILING ORDER, or ORDER OF SAILING Any determinate order preserved by a squadron of ships It usually implies 1, 2, or 3 parallel columns, but is at the disposition of the admiral

SAINFOIN (*Hedysarum onobrychis*) A plant of the family of the *Leguminosæ* It will not thrive well except when the soil or subsoil is calcareous, and is consequently not generally met with in this country, though it is extensively cultivated on the Cotswold Hills, and on the chalk soils of Dorset, Hants, Wilts, &c It generally remains for eight or ten years, — a much longer period than it does in France It is made into hay, the after crop eaten by cattle

SAINT JOHN KNIGHTS OF, or HOSPITALLERS A military order of religious persons They derived their name from a church and monastery dedicated to St John the Baptist, founded at Jerusalem about 1048 by merchants from Amalfi, the brotherhood of its members [illegible] and sick [illegible] brotherh[illegible] the 12th c[illegible] chaplains [illegible] was bound to defend the church against the infidels It possessed various possessions and settlements at different times in different parts of the East In the 13th century, being driven from Palestine, the knights of this order fixed their principal seat first in Cyprus, and afterwards at Rhodes where they remained from 1309 to 1522, when the island was captured by Solyman II After several changes of settlement, they were fixed in 1530 by Charles V at Malta and its dependent islands whence they took the name of Knights of Malta Here they maintained themselves until 1798, when the island was taken by Napoleon The order however, continued to subsist, notwithstanding the loss of its sovereign possessions both in Malta and Tuscany the seat of the chapter is now at Ferrara Before the French Revolution the number of knights was estimated at 3000 The temporal powers of the order were chiefly concentrated in the hands of the grand master, but he was in fact, controlled by the governors of the eight languages These were of Provence Auvergne, France, Italy, Aragon, Germany Castile, and England The lands were divided into priories commanderies, and bailliages The spiritual power was exercised by the chapter, consisting of [illegible] The knights were under the [illegible] Protestants were not bound to celibacy They were required to be necessarily of good descent, but those whose proofs of noble ancestry were unquestionable were termed *cavalieri di giustizia* while others who could not show such proofs might be admitted on account of their merits as *cavalieri di grazia* See HOSPITALLERS

SAINTS (Lat *sancti*, *holy persons*) Pious men, who, according to a custom early prevalent among Christians, were commemorated with honour after their death in the services and ceremonies of the church This distinction was originally applied to the apostles and eminent martyrs and confessors, whose places of burial were regarded with pious affection by the faithful in the neighbourhood, and memorials or relics of whom were carefully cherished among them The observance of particular days in the honour of the saints was also a very early custom, but the natural feeling which prompted this and other tributes of gratitude and respect towards them became gradually corrupted The intercession of the saints was supposed to have power with God, and individuals put themselves under the especial patronage of one or more amongst the number which in later times was vastly augmented, giving to them the honour and worship due to God alone, and conceiving themselves sufficiently protected by the influence of their prayers It was affirmed that miracles were performed at their tombs and by their relics, and the greatest rivalry and contention arose between the votaries of the shrines of different saints, and sometimes those of the same For the manner of enrolment among the number of saints, see art CANONIZATION (See *Bingham and Palmer's Origines Liturgicæ* as to the progress of the invocation of saints in the church, vol i 76, &c)

SAINT SIMONIANS The [illegible] followers of [illegible] He was born in 1760, [illegible] series of unsuccessful commercial enterprises, in which [illegible] having been unfortunate [illegible] a variety of [illegible] which he was constantly publishing [illegible] he lived, however, a few years longer, and died in 1825, leaving his papers and projects to Olinde Rodriguez St Simon's views of society and [illegible] riety of wor[illegible] the *Nouveau*[illegible]

Rodriguez This book does not contain any scheme for the foundation of a new religion, such as his disciples afterwards invented It is a diatribe against both the Catholic and Protestant sects for their neglect of the main principle of Christianity, the elevation of the lower classes of society, and inveighs against "l'exploitation de l'homme par l'homme," the existing system of individual industry, under which capitalist and labourer have opposite interests and no common object The principle of association, and just division of the fruits of common labour between the members of society he imagined to be the true remedy for its present evils After his death these ideas were caught up by a number of disciples and formed into something resembling a system The new doctrine of St Simonian *family* was chiefly framed by Rodriguez Bazard Henry, Chevalier and other men of talent After the revolution of July, 1830, it rose rapidly into notice the sympathy between the notions which prevailed and those entertained by many of the people favourable In 1831, the society had about 3000 members a newspaper (the *Globe*) and large funds The views of the St Simonian family were all directed to the abolition of rank and property in society, and the establishment of associations (such as the followers of Mr Owen in this country have denominated co-operative), of which all the members should work in common and divide the fruits of their labour But with these notions, common to many other social reformers, they united the doctrine that the division of the goods of the community should be in due proportion to the merits or capacity of the recipient Society was to be governed by a hierarchy consisting of a supreme pontiff apostles, disciples of the first second and third order It was not until about this period (1830) that they began to invest these opinions with the form and character of a religion, but shortly after having done so they went into great extravagances There was a disunion among them as to the fittest person to preside in the society, and consequently Messrs Bazard and Enfantin divided, for some time the duties and dignity of the "Supreme Father," as he was termed But on the 19th Nov 1831, Bazard and many others left the society of which Enfantin remained the supreme father Their doctrines and proceedings now became licentious and immoral to the last degree On the 22d Jan 1832 the family was dispersed by the government Enfantin and Rodriguez were tried on various charges and imprisoned for a year The former afterwards collected again a part of the society at Menilmontant, but it broke up for want of funds Some former members of the St Simonian association are now in places of rank and consideration, and others have founded new schools of Socialism and Communism of whom Louis Blanc, Cabet, and Proudhon are the leading names

SALAMANDER *Salamandra* (Gr σαλαμανδρα) The name of a genus of Batrachian reptiles, now limited to the terrestrial species of long-tailed Caducibranchiate Batrachians or those which lose their gills before arriving at maturity but retain their tails This appendage is changed in the progress of growth in the true salamander to a rounded form The female brings forth young which are hatched in the oviduct, and the sexes frequent the water at the season of reproduction *See* BATRACHIA and TRITON

SAL AMMO'NIAC Muriate of ammonia, hydrochlorate of ammonia A compound of 17 of ammonia and 37 hydrochloric acid Its name is derived from the Temple of Ammon, in Egypt, where it was prepared by burning camels' dung it is now largely manufactured in this country *See* AMMONIA

SALEP *See* SALOP

SAL GEM Common salt

SALICA'CEÆ (*Salix*, the principal genus) A natural order of Achlamydaceous Exogens, distinguished by a two valved capsule and numerous seeds tufted with long hairs The genus *Salix* comprehends the plants called osiers, sallows and willows, and is of great economical value, not only for the purposes of the basket-maker, but because several species have a bark which has been found by Davy to contain as much tannin as the oak, and a crystallizable principle called *salicine* has been found by others, which, according to [illegible] distress of a fever with the same, [illegible] and bile The poplars, aspens and abele trees also form a part of this order

SA'LICIN A bitter [illegible] from willow bark It exists [illegible], and a similar substance has been extracted from the bark of the poplar, especially of the *Populus tremula* Its ultimate elements are carbon hydrogen, and oxygen, so that it differs from the vegeto-alkalis in containing no nitrogen

SA'LIC LAW The law of that community of the nation of Franks which inhabited the country between the Meuse and the Rhine —the law of the Ripuarian Franks governing those who dwelt between the Rhine and the Loire The origin of the name Salian, given to this portion of the Franks and their law, is uncertain some derive it from the river Saale, in Saxony, on the banks of which they suppose them to have inhabited before the period of their emigration westward The body of law in question was republished and corrected by Charlemagne in 798 and is still preserved both in the earlier and in the remodelled shape The most celebrated portion of it is contained in the title 62 *De Alode*, where it is declared that "no portion of the inheritance in Salic land (terra salica) can fall to females, but that the whole must pass to the males" What those lands were which are intended by the term Salic, has afforded room for infinite discussion among French antiquaries It is supposed by Ducange that they were those lands which were acquired by Franks at the period of the conquest, and held by military service only But it seems that the exclusion of females was only to take place where males were to be found in the same degree of kindred to the ancestor However this may be, the fundamental law which excludes females from succession to the crown of France received in very early times, the appellation of the Salic law and was [illegible] lawyers to be derived from the [illegible] code It was, indeed a custom prevalent from the earliest times, as we learn from Tacitus among the Germanic tribes It was observed in France under the first race, but the first occasion on which it was publicly canvassed was in 1316, when Jeanne the daughter of Louis Hutin, was excluded from the crown in favour of Philip V her uncle In 1328 it was contested by Edward III, who claimed by a prior title to Philip of Valois if females were admissible, being the son of Isabella sister of Louis Hutin From this pretension arose the wars between England and France which occupied the whole of the following century In 1593 the famous arret of the parliament of Paris was pronounced by which all treaties made to transfer the crown to a foreign dynasty were declared null, as contrary to the 'Salic' and other fundamental laws The same law has been recognized in all countries of which the crown has devolved upon the royal house of France and forms now the foundation of the pretensions of the Infante Don Carlos to the throne of Spain It was also considered as established in those great fiefs of the crown of France which had been granted to princes of the blood by way of apanage, and by this means on the death of Charles duke of Burgundy leaving a daughter only the dukedom of Burgundy proper reverted to Louis XI as a male fief (See *Mem de l Ac des Inscr* vol xx *Meyer's Origines Judiciaires*, *Hallam's Middle Ages*)

SALICOQUES The French term for the family of Macrourous or long tailed Crustacea of which the shrimp (*Crangon vulgaris*) is the type

SA'LIENT (Lat *salio I leap*) In Heraldry, a term used to describe a beast when represented as leaping or springing

SALIENT ANGLE In Geometry and Fortification, an angle of a polygon projecting *outwards* in reference to the centre of the polygon An angle pointing *inwards* is called a *re entering angle* All the angles of any regular figure, as the triangle, square hexagon, &c, are salient

SALIENTIA (Lat *salio, I leap*) The third order in the Mammalogical system of Illiger, including the Marsupial genera *Hypsiprymnus* and *Halmaturus* or the potoroos and kangaroos, whose progression is by successive leaps

SALIFEROUS ROCKS The new red sandstone system of some geologists *See* GEOLOGY

SALIFIABLE BASE This term, which is of frequent occurrence in chemistry is chiefly applied to those metallic oxides which combine in definite proportions with the acids, so as to form distinct salts ammonia, and the vegeto-alkalis are also, upon the same principle, salifiable bases

SA'LII The Roman flamens or peculiar priests of Mars They were twelve in number and were instituted by Numa to guard the *ancile* or sacred shield of Mars They used on solemn occasions to proceed through the city dancing, whence they derived their name (from *salire* to dance)

SALI'VA (Lat) The fluid secreted into the mouth by the salivary glands, its principal use is to lubricate the parts, and to assist in rendering the food of a proper consistency to be swallowed

SALIVA'TION The excessive flow of saliva which is produced by the continuous use of mercury and of some other remedies

SA'LIX (Lat *a willow*), is a genus of plants consisting of numerous species, all either trees or bushes, occurring abundantly in all the cooler parts of the northern hemisphere Some of them, like *S alba*, acquire the dimensions of the largest forest trees, others are lost among the grass with which they grow, as *S herbacea* The [illegible] plants that grow [illegible] are the only trees on Melville Island, [illegible] having

been a willow (*Salix arctica*) Few extend into warm regions, the *Salix babylonica*, or weeping willow, being [illegible] Their timber, when they form [illegible] and unfit for purposes of con- [illegible] sed for turnery, and for coarse in-door purposes Many species have long flexible shoots, and are called osiers, under which name they are extensively employed by the workers in wicker, others are not flexible, but form small trees or rough bushes, named sallows The latter, called *Saules marçeaux* by the French, yield the best kind of charcoal for military purposes, they are all, however, burnt for the preparation of this substance The bark of *S helix fragilis pentandria*, and others, has been found useful in intermittent fevers and as these maladies are most common in the low marshy places where salices abound it has been supposed that they are the means which the Creator has given us for protecting ourselves against such disorders The species intermix very freely, [illegible] and hybrids, which have led botanists to create a prodigious number of false species

SALLY PORTS, in Fortification, are underground passages leading from the inner works to the outward ones, for the troops to sally out They are otherwise called *postern gates*

SA'LMON (Lat salmo) The excellent and highly valuable fish so called in England is the *Salmo salar* of Linnæus, not of Rondeletius Both species exist in our rivers, the latter having been recognizably and accurately defined under the name of *Salmo eriox* or bull trout, which it is to be hoped will be retained for this species, as it will strengthen that the name of *Salmo salar* may have been applied by the older ichthyologist

The normal locality of the salmon is at the mouth or estuary of the larger rivers, which in the season of sexual excitement, they ascend, sooner or later, in the summer months, according as circumstances may influence their coming into breeding condition At first they ascend only so far as the tide wave reaches and retire with the ebb, but as the quantity of roe and milt increases the instinct which teaches the fit locality for oviposition becomes more imperative, and few are the natural obstacles which the salmon does not overcome in its endeavour to reach it

The great value of the fish renders an accurate knowledge of it, under the disguise of its immature form and markings, of the highest importance, but the difficulties which attend the observation of the migratory inhabitants of the water have only very lately been overcome in the present instance The proof that the small Salmonoid fish, called the parr is as many naturalists had suspected the young of the salmon has been elicited by the careful and repeated observations and experiments of Mr Shaw of Drumlanrig of which the following condensed account is taken from the *Transactions of the Royal Society of Edinburgh*

In the river Nith Dumfries the salmon oviposits in the month of January On the 10th of January Mr Shaw observed a female salmon of about 16 lbs weight and two males of at least 25 lbs, engaged in depositing their spawn The spot which they had selected for that purpose was a little apart from some other salmon which were engaged in the same process, and rather nearer the side of the stream, although still in pretty deep water The two males kept up an incessant conflict during the whole of the day for possession of the female and in their struggle frequently drove each other almost ashore and were repeatedly on the surface displaying their dorsal fins and lashing the water with their tails —The female throws herself at intervals of a few minutes upon her side and while in that position by the rapid action of her tail she digs a receptacle in the gravel for her ova a portion of which she deposits, and again turning upon her side she covers it up by the renewed action of the tail, thus alternately digging depositing and covering the ova until the process is completed by the laying of the whole mass an operation which generally occupies three or four days The embryo fish, conspicuous by the two dark eye specks and the vascular vitelline sac, presented some appearance of animation in the ovum on February 26th that is, forty-eight days after having been deposited, and on 8th April, or 90 days after impregnation of the ova, the young were excluded The head is large in proportion to the body, which measures $\frac{5}{8}$ths of an inch in length; the vitellicle is $\frac{2}{8}$ths of an inch in length, and resembles a light red currant, the tail is margined like that of the tadpole, with a continuous fin running from the dorsal above to the anal beneath The vitelline sac and its contents are absorbed by the 30th May, or in about fifty days, until which time the young fish does not leave the gravel The terminal fringe like fin now begins to divide itself into the dorsal, adipose, caudal, and anal fins, and the transverse bars on the sides of the body make their appearance At this period the young salmon measures an inch in length, and is very [illegible] in the shallows of its native stream till the following spring, when it has attained the length of from three to four inches, and is called the "May parr" they now descend into deeper parts of the river, but remain there over the second winter In April, the caudal, pectoral, and dorsal fins assume a dusky margin, the lateral bars begin to be concealed by a silvery pigment, and the migratory dress, characteristic of the salmon fry or smolt, is assumed The fish now begin to congregate in shoals, and to migrate seaward

The full grown salmon averages a weight of between 25 lbs and 35 lbs, but instances are recorded of their attaining to 55 lbs 60 lbs, 70 lbs 74 lbs, and 83 lbs The last-cited weight was that of a female salmon, which came into the possession of Mr Groves, the fishmonger, in Bond Street, about the season of 1821, it was a short fish for the weight, but of very unusual thickness and depth When cut up, the flesh was fine in colour, and proved of [illegible] See FISHERIES

SA'LMONOIDS *Salmonidæ* A family of soft-finned Abdominal fishes, of which the salmon is the type, having their upper jaw formed in the middle by the intermaxillary, and at the sides by the maxillary bones, both of which support teeth, they are also characterized by a posterior small adipose dorsal fin and the body is covered with regular cycloid scales They pass, by almost imperceptible gradations, into the Clupeoid or herring family, with which they have been united by M Agassiz to form a common group termed *Halecoids* Those species of Salmonoids which like the Clupeoids, inhabit the sea, not only approach the land, but ascend the rivers to near their source, in order to deposit their ova.

SALOON, or SALOON (It salone) In Architecture a large state apartment, or, as its name imports, a great hall, or one for the reception of works of art and [illegible] up through two stories of a house *Salon* [illegible] to the reunions of the French capital, which have always exercised considerable influence upon the country in all that relates to fashion, literature, and even politics M Guizot's admirable little work upon the Salons of Paris is well known It was recently well reviewed in the *Journal des Debats*

SA'LOP The prepared root of the *Orchis mascula* It consists principally of a modification of gum, much resembling *tragacanth* with a small quantity of starch, it is sometimes used as an article of food

SALP, *Salpa* (Lat salpa *a stock-fish*) A name applied to a genus of soft shelled or tunicated Acephalous Mollusks which float in the sea, protected by a transparent gelatinous coat, perforated for the passage of water at both extremities

SA'LPINX (Gr σαλπιγξ, *a trumpet*) The Eustachian tube or channel of communication between the mouth and ear

SALT SEIGNETTE Tartrate of potassa and soda See ROCHELLE SALT

SALT (Lat sal Germ salz) This term, though in ordinary language limited to common salt, or sea salt, is applied in chemistry to all combinations of acids with alkaline or salifiable bases The term has also been extended to certain binary combinations of chlorine, iodine, bromine and fluorine with the metals, and these have been called *haloid salts* (from αλς, *sea salt* and ειδος, *form*) inasmuch as modern chemistry has taught us that sea salt belongs to this class Certain definite combinations of the sulphurets with each other have of late been called *sulphur salts* but the former appellation of *double sulphurets* is perhaps, more properly applicable to such compounds

Sea salt is a compound of 1 equivalent of sodium = 24, and 1 of chlorine = 36, its equivalent, therefore is (24 + 36) = 60 and it is a chloride of sodium The circumstances which gave rise to the notion of its containing muriatic acid and soda and being therefore a muriate of soda will be apparent by reference to the article MURIATIC ACID For rock-salt *see* GEOLOGY

The nomenclature of salts has reference to the acids which they contain, *sulphates*, *nitrates*, *carbonates*, &c, implying salts of the sulphuric, nitric, and carbonic acids The termination *ate* implies the maximum of oxygen in the acids, and *ite* the minimum thus the salts of sulphurous and nitrous acids are called *sulphites* and *nitrites* When salts contain 1 equivalent of acid and 1 of base, they are called *neutral salts*, where 1 equivalent of acid is combined with 2 of base they are termed *basic salts subsalts* or *disalts*, and where there are 2 equivalents of acid and 1 of base, the salt is a *sup risalt*, or *bisalt* Thus the terms *subacetate* and *diacetate of lead* are synonymous, so are *supercarbonate* and *bicarbonate of potash* Many salts are *hydrous*, that is they contain a definite proportion of water of crystallization, others are destitute of water and are dry or *anhydrous salts* Some salts attract moisture when exposed to air, and are said to *deliquesce*, others suffer their water to escape and become opaque, or pulverulent these are called *efflorescent salts*

Salt is, next to bread, the most important necessary of life It is one of the most important British minerals,

and is procured in immense quantities, both from fossil beds and brine springs, in Cheshire and Worcestershire Previously to the discovery of the fossil beds during the 16th century, and subsequently a good deal of salt continued to be made by the evaporation of sea water in salt pans, at Lymington and many other places, but the works at these places are now all but abandoned, while not only has the quality of the article in question become greatly improved but instead of being imported as formerly, it is now largely exported The consumption of Great Britain only, exclusive of Ireland, amounts to about 180,000 tons, and [illegible] to about 300,000 tons per year, of [illegible] Canada, the Low Countries, Russia, Prussia and Denmark are the chief consumers Previously to 1823, an oppressive tax of 15*s* per bushel or about thirty times the original cost price of the article, was imposed on salt, but in that year it was reduced to 2*s*, and two years subsequently was totally repealed During the existence of the duty, the retail price of salt was 4½*d* it is now only ½*d* per lb

In ancient Rome, salt was subjected to a duty *vectigal salinarum* (see Burman, *Dissertatio de Vectigalibus Pop Rom* c. 6), and it has been heavily taxed in most modern states The *gabelle*, or code of salt laws formerly established in France was most oppressive From 4000 to 5000 persons are calculated to have been sent annually to prison and the galleys for offences connected with these laws the severity of which had no inconsiderable share in bringing about the Revolution

SA'LIATORY (Lat salto *I leap*) In Zoology the extremities of an animal which by their form and proportions are adapted for leaping are called *pedes saltatorii*, as the hind legs of the kangaroo, cricket &c

SA'LTIGRADES *Saltigrada* (Lat saltus *a leap* and gradi *to walk*) The name of a tribe of spiders which [illegible] by their [illegible] from a distance

SA'LTIRE In Heraldry [illegible] in the form of a cross of Saint Andrew formed by two bends dexter and sinister crossing each other [illegible] (swords, batons, &c) placed in saltire are said to be borne *saltire wise*

SALT MARSH Land under pasture grasses or herbage plants subject to be overflown by the sea or by the waters of estuaries or the outlets of rivers, which in consequence of proximity to the sea are more or less impregnated with sea salt

SALT MINE *See* GEOLOGY

SALT OF LEMONS Binoxalate of potassa is usually sold under this name and is used for the removal of iron-moulds and other stains from linen, it is generally effectual, and does not corrode

SALT OF SORREL Oxalate of potash

SALTPE'TRE (Lat sal *salt* and Gr πετρα, *a stone*, from its being found in certain stony soils) Nitrate of potash An anhydrous salt composed of 1 equivalent of nitric acid = 54 and 1 of potassa = 48 *See* NITRE

SALT, SPIRIT OF *See* MURIATIC ACID

SALT SPRINGS *See* GEOLOGY

SALU'TES In Military and Naval Discipline, an exhibition of respect performed in different ways according to circumstances In the army the officers salute their superiors by dropping the point of their sword In the navy, the usual mode of salutation is by firing a certain number of guns, which is regulated according to the rank or station of the individual (See *Miles's Epitome of the Naval Service of England*, 1841)

SA'LVAGE, in Mercantile Law, is defined to be a compensation to be made by the shipowners or merchant to other persons by whose assistance the ship or lading may be saved from impending peril or recovered after actual loss Salvage may become due—1 On rescue from perils of the sea In this case, the salvor or rescuer has a lien on the goods preserved until a recompence is made him The amount of this recompence may be fixed by a jury, but if the salvage happen at sea, or between high and low water mark, the court of admiralty has also jurisdiction to fix the amount on suit brought, and by 12 Anne, st 2 c 18, and other statutes summary powers for the same purpose are given to inferior officers in certain cases 2 On rescue from the hands of enemies In this case, the old law was, that if a ship was retaken from enemies before it was taken home or condemned by the captor, the original owner could recover her on payment of salvage to the recaptor, but if retaken at a later period, she became lawful prize to the recaptors But by 13 G 2 c 4 s 18, and other statutes the right of the original owner has been extended to all cases of recapture Salvage, on recapture by a king's ship, was fixed, in 1798 [illegible] by a [illegible]

SALVATELLA (Lat [illegible] *I save*) [illegible] terminating in the fingers It was formerly regarded as [illegible] on the health when opened

SAL VOLATILE Carbonate of ammonia The term is often applied to a spirituous solution of carbonate of ammonia flavoured with aromatics

SAMANÆ'ANS, SARMA'NES, GERMA'NES Names given by different classical writers to a sect of philosophers of India Clement of Alexandria derives the name from Gr σεμνος, *venerable* But it is more probably oriental, the word schamman, in India, signifying a philosopher The Samanæans are particularly distinguished by those who mention them from the Brahmins Saint Jerome and Clement of Alexandria represent them as priests of Buddha, and the same name appears in the *Cha-Men* of the Chinese, and *Sammono-Codom* of Siam (*See* BUDDHISTS) There is a memoir on the subject by M de Guignes (*Mem de l Ac des Inscr* vol xxvi See also *Hist de l'Acad des Inscr* vol xxxi, and *Mem* vol xl)

SAMA'RA An indehiscent superior fruit, being a few-seeded indehiscent, dry nut, elongated into wing-like expansions, as in the fruit or "key" of the ash tree, &c From this root is formed the word *samaroid*, expressing a resemblance to a samara

SAMA'RITANS The inhabitants of the city and district of Samaria to the north of Judea The city was the capital of the kings of Israel, and after the captivity of that portion of the Jewish nation a colony of Cuthites, who are supposed to be Scythians, was settled in the country by the kings of Assyria It is stated that they were instructed in the Jewish religion by a priest who was sent to them for that purpose by Esarhaddon, in order to avert the anger as was supposed of the god of the country The Samaritans professed belief in the Pentateuch only but no idolatrous practices are imputed to them, and it was probably their spurious origin which excited against them the jealousy and affected contempt of the Jews to which many passages of the New Testament so pointedly refer

SA'MIAN EARTH and STONE A species of marl from the island of Samos

SA'MSON'S POST A strong pillar resting on the kelson and supporting a beam of the deck over the hold, and thus acting to keep the cargo in its place Also a temporary or moveable pillar carrying a leading block for various purposes

SA'MUEL BOOKS OF Two canonical books of the Old Testament The first twenty four chapters of the first book contain all that relates to the prophet Samuel himself beginning with the government of Eli The second book, together with the remainder of the first carries on the history of the Jews to the death of David It is traditionally said that the prophet Samuel composed the first part, and the prophets Gad and Nathan the remainder

SANCTIFICATION, in Theology denotes the state of those Christians who having lost the inclination to vice have become pure and holy, and wholly devoted to works of goodness This state is produced by the special operation of the Holy Ghost and ensues upon *justification*, which see

SA'NCTUARY (Lat sanctus *holy*) The innermost chamber of the tabernacle and in after times of the temple among the Jews in which was kept the ark of the covenant and which was regarded as the especial residence of the Most High It is also called the Holy of Holies and was never entered except once a year, and then only by the high priest on the day of the great expiation of the sins of the people For the mystical signification of this act, see Hebr ix 24

By the Roman Catholics the part of the church immediately round the altar is called the sanctuary, which is supposed in many respects to bear an analogy to that of the Jews

From the time of Constantine downwards, certain churches have been set apart in many countries to be an asylum for fugitives from the hands of justice This seems to have been originally intended only to prevent sudden violence and to give time for the regular administration of the law and perhaps in the case of certain delinquencies for the intercession of the church But in England, particularly down to the Reformation, any person who had taken refuge in a sanctuary was secured against punishment if within the space of forty days he gave signs of repentance and subjected himself to banishment

SAND (Germ) Finely divided silicious matter constitutes common river and sea sand, particles of other substances are often blended with it, and sometimes it becomes calcareous from the prevalence of carbonate of lime

SA'NDALS [illegible] Jews, Greeks, and [illegible] with a hollow part at one extreme, to embrace the ancle and leave the upper part of the foot bare Originally sandals were made of leather, [illegible] articles of great luxury, being [illegible] or other precious stuff, and most beautifully ornamented

SANDARAC The resin of *Callitris quadrivalvis* is [illegible] powder of this resin is sometimes used under the name of *pounce*, to prevent ink from sinking into paper

SANDEMANIANS In Ecclesiastical History the [illegible] Robert Sandeman, who published [illegible]

in 1757 in a series of letters They are of a highly Antinomian character, and their distinguishing opinion is well expressed in Sandeman's epitaph, where "the ancient faith," for which he "long [illegible] is said to be "that the bare work [illegible] out a deed or thought on the part of man, is sufficient to present the chief of sinners faith according to them being only a simple assent to the testimony concerning the Redeemer The real founder of the Sandemanians was John Glass, the father-in-law of Sandeman The adherents of the former have retained the name of Glassites, but are confined entirely to Scotland, from which church their founder originally dissented, whereas the followers of Sandeman have extended to England and America as well as Scotland This sect has never been numerous, and it is now, we believe, nearly extinct

SA'NDERLING The name of a small wading bird, a species of *Tringa* (*Tr arenaria* Ill) which frequents many of our shores, but is not a plentiful bird

SANDIVER The impurities which collect upon [illegible] sion in the furnace are so called

SA'NDPIPER A name applied to different species of the genus *Tringa* but properly restricted to the *Tringa hypoleucos* of Linnæus, which is the type of the subgenus *Totanus*

SA'NDSTONE Stone composed of agglutinated grains of sand, which may be calcareous or siliceous *See* GEOLOGY

SA'NGIAC A Turkish officer, governor of a sangiacate, or district forming part of a pachalic There were two hundred and ninety such districts in the Turkish empire before the recent losses of territory on the side of Greece and the Caucasus

SANGUISO'RBEÆ (from the name of the genera) A [illegible] ubby Exogens, usually combined with *Rosaceæ* as a sub order, but apparently distinct, on account of the constantly apetalous flowers, indurated calyx, and solitary or almost solitary carpels Their general character is that of astringency Burnet, the *Sanguisorba officinalis*, is sometimes grown as a pasture plant

SANGUISU'GES *Sanguisuga* (Lat sanguis *blood*, and sugo *I suck*) The name of a family of Hemipterous insects including those which suck the blood of animals also applied to a family of Abranchiate Annelidans of which the leech (*Sanguisuga medicinalis* Sav) is the type

SA'NHEDRIM (Heb) The highest judicial tribunal among the Jews consisting of seventy one members, including the high priest Its origin is referred by some writers to the institution by Moses of a council of seventy persons on the occasion of a rebellion of the Israelites in the wilderness (See *Milman's Hist of Christianity* i 339 &c)

SA'NIES (Lat) A thin, unhealthy, purulent discharge from wounds or sores

SANSCRIT The learned language of Hindostan The literal meaning of the word Sanscrit is *polished*, and it is used by grammarians in the sense of "regularly inflected or formed" (*Colebrooke's Remains*, vol ii p 2) And it is a question whether in its present form it was ever a *spoken* language although the theory of Schlegel is, that it was imported by the conquering or Brahminical caste It constitutes the most ancient literature of the Hindoos, and is radically connected with the various dialects of Hindostan so that they may be regarded as more or less deflected from it Colebrooke however is of opinion that 'there seem [illegible] doubting that it was once universally [illegible], and he says that 'those who are learned in Sanscrit at the present day, deliver themselves with such fluency as is sufficient to prove that it may have been spoken in former times with as much facility as the contemporary dialects of the Greek language, or the more modern dialects of the Arabic tongue" Nine tenths of the Hindustani' it is said may be traced to the Sanscrit, the remaining tenth is thought to be perhaps founded on the old "Hindi" language, which Sir W Jones thought anterior to it, [illegible] have been introduced by conque[illegible] age In the Hindoo drama, the gods and saints are made to speak in Sanscrit, while women, benevolent genii &c speak another dialect, and the lower personages a third (See also *Professor Wilson's Hindoo Theatre*, Introduction) The attention of European inquirers was directed to the Sanscrit and its cognate language by Sir William Jones Since his time the study has made great progress in England, where it has been especially furthered by the labours of Houghton, Wilkins, and Wilson, and more [illegible] re Frederic Schlegel (*Sprache, &c der Indier* 18[illegible] was the first to excite the spirit of investigation He was followed by his brother A W Schlegel (who edited the *Bhagavat Gita*, translated into English by Mr Wilkins), and many others Among recent German philologists, Bopp deserves the highest name for his researches in this direction (See *Quart Rev* vol xlv &c , where it is said that in the course of thirty years nearly 70 works on and translations from the Sanscrit have appeared) The intimate connection of Sanscrit with the principal varieties of the Caucasian speech and especially the Zend, Greek and Sclavonic, has [illegible]

SANSCULOTTES [illegible] A name first given in ridicule to the Jacobins and other extravagant patriots in the French Revolution, and afterwards assumed by them as a title of honour, like the old nickname of "gueux" *the* [illegible] which the revolters of the Netherlands p[illegible]ed themselves We have never been able to ascertain the real history of this famous appellation but we believe that Camille Desmoulins was one of the first who rendered it popular his blasphemous application of it at his trial is well known It acquired great celebrity after the "journee" of the 20th June, 1792 when one of the principal standards borne by the insurgents was a pair of black breeches, with the inscription, "Tremblez, tyrans! voici les Sans-Culottes" Subsequently the French nation adopted it with the utmost gravity in the original Republican calendar The five supernumerary days (the twelve months containing thirty a piece) were named Sansculottides, and were festivals dedicated to 'Genius," "Labour' "Actions," 'Rewards' "Opinion" In Leap years there was to be a sixth Sansculottide, the festival of the Revolution Future generations will find some difficulty in believing the narrative of the ludicrous farces with which national caprice interspersed the [illegible] of the French Revolution

SA'NTALIN The colouring matter of red sandal or saunders wood from which it is separated by digesting the rasped wood in alcohol, and then adding water to the tincture, it falls in the form of a bright red precipitate, soluble in alcohol and in alkaline solutions

SA'NTONIN A proximate vegetable principle, obtained from the seed of the *Artemisia santonica* It is white, crystallizable bitterish, and very little soluble in water but more so in alcohol

SAP The fluid which is absorbed by the roots from the earth then sent upwards into the stem and afterwards conveyed from the leaves, where it is assimilated and altered to the bark In its crude state it consists of little except water holding earthy and gaseous matter in solution especially carbonic acid, but [illegible] through the tissue of the stem it dissolves the [illegible] meets with in its course and thus acquires new properties, so that by the time it reaches the leaves it is entirely different from its state when it first enters the root The course taken by the sap in its passage through the stem is by the whole of the tissue included within the bark provided it is all permeable but as in many plants the central part of the stem becomes choked up with solid matter deposited in the tissue, it usually happens especially in trees that the course of the sap is confined to the outer part of the wood hence called sapwood It is not certainly known through what kind of tissue the upward motion of the sap takes place but it is probable that it is carried onwards through all the tubes and vessels of the wood and their intercellular passages The dotted vessels of the wood seem more especially destined to fulfil this office when the sap is in rapid motion, but as they afterwards become empty while the ascent of the sap continues there can be no doubt that the woody tubes or pleurenchyma offer the most constant means by which the sap is conveyed In Fortification, *sap* is a trench or approach made under cover of gabions, &c

SAPAN WOOD A dye wood produced by certain species of (*Cæsalpina* It has long been used in India, and resembles Brazil-wood in its colour and properties

SAP GREEN The inspissated juice of the berries of the buckthorn (*Rhamnus catharticus*) It is used by [illegible] pigment

SAPHENA [illegible] *ible*) The large vein of the leg which ascends over the external ancle

SAPINDA'CEÆ (Sapindus one of the genera) A natural order of exotic trees and shrubs, the larger part of which occur in South America They usually have compound leaves and inconspicuous flowers resembling those of European maples, and many of them are climbing plants The order is poisonous in various degrees, nevertheless, the arillus of [illegible] fruit in Africa and the West [illegible] *akee* The most singular property observed in the order is that of having an astringent quality, and forming a lather when agitated in water whence the name of the ty[illegible] sapo, *soap*

SAPONIN A peculiar substance contained in the root of the *Saponaria officinalis* It is the cause of the lather which that root forms with water

SAPOTA'CEÆ (Sapota, the name of one of the species) are a small natural order of Exogenous trees, inhabiting the West Indies and other tropical countries They in some cases produce eatable fruits, known by the colonial names of [illegible] apple Surinam medlar, &c Their juice is acrid like milk, and unlike the secretions of most lactescent families of plants may be used for alimentary purposes The fruit of some

yields a greasy substance; whence one of them, *Bassia*, ha[illegible] or butter tree in Africa

SA[illegible] a term applied to the *cyanite*

SAPPERS AND MINERS, ROYAL The name given to the non-commissioned officers and privates of the corps of Royal Engineers Their duties consist in building fortifications, in executing field works, and in performing similar operations under the direction of their superior officer They were first embodied at the end of the American war, under the name of "Royal Military Artificers," and after being formed into independent companies, were stationed at Portsmouth, Chatham and some other military and naval arsenals In 1812 they received their present designation, and at the same time, an institution was formed at Chatham for instructing the men in all the duties of military engineering This corps consists of 13 companies, each of 68 men some of which are employed in the colonies, others in the mechanical operations connected with the survey at present carried on by the Board of Ordnance, and others remain at Sandhurst and Addiscombe, to execute the various military works undertaken for the instruction of the cadets of these seminaries

SA'PPHIC The name given to a species of verse, from Sappho the famous Greek poetess by whom it was said to be invented It consists of eleven syllables of five feet, of which the following is a plan —

$$-\cup|-\cup|-\cup\cup|-\cup|-\cup|$$

This measure was afterwards introduced into Latin, and received as the reader is aware great improvements in the hands of Horace and Catullus The rules for the composition of Greek are much less strict than those for the composition of Latin sapphics The sapphic strophe consists of three sapphic verses followed by a *versus Adonicus*, or Adonian verse, which see This species of verse has been successfully imitated in German and English

SA'PPHIRE (Gr σαφειρος) A very hard gem, consisting [illegible] It is of various colours [illegible] called the sapphire, the *red* the oriental ruby, the *yellow* the oriental topaz

SAPRO'PHAGANS, *Sarcophaga* (Gr σαρξ, *decomposing matter* and φαγω *I eat*) The name of a tribe of Coleopterous insects comprising those which feed on animal and vegetable substances in a state of decomposition

SA'PWOOD is the external part of the wood of Exogens which from being the latest formed is not filled up with solid matter, or with the colouring principles which are deposited in wood after a certain time For these reasons sapwood is that through which the ascending fluids of plants move most freely, and not being solidified by the earthy and other substances eventually incorporated with wood, is quickly decomposed when exposed to the action of air and moisture Hence for all building purposes the sapwood is brought to be removed from timber The sapwood or unsolidified wood of all trees is much the same in its power of resisting decomposition, that of the oak and lignum vitæ perishing as quickly as poplar and other valueless timber, and chemists have ascertained that if the hardest heartwood is reduced [illegible] condition of sapwood by the abstraction of [illegible] solidification all those properties which give heartwood its value are destroyed

SA'RABAITES A kind of oriental monks or cœnobites, described by Cassian in his *Institutions*, and supposed to be the same with those called Remoboth by St Jerome (Epist xviii) and Faustus and characterized as vicious and ignorant They seem to have been seceders from the ordinary monastic life who formed a species of society rather resembling that of the Moravians of the present day, and without community of goods (*Waddington's Hist of the Church*, ch xix)

SA'RABAND (Span) In Music, a composition in triple time very similar to a minuet When denoting music for the dance, it is to the same measure which usually terminates when the beating hand rises being thus distinguished from the *courant*, which ends when the hand falls

SARCOCE'LE (Gr σαρξ *flesh*, and κηλη, *a tumour*) A tumefaction of the testicle

SA'RCOCO'LLA (Gr σαρξ and κολλα *glue*) The concrete juice of the *Penæa sarcocolla*, a plant growing in the northern parts of Africa It somewhat resembles gum arabic, but it is soluble in alcohol, and its aqueous solution is precipitated by tannin

SA'RCOLITE (Gr σαρξ and λιθος, *a stone*) A variety of zeolite of a flesh colour

SARCO'LOGY (Gr σαρξ, and λογος *a discourse*) The history or doctrine of the fleshy parts of the body

SARCO'PHAGUS (Gr σαρξ and φαγω, *I consume*) In Antiquities, a stone receptacle for a dead body [illegible] lapis Assius, stone of [illegible] have been prepared [illegible] antiquity [illegible] this purpose, on account of its supposed property of corroding dead bodies, so as to consume them entirely in forty days, which, together with other incredible qualities, is ascribed to it by Theophrastus and Pliny. One of the most celebrated specimens of [illegible] rt is the great sarcophagus taken by the B[illegible] in 1801, commonly called that of Alexander it is deposited in the British Museum. Dr Clarke, the traveller, wrote an essay to prove that the Macedonian conqueror had really been entombed in it, but this opinion seems unfounded

SARDO'NIC LAUGH A convulsive laugh, said to have been first observed in those who ate the herb *sardonia*, which grows in Sardinia

SA'RDONYX (Gr) A reddish yellow or orange coloured chalcedony or carnelian, it is often blood red by transmitted light

SA'ROS An ancient astronomical period, the origin and exact length of which are unknown, though they have been the subject of much disputation George Syncellus, who wrote in the [illegible] a passage from Berosus, reported [illegible], which mention is made of three periods, — the *Sossos*, the *Neros*, and *Saros*, and the Saros is stated to be 3600 years According to Lalande (*Astronomie* § 1572), Syncellus also cites Ananus and Panodorus, who assigned the lengths of these periods as follows — the Sossos, 60 days, the Neros, 600 days, and the Saros, 3600 days or 9 common years 10 months, and 11 days Legentil after Fugeres, supposes the Saros to be 10 years, Freret supposed it to be 10⅓ years, Giraud 360 Julian months which make 3711 lunations, or 31 years Suidas states that the Saros was a period of lunar months equal to 18⅓ years, and Halley (*Phil Trans* No 194) adopting the same notion and supporting himself by a passage in Pliny, supposes it to be identical with the lunar period of 18 years, or rather of 223 lunations which corresponds almost exactly to 242 *nodical* revolutions of the moon (*see* MOON), and consequently brings back the eclipses in the same order But Goguet (*Origine des Loix, &c*) remarks, that the statement of Suidas is not supported by that of any ancient author and that there is no reason to suppose that Pliny in the passage in question had the Saros in view By some authors the Saros has been confounded with the *Metonic cycle*

SARRACENIACE (Sarracenia one of the genera), are curious herbaceous plants inhabiting the bogs of North America and having their leaves hollowed out into tubes or pitchers open at the upper end Their flowers are something like those of *Papaveraceæ*, to which they are doubtless allied

SARSAPARI'LLA The root of the *Smilax sarsaparilla* Several varieties of this drug are imported from South America that which is now generally preferred is the reddish fibrous root known in the market under the name of *Jamaica* or red sarsaparilla What is termed *Lisbon* sarsaparilla is less fibrous, and more mealy and white in the interior This root, though long employed in medicine seems only lately to have been properly estimated It was formerly regarded as a specific in syphilis but this opinion is now given up, and it is used as a powerful and valuable alterative medicine in many disorders of debility, but more especially in those cachectic habits which present symptoms formerly mistaken for venereal — such as pains of the bones nodes of the periosteum loss of strength and flesh and other characters of what is sometimes called a broken constitution In these cases a course of sarsaparilla has often effected a cure especially if resorted to in time, when all other remedies and more especially mercurials, had failed It must be taken in pretty large doses that is, in quantities not less than an ounce to an ounce and a half a day and persevered in for six eight, or ten weeks, or a quantity of extract or syrup or other preparation equivalent to that weight of the dried root a concentrated liquid extract and a syrup, are now prepared, which are the best forms They are apt to disagree with weak stomachs but generally, by proper management and perseverance this difficulty may be got over Where it agrees, the strength is gradually regained the pains and other symptoms abate and vanish, and the only other effect observed is, either that the bowels are rather more open than usual, or the flow of urine or the perspiration increased

SARTO'RIUS MUSCLE (Lat sartor, *a tailor*) A muscle of the thigh attached at the upper extremity to the edge of the anterior superior spinous process of the ilium and at the lower to the inner side of the head of the tibia It is concerned in bending the leg obliquely inwards and in crossing the thighs, thence called sartorius, or the *tailor's muscle*

SASH (Fr chassis) In Architecture, a piece of framing for holding the squares of glass in a window It is of two sorts — viz that called the French sash, which is hung like a door to the sash-frame, and that in which it moves vertically by a weight on each side, to which it [illegible] running over pulleys at the top of the sash-frame When in a window both the upper and lower sashes are moveable the sashes are said to be double hung, and single hung when only one of them moves

SASH-FRAME In Architecture, the wooden frame into which the sashes are fitted

SA'SSAFRAS The wood of the *Laurus sassafras*, a native of North America, and growing abundantly upon the banks of the river Sassafras whence its name It has a warm aromatic flavour and the decoction is directed to be sparingly used in cases of stone in the bladder (hence its name has by some been derived from saxum, *a stone*, and frangere, *to break*) It has also been extolled as an alterative and in rheumatic and cutaneous affections but is now scarcely ever employed except as an ingredient in the compound decoction of sarsaparilla

SA'SSOLIN Native boracic acid, from the vicinity of Sasso in Florence

SA'TAN A Hebrew word signifying enemy or adversary, and used as such, without any reference to the Evil Power itself, in one or two passages of the Old and New Testament The equivalent term in Greek for this word is διάβολος, literally *one who accuses or calumniates*, whence the word *devil* is derived

SATELLITE (Lat satellites *an attendant*), in the Solar System, is the attendant of a planet, a body which revolves about the planet, and follows it in its orbit round the sun Hence the satellite is sometimes called a secondary planet, or merely a *secondary*, the planet about which it revolves being the *primary*

The planets which are accompanied by satellites are the Earth, Jupiter, Saturn, Uranus, and Neptune The Earth has one satellite, namely, the Moon Jupiter has four, Saturn seven, Uranus six, and Neptune probably two For the Earth's satellites see MOON

Satellites of Jupiter — These bodies were first observed by Galileo and their discovery followed immediately that of the telescope With a telescope of ordinary power they may be seen (unless when eclipsed by the shadow of the planet, or concealed behind its disc), on any clear [illegible] the planet and arranged [illegible] h they appear to oscillate backwards and forwards with different velocities and performing unequal excursions, so that their arrangement with respect to the planet or *configurations* are constantly changing Sometimes they are observed to pass before Jupiter, in which case they cast a shadow on his disc like a small round black spot, whence they are inferred to be opake bodies illuminated by the sun at other times they pass behind the planet and are concealed from our view, and all these phenomena occur in regular order and, with respect to each satellite, after the same intervals of time

An attentive examination of the apparent motions of the satellites soon renders it evident that they revolve round Jupiter in small but unequal orbits the planes of which are nearly coincident with that of the equator of the planet which is inclined in a small angle to the ecliptic Observation also shows that the motions of the satellites about their primary are regulated by the same laws as are observed by the planets in their revolutions round the sun The orbits are ellipses of small eccentricity, of which Jupiter occupies one of the foci, the areas described by the radius vector are proportional to the times of description, and the squares of the periodic times are respectively proportional to the cubes of the mean distances Thus Jupiter and his satellites form a system in miniature entirely analogous to that of the sun and planets

The satellites [illegible] as the *first second*, *third*, and *fourth*, [illegible] respective distances from Jupiter the first being that which is nearest the planet The following table shows their mean distances (in terms of the equatorial radius of Jupiter) times of revolution, masses as compared with Jupiter, and diameters in English miles —

Satellite	Mean Distance	Periodic Time	Mass	Diameter in Miles
		Days		
1	6 04855	1 76914	0 000017	2508
2	9 62347	3 55118	0 000023	2068
3	15 35021	7 15455	0 000088	3377
4	26 99835	16 68877	0 000043	2890

The mean distances are found by measuring the angular distances from Jupiter at the time of the greatest elongations, and the masses were determined by Laplace from the theory of gravitation On account of the minuteness of their apparent diameters it is difficult to determine their true diameters with precision The second, which is the smallest, at the mean distance of the planet subtends an angle of rather less than 1″, and the third, which is the largest an angle of less than 1 5″ (*Memoirs Royal Astronomical Society*, vol iii p 301)

Small as the satellites of Jupiter are in comparison of the primary planet, they are in themselves bodies of considerable magnitude As compared with the Earth their diameters may be approximately stated as follows —That of the first rather less than $\frac{1}{3}$, of the second $\frac{1}{4}$, of the third $\frac{1}{3}$ and of the fourth rather more than $\frac{1}{3}$ The third is about the size of Mars These four moons must present to the inhabitants of Jupiter a spectacle of endless variety

Although their orbits are doubtless elliptical, the eccentricities of the first and second are so small as to be insensible to observation That of the third is sufficiently sensible, and that of the fourth still greater but [illegible] The direction of the motions in [illegible] orbits is from west to east, according to the general analogy of the planetary system, [illegible] and as the [illegible] which [illegible] moon, each of them revolves about its axis in the same time as that in which it completes a sidereal revolution about the planet

From the preceding table it will be seen that the periodic time of the first satellite is nearly half of that of the second, and that of the second nearly half of that of the third The mean angular motions of these three satellites, therefore, form very nearly the progression 1, 2, 4, so that the mean motion of the first satellite, added to twice that of the third is very nearly equal to three times the mean motion of the second Another equally [illegible] that the mean longitude of the first, *minus* [illegible] of the second, *plus* twice that of the third, is always very nearly equal to two right angles. These two results subsist equally in respect both of the sidereal and synodical motions and longitudes, and it follows as a consequence of the last, that for a great number of years at least the three first satellites cannot be eclipsed at the same time, for in the simultaneous eclipses of the second and third the first will always be between the Sun and Jupiter and *vice versâ*

On account of the shortness of the periods of revolution, the eclipses of the satellites (especially of the first) take place very frequently, and they are phenomena of considerable importance in astronomy, from their affording signals by means of which the differences of terrestrial longitudes are determined, in the same manner as in the case of an eclipse of the moon The method however, is not capable of the same precision as is afforded by lunar observations

The eclipses of Jupiter's satellites have also an historical interest from having led Rœmer to the important discovery of the successive propagation and velocity of light When Jupiter is [illegible] with the sun, and his distance from the earth consequently *less* than his distance from the sun by the whole radius of the earth's orbit the eclipses are observed to happen about 16m 26sec earlier than they happen when the planet is in conjunction and its distance from the earth *greater* than its distance from the sun by the same quantity This phenomenon can only be explained [illegible] that light occupies 16m 26 sec in [illegible] orbit, and consequently 8m 13 sec in coming from the sun to the earth, which gives a velocity of about 192 000 miles in a second The theory, with its consequences, has been amply confirmed by Bradley's discovery of the aberration *See* ABERRATION

Satellites of Saturn — Saturn as already mentioned, is accompanied by eight satellites at present known One of them, by far the largest was discovered by Huygens in 1655 Four others were first seen by Dominic Cassini about twenty years afterwards, the two interior ones, which can only be seen under very peculiar circumstances and with the aid of the most powerful telescopes, were discovered by Sir William Herschel, in 1789, and an eighth was discovered by Mr Lassell in England and Mr Bond in America in 1848 Their theory has been little studied but the third law of Kepler is found to be preserved The planes of their orbits coincide nearly with that of the ring, with the exception of the seventh, which makes an angle with that plane of about 3 or 4 degrees The orbit of this last is sensibly elliptical, the eccentricity being 049 Owing to the obliquity of the orbits to Saturn's ecliptic, the satellites are not eclipsed in every revolution but (with the exception of the two interior ones) only fall into the shadow of the planet at the times when the ring is seen from the earth nearly edgewise The following table shows their mean distances from Saturn in terms of the equatorial radius of the planet, and their periods of sidereal revolution —

Satellite	Mean Distance	Periodic Time		
		d	h	m
1	3 351	0	22	38
2	4 300	1	8	53
3	5 284	1	21	18
4	6 819	2	17	45
5	9 524	4	12	25
6	22 051	15	22	41
7				
8	64 359	79	7	53

[illegible] just to skirt the exter[illegible]th, like the satellites of [illegible] ges in the intensity of

its light, whence it is inferred that it revolves on its axis in the same time in which it completes its orbital revolution

Satellites of Uranus —Sir John Herschel remarks that [illegible] obtain a sight of, of any in our system Their existence was first discovered by Sir William Herschel, who suspected their number to be six, but he was only able to obtain micrometrical measures of the distance of two of them Of the remaining four, two were rediscovered in the year 1847, one of them almost simultaneously by Mr Lassell and M Otto Struve, the other by Mr Lassell alone In the year 1851, Mr Lassell announced the discovery of two others, but they do not appear to have been seen by any other observer See Sir J Herschel's *Outlines of Astronomy*, and *Monthly Notices of the Royal Astr Soc*, vols x and xi) Sir W Herschel's observations are given in the *Phil Trans* for 1788 and 1797, and again in the vol for 1815 They were made between the years 1787 and 1798, and from the latter period until 1828 the planet having been unfavourably situated, these satellites remained unobserved, and had even fallen out of notice Between the latter year and 1834 a series of observations, recorded in the *Memoirs of the R Astr Society*, vol viii, were made by Sir John Herschel for the purpose of verifying his father's results, which with respect to two satellites, were confirmed in the amplest manner The periodic times deduced from his observations are respectively 8 d 16 h 56 m 31 3 sec, and 13 d 11 h 7 m 12 6 sec The orbits are nearly circular and almost perpendicular to the ecliptic, being inclined to that plane at an angle of 78° 58′, and what is extremely remarkable, as contrary to the otherwise unbroken analogy of the solar system, the motions of the satellites in their orbits are retrograde from east to west

The [illegible] of the orbits have remained sensibly unchanged since their discovery, including a space of time during which Uranus has performed four-fifths of a revolution round the sun Whenever the earth passes through the planes of the orbits, the latter are projected into straight lines or very long ellipses, and at such seasons the satellites become invisible

SATIN A closely woven silk generally dressed with gum, especially when intended for ribands dresses &c

SATIN SPAR A fibrous variety of carbonate of lime assuming a silky appearance when polished

SATIRE in literature has been defined a representation of vice, or of the ridiculous either in the form of discourse or put in dramatic action The word satire must not be confounded as to its etymology with the satyri of the Greeks which were burlesque dramatic pieces in which the persons represented a band of satyrs (*See* DRAMA) The modern word satire Latin satira is derived from the *lanx satura* —a dish full of various fruits and herbs which was carried in procession at the feasts of Ceres Whence the word came to signify a poem full of miscellaneous matter without orderly method, and in this sense only it was probably employed by Lucilius, the first writer of satires although the title so usurped by him was afterwards only applied to poems of a similar character with his own viz containing moral reflection, interspersed with critical touches directed against real or imaginary persons

Satire in the literary sense of the word, as designating a species of composition, is usually confined to a species of poetry, but prose works, of which the contents are of a satirical character, are often comprehended under the same appellation Dramatic writings also are not satires in the stricter sense of the word although their contents be of a satirical character According to their subjects, satires are divided into political and moral, and these again severally subdivided into personal and general Political satires, in almost every language have been nearly confined to prose, the moral satire alone has found its appropriate vehicle in verse The only Greek satirist, of whom any fragments have reached us, was Archilochus, and his attacks were evidently directed against individuals [illegible] essed a vein of satirical power, both [illegible] and ludicrous strain, which has never been surpassed, and his dramas contain not only sarcasms on individuals, but also political and ethical lessons of the highest value But the moral satire, properly so called, was invented by the Romans, not only in form, but in substance also, and by them carried to perfection, and it is remarkable that the only species of Roman poetry which has any degree of originality is that which would seem to have accorded the least with the grave and austere turn of the genuine Roman character

Of the three Roman satirists whose works have reached us, Horace, the earliest, excels in conveying moral and prudential lessons in beautiful and precise language, in light allusions to the follies or excesses of his time; sometimes, though rarely assuming the comic character, but [illegible] the indefinable quality termed [illegible] shown by any other classical writer, with the exception of Aristophanes. Whether the various personages introduced by Horace, for the most part rather as examples to be shunned than as individuals to be held up to laughter or contempt, were intended to represent to his readers, by allusions now undiscernible, actual characters known to them, is a matter not easily ascertainable The same may be said with respect to Juvenal, whose selected victims are for the most part exalted or notorious personages of the ge- [illegible] own; and it is not [illegible] en conjectured, that their names were intended to conceal those of cotemporaries of his own Juvenal, without either wit or humour, excels in the deep tones of moral indignation befitting the scandalous excesses of the times in which he lived his exalted notions of virtue, and even of sanctity, are so far superior to the ordinary standard of moral excellence to be drawn from classical writers, that it has been conjectured that he, as well as Persius, had made some acquaintance, either directly or indirectly, with the lessons of Christianity Persius, although he occasionally rises into very elevated flights of poetry, does not afford many examples of the peculiar excellences of the satirist

In the literature of the modern nations, the fate of satire has been similar to that which has befallen many other species of composition The name and form of the ancient satire have been preserved by many writers, who have produced, for the most part, little besides cold or exaggerated imitations of antiquity But the true spirit of satire in its moral beauty, its humour, and its delicate irony has been inherited by others, who had too much originality of thought to tie down their genius to an antiquated form of writing Thus in France Boileau is or was generally cited as the prince of satirists his satires are closely formed on the model of Horace and are elegant and correct in style Besides him Regnier and many other writers have adopted the same line But the true satirists of France are Rabelais in his inimitable romances, Montaigne the essayist, endowed with much of the delicate and harmless sarcasm of Horace, and in later times, Voltaire So in England, although we possess satirists of considerable merit who have adopted the form of the ancient satire our true national satirists are to be found among our essayists and novel writers Bishop Hall in the reign of Elizabeth, and Donne in that of James published collections of satires directed partly against the actual follies or vices of their times, but too closely paraphrased for the most part from the Latin to admit of much original observation Withers among our early satirists, is the only other writer who is at all remembered Among our modern poets Pope founded his satires on the model of those of Horace and of some of his English predecessors His style and train of thought were rather French than Roman His works of this description are, in point of form mere imitations, but they are admirable for their point and the beauty of the verse and not unfrequently contain pungent personal allusions without which unfortunately a professed satirist can attract little notice and produce little effect Johnson in his two well-known imitations of Juvenal, Churchill and Young are the latest writers of any note who have composed in the form of the ancient satire But of all these writers, not one possesses a genuine or national character, except perhaps Churchill while Swift, Fielding, &c are in our literature, what Horace and Juvenal were in those of the Romans, —the painters of [illegible] and the representatives of public opi [illegible] ecting them The literary satire may perhaps be mentioned as a separate species of composition containing either rules of writing, or critical observations on the defects of individual writers Some of Horace's satires and epistles (as well as his *Ars Poetica*) [illegible] others partially, to this class, and h [illegible] series of similar productions down t [illegible] *'s and Scotch Reviewers* of Lord Byron (See as to the Roman satire, *Quart Rev* vol lii, *Mem de l'Ac des Inscr* vol xxxix)

SATRAP The title given by the Greek writers to the governors of provinces under the Persian kings before the conquests of Alexander The satrapies of that empire are enumerated by Herodotus The name is thought by some to be derived from a Persian word, signifying "fixed star" (*Mem de l'Ac des Inscr* vol xxxi)

SATURDAY The seventh day of the week, held by the Jews as their sabbath It was dedicated by the Romans to Saturn, whence its name

SATURN An Italian deity having many points of similarity with the Grecian Kronos (Κρονος), with whom he is accordingly frequently identified He seems to have been [illegible] of which his wife Tellus, Ops, [illegible] presided over tillage, of which the sickle he carried was the symbol The treasury at Rome was in his temple

The Grecian Kronos was the youngest son of Heaven and Earth, and the father of Jupiter, Juno, Neptune, and

Pluto He usurped the sovereignty and was in his turn deposed and imprisoned by Jupiter His reign was celebrated by the ancient poets as the golden age

The whole history of Saturn is probably allegorical He married Rhea with whom he [illegible] (*Rhea*, *flow*, the supposed flowing of the waters for the production of life), Queen of Heaven, by whom luminaries [illegible] Rhea flowing), and of his devouring his own progeny, are corroborative of this conjecture

Niebuhr regards Saturn and Ops as the god and goddess of the earth, its vivifying and its receptively-productive powers (*Rom Hist* vol i p 66, Cambr transl) Creuzer makes Saturn the great god of nature, in many respects assimilated to Janus He is the god who suffices for himself the god who is satisfied with his own powers (*Symbol*, par Guigniaut, vol iii p 499) Hence the derivation of the name from the Latin satur, *full, satisfied*

SATURN One of the principal planets in the solar system, and the sixth in the order of distance from the sun Though less brilliant than Venus and Jupiter, Saturn is still a conspicuous object in the heavens and [illegible] tracted the attention of astronomers [illegible] of the science

Saturn revolves at the distance of about 890 millions of miles from the sun, the mean radius of his orbit being 9 538786 times that of the earth's orbit, and the period of his sidereal revolution is 10759 2198171 mean solar days, or about 29½ years The orbit is nearly circular, its eccentricity being only 0 061505 (half the major axis being unity) and it is inclined to the ecliptic in an angle which, at the beginning of the present century, was 2° 29′ 35″ 7, and is subject to a decrease of 0 155″ annually

The diameter of Saturn at his mean distance from the earth subtends an angle of about 16 2″, whence his true diameter is 9 982 times that of the earth or about 76068 miles, and consequently his volume is nearly a thousand times that of the earth From the theory of his perturbations, his mass compared with that of the sun is found to be 000284738, whence his density is inferred to be to that of the sun as 95 to 100, or about ⅛th of the density of the earth

From the observation of certain dark spots on his surface, Saturn is found to revolve about an axis in 10 hours 29 m 16 8 sec This rapid rotation of so large a body gives rise to a great centrifugal force at the equator of the planet, and accordingly his form is that of a spheroid considerably flattened at the poles, the ratio of the polar to the equatorial diameter being nearly that of 11 to 12 The inclination of his equator to the plane of the ecliptic is 31° 19′, or nearly 28° 19′ to the plane of his orbit

When seen through a good telescope, the disc of Saturn appears striped with dark belts somewhat similar but broader and less strongly marked than those of Jupiter From their parallelism to his equator, it is inferred that they subsist in his atmosphere and are probably determined by currents similar to our trade winds

Saturn is attended by eight satellites, but the two nearest the planet can only be seen in certain favourable circumstances, and with telescopes of the very highest power *See* SATELLITE

Saturn's Rings — Saturn presents a phenomenon to which there is nothing analogous in the rest of the solar system This consists of two conspicuous rings, flat, broad, and very thin, lying in the same plane and concentric with each other and with the planet, and of an interior ring recently discovered The outer ones are separated from the body of the planet by an interval equal to about two and a half times the diameter of the earth and from each other by a much smaller interval The plane in which they lie is inclined to the ecliptic in an angle of 28° 40′, and hence they present themselves obliquely to the earth, under the form of an ellipse, the breadth of which, when greatest, is nearly equal to half the length The following are the dimensions of this extraordinary appendage, as given by Sir John Herschel (*Outlines of Astronomy*, 1849), from the micrometrical observations of Struve, with the exception of the thickness of the rings which was deduced from his own observations —

	Miles
Exterior diameter of exterior ring - - =	176418
Interior diameter of exterior ring - - =	155272
[illegible] - - =	151690
[illegible] - - =	117339
[illegible] - - =	79160
Interval between the planet and interior ring =	19090
Interval of the rings - - - - =	1791
Thickness of the rings not exceeding - =	250

As the plane of this double ring maintains its parallelism during the revolution of the planet the angle under which it is presented to the sun is continually changing and hence the varieties which take place in its apparent form and magnitude The points in which it intersects the ecliptic are in 170° and 350° of longitude, consequently whenever the planet comes into either of those longitudes (and it must pass through both in each revolution), the plane of the ring passes through the sun, and only the thin edge is illuminated In this case, the whole quantity of light which is reflected from it is insufficient to render it visible, and it entirely disappears, [illegible] On the 2 April, 1848, [illegible] inches in aperture and 20 feet in focal length" A little before or after the planet is in this position, the ring is seen as a fine straight line of light drawn across the disc of the planet, and projecting on each side like *ansæ* or handles As the planet continues to recede, the sun's rays fall upon the ring more obliquely, and the luminous line gradually opens out into an ellipse, which becomes wider and wider until it attains its maximum, when the longitude of Saturn is 80° or 260° In following out these phenomena, it is, however, necessary to take into account the position of the earth relatively to the sun and the plane of the ring, for it is evident, in the first place, that the ring will only be visible when the sun and earth are both on the same side of it, and, in the second place that it will become invisible when its plane passes through the centre of the earth, as none of the light reflected from its sides can then reach us On this account the disappearance of the ring is frequently double The successive disappearances of the ring form a period of about 15 years, or half the time of Saturn's revolution in his orbit, and the two sides of the ring have alternately fifteen of our years of sunshine, and fifteen years of darkness

The singularity of Saturn's appearance was first noticed by Galileo to whom the planet appeared *triple* or as a large body placed between two small ones The explanation of the phenomena by means of the ring was first given by Huygens [illegible] they observed numerous [illegible] that instead of two there must be a number of concentric rings In 1850 a third ring interior to the two others, and a second division near the inner edge of the inner ring, was observed both in America and this country, and the same phenomenon appears to have been previously noticed by Galle, at Berlin The new ring is very faint and dusky, but of its existence there can now be no doubt

That the ring is composed of solid ponderous materials is inferred from the circumstances of its casting a dark shadow on Saturn on the side nearest the sun, and receiving the shadow of the planet on the opposite side The ring must therefore be under the influence of the planet's attraction, and also liable to be deranged by the disturbing action of the satellites the largest of which does not move in the same plane Hence it is an interesting problem in physical astronomy to determine the conditions under which its equilibrium is maintained Laplace has shown, from the theory of gravitation, that in order to maintain the stability of the ring, it is necessary that the planet's attraction be counteracted by a centrifugal force arising from a very rapid rotation of the ring in its own plane Observation has confirmed the result of theory, for from the motions of certain dusky spots on its surface it has been found that the ring revolves in 10 hours 29 m 17 s, which is very nearly the period assigned by Laplace, and that in which a satellite would revolve at a distance equal to that of the middle of the ring Laplace also showed that in order to resist the tendency to subversion of the equilibrium, it is necessary to suppose the ring to be of unequal density or thickness in its different parts, so that the centre of gravity may not coincide with the centre of figure, for if it were perfectly similar [illegible] be disturbed by the slightest [illegible] satellite, and as it would have no tendency to recover itself, it would ultimately be precipitated on the planet This inequality of form would seem to be indicated by observation, for it has been noticed that the two arms of the ring sometimes appear to be dissimilar According to Bessel, the mass of the ring is equal to about the 1-118th part of that of the planet

SATURNA'LIA, the festival of Saturn, was celebrated at Rome about the middle of December, and occupied at different times one, three, and five days It was a season of complete liberty and rejoicing No business was done friends visited and made presents to each other, and, what was most remarkable, slaves were permitted to jest with their masters, and were even waited [illegible]

[illegible] classical Mythology divinities or rather supernatural per[illegible], arms, and bodies of men, and the lower parts of goats They were under the peculiar government of the god Bacchus Some antiquaries have fancied that the notion of satyrs arose from the introduction of ourang outangs by the real Bacchus, on his return from his conquest of India, and derive the name from the Heb sahurim, *hairy men*, Bacchus, according to tradition, having remained some time in Palestine during his return In the same

way we may perhaps account for St Augustin's story of a satyr having been seen and caught in his own time in the deserts of Africa In Greek Dramatic Literature the name satyr is applied to a theatrical piece, in which the chorus consisted of satyrs [illegible] burlesque character, [illegible] to us, the *Cyclops* of Euripides It was usual for the tragedian to present at the same time three tragic pieces and one satyr, forming a tetralogy In Zoology the ourang-outang (*Simia satyrus* Linn) is sometimes called satyr

SAUCISSON In Fortification a long roll or bag filled with gunpowder for the purpose of firing a mine The term is also applied to a fascine, longer than the common ones, used for raising batteries and repairing breaches

SAU'NDERS or SANDAL WOOD The white or scented sandal wood is the produce of the *Santalum album* It is brought from the East Indies When distilled with water it yields a thick essential oil, smelling something like roses Red saunders or sandal is the wood of the *Pterocarpus santalinus*, also a native of India Its colouring matter is insoluble in water but soluble in alcohol, and is used to impart a red tinge to certain tinctures The resinous exudation of this tree constitutes one of the [illegible]

SA'URIANS, *Sauri* [illegible] name of an order of reptiles [illegible] covered with scales and have four legs, as the crocodile and lizard The mouth of the saurians is always armed with teeth, and their toes are generally furnished with claws, they have all a tail more or less long, and generally very thick at the base A few species, exceptions to the general character, have only two legs The most gigantic and singular species of the Saurian order are now extinct

SAUSSURITE A variety of nephrite named in honour of Saussure, who discovered it on the banks of the lake of Geneva in rounded masses

SAVA'NNAHS The [illegible] of plains watered by [illegible] savannahs are greatly diversified in appearance, but they have some general features, which the reader will find systematically described in Mr Flint's work on America

SAVINGS BANKS *See* BANK, SAVINGS (See also Dégerando, *De la Bienfaisance Publique*, vol iii l 2 ch 4)

SAXIFRAGA'CEÆ (Saxifraga one of the genera) A natural order of herbaceous Exogens, chiefly inhabiting the mountainous regions of Europe and the northern parts of the world They are nearly allied to *Rosaceæ* from which they differ in having polyspermous, didymous, partially concrete carpels, and albuminous seeds and in wanting stipules The root of *Heuchera Americana* is a powerful astringent, whence it is called in North America alum root, other species are pretty herbaceous plants non [illegible] interest

SAXON [illegible] *See* ARCHITECTURE

SAXON BLUE A solution of indigo in concentrated sulphuric acid it is much used as a dye stuff

SCABI'NUS The Latinized form of the old German word schoppe, in French échevin Judicial officers of various descriptions in the middle ages bore this title especially in the "communes," or municipalities See as to its history, *Meyer's Instit Judiciaires*, *Mem de l'Ac des Inscr* vol xxxvii

SCA'BROUS (Lat scaber, *rough*) In Zoology, when a surface is rough to the touch, from granules scarcely visible

SCA'FFOLDING, in Architecture, is the temporary combination of timber-work, by the means of upright poles and horizontal pieces on which latter are laid the boards for carrying up the different stages or floors of a building and which are *struck* or removed as soon as they have answered their purpose The scaffolding used for carrying up buildings on the Continent has always been more scientifically and solidly constructed than that used in this country But great improvements have latterly taken place, and there seems to be a prevalent notion here, in the profession, that for large buildings a little more skill should be displayed than that which emanates from the combination of uninstructed Irish labourers

SCAGLIO'LA (It) In Architecture, a composition, sometimes called also *Mischia*, from the mixture of colours employed in it, being made to imitate marble The Florentines claim the invention of this art, but it had been practised in Lombardy previous to its introduction at Florence Lanza says that it was invented by Guido Sassi, who died at the age of 65, in 1649, at Carpi, in the state of Modena, and that he commenced by executing cornices and other members of architecture which had all the appearance of the finest marbles whereas its introduction at Florence was not till the middle of the 18th century Scagliola is composed of gypsum or sulphate of lime, calcined and reduced to a fine powder, with the addition of which to water a fine paste is made. When columns are made with this composition, a frame or cradle is first formed, with [illegible] and hair, raised [illegible] On this, when [illegible] pure gypsum, calcined and passed through a sieve and, as wanted, mixed with glue or isinglass, it is floated with wooden moulds of the proper form, during which operation the colours, by which the imitation is obtained, are put on When this is set the work is smoothed with pumice-stone with one hand of the workman, while the other is employed in washing it with a sponge and water It is then polished with tripoli, charcoal, and a piece of fine linen, and afterwards with a piece of felt dipped in oil and tripoli, and finished off with pure oil laid on with cotton wool

SCALD (*Skálld*) signifies in the ancient Norsk language a poet In the old northern literature, those mythological poems of which the writers are known are properly called songs of the Scalds, while those of unknown authors are [illegible] Tacitus that the ancient [illegible] sses of poems which were found at a later era in Scandinavia, namely, relating to the gods, to heaven, and to historical subjects The Scalds whose remains have come down to us are very numerous Their poems are partly alliterative and partly rhymed, and this latter circumstance seems to indicate works of comparatively recent date The historical value of their poems is considerable, but they are written in a peculiar vein of exaggeration and in a metre [illegible] which appears to [illegible] the poetical art of the north (See EDDA SAGA) The most complete list of the Scalds, and commentary on Scaldic poetry is to be found (according to the *Conversations Lex*) in the *Fundgruben des Orient* vol i

SCALE (It *scala*, *a ladder* or *series of stairs*) In Music a progressive series of sounds rising in acuteness or falling in gravity from any given pitch to the greatest practicable distance through such intermediate degrees as create an agreeable and perfect succession, wherein all the harmonical intervals are conveniently divided See the words DIATONIC and CHROMATIC

SCALE In Mensuration a line or rule of a definite length divided into a given number of equal parts, and used for the purpose of measuring other linear magnitudes It becomes a *standard scale* when all its divisions have been examined and compared with some *standard measure* (See MEASURE) The scales of thermometer [illegible] from some arbitrary point or zero (as [illegible] the temperature of freezing water) from which the heat is counted upwards or downwards in degrees which are also arbitrary

The term *scale* is also applied to a mathematical instrument consisting of an assemblage of lines and figures engraved on a plane rule by means of which certain proportional quantities or arithmetical results are obtained by inspection Of these the principal are the *plane scale*, the *diagonal scale*, *Gunter's scale*, &c For the construction and uses of these various scales, see *Robertson's Description and Use of Mathematical Instruments*

In Arithmetic, *scale* signifies the order of progression on [illegible] scale, [illegible] BINARY ARITHMETIC, NOTATION

SCALE in Zoology is properly applied to the plates, generally thin, small, and imbricated, which defend the skin of fishes They are substances of different texture which are developed beneath the true epiderm, and appertain to the system of the rete mucosum The so-called scales of serpents and other reptiles are modifications of the epidermis, and are sometimes termed "scutes" Fishes have been [illegible] to the structure of their scales See [illegible] CYCLOID, GANOID, PLACOID

SCALE'NE (Gr σκαληνος) In Geometry a scalene triangle is a triangle of which the three sides are unequal A cone or cylinder is also said to be scalene if its axis is inclined to its base, but in this case the term *oblique* is more frequently used

SCALE'NUS A muscle of the neck, situated between the transverse processes of the cervical vertebræ and the upper part of the neck

SCALPEL (Lat scalpare, *to carve*) A dissecting knife

SCALPRUM (Lat *a knife*) In Mammalogy, the [illegible] incisor teeth

SCAMMONY, in Pharmacy, is the gum-resin of the *Convolvulus scammonea*, chiefly imported from Aleppo and Smyrna in packages, called *drums*, weighing about 100 pounds each It is of a dark olive colour, and when wetted and rubbed should easily form a milky solution it is very apt to be adulterated, and an article entirely fictitious is often sold under the name of scammony Scammony is an excellent drastic purge, and is generally administered in combination with other purgatives in doses of three or four grains

SCANDALUM MAGNATUM In Law, an action

which still lies, although for a long period it has never been resorted to, on the stat 2 Ric 2 stat 1 c 5, and statute of Westminster the First, 3 E 1 c 34, for words spoken in derogation of a peer, a judge, or other great officer of the realm, which need not be such as would be actionable at common law in the case of a private person "The Duke of Richmond v Castellow," in the eighth year of Queen Anne, seems to have been the last instance

SCANSO[illegible] *scansores* (Lat scando, *I climb*) Climbing birds The name of an order of birds, including those which have the toes arranged in pairs, two before [illegible] foot which is ad-

SCANT In Naval language, the term applied to the wind when it is barely fair

SCANTLING (Fr echantillon) In Architecture, the measures of breadth and thickness of a piece of timber or other material It is also the name of a piece of timber when under five inches square

SCANTLING In Naval Architecture the scale or dimensions of the breadth and thickness of the timbers Thus two ships of different sizes may have the same scantling

SCAPE In Botany, a peduncle, which, in plants destitute of a stem, rises above the [illegible] and bears the flowers upon its apex, as in cowslip [illegible] of *Scapellus*

SCAPEMENT, or ESCAPEMENT *See* HOROLOGY

SCAPHITE (Gr σκαφη, *a boat*) A genus of cliptical-chambered shells belonging to the family of Ammonites, having the inner extremity coiled up in whorls embracing one another, and the outer extremity continued nearly in a horizontal plane, and then folded back, so as sometimes to touch the spire of the opposite end of the shell The transverse plates are numerous, and are pierced by a marginal siphuncle at the back of the shell, and their edges are deeply cut and foliated These beautiful shells, which thus resemble the ancient form of a boat, are almost peculiar to the chalk formation

SCAPOLITE A mineral originally from Arendahl in Norway, the crystals of which are often collected in groups of parallel diverging or intermingled prisms, hence its name from σκαπος *a rod* and λιθος, *a stone*

SCAPULA (Lat *the shoulder*) In Comparative Anatomy the bone which passes from the shoulder joint in a direction towards the vertebral column It is broad and flat, [illegible] sometimes subquadrilateral, in the Mammalia, narrow and commonly sabre shaped, in birds, narrow and straight in Saurian reptiles, a round, strong and straight column, in Cheloman reptiles, variously shaped, and articulated to the back of the skull in most fishes

SCAPULARS, or SCAPULAR FEATHERS, in Ornithology, are those which take their origin from the shoulders and cover the sides of the back

SCAPULARY A portion of the dress of the monastic orders, consisting of two bands of woollen stuff of which the one crosses the back or shoulders and the other the stomach According to the Abbe Fleury (*Mœurs des Chretiens*), the scapulary originated with St Benedict and was a large and heavy covering of the shoulders, worn by the early monks in their rural labours for the convenience of carrying loads, and to protect the tunic Simon Stock an Englishman, general of the Carmelites in the 13th century, first introduced under the authority of a vision, the notion that the scapulary is an especial sign of devotion to the Virgin Mary Since that time it has been not an uncommon superstition that whoever dies wearing it is sure of salvation The scapulary of [illegible] two little pieces of stuff on which [illegible] is embroidered

SCAPUS (Lat *stalk*) In Ornithology, the stem or trunk of a feather, including the hollow base or quill "calamus," which is inserted into the skin, and the solid exserted stem supporting the barbs, or rachis

SCAPUS In Architecture, the same as the *shaft* of a column, which see

SCARABÆIDANS, *Scarabæidæ* (Lat scarabæus, *a beetle*) The name of a family of Coleopterous insects, of which the genus *Scarabæus* is the type, it corresponds with great [illegible] *Lamellicorns* See that word

SCARABÆUS [illegible] ics The use and meaning of the scarabæus, as a symbol, are, as yet among the mysteries of [illegible] s, it is said, found in [illegible] with the seeds of life, because [illegible] by it forms a ball of earth in which to deposit its eggs It is also called a type of the sun However this may be, it was habitually worn by the ancient Egyptians and Etrurians as an amulet According to Mrs Hamilton Gray (*Tour to the Sepulchres of Etruria* 1840), several different styles of the scarabæus are traceable The ancient Egyptian scarabæus was plain, or inscribed with characters, and was made of opaque stone, basalt or porphyry The Etrurian scarabæus (found in quantities in the sepulchres) was of semitransparent stone, cornelian, onyx, sardonyx, agate, or jasper It is almost always engraved, generally with the figure of a god or genius, supposed to be the chosen protector of the individual who wore it sometimes with whole scenes, such as the labours of Hercules, race- &c [illegible] with Etruscan words or names, and occasionally with Egyptian divinities,—Isis or Horus Lastly, the modern Egyptian scarabæus of Roman times was generally of precious or semi-precious stones, and rudely engraved, and seems to belong to an age when the religious use of the scarabæus was forgotten, and it was retained only as an ornament In the Etruscan scarabæi themselves, according to the same authoress, there are three distinct styles of art remarkable,—the rude or native Etruscan, the Grecian, and that of a period of decline

SCARAMOUCH (Ital scaramuccia, *skirmish*) A personage in the old Italian Comedia dell' Arte, dressed in the Spanish or Hispano-Neapolitan costume, and representing a military personage, a poltroon and braggadocio, who [illegible] ended by receiving a beating from the hands of [illegible] The most celebrated Scaramouch of the Italian theatre at Paris was Tiberio Fiurelli, a Neapolitan, who had the honour of making Louis XIV laugh when an infant, and whose agility was such that he was able, according to his biographer, to give a box on the ear with his foot at the age of 80

SCARFING In Architecture, the formation of a beam out of two pieces of timber, usually employed when it cannot be conveniently procured in one length It is usually performed by indenting the pieces where they are joined to each other, and bolting them together in

[illegible] epidermis *See* SKIN

SCARIFICATOR An instrument used in cupping, it consists of 10 or 12 lancets, which are discharged through apertures in its plane surface by pulling a kind of trigger, so that in passing they make a number of incisions in the part to which the [illegible] applied

SCARLATINA, or SCARLET FEVER This highly contagious disease assumes two forms In the one it comes on with the usual symptoms of fever, such as languor, chills and heat, thirst, nausea and vomiting, and on the third or fourth day a scarlet efflorescence appears upon the skin which in three or four days ends in the cuticle peeling off in branny scales the febrile symptoms and soreness of the throat if any had been observed, then give way and the patient gradually recovers It is, however, not uncommonly followed by dropsical swelling of the body, which is but of short [illegible] In the other form of this disease the [illegible] symptoms are at first more alarming there is bilious vomiting, great soreness and ulceration of the throat, quick and small pulse laborious breathing, and the eruption, instead of mitigating the symptoms, is accompanied by the [illegible] dangerous increase The body becomes swollen and the nose and eyes inflamed, the breath grows fœtid, and the inflammation of the throat terminates in greyish sloughs, which give it a speckled appearance Under an aggravation of such symptoms, the patient is cut off, or his recovery is very slow, and dropsical swellings and glandular tumours follow, and leave him in a very precarious state It occasionally happens that the putrid symptoms run very high, the rash is livid, and accompanied by petechiæ, the breath highly fœtid, the throat gangrenous, and other symptoms announce a highly malignant form of the disease

In the milder form of scarlet fever, the bowels should be cleansed by saline aperients, and the patient kept in a moderate temperature, as near 60° as possible, and in a clean and open room If the throat is much affected, an [illegible] the heat of the body is much above the [illegible] or very distressing, sponging with cold w[illegible] resorted to has proved eminently useful [illegible] gargles must be used for the throat, and [illegible] with light preparations of bark and tonic [illegible] of the eruption, are required Where the malignant symptoms run high, cordial tonics, acids, wine, and the other treatment of putrid fevers must be adopted

Scarlet fever is distinguished from measles by the greater extent and want of elevation of the eruption, and by its not congregating into semilunar patches, nor is there the cough, and running from the eyes and nose, which usher in the measles It seizes those of all ages, but children and young persons are most subject to it; and [illegible] all seasons of the year, but in autumn [illegible] It may attack the same person more than once

SCARP In Fortification, the interior slope of the ditch *See* ESCARP

SCELIDES (Gr σκελος, *a leg*) In Mammalogy, the lower, posterior, or pelvic extremities

SCENE In Dramatic Literature (from the Gr σκηνη, *a booth*), dramatic representations having it is supposed, originally taken place on spots of ground shaded with boughs of trees The imaginary place in which the ac-

tion of the play is supposed to pass, also a division of a drama properly speaking, whenever the action changes to a new scene or place But in the French theatre, and those framed on its model (in which unity of place is observed), every entry of an actor constitutes a new scene On the English stage, the subdivision called a scene is extremely arbitrary, the scenes in most plays being far more numerous than the actual changes of scene while at the same time the French rule is not observed and actors enter in the middle of a scene The scenes in a play are numbered as subdivisions of the act *See* ACT

SCENE PAINTING A department of the art of painting governed by the laws of [illegible] the peculiar exigences of a theatre [illegible] in water colours, and admits of the most striking effects, which indeed, in scene painting, is almost all that is required

SCENERY The appearance of a place or of objects, or the representation of a spot wherein an action is performed *See* LANDSCAPE

SCE'PTICISM (Gr σκεπτομαι, *I examine*) In the History of Philosophy, a name given to that tendency of thought or system of doctrines the object of which is, by denying the existence of all grounds of knowledge, to introduce universal doubt and suspension of assent Schools of scepticism have existed at several different periods in the progress of philosophical inquiry The first who received or adopted the name was Pyrrho, a contemporary of Alexander the Great, and his successors, who taught in Athens about the year 300 B C Our chief notices of his opinions are derived from the writings in verse, of his disciple Timon, preserved to us by Sextus Empiricus He was led to his sceptical views partly by the contradictions observable in the impressions on our senses, and partly by the incompatibility of the principles of different schools with each other To a complete suspension of judgment in speculation (στοχη) he united a corresponding state of indifference in feeling (αταραξια), and made virtue and happiness to consist in the absence of mental perturbation Either he or his scholars endeavoured to present a synopsis of their sceptical views in ten general forms or commonplaces, all of which however, may be included in one or other of the two sources of doubt mentioned above

The school of Pyrrho seems to have expired with his disciple Timon, though many of his views were espoused and maintained by the later academy (*See* ACADEMICS) About the middle of the third century of the Christian era we meet with a school to which the name of the later sceptics has been assigned This sect seems to have originated with one Ænesidemus a physician It was in

[illegible]

their practice The grounds of this scepticism have been recorded by Sextus Empiricus It regarded not so much the validity of the notices given by the senses (to which their empirical method imposed on them a necessity of [illegible] as a formal form and method of [illegible] as utterly void, inasmuch as the conclusion must have been contained in the induction on which the major proposition was founded Perfect induction was impossible, imperfect was unsatisfactory They also attacked, with considerable acuteness, the received doctrines of cause and effect, and of the nature of God, chiefly in opposition to the Stoics, the most dogmatical of the ancient sects Their morality like their speculative creed was a system of mere sensualism This school may be considered as the last purely Grecian sect After them an oriental element was introduced into philosophy, which materially altered its character and bearing The most celebrated sceptics of modern times are, Montaigne (A D 1580), Glanville, an Englishman, who flourished about the period of the Restoration, Bayle, and Hume Of these Mr Hume has the merit of producing the most systematic and comprehensive scheme of scepticism the world has yet seen According to this philosopher, all the objects of consciousness may be reduced to two classes —1 the impressions on the senses, and, 2 ideas, or copies of those impressions, which differ from their originals only in being less vivid All knowledge, save that of mathematical relations, consists in the arrangement of these impressions according to the order of their succession Of the connection between any two links of this succession we know nothing, that to which we give the name of causation being, in fact, nothing more than habitual sequence relatively to the phenomena, and custom, or often-repeated association, in relation to ourselves All inquiry into things in themselves, or their grounds — in other words, all metaphysical speculation, is consequently founded on delusion The writings of David Hume, which contain his sceptical speculations, are his *Treatise on Human Nature*, and the early part of the second volume of his *Essays* (See *Ritter*, book x ch 1)

SCE'PTRE (Gr σκηπτρον, *a staff to lean on*) A well-known emblem of sovereignty Achilles, as is well known, swears by his staff or sceptre in the first book of the *Iliad* Tarquin the elder first assumed the sceptre among the Romans According to Justin, it was originally a spear The sceptre of the Merovingian kings, as represented on monuments is a rod probably of metal, of the height of the bearer, and slightly curved like a crosier

SCHAA'LSTEIN A mineralogical synonym of *table spar* (tafel-spath of the Germans) It occurs in grey laminated masses or concretions, chiefly at Dognatscha in the Bannat

SCHEELE'S GREEN A green pigment obtained by mixing arsenite of potassa with sulphate of copper It is an arsenite of copper

SCHEE'LIUM A name [illegible] applied to tungsten, in honour of Scheele, who [illegible]

SCHELLING, THE PHILOSOPHY OF, teaches the identity or *indifference* of the ideal and real Its author Frederick Wilhelm Joseph von Schelling, was born January 27th, 1775, and studied successively at Tubingen Leipzig, and Jena In the latter place, he was a pupil of Fichte Schelling lived till 1841 at Munich, under the patronage of the King of Bavaria, who ennobled him and advanced him to the dignity of geheimerath, or privy councillor, but at the period above mentioned he accepted of an invitation from the Prussian monarch to reside at Berlin where his lectures excited the most lively interest among the Prussian literati, though we believe he has not given them to the public

It is extremely difficult to understand the true import and significancy of any particular system of philosophy, if it is considered in itself, and apart from its connection with the general history of philosophy which, from its earliest origin to its latest development will be found to constitute a close and compact whole This general truth is particularly applicable to the philosophical development of Germany, the unity of whose literary pursuits [illegible] want of a true political unity [illegible] views and opinions, from Leibnitz and Spinosa to the philosophers of the present day is easily traceable, but it will be sufficient for the elucidation of Schelling's philosophy to begin with the critical theory of Kant The transcendental idealism of this philosopher formed the transition from the empiricism of the eighteenth century and effected as it were, a compromise between the scepticism of Hume and the realism which it succeeded to Without denying or asserting the existence of a material world Kant was content with confessing an ignorance at all events of its nature He taught that all that man can know of outward objects is that they furnish the material ground of his conceptions, to which the mind furnishes, on its part the form, in congruity with its original and connatural laws Of things themselves or as Kant calls them of phenomena man absolutely knows nothing, all that he can do is to note the modes under which they appear to him But while the criticism of the pure reason seemed to lead to a speculative idealism that of the practical reason appeared to possess a mystical tendency The principles of the latter work may thus be summed up —A consideration of the exigencies of man's moral nature enforces the validity of those ideas of God, immortality, and a future state of retribution, which the speculative reason does indeed project but cannot legitimate The latter tendency of the Kantian philosophy was worked out by Hamann and Herder, but found its culminating point in Jacobi's Philosophy of Faith (*Glauben's Philosophie*) which had many adherents in Germany, and extensively influenced the prevailing ideas of philosophy According to Jacobi the end and aim of true philosophy is a knowledge of God Now the pursuit of this object must set out from feeling and intuition, for there is no speculative method which can give a demonstration of God, for God is infinite but the understanding finite, and all mediate knowledge by reasoning which is a procedure of the intellect, cannot attain to the infinite Reasoning, moreover, cannot do more than establish the correspondence of certain identical propositions from which it passes, step by step, and on the presumption of whose truth it proceeds The element, therefore of all human knowledge is faith, an original instinct of man's nature, which immediately reveals to him the divine, and, in spite of any suspicions of the validity of sensuous testimony, enforces a belief in the existence of an external world The philosophical merits of Jacobi consist in this, that he did not, with Kant, regard God as a mere abstraction, but as a living spirit, whose presence is manifest within man himself, and further In the way that he insisted on the validity of the immediate perceptions of consciousness, in opposition to the absolute authority of the finite understanding However, true philosophical science cannot admit of any such contrariety of intellect and feeling, and to establish their identity, or at least to combine them in unison, was the problem which Fichte attempted to solve But the predominant character of the latter's

philosophy lies in the way in which he carried, to its extreme result, the idealistic tendency of Kant In the *Wissenschaftslehre* we have a system of pure and absolute freedom [illegible] real world is here [illegible] only so far as it is necessarily conceived by us, so that the external world is purely a creation of our conceptions, and the real is a product of the ideal To use the language of Fichte, — the ego is absolute, and posits itself, it is a pure activity As its activity however, has certain indefinable limits, when it experiences this limitation of its activity it also posits a non-ego, and so originates the objective world The ego, therefore, cannot posit itself without at the same time projecting a non-ego, which [illegible] first mere creation of the ego What [illegible] reflection, by which Fichte attained to this speculative result, he combined for practical ends the authority of immediate consciousness As, he argued, it is from the impulse of the ego to activity that the non-ego arises, the absolute ego is also in the same relation to the intelligent ego as a cause is to its effect But although the absolute practical ego is absolutely free, and the sole principle of all reality, so as to posit the world in opposition to itself, and to be its cause it has, nevertheless, a subjective limit to its operation This is the idea of duty which the consciousness immediately announces to man as an unconditional authority and obligation, which, however is not subversive of the freedom of the ego but is simply an impulsive motive to its activity Now, so far as the ego attempts to realize this duty it tends to a moral order He who does his utmost to establish this moral order, comes near to the Deity, and enters upon his true and proper life

Such was the point to which speculation had attained when Schelling appeared as a philosophical writer The subjective thought had been made the supreme and only principle, before which all objective entity was driven into the back ground, and the subjectivity of the idea was the only real existence acknowledged For this subjective idealism Schelling however did but substitute an objective idealism by giving objectivity to the idea itself and declaring every entity to be also rational thought Kant had spoken of the objective as unknowable, Fichte had denied its existence and Schelling identified the ideal and the real Fichte had confined himself to giving a derivation of nature and its laws out of an absolute and spontaneous activity of the ego Schelling maintained that not only must the laws of consciousness be immediately cognizable in the objective world as laws of nature, but conversely also the laws of nature must be immediately demonstrable in the consciousness as laws of the subjective Man finds himself in nature and nature in himself Besides Fichte's method therefore, of descending from the ego Schelling held it to be necessary to ascend from nature up to ego The former method is given in his transcendental philosophy the latter in the *nature philosophy* which make up his system of identity The general principles of this system are as follows — That true and perfect science which it has always been the object of philosophy to realize must be one which has its authority in itself, embraces all things and is perfectly correspondent to its object, for truth is impossible without a perfect agreement of the knowing and the known Now as all philosophy must proceed on the assumption that the cognizant mind is capable of true cognition it follows that the knowing subject cannot, in its essence be opposed to the object known, and that consequently it must be possible to know the real essence of things The essence, therefore of that which thinks and that which exists, of thought and entity, soul and body is one and the same By means of this essential oneness or in the terminology of Schelling, of this absolute identity and indifference of thought and being, the ideal and real, and in consequence of the mind being in substance at least, homogeneous with things without it, the former is capable of representing in cognition the latter such as they are in truth and in their essence The knowledge thus gained is a pure intellectual intuition, it is not mere reflection which, by its nature cannot go beyond its data Rising above phenomena to the ideas of the absolute, which is their identical origin it is able to apprehend the essence of things However, it is by reflection that man becomes conscious of these ideas through the aid of the senses, and this art of unfolding ideas by reflection constitutes Dialectics One of the duties of this art is to trace the identical principle in its [illegible] to determine every branch of [illegible] not only to the fundamental idea of the truth but to [illegible] The true method of philosophy is the method of construction, and without it no safe step can be taken in speculative science. This method is to become fully conscious of the laws of mind, which are inherent in it, and, agreeably to them, to shape every special science conformably to the existence of things By such a method philosophical science is possible, and this is a science of the existent agreeably to the ideas (*Wissenschaft von ideen*), that is, a science of God, and of his relation to the world, and of man and nature According to the *nature philosophy* the Absolute, or God, is both thought and [illegible] either unity or difference, out of which all contrariety has proceeded, and into which it will again return As the Absolute is the sole and eternal essence of all things, every true entity, and therefore nature also, is divine, without a participation in which there can be no existence In the eternal generation of things, the Absolute has revealed itself in infinite ways in space and time This revelation is a living development of the infinite according to certain contraries of the subjective and the objective, the ideal and the real These contraries strive to combine together in different proportions, and so acquire different names, according to the varying preponderance or polarity of the ideal and real Things, consequently, are not different in their essence, but merely quantitatively or in degree The preponderance of the objective constitutes unconscious nature, that of the subjective is spirit The more complete the combination of these contraries, the more perfect are the objects The most perfect union of them, or their absolute indifference, is found in the universe, and this complete identification and reunion of them is the full revelation of God Man, lastly, is a copy of the universe *in miniature* in so far as in a manner of his own, he unites to each the ideal and the real

The philosophy of Schelling appears then, to be directly opposed to that of Kant, from which, however, it is directly descended not only in the nature of the knowledge which it assumes to be possible, but also with respect to the objects of that knowledge In its essence it pretends to give a true image of the object known, and embraces, therefore, both nature and the world of man and spirits In its method of exposition, also, it pretends to imitate the true course of the development of nature, in which every thing passes by coherent and successive steps (or *powers*, A A^1 A^2, &c) from the undeveloped to the developed and the perfect, and, beginning from the lowest grades of entity, passes to its higher developments

Such is an outline of the system of Identity, as propounded by Schelling upwards of forty years ago, and which has exercised so important an influence on the mind of Germany There is, however, good reason to believe that the opinions of its author have been materially modified in the interval, and though, influenced by some singular feeling of reserve, which may, in fact, be said to have characterized him throughout life, Schelling has hitherto refrained from embodying his *new* views in any distinct or tangible form, yet the unaccountable leniency with which he treats [illegible] in the celebrated *Vorrede* to Beckers [illegible] *Cousins Vorrede* and the covert but ill concealed hostility therein displayed to some of the principles on which both his own system and that of Hegel are based (see *infra*), coupled with the (unacknowledged it is true, but still sufficiently authentic) revelations of some of his most distinguished pupils, — all these circumstances have given rise to the supposition that the long silence which he has maintained towards the public would be broken by a recantation of his *old*, and his avowal of a *new* system This conjecture was materially strengthened by his call to Berlin in 1841, and the rumours which have reached us of the nature of his lectures leave little doubt of the fact, though his present views have not been sufficiently developed to warrant us in hazarding an opinion respecting them

A brief statement of the manner in which the theory of Schelling was further modified by Hegel may be well appended here and will complete it as a general view of the modern philosophy in Germany In the *Encyclopædia of Philosophical Sciences*, which Hegel published in 1817 at Berlin, and designed as a manual for the use of his class he gives a general view of his system, and clearly exhibits its ultimate tendency "Logic," he says, "is the basis of ontology" The idea in itself and potentially is the primary substance, but *in actu* it passes into the real The ideal is to be examined, 1st, subjectively, as it exists in the mind 2d objectively or in *other*, *i.e.* in its outward manifestation, and 3d, absolutely as it is realized in art religion and philosophy Schelling had made triplicity or trinity to be the law which the principle of identity follows in its outward development [illegible] Thus he makes thought to be [illegible] *Pure thought* which is independent [illegible] universal language of Hegel, of *all contents*, 2 *Thought* as [illegible] fully determined, 3 *Idea* or thought [illegible] absolutely determined The last is the concrete, which is a self-developing and organical system, containing in itself all *momenta* or germs of further development Philosophy is the right evolution of this concrete, and its true method is the dialectical momentum The history of philosophy, apart

from its accidental media of schools and professors, is nothing less than the actual development of philosophy itself The several systems successively recorded are b [illegible] the latest system [illegible] ones Thus the the [illegible] Hegel are essentially based on the same principle the absolute identity of thought and being According to the former the mind is in full possession both of truth and reality the knowledge of which it attains by self-conscious ess in the intellectual intuition For the latter, Hegel substituted his *dialectical momentum*, or the logical development of the idea Generally Hegel stood in the same relation to Schelling as Wolff did to Leibnitz The cold and rigorous formalism of Fichte was displaced by Schelling for a loose and illogical style of political enthusiasm Hegel, however rightly insisted on the necessity of a scientific and systematic form as an indispensible condition of an exact science of truth (Michelet *Geschichte der letzten Systeme der Philosophie in Deutschland*, Jacobi *Briefe uber die Lehre des Spinosa*, Fichte, *Die Wissenschaftslehre*, *Die Bestimmung der Menschen*, Schelling, *System des transcendentalen Idealismus*, *Bruno Oder iiber die gottliche und natürliche Princip der Dinge*, Hegel, *Phenomenologie des Geistes*, *Encyclopædie der Philosophischen Wissenschaften* For some of the more recent views attr [illegible] see *Stahl's Philosophie des Rechts* [illegible] *Ansicht &c &c*)

SCHEME (Gr *σχημα*) A plan or representation of any geometrical or astronomical figure, a diagram

SCHE'RIF (Arab *lord* or *master*) A title given in the East by prescriptive usage to those who descend from Mahomet through his son-in-law and daughter, Ali and Fatima They are also called Emir and Seid, and have the privilege of wearing the green turban (See EMIR) The chiefs of Mecca and of Medina who are always supposed to belong to this sacred family, are styled the sheriffs of those cities

SCHERO'MA A dryness of the eye arising from a deficiency in the secretion of the lachrymal glands

SCHIAH See SUNNIAH

SCHILLER SPAR (Germ schillern *to change colours*) A mineral of a pearly lustre and changeable hues Hornblend and Labradorite are varieties of it

SCHI'RRUS (Gr *σκιρρος*) An induration of a gland, forming an indolent tumour not readily suppurating, and at first unattended by discoloration of the skin

SCHISM (Gr *σχιζω I cleave*) Separation from the true church of which as of heresy it may be said that Christians are not agreed whether the mere act constitutes the crime, or whether it is only a wilful and obstinate separation that deserves to be so denominated The chief schisms enumerated by Roman Catholic authorities are those of the Novatians the Donatists the Luciferians the Greek church and the Protestants The great schism of the West in the 14th century holds also an important place in the history of the Papacy See ANTIPOPE

SCHI'SMA (Gr *σχισμα*) In Music an interval equal to half a comma, therefore eighteen of them are required to make a complete tone

SCHIST (Gr *σχιστος*) A Geological term adopted from the German, and applied to the varieties of slate hence also the t [illegible] which have a slaty tex [illegible]

SCHI'ZOPODS (Gr *σχιζω I divide* and *τους a foot*) The tribe of long tailed Decapod Crustaceans including those which have the legs slender and filamentous, accompanied by an external articulated branch as long as the limbs, which thus appear doubled in number fitted for swimming, and not cheliferous the eggs being carried beneath them and not under the tail The opossum shrimps (*Mysis*) are examples of this tribe

SCHO'LARSHIP See BURSARS

SCHOLA'STIC PHILOSOPHY That method of philosophizing which arose in the schools and universities of what are commonly called the dark ages The father of the schoolmen was John Scotus Erigena a native of Ireland, who lived in the ninth century He first introduced among his contemporaries from what source is unknown, the philosophy of Aristotle which he combined with the doctrine of the new Platonists, and out of the combination constructed a complete system of Pantheism These speculations were at first regarded by the church with an evil eye, nor was it [illegible] following century that they were applied [illegible] and supporting the leading facts of [illegible] I was probably the necessity which was felt of combating heretics with their own weapons, that caused the universal adoption of the Aristotelian philosophy by the great religious authorities of the day It is at any rate certain, that the subtlety and ingenuity of the early schoolmen were confined to the task of co- [illegible] the doctrines of the Church [illegible] by that system The scholastic philosophy may be said to have expired with the conclusion of the 14th century, at least as to its influence on the leading minds of the age Four distinct periods have been observed in the course of [illegible] the first [illegible] and Archbishops Lanfranc, Anselm, and Hildebert The second era commences with the rise of the sect of Nominalists, the founder of whom was Johannes Roscellinus, and their most distinguished member the celebrated Peter Abelard The third period is marked by the introduction into Europe of the writings of the Arabian philosophers, and the translation into Latin of the versions of Aristotle's writings, with the complete ascendency of realism (which see) and the now undisputed supremacy of Aristotle The greatest names in this period, which embraces nearly all the 13th century are those of Albertus Magnus, Thomas Aquinas, and Duns Scotus, with the respective followers of the two latter, the Thomists and Scotists The glaring realism of Scotus roused the independent spirit of an Englishman, William of Ockam to a closer investigation of the internal conditions of thought, and in him led to what may be considered a transition state between the formation of the old schoolmen and the tendency towards nature and experience which distinguishes modern speculations The acuteness of this man restored the victory to the Nominalists His nominalism, however differed from that of Roscellinus and Abelard in the admission that 'universals' have a foundation of reality in the subjective conditions of the intellect though not in outward nature, whereas according to the former a general term was a name only,—a "flatus vocis" An excellent account of the leading principles of the scholastic philosophy and the mode of its combination with the Catholic doctrines is to be found in Dr Hampden's *Bampton Lectures* (Oxford, 1833) The learned author however does not sufficiently explain the points in which the scholastic notion of Aristotle's philosophy deviates from the genuine doctrines of that profound thinker especially with regard to the doctrine of *emanation* a purely oriental dogma grafted on the Grecian philosophy of the new Platonists of the Latin empire (See *Tennemann's Geschichte der Philosophie*)

The scholastic theology to adopt the definition of Mr Hallam (*Introduction to the Literature of Europe in the 15th 16th and 17th Centuries*) was, 'in its general principle an alliance between faith and reason, an endeavour to arrange the orthodox system of the church, such as authority had made it, according to the rules and methods of the Aristotelian dialectics, and sometimes upon premises supplied by metaphysical reasoning' The scholastic philosophy according to the same author, 'seems chiefly to be distinguished from this theology by a larger infusion of metaphysical reasoning, or by its occasional inquiries into subjects not immediately related to revealed articles of faith There can be no doubt that the sudden rise and expansion of the scholastic method was favourable to the growth of mental vigour and illumination, since it substituted ra [illegible] though on premises for the most part [illegible] mere acquiescence in authority which had distinguished the theology and the scanty remnant of philosophy which subsisted in the ages immediately preceding France, Germany England and at one period Spain were the principal seats of the scholastic controversies in Italy they had less influence Our own island has indeed the honour of having produced an unusual proportion of the chief names in this department of literature The best know [illegible] are Duns Scotus before mentioned, and W [illegible] one of the last of the distinguished schoolmen who flourished in the 14th century In the 14th century the dialectic method of the schools was applied by some learned legists to the science of jurisprudence Bartolus and Baldus have the highest reputation among the scholastic jurists

SCHO'LIASIS (Gr *σχολη leisure*) The name given to the old grammarians or critics who used to write annotations on the margin of the manuscripts of the classical authors of antiquity, called scholia; the fruits as it were of leisure

SCHO'LIUM (Lat) In Geometry, an explanatory observation or excursive remark, on the nature and application of a train of [illegible]

SCHOOLS FREE [illegible] Free schools are such as afford a gratuitous or nearly gratuitous education, to the children of the place from whatever source the funds be derived, endowed schools those of which the funds arise out of royal or private endowment The greater portion of these in England, are also grammar schools, viz schools in which elementary education in the classical languages is afforded according to the intentions of the founder A few among these have acquired, in popular phraseology, the designation of public schools Most of these schools were founded or endowed in the century and half following the Reformation Nearly 500 are described by Mr Carlisle in his work on these institutions

SCHOOLS INFANT, are said to owe their origin to

Mr. Robert Owen of New Lanark They have now been in operation since the year 1820 Their number is roughly estimated at 150 in England, 70 in Scotland, and 50 in Ireland, each school having on an average about 100 scholars, generally between two and seven years of age.

SCHOOLS, NATIONAL After public attention had been drawn to the advantages of Dr Bell's system of mutual instruction in schools chiefly through the activity of Mr Lancaster two societies were formed in England for carrying it into general operation The British and Foreign School Society dates D sentors in 1805 the National Society in connection establishment, a few years later The instruction of the former, in religion, is confined to those points in which all are agreed, that of the latter is founded on the liturgy and catechism of the established church The schools of these two societies are now extensively spread over the face of the kingdom The education given by them is nearly gratuitous, but certain small payments are in some cases exacted Mr Hill, in his work on the state of education in 1839 estimates the children attending schools of the former union at 60,000 or 80 000, and those of the National Schools at about 170,000, but these calculations seem to be founded chiefly on probabilities The same writer estimates the average length of education in these schools at about two years for each child Reading, writing and arithmetic, with religious knowledge according to the principles of the respective institutions, form the amount of education generally given, but in some schools geography, and even the elements of geometry, are taught, and attempts have been made to add instruction in various branches of manual industry Each society has a model school and establishment for training teachers That of the British and Foreign is in the Borough Road the principal one of the National in the Sanctuary, Westminster, but it has others in different places

SCHOOLS, NORMAL Schools for the education of persons intended to become schoolmasters, teachers, or professors in any line Normal schools form a regular part of the establishments for education in many Continental states, especially in Germany The normal school of Paris was suppressed in 1821 but revived a few years afterwards under the name of preparatory school and has now (since the event of 1830) resumed its original title

SCHOOLS OF ART See these under the heads Dutch School, Flemish School, &c

SCHOOLS, PUBLIC This is a name of not very definite application by which a certain number of schools are designated, conferring a classical education having on the average a larger number of boys, and frequented by the children of persons of rank and wealth The principal are, 1 The three colleges two of royal and one of private foundation — Eton Winchester, and Westminster 2 Some or all of the great metropolitan endowed schools, —Charter House, St Paul's, Merchant Tailors, Christ's Hospital (although the last is no longer frequented except by children of the less wealthy classes) 3 Certain endowed grammar-schools in the country raised by fashion and old reputation to the rank of public, — Harrow Rugby, Shrewsbury, and perhaps two or three more, but extremely arbitrary

SCHOOLS, SCOTCH PAROCHIAL In the reign of James IV (1494), the Scottish legislature enacted that all barons and substantial freeholders should send their children to school from the age of six to nine years, and afterwards to the academical institutions But it was not until 1615 that the foundations of the present system were laid by an act *empowering* the bishops, together with a majority of the landlords, or heritors," to establish schools in every parish In 1696 by another statute, the establishment of such schools was *directed* The appointment of the schoolmaster was vested in the heritors and minister, the burden of the expense of erecting the school and a dwelling house for the master, and paying [illegible] nor more than [illegible] former The general supervision of the schools was intrusted to the presbyteries in which they were situated Besides the salary (which has been raised to a maximum of 34*l* 4*s* 4½*d*, and minimum of 25*l* 13*s* 3⅓*d*), the master is supported by trifling fees from the scholars Reading, writing, [illegible] the branches of practical mathematics and even a slight amount of classical learning, have been usually taught in these parish schools Such is a short outline of the system, of the results of which, in the general education and morality of the poorer classes, Scotland has been so justly proud

SCHOOLS, SUNDAY First set on foot by Mr Robert Raikes of Gloucester According to Mr Hill, in his recent work on national education, the number of children at present frequenting Sunday schools varies from 800,000 to 900,000 The average length of a Sunday-school education he estimates at four years, the education given is almost uniformly confined to reading alone, but many Sunday schools appear to have evening schools connected with them, open two or three times a week, [illegible]

SCHOONER A small sloop-built vessel, with two masts of considerable length and rake, with small topmasts and fore and aft sails A schooner carries a square fore topsail and topgallant sail

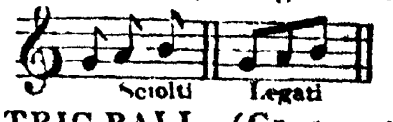
SCHORL (Swed scorl, *brittle*) A mineral usually occurring in black prismatic crystals, it is brittle, and has much lustre, and becomes electric by heat and friction [illegible]

SCIÆNOIDES The name of a family of Acanthopterygian fishes, of which the genus *Sciæna* is the type This family is nearly allied to the Percoids, but both the vomer and palatine bones are without teeth, the bones of the head are generally cavernous, and the muzzle more or less enlarged and obtuse

SCIATICA (Gr *ισχιον, the hip*) A rheumatic affection of the hip joint

SCIENCE (Lat [illegible] in its most comprehensive sense, is [illegible] knowledge of many, methodically digested and arranged so as to become attainable by one The knowledge of reasons and their conclusions constitutes *abstract*, that of causes and effects and of the laws of nature *natural* science The term science is however, more particularly used in contradistinction to *art* and *literature* As distinguished from the former, a *science* is "a body of truths, the common principles of which are supposed to be known and separated so that the individual truths, even though some or all may be clear in themselves, have a guarantee that they could have been [illegible] either with certainty or with such [illegible] the subject admits of, by other means than their own evidence" (*See* ART) As distinguished from *literature*, science is applied to any branch of knowledge which is made the subject of investigation with a view [illegible] first principles (*See* LITERATURE) [illegible] will be found under their particular heads

SCILLITIN The bitter principle of the squill (the bulb of the *Scilla maritima*), to which its medical properties of an expectorant and diuretic are referable It is a white substance of [illegible] appearance



SCINCOIDS, *Scincidæ* A family of Saurian reptiles of which the genus *Scincus* is the type They have short [illegible] the body and tail are covered with [illegible] like tiles, they have no impressed lateral line and the toes are margined

SCINTILLATION (Lat scintilla, *a spark*) In Astronomy the term applied to the *twinkling* or tremulous motion of the light of the larger fixed stars, by which they appear as if the [illegible] were not continuous but [illegible] each other at intervals with a sort of vibratory movement The planets [illegible] Venus sometimes, have not this [illegible] and they are thus readily distinguished [illegible] of first magnitude It arises from the extreme smallness of the apparent diameters of the fixed stars, and depends in some measure on the state of the atmosphere In countries where the atmosphere is very pure and dry and at considerable altitudes, the scintillation is observed to be much diminished, and the stars shine with a steady clear light

SCIOGRAPHY (Gr *σκια, a shadow*, and *γραφω, I describe*) In Painting, &c, the art of casting and delineating shadows with truth, and upon mathematical principles

SCION (Lat scindo, *I cut off*) The first young shoot produced during the year by a tree, or, more commonly, a part of a branch prepared for the purpose of being grafted upon some other tree

SCIOLTO (It *free*) In Music, a term which, applied to counterpoint, signifies that it is free from syncopated or tied notes, or that it is not constrained by general rules When applied to notes, it signifies that they are not tied together

SCIOPTIC or SCIOPTRIC BALL (Gr *σκια, shadow*, and *οπτομαι, I view*) A name sometimes given to a mechanical contrivance, used in the *camera obscura*, for the purpose of giving motion to a lens in every direction

SCIRE FACIAS, in Law, is a judicial writ, which lies in various cases, most commonly to call on a party to show cause to the court whence it issues why execution of judgment passed should not be made out It is not granted until a year and a day after judgment given

SCISSEL The clippings of various metals produced in several mechanical operations connected with their manufacture The slips or plates of metal out of which circular blanks have been cut for the purpose of coinage are called [illegible]

SCIURINÆ *Sciuridæ* Squirrel tribe The name of a family of Rodents of which the genus *Sciurus* is the type They are distinguished by their very narrow

lower incisors, and by their long and bushy tail They have four toes before, and five behind Th[illegible] the fore foot is sometimes marked by a [illegible] molars are tuberculated

SCLE'RODERMS, *Sclerodermi* (Gr σκληρος, *hard*, and δερμα, *skin*) A name given by Cuvier to a family of Plectognathic fishes comprehending those which have the skin covered with hard scales

SCLE'ROTICA (Gr σκληρος) One of the membranes [illegible] Eye

SCOLOPA'CIDÆ (Gr σκολοπαξ, *a woodcock*) Snipe tribe The name of a family of wading birds, of which the genus *Scolopax* is the type The snipes proper have a straight beak the nasal furrows extending to near its point, which is a little inflated externally so as to extend beyond the lower mandible The point is soft and very sensible

SCOLOPE'NDRÆ (Gr σκολοπενδρα) The generic name of the Centipedes

SCO'MBEROIDS *Scomberoides* Mackerel tribe The name of the family of fishes of which the genus *Scomber* is the type They are characterized by having a smooth body covered with small scales, and a very powerful tail and caudal fin and include species of the greatest utility to mankind in consequence of their abundance and flavour

SCO'NCES In Fortification small forts for the defence of a pass, river or other place

SCO'PA (Lat *a little brush*) In Mammalogy a fasciculus of long flaccid hairs which may grow from any limited part of the body or extremities

SCO'PIPEDS *Scopipedes* (Lat scopæ *a broom*, and pes *a foot*) The name of a tribe of Melliferous insects including those which have the tarsi of the posterior feet furnished with a brush of hairs

SCO'RPIO In Astronomy, the eighth sign of the zodiac, and one of the ancient zodiacal constellations When this constellation rises Orion sets, hence the mythological fable of the death of Orion who perished by the sting of a scorpion *See* CONSTELLATION

SCOT (Sax sceat *part* or *portion* in the sense of contribution) This old word has passed into various ordinary expressions such as "scot free &c, and at one time found its way into the Italian language (Dante *Purgatorio*) In English law it is still retained in the phrase 'inhabitant paying scot and lot' which has long been held to mean paying parochial rates and constitutes one of the old rights of voting in various boroughs existing before the Reform Act

SCO'TER A name of the black duck or black diver (*Anas nigra*, Linn), now the type of the subgenus *Oidemia* Flem

SCO'TIA (Gr σκοτια *darkness*) In Architecture the name of a hollow moulding chiefly used between the tori in the bases of columns It takes its name from the shadow formed by it, which seems to envelop it in darkness It is sometimes called a casement, and often, from its resemblance to a common pulley *trochilus*

SCO'TISTS An old scholastic sect followers of Duns Scotus, "the subtle doctor" one of the leading champions of Realism in the 13th century He held that the "universal" existed not *'in posse'* only but *'in actu,'* not depending in anywise on the conditions of the understanding, but presented to it as an outward reality In this respect his realism differs from that of his predecessor, Thomas Aquinas, whose doctrines he combats in other respects *See* THOMISTS

SCOTODI'NIA (Gr σκοτος, *darkness*, and δινος, *giddiness*) Giddiness, with imperfect vision

SCRIBDS (Etym uncertain) In Architecture, wooden rules for running mouldings Also the extreme guides on the margins of walls and ceilings for floating to by the aid of the rules They are always necessary for running a cornice when the ceiling is not floated

SCREEN (Fr escran) In Architecture a partition usually wrought with rich tracery, placed behind the high altar of a church, and also before small chapels and tombs Sometimes, as at Easter, they are placed temporarily at the sides of choirs

SCREW In Mechanics, one of the six mechanical powers consisting of a spiral ridge or groove, winding round a cylinder so as to cut every line on the surface parallel to the axis in the same [illegible] The screw may be formed either [illegible] the cylinder, in the former case [illegible] or *male* screw in the latter, the *interior* or *female* screw The [illegible] of the screw resembles that of the wedge, or inclined plane, but as the cylinder has always a handle attached to it, the screw is a real [illegible] of the inclined plane and lever, and if the direction of the power be parallel to the base of the cylinder and perpendicular to its radius, an equilibrium is produced when the power is to the resistance or pressure as the interval between the adjacent threads is to the circumference described by the point to which the power is applied Hence the mechanical advantage afforded by the screw is proportional jointly to the fineness of the threads and the smallness of the cylinder relatively to the length of the lever or handle It is to be observed, however, that by diminishing the distance between the threads, or diminishing the diameter of the cylinder we diminish also, in both cases the strength of the screw and hence there is obviously a limit to the increase of power But the action is greatly increased by means of the contrivance called a *double screw*, or, from the name of its inventor, *Hunter's screw*, which consists in the combination of two screws of unequal fineness of thread, one of which works within the other In this case the power does not depend upon the interval between the threads of either screw, but on the difference between the intervals in the two screws, and may be increased to almost any extent

The *endless screw* consists of a screw combined with a wheel and axle in such a manner that the threads of the screw work into the teeth fixed on the periphery of the wheel Suppose the power applied to the handle of the screw, and the weight attached to the axle of the wheel, then there will be equilibrium when the power is to the weight as the distance between the threads multiplied by the radius of the axle is to the length of the lever or handle, multiplied by the radius of the wheel

The *water screw* or *screw of Archimedes* is formed by winding a flexible tube round a cylinder in the form of a screw If the machine thus constructed be placed obliquely so as to make with the vertical an angle equal to that which the spiral makes with the lines parallel to the axis of the cylinder there will be in each convolution of the spiral a part parallel to the horizon If any body then be placed within the spiral at this part, it will remain at rest, and if the screw be turned the body will ascend because the part of the screw behind it becomes more inclined than the part before it and it is consequently urged forward This simple but ingenious contrivance is usually employed for the purpose of raising water to a small height but it may be employed to raise any substance that can pass within the tube and it is evident that the action may be increased by placing several tubes or spiral channels (for they may be formed of wood or iron) on the same cylinder The principle has been recently applied to the propelling of steam-vessels

The *micrometer screw* is a contrivance adapted to astronomical or optical instruments for the purpose of measuring angles with great exactness The very great space through which the lever of the screw passes in comparison of that which is described by the cylinder in the direction of its length renders the screw of immense use in subdividing space into minute parts

As a mechanical power the screw has innumerable applications, but it is employed with most effect in all cases in which a very great pressure is required to be exerted within a small space and without intermission Hence it is the power generally used for expressing juices from solid substances for compressing cotton and other goods into hard dense masses for the convenience of carriage for coining stamping printing &c

SCRIBES The copyists and at the same time the interpreters of the law, in the later periods of the Jewish history They were held in great honour among that people, and ranked with the priests themselves in their estimation In the New Testament we find them generally referred to in connection with the Pharisees, to which sect they appear generally to have belonged, and with whom they coincided in temper and sentiments Some ancient writers conceive the scribes to have formed peculiar sects in themselves, but there is no authority for this opinion

SCRIBING (Lat scribo *I write or scratch*) In Architecture, fitting the edge of a board to another board in the same plane as the edge In joiner's work, it is the fitting one piece of wood to another so that their fibres may be respectively at right angles

SCRIPTURES The Holy Scriptures, or writings of the Old and New Testament The Canonical Scriptures, which, having been duly authenticated, are inserted in the canon or rule by which the faith of a believer is determined [illegible] BIBLE NEW TESTAMENT, OLD TESTAMENT

SCRIVENER (From the Lat scribo, *I write*, apparently through the Spanish escribano) Money scriveners, in old English usage, were parties who received money to place it out at interest, and supplied parties who wished to lend money on security Money brokers and attorneys who practise in this manner have been held to be within the statutes relating to scriveners In this sense, the word is obsolete The last [illegible] is said to have been a person of the name of Jackson a cotemporary of Dr Johnson, [illegible] remains to attest [illegible]

SCROFULA [illegible] originally termed χοιρας, or *swine disease*, by the Greeks, and later nosologists have translated it by the term scrofula It consists in [illegible] especially about the neck, which when they suppurate discharge a white curdled matter, unlike healthy pus Scrofula is not co-

tagious, but often an hereditary disease, and dependent upon a peculiar predisposition in the constitution its first appearance is usually between the third and seventh years of the child's age, and it seldom shows itself after the age of puberty It is most common among delicate children with fair complexions, and those disposed to rickets It is rare in warm climates, and seems to be favoured by cold and variable countries It is promoted by every thing that debilitates, and when its exciting causes are by any accident not brought into action, it may even remain dormant through life, and not show itself till the next generation In mild cases the glands, after having suppurated, slowly heal, in others the eyes and eyelids are inflamed, and the [illegible] the disease gradually extending [illegible] bones, and producing a hectic and debilitated state, under which the patient sinks, or it ends in tuberculated lungs and pulmonary consumption In the treatment of the mild and simpler forms of scrofula the diet should be nourishing and invigorating, and a dry situation and sea air are to be sought for, great attention should be paid to the clothing so as to avoid colds and coughs, and tonics and gentle stimulants with mild narcotics, and occasionally the alkalis should be prescribed Iodine has sometimes appeared of much service but it requires the greatest circumspection in its internal use, it may be applied externally as may also sea water and other saline lotions Chalybeates and mercurials are frequently prescribed, and much benefit has in some instances, been derived from a course of sarsaparilla

SCROPHULARIA'CEÆ (Scrophularia one of the genera) A natural order of herbaceous or shrubby monopetalous Exogens inhabiting all parts of the world except the coldest The stamens are either didynamous or unsymmetrical, nevertheless the affinity of the order is undoubtedly with *Solanaceæ* through the medium of the tribe *Salpiglossideæ*, so that it becomes necessary to separate them by a mere artificial distinction considering as *Solanaceæ* such genera as have a plaited corolla and five stamens and as *Scrophulariaceæ* all those in which the fifth stamen is wanting, or the æstivation of the corolla imbricated They are generally acrid bitterish plants The leaves of some are purgative and even emetic, a property so much increased in digitalis that its effects become highly dangerous, and nearly all the tribe turn black in drying Many of the genera such as digitalis, calceolaria, &c, are valued by gardeners for their beautiful flowers

SCRU'PLE A denomination of weight the third part of a dram and equal to twenty grains See WEIGHTS

SCRU'TINY (Lat scrutor, *I examine*) In the Primitive Church an examination in the last week of Lent of the catechumens who were to be baptized on Easter day, used chiefly in the ancient church of Rome In parliamentary language, an examination of the votes given at an election by an election committee at which the bad given on both sides are rejected and the poll corrected accordingly is called a *scrutiny*

SCUD The name given by seamen to loose vapoury clouds driven swiftly along by the winds *To Scud* signifies to run directly before the wind in a gale As the object is to keep before the sea, the fore sail or foretop sail is set the latter or the maintop sail is often necessary as the fore sail is often becalmed from the height of the waves

SCU'DO See MONEY

SCULL An oar so short that one man can work a pair It most generally implies an oar placed over the stern of a boat, and worked from side to side the blade, which is turned diagonally, being always in the water In China where the method is well understood, large boats are impelled by a single scull with considerable velocity

SCU'LPTURE (Lat sculpo, *I carve*) The art of carving in wood stone or other materials The origin of sculpture is so remote, that at this period there neither exists the probability of [illegible] it being satisfactorily deduced, [illegible] of that nation in which it first appeared Though idolatry may have favoured its early advances and rendered it powerful assistance, we are not indebted to it [illegible] for its invention In Egypt, indeed, it [illegible] its progress was impeded by the restraints and shackles with which religion invested it "The monstrous shapes and sorceries" of "fanatic Egypt" clearly barred its perfection in the country, where a bird's head was combined with the body of a lion, and cats' and wolves' heads were joined to the divine form of man It was in Greece only that the unnatural junction of the two noblest animals was successful, and grace and dignity resulted from the attempt in creation of a centaur The first artist on record as a sculptor is Bezaleel, who, with Aholiab (see Exodus, xxxi), formed the cherubim that covered the mercy-seat; but, previous to these, the art of moulding and working in metal was long known The presents to Rebekah consisted of jewels of silver and gold, Judah gave to Tamar his signet and his bracelets, in Egypt "Pharaoh took off his ring from his hand and put it upon Joseph's hand" Even, as to the art of moulding or carving, from the use of idols, we know it must have existed in Asia, and in Egypt from the time of Abraham and Jacob The *teraphim*, which Rachel stole from her father (Gen xxxi v 19 30) were, according to the best commentators, carved in general [illegible] household deities, like the penates and lares of the Romans many centuries afterwards The commandment will doubtless occur to the reader "Thou shalt not make to thyself any graven image" as well as the address of Moses to the Israelites, "For ye know how we have dwelt in the land of Egypt, and how we came through the nations which ye passed by, and ye have seen their abominations, and their idols of wood and stone silver and gold, which were among them"

Some of the most extraordinary specimens of early sculpture on record are described by Diodorus as the works of Semiramis, but they are too wonderful to allow of our implicit reliance on the author She is said to have had representations in brick on her palace of every sort of animal in relief These were afterwards so coloured to nature as to [illegible] appearance of life In the midst of them was seen [illegible] piercing a tiger with a dart, and near her Ninus killing a lion with his lance In another part of the same palace were placed the statue of Jupiter Belus, those of Ninus, Semiramis, and the principal officers of the state the whole executed in bronze We are also told that, by command of this princess a temple was raised at Babylon, on the top whereof three massive statues were placed of Jupiter, Juno, and Rhea That of Jupiter was forty feet in height Stupendous as these works are stated to have been, we gather from the same author an account of the execution of one which throws them into insignificance One of the sides of the mountain Bagistan was extremely rough and steep, and seventeen stadia in height, this she caused to be reduced to a smooth surface, and then sculptured into a figure of herself attended by one hundred of her guards It is to be observed that Diodorus relates this story on the authority of Ctesias Doubtful as it is, the same sort of scheme was proposed to Alexander by the architect Dinocrates as related by Vitruvius in the preface to one of his books

Of the sculpture of the Persians little notice is necessary In the article PAINTING we have mentioned that it was contrary to the tenets of their religion to make in any way representations of the human form In Persepolis there are however some extraordinary sculptures, [illegible] considerable resemblance to the style of the [illegible] reliefs in the palace of Thebes, allowing [illegible] of dress, but they contain nothing in science or imitation particularly worthy of our notice The earliest sculpture to which we can refer, and on which we can rely [illegible] Egyptians Herodotus tells us, that they erected [illegible] temples to the gods and carved the figures of animals in stone The abundance and variety of the specimens still in existence of their sculpture, minute and colossal domestic and religious prove them to have been a nation with prodigious resources and distinguished for their wisdom and affection for the arts The greater portion of their sculpture seems to have been sacred, that is, representations of the divinities and their attributes and qualities In respect of the dimensions of some of their statues, Herodotus mentions one before the temple of Vulcan at Memphis, and another at Sais, placed there by king Amasis, each of the height of seventy-five feet The part of the sphinx, near the great pyramid still out of the sand, that is from the throat upwards, rises to the height of twenty-five feet At Thebes the sitting statues of Memnon the mother and the sons of Osymandyas, are each fifty eight feet high A long catalogue might be added to these we will however only add, that in the British Museum is a closed hand which must have been part of a statue sixty-five feet high Grace of form, elegance, and symmetry, are not to be found in Egyptian sculpture The faces of their statues have a resemblance to the Chinese, and their bodies are formed with large bellies They generally stand equally poised on both legs, having one foot advanced, the arms either hanging down straight on each side, or if one be raised, it is at a right angle across the body Some of their statues are seated, and some are kneeling, the position, however, of the hands is rarely different from what we have described The faces of them are generally flat, the brows eyelids, and mouths formed of simple curves slightly marked and with little expression The tunics and draperies are frequently without folds

The arts of Egypt seem to have been in a progressive state of improvement from about or before the period of Moses to the invasion and subjugation of the country by Cambyses, a thousand years afterwards Winckelman thinks that there were two distinct styles, the first ending with the conquest just mentioned, and the second commencing at that period, and ending after the time of Alexander the Great In the first of these styles he de-

ser bes the forms as straight stiff, and ungraceful The [illegible] figures have the legs always parallel, the feet are squeezed together and the arms fixed to the sides In the females the left arm is generally folded across the breast and the draperies exhibit very [illegible] In the second style the hands become more elegant, the feet are placed at a greater distance from each other, the arms hang more freely, and the figure is generally clothed with a tunic robe and mantle The material usually employed [illegible] sometimes formed of different materials from the statues themselves Small figures are frequently found, to which the name of penates has been given, they are sometimes composed of wood, sometimes of baked earth, and some are covered with a green enamel

"Winckelmann, says Flaxman in his Second Lecture on Sculpture "has remarked that the Egyptians executed [illegible] better than the human figure, for which he gives [illegible] two following reasons [illegible] that they were [illegible] to represent the [illegible] in their persons [illegible] needless hypothesis, for there are statues in the Capitoline Museum with as great a breadth and choice of grand parts, proper to the human form as ever they represented in their lions or other inferior animals In addition to these observations on Egyptian statues, we may remark, the forms of their hands and feet are gross, they have no anatomical detail of parts and are totally deficient in the grace of motion This last defect in all probability was not the consequence of a superstitious determination to persist in the practice of their ancestors, it is accounted for in another and better way' This 'better way' of the professor is from their being deficient at the time in geometry which, *he* says 'will naturally account for that of motion in their statues and relievos which can only [illegible] and with all respect for the splendid talents of the professor, whose own knowledge of geometry from his curious definition of the centre of [illegible] we apprehend to have been [illegible] her prefer the hypothesis of Winckelmann The Egyptian bassi-relievi are usually sunk from the surface of the material employed, which practice most probably obtained from their being cut in very hard stone such as granite or basalt, and from the distance they were usually placed above the eye In the first case, cutting the ground away from the figure would have occupied quite as much time as cutting the figure itself, in the second case the [illegible] breadth of shadow and [illegible] to the [illegible] These bassi-relievi or hieroglyphics when found on the walls of tombs relate the profession actions and funeral of the deceased, on those of palaces, the wars [illegible] phs processions, trophies, with the [illegible] domestic employments of kings, on those of temples they were the records of theology, and on obelisks they are hymns to the gods, or eulogies of their kings

The only correct notions that can be obtained on the subject of Phœnician sculpture is from a contemplation of the medals of the Carthaginians, who were a colony from Phœnicia, though perhaps these may mislead us The Phœnicians, known by the name of Canaanites in Scripture, were at a very early period advanced in civilization When Moses sent out the spies to search the land of Canaan, they returned with an account, 'that the people be strong that dwell in the land, and the cities are walled and very great" It was from Chaldea, according to the authorities cited by Jacob Bryant, that the arts of [illegible] having first been transplanted [illegible] their own persons, they were, unlike the Egyptian races, themselves models for their artists, and their situation and character were favourable to the progress of the art Their extraordinary and successful spirit of commerce led to its cultivation, and some of the statues that decorated their temples were celebrated in history Winckelmann is of opinion that the Etrurians, or ancient Tuscans, carried sculpture to a certain degree of perfection much earlier than the Greeks The same Dicæarchus has the reputation [illegible] Etrurians, for, in order to escape the resentment of Minos king of Crete, he is reported to have taken refuge in Sicily, whence he passed over into Italy Etrurian art proves that the first attempts towards sculpture were in clay, whereof innumerable specimens have been found in Rome and its environs, and as the Romans in the early period of their existence as a people were entirely ignorant of the arts, no doubt is left of these specimens being the work of the Etrurians or Volscians Clay was for a long time the only material used — 'nulla signa, [illegible] and Pliny and Varro tell us that [illegible] Jupiter Capitolinus, the quadriga on the top of his temple, and all [illegible] before the temple of Ceres was [illegible] of [illegible] Men of the [illegible] a resemblance to those of Greece [illegible] thought it probable they must have been brought from that country, or from Magna Græcia into Etruria, about the period of the conquest of Greece by the Romans, when Italy became almost saturated with the magnificent spoils of art which that country yielded The Etruscan sculpture is in two distinct styles of art In the first or earliest style, the general lines, or contours, are exceedingly stiff and straight, and the attitudes exhibit anything but a feeling of ease in the figure the form of the head is entirely devoid of beauty, the outlines not well rounded, their figures are almost invariably too slender, the form of the head is [illegible] the chin piked, the eyes flat, with some degree of tendency towards squinting All these defects indicate an infant state of the art, and it is not extraordinary to see the very same defects in the works of the Gothic sculptors The second style of Etruscan art is conjectured by Winckelmann to be contemporary with the age of Phidias, but it is to be observed that this conjecture is in no way borne out or supported by proof In this style the joints are strongly marked, the muscles raised the bones perfectly distinguishable and considerable knowledge of the science of anatomy is displayed The statues of the gods are executed [illegible] of great power without [illegible] The attitudes, however are far from natural, and the action constantly overstrained To this Millin adds a third period in the history of Etruscan art, commencing at the conquest of Greece by the Romans at which time the Etruscan artists became acquainted with the works of the Grecians and, adopting their style became at first their imitators and afterwards their rivals To the Italian artists of this period Horace is supposed to allude in one of his satires In concluding this succinct account of the sculptures of Etruria to exhibit the extent to which it was cultivated it is only necessary to state on the authority of Pliny that when the Romans conquered Volsinium, one of the twelve cities of Etruria they carried away from that city alone about 2000 statues

Before turning to the sculpture of the Greeks we may notice as bearing some resemblance to the Egyptian sculpture, that of the Hindus It is not, however, intended to compare the one with the other, for the latter is far more deficient than the former both in science and resemblance to nature The stupendous excavations at Ellora, which have been mentioned in the article ARCHITECTURE and those at Elephanta and other parts of India, are well known by representations which have been published in this country They are by some considered of very high antiquity and are decorated profusely with mythological sculpture whereof the subjects are symbols, [illegible] trines The reader who is desirous of further information on this subject may profitably consult *Moore's Hindu Pantheon* which contains upwards of 1500 outlines of Hindu painting and sculpture faithfully delineated from the originals

As we have seen the first dawn of the art was on the soil of Phœnicia and Egypt we have now to trace it to its meridian splendour on the shores of Greece In Egypt the forms of the human figure and its "face divine," far removed from beauty and intellectual expression, a burning climate, and institutions inimical to improving on the model, restrained the art within very narrow bounds, whereas in Greece the beautiful forms of the male and female models, the genial and delicious climate, were among the leading physical causes of the supereminent success of the Greeks With them, says D'Agincourt, "au lieu de noirs scarabees, du chacal, ou de la hyène feroce, du hideux crocodile, c'etoient les diligentes ouvrières du mont Hymette, le noble coursier, le taureau vigoureux, le cerf agile, l'elegant et doux chevreuil, qui peuplaient les rives émaillees de ses fleuves ses riantes collines, ses forets ombragees With them unlike the attachment to the combinations of human with the brutal forms of Egypt, the softest desires, the noblest and livelie[illegible] [illegible] in [illegible] of [illegible] public games, at which all men of consideration and celebrity, and of whatever rank, contended for honours, and the beauty of form to be seen at them, which was an unceasing object of contemplation, raised them into a nation of connoisseurs No [illegible] sculptor his works with the practice of former ages Egypt [illegible] with artisans, Greece with artists

Greek sculpture has usually been arranged under three epochs, which we shall here enumerate We of course pass over the rude and unfashioned representations of the

[illegible] which Parrhasius took [illegible] stone though regarded [illegible] the last with the greatest reverence, and to be seen as late as the time of Adrian at Thebes, Argos, and other cities, and which, indeed, were rather symbols than representations Neither do we think it here necessary again to touch upon the works of Dædalus and Endæus, about which we can now form no just conception, except that the material they employed was wood About 775 B C, Dipœnis and Scyllis the Cretan became celebrated for their marble statues, which retained much of the ancient style in the advancing position of the legs, the general form of the figure, and particularly in the vertical folds of drapery, whose edges were zigzag Soon after this period sculpture received the most elaborate finishing though the character of the face and limbs was not much changed from the tasteless and barbarous style of former times Flaxman conjectures that the colossal busts of Hercules and Apollo in the British Museum may have been the works of Dipœnis and Scyllis It is not difficult to conceive the progressive improvement in an art so much cultivated, between the time of which we are now speaking and the first epoch in which Ageladas, the master of Polycletus, appeared Ageladas with whom has been confounded Hiadis or Geladas, the master of Phidias, was a native of Argos, and cotemporary with Pisistratus It was at this period that art approached the personification of ideal beauty by the choice of forms from many models, so that the excellence found in each might be combined in one Its cultivation had become an object of necessity in most of the Grecian states induced greatly by a practice introduced about this era, of honouring with a statue every individual who had received three crowns in the public games Such a custom afforded the [illegible] some of the most [illegible] which were afterwards deduced those canons of proportion on which all future art has been unable to improve Within the interval of which we have just spoken appeared the sculptor Callimachus, to whom Vitruvius assigns the merit of having invented the Corinthian capital (See ARCHITECTURE) "The better drawing of the figure, with a more careful attention to its parts more precision and variety of attitude, a less elaborate curling and dressing the hair, the form of the figure better shown through [illegible] all certain signs of a near approach to [illegible]

The second epoch of sculpture among the Greeks was in the age of Phidias, who flourished about 490 years before the Christian era — a period peculiarly splendid in history as abounding with statesmen warriors, artists, philosophers, and poets, among whom will doubtless occur to the reader the names of Socrates Plato, Pericles, Miltiades Cimon Themistocles and Xenophon The emulation among such rare talents as then appeared was highly favourable to the growth and perfection of genius Athens destroyed by the army of Xerxes, rose under the auspices of Pericles in renewed and far greater grandeur Phidias the pupil of Hiadis the Argive, though by some it is thought that honour belongs to Hippias, was employed by Pericles in the superintendence of the public works, and the admiration of his powers was so universal with the ancients, that Quintilian says, speaking of his Athenian Minerva and Olympian Jupiter at Elis "Cujus pulchritudo adjecisse aliquid etiam receptæ religioni videtur ideo magestas operis deum æquavit Plutarch affirms that Callicrates and Ictinus executed the work of the Parthenon and this, as far as relates to the latter is confirmed by Pausanias The statue however, of Minerva, of ivory and gold, within the temple was the work of Phidias himself, and, excepting his Jupiter at Elis, his most celebrated production, some have doubted that Phidias himself ever worked in marble, but although his chief material was bronze when he did not use ivory it is certain that he occasionally wrought in marble The great reputation of Phidias was founded upon his representations of the gods, excelling more in them than in human forms, and in his works in ivory it is said he was unrivalled Polycletus, the scholar of Ageladas above mentioned, and cotemporary of Phidias, assisted in the perfection of style of the second epoch He was of Sicyon, and especially celebrated for his Doryphoros, or lance-bearer, and his Diadumenus, or youth binding a fillet round his head The first was so esteemed by artists, that it was called the "canon," from which they studied their proportions There is, however, some doubt whether it be this or another statue to which this honour was paid The cotemporaries of these great [illegible] Gorgias, Lacon, Myron, P[illegible] In a passage of Pliny, Al[illegible] Nestocles, and Hegias, who are called the rivals of Phidias The name of Colotes is preserved as another of his scholars

The third epoch is that in which we become acquainted with the names of Praxiteles and Lysippus, and in which what Winckelman calls the *fine style* was introduced The graces of youth and beauty were the delight of Praxiteles, and in his marble statues at the Ceramicus of Athens, he is said to have excelled himself His Venus of Cnidos was so endowed with charms, that her suitors were seaborne from all quarters to pay homage at her shrine This statue, which had been rejected by the Coans on account of its being naked, was refused to Nicomedes by the citizens of Cnidos in payment of a debt of immense amount It remained at Cnidos in the time of the Emperor Arcadius, about 400 A D Flaxman in his Lectures observes of it, that it "seems to offer the first idea of the Venus de Medicis, which is likely to be the repetition of another Venus, the work of this artist" A satyr, Cupid, Apollo (the lizard-catcher), and Bacchus leaning on a fawn are known works of this master Cotemporary with Praxiteles was Lysippus, so celebrated for the group of horses still to be seen in the front of St Mark's church at Venice This epoch, though that which Winckelman calls of the fine style, is not in grandeur comparable to its predecessor The refinement of art was carried almost to its utmost limit greater delicacy [illegible] indeed have been and was introduced [illegible] forms, but in dignity and simplicity of feeling it is inferior to the extraordinary productions of the age of Phidias After this period several of the finest groups and statues were nevertheless executed one of them, the Laocoon (*see* LAOCOON) is in a very high class of art, and perhaps not inferior to any group known The principal schools of sculpture were Athens and Rhodes, from which latter school came the Laocoon, the Torso Farnese, and the Colossus To what extent the Rhodians were sculptors may be conjectured from the circumstance of the Romans carrying off from this little island 3000 statues After the death of Alexander the Great, 324 years before Christ, the arts of design seem to have declined from their meridian excellence Apelles found an asylum in Egypt with Ptolemy, a prince whose liberality induced artists to repair to his dominions, and whose example in this respect was followed by his successor, but under the detestable tyranny of the seventh of that dynasty, the artists abandoned Alexandria altogether The alternate favour and disgrace which they experienced under the kings of Syria and those of Bithynia and Pergamus, was repeated in Sicily under Agathocles and Hiero II, till the taking (212 B C) of Syracuse by Marcellus, who was the first to appreciate Greek statues as invaluable ornaments to the eternal city

At the conclusion of the Macedonian war, 500 marble and bronze statues graced the triumph of the conquerors Mummius and Scylla left no place unstripped of all in the shape of art upon which they could lay their hands, and within a very comparatively circumscribed period Rome became the rendezvous of all artists who had any pretensions to talent for it was the only place in which they could obtain employment

The Romans had no natural taste in the fine arts, nor [illegible] lus characterized the art in its early age by the line,

Stabat in exigua ligneus æde deus,

and even to its last hour it may be truly averred that sculpture never shone in Rome except with a borrowed light Volsinium one of the twelve cities of Etruria (the modern Bolsena), was called the city of artists, and it was this depot which for a long time supplied the Romans with architects, painters and sculptors and taught the Romans at an early period what little they knew of art Before the 5th century of its existence the use of marble was scarcely known in Rome, but in the 6th the Romans began to spread themselves towards the regions inhabited by Greeians and imbibed a taste for the expensive materials used by that nation

The year 146 B C was signalized by the entire reduction of Greece under the dominion of the Romans Sixty-six years previously a dawn of luxury and taste had opened at Rome by the introduction, through Marcellus, of statues from Syracuse, but though the increasing luxury of the Romans created a constant demand for fresh objects of the art, its history in the city is but a melancholy continuing decline of it, its energies and beauties being destined to expire among the people of a strange land The only occupation then left for Greek artists was to be found in Rome, whither they were invited, and where abundance of them were to be seen Among them Pliny (l xxxv c 12 and xxxvi c 5) mentions the name of Pasiteles, a sculptor, who wrote five volumes, containing a catalogue raisonnée of the finest works of art known in his time Pasiteles excelled as a modeller in metal The silver statue he executed of Ro[illegible] [illegible] celebrated Archesilaus [illegible] sculptor, all Athenians were among [illegible] cotemporaries in the Augustan age [illegible] first of these who excelled [illegible] marble is extolled by Pliny for his care in modelling before he began upon the block He was the friend of Lucullus, for whom he executed a group,

described by Varro, representing a lioness with cupids sporting round her, and endeavouring to force her to drink Still, however, the passion for ancient Greek statues prevailed with the Romans Martial says, in speaking of a statue of Hercules,

> Non est firma recens res nostri gloria coli
> Nobilis Lysippi munus, opusque vides —(Lib ix Ep 45)

Under Augustus the art had not been entirely divested [illegible] at after his time it partook [illegible] his successors as they appeared Licentious and obscene under the sway of the vicious, debauched, and cruel Tiberius, under Caligula it [illegible] that ancient Greek statues of [illegible] o make room for the head of [illegible] (to whom, however, we per- [illegible] Apollo of the [illegible] were found in [illegible] extravagant, that some of the statues of Lysippus were actually gilt It has been conjectured that the Apollo and gladiator above mentioned were part of the spoils from the temple at Delphi The reigns of the three emperors that succeeded Nero were of such short duration, that had they been so minded they had not sufficient time to inflict any very serious injury on the arts Vespasian, whose only blemish was avarice, which is even extenuated by the laudable and patriotic use he made of his revenues cultivated the arts as well as literature The Temple of Peace which was really a temple of the arts, was by him decorated with the choicest specimens of Greek painting and sculpture The reigns of his son Titus and of Trajan were also favourable to sculpture The latter was the patron of Apollodorus, from whose hand is the sculpture on the column that bears the emperor's name and records his military exploits Trajan moreover, had the liberality and good [illegible] erect statues in honour of the eminent men of his time All works of this period were, however, rather architectural than sculptural such as temples palaces, triumphal arches, &c, and the sculpture chiefly in request was for their decoration, a want certainly not calculated to retrieve the art from its sinking state but rather to encourage bold and offhand execution at the expense of simplicity and expression Adrian was so great a lover of the arts that he did not think it beneath his character as emperor himself to exercise those of painting and sculpture for his amusement He not only restored the principal buildings at Athens but extended his fostering care to the temple of Jupiter at Olympia where he caused to be erected a colossal statue of the [illegible] The statue of Antinous so gene- [illegible] work of this reign Antoninus and [illegible] appointed by Hadrian as his successors, under them the art revived for a time and has acknowledged her gratitude to the last by his bronze statue at the Capitol The former crowded with the choicest specimens of sculpture he could procure his villa at Lanuvium How sculpture was encouraged at this time may be gathered from the innumerable busts of these emperors that have reached us Commodus had likewise been honoured with a multitude of statues but these upon his death were decreed by the senate to be all destroyed Only thirteen years afterwards under Septimius Severus, the decay of the art became very manifest its decline cont [illegible] reign of Alexander Severus, though two [illegible] ich were discovered a few years since, are not without merit During the next half century, the rapid succession of twenty emperors scarcely one of whom died a natural death, gave to sculpture little chance of a revival In fact by the end of the 4th century it was extinct, of which no other proof is necessary than the arch of Constantine and the statues of that prince, through whose removal of the capital of the empire to Constantinople Rome no longer swayed the sceptre of the fine arts If the Romans do not deserve the admiration in which the Greeks are held for their knowledge of the fine arts, they deserve our gratitude for [illegible] the noblest pr [illegible] two epochs under which the taste of the Romans for the fine arts may be classed the first beginning with the capture of Syracuse by Marcellus and ending at the time of Julius Cæsar, the second, that of the Augustan age, in which all the polite arts flourished

From the 4th to the 13th century, if there were materials sufficiently authentic, the history of the arts, as we have shown also in the articles ARCHITECTURE and PAINTING, is such a blank as to be scarcely worth the trouble of tracing In the 13th century, however, the clouds of darkness began to separate, opening a dawn for their revival in the 14th, which was soon afterwards to bring on the blaze of day We shall divide our account of the art from this period into three epochs

First Epoch — The Roman power having been entirely destroyed in the West of Europe, Italy became divided [illegible] d principalities, whereof the chief were [illegible] and Pisa, these being the earliest in [illegible] liberty The last, however, was foremost in founding a school of native art The Pisans, who possessed considerable extent of coast had beaten the Saracens in Africa, Sardinia, Majorca, Minorca, and Sicily, and had thus ac [illegible] which they commenced the erection of their cathedral, which was finished in 1092, about seven years after that of St [illegible]

and the cause of religion found employment for the talent they produced It has been conjectured that Buschetto, whom the majority of writers and weight of argument prove to have been a Greek, though thought by some to have been an Italian, was the founder of the school at Pisa The reputation of this school was raised to the greatest height by the [illegible] Nicolo de Pisa, the pride and glory of the [illegible] y, and the first who on its restoration gave dignity and importance to sculpture That the Grecian [illegible] Pisans had acquired soon enabled [illegible] between them and the style of Buschetto, is evident from some remains of his work in the Campo Santo In 1225 he was employed at Bologna in decorating the sarcophagus of St Dominic, in which his admiration and successful imitation of the antique shine forth He was afterwards engaged on the bas-reliefs of the pulpits at Pisa and Sienna, and on the façades of the cathedrals at Orvieto and Lucca The time of his death is uncertain Giovanni the son of Nicolo, succeeded his father, to whom in some respects he was more than equal Their figures, especially those of their draped females, are elegant, and exhibit "an originality of idea and a force of thought seldom met with when schools of art are in the habit of copying from each other" The school of Pisa is not limited to the two we have just named Arnolfo the Florentine, the brothers Agostino and Agnolo, and Andrea Ugolino, all deserve to be recorded Andrea executed in bronze the oldest gate of the baptistry at Florence, on which is represented the life of St John This work is designed with much grandeur and simplicity and almost if not quite equal to his master, but in his marble statues he is inferior Giovanni da Balduccio, scholar of Nicolo or Giovanni was of this epoch his first works were at Milan, where afterwards, in 1339 he executed the mausoleum of St Peter the Martyr In the 14th century Giotto esta- [illegible] blish pre- [illegible] the art Of it was Orgagna, a name ever to be remembered for his celebrated loggia at Florence who was also eminent for his works in sculpture A school at Sienna, towards the end of this century produced Jacopo della Quercia, whose principal works were at Bologna Lucca, and especially Sienna where a fountain which he designed was so admired that he acquired the name of Jacopo della Fonte From his hand is the bas relief in the façade of San Petronio at Bologna The 15th century was a splendid era for the production of every thing that was great and intelligent, and most especially for the art of sculpture The love of liberty and knowledge seemed to animate the whole of the Italian republics, and as if the republic of the arts were not excluded from the common sentiment no individual master seems so to have outstripped his rivals as to have impressed the art with his own particular style

This period brings us to the *second epoch*, at the beginning whereof we find six great artists engaged in a competition for executing the bronze doors of the baptistry at Florence in which after a year's trial, Lorenzo Ghiberti bore away the palm from his rivals Among these was Donatello, a Florentine, one of the most distinguished restorers of the art Some of his works 'says Flaxman, no incompetent judge both in bronze and marble, might be placed beside the best productions of ancient Greece without discredit' His alto relievo of two singing boys in the Duomo at Florence is in point of character, sentiment drawing, and drapery, of extraordinary beauty The marble statue he executed of St George standing upright equally poised on both his legs, with his hands resting on the shield before him, so excited the admiration of Michael Angelo, that after contemplating it in deep silence for a considerable length of time, he suddenly exclaimed "March" Lorenzo Ghiberti, the contemporary and as we have before mentioned, successful rival of Donatello, in the gates (1401) to the baptistry of San Giovanni, has immortalized himself by that work, [illegible] be [illegible] appella [illegible] of t [illegible] Gates of [illegible] years of his [illegible] of Reynolds, remains one of [illegible] modern art The subjects are from the Old and New Testaments, and the complaint of Reynolds is, that "the [illegible] so large a portion of the [illegible] remained but secondary objects, entirely contrary to the principle of the ancients" Brunelleschi the intimate friend of Donatello, known better by his high acquirements as an architect, was not less a sculptor of consi- [illegible] at Florence, in the church of St Maria [illegible] mirable crucifix by him in wood In

1450, Andrea Verrocchio and Dom[illegible] found amongst the first rank [illegible] The former of these two, the master of Pietro Perugino and Leonardo da Vinci, executed at Venice the famous figure of Bartolomeo Cogleone da Bergamo on horseback The latter was the master of Michael Angelo da Buonarotti, whom we have once more (*see* ARCHITECTURE and PAINTING) to introduce to the reader's notice as the most eminent of modern sculptors as well as of architects and painters The miraculous works of this extraordinary man seem rather the result of inspiration than of genius, and with him is introduced

The *third epoch*, in which the perfect restoration of the art was accomplished The historian of the painters sculptors, and architects wrote the life of Buonarotti while he was yet living, and thus apostrophises for his so doing —"Let none be surprised that I have here written the life of Michael Angelo, who is yet living Indeed it cannot be expected that he will ever die, and therefore it has appeared to me proper to do him this little honour, for when in common with other men his life shall pass away, he will be immortal in his immortal works, the fame of which, as long as the world lists, will live with glory in the mouths of men and in their records, in contempt of envy and despite of death" Michael Angelo was nobly descended, and at the early age of 15 was patronized by Lorenzo de Medici, who took him into his house, and whilst living continued his friend His career in sculpture was commenced b[illegible] Bacchus, and young fawn the colossa[illegible] of a Madonna sitting with the dead Christ on her knees, works which raised him immediately above his contemporaries It is not our purpose here to touch upon the productions of Michael Angelo in the other two arts which occupied a great portion of his time, and which it appears he afterwards regretted for Condivi his biographer, observes, "Che mi rammenta udirlo dire che quando [illegible] (the basso relievo of the battle of Hercules with the Centaurs,) vede, cognosce quanto torto egli abbia fatto alla [illegible] prontamente l'arte della scultura [illegible] gr used to the papal chair employed Michael Angelo on a mausoleum, which it was intended to place under the centre of the dome of St Peter's It was projected on a most magnificent scale, but being subjected to many delays and the pope dying, only one of its sides was completed which was afterwards erected in the church of St Pietro in Vincola by order of his nephew In this monument is found the celebrated Moses and some other statues, two of which in the present day are in the gallery at the Louvre It is mortifying to know that a large portion of this artist's time was wasted at the quarries of Pietra San[illegible] quet of the underlings of Leo X [illegible] Medici in 1523 engaged him on the sacristy and library of San Lorenzo In the Capella dei Depositi [illegible] the statues of Lorenzo and Giuliano di [illegible] and in Roman military habits the former is conceived with a simplicity worthy of the highest era of Grecian art The recumbent statues of Daybreak and Night under the statue of Giuliano in the same chapel are grand and mysterious the characters and forms bespeak the same mighty hand and mind evide[illegible] ceiling of the Sistine Chapel and last [illegible] this mighty master was doomed to experience ill treatment from his employers, his last years having been attended with mortification and chequered with vexation and trouble Universal in his accomplishments, he was mainly useful in defending the city of Florence when it was besieged by the Prince of Orange Having arrived at the advanced age of eighty and withdrawn from all employment except the conduct of the works at St Peter's, which he returned to prevent the intrigues for marring his design from being successful he gratified the pious inclination of his mind and derived amusement in his leisure hours from working on an enormous block of marble a group of four figures, consisting of the dead body of our Saviour, supported by Joseph of Arimathea attended by the two Marys, a composition of infinite grandeur and pathos which he lived not to finish His death occurred on the 15th of December, 1563 almost 90 years of age "Michel" says Ariosto "più che mortal Angel divino" Besides the honour he conferred on seven popes [illegible] e was the friend of Soliman emperor of [illegible] I king of France the emperor Charles V the princes of the republic of Venice, those of Italy, partic[illegible] duke of Tuscany reigning at the time of his death His body [illegible] he church of the Holy Apostles at [illegible] meditated a magnificent tomb to his memory, was privately removed to Florence, w[illegible] it with every [illegible] ceremony to [illegible] by all the members of [illegible] corated for the occasion [illegible] examples of p[illegible] The [illegible] re was pronounced by B[illegible] Fenth Lecture on Sculpture [illegible] thus —

The character and works of Michael Angelo have been dwelt on at greater length because as his merits and [illegible] powers [illegible] beyond the last [illegible] of human [illegible] had [illegible] attained to so much greater perfection [illegible] the [illegible] of art Vasari, the friend and [illegible] perspective of [illegible] harmony of h[illegible] facility of execution in painting and sculpture, besides his mathematical and mechanical attainments in architecture and building, together with the many and prodigious works he accomplished demonstrate how greatly he contributed to the restoration of art" After this epoch, or perhaps almost belo[illegible] to it appeared Giovanni da Bologna, a sculptor of extraordinary merit, and eminent particularly for his works in bronze and marble His Venus coming from the Bath is delicate and graceful, and the group of the Rape of the Sabines in the grand piazza at Florence is extremely well composed, and possesses a fine undulation of line The Mercury he executed, rising to fly, is energetic and [illegible] There are many small works extant by this [illegible] Benvenuto Cellini, one of [illegible] that ever existed [illegible] He was chiefly [illegible] metals, but was frequently employed on large figures and groups, of which the Perseus holding the head of Medusa in his left hand at Florence is a splendid instance of his talent Other real disciples of the great Tuscan master were Raphael di Monte Lupo, his favourite pupil, who assisted in the execution of the two statues of the Virtues on each side of the Moses, Nicolo di Tribolo, who made the bronze gates of the cathedral at Bologna, Giovanni dell Opera who received that name from the prolific chisel he wielded, and Vincenzo Danti Of this class also are Baccio Bandinelli, a man of considerable talent, but of course greatly inferior to Michael Angelo though he set himself up as a rival and competitor, Baccio di Monte Lupo, who in one his works executed the crucifix in the church [illegible] Santa Lorenzo Andrea Contucci, a clever and occasionally successful imitator of Michael Angelo, and founder of the school of Loretto, Francesco Rustici, a pupil of Leonardo da Vinci but whose works evince a devotion to the style of Michael Angelo Buonarotti, and who introduced it into France, and Jacopo Tatti, commonly called Sansovino, who was the head of the Venetian school of sculpture As an architect he was an artist of surprising talents as is manifest from his works at Verona, his sculpture, however, is deficient in purity, though not in richness of composition His principal pupils were Danese Cattaneo and Alessandro Vittoria The principles of the school were diffused through Italy, and were equally to be seen in Lombardy and Naples In the latter city the principal masters were Marliano Nola and Girolamo St Croce At Milan were Agostino Busti and Guglielmo della Porta whose reputation was raised by the statues executed by him on the tomb of Paul the Third at St Peters These have been esteemed as among the best examples of modern sculpture Torregiano who also belongs to this period, was of a vagabond disposition but a man of genius, he was invited over to England where he wrought upon the tomb of Henry VII at Westminster, for which he received the sum of 1000*l* From Benvenuto Cellini we learn that he was handsome but of consummate impudence, having the manner of a bravo more than of a sculptor, and to crown all what with his strange gestures, shrill voice, and a certain trick of knitting his brows he was enough to frighten any one who came in contact with him When he quitted England he visited Spain, says Vasari, and, distinguishing himself by many [illegible] sion in marble from the Duke [illegible] Christ of the size of life, with great assurances that he should be rewarded according to his merit The duke being a grandee of the first class the sculptor considered he should be proportionately rewarded After considerable study and application the work was finished to his own satisfaction, whereon with impatience to possess himself of the treasure, the duke forthwith sent for it, and to display his generosity to the greatest advantage, two of his servants were loaded with the money in payment for it The bulk was pleasing in appearance to the artist, but upon being opened the bags were found to contain only brass [illegible] pounds to the trifling sum of thirty ducats Vexation and disappointment roused the indignation of Torregiano, who, looking on the present more as an insult than a reward due to his merit, snatched up his mallet, and heedless of the perfect workmanship with which it had been finished as well as the sacred character of the subject broke it in pieces, and sent the lacqueys away with their load of brass to recount the tale to their master The grandee, enraged at the merited indignity with which the artist had treated him, and it may be horrified at the sacrilegious nature of the [illegible] the Inquisition as an infidel and a [illegible] pleaded the right of an author over [illegible]

the holy office of its victim by starving himself to death in his prison. This occurred in 1522, at which time he was fifty years old. In England we also had Giovanni da Padua in the following reign.

Spain produced some celebrated sculptors in the 16th century, their first native artist being Berruguette, a pupil of Vasari and Buonarotti. Berruguette's disciple Paul de Cespides is reputed the greatest sculptor that Spain ever produced.

It does not appear that Germany produced any sculptors of eminence before the 17th century. But in France, Jacques d'Angoulême, who had been at Rome, where he had a competition even with Buonarotti, Jean Gougeon, who finished the Fountain of the Innocents at Paris in 1550, and was one of the victims in the massacre on St Bartholomew's Day, Jean Cousin, whose works, though deficient in force and truth, yet exhibit much grace and delicacy, and German Pilon, whose details remarkable for [illegible] —are [illegible] that come [illegible] in which all the works of sculpture that were produced are so many testimonies of the influence which the genius of Michael Angelo exerted over the arts.

At the commencement of the 17th century, Bernini, a native of Naples, bor[illegible] before unknown [illegible] for becom[illegible] himself by [illegible] caprice [illegible] effaced all [illegible] narcotic [illegible] on the paintings of the Bolognese school, his affected style, the violent expression in which he delighted, are the marks of [illegible] whose only aim was to be striking. He [illegible] with his works and corrupted it with his taste till his death in 1680. The most celebrated cotemporaries of Bernini were Alguardi and Fiammingo. The latter is much esteemed for his representations of youth, and particularly of infants. At Naples he executed a concert of cherubs and two infants on a monument at Rome which are his most admired works; the latter was particularly admired by Rubens, who says of it, "Nature rather than art appears to have sculptured them, and the marble is softened into life." Rusconi in Italy succeeded to Bernini, and was the artist most in request at the b[illegible] the 18th century. His greatest work was at S. Giov[illegible] Laterano, where he was assisted by Monnot, Le Gros, Moraldi, Mor[illegible] [illegible] the former [illegible] in short, the art seemed to have departed, though men whose names are not worth recording, with all the pretensions of artists, still hovered about the scenes of its former glory.

In France, Anzirevalle Adrian, Della Bella, and Pacca [illegible] the interval up to [illegible] —one extremely [illegible] the remaining period of that monarch's [illegible] were Gerardon, born at Tr[illegible], P[illegible]orn at Marseilles in 1622, the latter of whom, from his fiery and energetic style, received the appellation of the Michael Angelo of France. These two were [illegible] head of the school of the succeeding sculptors of France, among whom was Falconet, celebrated for his writings, and for the equestrian statue he executed at St Petersburg of the Czar Peter. The unfortunate Louis XVI previous to the Revolution, was a great patron of sculpture, and had [illegible] ost eminent cha- [illegible] of the day had executed some of them before the dreadful period which stopped in France for a time the cultivation of the arts. The school of Pigal was of considerable extent and influence. Michel, Bocquet, Moette, Chaudet, and Le Brune being members of it, and within a generation of the present [illegible] or nearly so with these in Germany, were Rauchmuller of Vienna, Schluter of Berlin, Millich, Bartel, and others, subsequent to whom are Ohnmacht, Sonnenschein, and Nahl, all sculptors of much reputation. Our knowledge of Spanish sculptors is so limited, from their reputation not travelling away from their own country, and in it indeed [illegible] except in Madrid and the chief [illegible] employment for them is the decoration of churches, [illegible] e interest would be created by [illegible] In England, up to a la[illegible] were foreigners. Cibber, Ro[illegible] had the sway [illegible] of their genius, especially of the second [illegible] of some of our churches. The art, however, seemed to be near its dissolution, when Antonio Canova in 1757 revived in Rome [illegible] rity without which [illegible] artist was born [illegible] at Possagno, a village among the Asolani hills, at the foot of the Venetian Alps. Pietro, his father, and Pasino, his grandfather, were sculptors, whose labours were chiefly confined to the churches of the district. Deprived of his father when only three years of age, he was indebted to his grandfather for the early instruction and employment of the chisel in which he acquired great reputation at a very [illegible] [illegible] of the patrician Giovanni Falliero, who was [illegible] him placed with Torretto, one of the best Venetian [illegible] of that day. Torretto soon afterwards died, and young [illegible] [illegible] under Torretto's nephew, Ferrari. [illegible] through the trammels of the art as it was then practised, and the rapidity of his progress having induced his patron to find a more appropriate theatre for the exercise of his powers, the young artist was sent to Rome in December, 1780, soon after which time the Venetian government granted him a pension of 300 ducats for three years. At this period the fashionable sculptors of Rome were Agostino Penna, Pacili, Bracci, Sibilla, and others, whose [illegible] already forgotten, so that in the way [illegible] had little to excite his talents. Before the period had expired for which his pension was granted, the zeal of Volpato had been successful in procuring for him the commission to execute the monument of Clement XIV (Ganganelli). Thus was afforded to the young sculptor an opportunity of exhibiting his powers to a public who were fortunately capable of appreciating his merit. Before the expiration of the 18th century he had produced an amazing quantity of works, at which time it was not the practice (one afterwards introduced by him) to employ inferior workmen to reduce the block to the last shape of the superficies. The enumeration of his works would occupy much more space than can be here assigned to them; they were generally deficient in energy, but abounding in grace and elegance, and in his monumental sculpture there is vast originality of invention, whilst it is free from extravagance. His females are voluptuous but not offensively so, his execution of them exquisite. In the monument executed in memory of the archduchess Christina of Austria there is a pathos in the composition, [illegible] the chain of nature [illegible] Canova died at Venice on the 13th of October 1822, and his remains were removed to his native place, in which he had erected at his own expense a splendid church. Albert Thorwaldsen, a cotemporary of Canova, but much his junior, a native of Denmark, has by his great though irregular and erratic genius raised himself to eminence in Rome as well as in his own country. His powers in basso-relievo are great, but in extending the principles of the art we cannot assign to him a niche in the temple of fame by the side of the man whose merits we have just discussed.

In England the respectable artists Bacon, Banks, and Nollekens were followed by Flaxman,—a name honourable to the arts of this country. Intense feeling and simplicity characterize all his works, and in epic sculpture we think he very far surpassed Canova. He was born at York in 1755 and died in 1826. The lectures which he delivered as professor of sculpture at the Royal Academy have been published. In the present day we apprehend the sculpture of our country supported as it is by the talents of Westmacott, Lough, Rennie, Chantrey, and many others will bear comparison with those of any other country in Europe.

SCULPTURE, PRACTICE OF. What has been said under the article PRACTICE OF PAINTING, relative to anatomy, comparative anatomy, symmetry, invention, expression, and drapery, equally applies to the art of sculpture, and need not be here repeated. We shall, therefore, merely state the different methods practised in producing a work in this art.

A model as large as the intended figure or group is first made in clay. It is placed on a stand called the sculptor's easel, and the general form is got out with the hand and fingers, small box wood tools being made use of to touch the parts that the fingers cannot reach. The clay is kept moist, to prevent its shrinking, till the model is completed. The model is then moulded in plaster of Paris before it begins to dry, whence a matrix is formed, into which plaster is introduced, and the matrix being broken away from it, the model in clay is thus transferred into one of plaster. This becomes the standard from which the artist takes all the measurements for the figure he is about to execute. The block of marble and the model being now placed on stands, with a graduated rod, which moves on a frame perpendicular to it, and has a point attached to it which can be made to advance and recede at pleasure, certain prominent points are selected and marked in the model, and their distance measured on the frame longitudinally and vertically, and also the distance that the point on the rod is advanced or receded to touch a given point. This being found on the outside of the rough block, the particular point is drilled down to as great a distance as was measured in the model. This operation being repeated for a great number of points, the surface is worked away to all the several points found as above, till at last it begins to assume the general form of the model. As the sculptor

approaches the surface which is to be left when finished, more caution and finer tools become necessary, till at length it is brought into a state for his finishing touches The process which we have described of bringing the shapeless block into something like the form it is ultimately to bear, and which is an operation purely mechanical, is performed by inferior workmen, by which the artist's labour and time are much spared It is only with [illegible]

SCUPPER [illegible]

SCURVY [illegible] in our navy, is now of very rare occurrence It generally appears connected with debilitating causes, and especially unwholesome food, want of exercise, and by cold and moisture It begins with indolence, sallow looks, and loss of strength and spirits, the gums become spongy, the teeth loose, the breath fœtid eruptions appear on different parts of the body, and at length the patient sinks under general emaciation, diarrhœa and hæmorrhages In the prevention and cure of this disease, much effected by attention to diet and cleanliness Fresh vegetables, farinaceous substances, and brisk fermented liquors good air and due exercise, are among the principal remedial means Acids, and especially lemon juice, have been much extolled, but the researches of Dr Stevens have rendered [illegible] of acid diet somewhat doubtful

SCUTATE (Lat scutum *a shield*) In Zoology, when a surface is protected by large scales

SCUTELLUM (Lat scutum) A term used by Gærtner to denote the small cotyledon on the outside of the embryo of wheat inserted a little lower down than the other more perfect cotyledon, which is pressed close to the albumen

SCUTIBRANCHIANS, *Scutibranchiata* (Lat scutum, branchiæ *gills*) A name given by Cuvier to an order of heteropodous Gastropodous Mollusks, including those which have the gills covered with a shell in the form of a shield

SCUTIGERS, *Scutigera* (Lat scutum, gero, *I carry*) The name of a genus of unequal-legged Chilopodous Myriapods, which frequent houses and outbuildings in the South of Europe and prey upon insects, wood-lice, and other small creatures

SCUTIPEDS, *Scutipedes* (Lat scutum, *a shield*, pes, *a foot*) The name given by Scopoli to one of the divisions in his binary system of ornithology, including those birds which have the anterior part of the leg covered with segments of unequal horny rings terminating on each side in a groove

SCUTTLE An opening in the ship's side or deck to admit light or air, or for communication

To scuttle the decks, implies to cut holes to let the water down from them into the hold, as in the case of shipping a heavy sea, or of fire

To scuttle a vessel, is to cut a hole in her for the purpose of sinking her

SCUTTLE-BUTT A cask of water with a large hole in it placed for use in a ship

SCUTUM (Lat) The shield of the Roman heavy-armed legionaries was made of wood, defended with plates of iron, and covered with leather It was either oval (ovatum), or of semi cylindrical shape (called imbricatum) Polybius appears to make the latter sort 4 feet long, and it is evident that it covered a great part of the body In the centre was a boss of brass or iron projecting from the shield From this classical word is derived the modern term *esquire*, through the middle ages Lat scutifer *shield-bearer*

SCYLLA In Mythology, the daughter of Nisus king of Megara, who threw herself into the sea for love of Minos, king of Crete, and was turned into a bird Also a poetical monster, half man half dragon, who inhabited the coast of Italy opposite Charybdis, according to the well-known legend in the *Odyssey* The modern town of Scilla stands near the cave dreaded by the [illegible] the habitation of this monster

SCYPHUS (Gr σκυφος, *a cup*) The cup of a narcissus Also, in Lichens, a cup like dilatation of the podetium bearing shields upon its margin

SCYTALE (Gr σκυτος, *a skin*) An instrument used by the Lacedæmonians for the conveyance of secret instructions to their commanders The construction of it was as follows —When a general was sent out, a black rod was given him, while another of exactly similar dimensions was preserved at home When instructions were to be sent out, a strip of parchment was wrapped round the rod, and on the folds the orders were written, which accordingly could not be interpreted unless the parchment were rolled on a similar rod

SEA In Geography, a part of the great ocean *See* OCEAN TIDES

SEA The term used by sailors for a single wave, or for general agitation. In a *long sea*, the waves are distant, in a *short sea*, they are closer and more irregular A *cross sea* is composed of waves moving in different directions

SEA ANEMONE. The name of a highly organized Polype of the genus *Actinia*

SEA BOAT A term applied by seamen to a vessel, as respects [illegible] weather

SEA DEVIL [illegible] name of a large cartilaginous fish of the Ray tribe the type of the genus (*Pteroptera*, Cuvier, also applied to the angler (*Lophius piscatorius*, Linn)

SEAL (Lat sigillum) In Gem Sculpture, a stamp cut or sunk on stone, capable of yielding an impression to any soft substance When a gem is selected for cutting, it is put into the hands of the lapidary to reduce it to shape and smoothness It is then fixed with mastic to a piece of wood to serve as a handle, and the subject is sketched upon it with a copper point or a diamond The tool is a lathe somewhat resembling a turning lathe, into the end of the spindle whereof points, knobs, or circles can be inserted The gem is then applied to the end of one of these tools according to the nature of the cutting required, wetted with emend dust and olive oil, and by frequent working the subject is wrought Frequent impressions are of course taken during the progress, to show the excesses or defects These, however, are not necessary in working cameos, because the prominences are obvious to the eye The tools are soft iron or copper, and the powder of the ruby, or other hard stones, is often substituted for diamond powder

SEAL In Zoology, the English name for a genus of Marine Carnivorous Mammiferous Quadrupeds, otherwise called *Phocidæ* The variety of seals is very great, and they are found in vast numbers in the seas round Spitzbergen, and on the coasts of Labrador and Newfoundland As it frequents the British shores, it is well known, and has been repeatedly described Seals are principally hunted for their oil and skins When taken in the spring of the year, — at which time they are fattest, — a full-grown seal will yield from 8 to 12 gallons of oil, and a small one from 4 to 5 gallons The oil, when extracted before putrefaction has commenced, is beautifully transparent free from smell, and not unpleasant in its taste The skin when tanned, is extensively employed in the making of shoes, and when dressed with the hair on, [illegible] of trunks, &c *See* FISHERIES

SEAL [illegible] charters, commissions, grants of land franchises liberties &c, letters patent and letters close of the king pass the great seal The usual course is, that a grant or letters patent pass by bill, which is prepared by the attorney or solicitor general under warrant from the king It is then subscribed at foot with the sign manual, and sealed with the privy signet In this stage it is next, in some cases, taken directly to pass the great seal In other cases, an extract of the bill is taken to the keeper of the privy seal, who makes out a writ or warrant thereupon to the chancery, where it passes the great seal Then the sign manual is a warrant to the privy seal and that to the great seal There are, however some grants which only pass through certain offices as the Admiralty or Treasury, under the sign manual, requiring neither privy nor great seal The keeper of the great seal has, by 5 Eliz c 18, the same place and jurisdiction as the lord chancellor of England since that statute therefore, both offices cannot exist at the same time in different persons, which was not unfrequently the case before

SEALING-WAX The wax used for sealing letters, legal instruments, &c The best *red* [illegible] by melting in a very gentle heat 48 parts [illegible] with 19 of Venice turpentine and 1 of Peruvian balsam, 32 parts of the finest cinnabar, thoroughly levigated, are then stirred in, and the whole well mixed When it has cooled down, it is either rolled into sticks, or shaped in brass moulds The best *black* sealing wax is a mixture of 60 parts of shell lac and 30 of ivory black, it may be perfumed with a little Peru balsam or styrax The earliest application of sealing-wax to its present use seems to have been made about the year 1553 The first printed account of it is said by Berzelius to have appeared in 1563 The great seals applied in tin boxes to certain legal documents are made of a mixture of 15 parts of Venice turpentine, 5 of olive oil, and 8 of wax melted together, and coloured with red lead

SEAL, PRIVY All charters, pardons, &c, which require the great seal, pass first through the hands of the keeper of the privy seal, and other instruments of less consequence pass the privy seal only A warrant to issue money out of the king's coffers under the privy seal, is sufficient The keeper of the seal is now an [illegible] with the title Lord Privy Seal By 2 W 4 [illegible] of clerks of the signet and privy seal are to be abolished as soon as vacancies occur in them.

SEAMAN A man brought up to the sea, and capable of discharging the duties of that life A complete seaman is called an *able seaman*, and is rated A B, one less competent, an *ordinary seaman*, and a man fresh from [illegible] The [illegible] of the *Commercial* [illegible] wages, and in short all the statistics of seamen.

SEAMS The spaces between the edges of planks when in a ship are caulked and then covered with pitch

SEAMS In Geology, thin layers which separate thicker strata

SEAMEW A name for the gull *See* LARUS

SEARCH WARRANT [illegible] of the peace, under 7 & 8 G 4 [illegible] stolen, or respecting which other offences specified in the act have been committed The warrant is granted on the oath of a credible witness, that he has "reasonable cause to suspect" the goods to be in the possession and on the premises of a certain individual

SEA SICKNESS Nausea and retching, which attack most persons on first going to sea, sometimes continuing only a day or two, but often lasting the whole of a long voyage The most effective antidote, or remedy consists in lying in the horizontal position In some persons its violence is prevented by small doses of opium, or by soda water, or saline draughts in the act of effervescence, liniments and plaisters containing opium applied to the pit of the stomach are also recommended, as mitigating, or even preventing this most annoying malady The violence of the [illegible] not only varies in different individuals at different times, but the same person who escapes in one voyage shall suffer severely in another The cause of sea sickness is probably referable to the influence of the motion of the vessel upon the circulation of the blood it has been compared to the sickness occasioned by swinging For some ingenious observations upon this subject, see Dr Wollaston's Croonian Lecture, in the *Philosophical Transactions* for 1810

SEASONS (Fr saisons) The four quarters of the year, — spring, summer, autumn, winter The seasons are considered as beginning respectively when the sun enters the signs Aries, Cancer, Libra, and Capricorn, so that the *spring* season commences about the 21st of March, *summer* about the 22d of June *autumn* about the 23d of September, and *winter* about the 23d of December

SEA UNICORN The name of the narwhal (*Monodon monoceros* L)

SEA URCHIN The name generally applied to the different species of *Echinus*

SEBA'CEOUS GLANDS Small cuticular glands which secrete a greasy matter, serving to protect and soften the skin or cuticle

SEBA'CIC ACID One of the acids produced during the [illegible] of fat

SECALE [illegible] The ergot or clavus of rye *See* ERGOT

SE'CANT (Lat seco, *I cut*) in Trigonometry is a straight line drawn from the centre of a circle to one extremity of an arc, and produced until it meets the tangent to the other extremity The secant of an arc is a third proportional to the cosine and the radius, hence, if the radius be taken as unit the secant is the reciprocal of the cosine *See* TRIGONOMETRY

SECI'DERS *See* BURGHERS

SE'COND in the Sexagesimal Arithmetic, is the 60th part of a minute, or *prime* Thus a degree of a circle and an hour of time are each divided into 60 minutes and each minute into 60 seconds In the old treatises on astronomy, the seconds are sometimes denominated *second minutes* (minutæ secundæ), while the minutes being the first division of the unit, are the *primes* (minutæ primæ) Following out the analogy the sixtieth part of a second was called a *third*, but this term is not found in modern works It was formerly usual to denote minutes and seconds, both of time and arc by the characters ' and '', but these are now generally used only to indicate minutes and seconds of arc those of time being indicated respectively by the abbreviations *m* and *sec*

SE'COND In Music, a musical interval, being the difference between any sound and the next nearest, whether above or below it It may be either major or minor

SE'CONDARIES, or SECONDARY QUILLS (*Secondariæ*, Linn) The large feathers of the wing which arise from the bones of the antibrachium or fore-arm, and principally from the ulna are so called

SECONDARY CIRCLES in Astronomy are great circles of the sphere perpendicular to another great circle, which is regarded as [illegible] through the poles [illegible] are the circles on which the latitudes of celestial objects are measured

SE'CONDARY ROCKS or STRATA A series of stratified rocks with certain characters, by which they are distinguished as a class from the *primary* rocks, which underlie them, and from the *tertiary* rocks, which [illegible] *See* GEOLOGY

SECONDCOAT In Architecture, either the finishing coat, as in laid and set, or in rendered and set, or it is the floating when the plaster is roughed in, floated, and set for paper

SE'COND SIGHT (called in Gaelic Taischitaraugh, from taisch *an unreal* or *shadowy appearance*). A well-known Highland superstition. In all ages the idea has prevailed that persons endowed with the power of divination did not only foretel by instinct, but had sometimes an actual and mysterious vision of distant or future events as in the lines of Lucan which describe the presage before the battle of Pharsalia

> Fugarunt si vera fides memor imbus, augur
> Concussos
> Vertisse deos et turres maxima, dixit
> Impia [illegible]

But the peculiarity of the Highland superstition seems to consist in this, that persons were supposed to be endowed with the faculty who were in no other respect feared or reverenced for their supernatural powers it was regarded as a mere natural power, like superior sharpness of sight or hearing The inhabitants of the Western Islands were thought to be peculiarly gifted with it It could not be exerted at pleasure, the power came on [illegible] and often to his extreme terror [illegible] certain rules were in fashion for the interpretation of the visions, such, for instance as that mentioned by Sir W Scott, that if a seer saw a figure with its back to him, on altering the position of his own plaid if the figure appeared with its plaid similarly arranged the vision regarded the seer himself Martin, in his *Description of the Western Islands*, seems to have brought this superstition into notice in England It is well known how Johnson undertook the defence of it in his *Journey to the Western Islands*, but in despite of evidence which neither Bacon Boyle, nor Johnson were able to resist, the *taisch*, with all its visionary properties seems to be now universally abandoned to the use of poetry The exquisitely beautiful poem of *Lochiel* will at once occur to the recollection of every reader (Notes to the *Lady of the Lake*) It is finely described by Collins in his ode on the *Superstitions of the Highlands* But the classical bard of the second sight is Sir Walter Scott (See especially his noble ballad *Lord Ronald* the character of Allan Maclister in the *Legend of Montrose* &c &c) How far the belief in second sight is preserved at the present day, we cannot tell Mr Logan in his *Scottish Gael* only says, "It is not so prevalent as formerly" (Vol II 310)

SE'CRETARY An officer employed in writing letters despatches &c under the orders of his superior The title of secretary was first used to denote a public minister in France where the three clerks of the privy council were also termed secretaries as early as the 14th century

SE'CRETARY LORD A high officer in the kingdom of Scotland [illegible] the great prothonotary in foreign courts The office was kept up after the Union, but has been disused since 1746

SE'CRETARY OF STATE One of the highest officers of the British crown This office however is comparatively modern in point of importance the secretary of state having been originally what his name implies a mere servant of the privy council There was only one until the reign of Henry VIII, who added another, but their functions were limited to preparing business for the council board, which they attended afterwards with their proposals Under Elizabeth they became members of the council Queen Anne raised the number to three, by the appointment of a secretary for Scotch affairs — an office which did not long continue, and one for the American department was appointed in the reign of George III but abolished in 1782 At present there are three secretaries of state 1 The Secretary for the Home Department 2 The Colonial Secretary 3 The Secretary for Foreign Affairs In each of these departments there are two under secretaries, one of whom remains in office on a change of ministry The clerks in the Home Office are divided into senior and junior, but no such distinction obtains in the other two Each of the principal secretaries has 6000*l* a year The Alien Office is annexed to the Home Department the State [illegible] all the departments [illegible] is the custody of the privy signet, and the Privy Signet Office in which grants, letters &c, sealed with the privy signet, are made out is in his department The principal secretaries are always ex officio cabinet ministers Their position in the English government is in fact, identical with that of the ministers of home and foreign affairs, &c, in France and other Continental countries The Secretary at War is attached to the War Office His salary is 2480*l*, and he is also frequently, though not always a member of the cabinet The secretary of state for Ireland is also keeper of the privy seal of that part of the kingdom, and chief secretary of the lord lieutenant His office is divided into two departments, military and civil, in each of which an under-secretary is placed Like the secretary at war, he is, though more rarely, sometimes a member of the cabinet

SECRETION (Lat secretio) The process by which substances are separated from the blood in animals, or from the sap of vegetables

In some cases a secretion appears to be a mere separation [illegible] by it, from the blood, but in others the process is much more elaborate and intricate A highly complicated glandular structure is requisite, and the proximate or ultimate elements of the blood are arranged into new combinations, so as to constitute a new and distinct product, of which no traces are to be found in the healthy blood The animal secretions are arranged by Bostock under the heads aqueous, albuminous, mucous, gelatinous, [illegible] Exhalations, as from the skin, the surfaces of the closed cavities of the body, and the lungs, 2 Follicular secretions, which are either cutaneous or mucous, and, 3 Glandular secretions, such as milk, bile, urine, saliva, &c *See* PHYSIOLOGY and BOTANY, &c

SECT A term used in ordinary language to signify any body which separates from the established religion of a country In this sense, the word appears to be derived from Lat seco, *I cut*, sectarians being, as it were, *cut off* from the general mass But on the other hand, the term was anciently applied to the *followers* of some distinguished leader in which sense the idea of *cutting* [illegible] and the word then seems to be derived from Lat sequor, *I follow* The chief sects, both of philosophers and religions, will be found noticed under their respective heads

SECTION (Lat sectio), in Geometry denotes the line formed by the intersection of two surfaces and likewise the surface formed when a solid body is cut by a plane When a plane is cut by a plane the section is a straight line, when a sphere is cut by a plane the section is a circle, and when a cone is cut by a plane the section may be a triangle, a circle, an ellipse an hyperbola or a parabola which five figures are consequently called the *conic sections* (See CONIC SECTIONS) Vieta gave the name of *angular sections* to the branch of analysis which has for its object the investigation of the sines and chords of the multiples and submultiples of a given arc On this subject the student may consult the work of Poinsot entitled *Recherches sur l Analyse des Sections Angulaires*, Paris, 1825 — *Section of a Ratio*, and *Section of a Space*, are terms that were employed by Apollonius of Perga who wrote two books with those titles, the former of which was restored by Dr Halley, and the latter by Willebrord Snell

SECTION In Architecture, the projection or geometrical representation of a building supposed to be cut through so as to exhibit its interior

SECTOR (Lat) In Geometry the *sector of a circle* is a portion of the area of the circle bounded by two radii and the intercepted arc Sectors of different circles are said to be *similar* when the sides or radii include equal angles The area of a sector is equal to that of a triangle whose base is equal to the length of the contained arc, and altitude equal to the radius of the circle

SECTOR A mathematical instrument of considerable use in making diagrams laying down plans &c Its principal advantage consists in the facility with which it gives a graphical determination of proportional quantities, and hence it is called by the French *the compass of proportion*

The instrument consists of two rulers (generally of brass or ivory), representing the radii of a circular arc and moveable round a joint, the middle of which forms the centre of the circle From this centre there are drawn on the faces of the rulers various scales, the choice of which, and the order of their arrangement may be determined by a consideration of the uses for which the instrument is chiefly intended The scales usually put on sectors are of two kinds — single and double, that is to say, such as are drawn only on one of the limbs and such as are drawn on both limbs The first kind however (comprising, for example a line of inches, of chords, sines, logarithms, &c) are not peculiar to the sector but are merely placed there for convenience, and may be used whether the instrument is shut or open Of the lines repeated on both limbs the principal are the following — 1 A line of equal parts, by which, with a pair of compasses, we are enabled on the principle that similar triangles have their homologous sides proportional, to find a third proportional to two given lines, a fourth proportional to three given lines, to diminish a line in any given proportion &c 2 A scale of chords, which enables us to protract an angle of any given number of degrees, to find the degrees which any given angle contains, to cut off an arc of any magnitude from the circumference of a given circle, &c 3 Scales of sines, tangents, and secants, whereby the lengths of those trigonometrical lines corresponding to a given arc of a circle of any radius are determined 4 A line of polygons, whereby the proportional length [illegible] regular polygon (of not more than [illegible] sides, to the radius of the circumscribing circle is found

The sector may be used in trigonometry for obtaining a rough solution of all the cases of right-angled plane triangles, and it is also conveniently applied to the construction of various geometrical problems For a description of its several uses see *Robertson's Treatise of such Mathematical Instruments as are usually put into a Portable Case*

SECTOR In Astronomy, an instrument constructed for the purpose of determining with great accuracy the zenith distances of stars passing within a few degrees of the zenith, where the effect of refraction is small *See* ZENITH SECTOR

SECULAR EQUATION SECULAR INEQUALITY [illegible] In Astronomy, any deviation from the mean motion or mean orbit of a celestial body is called an *inequality*, and the numerical expression of the magnitude and period of the inequality is called an *equation* The equations representing the motions of the bodies of the solar system are of two kinds, *periodic* and *secular* the first being those which pass through all their changes and return to the same state in a comparatively short period of time, and the second such as change their values so slowly that the variation only becomes sensible after the lapse of centuries and require for the accomplishment of the series of their changes a length of time which in some cases astronomers have not yet ventured to calculate Thus the lunar *evection* which depends on the position of the transverse axis of the moon's orbit in respect of the line of the syzygies is a periodic inequality passing through all its different values [illegible] but the acceleration of the moon's mean motion depending on a slow variation of the eccentricity of [illegible] is a *secular* inequality, amounting only to about 10 seconds in a century The secular inequalities are in fact periodic as well as the others, but they proceed so slowly that the observations of many hundreds or even thousands of years would be insufficient to make known their periodicity The discovery of their true nature is one of the results of the theory of gravitation

SECULAR GAMES In Antiquity, were games celebrated once in a hundred years They lasted three days and three nights during which period sacrifices were offered up and theatrical shows exhibited, and combats in the circus, &c took place Valerius Publicola, the first consul created after the expulsion of the kings, A U C 245 was the first who celebrated them at Rome Some authors maintain that the *seculum*, or age, consisted of 100 and others of 110 years, but it is certain several Roman emperors did not allow so long an interval as either period to elapse Thus Augustus celebrated secular games A U 736 Caligula 61 years later and Domitian 26 years afterwards on which occasion Tacitus assisted in the capacity of juris decemvir According to Zosimus the emperor Septimus Severus was the last who celebrated them but other writers have stated that under the emperor Philip A U 1000, these games were held with more magnificence than had ever been before witnessed They were celebrated, in all eight times

The original seculum of the Etruscan augurs is said by some to have been measured by the longest life of those who were born at its commencement, and they had a peculiar tradition, that the duration allotted to nations was measured by a certain number of these secula (Plutarch *Sylla*, Censorinus, *De die Natali*)

SECULARIZATION In Politics the appropriation of church property to secular uses In most European states such appropriations have taken place on a great scale within the last century In [illegible] eat secularization has been that made [illegible] IN VIII

SECULAR POEMS, in Antiquity, were those recited at the celebration of the secular games Of this species of poem the Sapphic Ode of Horace, at the end of his book of *Epods* is a noble specimen Several editions of Horace give the name *secular poem* to the 21st Ode of the first book (See *Niebuhr's Rome*, 2d edition, p 288)

SECULAR REFRIGERATION The periodical cooling and consequent consolidation of the crust of the globe a term used by geologists in reference to the supposed central heat and even fluidity of the globe, and to the phenomena of its [illegible]

SECULAR YEAR [illegible], kept once in a century

SECUNDINE (Lat secundus) In Botany, the outermost but one of the enclosing sacs of the ovulum, [illegible] considers [illegible] Schleider says it is the first, and that the primine or first integument of Mirbel is formed afterwards

In Zoology the foetal membranes collectively are sometimes termed *secundines*

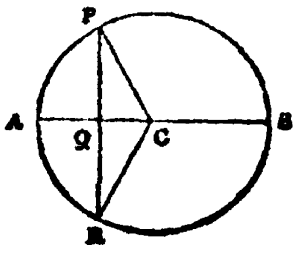
SECURIFERS [illegible] (Lat securis, *a hatchet*, [illegible] *terebrantia*, or boring Hymenopterous insects, comprising those in which the females have a saw shaped or hatchet-shaped terebra or appendage to the posterior part of the abdomen, for the purpose of preparing a place to receive the eggs, and of depositing them therein

SECURIPALPS, *Securipalpi* (Lat *securis*, *a hatchet*, *palpo I feel*) The name of a family of Coleopterous insects, comprehending those in which the maxillary palps terminate in a joint which is elongated and hatchet-shaped.

SE'DATIVES. (Lat *sedo*, *I assuage*) Medicines which assuage pain generally by inducing sleep and diminishing irritability

SI'DENTARIES *Sedentaria* (Lat *sedeo I sit*) The name of a section of cephalous (*branchiferous*) conchifera those which remain nearly stationary during the greater part of their existence with valves of unequal size

The name of the *Sylvia phragmitis*



Bech It is a species of warbler very abundant in this country about the middle of April and emigrates in September It frequents the sedgy banks of rivers, and constructs a nest composed of a little moss intermixed with dry stalks, lined with dry grass and occasionally a few hairs It lays five or six eggs of a light brown colour, mottled with darker shades of the same It is sometimes called *reed bunting*

SEDITION (Lat *se*, *apart*, and *ire*, *to go*) In Law, a general and not strictly technical word comprising, in common language, offences against the state which do not amount to high treason The distinction between the two offences was not very accurately adhered to or defined until later times Sedition is of the like tendency with treason, but without the *overt acts* which are essential to the latter Thus, there are seditious assemblies, seditious libels, &c, as well as direct or indirect threats and acts amounting to sedition, all punishable as misdemeanours The acts 39 G 3 c 79 (by which the famous Corresponding Societies were suppressed) and 57 G 3 c 19 were passed to prevent seditious meetings and assemblies

SEE (Lat *sedes*, *a seat*) The name usually given to the diocese of a bishop in England It was originally applied exclusively to the papal chair at Rome but it has long been used in its present wide signification

SEED, is the reproductive part of a plant resulting from impregnation, and containing the embryo or rudiment of a future plant, or, in other words it is the ovulum in its most perfect and finally organized state It is a form of reproductive matter peculiar to flowering plants, its equivalent in flowerless plants being the spore It is commonly said that as the seed is the part intended by nature to multiply the races of plants special contrivances are provided for ensuring its dispersion and migration from place to place, such for instance as being discharged with force by the sudden explosion of the case or seed-vessel in [illegible] that render [illegible] to a certain [illegible] vessels, as in the instance of the dandelion the ash tree, the sycamore &c in these latter cases the part to which the name of seed is given is a true pericarp or seed vessel On the other hand, many kinds of seed vessels, such, for instance, as those of corn, of labiate and boraginaceous plants, &c, are miscalled seeds, or naked seeds

SE'GMENT (Lat) In Geometry a part cut off from a figure by a line or plane The segment of a circle is a part of the area comprised between an arc and its chord In [illegible] different circles are said to be *similar* when [illegible] have the same ratio to the circumferences of their respective circles or when they contain the same number of degrees The area of a circular segment may be found as follows —Let P R be the chord of a circle whose centre is C, and let A B be the diameter perpendicular to P R, and meeting it in Q, and put $x = A Q$ $y = P Q$, $z = A P$ $r = A C$ the radius, and $\pi = 3.14159$ the ratio of the circumference to the diameter Now the area of the segment P A R is evidently equal to the difference between the sector A P C R and the triangle P C R, but the area of the sector $= r z$ (the radius into half the arc), and the triangle $= y (r - x)$, therefore the segment $= r z - r y + y x$ When the radius of the circle and the chord of the segment (that is r and y) are known, this expression is easily calculated from a table of sines, for the angle A C P is found from its sine $= y \div r$, and when the angle is given the arc is obtained from this proportion, z : πr :: A C P : [illegible] With respect to x, we have from the property of the circle $x = \sqrt{(r^2 - y^2)}$

The superficial and solid contents of a segment of a sphere are found thus —Let S be the spherical surface of the segment of the sphere whose centre is C by the plane P Q R The symbols having the same values as above, the circumference of the circle P Q R is $2 \pi y$, and the differential of the surface is $d S = 2 \pi y d z$ But from the nature of the circle, $y d z = r d x$, hence $d S = 2 \pi r d x$, and $S = 2 \pi r x$, so that the surface of the segment is found in terms of the radius of the sphere [illegible]

Let [illegible] the area of the circle [illegible] the segment $= \pi y^2 d x = 2 \pi r x d x - \pi x^2 d x$, whence $U = \pi x^2 (r - \frac{1}{3} x)$

SEGNO (Ital *a mark*) In Music *See* AL SEGNO

SEGUE (It *it follows*) In Music, a word which, prefixed to a part, denotes that it is immediately to follow the last note of the preceding movement When minims crotchets, &c are subdivided by a stroke drawn through their tails so as to make them into abbreviated groups the term indicates that the following notes are divided similarly to those first marked

SEIDLITZ WATER The mineral water of Seidlitz, a village of Bohemia sulphate of magnesia sulphate of soda, and carbonic acid, are its active ingredients It is often taken as an agreeable and effective aperient The article sold under the name of *Seidlitz powders* is intended to produce the same effect though very different in composition These powders are generally sold in different coloured papers one blue, containing 2 drachms of the potassa-tartrate of soda mixed with 2 scruples of bicarbonate of soda, the other red, containing 35 grains of finely powdered tartaric acid The former powder is dissolved in half a pint of water and the latter in a separate [illegible] ons are then mixed, and taken [illegible]

SEIGNORY (Fr seigneurie) In Lower Canada, the right of feudal superiority in real estate The term fief is applied both to the land held of a seigneur and to the dominium directum, or right of direct seigniory, reserved to him who has granted the land in fief The king has the paramount seigniory in all the feudal lands By 6 G 4 c 59 persons holding fiefs or seigniories may on application to the king obtain a commutation and release of feudal burdens, and the fief or seigniory may be regranted in common socage The land held in seigniory is said to amount to more than 10,000 square miles

SEIGNORAGE An ancient prerogative of the crown whereby it claimed a per-centage upon every ingot of gold or silver brought to the mint to be coined Upon gold it amounted under Edw III to 5s per lb weight, of which a fifth was appropriated to the master of the mint upon silver it varied from 1s to 1s 3d &c, but the amount varied in different reigns The term *seignorage* is used in common language to [illegible]

SEISIN in the Common Law of England, signifies possession either actual (seisin in deed) or in law as where lands have descended to a party who has not entered into actual possession of them, or is by wrong dissessed of them

SEISMO'METER (Gr σεισμος, *an earthquake*) An instrument for measuring the shock of earthquakes and other concussions (*Edin Phil Trans* vol xv p 219)

SE'JANT In Heraldry a term employed to describe beasts when represented in a sitting posture *Sejant-rampant* sitting with the two fore feet lifted up &c

SELACHIANS *Selachi* (Gr σελαχος *a species of scaleless fish*) The name given by Cuvier to the tribe of [illegible] rays and sharks

SELENE [illegible] Greek Mythology, the goddess of the moon Her Latin equivalent was *Luna* She was represented sometimes as the wife, the sister and the daughter of Helios the sun, and was identical with Artemis or Diana which see

SELENITE (Gr σεληνιτης) One of the mineralogical synonyms of crystallized sulphate of lime

SELENIUM (Gr Σεληνη *the moon*) A substance discovered in 1818 by Berzelius In its general chemical habitudes it bears a resemblance to sulphur It has hitherto been obtained in very small quantity, and generally occurs in some of the varieties of iron pyrites It is a brittle opaque substance, tasteless and inodorous, having something of the appearance of lead but of a deep red colour when reduced to powder Its specific gravity is about 4 3 At 212° it becomes soft and tenacious and at 220° is perfectly liquid, at 650° it boils and sublimes It is insoluble in water, and unaltered by air, and when heated by the blowpipe, so as to become oxidized, it exhales a strong odour of horse radish Its equivalent is about 40 It forms an oxide and two acids, the *selenious acid* being a compound of 1 equivalent of selenium and 2 of oxygen and the *selenic acid* of 1 and 3 It also combines with hydrogen, forming the *hydroselenic acid*, a gaseous compound of 40 selenium + 1 hydrogen Its odour at first resembles sulphuretted hydrogen, but it [illegible] productive of certain forms of the epidemic disorder [illegible]

SELENOGRAPHY (Gr Σεληνη, *the moon*, and [illegible] description of the surface of the moon, as geography is a description of the surface of the earth.

SELEUCIDÆ, ERA OF THE In Chronology, the era of the Seleucidæ, otherwise called the Macedonian era, dates from the epoch of the first conquests of Seleucus Nicator in Syria, about 311 years before Christ It was followed generally by the Greek colonies bordering on the Levant, and by the Jews till the 15th century, by whom it was called the *era of contracts* There is considerable difference of opinion among authors respecting the month and day on which the year of this era commenced, so that it is frequently not possible to fix the correspondence of dates, but according to the computation most generally followed, the year 312 of the era of [illegible] 1st of September in the Julian [illegible] ear of our era Hence to reduce a Macedonian date to the common era, subtract 311 years and 4 months

SE'LLA TURCICA A cavity in the *sphenoid* bone it is surrounded by the four clenoid processes, and contains the pituitary gland

SE'LLI The priests of Jupiter who delivered his oracles at the sacred grove of Dodona in Epirus

SE'LTERS or SELTZER WATER A mineral water from Seltzer, about ten miles from Frankfort on the Maine It is an agreeable beverage, from the quantity of free carbonic acid which it contains and which covers its slightly saline taste Common salt with the carbonates of magnesia, lime, and soda, are the saline ingredients

SE'LVAGE A piece of very flexible kind of rope, composed of yarns not twisted together, but laid parallel, and confined by external marline

SE'MAPHORE (Gr σημα, *a sign* and φερω, *I bear*) A term mostly used synonymously with *telegraph* but which as its derivation imports may be applied to any means whatever employed to communicate intelligence by signals *See* TELEGRAPH

SEME' (Fr *semé*) In Heraldry a term employed to describe a field or charge powdered or strewed over with figures such as stars, billets crosses &c

SEMEIO'TIC (Gr σημειον *a sign*) That which relates to the signs or symptoms of diseases

SEMI-ARIANS A branch of the Arian heresy who denied the ὁμοουσιον or [illegible], the Son with the Father, but admitted the ὁμοιουσιον or *similarity of substance* (*See* art ARIANS and Mosheim *Eccl Hist* vol i trans 1790, p 41 *See* HOMOOUSIANS)

SE'MIBREVE (*i e* half a breve) In Music a note whose length is half that of a breve It is the integer whose fractions and multiples express the time of other notes *See* MUSIC

SE'MICIRCLE In Geometry, the half of a circle, or the figure bounded by the diameter and half the circumference

SEMICO'LON *See* PUNCTUATION

SEMICU'BICAL PARABOLA In Analysis a curve of the second order defined by this property that the cubes of the ordinates are proportional to the squares of [illegible] abscissæ or by the equation $y^3 = ax^2$ [illegible] evolute of the common parabola

SE'MIDIAMETER In Geometry half of the diameter, or the part of the diameter of any figure comprehended between the centre and the extremity of the diameter

SEMIDIAPA'SON (Gr) In Music a defective octave, or one diminished by a minor semitone

SE'MIDIAPE'NTE (Gr) In Music, the same as [illegible] which see

SEMIDIATE'SSARON (Gr) In Music, a defective fourth, properly called a *false fourth*

SEMIDI'TONO (Gr) In Music, the same as a *minor third*

SEMIME'TAL A term applied by the old chemists to the brittle metals

SEMIMI'NIMA In Music, a half minim or crotchet

SE'MINYMPH Lyonnet so calls the nymphs of those insects which undergo but slight changes in passing to the perfect or imago stage

SEMIO'PAL A siliceous mineral nearly resembling the common opal

SEMIPA'LMATE (Lat semi, *half*, and palma, *a palm*) In Zoology, when the toes are connected together by a web extending along only their proximal half The term *semi* being frequently used in the composition of zoological terms with the same meaning, it is only requisite to refer to the term to which it is prefixed

SEMI-PELA'GIANS A sect who differ from the Pelagians, from whom they [illegible] the necessity of the divine grace towards the practice of virtue, but at the same time to allow that this grace may be obtained by an effort of the human will (*See* CALVINISTS, PELAGIANS, &c, and Mosheim, *Eccl Hist* vol ii trans 17[illegible] p [illegible])

SE'MIQUADRATE or SEMIQUARTILE. In the language of Astrology [illegible] distant from each other [illegible] 45 degrees *Semiquintile* and *semisextile* have a similar meaning, the first denot[illegible] [illegible] that [illegible]

SE'MIQUAVER In Music, a note whose duration is half [illegible] quaver

SEMISOPRO (It) In Music, a small pause equ[illegible] [illegible] part of a bar in common time

SEMITONE (Gr) In Music, the half of a tone, though, [illegible] speaking, this is not a proper definition of it, musical semitones are of three sorts,—greater, lesser, and natural In keyed instruments which have their sounds fixed, the semitones afford the means of a new sort of scale between the different tones, by which their defects are partially remedied

SEMIVO'WEL, is said of those consonants which, like vowels, can be pronounced independently, or without the aid of any other letter To this class belong *b, d, c, g, k, p, s t v, x*, and *z*

SEMO'NES, in Roman Classical Antiquity, were deities holding [illegible] between the twelve supreme gods and [illegible] class belonged such gods as Vertumnus, Priapus, the Fauns, Satyrs, &c The word *semones* is a contraction of Lat semi, *half*, and homo, *man*

SEMUNCIA A small Roman coin, equivalent to half an ounce being 1-24th of the Roman pound

SENA'RIA (Lat) In ancient Architecture, the pipes of aqueducts, whose diameter was an inch and a half or six quarters, when they were seven quarters they were called *septenaria*, and so on, according to the number of quarters of inches in their diameter

SE'NATE (Lat senatus, *i e assembly of elders*) The deliberative assembly of the Roman people The members of this council were originally chosen from the patricians and were probably single representatives of each of the houses of that order a plebeian senator is first mentioned A U C 355 At the foundation of the city their number was 100, which was doubled on the admission of the Sabines, and increased to 300 by Tarquinius Priscus, but the more ancient members and those admitted by this last king were distinguished by the titles of *patres majorum* and *patres minorum gentium*, or senators of the greater and of the lesser houses respectively In the last ages of the republic the members of the senate amounted to above 400, and were still further raised by the emperors to 1000 The members of the senate were originally chosen by the kings, and afterwards the election fell into the hands of the consuls, military tribunes, and finally of the censors, but the fact of having held certain magistracies, as the quæstorship and all superior posts gave [illegible] [illegible] privilege Under the regal government the [illegible] [illegible] of such affairs as the king proposed to them, and he was said to act according to their counsel On the establishment of the republic the whole power of the state was thrown into its hands, the different magistrates using the authority they enjoyed merely as its delegates The first constitutional check imposed on it was the power of intercession or negativing their proceedings, granted to the tribunes of the commonalty Still while Rome was free the authority of the senate though subordinate to the assembly of the people remained very great It assumed the guardianship of public religion, the management of the [illegible] [illegible] [illegible] of governors to the provinces [illegible] [illegible] [illegible], the direction of diplomatic affairs, and many other functions of importance Under the emperors its power became, in general, little more than nominal, yet the assembly still existed till the occupation of Italy by the Goths in the 13th century after the foundation of Rome and in the last ages of its existence, after the seat of empire had been transferred to Byzantium, it seems to have been the centre of what remained of the old national spirit After that time its existence as a council ceased, though the name of senator was still retained by some noble families of Rome as an empty but high sounding title The senatorial badges were the laticlave or tunic with a purple band, black buskins reaching up to the middle of the leg and a silver crescent on the foot

The affairs of the Italian and provincial towns of the Roman empire, in imitation of the capital, were administered by senates See as to these provincial senates, or curiæ, *Savigny's Hist of the Roman Law*, vol i

SENATE In many republican constitutions of modern times, the upper house of the [illegible] [illegible] assembly has been so called The senate of the United States (*see* CONGRESS) is composed of two members for each state of the Union The senators are chosen by the state for six years [illegible] [illegible], besides its legislative functions, is also [illegible] executive council assisting the president [illegible] necessary for the ratification of treaties appointing ambassadors, judges of the supreme court heads of departments in the administration &c It is also the high court of impeachment for public functionaries

SE'NEGA ROOT The root of the *Polygala senega*. Rattlesnake root It is brought from North America. it has a peculiar pungent flavour, and promotes the flow

of saliva. In large doses, it nauseates and purges It is occasionally used in stimulating gargles, and in America, as an antidote probably a very inefficient one,—to the effect of the bite of the rattlesnake

SE'NEGIN The bitter acrid principle of the *Polygala senega* or rattlesnake root

SE'NESCHAL A French title of office and dignity, derived from the middle ages, answering to that of steward, or high steward, in England They were originally the lieutenants of the dukes and other great feudatories of the kingdom, sometimes termed bailiis, or bailiffs When the kings recovered the rights of suzerainty, and especially the judicial authority, in those provinces which had been previously governed by these great nobles, the bailiffs and seneschals continued as royal judges and superintendents, both military and financial, but their powers like those of the dukes and counts whom they succeeded, were gradually encroached on by the crown

SENNA LEAVES The leaves of the *Cassia senna* They are imported from Alexandria, whither they are brought from Upper Egypt They are largely mixed with the leaves of the *Cynanchum oleafolium* or *Argel*, which are thick, and not ribbed like the genuine senna leaves, and which have a disagreeable taste, and render the use of senna leaves are distinctly ribbed thin generally pointed and when chewed have a peculiar nauseous flavour and yield a dark brown infusion It is a griping, nauseating and somewhat drastic purge and a most valuable addition to or vehicle for, other purgatives

SE'NSES (Lat sentio *I feel*) The faculties are so called by which we become acquainted with the properties and states of external things They are five in number —sight hearing taste touch and smell for the physiology of which the reader is referred to the articles, such as EYE, EAR, SMELL &c See also NERVOUS SYSTEM We can only here advert to the fact that the late Dr Thomas Brown of Edinburgh and Sir C Bell have propounded the novel doctrine of a sixth sense called the *muscular* sense (our whole muscular frame being supposed to be endowed with a distinct order of sense), —a doctrine which had also found numerous supporters but to which Mr Whewell has recently declared his adherence in his *Philosophy of the Inductive Sciences* &c This part of the subject is ably treated in the *Edin Review* vol lxxiv

SENSITIVE PLANT This name is generally applied to a small annual called *Mimosa pudica* inhabiting the tropics of America It has a stem about a foot and a half high, covered with stiff hairs, the leaves are bipinnate in six or eight pairs, and the flowers are collected in [illegible] It derives its name from the irritability of its leaves, which collapse and fold up when touched or even when irritated by casting on them the focus of a burning glass, or by exposing them to the vapour of hydrocyanic acid The cause of this irritability has been investigated by Dutrochet (*Mémoires pour servir à l'Hist Anat et Phys des Végétaux* &c vol i 534) who refers the phenomenon to the action of endosmose and to the operation of a "fibrous tissue capable of moving inward under the influence of [illegible] Without attempting to analyze the speculations which however curious can scarcely be said to throw much new light upon the subject, it will be sufficient to explain the nature of the phenomena themselves When the leaf of a sensitive plant is at rest it consists of many leaflets spreading flat, and connected in pairs along the sides of certain common leaf-stalks When one of these leaflets is irritated the pair to which it belongs rise upward and apply their faces to each other, this is rapidly followed by the same action in the succeeding leaflets and in the course of a few seconds the whole of the leaflets are in a state of collapse, then the leaf itself suddenly bends downwards and if the plant is in very good health the shock thus communicated to one leaf will extend to those immediately above and below it After a time the leaf resumes its original position Upon the approach of night that is to say, upon the withdrawal of light the leaf falls of itself into the same state without any special irritation This kind of irritability is by no means confined to the *Mimosa pudica*, on the contrary, some other species of the same genus, as the *M dormiens*, *sensitiva casta*, *arenaria pectinata* &c possess the same property as is indicated by their names And in the Leguminous order, it is also found beyond the genus *Mimosa*, as in the *Hedysarum gyrans*, whose three leaflets are in a continual state of dancing or balancing during the day In fact the folding their leaves at night, which is universal in all the compound-leaved species of this order, [illegible] Nor is such irritability confined to this order, the ternate and pinnate leaved species of *Oxalis*, the *Diandra muscipula*, and numerous others [illegible]

SENSUALISM [illegible] that theory which resolves all our mental acts and intellectual powers into various modifications of mere sensation The best known, and the most elaborate attempt of this kind which has been made in modern times, is that of Condillac, who conceived that he was following out the principles of Locke into their legitimate consequences For this belief it cannot be denied that there exists at least plausible ground Locke does indeed draw a distinction between sensation and reflection, as separate sources of "ideas," but his account of reflection is so vague and its existence appears so unphilosophical a supposition as to justify the attempt to reduce it to mere revived sensation The writings of Condillac may be regarded as a fair *reductio ad absurdum* of the theory which attempts to explain the existence of our mental phenomena independently of conditions in the mind itself The theory opposed to sensualism is called *intellectualism*

SENTENCE In English Law the decree or judgment [illegible] of a convicted person

SENTRY (It *I perceive*) The name given to a soldier when placed on guard In all the countries of Europe, sentries are relieved every two hours

SE'NZA (It *without*), in Music, signifies without, as *senza stromenti*, without instruments, *con è senza violini*, with and without violins

SE'PALS The divisions of that portion of a flower called the *calyx*

SE'PARATISTS A religious sect which originated in Dublin about the year 1803 Their principle like that of most sects at their commencement, was to return more nearly to what they conceived to be the primitive form of Christianity There is nothing very peculiar in their tenets, beyond their withdrawal from the fellowship of other Christian bodies In the year 1833 an act of parliament was passed for their relief in the matter of oaths

SE'PARATISTS, or MOTAZALITES The name of one of the chief heretical sects of the Mohammedans They were the followers of Wasel Ebn Orta who dissented from the main body of the Mohammedans about the 40th year of the Hegira Their leading tenets consisted in rejecting the eternal attributes of God, in denying the great doctrine of predestination, so zealously cherished by all the orthodox Mussulmans, and in asserting the free agency of man This sect is said to have been the first inventors of scholastic divinity, and are subdivided into several inferior sects, which mutually brand one another as infidels (*Sale's Koran* Preliminary Discourse, vol i p 212) The great opponents of the Separatists were the Sefatians who maintained the eternal attributes of God (hence they were called *Sefati*, or Attributists), but who afterwards adopted a belief in the outward resemblance of God to created beings This sect was afterwards subdivided into various sects, the chief of which were the Asharians Moshabbehites Kerammians, Jabarians, and Morgians for an account of which the reader is referred to the *Preliminary Discourse* above mentioned

SEPIA In the Fine Arts a species of pigment prepared from a black juice secreted by certain glands of the *sepia* or cuttlefish which the animal ejects both to darken the water when it is pursued, and as a direct means of annoyance That this juice was used as ink by the ancients is well known

> Tunc queritur, crassus calamo quod pendeat humor,
>
> [illegible]
>
> *Pers* Sat III

Compare Pliny (*Nat Hist* l ii c 29) where he says that it was the property of this fish when it was enclosed by a net to shed a black juice, which so darkened the water that the fisherman could not see it All the varieties of the sepia yield this juice, but the *Sepia officinalis* which is so common in the Mediterranean, is chiefly sought after, from the profusion of colour which it affords It is insoluble in water, but is extremely diffusible through it and is very slowly deposited When prepared with caustic lye, it forms a beautiful brown colour with a fine grain, and has given name to a species of drawing now extensively cultivated for landscapes and other branches of the fine arts The honour of the invention of the sepia drawing is due to Professor Seidelmann of Dresden, who discovered it at Rome in 1777

SEPIADÆ (Gr σηπια) Cuttle fish tribe The name of the family of Decapodous Dibranchiate Cephalopods of which the cuttle fish (*Sepia officinalis*) is the type They are characterized by the [illegible] of a shell, in the form of a friable calcareous plate, imbedded in the back part of the mantle, and of which the mate[illegible]

SEPIOLA (Lat sepia, *a cuttle fish*) The name of a genus of Decapodous Dibranchiate Cephalopods, of which the species are of small size, and are characterized by short, rounded, advanced subdorsal fins, and a short internal horny style

SE'PIUM. The bone or internal shell of the cuttle-fish

SE'POY (A corruption of the Indian word sipahi, *soldier*) The designation of the native troops in the service of the East India Company They were so called as early as 1708 (see *Mill's British India*, book iv ch 1), although at that period they do not seem to have been as yet disciplined in the European fashion, nor, indeed, until long after other European powers had set the example (See the *United Service Journal* for 1836 vol i p 461, where there is a valuable paper on the "History and Character of the Indian Army") The first Sepoys (says the author) who were raised and regularly disciplined by the English, seem to have been carefully chosen either from among the Mohammedan portion of the population, or from among the higher castes of Hindoos, a considerable proportion of the latter being Rajpoots the most warlike of Indian races But the necessities of the service have subsequently introduced a greater mixture in their ranks The character of the Sepoys as soldiers has been the subject of much discussion According to a writer in the same periodical (1831, vol iii p 3) "the Sepoys have justly been celebrated for excellent qualities as for instance patience and fortitude under difficulties and privations But on the other hand, if we analyze the account of the wars in which they have been employed, we shall find that they seem to possess passive rather than active courage, for instance that in line they will remain steady under fire in a broken or close country, however where skirmishers and small detachments are necessarily most employed they are found w[illegible] Officers however disagree even from this [illegible] At all events their fidelity and respect for their officers have generally been found of the highest and most durable character, the famous mutinies of Vellore in 1806 and Barrackpore in 1824 having been both, it is generally thought provoked by the mismanagement of their superiors Some indeed allege that these qualities received a severe shock in 1796, when a considerable alteration was made in the organization of the Indian army and a larger proportion of British officers introduced so that the internal economy of their battalions ceased to be superintended by their own subadars The Sepoys of Madras says Sir J Malcolm (*Quarterly Rev* vol xviii) still remember with pride the campaigns of Clive and Coote which are far beyond the memory of the present generation The native Indian cannot rise higher than the rank of ensign or cornet The native cavalry is of more recent introduction and seems scarcely to merit the praise of steadiness which all agree in bestowing on the infantry (See also *Williams's Indian Army*, Alison *Hist of the Revolution* chap li Sir J Malcolm's *Political History of India*, vol ii chap x)

SEPS (Lat *a species of serpent*) The name of a genus of Saurian reptiles which have a long round serpentiform body and four very short legs each terminated in the common seps (*Seps chalcides*) by only three toes

SEPTA'RIA Nodules of indurated and slightly ferruginous marl with interior fissures generally filled with some crystallized mineral such as carbonate of lime quartz, sulphate of baryta, &c thus dividing the section of the nodule into *septa* or distinct partitions When calcined and reduced to powder these septaria furnish the valuable mortar called *Roman* or *Parker's cement*, which has the property of hardening under water

SEPTE'MBER (Lat septem, *seven*) so called from its being the seventh month in the Roman year as established by Romulus, which began with March is the ninth month in the calendar of Numa Several of the Roman emperors gave names to this month in honour of themselves, but, unlike the month of August whose ancient name of Sextilis has been quite merged in that of Augustus the name of September has outlived every other [illegible]

SEPTEMBRISTS The name given to the agents in the dreadful massacre which took place in Paris on September 2 1792 during the French Revolution The numbers that perished in this massacre have been variously given but the term has become proverbial throughout Europe for all that is bloodthirsty and malignant in human nature

SEPTE'MVIRI EPULONUM Certain priests in ancient Rome were so called, whose duty consisted in preparing the sacred feasts at games, processions, and on other solemn occasions They were assistants to the *pontifices*, certain of whose privileges, such as the right of [illegible] enjoyed Their office was [illegible] at first they were only three in number, which was increased to seven, it is supposed, by Sylla

SE'PTIC (Gr σηπτος, *putrid*) A term applied by the old chemists and physiologists to certain substances supposed to promote putrefaction

SEPTUAGE'SIMA (Lat *seventieth*) In the Ecclesiastical Calendar, the third Sunday before Lent, the first Sunday in Lent being termed Quadragesima (fortieth), the three preceding ones Septuagesima, Sexagesima and Quinquagesima

SEPTUAGINT (Lat *seventy*) The Greek translation of the Old Testament made at Alexandria for the advantage of the Jews of Egypt who had lost the use of the Hebrew language According to the old tradition, this version was the work of [illegible] who were shut up in [illegible] Ptolemy Philadelphus, and there completed the whole translation alone, in which, upon examination they were all found to agree to a letter,—a prodigy which established the inspiration of the work It is supposed, however, by modern critics, that this version of the several books is the work not only of different hands, but of separate times, although the general design may have been that which we have mentioned The authority of the Septuagint, as compared with the Hebrew text, from which it differs in many points, has been the subject of much controversy It is from this version that the authenticity of the Apocrypha which are not found in the Hebrew is asserted by Roman Catholic writers The quotations of the Old Testament which are found in the New are for the most part given in the words of the [illegible] (See *Prideaux Connection*)

SEPTUM (Lat *a partition*) In Botany, any partition separating a body into two or more cells in a direction parallel with the longer axis Partitions parallel with the shorter axis are called *phragmata*

SEPTUM In Anatomy the plate or wall which separates from each other two adjoining cavities, as the septum transversum, or diaphragm, between the chest and the abdomen, the septum narium, between the two nasal passages, the septum ventriculosum in the brain, and in the heart, &c The partitions of chambered shells are also called *septa*

SE'PULCHRE *See* TOMB

SE'PULCHRE, SAINT, HOSPITALLERS OF An order of knighthood, originally instituted in Palestine, afterwards established in France by Louis VII, and united by Pope Innocent VIII to that of Malta, but the order still continued to exist in France, and was taken under protection by Louis XVIII in 1814

SE'PULCHRE RITES OF (Lat sepelio, *I bury*), signify literally the ceremonies performed in depositing the bodies of the dead *in the earth*, but the expression is applied in a more extended signification to all ceremonies of this kind whether they consist in *interment*, *incremation* or *embalming* A veneration for the dead has characterized the history of every age and country, and the different kinds of funeral rites that prevail among different nations are intimately connected with their religious feelings, and form important testimonies at once of their modes of thinking and degrees of civilization The three chief modes of treating the dead that have prevailed from the earliest ages down to the present times are burning interment, and embalming*, and all these modes were accompanied by ceremonies differing according to the genius or taste of the different people but bearing in [illegible] such strong features of resemblance as seem clearly to indicate the universality of the feeling which led to their adoption The peculiar solemnities of the Greeks and Romans, among whom both incremation and interment prevailed though the former was by far the most frequent, need not be detailed in this place Among the Romans, the importance of burial to the dead may be gathered from the belief, that the souls of the unburied wandered a hundred years on the borders of the Styx before they were admitted to the infernal regions The practice, peculiar to the Egyptians of embalming their dead, has been noticed under MUMMY, and the custom still prevalent in India—which it may be truly said monopolizes the cruelties of funereal observances—of immolating women on the funeral pile of their husbands, will be found under SUTTEE The practice of interment has been adopted by all the nations that have embraced Christianity See CEMETERY

[illegible]

SEQUESTRATION [illegible] execution for debt in the case of a beneficed clergyman, issued by the bishop of the diocese on the receipt of a writ to that effect The profits of the benefice are paid over to the creditor until his claim is satisfied *Sequestration* is also, in Chancery, the setting aside from both parties the matter in controversy

SEQUESTRATION In Scottish Law—1. A species of diligence (i e a process), used where two or more creditors are in competition for the property of a land estate, the

* The singular usage adopted by the followers of Zoroaster and still preserved in Thibet, is worthy of [illegible] from an idea that the pure elements of earth and fire would be contaminated by being made the instruments of dissolution, the corpse is laid upon a [illegible] and enclosed within massy walls and towers to the wolves and the vultures (*Schlegel's History of Literature*)

owner of which is in insolvent circumstances, or where the right to a land estate is the subject of litigation In these cases the court may, on application, sequestrate the rents, and employ a factor to collect them 2. Sequestration is also the process whereby the whole estate both heritable and moveable, of a bankrupt, is distributed equitably amongst his creditors It is granted on application to the court of session by the bankrupt, with the concurrence of one or more creditors, or on their application, and on citation of the bankrupt, and is analogous to a fiat in bankruptcy in English law

SE'QUIN (Ital zecchino, derived from zecca, *a mint*) The gold pieces of Venice were originally so called, afterwards the name was extended to other gold coins in use in the Mediterranean, as those of the Pope, the Sultan Florence, and Genoa *See* MONEY

SERAGLIO An Italian corruption of the oriental word *serai* The palace of the Turkish sultan in Constantinople is thus designated by European writers "The principal gate of the seraglio is the Bab Humayun, or Sublime Gate whence the ordinary title of the Turkish government is derived

SERAPHIM or ILLUS ORDER OF THE An ancient Swedish order of knighthood instituted in 1334, but dormant from the period of the Reformation until 1748 The number of knights besides the king and members of the royal family is limited to twenty four

SE'RAPHINE A keyed musical wind instrument of the organ species adapted to the size of a chamber

SE'RAPHIS or SERAPHIM (Heb *to purify*) In the Celestial Hierarchy, the angels of the highest rank They are represented as surrounding the throne of God, whose messengers they are and being more immediately inspired with the Divine love which they communicate to the inferior inhabitants of heaven They are almost invariably spoken of in connection with the *cherubim* whom they resemble both in rank and attributes

SERA'PIS An Egyptian deity The image and worship of this god were brought from Sinope in Pontus to Alexandria, in the last year of Ptolemy Soter, in consequence, it is said, of a vision of Ptolemy I According to some accounts this image was a statue of Jupiter, but however this may have been, Serapis was clearly as Sir G Wilkinson expresses it (*Anc Egypt* iv 360) 'at most a Græco-Egyptian deity' And there is no foundation for the notion entertained by some early Christian fathers, that he represented the Patriarch Joseph (which they supported by an argument drawn from the ornament in the shape of a bushel which the images of this god usually bore on the head), or for that of some modern antiquaries that it was another name for Apis (*Plut de Is et Osir Quart Rev*, July, 1840)

SE'RASQUIER The name given by the Turks to the commanders in chief of the [illegible] compounded 'two Persian words signifying [illegible] *chief of the head*'

SERENA'DE (Span *serena*, [illegible] *clear, serene*) [illegible] air on a *serene* evening but it is now universally applied to a musical performance made by gentlemen in a spirit of gallantry under the windows of ladies whom they admire This practice, which was formerly very general in Spain and Italy has latterly fallen greatly into disuse in these countries, but it is still very common in the German university towns where the students are in the habit of assembling in the evening under the windows of a favourite professor, and offering him a musical tribute

SERENE SERENE HIGHNESS, SERENITY (Germ durchlaucht) Title of courtesy in European etiquette of considerable antiquity Before the dissolution of the German empire Serene and Most Serene Highness were the appropriate addresses of princely houses holding immediately of the empire Since that period the rules of princely etiquette have become more uncertain, but it appears to be the general principle that these titles belong of right to members of the families of sovereign houses in the confederacy and also to members of ci-devant sovereign houses *now mediatized*, and that sovereign princes can moreover concede these appellations to princes not sovereign within their own dominions, but not so as to give them a title to it out of them But the distinctions as to the mode in which these titles are to be employed in addressing superiors, equals and inferiors are extremely complicated

SERF (Lat *servus*) The French name for the lowest class of slaves in the dark ages those who were incapable of holding property attached to the land and liable to feudal services of the lowest description In England this appears to have been the general character of the condition of the *villeins*; but in France and Germany Mr Hallam thinks that the villeins, properly so called, were a superior class, only bound to fixed payments and duties in respect of their land (*Middle Ages*, chap. ii part 2 *See* VILLEIN) The emancipation of this class in France was extremely gradual Louis Hutin enfranchised [illegible] by edict in 1315; but it does [illegible] immediately into execution, and a limited kind of servitude existed in some places down to the Revolution The "serfs," or "gens de main morte" on some estates (*e g* in part of Champagne and Nivernois), could not leave their habitations, and might be followed by the lord in any part of France for the *taille*, or villein tax, which in some localities was not permanent but *a volonté* (See, as to the [illegible] a memoir by Duprey, *Hist de la Serf*

SERGE A thick woollen, extensively manufactured in Devonshire and other English counties

SERGEANT *See* SERJEANT

SERIES (Lat *order*), in Arithmetic and Algebra, is a progression of numbers or quantities which succeed each other according to some determinate law Thus, the progression of the natural numbers 1, 2, 3 4, 5, &c constitutes a series, the law of which is, that any term is greater by unity than the preceding As the law which connects the terms may be varied in an infinite number of ways, it follows that series may have an infinite number of different forms thus, an *arithmetical* series is one in which each term differs from the preceding by a constant number or quantity, a [illegible] in which each term is a multiple [illegible] constant factor

The usual form of a series is a set of terms connected by the signs + or — When the number of terms is greater than any assignable number, the series is said to be *infinite*

A *converging series* is one in which the successive terms become less and less, each being smaller than that which immediately precedes it

A *diverging series* is one in which any term is greater than the preceding

A *recurring series* is one in which each term is a certain constant function of two or more of the preceding terms Thus $1 + 3x + 4x^2 + 7x^3 + 11x^4 +$ &c, is a recurring series every term being formed in the same manner from the two immediately preceding This series is formed by the expansion by division of the algebraic fraction $\frac{1 + 2x}{1 - x - x^2}$

An *exponential series* is one whose terms depend on exponential quantities [illegible] *logarithmic series* is one whose terms depend on logarithms and a *circular series* one whose terms depend on circular functions, as sines, cosines &c

The *general term* of a series is a function of some indeterminate quantity x which, on substituting successively the numbers 1, 2, 3, &c for x, produces the terms of the series

In general the principal questions which arise respecting series are to find the sum of all the terms, or of a given number of them, and the exposition of the methods which have been invented for this purpose forms an extensive and important part of every treatise on the calculus The student may be recommended in particular to Euler's *Introductio in Analysin Infinitorum*, and *Calculus Differentialis*, and the third volume of Lacroix's *Calcul Differentiel et Integral*

SERJEANT (Lat *servientes*) Serjeant at law is the highest degree in the common law, and all must proceed through this degree before attaining the dignity of judge The Court of Common Pleas is open to serjeants only for the purpose of pleading This exclusive privilege was attempted to be taken away in 1834, and for five years the court was thrown open But after solemn argument it was decided by the privy council that this enlargement was unwarranted, and the former practice again prevails Serjeants at law are now made by the king's writ commanding them to take their degree No precise time seems now necessary to permit a barrister to become a serjeant (See Serjeant Manning's learned work *Servientes ad Legem*)

SERJEANT In the Army a non commissioned officer, both in infantry and cavalry regiments whose duty it is to form the ranks and to instruct recruits in discipline On parade they act as fuglemen, in going through the evolutions The serjeant-major is a non-commissioned officer who acts as assistant to the adjutant, but originally he was a field officer, corresponding in rank to the modern major Colour-serjeants are certain non-commissioned officers appointed to attend the officers who have charge of the colours of the regiment

SERJEANT, KING'S One or more of the serjeants-at law, whose presumed duty is to plead for the king in cases [illegible] as indictments for treason, &c

SERJEANTS-AT-ARMS Officers whose duty is to attend the person of the king, the lord-high-steward when sitting in judgment on a traitor, &c The whole [illegible] (13 R 2) to thirty. [illegible] belonging to attend at the houses of parliament during their sittings, and each has a deputy In the House of Lords, the practical maintenance of decorum below the bar, near the throne, and in the gallery, devolves upon the gentleman and

yeoman usher, with their assistants; so that "the serjeant at arms attending the House of Lords" has less responsible duties to perform than those which devolve upon "the serjeant attending the House of Commons" both, however, execute the commands of the house to which they belong, as regards the apprehension or custody of all persons committed by order of parliament In the House of Commons, the serjeant-at-arms is an officer of considerable importance, enjoying large emoluments, assisted by a deputy and several subordinate officers During the sittings of the house he occupies a chair below the bar, and he directs a large proportion of the arrangements connected with the maintenance of order in the approaches to the house and the offices adjacent He is at once the executive and the ceremonial officer of the lower house, but his discretionary powers are not extensive, for almost all his more important duties are performed under the immediate direction of the house itself, communicated through the speaker The office is usually held by a gentleman of the military profession, seldom under the rank of a field officer

SERJEANTY, GRAND AND PETTY In English Law, feudal tenures Tenure by grand serjeanty was where the tenant held land of the king by service, to be performed in his own person, in his wars, &c, such as to bear a banner or spear, or to assist at his coronation Tenure by petit serjeanty was where the owner was bound to contribute some small thing towards military service, &c, such as a sword, dagger, bow, or spear Tenure by grand serjeanty was preserved by stat 12 C 2 which abolished the other feudal tenures and still subsists in some cases, as, for instance the family of Dymoke hold the lands of Scrivelsby by the service of attending as champions at royal coronations

SERMON In Ecclesiastical usage The use of the sermon or homily as a portion of the communion service is said to be of remote antiquity This ancient custom fell into partial disuse during a great part of the middle ages The Homilies of Ælfric, archbishop of Canterbury in the 10th century were long used in the English church, but these became antiquated, and in the year 1281, says Mr Palmer (*Orig Liturg* vol ii ch 4) preaching seems to have been generally omitted In that year Archbishop Peckham ordered in his Constitutions, that four sermons should be delivered during the year But for some time prior to the Reformation preaching was again coming more into use and the publication of homilies by authority seems to have completely restored the ancient practice See HOMILY

SERON A buffalo's hide, used for packing drugs and other articles

SERO'SITY (Lat serum) The liquid which exudes from the serum of the blood when it is coagulated by heat It is water holding some of the salts of the blood and a trace of albumen in solution

SE'RPENS or SERPENS OPHIUCHI In Astronomy, one of the ancient constellations in the northern hemisphere

SERPENT In *Zoology*, a general name for the species of the order *Ophidia*

Serpents are divided into spurious or *Pseudophidians* and true or *Ophidians* proper The *Pseudophidians*, although presenting the well marked external characters of the order, retain an imperfect pelvis a small sternum scapulæ, and coracoids or clavicles, hidden beneath the skin, whereby, as well as in the structure of the skull, they approach the Saurian order The common blind worm (*Anguis fragilis*) is a native representative of the *Pseudophidian* family

The true serpents have neither sternum nor vestige of the scapular arch they have no third eyelid nor tympanum, but the auditory ossicle exists beneath the skin, and its handle passes behind the tympanic bone Several species retain a vestige of hind-limbs, which in some even shows itself externally in the form of a small hook The chief subdivisions of the true *Ophidians* are — the *Amphisbænæ*, the *Typhlopes*, the *Roles* (*Tortrix*), the *Boas*, the *Pythons*, the *Coluberes*, the *Acrochords*, — all which tribes are non-venomous The *Pseudoboas*, *Rattlesnakes Trigonocephali* and *Vipers* are the venomous tribes, and are distinguished by having the superior maxillary bones short and moveable supporting fewer teeth than in the non venomous serpents, and having the first of the short series larger than the rest, sometimes the only conspicuous fang, and traversed by the duct of a poison-gland, around which duct the tooth is, as it were longitudinally folded, so as to appear perforated by a canal The last tribe of true serpents includes the *Hydrophides*, or sea snakes, which have likewise a poison-gland and duct, the latter being inclosed by the last instead of the first of the maxillary series of teeth The tail of the sea-snakes is flattened vertically, and forms their chief organ of swimming No species of this family has yet been discovered which exceeds seven feet in length

The remains of an extinct genus of serpents (*Palæophis*), indicating species of from ten to twenty feet in length, have been discovered in the Eocene tertiary formations in Suffolk Kent and Sussex (See Mr Owen's Paper in the *Geological Transactions*, 2d Series, vol vi p 209)

In antiquity the serpent played an important part By some nations it was regarded as the emblem of cunning, deceit, and wickedness (compare the narration of the fall of man in Genesis with the Persian saga of Ahreman and Ormuzd), by others, such as the Egyptians and Phœnicians, it was looked upon as a good genius (*αγαθοδαιμων*), and worshipped as the emblem of fertility, while by the Greeks and Romans, whose mythology originated undoubtedly from Egypt and the East, it appeared under a variety of symbolic representations With the latter the serpent was the well known emblem of the healing art, and in the present time a serpent with its tail in its mouth is regarded as an emblem of eternity The serpent appears also to have held a place in the Scandinavian mythology, where it was regarded as a symbol of the human passions In the early ages of the Christian church, a sect of the Gnostics, also worshipped the serpent whence they were called Ophites from Gr *οφις*, *a serpent* (See *Mosheim's Geschichte der Schlangenbrüder der ersten Kirche*)

SERPENT (So called from its form) A musical brass wind instrument, serving as bass to the horns or cornets It is most generally covered with leather, and has three parts, — a mouth piece, neck, and tail The compass is two octaves, produced by six holes stopped with the fingers

SERPENTARIUS One of the ancient northern constellations, represented on the globes by the figure of a man grasping a serpent (*serpens*) in his hand *See* CONSTELLATION

SERPENTINE A magnesian rock of various colours, and often speckled like a serpent's back *See* GEOLOGY

SERPIGO *See* RINGWORM

SERPULIANS *Serpulæ* (Lat serpo, *I creep*) The name of a family of Cephalobranchiate Anellidans, inhabiting cylindrical and tortuous calcareous tubes, generally parasitic on shells

SERRATE (Lat serra, *a saw*) In Zoology, when a part is cut into teeth like a saw, or is armed with teeth whose sides are unequal

SERRICORNS, *Serricornes* (Lat serra, *a saw*, cornu *a horn*) The name of a family of Coleopterous insects, comprehending those which have serrated or saw-shaped antennæ

SERTULA'RIA (Lat sertum, *a wreath*) The name of a genus of compound tubular Polypes, restricted, in modern zoology to those species in which the cells are arranged on two sides of the stem, either opposite or alternate

SERUM (Lat) The fluid which separates from blood [illegible] *See* BLOOD

SERVANT [illegible] the [illegible] in the [illegible] [illegible] vocate [illegible] following years

SERVITES (Servants of the blessed Virgin) A religious order instituted in Tuscany in A D 1233, under the rule of St Augustin The monks wore a black habit, in commemoration of the widowhood of the Virgin (*Mosheim* cent xiii part 2)

SERVITOR (Lat) An undergraduate who is partly supported by the college funds is so called at Oxford The servitors at Oxford are the same class as the sizars at Cambridge

SERVITUDE in the Civil Law, is divided into real or predial mixed, and personal the first being the subjection of an inheritable thing to certain duties or services towards another inheritable thing, the second, that of an inheritable thing towards a person, the third, that of a person towards a person or thing, *i e* slavery, whether by dependence on a person or on the soil The word *servitude* is equally applicable to the duty or burden, and to the right of exacting it [illegible] enjoys on the land of B, and [illegible] to permit that right to be exercised, are both designated by the term *servitude*, the first active the latter passive Real servitudes are numerous, and fall into several classes or divisions They are for example either *visible*, such as the right to light and air, sewers, &c, or *latent*, such as the right of way right of drawing water, &c, which appear only when they are exercised They were also divided by the Romans into urban, which affected dwellings in the city, and rustic, appertaining to land and farm building Of mixed servitudes only three species were recognized by their writers on jurisprudence — usufruct, use and habitation

SESAMOID BONES (Gr *σησαμον a seed or grain*, and *ειδος, form*) Small bones found at the articulations of the great toes, and occasionally at the joints of the thumbs Little tendinous ossifications are sometimes met with in other parts, especially in the advanced age of laborious persons

SE'SAMUM. (Gr *σησαμον.*) A genus of plants of the natural family *Pedaliæ* They are supposed originally to have been natives of India, but are now cultivated in many countries Their seeds, which are employed as an article of diet, and yield an oil of a very fine quality, form an extensive article of commerce in the East All the species are annuals The term *sesame* has long been familiar to all the readers of the *Arabian Nights' Entertainments*

SESIA (Gr *σης a moth*) The name of a genus of Lepidopterous insects

SESQUI, Lat, applied to words, signifies one integer and a half, as sesqui granum, *a grain and a half*, &c In Chemistry this term is used to designate compounds in which an equivalent and a half of one substance are combined with one of another, thus sesquicarbonate of soda is a salt composed of one equivalent and a half of carbonic acid with one of soda

SESQUI In Music, a whole and a half, which joined with *altera*, *terza*, *quarta* &c, is much used in the Italian music to express a set of ratios, particularly the several species of triple time

SESQUI In Geometry, the expression of a ratio in which the greater term contains the [illegible] a certain aliquot part of the less over [illegible] remaining is half the less term, the ratio is called *sesquialtera*, if the [illegible] be a third of the less term (as in the [illegible] ratio is called *sesquitertia*, and so on These terms are nearly obsolete *Sesquiduplicate*, however, sometimes occurs in modern treatises, and signifies the ratio in which the greater term is twice and a half times the less, as the ratio of 10 to 4, or of 15 to 6

SESSILIS (Lat *sedeo, I sit*) The name of a division of [illegible] comprehending those species which are not suspended by a pedicle

SE'SSION COURT OF The supreme civil court of Scotland having jurisdiction in all [illegible] whatever nature It was constituted by the Scottish parliament in 1537 It was intended to supply place of [illegible] especially of [illegible] the lords of session, who [illegible] the titles of the judges Originally it consisted of seven laymen and eight churchmen, including the president In 1640 however, an act was passed providing for the exclusion of churchmen from the court, and though repealed in 1661, the principle laid down in it has ever since been acted upon Other important improvements were introduced at different periods, particularly after the Revolution, when the right of appeal from the court to parliament was, for the first time recognized At the Union power was given to all individuals who considered themselves aggrieved by judgments of the Court of Session to appeal to the H of Lords, and it is a curious fact that at this moment, and for a lengthened period the principal judicial business of the H of Lords has consisted in hearing [illegible] cotch appeals Originally and down to [illegible] fifteen judges sat together in the court but in that year an act was passed dividing the court into two chambers, the lord president presiding in the first division of seven judges, and the lord justice-clerk in the second of six, the two remaining judges trying cases in the first instance, or, as it is technically termed sitting as lords ordinary Since then the number of judges has been reduced to thirteen, four belonging to each of the divisions, and five acting as lords-ordinary The judges were at first chosen by the Scotch parliament, but since 1554 they have been appointed by the crown They are either, as already stated, called lords of session, or senators of the college of justice, which last embraces the whole body of barristers (advocates) and attorneys or solicitors who practise before the court They must be twenty-five years of age and by the Treaty of Union, no person can be named to the office unless he have served as an advocate or principal clerk of session for five years, or as a writer to the signet for ten The salaries of the ordinary judges have recently been raised to 3000*l* a year each, those of the lord justice-clerk and lord president being respectively 4000*l* and 4500*l*

[illegible] the Court of Session [illegible] as a standing or perpetual jury [illegible] introduction of petty juries into the trial of civil cases in Scotland being only of very recent date, as well as of limited application It was, in fact, unknown till 1815, when a special or jury court was instituted, for the trial of cases involving questions as to the value of property, or damages, or the determination of some fact But in 1830 this court was suppressed, and the Court of Session now avails itself of the assistance of petty juries in the trial of the above description of cases *See* JUSTICIARY, COURT OF

SE'SSION OF PARLIAMENT The period between its meeting and prorogation All the acts passed in a session are legally considered as forming a single statute, each separate act being designated as a chapter, and its subdivisions as sections *See* PARLIAMENT

SESSIONS OF THE PEACE In English Law, the term "Session of the Peace" is applied to designate a sitting of justices of the peace for the execution of those duties which are confided to them by their commission, and by charter or statute Such are, — 1 A petty (or petit) session, which is a private meeting of two or more justices of the peace for the execution of some power vested in them by law, many acts of parliament requiring the concurrence of a plurality of justices, and there being other occasions on which, although not strictly necessary it is considered usual and expedient One of the most important instances of the first kind is the holding parties to bail against whom a charge of felony has been entertained 2 A special session, which is principally distinguished from the former by being public, instead of on the private motion of the justices it being necessary that notice should be given to every magistrate of the division Special sessions are held to grant licences execute the provisions of the Highway Act appoint overseers of the poor, and for many other purposes 3 Quarter sessions (See that article; and see JUSTICE OF THE PEACE)

SESTE'RTIUM (Contracted from mille sestertiorum) The sum of 1000 sestertii, usually estimated at about 8*l* English

SESTE'RTIUS A sesterce, a Roman silver coin, equal in value to two *asses* and a half, or nearly twopence of English money

SE'TA (Lat) is a term used by botanists in various senses It is the stalk [illegible] capsule, or sporangium of mosses, [illegible] of grasses, when it proceeds from the extreme point of a palea or glume, sometimes the glandular aculeus of roses, and also the abortive stamens or rudimentary perianth of Cyperaceous plants

SETACEOUS (Lat seta) In Entomology, the antennæ which resemble a bristle are so called

SE'T FAIR In Architecture, the coat of plaster used after roughing in and floated, or pricked up and floated It should be well trowelled, to answer well for colour

SETHIANS In Ecclesiastical history, a sect of Christian heretics who sprung up in Egypt in the second century, strongly imbued with the principles of Gnosticism, but whose chief peculiarity consisted in their belief in the identity of Jesus Christ with Seth the son of Adam, whence they derived their name They continued to exist about 200 years, during which period they had many followers

SE'TICERS, *Setocera* (Lat seta, *a bristle*, Gr *κερας*, *a horn*) A term applied by Latreille to a family of Lophyropodous Crustaceans, including those in which the superior antennæ are long and setaceous

SE'TIGERS *Setigera* (Lat seta, *a bristle*, gero, *I carry*) The name of a tribe of Anellidans, including those which, like the earthworm, are provided with bristles for progressive motion The *Setigera* are the first tribe of the Abranchiated order of Anellidans

SE'TIREMES (Lat seta *a bristle*, remus, *an oar*) A name given by Kirby to the natatory legs of certain aquatic insects, which are fringed with bristles

SE'T OFF In Law, a species of defence to a civil action, by which a party acknowledges the justice of the plaintiff's demand but sets up a demand of his own against the plaintiff sufficient to counterbalance either the whole or a part of it

SE'TON (From Lat seta, *a bristle*, because bristles or horse hairs were formerly used to keep open the wound) A seton is an artificial ulcer, made by passing a skein of thread under a portion of the skin by means of an instrument called a seton needle the thread is occasionally anointed with irritating substances, in order to keep up a discharge from the sore

SETOSE (Lat seta, *a bristle*) In Zoology, when a surface is beset with stiff scattered hairs

SE'TTING In Architecture, the quality of hardening in plaster Also the laying of stones in walls or vaults

SE'TTING COAT In Architecture, the best sort of plastering on ceilings or walls, in inferior work it is made of *fine stuff*, and when the work is very dry a little sand is used A setting coat may be either a second coat on laying or rendering, or a third upon floating The term *Finishing* denotes the third coat, where stucco is used [illegible] where the work is for paper

SETTLEMENT In Law, the right which an individual [illegible] to claim relief or assistance under the statutes for the relief of the poor [illegible] parish or district to which he legally belongs, and in which he is said to have the settlement

The law of settlements has recently undergone considerable alterations by the Poor Laws Amendment Act, 4 & 5 W 4 cap 76 But that act does not, except in certain cases, take away settlements already possessed by virtue of the law as it previously stood under a great variety of enactments It is, consequently, necessary to consider in how many modes a settlement may now be legally acquired, and, also, what modes of settlement were recognized before the passing of the act in question

The first species of settlement is by birth; all persons who have not obtained a settlement elsewhere by other means being legally settled in the parish or district wherein they were born. Before the passing of the late act, bastard children were deemed to be settled in the parish where they were born: they now have, and follow, the settlement of their mother until they attain the age of sixteen, or acquire settlements in their own right 2 Settlement by parentage All legitimate children are settled in the parish where their parents are settled, until they become emancipated Emancipation takes place on attaining the age of twenty-one, if living separate from the parents, or marriage, or [illegible] settlement in the party's own right, or [illegible] other relation inconsistent with the notion of a subordinate situation in the parental family 3 Settlement by marriage A woman acquires the settlement of her husband, and after his death she retains his last settlement unless she acquires a new one for herself 4 Settlement by apprenticeship Is acquired by a person who has been bound an apprentice and has inhabited, under such apprenticeship in a town or parish, the place where he has resided the last forty days being that in which he is settled Actual service with the master is not necessary, but if he have served elsewhere, it must be with the master's permission [illegible] in the sea service or fishing trade does [illegible] recent act, confer a settlement 5 Settlement by renting a tenement A person *bonâ fide* occupying and renting a tenement, at the rent of 10*l* per annum at least, for the term of a year, the rent for a year having been actually paid (and the tenement having been actually occupied by him for a year also), acquires a settlement by dwelling forty days in the parish in which such tenement is situated Since 4 & 5 W 4, no settlement can now be acquired by renting a tenement, unless the person occupying it has been rated to and has paid the poor's rate for one year at least 6 Settlement by estate A person having, by descent or devise, &c, an estate in lands or tenements, either freehold, copyhold, or for years, acquires a settlement in the parish in which it is situate by forty days' residence But no such settlement is acquired by the purchase of an estate, unless bought for 30*l* at least, *bona fide* paid And, by the late act no person possessing such a power of acquiring a settlement shall retain it longer than he shall inhabit within ten miles of the parish 7 Settlement by being charged with and paying parish taxes and levies in respect of a tenement of the value of 10*l*, such as poor rate, church rate, or land tax These are now the only modes of acquiring a settlement but two more must be mentioned, by which a settlement could formerly be acquired, as the settlements so gained still continue in force 1 By hiring and service This could be obtained by any unmarried person lawfully hired into any parish or town for the space of a year, provided he continued in service under such hiring for the space of a year, and resided in the parish forty days 2 By executing an office This was obtained in any place by executing any public annual office

Poor people coming from one parish to another, and [illegible] in the latter, may, if [illegible] be removed by an order of two justices to that in which they were last legally settled, and all persons who think themselves aggrieved by such order of removal (usually the parish to which the removal takes place) may appeal against such order to the next general or quarter sessions of the peace It is doubtful, indeed, since the statute 4 & 5 W 4, whether any but the parish can appeal The parish appealing is bound to give sufficient notice of the intended appeal, and also (since the stat 4 & 5 W 4) to state in writing the legal grounds on which the order is contested The sessions must either quash or affirm the order of the justices, and the order of the sessions can only be quashed by the Court of King's Bench, either on a special case, granted by the sessions, for the reference of a point of law to the superior court, or on certiorari, for [illegible] he order

A *certificate* [illegible] by the churchwardens and overseers, that a particular person is legally settled in their parish A certificate-man cannot gain a settlement in the parish to which the certificate is directed, except by renting a tenement of the annual value of 10*l* See POOR LAWS

SETTLEMENT, ACT OF In English History, the statute 12 & 13 W 3 c 2, by which the crown was limited to the Princess Sophia, duchess dowager of Hanover (youngest daughter of Elizabeth, queen of Bohemia, who was daughter to James I), and the heirs of her body being Protestants,—on the failure of issue of the Princess Anne and next in succession The duchess [illegible] and her son, George I, [illegible] throne

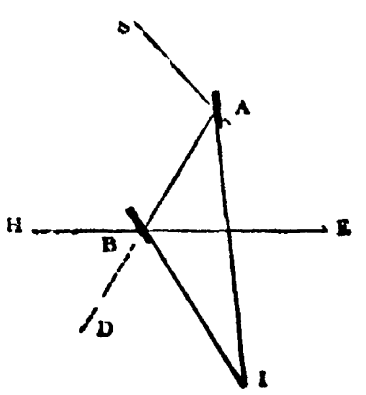
SHELF In Architecture the horizontal projection [illegible] where the thickness of [illegible] stories

SE'VENTH. In Music, an interval, whereof there are four species First, the defective seventh, consisting of three tones and three greater semitones. Second, the minor seventh consisting of seven degrees and six intervals diatonically taken, four being tones and the rest greater semitones Third the major seventh being only a major semitone less than the octave Fourth the extreme sharp seventh, which is only a comma less than the octave

SEVEN YEARS' WAR In History a war carried on in Germany between two alliances, headed respectively by Austria and Prussia, from the year 1756 to 1763, when it was ended [illegible] signalized chiefly [illegible] of Frederick II [illegible] principal ally throughout the struggle was England, while he was, at one period, assailed by the forces of Austria, France, the Empire, Sweden, and Russia When the forces of the Prussian sovereign had been almost annihilated by this coalition, the death of the Russian empress, Elizabeth, caused the withdrawal of Russia from the alliance of his enemies, and thus brought about the termination of the war without material advantages gained by any party

SEWER In Architecture, a subterraneous conduit, or channel, to receive and carry off the superfluous water and filth of cities The sewers of Rome have been the models of those of the modern cities of Europe They are as old as the elder Tarquin The *cloaca* had, between the Quirinal, Capitoline and Palatine hills, many branches, which joining in the Forum, now the Campo Vaccino, were received for conveyance into the Tiber by a larger one, called the *cloaca maxima* It must be admitted, however, that it is erroneous to designate the Roman cloacæ by the term sewers They were rather drains made to carry off the stagnant water of the pestilential marshes which occupied much of the low ground near the Tiber, and the spaces between the Aventine, Palatine and Capitoline hills The height and width of the cloaca maxima are equal, each measuring 13½ feet

SEXAGE'SIMA (Lat *sixtieth*) In the Calendar, the eighth Sunday (nearly sixty days) before Easter



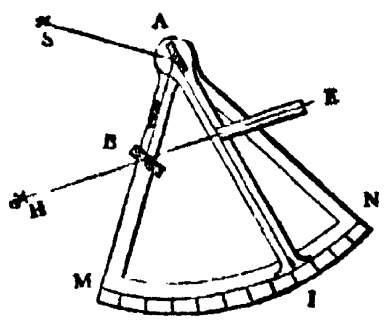
SEXAGE'SIMAL ARITHMETIC A method of computation proceeding by sixties (as the common arithmetic proceeds by tens), and used by the ancient Greek astronomers for facilitating arithmetical calculations, particularly division and the extraction of roots, operations which when performed on numbers expressed by the complicated Greek notation are attended with great [illegible]

SEXAGESIMAL FRACTIONS, are such as have 60, or some multiple of 60, for their denominator Fractions of this kind were anciently the only fractions used in astronomy, and they are still retained in the division of the circle, and of time, where the degree, or hour, is divided into 60 minutes, the minute into 60 seconds, and so on

SE'XTANS, or SEXTANT In Astronomy, one of the constellations formed by Hevelius It is placed across the equator, and on the south side of the ecliptic

SE'XTANT (Lat sextans, *the sixth part*, the limb of the instrument being the sixth part of a complete circle) An instrument for measuring the angular distances of objects by reflexion The sextant is capable of very general application, but it is chiefly used as a nautical instrument for measuring the altitudes of celestial objects and their apparent angular distances It is an instrument of the utmost importance in navigation

The principle of the sextant, and of reflecting instruments generally, depends upon an elementary theorem of catoptrics, viz if an object be seen by reflexion from two mirrors which are perpendicular to the same plane, the angular distance of the object from its image is dou-



[illegible] the angle A I B, a ray of light coming from the sun and falling upon the mirror A in the direction S A, will be reflected in the line A B, and falling upon B, it will again be reflected in the direction B E Let A B be produced to D, and S A prolonged to meet B E in E [illegible] incidence and reflexion are always [illegible] we have D B E = 2 D B I, [illegible] 2 B A I, D B E = B A E + B E A, and D B I = B A I + B I A, consequently B A E + B E A = 2 B A I + 2 B I A, and therefore, since B A E = 2 B A I, we have also B I A = 2 B I A, that is to say, the angular distance between the object S and its image seen by the eye at I, in the direction E B H, is the double of the in-

clination of the mirrors It may be remarked, that the place of the image, as seen from E, is independent of the situation of the mirrors on the plane so long as the line of the intersection of their planes and their inclination to each other remain constant

From what has been now said, it may be seen that if a convenient method could be devised for measuring the inclination of two mirrors perpendicular to the same plane, when they are so placed that the image of an object S is brought to coincide with an object H seen directly we should at once have a reflecting instrument for measuring angular distances Such instruments are the *sextant*, the *quadrant* the *reflecting circle*, respectively so called from the extent of the arc which the graduated limb embraces

The contrivance adopted for this purpose in the sex-

plane of the sector of a circle A M N, and the frame of the mirror A to a radial bar A I revolving in the plane of the sector round a pin passing through the centre Both frames are generally supplied with the means of adjusting the planes of [illegible] capable of being turned by a delicate motion a small way round a pin passing through the frame of the sector

The arc or *limb* M N of the sector is graduated, and the revolving radius or *index* carries at its extremity a vernier scale, applying to the graduations on the limb, and subdividing them into such smaller portions as may be desired

The method of finding the zero point of the limb may be understood generally from the following considerations —The angle E (see the first figure) being double the angle I, it follows that when the mirrors are parallel or the angle I is nothing, the angle E is nothing also, and S and its image will appear as one object, the one exactly covering the other It is therefore only necessary to turn round the radial bar which carries A till the image of a distant object seen by reflexion from B is in accurate conjunction with the object itself, seen directly and the point on the limb at which the index then stands is the zero point of the arc If it is not also the zero of the numbered graduations, its distance from the numeral zero is called the *index* error of the instrument, and is to be applied as a correction [illegible] In general the [illegible] marked is when [illegible], so that the angle read from the instrument is not the inclination of the mirrors, but the distance of the object from its image In this class of instruments therefore 90° are indicated by an arc of 45° 120° by an arc of 60°, &c

The mirror A is completely silvered behind, but B is silvered on that half only which is next the plane of the instrument, the upper part being left clear, that objects, such as H, may be seen *through* it, as well as the images of others, as S, by reflexion *from its surface* The mirror B is so placed by the maker that when A is parallel to it, the index which carries A either exactly or nearly corresponds with the zero of the divisions as they are numbered on the limb When the index has been set by hand nearly in the position requisite for measuring any proposed angle, it is clamped to the limb by a screw acting on a spring and moved slowly by a tangent screw till it attains accurately the required position

Such being the general principles of the instrument, we shall now briefly describe the different parts of it as constructed by the best makers, and the methods of adjusting and observing with it

The only important object to be aimed at in the frame is to combine lightness with sufficient strength The frames are generally of brass, and cast in one piece from a model, but the late Mr Troughton introduced thin double frames parallel to each other, and connected by pillars These frames are very light, but it may be doubtful whether they sufficiently fulfil the condition of strength

In all good instruments the index is strengthened by an *arc bar* [illegible] The graduations are made on a slip of [illegible] ina, which is *let in* to a groove in the [illegible] s of this kind are now all graduated by [illegible]

The frame of the [illegible] supported by three feet, one near each end of the limb, and the third at the centre, where it serves also as a sheath to cover the central pin (with its fastening screw) round which the index revolves A handle parallel to the frame is attached to the back of it, to hold the instrument by when observing

The revolving mirror A is attached by three screws to the head of the index In common instruments only two of these screws are fastening screws, and the third is used as an *adjusting* screw for placing the mirror perpendicular to the plane of the instrument But in the better class of instruments all three are *fastening* screws, the maker himself placing the mirror in its perpendicular position

The other mirror, B, is attached to the frame of the sector, and in some instruments is incapable of lateral motion being only provided with the means of placing it perpendicular to the plane of the instrument, so that the position of its plane with [illegible] be regarded as permanent [illegible] effected by a screw, which sometimes acts on the frame, and in some instruments directly on the mirror, on which it presses by means of a spring In other instruments the frame of this mirror turns round an axis passing through the frame of the instrument, so that when the index is set to zero on the limb, B can be set parallel to A and the index error, therefore, reduced to nothing This mirror B is called the *horizon glass* by seamen, and the adjustment we have been speaking of is called the *parallel adjustment* of the horizon glass It is a most important adjustment and one that requires continual attention being liable to be altered by very trifling causes

In common quadrants, a sight vane with two holes is placed [illegible] B [illegible] same distance from the [illegible] reflecting part of the mirror [illegible] the unsilvered part But the best instruments, instead of the sight vane, are furnished with telescopes, which screw into a socket attached to a piece of brass passing through the frame of the instrument, and by means of a screw the socket can be raised or depressed, so that the telescope can be placed with more or less of the object-glass opposite the silvered or the unsilvered part of the index glass as the varying brightness of the objects observed may render necessary

The telescopes are of two kinds One, a direct telescope, which is simply an opera glass, and having a narrow field of view, is generally used in the more ordinary sort of observations, such as observing altitudes The other is an inverting or astronomical telescope, which has a large field of view, and is that which dexterous observers use exclusively It is commonly supplied with two eye-pieces, one of considerable power, and chiefly for determining the index error, and the other for observing with In the frames of each eye piece are two pairs of wires each pair perpendicular to the other, dividing the field of view into nine spaces of which that in the middle is square, and it is important that in all observations made with this instrument the contact of the image seen by reflexion, and of the object seen directly, should be made as near the middle of this square as possible, at any rate at the same distance as the centre of the square from the plane of the instrument

It is essential, also that the telescope should be parallel to the plane of the instrument, and in the collar into which the telescope is screwed there are two screws for making this parallel adjustment The adjustment is not very liable to alter but no careful observer will omit to examine it at every convenient opportunity

Both the mirrors are supplied with coloured glasses of different degrees of shade, framed and placed in such a position that they can be turned down before the mirrors, either singly or combined The eye pieces of the telescopes [illegible] coloured shades, set in caps, which [illegible] eye-piece They are used in taking the index error by means of the sun and in observing the sun's altitude from an artificial horizon

Adjustment of the Sextant —1 To set the index glass, when it admits of adjustment, perpendicular to the plane of the instrument

Place the index about the middle of the limb, and looking obliquely into the index glass, the part of the limb will be seen by reflexion in the glass as well as directly If the part of the limb seen directly and its image in the glass appear as one continued frame, the mirror is in adjustment, but if the reflected image appears to incline downward, it shows that the face of the glass inclines backward from the perpendicular, if upwards, that it inclines forward and the adjustment must be made by the screw supplied for the purpose

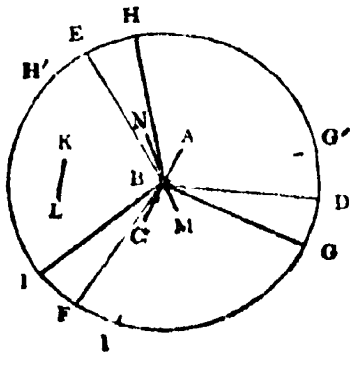
2 To set the horizon glass perpendicular to the frame [illegible]

Having [illegible] adjusted the index glass, or seen that it is in adjustment, screw the telescope into its socket, adjust the eye-piece to distinct vision, screw the dusk shade cap on the eye end of the telescope, or turn down shades before the mirrors, and looking towards the sun, bring the index near to zero move it steadily backwards and forwards, and the reflected image of the sun will be seen to pass over his disk, as viewed directly If the two circular disks accurately cover each other in passing the perpendicular adjustment of the horizon glass requires no adjustment but if they pass a little aside of each other [illegible] two [illegible] lines appear on each [illegible] the mirror B must be turned by the appropriate screw

till the disks accurately cover each other when the adjustment will be complete This adjustment may also be effected by making a bright star and its image coincide with each other [illegible] to say [illegible]

3 To set the telescope parallel to the plane of the instrument This adjustment is effected by two screws in the collar which attaches the telescope to the arch of the sextant, and diametrically opposite each other and perpendicular to the plane of the instrument By tightening the upper one the object end of the telescope is inclined towards the instrument, and the contrary effect is produced by tightening the lower one To make the adjustment, turn round the eye piece of the telescope till two of the wires in its focus appear parallel to the plane of the instrument (and of this the eye can judge with sufficient accuracy), then take two objects, as two bright stars, or the sun and the moon, whose distance in either case should not be less than 90°, in order that any error in the adjustment may become more apparent, and bringing the image of one of the objects in accurate contact with the other object on the wire next the instrument, *instantly* bring them to the other wire, and if they are also in accurate contact upon that wire, it may be concluded that the axis of the telescope is parallel to the plane of the instrument If the objects are the sun and moon, and they separate at the farther wire it shows that the object end of the telescope inclines towards the plane of the instrument, and the contrary if they overlap, and the error must be corrected by turning the proper screws in the collar

The above are all the adjustments which this class of instruments admits of, and they are essential to every instrument of the kind We have now only to state how, in practice, the index error of the instrument may be most conveniently and accurately determined



Having effected the perpendicular adjustment of the horizon glass by the method above explained, bring the border of the sun's reflected image to coincide with the sun seen directly both on the right and left side, and reading the index at both observations, if one reading is on the left and the other on the right of zero, *half the difference is the index error*, and the fourth part of the sum is the sun's semidiameter, but if both readings are on the same side of zero, *half the sum is the index error*, and the fourth part of the difference is the semidiameter No instrument-maker however, will leave the index error so large that the readings for the sun's diameter will be both on one side of zero

The Reflecting Circle depends on the same principles as the sextant, from which it differs chiefly by having the whole circle graduated In some instruments of this kind the angle is measured by repetition See REPEATING CIRCLE

But the only instrument of this kind that can be now said to be in general use in this country is Troughton's reflecting circle, in which by means of three equidistant indexes, and by observing alternately with the face of the index direct and reversed, *six times* the required angle is obtained, without reference to the index correction After what has been said above on the principles of reflecting instruments generally the following short account of this instrument will be sufficient

All the indexes move round together, and, of course, the apparent [illegible] require to [illegible] index, and which, for the sake of convenience, stands at or near zero on the limb when the revolving and fixed mirrors are parallel

In the annexed figure let B D B F, and B Γ, be the positions of the indexes when the revolving mirror is parallel to the fixed one K L, and let A C and M N be two positions of the revolving mirror when it is equally inclined to K L Then the arcs D G D G', F H, E H', F I, Γ I', passed over by B D, B F, and B F, will be all equal, and if, when the mirror has the position M N, the face of the instrument be reversed, M N and K L will have the same relative position to each other that A C and K L have, and consequently if an object is seen by reflexion from A C and K L it will also, when the instrument is reversed, be seen by reflexion from M N and K L to an eye placed in the same situation Hence the degrees on the arcs G G', H H', I I', which are the differences of the readings of the observations in the direct and reversed positions, are each the measure of double the distance of the object from its reflected image The degrees [illegible] the circle from 0 to 720°, and the [illegible] nearly at equal distances from each other, it is customary in practice to read the degrees, with the minutes and seconds, from the leading index only, and to read only the minutes and seconds at [illegible] xes.

SEXTILE ASPECT, in Astrology, is the aspect of two planets when they are distant from each other the sixth part of a circle, or sixty degrees

SEXTON (Lat. sacristanus, sacrista) A church officer who is properly the keeper of holy things belonging to divine worship, and said to be the same with the *ostiarius* in the Romish church A sexton is usually [illegible] he minister or others, [illegible] case a mandamus lies to restore him to his office

SFORZA'TO (It. *forced*) In Music, a term written over a note to signify that it is to be played or struck louder than the rest

SFUMA'TO (It. *smoky*) In Painting, a term applied to that style of painting wherein the tints are so blended that the outline is scarcely perceptible, the whole presenting an indistinct misty appearance Guercino's works present some of the most examples of the style

SGRAFI'TTO (It. *scratched*) In Painting, a species of painting in which the ground is prepared with dark stucco, on which a white coat is applied, which last being removed with an iron instrument, the chipping it away opens to the black ground and forms the shadows, giving it the appearance of a chiaro-scuro painting The principal pictures of P [illegible] in this manner, which [illegible] extremely durable, though it must be conceded the appearance is rather harsh

SHABRACK The cloth furniture of a cavalry officer's [illegible] The term is of Hungarian origin

SHADDOCK The fruit of the *Citrus decumana* it is a species of orange

SHA'DOW In Optics, a portion of space from which light is intercepted by an opaque body As the rays of light proceed in straight lines, every opaque object on which light falls is accompanied with a shadow on the side opposite to the luminous body, and the shadow appears more intense in proportion as the illumination is stronger, because any object placed within it contrasts more strongly with the surrounding objects on which the light is suffered to fall

As every point of a luminous body is a separate focus of illumination, it follows that an opaque object illuminated by the sun, or any other source of light which is not a single point must have an infinite number of shadows, though not distinguishable from each other, and hence the shadow of an opaque body received on a plane is always terminated by a *penumbra* or partial shadow, the extent of which is greater in proportion to the magnitude of the luminous body the distance of the opaque body from the plane on which the shadow falls and the degree of obliquity with which the luminous rays fall on the plane

Shadows are said to be *right* or *versed*, according to the position of the planes on which they are thrown The shadow of an upright body projected on the plane of the horizon is a right shadow, and that of a body on a vertical plane to which the body is perpendicular as that of a bar of iron fixed perpendicular in a wall, is a versed shadow In both cases the length of the shadow is to the height of the opaque body as the cosine to the sine of the angle which the luminous ray makes with the plane The ancient geometers availed themselves of this property of shadows to measure the altitudes of objects

Coloured Shadows — In certain states of the atmosphere the shadows of opaque objects projected on a white surface are frequently observed, about the time of sunrise or sunset to be of a blue colour This curious observation appears to have been first made by the celebrated painter Leonardo da Vinci, and is also noticed [illegible] until about a century later, when it again occurred to Buffon [illegible] coincidence about the time [illegible] on a white wall about 30 or 40 feet distant to be coloured with a light green inclining to blue The next morning, at sunrise he repeated the observation, but instead of finding the shadows green, he found them blue, or rather the colour of lively indigo Afterwards he often observed the shadows both in the [illegible] but always observed them to be bl[illegible] and he remarks that any one may see a blue shadow, if he will hold his finger before a piece of white paper at sunrise or sunset. The phenomenon has since been frequently observed, [illegible] he aerial colour of the at[illegible] the [illegible] (*Priestley's History of Light &c*, 1762) For remarks on [illegible] borders [illegible] *Red Shadows*, and other optical phenomena of the same kind see Prof Forbes's Report on Meteorology in the *Report of the British Association for* 1840

SHADOW In Painting, the form which a solid object projects on a surface or surfaces by being interposed

between the surface or surfaces and the sun, or other luminous body the doctrines whereof have received the name of *scenography* *Shade* a term applied to that portion of [illegible] to the luminous body [illegible] that part of a column between the base and capital, sometimes called the *trunk* of the column The shaft of a column always diminishes in diameter from about a third of its height Sometimes it has a slight swelling (*see* ENTASIS) in the lower part of its height In the oldest Doric columns, the diminution was so considerable as to give the column a conical appearance In the Doric edifices at Athens, the upper diameter is not more than a quarter less than the lower diameter, in the temples of Jupiter Nemeus, between Argos and Corinth, not more than a fifth less In Ionic and Corinthian columns, the difference of the upper and lower diameters varies from a fifth to a twelfth The ancients seem to have regulated the [illegible] by the [illegible] the height [illegible] the [illegible] to be [illegible] and [illegible] expressed in terms of the lower diameter

SHAFT In Mines A shaft or pit is a prismatic or cylindrical hollow space, the axis of which is either vertical or much inclined to the horizon The dimension of the pit, which is never less than 32 inches in its narrowest diameter, amounts sometimes to several yards its depth may extend to 1000 feet, and more Whenever a shaft is opened, means must be provided to extract the rubbish which continually tends to accumulate at its bottom, as well as the waters which may percolate down into it, as also to facilitate the descent and ascent of the workmen For some time a wheel and axle erected over the mouth of the opening, which serve to elevate one or two buckets of proper dimensions, may be sufficient for most of these purposes, but such a machine becomes ere long inadequate Horse-whims, or powerful steam-engines, must then be had recourse to, and effectual methods of support must be employed to prevent the sides of the shaft from crumbling and falling down. (*Ure's Dict of Arts, &c*)

SHAG The English name of a species of cormorant *Phalacrocorax graculus*, Linn

SHAGREEN [illegible] to have been prepared [illegible] species of whale It is prepared from horse or ass skin, a granular appearance being given by embedding in it whilst soft, the seeds of a species of chenopodium, and afterwards shaving down the surface it is dyed with the green produced by the action of sal ammoniac on copper filings It was formerly much used for watch, spectacle, and instrument cases, and was made chiefly in Astracan

SHAH (In Persian, *prince*) The title given by European writers to the monarch of Persia, who in his own country is designated by the compound appellation of *Padishah* [illegible]

SHAH NAMAH (*The Book of Kings*) The most ancient and celebrated poem in the modern Persian language, by the poet who received as a title of honour the name "Firdousi" (*of Paradise*), by which he is known Its date is supposed to be about A D 1000 A complete translation into English in four volumes, was published by Capt Macan Calcutta 1829

SHAKE In Music, a quick alternate repetition of the note above with that over which the mark *tr* is placed, commonly ending with a turn from the note below

SHAKERS In Ecclesiastical History, a sect said to have originated by a secession from the body of Quakers, in 1747, in Lancashire, who received their nickname from the peculiar contortions of body which they adopted in their religious exercises Anne Lee, the great female leader of this sect, joined the society in 1758, and con[illegible] England, went, with a few followers, to New York in 1774, and died ten years afterwards, at which time her sect had made great progress in America She was considered as the woman spoken of in Revelations The sect appears to have fallen into obscurity although a few congregations still remain

SHALE A crumbling variety of slate

SHA'MANISM, or SCHAMANISM A general name applied to the idolatrous religions of a number of barbarous tribes comprehending those of Finnish race the Ostiaks Samojedes and other inhabitants of Siberia as far as the Pacific ocean These nations generally believe in a supreme Being but to whom they attribute little share in the immediate government of the world they pay [illegible] kinds of [illegible] to [illegible] benevolent [illegible] to [illegible] appear to be very certain and [illegible] [illegible] last [illegible] those tribes which [illegible] [illegible] Russia [illegible] Saint [illegible] [illegible] the Samoiedes [illegible] [illegible] religion [illegible] [illegible] [illegible] [illegible] These [illegible] are called [illegible] [illegible] [illegible] [illegible]

dards, but nothing certain can be averred on the subject Wener and M'Culloch, however, adopt the opinion that the shekel used differed from both of these (See Ar. Fr. Delitzsches *Realwörterbuch*, art "Sekel")

SHEKINAH The Jewish name for the Divine presence, which rested, in the shape of a cloud, over the "propitiatory" or "mercy seat" as it is rendered in our translation (Leviticus, xvi 2) The Jews reckon it among the five particulars which were present in the first temple, and wanting in the second (See *Prideaux' Connection*, i 3) On this account God is so often said in Scripture to "dwell between the cherubim," that is, between the images of cherubim on the mercy seat (1 Sam iv 4, Psalm lxxx 1. &c See also *Mem de l'Ac des Inscr* vol xxxviii)

SHE'LDRAKE The common name of the species of duck called *Anas tadorna*, which is the type of the subgenus *Tadorna* of Ray and modern ornithologists This elegant species frequents many parts of our coast, and remains throughout the year The female commonly selects a rabbit-hole in which to deposit her eggs, which are sometimes as many as sixteen in number The sheldrake feeds on small fish, marine insects, and sea-weed

SHELL The hardening principle of shell is generally carbonate of lime nearly pure The animal principle, in the porcellaneous shells, is a small quantity of soluble gelatine, in the mother of pearl shells it is albuminous The latter, therefore, when steeped in dilute muriatic acid, leave a membranous or cartilaginous residue, but the former are entirely soluble For the form structure, and mode of growth of shell, see CONCHOLOGY

SHELL In Artillery a hollow sphere of iron, which being filled with gunpowder and fired from a mortar, bursts into pieces, when the powder is exploded, and produces a very destructive effect [illegible] a hole in the shell of about [illegible] by means of a fuze The fuze is a wooden tube made to fit the hole, and filled with a composition of sulphur saltpetre, and mealed powder, and is cut of such a length that the shell is calculated to explode just before or immediately after it reaches the ground

SHELL MARL A deposit of clay and other substances, mixed with shells, which collects at the bottom of lakes

SHE'RBET (a word borrowed from the Persian), signifies a favourite beverage in the East, bearing some resemblance to our lemonade made of water, lemon-juice, and sugar, with the addition of some other ingredients such as rose water, to give it a delightful perfume

SHE'RIFF (originally shire-reeve from the Saxon, meaning the reeve or governor of the shire), is the title of that functionary who acted at first only as the deputy of the earl, hence styled in Lat *vice-comes*, but has long been the chief civil officer in each county, where he is styled bailiff of the crown and where he is specially entrusted with the execution of the laws and the preservation of the peace for which purposes he has at his disposal the whole civil force of the county — in old legal language the *posse comitatus* The most ordinary and important functions of the sheriff, which he universally exercises by a deputy, called under sheriff, for whose conduct he is responsible, consist 1st, In the execution [illegible] by the judges on circuit [illegible] county 2 In the holding of the sheriff's court The sheriff himself only executes in person such parts of his office as are either purely honorary such as attendance upon the judges on circuit (for whose lodging he is also bound to provide), or as are of some dignity and public importance, such as the presiding over elections and the holding of [illegible] power to call at any time [illegible] to the jurisdiction of the sheriff [illegible] would only hold pleas of debt or damages under the value of 40*s* except in replevin, or actions by virtue of a particular writ termed a *justicies* But it is now enacted, by 3 & 4 W 4 c 42, that in any action depending in a superior court for a debt or demand, not exceeding 20*l*, it shall be lawful for the court to direct that the issue joined shall be tried before the sheriff of the county in which the action is brought *See* COURTS

Sheriffs were originally chosen by the freeholders of the county except in [illegible] where the office was hereditary as it still is in Westmoreland The system of popular election was abolished in the reign of Richard II, and sheriffs have long been appointed by the crown upon presentation of the judges, in a manner partly regulated by law, partly by custom, but sheriffs may also be nominated by the crown without recommendation of the judges, and are then familiarly styled *pocket sheriffs* Those appointed in either way are bound under a penalty of 500*l* to serve the office except in specified cases of exemption or disability The description given of the office as it is in England applies to Ireland without variation, except as to the time of its origin

SHE'RIFF DEPUTE In Scotland, the principal sheriff of a county He is named by the crown must be an advocate of three years standing, and receives a salary varying from 300*l* to 1200*l* per annum He is entitled to name sheriff substitutes, executes writs returns juries, &c, decides on claims for enrolment in the county lists of parliamentary voters, and exercises a certain criminal jurisdiction He holds also civil courts for the recovery of small debts, and a court of record, the jurisdiction of which extends to all personal actions, and possessory actions for the recovery of real property

SHE'RRY A Spanish wine made from the grapes of Xeres in Andalusia Genuine sherry is a rich dry wine, containing from 20 to 23 per cent of alcohol there are many varieties, and it is extensively imitated and adulterated *See* WINE

SHEW-BREAD In the Old Testament The name given to the twelve loaves of bread, one for each of the twelve tribes of Israel, which were appointed to be placed every Sabbath "on the pure table before the Lord," for the sustenance of the priests They appear to be the same with that which is called "shew-bread" in 1 Sam 21, where the act of David in taking these loaves for the [illegible] self and his followers is related

SHIBBOLETH (Heb *a flood*) The name given to a sort of test or criterion by which the ancient Jews sought to distinguish true persons or things from false The term originated thus — After the battle gained by [illegible] Judges xii) the [illegible] of the river, and on an Ephraimite attempting to cross, they asked him if he was of Ephraim If he said no, they bade him pronounce the word *Shibboleth*, which the Ephraimites from inability to give the aspirate called *Sibboleth*, and by this means he was detected and instantly thrown into the river In modern times this word has been adopted into the language of politics, in which it signifies those political opinions on which all the members of a party are agreed, or the watch-word by which it is intended to unite them

SHIELD (Germ schild) A well-known piece of defensive armour very extensively used before the invention of gunpowder and still employed by many nations [illegible] which in ours is made in perfect progress It would be [illegible] to detail the various materials and shapes of which it has been constructed at different periods The ancient Greek shield, as described in Homer, was large and massive, sufficient to cover the man from the face to the knee, composed of leather, inlaid in some instances with metal That of the Roman legionary was four feet high and two and a half broad, formed of wood covered with leather, and strongly guarded with bosses of iron or bronze The ancient Britons and other nations [illegible] basket like shields, often of [illegible] called the parma or lighter [illegible] The Norman shield, as used in England down to the time of Henry II, was "of the form called kite or pear shape," flatter at first, afterwards approaching to the semi cylindrical Heraldic devices were first borne on it so far as is distinctly ascertained, in the reign of Henry II (*Pictorial Hist of England* i 640) In that of Edward IV the shield had become triangular the point of the triangle was rounded off about the end of the 14th century Afterwards the shape of the shield, as worn by knights, became more and more fantastic In actual service it fell gradually into disuse sword and buckler fight the favourite pastime as well as warlike practice of former days, became obsolete after the rapier and dagger had been introduced in the reign of Elizabeth The Highlanders carried the target with the broad sword to a much later period

SHIELDS In Botany, little coloured cups or lines with a hard disk, surrounded by a rim, and containing the fructification of lichens

SHILLING An English silver coin equal to twelve pence, or the twentieth part of a pound sterling Among the ancient Saxons, the value of the shilling was only five pence, it afterwards underwent many alterations, containing sometimes sixteen pence, and often twenty pence The period when it obtained its present value is assigned to the reign of Edward I Many other countries besides England have a coin of this name, of these, perhaps the Hamburgh schilling is the best known Its value is 1*d* English

SHI'LOH (Heb differently rendered — *Son*, *He who is sent*, or *the Sent*, or *the Peaceable*, or *the Prosperous*) The name given to the Messiah by Jacob in his prophecy, Genesis xlix 10

SHINGLE (Germ, or perhaps from Lat scindendo) The coarse gravel, or accumulation of small stones, found on the shores of rivers or the sea: in the latter case the term *sea-beach* is applied

SHI'NGLES A corruption of the French word *cengle*, which means *a belt* This eruptive disorder is generally ushered in with febrile symptoms, followed by an itching or tingling sensation of some part of the body, occasioned by patches of little red pimples, forming in the course of twenty-four hours small transparent ve-

sicles; these succeed each other till they at length form a kind of belt round some part of the trunk or abdomen they often form small ulcerations and scabs, continuing their progress for three or four weeks This disorder is not contagious and generally very slight, but in irritable habits the itching occasions want of rest and fever, and it is sometimes attended by a deep-seated pain of the affected part The cause of shingles is generally obscure though it may sometimes be referred to indigestion and suppressed perspiration young persons are most subject to it Gentle aperients and diaphoretics strict attention to the diet and occasional anodynes are the only internal remedies generally required and externally a little cold cream or fresh spermaceti ointment or the occasional application of a very weak Goulard's lotion, is all that is necessary

SHINGLES In Architecture, small slabs of wood, or quartered oaken boards, used instead of slates or tiles for covering churches or spires They are sawn to a certain scantling, or rather cleft to about an inch thick at one end, and shaped like wedges, four or five inches broad and [illegible]

SHIP A general term for all large vessels, but restricted by seamen to such only as have three complete masts, *i e* lower, top, and top-gallant masts As we cannot here give a complete description of so complex a fabric, and as the reader will have become familiar with the forms of ships from prints, we shall merely attempt to convey some general ideas on the subject After the hull has been completed a slight account of the construction of which has been given under NAVAL ARCHITECTURE, the ballast which is necessary in most ships to keep them upright when under sail, and which is in men-of-war in iron pigs, is spread over the bottom of the hold chiefly towards the middle of the length The masts are then taken in On the ballast are laid loose pieces of wood, called *dunnage*, on which rest the iron tanks containing the water to drink, or water casks The hold in large ships is divided by partitions into the fore, main, and after holds At the fore extremity, in men-of-war are the gunner's, boatswain's, and carpenter's store rooms, containing arms, supplies of rope, bolts pump gear, and other materials of the fittings, or for repairs In this part also is the fore powder magazine, when there are two In the fore hold are stowed water wood for firing and separated by a strong partition, coals In the main hold are stowed water, stores, chain cables, &c In the after hold are the provisions, and, in the *spirit room*, the spirits here also is the powder magazine In the narrow and shallow after extremity is stowed the bread or biscuit The spare sails are kept in a place called the *sail room*, over the fore hold The hemp cables are kept in the cable tiers on a deck over the main hold These decks immediately over the holds constitute generally the fore and after *cock pits* In large ships the whole deck is called the *orlop* deck On the *lower* deck which is next above the former, the men mess and sleep In frigates, and smaller vessels, this deck is a little below the water, in two and three deckers, it is three or more feet above the water, and is the lower gun deck

In merchant ships the arrangements depend, of course on the size of the vessel and the nature of the cargo In all these vessels, however, the place allotted to the crew is in the fore part, and is called the *fore peak* Ships are, in general, constructed for the purposes of burden expedition, and war, the latter class which must possess also, in part, the qualities of the other two exhibit the finest models The largest ships, of 120 guns, carry three complete rows or tiers of heavy cannon (32-pounders), and are thence called three deckers, of late years some still heavier guns have been introduced Each deck has from 15 to 17 guns on each side The middle of these decks is called the *middle* deck, and the deck next above this, or which is next below the uppermost deck, the *main* deck Guns are also carried on the upper deck, of which the fore part is called the *forecastle*, and the part abaft the main mast the *quarter* deck The deck over this last, extending from the after extremity to a little before the mizzen mast, is called the *poop* The after parts of these decks from the [illegible] the mizzen mast are the cabins of the admiral captains and the officers, the latter being called the *wardroom* in ships of the line and the *gun room* in frigates The length of a ship of the largest class is about 200 feet at the water line, extreme breadth 54 feet, and draught of water about 26, and the height of the truck above the water 210 feet The whole weight of such a ship with her crew and provisions is about 4000 tons of which the hull or shell is about half The men, with their effects, amount to 100 tons; and the guns, arms, and powder, to 500 tons The 32 pounder (long gun) and carronade weigh 7 cwt, and the carronade one third of this Two deckers carry from 70 to 90 guns In bad weather the ports of the lower deck are defended by heavy lids called *ports* which are firmly secured from within the guns being then run in and secured from motion Frigates carry one tier of guns on the main deck, besides guns on the upper deck, vessels of the lower classes carry their guns on the upper or open deck

Fine [illegible] ships have gone upwards of 13 knots (or sea miles [illegible] hour, in a squall and upwards of 10 knots on a bow line, that is, the sails being sharply trimmed when the direction of the wind makes an angle of about 67° with that of the ship's head

The [illegible] works on ships are Bouguer, *Traité du Navire*, Euler *Scientia Navalis*, la *Théorie de la Construction et de la Manœuvre des Bâtimens*, Dupin Georges *Essai sur l'Architecture Navale*, Chapman's *Architectura Navalis Mercatoria*, Marestier *Mémoire sur les Bateaux à Vapeur*, &c &c and in *Charnock's Marine Architecture*, and many other works contained in any good catalogue, under the heads Naval Architecture, Seamanship, especially in *Darcy Lever's Seamanship*, &c But the subject has as yet been but imperfectly treated, and many points of great practical importance, and unconnected with the particular properties of fluids, have not been discussed

SHIP, ARMED In [illegible] of war a private vessel occasionally [illegible] service of the government in time of war, armed and equipped like a regular ship of war, and commanded by an officer of the navy, with the rank of master and commander

SHIP-BUILDING *See* NAVAL ARCHITECTURE

SHIP MONEY The celebrated tax imposed by Charles I without authority of parliament, which proved one of the most immediate causes of the discontents that ended in the great rebellion This device was first put in practice in 1634 It was by a writ, directed to the sheriff of every county, to provide a ship for the king's service, accompanied by written instructions appointing a sum of money to be levied instead This writ was framed by Attorney-General Noy The tax was paid for about four years without opposition, when the question of its legality was raised by the refusal of Hampden to pay his share It was argued before the judges in the Exchequer Chamber of whom a great majority gave judgment for the crown The act 'whereby all the proceedings in the business of ship money were adjudged void and disannulled, and the judgments enrolments, and entries thereupon vacated and cancelled," was one of the first proceedings of the Long Parliament (See *Clarendon*, books i iii)

SHIPS REGISTRY OF In Commercial Navigation, the registration or enrolment of ships at the custom house, so as to entitle them to be classed among, and to enjoy the privileges of British-built ships

The registry of ships appears to have been first introduced into this country by the Navigation Act (12 Car 2 c 18 anno 1660) Several provisions were made with respect to it by the 7 & 8 Will 3 c 22, and the whole was reduced into a system by the 27 Geo 3 c 19

It may be laid down in general that a vessel, in order to be admitted to registry and consequently to enjoy the privileges and advantages that exclusively belong to a British ship must be the property of his Majesty's subjects in the United Kingdom or some of its dependencies, and that it must have been built in the said United Kingdom &c or been a prize vessel legally condemned, or a vessel legally condemned for a breach of the slave laws

The great and perhaps the only original object of the registration of ships was to facilitate the exclusion of foreign ships from those departments in which they were prohibited from engaging by the navigation laws, by affording a ready means of distinguishing such as were really British It has also been considered advantageous to individuals by preventing the fraudulent assignment of property in ships, but Lord Tenterden has observed, in reference to this supposed advantage, that "the instances in which fair and honest transactions are rendered unavailable, through a negligent want of compliance with the forms directed by these and other statutes requiring a public register of conveyances, make the expediency of all such regulations considered with reference to private benefit only a matter of question and controversy" (*Law of Shipping* part I c 2)

SHIPWRECK in the open sea, arises from the water leaking in at the bottom of a ship faster than the pumps can discharge it, or from the sea coming over one of the decks, and getting below in great quantity, or from the vessel being overset by the wind In the labouring of a weak ship in a heavy sea the seams of the sides and bottom open, and the caulking works loosen When the loss of a mast occurs, the ship is often left entirely to the action of the waves People unused to the sea look with admiration on the strength and solidity of a ship, but those who have experienced the violent shocks of the waves and are conversant with the effects of incessant agitation upon any fabric, and the straining effects of the masts and sails on the hull, are rather surprised that such a machine should hold together for so many years

When the ship is wrecked near the shore, the object is to land the crew The first method proposed was, we

believe, Bell's, in 1791 A mortar was fired from the ship, carrying a shell with a rope attached, by which communication with the shore might be established. Captain Manby, in 1808, employed the mortar on shore, where alone it is obvious its action could be depended upon, and these arrangements have since been adopted for sending the rope or hawser on board ships in distress, which had been found the chief difficulty

SHIRE A territorial division (From the Anglo-Saxon scyran, *to divide*, whence the verb *to sheer*) In modern language, shire is synonymous with county, but some smaller districts in the north of England retain the provincial [illegible] as Richmondshire, in the North [illegible] Hallamshire, or the manor of Hal [illegible] ling, which is nearly coextensive with the parish of Sheffield *See* COUNTY

SHIRE CLERK An officer appointed by the sheriff to assist in [illegible] ounty court

SHIRE [illegible] Shire Meeting, *see* sheriff's court

SHOOTING STARS Well-known meteors, of which the origin and nature are involved in great obscurity, and which have, of late years, excited extraordinary interest by their periodical appearances in unusually great numbers

Phenomena of Shooting Stars — The apparent magnitudes of these meteors are widely different The greater part of them resemble stars of the 3d 4th, 5th, and 6th magnitudes, but some occur which surpass stars of the 1st magnitude, and even exceed Jupiter and Venus in brilliancy In some of them the globular form can be [illegible] hese are, in every respect similar to [illegible], and, in fact it is impossible, from their appearance to make any distinction between the larger [illegible] and the smaller individuals of the class of meteors to which the name of fire-balls is usually [illegible] FIRE-BALLS [illegible] equally numerous in every cl[illegible] to have no influence upon their number They are observed at all times of the year, but, generally speaking they appear to be more abundant in the end of summer and autumn than at the other seasons

Some of the shooting stars leave a luminous train behind them, which marks their path through the sky with a milk-white light These trains for the most part disappear in a few seconds, but sometimes they continue longer, and even for several minutes In the case of actual fire-balls Dr Olbers observed trains which continued from six to seven minutes, and Brandes in one instance estimated that fifteen minutes elapsed between the extinction of the fire-ball and the disappearance of the luminous train The trains in general assume the form of a cylinder, the interior of which is void of luminous matter, and not unfrequently before their disappearance, they take a curved form The most probable explanation is, that they are caused by a gaseous matter left behind by the meteor and bent by currents of air

The older philosophers had formed various theories to explain these remarkable phenomena By some they were supposed to be the products of an oily sulphurous vapour existing in the atmosphere which being disposed in thin layers, and becoming inflamed by some means would exhibit the appearance of a clear brilliant spark passing rapidly from one point to another About the middle of the last century when the effects and phenomena of electricity began to be better understood, Beccaria and Vassalli, among others, regarded the shooting stars as merely electrical sparks, an hypothesis which was soon shown to be untenable At a later period when the inflammable nature of the gases became known, Lavoisier, Volta, Herbert, Toaldo Gren and others referred these meteors to hydrogen gas, which, by reason of its inferior density they supposed must be accumulated in the higher regions of the atmosphere Dalton, however, showed that such accumulation cannot take place, inasmuch as all the gases which constitute the atmosphere must be equally diffused through its whole extent, according to the law of Mariotte Deluc maintained that certain phosphoric exhalations generated in the earth, and becoming inflamed in the sky formed the true essence of the shooting stars

In this state the subject remained when Chladni published his celebrated work on the causes of the masses of iron and other similar substances found in Siberia by Pallas, in which he clearly established, by comparing [illegible] ide of observations, [illegible] their origin beyond [illegible] are masses of nebulous matter moving in space with planetary velocities, which, when they come in the way of the earth in its revolution about the sun, and enter the atmosphere, are inflamed by its resistance and friction, and become l[illegible]inous sometimes so as to [illegible] masses of stone and iron on the ground Halley, Wallis, Pringle Maskelyne and others, had previously assigned a cosmical origin to these meteors, but without suspecting that masses of stone and iron fell from them The close resemblance which the greater part of the shooting stars present to fire-balls at once induced Chladni to consider these phenomena also as cosmical, that is to say, as small masses of matter [illegible] originating in our atmosphere but entering it from without and which are either [illegible] in it, or become extinguished when they have passed beyond it

These conclusions, however, required to be confirmed by a more accurate investigation of the phenomena, for as yet no exact determination had been made of the actual average heights of the shooting stars above the earth, or of their orbits, velocities, or magnitudes In the year 1798 this important but difficult inquiry was undertaken by Professors Brandes of Leipsig, and Benzenberg of Dusseldorf (both at that time students in Gottingen) Having selected a base line (about nine miles in length), they placed themselves at its extremities and [illegible] observed all the shooting stars which [illegible] through the heavens on a celestial map, and noting the instants of their appearances and extinctions by chronometers previously compared The differences of the paths traced on the maps afforded data for the determination of the parallaxes [illegible] and the lengths of the [illegible] between September and November, the whole number of shooting stars seen by both observers was 402, of these 22 were identified as having been observed by each in such a manner that the altitude of the meteor above the ground at the instant of extinction could be computed The least of the altitudes was about 6 English miles Of the whole there were 7 under 45 miles, 9 between 45 and 90, 6 above 90, and the highest was above 140 miles There were only two observed so completely as to afford data for determining the velocity The first gave 25 miles, and the second from 17 to 21 miles in a second The most remarkable result was, that one of them certainly was observed not to *fall* but to move in a direction away from the earth

By these observations a precise idea was first obtained of the altitudes distances and velocities of these singular meteors A similar but more extended plan of observation was organized by Brandes in 1823, and carried into effect at Breslau and the neighbouring towns by a considerable number of persons observing at the same time on concerted nights Between April and October about 1800 shooting stars were noted at the different places, out of which number 62 were found which had been observed simultaneously at more than one station in such a manner that their respective altitudes could be determined and 36 others of which the observations furnished data for estimating the entire orbits Of these 98, the height (at the time of extinction) of 4 were computed to be under 15 English miles, of 15 between 15 and 30 miles of 22 between 30 and 45, of 33 between 45 and 70, of 1 between 70 and 90 and of 11 above 90 miles Of these last two had an altitude of about 140 miles, one of 220 miles one of 280, and there was one of which the height was estimated to exceed 460 miles

Of the 36 computed orbits, in 26 instances the motion was downwards, in one case horizontal, and in the remaining 9 more or less upwards The velocities were between 18 and 36 miles in a second The trajectories were frequently not straight lines but incurvated sometimes in the horizontal and sometimes in the vertical direction and sometimes they were of a serpentine form The predominating direction of the motion of the meteors from north-east to south-west contrary to that of the earth in its orbit, was very remarkable, and is important in reference to their physical theory

A similar set of observations was made in Belgium in 1824 under the direction of M Quetelet, the results of which are published in the *Annuaire de Bruxelles* for 1837 M Quetelet was chiefly solicitous to determine the velocity of the meteors He obtained six corresponding observations from which this element could be deduced, and the results varied from ten to twenty-five English miles in a second The mean of the six results gave a velocity of nearly seventeen miles per second, a little less than that of the earth in its orbit

Another set of [illegible] observations was made in Switzerland on [illegible] A circumstantial account of which is given by M Wartmann in *Quetelet's Correspondance Mathématique* for July, 1839 M Wartmann and five other observers provided with celestial charts, stationed themselves at the observatory of Geneva and [illegible] observation were made at Planchettes [illegible] miles to the north east of [illegible] In the space of [illegible] and a half hours, the number of meteors observed by the six observers at Geneva was 381, and during five and a half hours the number observed at Planchettes by two observers was 104 All the circumstances of the phenomena — the place of the apparition and disappearance of each meteor, the time it continued visible, its brightness relatively to the fixed stars whether accompanied with a train, &c — were carefully noted, and the trajectories projected on a large

planisphere The extent of the trajectories described by the meteors was very different varying from 5° to 70° of angular space The velocities appeared also to be [illegible] M Wartmann [illegible] the comparison of the simultaneous observations, that the average height above the ground was about 50 miles, and hence the relative velocities were computed to be about 24 miles a second But as the greater number moved in a direction opposite to that of the earth in its orbit the real velocities must be diminished by the earth's velocity of 19 miles in a second This will leave upwards of 22 miles per second for the absolute velocity of the meteor, which is more than eleven times the orbital velocity of the earth, seven and a half times that of the planet Mercury and probably greater than that of the comets at their perihelia

Such are the principal facts which have yet been established respecting the heights, velocities, and orbits of the shooting stars, and it is from these chiefly that we are enabled to form any probable conjectures respecting their origin A [illegible] of the observable appearances [illegible] fire balls, both [illegible] presenting absolutely the same appearances we may assume them to be of the same nature, and that whatever has been proved respecting fire-balls will apply equally to the larger shooting stars Whether the meteoric appearances to which the latter term is applied may not include objects of totally different natures, is a question admitting of doubt It is possible that among the shooting stars there may be objects which are merely electric sparks, or which have their origin in spontaneously inflammable gases, known or unknown, existing in the atmosphere, but the greater part of them must be considered as identical with fire-balls

Physical Theory of the Shooting Stars — Some philosophers, as already stated, have ascribed an atmospheric origin both to the shooting stars and fire-balls, but the observations of Brandes, and more particularly those of Wartmann which prove that they appear at altitudes far beyond the limits which can be assigned to the probability to the atmosphere have rendered this supposition altogether untenable Another hypothesis of their origin is that they are bodies projected from volcanoes in the moon Dr Olbers was the first, perhaps, who showed the possibility of this hypothesis On computing the forces necessary to overcome the moon's attraction, he found that a body projected from the moon with a velocity of about 8500 feet in a second would not fall back on the lunar surface, but recede from it indefinitely, and that in order to reach the earth it is only necessary that the projectile should have the velocity of 8300 feet, which is quite conceivable being only about four or five times that of a cannon ball The hypothesis of the lunar origin of meteoric stones was adopted by Laplace, Berzelius Benzenberg and others, but the observed velocities of the shooting stars have rendered this origin extremely improbable with respect to them In order to enter our atmosphere with a velocity of 20 miles in a second, it may be shown that if they come from the moon they must have been projected from the lunar surface with a velocity of about 120,000 feet in a second, which may be regarded as altogether impossible

It thus appears that those shooting stars and fire-balls which have the planetary velocity of from 20 to 40 miles in a second, cannot with any probability be regarded as having their origin in the moon Whether any individual bodies moving with a smaller velocity may have a lunar origin is a question which cannot be decisively answered. "To me," says Dr Olbers, "it does not appear at all probable, and I regard the moon, in its present circumstances, as an extremely peaceable neighbour, which, from its want of water and atmosphere, is no longer capable of any strong explosions"

The hypothesis first suggested by Chladni is that which appears to have met with most favour, having been adopted by Arago and other eminent astronomers of the present day to explain the November phenomena It consists in supposing that, independently of the great planets, there exist in the planetary regions myriads of of small bodies which circulate about the sun, generally in groups of zones, and that some of these zones intersect the ecliptic, and are consequently encountered by the earth in its annual revolution The principal difficulties attending this theory are the following — First, that bodies moving in groups in the circumstances supposed must necessarily move in the same direction, and consequently when they become visible from the earth, would all appear to emanate from one point and move towards the opposite Now, although the observations seem to show that the predominating direction is from north-east to south west, yet shooting stars are observed on the same nights to emanate from all points of the heavens, and to move in all possible directions Secondly, their average velocity [illegible] as determined by Wartmann [illegible] greatly exceeds that which any body circulating about the sun can have at the distance of the earth Thirdly, from their appearance, and the luminous train which they generally leave behind them, and which often remains visible for several seconds, sometimes for whole minutes, and also from their being situated within the earth's shadow, and at heights far exceeding those at which the atmosphere can be supposed capable of supporting combustion, it is manifest that their light is not reflected from the sun, they must therefore be self-luminous, which [illegible] to every analogy in the solar system Fourthly if the [illegible] so near the earth as [illegible] of them would [illegible] thousands of [illegible] which have been observed, there is no [illegible] instance of any one having actually reached the earth Fifthly, instead of the meteors being attracted to the earth, some of them are observed actually to rise upwards, and to describe orbits which are convex towards the earth, a circumstance of which, on the present hypothesis, it seems difficult to give any rational explanation

From the difficulties attending every hypothesis which has hitherto been proposed it may be inferred how very little real knowledge has yet been obtained respecting the nature of the shooting stars It is certain that they appear at great altitudes above the earth, and that they move with prodigious velocity, but every thing else [illegible] is involved in profound mystery From facts, M Wartmann thinks that the most rational conclusion we can adopt is, that the meteors probably owe their origin to the disengagement of electricity, or of some analogous matter, which takes place in the celestial regions on every occasion in which the conditions necessary for the production of the phenomena are renewed

The presumptions in favour of the cosmical origin of the shooting stars are chiefly founded on their periodical recurrence at certain epochs of the year, and the extraordinary displays of the phenomena in various years on the nights of the 12th or 13th of November We shall here merely state the principal circumstances accompanying those of 1799, which put the notion of a *lunar* origin entirely out of the question

On the morning of the 12th of November, 1799, before sunrise, Humboldt and Bonpland then on the coast of Mexico were witnesses to a remarkable exhibition of shooting stars and fire balls They filled the part of the heavens extending from due east to about 30° towards the north and south They rose from the horizon between the east and east-north east points, described arcs of unequal magnitude, and fell towards the south, some of them rose to the height of 40° all above 25° or 30° Many of them appeared to explode but the larger number disappeared without emitting sparks some had a nucleus apparently equal to Jupiter This most remarkable spectacle was seen at the same time in Cumana, on the borders of Brazil, in French Guiana in the channel of Bahama, on the continent of North America, in Labrador, and in Greenland, and even at Carlsruhe, Halle, and other places in Germany many shooting stars were seen on the same day At Nain and Hoffenthal in Labrador, and at Neuhernhut and Lichtenau in Greenland, the meteors seem to have approached the nearest to the earth At Nain they fell towards all points of the horizon, and some of them had a diameter which the spectators estimated at half an ell (See *Humboldt's Recueil des Voyages* &c vol ii)

Under the term FIRE BALLS the reader will find an account of a not less stupendous exhibition which took place in North America on the night of the 12th of November, 1833 In 1834, a similar phenomenon occurred on the night of the 13th of November, but on this occasion the meteors were of a smaller size In 1835, 1836, and 1838, shooting stars were observed on the night of November 13th in different parts of the world, but though diligently looked for on the same nights in 1839 and 1840, they do not appear to have been more numerous than on other nights about the same season of the year

The second great meteoric epoch is the 10th of August, first pointed out by M Quetelet, and although no displays similar to those of the November period have been witnessed on this night, there are more instances of the recurrence of the phenomena In the last three years (1838, 1839, 1840) shooting stars were observed in great numbers both on the 9th and 10th, but they appear in general to be unusually abundant during the two first weeks of August The other periods which have been remarked are the 18th of October, the 23d or 24th of April, the 6th and 7th of December, the nights from the 15th to the 20th of June, and the 2d of January

Halley first suggested the idea that the shooting stars may be observed as signals for determining differences of longitude by simultaneous observations and Maskelyne in 1783 published a paper on the subject, in which he calls the attention of astronomers to the phenomena, and distinctly points out this application The idea was revived by Benzenberg in 1802, but so long as they were

regarded merely as casual phenomena, it could scarcely be hoped that they would be of much use in this respect to practical astronomy As soon, however, as their periodicity became probable, the phenomena acquired a new interest, and some recent attempts to determine longitudes in this manner have proved that the method is not to be disregarded (*Monthly Notices of the R Astr. Society for January* 1841)

See an interesting paper on this subject by Dr Olbers, in *Schumacher's Jahrbuch* for 1837, also the *Annuaire du Bureau des Longitudes* for 1836, *Mem de l'Academie de Bruxelles* for 1838, *Schumacher's Astronomisches Nachrichten*, vols xvi and xvii, and the various Scientific Journals

SHORING In Architecture and Engineering, timber or other material placed in such a direction as to prop up a wall or other heavy body

SHOT Any kind of missile discharged by an instrument of war usually of metal for fire-arms

SHOT LOCKERS Long pieces of wood pierced with holes in which the shot are placed, along the sides and round the hatchways

SHOU'LDER In Fortification, the angle of a bastion formed between the face and flank

SHOVELLER The name of a species of duck, remarkable for the length and terminal expansion of the bill, whence the name of *Spathulea*, proposed for the subgenus of which it is the type It is the *Anus clypeata* of Linnæus

SHRA'PNELL SHELLS, in Gunnery, are shells filled with a quantity of musket balls, which, when the shell explodes, are projected about 150 yards further They are fired from guns, mortars, and howitzers and have been found most effective A six-pounder spherical case contains twenty-seven musket balls, which when the shell explodes, do as much injury as an equal number (Navy Encyc)

SHREW *See* SOREX

SHRIKE A name for the *butcher birds*, or species of *Laniarus*

SHRINE (Lat scrinium, *a desk or cabinet*, whence also *screen*) Properly, the receptacle of the remains or relics of a saint Shrines are of two sorts portable, used in processions, called in Latin *feretra*, and fixed in churches The appropriate place for shrines, in the churches of the middle ages was generally in the eastern part, in the space behind the high altar Such is the situation of the celebrated shrine of the three kings of Cologne, and such was that of the shrines at St Alban's, Canterbury, Durham and Westminster, before the Refo[illegible] (Brand vol i)

SHROUDS Large ropes supporting a mast laterally, they take the names of their respective masts, as the lower main shrouds, &c

SHROVE TUESDAY The Tuesday after Quinquagesima Sunday, and immediately preceding Ash Wednesday, so called from the Sax shriven, *to confess*, because on that day confession was made preparatory to the fast of Lent. The custom of ringing the bells for this occasion was long retained in many parishes, particularly [illegible] pancake bell" [illegible] beyond the dinner on pancakes which followed it See *Brand's Popular Antiquities*, for an account of the various shrovetide or carnival amusements of this country

SHRUB A small low dwarfish tree, which, instead of one single stem, frequently puts forth from the same root several sets or stems

Shrub is also the name given to a species of sweet wine or liqueur, of which rum forms the chief ingredient

SHUTTLE An instrument used by weavers, which guides the thread it contains, so as to make it form the woofs of stuffs, cloths, linen, and other fabrics, by throwing the shuttle alternately from left to right and from right to left across between the threads of the warp, which are [illegible] in the middle of [illegible] or chamber, in which is enclosed the *spoul*, which is part of the thread destined for the woof

SHWAN PAN The calculating instrument of the Chinese It is similar in shape and construction to the Roman abacus, and is used in the same manner *See* ABACUS

SI In Music, the name for the seventh sound, added by Le Maire, a Frenchman, at the latter end of the 17th century, to the six ancient notes, ut, re, mi, fa, sol, la, of Guido, by means whereof, some authors say, much inconvenience in the ancient gamut is avoided

SIALAGOGUES (Gr σιαλον, *saliva*, and αγωγος, *a leader*) Medicines which increase the flow of saliva

SIBI'RITE A mineral [illegible] of rubellite or red tourmaline the finest specimens of which have been found in Siberia

SI'BYL The name given to certain prophetic women said to have lived in early ages in Greece and Italy. Some authors recount as many as ten of them The most celebrated were the Sibyl of Cumæ fabled to have been consulted by Æneas and the prophetess who offered her books to Tarquin the Proud (see, among many authorities the *Mém de l'Ac des Inscr* vol xxiii)

SI'BYLLINE BOOKS Documents supposed to contain the fate of the Roman empire Nine of them are said to have been offered by an old woman called Amalthæa to Tarquin the Proud, but Tarquin refusing to give the price she asked, she went away, and burnt three of them Returning with the remainder, she offered them to the king on the same terms as before, and on his second refusal departed again, and returned with three, which she still offered at the same price as the original nine The king, struck with her conduct, at last acceded to her offer, and entrusted the care of the books to certain priests (the quindecemviri) They were preserved in a stone chest beneath the temple of Jupiter Capitolinus, and were consulted in times of public danger or calamity. They were destroyed by the fire that consumed the Capitol in the Marsic war After this calamity, ambassadors were sent to collect such fragments of Sibylline prophecies as they could pick up in various countries; and from the verses thus collected Augustus formed two new books, which were deposited in two gilt cases in the temple of the Palatine Apollo Sibylline verses are often quoted by Christian writers, as containing prophecies of Christianity, but these are spurious, a forgery of the 2d century

SICILIAN VESPERS In Modern History, the name commonly given to the great massacre of the French in Sicily, in A D 1282 They were the soldiers and subjects of Charles of Anjou, who had made himself master of the island after the defeat and death of Conradin The insurrection broke out on the evening of Easter Tuesday, whence the name Its consequence was the expulsion of Charles, and the islanders placed themselves under the protection of the king of Arragon

SIDE'REAL (Lat sidus, *a star*) Something relating to the stars

The *sidereal day* is the time in which the earth makes a complete revolution on its axis in respect of the fixed stars or any fixed point in space (*See* DAY) "If the sidereal day be taken equal to 24 sidereal hours, the mean solar day will be equal to 24 h 3 m 56 55 sec of those hours, and if the mean solar day be taken equal to 24 mean solar hours, the sidereal day will be equal to 23 h 56 m 4 09 sec of those hours Or, in all cases, if we wish to determine in sidereal time, the value of any given interval expressed in mean solar time, and *vice versa*, we shall have

sidereal time = 1 00273791 × mean solar time,
mean solar time = 0 99726957 × sidereal time"

(*Baily's Astronomical Tables*, 1827)

The *sidereal year* is the time in which the earth performs a complete revolution, relatively to the fixed stars, in its orbit, [illegible] 365 d 6 h 9 m 9 [illegible] sec longer than the tropical year *See* YEAR

SIDE'ROCALCITE (Gr σιδηρος, *iron*, Lat calx, *lime*) The name given by Kirwan to the *brown spar* of Werner

SIENITE, or SYENITE (From Syene in Egypt, whence the Romans obtained it for architectural purposes) A granitic aggregate of quartz, felspar, and hornblende *See* GEOLOGY

SIERRA A Spanish term, signifying a chain of hills, and prefixed to the names of several places in Spain and other parts discovered or colonized by the Spaniards

SIESTA (Span) The name given to the practice indulged in by the Spaniards, and the inhabitants of hot climates generally, of resting two or three hours in the middle of the day, when the heat is too oppressive to admit of their going from home

SIGILLA'RIA Fossil plants found in the coal formation

SIGN In Algebra, a symbol indicating an operation to be performed, or a relation subsisting between two quantities Of the former kind, those most commonly used are, + for addition, − for subtraction, × for multiplication, — for division, $\surd$ for the square root, $\sqrt[3]{}$ for the cube root, $\sqrt[n]{}$ for the *n*th root, &c The signs denoting a relation are, = equal to, > greater than, < less than, &c

SIGN In Astronomy, a portion of the ecliptic or zodiac, containing thirty degrees, or a twelfth part of the complete circle The first commences at the point of the equator through which the sun passes at the time of the vernal equinox, and they are counted onwards, proceeding from west to east, according to the annual course of the sun, all round the circle The names of the twelve signs, in the order in which they follow each other, with the characters by which they are indicated on globes, and in the almanacs and books, for short are as follows — *Aries* ♈, *Taurus* ♉, *Gemini* ♊, *Cancer* ♋, *Leo* ♌, *Virgo* ♍, *Libra* ♎, *Scorpius* ♏, *Sagittarius* ♐, *Capricornus* ♑, *Aquarius* ♒, *Pisces* ♓

It is to be remarked, that the above are also the names

of the twelve constellations of the zodiac, and in ancient times (above 2000 years before our era) the places of the signs and the constellations were coincident, but owing to the motion of the earth's equator, by which the equinoctial points are carried backwards on the ecliptic about 50" annually, the intersections of the ecliptic and equator, and consequently the commencement of the signs, now correspond to different stars, the first point of the sign Aries being at present near the beginning of the constellation Pisces On this account care must be taken not to confound the signs of the zodiac, which are fixed in respect of the equinoxes, with the constellations, which are moveable in respect of those points *See* CONSTELLATION

The *ascending signs* are the six beginning with Capricornus, through which the sun passes while advancing from the winter to the summer solstice, and is, consequently, acquiring altitude with respect to inhabitants of the northern hemisphere The other six, beginning with Cancer, are called the *descending signs*

SIGNALS, NAVAL imply a system of symbols addressed to the eye, as flags, boards, lights &c for establishing communication at distances too great for the voice Guns are also used for the same purposes The first signals seem to have been merely distinguishing flags for certain ships [illegible] by James II [illegible] on the part of the ship at which they were exhibited, a condition very detrimental to the use of signals at sea A code composed of *numeral* flags and pendants [illegible] in which each symbol had a number assigned to it, seems to have been the first step towards a general system, as before this plan each admiral instituted his own code In 1815, Sir Home Popham's code was adopted This added several *literal* or alphabetical flags and pendants which greatly extended the means of communication, but necessarily rendered the signals indistinct, and their purports deceitful in many cases, from the increased difficulty of distinguishing each flag from the rest In 1826, in consequence of some plans having been submitted by admirals for a more efficient system, the code now in use, which is considered as an improvement on its predecessor, was adopted In 1828 Admiral Raper published his code, which was one of those under consideration The principle of this system which is undeviatingly adhered to, is, that the manner of combination of the flags and pendants of which the signal is composed [illegible] their order or arrangement, points out the subject of the signal, or, as the author terms it the *point of service* to which the signal relates, while the *numbers* of the individual symbols indicate the number of the signal in its class The numbers are denoted, as usual by the colours, but when these fail, from haze or distance the [illegible] *numeral distant signals* From the small number of symbols [illegible] complete numeral signals), the precision obtained from classification by which the simplicity of each signal is proportioned to its importance and [illegible] the time often wasted in vain attempts [illegible] the precise disposition of the colours of each flag, this system has been considered by some competent judges as the sole thoroughly efficient method

In the merchant service, signals are of less extensive utility than in the royal navy, their chief employment being to express the names of vessels, latitude and longitude, and a few other such particulars, and it were much to be desired that governments would agree to establish universal signals [illegible] of general interest The code in use is Captain Marryatt's

Ingenious systems have been published by Lieut C Phillips, R N, for the ships of all nations, and also by Admiral Sir C Ekins, entitled *Universal Signals* the symbols being black and white only From what little acquaintance we have had with foreign signals, we consider them by no means in advance of our own

SIGNATURE (Lat signatura) In Music the flats and sharps placed after the clef, at the beginning of the staff, which affect, throughout the movement, all notes of the same letter

SIGNATURE In Printing, a letter of the alphabet placed at the bottom of the first page of each sheet of a work, to denote, alphabetically, the order of the sheets

It is customary to commence with B on the first sheet of the body of the work, and to go regularly through the alphabet, with the exception of the letters J, V, and W, which are never used as signatures; and which had, in fact, no existence in the alphabet at the time of the invention of printing, I, expressing both I and J, U, both U and V, and VV, the double letter W If the work extend to more sheets in number than there are letters in the alphabet, the succeeding sheets go on with a second alphabet, which commences with A, and both the letters are usually given, in this manner, A A, or A a, and sometimes, to avoid the repetition, thus, 2 A If a third alphabet be necessary it is always, at the present day, placed with the letter before it, as ∂ A

The printer's first alphabet consists of twenty two letters and the second and succeeding ones of twenty three

As a guide to the bookbinder there are other signatures used in a sheet besides the first In a sheet of octavo the first page has B, the third has B 2, the fifth has B 3 and the seventh has B 4 in a sheet of twelves they are carried to B 6, B 5 being the first page of the offcut, and however numerous the pages may be in a sheet with one signature, when they are all inserted they are continued to the last odd page before the middle of the sheet, but never carried beyond the middle In general they are all omitted except the two first, to show the first fold of the paper, and the first on the offcut Small capitals are more frequently used for signatures than large capitals, as disfiguring the foot of the page in a slighter manner Sometimes figures are used instead of letters but not often, the Gentleman's Magazine is an instance (*Savage's Dict of Printing*)

SIGNET, THE PRIVY One of the king's seals in England, used in sealing private letters and grants under the sign manual It is in the custody of the Secretary of State for the Home Department (*See* SEAL, SECRETARY) The signet in Scotland is the seal by which the king's letters and writs for the purpose of justice are now authenticated Hence the title of clerks to the signet, or writers to the signet, whose business is nearly the same with that of attorneys in England They were anciently clerks in the office of the Secretary of State by whom writs were prepared, and when the signet became employed in judicial proceedings they obtained a monopoly of the privileges of acting as agents or attorneys before the Court of Session

SIGN MANUAL The royal signature, superscribed at the top of bills of grants or letters patent, which are then sealed with the privy signet or great seal, as the case may be, to complete their validity But there are some grants which pass through certain offices, as the Admiralty or Treasury under the sign manual only

SIGNOR The Italian term equivalent to the English *Lord Sir* or *Mr* the French *Monsieur*, and the German *Herr* [illegible] recently the appellation of the chief council [illegible] Venice Genoa and Lucca

SILENACEÆ (Silene one of the genera) An order of Polypetalous Exogenous plants with opposite undivided leaves and a stem with tumid nodes The principal part of the order consists of uninteresting weedy plants, but it also contains the genera *Dianthus* of which the garden pink clove, and piccotee are species, the *Agrostemma Saponaria* and some other plants cultivated for their beautiful flowers

SILENTIARY Among the Romans, the title or office of a class of slaves attached to wealthy houses In the court of the emperors there was a body of officers attached to the household styled silentiaries Thence the title came to functionaries of higher authority, and was borne by cabinet secretaries in the Lower Empire and in the courts of Charlemagne and other western potentates who derived their code of ceremonial from Byzantium Members of the privy council seem to have been sometimes called by this name under the Plantagenets in England

SILENUS (Gr Σιληνος) A Grecian divinity the foster-father and attendant of Bacchus and likewise leader of the satyrs This deity was remarkable for his wisdom his drunkenness being regarded as inspiration He was represented as a robust old man in a state of intoxication and riding on an ass with a cup in his hand Silenus says Mr Bryant, is only a corruption of a masculine form of Σεληνη *the moon* By some speculative mythologists the drunken companion of Bacchus is converted into a sage who was honoured as a dæmon after his decease (*Theopompus in Ælian*, cited in Bryant *Anc Mythol* vol iii p 328) There was an order of priests called Sileni, of the same class with the Curetes

SILEX or SILICA (Gr χαλιξ, *a pebble* or *stone*) The earth of flints This important substance constitutes the characteristic ingredient of a great variety of siliceous minerals, among which rock-crystal, quartz chalcedony, and flint may be considered as silica nearly pure It also predominates in many of the rocky masses which [illegible] the [illegible] has none of the ordinary or more obvious acid properties yet as it combines in definite proportion with many salifiable [illegible] and its various compounds have been denominated *silicates* When pure and colourless rock-crystal is heated red hot and quenched in water, it becomes opaque and friable and if in this state it be reduced to powder, it presents one form of pure silica If in this state (in which it is perfectly insoluble in water) it be fused with three parts of carbonate of potash, it forms a glass which is soluble in water, and from this solution (formerly called *liquor of flints*) the concentrated acids throw down the silica in the form of a *gelatinous hydrate*, but if the solution be diluted, and the acid gradually added, the alkali may be

perfectly neutralized without any deposition of the silica, which, therefore, is thus exhibited in a very soluble state when however it is evaporated to dryness, the silica is rendered insoluble as before This solubility of hydrated silica, whilst when dry it is perfectly insoluble, may serve to explain the occasional occurrence of silica in mineral waters and its deposition in various chalcedonic incrustations But silica presents another very remarkable character, which is, that if we reverse the above proportions, and fuse together a mixture of one part of carbonate of potash and three of powdered rock-crystal or calcined flint, we then obtain a transparent and fusible compound, which is insoluble in water, and which, in fact, is glass

Plate glass and *window glass*, or, as it is commonly called, *crown glass*, are silicates of soda or potassa, and *flint glass*, of which our common glass utensils are made, is a similar compound, with a large addition of silicate of lead *See* GLASS

Silica, in its ordinary or *anhydrous* state is insoluble in all acids except the *hydrofluoric* which immediately acts upon it, and forms an extraordinary gaseous compound, the *fluosilicic* acid Silica was long considered as an elementary form of matter, but Sir H Davy found that when the vapour of potassium was brought into contact with pure silica heated to whiteness, silicate of potassa was formed, and a dark-coloured matter separated which was afterwards found to be the base of silica, and to which the terms *silicium* and *silicon* have been applied It is probably not metallic, and bears a greater analogy to boron than to any known principle Silicon is a nonconductor of electricity incombustible in air and oxygen, and not acted upon by any single acid, but it is readily soluble in a mixture of the nitric and hydrofluoric acids It is, however, rapidly oxidized by and burns vividly at a temperature below redness, when in contact with fused soda or potassa The exact equivalent of silica has not been very satisfactorily determined, but we are probably not very incorrect in regarding silica as a compound of equal weights of silicon and oxygen In that case if it be regarded as a protoxide, it is obvious that 8 will be the equivalent of its base, and silica will consist of 8 silicon + 8 oxygen, and be represented by the equivalent 16 But if silica be regarded as a compound of 1 atom of silicon and 3 atoms of oxygen and Berzelius has shown that some analogies favour this view, then 24 will be its equivalent, and 48 that of silica The *chloride of silicium* and its *bromide* are limpid fuming liquids, the former very volatile The *sulphuret* is a white earthy-looking substance

SILHOUETTE In the Fine Arts a name given to the representation of an object filled in of a black colour and in which the inner parts are sometimes indicated by lines of a lighter colour and shadows or extreme depths by the aid of a heightening of gum or other shining medium This sort of drawing derives its name from its inventor Etienne de Silhouette, the French minister of finance in 1759 Representations of this sort may be well enough taken from the shadow of a person thrown on a piece of paper placed against a flat surface or wall The likeness may be still better taken, if on a reduced scale, by means of the instrument called a pantograph

The invention of what is called a *silhouette* is however ascribed to a remote period, being said to have been the method whereby the daughter of a Greek potter drew the outline of her lover's portrait on a wall and has been placed at the time of the renewal of the Olympic games shortly before the expulsion of the Bacchiades from Corinth, about 776 B C It is to be observed that Sicyon and Corinth were the first cities in which painting flourished, and that Crato of Sicyon Philocles of Egypt and Cleanthes of Corinth, were considered the inventors of *monochromes*, or silhouettes, as they have been more recently called, which were applied to large objects The Etruscan vases furnish to an amazing extent, and in boundless variety, some of the most beautifully drawn and elegant monochromes or silhouettes that have ever been executed

SILICIFICÆ Substances petrified or mineralized by siliceous earth

SILICULA (Lat siliqua, *dim*) A fruit exactly similar to that called a siliqua, except that it is shorter, and contains fewer seeds It is never more than four times as long as broad, and usually much shorter

SILIQUA (Lat) A one or two celled, many-seeded, linear fruit, dehiscent by two valves separating from a replum, the seeds are attached to two placentæ adhering to the replum and opposite to the [illegible] of the stigma

SILK (Lat sericum, from Seres, the supposed ancient name of the Chinese) A fine glossy thread or filament spun by various species of caterpillars or larvæ of the *Phalæna* genus Of these, the *Phalæna atlas* produces the greatest quantity, but the *Phalæna bombyx* is that commonly employed for this purpose in Europe The silkworm, in its caterpillar state, which may be considered as the first stage of its existence, after acquiring its full growth (about three inches in length), proceeds to enclose itself in an oval shaped ball or cocoon, which is formed by an exceedingly slender and long filament of fine yellow silk emitted from the stomach of the insect preparatory to its assuming the shape of the chrysalis or moth In this latter stage, after emancipating itself from its silken prison, it seeks its mate, which has undergone a similar transformation; and in two or three days afterwards, the female having deposited her eggs (from 300 to 500 in number) both insects terminate their existence According to Reaumur, the *phalæna* is not the only insect that affords this material, — several species of the *aranea*, or spider, enclose their eggs in very fine silk

Raw silk is produced by the operation of winding off, at the same time several of the balls or cocoons (which are [illegible] in hot water, to soften the natural gum on the [illegible] on a common reel, thereby forming one smooth even thread When the skein is dry, it is taken from the reel and made up into hanks, but before it is fit for weaving, and in order to enable it to undergo the process of dyeing, without furring up or separating the fibres, it is converted into one of three forms, — viz *singles*, *tram*, or *organzine*

Singles (a collective noun) is formed of *one* of the reeled threads, being twisted, in order to give it strength and firmness

Tram is formed of two or more threads twisted together In this state it is commonly used in weaving, as the *shoot* or *weft*

Thrown silk is formed of two, three or more singles, according to the substance required, being twisted together in a contrary direction to that in which the singles of which it is composed are twisted This process is [illegible] and the [illegible] was originally performed [illegible] where it was kept a secret for a long period Stowe says it was known in this country since the 5th of Queen Elizabeth, "when it was gained from the strangers," and in that year (1562), the silk throwsters of the metropolis were united into a fellowship They were incorporated in the year 1629, but the art continued to be very imperfect in England until 1719 (See *post*)

Historical Sketch of the Manufacture — The art of rearing silkworms of unravelling the threads spun by them, and manufacturing the latter into articles of dress and ornament, seems to have been first practised by the Chinese Virgil is the earliest of the Roman writers who has been supposed to allude to the production of silk in China and the terms he employs show how little was then known at Rome as to the real nature of the article —

> Velleraque ut foliis depectant tenuia Seres.
> *Georg* book ii lin 121

But it may be doubted whether Virgil do not, in this line refer to cotton rather than silk Pliny however has distinctly described the formation of silk by the *bombyx* (*Hist Nat* lib xi c 17) It is uncertain when it first began to be introduced at Rome, but it was most probably in the age of Pompey and Julius Cæsar the latter of whom displayed a profusion of silks in some of the magnificent theatrical spectacles with which he sought at once to conciliate and amuse the people Owing principally no doubt to the great distance of China from Rome and to the difficulties in the way of the intercourse with that country, which was carried on by land caravans, whose route lay through the Persian empire, and partly perhaps, to the high price of silk in China, its cost when it arrived at Rome was very great, so much so, that a given weight of silk was sometimes sold for an equal weight of gold! At first it was only used by a few ladies eminent for their rank and opulence In the beginning of the reign of Tiberius, a law was passed —*ne vestis serica viros fœdaret* — that no man should disgrace himself by wearing a silken garment (*Tacit Annal* lib ii c 33) But the [illegible] Heliogabalus despised this law and was the first of the Roman emperors who wore a dress composed wholly of silk (*holosericum*) The example once set, the [illegible] of wearing silk soon became [illegible] the wealthy citizens of Rome and the [illegible] According as the demand for [illegible] increased [illegible] were made to import larger quantities, and the price seems to have progressively declined from the reign of Aurelian That this must have been the case, is obvious from the statement of Ammianus Marcellinus, that silk was, in his time (anno 370), very generally worn, even by the lowest classes *Sericum ad usum antehac nobilium, nunc etiam* [illegible] (Lib xxiii c 6) [illegible] Roman empire in return for silk, now become indispensable to the western world, till the 6th century About the year 550, two Persian monks, who had long resided in China, and made themselves acquainted with the mode of rearing the silkworm, encouraged by the gifts and promises of Justinian, succeeded in carrying the eggs of the insect to Constantinople Under their direction they were hatched and fed, they lived and

[illegible] a sufficient number of but[illegible] to propagate the race, and mulberry trees were planted to afford nourishment to the rising generations. A new and important branch of industry was thus established in Europe Experience and reflection gradually corrected the errors of a new attempt, and the Sogdiote ambassadors acknowledged in the succeeding reign, that the Romans were not inferior to the natives of [illegible] and the manufactu[illegible] vol vii p 99)

Greece, particularly the Peloponnesus, was early distinguished by the rearing of silkworms, and by the skill and success with which the inhabitants of Thebes, Corinth, and Argos carried on the manufacture Until the 12th century, Greece continued to be the only Europ[illegible] these arts were practised, but the [illegible] Roger, king of Sicily, having, in 1147, [illegible] and Thebes, carried off large numbers of the inhabitants to Palermo, who introduced the culture of the worm and the manufacture of silk into Sicily From this island the art spread into Italy, and Venice, Milan, Florence, Lucca, &c were soon after distinguished for their success in raising silkworms, and for the extent and beauty of their manufactures of silk (*Gibbon*, vol x. p 110, *Biographie Universelle*, art "Roger II")

The manufacture of silk appears to have been introduced into Spain at a very early period by the Moors, particularly in Murcia, Cordova, and Granada "The last town, indeed, possessed a flourishing silk trade when it was taken by Ferdinand in the 15th century The French having [illegible] with workmen from Milan, commenced, in [illegible] manufacture, but it was not till 1564 that they began successfully to produce the silk itself, when Traucat a working gardener at [illegible] formed the first nurseries of white mulberry trees and with such success that in a few years he was enabled to propagate them over many of the southern provinces of France Prior to this time, some French noblemen on their return from the conquest of Naples had introduced a few silkworms with the mulberry into Dauphiny, but the business had not prospered in their hands The mulberry plantations were greatly encouraged by Henry IV, and since then they have been the source of most beneficial employment to the French

James I was most solicitous to introduce the breeding of silkworms into England, and in a speech from the throne he earnestly recommended his subjects to plant mulberry-trees, but he totally failed in the project This country does not seem to be well adapted to this species of husbandry, on account of the great prevalence of blighting east winds during the months of April and May, when the worms require a plentiful supply of mulberry-leaves. The manufacture of silk goods, however, made great progress during that king's peaceful and pompous reign In 1629 it had become so considerable in London, that the silk throwsters of the city and suburbs were formed into a public corporation So early as 1661 they employed 40 000 persons The revocation of the edict of Nantes, in 1685, contributed in a remarkable manner to the increase of the English silk trade, by the influx of a large colony of skilful French weavers, who settled in Spitalfields The great silk-throwing mill mounted at Derby, in 1719 also served to promote the extension of this branch of manufacture, for soon afterwards, in the year 1730, the English silk goods bore a higher price in Italy than those made by the Italians, according to the testimony of Keysler It would be impossible, within our limits, to give an account of the gradual progress of the silk manufacture from that period down to the present time Upon this subject, the reader will find ample details in the *Commercial Dictionary*, meantime we may remark that a great revolution was effected in the manufacture in 1825 Previously to that epoch [illegible] enactments with respect to it were the [illegible] and impolitic that can well be imagined The importation of foreign silks was prohibited under the severest penalties, but the advantage that this prohibition was believed, though most [illegible] on the manufacturer, would [illegible] circumstances, have been more than [illegible] of oppressive duties on the raw material This vicious system was productive of a twofold mischief, for, by teaching the manufacturers to depend on custom-house regulations for protection against foreign competition it made them indifferent about new discoveries and inventions while, owing to the exorbitant duties on the raw material, and the want of improvement the price of silks was maintained so high as to restrict the demand for them within comparatively [illegible] limits In 1825, however, a new and more reasonable order of things was introduced The duties on the raw material were greatly lowered; at the same time [illegible] were allowed to be imported on [illegible] of 30 per cent *ad valorem* This new system was vehemently opposed at its outset, and it was confidently predicted that it would occasion the ruin of the manufacture, but the result has shown the soundness of the principles on which it was bottomed The manufacturers were now, for the first time, compelled to call all the resources of science and ingenuity to their aid; and the result has been that the manufacture has been more improved during the last twenty-five years than it had been in the whole previous century, and that it has continued progressively to increase These duties have again been [illegible] 10 Vict c 23 [illegible] manufactured silks being charged at [illegible] and upwards, or [illegible] weight [illegible] imported for home consumption in 1850 was nearly 5,000,000 lbs The total number of individuals directly engaged in the manufacture has been estimated at upwards of 207 000 but we incline to think that this is very decidedly beyond the mark The value of the silks annually produced may, perhaps, be estimated at from [illegible] to 12,000,000*l*

SILL (Sax syll) In Architecture the horizontal piece at the bottom of a framed case, such as that of a door or window This word is also used to denote the bottom piece of a quarter partition *Ground sills* are those timbers on the ground on which are placed the posts and superstructure of a timber building

SILLIMANITE A mineral named after Professor Silliman, from Saybrook in Connecticut, it is of a brown or dark grey colour, and composed of silica and alumina, with a trace of oxide of iron

SILT The name given to the sand, clay, and earth which accumulate in running waters

SILURIAN The name given by Murchison to a series of rocks forming the upper subdivision of the sedimentary strata found below the old red sandstone, and formerly designated the *grey-wacke series* These strata are well developed in that part of England and Wales formerly included in the ancient British kingdom of the *Silures* See GEOLOGY

SILURIDANS *Siluridæ* (Lat silurus, *a sheath-fish*) The name of the family of fishes of which the genus *Silurus* is the type, and which includes the electric silurus (*Malapterurus electricus*) They are chiefly distinguished by the want of true scales, having merely a naked skin, or large osseous plates A strong osseous spine forms the first ray of the dorsal and pectoral fins, except in the genus *Malapterurus*

SILVANUS A rural Italian deity, so called from Lat sylva *a wood* He also presided over boundaries

SILVER (Germ silber) A white, malleable, ductile, and tenacious metal, of a brilliant lustre when polished, and soft when pure Its specific gravity is 10 5 It is not altered by air or moisture, but is blackened or tarnished by sulphuretted hydrogen When melted in open vessels it has the curious property of absorbing oxygen, which it gives out when it congeals This is the cause of the appearance of granular crystallization which silver assumes when hastily cooled [illegible] of copper entirely prevents the effect [illegible] which act upon silver are the nitric and sulphuric The nitric acid dissolves silver without the aid of heat nitrous gas is evolved, and a dense colourless solution obtained, from which tabular crystals of nitrate of silver may be procured by evaporation These crystals are anhydrous and consist of 118 oxide of silver and 54 nitric acid, the equivalent of silver being 110 When melted, and cast into sticks or quills, they form the *lunar caustic* of the surgeons Any gold which the silver might have contained, being insoluble in nitric acid, remains in the form of a black powder, and this simple process enables us readily to separate those metals Silver is not attacked by cold sulphuric acid, but when granulated silver is heated in concentrated sul-

[illegible] the oxide of [illegible] and [illegible] forming a sulphate of silver [illegible] anhydrous [illegible] crystals In this case, the gold also [illegible] as sulphuric is much cheaper than nitric acid, it is used for the separation of those metals upon the large scale The solutions both of the nitrate and sulphate of silver are decomposed by the immersion of several of the other metals Copper is generally used for the purpose, which, when immersed in the solution of silver, causes its separation in the form of a grey metallic powder which is sometimes technically called *water silver* Chlorine and all the soluble chlorides, when added to solutions of silver occasion a white curdy precipitate which is distinguished by the rapidity with which it [illegible] by exposure to light The substance thus formed is a chloride of silver composed of 110 silver + 36 chlorine, the equivalent of chloride of silver being 146 It is not decomposed by heat alone, but when carefully melted it concretes into a horny substance, formerly called *luna cornea* Chloride of silver may be easily decomposed either by mixing it in a moist state with zinc filings or [illegible] soda or potash in either [illegible] The insolubility of chlo-

ride of silver renders a solution of nitrate of silver an admirable test of the presence of common salt or other chlorides in mineral waters, and, on the other hand, a solution of common salt is used to detect silver when in solution A solution of [illegible] nitrate of silver in an ounce of water, [illegible] sap green or Indian ink, forms marking ink, and when written upon linen, previously prepared by the application of a weak solution of carbonate of soda with a little gum in it, soon forms black indelible letters When a dilute solution of silver is mixed with alcohol an effervescence ensues, and *fulminating silver* is precipitated This most dangerous compound (a peculiar cyanate of silver) ought never to be meddled with in quantity, and always with [illegible] upon the [illegible] rubbed, or heated

The numerous uses and applications of silver are well known In its pure state it is too soft for coin, plate, and most ornamental purposes, and is therefore, in such cases, alloyed with copper, by which, in proper proportion, its colour is not materially impaired, and it is considerably hardened The standard silver of our coin is an alloy of 11 oz 2 dwts of pure silver, and 18 dwts of copper, to the pound Troy, and this weight is coined into 66 shillings

Silver is found *native*, and in the state of *sulphuret*, constituting the varieties of black and vitreous silver ore It also occurs in combination with several other metals, and more especially with the sulphurets of lead, so that the lead of commerce is seldom quite free from traces of silver, and many such lead ores are worked as ores of silver

SIMARU'BA The bark of the root of the *Quassia simaruba*, a native of the West Indies This is a tough, fibrous, bitter bark, the infusion is occasionally used in medicine as a tonic

SIMARUBA'CEÆ (Simaruba, one of the genera) A natural order of arborescent or shrubby Exogens inhabiting the tropics The species are intensely bitter The wood of quassia is well known A plant called *Paraiba* in Brazil, the *Simaruba versicolor* of St Hilaire, possesses such excessive bitterness that no insects will attack it, and *Picræna excelsa* is another species of the order, which is employed in medicine for the same property

SI'MIA (Lat simus *flat-nosed*) The generic name applied by Linnæus to all the Quadrumanous Mammals except the lemurs The Linnean *Simiæ* are divided into numerous subgenera to none of which the name *Simia* is now applied except by some modern naturalists to the orang-utans (*Simia satyrus* and *S. morio*)

SI'MILAR (Lat similis *like*) In Geometry similar rectilineal figures are such as have their several angles respectively equal, each to each and their sides about the equal angles proportional The areas of two similar figures are to each other as the squares of their homologous sides *Similar segments of circles* are such as contain equal angles *Similar curves* are curves whose equations are of the same form and the ratio of the constants in those equations equal Hence all circles are similar, and all parabolas are similar, because in both cases, only one constant enters into the equation of the curve *Similar solids* are such as are contained by the same number of similar planes, similarly situated, and having like inclinations to one another Such solids are to one another as the cubes of their homologous sides

SI'MILE (Lat *like*) In Rhetoric, the same as *comparison* which see

SIMI'LITER (Lat *in like manner*) In Law, the technical designation of the form by which either party, in pleading, accepts the issue tendered by his opponent The one having concluded his plea, replication, &c., by [illegible] by "putting himself [illegible] that the truth of the facts may be inquired of by a jury, the other adds the similiter, which is in the form,—"And the said A B as to the plea, &c of the defendant (or plaintiff) above pleaded, and whereof he hath put himself upon the country, doth the like" *See* PLEADING

SIMI'LITUDE [illegible] signifies the relation of [illegible] to each other

SIMONIANS The name given to the followers of Simon Magus who pretended to be the great virtue and power of God sent from heaven to earth Their system was a medley of the philosophy of Plato, the mythological fables of the heathens, and of Christianity The sum of their doctrines as [illegible] by their founder, was, that from the Divine Being [illegible] fountain of light, flow various orders of eternal natures, subsisting within the plenitude of the Divine essence, that beyond these in the order of emanation are different classes of intelligences, to the lowest of which belongs the human soul; that matter is the most remote production of the emanative power, which, on account of its infinite distance from the fountain of light, possesses [illegible] malignant qualities, which appear the [illegible]

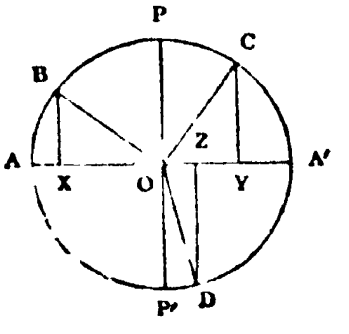
are the cause of evil, that it is the great design of philosophy to deliver the soul from its imprisonment in matter, and restore it to that divine light from which it was derived, and that for this purpose God had sent us one of the first *æons* into the world He believed also in the transmigration of [illegible] of the body (*Encyc B* [illegible] length the opinions of [illegible] entitled to, but considering that it was the first heresy in the Christian church, a resumé of its views was consi[illegible]

[illegible] *see* SAINT SIMONIANS

SI[illegible] lawful contract for the presenting a clergyman to a benefice When such presentation is made corruptly, for money, gift, or reward, by stat 31 Eliz c 6 such presentations are void, and the crown shall present for that turn And by 12 Ann 8 t 2 c 12 if any one, for money or profit, procures in his own name the next presentation to any living ecclesiastical, and is presented thereupon, the contract is simoniacal The term is derived from Simon Magus, who was punished, as is related in the Acts, for attempting to obtain the gifts of the Holy Spirit by bribing the apostles It is generally remarked, however, that the practices against which our laws are directed bear no precise [illegible]

SIMOON, or SIMOOM A hot arid wind which blows in Arabia, Syria, and the adjacent countries, and chiefly about the time of the equinoxes The simoon, which is identical with the *khamsin* of Syria and the *samiel* of the Turks, and resembles in many respects the *sirocco* and *sorana* of other countries, derives its qualities from blowing over sandy deserts heated intensely by the sun Sometimes it blows in squalls, bearing along with it quantities of burning sand and dust In the desert it is greatly dreaded, and the only chance of safesty the traveller has is to fall down with his face close to the ground, and [illegible] drawing breath [illegible] Bruce, Volney, Charlind Malcolm, and other travellers

SIMPLI'CIMANES, *Simplicimani* (Lat simplex, *simple*, manus, *a hand*) A name given by Latreille to a tribe of Caraboid beetles comprehending those in which, in the male, the two anterior tarsi are dilated



SIMPLI'CITY (From Lat simplex) In the Fine Arts that quality in works of art through which the elements whereof it is composed are arranged in the most natural order, and in which the ideas and images are presented to us so that [illegible] by the accessories, and [illegible] in due subordination to the whole Simplicity is the reverse of excess and exaggeration, and may be properly called a negative quality in art

SI'NAPISIN A peculiar principle extracted from mustard seed (*Sinapis alba*) It is a white crystallizable inodorous substance, of a bitter taste accompanied by the flavour of mustard It is supposed to contain sulphur, carbo[illegible]

SI'NAPISM [illegible], *mustard*) A mustard poultice

SI'NCIPUT The anterior region of the upper part of the head, from the vertex to the eyes in Mammals, and from the vertex to the base of the beak in birds

SINE (Lat sinus *the bosom*) In Trigonometry the sine of any arc of a circle is the straight line drawn from one extremity of the arc perpendicular to the radius passing through the other extremity Thus, in the circle A B C D let O A and O B be two radii and let B X be perpendicular to O A, then B X is the sine of the intercepted arc A B In like manner, if C Y and D Z be perpendicular to A O, or its prolongation O A', then C Y is the sine of the arc A B C, or of A' C, the supplement of A B C, and D Z the sine of A C D, or of A' D

Draw the diameter P O P', and suppose the arc A B to increase from 0 to 360° It is evident that as the arc A B increases from A to A P, or from 0 to 90°, the sine B X increases from zero to O P, [illegible] to the radius, and hence the ra[illegible] *totus*, or whole sine Between P and A the sine again diminishes as the arc is increased and vanishes at A' [illegible] P' it again increases till it becomes equal [illegible] and from this position decreases until it again vanishes at A Hence it appears that the origin being supposed at A the sine is positive in the first and second quadrants, or from 0 to 180°, and negative in the third and fourth, or from 180° to 360°

If [illegible] be described about the same centre O the two lines O A and O B would intercept on it an arc similar to A B, and if, also, we suppose the radius of this second circle = 1, and denote the inter-

cepted arc by ϕ; then we shall have evidently sin ϕ : 1 :: BX : BO, or sin $\phi = \frac{BX}{BO}$ But the arc whose radius is 1 is the measure of the angle at the centre, therefore the sine of the angle AOB is the ratio of BX to BO, or AO This definition of the sine of an angle is adopted in some of the best recent works on trigonometry

The sine of an arc is the half of the chord of the double arc Ptolemy, in the graphical constructions in the *Analemma*, makes use of the semichords instead of the chords, but the introduction of the sines into trigonometrical calculation was an importa it i provement of which the credit appears to be due to the Arabian astr omer Albategnius (Delambre, *Astronomie du Moyen Age*, p 12) The term *sine* has been variously derived, the Arabic name is *gib*, or *dgib*, signifying *a fold*, of which *sinus* is the Latin translation (*Hutton's Mathematical Tables*)

For the analytical expressions of the sines of the sums and differences of two arcs, of multiple arcs, and of the lines, see TRIGONOMETRY

SINECURE Politics, an office without any duties attached to it The term is properly ecclesiastical and applied to a benefice without care of souls, in which sense it is also still employed

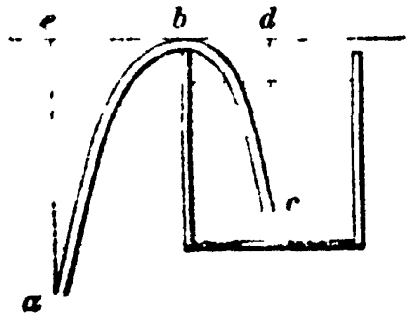
SINE DIE (Lat *without day*) In Legal and Parliamentary Usage, an adjournment or prorogation *sine die* means without any specified day for resuming the subject or reassembling

SINGULAR TERM In Logic, a term which stands for one individual A singular proposition is one which has for its subject either a singular term or a common term limited to one individual by a singular sign *See* TERM, PROPOSITION

SINISTER (Lat literally *left*) is used in its ordinary signification for unlucky, though the Romans in the rites of divination attached to it the opposite meaning Thus *avis sinistra* or a bird on the left hand was esteemed a happy omen, and *intonuit laevâ* it thundered on the left hand, indicated the same *Sinister* in Heraldry, is used to designate the left-hand side or part

SINKING FUND A provision made by parliament consisting of the surplusage of other funds intended to be appropriated to the payment of the national debt *See* FUNDS

SINOPLE In Heraldry, the Continental designation for the colour green, by English heralds called *vert* The name is said to be derived, through the importation of the Crusades, from the town of Sinope, in Asia Minor



SINTER A German word implying a *scale* (*Calcareous sinter*) is a variety of carbonate of lime composed of successive concentric layers *Silicious sinter* is a variety of common opal

SINUOUS (Lat sinuosus) In the Fine Arts of a serpentine or undulating form

SINUS (Lat) The veins of the dura mater of the brain are called *sinuses*

SIPHON (Gr σιφων, *a tube*) In Zoology the name of the membranous and calcareous tubes which traverse the septa and the interior of Polythalamous shells Also applied to the tubular prolongations of the valves of Bivalve Molluscous animals, and to the mouth of certain Suctorious Crustaceous, and Apterous insects

SIPHON, or SYPHON In Hydraulics a simple and well known instrument, chiefly used for the purpose of drawing off liquids from casks The siphon is simply a bent tube, *a b c* having one end longer than the other To use the siphon, the tube is in the first place filled with the liquid and the open end *a* stopt by the hand, or by a cock,

in which state the liquid will not flow from the other extremity The end *c* is then immersed in the liquid, and the stop removed from *a*, upon which if *a* be at a lower level than *c*, the liquid will immediately begin to flow out at *a*, and will continue to flow until the vessel is drained down to the level of *c*

The principle of the siphon may be explained as follows — The lowest section of the fluid within the tube at the extremity *c* is subjected to two unequal pressures in opposite directions first the pressure due to the weight of the liquid in the branch *b c*, which pressure is equal to the [illegible] external liquor at *c*, which is equal to the atmospheric pressure, or the weight of a column of liquid of about 34 feet in height, together with the weight of the column reaching from *c* to the surface of the liquid in the vessel, which, however, we may leave out of consideration Hence, if the line *c d* be less than 34 feet (if the liquid be water the last pressure will preponderate and the liquid will be forced in at the tube by a pressure equal to the weight of the atmosphere diminished by the weight of a column of the fluid equal to *c d* In like manner, the pressure upon a section of the liquid at *a* is equal to the weight of the atmospheric column diminished by the weight of a column of the fluid equal in height to *a e* If, therefore, *a e* be greater than *c d* the pressure at *c* will be greater than the pressure at *a*, and the liquid will be forced through the tube

From this explanation it is obvious that the limits within which the siphon can act are determined by the specific gravity of the fluid Water cannot be raised by the siphon [illegible] nor mercury to a greater height than [illegible] It is also obvious that the comparative diameters of the two branches, and their oblique lengths, are of no importance, the action depending only on the difference of their perpendicular heights

Sometimes the siphon is made with both branches equal, and turned up at the extremities, in which case, so long as the extremities are kept on the same level, it will continue always full and ready for use This form of the instrument is called the *Wurtemberg siphon*, from its having been first used at that place

SIPHONAPTERANS, *Siphonaptera* (Gr σιφων, α priv and πτερον *a wing*) A name given by Latreille to an order of insects, including those Apterous species which have a mouth in the form of a siphon

SIPHONIFERS, *Siphonifera* (Gr σιφων, Lat fero, *I bear*) A name given by D'Orbigny and Lerussac to an order of Cephalopods, including all those species which have a siphon contained within a polythalamous shell

SIPHONOBRANCHIATES, *Siphonobranchiata* (Gr σιφων, and βραγχια, *gills*) The name of an order of Gastropods, including those in which the branchial cavity terminates in a tube or siphon more or less prolonged by which the respiratory current of water is received and expelled

SIPHONOPHORES *Siphonophora* (Gr σιφων, and φερω, *I bear*) A name given by Eschscholtz to an order of Acalephes, to which he refers those species that have no central nervous system but simply isolated tubes

SIPHONOSTOMES *Siphonostoma* (Gr σιφων, and στομα *a mouth*) The name of a family of Crustaceans, including those which have a siphon shaped mouth [illegible] By M de Blainville the term is applied to those Gastropods which have the opening of the shell [illegible]

SIPHORHINIANS *Siphorhina* (Gr σιφων and ρις, *a nose*) A name applied to a tribe of swimming birds, including those which have the nostrils prominent and tubular

SIPUNCLE *Sipunculus* The name of a genus of worms which burrow in the sands of the sea shore, and are classed with the *Echinoderms* by Cuvier, and with the *Entozoa* by M de Blainville They differ from the soft bodied *Echinoderms* chiefly in the absence of ambulacral pores

SIR The term used in England, either out of respect or formality, in addressing any one More particularly, it is [illegible] appellation of knights and baronets, [illegible] names it is prefixed The derivation of this word has greatly puzzled etymologists The Latin herus *master* (whence the German herr), and senior whence *signior sire, sir*, and the Gr κυριος, *lord* are specimens of the origin which has been assigned to this term The second is undoubtedly correct Since the 16th century the word *sire* has been used in prose only in addressing sovereign princes

SIREN The generic name of certain Perennibranchiate reptiles which have only one pair of feet, and retain the external gills, they are peculiar to the southern provinces of the United States

SIRENE In Acoustics, an instrument for determining the velocity of aerial vibration, corresponding to the different pitches of musical sounds "In this elegant instrument the wind of a bellows is emitted through a small aperture, before which revolves a circular disc pierced with a certain number of holes, arranged in a circle concentric with the axis of rotation, exactly equidistant from each other, and of the same size, &c The orifice through which the air passes is so situated that each of these holes, during the rotation of the disc shall pass over it, and let through the air, but the disc is made to revolve so near the orifice that in the intervals between the holes it shall act as a cover, and intercept the air If the holes be placed obliquely, the action of the current of air alone will set the disc in motion, if perpendicular to the surface, the disc must be moved by wheel-work, by means of which its velocity of rotation is easily regulated and the number of impulses may be exactly counted The sound produced is clear and sweet, like the human voice. If, instead of a single aper-

ture for [illegible] where the several, so disposed in a circle of equal [illegible] with [illegible] the holes of the [illegible] pass [illegible] sounds of one pitch, and being heard together will reinforce each other The sirene sounds equally when plunged in water and fed by a current of that fluid as in air thus proving that it is the number of impulses only and nothing dependent upon the nature of the medium in which the sound is excited that influences our appreciation of its pitch" (Sir John Herschel's Treatise on Sound, *Encyc Metropolitana*)

The sirene, as thus described was invented by Baron Cagniard de la Tour An instrument on the same principle, and for the same purpose, had formerly been devised by Professor Robison, but the construction was much less elegant and commodious A current of air passing through a pipe was alternately intercepted and permitted to pass by the shutting and opening of a stop cock

SI'RENS (Gr Σειρῆνες, probably from *σειρα a chain*, to signify their attractive power) Melodious divinities, who dwelt on the shores of Sicily and so charmed passing mariners by the sweetness of their song that they forgot their homes and remained there till they perished of hunger Their history has been variously described According to Homer in the *Odyssey*, as Ulysses and his companions were on their [illegible] Æaea, they came first to the isl[illegible] it they passed in safety, for, by the directions of Circe, Ulysses stopped the ears of his companions with wax, and had himself tied to the mast before approaching the island, so that, although when he heard the song of the Sirens he made signs for his companions to unbind him, they only secured him the more closely in compliance with his previous instructions Thus he listened to the songs of the Sirens, and escaped notwithstanding Hence it was feigned that they threw themselves into the sea from vexation at the escape of Ulysses, an oracle having predicted that they should live only so long as their strains had power to arrest all who heard them But according to other poets, they threw themselves into the sea from rage and despair on hearing the more melodious song of Orpheus Originally there were only two Sirens, but their number was afterwards increased to three, and their names are given with great variety See the speculations of Bryant on the subject, *Anc Mythol* ii 277, and iii 237

SI'RIUS (called also *Canicula*, or *Canis Candens* the [illegible] the first magnitude in the constel[illegible] or the Great Dog and the brightest in the heavens The Egyptians observing that the Nile [illegible] ing of this star paid it [illegible] from *Seirs*, one of the appellations of the Nile

SIROCCO (Ital) A soft relaxing wind chiefly experienced in the south of Italy, Malta and Sicily It blows from the south east or south and having been heated over the sandy deserts of Libya it becomes occasionally moist in its passage across the Mediterranean and oppresses the inhabitants of the above named countries with excessive languor and a sinking of the mental energies The setting in of the sirocco is followed by a considerable rise of the thermometer and is attended with a haze which obscures the atmosphere See SIMOON

SIRVE'NTII In the Literature of the Middle Ages, as [illegible] the Troubadours, [illegible] phes of a peculiar construction See TROUBADOUR

SI'STRUM (Gr σιστρον from *σειω to shake*) A kind of timbrel, which the Egyptian priests of Isis used to shake with their hands at the festivals of that goddess

SISYPHUS In Ancient Mythology one of the descendants of Æolus respecting whom a variety of opinions prevails By some he is said to have resided at Ephyra in the Peloponnesus, others maintain that he was a Trojan prince, who was punished for betraying state secrets, while others allege that he was a notorious robber, slain by Theseus Be this as it may all the ancient poets are agreed that he was distinguished for his craftiness and cunning, and that his punishment in Tartarus for his crimes committed on earth consisted in rolling a huge stone to the top of a high hill, which [illegible] and thus rendered his labour incessar[illegible] phus is supposed to be derived from Gr σισοφος (by a common duplication for σοφος, *wise*), and to signify *over-wise*

SI'TTA (Gr σιττα) The name of a bird in Aristotle, which Gesner determined to be the nuthatch Linnæus retains the term for the genus of which the nuthatch (*Sitta Europæa*, L) is the type

SIVA In Hindoo Mythology a title given to the Supreme Being, considered in the character of the avenger or destroyer Sir William Jones has compared Siva to Jupiter, but he appears to sha[illegible] attributes of Pluto Under the name of Mahadeva, I is exhibited also as a type of reproduction to destroy, according to the Vedantas of India, the Sufis of Persia, and even to many European schools of philosophy being only to generate or reproduce under another form *See* VISHNU BRAHMA

SIVALIK [illegible] Siva and Gr [illegible] The [illegible] in fossil remains in the tertiary strata of the Sivalik Sub-Himalayan range It surpassed all known ruminants in size, and had four horns

SIZARS [illegible] At Oxford the [illegible] denominations of servitors, &c They are such as have certain allowances made in their [illegible] college bills), through the benefactions of founders or other charitable persons In college phraseology, a size is a portion of bread, meat, &c allotted to a student, and hence the name sizar The sizars at Cambridge are almost entirely on the same footing with independent students, at Oxford they are somewhat lower, and some relics of their [illegible] colleges [illegible] off [illegible]

SIZE A sort of varnish, paint, or glue, used by painters, and in many other trades It is made of the shreds and parings of leather, parchment, or vellum, boiled in water and strained

SKE'LETON (Gr σκελλω, *I make dry*) The dead [illegible] framework of an animal body, which, [illegible] setting of different parts, may be joined together by [illegible] which [illegible] a natural [illegible] and [illegible] which it is form [illegible] ized animals, as the *Polygastria* and *Polypi*, the skeleton, when it exists, commonly consists of a single piece In the *Polygastria* it is external, in the form of a case, and consists of pure silex In [illegible] sometimes internal, [illegible] bonate of lime or with a small additional proportion of phosphate of lime and these earths are combined with a greater or less proportion of gelatinous animal matter In the *Isis* the skeleton consists of numerous separate calcareous joints, connected together by portions of uncalcined gelatin In many of the Lithophytous *Polypes* innumerable minute spiculæ, of various but definite forms are scattered through the fleshy investment of the main internal skeleton In the *Echinoderms* the skeleton is external as regards the viscera, but is covered by an organized skin It is chiefly remarkable for the great number of pieces of which it is composed, and the regular and beautiful forms in which they are combined, it likewise supports numerous tubercles or spines it is composed of carbonate and phosphate of lime, with a gelatinous basis In *Insects* the skeleton is partly internal, but chiefly external, and the hardening material is a peculiar animal principle, called "chitine" In cabinets of dried insects it is the natural skeleton that is preserved In *Crustacea* the skeleton, which bears the same relative position to the animal as in insects, is rendered denser and more brittle by being consolidated with the carbonate and phosphate of lime In the *Mollusca* the skeleton is generally external but sometimes internal it is hardened by the carbonate of lime with a very slight trace of the phosphate of lime, and constitutes the shell The beauty, durability, and variety of form of [illegible] the shells [illegible] of collectors, and the subject of a distinct branch of natural history under the name of 'Conchology" The skeleton of mollusks is either in one piece as in the univalve mollusks, or in two pieces, as in most bivalves, or in many pieces as in the multivalve chitons, and others In the *Cephalopods* besides the shell, which offers re[illegible] [illegible] [illegible] condition In the Vertebrate animals, there is always an internal skeleton destined to protect the central part of the nervous system, and to form the fulcrum and support of the locomotive members In a few fishes it is cartilaginous, in the rest of the Vertebrates it is osseous, or consolidated by a large proportion of phosphate and a small proportion of carbonate of lime, and some other hardening salts (See BONE.) This is termed the "endo-skeleton" In most [illegible] as the crocodilians and in the [illegible] the Mammalia, osseous plates are developed in the substance of the skin, these are analogous to the skeleton of most of the Invertebrate animals, and form a more or less complete protecting case called the "exo-skeleton"

SKETCH (It schizzo) In Painting, &c, the first delineated [illegible] the artist's conception of a subject, in which are [illegible] the fire and enthusiasm with which the subject is expressed and felt

SKEW BACK In Architecture the sloping abutment in brickwork [illegible] masonry for the ends of the arched head [illegible]

SKEW BRIDGE In Engineering, the name given to a kind of bridge introduced upon railroads, when the

railway intersects any existing c[illegible] at right angles Such bridges were c[illegible] before railroads were introduced, but their general introduction has rendered the use of skew bridges universal in cases where it may be necessary or unavoidable to preserve as straight or direct a line as possible The *Ency Britannica* contains an elaborate article upon this subject

SKIN The external covering of the body It is divisible into three parts or membranes The exterior is called the scarfskin or cuticle it is an albuminous membrane Immediately underneath it is a thin layer of soft or pulpy matter, called the *rete mucosum* (mucous network), which is the seat of colour it lies upon the *cutis*, or true skin, which is a gelatinous texture

SKIP (Fr esquiver) In Music a passage from one sound to another by more than a degree at one time

SKIRTING In Architecture, the narrow vertical board on the floor round the sides of an apartment

SKO'LEZITE (Gr σκωλης *twisted*) A mineral which occurs crystallized and massive It is colourless and translucent, and when heated before the blowpipe shrinks up into wormlike contortions

SKO'RODITE (Gr σκοροδον, *garlic*, in allusion to its odour when heated) An arseniate of iron

SKO'RZITE A mineralogical synonym of a variety of epidote, from Skorza

SKULL The bony case which contains the brain it forms the forehead, and every part of the head except the face It consists of eight bones, namely the frontal and occipital bones, upon its fore and back part, the two temporal and two parietal bones forming the temples and the sides of the skull, and the sphenoid and ethmoid [illegible] of the orbits and nose

SKY[illegible] a species of the genus *Alauda* (see that word), the *Alauda arvensis* of Linnæus

SKY SAIL A small sail sometimes set above the royal

SLAB LINE A small rope leading through a block under the lower yards, and thence to the foot of the sail, f[illegible]

SL[illegible] he size of an egg

SL[illegible] or vitrifiable compounds which are produced during the reduction of metallic ores by v[illegible] of large smelting w[illegible] he slags which are abundantly produced, are sometimes used as building mate[illegible] They often co[illegible] metal

SLA'NDER In Law, a malicious defamation of a man by words spoken It is not actionable unless it impute some crime punishable by law, or some infectious disease, such as leprosy or the like which may have the effect of excluding from society the person slandered or be uttered concerning him in his trade or business in such a way as to impair his means of livelihood or lastly, unless it be attended with special damage In this case, such special damage must be incurred upon the [illegible] If special damage be not proved by the plaintiff he will not, in any action for words spoken, when the verdict is under 40 shillings be allowed more costs than damages A defendant cannot be proceeded against criminally for words spoken unless they have a direct tendency to a breach of the peace, as by containing a challenge to fight, or are of a seditious or grossly immoral character, or are spoken of a magistrate in the execution of his duty

SLAIE See Groove

SLA'VERY properly so called is the establishment of a right which gives to one man such a power over another as makes him absolute master of his life and property But the condition of a slave is susceptible of innumerable modifications, and there are few nations whether of ancient or modern times, among whom slavery has been long established that have not enacted certain laws for limiting the power of a master over his slave Slavery has existed from the earliest periods of authenticated history and its origin has generally been ascribed to a state of war In the rudest stages of society the difficulty of subsistence was so great that the lives of captives were seldom spared, but as society advanced and luxuries began to be introduced, the aid of labourers became requisite and it was found more profitable to employ than to slay a captive Thus the Latin word servus, *a slave*, appears to have been derived from servo *I preserve*, and to have meant a person whose life was preserved on condition of giving his labour to his conqueror, so that a state of slavery, how repulsive soever to our present feelings, probably formed at one time an important mitigation of the horrors of barbarism But in proportion as society rose in the scale of civilization, the state of slavery sprung from a variety of causes Thus, in several countries, those who had been convicted of crimes were often doomed to perpetual slavery, and as a necessary corollary of this principle of slavery, it was laid down as a fundamental regulation, that slaves could only beget slaves, and hence the principle of hereditary bondage It would be foreign to the purpose of this work to enter into details upon the different phases which slavery has exhibited in the various countries in which it has existed or to point out the malignant influence it has exercised upon the character of every nation among whom it has been tolerated Upon this subject the reader will find ample details in the third volume of the *Cours d'Economie Politique* of M Storch, Paris, 1823, and with regard to slavery as practised among the Romans he may consult with advantage the elaborate little volume of Mr Blair on this subject The species of slavery which existed during the feudal ages, and which is still to be found in some European countries, will be found noticed under the heads SERF, SERVITUDE, and VILLEIN, in this work, and for some details of negro slavery, see *infra*, and NEGROES

The British legislature, as is well known, passed an act in 1834 for the emancipation of Negro slaves throughout our dominions, by which after passing through a preliminary term of compulsory apprenticeship they were eventually raised to the [illegible]

SLAVE TRADE [illegible] carried on by [illegible] coasts of Africa and the American settlements, abolished, as far as Great Britain is concerned, in 1808

The European slave trade is, however, generally supposed to have been commenced by the Portuguese about the end of the 15th century About 1508 the Spaniards began to import Negroes into America, to supply the place of the Indians, whose numbers were rapidly diminishing under the severity of the toil to which they were exposed by their conquerors Sir John Hawkins one of Queen Elizabeth's most famous captains, seems to have been the first Englishman of note who embarked in this traffic having been concerned in the sale of Negroes to the Spaniards in the West Indies In the same reign the African Company was first chartered, for the purpose of trade with Guinea This company carried on a trade in Negroes with the English settlements in America from the beginning of the 17th century to the year 1732 when that traffic was abandoned by it, and chiefly carried on from that time by private traders It was not until the latter end of the 18th century that the atrocities of this trade began to engage the attention of parliament In 1788 an act was passed to regulate it, and after twenty years animated discussion, it was at last totally abolished in 1807 The United States of America and Denmark had preceded us in this righteous act (See *Clarkson's History of the Abolition of the Slave Trade*)

The slave trade is now prohibited by the laws of most European nations, except Portugal, and by the law of that country it can only be carried on within certain geographical limits Nevertheless it is extensively carried on by contraband dealers, and no measure can be reasonably expected to put a stop to it short of its being declared* piracy by the common consent of civilized states To obtain this result ought to be one of the most prominent objects of English diplomacy both for the sake of humanity, and in order to protect the interests of our own colonies, which suffer severely from competition with those European possessions into which an unlimited importation of slave labour takes place But it must be admitted that Sir Fowell Buxton, whose name ranks so high among the opponents of the slave trade appears to confess that even this measure would prove ineffectual, from the difficulty of execution. We can do no more here than advert to the scheme proposed in 1840, received with acclamation by a great portion of the public, and taken up by government of establishing a legitimate trade with central Africa by the channel of the Niger We can only say that those who expected the slightest effect to be produced on the progress of this abominable traffic by any such measure, must have estimated both end and means in a very different manner from ourselves, but the utter failure of the expedition, owing to the destructive influence of the climate, within a few months after it reached its destination, but too soon justified our misgivings, and the general opinion seems to be that henceforth those who may induce their fellow-countrymen to embark in a similar adventure will [illegible] very serious responsibility According to some recent [illegible] carried from their homes in Africa to supply the American markets, including those who perish by the way There can, however, be no doubt that this estimate is very greatly [illegible] average number of slaves carried from Africa during the ten years ending with 1850 can have been as high as [illegible] year and now, no doubt, even this exportation will be very materially reduced The principal import-

* This most desirable act was accomplished in 1842; the whole of the European states having [illegible] to enforce the strictest measures in regard to the *right of search*, and to regard those engaged in the trade as pirates

ing countries are Cuba, Portorico, and Brazil Publications on the slave trade are so numerous, that it is difficult to make a selection for purposes of reference Perhaps (after *Clarkson's History*) the student could not find the account of its progress better given than in successive numbers of the *Edin Review* especially vols xxi xxiii xxix xxxvi , though it must be admitted that there is in these and most works on the subject, a strong tendency to exaggeration There is a good article on the international law of the slave trade in the *Law Magazine* for August 1841

SLEEP (Germ schlaf) That state of the body in which the functions of sensation and volition are suspended, while the vital functions retain their usual activity the operations of the mind, if not at perfect rest, are [illegible] with external objects

How [illegible] natural sleep usually comes on with a peculiar sense of [illegible] lassitude, gaping, and desire of rest, [illegible] and there is general muscular relaxation The sense of hearing is that which is longest retained, and we generally hear what is going on about us, and even feel inclined to take occasional part in conversation long after the eyes are closed

The quantity of sleep required by different individuals is various, from six to nine hours being the average proportion Indolent listless persons, and especially those who indulge in the luxuries of the table, and are in good health, [illegible] t to ten hours daily, [illegible] and who live abstemiously, will be satisfied with four or five hours of sleep and such persons are generally more disturbed by dreams than the former Very young children sleep away much of their time, and so also do many old persons Sleep is often prevented by intense thought, by anxiety, and other mental affections, and also by hunger, and by the application of cold to a part of the body When a person has been over-fatigued by bodily exertion, sleep is also often courted in vain, and there are many stimuli by which its accession at the usual times is prevented or retarded, such as strong tea coffee, small doses of opium, and several other articles of medicine and diet Bodily exercise and mental tranquillity, a full meal, the absence of [illegible] other disturbing causes, are circumstances favourable to sleep, but in all these respects various habits often greatly interfere, and persons accustomed to very active lives when suddenly deprived of their usual occupations often sleep worse than before, indolence becoming an apparent stimulant A distended stomach keeps some individuals awake, and others cannot sleep in a dark room, or in the quiet of [illegible] have been used to a night lamp, and to [illegible] arriages over a London pavement

[illegible] cause of sleep has been discussed by several eminent physiologists, but without any very satisfactory results it is, in fact, as entirely beyond our grasp, as are the other functions of the nervous system *See* DREAMS

SLEEPER In Architecture, a piece of timber whereon are laid the ground joists of a floor *Sleepers* are also pieces of timber, now rarely used, in foundations crossed by planks, &c , and at right angles to them, where the soil is bad Formerly the term was used to denote the [illegible] rafters of a roof

SLICKENSIDE A provincial term applied by the Derbyshire miners to a species of galena, or sulphuret of lead

SLIDE In Music, a grace used in the German school, [illegible] small notes moving by degrees

SLIDING KEEL is a narrow oblong frame or platform, let down vertically through the bottom of a small vessel, like a deepening of the keel throughout a portion of her length Its use is, like that of the leeboard, to sustain the vessel against the lateral force of the wind

SLIDING RULE A mathematical instrument or scale, consisting of two parts, one of which *slides* along the other, and each having certain sets of numbers engraved on it, so arranged that when a given number on the one scale [illegible] on the other, [illegible] two numbers is obtained by inspection The numbers may be adapted to answer various purposes, but the instrument is chiefly used in gauging, and for the mensuration of timber

SLING (Ger schlinge) A weapon made of a strap and two strings, by means of which a stone or other missile is projected with much greater velocity than [illegible] by the hand without such assistance The [illegible] which the projectile is discharged is the same as that with which it is whirled round in a [illegible] before the [illegible] Goliath [illegible] pon of offence in the earliest ages

SLIPS In Geology, masses of strata separated vertically or askant

SLOAM Layers of clay between those of coal

SLOOP A vessel with one mast like a cutter, but having a jib stay, which a cutter has not Also the general name of ships of war below the size of frigates

SLOPS Clothes and bedding supplied from the ship's stores to the seamen, but [illegible]

SLOUGH A surgical [illegible] separation which ensues between dead and living parts

SLUE In Naval language, *to slue* is to turn a cylindrical piece of timber, as a mast or boom, about its axis, when [illegible] out of its place

SLUICE (Lat clausus, *shut up*) In Hydraulics, a frame of timber, stone, or other solid substance, serving to retain and raise the water of a river or canal, and, when necessary, to give it vent

SLUR In Music, an arch ⁀ connecting two or more notes not on the same degree, indicating to the performer that in playing they are to be united as much as possible

SMACK A vessel with one mast, commonly rigged as a sloop, and used in the coasting trade, or as a tender in the royal navy The vessels of this name that have long plied between Leith and London are well known, and have always been noted for their security

SMALLPOX Called also *Variola* from varius, *changing colour*, because it changes and disfigures the skin There are two forms of this disease generally called by medical men the *distinct* and the *confluent*, in the former the pustules are separate, in the latter they coalesce *Distinct smallpox* begins with the usual symptoms of inflammatory fever, that is, pains in the back and loins, sickness, drowsiness, headach, pain upon pressure about the region of the stomach, and in infants one or more [illegible] the [illegible] About the end of the third day little red [illegible] much resembling flea bites, make their appearance upon the face and head, which spread during the fourth day over the breast, body, and limbs, about the fifth day a small circular vesicle forms upon each little point, depressed in the centre, surrounded by an inflamed [illegible], and containing a colourless fluid [illegible] the eruptive fever disappears about the sixth day the throat becomes sore and the saliva is [illegible], and about the eighth day the face is swollen, and the pustules round, prominent, and prevalent, about the eleventh day the pustules attain their full size (about that of a pea), and the matter which they contain becomes opaque and yellow, and a dark central spot appears on each, the swelling of the face subsides, and is transferred to the hands and feet, and more or less secondary fever now ensues After this the pustules become rough, break, and scab over, and a dark brown spot remains for some days, and if the pustules have been large an indentation is left the remaining symptoms gradually subside, and about the seventeeth or eighteenth day the secondary fever disappears

Confluent smallpox is ushered in by a fever of a typhoid rather than of [illegible] symptoms are [illegible] there is diarrhœa, and in adults salivation The eruption is very irregular in its progress and appearance, and usually preceded by red patches upon the face, from which the pustules emerge on the second day in the form of clusters somewhat resembling measles Their progress is rapid, but instead of being circular and well-defined, they are flat and irregular in shape, and contain a brownish fluid very unlike pus the intermediate spaces between the clusters are generally pale and flaccid The tumefaction of the face and running of saliva are greater than in the distinct species, and the fever does not cease upon the appearance of the eruption, but about the ninth day it generally becomes aggravated, the eruption livid, and accompanied by petechiæ or purple spots, and about the eleventh day from the commencement of the disease it often terminates fatally

This disease is the effect of a specific contagion, and is produced either by inoculation, or by exposure to the effluvia from persons suffering under it in the latter case it is usually called the *natural smallpox* When the distinct smallpox goes regularly through the stages above described it is rarely dangerous, except from mismanagement, but it often leaves a tendency to inflammatory disorders, and in a scrofulous habit it excites that disorder into activity Any of the symptoms which have just been described as characterizing confluent smallpox are alarming, so is a sudden disappearance of the eruption, or change in its appearance, followed by depression or delirium In treating the distinct smallpox the febrile symptoms are to be moderated by cool air, saline and mild acid and diluting drinks, and very gentle aperients. Bleeding and purging are in almost all cases to be decidedly avoided Great irritability may occasionally be [illegible] by [illegible] of opium and camphor, which is preferable, by [illegible] of the [illegible] This will also check diarrhœa, should it supervene The confluent form generally requires more or less of the treatment which is adopted in low or putrid fever Obstinate vomiting, which is sometimes [illegible] but alarming symptom is best counteracted by the same draught in the act of effervescence with a few grains of aromatic confection, and a few drops of tincture of opium

SMALT (Germ schmalz) A fine blue colour used

in painting and [illegible] upon earthenware and applied to several other purposes in the arts. The finest smalt is made by [illegible] by which a very [illegible] when fused [illegible] Common smalts are prepared by fusing mixtures of zaffre, sand and pearlash

SMARAGD (Gr. σμαραγδος) In modern times used as a synonym of emerald (which see), but applied by the ancients to various other precious stones, such as fluor spar, green vitrified lava, green jasper, and green glass. The passage of Pliny (*Nat. Hist.* xxxvii. 5) in which Nero is said to have been in the habit of viewing the gladiatorial combats *in a smaragd*, is generally understood to signify a smooth polished mirror made of some of the above substances, but it has been maintained that the emperor was short-sighted, and used a concave eyeglass formed of the smaragd. The smaragd is found in various parts of Europe, Asia, and America, but particularly in the Ural mountains, and in the mines of Chili and Mexico.

SMART TICKET. A certificate of a seaman's having received a wound or hurt.

SMELL. This sense resides in the mucous or pituitary membrane which lines the nostrils, and the surface of which is more or less convoluted or extended in various orders of animals. In the human subject this membrane is highly vascular, and largely supplied especially in its upper parts, with nervous filaments or ramifications of the olfactory trunk, which has its origin, by three distinct roots, from the posterior, inferior, and internal parts of the anterior lobe of the brain, and proceeding towards the perforated plate of the ethmoid bone, divides into the small threads just mentioned.

The physiology of odours is a curious and intricate subject requiring much more experimental investigation than it has hitherto received. Air is the great vehicle by which their various influences are transmitted in the act of inspiring to the olfactory surfaces, and for the diffusion of most odours a certain degree of humidity in the air [illegible] There is scarcely any sense [illegible] of which varies so much in different individuals as that of smell, some being painfully alive to those odorous influences which are not even perceived by others. An obtuseness of this sense is also very frequent, and its almost entire absence by no means uncommon, this is especially the case in certain catarrhal complaints and in some other affections of the lining membrane of the [illegible].

SMEW. The name [illegible] called *Mergus albellus* by Linnæus. *See* MERGUS.

SMILA'CEÆ (Smilax one of the genera), form a small natural order of Endogenous plants with weak or twining stems and reticulated leaves not distinguishable from those of Dioscoreæ. The drug called sarsaparilla or sarza, is the root of various species inhabiting South America, and is held in high esteem for its diuretic, de[illegible]

SMOKE (Ger. Smoke) Smoke has been defined as the visible effluvium or sensible exhalation of any thing burning. The term is commonly applied to those results of the combustion or ignition of pit coal which escape from chimneys and which constitute a serious and well known evil and nuisance in large towns manufacturing districts, and almost every where where large quantities of coal are consumed. Coal is often a very complex substance, but, putting aside its occasional and adventitious [illegible] and oxygen may be regarded as its [illegible] constituents, and the results of its *perfect* combustion would therefore be carbonic acid, steam and nitrogen. These substances would constitute invisible and incombustible gases and vapour, and would therefore escape from the chimney top and blend with the atmosphere, without being perceived. But it unfortunately happens that [illegible] which coal is burned its combustion is far from being perfect, and that besides the above-mentioned products inflammable gases and vapours, together with [illegible] very finely divided carbon, constitute black and brown smoke, are vomited forth from the chimney shaft, not only contaminating the air, and making all neighbouring objects black and dirty but [illegible] fuel, so that the smoke of [illegible] is not a [illegible] but a very expensive one, and ought to be put down by legislative enactments, several of which have been from time to time suggested, but unfortunately never enforced, and are at this moment a mere dead letter.

The neglect which this subject has encountered has arisen [illegible] of the thing and inculcating [illegible] of combustion, and of [illegible] and the systems of construction [illegible] furnaces, the fireplaces, new methods of stoking and [illegible] new kinds of fuel, and it is astonishing to observe the obstinacy and perverseness which prevail in these respects [illegible] masters as well as the men. There is a [illegible]

which no doubt has had its influence in retarding the adoption of means for diminishing the smoke nuisance, which is the shoals of quacks and ignorant empyrics and impostors who have embarked in these speculations, so that till stringent and coercive measures are adopted in regard to it, founded upon scientific and rational principles, we must be content to continue breathing a tainted air, which fouls the organs of respiration, encrusts our buildings and covers our books, pictures, and every article of furniture with an enamel of soot, and which dims the atmosphere to such an extent as materially to shorten the duration of metropolitan daylight.

That all these evils may be got rid of admits of no doubt, and ultimately with economy and convenience, though the first introduction of the remedies will probably be attended by many practical difficulties, and considerable inconvenience and expense. One remedy and the most obvious, consists in the substitution of coke, anthracite, and certain other smokeless fuel, for the bituminous and eminently smoke-generating varieties of coal now in common use. Another is, the construction of fireplaces and furnaces which shall not indeed burn smoke, but prevent its formation. It must be allowed that there are many practical difficulties in the way of the application [illegible] of the invention or [illegible] of these contrivances, but experience has shown that none of these are of such a nature or magnitude that they may not be overcome by perseverance and skill. They all merge into one common principle, that of mixing air with the combustible vapours and gases generated by the action of heat on pit coal, so that by virtue of a due supply of oxygen they may be made to burn with flame, and become entirely converted into incombustible and transparent invisible vapours and gases, instead of being, as they now are, only partially burned, by which their carbon is precipitated, and escapes, together with the other imperfectly consumed matters, into the air. The foundation of a *practical* inquiry into the subject of the prevention of smoke has been laid by Mr C. W. Williams of Liverpool (*Essays on the Combustion of Coal and Prevention of Smoke*). The theoretical details are essentially blended with the whole doctrine of heat, but the [illegible] will be found in Sir H. Davy's *Researches into the Philosophy of Flame*.

SMOKE SAIL. A small sail hoisted before the funnel of the galley when the ship is at anchor head to wind, to screen the quarter deck from the smoke.

SMORZATO (It. *extinguished*) In Music, a term denoting that the violin bow is to be drawn to its full extent [illegible] lighter till the sound is nearly lost.

SMUGGLING. The offence of defrauding the revenue by the introduction of articles into consumption without [illegible] It may be common [illegible] e or customs revenue.

Origin and Prevention of Smuggling. — This crime, which occupies so prominent a place in the criminal legislation of all modern states, is wholly the result of vicious commercial and financial legislation. It is the fruit either of prohibitions of importation or of oppressively high duties. It does not originate in any depravity inherent in man, but in the folly and ignorance of legislators [illegible] does not take [illegible] of a high duty on any article occasions a universal desire to escape or evade its payment. Hence the rise and occupation of the smuggler. The risk of being detected in the clandestine introduction of commodities under any system of fiscal regulations may always be valued at a certain average rate, and wherever the duties exceed this rate smuggling immediately takes place. Now, there are plainly but two ways of checking this practice — either the temptation to smuggle must be diminished by lowering the duties, or the difficulties in the way of smuggling must be increased. The first is obviously the more natural and efficient method of effecting the object in view, but the second has been most generally resorted to, even in cases where the duties were quite excessive. Governments have uniformly almost consulted the persons employed in the collection of the revenue with respect to the best mode of rendering taxes effectual, though [illegible] their prejudices and peculiar habits [illegible] them from forming a sound opinion on such a subject. They cannot recommend a reduction of duties as a means of repressing smuggling and increasing revenue, without acknowledging their own incapacity to detect and defeat illicit practices, and the result has been, that instead of ascribing the prevalence of smuggling to its true causes, the officers of customs and excise have almost universally ascribed it to some defect in the laws, or in the mode of administering them, and have proposed repressing it by new regulations and by increasing the number and severity of the penalties affecting the smuggler. As might have been expected these attempts have, in the great majority of cases, proved signally un-

successful And it has been invariably found that no vigilance on the part of the revenue officers and no severity of punishment, can prevent the smuggling of such commodities as are either prohibited or loaded with oppressive duties The smuggler is generally a popular character, and whatever the law may declare on the subject, it is quite ludicrous to expect that the bulk of society will ever be brought to think that those who furnish them with cheap brandy, geneva, tobacco, &c are guilty of any very heinous offence

"To pretend," says Dr Smith, "to have any scruple about buying smuggled goods is through a manifest encouragement to the violation of the revenue laws, and to the perjury which almost always attends it, would, in most countries be regarded as one of those pedantic pieces of hypocrisy, which, instead of gaining credit with any body, seems only to expose the person who affects to practise them to the suspicion of being a greater knave than most of his neighbours By this indulgence of the public, the smuggler is often encouraged to continue a trade which he has thus taught to consider as in some measure innocent, and when the severity of the revenue laws is ready to fall upon him, he is frequently disposed to defend with violence what he has been accustomed to regard as his just property, and from being at first rather imprudent than criminal, he at last too often becomes one of the most determined violators of the laws of society" (*Wealth of Nations*, vol iii p 491)

To create by means of high duties an overwhelming temptation to indulge in crime, and then to punish men for indulging in it is a proceeding completely subversive of every principle of justice It revolts the natural feelings of the people, and teaches them to feel an interest in the worst characters — for such smugglers generally are, — to espouse their cause, and avenge their wrongs A punishment which is not proportioned to the offence, and which does not carry the sanction of public opinion along with it, can never be productive of any good effect The true way to put down smuggling is to render it unprofitable, to diminish the temptation to engage in it, and this is not to be done by surrounding the coasts with cordons of troops by the multiplication of oaths and penalties and making the country the theatre of ferocious and bloody contests in the field, and of perjury and chicanery in the courts of law, but by repealing prohibitions, and reducing duties, so that their collection may be enforced with a moderate degree of vigilance, and that the forfeiture of the article may be a sufficient penalty upon the smuggler It is in this and in this only, that we must seek for an effectual check to illicit trafficking Whenever the profits of the fair trader become nearly equal to those of the smuggler, the latter is forced to abandon his hazardous profession But so long as prohibitions or oppressively high duties are kept up, or, which is in fact, the same thing, so long as *high bounties* are held out to encourage the adventurous, the needy, and the profligate to enter on this career, we may be assured that armies of excise and custom house officers backed by the utmost severity of the revenue laws, will be insufficient to hinder them (For full particulars respecting the law of smuggling &c see the *Com Dict*)

SMUT A disease incidental to corn crops by which the farina of the grain in the whole body of the seed is converted into a black soot-like powder If an ear of corn affected by this disease be smartly struck with the finger, the powder will be dispersed like that of the fungus known as *Lycoperdon bovista* the common puff ball found in pastures, but darker, and if a portion of the powder be moistened and examined with the microscope, it will be found to consist of innumerable minute transparent globules Some attribute the smut to the richness of the soil, and others consider it as a hereditary disease transmitted by one generation to another through the seed Willdenow and Mirbel regard [illegible] but Bauer believes it to be a proper disease produced by a morbid swelling of the ear Some cultivators steep the grain of smutty corn in a weak solution of arsenic before sowing, but others deny the efficacy of this preparation Smutty grain is separated from such as may be used for [illegible] by being rapidly whirled [illegible] brushes, or by steeping in water, when the smut from its lightness floats on the surface. The safest mode for the farmer to pursue is never to sow grain from a field in which the smut has prevailed

SNAKE ROOT The term is applied to the root of the *Aristolochia serpentaria* native of Virginia it is a fibrous, aromatic, and bitterish root The infusion is occasionally used as a tonic and diaphoretic in typhoid fevers it is a good adjunct to Peruvian bark, and to quinia

SNAKE WOOD The wood of the *Strychnos colubrina* Supposed to be an antidote to the poison of certain snakes

SNEEZING A convulsive action of the respiratory organs, brought on by irritation of the nostrils Violent fits of sneezing have occasionally attacked persons, and are even said to have proved fatal, recourse must in such cases be had to soothing the nasal membrane by the application of warm milk and water, or decoction of poppies

SNIPE The common snipe (*Scolopax gallinago* Linn) This bird is found in [illegible] parts of Europe Great Britain [illegible] It resorts to moist and boggy situations on higher grounds, in ordinary seasons it frequents marshes Its principal food is worms in quest of which it perforates the soft earth with its long and slender bill, which is especially organized for that purpose

SNOW (Ger schnee) Congealed water, which falls from the bosom of the atmosphere Very little is yet known respecting the formation of this meteor It has not been ascertained, for instance, whether the clouds which produce it are composed of vesicular vapours, or of frozen particles, nor whether the flakes are completely formed before they begin to descend, or receive an increase in passing through the lower strata of the atmosphere The temperature of the flakes, and the circumstances which determine their form and volume, are likewise unknown The only observations which may be considered as in any degree complete are with reference to the different forms which the flakes assume This subject was considered by Kepler, Hooke, Cassini, Muschenbroek, and many others, but the most interesting series of observations we possess are those of Scoresby (*Account of the Arctic Regions*, 1820), who has reduced the different forms into classes, and given a number of excellent representations of the flakes in different states Generally speaking, when examined with the microscope they present modifications of stelliform and hexagonal crystals, and frequently they consist of a star of six rays formed of prisms united at angles of 60°, from which other prisms shoot at similar angles, giving the whole an appearance of exquisite beauty and great regularity The variety of modifications is probably owing to the state of the atmosphere when the snow is formed If the crystallization takes place when the air is calm, the crystals will be regularly formed on the contrary they will be irregular and imperfect when the air is much agitated Sometimes the flakes present no traces of crystallization

Snow is much less dense than ordinary ice The bulk of a given weight of ice is only about a ninth part greater than that of the water from which it is formed, while the bulk of new-fallen snow is ten or twelve times greater than that of the water obtained by melting it

At moderate elevations above the sea and in the mean latitudes, snow most frequently falls after some days of pretty hard frost, and when the temperature of the air, though still a few degrees above the freezing point is sensibly mitigated On this circumstance is founded the remark that it cannot snow in very severe cold, and though the remark does not always hold good it will do so generally, for two reasons — in the first place the air which comes from very cold regions contains a small portion of watery vapour, and secondly, because the formation of clouds by diminishing the radiation, necessarily mitigates the severity of the cold

As snow can only be formed when the temperature of the atmospheric strata containing the aqueous vapour is below the freezing point, it is obvious that if the snow in falling passes into strata of a higher temperature, it will be melted before arriving at the surface of the earth Hence it follows that it never snows in the torrid zone, nor in the heats of summer, excepting on the tops of very elevated mountains

Red Snow — It had been remarked by the ancients that snow sometimes assumes a red tint, and Pliny ascribes the cause to age — *Ipsa nix vetustate rubescit* Many modern observers have described and examined this curious phenomena, which appears to be met with in all parts of the world Saussure observed red snow on the Bevern in 1760, and on St Bernard in 1778, and [illegible] Parry Captain Ross in Baffin's Bay, Parry Franklin, and Scoresby collected it in still higher north latitude and it has been found abundantly in New Shetland in lat 70° south Among the Alps it is generally found in low sheltered spots, and penetrating to the depth of two or three inches, or rather the strata in which it is found (for it occurs overlaid at considerable depths) seldom exceed two or three inches in thickness The colouring matter of this singular substance has been examined by Wollaston, R Brown, De Candolle, Thenard, Bauer, &c Dr Wollaston first remarked that it is composed of minute spherical globules, which have a transparent envelop, and are divided into seven or eight small cells filled with a species of red oil insoluble in water Mr R Brown and De Candolle supposed the globules to be a kind of algæ Mr Bauer (*Phil Trans* 1820) found the globules to be exactly identical in snow collected in Baffin's Bay and New Shetland, and he supposed them to be small mushrooms of the genus *Uredo*, forming a peculiar species, to which he gave the name of *Uredo nivalis*

Snow Line, or Limit of Perpetual Snow — Since the [illegible] there must be in every latitude a certain limit of elevation at which the air attains the temperature of freezing water This limit is called the snow line, or line of perpetual congelation, and the mountains which rise above it are covered with perpetual snow Within the tropics the temperature varies little throughout the year, and hence the snow line is distinctly marked, but in countries remote from the equator the limit of congelation rises in summer and descends in [illegible] of considerable breadth [illegible] is of course the summer [illegible] snow line, however, is not dependent upon latitude alone; but also on the configuration and aspects of the mountain chains, the extent and temperat[illegible] plains, the quantity of snow that [illegible] mate of a country chain, for example the limit of perpetual congelation on the northern side is at an elevation exceeding [illegible] feet that on the southern side, [illegible] exposed to the sun, a circumstance which Humboldt ascribes to the radiation from the great plain of Thibet, the [illegible] that exceed [illegible] ence, therefore, can be placed on any general rule for estimating the height of the snow line, and it affords an exceedingly fallacious indication of the altitude of mountains The following table is given by Humboldt in his *Fragmens Asiatiques*, p 349 The elevations stated are the heights of the line of perpetual [illegible] level of the sea, and the measures [illegible] feet

Mountain Chains	Latitude	Elevation
		Feet
Cordilleras of Quito	0° — 1½° S	15,730
[illegible]	16 — 17½	17,060
[illegible]	19 N	15,030
Himalaya { Northern side	31	16,940
Himalaya { Southern side	31	12,170
Pyrenees	43	8,950
Caucasus	43	10,870
Swiss Alps	46	8,760
Carpathians	49	8,500
Altai range	50	6,395
Norway { Interior	70	3,518
Norway { Coast	71½	2,302

(See, in addition to the works already cited Humboldt, *Mémoire sur la Limite de Neige perpetuelle dans les Montagnes de l'Hémisphère Méridional*, and the *Annales de Chimie*, vol xx)

SOAP (Gr σαπων, Lat sapo) This useful compound is obtained by the action of alkaline upon oily substances There are, accordingly, a great variety of soaps, but those commonly employed may be considered under the heads of, 1 Fine [illegible] 2 Coarse household soaps, [illegible] terials used in the manufacture of white soaps are generally olive oil and carbonate of soda the latter is rendered caustic by the operation of quicklime, and the solution thus obtained is called *soap ley* The oil and a weak ley are first boiled together, and portions of stronger ley are gradually added till the soap produced by the mutual action of the oil and alkali, begins to become tenacious and [illegible] the water, some common salt is then added to promote the granulation and perfect separation of the soap the fire is then drawn and the contents of the boiler allowed to remain for some hours at rest, so that the soap may more completely collect When it is perfect it is put into wooden frames or moulds, and when stiff enough to be handled, it is cut into oblong slices and dried in an airy room Perfumes are occasionally added, or various colouring matters stirred in whilst the soap is semifluid to give it a mottled appearance The Spanish soap is *marbled* by stirring into it a solution of sulphate of iron, which is decomposed by the soap and black oxide of iron separated in streaks and patches through the mass The action of the air converts the exterior into red oxide, while the interior long retains its black colour hence a slice of this soap presents a black mottled centre, surrounded by a reddish external layer

Common household soaps are made chiefly of [illegible] tallow or if potash is used, a large [illegible] salt is made to harden the soap, which [illegible] by the transference of soda The new soap has a [illegible] of rosin added to it [illegible] potash instead of soda [illegible] soap used in London is a compound of this kind, it has a tenacious consistence, and appears granulated Soap is soluble in pure water and in alcohol, the latter solution *jellies* when [illegible] known under the name [illegible] evaporated the soap remains in a gelatinous state, which forms, when dry, the article sold under the name of *transparent soap*

The earths and common metallic oxides form *insoluble soaps*; and [illegible] when earthy and [illegible] It is the sulphate of lime and carbonate of lime in common spring water which thus render it unfit for washing, and give it what is termed *hardness*, and, upon this principle a spirituous solution of soap is a simple and valuable test of the fitness of any river or spring water [illegible] soft waters [illegible] but [illegible] before [illegible] and when we wash or shave with hard water, the separation of the insoluble calcareous soap is extremely disagreeable it adheres to the skin, and soils instead of cleansing it

The chemical nature of soap has been laboriously examined by Chevreul who has shown that the alkali in the process of saponification converts the oil into peculiar *acids*, as he terms them, the elain of the oil forming *oleic acid*, and the stearine *margaric acid* so that soluble soaps are oleates and margarates of soda and potash He has enumerated several other fatty acids similarly produced

All new soaps contain a considerable portion of adhering water, [illegible] dry place, [illegible] and hence the dealer in soap [illegible] keeps it in a damp cellar, that it may [illegible] weight by evaporation or as it is said, sometimes immediately [illegible] dissolve it, but keeps it [illegible]

Soap may be considered as a necessary of life, in all civilized countries its consumption is immense According to Pliny, the invention of soap must be ascribed to the Gauls, by whom, he says, it was composed of tallow and ashes though the German soap was considered the best Hence the Lat sapo, which by a slight transposition of letters has become *soap*, is probably derived from the old German sepe (now written *seife*) The great seats of the soap manufacture in Great Britain are Liverpool, London, Runcorn, Bristol [illegible] Brentford, Hull, and Glasgow Thus, of [illegible] [illegible] 13,546,119 [illegible] [illegible] 0 [illegible] 24 lbs, [illegible] Brentford, [illegible] Glasgow, 5,858,844 lbs The quantity of soap manufactured in Great Britain during the three years ending 1851 averaged 2,000,000 cwt The manufacture of hard soap in Great Britain is subject to a duty of 1½*d* per lb, that of soft soap to a duty of ½*d* per lb

SOAP STONE [illegible] ttite

SOAVE, SOA [illegible] In Music, a term denoting to the player that the music to which it is prefixed is to be executed with sweetness

SO'BRIQUET In French, a burlesque appellation or *nickname* The word has been variously derived from the Lat subridiculum, subrusticum, and the Gr υβριστικον, &c There is a curious dissertation in vol xiv of the *Histoire de l'Academie des Inscrip* on the authority of these appellations in history

SO'CAGE (Mod Lat socagium, from the Anglo-Saxon soke, or *jurisdiction*) denotes, according to Blackstone in its original a [illegible] tenure by any certain and determinate service The sokemen at and immediately before the Norman conquest appear to have been in the lowest ranks of free cultivators of the land, [illegible] with the villein in a law of Edward [illegible] the time when the works of Bracton and the author of *Fleta* were compiled, socage had come to signify any tenure not military or quasi-military; [illegible] either where military services were due (tenure in chivalry or by knight service), or other services of an honorary kind such as by the French feudal law were due on what were called imperfect fiefs (tenure by grand serjeanty) Socage therefore, comprehended various descriptions of tenure, and has been generally divided into *free* and *villein* socage In free socage, the services were certain, and, in the feudal sense, not base or dishonourable, as the payment of an annual rent, and none of the feudal incidents of wardship, &c were demandable in respect of lands so held, although certain aids and reliefs were peculiar to socage as well as to knight service By the stat 12 C 2 c 24, when military tenures were abolished, all sorts of tenures held of the king and others (except frank-almoign, copyhold, and the honorary part of grand serjeanty) were turned into tenure by free or common socage Villein socage was a species of tenure in lands held of the king by certain villein services, but certain and determinate, from which mixed species of tenure arose that in ancient demesne. Lands so held are deemed to be in certain respects copyhold, and these were within the exceptions of the statute 12 Charles 2, and still subsist.

SOCIETY (Lat *socius a companion*) The term usually applied to an association formed for the promotion of some object either literary religious, benevolent political or convivial Associations formed for commercial purposes are usually styled *companies*, which see Literary societies extend their attention to all the sciences and literature generally, or to particular divisions of each The chief literary societies of Europe have been noticed under ACADEMY The purposes for which *benevolent* and *religious* societies are formed will be best inferred from the titles which they severally bear Societies for the *temperance* societies are established with a view to promote sobriety, *mendicity* societies for the relief of the indigent, &c There is no feature, perhaps, which distinguishes a civilized from a savage state more than the establishment of such societies and in this view England has a right to claim a place in the foremost ranks of civilization, [illegible] of the many institutions It would be impossible in this place to give even the names of the chief societies of this nature scattered throughout the country, but the reader will find an account of them in the various reports published from time to time by their respective directors, and embodying a mass of information respecting them at once amusing and instructive

Societies formed for *convivial* or *political* purposes are most usually denominated *clubs*, — a term which may be truly said to be exclusively English, and which embraces so many complex ideas that it is all but impossible to reduce it within the limits of a precise definition The origin of clubs may be said to date from the end of the 17th century It would be superfluous to call to the reader's remembrance the beau ideal of a club which Addison has drawn in the *Spectator*, — the Kit Kat club, which numbered among its members all the most distinguished persons of the day, the Scriblerus club, of which Swift, Harley, Pope, Gay and Arbuthnot were members, or that still nearer our own times originally held at the Essex Head, which was ennobled by [illegible] Burke, Reynolds, Goldsmith Wyndham and Fox They were originally instituted solely for convivial purposes, but in the course of time the term *club* was successively adopted by various political associations, both in this country and on the Continent Since the commencement of the present century, the chief clubs have been either of an avowed political character, as the Carlton Boodle and the Reform clubs, or devoted exclusively to certain classes, as the United Service, the Oxford and Cambridge, or open to all gentlemen on election without [illegible] party or profession as the Athenæum, [illegible] There are about forty clubs in the metropolis They consist each of a limited number of members, varying from 1000 to 1500 who are admitted by ballot, and pay from ten to twenty five guineas on their admission, and an annual subscription varying from five to ten guineas We need scarcely add that the club houses are, generally [illegible] edifices, which add much to the [illegible] the streets and squares in which they are situated

The latest application of the term *club* has been made by several literary societies [illegible] club of London, the Bannatyne of Edinburgh, and the Maitland of Glasgow,—which were formed for the purpose of [illegible] which would not otherwise have [illegible] securing rare productions from oblivion by reprinting them from scarce and valuable editions

SOCINIANS The followers of Socinus, the uncle and the nephew, both of the same name, and celebrated for similar opinions concerning the nature of Christ The nephew, Faustus Socinus was the principal founder of the sect He was an Italian, born at Siena in 1539 who, after publishing a treatise upon the nature of the Saviour, desired to be admitted into a society of Unitarians already existing in Poland Their opinions do not appear to have precisely corresponded with his and admission was refused him, and he died without seeing during his lifetime the institution of any distinct congregation, but the views which he disseminated in his writings were gradually referred to and adopted by many ministers [illegible] especially in Poland, where [illegible] others published a Socinian system of theology, comprised in the *Bibliotheca Fratrum Polonorum*

Since the death of Socinus, the theologians who have asserted the mere humanity of Christ have been generally denominated Socinians The doctrines, however, to which that appellation can with strictness be applied are not precisely equivalent to those of the modern Unitarians The Socinian denies the existence of Christ previous to his birth of the Virgin Mary he allows, however, that that birth was miraculous, and considers the Saviour as an object of peculiar reverence and an inferior [illegible] By the term Mediator, as applied to Christ, he understands that in establishing the new covenant he was the medium between God and man; and of his sacrifice he says that as the Jewish sacrifices were not made for the payment of sins, but for the remission of them, so also the death of Christ was designed for the remission of sins through God's favour, and not for the satisfaction of them as an equivalent (See *Mosheim*, vol iv transl 1790, p 485 &c art "Unitarians")

SOCK (Lat soccus) The name given to the peculiar kind of shoe worn by the ancient Roman comedians, hence used metaphorically for comedy itself *See* BUSKIN

SO'CLE (It zoccoli, *a shoe*) In Architecture, a square member, whose [illegible] used instead of a pedestal for the reception of a column [illegible] cornice.

[illegible] extensive sense, is used to comprehend the whole development of [illegible] from Socrates to the Neo Platonists far just, as all the schools of this period, with the single exception of the Epicurean, called themselves by the name of Socrates, and arrogated to themselves the merit of exclusively propagating the true doctrines of Socrates But in a narrow and more proper signification it signifies the peculiar direction and method which Socrates gave to philosophical inquiry Rightly to understand this, a brief retrospect of the previous state of philosophy is requisite By the due course of things, the Ionian and other earliest philosophers of Greece directed themselves to the study of external nature, which as the outward condition of man's existence, attracts and constrains his attention, and so becomes the root and source of his intellectual life also In this state of mental development man is led to identify himself with the physical objects which are around him, and to form a single and exclusive science, — that of universal nature But on a wider range of observation, man began to perceive that his faculty of reason is not a physical power, but different in kind and peculiar to himself And so the belief in the affinity of man to the powers of the surrounding world was gradually weakened Philosophy, then, had now arrived at the point where either the distinction of the ethical and the physical must be set forth in clear evidence, or else, by adhering to the previous direction of thought the light which had been, however unconsciously, kindled must be obscured and extinguished To the latter result the labours of the Sophists directly tended, for Archelaus the physiologist, had opened the way, by his disquisitions into the nature and constitution of law and custom, in which, starting from a physical point of view, he declared reason to be simply a power of nature, and right to have no other foundation than might Such attempts however, served to stimulate rather than to repress that inquiry into the nature of the moral and rational, as distinct from the physical while other considerations were at this period establishing them as independent sciences But to admit the claims of both as two conflicting sciences, with equal pretensions to universality, was inconsistent with the unifying tendency of philosophy, and a more scientific range of thought was required adapted to reconcile and combine their opposite conclusions Such a view could only be presented by logical or dialectical investigations, which from the nature of science itself, might show that it is essential to the completeness and perfection of science that it should embrace both nature and reason at once It is this perception of the unity of science which constitutes the true merit of Socrates as a philosopher In all the accounts of him which either Xenophon or Plato furnish, we invariably discern the attempt at least, to embrace every question within the [illegible] prove that every species [illegible] to be a necessary member [illegible]

It was not the object of Socrates [illegible] fectly evolved system of doctrine, so much as to awaken by his discourses a new and more comprehensive pursuit of science, which, no longer one-sided and confined to special branches of inquiry but convinced of its universality, should direct itself to all that is knowable But beneath this conviction of the universality of science, and the oneness of its object-matter, we distinctly trace that division of the latter into dialectics, physics, and ethics, which his successors more distinctly established To these heads, therefore, without expressly ascribing them to Socrates, it will be convenient, for the purpose of classification, to refer his several doctrines

Under the head of dialectics, we have, on the testimony of Aristotle (*Met* xiii 4), to ascribe to Socrates two of the very first principles of science,—the inductive method of proof, and the definition of ideas The object which Socrates had in view by the latter was, by the definition of ideas, to determine what the thing is in itself, or its essence As to the former, we are told by Xenophon that when Socrates wished to come to a decision on any point, his investigations proceeded from propositions generally received as true, and if we are told that he often preferred to take up trifling and improbable po-

sitions, it was from a conviction that every thought, however imperfect as a work of reason, must necessarily involve the idea of certainty Another feature of the Socratic method was to place the particular idea to be examined in a great variety of combinations, a procedure which is evidently based on a conviction of the connection of all scientific thought, and implying that every particular thought must if it contain any degree of certainty, maintain its validity under every possible combination Such was the true Socratic method of dialectics, which derived its name from the *form* of dialogue (διαλεγεσθαι) in which it was accidentally worked out, while, on the other hand the term *Socratic method* has, in modern times, been confined to [illegible] than this outward form of [illegible] question and answer, to the exclusion of its essential character Socrates, indeed, did not evolve any systematic doctrine of the form and subject-matter of science He was satisfied with exercising his disciples in its form, and with infixing on their minds the pregnant truth, that the legitimacy of every branch of knowledge must be tested by its agreement with all others, and that every thought of man must give account of itself, and have its root in the knowledge of the soul and the divine nature

This knowledge was the end of his physical inquiries which were based on the general principle that all the objects of nature are only so far worthy of inquiry as they exhibit traces of intelligence and design The self-knowledge which the Delphian oracle had enjoined upon him Socrates held to be impossible, while man is ignorant of the universal principle whence are the issues of [illegible] and consequently, of the system of nature in the midst of which man is placed In order to oppose the atheism which prevailed in his day Socrates examined the causes of the existing unbelief and referred to the proofs of divinity which the wise order of natural things exhibits As the prevailing scepticism had its origin in the denial of whatever is unseen and imperceptible to the outward senses he argued that the soul which is the ruling principle within man is yet not discernible, but still its existence is admitted and it participates in the divine nature Whoever therefore can get rid of the weak desire of seeing the Deity under some palpable form, may easily recognize his operations within his own mind, where God has implanted a consciousness of his presence But he further held that not only man, but the whole universe, is under the rule of an intelligent governor, that all is formed for some wise end and affords evidence of that supreme reason from which man's rational soul derives and has its being In the consideration of individual things, not less than of the universe, the sole question with Socrates was to establish intelligence as the ruling principle of all This affords an explanation of his low estimate of the existing physiology, which has not unfrequently been objected to him His contempt for it was grounded on the same reason as Bacon's aversion for the schoolmen It stopped at secondary causes, and did not remount to the one first cause, which Socrates believed could only be found in [illegible] things for the best [illegible] did not entirely neglect the marks of design which may be discovered in the universe, still they confounded nature with intelligence Socrates, on the contrary, laboured to show that reason is above nature, and that the natural is merely subservient to intellectual ends Whatever is without reason is contemptible, and the corporeal is of no value except so far as it ministers to the rational soul Into the nature of the divine essence he did not inquire but was content with asserting the principle that the Deity is the supreme reason, and must be honoured by man as the source of all things, and of all phenomena, and as the end of all human endeavours Lastly, from the divinity within man, the intelligence visible in the universe and the worthlessness of body, except as an instrument of reason, Socrates deduced the immortality of the soul as a necessary consequence

The object-matter of Socrates' disputations exhibit a great preference of ethical to physical topics This may partly be explained by the fact, that in ethics a scientific spirit of inquiry had yet to be awakened, while physics had been long in extensively cultivated Partly, also, it had its origin in the mental state of Athens at this period The art of sophistry, which Socrates was seeking to overthrow, was based on the monstrous dogmas, that there is no truth for man, that he is the wisest who, rejecting all hope of it, is skilful enough to hide from others his own ignorance and incapacity by an ingenuous display of artifices and forms Successfully to combat these pernicious views, an appeal must be made to those general principles of belief which are implied in and indispensable to the right conduct of life, a strong hold must be taken of what is fixed and indestructible in man in his moral convictions But, content with thus awakening man to a consciousness of the moral destiny of man, and his moral responsibility, he did not seek to construct an elaborate system of ethics Having projected the ideal of science, both in its extent and form, he contributed little to its realization, either as a whole, or in its parts A few propositions are necessary, however, to exhibit the true spirit of the Socratic ethics Man naturally strives after happiness, but in this we must distinguish between accidental good fortune (*συντυχια*), and that which results from science and industry (*ευπραξια*) The essence, therefore, of the moral act consists in the freedom of man All virtue is one, and no act performed without a clear perception of its nature and tendency is either good or evil There is no merit in a virtuous action unless it has been undertaken as such, intentionally and knowingly, the will being determined thereto by the notion of good But this natural sense of right may be overborne by a stronger motive This innate perception of good, therefore, like all other human faculties, stands in need of education to expand and strengthen it Virtue may be taught, since it consists in the science of good

SOD The [illegible] of the soil pared off with a portion [illegible] turf

SO'DIUM [illegible] This important and useful [illegible] Sodium was discovered by Davy in 1808 It is a metal much resembling potassium in its general characters It is soft, malleable, fusible at 190°, and burns when heated in contact of air When thrown upon water it does not burn but floats about upon the surface, and rapidly disappears, being converted into soda, which is dissolved in the water and gives it an alkaline reaction The specific gravity of sodium is 0·97 By the quantity of hydrogen evolved during the action of sodium on water, we learn that soda or oxide of sodium consists of 1 equivalent of sodium = 24, and 1 of oxygen = 8 The equivalent of soda, therefore, is 32 The commercial demands for soda are chiefly supplied from two sources the combustion of marine vegetables, such as common sea-weed and the *Salsola soda* which furnish the impure alkalies called *kelp* and *barilla* and the decomposition of common salt or rather perhaps of sulphate of soda obtained by the decomposition of salt by sulphuric acid Carbonate of soda forms large rhombo prismatic crystals, composed of 32 soda + 22 carbonic acid + 90 water They fuse in their water of crystallization at about 150°, and it may be entirely expelled by exposure to heat They effloresce when exposed to air Sulphate of soda, or Glauber's salt is the result of the action of sulphuric acid upon common salt (See MURIATIC ACID) It consists of 32 soda + 40 sulphuric acid, and the crystals are constituted of 72 dry sulphate and 90 water they are efflorescent, and soluble in about 3 parts of cold water When sodium is introduced into chlorine it immediately combines with it to form chloride of sodium or common salt, if heated in the gas, it burns very vividly 24 parts of sodium combine with 36 of chlorine to form 60 parts of this important and well known compound (*See* SALT) When chlorine gas is passed into a weak solution of caustic soda it is absorbed, and a useful bleaching and disinfecting solution is obtained which has been called *Labarraque's soda liquid*

SO'DALITE A mineral composed chiefly of silica, alumina and soda

SODA WATER This common and refreshing beverage is, as usually prepared, a supersaturated solution of carbonic acid gas in water True *soda water* was formerly prepared (and is still by some manufacturers) for medical use, chiefly as a remedy for heartburn, and certain forms of dyspepsia and calculous complaints, and consisted of one two, or three drachms of carbonate of soda dissolved in a pint of water highly impregnated with carbonic acid This is often a valuable remedy, but would sometimes be attended by mischievous results, especially if indulged in to the extent to which some persons pursue the use of soda water The mere aqueous solution of carbonic acid, which is made by forcing the gas into water by a condensing pump, and under a pressure of six or eight atmospheres is an agreeable and gen[illegible] harmless diluent

SOD BURNING Burning of turf taken from the surface of worn-out pasture lands for the sake of the ashes as manure, &c

SODIUM *See* SODA

SOFFIT (It soffitta, *overlaid*) In Architecture *See* LACUNAR

SO'FI A Persian word, which is employed to designate religious persons, otherwise termed Dervishes It is probably a corruption of the Greek sophos, *wise* Sofi was the surname borne by the ancestors of the kings of Persia of the race preceding that which now occupies the throne, and Shah Ismael Sofi the first monarch of that race, also bore it, hence by European writers of the 16th and 17th centuries it was used erroneously as a title of the king of Persia

SO'FISM [illegible] The [illegible] the class of [illegible] name is ind[illegible] living together in a monastic way, and professing an

ascetic life But the tene[illegible] noted by the name of Suflsm are those [illegible] is said to be gaining ground extensively in oriental c[illegible]tries especially among the educated classes of M[illegible] These tenets, like [illegible] of the Quietists [illegible] tian sects of mystics, are founded on a notion of the union of the human soul with the divinity by contemplation and the subjugation of the appetites, but, as has been too frequently the case among Christians also, they have afforded a cover for the most licentious lessons of refined debauchery In the last volume of Mr Buckingham's *Oriental Travels*, containing a narrative of his journey in Mesopotamia, will be found a singular account of one of these [illegible] his doctrines and conduct The principles of S[illegible] also to have a remarkable affinity in some [illegible] those pantheistic notions which are prominent in the system of the Bramins, and seem to form the very foundation of the still more widely extended religion of Buddha

SOFTENING In Painting, the blending of colours into each other

SOIL The primitive earths in a state of mixture with organized matter fit for the growth of plants The surface of the earth in every country on which plants have grown and decayed is properly denominated soil, while the earth at a foot or more beneath the surface, commonly called subsoil, is comparatively without organized matter, and is therefore properly denominated earth, clay, sand, gravel, lime, or mixed earth, rocks, or stones, as the case may be

SOIRÉE (Fr soir, *evening*) The term originally given by the French to certain evening parties held for the sake of conversation only, music, dancing, and similar entertainments being excluded, but the word has been since introduced into all the languages of modern Europe and is now employed to designate most descriptions of evening parties in which ladies and gentlemen are intermixed, whatever be the amusements introduced It is frequently applied in England to the public meetings of certain societies held for the advancement of their respective objects, at which tea and other refreshments are dispensed during the intervals of business

SOKE A territorial division now subsisting in Lincolnshire This term, according to the etymology given by Bracton, designated a precinct in which a particular lord exercised justice

SOL In Music, the fifth note of the gamut

SOLANA'CEÆ (Solanum, one of the genera) A natural order of herbaceous or shrubby Exogens inhabiting all parts of the world excepting the arctic regions They are chiefly known from *Scrophulariaceæ* by their curved or spiral embryo the plaited estivation of the flower and the flowers being usually regular, with the same number of stamens as lobes The first of these characters however is not of universal importance, the plaited corolla and symmetrical flowers are better marks of distinction This order contains nightshade, henbane, mandrake tobacco, stramonium the potato and the tomato, the leaves of all which are narcotic and exciting, but in different degrees,—from *Atropa belladonna* which [illegible] tobacco which [illegible] of these symptoms, henbane and stramonium,—down to some of the Solanum tribes, the leaves of which are so inert as to be used as kitchen herbs Even in the potato plant the narcotic acrid principle is found in the stem and leaves, and even in the rind of the tuber But the principal part of the latter consists of starch, and the small quantity of deleterious matter being volatile and near the surface, is readily driven off by the heat used in cooking

SOLA'NIA The active principle of the *Solanum dulcamara*, or woody nightshade It is a white alkaline substance, insoluble in water but soluble in alcohol its combinations with the acids are bitter

SOLA'NO A hot oppressive wind which occasionally blows in the Mediterranean, and particularly on the eastern coast of Spain The solano is a modification of the sirocco

SOLA'NUM TUBERO'SUM The botanical name for the plant of which the potato is the root The potato, which is at present to be met with everywhere in Europe, and forms the principal part of the food of a large proportion of its inhabitants was entirely unknown in this quarter of the world till the latter part of the 16th century It is a native of America, but whether of both divisions of that continent is doubtful (Humboldt, *Nouvelle Espagne* [illegible] it was first introduced [illegible] in 1545, others, that it was introduced by Sir Francis Drake, in 1573, and others, again, that it was for the first time brought to England from Virginia by Sir Walter Raleigh, [illegible] have arisen from confusion [illegible] potato (the *Solanum tuberosum* of Linnæus) with the sweet potato (*Convolvulus batatas*) The latter was introduced into Europe long before the former, and it seems most probable that it was the species brought from New Granada by Hawkins Sweet potatoes require a warm climate, and do not succeed in this country, they were, however, imported in considerable quantities, during the 16th century, from Spain and the Canaries, and were supposed to have some rather peculiar properties The [illegible] of [illegible] like confections, [illegible] roots On t[illegible] are really indebted for the potato (as well as for tobacco) to Sir Walter Raleigh, or [illegible] planted in Virginia Gerarde, an o[illegible], mentions in his *Herbal*, published i[illegible] planted the potato in his garden at L[illegible], and that it succeeded there as well as in its native soil, Virginia, whence he had received it Potatoes were at first cultivated by a very few, and were looked upon as a great delicacy In a manuscript account of the household expenses of Queen Anne, wife of James I, who died in 1618, and which is supposed to have been written in 1613, the purchase of a very small quantity of potatoes is mentioned at the price of 2*s* a pound The Royal Society, in 1663, recommended the extension of their cultivation, as a means of preventing famine Previously, however, to 1684 they were raised only in the gardens of the nobility and gentry, but in that year they were planted, for the first time, in the open field in Lancashire,—a county in which they have long been very extensively cultivated

Potatoes, it is commonly thought, were not introduced into Ireland till 1610, when a small quantity was sent by Sir Walter Raleigh to be planted in a garden in his estate in the vicinity of Youghal Their cultivation extended far more rapidly than in England, and have long furnished from 3-5ths to 4-5ths of the entire food of the people of Ireland!

Potatoes [illegible] till 1728, w[illegible] a person of the name of Prentice, a day labourer at Kilsyth who died at Edinburgh in 1792

The extension of the potato cultivation has been particularly [illegible] ty years The quantity that is no[illegible] supposed to be from 10 to 12 times as great as the quantity raised at the end of the American war, and though the increase in England has not been nearly so great as in Scotland, it has been greater than during any previous period of equal duration The increase on the Continent has been similar Potatoes are now very largely cultivated in France, Italy and Germany, and, with the exception of the Irish, the Swiss have become their greatest consumers They were introduced into India some sixty or seventy years ago, and are now successfully cultivated in Bengal, and have been introduced into the Madras provinces Java the Philippines and China But the common potato does not thrive within the tropics, unless it be raised at an elevation of 3000 or 4000 feet above the level of the sea so that it can never come into very general use in these regions This, however, is not the case with the sweet potato, which has also been introduced into tropical Asia, and with such success, that it already forms a considerable portion of the food of the people of Java, and some other countries So rapid an extension of the taste for, and the cultivation of an exotic, has no parallel in the history of industry it has had, and will continue to have, the most powerful influence on the condition of mankind But upon this part of the subject we must refer the reader for full particulars to the *Com Dict* art 'Potatoes," from which the above historical sketch has been taken

SOLAR CYCLE A period of twenty-eight years *See* CYCLE

SOLAR SYSTEM, in Astronomy consists of the sun, and all the celestial [illegible] whose motions are controlled by its gravitation, viz the planets, satellites, and comets *See* SUN PLANET &c

SO'LDER Plumbers' solder is an alloy of three parts of lead and one of tin, it is more fusible than lead, and readily adheres to clean surfaces of that metal when it is fused Fine solder is a mixture of two parts of tin and one of lead, it fuses at 360° It is used in the process of tinning copper Hard soldering, or brazing, by which two surfaces of copper are made to adhere, is done by fusing together brass and zinc When this solder is used, [illegible]

SOLDIER [illegible] *one who serves for pay*) In general language, a person equipped and maintained by the state for the [illegible] defending it from foreign aggression, of putting down internal commotion, or, in short, of protecting its interests either at home or abroad, according to instructions issued by the civil government *See* ARMY, ENLISTMENT, &c

SOLEA (Lat *a slipper*), in Mammalogy, is the [illegible] hoof

[illegible] genus of flat fishes (*Pleuronectidæ*), characterized as follows —' Both eyes on

the right side, the mouth distorted on the side opposite the eyes; small teeth in both jaws, but confined to the under side only; [illegible] dorsal and anal fins extending [illegible] common sole (*Solea vulgaris*, Cu[illegible] and in enormous quantities, along our coasts, principally from Sussex to Devonshire, and excepting towards the latter end of February, and the beginning of March, when the soles are spawning, and are rather soft and watery, they are [illegible] for the table throughout the year

SOLECISM In Rhetoric and Grammar (Gr *σολοικισμος*, said to be derived from the name of a town in Cilicia, whose inhabitants spoke a barbarous Greek), a violation of the idiomatic rules of grammar or construction in writing or speaking a language Quintilian distinguishes solecism from barbarism, the latter word being applied to the erroneous use of single words

SOLENACEANS *Solenacea* (Gr *σωλην*, *a tube*) The name of a family of Dimiary Bivalve Mollusks, of which the razor shell (*Solen*) is the type, they are distinguished by the great length of the respiratory tubes, whence their name

SOLENOID (Gr *σωλην* and *ειδος*, *appearance*) In Electro-Dynamics, a name given by Ampère to a system of small electrical currents, equal and equidistant and returning into themselves the planes of which are normals to any given line, whether a straight line or curve upon which their centres are situated, and which forms the axis of the *solenoid* (Despretz, *Traité de Physique*, 1836)

SOLFATARA A volcanic vent emitting sulphur and sulphurous compounds The term is borrowed from Solfaterra, the celebrated mountain of Naples called by [illegible] *græt Campi*

[illegible] In Music, the system of arranging the scale by the names ut, re, mi, fa, sol, la, by which musical students are taught to sing these notes being represented to the eye by lines and spaces, to which the syllables in question are applied (See art Music, under which will be found a diagram of the scale under the arrangement in question)

SOLICITOR The professional [illegible] admitted to practise in the court of Chan[illegible] to conduct of suits, &c, who are styled attorneys in the courts of common law (*See* ATTORNEY) The *solicitor-general* is an officer of the crown, who holds by patent, and ranks next to the attorney-general, with whom he is, in fact, associated in the management of the legal business of the crown and public offices He receives some particular fees on pleadings and on the enrolment of patents, &c; but the division of business between him and the attorney-general is chiefly regulated by usage founded on convenience He is the officer on whom generally devolve the maintenance of the rights of the crown in revenue cases, patent causes, &c The earliest date at which the name of this officer occurs, so far as is known, is the year 1461 In Scotland the term solicitor is synonymous with attorney in England They are inferior to the *writers to the signet*, and practise in the inferior courts

SO'LID In Physics, the term *solid* is applied to that condition of matter in which the attractive forces of the molecules are greater than the repulsive and the molecules consequently c[illegible] with [illegible] or less force The other states of [illegible] in which the attractive and repulsive forces are balanced, and the *gaseous*, in which the repulsive prevail

SOLID In Geometry, a magnitude which has three dimensions, length breadth and thickness The boundaries of solids are surfaces *Regular solids* are those which are terminated by regular and equal planes They are five in number, viz the tetraedron, the hexaedron, the octaedron, the dodecaedron, and the icosaedron *See* PLATONIC BODIES

SO'LID ANGLE, in Geometry, is an angle made by the meeting of more than two plane angles which are not in the same plane in one point

SO'LID PROBLEM In Geometry, a problem which cannot be constructed by the intersections of circles and straight lines [illegible] the description [illegible] gebraic solution of a solid problem leads to a cubic or biquadratic equation Problems which admit of being constructed by the intersection of two circles, or of a straight line and circle, are called plane problems, and [illegible]

SOLIDUNGULATES [illegible] Lat solidus, *solid*, [illegible] Mammals, including those with only a single hoof on each foot, as the horse, ass, &c

SOLI'LOQUY *See* MONOLOGUE

SO'LIPEDS Synonymous with *Solidungulates*, which see

SOLLE'CITO (It *afflicted*) In Music, a term denoting that the movement to which it is affixed is to be performed in a mournful manner It also means that the music is to be performed carefully

SO'LO (It *alone* In Music [illegible] or part of a movement, in which only one voice or instrument is employed

SOLSTICE (Lat *solstitium*) The time at which the sun is at its greatest distance from the equator, and which [illegible] This happens at midsummer and midwinter, or when the sun arrives [illegible]

SOLSTITIAL POINTS [illegible]

SOLUTION [illegible] Mathematics, the construction of a proposed problem, or the expression of its conditions by an equation which gives the [illegible]

SOMMITE [illegible] name of the *nephelin* of Somma and Vesuvius *See* NEPHELINE

SOMNAMBULISM (Lat somno ambulare, *to walk in one's sleep*) This is a species of dreaming, in which the bodily as well as the mental functions are affected There are many remarkable cases of this kind on record, some of which would appear perfectly incredible, were they not attested not only by credible, but by competent and scientific witnesses Somnambulism has been defined as 'a state in which the mind retains its power over the limbs, but possesses no influence over its own thoughts and [illegible] the body executing those [illegible] of which are [illegible] walking' Dr Abercromby in his excellent *Inquiries concerning the Intellectual Powers and the Investigation of Truth* observes in regard to this singular affection that although the mind is fixed upon its own impressions in ordinary dreaming, the bodily organs are more under the control of the will, so that the individual acts under the influence of his erroneous conceptions, and holds conversation in regard to them He is also, to a certain degree, susceptible of impressions from without, through his organs of sense, not however, so as to correct his erroneous impressions but rather to be mixed up with them Dr Abercromby observes, that the first degree of somnambulism generally shows itself by a propensity to talk during sleep, the person giving a full and connected account of what passes before him in dreams, and often revealing his own secrets or those of his friends Walking during sleep is the next degree, and that from which the affection derives its name He gets out of bed, often dresses himself, and goes out of doors, walks frequently over very dangerous places in safety, sometimes he gets out of a window, walks along a parapet, gets to the roof of the house and returns through similar risks to his apartment On awaking in the morning he is either utterly unconscious of having stirred during the night, or remembers it as a mere dream These cases are comparatively common, but sometimes the transactions of the somnambulist are carried much further he will mount his horse and ride or go to his usual occupations, such as threshing, saddle-making playing on musical instruments, composing verses and so forth

Although somnambulists are generally insensible to any thing that is said to them, they are sometimes capable of holding conversation, especially in those cases where the affection occurs, as it sometimes does, in the daytime In these attacks the individuals are generally unconscious of external impressions, or at all events extremely confused in their notions of external things They frequently speak intelligibly, but in reference to the impressions which are present in their own minds They sometimes repeat poetry and other matters of which they were supposed to be perfectly ignorant, or they hold conversations with imaginary beings, or relate circumstances which were supposed to have been entirely unnoticed or forgotten Some have been known to sing in a style superior to any thing to which they could attain when awake, and there are, says Dr Abercromby, some well-authenticated instances of persons in this condition expressing themselves correctly in languages with which they were imperfectly acquainted

For the details of individual cases of this extraordinary disorder, we must refer to Dr Abercromby's instructive volume already quoted, and the authorities therein cited It is impossible to give any explanation of the extraordinary condition of the faculties which such cases exemplify, or to point out any general plan of treatment applicable to them

The more ordinary cases of somnambulism are sometimes cured by tying the patient to some part of the bed, or by securing the doors and windows, so that after ineffectual attempts to make his escape he is induced to return to bed, and remains quiet The state of the stomach and bowels, and of the nervous system, requires careful examination and proper treatment in some cases intestinal worms appear to have been connected with nocturnal disturbances bearing a close analogy to somnambulism, and which have disappeared after the successful operation of vermifuge remedies

SOMNUS, in Classical Mythology, the poetical god of sleep, is the son of Erebus and Nox, or of Nox alone He dwells with his brother Death in a palace at the

western extremity of the earth Homer makes Juno seek him in the isle of Lemnos, whither he had repaired for love of the nymph Pasithea Ovid makes him dwell in a cavern among the Scythians or Cimmerians; Statius in Æthiopia.

SONA'TA (It sonare, *to sound*) In Music, a composition executed wholly by instruments It is generally a free composition for exhibiting the composer's powers, without confining him within the rigid rules of counterpoint or measure

SO'NNET (It sonetto) In Poetry, a short composition of fourteen or fifteen lines, deca or endecasyllabic, rhymed according to an intricate but not always precisely similar arrangement It is the oldest form in which the Italian language was used, but was, at a still earlier period, employed, although not commonly, by the Provençal poets In Italy, Dante and the Tuscan poets his contemporaries brought the sonnet into public esti- [illegible] symbolical nature, though generally, in their outward signification, breathing the spirit of romantic and chivalrous love By Petrarch, in the course of the same century, the sonnet was carried to perfection in point of form and polish, although applied by him, as it had been by his predecessors, almost exclusively to the subject of his figurative and mystical passion Since the time of Petrarch the sonnet has been a favourite form of composition in Italy, [illegible] occasional poetry In France [illegible], or rather the French sonnet is a different poem, less regular in its construction than the Italian In Germany and England the comparative poverty in rhymes of their respective languages has rendered it unusual, but Milton has given to it a dignity peculiarly his own, together with much of the melody and tenderness which characterize his Italian models The proper sonnet is divided into two quatrains, with four lines and two rhymes each, and two terzines, each with three lines and a single rhyme Pieces of a similar metrical structure in octo-syllabic lines are termed by the Italians Anacreontic sonnets It is sometimes said that there is "hardly an educated Italian who ha[illegible]"

[illegible], from σοφος, *wise*) A Greek word, originally signifying a person of talent and accomplishments It was afterwards restricted to a bad sense, and applied to a class of men who arose in Greece in the fifth century B C and taught the youth in the principal cities various arts and acquirements for hire It has hence come to be the general designation of all such as cultivate any branch of science or philosophy with a view to outward advantages, careless of the truth of what they advance except in so far as true to those purposes The first Greek who [illegible] name of *Sophist* was Protagoras a native of Abdera, who flourished about the year 440 B C, and obtained numerous pupils and auditors, especially in Athens Of those who followed the same occupation the most celebrated were Hippias of Elis, Gorgias of Leontium, Prodicus of Ceos, and Euthydemus of Chios, with his brother Dionysiodorus None of the writings of these men have survived, but we have abundant notices in the writings of their contemporaries, especially Plato, Xenophon, and Aristophanes, of the nature and tendency of the doctrines and principles which they communicated to the youth of Greece Of the truth of these accounts the Grecian history of the latter part of the fifth century furnishes us with a melancholy testimony It is, indeed, to the changes which had begun to take place in the internal and external relations of the Greek states, that the prevalence and success of the Sophists are mainly to be attributed The changes in the distribution of property which these revolutions rendered necessary excited the passions and gave scope to the energies of the young and enterprising, at the same time that the political alterations tended to shake men's confidence in those moral principles which among the Greeks were intimately bound up with their civil institutions We accordingly find the leading feature of the sophistic doctrine to be a dislike to every thing fixed and necessary, in ethics as well as philosophy Prescription was represented as the sole source of moral distinctions, which must consequently vary with the character and institutions of the people The *useful* was held to be the only mark by which one opinion could be distinguished from another An absolute standard of truth is as absurd a notion in speculation as an absolute standard of morals in practice that only is true which seems so to the individual and just as long as it so seems Man is the measure of all things" These and similar doctrines they maintained with great subtlety and acuteness, and found numerous disciples among those who were well prepared for the admission of tenets which swept away at once all the remnants of those prejudices which might still interpose a barrier between their passions and their gratification Considered as a link in the chain of philosophical development, the Sophists were doubtless the involuntary cause of the greater depth and soundness of the subsequent Grecian philosophy The success which they had found in demolishing the systems of their predecessors proved the necessity of laying the foundations of human knowledge deeper than heretofore had been done and it is thus to the Sophists that we may attribute the more critical and cautious spirit which distinguishes the doctrines of Plato [illegible] *de Ld de Insv* xc xiii xxxii, *Ld Review*, vol xxxiv)

SOPORI'FICS (Lat sopor, *sleep*) Medicines which induce sleep

SO'PRA (It *above*) In Music, a term frequently used for description, as *nella parte di sopra*, in the higher or upper part, *di sopra*, above, *contrapunto sopra il soggetto*, counterpoint above the subject &c

SOPRA'NO (It sopra) The upper or treble part in composition

SO'RBIC (ACID) The acid of the berries of the *Sorbus aucuparia*, or mountain ash It is identical with the *malic acid*

SORBO'NNE A college at Paris for the study of theology, so called from the village of Sorbonne, in Champagne, where its founder, a priest named Robert, was born about the beginning of the 13th century He made a provision for the instruction of sixteen poor clerks in theology, and his college is said to be the first example of what was afterwards the common character of all the [illegible] the institution of a cœnobium for regular [illegible] The college of the Sorbonne was adorned with various new edifices and enriched with a library by Cardinal Richelieu [illegible] His monument in the church is considered a chef d'œuvre of French art. (See Mosheim, *Eccl Hist* vol iii transl 1790, p 53 &c) This great college of theology exercised a high influence in ecclesiastical affairs, and on the public mind, especially in the 16th and 17th centuries, insomuch that the sceptical wits of the 18th usually employ the name as synonymous with the spirit of bigotry itself Its proverbial celebrity for acuteness in theological disquisition is attested by the lines of our own Butler —

> For he a rope of sand could twist
> As true as learned Sorbonist

SO'RCERER (Lat sortitor, from sors, *a lot*; whence *sorcery*) Properly one who [illegible] or divination by lot (which see), but in the language of the middle ages, one [illegible] powers (*see* MAGIC), especially by the aid of evil spirits. The *sorcerer* of the middle ages was, generally speaking, a personage of distinction while the *witch* was degraded and loathsome The species of sorcery which is still practised in the East, especially in Egypt, by means of the magic mirror, has recently attracted much attention The most complete account of it will be found in *Lane's Modern Egypt*

SORDINI In Music *See* CON SORDINI

SORE'DIA In Botany heaps of powdery bodies found in lichens lying upon any part of the surface of the thallus

SO'REX (Lat sorex, *a field-mouse*) A Linnæan genus of the order *Bestiæ*, now forming an extensive tribe of [illegible] of Cuvier [illegible] original generic term is confined to the shrews or shrew-mice, which are the type of the family (*Soricidæ*), and are characterized by having the two superior middle incisors curved and indented at the base, the two inferior incisors prolonged and procumbent Behind the upper pair of incisors there are five little conical teeth on each side, and two similar teeth behind the lower pair of incisors the molars, which are beset with sharp cusps, are four on each side above, and three below The true shrews are further characterized by lateral, and sometimes anal and femoral scent-glands The principal genera, now distinct, which would have ranked with the Linnæan *Sorex*, are *Myogale Condylura Talpa Gymnura, Macroscelis*, [illegible] *Crossopus Crocidura* [illegible] to the family of hedgehogs and [illegible] moles

SORE'DIUM (Gr σωρος *a heap*) The small heaps of reproductive granules found growing upon the fronds of Pol[illegible]

SORI'TES (Gr σωρος *a heap*) In Logic, an abridged form of stating a [illegible] of which the conclusion of each is a premiss of the succeeding one e g A = B, B = C, C = D, therefore A = D This is a sorites, consisting of two distinct syllogisms, which, drawn out at length, would stand thus A = B, B = C, therefore A = C, and A = C, C = D, therefore A = D

SO'RREL, SALT OF Binoxalate of potash

SO'RTES HOME'RICÆ VIRGILIANÆ SANCTORUM, &c A species of sortilege or divination was practised in antiquity by opening at random a favourite author, and applying the first passage which met the eye to the circumstances of the inquirer as an oracular answer termed by the Greeks στοιχειομαντεια They

chiefly used Homer for this purpose Thus Socrates when in prison, hearing the line of Homer repeated,

ἡμαρ τὴν τριτατῳ, Φθιην ἐρίβωλον ἱκοιμην,

interpreted it to foretel his own death within three days, by a play on the word Phthia Among the Romans, Virgil was chiefly consulted, and many celebrated instances are preserved Adrian, when desirous to know on what terms he stood with his patron the emperor T [illegible] opened at the verses re[illegible] incanaque menta Regis Romani," &c , and thence drew the augury of [illegible] elevation to the empire Alexander Severus also, according to Lampridius, obtained a similar presage from the lines "Excudant alii spirantia mollius aera" &c The anecdote of the ominous passage discovered by Charles I and Lord Falkland when opening Virgil in the public library at Oxford, is well known (see *Welwood's Memoirs*) In Christian times, the Sortes Sanctorum came in fashion They were obtained by consulting the inspired writings in the manner before described, sometimes, also, the inquirer went into a church while service was performing, and drew a [illegible] the first words he heard In this way, [illegible] directed to adopt a life of solitary devotion These practices became the occasion of much superstition They are [illegible] o Januarius, [illegible] with evident credulity [illegible] by early ecclesiastical writers Gregory of [illegible] other similar stories has one of the French prince Meroveus, which shows the ceremonious manner in which they were sometimes performed That prince having fled to the basilica of St Martin, placed separately on the saint's tomb the Psalms the book of Kings, and the Gospels and, spending three days and nights at the tomb in fasting and devotions on the fourth day he opened these sacred books, from each of which he drew a discouraging prediction Elections to the episcopal offices, and other solemn proceedings seem to have been sometimes decided in the same manner in the dark ages And after this abuse had ceased, it was long a common practice, on the consecration of a bishop after the book of the Gospels had been laid on his head, to consider the first verse which offered itself [illegible] his behaviour and the fortunes of [illegible] the death of Albert bishop of Liege, was intimated by the ominous occurrence of the passage respecting the execution of John the Baptist, and that prelate was [illegible] put to death by Henry VI The Sortes Sanctorum had been however, forbidden by the council of Vannes in the 5th century, and that anathema was repeated on many later occasions, in which the consulting of the scriptures is classed with other profane and magical modes of divination There is an essay on Sortes in the *Mem de l Ac des Inscr* vol xix *See* STICHOMANCY

SORTIE or SALLY In Military language a term borrowed from the French to signify a sudden attack made by the inhabitants of a besieged city upon the besiegers

SORTILEGE (Lat sors *lot*, lego *I collect*) Divination by lots A very ancient mode of exploring future events, and which has been supposed by superstitious persons in modern times to derive countenance from various incidents in sacred history, especially the choice of St Matthias by lot to the place of an apostle (Acts, i 26) The different modes in which sortilege has been practised will be found detailed under that word, in a learned article in the *Enc Metropolitana*, and *see* SORTES

SOSPI'RO (It *a sigh*) In Music, the same as Rest, which see

SOSTEN'UTO (It *sustained*) In Music, a term which, affixed to a note, indicates that it is to be held out [illegible] manner

SOTHIC YEAR In Chronology, the Egyptian year of 365 days (said to have been introduced into Greece by Orpheus) was so called from Sothis, the Dog-star, at whose heliacal rising it was supposed to commence (*Bryant's Ancient Mythology*, vol iv)

SO'TTO (It *below*) In Music, a term frequently used for description, as *sotto il sogetto*, below the subject, *nella parte di sotto*, in a lower part

SOUND (Fr son) The sensation produced by the vibrations of the air or other medium with which the organ of hearing is in contact The doctrine of sound is usually treated under the head *acoustics*, a branch of physics which has for its object the determination of the laws by which the peculiar motions which give rise to the sensation of sound are produced in bodies and conveyed to our ears, and the manner in which they act on those organs, in other words to explain the origin, propagation and perception of sound

Although strictly speaking, sound is only a sensation excited in the auditory organ, yet in treating of the subject it is usual to transfer the name from the sensation to the motion which gives rise to it We shall therefore speak of sound as [illegible] it proceeding from the *sounding* body, and speak of a body as sounding when its particles are in that state of vibration which is requisite for making an impression on the ear, either immediately or through the medium of some other elastic substance

Phenomena of Sound — In order that a body may produce sound it is necessary that its particles be in a state of rapid vibration and in order that these vibrations may be communicated to the auditory organ, it is necessary that air or some elastic medium be interposed between the vibrating body and the ear Hauksbee having suspended a bell under the receiver of an air-pump, found the sound become feebler in proportion as the air was removed, and again become stronger as the air was readmitted and also that when the bell was suspended in a vessel full of air, and placed under the receiver, no sound was transmitted when the air between the vessel and the receiver was exhausted This experiment has been repeated by Biot, with a more perfect apparatus, and with every attention to the circumstances by which it is influenced, and it was found that when the exhaustion was complete no sound was perceptible, even when the ear was brought close to the receiver Hence it appears that sound cannot be communicated through a perfectly void space But although air is the medium through which sound is usually communicated, this only happens because it is the medium with which the ear is usually in contact, and many other media are found by experiment to perform the office even more perfectly Franklin having plunged his head under water, caused a person to strike [illegible] together beneath the surface, and at more [illegible] heard the blows distinctly Colladon by plunging a few feet into the water a thin tin cylinder closed at the lower end, but having the upper open to the air, was enabled to hear the sound of a bell struck under water at the distance of 2000 6000 and even 12,000 metres (about 9 miles), namely, across the whole breadth of the lake of Geneva from Rolle to Thonon The conducting power of wood along the fibres is very remarkable Let a person bring his ear close to the end of a fir deal however long, and he will distinctly hear the slightest scratch made with the point of a pin at the other end although the sound may be so feeble as to be inaudible to the person who makes it Miners at work in one shaft often hear the sound of the pickaxe in another through the solid rock, and in general all solids tolerably compact are good conductors of sound

Sounds are propagated to great distances and with remarkable distinctness over a surface of water, or ice, or frozen snow In the account of Parry's third polar expedition it is stated that two persons could hold a conversation across the harbour of Port Bowen, a distance of 6696 feet or about a mile and a quarter Instances are also recorded of sounds propagated to almost incredible distances over land Derham relates the following — Guns fired at Carlscroom were heard across the southern extremity of Sweden, as far as Denmark, a distance of 120 miles Dr Hearn a Swedish physician relates that he heard guns fired at Stockholm at the distance of 30 Swedish or 180 English miles the cannonade of a seafight between the English and Dutch, in 1672, was heard across England as far as Shrewsbury and even in Wales, a distance of upwards of 200 miles from the scene of action

The diminution of the intensity of sound in rarefied air is rendered manifest not only by experiments with the air pump, but also by the phenomena observed at [illegible] the atmosphere Saussure relates that [illegible] Mount Blanc the report of a pistol was not louder than that of a small cracker in the plain below, and Gay Lussac, having ascended in a balloon to an altitude of nearly 23,000 feet, far above the clouds and away from all solid substances, observed the intensity of the sound of his voice to be greatly enfeebled

It is matter of familiar observation that sounds are not propagated through the air instantaneously but occupy a sensible portion of time in passing from one station to another, greater in proportion as the stations are more remote The blow of a hammer on an anvil is not heard by an observer at some distance, until a sensible time has elapsed after the hammer has been seen to descend, and the flash of a gun fired a mile off is seen several seconds before the report is heard But all sounds, whatever be their loudness or pitch are propagated with the same velocity through the same medium In listening to the music of a concert, the sounds follow each other in the same order and at the same intervals, and the same measure and harmony are perceived, at whatever distance the hearer may be from the orchestra Biot caused several airs to be played on a flute at the end of a pipe 3120 feet long, which were distinctly heard at the other end [illegible] in the order or interval [illegible] could not have been the case if there had been the smallest difference in the velocity of their propagation

Numerous experiments have been made for the purpose of determining the actual velocity of sound through the

atmosphere The usual mode of making the experiment is to observe the interval between the flash and the report of a cannon fired at a known distance In this manner the Florentine academicians in 1660, found the velocity to be 1148 English feet per second These experiments were repeated in France in 1698, by Cassini, Huygens, Picard, and Roemer, who found 1172 feet, and Flamsteed and Halley at the royal observatory of Greenwich, from experiments made at the distance of 3 miles, found the velocity to be 1142 feet per second This result was confirmed by Derham (*Phil Trans* 1708), who found the same velocity by a mean of observations made at more remote distances In 1737 the Academy of Sciences of Paris directed farther experiments to be made by Cassini de Thury, Maraldi, and Lacaille, and on this occasion the experiments were for the first time made so as to eliminate the effect of the wind by reciprocal observations, that is to say, by firing cannon at both ends of the line, either simultaneously or at short intervals They also appear to have been the first who observed and recorded the temperature of the air at the time of the experiment, a very essential element, as will presently be seen The result at which they arrived gave the velocity equal to 1106 English feet per second, at a temperature between 4° and 6° of Reaumur, or between 41° and 44½° of Fahrenheit When the proper reduction is made for temperature, this agrees very nearly with the best modern observations

Numerous experiments were made in different countries in the course of the 1st century (viz by Bianconi in Italy, in 1740, by Condamine at Quito and Cayenne, in 1740 and 1744, by Mayer in 1778, and Muller in 1791, in Germany, by Espinosa and Bauza in 1794, at Chili), but as the observers had not the means of determining minute intervals of time with the precision which has been attained in more recent experiments, and besides neglected some circumstances which influence the result, it is unnecessary to state the details

Since the beginning of the present century the velocity of sound has been measured in various countries, in Germany, by Benzenberg at Dusseldorf in 1809 and by Myrbach and Stampfer at Saltzburg in 1822, in France by directions of the Bureau des Longitudes in 1822, in Holland, by Moll, Vanbeck and Kipp in 1823, in England by Dr O Gregory at Woolwich in 1824 in the East Indies by Mr Goldingham in 1821, and at Port Bowen in the polar regions, by Parry and Foster, in 1825 The results of these measurements when reduced to the same temperature, agree very nearly with one another, but the experiments made in France and Holland are by far the most circumstantial and satisfactory In the French experiments two stations in the neighbourhood of Paris were chosen Villejuif and Montlehery, and the signals were made by firing a gun from each station alternately, at an interval of five minutes The observers at Villejuif were Prony, Arago, and Mathieu, and at Montlehery, Humboldt, Gay Lussac, and Bouvard The observations commenced at 11 o clock on the nights of the 21st and 22d of June and were continued on both nights during two hours, but in many instances the reports were not heard, at least by all the observers The intervals between the flashes and reports were observed by means of stop watches of a peculiar construction, which permitted the seconds to be divided and noted The mean of all the observations gave 54·6 seconds for the time which sound took to travel from the one station to the other The distance between the stations was afterwards determined by Arago, and found to be 9549·6 toises (11⅛ miles), whence the velocity is 174·9 toises, or 340·88 metres in a second But this is the velocity belonging to the mean temperature, which was 16° centigrade (61° Fahrenheit) and corresponds to a velocity of 331·12 metres (1086·1 English feet) in the temperature of freezing water The details of these experiments are given in the *Connaissance des Temps* for 1825

In the Dutch experiments a clock with a conical pendulum was used, which gave the means of determining the time to the hundredth of a second by suddenly arresting the motion of the index without stopping the clock As in the French experiments, guns were fired from each extremity of the line, but instead of being fired alternately [illegible] so that a very small [illegible] the state of the atmosphere or the wind was entirely eliminated The state of the hygrometer was also observed The interval between the stations was 57839 feet (nearly 11 miles), and the mean of all the experiments reduced to the freezing temperature, and for dry air, gave for the velocity of sound 1089·42 feet in a second The details are given in the *Phil Trans* for 1824

Dr Gregory's observations are given in the *Transactions of the Royal Irish Acad* and *Phil Soc* for 1824 The signals were not reciprocal, but the velocity of the wind was measured by an anemometer, and allowed for The distances were also very much smaller (varying from 2700 to 13460 feet) nevertheless the results agree very well with those above mentioned Mr Goldingham's experiments at Madras are much less certain, his method consisted in taking a mean of the velocities observed daily in calm weather, during a long time, by the firing of the morning and evening guns at two stations visible from Madras [illegible] to be reduced (*Phil Trans* [illegible] are given in *Gilbert's Annalen*, new series [illegible] and those of General Myrbach in the *Jahrbuch des Polytek Instituts zu Wien* vol vii The experiments of Parry and Foster are given in detail in *Parry's Journal of a Third Voyage, &c* The mean result deduced by Dr Moll (*Phil Trans* 1828) gives the velocity equal to 1085·2 feet in a second, at the temperature of 17·7° Fahr, which corresponds to 1092 feet at 32°, but the circumstances were unfavourable The following table exhibits in one view the results of the principal experiments now described The numbers are taken from a more extended table given by Sir John Herschel in the *Ency Metropolitana* art "Sound," to which admirable treatise we refer the student for information on all points connected with this important subject

Date of Observation	Observer	[illegible]	Freezing water
1809	Benzenberg	29764	1093
1821	Goldingham	29547	1086·7
		13932	
1822	Myrbach	32615	1092·1
1822	[illegible]	61064	1086·1
1823	[illegible]	57839	1089·42
1823	Dr Gregory	from 2700 to 13460	1088·05
		Mean of the whole	1089·2

These results agree remarkably well with each other, the greatest deviation from the mean being less than 4 feet, and the mean of the whole being almost identical with the determination of Moll and Vanbeek "We may therefore," says Sir John Herschel, "adopt 1090 feet without hesitation (as a whole number), as no doubt within a yard of the truth and probably within a foot" This is the velocity with which sound travels in dry air, at the temperature of freezing water But the velocity increases with the temperature (as will be shown presently), at the rate of 1·14 foot, very nearly for each degree of Fahrenheit's scale Hence at the temperature of 62° (the standard temperature of the British metrical system), the velocity is 1124⅓ feet We may therefore assume the velocity of sound at this standard temperature, as determined by the best experiments, to be 1125 feet per second

Theory of Sound — It has already been stated that sound is produced by the vibrations of the molecules of a solid body communicated to the atmosphere or other elastic medium, and conveyed by it to the ear The physical theory of sound, therefore resolves itself into two parts 1st the state or condition of the vibrating body, and 2d the mode in which this mechanical action is propagated through the medium to the organ of sense

State of Sonorous Body — In order that a body may give out sound, its particles must be put into a state of rapid vibration If the frequency of the vibrations is under a certain limit, no sound will be produced, above that limiting velocity of vibration, sound is produced, and experience shows that the quality of the sound becomes more and more acute as the vibrations are more rapid, until a second limit of velocity is attained, beyond which the human ear is affected with no sensation of sound To prove this experimentally let a thin plate of tempered steel have one of its ends firmly fixed in a vice, and let the other end be drawn a little aside from the position of rest As soon as the force by which the plate is bent is removed, the plate commences a series of vibrations, which become smaller and smaller until the position of rest is again attained But the vibrations are all performed in equal times, and if sufficient length is given to the plate, they take place so slowly as to admit of being accurately counted On shortening the plate, they become more rapid, and long before they attain that degree of rapidity which is necessary for the production of sound, it becomes impossible to count them directly, but it is demonstrable that when a plate of metal of equal thickness throughout is made to vibrate in the manner now supposed, the time of a vibration is directly proportional to the square of the length of the plate, and consequently the number of vibrations in a given time is inversely as this square, so that if the number in a second corresponding to any length of the plate has been counted, the number corresponding to any other given length can be readily computed In this manner it has been found that a metallic plate begins to sound when the number of vibrations in a second is 32, and at this velocity of vibration, the sound

which it gives is of the same pitch as that of an organ pipe 32 feet in length, open at both ends (By *vibration*, we here understand the passage of the plate from the extreme excursion on one side of the position of rest to the opposite, and not the going and returning, or complete vibration)

[illegible] velocity at which sound ceases to be appreciable, is not so easily determined Until recently it has been usual to fix it at 8200 vibrations in a second, but M Savart has discovered that by increasing the amplitude of the vibrations, acute sounds may be distinguished at a velocity of 24,000 vibrations in a second, and it is possible that the limit may still be considerably above this number By means of an ingenious apparatus, Savart has succeeded in determining the number of vibrations producing a sound of any given pitch with great exactness

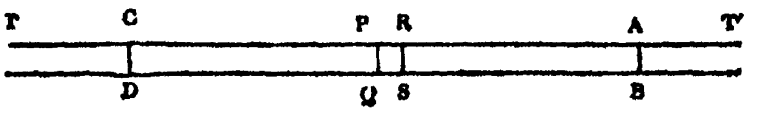
Several other means exist of determining the absolute number of vibrations in a given time, corresponding to different musical sounds, of which one of the most certain, and most frequently had recourse to, depends on the mathematical relation subsisting between the time of vibration, the length of the cord, and the tension of vibrating cords Let n denote the number of vibrations in a second, g the accelerating force of gravity (32 feet in a second), l the length of the cord, w its weight, t its tension (or the weight by which it is stretched), then a formula equivalent to the following was demonstrated by Brook Taylor (*Methodus Incrementorum*, p 93) —

$$n = \sqrt{\frac{g\,t}{l\,w}}$$

In this formula g is known and t, l, and w are measurable quantities, so that n is completely determined, but a more convenient expression is obtained by substituting the diameter and density of the cord for its weight. Let r be the radius of the cord, δ the density of its matter, and π the ratio of the circumference to the diameter, or $\pi = 3\,14159$, then $w = \pi\,\delta\,g\,r^2\,l$, and the above formula becomes

$$n = \frac{1}{r\,l}\sqrt{\left(\frac{t}{\pi\,\delta}\right)}$$

From this it results that the number of vibrations in a second is proportional directly to the square root of the tension of the cord, and inversely to its length, to its thickness or diameter, and to the square root of its density

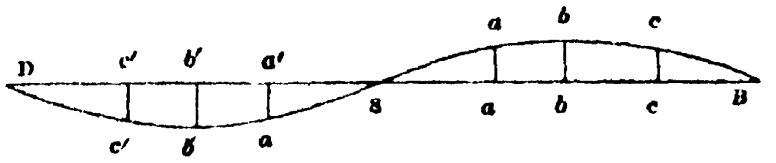


In the *Memoirs of the Berlin Academy* for 1822 and 1823, are given the results of a great number of experiments made in this manner by M Fischer, for determining the velocity of vibration corresponding to different musical sounds The rapidity of vibration giving the diapasons (that is, the concert pitches) of various orchestras at Berlin was found to be as follows — Berlin Theatre 437 32, Great French Opera 431 34, Feydeau 427 61, Italian Theatre 424 17 vibrations per second The reach of the voice of a man usually extends from sol_1 to fa_3 in the musical gamut, and that of a woman from re_3 to la_4 Taking the diapason of the Italian Opera as the standard, the rapidity of vibration corresponding to these several notes is as follows — Sol_1 190 8, fa_3 678 4, re_3 572 4, la_4 1606 vibrations per second But the voices of some singers reach much higher than la_4 and consequently the rapidity of vibration with respect to them will be higher in proportion

Some of the most acute sounds, or highest tones which the ear can distinguish [illegible] and their corresponding [illegible] or 15000 vibrations in a second When we reflect how extremely probable it is that the tympanum of the ear vibrates in unison with the sounds that affect it, we cannot fail to be struck with admiration of the wonderful delicacy of [illegible] which possesses the power of [illegible] vibration, from 32 times in a second up to 24,000, the number found by Savart to be sensible The limits, however, at which very acute sounds cease to be audible appear to vary considerably in respect of different individuals, some being altogether insensible to sounds which painfully affect others (See a very [illegible] on sounds inaudible to certain ears by D Wollaston in the *Phil Trans* for 1820)

The mathematical problem to determine the vibrations of a stretched cord is one of very great difficulty After exercising the talents of Dr Brook Taylor D'Alembert Euler, Daniel Bernoulli and others it was completely solved by Lagrange, in the first volume of the *Turin Miscellanies*, and all the deductions from theory are found to be confirmed by experiment The subject of the vibrations of solids has been recently examined experimentally by M Savart, and the results given in a series of most important memoirs communicated to the French Academy of Sciences, and printed in different volumes of the *Annales de Chimie* *See* VIBRATION

Propagation of Sound — In order to convey an idea of the manner in which the vibratory motions of a sonorous body are communicated to the atmosphere or other elastic medium, let us conceive a tube, T T', of an indefinite

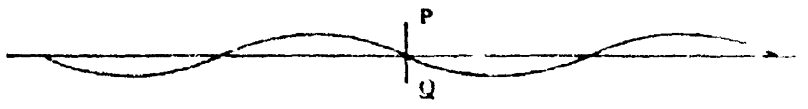


(1)

length, and open at both ends, to be filled with air of a uniform temperature and density throughout Let us also suppose a piston, P Q, which closely fits the tube, and is moveable within it along the direction of the axis, to be [illegible] osition P Q to R S; and the distance P R be supposed one foot and the time in which the piston moves from P Q to R S to be one second Now assuming the air within the tube to have been in a state of rest before the piston began to move, let us consider what will be its state at the instant when the piston arrives at R S If the air in the tube were acted upon as a perfectly hard body, any motion communicated to the particles at one extremity would be instantaneously conveyed to the other, and when the piston arrived at R S a quantity of air, equal to that which [illegible] P Q and R S, would be expelled at T', and all the particles within the tube would come to rest at the same time with the piston But in consequence of the compressibility of the air the motion is not communicated to the distant particles instantaneously, but only after a sensible interval of time, and we may conceive the tube to be so long that when the piston has arrived at R S no air has yet been propelled from the tube at T' In fact, the disturbance or compression of the particles, which takes place at the instant the piston begins to move, is propagated along the tube with a certain determinate velocity, depending on the elasticity of the air, and when the piston reaches R S will only have reached [illegible] Let A B be the section [illegible] pression has reached at the instant the piston comes to R S, then, at the instant of time on which we have to fix our attention, the column of air between R S and A B will be in a state of compression and between A B and the end of the tube at T' it will still remain in its natural state The column of air between R S and A B, which is thus modified by the stroke of the piston, is called a *wave of condensation*, and A R its *length* of the wave [illegible] R A, it will readily be seen that they are not subjected to the same degree of compression through its whole length Conceive the wave to be divided into a very great number of thin layers by sections parallel to R S or A B, and that the piston, in passing from the position P Q to R S, has produced the effect, not instantaneously, but by a great number of successive small impulses At the instant the piston comes to R S the disturbance has by hypothesis been propagated only to A B, and consequently the particles in the infinitely thin layer next to A B have suffered only the slightest degree of compression, or that caused by the first impulse of the piston In the second layer next to A B the molecules of air are in a state of greater compression, inasmuch as they have sustained not only the compression due to the first impulse of the piston, but also that which is due to the second, the effect of which is propagated to them at the same instant at which the effect of the first is propagated to A B In like manner, the compression in the third layer preceding A B is greater than in the second, and so on to the middle of the wave [illegible] [illegible] [illegible]

as the air within the tube on that side must be rarefied, instead of being compressed as the motion of the piston from P Q to R S (fig 2) may be a section of the tube, so that the column C R is equal to R A, then, as the velocity of propagation depends only on the nature of the medium, it is obvious that at the instant in which the piston arrives at R S the disturbance of the molecules will only have extended to C D The whole column between C D and R S will be rarefied by the withdrawal of the piston of air between P Q and R S, but the rarefaction will be greatest at the middle of the column, for the very same reasons that the condensation is greatest at the middle of the column between R S and A B If, therefore, we represent the rarefaction by

(3)



negative ordinates, $a'a'$, $b'b'$, $c'c'$, &c (fig 3), the state of the column of air between A B and C D (and this is all which is modified by the passage of the piston from P Q to R S) will be represented by the double curve D b' S b B, the small part between P Q and R S being neglected as insensible There are thus two distinct waves or undulations caused by the motion of the piston the wave S B *before* the piston is called the *condensed wave*, and S D *behind* the piston is called the *rarefied wave* But some writers on acoustics consider both these [illegible] and therefore understand by the term wave the whole mass of particles between C D and A B (fig 1) which have been disturbed by the motion of the piston from P Q to R S

As every thin stratum of air in the tube, by reason of its elasticity communicates to the stratum before it the impulse which it has received from the one behind it, all the particles will successively be affected in the same manner, and at the end of a second interval, equal to that in which the piston has passed from P to Q the motion will be communicated over another space equal to R A, or the wave will have moved forward its whole length, retaining always the same form, and, supposing the piston to have in this second interval remained at rest at R S, all the particles in the space R A will have returned to their original state of quiescence

If, instead of supposing the piston to remain at rest at R S, we suppose it to be drawn back, in the second interval of time, to its original position at P Q then all the phenomena now described will be repeated in the reverse order, that is to say, the compressed wave will be to the left of the piston, and the rarefied wave to the right, and the state of the particles within the tube, with respect to their compression, as modified by the advance and subsequent retreat of the piston (the complete vibration), will be represented as under (fig 4)

(4)

We have now only to suppose this forward and backward motion of the piston to be performed with the same rapidity as the vibrations of an elastic plate or stretched cord and the phenomena now described will give an idea of the mode in which sound is transmitted through the atmosphere

From this illustration (imperfect as it is) of the nature of the motions communicated to the air by the vibrating body, it is easy to see that the particles of air in the tube do not change their places *inter se*, but acquire a vibratory motion, backwards and forwards, along the length of the tube It is also obvious that the vibrations of the air through which sound is transmitted must be precisely equal in number to those of the sounding body, and as soon as the vibrations cease those of the air cease likewise But so long as the body vibrates, or the reciprocal motion of the piston is continued with the same velocity, a continued musical sound will be heard, and this will be precisely the same at whatever part of the tube the ear is situated, all the waves being [illegible]

It is also evident that sound is propagated not only in straight lines like light but in every possible direction Air being equally elastic in all directions, each point of a sonorous wave may be regarded as a new centre, from which [illegible] on all sides A sound heard from the opposite side of a mountain is not conveyed through the mountain, but through the air in curved or crooked lines along secondary rays

Sounds differ from one another in three respects,— [illegible] The pitch, or tone, depends [illegible] or, which comes to the same thing, on the number of vibrations in a given time (for the velocity being constant, the length of the wave multiplied by the number of vibrations in a given time is constant) The gravest tone which the ear can distinguish corresponds to a wave of about thirty-two feet in length and the most acute to one of about half an inch Two sounds, however different in loudness or quality, are always in perfect unison when the undulations by which they are conveyed are precisely of the same length The intensity or loudness does not depend on the length of the wave, but on the degree of compression which the air receives, that is, on the violence of the impulses, or the length of the stroke of the piston in the above illustration The *quality* of sound (the *timbre* of the French authors) is less easily explained It probably depends on the greater or less abruptness of the impulses, or of the changes of velocity and density of the strata of air between the two extremities of the wave

Theoretical Determination of the Velocity of Sound — The investigation of the velocity of sound through the atmosphere (or any gaseous medium) is based upon this fundamental proposition of dynamics viz that the velocity of the pulses in an elastic medium is as the square root of the elasticity divided by the density of the medium Let v = [illegible] d = the density, and the proportion [illegible] $\sqrt{\ }$ [illegible] Make g = the measure of gravity [illegible] inches per second w = weight of the unit of volume of air, h = height of the homogeneous atmosphere (i e of a column of air of the same density throughout, and whose weight exercises on the base a pressure = e), we have then $e = h\,w$, $d = w - g$, and the above equation becomes $v = \sqrt{(g\,h)}$ But this is the velocity which a heavy body acquires by falling in vacuo from a height = $\frac{1}{2}\,h$, therefore, the velocity with which sound is propagated through the air is the same as that which a heavy body would acquire by falling [illegible] but from a theory wholly inapplicable The correct demonstration was first given by Lagrange

In order to convert this formula into numbers, it is necessary to determine h Let b = the standard height of mercury in the barometer, and m = the ratio of the density of mercury to the density of atmospheric air under the same pressure, then $h = m\,b$, and the velocity becomes $v = \sqrt{(g\,m\,b)}$ At the temperature of freezing water (32° Fahr), and under a barometric pressure of 29 927 inches, the value of m is found by experiment to be 10,466 But we have also g = 386 29 inches, whence at that temperature v = 10,998 inches, or 916 feet

[illegible] proportional to the square [illegible] by the density an alteration in the height of the barometer, while the temperature remains the same, will produce no change in the velocity, for an increase of pressure, and consequently of elasticity, is accompanied by a proportional increase of density An increase of temperature, however, by increasing the elasticity without changing the density, is accompanied by an augmentation of velocity The correction for a difference of temperature is found as follows Let t denote the number of degrees of temperature on Fahrenheit's scale above 32°, and a a constant coefficient, then the elasticity at [illegible] being e, the elasticity [illegible] $a\,t$) But the value of a is found by experiment = 00208, therefore the elasticity is $e\,(1 + 00208\,t)$, and the formula for the velocity becomes $v = \sqrt{g\,m\,b\,(1 + 00208\,t)}$, or, in- [illegible] $\sqrt{g\,m\,b} = 916\,(1 + 00104\,t)$

[illegible] at the freezing temperature, thus deduced from theory, falls short of the experimental velocity (which has been shown [illegible] by 173 feet, or about a sixth part of [illegible] This discrepancy was remarked by Newton, who attempted to account [illegible] by supposing the spherical molecules of air to be [illegible] through which sound is propagated instantaneously, but the true solution of the difficulty was reserved for Laplace The explanation given by Laplace [illegible] takes place in [illegible] heat, which the [illegible] tube, and modifies the law of the elasticity, and accelerates the velocity On substituting it is to calculation be found that the formula for the [illegible] must be multiplied by a certain factor, [illegible] the quotient which is found by dividing [illegible] expresses the specific heat of the air (or other gas) under a constant pressure by that which expresses its specific heat under a constant volume. Let k = this factor, then Laplace's formula for the velocity of sound is

$$v = \sqrt{g\,m\,b\,(1 + 00208\,t)\,k}$$

The value of k for atmospheric air, as determined by Dulong (*Ann*, vol II p [illegible]), is 1 421, hence $\sqrt{k}$ = 1 192, and the formula in numbers is

$$v = 916 \times 1\ 192\,(1 + 00104\,t) = 1092 + 1\ 14\,t,$$

which is almost identical with the experimental determination

Velocity of Sounds through Liquids and Solids — The

following general formula for the velocity with which sound is propagated through elastic compressible bodies whether liquid or solid, as found by Laplace — Let b denote (as before) the standard height of the barometer, D the density of mercury at the freezing temperature, d the density of the medium, and c the *compressibility* of the medium, that is, the diminution of bulk it sustains by an additional pressure equal to one atmosphere, then the formula is $v = \sqrt{\frac{g\,b\,D}{c\,d}}$, or, (since $g = 386.29$ inches, $b = 29.927$ inches, $D = 13.568$), $v = 396.04\ \sqrt{(1 \div c\,d)}$ inches, or $33\ \sqrt{(1 \div c\,d)}$ feet per second Applying this to the case of water, we have $c = .00049589$ (Herschel, *Ency Metrop*), and $d = 1$, whence $v = 4687$ feet per second This result agrees very nearly with the velocity determined by Colladon and Sturm by direct experiment on the propagation of sound through the lake of Geneva, [illegible] em being 1435 mètres [illegible] from the theoretical velocity only by 21 feet,—a space described by the aqueous pulse in the 200th part of a second

By the above formula the velocity of sound through any medium of which the compressibility is known is readily computed [illegible] Chladni the velocities of sounds in different [illegible] of air being taken as unity are as follows — Tin = 7½ silver = 9 copper = 12, iron = 17, glass = 17, baked clay = 10 12, woods of different kinds = 11-17 But the velocity of propagation through cast-iron tubes was determined experimentally by Biot, and found to be only about 10½ times its velocity in air (See *Herschel's Treatise on Sound*, Chladni *Traité d' Acoustique*, Biot *Traité de Physique*, Pouillet, *Elémens de Physique*, Lamé *Cours de Physique* &c)

SOUND In Geography, a strait or inlet of the sea, applied specially to the strait which connects the German Sea with the Baltic

SOUND BOARD A thin board placed over the head of a public speaker to strengthen or extend the sound of his voice

SOUTH One of the four cardinal points of the compass, the direction in which the sun always appears at noon to the inhabitants of the northern hemisphere [illegible]

SOUTHCOTTIANS In Religious History the followers of Joanna Southcott whose singular life and influence, although now nearly forgotten deserve to be kept in record as examples of the contagious effects of fanaticism She was born at Gittisham, in Devonshire in 1750, and seems to have first persuaded herself of her miraculous calling in 1792 From that time she was in the habit of publishing pamphlets in an enthusiastic strain, travelled the west of England preaching and prophesying, with a select body of followers and gradually collected about her a considerable number of disciples She came to town about 1803, when she announced a meeting which [illegible] for the purpose of [illegible] her mission Several [illegible] 1804, and many persons [illegible] attested their belief in her pretensions [illegible] came the founder of a church, which had a chapel in Duke's Place, where service was performed by a Mr Tozer a Dissenting clergyman of Exeter, who followed her to London At last she announced her supernatural pregnancy and this strange announcement took great hold [illegible] in consequence of Dr Reece and four [illegible] having declared their belief that she was actually pregnant in her 65th year The excitement produced in London, in the summer of 1814 by the whole affair, was to be paralleled only by that which other delusions as absurd and impious have at different times occasioned Her death in December of that year, did not undeceive her disciples even when her body was opened, four days after it, and no trace discovered to verify her assertions, many of them continued to proclaim their belief in her future reappearance Her sect continued to exist for many years, nor are we aware that it is yet extinct Many of its followers wore [illegible] and a peculiar costume

SOVEREIGN In Politics, a person, or body of persons, [illegible] rests in every state As [illegible] jurisdiction of that person or body within the limits of the state is absolute and uncontrolled by any foreign authority The states which composed the German empire were termed, in the language of politics, "mi-souverains," because their sovereignty was qualified by their subordination in some respects to the imperial authority The same term should seem applicable to the several states in the American Union which are [illegible] termed sovereign, as on some of the subjects [illegible] power of their legislatures [illegible] subordinate to that [illegible] congress of the sovereign body [illegible]

SOVEREIGN An English coin of the value of twenty shillings, the standard weight of which is 5 pennyweights and 3·27 grains, [illegible]

SOWING [illegible]

of producing plants The operation of sowing is generally performed in spring in order that the plants may have the advantage of the coming summer The seed is [illegible] a sowing machine Some seeds which are of large size are planted singly The covering of seeds is greater or less, according to their size and the texture of the soil Where the soil is somewhat firm, and the seed is pressed into it by a roller or by other means, and where the climate is moist, very little covering is necessary, but where the soil is loose, and the climate dry and warm, the covering should be twice or thrice the thickness of seeds As the seeds of plants are the natural food of birds, insects, and vermin, in a state of culture artificial protection is required from their natural enemies

SOWING MACHINE A machine for depositing seeds in the soil, either equally over its surface or in rows The simplest machine, and perhaps the most efficient for sowing seeds broadcast, is a hollow cylinder pierced with holes about the average size of the seed to be sown This will deposit them at a greater or lesser distance asunder, according to the velocity with which it is turned round Machines for sowing seeds in rows are termed drills *See* DRILLS

SPA A place celebrated for its mineral waters, situate about seven leagues from Aix-la-Chapelle The term is now generally applied to places at which there are mineral springs

SPACE (Lat *spatium*), signifies generally extension in all directions Sometimes it has a less general signification, thus Euclid says two straight lines cannot inclose a space, that is an area

SPACE In Music the void between the lines in a musical staff The spaces are four in number, and the lines five

SPADIX A form of inflorescence in which the flowers are [illegible] and a fleshy rachis, and enclosed within a kind of [illegible] called a spathe, as in palms and araceous plants

SPAHI'S or SIPAHIS A part of the Turkish cavalry were so called The word has the same derivation with *Sepoy*

SPAN, in ordinary language signifies a measure taken from the space between the thumb and the middle finger both being extended In Architecture and Engineering it is applied to the extent or spread of an arch between its piers or abutments

SPANDREL (It *spandere*, *to spread*) In Architecture the space about the flanks or haunches of an arch or vault above the intrados, and not higher than its crown

SPANKER or DRIVER The name of the gaff sail set on the mizzen mast of a ship

SPANNER An iron instrument used in the manner of a lever to tighten the nuts upon screws There is usually a notch at either end of the spanner, to suit nuts and screw-heads of different sizes

SPAR (Germ spath) A mineralogical term applied to certain crystallized substances which easily break into cubic or prismatic or other fragments, with polished surfaces, hence also the term *spathose*, applied generally to minerals of a sparry fracture

SPAR, FLUOR, or DERBYSHIRE Fluoride of calcium *See* FLUOR SPAR

SPAR, HEAVY Sulphate of baryta *See* BARYTA

SPAR ICELAND Rhomboidal carbonate of lime

SPAROIDS *Sparoides* The name of a tribe of Acanthopterygian fishes, of which the genus *Sparus* is the type The palate is edentulous, but the jaws are generally well armed with teeth sometimes these are all [illegible] In some species, the anterior teeth are shaped according to the [illegible] posterior ones are grinders, in others [illegible] resemble the human incisors The genera of sparoid fishes are chiefly founded on these distinctions

SPARROW-HAWK The name of the *Falco nisus* of Linnæus, *Accipiter fringillarius* of Ray, which latter name is retained in modern ornithology for the subgeneric denomination of this small Raptorial bird

SPARS In Architecture, a term used in the provinces to denote the common rafters of a roof, as distinguished from the principal rafters

SPASM [illegible]

SPATANGUS [illegible] The name of a genus of *Echinidæ*, or sea-urchins, having the mouth situated laterally, and but four rows of pores

SPATHE In Botany, a large and coloured bracten situated at the base of a spadix, enclosing the latter, and supposed to perform the office of corolla

SPATULATE (Lat spathulum, *a broad knife to spread salve with*) In Zoology, when a substance or part of an animal is flattened, and broader and rounder at the apex, narrow at the base

SPEA'KER The presiding officer in each house of parliament is termed The Lord chancellor keeper of the great seal, or other person, holding the king's commission to act as speaker of the House of Lords and if there be no such, it is said the House may elect He can speak and vote on any question The speaker of [illegible] Formerly, [illegible] *Parliaments*, [illegible] under the [illegible] The speaker [illegible] The speaker cannot speak or vote except in a committee, when he is out of the chair, or in case of an equality of voices, when [illegible] out new writs for the election of members when seats are vacant This power he exercised only by virtue of orders of the House of Commons, until the passing of the stat 10 G 3 c 41, by which he was enabled to issue the [illegible] a recess *See* PARLIAMENT

SPEAKING TRUMPET *See* TRUMPET

SPE'CIALTY In Law any instrument in writing under seal Specialty creditors are those who have their debts secured to them by deed, in opposition to creditors on simple contract The advantages of the former security are, that it has priority in the distribution of assets, and that specialty debts in general are not presumed satisfied until after the lapse of twenty years whereas simple contract debts are barred in six by the Statute of Limitations

SPECIE A term used for gold and silver coin, in contradistinction to *paper money*

SPE'CIES (Lat) In Logic, a predicable which is considered as expressing the whole essence of the individuals of which it is affirmed The essence of an individual is said to consist of two parts 1 The material part or genus, 2 The formal or distinctive part or difference The genus and difference [illegible] up in logical language, the species *e g* [illegible] is compounded of the genus "animal," and the difference having two legs" It is obvious that the names *species* and *genus* are merely relative and that the same common terms may in one case, be the species which is predicated of an individual, and in another case the individual of which a species is predicated *e g* the individual, Cæsar belongs to the species man, but man, again, may be said to belong to the species animal, &c, as we contemplate higher and more comprehensive terms A species in short when predicated of individuals, stands in the same relation to them as the genus to the species and when predicated of other lower species it is then in respect of these, a genus, while it is a species in respect of a higher genus [illegible]

[illegible] genus, the lowest of all, which can be predicated of nothing, the "infima species" The difference which, together with the genus, makes up the species, is termed the "specific difference" *See* PREDICABLE LOGIC

SPECIFIC In Medicine, this term is applied to remedies the effects of which upon particular diseases are little liable to fallacy and uncertainty, hence cinchona is called a specific in certain forms of intermittent fever, and mercury in syphylis, &c A *specific character* is that which peculiarly and certainly distinguishes one [illegible] another

SPECIFIC GRAVITY *See* GRAVITY

SPE'CTACLES An optical instrument, consisting of two lenses set in a frame, for assisting or correcting the defects of imperfect vision The lenses are convex or concave, according to the nature of the defect to be remedied In old age the pupil of the eye becomes flat, and the rays of light are consequently not refracted sufficiently in passing through it to meet on the retina and produce distinct vision This defect is remedied by a convex lens, which produces a slight convergency of the rays before they enter the eye Short-sighted people, on the contrary, require concave lenses, because, in their case, the indistinctness of vision proceeds from too great a curvature of the pupil which causes the rays to meet in a point before they reach the retina —a defect which is remedied by giving the rays a slight divergency before they enter the eye

Spectacles appear to have been first used about the latter end of the 13th century, but the date and author of the invention are not certainly known and have been much disputed It seems most probable that the first hint of their construction and use was taken either from the writings of Alhazen, who lived in the 12th century, or of Roger Bacon who died about 1292 A passage in the *Opus Majus* of the latter renders it certain, at least, that he was acquainted with the use of crystalline lenses in magnifying minute or distant objects (See *Smith's* [illegible] "Works" art 85—90)

SPECTRA *Spectra* A name given by Stoll and

Latreille to Orthopterous insects, comprehending a linear and attenuated body, like the ghost of an insect

SPECTRUM (Lat *spectrum*, *image*) In Optics, the name given to an elongated image of the sun or other luminous body, formed on a wall or screen by a beam of undecomposed light received through a small hole, and refracted by a prism [illegible] different colours and fixed in [illegible] the solar spectrum see CHROMATICS, and for the refrangibility of the different rays REFRACTION

SPE'CULUM (Lat speculum, *a mirror*) In Optics, the term *speculum* is usually appropriated to reflectors formed of polished metal, while the term [illegible] to signify a reflector of glass For the [illegible] and laws of reflexion of spherical specula, see REFLEXION, and for a description of the method of casting and polishing the specula for reflecting telescopes see Sir W Herschel's Description of his Telescope in the *Phil Trans* for 1795, Brewster's edition of *Ferguson's Lectures*, and Lord Oxmantown's Account of Experiments on the Reflecting Telescope, in the *Phil Trans.* for 1840

SPE'CULUM METAL, with which mirrors for reflecting telescopes are made, is an alloy of two parts of copper and one of tin, its whiteness is improved by the addition of a little arsenic

SPELL (Ang Sax spel, *story* or *tale*) Any form of words written or spoken, supposed to be endowed with magical virtues This superstition seems common to every race of man, but it was more peculiarly prevalent among the ancients The lines of Horace—

> Sunt verba et voces, quibus hunc lenire dolorem
> Possis, &c —

probably refer to the belief in the efficacy of magical words in alleviating pain and disease There is an amusing article upon this subject in the *Encyclopædia Metropolitana*

SPELTER The commercial term for zinc

SPERMACETI This substance concretes or crystallizes spontaneously out of the oil of the spermaceti whale It is purified first by pressure, then by fusion and boiling with a weak alkaline ley When melted in masses it concretes in crystalline plates of a silvery lustre and unctuous feel It fuses at about 100° It dissolves in boiling alcohol, and as the solution cools it separates in brilliant scales, to which Chevreul has given the name of *cetine*

SPERMIDIUM (Gr σπερμα *a seed*) A kind of small seed vessel, resembling a seed, and more commonly called an *akenium*

SPHACELUS *See* GANGRENE

SPHÆRISTERIUM (Gr σφαιρα *a sphere or ball*) In ancient Architecture, a circular court for playing tennis, or other exercises *See* BALL

SPHENE Native silico-calcareous oxide of titanium

SPHENOID BONE (Gr σφην, *a wedge*) One of the bones of the head, so called from its being wedged in as it were amongst the other bones It is of a most irregular shape and very complicated in its processes and connections with the other bones When removed, it is something of the figure of a bat with its wings extended It is connected with all the bones of the skull and with those of the palate, cheeks, and upper jaw

SPHERE (Gr σφαιρα) In Geometry a solid body described by the revolution of a semicircle about its diameter, or it may be defined to be a body bounded by a surface of which every point is equally distant from a single point within the surface called the centre of the sphere It is [illegible] denote the radius of the sphere, and x, y, z the rectangular co ordinates, the origin being at the centre the equation of the surface is $x^2 + y^2 + z^2 = r^2$

The following are some of the principal properties of the sphere —1 The surface of the sphere is equal to [illegible] of a [illegible] 2 The curve surface of any zone, or portion contained between two parallel planes is equal to the curve surface of a cylinder of the same height with the height of the zone, or the distance between the planes and of the same diameter with the sphere Hence it follows that the whole surface of the sphere is equal to the curve surface of the circumscribing cylinder 3 The solid content of a sphere is equal to that of a pyramid whose altitude is the radius, and whose base is equal [illegible] and hence the content of the [illegible] duct of its radius into its surface 4 The sphere is equal to two thirds of [illegible]

Let s denote [illegible] its superficies, c its solid content, and π the ratio of the semicircumference to the radius = 3 14159, then [illegible] area of a circle of which r is the radius is πr^2 The [illegible] spheres above stated give the relations which follow, viz

$$\text{Surface} = s = 4\pi r^2 = 12\ 56637 \times r^2,$$
$$\text{Content} = c = \tfrac{4}{3} r s = \tfrac{4}{3} \pi r^3 = 4\ 18859 \times r^3.$$

If we suppose the diameter = 1, and consequently $r = \frac{1}{2}$, these relations become $s = \pi$, $c = \frac{1}{2}\pi$

SPHERE In Astronomy, the concave expanse of the h[illegible] which having [illegible] to the [illegible] spheres to the [illegible] wh[illegible] sphere [illegible] the earth which is placed at the centre The ancients gave the name of sphere to the orbits of the several heavenly bodies, thus the sphere of Jupiter, the sphere of Saturn, the sphere of the fixed stars In the Ptolemaic astronomy, the different spheres were supposed to be solid and transparent moving about their common centre independently of each other, and each carrying its appropriate body along with it

SPHERE, in Geography, denotes a representation of the earth on the surface of a globe, which has also represented on it an assemblage of circles [illegible] the positions of the equator, ecliptic, [illegible], &c The ancients gave different appellations to the sphere, according to the inclination of the earth's axis to the horizon When the poles are in the horizon, it was called a *right sphere*, when the poles are in the zenith and nadir a *parallel sphere*, and in every other position, an *oblique sphere*

SPHE'RICAL Relating to a sphere Thus, a *spherical angle* is an angle formed on the surface of a sphere by the intersection of two great circles, or circles whose planes pass through the centre, and a *spherical triangle* is a triangle formed by the intersecting arcs of three such circles For the properties of spherical triangles, see TRIGONOMETRY

SPHE'RICAL EXCESS, in Trigonometry, is the sum by which the three angles of any triangle on the surface of a sphere or spheroid exceeds two right angles Let the three angles of a spherical triangle be denoted respectively by A, B C and let E represent the spherical excess, then by the above definition $E = A + B + C - 180^\circ$ Now, in any spherical triangle the sum of the three angles is always greater than two and less than six right angles, consequently E may have any value not exceeding four right angles

In Geodesy the angles of each triangle are determined by instrumental measurement, and are consequently subject to the errors of observation But in order to compute the sides of the triangle with the requisite accuracy, it is necessary that the amount of the error in the sum of the three angles be known, and it is therefore necessary to determine the spherical excess independently of extreme precision in the values of the angles Let S denote the area of the triangle r the radius of the sphere, and π the ratio of the circumference to the diameter (= 3 14159), then, by trigonometry,

$$S = \frac{A + B + C - 180^\circ}{180^\circ} \times r^2 \pi,$$

whence, since $E = A + B + C - 180^\circ$ we have

$E = \frac{S \times 180^\circ}{r^2 \pi}$ in degrees, or $E = \frac{S \times 648000''}{r^2 \pi}$, expressed in seconds In any triangle that can be measured on the surface of the earth S is very small in comparison of r^2 and E is therefore a very small quantity seldom amounting to more than five or six seconds (though in some of the large triangles of the British survey where the sides were nearly 100 miles in length, it amounted to upwards of 30″), and therefore an approximate knowledge of the value of S, and of the radius r within the limits of any probable error, will suffice to give E correct to the 100th part of a second Hence, for computing the value of E, the triangle may be considered a plane one and the value of S computed from approximate values of two of its sides and the included angle If, therefore, a and b denote the number of feet [illegible] A and B respectively, we [illegible] $\frac{a\,b}{\quad}$, if we also assume $m = 648000 - 2r^2\pi$ (where r is expressed in feet), the logarithm of E in seconds will be found from this formula,

$$\log E = \log a + \log b + \log \sin C + \log m$$

For the middle of England, the radius of an arc intersecting the meridian at an angle of 45° is 20,941 000 feet, nearly Assuming this to be the value of r, then $\log m = 9\ 62860$

SPHE'RICS In [illegible] properties of the sphere [illegible] body, and, in particular, of [illegible] on its surface See TRIGONOMETRY

SPHE'ROID (Gr [illegible] and [illegible] form) In Geometry, a solid generated by [illegible] about one of its axes If the generating figure be revolved about its major axis the [illegible] if about its minor axis, the [illegible]

Let 2 be the axis of revolution [illegible] and 2 b the diameter of the [illegible] perpendicular to the axis then the origin of the co-ordinates being at the centre and x being taken on the semi-axis a, the equation of the surface of the spheroid is

$$\frac{x^2}{a^2} + \frac{y^2 + z^2}{b^2} = 1$$

Let k^2 denote the ratio of the difference of the squares of a and b to the square of a, that is, make $a^2 k^2 = a^2 - b^2$, and put $\pi = 3\ 14159$ then the whole surface S of the spheroid is expressed by the following series, in which the upper signs are to be used if the spheroid is oblong (that is if a is greater than b), and the under signs if the spheroid is oblate viz

$$S = \pi a b \left(1 \mp \frac{1}{2\ 3} k - \frac{1}{2\ 4\ 5} k^2 \mp \frac{3}{2\ 4\ 6\ 7} k^3 - \&c\right)$$

The solid content of any spheroid, whether oblate or oblong, is equal to two thirds of its circumscribing cylinder, and is therefore equal to $\frac{4}{3}\pi a b^2$ And since the content of a sphere, of which the radius is equal to a, is $\frac{4}{3}\pi a^3$, it follows that the content of the spheroid is to the content of a sphere whose diameter is equal to the axis of revolution as b^2 a^2

The oblate spheroid being the figure assumed by the earth and the other planets its properties are of great importance in astronomy and geodesy Newton demonstrated that the attraction of a sphere on any exterior body is the same as if all the matter in the sphere were collected into a point at the centre, but this property does not hold true of spheroids, and the calculation of the effects of attraction is thereby rendered greatly more difficult See GRAVITATION

In geodetical operations it is necessary to have regard to the curvature of the spheroidal surface of the earth [illegible] the elements of the spheroid (that is, the polar and equatorial axes to be known the curvature of the surface at any place of which the latitude is given is determined by the [illegible]

Let a be half the [illegible] is b [illegible] the equator, e the ellipticity, or a number such that $b = a(1 + e)$ (*see* ELLIPTICITY) and l the given latitude Also, let r be the radius of curvature in the direction of the meridian, r' the radius of curvature in the direction perpendicular to the meridian and R the radius of curvature of a normal section, making with the meridian an angle = θ, then

$$r = a(1 - e + 3e \sin^2 l) \qquad (1)$$

$$r' = a(1 + e + e \sin^2 l) \qquad (2)$$

$$R = \frac{r\,r'}{r \sin^2\theta + r' \cos^2\theta} \qquad (3)$$

Dividing the numerator and denominator of this last expression by r', substituting $1 - \sin^2\theta$ for $\cos^2\theta$, and converting the result into a series, of which it is sufficient to retain only the two first terms, we obtain the following, which is more convenient for calculation,

$$R = r\left(1 + \frac{r' - r}{r'} \sin^2\theta\right)$$

SPHEROMETER (Gr σφαιρα, and μετρον, *measure*) In Physics, an instrument [illegible] great precision the thickness of [illegible] ture of optical glasses, &c

SPHE'RULITE A term applied by some mineralogists to a variety of obsidian or pearlstone, which occ[illegible]

(Gr σφιγμος, *the pulse*) An [illegible] pulsations

SPHINCTER (Gr σφιγγω *I close*) A term applied by anatomists to several muscles which close or contract the orifices which they surround

SPHINX A fabled monster, half woman and half lion said by the Grecian poets to have infested the city of Thebes devouring its inhabitants till such time as a riddle it had proposed to them should be solved This was done by Œdipus, who slew the sphinx, and was by the gratitude of the Thebans chosen their king The Grecian sphinx was probably borrowed from Egypt, where the enormous figure, now half buried in the sand, was probably the archetype of the more elegant monster of Greece This figure is close to the Pyramids of Ghizeh and was disinterred by the late Mr Belzoni, but has been again nearly covered It has been said (on the authority of Pliny) that the sphinx represented the Nile in a state of flood, that event regularly occurring under the signs of the Virgin and Lion But others contend that the original Egyptian sphinx was male (Androsphinx), like the specimen described by Herodotus, book ii (*Wilkinson's Manners and Customs of the Ancient Egyptians*) B[illegible] greater part of [illegible] of Luxor (1500 in a single avenue) are said to be female (*Libr of Entertaining Knowledge*) Sphinxes are also represented with the heads of rams and hawks (Criosphinx, Hieraco-sphinx) The Egyptian sphinx had wings, these appendages were added by the Greek artists

SPHRAGI'STICS (Gr σφραγις, *a seal*) The science of seals, their history, peculiarities, and distinctions, especially with a view to the means which they afford of ascertaining the age and genuineness of documents to which they are affixed Ancient seals were chiefly impressed on common wax of different colours, [illegible] This [illegible] who

published a work on the subject in 1709 Gercken's treatise, styled *Anmerkungen über die Siegel zum Nutzen der Diplomatik* (Augsburg, 1781), will be found a

[illegible] (It *divided*) In Music, a term indicating that every note is to have its distinct sound When used in relation to instruments played with a bow, it is to be understood that every note is to have a bow distinct from the preceding or succeeding one

SPI'DER *See* ARACHNIDÆ

SPIKE In Botany, a form of inflorescence in which all the flowers are sessile along a common axis, as in *Plantago*

SPI'NDLE In Geometry a solid generated by the revolution of a curve line about its base or double ordinate The solid generated by the revolution of a curve about its axis is called a *conoid* In Mechanics, *spindle* denotes the axis of a wheel or roller

SPINE *See* VERTEBRÆ

SPINEL'L (Fr spinelle) A subspecies of the ruby It is of various colours, such as red, brown yellow, and sometimes blue, its colouring matter is sometimes oxide of chromium, but generally oxide of iron It usually contains from 80 to 84 per cent of alumina, and from 8 to 10 of magnesia

SPINELLANE A term applied by some mineralogists to a dodecaedral variety of zeolite of a blueish or brownish colour, found near Andernach on the Rhine Its essential components are silica alumina and soda

SPINES Branches that, being imperfectly formed, lose their power of extension, become unusually hard, and acquire a sharp point They are very different from aculei, or prickles, which are a kind of hardened hair In leaves, they are processes formed either by an elongation of the woody tissue of the veins, or by a contraction of the parenchyma In the former case they project beyond the surface or margin of the leaf as in the holly, in the latter case, they are the veins themselves become indurated, as in the palmated spines of *Berberis vulgaris*

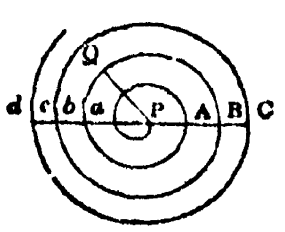
SPINE'T A musical stringed instrument with a key-board &c, similar in construction to a harpsichord, from which, indeed, it little differs, except in being much smaller Its general form is that of the harp, and it was originally called the *couched harp*

SPINNERS or SPINNERETS In Entomology, organs with which insects form their silk or webs In spiders they consist of two retractile pieces issuing from anal protuberances and giving out the threads

SPINNING *See* COTTON MANUFACTURE

SPINNING JENNY *See* COTTON MANUFACTURE

SPINO'ZISM In Philosophy, the system of Benedict Spinoza a Jew of Amsterdam, born in 1634, which is developed in his work on ethics In it he deduces by strictly mathematical reasoning from a few axioms the well known principles that 'there can be no substance but God, whatever is is in God and nothing can be conceived without God" Hence his scheme is called with justice Pantheistic In fact as Mr Hallam observes, 'he does not essentially differ from the Pantheists of old He conceived, as they had done that the infinity of God required the exclusion of all other substance, that he was infinite *ab omni parte*, and not only in certain senses" 'It was one great error of Spinoza" says the same writer, "to entertain too arrogant a notion of the human faculties, in which by dint of his own subtle demonstrations he pretended to show a capacity of adequately comprehending the nature of what he denominated God And this was accompanied by a rigid dogmatism, no one proposition being stated with hesitation, by a disregard of experience, at least as the basis of reasoning, and by a uniform preference of the synthetic mode" [illegible] p 243 &c, and see *Bucke* [illegible] *Stewart's Introduction to* [illegible] *Britannica*)



SPINTHERE A mineral of a greenish grey colour, found in the department of the Isere in France

SPI'RACLES, or SPIRACULA (Lat spiro, *I breathe*) In Entomology, the breathing pores of insects are so called

SPIRAL In Geometry, the name given to a class of curves distinguished by this general property, that they continually recede from a centre or pole, while they continue to revolve about it Spirals receive different names from the properties by which they are characterized, or

[illegible]

may be supposed to be generated as follows —If a straight line P A B C turn uniformly about its extremity P, a point in the straight line which advances from P with a uniform motion and arrives successively at *a*, A, *b*, B, *c*, C, *d*, will describe the spiral The point P is called the pole, and the portion of the revolving line intercepted between the pole and any point of the curve is the radiant [illegible] Let Q be any point in the spiral the line P Q = *u* drawn to the pole is the radiant vector and the angle P A Q = θ described by the revolving line while the describing point advances from P to Q, then, since from the definition the radiant *u* and the angle θ are both proportional to the time they are proportional to each other, and the polar equation of the equable spiral is $u = a\theta$, where *a* is a constant If [illegible] when the revolving line has made a [illegible], or when $\theta = 2\pi$, then $a = r - 2\pi$, and the equation becomes $u = \frac{r}{2\pi}\theta$

Some of the principal properties of this spiral are the following —1 The area of the spiral P *a A b* Q is equal to $\frac{u^3}{6a} = \frac{\pi u^3}{3r}$ If $u = r$, this becomes $\frac{1}{3}\pi r^2$, or the area generated while the revolving line makes one revolution is equal to a [illegible] whose radius is *r* If $u = 2r$, the expression for the area becomes $\frac{2}{3}\pi(2r)^2$, and the spiral area is therefore the third part of a space that is double of a circle described with a radius $= 2r$ And generally the whole area generated by the radiant, from the beginning of the motion till after any number of revolutions, is equal to the third part of a

[illegible]

lutions is of unit 2 The arc of the spiral between its origin and the radiant *u* is equal to that of a parabola whose *latus rectum* is 2 *a* included between the vertex and an ordinate $= u$, and the corresponding area of the spiral is equal to one half the corresponding area of the parabola 3 The subtangent to any point Q of the spiral is equal to the arc of a circle described by the radiant P Q, and hence at the termination of the first, second, third fourth, &c revolutions, the corresponding subtangents are as the series of square numbers, 1, 4, 9, 16, &c, for the second, third, fourth, &c the subtangents are equal to 2 3 4, &c circumferences, whose radii are at the same time doubled tripled, quadrupled &c

The equable spiral was proposed by Conon to Archimedes who in his treatise Περὶ Ἑλίκων, has investigated its quadrature and some of its chief properties

The *hyperbolic spiral* belongs to a class of spirals of which the general equation is $u = a\theta^{-n}$ If we suppose $n = 1$, we have $u = a\theta^{-1}$, or $u\theta = a$, which is the equation of the hyperbolic spiral, and from which it follows that if from a point in a straight line, given by position arcs be described of a given length and having each one extremity in the given straight line the locus of their other extremities will be in the spiral

This curve was proposed by James Bernoulli, and has been called the hyperbolic spiral from the analogy between its polar equation and the equation to rectangular co ordinates of the common hyperbola, when referred to its asymptotes, namely, $x y = A$, a constant area

[illegible] *spiral* differs from the equable spiral in [illegible] the point which describes the curve, instead of advancing equably along the uniformly revolving straight line, is carried along it with a velocity increasing in proportion to the distance from the centre This curve which was noticed by Des Cartes, has many remarkable properties, of which the more abstruse were investigated by James Bernoulli *See* LOGARITHMIC SPIRAL

For the investigation of the properties of spirals, see *Leslie's Geometrical Analysis*, *Peacock's Examples of the Differential and Integral Calculus*, *Maclaurin's Fluxions*, &c

SPI'RAL VESSELS, in Plants, are membranous tubes with conical extremities, lined in the inside by a fibre twisted spirally, and capable of unrolling with elasticity, their function is that of the conveyance of air They are found in almost any part of plants except the bark, but are most abundant in leaves and flowers, and least common in the stem and root, except in the medullary sheath of the former

SPIRE (Gr σπεῖρα, *a twisting*) In Architecture, among the ancients, the base of a column also the astragal or torus of the base In modern architecture, it is an erection above the tower of a church, which diminishes gradually as it rises, sometimes rising in the form of a plain slender pyramid, polygonal on the plane

SPI'RIFER The name of a genus of extinct Palliobranchiate mollusks, characterized by the shell having two internal calcareous spiral appendages

SPI'RIT OF WINE *See* ALCOHOL and FERMENTATION

SPI'RITO, SPIRITO'SO (It *spirit, with spirit*) in Music, denotes, when affixed to a movement, that it is to be

[illegible]

lation, as brandy, rum, geneva, whisky, &c, are comprised under this designation The manufacture of spirits is placed under the surveillance of the excise, and a very large revenue is obtained from it Ordinary spirits con-

tain from 50 to 52 per cent of alcohol, spirits of wine, from 62 to 67 per cent., rectified spirits from 82 to 85 per cent. spirit proof By the expression that a spirit is any number, say ten, over proof, is meant that 100 gallons of the spirit would bear the addition of ten gallons of water to reduce it to proof strength, or it would form 110 gallons of proof spirit, *i e* spirit of density 0 918653 The term ten under proof, means that ten gallons of water must be taken from [illegible] of the spirit to raise it to proof, or that [illegible] contain only 90 gallons of proof spirit. The total number of proof gallons distilled in the year ending Jan 1851 was 25,844,887, of which 5,913,424 gallons were distilled in England 11,638,429 in Scotland, and 8,293,034 in Ireland The amount of gallons on which duty was paid for consumption, was 23,862,585 The higher duty of 7*s* 10*d* per gallon has to be paid on the transfer, the duty in Scotland is 5*s* 8*d* per gallon, in Ireland 2*s* 8*d* per gallon

Table of the Foreign and Colonial Spirits imported, exported and retained for Home Consumption in the Year ending Jan 5 1851

United Kingdom	Imported	Retained for Home Consumption	Exports
	Proof Galls	*Proof Galls*	*Proof Galls*
Rum - -	1 190 000	2 900 000	1,187,000
Brandy - -	3,237,000	1,860 000	876 000
Geneva -	337,000	45,000	280 000
Other spirits - -	381,000	12 000	11 600
Total -	8 145,000	4,800 000	2,160 600

SPIRIT LEVEL A glass tube nearly filled with spirit of wine, and hermetically sealed at both ends The exact horizontal position of its axis is ascertained by the air-bubble being at equal distances from the middle point in the length of the tube The level is used for determining the relative heights of ground at two and more stations

SPIRITUALISM [illegible] Materialism That [illegible] soul, or self, that which is called the external world being either a succession of notions impressed on the mind by the Deity or else the mere product of the mind itself The first is the spiritualism of Berkeley, the second, which may be called pure egoism that of Fichte

SPIRULIDÆ The name of a family of Dibranchiate Cephalopods, of which the genus *Spirula* is the type They are chiefly characterized by having a spiral discoid chambered shell developed in the substance of the mantle instead of a calcareous or horny plate

SPLANCHNO'LOGY (Gr σπλαγχνον, *an entrail* and λογος *a discourse*) The doctrine of the viscera

SPLAYED (*Displayed, spread out*) In Architecture, a term used to denote an angle which is cut off, or oblique

SPLEEN A spongy viscus, of an oval form the use of which is unknown, placed in the human subject in the left hypochondrium, between the eleventh and twelfth false ribs *Spleen* is also used for a species of hypochondriasis to which the English are said to be particularly open

SPLENI'TIS Inflammation of the spleen

SPLE'NIUS A flat muscle situated between the back of the ear and the lower and posterior part of the neck

SPLENT COAL An inferior kind of cannel coal from the Scotch collieries

SPLICE In Naval language, to join the end of a rope with the end or bight of another, by untwisting the strands of both and laying them up again involved

To *splice the main brace* a term applied to an extra allowance of spirits in cases of cold or wet

SPLINT A piece of wood or pasteboard, so shaped as to support a broken or debilitated limb

SPLINTERY That fracture of minerals which is nearly even, but exhibits small splinters or scales thicker at one extremity than the other, and adhering by their thicker ends to the broken surface

SPODUMENE A mineral found in laminated masses, hard, brittle, translucent, and of various shades of green or grey It was first discovered at Utoe, in Sweden It consists of silica and alumina, with 8 to 10 per cent of lithia Before the blowpipe, it exfoliates into little scales of an ash colour hence its name, from σπόδιος *[illegible]*

SPOLIATION, WRIT OF [illegible] obtained by one of the parties to a suit in the ecclesiastical courts suggesting that his adversary has wasted the fruits of a benefice, or received them to his prejudice The suit founded on this writ lies for one incumbent against another, where they both claim by one patron, and the right of [illegible]

SPO'NDEE (Gr [illegible] In Greek and Latin Poetry, the [illegible] two long syllables It was so called because it was originally employed in the hymns sung in honour of the gods during the offering up of a sacrifice, for which it was admirably fitted from its grave structure *Spondaic verse* is an hexameter line, in which the two last feet are spondees; instead of the usual termination, a dactylus and a spondee

SPO'NDYLUS (Lat spondylus, *a spindle* or *shell fish*) The name of a Linnæan genus of the Vermes Testacea comprehending the spring oysters, characterized by having a strong tooth on each side of the depression lodging the elastic ligament [illegible] hinge of the shell The genus is included [illegible] Ostracea immediately of the Acephalous Testacea by Cuvier, and has been subdivided by Lamarck into the genera *Spondylus* proper and *Plicatula* Some of the species of *Spondylus*, as the water-clam (*Sp varius*), form a series of chambers by secreting successive layers of calcareous shell at a distance from each other, the last chamber containing a quantity of fluid, which escapes by very slow evaporation through the pores of the calcareous shell

SPONGE (Fr eponge, Germ schwamm), is a cellular fibrous tissue produced by small animals, almost imperceptible, called Polypi by naturalists, which live in the sea This tissue is said to be covered in its recent state with a kind of semifluid thin coat of animal jelly, susceptible of a slight contraction or trembling on being touched, which is the only symptom of vitality displayed by the sponge After death this jelly disappears and leaves merely the sponge, formed by the combination of a multitude of small capillary tubes, capable of [illegible] thereby [illegible] the bottom of the sea, and abound particularly upon the shores of the islands in the Grecian Archipelago [illegible] analogous in their origin to coral sponges are [illegible] in their nature, the former being composed almost entirely of carbonate of lime, while the latter are formed of the same elements as animal matters, and afford on distillation a considerable quantity of ammonia

Dilute sulphuric acid has been recommended for bleaching sponges after the calcareous impurities have been removed by muriatic acid Chlorine water answers better

The sponges of commerce are usually prepared before they come to the market, by being beaten and soaked in dilute muriatic acid with a view to bleach them and to dissolve any adherent portions of carbonate of lime Three kinds are found commonly in the market, and known as the Turkey the variety of the same, which is very rare, and the West Indian On exa[illegible] sponge of commerce with a power of [illegible] the fleshy matter will be distinctly observed having in its interior gemmæ which are considered to [illegible] are occasionally given off from the [illegible] the mass of sponge consists of [illegible] or fibres various in size The spiculæ are not found within these, but in the large and flattened fibres, and varying in number from one to three or more, imbedded in their substance Sometimes one spiculum projects a half or more from the side of the fibre, and is then only covered with the animal matter at the base, or half way up The fibres of the West Indian species of sponge have been clearly proved to be solid In the rare variety of [illegible] which ants [illegible] such in size, and not imbedded in horny fibre but in a separate sheath This true vascular tissue performs very important functions in the economy of the animal during life In some of the tubes of sponge [illegible] the largest of which [illegible] the smallest the 50,000th of an inch They were accidentally perceived to move from right to left (See a Paper read by Mr Bowerbank at a meeting of the Microscopical Society in 1841)

SPONGE TENT, is formed by dipping sponge into hot melted wax plaister, and pressing it till cold between two iron plates it is then cut into pieces, and used for dilating wounds

SPO'NGIÆ The name of a class of aquatic Zoophites composed of the different genera and species of sponge

SPO'NGIOLE In Botany, the lax cellular tissue and mucus situated at the extremities of roots, having the property of absorbing fluid like a sponge, whence the name

SPO'NSIONS In International Law, acts and engagements made on behalf of states by agents not specially authorized, or [illegible] the authority under which they [illegible] to be made [illegible] so called by writers on this branch of jurisprudence Such conventions must be confirmed by express or tacit ratification, the latter of which is implied from the fact of acting under it as if bound by its stipulations, but mere silence is not, in general held equivalent to ratification Such are the official acts of [illegible] generals suspending or limiting hostilities, [illegible] surrender cartels of exchange, &c (See Grotius, *De Jure Bel et Pac* lib iii,

Vattel, liv II, Wheaton, *On International Law*, vol I p 291)

SPONSORS In the Roman Catholic, Greek, Lutheran, and Calvinistic Churches on the Continent, and in the Church of England, the name given to the parties who at the baptism of infants make a profession of the Christian faith in their name, and guarantee their religious education (See *Neander's Church History*, vol I part 2) In the Presbyterian Church, baptism is administered without sponsors

SPOONDRIFT The light spray blown off the waves in a violent wind

SPORADIC (Gr σπειρω, *I sow*) A term applied to such diseases as attack a few persons at a time

SPORANGIUM (Gr σπορα, *a seed*, and αγγειον, *a vessel*) The case in which the reproductive matter of ferns, mosses, and many other Cryptogamic plants is enclosed Sporangiolum is the same part, when so small as to be microscopic

SPORIDIA (Gr σπορα, and ειδος, *form*) A term used in describing Algæ and Characeæ, to denote the granules which resemble sporules, but which are of a doubtful nature Also in describing Fungi, to indicate the immediate covering of the sporules

SPORIDIOLA The sporules or reproductive granules of Fungi

SPORIUM, SPORTULA In Roman Antiquities It was an ancient usage in Rome for rich men to distribute victuals on certain occasions among their poor clients, each of whom attended for the purpose with a wicker basket (sportum) Afterwards this dole was generally commuted for money, and the sum thus distributed, about 100 quadrantes, or eighteen pence English, was called *sportula*

SPORULES or SPORES (Gr σπορα, *a seed*) The reproductive bodies of Asexual or Cryptogamic plants differing from seeds in not being generated by impregnation, and in having no definite and predetermined points of growth, but springing forth into young plants from any part of their surface

SPOTS ON THE SUN See SUN

SPRING In Astronomy, one of the four seasons of the year For the northern hemisphere the spring season begins when the sun enters Aries the first of the northern signs, or about the 21st of March, and ends at the time of the summer solstice See SEASONS

SPRING In Mechanics a piece of mechanism formed of tempered steel or some other elastic substance applied mostly for the purposes of producing resistance or of preventing a shock from the collision of hard bodies or of giving motion to mechanism by its effort to unbend itself For the law of the force exerted by a spring, see ELASTIC CURVE

SPRING In Natural History See FOUNTAIN

SPRING In Naval language, a rope or hawser by which a ship is held at one part, as the bow or quarter in order to keep her in a particular position, or to turn her in a short compass

SPRINGING In Architecture, the lower part of an arch, or that part from which it rises

SPRING TIDES The tides at the times of the new and full moon At these times the sun and moon are in a straight line with the earth and their joint effect in raising the waters of the ocean is a maximum, and the tides are consequently the highest See TIDES

SPRIT SAIL This is generally a four cornered fore-and-aft sail, supported diagonally by a piece of wood called the sprit Ships formerly carried sails on their sprit sail yards

SQUADRON in Military affairs signifies a body of cavalry, averaging from one to two hundred men In naval matters it is applied to a detachment of ships employed on a particular expedition

SQUALL The Sea term for a gust of wind, or for a short temporary increase in the force of the wind

SQUAMA (Lat *a scale*) The bracteæ of an amentum, also used occasionally for any kind of bracted or rudimentary leaf which has a scaly appearance

SQUAMMIPENNES (Lat squama penna, *a fin*) The name of a family of Acanthopterygious fishes comprising those which have the dorsal and anal fins covered with scales

SQUAMOUS (Lat squama, *a scale*) In Zoology, when a surface is covered with small scales

SQUARE In Geometry a four-sided rectilineal figure, of which all the angles are right angles, and all the sides equal

SQUARE MEASURES The squares of the lineal measures *See* MEASURE

SQUARE NUMBER in Arithmetic, is the product of a number multiplied by itself Thus, the squares of the natural numbers, 1, 2, 3, 4, 5, &c, are respectively, 1, 4, 9, 16, 25, &c The square numbers are the first series of figurate numbers derived from the progression 1, 3, 5, 7, 9, &c., in which the common difference of the terms is 2 (*See* FIGURATE NUMBERS) Among the properties of square numbers the following may be mentioned —Every odd square number is of the form $8n+1$, or when divided by 8 leaves 1 for the remainder Every even square number is of the form $4n$, or is divisible by 4 Every square number ends with one or other of the following digits, 0, 1, 4, 5, 6, 9 No number of the form $2n^2+3n$ is a square

SQUARE RIGGED The term for a vessel carrying *square sails*, which are extended by yards suspended horizontally, or slung by the middle

SQUARE ROOT In Arithmetic, the square root of any number is the number which being multiplied into itself produces the given number Thus 12 is the square root of 144, $\frac{1}{3}$ is the square root of $\frac{1}{9}$, and 05 the square root of 0025 When the given number is not an exact square, the root may be found to any degree of approximation by the process for extracting the square root, which is taught in every book of common arithmetic *See* QUADRATIC EQUATION

SQUILL The root of the *Scilla maritima* Squills are imported from the Levant, they have a nauseously bitter and very acrid flavour and are generally cut into slices and dried for pharmaceutical uses There are two varieties, the red and the white, which, however, do not appear to differ materially in composition In large doses squill is purgative and emetic, but it is chiefly employed in smaller doses as a powerful expectorant, and as a diuretic in combination with other remedies Half an ounce of oxymel of squills is sometimes prescribed as an emetic in cases where the bronchiæ are much loaded with viscid mucus, and in the chronic coughs of old people

STABAT MATER DOLOROSA The first words of a celebrated Latin hymn of the church, in rhymed lines of all varieties without metre, said to have been composed by a Franciscan monk named Jacopone, in the 14th century It has been set to music by nearly all the greatest composers, but the best known of all their compositions is that of Pergolesi, commenced by him when nearly on his deathbed, and finished by another hand The stabat mater is performed in the ecclesiastical services of the Roman church during Holy Week

STACCATO (It *separated*) In Music, a term denoting that the notes to which it is affixed are to be detached in a striking way from each other, being much like *spiccato*, which see

STACK Corn in the sheaf piled up in a circular or rectangular figure, brought to a point or ridge at top, and afterwards thatched to protect it from the influence of the weather, and more especially from rains The term is also sometimes applied to hay piled up in the same manner, which, however, in most places, is called a *rick* The foundation of a corn stack is commonly made on a platform of wood or iron, raised on props to protect it from the moisture of the soil, and also from rats and mice, in which respect stacks of corn differ from ricks of hay, which are built always on the ground

STADIUM (Gr σταδιον) A measure of length in use among the ancient Greeks and some other nations, the precise value of which is unknown, though there are some data from which a rough approximation to its value may be made The most ancient measurement of an arc of the terrestrial meridian is that of Eratosthenes, and the result gave the length of the circumference of a great circle = 250 000 stadia But the circumference of the earth's equator is known to be nearly 25,000 English miles, whence supposing the measurement of Eratosthenes to be correct, a stadium is the tenth part of an English mile Posidonius found by another measurement the circumference of the earth to be 240,000 stadia on the same supposition of an accurate determination, this gives about 9½ stadia to the English mile But it is to be remarked that little dependence can be placed on these ancient measurements, for Ptolemy estimated the circumference of the earth at 180,000 stadia which is only 3-4ths of the result found by Posidonius The stadium is, however, supposed to have been different at different places (See Paucton, *Metrologie*, also the *Quarterly Review*, No 5) The best account of the stadium, and the ancient mode of measuring distances, is to be collected from the various memoirs of Danville, in the *Mem de l Acad des Inscr* vols xxiv xxviii xxxvi, and *Histoire de l Acad* vols xxvii xxxi

STADIUM In Ancient Architecture, an open area used for exercises by the Grecian youth With the Romans it was much in the form of the circi, but most of the Grecian stadia were enclosed by merely an earthen mound Vitruvius informs us that its length was much greater than its breadth, the lists were formed by a bank or terrace Though the stadium mostly formed part of a gymnasium, it sometimes formed a separate structure, and was built at great cost and with considerable elegance, witness that on the Corinthian Isthmus mentioned by Pausanias, as well as that of Herodes Atticus at Athens, [illegible] and constructed of Pentelic [illegible] By [illegible], mention is made by that author of several others

STA'DTHOLDER (Dut stadhouder, *city-holder*) The name formerly g[illegible] the military forces in [illegible] lands William I Prince of Orange had been made [illegible] Holland, [illegible] Independ[illegible] goodwill of those provinces After his death the Earl of Leicester was declared stadtholder by the States General, while some of the separate provinces [illegible] son of their former governor [illegible] afterwards the office was conferred and withdrawn by the several provinces at many different times, although always confined to members of the house of Orange William IV Prince of [illegible] hereditary stadtholder [illegible] French conquest, in 1814 the head of the house of Orange was raised to the throne by the title of King William I —a title retained by his successors The power of the stadtholder varied in different provinces, and at different periods

STAFF In Music, the five lines and spaces between them on which music is written

STAFF In Architecture *See* RUDENTURE

STAFF In Military affairs those officers attached to the commander of an army to assist him in carrying his plans into execution They consist of a quartermaster-general [illegible] majors of brigade &c The importance of [illegible] selection of a staff is ably demonstrated in the preface to *James's Military Dictionary*

STAFF ANGLE In Architecture, a square rod of wood standing flush with the wall on each of its sides, at the external angles of plastering on the inside of apartments to prevent the angles thereof being broken or damaged

STAIRS In Architecture steps for ascending from the lower to the upper part of a house When these are enclosed with walls or balustrades, with landing-places for communication between the several stories of a building, the whole is called a staircase Vitruvius makes no mention of staircases in his Treatise on Architecture, and indeed with the ancients they formed no feature in the interior, being generally on the outside of the houses Those of which traces remain are narrow, and so inconvenient that in some cases the steps are 1 foot in height In modern architecture they are often constructed with great display of skill and magnificence, and are no small test of the skill and power of the architect Those stairs which proceed in a right line of ascent are called *flyers*, when they wind round a solid or open *newel* they are called *winders* *Mixed stairs* are such as partly wind and partly fly

STALACTITES Conical concretions of carbonate of lime attached to the roofs of calcareous caverns and formed by the gradual dropping of water holding the carbonate in solution from σταλασσω, *I drop*

STALAGMITE Stalactical formations of carbonate of lime found upon the floors of calcareous caverns

STALK In Architecture an ornament resembling a stalk in the Corinthian capital from which the volutes and helices spring It is sometimes fluted

STALL In Architecture a seat raised on the sides of the choir or chancel of a church, mostly appropriated to a dignitary of a cathedral or collegiate church Sometimes stalls are placed near the high altar, for the priest and deacon or subdeacon to rest whilst the service in certain parts is carried on by the choristers In churches of the kinds named there is generally a series of them At St George's Chapel Windsor [illegible] to every Knight of the Garter [illegible] installation

STALLAGE In Law, a duty paid for the liberty of setting up moveable stalls or tables, or the like, in a fair or market due to the owner of the soil as such to set up stalls without whose licence is trespass When the stalls are fixed into the ground, the duty is termed *pickage*

STALL-FEEDING Cattle kept in stables and tied up [illegible] which have their food brought to them, [illegible] The advantages of this mode of fattening cattle are very great, both to the farmer or feeder and to the public, because much less food is wasted, and a much greater quantity of manure is produced The disadvantages are, that more manual labour is required for cutting and carrying the food from the field to the stable, and that the flesh of the animals for want of exercise in the latter, is not considered so wholesome or high-flavoured as that of cattle which have pastured at large To remedy this defect of stall-feeding, the most enlightened farmers, instead of rendering their cattle fixtures by tying them up to stakes, put two or three together in small yards, with a shed at one end, in which they can take exercise, shelter, or repose, according to their inclination By this mode an equal quantity of manure is produced with less labour, and the flesh of the cattle is reckoned wholesome When herbage plants or grasses are [illegible] over once or twice [illegible] the course of a season [illegible] by the bite of [illegible] of vegetable produce is found to be much greater, be[illegible] given to cattle in racks, in stables, sheds, or small courts, much less of it is wasted than if it were eaten on the spot where it grew Hence any given surface of cultivated land will produce a much greater quantity of butcher meat under crops to be mown than under herbage to be pastured, and stall-feeding, therefore, is one of the greatest modern improvements that has been introduced into husbandry There can be little doubt that, with the progress of rural improvement, it will ultimately become universal, and then, and not till then, will the butcher meat of warm climates be equal to that of such climates as that of Britain In warm climates, at present, cattle cannot be fattened by pasturing

STAMENS [illegible] They [illegible] consist each of a filament, the anther, and the pollen, of which the two latter are essential, and the former not They are a modified form of the petal and are placed next it on the inside next the centre of a flower Independently of their [illegible] they are much used as [illegible] in systematical botany

STAMEN (Lat stamen) Those bodies which are supposed to be, in *Hepaticæ*, and other Cryptogamic plants the equivalent of anthers in more perfect plants

STAMP DUTIES Duties imposed on pieces of parchment and paper on which many species of legal instruments are written, on newspapers, advertisements, cards, dice, &c The stamp duties have been consolidated and altered by a great variety of acts of parliament, and by 4 & 5 W 4 c 60 the boards of stamps and taxes are united into a single one

The manner in which the stamp duties on legal instruments are chiefly secured is by prohibiting the reception of them in evidence, unless they bear the stamp required by the law Should the instrument, after being stamped and executed be altered a restamping will in certain cases be requisite thus a mere mistake may be altered without a stamp, but any change in the terms of a contract, or any fresh conveyance by indorsement on a former one, requires a fresh stamp The objection to an instrument arising from the want of a stamp must be taken at the trial before the instrument is read, but it is sufficient for the purpose of evidence that the instrument when produced on the trial should be properly stamped, although it may not have been stamped when it was executed, except in cases where the commissioners of stamps are prohibited by express enactment, from affixing in this manner a subsequent stamp When an instrument has been lost, and it is proposed to give secondary evidence of its contents, it is necessary first to give evidence that it was duly stamped, but this fact may be presumed from circumstances and where an instrument is withheld by an adversary after notice to produce, it is always taken as against him that it is so stamped An unstamped instrument, though inadmissible in evidence of its contents, may yet be received in evidence for collateral purposes Thus in indictment for forgery of an instrument the instrument may be produced, although unstamped, and an agreement, although unstamped, is admissible for the purpose of proving [illegible] (See *Starkie on Evidence*)

STANCHIONS The Sea term for upright supports in general

STAND A Sea term, used variously, as, for example, a sail is said to *stand* well or ill A ship is said to *stand* towards or from the shore or any object (for *to sail*) To *stand on*, to continue the course To *stand by*, to be ready

STANDARD In Botany, [illegible] the uppermost petal of that form of corolla which [illegible] from its fancied resemblance to a butterfly

STANDARD *See* BANNER, FLAG

STANDARD OF MONEY *See* MONEY

STANISLAUS, SAINT A Polish order of knighthood, founded by Stanislaus, king of Poland, in 1765, renewed by the emperor Alexander in 1815

STANNARIES (Lat stannum, *tin*) The stannary courts of Devon and Cornwall are courts of record for the administration of justice among the tinners They are held before the lord warden and his substitutes The privileges of the tinners were confirmed by 33 E 1. The appeal from the lord warden lies to the [illegible] of the Prince of Wales, and [illegible] to the sovereign

STANNIC ACID Peroxide of tin

STANZA (Ital stanza, *station*) In Poetry, a series or number of verses connected with each other in a poem, of which the metre is constructed of successive series similar in arrangement The stanza, however, must be understood to form a shorter division than the classical strophe, to which this definition would be equally applicable The term is of Italian origin, and

signifies literally a *station* or *resting place*: it is so called from [illegible] *rima*, [illegible] by a [illegible] decasyllabic, [illegible] RIMA) The Spenserian stanza (which was perhaps invented by the poet from whom it derives its name, but certainly first applied by him to the construction of a regular poem) consists of eight deca-syllabic verses and an Alexandrine at the end, the first and third verses forming the first rhyme, the second, fourth, fifth, and seventh another, and the eighth and ninth a third rhyme Lord Byron has given both to the Ottava and the Spenserian stanza in English verse a peculiar and original character

STANZA [illegible] rtment or division in a building [illegible] of the Vatican, for instance, are called the *stanze* of the Vatican

STAPES A stirrup One of the bones of the internal ear is so called, from its shape

STAPHYLO'MA (Gr *σταφυλη a grape*) A disease of the eyeball, in which the cornea becomes opaque and tumid, [illegible] sometimes resembling a grape in shape, [illegible] increases to a great extent, and requires to be removed by an operation

STAPLE [illegible] m [illegible], but it is now applied to the chief commodities either grown or manufactured in any country

STAR (Gr *αστερ*, Ger stern) In a popular sense, the term star is used to designate any celestial body whatever, including the planets, but in astronomy it is [illegible] shining bodies which are situated [illegible] olar attraction and consequently do not participate in the motions of the solar system

One of the first results of the observation of the heavens was that the stars maintain always the same positions relatively to each other Hence they were called *fixed stars* in distinction to the *planets* or *wandering stars*, which are constantly changing their places in the firmament The fixity of the stars is indeed not absolute, for modern observations have detected some changes of relative position among them, but these changes are so minute that in general they only become sensible after the lapse of a number of years by a comparison of positions determined with the most perfect instruments at the beginning and end of the interval They are consequently altogether inappreciable to unassisted vision and the discovery of their existence has not rendered a change of language necessary astronomers still speak of the *fixed stars*

Apparent Magnitude of the Stars — The first circumstance which arrests the attention of the observer of the stars is the great differences of their relative brightness [illegible] tion in this respect and for the convenience of description and reference, astronomers divide them into classes or orders, which are called magnitudes A few of the most brilliant are denominated stars of the *first magnitude*, those of an inferior degree of brightness are of the *second magnitude*, and so on down to the 6th or 7th which are [illegible] still continued among those which are only visible in the telescope, and magnitudes from the 8th to the 16th are familiar to those who are in the practice of using powerful instruments It is, however, to be remarked, that this classification is not based on any photometrical determination, but is entirely arbitrary "Of a multitude of bright objects says Sir John Herschel, 'differing pro- [illegible] r and ar- [illegible] necessity [illegible] on An order of succession *must* exist, and it is a matter of absolute indifference where, in that infinite progression downwards from the brightest to the invisible, we choose to draw our lines of demarcation All this is matter of pure convention Usage has however, established such a convention, and although it is impossible to determine exactly or *à priori*, where one magnitude ends and another begins and although different observers have differed in their magnitudes yet on the whole, astronomers have restricted their first magnitudes to about 15 or 20 principal stars, their second to [illegible] or 60 next inferior, their third to about 200 yet smaller, and so on, the numbers increasing very rapidly as we descend in the scale of brightness the whole number of stars already re- [illegible] g [illegible] t [illegible] p 374)

[illegible] to [illegible] situated, astronomers, in the earliest ages of the science, had recourse to the method of forming them into groups, to which they gave the name of *constellations*, or *asterisms* (*see* CONSTELLATION), and distinguished the different groups one from another by appellations borrowed in general from mythology, and suggested by vague resemblances or fanciful analogies, the origin of which it is now difficult or impossible to trace A few of the brightest stars received particular names, some of which, conferred by the Greeks and Arabs, have been preserved, as Sirius, Rigel, Aldebaran, Arcturus, Capella, &c, but it is obvious that this nomenclature could not be carried to any great extent The system which has prevailed in modern times, and been generally adopted by astronomers in their charts and catalogues, was invented by Bayer, whose *Uranometria* [illegible] charts of all the constellations, was first [illegible] Augsburg in 1603 It consists in distinguishing the stars belonging to each constellation by the letters of the alphabet beginning with the brightest, which is called α The next brightest is called β, the next in order of brightness γ, and so on, and when the letters of the Greek alphabet were exhausted Bayer had recourse to the Roman and then to the Italian It is to be observed, that the order of the letters indicates only the relative brightness of stars in the same constellation without reference to other parts of the heavens Admitting the principle, it might have been simpler to have employed the ordinal numbers 1, 2 3, 4 &c for distinguishing individual stars But great perplexity is caused by the irregular forms of the constellations, whose numerous contortions and interlacings with each other baffle the efforts of memory, and which seem, as Sir J Herschel remarks, "to have been purposely named and delineated to cause as much confusion as possible"

Distribution of the Stars — The stars are very irregularly distributed over the celestial sphere In some regions spaces of considerable magnitude occur in which scarcely a single star is to be seen, while in others they are crowded together, so as to present to the unassisted eye the appearance of a confused mass of light A great and rapid increase of number is in general perceptible as we approach the borders of the Milky Way, where they appear when viewed through a powerful telescope, to be crowded almost beyond imagination (*See* MILKY WAY) Besides the general increase which takes place towards this region, there are in several parts of the heavens patches or clusters of stars, where great numbers are condensed into a very narrow space A telescope turned upon the Pleiades shows fifty or sixty large stars crowded together within a small [illegible] from the rest of the h [illegible] ([illegible] Berenices is a similar group though more diffused Another occurs in the constellation Cancer, and is called Præsepe or the Beehive, from the great number of stars it presents in the telescope In the sword-handle of Orion there is also a group of the same kind, but in which the individual stars can only be distinguished in a telescope of considerable power, and in various parts of the heavens there are found luminous spots in which no star can be distinguished with ordinary telescopes, but which when viewed through very powerful instruments, are found to consist of stars crowded together so as to occupy almost a definite outline Many of them, says Sir J Herschel 'are of an exactly round figure and convey the complete idea of a globular space filled full of stars, insulated in the heavens, and constituting in itself a family or society apart from the rest, and subject to its own internal laws It would be a vain task to count the stars in one of these *globular clusters* They are not to be reckoned by hundreds, and on a rough calculation, grounded on the apparent intervals between them at the borders (where they are not seen projected on each other) and the angular diameter of the whole group, it would appear that many clusters of this description must contain at least ten or twenty thousand stars compressed and wedged together in a round space, whose angular diameter does not exceed 8 or 10 minutes, that is to say, in an area not exceeding the tenth part of that covered by the moon' (*Astronomy*, p 400)

Number of the Stars — Hopeless as any attempt to count the number of the 'starry host" may appear to be, it has nevertheless been sometimes made Of the stars visible to the naked eye at any one time, the number probably does not exceed a few thousands, but in the [illegible] W Herschel [illegible] 40 degrees in [illegible] Milky Way, the number which passed through the field of his telescope in a single hour amounted to 50,000 On account of their irregular distribution this estimate furnishes a very imperfect datum for inferring the whole number in the sphere, but it has [illegible] 75 millions may be vis [illegible] Bar Zach, indeed, was of opinion that there may be 1000 millions in the entire heavens But it is abundantly obvious that all estimates of this sort are nothing better than fanciful conjectures, and instead of a limit being found to the number of the stars, there is an infinitely greater probability that if an observer could transport himself to the remotest visible star, he would there behold a firmament not less rich than the one he left

behind "Every [illegible] Herschel, "in the dimensions [illegible] which successive improvements in optical science have attained, has brought into view multitudes innumerable of objects invisible before, so that, for any thing experience has hitherto taught us, the number of the stars may be really infinite, in the only sense in which we can assign a meaning to the word" (*Astronomy* p 373)

Parallax and Distance of the Stars — The distance of the fixed stars from the earth has in all ages been an object of interest and inquiry The element from which the distance can be deduced is the annual parallax, or the angle subtended by the diameter of the earth's orbit at the distance of the star (*see* PARALLAX), but this distance is so great that if we except one or two instances, perhaps still doubtful, all the attempts of astronomers to determine it have hitherto been fruitless The instance in which the observations have *most probably* shown the annual parallax to have a measurable value is that of the double star 61 Cygni, observed by Bessel at Konigsberg in 1839 and 1840 The value of the parallax obtained by this celebrated astronomer was 0 3483″ (a little more than the third part of a second) from which it results that the distance of the star is 592,000 times the mean radius of the earth's orbit, a distance so enormous that light, which is propagated with a velocity of 192 000 miles in a second, would require 9¼ years to traverse it (*Monthly Notices of the Royal Astr Society* May, 1840) Now there is every reason to believe that this is one of the nearest of the fixed stars, and it is no extravagant supposition that there may be others still visible which are a thousand times more remote If therefore one of these were annihilated some ten thousand years would elapse before its extinction could be perceived at the distance of the earth

Proper Motions of the Stars — On comparing the places of the stars determined by recent observations with the positions assigned to them in the older catalogues, it is found that many of them have undergone a very sensible displacement Within the last fifty years the double star 61 Cygni above mentioned, has moved through 4′ 23″ of right ascension, and as the motion appears to be uniform, its rate is therefore about 5 3″ annually Another star (μ Cassiopeiæ) has an annual proper motion of 3 74″ The number of stars in which such motion has been detected though of smaller amount than in the above instances, is very considerable Out of 2959 stars in the catalogues of Bradley and Piazzi, Bessel [illegible] a proper motion of not less than 0 2″ [illegible] the existence of such changes in the places of the stars gives rise to some interesting speculations relative to the constitution of the universe That the stars gravitate to each other like the bodies of the solar system is rendered certain from the phenomena of binary stars and when we admit the prevalence of this force among them we are led to suppose a centrifugal force to be necessary to counteract the tendency to a general collapse produced by their mutual gravitation Hence we conclude that the proper motions must be performed in circular or elliptic orbits round some very remote centre, and as every appearance leads us to suppose the stars to be bodies of the same nature as our own sun, it becomes extremely probable that the sun with its attendant system is transported through space with a similar motion Now the translation of the solar system would necessarily give rise to an apparent change of the positions of the stars, for in consequence of the diminution of distance, they must appear to recede from that point of the heavens towards which the sun's motion is directed, and to converge and become more condensed in the region diametrically opposite Sir William Herschel was of opinion that this is what actually takes place, and that a general recess of the principal stars from the point occupied by ζ Herculis is already indicated by the catalogues, and consequently that the solar system is carried forward in the direction of that star It seems, however to be the opinion of astronomers at present that the observations are not yet sufficient to establish the certainty of this motion, but whether the supposition shall be confirmed or not, it is evident that the proper motions which have been remarked cannot be all accounted for in this way They appear indeed to be subject to no one assignable law, but to be directed to many different and even opposite points of space It is a curious circumstance, and was first noticed by Bessel, that a large proportion of the stars which have a proper motion are double stars In the *Memoirs of the Royal Astron Society* vol ii, a list is given of all the stars whose proper motions, as determined by [illegible] Mayer with [illegible] in right as [illegible]

Variable and Periodic Stars — The proper motions are not the only indications of the existence of active forces in the stellar regions Many stars have been observed whose light appea[illegible] increase and diminution of [illegible] instances to a complete [illegible] Of [illegible] kind one of the most remarkable is the star *Omicron* in the constellation Cetus [illegible] Ceti which has a period of about 334 days At its greatest brightness it is a star of the second or third magnitude and continues in this state about a fortnight, when its light begins to wane, and at the end of three months it becomes for some time invisible to the naked eye Algol, in the constellation Perseus appears [illegible] about 3½ hours it is reduced to the fourth magnitude it then begins to revive and in the space of 3½ hours more it is restored to its original state thus accomplishing its period in about 69 hours The star δ Cephei has a period of about 5 days 8½ hours, and β Lyræ one of 6 days 9 hours A star in the breast of the Swan has a period of about 15 years, during five of which it is invisible Various other similar instances have been remarked, and recently Sir John Herschel has pointed out α Cassiopeiæ and α Orionis (the latter of the first magnitude) as variable stars (*Monthly Notices of the Royal Astr Society*, May 1839, and June 1840)

Several hypotheses have been suggested to account for these variations [illegible] about axes of rotation like the sun and the planets, and that [illegible] Mayer supposed that their surfaces were not flat, and that the variations of light were produced by the alternate [illegible] made by the flat sides with the visual ray Others, again, have imagined that the partial obscurations may be occasioned by dark bodies or [illegible] splendour have entirely disappeared no stars being now found in the places which they are set down as having occupied Others have suddenly shone forth with extraordinary brilliancy, and after a longer or shorter period have gradually died away and become extinct A phenomenon of this kind about 125 years B C induced Hipparchus to undertake the formation of his catalogue In the year 389 of our era a star suddenly blazed forth near α Aquilæ and remained for three weeks as bright as Venus and then disappeared But one of the most remarkable instances is that of the star which appeared in 1572, and was observed by the astronomer Tycho Brahe It suddenly shone forth in the constellation Cassiopeia, attained a splendour equal to that of Jupiter and Venus when nearest the earth and could be seen by the naked eye at mid-day Its brightness gradually diminished, and at the end of sixteen months it disappeared and has never been seen since During the period of visibility, its apparent place remained unchanged All the phenomena attending it are fully described by Tycho in his work entitled *De Nova Stella Anni* 1572 A similar phenomenon occurred in the year 1604, in the constellation Serpentarius of which an account is given by Kepler (*De Stella Nova in Pede Serpentarii* Pragæ, 1606) For various other instances of a similar kind, and also of stars set down in the catalogues but which cannot now be found the reader is referred to *Lalande's Astronomie*, tome i p 259

Double and Multiple Stars — Many of the stars which appear to the naked eye or in telescopes of feeble power, merely as bright points, are found when observed with high magnifying powers, to be composed of two, and some of them of three or more stars, in close juxtaposition This appearance may arise from the circumstance of two stars being situated in nearly the same line of view, for it is evident that two stars thus placed would appear as a double star, however great the real distance between them may be It was suggested by Galileo that the variations (if sensible) of the apparent distance between two contiguous stars would furnish a good method of determining the annual parallax, and a series of observations on double stars was undertaken by Sir William Herschel with a view to this question The result, however, was a discovery of a very different kind, for instead of finding an alternate increase and decrease of the apparent distance between the two stars, which would be the consequence of an annual parallax he observed in some instances a regular progressive change from year to year in one direction By reason of the slowness of the apparent motion, a considerable interval elapsed before he was able to determine its laws, but it was explicitly announced by him in 1803 that there exist sidereal systems composed of two stars, one revolving round the other, or both about a common centre Subsequent observations have fully confirmed this discovery, and in some instances even the ellipticity of the orbits and the periods of revolution have been determined Some of these binary systems, as they are called have periods of great length, but in such cases the periods, being computed from observations extending over only a small part of the orbit, and liable besides to considerable uncertainty, cannot be held to be determined with much precision Thus, the period of Castor has been computed by Sir J Herschel to be 252 years, and by Mr Hind to be 632

years A period of 629 years was assigned to γ Virginis, but Sir J Herschel has found that the observations are better represented by an orbit in which the time of revolution is 182 years The period of 61 Cygni is supposed to be about 500 years There are others, however, having much shorter periods, and which have already been observed through their entire orbits The star η Coronæ, for example, has a period of little more than 43 years, and has consequently completed nearly two revolutions since its discovery as a double star by Sir William Herschel in 1761, ζ Ursæ Majoris has a period of about 58½ years, and 70 Ophiuchi one of about 80 years Since the time of Sir William Herschel, the observations of double stars has been a subject of much attention, and catalogues containing some hundreds have been published, giving the apparent distances of the two bodies, and their angles of position, or the direction of the straight line which joins them, by comparing which with future observations their orbits and periods will become known (Herschel and South, *Phil Trans* 1826, Herschel, *Memoirs of the* [illegible] ruve, *Catalogus Stel* [illegible] Petropoli, 1837, Herschel, *Outlines of Astronomy*, 1849)

About 40 or 50 of the double stars are already known to form binary or revolving systems, and there are others presenting phenomena still more remarkable Struve has enumerated 52 triple stars, and systems have been observed compounded of five and even more stars, all appearing to revolve about a common centre

Some of the binary systems afford curious instances of contrasted colours the colour of the smaller star being frequently complementary to that of the larger In such instances the larger star is usually of a ruddy or orange hue and the smaller one blue or green Sir J Herschel thinks it probable that the colour of the small star is the effect of the brighter light of the large one, for it is a general law of optics that when the retina is under the excitement of any bright coloured light feebler lights for the time appear coloured with the complementary tints This opinion seems strengthened by the fact that though insulated stars of a red colour almost as deep as that of blood appear in many parts of the heavens, no green or blue star (of any decided hue) has been noticed unassociated with a companion brighter than itself

Intrinsic Light of the Stars.—On account of the distance of the stars, it is not possible to form any idea of their actual magnitude, for when viewed through good telescopes they appear simply as luminous points without any sensible disks Their light may, however, be compared with that of any other luminous object and Dr Wollaston found by photometrical experiments the light of Sirius the brightest of the fixed stars, to be to that of the sun in the ratio of 1 to 20,000 000 000 Now the proportion of light received from any luminous body being inversely as the square of its distance it follows that the sun would require to be removed to 141,400 (the square root of the above number) times its actual distance, in order that its light should be equal to that of Sirius But the parallax of Sirius, if sensible at all is undoubtedly less than 1″, whence it is easily calculated that the distance of Sirius cannot be less than 200 000 times the distance of the sun from the earth from this it follows that the light of Sirius cannot be less than the double of that emitted by the sun Dr Wollaston, assuming a smaller and more probable limit of the parallax supposes the light of Sirius to be equal to that of fourteen suns (*Phil Trans* 1829, *Herschel's Astronomy* p 380)

Recent Remarks on the Distance Magnitude, &c of the Stars.—Argelander of Bonn, has given a catalogue of the stars visible to the naked eye, in which they are divided into six orders of magnitude, the faintest stars, or those just perceptible by the naked eye being considered as the smallest of the sixth magnitude If we suppose six concentric spheres to be described about the sun, with radii such that the first contains all the stars of the first [illegible] those of the first and second magnitudes [illegible] those of the three first magnitudes, and so on, and if we also suppose the *mean* distance of the stars of the first magnitude to be unity, then, according to the computation of Struve (founded necessarily on certain hypothetical assumptions respecting the distribution of the stars in space), the mean distances of the stars of the different orders of magnitude, and the radii of the spheres circumscribing them, are as follows —

Magnitudes	Mean Distance	Radius of Sphere.
1	1 0000	1 2638
2	1 8031	2 1408
3	2 7639	3 1961
4	3 9057	4 4374
5	5 4545	6 2093
6	7 7258	8 8726

[illegible] gnitudes, the data for comhave been furnished by Bessel's zone observations Struve finds the radii of the circumscribing spheres to be as follows. For those of the seventh magnitude [illegible], for those of the eighth 21 8115 of the ninth 31 7300, and lastly he concludes that the smallest stars observed by Sir William H[illegible] foot reflector are at an average [illegible] 25 67 times more distant than the smallest stars visible to the naked eye (*E'tudes d'Astronomie Stellaire*, p 81) See SUPPLEMENT

The observation of the places of the stars has formed the principal business of the astronomer in all ages, for as it is to them that the motions of the planets and all the other bodies of the solar system are referred, the knowledge of their exact relative positions is the foundation of all our astronomical theories, and of all the applications of the science to the practical purposes of geography and navigation The discovery of their proper motions could only be made after instruments and methods of observation and theory had been brought to a state of great perfection, and is consequently of recent date For our knowledge of binary and other systems of connected stars, and in general of the facts which have been brought to light respecting the constitution of the heavens, we are chiefly indebted to the two Herschels, and so distinguished have been the discoveries of these illustrious astronomers in this department of observation that it is now usually called the Herschelian branch of Astronomy *See* ASTRONOMY, NEBULA

STARBOARD The right-hand side of a ship, looking forwards

STARCH (Germ starke) Starch is one of the commonest proximate principles of vegetables It is characterized by its insipidity, and by insolubility in cold water, in alcohol and in ether It dissolves in, or at least forms a gelatinous compound with water, heated to 175°, and this solution, even when much diluted, is rendered blue by iodine This admirable test of the presence of starch is not effective in hot solutions, and by boiling the blue colour disappears but returns in them on cooling as they cool It is [illegible] *starch* commercially applied to that obtained from wheat, which for this manufacture is ground and diffused through vats of water, where it undergoes a [illegible] smell After [illegible] the albumen of the grain is thus separated in the form of a viscid scum, the starch being in the form of a finely divided white powder, is gradually further separated by washing in large quantities of water, from which it is ultimately allowed to settle, and put into boxes lined with linen to drain, it is then cut into squares, which are dried first in airy chambers upon porous bricks and afterwards rolled up in papers and *stove* dried, it is in this latter operation that the starch acquires that peculiar columnar texture and fracture which is well exhibited in opening a paper parcel as it comes from the stove A little *smalt* is generally added to the starch, by which it acquires a very pale blue tint, and is better adapted to conceal or cover the yellow tint acquired by worn linen Starch may be obtained from many other grains, and from potatoes and several other esculent vegetables *Arrow root* is the starch of the *Maranta arundinacea*, *sago* of the *Sagus farinifera*, an East Indian palm tree, and *tapioca* and *cassava* of the *Jatropha manihot* Viewed under the microscope, the varieties of starch exhibit a more or less distinct globular appearance and are said to be made up of little spherical particles of soluble starch, enveloped in an insoluble membrane, which protects the interior from the action of cold water, but which is broken or burst by hot water In the process of germination, and by various chemical agents, starch may be converted into a species of gum and of sugar

STAR CHAMBER, COURT OF (Curia camera stellatæ, from the ornaments of [illegible] in which at one period it sate), was [illegible] council itself, "sitting in the st[illegible] exercising important criminal jurisdiction, and administering equitable relief It is mentioned as early as the reign of Edward III In the third year of Henry VII an act was passed giving determinate criminal powers, extending chiefly to state offences and misdemeanors of a public kind, to the court of star chamber The judges were four high officers of state, with power to join a bishop and a temporal lord of the council, and two justices of the courts of Westminster, to their number. They proceeded by bill and information without the assistance of a jury The sittings of the privy council itself, as a criminal court, [illegible] doned, and its powers tr[illegible] This court continued to exercise very extensive jurisdiction, both in [illegible] during the reig[illegible] until it was finally dissolved by 16 Car[illegible] together with what remained of its cognate jurisdictions (See COUNCIL PRIVY)

STARKEY'S SOAP A compound of turpentine, or oil of turpentine, and alkali

STAROST A title under the Polish republic enjoyed by noblemen who were in possession of certain castles and domains called starosties These were grants

of the crown, and only conferred for life, but generally renewed after the demise of a possessor to his heirs

STARSTONE. A very rare variety of sapphire which when cut and viewed in a direction perpendicular to the axis, presents a peculiar reflection of light in the form of a star

STA'TER. (Gr στατηρ.) An ancient Greek measure of value. It was undoubtedly a coined piece of money at an early period. The common gold currency in the republican times of Greece consisted of staters. The Attic golden stater weighed two drachms and is estimated at twenty silver drachms, but the value of the coin struck by different states with this denomination varied greatly.

STATES or ESTATES. In modern European History (French états, Germ. stande), those divisions of society, professions or classes of men which have partaken, either directly or by representation, in the government of their country. Their number has varied in different countries. In France, and most other feudal kingdoms, there have been three estates (nobles, clergy, commonalty), members of the ancient national assemblies. Hence the well-known appellation *tiers etat* (third estate) for the last. In Sweden there are at this day four, nobility, clergy, citizens, peasants. In most countries the ancient system of assemblies convoked from separate estates disappeared by the progress of the government in the 16th and 17th centuries, and in monarchical constitutions the legislative power, ment, by king, lords, and commons or analogous powers, has prevailed. But the states have been reconstituted of late years in some German monarchies, as Hanover and the electorate of Hesse Cassel, &c.

STATES-GENERAL. In French History, assemblies which were first called A.D. 1302, and were held occasionally from that period to the year 1614, when they were discontinued, till they were summoned again at an interesting period, viz. in the year 1789. These states-general, however, were very different from the ancient assemblies of the French nation under the kings of the first and second race. There is no point with respect to which the French antiquaries are more generally agreed than in maintaining that the states general had no suffrage in the passing of laws, and possessed no proper jurisdiction. The whole tenor of the French history confirms this opinion. *See* ASSEMBLY, DIRECTORY.

STATICS (Lat. stare, *to stand*). The branch of Mechanics which has for its object the investigation of the conditions of equilibrating forces, or the conditions under which several forces applied to a rigid body mu-

principles on which the theory of equilibrium may be grounded: these are 1. The principle of the lever, 2. The principle of the composition of forces, and 3. The principle of virtual velocities.

Principle of the Lever. — The equilibrium of a straight horizontal lever, loaded at its extremities with weights which are reciprocally proportioned to their distances from the fulcrum, was demonstrated by Archimedes (*see* LEVER), and it is easy to extend this principle to the bent lever, when the fulcrum is at the angular point, and to show that if the two arms be urged in opposite directions by two forces perpendicular to the arms and reciprocally proportioned to their lengths, there will be equilibrium. Now, it is an axiom in statics that a force may be regarded as acting at any point whatever in the line of its direction, and hence it follows that any two forces applied at any points whatever in a plane which is only moveable round a fixed point, and having any directions whatever in that plane, will be in equilibrium

for the perpendiculars may be regarded as the arms of a bent lever having the fixed point for its fulcrum. This general principle, which is also called the *principle of moments*, suffices for the resolution of all the problems of statics, and is indeed the only one which was rigorously demonstrated previous to the discovery of the composition of forces, that is to say, previous to the publication of the *Principia* in 1687.

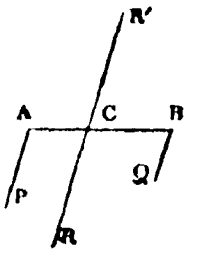
Composition of Forces. — The second general principle consists in this, that any two forces acting together upon the same point of a body, are equivalent to a single force represented in intensity and direction by the diagonal of a parallelogram, of which the two given forces are repre- sented by the sides. This equivalent of the two forces is called their resultant, and as the resultant may be combined with a third force acting on the same point, and the resultant of this combination with a fourth, and so on, it follows that any number of forces applied to the same point have a single resultant, or may be replaced by a single force. (*See* FORCE.) This principle was not known to the ancients. Galileo demonstrated that a body moved by two uniform velocities, the one vertical and the other horizontal, must acquire the velocity represented by the hypothenuse of the right-angled triangle whose sides represent respectively the two velocities. This is a particular case of the principle. Newton proved it to be true generally, and substituted the composition of forces for that of motions, and in the second corollary to the third law of motion, he shows that

may easily be deduced from it. The *Nouvelle Mécanique* of Varignon, published in 1725, contains the first complete theory of the equilibrium of forces in different machines, deduced solely from the principle of the composition of forces. The simplicity of the principle, and the facility of its application to all questions connected with equilibrium, caused it to be almost immediately adopted, and it is the basis of all the modern treatises of statics.

Virtual Velocities. — The third general principle on which the conditions of equilibrium may be made to depend consists in this, that forces acting in opposite directions destroy each other when they are inversely proportional to the velocities which they would respectively communicate to the body in the first instant of its motion, if the equilibrium were destroyed. This principle applies almost self-evidently to the conditions of equilibrium of the lever, pulley, and other simple machines. Its generality was first remarked by John Bernoulli. It has been adopted by Lagrange as the basis of his *Mécanique Analytique*, and it has the advantage over the others of being capable of representation in a single general formula which includes the solution of every question that can be proposed relative to the equilibrium of forces. Lagrange however, remarks that it is not sufficiently self-evident to be erected into a primitive principle, but it may be regarded as a general expression of the laws of equilibrium deduced from the two former. *See* VIRTUAL VELOCITY.

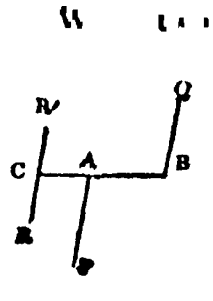
The general problem of statics may be thus enunciated. — *To find the equations of equilibrium of a body urged by any number of forces having any directions whatever in space.* We shall briefly indicate the steps by which the equations which express the conditions of equilibrium are obtained, adopting the principle of the composition of forces.

1. A force which acts on any point of a solid body may be regarded as applied at any point in the line of its direction, as all the different points of the line are invariably connected as is the case with any two points of a rigid body. This, as already stated, may be assumed as an axiom.



2. If a material point is urged by two forces acting in the same straight line, and in the same direction, the effect will be the same as if the point were urged in the same direction by a single force equal to their sum, and if the two forces act in opposite directions the effect will be the same as if the two forces were replaced by a single force equal to their difference acting in the direction of

which the others are



and as a third force may be compounded with the resultant of two, another with the new resultant, and so on, it is obvious that any number of parallel forces acting on a point have a single resultant.

3. It has been shown in the article FORCE (p. 462) that a force acting in any direction can always be decomposed into three others respectively parallel to three straight lines given in space, provided no two of these lines be parallel. Hence it follows that whatever be the number or the direction of the forces which act upon a solid body, they may be all replaced by three sets of parallel forces acting in given directions. We have therefore only to consider the theory of parallel forces.

4. When two parallel forces P and Q acting in the same direction, are applied to the extremities of a rigid straight line A B, the resultant R will be equal to their

parts in C, so that the distance of the points of application from C are reciprocally as the forces, or so that A C : C B :: Q : P. Thus, if A P and B Q be taken to represent the forces, and C R the resultant, we have C R = A P + B Q, and the two forces will be in equilibrium with a force C R', equal to C R, and acting in

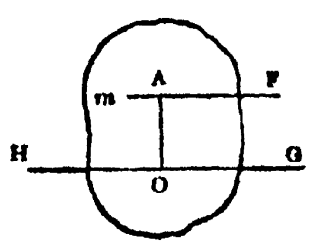
When the forces P and Q act in opposite directions, and are applied to the extremities of the line A B, there are two cases for consideration. If P and Q are unequal, they have a resultant which is parallel to their direction, equal to their difference, and applied at a point C in A B produced, which is such that A C : C B :: Q : P, or A C : A B :: Q : P − Q, and the two forces represented by A P and B Q will be in equilibrium with a force C R' equal and opposite to C R. If the two forces P and Q are equal, the point C, determined as above, is at an infinite distance, and

the resultant In this case, therefore, the forces P and Q cannot make equilibrium with any single force

The system of two equal and parallel forces applied in opposite directions at the extremities of a right straight line is very important in statics For the sake of facilitating calculation the forces are transferred to other points of their direction so that the line joining the new points of application shall be perpendicular to the direction of the forces Under this form, the system has been designated by the French mathematicians a *couple*, and its consideration has introduced great simplicity into the theory of equilibrium We shall here state the principal properties of couples, referring for the details of demonstration to the *Elémens de Statique* of Poinsot

6 Def —A couple is a system of two equal parallel forces acting in opposite directions, and applied perpendicularly to the extremities of an inflexible straight line of a given length

7 It is obvious from the definition that the efficacy of a couple depends on two things, the intensity of the forces, and the length of the straight line or lever to the extremities of which they are applied Now the force multiplied into the leverage is the *moment*, or the measure of the effect produced Let the force be denoted by F, and the length of the straight line by a, then F a is the statical moment of the couple And if there be another couple F′ a', such that F F′ a' a, then F a = F′a', or the statical moments of the two couples are equal and the one may be substituted for the other without disturbing the conditions of equilibrium



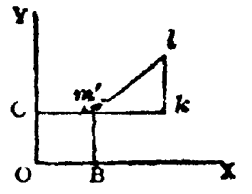
8 Any couple applied to a solid body may be transported, parallel to itself to any position in its own plane or in any other parallel plane, and it may be turned round through any angle in those planes without altering in any manner its effect on the body to which it is applied, provided the new points of application are invariably connected with those to which the couple was originally applied

9 Two couples situated any where in the same plane, or in parallel planes, may be composed into a single couple equal to their sum, if they tend to turn the body in the same direction, or equal to their difference if they tend to turn it in opposite directions Hence, by successive composition any number of couples acting in parallel planes may be replaced by a single couple, the statical moment of which will be equal to the difference between the sum of the moments of all the couples tending to turn the body in one direction, and the sum of the moments of those which tend to turn it in the opposite

10 Two couples situated any where in two planes which intersect each other may always be compounded into a single couple and if we represent the moments of the two couples respectively by two straight lines making an angle equal to that of the two planes and complete the parallelogram the moment of the resulting couple will be represented by the diagonal and the plane of the resulting couple will divide the angle formed by the plane of the component couples into two parts respectively equal to the parts into which the diagonal divides the angle of the parallelogram From this it is obvious that by successive composition any number whatever of couples, applied in any manner to a solid body, may be replaced by a single couple

11 Reciprocally any couple may always be resolved into two others situated in given planes, provided these planes and the plane of the proposed couple meet in the same or in parallel straight lines

12 From the principles above stated, we draw this important conclusion,—viz that when a solid body is urged by any number of forces having any directions whatever, the whole may be reduced to one force and to one couple For let m be one of the points of a solid body, and conceive a force F represented in intensity and [illegible] line m [illegible] Take O any point whatever in the solid body or invariably connected with it, and draw O A perpendicular to m I, and conceive the force F to be applied at A in the same direction m F Now suppose another force G represented by O G, equal and parallel to m F, to be applied at O, and let a third force H represented by O H, equal to O G, but acting in the opposite direction, be also applied at O These two auxiliary forces will not alter the statical condition of the body, because the one exactly destroys the effect of the other But the system of three forces F, G, H may now be conceived as consisting of a single force G applied at O, and of a couple formed by the two forces F and H applied at the extremities of the lever O A Let O A be denoted by a, then the statical moment of this couple is F a, and by



(9) we may conceive it to be moved in its own plane until the centre of the arm O A coincides with the point O.

[illegible] O will have a single resultant R applied at the same point, and all the couples having their centre at O may be compounded into a single couple, which has its centre at the same point (9) Therefore, finally, the whole of the forces acting on the solid body may be reduced to one force and to one couple, and in order that the body may remain at rest, it is necessary that the efforts of the resulting force and the resulting couple be severally destroyed It is to be observed, that the resultant R cannot destroy the couple, or be in equilibrium with it, and, in general, the resultant and the couple will be situated in different planes

From this it appears that the conditions necessary for the equilibrium of a body urged by a number of forces are these —1 That the resultant of all the forces at the point O be nothing, and 2 That the moment of the couple be nothing When the first of these conditions is satisfied, there can be no progressive motion, and when the second is satisfied, there can be no rotatory motion about an axis In order to express these conditions by equations an expression for the single resultant, and an expression for the single couple, must be deduced from the conditions of the proposed problem, and the results severally made equal to nothing We shall now show the general forms of these expressions, and for simplicity we shall first suppose all the forces to act in the same plane

Let there be any number of forces F′, F″, F‴, &c applied respectively at the points m', m'', m''', &c of a system of points invariably connected, and suppose all the points to be in one plane, and all the forces to act in the same plane, but to have any directions whatever in that plane From a point O taken arbitrarily in the plane draw the rectangular axes O X, O Y, then, whatever the direction of the force F′, it may be resolved into two forces respectively parallel to these axes Let the force F′ be represented in intensity and direction by the line $m' l$, and let X′ = $m' k$ be its component parallel to the axis O X, and Y′ = $k l$ its component parallel to O Y In like manner let X″ and Y″ be the components of a second force F″ resolved in the same manner, X‴, Y‴ those of a third F‴ and so on, then, instead of the system of forces F′ F″, F‴, &c, we shall have two groups of parallel forces namely, X′, X″ X‴, &c parallel to O X, and Y′, Y″, Y‴, &c parallel to O Y

Now if x' and y' be the co ordinates of the point m', so that x' = O B and y' = O C (m' B and m' C being respectively perpendicular to O X and O Y), then (12) the force X′ may be replaced by an equal force applied at O, and by a couple whose statical moment is X′ × O C = X′ y' In like manner the force Y′ may be replaced by an equal force applied at O, and by a couple whose statical moment is Y′ × O B = Y′ x' Each of the remaining forces X″, X‴, &c Y″, Y‴, &c may evidently be replaced in a similar manner But it is evident that the group of forces X′, X″, X‴, &c applied at O may be represented by a single force X equal to their sum (those which fall to the right of the axis O Y being considered as positive and those which fall in the opposite direction as negative), and those of the group Y′, Y″, Y‴, &c by a single force Y (having due regard to the signs), and the first condition of equilibrium requires that we have X = 0 Y = 0 (for the resultant of X and Y can only be nothing when these quantities are severally = 0), that is to say, we must have the two following equations —

$$\left.\begin{aligned} X' + X'' + X''' + \&c &= 0 \\ Y' + Y'' + Y''' + \&c &= 0 \end{aligned}\right\} \qquad (a)$$

With respect to the two sets of couples X′ y', X″ y'', &c, Y′ x', Y″ x'' &c, since they are all situated in the same plane, it follows from the principle stated in (9) that they may all be compounded into a single couple whose statical moment is equal to the sum of the statical [illegible] couples and since the second [illegible] that the moment of this resultant couple be nothing, the following equation must be satisfied —

$$X'y' + X''y'' + \&c - Y'x' - Y'x'' - \&c = 0 \qquad (b)$$

The effort exerted by each of these separate couples is to turn the system round an axis passing through the point O, and perpendicular to the plane X O Y, and the sum of the efforts being nothing, there is consequently no rotatory motion communicated

The equations which have now been obtained for the equilibrium of a system of forces all acting in the same plane are easily rendered general Let F′, F″, F‴, &c

be the forces, having any directions whatever in space, applied to the points of a solid body, through a point O in the body, or invariably connected with it, draw three rectangular axes, O X, O Y, and O Z, and let each of the forces F′ be resolved into three others parallel to [illegible] X′, Y′, Z′, then the [illegible] requires the three equations,

$$\left.\begin{aligned} X' + X'' + X''' + \&c &= 0 \\ Y' + Y'' + Y''' + \&c &= 0 \\ Z' + Z'' + Z''' + \&c &= 0 \end{aligned}\right\} \quad (c)$$

With respect to the couples arising from [illegible] resolved forces from their [illegible] point O, it is [illegible] the forces are now in [illegible] planes, X O Y, X O Z, and Y O Z, the couples may all be transferred to those three planes, therefore, by the same reasoning as above, it is easy to see that in each plane there will be two sets of couples tending to turn the body about an axis perpendicular to that plane. Thus, in the plane X O Y, there will be, as before the two sets of couples X′ y′, X′ y″, &c., Y′ x′, Y″ x″, &c., and, similarly, in the plane X O Z there will be the two sets X′ z′ X″ z″, &c., Z′ x′ Z″ x″, &c., and in the plane Y O Z the two sets Y′ z′, Y″ z″, &c., Z′ y′, Z″ y″ &c. Now supposing all these couples compounded into one, it is manifest that the moment of this resulting couple can only be nothing when the sums of the moments of the couples in each plane are respectively nothing; hence we have this second set of equations,

$$\left.\begin{aligned} X' y' + X'' y'' + \&c - Y' x' - Y'' x'' \&c &= 0 \\ Y' z' + Y'' z'' + \&c - Z' y' - Z'' y'' \&c &= 0 \\ Z' x' + Z'' x'' + \&c - X' z' - X'' z'' \&c &= 0 \end{aligned}\right\} \quad (d)$$

These two systems of equations (*c*) and (*d*) contain the conditions necessary for the equilibrium of any solid body. When the first system (*c*) is satisfied there can be no progressive motion, and when the system (*d*) is satisfied, there can be no rotation about an axis.

These two systems of [illegible] under a different form. Let [illegible] angles which the direction of the force F′ make with lines parallel to the three axes O X, O Y, O Z, we shall then have for the components of the force F′,

$$X' = F' \cos \alpha', \quad Y' = F' \cos \beta', \quad Z' = F' \cos \gamma'$$

Do. [illegible] in respect of the force F″ [illegible] α'', β'', γ'' [illegible] similar expressions for the components of that force, and so on. Hence the six equations (*c*) and (*d*) become

$$\left.\begin{aligned} F' \cos \alpha' + F'' \cos \alpha'' + \&c &= 0 \\ F' \cos \beta' + F'' \cos \beta'' + \&c &= 0 \\ F' \cos \gamma' + F'' \cos \gamma'' + \&c &= 0 \end{aligned}\right\} \quad (c')$$

$$\left.\begin{aligned} &F' (y' \cos \alpha' - x' \cos \beta') + F'' (y'' \cos \alpha'' - x'' \cos \beta'') + \&c = 0 \\ &F' (z' \cos \beta' - y' \cos \gamma') + F'' (z'' \cos \beta'' - y'' \cos \gamma'') + \&c = 0 \\ &F' (x' \cos \gamma' - z' \cos \alpha') + F'' (x'' \cos \gamma'' - z'' \cos \alpha'') + \&c = 0 \end{aligned}\right\} (d')$$

Our limits will only permit of our giving a general indication of the manner in which the above equations are applied to the solution of particular problems.

1. If the body is retained by a fixed point we have only to assume the fixed point as that in respect of which the [illegible] are made. The effort of the [illegible] forces will then be annihilated by the [illegible] there will be equilibrium, when the three equations (*c′*) are satisfied, or if the three equations (*d′*) are satisfied.

2. If the body is retained by two fixed points the line which joins them will constitute a fixed axis in the body. On taking the point O anywhere on the axis the resultant of the forces applied at O will again be destroyed by the resistance of the axis, but in order that equilibrium may take place, it is not now necessary that the resulting couple be nothing, — it is sufficient that it be situated in any plane which contains the axis, for when this condition is fulfilled its arm coincides with the axis and is fixed, and consequently the effect of the forces applied at its extremities will be annihilated.

3. Lastly, if the body, in other respects free, be subjected to touch an invariable plane, it is not necessary for equilibrium that the equations (*c′*) be satisfied, it will be sufficient if the resultant of the forces be perpendicular to the plane, provided it also fall within the interior of the space which limits the points of contact of the body with the plane, for in this case it will be destroyed by the plane's resistance. The second system of equations (*d′*) must, however, be satisfied, since the resistance of the plane can only generate a normal resistance, which, therefore, is incapable of destroying the action of the couple.

Of all the forces which act upon bodies, that which most frequently comes under our observation is terrestrial gravity, under the influence of which all bodies, when unsupported, fall to the ground in vertical lines. A solid

body acted upon by gravity presents the case of an infinite number of connected points urged by parallel forces; for though gravity is directed towards the centre of the earth, yet, by reason of the great magnitude of the earth in comparison of such bodies as usually come under consideration, the direction of the forces acting on the different points may all be regarded as parallel. All these forces have therefore a single resultant, which, in respect of every particular body, [illegible] point, called the centre of gravity. [illegible] of the centres of [illegible] on statics. For the general formulæ, see CENTRE OF GRAVITY. (See Poinsot, *Eléments de Statique*, Biot, *Notions de Statique*, Poisson, *Traité de Mécanique*, Lagrange, *Mécanique Analytique*, *Whewell's Mechanics*, and [illegible] under the term MECHANICS.)

STATION (Lat. *stare*, *to stand*.) In Astronomy, a planet is said to be at its *station*, or to be *stationary* when its motion in right ascension ceases, or its apparent place in the ecliptic remains for a few days unaltered. The real motions of the planets are always in the same direction from west to east, but owing to the motion of the earth from which they are seen, their *apparent* motions though generally from west to east, or direct, are sometimes from east to west, or retrograde, and in changing from one of these directions to the other the planet appears for some short time to stand still. The distance of the earth and of a planet from the sun being given, and also their periodic times, the determination of the arc of retrogradation, or the times at which the planet will appear stationary, is an easy problem, but to the ancient astronomers who were unacquainted with the relative distances of the planets, and who, moreover, supposed the earth to be the centre of motion, the phenomena of the stations and retrogradations occasioned great embarrassment, and the principal object of the various systems which were propounded previous to that of Copernicus was to give a satisfactory explanation of them. See PLANET.

STATION in Surveying is the place selected for planting the instrument with which an angle is to be measured.

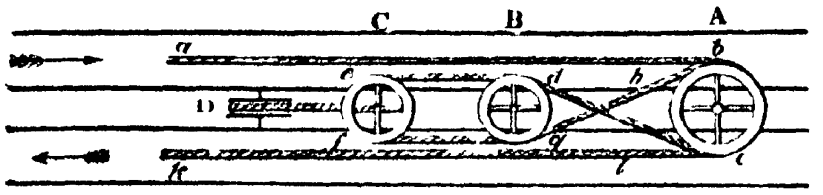
STATION in the Church of Rome, is applied to certain churches in which indulgences are granted on certain days.

STATION is applied to those resting-places on railways at which a halt is made for the purpose of receiving or letting down passengers or goods. The last stations on a railroad are called the *termini*.

STATIONARY ENGINE, in contradistinction to 'Locomotive Engine,' expresses a steam engine in a fixed position which draws loads on a railway by a rope or other means of communication extended from the *station* of the engine along the line of road.

On railways worked by locomotive engines, inclined planes sometimes are constructed of an acclivity too steep to be worked with advantage by these machines; such a plane occurs on the London and Birmingham railway, between the passenger station at Euston Square and the depot and station for goods at Camden Town. Similar inclined planes are constructed on the Liverpool and Manchester railway between the quay at Liverpool and the station at Edge Hill, and between the passenger station at Lime Street and the same place. In these cases a stationary engine is placed at the summit of the inclined plane, by the power of which acting on a rope carried along the plane the trains of carriages and waggons are drawn to the summit.

But it is not only on planes whose acclivity forbids the advantageous application of locomotive engines that stationary engines are used as the [illegible] power on railways. In some situations, where the railway is sufficiently level, [illegible] rence to locomotive power. Thus [illegible], from the India House in London [illegible], [illegible] acclivities do not exceed sixteen feet per mile, is worked throughout its entire length by stationary power.



When a line of railway is to be worked by stationary engines the whole line is resolved into a succession of stages of certain lengths at the end of each of which a stationary steam engine is placed, or, more generally, *two* such engines are provided in order that the occasional suspension of one for the purpose of repairs may not interrupt the traffic of the road. The power of these engines is applied to give motion to a drum, or cylinder, or wheel, on which a rope is wound. This rope extends [illegible] the road by [illegible] and at short intervals from [illegible] by which its friction and consequent wear and resistance are diminished.

There are several methods by which the stationary engine is made to draw the train by a rope.

The plan adopted by Mr Stephenson to draw the trains of goods from the quay at Liverpool to the station at Edge Hill up [illegible] inclined plane of about a mile in length, is by [illegible] rope. At the foot of the machine a wheel is laid down in a horizontal position, revolving on a ver-

tical axis have a groove on the circumference of a proper magnitude to receive the rope The diameter of this wheel is equal to the distance between the centres of the two lines of rails so that when the rope is extended between each line it will fall into the groove at the end of [illegible] wheel which [illegible] to the [illegible] the rope being brought round the groove of the wheel for half its circumference, is carried up each line of rails midway between the rails

At the summit of the plane, a similar wheel is similarly placed, round which the rope is conducted, but, instead [illegible] which the necessary tension is given to it Let A repre-

sent the great wheel at the top of the plane, and let *a b* represent the rope passing up the plane between one line of rails and falling into the groove of the wheel at *b* It is carried round the wheel A to *c*, and thence passes diagonally to *d*, where it falls into the groove of a smaller wheel B, from whence it is carried to *e* and half round another wheel C, equal to B, and from *f* it is conducted to *g*, where it falls again into the groove of the wheel B, from whence it passes diagonally to *h*, and half round a second groove in the great wheel A to *i k*, from whence it is carried down the other line between the rails

The steam engine is thrown into connection with the axle of the wheel, to which it imparts continued revolution The adhesion of the rope to the grooves makes this motion cause the rope to be drawn in the direction of the arrows Any train of carriage therefore attached to the rope *a b* would be drawn in one direction, and a train attached to *i k* would be drawn in the other direction The tension of the rope is regulated by a weight suspended by a rope passing over a vertical wheel D and attached to the axle of the wheel C This weight hangs in a pit, and continually draws the wheel C from the wheel D By this means however the rope may vary its length by moisture or other hygrometric causes, it will necessarily have the same tension

The new tunnel at Liverpool, extending from the engine station at Edge Hill to the passenger station at Lime Street, is differently worked but also by an endless rope The distance from the Lime Street station being 2200 yards a horizontal shaft is extended across the whole width of the two lines of railway at Edge Hill The extremities of this shaft are continued on either side into two buildings, where stationary engines are erected A motion of revolution may be given to the shaft by either of those engines separately or by both of them simultaneously Upon the shaft, and in the centre of one of the lines of railway, a grooved wheel 19½ feet in diameter, is fixed with its plane vertical The rope, which constantly ascends the plane between the rails of the line appropriated to ascending trains passes over this wheel, and being brought under it is returned nearly to the point where it first comes upon it It is there conducted into the groove of another wheel 4 feet in diameter, placed in front of the greater wheel By this arrangement the rope embraces nearly the whole circumference of the greater wheel and an adhesion is obtained sufficient to draw a load of one hundred tons up the plane After the rope passes over the smaller wheel it is carried [illegible] running [illegible] wheel is drawn by a weight similar to that described in the preceding case, by which a uniform tension is given to the rope After passing round this horizontal wheel, the rope is then directed to the centre of the other line of railway by two other horizontal wheels, and, after passing down the plane is conducted by two other horizontal wheels at Lime Street into the centre of the ascending line, along which it is conducted, as already described, to the large shaft wheel at the top of the plane

By either of the contrivances here described a railway of any extent may be worked by stationary engines driving endless ropes, and as the rope is at the same time moving in contrary directions along the two lines of railway, trains may be drawn by the same engine at the same time in contrary directions In case of such a rope being applied to an inclined plane, the weight of the descending train would act upon the ascending train leaving the moving power to act against the difference of their weights only If, in such a case, the descending load were greater than the ascending load the latter would not only descend by its gravity without any moving power, but would draw the ascending load up A plane worked in this way without an engine is called a self-acting plane Railways composed of self-acting

planes are very frequent in mining districts, where the level at which the mineral product is obtained is much more elevated than that at which it is shipped The weight of the mineral itself is, in such cases, used as the moving power, the loaded waggons in their descent drawing the empty waggons in the contrary direction

When an endless rope is not used, the power of the engine is applied to a drum or cylinder, called a rope-roll, on which the rope is coiled In such cases, the rope being carried along the line of rails, has its extremity attached to the train to be drawn, and the engine, as it works, turns the rope-roll on which the rope is gradually coiled, and the train is thus drawn towards the engine When the train has arrived there, the whole of the rope will be coiled on the rope-roll In order to move the train in the other direction, a similar engine is placed at the other extremity of the railway along which the train is moved, and the train is drawn back by the other engine in the same manner But, in order to unroll the rope from each rope-roll, the train, in returning, is made to draw the rope after it Thus the two engines reciprocally draw the train backwards and forwards between them, each engine, while it draws the train in one direction, unrolling the rope from the rope-roll of the other

There are various other expedients that have been [illegible] of the principle of one or other of these here described. The speed attainable by such means was formerly very limited, but the application of ropes and the machinery connected with them has been much improved, and if it were otherwise desirable a line of railway could now be worked at an average speed of from fifteen to twenty miles an hour by a series of stationary engines and ropes Nor would it be necessary in passing each station to stop the train expedients being devised by which the train may be transferred from one rope to another without [illegible]

STATIONERY The name given to all the materials employed in the art of writing but more especially to those of pens, ink and paper The term *stationery* is derived from the business of booksellers having been anciently carried on entirely in stalls, or *stations* The Stationery Office in London is the medium through which all government offices, both at home and abroad, are supplied with writing materials, and at the same time it contracts [illegible] and other matters had before [illegible] It consists of a comptroller, a storekeeper and about thirty clerks and other subordinate officers, and has a branch establishment at Dublin

STATION POINTER An instrument used in maritime surveying, for expeditiously laying down on a chart the position of a place from which the angles subtended by three distant objects, whose positions are known, have been observed It consists of three scales, which move about a common centre, two of them carrying each a divided circular arc and the third two verniers adapted to the arcs, by means of which the scales can be opened so as to form two angles of any magnitude Suppose the angles of the scales to be adjusted to the two measured angles and the instrument to be laid on the chart, so that the edges of the three scales coincide with the positions of the observed objects the centre marks the position of the spot from which the objects were observed (See *Simms's Treatise on Mathematical Instruments*, p 98)

STATIONS In [illegible] Roman statio, *a sola[illegible]ra* The weekly fasts of Wednesdays and Fridays These were omitted between Easter and Whitsuntide They terminated at three in the afternoon, hence sometimes called *semi-jejunia* Saturday was made a station day by the council of Elvira, which, it is said, led to the gradual neglect of the Wednesday station in the Western church (*Riddle's [illegible]*)

STATISTICS [illegible] The name given to the [illegible] state or condition of a country [illegible] in relation to its extent population, industry, wealth, and power

By a statistical account of a country, we mean a work describing its situation and extent, its natural and acquired capacities of production, the quantity and value of the various articles of utility and convenience existing and annually produced in it, the number and classes of its inhabitants with their respective incomes, its institutions for the government, improvement, defence, and maintenance of the population, with a variety of subsidiary statements and details A science embracing so great a variety of objects is not easily defined or limited, nor is it possible to draw any distinct line of demarcation between what should be left out of statistical works, and what should be included in them Much must always depend on the object in view, and on the good sense and discrimination of the author Statistics has many features in common with geography and politics, and embraces that sort of mongrel science

[illegible] been called political arithmetic Some authors, and, among others, Mr Macculloch, contend that any description, however brief, of the territory of a country is foreign to statistics* and belongs exclusively to physical geography But this is evidently a most erroneous statement How can we acquire any accurate or comprehensive knowledge of the capacities of production enjoyed by a country if we be unacquainted with its situation [illegible] and native products, and with its facilities for bringing them to market and exchanging [illegible] ng alien to, this [illegible] the science, and [illegible] ver well it might [illegible] e considered as a complete statistical work Those topographical details which are essential in a geographical work would, however, be totally out of place in one devoted to statistics One of the principal objects of the latter is to exhibit [illegible] the national wealth, its amount [illegible] ese would not be in any respect promoted by indulging in topographical details Hence, in statistical works, a short notice of the principal divisions of the country, with [illegible] climate, soil, [illegible] products [illegible] the method of holding and occupying lands, manufactures, and population, is generally sufficient This much, however, cannot be dispensed with It is the foundation on which all the rest of the building is to stand, and the completeness of the other, and more elevated parts, will generally depend more on the compactness and solidity of [illegible] se

[illegible] as to the mode in which statistical treatises should be drawn up, as with respect to the topics they should embrace Some contend that their object is limited to an exposition of the state of a country, province, or place, at some given period, and that, historical and theoretical discussions [illegible] excluded The Germans, who are supposed to be the great authorities in statistical matters mostly compose their works on this plan, but it, notwithstanding appears to us to be radically objectionable, and to be calculated to deprive the science of all that is most interesting and instructive Nor need we travel beyond the sphere of German statistical works for ample proof of what is now stated They are in fact with few exceptions, the most worthless rubbish imaginable We have accounts, sometimes accurate and sometimes not but usually put forward with equal confidence, of a variety of minute facts, but as we have no explanation of the circumstances under which they originated they communicate, even when accurate little useful information, and it would not be more idle to attempt to form any notion of St Peter's or St Paul's from an account of the number of tons of stone, brick and mortar in each than it would be to attempt to form any opinion of the state of Prussia, Austria, or any other German state, from the details respecting it supplied by German statistical writers They tell us, for example, that so many looms were at work in such a town or place at such a time, but the chances are, not a word will be said as to whether the number of looms was increasing or diminishing, and supposing that were stated, it is all but certain that not a word will be said explanatory of the causes by which this result has been brought about, though these [illegible] facts [illegible] times more importance than anything else [illegible] plan of statistics presents us with a skeleton, instead of a living animated body It is of importance, no doubt, to know the amount of population, the sum paid in taxes, the rate of wages, &c in a country or district [illegible] and but it is only by comparing these statements with [illegible] of the same sort, applying to different epochs, that we learn whether such country be advancing or retrograding and it is only by comparing details peculiar to one country with those peculiar to another that we learn in what respects they agree and differ, and that the attention of the politician and economist is called to those circumstances that retard the progress of the one [illegible] that of the other Those who make a practice of publishing would call this *comparative statistics* and would contend that it should not be mixed up with descriptive statistics But to be really good, and possessed of interest enough to make it be read, a work must embrace both They should not be so intermixed as to create confusion, but unless they be combined in due proportions, the principles on which the comparisons are made expounded, and the circumstances that produce the discrepancies pointed out, and their influence correctly appreciated, no details, however accurate, can be of much value It is the easiest thing possible to pile figures on figures, but unless deduced from correct data, they serve only to mislead, and they do this the more easily, that they have a scientific air about them, and that most people shrink from the irksome task of examining whether tabular statements be correct or not There is nothing, indeed, about which one should be so sceptical as the greater number of what are called statistical facts and details, or with respect to which a sound and searching criticism is so necessary The reader would do well generally to look with suspicion and distrust on most statements, how imposing soever they may appear, unless he be informed of the sources whence they have been derived, and of the principles on and the mode in which they have been compiled

It would be easy to illustrate what has now been said by references to the statements in parliamentary and other official documents, many of which are altogether false, while many more from the condition to which they apply not being clearly set forth, are, though not absolutely incorrect fitted only to mislead

Perhaps the least valuable book ever published on any important subject was that of Dr Colquhoun *On the Wealth and Resources of the British Empire* It is, from beginning to end a tissue of extravagant hypotheses, exaggeration, and absurdity Nothing was too difficult for this intrepid calculator Under his transforming hand every thing was reduced to figures, and matters as to which it is impossible to obtain any certain information, and of which he knew nothing, were set down as if they had been ascertained with absolute precision! And yet the most extravagant of his statements were for a while regarded as well-established truths The book obtained an extensive circulation, it was translated into German, and the German doctors continue to refer to it as if its authenticity were alike unquestioned and unquestionable

In justice, however, to the German writers on statistics, it should be stated that the circumstances under which they are placed do not really admit of their publishing the best class of works In Prussia, Austria, and most German states, the press is subject to a rigorous censorship, and no statements of a political kind are allowed to be published that might give offence to government, or that would be likely to call the attention of the reader to the defects in the organisation of the state This sufficiently accounts for the absence of such discussions in German works, and their anti-critical character But this certainly is no reason why the writers of other nations not laid under any restraints, should adopt such emasculated works as models for their treatises

Indeed it would seem to be considered by some writers that every thing in statistics may be estimated in figures, and exhibited in tabular statements! But the truth is, that but a few of the more prominent facts, in regard to the situation of any great country can be so exhibited A grand object in every good statistical work should be, not merely to state what is, but *why it is,* to trace and exhibit causes as well as effects, to show how advantageous results may be best brought about, and how those of an opposite character may be best avoided

It may be [illegible] ld encroach on the province of [illegible] economist But, in our estimation, a certain admixture of politics and political economy is indispensable to statistics Without such admixture most statistical works are little better than worthless if they are to be excluded, a good almanac may be taken as the model of a good statistical work

Arthur Young, in his *Travels in France*, Townsend, in his *Travels in Spain* and Volney, in his *Syria and Egypt*, indulge largely in discussions that depend more or less on politics and political economy But, nevertheless no one can doubt that the books in question belong to the class of travels, of which, indeed, they are among the very best specimens And why should it be otherwise with statistical works? If their writers know what they are about, they will use political science not to supersede but to illustrate, explain, and give utility to their statistical details

A really good statistical work can only be compiled by a writer who to great talent and good sense adds the most extensive information, and hence the extreme rarity of such works, but when properly executed they are alike instructive and interesting *Est enim cognitio reipublica et privato homini et publico utilissima et maxime necessaria,* [illegible] *nitionem reipublicæ* [illegible] *esse quam studiosus colamus et prosequamur, non est, quod jure negare vel adeo dubitare possimus* (Mone, *Hist Statisticæ*, p 4)

The reader will find in Mr [illegible] *stics of the British Empire*, and Mr [illegible] *of the Nation*, a full account of all [illegible] upon the moral and social condition of the people of this country

* The word "Statistics" was first introduced by Professor Achenwall [illegible], and [illegible] exhaustive description of any state or states, their political and social organisation, their progress in civilisation and their economical resources at any given time, calculated to furnish materials for an estimate of their power and character But the word was long tabooed by the learned as of doubtful purity even so late as the beginning of this century, [illegible] to his Geography, apologises for [illegible]

STA'TUARY (From statue) The art of carving or [illegible]

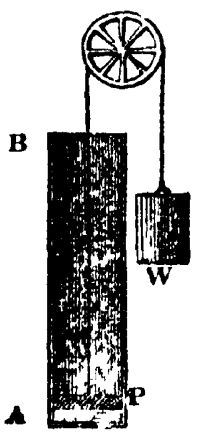
STATUE (Lat statua, *I set up*) In sculpture a representation in [illegible] marble or bronze, or in [illegible] of a man or other animal There are various species of statues —1 Those smaller than nature 2 Those of the same size as nature 3 Those larger than nature 4 Those that are three or more times larger than nature, and are called *colossal* The first were by the ancients confined to men and gods generally The second were confined to the representation of men celebrated for their learning and talents, who had rendered service to the state, and were executed at the public expense The third were confined to kings, emperors, and when more than twice the size of nature, to heroes The fourth species were confined to statues of the gods, or of kings and emperors represented under the form of gods *Equestrian statues* are those in which the figure is seated on a horse *See* SCULPTURE

STA'TUS QUO In Politics, a treaty between two or more belligerents, which leaves each party in possession of the same territories, fortresses, &c as it occupied before hostilities broke out, is said to leave them "in statu quo ante bellum," in the same state as before the war

STATUTE (Lat statuo, *I establish*) An act of parliament made by the king by and with the advice of the lords and commons But some ancient statutes are in the form of charters or [illegible] in the crown, and in which the consent of the lords and commons is not expressed 1 As to the time from which statutes run, if no time was expressed for the operation of a statute to commence it was of force anciently from the first day of the session and consequently had a retrospective operation By 33 G 3 c 13 it now has force from the day on which [illegible] statutes are divided into public and private [illegible] which rests rather on conventional usage and difference in the formalities of passing them, than on any principle, and public acts themselves may be either local or general There may be a private clause in a general act Statutes are also said to be *declaratory* of the law as it stood at their passing, *remedial*, to correct defects in the common law subdivided into *enlarging* and *restraining*, and *penal*, imposing prohibitions and penalties But these again, are rather distinctions of an arbitrary character than of any legal effect although some legal maxims have been founded on them, e g that penal statutes or clauses in statutes, are to be construed strictly remedial statutes liberally &c A few other rules laid down by learned authorities in the construction of statutes are, — that they are to be construed out of the words themselves according to the true intent of the makers, that when the words of a statute are doubtful general usage may be called in to explain them, that the purview of the whole act is to be considered and not particular words or clauses only, that doubtful words are to be construed with reference to the object of the act, that the *preamble*, or recital at the commencement is to be considered as it generally indicates the evil which it was meant to remedy, and consequently affords an insight into the meaning of the framers, that repeal of former statutes by implication shall not be favoured, &c Statutes are numbered according to rather an inconvenient arrangement the entire acts of one session are considered as forming two collections or volumes, one of public and one of private acts, each act forming a distinct chapter," and subdivided into sections

STAUROLITE (Gr σταυρος, *a cross*, and λιθος *a stone*) The mineral called *cross stone*, *harmotome* and *Andreasbergolite* It is a silicate of baryta and alumina, with traces of lime and potash and forms small quadrangular prisms crossing each other the most characteristic [illegible] Andreasberg, in the Hartz

STAUROTIDE (Gr σταυρος, *a cross* and ειδος, *form*) A name given by H [illegible] to the prismatic garnet, [illegible] and six-sided prisms, sometimes crossing each other at right angles It is a silicate of alumina and lime, with the oxides of iron and manganese It occurs in primary rocks and is distinguished from garnet by its form and difficult fusibility



STAY A strong rope from the mast head, leading forward to support it from falling aft It takes the name of the mast, as the fore stay, main-topmast stay, &c *To stay*, means to tack To be *in stays*, is to be in the act of tacking To *miss stays*, signifies to fail in at- [illegible]

[illegible] The elastic fluid into which water is converted [illegible] of heat

All [illegible] exposed to a sufficiently high temperature, are converted into vapour The mechanical [illegible] gases in general [illegible] to be considered, in the case of steam, is the elastic pressure When a vapour or gas is contained in a close vessel, the inner surface of the vessel will [illegible] rising from the *elasticity* of the fluid [illegible] by the mutual repulsion of the particles, which gives them a tendency to fly asunder, and causes the mass of the fluid to exert a force tending to burst any vessel within which it is confined This pressure is uniformly diffused over every part of the surface of the vessel in which such a fluid is contained it is to this quality that all the mechanical power of steam is due

To render the chief properties of steam intelligible, it will only be necessary to explain the phenomena which attend the conversion of water into vapour by the continued application of heat, under the various circumstances of external pressure which present themselves in the processes of nature and art

Let A B be a tube or cylinder, the magnitude of whose base is a square inch, and let a piston P move steam-tight in it, let it be imagined that under this piston, in the bottom of the cylinder, there is an inch depth of water, which will therefore be in quantity a cubic inch, let the piston be counterbalanced by a weight W acting over a pulley which shall be sufficient to counterpoise the weight of the piston and its [illegible] to the weight W [illegible] from time to time [illegible] led to any required [illegible] circumstances here supposed, the piston being in contact with the water, and all air being excluded from beneath it, it will be pressed down by the weight of the atmosphere, which we shall assume to be 14¾ lbs Let it be also supposed that a thermometer is placed in the water under the piston, and that the tube A B is transparent so that the indications of the thermometer may be observed The temperature of the water under the piston being reduced to that of melting ice, which is 32° of the common thermometer, let the flame of a lamp be applied under the tube, and let the time of [illegible] be noted If the thermometer be now observed it will be seen slowly and gradually to indicate an increasing temperature of the water, the piston maintaining its position in contact with the water unchanged [illegible] temperature will continue until the thermometer stands at the temperature of 212 Let the time be then noted It will be found that after that epoch the water will cease to increase in temperature notwithstanding the continued application of the lamp the thermometer not rising above 212 But another effect will begin to be [illegible] ted, the piston P will be observed gradually to rise, leaving a space apparently vacant between it and the water The depth of the water will, however be at the same time gradually diminished, and the diminution of its depth will be found to bear constantly the same proportion to the ascent of the piston This proportion will, under the circumstances here supposed, be that of 1700 to 1 If the application of the lamp be continued, and the tube have sufficient length the water will, after the lapse of a certain time altogether disappear from the bottom of the tube, and when that occurs the piston will have risen to the height of 1700 inches, being 1700 times the original depth of the water

The tube will now, to all appearance be empty, but if the apparatus were weighed, it would be found to have the same weight as at the commencement of the experiment The water, therefore, must still be contained in the tube, though it has assumed an invisible form To demonstrate its presence, let the lamp be removed, immediately the piston will begin to descend, and the inner surface of the tube will be covered with a dew, which speedily increasing, will fall to the bottom in drops of water The piston meanwhile will continue to move downwards, sweeping before it the water from the sides of the tube, and at length will recover its first position, having under [illegible] inch of water

In the above [illegible] the piston is produced by the elastic force of the steam, into which the water was gradually converted by the lamp The space between the piston and the water during its ascent, though apparently empty, was filled with steam, which like air and most other gases, is a colourless and invisible fluid The proportion of the elevation of the piston to the diminution of depth of the water being 1700 to 1, proves that the water in passing into steam increases its volume in that proportion When the water [illegible] the height of the piston from the [illegible] 1700 inches, and as the tube under the piston was then filled with the steam into which the water had been converted, it is apparent that the cubic inch of water, in this case, was converted into 1700 inches of steam

The pressure of the atmosphere above the piston was, in this case overcome by the elastic force of the steam, and the piston, [illegible] that pressure upon it, was raised to a height of 1700 inches In the evaporation, therefore,

of this cubic inch of water, a mechanical force has been evolved equivalent to 14¾ lbs raised to the height of 1700 inches.

From the moment at which the water began to be converted into steam the thermometer having thus attained 212°, ceased to rise Nevertheless the application of the lamp was continued, and therefore the same quantity of heat per minute was still supplied to the water Since the water did not increase in temperature, it may be asked what became of this continued supply of heat received from the lamp? It may be said that it was imparted to the steam into which the water was converted, but if the thermometer were raised out of the water, and held in the steam between the water and the piston, it would still indicate the same temperature of 212° We thus arrive at the fact that notwithstanding a large supply of heat imparted to water during its evaporation, that heat is sensible neither in the water itself nor in the vapour into which the water is converted

The quantity of heat which is thus absorbed in converting water into steam is easily determined, the interval of time being noted which elapsed between the first application of the lamp and the moment at which the thermometer ceased to rise Let us suppose that interval to be an hour, the interval being also noted between the moment the thermometer ceases to rise and the process of evaporation begins, and the moment at which the last particle of water disappears from the bottom of the tube and the evaporation is completed, it will be found that this interval is 5½ hours, and in general, whatever may be the length of time necessary to raise the temperature of the water from 32° to 212°, 5½ times that interval will be necessary for the same source of heat to evaporate the same quantity of water It follows therefore, that *to evaporate water under a pressure of 14¾ pounds per square inch requires 5½ times as much heat as is necessary and sufficient to raise the same water from* [illegible] 2°

Since the difference between 212° and 32° is 180°, and since 5½ times 180° is 990° it follows that to convert the water into steam after it has attained the temperature of 212°, as much heat must be supplied to it as would be sufficient, if it were not evaporated, to raise it 990° higher The heat thus absorbed in evaporation, and not sensible to the thermometer, is said to be latent in the steam, and the phenomena which have been just described form the foundation of the whole theory of *latent heat* That this [illegible] actually contained in the steam [illegible] thermometer admits of easy demonstration, by showing that it may be reproduced by converting the steam into water If a cubic inch of water, in the form of steam at the temperature of 212°, be introduced into the same vessel with 5½ cubic inches of water at the temperature of 32°, the steam will be immediately converted into water, the temperature of the 5½ inches of ice-cold water will be raised to 212°, and there will be found in the vessel 6½ cubic inches of water at 212° Thus, while the steam, in reassuming the liquid form, has lost none of its temperature, it has nevertheless given up as much heat as has raised 5½ cubic inches of water from 32° to 212° It is therefore demonstrated that this quantity of heat was actually in the steam, and that it was its presence there in the latent state by some agency not yet explained, that conferred upon the water in the vaporous form the property of elasticity

We have here supposed that the pressure under which the water in the tube was evaporated was the mean pressure of the atmosphere, or 14¾ lbs per square inch Let us now suppose that the piston resting on the water is loaded with a force of 14¾ lbs besides the pressure of the atmosphere, which may be done by taking 14¾ lbs from the [illegible] If the same process be followed as before, it will now be found that the thermometer will not cease to rise when it has attained 212°, nor will the piston then begin to ascend The thermometer will, on the other hand, continue to rise until it has attained 250° It will then, as in the former case, cease to rise, the piston will ascend, and the water will begin to be converted into steam, the proportion, however, between the ascent of the piston and the diminished depth of the water, or, in other words, between the volume of steam produced and the volume of water producing it, instead of being 1700 to 1, will now be about 900 to 1, being little more than half the former proportion The force against which the elasticity of the steam, in the present case, acts, is 29½ lbs, and this force is raised about 900 inches by the evaporation of a cubic inch of water In the former case a force of 14¾ lbs being half the present force, was raised to 1700 inches by the evaporation of the same quantity of water, so that in each case the mechanical effect produced is very nearly the same

If the pressure under which the evaporation is carried on were further varied, it would be found that with every increase of pressure the temperature at which the evaporation [illegible] steam produced by a cubic inch of water would be less [illegible] increase of pressure under which the evaporation is made, and that the diminution of volume would be nearly, but not in quite so great a proportion, as the increase of pressure In like manner, if the pressure be diminished the volume of steam produced by a cubic inch of water will be augmented in nearly, but not quite so [illegible] of pressure. [illegible] the mechanical effect evolved by the evaporation of a given volume of water under different pressures is very nearly the same, greater pressures, however, having a slight advantage over lesser ones

It has been seen that 14¾ lbs are raised to a height of 1700 inches by the evaporation of a cubic inch of water under the pressure of 14¾ lbs per square inch. Now, 1700 inches are nearly equal to 142 feet and 14¾ lbs. raised 142 feet is equivalent to [illegible] raised one foot, which is equal to very nearly 2100 lbs raised one foot To use round numbers, it may then be stated, that by the evaporation of a cubic inch of water a mechanical force is produced equivalent to a ton weight raised a foot high, and that this force is very nearly the same whatever be the temperature or pressure under which the evaporation takes place

From what has been above explained, it is apparent that the quantity of sensible heat in steam is augmented with every increase of pressure under which the evaporation is carried on, but if the interval of time be observed which elapses between the first application of the lamp to the ice-cold water in the experiment above described, and the moment at which the last particle of water disappears by evaporation from the bottom of the tube it will be found that this interval is nearly the same, whatever be the temperature or pressure under which the evaporation takes place It follows that the actual quantity of heat necessary to convert ice-cold water into steam is nearly the same, whatever be the pressure of the steam, but as the temperature of steam increases and diminishes as the pressure is increased or diminished, it follows that this given quantity of heat is differently distributed between sensible and latent heat in steam of different pressures As the pressure is increased the sensible heat is augmented and the latent heat undergoes a corresponding diminution, and *vice versâ* The sum of the sensible and latent heats is, in fact a constant [illegible] nearly so, the one being always increased at the [illegible] the other It has been shown that in converting water at 32° of temperature, and under a pressure of 14¾ lbs per square inch, into steam, it was necessary first to give it 180° additional sensible heat, and afterwards 990° of latent heat the total heat imparted to it being 1170° The actual temperature to which water would be raised by the heat necessary to evaporate it, if its evaporation could be prevented by confining it in a close vessel, will be found by adding 32° to 1170° It may, therefore, be stated that the heat necessary for the evaporation of ice cold water is as much as would raise it to the temperature of 1202°, if its evaporation were prevented If the temperature of red hot iron be, as is supposed, about 1200°, and if all bodies become incandescent at the same temperature, it follows that to evaporate water it is necessary to impart to it as much heat as would be sufficient to render it red hot if its evaporation were prevented As the mechanical effect evolved by water evaporated is at all pressures [illegible] same, and as the quantity of heat necessary [illegible] evaporation is also nearly the same, it follows that the same quantity of fuel employed in the evaporation of water is productive of very nearly the same mechanical effect, whatever be the pressure of the steam

Since water, in passing into steam, suffers a great enlargement of volume, steam, on the other hand, in being converted into water undergoes a corresponding diminution of volume It has been seen that a cubic inch of water, [illegible] ills into 1700 cu [illegible] that if a close [illegible] cubic inches of such steam, be exposed [illegible] to take from the steam all its latent heat, the steam will be reconverted into water, will shrink into its original dimensions, and will leave the remainder of the vessel a vacuum This property of steam has supplied the means, in practical mechanics, of obtaining that amount of mechanical power which the properties of the atmosphere confer upon a vacuum If by any means whatever the space in a cylinder under the piston be rendered a vacuum, the atmospheric pressure will take effect above the piston, and will urge the piston downwards with a force amounting to about 15 lbs on each square inch on the surface of the piston To render steam available for this purpose, it is only necessary to inject it into the cylinder until it expels from the cylinder all the atmospheric air or other uncondensable gases which the cylinder [illegible] when that is effected, the pure steam [illegible] the cylinder being suddenly condensed by the application of cold, leaves the cylinder a vacuum, and gives effect to the atmospheric

pressure above the piston, as before explained This is, in fact, the principle of the atmospheric engine, which is the species of engine which remained in use up to the time of Watt

In the mechanical operation of steam, which has been already explained, the pressure, density, and temperature of the steam are supposed to remain the same during its action, and the mechanical effect is produced by the continual increase of volume produced by evaporation represented in the figure is moved upwards, not by any change in the temperature, density, or pressure, but by the increased volume acquired by the continual production of steam It has been proved that by this process alone the evaporation of a cubic inch of water, whatever be the pressure under which it takes place, evolves a mechanical force equivalent to a ton weight raised a foot high But if, after this evaporation has been completed, the steam be separated from the water which produced it, and the load on the piston be gradually diminished, the steam will expand by moving the piston upwards in virtue of its excess of pressure, and this expansion will continue until the pressure of the steam shall be reduced to equality with the load on the piston All mechanical effect developed in this process is due to the steam itself, independently of any further evaporation

To make this important quality of the expansive action of steam understood, let us suppose the piston loaded with a pressure equal to four times that of the atmosphere, the density of the atmosphere itself If the water under the piston be evaporated under this pressure, it will have a temperature of about 292°, and by its evaporation the piston will be raised 40 feet This will, therefore, be the whole mechanical effect arising from the immediate evaporation of the water But when the evaporation has been completed, and the piston, with its load of four atmospheres, stands suspended at 40 feet above the bottom of the tube let a pressure equal to that of one atmosphere be removed from the piston The remaining pressure of three atmospheres being less than that of the steam below the piston, the piston will be raised, and will continue to rise until it has attained a height of about 50 feet, and the temperature of the steam thus expanded will fall to about 275°, and its pressure being reduced to that of three atmospheres it will cease to rise By this process therefore a mechanical force has been obtained from the steam equal to the weight of three atmospheres raised 10 feet in addition to the effect obtained by immediate evaporation, but the expansive action does not stop here Let it be supposed that the piston is again relieved from the pressure of another atmosphere, the superior pressure of three atmospheres below will cause it to rise, and it will ascend to the height of about 75 feet, the temperature of the steam falling to about 250°, and its pressure being reduced to two atmospheres A further mechanical effect equivalent to the weight of two atmospheres raised to about 25 feet has thus been obtained, and it is evident that by constantly the piston, and adding from a given amount of evaporation, to an extent which is only limited by practical circumstances which restrain the application of this expansive principle Since the cost of producing steam as a mechanical agent depends chiefly on the quantity of fuel necessary to effect the evaporation of a given volume of water, it follows that all the mechanical effect obtained by this principle of expansion is so much power added to the steam without further expense Its importance, therefore, will be obvious in the economy of steam power For the manner of rendering it available in steam machinery, see STEAM ENGINE

The temperature and pressure of steam produced by immediate evaporation when it has received no heat save that which it takes from the water, have a fixed relation one to the other If this relation were known and expressed by a mathematical formula the temperature might always be inferred from the pressure, or *vice versâ* But physical science has not yet supplied any principles by which such a formula can be deduced from any known properties of liquids In the absence therefore of any general relation established by direct reasoning empirical formulæ have been proposed which express with more or less precision this relation in different parts of the thermometric scale These formulæ have been constructed so as to give results which nearly agree with the results obtained by experiment One set of experiments to ascertain the relative bulks of steam and water was made by Watt at an early period of his career, and these experiments were subsequently repeated by his assistant Southern, with great care and skill Southern's formula for determining the pressure of steam of any given temperature is probably more widely identified than any other with engineering calculations, as it is sufficiently accurate for practical purposes His formula is as follows, — If F represent the elastic force of the steam in inches of mercury, and t its corresponding temperature in degrees of Fahrenheit's thermometer,

Then $$F = \left\{\frac{t + 51\,3}{135\,767}\right\}^{5\,13} + 0\,1$$

The numerical process indicated by this formula being somewhat complicated, may for greater convenience be performed by logarithms, as follows —

To find the elastic force of steam in inches of mercury by Southern's formula

RULE — *To the given temperature in degrees of Fahrenheit's thermometer add 51 3, then from the logarithm of the sum subtract the logarithm of 135 767, multiply by the index 5 13, and to the natural number answering to the sum add the constant fraction 1 10th The result will be the elastic force of the steam in inches of mercury*

One of the most important courses of experiment which have been made upon this subject is that undertaken by a committee of the French Institute, consisting of MM Prony Arago Dulong in consequence of an application from government to the academy to point out the best means of preventing accidents from the bursting of the boilers of steam engines The experiments were conducted chiefly by Arago and Dulong, and were certainly not only extremely delicate as to their management but the most hazardous which science and art owe to the courage and zeal of philosophers Steam was produced of a sufficient pressure to force a column of mercury up a glass tube to the height of nearly 43 feet, an atmosphere being measured by a column of mercury measuring 29 922 inches This exhibits the temperatures and steam, as determined by these experiments, up to fifty atmospheres

The last six temperatures in the above table are deduced by calculation from the formula $e = (1 + 0\,7153t)^5$, in which e expresses the elasticity in atmospheres, and t the temperatures in centigrade degrees, beginning from 100°, and proceeding upwards The methods employed in this magnificent course of experiments will be found detailed in the *Annales de Chimie et de Physique*, tome xlii p 71

A very valuable series of experiments upon this subject was also undertaken by a committee of the Franklin Institute in America The more material results of these experiments are exhibited in the following table —

Pressure in Inches of Mercury	Temperature in Degrees of Fahr	Pressure in Inches of Mercury	Temperature in Degrees of Fahr
30	2[illegible]5	180	315 50°

165	310		

A column of mercury two inches in height will balance a pressure of 0804 lbs on the square inch

These calculations are expressed with considerable accuracy by the following formula, which gives the pressure in lbs per square inch instead of in inches of mercury — If P be the pressure in lbs per square inch and t the temperature under which the steam is generated expressed in degrees of Fahrenheit, then

$$P = (0\,460467 + 0\,00521478\,t)^6$$

Formulæ for determining the pressure of steam at different temperatures have been given by Young, Tredgold, Biot, Navier, Roche, and many others, but these formulæ it is needless to recapitulate here, as they do not add to our knowledge of the subject, but tend rather to perplex it We cannot however, in this enumeration omit a notice of the experiments recently made in France by M Regnault to determine the pressure of steam at

different temperatures, those experiments being remarkable for the great accuracy with which they were performed M Regnault has shown that the total amount [illegible] weight of steam increases with [illegible] with a pressure of 14 7 lbs upon the square inch, the sensible heat of the steam is 212° the latent heat [illegible], and the sum of the latent and sensible heats 1178°, whereas, in steam of 90 lbs upon the square inch the sensible heat is 320 2°, the latent heat 891 4°, and [illegible] heats 1211 6° There [illegible] the total heat of a pound of water raised into steam of 14 7 lbs pressure and that of a pound of water raised into steam of 90 lbs pressure, so that the high steam if expanded into low will have an excess of temperature beyond that necessary for the maintenance of the vaporous form, or, in other words, will be in the state of surcharged steam Surcharged steam, or steam to which more heat is imparted than is necessary for the maintenance of the vaporous form, conforms under the same physical laws as air and other permanent gases And with all gases, when the temperature is constant, the pressure varies simply as the density, or inversely as the volume When the pressure is constant the dilatation is uniform with uniform additions of heat, and is at the rate of $\frac{1}{490}$ of the volume at 32° for every additional degree of temperature When the volume is constant the increase of pressure is $\frac{1}{490}$ of the pressure, at 32° for each additional degree of temperature In the Edinburgh New Philosophical Journal for July, 1849, a formula is given by Mr Rankine which educes results very nearly corresponding with those which M Regnault obtained by experiment, and from this formula, therefore the most material of M Regnault's results may be obtained Mr Rankine [illegible] 462 28° of [illegible] that scale, as a new *absolute zero*, and he supposes the boiling point of the water to have been adjusted under a pressure of 29 922 inches of mercury; so that 180° of Fahrenheit may be exactly equal to 100° of the centigrade thermometer. The formula is applicable for finding the elasticity of other vapours besides that of water; but three constants, α, β, γ, have to be determined for each fluid by experiment If P be the pressure of the steam and t the point of absolute zero, as explained above, then the formula for calculating the pressure from the temperature is

$$\text{Log } P = \alpha - \frac{\beta}{t} - \frac{\gamma}{t^2},$$

and the inverse formula for calculating the temperature from the pressure is

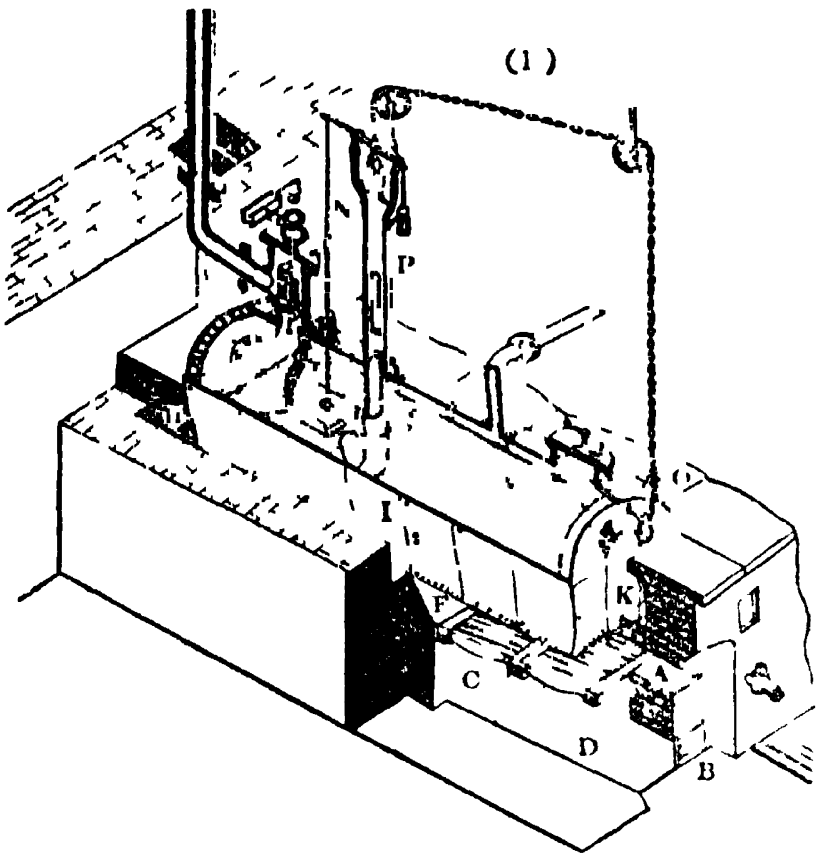
$$\frac{1}{t} = \sqrt{\frac{\alpha - \text{Log } P}{\gamma} + \frac{\beta^2}{4\gamma^2}} - \frac{\beta}{2\gamma}$$

The values of the constants have been derived from M Regnault's experiments and they are as follows —

$$\text{Log } \beta = 3\,4403816, \quad \text{Log } \gamma = 5\,5926244, \quad \frac{\beta}{2\gamma} = 0{\cdot}0035189$$

$$\frac{\beta^2}{4\gamma^2} = 0\,000012364$$

The value of α, other things being the same, depends upon the measure of elasticity adopted If it be inches [illegible] of α will be 6 426121, if it be pounds [illegible] square inch, the value of α will be 6 117817



The following table is derived from M Regnault's experiments, with the addition of a column showing the volume of the steam relatively with the volume of the water from which it is generated, computed by Mr D K Clark, and given in his work on Railway Machinery In this table we have the total pressure of the steam in lbs per square inch, its relative volume as compared with that of the water from which it is produced, its tempera-

ture, its total heat, or in other words the sum of its latent and sensible heats, and finally the weight of a cubic foot of the steam at the several pressures or densities enumerated The steam is supposed in every case to be saturated with water

STEAM BOILER A vessel in which water is converted into steam for the purpose of supplying steam engines, or for any other purposes for which steam is used in the arts, or in domestic economy

Waggon Boiler —The most common form of boiler used for land engines is that called the *waggon boiler*, an isometric view of which is given in the cut The

steam used in these boilers does not exceed the pressure of the atmosphere by more than 5 lbs per square inch, and the sides and ends, though not so favourable to strength as the cylindrical form, are sufficiently strong for this pressure In a boiler of this form the air and smoke pass through flues that are carried round the external shell, but in some waggon boilers there is a flue which passes through the centre of the boiler

The grate and a part of the flues are rendered visible in the figure, by the removal of a portion of the surrounding masonry in which the boiler is set The interior of the boiler is also shown by cutting off one half of the semi-cylindrical roof The door by which fuel is introduced upon the grate is represented at A A door is also represented at B leading to the ash-pit but in land boilers doors are not commonly applied in this situation The fire-bars at C slope downwards from the front at an angle of about 20°, giving a tendency to the fuel to move towards the back of the grate The ash pit D is constructed of such a magnitude form, and depth, as to admit a current of atmospheric air to the grate bars sufficient to sustain the combustion

The fuel, when introduced at the fire door, is laid on that part of the grate next the fire door which is called the *dead plate* There it is submitted to the process of coking, by which the gases and volatile matter are expelled from it and being carried by a current of air admitted through small apertures in the fire-door over the burning fuel in the hinder part of the grate, the gases are burnt When the fuel in the front of the grate has been thus *coked* it is pushed back, and a fresh feed is introduced upon the dead plate The coal thus pushed back soon becomes vividly ignited, and by continuing this process, the fuel spread over the grate is maintained in the most active state of combustion in the hinder part of the grate By such an arrangement the smoke produced by the combustion will be burnt before it enters the flues The flame and heated air proceeding from the fuel to the back of the furnace pass over the fire bridge [illegible] being [illegible] the flue, pass below the concave base of [illegible] Its bottom flue is very nearly equal in width to the base of the boiler, the space left near the [illegible] the flame and heated air rise to the [illegible] by the effect of their high temperature, and *lick* the bottom from the fire-bridge to the further end

The flue rises at the back of the boiler, and returns along the side from H to I, but in the larger class of waggon boilers it [illegible] the form of a square or cylindrical [illegible] the boiler before it winds round the outside. In this instance it passes in front of the boiler at K to the opposite side along which it is again carried from the front to the back of the boiler. At the back it finally turns upwards to the base of the chimney By this arrangement the flame and heated air are made to circulate round the boiler, and the length and magnitude of the flues should be such that when it arrives at the chimney its temperature shall be reduced, as nearly as is consistent with the maintenance of the draught, to the temperature of the water with which it is in contact

The proper level of the water within the boiler is maintained by means of a balanced buoy or float communicating with the rod N which is attached to a lever set on the top of the stand pipe P The top part of this pipe is widened out so as to form a small cistern into which the water for replenishing the boiler is pumped by the engine, and a valve in the bottom of the cistern, when opened by the lever [illegible] the rod N as the float subsides from [illegible] water level, admits a sufficiency of feed water to replace the water removed by evaporation When there is already a sufficiency of water in the boiler the valve in the feeding cistern remains closed, and the excess of water in such a case runs to waste through an overflow pipe provided for that purpose

In marine and locomotive boilers the use of a float for regulating the admission of the feed water is inapplicable, and there the attendant has from time to time to adjust a cock in the feed pipe, so as to admit the proper quantity of water To enable him to know at what level the water stands within the boiler a succession of cocks, [illegible] is attached to the boiler, rising one [illegible] and the highest of these cocks when [illegible] of the boiler in such a manner, that its upper extremity communicates with the steam within the boiler, and its lower extremity with the water The water consequently stands in the tube at the same level as in the boiler, and the height of the water in the boiler is thus rendered visible Cocks are provided at the top and bottom of the tube so that if the tube happens to be broken the issue of the steam or water may be prevented

The [illegible] is a valve, [illegible], which closes, to a greater or less extent, the opening of the flue, in the manner of a sluice A damper of this kind is seen at O, and it is counterpoised by a weight in the stand-pipe P, by means of a chain passing over pulleys When the pressure of the steam in the boiler rises beyond the desired point, the water is forced up by it into the pipe P to a more than usual height The weight in P being thus floated up, the damper at O preponderates, and partly closes the flue, whereby the intensity of the draught through the furnace is diminished and less steam is raised To enable the superfluous steam to escape from the boiler, which if suffered to accumulate would burst it, one or more valves opening upwards and loaded by a weight or spring to a sufficient degree to balance the pressure of the steam is applied This species of valve is called the safety-valve and a valve of this kind is seen in the figure affixed to the top of the boiler near N a pipe proceeds from the safety-valve, which conducts the waste steam into the atmosphere

The dimensions of a boiler should be determined by the demand made upon it for steam by the engine, and a large engine therefore requires a large boiler, or it may be several boilers, to supply it adequately with steam Mr Watt found by experiment that about a cubic foot of water must be evaporated from the boiler in the hour for every horse power of his engine, and he also found that it required about a square yard or nine square feet of the surface of the boiler to be exposed to the fire and flame to evaporate a cubic foot of water in the hour To evaporate this quantity of water, from 8 to 10 lbs of coals were required to be consumed, spread over about three quarters of a square foot of grate-bars The proportions assigned to waggon boilers by scientific writers have heretofore been very conflicting, but Mr Bourne has put an end to these discre[illegible] in his work on the steam engine, [illegible] settled for each size of boiler by Watt, and which have been employed by Boulton and [illegible] upwards of fifty years with remarka[illegible] These proportions are given in the following page

Cylindrical Boilers — The usual pressure of steam employed in waggon boilers is from 3 to 5 lbs per square inch In many engines, however, and especially in those which work expansively, it is found expedient to use steam of a [illegible] To sustain this pressure waggon boil[illegible] adapted, and hence a new class of boilers has been introduced of a cylindrical form, and which are therefore [illegible] These boilers can withstand [illegible] without danger The construction of these boilers in their subordinate features is very various The smaller

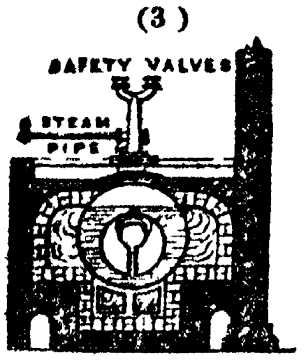
class of boilers usually consist of a cylindrical vessel with hemispherical ends set over a furnace, and the smoke is conducted along the sides of the boiler before it escapes into the chimney Sometimes the smoke is also conducted through a flue immerged in the water of the boiler, and in the larger class of boilers the furnace is very commonly situated within the boiler

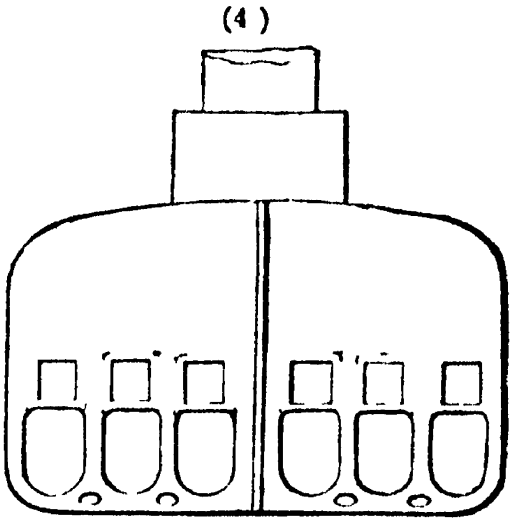
Cylindrical boilers with internal furnaces are open to several objections One of these is, that it is difficult to stay the sides of the furnace and as the diameter of the boiler is necessarily considerable its strength is correspondingly impaired In order that the boiler may be worked with safety the crown of the furnace must always have a considerable depth of water upon it, and by maintaining this depth the water-level is raised so high up into the boiler-crown, and is therefore narrowed so much, that the steam in its escape is likely to carry a considerable quantity of water with it, thereby diminishing the efficiency of the engine, and occasioning a waste of fuel It appears to be very much preferable to place the furnace in a separate chest at the end of the boiler like the fire-box of a locomotive The sides of the furnace may then be efficiently stayed, and the furnace-crown may be kept as low as appears desirable without contracting the ash-pit, or the furnace itself This is the practice pursued in many of the boilers constructed in America, but the American boilers are very often dangerous from the iron being too thin of which they are composed



Cornish Boilers — The boilers used at the mines in Cornwall come properly under the denomination of cylindrical boilers But [illegible] they are reputed to effect [illegible] circumstances, have caused them to be regarded as a distinct class of boilers A very good example of a Cornish boiler is represented in figs 2 and 3, fig 2 being

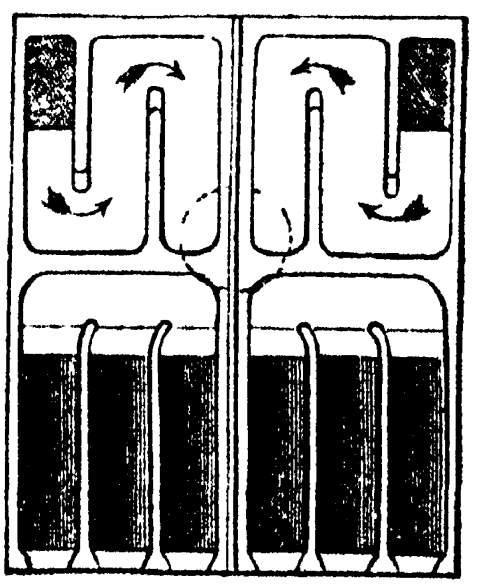
(2)

a longitudinal section of a Cornish boiler, and fig 3 a transverse section The furnace is placed not beneath the boiler but within it, and the flame and hot air pass through a central flue to the end of the boiler They next pass along the boiler sides, and finally beneath the boiler bottom, before they escape to the chimney A brick wall is built at the back end of the fire bars, to form the termination of the furnace This wall is called the furnace bridge Behind the bridge a pipe containing water extends horizontally within the flue, communicating at the one end with the bottom part of the boiler, and at the other end with the top part of the boiler The hot air impinging upon this pipe causes the water within it to boil, and a constant circulation of the water is maintained within it This boiler like the waggon boiler, is set in brickwork, and it is also covered over with a brick arch, for the purpose of retaining the heat But a vacant space is left between this brick arch and the top of the boiler for the purpose of enabling the boiler to expand without disturbing the brickwork



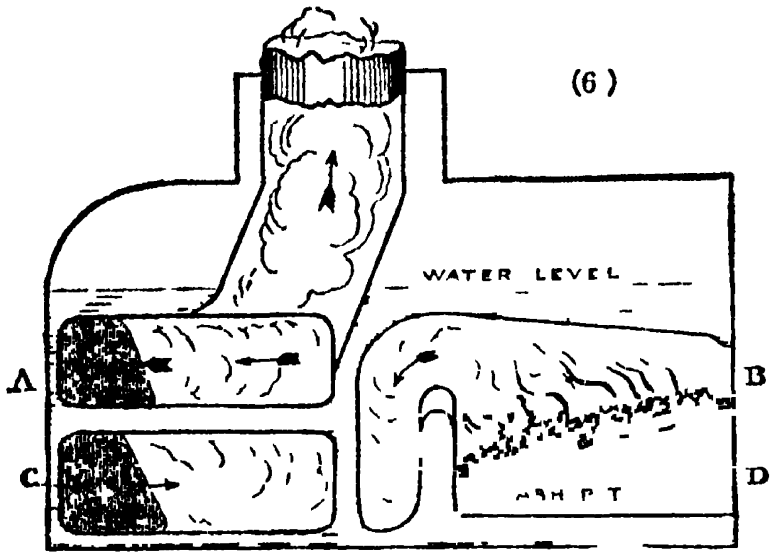
(3)

One of the most remarkable peculiarities of the Cornish boilers is the slowness of the combustion in the furnaces, and the large amount of heating surface allowed for the evaporation of the water Thus, in certain experiments upon Cornish, waggon and locomotive boilers, recorded in Mr Bourne's work upon the steam engine, it was found that the number of pounds of fuel burned upon each square foot of fire-grate in the hour was, in the Cornish boiler, 3 46 lbs , in the waggon boiler, 10 75 lbs , and in the locomotive boiler, 7 1 33 lbs The number of square feet of heating surface of the boiler employed to evaporate a cubic foot of water in the hour was, in the Cornish boiler, 69 58 square feet, in the waggon boiler, 9 96 square feet, and in the locomotive boiler, 6 06 square feet The number of cubic feet of water evaporated by 112 lbs of fuel was, in the Cornish boiler 18 87 lbs , in the waggon boiler, 13 91 lbs , and in the locomotive boiler, 11 14 lbs The modern Cornish engines perform five or six times the work that Watt's original engines performed but the Cornish boilers are not very much more efficient than Watt's original waggon boilers The reason for the superior performance of the Cornish engines must therefore be sought in the engine itself, and it is known to be mainly due to the adoption of a large amount of expansion in using the steam The Cornish engines and boilers are invariably clothed in a very efficient manner to prevent the dispersion of the heat and in all cases this practice is a beneficial one But the radiating surfaces of the Cornish engines and boilers being large relatively with the power, clothing will accomplish a greater benefit in their case than in the case of boilers with a more rapid combustion, and engines making a higher speed



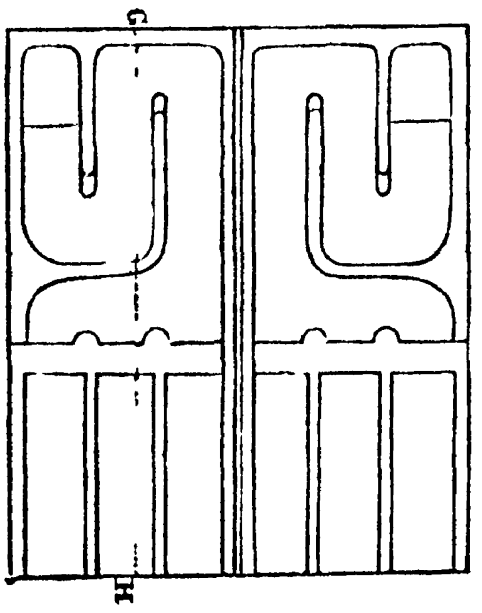
Marine Boilers Boilers set in brickwork being ineligible in steam vessels, a distinct class of boilers has

(4)



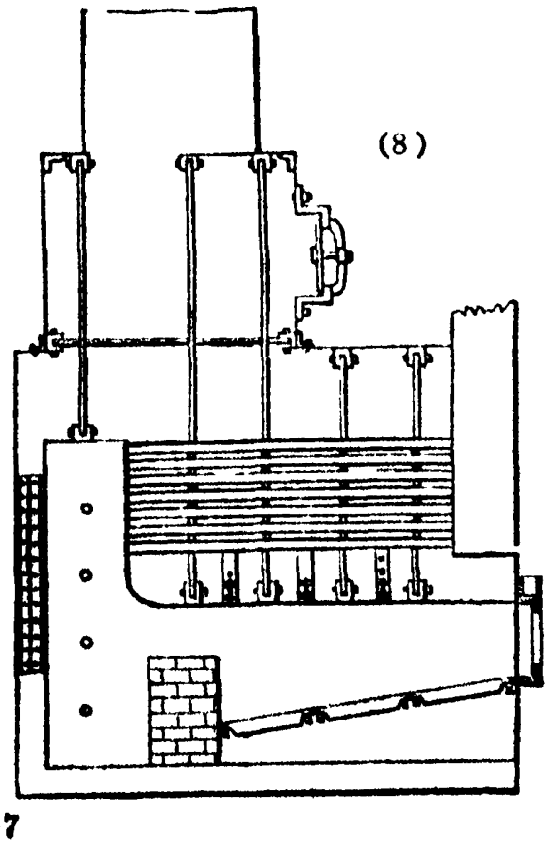
been called into existence to meet the exigencies of steam navigation In these boilers the fire and smoke come

(5)



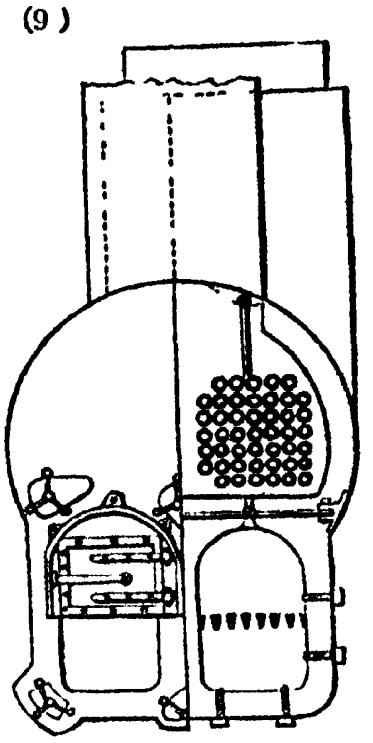
into contact only with metallic surfaces surrounded by water Marine boilers consist of a series of large iron vessels, in which are set a number of metallic furnace chambers, connected with metallic flues winding within the boiler, or with a number of short metallic tubes of small diameter which deliver into the chimney Boilers with large flues winding within them are termed *flue boilers*, and boilers in which the heat is communicated by means of a faggot of small tubular flues passing through the water are called *tubular boilers* In figs 4, 5, 6, 7, and 8, representations are given of the flue boilers of the steam ship Phœnix Fig 4 is a front elevation of these boilers, fig 5 a horizontal section through the line A B, seen in fig 6, and fig 7 a horizontal section through the line C D, seen in fig 6 Fig 6 is a perpendicular section through the line G H, seen in fig 7 It will be obvious from these figures, that the boiler

(6)



consists of two portions placed side by side, and each containing three furnaces The smoke from each group of three furnaces passes into one flue which winds until it reaches the corner of the boiler, as shown in fig 7 The

(7)



flue then ascends perpendicularly upwards, and winds in a similar manner through an upper tier of flues until it finally reaches the chimney in the centre of the boiler, represented by the dotted circle, in fig 5

(8)

Figs. 8 and 9 are representations of one of the tubular boilers of the steam vessel Tagus, fig 8 being a longitudinal section made perpendicularly through the boiler, and fig 9 an end view, with one half cut transversely through the furnace and boiler This vessel, which is of 280 horses power, has four such boilers There are two furnaces in each boiler, and the smoke and flame, after passing over the furnace bridge, ascends into a bundle of small brass tubes, and passes through them on its way to the chimney Upon the top of the boiler a chest is placed to serve as a receptacle for the steam, which there deposits any particles of water that may happen to be mixed with it Iron rods pass perpendicularly and horizontally within the boiler to strengthen it, and to enable it to withstand a considerable pressure Nearly all marine tubular boilers are formed on this general type Sometimes the boiler shell is square instead of waggon-formed, and has more furnaces set within it, but these differences are not very material Tubular boilers are now very largely employed in steam vessels They were

(9)

patented by Mr Bourne in 1838, but first came into general use about 1844 They are lighter than flue boilers, and occupy less space, and if they are properly constructed they are not difficult to keep in repair

Another variety of tubular boilers patented some years since by the Earl of Dundonald has been occasionally employed in Sweden, Russia, and America, and also in this country In these boilers the tubes are set in a vertical position in a suitable chamber, and the tubes contain the water within them, from which the steam has to be raised The smoke and hot air proceeding to the chimney impinges upon the metallic surfaces presented by this forest of vertical tubes, and steam is generated within the tubes which escapes through the water covering their upper ends into the steam space of the boiler Upon the whole, this species of boiler appears to be the one most likely to come into use for marine purposes The vertical tubes being open at both ends are easily cleared of deposit the weight of the boiler [illegible] that of the species of tubular boiler [illegible]

Proportions of Marine Boilers — Marine boilers are commonly proportioned according to the nominal power of the engines they are employed to drive But this is not a proper practice Their dimensions should be determined by the number of cubic feet of water they are required to evaporate in the hour, and not by the nominal power To evaporate a cubic foot of water per hour in *flue boilers* the following are the proper proportions — heating surface 8 square feet, fire grate 70 square inches, sectional area of flue 13 square inches, sectional area of chimney 6 square inches, area over furnace bridges 14 square inches, area of flue to area of fire grate as 1 to 5 4, total heating-surface in feet divided by the area of flue in feet 1 88th To evaporate a cubic foot of water per hour in *tubular boilers*, the following are the proper proportions — heating surface 9 square feet, fire grate 70 square inches, sectional area of tubes 10 square inches, sectional area of back uptake 12 square inches, sectional area of front uptake 10 square inches, sectional area of chimney 7 square inches, ratio of length of tube to diameter 1-28th to 1-30th, ratio of length of tube to area of tube 1-12th to 1-15th, cubical content of boiler, exclusive of steam chest, 6 5 cubic feet, cubical content of steam chest 1 5 cubic feet

The amount of mechanical power produced by a cubic foot of water evaporated per hour in the boiler depends very much upon the manner in which the steam is used in the engine In the original engines of Watt a cubic foot of water evaporated in the hour produced only steam sufficient for one horse power, but in modern marine engines, which work to some extent on the expansive principle, from 1½ to 1¾ horses power are produced by the evaporation of a cubic foot of water per hour — a [illegible] 55,000 lbs. [illegible] Horse Power, in the Supplement)

Incrustation of Marine Boilers — One of the greatest inconveniences attending the original application of the steam engine to the navigation of the ocean arose from the rapid accumulation of salt within the boiler in consequence of the necessity of feeding the boiler with salt water from the sea. In the early voyages of the

City of Edinburgh steamer between London and Leith the water in the boiler was found to have acquired nearly the same amount of concentration that exists in a salt pan, and it became necessary [illegible] placed at the bottom of the [illegible] sing, in order that it might be emptied of its contents and be refilled again with water To remedy this inconvenience Messrs Boulton and Watt, by whom the machinery of the City of Edinburgh was made, applied a pump to the boiler, which should continually draw off a portion of the over-salted water, and by adjusting the dimensions of this pump to the dimensions of the feed-pump in a certain proportion, the boiler might be worked with water in any state of concentration that might be judged most convenient It was soon found, however, that the employment of pumps for the extraction of the over-s[illegible] the boiler would itself [illegible] opened with the sea, a [illegible] communication are now very generally employed These cocks are termed blow-off cocks

Sea-water contains about $\frac{1}{33}$ of its weight of saline ingredients, and it is found that when the density of the water is increased by evaporation until it contains $\frac{4}{33}$ of its weight of saline ingredients, some of those ingredients begin to be deposited upon the flues forming upon them a stony crust which retards the transmission of the heat It is hence very important that the water in marine boilers should never contain more than $\frac{4}{33}$ of salt, and it is easy to keep the water below this point of concentration by blowing out a sufficiency of the over salted water and filling up the boiler with the fresher water of the hot well or the sea Hydrometers are now very generally provided in steam vessels to enable the engineer to determine the density of the water, and in every case it is right to practise blowing out to such an extent as will prevent the formation of saline or stony encrustations upon the flues It is better also to blow the water out from the top of the boiler than from the bottom The substance which forms a scale upon the flues exists in the first place in the state of an impalpable powder, which is ballooned up to the surface of the water by the steam If it be there collected and ejected from the boiler no scale will be formed, whereas if it descend upon the flues it is there hardened by the heat into a stony scale which it is afterwards difficult to remove

Corrosion of Marine Boilers — Marine boilers last for a much less time than land boilers, and the cause of their rapid decay is internal corrosion This corrosion has its seat chiefly in the interior of the steam chest and upon the inner surface of the top of the boiler, and Mr Bourne, in his work upon the steam engine, has suggested that this corrosive action is mainly imputable to the existence of surcharged steam within the boiler It appears inadvisable therefore to carry the roof of the chimney through the steam space, as is generally done in marine boilers, but it should be carried to the outside of the boiler beneath the level of the water, and be then carried up outside

Boiler Explosions —The explosion of a boiler generally arises from one of two causes — either from the strength of the boiler being inadequate to bear the pressure accidentally or perhaps habitually put upon it, so that it at last gives way, — or from the flues having been suffered by an improper subsidence of the water to become red hot, when they cease to be able to sustain the pressure to which they are exposed A marine boiler may also burst if the water within it be suffered to attain such a point of saturation that salt is deposited to a great thickness upon the flues, for the metal composing the flues being in such a case unable to transmit the heat to the water with sufficient rapidity, may become red hot and may thereby lose the strength necessary to withstand the pressure of the steam Nearly all explosions, however, are traceable either to an undue pressure in the boiler or to a deficiency of water Sometimes the safety-valve becomes deranged when the steam is unable to escape from the boiler The occurrence will always become discoverable by a reference to the steam gauge, — a syphon tube containing mercury affixed to the boiler, and which shows by the position of the mercury the pressure of the steam If the steam becomes dangerously high the mercury will be blown out of the steam-gauge, and all the gauge-cocks should then be opened, and the blow-through valve [illegible] to let the steam [illegible] ive become red-hot from a deficiency of water, on no account must more water be added, but the pressure of the steam must be *gradually* reduced, and the fires should be immediately raked out To reduce the pressure of the steam suddenly would cause a sudden ebullition which might carry the water over the red-hot flues, and perhaps cause the [illegible] le

Power of various Kinds of Coal in Boilers —In a boiler so proportioned that a pound of the best Welsh coal will evaporate 9 493 lbs. of water, a pound of anthracite will evaporate [illegible] of water, a pound of the best small Newcastle coal, [illegible] and a pound of Newcastle [illegible] one pound of Welsh and Newcastle mixed half and half [illegible], a pound of Derbyshire, 6 772 lbs and a pound of Brown coal, Northumberland, 6 lbs Cannel coal nearly equal in evaporative power A pound of wood, in its [illegible] evaporates about 4 72 lbs of water, and a pound of turf 5 45 lbs

Proper Method of feeding Furnaces —The coals should be broken up into small pieces and sprinkled thinly and evenly over the fire, [illegible] fire should be without any holes or uncovered places in it, as the efficacy of the fuel would be greatly diminished by the cooling effect of the cold air which would enter thereby The absolute thickness of the stratum of incandescent fuel should be regulated to a considerable extent by the quality of the draught through the furnace If the stratum of coal be thick while the draught is sluggish, the carbonic acid resulting from combustion combines with an additional atom of carbon in passing through the fire, and is converted into carbonic oxide, which carries off a portion of the fuel to waste whereas, if the stratum of coal is thin, while the draught is very rapid, an injurious refrigeration is occasioned by the large excess of air beyond that necessary for combustion, which passes through the fire For further information about steam boilers see *A Treatise on the Steam Engine, by the Artizan Club*, *A Treatise on Steam Boilers, by R Armstrong C E*, *A Catechism of the Steam Engine, by J Bourne, C E*, and *The Steam Engine Explained, by Dr Lardner*

STEAM CARRIAGE A name usually applied to locomotive engines adapted to work on common roads

The principle of the construction of these engines is, in its general conditions, similar to that of the locomotive engine used on railways (*see* LOCOMOTIVE ENGINE), but the engine adapted to common roads must be lighter than the locomotive engine, and must also have wheels with very wide tires, which will not sink deeply into the ground

Although the attempt made to adapt the steam engine as an accessory power on common roads has not hitherto been productive of any practical result of a permanent nature this has not arisen so much from the inability of steam power to accomplish the traction of carriages upon common roads as from other circumstances At the time when the construction of railways throughout the country was extensively undertaken and when the great power and economy of the locomotive engine upon them was demonstrated by the results of the traffic on the Liverpool and Manchester railway, several projects for the application of the locomotive engine on common roads were in progress and were attended with effects which presented a fair prospect of ultimate success The establishment of the great lines of railway communication throughout the kingdom however, by engrossing the traffic of all those districts in which the locomotive engine on common roads promised greatest advantage and on which if any where, it would have taken the place of horse power, discouraged speculators and most of the projects which had been in progress fell to the ground Many of these projects no doubt were very crude and imperfect, for the construction of engines adapted to the common road had not, to any considerable extent, yet fallen into the hands of efficient practical engineers But enough was accomplished to show that the steam engine may be employed advantageously in substitution of horses in drawing carriages upon common roads in all cases where there is a considerable traffic, and where a competing railway does not exist

The engine in steam carriages generally acts either directly on the wheels and causes them to revolve and thereby propels the carriage, or it acts on cranks formed on the axle of the wheels and the wheels being keyed upon the axle are compelled to revolve with it In either case, the revolution, whether of the wheels or the axle, is produced by a connecting rod jointed on the end of the piston rod, and receiving motion from the piston rod The wheels are generally driven by two pistons working in two cylinders, so that one is at its dead point when the other is in the position most favourable for its action The arrangement of this part of the machinery being similar to that of the railway locomotive, need not be here more fully described

The steam carriages of different projectors differ one from another, chiefly in the boilers, and in the apparatus for generating the steam and admitting it to the cylinder Mr Gurney's boiler consisted of a series of strong iron tubes placed side by side, so as to form the bars of the grate of the furnace These were connected with another system nearly at right angles to them, forming the back of the furnace, and these again with a third system, forming the roof of the furnace The tubes forming the grate bars had their ends inserted in a strong iron cylinder, [illegible] extended across [illegible] the furnace under the fire-door, and the tubes

forming the roof of the furnace were inserted in a similar cylindrical vessel extending in like manner across the front of the furnace *above* the fire door These two cylinders were likewise connected by upright cylinders of less diameter placed at each side of the fire-door This system of tubes and cylinders being filled with water the heat of the furnace acting on the tubes surrounding the fireplace, and the heated air and flame being afterwards conducted above the tubes forming the roof of the fireplace before it escaped into the chimney, steam was produced in the tubes, which by its lightness passed from them to the cylindrical vessel extending over the fire-door From that vessel the steam passed into a larger cylindrical vessel above it, called a *separator*, its purpose being to disengage the pure steam from the spray of water with which it is generally mixed when it first escapes from the boiling water in a state of violent agitation

In these engines the draught of the furnace was produced by projecting the waste steam into the chimney, but instead of dismissing it directly from the eduction pipe of the cylinder to the chimney, it was conducted to a receptacle called a *blowing box* This box served the same purpose as the [illegible] It received the steam from the cylinder [illegible] but it let it escape into the chimney in a continued stream by a number of small jets A regular draught was by this means produced, and no noise was perceived, which, if it had existed to any serious extent, would have frightened the horses on the road

A steam carriage constructed by Mr Gurney, weighing 35 cwt , working for eight hours was found according to Mr Gurney's statement, to do the work of about thirty horses The engine was placed on a carriage separate from that which bore the passengers and the one drew the other after it in the same manner as the railway engine draws its train Mr Gurney stated that the weight of an engine sufficient to draw after it a carriage containing eighteen passengers would be about a ton, so that the gross weight of the whole the engine and carriage for passengers taken together would not exceed that of a common stage coach and four horses But there is every reason to believe that this estimate is below what could be realised permanently in practice

In the steam carriage proposed by Mr Hancock and which was worked for some time on the New Road and other roads about London, the engine and passengers were placed in the same carriage In the boiler the subdivision of the water, so as to expose a sufficient surface to the action of the fire was accomplished by dividing a case or box by a number of thin plates of metal like a galvanic battery, the water being allowed to flow between every alternate pair of plates, the intermediate spaces forming the flue through which the flame and hot air pass In fact a number of thin plates of water are exposed on both sides to the most intense action of flame and heated air, so that steam of a high pressure is produced in great abundance, and with considerable rapidity The plates forming the boiler were bolted together by strong iron ties, extending across the boiler at right angles to the plates The distance between plate and plate was two inches, and each chamber formed, in point of fact, a separate boiler

There were ten flat chambers of this kind for water and intermediately between them ten flues Under these flues was the fire grate, six square feet in magnitude The water spaces were filled to about two thirds of their depth with water, and the other third was left for steam The water chambers throughout the whole series communicated with each other at top and bottom and were held together by two large bolts By releasing these bolts at any time, the chambers fell asunder, and by screwing them up, they might be all made tight again

These boilers were constructed to bear a pressure of 400 or 500 lbs per square inch, but the safety valve was screwed up to a pressure not exceeding 100 lbs per inch There were 100 square feet of surface exposed to the fire The stages which the engine performed were eight miles, after which a fresh supply of water and fuel was taken in

One of the most judiciously constructed steam carriages intended to be used upon the common road was the production of Mr Summers, of Southampton The boiler of this carriage was composed of vertical tubes, within which the water circulated and the heating surface when thus arranged, was found to be exceedingly efficient The weight of this carriage was about 3 tons, the surface of the boiler exposed to the action of the fire and flame was 245 square feet, and the usual working pressure of the steam was about 250 lbs on the square inch, but the boiler was made capable of [illegible] pressure of 740 lbs on the square inch [illegible] two driving cylinders, each 7½ inches in diameter and 18 inches stroke Mr Summers, in his evidence given before the House of Commons in 1831, states that his carriage has ascended hills rising one foot in six, and has run upon level roads at a speed of thirty miles an hour. Mr. Summers also states that he considers merchandise may be transported more cheaply by steam carriages than by horse carriages or waggons, even at the lowest rates of speed, and also more cheaply than by railway, if regard be had to the original expenditure This, however, is manifestly a question of the amount of traffic If there be much traffic, a railway will be able to carry [illegible] coach on the common road [illegible] steam coach may be profitable when a railway is unable to realise a remunerative return Both expedients may be made perfectly efficient, and the amount of traffic must determine which expedient of transport is to be preferred

In the early career of steam locomotion upon roads and railways much [illegible] from fractures in the [illegible] the boiler, and the shaking [illegible] bolt keys and other similar instruments of adjustment The progressive improvements introduced into the locomotive engines upon railways have reduced these evils to a small amount, and these improvements may now be applied to steam carriages intended to maintain communication upon the common road, whereby those carriages will be placed in a better position than they originally occupied They must be made stronger than heretofore, they must possess a powerful [illegible] and be supported by wide wheels, they should also possess a [illegible] gear for overcoming heavy acclivities and [illegible] they should be supported upon [illegible] For further details about steam carriages, see the *Report from the Select Committee of the House of Commons upon Steam* [illegible] a *Treatise on Elemental Locomotion*, [illegible] C E , *The Mechanics' Magazine*, and the *Foreign Quarterly Review*

STEAM ENGINE A machine in which the mechanical power developed in the evaporation of water is rendered available as a moving power Steam engines vary much in magnitude, form, and proportions, as well as in the details of the machinery by which the power of the steam is adapted as a prime mover The forms of steam engine, and the mode of its application to transport by [illegible] articles [illegible] see STEAM NAVIGATION

History of the Steam Engine — Various attempts at the mechanical application of steam on a small scale were made at very early periods in the history of mechanical science Hero of Alexandria has left a description of a small machine, in which a motion of continued rotation was imparted to an axis by the reaction of steam issuing from lateral orifices in arms placed at right angles to the revolving axis The date of this invention is about a century before the birth of Christ Branca, an Italian engineer, about the beginning of the 17th century proposed to move a wheel by a blast of steam blown [illegible] and about the same period De [illegible], described a machine by which a column of water might be raised by the pressure of steam confined in a vessel above the water to be elevated There is nothing, however, in the descriptions and developments which these projectors have left to demonstrate that they were acquainted with those physical properties of elasticity and condensation (*see* STEAM) on which all the power of steam, as a mechanical agent, depends In the middle of the 17th century, or somewhat later, the celebrated Marquis of Worcester published in his work called *A Century of Inventions*, a description of a steam engine to be worked by steam of high pressure, which, though [illegible] its details, is still such as it [illegible] written by any one unacquainted [illegible] of steam Towards the close of that century, Papin, a French engineer, who was professor of mathematics at Marbourg directed his attention to the properties of steam, and conceived the idea of obtaining a moving power by introducing a piston into a cylinder and producing a vacuum under it by the gradual condensation of steam by cold But the steam was also to be generated in the cylinder by the [illegible] a fire, and it was not to be condensed by [illegible] of cold substances to the cylinder, but was to cool gradually of its own accord The details of the project were altogether so imperfect as to render it useless in practice There is no evidence of Papin having carried his idea even so far as the construction of a model until after machines worked by steam had been constructed elsewhere, and he then relinquished his own project in favour of that of Savery

The first actual working steam engine of which there is any detailed account was constructed by Thomas Savery, an Englishman, to whom a patent was granted for it in the year 1698 Savery reproduced the method of forming a vacuum by the condensation of steam, apparently without being aware of the paper written by Papin He combined this with the elastic pressure of steam as applied by Lord Worcester, and constructed an

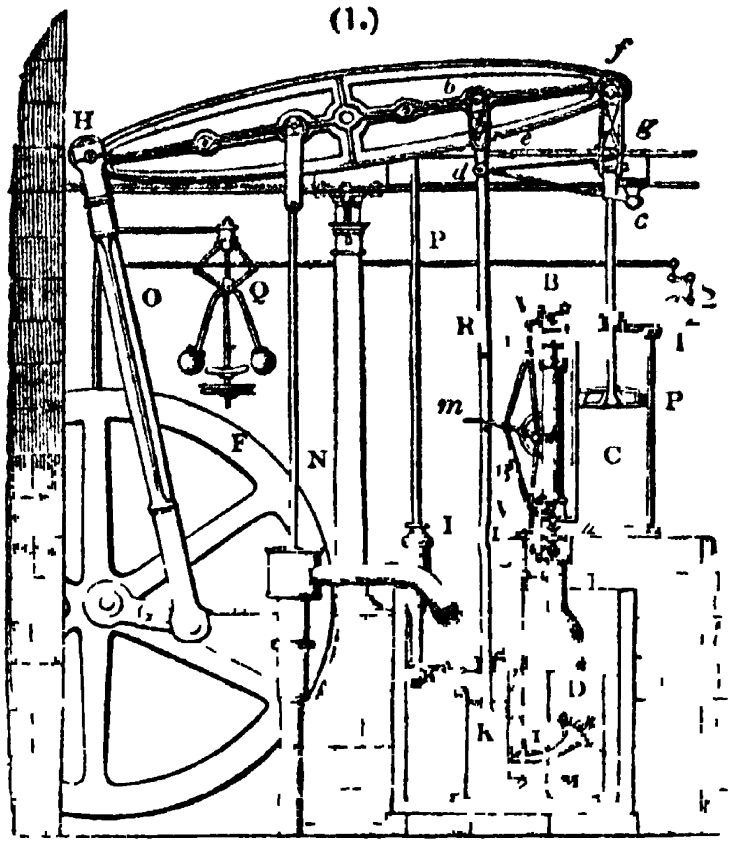
engine, which, for a time, was used to a considerable extent for raising water Savery's steam engine consisted of a strong iron vessel formed in the shape of an egg, having a tube or pipe at the bottom, which descended to the place from which the water was to be drawn, and another at the top, which ascended to the place to which it was to be elevated This oval vessel was filled with [illegible] which the atmospheric air [illegible] filled was first blown out of it When the atmospheric air was thus expelled, and nothing but pure steam was left in the vessel, the communication with the boiler was cut off, and cold water was poured on the external surface of the vessel The steam within it was thus condensed and a vacuum produced and the water was drawn up from below in the usual way by suction The oval steam vessel was thus filled with water, a cock at the top of the lower pipe was then closed and steam was introduced from the boiler into the oval vessel above the surface of the water This steam, being of high pressure, forced the water up the ascending tube from the top of which it was discharged, and the oval vessel being thus again filled with steam, the vacuum was again produced by condensation, and the same process was repeated By using two oval steam vessels which would act alternately one drawing water from below while the other was forcing it upwards, an uninterrupted discharge of water was produced

Owing to the danger of explosion, from the high pressure of the steam which was used, and from the enormous waste of heat by unnecessary condensation these engines [illegible] was introduced consisting of [illegible] piston being connected to one of the ends of a great beam, hung like the beam of a pair of scales, while to the other end of the beam the pump rods of the mine were attached The cylinder was close at the bottom and open at the top and when the steam from the boiler was introduced beneath the piston, the pump rods being heavier than the piston preponderated and the piston ascended to the top of the cylinder The ingress of steam from the boiler was then stopped, and the steam within the cylinder being gradually condensed the piston descended and made a stroke This machine was invented by Newcomen a blacksmith, and Cawley, a glazier, at Dartmouth, in Devonshire In the first engine constructed by them the condensation was effected by the affusion of cold water upon the external surface of the cylinder which was introduced into a hollow casing by which it was surrounded The discovery of condensation by jet within the cylinder one of the most important steps in the improvement of the steam engine was accidental It happened that a small hole occurred in the bottom of the cylinder of an engine by which the water let in to cool its external surface oozed in forming a little jet The effect was a much more rapid and perfect condensation than ever was or could be effected by external cold Thenceforward the method of condensation by jet was adopted, and has ever since been used

In the early atmospheric engines the cocks by which the steam was admitted and condensed, and by which the injected water and condensed steam were drawn off were worked by hand, and as the labour was light and monotonous and required no skill, boys were employed for the purpose, called *cock boys* It happened that a cock boy, by name Potter, having an itch for play, and endowed with more ingenuity than [illegible] that by tying strings to the cocks, and [illegible] with the working beam above the cylinder, regulating the action by carrying them under or over certain pipes, he could make the beam, as it ascended and descended, open and close the cocks more regularly and effectually than he found himself able to do This he accordingly accomplished and was habitually absent from the engine-house, enjoying himself with his playfellows, when his employers were giving him credit for most extraordinary industry and regularity [illegible] his duties The engine, in fact by [illegible] tripled its work Thus by the ingenuity of a child, the steam engine was first endowed with the qualities of an automaton which have ever since rendered it an object of admiration and interest The engine thus endowed with new powers, was subsequently greatly improved in its details by Beighton and by Smeaton As thus improved, it held its place as the great instrument for the drainage of mines until the epoch which was [illegible] by the inventions and discoveries of [illegible], even still be seen in use at coal mines, and in other situations where coal is cheap In these early engines the cylinder was open at the top, and the piston was pressed down by the weight of the atmosphere They were therefore called *atmospheric engines*

Watt was a mathematical instrument maker in Glasgow, and, being employed by the university of that place, it chanced, about the year 1763, that the model of an atmospheric engine used at the lectures of the professor of natural philosophy required some repairs, to make which it was placed in the hands of Watt. In the [illegible] which it became his duty to make with this [illegible] was struck with the fact that the quantity of steam it consumed for each stroke of the piston was many times more than the contents of the cylinder The large quantity of water necessary to be injected in order to complete the condensation also excited his surprise This led him to make [illegible] which he soon [illegible] important with the evaporation of water He made a near approximation to the proportion of the volume of steam to that of water He ascertained with great precision the latent heat of steam, and consequently determined the quantity of water necessary to condense any given quantity of steam Filled with astonishment at these results, and more particularly at the nature of latent heat, and at the great amount of the latent heat of steam he repaired to Dr Black, then professor of natural [illegible] and communicated to him [illegible] He then, for the first time learned Black's celebrated theory of latent heat, and found that he had himself thus accidentally discovered one of the most striking facts on which that theory rested

Considering the atmospheric engine in an economical point of view, Watt was forcibly impressed with the waste and expense which appeared to arise in the unnecessary consumption of steam involved in its operation In the theory of that engine, one cylinderful of steam ought to be sufficient for each stroke of the piston Watt, on the other hand, found that the actual consumption was at the rate of four or five cylinderfuls per stroke On examination, he discovered the source of this waste to arise from the necessity, in order to make the piston ascend, not only to condense the steam but to cool the whole mass of the cylinder down to 100°, and, to make the piston descend it was necessary not only to fill the cylinder with steam, but to raise the temperature of the cylinder and piston from 100° to 212° He soon perceived that this enormous waste of fuel was the inevitable consequence of condensing the steam in the cylinder



Reflection on these circumstances happily led him to the idea of condensing the steam in a separate vessel, which should be kept immersed in a cistern of cold water, and in which a jet of cold water might be kept constantly playing, with the addition of a pump to draw off the injected water and condensed steam from such vessel In fact all the details of the steam engine as already described were soon carried into practical effect, and engines constructed according to these principles Instead of causing the piston to descend by the pressure of the atmosphere, as in the old atmospheric engine it was forced down in Watt's engines by means of steam and a lid was applied to the top of the cylinder through a steam-tight hole in which the piston rod passed to connect itself with the working beam

Single acting Condensing Steam Engine — When the steam engine is applied to the purpose of pumping water, which in the first periods of its invention was its only practical application the force which it exerts is only required in raising the pump rods with their load of water their own weight being more than sufficient for their descent As the pump rods are attached to the end of a working beam hung upon an axis, the force of the steam is required to draw up that end by drawing down the end at which the steam piston is attached The steam, therefore, being only required to press the piston downwards is admitted above the piston while the space in the cylinder below the piston is kept in free communication with the condenser The operation of the valves by which the steam is admitted and withdrawn is precisely the same as in the double-acting engine, which will presently be described and to which reference may be made for a fuller explanation of the action of the machine When the piston has reached the bottom of the cylinder, the valves for admitting and withdrawing the steam being closed, a valve called the equilibrium valve is opened, by which a free communication is made between the top and bottom of the cylinder by this means the steam which fills the upper part of the cylinder, being allowed to flow equally to the lower part, will press with the same force on both sides of the piston, and will therefore have no tendency whatever to move it Under these circumstances the preponderating weight of the pump rods suspended from the other end of the beam will draw the piston to the top of the cylinder, while it is ascending the steam which was above will pass through the equilibrium valve below it, and when the piston has reached the top of the cylinder, the cylinder under the piston will be filled with the same steam which previously had driven the piston down In order to accomplish the next down stroke, the equilibrium valve is closed, and the upper inlet valve and lower outlet valve are opened, the steam pressure acts above the piston, while a vacuum is produced below it, and the piston consequently descends

Double-acting Condensing Steam Engine. — This form

of engine is that which is almost invariably used as a moving power in all manufactures in this country It consists of a cylinder represented in the figure in section at C, in which a solid piston P is driven upwards and downwards by the force of steam supplied by a boiler placed near the engine. *See* STEAM BOILER.

(1.)

T [illegible] which, by [illegible] moves a *crank* and *fly wheel*, from which the machinery to be worked directly receives its motion Steam is supplied from the boiler to the cylinder by the steam pipe S The *throttle-valve* T in that pipe, near the cylinder, is regulated by a system of levers connected with the *governor* Q This governor is an apparatus consisting of two heavy balls attached to the ends of rods which are kept revolving on a vertical shaft by a cord or band or by a train of cogged wheels connected with the fly wheel The velocity with which the balls of the governor revolve is therefore always proportional to that of the fly-wheel, and of the machinery driven by it If by reason of too rapid a supply of steam an undue speed be imparted to the fly-wheel, the balls are whirled round with a corresponding velocity, and by reason of their centrifugal force they recede from the vertical spindle round which they turn, and acting thereby on the system of levers which connect them with the throttle-valve T, they partially close the latter, check or diminish the supply of steam to the cylinder, and moderate the velocity of the machine If, on the other hand the motion of the engine be slower than is requisite, owing to a deficient supply of steam through S then the balls, not being sufficiently affected by centrifugal force fall towards the vertical spindle, and acting on the system of levers in the contrary way they turn the throttle valve T more fully open, and admit a more ample supply of steam to the cylinder, so as to increase the speed of the engine to the requisite extent

The piston P is accurately fitted to the cylinder and made to move in [illegible] is surrounded T [illegible] compartments, between which there is no communication by which steam or any other elastic fluid can pass A case B B′ placed beside the cylinder contains the valves by means of which the steam which impels the piston is admitted and withdrawn as the piston commences its motion in each direction The *upper steam box* B is divided into three compartments by two valves, above the upper steam-valve V is a compartment communicating with the steam pipe S Below the exhausting valve E is another compartment communicating with a pipe called the *eduction pipe*, which leads downwards from the cylinder to a vessel called the condenser which we shall presently describe By this eduction pipe the steam is withdrawn from the cylinder after it has driven the piston By the valve V a communication may be opened or closed between the boiler and the top of the cylinder, so as to admit or intercept the supply of steam from the one to the other By the valve E a communication may be opened or closed between the top of the cylinder and the condenser, so that the steam in the top of the cylinder may either be permitted to escape into the condenser or confined in the cylinder The continuation S′ of the steam-pipe leads to the *lower steam-box* B′, which like the upper is divided into three compartments by two valves V′ and E′ The upper compartment communicates with the steam-pipe S′, and the lower with the eduction-pipe By means of the valve V′ steam may be admitted from the steam-pipe S′ to the bottom of the cylinder, and by means of the valve E′ this steam may be permitted [illegible]

The four valves V, E, V′, and L are in the engine represented in the figure connected by a system of levers with a single handle or *spanner m* which being pressed upwards or downwards opens and closes the valves in pairs Thus when it is pressed *down* the levers connected with it raise the upper exhausting valve E and the lower steam valve V′, and close the upper steam valve V and the lower exhausting valve E′ On the other hand, when the spanner *m* is pressed *up* it opens the upper steam valve V and the lower exhausting valve V′, and at the same time closes the upper exhausting valve E and the lower steam valve V′

The cylinder is closed at the top, and the piston-rod P being accurately turned, runs in a steam-tight collar furnished with a stuffing box, by means of which it is surrounded by a packing of hemp and constantly lubricated with melted tallow A funnel is screwed on the top of the cylinder, through which by opening a stop-cock, melted tallow is permitted to fall from time to time on the piston so as to lubricate it

The condenser D is submerged in a cistern of cold water at its side there enters a tube I′, governed by a cock I, which being opened or closed to any required extent a jet of cold water may be allowed to play in the condenser This jet throws the water upwards towards the lower orifice of the eduction pipe L′ From the bottom of the condenser D proceeds a tube having a valve M in it opening outwards, this tube leads to the *air-pump* K′, which is a pump submerged in the same cistern with the condenser, worked by a piston having a valve in it opening upwards The piston-rod R of the air-pump is carried upwards, and attached at *d* to a system of jointed rods called the *parallel motion*, to which is also attached at *g* the great steam-piston rod On the rod of the air-pump is placed projecting pins, which as it alternately ascends and descends strike the [illegible] *m*, and thereby open and close the valves V, V′, L, L′, in pairs, as already described

The upper [illegible] by a valve o [illegible] k, called the *hot well*, for a reason which will presently appear A pump L, called the hot-water pump, descends into the hot well, and is worked by the great working beam to which its rod is attached

If the machine thus arranged continued to be worked for any length of time, the cistern of water in which the condenser and air pump are immersed would become warm, and the condenser would be rendered incapable of doing that for which alone it is useful, viz of reducing the steam to water *by cold* To prevent this a pump N is provided called the *cold-water pump*, by which a supply of cold water is constantly kept flowing into the cistern, the heated water being at the same time allowed to escape by a waste pipe By this means the temperature of the water in the cold cistern is kept so low as to be capable of effectually condensing the steam

The piston being supposed to be at the top of the cylinder, the spanner *m* will be raised by the lower pin on the air-pump rod and the valves V and E′ will be opened, and at the same time the other pair of valves V′ and E will be closed Steam will therefore be admitted above the piston, and the steam which had previously filled the cylinder below the piston will be drawn off to the condenser It will there encounter the jet of cold water, which is kept constantly playing there by keeping the cock I sufficiently open It will thus be immediately reduced to water or condensed (*see* STEAM), and the cylinder below the piston will remain a vacuum The steam therefore, admitted from the steam-pipe through the open valve V to the top of the cylinder will press the piston to the bottom of the cylinder As it approaches that position the spanner *m* will be struck downwards by the upper pin on the air-pump rod, and the valves V and E′ previously open will be closed, while the valves V′ and E previously closed will be opened The steam which has just pressed down the piston, and which now fills the cylinder above the piston, will then flow off through the open valve E by the eduction-pipe to the condenser, where it will be immediately condensed by the jet of cold water which constantly plays there, and steam from the boiler admitted through the open valve V′ will fill the cylinder below the piston and press the piston upwards When the piston has reached the top of the cylinder the lower pin on the air-pump rod will have struck th [illegible] *m* upwards, and will thereby have [illegible] s V and E and opened the valves V and [illegible] will then be in the same situation as in the commencement, and will again descend, and so will continue to be driven upwards and downwards by the steam

While this process is going on in the cylinder a quantity of warm water is formed in the condenser, by the

mixture of condensed steam with the cold water admitted through the condensing jet I'. It has been shown (*see* STEAM) that any quantity of water in the state of steam, being condensed by cold water, will raise nearly six times its own weight of cold water from the freezing to the [illegible] which is rendered sen- [illegible] But since the jet of cold water, instead of being at the temperature of melting ice, is at the common temperature of the atmosphere say 50°, and it is necessary to reduce the temperature of the water in the condenser to at least 100° (otherwise steam would be produced by it, which would seriously resist the motion of the piston), and to reduce water from 212° to 100° by mixture with water at 50° would require a quantity of the latter about twice the former, it follows that the quantity admitted through the jet must be more than twenty times the quantity which passes through the cylinder in the form of steam

The warm water which is thus formed in the condenser, if allowed to accumulate there, would soon choke it up and stop the action of the machine To prevent [illegible] when the air-pump piston [illegible] uum, and the *foot valve* M being relieved from all pressure, the weight of the water in the condenser forces it open and the warm water flows from the condenser into the lower part of the air-pump, from which its return to the condenser is prevented by the closed valve When the air-pump piston descends, its pressure on the liquid under it will force open the valve in it, through which the warm water will pass, and when the piston descends to the bottom of the pump-barrel the warm water which was below it will pass above it and cannot return, as the valves which open upwards will be kept closed by its weight When the piston next ascends it will raise the water thus collected above it, and will throw it through the valve into the hot well K

The hot-water pump L is usually a suction and forcing pump, and draws up the warm water from the hot well and drives it through a pipe called the feed pipe to a cistern placed over the boiler, from which the boiler derives its feed of water *See* STEAM BOILER

The system of jointed rods *c d e f g*, called the parallel motion, has for its object the maintenance of the rods of the steam piston and air-pump in a truly vertical position The steam-piston rod imparts motion to the beam, and the air-pump rod receives motion from it The beam, however, moving as it does alternately upwards and downwards on an axis every point on it must move alternately in the arc of a circle whose centre is in the axis of the beam If the ends of the rods of the steam-piston and air pump were immediately attached to the beam they would move therefore not in truly vertical straight lines, but in the arcs of circles, and by reason of the curvature of such arcs they would be alternately reflected to the right and to the left Such an effect would be quite incompatible with that smoothness and precision which are essential to the effective action of the steam engine By the parallel motion the ends of these piston rods are not immediately attached to the working beam, a rod *c d*, called the *radius rod* moves on a fixed centre *c* attached to the framing of the engine, a bar *d b* connects the other end of this radius rod with a pivot *b* on the beam, so that as the beam ascends and descends the pivots *b* and *d* each move in an arc of a circle, and these pivots [illegible] [illegible] tralized at its middle point *e*, which neither deviates to [illegible] is in a vertical straight [illegible] the air-pump piston is attached

At the end of the beam to another joint *f* is attached a bar *f g*, equal to *b d* connected by pivots with another bar *d g* equal in length to *b f*, so as to form the jointed parallelogram *b d g f* By this arrangement as the beam ascends and descends, the point *g* is moved in a manner altogether similar to the point *e*, only that it moves through a greater space in the proportion of the distance of *g* from the axis of the beam to that of *e* from the same point The point *g* therefore to which the steam-piston is attached, is moved upwards and downwards in a truly vertical straight line while the end *f* of the beam with which it is connected is moved upwards and downwards in the arc of a circle

When the piston is at the top of the cylinder the crank G placed on the axis of the fly-wheel F is at its lowest position, and when the piston is at the bottom of the cylinder it is in its highest position In each of these positions the action of the steam on the piston could not impart any motion to the crank, for the connecting rod O being then in line with the crank any force given to it, being necessarily exerted in the direction of its length, [illegible] pressure or strain on the crank-pin [illegible] dency to turn the crank round the axis of the fly-wheel In these positions the machine is therefore placed in a dilemma, in which the moving power ceases to have any influence on the object it is intended to move

The machine is extricated from this dilemma by the inertia of the fly wheel, that wheel being a large mass of matter, having once received a certain velocity of rotation on its axis, has a tendency to retain such motion, and [illegible] therefore, the crank arrives at either of the positions above mentioned and the moving power ceases to be effective, the inertia of the fly-wheel causes it to continue its motion, and the crank is immediately turned out of the extreme position it had assumed, and thrown into a position in which the power of the piston on it becomes effective

The functions of the fly-wheel are, however, not confined to carrying the machine thus through the dead points by the energy of the force it has received from the piston when the crank was in a more favourable position, it likewise equalises by the same property the unequal effect of the crank It is only when the crank forms a right angle with the connecting rod that it is fully effective, and as that angle changes [illegible] until at length the leverage is reduce [illegible] extreme positions just mentioned When the crank is in and near the position in which it is rectangular to the connecting rod, its action is shared between the fly-wheel and the machinery driven by the engine, a part being engaged in accelerating and therefore giving momentum to the fly-wheel As it passes towards the dead point this momentum taken up by the fly-wheel is given back to the crank in aid of the moving power, at those positions of the crank where the effect of the moving power upon it becomes enfeebled In this manner the fly-wheel in the steam engine becomes a perfect equaliser of the mechanical action of the machine

To the working end H of the beam is attached the *connecting rod* O formed of cast iron, the lower end of which is attached to the crank G by a pin On the axis of the crank is placed the fly wheel and connected with its axle is the governor Q already described The manner in which the crank affects the connecting rod at the dead points produces an effect of great importance in the operation of the engine When the crank approaches the lowest point of its play, and at the same time the piston is approaching the top of the cylinder, the motion of the crank pin becomes nearly horizontal, and consequently its effect in drawing the connecting rod and the end of the beam downwards, and the piston upwards is extremely small The consequence of this is, that as the piston reaches the top of the cylinder its motion becomes very rapidly retarded, and as the motion of the crank pin at its lowest point is actually horizontal, the piston is brought to a state of rest by this gradually retarded motion A similar effect is produced at the other dead point The motion of the engine is consequently very smooth and free from shocks and jerks by which, if they existed its durability and also its eligibility as a prime mover would be materially impaired

Such, then, is the engine of Watt Notwithstanding the manifest advantages attending these improvements the mining and manufacturing interests were slow and reluctant in their adoption of them and, at the end of twenty years from the date of his first improvement, Watt and his partners found that the manufacture of the steam engine had not only not been a source of commercial profit but had entailed upon them a loss of capital to the amount of about 50 000*l* An application was made to parliament on this ground, for an extension of the patent, which was, after much opposition, granted till the year 1800 Various improvements in the more minute details of the machinery of the engine succeeded this, and Watt lived to reap an ample reward for his ingenuity and perseverance, and to be acknowledged as one of the greatest benefactors of the human race

The engine, as applied to drainage and to manufactures has received no important improvement in its principle since it was dismissed from the hands of Watt Those principles which he suggested and applied have been carried out to their fullest extent, and the efficiency of the engine has been proportionally increased thereby Modern engines it is true, as applied to manufacturing purposes, are very different in some of their details from the form of engine just described For example the valves, instead of being moved by means of pins or tappets on the air-pump rod, are now moved by an eccentric, and sliding or sluice valves are also very generally used Sometimes the beam is discarded altogether, and in the construction of the parts malleable iron is now much more largely employed But all these modifications merely affect the detail, and any one who perfectly understands the operation of Watt's engine will have no difficulty in understanding the mode of action of any other variety of engine that has been introduced since his time

Expansive Engine — As the operation of the steam engine has been explained, the power which moves the piston is the [illegible] with which vapour is produced in the boiler Each quantity of water which is

successively evaporated obtains the same force in the form of steam, by pressure, as the original an equal quantity of steam previously contained in the boiler; and it is the force with which the steam is thus pressed forward that [illegible] But it has been shown that the steam may be employed as a mechanical power with [illegible] the expansive power of the steam separated from the water be used This is accomplished by closing the valve through which steam flows from the boiler to the cylinder before the piston has completed its stroke [illegible] piston has advanced [illegible] valve be closed The steam which is then acting upon the piston will still urge it forward, but as the piston advances, this steam assuming a proportionally augmented volume, will acquire a proportionally [illegible] pressure, so that through the remaining half of the stroke the piston will be urged by a pressure progressively decreasing and at the termination of the stroke it will be a little less than half the force with which the piston was impelled while the steam valve was open

Since the force of the steam from the moment the steam valve is closed is thus continually diminished, its moving power might be so much attenuated that it would be incapable of overcoming the resistance so as to complete the stroke, this would happen if the steam were cut off when only a small fraction of the stroke has been made, unless the pressure of the steam while the valve is open exceeds the resistance in a proportionate degree It is for this reason that the expansive principle cannot be brought into operation to any considerable extent, unless steam be used of a greater pressure than is commonly adopted in low-pressure engines It is also apparent that with an equal volume of cylinder, greater length of stroke, or greater velocity of motion, should be given when the expansive principle is used

The mechanism by which the expansive principle is brought into practical operation consists merely in the adaptation of valves or slides which shall stop the admission of steam when the required fraction of the stroke has been made by the piston, but which shall leave the communication with the condenser open till the stroke is completed If separate valves be used, this is accomplished by adapting the pins or other mechanism by which they are worked to open and close them independently of each other at the proper times If slides be used it is effected by regulating the form and movement of the slide, so as to cover and uncover the passages to the cylinder at the proper times Each species of valve, and each form of slide or cock, has its own peculiar provisions for accomplishing this, the details of which the limits of this article do not enable us to explain

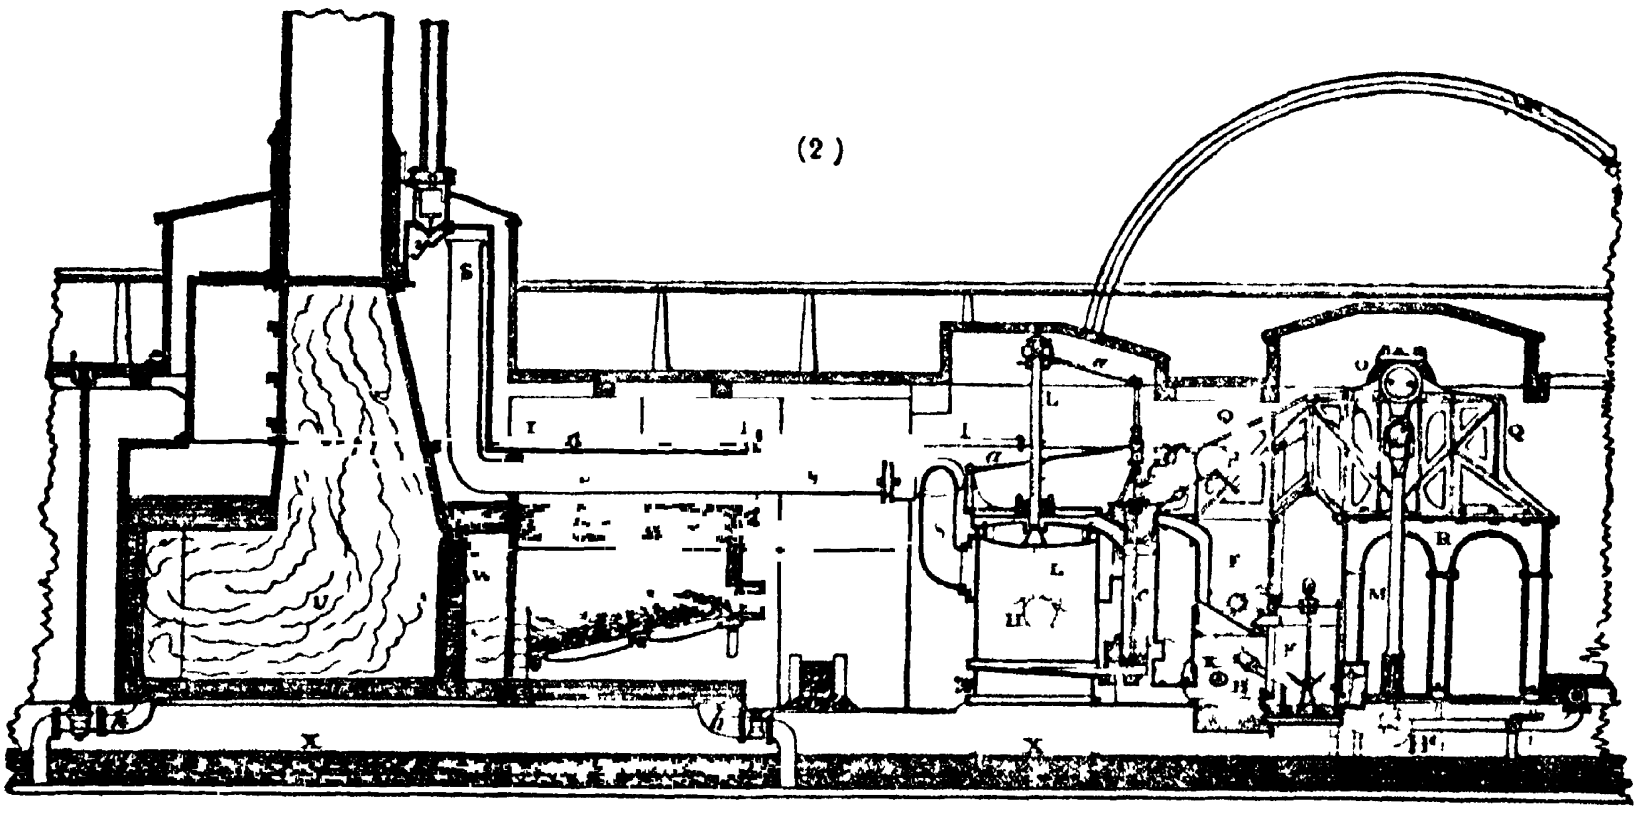
At the time of this invention the steam engine had never been used, except for the purpose of raising water [illegible] Although Watt, [illegible] with which it might be adapted as a general moving power, his first efforts were to get it adopted in the mining districts for drainage His first engines were, accordingly, single-acting or pumping engines, and it was not until about the year 1784 that he took a patent for the double-acting engine, the structure and mode of action of which has now been described

Cornish Engines — The Cornish pumping engines are for the most part single-action engines They are constructed of enormous power, and carry out the expansive principle to a great extent In Cornwall engines are [illegible] of mines with cylinders from 7 to 8 feet in diameter, and from 10 to 12 feet stroke Steam having a pressure of from 20 to 50 lbs per square inch, and upwards, is used for impelling them, and is cut off at a third, a fourth, and sometimes even at a twelfth, of the stroke. A system of careful inspection has been for some years established by the mining companies, with a view to the improvement of the efficiency of the engines, and monthly reports of the performance of the engines have been regularly published The effect of this has been to stimulate the activity and skill of all concerned in the manufacture and working of these machines, and a rapidly progressive improvement in them has taken place The efficiency of these engines is estimated by the number of pounds weight of water which they are capable of elevating one foot high by the combustion of a bushel of coals This has been termed the *duty* of the engine In 1769, when Mr Watt first directed his attention to the steam engine, Smeaton computed the [illegible] duty of the engines then in use was at [illegible], from that time to the year 1800, a period of thirty years, Mr Watt's improvements [illegible], and the duty was gradually [illegible] very nearly quadrupled. In 1813, the system of inspection just mentioned was commenced, and the average duty was the same as in 1800 From this time to 1826, the engines underwent a progression of slow but steady improvement, and the duty was increased to 30 millions This state of improvement continued, and, in 1828, the average duty had risen to nearly 37 millions The increase since that time has been slower the average [illegible] for the last few years has been from 60 to [illegible], but in a well-conducted experiment it was found that by the combustion of a bushel of coals an amount of mechanical power was produced which raised the inconceivable load of 125 millions of pounds weight one foot high Thus, by the improvement of Watt and their immediate consequences, the power of the steam engine was, within the space of seventy years [illegible] The [illegible] structure [illegible] differ in nothing from that of double-acting condensing engines except in the absence of [illegible] to say, the condenser, [illegible] water pump The steam [illegible], instead of being conducted to a cold vessel to be condensed, is simply allowed to escape into the atmosphere, and is commonly conducted into the chimney of the furnace

The operation of such a machine is extremely simple The valves by which the steam is admitted to, and allowed to escape from, the cylinder are exactly similar to those of the double-acting engine In the down stroke of the piston the upper steam valve being open admits steam from the boiler above the piston, and the lower exhausting valve allows the steam below it to escape through a tube into the atmosphere It is evident that, in such a machine, the piston is always resisted by the pressure of the escaping steam As such escape cannot be effected except by steam of greater pressure than that of the atmosphere, it follows that the piston is always resisted by a force somewhat greater than the atmospheric pressure The steam which urges the piston is therefore only effective by the excess of its pressure above that of the escaping steam, and hence it is the more economical course in non condensing engines to employ steam of as high a pressure as is convenient, — the counteracting pressure of the atmosphere being relatively smaller in such a case All locomotive engines are [illegible] and the waste steam is invariably projected [illegible] chimney in locomotive engines, and thereby greatly increases the intensity of the draught

[illegible] non-condensing engines must, of [illegible] have a pressure considerably exceeding that of the atmosphere, and have been generally called *high pressure engines*, while those which condense the steam have, on the other hand, been called *low-pressure engines* These terms are not, however, correctly expressive of the nature of these engines respectively Many engines in which condensation is used, especially those in which the expansive principle is applied with much effect, are worked with steam of a high pressure, not unfrequently with a [illegible] to from two to three atmospheres It [illegible] not correct to call such machines low-pressure engines It is, however, true that engines worked without condensation must of necessity, be worked by steam of a pressure which is [illegible]

Rotatory [illegible] is applied to an engine in which a motion of rotation is produced immediately by the action of the steam, without the intervention of such mechanism as the working beam, crank, and fly-wheel This is usually effected by a piston which instead of moving longitudinally in the cylinder, revolves within the [illegible] with the geometrical [illegible] The mechanism is so contrived that this piston shall revolve in steam-tight contact with the sides and ends of the cylinder, [illegible] continually presses it [illegible], [illegible] other side shall continually escape to the condenser, if it be a condensing engine, or to the chimney if it be a non-condensing engine, — a moveable division of some kind or other being necessarily interposed between the steam and vacuum to enable this to be done Most of the contrivances for rotatory engines which have been suggested differ one from the other only in the mechanical expedients by which these ends are attained Such machines are very numerous and various, but as none of them have yet been found to be attended with sufficient practical advantages to force them into any use beyond the experimental trials of their inventors, it is sufficient here to have indicated the general principle of their structure



Marine Engines — The manner in which the steam engine is rendered an instrument for the propulsion of vessels must, in its general features, be so familiar to every one as to require but short explanation A shaft is carried across the vessel, [illegible] and on either side beyond the timbers, [illegible] of this shaft on the outside of the vessel are attached a pair of wheels, constructed like under shot water wheels, having fixed upon their rims a number of flat boards called *paddle boards* As the wheels revolve, these paddle boards strike the water, driving it in a direction contrary to

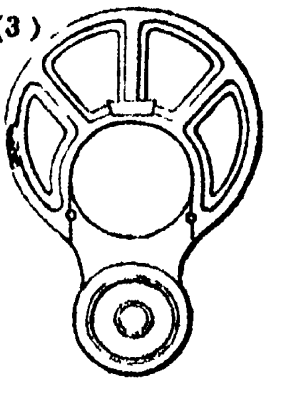
that in which it is intended the vessel shall be propelled The moving force imparted to the water thus driven backwards, by reaction on the vessel propels it On the paddle shaft are fixed two cranks, placed at right angles one to the other, so that whenever one of them is thrown [illegible] on the other is horizontal [illegible] strong iron rods called *connecting rods*, which are themselves either driven directly by the pistons of two steam engines, or are worked by those pistons, thus the medium of working becomes similar to those used in the ordinary land engines The two cranks being placed at right angles, it follows that when one piston is at top or bottom of its [illegible] by it into the highest or [illegible] be at the middle of its stroke, and the crank driven by it will be in the horizontal position One of the pistons is therefore always in a position to produce the most advantageous effect on the crank at the moment that the other piston loses all power over the crank driven by it, and in the same manner it may be seen that while the power of one piston is augmented from zero to its greatest effect, the power of the other is decreasing from its greatest effect to zero Thus the combined action of the two pistons is nearly uniform in its efficiency If one engine only were used the motion of the wheels would be unequal, being most rapid when the piston is at the middle of the stroke, and slowest at the extremities

The steam engines used for navigation may be either condensing engines or non condensing engines If the latter are employed, steam must be used having a pressure above the atmosphere of from 30 to 50 lbs per square inch. Boilers in which steam is produced under this pressure are considered in Europe so unsafe, that non-condensing engines with low-pressure boilers are almost universally used for navigation. In America, however, high-pressure boilers with non-condensing engines are extensively used

The arrangement of the parts of marine engines is different in several respects from land engines. Steam vessels being generally employed to navigate the open seas, and being therefore subject to the vicissitudes of tempestuous weather, the machinery must be protected by being placed below the deck The space allotted to it being thus limited, great compactness is necessary The paddle shaft being very little below the deck, the working beam and connecting rod could not be placed so conveniently as [illegible] If a beam engine therefore be employed, two beams are so placed that one comes on each side of the cylinder, and is driven by the piston by means of a cross head attached to the piston rod, from the ends of which rods, called side rods, are carried downwards to the ends of the beams From the other ends of the beams the connecting rod is presented upwards towards the crank

Side-Lever Engines — Marine engines are of various forms, but perhaps the most usual form is the side-lever [illegible] fig 2 in which is represented in section a side-lever marine engine with its boiler, as placed in a steam vessel The sleepers of oak supporting the engine are represented at X, the base of the engine is secured to these by bolts

passing through them and the bottom timbers of the vessel S is the steam pipe leading from the steam chest in the boiler to the slides *c* by which it is admitted to the top and bottom of the cylinder The condenser is represented at B and the air-pump at I The hot well is seen at F from which the feed is taken from the boiler L is the piston rod connected with the beam H working on a centre K, near the base of the engine The other end of the beam H drives the connecting rod M, which extends upwards to the crank, which it works upon the paddle shaft O *a a* are the rods of the parallel motion The framing by which the engine is supported is represented at Q R

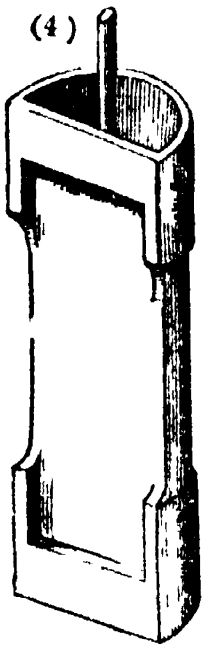


The beam exhibited in the figure is shown in dotted lines, as being on the further side of the engine A similar beam similarly placed, and moving on the same centre, must be understood to be at this side, connected with the cross head of the piston in like manner by a parallel motion, and with a cross tail attached to the lower end of the connecting rod and to the opposite beam The eccentric which works the slides, is placed upon the paddle shaft O, and the connecting arm which [illegible] when the engine [illegible] of the boiler grate and flues is represented at W U The safety valve *y* is enclosed beneath a pipe carried up beside the chimney, and is inaccessible to the engine-man The cocks for blowing out the salt water from the boiler (a process explained under the head STEAM BOILER) are represented at *h*, and the feed pipe at I

The nature and operation of the several parts just mentioned will be understood by reference to the explanation of the structure and operation of the double acting land engine, for, in fact, the marine engine, such as is here represented, is nothing more than a double-acting condensing steam engine, adapted in its form to the circumstances in which it is used in navigation

Since, however, the double-acting land engine, which has been described, is not provided with a slide-valve worked by an eccentric, it will be proper to explain the form and mode of action of those important parts of the machine

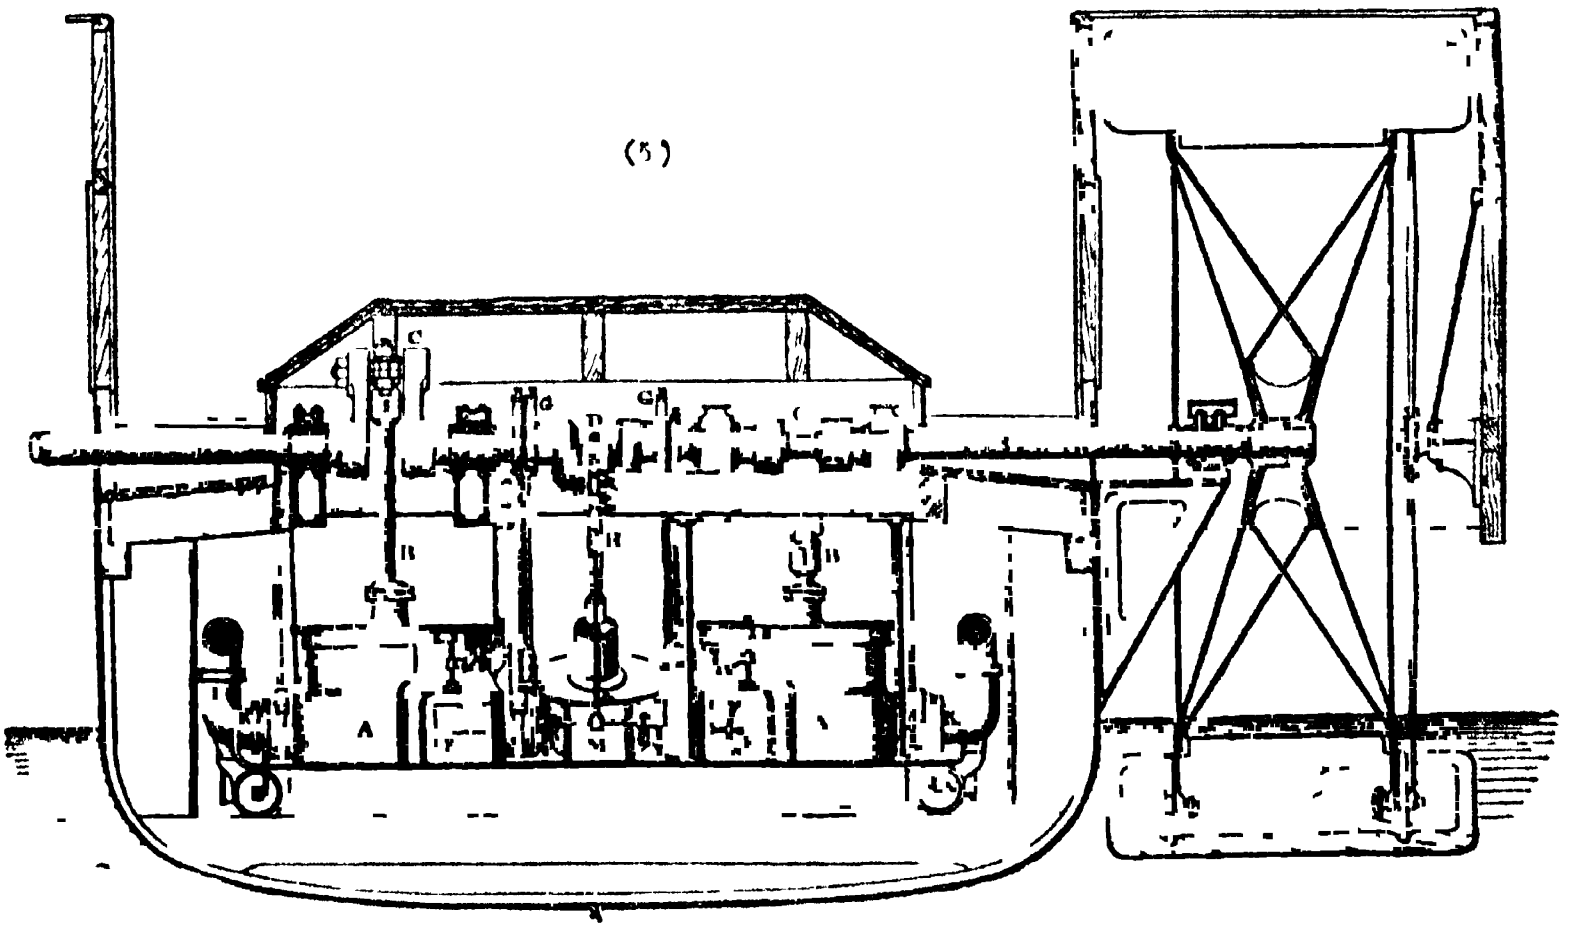
An eccentric is a disc of metal perforated with a hole for the reception of the crank shaft, but this hole is not in the middle of the disc The edge of the disc is encircled by a ring of brass from which a rod proceeds to the connections of the slide valve, and it will be obvious that by the revolution of the shaft this rod will be drawn backwards and forwards, in the same manner as if it were connected with a crank in the shaft An eccentric, indeed, is virtually a short crank with a very large crank-pin, and a crank of the same length as the distance from the centre of the shaft to the centre of the disc which constitutes the eccentric, would give precisely the same motion that is given by the eccentric itself The form of eccentric usually employed in steam vessels is represented in fig 3 A balance-weight is applied opposite to the heavy part of the eccentric, in order that the eccentric may stand in any position on the shaft, and a projecting piece of metal is fixed upon the shaft, which, when it comes in contact with a similar piece of metal upon the



(3)

eccentric, carries the eccentric round with the shaft. Should it be necessary to reverse the engine there is a corner piece of metal upon the opposite side of the shaft which also comes into contact with the stop upon the eccentric and the projecting piece of the eccentric and the stop upon the shaft, as may be necessary it should do to communicate a reverse motion to the valve

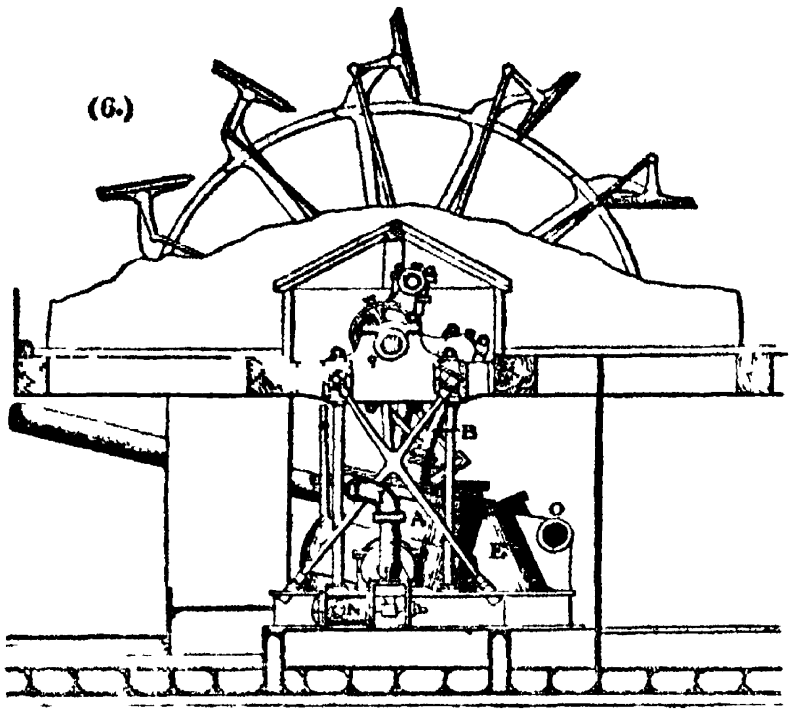
The species of valve usually employed in side-lever marine engines is the D-valve, so called because it is half a cylinder, and its cross section therefore resembles the letter D Of this species of valve there are two varieties, the long D and the short D In the long D the waste steam escapes from one of the ports of the cylinder through the centre of the valve In the short D there is no central passage in the valve, but the valve consists of two short and closed portions connected together by one or more rods The long D valve has obtained the widest acceptation A valve of this kind is represented in fig 4 The flat projecting part of the valve moves upon similar flat parts on the front of the cylinder, and when the valve is in the middle of its stroke the flat projecting portions accurately close the ports or passages by which the steam enters and leaves the cylinder The round part of the valve opposite to each cylinder-port is made tight by the application of a hemp packing, placed in the casing by which the valve is surrounded, and between the upper and lower packing steam is admitted to circulate round the valve —the steam-pipe from the boiler having its debouche in the valve-casing If now the valve be in its middle position, so as to cover accurately both of the cylinder ports it will be clear that if it be drawn upwards steam will be allowed to enter from the valve casing above the piston and at the same time any steam or vapour will be allowed to escape from beneath the piston into the central part of the valve which communicates with the condenser by means of a pipe penetrating either above the upper packing or lower packing If the valve be forced below its middle position the contrary operation will be produced, and by moving the valve up and down, therefore, which is done by the eccentric the piston is pressed up and down in the manner required In some steam vessels valves are employed which differ considerably in construction from the D valve, but the limits of this article prevent these various kinds of valves from being described



(4)

Oscillating Engine — Side-lever engines occupy an inconvenient amount of space in steam vessels and also exhibit a needless complication of parts The strain has to be transmitted, not merely through the piston-rod and crank shaft, but also through the cross head and cross tail, side rods and connecting rod, and the side levers or beams This multiplication of the moving parts obviously increases the risk of fracture, and the side-levers themselves are peculiarly susceptible of accident from this cause, since by the properties of a lever of this class, the stress or strain upon the beam at the main centre or pivot is twice greater than the strain upon the piston, and since also the beams are generally made of cast-iron for facility of manufacture These defects of the side-lever engine have caused a new species of engine to be introduced, called the oscillating engine, because the cylinder vibrates or oscillates somewhat in the manner of a pendulum In this engine the top of the piston rod is coupled immediately with the crank pin, and as the piston-rod moves up and down in a line coincident with the axis of the cylinder, while the crank pin revolves in a circle, it is necessary that the cylinder should be able to vibrate laterally, to enable the motions of the piston-rod and crank pin to be reconciled with one another The cylinder is consequently provided on each side with a short hollow pivot, or trunnion on which it swings, and through one of these trunnions the steam enters the cylinder from the boiler, while through the other the steam escapes from the cylinder to the condenser The alternate introduction of the steam above and below the piston is governed by a slide-valve attached to the cylinder, and swinging with it, or, in large engines, two valves may be employed for this purpose, and by their suitable attachment to the cylinder they will balance one another

In steam vessels in which oscillating engines are employed the cylinders are set immediately beneath the cranks, and the engines occupy but little more in the length of the vessel than the diameter of the cylinder. In the shaft which connects the engines together, and which is called the *intermediate shaft*, a crank is forged, and this crank in its revolution gives motion to the pistons of one or more air-pumps The general nature of the arrangements at present employed in vessels of the most improved class, will be readily understood by



(5)

a reference to fig 5, which is a transverse section of the steam yacht Peterhoff, constructed for the Emperor of Russia by Messrs Rennie, and to fig 6, which is a side view of the engines of the same vessel A, A are the cylinders B, B are the piston-rods, which the cranks C, C, D is a for working the piston bucket of the air-pump E, F, F are the slide valves by which the admission of the steam to the cylinders is regulated, G, G are double eccentrics on the intermediate shaft, whereby the valves F, F are moved The purpose of the double eccentrics is, to enable the link motion n account of which see the article H is a handle whereby the engines may be stopped, started, or reversed I, I are the steam pipes leading to the steam trunnions K, K, on

(6.)

pipe, through which the water which has accomplished the function of condensing the steam is ejected overboard The same letters refer to the same parts in the two figures, and the second figure [illegible] ment necessary for feathering the f[illegible] wheels

Feathering Paddle Wheels — In one variety of paddle wheel the float boards which act upon the water are fixed in a radial position, like the buckets of an undershot water wheel, as has already been explained, and this species of wheel is largely employed, both in the case of river and sea going vessels Latterly however, paddle wheels with moveable floats of the kind represented in the preceding engravings have obtained a marked preference, and vessels fitted with such wheels are found to realise a considerably increased performance It will be remarked that each float is hung upon an axis, whereby the inclination at which it enters or leaves the water may be altered, and by means of levers attached to the floats, and which are acted upon by rods converging to a centre eccentric to the shaft a feathering motion is imparted to the floats by the revolution of the wheel In river vessels the use of feathering wheels enables a small diameter of wheel to be employed without loss from angular impact, and with wheels of a small diameter, the engines may be worked with a greater speed, whereby they will exert more power In the case of sea going vessels the diameter of the paddle wheels cannot be materially reduced, whatever species of wheel is employed, for if the wheels were made very small they would be immerged to the centre, or be out of the water altogether if any considerable roughness of the sea occurred, nevertheless, feathering wheels are advantageous in the case of ocean vessels also, as they act more beneficially than common radial wheels when deeply immersed, and with variable [illegible] therefore, they maintain a greater average efficiency There are objections, however incident to the [illegible] feathering wheels which go far to balance these advantages They are expensive both to make and to maintain The wear and friction in such a multitude of joints is very considerable, and if any of the arms get adrift or break, they will be whirled round like a flail, and may perhaps cut through the paddle box, or even the vessel If the injury be of such a nature that the wheels cannot be turned round (and this has sometimes happened) it will follow that the engines will be virtually disabled until the obstruction can be cleared away, and if the weather be very stormy, or the vessel be in a critical situation, she may be lost in consequence of her temporary de[illegible] ment [illegible] whole, therefore, the application of [illegible] vessels intended to perform [illegible] seas appears to be of doubtful advantage In short trips, and in situations where the wheels can be carefully examined at short intervals, the risk is not so great, but in that case nearly the same benefits will be attained by increasing the length of the paddle floats, and giving the wheel less dip There is no material difference between the performance of a feathering wheel and that of a radial wheel, if the two wheels be of the same diameter, and if they have both a light dip with long narrow floats And as in sea going vessels the wheels must necessarily be of considerable diameter, and as the [illegible] ing to prevent the other circumstances conducive to efficiency from being observed, it follows that in ocean vessels radial wheels would be about as efficient as feathering wheels but for the circumstance of a variable immersion It is not necessary however, that there should be much variation in the immersion of large vessels be employed or if coal is more frequently taken on board during the voyage, and as neither of these alternatives is attended with the risk incident to the use of feathering wheels, they appear to be entitled to that preference which ultimately they are likely to obtain

Proportions of Marine Engines [illegible] the piston-rod is [illegible] of the [illegible] the crank pin is made about one-seventh of the diameter of the cylinder The diameter of the paddle shaft must have reference, not merely to the diameter of the cylinder, but also to the length of the stroke of the piston, or what is the same thing, to the length of the crank If the square of the diameter of the cylinder in inches be multiplied by the length of the crank in inches, and the cube root of the product be extracted, then that root multiplied by 242 will give the diameter proper for the shaft in inches at the smallest part The diameter of the trunnions is regulated by the diameter of the steam and eduction pipes, and these are each usually about one-fifth of the diameter of the cylinder, but it is better to make the steam trunnion a little less and the eduction trunnion a little more, than this proportion The steam and eduction pipes, where they enter their respective trunnions, are kept tight by a packing of hemp which is compressed by a suitable ring or gland tightened by screws In land engines, the air-pump and condenser are each made about one-eighth of the capacity of the cylinder, but in marine engines they are made somewhat larger

Proportions of Paddle wheels — The diameter of paddle wheel proper to introduce into a steam vessel depends mainly upon the variation of immersion which she is required to undergo In river steamers, where there is little variation of immersion the wheels should be small in diameter If a line be taken in the length of each float, so that the mean pressure of the water against the float is the same above the line that it is below it, then this line will constitute a *centre of pressure*, and in determining the velocity of the wheel it is the velocity of the centre of pressure which should be regarded In all cases the centre of pressure must move more rapidly through the water than the vessel, and the difference between the velocity of the wheel and the velocity of the vessel is termed the *slip* of the wheel The slip which usually occurs in steam vessels is one-third or one-fourth of the velocity of the wheel, and an imaginary circle described upon the arms of the wheel at that point at which the velocity is the same as that of the ship, is termed the *rolling circle* The rolling circle should fall about the level of the water As a general rule, the larger the paddle floats are made the more efficient will be the performance of the wheel as is more fully explained in the article on the SCREW PROPELLER, in the Supplement In radial wheels, the usual practice is to introduce one float for every foot the wheel has of diameter, so that the floats are about three feet apart In feathering wheels the floats are usually set somewhat further asunder The best average distance appears to be about four feet measuring from the centre of one float to the centre of the next, but this proportion varies somewhat with the diameter of the wheel

Relations of Power and Speed — With any given type of vessel and any given power of engine, it is possible to predict with very considerable accuracy, the speed which a steam vessel will attain First, a co-efficient must be found which when introduced into the computation will give a result answering to that derived from experiment, and this co-efficient will vary with the shape of the vessel In the case of sea going vessels of good average form, the co-efficient is 800, and in the case of very sharp river vessels it is 1000 Multiply this co-efficient by the number of actual horses power exerted by the engine (*see* HORSE POWER in the Supplement), and divide the product by the number of square feet in the transverse section of that part of the vessel lying beneath the water Extract the cube root of the quotient, which will be the speed which the vessel will attain in statute miles per hour It is possible to make steam vessels too sharp to attain a minimum resistance, since the increase of length consequent upon increased sharpness, involves a larger amount of rubbing surface in the bottom of the vessel, and the loss due to the increased friction may more than compensate for the benefit accruing from the finer lines

Circumstances conducive to the Efficiency of Marine Engines — Supposing the boiler to be properly proportioned, it is necessary to see that the flues are kept clean, that blowing off be sufficiently practised, and that the furnaces are fed with coal in a regular manner — the coal being distributed evenly over the grate without allowing any holes to exist in the fire The boilers should be covered with felt to prevent the radiation of the heat, and over the felt sheet lead should be spread, soldered at the

pipes should be covered with felt and then wrapped round with canvas The cylinders should also be covered with felt, round which staves of wood may be placed, which should be hooped like a cask The felt proper for this purpose is thick and soft, and is made expressly for the retention of heat. The steam should be used with a considerable pressure, and be worked expansively; but very little advantage will be derived from so using it expansively in steam vessels, unless the cylinders be clothed very effectually, so as to prevent the dispersion of the heat It appears probable, that some species of condenser which condenses the steam by mixing the water with water from the sea, for the only impediment to the use of steam of a considerably higher pressure in steam vessels is, the liability of the boiler to become encrusted with salt, when it might become red-hot in some part, and perhaps burst, and this risk the use of fresh water in the boilers would prevent A species of condenser, called Hall's condenser, which operated on the principle of a still, was at one time in pretty extensive use in steam vessels, but it was unskilfully applied in most cases, and the main benefit — the ability to use steam of a higher pressure — was not simultaneously obtained In Hall's condenser, the steam passed into a multitude of copper pipes, immerged in a cistern of cold water, and the steam being thus reconverted into water was returned by a pump to the boiler In another species of condenser suggested by Symington a jet of cold water was to be employed, as is the present practice, but the fresh water with which the vessel started instead of being discharged into the sea, was transmitted through a number of pipes which were kept cool by the sea water, and was returned to the condenser after having suffered sufficient refrigeration It appears highly probable that one or other of these projects will be revived to meet the existing exigencies of steam navigation The urgent demand for speed necessitates the employment of a large amount of power, which in its turn involves a large consumption of fuel To reduce the consumption of fuel, without reducing the power, engines operating more expansively must be employed, but steam of a higher pressure is necessary for the satisfactory operation of such engines and fresh water in the boilers is conducive to safety where a considerable pressure is employed With the existing pressures fresh water in the boilers is not material It is of course necessary with every kind of engine to see that there are no air leaks, or steam leaks, for the efficiency of the engine would be thereby impaired, or the consumption of fuel increased

For further information on the Steam Engine, see the *Treatise on the Steam Engine by the Artizan Club*, *A Catechism of the Steam Engine, by J Bourne, C E*, or *The Steam Engine explained by Dr Lardner*

STEAM GUN A contrivance by which balls, or other projectiles used in warlike operations, may be projected by the expansive force of steam

This invention, which is due to Mr Jacob Perkins so well known for various ingenious and useful contrivances in the mechanical arts, having been first brought forward since the general peace which succeeded the battle of Waterloo has never been submitted to any decisive test of experience either in military or naval operations and consequently has not received the benefit of that stimulus to improvement which is always so necessary to bring mechanical contrivances of a novel kind to perfection, and which can only be derived from their practical application on a large scale Of the probable or possible utility of the steam gun nothing therefore can be inferred from that safest source of information — experience, and we are left to judge of it by the general properties of vapour and by the experiments on a small scale to which it has been submitted

If a strong close iron vessel, having two valves, one opening inwards and the other outwards — the latter being loaded with some definite pressure — be *completely* filled with water, such a vessel may be heated to the temperature corresponding to the pressure with which the valve is loaded without causing any portion of the water in it to be converted into steam To render the effect more easily understood, let us suppose that the valve is loaded with a pressure of fifty atmospheres. The temperature of water evaporated under that pressure being 510° (*see* STEAM), the vessel may be raised to any temperature not exceeding 500°, without having any of the water contained in it converted into steam If the temperature to which the water is raised be 500°, and a cubic inch of water at common temperatures be forced into the vessel through the valve which opens inwards, water being sensibly incompressible, a cubic inch of water at 500° will be forced out at the valve which opens outwards. This water, being no longer subjected to the pressure which kept it in the liquid state, will suddenly expand and flash into steam, which at first will have a pressure of 50 atmospheres but as it expands will have its pressure diminished in nearly the same proportion as the volume into which it swells shall be increased. Since, however, 500° is not sufficient heat to enable the whole of the water thus ejected to pass into steam (*see* STEAM) that part of it which will assume the vaporous form will take the requisite amount of latent heat from the sensible heat of that portion which remains in the liquid state As this latter portion will still retain a considerable temperature, it may be conducted to a vessel containing the feed for the heated vessel just mentioned, from which it will be again forced into that vessel

Such was the principle of Mr Perkins's *generators*, by which term he denominated those close vessels in which water was raised to a high temperature without being converted into steam

Now if the valve through which the heated water is ejected be supposed to be in communication with the barrel of a gun or piece of ordnance, in the same manner as the barrel of an air gun is in communication with the hollow metallic ball in which air is compressed, a ball may be projected by the expansive force of the water ejected from the valve, in the same manner exactly as the ball of an air gun is projected by the expansive force of the compressed air

As the water may be ejected from the valve either in a constant stream or by a rapid succession of jets, the balls may be discharged from the barrel as rapidly as it is possible for them to be brought under the action of the steam, and since the heating of the barrel only tends to increase the elastic force of the steam, there appears to be no other practical limit to the action of such an engine of offence except that which may be imposed on the heating power applied to the generator

Of the abstract principle of applying steam in this manner as an offensive engine there can be no doubt. Both theory and experiment conspire to establish it, but of the comparative efficacy, convenience, and economy of it compared with gunpowder, many doubts will present themselves to all who duly reflect on the circumstances by which the innovations are surrounded The necessity of using a steam generator of any kind obviously limits the application of such an instrument to particular cases, and even in those special cases the necessity of employing a generator or boiler which shall be capable of ready conduction of the heat to the water, with great strength and solidity in the heating vessel, must continue to be regarded as a weighty difficulty Without a very high pressure of steam the ball cannot acquire an adequate momentum with any ordinary length of gun, or any ordinary bore and the use of steam of a very high pressure is dangerous and inconvenient By greatly increasing the length of the gun the pressure of the impelling fluid may be lessened, but this expedient is also inadmissible and the most promising method of enabling the steam gun to come into practical operation appears to consist in increasing the bore of the gun very much, and in using either hollow shot, bullets with a piston wadding or some other form of projectile which will receive the impulse of the steam upon a large surface which is left behind when the ball leaves the gun

STEAM NAVIGATION The art of propelling vessels by the instrumentality of the steam engine Vessels so propelled are called steam vessels, and the navigation of seas or rivers by steam vessels is termed steam navigation The propelling instrument, by means of which the steam engine acts upon the water, may either be the paddle wheel (see STEAM ENGINE), or the screw (see SCREW PROPELLER in the SUPPLEMENT), and the vessel is forced forward by the backward pressure of the paddle boards or screw upon the water just as a boat is forced forward by the reaction of the oars, or as the body of an aquatic bird is propelled by the action of the feet The pressure with which the vessel is forced forwards is in all cases the same as that with which the water is forced backwards, and this pressure will remain unchanged whether the surface pressing the water be large or small, being dependent altogether upon the power of the engine, other things being equal But if the propelling surface be large the water will be moved backwards through only a small distance, while the vessel is moved forward through a great distance, whereas if the propelling surface be small, then with only the same forward motion of the vessel there will be a larger backward motion of the water, and more steam will be expended in producing the same result

History of Steam Navigation — Vessels propelled by paddle wheels driven by oxen were employed by the Carthaginians and were introduced by them into Sicily, from which country the Romans obtained a knowledge of that method of navigation In 1543, Blasco Garay, a sea captain in Spain, exhibited to Charles V a vessel propelled by wheels of this kind which were driven by steam, but it is not known in what way the steam acted so as to produce motion. In 1618, and again in 1630,

patents were granted in England to David Ramsey for propelling vessels by fire or steam Various projects [illegible] after this time by [illegible] mberlaine, Bushnell, [illegible] Dickens, Allan and [illegible] pamphlet descriptive of his mode of propulsion and of which the main features were a paddle wheel placed at the stern and driven by an atmospheric engine within the vessel In 1787 Mr Patrick Miller, of Dalswinton in Scotland, published a pamphlet descriptive of a new species of vessel he had invented, which was to be driven by paddle wheels, but these wheels were to be worked by manual labour by means of capstans With a vessel constructed by Mr Miller upon this plan, it was found that a considerable speed was attainable, but the operation of turning the capstan was found to be very laborious, and it occurred to Mr Taylor, a tutor in Mr Miller's family, that a steam engine might be applied to perform this work Mr Taylor, having shown that such an engine might be introduced without setting the vessel on fire, was commissioned by Mr Miller to order an engine of an acquaintance of Taylor's, called William Symington, a young engineer of much ingenuity This engine was made and introduced into a pleasure boat, which was many times tried successfully on the lake of Dalswinton Mr Miller then built a vessel on a larger scale, the engine of which was made at Carron This vessel was tried on the Forth and Clyde canal in 1789, and realised a speed of nearly seven miles an hour Nothing further was done in the matter, however till 1801, when Symington received an order from Lord Dundas to construct a steam vessel for the Forth and Clyde Canal Company Watt's patent having by this time expired, the engine was made upon his plan and the performance of the vessel was satisfactory in every respect From an impression however, that the waves which were created would injure the banks of the canal, this new method of propulsion was not further pursued

In 1801, shortly after this vessel was completed she was visited by Robert Fulton, a native of America, at whose desire Symington caused the vessel to be put in operation in order that he might witness her performance Symington's belief was that the speed of the vessel was impaired by the narrowness of the canal and Fulton, in reference to this remark observed, that such an objection could not have existence in the great rivers of North America, where vessels of such a character would confer important advantages Shortly after this time Fulton commissioned Boulton and Watt to construct for him an engine which was to be put on board a vessel in America This vessel was to be propelled by paddle wheels in the manner previously practised in Scotland The name of this vessel was the Clermont, she was launched and tried in 1807 and performed her [illegible] duties in a satisfactory manner Numerous vessels resembling the Clermont were soon after this time built in America In 1812 Mr Henry Bell, of Helensburgh on the Clyde, constructed the Comet the first vessel that was employed for commercial purposes in Europe Numerous other vessels resembling the Comet were soon after this built in the Clyde, and steam navigation before long came into general use in all parts of the kingdom Mr David Napier, of Glasgow, who had constructed the boiler of the Comet, and who soon signalised himself in this department of engineering, was the first person who sent steam vessels to sea He established lines of communication between Greenock and Belfast, and subsequently between Dublin and Holyhead, and between Dover and Calais The method of combining two engines with their cranks set at right angles with one another was a suggestion of Mr Watt's When the City of Edinburgh constructed by Boulton and Watt, was set to run between London and Leith it was found that the sea water in a voyage of this length acquired such a degree of concentration that it was no longer fit for the production of steam The vessel had, therefore, to be stopped in the middle of the voyage, the water let out of the boiler into the hold, and a fresh supply of water to be introduced from the sea To remedy this inconvenience, Boulton and Watt applied *change pumps* to the vessel, which by continually removing a portion of the super-salted water during the voyage prevented an injurious concentration from being attained They afterwards superseded the change pumps by *blow-off cocks*, which on being turned at intervals allowed a portion of the super-salted water to escape overboard, and this is the expedient for preventing an accumulation of salt in the boiler which is still generally employed

The side lever form of engine still largely employed in steam vessels, was settled by Boulton and Watt at an early period in the history of steam navigation The oscillating engine was invented by their foreman, Mr Murdock, towards the close of the last century, but it is mainly from the admirable manner in which the details of

[illegible] been carried out by Messrs. [illegible] obtained such favourable ac- [illegible] rs for marine purposes were [illegible] 1838, but were first practically introduced by Messrs Penn and Son and Messrs. Miller and Ravenhill about 1844

Ocean Steam Navigation —Lines of steam navigation now connect together nearly all the countries of the world In the case of coasting voyages, the establishment of railways is gradually bringing about the supercession of paddle vessels by screw vessels with auxiliary power (see SCREW PROPELLER in the SUPPLEMENT), but for all purposes of swift ocean voyaging, paddle vessels appear to be the best adapted. Lines of steam communication now proceed from this country, not merely to the principal countries of Europe, but to North and South America, the West Indies, the Cape of Good Hope, the East Indies, and China, and contracts have been concluded for their extension to Australia. The various companies carrying on these lines of communication receive large yearly payments from the government for the conveyance of the mails, without which the existing measure of efficiency in the vessels could not be maintained, and it may be taken as an axiom in steam navigation, that no line of distant communication in which a high rate of speed is necessary can be profitable unless supported by a government subvention Some of the vessels now [illegible] navigation are of [illegible] power The actual power of such vessels should be at least three times the nominal and this makes the actual power of the largest about 3600 horses Some of these vessels are considerably more than 300 feet in length In sea-going steam vessels from 18 to 19 miles an hour is the utmost speed that has yet been attained

River [illegible] Trade [illegible] nt of steam navigation [illegible] not considerable, the rivers being only in a few cases, or through an inconsiderable part of their length, of sufficient volume to enable navigation to be carried on upon them Upon the Thames and also upon the Clyde there are considerable numbers of river steamers, which are well adapted to the functions they have to perform, but in no case are these vessels of large dimensions or great power In America, however, where the rivers are of a far larger volume than in this country, and perform a far more important part in the means of internal communication, there are river steamers of nearly 400 feet in length, and with paddle wheels 50 feet in diameter, and some of these vessels are said to have attained a speed of 24 miles an hour The engines are usually set upon the deck and are formed in the same manner as a common land engine—the beam being poised high in the air and the connecting rod extending from the beam down to the crank The river steamers of America more nearly resemble arks than ships as they are built with several decks or stories resting on the hull, which is always made very sharp, so as to enable a high rate of speed to be attained A pressure of 50 lbs per square inch is commonly maintained in these engines if condensing The stroke of the piston is always very long relatively with its diameter, the steam is of considerable pressure, and is used to a considerable extent expansively. The engines are of rude construction compared with English engines but they are cheap and answer their intended purpose Upon the Mississippi and its tributaries most of the engines are high-pressure with the cylinders lying horizontal as in locomotive engines and accidents by explosion and fire are of frequent occurrence Some of these engines are worked with steam of 250 lbs pressure upon the square inch The muddiness of the water of the Mississippi causes it to froth very much and the boilers to prime, unless steam of a high pressure be employed, which, as it occupies a less volume, occasions less agitation in the water as it rises to the surface The cabins of American steamers are in nearly all cases very handsome and spacious, the boilers are usually disposed at the sides of the vessel behind the paddle boxes so that the cinders fall into the river, and the steering wheel is placed on the upper deck near the bow and communicates with the rudder at the stern by means of iron rods or chains

Steam Navigation upon shallow Rivers —The shallowness of many of the rivers of the continent on which it became important to establish steam navigation, has led to the introduction of very light vessels upon them Upon the upper part of the Rhine, and upon the Moselle, there are vessels plying which draw only 11 inches of water Upon the Loire there are vessels plying which draw only from 8 to 10 inches of water, and upon the Red River, a tributary of the Mississippi in America, there are vessels plying which are [illegible] to draw only 7 [illegible] These vessels of course do not carry [illegible] Mr Bourne has proposed a species of steam train for navigating the rivers of India, consisting of a steamer of high draught towing a train of

shallow barges in which cargo would be deposited; and he reckons that by this simple expedient he would be able to open up ten thousand miles of river, now inaccessible, to commercial intercourse by steam Each of the proposed barges would carry 50 tons of cargo on a draught of 12 inches of water, and it is considered that a steam vessel of suitable construction would be able to draw five of these barges behind her at an average speed of 8 or 10 miles an hour Mr Bourne in his Report upon the navigation of the rivers of India, has very clearly pointed out the necessity of employing vessels of a very light draught in the navigation of shallow rivers, not [illegible] possible [illegible] For if the bottom of any vessel of considerable draught approaches near the bottom of the river, a great declension in the speed will immediately ensue, in consequence of the difficulty with which the water closes in at the stern, owing to the friction presented by the river bed It is consequently necessary to the efficiency of any scheme of steam navigation proposing to maintain a considerable rate of speed upon shallow water, that the draught of the vessel employed shall be considerably less than the depth of the water The vessel should be also of great length, and should be trimmed by the head, so that the bottom may rise out of the water altogether at the stern These objects are attained, and are reconciled with the necessary degree of strength, by Mr Bourne's articulated steam train, by means of which shallow and shifting rivers, like those of India, may be navigated at a speed adequate to most of the locomotive wants of any country in a primitive state A very long and shallow vessel laden with cargo would break if she grounded on an uneven place, but a train of barges will be exempt from this accident, will also be able to turn with facility in the river bends, and will be able to realise all the benefits which a very long and shallow vessel could attain

Steam Navigation upon rapid Rivers — A method of towing barges by steam has for some years past been in successful operation upon the Rhone which appears likely to be of service in all cases where rapid rivers have to be ascended with heavy loads Upon the paddle shaft a toothed drum is fixed which engages an endless chain that passes round a great wheel like the fly-wheel of an engine, but armed with projecting spikes that runs along the bottom of the river This wheel is placed at the lower extremity of a wooden frame hinged at its upper end so that it can rise and fall with the irregularities of the river bed, and this wheel being put into revolution with about one-third of the speed of the paddles, drags the vessel up against the stream The paddles are thrown out of action when this wheel is in operation, but the paddles are used in descending the river, at which time the great wheel which rises through a well in the centre of the vessel is lifted out of the water

Comparative Eligibility of Wooden and Iron Steamers — The increasing dearth of oak and other timber in this country suitable for ship-building and the increasing cheapness of iron owing to the successive improvements which are being made in its manufacture, bring with them the inevitable condition that iron vessels must supersede wooden vessels for all the ordinary purposes of commercial intercourse In some respects iron vessels are better than wooden vessels, and in other respects worse They are stronger [illegible] getting on rocks or shoals [illegible] duction of water-tight bulkheads dividing the vessel into several distinct compartments, are more free from bilge water and from rats, are not attacked by the white ants or by the dry rot, and do not involve the same expense for caulking and repairs For all purposes of river navigation, and also for coasting navigation, especially if the vessels require to enter tidal harbours, iron vessels are unquestionably the best adapted, but when dispatched upon long voyages to tropical countries iron vessels are attended with inconveniences which do not attach in the same degree to wooden vessels Of these the most serious is fouling Sea weeds and shell fish attach themselves to the bottom of the vessel beneath the water and they not merely impede the progress of the vessel, but some species of shell fish corrode the iron into holes Iron vessels, moreover, are both hotter in warm climates than wooden vessels, and colder in cold climates In some cases too in which iron vessels have been employed in [illegible] it has been found that the rapid radiation of heat at night from the hull has caused a deposit of dew upon the surface of the iron within the vessel, and this dew has trickled down within the hold and damaged the cargo Such an accident, however, it is obvious, might be prevented by putting a few battens along the vessel's sides so that the cargo would not press against the surface of the iron, and the dew might then trickle down without producing any injurious effect

The only effectual expedient that has yet been discovered for preventing the fouling of iron ships is the application of a partially soluble poisonous paint to the bottom of the vessel, as first proposed by Mr Robert Mallett of Dublin [illegible] poison [illegible] time prevent [illegible] marine plants or animals, but if the body of the paint be insoluble the poison on the surface will be speedily dissolved out, leaving a film presented to the water in which there is no poison, and to this film the sea weeds and barnacles will adhere By giving a slight solubility, however, to the body of the [illegible] poison [illegible] The necessary degree of solubility is given to the paint by adding to it a certain proportion of soap A paint compounded on Mr Mallett's principle is manufactured by Mr Peacock of Southampton, and this paint has been found to be highly efficient in preventing marine adhesions, even in the most unfavourable circumstances in which iron vessels can be placed In the case of iron vessels which do not pass into warmer latitudes than that of Great Britain, it will be sufficient to coat the bottom with red lead paint, and the only growth which, under these circumstances, will take place is some long grass, which will show itself near the water line, but which may easily be scrubbed off with a brush

Much conflicting testimony has been given touching the comparative advantages of wood and iron for the construction of war steamers, but before any conclusive judgment on this subject can be arrived at, further experiments are needed to develope more fully the good and bad qualities of each material In a wooden vessel a hole made by a ball contracts, and nearly closes of its own accord, whereas in an iron vessel the hole is always as large as the ball, and sometimes much larger But by applying to the interior of the vessel near the water-line a thick layer of a substance called kamptulicon, consisting of ground cork and Indian rubber, the hole made by a shot will be effectually closed by this substance, so as to prevent the water from entering It has yet to be ascertained moreover, whether a [illegible] will not be given to the side of an iron vessel that any ball or projectile would glance off without entering it at all

Proper Mode of constructing Steam Vessels and Ships — Vessels of every kind should be so built as to realise the maximum of strength with the minimum of materials, and as they are weakest in the direction of their length, they should be built on [illegible] beam In other words [illegible] is nearly as possible on the proportions of the Menai tubular bridge to which end the main-deck should be nearly as strong as the bottom There are too many ribs in iron vessels One rib for every beam is sufficient, and beam and rib should be formed into a continuous outline Iron vessels should have iron decks formed in a piece with the sides and the deck and the bottom should be brought into equilibrium, so that the one would crush at the instant the other would tear Vessels constructed upon this principle would be much stronger than common vessels [illegible] and they would also better resist twisting and all other strains to which vessels are exposed

Mode of determining the best Form of Hull — It is easy to tell the comparative facility with which bodies of different forms pass through the water, by ascertaining the weight necessary to draw each at a given velocity, but although this information is arrived at, it nevertheless remains uncertain whether any of these forms is the best for the velocity in question This problem Mr Bourne many years ago proposed to solve by placing in a running stream, or by drawing with a given velocity through stationary water some substance which would be moulded by the action of the water itself and as those parts which were struck most forcibly would be driven most in the [illegible] face, and the total resistance would thus become a minimum The shape proper for different proportions of breadth to length, and also for different velocities, would thus be arrived at, and by making a few experiments with larger models, the law would be discovered of the influence of size upon the results obtained

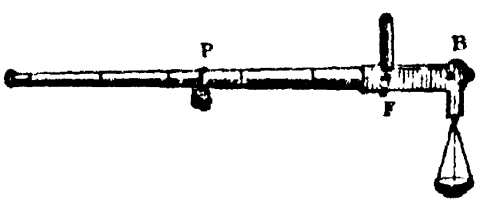
Secrets of Efficiency in Steam Vessels — The first condition of efficiency in a steam vessel is, that the hull shall be of such a form as to pass through the water with the least possible resistance, and in order that it may be so, it may be accepted as a general rule that there should be no straight lines in it A wall sided vessel will realise a less speed than if the breadth were somewhat extended, so as to take away the flatness of the sides, and at the same time she will be less able to bear fore and aft canvass from the deficient stiffness due to her deficient breadth The paddle boards should be large relatively with the propelling power employed, and if of the common radial kind should be [illegible] and narrow, rather than short and deep [illegible] should be made with steam casings or jackets, and then the steam may be worked expansively with advantage through a considerable part of the stroke The boilers should be capable of being worked with safety with a considerable pressure

of steam, and should have abundant heating surface, so that an adequate supply of steam may at all times be maintained, even with flues not quite clean, and coal not of the best quality It is a rare thing for steam vessels to have adequate boiler power There is consequently a frequently recurring difficulty in keeping the steam up to the proper pressure, and much fuel is wasted by the frequent stirring of the fire, owing both to the refrigeration caused by the cold air which enters through the open furnace door, and to the loss of small coals through the bars of the grate Feathering paddle-wheels increase the amount of work done by a given expenditure of fuel, but there is also an increased consumption of fuel incident to their use They enable a smaller wheel to be employed, so that the engine works faster, whereby an increased power is exerted, and the vessel goes at a greater speed than before But about the same quantity of coals is relatively with these coals consumed in working the [illegible] ary wheel with fixed floats, provided the floats be long and narrow with little immersion, and that the wheel is of considerable diameter Upon the whole, feathering wheels appear to be advisable in the case of river steam vessels, or vessels which permit frequent inspection and repairs, but not in the case of vessels called upon to perform ocean voyages of great length, and subject to violent vicissitudes of wind and sea All vessels intended to be fast should have engines which work well up to their power, and in order to do this they must employ a considerable pressure of steam. To enable this necessary pressure to be employed with safety, the boilers must be strong, and they should be tested once a year by forcing them full of water with the deck pump to make sure that the gradual progress of decay has not left any weak place which renders the pressure they carry no longer safe

Secrets of Economy in Steam Vessels — The main secret of economy in steam vessels is to make as large use as possible of the sails, and the object of the commander should be to maintain a speed which shall be as nearly as possible of a uniform rate When therefore a favourable wind occurs the steam should be shut off from the engines to such an extent that the speed is not materially increased, and, on the contrary when a calm or adverse wind occurs such an increased supply of steam should be given to the engines that the speed of the vessel is not materially diminished When the wind alone suffices to give a good speed to the vessel, the engines, even though worked at their utmost power, will not increase the speed very much, and it will be better in such a case to save the fuel, as the voyage cannot be materially abbreviated by any increase that can be given to the speed It is mainly therefore by varying the amount of expansion used in the engines according to the resistance to be overcome, that fuel in steam vessels is to be economised, and at the same time the other conditions necessary to efficiency must be observed The effectual clothing of the boilers and the engines, so as to prevent the dispersion of heat by radiation, is of course to be attended to, and care must also be taken in the selection of the coal Welsh coal has greater evaporative efficacy than any other, and is therefore best (For further information respecting Steam Navigation, see *Treatise on the Steam Engine, by the Artizan Club*, *Catechism of the Steam Engine, by J Bourne, C E*, and *Treatise on the Screw Propeller, by J Bourne, C E*)

STEARIC ACID (Gr στεαρ, *fat*) One of the acids produced in the process of saponification by the action of alkalies upon *stearine*

STEARINE (Gr στεαρ) That part of oils and fats which [illegible] temperatures



STEATITE (Gr στεαρ) A soft mineral of an unctuous or soapy feel, hence called *soapstone* It is a hydrated silicate of magnesia and alumina

STEATOMA (Gr στεαρ A tumour, the contents of which are of the appearance and consistency of hard fat

STEEL (Germ stahl) This most useful and curious substance is a compound of iron and carbon their relative proportions vary in steel [illegible] s, but in that used for ordinary purposes [illegible] exceeds 2 per cent [illegible] it Certain kinds of iron [illegible] manufacture, but this relates entirely to its purity, which is the essential requisite Steel is made by a process called *cementation*, which consists in filling a proper furnace with alternate strata of bars of the purest malleable iron and powdered charcoal [illegible] the air is carefully excluded from the boxes [illegible] the whole kept for several days at a great [illegible] process carbon, probably in the state of vapour, penetrates, and combines in the above small relative proportion with the iron the texture of which, [illegible] s surface acquires [illegible] of steel falls [illegible] and more sonorous and elastic and susceptible of a higher polish and has less tendency to rust At a red heat it admits of hammering into various forms, and of being welded or united by the blows of the hammer to another piece of steel or iron Blistered steel, rolled or beaten down into bars, forms *shear steel*, and if melted, cast into ingots, and again rolled out into bars, it forms *cast steel*, which, when well prepared has the great recommendation of perfect uniformity of texture and a fine and close grain The peculiarities of steel upon which its high value in the arts in great measure depends are its property of becoming, by sudden quenching in water, when at a bright red heat, extremely *hard* and of being [illegible] ened down to any requisite degree by the application of a certain temperature, which may be indicated by a thermometer, commonly [illegible] different [illegible] heated steel The process is called *tempering*, and the workman is sometimes guided in the extent to which it is carried by the *colour* of the polished surface of the heated steel, which is at first rendered of a pale straw tint, then yellow, brownish, purple and blue as the temperature rises from one extreme to the other The latter colour indicates extreme softness and elasticity, such as belongs to watch springs, some sword blades &c, pale straw indicates great hardness, as for razor blades, yellow is somewhat softer, and shows a fit temper for penknives, and the incipient blues announce the temper that belongs to coarser cutting instruments, and to table knives, any of which, made of hard steel, would soon get spoiled and notched, but the edges of which, when duly tempered, resist breaking on the one hand, and bending on the other. When a large mass of steel is hardened by quenching in water, it undergoes a certain degree of expansion, so that the specific gravity of hard steel is somewhat less than that of soft It has been attempted to improve the quality of steel for certain purposes by adding to it small [illegible] hence the term *silver steel*, &c, have on the whole proved superior to well made common steel There is a kind of steel imported from India, known under the name of *wootz*, the [illegible] which is celebrated for the tough [illegible] of its edge It appears probable that its peculiarities depend upon the presence of a little aluminum When the surface of some kinds of steel is washed over with a weak acid, it acquires a peculiar mottled or *damasked* appearance, as if its texture consisted of an intimate mixture of two different kinds of steel or of fine fibres of steel and iron Steel, alloyed with a little nickel, often puts on this appearance, but these and some other imitations of the celebrated *Damascus* sword blades have not led to any important improvements in the manufacture of our cutting instruments (See Stodart and Faraday, *Phil Trans* 1822)

STEEL ENGRAVING The art of engraving on steel See ENGRAVING

STEEL YARD A balance by which the weights of bodies are determined by means of a single standard weight The instrument, which is represented in the annexed figure, is a lever having unequal arms The load whose weight is to be determined is suspended from the extremity B of the short arm, and in weighing the constant weight or counterpoise P is slid along the longer arm [illegible] Divisions [illegible] weight B corresponding to each position of P

In the Roman steel yard, or *statera*, the lever was so constructed that the centre of gravity was brought immediately over the point of support, and the system being accordingly balanced upon its fulcrum F, the effect of the weight of the lever was neutralized The longer arm was then divided into parts each equal to the shorter arm, and those again equally subdivided Suppose now the length of the shorter arm, or the distance F B, to be one inch, and the [illegible] P to be one pound, then if P be placed [illegible] of five inches from F, it will make equilibrium with a load of five pounds suspended from B, for, from the property of the lever, when the equilibrium is established the weight P is to the load at B as the distance of B from F is to the distance of P from F Whatever proportion, therefore, F P has to F B the same proportion has the weight suspended from B to the constant weight P

The steel yard in common use is constructed somewhat differently, the beam being seldom made so as to balance itself on the fulcrum F, but the error that would arise on this account is compensated by beginning the divisions at that point where the weight P being placed the equilibrium is established If, therefore, when P is removed the longer arm preponderates, the divisions commence from a point between F and B For the purpose of increasing the range, there are also in general two fulcra, from either of which the beam may be suspended, and two corresponding scales of division are marked on opposite sides of the longer arm

For weighing heavy loads the steel yard is a convenient instrument but for smaller weights it is susceptible of less accuracy than the common balance. It should be con-

structed so that the point of support F, and the point of suspension at B, may be in the same straight line with the divisions of the beam

STEEL YARD, MERCHANTS OF THE A company of London merchants to whom the *steel yard* (see above) was assigned by Henry III A D 1232 They were all foreigners, chiefly Flemish and German, and were long the only exporters of the staple commodities of England

STEINING or STEANING In Architecture, the brick or stone wall or lining of a well

STEEPLE [illegible] usually attached [illegible] in which bells are frequently but not always suspended

STEER To keep the ship on a given direction This is done by moving the rudder by the tiller, which last is moved from that side to which the ship's head is required to be moved

STEERAGE The steering of the ship Also a place below in the fore part of ships, is distinguished from the *chief* [illegible] is of uncertain acceptation

STEGANOGRAPHY (Gr στεγανος, *covered*, and γραφω, *I write*) The art of writing in cypher *See* CYPHER

STEGANOPODS (Gr στεγανος, *covered*, πους, *a foot*) The name of a family of web-footed birds (*Natatores*) in the system of Illiger, [illegible] species in which all the four toes are connected by the same web It corresponds with the genus *Pelecanus* of Linnæus

STEINHEILITE A mineral of a blue colour, a variety of *iolite*

STELA (Gr στηλη, from ἱστημι *I stand*) In Architecture, a small column without base or capital, usually with an inscription to record an event, or to perpetuate the memory of some deceased person The ancients also used [illegible] There are several specimens [illegible] M

STELLATÆ In Botany a natural order of Exogens, also known under the name of *Galiacea*, which see

STELLERIDANS, *Stellerida* (Lat stella *a star*) Star fishes The name of the family of Echinoderms of which the genus [illegible] is the type

STELLIONATE In the Roman law, a general term comprehending all sorts of fraud committed in matters of agreement which were not designated by any more special appellation The name is said to be derived from *stellio*, a lizard because the fraudulent man is comparable to that animal for versatility and address The six common species of stellionate enumerated by Roman writers were, 1 When one sells the same thing to two purchasers, 2 When a debtor pledges to his creditors something which does not belong to him, 3 When one abstracts or damnifies something which he has pledged to creditors, 4 Collusion by two parties to the prejudice of a third 5 When a vendor substitutes an object of less value for that which he has engaged to sell, 6 A wilful false declaration in an instrument

STEM In Music the upright or downright line added to the head of a musical note, the head being that part filled in black or left open, as the case may be

STENELYTRANS *Stenelytra* (Gr στενος *narrow*, ελυτρον, *a sheath*) The name given by Latreille to a family of Coleopterous insects, comprehending those in which the elytra become narrow at the posterior part of the body

STENOGRAPHY (Gr στενος, and γραφω *I write*) The art of short hand, otherwise termed *tachygraphy* This art has been practised from remote antiquity, and is said to have originated in the hieroglyphics of the Egyptians Numerous systems of stenography have been invented in more recent times many of them of great simplicity, but it would be out of place here to enter into any details respecting them

STEP A block of wood, or in large ships of late years a strong solid platform upon [illegible] the keel of the mast It was found [illegible] mast, yards, &c added to the enormous force upon the rigging, especially during strong winds, forced the keel down

STEPPES (Russ) The name given to the vast system of plains peculiar to Asia, synonymous with the prairies of North America and the Llanos of South America The steppes of Russia are not unlike the heaths of Germany, being in part susceptible of cultivation and [illegible] numerous herds of nomadic tribes

STERCORANISTS In Eccl [illegible] nickname which seems to have [illegible] Western church, in the 5th and 6th [illegible] held the opinion that a change to [illegible] stance of the consecrated elements, so as to render the divine body subject to the act of digestion (See *Mosheim*, vol [illegible] 1796 p 342)

STEREL MINTHANS *Sterelmintha* (Gr στερεος, *solid*, and ελμινς, *an intestinal worm*) The name of a class of internal parasitic animals or Entozoons, comprising those which are composed of a solid parenchymatous substance, in which the nutrient and generative canals are simply excavated and not freely suspended in [illegible]

STEREOGRAPHIC PROJECTION (Gr στερεος, *solid*, γραφειν *to describe*) The projection of the sphere upon the plane of one of its great circles, the eye being situated at the pole of that circle *See* PROJECTION

STEREOGRAPHY In the Descriptive Geometry, the [illegible] of solids on a plane

STEREOMETER (Gr στερεος, *solid*, μετρον, *measure*) In Hydrodynamics an instrument invented by M Say, a French officer of engineers, for determining the specific gravity of liquid bodies, porous bodies, and powders as well as of solids The instrument may be described as follows —Let A E be a glass tube, about three feet long, and open at both ends, the upper part A B being about 4-10ths, and the lower 2-10ths of an inch in diameter The upper edge is ground smooth, so that it can be shut air-tight by a piece of ground plate glass, and the upper part A B communicates with the lower by a very narrow slit at B, which allows air to pass, but prevents the passage of sand or water In using the instrument, a powder (for instance) is placed in the tube A B and the lower part B E is plunged in water or other fluid, till the fluid rises exactly to B The ground glass cover is then placed upon the mouth A, and there is now no air in the tube except what is mixed with the powder Supposing the barometric pressure to be 30 inches, let the tube be elevated until the mercury stands within it at a point C, 15 inches above its surface in the open vessel, and it is manifest that the air within the tube is pressed with exactly half an atmosphere It consequently expands to twice its original bulk, and hence the tube A B now contains only half the quantity of air it contained at first The part B C must therefore contain the other half or the air in B C is equal to the air mixed with the powder in A B, and being half the original quantity under half the original pressure, it fills the same space which the whole occupied previous to the expansion Let the powder be now removed from A B, and the process repeated when the tube is filled with air The quantity of air being now greater, will, when expanded to twice its bulk, fill a larger space than B C, and the mercury will rise only to some point D, but as the expanded air occupies exactly the same space in B D or B C as the whole occupied in A B under twice the pressure, it follows that the cavity C D = B D − B C is equal to the bulk of the solid matter in the powder If, therefore, we now find the number of grains of water which would fill the part C D, we determine the weight of water equal in bulk to the solid matter in the powder, and by comparing this with the weight of the powder, we obtain its specific gravity (*Ency Brit* art Hydrodynamics)

Say's stereometer was first described in the *Annales de Chimie* for 1797 An instrument on exactly the same principle was afterwards brought forward by Sir John Leslie under the name of a *conniometer*

STEREOTYPE (Gr στερεος, *solid*, and τυπος *a figure*) Masses of letters, called letter-press plates, of the size of a page, cast from a plaster mould, in which an exact representation of the types has been made, and thus form-

[illegible] with the impression of whole blocks, it may be said that in its progress towards perfection it has again reached the same point by the introduction of stereotype plates The origin of the more modern invention is involved in greater obscurity than might at first sight appear probable from its comparatively recent date By some writers the merit of the invention is ascribed to the Dutch, who had adopted the plan of printing with solid or fixed types in the 17th century, but it was not till the end of the last, and the commencement of the present century, that the process was perfected and generally introduced In this useful invention, the most prominent names are those of [illegible] Tulloch and Foulis of Glasgow and Didot Paris and Wilson and Earl Stanhope in London The process of stereotyping is very simple A page of any work proposed to be stereotyped is set up with moveable types in the ordinary way A plaster cast is then taken from it, which, being first dried, is immersed in fluid metal The cast or plate, after being sufficiently cooled, is then withdrawn from the mould, and at a subsequent stage, carefully examined with a view to removing any imperfections previous to its being printed from The plaster used for forming the mould is [illegible] mixed with water to the consistence of cream After the form of types has been surrounded with a brass frame, and slightly oiled on the surface, the fluid plaster is poured upon it, and by the application of a brush, made to fill every cavity of the letters, the superfluous portion being cut off When the plaster has set sufficiently hard, it is by means of the frame lifted off the face of the type and detached from it It is then

baked to dryness in an oven; and when quite hot it is placed in an iron box, or casting pot, which has also been heated in an oven The box is now plunged into a large pot of melted type metal, and kept about ten minutes under the surface, in order that the weight of [illegible] all the finer parts of the [illegible] cooled, the mould is broken and [illegible], and [illegible] of the plate turned smooth on a lathe, or planed by a machine (*Conversations-Lexicon*)

STERLING The legal description of the English current coin, of which the most probable derivation is from *Easterling*, the popular name of the Baltic and German traders who visited London in the middle ages, but in what manner it came to be so applied is unknown Camden says from [illegible] artists in coining The silver penny was [illegible] Esterling

STERN In Naval affairs, the after extremity of a vessel

STERNA A genus of web footed birds, having a bill as long as or longer than the head, almost straight, compressed, and pointed, the mandibles of equal length, the upper one slightly inclined towards the point, nostrils pierced towards the middle of the bill, legs small, naked to above the knee, three anterior toes, united by an indented web the hind toe free, wings very long and pointed, tail more or less forked From the two latter characters, the species of *Sterna* are sometimes called "sea swallows" their proper English name is 'tern"

STERNOPTI (Gr στέρνον *sternum*, and ὄψις, *pointed*) The name of a tribe of Coleopterous insects comprehending those in which the sternum is prolonged into a point at both extremities

STERNUM (Lat sternum, *the breast bone*) In Comparative Anatomy the simple or compound bone which completes the [illegible] cage anteriorly and serves as a medium of union to a greater or less number of the ribs The sternum is not present in the skeleton of Fishes Amphibians, or Ophidians In Saurians the anterior portion is generally expanded, to be joined to the broad coracoids and clavicles In Chelonians this part of the skeleton is remarkably developed and very complex and constitutes the greater part of the plastron or floor of their defensive osseous case In Birds also, it is more or less complex at the beginning of its development, but the different ossifications are soon blended together, and form a single broad bone principally remarkable for the keel-like process developed from the middle line of its under surface This keel is subservient to the attachment of the muscles of the wing, and bears a direct proportion to the powers of flight, except where the wings, as in the penguin are used as fins In the Struthious birds, the keel of the sternum is wanting

In Mammalia, the sternum is generally simple and consists of a single chain of ossicles, except in the orang utang and occasionally in man, where a double series of ossifications are originally developed in the body of the bone, but which afterwards become confluent The upper portion, or *manubrium sterni*, remains long distinct from the main body of the sternum, in man, the cartilaginous appendage of the lower edge of the sternum is called xiphoid or ensiform

STETHOSCOPE (Gr στῆθος *the chest*, and σκοπέω *I explore*) A cylinder of cedar wood, about 12 inches long and 1 in diameter, perforated throughout its length and divided into two parts for the convenience of using the whole or half its length The end of each part terminates in a funnel shaped cavity Its use is adverted to under the head AUSCULTATION

STEWARD, LORD HIGH was anciently the first officer of the crown in England with the Latin title of Magnus Seneschallus The office was at one period annexed to the lordship of Hinkley in Leicestershire held by the family of De Montfort, but on the rebellion and fall of that noble house, it was in effect abolished as a permanent dignity, and is now only revived *pro hac vice* on the occasion of a coronation, or the trial of a peer In the former case, the lord high steward's commission is to settle matters of precedence, &c, in the [illegible] to preside in the House of Lords

STEWARD LORD, OF THE HOUSEHOLD An officer of the king's household England, in Norman French, Seneschal He is steward of the marshalsea or court of the household, an office which he performs by deputy In his department is the counting house where the expenses of the king's household are taken, within which [illegible] court which has [illegible] in the king's palaces and verge of the court

STHENIC DISEASES Those which are the result of inflammatory or increased action, as opposed to asthenic or diseases of debility

STIBIUM An [illegible]

STICHOMANCY (Gr στίχος, *a line*, and μάντεια, *prophecy*) Divination by lines or passages in books taken at hazard Among the Romans, verses from the Sibylline books were written on slips of paper, which were thrown into a vessel, and future events were conjectured from the interpretation of one of these slips drawn out at hazard Of the same kind were the *Sortes Virgilianæ*, *Homericæ*, &c, a sort of literary superstition by which the works of authors were consulted, and the meaning of a line casually taken assumed as indicative of the fate of the person discovering it Verses of the Bible selected in this way by chance have been, and are still, frequently taken by the superstitious as oracular This sort of divination has been [illegible] *sortes biblicæ* It was condemned [illegible] in 465, and other early synods, but was long afterwards practised in France at the elections of bishops, abbots &c The custom of drawing by lots verses from the Bible on such occasions is said to have prevailed as late as 1740, in the cathedrals of Ypres, St Omer, and Boulogne *See* SORTES, SORTILEGE

STICK, GOLD The colonels of the two regiments of Life Guards are so called whose duty it is to be in immediate attendance on the sovereign on all state occasions These colonels do duty for a month alternately; the one on duty being called the *gold stick in waiting* The field officer of the Life Guards, when on duty, is called *silver stick* The term originated in the custom of the sovereign presenting the colonel of the Life Guards with a gold stick on [illegible]

STIGMA [illegible] An impression such as that made [illegible] hot iron Stigmatizing was a common practice among the ancients to mark their slaves as property, and it is pursued at the present day among slave-drivers It was customary also to stigmatize the votaries of some of the gods with some recognized emblem of their divinity, such as the ivy of Bacchus, trident of Neptune &c, or with the initial of their names, or some mystical number It is supposed that reference is made to this practice by St John, Rev ch 13 *See* TATTOOING

STIGMA In Botany, the upper extremity of the style without a cuticle, in consequence of which it has almost uniformly a humid and papillose surface It is the part upon which the pollen falls and where it is stimulated into the production of the pollen tubes, which are indispensable to the act of impregnation

STIGMATA In Theological language, the marks of the wounds of our Saviour The text at the end of the Epistle to the Galatians, "From hence let no man trouble me for I bear in my body the marks of the Lord Jesus" seems to have given rise to the superstitions promulgated in the [illegible] church respecting the impression of the stigmata on favoured saints, of which the legend of St Francis of Assisi affords the most remarkable instance

STILE In Architecture, the vertical piece in framing or panelling *See* RAIL

STILL (Lat stillare, *to drop*) An apparatus for the distillation of liquids upon the large scale It includes the *body* or *boiler*, which is usually set in brickwork over a furnace, and to which is annexed the *head*, forming the communication between the boiler and *condenser* or *worm pipe*, from the extremity of which the distilled liquid passes in successive drops, or a small continuous stream, into the *recipient* There are an infinite variety of stills adapted to particular purposes, of which the most important are the distillation of spirituous liquors (*See Ures Dict of Arts &c*)

STILT BIRD The name of the *Himantopus melanopterus* [illegible] It has very long and slender legs

STINKSTEIN A bituminous carbonate of lime, which exhales a fetid odour when rubbed

STINT In Coal Mines, a measure of work used under ground, 2 yards long and 1 broad, which each miner clears before he removes to another place, and which is proved by a boy appointed for the purpose, who is colloquially called "the judge"

STIPEND (Lat stipendium), signified originally the pay of soldiers In a legal sense it is applied to the salary or allowance given to some person for transacting the business of another, but in Scotland the term is almost exclusively confined to the provision made by law for the established clergy *See* PRESBYTERY

STIPPLING In Engraving, the method of producing shadows by means of dots of greater or less size, according to the intensity of shadow required By this method the resemblance to chalk drawings is produced

STIPULA In Botany, a small appendage situated upon each side of the base of a petiole, most commonly of a less firm texture than the latter, and having a subulate termination the word is also used in describing *Hepaticæ*, to denote the appendages which are occasionally present at the bases of the leaves, but of which they seem rather to [illegible]

STOCK DOVE [illegible] *Columba Ænas* by Linnæus

STOCK EXCHANGE The name given to the system whereby the purchase, sale, and "carrying over"

[illegible] ted by certain parties called [illegible] be explained and discussed — viz first, the parties engaged in stock transactions, whether brokers or jobbers, secondly, money and time bargains, thirdly the rules and regulations by which these operations are conducted

The Clearing House in Lombard Street affords the greatest facilities to the transactions of the Stock Exchange, inasmuch as, without its intervention, difficulties and embarrassments would present themselves in the final settlement or adjustment of those transactions of an almost insurmountable character By means of this clearing-house, all the great monetary transactions of the day are brought to a close by 5 o'clock in the afternoon, whereas in the ordinary mode of paying or receiving moneys whether in notes or hard cash, their settlement might not be finally effected for several days afterwards, to say nothing of the security afforded to all parties concerned by the operation of the clearing-house

The members of the Stock Exchange are divided into two distinct classes — viz the brokers, and the jobbers It is the business of the brokers to receive and to execute the orders of merchants, bankers, capitalists and private individuals, who are "out of the house," the Stock Exchange being [illegible] own members honoured with [illegible]

The jobbers remain [illegible] the "house," and ready to act upon the orders thus received by the brokers And here it may be as well to explain the nature and character of the business transacted by these jobbers, who, being men possessed of more or less capital, endeavour to turn it to account in the manner we are about to explain It is their business to be always prepared to make a price to the brokers whenever the latter present themselves the readiness which they display in offering to do business to large amounts at the apparently small difference of 1 8th per cent would appear extraordinary, were it not that they are so numerous that an eager competition is excited amongst them for the favours of the brokers When one of the latter appears in the market, he is surrounded by a knot of jobbers, who announce themselves ready to buy or sell whatever amount of stock he has to deal in at a price varying only 1 8th per cent For instance if a broker has to do business in 5000*l* Consols (the market price being about 90) the jobber offers to buy his 5000*l* at 90 or to sell him that amount at 90⅛, without being in the slightest degree aware whether the orders of the broker are to buy or to sell, and thus taking upon himself the risk of selling that which he does not possess, or of buying what he does not intend to keep, his only object being to undo his bargain, at a difference of 1 8th per cent, or even less, with another broker, who may have to effect an operation the very reverse of the other, which 1 8th or even 1-16th constitutes his profit

Without the intervention of the jobber, therefore, it will be seen that there would exist a vast difficulty in effecting the transactions which daily take place The jobbers are, in fact, the "middle men" who stand in the house in the character of dealers, always ready to buy or sell, thus obviating the necessity of the broker's going in quest of a second broker, with whom he might transact his business, or, in other words, whom it might suit to buy what the other broker had to sell or *vice versa* Again, even if one were at hand he might not be able to concur in the actual amount of stock which the other wished to deal in, whereas the jobber is ready to do business to any amount, even to the smallest fraction, and hence a great deal of time is saved It often happens that a broker who has to dispose of shares not currently dealt in is frequently obliged to wait for months before he can find a purchaser, whereas, in the case of stock the jobbers offer themselves as buyers or sellers at a moment's notice, and thus offer facilities for transactions in the public funds which could not be effected without them

Having thus endeavoured to explain the difference between broker and jobber, and confined our attention hitherto to money transactions, we next proceed to describe the nature of "time bargains," which form so essential a feature in stock business Indeed the very existence of the Stock Exchange as at present constituted, depends upon speculations in time bargains, for where there exists a body of 600 members, the actual *bonâ fide* business [illegible] employment for [illegible] the nominal [illegible] and sales of stock made for a certain fixed period, regulated by the committee There can be little doubt that they had their origin in the business which has always been transacted in the funds during the periods when the stocks are shut For instance, Consols usually close about the beginning of June and December, that is to say, the transfer books at the bank are shut for the space of five or six weeks, in order to afford time for the preparation of the dividend warrants, which are paid in the following July and January Hence it is clear that a person wishing to buy or sell that particular stock during the period referred to would be unable to effect his object, but in order to secure the price of the day, he buys or sells the stock "for the opening" that is for actual transfer on the day on which the transfer books are re-opened This mode of doing business is legitimate enough, but this practice has no doubt given rise to operations of the greatest magnitude, founded, not on actual necessities, but merely on speculation, and this method being found convenient for one period, has been continued on other occasions, without, however, possessing the same pretext for its adoption Periodical dates have consequently been fixed upon by the committee, similar to the "opening," at intervals of about six weeks, making altogether about eight 'settling days," as they are called, in the course of a year On these settling days are arranged and adjusted all the bargains made during the preceding six weeks for that particular day, those who sold stock having to deliver it on the one hand and those who purchased having to accept and pay for it on the other But as the majority of the speculators have no intention of doing either the one or the other, their bargains having been of a purely speculative character, founded on their anticipations of a rise or fall in the value of the securities, so whatever difference may exist between the price at which a party commenced his speculation and that at which he finally closed it is settled on this important day, and his operations most likely not having been confined to the same jobbers, but having been effected with several, it becomes necessary to balance them with the parties concerned, and much the same process takes place on this occasion as that practised at the bankers' clearing-house, by establishing balances between each other Whatever balance remains unsettled is adjusted by the name of the *bona fide* purchaser of the stock (who intends to pay for it) being passed from one broker, or jobber, or speculator to another, until it comes into the hands of the party who intends to deliver or transfer the stock, by which means all the intermediate persons through whose hands it passes (the price given by the purchaser being marked on the ticket) are enabled to close their accounts with each other at that particular price, and to pay and receive the difference accordingly In short, all transactions kept open [illegible] the clearing day *must* then be closed, and the party who delays this operation until the last moment is often exposed to [illegible] from the difficulty of finding others who, having [illegible] accounts, are unable or unwilling to enter into a fresh transaction on this day of reckoning," whereby he is compelled to pay something extra in the price to those who have it in their power to afford him this facility, in order to enable him to settle his account

But as many of the bargains made for this particular day are really *bona fide* transactions the stock bought and sold being, in point of fact, delivered by the actual holder and taken by the new purchaser, let us briefly explain how this is effected. This process is one of daily occurrence and is not necessarily confined to a settling day although on such occasions it usually amounts to a considerable item, from having extended over a wider period In either case however the following is the way in which the matter is settled between the broker and his principal who has sold stock — The broker usually passes his check for the proceeds of the sale to his principal, taking the precaution of crossing it, by writing a banker's name across the check When, however, Bank of England notes are demanded in lieu of crossed checks (as is sometimes the case), the bargain is made accordingly in this case, the jobber who buys the stock provides them either by borrowing of those who happen to have large balances at their bankers', or from their own private bankers The notes so borrowed by the jobber are then paid over to the broker, and by him to his principal This operation is, however, seldom resorted to by men of business where there is no reason to doubt the credit of the party drawing the check

The jobber, on the other hand, having sold the stock to some other broker, who buys for his principal, receives in return his check, so that, by this simple process of passing four checks, — viz that of the purchaser to his broker, that of the broker to the jobber, that of the jobber again to the broker who first sold the stock, and that of the latter to his principal, — the whole transaction is completed

To advert to another technical peculiarity appertaining to the Stock Exchange which may appear puzzling to the reader, the use, [illegible] of the terms bull and bear A *bull* is one who speculates for [illegible] on the [illegible] will for the account buy a [illegible] Consols for the settling [illegible] for the account" with a [illegible] during the intervening period at a higher price The bear on the other hand, would sell the [illegible] stock (which, however, he does

not possess) "for the account," with a view of buying them in for the p [illegible] at a lower price than [illegible] during "one account," vast profits may be realized, or equal losses sustained, by these gambling operations

The transactions in the foreign market are carried on much in the same way as in that of the English stocks, with the exception that the settling days are much more frequent, occurring as they do once in every fortnight The foreign house is quite of modern origin, but it is subject to the same rules and regulations as the English with a few exceptions The dealings are there carried on in all the foreign stocks, as well as in [illegible] and other shares The jobbers are dist [illegible] in the English [illegible] there is nothing to prevent them from [illegible] if they possess sufficient intelligence to enable them to give their attention in two places at once

In connection with time bargains may be noticed that important branch of business which goes under the [illegible] ation," or "carrying over" [illegible] interest for money borrowed or lent on security of stock The rate of this continuation or interest varies according to the abundance or scarcity of money, and the nature of the security offered For instance, on British stocks even when money is very scarce, it seldom exceeds the rate of 5 per cent per annum from one account to another, whereas in the foreign market, where the security consists of foreign bonds of various and doubtful descriptions, it ranges from 5 to 10 per cent, or even more on particular occasions when it reaches 10 per cent per annum

There are several causes which tend to produce this extraordinary variation in the rates of continuation, for in the case of Consols, which constitute the only stock for speculation in time bargains in the English market, the price varies so little in comparison with the value of the stock in the course of an "account," that the security is considered good in itself, and therefore no extra charge is superadded by the party who lends his money This is not the case with regard to foreign stocks, which are constantly fluctuating in value, a fact to be accounted for by the extremely precarious nature of this description of property Most of the bonds in circulation in the foreign house have ceased to bear any interest whatever and many of them bear upon them the marks of their shame and disgrace in the shape of the arrears of interest, called *coupons*, overdue for several years It is not therefore to be wondered at that foreign securities of this description do not command the same credit as our own English stocks, and it must hence follow, as a matter of course that parties who wish to raise money upon them must consent to pay a higher rate of interest for the accommodation

A great deal of business is transacted in this way and some brokers who possess the means of obtaining large sums of money without much difficulty devote their entire attention to it The process by which the operation is effected is simple, both in the English and foreign market The present rate of continuation in the Consol market is 9-16ths per cent until the opening, and if a person, we will suppose, wishes to lend money on that stock, from the shutting (on the 2d of December) to the opening (on the 14th of January 1842) his broker procures him 1,000*l* Consols as security, for which he furnishes the money at the actual price of the day, which is 90, making 900*l*, and resells at the same time the said 1000*l* stock for the opening (on the 14th of January) at $90\frac{9}{16}$, making 906*l* 12*s* 5*d*, and thereby leaving a difference in his favour of 5*l* 12*s* 6*d* for the loan of 900*l* d r n, th a [illegible] forty-four days, which will be found to be at the rate of 3*l* 3*s* 8*d* per cent per annum On foreign securities the principle is the same Supposing he lends on the security of Spanish bonds, he receives as security 5100*l*, for which he pays on the 30th of November, at the price of $24\frac{1}{2}$ per cent, 1249*l* 10*s*, but sells it to the same party for the 15th of December (the next settling day) at $24\frac{9}{16}$, producing 1252*l* 13*s* 9*d*, leaving a difference in his favour of 3*l* 3*s* 9*d*, or 1-16th upon the stock bought and resold, which, for fifteen days, is equal to 1-8th per cent per month, or 12-8ths per cent, per annum, equal to 76*l* 10*s*, being at the rate of about 6*l* 2*s* 6*d* per cent per annum interest This calculation is made upon the current rate of interest for the "continuation" of that stock on the 30th of November, which was considered as extremely low

The continuation on shares, in which a great deal of business is also done, varies but little from the above, but a difficulty here arises, which offers a great obstacle to the lending of money for short periods

The *stamps* which by law are necessary for the due transfer of property of this description, and without which transfer there could be no security to the lender of money, are so onerous, and press so heavily on all *bona fide* transactions, that notwithstanding the many attempts made at various times to evade them, they operate materially against the parties who lend money upon them, and in fact, neutralize all profit for short periods

Persons who have sold shares or stock, if they are not [illegible] with their brokers, [illegible] the interest of the [illegible] copies of profit to obtain interest for it until they actually deliver the stock On the other hand, speculators for the rise are by this means able to carry over their purchases from one account to another, and although it may appear strange that they should be paying at the rate of 5 and even 10 per cent per annum interest on a stock which, in the instance of Consols, pays them only 3 per cent, and in that of Spanish pays them actually nothing, still, when viewed solely in the light of speculations, the rise in either security, if it take place, will more than compensate for this apparent inconsistency

The proceedings of the Stock Exchange are regulated by a committee consisting of thirty members, who are elected from the general body every Lady day, each member having one vote They take care that the rules and regulations enacted for the admission and expulsion of members, and for the settlement of disputes, are properly observed, and although some of their laws are at variance with the established laws of the country, they are not so strictly enforced by the committee as to bring them into collision with the courts of justice they fully answer the purpose for which they were intended, and all members previously to their admission subscribe to the conditions there laid down

All members, on being admitted, are obliged to produce three securities of 300*l* each for the first two years of their probation, which 900*l* becomes forfeited in the event of their failure, and goes to the creditors of the new member In consequence of their being interdicted from engaging in any other business, on becoming members of the Stock Exchange they are no longer subject to the bankrupt laws, and therefore, in the event of failure, all their assets are secured to the creditors *in* the house, to the exclusion of those *out* of it This rule is enforced in order to secure the house from the loss which would ensue to its members were the legal creditors (if any existed) to step in and lay claim to their property

The tendency of the above regulation is to insure honesty amongst its members Should any principal have reason to complain, he has only to appeal to the committee, who instantly take cognizance of the matter, and subject it to the strictest investigation Defaulters whose conduct has been dishonourable are punished, and an example is made of them by publicly affixing their names in the house on what is termed the *black board* this is the heaviest disgrace which a member can possibly experience (For this elaborate account of the procedure of business in the Stock Exchange, we are indebted to the *Times* of 1841)

STOCKS A well known kind of punishment The practice of confining men by the legs was so common as to have given the ordinary name to a chain of any kind in several languages *e g* Gr πέδη Lat *compes*, Engl. *fetter*, all from πους, *foot* The stocks in England have been, generally speaking, rather used for restraint than punishment, constables being empowered to put disorderly persons into them, but it is likewise ordered by some statutes as a punishment on conviction It is now almost disused, though, we believe, not entirely in remote districts

STOICS A celebrated sect of antiquity, so called from the *stoa* or *porch* in Athens which was the scene of the discourses of their founder Zeno of Cittium (B C 300). The Stoics are proverbially known for the sternness and austerity of their ethical doctrines, and for the influence which their tenets exercised over some of the noblest spirits of antiquity To give a connected and systematic account of the philosophical principles on which they grounded their moral precepts is a less easy task than, from the notoriety of the latter in some of their main features, might have been anticipated Their speculations were not confined to ethical subjects, but aimed at embracing the whole circle of human knowledge, physics, theology, and logic, no less than morals and politics Their system, as far as we can gather from the notices preserved by [illegible] hers, appears to be an attempt to [illegible] pantheism and a materialist psychology with a logic which seeks the foundations of knowledge in sensible experience, and a morality which claims as its first principle the absolute freedom of the human will Of the mode in which they combined dogmas apparently so inconsistent into a philosophical whole, we have accounts sufficient to inspire us with respect for the earnestness and strength of character possessed by the leaders of their sect, and with [illegible] We [illegible] a narrow and controv [illegible] but comprehensive [illegible] sophical writings of their great predecessors, of Plato, and, in a still more eminent degree, of Aristotle The

philosophy of the Stoics was essentially polemical On every side it presented an armed front to an opponent It sought to confute the academic scepticism by the strenuous assertion of the truth of sensible perceptions, and the validity of the judgments to which they lead by a vigorous protest in favour of the common sense of mankind as opposed to the theories of the schools Sensation, they affirmed, is not merely a passive affection of the mind, it becomes, under certain conditions, perception or *comprehension* (κατάληψις) —a faculty whereby the mind reaches beyond itself, and *lays hold*, as it were, on outward being From the acquisitions of sensible experience are formed conceptions and judgments of successive stages of generality, which it is the province of the reason to construct into philosophical system Such is the stoical logic, which is consequently a *material*, and not, as with Aristotle, a *formal* science An equally controversial bearing is perceptible in the remainder of [illegible] critus, which accounted for all physical phenomena by the varieties in size and figure of the ultimate atoms of which all substances are the aggregate The fortuitous concretions which thus became the first cause of all things, had attracted the partialities and won the assent of a sect averse in all things equally to limitation or constraint The Stoics espoused the opposite doctrine of a one all-pervading substance, a permeating ether, a creative fire the source of life and law to the material universe On this they built their doctrine of a universal providence, excluding chance in the least things as in the greatest, and directing all events by irresistible necessity to the promotion of perfect good The same hypothesis furnished them with a ground for the first principle of their ethical doctrines "Live according to nature" is, with the Stoics the expression of the coincidence which ought to exist between the human will and the universal reason, which, as we have seen, they identified with the life and power of nature This coincidence is virtue, the only good, as vice, its opposite, is the only evil All things else are in themselves indifferent, being approved or disapproved only by comparison Virtue is the perfect harmony of the soul with itself, vice is, in its essence, inconsistent and self contradictory The wise man, the ideal of human perfection, is absolutely, and without qualification, free His actions are determined by his free will with a power as irresistible as that by which universal nature is guided and animated In the one no less than in the other, freedom and necessity are one

In these doctrines the controversial character to which we have adverted is sufficiently obvious Much, however that is exaggerated and paradoxical both in the tenets of the Stoics and in those of their opponent Epicurus is to be accounted for by a reference to the political circumstances of the age in which both lived The pressure of public calamity and the utter extinction of national life in Greece while they precluded all healthful exercise of the duties of a citizen —duties which had entered so largely into the calculation of the earlier Greek moralists,—would drive the more virtuous and thoughtful part of mankind to seek in the development of the individual life for that satisfaction which they sought elsewhere in vain It is easy to conceive that the same circumstances which would recommend to minds of a certain order the good-humoured apathy and the tranquil voluptuousness of the garden, might with men of sterner temperament be the occasion of drawing forth all the energies of their will and of placing those energies at once in distincter consciousness to themselves, and in sharper antagonism with the evil that surrounded them In the declining period of the republic, as well as in the darkest periods of the empire, we find the noblest Romans seeking for consolation in the doctrines of one or the other of these rival sects Brutus, Seneca, Epictetus, and the philosophic emperor Aurelius, are among the names of the most celebrated Roman Stoics Little, however, was done by the Romans to advance the speculative part of the stoical philosophy, which was indebted for its systematic form to Cleanthes and Chrysippus

The chief sources of information concerning the doctrine of the earlier Stoics are the philosophical works of Cicero, for their logic, the *Academic Questions*, for their ethics, the treatise *De Finibus*, and the *Tusculan Questions*, and for their theology and physics, the books *De Natura Deorum*, and *De Fato* See also *Diog Laert* l vii Plutarch, *Adv Stoicos*, &c , Ritter, *Hist of Ancient Philos* xi part 5

STO'LA (Gr στολη) A dress of which the name was borrowed by the Romans from Greece, but acquired in their language a peculiar signification, being the habit appropriated to women It was a long vest coming down to the ankles worn within doors, and covered by the palla when they went out, as described by Horace, *Sat* l i 2 —

Ad talos stola demissa et circumdata palla

Common prostitutes, at least in the age of Horace, were not permitted to wear this distinguishing garb of the Roman lady The stole is a robe worn by deacons in the Roman Catholic church *See* VESTMENTS

STOLE, GROOM OF THE An officer of the king's household in the lord chamberlain's department He is first lord of the bedchamber, his title is derived from the [illegible] occasions He originally performed likewise the office of the king's shirt on of a morning, which in his absence, devolved on another lord of the bedchamber

STO'MACACE (Gr στομα, *the mouth*, and κακος, *evil*) A fetor of breath, arising from ulcerated gums Mouth-washes, with tincture of myrrh and borax and the internal use of tonics, are the remedies which relieve it

STO'MACH, *Stomachus* (Gr στομα, *the mouth*, and χεω, *I melt*, from its receiving the contents of the mouth and melting them down into nutriment) The human stomach is a somewhat oblong and rounded membranous bag, situated in the epigastric region It is largest on the left side (or cardiac end, and gradually diminishes towards the right or lower orifice, which is called the *pylorus* Like the intestines the stomach has three coats or membranes, connected together by cellular membrane The exterior or peritonæal coat is a dense firm membrane, the internal or villous coat is soft, mucous, and vascular, the central coat is muscular, and the glands of the stomach are situated between it and the villous coat The stomach is largely supplied with nerves which come from the eighth pair and sympathetic They are chiefly from the cæliac and are accompanied by veins which empty themselves into the vena portæ The lymphatics of the stomach proceed directly to the thoracic duct *See* ANATOMY and DIGESTION

STOMACH PUMP A small pump or syringe with two apertures the valves of which are so arranged as to admit of liquids being drawn out of, or injected into the stomach, by means of a flexible tube

STO'MAPODS *Stomapoda* (Gr στομα, *a mouth*, πους, *a foot*) The name of an order of the class *Crustacea*, comprehending those in which the maxillary feet are formed like the first four thoracic feet

STO'MATA Passages through the epidermis of plants, [illegible] which [illegible] stances and lies over a cavity in the subjacent tissue They are universally regarded as spiracles or breathing pores

STONE BORERS, called also *Lithophagi* Molluscous Bivalves which, by means of a fleshy foot, on which they turn as on a pivot, perforate or bore into rocks

STONE CHAT A species of warbler, forming the type of the genus *Saxicola* of Bechstein It is the *Sylvia rubicola* of Latham, *Motacilla rubicola* of Linnæus Also called the "chick stone"

STONE CURLEW The name of a large species of plover, the *Œdicnemus crepitans* of Temminck It appears in England at the latter end of April, frequents open hilly situations, makes no nest, but lays two eggs on the bare ground, and emigrates in small flocks about the end of September

STONE GALLS A technical term applied to nodules of clay occurring in sandstone, they often fall out on exposure to weather, and render the stone unfit for architectural purposes

STONE IN THE BLADDER *See* CALCULUS

STOO'KING [illegible] of corn in stooks, t [illegible] formed soon after the corn is cut, it being previously tied into bunches or sheaves

STOOL The root of a timber tree, which throws up shoots Coppice wood consists chiefly of the shoots sent up by the roots of stools of trees or shrubs which have been cut over by the surface In general all Dicotyledonous trees are endowed by nature with the property of sending up shoots from the stump or stools; but this is not the case with most of the Gymnosperms or Coniferous trees A wood of pines or firs, therefore, when once cut down, can never be renewed, except by seeds

STO'RAX [illegible] exudation from the *Liquidambar* [illegible] It is generally much adulterated

STORK An English name [illegible] the *Ciconia* of modern ornithologists [illegible] (*Ciconia alba*) is that species which visits [illegible] England

STORM The causes of those violent commotions of the atmosphere to which we give the names of storms, tempests, hurricanes, tornados, &c , are involved in great obscurity, chiefly from the difficulty of obtaining a precise knowledge of the various circumstances with which they are accompanied In order to ascertain the general laws of these phenomena [illegible] to determine, in a great [illegible] the place and time at which the storm begins and ends, the path it describes, the extent of atmosphere disturbed, the di-

rection and force of the wind and the barometric pressure at every part of the disturbed column during the whole time of its continuance But several of these points could only be determined from the comparison of a great number of simultaneous observations on that tract of the earth's surface over which the storm passes, while from the nature of the thing to be observed, it is evident that a few insulated observations is the most that can be expected in almost any case Besides, a storm for the most part passes over some part of the sea, where, unless a ship unfortunately happens to be caught in it no observation can be made, or even evidence be obtained of its existence

It is in the torrid zone that storms display the greatest violence, and rage with most destructive fury In our latitudes they are comparatively rare, and in the polar regions they seldom amount to more than a strong wind

Until recently it was generally believed that during a hurricane the wind at every part of the agitated mass blows in a rectilinear and parallel direction, and a storm was considered to be sufficiently explained when it was described as a wind blowing with a velocity of 100 or 120 miles in an hour A comparison of the recorded accounts of [illegible] storms has of late yea[illegible]eous, and that the phenomena are considerably more complicated

Franklin appears to have been the first who remarked that storms travel in a direction opposite to the actual movement of the wind at the time the storm is raging, and he ascribed the phenomenon to a great but partial rarefaction of the air, arising from the sudden precipitation of vapours, or other causes, the consequence of which would necessarily be a simultaneous rush from all quarters to fill up the vacuity, and the mass of air being thus set in motion by a sort of aspiration, the gale will be first felt at those places towards which it blows (*Letters and Papers on Philosophical Subjects*) In a work on winds and monsoons published in 1801, Colonel Capper was led, from a comparison of the details respecting the hurricanes at Pondicherry and Madras in 1760 and 1773, to remark that these hurricanes must have been whirlwinds, whose diameter could not exceed 120 miles and that the velocity of the wind at any point was due to the rotatory velocity of the vortex He also supposed that, besides the gyratory movement which forms the characteristic of the whirlwind, a storm has probably also progressive motion Colonel Capper's speculations however appear to have met with little attention until the subject was taken up by Mr Redfield of New York who, in a series of papers published in the American journals diligently collected and examined a great number of observations relative to the storms of the West Indies and North American coasts and arrived at similar conclusions The following general phenomena appear to be established —1 The severest hurricanes originate in tropical latitudes to the north or east of the West Indian Islands 2 They cover simultaneously an extent of surface from 100 to 150 miles in diameter, acting with diminished violence towards the exterior, and increased energy towards the interior of that space 3 The tract over which the hurricane passes is not a straight line South of the parallel of 30° north latitude, it proceeds in a westerly course inclined to the north, but [illegible] rather abruptly [illegible] incline gradually more to the east The average progressive velocity appears to be from fifteen to twenty five miles per hour 4 The duration of a storm at any particular place depends of course on the extent of the mass of agitated air, and the progressive velocity, and storms of smaller extent move with even greater rapidity than large ones 5 The direction of the wind in a hurricane is not in the direction of its progress When the progressive motion of the storm is westward, the wind at the commencement is from a northern quarter, and during the latter part of the gale from a southern quarter of the horizon When the progressive motion is eastward the phenomena are reversed, the wind blows at first from a southern quarter, and towards the end of the gale from a [illegible]

[illegible] particularly the last, Mr Redfield concludes that the great body of the storm whirls in a horizontal circuit round a vertical or somewhat inclined axis of rotation, which is carried forward with the storm, and that to a spectator placed at the centre the direction of the rotation is invariably from *right to left* It is to be understood, however, that the phenomena now described and the conclusions drawn from them apply only to the northern hemisphere

Another fact deserving of attention is, that the barometer, in all latitudes, sinks during the first half of the storm [illegible] This phenomenon is ascribed to the effects of the centrifugal force of rotation, and such is the regularity of its occurrence, that it has been [illegible] self a strong proof of the rot[illegible]

Colonel Reid of the engineers having been officially employed to repair the government buildings at Barbadoes [illegible] by the great hurricane of 1831, was led to investigate the subject generally, and in his work, entitled *An Attempt to develop the Laws of Storms, &c*, he has collected and given the results of an immense number of details, obtained from an examination of ships' [illegible] and other sources These results [illegible] all respects the conclusion Mr [illegible] the gyratory motion of the [illegible] progressive motion in a curve line, first westward, and then towards the north and east, the position of the vertex of the curve at or near the 30th degree of latitude, and the fall of the barometer during the first half of the storm, and its rise during the second Colonel Reid has also given an account of several great hurricanes in the southern hemisphere, from which it appears that the southern storms [illegible] the northern, but in a reverse [illegible] f the rotation is from *left to right*, the centre of the gyrating mass advances first eastwards, then turns towards the south, and falls off towards the south-west and west, the vertex of the curve being at the [illegible]th degree of south latitude In the northern hemisphere the West Indies and Atlantic coast of North America appear to be the places where storms most frequently rage, in the southern, the focus of storms appears to be placed near the Mauritius

The uniformity of the direction of the rotatory motion of [illegible] he [illegible] Mr Reid [illegible] retical considerations respecting the origin of storms, which he supposes to be produced by the mingling and collision of two atmospherical currents near the outer border of the trade winds, namely, the superior or equatorial stream and the polar stream which counterbalance the trades On looking at the curves representing the paths of the hurricanes on the charts projected by Mr Redfield and Colonel Reid it is difficult not to believe that the direction of their progressive motion is mainly determined by the configuration of the American continent

The fact of the whirling character of storms has been controverted by Mr Espy another American writer on the subject who advocates Franklin's theory of progressive motion in radial lines Mr Espy states, that on comparing simultaneous observations in the middle of storms and all round their borders, he found that the wind blows *inward* on all sides of a storm towards the central parts, — towards a point, if the storm be round, [illegible] teen storms, without finding a single exception to the general rule Professor Bache of Philadelphia maintains the same opinion and has described a tornado which occurred at New Brunswick in 1835, in which he could find no proof of rotation, the objects thrown down by the wind being all directed to a centre It is not improbable that there may be hurricanes of both characters An outline of Mr Espy's theory is given in the *Report of the British Association for* 1840

Independently of the interest which attaches to the subject in a meteorological point of view, a knowledge of the general laws which regulate the phenomena of storms would be of immense importance, inasmuch as it would enable the navigator to avoid those tracts of the ocean in which they chiefly prevail at particular seasons, or at least, if surprised by a storm, to steer on the course by which he may soonest escape from it or fall into its wake On either theory the direction of the wind at the commencement of the gale must indicate, with considerable certainty, the quarter in which the storm is raging with great [illegible] In addition to the works already [illegible] *Journal* from 1831, Prof Forbes's Reports on Meteorology in the *Reports of the British Association* for 1832 and 1840, and the *Edin Review*, vol lxviii) See also WIND

STO'RTHING The parliament of Norway It is elected once in three years, and sits every year for the despatch of business The election is double, every qualified person (an owner or liferenter of land paying taxes in the country, and every one possessing land or houses of 150 rix dollars value in towns) joining in the election of councillors who elect out of their own body the representatives of the country These must be from 75 to 100 in number The storthing, when elected divides itself into two houses one fourth, chosen by the rest, joining the lagthing, or upper house, the remainder the odelsthing, or lower house The storthing has the usual powers of a legislative assembly in a constitutional country, and the king has only a suspensive veto, which if the storthing passes a law three times in six successive years, becomes of no effect

STORY In Architecture, a subdivision of the height of a house, comprehending the height ascended by one fli[illegible]

STORY POST In Architecture, a vertical post to support a floor or superincumbent wall.

STOVE (Dutch, *stove*) A receptacle for the combustion of fuel for the purpose of heating houses, &c The common fire-grate for the combustion of coal, with its various appendages is generally called a *stove*, hence *register stoves*, *Bath stoves*, &c These are often, and indeed generally, very ineffectively constructed, and calculated to consume a large quantity of fuel, with a proportionate waste of heat They are generally intended to diffuse warmth principally or entirely by *radiation*, and should be placed as near the ground as possible, while the different parts into the contact of which the burning fuel is brought should be of fire-brick, or some similar composition, which is a bad conductor but a good radiator of heat It is manifest that in our common fire-[illegible] volume of hot air which passes up [illegible] available as a source of heat, hence, [illegible] where greater economy of fuel is studied, the fireplace is frequently closed in, and contained in an iron box which projects into the room while the heated air before it finally enters the chimney is made to circulate through tubes or pipes, to which it communicates much of its excess of heat, and these again impart it to the surrounding air What are termed *German stoves* are usually made upon such principles, and in them the fuel is often introduced and the air required for the support of its combustion admitted, on the outside of the room in which the stove with its flues and heating surfaces is placed

In *Arnott's stoves* the heat is similarly but more scientifically economized There is only enough air admitted to keep up the slow combustion of the fuel and the heat is communicated to the radiating surfaces of the stove, so that before the air which has passed through the fuel finally enters the chimney it has been deprived of the greater part of its available heat These stoves are also so constructed as, by means of thermometric or self-acting registers to adjust with much nicety the supply of air, so that neither more nor less may enter than is required to maintain the combustion of a given quantity of fuel

In *Feetham's air-stoves* the common open fire is retained, but the heat is to a certain extent economized by by causing the hot air before it enters the chimney to communicate a portion of its heat to an iron box, over which a current of air passes and is sent warm into the room

It is manifest that our common open fires must act as powerful ventilators, and that the large quantity of air which is driven up the chimney must be supplied in some way or other through the apartment in which the fire is burning This supply of air is generally left to chance, and finds its way into the room by crevices in the doorways and window sashes or between the boards of the floor or any similar accidental passage through which it can make its way, and as in London at least, the air always abounds in fuliginous particles these are carried in along with it and show its track by the blacks which it deposits If this supply of air is inadequate and it generally is so in new and well built houses, in consequence of the tightness of the doors, windows, and floors the chimney of necessity smokes, and the door or window requires to be left open to prevent such an effect This evil may usually be effectually prevented by admitting fresh air from without through some proper and adequate channel, and various ornamental or concealed apertures may be contrived for the purpose, in the best arrangement of which, however much practical as well as theoretical skill is often essential

When rooms are warmed by German or Arnott's stoves, the ventilating powers of which are very inferior to the open grate, *ventilation* requires to be strictly attended to Where buildings are warmed by currents of hot air sent up from stoves on the basement story great attention should also be paid to ventilation, and in such cases the leading object should be to send in a large volume of air very moderately heated (to about 100°), rather than a small quantity of very hot air the latter does not readily mix with the surrounding cold air, but forms a distinct and rapidly ascending column which does not diffuse itself where most wanted, and it is apt to have a disagreeable and burned odour, arising from the charring of the particles of organic dust which are carried with the air over the too highly heated surfaces of the stove or flues A little aqueous vapour, sent in along with the warm air by placing a saucer of water in some convenient situation, is often effectual in preventing the disagreeable sensation occasioned by respiring too dry an atmosphere

STOVE In Horticulture, a structure in which plants are cultivated that require a considerably higher temperature than the open air in Britain and similar climates There are two or three kinds of stoves, but the principal are the dry stove and the damp stove The dry stove is a structure, the atmosphere of which is heated to the temperature of from 55° to 60° during winter, in which are chiefly cultivated succulents, such as the different species of *Cereus*, *Cereus*, *Stapelia*, *Euphorbia*, *Mesembryanthemum*, and other succulents having similar habits. During winter these plants require very little water, and during summer they require intense heat and abundance of air and water during bright weather The damp stove, sometimes also called the bark stove, requires a temperature of between 60° and 70° during winter, with a proportionate increase during summer, accompanied, in both seasons, with a high degree of atmospherical moisture This moisture is produced partly by evaporation from the bark bed in which the plants are plunged, but chiefly by watering the floor of the house, and by syringing the plants During summer the plants in the bark stove require all the high [illegible] which the atmosphere in this country is capable of producing, together with abundance of air, as in the dry stove Both stoves are heated by smoke flues, or by hot water or steam, circulated in metallic or other tubes The plants cultivated in the moist stove are exclusively those of the tropics, and those which require the highest degree of heat are chiefly Monocotyledonous plants, such as the *Scitamineæ*, which include the ginger, plantain, banana, sugar cane, palms, *Orchidaceæ*, [illegible] the yam [illegible] and other [illegible] plants The bark bed is chiefly employed for producing a uniform degree of moisture and heat to the roots, and also as a reservoir of heat for the atmosphere of the house in case of any diminution from the flues, water or steam pipes, or the sun Stoves of every description require a constant degree of attention from the gardener throughout the year, more especially such as are devoted to the palms, the banana, the pine apple, and the *Orchidaceæ*

STRABI'SMUS (Gr στραβίζειν, *to squint*) An unnatural obliquity in the axis of the eye arising from various causes It may often be, to a great extent overcome, especially in children, by blindfolding the sound eye, presuming one only to be affected In very bad cases, especially those of squinting inward and such are by far the most common an operation which has lately been introduced is often effectual in greatly relieving the deformity, it consists in dividing the internal rectus muscle of the eyeball which is done by a proper scissors without externally wounding the eyelid

STRAIGHT ARCH In Architecture, the arch over an aperture whose intrados is straight, but with its joints drawn concentrically as in a common arch

STRAIGHT JOINT FLOOR In Architecture *See* FLOOR

STRAI'NING PIECE In Architecture, a piece of timber, whose office is to prevent the farther approach of two pieces of timber in a framework, such is the collar in a queen post roof *See* ROOF

STRAIT in Geography, signifies a narrow pass or frith separating one country from another

STRA'MONY or THORN APPLE The *Datura stramonium* an indigenous narcotic plant, the seeds and leaves of which are used in medicine The dried leaves are occasionally smoked, like tobacco, for the relief of spasmodic asthma, and an extract of the seeds is used as a sedative in some painful chronic affections *See* DATURA

STRA'NGURY (Gr στραγξ, *a drop*, and ουρον, *urine*) A difficulty in voiding urine

STRATH, in Scotland is generally understood to signify a valley of considerable size, whose appellation is determined by some river running through it, or some particular characteristic

STRA'TUM When different rocks lie in succession upon each other, each individual forms a *stratum* *See* GEOLOGY

STREAK The appearance which arises from scratching a mineral with the point of a knife The streak is *similar* when the colour of the scratch is the same as that of the mineral, but *dissimilar* when the colour varies

STREAM TIN Native oxide of tin, or tinstone, which is found in rounded particles and masses, mixed with other alluvial matters The finest grain tin is procured from this ore

STRE'LITZ (Rus plural strelitzy, said to be derived from strelat, It strale, *an arrow*) A soldier of the ancient Muscovite militia was so called The strelitzy were [illegible] and [illegible] the empire and, like the Turk [illegible] terrified with its governmen [illegible] during the absence of the Czar Peter I, who, on his return, cashiered the corps altogether

STRENGTH in Mechanics, is used in the same sense as force or power Thus strength of animals is the muscular force or energy which animals are capable of exerting, strength of materials is the resistance which bodies oppose to a force acting upon them

Strength of Animals — It is obviously a matter of much importance to be able to estimate with tolerable accuracy the effort which an animal of the average [illegible] capable of exerting, and [illegible] is subject to

variation from so great a number of circumstances, both physical and mechanical that the results given by different authors present very little agreement with each other, though they are of great value as affording data for determining the modes in which animal labour is most advantageously employed

The force which an animal is capable of exerting against an obstacle is greatest when the animal stands still When it begins to move, a considerable part of its strength is expended in the transference of its own body, and the greater the velocity with which it moves the less will be the load which it is capable of transporting There must, also be a certain velocity at which it can only move when it carries no load Now, if from the total effect of the muscular force exerted we subtract the part which represents the transference of the weight of the animal's body the remainder, which is called the *useful effect*, will be obviously measured by the load which the animal is capable of transporting to a given distance in a given time, therefore, putting w = the weight v = the velocity, and t = the time, the useful effect is represented by the product $w\,v\,t$, and will be greatest when this product is a maximum In order to determine this maximum it is necessary to establish a relation between w and v (for the time t may be taken as unity) The empirical formula given by Euler for representing the relation between the load and the moving power in machines generally may be adopted for this purpose as it has been found to agree tolerably well with experiment Let P denote the power of the animal or the greatest load it is capable of moving and c the greatest velocity with which it can move unloaded, then the equation between w and v is $w = P\left(1 - \frac{v}{c}\right)^2$, and the product $w\,v$ becomes a maximum when $3v = c$, or v is one third of c *See* MACHINE.

In order to compare the effects produced by different animals, or by the same animal under different circumstances it is usual to express the effect numerically in terms of some conventional unit, which as being the measure of a force, is called the *dynamic unit* Thus, in the product $w\,v\,t$ we call $w = 1$ lb $v = 1$ foot and $t = 1$ minute, the measure of the force will be the effort necessary to raise or transport a pound through one foot of space in one minute of time For example Desaguliers asserts that a man can raise a hogshead of water 10 feet high in a minute Now a hogshead of water, vessel included weighs about 550 lbs, and 550 lbs raised through 10 feet must require the same exertion of muscular force as 5500 lbs raised through one foot, therefore the useful effect, which in this case is the whole effort as the man stands still is expressed by 5500 dynamic units and may thus be compared with any other effort which is capable of being similarly expressed Instead of a pound, a foot and a minute we might assume a hundred weight a yard a day or any other denominations that may be convenient

Strength of Men — The measure of human force has been the subject of numerous experiments, principally by Desaguliers, Lahire, Guenyveau Coulomb Schulze Buchanan, &c, whose results may be found in most treatises on practical mechanics These results differ very widely, as indeed might be expected considering the very great differences of the force which different individuals are capable of exerting — differences which depend not only upon age constitution, and habit, but even upon climate, temperature, and food

Of the different modes of estimating human strength the most practically useful is the observation of the average effect produced daily by a labourer who continues his exertions for a number of successive days We shall state a few of the results, and for the sake of comparison reduce them to dynamic units, assuming the unit to be 1000 lbs avoirdupois transported to the distance of one foot in one minute

According to Coulomb, a man walking on a level road may travel at the rate of 30 miles per day or 264 feet per minute, and continue his exertions 10 hours a day Taking the weight of the man at 150 lbs, the quantity of action is 23760 dynamic units

If instead of walking on a level road he mounts a stair, the velocity is reduced to 26 4 feet per minute, and the labour can be continued only 8 hours a day In this case, the effect produced is 1901 dynamic units

A man walking on a level road, and carrying on his back a weight of 90 lbs travels at the rate of a mile and a half per hour, or 132 feet per minute, and continues his exertions 7 hours per day The *useful effect* is consequently 4989 dynamic units

A man climbing a stair and carrying on his back a load equal to his own weight or 150 lbs proceeds at an average rate of only 7 feet per minute during 6 hours a day The useful effect is consequently 378 dynamic units

A labourer transporting materials in a wheelbarrow, and returning unloaded for a fresh burden, transports a load of 130 lbs with a velocity of 90 feet per minute, working 10 hours a day The useful effect is consequently [illegible]

The power which a man exerts in dragging a load has been variously estimated Schulze estimates the absolute effect, or that which the man can exert for a short time without moving as equal to a pressure of about 107 lbs, Bernoulli at 75 lbs, and Guenyveau found the absolute force of traction, when exerted by means of a rope passing over the shoulder, to be from 110 to 132 lbs Allowing the accuracy of Euler's formula above given, and assuming the action to be a maximum when the velocity is 2 miles per hour, we shall have $c = 6$, and if we also assume the absolute force P = 72 lbs, then the formula will become $w = 2(6 - v)^2$, in which w represents the number of [illegible] to the force developed when the velocity [illegible] Thus when $v = 0$, we have $w = 72$ lbs, when $v = 2$, we have $w = 32$ lbs, and when the velocity is 4 miles per hour, the force of traction becomes 8 lbs In the extreme cases the formula is inaccurate, but for moderate velocities it affords a tolerable approximation

The greatest velocity with which a man can walk for a length of time, having no load to drag, is, according to Schulze, 5 37 feet per second, according to Bernoulli, 6 56 feet, according to Guenyveau, from 6 56 to 9 84 feet per second or from 4½ to 6¾ miles per hour

According to Mr Buchanan (*Repertory of Arts*, vol xv) the effective strengths of men in working a pump, in turning a winch in ringing a bell, and rowing a boat are respectively as the numbers 100 167 227, 318 The last is one of the most advantageous modes in which human force can be exerted

Porters in London carry from 200 lbs to 300 lbs at the rate of 3 miles per hour, chairmen walk at the rate of 4 miles an hour with a load of 150 lbs each and it is said that an Albanian porter will carry from 700 to 900 lbs, [illegible] The [illegible] the comparative strength of [illegible] countries with Regnier's dynamometer, are given by M Peron [illegible] 71 4; France 69 2, Timor, 58 7, Van Diemen's Land, 51 8, New Holland 50 6

Strength of Horses and other Quadrupeds — Of all animals employed as first movers, the horse is beyond question the most useful, and that whose labour is susceptible of the most numerous and varied applications It is therefore very important to ascertain his average force [illegible] estimates have been [illegible] of performing and of his absolute muscular power For the purpose of determining the latter, the dynamometer may be conveniently used, but as the action of the animal is very quickly reduced by continued exertion it is more usual to estimate it according to the amount of daily labour performed Desaguliers and Smeaton estimate the strength of a horse as equivalent to that of five men, the French authors have commonly stated it as equal to that of seven men, and Schulze makes it equal to that of fourteen men in drawing horizontally According to Desaguliers a horse's power is equivalent to 44 000 lbs raised 1 foot high in one minute, Smeaton makes this number 22 916 Hachette 28 000, and Watt 33 000 This last estimate is what is commonly understood by the term *horse power* as applied to steam engines

The quantity of action which a horse can exert diminishes as the duration of the labour is prolonged Tredgold gives the following table showing the average maximum velocity with which a horse unloaded can travel, according to the number of hours per day —

Time of March in Hours	Greatest Velocity per Hour in Miles	Time of March, in Hours	Greatest Velocity per Hour, in Miles
1	11 7	6	6 0
2	10 1	7	5 5
3	8 5	8	5 3
4	7 3	9	4 9
5	6 6	10	4 6

The useful effect a horse is capable of producing depends much on the manner in which his strength is applied One of the best modes is to make him draw a loaded carriage The carriers in Scotland usually transport in a single horse cart weighing about 7 cwt the load of a ton and travel at the rate of 22 miles per day Neglecting the weight of the animal and of the cart, and supposing the journey to be accomplished in 10 hours, the useful effect reduced to dynamic units (1000 lbs one foot in one minute) is 260,198 dynamic units

[illegible] drawing in a [illegible] travels at the [illegible] hours per day Here the useful effect is 200,046

A horse harnessed in a coach, and drawing a load of 770 lbs avoirdupois, goes at a trot at the rate of 433 feet per minute, during 4½ hours per day The useful effect is consequently 90,020

A horse carrying on his back a load of 264 lbs can travel at the rate of 216½ feet per minute, 10 hours a day The useful effect is 34,294 dynamic units Going at a trot with double the load during 7 hours a day and carrying a load of 176 lbs, the useful effect is 43,057

A horse harnessed in a mill, going at a pace of 195 feet per minute, and exercising a force equal to a pressure of 99 lbs, during 8 hours a day, produces a useful effect represented by 9266 dynamic units

On the strength of mules, oxen, and the other animals employed in industry, there are few correct observations The following are the principal results The useful effect of the daily labour of [illegible], Coulomb's estimate as unity, then the [illegible] the labour of some of the other animals applied in the same manner are thus estimated —

For carrying loads in a horizontal plane

Strength of a man	1	(Coulomb)
— of a horse	4 8	(Brunacci)
— of a horse	6 1	(Wesermann)
— of a mule	7 6	(Brunacci)

For transporting burdens with a wheel carriage

Man with a barrow	1	(Coulomb)
Horse in a 4 wheel waggon	17 5	(Wesermann)
Horse with a cart	21 3	(Brunacci)
Mule with a cart	23 3	(Brunacci)
Ox with a cart	12 2	(Brunacci)

The above comparisons are probably nearer the truth than the following which are usually quoted from Hassenfratz (*Encyclopedie Methodique*) —

In carrying loads on a horizontal plane

Strength of a man	1	Strength of a dromedary	25
— of a horse	8	— of an elephant	147
— of a mule	8	— of a dog	1
— of an ass	4	— of a reindeer	3
— of a camel	31		

In drawing a [illegible] horizontal plane

Strength of a man	[illegible]	of an ox	4 to 7
— of a horse	7	— of a dog	0 6
— of a mule	7	— of a reindeer	0 2
— of an ass	2		

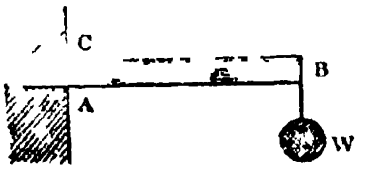
On the subject of animal power and the best modes of its employment reference may be made to the following works — Coulomb *Sur la Force des Hommes* (*Mem de l'Acad*), Prony *Architecture Hydraulique*, Hachette *Traité des Machines*, Guenyveau *Essai sur la Science des Machines* Coriolis *Calcul de l'Effet des Machines* Borgnis *Traite de la Composition des Machines* Wesermann *Taschenbuch für Strassen und Wegbaubeamte*

STRENGTH OF MATERIALS The force with which a solid body resists an effort to separate its particles or destroy their aggregation can only become known from experiment, nevertheless if we assume an hypothesis to represent the manner in which the elementary particles are arranged and cohere general formulæ may be deduced which will [illegible] of bodies of different [illegible] to the action of forces applied in different manners and will consequently be of great use in practical mechanics

There are four different ways in which the strength of a solid body may be exerted first in resisting a longitudinal tension, or force tending to tear it asunder secondly, in resisting a force tending to break the body by a transverse strain, thirdly in resisting compression or a force tending to crush the body, and fourthly in resisting a force tending to wrench it asunder by torsion We shall consider these separately

1 *Long. and Tension* — The resistance opposed by a solid body to a longitudinal strain is usually termed the *absolute strength* or force of direct cohesion, of the body Two points may be proposed for investigation first, to determine the quantity by which a body of a given length is stretched or elongated under the action of a given force or weight, and secondly, the effort required to separate the parts or produce rupture Experiments have usually been directed to the last of these only, but the first may be determined indirectly from experiments on flexure In bodies of a fibrous structure, as the woods, the cohesive force differs greatly, according as the effort is applied in the direction of the fibres or at right angles to it When the strain is exerted in the direction of the fibres, the cohesive force obviously depends on two circumstances only — the strength of each fibre and their number, and in general in bodies of the same substance and structure, the strength is proportional to the transverse area of the body, and to a certain constant which must be determined by experiment

Suppose the body to be a prism or cylinder, and let A be the area in square inches of a section perpendicular to its length, or to the direction of the force, W the weight in pounds which produces rupture and s the absolute strength of the substance or the weight in pounds which would overcome the cohesive force of a rod whose transverse section is one square inch, then $W = s A$, or $s = W - A$ In a rectangular beam whose breadth and thickness are respectively a and b, we have $A = a b$, whence $W = s a b$, $s = W - a b$ In a cylindrical rod whose radius is r, we have $A = \pi r^2$ ($\pi = 3.14159$), whence $W = s \pi r^2$, and $s = W - \pi r^2$



Under the term COHESION we have already given a table of the [illegible] of [illegible] for [illegible] woods and metals For [illegible] the [illegible] to *Barlow's Treatise on the Strength of Timber* &c 1837, but a much more ample collection of experimental results will be found in the work of Navier, *Resumé des Leçons, &c., sur l'Application de la Mécanique à l'Etablissement des Constructions et des Machines* We may remark, that although the longitudinal tension is with respect to mechanical action, the simplest of all the strains to which a solid body can be subjected, it is the most difficult to submit to experiment, by reason of the enormous forces required to produce rupture, and, in the case of fibrous bodies, the difficulty of applying those forces in the direct line of the fibres If the fibres are not all subjected to the same strain, it is obvious that the direct cohesion will be estimated at less than its real value, and, as Mr Barlow remarks, it is probably owing to this circumstance that so little agreement is found in the results of experiments

2 *Transverse Strength* — When a body suffers a transverse strain, the mechanical action which takes place among the particles is of a more complicated nature Galileo was the first who attempted to give a rational explanation of this action and to submit the strength of the materials used in the mechanical arts to the measures of geometry and arithmetic He assumed that all solid bodies are composed of numerous small parallel fibres, perfectly inflexible and inextensible, and that when they break the several fibres give way in succession, the body turning on the last which give way as on a hinge, and the strain on each fibre previous to the rupture being proportional to its distance from the quiescent fibres From this it follows that the resistance of a beam to a transverse strain is in the compound ratio of the strength of the individual fibres, the area of the cross section, and the distance of the centre of gravity of the cross section from the points round which the beam turns in breaking

The first who attempted to submit the theory of Galileo to actual experiment was Mariotte, whose results were published in his *Traite sur les Mouvements des Eaux*, 1680 These experiments attracted the attention of Leibnitz who, in the *Acta Eruditorum* for 1684 pointed out defects of the theory and proposed a different hypothesis Leibnitz assumes that every body before it breaks admits of a certain degree of extension, and consequently the fibres are neither inflexible nor inextensible He further assumes a principle first proposed by Hooke, namely, that the strength of each fibre under the action of a straining force varies with the degree of extension, or is proportional to the distance of the fibre from the fixed point about which the beam is supposed to turn In this hypothesis, the beam is [illegible] to turn about its upper or lower edge or [illegible] excepting the quiescent ones, are in a state of tension, although it had been remarked by Mariotte (and is indeed sufficiently obvious), that when flexure takes place part of the fibres only are in a state of tension, another part being compressed so that the line about which the beam turns is somewhere within the section of fracture Professor Robison appears to have been the first who distinctly knowed that the position of the *neutral axis* is a necessary datum in the solution of the problem

Although it cannot be doubted that the hypothesis of Galileo is at variance with the precise fact yet it is found to be sufficient for practical purposes, and indeed the results which it gives appear to agree nearly as well with experiment as those which are derived from a more refined theory and more elaborate calculations It has, therefore, on account of its great simplicity, been very generally adopted by writers on mechanics We shall here briefly state the principal results

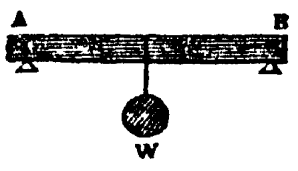
Suppose a prismatic beam A B to have one end firmly fixed in a wall, and a weight W to be suspended from the other end, the beam lying horizontally According to the hypothesis, the fibres are inflexible and inextensible, so that no bending takes place, and when the rupture commences the fibres first give way at the upper side C, and the beam turns about A as upon a hinge The two forces brought into action are, therefore, the weight W acting at the end of the lever A B, and the resistance of the particles in the section A C, and at the instant previous to the rupture the two forces are in equilibrio, or their respective moments of rotation are equal Now, the resistance of any fibre in the section A C is the absolute strength of the fibre multiplied into its distance from the point A, therefore the [illegible] beam is found by multiplying [illegible] the area into its distance from the point A, and into the abso-

lute strength, and taking the sum of all the products But this is equivalent to the product of the area of the section by the distance of its centre of gravity from A, and by the absolute strength, hence if we put A = the area of the section, c = the distance of its centre of gravity from the lowest point, s = the absolute strength of the unit of surface, the resistance to fracture is $s\,c\,A$ Let W = the breaking weight in pounds and l = A B, the length of the beam then the moment of the force tending to produce fracture is $W\,l$, and the equation of equilibrium is $W\,l = s\,c\,A$, whence $W = s\,c\,A - l$, or $s = W\,l - c\,A$

In a rectangular beam whose breadth is b, and thickness or depth d, we have $A = b\,d$, $c = \frac{1}{2}d$, whence $W = s\,b\,d^2 - 2\,l$, or the strength of the beam is directly as its breadth and the square of its depth, and inversely as its length

In a square beam $b = d$, whence $W = s\,b^3 - 2\,l$

In a square beam whose diagonal is vertical, we have $A = a^2$, and $c = \frac{1}{2}a\sqrt{2}$, whence $W = s\,a^3\sqrt{2} - 2\,l$ The beam ought, therefore to be stronger in this position, but this result of the theory is contradicted by experience



If the beam be cylindrical, and r be the radius of its section, then $A = \pi r^2$, and $c = r$, whence $W = \pi\,s\,r^3 - l$

In a cylindric tube, the radii of whose external and internal surfaces are respectively r and r' we have $A = \pi\,(r^2 - r'^2)$ $c = r$, whence $W = \pi\,s\,r\,(r^2 - r'^2) - l$

From the two last cases it may be shown that the strength of the tube is to the strength of the same quantity of matter formed into a solid cylinder in the ratio of r to $\sqrt{(r^2 - r'^2)}$, so that a tube may be much stronger than the same quantity of matter in a solid form This principle furnishes an explanation of many facts in the economy of nature To obtain the greatest strength with the least possible weight, the bones of animals and the quills and feathers of birds have the form of hollow tubes and the same arrangement is observed in many of the vegetable [illegible] *culms*

In the preceding formulæ the weight of the beam is neglected as [illegible] comparison of the weight applied, [illegible] beams of the same substance the strength increases as the square of the depth, while the weight increases as the cube, there is consequently a limit, which if a beam of a given shape and of a given materials were to reach it could only bear its own weight and would be broken by any further increase

Suppose a beam A B to be laid horizontally on two props and to be broken by a weight placed at equal distances between them, the pressure will be equally shared between the props, and since by the hypothesis fracture takes place without bending, the effect will be the same as if the beam had been fixed at the middle and each end acted upon by a force equal to half the weight but directed upwards The breaking weight is consequently double of that which would be required to break a beam of half the length having one end fixed in a wall, or the transverse length of the beam when supported at one end is [illegible] the same beam supported at [illegible] weight suspended from its other extremity In this case therefore, when the beam is rectangular $W = 2\,s\,b\,d^2 - l$, when the beam is square, $W = 2\,s\,b^3 - l$, when cylindrical $W = 4\,\pi\,s\,r^3 - l$, and so with the other cases

When the horizontal beam, instead of being merely supported, is firmly imbedded in a wall at each end the resistance will be equal to that of the same beam merely supported at each end, added to the resistance of two beams of half the length fixed at one end only, and acted upon by half the weight For it is manifest that three fractures must take place — one in the middle, and one at each end, and the strain in the middle is equal to that of the supported beam, which has just been shown to be $2\,s\,b\,d^2 - l$, and that at each end is one fourth of this or $\frac{1}{2}\,s\,b\,d^2 - l$, therefore the whole weight W, under which if suspended from the middle the beam will give way, is $W = 3\,s\,b\,d^2 - l$

On the same principle it may be shown that when a beam is supported at both ends, the weight which it is able to bear at any point is inversely as the rectangle under the segments into which it is divided by that point Hence a beam supported at both ends is weakest in the middle, the rectangle under the segments at that point being a maximum It also follows that when the pressure is equally distributed over the whole beam, twice the weight will be required to break it

When the beam, instead of being laid horizontally, is inclined, its strength is increased in the ratio of unity to the square of the cosine of the angle of inclination This consequence of the theory, however, can obviously hold only within certain limits, inasmuch as it would give the strength equal to infinity when the inclination is a right angle, or when the load is applied endwise

In the hypothesis of Galileo, from which the preceding results have been deduced, the beam is supposed to be absolutely inflexible, which is not the case with any material substance, and although the results are sufficiently accurate in their application to architectural or mechanical purposes, yet in the comparison of experiments to determine the ultimate strength of different substances it becomes necessary to take the elasticity and consequent incurvation into the estimate Mr Barlow, assuming that the flexure takes place only at the section of fracture, and that the fibres remain inextensible in every other point, deduces the following formulæ for the transverse strain, which agree very well with the experiments

As before, let l denote the length, b the breadth, and d the depth of the beam all in inches, and let Δ be the angle of deflection, W the breaking weight, and S the resistance of a rod whose section is one square inch, W and S being expressed in pounds, then,

1 When the beam is fixed at one end and loaded at the other, $S = W\,l \cos \Delta - b\,d^2$,

2 When the beam is supported at each end, and loaded in the middle, $S = W\,l \sec \frac{1}{2}\Delta - 4\,b\,d^2$,

3 When the beam is fixed at each end and loaded in the middle, $S = W\,l \sec \frac{1}{2}\Delta - 6\,b\,d^2$

The angle of deflection [illegible] secant in the ordinary applications may be considered as equal to unity and if we also write $\frac{1}{2}s$ instead of S in the above formulæ they will become the same as those deduced from the hypothesis of Galileo

The preceding results have reference to the absolute strength of the beam, or to the weight which it can just support without being broken, but it is also very important to know the amount of deflection which a given weight will produce in a beam of a given material and of given dimensions Suppose a prismatic beam to be firmly fixed at one end, and to have a weight suspended from the other then if we adopt the hypothesis that the extension of the fibres at each point is proportional to the straining force, the curvature at the different points and the law of the action which takes place may be deduced from the properties of the elastic curve (*See* ELASTIC CURVE) The following results of theory are confirmed by the experiments of Dupin and Barlow

1 The deflections of a beam loaded with different small weights are proportional to those weights 2 The deflection, *cæteris paribus* is directly as the cube of the length, inversely as the cube of the depth, and inversely as the breadth Hence if l denote the length, b the breadth, d the depth and k the deflection (that is, the distance to which the loaded end of the beam is drawn below the horizontal line) all expressed in inches, and if w be the weight in pounds which the body can support without its elasticity being impaired, then k is proportional to $w\,l^3 - b\,d^3$, or if we assume E as the constant modulus of elasticity $E = w\,l^3 - k\,b\,d^3$

The deflection of a beam fixed at one end and loaded at the other is double that of a beam of twice the length supported at both ends and loaded at the middle with a double weight supposing the strain to be the same in both cases, consequently when the weights are the same, the deflection in the first case is to that in the second as 1 [illegible] 1, and when the [illegible] the deflections (which [illegible] be to each other as 32 1 In the case of the beam supported at both ends, the formula therefore becomes $E = w\,l^3 - 32\,k\,b\,d^3$

From the table of *data* given by Barlow (*Strength of Timber* p 150) we extract the following mean results of experiments (on beams supported at both ends), made in the dock yard at Woolwich, for determining the elasticity and strength of various species of timber

Description of Wood	Elasticity $E = \frac{w\,l^3}{32\,k\,b\,d^3}$	Strength $S = \frac{W\,l}{4\,b\,d^2}$
Teak	301800	2162

Mar Forest Fir -	108700	1262
Larch	131600	1149
Norway Spar	182200	1474

From the mean of a number of experiments by Tredgold the values of E and S for rectangular cast iron bars, were found to be E = 2254000, S = 7620

3 *Resistance of Bodies to Forces tending to crush them* — The resistance of a body to a crushing force might be supposed, *a priori*, to follow the same law as the absolute force of cohesion, and consequently to depend only upon the area of the section and the force of aggregation of the

particles It is found however by experiment, that the thickness of the body (or length if the force is applied endwise) has an important influence on the amount of pressure it is capable of bearing Very thin plates are readily crushed, and the resistance appears to increase with the thickness up to a certain maximum, after which it diminishes The theory of the resistance of pillars, which is of great importance on account of its application to architectural purposes was investigated by Euler, and, according to the hypothesis adopted by him, the strength varies directly as the fourth power of the diameter or side, and inversely as the square of the length This is confirmed by the recent experiments of Mr Hodgkinson (*Phil Trans* 1840) in respect of pillars of wrought iron, or timber, but in the case of pillars of cast iron, the powers of the diameter and length were somewhat different Mr H[illegible] of experiments that a sol[illegible] whose transverse section is one square inch, is destroyed by a weight of 98922 lbs, or 44 16 tons Assuming this as a unit of measure, he gives the following formula (as [illegible] in which s is the strength or weight in lbs that would crush the pillar d the diameter, and l the length, viz $s = 98922 \times d^{3\cdot55} - l^{1\cdot7}$ This formula applies to pillars of which the lengths are twenty-five times the diameter and upwards and which are perfectly flat at the ends When the ends of a pillar are rounded so that the load bears only on the middle fibres, the strength is greatly reduced In pillars whose length is thirty times the diameter or upwards Mr Hodgkinson found the strength of those with flat ends to be about three times greater than the strength of others of the same dimensions with round ends, the mean ratio being 3 167 In shorter pillars the ratio was not constant The strength of a pillar is slightly increased by placing discs on the ends to increase the bearings

Mr Hodgkinson gives the following results of his experiments on the resistance to a crushing force of short pillars of some of the most common descriptions of wood, the force being applied in the direction of the fibres

Description of Wood	Strength per Square Inch, in lbs
Alder	6831 to 6960
Ash	8083 — 9563
Bay	7518 — 7718
Beech	7773 — 9303
English Birch	3207 — 6402
Cedar	5674 — 5803
Red Deal	5718 — 6486
White Deal	6781 — 7293
Elder	7151 — 9073
Elm	10331
Fir (Spruce)	6199 — 6819
Mahogany	8198 — 8198
Oak (Quebec)	4231 — 5082
Oak (English)	6184 — 10058
Pine (Pitch)	6790 — 6790
Pine (Red)	5365 — 7218
Poplar	3107 — 5114
Plum (Dry)	8241 — 10193
Teak	12101
Walnut	6083 — 7227
Willow	2898 — 6128

The results in the first column were deduced in each case from experiments upon cylinders of wood turned to one inch diameter and two inches long, flat at the ends The wood was moderately dry The second column gives the mean strength from similar specimens after being turned and kept dry in a warm place two months longer The great difference in the strength frequently seen in the two columns shows strongly the effect of drying upon [illegible] weight of 93,000 lbs upon a square inch, and will bear 10,000 lbs without permanent alteration

4 *Strength of Iron* The resistance which bodies oppose to a force tending to wrench them asunder has frequently been made the subject of experiment The following results, showing the comparative strength of various metals, as ascertained by resistance to torsion, is given by Mr Rennie For the law according to which the elasticity is evolved in the case of slender metallic wires or threads of fibrous substances, when the twisting force is less than is necessary to produce a permanent change of structure, we refer to the term TORSION

Lead	1000
Tin	1438
Copper	4312
Brass	4698
Gun metal	5000
Swedish iron	9500
English iron	10125
Cast iron	10600
Blister steel	16688
Shear steel	17063
Cast steel	19562

Mr Banks (*on the Power of Machines*) states, as the mean result of several experiments, that a bar of cast iron, one inch square, is wrenched asunder by a weight of 631 lbs avoirdupois, applied at the extremity of a lever two feet in length Other experiments on the force of torsion are given by G Bevan (*Phil Trans* 1829), and Savart (*Annales de Chim[illegible]*

For further [illegible] addition to the works already [illegible] Barlow, Girard, *Traité Analytique de la Résistance des Solides*, Tredgold, *Elementary Principles of Carpentry* and *Practical Essay on the Strength of Cast Iron*, Banks, *Treatise on the Power of Machines*, Hodgkinson, *Transactions of the British Association*, vol vi, and *Phil Trans* 1840, &c

STREPSI'PTERANS, *Strepsiptera* (Gr στρεπτος, *twisted*, πτερον *a wing*) The name given by Kirby to the order of insects which he discovered to possess rudimental elytra in the form of linear and spirally twisted scales

STRETCHER In Architecture, a brick or stone laid horizontally with its length in the direction of the face of a wall

STRETCHING COURSE In Architecture a course in which the bricks or stones are laid horizontally with their lengths in the direction of the face of the wall. *See* HEADERS and HEADING COURSE

STRI'TTO (It *narrow*) In Music, a term indicating that the measure to which it is affixed is to be performed short and concise, hence quick. It is the opposite of *largo*

STRI'ATI (Lat stria, *a groove*) In Zoology, when a surface is painted or impressed with several narrow transverse streaks

STRIGÆ (Lat) In Architecture, the flutings of a column

STRIGI'DÆ The name of the family of Nocturnal Raptores of which the owl (*Strix*) is the type

STRING BOARD In Architecture, a board with its face next the well-hole in a wooden staircase, which receives the ends of the steps

STRING COURSE In Architecture a course running quite along the face of a building, the projecture whereof is small in proportion to its height

STRO'BILE, or STRO'BILUS, is the fruit of the fir tree to which the common name of cone is assigned It may be defined to be a spike of very imperfect flowers subtended by bracts, which are woody, pressed close to each other and in many cases consolidated

STRO'MBUS The name of a shell-fish in Pliny This term was applied by Linnæus to a genus of the Vermes Testacea characterized by the form of the shell, of which [illegible] and produ[illegible] Mollusca to which this character is applicable form a group of Pectinibranchiate Gastropods in the system of Cuvier, which has been subdivided into the genera *Strombus* proper, *Pterocera*, Lam, &c

STRO'NGYLUS A genus of intestinal worms in Rudolphi's classification, characterized by having a cylindrical body the anal extremity of which, in the male, is surrounded by a kind of pouch of a varied shape, from which is protruded a small filament or spiculum, probably subservient to generation. The mouth is orbicular, sometimes armed with spines, as in the *Strongylus armatus* which infests the mesenteric arteries of the horse and ass producing aneurisms, sometimes the mouth is surrounded by tubercles or papillæ, as in the *Strongylus gigas* which is sometimes found in the kidney of the human subject

STRO'NTIA An earth contained in a mineral, generally of a pale green tint and radiated crystalline texture, found at Strontian in Argyleshire It [illegible] strontia Strontia is the oxide of a [illegible] properties of which are very imperfectly known, called strontium, the equivalent of strontia, or oxide of strontium (composed of 44 strontium and 8 oxygen), is 52 It has a caustic taste, an alkaline reaction, and a degree of solubility in water intermediate between lime and baryta The salts of strontia are generally obtained by dissolving the natural or artificial carbonate in the acids, those which are soluble give the flame of burning bodies a fine rose red colour the nitrate of strontia is used for this purpose, and with beautiful effect, in theatrical exhibitions and fire-works The sulphate of strontia is found native it is an insoluble white powder when artificially prepared Some of its native varieties have a pale blue tint, whence the term *cœlestine* A colourless prismatic crystalline variety, of great beauty, is found associated with the native sulphur of Sicily

STRO'NTIANITE Native carbonate of strontia

STRO'PHE (Gr στροφη, *a turning*) A division of a Greek choral ode answering to a stanza The name is derived from στρεφω, *to turn*, because the singers turned in one direction while they recited that portion of the poem, they then turned round and sung the next portion, which was of exactly the same length and metre as the preceding, and was termed the antistrophe (ἀντι-

[illegible] from an [illegible] The [illegible] follow[illegible] by a single-branched [illegible]

STROPHIOLATED [illegible] *Formula*, which see

STROPHU'LUS (Lat) The *red gum*, an eruption peculiar to infants

STRUMA (Lat) In Anatomy, an enlarged gland

STRUMA In Botany, a swelling that is present in some leaves at the extremity of the petiole, where it is connected to the lamina, as in *Mimosa sensitiva* The term also used in describing mosses to denote a dilatation or swelling that is at times present upon one side of the base of the theca

STRUT In Architecture, a piece of timber obliquely placed from a king or queen post to support a rafter [illegible] *See* ROOF

STRUTHIO NIDI (Struthio, *an ostrich*) The name of a family of terrestrial birds, incapable of flight, with very short or rudimental wings, and long and strong legs, including the ostrich and other congeneric species which constitute the order *Cursores* of Kirby, and the family *Brevipennes* in the system of Cuvier

STRYCHNIA A poisonous vegetable alkaloid, discovered in 1818 by Pelletier and Caventou in the seed of the *Strychnus ignatia* and *Nux vomica*, and also in the upas poison It is almost insoluble in water, but very soluble in boiling alcohol from which it is deposited by careful evaporation in small white crystals It is so virulently poisonous that half a grain blown into the throat of a rabbit occasioned death in five minutes, its operation is accompanied by lock jaw and by other tetanic affections The chemical equivalent of strychnia is about 238 It probably consists of 30 atoms of carbon, 16 hydrogen, 3 oxygen and 1 nitrogen

STUBBLE The root ends of stalks of corn left in the field standing as they grew after the corn has been reaped by the sickle or scythe In some parts of the country only a small portion of the straw is cut off with the ears of corn, and the stubble in that case is a foot or eighteen inches in length, but in others the corn is cut as close to the surface as possible, in which case the stubble is quite short In general long stubble is a symptom of bad farming, because a quantity of straw is in this case left waste in the field, which might have been carried home and rotted into manure

STUCCO (Ital) In Architecture a term applied to many sorts of calcareous cements The sense in which it is most commonly used in this country is to denote the third coat of three coat plaster consisting of fine lime and sand The better sort is hand-floated twice and well trowelled There is a species called bastard stucco in which a small portion of hair is used (*See* FINISHING) Rough stucco is merely floated and brushed with water, but the best is trowelled stucco

STUDDING SAILS called also Steering Sails, are narrow sails set temporarily at the outer edges of the square sails

STUFA (Ital) A jet of steam issuing from a fissure in the earth these jets are not uncommon in volcanic districts

STUFF A Commercial term applied to various woven fabrics, it especially signifies a light woollen cloth formerly much used for curtains and bed furniture

STURGEON (Lat sturio, from the German stoer *a sturgeon*) The type of a genus of Cartilaginous fishes, with free gills having the body more or less covered with bony plates in longitudinal rows The mouth is placed beneath the snout is small and edentulous, but is protractile Soft feelers or cirri are attached beneath the snout The bodies of the vertebræ retain the primitive condition of an undivided gelatinous cord The sturgeons ascend the larger rivers of Europe in great abundance, and are the objects of important fisheries The flesh of most of the species is wholesome and agreeable food, their ova are converted into caviar, and their air bladder affords the finest isinglass

The sturgeon which is occasionally captured on our east coast is the *Accipenser sturio* of Linnæus *See* ACCIPENSER

STURIONIANS, *Sturiones* (Lat sturio, *a sturgeon*) The name of the family of Cartilaginous fishes of which the sturgeon is the type

STY A little boil or tumour projecting from the edge of the eyelid

STYLAGA'LMAIC (Gr στυλος, *a column*, and αγαλμα *an ornament*) In Architecture, a term used to denote figures which perform the office of columns *See* CARYATIDES

STYLE (Lat stylus, or stilus) A kind of pencil made use of by the Romans for writing on waxed tablets It was made of brass or iron, with one end sharp for writing, and the other broad and smooth to make erasures with, hence to *turn the style* is a phrase used by ancient writers, signifying to make corrections

In Literature the word style may be defined to mean the distinctive manner of writing which belongs to each author, and also to each body of writers, allied as belonging [illegible] to its [illegible] from all others The style of an author is made up of various minute particulars, which it is extremely difficult to describe, but each of which adds something to the aggregate of qualities which belong to him Collocation of words, turn of sentences, syntax, rhythm, the relation, abundance, and the character of his usual figures and metaphors, the usual order in which thoughts succeed each other, the logical form in which conclusions are generally deduced from their premises, the particular qualities most insisted on in description, amplification and conciseness, clearness and obscurity directness and indirectness, exhaustion, suggestion suppression, — all these are features of style, in the largest sense of the expression, in which it seems to comprehend all peculiarities belonging to the manner in which thought is communicated from the writer to the reader Excellence of style, particularly of the rhetorical parts of style, was more cultivated by the ancients than the moderns, and less, perhaps at the present day, than at any former period since the English language began to be written in prose with correctness and elegance Since the period when Bolingbroke Junius, Johnson, Gibbon, and Burke became established as models, a certain superficial sameness of style wanting in the roughness and vulgarity, but also in the force and individuality of old English composition seems to prevail to such an extent as to render modern writing extremely monotonous and artificial But it should never be forgotten that whatever quality may command a temporary popularity no work, either in poetry or prose, has ever permanently maintained its hold on public admiration without excellence of style

STYLE, in the Calendar is a manner of reckoning time The reformation of the calendar by Julius Cæsar consisted chiefly in restoring the equinox to its proper place in the month of March This reformation took place in A U C 707 which year was made to consist of fourteen months, in order to fill up the deficiency which had been produced by the former method of computing and was styled the 'year of confusion' By the Julian calendar an intercalary day was added to every fourth year (leap year) In consequence of this erroneous intercalation the equinox receded a day in about 130 years, and, in the beginning of the sixteenth century, the vernal equinox fell on the 10th instead of the 21st of March The calendar was reformed by Gregory XIII in 1577 By this reformation ten days were dropped in the year 1582 the 5th of March being reckoned immediately after the 4th, and it was arranged that every 100th year (which by the former calendar was a leap year) should be a common year, except the fourth, so 1600 remained a leap year, but 1700, 1800 were common years, and 1900 will be a common year likewise, after which the cycle of four centuries will again commence The Gregorian calendar was immediately adopted in Catholic countries, but by Protestant nations the old style was for a long time continued It was at last made to *New Style* in 1752 by statute after [illegible] of Parliament, of which a curious notice will be found in *Lord Chesterfield's Letters* Previously to this time dates according to the old style are frequently denoted by the initials O S, or thus, $\frac{10\text{th}}{22\text{d}}$ of January, 1750, the upper line denoting the old and the latter the new style This mode of dating will still be found in the despatches and public papers of Russia and Greece, which are the only European states in which the Julian year is still in use The time of the two styles now varies thirteen days For further information on this subject see CALENDAR

STYLE in Dialling, is the gnomon which projects the shadow on the plane of the dial *See* DIAL

STYLE, in Botany, is that elongation of the ovarium which supports the stigma It is an extension of the midrib of the carpellary leaf or is formed by the rolling up of the attenuated extremity of the latter

STYLE In the Fine Arts, the mode in which an artist forms and expresses his ideas on and of a given subject It is the form and character that he gives to the expression of his ideas, according to his particular faculties and powers Style may be almost considered as the refinement of *manner* (*see* MANNER) it is a characteristic essence by which we distinguish works of one master from another From [illegible] this word has passed into the theoretic language of the fine arts, and as in that we hear of the *sublime*, *brilliant*, *agreeable*, *historic*, [illegible] and other styles, so we have almost the same terms applied to styles of art Indeed this is not wonderful, since the principles of taste, in both the one and the other, are founded in nature; and it is a well known saying that poetry is a speaking picture This word is improperly used as applied to colouring and harmony of tints we speak of the style of a design, of a composition, of draperies, &c, but not of the style of colouring, but rather the *method*

or *mind* [illegible] word by Sir Joshua Reynolds is as [illegible] painting is the same as in writing,—a power over materials, whether words or colours, by which conceptions or sentiments are conveyed But we can scarcely consider this definition sufficiently general

STYLITE (Gr στυλος, *a column*) The title given to a peculiar class of anchorites from the places on which they took up their solitary abodes, being the tops of various columns in Syria and Egypt This strange method of devotion took its rise in the [illegible] and continued to be practised by [illegible] for a great length of time The most famous among them was one St Simeon, in the 5th century, who is said to have lived thirty-seven years upon various columns of considerable height in the neighbourhood of Antioch

STYLO Names compounded of this word apply to the muscles attached to the styloid process of the temporal bone

STY'LOBATE (Gr στυλος, *a column*, and βασις *a base*) In Architecture, a term signifying the uninterrupted base below a range of columns

STY'PTICS (Gr στυφω *I restrain*), in Medicine and Surgery are remedies used for checking a flow of blood

STYRAX See STORAX

STYX (Gr Στυξ) In Mythology, a nymph the daughter, according to Hesiod of Oceanus and Thetis, but other mythologists relate the genealogy differently She dwelt in a rock palace in the infernal regions, from whence one of the infernal rivers burst forth This river, Styx, was one of the ten arms or branches of Oceanus The gods of Olympus swore by the water of Styx, and a deity who took this oath in vain was banished from the heavenly mansions for ten years, to endure various torments The river Styx has been sought for in various places, but the most remarkable stream of the name was in Arcadia It forms a terrific waterfall

SU'BALTERN (Lat sub *under*, and alter, *other*) Literally an inferior officer but generally applied to all officers under the rank of captain

SUBBRA'CHIANS, *Subbrachia* (Lat sub and brachium *the arm*) The name of the order of Mala[illegible] [illegible] [illegible] [

terms *entail*, *remainder*, *executory devise*, &c Substitutions were of two classes 1 *Vulgar* or common, by which a [illegible] devisee to receive the succession [illegible] or unwilling to do so 2 *Fidei-commissary* in which the second devisee was named to receive the succession *after* the first *See* FIDEI-COMMISSUM

SUBSTITUTION, in the language of Algebra, signifies the replacing of one quantity by another which is equal to it, but differently expressed

SUBSTITUTION, CHORD OF In Music, a name given to the chords of the sixth major [illegible]

SUBSTRA'TUM A stratum lying under another The term *subsoil* is generally applied to the matters which intervene between the surface soils and the rocks on which they rest, thus clay is the common substratum or [illegible]

SUBSTYLE In Dialling, is the straight line formed by the intersection of the face of the dial with the perpendicular plane which passes through the gnomon *See* DIAL

SUBTA'NGENT, in Geometry, is the part of the axis of a curve [illegible] between the tangent and the ordinate The general expression for any curve whose equation is $y = f(x)$, being a function of x the abscissa) is $y\frac{dx}{dy}$

SUBTE'NSE (Lat sub and tensus) A term sometimes used in Trigonometry to denote the chord of an arc *See* CHORD

SUBTRA'CTION (Lat subtraho *I draw away*) In Arithmetic, the taking of one number or quantity from another in order to find their difference The operation is precisely the reverse of addition

SUBULICORNS, *Subulicornes* (Lat subula, *an awl*, cornu, *a horn*) The name of a family of Neuropterous insects, including those which have awl shaped antennæ

SUBU'LIPALPS *Subulipalpi* (Lat subula and palpus, *a feeler*) The name of a section of Carabod beetles, including those which have the exterior palps or feelers awl-shaped

SUCCEDA'NEUM A medicine or remedy substituted for another

SUCCE'SSION, APOSTO'LICAL In Theology By these words is meant the uninterrupted succession of priests in the church by regular ordination, from the first commission given by our Saviour to the Apostles, and recorded in the Gospels, down to the present day And the doctrine of "the apostolical succession" as it is popularly called, means the belief that the clergy so regularly ordained have a commission from God to preach the gospel, administer the sacraments, and guide the church, that through their ministration only we can derive the grace which is communicated by the sacraments It follows, of course, that those sects of Christians which have no regular succession (having seceded from Romanism without retaining ministers regularly ordained, or having subsequently interrupted the succession, that is, all Protestant bodies, except the church of England) have, properly speaking neither church nor sacraments since they possess no apostolical authority

This doctrine was, by admission on all hands, of very great antiquity in the church, but whether that antiquity is primitive or not, is matter of discussion at the present day The arguments from Scripture cannot alone be relied upon by either party As to the historical part of the question, those Epistles of Ignatius which the learned have in the most part agreed to regard as genuine (commonly called the Greater), are much referred to by the maintainers of the doctrine in support of it They do not, indeed, declare it in express terms, but the strict and repeated injunctions to honour and obey the bishop and presbytery, together with some insulated expressions (such as, "If a man be not within the altar, he faileth of the bread of God," &c), have been thought important in the controversy, and, as Mr Keble observes, "the discovery of those remains probably lent considerable force to the course of opinions among the clergy of England in favour of the doctrine in the 17th century"

At the Reformation it was almost entirely lost sight of, and that the succession was actually preserved in England is rather owing [illegible] In fact, the Romanists contest the validity of English ordinations, partly on the ground that the succession was actually interrupted at the accession of Elizabeth, but there is no need to discuss an historical question on which there seems to be [illegible] The church of England [illegible] her articles; and the language of art 19, although not excluding it, is plainly not such as would have been used by framers who wished to inculcate it Many expressions of her services, borrowed as they are from ancient liturgies, more or less distinctly point towards it. The first school of Anglican divines did not rely on it in their controversy with Puritanism They rather rested their argument on the fact, that the church *had* in early times appointed the episcopal government and regulated ordination and that it could not, therefore, be wise or prudent to swerve from it It was at this point that Hooker took up the subject Whether he actually held the tenet or no, has been much controverted His recent editor (Mr Keble) contends that he did, but, at the same time, admits that there is a marked difference between his language and that of the succeeding school of Laud, Hammond and Leslie (Preface to *Hooker*, p xxxv) Under that school, it became the rallying point of high churchmen, and was zealously maintained by the divines of that section of the church down to and long after the Revolution But since that time, without being renounced, it had certainly long ceased to be brought prominently forward in ecclesiastical controversy, until within the last seven or eight years

In fact the opposite ground had been constantly taken by ordinary Protestant reasoners, both in and out of this [illegible] their contests with the church of Rome [illegible] as is well known argues against the Romanist tenet that 'succession is a certain and perpetual mark of the true church," by maintaining that it is impossible to prove it, that is, that it is impossible that any individual can feel certain that *his* orders were derived by regular succession from the Apostles If we assume, with the Romanist, *à priori*, that the church must have regular succession because of Christ's promise to it then there is no room for such doubts, but if we are endeavouring to insist on the fact of succession as a test of the truth of a church, then it cannot be denied that this argument presents difficulties not easily surmounted

SUCCESSION, LAW OF In Political Economy, the law or rule according to which the succession to the property of deceased individuals is regulated Generally speaking this law obtains only in cases where a deceased party has died intestate or in cases where the power of bequeathing property by will is limited by the legislature It is plain that in cases of intestacy, where the deceased either leaves a number of descendants, or where he leaves no direct descendants, the law, in order to prevent endless disputes and litigation must interfere to regulate the succession to the property, and it will necessarily follow that the succession will be determined in different countries by local circumstances, depending partly on the peculiar state and institutions of each country and on the views entertained by its legislators of what is just and proper and most conducive to the public advantage Hence it is to no purpose in a matter of this kind to look for any general or fixed principles The succession to the property of those dying intestate, and the power of bequeathing property by will or testament depend wholly on the rules and regulations enacted in each country, and these necessarily vary with the varying circumstances of different countries and conditions of society

In most countries a preference has been given, in [illegible] will in favour of male heirs, and in some countries, and especially in modern times, a marked predilection has been shown in favour of the eldest son or, as it is usually termed in favour of the [illegible] Among the Jews the eldest son [illegible] share of the paternal inheritance, but among the Greeks, Romans, and our Saxon ancestors, all inheritances, whether consisting of land or moveables, [illegible] some cases among all the male [illegible] among all the children, whether male or female The growth of the feudal system appears, however to have put an end to this rule of inheritance in most European nations When titles of nobility were created, it was necessary to limit their descent to the eldest son, and it was also necessary that the estate required to maintain the dignity of the possessor of the title should descend according to the same rule of primogeniture And even when estates were not held by noble proprietors, various inconveniences were found to result from their partition, in the division of military services, the number of infant tenants incapable of performing any kind of duty, and, more than all the rest (though its importance was the [illegible] of the land, in emancipating the younger sons from the control of their parents, in tempting them to remain at home and to indulge in the pleasures and idleness of a country life, and lastly, in overspreading the country with a proud [illegible] Inconsequence, the old rule of [illegible] was changed in most countries [illegible] Kent and a few other places [illegible] estate descends [illegible] afterwards seen, notwithstanding the statements of Adam

Smith and others to the contrary, that this rule, though not without its disadvantages, is, on the whole, the best that can be devised

Females being incapable of performing any personal feudal service, it is the common rule, when a person seised of an estate dies intestate leaving only daughters, that they should succeed as co-heiresses Such is the law of England, and when thus limited, little harm can ensue from the subdivision that is thus occasioned

It has, speaking generally been the usual practice in cases of intestacy to divide the money or other moveable property in equal portions among the children or kinsmen of the deceased, without respect to sex or seniority This, however, though a general, is by no means to be regarded as a constant rule Thus, in the case of the Jews, daughters were excluded from all participation in the inheritance, and, apparently, were left to depend on the bounty of their father's heirs (Michaelis, *Law of Moses*, i 420) In Athens, also, daughters inherited nothing when there were sons alive, and when there was no son, and a daughter succeeded to the inheritance, she was bound to marry her nearest relation, so that the property might not be taken out of the family (Michaelis, *ubi supra*) In Rome, however, all sorts of property were divided equally between sons and daughters And as the inconveniences found to result in modern times from the splitting of landed property do not follow at all, or in anything like the same degree, from the subdivision of moveable property, it is the practice in this and most modern countries to admit females of the same propinquity to share in the succession to such property, when left intestate, equally with males, excluding all preference on account of primogeniture

These notices, brief and imperfect as they necessarily are, will probably be sufficient to give the reader a general idea of the rules that have been most commonly followed in regulating the succession to property in cases of intestacy, or where there is no power to bequeath property by will or testament Inasmuch, however, as this power exists to a greater or less extent in most civilized countries, we shall now proceed shortly to state some of the more important principles and limitations that either have been or should be attended to in the construction of such documents

Bequeathing of Property by Will —The power of bequeathing property by will or testament (*libera testamenti factio*) is not usually recognized in the earlier stages of society A man's property is then, for the most part divided in equal shares among his children who succeed to it as matter of right, and in their default it is inherited by his surviving relations, or nearest of kin But experience begins at length to manifest the inconveniences resulting from the enforcement of this strict rule of succession, and power is, in consequence given to persons possessed of property to make testaments, or to dispose of a part at least of their personal or real estate by will At first however this power is usually confined within very narrow limits, being in general restricted to the making of alterations in the shares falling to the children or kinsmen of the testator, that is, to the increasing of the portion of some to the diminution of that of others Thus in Athens, there was no power to devise property from the natural heirs previously to the age of Solon, and that legislator confined the privilege to those who died without leaving issue In Rome three centuries elapsed before a citizen could dispose of his property by a deed *mortis causa*, except in an assembly of the people, and in that case his will as Montesquieu has remarked, was not really the act of a private individual, but of the legislature "With us in [illegible] times, a man could only dispose of one [illegible] his moveables from his wife and children, and in general no will was permitted of lands till the reign of Henry VIII and then only of a certain portion for it was not till after the Restoration that the power of devising real property became so universal as at present" (*Blackstone*, book ii cap i) In Scotland, down to a comparatively recent period almost all landed property was inalienable from the lineal heir

Not only, however, is the power of testators usually augmented as society advances, but in some countries they are permitted to exercise a nearly absolute control over the disposal of their property, and even to bequeath the whole, or the greater part of it to strangers, to the exclusion of their children and relations as is substantially the case at this moment in England This, however, is an extension of the power of bequeathing, as to the policy of which much difference of opinion is entertained It is contended that no one who has any property to dispose of should be allowed to throw his children destitute upon society, that the fear of total disinheritance should not be rendered an instrument of tyranny in the hand of fathers, and that before allowing a man to leave any portion of his fortune to strangers, he should be compelled to make an adequate provision for the individuals he has been the means of bringing into the world, and to whom, independently altogether of any considerations of personal merit or demerit, he is under the most sacred obligations But [illegible] ned that this is a question of con- [illegible] nicety and with respect to which it does not [illegible] possible to come to any conclusion that will not be liable to [illegible] on the whole it would seem that the reasoning of those who argue in favour of the unlimited power of bequeathing to strangers is the most satisfactory and convincing or if any restriction be laid on this, it would appear to be enough to enact that parents possessed of property should be obliged to appropriate a portion thereof sufficient to bring up and educate their children till they come to maturity, or be in a condition to provide for themselves, when all compulsory obligations on the part of the parents should cease [illegible] in the people It is plain, however, that if it interfere to regulate the disposal of property, it must unavoidably do this if it be enacted that how undutifully soever a man's children or relations may have behaved, they shall notwithstanding be entitled to the whole or a certain proportion of his fortune this will, in the first place, render every one less anxious about the accumulation of that wealth which he is not to be permitted to dispose of at pleasure than he would otherwise be [illegible] In the second place the securing of a certain provision for children, independently of their conduct, must in so far render them independent of their parents, and weaken that parental authority, which, though occasionally abused, is yet, in the vast majority of instances exercised in the mildest and most indulgent manner, and with the best effect The more, therefore, that this subject is inquired into, the more, we apprehend it will be found that it is always the safest policy to abstain as much as possible from making the relations of private life the object of legislative enactments The humanity of the law is but a sorry substitute for parental affection If children be ordinarily well-behaved, if they be not extremely deficient either in filial affection or common prudence we have, in the principles and instincts inherent in our nature, a sufficient security that but few parents will be found disposed to leave their property to others to their exclusion The interference of the legislature in their behalf appears therefore to be, speaking generally, quite unnecessary In countries like England and Holland, in which the greatest latitude is given to the power of bequeathing the instances are extremely rare in which an affectionate and dutiful family have suffered from [illegible] permitted to leave [illegible] be most impolitic to attempt to obviate an evil of such rare occurrence by exempting children from the constant influence of a salutary check on their vicious propensities, and compelling a man to bestow on profligacy, extravagance and idleness that property which is at once the fruit and the appropriate reward of virtue, economy, and industry

The advantages resulting from the unrestrained power of bequeathing property by will are so striking as hardly to require to be pointed out Perhaps, however, we may be excused for laying the following passage, from the valuable though little known work of M Luzac, *De la Richesse de la Hollande*, before the reader It strongly corroborates what has now been stated "La liberté de tester, celle de disposer à volonté de ses biens par un acte de dernière volonté peut encore etre mise au nombre des causes, qui ont contribué à animer l'industrie des habitans Quelque indifférent que l'on soit sur le partage des biens que l'on laisse en mourant, l'idée de pouvoir en faire jouir ceux qu on veut en gratifier, est sûrement un aiguillon qui doit exciter au travail, ou du moins prevenir qu on se dégoute d'accumuler des richesses Pourquoi travaillerai-je à augmenter ma fortune si je suis obligé de la laisser à ceux qui ne m'en sauront aucun gré et qui ne la meriteront pas? *La liberté de disposer librement de ses biens par testament, est peut-être la principale cause que les fortunes des particuliers sont plus considérables en Hollande que par tout ailleurs*" (i 304)

Entails —The recognition of the right to bequeath property to any particular heir has, in several countries, been followed by an acknowledgment of the right of the proprietor of an estate to name an indefinite series of heirs, and to prescribe the conditions on which they shall be entitled to hold the property This right is founded by lawyers on the maxim of the civil law, that every one has the absolute disposal of his own property *unusquisque est rei suæ moderator et arbiter* This, however, is not a natural but a civil right, and it is not to be judged of by referring to abstract or imaginary principles, but by its practical operation and real influence over the condition and interests of society To enter into an examination of the advantages and disadvantages incident to the practice of entailing, would far exceed the narrow limits within which an article of this description must be confined, but we may, notwithstanding, glance at one

or two of the principal topics that should be attended to in forming a correct conclusion as to the influence of entails

In the first place, it is alleged in their favour that they stimulate exertion and economy, that they hold out to honest industry and ambition the strongest and safest excitement, in the prospect of founding an imperishable name and a powerful family and of being remembered and venerated by endless generations as the chief and benefactor, and in the second place that as they entails form the only solid bulwark of a respectable aristocracy and prevent generations from being ruined by the folly or misfortunes of an individual

Now it is true that the prospect of founding a powerful family and of securing property, accumulated by means of laborious and successful exertion and economy from the risk of being squandered by the inconsiderate projects or extravagance of any future individual, must act as a very powerful spur to the industry and ambition of the *original founder* of a family But here the beneficial influence of the system stops, its operation on the subsequent holders of the property is entirely different An heir of entail is in a great measure emancipated from the influence of parental authority, his chance of succeeding to the property of his ancestors does not depend on the circumstance of his having deserved it, of his being industrious or idle, dissipated or sober The succession to entailed estates is not regulated by the principle of *detur dignior* Their occupiers have no power to change the established order of succession, they cannot exclude the worst to make room for the best of their descendants, but must submit to see the properties of which they are in possession descend, as in fact, they not unfrequently do, to the most worthless and undutiful of their children or relations Granting, therefore that the institution of entails has a tendency as it undoubtedly has to make *one generation* active frugal and industrious, it is clear to demonstration that it must exempt every succeeding generation that is, every succeeding heir of entail from feeling the full force of some of the most powerful motives to such conduct A system of entail makes the succession to property depend, not on the good or bad conduct of the individual but on the terms of a deed written a couple of centuries, perhaps before he was in existence Its effect is, therefore, to substitute a species of fatalism in the place of an enlightened discrimination to throw property indifferently into the hands of the undeserving and the deserving, and it is plainly impossible it can do this without weakening the motives which stimulate men to act the part of good citizens [illegible] ening those of an opposite description fore, we refer, as we ought, to the decisive criterion of public utility, it is immediately seen that the industry of *one* generation is not to be purchased by the idleness of *all* that are to come after it, and that it is not much less injurious to allow an individual to appoint his remotest heirs, than it would be to deprive him of the power of nominating his immediate successors

As to the second point, there can be no doubt that a system of entail affords the best attainable security for the permanence of property in particular families, and as individuals possessed of property [illegible] ing with more independence, and [illegible] biassed by purely selfish considerations than those who are comparatively poor, it would seem that the privilege of executing a perpetual entail of a certain amount of property might, with propriety be allowed to noble families Indeed, we are disposed to think that in the case of such families it would be advantageous to carry this principle a good deal farther, and that no individual should be advanced to the peerage unless he were able to establish a *majorat*, or to entail such an extent of landed property on the heirs of the title as might be sufficient to secure them, supposing they acted with ordinary prudence, from falling into a state of poverty, and becoming mere dependents on the crown But though the power of entailing were conceded to noble families vested with the prerogative of hereditary legislation, it might be confined within certain limits, and made to vary with the entailer's rank in the peerage Neither is there the shadow of a reason, on political grounds, for conceding this power to others A system of perpetual entails in a general point of view, certainly injurious, and though constitutional considerations may require the privilege to be granted, under proper modifications, to a particular class, they can never require that it should be granted to all. It is not possible to interfere to protect the families of the commons from the casualties to which they are subject, by sanctioning a system of perpetual entail, without producing mischievous results It is the duty of government to adopt such regulations as may [illegible] effectually call forth industry and economy among [illegible] but it is no part of its duty to inquire whether the frugality of those on the box, and the extravagance of those in the coach, bid fair to make them change places, and still less to attempt to prevent it by throwing artificial ramparts round the property of the latter

In Scotland the practice of entailing has been carried to a very great extent, and in some counties hardly an acre of land is now to be met with that is not burdened with the fetters of a perpetual entail, chalking out an endless succession of heirs Latterly, indeed, the system has been so far modified by the interference of the legislature, that money is allowed to be be raised on the security of entailed estates for the effecting of necessary improvements, and certain provisions may made for widows and younger children In consequence of these modifications, and of the abolition of the practice of letting entailed lands by fine, the practice is by no means so injurious as it has been supposed and as it has been frequently represented Still however there can be no doubt of its extreme inexpediency in a public point of view, though, owing to the number of third parties interested in the succession to entailed estates, the question as to the abolition of entails is one of the greatest difficulty

In England, on the other hand, it seems as if the legislature had hit the happy medium between giving too much and too little power to those who have accumulated property over its disposal by will An English gentleman may entail an estate on such heirs as are in existence when the deed is executed, or till the first unborn heir be 21 years of age, but here the destination stops, and the heir in possession has then the absolute disposal of the property This gives to every one that degree of power over his property which is required to inspire him with the desire of accumulating a fortune, at the same time that it takes from him the power of legislating for future ages, or of creating rules to be obeyed in all time to come

French Law of Succession — We have already seen that it has been the practice in most countries, as society advanced, to relax the restraints imposed in early and less enlightened ages on the bequeathing of property by will But the modern legislators of France have followed a different course, and have confined the power of testators within the narrowest limits They have, in fact gone far to make that rule of the Roman law, as to equal [illegible] the children, that obtained in case [illegible] rative rule of succession to all property, whether landed or moveable

According to the new French law a person with one child must [illegible] at pleasure of a moiety of his property, the child inheriting the other moiety as matter of right, a person having two children is only allowed the absolute disposal of a third part of his property, and those having more than two must divide three fourths of their property equally amongst them, one fourth part only being left at their own disposal The property of those dying intestate is equally divided amongst their descendants, without respect of sex or seniority

This law was intended to subvert the foundations of that feudal aristocracy whose ascendency had been very prejudicial to France, and as the influence of an aristocracy must always be mainly dependent on the magnitude of their property, it was certainly well fitted to accomplish its object It is seldom, however, that a law adapted to a particular emergency may be maintained with advantage as a general rule of national policy, and it would be singular were a device originally fallen upon for the express purpose of splitting estates found beneficial for regulating the succession to property in a great kingdom Considered in a general point of view, this law seems infinitely more objectionable than a system of perpetual entail By interfering to so extreme an extent in the disposal of a man's property, it must plainly lessen the motives to accumulation, while, by rendering all the children in a great measure independent it weakens the parental authority and has the same injurious operation in reference to an entire family that the law of entail has in reference to a single child When the property of the father must be divided, all his descendants are aware, from their earliest infancy, that they are, without any peculiar merit or exertion on their part, to obtain a certain provision, and can any one doubt that this sort of certainty must tend to paralyse their efforts, and to render the younger children at least less enterprising than they would be, did they know that their condition in society was to depend principally on themselves, and that they had no security other than their own deserts, for obtaining any thing from their parents? But even these do not seem to be its worst effects The inevitable tendency of this, and of every similar system, is to occasion too great an increase of agricultural population, at the same time that it operates to reduce landed property into such minute portions as neither to afford sufficient employment to the families occupying them nor to allow of their being cultivated and improved in the best and most efficient manner The strong predilection entertained by the great bulk of the children of persons engaged in the business of agriculture for the pursuits of their fathers has been remarked by every

one in any degree familiar with rural affairs, and it is obvious that the existence of a law making the division of estates compulsory affords the greatest facilities for gratifying this inclination It will give to many, who might otherwise have been obliged to emigrate, or to resort to some other employment, the power of continuing in that line of life in which they have been educated, and which is endeared to them by those early associations [illegible] conduct [illegible] the share of the paternal property falling to each of the children be insufficient to enable them to maintain themselves in nearly [illegible] of the more adventur[illegible] to sell their portion, and to engage in other pursuits But experience shows that, in the great majority of cases, they continue to reside on the little properties obtained from their ancestors, and the fair presumption seems to be, that the process of division and subdivision will continue, until the whole land has been parcelled out into patches, and filled with an agricultural population, destitute alike of the means and the desire of rising in the world

It is no doubt true that the condition of the agriculturists of France, at this moment, is decidedly superior to what it was previously to the Revolution But it cannot be truly affirmed that this improvement has been in any respect owing to the law of equal inheritance It has taken place, not in consequence of that law, but in despite of it The abolition of the feudal privileges of the nobility and clergy, and of the gabelle, corvees and [illegible] and imposts, was of [illegible] and farmers, and, in [illegible] part of the property of the church and of the emigrants came into their hands at very low prices, so that small properties were augmented, and fresh energy given to agricultural pursuits Still, however, it is certain that the rapid subdivision of landed property, and the continually increasing excess of the agricultural population caused by the law of compulsory succession, have gone far to neutralize the effects of these advantageous circumstances, and form at this moment one of the most deeply seated evils in the social condition of the people of France

In every respect, therefore, this law would seem to be most inexpedient, and certainly the experience of France does not tend in any respect to shake our belief in the wisdom of those who contend that the interference of the legislature in respect to wills should in all ordinary cases be confined within the narrowest limits, and that in this as in most other things, their object should rather be to prevent abuses than to enact rules for the guidance of individuals in the distribution of their property under ordinary circumstances

Bequeathing of Property for Charitable Purposes — In the article FOUNDATIONS in this work, we have briefly glanced at some of the more prominent considerations that should be attended to in the endowment of hospitals, and in the appropriation of property for purposes of public utility No doubt it is of the greatest importance in a national point of view, that property should be bequeathed for such objects, and it would be easy to show that England has derived, and is deriving, the greatest advantage from the bequests of private individuals for the promotion of education, the support of the poor, and other charitable purposes Still, however, it seems abundantly obvious that such bequests should in all cases be subject to the control of the state It is difficult indeed, or rather impossible perhaps to define *à priori*, how far interference should be carried in such cases, but that, speaking generally, it is indispensable even to the proper carrying out of the views of the testators, is abundantly obvious

To regard the instructions in the wills of those who have established foundations as immutable laws, which are in no case to be altered is, in truth, to permit the ignorance, folly, or presumption of an individual to become a standard for all future ages, and to regulate the studies and the institutions of a more advanced and enlightened period by his crude conceptions and views Surely, however, it is needless to say, that no select number of men, and still less individuals, should be allowed to erect themselves into infallible legislators for every succeeding generation The regulations of the great Alfred and the other benevolent individuals who founded the Universities of Oxford and Cambridge may have been [illegible] but had they [illegible] now have been filled with [illegible] lecturers on the Ptolemaic system of the world and the infallibility of the Pope!

It is impossible to doubt the pious and benevolent views of many of those who, in the middle ages, left their property to monastic institutions, but still less is it possible [illegible] applauding the conduct of the reformers, who diverted this property to other purposes, and who justly considered that the terms of a will dictated in a comparatively barbarous period should not be permitted to consecrate and hallow a system which had become [illegible] and productive only of injurious consequences

The establishment of foundling hospitals is another instance of the same kind They were projected and have been kept up, with the best intentions, but it admits of demonstration, and is [illegible] admitted, that they have been [illegible] parably greater amount of crime and of [illegible] they have obviated

Even as respects the educational foundations established in many parts of England, no one can doubt that their utility is in very many instances greatly narrowed, and in not a few wholly nullified, by the injudicious rules laid down for their government, and, in fact, there is nothing that stands in greater need of revision and amendment than the constitution and administration of foundations

SUCCESSION In Civil Law In that jurisprudence, and those modern systems which are derived from it, there is no distinction between moveable and immoveable property, considered as a subject of succession Succession whether of real or personal property, is either *ab intestato*, or by testament The order of succession [illegible] DESCENT), is [illegible] Nov. 118 127, &c) It admits three classes of successors, — descendants, ascendants, and collaterals, who are preferred in that order in the succession, so that if a man leave any descendants, all ascendants and collaterals are excluded, and ascendants exclude collaterals, except brothers of the whole blood and their children The children of the deceased partake equally Stepchildren [illegible] to the succession of their step parents Children [illegible] issue of several marriages, succeed equally to the property of their father, but severally to the property of their respective mothers Grandchildren take *per stirpes*, or by right of representation, *i e* if a child die in the parent's lifetime his children divide his share equally Among descendants, he or she of the nearest degree is [illegible] Brothers [illegible] parents, but it is doubtful whether or no more distant ascendants divide with them Succession among collaterals is said not to extend beyond the 10th degree The wife (by *Novell*, 53 c 6) succeeds, under certain circumstances, to a fourth

SUCCINEA (Lat succinum, *amber*) A genus of freshwater Gastropods, so called from the transparent texture and amber colour of the shell Of this genus two species (*Succinea amphibia*, Drass, and *Succ[illegible]nga*) are British and to be found occasionally in the river Wandle and in Greenwich marshes

SUCCINIC ACID (Lat succinum) An acid obtained among the products of the destructive distillation of amber, when pure it is a white crystalline substance Its salts are termed *succinates*, of these the *succinate of ammonia* is occasionally used as a test for iron It precipitates the peroxide of that metal in the form of a brown insoluble succinate

SUCCINITE (Lat succinum) An amber-coloured garnet

SUCKING PUMP, or SUCTION PUMP The common construction of the pump, in which the two valves open upwards *See* PUMP

SUCTO'RIANS, *Suctoria* (Lat sugo, *I suck*) The name of a tribe of Cartilaginous fishes, comprehending those which like the lamprey, have a circular mouth adapted for suction

SU'ET The fat situated about the loins and kidneys, which is harder and less fusible than that from other parts of the same animal That of the ox and sheep is chiefly used, and when melted out of its containing membranes it forms tallow, and is largely used in the manufacture of candles and the ordinary soaps Beef and mutton suet when fused concrete at a temperature of about 100 Like other kinds of fat, it is a compound of carbon oxygen and hydrogen

SUFFETES (Said to be from the Phœnic schopetim) Certain Carthaginian magistrates, whose office bore considerable analogy to that of the Spartan kings and Roman consuls Their number was two, and they were elected annually from the noblest families of the state The functions of the suffetes seem principally to have been confined to the management of civil affairs Thus it was their province to assemble the senate and preside in it, and also to propose the subjects of debate, and collect the votes, but there are instances recorded of suffetes leading the armies of their country All the cities of note in the Carthaginian dominions had likewise their suffetes; but these, of course, were [illegible] with municipal authority (See *Mem de l'Acad des Inscr* vols xxxiv xxxviii)

SUFFRAGAN In Ecclesiastical Usage, every bishop is said to be suffragan, relatively to the archbishop of his province, thus the bishop of Carlisle is suffragan to the

archbishop of York, &c, either on account of the suffrages given them in the provincial synods, or because they can not be consecrated without the *suffrage* or consent of the archbishop Regular bishops ordained to assist a bishop in his spiritual functions, are also commonly, but rather improperly, styled suffragans, a title adopted by the stat 26 H 8 c 14

SU'FFRAGE *See* PARLIAMENT

SUFFRAGO (Lat suffrago *the pastern*) In Mammalogy and Ornithology, the joint of the tibia with the tarsus

SUFFRUTICOSI (Lat suffrutex, *an undershrub*) Any plant which is not exactly either a shrub or an herbaceous plant, that is, which has not hard woody twigs and complete buds like the one nor perishable succulent twigs like the other Lavender is an instance of a suffruticose plant

SU'GAR. (Fr sucre Germ zucker) The great commercial demand for sugar is almost exclusively supplied from the sugar cane (*Arundo saccharifera*) which contains it in greater quantity and purity than any other plant, and consequently affords the greatest facilities for its extraction A large quantity of sugar is contained [illegible] which it may be economically obtained, it has also been extracted from grapes [illegible] well known, is contained abundantly in many [illegible] and esculent vegetables It is, however, [illegible] so pure or in such quantity as to admit of ready separation

The process, as carried on in our West India islands, consists in pressing out the juice by rolling mills, and carefully evaporating it till it has acquired the proper consistency for crystallizing, [illegible] this operation, to neutralize any free acid and to facilitate the separation of certain vegetable matters which in consequence of the action of the lime, rise more readily to the surface, and admit of being skimmed off When duly concentrated, the syrup is run off into shallow wooden coolers, where it concretes, it is then put into barrels with holes in the bottom through which a quantity of treacle or molasses gradually drips, and the remaining sugar acquires the granular crystalline state, it is packed into hogsheads, and comes to us under the name of *raw* or muscovado sugar The following is a sketch of the process by which raw sugar is purified in this country Raw sugar is chosen by the refiner by the sharpness and brightness of its grain, it is put into a copper pan or boiler, previously charged with a certain quantity of lime water, with which a portion of bullocks blood has been well mixed by agitation and is suffered to stand a night to dissolve Early in the morning fires are lighted under the pans, and when the liquid boils the coagulated albumen of the blood rises to the surface and carries the impurities of the sugar with it The liquid is kept gently simmering and continually skimmed till a small quantity taken out in a metal spoon appears perfectly transparent this generally takes from four to five hours The clear syrup is then run off into a cistern, the pans are reduced to half their former size by taking off a moveable front, and a smaller portion of the purified syrup returned into each, the fires are now increased, and the sugar made to boil as rapidly as possible, till a small quantity taken on the thumb is capable of being drawn into threads by the fore-finger, the fire is then damped, and the boiling syrup carried off in basins to the *coolers*, a fresh quantity is then pumped into the pans and evaporated as before In the coolers the sugar is violently agitated with wooden [illegible] granulated It is upon this agitation [illegible] fineness of grain in the refined sugar principally depend, the crystals are thus broken down whilst forming and the whole converted into a pretty [illegible] mass, which permits the coloured liquid saccharine matter to run off, and which would be combined with the solid if it were suffered to form into larger crystals This granular texture likewise facilitates the percolation of water through the loaves in the after process, which washes the minutely divided crystals from all remaining tinge of molasses That this is the real theory of the whitening of sugar by the process of refining appears from a comparison with the process for making *sugar candy* In this the raw material is cleared and boiled as above, but instead of being put into [illegible] poured into pans, [illegible] to which the crystals attach themselves, these are set in a stove, and great care is taken not to disturb the liquid, as upon this depends the largeness and beauty of the candy In this state it is left for five or six days exposed to a heat of about 95°, when it is taken out and washed with lime water This takes off the molasses from the outside, but a great quantity is combined in the crystal, and the consequence is that candy is never whiter than the sugar it is made from When the sugar has attained the granular state in the coolers, as above described, it is poured into conical earthen moulds which have been previously soaked a night in water, in these it is again stirred, for the purpose of extricating the air bubbles, which would otherwise adhere to the surface and render it rough, when sufficiently cold, the loaves are carried to some of the upper floors of the manufactory, and the paper covers being removed from their points, they are set with their broad ends upward upon earthen pots The first portions of the liquid molasses soon run down, and leave the sugar much whitened by the separation, afterwards, pipe-clay mixed with water to the consistence of cream is put upon the base of the loaves to the thickness of about an inch, the water from the clay gradually filters through the loaf and carrying with it all remaining tinge of molasses, runs to the point the clay being of no other use than to retain the water and prevent its too rapid percolation, by which too much of the solid sugar would be dissolved This process called *claying*, is repeated four or five times, according to the nature of the sugar and the degree to which it has been refined When the loaves are thus cleansed from all relics of colour they are suffered to remain some time for the water to drain off, when this is completed, they are set with their points upwards, when all remains of it are equally diffused throughout, they are then *stove-dried* at a temperature between 95 and 100 The syrup, or [illegible] pots, is mixed with the raw sugar [illegible] it is divided according to its fineness, the first runnings which are the foulest, being reserved for the coarsest loaves, while the last, being little else than clear syrup, is boiled into loaves of the same fineness as those from which it ran The lowest syrups are boiled into what is called *bastard sugar*, from which the molasses runs with very little mixture of solid sugar this it is which is sold under the name of *treacle*, being quite incapable of further crystallization The average produce of 100 cwt of raw sugar treated as above is 63 lbs of refined, 18 of bastard, 17 of molasses, 4 loss in dirt, &c

Mr Howard, in his patent process for the refining of sugar introduced a variety of modifications and improvements the principal of which depended upon boiling under diminished atmospheric pressure, so that no part of the syrup was liable to be burned or otherwise injured by heat, he also employed recently precipitated aluminous earth to abstract part of the colouring matter, well burned charcoal, especially animal charcoal, has been found very serviceable for the latter purpose, and a number of other improvements in and modifications of the process of refining have more lately been adopted

The chemical characters of sugar are well defined, especially those of the crystallizable or cane sugar Its specific gravity is about 1 6 It dissolves in all proportions in water, is less soluble in alcohol, and is recognized by its purely sweet taste It is blackened by sulphuric acid, and when about one part of this acid is added to two of thick syrup, the mixture presently boils up into a black frothy mass, which is little else than carbon, acid, and water In respect to ultimate composition, sugar belongs to that important class of proximate vegetable principles which are theoretically regarded as compounds of carbon and water, that is, of carbon and of oxygen and hydrogen in the same [illegible] proportions as they exist in water The following [illegible] results of Dr Prout's analysis of the finest loaf sugar in a dry and pure state, with its probable atomic constitution —

	Atoms	Equiv	Theory	Expt
Carbon -	- 9	54	42 86	42 85
Hydrogen -	- 8	8	6 35	6 35
Oxygen -	- 8	64	50·79	50 80
	1	126	100 00	100 00

Several other varieties of sugar have been chemically examined, such as grape sugar, honey sugar, mushroom sugar manna liquorice sugar, &c

Consumption and Supply — Sugar is to be ranked rather as a necessary than as the most desirable of luxuries, and a larger sum is, we believe expended on sugar in this country than on any other article except flour and butcher's meat The sugar consumed in England is all derived from the *Arundo saccharifera*, or sugar cane, and was, for a great length of period, almost wholly supplied by our colonies in the West Indies, but latterly we have derived very extensive supplies from the Mauritius and India Foreign sugar is virtually excluded from our markets by the prohibitory duty with which it is loaded

Besides the West Indies, South America, especially Brazil, the East Indies, the Mauritius, Java, Siam, the Philippine Islands, &c are the countries which export by far the largest supplies of cane sugar, though it either is or may be produced in most tropical countries, and it is also cultivated to some extent in some countries within the temperate zone During the last war, when the nations of the Continent experienced very great difficulty in getting supplies of sugar from tropical countries, attempts were made to raise it at home from beet-root; and this sugar being exempted from the heavy duty laid on colonial sugar, its culture has latterly

been very greatly extended, especially in France But the general opinion seems to be, that were beet-root sugar subjected to the same duty as colonial sugar, its culture would be greatly restricted We subjoin

An Account of the Quantities of [illegible] Description, Sorts, and Countries [illegible] Duties [illegible] from each Country, and the Amount of Duties received thereon, in each Year, from 1814 to 1833, both inclusive; also the average Price of Muscovado Sugar in Bond, &c

For an account of the rates of duty, which are very complicated, see TARIFF, in *Commercial Dictionary*

SUICIDE, or SELF-MURDER (Lat suicidium) Few chapters in the history of the human mind are more singular than that of suicide, as showing the kind of honour in which a practice so unnatural has attained in the feelings of many nations The rank which religious suicide has held from immemorial antiquity, and still holds in the opinion of the Hindoos, has been too often described, and is too familiar in its most notorious and painful instances to need more than adverting to on the present occasion It is said that the practice is condemned by their older books, if so, the traditionary sentiments of the people have been formed on some different model The suicides of the Hindoos have proceeded partly from fanaticism partly from an apathetic philosophy, those of the ancient Scandinavians, esteemed equally honourable from the overflow of courage in warriors, who could endure any evil except the approach of helpless and unwarlike old age

Among the Greeks the first inquirers who reasoned out the principles of human life and action by a train of philosophical investigation, singularly vague and discrepant opinions on this subject seem to have prevailed, as might have been expected from a people to whom religion furnished so very few fixed data of reasoning and by whom abstract truth was pursued with such unequalled ingenuity and earnestness Socrates the great master of ethics, was emphatic in his condemnation of suicide Plato speaks in a more dubious strain writing as a lawgiver, he reprobates it, and in his arguments on the subject is to be found the well-known illustration which has figured ever since in all such discussions, in which he compares it to the desertion by a soldier of his post, yet he expressly excepts from his censure those cases in which it is committed under the pressure of unmitigable calamity Pythagoras, at an earlier period denied its lawfulness (See *Athenæus*, [illegible]) In the later days of Greek philo- [illegible] was most notorious for its tenets on this subject, Zeno and Cleanthes its great masters having both put an end to their own lives as Democritus had done before them, from the mere tedium of old age

Cum jam matura vetustas
[illegible]

The argument of an Epicurean philosopher on the topic may be collected from *Cic Tusc Disp* v 41, and, indeed, may be compressed in the pithy Greek motto for a drinking party, Ἡ πίθι ἢ ἄπιθι—*drink, or begone* "Stoical academics' (says Dr Moore in his *Essay on Suicide*, i 233), "if such an expression be warrantable would plead a dismission whenever their dignity was affronted or their glory diminished, whilst Epicurean academics would care nothing about such matters, as long as their personal indolence and tranquillity were not superseded" The influence of Greek philosophy had, as is well known, a great [illegible] tendency [illegible] which [illegible] Rome [illegible] later [illegible] Roman death," as it is emphatically called, was not really a national habit; the older manners of the commonwealth repudiated it, its prevalence was owing to foreign doctrines, acting on minds affected by the violent passions, engrossing luxuries, and rapid vicissitudes of fortune which distinguished that momentous era Virgil returns to the Pythagorean view, and, without inveighing against suicide, represents it as a sad and mournful death, the perpetrators of which are doomed to a long and shadowy existence,—without torment, but without enjoyment, one which they would willingly exchange for the bitterest poverty and labour in the celestial light of day Perhaps the courtier-poet was a little affected by the feelings of those in power, who loved to have contented, orderly, and not too irritable subjects, and disliked the fashion among the noble Romans of escaping in this manner from tyranny and persecution At a later period suicide committed by criminals under accusation was made criminal by the Roman law This was with a view to preserve the forfeiture of the criminal's property to the government Suicide, as such, does not seem to have been the subject of legislation

Although Christianity was not slow in effecting a reform in the feelings of mankind on this important subject, yet some relics of the ancient sentiments lingered awhile, even in the minds of enlightened believers The fanatical Donatists were greatly addicted to suicide, and are justly condemned on this account among others by the early writers of the church Nor did these latter ever esteem suicide lawful, even under the severe persecutions to which the church was subjected, except perhaps in one case—when committed by virgins to preserve their chastity The cherished sentiments of the fathers of the church on this subject rendered them not only lenient to such victims of honour but some of them have even gone so far as to commend them Augustine with his usual strong sense of moral right, only pities them, and expressly classes all suicide as homicide (*De Civ Dei*, l i c 19) There was, at an early period, no commemoration for the souls of suicides in the early church And the council of Braçara, A D 563, refused them Christian burial, a measure which has been pretty generally adopted throughout Christendom

There have been a few paradoxical writers who have contended in favour of the lawfulness of suicide, arguing on Christian premises In *Hume's Essay on Suicide* this ground is taken, with the author's usual adroitness in pointing out supposed deficiencies in the scheme of Revelation A more remarkable instance is Dr Donne's Βιαθανατος, or, a declaration of that paradox or thesis, that self homicide is not so naturally sin that it may never be otherwise It is remarkable however, less from the force of the argumentation, than the circumstance that a man [illegible] could have [illegible] arguments those derived from the silence of [illegible] subject, [illegible] others seem very puerile. [illegible] them seriously refuted, at much length, by the painstaking Dr Moore, in his *Essay* [illegible] which we have taken mos[illegible] To say the truth, his refutation is in some instances as weak as any part of Donne's paradox

Among the writings of another class of thinkers, the reasonings *pro* and *con* urged by Rousseau in the *Nouvelle Heloise* are well known Though there is little convincing in the logic of the antagonist of suicide, yet the side he takes is made to appear the generous and noble one, and in this case, as in several others, Rousseau must be owned to have done service to the cause of morality, considering the incredible influence which he exercised on the fervid heads and hearts of his time It is remarkable that Lord Edward, in the work above

alluded to, is made to admit one exception in favour of suicide, in the case of acute and irremediable pain Madame de Stael, in her *Essay on the Influence of the Passions*, advanced a sort of defence of suicide, in her later work (*Reflexions sur le Suicide*, published in 1810) [illegible]

In discussions on the subject of proneness to suicide in particular classes or nations, it is impossible to disconnect it from that of insanity, because the miserable delusions of that disease constantly impel their victim to its commission In societies, therefore, where insanity is most common, the number of suicides will be greatest It does not follow that the number of suicides committed by persons not insane will also be greatest in such communities that is when we disregard the refinements of those who profess to consider suicide itself as a proof of greater or less derangement of the mental functions What we mean by the suicide of a sane person is the suicide of one of whose insanity there is no evidence except such as may be considered to arise from the act itself Considered in this light, the tendency to deliberate suicide has been almost epidemic in many communities Nor does it arise from similar causes or in similar states of society Among the old Scandinavians as at this day with some tribes of savages, it was the offspring of the intolerance of fierce dispositions of the helplessness of age and disease It prevails, too, sometimes in effeminate communities, where there is little zest or excitement in life, with mean habits little self-respect and much apathy thus it is extremely common in China, even it is said among the lower classes, notwithstanding the proclamations, full of ethical saws, which the magistrates issue against its commission [illegible] disposed, the act is generally deliberate and not connected with insanity, so, again, where it results from a cold temperament, and a sarcastic and contemptuous view of life, which was the notion formerly entertained by foreigners of the English mania for suicide a notion which probably had not much foundation in truth at any time Sixty years ago Mercier (*Tableau de Paris* vol iv) thought it prevailed less in England than France At present, in communities civilized on the European model it would probably be found that the number of suicides was pretty nearly in proportion to that of insane persons, and that the same causes which produce mental disturbance lead likewise to self murder Perhaps the principal predisposing influences as they affect society in the mass, may be reduced to four —the spirit of mercantile speculation leading to sudden and overpowering vicissitude of prosperity and want, mental excitement produced chiefly by misdirected education literature and philosophy, absence of self-restraint especially on religious principles, and intemperance in spirituous liquors Either of these causes alone may be sufficient for example, in various parts of northern Germany and in Geneva, where there is little of commercial movement, and where the body of the people are orderly and well-conducted, suicide is nevertheless extremely common among the educated classes, and may be referred almost wholly to mental excitement But where they all combine, the effect is fearful, as may be witnessed in the great cities of France and the United States On the other hand, suicide is rare in nations where fatalism prevails, as among the Turks and Spaniards, in nations in which a love of order is joined with an unrefined mental organization and great love of physical enjoyment such as the south Germans, and to a certain extent the Italians The following table exhibits some of the results given by M Quetelet, from researches extending over a number of years [illegible] of doubt as to the [illegible] returns in many countries

Number of Suicides annually compared with the Population

Russia	1 in 49,182
Austria	— 20,900
France	— 18 000
Pennsylvania	— 15,875
Prussia	— 14 404
New York (State)	— 7,797
City of London	— 5,000
City of Berlin	— 2,941
City of Geneva	— 2,941
City of Paris	— 2,400

With regard to classes the [illegible] probably d[illegible] tion fro[illegible] however [illegible] no sovereign, at least in modern times, was ever known to commit self murder There is a remarkable paper in the first volume of the *Journal of the I[illegible] Society*, showing its prevalence amor[illegible]

this city The suicides in the Dragoon Guards and Dragoons are said to amount to one twentieth of all the deaths, while among the members of the Equitable (to make the comparison with a body of grown-up persons) they are only 1 in 110

With respect to the causes of suicide, some curious results have been obtained by statisticians, but, in giving them, we must profess our doubts concerning the value of such statements, from the very vague data on which they must necessarily be founded It appears from a classification of 134 suicides committed in ten years at Geneva (by M Prevost, in the 15th vol of the *Annales de Hygiene*), that the following causes produced them —

Disease	34	[illegible]	10
Mental alienation	24	[illegible]	6
Pecuniary misfortunes	19	[illegible]	6
Domestic chagrins	15	[illegible]	4
Melancholy, cause unknown	13	Mysticism	2

Comparing these with other accounts, it would seem that love produces at Paris $\frac{1}{28}$ of the suicides committed, at Geneva $\frac{1}{9}$, at Petersburg $\frac{1}{2}$ if Mr Schon is to be believed, a singular contrast to the commonly supposed effects of climate Domestic griefs at Paris (from 1794 to 1823), $\frac{1}{9}$, at Geneva the same Misconduct at Paris, $\frac{1}{23}$, at Geneva $\frac{1}{13}$ at Petersburg $\frac{1}{8}$ Gambling at Paris $\frac{1}{33}$, at Geneva $\frac{1}{11}$ Some of these results in Paris and Geneva, are certainly remarkable for their correspondence (See an essay of M Brouc, in the 16th vol of the *Annales de Hygiene* already cited The reader may consult also M de Villeneuve Bargement, *Econ Politique Chrétienne*)

The following statement is extracted from the official tables of revenue, trade, and population for 1839 —

Number of suicides in England and Wales during the year ended 30th of June 1838 Males 701, Females, 307

The Ages of 1011 Suicides

Between 10 and 15	8	Between 50 and 60	221
— 15 — 20	73	— 60 — 70	141
— 20 — 30	191	— 70 — 80	84
— 30 — 40	172	— 80 — 90	14
— 40 — 50	217	— 90	2

From this it appears that the greatest number of suicides (relatively to the numbers living) are between the ages of fifty and sixty (which appears from M Prevost's calculations to be also the case at Geneva), the tendency to suicide regularly increasing up to the latter age Between seventy and eighty the number is still very considerable

The Season of the Year	Males	Females
January February March	163	66
April May June	210	94
July August September	214	73
October November December	164	74
	751	308

Thus the proportion of male to female suicides is 2½ to 1 at Geneva exactly the same (95 to 38) The subject must not be dismissed without noticing the great increase of suicide which most observers represent to have taken place in the last twenty years especially in the large towns of northern Europe But there must be a certain degree of doubt how much of the apparent increase is owing to more accurate observations

The total number of suicides committed in London during the five years ending 1840 amounted to 1211 Of these 819 were males and 392 females, the proportion of females to males being about 48 per cent, and the age at which there was the greatest number of suicides was from 35 to 40 (See two interesting papers on *The Statistics of Suicide* by Mr Jopling, in Nos 4 and 5 of the *Assurance Magazine* from which various conclusions may be deduced at variance with the prevalent opinions on this subject)

Suicide is ranked by the English law as a peculiar species of felony, and like other felonies, cannot be committed by persons under the age of discretion, or insane From very ancient times (see *Bracton*) the law imposed the forfeiture of personal property as a consequence of it, and a felo de se (as a wilful suicide is termed) forfeits all chattels, real and personal But the offence was never attended with corruption of blood or the forfeiture of lands of inheritance, so that the will of a felo de se stands good as to realty In order to vest these chattels in the crown, the fact of self murder must be proved by an inquisition which the coroner is the proper officer to hold In addition, the law formerly required that a self-murderer should be buried in a highway, with a stake driven through his body Now, by 4 G 4 c 52 his remains are to be privately buried at night in the churchyard But the canon law (confirmed by the rubric in the Common Prayer Book) forbids the performance of Christian rites over them

SUIT In Law, the same as *action*, which see

SULCATE (Lat sulcus, *a furrow*) In Zoology, when a surface is deeply impressed with longitudinal parallel lines

SU'LPHATES Salts consisting sulphuric acid, green vitriol is a *sulphate* of the protoxide of iron Glauber's salt is a *sulphate* of soda

SU'LPHITES Salts [illegible]

SU'LPHOCYANIC ACID [illegible] was discovered in 1808, by Mr Porrett, who ascertained it to be a [illegible] sulphocyanuret, hydrogen and azote It is best formed by distilling a strong solution of sulphocyanuret of potassium with phosphoric acid, when [illegible] The strongest [illegible] boils at 217°, and [illegible] It gives a very characteristic deep red solution with persalts of iron, with a salt of copper it gives a white precipitate It is composed of

	Atoms	Equiv
Sulphur	2	32
Cyanogen	1	26
Hydrogen	1	1
	1	59

Sulphocyanuret of potassium is obtained by mixing equal weights of powdered sulphur and ferrocyanate of potassa and keeping them in fusion for half an hour in a flask, when cold, reduce the mass to powder and digest it in water filter the solution, and add a sufficiency of liquid potassa to throw down the iron

SU'LPHONAPHTHA'LIC ACID A compound of sulphuric acid and naphthaline, discovered by Mr Faraday (*Phil Trans* 1826)

SU'LPHOSINA'PISIN (Lat sulphur, and sinapi, *mustard*) A crystallizable substance obtained from mustard seed, it appears to contain sulphur, carbon, hydrogen and nitrogen

SULPHOVI'NIC ACID *Œnothionic Acid* An acid formed by the action of sulphuric acid upon alcohol From Mr Hennel's experiments (*Phil Trans* 1826 and 1828) it appears to be a compound of

	Atoms.	Equiv
Sulphuric acid	2	80
Quadri-hydrocarbon	1	28
	1	108

SU'LPHUR *Brimstone* A yellow brittle mineral product found in various parts of the world but apparently most abundant in volcanic regions Europe is chiefly supplied with it from the south of Italy and from Sicily It most commonly occurs massive, but it is sometimes met with crystallized in the form of an oblique rhombic octoedron Fine specimens of this description are seen in our mineral cabinets and bear a high price A considerable quantity of sulphur is also obtained from some of its metallic combinations, such as the sulphurets of copper and of iron These ores are heated, or roasted as it is termed, in furnaces so constructed that the sulphur vapour may be condensed and from time to time collected, this when purified by fusion is cast into moulds, and forms common or *roll brimstone* Small quantities of sulphur also occur in several animal and vegetable products, and are frequently recognized by the odour of sul[illegible] in which they evolve during putrefac[illegible] non-conductor of electricity, insipid and inodorous, unless rubbed or heated when it evolves a sulphurous smell Its specific gravity is 1 99 It melts at about 216°, and when heated to about 250° it becomes a limpid, amber-coloured liquid, if the heat be raised to about 450°, it again becomes viscid and deeper coloured, at 480° up to its boiling point it acquires rather more fluidity, at about 600° it rises rapidly in vapour, and in close vessels condenses in the form of a fine yellow powder, composed of crystalline grains in this state it is called *flowers of sulphur* The earthy and metallic impurities which, with a portion of sulphur remain in the subliming vessel were formerly called *sulphur vivum* When sulphur in its viscid state of fusion is poured into water it becomes a ductile mass, which slowly hardens, and which is often used for taking impressions of seals and medals When sulphur is in the form of vapour it is of a dense orange colour; its specific gravity in that state is about 6 6, and 100 cubic inches of it should therefore weigh about 200 grains

There is another form of sulphur which is sometimes called *milk of sulphur* (lac sulphuris), and which is a *hydrate of sulphur*; it is obtained by precipitating sulphur by muriatic acid from [illegible] solutions When sulphur which has been melted is allowed to cool slowly its latter portions exhibit prismatic crystals and very beautiful specimens of [illegible] crystallization

of sulphur may be obtained by melting a few pounds of it in a crucible or ladle, and when partially cooled [illegible] inverting the vessel so that [illegible] may run out, on breaking the mass when cold, the cavity will be found lined with [illegible]

[illegible] combinations and uses, are given under the heads of SULPHURETTED HYDROGEN, and of SULPHURIC and SULPHUROUS ACIDS

Sulphur is insoluble in water, it dissolves in boiling oil of turpentine, and is deposited often in crystals as the solution cools It is also soluble in alcohol, if both substances be brought together in the state of vapour It combines also with chlorine, bromine, and iodine Its native combinations with the metals form some of the most important ores It is from the sulphurets of lead and of copper that the commercial demands for these valuable metals are almost exclusively supplied

Sulphur is of great importance in the arts It is used extensively in the manufacture of gunpowder, and in the formation of sulphuric acid, or oil of vitriol It is also used in medicine, and for other purposes of the arts The entries for home consumption in 1838 and 1839 amounted at an average to 695,056 cwt a year The duty on refined or roll brimstone varies from 6*s* to 9*s* 9*d* a cwt, whereas on rough it is only 6*d*, so that the imports consist almost wholly of the latter The largest portion by far of the imports come from Italy, or rather Sicily The price of rough brimstone in bond in the London market usually varies from 6*l* 10*s* to 7*l* 10*s* a ton

SU'LPHURETS Compounds of sulphur with electropositive or inflammable bodies The most common ores of copper and of lead are *sulphurets* of those metals

SULPHURETTED HYDROGEN, *Hydro-sulphuric Acid* A [illegible] 1 atom of sulphur = 16 + 1 atom [illegible] equivalent, therefore, of sulphuretted hydrogen is 17 This gas was first examined by Scheele in 1777 It may be obtained by acting upon sulphuret of antimony by muriatic acid, or upon protosulphuret of iron by diluted sulphuric acid, and is immediately recognized by its peculiar fetid odour, which is so diffusible that a single cubic inch of it escaping into the atmosphere of a large room is soon every where perceptible by its smell It is very deleterious to respiration 100 cubic inches weigh [illegible] gravity compared with air being [illegible] pared with hydrogen as 17 to [illegible] a pressure of 17 atmospheres at 50° Water agitated with this gas takes up its own volume, and acquires a bitterish nauseous flavour, and the odour which characterizes Harrowgate and Aix-la-Chapelle waters, and which derive their chief peculiarities from the presence of this gas Sulphuretted hydrogen extinguishes flame, but is itself inflammable in the contact of air, burning with a blue flame and depositing during its slow combustion a portion of its sulphur When mixed with excess of oxygen and inflamed, it explodes, and the mixture is converted into sulphurous acid and water One volume of the gas requires one volume and a half of oxygen for its entire combustion and the results are water, and 1 volume of gaseous sulphurous acid [illegible] chlorine and by iodi[illegible] down its sulphur and combine with its hydrogen It is unequivocally recognized by its peculiar odour and by its blackening the salts of lead Sulphuretted hydrogen, diluted with 20,000 measures of pure hydrogen, sensibly blackens a piece of paper which has been dipped into a solution of acetate of lead white lead is also immediately discoloured by it, hence the mischief which it does to white paint and to pictures The aqueous solution of sulphuretted [illegible] litmus, and inasmuch as it combines with [illegible] bases, it is properly considered as a weak acid

SULPHURIC ACID, *Oil of Vitriol* This most important acid was discovered by Basil Valentine towards the end of the 15th century It was formerly obtained by the distillation of green vitriol and from its oily appearance it acquired the name, which it still bears, of *oil of vitriol* In this country it is procured by burning a mixture of 7 or 8 parts of sulphur with 1 of nitrate of soda or of potash The mixture is burned in a furnace so contrived that a current of air carries the products of the combustion into a large leaden chamber, the bottom of which is covered to the depth of a few inches with water The principal products of the combustion of the above-mentioned mixture of nitre and sulphur are sulphurous and nitrous acids, and these, together with atmospheric air and aqueous vapour, form the contents of the chamber

The sulphurous and nitrous acids, with a portion of water combine to form a white crystalline substance, which, upon falling into the water of the chamber, is instantly decomposed The nitrous acid imparts oxygen to the [illegible] into sulphuric

acid, whilst the nitrous gas loses oxygen reverts to the state of *nitric acid* which is given out into the air of the chamber, from which it immediately again abstracts oxygen and becomes nitrous acid, again ready to acidify a new portion of sulphurous acid. The oxygen, therefore, is thus indirectly transferred to the sulphur, or to the sulphurous acid from the atmosphere through the medium of the attractive power of the nitric oxide for that element, and the circumstance of this process being repeated over and over by the same portion of nitrous gas, explains the small quantity of nitre required in this curious process.

When the water in the chambers is rendered sufficiently acid, which is judged of by its specific gravity, it is drawn off into leaden boilers, where it is evaporated down to a certain density, after which, as it would then act upon the lead, it is transferred to platinum boilers supplied with still-heads, and there brought to the proper point of concentration by evaporation of much of the remaining residuary water. This is a process which could formerly be carried on at great risk and inconvenience, in glass retorts; its present improvement shows a [illegible] of platinum, which is not acted upon by the acid. Of late, sulphuric acid has been largely manufactured from the sulphur obtained by roasting common pyrites (sulphuret of iron), one of the objections to which is, that it almost always contains more or less arsenic by which the acid thus made is therefore contaminated. The acid made from Sicilian sulphur is indeed not always free from this mischievous impurity.

Sulphuric acid is a limpid colourless fluid, of a specific gravity of 1·8. It boils at 620°, it freezes at 15°. But the temperature at which the diluted acid congeals is singularly modified by the quantity of water which it contains. When of the specific gravity of 1·78 (which may be regarded as a compound of 1 atom of dry acid and 2 of water), it freezes at 40° and remains solid for a long time at several degrees above that point. If the density be either diminished or increased, a greater cold is required to congeal it.

It is acrid and caustic, and most powerful acid in all its characters, even when largely diluted. Its attractions for bases is such that it separates or expels all other acids more or less perfectly from their combinations. Its affinity for water is such that it rapidly absorbs it from the atmosphere, and when mixed with water much heat is evolved; thus by suddenly mixing 4 parts of the acid and 1 of water at 60°, the temperature rises to 300°. Its attraction for water also causes the sudden liquefaction of snow, and if mixed with it in due proportion an intense cold is the consequence. It acts energetically upon animal and vegetable substances, generally charring them, and often, as in the case of *sugar*, with singular rapidity.

This acid, as it usually occurs in commerce, under the name of *concentrated sulphuric acid*, is a compound of 1 atom of anhydrous acid and 1 of water. The anhydrous sulphuric acid is constituted of 16 sulphur (1 atom) and 24 oxygen (3 atoms), its equivalent, therefore, is 16 + 24 = 40; this is the composition of the acid as it exists in the *anhydrous sulphates*. The strong liquid acid consists of 40 of the dry or anhydrous acid (1 atom) and 9 water (1 atom), and is therefore represented by the equivalent 40 + 9 = 49.

Sulphuric acid is an article of great commercial consumption, its purity and value are judged of by its specific gravity. Upon this subject Dr Ure's tables may be consulted, which show the quantity of real or *dry*, and of commercial acid, in diluted acid of all densities.

By the term real, dry, or anhydrous sulphuric acid, we mean that which exists in the sulphates, and which may be obtained in a separate state by distilling protosulphate of iron, or green vitriol, at a high temperature. It becomes over a dense brownish liquid, which emits vapour when exposed to air, and has hence been termed *fuming sulphuric acid*. On putting this into a retort to which a receiver surrounded by ice or snow is carefully adapted, and heating it gently a vapour passes over, which condenses into a white crystalline solid, this, which is *anhydrous* or *glacial* sulphuric acid, liquefies at about 70° and evaporates at about 112°. Yet, when combined with such portion of water as constitutes the above described liquid acid, it is one of the most fixed of fluids. It hisses when dropped into water in consequence of the great heat evolved.

The ready test of sulphuric acid is a soluble salt of baryta, the solution of chloride of barium is generally used which, when dropped into any solution of free or combined sulphuric acid, announces its presence by a white cloud, or precipitate of *sulphate of baryta* which is insoluble in nitric acid. This precipitate when collected, and well washed and dried, consists of 77 baryta and 40 sulphuric acid, so that 117 is its equivalent, and this weight indicates 40 of the dry acid. In the same way sulphuric acid and the sulphates, are tests of baryta.

SULPHURIC ETHER. *See* ETHER.

SULPHUROUS ACID. This acid consists of 16 sulphur + 16 oxygen; its equivalent being 32. It is obtained by heating sulphuric acid in contact with certain metals, which abstract an atom of its oxygen, such, for instance, as silver or mercury. It is also formed by burning sulphur in oxygen gas. One volume of water takes up about 30 volumes of sulphurous acid gas, so that it may be collected and preserved over mercury or in dry stoppered phials. It has the well known suffocating odour of burning sulphur, and its gas possesses considerable bleaching powers, so that the fumes of burning sulphur are often used to whiten straw, and certain silk and cotton goods, and when certain flowers, such as violets, dahlias, &c., are exposed to such fumes, or to sulphurous acid, their colours are mostly destroyed. Upon other colouring matters it has little effect. 100 cubic inches of sulphurous acid gas weigh between 67 and 68 grains, its specific gravity compared with atmospheric air being 2·22. It extinguishes flame, and kills animals. When subjected to the pressure of about two atmospheres, or when cooled down to 6° it assumes a liquid form, and in this state it evaporates with such rapidity at common temperature as to produce a most intense degree of cold, so that by its aid chlorine may be liquefied and mercury frozen. It combines with bases, and produces a class of salts called *sulphites*, they are characterized by emitting sulphurous acid when acted upon by sulphuric acid, and by becoming converted into sulphates by oxidizing agents.

SU'LPHUR SALTS. Chemists have lately applied this term to the *double sulphurets*. The sulphurets of the most electro-positive metals have been termed *sulphur bases*, such as the protosulphuret of potassium, sodium, barium, &c., whilst the sulphurets of arsenic, antimony, &c., the bisulphuret of carbon, and sulphuretted hydrogen have been called *sulphur acids*, and the compounds resulting from the union of a sulphuret of the former with one of the latter class are *sulphur salts*.

SU'LTAN (Sultun.) In Arabic, *mighty*. Various Mohammedan princes are styled by this title besides the Ottoman emperor or grand sultan, to whom it is commonly given by Europeans but whose peculiar title of Padishah is more dignified. The princes of the deposed family of the khan of the Crim Tartars are also styled sultan; so also the pacha of Egypt in that country, although not by the court of Constantinople.

SUMACH (Eng. and Fr.) The powder of the leaves peduncles, and young branches of the *Rhus coriaria* and *Rhus cotinus*, shrubs which grow in Hungary, the Bannat, and the Illyrian provinces. Both kinds contain tannin, with a little yellow colouring matter, and are a good deal employed for tanning light-coloured leathers, but the first is the best. With mordants, it dyes nearly the same colours as galls. In calico-printing, sumach affords with a mordant of tin, a yellow colour, with acetate of iron, weak or strong, a gray or black, and with sulphate of zinc, a brownish yellow. A decoction of sumach reddens litmus paper strongly, gives white flocks with the proto-muriate of tin, pale yellow flocks with alum, dark blue flocks with red sulphate of iron, with an abundant precipitate. In the south of France, the twigs and leaves of the *Coriaria myrtifolia* are used for dyeing, under the name of *redoul* or *rodou*. The imports for home consumption amount to about 200,000 cwt. a year.

SU'MMER. One of the four seasons of the year. The summer season, for the northern hemisphere, begins when the sun reaches the tropic of Cancer, and ends at the following equinox.

SUMMER (Quasi trabs summaria, *an upper beam*.) In Architecture, any large piece of timber supported on two strong piers or posts, and serving as a lintel to a door, window &c.

SU'MMONS, WRIT OF. In Law. By the Uniformity of Process Act, 2 W. 4. c. 39. s. 1, it is provided that wherever (in personal actions) it is not intended to hold the defendant to special bail, or to proceed against a member of parliament under 6 G. 4. c. 16, this writ or process, shall be the commencement of the action. It may issue from either of the four superior courts of common law, and a copy of the writ must be personally served on the defendant against whom it is intended to proceed. The duration of a writ of summons is four calendar months, inclusive [illegible] tinued by [illegible] mons. T[illegible] to recover a debt), with other requisite particulars, must be indorsed on the writ of summons. If the defendant do not appear either personally or by his attorney in answer to the writ, the plaintiff may enter an appearance for him in the proper court, and proceed to declare as if he had appeared.

SUMPTUARY LAWS. (Lat. sumptus, *expense*.) Laws intended to restrain the expenditure of citizens. Ancient legislation abounded in them. Thus, among the Romans, the Lex Orchia limited the number of guests at a feast, the Lex Fannia restricted the cost of an ordinary entertainment to ten *asses*, and so forth. There were anciently many laws in England to restrain excess

in apparel, but they were all repealed by 1 J 1 c 25 It is said, however, that the enactment statute, 10 E 3. st. 3., which orders that no man shall be served at dinner or supper with more than two courses, remains unrepealed It is truly said by Montesquieu, that sumptuary laws are of all laws the most inefficacious and most constantly violated

SUN (Ger sonne) In Astronomy, the central body of our system, about which all the planets and comets revolve, and by which their motions are regulated and controlled In Physics, the sun is the source of light and heat, and therefore the primary cause of all the motions and changes effected on the surface of the earth by those great agents of nature

Apparent Magnitude of the Sun —The sun presents to the naked eye the appearance of a luminous circular disc, subtending an angle of rather more than half a degree But on measuring accurately the diameter of the disc it is found to be not always the same, but subject to an annual variation In fact, as the earth describes an ellipse, of which the sun occupies one of the foci, its distance from the sun is constantly changing, and the variation of the sun's apparent diameter is a necessary consequence of this circumstance When the earth is in its perihelion, or point of its orbit nearest to the sun, the sun's apparent diameter is 32′ 34 6″, and when the earth is at its aphelion, or most distant point, the apparent diameter is 31′ 30 0″ These values are given in the Nautical Almanac, and are derived from Bessel's value for the mean distance, 32′ 1 8″, derived from transits taken between the years 1820 and 1828

Distance of the Sun — The sun's true distance is found from his horizontal parallax This is so small a quantity that it would scarcely be possible to determine it in the usual way by observations made on opposite sides of the earth, but the astronomical phenomena of the transits of the planet Venus over the sun's disc afford the means of determining it with the utmost precision From such phenomena the parallax has been found to be only 8 6″, that is to say, if an observer could be placed at the centre of the sun, the earth's semidiameter would be seen by him under an angle of 8 6″ From this it follows that the mean distance of the sun from the earth must be at least equal to 24,047 times the earth's radius, and as the radius of the earth is nearly 4000 miles, it follows that the sun's true distance from the earth must be about 96,000,000 miles *See* PLANET

In order to obtain a more distinct idea of this enormous distance, we may compute the time in which it would be passed by some of the swiftest motions with which we are acquainted A 24 lb cannon ball fired with a charge of 8 lbs of gunpowder, is projected with a velocity of about 1600 feet in a second Supposing it were to continue to move towards the sun with the same uniform velocity, it would require ten years to reach its surface A body travelling with the velocity of sound would require about five years to pass from the sun to the earth Light itself, which travels with the astonishing velocity of 192 500 miles in a second, only reaches the earth eight minutes and eighteen seconds after leaving the sun's surface

Knowing the distance and apparent diameter of the sun it is easy to compute its real dimensions A body which subtends an arc of 32′ 2″ of a circle, whose radius is 96,000,000 miles, must have a real diameter of about 892,000 miles, which therefore is the diameter of the sun Or, since the true diameter of the sun must have to the diameter of the earth the same ratio which the sun's apparent diameter is seen from the earth has to the earth's apparent diameter as seen from the sun that is a ratio of 32′ 2″ to 17 2″, or of 111 8 to 1, it follows that the sun [illegible] nearly 112 times the diameter of the [illegible] volume of the sun must be 1 367 415 (the cube of 111 8) times, or, in round numbers, 1 [illegible] times the volume of the earth The mean distance of the moon being rather less than 60 times the earth's radius, if the sun's centre were placed at the centre of the earth its surface would be at twice the distance of the moon's orbit, and the volume of a sphere whose radius is equal to that of the moon's orbit would only be an eighth part of the volume of the sun The sun's volume is 500 times greater than the volumes of all the planets taken together

Mass and Density of the Sun —The magnitude and distance of the sun are determined by direct observation, his mass as compared with that of the earth is deduced from the law of universal gravitation The earth revolves round the sun at a given distance, and in a given time, and from these data the centrifugal force becomes known But the force which counteracts this centrifugal force, and compels the earth to move in its elliptic orbit, and prevents it from flying off in a tangent to that orbit, is the sun's attraction Hence the solar attraction is equal to the centrifugal force But the earth's attraction at its surface is a known force, being that which causes a heavy body to fall through $16\frac{1}{10}$ feet in a second of time, and consequently, from the known law of diminution proportionally to the inverse square of the distance, the earth's attractive force at any distance from the surface also becomes known. Now, on comparing the centrifugal force due to the earth's motion in its orbit with the force of terrestrial gravity on a body at the distance of the sun it is found that the former exceeds the latter in the ratio of 354 936 to 1 But when the distance is the same, the attractive forces of two bodies are directly as their masses or quantities of ponderable matter, and hence the sun's mass is 354936 times greater than that of the earth It is also found to be about 800 times greater than the aggregate of the masses of all the planets and satellites

The density of a body is directly as its mass, and inversely as its volume If, therefore, we call the density of the earth 1, the ratio of the density of the sun to that of the earth will be as 354936—1397415 to 1, or as 0 254 to 1, whence the sun's density is about one fourth of that of the earth

In order to compare the force of solar gravity at the sun's surface with that of terrestrial gravity at the earth's surface, we must recollect that the attraction of a body on an [illegible] varies as the mass of the attracting body directly and as the square of the distance of the point from its centre Hence, since the sun's mass is 354936 times that of the earth, and the radius (or distance of the surface from the centre) 111 8 times that of the earth, if A denote the force of solar gravity at the sun's surface, and B that of terrestrial gravity at the earth's surface, then

$$A \quad B \quad \frac{354936}{(111\,8)^2} \quad \frac{1}{(1)^2},$$

or A is to B as 27 9 (nearly) to 1 A body, therefore, which at the earth's surface weighs one pound, would weigh 27 9 pounds if carried to the surface of the sun "An ordinary man would not only be unable to sustain his own weight on the sun, but would be literally crushed to atoms under the load" (*Herschel's Astronomy*)

Rotation of the Sun —The sun's surface, when viewed through the telescope, is frequently diversified with a number of dark patches or *spots*, which being observed from day to day are found not to remain in the same place, but to move across the surface, without, however, changing their relative positions These phenomena are accounted for by supposing the sun to have a rotatory motion about an axis from west to east From observations by Delambre, Bianchi Laugier &c the period of rotation is found to be about 25 days, and the sun's equator is inclined to the ecliptic in an angle of about 7° 20′, and intersects it in a [illegible] with the line of the equinoxes The observations of the spots [illegible] but the [illegible] in the same direction as the earth and all the other planets, is established

Spots of the Sun —The solar spots, to which allusion has just been made as furnishing the elements of the sun's rotation, present very remarkable appearances, and have been the subject of numerous theories respecting the nature and physical constitution of the sun They began to attract attention soon after the discovery of the telescope, and their phenomena are described with sufficient accuracy by Hevelius and Scheiner In form they are exceedingly irregular, and, when watched attentively for some time, are observed to enlarge and contract, and to change perpetually their form and outline Frequently they disappear without approaching the edge of the disc and break out suddenly in places where none were seen before Sometimes a spot has been seen to break up into several parts, and the fragments to separate from each other, as if acted upon by an explosive force The *nucleus* of a spot is perfectly black, and sharply defined, and is surrounded by an *umbra*, or border of a fainter shade In the neighbourhood of [illegible] which are numerous, but not dark, [illegible] from the general surface of the sun, called *faculæ*, are frequently seen. Among these faculæ spots are often observed to break out, and when this does not happen they are generally succeeded by spots [illegible] the brightness of the antecedent [illegible] The [illegible] of the spots is generally confined to the equatorial parts of the sun, within about 30° of the equator, beyond which they are rarely seen, in the polar regions never

The magnitude of the spots and the scale on which their movements are performed, are not the least remarkable circumstances connected with the phenomena At the distance of the sun, a line which subtends an angle of one second is equal to about 460 miles, and a circle of that diameter has an area of about 166,000 miles, and this is the smallest space which can be distinctly discerned on the sun's disc But a spot was observed by Mayer having a diameter equal to 1 20th of the diameter of the sun, or upwards of 90′, and consequently (supposing it to be circular) covering an area of 1520 millions of square miles, — upwards of 30 times the whole surface of the earth

Numerous hypotheses have been formed respecting

the solar spots Scheiner supposed them to be planets revolving at no great distance from the sun's surface Galileo and Hevelius conceived them to be a sort of *scoriæ* or *scum* formed at the surface of the sun, and floating in an ocean of liquid matter Lahire supposed them to be protuberant parts of solid, opaque, and irregular masses, floating in the fluid matter of the sun Dr Wilson, of Glasgow, accounted for the spots by supposing the sun to consist of a dark nucleus, covered to a certain depth by luminous matter, through which cavities or gulfs are made by volcanic or other actions and permit the dark nucleus to be seen Lalande suggests that the spots or opaque bodies may be merely the summits of mountains, usually covered by the igneous fluid but which, by the flux and reflux of the fluid, sometimes protrude beyond its surface, and thus become visible (*Astronomie* art 3240) The most probable view, however, is that taken by Sir William Herschel who considers "the luminous strata of the atmosphere to be sustained far above the level of the solid body by a transparent elastic medium, carrying on its upper surface (or rather at some considerably lower level within its depth) a cloudy stratum which being strongly illuminated from above, reflects a considerable portion of the light to our eyes, and forms a penumbra, while the solid body shaded by the clouds reflects none The temporary removal of both the strata, but more of the upper than the lower, he supposes effected by powerful upward currents of the atmosphere, arising perhaps, from spiracles in the body, or from local agitations" (*Sir J Herschel's Outlines of Astronomy*, p 229)

Physical Constitution of the Sun — Respecting the physical nature of the enormous mass of matter which controls the motions of all the bodies of the solar system, and supplies them with light and heat we can only form conjectures, guided in a feeble degree by the phenomena of the spots According to the hypothesis broached by Sir William Herschel, as stated in the above quotation, there are two regions of solar clouds the inferior stratum being opaque and probably resembling our own atmosphere, while the upper stratum is the repository of light and heat, which emanate from it in all directions This upper luminous stratum he supposed to have an altitude of between 1840 and 2765 miles above the surface of the sun The lower stratum by reflecting a considerable portion of the rays which fall upon it from the luminous clouds above, not only increases the quantity of light which the latter send forth into space but serves as a canopy to screen the surface of the solid body of the sun from the scorching effects of the surrounding regions of light and heat, and he supposed its density might even be such as to maintain a temperature at the actual surface of no greater elevation than is consistent with the support of animal life But whatever may be the state of the temperature at the actual surface of which only casual glimpses are obtained through openings in the luminous clouds, it is difficult to conceive that the luminous matter can be otherwise than in a state of the most intense ignition "That the temperature, says Sir John Herschel at the visible surface of the sun cannot be otherwise than very elevated much more so than any artificial heat produced in our furnaces or by chemical or galvanic processes, we have indications of several kinds 1st, From the law of decrease of radiant heat and light which being inversely as the squares of the distances, it follows that the heat received on a given area exposed at the distance of the earth and on an equal area at the visible surface of the sun, must be in proportion to the area of the sky occupied by the sun's disc to the whole hemisphere, or as 1 to about 300 000 A far less intensity of solar radiation collected in the focus of a burning-glass, suffices to dissipate gold and platina in vapour 2dly, From the facility with which the calorific rays of the sun traverse glass — a property which is found to belong to the heat of artificial fires in the direct proportion of their intensity 3dly, From the fact that the most vivid flames disappear, and the most intensely [illegible] black spots upon the disc of [illegible] and the eye" (*Outlines of* [illegible]

[illegible] probability to the supposition that the luminous matter which surrounds the body of the sun has a temperature far exceeding any which can be produced by artificial means, but the sciences of light and heat are not yet sufficiently advanced to enable us to arrive at any certain conclusions on the subject, or to form other than purely conjectural hypotheses respecting the nature and constitution of the sun "The great mystery," continues Sir John Herschel, "is to conceive how [illegible] (if such it be) can be kept up For [illegible] chemical science here leaves us completely at a loss, or rather seems to remove farther the prospect of probable explanation If conjecture might be hazarded, we should look rather to the known possibility of an indefinite generation of heat by friction or to its excitement by the electric discharge, [illegible]

solid or gaseous, for the origin of the solar radiation" (P 238)

Considering the enormous and incessant emanation of light and heat from the sun the question has often arisen whether the volume of the sun undergoes any diminution [illegible] curren[illegible] volume would be sustained, but if, according to the hypothesis of Newton, light is produced by the actual emission of luminous particles, a diminution of volume would appear to be a necessary consequence Observation, however, can afford us no information on this head, for, supposing an actual diminution to be going on at such a rate as to lessen the diameter by two feet in 24 hours (which, having regard to the sun's magnitude may be considered [illegible] 3000 years would elapse before the [illegible] apparent diameter would [illegible] supposed the sun to [illegible] by comets precipitating themselves into it from time to time

Atmosphere of the Sun — The existence of a solar atmosphere was inferred by [illegible] of the intensity of radiation [illegible] By reason of the globular figure of the sun, a much larger portion of the surface towards the border is comprehended under a given visual angle than at the centre, and as every point of the surface must be supposed to radiate equally in all directions it follows that the intensity of light near the border should be greater than at the centre in proportion to the greater extent of surface comprised under the same angle Bouguer's observations, however led him to infer that the light from the centre of the disc had a greater intensity than that which proceeded from the borders — a circumstance which would be explained on the supposition of its being absorbed in a greater proportion by having to traverse a greater extent of atmosphere The more delicate experiments of Arago do not seem, however to support Bouguer's conclusions The existence of a solar atmosphere is however, indicated by the ring of light and the singular red protuberances that have been seen in solar eclipses, and especially in that of 1851, and, perhaps, still more unequivocally by the phenomenon of the zodiacal light See ZODIACAL LIGHT

Sun's Position and proper Motion in the Heavens — The discoveries in sidereal astronomy which have been made in modern times all tend to establish the hypothesis of a similarity of condition and a community of nature between the sun and the fixed stars The prevalence of gravitation among these remote bodies following the same law as is observed in the solar system, is no longer a matter of speculation, the proof being afforded by the elliptic orbits described by so many of the double stars about their common centre of gravity With respect to the place which the sun occupies in the heavens we have, says Sir J Herschel (*Mem Royal Astron Society* vol xi), almost ocular evidence that our system is excentrically situated within the nebula of the *Milky Way* and nearer to its southern than to its northern portion It was also an opinion of Sir William Herschel now confirmed beyond contradiction that the sun like many of the fixed stars has a proper motion in space in consequence of which it is at present advancing towards a point of the heavens within the constellation *Hercules* Yet, though the *fact* that the sun has a proper motion in space may be regarded as certain, many centuries of observation may be required to enable astronomers to detect its laws, or even to arrive at any definite conclusions respecting the [illegible] centre about which it is performed (*See J Herschel's Astronomy*, Lalande, tom iii, Biot, *Astronomie Physique*, Laplace *Système du Monde*, Delambre *Astronomie*, Argelander, Struve, and Galloway *on the Proper Motion of the Solar System*, Main, *on the Proper Motions of the Stars in Greenwich* [illegible] *See* STAR

SUNDAY The first day of the week, is said to derive its name from the Saxons, who consecrated it to the sun in heathen times The solemnisation of this day dates from the earliest age of the Christian church in memory of the death of Christ, and of the descent of the Holy Ghost, both of which events took place upon it The Jewish Christians retained at the same time their Sabbath, the last day of the week, but this practice became obsolete early at least in the Western church The Sunday was at first distinguished merely by peculiar prayers and passages of the Scriptures It does not appear to have been strictly observed as a day of cessation from labour before the reign of Constantine By the decree of that emperor (A D 321) public business and military exercises were suspended The Council of Laodicea (A D 360) forbade labour in general terms, and the laws of Theodosius (circ A D 420) sanctioned this interdiction by civil penalties *See* SABBATH

SUNDAY LETTER *See* DOMINICAL LETTER

SUNNIAH (Arab *a troop*, or *band*) The name given to the sect commonly considered as orthodox among the Mussulmans by the followers of Ali The

latter believe that the sovereign imânship, or imaginary dignity which conveys supremacy over all the faithful, belongs of right to the descendants of Ali son-in-law of Mohammed The schism between these two sects has subsisted from the earliest times of Mohammedanism, when Ali having become fourth caliph after the death of Othman, a rebellion was raised against him by Maaniah, founder of the Ommiad race of caliphs, about the year 1000 of the Christian era The division took place between the two parties in the court of the caliph Moll l' Mah, which resulted in the Schiite party becoming pre-eminent in Persia, the Sunniahites in T[illegible] Mohammedan countries

SUOVETAURILIA (Lat. sus, *a swine*, ovis, *a sheep*, and taurus, *a bull*) In Roman History, a quinquennial sacrifice, which consisted of the immolation of a sow, a sheep, and a bull, hence the name *See* LUSTRATION

SUPERCARGO The person in a merchant ship appointed to superintend all the commercial transactions of the voyage is so called

SUPERDOMINANT (Lat super, *above*, and dominus *governing*) In Music In the descending scale, the sixth of the key

SUPERROGATION WORKS OF In Theology It is a belief countenanced by many tenets of the church of Rome, that men may acquire merit in the eyes of God by good works beyond what are necessary for salvation This notion is said by Protestants to have been first known about the 12th or 13th century to have been founded upon what the Roman Catholics call "counsels of perfection," that is, rules which do not bind under the penalty of sin, but are only useful in carrying men to a higher degree of perfection than is requisite for Christians This doctrine is condemned by the church of England in her 14th article

SUPERFICIAL MEASURE The measure of surfaces or areas, also called square measure *See* MEASURE

SUPERFICIES The exterior face of any body *See* SURFACE

SUPERIOR In Scottish Law, one who has made an original part of heritable property with reservation of rent and service The grantee is termed *vassal* the interest of the grantor is *dominium directum* that of the grantee *dominium utile*, or, the former superiority, the latter property The reunion of these two rights in the same person is termed *consolidation*

SUPERLATIVE In Grammar, the name vulgarly given to the third degree in comparison, formed in the Teutonic languages by the additional syllable est

SUPERSEDEAS In Law, a writ that lies to stay various ordinary proceedings, as to stay an execution after a writ of error has been allowed and bail put in, to set aside erroneous judicial processes, and, in certain cases [illegible] oners

SUPERSTITION (Lat superstitio from super, *above*, sto, *I stand* the steps of the derivation are extremely obscure) This word like many others, has, in common language, both a subjective and objective sense, that is, we speak of superstition as a habit in the mind, and we also speak of a particular tenet or a particular observance, as "a superstition" Every belief, 1 in the existence of particular facts or phenomena, produced by supernatural agency, which existence is not demonstrated by experience nor asserted in Revelation, 2 in causation not demonstrated by experience or asserted by Revelation, *i e* of the *direct* agency of supernatural power in producing results which can either be proved to proceed from secondary causes, or by reasonable analogy must be inferred so to proceed, — is, in common language superstition An instance of the first species is the belief in the existence of imaginary beings ghosts, spectres, &c, of the second, the belief that epileptic fits are produced by witchcraft, — that meteorological phenomena hitherto imperfectly explained, such as wind or lightning, are produced without the intervention of regular physical causes by the immediate act of [illegible] The word is almost always used in a [illegible] like the Greek δεισιδαιμονία, that is, the belief which we regard as *superstitious* concerns the agency of the Deity or [illegible] For example, we do not generally [illegible] animal magnetism, [illegible] superstitions, these are persuasions respecting certain occult powers of nature undemonstrated (that is, in the case of most believers) by experience, they are *superstitions* in the mode in which they are generated and affect the mind, but not in point of subject matter On the other hand, there is much carelessness in the application of the word to religious tenets, where these flow necessarily from the belief in certain other truths as revealed for example, no Christian esteems it superstition to believe that a dead man was, in a certain instance, restored to life, although nothing can be in itself more incredible, because it is asserted in writings which he considers as revealed, and the power of working miracles is expressly claimed in that revelation But some Christians place faith in the declaration of their church, just as all Christians do in Scripture, and justly that faith by argument addressed to the reason. How, then, can they be accused of superstition in believing the truth of [illegible] however [illegible] in themselves, which [illegible] and approved for example, many of the miraculous legends commonly received in the Romish church Those who do not adhere to that church may stigmatize it as superstitious, but they can [illegible] belief which leads the Roman Catholic to address his prayers to Saints, or the Virgin, a superstition *in him*

SUPERTONIC (Lat super, *above*, and tonus, *a tone*) In Music the second above the key note From its being a comma higher in the major scale than in the relative [illegible] it is often considered inevitable sound

SUPINATION The act of turning the palm of the hand towards the [illegible] as in supporting the plate

SUPINES In Grammar certain forms of the Latin verbs The supine in *um* (of which the form is the same as the neuter of the past participle, as *amatum* in the verb *amo*) serves generally, in conjunction with another verb, to express an *intended* action, as "Lusum it Mæcenas," 'Neque vos ultum injurias hortor," in both which cases it would be expressed by the infinitive in modern languages, in the Greek, either by the infinitive, or more accurately by the infinitive used as a noun with a preposition The existence of the other supine (in *u*) is doubted by some grammarians The name is said to have been given to signify their character, neither passive nor active

SUPPLEMENT In Geometry and Trigonometry, the supplement of an arc or angle is what must be added to it in order to make a semicircle, or 180°

SUPPLEMENT In Literature, an addition made to any work or treatise, in the view of rendering it more complete

SUPPLY In Parliamentary language, the sum granted to the sovereign by parliament for defraying the expenses of the current year The known or probable amount of the different branches of the year's expenses is stated to the House of Commons in a committee of supply by the chancellor of the exchequer and, after these have been voted by the committee, they are formally granted by an act of parliament, called the Appropriation Bill The granting of the annual supplies is a peculiar [illegible] of the House of Commons which never permits [illegible] or amendment (except merely verbal) to be made by the House of Lords in the bills passed for this purpose

SUPPLY In Political Economy *See* POLITICAL ECONOMY

SUPPORT In Architecture *See* POINTS OF SUPPORT

SUPPORTERS In Heraldry, the figures placed on each side of a shield The device of supporters probably originated from the practice of knights at tournaments having their armorial shields fixed or hung near the place of justing, and guarded by pages or other retainers standing on the side of them dressed in various fanciful accoutrements, although some consider it as entirely a modern invention, or ornamental addition by painters and limners who found a vacant space on each side of the escutcheon which they filled up by imaginary figures [illegible] were at first exclusively [illegible] particular rank, and some [illegible] are said to be still entitled to them [illegible] By modern English heraldry, the grant of supporters is limited to sovereigns and princes of the blood royal, [illegible] of the Bath knights bannerets [illegible] (by their patents of creation), and to such persons as receive them by special license from the king It is said by heraldic writers that females cannot assume supporters, but this prohibition seems to be habitually infringed in practice

SUPPOSED BASS In Music, the bass of a chord when it is not the root of the common chord or harmonic triad It is also sometimes called the inversion of the accompaniment

SUPPOSITION (Lat suppositum) In Music, the use of two successive notes of equal value as to time, one of which [illegible] the other a concord [illegible] accented part [illegible] their proper preparation and resolution, and they are called *passing notes* Discords on the unaccented part of the measure are allowable by conjoint degrees, and it is then not required that the harmony should [illegible] the accented part This transient use followed by concords is what we, after [illegible] here are several kinds

SUPPOSITORY A pill or bolus introduced into the rectum, where it gradually dissolves Opium is sometimes usefully applied in this way to allay irritation of the bladder [illegible] bearing parts

SUPPRESSION A figure in Grammar is sometimes so called by which words are omitted in a sentence, which are nevertheless to be understood as necessary to a perfect construction as, for instance, in most languages, the repetition of a noun is avoided where it is coupled with a pronoun in one branch of the proposition, *e g*

"this (horse) is my horse," or "this horse is mine" (horse) *See* ELLIPSIS

SUPPURATION The process by which pus or matter is formed in inflammatory tumours

SUPRACRETACEOUS ROCKS A Geological term applied to certain rocks or strata lying above the chalk, they have also been called *tertiary strata* *See* GEOLOGY

SUPRALAPSA'RIANS Those who assert that the fall of Adam, with all its pernicious consequences, was predestinated from all eternity, and that our first parents had no liberty in the beginning *See* CALVINIST

SUPRANA'TURALISTS A name given of late years to the middle party among the divines of Germany, to distinguish them from the *Rationalists* who exclude all supernatural manifestations from religion, and from the [illegible] party, whose tenets are of a more strict [illegible] Illuminés the spirit of which is said to have given way to the [illegible] is termed) in religious matters, so far as to explain away the doctrine of original sin and other tenets which we are accustomed to consider as fundamental others approximate to what are regarded as orthodox Protestant [illegible]

SUPREMACY, OATH OF An oath denying the supremacy of the pope in ecclesiastical or temporal affairs in England, which by many statutes is required to be taken, along with the oath of allegiance by persons in order to qualify themselves for office, &c By 10 G 4 c 7 s 10 Roman Catholics are qualified for all offices (with the exception named in the act), on taking a declaration, which is substituted for the former oaths

SURAES A name given in Persia to buildings constructed for the accommodation of travellers They are synonymous with *khans* or *caravanseras*, which see

SURBASE (Fr) In Architecture the upper base of a room, or rather the cornice of the dado

SURD In Arithmetic and Algebra, a magnitude which is inexpressible by rational numbers Thus the square root of 2 the cube root of 5, &c are numbers which cannot be expressed exactly in the ordinary notation, and are represented by prefixing the radical signs indicating the operation, viz $\sqrt{2}$, $\sqrt[3]{5}$ Such quantities are otherwise called *incommensurable*

SURFACE A mathematical surface or superficies is defined by Euclid to be that which has only length and breadth This definition excludes a *line*, which has length only, and a solid, which has length breadth, and thickness As a line is generated by the motion of a point, so a surface is generated by the motion of a line If the generating line be a straight line and move subject to the condition of having always two consecutive positions in the same plane, the surface generated is *developable*, and can be stretched out on a plane, as the surface of a cone, a cylinder, &c But if the generating straight line is constrained to move so that no two of its consecutive positions are in the same plane, the surface cannot be developed on a plane Such a surface is called by the French geometers *surface gauche*

SURMOUNTED In Architecture a term used to denote an arch or dome which is higher than a semicircle

SURMOUNTED In Heraldry a term used when one figure is laid over another *e g* a pile surmounted of a chevron

SURNAME In modern European usage, the family name of an individual, but often used for any distinguishing name (*See* NAME) According to Ducange, the use of surnames in France began about the year 987, when the barons adopted the practice of designating themselves by the names of their estates And this has been the general, though by no means the uniform origin, of family names in the nobility of Europe, some having been derived from badges, cognizances the nicknames applied to individuals, &c Among the commonalty of this country surnames are said not to have been general before the reign of Edward II It will be found on examination that a great number of them originate in the still older custom of adding to the son's Christian name that of the father by way of distinction, many more from the names of trade, and many more from accidental distinctions, as of size or colour, probably applied in the first instance to the founder of the family

SURPLICE [illegible] (from pelisse *skin*) This ecclesiastical vestment is stated by Mr Palmer (*Orig Liturg* ii 320) to have been at one time not different from the alb It now has wider sleeves, a difference which is thought to have originated in some distinction between the dress of a superior and inferior order of clergy It dates from the 12th century The vehement objections entertained by the Puritans of the 16th century to its use are well known *See* VESTMENTS

SURRENDER In Law 1 A deed by which the tenant of a particular estate conveys his interest to tenant in remainder, a reversion immediately expectant on the determination of that estate 2 A surrender of copyhold or customary estates is the yielding up of such estates by the tenant into the hands of the lord for purposes expressed in the surrender By this means are accomplished conveyances of copyhold lands, the lord being in general bound to admit the party in whose favour the surrender is made *See* COPYHOLD

SURROGATE (Lat surrogatus) In Law, one substituted for or appointed in the room of another It is commonly used in the ecclesiastical courts as the description of an officer who acts as deputy for the bishop's chancellor

SURSOLID In Arithmetic, the fifth power of a number If 2 be the root, the sursolid is $2 \times 2 \times 2 \times 2 \times 2 = 32$

SURTURBRAND A species of peaty bituminous coal found in Iceland It resembles Bovey coal

SURVEYING (Fr survoir, *to overlook*) In Practical Mathematics, the art of determining the boundaries and superficial extent of a portion of the earth's surface The object of a survey may be either to ascertain the contents of a field or portion of land, or to determine the relative distances and bearings of the most prominent objects of a country for the purpose of con- and dimensions [illegible] view to deduce [illegible] the earth by comparing the [illegible] n given points with their astronomical positions In all cases the operation is conducted on the same principles but while the first requires [illegible] up a detail of the merest elements of arithmetic [illegible] ments the last cannot be accomplished with the aid of instruments of the most refined description, and processes of calculation deduced from mathematics of the highest order

In measuring land all the lines and the surfaces whose contents are to be found are reduced to the same horizontal plane, on the principle that as plants shoot up vertically no greater number can be produced on the slant side of a hill [illegible] the area covered by its horizontal base When lines actually measured are not horizontal, they are therefore multiplied by the cosines of their respective inclinations to the horizon

The English standard unit of land measure is the acre, which contains four roods, and a rood is subdivided into 40 poles or perches, each pole containing 30¼ square yards (*See* MEASURE) But though roods and poles are the legal subdivisions of the acre and the terms continually occur in all descriptions of the contents of land, in practice a decimal division is followed, which is greatly more convenient for calculation For the linear measurements a chain is employed consisting of 100 links, and its whole length is such that one *square chain* is equal to the tenth part of an acre But the acre containing 4840 square yards, the square chain consequently contains 484 square yards, and the length of the chain is the square root of 484, that is 22 yards, whence its 100th part, or one link, is 7 92 inches In order to avoid decimal fractions, surveyors usually set down all the measures in links, and when the contents of a field are cast up in square links, it is only necessary to mark off the five last figures as decimals in order to have the contents in acres, the number of square links in an acre being $100 \times 100 \times 10 = 100{,}000$

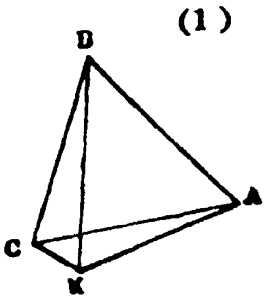
The measurement of angles being in general an operation much less liable to error than the measurement of [illegible] with the surface to be measured is of [illegible] to shorten surveys or will avoid taking further use of the chain than is necessary for obtaining the data requisite for a trigonometrical computation The most convenient instrument, and that which is almost universally employed in land surveying for the measurement of angles, is the theodolite which, from the nature of its construction, gives the angles reduced to the plane of the horizon, and consequently renders a computation for that purpose unnecessary (*See* THEODOLITE) As auxiliary to the theodolite, and for the purposes of sketching and filling in the details of a map, the *plane table* and the *prismatic compass* (see the terms) are used, and in order to determine the bearings of the several objects observed from any station with reference to the cardinal points of the horizon, a compass and needle accompany the theodolite

It frequently happens in surveying that triangles are to be measured whose sides contain very acute or obtuse angles In such cases a small error in the angular mea- [illegible] will lead to very erroneous results and for [illegible] triangle, to the greatest measure- [illegible] of the triangle a perpendicular let fall upon it from the opposite angle, the area being half the product of the side into the perpendicular. For the purpose of tracing the perpendicular, the simple cross-staff may be employed, but the instrument called the *optical square* (which is merely a small shallow circular box containing the two principal glasses of the sextant fixed at an angle of 45°) will effect the purpose with greater accuracy The method of using it is obvious If [illegible] line [illegible] with another object seen by reflexion, then a straight

line drawn to C from the point at which he stands when the coincidence takes place will be perpendicular to A B The box sextant might evidently be employed for the same purpose

Since every plane figure may be resolved as composed of [illegible] the theory of land surveying enables us, by the measurement of the angles of plane triangles, to find the area of a tract of country, by measuring the length of at least one side and the angles, together with any two of its other parts, the remaining parts and the area are computed by the rules of trigonometry As usual, let the sides of a triangle be denoted by a, b, c, and the angles respectively opposite by A, B, C, and let $s = \frac{1}{2}(a+b+c)$, then the area is found by either of the three following formulæ $\sqrt{\{s(s-a)(s-b)(s-c)\}}$, $\frac{1}{2}ab \sin C$, $\frac{a^2 \sin B \sin C}{2 \sin A}$ (*See* TRIGONOMETRY)

In surveying an estate, the usual practice is to measure round it with a chain and observe the several angles with the theodolite, and if the boundaries are very irregular a straight line is run between two points so as to cut off one or more of the bendings, and the perpendiculars or *offsets* from the straight line to each bending are measured with a rod or offset staff, the most convenient length of which is 10 links By this means the spaces included between the actual boundaries and the assumed straight lines are computed, and the sides and angles of the interior polygon being known, its area may be formed without resolving it into triangles *See* POLYGON



Trigonometrical Survey — When a survey is to be effected on a large scale as for making a geometrical map of a country or for measuring an arc of the terrestrial meridian, not only is minute accuracy required in all the practical parts of the operation, but it becomes necessary to have regard to the curvature of the earth's surface, the [illegible] tion, altitude above the sea, [illegible] of which the influence is sensible in the practice of ordinary surveying Trigonometrical measurements of this kind have been executed in various countries (*See* DEGREE) The first which was undertaken in our own country was that of General Roy, begun in 1783, for the purpose of connecting [illegible] posite Dover, and consequently for determining the difference of the meridians of the two observatories by actual measurement This gave rise to a more important operation, namely a general survey of the kingdom, which was begun in 1791 under the direction of the Board of Ordnance, and has been carrying on up to the present time A brief description of the methods employed in conducting the different parts of this splendid national undertaking will probably be the best means we could adopt to explain the nature and objects of an accurate trigonometrical survey

Measurement of Base — This is the fundamental, and probably the most difficult part of the whole operation, and requires to be executed with the most minute accuracy, as any error committed in its determination will affect all the distances deduced from it, and be multiplied in the ratio of these distances to the length of the base First of all, a suitable piece of ground, on which a straight line of not less than 5 or 6 miles can be laid down, must be selected and carefully levelled, and a measuring apparatus employed, of which the length is exactly known in units of a standard scale General Roy's base on Hounslow Heath was first measured with deal rods, but as these were found to be affected by the hygrometrical changes of the atmosphere it was again measured with glass tubes 20 feet in length, furnished with a peculiar apparatus for making the contacts In the subsequent measurement of the same line for the ordnance survey, two steel chains of 100 feet in length, made by the celebrated Ramsden, were made use of One of these was used as a measuring chain, the other was kept for the [illegible] in being compared with it [illegible] In the act of measuring, the chain was laid in a trough supported on trestles, and was stretched with a weight of 56 lbs The same apparatus was employed in measuring five other bases in different parts of the country, for the purpose of verifying the accuracy of the work For the measurement of the Lough Foyle base in the survey of Ireland, Colonel Colby employed a compensating [illegible] bars of different metals, so arranged [illegible] tween two points viewed by compensation microscopes [illegible] The [illegible] that of the Irish base about 8 miles. — See *Account of [illegible] Lough Foyle Base*, published in 18[illegible] [illegible] The next step in the operation is to divide the country [illegible] into a series of connected triangles The choice of the stations which form the angular points must depend in some measure on the nature of the country; but where circumstances admit of a selection being made, it is very important to form the triangles so that the small unavoidable errors of observation shall produce the least errors possible in the results The conditions required for this purpose are most nearly fulfilled by making the triangles as nearly as possible equilateral — (*Gallo [illegible] of the most probable Errors of [illegible] the Indian Survey*, *Mem Royal Ast Soc* vol xv)

Signals — Various plans have been adopted in the construction of the signals required at the stations at which the instrument is successively set up At first flag-staffs were chiefly used, carrying lamps and concave reflectors for night observations Such signals could be seen in the telescope of the great theodolite at distances of 20 or even 24 miles Bengal lights, fixed in small sockets were used for more distant stations In the mountainous countries of Scotland and Ireland, and where the sides of the triangles generally exceeded 50 and sometimes even 100 miles in length, conical piles of stone were erected on the tops of hills, and although these signals are attended with this disadvantage, that they can only be seen when [illegible] and the surveying parties have [illegible] to remain weeks on the summits of the mountains before a single observation could be made yet from the steadiness of the object observed they are found on the whole to be preferable to any night signals that have hitherto been tried When the theodolite is to be set up at a station which has been already observed from another, the pile is thrown down and the instrument placed exactly over its centre The heliotrope, and small plane mirrors, have likewise been [illegible] employed with success (On this subject, see Mr Dalrymple's paper in the *Phil Trans* for 1826)

Reduction to Centre of Station — In observing the angles at any st[illegible] ment is [illegible] condition was rigidly adhered to in the ordnance survey of Britain by erecting signals on purpose, but where the saving of expense is an object it will often be convenient to take advantage of spires, towers, &c, in which case the instrument cannot always be placed in the required position In such circumstances, the observation is made at a point near the station and the angle at that point subtended by two remote objects is reduced to that which would have been observed if the instrument had been placed exactly at the centre of the station The reduction is made as follows — Let C (fig 1) be the centre of the station, A, B the two remote objects observed, and suppose the instrument to be set up at a point K near to C, then the angle actually measured is A K B, while that which is to be determined is A C B Put C A = b, C K = d, the angle B A C = A, A C B = C, A K B = K, B K C = k, then the difference between C and K expressed in seconds of a degree is

(1)

$$C - K = \frac{d \sin (A - k) \sin K}{b \sin A \sin 1''}$$

The distance C K or d is measured, C A or b is found approximately [illegible] A C B with the approximate v[illegible] ([illegible]), and the angles A, K, k are given by observation The formula is not quite exact, but sufficiently so for all ordinary cases

Reduction to the Horizon — Another indispensable condition is, that the angles observed at each station be reduced to the plane of the horizon When the theodolite is employed for measuring the angles, this reduction is effected by the instrument itself, but when the angles are measured [illegible] reduction is necessary [illegible] be in the same horizontal plane with the instrument, which will rarely happen Suppose the observer stationed at A, and let B and C be the distant objects Let the angular elevation of B above the horizontal plane (which is found [illegible] be β seconds, and [illegible] of C be γ seconds, also let A′ be the horizontal projection of the angle A, and suppose A − A′ = x seconds, then

$$x = \left\{\left(\frac{\beta+\gamma}{2}\right)^2 \tan\left(\frac{A}{2}\right) - \left(\frac{\beta-\gamma}{2}\right)^2 \cot\left(\frac{A}{2}\right)\right\} \sin 1'',$$

which gives the correction to be subtracted from the observed angle A in order to have the corresponding angle A′ If one of the objects B or C be depressed, the arc of depression, β or γ, must be regarded as a negative quantity

Spherical Excess — The sum of the three angles of any spherical triangle exceeds [illegible] by a quantity which is called the spherical excess and which we shall denote by E If the observations could be made with absolute accuracy [illegible] on the [illegible], the difference of their

sum from this quantity is the aggregate error of the three observed angles, and must be distributed among those angles so as to render the sum precisely 180°+E before the sides are computed. It is therefore necessary to determine E. Let S denote the area of the triangle in square feet, r the number of feet in the radius of the earth, and $\pi = 3.14\ldots$, then E is given in seconds by this formula (*see* SPHERICAL EXCESS),

$$E = \frac{S \times 648000''}{\pi r^2}$$

(Si[illegible] that in every case which can arise in practice the area of the triangle must be a very small quantity in comparison of r^2, so that in order to f[illegible] to compute S with great preci[illegible] value will be obtained by calculating one of the unknown sides as if the triangle were a plane one, and computing the area from the formula $S = \frac{1}{2} a b \sin C$.—(*Measurement of Lough Foyle Base*, p. 126.)

With respect to r, which is here taken to represent the radius of curvature of the surface [illegible] any arc on the earth's surface varies not only with the latitude of the place of observation, but also with the direction of the arc in respect of the meridian. For the present purpose it would be sufficiently accurate to assume r as the radius of the meridian, but as the radius of the perpendicular and oblique arcs is required in other parts of the computation, we shall here state the formulæ from which they are computed. Let R be the radius of curvature of the [illegible] R the radius of the circle perpendicular to the meridian, and r the radius of a great circle making [illegible] let p denote half the [illegible] feet (Airy's value), and e the ellipticity or the difference between the equatorial and polar axes divided by the polar axis (= 1—301 026 = 003322), then

$$R = p\,(1 - e + 3e \sin^2 l)$$

$$R' = p\,(1 + e + e \sin^2 l)$$

$$r = R\left(1 + \frac{R' - R}{R'} \sin^2 \theta\right)$$

Since the inclination θ is different for each of the sides of the triangle a mean value of r may be found by making $\theta = 45°$, in which case $\sin^2 \theta = \frac{1}{2}$, and as the curvature varies very little through a considerable extent of country the same value of r may be used for all the triangles within a zone of two or three degrees of latitude. Suppose, then, the value to be computed for the mean latitude of a chain of triangles, the formula for the spherical excess will be $E = \frac{a b \sin C \times 648000}{2 \pi r^2}$, and on assuming the constant $648000 - 2\pi r^2 = m$, the formula for computation will be

$$\log E = \log a + \log b + \log \sin C + \log m$$

It is proper to remark that in general E is a very small quantity. When the sides of the triangles are about 20 or 30 miles, it will seldom exceed 4 or 5 seconds of a degree, but in some of the great triangles connecting Ireland with the west coast of Scotland its value was found to exceed 30 seconds.

Having computed the spherical excess E, make $e = A + B + C - (180° + E)$, (A, B, C being the observed horizontal angles), then e is the error of the sum of the observed angles, and if there be no reason for supposing that any one of the angles has been less accurately determined than the others, the error e must be equally divided among them, or a third of e must be added to or subtracted from each [illegible] excess or defect and th[illegible] which the [illegible] for computation be A′, B′, C′, we have

$$A' = A + \tfrac{1}{3}e,\quad B' = B + \tfrac{1}{3}e,\quad C' = C + \tfrac{1}{3}e$$

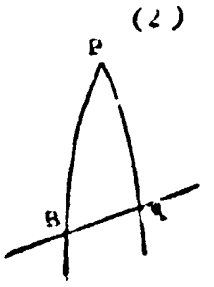
Calculation of the Sides. — The angles being thus corrected for errors of observation, it now remains to compute the two [illegible] The computation may [illegible] spherical trigonometry, but a better method, practised by Delambre and [illegible] horizontal angle the corresponding chords of the terrestrial arcs and [illegible] triangle as a plane one. In this manner the chords of the spherical arcs are found, whence the arcs themselves are easily obtained. The reduction of a horizontal or spherical angle to the corresponding chord angle is made as follows. — Let A be the observed spherical angle, b and c the lengths of the containing sides com[illegible] which may be explained [illegible] and A − x the angle [illegible] by [illegible] the sides b, c, then

$$x = \frac{1}{16}\left(\frac{b+c}{r}\right)^2 \frac{\tan \frac{1}{2}A}{\sin 1''} - \frac{1}{16}\left(\frac{b-c}{r}\right)^2 \frac{\cot \frac{1}{2}A}{\sin 1''}.$$

This [illegible] the reduction x expressed in seconds, [illegible] chord angle A − x. If we now denote by x′ and x″ the corresponding corrections for the other angles B and C, the sum of the three corrections will evidently be the difference between the sum of the three spherical angles of the triangle and the sum of the angles of the plane triangle formed by the chords, or 180°, and consequently

$$x + x' + x'' = E,$$

so that the spherical excess is obtained from the reduction, and does not require to be previously computed.



The three chord angles A − x, B − x′, C − x″, being computed from the above formula, the difference between their sum and 180° gives the error of the three observed angles, and must be apportioned among the three chord angles, so that their sum shall be precisely 180°. With these corrected angles the chords of the spherical sides are computed as in plane trigonometry, and the arcs are then found from the chords from the following formulæ, where a′, b′, c′ are the chords of the three terrestrial arcs a, b, c, namely,

$$a = a' + \frac{a'^3}{24 r^2},\quad b = b' + \frac{b'^3}{24 r^2},\quad c = c' + \frac{c'^3}{24 r^2}$$

Legendre's Theorem. — A third method of computing the [illegible] discovered by Legendre, and is demonstrated in his *Éléments de Géométrie* [illegible] triangle on the surfa[illegible] of the spherical excess be deducted, the sines of the angles thus diminished will be proportional to the lengths [illegible] sides, and consequently the sides may be [illegible] the triangle were rectilineal." This is the easiest method of any, and in fact, if the three angles are assumed to have been equally well determined, the previous computation of the spherical excess is not necessary for the calculation of the sides, though it will be required for estimating the relative accuracy of the observations. The method of proceeding is this. — Let A, B, C be the three observed angles, and let $\delta = A + B + C - 180°$, then, from each of the three observed angles subtract $\frac{1}{3}\delta$, and with the angles thus reduced compute the sides as in a plane triangle from the formula $b = a \sin (B - \frac{1}{3}\delta) - \sin (A - \frac{1}{3}\delta)$. The sides thus determined are equal to the geodetical lines, or the spherical arcs on the ground.

Latitudes, Longitudes, and Azimuths. — When the sides of all the triangles have been computed the distances between the stations become known, but in order to complete the survey, it is still necessary to determine the astronomical positions of the principal stations, and the bearings of the sides of the triangles with respect to the terrestrial meridians. For this purpose the latitude and longitude of one of the stations, and the azimuth of another as seen from it, must be found by astronomical methods (*see* LATITUDE, LONGITUDE, AZIMUTH), but when this has been done these elements may be computed for each of the other stations in the chain of triangles provided the dimensions and ellipticity of the spheroid are assumed to be known. The formulæ for computation are the following. —

(2)

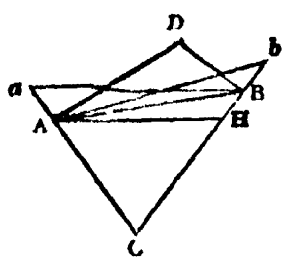
Let A and B (fig. 2) be two stations, A P and B P the meridians passing through A and B and meeting in the pole P, and let the azimuths at each station be counted from the south towards the west. Assume

$l = 90° - A P$ = latitude of A,
$l' = 90° - B P$ = latitude of B,
$A = 180° - P A B$ the azimuth of B as seen from A,
$B = 180° + P B A$ the azimuth of A as seen from B,
$P = A P B$ the difference of the longitudes of A and B,
d = length of the geodetical line A B in feet,
R' = radius of the circle perpendicular to the meridian at A in feet,
e = the ellipticity as above defined = 003322,

then,

$$l' = l - \left\{\frac{d \cos A}{R' \sin 1''} + \frac{d^2 \sin^2 A \tan l}{2 R'^2 \sin 1''}\right\}(1 + 2e \cos^2 l)$$

$$P = \frac{d \sin A}{R' \cos l' \sin 1''}$$



$$B = 180° + A - P\frac{\sin \frac{1}{2}(l + l')}{\cos \frac{1}{2}(l - l')}$$

These formulæ are theoretically sufficient to give the elements in question, but as some uncertainty must exist as to the [illegible] of the earth and a small error in this respect will affect the convergence of the meridians and produce a considerable error in the computed longitudes.

and azimuths, it is necessary, [illegible] a survey over a considerable tract of country to [illegible] by determining the direction of the meridian at different stations by astronomical observations

Calculation of Altitudes — The only element which remains to be determined [illegible] is the relative altitudes of [illegible] cipal points At every station the elevation or depression of each of the others observed from it is measured with the the [illegible] earth, and the [illegible] sary in order [illegible] or of distance from the centre of the earth

(3)

Let A and B (fig 3) be two stations, C the centre of the earth, and let *b* be the position of B as seen from A elevated by refraction, and *a* that of A as seen from B Make C H = C A, then H B is the true difference of altitude of A and B, or the quantity to be determined from observation Join A H, A B, A *b*, and draw the horizontal lines A D and B D, which will be respectively perpendicular to C A and C B Assume in seconds,

d = D A *b* the observed depression of B,
d' = D B *a* the observed depression of A,
C = A C B the angle measured by the arc A B,
ε = the mean refraction
φ = B A H the [illegible] then B H will be found by the [illegible] —

$$\varepsilon = \tfrac{1}{2}\left\{C - (d + d')\right\} \quad \varphi = \tfrac{1}{2}C - (d + \varepsilon)$$

$$B\,H = A\,B \times \varphi \sin 1''$$

Thus B H is found in terms of A B and the reciprocal observations at A and B The mean refraction *ε* is also determined at the same time, but if this be assumed to be known, the observation of depression at one of the stations would be sufficient to give the difference of elevations The two quantities *d* and *d'* have been both assumed to be depressions, if one of them is an elevation, it must be taken with the negative sign

SURVIVORSHIP in the doctrine of Life Annuities, is a reversionary benefit contingent upon the circumstance of some life or lives *surviving* some other life or lives or of the lives signed order For the solut [illegible] which can be put relative to the values of annuities and assurances in every order of survivorship where there are only three lives see the treatises of Baily and Milne, or the *Essay on Probabilities* by Professor De Morgan, in the *Cabinet Cyclopædia*

SUSPENSION BRIDGE In Architecture a bridge in which the roadway, instead of being carried over the support [illegible] points by chains or [illegible] principle has recently been carried to a great extent in this country, as in the case of the Menai bridge, but its application is old, and has long been practised among people who have attained very little if any skill in the arts *See* BRIDGE

SUSSEX MARBLE A variety of limestone which constitutes one of the fresh-water deposits of the Wealden group, it abounds in shells of *Paludinæ* a genus of fresh-water Univalves It occurs in layers varying from a few inches to upwards of a foot in thickness the layers being separated by seams of clay or of friable limestone

SUTTEE (More correctly written Sati or Satee, in Sanscrit, *pure*) A word applied by the Brahmins to various rites of religious purification but more especially, by usage, to the voluntary self-immolation of widows on the funeral pile of their husbands This is nowhere commanded in the religious books of Hindoostan, although it is spoken of, in common with many other acts of similar fanaticism as highly meritorious The English government, up to a late period had only interfered to ensure, as far as possible, that the sacrifice should be voluntary on the part of the sufferer which [illegible] presence of a government officer Thus [illegible] became frightfully common in Bengal [illegible] vinces in the present century At [illegible] 1829, they were abolished in the [illegible] Lord W Bentinck (See *Forbes's* [illegible] 26, *Heber's Journal*, i 70, and many other authorities) There is [illegible] account of a suttee in Bali, an island in which the Hindoo religion now prevails, in *Crawford's Ind Archipelago*, book vi ch 2

SUTURE, in Mammalogy, is the line formed by the [illegible] ing series of hairs of the integument [illegible] it is the line at which the elytra meet, and are sometimes confluent

SUTURE, in Anatomy, means the junction of bones by their serrated or teethed margins the bones of the skull are so united

SWAB A large bundle of old yarns hung by the middle, and swung right and left to dry the decks

SWALLOW A name equivalent to the subgeneric term *Hirundo*, appropriated in modern Ornithology to [illegible] swifts

SWAMP Ground habitually so moist and soft as not to admit of being trod on by cattle, but, at the same time, producing particular kinds of trees, bushes, and plants A swamp differs from a bog and a marsh in producing trees and shrubs, while the latter produce only herbaceous plants and mosses

SWAN Of the [illegible] there are three British species [illegible] the wild and the tame swan These form the type of the subgenus *Cygnus* The wild swan and Hooper ought perhaps to be regarded as the only true native species The tame swan (*Cygnus olor*) is superior in bulk to either of the wild species, and is at once [illegible] by a large black callous knob on the bas Both the wild species are peculiarly characterized by convolutions of the windpipe, extending in the mature bird through the whole length of the keel of the sternum These convolutions are horizontal in the *Cygnus Bewickii*, and vertical in the *Cygnus ferus*

SWARD Green turf, that is, the surface of land under pasture grasses A fine sward may be called the characteristic feature of British landscape, not being found in the same degree of perfection in any other country, not even in Ireland

SWEDENBORGIANS Those persons who on religious subjects receive the testimony of Swedenborg, a Swedish nobleman who died in 1772 In his work entitled *Arcana Cœlestia*, and in his *Apocalypsis Revelata*, Swedenborg professes to make known what he calls the Science of Correspondences, or that analogy between spiritual and natural things according to which he says the Word of God is written Thus Jerusalem signifies not only the chief city of Palestine, but the Lord's church and more specifically the religious doctrines by which persons are united into a church Hence the new Jerusalem, seen by John descending from God out of heaven, signifies a new church, or a new development of pure doctrines from the holy Word, which will eventually regenerate the world In these doctrines may be considered as most prominent the [illegible] of the Lord Jesus Christ as the one [illegible] is centred the divine trinity and the necessity for [illegible] th faith, or in other words for the kee [illegible] commandments in which is included the performance of every duty The admirers of Swedenborg who form a separate religious body have places of worship in London and other towns of England and are greatly increasing in America, but besides these it is said that there are many, among both clergy and laity, who receive the views of Swedenborg [illegible] it

SWELL In Music, a set of pipes in an organ acted upon by a key board and capable of being increased in intensity of sound by the action of a pedal, which allows of its being thereby gradually augmented *See* ORGAN

SWIMMERS The web-footed or aquatic birds (*Natatores*, Ill, *Palmipedes* Cuv) are so called, also a tribe of spiders (*Aranеidæ natantes*) which live in water, and there spin and spread abroad filaments to entrap their prey

SWINE POX The *chicken pox*, which see

SWINESTONE Fetid or bituminous limestone, which exhales a disagreeable odour on friction

SWING The ship at anchor is said to swing when she changes her position at the turn of the tide

SWIVEL In Gunnery, a small cannon, so called from its being fixed in a *swivel*, by means of which it may be directed to any object Swivels are chiefly used at sea, and are placed on the ship's side, stern, or bow, and also in the tops

SWORD OF STATE Four swords are used at the coronation of a British sovereign 1 The sword of state properly so called 2 The curtana (curtus, *shortened*), the sword of mercy, which is pointless it is mentioned by Matthew Paris 3 The sword of spiritual justice 4 The sword of temporal justice These three are carried [illegible] he is girt with the first

[illegible] OF THE A Swedish military [illegible] instituted by Gustavus Vasa

[illegible] term used metaphorically to designate an effeminate voluptuary, [illegible] inhabitants of Sybaris, formerly a town [illegible] on the gulf of Tarentum whom a devotion to sensual pleasures had so enfeebled that they became an easy prey to the Crotonians,

sum from this quantity is the aggregate error of the three observed angles, and must be distributed among those angles so as to render the sum precisely $180^\circ + E$ before the sides are computed. It is therefore necessary to determine E. Let S denote the area of the triangle in square feet, r the number of feet in the radius of the earth, and $\pi = 3.14159$; then E is given in seconds by this formula (*see* SPHERICAL EXCESS),

$$E = \frac{S \times 648000''}{\pi r^2}$$

(648000 being the number of seconds in 180°). In order, therefore, to compute E we must previously know the values of S and r. Now with respect to S it is to be observed that in every case which can arise in practice the area of the triangle must be a very small quantity in comparison of r^2, so that in order to find E it is not necessary to compute S with great precision. A sufficiently near value will be obtained by calculating one of the known sides as if the triangle were a plane one, and computing the area from the formula $S = \frac{1}{2} a b \sin C$. (*Account of the Measurement of Lough Foyle Base*, p. 126.)

With respect to r, which is here taken to represent the radius of curvature of the surface of the triangle in question, it is to be remarked that by reason of the ellipticity of the earth the radius of curvature of any arc on the earth's surface varies not only with the latitude of the place of observation, but also with the direction of the arc in respect of the meridian. For the present purpose it would be sufficiently accurate to assume r as the radius of the meridian, but as the radius of the perpendicular and oblique arcs is required in other parts of the computation, we shall here state the formulæ from which they are computed. Let R be the radius of curvature of the meridian at latitude l, R′ the radius of the circle perpendicular to the meridian, and r the radius of a great circle making an angle $= \theta$ with the meridian; also let p denote half the [illegible] of the earth = 20,853,810 feet (Airy's value), and let e denote the difference between the equatorial and polar axes divided by the polar axis (= 1 − 301 026 = 003322); then

$$R = p\,(1 - e + 3e \sin^2 l)$$

$$R' = p\,(1 + e + e \sin^2 l)$$

$$r = R\left(1 + \frac{R' - R}{R'} \sin^2 \theta\right)$$

Since the inclination θ is different for each of the sides of the triangle, a mean value of r may be found by making $\theta = 45^\circ$, in which case $\sin^2 \theta = \frac{1}{2}$; and as the curvature varies very little through a considerable extent of country, the same value of r may be used for all the triangles within a zone of two or three degrees of latitude. Suppose, then, the value to be computed for the mean latitude of a chain of triangles: the formula for the spherical excess will be $E = \frac{a b \sin C \times 648000}{2\pi r^2}$, and on assuming the constant $\frac{648000}{2\pi r^2} = m$, the formula for computation will be

$$\log E = \log a + \log b + \log \sin C + \log m$$

It is proper to remark that in general E is a very small quantity. When the sides of the triangles are about 20 or 30 miles, it will seldom exceed 4 or 5 seconds of a degree, but in [illegible] Ireland with the [illegible] found to exceed 30 seconds.

Having computed the spherical excess E, make $e = A + B + C - (180^\circ + E)$, (A, B, C being the observed horizontal angles), then e is the error of the sum of the observed angles, and if there be no reason for supposing that any one of the angles has been less accurately determined than the others, the error e must be equally divided among them, or a third of e must be added to or subtracted from each angle according as the error is in excess or defect, and the results will give the angles free from [illegible]. Thus, if the angles for example A, B, C have

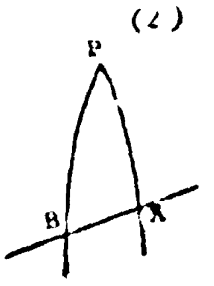
$$A' = A + \tfrac{1}{3}e,\quad B' = B + \tfrac{1}{3}e,\quad C' = C + \tfrac{1}{3}e$$

Calculation of the Sides. — The angles being thus corrected for errors of observation, it now remains to compute the two unknown sides of the triangles. The computation may be made by the ordinary rules of spherical trigonometry, but a better method, practised by Delambre and [illegible], is to compute the chords of the terrestrial arcs, and then calculating the triangle as a plane one. In this manner the chords of the spherical arcs are found whence the arcs themselves are easily obtained. The reduction of a horizontal or spherical angle to the corresponding chord angle is made as follows. — Let A be the observed spherical angle, b and c the lengths of the containing sides computed approximately as above explained, r the radius of curvature at the [illegible] angle contained [illegible]

$$x = \frac{1}{16}\left(\frac{b+c}{r}\right)^2 \tan \tfrac{1}{2}A \sin 1'' - \frac{1}{16}\left(\frac{b-c}{r}\right)^2 \cot \tfrac{1}{2}A \sin 1''.$$

This formula gives the reduction x expressed in seconds, and consequently the chord angle $A - x$. If we now denote by x' and x'' the corresponding corrections for the other angles B and C, the sum of the three corrections will evidently be the difference between the sum of the three spherical angles of the triangle and the sum of the angles of the plane triangle formed by the chords, or 180°, and consequently

$$x + x' + x'' = E,$$



so that the spherical excess is obtained from the reduction, and does not require to be previously computed.

The three chord angles $A - x$, $B - x'$, $C - x''$, being computed from the above formula, the difference between their sum and 180° gives the error of the three observed angles, and must be apportioned among the three chord angles so that their sum shall be precisely 180°. With these corrected angles the chords of the spherical sides are computed as in plane trigonometry, and the arcs are then found from the chords from the following formulæ, where a', b', c' are the chords of the three terrestrial arcs a, b, c, namely,

$$a = a' + \frac{a'^3}{24 r^2},\quad b = b' + \frac{b'^3}{24 r^2},\quad c = c' + \frac{c'^3}{24 r^2}$$

Legendre's Theorem. [illegible] computing the sides [illegible] surveys on the Continent, is derived from a theorem which was discovered by Legendre, and is demonstrated in his *Eléments de Géométrie*: "If from each of the angles of any small triangle on the surface of a sphere or spheroid one third of the spherical excess be deducted, the sines of the angles thus diminished will be proportional to the lengths of the opposite sides, and consequently the sides may be computed as if the triangle were rectilineal." This is the easiest method of any, and in fact, if the three angles are assumed to have been equally well determined, the previous computation of the spherical excess is not necessary for the calculation of the sides, though it will be required for estimating the relative accuracy of the observations. The method of proceeding is this. — Let A, B, C be the three observed angles, and let $\delta = A + B + C - 180^\circ$, then, from each of the three observed angles subtract $\frac{1}{3}\delta$, and with the angles thus reduced compute the sides as in a plane triangle from the formula $b = a \sin (B - \frac{1}{3}\delta) - \sin (A - \frac{1}{3}\delta)$. The sides thus determined are equal to the geodetical lines, or the spherical arcs on the ground.

Latitudes, Longitudes, and Azimuths. — When the sides of all the triangles have been computed the distances between the stations become known, but in order to complete the survey it is still necessary to determine the astronomical positions of the principal stations, and the bearings of the sides of the triangles with respect to the terrestrial meridians. For this purpose the latitude and longitude of one of the stations, and the azimuth of another as seen from it, must be found by astronomical methods (*see* LATITUDE, LONGITUDE, AZIMUTH), but when this has been done these elements may be computed for each of the other stations in the chain of triangles, provided the dimensions and ellipticity of the spheroid are assumed to be known. The formulæ for computation are the following. —

(2)

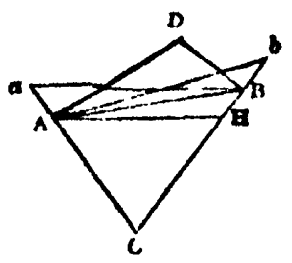
Let A and B (fig. 2) be two stations, A P and B P the meridians passing through A and B and meeting in the pole P, and let the azimuths at each station be counted from the south towards the west. Assume

$l = 90^\circ - A P$ = latitude of A,
$l' = 90^\circ - B P$ = latitude of B,
$A = 180^\circ - P A B$ the azimuth of B as seen from A,
$B = 180^\circ + P B A$ the azimuth of A as seen from B,
$P = A P B$ the difference of the longitudes of A and B,
d = length of the geodetical line A B in feet,
R′ = radius of the circle perpendicular to the meridian at A in feet,
e = the ellipticity as above defined = 003322,

then,

$$l' = l - \left\{\frac{d \cos A}{R' \sin 1''} + \frac{d^2 \sin^2 A \tan l}{2 R'^2 \sin 1''}\right\}(1 + 2e \cos^2 l)$$

$$P = \frac{d \sin A}{R' \cos l' \sin 1''}$$



$$B = 180^\circ + A - P\frac{\sin \frac{1}{2}(l + l')}{\cos \frac{1}{2}(l - l')}$$

These formulæ are theoretically sufficient to give the elements in question, but as some uncertainty must exist as to the ellipticity of the earth and a small error in this respect will affect the convergency of the meridians and produce a considerable error in the computed longitudes

and azimuths it is necessary, in carrying a survey over a considerable extent of country, to check the azimuths by observations of the sun or stars at different stations by means of chronometers

Calculation of Triangles — The triangles when all the angles have been measured, and one side, remains to be determined, are usually solved by means of the relative altitudes of the principal points At every station the elevation or depression of each of the others observed from it is measured with the theodolite, but owing to the curvature of the earth, and the refraction of light, a calculation is necessary in order to determine their true differences of level, or of distance from the centre of the earth

(3) Let A and B (fig 3) be two stations, C the centre of the earth, and let *b* be the position of B as seen from A elevated by refraction, and *a* that of A as seen from B Make C H = C A, then H B is the true difference of altitude of A and B, or the quantity to be determined from observation Join A H, A B A *b*, and draw the horizontal lines A D and B D, which will be respectively perpendicular to C A and C B Assume in seconds,

d = D A *b* the observed depression of B,
d' = D B *a* the observed depression of A
C = A C B the angle measured by the arc A B,
ϵ = the mean refraction
ϕ = B A H the angular difference of altitudes,

then B H will be found by the following formulæ —

$$\epsilon = \tfrac{1}{2}\left\{C - (d + d')\right\} \quad \phi = \tfrac{1}{2}C - (d + \epsilon)$$

$$B H = A B \times \phi \sin 1''$$

Thus B H is found in terms of A B and the reciprocal observations at A and B The mean refraction ϵ is also determined at the same time, but if this be assumed to be known, the observation of depression at one of the stations would be sufficient to give the difference of elevations The two quantities d and d' have been both assumed to be depressions, if one of them is an elevation, it must be taken with the negative sign

See the *Trigonometrical Survey of England and Wales*, Delambre, *Base du Systeme Metrique*, Puissant, *Traité de Geodesie*, Id *Nouvelle Description Geometrique de la France*, *Encyc Brit* art Trigonometrical Survey"

SURVIVORSHIP in the doctrine of Life Annuities is a reversionary benefit contingent upon the circumstance of some life or lives *surviving* some other life or lives or of the lives [illegible] to some assigned order For the solution of the questions which can be put relative to the values of annuities and assurances in every order of survivorship where there are only three lives see the treatises of Baily and Milne or the *Essay on Probabilities* by Professor De Morgan, in the *Cabinet Cyclopædia*

SUSPENSION BRIDGE In Architecture, a bridge in which the roadway, instead of being carried over the supporting points is suspended from them [illegible] points being chains or other flexible materials The principle has recently been carried to a great extent in this country as in the case of the Menai bridge, but its application is old, and has long been practised among people who have attained very little if any skill in the arts *See* Bridge

SUSSEX MARBLE A variety of limestone which constitutes one of the fresh water deposits of the Wealden group, it abounds in shells of *Paludinæ* a genus of fresh-water Univalves It occurs in layers varying from a few inches to upwards of a foot in thickness the layers being separated by seams of clay or of friable limestone

SUTTEE (More correctly written Sati or Satee, in Sanscrit, *pure*) A word applied by the Brahmins to various rites of religious purification but more especially, by usage, to the voluntary self immolation of widows on the funeral pile of their husbands This is nowhere commanded in the religious books of Hindoostan although it is spoken of in [illegible] acts of similar fanaticism as [illegible] The English government, up to a late period, had only interfered to ensure, as far as possible, that the sacrifice should be voluntary on the part of the sufferer, which was done by the presence of a government officer Thus legalized, suttees became frightfully common in Bengal and the [illegible] provinces in the present century At length in December 1829, they were abolished in the British dominions by Lord W Bentinck (See *Forbes's Oriental Memoirs* ii 26, *Heber's Journal*, i 70, and many other authorities) There is a curious account of a suttee in Bali, an island in which the Hindoo religion now prevails, in *Crawford's Ind Archipelago*, book vi ch 2.

SUTURE, in Mammalogy, is the line formed by the incumbent series of coronal [illegible] series of hairs of the [illegible] line at which the [illegible]

SUTURE, in Anatomy, means the junction of bones by their serrated or teethed margins the bones of the skull are so united

SWAB A large bundle of old yarns hung by the middle and swung right and left to dry the decks

SWALLOW A name equivalent to the subgeneric term *Hirundo*, appropriated in modern Ornithology to the British species called bank chimney, and window swallow and to foreign allied forms dismembered from the swifts

SWAMP Ground habitually so moist and soft as not to admit of being trod on by cattle, but, at the same time, producing particular kinds of trees, bushes, and plants A swamp differs from a bog and a marsh in producing trees and shrubs, while the latter produce only herbaceous plants and mosses

SWAN Of [illegible] are three British [illegible] wild and the tame swan These form the type of the subgenus *Cygnus* The wild swan and Hooper ought perhaps to be regarded as the only true native species The tame swan (*Cygnus olor*) is superior in bulk to either of the wild species, and is at once [illegible] by a large black callous knob on the base [illegible] Both the wild species are peculiarly characterized by [illegible] and vertical in the *Cygnus ferus*

SWARD Green turf, that is, the surface of land under pasture grasses A fine sward may be called the characteristic feature of British landscape, not being found in the same degree of perfection in any other country, not even in Ireland

SWEDENBORGIANS Those persons who on religious subjects receive the testimony of Swedenborg, a Swedish nobleman who died in 1772 In his work entitled *Arcana Cœlestia*, and in his *Apocalypsis Revelata*, Swedenborg professes to make known what he calls the Science of Correspondences, or that analogy between spiritual and natural things according to which he says the Word of God is written Thus Jerusalem signifies not only the chief city of Palestine, but the Lord's church, and more specifically the religious doctrines by which persons are united into a church Hence the new Jerusalem, seen by John descending from God out of heaven, signifies a new church, or a new development of pure doctrines from the holy Word, which will eventually regenerate the world In these doctrines may be considered as most prominent the acknowledgment of the Lord Jesus Christ as the one God in whom is centred the divine trinity, and the necessity for uniting charity with faith, or in other words for the keeping of the divine commandments in which is included the performance of every duty The admirers of Swedenborg who form a separate religious body have places of worship in London and other towns of England and are greatly increasing in America, but besides these it is said that there are many, among both clergy and laity, who receive the views of Swedenborg without avowing it

SWELL In Music, a set of pipes in an organ acted upon by a key board, and capable of being increased in intensity of sound by the action of a pedal, which allows of its being thereby gradually augmented *See* Organ

SWIMMERS The web-footed or aquatic birds (*Natatores* Ill, *Palmipedes*, Cuv) are so called, also a tribe of spiders (*Dranetidæ natantes*) which live in water, and there spin and spread abroad filaments to entrap their prey

SWINE POX The *chicken pox* which see

SWINESTONE Fetid or bituminous limestone, which exhales a disagreeable odour on friction

SWING The ship at anchor is said to swing when she changes her position at the turn of the tide

SWIVEL In Gunnery, a small cannon, so called from its being fixed in a *swivel* by means of which it may be directed to any object Swivels are chiefly used at sea, and are placed on the ship's side, stern, or bow, and also in the tops

SWORD OF STATE Four swords are used at the coronation of a British sovereign 1 The sword of state properly so called 2 The curtana [illegible] *short sword*, the sword of mercy, which is pointless [illegible] mentioned by Matthew Paris 3 The sword of spiritual justice 4 The sword of temporal justice These three are carried [illegible] he is girt with the first

SWORD OF THE [illegible] A Swedish military order of knighthood, instituted by Gustavus Vasa

SYBARITE A term used metaphorically to designate [illegible], so called from the inhabitants of Sybaris a town of Italy on the gulf of Tarentum, whom a devotion to sensual pleasures had so enfeebled that they became an easy prey to the Crotoniana,

a people comparatively insignificant in point of numbers, by whom their city was levelled to the ground, B C 310

SYCEE SILVER The only approach to a silver currency among the Chinese In it the government taxes and duties and the salaries of the officers are paid, and it is also current among the merchants in general The term *sycee* is derived from two Chinese words *se sze* "fine gloss silk," which expression is synonymous with the [illegible] This silver is formed into [illegible] called shoes), which are stamped [illegible] *office* that issues them and the dates of their issue The ingots are of various weights, but most commonly of ten taels each

Sycee silver is divided into several classes according to its fineness and freedom from alloy The kinds most current at Canton are the following, —

1 Kwan heang The hoppos duties or the silver which is forwarded to the imperial treasury at Pekin It is of 97 to 99 touch On all the imperial duties a certain per centage is levied for the purpose of turning them into Sycee of this high standard and of conveying them to Pekin without any loss in the [illegible] The [illegible], however in all probability, increases the per-centage far above what is requisite, that he may be enabled to retain the remainder for himself and his dependants

2 Fan hoo, or fan foo the treasurer's receipts, or that in which the land tax is paid This is also of high standard, but inferior to the hoppos duties, and being intended for use in the province and not for conveyance to Pekin, no per-centage is levied on the taxes for it

3 Yuen paon, literally "chief in value" This kind is usually imported from Soochan in large pieces of 50 taels each It does not appear to belong to any particular government tax

4 [illegible] "salt duties" It is difficult to account for these being of so low a standard, the salt trade being entirely a government monopoly

5 Muh tue, or wuh tue, the name of which signifying "uncleansed or unpurified," designates it as the worst of all It is seldom used except for the purpose of plating (Prinsep's "Useful Tables," *Appendix to Journal of Asiatic Society* [illegible] Calcutta, 1834)

SYCOMA (Gr *συκον, a fig*) A fig-shaped tumour

SYCOPHANT (Gr *συκοφαντης* from *συκον a fig, φαινω, I discloss*) It was [illegible] by the laws of Athens at one period to [illegible] public informers who gave notice of [illegible] this fiscal law were extremely unpopular, and hence the word came into use to signify an informer or false accuser generally, in which sense it is constantly used by Aristophanes and the orators. In modern languages it has acquired the sense of a mean flatterer

SYCO'SIS A tubercular eruption upon the scalp, or bearded part of the face It sometimes forms a very troublesome impediment to [illegible]

SY'ENITE A granitic rock from *Syene*, or *Siena* in Egypt It often has the appearance of a variety of granite *See* GEOLOGY

SY'LLABLE (Gr *συλλαβη*, from *συλλαμβανω, I collect*), is defined by Girard, the celebrated French grammarian, 'a simple or compound sound, pronounced with all its articulations by a single impulsion of the voice' The principal difficulty in arranging the syllabic construction of language is to ascertain in what cases two or more consonants following each other may be joined in a syllable, which can only be done by [illegible] the mechanism of speech (See a learned article on this subject in the *Encyclopédie*)

SY'LLABUS (Gr *συν* and *λαμβανω*) A compendium or abridgment, or a table of contents, as a syllabus of lectures &c

SYLLEPSIS (Gr *συλλεψις, connection or bringing together*) In Grammar sometimes called subst[illegible] A name given by some writers to that idiom of the Greek and Latin languages whereby an adjective predicated of a masculine and feminine substantive is made to accord in gender with the former *e g* "rex et regina beati"

SY'LLOGISM (Gr *συλλογιζομαι, I collect*) In Logic, an argument stated in the correct logical form, consisting of three propositions, distinguished by the property that the conclusion necessarily follows from the premises, so that if the premises [illegible] must be true also (*See* PROPOSITION, LOGIC) As often as the mind observes any two notions to agree with a third, it immediately concludes that they agree with each other as A is equal to B, B is equal to C, therefore A is equal to C Or, if it finds that one of them agrees and the other disagrees with the third [illegible] disagree with each other In [illegible] it produces a syllogism with an affirmative conclusion in the latter a syllogism with a negative conclusion

Syllogisms are variously divided by some into simple, complex and conjunctive &c, by others categorical, the Oxford system of logic [illegible] conditional, &c But the categorical syllogism, consisting of three categorical propositions, is the simplest form of reasoning, and that to which all other forms can be reduced

The following are the two canons by which the validity of a categorical syllogism is explained — 1 If two terms, *i e* notions expressed in language (*see* TERM), agree with one and the same third they agree with each other 2 If one term agrees and another disagrees with a third, the two first disagree with one another Hence are deduced the six following rules

1 Every syllogism has three terms only; viz the middle term, and the two extremes The subject of the conclusion is called the minor term, its predicate the major term the middle term is that with which they are respectively compared 2 Every syllogism has three propositions only the major premiss in which the major term is compared with the middle, the minor premiss, in which the minor term is compared with the middle, the conclusion in which the major and minor terms are compared together 3 The middle term must be in logical language distributed (*i e* taken in the premises) *i e* it must be the subject of a universal, or the predicate of a negative (*see* PROPOSITION), otherwise it may happen that one of the extremes is compared with one part of it, and the other with another part 4 No term must be distributed in the conclusion which is not distributed in one of the premises, otherwise the whole term would be employed in the conclusion, where part only are employed in the premiss this error is called an illicit process of the major or minor premiss 5 From negative premises you can infer nothing, *i e* if two terms disagree with a third, you cannot conclude either their mutual agreement or disagreement 6 If one premiss be negative the conclusion [illegible] for if one term disagree with the [illegible] necessity also disagree with the other The other rules are corollaries deducible from these six

The *mood* of a syllogism [illegible] of three propositions in their [illegible] quantity and quality By reference to the head PROPOSITION, it will be seen that arbitrary symbols are adopted in logic to mark the quality and quantity of propositions thus A stands for a universal affirmative, E represents a universal negative I particular affirmative O particular negative These four letters will afford sixty-four different combinations of three letters, but of these the greater part will afford syllogisms erring against some one or more of the rules previously laid down thus E E E would be at once inadmissible, as exhibiting two negative premises, — against rule 5 By an accurate examination it is found that eleven moods only will afford correct syllogisms A A A, A A I, A E E, A E O, A I I, A O O I A I I A O, E I O, I A I O A O

The figure of a syllogism consists in the situation of the middle term with reference to the major and minor terms 1 The first figure is where the middle term is the subject of the major premiss, and predicate of the minor 2 Where the middle term is the predicate of both premises 3 Where it is the subject of both 4 Where it is the predicate of the major and subject of the minor Multiplying the moods by the figures, we should have forty four different syllogisms But it will be found, on examination, that five moods in each figure (twenty in all) would err against some one or other of the rules before laid down *e g* I A I is an allowable mood in the third figure, but, in the first, it would have an undistributed middle Of the twenty-four remaining, five are unnecessary, *i e* they are moods in which a particular conclusion only is inferred from premises which would warrant a universal The nineteen remaining are expressed in the following mnemonic lines —

Fig 1 4 moods BA*rb*A*r*A, c*E*l*A*r*E*n*t*, d*A*r*I*I, f*E*r*IO*que* prioris
Fig 2 4 moods C*E*s*A*r*E, c*A*m*E*st*r*E*s, f*E*st*I*n*O, b*A*r*O*k*O*, secundæ
Fig 3 6 moods [illegible] d*A*r*A*p*t*I d*I*s*A*m*I*s, d*A*t*I*s*I*, f*E*l*A*p*t*O*n*, B*O*k*A*r*d*O, f*I*r*I*s*O*n, habet quarta insuper addit
Fig 4 5 moods B*r*A*m*A*nt*Ip, c*A*m*E*n*E*s, d*I*m*A*r*I*s, f*E*s*A*p*O, f*r*E*s*I*s*O*n*

One mood in each figure may be given by way of example The letter M designates the middle term; the letter preceding the proposition its quantity and quality

1 A All excess (M) is sinful
A All gluttony is excess (M) therefore
A All gluttony is sinful (A syllogism in Barbara)
2 A Every [illegible] expedient is lawful (M)
E [illegible] is [illegible] (M) therefore
E Nothing unjust is expedient (A syllogism in Camestres)
3 A All conquerors (M) are cruel
I Some conquerors (M) are just therefore
I Some just men are cruel (A syllogism in Datisi)

4. A. Whatever is expedient is conformable to nature (M).
E. Whatever is conformable to nature (M) is not hurtful therefore
E. What is hurtful is not expedient. (A syllogism in Camenes)

It will be observed that in all these instances the major premiss is presumed to precede the minor; but although this is the most convenient form of reasoning the minor premiss is, with equal validity, made the first in the series *e g*

Brutus is an honourable man
Honourable men affirm the truth, therefore
Brutus affirms the truth

This is a syllogism in Barbara, with the minor premiss placed before the major

The fourth [illegible] to be inverted and unnatural, and [illegible] res, with their fourteen moods, furnish almost every argument which is employed, however far it may be removed in appearance, through the intricacy of language, from the syllogistic form But all arguments may be brought, by an ingenious process termed *reduction*, into one or other of the four moods of the first figure

In reducing a syllogism, the premises may be illatively converted (*see* ILLATIVE CONVERSION), or transposed, since the force of the argument can be altered by neither of these processes By employing this liberty, we deduce either the same conclusion with the original, or another conclusion from which the original conclusion follows by illative conversion We have not space to explain, by examples, these various processes The letters which compose the names of the [illegible] last figures are reduced into those of the first The first letter indicates [illegible] the same [illegible] reducible into Barbara, *m* indicates that the premises are to be transposed, *s* and *p* that the proposition denoted by the vowel immediately preceding is to be converted, — *s* simply, *p* per accidens, *k*, which occurs only in Baroko and Bokardo, indicates that the proposition denoted by the vowel immediately before it must be left out and the contradictory of the conclusion (*see* CONTRADICTORY) substituted, which is termed the *reductio ad impossibile*

A hypothetical syllogism is one in which the conclusion is deduced from an hypothetical premiss (called the major) and a categorical premiss (called the minor) It is of two kinds, — conditional and disjunctive the first subdivided into constructive and destructive

1 Conditional constructive
If the demand increases, the supply will increase
But the demand increases,
[illegible]

2 Conditional destructive
If [illegible] is flourishing
But agriculture is not flourishing,
Therefore the country is not flourishing

3 Disjunctive
Either A is B or C is D
But A is not B,
Therefore C is D

It is evident that a disjunctive syllogism may easily be reduced to a conditional (See the *Compendium of Logic* by Dean Aldrich, commonly used at Oxford, and the Treatise of Archbishop Whately)

SYLPH (Gr *σιλφη, a kind of insect*) The name given to the spirits of air in the fantastic nomenclature of the Rosicrucians and Cabalists (See those articles) The use which Pope has made of this fancy in his *Rape of the Lock* is well known He seems to have borrowed it from the enigmatical romance called the *Count de Gabalis*

SYMBOL (Gr *συμβολον*, from *συν, together*, and *βαλλω, I throw*) A word of many meanings, although now commonly used in one only 1 The primary meaning of the verb *συμβαλλειν* expresses the act of several in constituting or throwing together portions to form a whole Hence *συμβολον* signified a treaty or agreement (*Arist Polit*) And it seems to be in this sense that the creeds are termed by early ecclesiastical writers symbols either because (as Augustine says) all the fundamental doctrines of Christianity are *collected* in them, or from the old traditionary story, related by Rufinus, that the creed called the Apostles' was formed by each of them contributing a sentence (*See* CREED) 2 The mind may be said to put together (*συμβαλλειν*) outward appearances, and collect from them the notion of a thing signified by them, and hence the outward appearances themselves [illegible] *symbols*, signs, or emblems [illegible] is termed *conjecture* (Lat [illegible] the standards of military bodies were called [illegible] Greeks symbols, as likewise omens and portents, and expressions or figures denoting a received meaning, as the Pythagorean symbols. In this sense, the early Christian church called all rites, ceremonies, and outward forms bearing a religious meaning, by the general name of symbols; the sacraments themselves, and the sacramental elements, the Cross, and, in later times, images and pictures Symbols, properly so called, must be distinguished from types, *i e* phenomena, manifestations recorded in the Old Testament, of which the full meaning is developed by correlative manifestations in the New, and from mere symbolical attributes such as the figures usually introduced in company of the four Evangelists [illegible] is contained the creeds and confessions such as the three creeds, received by all, the Confession of Augsburg, received by the Lutherans, the articles of the Church of England, &c The Germans call the study of the symbols and mysterious rites of antiquity, and also the study of the history and contents of Christian creeds and confessions of faith, by the name of Symbolics (mythological or theological) *Marheineke's Institutiones Symbolicæ*, of which the first edition appeared in 1812, is one of their most distinguished works in the latter class

SYMMETRICAL SOLIDS In Geometry, a name given by Legendre to solids which, though equal and [illegible] afford an example of symmetrical solids The equality of plane figures is proved by showing that they may be made to coincide, but [illegible] evident that this mode of proof cannot be extended to all solids

SYMMETRY In the Fine Arts *See* PROPORTION

SYMPATHY (Gr *συμπασχω, I suffer with*) In Moral Philosophy, the quality of being affected by feelings common to our fellow-men In his *Theory of Moral Sentiments*, Dr Smith maintains that sympathy is the real foundation of morals (*See* VIRTUE) For a succinct statement of this theory, see "The Life of Dr Smith," prefixed to M'Culloch's edition of the *Wealth of Nations*, p iv In the Fine Arts, the term signifies conformity of the parts to each other, but in Painting it is more usually applied to the effective union of colours

SYMPHONY (Gr *συν, with*, and *φωνη, voice*) In Music, a composition which, from the etymology of the term, evidently implies that the voice anciently formed an essential part of its construction In the present day, however, the term is otherwise applied, and is exclusively used for a piece in which instruments only are engaged It is, in fact, a composition for a perfect instrumental orchestra, which, until the beginning of the eighteenth century, was unknown The *Concerti grossi* of Corelli were the first of the species, which was carried out to a greater extent in the works of Geminiani and Vivaldi, but it does not seem to us that before the time of Haydn it can be said to have assumed the form which the name now imports There is, perhaps, no musical composition in which the power of the author is so completely developed as in a symphony The musician in it becomes a poet, or perhaps rather a painter Scenes and the passions are represented therein by a combination of musical sounds, in illustration of which we need only cite that splendid work of Beethoven, known to all under the name of *Il Pastorale* The general form of the symphony may be thus described — It opens with a short, serious, slow movement, this is followed by and forms a contrast to one of spirit and of a lively nature, then comes an andante varied, or [illegible], a minuet with its trio follow [illegible] closes with a lively rondo, or a finale of rapid motion

SYMPHYSIS (Gr *συμφυειν, to grow together*) A term applied to the junction of certain bones, or to joints as the *symphysis of the pubes*

[illegible] (Gr *συμπιεζω, I compress*; *μετρον measure*) An [illegible] Mr Adie of Edinburgh for measuring the [illegible] atmosphere by the compression of a column of gas It consists

[illegible] having an enlarged portion or bulb of about 2 inches in length and half an inch in diameter at each end The top at A is hermetically sealed, and [illegible] be stopt by a cork [illegible] A *m* is filled with some permanently elastic gas different from common air (hydrogen gas is found to answer best), and the lower *m B n* with a fixed oil, or some fluid which does not act upon the gas and is not acted upon by air

The tube being opened at C, the oil is exposed to the pressure of the atmosphere, and stands at a height *m*, corresponding to the difference of the pressures of the atmosphere and of the column of enclosed gas Consequently as the atmospheric pressure becomes greater the gas will be compressed, and the column of oil will rise The change in the bulk of the gas occasioned by a change of pressure is measured by a scale, which is formed experimentally, and of which the divisions are entirely arbitrary

But as the bulk of the enclosed gas is altered by any change of temperature as well as of pressure, it is necessary to apply a correction on this account For this purpose a common thermometer is attached to the instrument to indicate the temperature, and the principal or barometric scale, which measures the compression of the gas, is made to slide upon another scale divided so as to represent the change of bulk in the gas produced by a change of temperature under the same pressure, and corresponding to the graduation of the thermometer In making an observation, the temperature is first observed by the thermometer, an index or pointer, which is fixed to the top of the sliding scale, is then set opposite to the degree of temperature on the fixed scale and the number the sliding scale opposite the top of the column of oil gives the pressure of the air in inches of the mercurial barometer

The principle of the syphon tube is that of the *manometer* or air barometer which was long ago proposed by Hooke, and Mr Adie's great improvement consists in the substitution of a gas for common air, which has the defect of being absorbed by the enclosing fluid It is a valuable instrument at sea, as it is not affected in any degree by the motion of the ship, and it possesses several advantages over the barometer in its convenient size its greater portability and in being less liable to accident (See the *Edinburgh Encyclopedia*, art "Meteorology *Edin Phil Journal* No I, *Edin Journal of Science*, No xi)

SYMPO'SIARCH (Gr συμποσιον, *feast* and αρχω *I rule*) The ruler or master of a feast, one selected by the consent of the party to be their president for the occasion, whom the Greeks sometimes called βασιλευς The word rendered "governor of the feast" in John, ii 8, is αρχιτρικλινος Some think that a priest or Levite was chosen to fill this office in Jewish feasts

SYNE'RESIS (Gr συναιρω *I contract*) Otherwise called *Crasis* (Gr κρασις *mixture*) In Grammar the contraction of two syllables into one by the formation of a diphthong or by rendering one of them mute as, Atreides for Atreides *See* METAPLASM

SY'NAGOGUE (Gr συναγω, *I assemble*) The religious assemblies of the Jews are so called by Hellenic writers The Jews had no synagogues it is thought before the Babylonish captivity They were first formed after the return of the Jews to the Holy Land The rule was, that a synagogue was to be erected in any place where there were ten persons of full age and free condition ready to attend the service of it Others, however consider the ten *batelnim*, to use the Hebrew word, to have been ten elders, or stationary men of the synagogue (See *Lightfoot*) The service performed in the synagogues consisted, and still consists, of prayers the scriptures and preaching The prayers are contained in the Liturgy the scripture consists of three lessons certain selected passages from Deuteronomy and Numbers, the law and the prophets The third part of the service is mentioned in several places in the narratives of the life of our Saviour, and the Acts Luke iv 16 Acts xiii 5 The times of the synagogue service were three days a week (Monday, Thursday and Saturday), besides the holydays The ministration of the synagogue was not confined to the order of priests, the elders, or "rulers of the synagogue," were persons qualified, and duly admitted, of all tribes (Prideaux, *Connection*, vol i)

SYNALÆ'PHA (Gr συν, *together*, αλειφω *I anoint*, from the melting together of two sounds) In Classical Prosody, the usage by which, when a word ends with a vowel, with the letter *m*, and the next begins with a vowel, the final syllable of the one runs into the first of the other This, in Latin verse, also takes place when the last letter is *m*, but the usage in this instance is called *ecthlipsis*, or elision The synalæpha is commonly, though not with equal regularity adopted in Italian and Spanish poetry, and is not unfrequently attempted especially by Milton, in our own, in French it extends only to the e mute at the end of words

SYNARTHRO'SIS (Gr συν, *with*, and αρθρον, *a joint*) The immoveable connection of one bone with another

SYNCA'RPOUS (Gr συν, and καρπος, *fruit*) In Botany, a term applied to the carpels of a compound pistil when they are completely united into an undivided body; as in the orange

SY'NCATEGOREMA'TIC (Gr συν, and κατηγορημα, a word employed together with categorematics or terms) In Logic, a word which cannot be employed by itself as a term, but requires to be conjoined with another or others for that purpose Such are adverbs, prepositions, nouns in other cases besides the nominative, &c *See* TERM

SY'NCHONDRO'SIS (Gr συν, and χονδρος *a cartilage*) The junction of one bone with another by an intervening cartilage

SYNCHRONISM (Gr συν, and χρονος, *time*) The tabular arrangement of history according to dates, by which contemporary persons and things in different countries are brought together

SYNCLINAL See ANTICLINAL.

SYNCOPATION In Music *See* DRIVING NOTES

SYNCOPE (Gr συν, and κοπτω, *I cut*) A figure of Grammar, by which one or more letters are omitted in the middle of a word, as in the Latin *litus* for *littus* *See* METAPLASM

SYNCOPE In Pathology, fainting A disease in which the circulation and respiration temporarily cease, or become extremely feeble

SYNCOPE In Music *See* LEGATO

SY'NCRETISM (Gr συν, and κρασις, *mixture*) In Philosophy, the blending of the tenets of different schools into a system A party among the Platonists at the revival of letters, to which belonged Ammonius, Pico della Mirandola, Bessarion, and other distinguished men, have received the name of Syncretists

SY'NCRETISTS In the history of the partisans of Calixtus, a [illegible] century who endeavoured to form a comprehensive scheme which should unite the different professors of Christianity The opinions of Calixtus raised a strong controversy in the Lutheran church A new confession of faith was drawn up in Saxony for the purpose of excluding his partisans As doctrines, however, they did not long survive his death although not without effect on the spirit of the age (*Mosheim*, cent xvii sect 2)

SYNDA'CTYLES *Syndactyli* The name of a tribe of Perching birds, those which have the external and [illegible] as far as the second joint

SYNDESMO'SIS (Gr συνδεσμος, *a ligament*) The union of one bone with another by means of ligament

SY'NDIC (Gr συν *with*, δικη, *justice*) A title given at different times to various municipal and other officers The syndics of cities in Provence and Languedoc, under the old French government, were officers delegated by the municipality as agents or mandatories Such were also the syndics of [illegible] of a bankrupt under [illegible] or syndics of the number

SYNE'CDOCHE (Gr συν *with* or *in out*, and δεχομαι, *I receive*) In Rhetoric a figure by which the whole is put for a part or part for the whole It is a species of trope (*See* TROPE) There are six ordinary instances of synecdoche 1 When genus is put for species (as 'being' in the sense of 'man') 2 When species is put for genus 3 When the essential whole is put for one of its parts 4 When the matter, or form, is put for the whole being 5 The whole for a part 6 The part for the whole

SYNE'CHIA (Gr συνεχω, *I adhere*) A disease of the eye in which the iris adheres to the cornea, or to the capsule of the crystalline lens

SYNE'RGISTS (Gr συνεργιζω, *I co-operate*) A name given to a party in the Lutheran church in the latter end of the 16th century Those who were thus called appear to have held the doctrine that the divine grace requires a correspondent action of the human will in order to become effectual, which, or something resembling it, is termed semi-pelagian in early ecclesiastical history Some sentiments expressed by Melanchthon, towards the close of his life, seem to have introduced it into that church

SYNEURO'SIS (Gr συν, and νευρον, *a nerve*, or *ligament*, or *membrane*) The union of one bone with another by means of [illegible] membrane

SYNGNA'THIANS *Syngnathi* (Gr συν, *with*, γναθος *a jaw*) The name of a family of Lophobranchiate fishes including those in which the lengthened jaws are united by a surrounding integument so as to form a tubular mouth the genus *Syngnathus* or pipe fish, is the type *Syngnatha* is a name given by Dr Leach to an order of Myriapodous insects

SY'NGRAPHA (Gr συν, and γραφω, *I write*) In Dutch [illegible] the creditor and debtor, and [illegible] was kept by each

SYNIZE'SIS (Gr συν, *I meet*) An obliteration of [illegible] pupil

SYNOCHA (Gr συνεχω *I continue*) A continued inflammatory fever The term *synochus* is applied to continued fevers, which are in their symptoms intermediate between *synocha* and *typhus* They are also called *mixed fevers*

SY'NOD (Gr συνοδος, employed in that language to [illegible] Among the [illegible] council and a synod, the former [illegible] assembly of the episcopal, [illegible] the latter the convention of [illegible] cese under its bishop or archbishop

SYNOD In the Scottish Kirk an assembly composed of two or more presbyteries It consists of every parish minister within its limits and of the elders who have been appointed to represent the different sessions in the presbyteries There are sixteen synods in Scotland *See* PRESBYTERY

SY'NOD OF DORT. *See* DORT, SYNOD OF.

SYNO'DIC. (Gr. *συν, together, ὁδος, pathway*) In Astronomy, the synodic revolution of a planet (or the moon), with respect to the sun, is the time between two consecutive conjunctions or oppositions. The duration of this period is easily found when the difference between the mean motion of the planet and sun in a given interval of time is known, for this difference is to add as the given interval to the synodic revolution. The *synodical month* is the period of the moon's synodic revolution, and is the same with *lunar month* or *lunation*. *See* MOON.

SY'NONYMS. (Gr. *συν*, and *ονομα, a name*) Words of the same language which have a similar signification. Strictly speaking, words having exactly the same signification are not to be found in any language, unless one [illegible] words may be frequently used for one another, and this interchange produces a pleasing variety in composition, necessary in poetry. Synonyms form an important object of philological study, demanding, on the part of the inquirer, great knowledge of the principles of language. The chief works on this subject are the *Onomasticon* on Greek, Dumesnil on Latin, Blair, Crabbe, and Taylor on English, Stosch and Ebernard on German, and Giraud, Beauzée, Roubaud, and Guizot on French synonyms.

SYNO'PSIS. (Gr. *συν, together, ὀψις, view*) A collective view of any subject, as a synopsis of astronomy, theology, &c.

SYNO'VIA. (Gr. *συν*, and *ωον, an egg*) The fluid which lubricates the cartilaginous surfaces of the joints. It [illegible] white of egg.

SY'NTAX. (Gr. *συν, with, τασσω, I arrange together*) In Grammar and Rhetoric, the disposition of the words and members of a sentence in the grammatical arrangements proper to the language. *See* GRAMMAR.

SY'NTHESIS. (Gr. *συν, with, τιθημι, I place*) In Geometry and Logic, the method [illegible] out from some principle established [illegible] sition already demonstrated, and ascends through a series of propositions to that which is enunciated. Synthesis is also called the direct method or *composition*, and is the reverse of analysis or resolution. It is the method followed in *Euclid's Elements*. For the sense in which analysis and synthesis were understood by the ancient geometricians, see ANALYSIS.

SYNTHESIS. In Chemistry, those chemical operations by which compounds are obtained by the union of the separate component parts are called *synthetic*. The term is especially used in opposition to *analysis*. Thus I decompose water *analytically* by resolving it into oxygen and hydrogen gases, and *synthetically*, by recombining those gases so as again to produce the water which had previously been decomposed, the terms *synthesis* and *analysis* being, in fact, synonymous with *composition* and *decomposition*.

SY'PHILIS. (Probably from Gr. *σιφλος, unclean*) The venereal disease.

SYRINGE. In Hydraulics, a machine consisting of a small cylinder with an air-tight piston or sucker, which is moved up and down in it by means of a handle. The lower end of the cylinder terminates in a small tube through which a fluid is forced into the body of the cylinder by the atmosphere [illegible] the handle is drawn up, a [illegible] by pushing the handle in the opposite direction. The syringe acts on the principle of the sucking pump. The syringe is also used as a pneumatic machine for condensing or exhausting the air in a close vessel, but for this purpose it must be furnished with two valves. In the condensing syringe, the valves open downwards and close upwards, in the exhausting syringe they are closed downwards and opened upwards. *See* AIR GUN and AIR PUMP.

SY'RMA. (Gr. *συρμα*, from *συρω, I draw*) A long garment, so called from its train reaching the ground. It was the proper dress of actors in the classical tragedy.

SYSSARCO'SIS. (Gr. *συν, with*, and *σαρξ, flesh*) The junction of bones by intervening muscles.

SYSSI'TIA. (Gr. *συσσιτια, common messes*) An institution of some ancient states, particularly Lacedæmon and Crete, by which the male freemen had their meals together in common messes, instead of eating with their families in private.

SYSTEM. (Gr. [illegible] *I set, I* Astronomy, [illegible] ment of the [illegible] motions are explained [illegible] Ptolemy, Copernicus, Tycho Brahe, see ASTRONOMY.

System, in the Arts. Arts, a collection of the rules and principles upon which an art is works.

System. In Music, an interval composed, or supposed to be composed of several lesser ones, as an octave, which is a system. *See* DIASTEM.

SY'STOLE. (Gr. *συστελλω, I contract*) In Greek and Latin prosody, a licence by which a long syllable is used as short. *e g*

Matri longa decem tulerunt fastidia Menses.

SYSTOLE. The contraction of the heart.

SY'STYLE. (Gr. *συν, with*, and *στυλος, a column*) In Architecture, the arrangement of columns in such a manner that the [illegible]

SY'ZYGIES. (Gr. *συζυγια, union, conjunction*) In Astronomy, the places of the moon or planets when in conjunction or opposition with the sun.

T.

T, the nineteenth letter in the English alphabet, belongs to that order of consonants called *dentals*, or *palato-dentals*, and is susceptible of numerous interchanges, both in the [illegible] the Roman tribunes indicated their assent to the decrees of the senate by subscribing T. The sound of *th* is peculiar to the English language.

T BANDAGE. A bandage so named from its shape; it is used to support the dressings after certain surgical operations. (See *Cooper's Surgical Dictionary*.)

TABA'RD. A sort of tunic, or mantle, covering the body before and behind, reaching below the loins, but open at the sides from [illegible] an ordinary article of dress [illegible] in the middle ages. It was a [illegible] military, afterwards by other cla[illegible] coats of arms blazoned before and behind, is the state dress of heralds to this day. It is the dress worn by the knaves in cards. Long tabards reaching to the mid-leg, were a peculiarly English fashion.

TABASHEER. A Persian word signifying a light white porous substance found in the joints of the bamboo. It consists almost entirely of silica. It is said to be used medicinally in the East Indies, but its virtues must be merely imaginary.

TA'BBY. (Ital. tabino.) A term formerly applied to certain figured silks and other goods upon which an irregular pattern had been stamped, either by the pressure of engraved rollers, or by folding the stuffs in such a way as to produce, by the mutual pressure of their fibres, an inequality of surface, which, by reflected light, gives rise to the appearance called *watering*.

TABELLION. (Lat. tabula, from the tablets on which they wrote.) In the Roman empire, officers who had charge of public documents were so called, they were also secretaries, or registrars, and in some cases judges. (See Savigny, *Hist. of the Roman Law*, vol. i.) The notaries were their assistants. In France, the titles of "Tabellion" and "Greffier" were confounded, and Henry IV. united the functions of tabellion with those of notary, but the old title seems still to be retained (or was until the Revolution) in some few places.

TA'BERNACLE. (Lat. tabernaculum.) A Latin word signifying a *tent* or *cabin*. The tabernacle which was carried from station to station by the Jews during their wanderings in the desert, was a tent of sails and skins stretched upon a framework of wood, and divided into two compartments, the outer, named *the Holy*, being that in which incense was burned, and the shew bread exhibited, and the inner, or *Holy of Holies*, in which was deposited the ark of the covenant. (Exod. xxvi. xxvii. See *Index Volume*, vol. i.)

The feast of Tabernacles was one of the three principal festivals among the Jews. It commenced on the 15th of the month Tisri, corresponding with the 30th of September, and lasted seven days, during which the people dwelt in booths formed of the boughs of trees. It was instituted in commemoration of the habitation of their ancestors in similar dwellings during the forty years of their pilgrimage in the wilderness. (See Leviticus, xxiii.)

TA'BES. (Lat.) A wasting away of the body; emaciation, atrophy.

TA'BLATURE. (Lat. tabula, *a table*) In Music, the use of the letters of the alphabet, or any other character, for expressing the notes or sounds of a composition. It is not now a usual mode of writing. In its stricter and more original sense it is a mode of writing music for a particular instrument on parallel lines (of [illegible] ents a string of the instrument) by [illegible] tters of the alphabet. Thus A de[illegible] is to be struck open, B that one of [illegible] on the first stop, C on the second, D [illegible] on through the octave.

TABLE. [illegible] [illegible] [illegible] place [illegible] [illegible] ex[illegible] [illegible] [illegible] [

some given law expressed by a mathematical formula Of this kind are the logarithmic tables, tables of the powers or roots of the different numbers; of the sines, cosines, and other angular functions, of astronomical refractions, of the equations of the planetary orbits, &c Tables of this sort, by exhibiting at once to the eye all the different values [illegible] endless labour in [illegible] portance in every branch of natural philosophy The logarithmic tables, for example, form the universal instrument of astronomical calculation, and it may be safely affirmed that without them the computations necessary for determining the places of the different bodies of the solar system and rendering astronomy a science of practical utility would be altogether impossible

Table is also used in a popular sense to denote a collection of particulars brought under one view Thus, in history, we have chronological tables, in statistics, tables of mortality at different ages, &c The mere titles of the useful tables which have been formed in the various departments of knowledge would fill a large volume

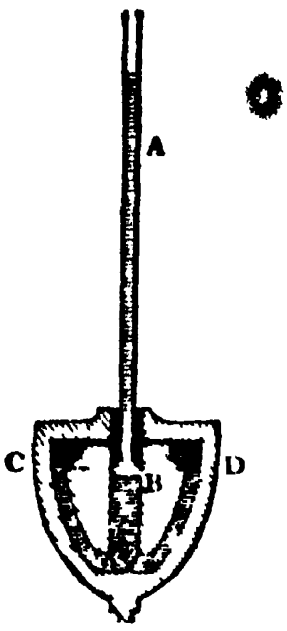
TABLEAUX VIVANTS (Fr *living pictures*) The name given to an amusement in which groups of persons dressed in appropriate costume are made to represent some interesting scene in the works of distinguished painters or authors It is thus managed —The room in which the spectators are placed being darkened, the group assume their respective attitudes behind a frame (or some other contrivance intended to represent it) covered with gauze, and candles being so placed as to reflect light upon the group from above, the illusion is complete These representations are not unfrequently resorted to in England, but their home is chiefly in France and Germany where they form an important feature on all festive occasions They owe their present popularity to the celebrated M Handel Schutz, whose genius for imitation and declamation was unrivalled in Germany (See the *Damen Lexicon*) Tableaux are often employed to represent some scene in which a riddle is concealed

TA'BLE LANDS In Physical Geography, the name [illegible] plains with steep acclivities [illegible] from other plains which are either not much elevated above the sea, or rise by imperceptible degrees Some of these are very extensive and retain a general level of several thousand feet above the sea Sometimes they are bordered with chains of mountains much less elevated on the side towards the table land than in the opposite direction and sometimes they have surfaces much undulated or broken The chief table lands are in Central Spain Southern Africa Central Asia, Persia, Southern India, Mexico and the Southern Andes (See *Traill's Physical Geography*, p 25 *et seq*)

TABLE SPAR, TABULAR SPAR *Schaalstein* of Werner A greyish white mineral, which occurs in masses and in granular concretions it is a silicate of lime.

TABLETS In Roman Antiquities pieces of ivory, metal, stone, or other substance used in judiciary proceedings, or in the passing of laws

TA'BOR (Fr tabourine) A small drum



TA'BORITES, or THABORITES The denomination of one of the parties into which the followers of Huss, in Bohemia, separated after the death of their leader They were so called from Tabor, a hill or fortress of Bohemia, upon which they [illegible] which they maintained against the civil and ecclesiastical power At their head stood John Ziska von Brockznow, who was distinguished at once for his indomitable courage and his remorseless cruelty After various fanatical exhibitions which were met by their adversaries with determined hostility the latter and more quietly disposed portion of the Taborites formed themselves into a religious society under the denomination of the Bohemian Brethren They established several Christian communities, elected their own bishops, priests and elders, drew up a rigorous plan of ecclesiastical discipline, and sent forth missionaries to various parts, though with little success Though harassed by persecutions, they continued to augment their numbers, and at the end of the 15th century they counted about 200 communities of adherents. At the end of this period the distinctive name and opinions of the Taborites were lost among the [illegible] corruptions which formed [illegible] in Germany (See CALIXTINES, HUSSITES) An interesting picture of the horrors of the bloody religious war in which this sect was engaged at the period of its institution is to be found in the historical romance of Herlossohn, called *The Last Taborite* (*Der Letzte Taborit*)—a work well worthy of being translated into English

TABULA'TUM (Lat) In Ancient Architecture a term used to denote the floors ceilings and other wood work in a house occasionally also it was applied to balconies and projections of that nature

TA'CAMAHAC (An Indian word) A brownish aromatic resin formerly used in medicine, supposed to be the produce of the *Populus balsamifera*

TACIT (Lat *tacere, silent*) In Music, a term denoting that through the movement to which it is affixed [illegible] part that part is to lie still or be silent during its performance

TACHOMETER (Gr *ταχος, speed*, and *μετρον, measure*) A contrivance invented for the purpose of indicating minute variations in the velocity of machines When a vessel containing a fluid is whirled rapidly round a vertical axis the centrifugal force produced by the whirling motion causes the fluid to recede from the axis, and to rise on the sides of the vessel, so that the surface of the fluid assumes a concave parabolic form, and the distance to which the centre of the surface falls below its original level is proportionate to the velocity of rotation, and subject to corresponding variations Any method, therefore, of measuring or rendering visible the depression of the central surface will indicate the variations of velocity The method usually adopted is the following —A glass tube A, open at both ends, and expanding at one extremity into a bell B is immersed with its wider end in mercury contained in a cup C D The tube is so suspended as to be unconnected with the cup This tube is then filled to a certain height, A, with spirits tinged with [illegible] render [illegible] cup is

attached to a spindle turned by the machine Now as the cup is whirled round by the spindle, the level of the mercury in the bell falls, and the spirit therefore descends in the tube As the motion is continued, every change of velocity causes a corresponding change in the level of the mercury, and consequently also in the height of the spirits in the tube at A, and as the capacity of the bell B is much greater than that of the tube A a very small change in the level of the mercury causes a considerable change of the height of the spirits in the tube (*Cabinet Cyclopedia*, art 'Mechanics,' p 235)

TACHYDROMIANS *Tachydromia* (Gr *ταχυς, swift* and *δρομος a course*) The name of a family of wading birds [illegible] The term [illegible] Latreille and to a family of Dipterous insects by Mirgen

TACHYDROMUS (Gr *ταχυς*, and *δρομος, a course*) A subgenus of *Lacertidæ*, differing from the true lizards in having a very long body and tail, with their fore legs very distant from the hind legs and the back covered with scales similar to those on the belly They are found in the Indian islands and China and run with great velocity, whence their name of swift lizards

TACHYGRAPHY, or TACHEOGRAPHY (Gr *ταχος quick* and *γραφω, I write*) One of the many names of Greek derivation which have been given to the art of short hand

TACK The weather clue or corner of a course, as also of any sail set with a boom or gaff and of a flag Also, the rope by which such clue is extended thus, the *main tack* is the rope by which the tack or weather clue of the mainsail is drawn down to the ship's side

A ship is said to be on the *starboard tack* when she is close-hauled, having the wind on the starboard side, and on the *larboard tack*, when the wind is on the larboard side *To tack* is to change from one tack to the other by turning the vessel round with her head to the wind

TACKLE The Sea term for a pulley composed of two or more blocks The rope is called the *fall* The term appears to have been derived thus —Gr *τροχαλια*, Lat trochlea, Ital taglia, Dutch tankel (See *Willis's Principles of Mechanics*, p 198)

TACTICS In a general sense, the evolutions, manœuvres, and positions which constitute the main spring of military and naval finesse

The expression *naval tactics* is commonly understood to relate to the attack or defence of fleets or single ships, but as tactical manœuvres are necessarily practised also [illegible] number of ships together, and in the [illegible] single ships, whether for hostile purposes or not, the subject, in fact, includes all considerations relative to the closing or separating of vessels at sea We can of course here merely attempt to convey such general notions on the subject as may assist the reader in the study of it

The subject of tactics, as applied to war naturally divides itself into two parts, viz disposing the fleet for closing with or avoiding the enemy and bringing on the engagement [illegible]

can be made the subject of fixed rules, but the manner of bringing on the action with the whole or part of the fleet, the choice of the weather or lee *gage* (as the windward or leeward position is called), under given circumstances of weather locality, armament, relative numbers discipline &c must depend on the experience, skill and *coup d'œil* of the commander in chief

The evolutions by which the ships of the fleet pass from one position to another are given in all works on naval tactics, and those in most common use are often contained in Signal Books, both English and foreign Though the evolutions really necessary are but few, in foreign works, they are multiplied to an inconvenient, if not impracticable extent The opinions of officers and writers have differed on many points of great importance, such as the position of the commander-in-chief, the tacking or wearing of the fleet together, or in succession, and also in the general disposition of the fleet

In regard to the action itself, it appears it was the custom formerly to enemy's whole fleet, ship to ship in most cases, easily avoided, and actions were consequently often indecisive The circumstance of Lord Rodney's passing through the French fleet on the 12th of April 1782, seems to have drawn attention strongly to the principle of portions which might be suggesting the breaking of the enemy's line on this occasion having been attributed to Mr Clerk of Eldin, author of a work on Tactics which appeared at the time, has become the occasion of much controversy, but the manœuvre had been already treated in French and Spanish works on Tactics One of the most striking applications of the principle was exhibited in Lord Nelson's attack at the battle of the Nile Among the works on Tactics may be noticed here, *Tactique Navale*, by the Count Morogues which was considered an improvement on Le Pere Hoste's work, *Tactica Naval*, by Salazar, and Mr Clerk of Eldin's *Naval Tactics* above quoted Much information is contained in Admiral Elkins's *Naval Battles*, and remarks on the tactics of single actions are found in Sir Howard Douglas's *Naval Gunnery* Some other works on the subject will be found in any good catalogue of naval books

TA'CTION (Lat tango, *I touch*) In Geometry, the same as Tangency or touching See TANGENT

TÆNIA (Gr ταινια, *a fillet*) An intestinal worm, commonly called the *tape worm* When this worm infests the bowels it often produces a variety of anomalous symptoms, and is very difficult to get rid of The most effective remedies are purges and especially oil of turpentine, half an ounce of which is taken in the morning, fasting, mixed with a little barley water If it does not purge briskly, a dose of castor oil may be taken after it, or the oil of turpentine repeated If any portion of the tape worm remains in the intestines, the symptoms are apt to recur, so that much attention is requisite to ensure its total evacuation

TÆNIA In Architecture, the lintel above the architrave which separates it from the frieze in the Doric order

TÆNIOIDS, *Tænioides* (Gr ταινια, *a riband*, ειδος, *form*) The name given by Cuvier to a family of Acanthopterygious fishes, comprehending those which have a flattened riband shaped body, also the name of a family of Sterelminthoid intestinal worms, of which the tape worm (*Tænia*) is the type

TA'FFETY A thin glossy silken fabric, formerly much used in England It is extensively used on the Continent for window curtains

TAFFRAIL The uppermost rail of a ship's stern

TAGES In old Italian divinity, who is represented to have sprung as a beautiful boy from the earth which a Tuscan ploughman had furrowed too deep The first act of this earth-born god was to foretel from the wings of birds what was to happen to the peasants by whom he was quickly surrounded, and hence he was worshipped as the inventor of augury (See AUGURS) A collection of his prophecies was made and preserved in the sacred records of Etruria

TA'GLIA (Ital) In Mechanics, the name given to a "The taglia consists of in one common block, and also of a system of moveable pulleys in a separate block, to which the weight is attached, with one string going round all the pulleys, and having one of its ends fixed to a point in the system, and the other end going from one of the fixed pulleys drawn by the power" (*Leuturoff's Mechanics*, by Cresswell) Sometimes several taglias are combined, so that one acts upon the other, the system is See PULLEY

TAGLIACOTIAN OPERATION The operation for the restoration of the nose *Rhinoplastic* of the French The merit of inventing this operation is usually given to Tagliacotius a Venetian surgeon, who wrote upon the subject in 1598, and proposed the replacement of the deficient organ by an artificial nose cut out of the skin of the shoulder or arm A supposed modern improvement consists in having recourse for the new materials to the skin of the forehead, out of which a triangular piece is so cut that it may retain connection at its apex, which is downwards, and so admit of being twisted or turned down to form the artificial nose by adhesion to the recently cut surfaces of the truncated organ It appears that this operation was practised in India from time immemorial, and that it was also not uncommonly resorted to by the Italians, and especially the Romans, among whom the loss of the nose was a punishment of not unfrequent infliction (See *An Account of Two Successful Operations for restoring a lost Nose*, by J C Carpue, Lond 1816, *Liston's Practical Surgery*, Lond 1837, and *Cooper's Surgical Dictionary*)

TA'GUS (Gr ταγος) In ancient Greek History, the title of the president of the Thessalian confederacy

TAIL In Architecture, the bottom or lower end of any member as of a slate or tile A *tail trimmer* is that next the wall into which the ends of joists are fastened to avoid the flues Used as a verb, *to tail in* any thing is to fasten it by one of its ends into a wall

TAILLE In ancient French Jurisprudence, any imposition levied by the king or any other lord on his subjects There is some obscurity about the derivation of this word It is commonly deduced from talcæ, *tallies*, little pieces of wood with which reckonings were made But whether these were not so called from their use in *telling* or counting (Germ zahlen), does not appear Again, it is apparently connected with the Germ zoll, Engl *toll*, but these words are derived by some, through the Ital tolta, from the Lat tollere, *to raise* Perhaps the whole series of words is from the same original root, but it is not easy to trace the affinities The *Royal Taille*, in old France, which was the impost commonly understood under the general name, was a personal or rather mixed constitution, from persons not noble or ecclesiastical or enjoying certain other exemptions imposed according to their supposed ability measured by their goods In the respect in which it fell on the agricultural class from which it was chiefly levied, it is described by Adam Smith as 'a tax on the supposed profits of the farmer, which they estimate by the stock which he has upon the farm' (Book iii ch 2) In Languedoc, and one or two other districts, the taille was real, i e imposed on land and goods This tax was rendered annual and permanent in 1445 The 'real' taille is now replaced by the 'contribution foncière," and the personal by the "contribution personnelle et mobiliaire"

TAILLOIR (Fr) In Architecture, the same as *abacus*, which see

TAILZIE, or ENTAIL (Fr tailler, *to cut off*), in Scottish Law, signifies in general, any deed whereby the legal course of succession is cut off, and an arbitrary one substituted But, more strictly, a deed of tailzie is one framed in terms of the statute 1685, c 22, and intended for the purpose of securing the descent of an heritable estate to the series of heirs and substitutes called to the succession by the maker of the tailzie The principal difference between Scottish and English entails lies in the absence of any provision in the law of the former country, similar to the fictions of fines or recoveries in the latter, whereby parties in possession were enabled to cut off the entail Several statutes have been passed since that of 1685 to give heirs of entail in possession certain liberties which they could not otherwise possess, as, to sell superiorities (2 G 2 c 50, 51), to grant leases for 31 years, 14 years, and a life or two lives, and building leases for 99 years, and (10 G 3 c 51), redeem the land tax (48 G 3 c 151), make provisions for wives and children (5 G 4. c 87)

TALAPOINS The title, in Siam, of the priests of Fo, who are called in China, Seng, in Tartary, Lamas; and by Europeans, Bonzes

TALC A soft unctuous mineral of an unctuous feel, often used for drawing lines on wood, cloth, &c., which are not so easily effaced as those of chalk Talc is employed in the composition of *rouge végétal* The Romans prepared with it the natural blue, by combining it with the colouring fluid of particular kinds of testaceous animals Talc is met with in Aberdeenshire, Perthshire, and Banffshire in Scotland and in various parts of the Continent, where rocks of serpentine and porphyry occur The talc brought from the Levant or Continent is called in commerce Venetian talc Several varieties are found in India and Ceylon

TA'LCITE In Mineralogy, a synonym of *sacrite*; which see

TA'LENT (Gr ταλαντον) A Grecian weight, which was much used in the computation of money. It contained 60 minæ, but its value varied in different states The Attic talent was equivalent to about 198*l* of English money, the Æginetan to 331*l* (See as to the Attic talent, *Boeckh*, i 25, *Gibbon's Miscellan Works* iii 410)

TA'LES In Law If by reason of challenges or other causes a sufficient number of jurors do not appear at a trial, either party may pray a tales, that is, may pray that the sheriff supply the deficiency (4 c 50, the judge at the trial) to supply the number of qualified men who happen to be present (tales circumstantibus) to be joined with the other jurors to make up the twelve In practice this seldom arises, except in the case of special jury trials, when the talesmen are taken from the common jury panel in the same court *See* JURY

TALIO'NIS LEX (Lat) A punishment in which a person convicted of a crime suffered exactly in the same manner as he had offended thus an eye was required for an eye and a tooth for a tooth This mode of punishment was established by the Mosaic law, and was in some cases imitated by the Romans

TA'LISMAN (From the Arabic, dual of the noun telesm, Gr τελεσμα, in the sense of an astrological wonder, or effect of the stars) Among the Eastern nations, a figure cut in metal, stone, &c, supposed to have been made with particular ceremonies, and under particular astrological circumstances, and to possess various virtues, but chiefly that of averting disease or violent death from the wearer In a more general sense, any portable object endowed with imaginary influence in controlling evil spirits, &c has been so designated The term is frequently used as synonymous with amulet (which see), but, strictly speaking, the latter is not believed to possess such extensive powers as the talisman (See a curious article in the *Enc Metropolitana*)

TA'LLAGE (from the Fr taille), in the language of the old English law, is said to be a general name for all taxes by Sir E Coke *See* TOLL, TAILLE

TA'LLOW (Germ talg) The fat obtained by melting the suet of the ox and sheep, and straining it so as to free it from membrane

Tallow is an article of great importance It is manufactured into candles and soap, and is extensively used in the [illegible] various processes of the arts Besides the supplies of native tallow, we annually import a very large quantity, principally from Russia The exports of tallow from Petersburgh amount, at an average, to between 3,500,000 and 4,000,000 poods, of which the largest portion by far is brought to England the remainder being exported to Prussia, France the Hanse Towns, Turkey, &c

TALMUD The traditionary or unwritten laws of the Jews It is called *unwritten*, to distinguish it from the textual or *written* law, and, is in fact, the interpretation which the rabbins affix to the law of Moses, which embodies their doctrine, polity, and ceremonies, and to which many of them adhere more than to the law itself

The word is derived from Heb lamad, *he taught* The Talmud, therefore, is a book or volume, which contains such doctrines and duties as are *taught* to the Jews by their own authorized *teachers*, the ancient rabbins

There are two Talmuds, that of Jerusalem and that of Babylon, not to mention those of Onkelos and Jonathan, which are rather paraphrases than volumes of traditionary doctrines

The Talmud of Jerusalem consists of two parts — the *Gemara*, and the *Mishna* The *Mishna* signifies a doubling or reiteration, the *Gemara*, a work brought to perfection or completed, — from the Chaldee *gamar* to finish or complete The Gemara and the Mishna together, strictly speaking, form the Talmud, but the rabbins are wont to designate the Pentateuch of Moses the *first* part of the Talmud, and which is simply the law The *second* part is the *Mishna*, which is a more extensive explication or amplification of the law, and the *third* part, the *Gemara* as finishing, and completing it

The Mishna is the work of Rabbi Judah Hakkadosh, 120 years after the destruction of the temple of Jerusalem It is written in a tolerably pure style, and its reasonings are much more solid than those of the Gemara, which the Jewish doctors, it is stated, have stuffed with dreams and chimeras, and many ignorant and impertinent questions and disputations The Gemara was written about 100 years afterwards by Rabbi Jochanan, the rector of the school at Tiberias These two works form the Jerusalem Talmud

But the Talmud of Jerusalem is less esteemed than the Talmud of Babylon formed by Rabbi Asa or Aser, who had an academy for forty years at a place called Sura, near Babylon, where it was [illegible] Babylonish Talmud It is this Talmud which the Jews frequently consult, and it is esteemed [illegible] Jews who live beyond the Euphrates, from the circumstance that it was compiled at Babylon Rabbi Asa was called to his fathers before the celebrated commentary of the Mishna was completed but it was finished by his disciples (some say his children) about 500 years after Christ With the exception of the sacred authors, these Talmuds, after the Chaldee paraphrases, are the most ancient books of doctrine possessed by the Jews

A [illegible] in the year 1238 detected several errors [illegible] which he laid before Pope Gregory IX, who required the archbishops of France and the kings of Spain and Portugal to seize and burn all such books of the Jews and twenty cartloads of Hebrew books were accordingly burnt in France alone

Pope Paul IV and Clement VIII also signalized themselves in destroying all the Talmudic books that could be found, and many thousand volumes of the Talmud were by their orders juridically condemned to the flames These acts, worthy of Roman pontiffs might have suggested that famous list, entitled *Libri Prohibitorum*, which afterwards received much augmentation, and among the many *heretical* works enumerated might be found [illegible] *Spectator*

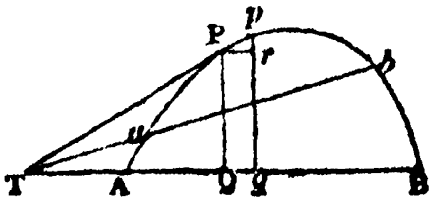
The Talmud of Jerusalem was printed in one vol folio, and that of Babylon in twelve and fourteen vols folio, which we find in a bookseller's catalogue thus described, "Talmud Babylonicum Hebraicum integrum ex Sapientum Scriptis et Responsis compositum a Rab Aser, additis Comment Rab Sal Jarchi, et Rab Mosis Ma[illegible] Hispani [illegible] Mant[illegible]" Extracts [illegible] and dissertations of the Jews, and selections from the Talmud, were written by Peter Stehelin and W Wotton, the former entitled *Traité sur les traditions des Juifs, avec des dissertations sur quelques passages du Talmud et autres Rabbinical Writings*, 2 vols 8vo 1742, the latter, *Miscellaneous Discourses relating to the Traditions and Usages of the Scribes and Pharisees in our Saviour's Time*, 2 vols 8vo 1718 (See the *Enc Metropolitana*, Wolff, *Bibl* ii 658, Eisenmenger, *Das Entdeckte Judenthum*, Remarks on the study of it in *Quart Rev* vol xlvii)

TA'LON (Fr) In Architecture, the same as *ogee*, which see

TA'LPA In Surgery a tumour under the skin or cuticle commonly called a *mole*

TA'LUS The sloping heap of fragments accumulated at the foot of a steep rock The term talus has also been applied [illegible] one of the bones of the ankle

TA'MARIND (Arab tamar hindy, *Indian date*) A large tree of the Leguminous order, whose pods supply the subacid preserve commonly sold in the shops under this name The pods in their natural state are acid, and acquire their sweetness by the sugar in which they are packed after their hard brittle shell has been taken off The tree itself is a native of both the East and West Indies



TA'MARIX (Tamarisia the people among whom it grows) is a name given by botanists to some shrubs of slender growth clothed with very small green leaves and long spikes of pink flowers, the natural country of which seems to extend from Spain to Delhi, occupying a band of ten or twelve degrees of latitude They are in this country merely ornamental plants, but in Syria and the adjoining countries they secrete a kind of manna, which some authors have asserted was the manna of scripture, but this opinion is not regarded as well founded

TAMBOURI'NE (Fr tambour) A musical instrument of procession of the drum species, being a cylinder of about 6 inches wide, in which bells are suspended It is covered at one end with parchment, after the fashion of a drum

TA'MPING A term used by miners to express the filling up of a hole bored in a rock for the purpose of [illegible]

TANGENCIES (Lat tango, *I touch*) In the ancient Geometry the *problem of tangencies* was one of the six branches of the geometrical analysis created by Apollonius of Perga Its general object was to describe a circle passing through given points, and touching straight lines or circles given in position the number of data in each case being, of course limited to three Of the treatise of Apollonius some lemmas only were preserved in the mathematical collections of Pappus; from which the treatise was restored by Vieta, of whose restoration there is an English translation by Lawson, with the addition of a supplement by Fermat, on Spherical Tangencies The principal cases of the problem of plane tangencies are given and neatly demonstrated, in *Leslie's Geometrical Analysis*

TA'NGENT (Lat tangens, from tango, *I touch*) In Geometry, the tangent to a curve is a straight line which meets or touches the curve without intersecting it The nature of the tangent may be explained as follows. — Let A P B be an arc of a curve, and let the straight line T A B intersect it in two points, A and B Conceive the straight line to revolve about the point T When it comes into the position T *a b* the intercepted arc *a* P *b* is shorter than A P B, or the points *a* and *b* have approximated Let the motion of the line about T still be continued, and the length of the intercepted

arc of the curve will become less and less, until the straight line comes into the position T P, when the two points *a* and *b* coalesce, or rather their distance becomes smaller than any assignable quantity In this ultimate position, the direction of the vanishing arc is that of the tangent, or the element of the arc coincides with the tangent.

From this it is easy to deduce an expression which determines the direction of the tangent at the point P Let A be the origin of the [illegible] ordinates, the abscissa being measured on A B Through P draw the ordinate P Q, and taking P *p* an indefinitely small element of the curve, draw *p* [illegible] *p*, and P *r* parallel to A B, also [illegible] A B produced in T The line Q T is called the subtangent, and the point P being assumed, it is only necessary to determine T, or the distance Q T, in order to have the tangent P T Now the triangles P *p r* and P Q T are similar, whence *p r* : *r* P :: P Q : Q T, but by the principles of the infinitesimal calculus *p r* = *d y*, *r* P = *d x*, and we have also P Q = *y*, therefore *d y* : *d x* :: *y* : Q T, that is, the subtangent $Q T = y \frac{dx}{dy}$

See DIFFERENTIAL CALCULUS, p 343

This is the general formula for the subtangent of any curve at the point whose co-ordinates are *x* and *y*, and therefore the position of the tangent can always be determined when the relation between *x* and *y* is defined by an equation, by differentiating that equation

One of the earliest uses which was made of the differential calculus was to find the positions of tangents to curve lines, and hence the calculus itself in its early period, was often denominated the *method of tangents* When the equation of the curve is given, it is easy to find [illegible] but the inverse problem to determine the equation of the curve when its subtangent at any point is given, requires an integration, and is consequently in general, attended with much greater difficulty The first problem was called the *direct* and the second the *inverse* method of tangents The terms are synonymous with differential and integral calculus

Euclid has shown that no straight line can be drawn between a circle and its tangent which does not cut the circle This property is true of all other curves, and the contact of a curve with its tangent is called a contact of the first order *See* CONTACT ANGLE OF

TANGENT, in Trigonometry, is the straight line which touches a circular arc at one of its extremities, and is terminated by the production of the radius passing through the other extremity The arc and its tangent have always a certain relation to each other, and when the one is given in parts of the radius the other can always be computed by means of an infinite series Let ϕ denote an arc and tan ϕ the tangent of the arc ϕ, we have the following series —

$$\phi = \tan\phi - \tfrac{1}{3}\tan^3\phi + \tfrac{1}{5}\tan^5\phi - \tfrac{1}{7}\tan^7\phi + \&c$$

$$\tan\phi = \phi + \frac{\phi^3}{3} + \frac{2\phi^5}{3\ 5} + \frac{17\phi^7}{3^2\ 5\ 7} + \frac{62\phi^9}{3^3\ 5\ 7\ 9} + \&c$$

The tangents were introduced into trigonometry by the Arabians, and the introduction has been of the most important use in simplifying calculations For the manner of using the sines cosines tangents, and other angular functions, see TRIGONOMETRY

TANISTRY An ancient Irish custom of descent defined as "descent from the oldest and worthiest of the blood" (See *Sir J Davies's Cases before the Irish Judges*, 1762) [illegible] but this seems [illegible] also *Quart Rev* vol lvi p 223)

TANK In the Navy a case of sheet iron about 4 feet square, and containing about 2 tons Bilge tanks are of various forms in order to employ the vacant spaces near the sides in small vessels Iron tanks have for many years been used in the navy from their incomparable superiority over casks in keeping the water sweet

TANK In Gardening, a cistern or reservoir, made of stone or timber or some other material, used in collecting and preserving water during a scarcity or drought Tanks are sometimes built in the ground and lined with [illegible] (*Loudon's Encyc of Gardening* p 603)

TANNERS BARK The bark of oak chestnut, willow, larch, and other trees, which abounds in tannin, and is used by tanners for preparing leather After being exhausted of the tanning principle by being chopped into small pieces or bruised, and steeped in water it is laid up in heaps to dry, and sold to gardeners for the purpose of producing artificial heat by fermentation in pits or beds, in bark stoves or other out-houses, or pits *See* STOVE

TANNIC ACID This term has been especially applied to a substance obtained by Pelouze by acting upon bruised galls by common ether, it is a white uncrystalline powder, very astringent, little soluble in water, and reddening litmus When [illegible] exposed to air it becomes converted into [illegible] It is extremely astringent, and appears to be the active principle of tanning substances (tannin) in general Its equivalent, deduced from the analysis of the neutral *tannates*, appears to be 426 Its ultimate elements are 30 atoms of carbon, 18 of hydrogen, and 24 of oxygen

TANNIN The pure astringent principle of vegetables, upon which the [illegible] into leather depends Its [illegible] of producing a dense whitish precipitate in a strong solution of animal jelly, such, for instance, as isinglass It may be obtained tolerably pure by infusing bruised grape seeds in cold water, or more circuitously by adding acetate of copper to filtered infusion of galls washing the precipitate, and decomposing it (diffused through water) by sulphuretted hydrogen On evaporating its [illegible] [illegible] [illegible]

Reichenbach, who has obtained from it six distinct substances, which he terms *paraffine*, *eupion*, *kreasote*, *picamar*, *capnomar*, and *pittacal*.

TAR, MINERAL. A variety of bitumen, much resembling petroleum

TA'RANIS. In Mythology, a Celtic divinity, confounded by Latin writers with their Jupiter He was regarded as the evil principle, and worshipped with human sacrifices; whence the verse of Lucan,—

Et Taranis Scythicæ non mitior ara Dianæ.

(See *Mem de l'Acad des Inscr* vol xxiv)

TARANTULA (So called from Taranto in Sicily) The name of a Labrician genus of Pedipalpous Pulmonary Arachnidans, infesting the torrid regions of Asia and America. The group is now divided into the genera *Phrynus* and *Thelyphonus* The term is also applied to a genus of spiders found in some parts of Sicily, whose bite produces a train of symptoms long believed to be curable only by music From this word is derived the term *tarantelle* the national dance of the Sicilians

TARDIGRADES (*Tardigradus* [Lat *tardus* slow, gradior *I march*]) A family of Implete Mammalia comprising those which are remarkable for the slowness of their motions when upon the ground, as the sloths

TARDO (*It slow*) In Music, a term denoting that the movement to which it is affixed is to be performed slowly It is nearly the same in signification as *largo*

TARE In Commerce an abatement or deduction made from the weight of a parcel of goods on account of the weight of the chest cask, bag &c in which they are contained Tare is distinguished into *real tare customary tare* and *average tare* The first is the actual weight of the package, the second its supposed weight according to the practice among merchants and the third is the medium tare, deduced from weighing a few packages and taking it as the standard for the whole In Amsterdam and some other commercial cities tares are generally fixed by custom, but in this country the prevailing practice, as to all goods that can be unpacked without injury, both at the custom house and among merchants, is to ascertain the real tare Sometimes however, the buyer and seller make a particular agreement about it

TARE In Agriculture *See* VETCH

TA'RGUM A Hebrew word denoting a paraphrase of some portion of scripture in the Chaldean language of which there are ten in existence the two principal ones being those of Jonathan (or rather the Pseudo Jonathan) an author who wrote a paraphrase or rather a commentary, upon the Greater and Lesser Prophets about thirty years B C, and of Onkelos upon the Pentateuch which is considered the most valuable of all and is referred to the first century of our era Two others are supposed to be of considerable antiquity The remaining six are comparatively modern (See *Enc Metr*)

TA'RIFF A table alphabetically arranged specifying the various duties, drawbacks, bounties &c charged and allowed on the importation and exportation of articles of [illegible]

TARPAWLING A [illegible] or tarred canvass cover generally

TARRAS, or TERRAS A volcanic product which, mixed with mortar gives it the property of hardening under water Several argillo-ferruginous minerals possess this property, and are often indiscriminately used under this term

TARSE, *Tarsus* (Gr ταρσος, *sole of foot*) In Mammalia, signifies the collection of small bones between the tibia and metatarsus, or those which constitute the first part of the foot In Birds, it is sometimes applied to the third segment of the leg which is rarely fleshy or feathered, and corresponds with the tarsus and metatarsus conjoined In Insects, it signifies the aggregate of minute joints which constitute the fifth principal segment of the leg or the foot

TA'RTAR (Gr ταρταρος *infernal*, because it is the sediment or dregs of wine) The substance which concretes upon the inside of wine casks It is called red and white *argol*, according to the wine from which it is obtained. When purified it is often called *cream of tartar* it is a bitartrate of potash

TARTAR EMETIC A double salt, consisting of tartaric acid in combination with potassa and protoxide of antimony *See* ANTIMONY

TARTARIC ACID [illegible] of tartar This acid is contained in grapes [illegible] in tamarinds and several other fruits It is usually obtained from purified tartar 4 parts of powdered tartar and 1 of chalk are mixed in hot [illegible] of [illegible] combines with the [illegible] the tartaric acid being thereby liberated by decomposition When pure it forms white crystals composed of one equivalent of dry acid and one of water (66 + 9 = 75) The anhydrous tartaric acid, as it exists in the dry tartrates (tartrate of lead, for instance), is composed of

		Atoms.	Equiv.	
Carbon		4	24	36 36
Hydrogen		2	2	3 03
Oxygen		5	40	60 61
		1	66	100 00

TARTAR OF THE TEETH This substance, which occasionally concretes upon the teeth, consists, according to Berzelius, of

Salivary mucus	13 5
A [illegible] matter soluble in muriatic acid	7 5
Phosphate of lime (earthy phosphates)	7 9
	100·0

TA'RTARUS (Τάρταρος, called also the house of Hades by the Greeks, and Orcus by the Latins), was the name of the infernal regions, over which Pluto or Hades had dominion

TARTRATES Salts in which the tartaric acid is combined with bases

TARTROVI'NIC ACID An acid composed of tartaric acid in combination with the elements of ether

TARTUFFE A common French nickname for hypocritical pretenders to devotion It is derived from the celebrated comedy of Molière of which the hero is so called Whether Molière invented or took it from the popular language of the time, does not appear some say that he intended to attack Louis XIV 's confessor, Père la Chaise, whom he had once seen eating truffles with peculiar *goût*, and thence the name The play was written in 1664 but not acted till 1669, great difficulties being thrown in the way by the authority the clergy and the papal legate On one occasion it was prohibited when the curtain was on the point of rising and Molière announced to the public its disappointment in the well-known equivocal words 'Monsieur le président ne veut pas qu'on le joue' When it last succeeded through the influence it is said, of the king himself it had a run of three months with unparalleled success, and the eager attention [illegible] at once [illegible] of those who profess a religious character In England, this play has been made more than once to serve the popular passions of the day Cibber translated it and made the hero a [illegible] and the play is still acted under the name of *The Hypocrite* in which the Tartuffe is a methodistical divine

TASTE That power of the mind which is conversant about the beautiful both of nature and of art In the Latin language the same metaphor obtained a very wide application and the term sapientia was employed to signify quickness and correctness of judgment generally Shaftesbury's use of the term is nearly as extensive, being applied by him to manners morals, and government, and to wit ingenuity and beauty In its modern use it is restricted to those objects which fall within the province of imagination Now although imagination derives its objects pre-eminently from those of the sight and hearing, and although the epithet *beautiful* is, for the most part, confined to these yet the mental power which judges of them borrows its name from a third sense The reason of this is satisfactorily shown by Coleridge (*Literary Remains* vol i) The senses, he observes, are either purely organic, or mixed The former present their objects to the mind distinct from its perception of them, while the latter invariably blend the perception of the object with a certain consciousness of the percipient subject To the latter class belong the touch the smell, and the taste Of these taste and smell differ from the touch as adding to that reference to our vital being which is common to the three a degree of enjoyment or otherwise, while the taste is distinguished from the smell only by its more frequent and dignified use in human nature By taste then, as applied to the fine arts, we must be supposed to mean an intellectual perception of any object blended with a distinct reference to our sensibility of enjoyment or dislike

In the same essay Coleridge gives another and a wider definition of taste, as "a metaphor taken from one of the mixed senses, and applied to objects of the more purely organic, and of *our moral sense* when we would imply the coexistence of an immediate personal dislike or complacency" Now, by the constitution of man's nature, every exertion of human activity in the pursuit of the good, the beautiful, and the true, combines a sense of pleasure, or the contrary, with the perception of their [illegible] in fact would [illegible] dest [illegible] While, however, in the case of the true, this coexistent pleasure has not received any distinctive appellation, and while [illegible] pre- [illegible] [illegible] [illegible]

But taste, like all other metaphorical terms is extremely [illegible] and by directing attention exclusively to this element of pleasure, it has led to a very inadequate conception of the true nature of the faculty which it designates It is Alison's *Inquiry into the Ideas of Beauty and Virtue* which first [illegible] and a sense which, similarly to the other senses, procures a pleasure totally distinct from a cognition of principles, or of the causes relations and uses of an object, that beauty strikes at first sight, and that knowledge the most perfect will not increase the pleasure which it gives rise to, and lastly, that all the diversity of sentiments excited in different minds by the beautiful arise solely from the modifications of the sense by association, custom, example, and education Among the [illegible] of the theory of a moral taste we may reckon Hume, Akenside Blair, Lord Kames, and Beattie

Blair accordingly defines taste to be the power of receiving pleasure from the beauties of nature and art, while Akenside describes it as "certain internal powers feelingly alive to each finer impulse" Dr Beattie (*Essay on Poetry and Music*) supposes taste to have its origin in a mutual harmony and sympathy between the soul in its first formation and the rest of nature, which experience may confirm, but no perverse habits subdue In the *Essay on the Delicacy of Taste*, Mr Hume talks of it as a natural sensibility, while in the *Essay on the Standard of Taste*, he seems to admit of no other criterion than the decisions of a due and sufficiently extensive experience Lastly, Lord Kames declares a taste in the fine arts to be nearly allied to the moral sense, but yet, like morals, capable of being raised to a rational science by an examination of the sensitive branch of the human constitution, and an enumeration of the objects which are either agreeable or disagreeable by nature

But taste is not only a sensitive, but also a cognitive faculty When a beautiful object is presented to the mind, not only does it make on it a delicious impression of pleasure, but the mind in the first place passes judgment upon it, and declares it to be beautiful, that is, conformable to a standard called the beautiful In this complex operation of taste the judgment is the antecedent, and the pleasure the consequent When the impassible judgment has passed sentence upon the object, then the sensibility is awakened to certain sentiments, which are, as it were, the echo of the reason (Cousin, *Sur le Vrai, le Bien et le Beau*)

Thus, too, Ancillon (*Melanges Literaires &c*) —'The impression which an object makes on the senses is insufficient to give rise to the sentiment of the beautiful The impression on the senses is but the occasion on which the taste declares that the idea which it impressed on the sensible object, and which that object expresses is the idea of beauty" To this view of taste we may refer the opinions of Addison and Burke According to the latter, taste is that faculty or those faculties of the mind which are affected with, or form a judgment of, the works of imagination and the elegant arts, while Addison connects the emotion of pleasure with the power of distinguishing the beauties and imperfections of an author To this class also we must refer the views of Sir Joshua Reynolds, Dr Gerard, and Mr Alison According to the latter, taste is that faculty of the human mind by which we both perceive and enjoy whatever is beautiful and sublime in the works of nature and art the perception of these two qualities being attended with an emotion of pleasure distinguishable from every other pleasure of our nature In the sketch of his proposed work, which unfortunately he has never completed, he intended to show the nature of the [illegible] refutation of the theory of Hutcheson, [illegible] it has no resemblance to a sense, and that it is not even a separate and peculiar faculty but admits of being ultimately resolved into more general principles of our mental constitution If taste were only a sense, it would be difficult to explain the fact, that amidst the inexhaustible variety of sensations which different minds experience from the beautiful, there nevertheless reigns a certain unanimity in men's judgments with respect to it, which cannot have any other source than the identity of reason in the human species The sense of pleasure, however, is still a necessary and essential element of the faculty of taste Without it we should be condemned to a perfect uniformity of sentiment in the presence of the beautiful, in the same manner as the absence of judgment would reduce us to an endless diversity

The same conclusion will follow from an examination of some of the principal definitions of beauty According to St Austin (Ep 18), "unity is the universal form of [illegible] (*De Libero Arbitrio*), "beauty [illegible]" De Crousaz (*[illegible]*) makes it consist in variety, unity, regularity, order, and proportion Winckelmann and Sulzer agree also in making unity and multiplicity to be essential constituents of the beautiful And lastly, [illegible] unity in the Italian schools of painting, was, [illegible]," —variety in unity, which is nearly identical with Hutcheson's explanation of it, —uniformity in variety The justness of these views will readily appear, if we consider that while variety satisfies the demands of the imagination by affording the gratification most conformable to its nature and laws, unity is necessary for its being apprehended by the judgment, and in order to its appreciation as a work of art

A few definitions of beauty remain to be noticed, which approximate to the theory of Hutcheson According to Burke (*On the Sublime and Beautiful*), and Price (*Essay on Beauty*), beauty consists in such qualities as induce in us a sense of tenderness and affection Alison declares that the qualities of matter are neither beautiful nor sublime in themselves, but only such so far as they are signs or expressions of qualities capable of producing emotion Wieland makes beauty consist in the unity in an *agreeable* variety [illegible] to the [illegible] mind pleases irrespectively of any idea of utility, or of any conception of design, simply by the correspondence of the object and and the sensitive organ

The emotions of taste are [illegible] to those of the sublime and beau[illegible] Burke seems with justice to have denied the existence of any intrinsic difference between them According to Burke, indeed, the terrible is a fruitful source of the sublime and this idea does not seem capable of being made an ingredient of the beautiful In the same way, on the other hand, there are ideas eminently beautiful which can never give rise to an emotion of sublimity Nevertheless, this does not constitute an essential difference between the two It is with reference to their several effects upon the imagination that they may perhaps be most correctly distinguished Considered in itself, a beautiful object ought to present the greatest possible unity combined with the greatest possible variety, and considered in the effect it produces on the mind, its beauty consists in the free, facile and harmonious play of the imagination On the other hand the [illegible] lost and overpowered in the contemplation [illegible], which in its infinity presents at once unity and variety

TASTO (It *the touch*) In Music, a term used in conjunction with *solo*, to signify that the instruments that can accompany by chords are only to play single sounds till the direction is contradicted by the word *accordo* or *accompanimento*

TA'TTA (Indian) A bamboo frame or trellis, over which water is suffered to trickle with a view of cooling the air as it enters the windows or doors

TATTOO'ING The name given to a practice common to several uncivilized nations, which consists in puncturing the skin and rubbing a dye or gunpowder into the wounds by means of which certain figures are represented on the face and other parts of the body on which the operation has been performed

TAU'RUS (Lat *the Bull*) In Astronomy, the second in order of the twelve zodiacal constellations There are several remarkable stars in this constellation Aldebaran, of the first magnitude, in the eye, the well-known cluster called the Pleiades, in the neck, and the Hyades in the face *See* CONSTELLATION, ZODIAC

TAU'TOCHRONE (Gr ταυτος *the same* and χρονος, *time*), in Mechanics, is a curve [illegible] having this property that a heavy body descending [illegible] by the attraction of gravity will always arrive at the lowest point in the same time wherever the point from which the body begins to fall be taken in the curve Huygens first showed that this is a property of the common cycloid when the motion takes place in a vacuum, and gravity is supposed to act in parallel straight lines (See CYCLOID) Newton and Hermann also determined the tautochrone in a vacuum, when gravity is supposed to be directed towards [illegible] Newton likewise showed that the cycloid [illegible] a medium when the resistance is proportional to the velocity (*Principia*, book ii prop 26), and Euler first determined the nature of the curve when the resistance is proportional to the square of the velocity (*Mechanica*, vol ii) See also Joh Bernoulli, *Opera*, vol iii

TAUTO'LOGY (Gr ταυτο, *the same thing*, and λογος, *discourse*) In Rhetoric, a vicious diction, by which the same idea is expressed in two or more different words or phrases, apparently intended to convey different meanings

TAWING The art of preparing certain kinds of leather by imbuing the skins with saline, oily, and other matters *See* LEATHER

TAXATIO ECCLESIASTICA A name given to several public records The oldest is that of Norwich, made in 1253, for the purpose of assessing the first fruits and tenths of ecclesiastical benefices, sometimes called Pope Innocent's valor that pontiff having made a present of them for [illegible] to Henry III All taxation was regulated by this assessment until the reign of Henry VIII, when the *Valor Ecclesiasticus*, sometimes called the *King's Books*, was compiled by his commissioners

TAXATION A tax is a rate or duty laid by government on the incomes or property of individuals, or on the

products consumed by them; the produce of such duty or rate being placed at the disposal of government

A tax may be either general or particular, that is, it may either affect all classes indiscriminately, or only one or more classes.

Taxation (Lat taxatio) is the general term used to express the aggregate of particular taxes It is also the name given to that branch of the science of political economy which explains the mode in which the revenue required for the public service may be most advantageously raised

It would be quite superfluous to enter into a lengthened argument to show the utility or rather necessity of raising a revenue for the use of government. *Neque quies gentium, sine armis, neque arma, sine stipendiis, neque stipendia, sine tributis haberi queunt* (*Tacit Hist* iv cap 74) It is admitted on all hands that security from foreign invasion, the speedy and impartial administration of justice, and the maintenance of good order and tranquillity are absolutely indispensable to the successful exertion of industry and to the advancement of society And when such is the case, no individual can justly complain that he is made to contribute, in the same proportion to his means as others, for the attainment of such objects, or, which is the same thing that he is made to pay his fair share of the sum required to procure the services of the soldiers and sailors necessary to repel hostile aggression, and to support the various institutions and public functionaries required to maintain internal peace to promote prosperity and to protect every citizen in the undisturbed enjoyment of his property and rights In most countries the public has frequently had to contribute larger sums than have been required for the ends of good government But abuses of this kind obviously originate either in the misconduct of administration, or in the defective political organization of the states in which they occur, and do not, therefore properly come within the scope of our inquiries In treating of taxation, the object of the political economist is not to inquire whether the revenue raised by the state exceed its necessary wants, or whether it be judiciously expended, but to point out the effect of taxation on individual and public wealth and, by analyzing the various methods in which a revenue may be raised and comparing them together to show which is most advantageous, or rather which is least injurious But as such inquiries, were they prosecuted at any considerable length, would involve discussions nowise suited for a work of this kind, and far exceed its limits, we must confine ourselves to a few observations illustrative of the principles that should be especially kept in view in the imposition of taxes

Taxes may be either direct or indirect, that is they may be either imposed on the incomes or property of individuals, or on the articles on which these incomes or property are expended But before proceeding to inquire into the nature and influence of different taxes it may be proper to premise the maxims laid down by Adam Smith with respect to taxes in general inasmuch as they are drawn up with singular judgment and comprehensiveness

First Maxim —"The subjects of every state ought to contribute towards the support of the government, as nearly as possible in proportion to their respective abilities, that is, in proportion to the revenue which they respectively enjoy under the protection of the state The expense of government to the individuals of a great nation is like the expense of management to the joint tenants of a great estate In the observance or neglect of this maxim consists what is called the equality or inequality of taxation"

Second —"The tax which each individual is bound to pay ought to be certain and not arbitrary The time of payment, the manner of payment, the quantity to be paid, ought all to be clear and plain to the contributor and to every other person When it is otherwise, every person subject to the tax is put, more or less, in the power of the tax-gatherer, who can either aggravate the tax upon any obnoxious contributor, or extort, by the terror of such aggravation, some present or perquisite to himself The uncertainty of taxation encourages the insolence and favours the corruption of an order of men who are naturally unpopular, even where they are neither insolent nor corrupt The certainty of what each individual ought to pay is, in taxation, of so great importance, that a very considerable degree of inequality, it appears, I believe from the experience of all nations, is not so great an evil as a very small degree of uncertainty"

Third —"Every tax ought to be levied at the time and in the manner in which it is most likely to be convenient for the contributor to pay it A tax upon the rent of land or of houses, payable at the same term at which rents are usually paid, is levied at the time when it is most likely to be convenient for the contributor to pay, or when he is most likely to have wherewithal to pay. Taxes upon such consumable goods as are articles of luxury are all finally paid by the consumer, and generally in a manner that is very convenient for him He pays them by little and little as he has occasion to buy the goods, and as he is at liberty, too, either to buy or not to buy as he pleases, it must be his own fault if he ever suffers any considerable inconveniences from such taxes"

Fourth —"Every tax ought to be so contrived as to take out and to keep out of the pockets of the people as little as possible, over and above what it brings into the public treasury of the state" (*Wealth of Nations*, M'Culloch's ed 1 vol 8vo p 371)

It may be, and in fact often has been supposed, that direct taxes, or taxes laid on property or income, or both, would have the advantage of corresponding better with the first of Smith's maxims than any other description of taxes, by making individuals contribute to the wants of the state proportionally to the revenue which they enjoy under its protection, and so, no doubt, were it possible to assess them fairly, such would be the case But the obstacles in the way of their fair and equal assessment are such as can never be overcome, and the truth is, that taxes on property and income are theoretically the most unjust that can be imagined We may get a pretty accurate notion of the income derived from lands, houses, funded property, and mortgages, but all beyond this is mere guesswork There are no means by which to ascertain the amount of farming capital, stock in trade, the profits derived from them, or the incomes of professional men No inquisition into the private affairs of individuals can ever discover these particulars There is nothing, in fact, to depend upon in such cases but the declarations of the parties and we need not dwell on the impolicy of any system of finance that sets the duty and the interests of the contributors in opposition and makes them profit by concealing or perverting the truth Besides, although these preliminary and insuperable difficulties were overcome and we learned the capital and incomes of different parties we should have other and greater difficulties to surmount before the tax could be fairly assessed The same deduction should not be made from incomes derived from sources that are not equally lasting To assess them on a just principle the present value of different incomes, or their value reduced to a perpetuity, would have, in the first place to be determined

But it may be unhesitatingly affirmed that to do this upon a large scale would be quite impracticable It is clear therefore that taxes on income or property should not be introduced except as a *dernier resort*, as a means of filling the coffers of the treasury when the other and more legitimate sources of revenue are insufficient, and when as in the late war, money must be had at all hazards

It is besides absurd to suppose as has been done, that the burdens that at present fall on the labouring classes could be sensibly reduced by repealing the duties on tea, sugar, soap, &c, and imposing in their stead taxes on property Suppose that the attempt were made, and observe what the result must be A manufacturer employs a certain number of men, who pay 100*l* a year in taxes on commodities Now if the taxes that are at present paid by the labourers be repealed, those that fall on their employers must be equally increased, so that the manufacturer in question will have 100*l* more to pay in taxes after the change takes place, and will of course have 100*l* less to lay out on wages It is consequently contradictory and absurd to suppose that you can improve the condition of the labouring classes by removing the taxes that fall on them to lay them on capitalists

Direct taxes on property have been the curse of every country into which they have been introduced, and are at once a consequence and a cause of a low and impoverished state of society To evade them, people that are not poor counterfeit poverty, some of the most powerful incentives to industry and economy are in consequence destroyed at the same time that inferior stock, machinery, &c are made use of Such taxes are besides most unpopular, as well from their requiring an odious though ineffectual inquisition into the affairs of individuals, as from their being direct So much is this the case that we are well convinced that the raising of eighteen or twenty millions by taxes on income would be felt to be a much greater burden, and would really be far more injurious than the raising of fifty or sixty millions by well-devised indirect taxes such as the greater number of those that now exist in England

Luckily however indirect taxes have almost invariably been the great favourites both of princes and subjects, and there are many solid reasons why this should be the case The burden of direct taxation is palpable and obvious It admits of no species of disguise or concealment, but makes every one fully sensible of the exact amount of income taken from him by government Every one, however, is extremely averse from parting with property, unless he obtain some more acceptable equivalent in its

stead; and as the benefits derived from the institution of government are neither [illegible] to be easily and readily fel[illegible] of the people there is, in the great majority of cases, a [illegible]nclination to pay a large amount of direct [illegible] it is that governments have so generally had recourse to indirect taxes Instead of exciting the prejudices of interested parties by openly demanding a specific portion of their incomes, they have taxed the articles on which these incomes are usually expended This ingenious plan conceals the amount of taxation, and makes its payment appear in some measure voluntary The tax being generally paid, in the first instance, by the producers, [illegible] the natural price of the [illegible] demand being made upon them for the tax, it escapes their recollection, and the article which they receive seems the fair equivalent of the sacrifice made in acquiring it Such taxes have also the advantage of being paid by degrees, in small portions, and at the time when the commodities are wanted for consumption, or when it is most convenient for the consumers to pay them

That indirect taxes labour under some considerable disadvantages is obvious, but these have been much exaggerated It is alleged in the first place that taxes on commodities necessarily alter the natural distribution of the capital and industry of a country, and force them into less advantageous channels, because, where a tax is laid on a particular class of commodities, the producers, in order to raise the price proportionally to the tax, diminish the supply in the market by transferring a portion of the capital employed in the production of the taxed commodities to some other business But it is to be observed that this effect, if it be sensible at all, [illegible] when a duty is first imposed, and that [illegible] the duty is blended with the cost of production, and has no further influence over the distribution of capital It is also true, that, provided the tax be not oppressive, or so high as to drive capital wholly from the business, it acts as a stimulus to invention, and makes those engaged in the business exert themselves, by new efforts of ingenuity and economy, to find out means of paying the tax without adding to the price of the articles produced, or withdrawing any portion of their capital from the business In many instances these efforts have been completely successful, and in some instances the influence of the tax has been more than neutralized by the exertions made to defeat it

Taxes on commodities being almost always paid by the producers before they are sold to the consumers, they not only, it is said, increase prices by the whole amount of the duties, but also by the profits due to the manu[illegible]

[illegible]

its influence in this respect has been greatly over-rated by M Say, M Sismondi, and others The latter has calculated that a tax of 4000 francs, paid originally by a manufacturer whose profits were 10 per cent, would, if the manufactured commodity only passed through the hands [illegible]

[illegible]

ceeds on the supposition that he who first advanced the tax would receive from the next manufacturer 4400 francs, and he, again, from the next, 4840 francs, so that at each step 10 per cent on its value should be added to it "But," as Mr Ricardo has justly observed "this is to suppose that the value of the tax would be accumulating at compound interest, not at the rate of 10 per cent per annum, but at an absolute rate of 10 per cent at every step of its progress M Sismondi's statement would be correct if five years elapsed between the first advance of the tax and the sale of the taxed commodity to the consumer, but if one year only elapsed, a remuneration of 400 francs, instead of 2734, would give a profit at the rate of 10 per cent per annum to all who had contributed to the advance of the tax, whether the commodity had passed through the hands of five manufacturers or fifty" (*Principles, &c* 3d edit p 459)

It is certainly true that duties on commodities encourage smuggling "They tempt," says Dr Smith, "persons to violate the laws of their country who are frequently incapable of violating those of natural justice, and who would have been [illegible] lent citizens, had not the laws [illegible] that a crime which nature never meant to be so" (P 378) In consequence of this tendency, duties on commodities require the employment of a number of revenue officers, and as they expose the producers of the taxed articles to considerable inconvenience and hardship from domiciliary visits they are [illegible] by the necessity of making a corresponding addition to the price of the goods But this, after all, is not so much a consequence of duties on commodities, as of their abuse, or of their being carried to an oppressive extent So long as they are confined within reasonable limits, the temptation which they create to engage in smuggling transactions may be very easily obviated; and it has been shown over and over again that duties so restricted are uniformly more productive than those which are carried to such a height as to hold out any great encouragement to smuggling

It may also be said that duties on commodities do not fall on individuals in proportion to their means of paying them, and that while they press with undue severity on persons with large families or who occupy prominent stations they [illegible] direct wealth wrought by rich miners and those in the more [illegible] walks of life But in taxation we have only a choice of difficulties However desirable, it is, as already seen, quite impossible to tax individuals in proportion to their incomes, and as any attempt to impose an equal income tax would not only be sure to fail, but would be attended with the most disastrous effects, resort must necessarily be had to the best practicable taxes, that is, to duties on commodities. And it does not really appear that such duties can be considered as unequal If duties be laid on sugar or wine, those who abstain from their use will, of course, escape them, but those who use such articles have no good right to complain of this, seeing that they may also, by exercising the same self-denial as the others, exempt themselves from the duties

Taxes on commodities are most commonly divided into two great classes, [illegible] external or frontier, and the other [illegible] first class, [illegible] portation into a country, and sometimes also on native commodities when exported The second class, which are here called excise duties, are charged on certain articles produced [illegible] intended for home consumption [illegible] great sources of indirect taxation, duties are [illegible] laid on the paper or other materials necessary to the completion of deeds and other contracts, on the liberty to use certain articles and to exercise certain privileges, &c

Customs duties formed an important branch of the public revenue of most ancient states, and in modern times they have been very extensively imposed In England they have been charged from a very remote period, and though inconsiderable at first, they have increased with the increase of civilization and commerce, till they have long formed one of the most copious sources of the public revenue The [illegible] were collected for the first time in a book of rates, [illegible] published in the reign of Charles II, but there is hardly a year in which the customs duties [illegible] cations It is now [illegible] acts imposing or varying the customs duties before they become inoperative, so extremely numerous, and tariffs, or tables of duties, drawbacks, &c, are annually published for the convenience of merchants and others

Owing principally to the vast increase of the commerce, wealth, and population of the country, but partly also to the increase of the rates, the progress of the customs duties has been quite extraordinary The revenue derived from the customs duties in 1596, in the reign of Elizabeth, amounted to no more than 50,000*l* In 1613, it had increased to 148,075*l*, of which no less than 109 572*l* was collected in London In 1660, at the Restoration, the customs produced 421,582*l*, and at the Revolution, in 1688, they produced 781 987*l* During the reigns of William III and Anne, the customs revenues were considerably augmented the nett payments into the exchequer in 1712 being 1 [illegible] 422*l* During the war terminated by the peace of Paris in 1763 the nett produce of the customs revenue of [illegible] nearly 2,000,000*l* In 1792, it [illegible] at the close of the war [illegible] France, it amounted to [illegible] and [illegible] the customs revenue of the United Kingdom amounted to 22 015,754*l*, of which [illegible] 12 031 501*l*

[illegible] duties were charged [illegible] duties, whether exported or imported, the duty on wool sent to the Netherlands, France, &c being formerly, in fact, the principal item in the customs revenue But for a long time past customs duties have been almost exclusively laid on imported articles, those laid on exports being, in most instances, imposed rather to check or prevent the exportation of the articles, than in the view of raising revenue.

Customs duties, when judiciously imposed, and confined within reasonable limits, are perhaps the least exceptionable of all taxes (*See* CUSTOMS) But if they be carried to such a height as [illegible] stimulate smuggling they [illegible] very purpose for which they are intended Our finance ministers have not, however, been sufficiently alive to this obvious consideration There can be no articles better fitted to bear customs duties than tobacco and spirits, but the duties with which they are loaded are so extravagantly high that they occasion a great deal of smuggling, with its accompanying crime and demoralisation, and [illegible] more productive were they [illegible] existing duties on brandy and geneva are, perhaps, the very worst in our tariff, but

they would be about the very best were they reduced from 22*s* 6*d* to 8*s* or 10*s* a gallon.

As already stated, the customs revenue of 1840 amounted to 23,341,813*l*, and we hesitate not to affirm that no equal amount of revenue was ever raised in any country, or in any period of time, with so little difficulty and inconvenience. The assessed taxes, exclusive of the land tax produced in 1840, 2,191,404*l*, and which only fall heavily on the wealthy, no one can doubt that their payment produced more irritation, and was regarded as a greater burden by the public than the payment of the customs duties, though the latter [illegible] seven times as great an amount of money into the treasury.

The excise revenue for 1840 was collected in Great Britain at a charge of 4*l* 18*s* 10*d* per cent on its gross produce, and in Ireland, at a charge of 10*l* 8*s* 3*d* on ditto.

Excise Duties. — The next great branch of the public revenue consists of inland or excise duties, that is, as already seen, of duties charged on certain commodities produced or manufactured at home.

Excise duties were introduced into England by the Long Parliament in 1643, being then laid on the makers and venders of ale, beer, cider, and perry. The Royalists soon after followed the example of the Republicans both parties declaring that the excise should be continued no longer than the [illegible] of the war. But it was found too productive a source of revenue to be again relinquished, and when the nation had been accustomed to it for a few years, the parliament declared, in 1649, that the "impost of excise was the most easy and indifferent levy that could be laid upon the people." It was placed on a new footing at the Restoration, and notwithstanding Mr Justice Blackstone says that "from its first original to the present time its very name has been odious to the people of England" (*Com.* book i. c. 8), it has continued progressively to gain ground, and it is at this moment imposed on several most important articles, and furnishes nearly a third part of the entire public revenue of the kingdom. *See* EXCISE DUTIES.

Some excise duties that were justly objected to have been repealed within these few years, and with the exception of the duty on glass, which interferes injuriously with the manufacture, we are not sure that there is one of the existing duties that can be fairly objected to on principle, though the rate of duty might, in some instances, be advantageously reduced. We subjoin an account of the articles subject to excise duties in Great Britain in 1850, with the nett produce of the duties in the same year:

Articles	Nett Revenue		
	l	*s*	*d*
Hackney carriages - -	79,208	3	0
Hops - - -	307,077	2	2½
Licences - - -	1,029,398	10	5½
Malt - -	5,169,371	9	9½
Paper - - -	809,241	5	2½
Post horse duty -	112,027	3	3½
Post horse licences - -	4,935	3	6
Railways - -	251,214	16	0½
Stage carriages - -	192,079	16	8
Soap - - - -	1,065,571	10	4½
Spirits - - -	4,808,811	5	1½
Total - -	13,853,436	14	8

It has been said that the excise duties "greatly raise the cost of subsistence to the labouring classes." But this assertion has really no solid foundation. We have seen above that, in 1850, the excise duties in Great Britain produced 13,853,437*l*. Now of this sum the duties on spirits, malt, and licences, produced 10,998,580*l*. In fact, the only excise duty that can be said to fall on a necessary of life is that on soap, which produced in 1850 (in Great Britain) 1,065,572*l*, and as the population of Great Britain amounts at present to about 21,000,000, the soap tax, at an average, does not impose a burden of above 1*s* a year on each individual! If we estimate its annual pressure on a labouring family of five persons at 3*s*, we shall not be within, but rather beyond the mark. In Ireland there is no tax on soap.

The duties on glass were lately the most objectionable, and various reductions were made in their amount. But in their amended state they interfered most materially with the processes carried on in the manufacture, and, by obstructing the introduction of new discoveries, and improved methods, enhanced the price of the article in a greater degree than might have been inferred from the amount of the duty. In consequence they were finally repealed in 1845.

The only taxes in the departments of customs and excise, or of the revenue generally, that can be truly said to fall on articles necessary to the labourer are, besides soap, those on tea, sugar, and one or two more. It is pretty certain that the duty on tea, which is the most [illegible] might be materially reduced without affecting the revenue, and the presumption is that it will be so reduced. The duty on sugar, which enters so largely into most descriptions of food is now very moderate, and the trade [illegible] they were [illegible] the pressure of exigencies, the duties on spirits obstruct a pernicious habit, and should not be given up. They are the best of all possible duties, and the only thing to be attended to in their imposition is, not to carry them to such a height as to defeat their operation by encouraging smuggling. We have yet to learn, supposing they are not carried beyond this limit, that a single good objection can be made to these duties.

The obscurity and complexity of the excise laws have been justly complained of, in this respect, however, they have been materially improved of late years, and the statutes under which they are collected are now, for the most part, sufficiently perspicuous, and easily understood.

The capacity of a tax on a commodity to raise a revenue depends partly on the nature and extent of the demand for the taxed article, and partly on the means of preventing its being smuggled or the duty evaded. Every tax, by raising the price of the article on which it is laid, has a tendency to bring it within the command of a smaller number of purchasers, and to lessen its consumption. An individual who might be able and disposed to pay 1*s* a bottle of duty on wine might neither have the means nor the inclination to pay 2*s* or 3*s*, and instead of being augmented the revenue might be diminished by such an increase of duty. And hence, whenever the duties on commodities are raised beyond certain limits, — which, however, it is impossible to define *a priori*, seeing that they necessarily vary according to the description of commodities charged with duties, the varying tastes and circumstances of society, and the means of counteracting smuggling, — they depress consumption to such an extent as to become less productive than if they had been lower.

Variations in the amount of the duties affecting commodities have exactly the same effect on their price, and consequently on their consumption, as corresponding variations in the cost of production. But it is clear that any reduction in the price of articles the necessary cost of which is very considerable, and can therefore be used only by the rich, would not so powerfully increase their consumption as an equal reduction in the price of cheaply produced commodities in general demand. Thus, a reduction of 25 or even 50 per cent in the price of coaches, would not add greatly to the demand for them, for notwithstanding this reduction, they would still be luxuries for which none but the rich could afford to pay. But a reduction of 25 or 50 per cent in the price of tea, sugar, beer, gin, or any article in general demand, would extend its consumption in a much greater ratio. The reason is plain. The lower classes form by far the most numerous portion of society, the articles referred to, and others of the same description, are highly esteemed by them, and are, even at their present prices, extensively consumed. But a reduction of a half, or even a fourth from their price, would add prodigiously to the demand for them. It would enable their present consumers to use them in larger quantities, while it would at the same time bring many of them fully under the command of a very large class by whom they are now used as luxuries only on rare occasions. The history of taxation in this and other countries fully confirms this statement. When carried beyond due limits, taxes [illegible] to be productive, and recover that [illegible] by which they are reduced. There is much truth in the shrewd remark of Dr Swift, that in the arithmetic of the customs two and two do not always make four, but sometimes only one. In 1808 the duty on coffee was 1*s* 7½*d* per lb, the quantity [illegible] 1,069,691 lbs, [illegible] 1*s* 4*d*. In the course of the year the duty was reduced to 7*d* per lb, and next year no fewer than 9,251,837 lbs were entered for home consumption producing a nett revenue of 245,886*l*. The coffee duty was subsequently lowered to 4½*d*, and the quantity entered for consumption is now (1852) about 32,000,000 lbs, and the revenue about 640,000*l* a year.

The history of the duties on tea, spirits, wine, sugar, and indeed of every other article in extensive demand, is precisely similar. When carried to an oppressive height, the duty either occasions the use of the article to [illegible] which is the most common case, it makes [illegible] through clandestine channels in defiance of the law. But when the duty is moderate, a taste for the article is diffused, and the profits to be made by trampling on the law not being sufficient to remunerate the smuggler, he is forced to abandon his hazardous occupation, and the article is wholly supplied through legitimate channels. After the various disastrous consequences entailed on the country by the exorbitant height to which many duties were carried previously to 1825, and the signal advantages that have resulted to the revenue and the public from [illegible], it may be hoped that the principle now established will meet with more attention in future.

TAXATION.

The attempts that have been made in Great Britain and elsewhere to suppress smuggling, and at the same time to maintain exorbitant duties, have [illegible] failed It has been invariably found that [illegible] the law, nor vigilance on the part of the officers, can prevent the smuggling of commodities loaded with excessive duties At this moment it is supposed that from [illegible] to 600,000 gallons of foreign brandy and geneva find their way into our market without paying any duty, in defiance of the coast guard, and of all the other machinery for keeping them out Large quantities of tobacco are also smuggled In fact, there are no means of effectually putting down smuggling other than a reduction of duty The very severity of the laws prevents their execution It creates a sympathy in favour of the smuggler, it stimulates the trader to corrupt the officer to conceal a fraud, and it makes the officer overlook what he might otherwise [illegible]

Stamp Duties.—These form the next most important branch of the public revenue, after the customs and excise They are mostly laid on the parchment or paper on which certain deeds, contracts, receipts, acquittances, bills of exchange, newspapers, policies of insurance, indentures of apprenticeship, &c are written or printed, and derive their name from the parchment or paper being impressed with a stamp stating the amount of the duty When imposed on fair principles and not carried to too great a height, stamp duties seem to be one of the most legitimate sources of revenue They assist in authenticating legal instruments, and render it much more difficult than formerly to forge deeds of any standing It is needless, perhaps, to say, that if stamp duties be carried to such a height as to oppose any serious obstacle to the free circulation of property, or to the execution of necessary deeds, they become exceedingly injurious Perhaps the duty on fire insurance is the most objectionable of the existing stamp duties It amounts to *3s* per cent on all property insured, whereas the premium paid to insurance offices, for common risks, is no more than *1s 6d* per cent, or only half the duty Thus, if a person wish to insure 1000*l* on a dwelling-house, a shop, warehouse, or other commonly hazardous property, he pays 15*s* to an insurance office as an indemnification for the risk, and 30*s* to government for leave to enter into the transaction So exorbitant a duty cannot be too severely condemned It discourages that providence and foresight the encouragement of which ought to be an object with all prudent governments, and it is the principal cause that much property is not insured at all, and that what is insured is seldom sufficiently covered Every individual, in fact, who insures any commonly hazardous property is obliged to pay three times as much as the risk is really worth Under such circumstances, the wonder certainly is, not that a great deal of property is uninsured, but that such is not the case with a great deal more Seeing the vast importance of insurance, it may well be doubted whether it ought to be charged with any duty, however slight But were the duty fixed at *5d* per cent, or at half the premium, its influence in repressing insurance would not be very sensible, and the increase of business to which such a reduction of the duty would lead would be so very great, that we have little doubt that in a few years the reduced duty would yield nearly as large a revenue as is derived from the present exorbitant duty

The duties on legacies and on the probates of wills, are included under the head of STAMP DUTIES, of which they are very important items These duties affect only personal or moveable property The first or legacy duty, varies according to the propinquity of the successor, being 1 per cent on property devolving on children and lineal heirs, 3 per cent on property devolving on brothers and sisters, 4 per cent on property devolving on cousins, and 10 per cent on property devolving on strangers The probate duty varies [illegible] the amount of property in the will The duties on stage and hackney coaches, gold and silver plate, &c, come under the head of STAMPS

Land Tax.—The existing land tax originated in 1692, being intended to replace the subsidies and such like grants previously made to the crown According to the valuation at which it was assessed, it was found that a charge of 1*s* per pound on the rental of the country produced 500,000*l* [illegible] e in this valuation [illegible] ted, usually amounted [illegible] In 1798, it was made perpetual at that rate, leave being at the same time given to the proprietors to reduce it

The land tax has always been very unequal When imposed, the proprietors friendly to the Revolution returned their estates at a much higher value than those [illegible] districts of the country have, in some instances, tended to correct the inequalities [illegible] imposition of the tax, but their general effect has been to increase them.

Assessed [illegible] revenue [illegible] horses, carriages, armorial bearings, game, &c The window duty, that used to be one of the principal items in the assessed taxes, has been recently repealed. A hearth tax, or duty proportioned to the number of fire places in a house, was established in this country at a very early period, but owing to its being necessary to the assessing of the tax that the government officers should be admitted to view the inside of each house, the hearth tax became exceedingly unpopular, and was repealed by the stat 1 Will & Mary, c 10. This statute declares hearth money "not only a great oppression to the poorer sort, but a badge of slavery upon the whole people, exposing every man's house to be entered into and searched at pleasure by persons unknown to him, and therefore to erect a lasting monument of their majesties' goodness in every house in the kingdom the duty of hearth money was taken away and abolished"

But six years afterwards "the prospect of this monument of goodness was," to use Blackstone's words, "somewhat darkened," by the passing of an act (7 Will 3 c 18) laying a duty on all inhabited houses except cottages, and also on windows These duties were afterwards considerably increased they were, however, materially modified within the last few years, and neither the late window tax, nor the former house tax, could, previously to their repeal, be said to be oppressive But of the two the window tax was certainly the more objectionable, and if either was to be repealed it should have had the preference The house tax being, however the more unpopular was repealed in 1834 But the inexpediency of this measure having become obvious, the house tax was again revived in 1851, as a compensation for the loss of the window tax, which was then repealed The basis of the new tax is extremely narrow, for it affects only houses worth 20*l* a year and upwards It amounts to 3¾ per cent on the rent of all but farm houses and shops, being on the latter 2½ per cent

The house tax being assessed according to the rent, it frequently happened that private houses, shops, and taverns in towns were [illegible] larger sum than the finest houses of the nobility and gentry in the country There was not, however, any injustice in this, for, in point of fact, had any attempt been made to let the latter, they would rarely have found a tenant or brought any rent This apparent inequality afforded a convenient topic for declamation, and for raising an outcry against the tax, which might have been obviated by taking the cost as well as the rent of first-class houses into view [illegible]

With the exception of the duties on the postage of letters, which have been noticed elsewhere (*see* POST OFFICE), the observations now made will probably suffice to give the reader a general idea of the principles on which taxes should be imposed, and of the leading characteristics of the principal taxes now in force in this country

Collection of Taxes.—Taxes in Great Britain are almost [illegible] stamps, with the assessed taxes are each under the management of a particular department, having at its head a board of commissioners, with various classes of inferior officers The post office revenue is managed by a postmaster general and a principal secretary The heads of the different revenue departments correspond with and receive their instructions from the treasury, to which is committed the charge of supervising, controlling, and regulating all matters connected with the assessment and collection of taxes The number of commissioners in the different revenue boards was formerly much greater than at present, and it is contended by some very high authorities that their number might be advantageously reduced, and that the whole responsibility should rest with the head of each department Various reforms and retrenchments have been also introduced into the subordinate departments, and not a few abuses have been rectified in the assessment and collection of most duties Perhaps the only very material reforms that need now be looked for in this department, must arise rather from changes and modifications of duties than from any changes in the way in which they are charged and collected The reduction of the present exorbitant duties on tea and tobacco, by taking away an overwhelming temptation to their clandestine importation and adulteration, would be productive of great public advantage, at the same time that it would have other beneficial consequences In the excise there remains little to be amended

Those who wish for further information on the subjects treated of in this article may consult the article on Taxation in the new edition of the *Encyclopædia Britannica*, *Ricardo's Principles of Political Economy*, M'Culloch's *Treatise on Taxation*, &c.

* No part of this income is at present paid for the use of King Leopold. The trustees, after discharging certain annuities and pensions to the establishment of the late Princess Charlotte, repay the balance of the annuity to the Exchequer, the sum so repaid in the last year was 36,000*l*.

TA'XICORNS *Taxicornes* (Lat taxus, *a yew tree*, cornu, *a horn*) The name of a family of Coleopterous insects including those in which the antennæ gradually augment in size as they extend from the head, or terminate in an enlargement.

TA'XIDERMY (Gr ταξις *arrangement* and δερμα *skin*) The art of arranging and preserving the skins of animals The most popular treatise on taxidermy is Mr Swainson's volume in *Lardner's Cyclopædia*

TA'XIS In Surgery, the replacement of parts which have quitted their natural situation by the hand, and without instrument or operation, as in reducing hernia or rupture

TAXIS [illegible] ness of the parts to the end for wh[illegible]

TA'XUS (Lat) The botanical name of the yew tree, celebrated for the hardness and elasticity of its wood Its berries are harmless, but its leaves are poisonous, partaking of [illegible] oxglove It is the most simple form [illegible] alliance, and is usually taken as the [illegible] of the gymnospermous struct[illegible] its female flower is quite [illegible] What travellers in New [illegible] e species of *Dacrydium*.

TAYLOR'S THEOREM In Mathematics a very general and remarkable formula of most extensive application in analysis, discovered by Dr Brook Taylor, and given in his *Methodus Incrementorum*, published in 1715 The formula is this —Let u be any function whatever of a variable x, and let u' be what u becomes when x receives an increment $= h$, then

$$u' = u + \frac{du}{dx}\frac{h}{1} + \frac{d^2u}{dx^2}\frac{h^2}{1\ 2} + \frac{d^3u}{dx^3}\frac{h^3}{1\ 2\ 3} + \&c$$

Demonstrations of this important theorem are given in every treatise on the differential calculus, and it is made by Lagrange the [illegible] of the calculus itself (See Lagrange, *Théorie des Fonctions Analytiques*)

TEA The dried leaves of the tea tree of which there are two varieties 1 The *Thea nigra*, black or bohea tea. 2 *Thea viridis*, green tea The boheas include souchong, pekoe and congou, and singlo, and imperial or bloom tea lected and dried on iron plates by a gentle heat Tea taken in moderation, especially as we use the infusion, with sugar and milk, is strengthening and invigorating, [illegible] narcotic [illegible] tarly susceptible, and which renders it improper in hypochondriacal and hysterical patients We know little of the chemical properties of the varieties of tea, but the following table shows that, in regard to its more obvious constituents the different varieties are not widely dissimilar The column showing the weight of the precipitate by jelly may be taken as indicating the relative proportion of the astringent matter

100 Parts of Tea.			Soluble in Water	Soluble in Alcohol	Precipitate with Jelly	Inert Residue
Green	hyson	14*s* per lb	41	44	31	56
	—	12*s* —	34	43	29	57
	—	10*s* —	36	43	26	57
	—	8*s* —	36	42	25	58
	—	7*s* —	31	41	24	59
Black	souchong,	12*s* —	32	36	28	64
	—	10*s* —	34	37	28	63
	—	8*s* —	37	35	28	63
	—	7*s* —	36	35	24	64
	—	6*s* —	35	31	23	65

Of the above precipitate by jelly, about 40 per cent may be regarded as *tannin*, and the difference between the second and the first column shows the quantity of resin contained in the above teas the resin has an agreeable flavour of the tea Water distilled off tea has an agreeable flavour, and is said to be narcotic it contains a trace of volatile oil Oudry's statement of the existence of a peculiar principle in tea (*thein*) requires confirmation

The late rise and present magnitude of the British tea trade are among the most extraordinary phenomena in the history of commerce Tea was wholly unknown to the Greeks and Romans, and even to our ancestors, previously to the end of the 16th or the beginning of the 17th century It seems to have been originally imported in small [illegible] by the Dutch; but was hardly known in this country [illegible] In 1660, however, it began to be used [illegible] sea, for, in an act passed in that year a duty of 8*d* is laid on every gallon of coffee, chocolate sherbet and tea, made and sold But it is abundantly evident that it was then only beginning to be introduced The following entry appears in the Diary of Mr Pepys secretary to the Admiralty —'September 26 1661 I sent for a cup of tea (a China drink) of which I had never drunk before' In 1661, the East India Company bought [illegible] as a present for his Majesty [illegible] import tea, directed to their agent at Bantam, to the effect that he should send home 100 lbs of the best tea he could get! (See the references in *Milburne's Orient Com* vol ii p 530, *Macpherson's Hist of Com with India*, pp 130—132) Since then the consumption seems to have gone on regularly, though slowly, increasing In 1689, instead of charging a duty on the decoction made from the leaves, an excise duty of 8*s* per lb was laid on the tea itself [illegible] to be ascribed to the reduction that was then effected in the duties Smuggling was then carried on to an enormous extent, and after every other means of checking it had been tried to no purpose, Mr Pitt proposed, in 1784, to reduce the duties from 119 to 12½ per cent This [illegible] ful Smuggling and the [illegible] immediately put an end to and the legal imports of tea were about trebled In 1795, however, the duty was raised to 25 per cent, and after successive augmentations in 1797, 1800 and 1803, it was raised in 1806, to 96 per cent *ad valorem* at which it continued till 1819, when it was raised to 100 per cent on all teas that brought above 2*s* per lb at the Company's sales

Down to the 22d of April, 1834, the duty on tea was an *ad valorem* one, being 96 per cent on all teas sold under 2*s* a pound, and 100 per cent on all that were sold at or above 2*s* Seeing that tea may now be considered almost as a necessary of life, this was certainly a high duty, though as a large amount of revenue must be raised we do not know that it could be fairly objected to on that ground But under the monopoly system the duty was, in fact, about 200 per cent *ad valorem!* For the price of the tea sold by the Company being forced up to nearly double what it would have been had the trade been free, it followed, inasmuch as the duty varied directly as the price, that it also was doubled when the latter was doubled But the monopoly having terminated in 1834, a new duty, charged as follows, was then imposed, viz —Bohea 1*s* 6*d* per lb, congou twankay, hyson skin, orange pekoe and campoi 2*s* 2*d* per lb, souchong, flowery pekoe, hyson young hyson, gunpowder, imperial, and other teas not enumerated 3*s* per lb

But it was soon found to be impracticable fairly to assess these duties and in 1836 they were repealed, and a new duty of 2*s* 1*d* per lb increased in 1840 to 2*s* 2½*d* per lb, imposed in their stead But while we admit that the necessity of the case or the impossibility of fairly assessing [illegible] have justified their repeal, we [illegible] justify the magnitude of the single duty by which they have been replaced It is beyond all question the most objectionable in our tariff

Taking the price of bohea and low congou in bond in London at 1*s* per lb (and it is usually less), the duty of 2*s* 2½*d* with which they are at present charged is equivalent to an *ad valorem* one of considerably more than *two hundred* per cent, whereas taking the price of the hyson and other superior teas consumed by the rich at from 3*s* to 4*s* per lb, the duty on them does not exceed from about 50 to 67 per cent *ad valorem* that is, it does not amount to more than from ¼ to ⅓ part of the duty laid on the teas consumed by the poor! Surely, however, this is neither an age nor a country in which an anomaly of this sort can be safely maintained The public necessities require that the tea sugar and other necessaries of the poor should be taxed, but the obvious principles of justice also require that the duties on them should be, if not lower, at all events no higher than those laid on the necessaries or luxuries of the rich The existing tea-duties contradict this plain principle and are at once unjust and exorbitant The duty on bohea and the lower congous should not, in fact, exceed 6*d* or 8*d* per lb

We subjoin an account of the quantities of tea entered for home consumption in the United Kingdom in 1849 and 1850, with the gross amount of duty received on the same —

	Quantities lbs	Revenue £
1849 -	50,021,576 -	5,471,4-2
1850 -	51,172,302 -	5,596,961

TEAK WOOD, or INDIAN OAK The produce of the *Tectona grandis*, a large forest tree, that grows in dry and elevated districts in the south of India, the Burman empire, Pegu, Ava, Siam, Java, &c Teak timber is by far the best in the East, it works easily, and, though porous, is strong and durable, it is easily seasoned, and shrinks very little, it is of an oily nature, and therefore does not injure iron Mr Crawfurd says that, in comparing teak and oak together, the useful qualities of the former will be found to preponderate "It [illegible] are buoyant Its dura[illegible] and to insure

that durability it demands less care and preparation, for it may be put in use almost green from the forest, [illegible] wet rot [illegible] of climate [illegible] *Principles of Carpentry*, p 206, [illegible] *chip* vol i p 451)

The teak of Malabar, produced on the high table land of the south of India, is deemed the best of any It is the closest in its fibre, and contains the largest quantity of oil, being at once the heaviest and the most durable This species of teak is used for the keel, timbers, and such parts of a ship as are under water owing to its great weight, it is less suitable for the upper works, and is not at all fit for spars The teak of Java ranks next to that of Malabar, and is especially suitable for planking The Rangoon or Burman teak, and that of Siam, is not so close-grained or durable as the others, it is, however, the most buoyant, and is therefore best fitted for masts and spars Malabar teak is extensively used in the building yards of Bombay Ships built wholly of it are almost wholly indestructible by ordinary wear and tear, and instances are not rare of their having lasted from 80 to 100 years, they are said to sail indifferently, but this is probably owing as much to some defect in their construction as to the weight of the timber Calcutta ships are never wholly built of teak, the timbers and framework are always of native wood, and the planking and deck only of teak The teak of Burma, being conveyed with comparatively little difficulty to the ports of Rangoon and Martaban, is the cheapest and most abundant of any It is largely exported to Calcutta and Madras

A species of timber called African teak is pretty largely imported into England, from the west coast of Africa But, in point of fact, it is not teak and it is destitute of several of its most valuable properties It is, however, for some purposes a useful species of timber

TEANY, TAWNY or BRUSK In Heraldry a colour compounded of red and yellow, employed in blazonry, but rarely met with in English coats of arms, and reckoned one of the dishonourable colours In engraving, it is represented by diagonal and horizontal lines crossing each other

TEARS The fluid which lubricates the cornea of the eye, when secreted in excess forms *tears*, they are limpid, saline perfectly miscible with water, and have a slight alkaline reagency, owing to the presence of free soda their principal saline contents are common salt and a trace of phosphate of soda, and they contain traces of albumen, but the whole solid matter scarcely amounts to 1 *per cent* When the lachrymal duct by which the tears are conveyed into the nostrils is obliterated and they flow over the angle of the eye, they become concentrated by evaporation and leave an irritating muco saline crust The exact nature, however, of the animal matter contained in the tears has not been determined

TECHNOLOGY (Gr τεχνη *art* and λογος *a discourse*) A term invented to express a treatise on art or the arts

TECTIBRANCHIATA (Lat tego, *I cover*, and [illegible] In which the gills are covered by a process of the mantle containing a shell or enveloped in a reflected margin of the foot for this name that of *Monopleurobranchiata* has been substituted by M De Blainville

TECTORIUM OPUS (Lat tector, *a plasterer*) In Architecture the plasterers' work used on ceilings and interior walls it was a composition of lime and sand, and differed from stucco which was called albarium opus Great pains were taken to prevent its cracking, by crossing layers of reed upon it coated with argillaceous earth previous to coating it with paint

TECTRICES *Coverts* (Lat tego, *I cover*) The name of the feathers which cover the quill feathers and other parts of the wing See COVERTS

TE DEUM (From the first words of the original Latin, "Te Deum laudamus," *We praise thee O God*) The authorship of this sublime hymn has been ascribed by some to Ambrose and Augustine, by others to Ambrose alone, to Hilary, and other less distinguished persons It is, however, generally thought to have been composed in the Gallican church the most ancient mention of it being in the rule of Cæsarius, bishop of Arles in the fifth century The Te Deum, in the office of matins, is always sung after the reading of scripture, in the English morning service, between the two lessons (Palmer *Origines Liturgicæ*, ch i part i sec 2)

TEETH See DENTES

TEETH OF WHEELS, are generally the means by which the power of the first mover is conveyed to the working point of a machine, and it is obviously of great importance that they should be of such a form that as little as possible of the original power may be lost in transmission, and that the impulse should be conveyed through the train of wheels with a uniform force

In the formation of the teeth of wheels, the object aimed at is to give them such a curvature that the angular velocities of the two pieces working together shall maintain the same constant ratio in all positions of contact In order to preserve the constancy of the angular velocity ratio it is only necessary that the acting faces of the teeth shall have such a form that the normal common to the two surfaces in contact shall always divide the *line of centres* (that is, the line joining the centres of the wheel and pinion) in a fixed point Now the teeth of one wheel being assumed to have any form whatever, it is always *geometrically* possible to assign the form of those of another so that they shall fulfil this condition, and, consequently, work together correctly, but the forms which are found to answer in practice are limited to a comparatively small number We subjoin the following cases from Brewster's edition of *Ferguson's Mechanics* —

Case 1 — If the acting faces of the teeth of a wheel are epicycloids whose generating circle has the same radius as [illegible] pinion, and whose base has the same radius as the primitive radius of the wheel, and if these teeth drive the pinion by acting upon infinitely small pins in its circumference, — the motion of the wheel and pinion will be uniform

Case 2 — If the acting faces of the teeth of a wheel are epicycloids whose generating circle is of any magnitude whatever, and whose base is the convex circumference of the wheel, and if the acting faces of the leaves of the pinion are epicycloids described by the same generating circle and whose base is the concave circumference of the pinion, — the motion of the wheel and pinion will be uniform

Case 3 — If the acting faces of the teeth of a wheel are epicycloids whose generating circle has a radius equal to half the radius of the pinion, and a base of the same radius as the wheel, and if the acting faces of the leaves of the pinion are straight lines directed to the centre of the pinion, — the motion of the wheel and pinion will be uniform

Case 4 — If the teeth of a rack drive a pinion, then, when the acting faces of the teeth of the rack are cycloids whose generating circle has the same radius as the pinion, and when their teeth drive the pinion by acting upon infinitely small pins placed in its circumference, the motion of both will be uniform

Case 5 — If the acting faces of the teeth of the rack are cycloids whose generating circle has a radius equal to half the radius of the wheel, and if they drive the wheel by acting upon rectilinear teeth which are a continuation of the radii, — the motion of both will be uniform

Case 6 — When the teeth of a wheel driving a rack have their acting faces formed of the involutes of a circle having the same radius as the pinion, and drive the rack by acting upon infinitely small pins fixed in its rectilinear edge the motion will be uniform

For detailed information connected with this subject, the reader may be referred to the following works — Camus *On the Teeth of Wheels*, *Buchanan's Treatise on Mill Work*, by Rennie Airy, *On the Teeth of Wheels* (Cambridge *Phil Trans* vol ii), and particularly to *Willis's Principles of Mechanism* 1841 See WHEEL

TEGMENTA (Lat tego *I cover*) In Botany, the scales covering the leaf buds of the deciduous trees of cold climates

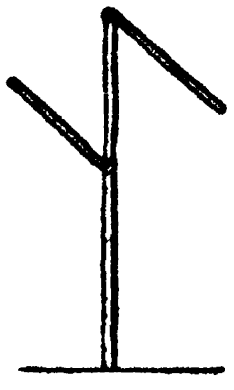
TEGUMENT or TEGMEN In Anatomy, the general covering of the body In Entomology, the term is applied to the coverings of the wings of the order *Orthoptera* or straight-winged insects

TEINDS In Scottish Law tithes By the course of various usurpations, the whole teinds of Scotland had become vested after the Reformation in the crown, or in private individuals, termed *titulars*, to whom they had been granted by the crown, or to the *feuars* or renters from the church By a succession of decrees and enactments these tithes were generally rendered redeemable at a fixed valuation and the clergy are provided for by stipends paid by the commissioners of tithes (when these are vested in the crown) or by the titular The minister can seek the increase of these stipends by process of augmentation and modification, and, if augmented, every heritor becomes liable in proportion to the amount of his teinds

TEINOSCOPE The name given by Sir David Brewster to an instrument otherwise called the *prism telescope*, formed by combining prisms in a particular manner, so that the chromatic aberration of the light is corrected, and the linear dimensions of objects seen through them increased or diminished

"If we take a prism, and hold its refracting edge downwards and horizontal so as to see through it one of the panes of glass in a window, there will be found a position, viz that in which the rays enter the prism and emerge from it at equal angles, when the square pane of glass is of the natural size If we turn the refracting edge towards the window, the pane will be extended or magnified in its length or vertical direction, while its breadth

remains the same If we now take the prism, and hold its refracting edge vertically we shall find, by the same process that the piece of glass is extended or magnified in breadth If two such prisms therefore are [illegible] in these positions so as to magnify the same [illegible] length and breadth, we have a telescope composed of two prisms, but unfortunately the objects are all highly fringed by the prismatic colours We may correct these colours in three ways —1st, We may make the prisms of a kind of glass which obstructs all the rays but those of [illegible] or we may use a piece of the same [illegible] ther rays when two common glass prisms are used 2d, We may use achromatic prisms in place of common prisms Or, 3d, what is best of all for common purposes, we may place other two prisms exactly similar in reverse positions" (*Brewster's Optics, Cabinet Cyc* p 363)

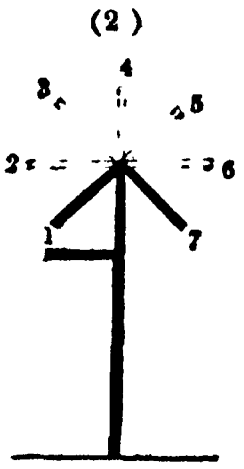


Professor Amici, of Modena, has recently constructed a combination of prisms of the same glass, in which the chromatic aberration is corrected, and a power of about three times obtained The plan is well suited for opera glasses Amici's telescope consists of four rectangular prisms having their refractive angles different and connected by pairs, the two pairs being similar those next the eye or the first pair are vertical, and the second pair horizontal, so that equal refraction is produced in every direction The distance between each pair is about an inch and a half (*Library of Useful Knowledge*, "Optical Instruments," p 55) Sir D Brewster (*Optics*, p 364) states that this instrument had been made by Dr Blair as well as by himself, before it was proposed or executed by Amici

TELAMO'NES (Gr τλαω, *I bear up*) In Architecture, figures of men used for supporting entablatures similar to Caryatides see that word

TE'LEGRAPH (Gr τηλε, *afar off*, and γραφω, *I write*) The name given to a mechanical contrivance for the rapid communication of intelligence by signals Of late years, the term *semaphore* (Gr σημα, *sign*, φερω *I bear*) has been introduced by the French, and frequently adopted by English writers

Although the art of conveying intelligence by signals was practised in the earliest ages and is known even to the rudest savages [illegible] only observed [illegible] established it has been [illegible] state of imperfection down almost to our times The first description of a telegraph universally applicable was given by Dr Hooke, in the *Philosophical Transactions* for 1684 The method which he proposed for it was not carried into practice consisted in preparing as many differently shaped figures, formed of deal —for example, squares, triangles circles, &c —as there are letters in the alphabet and exhibiting them successively, in the required order, from behind a screen, and he proposed that torches or other lights, combined in different arrangements, should supply their place by night About twenty years later, Amontons exhibited some experiments before the royal family of France and the members of the Academy of Sciences by which the practicability of the art was demonstrated But although both the proposal of Hooke and the experiments of Amontons were made public, telegraphic communication was not applied to any useful purpose until 1794 when the plan was adopted for conveying intelligence to the French armies The first telegraph actually used was the invention of Chappe It consisted of a beam which turned on a pivot in the top of an upright post, having a moveable arm at each of its extremities, and each different position in which the beam and its two arms could be placed at angles of 45° afforded a separate signal, which might represent a letter of the alphabet, or have any other signification that might be agreed upon In the following year 1795 several plans were submitted to the English admiralty, of which one, proposed by Lord George Murray was adopted, and continued to be made use of down to the year 1816 It consisted of six shutters, arranged in two frames which being opened and shut according to all the different combinations which can be formed, afforded the means of giving sixty-three separate and distinct signals In 1803, the French erected *semaphores* along their whole line of coast, formed of an upright post, carrying two, or sometimes three beams of wood each turning on its own pivot one above the other In 1807, Captain (now General) Pasley, of the Royal Engineers, published a *Plan for making Telegraphic Signals* by having beams turning on the same pivot, and, in order to obtain a sufficient number of different signals, he proposed to erect two or three posts at each station In 1816 Sir Home Popham considerably simplified this construction His telegraph, which was



(1)

adopted in that year by the Admiralty instead of the shutter telegraph, and has continued in use ever since, consists of merely two arms, moveable on different pivots on the same mast, as represented in the annexed figure (1) It is capable of giving forty-eight [illegible] nals Lastly in 1822, General Pasley [illegible] plified the construction, by placing the two arms on the same axis As this form of the instrument appears to be the most perfect at present in use, we shall give a few details repecting its construction, and the mode of using it

For day signals, the telegraph consists of an upright post of sufficient height, with [illegible] same pivot on the top of it, and a [illegible] *indicator*, or one side, as in the annexed [illegible] (2) Each arm can [illegible] positions, 1, 2, 3, 4, 5, 6 7, besides the position called the *stop*, which points vertically downwards, and is hid by the post In order to show the number of signals that may be made with this machine, we may suppose the arm on the left hand [illegible] indicator reckoning in the order of the numbers as shown in the figure to denote tens, and the other arm [illegible] the signal represented in the figure would be 17, which may be taken to denote a letter of the alphabet If the arm on the left had the position indicated by 3 and that on the right the position indicated by 6 the signal would be 36 In this manner, the number of separate and independent signals, with their signification, will be as in the following table —

(2)

No of Signal	Signification	No of Signal	Signification	No of Signal	Signification
1	A	15	L	36	V
2	B	16	M	37	W
3	C	17	N	45	X
4	D	23	O	46	Y
5	E	24	P	47	Z
6	F	25	Qu	56	
7	G	26	R	57	
12	H	27	S	67	
13	I	34	T		
14	K	35	U		

There are thus, as already stated, 28 independent signals, which are more than sufficient for spelling any message, though not enough for indicating both the letters of the alphabet and also the numeral digits, and it may be remarked that No 4 is a bad signal, when used by itself, because it appears in the telescope as a prolongation of the post Advantage may, however, be taken of the indicator, if made moveable, to increase the number of combinations

The use of the indicator is to show the order or direction in which the signals are to be reckoned, that is, whether from right to left or from left to right This is indispensable at sea, or wherever it is required to convey intelligence in different directions at the same time

In order to adapt the telegraph to the purpose of making night signals a lantern called the central light, is fixed to the pivot on which the arms move, and one is also attached to the extremity of each arm A fourth lantern, used as an indicator is fixed in the same horizontal line with the central light, at a distance from it equal to twice the length of one arm, and as nearly as may be in the plane in which the lights revolve

The arms and the indicator are made of wood, framed and panelled for the sake of lightness The arms are fixed one on each side of the post, and counterpoised by [illegible] of light frames of iron work, which at a little [illegible] are invisible The precaution of counterpoising is necessary, as the arms would not otherwise remain in any given position unless held by the hand, or stopped by some mechanical contrivance, which would be attended with inconvenience Motion is communicated to the arms by means of an endless chain passing over two pulleys, one fixed to the arm itself, and turning on the same pivot, and the other on a pivot fixed to the lower part of the post, within the reach of the signalman The pulleys are of the same size, and worked with great care, so that the arms can be set with the greatest exactness, and the required positions are pointed out by a dial plate, the index of which is moved by a lever attached to the lower pulley

It is found from experience that the length of the arm should be about one foot for each mile of distance, and the width of the arm should be from one sixth to one eighth of its length The indicator should be of the same width, but only about four fifths of the length of the arm

Instead of employing the different telegraphic signals to represent the letters of the alphabet, each may have

a signification entirely arbitrary but settled by previous agreement, and thus a message may be communicated by a single sign When this plan is adopted, a much greater number of signals is required, but this is obtained by successively exhibiting two or more of the different single signs Thus, supposing the telegraph capable of exhibiting 20 independent signs, then by two successive changes 400 signals may be made, and [illegible] Every system of telegraphic [illegible] plan is of necessity accompanied with a telegraphic dictionary, containing the signification of the different combinations of signs Several works of this kind have been compiled One by Sir Home Popham, at present used in the English navy, contains about 13,000 words or sentences, which is probably more than is necessary for any practical purpose, though there are others much more extensive The Admiralty adheres to the safer, though somewhat less rapid practice, of spelling all the sentences

In the management of a fleet at sea, telegraphic communication is indispensable In the English navy, the signals are generally made by flags, though, from the difficulty of making out their figures and colours in calm weather, or when the wind blows in the direction in which the signal is to be communicated, the communication [illegible] be supposed would be made with greater certainty by means of the sun-glass

Various attempts have been made at different times particularly on the Continent, to supersede the optical telegraph, which is always useless in hazy weather, by applying the agency of electricity or galvanism to the [illegible] of intelligence An apparatus for accomplishing this purpose by means of galvanism has recently been contrived by Professor Wheatstone, of King's College, London, which, if experiments on a relatively small scale may be trusted to appears to be completely successful It has been adopted on some of the principal lines of railway in this country

TELLO'LOGY (Gr τελος, *an end*, and λογος *a discourse*) The doctrine of final causes is so called [illegible] existence of a Deity is deduced from the [illegible] apparent in the universe, which not only imply an intelligent Creator, but demonstrate at the same time his benevolence and other moral attributes When these are derived from material nature the argument is styled the *physico theological* The reader will find in *Whewell's Bridgewater Treatise* an explanation of Bacon's meaning in banishing final causes from the domain of physical science

TELEOSAUR, *Teleosaurus* (Gr τελειος *perfect*, [illegible] Saurian reptiles [illegible] Gr., [illegible] vertebræ [illegible] articulating surfaces [illegible] joints

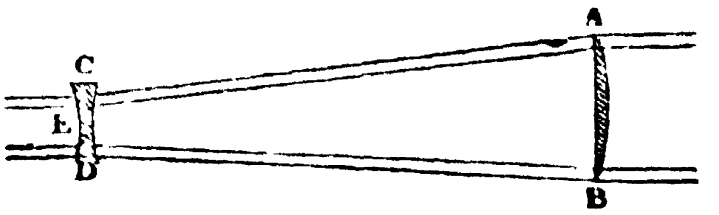
TELESCOPE (Gr τηλε, *distant*, σκοπεω, *I look at*) An optical instrument for viewing distant objects

For several reasons a distant object is seen less distinctly than a similar near one The angle which an object subtends diminishes as the distance increases, the density of the light which renders it visible also diminishes with the distance, but in a much faster ratio, and a considerable portion of light is always lost in its passage through the atmosphere

It is found by experience that to be discernible at all in ordinary daylight, a detached object must subtend at the eye an angle of not less than 30″, and that the least angle under which [illegible] distinguished is about [illegible] By the aid of a telescope a magnified image of the object is formed, and within certain limits the object is not only enlarged, but rendered brighter than it appears to the unassisted eye

The invention of the telescope, to which practical astronomy is indebted for its most important discoveries, has been ascribed to various persons Sir David Brewster (*Encyc Brit*, art "Optics") says, "We have no doubt that this invaluable instrument was invented by Roger Bacon or Baptista Porta, in the form of an experiment, though it had not, perhaps, in their hands assumed the maturity of an instrument made for sale and applied to useful purposes, both terrestrial and celestial If a telescope is an instrument by means of which things at a distance can be seen better than by the naked eye, then Baptista Porta's concave lens was a real telescope, but if we give the name to a tube having a convex object-glass at one end, and a convex or concave lens at the other, placed at the distance of the sum or difference of their focal lengths, then we have no distinct evidence that such an instrument was used before the beginning of the 17th century Descartes ascribes the invention to James Metius [illegible] Alkmaer in Holland, Huygens to both [illegible] Zacharias Jansen, Borellus also to Jansen Professor Moll, who has discussed these rival claims, after examining the official papers preserved in the archives at the Hague, comes to the conclusion that Metius [illegible] was Jacob Adrianszy), on the 17th of October was in possession of the art of making telescopes, but that from some unexplained reason he concealed his invention, and thus gave up every claim to the honour he would have derived from it, that on the 21st of October in the same year 1608, John or Hans Lippersey a [illegible] maker of Middelburg was actually in possession of the [illegible] but there is little reason to believe that either Metius or Zacharias (or Jansen, father and son) were inventors of the telescope, though one of them invented a compound microscope about 1590 (*Journal of the Royal Institution*, vol i)

[illegible] its way into other countries In [illegible] the illustrious Galileo having heard [illegible] of the invention [illegible] the merchant who [illegible] and was soon in possession of a telescope which magnified three times In subsequent trials he succeeded in [illegible] countryman Harriot also, in 1609, began to use the telescope for examining the disc of the moon, and before he had heard of the discoveries of Galileo (*Priestly's History of Discoveries relating to Vision, Light, and Colours*)



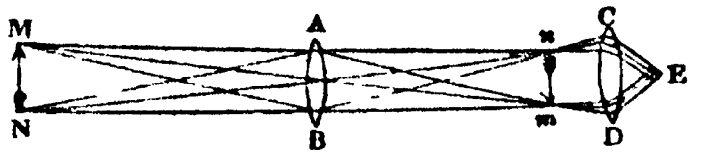
Telescopes are of two kinds, *refracting* and *reflecting* telescopes the former depending on the use of properly figured lenses, through which the rays of light pass, and the latter on the use of specula, or polished metallic mirrors, which reflect the rays, an inverted image of the object being formed in both cases in the focus of the lens or mirror

Refracting telescopes were those which were first constructed They were of the most simple character, consisting merely of an object glass of one lens, and an eye-glass of one lens, but of a shorter focus But in this construction the prismatic colours produced by the difference of refrangibility of the luminous rays tinged the images of all objects seen through the telescope, and the image was likewise distorted by the aberration of the extreme rays It was soon found that the latter defect could be sufficiently corrected by employing more lenses than one in the eye piece, but it was long before a remedy was found for the chromatic dispersion, and artists despairing of success generally turned their attention to the improvement of instruments of the reflecting class The difficulty, however, was at length overcome through the persevering efforts of John Dollond (*see* ACHROMATISM), and the *achromatic refracting telescope* may now be [illegible] instrument all but perfect

[illegible] on which telescopes depend having been explained under the terms REFLEXION and REFRACTION, and the properties and construction of their principal parts under ACHROMATISM LENS, MIRROR, we shall here describe some of the principal forms which the instrument has assumed It will be borne in mind that the general aim in the construction of a telescope is to form, by means of lenses or mirrors, as large, bright, and distinct an image of a distant object as possible, and then to view the image with a magnifying glass in any convenient manner We shall first describe those of the refracting class

Galilean Telescope — This is the most ancient form of the telescope and is that which was used by Galileo It consists of a convex converging object-glass A B (fig 1),

(1)

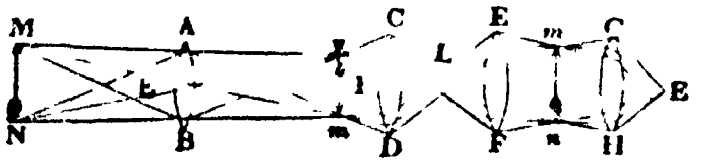


and a concave diverging eye glass C D On passing through the object-glass A B, the rays of light coming from the different points of a distant object in sensibly parallel pencils are rendered convergent, and proceed towards the principal focus where they would form an inverted image, but before they arrive at this point they fall upon the concave lens C D, by which they are again rendered parallel, or at least their convergence is corrected so as to give distinct vision of the object to the eye at E The lens C D is therefore placed between the object glass and the image and at a distance from the image equal to its principal focal distance The magnifying power is equal to the focal length of the object-glass divided by the focal length of the eye-glass. *See* LENS

In this telescope the object is seen erect and the length of the tube is only equal to the [illegible] between the [illegible] of the two lenses These properties render it preferable to any other telescope for many ordinary purposes, as, for example an *opera glass* When used for this purpose, the magnifying power is hardly ever greater than 4, and it is often as low as 2

Astronomical Telescope — This is composed of a convex object glass A B (fig 2), and of a converging eye glass C D Rays of light proceeding from any point

M of a distant object M N, and falling on the different points of the object-glass, are refracted into a point *m* in

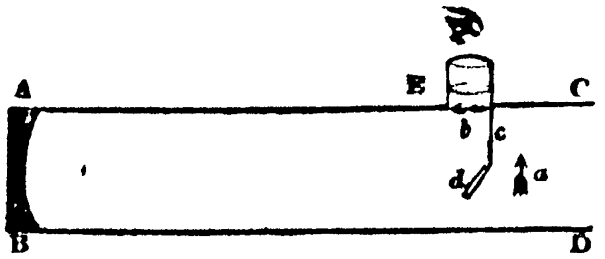


(2.)

the principal focus In like manner, those proceeding from the point N are refracted into the point *n*, and thus an inverted image *m n* is formed at the focus of the object-glass The eye-glass is placed so that its focus shall coincide with the place of the image, consequently rays diverging from any point of the image [illegible] lens C D, are refracted into a parallel direction [illegible] they enter the eye at E, and are thereby rendered fit to produce distinct vision The length of the telescope is equal to the sum of the focal distances of the two lenses, and the magnifying power is equal to the focal distance of the object-glass divided by the focal distance of the eye glass This telescope was first described by Kepler in his *Dioptrice* (1611), but it does not appear to have been executed until about twenty or thirty years later

Terrestrial Telescope — This differs from the astronomical telescope only in having two additional lenses F F, G H (fig 3), placed in the tube of the eye-glass for the purpose of restoring the inverted image to its erect position, and [illegible] trial object [illegible] are usually the same as [illegible] pencils of rays proceeding from the points M and N cross each other in the anterior focus of the second lens E F, and falling parallel on F F form in its principal focus an inverted image of *m n*, and consequently an erect image of the object M N This image *m' n'* is seen by the eye at F through the lens G H as the rays diverging from *m'* and *n'* in the focus of G H enter the eye in parallel pencils When the three first lenses are equal the magnifying power is the same as that of the astronomical telescope whose object and eye glasses are the same as A B and C D

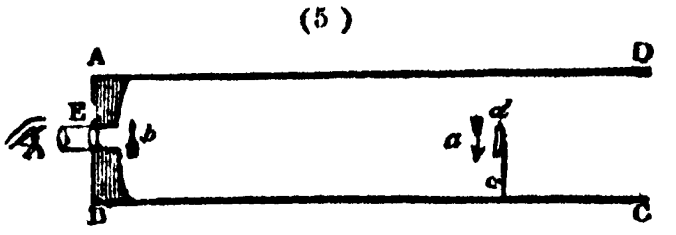
(3)



The performance of refracting telescopes depends most essentially on the goodness of the object glass, for if the first image is bright and distinct, and perfectly achromatic, there is little difficulty in constructing eye pieces to magnify it, without causing it to undergo any sensible alteration

Reflecting Telescopes — In reflecting telescopes the speculum, or mirror performs the same office that the object-glass does in those of the refracting kind and is therefore called the *object mirror* The instrument is constructed in various forms, but these differ from one another chiefly in reference to the contrivances which have been adopted for bringing the focal image into a convenient situation for being viewed by the eye piece The principal forms are the Newtonian, the Gregorian, the Cassegrainian, and the Herschelian

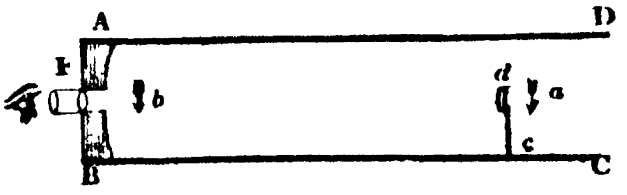
Newtonian Telescope —Let A B C D (fig 4) represent



(4)

a section of the tube of the telescope A B a section of the object-mirror, which would form at its focus the image *a* of any distant object Now if a person attempted to view the image in its place at *a* by placing himself directly before the mirror, he would necessarily intercept the rays of light from [illegible] n the tube to the mirror, and [illegible] be no image to view Sir Isaac Newton overcame this difficulty by introducing a small diagonal plane speculum *d* between A B and *a*, which intercepting itself but a small portion of the light, reflects towards the side of the tube the rays converging from A B and causes the image which would have been formed at *a* to be formed at *b* where it can [illegible] viewed by the eye piece F attached to the [illegible] The [illegible] mirror is of an oval form, and is fixed on a slender arm *e* connected with a slide, by means of which it may be made to approach or recede from the large speculum A B, according as the [illegible] recede from it In this telescope [illegible] equal to the focal length of the object-mirror A B divided by that of the eye-glass

Gregorian Telescope — In this construction the object-mirror A B, fig 5, is perforated in the middle, and the

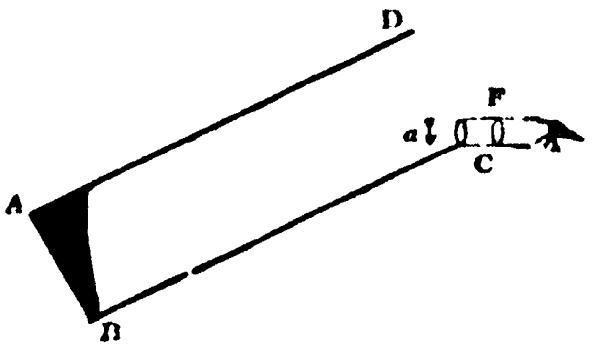


(5)

rays of light from a distant object being reflected from the surface of A B cross each other in the focus, where they form an inverted image *a*, and are then intercepted by a small convex mirror *d* which causes them again to converge to a focus at *b*, near the perforation of the object-mirror, where they form a reinverted or direct image, which is viewed by an eye piece E screwed into the tube behind A B The curvature of the small speculum should be elliptical, having the foci at *a* and *b*, but it [illegible] spherical In this case the great speculum should be slightly hyperbolic, to counteract the aberration of the small mirror

Cassegrainian Telescope — The great speculum of this instrument is perforated like the Gregorian, but the rays converging from the surface of the mirror A B (fig 6)

(6)



towards the focus *a* are intercepted before they reach that point by a small convex mirror *d*, not sufficiently convex to make the rays divergent, but of such a curvature as to prevent them from coming to a focus till they are thrown back to *b* near the aperture in A B, where they form an inverted image which is viewed by the eye piece F This construction has the advantage of requiring a shorter tube than the Gregorian, but the inversion of the image is not corrected and for this reason probably it has not been much used

In the two last constructions the small mirror *d* is adjusted by means of a rod turning on a shoulder near the eye end of the tube, and connected by a screw with the apparatus which carries the arm *c* to which the mirror is attached

Herschelian Telescope — This construction differs from the others in having no second mirror, and thus preventing loss of light by a second reflexion The large speculum A B (fig 7) is placed at the bottom of the

(7)

tube in an inclined position, so as to bring the focal image *a* near the edge of the tube, where it is viewed directly by the eye-piece F without interfering with the light entering the telescope from the object observed, but the image is a little injured by the oblique reflexion The magnifying power is the same as in the Newtonian

The reflecting telescope was invented by James Gregory, and is described by him in his *Optica Promota* (1663), but the first telescope of the kind was executed by Newton The celebrated instrument of Sir William Herschel, erected at Slough in 1789, was 40 feet in length. Its great speculum had a diameter of 49½ inches its thickness was about 3¼ inches, and its weight when cast was 2118 lbs Its focal length was 40 feet, and it admitted of a power of 6450 [illegible] it The essential advantage of large [illegible] kind con- [illegible] the [illegible] of light which they collect, [illegible] to perceive faint nebulæ and stars which are altogether invisible in ordinary instruments (For description of Lord Rosse's telescope, *see* SUPPLEMENT)

Reflecting telescopes are used only for observing *phenomena* In order to derive full benefit from them, they

must be used in the open air and must either be mounted equatorially (*see* EQUATORIAL) or else in such a manner as to be capable [illegible] th in a vertical and horizontal [illegible] this kind being generally used with a high magnifying power, and consequently having a small field of view, are always accompanied with a smaller telescope or *finder* fixed to the tube, so that the axes of the two instruments are exactly parallel

Eye-pieces of Telescopes — When the image formed by the object-glass or mirror is viewed with a single lens or eye-glass, whether concave or convex, it is only in the centre of the field that distinct vision is obtained, all towards the margin being hazy and distorted To remedy this defect, Boscovich and Huygens separately proposed the construction of an eye-piece formed of two lenses, placed at a distance from each other equal to half their focal length Boscovich recommended two similar lenses, Huygens that the focal length of the one should be twice that of the other and as this construction is found to answer best in practice, it is that which is most commonly used.

The two lenses are usually plano-convex, with the convex faces towards the object glass the larger lens, called the field glass, is innermost, or nearest the object-glass and a diaphragm cutting off the marginal rays is usually placed between them near the focus of the eye-lens, where the image is formed This eye piece is usually called the *negative* eye-piece, from its having the image seen by the eye behind the field-glass, and is that which is commonly supplied with telescopes intended only for the purpose of *seeing* objects, without reference to measurement

Another modification of the two lens eye-piece was proposed by Ramsden and is called the *positive* eye-piece, because the image observed is before both lenses The lenses are plano-convex, and nearly of the same focal length, but their distance from each other is less than the focal distance of the lens nearest the eye, two lenses thus placed acting as a compound simple lens This eye-piece is the most convenient when micrometer wires are placed in the focus, because it can be taken out without injuring the wires, and it has also this advantage, that the measure of an object given by one eye piece is not altered when it is changed for another of a different magnifying power

In both the eye pieces now described the image is seen inverted, and though this is of no importance in astronomical observations, it is inconvenient when the telescope is used for looking at terrestrial objects By placing an additional pair of lenses in the tube of the eye piece, the image is repeated and reinverted, and consequently seen erect By this means as explained above, the terrestrial telescope is obtained

The name of *diagonal eye piece* has been given to eye-pieces furnished with a diagonal reflecting mirror the object of which is to give a more convenient direction to the rays emerging from the eye piece when the telescope is pointed high

Telescopes are generally supplied with eye-pieces of different powers, which are all fitted to enter the same tube, and the focal adjustment is commonly effected by a rack and pinion motion acting on the tube which carries the eye piece

For full information respecting the construction of telescopes, and the best modes of mounting them, to secure steadiness and allow of the requisite motion, the reader is referred to *Pearson's Practical Astronomy*, vol ii (See also *Coddington's Optics*, and SUPPLEMENT for description of the largest refracting telescopes now in use)

TELLINA (Gr τελλίνη *a species of muscle*) A genus of cockles (Cardiaceous Bivalves in the Cuvierian system), characterized by the hinge of the shell having one tooth on the left and two teeth on the right valve, often bifid, in the right valve there is a plate which does not enter a cavity in the opposite valve There is a slight fold near the posterior extremity of both valves which renders them unequal at that part, where they gape a little The soft parts, or animal of the *Tellina*, called *peronæa* by Poli, has two long tubes for respiration and excretion, which can be withdrawn into the shell, and are concealed in a fold of the mantle

Cuvier separated from the Linnæan *Tellinæ* the genus *Loripes*, distinguished by the feebly developed cardinal teeth, and by a long cylindrical foot Other genera have since been detached from the Cuvierian *Tellinæ*, which now form a family *Tellinidæ*, in the system of Lamarck

TELL TALE The dial plate at the wheel, showing the position of the tiller

TELLURIUM (Lat tellus *the earth*) This rare metal has only been found in small quantities in the gold mines of Transylvania it occurs in the metallic state, combined with gold or silver It is white, brilliant, brittle, and easily fusible Its specific gravity is about 6 25 It is combustible, and often exhales a peculiar odour, like horse-radish, which Berzelius ascribes to the presence of minute portions of selenium It forms a protoxide and a peroxide, often called *tellurous* and *telluric acids* Its equivalent is either 32 or 64 In the former case, the protoxide consists of 1 atom of tellurium and 1 of oxygen (32 + 8), and the peroxide of 1 atom of tellurium and 1½ of oxygen (32 + 12), in the latter the numbers are doubled Tellurium forms a gaseous compound with hydrogen which has been called *hydrotelluric acid*

TEMPERAMENT (Lat temperare, *to moderate*) In Music, the adjustment of the imperfect concords, in musical instruments whose sounds are fixed, such as organs, piano-fortes, &c, so as to transfer to them part of the beauty of the perfect concords The defect to be remedied arises from the single short keys between the two larger ones serving for flats as well as sharps It is necessary to observe, that in the theory of harmonies the interval of a tone is not always the same, for instance, that lying between the fourth and fifth of the scale contains nine small parts, called commas, whereas that between the fifth and sixth of the major scale contains only eight commas Again, the diatonic semitone contains five commas, and the chromatic semitone three or four, according to the magnitude of the tone Hence it is that the different situation of these elements with regard to each other, causes intervals of the same names to consist of different degrees or elements To improve them, therefore, musicians *temper* them so as to reduce the whole more to mean distances from each other, necessarily producing a new division of the octave

TEMPERAMENT, in Physiology, has been defined as that peculiarity of organization which to a certain extent influences our thoughts and actions The ancient physicians enumerated four temperaments, namely, the bilious, the choleric, the phlegmatic he sanguine the melancholic To these some have added the nervous, and these terms are still in use among medical writers

TEMPERATE ZONES, in Geography, are two of the five zones into which the terrestrial globe is divided The *north temperate zone* is included between the tropic of Cancer and the arctic circle, and the *south temperate zone* between the tropic of Capricorn and the antarctic circle

TEMPERATURE A definite degree of sensible heat, as measured by the thermometer

TEMPLARS or KNIGHTS OF THE TEMPLE, A military order of religious persons It was founded by an association of knights, in the beginning of the 12th century, for the protection of pilgrims on the roads in Palestine afterwards it took for its chief object the protection of the Holy Sepulchre at Jerusalem against the Saracens Knights were fixed at Jerusalem by King Baldwin II [illegible] of the Temple [illegible] monks [illegible] poverty The classes of the [illegible] servitors, and chaplains, [illegible] was a girdle of linen thread The officers of the order were chosen by the chapter from among the knights they were, for military affairs, marshals and bannerets, for purposes of government, priors who superintended single priories or preceptories, abbots, commanders, and grand priors, who governed the possessions of the order within separate provinces, and the grand master, who, in some respects, assumed the dignity of a sovereign prince, being independent in secular matters, and depending solely on the pope in spiritual The chief part of the 9000 estates, lordships, &c which the society possessed in the 13th century was situated in France, and the grand master was usually of that nation The Templars were driven from Palestine by the Saracens, with the rest of the Christians and then fixed the chief seat of their order in Cyprus Their exorbitant power and wealth and the haughty manner in which they endeavoured to keep aloof from the control of European sovereigns, and act as a military republic independent of their authority, were probably the principal reasons which induced Pope Clement V and Philip the Fair of France to concert their overthrow The charges of heresy and idolatry, which were preferred against them, were at least unsupported by evidence In 1307, Jacques de Molay, the grand master having been enticed into France, was arrested by Philip, the Templars' estates were seized, many of them burnt alive after the mockery of a trial, and in 1312, the order was abolished by a bull of Clement V Its vast estates fell partly into the hands of the sovereigns of the countries in which they were situated partly into those of the Hospitallers and other military orders Detached bodies of the order, however, continued to subsist for some time in different countries See among numerous authorities, Raynouard's tragedy of *Les Templiers*, with the notes, *Turner's England in the Middle Ages*, vol ii, *Mem. de l'Ac des Inscr* vol xxxvii, *Addison's History of the Knights Templars and the Temple Church*, 1842 For a notice of the [illegible] doctrines attributed to them, see the [illegible] Baphomet

TEMPLE A building dedicated to the service o

some deity D ver [illegible] Gr τέμενος, [illegible] The term is [illegible] edinces, excepting in the [illegible] for the worship of God by Solomon at Jerusalem, which is emphatically denominated *the Temple* This edifice was similar in its plan to the Tabernacle, consisting of the holy of holies, the sanctuary, and a portico It is minutely described in 1 Kings vi

The Temple of Solomon was begun B C 1012, and destroyed by Nebuchadnezzar B C 586 It was rebuilt after the return of the Jews [illegible] period of nearly 500 years repaired and beautified by Herod the Great The restoration contemplated by this prince must have been extensive When the Jews said to Christ, "Forty years was this temple in building" they are generally supposed to allude to [illegible] repairs had been in progress, [illegible] were they brought to a completion when the temple itself, together with the entire city, were demolished by the army of Titus, A D 70

The structure to which this term is applied is of comparatively modern date for the earliest temples were an open spot with a rude altar of earth and stones, indeed, the Persian religion forbade the worship of the Deity except in the open air, and the earliest Greek temples give us some notion of the same sort of practice The oracle at Delphi, according to Pausanias, was merely an arbour of laurels, and from Herodotus we learn that the oracles at Dodona were delivered from an old oak The re- [illegible] lumns, the cell being always of diminutive size In Greece, at the period when they had advanced in art, every city exhibited structures of the most elaborate and splendid description dedicated to the service of their divinities, and the Romans long after emulated their masters in the care and riches bestowed upon these edifices Some of the most celebrated were those of the Parthenon (to Minerva) at Athens of Diana at Ephesus, of Apollo at Delphi, of Jupiter at Olympia, of Venus at Paphos and Cythera and that of the Capitoline Jupiter at Rome Asia Minor abounded with them, and in the other direction we find them as far west as Nismes Vitruvius has classed temples under seven heads, viz those *in antis*, the *prostyle*, the *amphiprostyle*, the *peripteral*, the *dipteral* the *pseudodipteral*, and the *hypæthral*, all of which are defined under these names in this work

TE'MPLET (Etym doubtful) In Architecture a short piece of timber laid under a girder or beam to distribute the weight Also a mould used by bricklayers for cutting or setting out work, and by millwrights for shaping the teeth of wheels

TE'MPO (It *time*) In Music, the Italian word constantly used to express time

TE'MPO D'IMBROGLIO (It *time of trouble*) In Music, a term applied to a composition written in one measure, but really performed in another

TE'MPORAL or TEMPLE BONES Two irregular bones one on each side of the head They are connected with the occipital, parietal, and sphenoid bones and are articulated with the lower jaw Comparative anatomy shows that the so called 'temporal bone,' in man, is essentially an assemblage of five bones, called squamous, zygomatic, tympanic, petrous, and mastoid, having distinct functions developed in different proportions and continuing permanently detached in the cold-blooded classes, but soon coalescing in the warm-blooded classes The tympanic element, however, continues perman [illegible] is

TENACITY OF THE METALS The power which metallic wires possess of sustaining, without breaking, the action of a suspended weight *See* COHESION, STRENGTH OF MATERIALS

TENA'CULUM A surgical instrument consisting of a fine sharp pointed hook [illegible] ing arteries are seized and drawn out, so that in operations they may be secured by ligaments

TENAILLON In Fortification, a kind of outwork made on each side of a small ravelin to increase its strength, and to cover the shoulders of the bastion Works of this kind are, however, so decidedly inferior to large ravelins that they are seldom adopted

TENANT, TENEMENT In Law These words are derived from the principles of the feudal system, according to which (as it prevailed in England) no land was without a lord, and every one who enjoyed land *held* it either of a mesne tenant, or of the crown The party holding the land is called *tenant*, the thing holden *tenement*, the mode of holding *tenure* Thus tenants are said to be in fee-simple, in tail, for life, for years, &c Tenement, in the largest sense of the word is every thing which may be holden, viz all corporeal hereditaments, and incorporeal hereditaments of a permanent nature issuing out of the same Thus lands, houses, rights of common, &c, franchises, offices, are all tenements in the larger sense In the more narrow acceptation in which the word is popularly applied, it describes a house with the homestall or immediate appurtenances

TENCH The name of a species of Cyprinoid fishes (*Tinca vulgaris*, Cuv) and the type of a subgenus of the family It is generally more or less abundant in ornamental waters and ponds, but is seldom found in rivers in this country It is common in most of the lakes of the European continent, whence it is supposed to have been imported into England The tench is remarkable for its tenacity of life, it spawns about the middle of June at which time the female is attended by two males Their food consists of the smaller soft-bodied aquatic animals, and vegetable matter In stocking a pond with tench, the large-sized fish should be selected, and two males to one female should be the proportion of the sexes See CYPRINIDÆ

TENDER In Law, the legal tender of a debt is by the actual production and offer of the sum due, unless [illegible] with it by a declaration that he will [illegible] The tender must be of money if beyond the sum of 40*s*, in gold, or in what has been rendered by act of parliament equivalent for that purpose, viz Bank of England notes, which are a legal tender for every sum above £5, except at the Bank [illegible] and its branches A tender of country bank notes, if not objected to on that ground, is sufficient The tender of a larger sum than that due is legal unless it be of a sum requiring change

TENDO ACHILLIS [illegible] from the muscles of [illegible] name has reference to the [illegible] in the Styx, his mother, [illegible] him by that part

TENDRIL, is any slender twining part by which one plant attaches itself to another It is often a transformation of a leaf which has no lamina, or which has the midrib elongated beyond it, retaining its usual tapering figure, and becoming long and twisted spirally In the vine it is an abortive bunch of flowers, in the passion flower, a metamorphosed branch, in some petals a thin extended point, as in *Strophanthus*

TENESMUS (Gr τείνω, *I stretch or constringe*) A straining and ineffectual inclination to void the contents of the bowels

TENNANTITE A mineral named in honour of the late Mr Tennant It is an arsenical sulphuret of copper and iron It occurs in the copper veins of some of the Cornish mines, both massive and crystallized

TENON (Lat teneo, *I hold*) In Architecture, the end of a piece of wood or timber, diminished usually by one third of its thickness, which is received into a hole [illegible] in size called a mortise by which exposed [illegible] are held jointed or fastened together

TENOR, or TENOR (It) In Music, the mean or middle part of a composition being the ordinary compass of the human voice when neither raised to a treble or lowered to a bass What is called counter-tenor is only [illegible]

TENREC The name of a small Insectivorous quadruped of Madagascar allied to the hedgehog it forms the type of the genus *Centetes*

TENSE (Lat tempus, *time*) In Grammar, that modification of the verb which defines the time at which the action is conceived as taking place *See* GRAMMAR

TENSOR MUSCLES, in Anatomy are those which tighten the part to which they are fixed, as the tensor vaginæ femoris tensor palati, &c

TENT, *Tinta* A Spanish red wine, chiefly from Malaga and Gallicia

TENT, in Surgery is a plug of lint used for dilating wounds a piece of sponge which has been imbued with [illegible] *tent*

TENTACLE (Lat tentaculum, *a holder*) This term is used by Savigny in a restricted sense to signify [illegible] whether jointed or not, which are used as instruments of exploration and prehension Thus the oral arms of the Polyps, the prehensile processes of Cirripeds and Annellides, the cephalic feet of the Cephalopods, the barbs of fishes, are termed tentacles

TENTH In Music, an interval containing nine degrees and five spaces

TENTHS The tenth part of the yearly value of all benefices, which was anciently paid, with the first fruits, to the pope *See* FIRST FRUITS

TENTORIUM The process of the *dura mater* which [illegible] the cerebrum from the cerebellum

TENUES (Lat *thin*, Gr ψιλαί) The three letters *k*, *p*, *t* in the Greek alphabet are so called, in relation to their respective middle letters *g*, *b*, and *d*, and [illegible]

TENUIROSTERS *Insessores* (Lat tenuis, *slender*, and rostrum, *a beak*) The name of a tribe of Insessorial birds, including those which have a long and slender bill

TENURE The feudal relation between lord and vassal in respect of lands Tenures in capite, or in chief,

were those by which land was held immediately of the crown, mesne tenures, of mesne or inferior lords English tenures under the feudal system are reduced by Blackstone to four knight-service, or chivalry, free socage, pure villenage, and villein-socage *See* FEUDAL SYSTEM, SOCAGE, VILLENAGE

TENURES, SCOTTISH, were five viz 1 Military, or *ward-holding*, abolished, with all its *casualties* or incidents, by 20 G 2 c 50 2 By *mortification*, or *mortmain*, which now only applies to manses and glebes, retained by the act of 1587 as mortified to the church 3 *Burgage holding*, by which the burgesses of royal burghs hold lands and houses within the burgh of the sovereign by service of watching and warding &c 4 *Blanch tenure* by which the grantee or vassal is bound to pay to the superior annually a species of quit rent or [illegible] 5 *Feu-holding* by grant, with reserva[illegible] services *See* FEU

TEPHROMANTIA (Gr τεφρα, *ashes* and μαντεια, *prophecy*) Divination [illegible] by redhot embers [illegible]

TERAPHIM A word used thirteen or fourteen times in the Old Testament, and commonly rendered by our translators "idols" Bryant explains them as "lunar amulets or types of the ark in the form of crescents supposed to have been invented by the patriarch Terah" (*Antiq* iii 321) In later times strange and horrible practices of witchcraft are described by Rabbinical writers in explaining this word The teraph, according to Rabbi Eliezer, was made by killing a first-born child, opening the head, putting a gold plate with the name of the impure spirit under the tongue, &c (See also the notes to *Southey's Thalaba*, book i)

TERATOLOGY (Gr τερας, *a monster*, and λογος, *a discourse*) That branch of physiological science which treats of the various malformations and monstrosities of the organic kingdoms of nature

TEREBELLUM (Lat terebro, *I bore*) The name of a genus of Buccinoid Pectinibranchiate Gastropods, having an oblong shell with a narrow aperture, destitute of folds and ridges and gradually enlarging to the extremity opposite to the spire

TEREBRANTIA (Lat terebro *I bore*) The name of a section of Hymenopterous insects, characterized by the possession of an anal instrument organized for the perforation of the bodies of animals or the substance of plants The borer (*terebra*) is peculiar to the female, and is composed of three long and slender pieces of which two serve as a sheath for the third, it is placed at the anal extremity of the abdomen and the oviduct is continued into it The females instinctively use this weapon to prepare a place for the deposition of their eggs, where the maggot may be incubated in safety, and upon its exclusion be surrounded by already organized matter adapted for its sustenance Some genera select vegetables for the parasitic support of their young as *Sirex* (Linn), which infests the pine tree, and *Cephus* (Latr) which perforates the stalks of corn for the purpose of oviposition Others as the ichneumons pierce the skins of insects and deposit their eggs in the subcutaneous fatty and nutrient material Some ichneumons are provided with long and extensible anal borers which they insinuate beneath the bark of trees, and into crevices and fissures, where their instinct and peculiar antennal organs of sensation teach them that the insect resides that may form a fitting nidus for the parasitic and carnivorous larvæ Other ichneumons with short terebra place their ova in the bodies of Lepidopterous larvæ or in those pupæ which are readily accessible to their attacks

The female ichneumons manifest a wonderful instinct at the season of oviposition in discovering the insects, as well mature as in their different stages of egg, maggot, caterpillar and chrysalis which are obnoxious to the wounds, with all the fatal consequences, of the instrument from which the present section of *Hymenoptera* takes its name

TEREBRATULA (Lat terebro, *I bore*) The name of a genus of Palliobranchiate Acephalous Bivalve Mollusks, in which one of the valves is perforated for the transmission of a peduncle the hole through which the peduncle passes is completed by a small detached calcareous piece

TEREDO (Lat teredo, *the ship-worm*) The name of a genus of Acephalous Mollusks which bore their habitations in submerged timber, and occasion destructive ravages in sunken piles, ships' bottoms, &c

TERGUM (Lat tergum, *the back*) in Entomology, [illegible] supine surface of the abdomen

TERM (Lat terminus *a boundary*), in Logic, is the expression in language of the notion obtained in an act of apprehension (*See* APPREHENSION) A term may consist of one word, or of several, but every word is not capable of being employed by itself as a term or, in logical language, *categorematic* Adverbs, prepositions, &c, and also nouns in any other case besides the nominative, are syncategorematic, i e can only form part of a term, while a verb is a mixed word, being resolvable into the copula (or auxiliary verb) and the term, to which the copula gives tense, mood, and position, but an infinitive mood is a term by itself Simple terms, or categorematics, are divided into *singular* and *common* A singular term stands for one individual as "Cæsar," "the king" [illegible] cannot be affirmed or denied [illegible] affirmatively or negatively) of any thing but themselves A common term stands for many individuals (which are called its significates), as "man," "king" These, it is evident, can be said (or predicated) of others, e g "Cæsar is a man," "[illegible] The subject of a proposition, therefore [illegible] may be either a singular or a common term, the predicate must be a common term Terms are said to be univocal, equivocal, analogous, &c, but these are rather distinctions of language than of logic They are also said to be "of the first intention" and "of the second intention," the [illegible] words used in a vague and general [illegible] words used in a limited and specific sense, which they bear in some particular art or science

TERMINALIA Annual festivals celebrated by the Romans in the month of February, in honour of Terminus, the god of boundaries On such occasions the peasants assembled at the different landmarks or *termini* that divided their property, and offered up libations of milk and wine *See* TERMINUS

The word *terminus* is now employed chiefly to designate the extreme points of a railroad

TERMINISTS In Ecclesiastical History, a name given to a class among the Calvinists, whose tenet it is (or was, for such opinions hardly exist at the present day), that there are persons to whom God has fixed, by a secret decree, a certain *term* before their death, after which he no longer wills their salvation, however long they may live They instanced the cases of Pharaoh, Saul and Judas among others

TERMINOLOGY (Lat terminus) In every science or art that preliminary knowledge which teaches us to define the words and phrases peculiarly employed in it (in other words, its technical terms) is called its terminology

TERMINTHUS A black pustule chiefly attacking the legs It is not, however clear what the disease was which the Greek writers describe under this name (*Med Dict*)

TERMINUS (Lat) In Ancient Architecture, a stone raised for the purpose of marking the boundary of a pro[illegible] or a [illegible] was the name of the god of boundaries among the Romans Terminus, in more recent times, is applied to the [illegible] to the first and last station of [illegible]

TERMITES (Lat termes, *the branch of a tree*) These insects constitute an extensive and important tribe of the Neuropterous order, confined to the warmer latitudes of the globe and performing a considerable share in the essential labour of completing the comminution and destruction of dead and decomposing organized matter The termites are all social, terrestrial, and are active carnivorous or omnivorous, in all the stages of their existence, save that of the ovum, after which they undergo only a semimetamorphosis The mandibles are always strong and hard but differ in relative size in dif[illegible] the same community [illegible] ides the genera *Mantispa*, *Raphidia Psocus*, *Perla*, and *Termes* proper (now the type also of a family, *Termitidæ*, as they are commonly called) [illegible] by four-jointed tarsi, but the wings are carried horizontally on the body, and very long the head rounded, and the prothorax short and square The body is depressed, with the antennæ short, the mouth very similar to that of the *Orthoptera*, with the four-cleft lower lip, three ocelli, one rather indistinct, the wings generally but slightly transparent, coloured, with the nervures not [illegible] and the legs short

The termites peculiar to the tropical and adjacent countries are known under the name of white ants, and commit most extraordinary ravages, especially in the larva state, in which they are called *workers*, these are like the perfect insect, but with the body softer, and without wings, and the head generally larger and destitute of eyes, or nearly so They are united into colonies of incalculable numbers, and live concealed in the interior of the earth, trees, and other wooden matters, such as furniture, shelves, &c, in which they form galleries, forming routes conducting to the centre of their nests, so that these objects, of which the outer surface is (with surprising instinct) left untouched, fall to pieces on the slightest touch The [illegible] of some species are external, but without any evident exit Sometimes they are elevated to a great height above the surface, like pyramids, occasionally surmounted by a solid roof, which,

[illegible] and number, appear at a distance like a [illegible] Sometimes these insects affix their nests to the branches of trees Another sort of individual, termed *neuters* or *soldiers*, and which Fabricius mistook for pupæ, defend the nest They have a head much larger and longer, and the mandibles are very long, and cross over each other They are far less numerous than the larvæ, and live near the outer surface of the nest, so that they make their appearance just when it is attacked they are also stated to compel the workers to labour The demi-nymphs have the rudiments of wings, and in other respects resemble the larvæ

When arrived at the perfect state the termites quit their habitation, fly abroad during the evening and night in great numbers they lose their wings before morning, which dry; [illegible] become the prey of birds, lizards, [illegible] collected by the larvæ, which inclose each of them in a large cell, but Latreille conjectures that the act of coupling takes place in the air, as in the ants, and that the females alone occupy the attention of the larvæ in order to the establishment of fresh colonies The abdomen of the female subsequently acquires an enormous size from the innumerable eggs which it contains The royal chamber occupies the centre of the habitation, and around it are distributed those which contain the eggs and provisions

Some larvæ of [illegible] to have habits somewhat approach our ants

Negroes and Hottentots are very fond of these insects

TERMS, in Law, are four sections of the year appropriated to the transaction of particular business in the superior courts of common law and equity They are now regulated by 11 G 4 and 1 W 4 c 70

Hilary Term begins the 11th, and ends the 31st of January

Easter Term begins 15th of April, and ends the 8th of May

Trinity Term begins 22d of May, and ends the 12th of June

Michaelmas Term begins the 2d, and ends the 25th of November

Whenever any one of these days falls on a Sunday the following Monday is substituted for it, and if the days from Thursday before to Wednesday after Easter Sunday inclusive, or any part of them fall within Easter term such days are regarded as holydays and the term is increased by an additional number of days at the end, and Trinity term proportionably postponed During term the three superior common law courts sit *in banc*, and all their business with the exception of the trial of issues in fact and such preliminary or other matters of minor importance as can be transacted before a judge at chambers, is performed The power of the courts has however been increased by a recent statute, enabling them to transact certain term business in vacation time The rest of the year is termed Vacation During the vacation one judge of each court sits at Nisi Prius for the trial of causes in London and Middlesex through the periods called Sittings, which are fixed by the same act to last not more than twenty-four days after Hilary Trinity and Michaelmas terms respectively nor more than six days after Easter term During the vacation also the circuits are held in which causes are tried and the gaols delivered in other parts of England and Wales

TERMS OF EQUATIONS, are the several parts of which they are composed connected by the signs of addition or subtraction Thus $2ax - bc$, has for its terms $2ax$ and bc Generally all terms containing the same power of the unknown quantity are considered as one compound term, the coefficients, with their proper signs being connected with that power of the unknown quantity

TERPSICHORE (Gr τερπω, *I delight*, and χορος *a dance*) The muse who presided over dancing usually represented with a seven-stringed lyre or a plectrum in the hand and in the act of dancing

TERRACE (Fr terrasse) In Architecture a raised natural or artificial bank for the purpose of affording a promenade

TERRA COTTA, literally baked clay is the name given to statues architectural decorations figures vases &c, modelled or cast in a paste made of pipe or potter's clay and a fine-grained colourless sand from Ryegate with pulverized potsherds slowly dried in the air, and afterwards fi[illegible] hardness in a proper kiln

TERRÆ FILIUS In Classical Latinity a humorous designation of persons of low origin or obscure birth terræ filii, *sons of the earth* (See *Persius*, Satire 6) In the university of Oxford by an ancient custom, abolished [illegible] a Latin oration was read at the commencement annually by an undergraduate, who assumed the title of Terræ Filius and often indulged in considerable license in his treatment of the authorities of the place

TERRA JAPONICA The old pharmaceutical designation of the substance now called *catechu* It was formerly [illegible] earthy mineral

TERRA PONDEROSA The old mineralogic name of carbonate and sulphate of baryta

TERRA SIENNA A brown ochreous clay brought from Sienna, and sometimes used as a pigment

TERRE-PLEIN In Fortification, the horizontal surface of the rampart where the guns are placed and worked Its breadth may be from 24 to 40 feet, and it is bounded outside by the parapet and inside by the inner slope of the rampart *See* FORTIFICATION

TERRESTRIAL, *Terrestres* (Lat terra, *the earth*) The name of a section of the class *Aves*, comprehending the orders *Rasores* and *Cursores*, also of the family of Pulmonated Gastropods, and of a division of Isopodous Crustaceans

TERRE-VERTE Green earth A species of chlorite [illegible], found in Germany, France [illegible] According to Klaproth, it is a hydrated silicate of ox[illegible] little magnesia and alumina once used as a pigment

TERROR REIGN OF In the History of the French Revolution This term has been generally applied to the period during which the executions were most numerous and the country under the sway of the actual terror inspired by the ferocious measures of its governors, who had established it avowedly as the principle of their authority It seems to be most properly confined to the period between October, 1793 when the revolutionary tribunal although constituted at an earlier time, was first put in permanent action on the fall of the party of the Gironde, and the overthrow of Robespierre and his accomplices in Thermidor (July) 1794 The agents and partisans of the system have been termed Terrorists

TERTIALS, *Tertiariæ* (Lat tres *three*) These are the large feathers which take their rise from the proximal extremity of the bones of the wing, corresponding to those of the forearm near the elbow joint, forming a continuation of the secondaries They are so long in some birds of the snipe and lapwing kind, that when the bird is flying they give it the appearance of having four wings

TERTIAN FEVER An intermittent fever or ague the paroxysms of which return every other day *See* AGUE

TERTIARIES In Ecclesiastical History, a religious body a kind of associates of the Franciscans, who acknowledged the *third* rule of Saint Francis, and were connected with the Fraticelli and Beghardi of the 13th century (See *Mosheim* 13th cent part ii chap ii)

TERTIARY STRATA A series of sedimentary rocks which lie above the primary and secondary strata and are distinguished from them by their *organic remains* See GEOLOGY

TERTIUM QUID An obsolete chemical term formerly applied to neutral salts as being a third substance or *tertium quod*, resulting from the union of an acid and alkali

TERTULLIANISTS In Ecclesiastical History a branch of the African Montanists, so named from their father Tertullian, who embraced Montanist opinions (See *Burton's Lectures*, vol ii p 234)

TERUNCIUS A coin of ancient Rome, the same as the quadrans or triuncis being the 4th part of the *as* and consequently containing three ounces before the value was diminished

TERZA RIMA (*third or triple rhyme*) A peculiar and complicated system of versification borrowed by the early Italian poets from the Troubadours The verse are the ordinary Italian heroic lines of eleven syllables (interspersed very rarely with ten-syllable lines) The rhyme is thus arranged —At the commencement of a poem or portion of a poem verses 1 and 3 rhyme together, as do verses 2, 4 and 6, the third rhyme begins with verse 5 which rhymes to 7 and 9, the fourth is formed by 8, 10, and 12, and so on, and the poem or canto ends abruptly the last rhyme, like the first, being on a couplet instead of a triplet It is obvious that the rhyme is interlaced throughout and continually in suspense, so that no pause can be found until the end of the poem or canto, as at the end of every line, there must still be a rhyme incomplete This continuity gives a very peculiar character to the metre and renders it highly expressive of sustained narrative or passion, and the abruptness of the conclusion is often turned to good effect by masters of versification This metre has been rendered celebrated by Dante, who wrote in it his *Divina Commedia* It has been adopted by his imitators, of whom the latest, Vincenzo Monti, has used it to much advantage, and by Ariosto and other poets for their satires Byron has adopted it in English, with indifferent success, in his *Prophecy of Dante*, and it has been attempted by various translators

TERZETTO (It) In Music, a composition in three parts

TESSELATED PAVEMENT (Lat tessela, di-

min of tessera) In ancient Architecture, a pavement [illegible] strata

TE'SSERA In Roman Antiquities, a die six-sided, like the modern dice, and thus to be distinguished from the talus, which had only three sides Tickets or tallies used for various purposes were called tesseræ Thus guards were set at night in their camps by means of a tessera with a particular inscription, given from one centurion to another through the army, and in this way the word tessera seems to have come to signify the watchword or password delivered to the guard (See *Mém de l'Acad des Inscr* vol xxxvii)

TESSERA In Architecture *See* TESSELATED PAVEMENT

TE'SSERACONTE'RIS (Gr τεσσερακοντα, *forty*, and ερετης, *I row*) A galley with forty banks of oars, one of the largest of monstrous vessels mentioned by ancient writers Great doubts have been entertained as to the possibility of the construction of a vessel which, according to the received notions respecting classical shipbuilding, must have required about *four thousand* rowers, but it is seriously recorded that one was built for Ptolemy Philopater probably for purposes of show only *See* TRIREME GALLEY

TESSULAR A term applied in Crystallography to a system of crystals, including the cube, tetraedron, &c

TEST In Chemistry, any thing by which we distinguish the chemical nature of substances from each other thus infusion of galls is a *test* of the presence of iron, which it renders evident by the production of a black colour in water and other liquids containing that metal, in the same way sulphuretted hydrogen is a test of the presence of lead, and nitrate of baryta of sulphuric acid In Metallurgy and Assaying, the porous crucible which absorbs the liquid vitrifiable oxide of lead and other metals combined with it is sometimes called the *test*

TE'STA In Botany the integuments of a seed

TESTA'CEANS *Testacea* (Lat testa, *a shell*) This term was employed by Linné to signify an order of the class *Vermes* It is applied by Cuvier to an order of his class *Acephala*, comprehending those which are provided with a calcareous shell

TESTACE'LLUS (Lat testa) A [illegible] so called from their being furnished [illegible] shell, which forms a shield or protection to the heart Of this destructive genus the following species are British, and occasionally infest our gardens and nursery grounds — *Test scutellum*, Sowerby, *Test halyotideus*, *Test manget*

TESTAMENT, OLD AND NEW *See* BIBLE

TEST AND CORPORATION ACT The popular names of the statutes 13 Car 2 st 2 c 1 and 25 Car 2 ch 2 by the first of which it was provided that all magistrates in corporations should take the oaths of allegiance and supremacy, and another renouncing the doctrine that it is lawful to take arms against the king, and should have received the sacrament within a year before their election, according to the rites of the church of England The [illegible] these provisions to "all persons that shall bear any office or offices, civil or military," &c, and introduced a new declaration against transubstantiation These acts, long esteemed the great bulwarks of the Protestant church, were nevertheless evaded by means of acts of indemnity annually passed for the relief of those who had neglected to take the oaths They were finally repealed (9 G 4 c 17), as far as regarded the administration of the sacrament, and a declaration set forth in the act substituted Locke, as well as many other eminent men has strongly objected to the principle of making a religious solemnity a test of conformity it is defended by Dean Swift

TESTIMONY *See* EVIDENCE

TE'STING In Metallurgy, the operation of refining gold and silver by means of lead upon a vessel called a *test* or cupel *See* CUPELLATION

TESTUDINA'TA (Lat testa) The name of a tribe of Cheloman reptiles of which the tortoise (*Testudo*) is the type It has been sometimes used as synonymous with *Chelonia*, and as a name for the whole order

TESTU'DO A military contrivance adopted by the Greeks and Romans principally in attacking walls and fortified places It was formed by a body of troops holding their shields above their heads so as to overlap one another and form a kind of penthouse, which threw off the missiles of the enemy while the assailants were up- [illegible] the name was borrowed

TE'TANUS (Gr τεινω, *I stretch*) A spasm of the whole of the muscles It is frequently caused by lacerated [illegible] is termed *lockjaw* In hot [illegible] times produced by exposure to cold, or by suppressed perspiration, and it then often admits of relief and cure, but when it is the consequence of a wound it is usually fatal

TETHYDANS, *Tethydes* The name of a tribe of Tunicated Acephalous Mollusks, of which the genus *Ascidia* (Tethya of the ancients) is the type

TETHYS (Gr τηθυον *an ascidian*) A name applied by [illegible] to a genus of Vermes [illegible] and by Cuvier to a [illegible] characterized by having two rows of branchiæ along the back in the form of tufts

TETHYS In Greek Mythology, the daughter of Uranus and Gaia, and wife of her brother Oceanus The symbol of the sea, and of the element of water, in which character she is sometimes confounded with Thetis, unless indeed the name of the latter goddess be only another form of hers

TETRA'CERAS (Gr τετταρες, *four*, and κερας, *a horn*) The generic name proposed by Dr Leach for the four-horned antelope

TE'TRACHORD Gr [illegible] δη, *a string*) In Music, a concord [illegible] degrees or intervals, and four terms or sounds, in modern music it is commonly called *a fourth* The word, in its strictly literal sense, signifies any instrument with four strings, and was applied to the lyre in its primitive state

TE'TRADITES A word used in several senses, all of them, however, bearing upon its original derivation from Gr τετταρες *four* 1 Among the ancients children were so called who were born in the fourth month, and such were believed to be unlucky 2 The Manichees and others, who believed the Godhead to consist of four instead of three persons, bore this name And 3 In Ecclesiastical History different sects of heretics were so called, in consequence of the respect with which they regarded the number four

TETRA'DORON (Gr) [illegible] species of brick used by Greek [illegible] length

TETRADRACHM A common silver coin of the ancient Greeks of the value of four drachms

TETRADY'NAMOUS (Gr τετταρες, and δυναμις, *power*) A flower having six stamens, of which two are short and separated by two [illegible]

TETRAE'DRON, or TETRAHE'DRON (Gr τετταρες, and εδρον, *side*) In Geometry, one of the five Platonic bodies, or regular solids It is bounded by four equilateral and equal triangles, or it is a triangular pyramid having four equal and equilateral faces If we assume a = the linear edge, b = the whole superficies, c = the solid content, r = the radius of the inscribed sphere, R = the radius of the circumscribed sphere, then the following relations hold true —

$$a = 2\sqrt{6}\,r,\quad b = 24\,r^2\sqrt{3},\quad c = 8\,r^3\sqrt{3},\quad R = 3\,r$$

See PLATONIC BODIES

TETRAETE'RIS (Gr τετταρες, and ετος, *a year*) In Grecian Chronology, a cycle of four years, invented by Solon to make the lunar year equal to the solar This he effected by intercalating a month of twenty-two days at the end of two years, and at the lapse of other two years another month of twenty three days making in all forty five days which will be found to be the difference between the lunar and solar year after an interval of four years

TE'TRAGON (Gr τετταρες, and γωνια, *angle*) In Geometry a figure having four angles

TETRAGONIA (Gr τετταρες and γωνια), is a genus of herbaceous plants of the Portulaceous order, with four-cornered fruit, one species of which, native of New Zealand is cultivated as an esculent under the name of New Zealand spinach Although inferior to genuine spinach it is valuable on account of its resistance to drought and the great quantity of foliage that may be gathered from a single plant It is an annual of the easiest culture

TETRAGRA'MMATION Among several ancient nations, the name of the mystic number four, which was often symbolised to represent the Deity, whose name was expressed in several languages by four letters thus the Heb יהוה, the Assyrian Adad, the Egyptian Amon; the Persian Syre, the Greek Θεος, the Lat Deus By a curious coincidence, the same peculiarity prevails in many modern languages, as will be seen in the Germ *Gott*, the French *Dieu*, &c

TETRA'LOGY (Gr τετταρες, and λογος, *discourse*) The name given to the collection of four dramatic compositions which was brought forward for exhibition at Athens by competitors for scenic honour It consisted of three tragedies and a "satyrus" (*see* SATIRE), of which the only example left is the *Cyclops* of Euripides

TETRAMETER (Gr τετταρες, and μετρον, *measure*) A verse consisting of four measures, that is, according to the Greek prosody, of eight iambic, trochaic, or anapæstic [illegible] exceeding three times

TETRA'NDROUS (Gr τετταρες, *four*, and ανηρ, *a man*) A flower having four stamens

TETRAO (Lat tetrao, *a bustard*) A name selected

by Linnæus for an extensive genus of gallinaceous birds, characterised by a naked and generally red band, which occupies the place of the eyebrow This genus comprehended all the various species of grouse partridges, francolins quails, and tinamous and the necessity for subdividing it was consequently soon recognised Latham restricts the genus *Tetrao* to those species of which the feet are covered by feathers, and are without spurs, with naked toes, and a round or forked tail these are the true grouse The species in which the toes are feathered as well as the legs, called ptarmigan, form the genus *Lagopus* Brisson separated from the Linnæan *Tetraones* the partridges, francolins, and quails under the generic title *Perdix*, and the obvious characters indicated by the common names of these tribes, have been [illegible] grounds for so many distinct [illegible] New World to form the distinct genus *Ortyx*, The long-necked tinamous of America, constitute the last genus (*Tinamus*, Latham) of the family *Tetraonidæ*

TE'TRAPHA'RMACON An ointment composed of four remedies, namely, wax resin lard, and pitch

TE'TRAPLA (Gr τετραπλα) In Ecclesiastical History, the name of a Bible arranged by Origen in four columns, consisting of [illegible] versions, viz that of the Septuagint [illegible] of Symmachus, and that of Theodosian This work must not be confounded with the *Hexapla*, which see

TETRAPNEUMO'NIANS, *Tetrapneumones* (Gr τετρας, and πνευμων, *a lung*) The name of a section of spiders (*Aranidæ*), comprehending those which have four [illegible]

TETRAPTERANS, *Tetraptera* (Gr τετρας and πτερον, *a wing*) A name applied by some entomologists to the insects which have four wings, and which thus constitute an extensive primary division of the class

TE'TRARCH (Gr τετραρχης) The governor of a fourth part of a country This was a title granted by the Romans to some tributary princes, whom they did not dignify with the style of king It seems to have originated among the Galatians Such were the sons of Herod the Great amongst whom his dominions were divided after his death (See *Mém de l'Acad des Inscr* vol xxvii)

TETRASPASTON (Gr τετρας and σπαω *I pull*) In Mechanics, a machine in which four pulleys all act together

TE'TRA'STICH (Gr τετρας, and στιχος, *verse*) In Poetry a stanza of four verses

TE'TRASTYLE (Gr τετρας, and στυλος, *a column*) In Architecture a building that has four columns in front

TETTER An eruptive disease of the cuticle *See* Psoriasis

TETTI'GES (Gr *grasshoppers*) An appellation assumed by the ancient Athenians in allusion to the boast that they were produced from the soil which they inhabited In conformity with this belief they were often styled αυτοχθονες or earthborn, and wore golden grasshoppers in their hair

TETTIGO'NIANS *Tettigonia* [illegible] (Gr τεττιγονια *a kind of grasshopper*) A [illegible] insects, of which the genus *Tettigonia* is the type It is synonymous with Cicadarians *See* Cicada

TEUTA'TES In Mythology, a Celtic divinity to whom Roman writers have given some of the attributes of their Mercury (*Mem de l'Ac des Inscr* xxiv 349), enumerated by Lucan among the gods of the Gauls Quibus immitis placatur sanguine diro Teutates

TEUTHIDANS, *Teuthidæ* (Gr τευθος *a calamary*) The family of Dibranchiate Cephalods of which the calamary (*L* [illegible] he type

TEUTONIC [illegible] One of the principal military orders of religious persons It was founded in 1190, by Frederic duke of Swabia, and intended for Germans of noble rank only its rules were the same with those of the Templars Like the other orders (*see* Saint John Templars) its original object was the performance of service against the infidels in Palestine It was dedicated to the Virgin Mary After the conquest of Jerusalem by the Saracens, the grand master removed to Venice, and afterwards to Marburg By degrees it made extensive conquests from the various heathen nations on the southern shores of the Baltic The Prussians were subdued by it and forced to embrace Christianity, after a struggle of more than half a century In 1237 it was united with the order of the Brethren of the Sword in Livonia [illegible] it to the rank of a sovereign powe [illegible] rand master, during the epoch of its domination, had his seat at Marienburg, in Prussia Its territory extended from the Oder to the Gulf of Finland, and the population under its government is supposed to have amounted in the 15th century to two millions and a half of souls Its dominions, however, were gradually lost by revolt or foreign conquest West Prussia fell to Poland, East Prussia to the house of Brandenburg Afterwards the seat of the grand master was at Mergentheim in Swabia, and he became a spiritual prince of the empire By the peace of Presburg, in 1805 the rights and revenue of the grand mastership was obtained by the emperor of Austria, but the order was abolished by Napoleon in 1809; and its lands having passed to the sovereigns of the various districts in which they were situate, it now retains a titular existence only in A [illegible]

TEXTUARIES Among the Jews, the sect of Ca [illegible] has been so called (see that word), from [illegible] adhere to the text of the Jewish scriptures

THABORITES *See* Taborites

THALAMUS (Gr θαλαμος, *a bed*) In Anatomy, the part of the brain from which the optic nerves have part of their origin

Thalamus, in Botany, is the part on which the ovary is seated The succulent red centre of a strawberry, the core in the fruit of a raspberry are the thalami of these plants Some botanists call it the receptacle of the fruit

THALI'A (Gr θαλια, *the blooming one*) The muse who is generally regarded as the patroness of pastoral and comic poetry She is also supposed to preside over husbandry and planting She is represented leaning on a column with a mask in her right hand and a shepherd's crook in her left

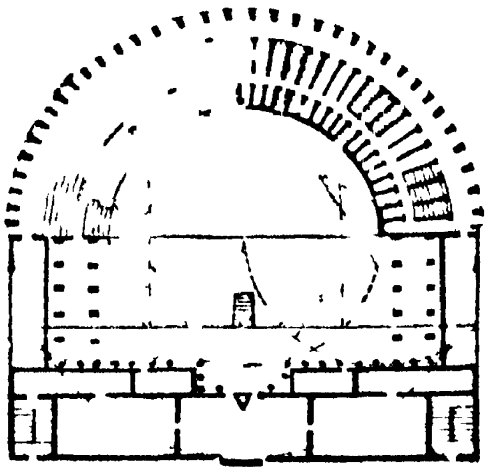
THALI'DANS *Thalides* (Gr Θαλια, one of the Muses) The name of a tribe of Tunicaries, of which the genus *Salpa* or *Thalia* is the type *See* Salpa

THA'LLUS In Botany, a term given to the organs of vegetation of liverworts, lichens, and seaweed and to the bed of fibres from which many species of fungi arise It is regarded as a fusion or blending together of leaf and stem Hence [illegible] Thallophytes or [illegible] shows the appea [illegible]

THAMMUZ The tenth month of the Jewish civil year, answering to part of June and July, and including twenty nine days In Mythology, the name under which the Phœnicians worshipped Osiris or Adonis *See* Adonis

THANE (Sax thegn) In early English History, a title of honour among the Anglo-Saxons In its original meaning it [illegible] minister or servant and was applied to the [illegible] of kings and chieftains Thus the king's thanes were at an early period a distinct and elevated class In a later age of the Anglo-Saxon power the term had become more extensive in its signification and seems to have been appropriated to all landed proprietors who were below the rank of earl and above that of alderman, and had the privilege of assisting in framing the laws In Latin charters the word *miles* is the equivalent of thane There were superior and subordinate thanes, standing in the same relative situation as mesne lords and vassals under the feudal system of France and Normandy (See *Turner's Anglo-Saxons*, *Palgrave's Commonwealth*)

THATCHING Covering houses, stacks, or ricks with straw or reeds, in such a manner as to throw off the rain and exclude excessive heat or prevent its escape from within The straw generally used in thatching is that of the wheat as being the longest and thickest, and the most durable Next to wheat rye straw is preferred or, in default of that, the straw of oats, but the most durable of all thatch in cold countries is that formed of the reed (*Arundo donax*, Linn), or of the common heath or ling (*Calluna vulgaris*, Sal) A very durable covering of the thatch kind is also formed of the spray of birch of the bark of that tree, or of oak or pine and of the chips and shavings made by hurdle makers from the poles and shoots supplied by copse woods Thatched roofs were formerly almost universal in cottage architecture, but they are now being supplanted by roofs covered with tiles or slates, which are much more durable and not subject to catch fire, while the straw formerly used for roofs is much more profitably employed as litter for cattle, and thus turned into manure, and employed in reproduction,—a process which, in agriculture at least, ought not to be deprived of any material [illegible] to its aid as manure



THAUMATROPE [illegible] (Gr θαυμα *a wonder*, τρεπω, *I turn*) The name given by Dr Paris to an optical toy, the principle of which depends on the *persistence* of vision A circle is cut out of a piece of card, to opposite edges of which two silk strings are fixed, by twisting which between the finger and thumb of each hand the disc is turned round with considerable velocity On one side of the disc is drawn any object, as a chariot; on the other side, the charioteer in the attitude of driving, so that when the card is twirled round, we see [illegible] sequence of [illegible] retina, we [illegible] of the card. (*Library of Useful Knowledge*, "Optics")

THEA (Chinese tcha), is the botanical name of the genus which includes the plants yielding tea They are found in China and the bordering countries in various situations, either in warm and damp valleys by the sides

of rivers as in Assam or on mountain sides, and on cool hills occurring in the latter situations as far northward as Chusan Some botanists assert that there is but one kind of tea tree, the difference in the samples of commerce depending upon the mode of preparation, others say that genuine black and green teas are the produce of distinct species, but that both kinds may be made artificially from the former sort The latter appears to be [illegible] cultivation of tea for commercial purposes has been attempted successfully in the Himalayas, Java, Brazil, and Madeira, but unprofitably in the two latter countries, on account of the high price of labour *See* TEA

THEATINES A religious order in the Roman Catholic church, the earliest in point of date of the communities of "regular clerks" it was founded in 1524 by St Cajetan of Thiene The members, besides the ordinary monastic vows, bound themselves to the duties of the cure of souls, preaching against heresies, tending the sick and convicts and to abstain from possessing property or asking for alms This order does not appear to have met with much success, except in Italy, where (it is said in the *Conv Lexicon*) the bishops are very generally chosen from it (See *Mosheim*, cent xvi)

THEATRE (Gr θεατρον, from θεαομαι, *I behold*) In Architecture, a building appropriated to the representation of dramatic spectacles The theatres of the Greeks and Romans display some of the most extraordinary specimens of their power in the arts Bacchus has the reputation of being the inventor of them, which, after their temples, appear to have been the most important public edifices of those people They seem to have been carried to perfection in the Grecian colonies at an earlier period than they were in the mother country The first theatre of *stone* at Athens called the theatre of Bacchus, was built in the time of Themistocles, and as there seems little doubt that the Athenians were the inventors of the drama as a regular scenic action, it is fair to presume that they were the first to regulate the form and proportions which necessity and pleasure dictated in their arrangement The subjoined [illegible] the general form of the Greek theatre, which [illegible] little from that of the Romans, and the instructions given by Vitruvius in the eighth chapter of his fifth book, as to the general outline of the plan, are as follows —"Whereas in the Latin theatre the points of four triangles touch the circumference, in the theatres of the Greeks the angles of three squares are substituted and the side of that square which is nearest to the place of the scene at the points where it touches the circumference of the circle is the boundary of the proscenium A line drawn parallel to this at the extremity of the circle, will give the front of the scene Three [illegible] to the proscenium, [illegible] ing the circumference on the right and left the one foot of the compasses being [illegible] with a radius equal to the distance [illegible] describe a circle on the right-hand side of the proscenium, and, placing the foot of the compasses on the left-hand point, with the distance of the right-hand interval describe [illegible] on the left side of the proscenium [illegible] three centres, the Greeks have a larger orchestra, and their scene is further recessed The pulpitum, which they call λογειον is less in width, wherefore among them [illegible] act upon the scene the [illegible] the orchestra" The ancient theatres were frequently used [illegible] the general assembly of the people [illegible] as we find from Tacitus and [illegible] as quarries freely used by the inhabitants of the cities in which they stood, there are still considerable ruins at Ephesus, Alabanda, Teos, Smyrna, Hierapolis, Cyzicus, Alinda, Magnesia Laodicea, Mylassa, Sardis, Miletus, Stratonicea Tralles, Iasus, and Patara, all in Asia Minor, in Sicily at Catana Taurominium, Syracuse, [illegible] Greece [illegible] Greece in its beauty and proportions, but in grandeur and magnificence the Roman theatres far surpassed those of the Greeks, nor is this surprising, considering the population the former had to accommodate compared with that of the latter For a very considerable period the theatres of Rome, like those of the Etruscans, were of wood and Pompey, on his return from the war against Mithridates was the first who constructed one of stone It must have been of large dimensions, inasmuch as it would contain 40,000 spectators The remains of it at some stables of a palace are still visible There were two other considerable theatres in Rome, the first built in the year 741 of the city, by Cornelius Balbus, and the second, which was begun by Julius Cæsar but not finished till the time of Augustus, who dedicated it to his friend Marcellus From the remains it appears that it was a specimen of great beauty and purity, as far as relates to the profiles of two of its orders there being no vestiges of the upper order The only other remains of Roman theatres are those at Fiesole and Orange, though the Romans usually erected theatres in their newly conquered cities, or at least embellished and improved those they found on the spot

The modern theatres of Rome are, perhaps, the worst in Europe Italy, however, boasts some beautiful examples, the principal whereof are those at Parma, now [illegible] Milan Verona, Turin, Naples, and Bergamo France has a very fine theatre at Bourdeaux, the theatre at Versailles, and some elegant theatres in Paris Till recently this country has been unsuccessful in the design of theatres, but a taste seems rising, which we doubt not, if opportunity occurred, would tend to raise its character in that respect in the eyes of foreigners We subjoin a short table of the width of the stage in a few European theatres —

Milan	40 feet
San Benedetto, Venice	40
Theatre Français, Paris	40
Parma	40
Bourdeaux	39
Turin	39
Covent Garden	37
Argentino at Rome	36
Theatre Italien, Paris	33

THEBAID The name given to the heroic poem of Statius, which celebrates the civil war of Thebes waged between the two brothers Eteocles and Polynices It consists of twelve books The poet Gray has translated book ii

THEBAN YEAR In Chronology, the Egyptian year of 365 days 6 hours was so called (See Bryant, *Ancient Mythology*, iii 437)

THECA (Gr θηκη, *a case or receptacle*) This term is used in Botany in various senses It is applied to one of the lobes of an anther, to the case or urn containing the spores of mosses, to delicate tubes sunk in the shields of some lichens, and to certain simple kinds of fruit In all cases it expresses a hollow case It is now seldom used, except for the spore-vessel of a moss

THECAPHORI (Gr θηκη and φερω, *I bear*) In Botany, the long stalk upon which the ovarium of some plants is seated, as in *Clome* and the caper bush

THECODACTYLUS (Gr θηκη, and δακτυλος *a digit*) A subgenus of night-lizards or geckoes, distinguished by having the subdigital scales divided by a [illegible] to which the claw can be retracted

THECODONTS (Gr θηκη and οδους *a tooth*) A [illegible] The only remains of this tribe, from the magnesian conglomerate near Bristol has been called *Thecodontosaurus*

THECOSTOMES *Thecostoma* (Gr θηκη, and στομα, *a mouth*) The name given by Latreille to those insects which have a suctorious mouth enveloped in a sheath

THEFT In Jurisprudence, the general name for the most ordinary class of offences against property, for which English law uses the peculiar designation of larceny The difficulty of distinguishing between theft, those other species of fraudulent appropriation which are regarded by the laws of most countries as criminal offences, and, finally, that class which is only the subject of civil action, has given rise to a variety of definitions By the French Code, art 379, "Whoever has fraudulently abstracted a thing which does not belong to him is guilty of theft By that of Bavaria, art 209, "Whoever knowingly of his own accord takes possession of moveables not his, without consent of the person entitled thereto, but without violence to any one, with intent unlawfully to hold the same as his property, is a thief" The principal characteristics of English law on the subject are, that it requires an actual taking, and an actual [illegible] from the possession of another; [illegible] Criminal Law, [illegible] Whoever shall [illegible] without such consent as is hereinafter specified, [illegible] being the property of any other person, and, unless when it shall be otherwise provided, of some value, with intent to despoil the owner, and fraudulently appropriate the same, shall be guilty of theft."

THEISM *See* DEISM

THEME (Gr θεμα) A subject proposed for discussion, whether orally or in writing

THE'MIS (Gr Θεμις) In Grecian Mythology, the [illegible] She was one of the Titans, and bore to [illegible] er, Justice, the Fates, and Seasons

THEOCRACY (Gr Θεος, *God*, κρατεω, *I rule*) A term expressing the government of a state immediately by God The constitution of the Israelites previous to the appointment of kings, was emphatically a [illegible] considered in a secondary sense as a theocracy, from the general superintendence which Jehovah continued to exercise over it All polities may in this sense be called theocratic in which the final appeal in matters of moment is made to the will of God, as expressed in oracles, by [illegible] the mouth of the priesthood

THEODICY'SY (Gr Θεος, and κρασις, *mixture*) In ancient Philosophy, a term invented to signify the intimate union of the soul with God in contemplation, which was considered attainable by the newer Platonists Similar ideas are entertained by the philosophers of [illegible] *See* QUIETISM

THEODICE'A (Gr Θεος, δικαιος, *just*) A [illegible] Providence with man A work under this title was published by Leibnitz in the year 1710, in which he endeavours to prove that of all the possible schemes of government which God might have adopted, the one which actually exists in the world is the best This is commonly known under the name of Optimism

THEO'DOLITE (Gr Θεαομαι *I view*, and δολος, *stratagem*) A surveying instrument for measuring the angular distances between objects projected on the plane of the horizon

In accurate surveying, when the instrument used for observing the angles is a sextant or reflecting circle or such that its plane must be brought into the plane of the three objects which form the angular points of the triangle to be measured the altitudes of the two distant objects above the horizon of the observer must be determined, and a calculation is then necessary to reduce the observed angles to the plane of the horizon The object of the theodolite is to measure the horizontal angles at once and thereby render the previous calculation, and even the observation of the altitudes, unnecessary

It is easy to conceive, in a general way, how this object may be effected A telescope with cross wires in its focus must be mounted so as to be moveable both about a vertical and horizontal axis, in order that it may be brought to bear upon any object, whether in the horizon, or above or below it, and the proper means must be applied for measuring, with the utmost accuracy, the angle described about the vertical axis (which is the horizontal angle) in turning the telescope round from one object to another It is consequently necessary to fix a graduated circle to the vertical axis, with its plane exactly horizontal, and its centre coincident with the vertical axis, and about the same axis a radial bar, firmly connected with the telescope, must revolve parallel to the plane of the circle, for the purpose of indicating the divisions passed over on the limb of the circle when the telescope is turned from the first object to the second In order also to render the instrument subservient to the purpose of measuring altitudes, a graduated vertical arch is attached to the telescope, but as it seldom happens, in the practice of surveying that the objects observed are very much elevated above or depressed below the horizon, or that the vertical angles are required to be taken with the same degree of accuracy as the horizontal angles the vertical arch is generally only a portion of a circle of smaller radius and less minutely divided than the horizontal circle

The theodolite, as now generally constructed for the purposes of [illegible] is described as follows —The [illegible] two circular plates, which turn freely on each other The lower or graduated plate receives the divisions of the circle, and the upper [illegible] intricately opposite [illegible] conical parts, one working within the other The external part is attached to the graduated plate, and the internal to the vernier plate The diameter of the under plate is somewhat larger than that of the vernier plate, and its edge is sloped off to receive the graduations, and portions of the opposite edges of the vernier plate are sloped off in like manner to receive the vernier divisions The [illegible] to a degree, but sensibly [illegible] minutes, and in a well-made instrument quarter minutes may be estimated by the eye For the purpose of adjusting the plane of the circle to the horizon, the external axis is fitted into a ball, which works in a socket between two parallel plates held firmly together by the ball and socket, the under plate being connected with the staff head supporting the instrument But this adjustment may also be made (and in larger instruments is usually made) by [illegible] a foot screw at each extremity [illegible] a plate of metal supported by the staff Upon the [illegible] of the vernier plate are placed two spirit levels at right angles to each other, with their proper adjusting screws, by which the circle is brought accurately into the horizontal plane indicated by the levels In order that the circle is adjusted over the point which forms the centre of the station from which the observation is to be made by means of a plummet

Instead of the vernier plate described above, the index is sometimes formed by three radial bars connected with the internal vertical axis, each carrying a vernier at its extremity, and a fourth bar carries the clamp, by which the system is secured to the graduated limb

The horizontal axis of the vertical limb (which is usually a semicircle) is supported by a frame firmly imbedded in the vernier plate, and turning along with it about the vertical axis The telescope has two collars or rings of bell metal, ground truly cylindrical, on which it rests in supports permanently attached to the vertical limb, so that both move together in the vertical plane The divisions on this limb are read off to single minutes by means of a fixed vernier connected with the frame, and so adjusted that the index points to the zero of the graduated arc when the optical axis of the telescope is truly horizontal For effecting this adjustment, or determining its index error, a spirit level is attached to the telescope, at one end by a joint, and at the other by a screw whereby the end is raised or depressed until the air bubble stands at the middle of the glass tube The telescope is then reversed, and if the air bubble of the level still stands at zero, the adjustment is perfect, if not, the index error becomes known by bringing the level to the proper position, and may either be corrected or allowed for in the observations

In some theodolites the telescope is supported in the manner of a transit instrument, that is to say the telescope and the horizontal axis on which it turns form one piece and the vertical limb is a complete circle By this construction the instrument becomes better adapted for determining the altitudes of stars, and consequently for finding the direction of the meridian and the azimuths of objects, or for other astronomical purposes In fact, it becomes an altitude and azimuth instrument

In theodolites for common topographical purposes the horizontal circle is seldom more than five inches in diameter but as the double vertical axis gives the means of carrying round the telescope from the first object to the second without disturbing the graduated circle, and then, by clamping the vernier and graduated plates, of bringing it back, and the graduated circle along with it, to the first object, the measure of the angle may be repeated any number of times exactly as with the repeating circle, and a [illegible] of accuracy obtained even with a [illegible] (See REPEATING CIRCLE) But the principle of repetition is better carried into effect by means of a particular kind of stand or tripod, called a *repeating stand*, which turns round concentrically with the vertical axis of the theodolite, and this apparatus is usually had recourse to when the instrument is on a large scale

As the accuracy of the observation must depend on the horizontal circle remaining perfectly fixed while the telescope and verniers are turned round, a second telescope, called a watch telescope is sometimes attached to the horizontal circle beneath the limb, which [illegible] to a fixed object, serves to detect any disturbance of the circle clamp or accidental shifting of position while the upper telescope with the verniers is turned from the first object to the second But this can scarcely be applied to the repeating theodolite

The principal adjustments of the theodolite are, first, to rectify the line of collimation of the telescope, secondly, to make the axis of the horizontal limb truly vertical and thirdly to adjust the zero of altitude For the practical methods of making these adjustments in the case of the common [illegible] theodolite and instructions as to the mode of observing the reader may be referred to *Simms's Treatise on Mathematical Instruments*, 1834

In geodetical operations, where very great accuracy is indispensable, as, for example, in measuring an arc of the meridian, the instrument is constructed on a much larger scale The great theodolite by Ramsden, belonging to the Board of Ordnance, which has been used for measuring most of the principal angles of the British Trigonometrical [illegible] three feet in diameter, [illegible] inches focal length A similar one of equal dimensions had formerly been constructed by the same excellent artist for the Royal Society, and was used by General Roy in his operations for connecting the observations of Greenwich and Paris towards the end of the last century, and also by Colonel Colby and Captain Kater for the same purpose in 1821 A full description of this superb instrument is given in the *Phil Trans.* vol lxxx, and in the

first volume of the *Trigonometrical Survey of England and Wales* A theodolite of equal dimensions, by Cary, has been employed in the measurement of the great meridional arc of India by Colonel Lambton and Colonel Everest The French astronomers, in measuring their arc of meridian, used only the repeating circle, but in the more recent operations of the same kind in Germany and Russia, the geodetical angles were measured with the [illegible]

THEOGONY (Gr Θεος, *God*, γονος, *birth*) In the Religion and Literature of ancient Greece and Rome, the history of the descent and relationships of the various gods who were the objects of popular worship These genealogies were very variously related by different writers, and originated in some instances from national superstition, while in others they had an allegorical sense, and were invented by the learned men or poets of those countries

Theogony is also the title of a poem attributed to H[illegible] on the birth and parentage of m[illegible]

THEOLOGIUM [illegible] upper stage in the ancient theatre upon which the machinery of the gods was arranged

THEOLOGY (Gr Θεος, and λογος, *discourse*) The science which treats of the nature and attributes of God, of His relations to man, and of the manner in which they may be discovered Lord Bacon divides the science under the following heads —1 Inspired 2 Natural, which he calls the first part of philosophy 3 Appendices Theologiæ Inspiratæ sc Doctrina de legitimo usu rationis humanæ in civitate Dei, [illegible] logicam in prat[illegible] de angelis et spiritibus (*De Augm Scient* lib ch 1) [illegible] these subjects [illegible] res concerning them from data furnished by the constitution of nature alone It is only by the conclusions arrived at by this process that we are put in a proper condition to examine the evidence of *revealed religion*, the basis of which is the satisfaction it affords to the demands of the human reason and affections

A pure system of natural theology, looking no farther for the evidence of divinity than the marks of it displayed in the creation, is deism, — the belief in God as a superintending Providence, which seems to require as a corollary the idea of a future retribution Those who can discover no design in the constitution of the world, or no trace of God's hand therein, are atheists, or deniers of a Deity Again, the most common form of religion deduced by the heathens from their researches in natural theology is the [illegible] numerous gods, each manifesting himself [illegible] various functions and qualities of the animate and inanimate world, and sometimes, according to ancient legends and traditions, by direct communication in various ways Opposed to this is monotheism, which recognizes more distinctly than deism the unity of the godhead, and gathers up under one volition and agency the attributes which the polytheist dispersed in only a vast number of divinities Of monotheist religions the Jewish, Christian, and Mohammedan lay claim to express revelation by the word of God

THEOMANCY (Gr Θεος, and μαντικ *prophecy*) A name which has been given to that species of divination which was drawn from the responses of oracles among heathen nations, in which a god himself was supposed to answer the inquirer, or from the predictions of sibyls and others supposed to be immediately inspired by some divinity

THEOPA'SCHITES (Gr Θεος, and πασχω, *I suffer*) In Ecclesiastical History, a name given by the orthodox to certain heretics of the 5th century, followers of Peter the [illegible] Being strongly attac[illegible]s, his enemies charged him and his disciples with holding that all the three persons of the Godhead were crucified (*Mosheim*, 5th cent part ii ch 5 1)

THEOPHANY (Gr Θεος, and φαινομαι, *I appear*) A word invented to signify the manifestations of God to man by actual appearance These have formed a striking feature in most systems of religion (See on Pagan Theophanies the 4th Dissertation of M Foucher on the Religion of Boudha, *Mém de l'Acad des Inscr* vol xxxvi p 292)

THEOPHILA'NTHROPISTS (Gr Θεος, *God*, and φιλανθρωπος, *a lover of men*) A title assumed by a society formed at Paris during the first French revolution The object of its founders was to establish a new religion in the place of Christianity, which had been formally abolished in France by the Convention, and had lost its power over the minds of large classes of the people The Directory granted these philosophical sectarians the use of ten parish churches in Paris, where they held meetings for [illegible] st on the Decadi, or revolutionary Sunday afterwards on the Sunday Their system of belief was a pure deism; their service a simple liturgy, with some emblematic mummeries The attempt to found a new sect was, however, wholly unsuccessful In 1802 they were forbidden the use of the churches by the consuls, and then ceased to exist

THEO'RBO (It tiorba.) A lute of large dimensions, sometimes called the arch-lute, and formerly used for striking the chords of the thorough bass in accompaniments

THEOREM (Gr θεωρημα, from θεαομαι, *I observe*) In Geometry a truth proposed to be proved, in contradistinction to a *problem*, which proposes something to be done A theorem wants demonstration, a problem requires solution In algebra, the term is applied to various formulæ, as the *binomial theorem*, *Taylor's theorem*, and others, for which see the respective terms

THEO'RICON In ancient Attic History, the name given to that portion of the revenue of the state which was exclusively reserved for the purpose of theatrical representations (See *Boeckh's Public Economy of Athens*, i 289 299 &c)

THEORY (Gr θεωρια), in Science, properly expresses a connected arrangement of facts, according to their bearing on sc[illegible] law A *hypothesis* has been d[illegible] as an assumption which is conceived to allow [illegible] the discovered law Thus some have [illegible] at the [illegible] ted on the supposition of a [illegible] Here it is evident that the *facts*, and therefore the *theory* or connected survey of them, are unaffected by the *supposition* in question

THEORY The abstract principles of any science or art, considered without reference to practice

THEO'SOPHISTS (Gr θεος, *God*, and σοφια, *wisdom*) The name commonly g[illegible] who pretended to derive their knowledge of God and divine matters from direct inspiration One of the most distinguished of this class in modern times was Jacob Bohme

THERAPEU'TÆ (Gr *worshippers*) A Jewish sect of the first century after Christ, concerning whom some doubt is entertained whether or not they had embraced Christianity They are mentioned by Philo Judæus (See *Burton's Lecture on the Ecclesiastical History of the First Three Centuries*, vol i p 300)

THERAPEU'TICS (Gr θεραπευειν, *to heal*) A branch of pathology relating to the application of remedies, and the curative treatment of disease

THERAPHIM See TERAPHIM

THERIA'CA (Gr θηρ, *a venomous animal*) A name given in ancient Pharmacy to certain complex remedies supposed to be antidotes to poisons they were usually in the form of confections Some of the more celebrated have been transferred to comparatively modern pharmacopœia, such as the *Theriaca* of Andromachus, *Theriaca Veneta*, *Confectio Mithridati*, &c

THERMÆ (Lat) In Ancient Architecture *See* BATH

THE'RMIDOR In the French Calendar, the name of the 11th month of the year in the French Republic It commenced on the 19th of July, and ended on the 17th of August The name is derived from the Gr θερμος, *warm*, and was borrowed from the great heat which characterizes that period of the year It was the month [illegible] by which there and the be[illegible] [illegible] ly called the Revolution of Thermidor, and those who boasted of having participated [illegible] called themselves Thermidorians

THERMO-ELECTRICITY When one part of a metallic bar is heated and another cooled an electric current is generated in its substance which may be rendered evident and its direction ascertained by the galvanometer When two metals of different temperatures are brought into contact similar electric currents are generated, the quantity and direction of the electricity varying with the nature of the metals and their respective temperatures [illegible] ting these thermo-electric [illegible] bars of antimony and bismuth soldered together at their ends, so as to form a compound bar or parallelogram, the junctions of which may be alternately heated and cooled in this case the direction of the current is from the antimony to the bismuth, so that these metals bear the same relation to each other in the thermo-electric series, as the zinc and silver in the simple voltaic circuit The term *stereo-electric* has also been applied to these currents, implying their production in solid bodies independent of a fluid, ar[illegible] [illegible] hydro-electric or voltaic current See VOLTA'S BATTERY

THERMO'METER (Gr θερμος, *warm*, and μετρον, *measure*) An instrument for measuring variations of heat or temperature

The principle upon which thermometers are constructed is the change of volume which takes place in bodies when [illegible] an alteration Generally spe[illegible]en heated and contract when cooled, and in such a manner that, under

the same c[illegible] ...ngths of temperat[illegible] ...ber not [illegible] to the same d[illegible] ... becomes the exponent of the temperature which produces it But as it is necessary not merely that expansion and contraction take place, but that they be capable of being conveniently observed and measured, only a small number of bodies are adapted for thermometrical purposes Solid bodies, for example, undergo so small a change of volume with moderate variations [illegible] they are in general only used for [illegible] temperatures, as the heat of furnace [illegible] &c [illegible] (*See* [illegible] The gases on the other hand, are extremely susceptible of the impressions of heat and cold, and as their changes of volume are great even with moderate accessions of heat, they are only adapted for indicating very minute variations, or for forming *differential* thermometers (*See* DIFFERENTIAL THERMOMETER) Liquids hold an intermediate place, and, by reason of their moderate but sensible expansion through the ranges of temperature within which observations have to be made for by far the greater number of purposes, are commonly used for the construction of [illegible] Various liquids have been proposed, as [illegible] rits of wine, and mercury, but scarcely any other than the two last are now ever used, and mercury by far the most generally

The properties which render mercury preferable to all other liquids (unless for particular purposes) are these —1 It supports before it boils and is reduced to vapour more heat than any other fluid excepting certain oils and endures a greater cold than would congeal most other liquids excepting certain spirituous liquors 2 It takes the temperature of the medium in which it is placed more quickly than any other fluid Count Rumford found that mercury was heated from the freezing to the boiling point of water in 58 seconds, while water took 133 seconds, and air 617 seconds, the heat applied being the same in all the three cases 3 The variations of its volume within limits which include the temperatures most frequently required to be observed may be presumed to be regular, and proportional to the variations of temperature The spirit thermometer is now little used excepting for observations of very low temperatures, or as a self-registering instrument for meteorological observations

Construction of the Mercurial Thermometer —In order to render small [illegible] glass bulb, having a slender [illegible] s filled with mercury, so that expansion or contraction can only take place by the rise or fall of the liquid in the tube The diameter of the tube may be of any convenient size, but the smaller it is the larger will be the scale of the variations, and capillary tubes are usually employed It is essential that the diameter of the bore be of a uniform width throughout, a quality which is tested by drawing up into the tube a short column of mercury, and measuring its length at the different parts with a pair of compasses Not more than a sixth part of the tubes which come from the glass-house are found to be fit for the purpose

Having selected a tube, the workman begins by blowing a hollow ball A upon one extremity of it, by means of an air-bag of caoutchouc (in order to avoid the introduction of watery vapour by blowing from the mouth) The length which the thermometer is to have is then marked, and above this point the tube is expanded into a second bulb B, rather larger than the first When the tube has acquired its natural temperature one of the bulbs is warmed, in order to expel the air from it, and the open end of the tube is plunged into distilled and well-boiled mercury During the cooling the mercury rises into the second bulb B, which it is made to pass into A by placing this undermost, and expelling the air from it by heat, after which the mercury descends from the effect of cooling When the bulb A has been completely filled, and also a part of B, the tube is suspended horizontally over a charcoal fire, so as to be equally heated throughout, and the enclosed mercury boiled, in order to expel every remaining particle of air or humidity The open end is then touched with sealing-wax and the tube withdrawn from the fire, and placed in an upright position until it is cooled, when the bulb A and the portion of the tube under B will be filled with mercury A portion of mercury is then expelled by heat, so that the column may stand at the proper height in the tube The tube is then carefully softened with the blow-pipe, and hermetically sealed under the bulb B, which is thus cut off

Graduation of the Scale —The instrument prepared in the manner now described is admirably adapted for rendering evident the expansions and contractions of the enclosed fluid and it only remains to adapt a scale to it in order to have a complete thermometer The graduation of the scale is in some measure arbitrary, nevertheless, in order that different thermometers may be comparable with each other, it is necessary that two points at least be taken on the scale corresponding to fixed and determinate temperatures, the distance between which will determine the graduation The two points which are now universally chosen for this purpose are those which correspond to the temperatures of freezing and boiling water With respect to the first of these there is no difficulty, it is only necessary to surround the bulb with ice, and to mark on the stem the point at which the mercury stands when the ice begins to melt The boiling point is not so readily determined As the temperature at which water boils varies to a small extent with the barometric pressure it is necessary in order to have instruments comparable with each other, either that the boiling point on the scale be determined when the barometer stands at a certain height which is arbitrarily assumed for the standard, or else to apply a correction when the actual height of the barometer is above or below the assumed standard De Luc made a number of experiments on this subject, and gave a formula for the correction, which was adapted to Fahrenheit's scale and English inches by Horsley (*Phil Trans* vol lxiv) A committee of the Royal Society, who undertook to investigate the best method of [illegible] the fixed points and whose report is contained in [illegible] *Transactions*, laid down a set of rules which have been generally followed by English instrument makers They recommended the adoption of 29 8 inches for the standard barometric pressure, and gave a table of the corrections for all ordinary pressures above or below this standard. Their table is very nearly represented by the following simple rule, which will be quite sufficient for the guidance of the artist in all ordinary cases —

Supposing the thermometer placed in an atmosphere of steam immediately over the surface of boiling water, then for every tenth of an inch by which the barometer is above or below 29 8, the correction for the boiling point of the scale of the thermometer is one thousandth part of the interval between the freezing and boiling points The corrected must be placed lower than the observed boiling point by this quantity when the pressure exceeds 29 8 [illegible], and higher when the pressure is less than the standard

Several other minute circumstances must be attended to in the construction of delicate instruments As the temperature of boiling water is different at the top and near the bottom of the vessel in which it boils, the thermometer should not be plunged into the water itself, but into the vapour which rises above it, in a close vessel with an aperture for the escape of the steam The vessel should be of metal, because water boils at a different temperature in vessels of different substances, as metal and glass Distilled water, or clear soft water, should be used, if mixed [illegible] it boils w[illegible] ...ferent, and [illegible] ...ld inaccurate

The interval between the two fixed points on the stem may be divided into any number of degrees at pleasure, and the graduation continued above and below as far as may be thought requisite the numeration may also be begun at any point whatever on the scale, but there are only three methods of division so generally adopted as to require particular notice The first is Fahrenheit's, which is used in this country, in Holland, and North America, the second Reaumer's, which was formerly in general use in France, and is still followed in Spain and some parts of Germany, and the third that of Celsius, or the centigrade scale, now used in France, Germany, and Sweden

Fahrenheit's Scale —In this scale the interval between the freezing and boiling points of water is divided into 180 equal parts, or degrees, which number was chosen by Fahrenheit (or pro[illegible] ...retical considerations [illegible] the expansion of mercury, it being computed that the thermometer when plunged into melting snow contained 11,156 parts of mercury, which, at the temperature of boiling water, were expanded into 11,336 parts, being an increase of 180 parts. The zero point of the scale is placed at 32° below the freezing point of water It has been frequently stated that this point was [illegible] of a freezing mixt[illegible] from Boerhaave that it was adopted from a still more precarious supposition, namely, the greatest cold observed in Iceland, which was probably assumed to be the lowest natural temperature The freezing point is thus marked 32°, and consequently the boiling point at 32° + 180° = 212° [illegible] it possesses some [illegible] point and the smallness of the divisions, is not well adapted to philosophical purposes

Reaumer's Scale — Reaumer, in 1730, proposed to adopt the temperature of melting ice as the zero of the scale and to divide the distance between this and the boiling point of water into 80°, having observed that between those temperatures spirits of wine (which he used

for the thermometric fluid expanded from 1000 parts to [illegible] This division soon became general in France and other countries, and a great multitude of valuable observations have been recorded in terms of it, but it is now seldom used in works of science

Centigrade Scale — In 1742, Celsius, professor at Upsal in Sweden proposed to divide the space between the freezing and boiling points of water into 100 equal parts, [illegible] placed as in Reaumur's) at freezing [illegible] This is obviously in harmony with our decimal arithmetic, and has been adopted universally by writers since the Revolution, and is the best known in most parts of the world, notwithstanding [illegible]

It has been sometimes objected to this scale (and the [illegible] Reaumur's), that on account [illegible] point at which the zero is placed in each of these scales is determined by [illegible] the objection (if any) is a very trifling one, and is much more than compensated by the facilities for calculation which the scale affords

Conversion of Degrees of one Scale into Degrees of another — From the manner in which the three scales are graduated, it is easy to deduce formulæ expressing any temperature given according to one scale in terms of either of the others The interval which in Fahrenheit's scale is divided into 180 parts is divided into only 100 parts in the centigrade scale and into 80 in Reaumur's Hence one degree of Fahrenheit's is equal to 5 9ths of a degree of the centigrade, and to 4 9ths of a degree of Reaumur But some attention is required on account of the difference of the zero points For the sake of perspicuity, it is convenient to adapt the expressions to three distinct cases Let F denote degrees of Fahrenheit's scale, C degrees of the centigrade, and R degrees of Reaumur, then,

Case 1 For all temperatures above the freezing point

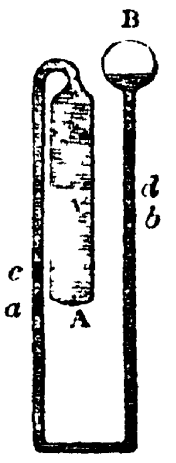
$$F - 32 = \tfrac{9}{5} C = \tfrac{9}{4} R.$$

Case 2 For all temperatures between the freezing point and the zero of Fahrenheit's scale,

$$32 - F = -\tfrac{9}{5} C = -\tfrac{9}{4} R$$

Case 3 For all temperatures below the zero of Fahrenheit,

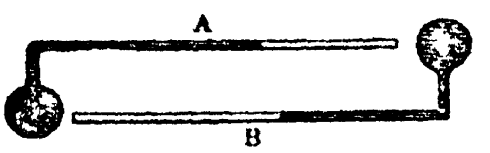
$$-32 - F = -\tfrac{9}{5} C = -\tfrac{9}{4} R$$



By substituting numbers in these formulæ for F C, or R as the case may require the corresponding values on the other scales is immediately obtained, but if many reductions are required to be made, it is more convenient to have comparative tables by which the correspondence of the scales is seen at a glance

Theory of the Graduation — It will be evident from what has now been said that, whatever scale be adopted, the division is founded on the assumed principle that equal increments of heat produce equal expansions. This assumption may be put to the test of experiment by the mixture of fluids at different temperatures For example if a pound of water at 122° F be mixed with another pound of water at 32°, and the requisite precautions be used, then the temperature of the mixture will be 122° which is the arithmetical mean between the two temperatures, and if the assumed principle be correct, a thermometer plunged into the mixture will stand at 122° This is found to be the case with the mercurial, but not with the spirit thermometer, and, in general, thermometers formed of other fluids when exposed to the same temperatures, do not give the same indications throughout the whole extent of the scale An important question hence arises what substance ought to be adopted as the standard to which, in comparing observations, all others should be reduced? It is, perhaps, not possible to determine this question with absolute certainty, but the experiments of the French chemists Dulong and Petit on the dilatation of various substances render it probable that air and the other permanent gases (which all expand equally) afford the most accurate indications of the true variations of temperature As compared with the air thermometer, the expansion of mercury is proportional to the increase of [illegible] to + 100° of the centigrade scale [illegible] point of mercury), mercury expands more rapidly than air, and consequently the mercurial thermometer stands higher than the air thermometer in the same circumstances When the former indicates 80 and 100 respectively, and it seems to be a [illegible] that all fluids with the same increase of heat expand more rapidly as the temperature approaches their boiling point The more rapid expansion of the mercury at high temperatures is, however, in some measure corrected by [illegible] of the bulb

Change of the Zero Point — There is a circumstance connected with the mercurial thermometer which requires to be attended to when very exact determinations of temperature are to be made Bellani in Italy, and Flaugergues in France, observed that when thermometers which have been constructed for several years are placed in melting ice, the mercury stands in general higher than the zero point of the scale, and this circumstance, which renders the scale inaccurate, has been usually ascribed to the slowness with which the glass of the bulb acquires its permanent arrangement after having been heated to a high degree [illegible] of the mercury Despretz (*Traité de Physique*) observes, that in very nice experiments it is always necessary to verify the zero point, for he found that when thermometers have been kept during a certain time in a low temperature, the zero point rises, but falls when they have been kept in a high temperature and the same applies equally to old thermometers and to those which have been recently constructed



Register Thermometers — In meteorological observations, it is of great importance to ascertain the limits of the range of the thermometer in a given period of time, during a day or night, for example, while the observer is absent Numerous contrivances have accordingly been proposed for this purpose, but the two following are those most frequently used

Six's Register Thermometer — This instrument was invented by Mr Six of Colchester, and is described in the *Phil Trans* vol lxxii It is a spirit thermometer, having a long cylindrical bulb A, with a tube bent in the form of a siphon, and terminating in a small cavity B A part of the tube, from *a* to *b*, is filled with mercury, but the bulb A, and the remaining portion of the tube and a small part of the cavity B, with highly rectified alcohol The use of the mercury in the middle of the tube is to give motion to two indexes, *c* and *d* which consist each of a glass tube in which a small bit of iron wire is enclosed the ends being capped with enamel The indexes are of such a size that they move freely within the thermometric tube and allow the spirit to pass, but a slender spring is attached to each, which presses against the side of the tube, and is just strong enough to prevent the index from falling down when it has been raised to any point and the mercury recedes The action of the instrument will be readily [illegible] the figure An increase of heat expanding [illegible] in the bulb A, [illegible] mercury at *a* and consequently raises it [illegible] branch of the siphon at *b* The mercury while rising drives the index *d* before it, and when the temperature diminishes the mercury recedes from the index, which is retained in its place by the action of the spring, and consequently marks the highest point at which the mercury has stood In like manner, when the spirit in the bulb A is contracted by a diminution of heat, the mercury is pressed towards A by the elastic force of a portion of air purposely [illegible] with B and drives before it the index *c*, which [illegible] and consequently remains at the highest point at which the mercury has stood in that branch of the siphon When the observation has been made the indexes are brought back to the surface of the mercury by means of a magnet, which acts on the enclosed iron wire and overcomes the [illegible] A scale is applied to each limb of the [illegible] and by comparison with a standard thermometer

This instrument has all the defects which belong to the spirit thermometer, and the indications are besides in some degree deranged by the expansion and contraction of the enclosed column of mercury, probably, also, by the friction of the indexes Nevertheless, it is the best instrument we possess for determining the temperature of the [illegible]
