INCARCERA'TION (Lat) Literally, imprisonment In Surgery, this term is generally applied to ruptures or hernia with the same meaning as *strangulation*, but, according to Scarpa, an *incarcerated* hernia is that in which the course of the intestinal matter is interrupted without any considerable injury of the bowel itself, whereas in *strangulated* hernia the vitality of the bowel is affected or there is organic injury of its coats The functions of the merely incarcerated intestine are healthily resumed upon its return into the abdomen, which is not the case where true strangulation has taken place

INCARNA'TION (Lat caro, *flesh*) A word in common use [illegible] to express the union of the Godhead and the Manhood in Jesus Christ St John says The Word was made flesh, and dwelt among us, a text sufficiently explicit when coupled with other expressions respecting the divine nature of the Word, to maintain the doctrine of the incarnation among the vast majority of the Christian world But the subtle inquiries which men have instituted into the manner and nature of this union have given rise to many varieties of opinion, and to many sects which have incurred the reproach of heresy Not the Socinians only, but the Arians and Sabellians also are led necessarily by their premises into heterodoxy upon this point, the Nestorians, however, and Eutychians, may be considered the principal sects which have joined an orthodox belief as to the relations of the three persons of the Trinity one to the other, with peculiar conceptions of the manner of the union of the two natures in Jesus Christ (See the respective articles)

The real manner of this union or indwelling of the God in the Man is allowed to be a mystery such as cannot be fully apprehended by the human intellect It is easier to point out the errors which beset its investigation than to express in words the true doctrine The phrase, 'The Word was made flesh' cannot imply that the divinity was lost and annihilated in becoming flesh, nor that it changed its own nature and was turned into humanity In either of these cases, Christ would cease to be a divine being while on earth Nor did the Godhead inspire the Manhood after the manner in which the Prophets had been inspired in earlier times, for the terms applied to Christ are of a very different kind Nor on the other hand could the humanity be lost and absorbed in the divinity which would seem to destroy the sympathy with which the m[illegible] regarded mankind, upon which so much of the [illegible] structure [illegible] religion is raised

INCE'NDIARY (Lat incendo *I burn*) Literally, one who sets fire wilfully to a building or stores but it is used also in a metaphorical sense for any political agitator who seeks to inflame the minds of the people See ARSON

INCE'NSE See FRANKINCENSE

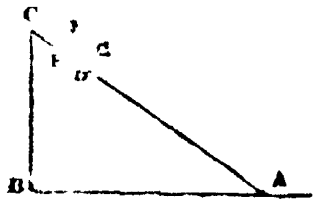
INCE'PTIVE (Lat incipio *I begin*) A word used by Dr Wallis to express such *moments* or first principles as, though possessed of no magnitude themselves, have yet the power of producing it by being extended or enlarged Thus a point or a line, though the former has no proper magnitude and the latter no breadth, are both said to be *inceptive* of enlargement In the Latin language *inceptive* or *inchoative* verbs (the latter term being derived from the Lat inchoare, *to begin*) are those which, according to grammarians, are characterized by the termination *sco* or *scor* added to their primitives, and are expressive of a commencement of increase or augmentation of the qualities indicated by the words from which they are derived [illegible] case, *augescere*, to begin to increase *pallere*, [illegible], *pallescere*, to grow pale

INCE'RTUM O'PUS (Lat) In Ancient Architecture, a [illegible] with [illegible] whose [illegible] exhibits an [illegible] [illegible] [illegible]

INCH A [illegible] enough, the tenth part of a foot

INCH A word used as a prefix to certain small Scottish islands, as Inch-Keith, Inch-Garvie It is derived from the old Irish or Gaelic word [illegible] an island

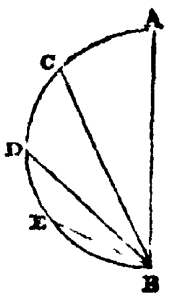
I'NCIDENCE In [illegible] *Impingement* The meeting of one body with another The term *angle of incidence* is used by writers on mechanics and optics in different senses Thus, in the case of a body striking against a plane the angle of incidence is by some understood to signify the angle formed by the line in which the body moved with a straight line perpendicular to the plane, while others use the term to denote the angle which the line of incidence makes with the plane itself When light or any elastic body is reflected from a surface the angle of incidence is equal to the angle of reflection, and in the case of refraction, the sine of the angle of incidence has to the sine of the angle of refraction a constant ratio



I'NCIDENT In Law something necessarily appertaining to and depending on another, which is termed the principal

INCINERA'TION (Lat incinero *I reduce to ashes*) The combustion of organic substances for the purpose of obtaining their ashes or incombustible residue

INCI'SORS *Incisores* (Lat incido *I cut*) The teeth implanted in the intermaxillary bones of the upper jaw and in the corresponding place in the lower jaw and which are generally shaped for the purpose of cutting or coarsely dividing the food



INCLINA'TION (Lat) A term of frequent occurrence in geometry mechanics physics and astronomy It is in all cases measured by an angle Thus the *inclination of the orbit of a planet* is the angle between the plane of its orbit and the plane of the ecliptic In the history of geometry the *problem of inclinations* is a subject that was treated of by Apollonius in two books which are lost but of which a description has been given by Pappus The problem proposed was this 'To insert a straight line of a given magnitude and tending to a given point between two lines which are given by position' The problem was restored by Marinus Ghetaldus and various other investigations have since been given by the method of the ancient analysts

INCLINED PLANE One of the five simple mechanical powers The theory of the inclined plane is easily deduced from the decomposition of forces Let AC be the position of the plane BC its altitude and AB the horizontal distance of the foot of the plane from the perpendicular BC Suppose a cloud to be placed on the plane at D and let it be required to determine the relation between its whole weight and its tendency to descend along the plane Let DL denote the vertical pressure of the weight and decompose this into DI parallel to the plane and FI perpendicular to it and complete the parallelogram IG Now the part FI is supported by the resistance of the plane there remains therefore only the force represented by FD to urge the descent of the weight along the plane But the triangle DFI is obviously similar to CBA and therefore DI is to DF as CB to CA that is the force of descent along the plane is to the whole weight of the body as the height of the plane to its length or as the sine of its elevation is to radius The force therefore, which is required to raise a body along the plane is less than that which is required to raise it perpendicularly in the same proportion

This fundamental proposition was first demonstrated by Stevinus of Bruges, but by a very different process of reasoning He supposed a chain or chaplet composed of equal links to be thrown over the triangle ABC and the two ends to be united a little below the base AB It is evident that this chain would remain at rest for on altering its position each link would be succeeded by a similar one in the same situation, and if it began to move of itself it would move for ever, a supposition which is absurd But the part below the base being suspended equally at both extremities, is evidently in a state of equilibrium, therefore the part which hangs along the perpendicular BC must balance the part lying along the inclined plane, and the weights of these two parts being as their lengths it follows that a weight placed on the plane is to the force required to sustain it as the length of [illegible] to its height

[illegible] connected with the motion of bodies on inclined planes which deserve to be noticed The first is that the velocity acquired by a body in descending from any altitude to a horizontal plane is the same when it reaches the horizontal plane, whether it has been allowed to fall freely in the vertical, or been constrained to move along an inclined plane at any angle of elevation The second is that the times of descent through all chords of the same circle to the lowest point are equal, and equal to the time the body would take to fall through a height equal to the diameter of the circle Thus, let A B be the diameter, and C B D B, and E B chords of a circle, the time a heavy body would consume in falling vertically through the diameter is the same as that in which it would roll down the inclined plane C B or D B, or F B In other words bodies placed at A, C, D, and F, and abandoned at the same instant to the action of gravity, would arrive at B at the same time In these propositions it is supposed of course, that there is no resistance from friction

INCLO'SURE (Lat includo, *I shut up*) This term in a general sense is one of the first acts of appropriation since in a new country when any portion of land is purchased or taken possession of, it is inclosed, that is surrounded by a boundary line indicated by certain objects, natural or artificial or of both kinds In a particular sense to inclose land is to divide it into fields and surround these by fences, in order that each field may be devoted to a particular description of culture If nothing farther than the cultivation of plants of different kinds were carried on in the fields of a farm their subdivision by fences would be altogether unnecessary, but as in most cases fields are kept alternately under tillage and pasture it is desirable to have fences to confine the pasturing animals to the field appropriated for their use

INCLU'SA (Lat includo *I inclose*) The name of a tribe of shell bearing Acephalous Mollusks in the system of Cuvier characterized by the closed state of the mantle which every where surrounds and envelopes the body leaving only a narrow aperture for the passage of the foot and [illegible] mostly into two siphons projecting [illegible] is always open at its two extremities The bivalves of this family are remarkable for their powers of burrowing and excavating clay, sand wood or even stony rocks, and many of the genera secrete in addition to the ordinary valves a calcareous lining to their burrows, which forms a tube surrounding the valves themselves The relative proportions of the tube and valves well illustrate the so called Law of the balance of organs the valves becoming diminished in size as the external sheath is more developed In the shipborer (*Teredo navalis*), which has the longest tube the valves are of the smallest size being reduced to the office of mere boring instrument instead of serving to protect the soft parts of the animal In the watering-pot shell (*Aspergillum* Lam) they cease to be moveable organs and are blended or confluent with the external tube this is dilated at the anterior extremity which is surrounded with a projecting perforated ridge and closed by a convex plate, perforated like the mouth of a watering-pot

INCLU'SI or RECLU'SI (Lat *shut up*) In Ecclesiastical History a class of religious persons who lived as hermits in single cells generally attached to monasteries sometimes in the neighbourhood of villages and towns —under the law of not leaving them unless in case of extreme necessity and with the approbation of the bishop whose seal or that of the abbot was impressed on its door The cells are said to have been commonly twelve feet in length and breadth Nuns became sometimes but more rarely recluses

INCOGNITO (Ital *unknown*) abbreviated into *incog* denotes the disguise resorted to by the great when they are unwilling to be recognized It consists either in assuming a different name or title for the nonce or in travelling from one place to another without a retinue or other marks of distinction

INCOMBU'STIBLE CLOTH This term was originally applied to cloth with which asbestus was interwoven on burning away the fibre, the incombustible mineral texture remained

More recently cloth and other materials have been rendered to a great extent incombustible by impregnating them with certain saline substances which, upon the application of fire form a species of glaze upon the goods and prevent them burning with flame by protecting them from the necessary access of air (*See* Combustion) Borax, alum and phosphate of soda, or ammonia, are the most effectual salts for this purpose, and by properly applying them, with starch, if to muslin dresses curtains or bed furniture, or with size to paper hangings and scenery, these several articles may be rendered incapable of burning with flame, and thus serious accidents by fire prevented Wood may also be rendered comparatively incombustible by soaking it in [illegible] *See* Asbestus

[illegible] Two numbers or homogeneous quantities of any kind are said to be incommensurable when they have no common measure, or when no number or quantity of the same kind can be found which will divide them both without a remainder Thus the numbers 21 and 22 are incommensurable The

side of a square and its diagonal are incommensurable lines as is proved by Euclid in his tenth book Numbers are said to be *incommensurable in power* when their squares or second powers are incommensurable as 2 and 3 the squares of which 4 and 9, have no common measure It is owing to the incommensurability of quantities, that it is found so difficult to explain the doctrine of proportion in the elements of geometry

INCOMPA'TIBLES In Chemistry, salts and other substances are said to be *incompatible* which cannot exist together in solution without mutual decomposition Thus the soluble salts of lead and of baryta are incompatible with sulphuric acid and the sulphates, because the sulphates of lead and of baryta are insoluble, and consequently thrown down in the form of precipitates

INCOMPRE'SSIBILITY That quality of bodies in virtue of which their volumes cannot be diminished There are no substances, perhaps, absolutely incompressible Liquids, however resist compression with great force, but the experiments of Canton have proved that water has its bulk sensibly enlarged by withdrawing the pressure of the atmosphere Nevertheless the extent to which the compression can be carried is very small On enclosing water within an iron cannon the sides of which were three inches in thickness and applying a very great force of pressure the cannon burst before the volume of water had been reduced to 19-20ths of its original dimensions A pressure equal to that of the atmosphere reduces the bulk of water only about 48 parts in one million

I'NCREMENT (Lat *increase*) in the higher Mathematics, denotes a small but finite increase of a variable quantity it is the difference between two successive values of the function of a quantity increasing, according to a determinate law *The method of increments* was the name given by Dr Brook Taylor to a method of analysis invented by him and which has since been extensively cultivated under the appellation of the *calculus of finite differences* It is of great use for the summation of series and furnishes an easy and rapid solution of a great variety of difficult problems to which other means of investigation would hardly apply *Taylor's Methodus Incrementorum* was published in 1715 and contained the celebrated theorem which has since been made the base of the differential calculus (See *Euler's Calculus Differentiaus* Bossut *Calcul Differentiel et Intégral*, Lacroix's large work and Sir J Herschel's Essay in the Appendix to the Cambridge translation of *Lacroix's Differential and Integral Calculus*)

INCREMENT In Rhetoric is a species of climax rising gradually from the lowest to the highest See CLIMAX

INCRUSTATION (Fr) In Architecture and Sculpture a work fixed with cement or cramp irons into notches made to receive it, such as inlaid work and mosaics &c

INCUBATION (Lat incumbo *I brood over*) Hatching or the lying down of an animal upon her own or another's eggs communicating to them and maintaining them at her own temperature a condition essential to their development In many animals the development of the fœtus takes place after the exclusion of the egg and whilst it is maintained in contact with the external surface of the parent's body as in the crab and lobster tribes beneath the caudal plates or agglutinated to the surface of the abdomen as in certain species of pipe fish (*Syngnathus*), or concealed in cutaneous marsupial cavities as in other species of *Syngnathus* and the *Hippocampus*, but in these and other instances from the cold-blooded animals the protection of the ova seems to be the object of their attachment to the parent and not the communication of warmth or any other influence essential to their development It is only in the Oviparous class with warm blood or birds that true incubation takes place and in this class without any exception Another characteristic of true incubation is that the place of the eggs determines that of the incubator which can only perform its office by *lying down upon the eggs*, while in most of the examples of false incubation in the cold blooded animals, the eggs are retained by special contrivances in contact with the parent without occasioning any restraint upon her postures or movements

That a due degree of warmth is the essential object of incubation in birds, is proved by the ancient and well-known practice of substituting artificial heat, by which fertile eggs are hatched in the same period, and the excluded chick is as fully and strongly developed, as when produced by natural incubation (See *infra*)

The mean temperature of incubation is 100° Fah, it may vary from 95° to 105°, and towards the close of the process, may be suspended for one or two hours, or for a longer period, according to the degree of extraneous heat which the eggs may derive from their situation, without fatal consequences to the embryo

The power of communicating the requisite degree of warmth [illegible] the unusual development [illegible] to, a peculiar plexus of vessels distributed over the skin of the abdomen, and which, in most birds, is connected with a derivation of blood from the internal organs of generation, after the subsidence of the menstrual activity of the ovarium and oviduct, to the external integuments The vascular, hot and sensitive condition of the skin of the abdomen is the exciting cause of that uncontrollable propensity to incubate which the Greeks denominated "storge," and which, with its associated phenomena of patience abstinence, and self-denial, forms so remarkable a feature in the economy of birds The egg of the bird presents several peculiarities in relation to the circumstances under which it is to be developed its oval form permits a greater proportion of its surface to be in contact with the heat-communicating skin of the parent than if it had been a spherical body, while the shell, by virtue of its hard calcareous texture, and its arched disposition about the soft contents sufficiently defends them from the superincumbent pressure As warmth is the only essential influence which the egg derives from the parent, the shell is porous, and permeable to air, and the germ is surrounded by an adequate store of nutritious matter This matter is of two kinds the external, called the white of the egg or albumen which wholly disappears during the process of incubation and the internal part, or yolk inclosed in a peculiar membrane, and rendered lighter and of an orange colour by the admixture of a peculiar oil The germ is situated at the superficies of the yolk, beneath the vitelline membrane, in the circular opaque white spot called the "cicatricula" or "tread," and a peculiar mechanism is superadded to the yolk by means of which the germ-bearing surface of the yolk is always kept uppermost and next the warmest surface of the egg, and at the same time is relieved from the pressure against the hard shell to which it must have been subject if the light yolk had not been restrained from rising to absolute contact with that surface Both these purposes are effected by the attachment of two cords of condensed albumen, continued at one end from near the poles of the yolk but a little more distant from the germ bearing side than the line of the transverse axis and expanding at the opposite end which is lost in the layers of albumen near the poles of the egg Thus by their presence and place of attachment these cords, called the 'chalazæ' restrain and regulate the rising of the yolk, so that whichever way an egg be turned the larger proportion of the light yolk always rises above the [illegible] with the cicatricula [illegible] cubation is generally directly as the size of the bird but the degree of development which the chick attains prior to exclusion varies As a general rule it is inferior in birds of flight as the Accipitrine and Passerine orders than in the terrestrial wading and swimming birds and the warmth and complexity of the nest bears relation to this difference of development If the thrush had been forewarned that her young would be excluded from the egg naked and helpless she could not have prepared beforehand a warmer and more comfortable abode than her instinct led her to construct for their accommodation, and if with such a nest we contrast the rude recess of straw in which the hen deposits and incubates her eggs it might be imagined that she knew beforehand that her chickens would come into the world well clothed and strong enough at once to run about and pick up their own food In this case therefore the nest relates only to incubation in the other to incubation and subsequent rearing of the young and according to the degree of development attained during incubation and the associated condition of the nest and habits of the parent birds have been divided into two great groups, the *Aves altrices*, and *Aves præcoces* See AVES

Artificial incubation has been practised from a remote period by the Egyptians and Chinese the former indeed, have carried this process to such a high degree of perfection as in many instances to have entirely superseded the use of the hen in hatching It is effected either by means of an oven stove or steam, the principles of which will be found detailed in *Ure's Dictionary of Arts &c* This process has received considerable attention from the French philosophers but perhaps the best exemplification of its results that has been witnessed in Europe is given by the *Eccaleobion*, or egg hatching machine exhibited in London This term recently invented to express the process of artificial incubation is derived from the Gr ἐκκαλέω *I call out* or *produce*, and βίος, *life*.

I'NCUBUS (Lat incubo, *I lie upon*, because the sufferer feels as if something pressed upon his chest) The nightmare The name incubus is derived from imaginary fiends or spectres to whom strange powers are attributed by the writers on dæmoniacal agency Many noble families were supposed to have their origin from the connection of incubi with females as in the well-known instance of Robert of Normandy called *le Diable* (See *Encyc Met*)

INCU'MBENT (Lat incumbo, *I lie upon* or *occupy*) A [illegible] of an ecclesiastical benefice

INCUNABULA (Lat *a cradle*) In Bibliography, a term applied to books printed during the early period

of the art: in general confined to those which appeared before the year 1500

INCURVED (Lat incurvo, *I curve inwards*) In Zoology when applied to [illegible] words

INDECLINABLE In Grammar a word admitting of no declension or inflexion Adverbs, prepositions particles conjunctions, are all indeclinable In classical languages, indeclinable nouns are those few (chiefly borrowed by the Greeks and Latins from foreign languages) of which the termination is not altered in the several cases

INDEFINITE In Botany, when stamens are above twenty in number the word is applied to all other parts when their number is greater than can be readily counted This term always refers in botany to number, and never to form

INDEFINITE PROPOSITION, in Logic, is one which has for its subject a common term, without any sign to indicate whether it is distributed or undistributed *See* PROPOSITION

INDEHISCENT (Lat in and dehisco *I gape*) is said of a fruit the pericarpium of which continues perfectly closed without opening in any degree when ripe

INDEMNITY (Lat in, *without* and damnum, *loss*) In Politics and Jurisprudence, a word of various significations, but applied usually to laws passed to relieve individuals from penalties to which they are liable in consequence of acting in an illegal manner The Act of Indemnity, annually passed by the British parliament for many years prior to the repeal of the Test and Corporation Acts in 1828, was a measure for the relief of persons who had assumed any office without qualifying themselves for it by taking the oaths prescribed by those enactments In Feudal Jurisprudence, the right of the lord to a certain duty payable by religious establishments to compensate him for the loss of those fines on alienation which would probably have accrued from time to time had their property remained in lay hands was termed indemnity In the language of modern politics, compensations paid by a state to other states corporations or individuals for losses sustained through its acts bear the same name Acts of indemnity are also sometimes passed to relieve ministers from the responsibility of measures exceeding their strict constitutional powers, taken by them when parliament was sitting to meet some unforeseen public emergency, or in ignorance, it may be that they had exceeded the powers vested in them by the constitution In 1825 a law of indemnity was passed in France to compensate the losses sustained by the emigrants their families, and those of persons who had been condemned to death for political offences in the course of the Revolution The sum allotted to this purpose was an annual amount of 30 000 000 francs (about 1,200 000*l*) A special commission was appointed to carry it into execution but it appears that its labours were broken off before their completion by the political changes of 1830

INDENTURE In Law a writing or deed comprising some contract between two or more parties The name is derived from the ancient practice according to which the original and counterpart original (to be retained by each party respectively) were written on the same skin of parchment, and then the two parts were separated by a notched or indented cut so that when applied to each other they would appear to match (See DEED)

INDEPENDENCE, DECLARATION OF, in the History of the United States of America The Declaration of Rights was [illegible] by the first general congress of the [illegible] colonies which met at Philadelphia in September, 1775 In this declaration that assembly asserted the right of internal legislation and taxation to be in the provincial legislatures and declared various acts of the mother country to be infringements and violations of the rights of the colonists The second congress, which met in May, 1776, adopted on July 4 of that year a declaration of independence, by which, after a recapitulation of grievances complained of in the former declaration declared the colonies to be free and independent states absolved from all allegiance to Great Britain The first draught of this famous declaration was prepared by a committee of five, consisting of Jefferson and Adams both afterwards [illegible] Franklin and Sherman but Jefferson and Adams were afterwards deputed as a sub-committee to prepare the declaration itself, but, in the shape in which it finally appeared it was in fact the work of the former

INDEPENDENTS A Protestant sect, so called because they maintain that every single congregation of Christians which meet in any one place for public worship forms a church or independent religious society in itself, under [illegible] or [illegible] thing like a national establishment of religion, whether episcopal or presbyterian, and insist that each congregation of Christians has inherent and indefeasible power in itself to exercise ecclesiastical government, to fix their own tenets and form of religious worship, and to adopt their own standard of church discipline, without being responsible to bishops, presbyteries, or synods, or even to the state itself The Independents were not at any time, and are not at this day, remarkable for any peculiarity of religious creed They have always maintained, speaking generally, Calvinistic doctrines their only peculiarity consisting in their maintenance of independent ecclesiastical government

Of the history of this sect it may be proper to give a brief account On the reformation of religion in England the great body of Protestants adopted under the auspices of the government, the episcopal form of church polity, which was in consequence established as the national religion But there were not a few who conscientiously thought that this polity too nearly resembled that which had been supplanted, and objected besides, to the vestments adopted by the clergy in the celebration of divine worship to the liturgy, and above all to the sign of the cross used in baptism, as unscriptural and erroneous These non-conformists or dissentients from the established faith are known in history under the name of *Puritans* as the followers of Novatian had been denominated in the third century They were evidently so called in derision, in consequence of the superior purity and sanctity they assumed and of the greater deference they showed to scripture authority both as to doctrine and the form of religious worship But while they forsook the national church and condemned many of her tenets, they did not agree among themselves They were, in truth unanimous in nothing but in resisting the constitution of the predominant hierarchy Some of them were in favour of presbytery or ecclesiastical government vested in a gradation of church courts such as Calvin had established in Geneva, and as Knox had introduced into Scotland Others were against every form of state religion, or union of churches under the same ecclesiastical government but regarded each congregation of Christians as being *jure divino* a complete and independent church competent to judge decide and act for itself without any external interference or responsibility whatever Of this latter opinion which constitutes the pure principle of English Independency the author and great advocate was Robert Brown who was originally a clergyman of the Protestant episcopal church from which he seceded and avowed his new doctrines about the year 1580 (*Neal's Hist of the Puritans* vol i ch vi London, 1822) Brown is represented by Neal as a vehement and popular declaimer and insinuating in his manners, and hence he succeeded in detaching many from the episcopal faith, and in establishing several separate churches He not only advocated the leading principles of Independency as we have stated them above but taught that the priesthood was neither a distinct order in the Christian church, nor conferred an indelible character, that every person regarded by the majority of a congregation as qualified to teach might be set apart for that office by the election of his brethren and by imposition of their hands, in like manner by their authority he might be discharged from that function and reduced to the rank of a private Christian He also maintained that the right of the pastors to preach was not peculiar to them, on the contrary, that any member who thought proper to exhort or instruct the brethren enjoyed the inherent right of doing so or of 'prophesying' before the whole assembly Hence it happened that after the stated pastor had finished his services the ordinary members were allowed to communicate in public their sentiments on any religious subject (*Ibid*, and *Mosheim's Ch Hist* vol v 355-6 London, 1822) But while Brown enforced these views and claimed liberty of conscience [illegible] called 'did not differ from the Church of England in any articles of faith but were very rigid and narrow in points of discipline They denied the Church of England to be a true church and her ministers to be rightly ordained They maintained the discipline of the Church of England to be popish and anti-Christian and all her ordinances and sacraments invalid Hence they forbade their people to join with them in prayer in hearing, or in any part of public worship, nay they not only renounced communion with the Church of England, but with all other reformed churches except such as should be of their own model' (*Neal*, i 303)

Brown and his followers, as they had imbibed such extreme views, cannot be expected to have been allowed to live undisturbed in the dark times to which we refer He, in truth, suffered severely for his principles, both for some works he published, and for the ecclesiastical doctrines which he travelled throughout England in propagating He was committed, as he afterwards boasted, to no fewer than thirty-two prisons in succession, in some of which he could not see his hand at noonday Nor were his adherents more mercifully treated many of them were fined and imprisoned, and some put to death (*Neal*, i 313) Under these circumstances, a body of the party, with Brown at their head, fled to Holland,

and founded churches at Middelburg Amsterdam and Leyden But these establishments were neither solid nor lasting When the Brownists were delivered from the hands of the bishops their [illegible] and their [illegible] in 1589, and not merely renounced the opinions which he had suffered so much in promulgating, but returned into the bosom of the church which he had abandoned, and which he had so long and so severely calumniated

The Brownists that still remained in Holland, now left to their own discretion, and learning moderation from experience, were not unprepared to modify or reform the severity of the discipline of their founder This judicious [illegible] John Robinson of Norfolk, [illegible] Leyden, "a man who had much of the solemn piety of the times, and who, perceiving the defects that reigned in the discipline of Brown, and in the spirit and temper of his followers, employed his zeal and diligence in correcting them, and in modelling the society in such a manner as to render it less odious to his adversaries, and less liable to the just censure of those true Christians who looked on charity as the end of the commandments" (*Mosheim*, v 359 60) Hitherto the sect had been called Brownists they now renounced that name, and have since been known under the title of Independents, and Robinson, who wrote an "Apology" (*Apologia justa et necessaria pro Exulibus Anglis, qui Brownistæ vulgo appellantur* Lugd Batav 1619 8vo) for them, in which he gave a minute and systematic exposition of their principles was considered as their founder The Independents were much more commendable than the Brownists particularly in the moderation of their sentiments and the order of their discipline They laid aside that hostility to other sects which Brown had inculcated They agreed with the reformed churches generally in articles of faith They wished to maintain communion with them they differed with them only on the subject of church government They were also much more attentive than the Brownists had been to the establishment of a regular ministry in their communities, for while the latter promiscuously allowed all ranks and orders of men to teach in public and to perform the other pastoral functions, the Independents had and still have a certain number of ministers chosen respectively by the congregations where they are fixed Nor is any person among them permitted to speak in public till he has received the sanction of the congregation (*Ib*, and *Mosheim*, ut supra)

Independency thus put on a more rational and Christian footing in Holland was introduced into England by Mr Henry Jacobs in 1616, an individual who constituted the first Independent or (as it is not inappropriately called) Congregational Church in this country For some time however, the sect made but slow progress in England Its members concealed their principles from public view to avoid the penal laws that were in existence against non conformists But during the latter part of the reign of Charles I, when amidst the shock of civil and religious discord, the authority of the Episcopal Church began to decline the Independents assumed greater courage, and publicly avowed their principles with a degree of confidence not previously exhibited by them From this period their progress was rapid a circumstance that may be imputed to a variety of causes, particularly the learning of their teachers the unpopularity and declining state of episcopacy, and the support of Oliver Cromwell who espoused their cause and enrolled himself among the list of their members They probably were, during Cromwell's time the most powerful and important religious body in England, though for a few years previously to the death of Charles I the Presbyterians may be said to have had the ascendency Indeed, presbytery had been established by act of parliament as the national church, and it was chiefly owing to the growing influence of the Independents that this act was rendered inoperative (*Murray's Life of Samuel Rutherford*, chap viii Edinburgh, 1828) Notwithstanding the "Apology" written by Robinson which was regarded as [illegible] standard of faith and discipline, but, in the year 1658, their leading members held a meeting in London, under the [illegible] practised by the Congregational Churches in England, agreed upon and consented unto by the Elders and Messengers at their Meeting at the Savoy, Oct 12 1658" The Confession and Robinson's "Apology," on which it is mainly founded, contain a synopsis of their various tenets, and from these it appears as Mosheim remarks, "that they differed from the Presbyterians or Calvinists in no single point of any consequence, except that of ecclesiastical government" (*Adam's Religious World Displayed* ii 312 13)

Thus matters stood at the date which we have just specified What might have been the issue of the struggle between the Independents and Presbyterians if Cromwell had lived, or if the dynasty which he established had stood [illegible] be told But the restoration of Charles II, and with him the episcopal church, put an end to the influence of both sects The Act of Uniformity was passed in 1662, the object of which was to crush non-conformists, particularly the Independents and Presbyterians The Act required from clergymen a direct [illegible] principle of episcopacy The effect of [illegible] of about 2000 clergymen [illegible] members," or "the Bartholomew worthies" The Independents, however, though proscribed, still subsisted; but in a state of persecution, dejection, and weakness But the Revolution of 1688, and the Act of Toleration, which was passed in the subsequent year, brought them peace and the free exercise of their religion They were now a small body as compared with the Presbyterians, but the two sects, having much in common, and differing only as to church government, entered into an association with each other, under certain heads [illegible] tended to the maintenance of their [illegible] tions (*Whiston's Memoirs of his Life*, vol ii, *Mosheim*, v 361-63)

Since the period of the Revolution, the Independents have greatly increased both in numbers and importance The extraordinary revival of religious zeal which took place about the middle of last century, under the influence of the two Wesleys and Whitfield, was of essential service to the sect of which we are treating Many other persons, awakened to a deeper sense of religion, refusing to unite with any of the three bodies of Methodists, the Wesleyan, the Whitfieldian, or the Countess of Huntingdon's, joined the Independents, and formed numerous churches in connection with that sect The Independents have long ago withdrawn from their association with the Presbyterians, or indeed with any body of Dissenters, and act by themselves They are distinguished from all other Protestant communities chiefly by the two following circumstances —*First* They reject the use of all creeds and confessions (including the Savoy Confession and Declaration) drawn up by fallible men, requiring of their teachers no other test of orthodoxy than a declaration of their belief in the gospel of Jesus and their adherence to the Scriptures as the sole standard of faith and practice *Second*, They attribute no virtue whatever to the rite of ordination, for they declare that the qualifications which constitute a regular minister of the gospel are a firm belief in the Bible, fervent piety, a desire for the glory of God and [illegible] the pastoral charge of [illegible] Christian congregation These two circumstances constitute the distinguishing characteristics of the Independent denomination They do not believe, as may also be mentioned, that an imposition of the hands of bishops or presbyters at ordination confers any new power or prerogative though it is their custom to impose hands in inducting a pastor to a particular charge as a token of recognition in a new relation In point of religious doctrine they vary from the high Calvinism of the Savoy Confession, though moderate Calvinism is maintained, speaking generally by both pastors and people The Independents teach that every point both of doctrine and church discipline is vested exclusively in the congregation and that whatever is supported by a majority must necessarily be law They do not think it imperative to assemble synods, yet if any such be held, which they are periodically, they look on their resolutions as prudential counsels, but not as decisions to which they are obliged to conform (*Adam's Rel World Displayed*, ii 311)

Of the extent and influence of the Independents in England a pretty correct idea may be formed from the number of their colleges or academies, and of their chapels These colleges or academies are exclusively confined to the education of ministers belonging to their own denomination Some of these institutions are wealthy endowments others of them are supported by annual subscriptions Their number is ten, the oldest of which is at Homerton, Middlesex, which was founded in 1730 The last established college is at Manchester, which was instituted in 1837 The others were founded at different intermediate dates The number of Independent chapels in England is upwards of 1700, and appears to be on the increase In Scotland the Independents have upwards of 100 chapels, and in Ireland about 30, but it is reckoned that they have no fewer than 1000 congregations in the United States, and the best authorities concur in stating that their numbers are on the increase

INDETE'RMINATE In Mathematics, quantities which change their values are said to be *indeterminate*, in opposition to those whose values remain fixed and invariable For example, in the equation of the ellipse

$b^2 x^2 + a^2 y^2 = a^2 b^2$, the co-ordinates x and y are indeterminate, while the axes a and b are constant quantities

INDETERMINATE In Botany, when a stem is never terminated by a flower, nor has its growth stopped by any [illegible] example, *Veronica arvensis*

INDETERMINATE ANALYSIS, is a branch of Algebra which has for its object the investigation of problems which admit of an infinite number of different solutions When the enumeration of a problem furnishes a less number of equations than there are unknown quantities, the problem is indeterminate in this sense —that the equations may be satisfied by assigning to the unknown quantities an infinity of different values It happens, however, in the greater number of cases, that the nature of the question requires the values of the unknown quantities to be expressed in whole and positive numbers, a condition which greatly restricts the number of solutions

As in the ordinary algebraic analysis problems belonging to the indeterminate analysis are of the first or second degree, according as the simple powers or squares of the unknown quantities enter into the equations expressing their conditions Every equation of the first degree, containing two unknown quantities may be reduced to the form $a x + b y = c$, and it is plain that if only one equation of this sort is given the values of x and y are wholly indeterminate, for any value whatever may be given to one of these quantities and it will be easy to find a value of the second which will satisfy the equation In the indeterminate analysis the object is to find all the values which x and y can have in whole numbers the constants a, b and c denoting whole numbers, either positive or negative

For example let it be proposed to divide the number 159 into two parts one of which is divisible by 8 and the other by 13 If we denote by x and y the quotients of the required parts divided respectively by 8 and 13 these parts themselves must be $8x$ and $13y$ consequently the problem is expressed by this equation

$$8x + 13y = 159 \qquad (1),$$

and it will be solved when x and y are expressed by whole positive numbers

In the first place, this equation gives $x = \frac{159 - 13y}{8}$ or $x = 19 - y + \frac{7 - 5y}{8}$, but as x and y must be whole numbers, it is obviously necessary that $\frac{7 - 5y}{8}$ be also a whole number Suppose this to be n, we have then $\frac{7 - 5y}{8} = n$, whence

$$5y + 8n = 7 \qquad (2)$$

an equation of the same form with (1) The value of y deduced from this is $y = \frac{7 - 8n}{5}$ or $y = 1 - n + \frac{2 - 3n}{5}$ Now precisely in the same manner as before since y and n are whole numbers, $\frac{2 - 3n}{5}$ must necessarily be a whole number Suppose this to be n', and we have $\frac{2 - 3n}{5} = n'$, whence

$$3n + 5n' = 2 \qquad (3)$$

From this last equation we get $n = \frac{2 - 5n'}{3}$ or $n = -n' + \frac{2 - 2n'}{3}$ Continuing the same process, we now make $\frac{2 - 2n'}{3} = n''$ (where n'' must be a whole number) whence

$$2n' + 3n'' = 2 \qquad (4),$$

from which we obtain $n' = \frac{2 - 3n''}{2}$, or $n' = 1 - n'' - \frac{n''}{2}$ Suppose, next $\frac{n''}{2} = n'''$, and there results

$$n'' = 2n''' \qquad (5)$$

Thus at last an equation has been found which is satisfied by making n''' equal to any whole number whatever, and, on attending to the different steps of the process it will readily be observed that x and y, and the indeterminate quantities n, n' n'', n''', are connected by the following system of equations —

$$\begin{aligned} x &= 19 - y + n \\ y &= 1 - n + n' \\ n &= 0 - n' + n'' \\ n' &= 1 - n'' - n''' \\ n'' &= 2n''' \end{aligned}$$

On deducing from these equations the values of x and y in terms of n''', we find $x = 15 + 13n'''$ and $y = 3 - 8n'''$ Now, on making n''' successively equal to 0, 1, 2 3, &c , or equal to -1, -2, -3, &c , these two equations will give all the values of x and y in whole numbers whether positive or negative, by which the equation $8x + 13y = 159$ can be satisfied But if, as the conditions of the problem require, we take account only of the positive solutions, the values of n''' must be so assumed that the expressions $15 + 13n'''$ and $3 - 8n'''$ are both positive, and it is manifest that this can only be done by assuming $n''' = 0$, or else $n''' = -1$, for all other numbers substituted for n''' render the one or the other of these two expressions negative If we make $n''' = 0$, we obtain $x = 15$, $y = 3$, and if we make $n''' = -1$, $x = 2$, $y = 11$, and either of these two systems of values verifies the proposed equation

The preceding example will show more distinctly than perhaps any rule would do the general methods employed to solve indeterminate algebraic problems of the first degree With regard to equations of the second degree the difficulties of solution are infinitely greater, and in fact involve some of the most abstruse theories of algebraic analysis The subject is discussed at length in *Legendre's Theorie des Nombres*

The oldest treatise on the subject of the indeterminate analysis is the *Arithmetic* of Diophantus of Alexandria the best edition of which is that of Toulouse 1670 with a *Commentary* by Bachet and notes by the celebrated Fermat On the revival of the mathematical sciences, the subject was extensively cultivated by Fermat, Descartes Wallis Lord Brounker and others One of the most luminous elementary treatises on the subject is contained in the second volume of Euler's Algebra

INDETERMINATE COEFFICIENTS A method of analysis invented by Descartes and of very extensive application in the higher mathematics The principle of the method of indeterminate coefficients consists in this, that if we have an equation of this form

$$A + Bx + Cx^2 + Dx^3 + \&c = 0,$$

in which the coefficients A B C are constant quantities and x a variable which may be supposed as small as ever we please each of these coefficients taken separately, is necessarily equal to zero that is to say we must always have $A = 0$ $B = 0$ $C = 0$ &c, whatever may be the number of terms of the given equation

In fact since x may be supposed as small as we please it is always possible to render the sum of all the terms of the given equation which have x for a factor as small as we please that is the sum of all the terms following the first may be rendered as small as we please Hence the first term differs from zero only by a quantity which may be less than any assignable quantity but the first term A being constant its difference from zero cannot be any finite quantity assumed at pleasure for this would suppose it to be variable It follows therefore that A can be nothing else than zero, that is we must have $A = 0$, whence there remains

$$Bx + Cx^2 + Dx^3 + \&c = 0$$

Divide this last equation by x and there results

$$B + Cx + Dx^2 + \&c = 0,$$

and for the same reasons as before it is manifest that we must have $B = 0$ Proceeding in the same manner, we find successively $C = 0$, $D = 0$ &c

The principle here explained is extremely fertile in applications and in fact gives the means of resolving by ordinary algebra all the questions which are considered as belonging to the infinitesimal analysis The respective procedures of both methods when properly simplified are absolutely the same, all the difference consists in the manner of viewing the subject

INDEX In Bibliography, an alphabetical table, containing the principal subjects of a work, or words employed in it, with references to the part of the work in which they are to be found Many independent works containing catalogues of various kinds have been also entitled index

INDEX (Lat indico, *I point out*) A term often applied to the fore finger

INDEX In Music the same as *Direct* which see

INDEX EXPURGATORIUS A catalogue of works, which the church of Rome prohibits the faithful from reading, or condemns as heretical It is annually published at Rome

INDEX OF A QUANTITY, in Arithmetic and Algebra, is used in the same sense with *exponent* Thus, in the expression $(a + b)^3$, 3 is the index, and denotes that the quantity $a + b$ is to be raised to the third power, or cube The index of a logarithm or its *characteristic*, is the figure prefixed to the logarithm for the purpose of indicating the unit's place in the corresponding number *See* LOGARITHM

INDEX OF REFRACTION, in Optics, expresses the constant ratio which exists between the sines of the angles of incidence and refraction Thus, with respect to a ray of [illegible] on the surface of water, the [illegible] is found by experiment to be to the sine of the [illegible] in the constant ratio of 1 336 to 1 Hence 1 336 is the index of refraction in water *See* REFRACTION

INDIAN ARCHITECTURE *See* ARCHITECTURE

INDIAN INK A species of ink used in Europe for the lines and sh [illegible] It is principally manufactured in [illegible] writing From the experiments of Dr Lewis, it appears to be a compound of fine lampblack and animal glue *See* INK

INDIANITE A mineral which occurs in granular masses, associated with garnet, felspar, and hornblende It is hard enough to scratch glass, and of a white or gray colour

INDICATIVE MOOD (Lat indico, *I point out*) That form of a verb which expresses a simple or unconditional judgment *See* GRAMMAR

INDICATOR (Lat indico) A genus of birds belonging to the cuckoo tribe (*Cuculidæ*), characterized by a straight finch like bill with compressed sides and a triangular base, the culmen and gonys being equally inclined towards the tip, and the gonys angulated, wings lengthened pointed, tail moderate, rounded, feet short, middle toe much longer than the tarsus

The species of *Indicator* are remarkable for their habit of indicating the nests of bees, and of guiding men to them by their motions and cries whence both their scientific name and common appellation of honey guides

INDICATOR A muscle of the lower part of the fore-arm which extends the fore finger

INDICAVIT (Lat *he has shown*) In Law a species of the writ of prohibition It lies for a patron of a church, whose incumbent is sued in the spiritual court by another clergyman for tithes amounting to a fourth part of the profits of the advowson, and depends on stats West 2 c 5 13 Ed 1 st 4

INDICTION (Lat indictio, *establishment order*, or *denunciation*) In Chronology a cycle or period of fifteen years the origin of which is involved in obscurity Unlike other cycles the indiction has no reference to any astronomical phenomena, but is supposed to relate to certain judicial acts probably the publication of tariffs of the taxes which took place at stated intervals under the Greek emperors. The Cæsarean indiction fell on the 8th of the calends of October (24th of September), the indiction of Constantinople (beginning A D 312) on the the 1st of September), the pontifical indiction on the calends of January It is a date commonly employed in very ancient charters The commencement of this computation is generally referred to the 1st of January of the year 313 of the common era, hence by counting backwards, it will be found that the first year of our era corresponded to the fourth of one of the cycles of indiction The year of indiction corresponding to any other year of our era is found therefore by this rule — Add 3 to the date divide the sum by 15, and the remainder is the year of the indiction The remainder 0 indicates the 15th of the cycle Thus the year 1800 was the third of the indiction See as to the historical commencement of the era of indictions *Gibbon's Decline and Fall*, ii 223 last ed *Mem de l Acad des Inscr* vol xli

INDICTMENT, PROCESS BY (Lat indico *I proclaim against*) In Law, all persons, without exception are liable to be arrested on a warrant of a justice of peace, if charged with crime, and some officers as the [illegible] liable, have the power of [illegible] without a warrant on some occasions When a party is arrested and brought before a justice of peace he is examined and the information of those who came with him is taken, and the depositions of the witnesses, if taken down in the presence of the prisoner, are evidence against him on the trial If the offence be bailable the justice must then take sufficient bail on the part of the prisoner If otherwise he commits him to prison, and the witnesses are bound over to attend and give evidence the king being in all cases the nominal prosecutor The grand jury being summoned by the sheriff (at every session of the peace commission of oyer and terminer and gaol delivery), consisting of not fewer than twelve nor more than twenty-three of the principal men of the county receives the *indictment* or *presentment* (as it is also termed) preferred against the prisoner, and either *finds* or *ignores* it, returning it into court in the first case, indorsed a *true bill*, in the latter, *not found*

An indictment may be found in the absence of the prisoner, but cannot be tried unless he personally appears The summons, when he is absent, in order to bring him into court, is by *capias*, and if he still abscond he may be further pursued to outlawry When the prisoner appears on this process, or voluntarily, or is brought up in custody, he is *arraigned*, that is called before the bar to answer the indictment If the prisoner refuse to answer (in which event he was subjected in former days, to the famous *peine forte et dure*, by which it was intended to torture him into pleading, in order that the forfeiture of his goods might attach), a plea of not guilty is now recorded, and the trial proceeds, if he plead guilty, judgment is awarded Otherwise he may plead — 1 To the jurisdiction, *i e* that the court before which he is arraigned is not competent to try the offence 2 In abatement for misnomer, but the advantage of this plea is now taken away by 7 G 4 3 He may demur to the sufficiency in law of parts of the indictment 4 He may plead one of the four special pleas in bar (former acquittal, former conviction, former attainder and pardon) 5 He may plead not guilty of the [illegible] prisoner plead not guilty, the fact [illegible] tried on examination of witnesses [illegible] The nobility, it must be observed, are tried by their peers for treason or felony, and misprision of these crimes, but in other cases by a jury The jurors are taken by the panel or list returned by the sheriff, and *criminal offences* are tried by the same common jurymen who try the issue of facts in civil cases in which a *special* jury has not been demanded (*See* JURY) The rules of evidence observed on the trial are mostly the same with those which prevail in civil actions (*See* EVIDENCE) [illegible] liar to this branch of law) [illegible] is considered essential that his testimony should be confirmed by other evidence The verdict of the jury must in all cases be unanimous After trial and conviction follows judgment, unless arrested by motion for that purpose, which it still may be on some exceptions to the indictment in point of law Benefit of clergy, as it was termed, was usually prayed after conviction, and was held in cases where not abolished by statute, to discharge the claimant from the capital part of the punishment But this ancient privilege which had long been founded on a misconception of law, was abolished by 7 G 4 c 30 Forfeiture of real property, absolutely is a consequence of judgment in cases of high treason The forfeiture of goods and chattels relates to, that is takes effect upon conviction, but fraudulent conveyances without consideration in order to escape the forfeiture by the transfer of the property after or in contemplation of indictment are void as against the king The sentence of punishment pronounced or recorded on judgment is in some cases fixed and stated, so that the judges cannot modify the statutory penalty, in others (as in all offences at common law unregulated by statute), it is wholly or partly discretionary

A criminal judgment may be reversed by writ of error for notorious mistakes and irregularities A reprieve suspends the execution of a judgment a pardon avoids the judgment altogether, and a pardon may be conditional on the prisoner's submitting to a substituted punishment, which is the ordinary mode of mitigating the severity of the law in capital felonies

INDIGESTION *See* DYSPEPSIA

INDIGITES The title of a class of Latin divinities, concerning the exact import of which there is some dispute but it is probably most correctly referred to ancient heroes who became tutelary deities after death, according to the ancient mythology — as Romulus The word is of very doubtful etymology

INDIGO A blue substance much used as a dye-stuff The best [illegible] and American plant the [illegible] is used and fermented in vats of water during which it deposits indigo in the form of a blue powder which is collected and dried so as to form the cubic cakes in which it usually occurs in commerce Indigo is quite insoluble in water, when heated it yields a purple vapour which condenses in the form of deep blue or purple acicular crystals When indigo is exposed to the action of certain deoxidizing agents it becomes soluble in alkaline solutions, losing its blue colour and forming a green solution, from which it is precipitated by the acids *white*, but it instantly becomes blue by exposure to air This *white indigo* has been termed *indigogene*, and indigo appears to be its oxide It is best obtained by mixing 3 parts of finely powdered and pure indigo with 4 of green vitriol 3 of slaked quicklime and 100 of water, repeatedly shaking the mixture In about twenty-four hours the supernatant liquor which is transparent, and of a green colour, is to be decanted off, and poured into dilute muriatic acid when the deoxidized indigo is thrown down, but in order to prevent its absorbing oxygen and becoming blue it must be most carefully excluded from the contact of air which may be effected by syphoning it off into the acid collecting it in vessels filled with hydrogen, and washing it with water deprived of air and holding in solution a little sulphate of ammonia In this white state indigogene absorbs between 11 and 12 per cent of oxygen to become blue indigo It would appear from Dumas' experiments that indigogene is a compound of

	Atoms		Equivalents
Carbon	45	=	270
Hydrogen	15	=	15
Nitrogen	3	=	42
Oxygen	4	=	32
	1		359

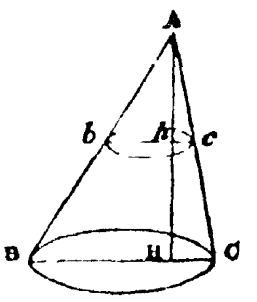
and that indigo consists of 1 atom of indigogene = 359,

and 2 of oxygen = 16 The chemical equivalent of indigo, therefore is 375

When indigo is dissolved in concentrated sulphuric acid, it forms a deep blue liquid, known to the dyers by the name of [illegible] Bengal, and [illegible] of that name, from the 20th to the 30th deg of N lat , but it is also cultivated, though not nearly to the same extent, in the province of Tinnevelly, under the Madras government in Java , in Luconia the chief of the Philippine Islands , and in Guatemala and the Caracas in central America The following remarks, from the *Commercial Dictionary*, will exhibit the history of this now indispensable commodity, and the difficulties with which it had to contend before it obtained a permanent footing in the commerce of Europe "It appears pretty certain that the culture of the indigo plant and the preparation of the drug, have been practised in India from a very remote epoch It has been questioned, indeed whether the *indicum* mentioned by Pliny (*Hist Nat* lib xxxv c 6) was indigo , but, as it would seem, without any good reason Pliny states that it was brought from India , that when diluted it produced an admirable mixture of blue and purple colours (*in diluendo misturam purpuræ cæruleique mirabilem reddit*), and he gives tests by which the genuine drug might be discriminated with sufficient precision It is true that Pliny is egregiously mistaken as to the mode in which the drug was produced , but there are many examples in modern as well as ancient times to prove that the possession of an article brought from a distance implies no accurate knowledge of its nature or of the processes followed in its manufacture Beckmann (*Hist of Inventions* vol iv art "Indigo") and Dr Bancroft (*Permanent Colours* vol i pp 241—252) have each investigated this subject with great [illegible] sagacity , and agree in the conclusion that the *indicum* Pliny was real indigo and not as has been supposed a drug prepared from the *isatis* or woad At all events there can be no question that indigo was imported into modern Europe by way of Alexandria previously to the discovery of the route to India by the Cape of Good Hope When first introduced it was customary to mix a little of it with woad to heighten and improve the colour of the latter, but by degrees the quantity of indigo was increased , and woad was at last entirely superseded It is worth while however to remark, that indigo did not make its way into general use without [illegible] *woad* prevailed [illegible] of indigo In Germany [illegible] in 1654, prohibiting the use of indigo or *devil's dye* and directing great care to be taken to prevent its clandestine importation , because ' says the edict the trade in woad is lessened, dyed articles injured and money carried out of the country ' The magistrates of Nuremburg went further, and compelled the dyers of that city to take an oath once a year not to use indigo , which practice was continued down to a late period In 1598 upon the representation of the states of Languedoc, at the solicitation of the woad growers the use of indigo was prohibited in that province , and it was not till 1737, that the dyers of France were left at liberty to dye with such articles and in such a way, as they pleased ' (*Beckmann*, vol iv p 142)

INDI'GOLITE Blue *tourmalin*

INDIGO'TIC A'CID An acid obtained by boiling indigo in nitric acid diluted with an equal weight of water It forms white crystals, very soluble in hot water but very sparingly soluble in cold water It consists, in the 100 parts of 48 25 carbon, [illegible] nitrogen, and 41 28 oxygen , or, [illegible] of 1 atom of indigogene = 359, and 30 atoms of oxygen = 240



INDIVI'DUAL (Lat individuus) In the Fine Arts, that which is proper or peculiar to a single object of a species

INDIVI'SIBLES Infinitely small quantities which admit of no further division

In Algebra, the *method of* [illegible] to a peculiar species of calculation [illegible] disciple of Galileo, and much used by mathematicians before the invention of the method of fluxions, or the differential and integral calculus , for which it prepared the way, and of which to a certain extent it supplied the place

In the method of indivisibles lines are considered as composed of an infinite number of points, surfaces as composed of an infinite number of lines, and solids of an infinite number of surfaces These hypotheses are no doubt inconsistent with the rigorous exactness of the ancient geometry, and, taken in the strict sense of the terms, absurd [illegible] can never [illegible] magnitude [illegible] together, compose a solid, or any thing but an area Nevertheless, inaccurate as these ideas are, the conclusions deduced from them are strictly correct, and they afford, in numerous cases, a means of obtaining readily and easily what could only be found by a very long and troublesome process in following the ancient and rigorous method of exhaustions In fact, the objections apply rather to the manner in which the hypotheses are stated than to the method itself, which, in reality, is merely a formula of abbreviation, extremely useful as a means of avoiding the tediousness of the method of exhaustion without diminishing in any way the accuracy of the results Its purpose is to give at once the result of an infinite series of successive approximations , and, as is remarked by Professor Playfair, nothing perhaps more ingenious, and certainly nothing more happy ever was contrived, than to arrive at the conclusion of all these approximations without going through [illegible] approximations themselves

As an example, – Let it be proposed to determine the volume of a cone From A, the vertex of the cone, let a perpendicular A H be drawn to its base Conceive this perpendicular to be divided into an infinite number of equal parts and through each of the points of division a plane to pass parallel to the base of the cone , according to the principles of the method of indivisibles, each of these planes, as *b c*, limited by its intersection with the surface of the cone, will be one of the elements of the volume of the cone, and the whole volume will be the sum of all these elements Now by the properties of the cone these elements are to each other as the squares of their distances from the vertex , therefore, taking A to represent the area of the base of the cone B C, *a* the area of the plane *b c*, H the height A H, and *h* the height A *h*, we have

$A : a :: H^2 : h^2$, whence $a = \frac{A}{H^2} h^2$ Now, if we make V = the sum of these elements or the volume of the cone, it is evident that we have V equal to the constant $\frac{A}{H^2}$ multiplied by the sum of the squares h^2 But the distances *h* increase as the series of natural numbers from nothing to H , consequently the quantities h^2 represent the squares of those numbers from 0 to H Now it is known that the sum of the squares of the natural numbers, from 0 to H^2 inclusive, is

$$\frac{2H^3 + 3H^2 + H}{6},$$

but in the present case the number H being supposed infinite, all the terms in the numerator after the first will be infinitely small in comparison of the first and ought therefore to be rejected whence the sum of all these squares is reduced to $\frac{1}{3} H^3$ Multiply, therefore, this value by the constant $\frac{A}{H^2}$ found above, we have for the volume of the cone $V = \frac{1}{3} A H$ that is to say, the volume of the cone is equal to the product of its base by a third of its altitude

In a similar manner the areas of innumerable curves, and the cubature of many solids are found without difficulty It was in this way that Torricelli, or Roberval, found the quadrature of the cycloid, – a problem of great celebrity among the early mathematicians The work of Cavalieri, *Geometria Indivisibilibus continuorum nova quadam ratione promota* was published at Bologna in 1653 , but he had treated of the subject in a previous work *Exercitationes Geometricæ Sex*, published in 1647

INDU'CEMENT In Law, a term used specially in various cases to signify a statement of facts alleged by way of previous explanation or introduction to other material facts Averments which are mere inducement need not be proved so precisely as others

INDU'CTION (Lat *in*, and duco, *I lead*), the counter-process in scientific method to deduction, implies the raising individuals into generals and those into still higher generalities , deduction being the *bringing down* of universals to lower genera or to individuals Every deduction therefore to be valid, must rest on a prior induction, which, in order that we may obtain logical certainty, must be a *complete* induction , that is to say, must include *all* the individuals which constitute the genus This, it is evident, is impossible, so long as we assume the only power necessary to induction to be the observation of particulars , for these are infinite in number we can never be sure that we have observed them all We are therefore compelled, if we are to admit the possibility of science properly so called, to allow the necessity of some spontaneous action of the understanding in every inductive process , of a faculty, in short, which takes [illegible] from experience [illegible] to arrive at the knowledge of truths not contained in that experience Philosophers differ widely in the language under which they convey their belief of this truth Had the thing itself however, been more distinctly borne in mind, we should have been saved much useless obscurity , in particular, we should

have escaped that altogether false distinction made by logicians between perfect and imperfect induction" All the certainty that can be obtained in physics is a hypothetical certainty, founded on our belief that the course of nature is uniform, but it regards the form of our reasoning, which is all that science contemplates, that remains the same whether the latter be either assumed (See for various observations on the Baconian system of induction, *Playfair's Introductory Essay to the Enc Brit*, and *Hallam on the Literature of Europe*, vol iii)

INDUCTION In Electricity, when one electrified substance is opposed to another, the latter acquires, under certain circumstances, an opposite electric state upon the surface opposed to the inducing body, and is rendered electro-polar *See* ELECTRICITY

INDULGENCE (Lat) A power claimed by the Roman Catholic church of granting to its contrite members remission for a certain term, either on earth or in purgatory, of the penalty incurred by their transgressions The practice was first instituted in the eleventh century by Popes Gregory VII, Victor, and Urban II, as a recompence to those who embarked in the perilous enterprise of the Crusades, but its benefits in process of time extended to all who either by donations or other services [illegible] is the [illegible] for [illegible] although the traffic in indulgences has been reprobated [illegible] minor corruptions have been [illegible] Council of Trent decreed the usefulness and validity of such instruments, and left the whole control of their nature and manner of issuing them entirely in the discretion of the pope for the time being (For an elaborate exposition of this subject see the *Bibliothèque Sacrée*, article 'Indulgence,' also *Mosheim*, iii 83 translation)

INDUMENTUM (Lat induo, *I put on*) In Zoology, the term is restricted in its signification to the plumage of birds This consists of the peculiar epidermic organs called feathers and down, with sometimes a scanty admixture of hair (The description of the component parts of plumage is given under the head of FEATHERS) The plumage is generally more than once changed before it attains that state which is characteristic of the fully mature bird The period during which these mutations are proceeding varies from one to five years, and many birds rear a progeny before they acquire the plumage of maturity When the indumentum of the male bird differs in colour from that of the female the young birds of both sexes resemble the latter in their first plumage, but when both the adult male and female are of the same colour, the young have then a plumage peculiar to themselves In some species the adult birds have a plumage during the breeding season decidedly different in colour from that which they bear in winter in these cases the young birds differ in colour from both parents, and have a plumage which is intermediate in its general tone to that of the two periodical states of the parent birds and bearing indications of the colours to be afterwards attained at either period

The changes in the colour of the plumage of birds are effected either by a total moult of the old and acquisition of new feathers, or by a partial moult and the admixture of new feathers with a certain proportion of the previous plumage or on the [illegible] certain number of new feathers without [illegible] the old ones, or, lastly, by the fully formed feather itself becoming altered in colour the last two changes take place in the adult birds at the approach of the breeding season The change of colour of a fully developed feather is produced either mechanically by the wearing away of the lighter coloured tips, which exposes the brighter tints of the plumage beneath, or by some internal chemical or vital influence upon the colouring matter of the feather itself the latter change begins at that part of the web nearest the body of the bird, and gradually extends outwards till it pervades the whole feather

INDUSIAL LIMESTONE A fresh-water limestone found in Auvergne abounding in the indusiæ or cases of the larvæ of *Phryganea*, great heaps of which have been encrusted by hard travertin and formed into rock

INDUSIUM (Lat induo) A cup that surrounds the stigma of Goodeniaceous and some other plants, it is also the name of the membrane that covers the theca in Dorsiferous ferns

INDUVIÆ (Lat) The withered remains of leaves that not being articulated with the stem cannot fall off, the [illegible] them is said to be *induviate*

INEQUALITY, in Astronomy, is applied to any deviation in the motion of a planet or satellite from its uniform mean motion

INFANGTHEF [illegible] name of an [illegible] Temminck, in [illegible]

INFANT [illegible] This term is used to denote the principle or law of the material world that all bodies are absolutely passive or indifferent to a state of rest or motion, and would continue for ever at rest, or persevere in the same uniform and rectilinear motion, unless disturbed by the action of some extrinsic force The ancients attributed to matter a certain inaptitude, reluctance, or renitency to motion, but that a body in motion required the operation of an extrinsic cause to bring it to rest was first discovered by Galileo Is the disposition of a body to maintain ating an exertion of power, prefixed the word *vis*, and the compound expression, *vis inertia*, though less accurate, has been generally retained Inertia is one of the inherent properties of matter, and unceasingly recalled to our observation in every incident of life

INESCUTCHEON In Heraldry, a species of ordinary, being an escutcheon placed upon the fess point [illegible] and containing, it is said, the third part when charged the fifth when otherwise All escutcheons borne within escutcheons are by some heralds called by this name

INESSE (Lat) A term applied to things actually existing A difference is made by authors between *in esse* and *in posse* the latter being applied to things that are not, but may be, the former being said of things actually apparent and visible

INFANT In Law, a person under twenty-one years of age He is not considered in law as having sufficient ability to contract, and is protected from his own improvidence and the artifices of designing persons by his not being liable for any engagements into which he may have entered, except for necessaries suited to his condition in life His contracts, however are not absolutely void, but only voidable, and though they cannot be enforced against him, yet he may, if he do not choose to avoid them, enforce them against another, and may always confirm them on the termination of his minority He is in general responsible in damages for torts committed by him as for slander or assault His responsibility for crimes varies according to his age and discretion under seven years of age he cannot be guilty of felony, between seven and fourteen a presumption arises that he is doli incapax, but this presumption may be repelled by proof that he could plainly distinguish between good and evil, and he may then suffer death as a felon, and after fourteen he is in general as amenable to punishment as a person of full age

His disabilities many of which are in the nature of privi[illegible]ion, are numerous [illegible] the administration of justice or sit in parliament, he cannot be an executor, nor appear in court by attorney The consent of parents or guardians, or of the Court of Chancery, is requisite to his marriage

INFANTE, INFANTA The titles borne by the younger sons and the daughters of a king of Spain the eldest son being styled Prince of Asturias It is found in a document of the year 999, applied to the sons of King Veremond II It appears however, to have been anciently given to all hidalgos (*Quart Rev* vol lxii p 104, where the reader is referred to the Ley de Partidas, 1, 2) The word "childe" was similarly used in England in the middle ages

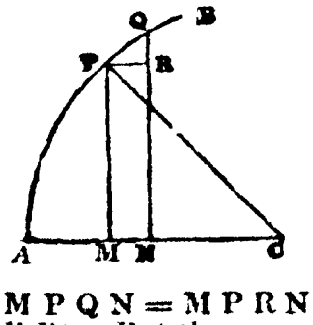
INFANTICIDE or CHILD-MURDER, by the law of England is placed upon the same footing with other homicide By 9 G 4 c 41 s 14 a woman indicted for murder of her child may, if acquitted of the murder, be convicted of the misdemeanour of secreting the body of the child to conceal its birth To administer poison, or use other means to procure the miscarriage of a woman great with child, is a capital felony by the same statute (c 14) The exposure of new-born infants, especially females is a common practice among many savage nations at the present day, and especially prevalent among the Chinese According to Lord Macartney, the number of infanticides committed in Pekin alone exceeds 20,000 a year, but it is to be hoped that this calculation is highly exaggerated

INFANTRY The general name for soldiers who serve on foot The term is in all probability derived from the Italian word *fante* signifying a child or young person, and was originally conferred on the young Italian peasantry, who served in the wars on foot, the [illegible] There are, however, various [illegible] origin of the term Among the ancient Greeks and Romans, the infantry constituted the chief strength of an army; and, with the exception of that period in European history [illegible] with the institutions of chivalry prevailed, when the tournament with its gay appendages engaged the attention of all the powerful nobles and otherwise distinguished persons, [illegible] to the cavalry, of little importance, it has generally been regarded as the principal military arm Since the institution of standing armies this has been peculiarly the case From the period of the Conquest down to the reign of Henry VIII, the infantry or

this country consisted of the inferior vassals of the feudal tenants, and from the cause above referred to was neglected both in discipline and accoutrements, but the connection of that monarch with Charles V of Germany and Francis I of France, whose rivalry in arms had introduced great improvements into this arm was the means of directing attention to the defects of the English infantry and paved the way for the introduction of that system of discipline which after the lapse of three centuries has now brought it to perfection The British army comprises exclusively of the militia artillery engineers, and marines, 99 regiments of regular infantry, three regiments of foot guard besides a rifle brigade two West India regiments and the Ceylon rifle regiment *See* Army and the authorities there referred to

INFECTION *See* CONTAGION

INFERIÆ (Lat) Sacrifices offered by the Greeks and Romans to the Dii Manes or the souls of deceased heroes, or any person whose memory was held in veneration These sacrifices consisted of almost every kind of offering, and were instituted on the ninth and thirtieth days after interment They are supposed by some writers to have been the origin of the exequies (quod vide) of the Roman Catholic church



INFERIOR A term given to a calyx that is distinct from the ovarium, as in *silene*, or to an ovary that adheres to the calyx, as in the myrtle It is a bad expression though commonly employed for which the French school have substituted the words nonadherent and adherent

INFERO-BRANCHIATA (Lat inferus, *lower*, and branchiæ *gills*) An order of Gastropods, characterized by the position of the gills which are situated beneath the produced margin of the mantle, they consist of two long series of leaf shaped vascular organs This order comprehends in the system of Cuvier, two genera *Phyllidia* and *Diphyllidia*

INFIDEL (Lat) A term applied to such persons as are not baptized, or do not believe in the Christian religion *See* DEIST

INFINITE (Lat infinitus *boundless*) In Geometry, an infinite quantity is properly that which is greater than any assignable magnitude, and as no such quantities exist in nature, it follows that an infinite quantity is merely an abstraction of the mind formed by excluding the idea of limit or boundary An *infinitely small quantity* is a quantity considered as less than any assignable magnitude There is however, a peculiar signification attached to this expression in mathematical language which has frequently been misunderstood Infinitely small quantities are not absolute zeros or even quantities actually less than certain determinate magnitudes, they are merely quantities which the conditions of the proposed question permit to be regarded as variable until the calculation is entirely completed and as diminishing continually until they become as small as we please, without its being necessary to change the values of those quantities of which they are the differentials It is in this circumstance alone that the character of what are called infinitely small quantities consists, and not in the *littleness* which their denomination seems to imply or in the absolute nullity which may be attributed to them

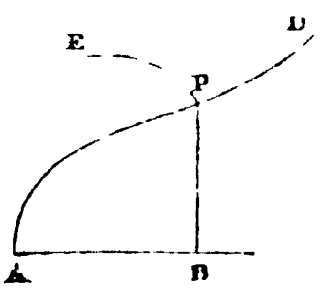
INFINITESIMAL In Geometry and Analysis an infinitely small quantity that is to say a quantity which is less than any assignable magnitude The *infinitesimal analysis* is that method of finding the relations which exist among the proposed quantities It differs from the differential calculus, or the method of fluxions, only in respect of its metaphysical principles, the analytical processes are precisely the same in both In the theory of infinitesimals a curve is regarded as a polygon of an infinite number of sides, any one of which represents the arc Thus let P Q be one of those sides, then P Q is the hypothenuse of a right angled triangle, of which the sides P R and R Q are the differentials of the co ordinates A M and M P or of x and y Hence making $PQ = dx$ we have $dz^2 = dx^2 + dy^2$ On the same principle, if s denote the area A P Q B, and the area M P Q N, we shall have $ds = y\,dx + \frac{1}{2}\,dy\,dx$ (for M P Q N = M P R N + P Q R = M P × M N + ½ Q R × P R) But the second part of this expression namely, $\frac{1}{2}\,dy\,dx$, is an infinitesimal of the *second order*, being the product of two infinitesimals of the first order The part $\frac{1}{2}\,dy\,dx$ must therefore be omitted being of no value in comparison of the quantity to which it is added and we have consequently $ds = y\,dx$ The elemental triangle P Q R also shows at once the differential values of the trigonometrical lines Thus, supposing the curve A B to be a circle whose centre is C, then the radius C P being unity, and the arc A P being denoted by z, we have I cos z P Q Q R dx d sin z, whence d sin $z = \cos z\,dz$ Again, I sin z P Q P R dz $= d \cos z$, therefore $d \cos z = -\sin z\,dz$

The theory of infinitesimals affords very great facilities in the application of the calculus to the higher geometry, and especially in the doctrines of physics Whatever view may be taken of the principles, the results, if deduced by correct reasoning, are rigorously accurate, and the mathematician will scarcely be restrained by metaphysical considerations from attempting to reach his object in the shortest way, which, in very numerous applications of the calculus is by the infinitesimal method

INFINITIVE MOOD In Grammar, that inflexion of the verb which expresses the action or passion indefinitely *See* GRAMMAR

INFINITY *See* INFINITE

INFIRMARY (Lat infirmus, *weak*) An hospital for the reception of the sick poor, either supported by the public, or endowed by benevolent persons with funds to defray the necessary expense Establishments bearing this name are not uncommon in all considerable towns of the British empire *See* HOSPITAL



INFLAMMATION In Pathology, this term is applied to redness and heat of some part of the body attended by pain and swelling the vascular action of the part is increased, and if it does not subside or terminate in *resolution* it produces three different effects which, where they take place healthily follow each other in regular order These are, 1 adhesion, 2 suppuration, 3 ulceration

INFLEXED (Lat inflecto, *I bend*) In Zoology, when a part is bent inwards

INFLEXION, in Grammar, in strictness of language is any change which takes place in a word from a modification of its sense between the *root* and the *termination* The inflexion must therefore not be confounded with the termination itself Thus the syllable *am* is the root of all the words employed in the conjugation of the Latin verb amo *I love* in the imperfect tense, the inflexion is the syllable *ab* The termination varies according to the person amabam amabas amabat

INFLEXION In Optics the same as *diffraction*, or that property of light by reason of which, when it passes very near the borders of an opaque body, it is turned from its rectilinear course *See* DIFFRACTION and LIGHT

Point of inflexion in Geometry is that point of a curve line where the curvature in relation to the axis changes from concave to convex or from convex to concave The same point is also called the point of *contrary flexure*, and if the direction changes suddenly with relation to the ordinate as well as the abscissa the point becomes a *point of regression* Thus let A P be a curve which from A to P is concave towards the axis A B and from P to D convex towards the axis the point P at which it passes from concave to convex is the *point of inflexion*, and if the curve at P is turned backwards as P E, then P is the point of regression The determination of these points is attended with no difficulty and the method of determining them will be obvious from the following considerations When a curve is concave to the axis, the differential of the ordinate (that of the abscissa being supposed constant) decreases consequently the second differential or $d\,y$ is negative On the contrary, when the curve is convex to the axis $d\,y$ increases, and d^2y is positive At the point therefore at which the curvature changes from concave to convex d^2y changes its sign, but as no variable quantity can change its sign without becoming nothing or infinite in relation to its former magnitude it follows that at the point of inflexion or regression $d\,y = 0$ or infinity Hence to find the point of inflexion in any given curve, it is only necessary to find from the equation of the curve the value of $\frac{d^2y}{dx^2}$, this value made equal to 0 or infinity will give an equation by which x is determined This subject is treated at length in the work of Cramer *Sur les Lignes Courbes*, also in Lacroix's *Calcul Différentiel et Intégral*, and noticed in almost every work on the Differential Calculus

INFLORESCENCE (Lat inflorescere, *to flourish*) The general arrangement of flowers on a stem or branch In botany there are five kinds viz the spike the raceme, the panicle, the capitulum, the umbel, and the cyme, each of which is mentioned in its place

INFLUENZA (As if produced by the influence of [illegible]) often run very high and assume a variety of aspects, [illegible] and other causes The possible [illegible] are highly poisonous and irritating vapour, though in very minute quantity, as the exciting cause of influenza, has been suggested by Dr Prout It may possibly be of volcanic origin, and such a

substance as seleniuretted hydrogen, the effects of which, even in extremely minute quantity, [illegible] might perhaps account for some of [illegible] extraordinary disease

IN FO'RMA PAU'PERIS In Law, a person is said to sue as a pauper, or *in forma pauperis*, when he takes advantage of the stat 11 H 7 c 12, swearing himself not to be worth five pounds, in which case he is entitled to have original writs and subpœnas gratis, and attorney and counsel assigned him without fee, and is excused from paying costs when plaintiff By misconduct, and under certain other circumstances the party is dispaupered, and loses his privilege He is capable of recovering costs though not liable

INFORMATION In Law, an accusation exhibited against a defendant for some criminal offence, not on the oath of jurors but on the special allegation of an officer empowered to exhibit it Criminal informations are either partly at the suit of the king and partly at that of a subject, namely, such as are brought upon certain penal statutes at the suit of common informers, or wholly at the suit of the king These are of two sorts 1 those filed ex officio by the attorney-general, which is a proceeding resorted to in the case of some particular misdemeanours of a public nature, as libels and various other [illegible] public government, and 2 informations [illegible] of the master of the crown office, which lie for some gross and notorious misdemeanours as riots batteries libels &c, not immediately tending to dis

IN FORMERS STELLÆ (Informes Stellæ) in Astronomy are stars not included in any of the constellations See CONSTELLATION

INFRALAPSARIANS In Ecclesiastical History a sect of Presbyterians who maintain that God has created a certain number of human beings only to be damned without allowing them the opportunity of salvation even if they chose to embrace it They are thus designated because they hold that the decrees of God were formed *infra lapsum*, after his knowledge of the fall, and in consequence of it See SUPRALAPSARIANS

INFUSO'RIA (Lat infundo *I pour in*) A name applied by Otho Fr Muller to an assemblage of microscopic animalcules which are for the most part developed in infusions of decayed animal and vegetable substances Some of these minute organized beings were known to Linnæus and were placed by him at the end of the class *Vermes* in a genus which he denominated *Chaos* Muller who made the Infusoria a subject of special study discovered numerous distinct genera and species which he named and classified according to their outward form Gmelin and Lamarck introduced Muller's discoveries and classification of the Infusoria into their systems without any particular modification Cuvier in 1829 observes that 'Naturalists usually close the catalogue of the animal kingdom with beings so extremely minute as to be invisible to the naked eye and which have been discovered only since the invention of the microscope has unveiled to us, as it were a new world Most of them present a gelatinous body of the greatest simplicity and for these this is undoubtedly the situation, but authors have placed among the Infusoria animals apparently much more complicated and which only resemble them in their minuteness and the dwelling in which they are usually found" These higher organized Infusoria were placed by Cuvier at the head of the class in a distinct order under the name of *Rotifères* or *Rotifera*, a name which has subsequently been retained Cuvier attributes to these animalcules a mouth a stomach, an intestine, and an anus, and notices the prominences on the anterior part of the body which some observers had regarded as eyes The anterior lobated organ and its vibratory denticulations the successive action of which gives to the organ the appearance of a swiftly rotating wheel forms the main external character of the order Cuvier includes in the order *Rotatoria* the genera *Furcularia* Lam, *Vaginicola*, Lam *Tubicolaria*, Lam, *Brachionus* Muller

The investigations of Ehrenberg with the aid of a superior microscope to that of his predecessors have brought to light many additional organs and complexities of structure in the *Rotifera* besides several genera and species before unknown, and since these researches naturalists have generally regarded the *Rotifera* as a distinct class of Invertebrata which Professor Grant has placed in the Articulate sub kingdom and Professor Owen in the *Nematoneura*, or higher division of Cuvier's Radiata For the character, subdivision, and organization of the *Rotifera*, see that word

The second order of Infusoria in Cuvier's system is denominated *Homogenea*, a term sufficiently expressive of the inadequate ideas current at that recent period respecting their organization Cuvier says, 'The body of the *Homogenea* presents neither viscera nor other complication, and is frequently destitute of even the appearance of a mouth" Ehrenberg has since shown that they have not only really a mouth, but that the greater part of the *Homogenea* of Cuvier possess a digestive cavity complicated with many cæcal pouches or stomachs, and accordingly proposes to name the order *Polygastrica* Cuvier includes in his second order of Infusoria the genera *Urceolaria*, Lam, *Trichoda*, *Leucophra*, *Kerona*, *Himantopus*, *Cercaria*, *Furcocerca*, *Vibrio*, *Proteus*, *Volvox*, and *Monas* As the polygastric structure has not been detected in any species of *Cercaria*, but as, on the contrary, some species, as *Cercaria lemnæ*, possess a simple alimentary canal, these are together with the cercarial *Spermatozoa*, and the *Ichthydia* which all possess a straight and simple alimentary canal, have been removed from the Infusoria and classed by Mr Owen with the Entozoa

Thus the animals of infusions, although of comparatively simple organization, possessing neither a heart nor respiratory organs, yet manifest at least three distinct types of structure, and are referable to three different classes of animals

Many genera of Infusoria are protected by an external siliceous case The observations which Ehrenberg had made on the modifications of the form and surface of these cases of the existing Infusoria led to his capital discovery of their remains in a fossilized state The mineral called *Polir-schiefer*, used for a long period in the arts for polishing metals and other substances, was first discovered to be composed of myriads of the microscopic flinty cases of polygastric Infusoria belonging to the genera *Gaillonella Bacillaria Diatoma*, &c Whole strata of considerable extent and thickness have since been found to consist almost exclusively of the fossil remains of Infusoria

INGLU'VIES (Lat *a crop*) The crop or dilatation of the œsophagus in which the food is accumulated and macerated but not digested It is largest in the Gallinaceous birds and pigeons but exists in certain birds of prey and also in the flamingo, and others

[illegible] the small masses [illegible] either for coining or exportation

INGRO'SSING See ENGROSSING FORESTALLING

INHA'BITANT In Law a word used in various technical senses Thus a person having lands or tenements in his own possession is an inhabitant for the purpose of repair of bridges wherever he may reside, but for purposes of personal services the 'inhabitant must necessarily be a resident For the purpose of the poor rate the word means a person residing permanently and sleeping in the parish Where the right of voting is in inhabitant" householders a variety of divisions in committees of the House of Commons, in some instances conflicting, have taken place on the point But it appears to be generally understood that an inhabitant is one who keeps a house in his own occupation, either personally residing in it or having it occupied by servants and ready for his residence, having what is termed the 'animus revertendi' or intention to return

INHARMO'NICAL RELATION In Music, that in which a dissonant sound is introduced

INHE'RITANCE In Law an estate or real property which a man has to himself and his heirs, or the heirs of his body &c is termed a freehold of inheritance

INHIBI'TION (Lat inhibeo, *I restrain*) In Scottish Law a species of diligence *i e* process It is a writ in the king's name passing under the signet whereby a debtor is prohibited from contracting any debt which may become a burden on his heritable property in competition with the creditor at whose instance the inhibition is taken out and from granting any deed of alienation, &c to the prejudice of the creditor The heir of the debtor is not affected by the inhibition of his ancestor Other species of inhibition are, that of a husband against his wife, intended to signify that her superintendence over domestic affairs has ceased on which his liability for domestic expenditure contracted by her also ceases, and inhibition of tithes or tends

INHIBITION In Ecclesiastical Law a writ commonly issuing out of a higher court Christian to forbid an inferior judge from further proceeding in a cause before him being analogous to a prohibition issuing out of one of the king's superior courts of justice

INIS An Irish word signifying island, used as a prefix to the names of some islands on the coast of Ireland, and of several towns situated on lakes or rivers in the same country, as Inistallen Inniskilling &c

INITIATIVE (Lat initium *a beginning*) In Politics In legislative assemblies constituted so as to comprise more than one chamber or more than one distinct and co ordinate power that branch of the legislature to which belongs of right the power to propose measures of a particular class is said to have the initiative with respect to those measures Thus in England all propositions for taxing the subject, whether directly or indirectly, must begin in the Commons, a usage which has been adopted in most modern constitutions On the other hand, there are some private bills which by custom originate in the Lords and one bill, that, namely, for a

general pardon, is proposed in the first instance by the crown In France, by the charter of 1830, the three branches of the [illegible] like privileges in proposing laws [illegible] concedes the initiative to the Chamber of Peers, excepting in the case of money bills which must, as in England, originate with the Chamber of Deputies

INJU'NCTION, in Law, is a writ which issues under the seal of a court of equity It is granted in various cases, where the court thinks fit to interfere on equitable grounds with the acts of parties, or with the course of other jurisdictions Thus injunctions are granted under certain circumstances to stay proceedings at common law to restrain the execution of decrees, to other courts, to restrain parties from the commission of waste to preserve property which is in course of litigation, &c Injunctions are also granted to direct parties to quit possession of lands, &c after a decree Disobedience to an injunction is punishable as a contempt of the court from which it issues

INK (German [illegible] The colouring matter of common writing ink is the tannogallate of iron which is suspended in water by gum arabic a little logwood is generally added to [illegible] made [illegible] four ounces of gum [illegible] and six pints of soft water [illegible] then add the other [illegible] together, keep it [illegible] shaking it. In two months' time carefully pour off the ink from the residue into glass bottles, which should be well corked, a few cloves or a drop or two of creosote put into each bottle prevent moulding The addition of a little sugar to ink gives it a gloss, and prevents its drying rapidly and perfectly, so that it is generally used in what is called *copying ink*, from the writing with which copies may be taken by pressure *Indian ink* is a compound of very fine lampblack and size It cannot, like common writing ink, be removed by acids, but as it does not bite or sink into the paper, it may generally be wiped [illegible] *Printing ink* is made with boiled [illegible] lampblack *Red ink* is a solution of alum coloured with brazil wood Boil two ounces of brazil wood, half an ounce of gum arabic, and a quarter of an ounce of alum in a pint of water for ten minutes, strain the decoction, and set it aside to clear *Sympathetic inks* are compounds which when written with will remain invisible till heated solutions of cobalt thus become blue or green, lemon juice turns brown, and a very dilute sulphuric acid blackens *Marking ink* is made as follows — Dissolve one drachm of lunar caustic (fused nitrate of silver) in half an ounce of water previously thickened with a little sap green write with this upon the linen previously prepared for its reception by the application of a weak solution of carbonate of soda [illegible] and [illegible] to dry upon the linen

INULIDANS, *Inlida* [illegible] name of a family of Myriapods having the iulus or gally-worm as the type

INNOCENTS' DAY In the Calendar, a festival celebrated on the 28th of December, in commemoration of the infants murdered by Herod

INNO'MINATUM (Lat in, priv, and nomen, *a name, without a name*) Each of the lower bones of the pelvis is called *os innominatum*, because the three bones of which it [illegible] and the *pubis*, [illegible] share bone, grow afterwards together so as to form what [illegible] which is thus left nameless

INNS [illegible] four corporate societies established in London Every candidate for the rank of barrister-at-law is obliged to be admitted a member of one [illegible] regulations as a student [illegible] Temple, to which three *Inns of Chancery* (Clement's, [illegible]'s, and Clement's) belong, 2. the Middle Temple, with Strand Inn (no longer existing) and New Inn dependent on it 3 Lincoln's Inn (with Furnival's and Thavie's Inns), Gray's Inn (with Staple's Inn and Bernard's Inn)

INNUENDO (Lat *innuendo*, by signification) In Law In the [illegible] was used as a word of reference, when in relating the words of another party it was necessary to describe more particularly the person or thing meant by that party, as, for instance, in a declaration in action for slander, which is the most ordinary modern case of the employment of the innuendo, the plaintiff avers that the defendant said that "he," innuendo (meaning the plaintiff), was a thief, &c Hence the use of the word "an innuendo" in ordinary language to signify a covert allusion

INOCULATION The insertion of poisonous or infectious matter into any part of the body, but in this country the phrase is commonly used to signify the insertion of the virus of the common smallpox the insertion of the virus of the cowpox being called *Vaccination* Inoculation was introduced into general notice by Lady Mary Wortley Montague, whose son was inoculated at Constantinople about the year 1721, and whose daughter was the first who underwent the operation in this country A murder disease is thus protected that when it is received in the natural way Inoculation is performed by inserting the point of a lancet armed with proper matter just under [illegible] ordinary method of turning a ploughed field into a meadow or pasture is by sowing it with grass seeds, but as this part of agriculture has hitherto been very ill understood, and the result of sowing grass seeds has frequently not answered the expectations of the sower, the practice of what is called *inoculation* has of late years been invented, though practised but in very few instances This consists in preparing the soil as if it were to be sown down with grass seeds, but instead of sowing these on the surface, there are distributed over it small fragments of turf taken from the best old pasture land which the neighbourhood affords These fragments may be about two or three inches square, and they are laid down on the surface at the rate of about one in every square foot. After they are deposited grass seeds and [illegible] clover are scattered over the surface and the [illegible] is rolled to press down the the turf and press in the seeds In consequence of the fragments of turf being placed on fresh soil, the grasses and other vegetables which they contain, if of the creeping kind, grow luxuriantly, and their stems cover the intervals between the fragments, but if the grasses which the fragments contain should not be of the creeping or stoloniferous kinds it is evident that the intervals between them must chiefly depend for their grassy surface on the seeds which have been sown On the whole, the inoculation of grass land may be considered as a needlessly expensive process, altogether unscientific, and unsuitable to [illegible] ture

INVERSE PROPORTION, in Geometry, is a proportion in which the terms are placed out of the regular order

INOSCULATION (Lat inosculatio) The union of vessels by conjunction of their extremities This term is sometimes limited to the communication of trunks or [illegible] by [illegible] vessels [illegible] *anastomose*

INQUEST In Law an inquisition of jurors in causes, civil or criminal, when the facts are referred to their trial, being impanelled by the sheriff for that purpose Also the persons to whom the trial of fact in any question, civil or criminal is committed An inquest of office, or inquisition, is an inquiry made by the king's officer, sheriff, coroner, &c, by virtue of their office, or by writ sent them for that purpose or by persons acting under a special commission, to inquire concerning any matter which entitles the king to the possession of lands and tenements, or goods and chattels, as forfeiture for offences, wreck, treasure-trove &c The king's title in general commences on office found

INQUISITION The title given to a court armed with extensive criminal authority in various European countries, especially instituted to inquire into offences against the established religion The first of these tribunals of faith was that established in the south of France after the conquest of the Albigeois in the 13th century They were established in Spain in the middle of the same century not without much opposition on the part of the bishops and secular clergy, who, in Castile, long maintained their exclusive spiritual jurisdiction In 1484, the supreme general inquisition was founded at Seville by Queen Isabella with the aid of the Cardinal Pedro Gonzalez de Mendoza This great court, commonly known by the name of the Holy Office, had far more extensive authority than those local tribunals of the same name which had previously been established Thomas de Torquemada prior of a Dominican convent, was its first president, with the title of inquisitor-general The process of the inquisition was widely different from that of all other courts of justice The kings named the grand inquisitor, who appointed his assessors, some of whom were secular, but the greater part regular ecclesiastics the counsellors were six or seven in number, of whom one, by the ordinance of Philip III, must be a Dominican A party who was brought under cognizance of the court by secret accusation was immediately seized by its officers (termed officials or familiars), and his property put under sequestration If the accused was fortunate enough to absent himself, and did not appear at the third summons, he was excommunicated, and in some cases burnt in effigy. The subsequent process of the court by imprisonment, secret examination, and torture, is well known Penitent offenders were subjected to imprisonment, scourging, confiscation, and legal infamy Those convicted, who were sentenced to death were burnt at the Autos da Fe, which usually [illegible] Advent [illegible] of the inquisitors were for the most part men of intelligence and moderation, and its proceedings chiefly directed against parties guilty of such offences against

decency or religion as would have been punishable in most European countries, although not by an equally arbitrary process But there were exceptions to this general character, and by the provincial courts of inquisition, of which Spain contained sixteen, some acts of barbarous injustice were committed According to a common calculation, 340,000 persons had been punished by the inquisition from 1481 to 1808, of whom nearly 32,000 were burnt In that year it was abolished by Napoleon It was afterwards re-established by Ferdinand III in 1814, but having been again abrogated by the Cortes in 1820, it has not been since reconstituted In Portugal, the supreme court of inquisition was established in 1557 Its history in many respects resembles that of the Spanish court, [illegible] curtailed [illegible] of publicity [illegible] was [illegible] Cortes of 1821 There were courts of inquisition in various southern provinces of France, the principal that of Languedoc, established at Toulouse, which was first founded after the war against the Albigeois, but their power was limited not long after their creation, and fell into desuetude long before their final abolition In several Italian states courts of inquisition have been established, but the institution has never taken much hold on the sentiments or habits of the people of that country It was restored at Rome by Pius VII after the expulsion of the French, but had jurisdiction only over the faith and conduct of the clergy Several well-known histories of the inquisition have been published, particularly that of Limbosch The reader may also consult *Mosheim*, vol iii, *Prescott's Ferdinand and Isabella*, *Quart Rev* vol lv, *Llorente's Hist of the Inquisition*

INSANITY *See* LUNACY

INSCRI'BED FI'GURE In Geometry, a circle is said to be inscribed in a triangle when it touches each of the three sides of the triangle In like manner it is inscribed in a polygon when it touches all the sides of the polygon A triangle or polygon is inscribed in a circle when each of the angles of the figure stands on the periphery of the circle It is a very obvious but remarkable property, that the area of a triangle is equal to the product of the radius of the inscribed circle into half the perim[illegible]

INSCRIPTION In Numismatics, words placed in the middle of the reverse side of some coins and medals *See* NUMISMATICS

INSECTA *See* ENTOMOLOGY

INSECTI'VORA (Lat insecta *insects* and voro *I devour*) The name of a tribe of Zoophagous Mammals, comprehending those which live wholly or chiefly on insects, also of an order of birds in the ornithological system of Temminck

INSE'RTED COLUMN In Architecture, one standing [illegible] all

Botany to denote the manner in which one part grows out of another It was invented at a time when the laws of vegetable structure were unknown, and it was [illegible] that bodies that really grow from each other were inserted into each other Thus stamens said to be inserted into a calyx are in reality stamens that adhere to the sides of a calyx

INSESSO'RES (Lat insideo, *I sit*) A name by which Mr Vigors has designated his second order of birds including the *Passeres* and *Scansores* of Cuvier and which C Bonaparte applies to a primary division of birds in his *Systema Vertebratorum* including the *Passeres Scansores*, and *Accipitres* of Cuvier As the term signifies those birds which perch it is applicable to numerous species belonging to Linnæan and Cuvierian orders not yet included by later innovations under the term of Perchers or *Insessores*

INSOLA'TION, or SCORCHING A local disease of plants, attributable to exposure to too bright a light which causes an excessively rapid evaporation, the effect of which is to kill the part in which the evaporation takes place

INSO'LVENCY In Law the inability of an individual not engaged in trade to pay his debts The insolvency of a trader is called Bankruptcy which see Several statutes have been enacted successively for the relief of insolvent debtors, by releasing them from imprisonment on surrender of the whole of their effects to their creditors Their provisions were consolidated in [illegible] (7 G 4 c 57), and are now [illegible] Act for abolishing Arrest on Mesne Process (1 & 2 Vict c 110) The Insolvent Court consists of four commissioners and other officers, and is a court of record, [illegible] compel attendance, &c [illegible] (Portugal-street), but single commissioners make circuits three times a year through England and Wales The court proceeds upon petition from prisoners in actual custody, or, if the prisoner do not pray, on petition from a creditor An order is then made vesting the prisoner's estate and effects in [illegible] the court, which, however, is [illegible] dismissed

[illegible] court Other assignees are afterwards appointed by the court, in whom the property vests, who must formerly have been creditors, but this appears to be no longer necessary The insolvent delivers into court a schedule, which must contain a full account of his property The petition is then heard, and at the hearing creditors may oppose the discharge, and compel a full investigation of the prisoner's accounts The court may order the discharge either forthwith, or may remand him for a discretionary period, but not exceeding three years, if any frauds or malpractices on his part with reference to the state of his affairs should be detected The insolvent then executes a warrant of attorney for the amount of his debts which the distribution of his property is inadequate to cover, and other modes are provided by which his future property may be made available for his creditors It has long been proposed to unite the bankrupt and insolvent courts The insolvent acts extend only to England and Wales

INSPIRA'TION (Lat in, and spiro, *I breathe*) The act of drawing air into the lungs *See* RESPIRATION

INSPIRA'TION *See* REVELATION

INSTALLA'TION (Modern Lat in, and stallum, *a seat*) A name applied to the ceremony of instating persons in honours or dignities, as a knight of the Garter in the chapel of St George at Windsor, a chancellor in a university, or a [illegible] or other ecclesiastical dignitary, in [illegible] to which he belongs

I'NSTANT (Lat) A part of time or duration in which no succession is perceived There are three kinds [illegible] schoolmen, a *temporary*, [illegible] The first is a part of time immediately preceding another, the second is what is otherwise termed a *priority of nature*, which obtains [illegible] instant, but a point which the understanding conceives to have existed before some other instant, founded on the na[illegible] which cause it to be conceived

IN[illegible]RUCIS In Philosophy, *crucial* instances or examples, a phrase invented by the fancy of Bacon The use of crucial examples or experiments is to facilitate the process of induction For example, A and B two different causes, may produce a certain number of similar effects, find some effect which the one produces and the other does not, and this will point out, as the direction post at a point where two highways meet (crux), which of these causes may have been in operation in any particular instance Thus, for example, many of the symptoms of the oriental plague are common to other diseases, but when the observer discovers the peculiar *bubo* or boil of the complaint, he has an *instantia crucis*, which directs him immediately to its discovery (See, amongst other commentaries on Bacon, *Playfair's Introduction* and *Ed Rev* vol xxxvi)

INSTINCT *See* REASON

I'NSTITUTE The principal philosophical and literary society of France formed in 1795 by the union of four academies (See ACADEMY) *Institute* is applied also to several works embodying the principles of Roman law, of these the chief are those of Justinian and Gaius

INSTITU'TIONS (Lat instituo, *I instruct*) In Literature, a term denoting originally a system of the elements or rules of any art or science, but signifying in a more comprehensive sense all associations formed for the improvement of society at large, or the parties immediately concerned by whatever name they are designated, or to whatever object the labours of the members are directed Institutions formed for the promotion of learning or science have been distinguished by the name of academies or societies, and associations constituted for commercial purposes are usually styled companies, while those formed for other purposes have various designations, or have some epithet prefixed descriptive of their character

I'NSTRUMENT, MUSICAL A musical instrument is one for the production of musical sounds, either by percussion, wind, the drawing a bow across strings, or the production of sound from the vibration of the strings by pulling or pinching them transversely, as in the harp or guitar

I'NSULATED (Lat insula, *an island*) In Architecture, a [illegible] o which it is applied is [illegible] a church is said to be insulated when it adjoins no other building, so also a column is said to be insulated when standing out free from a wall, hence the columns of peripteral temples are insulated

INSULA'TION A body is said to be insulated which, containing a quantity of free caloric, or the electric fluid, is surrounded by [illegible] with other bodies [illegible] *See* ELECTRICITY

INSURANCE A contract of indemnity whereby the insurer, in consideration of a certain premium, undertakes

to indemnify the insured against loss arising by the occurring of a contingent event, such as the destruction of houses by fire, the loss of ships at sea the failure of crops through the inclemency of the seasons

Insurance is sometimes synonymously used with *assurance*, but the latter term is now more frequently [illegible] fall other kinds For which life assurances are calculated, see ASSURANCE

In all cases of insurance, the first thing to be determined is the degree of probability that the event under consideration will take place, but it seldom if ever happens that this is known with any moderate degree of precision Even in the commonest cases, it is perhaps altogether impossible to procure the data necessary for the accurate determination of this element Suppose for example, an insurance is to be effected on a ship bound on a voyage to China In what manner is the probability of its reaching its destination in safety to be determined? Even if an accurate account had been kept of all the voyages made during a century, and the number of successful as well as the number of unsuccessful ones were precisely known, the data would still be very insufficient for determining the risk of the loss of any individual vessel The loss of a ship is not a simple event like the turning up of a number on the face of a die The greater or less prevalence of hurricanes at the season of the year when the voyage is to be made, the strength of the ship and sufficiency of its equipment, the skill of the commander, and the character and discipline of the crew —are all elements materially affecting the risk, but which it is impossible to reduce to numerical values and precise calculation All, therefore, that can be done is to adopt certain mean or average values, deduced from observations of the fate of vessels in circumstances not indeed precisely the same but having some degree of similarity To the insurer if he sufficiently multiplies his adventures the result will be the same in the long run as if he had a more accurate appreciation of the separate influences of which the probability of the safe arrival of a vessel at a given port is composed, but the evil which results from this deficient knowledge of facts is, that the owner of a good ship by paying the same premium for insurance as the owner of a bad one, is charged for indemnification against a risk which he really does not run and hence the motives for improving the construction of vessels are not only destroyed, but it even becomes an object of pecuniary interest to expend in their equipment nothing beyond what is necessary to give them that moderate degree of goodness or sea worthiness which suffices to render them insurable on the ordinary terms This system, however much it is to be deprecated, is rather advantageous than otherwise to the underwriters or insurers, because their premiums are charged in proportion, and it renders insurance more necessary the pecuniary loss falls ultimately on the million who consume the merchandise and as to the loss of human life *that* consideration will probably operate as a check to cupidity only in so far as it may tend to raise the wages of seamen

With respect to insurances against fire the exact appreciation of the risk is not less difficult than in the case of marine insurances, but mathematical nicety on this subject is of little importance, for the amount of experience afforded by the general prevalence of the practice and the competition which exists among the numerous rival companies have probably had the effect of adjusting the premium to the average risk with all the accuracy which is practically attainable The premium charged by the London offices for insuring property of the value of 100*l* for a year is one shilling and sixpence, which corresponds to an average annual loss of nearly one in 1300, but it is to be observed that the sum which is charged as premium is presumed to be sufficient not only to cover the losses but also to defray the expenses of the establishment, and to afford an adequate interest on the amount of the capital laid out or risked by the insurance company [illegible] to which the practice of insuring is [illegible] possible that it would be still more general were it not for the circumstance that the government imposes a tax on the transaction of three shillings per annum for each 100*l* insured, which is double the amount of the premium charged by the insurer In 1837, the government duty on insurances amounted to 863,196*l* 12*s* 3*d*, which supposes the value of the property insured in that year to have been upwards of 575 millions

The characteristic property of insurances, of whatever nature, is their tendency to reduce to a certain average value the profits or advantages arising from all speculations of the same kind, however great the number may be The gain which the insurer makes on his successful speculations indemnifies him for the loss he sustains by those which are unsuccessful, and to the insured the result is the same as if they had paid their premiums into a common fund, and agreed to make good to each other their individual losses The insurers are only the intermediate agents of this supposed association, and their profits may be regarded simply as the salary of their functions If other means exist of dividing the risks, insurance becomes unnecessary A mercantile company employing a very great number of ships or taking part in a very great number of enterprises, would derive no benefit from insurance The loss on those which are unsuccessful is compensated by the premiums saved on the whole, in fact the company acts as insurer to itself On this [illegible] insures vessels belonging [illegible] buildings

INTAGLIO (It intagliare, *to cut in*) In Sculpture and Gem Sculpture a stone or gem in which the subject is hollowed out so that an impression from it would present the appearance of a bas relief

INTEGER (Lat *entire*) In Arithmetic a whole number, as opposed to a fractional number, or a mixed number

INTEGRAL CALCULUS The branch of mathematical analysis which treats of the processes by which a function may be found such that its differential shall be a given quantity By English writers this function used to be denominated the *fluent* or *flowing quantity*, and the method of finding it was called the *inverse method of fluxions* Foreign mathematicians who adopted the views and notation of Leibnitz, have called it the *integral* or *sum* of the proposed differential, and this phraseology is now universally adopted by the mathematicians of our own country

The method by which the integral of a proposed differential quantity is to be found is, generally speaking neither obvious nor capable of being reduced to fixed and general rules When an integral is proposed, its differential may always be found by general rules but there is no direct method of returning from the differential to the integral the analyst can only compare the differential expression which is to be integrated with the differentials of known quantities and from such comparison infer the form of the corresponding integral The principal art employed in the integral calculus consists in transforming the proposed functions into expressions which are known to be the differentials of given quantities

In order to denote the integral of a quantity the symbol $\int$ (originally S, the initial letter of the word *sum*) is employed Thus $\int X dx$ denotes the integral of the differential $X dx$

1 To begin with the simplest cases —Let it be proposed to integrate the expression $x^m dx$, or to find the function denoted by $\int x^m dx$ It has been shown, under the term DIFFERENTIAL CALCULUS that the differential of a quantity x^n is $n x^{n-1} dx$, that is to say $dx^n = n x^{n-1} dx$ Let $n = m + 1$, and this becomes $d x^{m+1} = (m+1) x^m dx$, whence we have $x^m dx = \frac{d x^{m+1}}{m+1}$, or, as the constant quantity $(m+1)$ does not affect the differentiation, $x^m dx = d \frac{x^{m+1}}{m+1}$ But as the integral of an expression dP is evidently P the equation gives, on integrating both members $\int x^m dx = \frac{x^{m+1}}{m+1}$ From this we derive the following general rule for integrating a differential of one term —Increase the exponent of the variable quantity by unity, and then divide by the new exponent and by dx

It is necessary, however, to remark that the integral thus formed may either be the expression from which the differential $x^m dx$ was derived, or it may be that expression increased or diminished by any constant quantity For the differential of $a x^5$ being $5 a x^4 dx$ and of $a x^5 + b$ being also $5 a x^4 dx$ (b being any constant quantity whatever), it follows that if we have to integrate the expression $5 a x^4 dx$ the integral will be incomplete unless we add to it a quantity which though indeterminate does not change its value with the variation of x We have, therefore, in general, $\int x^m dx = \frac{x^{m+1}}{m+1} + C$, where C is a quantity, positive or negative, the particular value of which remains to be determined by the nature of the problem under consideration This quantity, C, which is necessary in order to complete the integral, was denominated by the older English writers *the correction of the fluent*, in the language of modern analysts, it is *the arbitrary constant*

2 The differential of a polynomial being composed of the sum of the differentials of its terms taken separately, the integral of a polynomial is in like manner formed by adding into one sum the integrals of its component terms

Thus,

$$\int (a\,dx + b\,x\,dx - c\,x^n\,dx) = ax + \tfrac{1}{2}bx^2 - \frac{c\,x^{n-1}}{n-1} + C,$$

and one constant [illegible] for the sum of the constants which [illegible] the separate terms may evidently be represented by a single letter. In the same manner, the integral of a function having the form $(a + b\,x + c\,x^2)^n$ may be found when n is a whole positive number, it being only necessary to raise the root to the power denoted by n.

3. By the differential calculus, $d\,\log x = \frac{dx}{x}$. When any differential expression, therefore, can be reduced to this form, its integral will be found by means of a logarithm. Thus, supposing it were required to find the integral of $\frac{a\,dx}{a + bx}$. Suppose $a + bx = z$, and we have $dx = \frac{dz}{b}$. Substitute this in the given expression, and we have $\frac{a\,dx}{a + bx} = \frac{a\,dz}{bz}$. But $\int \frac{a\,dz}{bz} = \frac{a}{b}\int \frac{dz}{z} = \frac{a}{b}\log z + C$, which, on writing for z its value, becomes $\frac{a}{b}\log (a + bx) + C$.

4. An extensive class of differential expressions of very frequent occurrence in the solution of problems, is integrated by means of circular arcs. Let x be the sine of an arc z, we have then $x = \sin z$, and by the differential calculus $dx = \cos z\,dz$, whence $dz = \frac{dx}{\cos z}$. But by the properties of the trigonometrical lines $\cos^2 z + \sin^2 z = 1$, whence $\cos z = \sqrt{1 - \sin^2 z}$, or $\cos z = \sqrt{1 - x^2}$, consequently $dz = \frac{dx}{\sqrt{1 - x^2}}$. Transposing the terms of this equation and integrating, we find $\int \frac{dx}{\sqrt{1 - x^2}} = z + C$, z being an arc of which the sine is x. Whenever, therefore, an expression occurs of the form $\frac{dx}{\sqrt{1 - x^2}}$, we know that its integral, though it cannot be expressed generally in numbers when a numerical value is given to x, is represented by means of an arc of a circle. The expression $\frac{dx}{\sqrt{a^2 - x^2}}$ is reducible to the same form, for on dividing the numerator and denominator by a, or $\sqrt{a^2}$, and making $\frac{x}{a} = u$, we get $\frac{dx}{\sqrt{a^2 - x^2}} = \frac{du}{\sqrt{1 - u^2}}$, and $\int \frac{du}{\sqrt{1 - u^2}}$ = arc of which the sine is u or $\frac{x}{a}$. The constant C in the present case is zero, for the arc and its sine both vanish together.

Let us suppose, in the second place, $x = \cos z$. By differentiating we find $dx = -\sin z\,dz$, whence $dz = -\frac{dx}{\sin z} = -\frac{dx}{\sqrt{1 - \cos^2 z}} = -\frac{dx}{\sqrt{1 - x^2}}$. Transposing and integrating as before, $\int -\frac{dx}{\sqrt{1 - x^2}} = z + C$, z being the arc whose cosine is x. In this case, the constant C must be determined from this consideration, that when the cosine of an arc is 0 the arc itself is equal to a quadrant. Supposing, then, $x = 0$, and consequently $\frac{dx}{\sqrt{1 - x^2}} = 0$, and denoting the semicircumference as usual by π, the integral becomes $0 = \frac{1}{2}\pi + C$, whence $C = -\frac{1}{2}\pi$. Substituting this value of π, we get $\int -\frac{dx}{\sqrt{1 - x^2}} = z - \frac{1}{2}\pi = -(\frac{1}{2}\pi - z)$.

Lastly, let us suppose $x = \tan z$. The differential of the tangent of an arc is equal to the differential of the arc divided by the square of the cosine. Hence $dx = \frac{dz}{\cos^2 z}$, and therefore $dz = dx \cos^2 z$. But $\cos z = \frac{1}{\sec z}$, whence $dz = \frac{dx}{\sec^2 z} = \frac{dx}{1 + \tan^2 z} = \frac{dx}{1 + x^2}$. Transposing and passing to the integral, we have $\int \frac{dx}{1 + x^2} = z + C$. In this case, as the arc and its tangent vanish together, $C = 0$, therefore $\int \frac{dx}{1 + x^2}$ = arc whose tangent is x.

To this form we may reduce the expression $\int \frac{dx}{a^2 + x^2}$. Divide the terms by a^2, and make $\frac{x}{a} = u$, it then becomes $\int \frac{1}{a}\frac{du}{1 + u^2}$, or $\frac{1}{a}\int \frac{du}{1 + u^2}$, whence $\int \frac{dx}{a^2 + x^2} = \frac{1}{a}$ × arc whose tangent is $\frac{x}{a}$.

5. [illegible] which [illegible] venient [illegible] *tegration by parts*. This consists in making an integral of the form $\int v\,du$ depend on another of the form $\int u\,dv$. Thus, by the differential calculus, $d(uv) = u\,dv + v\,du$, transposing and integrating, we get $\int u\,dv = uv - \int v\,du$, which is the formula by which the artifice in question is accomplished. As an example, let it be proposed to find in this manner the integral $\int x^m\,dx$. Make $x^m = u$, and $dx = dv$, we have then $v = x$, $uv = x^m x = x^{m+1}$, $du = m\,x^{m-1}\,dx$, and $v\,du = m\,x^m\,dx$. Substituting these expressions in the formula $\int u\,dv = uv - \int v\,du$, it becomes $\int x^m\,dx = x^{m+1} - \int m x^m\,dx$, whence (since $\int m\,x^m\,dx = m\int x^m\,dx$) we have by transposing $(1 + m)\int x^m\,dx = x^{m+1}$, and therefore $\int x^m\,dx = \frac{x^{m+1}}{1 + m}$, which is the same expression as was given above. It may be remarked that by the use of this artifice the integral of the expression $x^m\,dx$ has been found by differentiating x^m and making the substitutions ordinarily employed in common algebra.

Another method of integration consists in transforming the given expression into a series, and taking the integrals of the several terms separately. Let it be proposed, for example, to integrate by the method of series the expression $\frac{dx}{a + x}$, which is the differential of the logarithm of $(a + x)$. In the first place, $\frac{dx}{a + x} = \frac{1}{a + x} \times dx$, but on expanding $\frac{1}{a + x}$ into a series by division, we have

$$\frac{1}{a + x} = \frac{1}{a} - \frac{x}{a^2} + \frac{x^2}{a^3} - \frac{x^3}{a^4} + \&c,$$

and multiplying both sides by dx and integrating by the the rules already explained, we find

$$\int \frac{dx}{a + x} = \frac{x}{a} - \frac{x^2}{2a^2} + \frac{x^3}{3a^3} - \&c + C$$

that is to say,

$$\log (a + x) = \frac{x}{a} - \frac{x^2}{2a^2} + \frac{x^3}{3a^3} - \&c + C$$

In order to determine the constant suppose $x = 0$, and the expression becomes $\log a = C$, whence, substituting this value of C,

$$\log (a + x) = \log a + \frac{x}{a} - \frac{x^2}{2a^2} + \frac{x^3}{3a^3} - \&c,$$

a series by which the logarithm of one number may be found from another when the difference between them is small in comparison of the latter number, or, which is the same thing, when the series converges with sufficient rapidity.

As a second example of this method, let the proposed differential be $\frac{dx}{1 + x^2}$, or $\frac{1}{1 + x^2} \times dx$. In this case we have $\frac{1}{1 + x^2} = 1 - x^2 + x^4 - x^6 + \&c$, whence multiplying by dx and integrating the terms,

$$\int \frac{dx}{1 + x^2} = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \&c + C$$

But $\frac{dx}{1 + x^2}$ is the differential of the arc whose tangent is x, therefore

$$\text{arc (tan} = x) = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \&c + C$$

and as the arc and its tangent both vanish together, the constant C is in this case $= 0$.

The series which has now been found for the arc in terms of the tangent converges only when the tangent is less than radius, or when x is less than unit, but it may be put under a form which will be convergent when x is greater than unit, or the arc greater than 45°. Thus, the series

$$1 - x^2 + x^4 - x^6 + \&c$$

was obtained by dividing 1 by $1 + x^2$, but if instead of dividing by $1 + x^2$, we divide by its equal $x^2 + 1$, we shall find

$$\frac{1}{x^2+1} = \frac{1}{x^2} - \frac{1}{x^4} + \frac{1}{x^6} - \frac{1}{x^8} + \&c\ ,$$

whence

$$\int \frac{dx}{x^2+1} = \int \left(\frac{1}{x^2} - \frac{1}{x^4} + \frac{1}{x^6} - \frac{1}{x^8} + \&c \right) dx + C\ ,$$

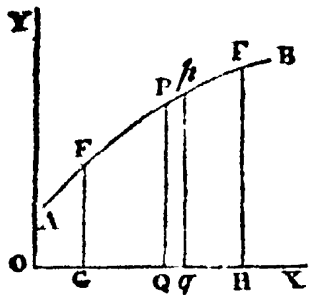
and on multiplying each term of the second member by dx and integrating,

$$\text{arc (tan} = x) = -\frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \&c + C$$

In order to find the constant, we cannot in this case suppose $x = 0$ for on this supposition the second member of the equation is infinite, but if $x = \infty$ the arc becomes a quadrant, or $\frac{1}{2}\pi$, and the equation becomes

$$\tfrac{1}{2}\pi = 0 + C', \text{ or } 0 = -\tfrac{1}{2}\pi + C,$$

and subtracting this equation from the former,



$$\text{arc (tan} = x) = \tfrac{1}{2}\pi - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \&c$$

which converges the more rapidly the greater we assume the value of x

The preceding examples will give an idea of the method by which the primitive function is obtained from its differential, but the subject is of by far too extensive and abstruse a nature to be entered into at any length in this place We shall therefore content ourselves with indicating some of the applications of the integral calculus to geometry

One of the first objects to which the new calculus was applied by its inventors was the finding the quadrature or areas of curve lines, and their rectification, or the determination of the lengths of their arcs

Let A B be a curve referred to two rectangular coordinates O X and O Y, let E and F be given points in it, and let it be required to find the quadrature of the curvilinear space between E G and F H, the ordinates passing through E and F Through P imagine one of the arc E F draw the ordinate P Q and also $p\,q$ indefinitely near to P Q then the space P Q q p is the differential element of the area G E P Q, and the area itself is equal to the sum of all the differential elements taken between E G and F H But by the principles of the differential calculus the space P Q q p is ultimately (that is, when Q q is less than any assignable quantity) equal to the rectangle under P Q and Q q, therefore, making as usual O Q $= x$ P Q $= y$, and $s =$ the area, we have $ds = y\,dx$, and consequently the area $= s = \int y\,dx$ In order to apply this formula it is necessary, in the first place to determine y in terms of x by means of the equation of the given curve

Suppose the given curve to be the common Apollonian parabola, the equation of which is $y^2 = a\,x$, a being a constant From this equation $y = a^{\frac{1}{2}} x^{\frac{1}{2}}$, and consequently $y\,dx = a^{\frac{1}{2}}\, x^{\frac{1}{2}}\, dx$, whence, passing to the integral by means of the formula $\int x^m\,dx = \frac{x^{m+1}}{m+1} + C$, we obtain $\int a^{\frac{1}{2}}\, x^{\frac{1}{2}}\, dx = \frac{2}{3} a^{\frac{1}{2}} x^{\frac{3}{2}} + C$, which on substituting for $a^{\frac{1}{2}}$ its value in terms of y, becomes $\frac{2}{3} y\,x + C$ This is the general expression for the area of the parabola, to determine it between the proposed limits we have only to substitute in it the values of x and y at those limits At the point E it becomes $\frac{2}{3}$ O G G E $+ C$, and at the point F it becomes $\frac{2}{3}$ O H H F $+ C$ Subtracting therefore the first of these from the second we have the space G E F H $= \frac{2}{3}$ (O H H F $-$ O G G E), the indeterminate C being eliminated by the subtraction

From this example it is easy to see that the space represented by the integral $\int y\,dx$ is the increment which a certain area receives while the independent variable x passes from one state of magnitude to another, and that the absolute magnitude which represents the integral cannot be known before C is determined or eliminated as above For the purpose of expressing the limits within which the integral is to be taken a particular notation is employed Let O G $= l$, and O H $= k$, then it is usual to write

$$\text{area G E F H} = \int_l^k y\,dx,$$

to express that the integral includes all values of x, from $x = l$ to $x = k$ The one of these is the value of x at its commencement, the other at its completion and the integral itself is an indeterminate quantity till the initial and [illegible] is another of the earliest applications of the integral calculus To rectify a curve, signifies to find a straight line equal to its arc According to the principles of the differential calculus, if z denote the arc of a curve then $dz = \sqrt{dx^2 + dy^2}$, consequently if the value of dy^2 be found by means of the equation of the curve in terms of x (or that of dx^2 in terms of y) and substituted in this equation, the radical will contain only one variable and when the expression is capable of being integrated the curve is rectifiable It is, however, only in a comparatively small number of cases that the differential of the arc of a curve can be integrated in finite terms

As an example, let us take the circle, the equation of which is $x^2 + y^2 = a^2$, reckoning the co ordinates from the centre From this equation $y = \sqrt{a^2 - x^2}$, whence $dy = \frac{-x\,dx}{\sqrt{a^2 - x^2}}$, $dx^2 + dy^2 = \frac{a^2\,dx^2}{a^2 - x^2}$, and $dz = \frac{a\,dx}{\sqrt{a^2 - x^2}}$

This expression cannot be integrated otherwise than by an infinite series We have already seen that it is reducible to the form $\frac{dx}{\sqrt{1 - x^2}}$ But the expression $\frac{1}{\sqrt{1 - x^2}}$ expanded by the binomial theorem gives

$$1 + \tfrac{1}{2}x^2 + \frac{1\ 3}{2\ 4}x^4 + \frac{1\ 3\ 5}{2\ 4\ 6}x^6 + \&c\ ,$$

whence, multiplying by dx and integrating the terms separately,

$$\int \frac{dx}{\sqrt{1 - x^2}} = x + \frac{x^3}{2\ 3} + \frac{1\ 3\ x^5}{2\ 4\ 5} + \frac{1\ 3\ 5\ x}{2\ 4\ 6\ 7} + \&c$$

Now if in this series we write $\frac{x}{a}$ for x, and multiply the whole by a, we shall have

$$\int \frac{a\,dx}{\sqrt{a^2 - x^2}} = x + \frac{x^3}{2\ 3\ a^2} + \frac{1\ 3\ x^5}{2\ 4\ 5\ a^4} + \frac{1\ 3\ 5\ x^7}{2\ 4\ 6\ 7\ a^6} \&c$$

for the length of the arc of the circle whose radius is a and abscissa x Suppose $x = a = 1$, this series gives for the length of the quadrant

$$1 + \frac{1}{2\ 3} + \frac{1\ 3}{2\ 4\ 5} + \frac{1\ 3\ 5}{2\ 4\ 6\ 7} + \&c$$

The quadrature and rectification of the circle are problems which have exercised the ingenuity of mathematicians ever since the invention of the science, but the solution neither of the one nor the other can be obtained in finite terms

The application of the integral calculus to the determination of the volumes and surfaces of solids, is perfectly analogous to the determination of the areas and arcs of plane curves Supposing the solid to be generated by the revolution of a plane curve about its axis, the expression for its volume is $\pi \int y^2\,dx$, where π is the semicircumference of the circle whose radius is unit The expression for its surface is $2\pi y \sqrt{dx^2 + dy^2}$ In these expressions the values of y^2 y and dy^2 must be found in terms of x from the equation of the curve by the revolution of which the solid is formed, and when the values thus found are substituted the formula will contain no other variable than x

The integral calculus also affords the readiest and in general, the only means of determining the centres of gravity of oscillation [illegible] and is, in fact the instrument by which mathematicians have succeeded in solving the difficult and important questions of dynamics and physical astronomy, and in ascertaining the laws which regulate the motions of the material world

As the integral calculus with its various applications embodies almost the whole of mathematical science the treatises which have been composed to explain or illustrate its principles are by far too numerous to be mentioned in this place Almost all the improvements of the calculus were first given in the form of Academical Memoirs The great repositories in which it is contained are the writings of Newton, Cotes, Demoivre, the Bernoullis Maclaurin Simpson, Euler, D'Alembert, La[illegible] Gauss Ivory, & [illegible] ler's *Calculus Integralis*, in 4 vols 4to, now very scarce, and Lacroix's *Traité du Calcul Différentiél et du Calcul Intégral*, in 3 vols 4to Of the minor works we may mention Bossut's *Calcul Différentiél et Intégral*, Boucharlat, Lacroix's smaller treatise, translated by Babbage, Herschel, and Peacock, and the treatises which have recently been published at Cambridge, particularly those of Hymer, Peacock, Myers, Hind, &c

INTEGRANT PARTS, in the Corpuscular Philosophy, are the small parts of a body, by the aggregation of which it may be conceived to be formed *Integrant parts* result from the mechanical division of a body, *constituent* [illegible], its chemical decomposition

INTELLECT *See* UNDERSTANDING

INTENDANT (Lat intendo, *I give my mind to any thing*) A title in common use among the French

applied to persons who have the conduct, inspection, and management of any office or function, as intendants of the [illegible], of [illegible] buildings, houses &c which treat of such expressions

INTENTIONS FIRST AND SECOND A distinction drawn by the schoolmen between those acts of thought which relate to an object out of the mind, and those which [illegible] states of consciousness [illegible] *production*, are *first intentions* such terms as *abstraction*, *inference* &c, are the expression of *second intentions* It is to be regretted that this distinction is disused by modern inquirers, or misunderstood by them, as in particular by Whately Great ambiguity might be avoided in philosophical language were it closely kept in view, as in such terms as *cause* and *effect*, which may either allude to a connection between natural phenomena in themselves, or to our [illegible] the essential laws of t[illegible] was first revived in the present century in a learned and acute review of Whately's Logic contained in the 115th Number of the *Edinburgh Review*

INTERCALARY DAY (Lat calo, *I call* *See* CALENDAR) In the Calendar, a day inserted out of the usual order to preserve the account of time Thus every fourth year containing 366 days, while the other years contain only 365 one of the months in that year must have an additional day, which is called the intercalary day The additional day was given to February as being the shortest month, and in the ancient Roman calendar was inserted between the 24th and 25th days In the ecclesiastical calendar it still retains that place, but in the civil calendar it is the 29th *See* BISSEXTILE

INTERCELLULAR PASSAGES in Vegetable Anatomy, are the spaces that exist between the cells, tubes, or vessels of which the tissue of a plant consists As the cells are usually, and the tubes or vessels are always round, it necessarily follows that when pressed together there will be spaces left between their sides

INTERCOLUMNIATION (Lat inter, *between* and columna *a column*) In Architecture the distance between two columns measured at the lower parts of their shafts It is one of the most important elements in architecture and on it depend the effect of the columns themselves, their proportion and the harmony of an edifice Intercolumniations are of five species, viz Pycnostylos, Systylos Diastylos Aræostylos, and Eustylos, under which several terms in this work they are defined, and to them the reader is referred

INTERCOSTAL (Lat inter, and costa, *a rib*) A term applied to muscles and vessels situated between the ribs

INTERDICT (Lat) In Ecclesiastical History a spiritual weapon by which the Popes used in former times to reduce individuals or whole states to the most abject submission to their power In the middle ages it was the most terrible blow which could be inflicted on the people or the prince When an interdict was laid upon a kingdom all spiritual services ceased, the churches were shut up, the sacraments were no longer administered, no corpses were buried with funeral rites, and all the ministry of the church which was then believed to be the only channel of salvation was forbidden to be exercised The first memorable occasion on which this method of warfare was adopted was the marriage of King Robert of France with Bertha his cousin, when Gregory V in 998 issued interdicts against the whole country, and compelled the sovereign to dissolve his union It had, however, been often used before by bishops, an instance is quoted by Moreri as early as A D 870 (See *Gieseler's Text Book*, ii 117, translation) The ban under which England was laid in the reign of John by Innocent III is well known in the history of this country The latest pretensions to the exercise of this power were assumed by Pius VII, when he issued an inefficient decree against Napoleon in 1809

INTERDICT The technical term in Roman law for a decree of the prætor [illegible] or recovery of prope[illegible] subject see the *Penny Cyclopædia*

INTEREST The premium or sum of money given for the loan or use of another sum of money, generally estimated at so much *per cent*, or per 100*l* The sum lent, and for which the interest is paid, is called the *principal* and the [illegible] interest is called the *rate* The rate will evidently be proportional to the time, for whatever interest is paid for the use of 100*l* for one year, twice that interest will be required for the use of 100*l* for two years The principal added to the interest, or the whole sum paid back to the lender, is called the *amount*

Interest is either *simple* or *compound* *Simple interest* is that which is reckoned and allowed upon the principal only during the whole time of the loan, *compound interest* is reckoned not only on the principal sum lent, but also on the interest as it becomes due It is convenient to treat of these separately

1 *Simple Interest* — Let us assume
a = the amount,
p = the principal sum lent,
n = the number of years for which it is lent,
r = the rate, or interest of 1*l* for one year

Now, the interest of 1*l* for one year being r, the interest of p pounds for one year is $p\,r$, and for n years $p\,r\,n$ The amount, therefore, of p pounds for n years, at the rate r, is $p + p\,r\,n$, or, $a = p\,(1 + r\,n)$ From this equation we may determine any one of the four quantities in terms of the others The four equations are as follow —

$$a = p\,(1 + r\,n) = \text{the amount},$$
$$p = \frac{a}{1 + r\,n} = \text{the principal},$$
$$n = \frac{a - p}{p\,r} = \text{the time in years},$$
$$r = \frac{a - p}{p\,n} = \text{the rate of interest}$$

These formulæ suffice for the solution of all questions of simple interest It is only necessary to observe, that when the time is less than a year, n is a fraction for example, if the time is seven months, $n = \frac{7}{12}$, and if the time is 100 days, then $n = \frac{100}{365}$ If the rate of interest be 4 *per cent per annum*, then $r = .04$, if the rate be 5 *per cent per annum*, $r = .05$, and so on

2 *Compound Interest* — Though the law does not permit money to be lent at compound interest, yet in [illegible] leases, &c. or effecting [illegible] allowed, the subject is therefore of considerable importance

In order to show the manner in which any given sum increases at compound interest let us suppose 100*l* to be lent at the rate of 5 per cent per annum At the end of the first year this will amount to 105*l* Now this 105*l* may be regarded as a new principal lent out the second year at the same rate, its interest will therefore be 5*l* 5*s*, and consequently the amount at the end of the second year is 110*l* 5*s* This again may be regarded as a new principal, and in the same manner the amount at the end of the third year will be 115*l* 15*s* 3*d*, and so on for any longer period At simple interest the amount at the end of any given time will be greater, as the number of payments or times the interest is added to the principal is greater

As before, let
a = the amount
p = the principal,
n = the number of years,
r = the rate of interest

Therefore, since 1*l* amounts to $1 + r$ at the end of the first year and as every other sum is increased in the same proportion we have $1 \quad 1 + r \quad 1 + r \quad (1 + r)^2 =$ the amount of 1*l* at the end of the second year In like manner we have $1 \quad 1 + r \quad (1 + r)^2 \quad (1 + r)^3 =$ the amount at the end of the third year, and so on In general, the amount of 1*l* at the end

of the 1st year	$= 1 + r$
2d	$= (1 + r)^2$
3d	$= (1 + r)^3$
4th	$= (1 + r)^4$
nth	$= (1 + r)^n$

The amount, therefore, of any principal p, at the end of n years is $p\,(1 + r)^n$, and from this we derive the following formulæ for finding any one of the four quantities when the three others are given —

$$a = p\,(1 + r)^n = \text{the amount},$$
$$p = a\,(1 + r)^{-n} = \text{the principal},$$
$$n = \frac{\log a - \log p}{\log (1 + r)} = \text{the number of years},$$
$$r = \left(\frac{a}{p}\right)^{\frac{1}{n}} - 1 = \text{the rate of interest.}$$

As an example suppose it were required to find in how many years a sum of money lent at compound interest, at 5 per cent per annum would double itself Here the quantity to be found is n, and we must apply the third formula We have in the present case $a = 2\,p$, and $1 + r = 1.05$, therefore, $n = \frac{\log 2p - \log p}{\log 1.05} = \frac{\log 2}{\log 1.05} = \frac{.3010300}{.0211893} =$ 14.2067 nearly, therefore, at the rate of 5 per cent per annum, any sum of money doubles itself in 14$\frac{1}{5}$ years

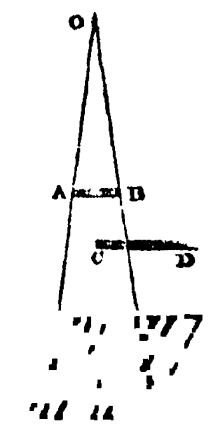
In the above formulæ the interest is supposed to be payable yearly, and r denotes the simple interest of 1*l* for one year, but if the payments become due at different intervals from a year, then r will not be the *annual* rate of interest [illegible] yielded by the principal but the nominal rate [illegible] the amount of the first payment For example, suppose the payments due half-yearly, and the nominal interest or simple interest for a year per cent 100*l* principal will produce 2*l* 10*s* of interest the first half year But the interest the second half year being on 102*l*. 10*s*, will be 2*l* 11*s* 3*d*, so that

while the nominal interest is 5 per cent, the interest actually made in a year on 100*l* is 5*l* 1*s* 3*d*

The advantages arising from a sum of money put out to compound interest for shorter periods than a year may be determined as follows Suppose the payments to be made half-yearly then each payment being half of the annual simple interest the amount of 1*l* at the end of the year will be expressed by $\left(1+\frac{r}{2}\right)^2$, which is equal to $1+r+\frac{r^2}{4}$ But the amount at a yearly payment is $1+r$, the advantage, therefore of the half-yearly payment is $\frac{1}{4}$th of the square of r If the payments of interest be supposed to be made quarterly, then the amount of 1*l* at the end of the year will be expressed by $\left(1+\frac{r}{4}\right)^4 = 1+r+\frac{3r^2}{8}+\frac{r^3}{16}+\frac{r^4}{256}$, which exceeds the amount when the payment is yearly, by $\frac{3r^2}{8}+\frac{r^3}{16}+\frac{r^4}{256}$ or by $\frac{3r^2}{8}$ nearly, the remaining terms being very small, and of scarcely any sensible value Generally if the interest is payable m times a year (each payment being the mth part of the annual simple interest) the amount of 1*l* at the end of the year will be expressed by

$$\left(1+\frac{r}{m}\right)^m = 1+r+\frac{m-1}{2m}r^2+\frac{(m-1)(m-2)}{2\ 3\ m^2}r^3 + \frac{(m-1)(m-2)(m-3)}{2\ 3\ 4\ m^3}r^4 + \&c$$

As r is a small number, all the terms of this series multiplied by the cube and higher powers of r may be omitted, and the amount becomes $1+r+\frac{m-1}{2m}r^2$, which exceeds the amount when the payment is yearly by $\frac{m-1}{2m}r^2$ If we suppose m to be infinitely great, or the interest to become due and to be added to the principal *momently*, the series becomes



$$1+r+\frac{r^2}{1\ 2}+\frac{r^3}{1\ 2\ 3}+\frac{r^4}{1\ 2\ 3\ 4}+\&c,$$

which is equal to the number whose Napierean logarithm is r, or the number whose logarithm is $r \times 1.1513$ in the common tables Suppose the rate to be 5 per cent, we have $.05 \times 1.1513 = .057565$ the natural number corresponding to which is 1.05127, consequently the amount of 100*l* at 5 per cent on the hypothesis of *momently* payments for a year, is 105.127*l* = 105*l* 2*s* 6½*d* nearly, exceeding the amount at simple interest only by 2*s* 6½*d* which differs very little from $\frac{1}{40}r^2$

INTERFERENCE In Optics a term first employed by Dr Young to express certain phenomena which result from the mutual action of the rays of light on each other The phenomena in question are considered of very great importance, and have accordingly been examined with great care, on account of the proof which they are supposed to give of the truth of the undulatory theory of light

The phenomena may be thus explained — Suppose two minute pencils of light from two different luminous points to fall on a screen or piece of paper, and making a small angle with each other If the spot on which both pencils fall is at the same distance from both foci or luminous points the intensity of the illumination is greater than would have been produced by either pencil alone Now it has been found that there is a certain difference between the lengths of the paths at which the intensity of illumination produced by their concourse is the same as when the paths are equal Call this difference d, then it is also found by experience that similar bright bands or fringes are produced when the difference between the lengths of the paths of the two pencils is $2d$, or $3d$, or $4d$, &c But it is very remarkable that when the difference between the lengths of the two paths is $\frac{1}{2}d, \frac{3}{2}d, \frac{5}{2}d$, &c, the two pencils, instead of adding to each other's intensity, destroy one another, and produce a black spot or fringe The two pencils thus act on each other, increasing the effect in one case and diminishing it in another, and it is this mutual action which is called *interference*

In order to study the phenomena in detail, Dr Young admitted a pencil of homogeneous light into a darkened [illegible] of a thread or opake disc (the diameter of which did not exceed 1 30th of an inch) placed a little behind the opening Having remarked that the shadow received on a screen was divided by parallel bands, of which that in the middle was always white, he proved that the bands were produced by the interference of the rays passing by the two sides of the thread or disc This was demonstrated by intercepting the light which fell on one of the sides of the dist[illegible]s of a screen placed between the disc and shadow, and allowing it to pass freely by the other side, as represented in the annexed figure, in which O is the hole, A B the disc, E F its shadow, and C D the interposed screen, the border of which receives the shadow of the side B of the disc The instant the screen is brought within the shadow of A B all the fringes of the shadow immediately disappear although the light inflected by the side of the disc A continues to follow the same route as before, which necessarily supposes that it receives some modification from the proximity of that which passes by the side B

The field of inquiry which had thus been opened by the ingenuity of Dr Young was explored to a much greater extent by Arago and Fresnel Instead of the screen C D Arago introduced the edge of a thin plate of glass into the shadow of the disc, and found that the luminous fringes received various modifications, according as the plate of glass was more or less thick When the plate was of a certain thickness, the central fringe M was brought nearer to F and the first dark fringe on the same side occupied the place which had before been occupied by the second, the second took the place of the third and so on On the other side of M the appearance was the reverse, the third fringe took the place of the second, the second of the first and the first was brought into the middle of the spectrum at M On using glass a little thicker the displacement was doubled the first fringe fell upon the place of the third the second on that of the fourth and so on This experiment of Arago proves that the mutual action of the rays does not alone depend on a particular modification which the rays receive at the boundaries of a body which they graze in their course, but also on the different media which they traverse from their source to the point where they interfere

Fresnel adopted a still more ingenious method of performing the experiment Having placed two plane metallic mirrors in a vertical position and so as to make a very obtuse angle with each other he concentrated by means of a lens of small focal length a pencil of homogeneous light directed horizontally to a point so situated before the mirror that part of the diverging cone fell upon the one mirror and part of it upon the other The rays of light reflected from the two surfaces being rendered convergent by the position of the mirrors again met each other at a small angle, and at the point of intersection produced alternations of brilliant and dark fringes These fringes are parallel to the line of intersection of the two mirrors, and on screening one of the mirrors they immediately disappear

In the experiment of Dr Young and Arago it might be supposed that the fringes were produced by some physical action of the interposed body on the light, but in Fresnel's experiment the light is reflected in the usual way, and no question can be raised about the influence of the body by the borders of which it passes The fact is thus established beyond all doubt that two rays of light issuing from a common source and after pursuing a different path meeting again under a small obliquity exercise an influence on each other to the extent of doubling the intensity of the light on the one hand or destroying it altogether on the other The phenomenon of two rays of light neutralizing each other and producing their mutual extinction is one of the most remarkable in the whole range of physical science Though first explained by Dr Young and established by Arago and Fresnel it had formerly been observed and described by Grimaldi

The fact of the interference of the luminous rays having been established it was interesting to determine the constant interval d or difference between the lengths of the paths of the two pencils at which the greatest effect is produced This interval has been very carefully determined both by Fresnel and by Fraunhofer and is found to be different for the different colours The following are values of d found by Fraunhofer for the different colours of the spectrum, expressed in decimals of an English inch —

Red - - -	$d = 0.00002582$
Orange yellow - -	$= 0.00002319$
Green - - -	$= 0.00002073$
Blue - - -	$= 0.00001912$
Indigo - - -	$= 0.00001692$
Violet - - -	$= 0.00001572$

These values of d, being obtained by direct experiments, are independent of any hypothesis respecting the propagation of light they are equally real whether light be supposed to be emitted from a luminous body, or produced by the vibrations of an elastic medium, or rather they are numerical conditions which must be satisfied by any theory of light which may be adopted But the phenomena of interference are scarcely susceptible of probable explanation by the theory of emission, whereas, if

we adopt the undulatory hypothesis, their explanation is remarkably simple Indeed they afford the most decisive reasons yet known for adopting that theory in preference [illegible] undulatory system, the [illegible]

If two luminous waves reach an ethereal molecule at the same instant of [illegible] impulsions, and the [illegible] the diagonal of the parallelogram of which the two sides [illegible] will be nearly equal to their sum and if they are in opposite directions, equal to their difference Let us now suppose, 1st, that two vibratory movements produced by a series of equal and successive undulations indefinitely repeated in an elastic medium are simultaneously experienced at the same point, situated at any distance from their common centre, 2d, that after having followed different paths, their directions at this point are sensibly confounded, 3d, that in consequence of the unequal lengths of the two paths or of their unequal velocities the time which a wave takes to arrive at the point by the first path (A) is shorter than that which it takes to arrive by the second path (B) These suppositions being made it is evident that an ethereal molecule situated at a point common to the two paths A and B will begin to vibrate in consequence of the undulations propagated along A before the undulation which comes by B reaches it, and when this second undulation does take effect the motion of the ethereal particle will be increased or diminished according as the new impulse conspires with or opposes the former Three cases may occur —

1 The difference of the lengths of the paths or the difference of velocities may be such that the wave coming by the path B may reach the molecule at an interval of time after it has been affected by the wave coming by A precisely equal to that of a semi vibration In this case the vibrating molecule having reached its limit of excursion on one side and about to return to the point of repose, would at that instant receive an impulse constraining it to move in the opposite direction with the same velocity The coexistence of the two systems of vibrations would therefore destroy the motion, and the molecule would remain at rest The same thing will take place if the difference of the lengths of the paths or velocities is such that the vibrations propagated along B arrive at the intersection of the paths precisely $3\frac{1}{2}$, $7\frac{1}{2}$ &c of a period of undulation after those which come by A

2 The undulations propagated along B may arrive at the molecule after those coming by A at an interval of time exactly equal to that of a complete vibration or of several vibrations, in which case the molecules would receive the impulse of the [illegible] together and consequently the [illegible] of its excursions would be doubled instead of being destroyed

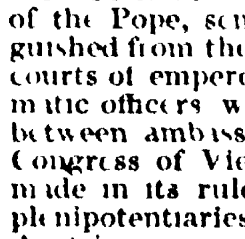
3 The interval between the two impulses may be neither an odd nor an even multiple of the time of a semi-vibration In this case, the molecule will vibrate with a velocity less than the double of that which it would have if each impulse took place independently of the other (*Herschel's Treatise on Light*, in the *Ency Metropolitana*)

It is a strong presumption in favour of the undulatory theory of light, that it affords not only a complete and satisfactory explanation of the whole of the phenomena of diffraction, but also the means of submitting them to arithmetical calculation See LIGHT

INTERIM (Lat *in the mean time*) In modern European History, the name given to a decree of the Emperor Charles V after the overthrow of the Protestant League of Smalcalde in which he attempted to reduce to harmony the contending opinions of the Protestants and Romanists The use of the cup however and the marriage of the clergy, were the only points which he conceded to the Reformers, and it became a question among them, and gave rise to many serious disputes whether they could conscientiously submit even to a temporary decree of such a nature The enactments of the *interim* were intended only to remain in force till some definitive settlement could be made, whence it derives the name by which it is generally known It received the force of law at the Diet of Augsburg in 1548 Its provisions against the Protestants were however, in most respects set aside by the treaty of Passau, 1552 (See *Mosheim*, vol iv)

INTERJE'CTION In Grammar a part of speech expressing simple emotion without involving any act of conception See GRAMMAR

INTERLO'CUTOR (Lat inter, and loquor, *I speak*) In Literary phraseology, a person who is introduced to take part in dialogue; in Dramatic literature, [illegible] *dramatis personæ* latter name, however, comprehends [illegible] but take no part [illegible] ate personages



INTERLOCUTORY JUDGMENTS In Law, such as are given in the course of a cause upon any proceeding arising out of it, and do not finally determine it as, the judgment in an action of damages upon which a writ of inquiry issues to assess such damages So a decree in chancery is either final or interlocutory — In Scottish law, a judgment of the court of session, or lord in ordinary, which if allowed to become final will be conclusive is termed interlocutor

INTERLUDE (Lat inter, *between*, and ludo, *I play*) A short dramatic piece, generally accompanied with music properly, such as is represented or performed between the acts [illegible]

INTERMEDE, or INTERMEZZO In Dramatic Literature, nearly the same with interlude A short musical piece, generally of a burlesque character, but many not intended merely for introduction between the acts of a more serious performance, are comprised under these names by the French and Italians

INTERMITTENT Any disease which ceases for a time and again returns, so that the patient is free from it in the intermediate intervals See AGUE

INTERMITTING SPRINGS, are springs which after having run for a certain time stop altogether, and after a time begin to run again and then stop, and so [illegible] the flowings and intermissions generally [illegible] other at pretty regular intervals These phenomena which often excite wonder in the ignorant and have sometimes even been ascribed to the influence of witchcraft are explained on the principle of the siphon Let A be cavern in a mountain, and *a b c* a channel communicating with A, and terminating in the side of the mountain or adjacent plain and let us suppose the cavern to be fed by small streamlets of water, of which the united supply is less than can be discharged by the channel *a b c* Let the cavern be supposed empty The water from the rills or fissures by which it is fed will collect at the bottom and as it rises in the cavern will also rise in the channel *a b* till it reaches the highest level *b*, when it will begin to flow out through *b c*, and by the property of the siphon will continue to flow till the whole cavern is drained to the level of *a* The cavern then begins to fill new and the same series of phenomena is repeated at intervals of which the length depends on the relative capacity of the cavern and channel and the abundance of the supply through the fissures When the supply is constant the intervals of intermission will be equal Some springs of this kind do not cease altogether to flow, but only discharge a much smaller quantity for a certain time and then a greater quantity In this case they are called variable or reciprocating springs They may be caused by the circumstance of a smaller fissure connecting the cavern with the lower part of the channel *c*, through which a portion of water continues to flow while the main discharge is stopt or there may be several siphons all communicating with a common outlet It is easy to imagine a combination of circumstances by which the discharge of water will be greatly increased by the elastic force of air compressed at the top of the cavern A This will take place when the fissures which communicate with the external atmosphere are filled with water and there is in consequence [illegible] which the air in the cavern can escape [illegible] then be propelled through the channel with considerable force, or even raised in a jet by the very same principle as in the fountain of Hero (See *Musschenbroek* Introd t n § 2379, *Desaguliers, Exper Phil* vol ii p 173 *Nicholson's Phil Journ* xxxv p 178, *Ferguson's Lectures on Select Subjects* by Brewster)

INTERMODILLION (Lat inter, *between*, and modillion) In Architecture the space between two modillions which is equal throughout the entablature

INTERNODE (Lat inter and nodus, *a knot*) In Botany the space that intervenes upon a branch between the leaves

INTERNUNTIUS or INTERNUNCIO An envoy of the Pope, sent to small states and republics, distinguished from the nuncio who represents the Pope at the courts of emperors and kings Also a species of diplomatic officers who ranked according to the old practice, between ambassadors and plenipotentiaries Since the Congress of Vienna, as no mention of internuncios is made in its rules they are considered on a level with plenipotentiaries This is (or lately was) the title of the Austrian envoy at Constantinople

INTEROSSEOUS MUSCLES Small muscles between the metacarpal bones of the hand and the metatarsal of the foot the former are concerned in moving the fingers and the latter the toes

INTERPILASTER (Lat inter and pilaster) In Architecture, the space between two pilasters, which depends entirely on the same rules as intercolumniation, and that more especially if both are employed in the same building

INTERPLEADER In Law A [illegible] in equity, is filed by a person who is [illegible] of debt or rent to one of the parties to a suit in equity,

but cannot ascertain, until the determination of the suit, to which of the parties he is indebted, and by this bill he desires to interplead in order that he may save himself harmless in the event of the success of either party In the common law courts, by 1 & 2 W 4 c 58, relief can be given [illegible] adverse claims made on sheriffs [illegible] persons having no interest is the subject of such claims, by a judge's order [illegible]

INTERPOLATION [illegible] terms of which have some determinate relation to each other, and of which the first is called the series of roots, and the second the series of functions, to find the function corresponding to any term in the series of roots from the numbers in the series of functions which precede or follow that which is required Thus, supposing the series of roots to be the natural numbers 101, 102, 104, 105, and the series of functions to be the logarithms of those numbers, then the question may be to find the [illegible] of 103 by means of the logarithms of 101, 102, 104, & 105 In the language of algebraists the problem is to determine the value of Y_{x+n} in a function of the terms which precede or follow Y_x

In Astronomy and Physics, interpolation signifies the method of finding a mathematical law which will connect together a number of observed facts Thus, supposing 20 places of a comet have been determined by observation, these places are said to be interpolated when a curve defined by an analytical equation has been found which passes through them all, for by means of this curve the place of the comet at any intermediate time can be found According to this view of the subject, the problem of interpolation is altogether indeterminate, for an infinity of analytic curves of different forms may be found which will pass through 20 given points but in general the circumstances of the question impose such restrictions as render it determinate In the instance now given we know that the curve must be an ellipse, and as an ellipse cannot be made to pass through 20 points taken any how, the question resolves itself into this —To find the ellipse which will *most nearly* pass through the given points, or represent the given observations Another question now arises —what conditions must be fulfilled in order that the observations may be represented *most nearly?* These conditions must be determined from other considerations Suppose the condition to be that the sum of the squares of the errors of observation (that is, of the differences between the observed places of the comet and the corresponding places in the orbit to be found) shall be a minimum, the problem is now quite determinate, though its solution may be sufficiently difficult and laborious

The method of interpolation by differences was first employed by Briggs in the calculation of logarithms, but was afterwards [illegible] way by Wallis, Newton, Cotes, [illegible] the fifth lemma of the third book of the *Principia*, Newton has given a solution of the problem of determining the curve which passes through the extremities of any number of ordinates By modern writers the subject is treated as a branch of the calculus of finite differences It is discussed at length by Laplace in the 2d vol of the *Mécanique Céleste*, and also in the *Theorie Analytique des Probabilités;* by Lagrange, in the *Journal de l'Ecole Polytechnique*, &c See also the Treatise on Differences and Series by Sir John Herschel in the Appendix to the English translation of Lacroix's *Differential and Integral Calculus*, or the 3d vol of Lacroix's large Treatise

INTERREGNUM (Lat) The period between the death of one king and the accession of another under the Roman monarchy, or under the republic, the space of time when there were by some accident [illegible] trates who could hold the [illegible] (comitia), during which an interrex was appointed *See* INTERREX

INTERREX A person appointed to discharge the royal functions during a vacancy of the throne The Romans first elected an interrex after the death of Romulus, and the custom was continued while the monarchy lasted The manner of their election was this, — the [illegible] whom discharged the functions of royalty [illegible] in an order appointed by lot It has been supposed that these ten senators were not elected, but they were the [illegible] volved on them by virtue of their rank An interrex was also appointed sometimes under the republic to preside over elections of magistrates, &c when the consuls were absent, or their election declared void and no dictator had been created

INTERSCE'NDENT (Lat inter, and scando, *I climb*) In Algebra, a term applied by Leibnitz to quantities when the exponents of their powers are irrational Such expressions are called *interscendent*, as holding a mean as it were between algebraic and transcendental

[illegible] (Lat inter, and seco, *I cut*) In Geometry, the [illegible] of lines or surfaces The intersection of a line, or of a line and a surface, is a point, and the intersection of two surfaces is a line

I'NTERTIE (Lat inter, and tie) In Architecture, an horizontal piece of timber framed between two posts [illegible] together

I'NTERVAL (Lat intervallum) In Music, the [illegible] between sounds as respects their [illegible] by the ancients a *diastem* Intervals are divided into *simple* and *compound*, the former being without parts or divisions, the latter consisting of several smaller intervals

INTERVE'NTION (Lat inter, and venio, *I come*) In Politics the interposition of one state in the domestic affairs of another The right of armed interveniton is one of the most contested portions of the public law of nations, as, although practised frequently enough by the more powerful with reference to the weak, it had never been regarded otherwise than as a permitted abuse of power until the time of the congresses of Vienna, Laybach, &c, when it was publicly recognized by the leading [illegible] Europe

INTESTACY (Lat in the sense of *without* and testor, *I testify*) In Law, the condition of a party who dies without having made a will Freehold lands and tenements in which he has an estate of inheritance descend to his heir, subject to such charges as affect real estate, copyhold lands of inheritance to the heir, by the custom of the manor, chattels must be distributed (subject [illegible] who takes out letters of administration to the estate and effects according to the provisions of the Statute of Distributions

INTESTINALIA *Intestinal Worms* (Lat intestina *an intestine*) The name by which Linnæus and Cuvier have designated the class of animals which infest the interior of other animal bodies and which indicates their most common locality, viz the intestinal tube

The knowledge of the intestinal worms, as a distinct class of invertebrate animals, is of a very late date In the twelfth edition of the *Systema Naturæ*, 1787-8, only eleven species of true Entozoa are enumerated, and of these only six are placed among the *Intestina — Gordius medinensis, Ascaris vermicularis Ascaris lumbricoides, Fasciola hepatica, Fas intestinalis* and *Fas barbata*, the remaining species viz *Hydra hydatula, Tænia solium Tan vulgaris Tan lata*, and *Tæn canina*, are ranged with the *Zoophyta Bloch's Treatise on the Generation of Intestinal Worms* and the succeeding work of Goeze entitled *Versuch einer Naturgeschichte der Eingeweidewürmer Thierischer Körper* 1782, added largely to the number of the described species, and led to the foundation of some accurately defined genera and better ideas of classification Gmelin availed himself of the labours of these authors and combining with them the species described by Redi Pallas, O F Muller, and Werner, was enabled to give two hundred and ninety-nine species of *Intestinalia* in the thirteenth edition of *Linne's Systema Naturæ*, but of this labour it has been justly remarked "Gmelinus, auctorum plurimorum observationes congessit, sed tam judicio et experientia quam sollertia destitutus, plurima miscuit et implicuit, ut in synonimis ab eodem perperam allegatis, extricandis, C A Rudolphi et Zederus multum desudaverint"

The first clear definition of the intestinal worms as a class and their distribution into a system of orders and genera are contained in the great work by Rudolphi, entitled *Entozoorum sive Vermium Intestinalium Historia Naturalis*, 8vo 1808-10 In this work, Rudolphi, after dividing the great class *Vermes*, of Linnæus, into four classes, viz *Mollusca, Gymnodela, Entozoa*, and *Phytozoa*, characterizes the third class as follows — "Entozoa ergo classem, aut si mavis ordinem sistunt peculiarem continentem *alius in animalibus obvia, oculis nudis conspicua, nervis carentia, partibus internis dissimilibus instructa*" Of the class of animals thus characterized, Rudolphi enumerates, in a subsequent work, *Synopsis Entozoorum*, 1819, upwards of eleven hundred species At the present time, nearly double that number of Entozoa are known

Rudolphi distributes the intestinal worms into five orders, which are characterized as follows, —

Order I *Nematoidea* (Round-worms) — Char Body elongated, rounded, elastic, an intestinal canal, with a separate mouth and vent, sexes distinct

Order II *Acanthocephala* (Hooked-worms) — Char Body roundish, utricular, elastic, head with a retractile proboscis, armed with hooks or recurved spines, sexes distinct

Order III *Trematoda* (Fluke-worms) — Char Body soft, rounded, or flattened, suctorial pores; male and female organs in the same individual

Order IV *Cestoidea* (Tape-worms) —Char : Body elongated, flatte [illegible] head either [illegible] (*bothria*), or [illegible] number, me [illegible] vidual

Order V *Cystica* (Hydatids) — Char Body flattened or rounded, continued posteriorly into a cyst, which is sometimes common to many individuals, head provided with two or four pits, or with four suckers, and with a circle of hooklets, or with four unarmed or uncinated tentacles, sexual organs hitherto indiscernible

The Entozoa which are included in the last four orders of Rudolphi have no distinct intestinal canal, and Cuvier considered the presence of this structure in the *Nematoidea* of Rudolphi of sufficient importance to form the character of a primary group, equivalent to all the remaining orders combined, and he observes that the orders thus d [illegible] naturally form two classes

The first order Cuvier terms *Cavitaires*, and he includes in it not only the Nematoid Entozoa, but also the genus *Pentastoma* of Rudolphi, and the Epizoa, or *Vers rigidules*, of Lamarck

The organization of the *Pentastomata*, which were defined, prior to Rudolphi, by Froelich, under the name of *Linguatula*, unquestionably entitles them to rank with the highest organized Entozoa (see *Zoological Trans*, vol i p 381 pl 41), but with respect to the Epizoa, or the external Lernæan parasites of fishes although they agree with the *Nematoidea* and all other Entozoa in the absence of distinct respiratory organs, yet the ciliated natatory extremities which they possess in the young state, and the external ovarian appendages of the adult are characters which raise them above the Entozoa, and indicate their intimate relations with the Siphonostomous Crustaceans

I have, therefore, combined the *Nematoidea* of Rudolphi with the genera *Linguatula*, *Porocephalus* and *Syngamus*, &c, which, under the habit of Cestoid or Trematode worms, mask a higher gr [illegible] to form a class under the name of [illegible] class already embraces the types of three different orders, of which one is formed by the *Nematoidea* of Rudolphi, and a second has been established by Diesing for the *Lin* [illegible] the name [illegible] of the genus *Syngamus* as described by Siebold clearly indicates the type of a third order of *Calelmintha* (See that word)

The four orders of intestinal worms which have no distinct intestine but in which the digestive function is carried on in blind canals, excavated in the parenchymatous substance of the body Cuvier combines into a group, which he terms *Vers intestinaux parenchymateux*, and for which I have proposed the name of *Sterelmintha* (See that word)

This group Cuvier subdivides into three families or orders, the first corresponding to the *Acanthocephala* of Rudolphi, the second to the *Trematoda* and the third being equivalent to the *Cestoidea* and *Cystica* combined with the exception of the genus *Ligula* of Bloch of which Cuvier makes a fourth order restricting to it the application of Rudolphi's term *Cestoidea* To this distinction it must be objected that the passage from the *Læniæ* to the *Ligulæ* is rendered very gradual by the traces of bothria and of generative organs which make their appearance in the higher-organized *Ligulæ* which infest the intestines of certain aquatic birds, and respecting which Rudolphi hazards the following ingenious hypothesis, viz, that these species are actually the more [illegible] developed into a higher grade of [illegible] the warmth and abundant nutriment which they enjoy in the intestines of the birds that have swallowed the fishes so infested To the conjunction of the hydatids with the tapeworms no sound objection can be made the structure of the *Tetrarhynchi* and *Anthocephali*, on the contrary shows how unnatural [illegible] Cestoidea the Cystic Entozoa [illegible] *ides* may be regarded as the point of transition, or of conjunction between the two groups The head in *Cœnurus* and *Echinococcus* presents the form and structure of that of *Tænia*, and the head of the *Tetrarhynchus*, the proboscis excepted, precisely resembles that of the *Echinococcus*, although the *Tetrarhynchi* neither inhabit a vesicle, nor terminate in a vesicle The *Cystica* appear, in fact, to be incomplete *Cestoidea* both consist at first of a simple cyst, like the *Acephalocyst*, but both proceed to develope therefrom a suctorious and uncinated head, from which the *Cestoidea* proceed to develope [illegible] annually shed and reproduced [illegible] worms, as at present known, form two classes, each divisible into three orders

Class I Cœlelmintha

Order 1 [illegible] *Filaria medinensis*, *Filaria oculi*, [illegible] *Ascaris lumbricoides*, *Ascaris vermicularis* *Trichocephalus dispar*, *Spiroptera hominis* *Strongylus gigas*, *Strongylus armatus*, *Trichina spiralis*

Order 2 *Acanthotheca* — Ex *Linguatula tænioides*

Order 3 *Syngamoidea* — Ex *Syngamus trachealis*.

Class II Sterelmintha

Order 1 *Acanthocephali* [illegible]

Order 2 *Trematoda* — Ex *Distoma* [illegible] *stoma pingue*, *Distoma hepaticum*

Order 3 *Tænioidea* — Ex [illegible] *solium*, *Cysticercus* [illegible]

The examples quoted are species which infest man, with the exception of those belonging to the orders *Acanthotheca*, *Syngamoidea*, and *Acanthocephala*, which have no representatives among the human internal parasites For the parts of the body which these latter infest, the

to Entozoa

[illegible] The convoluted membranous and muscular tube extending from the pylorus to the anus It is distinguished into small and large intestines the former including the *duodenum*, the *jejunum*, and the *ileum*, the latter the *cæcum colon*, and *rectum* The small intestines have internal membranous folds, called *valvulæ conniventes*, the large have three parallel muscular bands upon their surface The intestines admit of separation into three coats the external, membranous or peritonæal, the middle coat muscular, and the inner one villous They are attached to the body by the mesentery The structure of the intestinal canal in different animals is wonderfully adapted to its required functions, dependent upon the nature of their food and other circumstances Of these peculiarities the principal are diverted to under the titles of the animals in which they occur

INTONA'TION (Lat in, and tonus, *a tone*) In Music the act of sounding with the voice the consecutive notes of the scale, or in any other given intervals To do this correctly is the first qualification of a good singer It is scarcely practicable without the assistance of a good ear as well as a reference to some common standard such as the key or mode wherein a piece is written From the word *tone*, sometimes used in a sense almost identical with that of [illegible] The musical definition of the [illegible] of *Johnson's Dictionary* is "the accent of a syllable, or the [illegible] of an arch The exterior or upper curve is called the *extrados* See Arch

INTRE'NCHMENT In Fortification, any work that fortifies a post against the attack of an enemy It most usually denotes a ditch or trench with a rampart

I'NTROIT (Lat introitus, *entry*) In Ecclesiastical Antiquities the verses chaunted or repeated at the first entering of the congregation into the church, a custom as old as the fourth century called "ingressa" in the Ambrosian Ritual (*Palmer, Origines Liturgicæ*, ii 19)

INTRO'RSUS (Lat introrsum *inwards*) Turned inwards A term used in describing the direction of bodies to denote their being turned towards the axis to which they appertain, thus, in most plants the anthers are [illegible] towards the style

INTRU'SION (Lat intrudo, *I thrust upon*) In Law a species of injury to freehold property It arises when a stranger intrudes between the death of tenant for life or years and the entry of the heir of a remainderman or reversioner expectant on the estate for life or years who had died previous to the decease of such tenant for life or years Writ of intrusion lies only for a party who has the remainder or reversion in fee remainderman in tail has remedy by formedon *See* Fee-Tail, Formedon

INTUI'TION (Lat intueor, *I look into*) In Philosophy, any act of the mind by which a truth is *immediately* perceived, and as it were *beheld*, without any previous process of analysis or ratiocination Such, according to Kant, are the fundamental propositions of geometry, as, that "two straight lines cannot inclose a space," &c

INTUSSUSCE'PTION (Lat intus within and susceptio) In Anatomy a term [illegible] the folding or passing of one portion of intes [illegible] another

I'NULIN A white powder deposited by a decoction of the roots of the *Inula helenium* or elecampane In its chemical properties it appears intermediate between gum and starch

INU'NDATION (Lat in, and unde, *a wave*) In Agriculture, lands which are overflowed by water from natural causes uncontrolled by art, are said to be inundated when in consequence of the exercise of art and skill, the result is termed irrigation

INVALI'DS (Lat invalidus, *weak*) Those soldiers or sailors who, either on account of wounds or length of service, are admitted into hospitals, and there maintained at the public expense The practice of making provision for soldiers worn out or disabled in the public service dates

from high antiquity The liberality of Pisistratus to the Athenian soldiers is known to every scholar, and the history of ancient Rome is replete with instances of the veterans of the legions being rewarded with grants of land It must be admitted, however, that in ancient times such recompences had not their origin in that high philanthropic feeling by which the moderns are actuated in making provision for military and naval invalids, for they were granted only after victory and emanated more from individual power or favour than from any better established principles of benevolence In modern times there is no civilised country without institutions for the maintenance of invalids, but the most magnificent are, without question the Greenwich and Chelsea hospitals in England, and France the Hotel des Invalides

INVENTION (Lat invenire, *I find*) In the Fine Arts, the choice and production of such objects as are proper to enter into the composition of a work of art "Strictly speaking" says Sir Joshua Reynolds "invention is little more than a new combination of those images which have been previously gathered and deposited in the memory nothing can come of nothing he who has laid up no materials can produce no combinations" Though there be nothing new under the sun, yet novelty in art will be attainable till all the combinations of the same things are exhausted —a circumstance however never come to pass

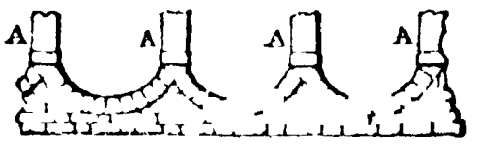
INVENTION OF THE CROSS A festival celebrated May 3d, in the Roman Catholic church in honour of the finding of the cross on which our Saviour was executed The search was instituted by order of St Helena, mother of the Emperor Constantine A D 326, and the discovery by St Cyril, was found among the ruins M

INVENTORY (Lat invenio *I find*) A catalogue of movables *See* EXECUTOR

INVERSE METHOD OF FLUXIONS The method of finding the *fluents* of given fluxional expressions It is the same with the integral calculus

INVERSE METHOD OF TANGENTS The method of finding tangents are lines drawn law or which fulfil some given condition For example, suppose rays of light issuing from a luminous point to fall on the concave surface of a sphere and to be thence reflected the problem may be proposed to determine the nature of the curve to which all the reflected rays in any given plane are tangents Problems of this kind require the application of the integral calculus and hence the method by which they are solved is called the *inverse* method of tangents as opposed to the *direct* method, viz that of finding the tangent to a curve which is performed by the differential calculus

INVERSE PROPORTION, in Algebra and Arithmetic is the application of the rule of three or proportion in a reverse or contrary order This is usually described by saying that less requires more or more requires less Thus, the question 'if 20 men cut down 3 acres of corn in a given time how many men will be required to cut down 6 acres in the same time?' belongs to the direct rule the quantity of work done being directly proportional to the number of men employed, but the question "if 20 men do a piece of work in 6 days in what time will 40 men perform the same?" is one of inverse proportion for more men will do the work in less time or the number of men required is inversely as the time The question may be stated in this manner, $\frac{1}{20}$ $\frac{1}{40}$ 6, and the answer is 3



INVERSE RATIO The ratio of the reciprocals of two numbers *See* INVERSE PROPORTION

INVERSION (Lat) In Rhetoric and Philology the transposition of words out of their natural order Every language has a customary arrangement of its own to regulate the order of succession in which words forming part of the same sentence member, or proposition follow each other On the other hand, there is undoubtedly a natural or philosophical order of words following each other in the same analytical succession in which ideas present themselves to the mind varied occasionally by that produced by the succession of sentiments or emotions, and as in every language many customary phrases, if not the general arrangement of the words, are contrary to this primitive order every language has customary inversions of its own Deviations from the *customary* order of words are more commonly called transpositions, but each word has, of course, a relative and somewhat arbitrary signification As an instance of ordinary inversion, it may be observed that, according to the metaphysical or analytical order, the subject of a proposition precedes the predicate, being the first idea which presents itself to the mind Thus in the construction of a sentence expressing a proposition (*see* LOGIC) 'Alexander reigns,' we have the subject of nature But when a substantive and adjective in connection form part of a sentence, i e a subject or predicate, or a part of either, the substantive is that which seems naturally to present itself first to the mind, whereas in most modern languages it follows the adjective, while in the Greek and Latin its ordinary although not its necessary place was before it "Who is a wise man?"—"Vir bonus est quis?" "The end of a long silence"—"Finis silentii diuturni" It is in general to be observed, that modern languages admit far less readily than ancient of transposition, but there are considerable differences in this respect between modern languages themselves German admits much latitude, French very little In our own language we are frequently able to vary the analytical order by following what may be termed the order of emotion, where a French writer could not do so thus in the proposition 'Great is Diana of the Ephesians,' it would be impossible in French to give the force which is added to the expression by the transposition of the predicate to the beginning without violating the habitual rules of construction A similar instance of inversion is to be found in the Swedish and some kindred languages, in which the article follows instead of preceding the noun

INVERSION In Music, the change of place between two notes of an interval, that is placing the lower note an octave the higher note an octave lower

INVERTEBRATA *Invertebrata* (Lat in priv, vertebra *a joint of the back bone*) The animals which are devoid of vertebræ or an internal bony skeleton, and which include the Molluscous Articulate Nematoneurous and Acrite sub kingdoms Lamarck's primary division of the animal kingdom into *Vertebrata* and *Invertebrata* corresponds with that proposed by Aristotle into *Enaima* and *Anaima* It is however subject to the same objection as applies to most of the Dichotomous systems in Zoology viz that the two members of the division are not equivalent to each other The *Invertebrata* for example contain three if not four primary divisions of the animal kingdom, each of which are equivalent to the *Vertebrata*

INVERTED ARCH In Architecture one wherein the lowest stone or brick is the key stone It is used in foundations to distribute the weight of particular points, such as A A A, over the whole extent of the foundation, and hence its employment is frequently of the first importance in constructive architecture

INVESTITURE In Feudal Law the delivery of a fief by a lord to his vassal accompanied by peculiar ceremonies (See FEUDAL SYSTEM) The investiture of a bishop was properly speaking his endowment with the fiefs and temporalties of the see Hence it became a subject of contest between the popes and emperors and one of the principal grounds of the great quarrel of Guelfs and Ghibellines It was conceded by the emperors to the Roman see in 1122, but the question was ended by a substantial compromise which left the nomination in reality in the hands of the temporal prince in European monarchies under the Roman Catholic religion (See *Hallam's Middle Ages*, *Raumer's History of the Hohenstauffen*, *Gieseler's Text Book of Ecclesiastical History*, vol ii *Mosheim's Eccl History*)

INVOCATION (Lat invoco *I call upon*), in Literature signifies in a general sense an address at the commencement of a poem preferred to the Muses or some other Being supposed capable of giving inspiration Thus while the ancient poets generally addressed their invocations to some particular muse or deity Milton invokes the Heavenly Muse 'and the Holy Spirit,' and in his *Henriade* Voltaire calls to his aid 'auguste Verité' For the chief rules of poetical invocation see the *Dict de Richelet* and the *Dict de la Conversation*

INVOCATION OF SAINTS In Theology According to Protestant writers the veneration of saints and martyrs increased rapidly throughout the 4th century, but their *invocation* as intercessors with the Divinity did not generally commence much before the 5th (See *Mosheim*, ii 32 102 ed 1826, transl, *Gieseler* i 283 transl) The followers of Origen are said to have been the first "who apostrophised the martyrs in their sermons, and besought their intercession" Prayers *for* the saints among other departed spirits were discontinued about the 5th century on the principle laid down by Saint Augustine, "Injuria est pro martyre orare, cujus nos debemus orationibus commendari" *See* MARTYRS, SAINTS

INVOICE A list or account of goods or merchandise sent by merchants to their correspondents at home or abroad, in which the peculiar marks of each package, with their value, customs, provision, charges, and other particulars are set forth (See *Com Dict*)

INVOLUCE'LLUM (Lat) In Botany, a secondary involucrum surrounding one of the florets of a umbelliferous flower, or the florets of a capitulum

INVOLU'CRUM (Lat) In Botany, a term having three significations —

1 A ring of bracts surrounding one or many flowers
2 In describing ferns to denote the superincumbent
3 I , to denote the cases of

INVOLUTE, in Geometry, is a curve co extremity of a string unwinding itself from the arc of another curve about which it has been lapped All curves, in which the curvature is neither infinitely great nor infinitely small, may be generated in this way by the evolution of a thread from another curve, which is called the *evolute* of the new curve *See* EVOLUTE

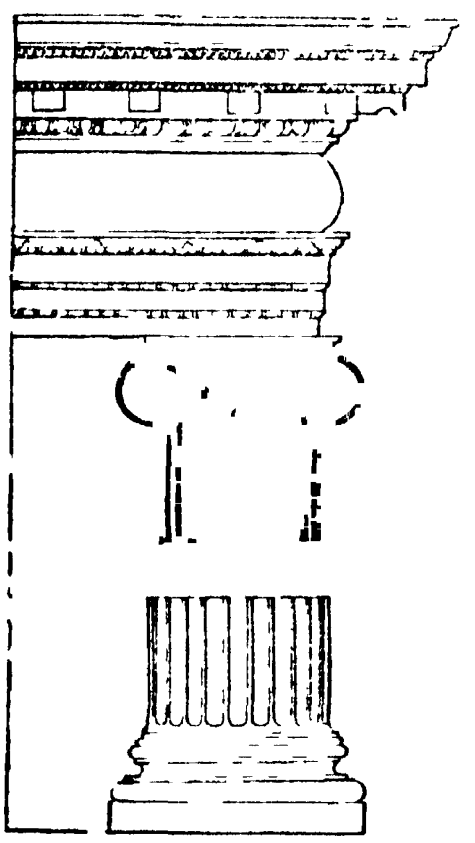
The method of generating curves by evolution is a geometrical theory inverted by Huygens, and given in his *Horologium Oscillatorium*, where he shows that the involute of a cycloid is another cycloid equal to the original one, and he applies this property to the practical purpose of causing a pendulum to vibrate in the arc of a cycloid, in which case, by another remarkable property of that curve, the vibrations are performed in equal times whether the arc of vibration be great or small

INVOLUTION, in Arithmetic and Algebra, is the method of finding any power of an assigned quantity, and is the reverse of *evolution*, which denotes the method of finding the root of any quantity, which is considered as a power of that root

The successive powers of any quantity are found by the continual multiplication of the quantity itself Thus, taking the number 5, we have

$5 = 5^1$ the first power or root
$5 \times 5 = 5^2$ or 25, the second power or square,
$5 \times 5 \times 5 = 5^3$ or 125, the third power or cube

and so on, whence we see that the number of multiplications required to raise a number to any power is one less than the number of the index by which the power is expressed



In algebra, simple quantities are involved by multiplying the exponents of the symbols by the index of the power required and raising the coefficients to the same power Thus the cube or third power of $2a^2x$ is $8a^6x^3$ Compound quantities are involved in the same manner as numbers by a continual multiplication of the quantity itself or more generally and expeditiously by means of the binomial theorem

IODINE (Gr ἰώδης, *violet coloured*) A substance discovered in 1812 by M Courtois of Paris In this country it is usually prepared from kelp which is lixiviated with water, and when the crystallizable salts have been separated the mother liquors are mixed with sulphuric acid and black oxide of manganese On the application of heat the iodine rises in the form of a dense violet coloured vapour which by condensation forms steel-grey crystals looking like micaceous iron The specific gravity of iodine is between 4 and 5 when dry it fuses at 227°, and boils and evaporates in purple fumes at 345° When heated with water it distils over at temperatures below 212° The specific gravity of its vapour is about 8 7, so that 100 cubic inches would weigh nearly 270 grams Iodine belongs to the electro-negative supporters of combustion It has an acrid taste, and a peculiar odour somewhat like that of chlorine It is an irritant poison, but in small doses and cautiously administered it has occasionally been of great service in certain forms of glandular disease It is very sparingly soluble in water of which it requires 7000 parts for its solution, the colour of the solution is brown it dissolves copiously in alcohol and in ether, and forms dark brown liquids It possesses strong powers of combination, forming with the metals a class of compounds called *iodides*, with oxygen it forms the *iodic acid*, and perhaps one or more oxides Combined with hydrogen it forms the *hydriodic acid* Its equivalent number is 126, and that of the hydriodic acid 127 Starch is a characteristic test of the presence of free iodine, forming with it a compound of a deep blue colour It is so delicate that a solution of starch dropped into water containing less than a 400,000th part of iodine is tinged blue by it, but the solutions must be cold, for the blue compound is soluble in hot water The great consumption of iodine is in medicine, it is employed in its pure state, and in the form of *iodide of potassium*, which is obtained by dissolving iodine in a solution of pure potash, evaporating to dryness, and fusing the residue

of potash
of a violet
it occurs crystallized, and in

IONIC DIALECT the most euphonious of the the Greek language, was spoken by the inhabitants of the Ionian Islands, and in their colonial possessions in Asia Minor It was originally the same as the Attic dialect, at least they boasted of a common origin, but from the extensive commercial intercourse of the Ionians with the eastern nations, their language gradually imbibed a portion of Asiatic effeminacy which at length became its chief characteristic, forming a striking contrast to that combination of strength and harmony which distinguished the dialect of Attica The chief writers in the Ionic dialect are Herodotus, Hippocrates, and Galen but it is in the writings of the first that to be found

IONIC ORDER of the five orders of architecture, whose distinguishing feature is the volute of its capital In the Grecian Ionic the volutes appear the same in the front and rear be connected on the flanks by a introduced The Romans gave their volutes, and curved the sides of the abacus The Greek volute continues the fillet of the spiral along the face of the abacus, whereas in the Roman its origin is behind the ovolo In some Grecian specimens a neck is added below the echinus, sculptured with flowers and leaves The height of the column is about nine diameters and the base varies considerably in different examples When a pedestal is used it is somewhat higher and more ornamented than the Doric pedestal The Greeks usually made the entablature of this order very simple The architrave has two fasciæ, the frieze plain, and the cornice of few subdivisions, but the modern Ionic is seldom with less than three fasciæ, the frieze is often cushioned, and the cornice is deeper and not unfrequently modillioned its profile being much varied The dentil is also much used in the bed mouldings The shaft is cut with twenty-four flutes separated by fillets Some of the most

celebrated examples of the order are the temple on the Ilyssus of Minerva Polias at Athens and Priene, Bacchus at Teos Apollo Didymæus at Miletus, Fortuna Virilis and the Coliseum at Rome The profile above given is after Palladio

IONIC PHILOSOPHERS The earliest among the Greek schools of philosophy Speculation arose in Greece as elsewhere in the attempt to discover the laws of outward phenomena, and the origin and successive stages of the world's development Such an attempt, it is needless to say, must at first have been extremely rude To the student of philosophical literature, however, no such undertaking however unsuccessful can possibly be otherwise than interesting, and in this instance in particular we are able to discover manifest traces of that liveliness of thought and systematic spirit which distinguish the later Greek speculations The fathers of the Ionic school were Thales and his disciple Anaximenes They were succeeded in the same line of thought by Diogenes of Apollonia and Heraclitus of Ephesus The characteristical mark which distinguishes the speculations of these thinkers is the endeavour to refer all sensible things to one original principle in nature The two first named were satisfied with a very simple solution of the problem Water with the one, and air with the other were made the original materials out of which all things arose, and into which they were finally resolved In their successors the germs of a more philosophical doctrine are apparent They retain, indeed, the simplicity of an original element, but the *air* of Diogenes and the *fire* of Heraclitus are apparently only sensible symbols which they used only in order to present more vividly to the imagination the energy of the one vital principle which is the ground of all outward appearances It philosophers as on between objective and subjective, between a *law* operating in the universe and the corresponding apprehension of that law by reason, however obvious it may seem at the present day, seems to have required the deep meditation of numerous powerful thinkers to bring it into clear consciousness

That the two things were confounded by Heraclitus is evident from his attributing to this universal fire the attributes of a universal reason — the source at once of the order in the world, and of the insight into that order possessed by man Notwithstanding this confusion, the discovery is due to him of the important truth, that "reason is common to all men"—that the ultimate principles of science derive their validity from their univer-

sality, a truth the value of which is not diminished by our finding it combined with the physical hypothesis to which we have alluded

T[illegible] the result of the spontaneous [illegible] ble or power, and all sensible things as modifications of this principle, real only in reference to their ultimate ground But we meet also with a class of thinkers in whom the contrary tendency prevailed Anaximander (B C 590) and Anaxagoras, the master of Pericles, agree in this respect, that they consider the world to be made up of numberless small particles, of different kinds and of various shapes, by the change in whose relative position all phenomena are to be accounted for This hypothesis is combined by Anaxagoras with a Supreme Reason, the author of all that is regular and harmonious in the disposition of these elementary atoms Anaxagoras may indeed be considered as the first philosopher who clearly and broadly stated the leading distinctions between mind and matter For a statement at once luminous and accurate of the leading peculiarities of this philosopher's doctrines and those of his predecessors, the reader is referred to Bishop Thirlwall's admirable *History of Greece* vol ii chap 12 The student who wishes for more minute information may consult Brandis and Ritter's Histories of Philosophy of the latter of which a translation has appeared at Oxford (See especially book iii) See also a collection of the Fragments of Heraclitus in *Wolf and Buttmann's Museum of Antiquities*, Bd I stck 3, and the *Memoires de l'Acad des Inscript* vol xvii

IPECACUANHA The root of the *Cephaelis ipecacuanha* This important article of the *Materia Medica* is the produce of South America, it is in short wrinkled pieces, covered with a grey or brownish grey epidermis and having a central woody fibre surrounded by a pale grey cortical part in which its virtue resides It has a nauseous odour and a repulsive bitterish taste It is difficultly reducible to powder and the dust which it throws off whilst under the process of pulverization is apt to excite great irritation of the respiratory organs From fifteen to twenty grains of powdered ipecacuanha root taken in an ounce of water is one of the safest and surest *emetics*, in doses of from one to three or four grains it is a *nauseant*, and in smaller doses, repeated every four or six hours, as from a fourth of a grain to a grain, it is expectorant and diaphoretic It contains from twelve to sixteen *per cent* of *emetin* to which its medical activity is referable When long boiled with water its emetic power is diminished but the decoction is aperient There are several varieties of ipecacuanha some of which arise from modifications of soil and climate [illegible] to be the roots of distinct plants

IRIDACEÆ (Iris, one of the genera) A natural order of herbaceous Endogens inhabiting the Cape and some other places It differs from *Amaryllidaceæ* essentially in being triandrous with the anthers turned outwards, from *Orchidaceæ* in not being [illegible] from *Zingiberaceæ* [illegible] remarkable for their beautiful flowers than for their utility The substance called saffron is the dried stigmata of the *Crocus sativus* The various species of *Iris*, *Ixia*, *Gladiolus* *Ixgridia* *Crocus*, &c, are among the favourite flowers of the gardener

IRIDIUM (Lat iris, *the rainbow* in consequence of the variety of colours exhibited by its solutions) A metal discovered by Dr Wollaston, associated with the ore of platinum It is grey, brittle very infusible and its specific gravity is about 18 6 It forms several oxides and chlorides, and combines readily with carbon

IRIS (Gr Ἶρις) In Grecian Mythology the personification of the rainbow She also performed the duties of a messenger to Jupiter and Juno

IRIS A name for the rainbow *See* RAINBOW

IRIS In Anatomy, the anterior part of the *choroid* coat of the eye, with its central perforation called the *pupil*, the posterior part or back of the iris is called the *uvea* The term iris is applied to that part of the eye on account of its various colours *See* EYE

IRITIS Inflammation of the iris of the eye

IRON A metal known from remotest antiquity of a peculiar grey colour, and possessing when polished much lustre It is not very malleable, but extremely ductile, and very tenacious At common temperatures it is hard and unyielding, but at a red heat it is soft and pliable and at a high red heat it may be united to another piece equally heated by hammering them together this process is called *welding* The specific gravity of pure iron is about 7 7 Its texture is fibrous, it is very difficult of fusion, requiring for that purpose the highest temperature of a wind furnace It is attracted by the magnet, and is itself susceptible of being rendered magnetic, a property possessed by no other metal except nickel Another remarkable circumstance in the history of iron is, that it has only hitherto been found *native* (that is, in its pure metallic state), in stones and [illegible]ly of *meteoric origin*, for the accounts [illegible] of native iron are doubtful In combination with oxygen and with sulphur, and occasionally with other substances, it is very abundant in the mineral world, and is found in small quantities in many animal and vegetable substances Those minerals which contain iron so combined as to be employed as sources of the metal for the purposes of the arts and manufactures are more exclusively termed the *ores of iron*, and among them the different *oxides of iron*, and the *carbonate* either pure or in combination with various [illegible] the *clay ironstone* of our coal d[illegible] most important The red oxide, and the black oxide (ferrosoferric oxide of Berzelius), are also valuable ores The finest Swedish iron is chiefly procured from the purer oxides, and especially from the native black oxide or *magnetic iron ore* and is reduced by charcoal, in this country clay ironstone is chiefly resorted to, and it is reduced by coke

There are two kinds of iron, known in commerce under the names [illegible] There are also two principal [illegible] distinguished by the terms *white* and *grey* The first is very hard and brittle, and when broken of a radiated texture grey iron is softer and less brittle and may be bored and turned in the lathe The varieties of cast iron are also very different in their chemical composition, some much purer than others they often contain traces of sulphur, phosphorus silicium, calcium manganese, and always more or less oxide of iron and carbon The purer kinds of cast iron which are chiefly carburets of iron may be converted into malleable iron by heating them surrounded by pure oxide of iron by which the carbon is gradually extracted in the form of carbonic oxide it is thus that horse shoes, and other articles such even as knives scissors snuffers, &c are fashioned by casting and afterwards purified by the curious process just noticed The cast iron manufactured in this country is converted into bar or malleable iron chiefly by a process called *puddling*, which consists in subjecting it to the continued action of heat in a reverberatory furnace where as soon as it melts it is stirred about till it gradually becomes less and less fusible and at length grows tough and pulverulent During this part of the process the mass heaves and emits a blue flame in consequence of the burning off of some of its impurities, the fire is then so far increased as to agglutinate the metal into a mass which intensely heated is transferred to a powerful rolling mill, as it passes successively through the rollers a large quantity of impurities, chiefly its earthy ingredients in combination with oxide of iron are squeezed out in the form of a fluid slag and the iron is extended into malleable bars, these are cut into pieces, placed in parcels or faggots in a very hot furnace and again hammered or rolled into bars, they thus become more tough flexible and malleable but much less fusible and may now be considered as nearly pure iron

When iron is heated red hot with the free access of air, it undergoes a slow combustion, that is it combines with the oxygen of the air and is converted into a black fusible substance, as is seen when a bar of white-hot iron is beaten upon the smith's anvil the scales which fly off in brilliant combustion producing the *black oxide of iron* When a thin piece of iron is introduced red hot into oxygen [illegible] becoming rapidly oxidized When this black oxide or when metallic iron is exposed to air and moisture or heated for a long time in contact of air, it becomes converted into a *brown oxide*, familiarly known as *rust of iron* When iron is acted upon by dilute sulphuric acid it decomposes the water of the acid and becomes converted into a *protoxide of iron*, which is taken up by the acid, and yields a green solution, from which, on evaporation, green crystals may be obtained of *protosulphate of iron*, commonly known as *green vitriol*

It appears from the analyses of these compounds that the number 28 may be assumed as the equivalent of iron, and that the protoxide (existing in green vitriol and in the protosalts of iron generally) is constituted of 1 atom of iron = 28 and 1 of oxygen = 8, and is consequently represented by the equivalent number 28 + 8 = 36, that the brown or red oxide, or peroxide of iron, consists of 28 iron and 12 oxygen, and is represented by the equivalent 40, and that many of the native oxides, and, generally speaking, the scales of iron are a definite combination of the above protoxide and peroxide containing 2 atoms of protoxide and 1 of peroxide

The most delicate tests [illegible] and [illegible] produces a purple or dark blue tint in liquids containing very minute proportions of iron, or a black precipitate where the metal is more abundant, and the ferrocyanate of potash, which produces Prussian blue under similar circumstances

Of the combinations of iron, *steel* is, perhaps, the most important It is formed by heating pure iron in contact

with charcoal, and is a compound of iron with a small
See STEEL
this valuable metal are too well known to require being pointed out, and no one can doubt that its discovery
thing else to facilitate
career of improvement "It accommodates itself," as Dr Ure has observed, "to all our wants, our desires, and even our caprices, it is equally serviceable to the arts, the sciences, to agriculture and war, the same ore fur-
and the bomb It is a medicine of much virtue, and the only metal friendly to the human frame The ores of iron are scattered over the crust of the globe with a beneficent profusion, proportioned to the utility of the metal, they are found under every latitude, every zone and in every mineral formation and they are disseminated in every soil But though iron is the most common of the metals, it is by far the most difficult to obtain in a state fit for use, and the discovery of the method of working it seems to have been posterior to the use of gold silver, and copper It would be vain to attempt to investigate the steps by which men were at first led to practise the processes required to fuse it and render it malleable, but that the invention of these curious arts is of a very early date is evident from the fact that Tubal Cain but a short time after the creation was "an instructor of every artifice in brass and iron" In most instances the profane historians of antiquity have either attributed the discovery of iron and its uses to their divinities, or they have deified those to whom they supposed they owed the blessings of so valuable a discovery

At what period iron began to be made in this country there is no means of ascertaining, but there is authentic evidence to show that iron works were established by the Romans in the Forest of Dean in Gloucestershire, and in other parts of the kingdom (*Pennant's Wales*, vol i p 89 ed 1810) They were also established at an early period in Kent and Sussex, but it was not till after the celebrated invention of Lord Dudley in 1619 by which pit coal was substituted for timber in the smelting of iron ore, that a great impetus was given to the working of this valuable mineral, an invention which though interrupted and clogged for a time by the devices of an ignorant rabble, at last established for itself a sure footing both in this and in every other European country From 1740 (the period at which Lord Dudley's invention be
manufacture
we have no means of
duced, the subjoined
of the manufacture, and the unexampled rapidity of its growth during the last century In 1740, the quantity amounted, in England and Wales only to 17 000 tons, in 1750, to 22 000, in 1788, to 68 000 in 1796 to 125 00, in 1806 to 250,000, in 1820 to 400,000 in 1827 to 690,000, in 1840, to 1,000 000 and in 1850, to nearly 2 000,000 tons

IRON PYRITES *Yellow sulphuret of iron* A bisulphuret of iron, composed of 28 iron + 32 sulphur It is a very common and abundant ore of the metal, hitherto it has only been used for the production of sulphate of iron, or *green vitriol*, but attention has lately been turned to it as a source of sulphur

IRONY (Gr εἰρωνεία, from εἴρων, *a dissembler*) In Rhetoric, the quality of style and of sentiment which Aristotle designates by the term εἰρωνεία is somewhat different from that which bears the same title in modern phraseology, being, in fact only a subdivision of it Ironia in his sense of the word is an artful representation of qualities or things as less than they really are Thus, among the
of the human mind as given by him, the
who affectedly conceals or depreciates his own good qualities Quintilian gives to rhetorical irony a far more general sense terming it *dissimulatio* or the use of expressions contrary to the thoughts of the speaker He also distinguishes it into
where the
to a few words, a figure of thought where it extends to a whole passage or discourse The Socratic irony is em-
when one speaker affects to take the
for granted in order adroitly to lead him into self-contradiction or obvious absurdity In the ordinary sense, irony is a more delicate species of sarcasm, by which praises are bestowed where it is intended to convey the opposite sense of disapprobation, or assent is notified where the real object is to express dissent

IRRADIATION, in Physics and Astronomy, is the phenomenon of the apparent enlargement of an object strongly illuminated The impression produced by light on the retina appears to be extended, though to an extremely small distance, round the focus of the rays concentrated by the lenses of the eye Hence the image of a star is never a point, but a disc having a sensible diameter, and larger in proportion as the light is more intense, and hence also the luminous part of the moon at her first quarter appears larger than the other This effect which is termed *irradiation*, results evidently from
the organ of vision

In Arithmetic and Algebra, a term or quantities of which the roots are incommensurable with unity, and therefore cannot be accurately extracted Thus, the root $\sqrt{2}$ is irrational, because it cannot be expressed by any finite number If the side of a square = 1, then $\sqrt{2}$ is its diagonal, and it is proved by elementary geometry that the diagonal of a square is incommensurable with its side Irrational quantities are also called *surds*

IRREDUCIBLE CASE In Algebra is that particular case of the solution of a cubic equation in which Cardan's celebrated formula contains an imaginary expression, and therefore fails in its application This circumstance occasioned great embarrassment to the early analysts, and all the efforts of their successors to overcome the difficulty in a direct way have proved unsuccessful In order to show in what it consists, let the proposed cubic equation be $x^3 + ax + c = 0$, then, by Cardan's rule we have

$$x = \left(-\tfrac{1}{2}c + \sqrt{\tfrac{1}{27}a^3 + \tfrac{1}{4}c^2}\right)^{\frac{1}{3}} + \left(-\tfrac{1}{2}c - \sqrt{\tfrac{1}{27}a^3 + \tfrac{1}{4}c^2}\right)^{\frac{1}{3}}$$

Now if in this expression a is negative, and $\frac{1}{27}a^3$ is greater than $\frac{1}{4}c^2$, then $\frac{1}{27}a^3 + \frac{1}{4}c^2$ will be a negative quantity, and consequently the extraction of its square root will be impossible, or the expression $\sqrt{\frac{1}{27}a^3 + \frac{1}{4}c^2}$ will be imaginary But it is known from the theory of equations that every cubic equation must have at least one real root, and it is a circumstance not a little remarkable that those cubic equations in which this imaginary expression occurs have not only one real root, but have all the three roots real

It is possible to disengage the expression for the value of x from the imaginary quantities by expanding it by the binomial theorem, for the imaginary quantities, which will be the same in both the resulting series, will be positive in the one series and negative in the other, and therefore on adding the series together, they will be eliminated But the series which results from this addition will very rarely be convergent, consequently this method is of no use whatever Various indirect methods of finding the roots have been proposed, the following is one of the simplest —

Let $y^3 - qy = r$ be the proposed equation Find in the trigonometrical tables an arc a whose natural cosine is $3r\sqrt{3} - 2q\sqrt{q}$, then the three roots of the proposed equation are,

$$y = 2\sqrt{\tfrac{1}{3}q} \times \cos \tfrac{1}{3}a,$$
$$y = -2\sqrt{\tfrac{1}{3}q} \times \sin \tfrac{1}{3}(90^\circ - a),$$
$$y = -2\sqrt{\tfrac{1}{3}q} \times \sin \tfrac{1}{3}(90^\circ + a)$$

These formulæ apply whether r be positive or negative, but when r is negative, it is more convenient to choose the arc a such that its natural *sine* is $3r\sqrt{3} - 2q\sqrt{q}$, and the three roots are then

$$y = 2\sqrt{\tfrac{1}{3}q} \times \sin \tfrac{1}{3}a,$$
$$y = 2\sqrt{\tfrac{1}{3}q} \times \cos \tfrac{1}{3}(90^\circ + a),$$
$$y = -2\sqrt{\tfrac{1}{3}q} \times \cos \tfrac{1}{3}(90^\circ - a)$$

See the article "Algebra," by Professor Wallace, in the *Ency Britannica*

IRREGULAR CADENCE In Music, one which does not end upon the essential chord of the mode in which a piece is composed *See* CADENCE

IRRIGATION (Lat) The art of watering lands artificially and by means of surface drains or channels, as contr
and
appl
those of Italy Syria, India &c, irrigation is considered as essential to the production of large crops in every description of field and garden culture When any surface is to be irrigated the supply of water which is to be used for this purpose is conducted to the highest part of that surface and from thence it is led over it in open gutters, so as to run very slowly, and sink into the earth as it proceeds As in general no very great extent of surface can be irrigated at once, different parts of a field or farm are irrigated in succession, and in countries where this practice is universal, it often happens that one source of of supply is common to two or more
of which have it on alternate days
and Italy, abundant crops cannot be produced without irrigation Even the potatoe crop and madder are irrigated in the neighbourhood of Avignon, and in Tuscany wheat, maize beans, turnips and every other crop that can be sown in drills in the fields, is watered from artificial channels The practice is as old as human civilization, and some of the first machines which we read of in history are those for raising water from the Nile for irrigating the lands on its banks Water, in short, is to the agriculture of warm climates, what manure is to the

cultivator of temperate regions It is not [illegible] substitute for manure, but as in temperate [illegible] without manure would be of little use, so in [illegible] manure without water cannot be rendered fit for being tak[illegible]

I[illegible] M[illegible] (Fr *loin*) So called from its proximity to the loin It is one of the bones of [illegible] of the *os innominatum* in the

ISCHURIA (Gr *ισχω*, *I retain*, and *ουρον*, *the urine*) Retention of urine

ISINGLASS A very pure form of *gelatine* prepared from certain parts of the entrails of several fish The best is derived from the sturgeon, and is almost exclusively imported from Russia, twisted up in rolls or formed into cakes, which are afterwards torn into shreds or cut into fine shavings in this country Good isinglass should be free from smell and taste, and perfectly soluble in boiling water The name *isinglass* is evidently a corruption of the Ger *Hausingblase*, its correlative term, though it is commonly derived from *ice* and *glass*

ISIS One of the chief deities in the Egyptian Mythology It is difficult amidst the mass of contradictory assertions to ascertain the real origin and attributes of this divinity, for while the Egyptians themselves are said to have confined their worship chiefly to Isis and Osiris [illegible] eek and Latin writers though exceed[illegible] details, assert broadly that these two divinities included, under different names, the whole pagan mythology It would be futile in this place to trace the attempt of the Greeks to identify Isis with Io the daughter of Inachus, whom they represent to have been introduced into Egypt under the form of a cow and [illegible] By the E[illegible] [illegible] sister or sister-wife of Osiris, who concurred with her in the endeavour to polish and civilize their subjects to teach them agriculture, and several other necessary arts of life Among the higher and more philosophical theologians she was made the symbol of Pantheistic divinity see especially the remarkable passage at the end of the *Golden Ass* of Apuleius By the people she was worshipped as the goddess of fecundity, and in her honour an annual festival was instituted which lasted seven days The cow was sacred to her She was represented variously, though most usually as a woman with the horns of a cow, and sometimes with the lotus in her head and the sistrum in her hand Her priests were bound to observe perpetual chastity, but on her worship passing into foreign countries her rites became merely a cloak for sacerdotal licentiousness which at last reached such a pitch that they were prohibited at Rome, and Tiberius, in the ho[illegible] [illegible] for ever ordered the images of [illegible] into the river The worship of Isis, however was afterwards revived, and furnished an ample theme for the indignant pen of Juvenal The *Isiac Table* in the Turin Museum which was so long supposed by the learned to represent the mysteries of Isis, has been judged by Champollion to be the work of an uninitiated artist little acquainted with [illegible] probably of the age of Hadrian [illegible], *Plutarch's Treatise on Isis and Osiris*, &c &c, an Essay by De Montfaucon *Hist de l'Ac des Inscr* vol xvi, which contains a summary of the Grecian learning on the subject, *Mem de l Ac des Inscr* xxxiv, and *Quart Rev*, July 1840)

Isis (*Isidos proclamos*, a marine plant, like coral according to Pliny) The name of a genus of jointed coral in which the joints are composed of substance resembling horn

ISLAM, or ESLAM The religion of Mohammed The body of the faithful, and the countries wherein it is professed, are so termed by the Mohammedans The original word is said to signify *submission to God* All those who professed the true religion and the unity of God, before the arrival of Mohammed, are considered as [illegible] and privileges of Islamism [illegible], chief minister of religion in Turkey, bears the title of Sheikh-ul-Islam

ISLAND (Lat insula) A tract of land encompassed with water, whether of the sea, a river, or a lake, in contradistinction to the *continent* or *terra firma*

ISLANDS OF THE BLESSED (Insulæ Beatorum Fortunatæ Islands Νησοι Μακαρων) According to the Grecian Mythology the Happy Islands [illegible] lie westward in the ocean without [illegible] the virtuous were transported In the early mythology of the Greeks, the Islands of the Blessed, the Elysian fields, and the infernal regions, were generally confounded with each other *See* ELYSIUM

ISMAE'LIANS A Mohammedan sect, who derived their [illegible] of Ishmael, the se[illegible] [illegible] exclusion of Moussa, who was adopted by that saint They consequently rejected the claims of Moussa and the five subsequent Imams The Ismaelians formed a secret asso[illegible] [illegible] of the Christian era by Abdallah [illegible] originated the famous

[illegible] *Tales of Mohammedanism* [illegible] vol xvii, "Secret [illegible] shed in the *Library of Entertaining Knowledge* 1837,

ISOCHROMATIC (Gr *ισος*, *equal* and *χρωμα*, *colour* Having the same colour In certain experiments [illegible] forms, arranged in a certain order, each curve in the one series having one [illegible] both in form and colour in the other [illegible] lines which have the same tint are called *isochromatic* (See Herschel's [illegible] in the *Ency Metropolitana*)

ISOCHRONAL or ISOCHRONOUS (Gr *ισος*, and *χρονος*, *time*, *performed in equal times*) Two pendulums which vibrate in the same time are isochronal, or the vibrations of a pendulum in the curve of a cycloid are so being all performed in the same time, whether the arc be large or small *Isochronal lines* are those along which a heavy body descends with a uniform velocity

ISODOMUM (Gr *ισος* and *δομος*, *structure*) In Ancient Architecture, a species of walling in which all the courses were the same height

ISOLATED (Fr *isole*, from the Ital isola, Lat insula *an island*) In Electricity, a body is said to be isolated when it is surrounded by non conductors, or bodies to which it cannot communicate its electric virtue, except by induction Bodies may be isolated in various ways, by suspending them by means of silken cords, by placing them on a cake of wax resin, or sulphur, or on a stand of glass or dry varnished wood, &c

ISOMERISM (Gr *ισος*, and *μερος*, *part*) Compounds which contain the same elements in the same ratio and yet exhibit distinct chemical qualities are said to be *isomeric* The cyanic and fulminic acids are isomeric compounds of nitrogen oxygen and carbon The distinctions thus arising are probably referible to the different ways in which the same elementary atoms are [illegible] and

ISOMORPHISM (Gr *ισος* and *μορφη*, *form*) Substances which resemble each other in their crystalline forms but differ in their component parts are said to be *isomorphous* Thus the phosphate and biphosphate of soda have the same form, or are *isomorphous*, with the arseniate and biarseniate of soda, and in regard to other bases such as potash and ammonia, each arseniate has a [illegible] the same form In [illegible] nalogy in the atomic constitution of the compounds which are observed to possess the same number of equivalents of acid, alkali, and water of crystallization, and differ in nothing except that the one series contains an atom of arsenic, and the other an atom of phosphorus

ISOPERIMETRICAL FIGURES (Gr *ισος*, and *περιμετρον*, *circumference*) are such as have equal perimeters or circumferences The term isoperimetrical problems in modern analysis designates a very extensive and difficult class of problems, the solution of which re[illegible] [illegible] analysis The general [illegible] curves having the same length to determine that of which some assigned property is a maximum or a minimum, for example among all curves having the same perimeter to find that which has the greatest area This is the simplest question of the kind, and the curve to which the property belongs is proved by elementary geometry to be a circle

In all isoperimetrical problems there are two conditions to be fulfilled according to the first of which a certain property is to remain constant, or to belong to all individuals of the [illegible] and [illegible] to the second in their property is to [illegible] [illegible] possible In the problems of this kind which first attracted the particular attention of mathematicians, the constant quantity was the perimeter of a certain curve, and hence the origin of the term, which is now applied to all problems indifferently in which the question is to find curves having a property of maximum or minimum, with or without the condition of equality of perimeters

James Bernoulli was the first who discovered the true principles on which questions of this kind depend, and the circumstances which render the ordinary methods of [illegible] [illegible] applicable to them The immediate [illegible] [illegible] was the problem of the Brachystochrone (see the term), or curve of quickest descent, celebrated in the early history of the calculus on account of the controversy to which it gave rise between the two brothers, James and John Bernoulli The analysis of the former, *Analysis magni Problematis Isoperimetrici*, was published at Basle in 1701, and in the *Leipsic Acts* of the same year Solutions were afterwards given by Taylor in his *Methodus Incrementorum*, by John Bernoulli in the *Memoirs of the Academy of Sciences* for 1718, and by Euler in the *Petersburg Memoirs* Euler afterwards gave a complete and general solution of the problem in his *Methodus Invenidi Lineas Curvas Maximi Minimive proprietate gaudentes*, a work of which Lagrange has said that there is perhaps no other which can be of more use

to those who wish to exercise themselves in the integral calculus The method, however, which is followed in this work has been superseded by the invention of the *calculus of variations* by Lagrange, a most important branch of analysis, of which the subject of isoperimetrical problems is one of the [illegible] (Lagrange, *Leçons sur le C[illegible]*, Whitehouse, *On Isoperimetrical Problems*, Lacroix, *Traité du Calcul Différentiel et Intégral*, *Airy's Tracts*, &c)

ISOPODA (Gr *ισος*, and *πους*, *a foot*) The name of an order of C[illegible] comprehending those which have the legs [illegible], and adapted only for locomotion and prehension

ISOPO'DIFORM The larvæ of Saprophagous Hexapods are so called which have an oblong body, a distinct thoracic shield, and a vent provided with filaments or laminæ

ISOPYRE (Gr *ισος*, and *πυρ fire*) In Mineralogy a silicate of alumina, lime, and peroxide of iron found near the granite of St Just, near Penzance in Cornwall It is a black amorphous substance, occasionally variegated with grey or red spots or streaks, slightly translucent Its specific gravity is about 3

ISO'SCELES (Gr *ισος*, and *σκελος*, *leg*) In Geometry, an isosceles triangle is that which has two equal sides [illegible] properties of isosceles triangles one is [illegible] the base are equal, and is the de[illegible] f this proposition in *Euclid's* [illegible] the very commencement is somewhat intricate and puzzling to beginners the proposition has been called the *pons asinorum*

ISOSTE'MONOUS (Gr *ισος* and *στημων a stamen*), in Botany, in expressing the proportion that one part bears to another, denotes that the stamens are equal in number to the petals

ISOTHE'RMAL (Gr *ισος* and *θερμη heat*) In Physical Geography, *isothermal lines* are those which pass through those points on the surface of the earth at which the mean annual temperature is the same *Isothermal zones* are spaces on opposite sides of the equator having the same mean temperature, and bounded by corresponding isothermal lines On account of the irregular form and disposition of the continental masses, by which the climate of different places is greatly influenced, the isothermal curves are not parallel to the equator excepting in the very low latitudes According to Humboldt the isothermal line which corresponds to the temperature of 32° of Fahrenheit passes between Ulea in Lapland lat 66°, and Table Bay on the coast of Labrador, lat 51° The isothermal line of 41° passes near Stockholm lat 59½° and St George's Bay Newfoundland lat 48° The line of 50° passes through the Netherlands lat 51° and near Boston in the United States lat 42½° that of 59° between Rome and Florence lat 43° and Raleigh in North Carolina lat 36° In all these cases we see that the isothermal lines in passing from the western side of the continent of Europe to the eastern coast of America deviate very considerably towards the south, the deviation in one case, amounting to 11½° of latitude In passing over the American continent, they again recede to the northward and in California and to the north of that peninsula along the western side of the continent the annual temperature is nearly the same as under similar latitudes in the west of Europe From the western to the eastern side of the old continent, the flexure of the isothermal curves and the diminution of the mean annual temperature under the same parallels are not less conspicuous The isothermal line of 55° passes through Nantes lat 47° and Pekin lat 39½ Edinburgh and Kasan (in the east of Russia) have the same latitude, but the mean annual temperature of the former is 48° while that of the second is below 38° For the different causes which affect the parallelism of the isothermal lines, or which produce the differences of the mean annual temperature of places under the same parallel of latitude, see CLIMATE

Humboldt gives the name of *isotheral lines* (*ισος* and *θερος*, *summer*) to the curves passing through those places at which the mean summer heat is the same, and of *isochimenal* (*ισος*, and *χειμων winter*) to those which pass through the places at which the mean temperature of winter is the same The isotheral and isochimenal curves deviate much more from the parallels of latitude than the isothermal The latitudes of places having the same winter temperature sometimes differ so much as 18° or 20° The winter of Scotland is as mild as that of Milan The mean temperature of the winter months at Edinburgh is about 38½°, of Kasan, under the same parallel, only 2° The winter of Pekin is as rigorous as that of Stockholm (*Humboldt's Fragmens Asiatiques*, *Murray's* [illegible], Introduction)

ISSUANT In Heraldry a charge represented as issuing or coming up from another charge or bearing, also, a lion or other beast represented as rising from the bottom line of a chief

ISSUE In Law, in the most ordinary senses of the word,—1 The points in dispute in a suit at law between two parties, a certain number of which are termed the [illegible], as distinguished from [illegible], to be determined by the court, or in fact, to be ascertained by a jury In each form of action (*see* ACTION, PLEADING) there was formerly a formal traverse, by which the whole or principal part of the allegations of the plaintiff in his declaration might be denied this was termed the general issue Since the adoption of the new rules of pleading (1834) there is now properly speaking no general issue, except in certain cases, where the privilege of giving special matter in evidence under it is [illegible] technical mode of [illegible] imaginary wager [illegible] it is usual to put printed copies of the issues into the hands of t[illegible] 2 Heirs [illegible] ISSUE, [illegible] made by wounding or cutting the skin, and placing a pea upon it, which is pressed upon the part by a bandage

ISTHMIAN GAMES One of the four great national festivals of Greece, so called from their being celebrated on the Isthmus of Corinth They were common to all the states with the exception in this case of the Eleans, against whom a curse had been pronounced should they ever present themselves there They were held near a temple of Neptune, the god who presided over them, and were celebrated every third year, according to some accounts but others assign them a period of one or four years The contests were the same as in the other sacred games (*see* OLYMPIC GAMES) the victors were crowned with [illegible] leaves (See *Potter's Grecian Antiquities*, *Blackmuir's Historical Antiquities*, ii 162 translation)

ISTHMUS In Geography, a narrow neck of land joining two continents or a continent and peninsula Thus, the Isthmus of Darien joining North and South America, the Isthmus of Suez, connecting Africa with Asia

ITALIAN ARCHITECTURE *See* ARCHITECTURE

ITALIC SCHOOL OF PHILOSOPHY, comprehends properly the Pythagorean and Eleatic systems taken together, but sometimes it is used as synonymous merely with the school of Pythagoras Under the several heads will be found the chief features of these philosophical systems which comprising as they do all that can be said in reference to the Italic school, it would seem unnecessary in this place further to advert to The Italic school has been so designated because its founder, Pythagoras, taught in Italy, spreading his doctrine among the people of Tarentum, Metapontum, Heraclea, Naples, &c

ITCH A disease of the skin consisting in an eruption of minute itching vesicles, which are commonly rendered more inflamed and troublesome by scratching They generally make their first appearance between the fingers, or about the bend of the wrist and often spread to other parts of the body especially where cleanliness is neglected The itch is highly contagious, and is supposed to depend upon a minute insect burrowing in the skin, some have regarded the insect as a consequence, and not the cause, of the disease The itch is cured by sulphur, which should be given internally, and applied externally in the form of ointment

ITIHA'SAS The two great heroic poems of the Hindoos the *Ramayana* and *Maha Bharata*, are so called They are of great antiquity, later however, than the *Vedas* Some indeed have attributed the latter poem to a period later than that of Alexander

ITINERARY (Lat *iter a journey*) In Literature, [illegible] as, an Itinerary from Paris to Rome or of the principal places and stations on the great roads throughout a country, as Itinerary of France, Italy, &c The Latin Itineraries which have been preserved to us consist merely of catalogues of stations, and are principally valuable to us because they contain the distance, in Roman miles, from one to another, and thus furnish us with assistance towards determining the actual site of each place mentioned

ITIS This termination, added to the genitive case of the Greek name of an organ or part of the body, implies *inflammation* of that part, as, *gastritis* inflammation of the *stomach*, *pleuritis*, of the *pleura*, &c

ITTNERITE Named after Ittner A rare mineral, which occurs massive and in rhombic dodecaedrons, of a grey or bluish colour It consists chiefly of silica, alumina, and soda, together with some hydrosulphuret

IU'LUS (Lat) A genus of Myriapodous insects, characterized as follows —Antennæ with seven joints, slightly enlarged towards the end, mandibles two, thick, without palps, each divid[illegible] provided with imbricated [illegible] the confluence of two maxillæ, feet attached in double pairs to most of the joints, body long, cylindrical, capable of being contracted into a discoidal spire The common gally-worm (*Iulus terrestris*) is an example of this genus

IVORY The tusk of the male elephant. It is less

brittle than bone, and of a beautifully uniform texture, admitting of turning in the lathe and receiving a high polish It consists of about 24 per cent animal matter [illegible] e of carbonate of lime, and 1 per cent of carbonate of magnesia The principal use of ivory in England is in the manufacture of handles for knives, but it is also extensively used in the manufacture of musical and mathematical instruments, chess-men, billiard-balls, plates for miniatures, toys, &c Ivory articles are said to be manufactured to a greater extent, and with better success, at Dieppe than in any other place in Europe, but the preparation of this beautiful material is much better understood by the Chinese than by any other people No European artist has hitherto succeeded in cutting concentric balls after the manner of the Chinese, and their boxes, chess-men, and other ivory articles, are all far superior to any that are to be met with any where else

The west coast and eastern coasts of Africa, the Cape of Good Hope Colony, India, and the countries to the eastward of the Straits of Malacca, are the great marts whence supplies of ivory are derived, but the most esteemed come from Africa, being of a closer texture and less liable to turn yellow than those from the East Indies The medium weight of a tusk is about 60 lbs, and the average importation for the three years ending 1850 was 6000 cwt, yielding a duty of 1*l* per cwt

IVORY BLACK The mixture of charcoal and phosphate of lime obtained by burning bone is sold under this name, and, like other forms of animal charcoal, is very effective in depriving certain substances of their colour

JABI'RN The name of a Grallatorial or wading bird b[illegible]

JACAMA'R[illegible] [illegible]nsorial birds *See* GALBULA

JACA'NA The wading birds of the genus *Parra* are so called

JA'CCHUS (Gr ἰαχω, *I cry aloud*) A genus of Platyrrhine Quadrumana, or South American monkeys, with thumbs on the hind foot only, all the digits of the fore foot having the same direction, and being armed with narrow, curved, claw like nails The characters of the genus are,—upper middle incisors separated from and larger than the lateral ones, lower incisors elongated, narrow, and vertical, the lateral ones the longest, upper canine teeth conical, and of moderate size but more developed than the lower ones The species of *Jacchus* are [illegible] and not very clearly defined they are all [illegible] The *Jacchus penicillatus*, which is remarkable for the radiated tuft of white hairs which projects in front of each ear, has bred in captivity in this country It is a very delicate little animal, susceptible of cold, and provided with a long and bushy tail, which it wraps round its head and body when asleep or requiring warmth Its food is of a mixed nature, but in the wild state the banana is said to be its principal and favourite nutriment

JACK In Mechanics, an engine for raising heavy weights

Jack is also the name given to a machine in common use for turning a spit The common roasting jack, or worm-jack, consists of a double set of wheels, a barrel round which the chain attached to the weight or moving power is wound, a perpetual screw, and a fly which secures a steady uniform motion A multiplying wheel is usually added, in order that the weight may be longer in running down

The *smoke jack* is used for the same purpose as the common jack, and is so called because it appears to be moved by the smoke of the fire It is in fact moved by the ascending current of rarified air, which acts on a fan properly placed in the chimney The motion may be obtained by various contrivances Sometimes spiral [illegible] more [illegible] to the sails of a windmill

JACK, in Nautical language, is a flag or colours used in making signals In the British navy the Jack is a small union flag, composed of red and white crosses, in merchants' ships, this union is bordered by a red field

JACK A common name for the pike

JACK, in Botany, is the name of the *Tsjaca* or *Artocarpus integrifolia* a species of the bread [illegible] in the Indian Archipelago

JACKAL (Ar tschakkal Pers schagal) A wild species of dog, the *Canis aureus* of Linnæus, of gregarious habits, hunting in packs rarely attacking the larger quadrupeds, but supposed to indicate their presence to the lion by the piercing cries which the jackals set up in chorus while scenting the [illegible] feeding on the remnants of the lion's prey, on dead carcasses, and the smaller animals and poultry The jackal interbreeds with the common dog, its period of gestation is the same and the hybrid progeny is fertile The wild jackal emits a highly offensive odour [illegible] tible in the domesticated animal [illegible]

that the 300 animals, called foxes, between whose tails Samson is said to have put firebrands in order to destroy the crops of the Philistines, were jackals The *Canis aureus* is abundant in the warmer parts of India and A[illegible] the new world

JA[illegible] *corvus monedula*, Linn) A comm[illegible] frequents church steeples, old towers, and ruins, in flocks, where they build their nests [illegible] eggs, paler and smaller than [illegible] may be readily tamed, and taught to imitate the sounds of words Like other species of the crow genus, they have the singular habit [illegible] glittering and metallic substances [illegible] wedges used in coal mines

JACK SINKERS Parts of a stocking frame

JACK TIMBERS In Architecture, those in a bay of timbers which, being intercepted by some other piece, are shorter than the rest thus, in a hipped roof, each rafter which is shorter than the side rafters is called a [illegible]

JACOBINS In French History, a political club, which bore a well-known part in the first revolution It was first formed by some distinguished members of the First Assembly, particularly from Britanny, where revolutionary sentiments ran high They took at first the name of Friends of the Revolution, but as at the end of 1789 they held their meetings in the hall of a suppressed Jacobin monastery in the Rue Saint Honore, the name of Jacobins, at first familiarly given them, was finally assumed by themselves The history of the Jacobin club is in effect, the history of the Revolution It contained at one time more than 2500 members, and corresponded with more than 400 affiliated societies in France The club of the Cordeliers, formed by a small [illegible]

The Jacobin club, which had almost controlled the first assembly [illegible] itself divid[illegible] the name [illegible] given to that section which opposed the Girondists or less moderate in the club no less than in the assembly After the destruction of the latter under the Convention, the club was again exclusively governed by the more violent among its own members, until the downfal of Robespierre After that period it became unpopular, and its members having attempted an insurrection on behalf of the subdued Terrorists Nov 11 1794, the meeting was dispersed by force, and the club finally suppressed Some writers, such as Barruel (*Hist du Jacobinisme*), have seen in the first formation of this and similar societies the long-concocted operations of a conspiracy against [illegible]nt and religion throughout Europe [illegible] the other principal clubs of the Revolution adopted all the forms of a legislative assembly In the constitution of 1792, their legal existence was recognized See the historians of the French Revolution, especially Carlyle, Mignet, and Thiers for general views, Messrs Buchez et Roux, *Histoire Parlementaire de la Rev Française*, for the most complete series of details respecting the Jacobins and their meetings which has yet been made public

JACOBINS In Ecclesiastical History the religious of the order of St Dominic were so called in France, from the situation of the principal convent at Paris, near the Rue St Jacques, also called *Frères Prêcheurs*

JA'COBITES In English History, that party which, after the Revolution of [illegible] adhered to the dethroned monarch James II and afterwards to his descendants In Scotland and Ireland where the revolution was not effected except with the assistance of arms, the Jacobite party formed one of the two great divisions of each nation, and although crushed in the latter country by conquest, they continued in the former to comprise a large proportion of the population until long after the last rebellion in 1745 But in England the revolution was effected at first with the consent of all parties, the adherents to the exiled monarch were silenced yet, in a year or two, the Jacobite faction rose into strength, and continued to harass the government of William throughout his reign "It seems undeniable," says Hallam (*Constitutional Hist of Eng* vol iii p 149), "that the strength of the Jacobite party sprung from the want of apparent necessity for the change of government" Its immediate cause however, was to be found in the refusal of a portion of the bishops and clergy to take the oaths to the new government (*see* NONJURORS), which gave, as it were, a certain consistency and tangible ground of opposition to the [illegible] of the dethroned monarch [illegible] At the same time many of William's chief advisers and officers maintained a secret correspondence with James II at the French court, less from any attachment to his cause than with a view to secure their own [illegible] rn After the death of James [illegible] of Anne in England, the efforts of the party languished for

a time; but towards the close of her reign they revived on the [illegible] We have now [illegible] hives, of a fact which had been long suspected, that Bolingbroke and Oxford, with others of Anne's Tory ministers, were in treaty with the son of James II, and either really or in pretence negotiating for his return In 1715, on the arrival of George I, [illegible] first rebellion in Scotland [illegible] proved a [illegible] to t [illegible] B [illegible] the [illegible] ished in 1722 after which time it is probable that no extensive conspiracy took place on their part In Scotland, however, the party maintained its strength unabated, [illegible] of 1745, by its complete failure [illegible] existence It is said t' [illegible] ence with [illegible] The Cardinal of York, his brother, died in 1807, and it has been said that, by his death, the adhesion of the Jacobites, if any existed, was transferred to the reigning family as his next heirs T' [illegible] error, the royal house of Sard [illegible] intervening between the house of Brunswick and the crown of England, according to the strict rules of hereditary descent

JACOBITES In Ecclesiastical History, the monophysite Christians of Syria are so called from Jacob Baradzi, who revived their belief and form of worship in that country and Mesopotamia in the middle of the 6th century Many unsuccessful attempts have been made at various times to unite them with the church of Rome (*Gieseler's Text Book*, Transl, ii 419, iii 414, &c) *See* MONOPHYSITES EUTYCHIANS

JA'COB'S LADDER In Naval affairs, a rope ladder with wooden steps or spokes

JACOB'S STAFF The same as *cross-staff* An instrument used by surveyors in measuring heights and distances where expedition and little accuracy are required

JACQUA'RD A piece of mechanism applicable to silk and muslin looms for the purpose of weaving figured goods The name is that of its inventor (For a description of the loom, see *Ure's Dictionary of Arts and Manufactures*)

JA'CQUERIE [illegible] 1356 *Jacques Bonhomme* was a term of [illegible] applied by the nobles to the peasants, from which this insurrection took its name It began in the Beauvoisis under a chief of the name of Caillet, and desolated Picardy, Artois and Brie where savage reprisals were executed against the nobility for their oppressions It was suppressed after some weeks by the dauphin and Charles the Bad king of Navarre A similar spirit in England produced not many years afterwards the rebellion of Wat Tyler (See Mezeray, iii 838, Froissart, Sismondi, *Hist des Français*, vol x)

JADE In Mineralogy, a synonyme of *nephrite*

JAGUA'R (*Felis onca*, Linn) The largest and most formidable feline quadruped of the new world It is marked with large dark spots in the form of circles, with a dark spot or pupil in the centre of each, it is generally pretty numerous in the neighbourhood of the large rivers where the capibara abounds, and preys chiefly on those large Rodents

JA'LAP So called from Xalapa in Mexico, whence it originally came The dried root of the *Ipomæa jalapa* This root occurs in irregular globular pieces of a dense and resinous texture when reduced to powder it has a very peculiar and nauseous odour and taste In doses of from five to twenty grains, jalap is a drastic purge it is apt to gripe and nauseate

JAMB A Sea term, to squeeze tight The opposite of jamb applied to a rope, is *to render*

JAMBS (Fr jambes) In Architecture, the side or vertical pieces of any opening in a wall which bear the piece that discharges the superincumbent weight of such wall

JA'MESONITE A mineral named after Professor Jameson It occurs crystallized and massive it consists [illegible]

JAMES SAINT [illegible] SWORD, ORDER OF [illegible] der in Spain and Portugal The reigning kings are grand-masters in those countries respectively The orders in the two countries were disunited in 1288

JANISSARIES or JA'NIZARIES (A corruption of [illegible] *yeni tscheri* new troops) A celebrated militia of the Ottoman empire The establishment of this corps has been usually attributed to Sultan Amurath I in 1368, but the researches of Hammer (*History of the Ottoman Empire*, vol i p 92) carry it back to Orchan, the conqueror of Nicæa (1326) This new corps was blessed by a saint of that time, Hadji Bektash by name, who cut off a sleeve of his fur mantle and gave it them as a token whence [illegible] that remained their distinguishing [illegible] irregular infantry long remained [illegible] strength of the empire, and formed [illegible] public within its limits It was long supplied chiefly by the capture of young Christian slaves, and when under Mohammed IV it began to be recruited principally from the children of the soldiers themselves its power and importance gave signs of decay Each regiment or oda of the Janizaries had its own soup kettle, which, in process of time, acquired a sort of prescriptive sanctity, and formed, as it were, the chief standard of the regiment, and the officers and other military functionaries drew their titles from their various supposed employments as cooks or kitchen servants The militia of the Janizaries continued to retain a great influence in the empire itself long after it had ceased to be serviceable in the field against the armies of modern Europe They controlled the sultans themselves, and, as it is alleged, presented a serious obstacle to all improvement, until in the year 1826 the late sultan, on the occasion of a mutiny dissolved the whole corps, after a bloody struggle in his capital in which 20,000 of them were said to have perished, but the number is now thought to have been exaggerated There was an official publication relating to the destruction of the Janizaries which was translated into French (Paris, 1833) See also *Walsh's Residence at Constantinople*, *Duval, Deux Années a Const* (1828), *Quarterly Review*, vol xli, and *Ed Rev* vol l, *Slade's Travels in Germany, &c* (1840)

JANSENISTS A denomination of Roman Catholics in France, who followed the opinions of Jansen, bishop of Ypres and formed a considerable party in the latter half of the 17th century The Jansenists were Calvinistic in many of their sentiments, and in several respects approximated to the Reformed opinions They did not, however separate themselves from the Catholic church, nor did they long survive the decree of Alexander VII, by which certain propositions extracted from their writings are condemned as heretical The Jansenists are chiefly celebrated for the contest they maintained with the Jesuists, by whom they were at last overcome, and subjected to the enmity both of Louis XIV and the Pope (See Leclerc *Bibl Univ* vol xiv, Racine *Histoire du Port Royal*, Fontaine, *Mémoires pour servir à l'Hist du P R*, *Saint Simon's Memoirs*, Palmer, *Essays on the Church*, i 320 &c, *Hallam on the Literature of Europe* vol iii, Schrokh, *Kirchengeschichte, seit der Reformation*, parts iv and vii, *Mosheim*, translation ed 1790, vol v 208 &c)

JANTHI'NA (Gr ἰανθος, *violet colour*) A genus of Gastropodous Testaceous Mollusks, so denominated on account of the beautiful violet colour of the shell There are but a few species [illegible] known all of which are marine and are [illegible] floating on the surface of the ocean in warm and tropical latitudes The shell as in all floating pelagic Testacea, is light and fragile, whence the specific name of the most common species (*Janthina fragilis*), but besides this relation of the shell to the habits and sphere of existence of the animal, each species also possesses a peculiar organ, by which it can as it were suspend itself to the surface of the water, and which has not hitherto been observed in any other molluscous species this organ consists of a congeries of transparent vesicles filled with air, the parietes of the bubble-like cells being composed of a thin colourless condensed mucus and the whole being attached to the posterior part of the foot On account of this place of attachment the vesicular float has been regarded as the analogue of the operculum which otherwise is wanting, but there is an important difference connected with the float viz the power which the animal [illegible] to sink they are also made subservient to the reproductive economy of the janthina, which attaches its egg-cells to the under surface of the float, and when it is thus laden casts it off By this means the ova are preserved in a situation where they may best receive the full influence of heat and light, and the power which the parent possesses of reproducing its float obviates the inconvenience which would otherwise result from this contribution to the well-being of its offspring The following is the process by which the janthina has been observed to repair a mutilation purposely made in its float —The foot was advanced upon the remaining vesicles until about two thirds of that part rose above the surface of the water, it was then expanded to the uttermost, and thrown back upon the water like the foot of a Lymnea when it be[illegible] edges, and [illegible] a globule o[illegible] of the flo[illegible] throughout the foot, and when it was again thrown back to renew the process the globule was found inclosed in its newly made envelope From this it results that the membrane inclosing the cells is secreted by the foot, and

that there is no attachment between the float and the animal other than that arising from the nice adaptation

[illegible] Pectinibranchiate [illegible] is capacious, and contains two pectinated gills Cuvier places the genus [illegible] *Pyrimidella* and *Nerita*, M Rouxe [illegible] *Immutata* and *Turgida*

JA'NUARY [illegible] the first month of the year Rome the name is derived from Janus, a Roman divinity, by others from janua, *a gate* The months of January and February were inserted in the Roman year by Numa Pompilius The Roman feast of the kalends of January seems to have been converted in the 6th century into the Christian festival of the circumcision (Beugnot, *Destr du Paganisme en Occident* vol ii)

JA'NUS [illegible] He was represented with two heads [illegible] and holding a key in one hand and a staff in the other He presided over the commencement of all undertakings, whence the first month in the year was named after him His temple at Rome was kept open in the time of war, and shut in peace The warlike disposition of the Romans is manifest from the fact that this temple was only shut six times in 800 years viz once in the reign of Numa, at the conclusion of the first Punic war, thrice in the reign of Augustus, and once again under Nero

JAPA'NNING The art of covering paper wood, or metal with a thick coat of a hard brilliant varnish it originated in Japan whence articles so prepared were first brought to Europe The material if of wood or papier-machee, is first sized, polished and varnished, it is then coloured, or painted in various devices and afterwards covered with a highly transparent varnish or lacquer, which is ultimately dried at a high temperature and carefully polished

JA'RGOON In Mineralogy, one of the varieties of *zircon*

JARL A word of Scandinavian extraction signifying noble, applied in the early history of the northern European kingdoms to the lieutenants or governors appointed over each province It appears to bear considerable analogy to the English earl (quod vide)

JASMINA'CEÆ (Jasminum one of the genera) A small natural order of Exogenous plants with monopetalous diandrous flowers of a regular figure It contains few species, chiefly inhabiting the warmer parts of the world The only plants of any interest are the jasmines well known for their fragrance

JA'SPER A siliceous mineral of various colours, sometimes spotted, banded or variegated It takes a fine polish, and the variety and richness of its colours render it useful in the ornamental arts

JAU'NDICE A disease characterized by a yellow colour of the eyes and skin, deep coloured urine and pale evacuations from the bowels, it comes on with languor, loss of appetite, dyspeptic symptoms vomiting bitter taste in the mouth, and generally pain in the region of the liver It is apparently caused either by obstruction of the duct that conveys the bile into the intestine by a gall stone, or by a morbid and viscid state of the bile which prevents its flowing freely or by spasm of the gall ducts or by some other pressure the consequence is that the bile, instead of passing off by the bowels is absorbed into the blood and becomes visible upon the skin and especially in the more delicate vessels It is an occasional consequence of pregnancy It sometimes affects infants soon after birth, in which case it usually goes off in a few days, aided by gentle aperients The most common cases of jaundice are probably occasioned by viscidity of bile Aperients and small doses of blue pill with tonics are the most essential remedies, and where it ensues in sedentary habits, moderate walking and horse exercise are requisite It is often a protracted and troublesome complaint, and then indicative of structural derangement Jaundice from gall stones is often attended by excruciating pain and vomiting, owing to the passage of the stone Opiates and such remedies as allay the irritability of the stomach are to be had recourse to, and the warm bath is useful It is the beneficial influence of saline aperients and diluents in this disorder, that has given celebrity to the waters of Cheltenham and similar mineral spring

JA VELIN (Fr javeline) A sort of spear or missile, anciently used both by horse and foot soldiers It was about five feet long, with an iron head hooked and jagged at the end The *pilum* of the Romans was of [illegible]

JAY [illegible] the genus *Garrulus*, separated by Cuvier from the genus *Corvus* of Linnæus on account of the weaker mandibles terminating in a sudden and nearly equal curve The tail is cuneiform, not long, and the slender feathers of the forehead can be erected like a crest The common jay (*Corvus glandarius*, Linn) midificates in woods and builds a simple nest of sticks and slender twigs, the female lays five or six eggs, of a greyish ash-colour mixed with green,

and faintly spotted with brown The young associate with the parents till the following spring, when they separate to form new pairs

JELRS Strong tackles for *swaying up* or raising the lower yards

JE'FFERSONITE In Mineralogy, a species of *pyroxene* It is found in New Jersey

JEHO'VAH The name by which the Deity is represented in the Hebrew Scriptures, in which language it signifies the *Self existent* the *I Am* The word itself was held in peculiar veneration by the Jews, who never allowed themselves to pronounce it in the reading of their sacred books, but substituted for it wherever it occurred the term Adonai, or *Lord* This practice is maintained even to this day, nor will they *write* the word in perfect Hebrew letters And agreeably to this scruple they have left the word Jehovah imperfectly written over the beautiful altar-piece in the recently-erected synagogue in St Helen's Place, making it to resemble that word, but in reality *Beloved*

JEJUNUM [illegible] Lat *jejunus*, *empty*) The second division of the [illegible] ied because when examined after death it is generally found empty or nearly so

JELLY *See* GELATIN

JERBOA *See* DIPUS

JESUATES OF SAINT JEROME A religious order, founded in 1363 by Giovanni Colombino of Sienna of extremely ascetic habits in its origin It was suppressed by Clement IX in 1668

JESUITS DE ROBE, applied to secular persons of high rank bound to the order of Jesuits by vows of obedience, without, however, having taken the spiritual vow

JE'SUITS or THE SOCIETY OF JESUS The most celebrated of all the Romish religious orders, founded by Ignatius Loyola a Spaniard in the year 1534, when he, with Francis Xavier and four or five other students at the University of Paris bound themselves to undertake the conversion of unbelievers The first principle of the society which was then formed was implicit submission to the commands of the Holy See in consideration of which their order was confirmed in 1540 by Pius III, and from that time to the present, though with many alternations of success and reverse the Jesuits have been one of the main bulwarks of the authority of Rome and have exercised immense influence in the destinies of the Christian world The zeal which they manifested at the period immediately succeeding the Reformation when the Dominicans and other orders which had been founded on similar principles and had faithfully executed their mission for many ages had degenerated into luxury and indifference secured for them the favour of the sovereigns and other political partisans of Rome They soon became installed in the confessionals of all the Catholic kings of Europe and throughout the 16th and following century were in fact the directors of their councils and the rulers of their subjects

In Protestant countries they acted as the emissaries and spies of the Pope, and in England, where early in Elizabeth's reign their landing upon our shores was made a capital crime, they persevered nevertheless in keeping alive the spirit of Roman Catholicism among the harassed remnant of the old faith, and passed and repassed the channel year after year devoting their lives, with almost a certainty of eventually suffering, to the maintenance of an illegal, and often a treasonable correspondence with the court of Rome and the enemies of the queen's government At the same time another division of their numerous body employed themselves with [illegible]

[illegible] aries in converting the heathens of Asia and America St Francis Xavier, the Apostle, as he is called of the Indies planted Christianity in Hindostan and Japan, and Ricci introduced it into China In the course of a few years the numbers of professing Christians in these countries became very large, although it cannot be denied both that the means which the missionaries took to increase the number of their conversions were little in accordance [illegible] form of [illegible] their success seems to have been the address with which they obtained the confidence of the ruling powers In Japan and China they became the intimate advisers of the sovereign, and frequently obtained the assistance of the civil power in the furtherance of their missionary system

The Jesuits obtained also, throughout Roman Catholic Europe, the direction of the education of youth they founded many schools and colleges, not only for the instruction of those who were designed for members of their own order but for that of the upper and lower classes generally, in the education of both of which they were eminently successful

As a religious body, the Jesuits differ from their predecessors, inasmuch as, their principle being to conform as much as possible with the manners of the age, they have never adopted the austere observances and exclusive spiritual character upon which all earlier orders had [illegible] to notoriety They are divided [illegible], of which only *the professed* take the religious vows of poverty chastity, and obedience to their superior Among the novices are frequently enrolled influential laymen, as was Louis XIV himself in his latter years, and this is one of the means which the order has employed to extend its efficiency where it would be least liable to observation The Professed are of several ranks, the whole body being under the absolute control of the General whose abode is fixed in Rome, and whose council consists of an admonitor and five assistants or councillors, who represent the five principal Catholic [illegible] communications from the superiors of the different provinces through which its members are distributed

The Pope has conceded to the Jesuits greater indulgence than even to laymen in exempting them from the religious observances which are enjoined to all Roman Catholics, and especially to the religious orders, and hence it is that they have been enabled to devote so great a portion of their time not only to instruction, but to many branches of learning and practice by means of which they have insinuated themselves into the confidence and the concerns of the laity They are remarkable also for the worldly air which when occasion serves they studiously assume, — for the ease with which they dispense with all the outward appearance of their spiritual character in places where their objects seem to be more attainable by a different behaviour, and they have been reproached at all times with allowing themselves on the same principle to make use of mental reservations and other *pious frauds* in pursuance of the peculiar ends of their society Hence, even when their influence in Europe was at its height great distrust was manifested towards them in many quarters In France they were supposed to be implicated in the plots by which Henry III fell and the life of Henry IV was attempted and were indeed banished from that country by royal decree before the end of the 16th century they were re-admitted however and continued in the enjoyment of their full influence in spite of the strong opposition of the Jansenists in the reign of Louis XIV They were banished in the course of the 18th century from France, Spain, Portugal and other Catholic states and in 1773 Clement XIV issued a bull by which he decreed the total abolition of the order The invitation however of Catherine II into Russia and the favour of the successor of Clement restored them in some degree, and they still exist and exercise considerable influence in Italy and Spain From Russia they are at the present moment entirely banished, nor has Portugal re-admitted them since their expulsion in 1759 In France and Germany their presence appears to be connived at though they have never formally been allowed to re-establish themselves in those countries In England they have been allowed to found and maintain the Roman Catholic college at Stonyhurst and their numbers in Ireland are supposed to be considerable By the Roman Catholic Relief Bill, natural born Jesuits resident in the United Kingdom are required to register themselves with the clerk of the peace in every county foreigners must provide themselves with licences from a secretary of state

The history of the order of Jesus has often been written, but with so much exaggeration both of friends and enemies, that it is difficult to point out a fair account The *Historia Jesuitica* of Hospinian a Protestant, carries it down to the end of the 16th century *Orlandi and Sacchetti's History of the Jesuits* was proscribed by the parlement of Paris, a 5th part was added to it by Souvency Coudrette, one of the order, published a history of it just before its dispersion, 6 vols 12mo with Supplement, 1761-4 D'Alembert published an account of the destruction of the order in France, 1765 See also *Georgel's Memoires* Paris 1817 The celebrated *Lettres Provinciales* of Pascal contain a powerful exposure of the errors of the [illegible] 16th and 17th centuries, of which [illegible] Jesuits (See [illegible] was under the management of Jansenists, and contains every charge which hostility could suggest against the Jesuits *Ranke's History of the Popes of the 16th and 17th Centuries* contains much valuable matter relative to that period

JESUITS' BARK *See* CINCHONA, or PERUVIAN BARK

JET A bituminous carbon Some varieties admit of polish, and are used for ornamental purposes

JET D'EAU (Fr) A fountain which throws up water to some height in the air According to the theory of hydrostatics the velocity with which water issues from an orifice is equal to that which would be acquired by a heavy body in falling through a height equal to the difference between the levels of the orifice and the fountain head, whence, if the resistance of the air and other impediments were removed, the height of the jet would be equal to that of the surface of the reservoir Among the causes which prevent the jet from obtaining the height which theory assigns to it, the following are the principal 1st The resistance of the air, which is proportional nearly to the square of the velocity 2d, The friction against the sides of the [illegible] which the water issues 3d, [illegible] diminishing at every instant as they ascend, the lower particles of the ascending column press against those next above them, and the pressure being by the nature of fluids communicated in all directions, the consequence is that the column is enlarged and proportionally shortened 4th, The water at the top of the jet does not fall off instantaneously when its velocity is destroyed, it rests for a moment at the top of the column, where its weight opposes an obstacle to the particles next succeeding which retards their velocity, and this retardation is communicated to the whole column This last obstacle may be avoided by slightly inclining the jet from the vertical, and it is found by experience that a jet so inclined plays higher than one quite upright though the effect is thereby rendered less pleasing It is necessary that the diameter of the adjutage or orifice be considerably less than that of the pipe (See *Desaguliers's Experimental Philosophy*, Mariotte, *Mouvement des Eaux*)

JIPPIRUS A disease of plants where the system becomes affected with a general yellowness

JEW'S HARP An instrument of metal, with a flexible vibratory thin metal tongue fixed to its circular base on which tongue the breath acting in different degrees of force, produces something like a modulated air

Shaped thus,  The outer bars are placed between the teeth and the central piece or tongue is set in vibration by the action of the fingers

JEWSTONE The fossil spine of a large egg-shaped echinus

JEZIDS, or DAVASIN A sect of religionists, long settled in the mountainous country near Mosul said to be disciples of Yezid Ben Anisa, a Mohammedan doctor Their religion, however, is said to be a mixture of the ancient Manichean belief of those [illegible] tenets of Mohammedanism and Zendism [illegible] to be on better terms with the Christian [illegible] neighbouring Turks by whom they are characterized as worshippers of the Devil (Arab *Scheitan*), whose name, it is said no threats of punishment will force them to pronounce and whom they only mention by periphrases as the great sheikh' or "he whom you know of" They live in villages huts and tents, and are dreaded for their ferocity and robber like habits They are noticed at length in a preliminary dissertation to *Sylvestre de Sacy's Description du Pachalik de Bagdad* 1809, said to be the work of Father Garzoni who was eighteen years a missionary in Kurdistan (See the art Yezidee" in *Ersch and Gruber's Encyclopædia*)

JIB A large triangular sail, between the fore-topmast head and the boom (thence called jib-boom), which projects beyond the bowsprit

The effect of this sail would seem to be to lift the ship's head, yet seamen find that as the wind freshens it causes the ship on the contrary to plunge and they either *case it in* (along the boom), or haul it down This anomalous effect may be explained as follows —

Let x and z be the horizontal and vertical co-ordinates of the centre of effort, the centre of gravity of the vessel [illegible] let P be the resultant of the pressures [illegible] may obviously be resolved into three δ the direct effort along x, λ the lateral effort along y, and ϱ the vertical effort in z The moment to raise the bow is $x\varrho - z\delta$ If $z\delta$ exceed $x\varrho$ the effect is negative, or tends to depress the bow In all vessels $x > z$, also $\delta > \varrho$ generally, hence the effect is not so decided as it may appear at first to be

Let ε be the angle which P makes with the horizon, and φ be the angle between x and the horizontal projection of P, then $\varrho = P \sin \varepsilon$ and $\delta = P \cos \varepsilon \cos \varphi$ hence the effect is

$$P (x \sin \varepsilon - z \cos \varepsilon \cos \varphi)$$

When the wind is aft, $\varphi = 0$, and $\varepsilon = 90 - \varkappa$ (the inclination of the jib stay to the horizon nearly), and the effect is

$$P (x \cos \varkappa - z \sin \varkappa),$$

which, as $\varkappa = 45°$, is positive or lifting

When the wind blows fresh, the vessel being close-hauled and heeling over the stay *sags* to leeward, and the after leech being also slacker than the foot the resultant P may become horizontal or $\varepsilon = 0$, or even negative, in which last case the effect is

$$-P (x \sin \varepsilon + z \cos \varepsilon \cos \varphi)$$

which is altogether depressing If now the jib be eased in, *x* and *z* are diminished Hence, in general, the plunging effect of the jib is owing to the heeling of the [illegible] and to the sheet lead too flat aft The like re[illegible] by hoisting [illegible] staysails

JIB DOOR (Derivation uncertain) In Architecture a door so constructed that it stands flush with the adjoining face of the wall on both sides, and without dressings or architraves Thus it appears part of the wall, the intention being to conceal even the appearance of a door

JO'GGLED JOINTS In Architecture, the joints of stones or other masses indented in such a way that the adjacent stones fitting into the indentations, they are prevented [illegible] shed away from each other by any force [illegible] the pressures by which they are th[illegible]

JOGGLED PIECE (Perhaps from joug, *a yoke*) In Architecture, a truss post whose shoulders and sockets receive the lower ends of the struts

JOHN BULL, the well-known collective name of the English nation, was first used in Arbuthnot's satire, *The History of John Bull* usually published in Swift's works, in which the French are designated as Lewis Baboon the Dutch as Nicholas Frog &c

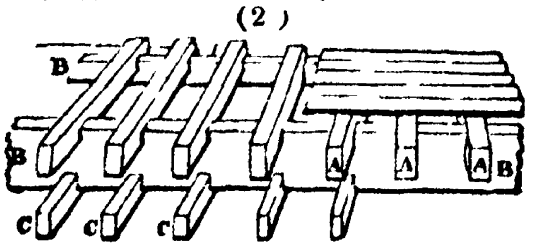
JOI'NERY (Fr joindre) In Architecture, the art of framing wood-work for the finishing of houses, such as doors, sashes, shutters, &c The term Carpentry is applied to the rough timbering, in which the only tools used are the axe, adze, chisel and saw

JOINT STOCK COMPANY In Mercantile Law a partnership consisting of a large number of members who [illegible] and shares [illegible] peculiar regulations imposed by their [illegible] are continued in an instrument termed a deed of settlement and heretofore in an act of parliament passed for the purpose, but now by 4 & 5 W 4 c 94 [illegible] the necessary powers by letters patent [illegible] constitutes trustees, directors, and other officers, contains the necessary covenants, limits the number of shares &c, and details the rules to be adopted in the management of of the concern By a clause contained in this instrument the shares are rendered transferable by each partner without the consent of the other shareholders subject in general to the approbation of the directors The act of parliament, or letters patent enables the company to sue and be sued in the name of its secretary or other officer, &c It [illegible] there [illegible] partnership

JOINT TE'NANCY, in Law, is where lands and tenements are granted to two or more persons to hold in fee simple, fee-tail, for life, for years, or at will It is created by particular words in a deed or devise Its properties are said to be unity of interest, of title of time and of possession, and it is subject to the right of survivorship in the case of estates for life Joint tenancy may be severed by partition or by the alienation of any party Personal chattels may be the subjects of a joint tenancy

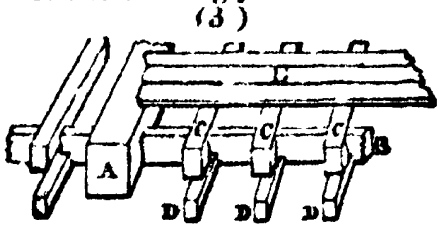
JOINTURE In Law, a settlement of lands and tenements made on a woman in consideration of marriage ordinarily an estate for life A jointure was made a bar of dower, if granted with certain requisites, by 27 H 8 c 10 *See* MARRIAGE LAW OF

JOISTS (Fr joindre) In Architecture the timbers of a floor whereto the boards or laths for the ceiling are nailed They either rest on the walls or on girders, or sometimes on both



Where only one tier of joists is used, it is called *single flooring* (fig 1), A A A being the joists, and in this sort of flooring such joists should not exceed sixteen feet in length or bearing, and even when the length is more than eight feet they should have stiffening pieces to prevent torsion

(1)



When two sets of joists are used, it is called *double flooring* (fig 2), in which A A are called *floor* or *bridging joists* B B the *binders* C C C the *ceiling* joists

(2)

If the binding joists be framed into girders, the floor is then properly called a *double-framed floor*, of which the subjoined is a diagram (fig 3), wherein A is a girder, B a binding joist, C C C are bridging joists and D D D [illegible] the floor boards of this floor [illegible] girders are the main support

(3)

JOLLY BOAT *See* YAWL

JOURNAL (Ital giornale, *i e* diurnale) Strictly a record or account of daily occurrences It is more extensively employed to signify a narrative periodically or occasionally published of the transactions of a society &c, as by ourselves in the phrase "Journals of the Houses of Parliament," &c It is also used as synonymous with *Magazine*, or other periodical publications of that class

JU'BA (Lat *a mane*) The long and thick-set hairs which adorn the neck, chest, or spine of certain quadrupeds

JUBILA'TE (Lat *rejoice*) A name given to the third Sunday after Easter, so called because in the primitive church divine service was commenced with the words of the 66th Psalm, "Jubilate Deo, omnes terræ," — Sing to the Lord, all ye lands"

JU'BILEE (Lat jubilo, *I rejoice*) The name given among the Jews to the grand sabbatical year, which was celebrated after every seven septennaries of years whether every forty ninth or fiftieth [illegible] the learned The institutic [illegible] in Lev xxv 8—17 This was a year of general release not only of all debts, like the common sabbatical year, but of all slaves and of lands and possessions which had been alienated from their original owners It has been [illegible] that the jubilee was intended to be [illegible] the [illegible] and redemption of mankind under the Gospel dispensation, and it was with this idea that Pope Boniface VIII [illegible] proclaimed a ge[illegible] should visit the tombs of the Apostles at Rome in the secular year 1300 At this period it was intended that the same celebration should take place only every hundredth year In consequence, however, of the enormous afflux of pilgrims which this proclamation brought together and the gain which resulted from it, Clement VI abridged the interval to fifty years, and the solemnity then received the name of the jubilee in imitation of the Jewish custom The second jubilee was accordingly solemnized in 1350 In 1389, Urban V reduced the term to thirty-three years, the number of the life of our Saviour it was [illegible] Nicholas V to fifty, and finally in 1470, [illegible] twenty five, and the jubilee has ever since been solemnized every quarter of a century beginning on Christmas eve, when the Pope opens with great pomp the door of St Peter's, closed except on that occasion (*Mosheim's Eccl Hist*, Transl, ed 1790 iii 263)

JU'DAISM Attachments to the rites of the Jewish law The Judaizing spirit of many of the early Christians is a subject of observation in many of St Paul's Epistles (especially that to the Galatians), and continued for a long period to exercise much influence on the character of the religion (See *Milman's Hist of Christianity* vol i 21 451 &c)

JU'DGES (Lat judex) Certain supreme magistrates who presided over the Israelites from the time of Joshua to the reign of Saul, a period of about 330 years They were so called because they formed at once the civil and the military governors of the people The dignity was retained for life, though it was not always hereditary

JU'DGMENT (Lat judicium) In Law the sentence of the law pronounced by the court upon the matter contained in the record The term judgment, in English legal language is restricted to the decisions of a court of common law those of a court of equity are denominated decrees Judgments are said to be of four sorts —1 Judgments in law (on demurrer where the facts are confessed upon the pleadings) 2 Judgments in fact (on the verdict of a jury), 3 Judgments by confession or default, *i e* where both facts and law are admitted by the defendant, 4 Judgments on a nonsuit or retraxit, where both fact and law are admitted by the plaintiff, who thereupon withdraws his claim Judgments are also said to be either interlocutory on matter arising in the course of the proceeding, or final, on the merits of the case Judgments, when obtained, must be signed by the proper officer, and entered of record, without which they are not judgments Arrest of judgment arises from error appearing upon the face of the record, but such error must now be generally speaking in substantial matter of law, and not on mere matter of form

JU'DGMENT, in Logic, is defined to be the second of the three logical operations of the mind It is the comparing together two of the notions which are the subjects of [illegible] and pronouncing that they agree or [illegible] Judgment, therefore, is either affirmative or negative, and the subjects of judgment are *propositions*, which are expressions of the agreement or disagreement of one term with another

JU'DGMENT In the Fine Arts, the faculty of selecting that which is most suitable to the purpose

JUDICA (Lat *judge*) The fifth Sunday after Lent was so called, because the primitive church began the service on that day with the words of the 43d Psalm, "Judica me Domine —" Judge me O Lord"

JUDI'CIUM DEI (Lat *Judgment of God*) The

term [illegible] all extraordinary trials of secret crime [illegible] ums, single combat, ordeals, &c , in which it was believed that Heaven would miraculously interfere to clear the innocent and confound the guilty (*See* ORDEAL, QUESTION) Full particulars of the ceremonies instituted on such occasions will be found in *Ducange*

JU'GAL BONE (Lat jugum or Gr ζυγον, *a yoke*) The cheek bone, so called because it has a *yoke-like* ar[illegible] [illegible] e upper jaw

JU'GATE [illegible] - represented upon a medal side by side or joining each other

JU'GGERNAUT *See* VISHNU

JU'GGLERS (Fr jongleurs) A general denomination for those persons who practise the arts of legerdemain or who exhibit feats of uncommon strength or dexterity The reader will find in *Beckman's History of Inventions* a learned and curious account of the origin and history of all the feats of this kind exhibited both in ancient and modern times

JUGLANDA'CEÆ (Juglans one of the genera) A small natural order of Exogenous trees, distributed through the temperate parts of North America and Asia The common walnut *Juglans regia* is well known for its agreeable fruit, and the useful oil it yields by pressure Hickory a very elastic kind of timber, is the wood of *Carya alba*, and that of other species especially *Juglans nigra* and *regia*, is valuable for cabinetmakers' work and similar purposes

JU'GULARS, *Jugulares* (Lat) The name under which Linnæus comprehended all those fishes which have the ventral fins anterior to the pectorals

JU'GULAR VEINS (Lat jugulum *the throat*) The [illegible] and *internal* By their union with the subclavian vein they form the superior *vena cava* which terminates in the superior part of the right auricle of the heart

JU'GULUM (Lat *the throat*) In Mammalogy it is restricted to the fore-part of the neck which intervenes between the throat (gula) and the chest The *fossa jugularis* is the hollow in front of the sternum at the base of the neck

JUJU'BE The fruit of the *Rhamnus zizyphus* it resembles a small plum and is occasionally used as a sweetmeat What is sold under the name of *jujube paste* professes to be the dried jelly of this fruit, but is in fact a mixture of gum arabic and sugar slightly coloured

JU'LIAN ÆRA The commencement of a period invented to correspond with the cycles of the Julian year It coincides with the 710th year before the creation of the world, according to [illegible] chronology

JULIAN CALENDAR The civil calendar introduced at Rome by Julius Cæsar, and used by all the Christian countries of Europe till it was reformed by Pope Gregory XIII in 1582 Before the time of Julius Cæsar the Roman year was lunisolar, and as the pontiffs who had a discretionary power of adjusting the calendar followed no certain rule in their intercalations but sometimes inserted a greater or less number of days for the purpose of prolonging or shortening the period of a particular magistracy the civil year did not long correspond with the astronomical or the course of the seasons, and the reckoning of time fell into great confusion With the advice of the astronomer Sosigenes Cæsar fixed the mean length of the year at 365¼ days, and in order that the year should always commence with the commencement of a day, he decreed that three successive years should contain 365 days, and the fourth 366 and so on for ever He also restored the vernal equinox to the 25th of March the place it occupied in the time of Numa, and thus fixed the correspondence of the civil year with the seasons

In distributing the days of the year among the twelve calendar months Cæsar adopted a very commodious arrangement, which unfortunately was not long suffered to prevail He ordained that the odd months, viz the first third fifth, seventh, ninth, and eleventh, should have each 31 days, and the even months 30 days, with the exception of February which in common years should have only 29 but in the intercalary years 30 days This was as simple and natural a disposition as, perhaps it is possible to make, but the whole arrangement was soon thrown into disorder and confusion to gratify the frivolous vanity of Augustus, by giving to the month which he had named after himself the same number of days as July, which bore the name of the first Cæsar A day was accordingly taken from February and given to August, and lest three months of 30 days might not come together, September and November were reduced to 30 days, and 31 given to October and December Such was the origin of the capricious arrangement which has ever since been adhered to *See* CALENDAR

JULIAN EPOCH In Chronology, the epoch or commencement of the Julian Calendar The first Julian year commenced with the 1st of January of the 46th year before the birth of Christ, and the 708th from the foundation of Rome

JULIAN PERIOD, in Chronology, is a period con[illegible] [illegible] and 15, that is, of the cycle of the sun, the cycle of the moon, and the cycle of indiction The first year of the Christian era had 10 for its number in the cycle of the sun, 2 in the cycle of the moon, and 4 in the indiction Now the only number less than 7980 which, on being divided successively by 28, 19, and 15, leaves the respective remainders 10, 2, and 4, is 4714 Hence the first year of the Christian era corresponded with the year 4714 of the Julian period, and hence also the year of our era corre[illegible] [illegible] ie period, or *vice versâ*, is [illegible] [illegible] nterior to the commencement of the era, subtract the number of the year of the Julian period from 4714, and the remainder is the year before Christ, or subtract the year before Christ from 4714, and the remainder is the corresponding year in the Julian period

2 When the given year is after Christ, subtract 4713 from the year of the period, and the remainder is the year of the era, or add 4713 to the year in the era, and the sum is the corresponding year of the Julian period (*Ency Brit*, art 'Chronology')

JU'LIAN YEAR The year adopted in the calendar of Julius Cæsar, and equal to 365¼ days The Julian year exceeds the mean solar year, as determined by the best astronomical observations, by 11 minutes and 10·35 seconds which amounts to a day in 129 years In the course of a few centuries this error would become very perceptible, as the equinoxes and solstices would fall back towards the beginning of the year When the Julian calendar was introduced by Cæsar the vernal equinox fell on the 25th of March, at the time of the Council of Nice in 325 it fell on the 21st, and at the reformation of the calendar, in 1582, it had retrograded to the 11th This observation enabled Pope Gregory to fix the length of the year more precisely, and correct the intercalations *See* CALENDAR

JU'LIS (Lat *the name of a fish*) A genus of [illegible] [illegible] lateral line bent suddenly downward [illegible] opposite the end of the dorsal fin The rainbow [illegible] (*Julis Mediterranea*) has been taken on the coast of Cornwall

JULY, so named by Mark Antony, in honour of Caius Cæsar the dictator, whose gentile name was Julius is at present the seventh month of the year In the Latin calendar it was the fifth, and hence was termed *Quintilis* The Dog-days are supposed to commence on the 3d of this month

JU'MPING HARE [illegible] of the family of the [illegible] the genus *Helamys* [illegible] Cape of Good Hope, and inhabits deep burrows *See* HELAMYS

JUNCA'CEÆ (Juncus one of the genera) A small obscure natural order of Endogenous plants in most [illegible] [illegible] *Juncus* and [illegible] [illegible] brown or green in colour There are however, species intermediate between the two orders in this respect None of the species are of any importance The common rush is the usual type of this order

JUNCAGINACEÆ A small natural order of Endogenous plants growing in marshes, with minute green flowers They are considered by botanists allied to *Aracæ*, on account of the structure of the embryo, in their general aspect they are something like little rushes

JUNE, so named, according to some, either from the Latin Junius Juno, or Juniores (May, as was alleged, being derived from Majores) At present the sixth month of the year, but in the old Latin calendar the fourth It consisted originally of twenty-six days, to which Romulus is said to have added four Numa afterwards deprived it of one day, which, however, was again restored by Julius Cæsar, and it has ever since remained unaltered

JUNGERMANNIACEÆ (Jungermannia, one of the genera) A very small natural order of Acrogenous or Cryptogamic plants resembling mosses in appearance, and, like them, growing upon the bark of trees and in damp ground in shady places They bear their seeds in cases containing spiral threads, which, by their elasticity disperse the former when ripe Until lately they were considered to form a part of *Hepaticæ*

JU'NIPER BERRIES The fruit of the *Juniperus communis* They are used in medicine as a diuretic, but their principal consumption is in flavouring gin When distilled with water they yield an essential oil, upon which their peculiar flavour depends The resin of this tree is called juniper gum or sandarach, and is occasionally used in varnishes When powdered it is

used under the name of *pounce*, to prevent ink sinking into paper from which writing has been erased

JUNK A large flat-bottomed vessel, with three masts, and a short bowsprit placed on the starboard bow, used by the Chinese The masts are supported by two or three shrouds, which at times are all carried on the windward side and the fore or main mast carries a sort of lug sail of cane (bamboo)

JU'NO The Latin name of the divinity called by the Greeks Hera ("Hρη) She was the sister and consort of Jupiter, and was held to preside over marriage, and protect married women She was represented as the model of majestic beauty, in royal attire, and attended by her favourite bird the peacock Her principal temples in Greece were at Samos and Argos She was also the patroness of Veii, whence she was invited to Rome on the occasion of the last siege of the former city

JU'NO One of the four small extra-zodiacal planets which circulate between the orbits of Mars and Jupiter Juno was discovered by Professor Harding of Lilienthal (near Bremen) on the 22d of September, 1804, Ceres and Pallas having been discovered previously Juno appears like a star of the eighth or ninth magnitude and is of a whitish colour without nebulosity This planet is distinguished by the great eccentricity of its orbit, exceeding that of any other planet and amounting to 2578, the semi-axis major being taken as unit The effect of this eccentricity on the motion of the planet is such, that the half of the orbit which is bisected by the perihelion is described in about half the time in which the other half is described The sidereal revolution is performed in 1592 66 mean solar days The inclination of the orbit to the ecliptic is 13° 4′ 10″ and the greatest equation of the centre 29° 46′ 19″ The extreme smallness of the planet renders it impossible to determine its apparent diameter, and consequently its magnitude, with any degree of certainty

JU'NTA (Span *an assembly*) A grand Spanish council of state Besides the assembly of the states or *cortes*, there were two juntas one which presided over the commerce, the mint, and the mines, and the other forming a board for regulating the tobacco monopoly The assembling of a junta by Napoleon in 1808 and the part they subsequently played in Spanish history are sufficiently known to the reader In England the term *junto* (evidently of Spanish origin) is used almost synonymously with cabal or faction

JU'PITER In Mythology the Latin name of the deity called by the Greeks Zeus (*Ζευς*) it is derived from that word with the addition Pater *Father* He was the son of Saturn, whom he deposed from his throne, and thence became the supreme monarch of gods and men He married his sister Juno, by whom he had Vulcan, but be- [illegible] demigods by [illegible] The most celebrated of his children were Minerva who had [illegible] her father's forehead, Ba[illegible] and Diana Mercury Pr[illegible] and Minos The most celebrated Grecian temple of this god was at Olympia in Elis, where every fourth year the Olympian games were celebrated in his honour his most revered oracle was among the oak woods of Dodona in Epirus The Romans considered Jupiter as especially the patron of their [illegible] Ol[illegible] columns standing

Jupiter was represented as the model of dignity, grave but mild he is seated on a throne grasping his sceptre and a thunderbolt, and by his side stands his peculiar bird, the eagle

It has been remarked that there is a striking similarity between *Jove* (from *Jovis*, gen of Jupiter) and the Hebrew name of the Supreme Deity, Jehovah

JUPITER In Astronomy, one of the planets and the largest in the system The mean diameter of Jupiter is no less than 87 000 miles, or about eleven times that of the earth, consequently his bulk is about 1300 times greater than that of the earth The distance of Jupiter from the sun is nearly 490 millions of miles, or about 5½ times the radius of the earth's orbit, and he performs his revolution in respect of the stars in 4332 days, 14h 2m 8½ sec, which is nearly 12 years The inclination of the orbit to the plane of the ecliptic was 1° 18′ 51″ at the beginning of the present century and undergoes a diminution of about a fourth of a second in a year

The disc of Jupiter is always observed to be crossed in one certain direction by dark bands or belts These belts are, however, by no means alike at all times, they vary in breadth and in situation on the disc (though never in their general direction) They have even been seen broken up, and distributed over the whole face of the planet, but this phenomenon is extremely rare Branches running out from them, and subdivisions, as well as evident dark spots, like strings of clouds, are by no means uncommon, and from these, attentively watched, it is concluded that the planet revolves in the surprisingly short period of 9h 55m 50 sec (sid time) on a [illegible]

"The [illegible] their occasional variations, and the appearances of spots seen upon them, render it extremely probable that they subsist in the atmosphere of the [illegible] forming tracts of comparatively clear sky, determined by currents analogous to our trade winds, but of a much more steady and decided character, as might indeed be expected from the immense velocity of its rotation That it is the comparatively darker body of the planet which appears in the belts is evident from this — that they do not come up in all their strength to the edge of the disc but fade gradually away before they reach it" (*Herschel's Astronomy, Cabinet Cyclopædia*, p 281)

The radius of Jupiter being 11 times greater than that of the earth, and the rotation on the axis being 2 4 times more rapid, the space passed over by a point on the equator of the planet will be 26 times greater than that described by a point of the terrestrial equator in the same time Hence the centrifugal force is about 26 times greater, and we may therefore conclude that its effect in impressing a flattened form on the planet will be much greater than takes place with regard to the earth Now observation shows this to be the case The disc of Jupiter is evidently not circular, but elliptic, being considerably flattened in the direction of its axis of rotation, and this appearance is no optical illusion, but is authenticated by micrometrical measures, which assign 15 to 14 as the proportion of the equatorial and polar diameters This far exceeds the compression of the earth the ratio of the equatorial to the polar diameter of which is 302 to 301

The annual parallax of Jupiter is less than 12″, consequently the earth as seen from Jupiter will never appear at a greater distance than 12″ from the sun The digressions of Mars will be 17°, those of Venus 8°, and those of Mercury only 4° 16′ An inhabitant of Jupiter would therefore probably be ignorant of the existence of Mercury, which will be almost constantly plunged in the sun's rays and likewise diminished in splendour, on account of the greater distance

The density of Jupiter is very nearly the same as that of the sun and about one fourth of the mean density of the earth The mass of the planet compared with that of the sun taken as unity is 000943, but this is sufficient to produce a very sensible perturbation of the motions of some of the other planets The proportion of light and heat received by Jupiter from the sun, compared with that received by the earth is as 037 to 1

Jupiter through the telescope is observed to be accompanied by four moons or satellites, which revolve about the planet nearly in the plane of its equator, exactly in the same manner as the moon revolves about the earth Their configuration changes at every instant, they appear to oscillate on each side of the planet and their rank or order of distance is determined by the extent of their oscillations In coming between the sun and Jupiter, the satellites throw their shadows on the planet, and produce eclipses of the sun, and when they come to the side of the planet opposite to the sun they are eclipsed in passing through the shadow The beginnings and endings of these eclipses can be observed with great precision, and their observation furnishes the surest means of determining the sidereal and synodic revolutions of the satellites The same observations also afford a means of determining terrestrial longitudes, and it was by means of them that astronomers discovered and measured the velocity of light See PLANET and SATELLITE

JU'RISCONSU'LT (Juris consultus, *learned or skilled in law*) A title given to a class of Roman lawyers, and commonly denoted by the abbreviation *ictus* From what we know of the jurisconsults, they appear to have been a different class from the advocati or causidici who conducted causes, and to have confined themselves to the employment of giving responsa or opinions on cases put to them (See *Mem de l'Ac des Inscr* vol xli) From the recorded opinions of the most learned jurisconsults the *Digest*, the great work of Justinian, was chiefly compiled See ADVOCATE

JU'RISPRU'DENCE The science of right (From the Latin words juris prudens, *skilled in law*) The term *civil jurisprudence* is sometimes restricted to the science of the Roman or civil law For a literally complete list of works on this extensive subject see *Krug's Philosophisches Lexicon*, art "Rechtslehre"

JURY-MAST In Naval affairs, a temporary mast erected in a ship in the room of one that has been carried away by tempest or any other accident Jury-masts are sometimes erected in a new ship to navigate her down a river, or to a neighbouring port, where her proper masts are prepared for her

JURY, TRIAL BY Of the origin and progress of this institution, as far as it has been very [illegible] traced by antiquarians, some account has been [illegible]

the historical review of the Common Law When issue has been taken in fact in a civil suit (*see* PLEADING), the cause stands ready for trial *at bar* of the court itself (*see* LAW, SUPERIOR COURTS), unless by the fiction of *nisi prius* (ib) it is transferred to the sittings in London and Middlesex, or the assizes in the country (A trial at bar is now c
cases) The
venire facias to summon jurors
and by a further compulsory pro
he is ordered to distrain them by their lands and goods u
they make default in appearance On motion of either the plaintiff or defendant, the court orders a *special jury* to be summoned The list of persons liable to serve as common jurors is made out by the churchwardens and overseers in each parish, and, after being considered by justices at petty sessions, is copied into a book and delivered to the sheriff On the return of the writs of venire facias, the sheriff annexes a *panel* or list of persons taken from this book, in number from 48 to 72, and the judges are empowered to direct the same panel to attend both for the civil and the criminal sides amounting in all to 144 The twelve jurors who are to try the cause are chosen by ballot out of this list The qualification of a common juror is to be a natural born subject (unless on trial of an alien in which he may if he pleases have a jury *de medietate linguæ* of which one half consists of aliens), to be free from attaint of infamous crime, and to be between the ages of 21 and 60 All such persons (with certain privileged exceptions) possessing 10*l* a year in freehold or copyhold lands and tenements, or 20*l* a year in lands held on lease for 21 years, or rated as householders to the poor's rate in Middlesex for 30*l*, elsewhere 20*l*, or occupying a house with 15 windows are liable to serve In the city of London the juror must be a householder or occupier
property real or personal, to the
ons described in the jurors book as esquires or of a higher degree, or as bankers or merchants are qualified to serve on special juries If on a trial sufficient qualified jurors are not in attendance, a *tales* may be prayed, and bystanders are called in to fill up the number This seldom occurs but in special jury cases, and in these the *talesmen* as they are vulgarly termed are taken from the common jury list

The jury being summoned, the trial proceeds, unless either party *challenge* the jurors *Challenges* are either *to the array* or *to the polls* A challenge to the array is an objection to the whole panel and can only be on account of default or partiality of the sheriff Challenges to the polls are to individual jurors, are said to be of four kinds, *propter honoris respectum*, *propter affectum*, and
is exempted by statute from serving he may challenge himself 2 Insufficient qualification is a ground of challenge by either party 3 On suspicion of partiality as by reason of kindred Challenge to the favour are on a mere suspicion of partiality Legal infamy is the fourth ground of challenge In a criminal case the law of challenges is the same as in a civil one, except that the prisoner for felony has the additional privilege of making *peremptory*
any number of jurors
for cause, if *to the polls*, are tried by the court, except those to the favour, which the court appoints two jurors if sworn, if not two indifferent persons to try Challenges to the array are tried entirely at the discretion of the court

According to the common course of a trial at nisi prius, the counsel for that party on which the affirmative of the issue is thrown by the pleadings (that is, except in occasional cases, the plaintiff) *opens his case* by a statement to the jury and then calls witnesses to prove it The counsel for the other party then replies, and if he also calls witnesses the first speaker has a final reply After the evidence is given and the case closed the jurors are kept together to deliberate of their verdict They must be without meat drink, or fire, unless otherwise ordered by the judge, and as unanimity is necessary to a verdict, it was held at common law that if the jury could not agree, the judge might cause them to be carried round the circuit from town to town in a cart In practice it is usual when they cannot be brought to agreement, to discharge the jury Although the jury in
be judges of the *fact* only, yet
or criminal case ordinarily decides both the facts, and whether the law as stated by the judge is immediately applicable to those facts *e g* a verdict 'guilty' on a charge of murder implies both that the act was committed, and that it was committed under circumstances amounting to murder The jury may, however, find under certain circumstances a *special* verdict, that is, a verdict in which the facts of the case are specially stated, and it is left to the court to apply the law, or they may find a general verdict, subject to a special case as to a point of law In cases of criminal prosecution for libel, much difference of opinion formerly prevailed as to the

effect of a verdict It was held by most lawyers that the only questions for their consideration were the fact of publication, and the truth of what is technically called *the innuendos*, viz that the passages of the libel cited did apply to such or such facts and individuals But by 32 G 3 c 60 (passed through the influence of Mr Fox) it was enacted that on every trial of an indictment or information for libel the jury may find a general verdict of
of
JUST, or JOUST
two persons with lances properly, a mere amicable contest of trial of strength *See* TOURNAMENT

JUSTI MILITU *See* MILITU JUSTE

JUSTICES OF THE PEACE, in Law, are descended from the ancient conservators of the peace, and are appointed
all jointly and separately, to keep the peace, and any two or more of them to inquire of or determine felonies and misdemeanours Some justices, also, are so by act of parliament (namely, a few high ecclesiastical officers), and some by charter or grant, as the mayor and other magistrates in corporate towns Some justices are expressly nominated in the commission, so that certain business cannot be transacted without their presence, these are said to be of the *quorum*, and all the justices are now usually included in the list The qualification of a justice is to have an estate of 100*l* a year free of incumbrance, or a reversion after one or more lives of 300*l* a year, but many privileged persons may act without qualification by estate A justice intending to act under this commission sues out a writ of *dedimus potestatem* from the clerk of the crown in chancery, and takes certain usual oaths

The duties and powers of a justice of the peace are of two kinds, ministerial and judicial In the acts in the former capacity in preserving the peace, hearing charges
examining the informant and his witover the parties
dence, and committing or admi
to the nature of the offence parties who are brought before him The stat 7 & 8 Geo 4 c 64 requires justices to take the most material part of the evidence on examinations before them in writing, to be returned to the assizes both in charges of felony and misdemeanor 2 An extensive jurisdiction, summary and formal, is now exercised by justices of the peace, numerous branches of judicature, both criminal and civil, having been gradually confided to their authority, either exercised by them individually or at the petty sessions and general quarter sessions of the peace The latter court, by 34 Ed 3, has jurisdiction over all felonies and trespasses whatever in practice simple larcenies and many other felonies and small misdemeanors are tried by a jury before it It has also by various statutes jurisdiction over several ot
appellate
vide
trade, and it has one large and exclusive power committed to its care by the legislature, viz the hearing and deciding appeals from orders of magistrates relative to the imposition of the poor's rate, and to the removal of paupers from one parish to another in which they are shown to have a legal settlement (See SETTLEMENT) Justices have either singly or jointly, summary jurisdiction in questions of contract between certain classes of masters
whether
with
freehold, not exceeding 5*l* in value,
batteries not causing injury
the latter case two justices are required), and in certain malicious injuries to property The proceedings are in general on a written charge sometimes termed a complaint, but in proceedings for
an information on receiving which
a summons to cause the appearance of the party charged An appeal to the quarter sessions from the conviction or order of justices is sustainable only where expressly given by statute, and the court of session on hearing the case, is said either to *affirm* or *quash* the conviction or order And the
into the

Other summary remedies afforded by magistrates are in cases of forcible entry and detainer, and some that arise between landlord and tenant

Justices of the peace are liable to actions at the suit of parties injured by them wilfully in the exercise of their authority But it is provided by statute that they shall have notice of any action commenced against them, and the cause of such action, one month before the writ is sued out, and the action must be commenced within six months after the injury complained of Persons recovering a verdict against a justice for any wilful or malicious injury are entitled to double costs These magistrates are also punishable criminally by indictment or information

The police justices of London and its vicinity are stipendiary magistrates, created by act of parliament

JUSTICIARY CHIEF (Lat magnus justiciarius or capitalis justiciarius totius Angliæ) An officer of high power and dignity under the Norman kings of England, who presided over all the courts in the aula regis or king's court so long as it followed the person of the king, and was says Blackstone by virtue of his office guardian of the realm in the king's absence The fundamental power of the chief justiciary was curbed to some extent by the provisions of the great charter, especially that which fixed the trial of common pleas at Westminster, and became altogether obsolete when the various branches of his jurisdiction were broken up into judicature under Edward I *See* [illegible]

JUSTICIARY, THE HIGH COURT OF, IN SCOTLAND, is composed of five of the Lords of Session, added to the Justice-Clerk, the president of the court It is the supreme court of criminal justice, with the power of advocating or suspending all sentences of inferior criminal judges It has circuit courts twice a year, and an additional circuit is now held in Glasgow during the Christmas recess of the Court of Session The sinecure office of Lord Justice-General was in 1831 merged in that of the Lord-President *See* SESSION, COURT OF

JUSTICIES In Law [illegible] sheriff of a county to [illegible]
By means of this writ all personal and many real actions may be tried in the county courts

JUSTIFICATION (Lat transl of the Greek word δικαιωσις) In Theology men are said to be justified when accounted just or righteous in the sight of God, or placed in a state of salvation Justification is used of the state of Christians in the present life only, as in Rom v 9, 'Being justified by his blood we *shall be* saved from wrath through him' The doctrine of justification through faith or rather by faith (εκ πιστεως, διὰ πιστιν *for or by reason of faith*) is set out with peculiar distinctness in the whole Epistle to the Romans According to the eleventh article of the Church of England we are justified 'by faith, and not for our works or deservings' The twelfth declares, that "although good works, which are the fruits of faith and follow after justification cannot put away our sins and endure the severity of God's judgment, yet are they pleasing and acceptable to God in Christ, and spring necessarily out of a true and lively faith, insomuch that by them a lively faith may be as evidently known as a tree is discerned by the fruit" The first of these articles is chiefly directed against the Romanist doctrine of meritorious works, the second, based on the language of St James, that a "man is justified by works, and not by faith only" (c 2 v 24) regards faith and works as inseparably connected and is aimed principally against the doctrine of those who were termed Antinomians or Solifidians For a summary of the opinions [illegible] on this difficult subject, see *Hoskin's Sermon on Justification*, for the views of what is called the High Church party of the present day, *Newman's Lectures on Justification*

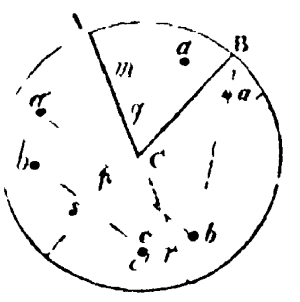
K.

K, a consonant, used in most ancient and modern languages It is derived from the Greek *kappa* or the Hebrew *koph* It has the same sound as C before *a o*, and *u*, and hence it has often been pronounced superfluous In Latin K occurs only in a few words though it was frequently used in the same language as an abbreviation for words beginning with C, as K F for capite tonsus, K R C for cara civitas &c &c In the French alphabet K is only used in words derived from foreign languages As a numeral it was employed to express 250,—

K quoque ducentos et quinquaginta docebit

KA'ABA *See* CAABA

KA'KOXENE (Gr καχος *bad* and οξυς *sharp*, so called probably from the mischief it does to the iron) A mineral occurring in brown or red radiated crystals in the ironstone of Zbiron in Bohemia when heated it emits a green phosphoric light It contains phosphoric and fluoric acids, peroxide of iron and silica



KA'LAND (Germ) A lay fraternity instituted in Germany in the 13th century for the purpose of doing honour to deceased relatives and friends The term is probably derived from kalendæ, *the first day of any month*, as the members of this society chose that day for the observance of their ceremonies These consisted originally of prayers, followed by a slight repast in which all the members participated, but in process of time the religious purposes of the society became wholly merged in the festivities, so that it eventually was found necessary to abolish [illegible] on account of its excesses

KALEIDOSCOPE (Gr καλος, *pretty*, ειδος, *form*, and σκοπεω, *I view*) An [illegible] or revived by Sir David Brewster, [illegible] arrangement of reflecting surfaces, presents to the eye a series of symmetrical images often remarkable for their beauty

The kaleidoscope is formed by two plane mirrors or slips of glass, from six to ten inches in length and from an inch to an inch and a half in breadth at the one end though somewhat narrower at the other, joined together along the edges lengthwise, and inclined to each other in an angle, which must be an exact aliquot part (that is to say, the sixth, eighth, tenth, &c) of four right angles The edges of the mirrors are kept in contact by a strip of black silk glued along the back of the plates, which, if formed of glass, must be coated with black varnish or sealing wax, to prevent reflexion from their posterior surfaces The mirrors being adjusted at the proper angle, are placed within a tin tube, where they are kept in their proper position by pieces of cork or wood wedged in between them and the tube One end of the tube has a small circular aperture in its centre, to which the eye is applied, in the other end two plane glasses are fixed parallel to each other, and perpendicular to the axis of the tube, and about an eighth of an inch apart Between these glasses which form a cell, the objects which produce the images are placed Those which answer the purpose best are small fragments of coloured glass, beads, or other coloured diaphanous matters, of such a size that when the tube is turned round they move freely within the cell and assume new positions In order that the eye may not be disturbed by objects without the tube, the outer glass should be slightly ground, but the inner must be perfectly transparent

On applying the eye to the aperture of the tube the objects within the cell at the other end are seen multiplied by repeated reflexions from the two mirrors and a succession of symmetrical images presented, all arranged round a centre and combined into a perfect whole As the objects are placed loosely in the cell, every motion of the tube changes their relative positions whereby an entirely new image is produced, and it is this constant change and endless variety of new combinations which create the pleasing effect

In order to show how this multiplication of the images is produced let A C represent one of the mirrors and B C the other, and suppose them to make with each other an angle of 60° let *a* also be an object placed between the planes of the two mirrors or one of the diaphanous bodies in the cell between the two parallel glasses at the end of the tube Now when an object is seen reflected from a mirror the image always appears as far behind the mirror (in a perpendicular line) as the object itself is before it, and, with relation to a second mirror, this image will have all the effect of a real object Let therefore *a m* and *a n* be drawn perpendicular to A C and B C and produced till $m a' = m a$, and $n a'' = n a$, then a' and a'' will be the two first images of the object *a* Make $a' p$ perpendicular to B C, and $a'' q$ to A C, and let $p b' = a' p$ and $q b'' = a'' q$, then will b' and b'' be the images of *a* formed by a second reflexion Again draw $b' c'$ perpendicular to A C and $b'' c''$ perpendicular to B C, and let $c' r = b' r$ and $c'' s = b'' s$, then will c' and c'' be the images of *a* formed by the third reflexion But by the geometrical properties of the figure these two points c' and c'' coincide or the two images are blended together and the object will be seen in six different places symmetrically arranged in a circular field about the centre C In like manner if A B C had been the 8th part of 360° the object would appear in eight positions, and so on, but if the angle at C, which is the angle of the mirrors be the 5th or 9th, or any odd aliquot part of 360° the images will not coincide, and the symmetrical [illegible] cannot be produced

[illegible] here described was first made known by Sir David Brewster, who took out a patent for it in the year 1817, but by some means or other its properties were discovered and it had acquired great popularity as an agreeable toy, and was in the hands of every body before any number of the patent kaleidoscopes could be prepared for sale It was also very soon remarked that the discovery was by no means new, as an instrument on the same principles [illegible] Porta and Kircher, and also [illegible] England in 1810 under the title of *New Improvements of Planting and Gardening*, by R Bradley, in which it was recommended as useful for assisting to form designs of garden plots and fortifications In fact, the principle, so far as the multiplication of images and their general arrangement are concerned, had been long known, but in order to produce the symmetry which constitutes the principal beauty of the kaleidoscope, it is also necessary that the object and the eye have certain positions with respect to the mirrors, and [illegible] condition seems to belong exclusively to Sir D Brewster See *Brewster's Treatise on the Kaleidoscope*, *Harris's Treatise on Optics*, *Brewster's Optics Cab Cycl*, the *Ency Brit*, &c

KA'LENDERS (From an Arabic word signifying

pure gold) Wandering dervises (See *Lane's Arabian Nights Entertainments*)

KA'LI An Arabic word, signifying the ashes left after the combustion of certain plants, hence the word *alkali* Plants containing *kali*, and potash in *kali-um* the Germans call, hence they

KA'LMIA From Kalm a botanist North American plants, with stamens by their anthers in the same number of niches in its sides The flowers are white or pink, and the leaves evergreen, but the plants are said to be deleterious

KAMI Spirits or divinities, the belief in which appears to have characterized the ancient religion of Japan before it became intermingled with foreign doctrines, and still constitutes These spirits are partly elemental, gods of the sun and moon, and partly the spirits of men, but in fact every natural agent or phenomenon has its spirit or genius The human spirits survive the body, and receive happiness or punishment for the actions of the individual in his Distinguished benefactors of their species, or men renowned for purity of life are deified, and their *kami* rship, like the heroes of antiquity is said at present to be above 3000 They are worshipped in temples in which no images are retained, each pure Deity being merely typified by a mirror, the emblem of purity, and all the rites of the worship appear to be symbolical of purification The priests of these temples are styled Kami-Nusi, *i e* ministers of the spirits (*Klaproth, Annals of Japan*, 1834, *Wiener Jahrbuch* for 1837)

KAMICHI The name of a Rassorial or Gallinaceous bird, remarkable for having its wings armed with two strong spurs and its head with a long slender, cylindrical and nearly straight horn *See* PALAMEDEA

KA'NGAROO The native name of a large indigenous quadruped of New Holland, it belongs to a genus characterized by a strictly herbivorous modification of the marsupial type of the dental organs and by a remarkably long and strong tail and hind legs *See* MACROPUS and MARSUPIALIA

KA'NTIAN PHILOSOPHY (known also by the name of the Critical Philosophy) A system which owes its existence to Immanuel Kant, professor of logic and metaphysics in the university of Konigsberg in the latter half of the 18th century The promulgation of Kant's doctrines forms a very marked era in the history of philosophy Our limits will prevent us from giving an explanation of this system in any degree adequate to its importance We must confine ourselves to a brief outline of its leading features At the time when Kant commenced his metaphysical labours the philosophical world was divided between the sensualism of the French followers of Locke on the one hand and the dogmatic rationalism of the disciples of Wolf and Leibnitz on the other The former, by a species of analytical legerdemain, resolved all our mental powers into modifications of sense, while the latter in an equally indiscriminating spirit, though with far more laudable intentions, sought to construct a system of real truth out of the abstract conceptions of the understanding Against both of these schools Kant declared open warfare Withdrawing himself from all ontological speculation, he sought by a stricter analysis of our intellectual powers to ascertain the possibility and to determine the limits of human knowledge He divides the speculative part of our nature into three great provinces —sense understanding and reason Our perception of the outward world is representative merely of things as they are in themselves it affords us no notices In order to render human experience possible two ground-forms under which all sensible things are contemplated, are assumed —time and space To these he assigns a strictly subjective reality The truth of the fundamental axioms of geometry rests on the necessity and universality of our intuitions of space in its three dimensions —intuitions which are not derived from any one of our senses, or from any combinations of them, but lie at the ground of all of all sensible human experience The understanding or the faculty which combines and elaborates the materials yielded by sense, Kant subjects to a similar analysis All its operations are generalized into four fundamental modes or forms of conception, which, after the example of Aristotle, he names categories (*See* CATEGORY) These are four in number —1 Quantity, including unity, totality, 2 Quality, divided into reality and limitation, 3 Relation, viz substance and accident, cause and effect, action and reaction, and 4 Modality, also subdivided into possibility, existence, and necessity These form, as it were, the moulds in which the rude material of the senses is shaped into conceptions, and becomes knowledge properly so called The categories in themselves are the subject-matter of logic, which is so far forth a pure science, determinable a priori The third and highest faculty, the reason, consists in the power of intelligence, to which the correspondents Out of formed they are to be regarded as regulative only not as constitutive The existence of God, immortality, freedom, are the objects after which the reason is but concerning which it can decide either one way or the other Thus far Kant's system may be regarded as one of pure scepticism The deficiencies of our speculative reason he conceives to be supplied by the moral faculty, to which he has the object of which is what ought to be As the former determines the *form* of our prescribes the form of our *action* feeling, it is a pure form under which the reason is compelled to regard human conduct The personality of man which lies at the ground of speculative knowledge becomes in relation to action freedom of the will It is in our moral nature that we must seek for the only valid foundation of the belief in God, the immortality of the soul, and a future state in which the demands of the practical reason shall be realized (See *Kant's Philosophical Works, Kritik der Reinen Vernunft, Kritik der Practischen Vernunft*, &c)

KA'OLIN The Chinese name for *porcelain clay* A large tract of this useful substance occurs near St Austle in Cornwall, whence our potteries and porcelain manufactories are copiously supplied Its essential component parts are silica and alumina, the former usually preponderates The kaolin of Cornwall, and probably of other countries, is derived from the decomposition of the felspar of granitic rocks

KA'RA A Tartar word, signifying *black*, used in many of the Eastern languages as a prefix to geographical names, as Karamania, *the country of the black people* It has also been employed in the same capacity to signify "tributary," as

KARMA'THIANS a Mohammedan sect which arose in Irak during the 9th century of the Christian era It derived its name from Karmata, its founder, a poor labourer, who assumed the rank of a prophet They maintained bloody wars with the caliphs for nearly a century (*Taylor, Hist of Mohammedanism*, p 223, *Secret Societies of the Middle Ages*, Lib Ent Kn 1837)

KA'RPHOLITE (Gr *καρφω, I dry or shrivel*) A mineral which occurs in stellated crystals of a yellowish colour and silky lustre it is a hydrated silicate of alumina and

KARPHOSIDERITE A mineralogical name of the hydrated phosphate of iron of Labrador

KEEL (Probably from the Gr *κοιλος hollow*) The principal piece of timber in a ship, usually first laid on the blocks in building If we compare the body of a ship to the human skeleton, the keel seems to resemble the back bone and the timbers the ribs It is generally composed of several thick pieces of wood placed lengthways

a ship on coming into port

KEEL In Botany, a name applied in a figurative sense to the two lowest petals of a Papilionaceous corolla which together, have some resemblance to the keel of a boat

KEEL-HAULING A nautical punishment practised chiefly in the Dutch navy by which the culprit is let down on one side of the ship and after passing under the keel is *hauled* up on the other This punishment was formerly not altogether unknown in the British navy, but it is not now resorted to

KEELING A name for the common cod (*Morrhua vulgaris* Cuv) *See* MORRHUA and GADUS

KEEP (Anglo Sax kepan) Applied in ancient Military History to the stronghold of a castle to which in cases of emergency the besieged inmates retreated and there made their last efforts of defence It is almost synonymous with *donjon* (which see)

KEEPER OF THE GREAT SEAL, LORD, or LORD KEEPER An officer of high dignity in the English constitution, whose office is created by the delivery of the king's great seal into his custody He is prolocutor or speaker of the House of Lords by prescription By 5 Eliz c 18 the offices of lord chancellor and lord keeper are declared to be of exactly the same authority, and when there is no chancellor the great seal is put in commission (*See* CHANCELLOR, SEAL *Ill Comm* 17) The keeper of the privy seal is styled lord privy seal

KEEPING (Ang Sax kepan, *to keep*) In Painting, perspective has assigned to it Objects in the nearer parts or foreground of a picture will necessarily receive as they

become more distant, so in the representations of them the colours must be less brilliant and vivid, to direct from the eye towards the distance where they are lost This word must not be confounded with the term *effect*, though effect is doubtless the result of keeping in view that word being more peculiarly applicable to the combination produced by the combination of accidental circumstances in the disposition of light and shade

KELP A common term for sea weed or vraic, which consists of different species of *Fucus* (Lin) In a strict sense, the term kelp is confined to the produce of sea weeds when burned, which consists of alkaline ashes used in the manufacture of glass and soap It has been recently found, however, that the alkali required for these purposes can be obtained more abundantly from sea-salt, and kelp is at present chiefly used as a manure For this purpose it is eagerly sought after by all farmers on the sea coast, and especially by those who have dry soils, the salt contained in the kelp being a powerful absorbent of moisture from the atmosphere It has lately acquired much importance as a source of *iodine*

KE'NNEL Applied literally to the house in which a pack of hounds is lodged, but used metaphorically also for the pack itself It signifies also the spot to which the fox after his nocturnal depredations retires about the dawn of day Hence, on being found by the hounds in drawing cover he is said to be *unkennelled*

KE'PLER'S LAWS are laws of the planetary motions first discovered and demonstrated by Kepler and which form the basis of the whole theory of [illegible] They are three —1 That every planet moves in an ellipse each of which has one of its foci in the same point namely, the centre of the sun 2 That every planet moves so that the line drawn from it to the sun describes about the sun areas proportional to the times 3 That the squares of the times of the revolutions of the planets are as the cubes of their mean distances from the sun These three laws or general facts were discovered by Kepler from a comparison of astronomical observations, and though it was by means of them that Newton established the more general law of attraction inversely as the square of the distance they are themselves direct consequences of that hypothesis The first law, that of the elliptic motion of the planet was announced by Kepler in his famous work *Physica Cœlestis tradita Commentariis de Motibus Stellæ Martis* 1609 Kepler having computed from the observations of Tycho Brahe the distances of Mars from the sun at different points of his orbit, found that the orbit was not circular [illegible] by astronomers till then, but an ellipse, [illegible] occupies one of the foci of the ellipse He afterwards discovered the same thing to be true of the earth's orbit, and thence extended it by analogy to all the other planets Newton demonstrated in the *Principia* that if a body projected in space is acted upon by a central force varying inversely as the square of the distance the body will necessarily describe one of the three conic sections, but whether the orbit will be an ellipse an hyperbola or a parabola, depends on the intensity of the force with which it is projected

Kepler was led to the discovery of his second law by a comparison of [illegible] *vectores* and [illegible] which he assumed were not rigorously exact, but Newton afterwards demonstrated from the theory of dynamics that the fact is necessarily true of all motions regulated by a central force, whatever the law of that force may be

The history of the discovery of the third law is remarkable, and detailed by Kepler himself in his *Harmonices Mundi* lib v He had long been persuaded that some numerical relation must exist between the periodic times of the planets and their distances from the sun In order to discover this relation he tried successively numerous hypotheses, each of which involved a mass of tedious calculation He began by comparing the intervals between the planetary orbits with the five regular solids, and having failed in this speculation as well as various others, he at length thought of comparing the [illegible] roots and powers of the periods and distances After many attempts and failures, he at last perceived the analogy of which he had been so long in search

> —— "Sera quidem respexit inertem,
> Respexit tamen et longo post tempore venit,

he exclaims, and in the fulness of his delight he has recorded the year and day on which the discovery was made It was the 15th of May, 1618, and, as Professor Playfair has remarked, "perhaps philosophers will agree that there are few days in the scientific history of the world which deserve so well to be remembered" (*Dissertation, Ency Brit* See *Kepler's Harmonices Mundi*, p 189)

KE'PLER'S PROBLEM The discovery made by Kepler, that the planetary orbits are ellipses having the sun in the focus which is common to each ellipse and that the line which joins the centres of the sun and a planet passes over equal areas in equal times, made it necessary to solve a problem which transcended the geometry of that time —Supposing the semitransverse axis of a planet's orbit to be represented by 1, and the eccentricity by e, also the mean anomaly at any given instant of time by z, and the eccentric anomaly by x, both being reckoned from the perihelion Kepler found the relation between the angles x and z to be expressed by the equation $z = x - e \sin x$ When x is given, z is easily found from the trigonometrical tables, but there is no direct way, unless by infinite series, of finding x when z is given, which is the case that occurs in astronomy The determination of x in terms of z constitutes what is called Kepler's Problem Solutions of this important problem are to be found in most works on astronomy They are generally tentative, depending on a combination of geometrical and trigonometrical principles, but two very elegant ones, purely analytical, are given by Professor Wallace in the *Memoirs of the Royal Astronomical Society* vol ix p 185 The first of these solutions is as follows —

1 Find z', a first approximation to the eccentric anomaly x, by this formula,

$$\tan (x' - \tfrac{1}{2} z) = \frac{1 + e}{1 - e} \tan \tfrac{1}{2} z$$

2 Find y such that

$$\tan (\tfrac{1}{2} x' + y) = \frac{1 + e}{1 - e} \tan \tfrac{1}{2} x'$$

3 Find c, a correction of x', so that

$$\sin (y - c) = \frac{\sin y}{\sin x'} \frac{\sin 1''}{e} (x' - z)$$

(Here $x' - z$ must be expressed in seconds of a degree)

4 Then the eccentric anomaly $x = x' + c$ The computation of the eccentric anomaly by this method is extremely simple

KE'RATONY'XIS (Gr κέρας, *a horn*, νύξις, *puncture*) A term applied by the German surgeons to the operation of couching, performed by introducing a needle through the cornea or horny coat of the eye, and depressing the [illegible] lens

KE'RI (CHETIB (Heb) In Philology the name given to various readings in the Hebrew Bible Keri signifies *that which is read* and Chetib *that which is written* When any such various readings occur the false reading or chetib is written in the text and the true reading or keri is written in the margin, with ק under it These corrections which are about 1000 in number have been generally attributed to Ezra, but as several Keri chetibs are found in the sacred books the produce of his own pen it is more probable that they are of later date (See *Dr Kennicott's Dissertatio Generalis*)

KE'RMES (Arab *little worm*) An insect found in many parts of Asia and the south of Europe, the *Coccus ilicis* of Linnæus They were long taken for the seeds of the tree on which they live and hence called *grains of kermes* They are used as a red and scarlet dye but very inferior to cochineal Previously to the introduction of cochineal by which it is now nearly wholly superseded kermes had been the most esteemed drug for dyeing scarlet from a remote period of antiquity Cloths dyed with kermes are of a deep red colour, and though much inferior in brilliancy to the scarlet cloths dyed with real Mexican cochineal they retain the colour better and are less liable to stain The tapestries of Brussels and other parts of Flanders which have scarcely lost any thing of their original brilliancy even after a lapse of 200 years, were all dyed with kermes (See *Beckmann's History of Inventions*, and *Bancroft's Permanent Colours*)

KE'RMES MINERAL A name given by the old chemists to the hydrosulphuret of antimony, in consequence of its reddish colour

KE'RODON (Gr κέρας, *a horn*, ὀδους, *a tooth*) A genus of Herbivorous Rodents, characterized by $\frac{4}{4}\ \frac{4}{4}$ molar teeth each composed of two equal parts, of which the transverse section presents a cordiform or heart-shaped figure the two parts are united on the external side in the upper, and on the internal side in the lower jaw The incisors are two in number in both jaws, and present the form common to the Cavies, to which family the present genus belongs The species are small, scarcely equalling in size the Guinea-pig They are peculiar, with the other Cavies, to the South American continent

KE'RSEY (Probably a corruption of Jersey, whence it originally came) A kind of coarse cloth, usually ribbed, and woven from long wool It is chiefly manufactured in the North of England *Kerseymere*, on the other hand, is a thin stuff, generally woven plain from the finest wools, and hence it has been inferred that these two terms, whose meaning is so distinct, cannot be referred to the same origin Kerseymere is said to have derived its appellation from Cashmir, a country which

in [illegible] The female makes a simple nest by scraping a hollow in the ground, lining it with grass, and thereon [illegible] The young birds are clothed with down, and soon begin to run about at the approach of danger they squat down, and the parent, by a curious instinct, endeavours to attract the attention of the intruder, and draw him away from the spot, by fluttering about with cries of inquietude, or even running along the ground as if lame In October the lapwings are fat, and in good condition for the table their eggs are considered a great delicacy

LAQUEAR In Architecture *See* LACUNAR

LARA'RIUM (Lat) In Ancient Architecture, the apartment in which the lares or household gods were deposited, it also frequently contained statues of the proprietor's ancestors

LA'RBOARD The left-hand side of a ship to a person whose face is turned towards the head The other side is called the *starboard*

LA'RCENY (Lat latrocenium, *theft*) In Law, a species of [illegible] mixed [illegible] chattels from the person, or from the house to above the value of twelve-pence But this distinction has been abolished by the statute which consolidated the laws relative to this class of offences (7 & 8 G 4 c 29) Larceny is the felonious and fraudulent taking and carrying away of the goods and chattels of another Thefts of things affixed to the freehold, if forming part of what is termed real property, are not larceny at common law, but many offences of this description have been brought within the character of larceny by enactment Robbery, breaking into and stealing in a dwelling-house if in the daytime, [illegible] ceiver of [illegible] felony, or [illegible] 14 Vict c 11, after reciting the provisions of the 7 & 8 Geo 4 c 29 and 9 Geo 4 c 55, declares the punishment of transportation to be abolished in the case of simple larceny save as regards tenants and lodgers stealing from houses to the value of more than 5*l*, and larceny after two previous summary convictions

LA'RES (Lat) Domestic deities of the Italians, who were probably regarded as the souls of the deceased ancestors of a family Their worship, however was not confined to private houses, as there were lares of the city, the country roads &c *See* PENATES

LARGE [illegible] greatest [illegible] ing two longs, one long two breves one breve two semibreves and so on in duple proportion

LARGHE'TTO (Ital dimin of largo) In Music, [illegible]

LARGO [illegible] ALLEGRO

LA'RIDÆ A family of swimming birds, having the gull (*Larus*) as the type

LARK The common name of the native species of [illegible] us, of which one the *Alauda* the sky-lark or lavrock, the other, *Alauda campestris* Linn is called the field lark As the species of the present order differ from most other Insessorial birds in resting, habitually and sleeping upon the ground, their feet present a singular but simple modification, which at the same time beautifully adapts them to their office of supporting the superincumbent body on a flat surface it consists in the extreme elongation in an almost straight line of the claw of the hinder toe, which is, at the same time, proportionally robust, thus the plane of support is extended at the expense of the prehensile faculty, which the habits of the lark render of little or no value to it

The sky-lark is universally admired for the power and melody of its song and for the beautiful associations inspired by the circumstances under which its notes are most richly poured forth—viz while soaring aloft to greet the rising sun It ascends in the air almost perpendicularly, by successive flights, to an elevation at which its song becomes inaudible its descent is generally oblique The female builds her nest on the ground and lays four or five eggs, which are of a greyish brown colour marked with darker spots she sits about fifteen days, and usually rears two broods in the year This [illegible] and in the winter large [illegible] are very fat at this season and are captured in great numbers for the table

LA'RMIER (Fr) In Architecture, the same as *corona*, which see

LA'RUS (Gr λαρος, *a gull*) A Linnæan genus of aquatic birds belonging to the Longipennate division of Palmipedes in the system of Cuvier, and now raised to the rank of [illegible] subgenera The *Laridæ*, or [illegible] their compressed elongated pointed bill, of which the superior mandible is curved downwards near the end, and the interior forms a salient angle beneath The nostrils, placed near its middle, or a little more forwards, are long, narrow, and form a complete transverse perforation, the tarsus ample, and sometimes pointed *Sterna* The gulls are common and numerous on the sea-coast, and feed on the different animal substances which are left on shore or float down with the ebbing tide The black-headed gull (*Larus ridibundus*, Linn) breeds on the marshy edges of rivers or fens, the female makes her nest, among the reeds and rushes, of heath or dried grass, and lays three or four eggs, of an olive brown colour spotted and streaked with dusky red [illegible] the [illegible] species of gulls breed on the most part in the sand or the clefts of rocks

LA'RVA (Lat larva, *a mask*) A Metabolian insect in its first stage after exclusion from the egg so called, because its real form is, as it [illegible] the same term is also applied to those reptiles which undergo a metamorphosis, as the frog, when at a corresponding period of existence

LARVA Spectres of the deceased were so termed by the Romans mere empty forms or phantoms, as their name indicates, yet endowed with a sort of existence resembling life, since they were to be propitiated by libations and sacrifice The larva of Caligula, according to Suetonius, was often seen in his palace after his decease The larvæ are described by Seneca, and often represented in paintings and on gems under the figure of skeleton, sometimes under those of old men, with shorn locks and long beards, carrying an owl on their hands

LARVI'PARA (Lat larva, and pario, *I bring forth*) Those insects are so called which bring forth larva instead of [illegible] the latter being hatched in the oviduct

LARYNGI'TIS Inflammation of the larynx The symptoms are hoarseness, sense of suffocation, great anxiety and restlessness and spasmodic difficulty of deglutition The acute form of the disease sometimes terminates fatally in 24 hours Chronic inflammation of the larynx is not an uncommon complaint, and often a very troublesome one, it is frequently met with among dram drinkers low diet, abstinence from spirituous liquors, and astringent lozenges and gargles generally relieve it, the acute form of the disease requires local and general bleeding and blister on the external throat

LARYNGO'PHONY (Gr λαρυγξ, and φωνη, *the voice*) The sound of the voice as heard by applying the stethoscope over the larynx

LARYNGO'TOMY (Gr λαρυγξ, and τεμνω, *I cut*) The operation of making an opening into the larynx *See* BRONCHOTOMY

LA'RYNX (Gr λαρυγξ) The upper extremity of [illegible] cate, especially in reference to its construction and physiology as the organ of voice

LA'SCARS The name given to the native Indian sailors, many of whom are in the service of our mercantile navy

LA'SER A gum resin greatly esteemed by the ancients, and obtained from the north of Africa It is described by Dioscorides (lib iii c 48), and, under the name of *silphion* by Theophrastus Different names were given to different parts of the plant which affords it, the term *laser* or *lasoon* being exclusively applied to the inspissated juice From the representations of the plant upon the coins of Cyrene it appears to have been one of the *Umbelliferæ* According to Dr Lindley (*Flora Medica* p 52) it was in all probability obtained from *Thapsia asclepium*

LAST In Commerce, a measure of uncertain quantity varying in different countries and with respect to different articles Generally however, a last is estimated at 4000 lbs (See *Commercial Dictionary*)

LATEEN SAIL A peculiar sail having a long yard [illegible]

LATENT HEAT Heat insensible to the thermometer, upon which the liquid and aeriform states of bodies depend, and which becomes *sensible* during the conversion of vapours into liquids and of liquids into solids *See* HEAT

LATERAL OPERATION [illegible] to one of the methods of [illegible]

LATERAN A church [illegible] Peter's see, and the metropolitan of the whole world, dedicated to St John Lateran The name is derived from the Roman family of the Laterani, who possessed a palace on this spot, which was seized by Nero, and became from his time an imperial residence The Lateran palace was given by Constantine to the popes (see *Milman's Hist Christianity*, [illegible] continued to inhabit it [illegible] when it was exchanged [illegible] Vatican The building was then converted [illegible] a church Five councils have been held in the Basilica of the same here called Lateran councils in ecclesiastical history) of which four are considered by

the Roman Catholics to be general The last of these (or the 12th General, according to the sa most celebrated It was held in and is principally famous as establishing the Roman Catholic doctrine of the Eucharist, using for the first time the term transubstantiation for the change of the elements This council was convoked on the occasion of the heresy of the Albigenses, and its exposition of the Catholic faith is directed principally against them for the maintenance of that (omnis utriusque and communion upon

LATERITIOUS er, *a brick*) This term is which is often deposited by the urine

LATIN a rapid vital motion, and containing numerous granules of organizable matter He supposed it to be analogous to the What is usually denominated latex is to be latex

LATH (Sax Lætt) In Architecture, a thin cleft piece of wood used in slating, tiling, and plas There are two sorts of laths, single and pantile, the former being barely a quarter of an inch, whilst the latter are three eighths of an inch thick Pantile laths are long square pieces of fir

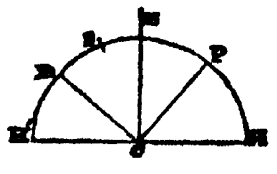
LATHE A Sax which the etymology is uncert ty divided into laths of about four or five hundreds Each was originally under the jurisdiction of a lathe-reeve, superior to the county *Lathe* is also the name of a well-known instrument or engine used in turning wood, ivory, or other materials

LATH FLOATED AND SET FAIR In Architecture three-coat plasterer's work, in which the first is called pricking up, the second floating, the third or finishing is done with fine stuff

LATH LAID AND SET In Architecture, two-coated plasterer's work, except that the first is called *laying*, and is executed without scratching unless with a broom When used on walls this sort of work is generally coloured white for ceilings it is white

LATH PLASTERED SET AND COLOURED In Architecture, the same as lath laid set and coloured

LATH PRICKED UP, FLOATED AND SET FOR PAPER The same as lath floated and set for



LATICLAVE (Lat laticlavus) The broad stripe which Roman senators and patricians were privileged to wear on their robe

LATISSIMUS DORSI A broad muscle of the back which pulls the os humeri downwards and backwards, and as

LATITUDE (Lat *latitudo*, *breadth*) in Geography signifies the distance of a place from the equator expressed in degrees of the earth's circumference or it is the angle which a line perpendicular to the horizon of any place makes with the plane of the earth's equator term latitude, of the bodies from of the earth's orbit The term declination is applied to denote the angle corresponding to terrestrial latitude, namely, the distance of a star or planet from the plane of the earth's equator This double signification of the term is extremely unfortunate, as it tends to create a confusion of ideas, but having been introduced by the early astronomers, and being ingrafted into every existing work on the science, it is now too late to remedy the evil

Latitude and longitude being the co-ordinates by which the positions of places on the terrestrial surface are defined, their determination forms the most important application of astronomy

In order to give an idea of the methods of finding the latitude of a place, or of a ship at sea, it is necessary to recal some of the elementary properties of the sphere

Let H H′ be the horizon of a spectator placed at C, C P the direction of the axis of the earth's rotation, and C Z the direction of the zenith, or perpendicular to the horizon Let C E to C P, in by the straight lines C P and C Z, or the plane of the meridian, then C E is the intersection of the planes of the equator and meridian, the semidiameter of the earth being neglected as infinitely small in comparison of the distances of the stars, to which C P, C Z and C P are supposed to be prolonged

Now by the P C Z is the latitude of C, and it is which is to be determined The observer always knows his zenith by the direction of the plumb-line, but there is no visible mark in the heavens by which he can at all times determine the place of the equator or the position of E in the meridian, or even the meridian itself But the angles E C P and Z C H being each right angles, E C Z is equal to P C H; that is to say, the latitude of the place is equal to the height of the visible pole in the heavens, and its position in the sphere) is indicated near or *polaris*, which describes within 1° 40′ of it By observing therefore the height of the pole star at any place and making a small correction to the latitude will be obtained, which is the true value But this approximation is very far from being sufficient for any useful purpose

The places of the principal stars being given in the existing catalogues, the observed altitude of any one of them at the time it passes the meridian will give the latitude of the place Let S be a star on the meridian, and S P its polar distance in the catalogue and let its altitude H′ S be observed, then H′ S being known, S Z, the zenith distance, is also known; and S P being also known, we have S P − S Z = Z P, the complement of the latitude In like manner, the latitude may be found by or the be But go some of them give a result affected with much greater uncertainty than others The following are those which are chiefly employed

1 By observing the altitude, or, which comes to the zenith distance of a star on the meridian requiring only a single observation and no other correction than for refraction It is accordingly generally employed for common geographical purposes When the sun or planets are the bodies observed, corrections must also be applied for the semidiameter of the body and for the parallax At sea the bodies selected are the sun and moon, the observation of a star or planet being difficult on account of the motion of the vessel To know when a heavenly body is on the meridian it is necessary to have a pretty accurate knowledge of the time but it may be remarked that near the meridian the altitude varies very slowly, and therefore a small error in respect of the time does not much affect the result

2 By the altitudes of the circumpolar stars (those which never go below the horizon of the place) at their upper and lower transits If the altitude of a star on the meridian is observed both above and below the pole, the sum of the two altitudes is equal evidently to twice the height of the pole, or twice the latitude The only correction required is for refraction, which is not the same in the two observations

3 The latitude may also be found by observing the greatest and least meridian altitudes of the sun in the course of a year The sum of the altitudes of the sun at the summer and winter solstices is equal to twice the height of the equator or twice the complement of the latitude, but this method requiring observations to be made at an interval of six months is seldom had recourse to excepting in fixed observatories

4 to be ders some calculation unnecessary is not indispensable The latitude may be determined by the observed altitude of a body out of the meridian, and indeed with more certainty because several observations may be made successively the mean of which will give a surer result than a single meridional observation Let P be the pole S the place of the star or planet, and S Z its observed zenith distance, or the complement of its observed altitude In the triangle P S Z P S the polar distance of the star, is known, S Z is given by observation and the hour angle Z P S is given, because the time of the observation is supposed to be exactly known, therefore P Z, the co-latitude, may be found by the solution of a spherical triangle This method, however, can only be successfully applied by observing near the meridian, and some artifices of analysis are required to adapt the trigonometrical formulæ to calculation A method has lately been proposed by Professor Littrow of Vienna for determining the latitude by means of observations of the pole star off the meridian, which is found to be of great practical utility

5 The last method which we shall notice for finding the latitude is one that has been proposed by Bessel and consists in observing the eastern and western passages of a star through the prime vertical, that is, the vertical plane at right angles to the meridian When a transit instrument is adjusted to move in this plane, and consequently has its horizontal axis in the direction of the meridian, all the stars which pass the meridian between the zenith and equator will twice enter the field of the telescope Now let t be the time of the eastern transit, t' the time of the western transit, δ the declination of the star, φ the latitude, and P the diurnal arc corresponding

to the time $\frac{1}{2}(t - t')$, then the formula by which the latitude is determined is

$$\tan \phi = \frac{\tan \delta}{\cos P}$$

The advantages of this method are, that the observations may be made with a portable instrument, which can easily be oriented by means of the circumpolar stars; a small error in the altitude will produce no sensible error in the result if the stars observed pass near the zenith, the observations are altogether independent of errors in the division of the instrument, and in determining differences of latitude errors of declination are also eliminated by observing the same stars at all the stations It is therefore a very convenient method for a [illegible] survey

LATITUDINARIANS In English history the name of Latitudinarians was given to a party of English divines in the reign of Charles II who were opposed to the high tenets of the ruling party in the church and who distinguished so many of the doctrines of religion as were of course the objects of much attack, and one of their number, Fowler, Bishop of Gloucester, explained their principles in his treatise entitled "*The Principles and Practice of certain modern Divines of the Church of England, vulgarly called Latitudinarians truly represented and defended by way of Dialogue*" 1671 Henry More, and the other Platonizing divines of the time, were sometimes comprehended under this appellation (See *Mosheim*, vol v p 412, transl, ed 1790) The word has been since very generally used to [illegible] opinions at variance with the [illegible] Scripture and church traditions or merely as a term of party vituperation

LATROBITE A mineral found on the coast of Labrador, and also in Ireland It is translucent, of a pale red colour, and occurs [illegible] It is a silicate of alumina with lime, potash, and traces of manganese

LATTEN (Fr laiton) Brass or bronze Tinned iron is also sometimes known under this name

LATUS RECTUM In the Conic Sections the same with parameter — *Latus transversum*, the same with the transverse axis *See* CONIC SECTIONS

LAUDANUM (Supposed to be derived from Lat. laus *praise*) Different preparations of opium have been so termed the tinctures used formerly to be called *liquid laudanum*

LAUDICOENI (Lat) among the Romans, were persons who (like the modern claqueurs in France or the puffers in England at auctions) attended the performance of plays and the delivery of orations, in order to raise or to join in the acclamation The derivation of the word would indicate that an entertainment was the chief, if not the only reward, which they obtained for their services

LAUDS (Lat laudes, *praises*) In the Roman Catholic Church, the prayers formerly used at daybreak, between those of "matins" and "prime" In later times they have become generally confounded with "matins"

LAUMONITE A variety of zeolite, named in honour of its discoverer, Gillet-Laumont It crumbles when exposed to air in consequence of loss of water It is a silicate of alumina and lime with 16 per cent of water

LAUNCH The putting of a new vessel into the water When the vessel is to be launched, a frame called *cradle* is built under her, thus — At about one third of the extreme half breadth are laid, on each side of the keel and parallel to it, long pieces of timber forming, as it were, two keels under the principal portion of the vessel On these are placed vertical timbers meeting the ship's bottom and inwardly from [illegible] plans or ribband [illegible] on each side upon a platform sloping to the water, these platforms are called *the ways*, and are greased The blocks on which the keel was laid being removed with the shores, the vessel rests on the cradle, which is kept from sliding down by a small piece or bar of wood fixed to it lying nearly horizontal, abutting against a place in the ways called the *dog shore*, which being struck downwards falls, and the vessel slides down into the water When afloat, she is rolled from side to side by the persons on board [illegible]

LAUNCH [illegible] boat, the largest carried by a man-of-war

LAURACEÆ (Laurus, one of the genera) A natural order of [illegible] parts of the [illegible] are distinguished from all other incomplete apetalous Exogens, excepting *Atherospermaceæ*, by the peculiar dehiscence of the anthers, which open in consequence of the face of the valves rolling back, and from that order by the ovules being pendulous, not erect The species are generally tonic and stimulant Cinnamon and cassia are the produce of some, camphor of others, and the common sweet bay is a frequent instance of the order in the northern form A few are so aromatic that their seeds have been used as substitutes for nutmegs

LAUREATE (Lat laureatus) Literally crowned with laurels, applied at present to a well-known officer in the royal household At the Certamina, or gymnastic and other contests celebrated under the Roman emperors, especially at the Quinquennalia, or games of Minerva, poets also contended and the victor was crowned with oak or olive leaves But it was from some traditionary belief respecting the coronation of Virgil and Horace with laurel in the Capitol (of which, however, no record is extant) that the dignity of poet laureate was invented in the 14th century, and conferred on Petrarch at Rome by the senator or supreme magistrate of the city It was intended to confer the same honour on Tasso, who, however, died on the night before the proposed celebration In 1725 and 1776 it was granted to two celebrated improvisatori, the Signor Rufetti and the Signora Morelli, better known by the name of Corilla (*see* IMPROVISATORI) In most European countries the sovereign has assumed the privilege of [illegible] with various titles [illegible] poets laureate, but the imperial poet, or Poeta Cesareo, in Germany, was invested with the laurel This crown, however, was customarily given at the universities in the middle ages to such persons as took degrees in grammar and rhetoric, of which [illegible] Baccalaureus (quod vide) has been derived In England traces of a stipendiary poet royal are found as early as Henry III, and of a poet laureate by that name under Edward IV Skelton, under Hen VII and VIII, was created poet laureate by the universities of Oxford and Cambridge, and appears to have held the same dignity at court, but [illegible] and court honour were distinct until the extinction of the university custom, of which Henry VIII's reign exhibits the last instance

Royal poets laureate are supposed not to have begun to write in English until after the Reformation The office was made patent by Charles I, and the salary fixed at 100*l* annually and a tierce of Spanish Canary wine Under Queen Anne it was placed in the control of the lord chamberlain In the reign of George III the annual tierce of wine was commuted for an increase of salary, and at the close of the same reign the custom of requiring annual odes from the lord chamberlain was discontinued

LAURINE A fatty matter of an acrid taste, contained to the amount of about 1 per cent in the berries of the common laurel

LAVA The substances which flow in a melted state from a volcano They vary considerably in texture and composition *See* GEOLOGY

LAVER (Lat lavo, *to wash*, because washed by the waters of the ocean) A species of *ulva* which is eaten as a delicacy

LAW, in Latin *Lex*, derived from the verb *lego*, I collect or select

Law collective and particular — We employ the term "law" to denote a body of rules or all the rules applicable to a given subject, e g the Roman Law, the Law of Nature We employ the term "a law" to denote an individual rule

The idea of law, in its strictest sense, comprehends the notion of two parties, a superior imposing it, and an inferior obeying it

Laws, improperly or metaphorically so called — In common [illegible] the word "law" to designate [illegible] can only be thus named by analogy Whenever certain causes invariably or generally produce like effects, this consequence of effect upon cause is popularly termed "a law" Thus we speak of the *law of nature* with reference to inanimate or irrational subjects, of the *law of gravitation*, by which bodies are mutually attracted to each other, of the *laws of motion*, of the *laws* which regulate certain processes in animal and vegetable economy, &c In this sense, laws have been defined to mean "the necessary relations resulting from the nature of things" The analogy is nobly expounded in a well known passage of *Hooker's Ecclesiastical Polity* at the end of the first book

Laws in their strictest sense as applied to the voluntary actions of man, comprises the notion of a command issued by a superior imposing an obligation on a subject

Laws Divine and Human Laws are divided according to the superior at [illegible] them, into divine and human the law of God, and the law of man

Divine Law — The Author of our being has declared his will to mankind at various times through the instrumentality of inspired prophets and teachers There are also certain rules of right and wrong commonly received, which are generally supposed to have their origin in the nature of man and to subsist independently of God's revealed will Thus the term divine law signifies, 1 Revealed law, 2 Natural law

Revealed Law — God, as the Lawgiver of the Jewish nation, dictated to Moses a code of laws for that people, comprising both a confirmation of such laws as are

commonly considered [illegible] sanctions, and also various minute ce[illegible] observances Thus the Jewish la[illegible] to consist of, 1 The moral law, 2 The ceremonial law, 3 The civil or political law

Law of Christianity — The second branch of revealed law is that which is declared to us in the New Testament

Law of Nature — The law of nature, however extensive in its philosophical meaning, is much more confined in that sense in which alone it is within the province of jurisprudence Regard[illegible] relative duties of men [illegible] practical purposes to ob[illegible] principle is the sociability of man, and, consequently that the conservation of society in its actual state whether from the motive of mutual distrust, as Hobbes maintained, or from innate benevolence, as his adversaries contended, is the duty which it imposes on every one

Let us suppose, therefore, that in a community such as our own there could occur at once a suspension of all civil positive law, and that, at the same time the sanctions of God's revealed law could be withdrawn Men would thus be restored to a state of natural liberty The natural law is that code of duties which would then take the place of all other legislation Every act tending to injure our neighbour in person and property every act in any way tending to [illegible] society would then be prohibited by natural law [illegible] now is prohibited by laws human and divine Undoubtedly the natural law in the sense in which it is commonly used comprehends a far wider range of objects The duties of personal holiness the relative duties of the members of a family, the duties of active benevolence, all these are dictated to us by conscience, as much as abstinence from positive injustice But the province of jurisprudence is too limited to admit of the consideration of these higher parts of morality, it is with political society only that she is concerned

Law of Nations — The principle of natural law between individuals in a community would thus be the maintenance of the status quo, or actual condition of things, and the insuring to every one the continuance of all his possessions This, therefore is the elementary dogma of that only branch of natural law which can be said to exist as a definite rule of conduct, namely, the law of nations Nations are in a state of natural liberty with reference to other nations For since they have no earthly superior to establish rules for them and since the decrees of Christianity, addressed as they are directly to individuals have been generally discarded in the practice of collective bodies, the only maxims which govern their intercourse are certain conventional arrangements the object of which is the maintenance of the existing society and intercourse between the subjects of distinct sovereign states All the rules of national law have this for their ultimate end The natural law of men to use the phrase of Hobbes teaches the absolute duties subsisting between men and men, the natural law [illegible] between men in societies [illegible] tion) national law is the law of nature applied to independent states as if they were individuals

The law of nations according to the comprehensive arrangement of Mackintosh comprises "the principles of national independence, the intercourse of nations in peace, the privileges of ambassadors and inferior ministers, the commerce of private subjects the grounds of just war, the mutual duties of belligerent and neutral powers, the limits of lawful hostility the rights of conquest the faith to be observed in warfare, the force of an armistice, of safe conducts and of passports the nature and obligation of alliances the means of negotiation, the authority and interpretation of treaties of peace"

But the law of nations, in its practical sense widely differs from this extensive and philosophical compendium of international duties Many of the maxims which relate to [illegible] belong rather to the the hig[illegible] to that of jurisprudence The only punishment of which the sanction can be applied in this species of law is the hostility of other states towards that which violates it Whoever, therefore, is powerful enough, whether from his own strength or from position and alliances, to defy such punishment, is, in a certain sense, above the law Hence, although the law of nations, considered as a branch of that of nature, would lay down absolute rules of conduct in the highest as well as the lowest matters of policy within its reach, it may safely be said that the law of nations as a body of recognized right extends only to a portion, and that the least important, of these matters The only maxims which can be said to subsist as laws are those which are never or rarely violated by European states, because the inconvenience of their general neglect would overbalance the particular inconvenience of adhering to them in a given instance Thus all will acknowledge that there is a wide difference in [illegible] on, between the principles which forbid unjust [illegible] or severity towards the conquered and those which prescribe the privileges of ambassadors and the protection of peaceful aliens

The subjects to which national law is most strictly confined are customary rules respected by the mutual consent of nations, rarely infringed by the voluntary act of a sovereign power, and of which the infringement is considered to require satisfaction and reparation

It is to be observed, that although several of the maxims of national law (such, for example, as the sanctity of the [illegible] of its rules are only recognized and observed by the Christian states of Europe and America in their dealings with each other

National law (from its defective sanction and want of a sovereign legislator as to its details) may, perhaps, be more properly termed the custom than the law of nations

The reduction of the law of nations to a system was first made by Grotius in a work which, as Sir J Mackintosh has well observed, though we now indeed justly deem it imperfect is perhaps the most complete that the world has yet owed at so early a stage in the progress of any science, to the genius and learning of one man To him succeeded Pufendorf, who avoiding the inconvenient and unscientific method of Grotius has, to use the words of the statesman already quoted, without the genius of his master, and with very inferior learning, yet treated the subject with sound sense with clear method with extensive and accurate knowledge, and with a copiousness of detail sometimes indeed tedious, but always instructive and satisfactory But in addition to the works of these illustrious authors, the rules of national law are to be found first in the treatises of several other authors who are usually regarded as authorities, of whom Bynkershoek (*Opera Omnia* fol Lug Bat 1767, Engl Trans fol 1749) Vattel, Wiequefort Rutherforth (*Institutes* 1779) Von Martens, and others, may be cited secondly in the treaties which have been at different times concluded between European states, especially those of Westphalia 1648, Utrecht, 1713 Aix-la-Chapelle 1748, Paris 1763 and Vienna 1814 A pretty complete summary of the bibliography of this subject will be found in the introductory chapter of Mr Manning's work on the *Law of Nations* (1839) (See also Dr Wheaton, on *International Law*, 2 vols 8vo Lond 1836)

[illegible] of letters and until the peace of Nimeguen (1679), the state language ordinarily used was the Latin, but since that period it has chiefly given way to the French which is now commonly used between nations employing different languages in their public acts

Law Positive or Municipal — This is the term usually employed to distinguish law in its ordinary sense (the expression of the will of the supreme power in a state), from all the other species of law (improperly so called) with which we have hitherto been occupied It is called *positive* law, because established in the form of direct and definite injunctions, *municipal* from the Latin *municipium* a town possessed of [illegible] and local laws

Positive law is "a rule of civil conduct prescribed by the supreme power in a state" Blackstone adds "commanding what is right and prohibiting what is wrong" [illegible] wrong prohibited acquire the character of right and wrong only from being so commanded and prohibited, the latter half of the definition is evidently comprehended in the first A regulation or body of [illegible] usually adhered to by men in their dealings with each other but not commanded by the civil power nor enforced by lawful punishment is properly called a custom, but when [illegible] whether set by men to each other on [illegible] or by subordinate bodies within the state to individuals, can be enforced by lawful punishment, the sovereign power allowing such punishment, the sovereign power thereby adopts the regulations, and they become laws in the strictest sense of the word

A law is also defined, "a command of a political superior obliging the subject to a particular course of conduct" This definition comprehends most of the civil institutions with which jurisprudence is concerned, but it appears to exclude some which are nevertheless within the province of that science For example,—

1 Many laws are enacted to explain former laws, and also to repeal former laws Neither of these can be said, in strictness, to answer the definition of law which describes it as a command, unless we consider them as [illegible] former [illegible] and [illegible] Roman jurists applied to form laws or imperfect obligations to certain [illegible] of their law prescribing particular conduct but without any penalty being expressed in the event of their violation These were not commands, not being enforced, and could not be said to oblige the subject, who was at liberty to escape the obligation Our laws recog-

nize no such rules as these If a statute enjoins or prohibits an action without adding any express penalty, the courts of justice *presume* that a violation of the statute is punishable Law as the subject matter of jurisprudence, is that which obliges the subject to a particular *course* of conduct by *general* rules of action This excludes —

1 Laws made to permit or restrain the acts of specified individuals Such were called by the Romans *privilegia*, or, under the emperors, private rescripts, in our law, *private acts of parliament* The sovereign body in the state, having the power to repeal and modify its own enactments, can by an expression of its will exempt particular persons from its own injunctions, or can impose new duties on particular persons Such decrees have all the force of law, but they do not form a part of the general law of the country

2 Laws made to suit a particular emergency, occasional or particular commands, which are distinguished from general laws by their *shorter duration* To exemplify this difference, it has been said that should a sovereign command all his subjects to wear black as their ordinary dress, such a command would be a law, but should he order a general mourning for a stated time, such an order would not have sufficient permanence to entitle it to that appellation

Every command given by a political superior is a law in point of force, but it is necessary to establish some distinction between occasional commands, as otherwise every direction every incidental command of a military superior must be considered as a law An act to suspend the collection of a duty for a given time, an order in council to admit bonded goods or to issue any temporary regulations respecting trade and commerce, royal proclamations, all these are familiar instances of the species of occasional or particular commands

Municipal law is commonly divided into two branches, that which concerns the public duties of individuals with reference to the state and that which concerns the private relations of individuals towards each other The division between these branches is not in all systems the same Under the old Germanic institutions for example, most crimes were considered as civil injuries only

Laws, strictly so called and forming the body of public right in each separate state are to be found either in codes sanctioned by the authority of the state, or in decrees issued and made public by such authority, or, finally in certain unwritten customs to which that authority, by

The code is to be found wholly or in part in the Koran, which to Mohammedans bears the character both of revealed and civil law Those of the Hindoos and many other nations have likewise the authority of an imaginary religious sanction

In Western Europe the laws in force in most of its countries, although modified and republished by their several legislatures, are in great measure founded on what is termed the Roman law This body of law is principally declared in the *Pandects*, *Code* and *Institutes* of the Emperor Justinian but these contain only a digest of a small portion of the laws which prevailed in the ancient Roman empire

The Roman Law —"Inasmuch," to use the words of our own learned judge Lord Holt, "as the laws of all nations are doubtless raised out of the civil law, as all governments are sprung from the ruins of the Roman empire, it must be owned that the principles of our law are borrowed from the civil law, therefore grounded upon the same reason in many things — The manner in which the Roman law has been introduced into the jurisprudence of modern Europe may be said to have been twofold first, through the prevalence of Roman usages, derived from the times of the empire among the population of various countries, especially that part of it which was collected in towns, secondly through the efforts of the ecclesiastics, who learnt the civil law from the *Codex* of Theodosius, and from the works of Justinian, and introduced it, as far as their authority extended, into such branches of justice as they were permitted to administer, and especially into their canon law, which the various princes of Europe permitted to be binding, to a different extent in different countries, upon their lay as well as clerical subjects Thus the Roman law is in one sense the oldest and fundamental part of public right in many countries, in another sense it was introduced by legislation, altering the character of the received institutions The Roman law comprises what are termed the *Institutes*, *Pandects*, *Code* and *Novels* (See these terms) These have been collected and usually published under the title of *Corpus Juris Civilis*, the best editions being those of Amsterdam (8vo 1664) for the text, and of Gothofred (folio, Paris 1628) for the text and notes The most elaborate modern work on the history of the Roman law is that of Savigny

It would be impossible, within our limits, to give the reader any useful bibliographical notice on a subject which has recently received much attention in Germany and England, and English treatises on the subject are numerous, and of no great value, that law having only existed among ourselves, as we have seen, in certain limited departments

Civil Law in England In England while in the way of ancient custom there are fewer vestiges of the civil law than in any other of the provinces of ancient Rome, yet in the way of ecclesiastical jurisdiction it has been wider spread and continued longer in force than almost any where else.

Although Britain was a highly civilized province possessing 140 cities and towns in the time of the Romans, yet the numbers and violence of her invaders, especially the Saxons and the Danes, appear to have extinguished almost every relic of her provincial customs and jurisprudence It is chiefly, therefore, to the clergy that we are to look for the prevalence of the civil law in England, and it has been introduced by them in several ways

1 At the Norman invasion a considerable accession to the numbers and influence of the spiritual body in England took place A century afterwards the discovery of the *Pandects* rendered the study of jurisprudence familiar chiefly among that body, who monopolized most of the learning and intelligence of the age They introduced it into England, and, as the rude and simple justice of the Saxons was inadequate to meet the wants of the people most of the early lawyers, who were themselves chiefly ecclesiastics, sought in the pages of their favourite works for principles to supply the defects as they arose Hence, in the works of Bracton, Britton, and Fleta (written expressly on the common law of England, that is, the customary law of the Saxons modified by extensive introduction of Norman usages), we find constant reference not only in spirit but in words to the civil The time during which the study of this latter was most in vogue among English lawyers appears to have been between the reigns of Stephen and Edward III During the greater part of that period a constant struggle was carried on between the ecclesiastical lawyers, supported in many cases by the crown, and the popular party in favour of the old which was defended by the temporal The victory of the common law, and its establishment as the rule of the land, except in particular cases, may be dated from the reign of Edward I

2 The jurisdiction of the lord chancellor of England is a subject considered elsewhere (*See* CHANCERY) It is sufficient here to observe, that as most of the chancellors under the Plantagenet kings were ecclesiastics and as the matters entrusted to their decision were such as the rules of the common law did not apply to, they generally searched for precedents in that of Rome, which has hence been largely imported into one great branch of modern English law, namely Equity

3 In some particular matters the rules of the civil law have always been allowed by custom to prevail in England These are, such as were taken cognizance of by the courts of in the High Court of Admiralty, the courts of and were ecclesiastical bodies

4 The chief influence of the civil law in England has been through the canon law, which was founded upon it

Law, Canon — The rules which were framed by the Christian church for its own spiritual polity may be supposed to have had their origin in the very earliest periods of Christianity itself, but all the authority and force which they possessed could arise only from the mutual consent of the faithful to be bound by them, until the establishment of Christianity as the religion entirely altered the character of The temporal jurisdiction which was naturally conceded to the bishops, together with the legal force given by several emperors, Justinian in particular, to the canons of councils, gradually called into existence a new and independent body of legislation

When the Western Empire had been overthrown, the authority of the popes, as temporal governors, was by the of Rome at the end of the of Western Empire, and the power of the ecclesiastical body was increased and extended in other countries, and the reverence attached to their authority gave to the spiritual censures with which they visited particular offences a greater force than to the sanctions of the national law Thus, besides matters of church government, which were at first the particular subject of the pontifical law, it comprehended within its purview numerous and important branches of the civil law of persons and property

About the year 1150, the various edicts then in force of the several popes, together with the canons of councils, and the authoritative declarations of fathers and doctors of the church, were collected together by the Monk Gratian, and reduced into a volume called the *Decretum*, and considered as the earliest authority in canon law

In the next century Pope Gregory IX published five books of Decretals, collected from the Decretal Epistles of the Popes to which Boniface VIII added a sixth book, about the end of the same century These were added, at subsequent periods to the Clementine Constitutions, a seventh Book of Decretals, and a Book of Institutes The whole of these authorities were collated and published by Gregory XIII in 1580, under the title of *Corpus Juris Canonici*

In matters of evidence, and as far as practicable in the forms of proceeding, the compilers of the canon law founded their system upon that of Rome, with which they were best acquainted In all such matters of civil jurisdiction as their legislation embraced, they likewise assumed it as the basis of their structure By the practice of all ecclesiastical courts the civil law is allowed to come in aid of and to supply the canon law, in all such cases as are there omitted The subjects of the canon law were, 1 The hierarchy and government of the church, 2 All [illegible] 3 The wills of defuncts, [illegible] in most European countries to its full extent Its jurisdiction only subsisted by the toleration of princes, and therefore varied, according as the superstition or piety of these sovereigns, or their jealousy of ecclesiastical usurpation, alternately predominated But, upon the whole, its authority became so deeply rooted that even in countries which have rejected in later times the authority of the pope its rules are still referred to not merely in matters relating to church benefices, but also in some cases of purely civil jurisdiction

Nevertheless, although in early times its authority was asserted by the popes on the ground of their temporal superiority over all earthly sovereigns, its force in every country must now be said to depend upon the will of the state, which gives the force of law to its provisions [illegible] the church [illegible] as A D 60 shortly after the introduction of Christianity among the Saxons, but they were not fully recognized by the state until after the Norman conquest The bishops who held in Saxon times sate with the sheriffs and landed proprietors in the county courts, then withdrew from participation with the execution in civil government From that period the power of the bishops made rapid strides, insomuch that they have succeeded in retaining many branches of jurisdiction of which in other countries the temporal power has deprived them In addition to the general canon law we have in England a particular provincial law—the *constitutions* of the papal legates and councils of this country in 1237 and 1269, and a further body of constitutions framed in provincial synods under the authority of successive archbishops of Canterbury, from Stephen Langton in 1222 to Archbishop Chichele in 1414, and adopted subsequently by the province of York. These constitutions have been illustrated by the commentaries of distinguished ecclesiastics and principally those of Lyndwood, who flourished in the reigns of Henry V and VI The canons of the Protestant church passed in the Convocation of A D 1603, although ratified by King James I for himself and his successors yet do not (as Lord Mansfield finally decided) bind the laity except so far as they declare the older provisions of the law The most standard work [illegible] lesiastical Law is *Gibson's Codex Juris* [illegible] est guides for the student are the treat[illegible], and the recent one of Mr Rogers (1840)

Law of England Common Law — This expression is used in two different senses, according to the subject under consideration We speak of the common law in contradistinction to the civil law, or to equity, meaning a certain portion of [illegible] matter, and administe[illegible] rules of evidence and modes of procedure We also by the common law, sometimes mean the unwritten or ancient customary law in this sense it is opposed to the statute law, which is of positive enactment

The constitution and laws of our Anglo-Saxon ancestors have been the subject of innumerable theories and contradictory systems, since the ingenuity of modern times has [illegible] investigation but all the efforts of the learned have gone no farther than to establish the existence of a few principles and customs common, for the most part, to the Germanic tribes in general The leaders of the Saxons emulated each other in assuming the kingly dignity in every district of the island, and endeavoured, as far as the independent spirit of their followers would allow, to adopt the imperial style and legislative powers which the British kings had derived from the provincial tyrants of the empire, and these from the Cæsars [illegible] and rights, and [illegible] the [illegible] But for centuries England was one battle field, between the several clans of Saxons who had usurped her dominion Mercia, Wessex, and Northumberland were divided in law and custom scarce less than in government, and when the island had at last fallen under the dominion of a prevailing Saxon dynasty, the invasion of the Danes [illegible] adulterated her blood and her institu[illegible] the Confessor reduced the customs of the country into something resembling a system of law, and although his enactments are lost, it is to his reign that we must look for the most authentic form of Saxon polity The king was guided and controlled in his deliberations by the witan, or chief men, assembled in the gemote, or meeting, but their relative power and that of the sovereign varied according to the strength or weakness of the latter The body of landholders held their lands by an independent tenure which custom rather than law had rendered hereditary, but there were many who held benefices or enjoyed land under personal grants from the king, or from the great earls who had succeeded the aldermen of the early Saxon times, or from the thanes or inferior nobility Great part of the land was cultivated in common by the people of hamlets and tythings Justice was administered in the county courts, where the *good men* or land owners assembled, and the bishop and sheriff presided Questions of property were decided by ordeal or by a tribunal of sworn witnesses In criminal as well as civil cases the defendant sometimes freed himself by the oath of [illegible] er of law, as it was called when ad[illegible] The inhabitants of every district were mutual guarantees, by the custom of frankpledge which was founded on two principles the one the liability of the lord or superior for the appearance of his vassals, the other, the collective responsibility of the tything or hundred for all its individual members which was not prevalent in all England, and entirely unknown in the northern shires

By the Norman conquest and the division of the better portion of England between Norman proprietors holding in chief of the crown the feudal system of law, as regarded land and its incidents, was early introduced into the country Other portions of Norman jurisprudence were imported at a later period, through the medium of the king's courts, which being at first confined in jurisdiction to the domains of the crown, gradually supplanted the old Saxon courts although these long continued to be governed by their national law

The three great [illegible] from that of other of tenures and their incidents on which the law of real property is founded, and the trial by jury—may perhaps be said to have been founded on Norman jurisprudence but to have become prevalent through their analogy to Saxon institutions See PARLIAMENT

The first consequence of the invasion of the Normans was that different modes of trial were prevalent according to the nation to which the contending parties belonged Compurgation or 'wager of law" was the common mode of decision between Englishmen In criminal cases it was usually by the oath of eleven compurgators chosen out of an array of fourteen In civil suits, the amount of the compurgation required seems to [illegible] value of the property claimed [illegible] mode of trial was added the *wager of battle* which is first named in the laws of the Conqueror, but which either French or English and French might use *Inquest of witnesses* was a Norman mode of trial in civil cases by which witnesses were summoned from the neighbourhood in which the quarrel arose to declare on their oath the truth concerning the matter in question Finally, the ancient proof of *ordeal* subsisted in criminal cases

This diversity in the modes of trial was accompanied by a diversity of judicature The ancient county courts received one blow by the withdrawal of the bishops, who ceased to preside in them becoming chiefly foreigners, and who gradually established, as before shown a separate jurisdiction of their own A still more important wound, in its consequences, was inflicted by the increasing power and influence of the king's courts, at first only confined to causes arising within the royal demesne, in which the Norman law and modes of procedure were adopted, and in which the machine of our own common law was gradually elaborated by judicial ingenuity during successive centuries

Henry the Second is commonly regarded as the founder of the common law His principal contribution towards it consisted in his ordinance of the grand assize, justices in eyre, or circuit justices of the king's courts, being appointed to try causes by inquest of twenty-four witnesses, at the option of the tenant or demandant, if either party preferred to purchase this mode of trial instead of the ordinary trial by battle Shortly after his reign the Fourth Council of Lateran, by abolishing the ordeal (A D 1215), gave a new impulse to the development of the jury system Criminal cases were now tried by a jury of witnesses de vicineto, and the process by which these witnesses, both in civil and criminal cases, became con-

verted into sworn judges of the fact, has never been distinctly traced, but the intermediate steps had certainly all been passed before the reign of Edward III, possibly before the death of the first monarch of that name

If Henry the Second was the founder, Edward I may almost be [illegible] of the common law From his [illegible] ange has taken place in its general principles all that subsequent reforms have effected has been to accommodate those principles to altered circumstances And long may the spirit of these institutions remain unchanged amidst the march of improvement,—holding together, as they now do, the mightiest commercial community of the globe, with no less beneficial authority than they exercised six hundred years ago over the barons, peasants, and burghers of a small feudal monarchy!

The system of real property may be said to have been fixed by the statute *Quia Emptores*, 18 Edw I Before that time we may consider the lands of England as having been subject, in general, to the unrestricted feudal law All land was held, mediately or immediately, of the king The two classes of free proprietors were those who held by the military service (of Norman introduction) and those who held by the old Saxon custom their property in their lands being retained by them, subject only to acknowledgment or fealty to the sovereign,—a less honourable, but probably a less burdensome tenure But either of these tenants might in his turn, create fresh tenants under him, yielding the same homage to him which he yielded to the sovereign Below these, the only two classes of tenants recognized by the law were those who held of the king, or mesne lords, by pure villenage or absolute and base service, and by villein socage, which was also a base service, but restricted to certain specified duties From the tenure of pure villenage have sprung our present copyhold tenures, by which certain lands are held within *manors* (which are the old estates held in early times directly of the king) by the *will of the lord*, as it is expressed in their grant, although by long usage the will of the lord is merely nominal, and the obligations of the tenant consist only in certain specified rents and services

The object of the statute *Quia Emptores* was to restrain the creation of fresh subordinate [illegible] that if any one alienated his land by [illegible] which purported to convey it in perpetuity) the feoffee should hold the same, not of the feoffor, but of the feoffor's lord whether a mesne lord or the king himself Hence all manors must have existed prior to the reign of Edward the First, as it is essential that there should be in them tenants who hold of the lord and such tenancies could not have been created at a later period

When alienation of lands and tenements was made in early Norman times the alienation was either to the donee and his heirs for ever—thus giving him an absolute unrestricted property descendible to his heirs, whether male or female subject only to his homage to the donor, in other words, a *fee simple*, or it was upon condition—as, for instance, a grant to a donee, provided he had issue, under which grant, if the donee died without issue or his issue came to fail, the land would revert to the donor The conditional donees had devised, with the assistance of the king's judges, various ingenious methods of defeating these provisions, as by altering as soon as they had issue, and then repurchasing the fee-simple It was to fix the law of conditional gifts that the statute *De Donis* 13 Edw I, was passed, by which such a donee was absolutely prevented from altering the tenements Hence arose *estates in fee-tail* in other words, estates granted to a man and to certain specified heirs, for example, the heirs male of his body In after times when the restraint on alienation which this statute created began to be repugnant to the more liberal feelings of the people, certain devices were invented (fines and recoveries), whereby the donee in tail was enabled to bar the entail and acquire the fee-simple, as he could have done before this statute was passed

Besides these famous statutes, we find the reign of Edward I distinguished by the confirmation of Magna Charta and the Charter of Forests The first of these great constitutional acts contains few provisions of much importance in legal history, and was far more valuable as an evidence of the spirit of the country in restraining arbitrary usurpations, than as is commonly supposed, by establishing any new franchises or even confirming ancient ones Perhaps its most important legal effect was the fixing to the city of Westminster the court of Common Pleas, which had formerly caused the suitors much inconvenience by following the person of the king in his numerous progresses

It is also to Edward the First's reign that we must refer for the distinct definition of the province of that court, and of the other two superior common law courts of record, the King's Bench and Exchequer The history of these three courts is far too intricate, and requires too much exposition to find a place in these pages I must call [illegible] that the King's Bench [illegible] which the king was supposed, as it [illegible] is, to sit in person, and which followed him in all his progresses, insomuch that in the reign of Edward I it actually sate in Scotland Its jurisdiction consequently extends to all matters which are of the king's prerogative it took cognizance of criminal causes on the crown side, and of civil causes, at first those in the result of which the king was interested and by a fiction all personal actions whatever It was likewise a court of appeal from all inferior courts of records The court of Common Pleas, or Common Bench, had in strictness jurisdiction in all civil causes between subject and subject In this court only real actions, in which the right to land is tried—now nearly fallen into disuse (*see* PLEADING), but anciently the most important part of judicial business—could be adjudicated The court of Exchequer was intended to recover the king's debts, and [illegible] revenues of the crown It acquired in process of time a jurisdiction over common personal actions, by the fiction [illegible] a debtor to the king, and [illegible] similar in form to that of the chancellor's court

The equitable jurisdiction of the chancellor had probably commenced long before the reign of Edward I (*see* CHANCERY), and before his reign the original writs, by which actions were commenced, had been sued out or obtained in the chancery the clerks of which, like the pontifical framers of the *actiones* among the Romans, had the monopoly of drawing up the original instruments In the reign of Edward I (by *Statute of Westminster the Second*, 13 Edw I) an important change was made in this branch of law, by authorizing the clerks to frame writs adapted to particular cases which the old forms did not adequately suit. Hence originate our modern actions of *trespass on the case* *See* PLEADING

From the same statute the modern judges of *assize* and *nisi prius* (*see* NISI PRIUS) are chiefly derived These were originally occasional commissioners, sent down into the counties to deliver the gaol of prisoners, or to try civil causes By this statute the commission was first directed to be given to the king's justices, associated (as they still are in form) with one or two discreet knights of the county The commission of assize is, strictly speaking, a commission to try disputes respecting land wherein the writ of assize (which dates as before stated, from Henry II) was brought,—now fallen into disuse The commission of *nisi* [illegible] be called a legal fiction [illegible] tion in the superior courts (*see* PLEADING) are concluded, and an *issue of fact* is taken between the parties, the issue is appointed, by the entry on the *record* or written proceedings, to be tried by a jury from the county in which the proceedings arise at Westminster, *unless before* the day appointed (*nisi prius*) the judges shall have come to the county in question Besides these commissions, the same judges try criminal cases by virtue of a *commission of the peace* in which they are associated with the justices of the county, a commission of *oyer and terminer*, to hear and determine all treasons felonies and misdemeanors, and a commission of general gaol delivery, to try and deliver every prisoner who shall be in the gaol at their arrival in the county

Having referred to the reign of Edward I as the period under which a general sketch of our old common law might be most advantageously presented, we proceed to notice very briefly the chief alterations which mark its subsequent history These alterations can be easily ascertained where they were caused by the highest legal authority—by the parliament of the nation But far greater changes have been wrought by the silent course of the tribunals—by the discretionary power which our judges have assumed to extend the remedies, which they were authorized to administer, to cases unprovided for by earlier law, which either the ingenuity of practitioners, or in many more instances the increasing wants and more intricate relations of life had called into existence To trace such alterations is as impossible as to note, day by day the increase of stature by which the child grows into the man Often in laboriously investigating the history of our English jurisprudence, we are surprised when we look back, after perusing the events of a generation or a century, to the state of things as it existed at the beginning of that epoch, and find that although we cannot with all our diligence detect in its history the occurrence of any external changes in the subject on which our minds are fixed, yet the same forms, the same modes and circumstances, present themselves to our eyes under a totally different aspect and character

The reigns of Henry II and III are principally remarkable for the gradual substitution of the king's justices of the peace for the various elective magistrates who exercised the several duties of that office before It was in the reign of the latter prince also that the parliament is supposed to have finally acquired its present form Under the successors of the Edwards, and during the wars of the [illegible] [illegible] were made to the general [illegible] law, but during those

times very great changes were silently taking place in the disposition of property by means of the invention of Uses, borrowed from the civil law This extensive and most important subject will be found briefly treated of under the head of CHANCERY

The laws of Henry VII had principally in view the benefit of the exchequer, and hence various more comprehensive modes of enforcing justice against delinquents who might be liable to fine date from his reign methods which in their practice were oppressive and arbitrary, although not without check in the hands of justice Such was the proceeding by information, instead of indictment, in various cases on behalf of the crown The Statute of Fines, passed in this reign confirmed and extended a mode already in use of barring entails Under his successor, whose reign forms so important an epoch in political history, the laws of property were very considerably remodelled by the two statutes of Uses and of Wills (for the former, see CHANCERY) The latter rendered general the power of devising estates by will The system of bankrupt laws also had its commencement under Henry VIII His daughter Elizabeth did not add much to the essential and valuable parts of our statute book, but under her government the acts which restrained the alienation of lands by ecclesiastical bodies were passed and also the celebrated statute respecting the poor, of which the policy forms, even at the present day, a subject of such ardent controversy In the succeeding century, the reign of James I witnessed the first attempt to limit the period at which actions and suits might be commenced, and the first statute of bankruptcy But it is most remarkable for the laborious attempt to systematize our ancient law by Sir E Coke, one of the most acute, if not philosophical jurists of any age or country That of Charles II forms the next marked epoch in the history of our law after those of Edward I and Henry VIII His restoration was distinguished by the abolition of feudal tenures and incidents and the reduction of all the modes by which estates of inheritance might be held (with few exceptions) to two only,—free- The Statute of Frauds, a necessary unwary transactors of business but a source of endless litigation, the statute which regulates the distribution of the effects of intestates, and finally, the celebrated Habeas Corpus Act, which gave or rather confirmed, to every person imprisoned by any authority short of the express [illegible] course of justice, the means of releasing himself — are all productions of this reign

[illegible] gave rise to new views and [illegible] on jurisprudence did not in England produce much substantial alteration by statutory enactment It was rather a period of preparation for change, in [illegible] than of actual reform [illegible] learning and acuteness of several judges who occupied the seats of justice during many years, and introduced by the slow exertion of their own authority a new spirit into institutions of which the forms were preserved

Recent years have introduced some material changes, of which the effect has not yet been fully tried Lord Ellenborough and Lord Eldon had pursued the work of maintaining and embellishing the old institutions, succeeding judges have at last assumed in some degree the character of reformers Sir Robert Peel's criminal statutes conferred a great benefit on the country by removing many of the technical difficulties incident to this branch of law although they did not materially affect its spirit, which, in the article of capital punishments has been [illegible] by a succession of enactments, from [illegible] reign of George III until that of our present sovereign Many of the artificial distinctions, grounded on obsolete reasons, which subsisted between the practice of the different common law courts have been removed The system of pleading (see that article) has been very materially changed And in consequence of the general feeling in favour of local courts of justice to administer redress in trifling disputes between [illegible] has been [illegible] and some local tribunals have been constituted Lastly the ancient usage of imprisonment on mesne process has been abolished, and much additional power given in lieu of it to the Insolvent Court over the property of debtors

The term Common Law is ordinarily employed in two different senses In its legal signification it expresses the old unwritten law, established by precedent and custom, comprising, it has been said, "all recognized doctrines and customs, however introduced, which are neither to be found in the statute book, nor depend on the adjudication of courts of equity For this floating mass of legal principles our ordinary sources are precedents or [illegible], as contained in published [illegible] reference may sometimes be had to more uncertain guides the dicta of legal writers or the general principle and tendency of our laws, for authority in deciding a particular dispute

In its popular sense, common law is opposed to equity and ecclesiastical law; and thus comprises the whole of that law, both criminal and civil, which is administered in courts having trial by jury, and all the other subjects which are within the purview of the common-law courts of Westminster Hall, and of the various local jurisdictions of the country (except so far as some of them exercise equitable authority) It has been defined "the whole of that code, whether founded on statute, usage, or precedent which is administered in the common law courts of Westminster Hall," and this definition will comprehend the law administered in the various local courts in question, as these are bound to act on the decisions of the superior courts Its peculiar characteristic is, that questions of fact arising out of its proceedings are submitted to the decision of a jury

It is, perhaps, not very easy to assign either the history or the theoretical principles of the separation of equity from common law The former was undoubtedly in the first instance a jurisdiction of a remedial character, intended to moderate, according to the conscience of the judge, the rigour of legal judgments, but this is a peculiarity which can scarcely be said to distinguish it in the present day Its rules are as accurately laid down by precedents as those of the common law itself, but there are some subjects (as, trusts) which [illegible] in frustration of the provisions [illegible] out of [illegible] over these courts of equity have an *exclusive* [illegible] There are others over which both equity and law have *concurrent* jurisdiction But the remedies applied by law to injuries committed are subject to certain inflexible rules The power of a jury has limits from the very nature of the institution It can award a debt sought to be recovered, or damages for an injury, but it cannot modify the remedy according to peculiar circumstances Nor has it any means to enforce a course of action other than by imposing damages for neglecting it To take a familiar instance —If A sues B at law for breach of covenant, and judgment passes in favour of A, all that a jury can do is to award damages to A for the breach of contract, but equity can by a process of its own, compel B to a specific performance of the contract under the penalties attached to a contempt of court So, if one of several joint contractors be liable, at law, for penalties or debts incurred in respect of their joint undertaking his only legal remedy is by an action against each, in equity he can compel each of his partners to contribute to the extent of their liability

LAW, MARITIME *See* MARITIME LAW

LAW MARTIAL, is proclaimed by authority of parliament, on an emergency of rebellion, invasion and insurrection It is properly the putting under the cognizance of courts martial a great variety of subjects which by ordinary military law do not appertain to them to be [illegible] Where martial law is proclaimed [illegible] under all circumstances are placed within its jurisdiction even their debts are subject to inquiry before a military tribunal It extends also to a variety of cases not relating to the discipline of the army, and offences committed by non-military persons, as plots against the sovereign intelligence to the enemy, &c The statute for putting into execution martial law usually gives a power to arrest and detain in custody all suspected persons and to cause them to be brought to trial in a summary manner by courts martial, and to execute the sentence of all such courts whether of death or otherwise, and declares, that no act done in consequence of these powers shall be questioned in any of the king's ordinary courts of law and that all who act under the statute shall be responsible for their conduct only to such courts martial

LAW MILITARY, is properly that law which is administered by courts martial, under the authority of parliament and the Mutiny Act [illegible] usually printed together with the Articles of War See COURTS MARTIAL

LAWN (Fr linon) A fine variety of cambric, formerly exclusively manufactured in Flanders Of late the lawn manufacture of Scotland and of the north of Ireland has been brought to rival that of the Flemish weavers

LAWN In Gardening, a surface of grass or turf in pleasure grounds kept smoothly mown

LAXATIVE (Lat laxare *to loosen*), a gentle aperient medicine opposed to *cathartics*, which are drastic purgatives

LAY (Probably the same word with the German lied, *song*) The lyric poems of the old French minstrels, or trouvères, were termed lais, but [illegible] modern usage, to be peculiarly appropriated to [illegible] poems, or serious subjects of moderate length in simple style and light metre

LAY In Agriculture *See* LEA

LAY BROTHERS Persons received into convents of monks, under the three vows, but not in holy orders The introduction of this class of devotees appears to have [illegible] They are dressed somewhat [illegible] monks or *brothers of the choir*, and often employed in the manual exercises necessary for

the uses of the community The Carthusian and Cistercian orders are said to have first recognized the distinction, and their example was followed by the other orders The same distinction exists in monasteries of females between the nuns properly so called and the lay-sisters, or sist rs c nv rs

LAY ELDERS In Presbyterian churches ministers of ecclesiastical jurisdiction, r s who assist the pastor in each BYTERIANS, KIRK) The divines of that persuasion rest the appointment of lay elders in some measure on that of presbyters "in every city," by Paul and Barnabas, who, they imagine, from the manner in which they are mentioned, could not have been all preachers (See *Hooker Eccl Pol* b vi)

LAYERS In G by laying down s with soil so that the extremity of the shoot is left above ground, and the shoot itself not detached from the plant In order to facilitate the rooting of such layers the portion of the shoot buried in the soil is fractured by twisting or bruising, or cut with a knife immediately under a bud This operation, by obstructing the return of the sap from the leaves, occasions its accumulation at the wounded part, when roots are there produced from the effort of nature to perpetuate life

LAYING In Architecture the first coat on lath of plasterer's two-coat work the surface whereof is roughed by sweeping it with a broom, the difference between laying and *rendering* being that the latter is the first coat upon brick

LAYMAN (Gr λαικος, from λαος, *people*) The appellation by which the rest of the community are distinguished from the clergy (*See* LAITY)—*Layman*, or *lay figure*, among painters signifies a small statue whose joints are so formed that it may be put into any attitude for the purpose of figures

LAZAR HOU (Ital) A public building in the southern European states, of the nature of an hospital, for the reception of the poor and and those afflicted with contagious disorders In some places lazarettos are set apart for the performance of quarantine, in which case only those are admitted who have arrived from countries infested by the plague, or suspected of being so Howard's well-known account of the principal lazarettos of Europe furnishes the most detailed and interesting particulars of the establishments and to it we refer the reader for full information

LAZARISTS In Ecclesiastical History, a body of missionaries founded by St Vincent de Paule in 1632 so priory of St Lazarus at Paris Their primary object was to dispense religious instruction and assistance among the poorer inhabitants of the rural districts of France They were dispersed at the time of the Revolution but have since re established a congregation at Paris and the French government has lately projected entrusting them with the spiritual care of the colony at

LAZARUS, SAINT ORDER OF of religious persons, originally an association of knights for the purpo Se m lazar houses or hospitals and Being driven out of Palestine in 1253 they followed St Louis to France In 1490, their order was suppressed by Pope Innocent VIII and united with that of St John but the bull was not universally received In 1572 they were united in Italy with the order of St Maurice, in 1608 in France, with that of Our Lady of Mount Carmel The knights of these united orders were allowed to marry

LAZULITE A blue mineral from Styria and the Tyrol, composed of 66 alumina, 10 silica, 18 magnesia, 2 lime 3 oxide of iron

LAZZARO'NI A name given to the poorer classes at Naples, from the Hospital of St Lazarus which served as a refuge for the destitute in that city Forty years ago two large sections of the people were generally comprehended under this name—the fishermen, and the lazzaroni properly so called, who lived in the streets, and performed no other labour but that of errand porters and occasional servants These alone were estimated at 40,000 These Lazzaroni formed a powerful community, which under Masaniello accomplished the revolution of Naples and in later times overthrew the popular government, under the influence of Cardinal Ruffo and the English party But during the French occupation of Naples they ceased to exist as a distinct class, and the name is now only used to designate in general language the mob or populace of that great city

LEA, in Agriculture, is a term applied to lands which are kept under grass or pasturage for a short period For example, in a rotation of fallow, wheat, clover, and rye grass, for three years and rye grass, is said to be land, in lay

LEAD A metal of a blueish-grey colour Its specific gravity is 11 38 It is very soft, flexible, and inelastic, and though ductile and malleable, is possessed of very little tenacity It fuses at about 600°, and if air be carefully excluded, it does not appear to be volatile at a white heat When melted in open vessels, it soon changes into a grey powder, which upon further exposure to heat and air becomes yellow, and is called *massicot*, or, when partially fused, so as to assume a scaly form, *litharge* If massicot be [illegible] and partly converted into a brown powder, which is insoluble, and is a *peroxide of lead* Massicot, or the yellow oxide of lead, is the *protoxide*, and that which forms the salts of this metal it is constituted of 1 atom of lead = 104, and 1 of oxygen = 8, and its equivalent is 112 The brown peroxide consists of 1 atom of lead and 2 of oxygen, and red lead is intermediate between the two extremes, consisting probably of an indefinite mixture of the two oxides The protoxide of lead is soluble in the greater number of the acids and forms a variety of salts, of these the carbonate and the acetate are the most important *Carbonate of lead*, or, as it is commonly called, *white lead*, is the basis of white oil paint, and consequently of a number of other colours [illegible] sheet lead to the fumes of [illegible] corroded, and its surface [illegible] incrustation, which, when scraped off and well levigated, is white lead This article is also made by precipitating a solution of acetate of lead by carbonate of soda, it consists of 112 oxide of lead and 22 carbonic acid *Acetate of lead* is made by dissolving carbonate of lead in acetic [illegible] met with in confused crystalline masses It is soluble in about 4 parts of cold water and the solution has a remarkably sweet taste, whence the term *sugar of lead*, usually [illegible] salt It consists of 112 oxide of lead and [illegible] The crystals include 3 atoms of water, and are therefore represented by the equivalent 190, or 163 dry acetate and 27 water When protoxide of lead is boiled in distilled vinegar, or in a solution of acetate of lead, a dense solution of subacetate or *triacetate* of lead is obtained it is difficultly crystallizable This solution is often used in the chemical laboratory as a test and precipitant and it forms the *extract of lead*, or *Goulard's extract* of pharmacy

The most important native combination, or *ore of lead*, is the *sulphuret*, composed of 104 lead and 16 sulphur It is the *galena* of [illegible] demands for le [illegible] sulphur, and the [illegible] with charcoal The action of water upon lead is curious and interesting in consequence of the universal use of cisterns lined with this metal Perfectly pure water, such as distilled water put into a clean leaden vessel and exposed to air soon oxidizes and corrodes it, and delicate tests discover oxide of lead *in solution* in the water, but river and spring water exert no such solvent power the carbonates and sulphates in such water, though in very minute quantities entirely prevent its solvent power Hence it is that leaden cisterns are used with impunity for the preservation of common water and that the crust which forms upon the metal effectually prevents all further action As this crust partly consists of carbonate of lead, which is very poisonous great care should be taken to prevent its diffusion through the water upon any occasion, as by scraping or cleaning the cistern There is another way in which leaden cisterns sometimes prove injurious, and that is in consequence of galvanic action, where iron or zinc pipes are soldered or let into them the lead is thus rendered electro negative alkaline matter is evolved upon it and small quantities of the oxide or carbonate are thus rendered soluble There are several re-agents by which very minute quantities of lead may be detected, among these solution of sulphuretted hydrogen is perhaps the most effective it produces a brown tint in water containing the minutest trace of lead, and it similarly discolours the greater number of the insoluble salts of the metal A solution of sulphate of soda is also a sensible test of the presence of dissolved oxide of lead, it forms a white cloud in water containing the smallest traces of it a fragment of iodide of pota such water presently occasions in it a sequence of the formation of an iodide of lead

LEAD, BLACK *See* PLUMBAGO

LEAD, for Sounding The common hand lead weighs 11 lbs with about 20 fathoms of line The leadsman stands somewhere on the side of the vessel, leaning against a band for the purpose lets the lead descend near the water, then, swinging it over his head once, or twice if the ship is going fast, throws it forward The line is marked at 5, 7 10, 13, 17, and 20 fathoms The numbers between are called *deeps*, thus, 'by the mark 7," "by the deep nine," indicate 7 and 9 fathoms

When the depth is great, the deep-sea lead of 28 lbs is used The lead is dropped from the fore part of the vessel, the line being passed outside all It is generally necessary to heave the ship to

LEADING NOTE In Music, the sharp seventh of the scale

LEADS, or SPACE LINES, are pieces of type metal cast to size for the lines of a page, thinner than types, so that they do not take any ink in printing, but leave a white space where placed These pieces are to be placed between the lines of a page already printed, which is considered to look better than when printed solid, and also to branch out the heads of pages and titles

LEAF (Sax) An expansion of the bark at the base of a leaf-bud [illegible] being at once that of respiration and transpiration It is a plate of parenchyma, through which spiral vessels and woody tissue ramify Its surface is covered with stomates, which communicate with minute hollow chambers in the interior It is in the leaf that all the peculiar secretions of a plant are prepared out of the under sap which the roots obtain from the soil

LEAF-BUDS Rudiments of young branches, made up of scales imbricated over each other, the outermost being the harder [illegible] minute axis which is [illegible] woody and cellular tissue of the stem When stimulated by light and heat they extend into branches, or if artificially removed from the plant that bears them they are capable of multiplying the individual from which they have been taken

LEAFLET A small leaf formed by the petiole of a leaf branching out, and separating the cellular tissue of the lamina into more than one distinct portion, each of which forms a perfect leaf in itself

LEAGUE A measure of length, used in reckoning distances by sea The sea league is three nautical or geographical miles or the 1-20th of a degree, and consequently about 3 4 English miles

The common land league is a well-known itinerary measure on the continent of Europe, chiefly in France The French, however, have two distinct leagues the legal posting league (*lieue de poste*), containing 2000 toises, and equal to 2 42 English miles, and a league of [illegible] (frequently the *lieue moyenne*) or equal to [illegible] miles This last, however, can scarcely [illegible] and previous to the [illegible] in the different pro[illegible] ived from the Celtic leach, *stone*, the distances having been marked by stones in the Roman provinces In Gaul alone of those provinces, they were marked in some instances by leagues as well as miles The Gaulish league was considered by the Romans as equal to a mile and a half of their own measure, or as containing 1500 Roman paces It is supposed that the [illegible] or *leuca*, was introduced into England by the Normans where at an early period it came to be reckoned as equivalent to two miles of the time, this being the sense in which the term *leuca* is used by the oldest law writers, and in most of the old English charters *See* MILE

LEAGUE, in Politics appears to be in strictness an alliance between two or more powers, in order to execute some common enterprise It is therefore more active, and less durable, than an alliance or a confederacy both of which have some permanent object, while neither necessarily requires active co-operation In the middle ages, the word league was used nearly in the sense now attached to these latter terms hence we read of the Hanseatic league, and of the three leagues still subsisting in the canton of the Grisons in Switzerland, both of which were more properly confederacies The word is of Spanish origin, and it has been said that the period of its commonest use in political language was commensurate [illegible] and [illegible]

LEAGUE SOLEMN [illegible]

LEAGUE THE HOLY [illegible] **THE LEAGUE** In [illegible] formed by the Roman Catholic party in France under the reign of Henry III The project of the League is said to have been framed by one David an advocate, or, rather, he first conceived the idea of [illegible] tions of the Catholic party in [illegible] confederacy His written scheme bears date 1575 It was ardently received, especially by the [illegible] citizens of Paris and other large towns [illegible] the League was at first only the overthrow of the Protestant power, but the princes of the house of Guise soon placed themselves at its head, and the leaders of the party were not slow [illegible] chang[illegible] [illegible] on the [illegible] citizens, under the impulse of the League, drove Henry III from Paris on the day of the Barricades, and formed the revolutionary government of "the Sixteen" But after the death both of the duke and the king, much division arose in the head quarters of the League at Paris as to the choice of a successor, and in both the popular party, or that of the Sixteen, was put down by the citizens which event in effect destroyed the power of [illegible] ll continued to exis[illegible] [illegible] IV

LEAKAGE [illegible] e customs, granted to importers of wine for the waste and damage [illegible] to receive by keeping

LEAN-TO [illegible] itecture, a building whose ra[illegible] [illegible] inst or le[illegible] another building

LEAP YEAR, or BISSEXTILE A year containing 366 days [illegible] occurs every fourth year, [illegible] centuries, in which cas[illegible] unless the number of the year is divisible by four The term is probably derived from the *leap* or start occasioned by the insertion of the intercalary day, and would have been more appropriate if the year had been deficient by a day instead of being redundant *See* CALENDAR

LEASE in Law, is properly a conveyance of lands and tenements (usually in consideration of rent or other annual recompence), made for life, for years, or at will, but always for a less time than the lessor or party letting has in the premises The usual words of operation are, "demise grant, and to farm let" The conveyance by a lessee of part of his interest is properly an under-lease, of the whole [illegible]

LEASE AND RELEASE In Law a mode of conveyance appropriate to estates of freehold in lands, tenements or hereditaments Before the Statute of Uses, 27 H 8 c 10, it was customary to give lands to one person for the use of another, or to devise the use of land to one party, while the common law right to the same land descended to another In a court of equity the legal owner of the fee was compelled to cede to the *cestuy que use* or proprietor of the use, the enjoyment of the land, and certain modes of conveyance were employed by which the use was conveyed independent of the legal estate By that statute uses were declared to be executed, i e that if land were conveyed to one party to the use of another, the *cestuy que use* became seised of the legal estate Hence a *bargain and sale*—i e a deed in which for a recited pecuniary sum, technically called a *consideration*, land was conveyed to A to the use of himself or of B—became a good conveyance, because the deed gave the use and the statute immediately added the legal estate To prevent secret conveyances it was consequently enacted in the same reign, that no estate of inheritance or freehold should be conveyed by bargain and sale, unless the deed was enrolled or registered in a certain specified manner But as this statute did not extend to bargains and sales for a less estate than of freehold, the ingenuity of lawyers soon devised a new method of secret conveyance the land was made over to the purchaser by bargain and sale for a year and then the purchaser received a release of all the vendor's remaining interest Thus, by these two deeds (which are now ordinarily comprised in one) a perfect conveyance is created which has almost superseded in general use the older and more solemn modes of alienation for estates in fee-simple

LEATHER (Germ leder) The prepared skins of animals The principal object of the art of converting skin into leather is to render it strong and tough, durable, and often water-proof and to prevent its destruction by putrefaction The skins are first cleansed of hair and cuticle and then impregnated either with vegetable tan and extracts in the production of what is called *tanned* leather or with alum and other salts, as for *tawed* leather these processes are sometimes combined and tanned [illegible] results thick sole leather is tanned white kid for gloves is tawed, the upper leather for boots and shoes is tanned and curried, and fine Turkey leather is tawed, and afterwards slightly tanned

Tanned Leather—For thin skins which are afterwards curried, the hide is cleansed, and soaked for a day or two in water, it is then *beamed*, or stretched upon a solid half cylinder of stone, where it is cleared of adhering fat and flesh, it is then soaked for several days in a pit of lime and water by which the hair and cuticle are so far loosened as to admit of being scraped off upon the beam, the hide is then washed and put into the *mastering* pit, which is a mixture of water and dung,—that of hens, [illegible] or horse dung not being [illegible] When the hide has here become [illegible] thoroughly cleaned, and submit[illegible] which is at first used very weak, [illegible] from twelve to eighteen months for thick ox and boar hides intended for strong sole leather, and the latter hides, instead of being limed and dunged, are generally, after having been cleaned in water, placed in heaps, where they begin to putrefy, and then the hair may be removed without lime, which would be apt to render the skin hard and harsh The further opening of the texture, so as to prepare it for tanning, is effected by immersion in a sour liquor of fermented rye or barley, or in weak sulphuric acid

The process is called *raising*, and immediately precedes the tanning When fully tanned the goods are drained, stretched upon a convex piece of wood called a *horse*, and [illegible] issed [illegible] it is [illegible] ding [illegible] (Tan and Gelatine) that the principle [illegible] process depends upon the [illegible] the skin with the tanning of the oak bark, or other astringent material which is used, and that great care is [illegible] perfect penetration of the hide [illegible] s thick) by the tanning material hence the necessity of using weak liquors at first, and gradually increasing their strength, for if the hide were in the first instance put into a strong infusion of bark, the exterior surfaces would become so perfectly tanned as to be impervious to the further action of the liquor, and the centre would remain untanned, and consequently soluble and putrescible, so that we judge of the completion of the process by the leather when cut through, being of a uniform brown throughout, anything like a white streak in the centre announcing the imperfection just mentioned

Tawed Leather, &c —The skins are first soaked, scraped, and hung in a warm room till they begin to exhale an ammoniacal odour and the wool readily pulls off, they are then scraped and soaked for some weeks in lime water, which checks the putrefaction and hardens the texture, the skin is then again beamed, smoothed, and trimmed, and put into a vat of bran and water, where it is kept for some weeks in a state of gentle fermentation and becomes thin and extensible, and fit for any subsequent operation in this state it is called a *pelt* The method of bringing kid and goat skin to the state of pelt is nearly the same as for lamb skin, except that liming is used before the hair is taken off which is only sold to plasterers, whereas lambs wool is more valuable and would be injured by the lime If the pelts are to be tawed they are worked about in a solution of alum and salt in warm water, which again makes them thick and tough, they are then washed and again fermented in bran and water till the thickening is reduced by the removal of some of the salts, lastly they are stretched on hooks and dried in a stove room when they become a tough flexible white leather, but to give them gloss and suppleness they are again soaked in water and trodden in a large pail containing the yolks of eggs beat up with water, they are then dried in a loft, and smoothed with a warm iron

Morocco leather as it is called is chiefly prepared from sheep skins, which after the action of lime water, are brought down by a dung bath and reduced to the state of pelt If intended to be dyed red, they are sewn up in the form of a sack, with the grain side outward, and immersed in a warm cochineal bath, the skin is then tanned in a bath of sumach the skins intended to be blacked are [illegible] with [illegible] [illegible] [illegible] polished [illegible] [illegible] [illegible]

cannot return, as he would do to a book, for farther explanations, and the subsequent part of the lecture may in consequence be rendered nearly useless Hence *perspicuity of statement* is the first and highest quality of a lecturer Perspicuity, indeed, is indispensable to all good writing and speaking but in lecturing especially it is the one thing needful and without it other qualities can avail little or nothing In attaining this essential quality the subjects of the lecture should be arranged that they may follow each other naturally and easily, the sentences should be clear and distinct, neither too long nor too short, the illustrations should be appropriate and of a kind fitted to excite and keep awake the attention of the hearer, and the lecture so composed should be delivered in a plain, distinct, and impressive manner If a lecturer be deficient in these qualities, he can be of little or no use as a teacher, how well soever he may be acquainted with the subject on which he prelects Dr Brown, of Edinburgh, is an instance in point his views with respect to the philosophy of the mind are often original sometimes just, and always ingenious, but the style in which they are expounded is as bad as possible, even in a book made for the closet, and rendered his lectures all but unintelligible to nine tenths of his students It has been the fashion among certain parties who certainly do not owe much to the *belles lettres* to depreciate the lectures of Dr Blair, but they may be safely referred to as all but perfect models of the style and manner in which lectures should be written

When lectures are prepared in the way now stated by parties well versed in the subjects prelected upon and when they are regularly followed up next day by a searching examination of the students on the various subjects treated of, and explanations are given of such difficulties as may have occurred to them, they may perhaps as already stated, be regarded as a pretty unexceptionable method of teaching But lectures got up as they generally are not to instruct the hearer but to exhibit the attainments or prejudices of the lecturer and unaccompanied either by examinations or exercises are about the least profitable exhibitions at which a student can be present

LE'DGER *See* BOOK-KEEPING

LEDGER LINE (Dutch leggen *to lie*) In Music a line either above or below the staff when that is not sufficient in extent to lay the notes upon It is above the staff in ascending progressions, and in descending [illegible] below it

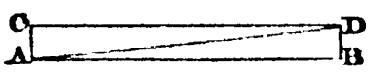
LEDGERS (Fr) In Architecture, horizontal pieces of timber used in scaffolding lying parallel to the wall opposite to which they are erected

LEE, LEEWARD Sea terms denoting generally the side or quarter not directly exposed to the wind The *lee-side* of a ship is the opposite to that on which the wind blows when it crosses her course and which is termed the *weather side* *Leeward* is on the *lee side*, opposed to *windward*, or on the *weather side* A *lee-shore* is the shore on the *lee-side* of the ship or the shore on which the wind blows, and a ship is said to be under the *lee* of the shore when the wind blows from the shore, or when she is in some measure sheltered by the shore The names Leeward and Windward, as applied to the West India Islands, were given to them from their situation in a voyage from the ports of Spain to Carthagena or Portobello The islands which lie to leeward extend from Portorico to Demerara

LEE-BOARD A small platform of planks, which being let down into the water on the lee side of flat-bottomed vessels, opposes the action of the wind to drive them to leeward

LEECH This name is given to those abranchiate red-blooded worms, or anellidans, which are provided with a sucker at both ends of the body (*see* HIRUDO) and of which we possess a few native species, some frequenting the fresh waters, as the horse leeches (*Hæmopis sanguisorba* and *H stagnorum*), others the ocean where they are parasitic upon fishes, as the skate-sucker (*Pontobdella muricata*) The medicinal leech (*Sanguisuga medicinalis*) belongs to that subdivision of the family *Hirudinidæ* which is characterized by having the superior lip of the anterior cup or sucker divided into several segments and the oral [illegible] surrounded by three curved jaws, [illegible] rows of very minute teeth [illegible] to penetrate the skin so as to ensure a ready flow without causing a dangerous wound The upper lip is marked with ten small points considered as eyes The species of the genus *Sanguisuga*, viz *S officinalis* and *S [illegible]* are most common in the south of [illegible] numbers are exported to this country [illegible] of Bretagne drive horses and cows into the ponds, that the leeches may fatten and propagate more abundantly by sucking their blood Children are employed to catch them by the hand, and the grown persons wade into the shallow waters in the spring of the year, and catch the leeches that adhere to their naked legs They are also taken by a sort of net made of twigs and rushes, which is used in the summer when the leeches retire into the deeper waters

The best method of preserving these valuable little animals is stated by the author of the article 'Leech' in the *Penny Cyclopædia* to be that described by Fee It is as follows —



Into a marble or stone trough a layer of seven inches of a mixture of moss, turf, and charcoal is to be put and some small pebbles placed above it, at one extremity of the trough, and midway between the bottom and the top, place a thin plate of marble pierced with numerous small holes, upon which there should rest a stratum of moss, or portions of the *Equisetum palustre* or horse-tail, firmly compressed by a layer of pebbles The trough to be filled with water only so high that the moss and [illegible] charcoal not only aids in keeping the water sweet, but [illegible] leeches being attacked by parasitic [illegible] are very liable The water should be changed about once a week, and more frequently in warm weather

The great importance of ascertaining the best method of preserving the medicinal leech may be inferred from the extent to which the trade is carried on, and the consequent increasing scarcity of these indispensable adjuncts to medicine Four only of the principal dealers in London import 7 200 000 annually

LEE'LITE A pink silico aluminous mineral tinged by oxide of manganese Named from Mr Lee of Cambridge

LEET (Sax leod, Germ leute, *people*) The court leet, or view of frankpledge, was an ancient Saxon institution [illegible] The administration [illegible] and the abatement of nuisances, 2 The preservation of the peace and the prevention of crime by the reception and enrolment of the pledge which each man was obliged to give by becoming a member of some tything The possession of a court leet was the characteristic of the hundred of which the proper leet was distinct from, and subordinate to, that which was held by the sheriff on his tourn The court leet of the hundred was usually held by a bailiff or steward of the sheriff, but it was sometimes granted as well as the leet of a smaller jurisdiction to private lords A court leet also properly belonged to a borough which ranked as a hundred, but such private and borough leets were like the leet of the hundred, subordinate to the county leet of the tourn

LEE-WAY in Navigation is the deviation of the course actually run by a ship from the course steered upon, or it is the angle formed between the line of the ship's keel and the line which she actually describes through the water In consequence of the action of the wind or currents a ship is generally impelled sideways as well as forward whence the direction of her motion is different from that of the keel Suppose the whole force urging the ship to be resolved into two, – one producing motion A B in the direction of the keel, and the other the motion A C in the same time

[illegible] then the ship will move in [illegible] A D and the angle D A B is the *lee way* To obviate the effects of this lateral motion, the ship is laid on a course to the windward of the point to which she is bound

LEGACY *See* WILLS (Lat lego *I bequeath*) A gift by will of personal property as goods and chattels, a testamentary gift of real property being called a devise Legacies are general such as a gift of a sum of money out of the general estate of the deceased, or specific, as a gift of a particular bank note or coin, or of any other individual chattel as a horse or a jewel, or residuary, as a gift of the residue of the estate remaining after all the debts of the deceased and general and specific legacies have been satisfied General legacies are subject to an equal rateable abatement, if the estate is not sufficient for payment of them in full, but a specific legacy is not subject to abatement, unless it be necessary for the payment of debts A specific legacy is, however, subject to what is called ademption, which is the consequence of the subject matter of the legacy being one identical thing in specie thus, if a testator bequeath a particular horse, which he afterwards disposes of in his lifetime, the legacy is said to be adeemed, or taken away, because the horse bequeathed has no longer any existence as part of his property, and the legatee will not be entitled to another horse of the testator's in lieu of it This identity of corpus is so inherent in the notion of a specific legacy, that if a 100*l* in Consols were bequeathed, and the same sum were afterwards transferred by the testator to another stock, the transfer of itself would adeem the legacy The mode of compelling executors to pay a legacy is by suit in equity for the administration of the testator's assets Courts of law have not, in general, any jurisdiction over such mat-

ters Executors cannot be compelled to pay a legacy until the expiration of a year after the testator's death they are allowed that period for ascertaining and discharging his debts, and even after a legacy has been paid the legatee must refund, if it should be necessary, for the payment of creditors who come in, although after the period above mentioned The party to whom a legacy is bequeathed is termed legatee For an account of the legacy duties, see art "Taxation," *Encyc Britannica*, (new edition)

LE'GATE (Lat legatus) A high functionary, in [illegible] whom the pope sends as ambassador [illegible] powers Legates are — 1 A Latere, who possess the highest delegated authority 2 De Latere the former are such as the pope commissions to take his place in councils 3 Legates by office are such as enjoy the titular distinction of legate by virtue of their dignity and rank in the church, but have no special mission

LEGATION *See* AMBASSADOR DIPLOMACY

LEGA'TO (Ital *tied*) In Music, a term used to denote the tying one note to another which is done by placing these marks ⌣ ⌢ above or below the notes intended to be so joined This is also known by the name [illegible]

[illegible] (Ital) In Music *See* DRIVING NOTES

[illegible] (Lat) In Roman History an officer who acted as deputy under a commander-in-chief and whose duty it was to aid the proconsuls and proprætors in the administration of the Roman provinces Of the number of the legati nothing certain is known, though the probability is that there was one to every legion In the absence of the consuls and other magistrates entitled to the *fasces* this honour was conferred on the *legati*

LE'GEND (Lat legenda, *things to be read*) A book originally used at divine service in the Romish churches, in which are recorded the lives of saints and martyrs, portions of which were selected and read for the edification of the people These legends, which contained many ridiculous stories of the lives of the saints, were studiously perused in the refectories of cloisters, and were earnestly recommended to the perusal of the laity, as so many evidences of the truth of the Roman Catholic faith Among these the Golden Legend (the work of Jacobus de Voragine, archbishop of Genoa in the 13th century) which is a collection of the lives of the saints, maintained its ground in the church for two hundred years, though, from the number of ridiculous stories with which it teems, it has now sunk into merited oblivion But although many of the legends consist of tasteless and unmeaning fictions, the offspring of childish credulity which indeed they were intended to feed there are many of them of a highly poetical and romantic character, and hence it is not surprising that this species of literature has often been regarded even by persons of taste, as a verdant oasis amid the desert of imaginative writings in the middle ages There are some sensible remarks as to the value of the early Christian legends in Beugnot, *Hist de la Destruction du Paganisme en Occident*, i 280 In a general sense the term legend is used to denote any fictitious or doubtful narrative, such as the exploits of heroes of the middle ages, or the history of a people or district in which truth is so mixed with fable as to be inseparable from it

LEGEND In Numismatics, that which is written *round* the field of a medal, opposed to *inscription*, which is written across it *See* NUMISMATICS

LEGERDEMAIN (Fr *light of hand*) A term given to some deceptive or sleight-of hand performances, which depend either entirely on dexterity and address, or derive but a small degree of aid from philosophical principles *See* MAGIC

LEGGIA'DRO (Ital) In Music a direction to the performer that the music to which the word is appended is to be performed rather briskly

[illegible] of the Roman army, comprising ten cohorts thirty maniples, or sixty centuries, so that if there had always been one hundred men in each century, as its name imports, the legion would have consisted of six thousand men But the number was in fact variable

There were usually three hundred cavalry joined to each legion, which were divided into ten troops (turmæ), and each of these troops into three bodies of ten men decuriæ) The defensive arms of the legionaries were an oblong shield, a helmet, hauberk, and greaves, their offensive weapons were a sword and two long javelins The legion was drawn up in three lines, the soldiers in each of which were distinguished by the names Hastati, Principes, and Triarii The Hastati, who formed the first line, were young men in the flower of life, and ori[illegible] were, however, afterwards [illegible] the second line, and were men in the [illegible] Triarii were veteran soldiers, and formed [illegible] In each legion there were six military tribunes, who commanded under the consul, each in his turn, usually for about a month This was the early organization of the legion, as it is known to us from the descriptions Livy, at the time of the great Latin war in the 4th century of the Republic It was materially changed in later times, and the three original lines were discontinued probably about the time of the Punic war But it always retained its distinctive character of a separate army, as it were, provided with its complement of cavalry and light infantry, and it has been remarked, as a striking proof of the military genius of the Romans, that after so many ages of additional experience, recent captains, and particularly Napoleon, have found it advantageous to divide their armies into separate corps, each in a similar manner complete, with its own cavalry and artillery, and these, in the French imperial armies, usually averaged from 4000 to 6000 men, or about the number of a Roman legion The organization of the legion is explained in most works on Roman antiquities but has been nowhere so thoroughly treated as by M Le Beau, in a long series of memoirs which [illegible] from time to time in the *Mem de l'Acad des Inscr et Belles Lettres* See particularly vols xxxv xxxvii xxxix. The reader may also now consult *Dr Arnold's History of Rome*, vol ii

LE'GION OF HONOUR An order instituted by Napoleon when first consul of France for merit, both military and civil The order consisted, under the Empire, of grand crosses, grand officers, commanders, officers, and legionaries They were divided into sixteen cohorts, each of 407 members, but the total amount was afterwards much increased Pensions, from 250 to 5000 francs per annum, were attached to these distinctions After the restoration of Louis XVIII the order underwent some modifications [illegible] numbers were limited [illegible] See HONOUR

LEGISLATION *See* LAW

LE'GISLATOR (Lat) [illegible] the laws and polity of a state [illegible] chiefly [illegible] persons of antiquity, such as [illegible] Theseus, Draco, Solon, among the Athenians, Lycurgus among the Spartans, and Numa among the Romans

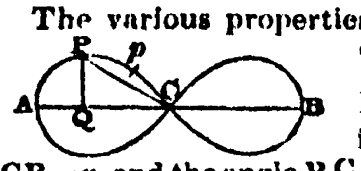
LEGISLATURE The name given to the body or bodies in a state in whom is vested the power of making laws Thus the king, lords and [illegible] in Britain, whose united consent is indispensable to the framing of a law are styled *the legislature*

LEGITIMACY, in Politics, signifies, in its strictest sense, the accordance of an action or of an institution with the municipal law of the land The principle of obedience to civil authority, in whatever hands the law has placed it, is consecrated by religion as well as by sound philosophy Resistance to or evasion of, the legal commands of a superior, is thus an offence against the law of God as well as of man, in things in themselves indifferent as well as in things commanded by the principles of morality How far they must be obeyed when against the conscience of the subject, is one of those questions of casuistry which never can receive a solution applicable to all cases and circumstances In this sense it is clear that the attribute of legitimacy belongs to no particular form of government, but is equally inherent in all when lawfully established But, looking at the subject from a higher point of view, the question arises, when and how shall a government be taken to be lawfully established? This can only be directly answered by two classes of political philosophers The first attribute the quality of legitimacy only to hereditary monarchical government which they conceive to be peculiarly of divine [illegible] but its advocates have never been able to show any real foundation for it in the language of Scripture, and it is of course impossible to raise it on any other basis (*See* DIVINE RIGHT, NON-RESISTANCE) The second class bases society on the abstract rights of man, attributes all power to the people and considers no government legitimate except such as is founded on their consent This theory also is plain and clear in the abstract, but has the defect of becoming impossible in application For, 1 The principle of the *social contract*, or implied consent of the people, is a mere philosophical fiction 2 The actual consent of the people (*i e* the majority of it) to any existing form of government has never been [illegible] obtained This is notoriously the case in every European country, and even the representative government of the United States of America is chosen by a constituency from which *slaves*, women, and persons under twenty-one years of age (that is, in all, five sixths of the population) are excluded Now the exclusion of any one of these classes can only be justified on grounds of expediency, and similar grounds might equally justify [illegible] other restrictions (e g that of property, as in England and other European countries) which would still further reduce the number of the constituency 3 Supposing a government established by the actual voices of a majority of the whole people, the question would still arise, whether every subsequent act of that

government was largely influenced by that original validity This question was much debated in France at the period of the trial of Louis XVI, when the Convention elected itself by a majority of the people, was assuming the extraordinary power of judging that monarch The Girondists on this occasion, contended that an appeal to the people (i e to the suffrages of a majority of the constituents) was necessary in order to ratify the act, and in practice it has been found that whenever a violent change has taken place the period of the election of the representative body has called for the adoption of extraordinary measures Between these two classes of theoretical politicians, the greater number are content to hold that the only fundamental principle of government is expediency and its only right that given by municipal law or peaceable possession In their view, all government is equally legitimate so soon as it is fairly established, while they fully admit that a question, and often a very difficult one, arises on every violent change of institutions, as to how soon the new government *de facto* has acquired the character of legitimacy In the language of modern politics this word has acquired a peculiar sense, chiefly from its employment about the period of the Congress of Vienna, when the old hereditary dynasties were termed legitimate in contradistinction to those which the French revolution and subsequent wars had founded Hence the principle of legitimacy has been, very incorrectly opposed to that of representative or popular government, a mere abuse of terms but an important one, from the powerful effect which words are able to produce in political discussion

LEGI'TIMACY (Lat legitimus *lawful*) In Jurisprudence the state of a child born in lawful wedlock

LEGITIMA'TION The act by which natural children are rendered legitimate *See* GRETNA GREEN MARRIAGES BASTARD



LEGU'MEN (Lat) In Botany, a one celled one or many-seeded, two valved superior fruit, dehiscing by a suture along both its face and its back and bearing its seeds on the ventral suture only It differs from the follicle only in dehiscing by two valves Sometimes it is indehiscent, as in (*cassia fistula*, &c but the line of dehiscence is in such species indicated by the presence of sutures It is very near a drupe, into which it passes in many genera such as *Dipteryx*, &c

LEGU'MINOUS F A very extensive natural order of Polypetalous Exogenous plants found in all parts of the world, forming large trees and huge twiners in the Tropics, and being herbaceous plants or small bushes, rarely trees, in colder countries The order contains a great variety of useful and beautiful species, some of which, like clover, lucern, sainfoin and vetches are cultivated for cattle, others, as peas beans lentils and various other kinds of pulse form part of the food of man Indigo, logwood and many others are well-known dyeing plants, several acacias produce gum arabic, certain *Astragali* yield tragacanth the tamarind and others bear pods whose interior is filled with an agreeable fæculæ or pulp, *Cassia acutifolia* and others yield senna, *Glycyrrhiza* the liquorice root, *Ceratonia* the wild locust fruits of Scripture, finally many are valuable tonics and some are dangerous narcotics, among which the common laburnum is to be named The larger part of this order consists of plants called Papilionaceous, because of a fancied resemblance between their flowers and a butterfly Such plants have one large expanded petal, and four others much smaller which form alæ and carina in front of the vexillum, but in others the more usual form of corolla is observed, and there are even some which like *Ceratonia*, are apetalous The division of the order called *Mimosa* is remarkable for having very small flowers with long stamens, and growing in balls or spikes

LE'MMA (Gr λημμα, from λαμβανω *I take or assume*) In Geometry, a preliminary proposition laid down or the purpose of facilitating or rendering more perspicuous the demonstration of a theorem, or the construction of a problem

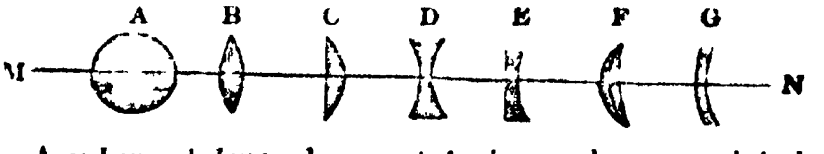
LE'MMING A name given to a species of claviculate Rodents (*Georychus lemmus* Ill), very abundant in the north of Europe on the shores of the Arctic ocean It is as large as a rat, with black and yellow fur, and is remarkable for its occasional migrations in innumerable bodies At these periods the lemmings are said to march in a straight line, regardless of rivers or mountains, and, unimpeded by any obstacle, they devastate the country through which they pass *See* GEORYCHUS

LEMNI'SCATA (Gr λημνισκος, *a ribband*) In Geometry, the name given to a curve of the fourth degree, having the form of the figure 8, and of which the equation is $x^2 + y^2 = a\sqrt{x^2 - y^2}$ There are many other curves of the same order but the equations differ from the above [illegible] the enclosing curve is susceptible of quadrature, and its whole area is equal to the square of its semi axis It is a remarkable property of this curve that it is capable of being divided algebraically into equal though dissimilar portions

The various properties of this curve are most easily derived from its polar equation Let C A = a, C Q = x, and P Q = y, the equation of the curve is $x^2+y^2=a\sqrt{x^2-y^2}$ Now let C P = r, and the angle P C Q = u, we shall have $x = r \cos u$, and $y = r \sin u$ Substituting these values of x and y in the equation of the curve, it becomes, after reduction, $r^2 = a^2 \cos 2u$ But, by the general theory of curves the differential of the area referred to polar co-ordinates is $\frac{1}{2} r^2 du$, hence in the present case it is $\frac{1}{2} a^2 \cos 2u\, du$ and integrating (p P Q = $\int \frac{1}{2} a^2 \cos 2u\, du$ = $\frac{1}{4} a^2 \sin 2u$ + const. At the point Q we have $r = 0$, therefore $\cos 2u = 0$ and consequently $u = 45°$ At this point, therefore, $\sin u = \sqrt{\frac{1}{2}}$, and $\cos u = \sqrt{\frac{1}{2}}$, and at the point A we have $u = 0$, therefore the area comprised between C A and the curve A P p C = $\frac{1}{4} a^2$ Hence the whole area bounded by both branches (the two branches being similar) is equal to a^2, or the square of A C, which is $\frac{1}{2}$ A B

Let P be any point in the curve, and p another point related to P by the equation cos A C P × cos A C $p = \sqrt{\frac{1}{2}}$, then the curvilinear arc A P is equal to C p which is the property above alluded to A similar property however belongs also to some other curves (See Legendre, *Exercises de Calcul Integral* tome i)

LEMONS, ESSENTIAL SALT OF The binoxalate of potash is often sold under this name, it is chiefly used for removing iron-moulds and ink-stains from linen



LEMUR (Lat lemur, *a ghost*) This term was applied in the Linnæan system to several of the lower Quadrumanous animals of different structure and habits, it is now restricted to those which have the inferior incisors long compressed, straight and sloping forwards and the lower canines approximated and of similar form and direction differing only in a slight increase of size, whence they have usually been enumerated as incisors the upper incisors are straight and the intermediate ones are separated from each other The long pointed canines of the upper jaw are principally opposed to the trenchant anterior false molars below Each of the four extremities is provided with an opposable thumb but the index digit of the hinder hand has its nail developed into a long, curved sharp pointed claw The use of this claw is to clean or dislodge vermin from the long and thick woolly hair [illegible] and [illegible] gated pointed head and sharp projecting muzzle, the posterior limbs are a little longer than the anterior, the tail is long thick and bushy They are all natives of Madagascar and of some of the smaller islands in its neighbourhood To judge from the nature of their covering it might be supposed that the lemurs were natives of a cold climate, but their fur has relation to the season of their activity They sleep by day and move about in the night season during which time the air is often sufficiently cold in the tropical latitudes Their nutriment is a mixed diet of fruits insects, and small birds, the latter they surprise while at roost

LEMURES Male and female genii or infernal gods, believed by the ancient Romans to haunt solitary rooms and desert places they were propitiated by casting beans to them Their feast was celebrated under the name of Lemuria or Lemuralia

LEMURIDÆ (Lat lemur, *a ghost*) The family of Quadrumanous Mammals of which the genus *Lemur* is the type it includes the genera *Tarsius*, *Otolicnus*, *Stenops Lichanotus* and *Lemur* proper

LENS (Lat) In Optics a thin piece of glass or any other transparent substance bounded on both sides by polished spherical surfaces or on the one side by a spherical and on the other by a plane surface, and having this property that parallel rays of light in passing through it have their direction changed so as to [illegible] point called the *principal focus* of the lens or to diverge as if they proceeded from that point

Lenses receive different denominations according to their different forms Thus,

A *spherical lens*, shown at A, is a sphere or globule of glass

A *double convex lens* shown at B, is a solid formed by two convex spherical surfaces, and is *equally convex*, or *unequally convex*, according as the radii of its two surfaces are equal or unequal

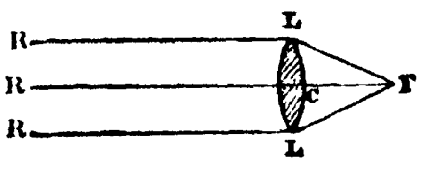
A *plano convex lens*, C, is that of which one of the surfaces is *plane*, and the other *convex*

A *double concave lens*, D, is bounded by two *concave* spherical surfaces, which may have either the same or a different curvature

A *plano concave lens*, E, has one surface *plane*, and the other *concave*

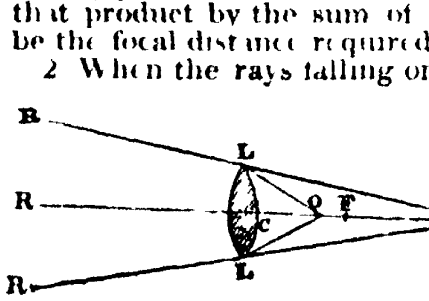
A *meniscus*, F (so called from its resemblance to a

[illegible] which one of the surfaces is *convex* [illegible] *e*, and which meet if continued The radius of the convex surface is consequently smaller than the radius of the concave



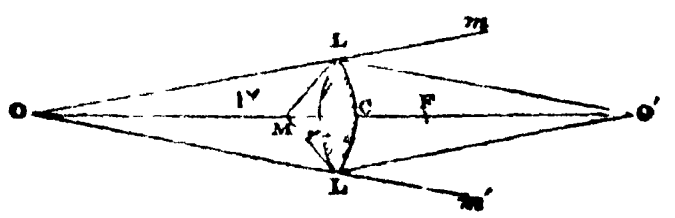
A *concavo convex lens*, G, is that of which one of the surfaces is *concave* and the other *convex*, but in this case the surfaces will not meet though continued, the radius of the concave surface being smaller than that of the convex one

The straight line M N which passes through the centres of all the curved surfaces, or is perpendicular to both surfaces of the same lens, is called the *axis* of the lens, and it is in this line that the focus of the lens is situated

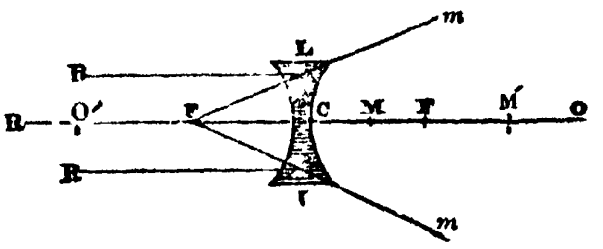


It was observed, at an early period, that a transparent body of a spherical form has the property of collecting at the focus the parallel rays of light which fall on its surface But it was remarked, at the same time, that the illumination at these foci was extremely feeble, in consequence of the thickness of the glass which the light had to pass through This inconvenience is removed by taking only two small segments instead of the entire sphere, by which means, as the refraction takes place only at the surfaces, and not in the interior of the glass, the very same refraction of the rays is produced as when the whole sphere is used, and the thickness of the glass being greatly diminished there passes a much greater number of the rays of the light in the focus is much more considerable

The rules for finding the focal distances of the different sorts of lenses are the following They depend in some measure on the refracting power of the glass We shall here suppose the index of refraction to be 1 500



1 Rays of light, R I, R L, falling on a convex lens in directions parallel to the axis, are refracted into the point I, which is called the principal focus In a *double* and *equally* convex lens the distance of I from C, the centre of the lens, is equal to the radius of the spherical surfaces If the lens is *plano-convex* the focal distance is equal to twice the radius of the spherical surface If the lens is unequally convex, its focal distance is found by this rule — Multiply the two radii of its surfaces and divide twice that product by the sum of the radii, the quotient will be the focal distance required



2 When the rays falling on a convex lens whose principal focus is F converge towards a point O their convergency will be hastened, and they will be refracted into a point O′ which is nearer the lens than the principal focus F The two points O and O′ are called *conjugate foci*, and they are related to each other in such a manner that C O′ is a fourth proportional to C O + C F C O and C F Hence when the point O is given the conjugate focus O′ will be found by this rule — Multiply the principal focal distance C F by C O and divide the product by the sum of those numbers It is obvious that as the distance of O becomes greater O′ approaches to F, and when O is at an infinite distance O′ coincides with F

3 Suppose diverging rays issuing from a point O to fall on a double concave lens of which the principal focus is F In this case they will be refracted to a point O′, and the conjugate foci O and O′ are so related that C O′ is a fourth proportional to C O − C F, C O and C F Hence O′ is found by the following rule — Multiply the principal focal distance C F by C O and divide the product by the difference between C O and C F As the point of divergence O recedes from the lens, the point O′ approaches nearer to F, and when O is at an infinite distance, O′ coincides with F As O approaches the lens, O′ recedes from it, when O is at F′ (the focal distance) the refracted rays become parallel to the axis, and when O is between F′ and C, as at M, the refracted rays diverge in the directions L *m*, L *m′*

4 The focal distance of a concave lens is the same as that of a convex one whose surfaces have the same curvature, and the rules for finding the conjugate foci are precisely the same, but the rays, instead of being collected, are scattered by passing through a concave lens, and the principal focus is on the same side as the point from which the rays proceed Parallel rays R L, R C R L, falling on the concave lens L L in the direction of the axis, become divergent as if they proceeded from F′ (the principal focus) When the rays which fall on a concave lens converge towards the point F, they are refracted in the direction parallel to the axis When the incident rays converge to a point O beyond F, the refracted rays [illegible] proceeded from a conjugate point O′ [illegible] than F′ and when the incident rays converge towards a point M, between C and F, the refracted rays will be convergent and meet in a conjugate point M′ on the [illegible] of the lens with M These conjugate foci are determined by the rules which have been given for convex lenses Lastly, when the incident rays diverge from a point O′, farther from the lens than the principal focus, the refracted rays will be more divergent, and proceed as if they emanated from a point between the principal focus and the lens The rule is, in this case, also the same as for convex lenses

5 The effect of a meniscus is the same as that of a convex lens of the same focal distance, and that of a concavo-convex lens the same as that of a concave lens of the same focal distance The principal focal distance is found by this rule — Divide twice the product of the two radii by the difference of the radii

6 The above rules for finding the principal and conjugate foci of the several kinds of lenses may be all expressed by two simple algebraic formulæ Let R denote the radius of the anterior surface (or that at which the light enters), S that of the posterior surface, and let R and S be considered as positive when the surfaces are convex, and negative when concave Also let F denote the distance of the principal focus, and *n* the index of refraction, then, neglecting the thickness of the lens as inconsiderable, the formula which gives the principal focus is

$$\frac{1}{1} = (n-1)\left(\frac{1}{R} + \frac{1}{S}\right) \qquad (1)$$

For reflection [illegible] of convergent and divergent rays, let U [illegible] C O of the focus of the entering rays and V the distance C O′ of the focus of the emerging rays, and let U be considered as negative when the entering rays are *divergent*, and V negative when the emerging rays are *convergent*, then,

$$\frac{1}{U} + \frac{1}{V} = \frac{1}{1}, \text{ or } V = \frac{U F}{U - F} \qquad (2)$$

the point F being determined by the formula (1)

For the [illegible] of these formulæ to the different cases and the correction to be made for the thickness of the lens see *Coddington's Treatise on the Reflexion and Refraction of Light*

In deducing the above rules it has been assumed that the focus into which the rays are refracted is a mathematical point, but this is not strictly true, unless the rays only fall on the lens very near its centre, by reason of the *spherical aberration* (*See* ABERRATION) For the correction of the *chromatic aberration*, arising from the unequal refrangibility of the luminous rays, *see* ACHROMATISM See also LIGHT, OPTICS, and REFRACTION

LENS SHAPED or LENTICULAR, or LENTIFORM A term used in describing the general figure of bodies, to denote their resembling a double convex lens, as the seeds of Amaranthus

LENT A solemn time of fasting in the Christian church, so called from the Anglo-Saxon signifying spring The term of Lent comprises the forty days before Easter, by which it is determined The period of time is intended to commemorate the fasting of our Saviour in the wilderness *See* EASTER

LENTO, or LENTO (Ital) In Music, a direction to the performer that the music to which the word is prefixed is to be performed slowly

LENTIBULA'RIA'CEÆ A very small natural order of Herbaceous Exogens natives of the marshes and waters of all parts of the world They are nearly allied to *Scrophulariaceæ*, but are distinguished by their free central placenta and minute exalbuminous embryo, from *Primulaceæ* by their irregular flowers the [illegible] stamens, and their ovary The beautiful *Pinguicula*, a wild plant in marshes, is one of the genera, and *Utricularia* another. They are of no known use

LENTICELLES, or LENTICULAR GLANDS A term invented by De Candolle to denote certain minute speck-like tubercles on stems Notwithstanding the importance assigned them by this great botanist, his lenticelles appear to be nothing [illegible] roots attempting to spring from [illegible]

LENTIGO A freckle of the skin, so named from its resemblance to a lentil seed

LENZINITE A hydrated silicate of alumina, found

at Eifield in Prussia, it is white, translucent, and falls into small hard grains when put into water

LI'O (Lat *a lion*) One of the zodiacal constellations, situated chiefly on the northern side of the ecliptic The star *Regulus*, called also *Cor Leonis*, belongs to this constellation

LE'O MI'NOR The Little Lion [illegible] the northern hemisphere, between Leo and Ursa Major This constellation has been formed by the moderns, and is not given in Ptolemy's catalogue

LE'ONINE VERSES Latin verses according to the rules of ancient prosody, but rhymed The name is said to be derived from one of the popes Leo or, more probably from a monk called Leoninus The end rhymes to the middle, *i e* to the two last syllables before the cæsura, in hexameters in pentameters, the two divisions are rhymed The following distich may serve as an example —

Dæmon languebat monachus tunc esse volebat
Ast ubi convaluit, mansit ut ante fuit

LE'PADITES, *Lepadita* (Gr λεπας, *a shell-fish*) Goose barnacles, an order of Cirripeds comprehending those which have a long flexible contractile stem fixed by its base to some solid body, and supporting at its extremity the principal parts of the animal, inclosed by a multivalve shell, or coriaceous case

LE'PADOGA'STER (Gr λεπας and γαστηρ, *stomach*) A genus of Discobolous Malacopterygian fishes, having the following characters pectoral fins expanded, with stouter rays at their lower edges which curve slightly forwards, and unite with each other [illegible] means of a transverse membrane directly [illegible] constituting the boundary of an adhesive disk, close to which there is a second, formed by the union of the ventrals, body smooth, and without scales, head broad and depressed, snout salient and protractile, branchiæ slightly cleft, and furnished with four or five rays, and opposite to the anal, which is near to [illegible] genus we possess two native species, one of which called the Cornish sucker (*Lepadogaster connubiensis*) was discovered by Dr Borlase on the coast of Cornwall, the other (*L. jaculatus*) has been taken on different [illegible] Weymouth coast Both species adhere by means of their ventral suckers to rocks stones, &c whence the generic name they feed principally on Crustacea

LE'PALS A term invented to denote stamens that are sterile It is very rarely used

LEPI'CENA A term invented by Richard to denote the two empty bracts situated at the base of the [illegible] usually called glumes

LE'PIDOIDS A family of extinct fossil fishes belonging to the oolitic formation remarkable for their large rhomboidal bony scales Figures of these scales are given in *Dr Buckland's Bridgewater Treatise*

LE'PIDOLITE (Gr λεπις, *a scale* and λιθος *stone*) A mineral of granular and foliated texture, moderately hard of a pinkish colour It contains lithia

LEPIDO'PTERA (Gr λεπις, and πτερον, *a wing*) The third order of insects in the system of Linnæus, and the tenth in that of Latreille, who has given the following concise and comprehensive description of the characters common to the insects of this most interesting, useful, and beautiful group

The wings are four, covered on both sides with minute generally coloured scales, resembling farinaceous dust, which are removed by merely [illegible] [illegible] [illegible]

alatine and pharyngeal bones Of this genus one native pecies is known, called the Scabbard-fish (*Lepidopus gyreus*) It is very rare only four examples are recorded by Mr Yarrell, which were taken on the southern hores

LEPIDO'TUS In P[illegible] ish, distinguished by its large, thick, rhomboidal, enamelled scales, and its hemispherical or obtusely conical eeth its remains are widely diffused through the weallen formation

LEPIDOTUS In Botany, Latin term for leprous

LI'PIS (Gr [illegible] of a thin tra[illegible] nd, owing to the imperfect union towards its circumference of the cellular tissue of which it is composed, having a lacerated irregular margin It gives origin to he adjective Lepidote

LI PI'SMA (Gr λεπισμα, *decortication*) A Linnean genus of Apterous [illegible] first family f Thysanourous insects [illegible] with small which circumstance the most common species has been compared o a little fish The antennæ are setaceous, and usually ery long The feet are short and frequently have very arge and strongly compressed coxæ, resembling scales hese insects run with great velocity some of them, by neans of their caudal appendage are enabled to leap several species conceal themselves in the cracks of the ramework of windows, in wardrobes, under damp boards, c others hide beneath stones

LEPISMA In Botany, a term sometimes applied to the up-shaped disk of *Pæonia* and *Aconitum*, but seldom mployed

LI PI'SMIDÆ The family of Thysanourous insects f which the genus *Lepisma* is the type It includes the [illegible] *Machilis*

LEPIS'TA [illegible] e tribe or the family of Rolents of which the genus *Lepus* is the type

LE'PRA (Gr λεπρος *rough*) The leprosy, a disease f the skin, characterized by scaly patches, nearly of a rcular form The cuticle becomes reddish and scaly, t first upon some one spot, often the knee and thence radually spreads over the body which becomes stiff and incomfortable and most unseemly in appearance Friction warm baths, sulphur baths and afterwards slightly timulating ointments such as pitch ointment or weak itrine ointment with light and moderate diet and careful bstinence from wine and stimulants are the principal eans of cure This disease appears to have been of much more frequent occurrence in ancient than in modern times, but it is generally believed that the *lepers* mentioned in the sacred and profane authors were afflicted with a disease resembling more that known by the name f elephantiasis than leprosy

LEPTOCE'PHALANS *Leptocephalidæ* (Gr λεπτος *slender*, κεφαλη, *a head*) The name of a family of fishes haracterized by the smallness of the head, of which the [illegible] e type

LEPTOCE'PHALUS [illegible] A genus of Apodal Malacopterygian fishes, in the system of Cuvier characterized by a ery small and short head, and a remarkably compressed nd delicate body the pectoral fins and branchial apertures are very small, the dorsal and anal fins are narrow, nd united at the point of the tail One species of this are and singular genus was discovered near Holyhead nd was described by Gronovius under the generic name f *Leptocephalus*, in reference to the diminutive size of he head The *Leptocephali* are more common in the eas of hot climates

LEPTU'RA (Gr λεπτος, *slender* ουρα *a tail*) A linnæan genus of [illegible] beetles now the type of an xtensive family *Leptu'rii* in which the eyes are ounded and entire, or, if slightly emarginate, with the ntennæ inserted before the emargination The head is lways inclined posteriorly behind the eyes, or is abruptly ontracted at its junction with the thorax in the manner f a neck, the thorax is conical or [illegible] nteriorly, the elytra become [illegible] rm *Leptura* is now restricted to those Lepturidans in hich the head is abruptly narrowed immediately behind he eyes, the antennæ inserted near the anterior extremity of the internal emargination of the eyes, the two minences from which they rise being almost confounded one plane The thorax is almost always smooth, or ithout lateral tubercles

LE'PUS (Lat *a hare*) A genus of Rodents peculiarly distinguished by having their superior incisors ouble, *i e* each of them has a smaller one behind it he molar teeth are also more numerous than in most ther Rodentia, there being six on each side of the upper w, and five on each side of the lower jaw the ears are ery long, the tail short and turned up The species of his genus are called hares and rabbits The eyes are rge and prominent, and, with the well developed ears, erve to announce to these timid and defenceless animals emote objects and sounds of peril the strength and proportions of the limbs, of which the hind pair is much longer than the fore, enable them to escape by rapid flight The smaller species, as the rabbit add to their means of safety by burrowing in the soil Among the anatomical characters of the [illegible] rudimental condition [illegible] bony structure of the infra-orbital spaces

LEPUS The Hare In Astronomy one of the forty-eight ancient constellations of Ptolemy situated in the [illegible]

LERNÆOPO'DIDÆ (Lat lernæa, *a parasitic worm*, forma, *form*) The name of a family of Siphonostomous Crustaceans, comprehending those with a long vermiform body

LERNE'A (Gr λερναια, *a name of the hydra*) A Linnæan genus of low-organized crustaceous animals, all of which are external parasites of fishes, and constitute the class *Epizoa* of modern systems

LE ROI LE VEUT (Fr *the sovereign wills it, or assents*) A form of words by which the royal assent is intimated by the clerk of parliament to the passing of public bills To private bills the royal assent is expressed by *Soit fait comme il est desiré* The dissent of the sovereign to the passing of any measure is signified by the words *Le roi s'avisera* *See* PARLIAMENT

LE'SSONS (Lat lego, *I read*) are certain portions of the scriptures read in most Christian churches during divine service, the performance of which in the ancient church devolved [illegible] In the English [illegible] the year at the [illegible], and that of [illegible] the two books of Chronicles, continues through the Old Testament, including portions of the Apocrypha

In the *second* lessons, as they are called, the same course is followed with the New Testament In the Presbyterian church the word *lesson*, in this sense, is unknown, though the practice of reading a portion of scripture is almost universally adopted, but the selection of the passage is left to the choice of the officiating clergyman

LESTRIS (Lat *a robber*) A subgenus of Gulls, separated from the *Larus* proper on account of their large membranous [illegible] edge of the beak, [illegible] They pursue the small gu[illegible] ness to rob them of their food, and hence their name

LETHARGY (Gr ληθη, *forgetfulness*) A heavy unnatural sl[illegible] s[illegible] depending upon apoplexy, from which [illegible] difficulty roused It sometimes arises from a plethoric state of habit, in which case it requires depletion, but it often also is a symptom of over fatigue of mind and then nervous remedies are indicated

LETHE (Gr ληθη) In Greek Mythology, the River of Oblivion one of the streams of the infernal regions Its waters possessed the quality of causing those who drank them to forget the whole of their former existence In the sixth book of *Virgil's Æneid*, the shades of the departed after fulfilling their various destinies in [illegible] thousand years, are brought [illegible] Lethe, as a preparation for their transmigration into new bodies

> Has omnes ubi mille rotam volvêre per annos,
> [illegible]
> Rursus et incipiant in corpora velle revertí

The beautiful verses of Milton are well known —

> Far off from these a slow and silent stream,
> Lethe the river of oblivion, rolls
> Her watery labyrinth whereof whoso drinks
> [illegible]

Nor is the "slow and silent stream" less exquisitely described by Dante —

> Tutte l acque, che son di là più monde,
> [illegible]
> Raggiar non lascia sole ivi, nè luna

Geographers have placed the river Lethe (that is, its supposed issue on the surface of the earth) in Bœotia, near Lebadea, in Crete, and on the coast of Africa There was also a river of oblivion (limia oblivionis) in Spain, now the Lima

LE'TTER (Lat litera) A character used to express one of the simple sounds of the voice Letters properly combined form the visible signs of those sounds by which we communicate our ideas What letters were originally, who first invented them, and among what people they were primarily used, are still questions of profound obscurity Philo, says the *Ency Brit*, attributes this great and noble invention to Abraham, St Irenæus and others to Enoch, Bibliander to Adam, Eusebius, Clemens Alexandrinus Cornelius Agrippa, and others, to Moses, Pomponius Mela, Herodian, Rufus Festus, Pliny, Lucan, and others, to the Phœnicians, St Cyprian to Saturn, Plato and Tacitus to

the Egyptians, some to the Ethiopians, and others to the Chinese, who cannot possibly be entitled to this honour since all the characters are the signs of simple ideas and have nothing in common with letters Various [illegible] are the conjectures concerning the different kinds of letters used in different languages Elias Mon[illegible] supposes the Greeks to have invented the Hebrew letters Annam the Syrian and Cadmus, the Phœnician those of Attica, Nicostrata the Roman, Isis the Egyptian, and Vulfilas those of the Goths All these statements, however, are purely conjectural, and it would be vain to examine the foundation on which they are based Letters are distinguished by grammarians into vowels, [illegible]

GUAGE

LETTER, in Printing is the usual term for an aggregate quantity of types in a printing office, as when a work is put in hand, and there happens to be a great quantity of type of the proper sort unemployed it is usual to say "there is plenty of letter," and, on the contrary, "there is a scarcity of letter"

LETTER OF CREDIT A letter written by one merchant or correspondent to another, requesting him to credit the bearer with a certain sum of money The bearer should be described with as many particulars as possible lest the letter fall improperly into other hands

LETTER OF LICENCE An instrument by which creditors allow a party who has failed in his trade time for payment of debts and [illegible] affairs

LETTER OF ATTORNEY A document by which a party gives another, named therein power to do certain lawful acts in his stead, the party so authorized being called his attorney, such as to give seisin of lands, sue, or receive rents debts and dividends

LETTERS OF MARQUE See MARQUE

LETTERS PATENT or LETTERS OVERT, in Law, are letters of the king open, but sealed at the foot with the great seal of England, conferring some privilege whereby a party is enabled to do or enjoy that which otherwise he could not Such are letters patent to make denizens to protect inventions &c

LEUCIN (Gr [illegible]) A white pulverulent [illegible] of dilute sulphuric acid on muscular fibre It combines with nitric acid, forming the *nitro-leucic acid*

LEUCITE (Gr λευκος) A crystallized mineral of a grey or white colour generally opake and something resembling the garnet in form It usually occurs in lava especially in that of Vesuvius, hence it is also termed *Ves[illegible]*

LEUCOMA [illegible] the cornea of the eye, arising from inflammation

LEUCOPHLEGMATICS In Ecclesiastical History the name of a fanatical sect of Christians which sprang up in the Greek and Eastern churches towards the close of the 12th century The tenets which they embraced were peculiarly strict while they rejected all the outward ceremonies of religion and spent their whole time in prayer and supplication to the Deity They derived their name and origin from an enthusiast, Leucopetrus, of whom little is known beyond his name

LEUCOPHLEGMATIC A pallid flabby state of body

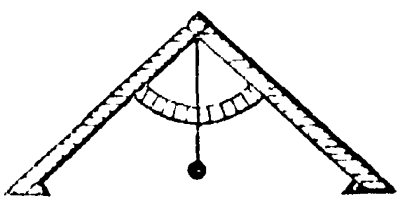
LEVANT (It levante, *rising*), in Geography is applied in a general sense to any country situated to the eastward of us, or in the eastern part of any continent or country but in more contracted signification it is given to that part of the Mediterranean [illegible] bounded by Asia Minor on the north Syria and Palestine on the east, Egypt and Barca on the south, and by the island of Candia and the rest of the Mediterranean on the west

LEVARI FACIAS In Law, a writ of execution directed to the sheriff, whereby he is commanded to levy a sum of money upon the lands and tenements, goods and chattels, of a man who has forfeited his recognizances It is superseded in practice by the writ of elegit, except in cases of outlawry

LEVATOR MUSCLES Those which lift the part to which tney are attached

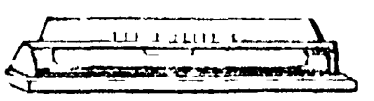
LEVEE (Fr lever, *to rise*), is the term used in court language for the ceremonial visits which distinguished persons are received in the morning, or, as the word implies at their *rising* It is chiefly applied in this country to the stated public occasions on which her Majesty receives visits from such of her subjects as are entitled by rank or fortune to the honour The difference between a *lévee* and a *drawing-room* consists in this, — that while at the former persons [illegible] appear with the exception of the chief officers of the court [illegible] ladies and gentlemen are admitted [illegible]

LEVIN MASS (Fr literally *an universal rising*) A military expression for the rising of a whole people to defend their country from invasion In Germany it is styled landsturm, in contradistinction to the landwehr or militia (*quod vide*), and there, as in Spain



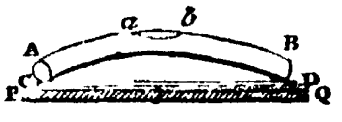
[illegible] instrumental in [illegible]

LEVEL, [illegible] as the direction of a straight line parallel to the plane of the horizon



The plane of the sensible horizon is indicated in two ways by the direction of the plummet or plumb line, to which it is perpendicular, and by the surface of a fluid at rest Accordingly, levels are formed either by means of the plumb line or [illegible] and applied in some part [illegible] or [illegible] on the same principle, namely, the action of terrestrial gravity

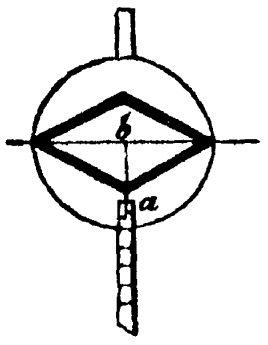
Levels in which the plumb line forms the essential part are those most usually employed for the common purposes required by bricklayers, masons, carpenters, &c They are constructed under many different forms, but the general principle is as follows —A frame or board is prepared, having one edge perfectly straight, and a straight line is drawn on the frame at right angles to the straight edge To some point of this straight line a thread carrying a plummet is attached [illegible] placed in such a [illegible], hanging freely coincides with the straight line, the straight edge of the frame which is perpendicular to it, must be horizontal See PLUMMET



The *Artillery Foot Level*, and the *Gunner's Level*, besides the line and plummet have a scale for showing the inclination of a straight line to the horizon The former has two equal legs or branches placed at right angles, and from their point of junction a thread and plummet hangs, and plays over a quadrant divided into twice 45° from the middle The plane or line on which the two ends rest is horizontal when the thread falls over the zero point of the scale, and when it falls over any other point the degree marked on the scale indicates the inclination of the line to the horizon The gunner's level is on the same principle though differently constructed the thread or plummet being replaced by a solid piece of brass, loaded at the lower end, and the legs, or rather the edges of the brass plate making an angle of 45° It is used in the same manner as the former

Spirit Level —By far the most convenient and also the most accurate level is the spirit level represented in the annexed figure, which is nothing more than a glass tube nearly filled with a liquid (spirit of wine being now generally used, on account of its *mobility* and not being liable

when the tube is placed hor[illegible] [illegible]rently in many parts if the tube could be made mathematically straight, but that being impossible to execute, and every tube having some slight curvature if the convex side be placed upwards the bubble will occupy the higher part, as in the figure (where the curvature is purposely exaggerated) Suppose such a tube as A B firmly fastened on a straight bar C D and marked at *a b* two points distant by the length of the bubble, then if the instrument be so placed that the bubble shall occupy this interval it is clear that C D can have no other than one definite inclination to the horizon, because, were it ever so little moved one way or other the bubble would shift its place, and run towards the elevated side Suppose now that we would ascertain whether any given line P Q be horizontal, let the base of the level C D be set upon it, and note the points *a b*, between which the bubble is exactly contained, then turn the level end for end so that C shall rest on Q, and D on P if then the bubble continue to occupy the same place between *a* and *b*, it is evident that P Q can be no otherwise than horizontal, if not, the side towards which the bubble runs is highest, and must be lowered Astronomical levels are furnished with a divided scale, by which the places of the ends of the bubble can be nicely marked" (*Herschel's Astronomy*, p 92)

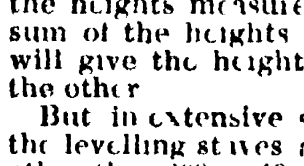


The accuracy of the indications of the level depends in a considerable degree on the regularity of the interior surfaces of the tube They are commonly made of glass tubes in the same state as they are obtained at the glass-[illegible] [illegible] rather spindle form, with a slight spherical curvature The tube and bubble must be of considerable length The larger the bubble the more freely it moves, and consequently the more sensible is the level to a small inclination With proper care they can be executed it is said with such delicacy as to indicate a single second of [illegible] exact horizontality

LEVELLERS In English History, a party which arose in the army of the Long Parliament, about the time when it overawed that assembly, and transferred the king

to Hampton Court in 1647 The levellers as they were called at first implied a determination to level all ranks, and establish an equality in titles and estates throughout the kingdom Several of the officers belonging to this party were cashiered in 1649, and, on Cromwell's departure for Ireland in the end of that year, they raised mutinies in various parts of the country, but were put down by the army, and were put down without bloodshed John Lilburne, one of the chiefs of the party, was said that, "if none but he were left in the world, John would quarrel with himself" His *Manifestation from J Lilburne and others, styled Levellers* (See *Clarendon*, books x and xii, *Godwin's History of the Commonwealth*)

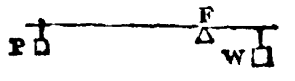
LEVELLING STAVES Instruments used with the spirit level, for supporting a mark, and showing at the same time its height above the ground Mr Adie constructed by Troughton the common levelling staves, rods of mahogany, each about four feet long, and divided into feet and hundredths They carry a vane having at the lower edge a small plane parallel to that which is levelled, and a line on the levelled side denotes the reading of the staff The face of the vane is made of white holly, with an inlaid lozenge of ebony, forming at once a conspicuous object, and one easy of bisection In levelling, the vane must be moved up or down till the horizontal wire of the telescope bisects the acute angle of the lozenge as shown in the figure As the line on the levelled edge at *a* denotes the reading of the staff a piece equal in length to the distance *a b* is cut off from the bottom of the staff, or rather the divisions commence at that number of inches above zero (*Simms's Treatise on Mathematical Instruments* 1834)



LEVELLING Art of surveying which has for its object to discover how much any assigned point is higher than another assigned point above a level surface or such a surface as water would assume when perfectly at rest

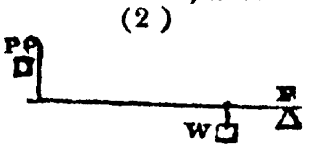
In ordinary cases of levelling (for example, for canals railroads, &c) the instruments commonly employed are a spirit level attached to a telescope and a pair of staves (See LEVELLING STAVES) Suppose that the difference of level between A and B is to be found the staves are placed successively at A, C &c, the intervals not exceeding 400 yards on account of the curvature of the earth and the levelling instrument placed between at equal distances to avoid corrections for refraction It is then directed backwards to the first staff A D and next forward to the second C I and at each observation the division on the staff, or the height at which the visual ray meets it is noted The difference of the heights—that is C I, A D—is the height of the higher station above the lower The hindmost staff, and the levelling instrument are now carried forward to a new position, and the back and fore observations repeated and so on till the operation is completed Then the difference between the sum of the heights measured in the back observations and the sum of the heights measured in the fore observations will give the height of the one extreme station above the other

But in extensive surveys, it is often necessary to place the levelling staves at much greater distances from each other than 300 or 400 yards, in which case allowance must be made for the earth's curvature Let D A D′ represent the arc of a great circle of the earth's surface and A the place of an observer All the points in this arc are in the same level, but the line of sight indicated by the level is a tangent to the circumference at A, and, consequently, objects B B′, in this line, will *appear* in the same level with A, though they are really elevated above it by the distances B D B′ D′ intercepted on the radii between the arc and the tangent Now from the nature of the circle A B′ = B D (2 C D + B D), but, in all cases of actual levelling, the arc A D is very small in comparison of the whole circumference, consequently the square of B D may be neglected, and the arc substituted for the tangent we have then, for the value of B D, this expression, $BD = \frac{AD^2}{2CD}$, that is to say, the depression of the true [illegible] to the square of [illegible] of the curvature of the earth Supposing the diameter of the earth to be 7916 miles, and A D = 1 mile, we shall have B D equal to the 1-7916th of a mile, or 8 004 inches At the distance of 2 miles, the correction will be four times this quantity, or 32 016 inches, and so on, increasing as the square of the distance It is most convenient to reckon both the distances and the corresponding depressions in feet and decimals of a foot, in which case the correction becomes $\frac{1}{7916 \times 5280} A D^2$, to be subtracted from the apparent or observed level, in order to obtain the true The following table shows the depression in feet and decimals of a foot, for the different distances therein stated, the mean diameter of the earth being assumed = 7916 miles —



Distance	Depression	Distance	Depression
Yards	*Feet*	*Miles*	*Feet*
100	0 00215	1	0 667
200	0 00861	2	2 669
300	0 01938	3	6 006
400	0 03445	4	10 677
500	0 05383	5	16 683
600	0 07752	6	24 024
700	0 10551	7	32 699
800	0 13781	8	42 709
900	0 17441	9	54 054
1000	0 21533	10	66 733
1100	0 26055	11	80 747
1200	0 31008	12	96 095
1300	0 36390	13	112 779
1400	0 42205	14	130 796
1500	0 48449	15	150 150
1600	0 55124	16	170 836

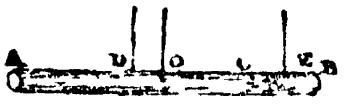
LEVER In Mechanics, an inflexible rod moveable about a *fulcrum* or prop, and having forces applied to two or more points in it The lever is one of the mechanical powers, and, being the simplest of them all, was the first that was attempted to be explained Its properties are treated of by Aristotle, but the first accurate explanation was given by Archimedes, in his Treatise *De Equiponderantibus*



In treating of the lever, it is convenient to distinguish the forces applied to it by different names One is usually called the *power*, the other the *weight* or *resistance*

Levers are commonly divided into three kinds, according to the relative positions of the power, the weight, and the fulcrum In a lever of the first kind (fig 1), the fulcrum F is between the power P and the weight W In a lever of the second kind (fig 2), the weight W is between the fulcrum F and the power P In a lever of [illegible] (fig 3), the power P is between the fulcrum F and the weight W

(1)



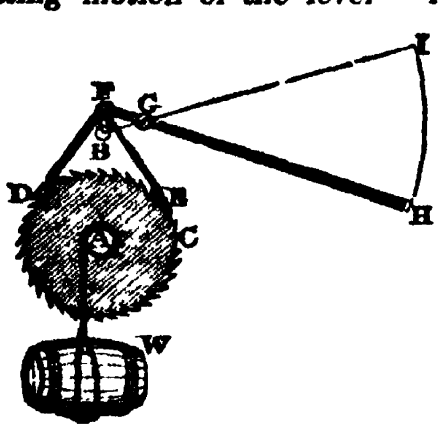
(2)

(3)

The general principle of the lever is, that when the power and weight are in equilibrio, they are to each other inversely as their distances from the fulcrum This property is almost an obvious consequence from the principle of virtual velocities, but it may be deduced from more familiar considerations Let A B be a cylinder or bar of homogeneous matter If supported from the middle O the two ends would evidently balance each other, and the pressure at O would be the same as if the whole matter of the bar were concentrated in that point Suppose it to consist of two parts A C and B C these again would be separately supported at their middle points D and E, or the whole of the matter in A C may be conceived to be concentrated at D and the whole of that in B C at E, and the equilibrium would not be disturbed Hence the weight of A C attached at D, and the weight of B C attached at E would balance the inflexible line D E, if supported at O, the centre of the whole bar A B But O D = A O − A D = ½ A B − ½ A C = ½ B C, and O E = O B − E B = ½ A B − ½ C B = ½ A C, consequently O D is to O E as B C to A C, or O D is to O I as the weight concentrated at I to the weight concentrated at D This demonstration is commonly ascribed to Archimedes (*Maclaurin's Account of Newton's Principia*)

This proposition shows the advantage obtained by using the lever as a mechanical engine The arm P F [illegible] W F and consequently, [illegible] exceeds the power The proportion in which the weight exceeds the power is called the *mechanical advantage*, or purchase Suppose P F (figs 1 and 2) = 4 feet and W F = 1 foot, then a power of 1 lb acting at P will overcome a resistance of 4 lbs at W

Suppose the lever with the weights P and W to turn round the fulcrum, the two points to which P and W are attached will describe arcs proportional to the radii F P, F W, consequently the power P is to the weight W as the velocity of the weight to the velocity of the power



Therefore in this, as in all mechanical engines, when a small power raises a great weight the velocity of the power is much greater than the velocity of the weight, and what is gained in force is therefore said to be lost in time

When the power and the weight do not act on the lever in directions perpendicular to its length, or when the arms of the lever are not in the same straight line or are bent, then the power and the weight are not to each other reciprocally as the arms of the lever, but as the straight lines drawn from the fulcrum perpendicular to the respective directions in which the power and the weight take effect

In [illegible] are of constant occ[illegible] crowbar, the handspike, the poker, scissars, nippers, pincers, &c., are levers of the first kind, the toothed hammer is only a bent lever of this kind The second kind includes the chipping knife nutcrackers, the common door, oars and rudders, the wheelbarrow, &c To levers of the third k[illegible] -shears, the treddle of the turning lathe [illegible] but admit of a prop [illegible] animals are generally levers of this sort The socket of the bone is the fulcrum, a strong muscle attached to it near the socket is the power, and the weight of the limb, with whatever resistance is opposed to its motion, is the weight A very moderate contraction of the muscle thus gives considerable motion to the limb

From the principle of the lever is deduced the distribution of pressure in the case of a pole borne [illegible] between the weight [illegible] the carrier will [illegible] the burden alike, but if a load is [illegible] suffers a greater strain than the other

Universal Lever is the name given to a machine formed of a combination of the lever with the wheel and axle [illegible] of which is to give a continued rectilinear motion to a heavy body by means of the reciprocating motion of the lever F G H is a straight line, whose centre of motion is at G At the extremity of its shorter arm hang two bars, the former of which has a hook to catch into the teeth of the wheel A C D, while the latter has its end bent in order to slide over the outer parts of those teeth The axle A has a cord wound round it to the end of which is attached the weight W Now suppose the end H of the lever to be raised from H to I while the other end descends from F to B, the bar F F will then push the tooth F of the wheel to C, while the hook D slides over an equal space on the other side of the wheel On bringing down again the end of the lever from I to H, the other extremity ascends through B F, and the hook D raises up the left-hand side of the wheel through a space equal to E C Thus the reciprocating motion of the lever is made to communicate a continued rotatory motion to the wheel, and, consequently, to lift the weight W suspended from its axle by the cord The universal lever has long been employed in saw mills, for the purpose of drawing along the logs to the saw (*Gregory's Mechanics*, vol ii)

LEVIATHAN The name of a great marine animal in the Book of Job, described in chapter xli, which was covered with close joined or confluent scales and had the jaws, or "doors of the face" armed with terrible teeth round about Some naturalists have supposed that the crocodile might be the subject of the sacred poet's allusions, but the "breath that kindleth coals" could scarcely be suggested by the respiratory actions of a cold-blooded reptile The same objection applies to the opinion that the leviathan of Job was the extinct megalosaurus with this additional difficulty, that the megalosaurus was a terrestrial reptile as the large me[illegible] while of the leviathan [illegible] He maketh the deep to boil like a pot he maketh the sea like a pot of ointment he maketh a path to shine after [illegible] be hoary Upon [illegible] pressions accord [illegible] exertions of a huge cetacean in his native element, and the verse, "Out of his nostrils goeth smoke, as out of a seething-pot or cauldron," does not inaptly figure the "blowing" of a whale The teeth of either the [illegible] of [illegible] exterior [illegible] to the scales of fishes, would have its distinguishing peculiarities correctly defined by the following expressions — "His scales are his pride shut up together as with a close seal One is so near another, that no air can come between them They are joined one to another, *they stick together, they cannot be sundered*" (Verses 15, 16, 17) Many persons must have witnessed the phenomena of the luminosity of the sea on our own coasts, where it is usually [illegible] t produced in the warmer [illegible] or in the tropics The phenomena which naturalists and voyagers have described as being produced by the swimming and blowing of the cetaceous animals in a phosphorescent ocean, during the night might likewise have suggested the description of the fire and sparks that escape from the mouth of the leviathan, and of the shining path that he leaves behind him in the deep

LEVIGA'TION (Lat lævus, *smooth*) The process of [illegible] o a state of fine mechanical division previously powdered, with water or [illegible] rubbing [illegible] smooth slab, with the flat face of [illegible] ler The paste is then often stirred into a large vessel of water where the coarser powder first falls, and the finer remains suspended, and is afterwards collected by pouring it off with the wa[illegible] [illegible] slowly to subside In this way, by [illegible] powders of very different degrees of fineness are obtained

LE'VITES The descendants of Levi, one of the twelve sons of Jacob, to whom no distinct territory was allotted in the land of Canaan, as to the other tribes, but who were set apart for the ministration of the re[illegible] throughout the [illegible] forty [illegible] in the suburbs of Pal[illegible] peculiarly appropriated to their residence The law of Moses commanded the tenth of the vegetable produce of the land, and also of the cattle to be given to them, of this a tenth was set apart for the priests, whose assistants the Levites were When God destroyed the first-born of the Egyptians he appointed that the first born males of the Israelites should be "set apart unto himself" (Exod xiii), in commemoration of the immunity from that visitation which was vouchsafed to the chosen people Afterwards it is recorded that upon the sons of Levi discovering an extraordinary zeal against idolatry in the case of the golden calf (Exod xxxii), the religious offices of the [illegible] [illegible] were [illegible] who with Moses his brother, were both of the tribe of Levi For the classes of which the Levites were composed, their offices privileges &c, see particularly Numb iii viii, also 1 Chron xxiii—xxvi

LE'VYNE (so called from Levy the crystallographer) A crystallized mineral found in Ireland, Faroe, and elsewhere, closely allied to the zeolites It is a hydrated alumino-silicate of lime and soda

LEXICO'LOGY, or LEXIGOGRAPHY (Gr λεξις, *a word or phrase*, and λογος, *description*) A word used by some writers to express that branch of philology which treats of words alone, independently of their grammatical and rhetorical uses, [illegible] composition and their et[illegible] There are two useful papers in the *Quarterly Review* on Greek lexicography, vols xxii xliv

LE'XICON (Gr λεξις) A dictionary of words, or vocabulary, [illegible] usually confined to dictionaries of the Greek or Hebrew tongues The oldest Greek lexicon is the *Onomasticon*, which was written 180 years before Christ the oldest Hebrew lexicon belongs to the 9th century *See* DICTIONARY

LEYDEN JAR *See* ELECTRICITY

LEZE-MAJESTY In Jurisprudence, any crime committed against the sovereign power in a state The name is derived from the Roman phrase, "crimen læsæ majestatis, [illegible] a citizen for [illegible] general misdemeanours of a political character, which were comprehended under the title of injuries to the "majesty of the Roman people" The emperors transferred to all offences against themselves the same criminal character, and offences of leze-majesty were multiplied under their arbitrary governments

LIAS A provincial name, adopted by geologists, for an argillaceous limestone, which, together with its associated beds, is characterized by peculiar fossils *See* GEOLOGY

LIBATION (Lat *libo, I pour*) The solemn pouring of wine and other liquids in religious ceremonies of antiquity, in Greek σπονδαι Libation appears (if our translation is correct) to have been used in the earliest recorded sacrifice for Abel offered milk (Gen iv 4) a daily libation of water was used by the Jews in the Feast of Tabernacles, the burnt offering instituted by Moses was of wine (Numb vi 7) The Grecian libations, in like manner were of unmixed wine, but sacrifices to nymphs, Ceres Proserpine and some other deities, were attended by libations of oil and wine, &c

The wine was poured between the horns of victims, on the altar or on the ground The ancients had also a well-known custom of pouring out a small quantity of wine, by way of [illegible] of their banquets, a [illegible] common under imperial Rome (See this art in the *Enc Met*)

Te multa prece, te prosequitur mero
Defuso pateris HORACE

LIBA'VIUS'S FUMING LIQUOR Bichloride of tin, obtained by distilling a mixture of 1 part of tin filings with 3 of corrosive sublimate It emits dense white vapours when exposed to air

LIBEL In the Spiritual Courts, the original declaration in a civil action is so termed See LAW, ECCLESIASTICAL

LIBEL in Law is applied to almost any malicious publication by writing or printing or by signs, pictures, &c Whatever tends to render a man odious or ridiculous, or to lower him in the esteem and opinion of the world, is a libel [illegible] for compelling [illegible] or, as having a tendency to excite his wrath, and provoke a breach of the peace, may be proceeded against by indictment or criminal information Where it is sought to make a party responsible in damages for a libellous publication, he may set up the truth of the [illegible] answer to the complaint, for the plaintiff [illegible] the misconduct or other thing imputed to him, is not considered to suffer by its disclosure any private injury which can be a legitimate ground of compensation to him, but when the proceeding is by criminal prosecution, the truth is no [illegible] altogether immaterial, for the [illegible] ally provoke a breach of the peace, whether it be true or false The court, however, will, in general, before granting a rule for a criminal information, which supersedes the usual practice of a presentment by the grand jury, require the prosecutor to deny on affidavit the truth of the matters charged against him It will be seen, however, that there is not in any case a legal foundation for the maxim vulgarly ascribed to the law, "The greater the truth the greater the libel" All publications are libels and criminally punishable as such, which have a tendency to disturb the public peace, his majesty's government the established religion, public morals, or the administration of justice Before the 32 Geo 3 c 60 (Fox's Act), on a criminal trial for libel the jury were not allowed to take the whole question into consideration, and return a general verdict of guilty or not guilty, but could only decide upon the fact of publication and whether the libel meant that which it was alleged in the indictment to mean, the court alone taking upon itself to determine the criminality or innocence of such meaning Now, however, in libel, as previously in all other criminal cases it is competent to [illegible] to the whole question, [illegible] not guilty The [illegible] Lord Campbell's act, has made various important changes in the law of libel

Libel is deemed in law a greater offence than slander, inasmuch as written defamation is commonly the result of more deliberate malice than that which is merely spoken, and frequently inflicts greater injury on the object of its attack Many words, such as 'rogue," "swindler," which are not actionable when spoken, are so when written

In an action for libel, a verdict for a farthing damages formerly gave the plaintiff his full costs, until the act of Lord Denman, whereas, in slander if the damages are found under forty shillings, the plaintiff is entitled to no more costs than damages

LIBE'LLULINES A genus of Neuropterous insects, of which the dragon-fly, *Libellula*, is the type

LI'BER (Lat *bark*) In Botany, the interior lining of the bark of Exogenous plants It consists of woody tissue [illegible] very thick-sided, intermixed with [illegible] to be formed annually, at the same time as the concentric zones of wood, and is intended by nature to convey downwards the secretions elaborated in the bark and leaves It is the principal seat of laticiferous vessels

LIBER In Roman Mythology, a surname of Bacchus, in reference, perhaps, to the idea of his being a liberator or deliverer Liber was originally an old divinity, who presided over fertility, and who was worshipped in connexion with [illegible] Proserpine, according to Cicero, *De* [illegible] Ceres

LI'BERAL [illegible] cant name, which has been applied since 1815 to the party in each country which advocates constitutional institutions where they do not exist, or their extension into a more popular character where they do As a party name, this word has been most definitely adopted in Spain where the party of the cortes assumed the title of *liberales*, and nicknamed their adversaries by that of *serviles*

LIBERA'LIA A sacred festival, with games, so called from Liber, a Latin name of Bacchus, in honour of which god they were celebrated at Rome On occasion of this festival that the Roman [illegible] who had attained the age of seventeen assumed the manly dress, or *toga*

LIBE'RTAS, in the mythology of the Greeks and Romans, was a goddess [illegible] Brutus [illegible] called the [illegible] and [illegible] and Italy, statues, temples, and altars were erected in honour of her At Rome, her most famous temple, built by C Gracchus, was situated on the Aventine Mount She was represented under the figure of a woman, holding in one hand a cap the symbol of Liberty and two pon[illegible] in the other In modern times a cap is also used as a symbol of Liberty thus, in France a red cap formed the badge of the Jacobin club In [illegible] cap with a white border is used as a symbol [illegible] titutional freedom of the nation, and Britannia sometimes bears it on the point of her spear

LI'BERTINES In C[illegible] H[illegible] a name given, in [illegible] early [illegible] the middle [illegible] (*Mosheim*, vol iv p 430, transl, ed 1790) See ANABAPTISTS

LI'BERTY In Philosophy *See* NECESSITY

LIBITI'NA An Italian goddess patroness of funerals and undertakers, synonymous with the Venus Infera or Epithumbia of the Greeks She had a temple at Rome in which was deposited a small coin called Libitinarius, for every person who died This custom, which originated in the desire of the Roman authorities to procure a faithful account of the number of deaths, may, perhaps, be regarded as among the first attempts to obtain an accurate census of the population

LI'BRA (Lat *the balance*) One of the zodiacal constellations, the seventh in order, beginning with Aries Libra is one of the forty-eight ancient constellations of Ptolemy

LIBRA denotes also the ancient Roman pound *See* WEIGHTS

LIBRARIES, ITINERATING The name given to a peculiar species of circulating library, instituted a few years ago at Haddington, in Scotland, by Mr Samuel Brown The principle on which [illegible] are formed consists, as the epithet [illegible] in the books being sent from one part or district of a country to another on the following plan —The books are formed into divisions, consisting each of a certain number of volumes, and proportioned in number to the extent of the country intended to be supplied Each division remains for a certain period (in some instances one or two years) in the same place, when it is removed to another locality, and succeeded by a new supply of books of the same number, by which means each locality has a fresh supply of useful reading at short stated intervals In Haddington, which may be called the head-quarters of the [illegible] the books consist of 43 divisions of 50 volumes each, and on the principle above explained each volume, at an average of the 43 divisions, is read [illegible] during two years, the period at which the books [illegible] The system of itinerating libraries has been extended to various other parts of Scotland, to several districts of England, to Ireland, Canada, South Africa, and Jamaica The use of the books is gratuitous, if so wished, and never more than 1*d* per annum has been systematically taken from any reader Voluntary contributions, however, either in books or money, are received (See *Geo Dict*, art "Haddington")

LI'BRARY (Lat liber *book*) The name given neither to a collection of books, or to the apartment or edifice in which they are kept The oldest public library of antiquity of which we have any credible account, is that founded by Pisistratus at Athens, which was carried by Xerxes into Persia, and recovered by Seleucus Nicanor. Whether this was the same library which Sylla (according to Plutarch) carried to Rome, and which was again restored by Hadrian, is not clear, nor is its ultimate destiny known [illegible] the Goths, [illegible] the public libraries [illegible] zens The library of Alexandria was [illegible] of antiquity Its history has been written [illegible] *de l'Ac des Inscr* vol ix), Reinhar[illegible] and many others It was first formed by the Ptolemies Soter, Lagides, Philadelphus, and Euergetes the last of whom resorted to very royal measures for the accomplishment of so laudable an end, for he is said to have seized on books imported from Greece, caused them to be copied, and returned the copies to the proprietors, keeping the original for his library The collection of Soter is said to have been deposited in a suburb called Bruchium, which was burnt by the troops in Cæsar's Egyptian war That of Philadelphus (the smaller of the two) was preserved in [illegible] the nucleus of the lat[illegible] the great library of P[illegible] 200,000 volumes), pre[illegible] by Mark Antony The

narrative of the destruction of this library by the fanatical Arabs in A D 641, is among the popular tales of history and the only circumstance [illegible] that it is substantially, I [illegible] ing the doubts thrown on it by [illegible] The first public library at Rome was founded by Asinius Pollio, A D 716, the second, the Palatine, by Augustus, in 726, great part of it was consumed under Commodus, but much remained even in the time of Constantine Reusch (1734) Fokerman (1764) and Eckhart (1799), have published separate dissertations on the libraries of the Romans The ancient libraries of the West must have wholly perished in the convulsions which attended the overthrow of its empire The history of those of the east is not easy to investigate Constantinople certainly possessed, at the period of its capture, extensive remains of ancient literature, and many, but almost wholly fruitless investigations have been made of late years in the monastic libraries of modern Greece, particularly of Mount Athos, for valuable manuscripts (See *Walpole's Oriental Memoirs*, *Journal of Education*, vol II) The best accounts of ancient libraries, to which we are able to refer the reader, are contained in the work of Petit Radel, *Récherches sur les Bibliotheques Anciennes et Modernes*, Heeren, *History of the Study of Classical Literature*, vol I, *Ersch and Gruber's Encyclopedia*, art "Bibliotheken," *Taylor's History of the Transmission of ancient Books in modern Times*, *Enc Brit*, Suppl, "Library"

Of modern public libraries the greatest and most celebrated is that of Paris (Bibl Nationale) It was commenced by King John, in the middle of the 14th century, with *ten* volumes; and has been augmented by subsequent kings to the enormous number it now possesses (Le Prince, *Essai Historique sur la Bibl du Roi*, Paris, 1787) Next to that of Paris in extent, and possibly in value [illegible] libraries of St Petersburg and Munich In Italy, the Ambrosian at Milan, and the Vatican at Rome, are peculiarly rich in MSS Of British libraries, the greatest are those of the British Museum, of the two English universities, of which that of Oxford (the Bodleian) is peculiarly rich in oriental manuscripts, that of the Advocates, at Edinburgh, and of Trinity College, Dublin Statements of the number of books contained in public libraries will be found in many works, but no statistical information is more imperfect and worthless Some have not scrupled to say that there is no information respecting the great [illegible] ber of printed books, wh [illegible] one half Such scepticism may be exaggerated, but that there is some ground for it may be conjectured from the [illegible] ch we have made between dif- [illegible] M Panizzi is contained in the Appendix to the Report on the Brit Mus, 1838, vol II No 6 The returns in the first column are borrowed from Mr Edwards's elaborate "Statistical View of the Public Libraries of Europe and America" We should premise that the number of printed books belonging to the library of the Brit Mus was actually returned in 1848 at 490 500 and the *volumes* of MSS at the same date were returned at 31,700

[illegible]			[illegible]							

LIBRA'TION (Lat libra, *a balance*) In Astronomy a term applied to certain phenomena resulting from the moon's motion, whereby the spots very near the border of the lunar disc alternately disappear and become visible [illegible] as if [illegible]

The [illegible] of three kinds, the libration in longitude, the [illegible] in latitude and the diurnal libration The libration in longitude is occasioned by this circumstance, that the rotatory motion of the moon about her axis is not always precisely equal [illegible] in her orbit If the moon's orbital motion were [illegible] and performed in the same time as her rotation about the axis, the radius vector from the centre of the earth would always intersect the lunar disc in the same point or the moon would always present exactly the same face to the earth But the rotatory motion is sensibly uniform, while the orbital motion, being performed in an ellipse is [illegible] faster than its average [illegible] the eastern and western [illegible] reappear

The libration in latitude is occasioned by the inclination of the moon's axis of rotation to the plane of her orbit Supposing this axis always to have the same direction in space, the angle which it makes with the radius vector of her orbit will [illegible] of her revolution and obtuse [illegible] poles of rotation, and the adjacent parts of the surface, are alternately visible from the earth

The diurnal libration is simply a consequence of the lunar parallax The observer being placed [illegible] of the earth, perceives [illegible] time of her rising which disappears as her elevation is increased, while [illegible] opposite border, that were before invisible, come into view as she descends towards the horizon *See* MOON

The libration in latitude and diurnal vibration were [illegible] Hevelius first observed and ex- [illegible] longitude

[illegible] licet, *it is lawful*) In Law, a power or authority given to a man to do some lawful act, and may be by word or by deed [illegible] other to do it on his ground which would [illegible] would be a trespass and the party [illegible] comes a trespasser *ab initio* Licence is also commonly taken for the admission of an individual, by proper authority, to the right of doing particular acts, practising in professions &c, and for the certificate of such admission

LICENTIATE A degree in some foreign universities [illegible] universities of Paris [illegible] except in [illegible] of Cambridge In the original sense of the word it appears to have been only a title applied to such as had obtained a licence to teach It is said to be of Italian origin [illegible] versity of Bologna Where [illegible] it intervenes between that of bachelor and that of doctor

LI'CHEN (Gr λειχην, *a roughness of the skin*) In Pathology, a papulous eruption of the skin terminating in scurfy exfoliations it is generally symptomatic of disordered stomach and bowels

LICHE'NIC ACID The acid peculiar to some species of lichens It appears to be the *malic acid*

LI'CHENIN A substance closely allied to starch, extracted from the *Cetraria islandica*, or Iceland moss

LI'CHENS Plants of a very low organization, which grow on the bark of trees or rocks, when they form a kind of incrustation, or upon the ground, when they consist of irregular lobes parallel with the earth's surface Occasionally in all situations they are found in a branched state, but their subdivis [illegible] regular and without order Their [illegible] of hard nuclei, called *shields*, which break through the upper surface of the *thallus* or main substance of the lichen, are of a peculiar colour and texture and contain the reproductive particles Lichens abound in the cold and temperate parts of the world The greater part are of no known use, but some, as the reindeer moss (*Cenomyce rangiferina*), the Iceland moss (*Cetraria islandica*), and various species of *Gyrophora*, are capable of sustaining life, either in animals or man The Iceland moss when deprived of its bitterness by boiling, becomes indeed a diet recommended to invalids Others are used as tonic medicines as *Variolaria fagnea*, and *Parmelia parietina* Their principal use is, however, that of furnishing the dyer with brilliant colours, orchall, cudbear, and perolle, with many more, are thus employed

LICKS A term applied in North America to sandy tracts of land, upon which common salt forms an efflorescence, and which almost all graminivorous animals resort to for the purpose of licking the surface

LI'CTORS (Lat ligo, *I bind*) Officers whose duty it was to attend the principal Roman magistrates (such as the consuls, master of the horse, and prators) and the vestal [illegible] their appearance in public and to act as constab [illegible] their command Their insignia were the *fasces* or bunch of rods (originally encircling an axe, which was removed by Publicola, used under the republic only by dictators, and restored under the emperor), and the *virga* or rod, which was used to touch the door of the magistrate on returning home The number of lictors in attendance varied according to the rank of the magistrate, thus the consuls had twelve, the prætors six, and dictators, according to some, twenty-four

LIEGE In the Latin of the middle ages *ligeus*, from *ligare*, to bind A liege lord, in feudal language, is a superior to whom *allegiance* is owed and a *liegeman* he who owes such allegiance Hence all subjects are termed *liege* of the king S new rs derive the word liege from the Teutonic word *leude* (modern German *leute*, people), which was used in the sense of *vassal*

LI'EN (Lat *ligo*, *I bind*) In Law signifies the right which a creditor has to retain the property of his debtor until the debt has been paid, and furnishes one of very few instances in which a party is allowed to take the law, as it were, into his own hands Liens are either general or particular A general lien is the right to retain anything for a general balance of accounts, and not for those demands only which arise in respect of the thing retained This sort of lien is said not to be favoured by law A particular lien, which the law is said to favour, is a right to retain a thing when the claim against the owner of it aris as, where a tailor has to a coat, the tailor is allowed to retain the cloth until he is paid for his labour in making it into a coat The payment of a simple contract debt cannot be enforced by action after six years have elapsed from the time the debt was incurred, but a party who has a lien on property may retain it for an unlimited period, until his claim has been satisfied.

LIE TO *See* LYE-TO

LIEUTE'NANT (Fr) An officer, who, as the derivation of the word implies, supplies the place and discharges the duty of a superior in his absence

LIEUTENANT IN THE ARMY The officer immediately subordinate to the captain, in whose absence he takes the command of his company In the British service the lieutenants of the Life Guards and Horse Guards and of the three regiments of Foot Guards have the rank of captain In the artillery, engineers, marines, and rifle brigade, of the British service, and in all the regiments of most of the Continental nations there being no cornets or ensigns, the subaltern officers are distinguished as first and second lieutenants The pay of a lieutenant varies, according to the regiment or branch of the service to which he belongs, from 10*s* 4*d* to 6*s* 6*d*, and the price of his commission, according to the pres is, for the Life Guards 1785*l*, Horse Cavalry 1190*l*, Foot Guards, 2050*l*, Infantry 700*l*

LIEUTENANT IN THE NAVY The next rank to that of commander, and co ordinate with that of captain in the army The number of war varies with their rat eight lieutenants besides supernumeraries, and those of the second, third fourth rates &c have respectively one less than the number appointed to the preceding rate The monthly pay of a lieutenant in the British navy varies according to the ship and his duration of service, from 11*l* 10*s* to 4*s*

LIEUTENANT-GENERAL OF THE KINGDOM A dignity equivalent to that of regent which has been occasionally held in France on temporary emergencies The Count d'Artois (afterwards Charles X) took this title in 1814 on entering France, and held it until the arrival of his brother, Louis XVIII On the expulsion of Charles X, in 1830 the Duke of Orleans was constituted lieutenant general, both by an ordinance of that prince, and by the provisory government of the Hotel de Ville, on July 29, and retained the title until he was proclaimed king, on the 7th August following.

LIFE ANNUITY *See* ANNUITY

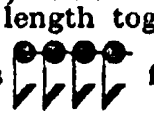
LIFE ASSURANCE *See* ASSURANCE

LIFE BOAT A boat originally made at Shields, in 1789, by Mr Greathead, for saving the crews of shipwrecked vessels The following are the general principles — The boat is wide and shallow, the head and stern are alike, for pulling in either direction, and raised to meet the waves, it pulls double banked the oars being fir, for lightness, and fitted with thole pins and grummets, and is steered with an oar The boat is cased round inside on the upper part with cork, in order to secure her buoyancy with as many persons as she can carry, even though full of water, the cork likewise assists in maintaining, or, if equilibrium in emerging from the hollow of the sea It is a curious fact that the smugglers paint their boats white for the contrary reason, because dark-coloured objects alone are discernible

LIFE BUOY A buoy, with a mast to render it conspicuous, thrown into the sea upon a man's falling overboard The one invented by Lieut Cooke, R N, is furnished with a composition which is fired by the act of disengaging the buoy from its place, at night, and burns with a strong light

LIFE GUARDS The body guard of a sovere land they consist of two regiments, comprising each 32 officers, 83 non-commissioned officers, and 351 privates In Germany such troops are styled the *leib garde* (body guard), and in France the *garde du corps* *See* GUARDS

LIFE LINE In a Ship, any rope stretched along for the safety of



LIFE, MEAN DURATION OF *See* EXPECTATION OF LIFE

LIFE RENT In Scottish Law, the right of enjoyment, either of an heritage or a sum of money, for the life of the life-renter The superior proprietor of the subject, or *fee*, in which this rent subsists, is termed the liar *Terce* (i e dower) and *courtesy* (analogous to the courtesy of England in English law) are instances of legal life rents

LIFTING PUMP *See* PUMP

LIFTS The ropes which support the ends of yards weight of the men upon them

LIGAMENTS (Lat ligo, *I bind*) Strong elastic membranes connecting the extremities of the moveable bones When boiled in water they yield more or less a portion of insoluble albumen

LIGATURE (Lat ligo) In Music, the tie which binds several notes of like length together, by which they appear in groups Thus  four quavers, by means of a ligature at top or bottom, assume the form , the line connecting them being the ligature

LIGHT (Germ licht) The cause of those sensations which we refer to the eyes, or that which produces the sense of seeing The phenomena of light and vision have always that they have been examined with such care as to afford grounds for any safe speculation respecting the nature of light and the mode of its propagation through space But the solution of these two questions is involved in very great difficulty, for notwithstanding the splendid discoveries of that immortal philosopher and the long train of interesting and important facts which have been investigated since his time, and more particularly since the beginning of the present century, the true theory of light still remains an enigma This does not arise from any difficulty there is in framing an hypothesis which shall afford a mechanical explanation of the various phenomena, but from the circumstance that more hypotheses than one have been imagined by which all the phenomena can be explained not merely in a general way, but with the precision of numerical calculation

The knowledge of the laws which regulate the phenomena of light constitutes the science of *Optics*, which is divided into a number of subordinate branches An account of the principal phenomena will be found under the terms ABERRATION, CHROMATICS, INTERFERENCE, OPTICS, POLARIZATION REFLECTION, REFRACTION, &c The present article will be confined to a brief enumeration of some of the principal properties of light, and a statement of the two rival theories by which modern philosophers explain its nature and propagation

Properties of most familiar from luminous intervenes to intercept the light, they are seen in all situations of the eye Thus, the flame of a lamp is visible from every part of the sphere of which it occupies the centre, and the same is the case with respect to a phosphorescent body, an electric spark, a ball heated red-hot, or light having any other source The sun throws its light, not only on the earth, but on the planets, and comets and every other body in the firmament

Another property of light is, that in a homogeneous medium it is always propagated in straight lines This is evident from various considerations The forms of shadows correctly represent the outlines of the objects which produce them, as seen from the luminous body, which could not be unless the light proceeded in straight lines from the extremities of the objects to the borders of the shadow If three plates of metal, each pierced with a small hole, are placed at some distance behind each other, and in such positions that the three holes are exactly in one straight line, the light will pass freely through them, but if the holes are not exactly in a straight line no light will pass In like manner, if a number of similar objects are placed behind each other in a straight line, the first renders all the others invisible to an eye placed in the same line We cannot see through a bent tube

A third property of light is that it requires time for its propagation The velocity with which it passes from one point to another is, however, so great, that, with respect to any terrestrial distances, the passage may be considered as instantaneous But astronomy furnishes the means, not only of detecting its propagation but of measuring its velocity with great precision Eclipses and emersions of Jupiter's satellites appear to happen later when the earth is at a greater distance from Jupiter, than when it is at its greatest Light, therefore, occupies above a quarter of an hour in passing

through the diameter of the earth's orbit Now, the sun's distance from the earth being nearly 95,000,000 of miles, it follows that light must travel through space with the [illegible] velocity of [illegible] nearly [illegible] time and consequently would pass round the earth in the eighth part of a second Astronomical [illegible] is, no result of science rests [illegible] It is also proved, by the phenomena of aberration, that the light of the sun, planets, and all the fixed stars, travels with one and the same velocity

When light in its progress encounters an obstacle, or enters a [illegible] undergoes certain modifications, depending upon the nature of the body on which it falls, or the [illegible] which it enters When it falls on a smooth polished surface a portion of it is regularly reflected, that is to say, it is returned from the surface at an angle equal to the angle of incidence, and pursues its course in a straight line as before the reflection The quantity of light thus reflected depends on the nature and polish of the surface, and on the angle of incidence, being greatest when that angle is small, but it is calculated that even the brightest and most opaque surfaces, mercury for example, do not reflect more than three fourths of the incident light Another portion of it enters the medium, and there (if the medium is homogeneous) pursues a rectilinear course but differing from its former direction In this case it is said to be refracted The [illegible] medium, [illegible] law of [illegible] the liquids [illegible] whole of the refracted light is bent from its original direction at the same angle In many others, as in most crystallized media, part of the refracted light follows one course, and another part of it a different one, the two portions acquiring at the same time different physical properties In this case the refraction is said to be double A third portion of the light falling on a body is neither reflected nor refracted regularly but is scattered in all directions, and it is this portion which renders bodies visible All bodies on which light falls absorb a certain part of it, more or less in proportion to their opacity In perfectly opake bodies the absorption is total and the light does not penetrate to a sensible depth under the surface In others it penetrates farther but even in the most transparent it is gradually stifled and lost A depth of only seven feet of pure water is required to extinguish one half of the incident light *See* REFLEXION

Solar light, refracted by a prism or other body, is separated into a multitude of rays of different colours, each of which afterwards proceeds in its course independently of all the others These differently coloured rays [illegible] from the variegated hues of natural bodies The investigation of the laws of the dispersion of the coloured rays forms the subject of *chromatics* One of the principal facts connected with it is, that the dispersion of the rays by different refracting substances is not proportioned to the refraction, the dispersive power of some substances being greater than that of others, while their refracting power is less This fact led to the important discovery of the *achromatic telescope* *See* ACHROMATIC CHROMATICS

Light, on being regularly reflected or refracted, undergoes a modification termed *polarization*, in virtue of which it presents, on encountering another medium, different phenomena of reflection and refraction from those presented by light which has not undergone such modification When a ray of light, having acquired this modification, is made to fall on a plane reflecting surface under a certain angle of incidence, no portion of it will be reflected, the whole is transmitted or absorbed But, in the case of ordinary light, some portion is always reflected from a polished surface, whatever be the angle of incidence, the light has therefore acquired the property of being acted upon in a particular way, whence Malus, who first investigated this subject in a philosophical manner, gave the phenomena the name of *polarization*, from its analogy to the effect produced by a magnet [illegible] *See* POLARIZATION

The last property of light which we shall notice as important [illegible] mutual influence on each other [illegible] or modifying each other's effects [illegible] laws This mutual action of [illegible] gives rise to a great [illegible] of the most intricate phenomena of optics, and affords a sufficiently simple explanation of [illegible] ation has [illegible] INTERFERENCE

[illegible] ories have long divided the opinions of philosophers respecting the nature and propagation of light One of these consists in supposing it to be composed of particles of excessive minuteness, projected from the luminous body with a velocity equal to nearly 200,000 miles in a second This hypothesis was adopted by Newton, and, till recently, has been acquiesced in by the greater number of writers on optics The other hypothesis supposes light to be produced by the undulations or undulations of an ethereal fluid of great elasticity, which penetrates all space and permeates all substances, and to which the luminous body communicates an impulse which is propagated with inconceivable velocity in spherical superficies, by a sort of tremor or undulation, as sound is conveyed through the atmosphere, or a wave along the surface of water Both of these hypotheses are rendered probable by the great number of phenomena of which they [illegible] they are both, also, [illegible] Other theories have not met with such general attention from philosophers as to make it necessary to explain them in this place

Corpuscular Theory of Light — Sir John Herschel, in his admirable *Essay on Light* in the *Encyclopædia Metropolitana*, states the principles of the Newtonian or Corpuscular theory as follows —

1 "That [illegible] of inertia [illegible] forces, and projected or emitted from all luminous bodies with nearly the same velocity, —about 200,000 miles per second

2 "That these particles differ from each other by the intensity of the attractive and repulsive forces which reside in them, and in their relations to the material world, and also in their actual masses, or inertia

3 "That these particles, impinging on the retina, stimulate and excite vision, the particles whose inertia is greatest producing the sensation of red, those of the least inertia of violet, and those in which it is intermediate the intermediate colours

4 That the molecules of material bodies and those of light exert a mutual action on each other, which consists in attraction and repulsion, according to some law or function of the distance between them, that this law is such as to admit, perhaps of several alternations or changes from repulsive to attractive force, but that when the distance is below a certain very small limit it is always attractive up to actual contact, and that beyond this limit resides at least one sphere of repulsion This repulsive force is that which causes the reflection of light at the external surfaces of dense media, and the interior attraction that which produces the refraction and interior reflection of light

5 "That these forces have different absolute values or intensities, not only for all different material bodies, but for every different species of the luminous molecules, being of a nature analogous to chemical affinities or electric attractions, and that hence arises the different refrangibilities of the rays of light

6 "That the motion of a particle of light, under the influence of these forces and its own velocity, is regulated by the same mechanical laws which govern the motions of ordinary matter, and that therefore each particle describes a trajectory capable of strict calculation as soon as the forces which act on it are assigned

7 "That the distance between the molecules of material bodies is exceedingly small in comparison with the extent of their spheres of attraction and repulsion on the particles of light

8 "That the forces which produce the reflection and refraction of light are, nevertheless, absolutely insensible at all measurable or appreciable distances from the molecules which exert them

9 "That every luminous molecule, during the whole of its progress through space, is continually passing through certain periodically recurring states, called by Newton fits of easy reflection and easy transmission, in virtue of which they are more disposed, when in the former states or phases of their periods, to obey the influence of the repulsive or reflective forces of the molecules of a medium, and when in the latter, of the attractive"

Such are the postulates on which the corpuscular theory of light dep[illegible] Mr [illegible] without difficulty, a[illegible] of mathematical reasoning to the phenomena, which may be investigated by the same sort of analysis with which [illegible] are already familiar in the theories of heat, capillary attraction, and other molecular forces

Undulatory Theory — The principles of the undulatory theory are thus stated by Sir J Herschel —

1 "That an excessively rare, subtle, and elastic medium, or *ether*, fills all space, and pervades all material bodies, occupying the intervals between their molecules, and either by passing freely among them, or by its extreme rarity offering no resistance to the motion of the earth, the planets, or comets, in their orbits, appreciable by the most delicate astronomical observations, and [illegible]

2 That the molecules of the ether are susceptible of

being set in motion by the agitation of the particles of ponderable matter, and that when any one is thus set in motion it communicates a similar motion to those adja- [illegible] propagated further and [illegible] according to the same mechanical laws which regulate the propagation of undulations in other elastic media, as air, water, or solids, according to their respective constitutions

3 "That in the interior of refracting media the ether exists in a state of less elasticity, compared with its density, than in vacuo (*i. e.* in space empty of all other matter), and that the more refractive the medium, the less, relatively speaking, is the elasticity of the ether in its interior

4 "That vibrations communicated to the ether in free space are propagated through refractive media by means of the ether in their interior, but with a velocity corresponding to its inferior degree of elasticity

5 "That when regular vibratory motions of a proper kind are propagated through the ether, and, passing through our eyes, reach and agitate the nerves of our retina, they produce in us the sensation of light In a manner bearing a more or less close analogy to that in which the vibrations of the air affect our auditory nerves with that of sound

6 "That as, in the doctrine of sound, the frequency of the aerial pulses, or the number of excursions to and fro from the point of rest made by each molecule of the air, determines the pitch or note, so, in the theory of light, the frequency of the pulses, or number of impulses made on our nerves in a given time by the ethereal molecules next in contact with them, determines the *colour* of the light and that is the absolute extent of the motion to and fro of the particles of air determines the *loudness* of the sound, so the *amplitude* or extent of the excursions of the ethereal molecules from their points of rest determines the brightness or intensity of the light"

That the sensation of light is produced by the vibrations of an extremely rare and subtle fluid is an idea that was maintained by Descartes, Hooke, and some others, but it is to Huyghens that the honour solely belongs of having reduced the hypothesis to a definite shape and rendered it available for the purposes of mechanical explanation Owing to the great success of Newton in applying the corpuscular theory to his splendid discoveries, the speculations of Huyghens were long neglected, indeed, the theory remained in the same state in which it was left by him till it was taken up by our countryman, the late Dr Young By a train of mechanical reasoning which in point of ingenuity has seldom been equalled, Dr Young was conducted by some very remarkable numerical relations among some of the apparently most dissimilar phenomena of optics, to the general laws of diffraction, and to the true principles of the coloration of crystallized substances 'It is a theory' says Herschel, 'which, if not founded in nature, is certainly one of the happiest fictions that the genius of man has yet invented to group together natural phenomena as well as the most fortunate in the support it has received from whole classes of new phenomena, which at their discovery seemed in irreconcilable opposition to it It is, in fact, in all its applications and details one succession of *felicities*, insomuch that we may almost be induced to say if it be not true, it deserves to be so" (*Ency Metr*, "Light" § 595)

Relations of Light Heat, and Chemical Power —Light and heat are so intimately related to each other that philosophers have doubted whether they are identical principles or merely coexistent in the solar radiations The chemical property of the sun's rays appears to bear the same relation to light and heat as these do to each other By some the phenomena of chemical change — as shown particularly in all the processes of photography — are considered as the result of luminous power, or the action of light, by others they are regarded as the operation of a distinct principle, and to which the name *Actinism* has been applied

These three principles, or phenomena, possess numer- [illegible] prized according [illegible] during quick [illegible] and when these are studied [illegible] producing chemical change is also developed All bodies, excepting the gases, when heated to a high temperature, become incandescent, and they all begin to give out light at the same temperature, viz about 1000° Fahrenheit Nevertheless there are many circumstances in which they appear to differ

A thin plate of transparent glass interposed between the face and [illegible] sensible portion of the light [illegible] the heat As the intensity of the fire is, however, increased, the heat rays begin to pass through the transparent screen, and the heat rays from a body glowing with an intense whiteness permeate it with but little [illegible] The experiments of Melloni have, however, shown, that certain media which are perfectly transparent to solar light are nearly opaque to heat, and that rock salt and black mica, which are opaque to light allow the passage of the heat rays very freely In a similar manner pale yellow glass through which daylight passes without [illegible] completely stops the dark red rays and a deep cobalt blue glass, or a dense blue fluid which obstructs ninety per cent of the luminous rays, offers no impediment to the permeation of the chemical agency

Light, heat, and actinism, are not, therefore, intercepted alike by the same substances Heat and actinism are also combined in different degrees with the different luminous rays of the spectrum A very remarkable discovery on this subject was made by Sir William Herschel, which would seem to establish the independence of the heating and illuminating effects of the solar rays Having placed thermometers in the several prismatic colours of the solar spectrum he found the heating powers of the rays gradually increased from the violet (where it was least) to the extreme red, and that the maximum temperature existed at some distance beyond the red, out of the visible part of the spectrum The experiments of [illegible] was stretched upon a frame, and blackened upon one side with lamp black, the unblackened side was now placed in such a manner that the prismatic spectrum fell upon it, the image being kept stationary by means of a heliostat The paper was then thoroughly saturated with ether, and the drying of this volatile fluid very distinctly indicated the points of greatest thermic action, by the formation of well defined spots By this means it was shown that the maximum of calorific power existed over the locality indicated by Sir William Herschel, and that the heat gradually diminished through the luminous rays, sinking to its minimum in the violet ray Beyond this, an extension of heating power, or of the calorific spectrum, was detected for a very considerable distance beyond the maximum point, — showing an extension of the thermic action, over a space where there was no light, equal to the length of the luminous spectrum itself In addition to this there has been detected a peculiar class of heat rays [illegible] possess a spe [illegible] have been called *Parathermic* rays, to distinguish them from the true thermic radiations, and it appears probable that they perform very important functions in perfecting the full development of fruits and seeds This discovery of the inequality of the heating power of the different rays led to the inquiry whether the chemical action produced on certain bodies by the solar rays was [illegible] was supported by the experiments of Gouelle, — or owing to some other cause? By a series of delicate experiments, Berard found that this action is not only independent of the heating power, but follows an entirely different law Investigations on this subject have been most ably pursued by Sir John Herschel and others By throwing a prismatic spectrum upon paper carefully prepared with the chloride or iodide of silver, or upon a Daguerreotype plate, — which is of silver, covered with a film of iodine, — the following curious results are obtained No change takes place upon that part of the paper upon which the most luminous rays fall, that space being preserved perfectly white In the green ray chemical change occurs but faintly, but it rapidly increases as we proceed towards the violet end of the spectrum, — the maximum varying slightly between th [illegible] violet rays under varying conditions [illegible] is also found to extend to a considerable space beyond the extreme end of the luminous spectrum, exhibiting an extension quite equal to that discovered to exist at the [illegible] of the spectrum

We [illegible] that the solar rays possess at least three distinct powers, those of heating, illuminating, and effecting chemical combinations and decompositions The actual antagonistic power of light and actinism is shown when by the employment of two prisms we produce two spectra, and so adjust them that the most refrangible rays may fall upon that part of the chemically prepared surface on which the maximum [illegible] Notwithstanding the actinic [illegible] with that of light, the [illegible] energetic to protect the paper or plate from any chemical change, and it is preserved without any alteration of colour This experiment appears to prove the complete independence of these phenomena

The solar rays perform some very important parts in the vegetable economy The experiments of Mr Robert Hunt (see *Reports of the British Association*) prove that the process of germination is mainly dependent upon the action of the chemical rays, or actinism that the growth of the plant — the decomposition of the carbonic acid absorbed by the leaves, in virtue of the excitation of the

vital functions of the living organism, and the colouring matter of the leaves—is entirely the result of luminous power, as distinguished from the other associated powers,
[illegible]
forms of some of the lower classes of animals have also been [illegible] and there are probably many [illegible] the same wonderful agent of which we can at present form no adequate notion. (See Sir J. Herschel's *Treatise on Light*, *Airy's Mathematical Tracts*, *Brewster's Optics*, *Young's Lectures*, Biot, *Traité de Physique*, Pouillet, *Elemens de Physique*, *Hunt's Researches on Light*.)

An account of the principal *Photographic Processes* will be found under the term PHOTOGRAPHY.

LIGHT. In Painting, the medium by which objects are discerned. In a picture it means the part the most illuminated. This may happen from *natural light*, as the sun or moon, or from *artificial light* as a fire, candle &c. The principal light is generally made to fall on the spot where the principal figures are placed, and generally near the centre of the picture. A reflected light is that which a body in shadow receives from a contiguous light object.

LIGHT. The sea term for not laden.

LIGHTER. A strong vessel or barge for transporting [illegible] fly on rivers and canals.

[illegible] An establishment for the exhibition of a light or landmark to direct the mariner. The use of lights for such a purpose is of very high antiquity, but their early history is involved in much obscurity. In the ancient world there were [illegible] Ostia, Ravenna, Puteoli, Capreæ, Rhodes, [illegible] Bosphorus, &c. (*Suetonii Opera* tom. i. p. 755), but by far the most celebrated lighthouse in antiquity was that erected by Ptolemy Soter on the small island of Pharos, opposite to Alexandria, —
vium regens" (*Pliny* [illegible]
height, which some authors have estimated at 600 feet and upwards, procured for it a place among the wonders of the world, and, according to Josephus, its "beaming summit" could be seen at a distance of 300 stadia — about 42 British miles. It is said to have cost 800 talents, and its celebrity was such that Pharos rapidly became, and still continues to be in many countries, a generic term equivalent to *Pharus*.

The most celebrated [illegible] of modern times are, the Tour de Cardouan at the entrance of the Gironde, in France, the Eddystone lighthouse opposite to Plymouth Sound, and that more recently constructed on the Bell Rock opposite to the Frith of Tay. The first of these was begun in 1584, and finished in 1611. It is 186½ feet [illegible] and besides being of the highest importance to the [illegible] so dangerous and frequented a coast, it forms at the same time a splendid specimen of architectural beauty. The Eddystone lighthouse constructed by the celebrated engineer Smeaton was completed in 1759, is regarded as a masterpiece of its kind, and, as has well been observed, bids fair to be little less lasting than the rocks upon which it stands. The Bell [illegible] built by Mr Stevenson on the [illegible] N[illegible] the most dangerous point [illegible] cipal harbours, are now erected in most civilized maritime countries. In the Baltic and the Sound they are particularly abundant, the Dutch have 20 lights on their coast, and in the Zuyder Zee, and on the northern and western coasts of France there are no fewer than 89 excellent lights. (The Admiralty has lately published lists of all the [illegible] The coasts of no [illegible] ithouses is those [illegible] they are under the management of the Brethren of the Trinity House, for Ireland, under that of the Board for the Improvement of the Port of Dublin, and for Scotland, under that of the Commissioners of Northern Lighthouses meeting at Edinburgh. It would swell our pages to too great an extent were we to attempt to give a complete list of the various lighthouses of this country, we must therefore beg to refer the reader to the *Commercial Dictionary* for full particulars upon this subject, and shall devote what remains of our limits to a view of the different principles adopted in the construction of their important machinery.

The ancient mode of exhibiting lights as beacons to the mariner consisted in burning wood or coal in a chauffer on the top of a tower, and till the year 1807, the Eddystone light was [illegible] er than the feeble [illegible] fatuus [illegible] any apparatus for concentrating the light or giving it any particular direction. But as [illegible] [illegible] foci are equally [illegible] which has the focus for its centre, it is evident that without some means of giving the light a horizontal direction, the greater part of it must be wholly lost, for only those rays which are directed in the plane of the horizon, or at least which are depressed only a few degrees below it, can be seen by a ship at a distance. Hence the first object to be attained is to prevent the loss of light by throwing the whole of it forward in the plane of the horizon, in order that its intensity may be increased in the greatest possible degree. Now there are two principles [illegible] principles are combined in the same apparatus.

Catoptric System.—The usual mode of applying the catoptric principle is by burning an Argand lamp in the focus of a parabolic mirror. This mode of illumination appears to have been first carried into effect at the [illegible] fleeting mirrors were placed in some of the English lighthouses, under the direction of the Trinity House, and in 1786 the principle was adopted in the only two be[illegible] on the coast of Scotland—viz. the Isle [illegible] Firth of Forth, and the Cumbrae Isle in the Clyde. Soon afterwards it was adopted generally in this country. Borda's reflector was formed of a sheet of copper plated with silver, those applied in Scotland were formed of small facets of mirror glass placed in hollow parabolic moulds of plaster. The mirrors in general use in the British lighthouses at the present time are of copper lined with silver, the focal length is about 3 or 4 inches, and the diameter at the outer edge about 21 inches.

If the curvature of a reflector could be made truly parabolic and it [illegible] point, the rays would [illegible] exactly parallel to the axis of the generating curve, and the beam of projected light would be a cylinder having a diameter equal to that of the mirror. Such a form of the beam would render the light nearly useless, on account of the small portion of the horizon which would be illuminated, and it [illegible] necessary to give the rays a certain degree [illegible] this is practically effected by the size of the flame. The burner of the lamp is usually an inch in diameter, and the origin of the luminous rays being thus at a small distance from the focus, instead of being reflected parallel they are projected in a cone having a divergence of about 14°. The curvature of the mirror may also be so adjusted as to increase the divergence.

In order to produce a light of sufficient intensity, several parabolic mirrors sometimes as many as eight, are placed on a frame with their axes all parallel to each other, so that the light reflected by all of them is blended together in the same beam. To form a revolving light, the frame is attached to a horizontal axis which is turned by means of clock machinery, and in this manner the different quarters of the horizon are successively illuminated. But as a rapid motion would be inconvenient, the frame has usually three or four sides on each of which the same number of mirrors and lights is placed, so that the illumination is repeated three or four times in one revolution. To form a stationary light, a number of reflectors are placed round a circular frame, having their axes on the radii of the circle. This arrangement has one obvious defect, namely that the illumination will not be equally [illegible] the direction of the [illegible] rection of lines bisecting the several angles formed by each pair of contiguous axes. The defect is one which cannot be entirely remedied in a stationary light on the catoptric principle.

Dioptric System.—The introduction of lenses for the purpose of giving the light a horizontal direction is of recent date. A project for this purpose is indeed mentioned by Smeaton in his account of the Eddystone lighthouse, and about the end of the last century the method was tried at some lighthouses in the south of England, but from the imperfect figure of the lenses, and the absorption of the light caused by the great thickness of the glass, it did not succeed. But the art of grinding spherical lenses having been since brought to greater perfection, and a means of greatly diminishing the ab-
[illegible]
is to say lenses formed of several pieces separately prepared and afterwards united,—*see* POLYZONAL LENS), the system has been revived of late years, and in many in[illegible] [illegible] [illegible] still into execution. The merit of [illegible] such lenses to lighthouses belongs to the late [illegible] Fresnel, of the Academy of Sciences of Paris. The annular lenses, constructed under the direction of Fresnel for the principal lighthouses in France, are plano convex, having a focal distance of about 3 feet, and they are formed of crown glass, as being less liable to *strike* than flint glass. The effective divergence of the cone of light projected by a lens is generally less than in

the case of a paraboloidal refractor, being only about [illegible] of that portion of the light which falls on the surface of the lens, it must be stopped by the apparatus of this kind would be superior in its effects to a parabolic mirror, but when [illegible] to the imperfections of the [illegible] ting surface, more than one [illegible] s lost in every case, and also [illegible] d more intense flame may be used for [illegible] lens than [illegible] easily appear [illegible] may be on the side of the lens In fact a lens of the largest size used in the French lighthouses projects a cone of equal intensity to that of eight mirrors of the best kind

The construction of a revolving dioptric apparatus of the first order is usually as follows —The revolving frame which carries the principal lenses has eight sides, and there are consequently eight large lenses, so arranged that their axes are all in the same horizontal plane, and meet in the common focus, where the lamp is placed This frame, with its lenses, consequently forms an octagonal prism For the purpose of preventing the loss of the rays which fall above and below the principal lenses, various methods are employed One is to place above the first frame a second frame, whose sides form [illegible] pyramid of 50° of inclination, [illegible] ch is placed a lens having its focus in the flame of the lamp The rays falling on these inclined lenses are refracted into directions parallel to the axis of the lens, and are then reflected into the horizontal direction by plane mirrors placed above the second frame Another method is to place curved reflectors above the frame containing the principal lenses But a third and still more elegant method, proposed by Fresnel, is to substitute for the upper lenses and mirrors a series of triangular prisms [illegible] axes arranged in horizontal [illegible] so that the light falling on the face next the flame is thrown upon the back of the prism, where it suffers a total reflexion, and a second refraction at the third side of the prism gives it [illegible] ection

[illegible] on the dioptric system, it is necessary to increase the number of the lenses, which in fact ought to be infinite, or to form a true cylinder in order to produce an equal diffusion over every point of the horizon In some of the French lighthouses the refracting apparatus consists of a polygonal belt of 32 lenses, but on establishing the Isle of May lighthouse, in 18[illegible] m proposed to form a true cylindric belt, and the task though attended with much difficulty, was successfully executed at a glass-house in Newcastle

The dioptric system is peculiarly adapted for fixed lights, and its advantages are these —1 A light of equal intensity is distributed round every point of the horizon 2 The consumption of oil is less for the same intensity of light, and consequently the expense of maintaining the light is less 3 The trouble attending it is less as there is only one lamp to trim and the lenses are easily kept in order, whereas the reflecting surfaces require much care and attention On the other hand, there is more risk from accident, for the accidental extinction of the lamp leaves the whole horizon in darkness, whereas in a system of reflectors the light would be extinguished over only a small portion of it

Fresnel published his first memoir on the subject in 1822, since that time the dioptric system has been generally adopted for all the principal lighthouses of France and Holland In this country it has as yet been applied only at Inchkeith and the Isle of May in the Firth of Forth, and at the Start Point in Devonshire

Lamps —For the lights on the catoptric system the illumination is usually produced by an Argand fountain lamp, having a burner of an inch [illegible] with silver, in order that it may th[illegible] the effect of the heat evolved In the dioptric system a larger flame is requisite, and Fresnel invented a lamp the peculiarity of which consists in its having a series of concentric burners For lights of the first class the number is four and they are protected from the effects of the excessive heat by a superabundant supply of oil, which is thrown up from the cistern below by a clock-work movement, and is kept constantly overflowing the wicks A tall chimney is necessary to supply a sufficiency of air In this country the lamp is fed with spermaceti oil, in France the oil of colza (expressed from the seed of the wild cabbage) is used, and in some parts of the Mediterranean olive oil, but the light obtained from this is comparatively feeble In a few instances coal gas has been used for dioptric lights All attempts to apply the Drummond light, and voltaic lights, have failed, by reason of the great practical difficulties with which those modes of illumination are attended

Method of dis[illegible] [illegible] importance in [illegible] the appearances of the different lights so that each may have some distinctive character by which it may be readily recognized, and the mariner be made aware of the part of the coast [illegible] methods adopted for [illegible] —1 The interposition of [illegible] or refractors, so as to give a particular colour to the light red is the only colour which can be used, as shades of any other colour are found to absorb too much light 2 The time of revolution, or the length of the interval between [illegible] appearances of the light this is th[illegible] on the French coasts 3 A *flashing light*, that is a light of which the alternate flashes and eclipses succeed each other so rapidly as to give the appearance of a succession of brilliant scintillations 4 An *intermittent* which consists of a fixed light which [illegible] and after a stated interval as suddenly revealed the appearance of this light is entirely different from that of any revolving light 5 [illegible] which admits of other dis[illegible] be placed vertically above the other, or in the same horizontal plane, or one may be white and the other red Sometimes three lights are necessary to indicate the entrances to harbours, &c

T[illegible] of [illegible] a land [illegible] of a floating light about 1200*l*

(*Encyc Brit*, art "Sea Lights," Smeaton, *Narrative of the Eddystone Lighthouse*, 1793, *Stevenson's Account of the Bell Rock Lighthouse*, 1824, Id, *British Pharos*, 1831, *Brewster's Treatise on Burning Instruments*, 1812; *The Lighthouses of the British Islands*, 1836, *Report of Select Committee of the House of* [illegible] 1839, *Report to the Commissioners* [illegible] *houses* by A Stevenson, 1834, and *on the Inchkeith Dioptric Light*, 1836, [illegible] [illegible] tomene, Peclet, *Tr*[illegible] [illegible] nel, *Memoire sur un* [illegible] *Phares*, 1822, A F[illegible] *Phares et Fanaux allumes sur les Cotés de France*, 1837, &c)

LIGHTNESS (Teut leicht) In the Fine Arts, a quality indicating freedom from weight or clumsiness

LIGHTNING An electric phenomenon, produced by the passage of electricity between one cloud and another or between a cloud and the earth

The identity of [illegible] been previously su[illegible] by the celebrated Dr Franklin, in the year 1749, by the experiment of drawing sparks from the electric kite Since that time the science of electricity has been greatly advanced, nevertheless, the cause of some of the appearances connected with lightning is not well explained even at the present day

There are three phenomena in particular for which theory fails satisfactorily to account The first is the form of the flash which is almost always zigzag, or in broken [illegible] other [illegible] repeatedly to [illegible] the flashes from the [illegible], which often follow each other in quick succession contrary to what takes place in the case of electric conductors, which [illegible] natural state or discharge the [illegible] at a single stroke The third is the length of the flash, which sometimes appears to embrace a large extent of the sky This phenomenon can be best observed from the tops of mountains reaching above the clouds from which the lightning proceeds, and observers in such circumstances agree in stating that they have seen flashes certainly extending several miles in length

The zigzag form of the flash is common to lightning and the electric spark the same explanation should consequently apply to [illegible] been able to give [illegible] the repetition of [illegible] mass of vapours constituting an electric cloud is a less perfect conductor of [illegible] and without knowing [illegible] arranged, so as to be in equilibrium over imperfect conductors, whose surfaces, as in the case of the clouds, often extend many miles, it is easy to see that an instantaneous contact [illegible] an oppo[illegible] a com[illegible] spark [illegible] This we may suppose to be the cause why numerous flashes are darted from the same cloud With respect to the third phenomenon, the great length of the flash may also be a consequence of the feeble conducting power of the clouds, and of the mobility of their constituent parts, or we may suppose parcels of vapour or air, electrified by the influences of two clouds charged with opposite electricities, to be scattered at very small intervals between the clouds, and that, at a given instant, the equilibrium is destroyed, without a transference of the electricity of the one cloud to the other, but merely from parcel to parcel,

along the whole extent of the line in which the flash appears

The theory of an electric fluid, and the well-ascertained differences in the conducting power of different substances suggested the idea of protecting buildings from the destructive effects of lightning by metallic rods It has been disputed whether they have been or can be of use in averting the stroke, but it will not probably be satisfactorily answered until the cause and nature of electric action are better understood *See* ELECTRICITY, THUNDER

LIGHT-ROOM A room in which the light is [illegible]

LIGHTS, NORTHERN *See* AURORA BOREALIS

LIGNEOUS (Lat lignum, *wood*) In Entomology, a part is so called when it is composed of a hard inelastic substance like wood

LIGNIN (Lat lignum) The woody fibre This most important proximate principle of vegetables exists in a variety of forms constituting the entire textures of hard and soft wood and diverse species of plants such as hemp, flax, cotton, &c When by fine mechanical division it is reduced to a pulpy state, it is formed into paper When, by different reagents, all the soluble matters are extracted from wood, the insoluble residue is lignin its ultimate components are charcoal, oxygen, and hydrogen [illegible] in water and according to Dr Prout exposed to [illegible] at a temperature [illegible]

rot arising out of the growth of a parasitic fungus, which causes its rapid decay Damp timber, in situations where air has not free access is particularly subject to its attacks, and, when once it has made its appearance the well-seasoned timber in its neighbourhood becomes liable to the same disease The dry rot may be prevented by impregnating the timber with certain saline solutions and of these solution of corrosive sublimate has been found most effectual the chloride combines chemically with the lignin and the compound is very indestructible (*See* DRY ROT) Lignin has also a strong attraction for alumine, and hence linen, cotton, paper, and other forms of this fibre, may be aluminized by steeping them in hydrated alumine diffused through water, or, more effectively, by soaking them in certain aluminous solutions drying them, and afterwards washing out the excess of the salt It is in this way that cotton goods are impregnated with lumine for the purpose of dyed and calico printing Other metallic oxides exhibit similar mordant powers, especially the oxide of iron

The analogy that exists between the composition of sugar, gum starch, and even vinegar and lignin suggests the possibility of the conversion of those proximate elements into each other, and it has accordingly been found that, by carefully roasting pure and fine sawdust, it is rendered partially soluble in water and that a part of it is converted into a nutritious substance probably intermediate between sugar and starch, and which, when mixed with a little flour, yields a palatable bread, not very unlike that made by some of the inhabitants of the northern parts of Europe of the bark of trees Mixed with sulphuric acid, lignin passes into gum, and from this sugar may be obtained by boiling it for some hours in a very dilute sulphuric acid this sugar, when purified, much resembles grape or honey sugar By this process rags may be converted into nearly their own weight of this peculiar saccharine matter

The production of vinegar by the destructive distillation of wood was originally suggested, about the middle of the 17th century, by Glauber, a celebrated German chemist of that time It has lately become a very important branch of manufacture in this country Upon the whole, there are very few natural products equally important with lignin in their applications to the useful and ornamental arts

LIGNIPE'RDOUS (Lat lignum, and perdo, *I destroy*) Insects which destroy wood

LIGNITE (Lat lignum, and ignis, *fire*) Wood [illegible] coal

LIGULA (Lat *ligula*, *a little tongue*, *strap*, or *shoe-tie*) In Botany a membranous appendage at the apex of the sheath of the leaf of grasses, and analogous to the corona of some Asclepiadeous plants The term *ligula* is also applied to the processes proceeding from the base and alternating with the horns, of the organ called the *orbiculus* in Vaginicolæ [illegible]

LIGULA In Entomology, a name applied by Latreille to the lower lip of insects, or *labium* of Linnæus [illegible]

LILALITE A mineral found in a talc rock on the banks of the Sterzing in the Apennines It occurs in yellowish green crystals and massive, cleavable [illegible]

LILIÂ'CEÆ A large natural order of Endogenous plants, with hexapetaloid hexandrous flowers, a superior ovary, and anthers which burst internally They are familiarly known in consequence of the asparagus, the lily the fritillary, the harebell, the star of Bethlehem, and many other [illegible] having a part of the order, which differ [illegible] having a simple style not three-styles, and [illegible] towards the style, not towards [illegible] extremely varied some, [illegible] trees form a tall woody perennial stem, which emulates that of palm trees, others are small bulbous plants, whose stem only lives a few weeks Almost all the order is sought after by cultivators of beautiful plants, and, in the case of the tulip and the hyacinth, innumerable varieties constitute the riches of [illegible] plants to [illegible] which, in different [illegible] gives their active [illegible] garden prod[illegible] and squills

LILIA'CEOUS In Botany, a term invented by Link [illegible] petals of which have their ungues [illegible] limb, and standing side by side It is rarely employed

LI'MA (Lat *a file*) A genus of Lamellibranchiate Bivalves, of the tribe *Ostracea*, characterized by the length of their shells as compared with those of the nearly [illegible] *Pecten*, and their more regular oval form [illegible] the shell are most of them relieved with scales The *Limæ* swim with rapidity by means of their valves but in a young state they secure themselves by means of a byssus

LIMACIDÆ *See* LIMAX

LIMACINA (Latinized form of limax, *a slug*) A genus of [illegible] Pteropodous Mollusks, existing in con-

of the whalebone whale The body terminates in a spirally convoluted tail and is lodged in a very thin shell, formed by one whorl and a half, umbilicated on one side, and flattened on the other The animal uses its light shell as a boat, and its wing-like fins as oars and thus navigates in countless fleets the surface of the tranquil deep

LIMAX (Lat limax *a slug*) The name of a genus of the Linnæan *Vermes Mollusca*, of which the common slug is the type The genus enters into the class *Gasteropoda* and order *Pulmonaria* of the system of Cuvier, and is now raised to the rank of a family (*Limacidæ*), which includes *Limax* proper, *Arion*, Fer, *Stenopus*, Gould, *Vaginulus* Fer *Testacella* Lam, *Parmacella*, Cuv, &c Each of these genera has a small scutiform rudimental shell developed in the substance of the mantle, and protecting the heart The orifice of respiration in the true slugs (*Limax*, Cuv) is on the right side, and not so far forward as in *Arion* The rudimental shell is marked with fine and concentric striæ, and is calcified internally The species of this genus are the pests of gardens and cultivated grounds Young plants may be protected from slugs by having a coarse horsehair rope coiled round their stems or by being plentifully sprinkled with soot, or they may be watered morning and evening with strong and fresh lime water

LIMB in Astronomy, signifies the border or outermost edge of the sun or moon Also the graduated edge of a circle or other astronomical instrument

LIMBERS In Artillery, a sort of advanced train to which the carriage of a cannon is attached on a march It is composed of two shafts wide enough apart to receive a horse between them, joined by two bars of wood, and mounted on a pair of wheels

LIMBO (Lat limbus, *a hem or edge*) A region supposed by some of the school theologians to lie on the edge or neighbourhood of hell This served as a receptacle for the souls of just men, not admitted into purgatory or heaven Such were according to some Christian writers, the patriarchs and other pious ancients who died before the birth of Christ hence the limbo was called Limbus Patrum These, it was believed, would be liberated at Christ's second coming and admitted to the privileges of the blessed in heaven [illegible] when our Saviour went down [illegible] souls, and carried them away with him into heaven This latter idea is probably an adorned representation of the remarkable passage in St Peter's Epistle (i 3 19), where he says that Christ preached to the spirits in prison, and, being held by certain of the later fathers, seems to have given some influence to the growing opinion in favour of a purgatory Limbus puerorum or infantum, was a similar receptacle allotted by some of the schoolmen to the souls of infants who die unbaptized Dante has fixed his limbo, in which the distinguished spirits of antiquity are confined, as the outermost of the circle of his hell The use which Milton has made of the same superstitious belief is well known (*Paradise Lost*, book iii)

LIMBUS [illegible] to denote that portion which [illegible] it is the same organ in a petal as the lamina in a leaf, and is what constitutes the broad, thin, coloured part which renders many [illegible]

[illegible] leim, *glue*) This very useful earth is

obtained by exposing chalk and other kinds of limestone or carbonates of lime to a red heat — an operation generally conducted in kilns constructed for the purpose the carbonic acid is thus expelled and lime more or less pure according to the original purity of the limestone, remains In this state it is usually called *quicklime* When sprinkled with water it becomes very into a dry powder, called *slaked lime* When exposed for some weeks to the air it also falls into powder, in consequence of the absorption of moisture, and of a portion of carbonic acid, so that, in this case, part of the lime reverts to the state of carbonate, and loses its causticity Pure lime may be obtained by heating powdered Carrara marble to whiteness in an open crucible It is white, very infusible, highly luminous when heated to full redness, and of a specific gravity of about 2 3 It requires for solution about 500 parts of water, and is somewhat more soluble in cold than in hot water But, weak as this solution is, it powerfully affects vegetable colours, and is the strongest *alkaline earth* applied to lime It absorbs carbonic acid by exposure to air, and as *carbonate of lime* is insoluble in water, it becomes milky in consequence, so that, from this property, lime-water is a useful test of the presence of carbonic acid The nature of lime was first demonstrated by Davy in 1807 he showed that, like the other alkalies, it was a metallic oxide The metallic base of lime has been termed *calcium* its equivalent is 20, and lime, being a compound of one atom of calcium and one of oxygen, is represented by the equivalent number 28, and hydrate of lime by 28 lime + 9 water = 37 The *salts of lime* are generally obtained by dissolving carbonate of lime in the respective acids several of them exist native *Sulphate of lime*, selenite, or gypsum, is an abundant natural product, and may be formed artificially by adding sulphuric acid, or the soluble sulphates to solutions of the salts of lime It consists of 28 lime + 40 sulphuric acid, and its crystals include two atoms = 18 of water When these crystallized sulphates of lime are heated they part with their water and fall into a white powder called *plaster of Paris*, when this is mixed with water it again combines with it and concretes into a white mass, hence its use for casts busts, &c Sulphate of lime is often contained in spring water, which is thus rendered *hard* and unfit for washing These waters become turbid upon the addition of a spirituous solution of soap *Phosphate of lime* is found *native*, constituting the mineral called *apatite* this is a *subphosphate*, composed of 3 equivalents of lime = 84 and 2 of phosphoric acid = 72 The *earth of bones* is also chiefly a similar phosphate of lime *Oxalate of lime* is very insoluble, and is precipitated whenever oxalic acid or a solution of an oxalate is added to solutions containing lime, hence it is that oxalate of ammonia is so valuable a test of the presence of lime, and is frequently used for the purpose of separating lime in analysis When oxalate of lime is well dried at 500°, it is anhydrous, and consists of 28 lime + 36 oxalic acid = 64 oxalate of lime This substance is occasionally found in the human urine, and sometimes forms calculi these are often of a reddish brown colour and a rough exterior, whence they have been termed *mulberry calculi* When [illegible] is absorbed, and a *chloride of lime* is obtained This article is manufactured upon an extensive scale under the name of *bleaching powder* It evolves chlorine when acted upon by acids, and gives it out very slowly when [illegible] carbonic acid [illegible] and when [illegible] *Carbonate of lime* is thrown down when alkaline carbonates are added to solutions of the salts of lime It is a most abundant natural product, and is found pure in the varieties of calcareous spar and statuary marble Chalk and several varieties of limestone are also nearly pure carbonates of lime It is easily distinguished from other minerals by effervescing in dilute muriatic acid, and by yielding quicklime when a fragment is heated before the blowpipe It is constituted of 28 lime + 22 carbonic acid the equivalent, therefore, of carbonate of lime is 50

The uses of lime are very numerous Its most important application is in the manufacture of mortar and other cements used in building It is also very extensively used in this country, and in some parts of the Continent and North America, as a manure to fertilize land But it is a curious fact that the use of lime as a manure is entirely a European practice, its employment in this way having been never so much as dreamed of by the natives of Asia or Africa (See *Commercial Dict*)

LI'MESTONE A generic term for those varieties of carbonate of lime which are neither crystallized nor earthy, the former being *calcareous spar*, the latter *chalk* When burned they yield quicklime *See* GEOLOGY

LI'MIT, in Geometry, denotes a given or determinate quantity to which some other variable quantity continually approaches so as to [illegible] but which it can never exceed Thus if we suppose a polygon to be inscribed in a circle, by increasing the number of sides of the polygon its area is increased But the area can never exceed that of the circle within which the polygon is inscribed, and it is only when the number of its sides is conceived to be infinitely great that its area becomes equal to that of the circle. The circle is thus said to be the limit of the areas of the inscribed polygon

Method of Limits, the same with the *method of prime and ultimate ratios*, a peculiar method of analysis employed by Newton in the *Principia* especially to fluxions or the differential calculus, but preserving the form of the

LIMITATION OF ACTIONS AT LAW The period beyond which personal actions of trespass, or debt on simple contract, cannot be [illegible] stat 21 J 1 c 16 They [illegible] years after the cause of action, with the exception of actions of assault, menace, and imprisonment, which are limited to four But a right of action may be revived by an express acknowledgment on the part of the debtor

Penal actions for forfeitures made by statute must be sued in general, according to the terms of the statutes, within two years or one year

By the recent statute 3 & 4 W 4 c 27, all process for the recovery of land by entry and distress, or by action, whether real or [illegible] years after the [illegible] the disabilities of [illegible] soundness of mind, or absence beyond seas, are allowed ten years after the termination of their disability so that forty years be in all cases the extreme limit This statute extends both to suits in equity and actions at law No advowson can be recovered after one hundred years Money charged upon land, and legacies, are deemed satisfied at the end of twenty years, unless there have been some receipt or acknowledgment Arrears of rent, or interest of money charged on land, cannot be recovered after six years But it has been thought that this limitation has been extended by the subsequent statute 3 & 4 W 4 c 42 which enacts that actions of covenant and debt for rent, &c may be brought at any time within 20 years after the cause of action has accrued

The statutes [illegible] apply [illegible] remedies directly and by [illegible], where the equitable remedy is sought (as it may be in some cases) for a right enforceable at law, and they have been adopted [illegible] those cases where a purely equitable right [illegible] of a legal one, as the right to mesne profits in respect of an equitable ownership, or a debt payable in equity but not in law Where there is not this strict correspondence between the equitable and legal claims, the rule prevails that twenty years' adverse possession, which is in law a bar to the possessory action for land, shall be a bar to all equitable claim, whether the adverse right be merely equitable also or equitable and legal, such period of limitation being, as at law capable of extension from infancy, absence, or disability But time is not a bar to the claim of cestui que trust against his trustee, where the trusteeship was in the origin direct and express, and not coupled with any beneficial interest, as it is in the case of a mortgage, nor does a purchaser, with notice from a trustee, stand in a better situation in respect [illegible] than the trustee himself

LI'MNEA (Gr λιμνη, *a pool*) A genus of freshwater snails, so named from their general location in ponds, ditches, and [illegible] water Many species of this [illegible]

LI'MNING The art of painting in water colours, in which sense it is used to distinguish it from painting in oil colours

LIMO'SA (Lat limus, *mud*) A genus of wading birds, belonging to the *Longirostres* tribe, and characterized by a straight beak longer than that of the snipes (*Scolopax*), and sometimes slightly bent at the extremity, the nasal groove extends [illegible] which is blunt and somewhat depressed, [illegible] or punctation on its surface The external toes are palmated at the base they are longer and slenderer than in the snipes The species of *Limosa* which, with us, are vernacularly termed Godwits, frequent salt marshes and the sea shore

LI'MULUS (Lat limus) A genus of gigantic Entomostracous Crustacea, in which the haunches of the first six pairs of feet are beset with small spines, and are so closely approximated about the mouth as to serve the office of jaws. The œsophagus, instead of proceeding backwards, is continued forwards for a short distance into the anterior part of the shield before it enters the stomach this cavity is lined with a thick rugous cuticle, and terminates in the intestine by a long muscular and valvular projection The heart is elongated, vasiform, and muscular, the branchiæ are supported on a series of closely-packed broad plates beneath the post-abdomen The total number of feet is twenty-two the first ten, with the exception of the two anterior ones in the males of some species, are terminated by a didactyle forceps, and are inserted, with the two following pairs,

beneath a large semilunar shield The species of this genus are found on the shores of the North American and Asiatic continents they are commonly known by the names of king crabs horse shoe or mollusca crabs The tail is long, straight, sharp pointed, and of sufficient strength and size to be used as a spear-head or arrow-point by savages

LINA'CEÆ (Linum, one of the genera) A small natural order of herbaceous Exogens, principally inhabiting Europe and the North of Africa , allied, according to De Candolle [illegible] *Geraniaceæ* The want of a synadelphic structure the imbricate calyx, the regular flowers and the small quantity of albumen in the seeds, rather point out an affinity with *Cistaceæ* and its allies Their chief characters are the tenacity of their fibre, the mucilage of their seeds and the beauty of their flowers Common flax or lin (whence [illegible] tplx to the order [illegible] what may be called the regular [illegible] from other military corps or establishments Thus all numbered infantry or marching regiments, with the exception of the Foot Guards, are designated by this term, in opposition to the cavalry the artillery the engineers the marines the militia the yeomanry &c

LINE in Fortification is used for a extended ditch as a ditch with [illegible] ions, &c

LINE, in Geography and Navigation is used for the equator, [illegible]

LINE In Geometry having only one dimension [illegible] hat which has length without breadth "

LI'NEAR In Geometry, a linear problem is one that is solved by the intersection of two straight lines, or by an equation of the first degree, and which, consequently, admits only of one solution

Linear Equations in the Integral Calculus are those in which the unknown quantities [illegible] Thus $Ax + B = 0$ is a linear equation, when A and B are not functions of x, and $Ady + By + C = 0$ is also a linear equation, when A, B, and C do not contain y

Linear Perspective is that which regards only the positions, magnitudes, and forms of the objects delineated, [illegible] *perspective* in which the variation [illegible] and shade of objects according to their different distances and the quantity of light that falls on them, are also considered and represented

LINEN (Germ. leinwand) A species of cloth woven with the fibres of the flax plant (*Linum usitatissimum*) The origin of the manufacture of linen is lost in its antiquity In the time of Herodotus linen was an article of export from Egypt, where it had been used from time immemorial , but it is evident that in ancient times its use was limited to the noble and the rich In modern times linen constitutes a staple manufacture in almost all [illegible] ore especially in Germany [illegible] England, Scotland and Ireland [illegible] en prosecuted for a very [illegible] until of late years its progress has been [illegible] compared at least with that made in other branches of manufacture This seems to be partly owing to the attempts to bolster up and encourage the manufacture in Ireland, partly to the absurd restrictions that were for a lengthened period laid on the importation of foreign flax and hemp, and partly to the rapid growth of the cotton manufacture — fabrics of cotton having to a considerable extent superseded those of linen It is only within the last fifty years that any machinery has been used in the production of linen cloth, the first mills for [illegible] about forty [illegible] Scotland, [illegible] principal seat of the manufacture is—in England, Leeds and its immediate vicinity, and in Lancashire, Dorset Durham, and Salop , in Scotland, Dundee which indeed may be regarded as the chief seat of the British manufacture (see *Geo Dict* , art "Dundee"), and in Ireland, the province of Ulster The entire value of the linen manufacture of Great Britain and Ireland is estimated at 8,000,000*l* , and the total number of persons employed in it about 185,000 (*Statist of the Brit Empire* vol [illegible]

LINE OF BATTLE, is the line formed by the ships [illegible] of each other, [illegible] nearly so It [illegible] tack The line is composed of ships of not less than two decks, thence called *line-of battle-ships* The line is also called the *line ahead*

LINE OF BEARING, THE, is formed by the ships of the fleet when ranged on a line six points from the wind, at equal distances, and with their heads in any direction whatever The line is called by the name of that tack upon which if the ships were to haul to the wind together they would form the line ahead For example suppose the wind N , and the ships in a line W N W and E S E of each other, this is the *starboard* line of bearing, whether the ships are going free, or close-hauled upon the *larboard tack*

LINE OF DIP In Geology, the strata which form the crust of the globe are rarely horizontal, but incline to some point of the horizon, and rise to the opposite point , a line drawn through these points is called the line of their *dip*

LI'NGUA (Lat *a tongue*) In Entomology, the name of an organ situated within the labium or emerging from it, by which insects in many cases, collect their food and pass it down the pharynx, which is situated above its root

LI'NGUA FRA'NCA The dialect spoken chiefly along the European and African coast of the Mediterranean It is a species of corrupt Italian mingled with words of other languages, and may be termed the Creole of the Mediterranean

LI'NGULA (Lat) A genus of Palliobranchiate Bivalves, with two nearly flat, smooth, oblong, triangular valves, attached between the two apices to a long fleshy pedicle The arms, or labial appendages, are spirally convoluted as in the rest of the class

LI'NIMENT (Lat lino, *I anoint*) A semifluid ointment or a soapy application, to rub upon painful [illegible] These are usually applied to spirituous and other [illegible] for external use

LINING In Architecture, any covering of an interior surface The linings, for instance or boxings of window shutters, are the pieces [illegible] the recesses into which the shutters [illegible] orways, they are the facings on each side the aperture to sashes, they are the vertical pieces parallel with the surface of the walls

LI'NTEL (Span lintel) In Architecture an horizontal piece of timber or stone, over a door, window, or other opening, to discharge the superincumbent weight

LION (*Felis leo* Linn) The largest most formidable, and most noble of the Carnivorous animals, though not the most typical of the genus at which it stands at the head It is chiefly distinguished by the presence of a [illegible] in the male and by a tufted tail and [illegible] the feline markings in both sexes before they arrive at maturity , the colour then being a nearly uniform light fulvous brown, with mane inclining to black especially in the Central and South African races The mane is scantier and lighter coloured in the Asiatic than in the African lions , and there exists a maneless variety in the eastern parts of Hindostan See FELIS

LION In Heraldry, a beast, of which the figure is very commonly borne as a charge The attitudes in which the lion is represented are very various (*See* RAMPANT, PASSANT REGARDANT GARDANT, COUCHANT, SALIENT, SEJANT) A lion passant is termed, in French heraldic language, a leopard , and hence the common notion that the lions of England were substituted for leopards

LION OF ENGLAND A lion passant regardant or (being the bearing of England), is frequently thus termed in heraldry

LIP A term applied to either of the two divisions of a Monopetalous corolla, where one portion takes a direction upwards and the remainder a direction downwards, as in *Labiatæ* It is the same as *labellum*, which see

LI'PARIS (Gr λιπαρος, *glistening*) The name of a genus of Lepidopterous insects , [illegible] applied by Pliny to a genus of fishes In Botany, it is the name of a genus of plants

LIPOGRAMMATISTS or WRITINGS (Gr λειπω, *I omit*, and γραμμα, *a letter*) Compositions in which a particular letter is omitted throughout The ancients produced many ingenious trifles of this description In the *Odyssey* of Tryphiodorus there was no A in the first book, no B in the second and so on There are other pieces of modern invention, such as the *Pugna Porcorum*, in which all the words begin with the letter P Odes in Spanish, containing only one of the vowels, are refinements on the same invention

LIPO'RNA (Gr λιπος, *fat*) A soft fatty tumour

LIPPITU'DO (Lat lippus, *bleareyed*) The disease commonly called *bleared eyes*, consisting in a puriform exudation from the margin of the eyelids, which [illegible] of melting or of fusion This term is also used synonymously with *solution*

LI'QUIDS In Grammar, the letters *l*, *m*, *n*, and *r* are so called

LI'QUOR SI'LICUM Liquor of flints A solution of silicated potash

LIRE'LLA In Botany, a term used in describing lichens to denote a linear shield, with a channel along its middle, as found in *Opegrapha*

LIST The enclosed field or ground wherein the ancient knights held their jousts and tournaments , so called from its being encircled with pales, barriers, or

stakes, as with a list Some of these were double, one for each cavalier, which kept them apart, and prevented them from coming nearer each other than a spear's length Hence the expression *to enter the lists* is synonymous with engaging in contest

LIST The name given to the border or selvage of a piece of cloth, &c

LIST, or LISTEL In Architecture, the same as fillet or annulet

LIST, CIVIL *See* CIVIL LIST

LI'STING (Fr leziere) In Architecture, the cutting away the sappy part from the edge of a board

LI'TANY (Gr λιτανια, *supplicatio*) signifies a general supplication, and was applied by the Eastern church in early ages to a special form of prayer which was introduced [illegible] where the words *rogatio* and *supplicatio* had before been used in the same technical sense It is supposed by Palmer (*Antiq* i 269) that the change of term was occasioned by the frequency of processional supplications from the Eastern to the Western churches, beginning in the 4th century It appears that some of the Eastern litanies contain the supplication to saints which forms a [illegible] is mostly translated from the forms of the Western litanies previously used in this country, those of the breviary of Salisbury and York The direction in the Prayer Book is that the litany shall be read on Wednesdays, Fridays, and Sundays on the two former as fast-days in the primitive church, the one as the day in which Christ was sold by Judas, the other as that of the crucifixion, and therefore periods of peculiar humiliation on the Sunday, as the day appointed for the most complete and solemn service in the week (See *Riddle's Christian Antiquities*, p 623, 1839, *Palmer's Origines Liturgicæ*, i 264)

LITERA'TI (Lat), denotes, in general learned men, but is applied in China to such persons as are able to read and write their own language and also to a particular sect, consisting chiefly of the most learned men of that country, amongst whom it is called *Jukiao* or learned It is from the class of the literati that the mandarins (*quod vide*) are alone capable of being selected

LI'TERATURE (Lat litera, *letter*), comprises, in the general sense of the word the entire results of knowledge and fancy preserved in writing, but in the narrower use to which ordinary custom restricts it we draw a distinction between literature and positive science, thus exempting from the province of the former one extensive branch of our studies and attainments And, in a still more restricted sense the word literature is sometimes used as synonymous with *polite* literature, or the French *belles lettres* (which see)

The history of literature is a peculiar and distinct subject, comprising several subdivisions, such as histories of the literature of special ages or countries, or histories of separate branches of literature such as poetry For its complete execution it requires an union of bibliographical knowledge with critical acumen It should give the reader a sufficient acquaintance with the titles, contents, and dates of remarkable books and with the general biography of remarkable authors, together with a critical appreciation of the characters and value both of authors and books, and of the dependence, connection, and derivation of literature, that is, the mode in which opinions, taste, and style have been propagated or changed This last, as it is the most difficult part of the subject, so is it that of which the execution has been hitherto most imperfect

Antiquity has left us no relics of this species of history, [illegible] stant references of such writers as [illegible] Quintilian, to earlier authors, accompanied by [illegible] merits, show that the taste [illegible] wanting A remarkable passage of Velleius Paterculus, in which he shows, by historical instances, how many of the great names of antiquity were coeval with each other, in limited periods of time clustering as it were, together in particular seasons and places, is one of the earliest instances we have of that spirit of generalization from literary phenomena which is now so common as to leave little room even for the [illegible]

In the following brief [illegible] works of general literary history which the student has it now in his power to consult, we shall follow in great measure, the criticisms of Mr Hallam, in the Preface to his *Introduction to the Literature of Europe in the Fifteenth, Sixteenth, and Seventeenth Centuries* The oldest work of this description (if such it can be called) is that of Polydore Virgil *De Inventoribus Rerum*, 1499 Conrad Gesner, who has been termed the 'father of literary history,' published his *Bibliotheca Universalis* at Zurich, 1545-55 Notwithstanding these and a few other meagre attempts, Lord Bacon, says Mr Hallam, was justified in denying that, up to his time, any real history of letters had been written [illegible] and [illegible] world wanting this to [illegible] of [illegible] his single eye The next in order of time is *Lamonus Prodromus Historiæ Literariæ*, 1659, a work pursued on a great plan, but scarcely begun But *Morhof's Polyhistor Literarius*, first published in 1688, and much enlarged by subsequent editors, "is still found in every [illegible]" Andrès, a Spanish Jesuit published [illegible] *Progresso, e Stato [illegible]* to 1799, a very extensive, and, in some respects, valuable work, though without much display of taste, and no signs of genius In the present century, no writers, except of Germany, have attempted a field which has become of such enormous extent, but *Eichhorn's Literary History*, in six volumes, 1805, 1811, appears to be now, on the whole, the most complete and valuable work of this kind extant *Wachler's Manual of Literary History*, in four volumes, appeared at Leipsig in 1833

But besides these general compendia, much assistance is to be derived from general biographers Of these the well-known Dictionary of Bayle, first published in 1697, is the earliest of any value It is characterized by Hallam [illegible] That of [illegible] *illustres de la République des Lettres*, 43 vols 12mo 1733, 1745, is extraordinarily copious, and useful in biographies but in other respects of no great value [illegible] *Universelle* (of which the original edition was in 52 volumes, and a supplement is now in course of publication which has reached the letter H) stands incomparably first among this class of works *Chalmers's Biographical Dictionary* scarcely deserves mention as a literary work, but its historical details are sometimes minute and useful, though not unfrequently most so in the obscurest names

Of *partial* works on literary history some of the most remarkable and useful are, 1 According to subjects — History of Philosophy Brucker, Buhle, Tennemann (abridged by Victor Cousin) To these we may add, briefly as they are, the Introductory Essays of Stewart and Playfair to the *Encyclopedia Britannica* Of Belles Lettres, generally, Bouterwek, 12 vols 8vo Poetry, Quadrio, *Storia d'ogni Poesia*, a work of remarkable industry, the [illegible] in point of critical taste [illegible] French Laharpe, *Cours de Litterature Française*, a performance of considerable, but in parts superficial and showy, talent Italian *Tiraboschi, Storia della Letteratura Italiana*, a work of extraordinary value in which the history of Italian literature has been traced, [illegible] the great lines and the most elaborate research, from the earliest times down to the last century It has been abridged, but with some original criticism, by Ginguené in his *Histoire Litteraire de l'Italie*, Corniani's *Storia della Letteratura Italiana dopo il suo risorgimento* 1804,1813 *Sismondi's Literature du Midi de l'Europe* is most valuable, also, in its Italian chapters, although those on Spanish and Portuguese literature touch on subjects less generally known In England, as Mr Hallam observes, "we cannot claim for ourselves a single attempt of the most superficial kind *Warton's History of Poetry* contains much that bears on our general learning, but it leaves us about the accession of Elizabeth" 3 According to ages — The recent work of Mr Hallam, which comprehends the literary history of Europe from 1400 to 1700, a work almost approaching to universal in its character Its peculiar excellences are a philosophical spirit, manliness and candour of judgment great honesty in the execution, and a taste unusually cultivated and correct It is, however, as might [illegible] character, [illegible] different subjects and authors, and in point of execution

The love of literature is, [illegible] remarkable and characteristic form in [illegible] exhibits itself From being the absorbing passion of the learned few, it becomes, with the progress of education, the delight and favourite occupation of numbers, losing, perhaps, in intensity what it gains in universality For, without joining in the views of the indiscriminate eulogisers of past times, it cannot, we think, be fairly denied [illegible] the revival [illegible] of interest now present themselves to the inquiring mind [illegible] of interior character, such, for example, as the establishment of correct rules of classical [illegible] are less appreciated, because we have daily [illegible] topics of much higher interest [illegible] to carry back the faculties to pursuits of special investigation That all this has some disadvantages it were vain to deny Some imagine that not only extent and minuteness of knowledge, but real depth of learning and

power of mind, are more rare among the literati of the present day than heretofore; that we have lost in profundity, to use the common expression, what we have gained in surface. Of that opinion we are not But we imagine ourselves to trace, both in the composition and tone of [illegible] and harmony of tone [illegible] the result of patience, and of that complacent dwelling of the mind on some favourite object of study which was so common in former ages The powers of men of ability are too much dissipated, both by the vast variety of subjects pressing on their attention, and by the temptation to satisfy the cravings of the public by hasty execution

On the other hand, in the four literary countries of the present day — France, Germany, England, Italy, and especially the three former — the number of persons to whom literature furnishes the sole and beloved *recreation* has increased, within the last century, we may add the last generation, to an amount perfectly surprising Were it possible to calculate the number of individuals more than half of whose waking hours are spent in reading, and writing on literary subjects, the result would be startling In Germany the number of books published has nearly trebled since the peace of 1815 The great bulk of the increase belongs to literature specially so called In France and England the accumulation is scarcely less And by the process, common in all these countries, of circulating libraries, the same copy of a book performs an infinitely greater quantity of service, passing under the eyes of many more readers than heretofore It is curious, among ourselves to trace [illegible] vourite amusements of [illegible] almost deserted by the ranks which used to frequent [illegible] The public assembly rooms of the rich [illegible] places of resort for nightly entertainments so common among the middle classes, are also falling into comparative disuse Of the increased infrequency of play, or even games of skill, in society, every one can judge Of wine the consumption has certainly not increased one half in place [illegible] the number of consumers has probably been doubled or sextupled All these things afforded a certain quantity of *occupation*, and the substitute for [illegible] has been the same — literature

It is plain, therefore, how far more important a part than heretofore literature must perform [illegible] the public mind of nations There has been [illegible] it scarcely represented the national [illegible] but merely that of a class by which it was encouraged Any one who were to judge of the social state of England under Charles II by its literature, would pronounce that the nation comprised a learned class of great knowledge, but visionary and unpractical habits of mind, and a frivolous course debauched community Yet, in truth, the great bulk of the nation was sound sober, religious and [illegible] The literature of the latter part of [illegible] is grave decorous, even rigorous in tone, because such was the affectation of the court The people are not represented [illegible] Such anomalies are now impossible The [illegible] rature of the day is and must be the real expression of the popular mind

Now the effect of literature on the moral habits of man is incalculable It is the remark of a [illegible] writer of the present day, that [illegible] rary work without acquiring any positive knowledge at all, or forgetting it as soon as acquired, but very rarely without receiving some moral impression And in this view we regard the predominance of literary habits in a nation as advantageous For, unless public taste is very far corrupted indeed, the tone of morality in the ordinary literature of the day to meet approval must be good not absolutely good perhaps — imperfect it may be, and occasionally false, but still more right than wrong And such a tone of literature, reacting on the minds of the public, will tend to preserve and augment right feelings in the reading classes The more special tendencies of literary habits seem to be to soften the disposition, — to melt down rancorous feelings, — to encourage benevolence of sentiment, and a ready sympathy with generous conduct That they serve essentially to promote self denial and self-devotion, and virtue of the higher order, we do not contend, but we see no ground for the suspicion which some entertain that they are incompatible with the sterner stuff of these more serious qualities or tend to weaken the main springs of thought and action On the other hand although a prevalence of literary habits may render the success of an utterly corrupt style of literature more improbable, yet, when such success does occur, its effects must be infinitely more noxious and destructive Were such a taste as French lighter literature has of late exhibited likely to obtain a real ascendency in that country, there could not be a more powerful cause, as well as decisive symptom, of national degeneracy, but, in truth, it [illegible] temporary evil

One more [illegible] the spread of literary habits remains to be noticed — the enormously increased importance of

what may now be justly termed the literary profession Such fortunes as that of Sir Walter Scott are phenomena belonging to this age alone At this moment (November 1847) the two contending party leaders in France, on whom the eyes of Europe are fixed, are writers by profession, who have risen to their present eminence [illegible] the most noted public [illegible] belong to the same class Spain has had a play-writer for her prime minister In Germany, when a national movement is attempted against an alleged act of usurpation on the part of a sovereign, those who assume the lead are the professors of an university [illegible] the less excitable nature of the people [illegible] influence of wealth and aristocratic [illegible] to in a state of [illegible] attention to the signs of the times will lead us to suspect that, if the frame of our society were shaken by any sudden impulse men of this class would assume a more marked position than they have hitherto occupied This is the brilliant side of the picture On the other hand, the multiplication of a body of men whose employment is essentially precarious, their remuneration irregular, their education high, their tastes luxurious, their wants numerous, their success requiring a constant strain upon the spirits and activity of the brain, is in some respects a thing to be regretted In ill-governed and restless communities they form the [illegible] and flourishing ones [illegible] liancy of society, but at the expense of much of their own peace and happiness We have outlived the days when the ideas of poverty and learning were habitually associated, and the custom of the humiliating dependence of intellect on wealth, —

> Toil, envy, want, the *patron* and the gaol,

but the young aspirant to literary distinction may be usefully reminded of the words of a great writer of our day 'Never' (that is with a free choice before you) 'pursue literature as a profession It would be a sort of irreligion scarcely less than a libel on human nature, to believe that there is any established and respectable profession or employment in which a man may not contrive to act with honesty and honour, and doubtless there is likewise none which [illegible] to the contrary But woefully will that man find himself mistaken who imagines that the profession of literature or, to speak more plainly, the trade of authorship, besets its members with fewer or with less insidious temptations than the church the law, or the different branches of commerce Let literature be an honourable augmentation to your arms, but never fill the escutcheon" (*Coleridge [illegible]*)

LITHIA-GLASS (Gr λιθος, *a stone*, and ξεγυρος, *silver*, probably from its silvery appearance) Fused oxide of lead *See* LEAD

LITHIA (Gr [illegible]) A rare alkaline substance, discovered in [illegible] Arfwedson in a mineral called *petalite*, it has also been found in some other lapideous bodies It is distinguished from potassa and soda by the difficult solubility of its carbonate, from baryta, strontia, and lime, by the solubility of its sulphate and oxalate, and from magnesia by the alkalinity of its carbonate It is the oxide of a white metal which has been named *lithium*, the equivalent of which is 10, and that of lithia 18

LITHI'ASIS (Gr λιθος, *a stone*) The disease of stone in the bladder or kidney

LITHIC ACID (Gr λιθος) The substance generally termed *uric acid* it forms the commonest variety of urinary calculus

LITHODENDRON (Gr λιθος, and δενδρον, *a tree*) Corals have been thus designated, from their frequent

(Gr λιθος, and δερμα, *skin*) A genus of Apodal Echinoderms, in the system of Cuvier, characterized by an oval body compressed posteriorly, of which the surface is covered with a layer of calcareous [illegible] an extremely indurated crust

LITHODOMUS *Lithodoma* (Gr λιθος, and δομεω *I build*) This term [illegible] found in rocks and [illegible] they form for that purpose A particular genus is called *Lythodomus*

LITHO'DOMI (Gr λιθος, and Lat domus, *a house*) Molluscous animals which bore into rocks and lodge themselves [illegible]

LITHOGRAPHY *See* ENGRAVING

LITHOLO'GICAL (Gr λιθος, and λογος, *a discourse*) A term expressing the [illegible] character of a mineral mass We speak of the *lithological* character of a structure, as distinguished from its *zoological* character

LITHOMANCY (Gr [illegible] and μαντεια, *prophecy*) A [illegible] the ancients Their oracular stones appear to have returned audible answers to those who consulted them Modern conjurors have

another species of lithomancy,—the inspection of the surface of smooth agates or crystals Such was the divination of the notorious Dr Dee and his assistant Kelly in the reign of Queen Elizabeth.

LITHOMARGE Stone-marrow A variety of talc of various colours, and generally associated with magnesian minerals

LITHONTRIPTICS (Gr λίθος and τρίβω *I carry away*) Remedies which are supposed to dissolve stone in the bladder, or which prevent the deposition of calculous matter in the urine

LITHONTRIPTOR (Gr λίθος, and θραυστης, *to break*) An instrument for breaking calculi in the bladder, so as to reduce them to small particles which may admit of being passed along with the urine, and thus render the operation of lithotomy unnecessary

LITHOTOMY (Gr λίθος, and τεμνω, *I cut*) The operation of cutting into the bladder for the removal of a stone

LITHOTRITY (Gr λίθος, and τριβω, *I break down*) The operation of breaking a stone in the bladder into small pieces capable of being voided by urine it is effected by the [illegible]

LITMUS In Chemistry a blue pigment obtained from the lichen *Roccella* and [illegible] the Canary Islands it is often called *turnsol*, and yields the dye called *archil* Paper tinged blue by litmus is reddened by the feeblest acids, and hence is used as a *test* of the presence of acids, and litmus paper which has been reddened by an acid has its blue colour restored by an alkali

LITOTES (Gr λιτοτης) In Rhetoric, a figure, according to the Greek and Latin rhetoricians, in which an affirmative is expressed by the negative of the contrary it is, therefore, a species of irony in the ancient sense of the word (*see* IRONY), in which less is expressed than what is intended to be conveyed to the mind of the reader or hearer Thus, "a citizen of no mean city" means "of an illustrious city" It is a figure constantly employed to soften what might otherwise appear obnoxious in self-commendation

LITRE The French standard measure of capacity in the decimal system The litre is a cubic decimetre, that is, a cube, each of the sides of which are 3 937 English inches it contains 61 028 English cubic inches and is therefore rather less than our *quart* Four and a half [illegible]

LITTLE (Sax lytel [illegible] deficient, [illegible] work [illegible] those qualities that tend to [illegible] in contemplating a work of art It is a term always used in a condemnatory sense

LITTORINA (Lat litus the *sea shore*) A genus of Pectinibranchiate Mollusks of the tribe *Trochoida*, characterized by its thick shell, of which the aperture presents a small angle, and is without a ridge The common periwinkle of our coasts (*Turbo littoreus*, Linn) is a species of the present genus

LITURGY (Gr λειτουργια) An office at Athens, by which persons of considerable property were bound to perform certain public duties, or supply the commonwealth with necessaries at their own expense The persons on whom this office was imposed were usually among the richest inhabitants, and if any one selected to fill it could find another more wealthy than himself who was exempt from public duty, he could insist on being released from his charge, which then devolved on the party denounced This obnoxious institution was abolished on the proposition of Demosthenes (See *Boeckh's Pub* [illegible] *ns*) It is from this term that the [illegible] vide), in ecclesiastical meaning has been derived, the sense having been contracted from public *ministry* or service in general to the ceremonies of religious worship

LITURGY The [illegible] services of a church [illegible] the ancients the name is restricted to the service of the Eucharist, which afterwards came to be distinguished in the Western church by the term *missa*, or mass

There still exist in Greek, Latin and some Oriental languages, various rituals by which the Eucharist was celebrated in very early ages Some have supposed that all these may be referred to one original liturgy, which may have been universally adopted in the primitive church Palmer, the latest English writer on this subject (*Antiq* vol i p 8), conceives that the number of original liturgies may be reduced to four, but not lower These he entitles the great Oriental liturgy, the Alexandrian, the Roman, and the Gallican, each of which was extensively used from the apostolic age in the quarters from which he assigns them their names, and became the parents of many other rituals such as were used with constantly diverging variations, in the different patriarchates of the empire

The earliest period at which any liturgical forms were consigned to writing is the end of the third or beginning of the fourth century, at least the liturgy called of St Basil can be traced as high as the latter period This practice, also, seems frequently to have been applied only to certain parts of the service We find, therefore, great differences in the MSS which now exist, and it becomes very difficult to ascertain what the contents of the primitive liturgies were and trace the periods at which many [illegible] were introduced into the service [illegible] of the Eucharist [illegible] the whole of the various services used on ordinary and extraordinary occasions throughout the year For the history of this liturgy, see COMMON PRAYER See also Assemanni, *Codex Liturgicus*, Muratori *Liturgia Romana Vetus*, Bragg's *Collection of Liturgies*, Palmer's *Origines Liturgicæ*, Riddle's *Christian Antiquities*, pp 369 377 As to the reformation in the English liturgy which were seriously contemplated a few years ago by various classes of the church, see *Quart Review*, vols. xlvii 1

LITUUS (Lat) In the geometry of curve lines, the name given by Cotes to a spiral of which the characteristic property is that the squares of any two radii vectores are reciprocally proportional to the angles which they respectively make with a certain straight line given in position, and which is an asymptote to the spiral Let r and u denote any two radii vectores drawn from the pole to the curve, and let ϕ and ψ be the measures of the angles they respectively make with the asymptote, then r^2 u^2 ψ ϕ If we take the angle $\psi = 57\ 29578^\circ$ (or such that the arc is equal to the radius), and call a the corresponding value of u, the above proportion becomes r^2 a^2 1 ϕ, whence we have for the equation of the curve, $r^2 = a^2\phi^{-1}$

Among the pro [illegible] —1 The radius [illegible] circular arc intercepted between its extremity and the asymptote 2 The area included between the two radii vectores a and r and the curve is equal to $a^2 \log (u-a)$, or proportional to the logarithm of the ratio of u to a

For the properties of the lituus see Varignon, *Mem Acad Paris*, 1704, Cotes, *Harmonia Mensurarum*, p 85, *Peacock's Examples to the Diff and Integral Calculus*, p 183

LITUUS Among the Romans, a crooked staff, resembling a crozier, made use of by the augurs in quartering the heavens It is affirmed by Dr E D Clarke that the use of the *augural* lituus, as it was called, is much posterior to that of the *regal* or *quirinal* lituus, which was instituted by Romulus and used as a sceptre by the Roman kings and that they had nothing in common except the name The origin of the word is uncertain (See *Clarke's Observations on the "Lituus," in the Archæolog* xix p 386)

LIVER (Germ leber) The viscus in which bile is secreted It is situated in the right hypochondriac region under the diaphragm, and in the human body is divided into two lobes of which the right lobe is the largest There is between them a smaller lobular process, called the *Lobulus Spigelii* The ultimate arrangement of the different blood-vessels of the liver is very peculiar It has been ably investigated by Mr Kiernan, by whom it is described in the *Philosophical Transactions*

LIVER OF SULPHUR Fused sulphuret of potas [illegible] from its *liver colour*

LIVERY (Fr livrée) A word derived, probably, from the clothes *delivered* by masters to their servants, in which sense it still continues to be used At tournaments the cavaliers used to distinguish themselves by wearing [illegible] badges or liveries, and persons of [illegible] gave liveries to persons unconnected with [illegible] to engage [illegible] The *livery men* [illegible] the [illegible] brace the different trades of the metropolis, and are so called because they are entitled to wear the livery of their respective companies [illegible] sheriffs, [illegible] the city, and, down to the passing of the Reform Bill in 1832, they had the exclusive privilege of voting at the election of members of parliament

LIVERY OF SEISIN In Law, a delivery of possession in lands, tenements, and hereditaments, to one that has a right to the same a ceremony at common law used in the conveyance of lands, whereby an estate of freehold passes by feoffment *See* FEOFFMENT

LIVE STOCK The quadrupeds and other animals kept in a farm [illegible] employed in farm labours, for breeding [illegible] or for other purposes of profit In the farming of Britain and similar climates the principal descriptions of live stock are horses cattle sheep and swine To these are generally added poultry, and sometimes goats, rabbits, fish, and bees In warmer climates the silkworm may be considered as part of the live stock, and under particular circumstances, both in England and on the Continent, deer, and even hares and [illegible] are bred for sale

LIVING [illegible] *See* [illegible]

LIVRE (Lat libra, *a pound*) An ancient French

coin, which appears as early as 810 A D It was at first [illegible] afterwards into 20 *sous* At the [illegible] was substituted for the livre

LIXIVIUM employed by the old chemists to signify an alkaline ley or solution

LIZARD *See* LACERTA

LLOYD'S LIST A well known periodical publication, which contains shipping intelligence It derives its coffee-house, so long celebrated as the resort of all classes connected either with the interest, and its importance in and early maritime information cannot be easily overrated It has been in existence since 1716

LOADSTONE The same with *magnet*, which see

LOAMY SOIL, in the language of practical agriculturists and gardeners, is one in which clay prevails it is called heavy or light, as the clay may be more or less abundant, and sandy, gravelly, or calcareous, according as these earths predominate in the composition In general, loamy soils are more fertile than sand or chalk, but the fertility of any soil is always to a certain extent relative to the nature of the subsoil, and to the local climate

LOBAR (Lat lobus, *a lobe*) A term applied by Linnæus to the feet of those birds, as the grebe which were furnished at their sides with broad-lobed membranes

LOBBY (Ger laube, *an arbour*) In Architecture, a hall or passage serving as an ante apartment for communication to rooms

LOBELIA INFLATA Indian tobacco The leaves of this plant have been used in medicine as an expectorant and emetic it quiets the action of the heart and relaxes the muscles It has been found of great use in allaying the paroxysms of spasmodic asthma, and as a [illegible]

LOCAL PROBLEM (Lat locus) In the ancient Ge[illegible] roblem which admits of an infinite num[illegible] or which can be solved not only by a single point, but by all points situated in some line which may be found *See* LOCUS

LOCH The Scotch term for *lake*, which see See also LOUGH

LOCK, in Internal Navigation, is a part of a canal included between two floodgates, by means of which a vessel is transferred from a higher to a lower level, or [illegible] igher *See* CANAL

[illegible] loc) An instrument composed of springs and bolts, used to fasten doors, drawers chests &c A good lock is the masterpiece in smithery and requires much art and delicacy in contriving and varying the wards, springs, bolts, and other parts whereof it is composed so as to adjust them to the places where they [illegible] to the various occasions of their use [illegible] ocks is so varied and the number of inventions of [illegible] that we cannot attempt to e[illegible] placed on outer doors are called *stock* locks, those on chamber doors spring locks, and such as are hidden in the thickness of [illegible] they are applied are called *mortice* [illegible] is too well known to need description [illegible] the conditions which, to Mr Nicholson, appear necessary in a lock of the most perfect kind —1 That certain parts of the lock should be variable in position through a great number of combinations one only of which shall allow the lock to be opened or shut 2 That this last-mentioned combination should be variable at the pleasure of the possessor 3 That it should not be possible after the lock is closed and the combination disturbed for any one not even the maker of the lock, to discover, by any examination, what may be the proper situations of the parts required to open the lock 4 That trials of this kind shall not be capable of injuring the works 5 That it shall require no key, 6 And be as easily opened in the dark as in the light 7 That the opening and shutting should be done by a process as simple as that of a common lock 8 That it should open with or without a key, or with one, at pleasure 9 That the keyhole be concealed, defended or inaccessible 10 That the key may be used by a stranger without his knowing or being able to discover the adopted combination 11 That the key be capable of adjustment to all the variations of the lock, and yet be simple 12 That the lock should not be liable to be taken off and examined, whether the receptacle be open or shut except by one who knows the adopted combination These considerations involve a mechanical problem of great difficulty, but much towards its accomplishment has been effected in various inventions that have been proposed especially in those of Bramah, [illegible]

LOCO-FOCO The name by which the ultra democratical or the tory party in America has been distinguished since the year 1834 The term originated in the [illegible] at parts having [illegible] meeting at [illegible], in New York, the gas-

accidentally extinguished, and on the hall being relighted with [illegible] (which in America are termed *lo-focos*, [illegible] from the Latin loco foci, *instead of a fire*), the [illegible] appellation, ar[illegible]

LOCOMOTION (Lat *locus*, *a place*, and *motio*, *change of place*) Such motion as is attended by change of place in the body which [illegible] a body [illegible] mill, a lathe moves, but no change of place of the machine is produced such *motion* is not locomotion A steam engine which being fixed in its position, impels other bodies is a stationary engine, but one which travels with the bodies which it drives is called a *locomotive* engine

LOCOMOTIVE ENGINE Any engine which, being employed to draw loads in transport overland, travels with the load which it draws

Since the improvement and extension of iron railways, this term has been exclusively applied to the steam engines, by which loads are drawn upon them Although, strictly speaking the steam engine by which a ship is propelled is a locomotive engine, it is not usual to apply that term to it, such an engine is called a marine engine. (*See* STEAM ENGINE) The term locomotive engine, [illegible] at present used, be understood [illegible] steam engine by which trains are drawn on railways

History of the Locomotive Engine —The first practical application of the steam engine as a locomotive power took place in 1804, on a railroad at Merthyr Tydvil, in South Wales The engine was constructed by Messrs Trevithick and Vivian, under a patent obtained by them two years previously This engine, in several respects, resembled in its form and structure those which have been since used for a like purpose

The boiler was a cylinder with flat circular ends, placed upon its side A large tube entered it at one end, and, being carried near the other, was there received and carried back parallel to its first direction, its course through the boiler resembling the letter U The two mouths or openings of this tube were therefore placed at the same end of the boiler One of the mouths of this tube communicated with the chimney, the base of which was flanged upon it, and the other contained the grate and furnace The flame and heated air were drawn through the curved tube and up the chimney The engine was worked by high-pressure steam without condensation the steam [illegible] withdrawn from it, by [illegible] trivance called a four-way cock The cylinder was placed on its side, and in one position of the cock a communication was opened between the boiler and one end of the cylinder, while another communication was opened between the other end of the cylinder and a tube leading to the chimney Steam was thus admitted to act on one side of the piston, and allowed to escape from the other side to the chimney When the piston attained the end of the stroke the position of the cock was reversed, and the steam which had just driven the piston in one direction was allowed to escape to the chimney, while steam from the boiler was admitted on the other side of the piston to impel it in the contrary direction, and in this manner the piston was continually driven backwards and forwards in a horizontal direction, and parallel to the direction of the road The piston rod was moved through a hole corresponding with it in magnitude, in the cover of the cylinder in which it was rendered steam tight by a stuffing box properly lubricated This piston rod acted by means of a connecting rod on a crank which it kept in revolution in the same manner as the crank in a common double acting steam engine is moved (*See* STEAM ENGINE) On the axle of this crank was placed a cogged wheel, which by means of ordinary gearing, conveyed motion to the axle of the hind wheels of the engine, so as to keep that axle in constant revolution The wheels being keyed upon that axle, so as not to be capable, like the wheels of a common carriage, of turning upon it, were necessarily made to revolve with it, and, so long as their pressure upon the road was sufficient to prevent them from slipping, a progressive motion of the carriage was the necessary consequence of their revolution

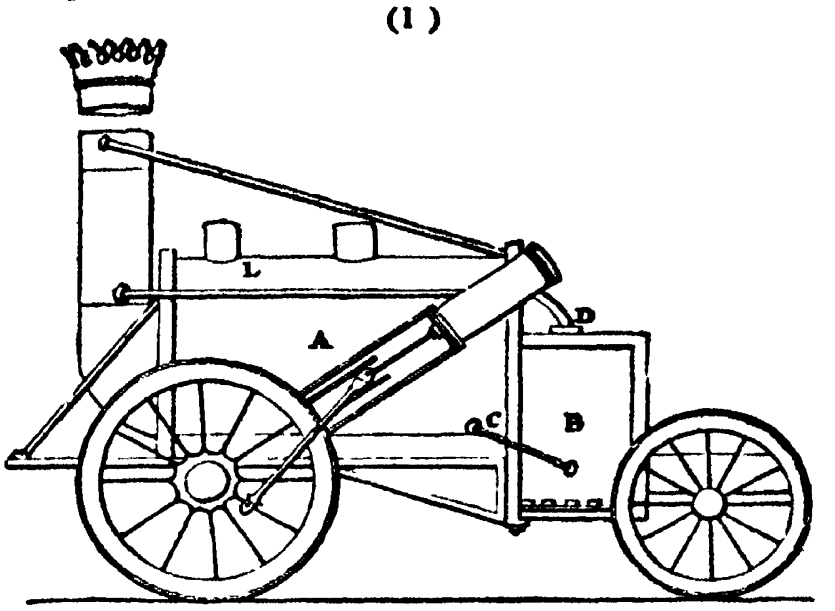
The early projectors of locomotive engines were all impressed with a notion that the adhesion of the driving wheels to the rails must be insufficient to enable the power applied to these wheels to give progressive motion to the carriage and, without thinking it necessary to ascertain by actual experiment whether such were really the case or not, they expended much [illegible] and capital in devising means of overcoming the difficulty, which, after all, [illegible] Engineers were, it [illegible] if any power compelled the wheels to revolve, they would [illegible] that the carriage or engine [illegible] To provide against this Messrs Trevithick and Vivian proposed to make the external rims of the wheels intended for common roads

rough and uneven by surrounding them with projecting heads of nails or bolts, or by cutting [illegible] in them Seven years afterwards [illegible] Leeds obtained a patent for a method of surmounting this [illegible], by the substitution of a rack rail for the ordinary smooth rail, and constructing teeth on the driving wheels to work in the teeth of this rack. Various other ingenious contrivances were subsequently produced for the same purpose, until about the year 1814, when experience at length [illegible] engineers the [illegible] of the tires of the wheels [illegible] was sufficient to propel the engine, even when drawing after it a great load

In 1814, an engine was constructed at Killingworth colliery, near Newcastle, having two cylinders with a cylindrical boiler, and working two pair of wheels by cranks placed at right angles, so that, when one was in full operation, the other was at its dead points By these means the propelling power was always in action The cranks were maintained in this position by an endless chain, which passed round two cog wheels placed under the engine, and fixed on the same axles on which the wheels were placed The wheels in this case were fixed on the axles, and turned with them

In an engine subsequently constructed by Mr Stephenson for the same railway, the mode adopted of connecting the wheels by an endless chain and cog wheels was abandoned, and the same effect was produced by connecting the two cranks by a straight rod This method is still used in the coupled engines which are applied to draw the trains of merchandise on the present railways

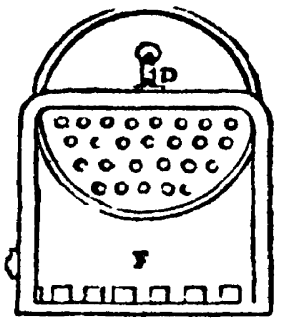
The next stimulus which the progress of this invention received arose from the project of constructing a railway between Liverpool and Manchester, for the purposes of general traffic When this project was undertaken it was not decided what moving power was most eligible—whether horse power, stationary steam engines, or locomotive engines, but the first, for many obvious reasons, was soon rejected, in favour of one or other of the last two



The steam [illegible] a railway by [illegible] is fixed, and draws a train of carriages towards it, by a rope extending the whole length of the road on which the engine works By this method the line of road is divided into a number of short stages, at the extremity of each of which an engine is placed The waggons or carriages, when drawn by any engine to its station are detached, and connected with the extremity of the rope-work to the next stationary engine, and thus the journey is performed from station to station by separate engines For a more detailed account of this method of working a railway, see STATIONARY ENGINE By the other method, each load transported along the line is drawn by an engine which travels with it as horses travel with a carriage on [illegible] road

To enable them to decide which of these two methods of working [illegible] it would be most advisable to adopt, [illegible] the Liverpool and Manchester [illegible] visit the different railways then in operation, to obtain the results of the experience which they afforded as to these two methods of applying steam power to transport and to report their opinion on the relative merits of the two methods After an elaborate inquiry the decision of the directors was given in favour of locomotive power

Until the period to which we now advert railways had been almost exclusively confined to the transport of mineral products from the mines up to the place of shipment, and to this purpose exclusively had the locomotive engine been applied, but the ends to be attained by a railway of thirty miles in length connecting the largest manufacturing town in the greatest manufacturing country in the world, with the greatest, most active, and most opulent commercial port, were of a nature so much more extensive and important, that it was considered that more than ordinary means should be resorted to to obtain a moving power commensurate with the traffic which might be expected under such circumstances Prizes were [illegible] certain stipulations [illegible] most effective [illegible]

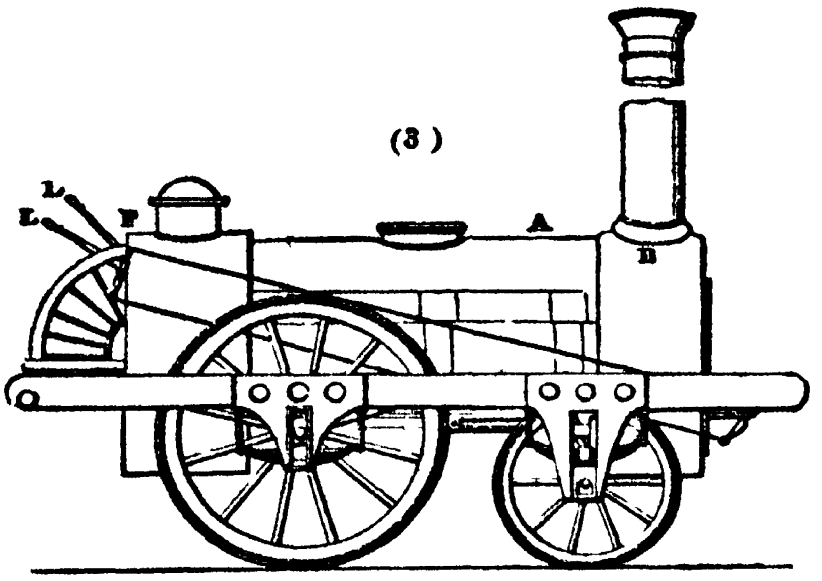


[illegible] wounded body was conveyed, by the same engine, a distance of about fifteen miles in twenty-five minutes, being at the rate of thirty-six miles an hour This engine, which involved in its construction all those mechanical arrangements to which the extraordinary speed and power of the locomotive engine of the present day are due, is represented in elevation in fig 1, and a cross section

(1)

of the boiler and furnace is represented in fig 2 It is supported on four wheels, the weight being principally thrown on the larger pair worked by the engine The boiler is a cylinder 6 feet long, [illegible] at one end, and [illegible] at the other This box is surrounded with a hollow casing, which communicates with the bottom of the boiler by a tube C, and with the top by a tube D The water in the boiler, therefore, flows into the casing and fills it to the same level as that which it has in the boiler When the engine is at work, the boiler is kept about half filled with water, and, consequently, the casing round the furnace is completely filled Steam is abundantly generated in [illegible] as it is on every side to the radiant [illegible] steam rises in bubbles, and passes through the tube D into the boiler The lower part of the boiler is traversed by a number of copper tubes, the [illegible] in fig 2 The flame and heated [illegible] engine burning fuel pass through these tubes, and, after traversing the whole length of the boiler, escape into the chimney [illegible] during their passage, heat to the water in the boiler [illegible] necessary draught [illegible] causing the cylinders [illegible] steam into a pipe, which is presented up the [illegible] is called the blast pipe There are two [illegible] outside the engine, on either side of it, as represented in fig 1 they are placed in a diagonal position and their rods move in guides, the end of the piston rod is connected with one of the spokes of the wheels by a connecting rod, and the piston, as it is driven by the steam in each direction in the cylinder, causes the wheels to revolve

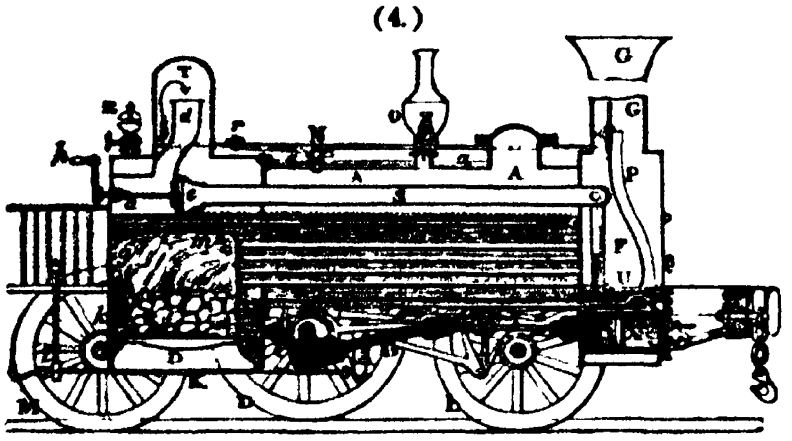
(2)



The circumstances in this mechanical arrangement, on which the rapid production of steam depends, are twofold first, the extensive surface exposed to the radiant heat of the fire, by the casing surrounding the fire box, and by the tubes, twenty-five in number and only three inches in diameter by which the flame and heated air are conducted through the boiler from the fire box to the chimney and, secondly by the powerful draught maintained in the furnace by the current of steam constantly discharged up the chimney It has been mainly by bringing these principles more fully into operation, that [illegible] the locomotive engine [illegible]

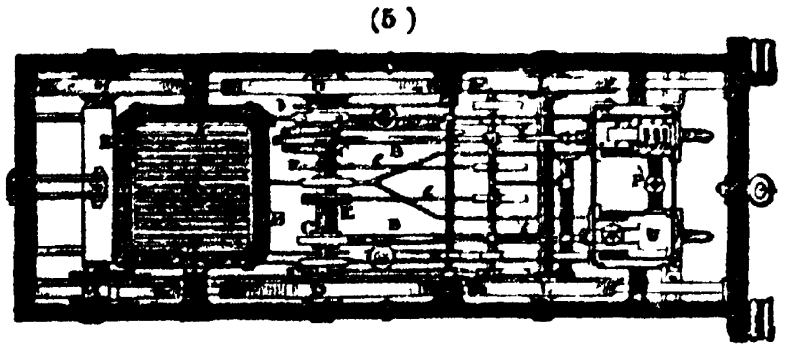
The railway was not long in operation, when the arrangement of the tubes in the boiler was improved, their number was increased from twenty-five to one hundred and upwards, and their diameters diminished from three inches to an inch and a half This change alone produced an increased efficiency of the fuel, in the proportion of nearly two to one, the consumption of coke in the Rocket having been very nearly 2¾ pounds per ton per mile, while, by the change above mentioned, the consumption of fuel in the new engines was reduced to 1¼ pound per ton per mile The position of the cylinder was also changed Instead of being placed, as in the Rocket, outside the boiler, they were now placed in that part of the engine called the *smoke box*, lying at the bottom of the chimney More recently, however, the [illegible] to view of obviating the necessity of forming cranks in the axles, which was involved by the plan of placing the cylinders between the wheels

The engine, as constructed with the cylinders in the smoke box, is represented in fig 3.



(3.)

The two chief improvements in the locomotive engine, which succeeded those now explained and which brought that machine to its present state of efficiency consisted first, in the substitution of brass for copper tubes, and, secondly, in the addition of another pair of wheels to support the engine It was found, by continued experience, that the copper tubes from the peculiar action of the fire upon them, which has never been explained or understood, were subject to rapid decay, and in the year 1833, after an experience of about three years of the working of these engines, it occurred to Mr Dixon, then one of the superintendents of the engineering department of the Liverpool and Manchester railway, to try the effect of brass tubes The experiment was eminently successful they were found to last six or eight times as long as copper tubes of the same dimensions Having now brought down the history of the locomotive engine to the present time, we shall give a description of one of these machines in one of its most common forms



Description of the Locomotive Engine —A longitudinal vertical section of a locomotive engine is represented in fig 4, and a plan of the working machinery, including

(4.)

the cylinders, pistons, eccentrics, &c, which are under the boiler, and by the operation of which the engine is driven, is represented in fig 5.

(5.)

The boiler, as has been explained in the engines already described is a cylinder placed upon its side The fire box consists of two casings of metal one within the other, bolted together by stays represented at *k*, the fire grate is represented at D The fire door is represented at *g*, opening upon the platform where the engineer stands It will be perceived in the section fig 4, as well as in the plan fig. 5, that the fire box is on every side surrounded by the water in the boiler The flame and products of combustion, are drawn from the fire box into the smoke box are represented at E, fig 4 The smoke box containing the cylinders and blast pipe, and supporting the chimney is represented at F In the engraving was taken the boiler is feet diameter, it is clothed with a boarding of wood, represented at *a*, and bound round by iron hoops screwed together at the bottom Wood being a slow conductor of heat, this covering has the effect of keeping the boiler warm and checking the condensation of steam

The external casing of the fire box, B B, is nearly square in its plan, as seen in fig 5, being 4 feet wide, and 3 feet 7½ inches long it is constructed of wrought iron plates inches feet below as in fig 1 than that of the boiler, and concentrical with it The inner casing, *k k*, fig 5, is similar in shape to the external, but it is lower and flat at the roof, as seen in fig 4 The space between the two casings is from 3 to 4 inches in width This internal fire box is made of copper plates

As the top of the fire box would be liable to be destroyed by the action of the fire if the level of the water in the boiler were suffered to fall below it, so as to leave it uncovered, a leaden plug *m* is inserted in it, which would melt out before the copper would become injuriously heated, and the steam rushing out at the aperture would cause the fire to be extinguished The tubes E, which serve to conduct the flame through the boiler to the smoke box, are made of the best rolled brass, $\frac{1}{13}$th of an inch thick, and $1\frac{5}{8}$ of an inch in external diameter, they are 121 in number, and the distance between tube and tube is $\frac{3}{4}$ of an inch The tubes act as stays, connecting the ends of the boiler to strengthen them, but besides these there are rods of wrought iron, represented at *o*, fig 4, which extend from end to end of the boiler above the roof of the fire box The smoke box F, containing the cylinders steam pipe, and blast pipe, is 4 feet wide, and feet long it is formed of wrought iron plates, rivetted in the same manner as those of the fire box From the top of the smoke box, which, like the fire box, is semi-cylindrical, rises the chimney G 15 inches diameter, made of ¼-inch iron plates, rivetted and bound round by hoops Near the bottom of the smoke box the working cylinders are placed side by side, in a horizontal position, with the slide valves upwards, as seen in fig 5

At the top of the external fire box, fig 4, a circular aperture is formed 15 inches in diameter, and upon this aperture is placed the steam dome T, 2 feet in height and secured to the aperture by nuts The steam dome is made of brass, nearly half an inch thick A funnel-shaped tube *d*, with its wide end upwards, is flanged upon the side of the great steam pipe S and is carried upwards so that its mouth is near the top of the steam dome T In order to pass into the steam pipe S, the steam which fills the upper part of the boiler A must ascend into the steam dome and enter the funnel *d*, as indicated by the bent arrow in fig 4 This arrangement prevents in a great degree, the effect of priming by which word is expressed technically the spray of water which rises from the water of the boiler, and is mixed with the steam in the upper part of it as the steam ascends into the steam dome this spray falls back, and nothing but pure steam enters the funnel *d* The wider part of the great the hinder end of the fire box, is covered by a circular plate, secured by screws having a stuffing box in its centre, of the same kind as is used for the piston rods of steam cylinders Through this stuffing box the spindle or rod *a'* of the regulator passes, and to its end is attached a winch *h*, by which the spindle *a'* is capable of being turned To the other end of this spindle, at *c*, is attached a plate, which moves upon apertures formed in the cover of the end of the great steam pipe S, so that, by turning the winch *h* more or less, this plate *c* may be removed more or less from over the openings, and thus the steam may be allowed to enter the steam pipe S from the steam dome T or may be shut off altogether enclosed within the boiler, is maintained at the same temperature as the steam in the boiler, and therefore the steam, in passing through it, is not liable to condensation The steam pipe, passing through the tube plate at the front of the boiler is turned down at right angles in the smoke box, where enlarging into wrought inches or is conducted to each of the valve boxes of the cylinders The lower ends of these branches are flanged to the valve boxes at the ends of the cylinders nearest to the boiler by these pipes the steam is conducted into the valve boxes, or steam chests, from which it is admitted by slide On the upper covers, there are valves U, communicating with the passages leading to the top of the cylinder and leading from thence to the blast pipe P to the blast pipe These openings are governed by a slide, so that, when steam is admitted through *m*, the communication shall be opened between *n* and *o* Thus, when steam is admitted to the top of the cylinder, the steam from the bottom will flow from *n*, through *o*, into the blast pipe When the piston reaches the bottom of the cylinder, then the slide opens a com-

munication between *n* and the steam pipe, and between *m* and *o* Thus steam will be admitted to the bottom of the cylinder, while the steam from the top will escape from *m* through *o*, to the blast pipe In this way, by the alternate shifting of the slide, steam is admitted alternately to each end of the cylinder, and allowed to escape from the other end, and the alternate motion of the piston in the cylinder is thereby maintained The pistons used in locomotive engines are of the kind called metallic pistons, and, from their horizontal position, they have a tendency to wear unequally in the cylinders, their weight pressing them on one side only, but, from their small magnitude this effect is found to be imperceptible in practice The cross pipe P', which communicates with the eduction passage *o*, in each of the valve boxes, has an opening in the centre presented upwards, as seen in fig. 5 To this opening is flanged the base of the blast pipe P, fig 4, which rises in a direction slightly curved, and has its mouth presented upwards in the centre of the chimney G The steam which is discharged at each stroke of the pistons from the cylinders passes into this pipe, and escapes up the chimney by puffs When an engine is moving slowly, these puffs are distinctly audible, resembling the coughing of a horse, but when at full speed they succeed each other so rapidly that the ear can scarcely distinguish their intervals It is this stream of waste steam, continually rushing up the chimney, that maintains the necessary draught in the fireplace [illegible] produced in the funnel causes a [illegible] into the smoke box F, through the tubes E, and there is this excellence in the arrangement, that the force of the draught in the chimney being proportional to the quantity of steam produced, it must be therefore proportional to the quantity of fuel necessary to be consumed

The force of [illegible] is communicated [illegible] heads of which move in guides, to the connecting rods B, which are attached to the crank pins of the working axle C, so that, as the piston rods are driven backwards and forwards in the cylinders, the working axle is made to revolve This axle has the driving wheels of the locomotive fixed upon it, and the engine is impelled forward upon the railway as the wheels revolve

The method by which the slides are made to govern the admission and escape of the steam to and from the cylinders is nearly the same as in the steam engine used for the general purposes of manufacture and for a general description of the method, see STEAM ENGINE Meanwhile it may be here briefly stated that this is effected by two circular plates called eccentrics, fixed at F E, fig 5, on the great working axle These eccentrics are circular plates or rings, formed upon or attached to the axle so as to revolve in their own plane, forming, in effect, a part of the axle itself, but they are so placed that their centres do not coincide with the centre of the axle and, consequently as they revolve with the axle, their centres are alternately thrown backwards and forwards, as they pass on the one side or the other of the axle These circular plates are surrounded by rings, within which they revolve but which do not revolve with them These rings are alternately thrown backwards and forwards by the play of the eccentrics, and to these rings are attached rods *e e*, which communicate motion to the arms which drive the rods of the slides Thus the alternate motions of the eccentrics backwards and forwards proceed from [illegible] admission and escape of the steam to and from the cylinders When it is required to reverse the motion of the engine, or to make it move backwards, the motion of the slides, and therefore the positions of the eccentrics on the working axle, must be the contrary of that necessary to produce a progressive motion Sometimes this is effected by shifting the position of the eccentrics on the working axle, but more commonly it is effected by a second pair of eccentrics represented at F F, fig 5, placed on the axle in a position contrary to the others When the engine is driven backwards the eccentrics E F are thrown out of gear, and the eccentrics F I are brought into action

As all the moving parts of the engine require to be constantly lubricated with oil, to diminish the friction and keep them cool, oil cups for this purpose are fixed upon them In some engines these oil cups are attached separately to all the moving parts, in others they are placed near each other in a row on the side of the boiler, and communicate by small tubes with the several parts to be lubricated

The tender is a carriage attached behind the engine, and close to it, carrying coke for the supply of the furnace, and a tank containing water for the boiler The feed for the boiler is conducted through a curved pipe proceeding from the tank, and carried first downwards, and afterwards in a horizontal direction, as [illegible], fig 4, under the boiler It communicates with a forcing pump which is worked by an arm driven by the cross head of the steam piston By this pump water is constantly forced into the boiler so long as the pump is kept [illegible] may be opened and cut off by a cock at the side of the engineer As the feed of the boiler by the introduction of cold water checks the activity of the evaporation, it is the custom not to feed the boiler regularly and constantly, but to throw on the feed when the work on the engine is light and the consumption of steam small, and to shut it off when much steam is required. The circumstances of a railway naturally suggest this When the engine is ascending an incline all the steam which the boiler is capable [illegible], and therefore the activity of [illegible] by shutting off the feed, but in descending [illegible] less power is required, and the feed is put on

Until within the last few years, locomotive engines were supported on only four wheels It is now, however, the general practice to place them on six, and in some cases the driving wheels are in the middle, as represented in fig 4, and, in other cases at the end of the engine Mr Stephenson has been in the practice of constructing the driving wheels without flanges, depending on the flanges of the two pairs of smaller wheels to maintain the engine between the rails In that case the driving wheels must be in the middle The wheels of the engine represented in fig 4 are constructed in this manner But it has been found [illegible] to acquire a pitching [illegible] speeds The driving wheels D are 5 feet in diameter The wheels I are 3 feet 6 in in diameter, and have conical tires with flanges They are placed immediately behind the smoke box The wheels M are precisely similar to L, and are placed immediately behind the fire box

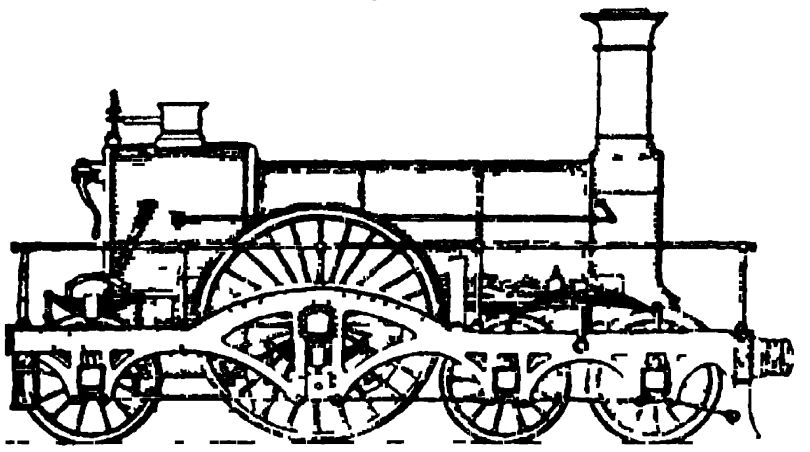
When an engine is required for the transport of very heavy loads, such as those of merchandise, the adhesion of one pair of working wheels is insufficient, and, in such cases, one of the two pairs of wheels L or M is made of the same diameter as [illegible] wheels, and a bar is attached to points on the wheels, at equal distances from their centre, connecting them in such a manner that any force applied to make one pair of wheels revolve must necessarily impart the same motion to the other pair By such means the force of the steam is made to drive both pairs of wheels, and consequently a proportionally increased adhesion is obtained

The pressure of steam in the boiler is usually limited by two safety valves,—one represented at N, under the control of the engineer, and the other at O, which cannot be approached by him The safety valve at N is held down by a lever *r*, which is attached to a spiral spring and which may, by an adjusting screw, be made to press on the valve with any required force The second valve O is pressed by several small elliptical springs, placed one above another over the valve, and held down by a screw, which turns in a frame fixed into the valve seat By this screw the pressure on the valve can be adjusted

In order to give notice of the approach of the train, a steam whistle Z, fig 4, is placed immediately above the fire box at the back of the engine This is an apparatus composed of two small hemispheres of brass, separated one from the other by a small space Steam is made to pass through a hollow space formed in the lower hemisphere and escapes from a very narrow circular opening round the edge of that hemisphere The edge of the upper hemisphere presented downwards encounters this steam, and an effect is produced similar to the action of air in organ pipes A shrill whistle is produced which can be heard at a great distance, and which from all ordinary sounds, never fails to give notice of the approach of a train

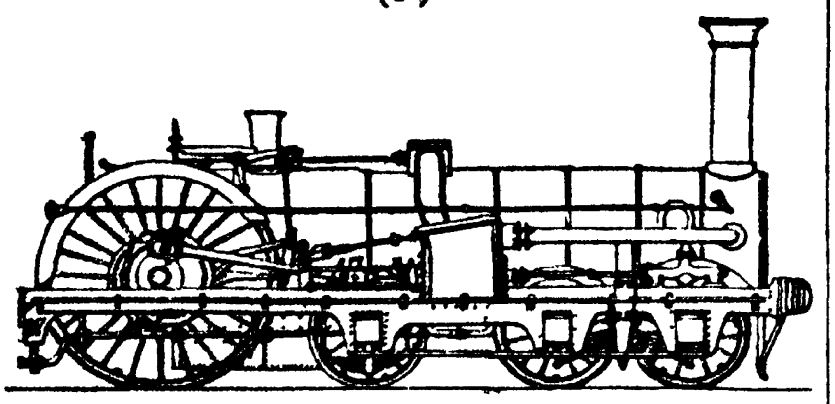
The Link Motion —One of the most elegant expedients of improvement that has been introduced into the locomotive engine is that known as the link motion It had been the custom previously to its introduction to employ two eccentrics for each engine, of which one was set in the right position for sending the engine forward, and the other was set in the right position for sending the engine backward The two were never in connexion with the valve at the same time, but when the one eccentric was in operation the other was out of gear with the valve, and the two eccentric rods were kept asunder by a link, so that one could not come into gear until the other was disengaged It was suggested, however, that by deriving the valve motion from this link, instead of from the ends of the eccentric rods the engine might be stopped or reversed with [illegible] connecting the ends of the eccentric rods [illegible] must be set nearly opposite to [illegible] be at the extremity of its throw [illegible] other is at the extremity of its throw in the other direction It will therefore follow, that the link connecting the eccentric rods will have nearly the same motion as the beam of a pair of scales, or any other lever controlled in the same manner, and by

raising or lowering the link, so that either its upper or lower end or its centre is situated at the end of the valve rod the valve will be moved in one or the other direction forward or backward or it will be maintained stationary at the middle position This result ensues because the centre of the link is a fulcrum or point of motion, while its ends move in opposite directions A very common form of link is represented in the accompanying figure, and it



(6.)

is armed with projecting lugs at the ends, to which the eccentric rods are attached The end of the valve-rod is connected with the central slot, and by raising or lowering the link by means of a handle provided for that purpose, the valve-rod may be made to partake of the motion of either end or may be maintained stationary in the intermediate position



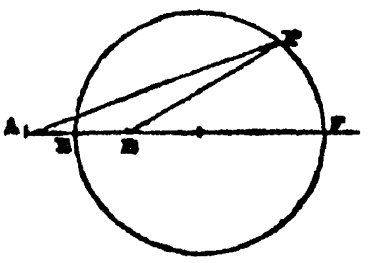
Express Locomotive Engines — The exigent demand for speed arising out of the competition of the rival gauges and the establishment of express trains, has caused engines of a much more powerful class to be introduced since the first edition of this work was published Annexed we give the most remarkable examples of this class of engine, being the express engine designed by Mr Gooch for the Great Western railway (fig 7), and Crampton's express engine (fig 8) applicable to the narrow gauge These engines were both displayed at the Great Exhibi-

(7)

tion The cylinders of Gooch's engine are each 18 inches in diameter and 24 inches stroke, the driving-wheels are 8 feet in diameter, the fire-grate contains 21 square feet of area, the heating surface of the fire-box is 153 square feet There are in all 305 tubes of 2 inches diameter, giving a surface in the tubes of 1799 square feet the total heating surface, therefore, is 1952 square feet Mr Gooch states that an engine of this class will evaporate from 300 to 360 cubic feet of water in the hour, and will convey a load of 236 tons at a speed of 40 miles an hour, or a load of 181 tons at a speed of 60 miles an hour The weight of this engine empty is 31 tons, of the tender 8½ tons, and the total weight of the engine when loaded is 50 tons.

(8)

In Crampton's locomotive, the Liverpool, the cylinders are of 24 inches diameter and 18 inches stroke, the driving wheels are 8 feet in diameter, the fire-grate contains 21½ square feet of area, the heating surface of the fire-box is 144 square feet. There are in all 300 tubes of $2\frac{3}{16}$ inches external diameter, and 12½ feet long, giving a surface in the tubes of 2136 square feet the total heating surface, therefore, is 2290 square feet The weight of this engine is stated to be 35 tons when ready to proceed on a journey. Engines of this kind were worked for a short time on the North-Western Railway, but were given up on account of the damage caused to the rails



Traction on Roads and Railways — The tractive force requisite for drawing carriages over well formed and level [illegible] is about $\frac{1}{150}$th of the load at low speeds [illegible] for drawing [illegible] the load, [illegible] ton at low speeds, but in the case of very well formed railways the force necessary for traction is less than this The resistance, however, increases very rapidly with the speed of the train, and Mr Gooch has ascertained [illegible] it requires a power of 1018 [illegible] cylinders to give to a train weighing 149½ tons a speed of 61·3 miles an hour Of this power 796 horses are expended in propelling the train, and the residue is expended in overcoming the resistance of the blast-pipe, or, in other words, in blowing the fire The evaporative power of a locomotive boiler varies as the fourth root of the speed.

Indications to be observed in the Construction of Locomotives — The demand for high rates of speed upon railways and the consequent establishment of express trains for the realisation of that object, have gradually led to such an increase in the length and weight of locomotives as have given rise to various practical evils The width of [illegible] railway which is in most cases only 4 [illegible] the diameter of boiler which can be employed, and as the power of the boiler must be greatly increased to render high speeds possible, the necessary increase in the heating surface has to be obtained by increasing the length of the tubes and diminishing their diameter This alteration, however, renders necessary in its turn a large increase in the force of the blast-pipe, in order that the combustion in the furnace may be maintained with adequate activity, and the back pressure thrown upon the pistons by contracting the blast-pipe, absorbs a large part of the engine power The weight, also, of such engines has a very injurious operation upon the rails, and it appears to be the preferable practice, instead of seeking to accomplish high rates of speed with a single engine to employ two engines with one tender between them so that one stoker and one engine driver may suffice for both Attached to one of the locomotives or to the tender there should be a small engine for replenishing the boiler when the train is standing still Such engines are now very commonly used in steam vessels, and are called donkey engines, but their use in the case of locomotives appears still more important, as the level of the water is liable to speedy subsidence from the smallness of the volume of water which the boiler contains To prevent the alternate action of the pistons from communicating a sinuous motion to the train, a weight should be so applied to each driving-wheel that, when the piston and its appendages are shot back, this weight shall be shot forward It is very desirable that the machinery should be removed from so inconvenient a position as that which it usually occupies beneath the boiler In that class of locomotive engines called Outside Cylinder Engines it is disposed at the sides of the boiler The machinery should be accessible when the train is in motion and the whole of the locomotive above the level of the foot-plate upon which the engine driver stands might be inclosed in a house with glass windows all round In America this has been already done

LOCOMOTIVE POWER, in contradistinction to stationary power, is any kind of moving power applied to the transport of loads on land which travels with the load which it draws [illegible] or carry loads are [illegible] ENGINE

LO'CULICI'DAL In Botany a term applied to the dehiscence of a fruit when it takes place through the back of the cells It is what botanists formerly called a dehiscence with [illegible]

LO'CUS (Lat [illegible] is, is the line traced by a point which varies its position according to some determinate law For example, let this problem be proposed To find a point P such that its distances from two given points, A and B, shall have a given ratio If the line joining A and B be divided in E, so that A E is to E B in [illegible] conditions of the problem But this is not the only

point which has this property, for let F be taken in the [illegible] A F is to B F in the given ratio [illegible] it can be described, then, [illegible] from A and B to any point whatever, P, in [illegible] this circle, A P will have to P B the [illegible] A F to E B, or as A F to F B that is, the [illegible] circle E P F is hence called the *locus* of the point P

When the locus of the variable point is a straight line or a circle, it was called by the ancient geometers a *plane locus*, and when one of the conic sections, a *solid locus*

The *plane loci* formed a branch of the ancient analysis, which, according to the account of Pappus, was treated of by Apollonius in two books which have been lost They were partly restored by Schooten, a Dutch geometer, who flourished in the 17th century, and by Fermat but afterwards in a complete manner by Dr Simson of Glas-

gow, whose treatise, *De Locis Planis*, published in 1749, is a model of geometrical exactness. The principal propositions may be found in Hutton's *Mathematical Analysis*.

Mathematicians have also begun to consider the loci of the equations of three variables; thus $ax + by + cz = o$ is a locus of the first order, $ax^2 + by^2 + cxy + dx + ey + f = o$, a locus of the second order, and so on. The loci of all equations of the second degree are conic sections. (See *Maclaurin's Algebra*.)

LOCUST, the Latin word signifying a crayfish, but now the common name of a species of insects, forming a group or subgenus of the *Gryllus* of Linnæus. They have coloured elytra, and large wings, disposed when at rest in straight fan-like folds, as in other Orthoptera, and frequently exhibiting bright blue, green, or red colours. The thorax is capacious, to afford room for the powerful muscles of the wings, and is marked in many species with one or more crests or wart-like prominences. The locusts fly by starts, but [illegible] in their passage through the air a dense cloud; wherever they alight all signs of vegetation quickly disappear, and cultivated grounds are left a desert. But the mischief does not end here, for when dead the mass of decomposing bodies is so great that the air becomes poisoned by the fetid exhalations. The 2d chapter of Joel gives a powerful description of the devastation committed by these destructive insects.

M. Miot, in his translation of Herodotus, has given it as his opinion that the heaps of bodies of winged serpents which that historian states that he saw in Egypt were nothing more than masses of this species of locust. These insects are eaten in various parts of Africa, where the inhabitants collect them both for home consumption and for commerce. They take away their elytra and wings, and preserve them in brine. One species (*Acridium migratorium*, Latr.) occasionally commits devastations in the south of Europe and Poland, and stragglers have occasionally reached our own coasts. In the United States the term "locust" is applied to a species of *Cicada*, which by their numbers and voracity are almost as destructive as the true locusts of the old world.

LOCU'STA. In Botany. If that form of inflorescence called a spike consist of flowers destitute of calyx and corolla, the place of which is occupied by bracteæ, the rachis is flexuose and toothed, and does not fall to the ground with the flowers, as happens in grasses, each part of the inflorescence so arranged is called a *locusta*, the structure of which is as follows:—At the base are two opposite empty bracteæ called glumes, one of which is attached to the rachis a little above the base of the other, above the glumes are several florets sitting in denticulations of the rachis, each of these consists of one bractea, sometimes with the midrib quitting the lamina a little below the apex, and elongated into a bristle, and of another bractea, facing the first, with its back to the rachis, bifid at the apex, with no dorsal vein, but with its edges inflexed, and a rib on each side at the line of inflexion, and, lastly, within these bracteæ are situated two extremely minute fleshy scales, which are sometimes connate, and stand at the base of the sexual organs.

LODE. A term used by miners, generally synonymously with metallic or mineral *vein*. The lodes containing metallic ores are said to be *alive*, others which [illegible] matters are called *dead lodes*.

LODGE. In Architecture, a small house situated in a park or domain subordinate to the mansion, also, the cottage situated at the gate of the avenue that leads to the mansion.

LODGE. See FREEMASONRY.

LODI'CULA. In Botany, a term given by Palisot de Beauvois to the two minute, colourless, fleshy, hypogynous scales which are situated beneath the ovary of grasses.

LOESS. A German geological term, applied to a tertiary alluvial deposit which occurs in patches between Cologne and Basle. The term is often used by English geologists in reference to that peculiar yellow loam with [illegible]

LOG, LOGLINE. In sea language, the log is a piece of wood, in the form of a sector of a circle (usually a quadrant) of five or six inches radius. It is about a quarter of an inch thick, and so balanced, by means of a plate of lead nailed to the circular part, as to swim perpendicularly in the water, with about two thirds immersed under the surface. The log-line is a small cord, one end of which is fastened to the log, while the other is wound round a reel in the [illegible] ship. The log thus poised keeps its [illegible], while the line is unwound from [illegible] the water, and the length [illegible] time gives the rate of [illegible] lated by *knots* made on the line at certain distances, while the time is measured by a sand-glass of a certain number of seconds. In order to avoid calculation, the length between the knots is so proportioned to the time of the glass that the number of knots unwound while the glass runs down shows the number of miles the ship is sailing per hour. Thus, suppose the glass to be a half minute one: it will run down 120 times in an hour. Now, distances by sea are reckoned by nautical miles of which a degree, so that each mile contains about 6080 feet, the 120th part of which is 51 feet. It, therefore, the knots (which are pieces of coloured cloth) are fastened to the log-line at distances of 51 feet, the number of knots unwound from the reel in half a minute is the number of miles the ship runs in one hour. If the glass runs down in less than half a minute, the intervals between the knots must be diminished in proportion. The first knot is placed about five fathoms from the log, to allow the latter to get clear of the ship before the reckoning commences, and the part of the line between the lead and the first knot is called the *stray line*.

LO'GAN STONES. *See* GEOLOGY, p. 500.

LOGARITHM (Gr. λογος, in the sense of *a proportion* and αριθμος, *number*.) The logarithm of a number is the exponent of the power to which another given invariable number [illegible] first number. [illegible] in which the invariable number is [illegible] the logarithm of 1000 is 3, because 10 raised to [illegible] power is 1000. In general, if $a^x = y$, in which equation a is a given invariable number, then x is the logarithm of y. All absolute numbers, whether positive or negative, whole or fractional, may be produced by raising an invariable number to suitable powers. The invariable number is called the *base* of the system of logarithms: it may be any number whatever, greater or less than unity, but, having been once chosen, it must remain the same for the formation of all numbers in the same system. Whatever number may be selected for the base, the logarithm of the base is 1 and the logarithm of 1 is 0. In fact, in the equation $a^x = y$ we make $x = 1$, we shall have $a^1 = a$, whence, by the definition, log $a = 1$, and if we make $x = 0$, we shall have $a^0 = 1$, whence log $1 = 0$.

From the nature of the exponential equation, by which logarithms have been defined, it is easy to discover some of the principal properties and uses of those artificial numbers. Suppose that we have a series of numbers, y, y', y'', y''' &c. to be multiplied together. Let a be the base of the system of logar[illegible] (to be calculated), and let x, x', x'', x''' [illegible] of y, y', y'', y''', &c. respectively. We [illegible], according to the definition, the series of [illegible]

$$y = a^x,\ y' = a^{x'},\ y'' = a^{x''},\ y''' = a^{x'''},\ \&c.$$

Multiplying the corresponding members of these equations into each other, we get

$$y\,y'\,y''\,y'''\ \&c. = a^{x + x' + x'' + x''' + \&c.},$$

whence log $y\,y'\,y''\,y'''$ &c. $= x + x' + x'' + x''' + \&c.$ = log y + log y' + log y'' + log y''' + &c. whence we infer this chief property of logarithms, namely, that the logarithm of a product is equal to the sum of the logarithms of its factors.

Again, let [illegible] two numbers y and y, to be divided the one by the [illegible] in the [illegible]. We have, as before, the equations $y = a^x$, and $y = a^{x'}$, whence $\frac{y'}{y} = a^{x' - x}$, and therefore log $\frac{y'}{y} = x' - x =$ log $y' -$ log y, that is to say, the logarithm of the quotient of a division is equal to the difference between the logarithm of the dividend and the logarithm of the divisor.

These properties of logarithms are of very great importance in facilitating the arithmetical operations of multiplication and division. For if a multiplication is to be effected, it is only necessary to take from the logarithm [illegible] and add them [illegible] the logarithm of the required product, and on finding in the table the number corresponding to this new logarithm, the product itself is obtained. Thus by means of a table of logarithms the operation of multiplication is performed by simple addition. In like manner, if one number is to be divided by another it is only necessary to subtract the logarithm of the divisor from that of the dividend, and to find in the [illegible] corresponding to this difference, which [illegible] the quotient required. Thus the quotient of a division is obtained by [illegible] subtraction.

Logarithms apply with equal advantage to the formation of powers and extraction of roots. Let y be a number to be raised to the power m (m being any number, whole or fractional, positive or negative). As before, we have $y = a^x$, and, on raising both sides of the equation to the power m, $y^m = a^{mx}$; whence, by the definition, log $y^m = mx = m$ log y, that is the logarithm of the power of a number is equal to the product of the logarithm of the number by the exponent of the power.

If in the equation log $y^m = m$ log y we make $m = \frac{1}{n}$, we shall have log $y^{\frac{1}{n}}$ (or log $\sqrt[n]{y}$) $= \frac{1}{n}$ log y, that is to say

[illegible] f any root of a number is equal to the [illegible] mber divided by the index of the root

From these two last results it is obvious that by means of a table of [illegible] bers may be raised to any power by [illegible] and that the roots of numbers may be extracted by simple division

The properties which have now been demonstrated are true of every system of logarithms which may be adopted but their application to numerical computations supposes the construction of a table, including on the one hand the natural numbers, and on the other the logarithms of those numbers calculated for a given base The tables usually employed are those of which the base is 10, and their construction is equivalent to the solution of the algebraic equation $10^x = y$ Hence, making y successively equal to the numbers 1, 2, 3, 4, &c , we have to resolve the equations

$$10^x = 1,\ 10^x = 2,\ 10^x = 3,\ 10^x = 4, \&c$$

The labour of computing the tables is greatly abridged by the circumstance that it is only necessary to calculate the logarithms of the prime numbers, for as all the other numbers may be obtained by the multiplication of prime numbers into each other, their logarithms according to what has been already shown may be found by the addition and subtraction of the logarithms of the prime numbers Hence a table containing merely the logarithms of the prime numbers is all that is strictly necessary for effecting computations by logarithms

When a table of logarithms has been calculated for any given base, it is easy to find by means of it any other system of logarithms corresponding to a different base, without having again recourse to the solution of exponential equations Thus supposing a system of logarithms has been calculated of which the base is a or, which is the same thing that the value of x has been found for every different value of y in the equation $a^x = y$ and that it is required to construct another table of which the base is b, or to find the values of v corresponding to every different value of y in the equation $b^v = y$ we may proceed as follows —Taking the logarithms of both members of this last equation from the table supposed already calculated, of which the base is a, and recollecting that $\log b^v = v \log b$, we have $v \log b = \log y$, whence $v = \frac{\log y}{\log b}$ But because $b^v = y$, it follows that v is the logarithm of y in the system of which the base is b, therefore, denoting the logarithms in this new system by L, we have $L\,y = \frac{\log y}{\log b}$ Hence it appears that, in order to find the logarithm of any given number y in the new system, it is only necessary to multiply its logarithm in the system already calculated by the constant number $\frac{1}{\log b}$ This constant number, by means of which we pass from the one table to the other, is called the *modulus* of the new table with reference to the old

In the common system of logarithms of which the base is 10, those numbers only which are perfect powers of 10 (that is, 100, 1000, &c) can have commensurable logarithms. The logarithms of all other numbers are incommensurable, and can only be obtained to a certain degree of approximation In general, the approximation will be sufficient if carried to the seventh decimal figure, and accordingly the ordinary tables contain the logarithms only to seven places of decimals, but where very great accuracy is required, as in some astronomical calculations, it may be necessary to use logarithms exact to ten places In Vlacq's tables they are computed to this extent

The relation between a number and its logarithm in the common system being $10^x = y$ (where y is the natural number and x its logarithm), if we make successively

$$x = 0,\ 1,\ 2,\ 3,\ 4\ .\ .\ .\ n,$$

we shall have for the corresponding values of y

$$y = 1,\ 10,\ 100,\ 1000,\ 10000\ .\ .\ .\ 10^n,$$

and if we make

$$x = 0 - 1 - 2 - 3 - 4\ .\ .\ .\ - n,$$

we shall have

$$y = 1,\ \frac{1}{10},\ \frac{1}{100},\ \frac{1}{1000},\ \frac{1}{10000}\ .\ .\ .\ \frac{1}{10^n}$$

From these series it is evident that the logarithms of all numbers greater than unity are positive, and that the logarithms of all fractions are negative It is also evi- [illegible] of every number between 0 and [illegible] ry number between 10 and 100 is 1 + a decimal, of every number between 100 and 1000 is 2 + a decimal, and so on But the digits in any number between 10 and 100 are 2, between 100 and 1000 are 3, and so on, [illegible] expressed by [illegible] number [illegible] with a [illegible] added For example, in the number 73594, comprised between 10000 and 100000, or between 10^4 and 10^5, [illegible] added This integral part of the [illegible] common to all numbers beween two successive powers of 10 is called the *characteristic* because it shows at once [illegible] number corresponding to the logarithm to which it is prefixed is composed If, then, we know the logarithm of any number, we have [illegible] to have [illegible] or 1000 times, &c as great Thus we have

log	73594	= 4 8668424
log	7359 4	= 3 8668424
log	73 594	= 1 8668424
log	7 3594	= 0·8668424
log	73594	= $\bar{1}$ 8668424

In this last example the negative sign is placed over the characteristic, this only being negative But it is more usual and convenient to substitute for the negative characteristics their arithmetical complements, thus,

log	73594	= 9 8668424
log	073594	= 8 8668424
log	0073594	= 7 8668424

[illegible] carry the decimal point 10 digits to the right or left of its true place — an error which would at once be evident In modern tables the characteristic is properly omitted, the logarithm to which it would be prefixed belonging, in fact not only to one particular number, but also to all multiples or sub-multiples of that number by 10

The methods employed by the first computers of the logarithmic tables were founded on the successive extraction of roots and involved calculations of very great labour, but analysts have since discovered series by which the computations are rendered much more expeditious and easy Let it be required to find the logarithm of any number x by means of a converging series Assume

$$\log (1 + x) = A\,x + B\,x^2 + C\,x^3 + D\,x^4 + \&c \qquad (1),$$

in which A, B, C D &c are coefficients to be determined Taking another number z, we shall have, in like manner,

$$\log (1 + z) = A\,z + B\,z^2 + C\,z^3 + D\,z^4 + \&c\ . \qquad (2)$$

Subtracting equation (2) from (1) we get

$$\log (1 + x) - \log (1 + z) = A\,(x - z) + B\,(x^2 - z^2) + C\,(x^3 - z^3) + \&c \qquad (3)$$

But, by the nature of logarithms, $\log (1 + x) - \log (1 + z) = \log \frac{1 + x}{1 + z} = \log \left(1 + \frac{x - z}{1 + z}\right)$, and, on developing this expression in the same manner as $\log (1 + x)$ in the equation (1), we have

$$\log \left(1 + \frac{x - z}{1 + z}\right) = A\,\frac{x - z}{1 + z} + B\left(\frac{x - z}{1 + z}\right)^2 + C\left(\frac{x - z}{1 + z}\right)^3 +, \&c$$

Substituting this development for $\log (1 + x) - \log (1 + z)$ in the equation (3), and dividing both sides by $(x - z)$ there results

$$A\,\frac{1}{1 + z} + B\,\frac{x - z}{(1 + z)^2} + C\,\frac{(x - z)^2}{(1 + z)^3} +, \&c.$$
$$= A + B\,(x + z) + C\,(x^2 + x\,z + z^2) +, \&c$$

Now as this equation is true independently of any particular values of x and z, let us suppose $x = z$, and it becomes

$$A\,\frac{1}{1 + x} = A + 2\,B\,x + 3\,C\,x^2 + 4\,D\,x^3 + \&c,$$

which, on expanding the quantity $\frac{1}{1 + x}$ by division, gives $A\,(1 - x + x^2 - x^3 + x^4 -, \&c) = A + 2\,B\,x + 3\,C\,x^2 + 4\,D\,x^3 +, \&c$ Therefore, by the theory of indeterminate coefficients we must have the separate equations $A = A\ -\ A = 2\,B,\ +\ A = 3\,C,\ -\ A = 4\,D, \&c$, and, on substituting the resulting values of B, C, D, &c , in terms of A in equation (1), we get

$$\log (1 + x) = A\left(\frac{x}{1} - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \frac{x^5}{5} -, \&c\right)$$

The quantity A, which is still indeterminate, is the modulus, and on assigning to it a particular value, we characterize the system which we wish to consider

Let [illegible] A = 1 and [illegible] particular system of [illegible] resulting from [illegible] position by L, we shall then have

$$L\,(1 + x) = x - \tfrac{1}{2}\,x^2 + \tfrac{1}{3}\,x^3 - \tfrac{1}{4}\,x^4 +, \&c$$

This series in its present form is unfit for the calculation of the logarithms of whole numbers, for when x is greater than unity it is divergent, but it may be easily transformed into others having the required properties On substituting $-x$ for x, it becomes

$$L\,(1 - x) = -x - \tfrac{1}{2}\,x^2 - \tfrac{1}{3}\,x^3 - \tfrac{1}{4}\,x^4 -, \&c.$$

And on substracting this from the former series, we have, since $L(1+x) - L(1-x) = L\left(\frac{1+x}{1-x}\right)$,

$$L\frac{1+x}{1-x} = 2\left(\frac{x}{1} + \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} +, \&c\right)$$

Let us now suppose $\frac{1+x}{1-x} = 1 + \frac{1}{z}$, or $x = \frac{1}{2z+1}$, then, since $L\left(1+\frac{1}{z}\right) = L\frac{z+1}{z} = L(z+1) - Lz$, the last series becomes, by substitution, $L(z+1) - Lz$

$$= 2\left(\frac{1}{2z+1} + \frac{1}{3(2z+1)^3} + \frac{1}{5(2z+1)^5} +, \&c\right)$$

This series gives the difference between the logarithms of two consecutive numbers, and it converges with sufficient rapidity Supposing successively $z = 1, 2, 3, 4$, &c, it gives

$$L2 = 2\left(\frac{1}{3} + \frac{1}{3\,3^3} + \frac{1}{5\,3^5} + \frac{1}{7\,3^7} +, \&c\right)$$

$$L3 - L2 = 2\left(\frac{1}{5} + \frac{1}{3\,5^3} + \frac{1}{5\,5^5} + \frac{1}{7\,5^7} +, \&c\right)$$

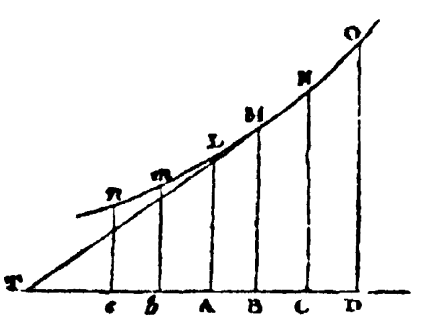
$$L4 - L3 = 2\left(\frac{1}{7} + \frac{1}{3\,7^3} + \frac{1}{5\,7^5} + \frac{1}{7\,7^7} +, \&c\right)$$

It will be observed that as the values of z increase the series becomes much more rapidly convergent Suppose, for example, $z = 100$, we have then

$$L101 = L100 + 2\left(\frac{1}{201} + \frac{1}{3\,201^3} + \frac{1}{5\,201^5} +, \&c\right)$$

The logarithm of [illegible] of this series will [illegible] places of decimals

The series now found gives the logarithms of the particular system of which the modulus is 1, and which is called the *Napierian system* because it is that according to which logarithms were first computed by their inventor, Baron Napier But as has already been shown when the logarithms have been found in any one system, they may be transferred into those of any other system by means of a constant factor In the common system the base is 10, and the Napierian logarithm of any number is consequently transformed into the common logarithm of the same number by multiplying by the modulus $\frac{1}{L10}$



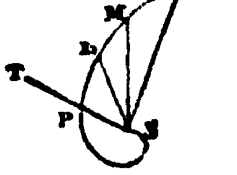
This number which is of great importance in the compu[illegible] ordinary logarithm of the base of the Napierian system, for calling e that we shall have $e^{L10} = 10$, whence taking the ordinary logarithm of both sides of the equation, $L10 \times \log e = \log 10 = 1$, therefore $\log e = \frac{1}{L10}$ $= 0.4342944819$ On passing to numbers we find $e = 2.718281828$

The Napierian logarithms are sometimes called the *natural logarithms*, on account of the modulus of the system being unity, and more frequently *hyperbolic logarithms* because they represent the area of a rectangular hyperbola between its asymptotes

Logarithms were invented by Lord Napier, Baron of Merchiston in Scotland, and made known in a work published [illegible] *Logarithmorum canonis descriptio*, 1614 Henry Briggs, a contemporary of Napier's, professor of geometry in Gresham college, constructed another system, having for its base the number 10 which, corresponding with our system of numeration, is much more convenient for the ordinary purposes of calculation Briggs calculated the logarithms to 14 places, besides the index of all numbers between 1 and 20,000 and between 90,000 and 100,000, and published them in his *Arithmetica Logarithmica* in 1624 Adrian Vlacq, a native of Holland, computed the logarithms of the numbers from 20,000 to 90,000 and thus completed what had been begun and partly accomplished by Briggs, but he reduced the tables to 10 decimal places Vlacq's *Arithmetica Logarithmica* was published at Gouda in 1628, and contained the logarithms of all numbers from 1 to 100,000, calculated to 10 decimals, as also the logarithms of the sines tangents and secants of every minute of the quadrant Vlacq afterwards, in 1633, published another most valuable work, his *Trigonometria Artificialis*, containing the logarithmic sines, cosines, tangents and cotangents for every ten seconds of the quadrant, calculated from the natural sines, &c of the *Opus Palatinum* of Rheticus In the same year another work of the same kind, the *Trigonometria Britannica*, was published at Gouda, containing the logarithmic sines and tangents for the 100th part of every degree of the quadrant, together with a table of natural sines tangents, and secants These had been computed by Briggs

Logarithms being of constant use in astronomical and trigonometrical calculations, the tables which have been published are very numerous The most complete are those of Vlacq, already mentioned, to ten decimals, but they are very scarce, and can with difficulty be procured. There is an edition of them by Vega, in 1797, also scarce *Gardiner's Logarithms*, printed in 1742, in 4to, and another edition of them at Avignon in France in 1[illegible] to seven [illegible] *Gardiner's Logarithms* in 8vo, [illegible] arithmetic sines, &c for every 10 seconds *Taylor's Logarithms*, in 4to, and also *Baguay's* have them to every second *Hutton's Logarithms*, and *Babbage's Logarithms of Numbers* are well known [illegible] and [illegible] *Hülfstafeln* (8vo [illegible] to be mentioned as very [illegible] The above (except Vlacq's and Vega's) are all to seven decimal figures, but for many purposes logarithms to a less number of decimals are sufficiently accurate For navigation and surveying tables to six figures are the most convenient as they give in general the trigonometrical lines [illegible] conds The best tables of this kind [illegible] *of Six-figure Logarithms* (12mo 1840 [illegible] iliary computations in astronomy it is sufficient to have the logarithms to five places The reprint of *Lalande's Five figure Table* by the Useful Knowledge Society (18mo 1[illegible] is convenient, and may be relied on for accuracy

LOGARITHMIC or LOGISTIC CURVE In the higher Geometry, a curve line having this property, that its abscissa are proportional to the logarithms of the corresponding ordinates It is constructed in the following [illegible] O the axis [illegible] A B, A C, A D, &c be taken in arithmetical progression (or such that A B = B C = C D = &c), and from the several points A, B, C, D, &c let the perpendiculars A I, B M, C N, D O, &c be erected, forming a geometrical progression, or such that A L : B M = B M : C N = C N : D O = &c, then their summits I, M, N, O &c will mark the [illegible] The curve is ascending or descendin[illegible] continued from L upwards towards [illegible] towards m



The equation of the curve is $x = a \log y$, and hence its principal properties are easily deduced Taking the differential of the equation, we get $dx = a\frac{dy}{y}$, whence $y\frac{dx}{dy} = a$ Now in any curve $y\frac{dx}{dy}$ is the expression of the subtangent therefore the [illegible] of the logarithmic at different points [illegible] The constant a to which the subtangents are equal is the modulus of the system of logarithms represented by the particular curve When the subtangent (B T for example) is equal to A L, the primary ordinate which represents unity, the curve will exhibit the natural or Napierian logarithms

From the equation $dx = a\frac{dy}{y}$ we have $y\,dx = a\,dy$, but $y\,dx =$ the differential of the area, therefore the area $= \int a\,dy = ay +$ const Making first $y =$ D O, and then $y =$ C N we have the area C N O D $= a$ (D O − C N), that is to say, the area contained between two ordinates is equal to the rectangle under their difference and the constant subtangent

The logarithmic curve was proposed by Gregory of St Vincent soon after the discovery of logarithms, and its leading properties were investigated by Huygens and others Great use is made of it in various applications of physical science, and particularly in exhibiting the relations of elastic fluids (See *Keill's Tract on Logarithms*, *Euler's Introd in Anal Inf*, vol ii, *Leslie's Geometry of Curves* &c)

LOGARITHMIC SPIRAL, or LOGISTIC SPIRAL A curve line, which is generated as follows —Let the line S T revolve uniformly about a fixed point S, while another point P advances or recedes on S T with a velocity always proportional to its distance from the centre S, then the point P will trace out the logarithmic spiral

From this definition of the curve it follows that radiants S L, S M, S N, &c, making equal angles with each other, are continued proportionals, and that the angles about the pole S are the logarithms of the ratios of the successive

radiants whence the curve has its name Let S L = 1, S M = *y*, the angle L S M = *z*; then *z* = *a* log *y*, where *a* is a constant quantity The curve is consequently [illegible] the difference being [illegible] taken as straight lines, whereas in the case of the spiral they may be conceived to be taken as the arcs of a circle

The logarithmic spiral has many remarkable properties. One of them is, that the curve intersects all its radiants at the same angle, and this angle is the modulus of the system of logarithms which the particular spiral represents Another of its properties is that its involute and evolute are the same curve with itself Newton proved that if the force of gravitation had been inversely as the *cube* of the distance instead of the *square*, the planets would have shot off from the sun in logarithmic sp[illegible] (See Appendix)

LOGEION (Gr λογειον) In ancient Architecture, the Greek name for *proscenium* (which see) By the Romans it was called the *pulpitum*

LO'GIC (Gr λογικη (τεχνη understood, from λογος *speech*, *discourse*, or *calculation*), has been defined the science, and also the art, of reasoning It is a science because it investigates those principles on which reasoning proceeds it has been termed an art, as furnishing rules whereby the formal part of an argument may be constructed Logic was highly valued, perhaps overvalued among ancient philosophers The Stoics, in particular, were celebrated for their application of its principles to their own favourite metaphysical discussions From the abuse of logical knowledge [illegible] fallacies of the Sophists, who according to [illegible] representations of Athenian writers, were hired to furnish their pupils with the means of defending right or wrong positions with equal facility Zeno of Elea is called the father of logic, or dialectics according to the ancient appellation of the science but we are not well acquainted with the discipline which he taught although it can hardly have consisted, as more recent writers have represented, of a mere manual of captious fallacies But it is to the master mind of Aristotle that the science owes, as far as we are able to ascertain not only its first exposition, but its complete development for although logic has been extensively interwoven in later times with the subtleties of metaphysics and of rhetoric yet, as far as the limited province of the pure science extends, little has been done besides placing in a clearer light the discoveries of the Stagyrite When in the middle ages the Aristotelian logic became the foundation of the scholastic philosophy (which was little better than a revival under another form of that of the Athenian sophists) attempts were made especially one by the famous Raymond Lullius, to throw the science into a new form but without success In consequence of the various misapplications and perversions which the system had undergone in the hands of later dialecticians, it fell into great disrepute in modern times, and many of our first metaphysical writers, as Locke for example have treated it with very unmerited contempt Confined to that narrow limit to which alone its rules really extend it is a serviceable exercise for the mind, and affords an accurate insight into the formal part or machinery of reasoning

However multifarious the subjects to which reasoning may be applied and however complicated its details may become, the process by which all reasoning is conducted is one and the same Whoever seeks to prove that because one thing is thus therefore another thing is so [illegible] In analysing the process in question, we find, in the first place, that every truth or apparent truth, arrived at by reasoning, technically termed a conclusion, is deduced from two other propositions, technically termed premises either both expressed, or one expressed and the other implied In many instances it is at once evident to the mind of one capable of reasoning that if the two premises be true, the conclusion must follow Thus, if I wish to prove the mathematical truth that every A is equal to B, I find a third quantity C which is equal to both, and my argument then assumes the following shape — whatever is equal to C is equal to B, but every A is equal to C, therefore every A is equal to B Here the connection between the conclusion and the premises is at once evident and true, but there are many cases in which there is an apparent connection which is in reality false in other words, from two premises a conclusion is deduced, which admitting the truth of those premises, does not in reality follow from them The following, for example, is an instance of a conclusion incorrectly deduced from its premises, which, nevertheless, might at first sight pass current for reasoning "Every rational agent is accountable, brutes are not rational agents therefore brutes are not accountable" To explain the reason why the first of these two arguments is sound, and the latter unsound, requires not the examination of truths in mathematics or in natural religion, but simply of the common process of reasoning, and it is the means of making such an analytical investigation which are afforded by logic

The one of these arguments is a correct, the latter a false or apparent, syllogism (*see* SYLLOGISM); and the validity of the first, and invalidity of the latter, depend upon the necessary or unnecessary connection between the premises and the conclusion, the rules for ascertaining which will be found compendiously given under the head SYLLOGISM A single sentence may often be found to contain, elliptically expressed, and compressed into a narrow compass a whole chain of separate syllogisms [illegible] has been arrived at by this [illegible]

The [illegible] famous maxim termed in the schools of the middle ages the "dictum de omni et nullo,"—viz that "whatever is predicated (*i e* affirmed or denied) universally of any class of things may be predicated, in like manner (*i e* affirmed or denied) of any thing comprehended in that class" Thus, for example in the instance previously given of a valid argument if it can be predicated of the whole class of things which are equal to C that they are also equal to B, if I find any thing equal to C, I may predicate of it that it is equal to B also Hence my second premise A is equal to C, serves to bring me, logically, to the required conclusion — that A is equal to B This therefore, is the general principle on which that process is conducted which takes place in every syllogism

In order that reasoning may be contemplated simply as reasoning without any reference to the essential truth or falsehood of the propositions contained in it, which have nothing to do with the science we are now considering and also with a view of furnishing brief and expressive forms, like those of algebra, instead of words at length a set of arbitrary symbols are employed in logic to denote the qu[illegible] termed of propositions [illegible] or denies a fact every proposition also predicates (*i e* affirms or denies) that a certain attribute belongs either to a whole class or to some members of a class, of objects propositions are therefore in quality, either affirmative or negative, in quantity universal or particular Thus the four symbols of propositions in logical manuals are A universal affirmative, I particular affirmative, E universal negative O particular negative And the form of a [illegible] of the character of each of its premises and of the conclusion, is expressed by three of these letters Thus [illegible] consisting of three univers[illegible] found on examination that each proposition predicates a certain attribute of all the members of a class), will be designated by A A A, a syllogism termed in logical language *barbara* *See* SYLLOGISM

It is also found on farther analysis, that a syllogism embraces three separate objects or notions, two of which are compared with the third and, in consequence of that comparison pronounced to agree or disagree with each other Thus, in the syllogism "No dishonest man is a good citizen Caius is a dishonest man, therefore Caius is not a good citizen" The individual object, 'Caius," and the class of objects 'good citizens," being compared with a third class dishonest men," are found, the one to agree the other to disagree, with that class, and hence it inevitably follows that they disagree with each other — *i e* the conclusion of the syllogism is negative These three objects or terms as they are called in logic, occur in every syllogism The predicate of the conclusion,—*i e* that term which in the conclusion, is predicated of the other, in this instance "good citizen"— is called the major term, the subject of the conclusion—*i e* that term of which the other is predicated (Caius)—is the minor term, and the term with which the other two are respectively compared, "dishonest man," is the middle term

But every word, or combination of words, is not capable of [illegible] — *i e* something which may be predic[illegible] of [illegible] or of which another thing may be [illegible] In the first place adverbs, prepositions nouns in any inflection from the nominative case, &c can only form parts of a term, in logical phrase, [illegible] adjectives, also, have always, [illegible] subjoined, when employed as terms Verbs are mixed words, being resolvable into a term employed as a predicate, united to the *copula* or auxiliary verb (*is* or *is not*) Thus, nouns in the nominative case alone are simple terms or categorematics, these, again, are either the name of an individual or the name of the class the [illegible] terms) may be subjects, but cannot be [illegible] latter may be either Thus, in [illegible] singular term, "C[illegible] dicated that he is rich — *i e* a rich man

A common term, being a word equally applicable to a number of individuals, expresses a notion formed by the faculty of abstraction. When, for example, we contem-

plate several individual oak trees and abstract from each its separate peculiarities of height, growth &c we form the notion of an oak Contemplating a number of trees [illegible] abstracting from each its specific [illegible] we next arrive at the common [illegible] These common notions or terms are then the *predicables* which can be affirmed or denied of other objects

Predicables are divided into several kinds, although the division is, perhaps, strictly rather appertaining to metaphysical than logical science Every predicable is said, according to this division, to express either the genus species difference property or accident belonging to an individual (see these heads and Predicables) But it is to be remembered that a predicable may be referred to one or other of these several kinds, according to the point of view from which it is contemplated If I say of Cæsar that he is a "man," I express his species, considering him in those respects in which he differs from other animals If I say that he was "brave," I express a property If I predicate of him the several circumstances in which he absolutely differed from all other men I express that property or that bundle of united properties which forms his "difference" Every predicable, with a little attention, may be ranged under one or the other of these five classes, although it must be confessed that the distinction seems occasionally arbitrary and unphilosophical

In this hasty outline of some leading features of the art of logic as taught at Oxford (where alone we believe, pure unapplied logic forms a branch of study), we have chiefly made use of the Archbishop of Dublin Dr Whately's valuable *Elements of Logic*

The following passage is cited by Mr Hallam from the *Port Royal Logic*, as giving a juster view of the value of the Aristotelian method than its admirers are wont to entertain —"Cette partie, que nous avons maintenant a traiter, qui comprend les règles du raisonnement, est estimée la plus importante de la logique, et c'est presque l unique qu on y traite avec quelque soin, mais il y a sujet de douter si elle est aussi utile qu'on se l imagine La plupart des erreurs des hommes viennent bien plus de ce qu'ils raisonnent sur de faux principes, que de ce qu ils raisonnent mal suivant leurs principes Il arrive rarement qu'on se laisse tromper par des raisonnemens qui ne soient faux, que parceque la consequence en est mal tirée, et ceux qui ne seraient pas capables d en reconnaitre la fausseté par la seule lumière de la raison ne le seraient pas ordinairement d'entendre les règles que l on en donne, et encore moins de les appliquer Neanmoins quand on ne considéreroit ces règles que comme verités spéculatives, elles serviraient toujours à exercer l esprit" (*Esprit de Penser*, part 3) "To represent this portion of logical science as the whole" adds the same writer, appears [illegible] lar Euclid's axioms and [illegible] metry" (*Introduction to the Literature of Europe*, vol iii p 221) All that can be said in answer is, that the more general meaning of the term logic is undefined, and that it is employed by various writers and schools in the most arbitrary manner, while this portion, though it may be but a small one, is so clearly marked out and forms so distinct a body, that it has occupied in common language the character of the whole science

LOGOGRAPHY Gr λογος, *speech*, γραφω *I write*) A system of taking down the words of an orator without [illegible] which was put in practice [illegible] Twelve or fourteen reporters were seated round a table Each had a long slip of paper, numbered The writer of No 1 took down the first three or four words, and as soon as they were spoken gave notice to his neighbour by touching his elbow, or some other sign No 2 [illegible] No 3, and so on, [illegible], No 1 then began the second line thus all the 12 or 14 slips, when filled, being arranged parallel to each other, formed a single page This mode required great attention and quickness, and was not found to answer well in practice It was introduced in the National Assembly in October, 1790, the expenses being paid by the civil list, and continued until the 10th August, 1792, when Louis XVI and his family, taking refuge from insurrection in the assembly occupied the box of the logographe After that time it was not used (*Dictionnaire de la Conversation*)

Logography is also used [illegible] in which whole words [illegible] letters This method was [illegible] the printing of *The Times* newspaper, but after a short trial [illegible] inconvenient

LOGOGRIPH Gr λογος, and γρυφος, *a net*) A [illegible] posed for solution, in order to exercise the mind, is so called The word is used by Ben Jonson

LOGWOOD The wood of the *Hæmatoxylon campechianum*, a tree growing in many parts of the West Indies and on the adjoining continent It is employed in dyeing and calico-printing for the production of reds, blacks, drabs, and several compound colours Its colouring principle has been termed *hæmatine* An extract of logwood is used in medicine as an astringent The price of [illegible] from 10*s* to 7*l* per ton, [illegible] Britain in the three [illegible]

LOIMIC (from λοιμος, *a pestilence*) Relating to the plague or contagious disorders

LOK In Northern Mythology, the name of a malevolent deity, corresponding to the Ahriman of the Persians, who is represented to be at war with both gods and men and originating all the evil with which the universe is desolated In the *Edda* (the great poem of the Norwegian nations) he is described as the great serpent which encircles the earth (supposed to be emblematical of sin or corruption) and as having given birth to Hela, or Death, the queen of the infernal regions

LOLLARDS A class of persons in Germany and the Netherlands who professed, in the 14th century, to undertake spiritual offices in behalf of the sick and dead, and succeeded in attracting the attention and love of the mass of the people who thus were in a great measure alienated from the secular and regular clergy by their general [illegible] The origin of the name has been [illegible] the inquiries of Mosheim seem to lead to the result that it is compounded of the German words *lallen* (identical with the *lallare* of the Romans and the *lull* of our own language, signifying to sing in a murmuring strain) and *hard*, a common affix, as in the somewhat similar word *beghard* A Lollard therefore, meant one in the habit of singing to the praise of God or funeral dirges and the like, as was the custom of the early professors of this holy manner of life The Lollards, however, were accused — probably through the envy and spite of the mendicant friars and others whose neglected duties they so zealously performed — of holding many heretical opinions It is not impossible that there might have been some degree of enthusiasm mixed up with so ardent and unworldly a devotion, but the charges of violent reforming views, still more those of practical vice appear to rest upon no authentic grounds In process of time the name was applied by the partizans of the church to all heretics and schismatics of the day generally, and the followers of Wicliffe in England are frequently stigmatized under the name of Lollards (See *Gieseler's Text-book*, transl, vol iii pp 99 129)

LOMBARD A term anciently used in England for a banker or money-lender The name is derived from the Italian merchants, the great usurers or money-lenders [illegible] of the 13th century, and to have taken up their residence in a street in the city which still bears their name Stowe, in his *Survey of London*, says, "Then have ye Lombarde Street so called of the Longobards and other merchants, strangers of diverse nations assembling there twice every day The meeting of which merchants there continued until the 22d of December, in the year 1568, on the which day the said merchants to make their meetings at the Bursse, a place then new builded for that purpose, in the ward of Cornhill, and was since, by her majesty Queen Elizabeth named the Royal Exchange" (P 202)

LOMENTUM A fruit similar to a legume, excepting that it is contracted in the spaces between each seed and there separates into distinct pieces, or is indehiscent, but divided by internal spurious dissepiments, whence it appears at maturity to consist of many articulations and divisions It occurs in the genera *Ornithopus Hedysarum*, &c

LONG A musical character of this form P, whose length in common time is equal to four semibreves, and consequently eight minims

LONGICORNS [illegible] (Lat longus *long*, cornu, *a horn* The [illegible] coleopterous insects in the system of Latreille so called on account of the length of the antennæ which are rarely shorter than the body and commonly surpass it in length But this conspicuous character is not the only one which the Longicorn beetles possess in common In all of them the under part of the three first joints of the tarsi is furnished with a brush, the second and third are cordiform the fourth is deeply bilobed and there is a little nodule, resembling a joint, at the base of the last The *labella*, placed on a short and transversal *mentum*, is usually membranous, cordiform, emarginate, or bifid, but sometimes is corneous, and forms the segment of a very short and transverse circle The antennæ are either filiform or setaceous they are sometimes simple in both sexes, and sometimes serrate pectinate, or flabelliform in [illegible] males The eyes in some species are rounded and [illegible] but slightly emarginate, and in these species the thorax is trapezoidal [illegible] The [illegible]

As the larvæ of a very great proportion of the Longicorns live in the interior of trees, or under their bark, they are destitute of feet or have but very small ones.

Their body is soft, whitish, thickest anteriorly, and the head spherical and provided with strong mandibles [illegible] particularly, perforating them very deeply, and sometimes killing them in every direction Some of them attack the roots of plants

The abdomen of the female Longicorns is terminated by a tubular and horny ovipositor These insects produce a small sharp sound, by rubbing the pedicle of the base of their abdomen against the interior of the parietes of the thorax

LONGIPALPS *Longipalpi* (Lat longus, *long*, palpus, *feeler*) The name of a family of Brachelytrous Coleopterans, or short-winged beetles, which have the maxillary feelers almost as long as the head

LONGIPENNATES, *Longipennes* (Lat longus, [illegible] *wing*) A family of swimming birds, comprehending those in which the wings reach as far as or beyond the tail, as the tropic bird, albatross, &c They are all denizens of the high seas, and from their powers of flight are to be met with in various latitudes The hind toe is free or wanting The beak is hooked or pointed at the tip

LONGIROSTERS, *Longirostres* (Lat longus, and rostrum, *a beak*) The name of a tribe of Grallæ, or wading birds, including those in which the beak is remarkable for its length and tenuity, and by the high sensibility of its tip is well adapted for searching or probing in mud or soil for worms or insects The different gradations in the form of the bill serve to divide the Longirosters into families and genera

LONGISSIMUS DORSI A muscle of the back, which assists others in keeping the spinal column erect

LONGITUDE, in Astronomy, has two different significations, according as it is applied to a celestial or terrestrial object The longitude of a heavenly body is the arc of the *ecliptic* intercepted between the vernal equinox and a great circle perpendicular to the ecliptic passing through the body It is reckoned eastward all round the sphere from 0 to 360° The longitude and latitude of a celestial object, having reference to the ecliptic, and not to the plane of the earth's diurnal motion, cannot be directly observed The elements necessary for determining a star's place, which are given directly by observation are its right ascension and declination, from which the longitude and latitude must be calculated by the rules of spherical trigonometry In the planetary theory, however, it is convenient to refer the motion of a planet to the plane of the earth's orbit or to make the longitude and latitude the co ordinates of its motion But the places of the stars are always defined, by modern astronomers, by means of their right ascensions and declinations

The longitude of a place on the earth is the arc of the *equator* intercepted between the meridian of the place and some conventional fixed meridian, which is regarded as the origin from which the measures are reckoned Terrestrial longitudes and latitudes correspond to right ascensions and declinations in the heavens with this distinction, however, that the right ascensions are always reckoned from the vernal equinox, or point in which the equator intersects the ecliptic, whereas the longitudes are reckoned by different geographers from different points, selected for some local reason, [illegible] thing connected with the earth's diurnal [illegible] can render one point of the equator more convenient than another [illegible] in the same direction [illegible] ircumference, while geographical longitudes are reckoned both eastward and westward, 180° each way

The parallels of latitude on the earth are distinctly marked out by the diurnal circles described by the stars and consequently latitude can always be determined by direct observation of the heavens but the case is entirely different with respect to longitude, for to observers situated under the same parallel of latitude, but under different meridians, the heavens present exactly the same aspect, and there is nothing whatever to indicate any difference of locality Longitude, therefore, cannot be measured by direct observation, it can only be inferred from the measurement of intervals of time to which it is proportional In the course of a sidereal day the rotation of the earth brings successively every different meridian [illegible] and, the rotation of the earth [illegible] t follows that the angular distance [illegible] will be the same part of 360° that the interval of time which elapses between their coming to the same star is of twenty-four hours For example, if a star pass the meridian of a place A at a certain moment, and that of B exactly one hour of sidereal time later, then the difference of longitude between A and B is the twenty-fourth part of 360°, or 15°, and the longitude of B is 15° west of A The determination of longitudes consequently resolves itself into the measurement of time; and as the time, or the instant of mean noon at any place can always be found without difficulty, if an observer at one place can by any means determine the precise hour it is at any other place *at the same instant*, he has then determined the difference of longitude between the two places

Of the various methods by which differences of longitude may be determined, the simplest and most obvious is that of transferring chronometers from one place to another Suppose [illegible] A and B, each to [illegible] sidereal time of his st[illegible] also regulated to true [illegible] the clock at A, and t[illegible] any change of rate to [illegible] would thus be exhibi[illegible] the time occupied by the equinoctial point or by any star in passing from the meridian of A to that of B, or it is the difference of longitude of the two places expressed in sidereal hours, minutes, and seconds Were chronometers perfect, nothing more complete and convenient could be desired, but this unfortunately is even now very far from being the case, and until within a comparatively very recent time the practical determination of the longitude by means of chronometers could not be attempted

Another method of determining the difference of longitude between two places, independently of astronomical observations is that by telegraphic signals This method though from its nature of the first application is susceptible of great accuracy The explosion of a rocket, the flash of gunpowder in an open dish the extinction of a bright light, &c, are instantaneous phenomena which can be seen at great distances and noted with the utmost precision A signal of this kind made at a station visible from two observatories, must be seen at the same absolute instant of time from both, and the time marked by the clock of each observatory at this instant being noted the difference of their local times, and consequently the difference of their longitudes, becomes known This method is chiefly practised in connection with geodetical operations for measuring degrees of longitude on the earth's surface, and is perhaps the best that can be adopted for determining the difference of longitude between two observatories situated at no very great distance from each other By means of intermediate signals and observers suitably disposed between each, it may also be applied to transfer the time from one place to another when the distance is too great to allow an artificial signal of any kind to be seen from both (See *Phil Trans*, 1826)

When the distance between two places is very considerable, artificial signals cannot be employed, and it becomes necessary to have recourse to the methods furnished by astronomy These are principally the following —

1 *Eclipses of the Moon* — The instant of time at which the moon's disk enters or quits the earth's shadow is independent of the position of the observer, and therefore if the phenomenon could be accurately observed, would give the longitudes of all places from which the eclipse is visible But the penumbra of the earth renders it impossible to determine the precise instant at which the disk enters into the true shadow the observation in fact is uncertain to the amount of a minute of time, which corresponds to a quarter of a degree of longitude, and therefore this method, which was proposed and employed by Ptolemy is now altogether abandoned

2 *Eclipses of Jupiter's Satellites* — These phenomena also occur at the same instant of absolute time to all places on the earth, but they are not susceptible of being observed with much exactness, for the same reason which renders the lunar eclipses uncertain namely, the penumbra of the planet The uncertainty is least in the case of the first satellite on account of its quick motion and as the eclipses of this satellite occur much more frequently than those of the others, the observations are chiefly confined to it The times of the eclipses of the three first satellites are given in the *Nautical Almanac*, so that an observer at any part of the world, who observes one of these eclipses, has only to compare his local time with that assigned to the phenomenon in the almanac in order to determine the distance of his meridian from that of Greenwich But, on account of the uncertainty of the observation, the longitude obtained by this method may be considerably in error

3 *Occultations of Fixed Stars by the Moon* —This method, which is one of the readiest and most useful on land, though it can seldom be practised at sea consists in observing accurately the time at which a certain fixed star disappears behind the disk of the moon, or reappears after having been occulted The first of these phenomena is called the immersion of the star, the second the emersion But, on account of the moon's parallax, the immersion or emersion of a star behind her disk does not take place at the same absolute instant to observers on different parts of the earth, a calculation is therefore necessary to clear the observation of parallax, or to determine the time at which the phenomenon would have occurred [illegible] from the centre of the earth This reduction being made the moon's apparent

semidiameter at that instant must be calculated; by means of which, after applying the proper corrections for parallax, refraction, &c, the exact distance of the star from the moon's centre at the moment of the immersion becomes known Now, suppose the same occultation to have been observed at another place, and the true distance of the star from the centre of the moon computed in the same manner, or, without a corresponding observation, suppose the time at the second place (Greenwich, for example) to be computed, for which the star's distance from the moon was the same as observed at the first place the comparison of the two times will show the difference of the meridians of the places The length of the calculation by which the longitude is deduced is a disadvantage which attaches to this method *See* OCCULTATION

4 *Eclipses of the Sun* The longitude is deduced from the observation of solar eclipses, in the same manner, and by precisely the same sort of calculations, as from the occultation of fixed stars An eclipse of the sun is, in fact, an occultation, but these phenomena occur so seldom at any particular place that they afford little assistance in the determination of longitudes It may be remarked that the irregularities of the border of the moon's disk render the instant of the commencement or end of a solar eclipse, as also of the immersion or emersion of a fixed star, somewhat uncertain But this uncertainty is corrected, or rather avoided, by measuring with a micrometer the distance between the two cusps, which, shortly after the commencement of the eclipse, appear like two sharp and well defined Knowing the diameters of the sun and moon, the length of the chord, and the distance between the centres of the two bodies, the true distance of their centres at the instant the measure was taken can be calculated without much difficulty As this measurement can be executed with much precision, and can also be repeated frequently during the progress of the eclipse, the phenomenon of a solar eclipse affords one of the most certain methods of determining a longitude which can be practised *See* ECLIPSE

5 *Transits of the Moon* — This method is founded on the moon's rapid change of place among the stars, which becomes very sensible even in short intervals of time Suppose an observer at the station A to determine the sidereal time of the transit of the moon's centre over his meridian, and suppose another observer at B, to the west of A, also to note the sidereal time of the same transit if the moon's right ascension had in the interval undergone no change, the sidereal times marked by the two observers would have been the same, but as the right ascension has increased, while the moon was passing from the meridian of A to that of B the sidereal time of the transit at the latter place will be increased, and, supposing the change of right ascension to be uniform, the difference of the times of transit will be proportional to the difference of meridians The chief objection to this method is, that any minute error in the adjustment of the transit instrument or rate of the clock is thrown upon the longitude, on which it produces a very sensible effect The method can, therefore, only be safely practised at fixed observatories with the best instruments

6 *Moon-culminating Stars* —This method has been proposed for the sake of avoiding the effect of minute instrumental errors, which render the method last described so difficult A star is chosen which *culminates* (that is, comes to the meridian) at nearly the same time with the moon, and which has very nearly the same declination, so that it may be seen in the field of view at the time of the position of the transit instrument The transit of the star, as well as the transit of the moon's limb, is observed at both stations (or at least observed at the one station, and calculated for the other whose meridian is known), and the difference of sidereal time between the two transits noted at each This difference, in consequence of the moon's motion in right ascension, is not the same at both stations, and its variation gives the difference of the longitude By this means any error of the position of the transit instrument affects the star and the moon both alike but it is erroneous to suppose that the method is independent of accuracy in the adjustment of the transit instrument, for if the instrument is out of the meridian, the resulting longitude will be in error by the amount of the moon's variation in the corresponding interval This is rarely practised.

7 *Lunar Distances* —None of the methods which have yet been described (excepting that by chronometers) can be applied to the very important problem of determining the longitude of a ship at sea In this case, no fixed or meridional instruments can be employed, and the observer can only measure the apparent distance of the moon's limb from a fixed star or planet with a sextant, or some reflecting instrument like it, and so find For the purpose of rendering this method available to seamen, the distance of the moon from certain fixed stars is computed (several years previously) for every three hours of Greenwich time, and published in the *Nautical Almanac* The moon's distance from one of these stars being observed on board a ship, and corrected for refraction and parallax, and the apparent time at the place and moment of observation being determined in the usual manner by the altitude of the sun or a known star, the difference between the apparent time of the observation and the apparent time at Greenwich *corresponding to the same distance*, interpolated from the *Nautical Almanac*, gives the longitude of the ship *See* LUNAR METHOD

In the projection of maps and charts it is necessary to assume a point of the equator as the origin of the longitudes The meridian passing through this point is called the *first meridian*, and as its selection is perfectly arbitrary, it has been placed by different geographers at various parts of the earth a circumstance which occasions some inconvenience in consulting works of geography Modern geographers usually assume the meridian of the capital of their own country as the first meridian English writers generally adopt the meridian of the Greenwich Observatory, for which the *Nautical Almanac* is computed, the French that of the Observatory of Paris (*See* MERIDIAN) Ptolemy, and the most celebrated of the ancient geographers, placed the first meridian at the Fortunate Islands (now the Canaries), which they conceived to be the utmost boundary of the habitable earth The Arabian astronomers also counted the longitude from the Fortunate Islands, and many of the modern geographers have counted from the island of Ferro, one of the most westerly of the Canaries The reason for fixing on this point was probably that as there was no land known to the west of the first meridian, the longitudes of all places would be reckoned in the same direction, or there would be no west longitude The discovery of America destroyed the force of this reason The inconvenience of counting in two directions is not very great, but it might be avoided by reckoning the longitude all round the circle to 360°, which would undoubtedly be an improvement on the present method

Degrees of Longitude — The earth being spheroidal, the degrees of we proceed from the equator towards either pole For the law of their variation, and their lengths on the different parallel circles, see DEGREE

Geocentric Longitude is the longitude of a planet as seen from the earth, that is, the point of the ecliptic to which it perpendicularly corresponds as seen from the centre of the earth

Heliocentric Longitude is the longitude of a planet as seen from the sun See the terms GEOCENTRIC and HELIOCENTRIC

LONGUS COLLI The name of a pair of muscles of the neck when one contracts, it moves the neck to one side, when they both act, the neck is bent forwards

LOOM The well-known machine for producing cloth by the interweaving a series of parallel threads which run lengthwise called the warp or chain, with other threads thrown transversely with the shuttle, called the woof or weft Under the head WEAVING will be found a notice of the history of the loom, and the numerous improvements that have taken place in its construction from the earliest times down to the invention of Jacquard

LOOMING The indistinct and magnified appearance of objects seen in particular states of the atmosphere *See* MIRAGE

LOOPHOLES Perforations or apertures formerly made in the battlements or in the walls of fortified places, for discharging arrows and javelins against the assailants Since the invention of gunpowder, and the substitution of cannon for such missiles, loopholes have necessarily been discontinued in the construction of fortresses, the assailants of which are now sought to be driven back by guns fired through apertures of a different ch which see

Lophobranchii (Gr. λοφος, *a tuft*, βραγχια *gills*) An order of Osseous fishes, comprehending those in which the gills are in the form of small tufts, and disposed in pairs along the branchial arches, as in the pipe-fish and hippocamp

LOPHOTES (Gr λοφος) A genus of Tænioid fishes, characterized by a short head, surmounted by a high osseous crest, to the summit of which a long and stout spine is attached, bordered behind with a membrane and a low fin, of which the rays are nearly all simple, and which extends from the occipital spine to the point of the tail, this is terminated by a distinct but very small caudal fin

LOPHYROPODS, *Lophyropoda* (Gr λοφους, *crested*, πους, *a foot*) The name of a section of Entomostracous Crustaceans, comprehending those species with cylindrical or conical ciliated or tufted feet

LOPPING Cutting off all the branches of a tree for the sake of the profit to be derived from them, as contrasted with pruning, by which some of the branches are cut off for the The lopping of a tree, however, does of the crop or

leading shoot; and hence when timber trees are sold the purchaser bargains to take them either with or without the lop and crop, as the case may be

LORANTHA'CEÆ. (Loranthus, one of the genera) A natural order of parasitical Exogens, principally inhabiting the equinoctial regions of Asia and America. They are distinguished from *Caprifoliaceæ* and all other orders by their parasitical habit, and by the stamens being opposite to the petals. Brown suggests their relation to *Proteaceæ*, and, upon the whole, the structure of this order appears to be rather that of a polypetalous or apetalous than of a monopetalous order. Schleiden has lately made the startling assertion that the [illegible]. The bark is usually astringent. [illegible] their power of rooting in the wood of other plants. They effect this when they first germinate by fixing their root upon the bark, and then by slow degrees introducing it into the tissue till they reach the wood, between the wedges of which they slightly insinuate themselves, thus placing their abortive roots in the line of the current of ascending sap. They are generally beautiful plants, but [illegible]. Mistletoe is the most [illegible].

LORD [illegible], said to be derived from two Saxon words signifying a giver or distributor of bread. It may be said to be either a title of hereditary dignity (as lord of parliament, &c.), or a title expressing certain powers, as lord of a manor, lord chancellor, lord of the treasury, &c. The eldest sons of earls, and all the [illegible].

LORD ADVOCATE [illegible] CATE.

LORD-KEEPER. *See* KEEPER, CHANCELLOR.

LORD-LIEUTENANT OF IRELAND. The chief executive officer of the Irish government, representing in some respects the person of the king. The first viceroy or lieutenant of Ireland appears to have been appointed in the reign of Henry II., and by acts of parliament passed in the reigns of Richard III. and Henry VIII. provision was made for the election of a governor by the chancellor, treasurer, and other high officers of the government, on the death or resignation of a lieutenant until the king's pleasure were known. The chief officer in Ireland has been variously styled at different times, as custos or keeper, justiciary, warden, procurator, seneschal, constable, deputy, and lieutenant. He is appointed by letters patent [illegible] bene placito. He has a council composed of the great officers of the crown in Ireland and others appointed by the crown. He corresponds with the secretary for the home department, but the management of the affairs of the Irish government in London is chiefly entrusted to the secretary for Ireland who is also chief secretary of the lord-lieutenant. He has also a household consisting of a private secretary, steward, [illegible], master of the horse, and [illegible]. His salary has been usually 20,000*l.* per annum.

LORD-LIEUTENANTS OF COUNTIES. In England and Wales, officers appointed by the king, and entrusted by parliament with full power and authority to call together, arm, and array the militia, and cause them to be trained and exercised once every year. Each may appoint twenty or more deputy lieutenants who must have 200*l.* a year freehold estate, except in the Welsh [illegible] the qualification [illegible] nominates officers in the militia and yeomanry; but the names both of deputy-lieutenants and officers must be laid before the king, and if he, within fourteen days, expresses disapprobation, the commissions do not issue.

LORD PRIVY SEAL. *See* SEAL.

LORDSHIP. *See* LEET.

LORE (Lat. lorum, *a strap*), in Ornithology, signifies the space between the bill and the eye, which is bare in some birds, as the great crested grebe, but is generally covered with feathers. In Entomology the term is applied to a corneous angular machine observable in the mouth of some insects, upon the intermediate angle of which the mentum sits, and on the lateral ones the cardines of the maxillare, and by means of which the trophi are pushed forth or retracted, as in the Hymenopterous insects.

LORI'CA (Lat. lorum, *a thong*). A cuirass or crest of mail, made of leather and set with plates of metal in various forms, chiefly in rings like a chain, used by the Roman soldiers.

LO'RICATES, *Loricata* (Lat. lorica, *a coat of mail*). The name given by Merrem to an order of reptiles dismembered from the *Sauria* of Cuvier, and including those species, as the crocodile, which are protected by an armour of bony plates.

LORICA'TION (Lat. loricare, *to crust over*). A term of old chemistry, signifying the application of a lute or coating to glass and other vessels.

LORIS. *See* STENOPS.

LOSS. In Geology. *See* LOSS.

LOTE TREE (of the Ancients). Of this there were two kinds: the one a small plant, from which the *Loto-* [illegible] the other a tree with cut leaves [illegible]. The former was the *Zizyphus* [illegible] *australis*. In the Hindoo mythology, the lote tree is regarded as the symbol of creation. *See* LOTOPHAGI.

LO'THIAN. A name common to that part of Scotland which stretches along a considerable part of the southern shores of the Frith of Forth, and comprehends the three counties Haddingtonshire, Edinburghshire, and [illegible] of the so-called East, Mid, and West Lothian. The etymology of the name is doubtful. Lothian was taken possession of by the Saxon invaders A.D. 450, and became the scene of contest between the Saxon Gaels and Scoto-Irish, and was at length ceded to Malcolm II. in 1020. Lothian was considered as a country wholly distinct from Scotland in the reign of David I., and the period of its incorporation with the rest of the country is assigned to the 11th or 12th century.

LO'TION (Lat. lotum, supine of lavare, *to wash*). A mixture of different ingredients, or a solution of various medicinal substances, in water or other menstrua, designed for external application. Indolent ulcers and tumours require stimulating lotions, whereas sedative and narcotic mixtures are used to alleviate pain.

LOTO'PHAGI (Gr. λωτος, and φαγειν, *to eat*). A name given to a people of ancient Africa who inhabited the Regio Syrtica (*Iber.* iv. 177), so called from the lotus berry forming their principal food. They were represented as a mild hospitable race of men. The food with which they were nourished, among other peculiar qualities is said to have had the power of obliterating all remembrance of one's native country.

LO'TTERY (Germ. loos, *lot*), is defined as a game of hazard in which small sums are ventured for the chance of obtaining a larger value, either in money or other articles. Lotteries are formed on various plans, but in general they consist of a certain number of tickets drawn at the same time, with a corresponding number of blanks and prizes, by which the fate of the tickets is determined. The invention of lotteries has been ascribed to the Romans, by whom, however, they seem to have been resorted to as a means chiefly of amusing and gratifying the people. In modern times this species of gaming has been sanctioned at different periods by most of the European governments, as a means of raising money for public purposes. It would be difficult to give a complete account of the various changes which have taken place in the regulation of lotteries in different countries, but the subjoined summary of their history, from their origin down to [illegible] England may not be uninteresting. [illegible] of which there is an authentic record was drawn in 1569, when 400,000 tickets were sold at 10 shillings each. The prizes consisted chiefly of plate, and the net profits were intended to be appropriated to repairing the harbours of the kingdom and other public works. In the year 1612 a lottery was drawn for the benefit of the English colonies, and, in the course of the same century the desire for embarking in speculations of this kind increased to such a degree, and gave rise to such an infinity of private undertakings, many of which were formed on the most delusive and fraudulent principles, that, in the beginning of Queen Anne's reign, parliament found it necessary to suppress *private* lotteries "as public nuisances." The year 1709 saw the birth of the first state or parliamentary lottery, and from that time down to 1823 they were annually licensed by act of parliament, under a variety of regulations and modifications. In the very early part of last century the prizes were paid in the form of terminable annuities. Thus in 1746 a loan of 3,000,000*l.* was raised on 4 per cent annuities, and a lottery of [illegible] tickets, at 10*l.* each, and in the following year [illegible] was raised by the sale of 100,000 tickets, the prizes in which were founded in perpetual annuities at the rate of 4 per cent per annum. During the same century government constantly availed itself of this means to raise money for various public works, of which the British Museum and Westminster Bridge are well-known examples. But at the commencement of the present century a great repugnance began to be manifested in parliament to this method of raising any part of the public revenue, in consequence of the spirit of gambling which it tended to foster in [illegible] and notwithstanding the [illegible] 1793, which were confessedly attended with much good, the evils to which it gave birth at last became so palpable that, in the year 1823, the legislature at last consented to the entire abolition both of state and private lotteries. It would be superfluous [illegible] nent to point out how prejudicial [illegible] must be to public morals, by giving the countenance of government to systematic gambling, [illegible] by diffusing a spirit of speculation by which the [illegible] is diverted from habits of continued industry to delusive dreams of sudden and enormous wealth, which, in the great majority of instances, must end in poverty and ruin. Those who

wish to see the melancholy results of this system of finance exhibited in its true colours, will find ample information [illegible] to the House [illegible] in 1808, but we cannot refrain from inserting a paragraph from the *Wealth of Nations*, which illustrates their principle and operation with great brevity and effect —

"The world neither ever saw, nor ever will see, a perfectly fair lottery, or one in which the whole gain compensated the whole loss, because the undertaker could make nothing by it In the state lotteries, the tickets are really not worth the price which is paid by the original subscribers, and yet commonly sell in the market for twenty, thirty, and sometimes forty per cent advance The vain hope of gaining some of the great prizes is the sole cause of this demand The soberest people scarce look upon it as a folly to pay a small sum for the chance of gaining 10 or 20,000 pounds, though they know that even that small sum is perhaps 20 or 30 per cent more than the chance is worth In a lottery in which no prize exceeded 20*l*, though in other respects it approached much nearer to a perfectly fair one than the common state lotteries, there would not be the same demand for tickets In order to have a better chance for some of the great prizes, some people purchase several tickets, and others small shares in a still greater number There is not however, a more certain proposition in mathematics, than that the more tickets you adventure upon the more likely you are to be a loser Adventure upon all the tickets in the lottery, and you lose for certain, and the greater the number of your tickets, the nearer you approach to this certainty" (See also *Degerando's Bienfaisance Publique*, l ii ch 6)

State lotteries were abolished in France in 1836, along with the gambling houses, from which a great revenue had been derived They still exist in several of the German states That of Hamburg is established on a comparatively fairer principle than was adopted either in France or England the [illegible] ey for which the tickets are sold [illegible] the buyers, except a deduction of 10 per cent made from the amount of the prizes at the time of their payment See *Penny Cyclo*

LOUGH An Irish term synonymous with the Scotch *loch*, but not with the English *lake*, for loch and lough [illegible] designate [illegible] of the sea, as well as col- [illegible] water, which lake is not

LOUIS D'OR A gold coin under the old system of France, first struck under Louis XIII in 1641, from whom they derived their name The louis d or, says Kelly, coined before 1726, which passed then for 20 livres, were coined at the rate of 36¼ per French mark of gold 22 carats fine From the year 1726 to 178[illegible] louis d ors were coined at the rate of 30 to the mark of gold, and about this period all the gold coins in France were ordered to he brought to the mint to be melted down, and a new coinage then took place at the rate of 32 louis d'ors to the mark of the same degree of fineness, with a remedy of 15 grains in the weight, and $\frac{12}{32}$ of a carat in the allov The intrinsic value of this new coin was 18*s* 9¼*d* sterling Louis d ors were formerly regarded as a current coin in all parts of the Continent, but in England they are sold merely as merchandise, and their value has fluctuated from 18*s* 6*d* to 21*s* sterling The term louis d'or is still given to the gold coinage of the present government of France, though they are also often called 20-franc pieces

LOUIS, SAINT, OF FRANCE A royal military order, founded by Louis XIV in 1693 The badge is a cross of eight points, with fleur de lis, and bearing a circular shield containing the effigy of Saint Louis

LOU'VRE One of the most ancient palaces of France, It existed in the time of Dagobert as a hunting seat, the woods then extending all over the actual site of the northern portion of Paris down to the banks of the Seine The origin of its name has not been satisfactorily ascertained It was formed into a stronghold by Philip Augustus, who surrounded it with towers and fosses, and converted it into a state prison for confining the refractory vassals of the crown It was then without the walls of Paris, but, on their extension in the latter part of the 14th century, it was included within their circuit Charles V made additions to it That part of the palace now called the *Vieux Louvre* was commenced under the reign of Francis I, after the designs of Pierre L'Escot, abbot of Clugny When Charles IX resided in the Louvre, he began the long gallery which connects it with the Tuilleries, and in which is now deposited the celebrated collection of pictures It was finished under Henry IV Louis XIV, from the designs of Lemercier, erected the peristyle which forms the entrance to the Vieux Louvre from the side of the Tuilleries That monarch also gave a beginning to the remainder of the present modern edifice, from the designs of Claude Perrault The edifice has never been finished, though, under the reigns of succeeding monarchs, and especially during that of Napoleon, it has slowly advanced towards completion The eastern front, though not finished even now, exhibits a façade of sur- [illegible] ever equalled. [illegible] square on the plan Three of its sides were from the designs of Perrault above mentioned An [illegible] be necessary to connect the [illegible] to which it is joined at present only on the river side by the great gallery above mentioned but preparations are in progress to effect this object and on the side next the Rue St Honore about 140 feet have been executed Besides the gallery above adverted to, which contains some of the finest pictures in the world, the Louvre contains a museum of sculpture, antiquities, and other specimens of art, equally valuable

LOVE, FAMILY OF A sect of fanatics in the 16th century Holding tenets resembling those of the early Anabaptists There is a proclamation against them by Queen Elizabeth, dated from her manor of Richmond, 1580

LOVE FEASTS A species of religious ordinance held quarterly by the Methodists, to which members of their church alone are admitted, and that only on presenting a ticket or a note from the superintendent They are a relic of the *Agapæ* (which see) held by the early Christians

LOWER CHALK AND GREENSAND *See* GEOLOGY

LOWER EMPIRE The Roman empire, from the removal of the imperial seat to Constantinople, and its successor, the Byzantine empire, down to the capture of that city by the Turks, are frequently joined together under this name by modern historians

LOW SUNDAY In Ecclesiastical Antiquities, the Sunday next after Easter has been popularly so called in England, perhaps by corruption for *close* (Pascha clausum, *close of Easter*, one of the many names by which it was known in the Christian church) (*Riddle's Christ Ant* 640)

LOXIA (Gr λοξος, *crooked*) A genus of Conirostral Passerine birds, characterized by having a compressed beak, and the two mandibles so strongly curved that their points cross each other, sometimes on one side, sometimes on the other The crossbill (*Loxia curvi-* [illegible] of this genus

LOXODROMIC CURVE or SPIRAL (Gr λοξος, [illegible] and δρομος course) A curve spiral [illegible] which it intersects all under the same angle being regarded as the radii of the spiral It is the path which a ship sailing always on the same rhumb, or making the same angle with the meridians, describes on the surface of the terrestrial sphere The properties of the curve are analogous to those of the com [illegible] arithmetical spiral It always approaches the pole, [illegible] ever reaches it so that a ship by following always the same oblique course, would [illegible] approach the pole of the earth without [illegible] find the equation of the loxodromic, let φ be the arc of the meridian intercepted between any point of the curve and the pole, and λ the longitude of that point, then the infinitely small arc of the parallel of [illegible] corresponding to an increment of the curve is $d\lambda$ [illegible] and the differential of the co latitude is $d\varphi$, but, because the curve cuts all the meridians under the same [illegible] the variation of the parallel of latitude corresponding to an increment of the curve is proportional to the variation of the co-latitude, consequently $a\,d\lambda \sin.\varphi = d\varphi$, or $a\,d\lambda = \frac{d\varphi}{\sin.\varphi}$ which is the differential equation of the loxodromic, a being a constant quantity

LOZENGE An oblique-angled parallelogram, or rhombus, formed by constructing two equal isosceles triangles upon opposite sides of the same straight line

LOZENGE In Heraldry, a bearing in the shape of a parallelogram, with two obtuse and two acute angles. The arms of maidens and widows are borne on shields of this shape

LOZENGE In Pharmacy a medicinal substance made up into a small cake gradually to be dissolved in the mouth Sugar, gum and starch are the usual inert parts of lozenges, and minute quantities of active substances are added, according to the purposes for which they are intended such as ipecacuanha or squills, for pectoral lozenges, extract of poppies or opium, for sedative lozenges, kyan pepper as a stimulant, oil of peppermint [illegible]

LUCANIDÆ (Gr λυκος, *a wolf*, also the name of an insect) A family dismembered from the Linnæan genus *Lucanus*, and including those insects which in addition to the comprehensive characters of the original genus present antennæ strongly geniculate, glabrous or but slightly pilose, the labrum very small, or confounded with the epistome, maxillæ terminated by a membranous or coriaceous, silky penciliform lobe, edentate, or with one tooth, and a ligula either entirely concealed or incorporated with the mentum, or divided into two nar- [illegible] or less beyond [illegible] and between the

elytra. The stag-beetle, *Lucanus cervus*, &c, is the type of this family. The sub genera are *Usalus*, *Lamprima*, *Sinodendrum* &c

LUCA'NUS (Gr λυκος) A Linnæan genus of Coleoptera, forming the type of a tribe of Lamellicorn beetles (*Lucanidæ*, [illegible] of Latreille) it is thus characterised Antennæ [illegible] joints, the first of which is usually much the longest, the antennal club has its leaflets or teeth arranged perpendicularly to its axis, in the manner of a comb The mandibles are always corneous, and most commonly exhibit a sexual superiority of development and peculiarity of form in the males The maxillæ are generally terminated by a narrow, elongated, and silky lobe, but sometimes are entirely corneous and dentated The ligula in most of the *Lucanines* is formed of two small silky pencils, projecting more or less beyond an almost semicircular or square mentum The anterior legs in the greater number are elongated, and their tibiæ dentated along the whole of their outer side The tarsi terminate in two equal and simple hooks, with a little [illegible] between them The elytra [illegible] to the upper part of the abdomen The insects thus characterised were first divided by the immediate successors of Linnæus into two genera, *Lucanus* proper and *Passalus*, both of which are now elevated to the rank of families, and subdivided into numerous subgenera *See* LUCANIDÆ and PASSALIDÆ

LU'CERES (Lat) In Roman antiquities, a body of horse composed of Roman knights, first established by Romulus and Tatius It is said to have received its name either from an Etrurian, who aided the Romans against the Sabines, or from the Lat *lucus*, a grove, where Romulus had instituted an asylum for all fugitives, slaves, and homicides, in order that he might people his infant city but it is difficult to account for the real origin of the word

LUCE'RN (*Medicago sativa*) A well known plant of the Linnæan class Diadelphia, and order Decandria, and of the natural family of the *Leguminosæ* There are many species of the Medicago, but of these the artificial grass, called Lucern, is most deserving of notice This plant was in high estimation among the ancients, and its nutritious qualities, easy cultivation, rapid growth, and luxuriant properties, have placed it in the first rank of vegetable food for cattle, even in the present times Lucern, says an old writer, is commended for an excellent fodder There is not any pulse or other feeding which is more agreeable or more precious for feeding beasts than lucerne so that it may seem to spring out of the earth as a more especial favour from God, not only for nourishing and fattening herds of cattle, but also to serve as a physic for beasts that are sick (*Country Farm*, 3d edit fol 1616, p 364) Those who wish to see the properties of this plant fully developed at once from the author's personal experience, and the concurrent testimony of the best agricultural writers both ancient and modern and its history traced from its discovery during the Persian expedition under Darius to its subsequent introduction successively into Greece, Italy, Spain, France, Germany, and, in fact wherever the art of husbandry has [illegible] down to its arrival in England, will find ample details in the learned *Essays on Husbandry* by the Rev Walter Harte (London, 1770), to which we beg to refer The origin of the term lucern is involved in obscurity Some authors have derived it, naturally enough, from the canton in Switzerland of that name, but from the account given by Mr Harte of the history of this plant, it does not appear either that Switzerland was particularly famous for producing it, or that the northern and western nations of Europe received it thence

LUCERNA'RIA (Lat lucerna, *a lamp*) A genus of fleshy polypi (*Polypi carnosi*) in the system of Cuvier, characterised by a long and slender [illegible] a radiated disc, which sends off numer[illegible] in bundles The *Lucernariæ* Cuvier regards as being nearly allied to the *Actineæ* or *sea-anemones*, but their substance is softer They emit [illegible]

LU'CIFER (Lat lux *light*, and *I bring* The morning star A name given [illegible], when she appears in the morning before sunrise When Venus [illegible] or appears in the evening, she was called *Hesperus* the evening star These names no longer [illegible] except by the old poets

LUCIFERS Matches tipped with a mixture of chlorate of potash and sulphuret of antimony they are inflamed by friction [illegible] piece of emery paper

LUCIFE'RIANS [illegible] and adherents of a sect of heretics, so called from Lucifer, [illegible] 4th century, whose opinions they [illegible] Luciferians considered the soul to be of a carnal nature and to be transmitted from father to child, but the chief occasion of the schism of Lucifer arose from his refusal to hold any communion with those clergy who had conformed to the Arian [illegible] Synod at Alexandria, A D 352 had determined to re admit into the church on condition of an open acknowledgment of their errors. The number of this sect was never considerable, and it was extinct in the time of Theodoret, but it deserves notice from being considered by the Roman Catholics as one of the great schisms in their church *See* SCHISM

LUCI'NA In Roman Mythology, the goddess who presided over the birth of children Her name is derived either from *lucus* or *lux*, according to Ovid's explanation,—

> Gratia Lucinæ, dedit hæc tibi nomina lucus;
> Aut quia principium, tu, Dea, lucis habes.

She is said to be the daughter of Jupiter and Juno, and has frequently been confounded with Diana and Juno, both of whom presided over childbirth She was called Ilithya by the Greeks

LUCU'LLITE A black limestone, often polished for ornamental purposes, to which it is said first to have been applied by Lucullus, the Roman consul

LU'ES (Lat) A poison or pestilence; a plague

LUFF The foremost edge or leach of a fore-and-aft sail *To luff* to bring the ship's head nearer the wind

LU'FFER BOARDING (Fr louvre) In Architecture boards in an aperture placed above each other at regular distances, and inclined to the horizon at an angle of forty-five degrees, so as to admit air without allowing the rain to penetrate

LUG-SAIL A four-sided sail bent to a yard, which is [illegible] about one fourth from the lower end

LU'MACHELLA Shell marble the [illegible] having a pearly lustre, it is sometimes [illegible] *marble*

LUMBAGO *See* RHEUMATISM

LUM'BAR A'BSCESS An abscess of the loins formed upon the psoas muscle it is frequently mistaken for nephritic or rheumatic disease, and, when it forms a swelling [illegible] from [illegible]

LUMBRICAL MUSCLES (Lat lumbricus *an earthworm*) Small muscles of the hand which assist in [illegible]

LUMBRICUS (Lat) A Linnæan genus of Vermes, now the type of a family (*Lumbricinæ*) which ranks as the first of the Setigerous Abranchian Anellidans in the system of Cuvier All the species of this family—the earthworms, as they are commonly called—are characterized by a long cylindrical body, divided by ruga into a great number of rings and by an edentate mouth The common earthworm (*Lumbricus terrestris* Linn) attains nearly a foot in length, and is composed of upwards of one hundred and twenty rings This species is extremely abundant they traverse the soil in every direction swallowing quantities of earth, together with portions of roots and ligneous fibres and other organized substances which they assimilate for their own nutriment Their castings constitute a rich soil

LUNA (Lat *the moon*) In Mythology the daughter of Hyperion and Terra usually confounded with Diana which see The heavenly bodies were favourite objects of worship among the ancients, and as they considered the sun to be sacred to Apollo, whom they worshipped as Sol, so they consigned the moon to the guardianship of his sister Diana [illegible] worshipped under the name of Luna

LUNAR CORNEA Fused chloride of silver, so called from its horn-like appearance, luna being the term by which the old [illegible]

LU'NACY, in Law [illegible] of an insane person who has lucid intervals, which in former times were supposed to depend on the phases of the moon, whence such persons were styled *lunatics* But, for convenience, the term is commonly used as embracing the condition of all those who are under certain legal disabilities on account of mental deficiency such as idiots, fatuous persons, &c, all, in short who are of unsound mind The chief of these disabilities are, incapacity to make contracts either personal or affecting the estate, to sue or defend in courts of justice, to perform offices and duties, to make devises or bequests By ancient legal maxim, the sovereign has the custody of lunatics This is in practice delegated to the keeper of the great seal, by virtue of the sign manual, countersigned by two secretaries of state Applications for a commission of lunacy are consequently directed to him When he determines that such a commission is proper, it issues to certain commissioners, appointed by the same authority They summon a jury to try the fact of lunacy If the party is found lunatic by its inquisition, the inquisition may still be avoided by a traverse, on which the record goes into the King's Bench, which either gives judgment or grants a new trial on it If the lunatic recover, the inquisition may be superseded On the return of the inquisition, the custody of the lunatic's person and estate devolves on the crown, and the chancellor, on petition, appoints *committees* to have the custody [illegible] These may be whoever the [illegible] fit, although next of kin are ordinarily preferred Lunatics are maintained by an allowance out of their own estate when they have none, by statute, in public asylums The custody of lunatics by private individuals is under the control of the provisions of the stat 8 & 9 Vict chaps 100

and 126, by which the powers vested in the Commissioners in Lunacy are placed on [illegible] and a commencement has been made in the management of lunatics which promises to be followed by the best results. Persons of unsound minds who are paupers, and those who have been tried for offences and found insane, and also lunatic convicts, are usually confined in county lunatic asylums, wherever these are established. As to the statistics of lunatic hospitals or asylums, see *Degerando, de la Bienfaisance Publique*, vol. iv. part 3. book 1.

The incapacity of a person of unsound mind to commit a crime depends, it is said, upon his [illegible] moral and legal. The general mode of [illegible] has been to acquit the prisoner, if satisfied that he was incapable of knowing right from wrong, or, as some eminent judges have worded it, if he was unconscious that the act was a crime against the laws of *God and nature*. On acquittal taking place on evidence of lunacy, the jury are now required, by 39 & 40 G. 3. c. 94, to find specially whether the person was insane at the time of committing the offence, and on that finding he is taken into public custody.

LU'NAR BONE. One of the bones of the wrist.

LU'NAR CAUSTIC. Fused nitrate of silver.

LU'NAR CYCLE. The period of time after which the new moons return on the same days of the year. *See* CYCLE.

LU'NAR DI'STANCE. In Navigation, the distance of the moon from the sun or from a fixed star or planet, by means of [illegible] a ship is found.

LU'NAR METHOD. In Astronomy and Navigation, the method of determining the longitude of a place or ship from the observed [illegible] *lunar distances*. This problem, which is of the very highest importance on account of its [illegible] finding the [illegible] into two parts. The first is to ascertain the distance of the moon's centre from one of the principal planets or fixed stars at a given moment, and the second, to find the Greenwich time to which, according to the tables, that distance corresponds. The general method of procedure may be explained as follows. — Six or eight observations of the star's distance from the nearest point of the moon's limb are taken with a sextant as quickly in succession as possible, and the corresponding time at each observation noted. The mean of the observed distances, at the mean time [illegible] distance corresponding to a known instant [illegible]. The true apparent time is here supposed to be given by the chronometer, the rate and error of which are determined by observations of altitude. Contemporaneously with the observations of distance, two assistants are employed in taking the altitudes, both of the moon and star, for the purpose of applying the proper correction for refraction. The remainder of the operation consists in making the requisite calculations. In the first place, the moon's semidiameter is added to the observed distance, whereby the true apparent distance is found. In the next place, the corrections are applied for refraction and parallax, and the apparent distance reduced to the centre of the earth. This part of the [illegible]. The [illegible] which the distances of the moon from some of the principal stars and planets is given for every three hours. Having found in the almanac the distances next less and greater than the true distance deduced from the observations, their difference gives the change of distance in three hours, whence, by interpolation, the Greenwich time is obtained at which the distance was exactly the same, and consequently the Greenwich time corresponding to the apparent time at the instant of the observation.

This method of finding the longitude at sea was first proposed by John Werner of Nuremberg so early as 1514, and recommended by several other astronomers who lived during the same century, but the theory of the lunar motions was then, and for a long time after, by far too imperfect to allow of its practical application. Besides, previously to the invention of Hadley's quadrant, there was no instrument by which the distances could be measured with the requisite precision. The advancement of astronomy, and the perfection of instruments of observation, have obviated [illegible] and the method of lunar distances is now [illegible] the mariners of all countries.

LU'NAR MONTH. The time in which the moon completes a revolution about the earth, and returns to the same position relatively to some celestial body, or point in space, with which her motion is compared. But the moon's period may be determined in relation to several objects, — as the sun, the equinoctial points, a fixed star, the perigee or nodes of her orbit, and accordingly there are as many different lunar months as there are assumed points of comparison, provided these points have different motions in the heavens.

1. The proper *lunar month* is the same as the *lunation* or *synodic month*, and is the time which elapses between two consecutive new or full moons, or in which the moon returns to the same position relatively to the earth and sun.

2. The *periodic month*, or *synodic month*, is the revolution with respect to the moveable equinox.

3. The *sidereal month* is the interval between two successive [illegible] with the same fixed star.

4. The [illegible] *month* is the time in which the moon returns to the same point, for example the perigee or apogee, of her moveable elliptic orbit.

5. The *nodical month* is the time in which the moon accomplishes a revolution with respect to her nodes, the line of which is also moveable.

The exact *mean* lengths of these different lunar months are as follow —

	days	h	m	sec
Synodic month - -	29	12	44	2 84
Tropical month - -	27	7	43	4 71
Sidereal month - -	27	7	43	11 54
Anomalistic month - -	27	13	18	37 40
Nodical month - -	27	5	5	35 60

These *mean* motions are not uniform, but are subject to periodic and secular variations. *See* MOON.

LU'NAR YEAR is the period of twelve synodic lunar months, and consequently contains 354 days, the lunar months in the calendar [illegible] 29 and 30 days. The exact period [illegible] 354 days, 8 hours, 48 min. 34 sec., so that the lunar year of the calendar requires to be adjusted by intercalation every third year. *See* CALENDAR.

LUNA'TION. The period of a synodic revolution of the moon, or the time from one new moon to the following, being that in which the moon passes through all her phases.

LUNI, or LU'NULA. A geometrical figure in form of a crescent bounded by two arcs of circles intersecting at its extremities. The lunula of Hippocrates, of Chios, is celebrated on account of a remarkable property discovered by that geometer, namely, that it can be exactly squared, though the quadrature of the whole circle has baffled the ingenuity of mathematicians of all ages. Let A D B be a semicircle whose centre is at C, and A E B a quadrant of another circle whose centre is at F (C F being perpendicular to the diameter A B), then the space contained between A D B and A E B is the lune of Hippocrates, and it is equal to the area of the triangle A F B. For the square of A F being equal to the squares of A C and C F, or twice the square of A C, and circles being to one another as the squares of their radii, the whole circle of which A F is the radius is equal to twice the circle of which A C is the radius, and consequently the area of the quadrant A E B F is equal to the semicircle A D B. Take away the common space A E B A, and there remains the triangle A B F, equal to the lune.

LUNE'TTE (Fr.). In Fortification, an enveloped counterguard or elevation of earth, made beyond the second ditch, opposite to the place of arms, differing from the ravelins only in situation. *Lunettes* are also works made on both sides of a ravelin. *See* FORTIFICATION.

LUNETTE. In Architecture, an aperture for the admission of light in a concave ceiling, such are the upper lights to the naves of St Peter's at Rome and of St Paul's at London.

LUNGS (Germ. lungen). The viscera by which respiration is carried on. The right lung is divided into three lobes, the left into two. They are, as it were, suspended in the chest by the *trachea* and separated by the *mediastinum*, they are also attached to the heart by the pulmonary vessels. They are nourished by the bronchial artery, which is a branch of the aorta, and the pulmonary artery carries the venous blood through them from the heart to subject it to the action of the air in their cellular structure; the blood when arterialized returns to the heart by the pulmonary veins, the four trunks of which enter the left auricle. The bronchial veins terminate in the vena azygos. The nerves of the lungs are from the eighth pair and [illegible] intercostal.

LUNISOLAR. [illegible] *moon*, and sol, *the sun*.) Combining the motions of the sun and moon. A lunisolar period is that after which the eclipses again return in the same order. (*See* CYCLE.) The Dyonysian period of 532 years, formed by multiplying together the solar and lunar cycles of 28 and 19 years, has sometimes been called the lunisolar year.

LUPERCALIA. A Pagan festival in honour of Pan [illegible], when the Luperci ran up and down the city naked, having only a girdle of goat's skin round their waist, and thongs of the same in their hands, with which they struck those they met, particularly married women who were thence supposed to be rendered prolific. The name is derived from lupus, *a wolf*, because Pan protected cattle from that animal.

The indecencies and excesses attending the processions of the Lupercals, which had degenerated from high religious rites to vulgar superstitions, provoked the indignation of Christians in the 4th and 5th centuries It is commonly, but erroneously, supposed that pope Gelasius caused them to be abolished (*Gibbon*, vol vi) Beugnot has shown the contrary (*Destr du Paganisme en Occident* book xix ch 2)

LUPER'CI The Roman priests of Pan, and most ancient religious order in the state, having been instituted, according to tradition, by Evander king of Pallantium a town that occupied the Palatine Hill before Rome was built There were three [illegible] them; viz the Fabiani, Quintiliani, and [illegible] of whom were founded in honour of Julius Cæsar For the derivation of the word see LUPERCALIA

LU'PININ The bitter substance, extracted from the leaves of the white lupin

LU'PULIN The active principle of the hop, it is more properly called *lupulite*

LU'PUS (Lat) The wolf One of the southern constellations, situated on the south of Scorpio

LUPUS In Pathology a disease which eats away the parts attacked by it with great rapidity

LUSIAD The name given to the great epic poem of Portugal, written by Camoens, and published in 1571 The subject of this poem is the establishment of the Portuguese empire in India, but whatever of chivalrous great, beautiful, or noble, could be gathered from the traditions of his country, has been interwoven into the story Among all the heroic poets says Schlegel, either of ancient or modern times, there has never, since Homer, been any one so intensely national or so loved or honoured by his countrymen as Camoens It seems as if the national energies of Portugal had centered and reposed themselves in the person of this poet whom they consider as worthy to supply the place of a whole host of poets, and as being in himself a complete literature to his country Of Camoens they say,

Vertere fas aequare nefas aequalia nil est
Est sibi par nemo, nemo secundus erit

The great defects of the *Lusiad* consist in its preposterous mythological machinery, and its clumsy management, but in all the qualities of versification and beauty of language it is perfect, and may be regarded as the "well, pure and undefiled" of the Portuguese language

Few modern poems have been so frequently translated as the *Lusiad* Mr Adamson, whose *Memoirs of the Life and Writings of Camoens* must be familiar to the reader, notices one Hebrew translation of it, five Latin, six Spanish four Italian, three French, four German, and two English Of the two English versions one is that of Sir R Fanshawe written during Cromwell's usurpa [illegible] for its fidelity to the original, [illegible] who unlike the former took great liberties with the original, but whose additions and alterations have met with great approbation from all critics—except as indeed was to be expected, from the Portuguese themselves (See the *Quarterly Review* vol xxv)

LUSTRATION (Lat lustro, *I purify*) In Roman Antiquities, a sacrifice by which the Romans purified their cities fields, armies or people defiled by any crime or impurity There were various manners of performing [illegible] re of the lustration [illegible] the Roman people he purified them as they were assembled in the Campus Martius by causing a young pig a sheep and a bull just sacrificed, to be paraded round them Before the celebration of the Ludi Seculares, which took place only once in a century, the *populace* was purified by a little sulphur bitumen, and perfume, fixed to a piece of fir called *tæda* which was lighted, and which thus circulated the smoke around them The *army* was purified by [illegible] the soldiers to defile between the two parts of a half-cut victim, while the priest offered up certain prayers The lustration of a funeral pile was effected by making the spectators march round it before the fire was kindled (See *Memoires de l'Ac des Inscriptions* vol xxxvi) *See* AMBARVALIA

LUSTRUM (Lat) In Roman Antiquities, a space of about five years at the end of which period the feast called Lustralia was celebrated, in which the censor purified the people by several sacrifices and ceremonies, among others, the *suovetaurilia*, or sacrifice of a hog, sheep, and goat It appears that rather more than five years usually elapsed between one lustralia and the next but the word lustrum is usually employed for the exact quinquennial period The derivation of the word is uncertain Lustrare, in Latin signifies to purify by a sole ceremony and many other lustral ceremonies were in use as for example the *dies lustrales*, or lustral days being the fifth or according to some writers the eighth day after the birth of a child, on which it was purified with certain solemnities, named, and placed under the protection of the gods of the family, the *lustration* of sheep in A[illegible] [illegible] pst May, &c, of which so many are contin[illegible] [illegible] Roman Catholic worship of modern times Sea-water was the most ordinary article used in lustrations. Varro derives the word lustrum from luere, *to pay*, because, according to the custom ordained by Servius Tullius, who first instituted the census (561 B C) the tribute imposed by the censors was paid at the beginning of every fifth year the last of the lustrum (See an Essay in the *Mémoires de l'Ac des Inscr* vol xxxix , and *Niebuhr's History*)

LU'SUS NATURÆ (Lat *a sport of nature*) A term applied to any thing unnatural in the physical world

LUTE (It liuto) A musical stringed instrument of the guitar species and played in a similar way, but in form more resembling the section of a pear, with a back in ribs like those of a melon

LUTES in Chemistry, applications by which the junctions of vessels are rendered tight A glass retort is said to be *luted* when smeared over with clay [illegible] fectly to resist the effects of heat and to [illegible] sion Common lute is a mixture of pipe-clay linseed meal, and water, and is spread upon paper and applied to the joinings of stills and of retorts and receivers *Fat lute* is a mixture of pipe-clay and linseed oil

LU'THERANS or FOLLOWERS OF LUTHER The denomination of Christians who [illegible] this system had its origin in the preaching of Luther In some respects approaches nearer to Romanism than that of any other of the reformed churches The notions of Luther upon the nature of the Eucharist are known under the name of consubstantiation, or the coexistence of the body and bread, the blood and the wine, at the same time It encourages also the private confession of sins makes use of wafers in the administration of the Lord's Supper, and allows of images in churches It insists however, very strongly upon Luther's cardinal doctrine the justification of man by faith and not by any merit in human actions With respect to the divine decrees it holds that God foreknows the dispositions of men whether they will be good or bad, and predetermines their salvation or rejection accordingly, differing therein from the tenet of the Calvinists, which represents the Supreme Being as making his decrees by his own mere will The dogmas of the Lutheran church are carefully set forth in various symbolic books the *Confession of Augsburg*, the *Articles of Smalcald*, the Shorter and Larger Catechisms of Luther, and the *Form of Concord* The principle however, of this church, which considers Christians as accountable to God alone for their religious opinions allows its teachers at the present day, an unbounded liberty of dissenting from these decisions The Lutheran church predominates in the north of Germany in Prussia, Norway Denmark and Sweden there are congregations also of the same denomination in England Holland, Russia and America In the Prussian dominions it has been remodelled under the late king, and is called the Evangelical Church *See* CHRISTIANITY

LUTHERN (Fr) In Architecture, the same as *dormer* which see

LUTRA (Lat *an otter*) A genus dismembered by Storr from the Linnæan *Mustela*, and now raised to the rank of a family (*Lutridæ*)

LUXA'TION (Lat luxare, *to put out of joint*) A dislocation of a bone

LYCAN'THROPY (Gr λυκος, *a wolf*, and ἀνθρωπος, *a man*) Herodotus relates that the Neurians, a Scythian tribe, were supposed to be changed, for a certain number of days every year, into wolves, and then to resume their former shape, and a similar superstition is noticed by Virgil in his *Eclogues*, by Pliny, Pausanias, and other writers The same superstition, of the power possessed by men of converting themselves into wolves, remained in more modern times, but that which the classical ancients had believed to be effected by the power of herbs or by innate powers, was by Christians considered as a species of sorcery These human wolves were called loup garoux by the French, were-wolves by the Anglo-Saxons, wehrwölfe by the Germans words of the same derivation and bespeaking [illegible] in those countries was of Teutonic [illegible] Lycanthropes were believed to be extremely ferocious, and to devour not only beasts, but human beings, but if they were pursued and wounded, the spell was frequently dissolved, and the sorcerers were found mutilated in those limbs in which they had received the wound in their wolfish shape From the prevalence of these superstitions in the minds of an ignorant peasantry originated the hideous species of madness termed *lycanthropy* in which the patient believed himself to be a wolf, and frequently imitated the actions and howl of that animal In France, in the 16th century, numbers of these unfortunate beings were executed like witches, on their own confession, and in the avowals which they made, of having killed and devoured mankind, they were probably not always under a delusion Some of these men also declared that they were actually wolves, but that in them the hair grew inside or between the skin and the flesh Oribasius, who lived in the fifth century of our era, mentions lycanthropy by its true cha-

racter as a species of madness, and describes the symptoms and the cure This species of insanity seems to have gradually died away along with the superstition which gave it birth (See a curious article in the *Encyclopædia Metropolitana*)

LYCEUM An academy at Athens was so termed, from its situation near the temple of Apollo Lyceus It was frequented, according to tradition, by Aristotle Preparatory schools for the universities, in which the Aristotelian philosophy was formerly taught, hence received the name of Lyceum

LYCHNITES An ancient name of marble, from λυχνος, a lamp, and ειδος, like, by lamp-light

LYCOPODIACEÆ (Lycopodium, one of the genera) A natural order of Acrogens, inhabiting all parts of the world, but abounding chiefly in hot humid situations They are intermediate, as it were, between ferns and coniferæ on the one hand, and ferns and mosses upon the other *Lycopodium rubrum* is a violent cathartic, *clavatum* and *selago* excite vomiting, and the powder contained in the seed-vessels of all the species is so highly inflammable as to be employed occasionally in the manufacture of fireworks They are propagated by spores formed in two-valved cases axillary to the upper leaves

LYCOPODIUM A fine yellow dust or powder, being the seed of the *Lycopodium clavatum* or club moss when thrown into the flame of a candle or of spirit of wine, it burns with a bright flash It is much sought after for producing theatrical lightning and is an excellent substance to sprinkle upon pills to prevent [illegible]

LYCOSA (Gr λυκος, *a wolf*) A genus of spiders in which the eyes form a quadrilateral group as long as or longer than it is wide the two posterior eyes not placed on an elevation The first pair of legs is evidently longer than the second but shorter than the fourth which is the shortest of all The internal extremity of the jaws is obliquely truncated Almost all the *Lycosæ* keep on the ground where they run with great swiftness They inhabit holes in the ground which they line with silk and enlarge in proportion to their growth Some establish their domicile in chinks and cavities in walls where they form a silken tube covered externally with particles of earth or sand In these retreats they change their tegument, and, as it appears, after closing the opening pass the winter in a state of torpidity The females, when they go abroad carry with them their eggs enveloped in a cocoon attached to the abdomen by threads On issuing from the egg the young ones cling to the body of the mother, and remain there until they are able to provide for themselves The *Lycosæ* are extremely voracious, and courageously defend their dwelling The famous Tarantula spider is a species of this genus

LYDIAN STONE A silicious slate, used by the ancients as a touchstone from Lydia

LYING PANELS In Architecture those in which the fibres of the wood lie in an horizontal direction

LYING-TO A nautical term denoting the state of a ship when the sails are so disposed as to counteract each other, and thereby retard or destroy the progressive motion of the vessel The fore and main staysails and mizen trysail serve very well for this purpose as they cause but little way and have sufficient power to keep the ship heeled over, and therefore steady, with her decks turned from the sea When the sea runs very high the lower sails are liable to be becalmed by the waves and therefore to suffer the ship to roll to windward, the maintopsail is then used

LYMPH (Lat lympha *water*) The liquid contained in the lymphatics

LYMPHATICS Absorbent vessels which carry lymph from all parts of the body, and terminate in the thoracic duct

LYNCH LAW The irregular and revengeful species of justice administered by the populace in some parts of the United States, is said to have been so called from a Virginian farmer of the name of Lynch, who took the law into his hands on some occasion, by chasing a thief, tying him to a tree, and flogging him with his own hands Some observers have thought that this barbarous system was, to a certain extent, palliated by the difficulty of e[illegible] which Captain Maryat (*Diary in [illegible]* with what justice we know not, to the inadequate pay of the judicial establishment in the newly settled districts, and the bad character of many of the judges raised to the bench by electioneering politics He instances the case of a single town in Georgia with 3000 inhabitants, in which there were in one year fifty-nine assassinations, as a proof of the occasional utility of some irregular acts of justice on the desperadoes of such a population But it must surely contribute to brutalize and occasion crime, far more than to repress it One of the most signal and violent acts of popular resentment, under the show of summary justice, was the mock trial and execution of a number of professed gamblers, at Vicksburg, on the Mississippi, four years ago Miss Martineau's work on America contains some fearful pictures of the persecution carried on, under the same pretences, against missionaries or supposed missionaries of the anti-slavery party, in the southern states Indeed, she received a hint that she ran herself some danger of being "Lynched," if she visited them, which however, did not affect her resolution Lynch law may be called a democratic imitation of the old feudal Vehmgerichte or self constituted tribunals in Westphalia and elsewhere which assumed the right of controlling the violent actions of the nobles, and have been the subject of so much romantic fiction

LYNX A constellation of the northern hemisphere, formed by Hevelius

LYNX A name given to the different species of a group of the *Cats* (*Felidæ*), distinguished by short tails, [illegible] ears The lynxes have been long [illegible] sight,—a quality which in all probability they derived together with their name, from Lynceus one of the Argonauts to whom on their perilous expedition, his quick sight was of essential service in enabling them to steer clear of rocks and sand-banks The lynx was consecrated to Bacchus

LYRA (Lat) The Harp one of the forty-eight constellations of Ptolemy It is situated in the northern hemisphere

LYRA A portion of the brain, the medullary fibres of which are so arranged as to give it somewhat of the appearance of a lyre

LYRE A musical instrument of the greatest antiquity among the Egyptians and Greeks Tradition attributes its invention to the accident of finding on the banks of the Nile a tortoise, whose flesh was entirely decomposed but whose tendons [illegible] dried and stretched by the sun's rays and [illegible] struck, of yielding musical sounds Hermes the finder of this tortoise, having made an instrument in imitation of it is supposed thus to have been the inventor of the lyre The Greeks attribute the invention to their Hermes (Mercury) the son of Jupiter and Maia It is generally considered that the original Egyptian lyre was only of three strings and that the Greek Mercury improved upon the invention, that the Muses clubbed together to add one string Orpheus Linus and Thamyris adding one each, thus forming it altogether into an heptachord, or seven-stringed lyre At a later period the lyre consisted of eleven strings, which were made of the sinews of animals, its body was hollow to increase the volume of tone, and it was played with the *plectrum* or lyre stick of ivory or polished wood, and sometimes with the fingers like the harp It went by the different names of lyra phorminx, chalys, barbitos, barbiton, cithara

LYRE BIRD or LYRE PHEASANT *See* MENURA

LYRIC *See* ODE

LYTHRACEÆ (Lythrum one of the genera) A natural order of Polypetalous Exogenous plants, with long tubular striated calyxes, at the [illegible] of which are inserted the petals while the stamens grow nearly at the base They are little known in cultivation, but some of [illegible] *Lagerstræmia Indica* [illegible] The rosewood of the cabinetmaker is the trunk of *Physocalymna floribunda* and the henna employed in the toilet of oriental ladies, is obtained from *Lawsonia inermis*

M.

M The labial letter of the liquid series It is susceptible of various interchanges, more especially in the Greek and Latin languages (See *Penny Cyclo*) In writing two Ms successively the Germans frequently drop one, and replace it by a stroke over that which they retain, thus m As an abbreviation M stands for Marcus, Manlius, Martius and Murcus M A for Master Artium, MS for Manuscript and MSS for Manuscripts M, or, more properly a symbol somewhat resembling it, was used by the Romans to denote 1000, and the moderns have also adopted that letter

MAB The name given by the English poets of the 15th and succeeding centuries to the imaginary queen of the fairies The passage in *Romeo and Juliet*, in which her qualities and attributes are so beautifully set forth, is familiar to all

MAC A Scotch term, signifying son, prefixed to many surnames, as *Mac* Donald, &c It is synonymous with *Fitz* in England and *O* in Ireland

MACACUS A genus of Catarrhine or Old World monkeys characterized by having a fifth tubercle on their last molars ischial callosities and cheek pouches; comparatively short and thick limbs a projecting muzzle and prominent superciliary arches They have generally a

pendant tail, but in some it is short, as in the pig tailed baboon (*Macacus rhesus*) When they cry out, they inflate a membranous sac, which communicates with the [illegible]

MACARONIC VERSE Verse in which the words of a modern language are ludicrously distorted into Greek or Latin inflections and metre Theophilo Folengo, who wrote under the name of Merlinus Coccaius, in Italy, in the 16th century, and calls himself the inventor of this sort of burlesque composition, informs us that its name is derived from the Italian macaroni eatables composed of flour, cheese, and butter, and that it expresses the gross and rustic characters appropriate to its words and sentiments *Drummond's Polemo Middinia*, a Scottish burlesque, is perhaps the best known macaronic form of our language

MACCABEES, BOOKS OF THE The two last books in the arrangement of the Apocryphal writings enumerated by our church The first is a Greek translation (as is supposed) from a Chaldaic original The second appears to be a compilation from various sources The two books are not connected the former comprehends the events of Jewish history for nearly 40 years B C 176 to 139, the second begins about B C 187 and extends over about 16 years Neither has ever been reckoned by the Jews in their catalogue of sacred writings, but they are received into the canon of Scripture by the church of Rome, with the title of *3d and 4th Chronicles* There are two other books, commonly called *3d and 4th Maccabees*, which were never received by any church

MACE A word of doubtful etymology signifying sometimes a club of metal and sometimes a military weapon appropriated to [illegible] About the period of Edward II maces were used in England both in battles and tournaments, and they remained so till the time of Elizabeth, when they were displaced by the pistol Maces are still used by the Turkish cavalry The mace is an ensign of authority, is often borne before magistrates By the old English writers it is used synonymously with sceptre

Mace, the external envelop of the seed of the nutmeg, is a particular form of what botanists call *arillus* It is aromatic but less so than the nutmeg and is chiefly used in cookery or in pickles, and not, like the latter in confectionary

MACEDONIANS In Ecclesiastical History a sect which derives its name from a bishop of Constantinople who, in the 4th century denied the distinct existence and Godhead of the Holy Spirit which he conceived to be merely "a divine energy diffused throughout the universe," "while the Father and Son together constitute the one existing Deity These opinions were condemned at the second general council held at Constantinople in 381 *See* PNEUMATOMACHI

MACERATION The steeping of substances in any cold liquor

MACHAIRODUS (Gr μαχαιρα *a sabre*, and οδους, *a tooth*) An extinct mammal allied to the bear

MACHE'TES (Gr μαχητης *a combatant*) The generic name under which Cuvier has distinguished the ruffs and reeves from the sandpipers godwits and other allied Grallæ The ruffs have the bill and carriage of the genus *Totanus*, but the membrane between their external toes is nearly as extensive as in *Limosa* Our native species (*Machetes pugnax* Cuv) is somewhat smaller than a snipe and celebrated for the furious combats that take place among the males in their nuptial season At this period the head is partly covered with red papillæ, the neck is surrounded with a thick collar of feathers, which often varies in different individuals

MACHIAVELISM A name given to the system of governing which is propounded in the general writings of Machiavelli and particularly in his treatise called *The Prince* The term is still used in a disparaging sense notwithstanding the different construction which has of late been given to the motives and purposes for which Machiavelli wrote his work

MACHICOLATED (Fr machicoulis) In Gothic and castellated Architecture a building whose parapets project beyond the faces of the walls, and are supported by [illegible] large corbels or consoles

MACHINE (Gr μαχανη), in a general sense signifies any thing which serves to increase or regulate the effect of a given force Machines are either *simple* or *compound* The simple machines, otherwise called the *simple mechanical powers* are usually reckoned six in number, namely, the *lever*, the *wheel and axle* the *pulley*, the *wedge*, the *screw*, and the *funicular machine* See the respective terms

Compound machines are formed by combining two or more simple machines They are classed under different denominations, according to forces by which they are put in motion, as *hydraulic* machines, *pneumatic* machines, *electrical* machines &c, or the purposes they are intended to serve, as *military* machines, *architectural* machines &c

Although there are no limits to the combinations and adaptations of machinery [illegible] ciples which may be appli[illegible] any machine whatever When a machine attains its state of uniform motion, the momentum of the power is equal to that of the resistance and is the same that would be *in equilibrio* with the resistance if there were no motion at all From this principle and from the consideration that in all machines the work done is to be estimated not merely from the quantity of resistance which is overcome, but from the quantity overcome in a given time, we can ascertain the relation that ought to subsist between the velocity and the load or resistance in order that the effect of the machine may be a maximum This maximum effect is produced when the two following conditions are fulfilled 1 When the load, or resistance, is about four ninths of that which the power when fully exerted, is just able to balance, or that which would keep the machine at rest altogether, and, 2 when the velocity of that part of the machine to which the power is applied is one third of the [illegible] These conditions are ded[illegible] expression which is adopted by Euler and other writers to represent the law of the moving power Let P = the power applied (or weight which the power when fully exerted is just able to overcome), R = the resistance or load or weight to be overcome, c the greatest velocity or that at which the power ceases to act, v = any other velocity then the law of the moving power is

$$R = P\left(1 - \frac{v}{c}\right)^2$$

The variables in this expression are R and v and the effect is represented by the product Rv, on making which a maximum the rules of the differential calculus give $v = \frac{1}{3}c$, whence the formula becomes $R = \frac{4}{9}P$

From these expressions it follows, that when the moving power and the resistance are both given if a machine be so constructed that the velocity of the part to which the power is applied is to the velocity of the part to which the resistance is applied in the ratio of 9 R to 4 P the effect of the machine will be a maximum or it will work to the greatest possible advantage The above conditions apply equally to machines impelled by animal force and the agents of [illegible] steam the force of gravity &c [illegible] to the greatest advantage or performs the greatest quantity of work in the least time when it moves with about one third of the utmost speed with which it is capable of moving and is loaded with four ninths of the greatest load which it is capable of putting in motion It has been supposed in the above remarks that the friction of the parts of the machine is included in the resistance (See Coriolis *Du Calcul des Machines*, Navier *Leçons sur l'Application de la Mecanique* Belidor *Architecture Hydraulique*, Gregory's *Mechanics*, Moseley's *Mechanics applied to the Arts* &c)

MACHINERY A general term by which the works of the complex machines are designated

MACIGNO (Ital) A hard siliceous sandstone

MACLE A mineral, called also *chiastolite* It forms prismatic crystals white externally and grey within which are found embedded in clay slate Its principal component parts are silica and alumina, with a little oxide of iron

MACLURITE A mineral named after Dr Maclure from New York and New Jersey It occurs in roundish embedded masses imperfectly crystalline It is a silicate of magnesia, with traces of potash, oxide of iron, and fluorine

MACMILLANITES A religious sect in Scotland the successors and representatives of the Covenanters in the 17th century and more recently denominated the Reformed Presbytery On the first settlement of presbytery as the established church of Scotland at the Revolution in 1688 a small body of the people the remnant of the Covenanters condemned the principles on which that act was founded as Erastian They insisted not only that the church though endowed by the state, should be entirely independent of civil authority, and uncontrollable and supreme in itself but that the revolution government should not be recognized inasmuch as it was not founded on the Solemn League and Covenant, and did not restore presbytery as it had obtained [illegible] Second Reformation," or be[illegible] [illegible] Church[illegible] This [illegible] to a very small [illegible] [illegible] Relief[illegible] [illegible] [illegible] [

state of matters throughout the body at large and to cultivate a better understanding with each other

Thus they continued without any formal separation for several years, and as they were at all times regarded as a fanatical and illiberal sect, enemies equally to the ecclesiastical and civil authorities Meanwhile, Mr John M'Millan, who had been ordained parochial minister of Balmaghie, in the stewartry of Kirkcudbright, in 1701 adopted and publicly avowed their principles, and was, in consequence, deposed in 1704 from the office of the ministry He did not, however, renounce his ministerial character, but continued to officiate both among his former people who almost to a man adhered to him, and others who favoured his views In 1706, having received a unanimous call from the scattered societies to be their minister, he accepted the invitation, and in a short time he was joined by Mr John M'Neil, a licentiate of the established church, who, like himself, had been deprived of all connection with that church The high veneration which Mr M'Millan and Mr M'Neil entertained for presby[illegible] prevented any attempt being made [illegible] for the latter in an irregular way Neither would they compromise their principles to gain the co-operation of other ministers who, like themselves, but for somewhat different opinions, had been expelled from the establishment They renewed the Covenant in 1712 and never ceased to bear public testimony against what they regarded the defections and corruptions of the church of Scotland

On the death of Mr M'Neil which took place not long afterwards, Mr M'Millan was joined by the Rev Thomas Nairn who had been driven from the church and had for some time been connected with the Secession The prospects of the *M'Millanites* as this sect had long been called in honour of their eminent leader now began to brighten The [illegible] and some lay elders (formerly ord[illegible] presbytery, in 1743 at Braehead near Carnwath Lanarkshire and gave their body the name of the Reformed Presbytery, — a designation which has superseded in a great measure, that of M'Millanites They are also called Mountain or Hill people, because having at first no chapels they conducted public worship, in imitation of their persecuted ancestors in the reigns of Charles II and his brother, in the open air generally on the side of a hill

From the time they were constituted into a presbytery their number has gradually but slowly increased In 1809 they had sixteen congregations, but their highest ecclesiastical court was a presbytery They now form a synod, consisting of six presbyteries the number of congregations [illegible] five In the days of persecution, [illegible] of the [illegible] took refuge in the north of Ireland, and the M'Millanites there form four presbyteries [illegible] The sect prevails [illegible] extent of eight or ten congregations Some of their congregations in Scotland are very small, and none of them are large They have a professor of divinity belonging to their own body In doctrine they profess the highest Calvinism and may be characterized as the strictest sect of Presbyterians They still hold substantially the same sentiments as the alleged Erastianism of the established church or what they regard as her unscriptural subjection to the civil power Some of their extreme opinions however on the subjects of the covenant and presbytery have of late been somewhat modified They generally, if not universally, use public prayers for the sovereign and for civil magistrates, an act which they from conscience avoided for about a century after their organization under Mr M'Millan Wherever their numbers are sufficiently large, they have built chapels, and public worship in any circumstances rarely takes place out of doors They have not thought it expedient to renew the Covenant since 1715 In short they have become a comparatively liberal and enlightened sect of Christians, and are eminently characterized by piety and moral strictness (See *Adam's Religious World Displayed*, vol iii 157—169, *The Testimony of the Reformed Presbyterian Church*, Paisley, 1837, *Historical Part of the Testimony*, Glasgow, 1830, *A short Acc of the Old Presbyterian Dissenters* Glasgow 1824, *Acts of Gen Assembly apud Ann* 1704 1708, 1715 also the articles CAMERONIANS and COVENANTERS in this work)

MACRODACTYLI (Gr *μακρος, long*, *δακτυλος finger*) A tribe of wading birds comprehending those in which the toes are remarkable for their extreme length as the jacanas

MACROPUS (Gr *μακρος long*, *πους, foot*) The generic name of the kangaroo, also applied to a genus of beetles

MACROURANS, *Macroura* (Gr *μακρος, long*, and *ουρα, a tail*) A section of Decapod Crustaceans including all those which have the tail, or post abdomen, as long or longer than the body

MACULÆ (Lat *spots*) Dark spots on the surfaces of the sun and moon, and on some of the planets The solar spots are very variable as to their number and continuance They were first observed by Galileo in Italy and Harriot in England soon after the invention of the telescope and unknown to each other The spots on the moon are permanent, and are caused by the shadows of its mountains, and the unequally reflecting materials of which parts of it are composed The planets have some permanent maculæ, as the belts of Jupiter and some variable especially Mars and Venus, and frequently also Jupiter These maculæ have led to many fanciful conjectures respecting the constitution and atmospheres of the bodies of *See* SUN, MOON

MADDER (Fr *garance*) The prepared root of the *Rubia tinctorum* It is extensively used as a red dye stuff, its infusion is of a dirty red colour, but it is rendered bright and permanent by an aluminous mordant Its colouring principle has been termed *alizarine*

MADIA (Gr *μαδος, bald*) A genus of Composite plants, inhabiting South America and California, and important because of the utility of the fruit as a source of vegetable oil From some German reports it appears that it is the most productive of all oil plants

MADONNA (Engl *my lady*) An Italian term applied to the Virgin Mary Hence pictures of the Italian school representing the Virgin are generally designated as Madonnas

MADREPORA (A hybrid compound of the French madre, *spotted*, and the Latin porus *a pore*) The word appears to have been first used by Imperati to designate a genus of Lithophytes in which the calcareous axis has its whole surface beset with small lamellate and stellate depressions

The genus was adopted by Linnæus, who placed it among his *Vermes Zoophyta* and characterized it as follows — *animal* resembling a medusa, *coral* with lamellate star-shaped cavities It is scarcely necessary to observe that the animal, especially in the larger madrepores, as the *Fungia* most closely resembles the *Actinia* in its general organization Cuvier places the madrepores in the tribe *Lithophyta*, of the family of *Polypiers nuds* The Lithophytes having the common character of the Linnæan genus are now subdivided into the genera *Fungia* Lam, *Turbinolia*, Lam, *Cyclolythus*, Lam, *Caryophyllæa*, Lam, *Oculina* Lam, *Faviopora*, Lam, *Serialopora* Lam, *Astræa Explanaria*, *Pontes*, *Meandrina*, Cuv, *Porcma* Cuv, *Hydrophora*, Fischer, *Agaricina*, Cuv, *Sarcinula*, Lam, *Stylina*, Cuv, and *Madrepora* proper

MADREPORITE A species of columnar carbonate of lime found in Norway and Greenland

MADRIER In Military Engineering, a thick plank covered with plates of iron and having a cavity sufficient to receive the mouth of a petard with which it is applied against a gate or any other obstacle intended to be broken down Also the flat beams laid in the bottom of a moat or ditch to support the wall There are also madriers lined with tin and covered with earth to form roofs over certain portions of military works, in order to afford protection against fires in ledgments, &c

MADRIGAL One of the lesser kind of poems, usually consisting of fewer verses than the sonnet or roundelay, In its composition the fancy and convenience of the poet are not subjected to very strict rules rhymes and verses of different species being often intermixed The subjects are mostly of a tender and gallant nature the character often quaint the expressions marked with great simplicity Sometimes however, a loftier and sublimer train of thought finds its way into these compositions, especially among those of the English school, as in the following celebrated specimen, set to music, and perhaps written, by Orlando Gibbons, in 1612 —

> Oh! that the learned poets of this time,
> Which can so lovesick lines so well contrive,
> Would not consume good wits in hateful rhyme,
> But with deep care some better subject find
> [illegible]

Of a lighter and more regular sort, the following may serve for a specimen —

> When Thoralis delights to walk,
> The fairies do attend her
> They sweetly sing, and sweetly talk,
> And sweetly recommend her
> The satyrs leap and dance around,
> And make their conges to the ground
> [illegible]

Grassineau in his *Musical Dictionary* describes the madrigal as "a little piece of poetry, the verses whereof were free and easy usually unequal it borders on a sonnet and an epigram, but has not the briskness of the one, nor the pungency of the other"

It is extraordinary that the etymology of this word, though introduced but little more than three centuries ago, is now altogether lost We subjoin the conjectures that have been raised upon it Bengilo (*Arte Poetica*) says that it is corrupted from the word mandrial, *a sheepfold* Cardinal Bembo seems to think with the last-named

author, and defines it as a pastoral love-song, adding, moreover that it is of Provençal origin Huet brings it from *Martegaux* the name of a people of Provence "Ces martegalles et madrigaux," he observes, ont pris leur noms des Martegaux, peuple Montagnards de Provence de mesme que les Gavots, peuple Montagnards du pays de Gass, ont donné le nom à celle que nous appellons gavotte" (*Traite des Romans*, p 124) Covarruvias (*Trésor de la Langue Castellan*) derives it from *mandra* So that there is much testimony in favour of its pastoral origin But the most curious, perhaps of all the etymologies is that of Ferrari in his *Origine de la Langue Italienne*, who derives the word from the Spanish verb madrugar, *to rise in the morning*, which Menage in his *Dict Ety* says is naught This last-named author throws out a suggestion that it may have had its origin [illegible] Vallee de Vire [illegible] 464) Others supposing that the earliest specimens of this sort of poetry were addressed to the Virgin *Calla madre* have thence derived madrialle and madrigale and go on to say that having afterwards been applied to poems of love and gallantry, the original meaning was lost The words of a very large proportion of the madrigals of the sixteenth century, a period when they were most in favour, are certainly opposed to [illegible] the mother of [illegible] rather than to the Virgin Many of the composers called their pieces *madrigali spirituali* We regret that we cannot [illegible] with any certainty upon this subject in which we must leave him to a choice among the etymologies here set down or to find one of his own that he may think more germane to the matter

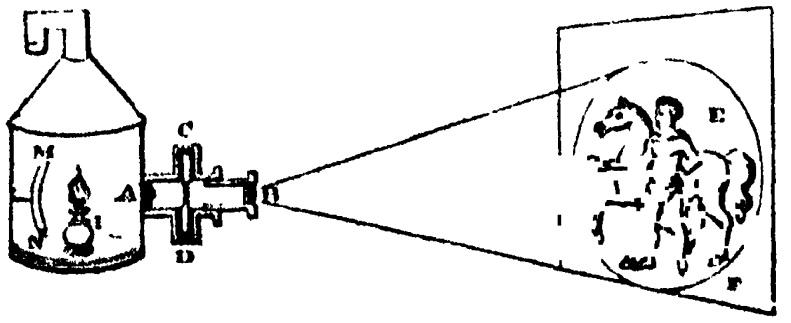
We will now endeavour to define this word in a musical sense, and we do not think we can better accomplish that object than in the quaint language of old Charles Butler (*Principles of Music* London 1636) He says The madrigal is a chromatic mode in discant whose notes do often exceed the number of the syllables of the ditty sometimes in duple sometimes in triple proportion with quick and sweet reports and repeats and all pleasing varieties of art, in four five or six parts having in one or more of them one or more rests, especially in the beginning to bring in the points begun in another part Choron calls it a species of composition resembling the fugue, but the style of which being less dry, is susceptible of every kind of expression The simple madrigal is for voices only the accompanied madrigal as its name imports is with an accompaniment of one or more instruments, mostly the organ Jo Arcadelt a Flemish composer, has, but without foundation been attributed the honour of composing the first madrigals They however exist by more ancient composers even by those of the Flemish school and to our readers who are at all conversant with the subject the name of Adrian Willaert will doubtless occur as one of the composers alluded to The fact is, that simple madrigals appeared about the beginning of the 16th century during which and the whole of that following the style was particularly cultivated and encouraged and may be considered to have now passed away unless we are allowed to consider the English glee an offset from it The first madrigals were a style of music very much resembling that of the church, but they afterwards assumed a character peculiar to themselves which is strikingly exemplified in those of Luca Marenzio (soon after the time that Palestrina flourished) and after him in the works of Gesualdo, the Prince of Venosa, Monteverde, and Mazocchi It is in their madrigals that the restraints which laboured counterpoint imposed were abandoned to make way for imitations, canons and fugues The style was indeed that of the age, but the subjects were free, and the tender and impassioned poetry adopted was well expressed in the inflections of the harmonies employed The original character gradually became more free, and was carried to its utmost limit in the compositions of the celebrated Alessandro Scarlatti In England during the reign of Elizabeth the composition of the madrigal attained [illegible] degree of excellence, perhaps the highest Our composers were in no respect interior to those of Italy and the Netherlands It is hardly necessary to observe that among them are to be found the names of Orlando Gibbons Dowland, Wilbye, Ward, Bennett and Morley

MAESTO'SO (Ital) In Music, a direction to the performer that the music to which the word is prefixed is to be performed slowly and with grandeur

MAGAZINE (Fr magazin) A receptacle for military stores, but especially for gunpowder, in a fortress

MAGAZINE An apartment below, in the after part of the ship, in which the powder is kept As lights are not allowed to be burnt here, the light is received from another apartment, called the light-room

MAGAZINE In Literature, the general designation for the periodical literature of a country, exclusive of the newspaper and review The peculiar province of the two latter seems to be to communicate information—the one on politics and passing events the other on literary and scientific subjects, while that of the magazine is of a more miscellaneous character, embracing all the features of the newspaper and review, but at the same time containing, in the form of tales, sketches, and poetry, &c, a great variety of what may be peculiarly termed *original* matter, the introduction of which would be foreign to the purposes of the others The earliest publication of this kind in England was the *Gentleman's Magazine*, which still exists It appeared in 1731, and the success which so deservedly followed its establishment immediately called into the field a host of competitors, which have so increased in number and variety as to form an era in literary history See PERIODICALS, REVIEW



MAGELLA'NIC CLOUDS Three nebulæ in the southern hemisphere, first recorded by the navigator Magellan, and named after him, two of them about 12° or 13° from the south pole, and the third more distant Whether they be resolvable into stars by means of the larger telescopes, has not been yet ascertained, but, from their distinctness as nebula they probably are

MAGIANS The caste of priests (hereditary) among the Persians and Medians are so termed by ancient Greek historians The name [illegible] cutists from *mog* or [illegible] Zend language Zoroaster is designated as the great reformer of the order, but the history and the very existence of that celebrated character are enveloped in complete obscurity He is generally supposed to have lived at no long period before the age of Cyrus The most remarkable feature of his doctrine consisted in the two principles of Good and Evil (Oromasdes and Arimanes) who were held to divide the dominion of the world in alternate periods during its whole predestined duration of 12000 years The books termed the *Zendavesta*, brought to Europe in the last century by Anquetil du Perron, are supposed by some to contain the essential doctrines of this religion but their authenticity has been the subject of much discussion The fire-worshippers of Persia and India still hold them in reverence (See ZENDAVESTA, CUBRIS) Our amplest resources for the study of the religion and character of the ancient magi are to be found in the learned researches of Anquetil (See especially *Memoires de l'Acad des Inscriptions* vol xxxix)

MAGIC (Ital *arte magica*, *the art of the Magi* because those Persian philosophers were ranked by the Romans among the highest professors of supernatural powers through intercourse with the genii or intelligences with which their universe was peopled) Common is the superstitious belief in the possession of such powers has been among all nations hitherto discovered on the globe the Romans were perhaps the most superstitious in this and other respects of all people No American tribe has a more implicit faith in its rude "medicines or mysteries than this great and civilised people had in its auguries and divinations, and it is a remarkable feature in their character that while their religion prescribed these rites the popular imagination was always searching after fresh excitement from others which were not only unauthorized but condemned by their laws—the practices of the Thessalian witches the magi the sorcerers of Egypt and Phrygia and the numberless other foreign nations with which their dominion brought them in contact [illegible] he emperors were continually renewing [illegible] edicts, and it seems to have been mainly from this circumstance that the idea of magic, as a black and forbidden art, became rooted in the minds of the people of modern Europe For the northern conquerors held such supernatural power in high respect, and in the East the favourite land of sorcery and magic, the professors have from time immemorial been regarded rather as venerable than as hateful As to ancient magic, see *Mém de l'Acad des Inscr* vol xxxix Hence, if any systematic account can be attempted of matters which have their foundation in the strange caprices of popular credulity it may be thought that in the superstition of the middle ages *white* magic or *celestial* magic according to Cornelius Agrippa's division, originated in the North or East, *superstitious* or *diabolical* magic from Roman notions engrafted on Christianity, while *natural* magic arose merely from the disposition among the scientific of those days to take advantage of the vulgar propensity to attribute every thing [illegible] auses It is to be observed [illegible] other [illegible] garded [illegible] with [illegible] was peopled by their imagination with enchanted castles and spectral illusions (see *Scott's Dæmonology and Witchcraft*, letter v), and Froissart gives a most picturesque account of the spells which were resorted to by Mahometan warriors in their conflicts with the soldiers of the cross In the romances founded on these historical encounters there are usually a good magician or witch (not the degraded witch of vulgar superstition, but the French fee Italian fata) enlisted in the Christian party, evil necromancers in that of the infidels Thus,

in *Ariosto*, Malagigi and Melissa aid the one side, and Atlas the other The notion of *white witches*, or beneficent wizards, was assiduously kept up by those impostors who wished to profit by the public credulity, and yet avoid the penalties awarded by the church, and in the church itself there was a contest continually maintained, whether magic, practised through laborious research and study of the celestial influences or intermediate spirits, was lawful But the public opinion always inclined the other way, and the magicians of highest pretensions were always in danger of being classed with the hated necromancers who derived their power from compact with the devil Among the earliest fables respecting the higher order of European magicians is that of Virgil, the Latin poet turned into a wizard by popular belief, which dates as high as the 11th or 12th century Robert of Lincoln (Grosseteste) Michael Scot Albertus Magnus, and the famous Roger Bacon all lived in the 13th Of these the first was a church reformer, who seems to have lain under the imputation of magic merely on account of the displeasure with which he was regarded by the orthodox Michael Scot is almost wholly a traditional personage, that is, his real history is scarcely known the European reputation which he had achieved as a wizard is proved by the high mention of him in the *Inferno* of Dante, who condemns all magicians indiscriminately to eternal punishment It is difficult to say that Roger Bacon ever gave any cause by pretensions of his own like so many other eminent natural philosophers of early time, to those charges of magic to which his high genius subjected him Perhaps Sir F Palgrave, in his amusing fiction (*The Merchant and Friar*) is not far wrong in representing him as partly dazzled by an inability to comprehend the real extent of those extraordinary discoveries which were opening upon him, and partly owing his magical reputation to the impostures practised by his servants in his name Albertus Magnus a Dominican and a celebrated magician in his time has more justly open to the charge of quackery It seems to have been after this time, about the 14th century that magic rose for a season into high repute as a lawful art and sovereigns had professed magicians and astrologers attached to them The extraordinary tales related of some of these point evidently to results effected by means of legerdemain the feats of Zito sorcerer to Wenceslas, king of Bohemia (Godwin *Lives of the Necromancers*, p 273) are exactly a counterpart of what Tavernier saw at the court of the Great Mogul The heads of magicians maintained their pretensions with diminished after the revival of letters Yet the three most famous of all belong to the commencement of that era Doctor Faustus (if that personage be [illegible] Cornelius Agrippa and Paracelsus It will be evident to any one who reads their history that the belief in *celestial* magic was with difficulty maintained in their days while that in *necromancy* and *witchcraft* was becoming more prevalent than ever There is a good deal of mystery about the character of the famous Dr Dee, and it does not appear distinctly how far he pretended to those powers which are ascribed to him in that dreary work entitled *A true Relation of what passed between Dr Dee and some Spirits* published by Meric Casaubon in 1659 In 1631 the French curate, Urbain Grandier was burnt for sorcery at Loudun, in 1640 the pretender Dr Lamb was murdered by the London mob and these are nearly the latest instances of distinguished magicians while the degraded belief in witchcraft lasted much longer As to *natural magic* or the production of singular phenomena by natural means see *Brewster's Letters on Nat Magic*, *Quart Jour* vols xlviii lix

MAGIC LANTERN An optical instrument, by means of which small figures painted with transparent varnish on slides of glass are represented on a wall or screen considerably magnified It is generally used as a toy, and affords amusement from the grotesque character of the figures, but is also employed to enlarge the diagrams employed in astronomical lectures so as to be seen by an audience for which purpose it is well adapted both by its portability and the small cost of the whole apparatus The principle of its construction is very simple A lamp L, with a powerful Argand burner is placed within a closed lantern, and in the focus of a concave

mirror M N At the opposite side of the lantern is fixed a tube A B containing a hemispherical illuminating lens A, and a convex lens B, and between A and B is a slit C D, through which the sliders of painted glass are introduced In this manner the picture is placed in the axis of the tube and strongly illuminated, in consequence of the light being concentrated upon it by the mirror The picture being also in one of the conjugate foci of the lens B an enlarged image of it is formed upon a wall or screen E F at some distance behind The tube A B is made to pull out so that the distance of the lens B from the slider can be increased or diminished at pleasure, and consequently an image formed of any size within moderate limits The magic lantern was invented by Athanasius Kircher

MAGIC SQUARE A term used to denote a series of numbers in arithmetical progression, arranged in the equal cells of a square in such a manner that the vertical, horizontal and diagonal columns give the same sum For example, let the first sixteen numbers be arranged as in the annexed table, and a magic square will be produced, for the numbers in each vertical column, in each horizontal column, and in the two diagonal columns, being added together, give the same sum, namely 34 This is, however, only one of a great number of ways in which the same numbers may be arranged so as to fulfil the conditions Frenicle *Des Combats*, Paris, 1693) has proved that there are 878 such arrangements Emanuel Moscopolus, a Greek author of the 14th or 15th century, is the first who is known to have treated of magic squares and to have given rules for their construction The principal authors who have written on the subject are Stifels Leibnitz, Bachet Poignard Lahire, Ozanam, Franklin &c For the history of the subject see *Montucla*, vol i p 346, or *Hutton's Dictionary*, and for the methods of constructing them, *Ozanam's* or *Hutton's Mathematical Recreations*

MAGILP When linseed oil and mastic varnish are mixed together they produce a gelatinous compound known under the above name and used by artists as a vehicle for colours

MAGILUS A name given by Montfort to a genus of Tubulibranchiate Gastropods in the system of Cuvier chiefly remarkable for the form length and solidity of their shell The modifications of this dermal production are due in the present instance in great measure to the accidental circumstances of the locality in which the growth of the individual proceeds The young *Magilus* commences its career in a bed of lithophytous coral and during the early and rapid stages of its development secretes its calcareous covering in the ordinary form of a spiral univalve but soon the growth of the surrounding madrepore surpasses its own and it is compelled to bring its oral and respiratory orifices by the most direct route to the level of the surrounding coral While this change of place is being effected the mollusk continues to secrete fresh layers of shell coextensive with its own advance and to fill up the deserted part of the shell with a solid deposit of a dense semivitreous and subtransparent carbonate [illegible] the form of a spiral univalve and the opposite end excavated for a certain depth for the lodgment of the animal The tube is characterized by being longitudinally carinated

MAGISTER (contracted Mister or Mr) An appellation given in the middle ages to those persons who had attained some degree of literary or scientific eminence — in scientia aliquâ præsertim literariâ It was equivalent to the modern title of doctor

MAGISTER EQUITUM An officer among the Romans subordinate to the dictator, by whom he was usually elected See DICTATOR

MAGISTERY The old chemists generally applied this term to *precipitates* produced by the dilution of certain solutions with water such as magistery of *bismuth*, which is an insoluble subnitrate, obtained by pouring nitrate of bismuth into water

MAGISTRATE (Lat) A general designation of those public officers to whom the executive power of the law is committed, either wholly or in part It is almost impracticable to give any definition of this term so comprehensive as to include within it all the offices both in ancient and modern times to which this appellation has been given Under the various heads, the reader will find a notice of the principal magistrates of all ages and countries

MAGMA (Gr μάσσω, *I blend together*) A thick

MAGNAGHAI [illegible] Charles Magna

MAGNALIS [illegible] [illegible] [illegible]

barons of the kingdom to the second The title is of Latin derivation

MAGNESIA A white, tasteless, earthy substance, usually obtained by exposing its hydrated carbonate to a red heat Its specific gravity is 2 3 It is almost insoluble, but when moistened and put upon turmeric paper it reddens it this sometimes depends upon a trace of lime It is an oxide of a brilliant white metal, which has been called *magnesium* and which may be obtained by heating chloride of magnesium with potassium The vapour of the two upon each other, chloride of potassium is formed, and magnesium separates it may be washed with water and dried Heated to redness in the air, it burns with great brilliancy into magnesia, 12 parts of the metal combining with 8 of oxygen to form 20 of magnesia In commerce, pure magnesia is generally distinguished by the term *calcined magnesia*, and the hydrated carbonate of magnesia, obtained by precipitating a solution of sulphate of magnesia by carbonate of soda and washing and drying [illegible] medicine *Sulphate* [illegible] vaporating the residue of sea-w [illegible] It has been separated, or by adding sulphuric acid to *bittern* and evaporating, so as to obtain the resulting sulphate of magnesia The [illegible] the action of dilute sulphuric [illegible] and it is not uncommon in mineral waters it was formerly procured from certain springs near Epsom in Surrey, and was hence termed *Epsom salt* It crystallizes in four-sided prisms with dihedral summits Its crystals are soluble in their weight of water at 60°, and in three fourths their weight at 212° They melt when heated, and gradually lose their water of crystallization They consist of 20 magnesia, 40 sulphuric acid and 63 water This salt is a useful purgative in medicine, and is the chief source of the other forms of magnesia All the magnesian salts have a peculiar bitterish flavour Magnesia is found native in the state of hydrate and carbonate it exists as a component part of several minerals, and many of them are soft or soapy to the touch

MAGNESIAN LIMESTONE An extensive series of beds lying in geological position immediately above the coal measures, so called because the *limestone*, which is the principal member of the series, contains *magnesia* See GEOLOGY

MAGNESITE Native magnesia

MAGNESIUM The metallic base of magnesia, which see

MAGNETIC COMPASSES See COMPASS

MAGNETIC COMPENSATOR A contrivance devised by Mr Barlow for eliminating the influence of a ship's guns and other iron in deranging the bearings of the compass It consists of a plate or combination of plates of iron placed near the binnacle so as to counteract, by an equal and opposite attraction, that of the rest of the iron on board the vessel Mr Airy (*Phil Trans* 1839) has investigated the law of disturbance in the case of vessels built of iron, and shown that the disturbing force consists of a very large force of permanent magnetism in the rolled and hardened plates employed in the construction of the vessel, and a very small force of induced magnetism which changes with the place of the ship, or rather with the varying circumstances of terrestrial magnetism by which it is produced Mr Airy has given a set of practical rules for correcting the disturbing forces by means of two powerful magnets placed at right angles to each other below the compass, and a box of small iron chain, which is used instead of Barlow's correcting plate

MAGNET, NATURAL One of the numerous oxides of iron, possessed, however, of properties peculiar to itself, if we except the metals nickel and cobalt which possess it also in a very slight degree The magnet consists chiefly of two oxides, together with a small portion of quartz and alumine Its colour varies in different specimens, according to minute differences in the ratios of the two oxides, and the nature of the foreign substances with which they are found united, but it is usually of a dark-grey hue, and has a dull metallic lustre It is found in considerable masses in the iron mines of Sweden and Norway, in the Isle of Elba, in different parts of Arabia, China Siam and the Philippine Islands Small magnets are also occasionally though rarely, met with among the iron ores of this country The properties are,—

1 It attracts iron in all its states except the oxides

2 If formed into a bar, and suspended freely by a hair, or on a pivot passing through its centre, it will turn itself round and after a few pendulous vibrations settle to some one position which it will return to if left undisturbed or if disturbed will, after a few similar vibrations, return to [illegible] as before

3 By rubbing on a bar of steel it will give the bar the same properties, and a bar of soft iron will, while contiguous to it, even when not touched by it obtain the same properties, which however, the iron does not, like the steel, retain upon removal

4 The position of rest is different at different places, and different at the same place at distant periods of time

A great number of amusing toys have been formed of this substance, and the phenomena are often at first sight very surprising, but its application to the purposes of navigation renders it one of the most important discoveries ever made The earlier navigators believed that it pointed always to the north pole of the world, and that therefore by means of it they could always at once tell the direction of their meridian and consequently in what [illegible] of navigation has long been laid aside, as *artificial magnets* can be constructed having a much greater intensity of directive power See MAGNETISM

MAGNETIC NEEDLE An instrument suspended by its centre, and magnetized which shows the direction of the resultant of the magnetic forces at the place of observation See COMPASS and DIPPING NEEDLE

MAGNETIC PYRITES Native black sulphuret of iron it attracts the magnetic needle

MAGNETISM The science which investigates the phenomena presented by natural and artificial magnets and the laws by which they are connected The following brief explanation of it under both aspects will serve to render the subject generally intelligible, but it is impossible to give more than the essential phenomena and the general laws without descending to the detail of particular cases For further information reference may be made to the excellent compendium of Dr Roget in the *Library of Useful Knowledge*, to *Mr Barlow's Magnetic Attractions* (2d ed) and *Treatise on Magnetism* in the *Encyclopædia Metropolitana*, *Sir D Brewster's Treatise on Magnetism* in the *Encyc Britannica*, Gilbert *De Magnete* 1600 folio, *Robison's Mechanical Philosophy*, Biot *Traité de Physique*, tom iii Pouillet *Elemens de Physique*, Becquerel *Traité d'Electricité et du Magnétisme*, and various papers in the *Transactions of the Royal Society of London and Edinburgh* To the work of Dr Roget we have been under great obligations in drawing up the present abstract

Phenomena of [illegible] Pl 1 If a nicely balanced [illegible] suspended by a piece of untwisted silk or allowed to rest upon a pivot, free to turn in all directions both horizontally and vertically and if it be then magnetized by any of the methods hereafter described it will turn itself into one particular position and if disturbed by any means it will return invariably to the same as its position of repose The horizontal angle which it makes with the meridian is called its *variation*, or its *declination*, and the vertical angle which it makes with the horizon its *dip* or *inclination*

Phenomenon 2 Both these angles (dip and variation) continually change at the same place of observation sometimes the latter very rapidly, the former so far as has yet been observed very slowly at all places Thus about 1659 at London the needle pointed in the direction of the geographical meridian before that time it had pointed east of it but from that time till about 1818 it had continually made an angle more and more westward till it arrived at a variation of 24½° Since then its motion has again been retrograde and it is now little more than 23½° west (See COMPASS) The dip has also undergone similar variations at London in 1773 it was 72° 15′ and in 1830 it was 69° 38′

Phenomenon 3 The observation of navigators shows that there is a curve line on the surface of the earth at every point of which the needle will take a horizontal position This is called the *magnetic equator* It seems to cross the geographical equator in four points, and its form and position are also undergoing continual changes M Morlet and M Hansteen have investigated this subject with great care, and the former thinks it changes only its position not its form which is contrary to what theory would lead us to expect

The lines at which the dip is the same number of degrees are called *magnetic parallels* of that degree or more properly *lines of equal dip*, and the points at which the needle takes a vertical position the *poles*, *poles of convergency*, or more properly *poles of verticity* The points at which the variation is any given number of degrees constitute lines on the earth's surface, called *lines of equal variation*, or (after Dr Halley, who made a considerable number of observations on them) *Halleyan lines*, and the vertical circle whose plane coincides with the needle in its free position at any place is called, though improperly, the *magnetic meridian* of that place

Phenomenon 4 If the [illegible] needle whether compelled by its form or by loading one end of it with a weight sliding as an armature to keep a horizontal position, or free to take its own proper dip at each place successively, be made to vibrate by being drawn from its natural position, and then liberated, it will perform its vibrations more rapidly in some places than in others, and in the same place at different distant periods Its

places of most rapid horizontal vibration are not to be considered as those at which the most rapid vibrations of the freely suspended needle take place Hansteen has very laboriously investigated, from observations made by himself and others, the curves where the horizontal vibrations are the same, and he thinks there are four poles at which it is more rapid than at any points immediately near them But the rate of vibration of the free needle has as yet been observed at very few places with sufficient care to justify any general conclusion respecting such poles of vibration The velocity of vibration marks at the variation of the *intensity* of the vibrating force, the needle itself being a pendulum

Phenomenon 5 The intensity itself varies at different times of the day and under all variations of temperature in the surrounding medium, the place of observation being the same This was first observed more than a century ago, but its laws and circumstances have been only recently investigated by Mr Christie and subsequently by M Kupffer (See *Phil Trans* 1821 *Annals de Chimie*, 1826, and *Mr Christie's Report on the Present State of our Knowledge concerning Terrestrial Magnetism* in the *Reports of the British Association* The variation also undergoes similar changes and it is believed the dip also, but this has not been well established by observation

It is the opinion of Mr Christie Sir David Brewster, and others that the places on the earth where the temperature is lowest are precisely those where the magnetic intensity is the greatest accordant with what Mr Christie's experiments on the influence of temperature would lead us to expect but till we have more certain knowledge of the state of magnetic intensity at those places we cannot affirm this to be the case, probable as it may seem to be

In the following phenomena the place is supposed to be chosen and the dip variation and intensity to be fixed thereby It may be any place whatever on the surface of the earth We shall suppose it to be London (and there is comparatively little variation of these elements in the British Isles) The point of the needle which dips below the horizon and points to the westward of the meridian is called the *north pole* of the needle and the elevated one the *south pole* When the horizontal needle is used these same terms apply the end which varies westward being the north pole and the other the south pole

Phenomenon 6 If either pole of a magnet be brought near any small piece of soft unmagnetized iron it will be found to attract it Iron filings for instance are immediately collected together when a magnet is placed among them and they adhere to it when lifted up and more especially about the poles of the magnet in thick clusters About the intermediate parts the number that adhere is much less than near the ends and in every magnet there is a part to which the filings have no tendency to adhere at all It thus appears that the magnetic forces whatever be their nature are situated near the extremities of the magnet but it has been long questioned whether they be resident in two isolated points or diffused for considerable distances round those points but in a state of less intensity as they recede from those centres

Phenomenon 7 When instead of fragments of iron we substitute a rectangular or cylindrical bar of soft unmagnetized iron the magnet and the iron will be mutually attracted towards each other The best mode of exhibiting this is to suspend them by threads of untwisted silk at the appropriate distances as the friction they would undergo in sliding on a table is thus removed It will be found that the ends which are nearest to each other will tend to coalesce and that the other ends will tend to coalesce or recede according as the remote end of the iron happens to be situated with respect to the body of the magnet

If another iron body be brought near the former in this state of the apparatus the first iron will be found to be converted into a *temporary* magnet also and in like manner the second piece of iron may be proved to have become also a temporary magnet and then the third and so on The intensity of attraction and repulsion is however weaker in each in succession till it at length becomes insensible This is prettily exhibited by attaching a key to a magnet, a nail to the key a smaller nail to that a sewing needle to the smaller nail and so on as long as there is sufficient magnetic force developed to sustain the concatenation in a state of suspension Some magnets will sustain a considerable weight, others, of course, are capable of exerting very little force

The iron is said to be converted into a magnet, or, more briefly to be *magnetized by induction*, or, to use the French term, to be *magnetized by influence*

Phenomenon 8 If two magnets be suspended, as in the last experiment it will be found that the two north poles repel each other and the two south poles repel each other but the north pole of the one and south pole of the other mutually attract each other They will, in consequence of this mutual action upon each other, take positions *generally* different from those which they would each take in the absence of each other

Phenomenon 9 If the poles of the successive induced magnets spoken of in Phen 8 be examined as to their nature, by means of their action on the poles of a small magnetic needle, it will be found that each of them is a distinct magnet, each consecutive pair of them having their dissimilar poles in contact This is known at once by observing which end of the needle is attracted before the next piece of iron is put on, and which after it is added, the needle being applied near the untouched end of the iron

If, moreover, the pieces of iron be laid on a table, and not in contact, the same phenomena will be observed on the application of the trial needle near their extremities

When two or more magnets are employed to act by influence on the same piece of iron the phenomena become more complex, and the operation is called *complex induction* The phenomena are very curious and interesting

Phenomenon 10 If the iron be removed it instantly ceases to be magnetic, and may have its position reversed with precisely the same effect as before, each phenomenon taking place now at the end opposite to that where it was exhibited before, and this will be the case, however long the apparatus has been allowed to remain in the position spoken of If, however pieces of steel be employed the inductive influence is less than in the iron whilst instead of [illegible] instantaneously as the iron did it requires a sensible time and becomes itself a permanent magnet There are indeed few, if any pieces of iron and steel in which the magnetic force is wholly lost or wholly returned upon removal, but we here speak of the sensible and approximate circumstances of the phenomena

Phenomenon 11 If a magnet be broken or any way severed it is converted into two separate magnets, the two ends of the fragments at which the fracture was made being of opposite kinds to the two ends of the whole bar respectively as if they had been but two magnets united by opposite poles

Phenomenon 12 If two magnets be brought near each other their intensity of action on the vibrations of a needle are affected according to the relative positions of the poles indicating not only that the direction of the quiescent state of the needle is affected (Phen 8) but that the intensity of the magnetic force is also altered This shows that the magnetized bar itself is affected by the inductive power of the other bar as soft iron is

Phenomenon 13 If a mass of soft iron be brought into the vicinity of a magnetic needle the needle will be *generally* deflected from its natural position in various degrees and directions, according to the form and position of the needle and the mass When an iron sphere is employed as a common ball the investigation of the order of the phenomena becomes more simple and easy and it was by remarking that in this case there was a certain plane in any point of which the needle may be placed with respect to the sphere where the needle would not be at all deflected, that Mr Barlow was led to prosecute his celebrated experiments on this subject Mr Christie remarked that this plane was the plane passing through the centre of the ball perpendicular to the *dip* direction of the needle itself

There are also lines on the iron sphere in which if the needle is placed the deflection will be a given quantity

The same phenomena however, are exhibited whatever be the form of the mass Mr Barlow experimented on a gun 58 cwt and found it so He also found that the action did not depend upon the mass itself but upon the surface of the mass, as the same effects were produced by a ten inch ball a ten inch shell and a globe of sheet iron of the same diameter If, however, the sheet iron was less than $\frac{1}{10}$th of an inch in thickness the effects were diminished but up to that degree of thinness they did not seem to vary whilst after they varied very rapidly, and soon became insensible

Phenomenon 14 If disks of various metals be put into rapid rotation they will also deflect the magnetic needle from its natural position That this is not owing to vibration or vorticity produced in the air is rendered evident by the same effects taking place in a more intense degree in vacuo than in the open air The phenomenon itself was first observed by Arago in France, but it has been chiefly [illegible] by Messrs Herschel Babbage Christie Barlow Faraday and Harris, to whose memoirs on the subject in the *Philosophical Transactions* the reader is especially referred

Phenomenon 15 Bars that have long stood in a vertical [illegible], &c are found to have become [illegible] A bar of soft iron, placed [illegible] the magnetic needle, acquires temporary [illegible] a bar of steel be left there for [illegible] a permanent magnet These facts show that the earth itself is a great magnet and converts the others into magnets by induction This was

observed so far back as the time of Dr Gilbert, and it is remarkable that, whilst his great cotemporary Lord Bacon was precipitively urging the new organon in philosophy, Gilbert was actually putting it into the most careful practice The doctrine of terrestrial induction, as taught by Gilbert, is the doctrine of the present hour, and with scarcely a single improvement in the whole range of the theory

The foregoing contain the most important phenomena of magnetism which depend upon terrestrial influence merely those which depend upon electrical influence will be found under the head ELECTRO-MAGNETISM

Laws of Magnetic Action — Law 1 The intensity of the attractive force exercised by the north pole of one magnet on the south pole of another, and its repulsive force on the north pole of the second, varies inversely as the square of the distance of those poles, and the like occurs when we consider the action of the south pole of the first magnet on the north and south poles respectively of the other The same law precisely holds with respect to the attraction of a corpuscle of unmagnetized iron

This is the fundamental law of the science and may be considered as the source from which the others flow by mathematical reasoning It has been determined with great care by several philosophers but especially Michell and Coulomb by means of the torsion balance Other laws were, in the earlier state of the science, conjectured to obtain, as for instance Newton supposed the forces to vary as the cubes of the distances and some recent inquirers have contended for the simple inverse of the distances, but Newton's opinion was founded upon insufficient experiments, and that of the authors referred to upon an oversight in their mode of estimating the intensity of the forces Not the slightest doubt however now remains upon the minds of those who are competent to form an opinion of the truth of the law stated above

Law 2 When the needle is very short in comparison with the distance and length of the magnet and has its centre fixed immoveably but is otherwise at liberty to take any directive position it will so arrange itself that its line of direction will be in the plane drawn through the two poles of the magnet and its own (the needle's) centre of rotation, and the line of the needle's direction being produced to meet the magnetic line (or line drawn through the poles) will divide the latter into [illegible] which are in the ratios [illegible] poles from the centre of the needle When the needle is not small in comparison, as above the law becomes more complicated

Law 3 If two magnetic needles be made to vibrate the intensities of their magnetic forces are as the squares of their number of vibrations made in the same time This is true whatever be the planes in which they vibrate, so far as the force is effective in that plane, but for a direct comparison of the ratio of the intensities without further computation the vibrations of both needles must in both cases be made in the *same plane* The planes most commonly used for vibration are — the horizontal plane the plane which has been called the magnetic meridian or that vertical plane which passes through the natural direction of the needle at the place of observation and the vertical plane at right angles to this

Law 4 If the needle be allowed to move vertically in a plane making any angle with the magnetic meridian the dip in that case is equal to the dip in the magnetic meridian multiplied by the cosine of the inclination of the two planes, and if [illegible] in which the dip is observed [illegible] of the natural dip at that place is equal to the sum of the squares of the cotangents of the observed dips

Law 5 The intensity of the horizontal force is equal to the intensity of the whole force multiplied by the cosine of the dip If, therefore, the same needle be used in all the experiments and observations be made to determine the dip and horizontal intensity at several different places, the relative intensities of the terrestrial magnetic force can be deduced from those observations by the three last laws for each of the places

The laws according to which magnetic force is influenced by temperature have been chiefly investigated by Coulomb, Kupffer Barlow and Christie It appears generally, that between the temperature of — 5 and + 17 of Fahrenheit, the intensity of magnets decreases as the temperature increases, and that at temperatures above 100° a part of the power of the magnet is permanently destroyed The effects produced on soft iron by changes of temperature appear to be directly the reverse of those produced on magnets, an increase of temperature causing an increase of magnetic force

On the Formation of Artificial Magnets — 1 If a steel bar be held in the natural direction of the dip [illegible] or three smart blows be given at the upper end with a hammer, it will become a permanent magnet

2 If the end of a steel bar be placed in contact with one of the poles of a magnet, it will become permanently magnetic by induction A better plan is to place the needle in a line between the opposite poles of two magnets of equal intensity

3 Lay the bar flat on a table, and draw another magnet (placed upright upon it) several times from one end to the other, always the same way Or take two magnets, and lay them horizontally upon the bar to be impregnated, having their dissimilar ends in contact over its middle, and slide each towards the end of the bar This must be repeated several times Or, again, instead of laying them horizontally, hold them in any angle of inclination (each in the same angle, estimated from the perpendicular to the middle of the bar) and draw them several times along towards the ends without varying their inclinations

The above methods were those originally employed, but when the principles of magnetic induction came to be better understood, more complicated but more effective processes were invented, for the explanation of which reference must be made to works expressly on the subject (See *Brewster's Treatise on Magnetism*) Those more complicated processes may be greatly simplified by the substitution of a magnet in the form of a horseshoe for the compound magnets If placed at once in the middle of the needle to be magnetized, with the poles turned in a direction the reverse of the poles intended to be given to the needle, and then moved backwards and forwards along the surface of the needle, taking care to pass over each half of it an equal number of times and repeating the same operation on the other side the needle is speedily and effectually rendered magnetic This is by far the simplest [illegible] and it may be considered as a method [illegible] induction being accelerated by the friction

On the subject of terrestrial magnetism which at the present time is occupying so much of the attention of scientific men reference may be made in addition to the works above cited to the following — Hansteen, *Untersuchungen über der Magnetismus der Erde* 4to Christiania 1817, Barlow *Phil. Trans.* 1833, *Allgemeine Theorie des Magnetischen Vereins im Jahre* 1838 by Gauss and Weber Leipzig 1839 (a translation of which will be found in *Taylor's Scientific Memoirs*), *Intensitas Vis Magneticæ Terrestris ad Mensuram Absolutam revocata* Auctore C. F. Gauss, Gottingæ, 1833 *Major Sabine's Report to the Seventh Meeting of the British Association* 1838 *The Report of the President and Council of the Royal Society on the Objects of Scientific Inquiry*, 1840, and to an excellent popular abstract of the present state of our knowledge on the subject in the *Quarterly Review* for June 1840

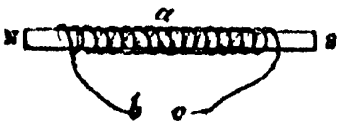
MAGNETISM ANIMAL This pretended influence or agent had its origin in Vienna about the year 1776 when a person of the name of Anthony Mesmer published a thesis *On the Influence of the Planets on the Human Body* About the same time a Jesuit called Father Hehl imagined that by the help of a loadstone and certain steel plates rendered magnetic he had cured several diseases and being struck with the analogy of Mesmer's views to his own they entered into a kind of partnership as joint practitioners and attracted considerable notice, so that although they soon quarrelled, their system of treatment had acquired some notoriety and many powerful advocates Hehl continued to practise this new and occult science in Germany, and Mesmer in 1778 went to Paris and in the course of a short time performed such wonderful cures and took care to have them so satisfactorily attested that his apartments were daily thronged with patients of all ranks and fees and reputation poured in from all quarters He here however unluckily associated himself with a M. d'Eslon, a medical man who being more skilful in the art of pleasing patients than his master, contrived to gain the ascendency, and so to disgust Mesmer that he was induced to quit Paris for Spa, where he soon contrived, under the pretence of initiating others in the secrets of his trade, to raise about 14000*l* with which he retired to his native place (Mersburg in Suabia) and left magnetism and the magnetizers to their own resources

As the jargon of Mesmer has been revived in our own days it may be worth while to give his own definition of his art which is quite as intelligible as some of the later versions of it which have recently appeared in London, for in this "hotbed of quackery" Mesmerism, as it is called, has occasionally taken root and at one time, but for an accident, which we shall presently notice, threatened to thrive and prosper

'Animal magnetism says Mesmer, "is a fluid universally diffused, it is the medium of a mutual influence between the heavenly bodies, the earth, and animated bodies, it is continuous, so as to leave no void, its subtilty admits of no comparison, it is capable of receiving, propagating [illegible] the impressions of motion, it [illegible] of reflux The animal body [illegible] of the magnet by insinuating itself [illegible] effects them immediately There are observed, [illegible] in the human body, properties analogous [illegible] mag-

net, and in it are discerned poles equally different and opposite The action and the virtues of animal magnetism may be communicated from one body to other bodies, animate and inanimate This action takes place at a remote distance, without the aid of any intermediate body, it is increased and reflected by mirrors, communicated, propagated, augmented, by sound, its virtues may be accumulated, concentrated, transported Although this fluid is universal, all animal bodies are not equally susceptible of it, there are even some, though a very small number, which have properties so opposite that their very presence destroys all the effects of this fluid on other bodies

"Animal magnetism is capable of healing diseases of the nerves immediately and of a mediate It perfects the action of medicines, it excites salutary effects salutary crises in such a manner that the physician may render himself master of them, by its means he knows the state of health of each individual and judges with certainty of the origin, the nature, and the progress of the most complicated diseases, he prevents their increase and succeeds in healing them without at any time exposing his patient to dangerous effects or troublesome consequences whatever be the age, the temperament, and the sex In animal magnetism nature presents a universal method of healing and preserving mankind"



Many of our readers have probably witnessed the silly and disgraceful exhibitions in this line of practice which some years ago were displayed in London and are therefore aware of the means by which the magnetized are brought under the 'influence' It is always necessary that the magnetizer himself should be charged with the fluid and [illegible] its influence, [illegible], nor can all persons be magnetizers some want power, and others faith, in short there must be a due share of folly or of imposture or both, on the one hand and of credulity, cunning or morbid irritability on the other and then all goes right The magnetizer with his wand of office performs certain antics before the patient, and the patient either falls asleep or into a fit or is dumb or deaf or garrulous and painfully sensitive to sounds as the case may be But it is by no means necessary that the doctor and the person magnetized should see each other a skilful artist, well charged can magnetize a fit subject in another room house street or town and can moreover tell by his own sensations to what extent the influence is communicated and how the persons receive it

Mesmer availed himself of certain aids which our modern practitioners have rejected, such as boxes of steel bars magnetized water and musical instruments imbued with the magnetic influence he also frequently tied his customers together or made them link their thumbs when several were to be magnetized at once When patients are in the crisis or under the full influence of the power they can be immmediately roused out of it by certain looks, gestures and touches of the adept

To ascertain how far the pretensions of the animal magnetizers were cut [illegible] French government [illegible] of scientific and unprejudiced persons to investigate its merits among whom were Bailly Franklin and Lavoisier, and it is curious that their report, which was translated into English, and published here in 1785 is not more often quoted 'This pretended agent say they, "is not magnetism, for on examining the grand reservoir of the fluid by a needle and electrometer neither magnetism nor electricity could be detected We tried it upon ourselves and others without effect and on blindfolding those who professed great susceptibility of its influence, all its ordinary effects were produced when nothing was done but when they imagined they were magnetized while none of its effects were produced when they were really magnetized but imagined nothing was done So also when brought under a magnetized tree, nothing happened if they thought they were at a distance from it while they immediately went into violent convulsions when [illegible] were near the tree though really not so [illegible] Therefore' say the commissioners 'are purely imaginary, and although they have wrought some cures, they are not without danger for the convulsions sometimes spread among the feeble of body and mind, and especially among women And finally there are parts of the operations which may readily be turned to vicious purposes, and in fact immoral practices have already actually grown out of them"

Some years ago a great animal magnetizer arose in this country called Perkins, who invented what he called "metallic tractors, for collecting condensing, and applying animal magnetism, but Dr Falconer and Dr Haygarth of Bath soon put an end to his pretensions, by performing all manner of cures and wonders with a pair of wooden tractors, and as those cases were well attested, they proved, as every person of common sense before knew, that all Perkins's results were imaginary or assumed, and so animal magnetism fell into oblivion A few years ago some lamentable attempts were made to revive it in London, not by quacks and impostors, but by [illegible] and even by persons who enjoyed a considerable share of public respect and favour The [illegible] of their credulity and folly, but the mania has spread into the provinces, where it still rages with unabated fury

MAGNE'TO ELECTRICITY Under the term ELECTRO MAGNETISM will be found the description of certain magnetic phenomena produced by electricity It has been demonstrated by Faraday that electric phenomena may be produced by magnetism and to these the term *magneto-electricity* has been applied Let *a* represent a hollow helix of copper wire covered by silk, the ends *b c* of which are connected with a delicate galvanometer, and N S a powerful bar magnet, which can easily be thrust into and withdrawn from the spiral or helix it will then be found that every time the magnet is pushed into the helix the galvanometer is deflected in one direction, and each time it is withdrawn it is deflected in the opposite direction On repeatedly threading the helix with the magnet, the deflection also takes place Now as the deflection of the galvanometer can only be produced by the motion of electricity in the helix, it is obvious that an electric current is produced each time that the magnet moves through it hence as, on the one hand electricity in motion produces magnetism so, here, magnetism in motion produces electricity By causing the pole of a powerful magnet to revolve before a coil of wire, or, what amounts to the same thing, if the coil be made to revolve opposite to the pole of a magnet, an electric current will be established in the coil which may be made sensible by sparks shocks and chemical effects

MAGNETOMETER An instrument for measuring the intensity of terrestrial magnetism The three elements sought to be deduced from magnetic observations are the declination the inclination or dip, and the absolute intensity, together with the variations to which they are subject and each of these elements requires for its determination a peculiar apparatus A detailed account of the construction and various adjustments of the instruments made use of in the magnetic observatories recently established and of the methods of observing, will be found in the *Report of the President and Council of the Royal Society on the Objects of Scientific Inquiry in Physics and Meteorology* 1840 The first accurate measurements of magnetic force were made by Coulomb with the torsion balance, but the more precise method which is now generally adopted and which depends on the dynamical principle of observing the number of vibrations made by a needle in a given time, was proposed by Graham so long ago as 1722

MAGNETOMO'TOR (Lat lit *magnet-mover*) A term applied to a voltaic series of two or more large plates which producing a great quantity of electricity of low tension is well adapted to the exhibition of electromagnetic phenomena

MAGNITUDE (Lat) Size, extent quantity This term was originally employed to designate the space occupied by any figure, or, in other words, 'was applied to objects strictly termed geometrical, and to the three dimensions —length, breadth, and thickness then it was extended to designate the quantity of any one of these, and also of angular space, or the inclination of two lines to one another, or again the compound idea of a solid angle formed by any number of planes meeting in a point The amount of any one of these, taken in reference to some standard of the same kind of quantity as that spoken of, was called its magnitude The term was gradually enlarged in its signification, so as to apply to every kind of quantity that admits of exhibition or mensuration, or of which greater or less can be predicated, and in this sense it was used by Euclid

MAGNITUDE, APPARENT The angular space (plane or solid) under which a body appears when viewed from some distant point The term is chiefly used in speaking of the celestial bodies, and is then employed to express the plane angle subtended by the diameter of the visual disc of the body It is also used in many branches of optical science, but always with the same *general* meaning

MAGNOLIA'CEÆ (Magnolia, one of the genera) A natural order of Exogenous plants, consisting of trees or shrubs of great beauty usually with evergreen leaves, and large fragrant flowers They inhabit the temperate parts of America and Asia, as well as the tropics, and are universal objects of cultivation The bark of the tulip tree, and of some of the true magnolias, has the reputation of being a good febrifuge

MAGPIE A common species of the Crow tribe *Corvus pica* of Linnæus now the type of a distinct genus, *Pica caudata* They continue in pairs throughout the year, and prey on a variety of food, chiefly animal, as the young of hares, rabbits, and feathered game, young poultry, eggs, carrion, and insects, lastly, fruit and grain

The magpie is celebrated for its crafty instincts its power of imitating words, and the propensity which it has in common with other species of the crow tribe to purloin and secrete glittering articles The nest of the magpie is admirably constructed for strength and warmth, and is commonly defended by a dome It lays six or seven eggs early in spring, of a yellowish white spotted with brown and cinereous In winter magpies will assemble in great numbers to roost in some coppice towards the [illegible] on the approach of day

MAHABA'RATA The name of one of the great Indian epic poems, the subject of which is a long civil war between two dynasties of ancient India the Kurus and Pandus This poem embraces the whole circle of Indian mythology, but it is still more valuable as embodying an immense number of historical fragments which will be of great importance to the future historian of India Many episodes from the *Mahabarata* have been ably translated by some of our most celebrated orientalists, and parts of the original have been published at different periods in Germany The period at which the *Mahabarata* was written is wholly unknown, and it has no less baffled all the researches of the learned to discover the date at which it assumed its present methodical form The *Penny Cyclop* [illegible] of this poem See RAMAYANA

MA'HADO A name of one of the Indian deities from whom the sacred Ganges is fabled to spring He is incorrectly used in Goethe's well known poem *Der Gott und die Bajadere* which begins Mahado, du Herr der Erde' (Lord of Earth), as synonymous with Siva

MAHOMEDANISM *See* MOHAMMEDANISM

MAI'A In Grecian Mythology — 1 The daughter of Atlas and Pleione one of the Pleiads who became mother of Mercury by Jupiter 2 A daughter of the god Faunus and wife of Vulcan, frequently confounded by mythologists with the former personage

MAI'DÆ A family of crabs (Brachyurous Crustaceans) of which the genus *Maia* is the type The form of the shell is ovoid the manus and the preceding joint are nearly of the same length The species called *Maia squinado* is occasionally taken on our own coasts as well as those of France and of the Mediterranean it is commonly called the "sea spider"

MAI'DEN The name given in Scotland to a sharp edged instrument, formerly used for the beheading of criminals It resembles in its construction the *guillotine* of the French See GUILLOTINE

MAIDEN HAIR The *Adiantum capillus veneris* a fern found in many parts of Europe on damp shaded rocks It formed an ingredient in the syrup of capillaire of old pharmacy

MAIL (Fr maille) A small piece of metal or money but used collectively to defensive armour formed of iron rings or round meshes See HAUBERK

MAIL signified originally the bag which contains letters forwarded by government for the public convenience but it was soon afterwards extended to the letters themselves, and it is now used also for the conveyance in which they are forwarded See POST OFFICE

MAILS, or MAILIS In Scottish Law the rents of an estate (Silver halfpence in England were recently called mailes) In the northern counties of England and in Scotland, payments made by the occupiers or owners of lands to persons in league with the various classes of freebooters who infested the country were termed *black mail* To take it was made a capital felony by stat 43 Hen 7 c 13

MAIM, or MAYHEM In old English Jurisprudence a wound by which any one was so disabled as to be less fit to defend himself [illegible] from an injury which [illegible] hem was abolished, with other criminal appeals, by 59 G 3 c 46 Cutting and stabbing, "with intent to murder and with intent to maim or disfigure, are now distinct offences, under 9 G 4 c 31 s 11 and 12 The latter was thereby made a capital felony only in such cases in which if death had ensued it would have been murder

MAI'NTENANCE, in Law is defined to be an officious intermeddling in a suit that in no way belongs to one by maintaining and assisting either party with money or otherwise to prosecute or defend it The punishment by common law is fine and imprisonment, and by 32 H 8 c 9 a forfeiture of ten pounds

MAI'NTENANCE, CAP OF A cap of dignity anciently belonging to the rank of a duke, termed by the French *bonnet ducal* The lord mayor's fur cap is also called a cap of maintenance

MAIZE (Mais, the American name), a kind of corn extensively cultivated for food, is the grain of the plant named by Linnæus *Zea mays* Like other corn, it is a species of grass, whose albumen is sufficiently large and farinaceous to be ground into flour In this plant the grains are unusually large, compressed, and packed closely in *regular parallel lines along the sides of a receptacle* many inches long In the young state each grain is tipped with a long slender style as fine as a thread of silk, and many hundreds of such styles being collected together from each receptacle, the whole resemble a silken tassel hanging down from the orifice of the sheathing leaves in which [illegible] When ripe the corn is [illegible] leaves and is only to be [illegible] stripped back The male or barren flowers grow in a loose panicle at the end of the stem There are many varieties of maize, some with stems seven or eight feet high, others not exceeding the stature of two feet, some requiring a long summer to ripen their grain, others coming to perfection in a couple of months The colour of the grain is also variable, chocolate-coloured, red, crimson, yellow, white, and variegated are all known to the American planter This kind of corn is not grown exclusively for the sake of the ripe grain, the young female inflorescence, which is sweet and tender, is boiled or cooked in other ways as a delicate vegetable, and the young stems are occasionally given to cattle Many attempts have been made to cultivate maize in England as a field crop but without success It does not thrive north of the basin of the Mediterranean, and requires a [illegible] heat than we experience in these islands

MAJESTY This title of honour is derived from the Romans among whom it stood for the collective power and dignity of the sovereign body, as majestas populi Romani Hence treason was termed crimen lasæ majestatis an injury offered to majesty Majesty was the attribute of consuls prætors &c only as representing the public and hence in later times when it was transferred to the emperors along with the sovereign power, inferior magistrates were entitled, in ceremonial language by the appellation of dignitas Majesty is now the conventional title of European emperors and kings (The Sultan of Turkey has no more elevated title in our ceremonial than Highness) It appears to have been first assumed by the German emperors who were considered as representing the imperial dignity of Rome then by the French kings Henry II in England by Elizabeth The Emperor of Austria has the title Majesty with the prefix K K (Kaiserliche Königliche or Imperial Royal)

Apostolical Majesty — A title bestowed on Stephen duke of Hungary about A D 1000 by Pope Sylvester II Re conferred on the empress-queen Maria Theresa in 1758

Catholic Majesty — A title bestowed on Ferdinand and Isabella of Spain by Pope Alexander VI in 1491 in memory of the conquest of the Moors it had, however, been borne by earlier Spanish monarchs

Most Christian Majesty — A title borne by the kings of France, first solemnly conferred on Louis XI in 1469 by Pope Paul II

Most Faithful Majesty — The title of the kings of Portugal bestowed by Benedict XIV on John V

MAJOR In the art Military a field officer next in rank above a captain and immediately inferior to a lieutenant colonel His chief duties consist in superintending the exercises of his regiment or battalion and of putting in execution the commands of his superior officer This class of field officers did not exist till the beginning of the 17th century The prices of a major's commission and his pay in the British army are as follow — In the regiments of the line, 3200*l* pay 16*s* per diem in the dragoons 1787*l* pay 19*s* 3*d* per diem in the life and royal horse guards 5380*l* pay 1*l* 4*s* 5*d* per diem and in the foot guards (with the rank of colonel) 8300*l* pay 1*l* 3*s* This appellation of major does not exist either in the artillery or engineers *Brigade major* is a staff officer, who performs for a brigade or in a garrison duties equivalent to those of a major in a regiment or battalion *Major general* is an officer next in rank below a lieu- [illegible] whose functions he has to discharge in [illegible] his superior officer

MAJOR AND MINOR In Music terms applied to imperfect concords differing from each other by a semitone *minor* They are used in the same sense when applied to discords

MAJORA'T In modern legal phraseology as employed by several Continental nations, the right of succession to property according to age It is defined "a fidei-commissum gradual successive perpetual, indivisible made with a view to preserve the name, arms, and dignity of a family and destined for ever to the eldest member of it" In the German empire and in Spain this species of entails is of great antiquity *See* MAYORAZGO

MAJORAT In the French Law expresses the property, landed or funded, which by virtue of several decrees of the empire might be reserved by individuals enjoying hereditary titles of honour and attached to the title so as to descend with it The German and Spanish laws of majorat had no exact equivalent in old France, but a species of majorat existed in the case of the Duches-Pairies, abolished at the Revolution, with other feudal institutions The general rule of French law that children succeed equally to their parents' property, is only modified by the regulations respecting what is termed a "portion disponible" (*Cod Civil*, art 913 &c) A per-

son who leaves one child only can dispose, by will or donation, of half his property; one who leaves two one third, and so on a person who dies without descendants, but leaving "ascendants," one half or three fourths, according to certain rules, if he leaves only collaterals, he [illegible] whole

MAJOR DOMO (Lat major domus *greater officer of the house*) In the courts of those kingdoms which were formed out of the fragments of the Western Empire, three different offices seem to be designated by this title —1 The maître d'hôtel, or chief officer of the prince's table, præfectus mensæ, architriclinus, dapifer, &c, 2 The mayor of the palace (æconomus, *steward*), 3 The first minister, prefect of the palace, count of the palace, &c Charles Martel is termed major domus by some ancient historians This title became in later times confounded with that of seneschal In Germany, under the Othos and the house of Swabia, the dapifer was an officer of high rank, who bore among other duties, the standard of his sovereign The corresponding office was dapifer of the empire the elector of Bavaria, arch dapifer In England he was a personage of less distinction and his subscription generally appears last among the attesting witnesses to ancient charters

MAJORITY In Politics the age at which the sovereign in hereditary monarchies becomes capable of exercising supreme authority See MINORITY REGENT

MAJOR TERM in Logic, is in a syllogism the predicate of the conclusion The major premise is that which contains the major term In hypothetical syllogisms the first premise is called the major

MAJUSCULE CAPITALS LETTERS In Diplomatics, capital letters The Latin manuscripts of the classical age which we possess (those found at Pompeii and a few parchment MSS of very early date) are written in capital letters Few instruments or books of later date than the sixth century are in capital letters

MALACHITE (Gr μαλαχη *the mallow flower*, or μαλακος *soft*, hence also called *soft* or *fibrous* copper ore) The *blue* and *green* varieties of copper

MALACIA (Gr μαλακια *a nauseous fish*) A depraved appetite

MALACODERMS, *Malacodermi* (Gr μαλακος and δερμα *skin*) The name of a tribe of Serricorn beetles including those with a soft and flexible body

MALACOLITE (Gr μαλακος) A variety of *augite* of a dark green colour

MALACOLOGY (Gr μαλακια the Aristotelian name of the Mollusca of the moderns, and λογος *a discourse*) The science of the Mollusks (See that word for their general characters) Cuvier the great reviver of this branch of natural history divides the Mollusks into six classes

I *Cephalopoda* — Mantle in form of a sac open anteriorly containing the branchiæ and abdominal viscera, head protruding from the mantle well developed and crowned by fleshy productions, by means of which they crawl and seize various objects

II *Pteropoda* — Mantle closed appendages of the head either wanting or extremely reduced The principal organs of locomotion are two membranous fins, like wings situated on the sides of the neck

III *Gasteropoda* — These crawl by means of a fleshy disk on their belly The mouth is supported by a head

IV *Acephala* — The mantle encloses the branchiæ and viscera the mouth opens within its cavity and is not supported by a distinct head The mantle may be open throughout its length, at both ends, or at one extremity only

V *Brachiopoda* — These are also enclosed in a mantle without an apparent head, but have a pair of long, fleshy, ciliated arms which are spiral when retracted

VI *Cirrhopoda* — This class Cuvier defines as being similar to the other Mollusks in the mantle branchiæ &c, but as differing from them in having numerous horny and articulated limbs, and a nervous system more nearly resembling that of the Articulata

Since the early form and metamorphoses of the *Cirrhopoda* or more properly *Cirripedia* were known, most zoologists have regarded them as members of the Articulate sub kingdom

The classification of the Mollusca has been much perfected by those zoologists who have been attracted to the study of this department of the animal kingdom by the beautiful and diversified coverings of the testaceous species Among these Lamarck ranks deservedly the chief, and his system is still that which mainly guides the conchologist in the arrangement of his shells

The following is the outline of the Lamarckian system —

In the system of Lamarck the natural primary group of animals to which the science of malacology relates constitutes the 11th and 12th classes of his Invertebrata The first of these classes, under the name of *Conchifera*, is equivalent to the Testaceous *Acephala* and *Brachiopoda* of Cuvier, and these low-organized headless Mollusca have their external shelly defensive covering rendered the more complete by way of compensation for the slight development of the nervous centres to which the impressions of external objects or [illegible] which the acts of [illegible] are therefore provided with and generally completely covered by two shells, which are technically called "valves," and the *Conchifera* of Lamarck thus include the Mollusks with bivalve shells These are divided into two orders, *Dimyaria* and *Monomyaria*

Class I CONCHIFERA

Order 1 *Conchifera Dimyaria* — Char Two muscles of attachment at least, shell internally with two muscular impressions, which are separate and lateral

(1) Shell regular generally equivalve

(A) Shell gaping in general at the lateral extremities, its valves being approximated

(*) *Crassipede Conchifers* — Mantle with its lobes united anteriorly, either entirely or partially, foot thick gape of the shell wide

Family 1 *Tubicolidæ* — Shell either contained in a tubular sheath distinct from its valves, or entirely or partially incrusted in the wall of its sheath, or projecting externally (*Aspergillum, Clavagella, Teredo* &c)

Family 2 *Pholadidæ* — Shell without a tubular sheath, either furnished with accessory pieces or gaping very much anteriorly (*Pholas, Gastrochæna*)

Family 3 *Solenidæ* — Shell without accessory pieces, and gaping at the lateral extremities only, ligament external (*Solen, Panopæa Glycymeris*)

Family 4 *Myadæ* — The same characters of the shell, with the ligament internal (*Mya Anatina*)

(**) *Inæquipede Conchifers* — Mantle with its lobes not united or hardly united anteriorly foot small, compressed, gaping of the shell often considerable

Family 5 *Mactridæ*

a Ligament internal only (*Mactra, Crassatella, Lyonsia Lutraria*)

b Ligament partly internal partly external (*Ungulina Solemya Amphidesma*)

Family 6 *Corbulidæ* — Shell inequivalve, ligament internal (*Corbula Pandora*)

Family 7 *Lithophagidæ* — Ligament partly external partly internal, shells without accessory pieces or any particular sheath more or less gaping at their anterior side (*Saxicava Petricola Venerupis*)

Family 8 *Nymphæ* — Two cardinal teeth at most in the same valve, shell often gaping a little at the lateral extremities, ligament external, nymphæ [illegible] *Psammobia* [illegible] *Crassina*) See CONCHOLOGY

(B) Shell closed at the lateral extremities when the valves are shut

(***) *Lamellipede Conchifers* — Foot flattened, lamelliform not posterior

Family 9 *Conchidæ* — Three cardinal teeth at least in one valve with as many or less in the other, lateral teeth sometimes

1 *Fluviatile Conchidæ* — Shell with lateral teeth and covered with a false epiderm (*Cyclas, Cyrena, Galathea*)

2 *Marine Conchacea* — No lateral teeth in the greater number, rarely an epidermis, which covers the whole shell except the umbones (*Cypræa, Cytherea, Venus, Venericardia*)

Family 10 *Cardiadæ* — Cardinal teeth irregular either in their form or situation, and accompanied in general by one or two lateral teeth (*Cardium, Cardita, Isocardia* &c)

Family 11 *Arcadæ* — Cardinal teeth small numerous, intrant and disposed in each valve on a line which is [illegible] straight or arched (*Cucullæa, Arca, Pectunculus Nucula Trigonia* and *Castalia*)

Family [illegible] [illegible] which is simple or divided, and with a longitudinal tooth which is prolonged under the corselet, and sometimes without any tooth at all or is furnished along its length with irregular granulous tubercles Umbones with the epidermis peeled off, and frequently eroded (*Unio, Hyria, Anodon*, and *Iridina*)

Family 13 *Chamidæ* — Shell irregular, inequivale, a [illegible] pressions distant, lateral, external ligament depressed (*Diceras, Chama, Etheria*)

Order 2 — *Conchifera Monomyaria* — Only one muscle of attachment which seems to traverse their body Shell with an internal subcentral muscular impression

(*) Ligament marginal, elongated on the border, sublinear
Family 14 *Tridacnidæ* — Shell transverse, equivalve, with an elongated muscular impression bordering the upper limb (*Tridacna Hippopus*)
Family 15 *Mytilidæ* — Shell longitudinal or subtransverse, with a muscular impression contracted into an isolated space without bordering the limb, hinge with a subinternal ligament, which is marginal, linear, very entire (*Modiola, Mytilus, Pinna*)
Family 16 *Malleidæ* — Ligament sublinear either interrupted by serial teeth or simple, shell subinequivalve foliated (*Crenatula Perna, Malleus, Avicula*)
(**) Ligament not marginal, contracted into a short space under the umbones, and not forming a tendinous tube under the shell
Family 17 *Pectinidæ* — Shell regular, compact not foliated (*Pedum, Lima, Plagiostoma, Pecten, Plicatula, Spondylus, Podopsis*)
Family 18 *Ostreidæ*
a Ligament partly external, shell foliated but nevertheless often acquiring great thickness (*Gryphæa, Ostrea Vulsella*)
b Ligament internal, shell delicate, papyraceous (*Placuna, Anomia*)
(***) Ligament either wanting or represented by a tendinous chord which sustains the shell
Family 19 *Rudista* — Shell very inequivalve (*Sphærulites, Radiolites, Calceola, Birostrites Discina Crania*)
Family 20 *Brachiopoda* — Shell adherent either immediately or by a tendinous chord mantle bilobate, the lobes separated anteriorly enveloping the body, two opposed, elongated, fringed arms near the mouth, rolled spirally when retracted (*Orbicula, Terebratula, Lingula*)

Class II Mollusca

Order 1 *Pteropoda* — Char No foot for creeping nor arms for progress or seizing the prey, two fins opposed and similar, proper for natation, body free and floating, some naked, others with thin semitransparent symmetrical shell (*Hyalæa Cleo Cleodora, Limacina, Cymbulia, Pneumodermon*)
Order 2 *Gasteropoda* — Animals with a straight body never spiral, nor enveloped in a shell which can contain the entire body, a foot or muscular disc along the whole length of the under part of the body serving for creeping, some naked, others protected by a dorsal shell [illegible] or less [illegible]
Section 1 *Hydrobranchiata* — Branchiæ whatever be their position, developed either in the form of a network, in laminæ, in a pectinated form, or in a ribbon-like shape The Gastropods of this section breathe water only
Family 21 *Tritonidæ* — Branchiæ external placed above the mantle, either on the back or on the sides and not being in any particular cavity (*Glaucus Eolis Tritonia Scyllæa Tethys Doris*)
Family 22 *Phyllidiadæ* — Branchiæ placed under the border of the mantle, and disposed in a longitudinal series around the body or on one side only not being in any particular cavity (*Phyllidia, Chitonellus Chiton, Patella*)
Family 23 *Semiphyllidiadæ* — Branchiæ placed under the border of the mantle, and disposed in a longitudinal series on the right side of the body only (*Pleurobranchus, Umbrella*)
Family 24 [illegible] — Branchiæ placed in a particular cavity [illegible] anteriorly near the neck, shell always external and covering the soft parts (*Parmophorus Emarginula Fissurella Pileopsis, Calyptræa, Crepidula Ancylus*)
Family 25 *Bullidæ* — Branchiæ placed in a particular cavity towards the posterior part of the back and covered either by the mantle or by an opercular escutcheon (*Bulla, Aplysia, Dolabella*)
Section 2 *Pneumobranchiata* — Branchiæ creeping, in in the form of a vascular network, on the wall of a particular cavity, the aperture of which is small, and can be contracted or dilated at will The Gastropods of this section breathe the [illegible] air
Family *Limnidæ* (See Limax)
Order 3 *Trachelipoda* — Body spiral in its posterior part, which is separated from the foot, and always lodged in a shell, the foot free, flattened, attached to the lower base of the neck or to the anterior part of the body, and serving for creeping, shell spirivalve and sheathing
Section 1 *Phytiphaga* — Trachelipods without a projecting siphon, and respiring in general by means of a hole, the greater part phytiphagous, and furnished with jaws, shell with the aperture entire, having at its base neither dorsal subascending notch nor canal
(*) Breathing air only, shell spirivalve unarmed, not distinctly nacreous
Family 26 *Helicidæ*
a Four tentacles (*Helix, Bulimus, Achatina*, &c)
b Two tentacles (*Auricula Cyclostoma*)
Family 27 *Limnæidæ* — Amphibious living in the water but coming to the surface to breathe shell with a sharp edged lip (*Planorbis, Physa Limnæa*)
(**) Breathing water only, branchiæ projecting in form of filaments laminæ, or tufts in the branchial cavity, shell often nacreous, and often also having protuberant parts on the surface
(*a*) Shell fluviatile, operculated the left border of which does not resemble a demi partition
Family 28 *Melanidæ* — Shell with disunited borders (*Melania, Melanopsis, Pirena*)
Family 29 *Peristomidæ* — Shell with united borders (*Valvata, Paludina, Ampullariæ*)
(*b*) Shell fluviatile or marine, the left border resembling a demi-partition
Family 30 *Neritidæ* — *Navicella, Neritina* (fluviatile), *Nerita Natica* (marine)
(*c*) Shell marine, the left border not resembling a demi partition
Family 31 *Janthinidæ* — Shell floating at the surface of the water (*Janthina*)
Family 32 *Macrostomidæ* Shell not floating having the aperture very wide no columella (*Siphonatus, Stomatella Haliotis*)
Family 33 *Plicacidæ* — Aperture of shell not very wide, plaits on the columella (*Tornatella Pyramidella*)
Family 34 *Scalaridæ* — Borders of the aperture united circularly, no plaits on the columella (*Vermetus, Scalariæ, Delphinula*)
Family 35 *Turbinidæ* — Borders of the aperture disunited (*Solarium Rotella, Trochus, Monodonta, Turbo Planaxis Phasianella, Turritella*)
Section 2 *Zoophaga* — Trachelipods with a projecting siphon and which only breathe water, which reaches the branchiæ by means of this siphon These feed on animal substances only are marine have no jaws, and are furnished with a retractile proboscis Shell spirivalve sheathing the soft parts with an aperture which is either canaliculated or notched, or turned up at its base
(*a*) Shell with a canal more or less long at the base of its aperture and the right border of whose lip does not change with age
Family 36 *Canalifera*
1 No constant process on the right lip of the shell (*Cerithium Pleurotoma Turbinella, Cancellaria Fasciolaria, Fusus Pyrula*)
2 A constant process on the right lip in all the species
α No processes on the spire (*Struthiolaria*)
β Processes on the spire (*Rancila Murex Triton*)
(*b*) Shell with a canal more or less long at the base of its aperture and the right border of whose lip changes its form with age, and has a sinus inferiorly
Family 37 *Alata* — Wing shells (*Rostellaria, Pterocera Strombus*)
(*c*) Shell with a short canal ascending posteriorly or with an oblique notch at the base of its aperture, this demicanal being directed towards the back
Family 38 *Purpurifera*
1 Canal ascending or recurved towards the back (*Cassis Cassidaria*)
2 An oblique notch directed backwards (*Purpura, Ricinula Monoceras, Concholepas Harpa, Dolium, Buccinum Eburna Terebra*)
(*d*) No canal at the base of the aperture but a subdorsal notch and plaits on the columella
Family 39 *Columellidæ* — *Columbella, Mitra, Voluta, Marginella Volvaria*
(*e*) Shell without a canal but having the base of its aperture notched or versant, and the whorls of its spire large compressed and enrolled in such a manner that the last whorl nearly entirely covers the others
Family 40 *Convolutidæ* — *Ovula, Cypræa, Terebellum, Ancillaria, Oliva, Conus*
Order 4 *Cephalopoda* — Mantle in form of a sac containing the lower part of the body, head projecting from the sac, surrounded by arms, which are not articulated [but furnished with suckers, and which environ the mouth, two sessile eyes, two horny mandibles to the mouth, three hearts*], sexes separate
Division 1 *Polythalamous Cephalopods* — Shell multilocular, enveloped completely or partially and which is inclosed in the posterior part of the animal, often with adherence
Family 41 *Orthoceratidæ* — Shell straight, or nearly so, with simple or not sinuous chambers (*Belemnites, Orthoceros, Nodosaria, Hippurites, Conulites*)
Family 42 *Lituolidæ* — Shell partially spiral; last

* The characters included within brackets apply only to the 4d division of Lamarck's order

whorl continued in a straight line (*Spirula, Spirulina, Lituola*)

Family 43 [illegible] re eccentric [illegible]

Family 44 [illegible] roidal, or oval, with [illegible] whorls or partitions united *en tunique* (*Miliola, Cyclolina, Vermia*)

Family 45 *Radiolidæ* — Shell discoid with a central spire, and partitions radiating from the centre to the circumference (*Orbitolina, Lenticulina, Placentula*)

Family 46 *Nautilidæ* — Shell discoid, with a central spire, and partitions which do not extend from the centre to the circumference (*Discorbis, Siderolites, Polystomella, Nautilus, Nummulites, Nonionites*)

Family 47 *Ammonitidæ* — Shell [illegible] with chambers sinuous at the edges (*Ammonites, Orbulites, Ammonoceras, Turrilites, Baculites*)

[From regard being only had to the characters afforded by the shell the Polythalamous Cephalopods of Lamarck form the least natural of his groups Many of the genera, especially the microscopic species belong to a different primary division of the animal kingdom, and one genus, *Gyrogona*, to another kingdom of nature, it being a fossil seed The genera *Belemnite* and *Spirula* which are true Cephalopods have been removed to the higher-organized or Dibranchiate order of Cephalopods]

Division 2 *Monothalamous Cephalopods* — Shell unilocular, entirely external, and enveloping the animal

Family 48 Genus *Argonauta*

Division 3 *Sepiary Cephalopods* — No shell either internal or external, a solid free cretaceous or horny body contained in the interior of the greater part of the animals

Family 49 Genera *Octopus, Loligopsis, Loligo, Sepia*

Order 5 *Heteropoda* — Body free elongated, swimming horizontally, head distinct, two eyes, no arms surrounding the head, no feet under the belly or under the throat for creeping, one or more fins without any regular order, and not disposed by pairs

Family 50 Genera *Carinaria, Pterotrachea, Phyllirœ*

Modifications of more or less importance in the classification of the Mollusca have been proposed by Oken [illegible], 1816) Ferussac (1819) De Blainville [illegible] J E Gray (*London Medical Repository*) Dr Hayes, Ring and others For an account of the structure and growth of shells see CONCHOLOGY

MALACOPTERYGIANS, *Malacopterygii* (Gr μαλακος and πτερυξ *a wing*) The name of a division of the class of fishes comprehending all those which with an internal osseous skeleton have the rays supporting the fins soft, except the first ray of the dorsal and pectoral fins

MALACOSTRACANS (Gr μαλακος, οστρακον, *a shell*) The name of a division of the class Crustaceans including those which are covered with a crust softer than the shell of the Mollusks but firmer than the covering of the Entomostracans (See that word) The term *Malacostraca* was first applied by Aristotle to the *Crustacea* of the moderns, being used by him in a comparative sense, as contrasted with the *Ostracoderma*, which are the modern *Testacea*

MALÆIC ACID An acid obtained by distilling malic acid at a temperature of about 160° When malic acid is exposed for a longer time to a moderate heat, it becomes modified into *paramalaic acid*

MALAGMA (Gr μαλασσειν *to soften*) A poultice

MALARIA (Ital mal aria, *a bad air*) The exhalation of marshy districts which produces intermittent fevers This term has now become of general application, but it was long restricted to that district of Italy extending from Leghorn to Terracina in one direction and from the sea to the Apennines in another Even in the time of Horace Rome was deserted two months in the year on account of the dangers of the malaria

MALIC ACID [illegible] A peculiar acid contained in the [illegible] several other fruits it may be obtained also from the berries of the *Sorbus aucuparia*, or mountain ash, and has hence been called *sorbic acid*

MALICE (Lat malitia), in the English Law, does not necessarily bear the signification of particular ill feeling towards an individual, but is a term directly importing wickedness in the commission of an act, and excluding a just cause or excuse (See MURDER) Malicious injury to property is in some instances a felony, in others a misdemeanour, punishable, in some on summary conviction the law respecting which is consolidated in one of the statutes commonly called Peel's Acts (7 & 8 G 4 c 30) By sect 25 of this act it is expressly declared that the word malice, in relation to these injuries, bears its legal and not its popular signification, it being there declared that the act applies, whether the offence shall be committed from malice conceived against the owner of the property, or otherwise" In civil actions for injuries to which malice is essential, *e g* slander, libel &c, the question of the existence of malice is one, in general, for the jury, but under certain circumstances, it may be implied by the court from the absence of reasonable and probable cause In actions for malicious prosecution

MALLEABILITY (Lat *malleus, a hammer*) The property of being susceptible of extension under the blows of a hammer It is especially characteristic of some of the metals, and in this quality gold exceeds all the others common gold leaf is not more than a two hundred thousandth part of an inch in thickness, five grains may be thus extended so as to cover a surface of more than 270 square inches *See* DUCTILITY

MALLEUS (Lat *a hammer*) One of the small bones of the internal ear, attached to the *membrana tympani*, somewhat in shape resembling a hammer

MALLEUS A genus of Ostracean Bivalves, characterized by having, in addition to the simple pit for the ligament, a notch on the side of the ligament for the passage of a byssus The species of this genus are called "hammer-oysters" The most noted is the *Ostrea malleus* of Linnæus which has the cardinal region of the shell [illegible] nothing like the head of a hammer, of which the [illegible] valves, extended transversely, represent the handle It is a native of the Indian archipelago, and still ranks among the number of rare and high priced shells

MALLOW (Lat malva), is a weed common by hedgerows and waysides in Europe It has mucilaginous properties, and has been employed in the preparation of emollient poultices, in the same way as the marsh mallow Its fruit is a depressed disk, and is called by the country people "cheeses" (Fr *Fromageon*)

MALLUM The public assembly or meeting of the people according to the usage of the old Teutonic nations Under the Carlovingian monarchs the mallum appears to have been summoned by the missus, or deputy of the sovereign There is a separate mallum for every leading state or kingdom which composed the empire, and it was attended by the notables of all the various races of inhabitants (Roman Frankish, Gothic, &c), and in some instances by the Scabini or Echevins, who represented the communities of the towns

MALMSEY A strong and fine flavoured sweet wine, made in Madeira of grapes which have been allowed to shrivel upon the vine, it is of a deep golden hue It contains between 16 and 17 per cent of alcohol

MALT, is used to designate grain which has become sweet in consequence of incipient germination Malt forms the principal ingredient in the manufacture of beer and is not used for any other purpose Three different kinds are employed 1 pale or amber malt, which yields the saccharine or fermentable extract, 2 brown or blown malt which is not fermentable, but is used to impart flavour, 3 roasted or black, or as it is sometimes called patent malt, which is employed instead of burnt sugar merely as a colouring matter The process followed in the manufacture of malt is very simple, and has been carried on for a very long period nearly in the same manner in which it is conducted at present (See *Thomson's Chemistry*)

The manufacture of malt has been carried on in England to a great extent from a very early period, but it is singular that notwithstanding the products obtained from it have always formed the principal beverage of the great bulk of the people the consumption of malt varied very little from the beginning of the last century till within the last half dozen years This extraordinary result so different from what would have been *a priori* anticipated is ascribable partly to the increased duties laid on malt but still more to the greater increase of those laid on beer, its principal product No doubt however it has been partly, also, occasioned by the change that has taken place in the mode of living by the introduction and universal use of tea, coffee and other articles substituted in the place of beer But the increase that has taken place in the consumption of malt since the reduction of the duty on it in 1822, and the repeal of the beer duty in 1830, seems to prove that the duties were at least quite as instrumental in checking the consumption as the introduction of the articles alluded to Malt was first made to contribute to the public revenue in England in 1667 in Scotland in 1713, and in Ireland in 1785 From the period at which the duty was first levied on malt down to the present time, it has been subject to numerous changes, a succinct account of which will be found in the *Penny Cyclopædia* The present duty on malt from barley is 2*s* 7*d* per bushel, and from bere or bigg 2*s* The quantity of malt charged with duty in the United Kingdom during the three years ending 1830, averaged nearly 500,000,000 bushels, and the revenue derived from it averaged, in the same period, [illegible]

MALTHA A mineralogical term applied to *mineral pitch*, an inflammable bituminous product probably de-

rived from the exsiccation of mineral tar A cement containing mineral pitch was used by the ancients for plastering their walls, and was composed of pitch wax, plaster, and grease Another sort, with which the Romans used to plaster the interior of their aqueducts, was made of lime incorporated with melted pitch The various bituminous pavements which have lately come into use are similar combinations

MALVACEÆ (Malva one of the genera) A natural order of monopetalous Exogenous plants, with polypetalous flowers and monadelphous stamens The species are herbs, bushes, or trees, and are found all over the [illegible] parts of the world, especially the [illegible] are in many cases large and handsome, but the order is chiefly interesting from the *Gossypium*, or true cotton plant, forming a part of it Another species is the mârsh mallow, or *Althæa officinalis*, and some yield a fibre fit for manufacture into [illegible]

MAMELUKE (Arabic, memalik, *a slave*) A name applied to the male slaves imported from Circassia into Egypt by the master of that country In the 13th century, when the countries in the vicinity of Mount Caucasus were ravaged by Gengis Khan, Nojmedden, sultan of Egypt purchased several thousands of the natives of those regions, especially Turks, and formed them into an armed body of guards These guards, or Mamelukes in the sequel, seized on all the power of the country murdered the sultan Touran Shah, A D 1258, and made Ibeg, one of their own number, his successor After that period the Mamelukes, whose numbers were continually enriched by importations from their own country governed Egypt 263 years (See *Gibbon*, vol xi) This military sovereignty was destroyed by Selim I the Turkish sultan, who took Cairo 1517 Nevertheless the Mamelukes under their 24 beys continued for 200 years more to exercise a power scarcely inferior to that of the Turkish pachas, whom, in the 18th century they reduced to mere ciphers in the government Their power was again considerably broken by the French invasion under Buonaparte, to which they offered a determined opposition After the abandonment of Egypt by the French, the struggle between the beys and the pachas was renewed finally, in 1811, the present pacha Mohammed Ali, having invited the principal leaders of the Mamelukes to a banquet, slew 470 of them by treachery, and compelled the remainder to submission

MAMERTINE PRISONS *See* PRISONS

MAMMA'LIA (Lat mamma *a teat*) The most highly organized class of animals, at the head of the great scale of organized nature They possess mammary glands and such [illegible] is developed in the womb Their external distinguishing marks are a covering of hair and teats or nipples but to the manifestation of these two characters there are a few exceptions The principal anatomical character is the condition of the lungs which are suspended freely in a thoracic cavity separated by a perfect diaphragm from the abdomen The entire tissue of the lungs is occupied by extremely minute air-cells, with highly vascular parietes so that the air inspired is rapidly decomposed and breathing can be safely suspended only for a short time The whole mass of circulating blood is transmitted to the lungs by the mechanism of a pulmonary auricle and ventricle equally perfect, and inferior only in power to the systemic auricle and ventricle, which subsequently propel the aerated blood to the general system the heart consequently consists of four distinct cavities

The upper jaw of the Mammalia is fixed the two rami of the lower jaw consist each of a single bony piece and are articulated by a convex or flat condyle to the base of the zygomatic process and not the tympanic element of the temporal bone With a few exceptions the jaws of the Mammalia are armed with teeth these are arranged in a single row, are lodged in sockets, sometimes by two or more fangs, and are never anchylosed to the substance of the jaw A deciduous tooth is never succeeded by more than one corresponding tooth in the vertical direction The tongue is fleshy, well developed, with the apex more or less free The posterior openings of the nasal passages are protected by the 'soft palate' and the larynx or opening of the wind-pipe, by an 'epiglottis" The alimentary canal varies with the nature of the food, but the 'cæcum coli" is usually single The rectum commonly terminates by a distinct aperture behind the urinary and generative orifices

The bodies of the vertebræ have their articular surfaces more or less flattened, and always joined together by a series of concentric ligaments with interposed glairy fluid The cervical vertebræ, with one or two exceptions are seven in number The atlas is articulated by two surfaces to two occipital condyles, developed from the ex-occipital elements With two exceptions, the coracoid bone appears as a small process or appendage of the scapula The sternum is narrow, and consists of a simple longitudinal series of bones

The brain presents its highest state of development in the Mammalia it consists of a cerebrum which is generally [illegible] with laminæ [illegible] tubercula quadrigemina, hence called 'bigeminal bodies" they are situated on the upper part of the crura cerebri and are generally concealed by the overlapping posterior cerebral lobes The rudiment of the "corpus callosum," or great cerebral commissure, first begins to be distinctly recognizable in the Implacental Mammalia; and in a state of normal development, or where it bears a direct proportion to the size of the corpora striata or hemispheres of the brain, it is peculiar to the Placental Mammalia

The eyes of the Mammalia are never complicated with a pecten or marsupium, a choroid gland, or sclerotic bony plates

The organ of hearing acquires in the Mammalia a fully developed cochlea with a "lamina spiralis" there are three distinct ossicles in the tympanum, the drum, or membrana tympani, is usually concave towards the meatus which generally commences with a more or less complicated external ear supported by a distinct fibro-cartilage

The Mammalia without exception bring forth their young alive hence they were termed by Aristotle *Zootoca* This phenomenon is however by no means peculiar to the present class but it was supposed that they differed from other viviparous animals as the viper in the development of the germ by means of a placenta Such however is not the case with the marsupial animals and probably not with the Monotremes, and as the absence of the placenta is associated with several important modifications of structure in the species so developed by which they approximate to the characters of the oviparous classes the class Mammalia may be primarily divided into two great sub classes, called *Placentalia* and *Implacentalia*

Before however the subdivisions of these groups are characterized it may be advantageous to trace the principal steps by which the present views of the affinities and classification of the Mammalia have been acquired

Aristotle although he has left no evidence of a systematic arrangement of the Mammalia in which the succession and subordination of the orders and families are methodically laid down was nevertheless the first who indicated the larger groups into which the Mammalia resolved themselves, according to their natural affinities

We may infer e g from one part of the *Historia Animalium* that the *Zootoca* would be divided according to the nature of their locomotive organs into three sections —1st *Dipoda* or bipeds, 2d *Tetrapoda* or quadrupeds and 3d *Apoda* or impeds Man is cited as the type of the first and the whole tribe is included in the last of these primary groups, the second embraces all the rest of the class which in common language are called quadrupeds These Aristotle subdivides into two great natural groups according to the modifications of the organs of touch In the first a part of the digits is left free for the exercise of the tactile faculty the nail or claw being placed upon one side only, in the second group the extremities of the digits are enclosed in hoofs

The first of these subdivisions is acknowledged to be natural and has been retained by modern mammalogists under the name of *Unguiculata* The following families were characterized in it by Aristotle —1st, those which have the front teeth trenchant and the back teeth flattened as the *Pitheconda* or apes and the *Dermaptera* or bats, 2d those with acuminated trenchant or carnivorous teeth which Aristotle calls *Karcharadonta*, 3d, the Rodent quadrupeds, which are indicated by a negative dental character With respect to the hoofed or ungulate quadrupeds Aristotle points out subordinate groups and characterizes them by modifications of the feet Thus, the 1st are the *Polyschidæ* or multungulate quadrupeds as the elephant, the 2d are the *Dischidæ* or bisulcate quadrupeds, as the Ruminants and hog, the 3d are the *Aschidæ*, or solidungulate quadrupeds as the horse and ass From the imperfect mode in which the zoological writings of the Stagyrite have been handed down we have not the means of knowing whether Aristotle viewed any of the groups thus defined in their relation of subordination to each other or in the spirit of modern classification, for although they agree in relative value with those termed *Classes*, *Orders*, *Families*, *Genera* yet Aristotle applies to each of them the same denomination, viz *genos*, or genus

The honour of having formed an original scheme for the classification of quadrupeds, in which the subordination of characters and of groups is attended to, is due to our great countryman Ray From Aristotle to his time the classification of the Mammalia received no improvement worthy of notice Ray's arrangement is given in a tabular form, in his *Synopsis Methodica Animalium Quadrupedum*, and is as follows —

MAMMALIA

A Table of Viviparous Four-footed Animals

Viviparous hairy animals or quadrupeds are, —

- *Ungulate*, and these either
  - *Solidipedous* as the Horse, Ass, Zebra
  - *Bisulcate*, which are
    - *Ruminants* with horns, that are
      - Persistent, as in the Ox, Sheep, Goat,
      - or
      - Deciduous as in the Stag
    - *Not Ruminants* as the Hog
  - *Quadrisulcate*, as the Rhinoceros, Hippopotamus
- *Unguiculate*, whose feet are either
  - *Bifid* as in the Camel, or
  - *Multifid*, which are
    - With *digits* adhering together, and covered with a common integument, so that the extremities alone are visible at the margin of the foot, and are covered with obtuse nails as in the Elephant
    - With *digits* in some measure distinct, and separable from each other, the nails being
      - *Depressed*, as in Apes,
      - or
      - *Compressed* where the incisor teeth are
        - *Many*, in which group all the animals are carnivorous and rapacious, or at least insectivorous, or subsist on insects, with vegetable matter
          - *The larger ones* with the
            - *Muzzle short* and head rounded, as the Feline tribe, or with the
            - *Muzzle long*, as the Canine tribe
          - *T* [illegible] tribe
        - *Two very large* of which tribe all the species are phytivorous, as the Hare

The anomalous species he afterwards observes among the viviparous quadrupeds with a multifid foot are the hedgehog the armadillo the mole the shrew the tamandua, the bat and the sloth The first five of these species agree with the *canine* and *vermine genera* in their elongated muzzle but differ from them in the form and disposition of the teeth the tamandua indeed is altogether destitute of teeth the remaining two anomalous species have the muzzle shortened

Linnæus defines the class Mammalia as follows — *Heart* with two auricles and two ventricles, blood warm *lungs* respiring reciprocally (*pulmones respirantes reciproce*), *jaws* incumbent covered armed with teeth in most penis intrans, generation viviparous Lutterous, *senses* tongue nostrils eyes ears tactile papillæ, *covering* hairs few in tropical very sparing in aquatic mammals, *support* four feet except in those which are entirely aquatic in which the posterior feet are bound together in the fin of the tail *Anal* in most

Linnæus like Aristotle and Ray founds his primary divisions of the class Mammalia on the locomotive organs, but his secondary divisions or orders are taken chiefly from modifications of the dentary system The following is the scheme of his arrangement —

Mammalia

Unguiculate	[illegible] lower jaw	*Bruta*
	[illegible] incisors 0	*Cete*
	[illegible] incisors 1	*Primates*
	[illegible] 10) incisors 1	*Feræ*
Ungulate	Front teeth in both upper and lower jaw	*Pecora*
	Front teeth none in the upper jaw	*Jumenta*
Multicuspidate	Teeth variable	*Glires*

(From the *Systema Naturæ* ed 16 Holmiæ p 24)

On comparing the three preceding systems it will be found that the most important errors of arrangement have been committed not by Aristotle but by the modern naturalists Both Ray and Linnæus have mistaken the character of the horny parts enveloping the toes of the elephant which do not defend the upper part merely as is the case with claws but embrace the under parts also, forming a complete case or hoof

With respect to Linnæus however it must be observed that although he has followed Ray in placing the elephant in the unguiculate [illegible] upeds he has not overlooked the great [illegible] which the latter naturalist adopted from Aristotle as is evident from the table above quoted He erred, perhaps in not giving names to those primary divisions

From the manner in which Linnæus has arranged his orders in this table, it would seem that he had the circular progression of affinities in view The walrus among *Bruta* connects the commencement of the chain with *Cete* which forms the last link, but whether or not he had perceived the affinity of *Elephas* to the *Glires* and intended it as the transitional genus to that order, as Cuvier has subsequently shown, is less certain

Pallas, in his great posthumous work entitled *Zoographia Rosso Asiatica*, has given the following outline of a *Systema Mammalium* —

Classis I ACTANTIA

Ordo I *Feræ* — 1 Felis, 2 Canis, 3 Ursus, 4 Meles, 5 Viverra, 6 Mustela, 7 Phoca

Ordo II *Semiferæ* — 1 Simia 2 Lemur 3 Didelphys, 4 Vespertilio, 5 Talpa, 6 Sorex, 7 Erinaceus

III *Glires* — 1 Hystrix, 2 Castor, 3 Lepus, 4 Arctomys, 5 Spalax 6 Cricetus, 7 Mus, 8 Myoxus 9 Myoxus 10 Dipus 11 Sciurus

IV *Ruminantia* — 1 Camelus, 2 Moschus, 3 Cervus, 4 Capreolus 5 Bos, 6 Antilopes

V *Anomalopoda* — 1 Equus, 2 Sus, 3 Rhinoceros, 4 Hippopotamus

VI *Belluæ* — 1 Elephas 2 Rosmarus

VII *Cetacea* — 1 Manatus, 2 Delphinus, 3 Physeter 4 Balæna 5 Ceratodon

We shall now proceed to the arrangement of the Mammalia proposed by Cuvier in the last edition of the *Regne Animal* and this is the more interesting as in giving the outline of this method Cuvier develops the principles on which his divisions are founded

The characters by which Mammalia differ most essentially one from another are derived from the organs of touch from which results their degree of dexterity, and from the organs of mastication which determine the nature of their food and upon these very closely depends not only every thing which is connected with the digestive functions but a variety of other circumstances relative even to their degrees of intelligence

The perfection of the organs of touch is estimated by the number and mobility of the digits and the extent to which they are enclosed in a claw or in a hoof A hoof which completely encloses that part of the digit which touches the ground precludes the exercise of it as an organ of touch or of prehension The opposite extreme is where the nail in the form of a simple lamina covers only one side of the end of the digit leaving the other side in possession of all its delicacy of tact

The kind of food is indicated by the molar teeth to the form of which the articulation of the jaws invariably corresponds

For cutting flesh the molar teeth must be trenchant and serrated, and the jaws fitted together so as to move like the blades of a pair of scissars, simply opening and closing in the vertical direction

For bruising grains and roots the molar teeth must have flattened crowns and the jaws a horizontal motion and further that the grinding surface may be always unequal like a millstone, the teeth must be composed of substances of different degrees of density and consequently wearing down in different proportions

The unguiculate quadrupeds are all of necessity herbivorous or with flat crowned molares because the conformation of their feet does not permit them to seize living prey

"The unguiculate animals are susceptible of more variety They are not limited to one kind of food, and besides the consequent variation in the form of their molares they differ materially from each other in the mobility and sensibility of their digits There is, moreover a characteristic which prodigiously influences their dexterity, and gives variety to their modes of action it is the faculty of opposing a thumb to the other fingers, so as to seize the smallest objects, which constitutes a

* Genus *Vermineum*, from their wormlike form

hand, properly so called This faculty is carried to its highest degree of perfection in man, in whom the whole anterior extremity is free, and can be exclusively employed in prehension These different combinations, which strictly determine the nature of the several mammiferous animals, have formed the grounds for their distribution into the following orders —

"Amongst the unguiculate animals the first is man, who in addition to his peculiar privileges in every other respect is distinguished zoologically by possessing hands on the anterior extremities alone, the posterior extremities being destined to sustain him in an erect position

"The order which comes nearest to man — that termed *Quadrumana* — has hands on the four extremities

"Another order, termed *Carnivora*, has not the thumb free and opposable on the anterior extremities

These three orders possess, likewise, severally, the three kinds of teeth, viz molars, lanaries, and incisors

"The quadrupeds of the fourth order, viz the *Rodentia*, have the digits differing little from those of the *Carnivora*, but they want the lanary teeth and have the incisors of a form and disposition altogether peculiar to themselves

"To these succeed the animals whose digits now become much cramped being sunk deep in large and, most commonly crooked claws They are further defective in the absence of incisor teeth, some of them even want the lanaries, and others are altogether destitute of dentary organs We shall comprehend them under the term *Edentata*

"This distribution of unguiculate animals would be perfect, and would form a very regular chain if New Holland had not lately furnished us with a small collateral chain, composed of the *Marsupial* animals all the genera of which, while they are connected by a general [illegible] at the same time correspond in their dentition and diet some to the *Carnivora*, others to the *Rodentia*, and a third tribe to the *Edentata*

"The ungulate animals are less numerous and present [illegible] form

The *Ruminantia* by their cloven feet, their want of upper incisors, and their complicated stomach, form a very distinct order

"All the other quadrupeds with hoofs might be united into a single order, which I would call *Pachydermata* or *Jumenta*, the elephant excepted, which might form an order of itself, having some remote affinities to the order *Rodentia*

"Last of all come the Mammalia which have no hinder extremities, and whose fish-like form and aquatic life would induce us to form them into a separate class, if their economy was not in every other respect the same as in the class in which we shall leave them They are the warm blooded fishes of the ancients, or the *Cetacea* which, combining the powers of other Mammalia with the advantage of being sustained upon the watery element [illegible] to be found in the whole animal creation *Règne Animal*, 2d ed p 65)

The proofs that this small collateral chain of mammals which New Holland has lately furnished forms a distinct primary group in that class, have been successively established in the memoirs by Mr Owen on the Generation the Structure of the Brain the Osteology and the Classification of the Marsupial Animals and on the Mammary Glands the Ovum and the Young of the Ornithorhynchus, published in the *Philosophical* and *Zoological Transactions* In the latest classifications of the Mammalia (Charles Lucien Buonaparte *Systema Vertebratorum*, Martin, *History of Mammalia*) the binary division of the class Mammalia founded on the anatomical and physiological facts detailed in those memoirs has been adopted

The first of these divisions, which we have proposed to call subclass PLACENTALIA, includes the following orders —

I	*Bimana* — Ex	Man
II	*Quadrumana* — Ex	Ape, Monkey, Lemur
III	*Cheiroptera* — Ex	Bat
IV	*Insectivora* — Ex	Shrew Mole, Hedgehog
V	*Carnivora* — Ex	Dog, Civet, Cat, Weasel, Bear, Seal
VI	*Cetacea* — Ex	Porpoise, Whale
VII	*Pachyderma* — Ex	Manatee, Hippopotamus Elephant, Hog, Horse
VIII	*Ruminantia* — Ex	Camel, Deer, Antilope, Ox
IX	*Edentata* — Ex	Sloth, Anteater, Manis, Armadillo
X	*Rodentia* — Ex	Rat, Squirrel, Rabbit, Guinea-pig

The second division, or the subclass IMPLACENTALIA, in- [illegible]

XI	[illegible] — Ex	Wombat, Kangaroo, Opossum
XII	[illegible] — Ex	Ornithorhynchus

[illegible] introduced into the Cuvierian system in the binary subdivision of the class, there are a few minor differences in the above classification on some explanation is requisite

From Pallas's great group of *Semiferæ*, the families of which he conceived to be linked together by an uninterrupted series of affinities the *Simiæ* and *Opossums* [illegible] the Cuvierian system to form the types [illegible] orders we conceive that the modification of the locomotive system, by which the bat is enabled to fly, is as cogent [illegible] the type of an order, as [illegible] of the ape and lemur The *Insectivora*, also, in their continuous dental series, comparatively feeble canines, and generally perfect clavicles, seem to claim equivalency of rank with the remaining *Carnassiers* of the Cuvierian system, which will thus correspond with the *Feræ* of Pallas From the seals, with their largely developed brains, acuminated teeth, and rudimental hind fins, the transition seems most natural to the piscivorous *Cetacea* The herbivorous *Cetacea*, for reasons given at length in the *Proceedings of the Zoological Society* 1838, we propose to remove to [illegible] true *Cetacea* they [illegible] No linear arrangement of the orders of a class can ever express more than a part of their mutual affinities If we were to place them according to their natural relations, the *Quadrumana* would occupy the centre of the class, as from these the greatest number and variety of affinities seem to radiate Thus the genus *Galeopithecus* leads to the *Cheiroptera* the *Lemurs* to the *Carnivora* the *Loris* to the sloths among the *Edentata*, while with the *Rodentia* the *Lemurs* claim close alliance through the *Cheiromys* or *Aye-aye* The *Insectivora* closely approximate the extreme of the implacental group while [illegible] join the other The *Rodentia* approach still more closely to the marsupial wombat The *Rodentia* again by the *Capybara* and the extinct *Toxodon* evidently merge into the *Pachyderma* and the Patagonian hare seems to lead them to the small musk-deer among the *Ruminantia* The *Edentata* have lost in the mailed *Glyptodon* a transitional step to the thick and tubercular-hided rhinoceros The twofold affinity of the *Cetacea* to the seals on the one hand and to the manatee and the hippopotamus on other has been already alluded to

In this reticulate interweaving of affinities under which image the true relations of the Mammalia as at present known can alone be impartially and [illegible] it will be observed that as the series [illegible] *Quadrumana* they likewise descend, so that the scheme may be likened to a cone, of which Man is the culminating point

From different points at the base of this cone the connection may be traced with the inferior classes the most direct transition appears to be made by the Monotremes to the class of Reptiles The extinct *Enaliosauria* once formed a transition, perhaps not less close, from the crocodiles to the *Cetacea* The *Pterodactyles* seem to have connected the *Cheiroptera* with the flying oviparа The Mammalia which present the closest relations to birds are the marsupial *Petaurists* and the arboreal *Rodents*, but the hiatus is great Between mammals and fishes, the reptiles interpose at all points, the extinct *Ichthyosaurus* seems to have been the transitional step from the *Cetacea* to the true fishes

MAMMA'LOGY (Lat mamma, *a teat*, Gr λογος, *a discourse*) The science of Mammals the doctrine of their organization, habits, properties, and classification See MAMMALIA

MA'MMIFERS *Mammifera* (Lat mamma, *a teat*, fero *I bear*) A term synonimous with Mammals, or Mammalia

MAMMI'LLARY (Lat dim mammilla) In Geology a surface studded over with rounded projections

MA'MMON (Syr) used in scripture to signify either riches or the god thereof By poetic licence Milton makes Mammon one of the fallen angels and has pourtrayed his character in some admirable lines which are too well known to be cited here

MA'MMOTH A word of Tartar origin, applied in Si- [illegible]

[illegible] the newer tertiary deposits in England, the continent of Europe and Asia In Siberia an entire animal has been discovered, with the soft parts preserved in the frozen soil of the banks of a Siberian river The particulars of [illegible] discovery are as follow In 1799, a Tungusian, named Semonoff, usually went to hunt and fish at the peninsula at Tamut, after the fishing season of the Lena was over had constructed for his wife some cabins on the banks of the lake Oncoul, and had embarked to seek along the coasts for mammoth horns (tusks) One day he saw among the blocks of ice a shapeless mass but did not then discover what it was In 1800 he perceived that this object was more disengaged from the ice, and that it had two projecting parts, and, towards the end of the summer 1801, the entire side of the animal and one of his tusks were quite free from ice

The summer of 1802 was cold, but, in 1803, part of the ice between the earth and the mammoth for such was the object, having melted more rapidly than the rest the plane of its support became inclined, and the enormous mass fell by its own weight on the bank of sand In March, 1804, Schumarhoff came to his mammoth, and, [illegible] with a merchant [illegible] Adams gives the [illegible] "Two [illegible] overy of the mammoth, I fortunately traversed these distant and desert regions, and I congratulate myself in being able to prove a fact which appears so improbable I found the mammoth still in the same place but much mutilated The [illegible] because the Tungusians [illegible] had recovered, there was no obstacle to prevent approach to the carcass of the mammoth, the proprietor was content with his profit from the tusks and the Jalutski of the neighbourhood had cut off the flesh, with which they fed their dogs during the scarcity Wild beasts, such as white bears, wolves, wolverines, and foxes, also fed upon it, and the traces of their footsteps were seen around The skeleton, almost entirely cleared of its flesh, remained whole, with the exception of one fore-leg, the spine, from the head to the os coccygis, one scapula the bones of the other three extremities were still held together by the ligaments and by parts of the skin The head was covered with a dry skin one of the ears, well preserved, was furnished with a tuft of hairs All these parts have necessarily been injured in transporting them a distance of 11 000 wersts (7330 miles), yet the eyes have been preserved and the pupil of the eye can still be distinguished This mammoth was a male, with a long mane on the neck but without tail or proboscis (The places of the insertion of the muscles of the proboscis are it is asserted visible on the skull, and it was probably devoured, as well as the end of the tail) "The skin, of which I possess three fourths is of a dark-grey colour, covered with a reddish wool and black hairs The dampness of the spot where the animal had lain so long had in some degree destroyed the hair The entire carcass, of which I collected the bones on the spot is 4 archines (9 feet 4 inches) high and 7 archines (16 feet 4 inches) long from the point of the nose to the end of the tail, without including the tusks which are a toise and a half (9 feet 6 inches) measuring along the curve the distance from the base or root of the tusk to the point is 3 feet 7 inches in length, the two together weighed 360 lbs avoirdupois, the head alone with the tusks weighs 11 poods and a half (414 lbs avoirdupois) The principal object of my care was to separate the bones, to arrange them, and put them up safely which was done with particular attention I had the satisfaction to find the other scapula, which had remained not far off I next detached the skin of the side on which the animal had lain, which was well preserved This skin was of such extraordinary weight that ten persons found great difficulty in transporting it to the shore After this I dug the ground in different places to ascertain whether any of its bones were buried but principally to collect all the hairs which the white bears had trod into the ground while devouring the flesh Although this was difficult from the want of proper instruments I succeeded in collecting more than a pood (36 pounds) of hair In a few days the task was completed, and I found myself in possession of a treasure which amply recompensed me for the fatigues and dangers of the journey, and the considerable expenses of the enterprise The place where I found the mammoth is about 60 paces distant from the shore and nearly a hundred paces from the escarpment of the ice from which it had fallen The escarpment occupies exactly the middle between the two points of the peninsula, and is three wersts long (two miles), and in the place where the mammoth was found this rock has a perpendicular elevation of 30 or 40 toises Its substance is a clear pure ice, it inclines towards the sea its top is covered with a layer of moss and friable earth, half an archine (14 inches) in thickness During the heat of the month of July, a part of this crust is melted but the rest remains frozen Curiosity induced me to ascend two other hills at some distance from the sea they were of the same substance, and less covered with moss In various places were seen enormous pieces of wood of all kinds produced in Siberia, and also mammoths horns [illegible] appeared between the hollows of the rocks [illegible] astonishing freshness How [illegible] collected is as curious as difficult to resolve The inhabitants of the coast call this kind of wood *adamcina*, and distinguish it from the floating pieces of wood which are brought down by the large rivers to the ocean, and collect in masses on the shores of the Frozen Sea the latter are called *mackena* I have seen, when the ice melts, large lumps of earth detached from the hills mix with the water, and form thick muddy torrents, which roll slowly towards the sea The earth forms wedges which fill up the spaces between the blocks of ice The [illegible] ment of ice was [illegible] feet high and [illegible] ground at [illegible] of the Lungusian the animal was, when [illegible] new [illegible] below the surface of the ice, &c On arriving with the mammoth at Boschaya, our first care was to separate the remaining flesh and ligaments from the bones, which were then packed up When I arrived at Jakutsk I had the good fortune to repurchase the tusks and from thence expedited them to St Petersburg This [illegible] the museum of the academy, and the skin [illegible] head and feet" A part of the skin and some of the hair of this animal, were [illegible] Mr Adams to Sir Joseph Banks, who presented them to the museum of the Royal College of Surgeons The hair is entirely separated from the skin, excepting in one very small part, where it still remains attached It consists of two sorts — common hair and bristles, that remaining fixed on the skin is of the colour of the camel, an inch and a half long very thick set and curled in locks it is interspersed with a few bristles, about three inches long, of a dark reddish colour The skin when first brought to the museum was offensive, it is now quite dry and hard, and where most compact is half an inch thick Its colour is the dull black of the living elephant's skin

MAN (Germ mann, probably from the Lat *humanus* or *mens*) Of all living beings on the surface of this planet the first is man, who, in addition to his peculiar privileges in every other respect, is distinguished zoologically by possessing a hand on the anterior extremities only the posterior or lower limbs being destined to sustain him in an erect position He is, however, naked, and without natural defensive or destructive weapons It is the modifications of the bones and muscles of the lower extremities and especially of the feet, that constitute the most striking anatomical characters of the human species but with these are associated many other characteristic conditions of the general frame-work of the body which as they have been nowhere so accurately, truly and eloquently set forth as in the lectures of Professor Green, we shall take the liberty to give in the words of that philosophic anatomist and accomplished writer

In a comparison of the frame and capabilities of man with those of the inferior animals, if we take the human frame as the ideal standard of form it will be found that all others present so many declensions from the idea by exaggeration or defect, and it will be found from this survey that man is unquestionably endowed with that structure, the perfection of which is revealed in such a balanced relation of the parts to a whole as may best fit it for a being exercising intelligent choice, and destined for moral freedom It is not therefore, an absolute perfection of the constituents singly, but the proportional development of all, and their harmonious constitution to One for which we contend, — a constitution which implies in a far higher degree than in any other animal a balanced relation of the living powers and faculties, and which requires therefore in man pre-eminently the endowment of rational will as necessary for the control and adjustment of the balance Man has not the quick hearing of the timid herbivorous animals but it was not intended that he should catch the sound of distant danger, and be governed by his fears he has not the piercing sigh [illegible] but [illegible] or a [illegible] the perfect proportion of man which we observe in the inferior animals may be regarded as deformities by exaggeration or defect, dependent upon a preponderance of a part that necessitates a particular use or the absence of a part that deprives the animal of a power, and in both instances alike abrogates that freedom for which provision is made in the balanced relation of the constituents of the human fabric, which permits the free choice of means and the adaptation to any purpose determined by an intelligent free-will Dilate the head, and you have a symptom of disease, protrude the jaws, you have a voracious animal, lengthen the ears, timidity is expressed, let the nose project and the animal is governed by its scent, enlarge the belly and you are reminded of the animal appetites long arms may fit him for an inhabitant of the trees and a fit companion for the ape, and predominant length of legs are infallibly associated with the habits of the wading or leaping animals In all, regarding man's form with reference to his destination as the ideal standard the means become ends, deformity prevails, and becomes the badge of unintelligent slavery to the mere animal nature

"This may be further illustrated by a general and brief comparison of the components of the skeleton in the vertebrated animals with that of man In considering the skull, it will be found that man, of all animals, has the largest and roundest cranium From the ape to the fish the brain-case decreases in capacity in correspondence with a proportionably diminishing development but in the same ratio the parts allotted to the senses, and the parts merely subservient to the preparation of the food, increase in size In looking at the head of the

horse and the dog, it will be readily observed how much the cranium recedes and the jaws protrude, but in birds, reptiles and fish, the proportions are so altered by the diminution of the cranium that the whole head appears almost to consist of the jaws witness the mandibles of the stork and pelican and the enormous jaws of the crocodile and shark And we may add, that man is the only animal that has a prominent chin This distinguishing character of the human skull is found in the proportion of the brain-case to the jaws when compared with the same in the inferior animals, the ingenious Camper devised the method of more accurately determining by means of what has been called the 'facial angle' It consists in drawing one line from the most prominent part of the forehead to the sockets of the upper incisor teeth, and a second, which describes the ground plane of the cranium, through the external *meatus* of the ear and lower edge of the nose and which cutting the first forms with it a determinate angle and it asserts that this angle will be greater in proportion to the development of the forehead and recession of the superior *maxilla*, less or more acute [illegible] jaw and recession of the [illegible] angle must be [illegible] it is worthy of notice that the Greek sculptors who were careful to mark strongly, or even exaggerate those circumstances which peculiarly mark the human character, have often exceeded the right angle in the ideal anatomy of their deities, though at the same time with the discriminative taste which prevented them from exceeding the limit beyond which the form would have become a symptom of disease It follows, then that the size of the brain-case in man, proportionate to the development of the brain, indicates the predominance of this organ over those of the senses, which may be regarded as the measure of the subserviency of the animal to the outward excitants and over the organs for the preparation of the food the preponderance of which marks the subjugation of the creature to the mere animal needs — that the predominant development of the cranium, I say is the mark, symbol and condition of man's characteristic excellence as pre-eminently gifted with mind"

"If we compare the lower limbs of man with the hinder extremities of quadrupeds we find the peculiar character and perfection of the former in their adaptation and appropriation to maintain the balance of the body in the erect posture In some indeed, the hinder limbs are so formed as to permit the creature to obtain for a time the free use of the fore extremities, but the endowment serves but to mark as in the monkey that it was intended for a climbing animal and the extraordinary length and strength of the legs of the kangaroo show only its aptitude to leap And if, in birds the support of the body is effected by two legs it leaves the interior extremities free only for the purpose of aiding in, and of executing, a different mode of locomotion In man alone the lower extremities, providing wholly the means of support and progression, leave the upper limbs as instruments the use of which is entirely at the choice of the agent And, in aid of this purpose we find in man the most perfect upper extremity From the ape to the fish the different components diminish in number development, and variety of motion This is especially noticeable in the hand, which, in consequence of the length of the fingers, the number of articulations and the multiplicity of their movements, especially in consequence of the capability of opposing the thumb to the fingers becomes an instrument fitted for the most delicate and varied operations directed by the skill and intellect of man Compare in this respect, this flexible and modifiable apparatus with the single digit of the extremity of the horse, on the horny tip of which the weight of the animal (by an admirable mechanism indeed) is supported and carried, or with the abortive hand of the whale, sufficiently like the human to be so called, but retracted, enveloped in skin, and degenerated into a fin, that merely serves as an oar in propelling the animal through the water It might be said perhaps, that the hand of the monkey claims the praise of a great perfection as that of man, but the dwindled thumb marks its imperfection for handling and for touch and the arms even of the anthropoeid orang outan lengthened to deformity irresistibly prove their use to be little else than for grasping and climbing

"In the contemplation of the human skeleton its most striking characteristic, however, and that which contradistinguishes it from the bony fabric of all other animals, is its adaptation to the erect position an attribute not only peculiar to man, but without which his structure could not correspond to his spiritual endowments, since it is at once the need and symbol of a being raised above the servile condition of the mere animal nature

"Thus the skull is poised, with only a slight preponderance anteriorly, at the top of the vertebral column, and a plumb-line dropped from the point of its support falls through the centre of gravity between the feet, which present the base of support to the whole towering fabric We remark, however, that the supporting parts do not range with this line.

The spine is set like an italic *S*: it recedes at the chest, in order to give room to its cavity; and at the same time is harmoniously inflected forwards at the loins and neck in order to facilitate its balance over the points of support and it cannot be doubted that these curves contribute to the capability of bending and changing the position of the trunk, without endangering the loss of balance But the balance of the body is also greatly aided by the breadth of the human pelvis, which supplying a broad base of support, permits the inclinations of the trunk without the necessity of [illegible] position of the lower limbs The lateral [illegible] pelvis, however, throws the heads of the thigh bones, upon which the weight of the body is transmitted, to some distance on each side of the line that falls through the centre of gravity, and in order to provide compensating adjustment the thigh bones are placed obliquely inclining towards each other, so that in the upright posture with the feet together they touch at the knees, and the weight is then received upon the heads of the leg bones or *tibiæ*, which stand perpendicularly under the centre of gravity and these again are planted upon the arch of the foot or instep, on which the whole weight of the body securely rests Then, in order to secure in the foot the requisite firmness in standing we find that it is articulated with the leg at right angles, so that both the heel and toes touch the ground, and the joint is placed nearer the posterior than the anterior part of the foot, so as to increase the base of support in that direction towards which the body tends most to fall besides which, the weight is here received on the inner side of the foot where it is most arched thereby offering not only the advantage of a strong support but one which is highly elastic yielding without injurious action upon the foot and acting as a spring in [illegible] This the main column of the human form is raised and built up upon its pedestal, and the living pillar readily maintaining its equipoise, bears aloft its capital, whilst the upper limbs are left free to ad-libitative motion Thus the place of the head, as the corporeal representative of that which perceives and wills, the disposition of the senses therein as the *media* of intelligence and of the organs of speech as the interpreters of thought, and the arrangement of the upper limbs as instruments of volition, no longer subservient to mere animal needs — all impress us with the conviction that even the skeleton cannot be intelligible to us without admitting that the human body frame was designed for the instrument and dwelling of a being contradistinguished from, and elevated above, all other animals —

A creature, who not prone
[illegible]
[illegible]
[illegible]

"Man alone is erect It is to this posture that the body of a man owes the character, impressed on the whole frame, of its emancipation from subserviency to the mere animal needs and becomes expressive of mind and of free and intelligent action It will be seen that the lower limbs answering the purposes of support and locomotion have alone any obvious or necessitated utility, while the upper extremities are in consequence, left at liberty as the ready and facile instruments of his will Hence too, the senses are best freed from their servitude to the bodily wants, and the countenance is raised as the expressive exponent of thoughts and feelings, which the mouth declares and interprets by words And thus, as the stem bears the corolla, the head is carried on high as the most noble part of the frame which it surmounts, all the rest of the body seems as if intended to carry it, and when considered in its fitness for expression, it may be said to be the representative of the whole man

"If principally connected with erect posture the body is admirable, and acquires its human character, we shall no less find in directing our attention to the organs of motion in man the aptitude and capabilities of a being designed for intelligent freedom We find in man the organic structure adapted for the greatest variety of motion It is true, indeed, that many of the Mammalia are so constituted as greatly to excel man in particular kinds of locomotion, but we shall in vain look for the same combination and mastery of his powers which the erect posture implies The monkey climbs and jumps with a [illegible]ry extraordinary, but it is with difficulty, or only for a short time, that he raises himself into the erect position Dogs, horses, deer, excel man in swiftness, but they cannot climb nor walk erect The otter, the beaver, and the seal swim well, but it is their only boast above creatures of their own kind And whales, or other cetaceous animals, though admirably adapted for swimming, have no other means of locomotion Man, on the other hand, stands and walks erect; runs jumps climbs, swims Man alone can so modify his frame that it is in his power to waive the high privilege of

the harmony and balance of his faculties, and by concentering [illegible] we have reason to [illegible] he bears most characteristic [illegible] — [illegible] ever, outstrip the [illegible] In short, man has the most modifiable organs of motion, an [illegible] of [illegible]

"The capability of varied motion in man depends greatly upon the facility with which the different parts of the body, especially the limbs move at the joints in opposite directions, — a power which not only permits variety of movement, and confers an aptitude of expressive action, but likewise gives pre-eminently a character of [illegible] and freedom to the total motion [illegible] his body, in connection with the erect position, which gives the unity to any totality of movement, and determines the attitude or carriage necessary to preserve its balance In order to balance the body whether at rest or in motion, it is necessary that the man should exert an incomparably greater number of muscles than the inferior animals, and for the same reason a far greater effort of his volition is required for adjusting the proportional action of each and for combining and harmonizing the actions of all, in short, of all animals, man must be the master of his own body

"It is further deserving of notice, that the inflections of the trunk, the motions of the limbs, and the play of the several joints, all tend to the circular and curvilineal in their movements, a circumstance which mainly tends to confer on human motion the character of beauty And it may be safely affirmed that, under all the varieties of expressive movement, the very structure and mechanism of the body tend to reduce its motions to the form of the beautiful, or resolve them into grace, a fact of which we may convince ourselves in watching the sinuous movements of the dance, wherein, aided by the totality of motion in the dancer, they present a harmony by continuity — a problem of grace which is ever solving, and ever beginning anew

"Beauty of attitude and grace of carriage are however, intimately connected with the maintenance and equipoise of the body No attitude can be beautiful in which the idea of rest is not conveyed by that permanence and security which result from a perfectly felt balance Grace of carriage requires not only a perfect freedom of motion but also a firmness of step arising from a constant bearing of the centre of gravity over the base of support" (*Arnott's Physics* p 128) It includes ease and security And in both, whether it be motion becoming fixed in attitudes, or attitudes presenting themselves in the shaping flow of motion beauty and grace reveal themselves in self-command, and in freedom made manifest by self-control In short look at the body in any position or attitude in any of the incidental or casual forms arising out of the free and unconstrained movements of man healthy in frame and unshackled by conventional usages and the truth will force itself on your conviction Pass in review the ponderous strength of the Hercules the agile Mercury, the graceful ease of the Antinous the reclining Ilyssus, all the animated forms of the frieze of the Parthenon — whatever Greek art has signalized or modern genius realized witness the sports of children or go even to the wild denizens of the American forest and proof will no longer be needed that grace and beauty are inherent in, not accidents of the human body as the fit instrument of human freedom and intelligence, and the translucent medium, as it were of man's proper and spiritual being" (*Green's Vital Dynamics* 1840, p 60)

The main points of internal anatomy in which man differs from or excels the lower animals are the following — First of all in the magnitude of the brain which is relatively greater than the spinal chord and nerves in him than in any other animal This superiority is chiefly due to the great development of the hemispheres of the cerebrum, which are likewise characterized in man by the number and depth of the convolutions by which the cineritious and vascular surface is augmented The parts which are most evidently superadded to the human brain are the posterior lobes of the cerebrum, the corresponding horn of the lateral ventricle, and the lesser hippocampus

Of the external senses, that of smell is the least developed, but both this and the other organs are well balanced, and in their [illegible] most delicate and perfect The two eyes are [illegible] forward, and thus, though man does not see on two sides at once, like many quadrupeds, there is more unity in the result of his vision, and he can concentrate his [illegible] closely on the objects of his [illegible] The [illegible] ear, having little mobility or extent, does not increase the intensity of sounds; notwithstanding which, Cuvier well remarks that man best distinguishes their intonation So also with respect to the organ of smell though most animals excel man in their power of scent for particular objects, there are none perhaps which can distinguish so many varieties of or which are so uniformly affected by, unpleasant, odours In the discrimination and delicacy of taste man has unquestionably the advantage over the lower animals, and [illegible] hand so framed, or the tactile extremities [illegible] so expanded, or endowed with such an exquisitely sensitive and discriminative integument, as in man

"Man," says Cuvier, "has a particular pre-eminence in his organs of voice he is the only mammal that can articulate sounds, probably on account of the form of his mouth and the great mobility of his lips He receives results his most valuable mode of communication, for of all signs that can be conveniently employed for the transmission of ideas, varied sounds are those which can be perceived at the greatest distance, and in most directions simultaneously

[illegible] of the heart, which rests obliquely on the diaphragm, and on which depends the absence of the [illegible] [illegible] [illegible] ha, — relates to man's erect position

The alimentary organs of man indicate his natural destination for a mixed diet of animal and vegetable substances, but the prehensile faculty of his hands, and the intelligence which [illegible] permitted the teeth to remain of [illegible] proportions as might simply serve to divide and crush the food which the hands carry to the mouth Thus the canine teeth, though present and with crowns shaped for piercing, do not exceed the adjoining teeth in size, and no interval in the dental series of one jaw is required to receive a produced tusk of the opposite jaw when the mouth is closed thus [illegible] but unbroken [illegible], the back-teeth have flat and tuberculate crowns for bruising the short and [illegible] admit of the mastication [illegible] of flesh that has not been previously prepared by cooking

The organs of digestion conform with those of manducation, the stomach is simple, the intestinal canal of mean length, the small intestines are provided with numerous transverse folds of the secreting and absorbing mucous membrane called *valvulæ conniventes* the large intestines are well marked, they commence by a short and wide cæcum provided with a long, slender, and vermiform appendage

The period of gestation is nine months In general there is only one child at a birth, twins are born once in about five hundred cases of parturition, and more than that number is extremely rare The fœtus of seven months is eleven inches in length, that of nine months eighteen inches Those which are born prior to the seventh month usually die The first, or milk teeth, begin to appear a few months after birth, commencing with the incisors, at two years the entire deciduous series twenty in number is attained These are shed successively from about the seventh year, to be replaced by others The eight deciduous incisors are succeeded by eight permanent ones, the four deciduous canines by four permanent ones, the eight deciduous molares by the eight bicuspides Of the twelve true or posterior molars which are permanent, there are four — one on each side of both jaws — that make their appearance at four years and a half, four more at nine years, the last four being frequently not cut until the twentieth year The fœtus presents one fourth of the adult stature when born, it has attained one half of it at two years and a half and three fourths at nine or ten years Between the seventeenth and twenty first years the growth almost entirely ceases Man rarely exceeds [illegible] and seldom remains under five Woman is [illegible] inches shorter When the full stature is attained the body generally begins to [illegible] [illegible] accumulated in the cellular tissue, [illegible] becomes rigid, the fat is commonly absorbed, the before smoothly-filled integument falls in wrinkles, and old age arrives, with decrepitude, decay, and death Man rarely lives beyond a hundred years, and most of the species, either from disease, accidents, or merely old age, perish before that term

"The child," says Cuvier, "needs the assistance of its mother much longer than her milk, whence results an education intellectual as well as physical and a durable mutual attachment From the long period of infantile weakness results domestic subordination, and, consequen [illegible] persons [illegible] with their parents those tender [illegible] ch they have been so long accustomed [illegible] to mutual assistance multiplies to an [illegible] extent those advantages previously derived by isolated man from his intelligence it has assisted him to tame or repulse other animals, to defend himself from the effects of climate, and thus enabled him to cover the earth with his species Circumstances, more or less favourable, have restrained the social condition within limited degrees, or

[illegible] [illegible] [illegible] [

have promoted its development The glacial climates of the north of both continents and the impenetrable forests of America, are still inhabited by the savage hunter or fisherman, the immense sandy or salt plains of Central Asia and Africa are covered with a pastoral people and innumerable herds these half civilized hordes assemble at the call of every enthusiastic chief and overrun the cultivated countries that surround them in which they establish themselves but to become enervated, and to be subjected in their turn to the next invaders This is the true cause of that despotism which, in every age, has crushed the industry called forth under the fine climates of Persia, India, and China Mild climates, soils naturally irrigated and rich in vegetables, are the natural cradles of agriculture and civilization, and when their position is such as to afford shelter from the incursions of barbarians, talents of every kind are [illegible] Such were formerly (the [illegible] Greece and Italy, and such is at present nearly all the happy portion of the earth's surface"

The influences of climate, and of the different habits and social conditions thence resulting, are associated with differences of form, stature, features and colour of the skin, not greater however, than the corresponding differences which indicate varieties of a species in the lower Mammalia and accordingly naturalists have distinguished and have [illegible] more or less successfully the [illegible] varieties in As the races and varieties of the domesticated quadrupeds so also those of the human species, blend imperceptibly with each other, and the absence of well defined boundaries depends not only on the gradual subsidence and change of those physical causes which probably gave rise to the original varieties but also to the faculty common to the individuals of different varieties of the same species to produce by their union, individuals capable of propagating the intermediate variety Hence has arisen the difficulty of defining the primary races of man, and the discrepancy which exists in the conclusions of those naturalists who have devoted the greatest attention to this important and most interesting branch of zoology Cuvier considers that *three* varieties are eminently distinct, — the white, or *Caucasian*, the yellow, or *Mongolian*, the black or *Æthiopian*

"The Caucasian," he observes "to which we belong is distinguished by the beauty of the oval which forms the head, and it is this one which has given rise to the most civilized nations — to those which have generally held the rest in subjection it varies in complexion and in the colour of the hair

"The Mongolian is known by his projecting cheek-bones, flat visage, narrow and oblique eyebrows scanty beard, and olive complexion Great empires have been established by this race in China and Japan and its conquests have sometimes extended to this side of the Great Desert, but its civilization has always remained stationary

"The Negro or Æthiopian race is confined to the southward of the Atlas chain of mountains, its colour is black its hair crisped the cranium is contracted and the nose flattened The projecting muzzle and thick lips [illegible] to the apes the hordes of [illegible] always continued barbarous [illegible] races characterized by Cuvier Blumenbach adds the *Malayan* and *American* races Of the Malays, however, Cuvier asks, "Can they be clearly distinguished on the [illegible] both sides, the Caucasian [illegible] the Mongolian Chinese?" And with regard to the Americans, he states "They have [illegible] character which can entitle them to [illegible] a particular race Their copper-coloured complexion is not sufficient Their general black hair and scanty beard would induce us to approximate them to the Mongols, if their defined features their nose as projecting as ours, their large and open eyes did not oppose such a theory, and correspond with the features of the European" Dr Pritchard however, considers that there are seven classes of nations which may be separated from each other by strongly marked lines

The *first* class corresponds with Cuvier's Caucasian variety, but which Dr Pritchard prefers to call *Iranian*

The *second*, which he terms *Turanian*, is equivalent to the Mongolian variety

The *third* class are the native American races, excluding the Esquimaux and some tribes which resemble them more than the majority of inhabitants of the new world

The *fourth* class comprises only the Hottentot and Bushman races

A *fifth* class includes the Negros

The *sixth* class consists of the Papuans, or woolly-ha[illegible]

[illegible] races

A study of the resemblances and differences of human speech in various regions and various ages has added much and will contribute more to the true knowledge and definition of the primitive races of the human species It has already led to the establishment of the [illegible] The Semitic which [illegible] Chaldean, Syriac, Phœnician, and Ethiopian, the *Indo-Europæan*, which includes Sanskrit, Persian, Greek, Latin, German, and Celtic, the *Monosyllabic* languages, as Chinese, Thibetan, Birman, Siamese, the *Polysynthetic* languages, a class including most of the American Indian dialects The combination of [illegible] glossological characters, is [illegible] exact characters of the human races

MANATI [illegible] herbivorous Cetacean, forming the type of a distinct genus *Manatus* See that word

MANA'TUS (Lat manus, *a hand*) The name given by Cuvier to a genus of his herbivorous Cetaceans, including the species usually called sea-cows They have an oblong body terminated by a lengthened oval fin, their grinders, which are eight on each side of both jaws, have square crowns marked by two transverse ridges There are no incisors or canines in the adult, but when very young there are two very small pointed teeth in the intermaxillary bones, which soon disappear Vestiges of nails are visible on the edge of their swimming paws, which they employ with some address in carrying their young, hence the comparison of these organs with hands, and the name *Manatee* and *Manatus* applied to the animal There are two species of Manatee in America, and one in Africa, they inhabit the mouths of the great rivers, and browse on the herbage that clothes the banks

MANCHINEEL (Mancinella the Spanish name) A tree inhabiting the West India islands and celebrated for its poisonous qualities It is asserted that to sleep beneath its shade is to poison, and that the land-crabs found in the groves of manchineel become poisonous from feeding on its seeds Although there is doubtless much exaggeration in these stories no doubt exists of the deadly effects of manchineel juice when introduced into the system

MANDA'MUS In Law a prerogative writ in the form of a command issuing from the Court of King's Bench directed to any person corporation, or inferior court of judicature within the king's dominions requiring them to perform various duties It is grounded on the suggestion of a party injured by the acts or omissions of such persons or bodies, and lies for instance, to compel the admission or restoration of a party applying to an office or franchise which has been illegally withheld, for the production of public papers, to compel the holding of courts &c

MANDARIN The [illegible] of the official order of [illegible] either civil or military of the former there are nine classes of the latter five Although the mandarins are inferior in dignity to the higher class of nobility, whose dignity partakes of a personal character, they form the effective ministry and magistracy of the country The Chinese equivalent of *mandarin* is *kouon*, which signifies literally *a public character*

MA'NDIBLE *Mandibula* (Lat mandibula *a jaw*) In Zoology, this term is applied to the lower jaw of mammals and to both jaws of birds (except by Illiger, who restricts its appellation to the lower jaw in this class also) In insects it is applied to the upper or anterior pair of jaws

MANDI'BULATES, *Mandibulata* (Lat. mandibula, *a jaw*) The name of a grand section of insects, including all those which preserve their organs of mastication in [illegible] state of metamorphosis

MANDIOC [illegible] can name of the plant which is otherwise called *cassava*, and which is most extensively cultivated within the tropics of America, for the sake of the nutritive fæcula contained in its stems It is the *Jatropha manihot* of botanists The substance called tapioca is one of its products In its raw state the whole plant is poisonous, but by the preparation and torrefaction of the fæcula the poisonous principle, which is volatile, is driven off

MA'NDRAKE, or MANDRAGORA A herb of fabulous character, concerning which there existed many singular superstitions The herb mentioned in Genesis, ch xxx, which our translation renders mandrake, was, probably, some flower or root to which common belief attached value as a philter The mandrake of modern as well as classical superstition is a herb supposed to have a resemblance to the shape of a man Those who [illegible] from the ground are obliged to do so with peculiar [illegible] according to some dogs must be employed to do so, which die instantly after) shrieks and groans are heard to issue from it, which have the power of injuring the unwary person who hears them Its favourite habitat was believed to be the ground under a gallows on which a criminal was hanging When plucked, it was said to be useful in conjurations, for the transformation of men or beasts, and was also believed to enable the

possessor to acquire riches at play, and to discover hidden treasures (*Encyc Metropol*)

MA'NDREL (Fr *mandrin*) In Machinery, a revolving shaft or axle to which turners affix their work in the lathe

MA'NDRILL (*Eng man*, and *drill*) A baboon The name of the Catarrhinæ or apes of the genus *Papio* Cuv They are the largest and most formidable of the baboons The mandrill proper is the great blue-faced baboon of our menageries — *Simia mormon* and *maimon* of Linnæus It is of a greyish-brown, inclining to olive above, with the cheeks blue and furrowed The nose in the adult male becomes red and even inclines to a fine scarlet at the end It is difficult, says Cuvier, to imagine a more hideous or extraordinary animal The male attains the size of a man, and is a terror to the negroes of Guinea and the other parts of Africa, of which this species is a native

MANE'GE (Fr from the Ital maneggio), is used in England to signify either the art of horsemanship or of training horses

MA'NES A word of uncertain etymology, applied generally by the Romans to souls separated from the dead There is some obscurity, however, about the precise meaning of this term According to Apuleius the Manes were originally called Lemures, and consisted of two classes, — the *Lares* and the *Larvæ*, the former of whom were the souls of those who had led virtuous lives, and the latter of those who had lived improperly, and, at a later period, the term *Manes* came to be a general designation for both On the other hand, St Augustin maintains that *Manes* was, from the first a term applied to the spirits of deceased men when no definite opinion could be formed of their merits — Animas hominum dæmones esse, et ex hominibus fieri Lares si meriti boni sint, Lemures sive Larvas si mali, manes autem cum incertum est bonorum eos sive malorum esse meritorum" In the month of February annually the Manes were propitiated at their sepulchres during twelve days It was the duty of the pontifex maximus to see that proper ceremonies were observed The stones in the Roman burial places, and their funereal urns, were generally inscribed with the letters D M S (*Dis Manibus Sacrum*)

MANGANE'SE This name is generally given to a black mineral originally described in the year 1771 by Scheele as a peculiar earth, and which was afterwards shown by Gahn to be the oxide of a metallic substance which he called *magnesium* This term however having been applied to the metallic base of magnesia the word *manganese* [illegible] the metal, and the ore above [illegible] black or peroxide of manganese The metal itself has a specific gravity of about 8 It is grey, hard brittle and very difficult of fusion, and has not been applied to any use The black oxide, on the contrary is largely employed as a source of oxygen, and is especially important from the use which is made of it in the decomposition of common salt for the production of chlorine Manganese may be represented by the equivalent 28, and the black oxide being a compound of 1 atom of manganese and 2 of oxygen, has the equivalent 44 (28 + 16) There is also a protoxide of manganese, composed of 28 metal + 8 oxygen, which is the basis of the salts of this metal When hydrate or carbonate of potassa, or nitre are fused with peroxide of manganese in an open vessel a dark-coloured compound is obtained, long known under the name of *chameleon mineral*, in consequence of its yielding in cold water a solution which is at first green then blue, purple, red, brown, and ultimately deposits a brown powder, and becomes colourless This substance has since been termed *manganate of potash* and has been proved to contain a compound of 1 atom of manganese and 3 of oxygen which has been called *manganic acid* and is represented by the equivalent 52 In the pink solution, which is produced at once by the action of hot water manganese exists in a still higher state of oxidizement forming the [illegible] *acid*, in which 2 atoms of manganese are [illegible] 7 of oxygen Both these compounds are very easy of decomposition Some of the proto-salts of manganese have lately been used in calico printing as the source of brown colours, and occasionally as deoxidizing agents

MANGE An eruptive disease which attacks several domestic animals, especially the dog It is said to resemble the itch, and, like that disease to be produced by a minute species of acarus which burrows beneath the cuticle It is stated that the fluid discharged from the eruption of mange, in horses and dogs, has produced the itch upon the human skin It is commonly produced by confinement and want of cleanliness, and bad or insufficient food

MA'NGEL WURZEL The root of the *Beta hybrida* This German name is translated *root of scarcity*, the root being large, and used as a substitute for bread [illegible] of cattle

MA'NGER [illegible] in which is placed the corn or other short food given to live stock, and more especially to horses *See* RACK

MA'NGER The space near the hawse holes bounded on the upper side by a partition across the bows called the *manger board* to receive the water while it enters the hawse holes and prevent it from flooding the deck

MA'NGO (Mangos maruma in the Tamul language of India), is a very large tree inhabiting the tropical parts of Asia throughout all which it is as extensively cultivated as the apple and pear trees are in Europe Old specimens have been seen with a trunk from ten to fifteen feet in diameter The fruit is something like a nectarine, but more compressed, longer, and more curved It contains a large stone covered with coarse fibres which lose themselves in the succulent flesh The wild and inferior varieties of this fruit have so much of turpentine as to be wholly unfit for eating, but in the fine varieties this flavour is replaced by a rich sugary quality, which renders it very delicious In this country the mango has rarely ripened its fruit, but it is common in the shops in a pickled state The fruit of the *Mangifera Indica*, a tree cultivated in Asia, is also called "[illegible]"

MANGOSTEEN The fruit of the *Garcinia mangostana*, growing in Java and the Molucca Islands it is of the size of an orange, and of a delicious flavour

MANGROVE (probably an abbreviation of *mangle* grove, the former being the Malay name), is a tree inhabiting the shores of the tropical parts of the world in either hemisphere, and well known to navigators on account of the dense groves it forms even down into the water itself It belongs to the genus *Rhisophora*, and is principally remarkable for its seeds germinating before they leave the case in which they were generated on the branches The young radicle grows downwards through the humid air till it reaches the mud, in which it fixes itself and then the leaves and new stem unfold at the opposite end The *white* of the tropics, is *Avicenn* genus from the genuine plants of that name

MA'NIA (Gr *μαινομαι*, *I rage*) Madness It is defined to be delirium unattended by fever, in which both judgment and memory are impaired and the irritability of the body diminished so as to resist many morbid causes There is a false perception of things, marked by incoherence or raving and resentment of restraint It is divided into melancholic and furious the former marked by dejection of spirits, the latter by violent exertion of strength, malice to particular individuals, and repugnance to scenes and places before agreeable Dissection has shown that in cases of madness there is usually effusion of water into the cavities of the brain, or appearances of previous inflammation of its membranes, or hardness of its substance, or peculiar thickness of the skull, and it has lately been stated that chemical analysis has shown an excess or deficiency of phosphorus in the composition of the brain in cases of madness and idiotcy

MANICHEISTS The followers of Manes, an oriental heretic of the 3d century, who having been ordained a Christian presbyter, attempted to effect a combination between the religion which he was appointed to preach and the current philosophical system of the East He pursued herein the same course as the Valentinians, Basilidians, and many others, whose leading ideas may be denominated Gnostic He maintained a dualism of principles governing the world, and a succession of dualisms generated from them, like the Gnostic æons All things were effected by the combination or repulsion of the good and the bad, men had a double soul good and evil, even their bodies were supposed to be formed the upper half by God the lower by the Devil The Old Testament was referred to the inspiration of the evil principle, the New to that of the good In the latter, however, Manes proposed many alterations, and maintained also the authenticity of various apocryphal scriptures A great part of his system related to cosmogony and psychology, in which fields of speculation he expatiated with the most arbitrary freedom Like most other oriental systems, the Manichean heresy was celebrated alike for the austerities which it enjoined, and for the scandalous excesses which were attributed to its most zealous votaries The charge of Manicheism, which in later times becomes scarcely intelligible, was frequently brought against the early reforming sects, such as the Albigenses, Waldenses, Picards, &c (See Mosheim (transl), ed 1790, i 303 &c, Beausobre, *Hist Critique de Manichée et du Manichéisme*, Amst 1734, Gieseler, vol i 190 (transl), ii 151, iii 340, Milman, *Hist of Christianity*, ii 322)

MANIFESTO In Politics, a declaration of motives publicly issued by a belligerent state, or by a general acting with full powers, previously to the commencement of hostilities They are in the form of letters, with a superscription or [illegible] addressed to the public in general, and signed by the [illegible] sovereign who sends them forth The usage of issuing manifestos is said to date so far back as the 14th century The term is probably derived from the Latin words "manifestum est," with which such documents usually commenced

MA'NIOC The Indian name of amylaceous products

MA[illegible], embraces the manual and mechanical operations of the laboratory, and in the delicate details of analysis, as well as in the exhibition of class experiments, great skill and practice in manipulation are required to ensure success The processes of weighing, measuring, filtering, distilling, precipitating, dissolving, using the blowpipe, &c all come within the meaning of manipulation Mr Faraday has published an excellent treatise upon this subject

MANIPULUS (Lat manus, *hand*) In Roman Military Antiquities, a subdivision of the cohort so called from the handful of grass, straw &c which formed its original standard A maniple of triarii consisted of 60 men, one of hastati and principes of 120, when the number of the legion was 300 (See M le Beau's Eighth Dissertation on the Roman Legion, *Mem de l'Ac des Inscr* vol xxxii)

MA'NIS The name of a genus of Edentate Mammals, singularly characterized by being covered with large, strong, imbricated, horny scales, like the Lacertine reptiles, and hence commonly called scaly lizards, and [illegible] Their [illegible] blooded mammals, and rank in the system of Cuvier among the Edentate order, of which they may be regarded as typical forms, being wholly destitute of teeth, and provided with a tongue of extraordinary length with associated glands for preparing an abundance of adhesive lubricous mucous By this organization they are peculiarly adapted to prey on ants termites &c and certain of their claws are extraordinarily developed, to enable them to break through the walls of the habitations of these social insects The manises are confined to the warmest regions of Asia and Africa, where they play a corresponding part with that assigned to the true anteaters (*Myrmecophaga*) in South America

MANITRUNK *Mantruncus* in Entomology is a term given to the anterior segment of the trunk, in which the head inosculates, or on which it turns

MA'NNA (Syrian mano *a gift*, it being a term applied to the food given by God to the children of Israel in the wilderness) What we now call *manna* is a saccharine substance which exudes from the bark of the *Fraxinus ornus* and some other species of ash natives of the south of Europe especially Sicily and Calabria Manna is used in medicine as a mild aperient It differs remarkably from common sugar in not being susceptible of vinous fermentation, so that if mixed with common sugar and yeast and subjected to the process of fermentation, the sugar becomes converted into alcohol but the manna remains unaltered in the liquor When manna is dissolved in boiling alcohol, the solution as it cools deposits it in flaky and acicular crystals often arranged in concentric groups Manna thus purified, has been chemically designated by the term *mannite*

Various opinions have been entertained respecting the precise nature of the manna on which the Israelites were sustained, and attempts have been made at various times to account for its miraculous appearance on natural causes, but in our opinion, without any success The Syriac word *mano* [illegible] to this circumstance, and is no doubt Hebrew *man hu*, the Scripture explanation of which is certainly the best The word asks a question and signifies *What is this?* for they wist not what it was' (Exodus xvi 15) And if they did not know *then* 'what it was,' it is not likely we should know now They could see that it was a little round grain, or something like a grain, of the size of coriander-seed, and white as the hoar frost on the ground, but it had no component parts such as they could describe And even admitting, as has been frequently maintained, that it exuded from the bark of the ash, or some other tree, it is incredible that it could be supplied in such abundance in the deserts of Arabia as to give sustenance to 50[illegible],000 Israelites for 40 years, without the miraculous intervention of Providence

MA'NNER (Fr maniere) In the Fine Arts, a peculiarity of treating a subject or of execution, by which individual artists are distinguished the latter arising out of a particular mode of using the media and implements of art, the former out of a singular method of observing nature (See *Sir J Reynolds's Sixth Discourse*)

MAN-OF-WAR, MERCHANT MAN The common terms for ship-of-war, merchant-ship

MANO'METER, or MA'NOSCOPE (Gr *μανος*, *rare*, and *μετρον*, *a measure*, or *σκοπεω*, *I view*) An instrument for measuring the *density* of the air, or rather its *elastic force*, to which the density is supposed to be proportional See PNEUMATICS

MA'NOR (Lat maneo, *I reside*, from the residence of the lord) signifies a district subject to the jurisdiction of a court baron In the feudal ages, a grant of lands from the king carried with it a right of dominion, and the grantee or baron had power to make laws, and hold a court of justice for his dependents within the territory, which was called a manor The baron might also by subinfeudation parcel out the land so granted to others, to hold of him, as he held of the king, by military service or other tenure These again further subdivided the land by grants to others, and so on, increasing manors by this process *ad infinitum* The services due to the lord of the fee were, in consequence, very negligently performed, and, to meet this inconvenience, the statute of Ed I, called Quia Emptores, was passed, which enacted that the buyers of lands should hold them by the same services, and of the same lord, as they were before held by when in the hands of the seller This put a stop to the increase of manors, and every manor, therefore, now in existence, must have existed in the time of Ed I, and [illegible]

MANSARD [illegible] from the name of its inventor, a celebrated architect) In Architecture, the [illegible] which see

MANTELET A moveable parapet, constructed of boards covered with tin, iron, or leather, to serve as a protection to the miners in carrying a sap or a trench towards a besieged place Mantelets are of various forms, adapted to the peculiar circumstances of the approach

MA'NTIS (Gr *μαντις*, applied by Hesychius (*Hyl* x 18) to the cicada) A Linnæan genus of Orthopterous insects, characterized by having the head exposed, and the body narrow and elongated, the palpi short, and terminating in a point, the ligula quadrifid, the tarsi five-jointed, and the [illegible] and not ray-wise like [illegible] times called *praying insects*, on account of the position of the anterior pair of legs, which differ from the rest,—are found only in tropical and temperate climates they are diurnal and remain almost stationary on plants and trees, frequently resembling, in a remarkable degree, their leaves and branches in both the form and colour of the wings and body, and thus they deceive the smaller insects on which they prey Their eggs are usually enclosed in a capsule formed of some glutinous substance, which hardens by exposure to the air and is divided internally into several cells It is curious to trace the correspondence with the vegetable kingdom already noticed in the wings and body continued into the form of the egg capsules which in many species closely resemble a seed receptacle of a plant presenting regularly disposed ridges and angles or even being bristled with little spines The female attaches it by an adhesive secretion generally to the stem of a plant

A second group of mantises characterized by having the anterior legs like the following ones now form a distinct subgenus *Spectrum* and are generally called *spectre insects* they feed exclusively on vegetables, of which they singularly resemble the dried twigs The progress of entomology has required further subdivisions of both the above groups

MANTISSA The decimal part of a logarithm is sometimes called the *mantissa* of the [illegible] the integral part being the *characteristic* Thus in log 900 = 2·95424, the characteristic of the logarithm of the number is 2 and ·95424 is the mantissa, which belongs equally to the numbers 9·90 900, 9 &c

MANTLE (Fr manteau) In Architecture, the piece lying horizontally across from one jamb of a chimney to the other In Malacology, the external fold of the skin of the mollusks

MANUAL (Lat manus *the hand*), was applied originally to the Roman Catholic service book from its convenient size (being [illegible] carried in the hand), but it now signifies a small work used chiefly for the purpose of reference

MANUFACTURE (Lat manus, *a hand*, and facio, *I make*) In Political Economy a term employed to designate the changes or modifications made by art and industry in the form or substance of material articles, in the view of rendering them capable of satisfying some want or desire of man Hence the perfection of manufacturing consists in the being able to effect the wished-for changes in the raw material with the least expenditure of labour, or at the least cost

With the exception of fishing, hunting, mining, and such branches of industry as have for their object to obtain possession of material products in the state in which they are fashioned by nature, all other branches may, in fact, be comprised under the term manufacture Generally, indeed, it is applied only to those departments of industry in which the raw material is fashioned into desirable articles by art and labour without the aid of the soil But there is no really good foundation for any such limitation, which, unless explained, is apt to make it be supposed that businesses which are substantially identical not only differ from, but are opposed to, each other It is obvious, indeed, on the slightest consideration, that agriculture in nothing but a manufacture, for the business of the agriculturist is so to dispose of the soil, seed, manure, and other materials, that they may supply him with other and more desirable products Manufacturing industry consists, in fact, in

the *application of art, science, and labour to bring about* [illegible] *modifications of already existing ma-* [illegible] varieties depend wholly on the modes in whic[illegible] is made The manufacture of any [illegible] usually derives its name from the raw material manufactured modified, or wrought up into a new shape Thus the terms woollen, cotton, and hardware manufacture, mean the working up of wool, cotton or metals into useful or desirable articles, shipbuilding is the manufacture of timber and iron into ships, agriculture (*ager* and *colo*) is the production of corn, beef, and other products, by the adaptation of the soil and the vegetative powers of nature to their manufacture, and so on The knowledge of the means by which art and labour may be most successfully employed in each of these departments forms the peculiar business of the woollen, cotton, and hardware manufacturers, ship-builders [illegible] &c

It would far exceed our limits to attempt to enter into any details with respect to the application of labour in the separate departments of manufacturing industry, but considering the vast importance of manufactures to mankind, and especially to the British nation, we may, perhaps, be excused for endeavouring shortly to state some of those conditions and circumstances that seem, in a general point of view, most essential to success in manufactures

These are partly of a moral and political, and partly of a physical description Of the former class the most important seem to be the security and free disposal of property, the absence of monopolies, and the non interference of government in industrious undertakings, the diffusion of knowledge amongst the people, the cordial reception of foreigners and the emulation and energy inspired by inequality of fortune, and by the gradual increase of taxation Among the more prominent of the physical circumstances conducive to the progress of manufactures are supplies of the raw materials to be manufactured, with the command of power, that is of coals water falls &c A good deal also of the progress of manufactures seems to depend on the advantageous situation of a country for commerce, and on the nature of its climate We shall briefly notice some of the more prominent of these circumstances

1 *Moral Circumstances contributing to the Progress of Manufactures* — It is unnecessary to take up the reader's time by enlarging on the necessity of security and of the free disposal of property to success in manufacturing industry or indeed in any laborious undertaking Without security there can be neither industry nor invention No man will engage in any employment, or exert either his bodily or mental powers unless he be well convinced that he will be allowed to reap all the advantages accruing from his labour skill or genius Any doubt as to this is sure to paralyse his exertions And if, owing to the weakness or ignorance of government the prevalence of a revolutionary spirit or any other cause, the security of property were materially impaired all sorts of industrious undertakings that did not promise an immediate return would be forthwith abandoned and every person possessed of property would endeavour to convey it out of the country The want of security is in fact the greatest of public calamities In its absence we find nothing but the most abject poverty and barbarism, and supposing other things to be equal the wealth and civilization of nations will be pretty nearly proportioned to the security of property they respectively enjoy Every other circumstance conducive to the advancement of industry may exist in a country, but without security these can be of no material service A high degree of security will compensate for many deficiences but nothing can make up for its want it is a *sine qua non* of manufacturing and national prosperity

2 The absence of monopolies and the non-interference of government in industrious undertakings undoubtedly conduce in no ordinary degree to the progress of industry Every man is always exerting himself to find out how he may best extend his command over the necessaries and conveniences of life, and sound policy requires that he should so long as he does not interfere with the rights and privileges of others, be allowed to pursue his own interest in his own way That individuals are, generally speaking, the best judges of what is most beneficial for themselves is now universally admitted to be the only principle that can be safely relied on It is the duty of governments to preserve order, to prevent one individual from injuring another, to maintain, in short, the equal rights and privileges of all But it is not possible for them to go one step further without receding from the principle of non interference, and laying themselves open to the charge of acting partially by some and unjustly by others

The most comprehensive experience corroborates the truth of this statement [illegible] the famous act of James I in 1624, for [illegible] monopolies, full scope has been given in Great Britain to the competition of the home producers, and though the various resources of talent and genius have not been so fully perhaps or at least so early developed, as they would have been had there been no restrictions on our intercourse with foreigners, they have been stimulated in a degree unknown in most other countries France, previously to the Revolution, was divided into provinces, having each peculiar privileges and separate codes of revenue laws, and, in consequence, the intercourse between them was subject to the most oppressive restrictions In Germany and Spain the same miserable system prevailed, so that they were not only deprived of the freedom of foreign, but even of internal commerce The inhabitants of each province being in a great measure isolated from the rest, there was comparatively little competition, and, instead of invention and active exertion there was nothing but routine and sluggish indifference Holland and the United States have been almost the only countries that have enjoyed the same degree of internal freedom as Great Britain, and the former, notwithstanding the unfavourable physical circumstances under which [illegible] placed has long been, and still is, the richest [illegible] while the latter, whose condition is in other respects more favourable, is advancing with giant steps in the career of improvement

It is sometimes said that restrictions on industry and commerce cannot be [illegible], seeing the progress [illegible] have always existed [illegible] show the weight to be attached to this allegation The restrictions referred to have been confined to some branches of foreign trade, and, luckily, the freedom allowed to all sorts of industry at home would have insured our advance even had our [illegible] been a good deal more fettered and restrained [illegible] been But to imagine, as many have done, that these restrictions contributed to accelerate our progress, is the climax of folly Their influence is, in every case, distinctly and completely the reverse, but though considerable even in Great Britain, it has been insufficient to counteract the advantages resulting from the freedom we otherwise enjoyed

3 The ability to read and the diffusion of instruction among all ranks and orders of the people by the general circulation of books and journals the establishment of mechanics institutes, &c, have had a material influence over the advancement of arts and industry They have had the double advantage of multiplying the means and chances [illegible] or discovering [illegible] a few [illegible] the means and capacities required for the manufacture of commodities and the accumulation of riches, being unable to apply them, are necessarily poor and destitute, but an intelligent people though placed in a comparatively unfavourable situation never fail by availing themselves of the powers and energies of nature and making them subservient to their purposes, to attain to distinction as manufacturers and so become rich and prosperous That knowledge is power is true in manufactures as well as in morals The more familiar our acquaintance with and the more complete our command over natural agents the greater of course, must be our ability to modify rude products, and to make them minister to our wants and the gratification of our desires In tracing the causes of our success in manufactures and industry, it is not possible to appropriate to each circumstance the portion belonging to it of a result which is the joint effect of the whole, but if this could be done it would be found that no inconsiderable share is fairly ascribable to the extraordinary diffusion amongst us of scientific information

4 For a lengthened period the reception given to foreigners in England was any thing but cordial In most countries indeed not in an advanced state of civilization, strangers are uniformly the objects of popular dislike, and this feeling seems at one time to have prevailed quite as much in England as any where else But notwithstanding the various legal disabilities laid on foreigners, and the ill-treatment they often experienced, their settlement here has been productive of the most advantageous results The Flemings, invited over and protected by Edward III, gave the [illegible] to the woollen manufacture, and the [illegible] the Low Countries during the persecution [illegible] Duke of Alva and from France subsequently to the revocation of the Edict of Nantes, materially forwarded our commerce and many branches of manufactures During the last century the prejudice against aliens lost much of its force, and several of the disabilities under which they formerly laboured have been removed But in all that respects [illegible] our policy has been less [illegible] of the Dutch In Holland they have always been received with open arms, and a short residence in the country and a small payment to the state, have entitled them to all the privileges

enjoyed by natives The highest authorities agree that this was one of the main causes of the extraordinary progress made by the republic in commerce and wealth "It has always been our constant policy to make Holland a perpetual safe asylum for all persecuted and oppressed strangers, however powerful for a time the tyrannical authority of any prince may have been able to weaken or destroy, or make the state recede from protecting, those who have fled to it for their own security and self-preservation Throughout the whole course of all the persecutions and oppressions that have occurred in other countries, the steady adherence of the republic to this fundamental law has been the cause that many people have not only fled thither for refuge with their movable stock in ready cash and other most valuable effects but have also thereby introduced many trades, fabrics, manufactures arts and sciences, in this country, notwithstanding the first materials for the said fabrics and manufactures were almost wholly wanting in it, and not to be procured but at a great expense from foreign parts" (Memorial by Dutch Merchants presented to the Prince of Orange in 1751)

5 We incline to think that the great inequality of fortune that has always prevailed in this country has powerfully contributed to excite a spirit of invention and industry among the less opulent classes It is not always because a man is absolutely poor that he is perseveringly industrious and economical, he may have already amassed considerable wealth but he continues with undiated energy to avail himself of every means by which he may hope to add to his fortune that he may place himself on a level with the great landed proprietors and those who give the tone to society in all that regards expense No successful manufacturer or merchant ever considers that he has enough till he be able to live in something like the same style as the most opulent landlords Those immediately below the highest become, as it were, a standard to which the class next to them endeavour to elevate themselves, the impulse extending in this way to the very lowest classes, individuals belonging to which are always raising themselves by industry address and good fortune to the highest places in society Had there been less inequality of fortune amongst us there would have been less emulation and industry would not have been so successfully prosecuted It is true that the desire to emulate the great and the affluent by embarking in a lavish course of expenditure is often prematurely indulged in, and carried to a culpable excess, but the evils thence arising make but a trifling deduction from the beneficial influence of that powerful stimulus which it gives to the inventive faculties, and to that desire to improve our condition and to mount in the scale of society which is the source of all that is great and elevated Hence we should disapprove of any system which like that of the law of equal inheritance established in France had any tendency artificially to equalize fortunes To the absence of any such law, and the prevalence of customs of a totally different character we are inclined to attribute a considerable portion of our superior manufactures, wealth, and industry

6 We are also disposed to believe, how paradoxical soever such a notion may appear, that the taxation to which we are subject has hitherto at least been favourable to the progress of industry It is not enough that a man has the means of rising in the world within his command he must be placed in such a situation that unless he avail himself of them, and put forth all his energies, he will be cast down to a lower station Now this is what our taxation has effected to the desire of rising in the world, implanted in the breast of every man it superadded the fear of being thrown down to a lower place in society, and the two principles combined produced results [illegible] separately Had taxes been carried [illegible] it would not have had this effect But though considerable, its increase was not such as to make the contributors despair of being able to meet the sacrifices it imposed by increased skill and economy, and the efforts they made in this view were far more than sufficient for their object, and consequently occasioned a large addition to the public industry and wealth, that would not otherwise have existed

II *Physical Circumstances contributing to the Progress of Manufacture* [illegible] raw material may be [illegible] of this description of circumstances Those who reflect on the value and importance of our manufactures of wool, of the useful metals such as iron, tin, lead, copper, &c, of leather, flax, and so on,—will readily admit that our success in them has been materially facilitated by our possessing [illegible] It is of less consequence [illegible] manufacture possesses considerable value in small bulk, whether it be furnished from native sources or be imported from abroad, though even in that case, the advantage of having an internal supply which cannot be withdrawn through the jealousy or hostility of others is far from immaterial But no nation can make any considerable progress in the manufacture of bulky and heavy articles, the conveyance of which to a distance necessarily occasions a large expense, unless she have supplies of the raw material within herself Had we been destitute of iron ore, lead and tin, we could never have distinguished ourselves by the magnitude and value of our manufactures of these articles, and any one who reflects on the signal advantage resulting to every branch of manufacturing industry from being able to procure abundant supplies of iron at the cheapest rate, will be convinced that we are under any thing but slight obligations to our exhaustless stores of this mineral

2 But of all the physical circumstances that have contributed to our extraordinary progress in manufactures and industry none have had so much influence as our possession of the most valuable coal mines These have conferred advantages on us, not enjoyed in an equal degree by any other country Our extraordinary success in the manufacture of iron, copper, &c is not owing so much to our possessing the ores as to our possessing the coal by the aid of which they have been smelted and refined The paramount importance of coal as a manufacturing [illegible] principally manifested since the [illegible] engine Without a cheap and abundant supply of fuel, the engine, as now constructed would be of comparatively little use It is, as it were the hands by which the most gigantic results are effected, but coal is the muscle by which the hands are set in motion and without which their all but illimitable power and dexterity could not be called into action or made subservient to any useful purpose Our coal mines may thus in truth be regarded as vast magazines of hoarded or warehoused power, and unless some such radical change should be made on the steam engine as should very decidedly lessen the quantity of fuel required to keep it in motion or some equally serviceable machine, but moved by different means be introduced, it is not at all likely that any nation should come into successful competition with us in those departments of manufacturing industry in which steam-engines, or machinery moved by steam may be advantageously employed

3 The advantageous situation of a country for commerce and the nature of its climate, have also a powerful influence over manufacturing industry Owing to the facilities afforded by the insular situation of Great Britain for maintaining an intercourse with all parts of the world our manufacturers have been able to obtain supplies of foreign raw materials on the easiest terms, and to forward their own products wherever there was a demand for them Had we occupied a central or internal situation in any quarter of the world our facilities for dealing with foreigners being so much the less, our progress would have been comparatively slow, but being surrounded on all sides by the sea that is by the great highway of nations we have been able to deal with the most distant as well as with the nearest people and to profit by the peculiar capacities of production enjoyed by each Under such circumstances it would have been singular had we not shot ahead of most of our competitors in the race of improvement, and it will require some powerful counteracting agency to neutralize or overcome these advantages

4 Our climate is peculiarly favourable for all sorts of exertion and enterprise without being too severe, it is sufficiently so to render comfortable clothing and lodging indispensable, and consequently gives rise to wants that are either unknown or less sensibly felt, in more genial regions Its inequality too by requiring incessant care and attention on the part of the husbandmen, or manufacturers of corn makes them [illegible] as well as industrious and the quality [illegible] naturally impressed on this great class are, through their example, universally diffused

The author of a valuable article on English statistics in the *Edinburgh Encyclopædia* when enumerating the causes of our extraordinary success in manufactures, lays the greatest stress on the superiority of our machinery, [illegible] our capital, and the extent to which [illegible] labour is carried amongst us But this is to mistake effects for causes These, in fact are the means and instruments by which manufacturing industry is immediately carried on, and the real inquiry is what are the circumstances that have rendered us so abundantly supplied with these means? We have endeavoured briefly to answer this inquiry by stating what appear to be the most prominent causes of that extraordinary accumulation of capital, and of that universal employment of improved and powerful machinery and subdivided labour, which mark our eminence as a manufacturing people Still, however, we are inclined to think that a good deal must in these matters be ascribed to chance or to some lucky contingency, that could not *a priori* be looked for Had Hargreaves, Arkwright, Watt, or Wedgwood not existed, or been born abroad, it is impossible to say how much it might have affected the state of industry here, but there seem to be sufficient grounds for thinking that it

would have been, at this moment, materially different from what it actually is A good deal too, depends on priority A country, town or district that has already established and made a considerable progress in any manufacture, acquires, in consequence, advantages that enable it successfully to contend against those placed under what are naturally more favourable circumstances, its merchants are already in possession of the markets, its inhabitants, being trained to the business, have acquired that peculiar sleight of hand that is necessary to form expert workmen, and they are in this way frequently able to preserve their ascendency for a lengthened period, and sometimes even to drive those from the field who have a preponderance of natural advantages on their side

It seems to be the peculiar good fortune of England that, as respects all the great branches of manufacture, priority and of acquired as well as the natural advantages she enjoys of abundant supplies of the raw material, of inexhaustible beds of coal, and of situation Cotton is not an exception, for though the raw material be the product of other countries, the freight upon it is not very considerable, and is but a trifling deduction from the other circumstances that seem to insure our superiority in this department To excel in machine-making is to excel in what is certainly the most important branch of manufacturing industry Superiority in any single branch, except this, may exist simultaneously with great inferiority in many others, but eminence in the manufacture of machinery is almost sure to lead to eminence in every other department

Considerable, though not, as it appears to us, too much stress, has been laid on the practice generally adopted in Great Britain of paying workmen wherever it is practicable, by the piece, or by the work done and not by the day This system gives the workmen an interest in being industrious, and makes them exert themselves to execute the greatest quantity of work in the least space of time, and in consequence of its prevalence, this practice materially influences even the day labourers, who, to avoid invidious comparisons, make exertions unknown in other countries Hence a given number of hands in Great Britain perform much more work than is executed by the same number of hands almost any where else, in fact, if we regard wages in their proper light, that is, if we look upon them as a compensation for work done, and not for the time spent in doing it they will we believe, be found to be cheaper in Great Britain than in most other countries (For farther particulars, see the section on Manufactures in the *Statistical Account of the British Empire*, whence this article has been partly abstracted)

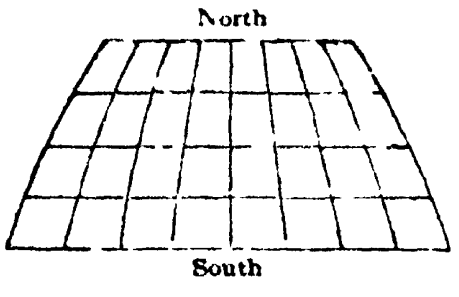
MANUMI'SSION, or ENFRANCHISEMENT (Lat manus, and mitto *I send away*) The grant of liberty to a slave Ancient charters containing such grants were frequently termed chartæ ingenuitatis (See a law of William the Conqueror, *Lamb Archai* 126) The term manumission is derived from a practice adopted by the ancient Romans in enfranchising their slaves The master seized the hand of the slave and dismissed him with the words "hunc hominem liberum esse volo" Among the Romans there were two classes of manumission, called perfect and imperfect the former of which were effected in three different ways The enfranchisement was perfect—1 Per censum, by which the name of the slave was, at the master's request, placed in the register of free citizens 2 Per vindictam, when the slave was led before the prætor, and, the master having demanded his liberty, that magistrate laid the vindicta (or rod of office) on his head with the words 'ajo te liberum esse more quiritium" 3 Per testamentum, by will It was imperfect when the slave was enfranchised at private entertainments or by letter See CLIENT

MANURES Substances added to the soil, with a view of accelerating vegetation and increasing the production of the crops Animal, vegetable, and mineral substances are used for this purpose Decomposing animal matter of any kind forms one of the most powerful manures, and in many instances accelerates the decay and decomposition of inert vegetable matters mixed with it, as in the mixture of dung and straw which forms the common offal of stables All animal excrements are also powerful manures, and, when duly applied to the soil, soon exhibit their influence by the luxuriance of the crop It, however, often happens in respect to esculent vegetables that their quality is deteriorated, and that they acquire a coarse and rank flavour, if over-manured, as is the case with much of the produce of the market-gardens near London, where, in consequence of the vicinity of the metropolis, manure is abundant, and luxuriant and fine-looking vegetables in great request for the table

In all cases where animal manures are used care should be taken that they are brought into action upon the soil as soon as they begin to decompose, or as soon as possible afterwards, and not suffered to rot, and exhale their best constituent parts whilst lying in the farmyard The drainings and the exhalations of a common dung heap contain its most effective ingredients and these are often suffered to go to waste or to contaminate the air and collect in pools of filth The fresh and the old manure of this decomposition are known to farmers under the terms *short* dung the advantages and economy when properly applied cannot be doubted Those animal manures which are slow of decomposition are most durable, and generally most effective in their operation Of these the best is ground bones, the animal part of which is very gradually dissolved out by moisture, so that their effect is long-continued, and their earthy matter is also probably beneficial, at least to many crops Vegetable manures are often very effective, especially as in the case of ploughing in a green crop, where all the soluble matters are brought into action, and inert vegetable substances may be rendered active by mixture with those which easily putrefy, or with animal matter Some vegetables, such as cabbages and many other cruciform plants approximate to animal matter in their composition, and are proportionately good manures Mineral manures act in two ways either by their causticity, as is the case with quicklime, by which they decompose m roots fibres, &c, and render to the growing crop, or they alter the texture of the soil Thus, sand may be called a manure for clayey lands, and clay and loam for those that are sandy Upon the same principle, stiff soils are improved by paring and burning, by which a superficial sandiness is produced, and the texture of the soil rendered more appropriate for vegetation

MANUSCRIPTS (Lat manu scriptum, *written by the hand*) Literally writings of any kind, whether on paper or any other material in contradistinction to such as are printed Books were generally written upon vellum after the paper manufacture had become obsolete, until the general introduction of paper made from rags, about the 14th century after Christ, and the finest and whitest vellum is generally indicative of great age in a manuscript The dearness of this material gave rise to the practice of using old manuscript books on which the writing had been erased (*see* PALIMPSEST) and also to that of abbreviations These were carried to excess in the 12th century, and from that time until the invention of printing, and for a long period subsequent to that invention abbreviations were still in common use in Greek printing they were usual until within the last fifty years Of Latin MSS those prior to the reign of Charlemagne (A D 800) are considered ancient Manuscripts of the early classical age were written on sheets rolled together *Illuminated manuscripts* are such as are embellished with ornaments, drawings emblematical figures, &c illustrative of the text This practice was introduced at a very early period, for we find the works of Varro Pomponius Atticus, and others adorned by illuminations But we owe the preservation of the Psalter and prayer book to the illuminators The colours most employed for this purpose were gold and azure Illuminations were in a high state of perfection between the 5th and 10th centuries, after which they seem to have partaken of the barbarism of the middle ages, which threw their chilling influence over every description of art On the revival of the arts in the 15th and 16th centuries many excellent performances were produced, but the art did not take deep root, and we believe the last specimen of illumination executed in this country was Cardinal Wolsey's *Lectionary* at Christ Church, Oxford See CODEX, DIPLOMATICS, PALÆOGRAPHY

MAP (Lat mappa) A delineation of some portion of the surface of the sphere (terrestrial or celestial) on a plane Terrestrial maps are *geographic* or *hydrographic*, according as they denote the parts of the land or of the sea, the latter, however, are usually called *charts* (*See* CHART) A map representing a small extent of country is a terrestrial map is to exhibit the boundaries of countries and the relative positions of their several parts A perfect representation of a country should present all its parts, not only in their true relative positions, but also in their just proportions This may be accurately done on a globe, but as the earth's surface is spherical it is impossible to represent any considerable portion of it on a plane so that the distances of places shall retain the same proportions which they have on the sphere and geographers have accordingly had recourse to various methods of projection all of which have their peculiar advantages in particular cases



One method is to represent the portions of the sphere according to the rules of perspective, or as they would appear to the eye, having some assigned position between the sphere and the plane of representation This method gives rise to the different modes of *projecting* the sphere, of which the three principal are the orthographic, the stereographic, and the central The method of projection answers very well when the surface to be represented is small and the eye is placed perpendicularly over it, but when it embraces a considerable

portion of the sphere, the parts near the extremities of the map are much distorted *See* PROJECTION

A second method is to suppose the surface to be represented to be a portion of the surface of a cone, whose vertex is somewhere in the polar axis produced, and which either touches the sphere at the middle latitude of the surface to be represented or falls within the sphere at the middle latitude and without it at the extreme parallels The conical surface is then supposed to be developed on a plane (which it admits of being); whence this method is called the method of development Of this method there are various modifications as that of Murdoch, who supposes the side of the cone to be parallel to the tangent of the meridian at the middle latitude but to penetrate the surface of the sphere between the middle latitude and the extremities of the projected arc, that of De Lisle, who assumed the cone such as to intersect the sphere in the two parallels equally distant from the extreme and middle latitudes, that of Euler, who placed the apex of the cone at a determinate distance beyond the pole

A third method is to lay down the points on the map according to [illegible] law, the condition to be observed being that [illegible] of the spherical surface to be represented, and their representations on the map, shall be similar in their small elements Of such methods the best known is *Mercator's Chart* (which nowever, may be [illegible] which the meridians are equidistant, parallels and the parallels [illegible] are also straight lines perpendicular to the meridians, but of which the distances from each other increase in going from the equator in such a proportion as always to show the true bearings of places from one another *See* MERCATOR'S CHART

Celestial Maps — For the construction of his maps of the stars the astronomer Flamsteed adopted the following method — All the parallels on the sphere are represented by straight lines, and likewise one of the meridians, namely, that which passes through the middle of the map, as in the annexed diagram The parallels which are all perpendicular to this meridian have the same relative lengths as on the sphere and consequently the degrees of longitude are represented in their just proportions, that is are proportional to the cosine of the latitude If therefore the parallels be each divided into the same number of equal parts, a curve line drawn through the points of division will represent the meridians By this method any distance in the direction of the parallels is equal to the corresponding distance on the sphere, but it is evident that the map is much distorted towards the extremities, in consequence of the oblique directions of the meridians Flamsteed's method is sometimes used in geography for representing countries which lie on both sides of the equator in which case the distortion is less A modification of it which consists in substituting arcs of circles for the curved [illegible] whereby their obliquity [illegible] employed in the construction of maps The Society for the Diffusion of Useful Knowledge has adopted the gnomonic projection for laying down their maps of the stars

For details respecting the general construction of maps, we refer the reader to the work of Mr Jameson on the subject, *Malte Brun's Geography*, *Malte Brun's and Balbi's Systems of Geography Abridged*, *Murray's Encyclopedia of Geography*, *De Morgan's Explanation of the Gnomonic Projection of the Sphere*, and particularly the *Traité de Topographie d' Arpentage et de Nivellement* of Puissant

MARANA'THA (Syr) A form of anathematizing among the Jews which was viewed as a tremendous denunciation (See 1 Cor xvi 22) It signifies "the Lord will come," [illegible]

MARANTA'CEÆ Maranta (one of the genera) form the natural order of Endogenous plants, from which the most genuine kind of arrow-root is prepared This substance is the starch contained in the tubers of *Maranta*, *Arundinacea*, and some other species, and of certain kinds of canna *Marantaceæ* are very nearly the same as *Zingiberaceæ*, from which they differ in the flowers being more irregular, and the anther having but one lobe instead of two

MARA'SMUS (Gr *μαραινω*, *I waste away*) Emaciation atrophy

MA'RBLE (Fr marbre) A term limited by mineralogists and geologists to the several varieties of carbonate of lime which have more or less of a granular and crystalline texture In sculpture, the term is applied to several compact or granular kinds of stone susceptible of a very fine polish The varieties of it are extremely numerous The most valuable sorts used by the ancients were the *Pentelican*, which was white, and obtained from Mount Pentiles in Attica; the *Parian*, also called *Marpessian*, obtained from the island of Paros, was of a white colour as was that from Mount Hymettus in Attica Thasus and Teïos also produced white marbles, which were in much repute A place called Luna, in Etruria, produced a marble whose whiteness exceeded that from Paros Of the white marbles were those from Mount Phelleus, from the neighbourhood of Coralios, in Phrygia, from Cyzicus, in Asia Minor, and the Marmor Phrygium, found near Synnada in Phrygia The black marbles most used were from Tænarus, and the Numidian The Chium Marmor, from the island of Chios was of a black transparent chequered colour The Obsidianum, procured from Ethiopia, was black The Proconesian marble was with black veins Mount Taygetes afforded the Marmor Laconicum, which was green, and is better known by the name of Verde Antique A marble of mingled green was obtained from Carystus The Atrician marble, from Mount Atrax in Thessaly, was a mixture of black, white, blue, and green The Tiberian and Augustan marbles were green, and brought from Egypt The Marmor Memphites was green, and is what we call serpentine Corinth produced a yellow marble The Marmor Phengites was white, with yellow spots, the Rhodian was marked with spots of a golden colour and that of Milos yellow In modern times the quarries of Carrara almost supply the world with white marble Of variegated marbles there are many sorts found in this country of singular beauty *See* ELGIN MARBLES see also GEOLOGY

MARCH The first month of the Roman year, and the third of the English In the ecclesiastical calendar used in England till the change of style in 1752 this was also the first month as it was in the Roman It is named Martius in honour of Mars the reputed father of Romulus There is an old proverb still prevalent in Scotland, which represents March as borrowing three days from April, which have thence come to be designated the borrowed days They will be found noticed in the *Complaint of Scotland* Upon this subject Dr Jamieson observes, "Those who are much addicted to superstition will neither borrow nor lend on any of these days If any one would propose to borrow of them, they would consider it as an evidence that the person wished to employ the article for the purpose of witchcraft against the lenders"

MARCH In Music a military air played by inflatile and pulsatile instruments to regulate the steps and to animate the minds of soldiers The march, however, has long been adapted to every species of musical instrument and some of the most celebrated compositions of [illegible], as the March of the [illegible] Peasant's March in Weber's *Freischutz* and above all Beethoven's Funeral Marches In the Supplement to the First Edition of the *Encyclopædia* it is truly said that a march should be always composed in common time with an odd crotchet or quaver at the beginning It is usually quick for ordinary marching and slow for grand occasions, but no general rules can be laid down for its composition

MARCH, in Military Language signifies the motion of a body of troops from one place to another It consists of three measures 1 ordinary time in which about 75 paces are taken in a minute, 2 quick time, in which about 108 steps are taken in a minute, 3 the quickest, or as it is called *wheeling* time, at the rate of 300 feet in the same space

MARCHES The name given to the borders or frontiers of any district, but more especially applied to the boundaries between England and Wales, and England and Scotland The term is derived from an old Anglo-Saxon word signifying a mark, and is to be found in every language of Teutonic descent Several titles of dignity both in this and other countries derive their origin from their possessors having been appointed governors of the *marches* or frontiers of their respective countries, of these marquis [illegible] and markgraf in Germany are the most [illegible] The Earl of March now enjoyed by the Duke of Richmond was originally bestowed on Mortimer, a member of the family so celebrated in English history, because he was the governor or superintendent of the Welch marches In the middle ages the name *marchers* was given to the noblemen who lived on the marches of Wales and Scotland. According to Camden they had once their own laws, and even the "power of life and death like petty kings" but these privileges were abolished by Henry VIII There was formerly a court of the marches of Wales in existence, where pleas of debt, or damages not above the value [illegible] tried and determined

MARCIONITES The followers of Marcion, a heretic of the 2d century, who adopted the Oriental notion of the two contending principles, and imagined that between them there existed a third power, neither wholly good nor evil the Creator of the world and the God of the Jewish dispensation The object of the Good Principle, or Supreme God, is to restrain the ambition of

these two powers, which wage a constant war against each other as well as himself. For this purpose it was that he sent his son Jesus Christ to destroy the Evil Principle on the one hand and to counteract and coerce the power of the Jewish Deity on the other The Marcionites were a branch of the great Gnostic heresy Their opinions are found in the writings of Irenæus, Epiphani[illegible]

M[illegible] of Christians, a branch of the Gnostics who derived their name from an Egyptian called Marcus, and reputed a magician The Marcosians had a great number of apocryphal books which they held to be canonical, and many of their fables are still in use and credit among the Gre[illegible]

MA'RIKANITE is a variety of [illegible], found at Marekan in Siberia in small spherules

MARGA'RIC ACID (Gr *μαργαριτη, a pearl*) The substance into which the margarine, or concrete portion of certain oils, is converted by the action of alkalies It has a pearly lustre, and is insoluble in water, but readily soluble in hot alcohol, which deposits it as the solution cools It fuses at 140°, and reddens betimes It closely resembles stearic acid

MA'RGARINE The solid fatty matter of certain vegetable oils has been thus termed by Lecanu, from its pearly lustre The purest margarine is obtained from the concrete portion of olive oil

MARGARI'FIC ACID A distinctive term applied to one of the fatty acids which result from the saponification of castor oil By the same process this oil also yields the œnic and the elaodic acids

MARGARO'NE When margaric acid is mixed with quicklime and distilled, a peculiar fatty product which crystallizes in pearly scales is obtained, which has been distinguished by the above term from other analogous substances

MA'RGIN (Fr marge) in Printing is the arrangement of the pages in a sheet at proper distances from each other according to the size of the paper, so that when the sheet is printed and folded the border of white paper round them shall be regular and uniform in every leaf of the book

MA'RGIN OF A COURSE In Architecture, that part of the upper side of a course of slates which appears uncovered by the next superior course

MARGI'TES The title of a satirical poem attributed, but with little probability of truth to Homer, it by him is meant the author of the *Iliad* or *Odyssey* The subject of the poem, which has not come down to us was the character of a silly empty-headed m[illegible]

MA'RGRAVE or more properly MARKGRAVE A title of rank formerly used in Germany, and equivalent to the English marquis Both words spring from a common origin See Marquess

MARI'A THERE'SA, ORDER OF A military order of M[illegible] and knights founded in 17[illegible]

MARI'NES A corps of men enlisted to serve as soldiers on board of ships of war in naval engagements and on shore under certain circumstances They sometimes assist, particularly in the British service in performing some naval duties on board of ship The period at which a distinct corps was embodied for this department of the British service is unknown In 1684 mention is made of the Duke of York's maritime regiment of foot and in the reign of Will III several regiments were placed on the establishment these, however, were subsequently disbanded In the beginning of Queen Anne's reign six regiments of marine soldiers were raised, and though these were again disbanded in 1749, six years afterwards 130 companies were raised on the recommendation of Lord Anson consisting in all of above 5000 men Since the commencement of the present century great additions have been made to this corps, and at present its strength amounts to 9000 men The men are clothed and armed in the same manner as the infantry of the line The corps is commanded by a lieutenant-general and a major-general, who are naval officers, holding in addition to their rank as such these military titles there are also four colonels commandants of divisions, besides four colonels and second commandants No commissions in the corps are obtained by purchase, and the officers of marines rise in it by seniority, without however, being able to obtain a higher rank than that of colonels commandant (See *Penny Cyclopædia*)

MARIOTTE'S LAW In Pneumatics, a general property of elastic fluids, first established by Mariotte, namely, that the elasticity or pressure is directly proportional to the density, or, which is the same thing inversely proportional to the space which the fluid occupies See PNEUMATICS

MA'RITIME LAW, signifies the laws relating to harbours, ships, and sailors It forms an important branch of the commercial law of all trading nations, and embraces an infinite variety of subjects, most of which have been defined under their respective heads The most celebrated codes of maritime law have been, in classical times, that of Rhodes; in modern times, the *Consolato del Mare*, a compilation supposed to have been framed at Barcelona as early as the 9th century, the laws of the Isle of Oleron, in the time of Richard I of England, the laws of Wisby in the island of Gothland, to which some northern jurists have assigned an earlier origin than the laws of Oleron, but which there can be little doubt were merely a compilation from those above specified But by far the most complete and well-digested system of maritime jurisprudence that has ever appeared is that comprised in the *Ordonnance de la Marine*, issued by Louis XIV in 1681, by which maritime law was elevated to the rank of a regular system, and has formed the basis of many of the subsequent decisions of English, American, and other [illegible] courts This excellent code was compiled under the direction of M Colbert, by individuals of great talent and learning, after a careful revision of all the ancient sea laws of France and other countries, and upon consultation with the different parliaments, the courts of admiralty, and the chambers of commerce of the different towns It combines whatever experience and the wisdom of ages had shown to be best in the Roman laws, and in the institutions of the modern maritime states of Europe In the preface to his treatise on the *Law of Shipping* Lord Tenterden says, — "If the reader should be offended at the frequent references to this ordinance, I must request him to recollect that those references are made to [illegible] code of a great commercial nation, which [illegible] prosperity to that code a code composed in the reign of a politic prince, under the auspices of a wise and enlightened minister, by laborious and learned persons, who selected the most valuable principles of all the maritime laws then existing, and which, in matter, method, and style, is one of the most finished acts of legislation that ever was promulgated" The ordinance of 1681 was published in 1760, with a detailed and most elaborate commentary by M Valin, in 2 vols 4to *See* ADMIRALTY, COURT OF (See also the *Commercial Dict*)

MARK An old coin current in England and Scotland valued 13*s* 4*d* A piece of money so called is at present used in Hamburgh, it is equal to 1*s* 4*d* sterling

MA'RKET (Mod Lat mercheta, from merx) In Law, the liberty or franchise whereby a town is enabled to set up and open shops, &c, at a certain place within its limits, for buying and selling, and better provision of such victuals as the subject wanteth The establishment of a market, with the grant of the tolls thereunto belonging is one of the king's prerogatives, and can only be effected by virtue of the king's grant, or supported on long and immemorial usage and prescription which presuppose such a grant The general rule of law is that all sales and contracts of any thing vendible in fairs or markets overt (or open) shall not only be good between the parties but valid against all claim by others having any right or property in the subject

MA'RKING INK An indelible ink used for marking linen, it effectively resists washing and almost all chemical agents its basis is oxide of silver, which has a strong affinity for the fibre of linen and cotton, and acquires by exposure a black colour A good marking ink is prepared by dissolving a drachm of fused nitrate of silver in half an ounce of distilled water and colouring it with a little sap green, but a thick gum to thicken it written with upon the unprepared linen, the place to be written upon is commonly prepared for its reception by the previous application of *liquid pounce*, which is made by dissolving two drachms of carbonate of soda and two drachms of gum arabic in four ounces of water this also effectively precipitates the oxide of silver upon the vegetable fibre, and prevents any injury from the corrosive action of the salt of silver A solution of ammonio nitrate of silver, thickened by a little gum, forms a marking ink which may be used without any previous preparation

MARKING NUT, in Botany, is the seed or nut of the *Semicarpus anacardium* a tropical tree, related to the cashew nut It derives its name from the juice contained in its fruits staining linen of a deep and indelible black colour

MARK, ORDER OF SAINT A Venetian order of knighthood, St Mark the Evangelist having been the patron of that republic The knights were elected by the doge and senate

MARL, is composed of carbonate of lime and clay in various proportions, and in different degrees of compactness and friability In some marls the proportion of clay is small, in which case the marl, as a manure, acts on soils much in the same manner as lime, but where clay is the predominant ingredient of marl, it acts on the soil partly as lime, but principally by altering the texture of the soil Hence all sandy soils are improved by marl, in consequence of its increasing their compactness and capacity for retaining moisture, while argillaceous marls applied to clays are of little or no use From these long-established facts has arisen the old adage, —

Who marls sand shall bury land,
Who marls clay throws all away

Marl is found in almost every country; not like limestone, in protruding rocks, but, from its friable nature, which moulders down into a comparatively earthy mass, under or near the surface of the soil, whence it is dug out and spread on the surface Hence, while limestone is quarried, chalk and marl are dug out of pits Marl has been in use in Europe since the time of the Romans it is very generally employed as a manure in France and Germany and in England it is most employed in Norfolk

MA'RLINGSPIKE An iron bolt tapering to a point [illegible]

MARLY MACHINE A celebrated piece of mechanism, one of the most complex perhaps ever constructed, for [illegible] Seine to supply the town of Mar[illegible] and Trianon Its mean produce was from 30,000 to 40,000 gallons per hour, and was attended with an expense of about a farthing for 15 gallons It was erected in 1682 by Runnequin, upon very unscientific principles, but still with considerable skill in its details It was, as such complicated machines always are, often out of repair, and Hachette reports of it that, after 128 years, it fell into total ruin Details of its construction may be seen in Belidor, *Arch Hydraulique*, *Gregory's Mechanics*, vol ii, and other places

MARMORATUM (Lat) In Architecture a cement formed of pounded marble and lime well beaten [illegible]

MARMOT The Rodent animal so called is the type of a genus (*Arctomys*) nearly allied to the squirrels being characterized by having five molar teeth on each side of the upper and four on each side of the lower jaw all bristled with points and indicative of a somewhat mixed diet The marmots however, in their general form are nearly the reverse of the squirrels [illegible] heavy, with short legs, a middle-sized or [illegible] and large flat head They pass the winter in a state of torpor, concealed in deep holes, the entrance of which they close with a heap of dried grass They are natives of Europe and North America live in societies, and are easily tamed

MA'RONITES The followers of Maro inhabitants of the mountains Libanus and Antilibanus in Syria who adopted in the 7th century the opinions of the Monothelites, they continued to form a separate sect until the 12th century, when they became reconciled to the see of Rome The Maronite writers, however have always maintained their freedom from the errors imputed to them, and declare themselves to have been uniformly attached to the doctrines of the Catholic church (See MONOTHELITES (*Mosheim*, transl ed 1790 ii 1 6)

MAROO'NS (Supposed to be derived from a word used in Spanish America, signifying *hog-hunters*) A name given in Jamaica to runaway negroes When Jamaica was conquered from the Spaniards a number of negroes, abandoned by their former masters occupied some of the mountainous parts of the island and caused great trouble to the colonists About 1730 they became extremely formidable, but after a war of eight years at length submitted to a capitulation by which they were allowed to retain their free settlements in the heart of the island, in 1795 a portion of them again rose in arms but were speedily put down, and transported to a new settlement in Nova Scotia (See *Dallas's History of the Maroons*)

MARQUE, LETTER OF [illegible] time of war to a private person [illegible] cruise at sea and make prize of the enemy's ships and merchandise the ship so commissioned is sometimes called by the same name (See REPRISALS, LETTER OF) The word is derived from mark (Germ *frontier*) as being a right of capturing property beyond the limits or frontiers of another prince

MA'RQUESS (Germ mark *a limit* or *frontier*) A title of dignity in England, France, and Italy next in rank to that of duke It is of German origin, those military chieftains in the Teutonic kingdoms and empires which arose on the fall of the Western empire who were entrusted with the defence of districts on the frontiers, having been styled mark-grafen, counts of the marches or frontiers (in Latin, marchiones) Many of these officers were appointed by Charlemagne, although he was not probably the first creator of the office According to the ordinary course of the development of feudal institutions, these chiefs, from military governors appointed for life, became territorial potentates, holding their lands by hereditary right, and, on the decay of that system, this honour, like others, became merely titular In England, the first marquess was Robert de Vere, Earl of Oxford, created by Richard II, in 1387, Marquess of Dublin for life The next creation was of John de Beaufort, Earl of Somerset, raised to the rank of marquess in 1397, which dignity he afterwards refused to bear, as a strange and novel one (See Nicolas, *Introduction to the Peerage*, lxxvi) After that period the title [illegible] until the reign of Edward VI

MARQUETRY (Fr marquetrie) In Architecture, inlaid work consisting of different pieces of divers coloured woods of small thickness glued on to a ground usually of oak or fir, well dried and seasoned, which, to [illegible] is composed of several thick [illegible] builders used it in cabinet work, and John of Vienna and others of his period by it means represented figures and landscapes, but in the present day it is chiefly confined in its use to floors, in which the various pieces of wood are usually disposed in regular geometrical figures, and are rarely of more than three or four species

MA'RRIAGE LAW OF Marriage, in its legal sense is a civil contract binding parties to certain reciprocal obligations, and the general principle of law respecting this, as well as other contracts, is, that it is to be held valid according to the usage of the country wherein it is made Thus a marriage between English subjects in Scotland according to the formalities of Scottish law is binding, and the children of such parents are legitimate in England A marriage between English subjects in France according to the ceremonies in the church of England would not be valid, according to the principles of general law unless registered before the civil magistrate according to the provisions of the French code But, by the statute 4 G 4 c 91 marriages between English subjects, solemnized abroad by ministers of the church of England in the chapel of a British ambassador or British factory are valid in the United Kingdom

Previous to the passing of the first Marriage Act in 1754 the law of England was governed by the canon law and consequently, an agreement to marry, followed by consummation, formed as it now forms in Scotland, a sufficient union That statute first rendered necessary the preliminaries of the publication of banns, or the obtaining a licence It was amended by 4 G 4 c 17 But that act imposed so many additional restrictions on parties wishing to become husband and wife that it was found necessary to repeal it in all haste, and another statute was passed (4 G 4 c 76), by which English marriages were next regulated

By this act the banns of marriage are to be published three Sundays in a parish church or public chapel of the establishment in the parish wherein both or the parish wherein each, of the parties dwell A licence is a dispensation by virtue of which marriage may be solemnized without the publication of banns It is granted by [illegible] persons having authority from the bishop [illegible] cannot now be obtained unless upon affidavit that the parish or district in which the marriage is to be solemnized has been the usual place of residence of one of the parties for fifteen days immediately preceding the granting of the licence The affidavit must also declare that there is no impediment of kindred or alliance nor any other lawful cause of hinderance

By the last marriage act, 6 & 7 W 4 c 85, a superintendant registrar of marriages was appointed, who is required to register marriages, and empowered to give licences &c either himself, or by inferior registrars Places of worship, certified according to law, may be registered for the solemnization of marriages, or they may be celebrated before the superintendant registrar himself thus entirely removing the contract from ecclesiastical control But all parties may, if they please, still marry in the parish church An extensive registration [illegible] provided by the same act

A special [illegible] with all restrictions as to time and place of marriage By a regulation of Archbishop Secker it is not to be granted except to persons of a specified rank, but in practice the privilege is extended as a matter of favour

The power of parents and guardians, in restricting the [illegible] of their minor [illegible], is now confined [illegible] the following [illegible] The publication of banns is void, if the parent or guardian of either party declare, or cause to be declared, their dissent in public at the time of the proclamation In case of marriage of a minor by licence, the father or guardian, or if none, the mother or the guardian appointed by the court of chancery, must give consent, and such consent must be notified in the affidavit on application for the licence. If consent be unreasonably withheld, the only resource of lovers against the flinty hearts of parents or guardians is by petition to the lord chancellor, who may, if he pleases, interpose his judicial authority in favour of their union

Marriages are void if solemnized in a wrong name They are also void where there is a prior existing marriage, and in case of lunac[illegible]

Proof of a marriage is [illegible] a party who was present at the celebration, or by production of the parish register, and showing the identity of the parties

The ecclesiastical courts have the direct cognizance of questions respecting [illegible] but as the common law courts [illegible] operty, and others in which the fact of marriage may be incidentally called in question, they can require proof of it without resorting to the assistance of the former

Marriage is voidable by suit in the ecclesiastical court, where such marriage has been contracted under a ca-

nonical impediment, namely, consanguinity or affinity, or bodily incapacity of either of the parties Marriages solemnized by force are also voidable, and such as are contracted in error under certain circumstances A voidable marriage is good to all intents until rendered void by a sentence of the court

Other matrimonial causes in these courts are—1 Jactitation of marriage When one party gives out or reports that he or she is married to another, the party is [illegible] (see Ecclesiastical Courts, under the head of Law) in the spiritual court, and unless the defendant proves marriage, silence is enjoined, which is the only remedy the spiritual court can give

1 Adultery, as a public crime, is left to the cognizance of the spiritual courts as a civil injury, it is pursued by the husband in an action of trespass for damages against the adulterer in those of common law

2 In suits on the ground of adultery in the spiritual court the remedy prayed is a separation or divorce *à mensa et thoro*, from bed and board And it may be obtained by either party, but will be refused in case the other party recriminates and mutual unfaithfulness is proved, or in case other circumstances are shown which, in the opinion of the court, disentitle the complainant to the remedy he prays for

A divorce *à vinculo matrimonii*, that is, the annulment of marriage, can only be conferred by act of parliament Evidence must be given on applying for the bill that there was judgment for the plaintiff on an action for damages against the seducer, or sufficient cause shown why such action was not brought or such judgment obtained

3 Another ground on which the spiritual courts will grant a separation is cruelty, but the cruelty for which such relief can be granted is only such as directly endangers the life or health of the injured party

4 A suit for restitution of conjugal rights is to compel mutual cohabitation And no deed of separation or mutual agreement, nothing short of a sentence by the court, can bar the complainant of his or her right to promote this suit, but cruelty or adultery may be pleaded in reply as constituting lawful grounds for separation

5 Alimony is that legal proportion of the husband's estate which by the decree of the ecclesiastical court, is allotted to the wife for her maintenance during the pendency of a suit between them, or after a sentence of divorce *à mensa et thoro* by reason of the cruelty or adultery of the husband, the permanent allowance to be paid to the wife during their separation The quantum of alimony is decided by the court on a statement of the husband's property (called *an allegation of facultics*) and his answer thereto

Marriage, its Effect on Property — The consideration of the legal effect produced by marriage on the property of the parties [illegible] relates to —

1 The [illegible] wife, as it respects property acquired by either before marriage

2 As it respects property acquired by either after marriage

3 As its dispositions are affected by separation or divorce

(1, 2) As to real property If the wife is seised of lands or tenements in an estate of inheritance and dies having had issue born living the husband is entitled to the lands or tenements for his life, being tenant as it is termed by the courtesy of England and this, whether the lands be held by a legal or equitable title

Dower is now, since the statute 3 & 4 W 4 c 115, the wife's right to one third part, for life of all estates of inheritance which her husband dies entitled to or seised of in possession It formerly attached to all estates of inheritance of which he was at any time possessed, so that he could not defeat her title by alienation but to legal estates only Since the 1st January 1834, the period on which the above-mentioned act came into operation equitable estates are also subject to it It has long been customary to bar this right to dower by various complicated processes, which the law has permitted to defeat the wife's claim, and especially by settlements before marriage, giving a jointure or provision in lieu of dower It may now be barred by the husband's alienation in his lifetime, or by his will, or by a declaration in the deed of conveyance of the land to the husband Anciently a *feme covert* could only alienate real property by the public solemnity of a *fine*, now, by a deed executed after her examination by commissioners, to show that no control is exercised by the husband

All the *personal* property to which a woman is entitled vests in her husband by marriage Her *chattels real*, that is, leasehold property for a term of years, will revert to her if she survive him, and although the husband may alienate them in his lifetime, he cannot dispose of them by will But should he survive her, they are his absolutely Her *chattels personal* — money and goods — are his without restriction, to give or bequeath as he pleases even in her lifetime Her *choses in action* (that is, property of which there is no immediate occupation, as debts due to her, money in the funds, &c) are the husband's property *conditionally*, that is, if he reduce them into possession by exercising his rights over them during her life If not they survive to her absolutely, and should she die first, he only takes them as her administrator, which he is by right

If the husband die intestate, the wife is entitled to half his personal property if there be no issue, and to one third if there be issue

The husband is liable for all his wife's debts and engagements made while unmarried, but not for such as she may have contracted during a former marriage But he is relieved from all debts by her decease, and if he die first, she only is responsible For debts contracted by the wife during marriage the husband is not liable unless they have been contracted with his consent, express or implied, and this implied assent gives rise, as may well be supposed, to numberless questions in courts of law

As to the acts of husband and wife before marriage — The will of a bachelor or widower not having children is revoked by his subsequent marriage and birth of issue A warrant of attorney given by an unmarried woman is revoked by her marriage So is her will, in every case, but there are others of her acts — such as the grant of a lease at will — which are not revoked, but merely revocable

Settlements or articles, made in contemplation of marriage, are contrivances to modify the effects which would be produced by the mere act of law on the rights of the respective parties, and also to ensure an alienable provision for issue It is usual to vest the property of both parties in trustees, generally for the benefit of the husband during their joint lives, then for the benefit of the survivor, after his or her death for the benefit of the children, in such proportions as the nature of the property or circumstances of the family may dictate But it is usual to give authority to the parents by means of a *power* to vary these relative proportions A jointure, although, in the strict sense of the word a joint estate to husband and wife, is in practice a separate estate to the wife in lands and tenements, to take effect immediately on the husband's death and to secure a competent provision for her during her life at least it is usually provided by settlement, and bars dower Pin-money is an annual income settled [illegible] before marriage by the husband on the intended wife, usually by means of trustees

But in other cases, and especially when the casualties of a trade render it desirable to secure a certain protection the wife is provided for in the settlements by vesting her own property, or a portion of it, in trustees for her sole and separate use In this case the sums so secured are wholly independent of her husband's control Where bequests are made to a married woman for her separate use and no trustees are named to protect them a court of equity will consider her husband a trustee for her She may sue him, or any other person, in those courts, in respect of such property Her savings out of it are likewise hers in separate right But savings made by a wife out of an allowance for her private expenditure are not in every case her separate property

A married woman has also a claim, in a court of equity, to a provision out of her own property in several cases, especially where the husband deserts or ill-treats her, or where being a ward of chancery, she is clandestinely married

(3) On a divorce *a vinculo matrimonii* dower is gone and if such divorce be on account of pre-contract consanguinity or affinity the children are illegitimate and the wife's property is restored to her But a divorce *a mensa et thoro* does not bastardize the children or bar dower

Adultery during a voluntary separation entitles the aggrieved party to a divorce *a mensa et thoro* as much as during cohabitation, and frees the husband from all debts of his wife or claims by reason of her

A husband is not held liable for debts contracted by his wife, even for necessaries, if he have turned her out of doors for adultery, or if after being turned out, she commit adultery, or if she depart from him without his consent, or if she elope with an adulterer, or if the husband and wife separate by mutual agreement In cases where the wife has separate means, or is provided for by separate maintenance

Bigamy or polygamy, is a felonious offence, punishable by transportation for seven years, and is now (since the statute 9 G 4 c 31) equally punishable, although the second marriage took place out of the jurisdiction of English law

A wife committing any felony except murder or manslaughter [illegible] with her husband is not responsible for the offence but she is indictable for high treason so committed

In both civil and criminal cases (with the exception of treason), husband and wife are not allowed, except under particular circumstances, to give evidence for or against each other

MARS In the Solar System, one of the old planets, and the fourth in the order of distance from the sun The mean distance of Mars from the sun is 1 5236923, the mean distance of the earth from the sun being 1 it is, consequently, about 142,000,000 of miles Mars performs his mean sidereal revolution in 686 '7964458 mean solar days, and his synodical revolution (that is, returns to the same position in respect of the earth and sun) in 779 936 days His orbit, at the beginning of the present century was inclined to the ecliptic in an angle of 1° 51′ 6″, and its eccentricity is 093307, half the major axis being unit His apparent diameter varies from 3 6″ at his greatest, to 18 28″ at his least distance from the earth At his mean distance the apparent diameter is 6 29″, whence the true diameter is found equal to 517, that of the earth being unit, or about 4108 miles Mars has a rotation about his axis which is performed in 24 h 39 m 21 sec The inclination of the axis to the ecliptic is 58° 18′ When the opposition of Mars takes place at the time he is near the aphelion of his orbit he is then at his least distance from the earth, and presents an interesting appearance when seen [illegible] 'In this planet," says Sir [illegible] with perfect distinctness, the outlines of what may be continents and seas Of these the former are distinguished by that ruddy colour which characterizes the light of this planet which always appears reddish and indicates, no doubt an ochreous hue in the general soil like what the red sandstone districts of our own country may possibly offer to the inhabitants of Mars, only more decided Contrasted with this (by a general law in optics) the seas, as we may call them, appear greenish These spots, however, are not always to be seen equally distinct, though, when seen, they offer always the same appearance This may arise from the planet not being entirely destitute of atmosphere and clouds, and what adds greatly to the probability of this is the appearance of brilliant white spots at its poles which have been conjectured, with a great deal of probability, to be snow, as they disappear when they have been long exposed to the sun, and are greatest when just emerging from the long night of their polar winter" (*Astronomy, Cab Cyc*) *See* PLANET

MARS, or MAVORS The Latin names of the deity called by the Greeks Ares He was fabled to be the son of Juno, conceived by means of the virtue of a certain plant, and was worshipped as the God of War At Rome he was honoured as the progenitor of Romulus the founder of the city, of which he was held to be the protector, and it was to the honour of this divinity that the Latin husbandmen used to offer up a peculiar sacrifice, called *suovetaurilia* which as the derivation of the word implies, consisted of a pig a sheep and a bull The priests of Mars were called *salii* and to their care was intrusted the sacred shield (*ancile*) which was said to have fallen from heaven during the reign of Numa *See* SALII, ANCILE

MARSEILLAISE HYMN The name popularly [illegible] even to the national anthem of the French The origin of this song which has played so important a part in the revolutions not only of France but of other continental states was long involved in obscurity, and we scarcely think it will be considered out of place to embody in our pages the following statement [illegible] which may be relied on as authentic

The Marseillaise Hymn was the production of Rouget de Lille, a French officer of engineers, who was quartered at Strasburg in the year 1791, when Marshal Luckner commanded the army, at that time entirely composed of young conscripts The marshal was to march the following morning of a certain day, and, late in the evening previous, he inquired if there were any men of a musical or poetical genius in the army who could compose a *soul-inspiring* song to animate his young soldiers Some one mentioned Captain Rouget de Lille who was immediately ordered into the presence of the marshal to receive his commands on the subject, which having been given, and a promise made by De Lille that a song would be ready the following morning he went to his quarters, and during the night he not only wrote the song in question, but also set it to music, and next morning the army marched to its tune, and carried every thing before it with an enthusiasm only to be equalled by absolute frenzy

The song is said to have been styled the *Marseillaise Hymn* from a body of troops, on their march from Marseilles, having entered Paris playing that tune at a time when it was little known in the capital The *original* of the *Marseillaise* is said to be in the possession of the family of Louis Philippe

MARSH. A flat surface, the soil of which is so far saturated with water throughout the year as to be unfit for culture by the spade or plough, but not so much as to prevent it from producing coarse grasses, and other kinds of herbage Marshes are generally situated in bottoms, where they are kept moist by the water which descends from the surrounding lands, or along the banks of rivers or lakes, [illegible] being nearly on the [illegible] Where a marsh is situated so as to be occasionally overflowed by the sea, or by a river up which the tide flows it is called a salt marsh; and the herbage produced by such lands is found highly conducive to the health of animals which pasture on them for a certain portion of the year, from the alterative effect of its saline properties

MA'RSHAL A title of honour in many European countries, applied [illegible] derivation of [illegible] uncertain The [illegible] hereditary in the family of the Dukes of Norfolk William Fitz-Osborn and Roger de Montgomery are said to have been marshals to William the Conqueror their successors for some time are not accurately known, but the office was held in 1138, in fee, by the family of Clare and thence descended to the Earls of Pembroke, and thence to Roger de Bigod, Earl of Norfolk, who surrendered it to Edward I After being granted for life and during pleasure, to several successive marshals, the dignity, with the title of Earl Marshal, was given to Mowbray, afterwards Duke of Norfolk, in whose family the dignity subsisted until it reverted to the crown in the reign of Edward IV Richard III granted it to his favourite, Howard, Duke of Norfolk, after whose death and attainder it passed through many hands, but was by Charles I granted for life to his descendant, Thomas Howard Earl of Arundel, and finally his grandson Henry Howard Earl of Norwich, was constituted hereditary earl marshal of England in 1672, with remainder to the issue male of the Earl of Arundel aforesaid, in which latter line it now subsists The earl marshal is eighth in rank among the great officers of state in England He has the same jurisdiction over the court of chivalry which was formerly exercised by the constable and marshal jointly

Marshal of the King's Household or Knight Marshal – An officer whose office is said to be to hear and determine pleas of the crown and suits between those of the king's household and other persons within the verge The marshal of the King's Bench has the custody of the King's Bench prison in Southwark

Marshal of France is the highest military rank in the French army This officer appears first in history under the reign of Philip Augustus as commander-in-chief of the royal armies The number of marshals was increased by several successive sovereigns in the reign of Henry IV the states of Blois limited it to four, but this restriction was not observed, and, in the reign of Louis XIV there were at one period no less than twenty In the same reign officers of the navy as well as the army received the rank of marshal The marshals bore two batons or marshal's staffs — azure semé of fleur de lys or saltier wise — as the token of their dignity After the deposition of Louis XVI the dignity of marshal ceased but was revived by Napoleon, with the title of Marshal of the Empire

MA'RSHALLING In Heraldry the arrangement and distribution of coats in a shield so as to denote the several matches and alliances of the family *See* BLAZONRY

MA'RSHALSEA In Law, the court or seat of a marshal The King's Bench prison in Southwark, is said to be so called because the marshal of the king's house was wont to sit there or to keep his prison The Marshalsea or Knight-marshal's Court, commonly called the Palace Court was created by Charles I, and had jurisdiction of personal actions within a circuit of twelve miles round Whitehall, but it was abolished in 1849

MARSH MIASMA The infectious vapours which rise from certain marshes and marshy soils, and which tend to the production of intermittent and remittent fevers

MARSU'PIALS *Marsupialia*, or *Marsupiata* (Lat. marsupium, *a pouch*) An order of Implacental Mammiferous quadrupeds, of which the females have a portion of the abdominal integument folded inwards, forming either a depression containing the mammæ, or a pouch serving also as a temporary abode for the young, and the males have a corresponding portion of the abdominal integument extended outwards, forming a scrotum or pedunculate bag for the testes In both sexes two supplementary trochlear bones are developed in the internal pillars of the abdominal rings, and are articulated to the anterior part of the brim of the pelvis, around which bones plays the [illegible] testes in the [illegible] the trochlear ossicles, from [illegible] these muscles with the [illegible]"

The quadrupeds associated together by the common [illegible] characters above defined so far [illegible] that a placenta is not [illegible] of the fœtus contracts no adhesion with the parietes of the uterus The fœtus is prematurely born after a gestation of only thirty-eigh

days in the great kangaroo, in which it does not exceed an inch in length. It is then received into the pouch, and adheres to the nipple for [illegible] pouch. The generative organs [illegible] and [illegible] striking peculiarities common to all [illegible] by which they differ from the ordinary [illegible]. Cuvier accordingly, in 1816, separated the marsupial from the other unguiculate quadrupeds, to form a distinct group, which he describes as forming with the Monotremes a small collateral chain, all the genera of which, while they are connected together by the peculiarities of the generative system, at the same time correspond in their dentition and diet, some to the Carnivora, others to the Rodentia, and a third tribe to the Insectivora. M. de Blainville, in the Tables of the Animal Kingdom which he published in the same year, 1816, constituted a distinct subclass of Cuvier's "small collateral chain" of mammals, and gave to the subclass the name of *Didelphe* [illegible] *Metatheles*, by which he distinguished the Placental Mammalia.

Many acute and sound-thinking naturalists refused their assent to these views, which, as they were supported by a knowledge of the conformity of organization of only the generative system in the Marsupials, were unquestionably defective in the evidence essential to enforce conviction. The best argument for returning to the older views of classification and for distributing the marsupial genera, according to the affinities indicated by their dental and [illegible] among the different orders of the [illegible] were advanced by Mr Bennett, the accomplished author of *The Gardens and Menagerie of the Zoological Society delineated* (vol. i. p. 265), and these have been repeated with approbation [illegible] later classificators, as Mr Swainson. [illegible] of the true affinities of the Marsupialia could only flow from an [illegible] organization, and the question [illegible] proposes with reference to the genus *Phascolomys*. What is there of importance in the structure of the wombat except this solitary character of the marsupium to separate it from the Rodent order?"—a question which he might in 1831, have asked with equal force in reference to any other marsupial genus—could only be answered satisfactorily by the anatomist who had submitted the Marsupialia in question to a thorough dissection.

Although the Marsupials present modifications of the dental system corresponding with the carnivorous, omnivorous, and herbivorous types, yet they agree with each other and differ from the analogous Placental Mammalia in having four instead of three true molars, or four molars which are not displaced and succeeded by others, in the vertical direction.

In the locomotive organs it is true that we see some of the Marsupials [illegible] like the Placental Quadrumana [illegible] with falculate claws, like the Placental Feræ, a third, as the wombat, has the feet adapted for burrowing, a fourth, like the Cheiromeles, is aquatic, and has webbed feet, yet all these Marsupials agree with each other in having a rotatory movement of the hind foot, analogous to the pronation and supination, which, in the placental quadrupeds, are limited, when enjoyed at all, to the fore feet, and they manifest moreover a peculiar modification of the muscles of the [illegible] in relation to these rotatory movements. In those Marsupials as the kangaroos, potoroos, and perameles, in which the offices of support and locomotion are devolved exclusively or in great part upon the hind legs, these are strengthened at the expense of the loss of the rotatory movements of the feet, but in the enormous development of the two outer toes, and the conversion of the two inner ones into unguiculate appendages useful only in [illegible] the fur, these Marsupials differ from all Placentals, whilst the same peculiar condition of the toes may be [illegible] Pedimanous group of Marsupials [illegible] organs notwithstanding their adaptation to different kinds of progression, testify to the unity of the marsupial group in the two remarkable peculiarities of structure above cited.

The vascular system gives evidence to the same effect. All the Marsupials present the following peculiarities in the structure of the heart, viz. the right auricle manifests no trace of either *fossa ovalis* or *annulus ovalis*, and receives the two *venæ cavæ superiores* by two separate [illegible] r, less urgent in [illegible] because the modification, as regards the separate entry of the superior *venæ cavæ* obtains in a few placental species, as the elephant and certain Rodents, but as the first-cited cardiac character is common and peculiar to the Marsupial Mammalia, and as the second, while it is universal in the Marsupials, occurs only as an exceptional condition in the placental series, the arguments which they afford to the unity of the marsupial group cannot be overlooked in a philosophical consideration of the affinities of the Mammalia.

With respect to the nervous system, it has been shown that, in the structure of the brain, the Marsupialia exhibit a close correspondence with the Ovipara in the rudimental state of the *corpus callosum*; the difference which the most closely analogous placental species offer in this respect is broadly marked (*Owen on the Brain of the Marsupial Animals, Phil. Trans.* 1837, p. 89, pl. vi.).

These coincidences in the Marsupialia of important organic modifications of the dental, locomotive, vascular, cerebral, and reproductive systems, establish the fact that they constitute a natural group, inferior, on the whole, in organization to the Placental Mammalia.

The following is a tabular view of the subordinate divisions of the Marsupialia regarded as an order of the Implacental subclass of Mammalia:—

Classification of the Marsupialia

Tribes	Families	Genera	Subgenera.
Sarcophaga			
Three kinds of teeth, canines long in both jaws, a simple stomach, no *intestinum cæcum*	*Dasyuridæ* -	Thylacinus Dasyurus Phascogale	
Extinct transitional forms - - - - - -		Phascolotherium Thylacotherium	Fossil
Entomophaga			
Three kinds of teeth in both jaws, a simple stomach, a moderately long *intestinum cæcum*	*Ambulatoria* -	Myrmecobius	
	Saltatoria -	Charopus Perameles	
	Scansoria -	Didelphys - -	Didelphys Cheironectes
Sarcophaga			
Anterior incisors large and long in both jaws, canines inconstant, stomach simple or with a special gland, a very long *intestinum cæcum*	*Phalangistidæ* -	Phalangista - -	Cuscus Pseudocheirus Tapoa
		Petaurus - -	Petaurista Belidia Acrobata
	Phascolarctidæ -	Phascolarctus	
Poephaga			
Anterior incisors large and long in both jaws, canines present in the upper jaw only, or wanting, a complex stomach, a long *intestinum cæcum*	*Macropodidæ* -	Hypsiprymnus Macropus	
Rhizophaga			
Two scalpriform incisors in both jaws, no canines, stomach with a special gland, *cæcum* short, wide, with a vermiform appendage	*Phascolomyidæ*	Phascolomys Diprotodon -	Fossil

MART. *See* Fair and Market.

MARTELLO TOWERS. The name given to the [illegible] were erected along [illegible] B[illegible] at the commencement of the present century, intended as a defence against the meditated invasion of Napoleon. The [illegible] is usually supposed to be derived from [illegible] (Myrtle) Bay, Corsica, which, after a determined resistance, was at last captured by the British in 1794. These towers were provided with vaulted roofs, and consisted of two stories,—the lower for the reception of stores, the upper, which was shell-proof for the casement of troops, and the wall of the building terminated in a parapet, which secured the men in working the pieces of artillery,

which besides were constructed on moving pivots, so as to be fired in any direction In most places of England these towers have been dismantled, those that remain either serve as stations for the use of the coast blockade force, or, like that near Leith, are not employed for any purpose

MARTINE'T A cant phrase for a severe military disciplinarian probably derived from a certain Colonel Martinet, who served in the French army under Louis XIV, who was the inventor of a peculiar whip, called by his name for the purpose of [illegible] and also (if Voltaire may be believed) [illegible]

MARTINGALE In Naval affairs, a rope leading downwards from the jib-boom end, to keep the jib-boom down against the force of the sail and stay In the manége, martingale is applied to a thong of leather fastened at the end of the girths under the belly of a horse, and at the other end to the musrol, passing between the legs to keep him from rearing

MARTLET In Heraldry, a fanciful bird, shaped like a martin or swallow, but depicted with short tufts of feathers in the place of legs It is the difference or distinction of a fourth son

MA'RTYR (Gr *μαρτυς*, or *μαρτυς witness* in which sense the word is used by the writers of the N Test when speaking of the apostles, in reference to the testimony they bore to the resurrection of Christ) When the members of the Christian church were subjected to persecution under the Roman emperors the persons accused were questioned as to their belief, and in undergoing punishments and death, were said to bear witness of their master before the world A distinction was also made between those who, although they boldly asserted their belief, were yet not visited with extreme punishment who were designated under the name of *confessors*, and those who actually suffered death who alone were dignified with the title of martyrs, and said to obtain the crown of martyrdom Martyr, in its ordinary signification, denotes a person who suffers death or persecution on account of his belief (See *Mosheim's Eccl History* (transl), ed 1790, i 77, *Giesler* (transl), c 8 14 71 &c As to the numbers of martyrs, *Ib* 109 162)

MARTYROLOGY (Gr *μαρτυς* and *λογος a description*) The name given to that department of ecclesiastical history which relates to the acts and deaths of martyrs It also signifies a calendar or register kept in religious houses, wherein were inserted the names and donations of their benefactors and the days of their death As specimens of this species of works we may mention the *Martyrology* of Eusebius, which was so celebrated in the early church but which is lost, and *Fox's Book of Martyrs* the most valuable record of the sufferings of the English reformers Many of the accounts in the early martyrologies are purely fabulous See *Ruinart's Acta Martyrum*, Baronii *Martyrologium Romanum*, and *Middleton's Free Inquiry* Gallonius *De Sanctorum Martyrum Cruciatibus*, 1598 and subsequent editions is a book of [illegible] popularity on the Continent

MASCAGNIN [illegible] of the native sulphate of ammonia o[illegible], named after Mascagni who first discovered it

MA'SCLE In Heraldry, a bearing in the form of a lozenge perforated, supposed to represent the meshes of a net

MA'SONRY (Fr) The science of combining and joining stones for the formation of walls and other parts in constructing buildings The science when applied in the construction of domes, groins, and circular arches, is difficult and complicated, depending on a thorough knowledge of descriptive geometry Hence the various methods of obtaining the requisite lines for the artificer would require a space and diagrams which cannot be given here, but the reader who desires acquaintance with that part of the subject may consult Rondelet *Traité Théorique et Pratique de l'Art de Batir* Paris 1829 30, 4to, with the certainty of finding all the information he requires Vitruvius mentions several kinds of masonry among the ancients, which were distinguished from a [illegible] different modes of arranging the stones [illegible] are 1 The *Reticulatum*, which is arranged in diagonal courses, like the meshes of a net, whence its name 2 The *Incertum*, wherein the rising courses are so laid, without any certain size of stones as that the vertical joint above always falls over the middle of the joint below The appearance of this work is not perhaps so pleasing as that of the first, but the work itself is stronger 3 The *Isodomum*, in which all the courses are of equal height, as its name imports 4 The *Pseudisodomum* which received its name from the [illegible] in height 5 The *Emplecton* in [illegible] work were wrought and the centre of the wall filled up with rubble work in which species of work the Greeks employed *diatoni* or bond stones, running in one piece through the thickness of the wall to tie it together The first principles to be attended to in building stone walls are, that the vertical joints in any course should not fall over the vertical joints in the course immediately below it; and that where the thickness of the wall consists of two or more pieces of stone, bond stones or blocks which run through the whole wall transversely, if possible in one piece, should be introduced as frequently as possible for the purpose of binding the whole mass together The different species of masonry in present use may be reduced to four — 1 *Bond masonry* wherein the stones of each succeeding course are laid so that the joint that mounts and separates two stones always falls directly over the middle of the stone below 2 That of *brickwork*, where the bodies and projections of the stones enclose square spaces or parts &c formed with bricks 3 That called by the French *de moilon*, or small work, wherein the courses are equal, well squared, and their edges or beds rusticated 4 That wherein the courses are unequal, and filled up in the middle with small stones and mortar

MASONRY *See* FREEMASONRY

MASQUE, or MASK A species of drama It originated from the custom in processions, and other solemn occasions, of introducing personages in masks to represent imaginary characters Many of these characters, even in the religious shows of Italy, &c, were of a grotesque description, and the performance often intermixed with dancing and buffoonery By degrees in England, something of a dramatic character was added to these exhibitions At first, as in the well-known progresses of Queen Elizabeth monologues or dialogues in verse were put into the mouths of the masked performers, and in the reign of James I, they had ripened into regular dramatic performances sometimes as in the *Tempest* of Shakspeare, introduced by way of interlude in regular plays, at other times acted as separate pieces, with much machinery and decoration Ben Jonson was the first, and indeed almost the only classical English writer (with the exception of Milton in the solitary and noble specimen of *Comus*) who devoted much labour and taste to this department of the drama His masques were represented at court the queen of James I, and after her the accomplished Queen Henrietta Maria did not disdain to take part at least as silent dramatis personæ, in some of these pageants The taste for them died away in the reign of Charles I, and after the interruption given to the progress of dramatic art and literature by the civil wars, they were not again brought into fashion

MASQUERADE (Ital mascherata) An amusement practised in almost every civilized country of modern times consisting of a ball and other festivities, in which only those who are masked or disguised can participate This species of amusement had its origin in Italy where according to *Hall's Chronicle*, they had become fashionable so early as the beginning of the 16th century Of its introduction into England Hall thus speaks — On the date of the Epiphaine, at night (A D 1512-13) the king (Henry VIII with xii others were disguised after the manner of Italy called a maske a thing not seen afore in England, they were apareled in garmentes long and brode wrought all with golde, with visers and cappes of golde, and after the banket doen, these maskers came in with the six gentlemen disguised in silke (in all probability the *domino* of more recent times), "baryngе staffe torches, and desired the ladies to daunce some were content, and some that knew the fashion [illegible] commonly seen [illegible] daunced together as the fashion of the maskes is, thei toke their leave and departed and so did the quene and all the ladies" The invention of masquerades is ascribed to Granacci, who died in 1543

MASS (Lat missa) The name by which the Roman Catholics designate the celebration of the Lord's Supper after the forms of their church The term is derived from the phrase "Ite, missa est, concio" (i e *Go, the assembly is dissolved*), by which the priest in the primitive ages, signified to the catechumens that all that part of the service of the church was concluded which it was allowed to all believers indiscriminately to attend The communion of the eucharist was extended only to the [illegible] the *fideles* who had completed the period [illegible] instruction and, after the pronunciation of these words, the offering of the body and blood was made It was to this offering itself that the term missa [illegible] The service of the mass, as it is still [illegible] throughout Catholic countries, was the work of Gregory I in the 6th century It consists of three parts the offertorium, or offering of the elements upon the altar, the consecration, by which they are supposed to undergo the transubstantiation into the real body and blood of Christ, and the sumption, or actual participation in them by the communicants These ceremonies are accompanied by the recitation of various prayers, and the priests go through numerous evolutions which are supposed to represent the circumstances attending the passion of our Lord High mass is the performance of this service accompanied with music

MASS (Germ masse) The quantity of matter of which any body is composed The mass is directly as

the product of the volume of the body into its density The mass multiplied into the constant force of gravity constitutes the weight, and hence the mass of any body is rightly estimated by its weight *See* MECHANICS

MASS In the Fine Arts a large quantity of matter of light or shade It is generally applied in painting to light and shade brought upon objects proper for their [illegible] so as to give repose and [illegible] each without [illegible] and the other without being scattered

MASSALIANS *See* EUCHITES

MASSETER (Gr *μασσασθαι, I chew*) A short thick muscle which raises the lower jaw, and assists in [illegible] forwards in the act of chewing

MASSICOT Yellow oxide of *lead*

MASSORA, or MASORA A critical work among the Jews [illegible] two portions of Hebrew B As the sacred books were originally written without any breaks or divisions into chapters or verses or even words the Jews found it necessary to establish a canon to fix and ascertain the reading of the Hebrew text This rule or canon is designated *Massora*, or tradition, in which the verses, letters, words &c are all numbered, and by this means the slightest variations can be detected The Jewish rabbis who drew up this work are styled Massorites *See* BIBLICAL HISTORY, &c

MAST A long piece or system of pieces of timber, placed nearly perpendicularly to the keel of a vessel to support the yards or gaffs on which the sails are extended When a mast is one entire piece it is called a *pole-mast*, but in all large vessels it is composed of several lengths called *lower*, *top* and *top gallant* masts sometimes a fourth, called a *royal* mast

The method of supporting each mast on the one next below it is peculiar On the sides of the lower mast, some feet below the head are placed cheeks on these are fixed horizontally two short pieces of wood fore and aft, called *trestle trees* Across these at right angles are laid, before and abaft the mast two or more longer and lighter pieces called *cross trees*, which give the name to the entire system On the mast head itself is a *cap*

The topmast being placed up and down the fore side of the lower mast is *swayed up* between the trestle trees and through the round or foremost hole in the cap When raised so high that the *heel* of the topmast is nearly up to the surface of the cross trees a piece of iron, called the *fid* is put through the hole in the heel for the purpose and on this fid, of which the ends are supported on the trestle trees, the topmast rests When fidded the topmast is *stayed* and the rigging or shrouds *set up* to the *dead eyes* in the ends of the cross trees These dead eyes pull from the lower rigging below and thus the cross trees serve merely to extend the rigging The topgallant is supported in the same manner on the topmast When the mast is to be taken down it is first raised to relieve the fid which being drawn out the mast is lowered

The masts are supported by a strong rope leading forward called the *stay* by others leading aft on each side of the ship called in general *backstays*, and by others abreast called *shrouds* and also *breast backstays*

Large lower masts are composed of pieces and have for some years been made of several lengths about a foot or so square, and the whole supported merely by hoops at intervals

The *main-mast* is near the middle of the vessel the *fore-mast* is that which is nearest the fore part and the *mizen-mast* is abaft the mainmast

The old rule for the length of the main lower mast is to take ½ the sum of the length of the lower deck and extreme breadth the fore mast is $\frac{8}{9}$ths of the main-mast the mizen-mast considerably smaller The top-mast is about $\frac{3}{5}$ths of the lower mast These rules, as well as others for the thicknesses, &c, are merely for convenience, based on no mechanical principle, and are by no means strictly followed

MA'STER (Lat magister) A title frequent among the Romans as [illegible] (master of the horse the lieutenant or [illegible] command to a dictator), magister peditum, magister census &c Magister militiæ (master of the army, or of military affairs) was a title under the later Roman emperors *Grand master*, in modern times is the common title of the chief of the orders of knighthood, and of some fraternities as the Freemasons The eldest sons of some noble landed proprietors are designated as masters in Scotland, as the master of Gray, master of Douglas, &c

MASTER In the Universities, a degree in arts, the most ancient of all the academical titles In the university of Paris, where this as well as the other learned distinctions appears to have originated it was originally a mere title belonging to [illegible] in the schools (magistri, doctores) Thus every master was, of necessity, a lecturer In process of time (and probably about the middle of the 13th century) the title became a degree, attainable by all after a certain amount of residence and proficiency, while the duty of lecturing was confined only to a certain number of masters, termed *regents* About the same period the separation of the degrees of master and doctor took place In the English universities, the degree of master of arts follows that of bachelor A master becomes a regent after a short period, and, according to the old academical constitution, is supposed to read lectures during the year of his regency On becoming a regent, he becomes a member of the governing body of the university, having a vote in [illegible] Oxford, in the senate at [illegible] the degree of master is the highest in the faculty of arts, but subordinate to that of bachelor of divinity Elsewhere the faculty of arts is synonymous with that of philosophy, in which the degree of doctorate is conferred, superior to that of master

MASTER, otherwise called Captain, in Commercial Navigation, the person entrusted with the care and navigation of a ship His duties are very important In some countries [illegible] this office who has not been [illegible] constituted board, but in this country the owners are left to their own discretion as to the skill and honesty of the master, and although he is bound to make good any damage that may happen to the ship and cargo by his negligence or unskilfulness, he cannot be punished as a criminal for mere incompetence No one is qualified to be the master of a British ship unless he be a natural-born British subject, or naturalized by act of parliament, or have become a subject to his majesty by conquest, cession, &c, and have taken the oaths of allegiance, or a foreign seaman who has served three years in time of war on board of his majesty's ships

MASTER In the Royal Navy, the officer who has the charge of the navigation of the ship, with other duties his rank is next to lieutenant

MASTER ATTENDANT The officer next in rank to the superintendent of the royal dock-yard

MASTER AT ARMS A petty officer of the navy, who is in fact, the head of the police of the ship his assistants are called ship's corporals

MASTER OF THE CEREMONIES An officer attached to all European courts whose duty consists in regulating all matters of etiquette and state ceremony (*See* CEREMONIES &c) The name is also applied to any individual who is appointed by general consent to preside over the arrangements of a public ball, with the power of deciding all disputes that may arise therein

MASTER OF THE HORSE The third great officer in the British court When not put in commission this office is always filled by a nobleman He has the management of all the royal stables and bred horses with authority over all the equerries and pages coachmen, footmen, grooms &c In solemn cavalcades he rides in the same carriage with the sovereign Salary, 1276*l* 13*s* 4*d* per annum

MASTER OF THE HOUSEHOLD An officer employed under the treasurer of the household to survey accounts Salary 800*l* per annum

MASTER OF THE MINT *See* MINT

MASTER OF THE ROBES An officer of the royal household in the lord chamberlain's department His salary is 800*l* per annum

MASTER OF THE ROLLS *See* MASTERS IN CHANCERY

MASTERS IN CHANCERY are assistants to the lord chancellor The masters in ordinary are twelve in number, of whom the master of the rolls is chief To them are referred interlocutory orders for stating accounts, computing damages, &c They also administer oaths, take affidavits and acknowledgments, and examine bills in chancery with reference to their propriety The masters are also employed by the house of peers in carrying messages to the commons Masters extraordinary are appointed to act in the country beyond twenty miles from London By 3 & 4 W 4 c 94 s 16, the appointment of masters in ordinary is taken from the lord chancellor and vested in the crown

MA'STER-SINGERS A class of poets who flourished in Germany during the 15th and part of the 16th century They were confined to a few imperial towns, and their chief seat was the city of Nuremberg They were generally of burgher extraction, and formed regular corporations, into which proficients were admitted by the ordinary course of apprenticeship Their poetry (generally confined to devotional or scriptural pieces, legendary tales with some admixture of satire and of amatory lyrics) was subjected to a peculiar and pedantic code of laws both composition and versification, and a board of judges (styled merker) assembled [illegible] criticised and *mark* the faults which [illegible] in either particular he who had the fewest faults received the prize. Hans Sachs, the famous cobbler of Nuremberg, was a member of these societies, although his genius was of too independent a character to submit to the trammels of their poetical regulations

MA'STIC (Gr *μαστιχη, a species of gum*) In Architecture, a cement of recent introduction into England,

employed for plastering walls. It is used with a consi- [illegible] of linseed oil, and sets hard in a few days [illegible] on account of its substance, and from its being fit for the reception of paint at an early period, it is much used in works where great expedition is requisite

MASTIC A peculiar resin which exudes from the *Pistacia lentiscus* Its chief use is in varnishes

MA'STICOT (Fr massicot) In Painting, a yellow colour being an oxide of lead

MASTI'TIS (Gr *μαστος*, *the breast*) Inflammation of the breast in women it commonly terminates in suppuration

MA'STODON (Gr *μαστος*, *a nipple*, and *οδους*, *tooth*) A genus of extinct fossil quadrupeds allied to the elephant, so called from the conical projections upon the surfaces of the molar teeth

MA'STOID (Gr *μαστος*, and *ειδος*, *form*) Certain *nipple like* processes of the bones

MASTOTHECA (Gr *μαστος*, and *θηκη*, *a receptacle*) A name sometimes used for Marsupium and applied to the abdominal pouch of the marsupial animals

MATE In a Merchant Ship, the deputy of the master, taking in his absence the command There are sometimes [illegible] wo, three, or four mates in a [illegible] her size, denominated 1st, 2d, 3d, &c mates The law, however, recognizes only two descriptions of persons in a merchantman — the master and mariners, the mates being included in the latter, and the captain being responsible for their proceedings

In men-of-war, the officers immediately subordinate to the captain are called lieutenants But the *master* or officer whose peculiar duty it is to take charge of the navigation of the ship, has certain mates under him, selected from the midshipmen The boatswain gunner, carpenter, &c have each their mates or deputies, taken from the crew

The officers [illegible] in the ships belonging to the East India Company are called 1st 2d 3d, &c officers East Indiamen had no sailing masters the commanders performing that duty (*Falconer's Marine Dictionary*, &c)

MATE The Paraguay name of a plant called *Ilex paraguensis* by botanists, whose leaves are used extensively in that country as a substitute for tea It has the property of turning milk blackish when mixed with it

MATE'RIAL Any thing composed of matter or possessing the fundamental properties of matter See MATTER

MATE'RIALISM That metaphysical theory which is founded on the hypothesis that all existence may be resolved into a modification of matter, including of course the conscious subject Materialists, of one sort or other, have abounded in every stage of philosophical thought They have consisted in the main, of persons accustomed to the exclusive pursuit of merely physical or empirical science, who have transferred the habits and prejudices thus engendered to the higher sciences of metaphysics and physiology The most celebrated materialists were among the ancients, Democritus and his later disciples Epicurus and his sect, to whom may be added though in a somewhat different sense, the Stoics among the moderns, Gassendi, Hobbes Hartley and Dr Priestley Most schemes of materialism rest on the assumption that all that is real in nature consists in the minute particles from the juxtaposition of which all sensible objects arise This is what is variously designated as the atomic, the mechanical, or the mechanico corpuscular theory and has met with supporters chiefly in France Among ourselves, in very recent times Dr Thomas Brown has eloquently maintained that part of this system which relates to physical phenomena, though he has combatted, with the utmost [illegible] portion of it which includes the [illegible] (Compare sect v ix with sect xii xiii Sect i) *Priestley's Disquisitions on Matter and Spirit*, 1777, and his *Three Dissertations on the Doctrine of Materialism and Philosophical Necessity* Also *Price's Letters on Materialism and Philosophical Necessity*) The latest and boldest defence of materialism that has appeared in England is to be found in the celebrated lectures of Mr Lawrence, who maintained that the brain is to be considered as secreting thought in the same sense in which the liver secretes bile or the [illegible]

MATE'RIA MEDICA [illegible] substances, natural and artificial, which are used in the cure of disease, and which are usually called *medicines* They are frequently arranged into classes dependent upon their virtues or effects, or upon their constituent parts but perhaps the most convenient arrangement is the alphabetical

MATHEMA'TICS (Gr *μαθησις*, *learning*) The science which [illegible] the consequences which are logically [illegible] from any given or admitted relations between magnitudes or numbers It is usually divided into two parts *pure*, where geometrical magnitude or numbers are the subject of investigation; and *mixed*, where the deductions thus made are from relations which are obtained by observation and experiment from the phenomena of material nature, and which constitutes [illegible] physical science [illegible] science was geometry and this received its highest degree of cultivation amongst the Greeks Several of their works are come down to our own times but all have undergone more or [illegible] and some of the most interesting are [illegible] as the *Porisms* of Euclid, or known [illegible] of Arabic translations, as [illegible] *See* GEOMETRY

The next object of research that comes under the denomination of pure mathematics is number, the science of which constitutes arithmetic By reason of their defective system of notation, the Greek geometers were under the necessity, in very complicated methods [illegible] ordinary numerical calculations and for [illegible] to abstruse properties and relations of numbers they had recourse to geometrical constructions The moderns have, however, discovered a much more simple and direct system of processes, constituting *algebra*, and this has also been applied with great success to the solution even of geometrical problems and theorems which by purely geometrical methods had never been effected The differential calculus and the calculus of functions are also branches of algebra *See* ARITHMETIC and ALGEBRA

Of the various branches of the mixed mathematics or applied mathematics, astronomy is by far the most advanced towards perfection, and next to it the doctrine of optics, which has been cultivated as subservient to astronomy This has depended chiefly on the simplicity of the *laws* which connect the phenomena, and the consequent simplicity of the mathematical investigations which are necessary for a development of their consequences Nevertheless simple as those laws are, and relatively simple as the investigations to which they lead also are, their perfect development is beyond the present powers of mathematical science, which in numerous cases can only furnish approximate results

MA'TINS In the Roman Catholic church the earliest of the canonical hours of prayer *See* HOURS

MATRASS A chemical vessel employed in sublimations and in digesting solutions in a sand heat It is superseded in the modern laboratory by a flask

MATRICULA (Lat *mater mother*) A register kept of the admission of persons into any body of society of which a list is made In the Romish church there was a *matricula clericorum* a list or catalogue of the officiating clergy, and *matricula pauperum*, a list of poor persons to be relieved Hence when a student is entered in the [illegible] universities he is said to be *matriculated*

MATRIMONY See MARRIAGE

MA'TRIX (Lat) In Metallurgy the stony substance in which crystalline minerals and metals are embedded is frequently termed their *matrix* or *gangue* In dyesinking the *matrix* is the indented mould from which impressions are taken in relief [illegible] the term to the iron moulds in which [illegible]

MA'TTER (Lat materies) Substance Of the intimate nature of matter the human faculties cannot take cognizance, nor can data be furnished, by observation or experiment on which to [illegible] All we know, or ever can know [illegible] *properties* Some of these are the foundation of physical science others of the different subordinate sciences, as, for instance, of chemistry

Matter is divisible by abrasion and other means into small fragments which, when the division is carried to any considerable extent, are called particles It is supposed however, and many reasons appear to justify the hypothesis, that it is capable of reduction into particles (called atoms) of particular forms, and each class having its own proper magnitude and peculiar properties, that determinate numbers of atoms of one kind admit of combination with some determinate number of another kind, or of several kinds, and of thereby forming compounded atoms having properties peculiar to that combination, and different from the *known* properties of their elemental atoms These solutions and combinations result from properties inherent in the atoms themselves, but whether the simple classes of atoms that are believed to exist are themselves really primary and elemental is not known, and probably never can be with certainty

In larger masses, or in masses of aggregated atoms, so classed that their peculiar properties are mutually neutralized, phenomena are exhibited which bear a great resemblance to one another through considerable classes of such compounds, whose elements we have reason to [illegible] and under [illegible] are [illegible] and [illegible] degree or intensity These last are the objects of *physical* investigation they are called emphatically the properties of matter; and the laws of their mutual influences are the foundation of *mechanical philosophy* These properties

may be regarded as either essential or accident The essential properties of matter are usually reckoned the following —

1 *Divisibility*, or the property which every known substance possesses of being separable into parts, and these again into smaller parts, and so on until the parts become inappreciable to our senses, nor can any limit be placed to the subdivision

2 *Impenetrability*, or a resistance exerted by every body to the occupation of its place by another This resistance is of various degrees of intensity dependent on the state and atomic constitution of the bodies, but no two bodies can simultaneously occupy the same place

3 *Porosity*, or the separation of the particles or atoms from each other by intervals or pores Every substance with which we are acquainted is more or less porous

4 *Compressibility*, or the property in virtue of which the volume of every body may be contracted into smaller dimensions

Among the essential properties of matter may also be included *extension* and *figure*, but these belong also to space, and form the subject of geometry

The contingent properties of matter are *mobility* and *weight* Matter in every form is capable of being moved from one place to another, and every substance gravitates towards the centre of the earth But motion has reference to space, and weight to the attraction of other matter

The above are the general properties of matter, upon which physical investigations depend There are however various other qualities belonging to particular substances or to matter in particular states the consideration of which is important in mechanical philosophy Among these the principal are *elasticity*, *fluidity*, *hardness*, *rigidity*, *solidity*, — for which see the respective terms

MAUNDRIL In Coal Mines a pick with two shanks

MAUNDY THURSDAY The Thursday preceding Easter on which the sovereign of England distributes alms to a certain number of poor persons at Whitehall, so named from the maunds or baskets in which the gifts were formerly contained This custom is of very great antiquity, and according to Ducange, it derives its origin from St Augustine Maundy Thursday is also called Shere Thursday (See *Nare's Glossary*, *Fosbrooke's Encyc of Antiquities*, p 702)

MAUR, SAINT, CONGREGATION OF A learned body of religious of the Benedictine order so called from a village near Paris where they were established in 1618 On the request of Louis XIII Gregory XV gave this order his approval by an apostolical brief dated 17th of May 1621, and it obtained new privileges from Urban VIII by a bull dated 21st of June 1627 The fame of this body attracted the attention of many other religious orders, several of which were induced to submit to its rules, and at last it numbered upwards of a hundred religious houses The literary world owes to them a series of very valuable editions of ancient Greek authors chiefly fathers during the 17th century Among the most eminent of its members during that period may be mentioned Jean Mabillon Thierri Ruinart, Hugh Menard and Bernard de Montfaucon, &c &c (See Mosheim, *Eccl Hist* vol v)

MAUSOLE'UM A sepulchral building, so called from Mausolus king of Caria to whose memory it was raised by his wife Artemisia about 353 B C hence all sepulchral structures of importance have obtained the name of mausolea From its extraordinary magnificence it was esteemed the seventh wonder of the world According to Pliny it was one hundred and eleven feet in circumference, and one hundred and forty feet high It is said to have been encompassed by thirty-six columns, and [illegible] enriched with sculpture

MAXILLA (Lat maxilla *a jaw*) In Anatomy this term is applied to the bones supporting the teeth of both jaws In Zoology, it is restricted to the upper jaw in Mammalia, and to the inferior pair of horizontal jaws in articulate animals

MA'XIM Synonymous with *axiom* which see

MA'XIMA AND MINIMA Terms employed in analysis to signify not the absolute greatest and least values of a variable quantity, but the values it has at the instant when it ceases to increase and begins to decrease, or *vice versâ* A variable quantity may therefore have several maxima and minima The theory of maxima and minima forms a part of the differential calculus, and is treated as given in all works on that subject

MAY The fifth month of our year, but the third of the Roman The name is supposed to be derived from Maia, the mother of Mercury, to whom the Romans offered sacrifices on the first day of the month, but various other derivations have been assigned to it *See* CALENDAR

MAY DAY The 1st of May is usually so called in England, by way of eminence, in commemoration of the festivities which from a very early period were till recently, and in many parts of the country are still observed on that day It would be out of place in this work to give any detailed account of them, as they are universally known, but a few words as to their origin may not be out of place In looking at the nature of these rites, which are to a certain extent common to every place in which they are observed, it is evident that they had their origin in the observances practised in honour of the Latin [illegible], but it is impossible to fix with accuracy the precise period at which they were introduced into England The earliest notice of the celebration of May-day may be traced to the Druids, who on May-eve were accustomed to light large fires on eminences in gratitude and joy for the return of spring At a later period the observance of this day appears not to have been peculiar to any class of society, for the most exalted as well as the lowest persons took part in it In his *Court of Love* Chaucer says, that on this day "forth goeth all the court, most and least, to fetch the flowres fresh, and braunch and bloom," and it is well known that Henry VIII and Katherine and all their court partook in the diversion The *maypole*, which is still visible in many of the English villages, and *Jack in the green* are still relics of this custom (Some interesting remarks on this subject are to be found in *Grimm's Deutsche Mythologie*, pp 448—451)

MAYOR (Lat major meaning the first or senior alderman) The title of the chief municipal officer of a borough, to whom it appears to have been first given by charters granted some time after the Conquest But the title and office of portreeve or boroughreeve still continued, in some few places to the exclusion of, and in some [illegible] Municipal Reform Act, 5 & 6 Will IV, by which latter title was applied universally and exclusively to every borough The chief magistrates of London and Dublin are designated Lord Mayor

MAYOR (Maire) In France, the first municipal officer of each commune, according to a general system established by the law of 14th Dec 1789, which created municipalities Since 1831 they are selected by the government out of the municipal council, which is chosen by the electoral body The maire has one or more *adjuncts* or assessors, according to the population of the commune chosen in [illegible] The maire keeps the registers of births marriages, &c of the commune, he acts as a magistrate in the prevention and commitment of offenders, he has a judicial power over certain minor offences He is also the principal agent of the general administration for his commune, and the executive authority to carry into effect the ordinances of the municipal council

MAYORAZGO (Span from Lat magistratus *See* MAJORAT) Strictly, the right possessed by the eldest born in noble families to inherit certain property on condition of transmitting it entire to those possessed of the same right on his decease Five distinct species of mayorazgo, or right of hereditary succession, are now known in Spanish law Property held in virtue of the right cannot be alienated or disposed of The mischievous effects of this strict system of entail on agriculture and national wealth and on the character of the higher classes of Spain, have been long insisted on by political philosophers

MAYOR OF THE PALACE (Lat major domus regia) In early French History the title of the chief officer of state under the Merovingian kings After the death of Dagobert I, A D 638 and in the subsequent decay of the royal authority, these functionaries by degrees usurped almost the entire power of the state The first of those mayors who exercised this kind of sovereignty was Grimoald under Sigebert III, king of Austraria Pepin, son of Charles Martel having succeeded his father in the office of mayor of the palace, afterwards ascended the throne in 752, after which time the office lost its importance, or was [illegible] (See Turner, *Hist of England during the Middle Ages*, vol i p 8)

MEAD (Dutch, mede) A vinous liquor made by dissolving one part of honey in three of boiling water, flavouring it with [illegible] portion of ground malt and a piece [illegible] and suffering the whole to ferment [illegible] mead is flavoured with primrose blossoms Mead formed the ancient, and for centuries the favourite beverage, of the northern nations It is frequently mentioned in *Ossian*

MEADOW A flat surface under grass, generally on the banks of a river or lake, but so far above the surface of the water as to be considerably drier than marsh [illegible] to produce grass and herbage of [illegible] The soil of meadow lands is generally alluvial [illegible] more or less mixed with sand, and it is kept in a state [illegible] by the deposition of matter on its surface, in consequence of being occasionally overflowed by the adjoining river or lake The produce of meadows is generally made into hay which though not equal in quality to that produced on drier grass lands, is yet superior to what is obtained from marshes

MEAN. In Mathematics, a quantity having an inter-

mediate value between several others which are formed according to any *assigned law* of succession

The *arithmetical mean* of several quantities is simply the *average* formed by dividing the sum of all the quantities by their number In physical inquiries, where a great number of values of a quantity have been determined by observation or experiments, of which the error is as likely to be in excess as defect, the average or arithmetical mean is the most probable result

The *geometrical mean* between two quantities or the *mean proportional*, is a quantity which forms the middle term of a duplicate ratio, or continued proportion of three terms viz such that the first given term is to the quantity sought as that quantity is to the other given term In arithmetic it is the square root of the product of the two given terms

The *harmonical mean* is such a number that, the first and third terms being given, the first is to the third as the difference of the first and second is to the difference of the second and third or, if a, b, c be the numbers, b being the mean,—

$$b = \frac{2ac}{a+c}, \text{ or } \frac{2}{b} = \frac{1}{a} + \frac{1}{c}$$

ME'ASLES *See* RUBEOLA

MEA'SURE (Lat mensura) In Geometry, a magnitude or quantity taken as unit and employed to express the relations of other magnitudes or quantities of the same kind Euclid defines the measure of a quantity to be that which, being repeated a certain number of times becomes equal to the quantity measured Thus in Arithmetic, the *measure of a number* is any number which divides the given number without leaving a remainder, but this definition rather corresponds to the notion of *aliquot part*

In a more extended sense the term measure is applied to that by which any thing is compared in respect of quantity Thus, we have measures of extension of weight time force, resistance temperature &c, in short of every thing of which greater and less can be predicated and it frequently happens that the unit or measure is not taken in the thing or property which is the immediate subject of consideration, but in something else which depends on it, or is proportional to it Angular space for example, is measured by an arc of a circle time by the rotation of the earth about its axis or its revolution about the sun, force, by the quantity of motion it impresses on a body, degrees of heat by the expansion of metals or other substances, muscular strength by the resistance of a spring &c *See* ANGLE, CHRONOLOGY, GRAVITY THERMOMETER DYNAMOMETER, &c

By measure, in an absolute sense is understood the unit or standard by which we measure extension We have, therefore, measures of length, of superficies and of volume or capacity, but as the two latter may be deduced in all cases from the former it is only necessary to establish a unit, or standard of length The choice of such a standard, and the different multiples and parts of it taken for the uses of society, form a metrical system or system of metrology

Standards of Measure —As no precise notion can be formed of the magnitude of a line in any other way than by comparing it with one of a known length the [illegible] the interchange of ideas to measures not entirely arbitrary, but fixed by nature and intelligible alike to all mankind, seems to have been perceived in the earliest ages Hence originated the *foot*, the *cubit*, the *span*, the *fathom* the *barleycorn*, the *hand-breadth* and other denominations of measure taken from parts of the human body, or from natural objects, which though not of an absolute and invariable length, have a certain mean value sufficiently definite to answer all the purposes required in a rude state of society But, as civilization advanced, the necessity of adopting more precise standards would be felt, and the inadequacy of such measures as the foot, the cubit, &c (referred only to the human body) to convey accurate notions, would be rendered most apparent in their application to itinerary measures or the estimation of great distances, where differences of the fundamental measure, of no account when one or two units only are taken into consideration, would amount, by repeated multiplication, to enormous quantities In order to avoid this inconvenience, recourse was had to other methods of estimation, but which, in fact, amounted only to descriptions more or less vague, and not to measures Thus, in ancient authors we [illegible] of a day's journey, a day's sail, and so forth, and in many parts of the continent of Europe even at the present time it is the custom of the peasantry to reckon itinerary distances by hours

On looking among the objects of nature for a standard of measure perfectly definite, and, at the same time, invariable, and accessible to all mankind, a very slender acquaintance with geometry and natural philosophy will suffice to show that the subject is beset with innumerable difficulties In fact, nature presents only two or three elements which, with the aid of profound science and a refined knowledge of the arts, can be made subservient to the purpose, and even all of these are applicable without such aid The [illegible] and its form and absolute magnitude are presumed to remain the same in all ages hence the distance between the equator and the pole is an invariable quantity, and any assigned part of that distance as the 90th or 360th of the meridian, is constant, and will furnish a precise and unalterable standard of measures, fit for the purposes of metrology, provided we [illegible] with the proper scales [illegible] The force of gravity at the [illegible] at any given place, and very nearly the same at all places under the same parallel of latitude and at the same height above the level of the sea, hence the length of a pendulum which makes a given number of oscillations in a day is also constant at a given place, and, with proper skill and precautions, may be determined in terms of any assumed scale These two elements the length of a degree of the meridian, and the length of the seconds' pendulum, are the only ones furnished by nature which have yet been used as the basis of a system of measures One or two others have been suggested, as the height through which a heavy body falls in a second of time, determined, like the length of the pendulum, by the force of gravity, or the perpendicular height through which a barometer must be carried till the mercurial column sinks a determinate part—for example a 30th of its own length, but, for reasons which it is unnecessary here to state, these distances are not so susceptible of being accurately determined as the terrestrial degree, or the length of the seconds pendulum

It has been [illegible] Prony's *Metrologie*, Bailly *Histoire de l'Astronomie ancienne* that several nations referred their measures of length to a unit chosen from an aliquot part of the earth's circumference, and that the different *stadia* were only different aliquot parts of the same great unit, but the supposition is altogether improbable for the ancients had no means of determining the magnitude of the earth with any tolerable precision, and do not themselves make any reference to such a standard Mouton an astronomer of Lyons about 1670, proposed as a universal standard of measure a *geometrical foot* of which a degree of the earth's circumference should contain 600,000, and remarked that a pendulum of this length would make 3959½ vibrations in a half hour In 1671 Picard proposed a similar idea, and Huygens first suggested the pendulum as the unit or standard of measures Condamine one of the French academicians engaged in the measurement of the terrestrial arc in Peru, proposed that the equatorial pendulum ought to be adopted, as being the most natural measure and independent of the pretensions of different countries No attempt however was made to establish a regular system of measures on any of these standards until the time of the French revolution when a system of weights and measures referred to the terrestrial degree, and accommodated to our arithmetical scale, was adopted in that country

English Standard Measures —The unit of lineal measure in this country is the yard all other denominations being either multiples or aliquot parts of the yard But as this is an entirely arbitrary measure, and until the year 1824, was never strictly defined by the legislature, great perplexity has often arisen in attempting to ascertain the exact portion of space it was meant to represent For the purpose of preserving some degree of uniformity among the ordinary measures of the kingdom, certain standards were preserved in the exchequer, with which all rods were required to be compared before they were stamped as legal measures The oldest of these standards in existence dates from the reign of Henry VII, but it has long been disused, and that which, till the year 1824, [illegible] brass rod, of the [illegible] placed there in the time of Elizabeth There was another similar rod of the same date, called an *ell* The ell however, does not appear ever to have been established as a legal measure, but was conventionally considered as equal to a yard and a quarter To these rods belonged a brass bar, on one edge of which was a hollow bed or matrix fitted to receive the square rod of a yard, and on another a like bed fitted to receive that of an ell, and into these beds were fitted the yard and ell measures brought to be examined and stamped with the standard marks All rods so stamped became standard measures It is abundantly obvious that measures determined in this coarse manner could have no strict claim to be considered as *accurate* copies of the original standard, but it would seem that the standard itself was incapable of affording any definite or correct measure. It is thus described by Mr Baily, in his Report on the new Standard Scale of the Royal Astronomical Society —"I have had an opportunity of seeing this curious instrument, of which it is impossible at the present day to speak too much in derision or contempt A common kitchen poker, filed at the ends in the rudest manner by the most bungling

workmen, would make as good a standard It has been broken asunder, and the two pieces been dovetailed together, but so badly that the joint is nearly as loose as that of a pair of tongs and yet within the last ten years, to the disgrace of this country copies of this measure have been circulated all over Europe and America, with a parchment document accompanying them certifying that they are true copies of the English standard" (*Phil Trans Roy Soc* vol ix)

Such being the condition of the legal standard, it was obviously impossible that any measure could be found in terms of it, where great accuracy and minuteness were necessary, for instance, that of the seconds' pendulum, [illegible] It was utterly inadequate [illegible] In the year 171[illegible] and Members of the Academy of Sciences at Paris proposed to have accurate standards of the measures and weights of both nations made and carefully examined, in order that a means might be provided of comparing the results of scientific experiments in England and France The committee who undertook the matter besides the legal standard in the Exchequer, found some others which were considered of good if not equal authority At Guildhall they found two standards of long measure, which were only two beds or matrices one of a yard, and the other of an ell, cut out of the edges of a substantial brass bar, like that at the Exchequer Another, preserved in the Tower of London, was a solid brass rod, about 7-10ths of an inch square, and 41 inches long, on one side of which was the measure of a yard divided into inches Another, belonging to the clockmakers company delivered to that corporation by indenture from the Exchequer in 1671, was a brass rod of eight sides nearly half an inch thick, on which the length of the yard was expressed by the distance between two upright pins, or small checks, filed away to the proper quantity The committee selected the standard in the Tower as being the best defined, and consequently the best adapted to their purpose, and Mr George Graham (a celebrated clockmaker) at their desire, laid off from it with great care, the length of the yard on two brass rods which were then sent to the Academy of Sciences at Paris, who in like manner set off thereon the measure of the Paris half toise One of these was kept at Paris the other was returned to the Royal Society where it still remains but unfortunately it was not stated at what temperature the toise was set off, and, consequently, the comparison is now of little or no value

In 1758 a committee of the House of Commons was appointed to inquire into the original standards of weights and measures in the kingdom The committee entered very fully into the subject and presented to the house an elaborate report in which they recommended that a rod which at their order had been made by Mr Bird from that of the Royal Society and marked 'Standard Yard 1758' should be declared the legal standard of all measures of length This rod consisted of a solid brass bar 1 01 inch square and 39 08 inches long At about 1⅛ inch from each end a gold pin or stud is inserted, in which pins, at the distance of 36 inches are two points intended to designate the length of the yard It was proposed that this rod should be carefully laid up in safe custody to be used only occasionally, and, for the ordinary sizing of yards another rod was prepared by the same artist furnished with checks and divided into inches and parts, for the easier adjusting of any comparative measure

In the following year another committee was formed on the subject It concurred in the recommendation of the former committee, that Bird's standard yard should be the only unit of lineal measure and at the same time recommended that a copy of it should be made, for security [illegible] ed in some public office [illegible] was constructed by Bird, in 1760, similar to the former of which indeed it was intended to be a copy This last standard (of 1760) was declared by the act of 1824 to be the legal standard of [illegible]

Notwithstanding these two parliamentary reports, no legislative enactment was passed and the subject remained for a long time in the same state of uncertainty In 1796 a scale was constructed by the celebrated Troughton, for Sir George Shuckburgh, which has been much referred to in scientific treatises, in consequence of its [illegible] experiments made by Captain [illegible] length of the pendulum, and also carefully compared with all the other standards, and with the French mètre Troughton at several times made various other measures, but, as they never possessed any legal authority, it is unnecessary to allude to them farther than to state that they were all copies, as nearly as could be made, of a scale that had been constructed by Bird, and had belonged to Mr Harris, assay-master at the Mint

In 1814 the subject of standard measures and weights was again brought under the consideration of parliament, and a committee of the House of Commons made a report, which, however, was attended by no result In 1819 a commission was named by the prince regent consisting of Sir Joseph Banks Sir George Clerk Mr Davies Gilbert, Dr Wollaston Dr Young and Captain Kater, who first recommended that, for the legal determination of the standard yard, the yard which had been employed by General Roy in the measurement of a base on Hounslow Heath as a foundation of the trigonometrical survey, should be adopted, but in a subsequent report, made the following year (1820), they proposed the standard which had been made by Bird in 1760, on account of its being, as they stated, "both laid down in the most accurate manner, and as best agreeing with the most extensive comparisons which have been hitherto executed by various observers and circulated throughout Europe, and in particular with the scale employed by the late Sir George Shuckburgh" This last report having been approved by a committee of the Commons, an act was at length passed, in June 1824 in which the unit of measure was for the first time defined, and in the following terms —

'The straight line or distance between the centres of the two points in the gold studs in the brass rod, now in the custody of the clerk of the House of Commons, whereon the words and figures *Standard Yard*, 1760, are engraved, shall be, and the same is hereby declared to be, the original and genuine standard of that measure of length or lineal extension called a yard, and that the same straight line or distance between the centres of the said two points in the said gold studs in the said brass rod the brass being at the temperature of 62° of Fahrenheit's thermometer shall be and is hereby denominated the *Imperial Standard Yard*, and, shall be and is hereby declared to be, the *unit* or only standard measure of extension' And the act further declared that if at any time hereafter the said imperial standard yard shall be lost, or shall be in any manner destroyed, defaced, or otherwise injured, it shall be restored by making under the directions of the lords of the treasury, a new standard yard, bearing the proportion to a pendulum vibrating seconds of mean time, in the latitude of London in a vacuum, and at the level of the sea, as 36 inches to 39 1393 inches

The recommendation of the commissioners, on which this enactment was founded, has been severely criticised, and, in point of fact so far as the exact length of the yard is concerned, the subject remained in the same doubtful state in which it was before the act was passed That the standard which was adopted was not an original measure (it was in fact a copy of Bird's standard of 1758, which was a copy of that of the Royal Society which again was a copy of that in the Tower) was of little consequence provided the measure had been laid down on it with such precision as to leave no doubt as to its exact length, but so far was this from being the case, that when it came to be compared with a new standard scale made for the Royal Astronomical Society, it was found to be utterly impossible to ascertain the centres of the points in the gold [illegible] and lines [illegible] perfectly applicable by the method [illegible] Mr Baily, in his report above cited says the mean diameter of each of the holes was nearly 100th of an inch, and they by no means [illegible] like a circular shape In fact, not only [illegible] sons differ in their estimate of the centres [illegible] times accor[illegible] that impinged on the sides of the holes And he adds, "How the legislature of the present day, when the art of making mathematical instruments has arrived at such a state of perfection, could have sanctioned the adoption of such an imperfect and undefinable measure as this for a standard, must always be a matter of astonishment, more especially when we consider that the French had recently set us a laudable example, in the great pains and labour taken in the execution of a new set of standard [illegible] perior accuracy and precision" (*Mem R A S* vol viii)

This scale was destroyed by the fire which consumed the two houses of parliament in 1834, so that the country is at the present time without a legal standard, for the provision of the act relative to its restoration by comparison with the seconds' pendulum is perfectly nugatory Its restoration could not be thus effected with any tolerable certainty The length of the seconds' pendulum is one of those constants of nature which it is possible to determine only within certain limits, very narrow indeed, but still too wide for the purpose in question Besides, the standard adopted by the legislature had never been directly compared with the pendulum, and the relation between them assigned in the act, namely, 36 to 39 1393, is now known to be incorrect, on account of the neglect of certain precautions in the determination of the [illegible] pendulum which subsequent experiments have shown to be indispensable [illegible] has however, [illegible] what the legislative enactment [illegible] Early

In the year 1834 a most laborious and minute comparison of the different standard measures was made with a new scale constructed for the Royal Astronomical Society The length of the legal standard, as nearly as it could be determined, is known in terms of this scale, and may therefore be recovered; but, as a new act is necessary in any case, the legislature may probably be advised to do now what ought to have been done in the first instance namely, cause a standard to be made in a more skilful manner, and authenticated copies of it, or rather other measures having ascertained relations to it, to be deposited in several public places, and only to be used in cases of emergency The evil in this, as in many other instances, has arisen from legislating too much All that is required is that two very fine points be struck in a strong rod of platinum or a block of cast iron at any convenient distance, and to declare that the distance between these points at a certain temperature of the metal shall be the standard of measure and that so many parts of this standard shall constitute the yard or unit all the rest may be safely left to experimental philosophers and mathematical-instrument makers

English System of Linear Measures —The unit of measure, as already stated is the yard The yard is divided into 3 feet, and the foot subdivided into 12 inches The multiples of the yard are the pole or perch the furlong and the mile, 5½ yards being a pole 40 poles a furlong and 8 furlongs a mile But the pole and furlong are now scarcely ever used itinerary distances being reckoned in miles and yards The relations of these different denominations are exhibited in the following table —

In	Feet	Yards	Poles	Furlongs	Miles
1	0 083	0·028	0 00 5	0 0001 [illegible]	0 000 01 [illegible] 8
12	1	0 333	0 0606	0 001 [illegible]	0 0001 [illegible] 9
36	3	1	0 1818	0 0013 [illegible]	0 [illegible] 1818
198	16 5	5 5	1	0 025	0 0 [illegible] 3125
7920	660	220	40	1	0 125
63360	5280	1760	320	8	1

Measures of Superficies —In square measure the yard is subdivided as in general measure into *feet* and *inches*, 144 square inches being equal to a square foot and 9 square feet to a square yard For land measure the multiples of the yard are the *pole* the *rood* and the *acre*, 30¼ (the square of 5½) square yards being a pole 40 poles a rood and 4 roods an acre Very large surfaces as of whole countries are expressed in square miles The following are the relations of square measure —

Sq Feet	Sq Yards	Poles	Rood	Acres
1	0 1111	0 00 [illegible] 7709	0 0 [illegible] 1827	0 00 [illegible] 7
9	1	0 0330579	0 0082644	0 0 [illegible] 12
272 25	30 25	1	0 025	0 00 [illegible]
10890	1210	40	1	0 [illegible]
43560	4840	160	4	1

Measures of Volume —Solids are measured by cubic yards, feet and inches 1728 cubic inches making a cubic foot and 27 cubic feet a cubic yard For all sorts of liquids corn and other dry goods the standard measure is declared by the act of 1824 to be the *imperial gallon* the capacity of which is determined immediately by weight, and remotely by the standard of length in the following manner —According to the act the imperial standard gallon contains 10 pounds avoirdupois weight of distilled water, weighed in air at the temperature of 62° Fahrenheit's thermometer the barometer being at 30 inches The pound avoirdupois contains 7000 troy grains, and it is declared that a cubic inch of distilled water (temperature 62° barometer 30 inches) weighs 252 458 grains Hence the contents of the imperial standard gallon are 277 274 cubic inches The parts of the gallon are *quarts* and *pints*, 2 pints being a quart, and 4 quarts a gallon Its multiples are the *peck* the *bushel* and the *quarter*, the peck being 2 gallons the bushel 4 pecks, and the quarter 8 bushels The following are the relations —

Pints	Quarts	Gallons	Pecks	Bushels	Quarters
1	0 5	0 125	0 0625	0 0156 25	0 0019 [illegible]
2	1	0·25	0 125	0 03125	0 003906 25
8	4	1	0 5	0 125	0 0156 25
16	8	2	1	0 25	0 03125
64	32	8	4	1	0 125
512	256	64	32	8	1

For an account of the various other measures used in commerce, see the *Commercial Dictionary*, or *Colonel Pasley's Observations on the Measures, Weights, and Money used in this Country* (London, 1834), where a full description is given

French System of Measures —The French system of measures, introduced during the Revolution, has for its standard the length of a quadrant of the earth's meridian The unit of measures of length is the *mètre*, which is taken as the ten-millionth part of the quadrant This length, deduced from the great trigonometrical measurement of the meridian from Dunkirk to Barcelona, is marked by two very fine parallel lines drawn on a bar of platinum, and preserved in the archives of the Academy of Sciences [illegible] accepted the mètre, or rod of the standards of [illegible] with a copy of the mètre, one of the Pavillon [illegible] Kater found the length of the mètre to be 39 37079 inches of the English standard (*Phil Trans* 1818) Mr Baily found the length of the mètre to be 3 [illegible] inches of the Royal Astronomical Society's (*Mem R A S*, vol ix p 133), from which, by reducing to [illegible] the imperial yard The comparison is, however, attended with some degree of uncertainty, from the circumstance that a reduction must be made for the expansion of the metals, the standard temperature of the English measures being 62° Fahrenheit and that of the French measures 32° or the temperature of melting ice

In the French system the unit of superficial measure is the *are*, a surface of 10 mètres each way or 100 square mètres The unit of measures of capacity is the *litre* a vessel containing the cube of a tenth part of the mètre and equivalent to 0 220097 parts of the British imperial gallon The standard temperature is that of melting ice All the divisions and multiples of the units are decimal, and the principle of nomenclature adopted was to prefix the Greek numerals to the decimal multiples, and the Roman numerals to the decimal subdivisions

The measures of length are,

Myriametre	=	10000 mètres
Kilometre	=	1000
Hectometre	=	100
Metre	=	1
Decimetre	=	0 1
Centimetre	=	0 01
Millimetre	=	0 001

The measures of surface are,

Hectare	=	10000 sq metres
Are	=	100
Centiare	=	1

The measures of capacity are,

Kilolitre	=	1000 litres.
Hectolitre	=	100
Decalitre	=	10
Litre	=	1
Decilitre	=	0 1
Centilitre	=	0 01

The unit of solid measure is the *stere* or cube of the metre equal to 35 3168 English cubic feet

No system of metrology hitherto invented can be compared with this of the French in scientific point of view, nevertheless the decimal subdivisions have been found unsuited to the purposes of retail traffic to which in fact only a binary system or the division of the unit into halves and quarters seems applicable Accordingly, it has been found necessary to permit a modified system for such purposes so that there are in fact at present in France three different systems of measures the ancient which was never wholly abandoned, the decimal system and a binary system or *système usuel* having the decimal standards for its basis with binary divisions to which the names of the ancient weights and measures are given, the word *usuel* being annexed to prevent confusion

Of the different measures of length used in European countries the foot is the most universally prevalent We subjoin the relation between the foot of different countries and the English foot —

	English foot
Russian foot - -	= 1
Paris foot - -	= 1 065765
Prussian and Danish foot -	= 1 029722
Bavarian foot - -	= 0 957561
Hanoverian foot - -	= 0 958333
Saxon foot - -	= 0 929118
Austrian foot - -	= 1 037128

Comparative tables of the measures used in different countries are given in various works one of the most complete and convenient will be found in *Hulsse's Sammlung Mathematischer Tafeln*, Leipzig 1840 For further information on the subject of this article, see *Pauctons Metrologie ou Traité des Mésures*, Paris, 1780, *Kelly's Universal Cambist*, 1821 See also LEAGUE, MILE and on the subject of weights, see WEIGHT

MEA'SURE In Music, the interval or space of time between raising and depressing the hand in a movement, being the same as *bar* The measure is regulated according to the different values of the notes of a piece, by which [illegible] Semibreves [illegible], one perpendicular stroke tall, called a whole measure

MEA'SURES In Geology, sometimes used as synonymous with beds or strata *coal measures*

MECHANICAL CURVE A curve of such a nature that the relation between the abscissa and the ordinate cannot be expressed by [illegible] equation Such curves are now more [illegible] *transcendental curves* See CURVE

MECHA'NICAL PHILOSOPHY The science of [illegible] to physical inquiries

MECHA'NICAL POWERS *See* MACHINE

MECHA'NICAL SOLUTION OF A GEOMETRICAL PROBLEM In the constructions of pure geometry only the ruler and compasses are allowed to be used, or, in other words, the constructions are required to be effected by means of straight lines and circles only The ancient geometers observed that there were many problems (as the duplication of the cube and the trisection of an angle, for instance) which could not be constructed by these means They hence had recourse to other instruments (*machinæ*) to effect this purpose, and such solutions were distinguished from the geometrical ones by the term *mechanical*

MECHA'NICS (Gr *μηχανη*, *machine*), in Natural Philosophy, is the science which treats of forces and powers, and their action on bodies, either directly or by the intervention of machinery

The theory of mechanics, which is a branch of mixed mathematics, is founded on an axiom or principle called the *law of inertia*, or Newton's *first law of motion*, namely, that a body must remain for ever in a state of rest, or in a state of uniform and rectilineal motion if it be not disturbed by the action of an external cause Theoretical mechanics is therefore divided into two parts *statics*, which treats of the equilibrium of forces, and *dynamics*, which is the science of accelerating or [illegible] the actions they produce When [illegible] leration are in the fluid state these become respectively *hydrostatics* and *hydrodynamics* which are comprehended under *hydraulics*, and sometimes the terms *ærostatics* and *aerodynamics* are used to denote the corresponding divisions of pneumatics, but all these divisions are more frequently included under the general term *mechanics*

Practical mechanics or a knowledge of the effects of some of the mechanical powers must have existed to some extent from the earliest ages of the world but of the machines used by the ancients in their constructions the oldest account which we possess is contained in the *Architecture* of Vitruvius Archimedes in his *Treatise De Æquiponderantibus* first investigated theoretically the principles of equilibrium, and the same philosopher is celebrated for the mechanical contrivances by which in the siege of Syracuse he so long frustrated the efforts of the Roman army under Marcellus During the eighteen centuries which succeeded the age of Archimedes the theory of mechanics remained in the same state Galileo laid the foundations of modern dynamics by his discovery of the law of accelerating force and by reducing the propositions of that science to mathematical formulæ In the hands of Newton mechanics assumed a new form, and the discovery of the new analysis enabled mathematicians to complete what had been begun by Galileo and to express all the effects of the actions of bodies on each other by analytical equations

For points connected with the theory see ACCELERATION, DYNAMICS, FORCE, STATICS &c, and for details LEVER PULLEY WHEEL AND AXLE &c The best treatise on the subject is that of Poisson, *Traité de Mecanique*, 2d ed 1833

MECHA'NICS' INSTITUTES The name given to the means by which instruction is communicated to tradesmen and mechanics in large towns throughout the British empire These institutes may be safely said to owe their origin to Dr Birkbeck who in 1800 delivered a course of lectures on natural philosophy and its application to the arts to an audience composed entirely of the mechanics of Glasgow though it was not until after the lapse of twenty years that his idea was followed up Institutions of this sort are at present established in almost every town in England whose population amounts to 10,000, and in some of much smaller number They are supported partly by contributions, and partly by the subscription of the members Short courses of lectures illustrated with experiments are given on the most popular and different branches of natural philosophy and occasionally on departments of literature, moral philosophy political economy &c Reading rooms are attached to the greater number of these institutions, which, speaking generally, are well attended On the whole we believe these establishments have been productive of considerable advantage The instruction they supply is, no doubt, very flimsy and superficial, but it notwithstanding serves to expand and inform the minds of the auditors, and is probably the most suitable for them An improvement in the system of school education by qualifying the members of mechanics' institutes the better to appreciate accurate scientific discussions, would be the most likely, or rather perhaps the only means by which to improve the lectures given at the institutions [illegible] (See *Stat of Brit Empire*, vol ii p 369)

MECHANISTS Those philosophers who refer all the changes in the universe to the effect of merely *mechanical* forces, such as *impact*, *weight*, and the like They are opposed to the dynamical philosophers, or those who assume a living and spontaneous power in nature, antecedent to and different from the phenomena present to the senses *See* MATERIALISM

MECHLO'IC ACID A compound of meconia and chlorine

MECHO'ACAN (From the province of Mexico, whence it is brought) The root of the *Convolvulus mechoacauna* it is a purgative, and was formerly used [illegible]

MECONIC ACID (Gr *μηκων*, *the poppy*) The peculiar acid with whi [illegible] When pure, it forms [illegible] solution forms a deep [illegible] which therefore are ge [illegible] bined The salts of this acid are termed *meconates*, those of lime, baryta, lead, and silver are white, and soluble in nitric acid Meconic acid is constituted of 7 atoms of carbon = 42, 2 of hydrogen = 2, and 7 of oxygen = 56 its equivalent therefore is 100

ME'CONIN (Gr *μηκων*) A white fusible substance, procured from opium and supposed to be a distinct principle It is said that more than from two to three grains of it are contained in a pound of opium, it seems doubtful whether it be an educt or a product

MECO'NIUM (Gr *μηκων*) Opium The term is also applied to the excrement found in the lower part of the fœtal intestines

MEDAL (Fr medaille) A piece of metal, in the shape of a coin, engraven with figures or devices, struck and distributed in memory of some person or event Ancient coins although intended for the purpose of circulation, are also commonly termed medals *See* NUMISMATICS

MEDA'LLION (Fr) In Numismatics, this name is appropriated to coins struck in Rome, and the provinces under the empire, which, in gold or silver, exceed in size the largest coins of which the name and value are known in those respective metals, viz the aureus in gold, and the denarius in silver It has been doubted whether they were intended for the purpose of circulation, or merely struck like modern medals, to commemorate persons or events *See* NUMISMATICS

MEDALLURGY (Fr medaille and Gr *εργον work*) The art of making and striking medals and coins *See* NUMISMATICS

MEDIE (Gr *μεσος middle*) The three letters *b*, *g* and *d* (beta, gamma, delta) are so called in the Greek alphabet as holding respectively a middle place between their several *tenues* *p*, *k*, *t* (pi, kappa, tau), and aspirates, *ph ch th* (phi, chi, theta)

MEDIANT (Lat medius) In Music, the chord which is a major or minor third higher than the key note according as the mode is major or minor

MEDIASTINUM The duplicature of the pleura, which divides the cavity of the thorax into two parts

MEDIATISATION The annexation of the smaller German sovereignties to larger contiguous states, which took place on a large scale, after the dissolution of the German empire in 1806 The same thing had been done [illegible] to be made mediately instead of immediately dependent on the empire The term was retained when the abolition of the German union had rendered it in strictness inappropriate A few more were mediatised after the peace of 1815 See *Conv Lex*, and *Hawkins's Germany*, 1838, which contains a chapter on this subject

MEDIATOR A term applied to Jesus Christ, as interceding between God and man and obtaining for the latter the remission of the punishment due to original and contracted sin The divinity of our Saviour is argued from his mediatorial character it seeming impossible to conceive that a mere man could efficaciously intercede by the sacrifice of himself for the sins of his fellow men Those reasoners, therefore who have arrived at the conclusion of the mere humanity of Christ, either expressly deny or essentially modify the idea of his mediatorial character

MEDIUM In Physics, the substance or matter in which bodies exist, or through which they move in passing from one point to another The resistance which different mediums oppose to bodies in motion is proportional to the respective densities of the mediums Newton supposed the existence of a universal medium, or ether, infinitely more rare and subtile than air and diffused through the whole creation The modern discoveries of the propagation of light by undulation, and of the acceleration of some of the small comets, give great probability to this supposition

MEDLAR (Corruption of Mespilar?) The fruit of the *Mespilus germanica*, a plant found wild in several parts of Central Europe It is remarkable for the austerity of its fruit when first gathered, and for its total loss of that quality after a few weeks, when it becomes soft brown, and sweet,—a condition which the French call *blessé* Of [illegible] finest as to [illegible]

in flavour In the eyes of a botanist the medlar is only a hawthorn berry of large size

MEDU'LLARY RAYS (Lat medulla, *marrow*) The vertical plates of cellular tissue which radiate from the centre of the stem of Exogenous plants, through the wood to the bark

MEDU'LLARY SHEATH

MEDU'LLARY SUBSTANCE The interior white portion of the brain The *medulla oblongata* is a part of the brain lying in front of the occipital bone and formed by the junction of the crura of the brain and cerebellum It terminates in the spinal marrow

MEDULLIN

MEDU'SA

MEDU'SA In Zoology a name given by Linnæus to a genus of marine animals now forming an extensive tribe (*Medusaria*) in the class *Acalepha* of the Cuvierian system The body is in the form of a

and more or less elongated, whence the resemblance to the fabled monster which suggested the original generic term The *Medusæ* are commonly known by the name of "sea-blubber" "jelly-fish" &c They have a stomach or digestive cavity excavated in the centre of the disk and opening externally either by a central and inferior crucial mouth, or continued into branched appendages and receiving the nutriment by innumerable minute pores, analogous to the "stomata" of plants or those root-like appendages The digested fluid is conveyed by vessels from the stomach to an exquisite network or plexus situated on the under surface of the border of the disk where it receives the influence of the atmosphere and is fitted for assimilation Some species as the *Medusa aurita* have also intestinal canals leading from the stomach to separate anal outlets Traces of a nervous system and rudimental organs of vision have been discerned in some of the *Medusæ* They swim by muscular contraction of the margins of the disk They are of distinct sexes which congregate together chiefly in the autumnal month The male and female organs much resemble each other and are situated in both sexes in

generally four in number on the

The ova are received when impregnated in marsupial sacs appended to the arms (in *Medusa aurita*) whence they escape in the form of ciliated infusoria afterwards assume the structure of eight armed polypes pass the winter in this state, and undergo their final transformation in spring Notwithstanding the complication of the organic machinery functions

of the *Medusæ* their solids form

their frame that of a Medusa of ten pounds weight, what remains upon the filter through which its fluid parts chiefly sea-water have escaped does not exceed two drachms A great number of the *Medusæ* are phosphorescent shining in the gloom of night like globes of fire, but the nature and the agents of this wonderful property remain to be discovered Most of the *Medusæ* at certain seasons sting and inflame the hand that touches them, but the cause of this property is equally unknown

MEE'RSCHAUM (Germ

magnesian mineral found

chiefly in some parts of Greece and Turkey It is light and soft, and is employed in the Turkish dominions as fuller's earth In Germany it is extensively used in the manufacture of tobacco pipes, which are prepared for sale by being soaked first in tallow, then in wax and finally by being polished with shave grass Imitation meerschaum pipes are sold in large quantities and the greatest caution is necessary to guard against deception To the connoisseur, the best criterion is the beautiful brown colour which the genuine meerschaum assumes after being smoked some time

MEGALE'SIAN GAMES (Gr *μεγας*, *great*) One of the most magnificent of the Roman exhibitions of the circus in honour of Cybele, the mother of the gods

MEGALI'CHTHYS (Gr *μεγας*, and *ιχθυς*, *a fish*) An extinct genus of fishes including species of great size, one of which the *Megalichthys Hibberti* has left its teeth and other parts in the channel coal of Lanarkshire, and the Lothians

MEGALO'NYX (Gr *μεγας*, and *ονυξ*, *a claw*) A large fossil quadruped the remains of which were found in a cavern in the limestone of Virginia in America

MEGALOPTERANS, *Megalopteres* (Gr *μεγας*, and *πτερον*, *a wing*) A name given by Latreille to a family of Pubescent Neuropterous insects comprehending those which have large wings horizontally folded

MEGALOSAURUS (Gr *μεγας* and *σαυρος*, *a lizard*) The generic name applied by Dr Buckland to an extinct genus of gigantic Saurians discovered in the oolite slate of Stonesfield near Oxford The species on which the genus is founded included individuals measuring from forty to fifty feet in length, they partook

The entire

The femur and tibia measure nearly three feet each, and a metatarsal bone has been found of the length of thirteen inches The bones of the extremities have large medullary cavities The

the teeth, which Dr Buckland has described as — "In the structure of these teeth we find a combination of mechanical contrivances analogous to those which are adopted in the construction of the knife, the sabre, and the saw When first protruded above the gum the apex of each tooth presented a double cutting edge of serrated enamel In this stage its position and line of action were nearly vertical, and its form like that of the two edged point of a sabre cutting equally on each side As the tooth advanced in growth, it became curved backwards in form of a pruning knife and the edge of serrated enamel was continued downwards to the base of the inner and cutting side of the tooth whilst on the outer side a similar edge descended but to a short distance from the point and the convex portion of the tooth became blunt and thick as the back of a knife is made thick for the purpose of producing strength In a tooth thus formed for cutting along its concave edge each movement of the jaw combined the power of the knife and saw, whilst the apex, in making the first incision, acted like the two edged sabre The backward curvature of the full grown teeth enabled them to retain like barbs the prey which they had penetrated (*Bridgewater Treatise*, i p 238) The entire teeth which sufficiently bespeak the carnivorous and predatory nature of the extinct monster were arranged in a pretty close series in sockets along the alveolar border of the jaws

MEGANYCTERANS (Gr *μεγας* and *νυκτερις a bat*) The first division or tribe of the order *Cheiroptera*, including the largest species of

which however are exclusively vegetable eaters living mostly on soft fruits and having

to that kind of food by their broad simple crowns The tribe is also distinguished from the animal feeding bats, whether bloodsuckers or insect catchers by having the two innermost fingers armed with hook shaped claws, and by the simple structure of the nose and ears The alimentary canal and especially the stomach of the great frugivorous bats are likewise more complicated than in the other tribes The meganycterans are distributed over the warmer parts of Asia Africa and the Polynesian Isles, but do not exist in America

MEGA'RIAN SCHOOL OF GREEK PHILOSOPHY founded at Megara by the disciples of Socrates, who retired thither after his death and distinguished in later times by its logical subtlety Its most celebrated names were those of Euclides Eubulides and Stilpo

MEGASCOPE (Gr *μεγας* and *σκοπειν* *I view*) An optical instrument proposed by M Charles of the French Academy of Sciences for the examination of bodies of considerable dimensions It is a modification of the solar microscope and has been used for determining the curvature of the different parts of the eye See MICROSCOPE

MEGASTOMES *Megastoma* (Gr *μεγας*, and *στομα* *mouth*) The name of a family of Univalve shells comprehending those which are not symmetrical, and which have

MEGATHE'RIUM (Gr *μεγας*, and *θηριον*, *beast*) The name given by Cuvier to a genus of extinct Edentate quadrupeds including and represented by one of the most gigantic of terrestrial mammalia The haunches of the *Megatherium Cuvieri* were more than five feet wide and its body twelve feet long and eight feet high, its feet were a yard in length, and terminated by formidable compressed claws of immense size its tail was of great length and probably much larger than that of any other extinct or

The head of the megatherium

cranium presents many of the peculiarities of that of the sloth The upper jaw was armed with five teeth on each side, the lower jaw with four on each side all the eighteen teeth belong to the molar series They were perpetually

like those of the Rodents, but had their

and

transverse ridges and

their

composed as in the teeth of the sloth, of a central body of coarse ivory, a thick outer coating of cementum, and a thin intermediate layer of fine and dense ivory, which forms the prominent terminating ridges of the crown

Nothing certain is known of the nature of the integuments of this singular and enormous animal; but the

fossil bony armour which has been conjectured to have appertained to the megatherium unquestionably belongs to another species of gigantic Edentate, more nearly allied to the armadillos See GLYPTODON

MI'GRIM (Fr megrim, probably from Gr ἡμι, *half*, and κρανιον, *the skull*) A violent intermitting pain affecting one side of the head

MELLONITE found in grains or small shining crystals, chiefly at Mount Somma near Vesuvius The name is from μειων, *less*, implying that the terminating pyramids of the crystals are the consequent shortness of the axis of the primitive form

MELÆ'NA (Gr μελας, *black*) The black vomit When blood is thrown up from the stomach it is generally black, in consequence of

ME'LAM A substance formed of a mixture of sal ammoniac and sulphocyanuret of potassium It is said to consist of 12 equivalents of carbon, 11 of nitrogen, and 10 of hydrogen

MELANCHOLY (Gr μελας, *black* and χολη, *bile*) A disease of the mind, chiefly characterized by ungrounded fear and apprehension of evil

MELA'NIA (Gr μελας) A genus of fluviatile Pectinibranchiate Gastropods, having a moderately thick shell, with an aperture longer than it is wide, enlarging opposite the spire, and the columella without folds or umbilicus the length of the spire is various They have the eyes with their external side, and about one third of their length from the base

MELANITE (Gr μελας) The black garnet

MELANO'SIS (Gr μελας) A morbid state characterized by deposition of a black matter in various parts of the body

MELANTERITE (Gr μελας) A mineralogical name of the native sulphate of iron

MELANTHIUM (Melanthium, one of the genera) A genus of plants, with a regular six-parted inferior perianth, and six stamens with the anthers [illegible] The number of species included in it is [illegible] but among them are the *Veratrum* or white hellebore, and *Colchicum* or meadow saffron the poisonous qualities of which indicate the general properties of the order

ME'LAS (Gr μελας) A disease endemial in Arabia It consists in the formation of dark brown or black spots upon the skin

MELAS'MA (Gr μελας) A disease of aged persons, in which a black spot appears upon the skin, which soon forms a foul ulcer

ME'LASOMES *Melasoma* (Gr μελας, and σωμα *body*) A tribe of Heteromerous Coleopterous insects comprising those which are of a uniform black or grey colour

MELASTOMACEÆ (Melastoma one of the genera) A natural order of Exogenous plants with polypetalous flowers and strongly ribbed leaves inhabiting tropical countries in great numbers but unknown in Europe in a wild state, and only occurring very sparingly in the temperate parts of America In the equatorial regions of this continent they are extremely numerous and some of the species bear berries the juice of which stains the mouth black, whence their name (μελας, and στομα *a mouth*) Their most characteristic mark is to have the anthers bent downwards and prolonged into a horn which is held fast in sockets of the ovary before the flower expands Many of the species are ornamental none are useful

MELCHISEDE'CIANS In Ecclesiastical History several sects of early heretics have been so termed from the opinions entertained by them respecting the character and office of Melchisedec arising from the language of St Paul in the Epistle to the Hebrews The Theodotians, in the 3d century are said to have regarded him as superior to Christ A sect of visionaries in Phrygia who appear to have been a branch of the Manichæans, are reported to have made Melchisedec an object of adoration Many divines of later times have entertained the belief that the Son of God appeared to Abraham under the form of Melchisedec (Cuneus, *De Rep Hebræorum*)

MELCHITES (Syr malek *king*) In Ecclesiastical History the Eutychians, when condemned by the council of Chalcedon gave this name (royalists, imperialists) to the orthodox who endeavoured to put the order of the Emperor Marcian into execution against them Among Oriental Christians it now designates in a general manner all those who are neither Jacobites [illegible] Catholic Greeks, [illegible] Eastern patriarchates (Mosheim *Eccl Hist* vol ii)

MELEAGRIS (Gr *a guinea-hen*) A term employed by Linnæus to designate the genus of which the turkey is the type The head and upper part of the neck is invested with a plumeless and caruncullated skin there is a cutaneous appendage of a similar construction under the throat, and another of a conical form on the forehead, which in the male, when under excitement, can be distended and elongated so as to hang over the point of the beak From the lower part of the neck of the adult male hangs a tuft or tassel of stiff hairs The coverts of the tail are shorter and stiffer than in the peacock, but can be erected and displayed in the same way The tarsi of the male are armed with weak spurs The common turkey (M. [illegible] L.) was introduced into Europe in the [illegible] size, and the excellence of its flesh led to its being cultivated with great care is now common, and widely dispersed [illegible] of the American woods is of a greenish colour with a copper gloss A second, and much more beautiful species (*Meleagris* [illegible]) has been discovered in Honduras [illegible] is greatly to be desired

MELES (Gr μελι, *a badger*) A genus separated by Storr from the Linnæan *Ursus*, and characterized by Mr Bell as follows — Second incisor in the lower jaw placed behind the others, molars $\frac{5-5}{6-6}$, arranged in an uninterrupted series, feet plantigrade, a glandular pouch underneath the tail, having a transverse orifice Since the extirpation of the common bear the badger, *Ursus meles* of Linnæus, which is a typical species of the present genus is the sole representative of the Ursine family in our indigenous zoology The habits of this quadruped are nocturnal, inoffensive, and slothful, its food consists of roots, earthnuts, fruits, the eggs of birds, insects reptiles, and the smaller quadrupeds its noxious qualities are consequently few and of slight moment, and by no means justify the exterminating war unintermittingly waged against it The muscular strength of the badger is great, its bite proverbially powerful, and a dog must be trained and encouraged to enter willingly into a combat with this species The long claws of the fore feet enable the badger to dig with effect, and he habitually dwells in burrows, which he digs by choice in declivities covered by thick coppice, or concealed in the recesses of woods The female prepares a nest of moss and grass, and brings forth her litter of three or four blind young in the summer season

MELE'TIANS In Ecclesiastical History the partisans of Meletius bishop [illegible], deposed in a synod at Alexandria about 306, on the charge of having sacrificed to idols during the persecution by Diocletian He was supported by numerous adherents, and thus a schism [illegible], which was partially concluded by the submission of Arsenius chief of the party, to Athanasius in 333, but does not seem to have been wholly extinct for 100 years (*Mosheim*, vol i)

MELICE'RIS (Gr μελι, *honey*, and κηρος, *wax*) An encysted tumour the contents of which resemble honey

MELILO'TUS (Lat mel *honey*, and lotus, *a leguminous plant*) A honey scented, [illegible] with erect stem and long erect racemes of small yellow or white flowers, resembling those of clover, of which it was formerly regarded as a species In some parts of Europe two or three species are cultivated as annual fodder plants

MELINGA or MELINGEA (From Μελιταια, a state in Thessaly, or Μελιτηεια a name of Venus, derived from μελι *honey*) In Zoology, a genus of beautiful corals and also a genus of butterflies

MELIPHAGANS [illegible] Gr μελι *honey*, φαγω, *I eat*) A family [illegible], comprising the birds which feed on the nectar of flowers

MELLITE, or MELILITE (Gr μελι, and λιθος, *a stone*) A yellow crystallized mineral, composed of mellitic acid and alumine It is very rare, and was first observed in the beds of brown coal in Thuringia The term *melilite* has also been applied to a yellow mineral which occurs in very minute crystals in the fissures and cavities of lava It fuses into a glass before the blowpipe but its composition has not been determined

MELLITIC ACID The peculiar acid of the mellite or honeystone of Thuringia According to Liebig the ultimate elements of this acid are 4 equivalents of carbon = 24 4 of oxygen = 32 and 1 of hydrogen = 1

MELLON A lemon-yellow substance composed of 6 equivalents of carbon and 4 of nitrogen, obtained by heating dry bisulphuret of cyanogen

MELOCA'CTUS (Melon-cactus) Round stemmed, ribbed succulent plants covered with spines on the ridge of the ribs, and producing the flowers among wool, on a hairy head or cap, which is protruded from the top of the stem They were included by Linnæus in his genus *Cactus*, and they [illegible] distinguished from [illegible] to which the modern [illegible] Cereus [illegible] are applied For the sake of their grotesque form, [illegible] are cultivated by persons curious in col[illegible]

MELODRA'MA (from [illegible]) A short drama in which [illegible] ing from the opera, as the [illegible] of the words are recited, and not sung In Germany melodrama is a short dramatic piece in lyrical verse themselves, and in France, its character [illegible] a vehicle for gorgeous decoration [illegible] insignificant plot, usually of a serious or romantic description

MELODY (Gr μελωδια, from μελος, *a song*) In Music, the arrangement in succession of different sounds

for a single voice or instrument, being distinguished from harmony, which is the result of the union of two or more concording musical sounds

ME'LOË (Gr *μελω a probe*) A genus of Coleopterous insects, of the section *Heteromera* tribe *Trachelides* and family *Cantharidæ*, in the system of Latreille In this genus the antennæ are composed of short and rounded joints the intermediate of which are the largest, and sometimes so disposed that these organs present in this point, in several males, an emargination or crescent The wings are wanting, and the elytra, oval or triangular, with a portion of the inner margin cross each other, only partially cover the abdomen particularly in the females, in which this segment of the body is extremely voluminous The meloes crawl along the ground or upon low plants, on the leaves of which they feed A yellowish or reddish oleaginous liquid exudes from the articulations of their legs In some districts of Spain these insects are used in the place of the true blister-flies (*Cantharides*), they are also employed by the farriers Latreille is of opinion that the modern meloes were the *Buprestes* of the ancients —insects to which they attributed very noxious properties supposing them to be fatal to the oxen that swallowed them

MELOLON'THIDANS *Melolonthidæ* The family of Coleopterous insects, of which the May-chafer (*Melolontha vulgaris*) is the type

MELPO'MENE (Gr *μελπομαι, I sing*) The muse who presides over tragedy, represented usually with a mask in one hand, a club or dagger in the other, and with buskins [illegible] et

MELUSINE In the mediæval Mythology of France, a beautiful nymph or fairy whose history occupies a large space in the popular superstitions of that country She is represented as the daughter of Helmas king of Albania, and the fairy Persine, [illegible] Raymund, count of Toulouse [illegible] ncent castle of Lusignan (originally called Lusinem the *anagram* of Melusine) Like most of the fairies of that period, she was doomed to a periodical metamorphosis during which the lower part of her body assumed the form of a fish or a serpent On these occasions she exerted all her ingenuity to escape observation, but having been once accidentally seen by her husband in this condition, she swooned away, and soon afterwards disappeared, none knew whither But her form is said to be seen from time to time on the tower of Lusignan clad in mourning and uttering deep lamentations, and her appearance is universally believed to indicate an impending calamity to the royal family of France

MELYRIS (Gr *μελυρις* an insect mentioned by Nicander) A Fabrician genus of Coleopterous insects, belonging to the section *Pentamera* subsection *Serricornes* tribe *Malacoderma* and constituting the family *Melyridæ* in the system of Latreille in which it is characterized as follows —Palpi commonly short and filiform, mandibles emarginated at the point, body usually narrow and elongated, head covered at the base by a flat or slightly convex thorax, joint of the tarsi entire and the terminal hooks unidentate or bordered with a membrane, antennæ usually serrate, and in the males of some species even pectinate

MEMBRA'NA TYMPANI The membrane which separates the internal from the external ear The drum of the ear

MEMBRANE The expansion of any of the tissues of the body into a thin layer Anatomists generally enumerate three kinds of membrane, namely the *mucous* the *serous*, and the *fibrous* The mucous membranes are those which line the canals of the body which are exposed to the action of air or foreign matters, —such as the lining of the nose, trachea, æsophagus, stomach intestines, &c The serous membranes form the lining of the sacs or closed cavities, as of the chest abdomen &c The fibrous membranes are tough inelastic and [illegible] such as the dura mater, the periosteum [illegible] of joints, &c

MEMNON In Greek Mythology, a fabulous king of Ethiopia, son of the goddess Aurora who is said to have assisted the Trojans in the siege of Troy, and to have been slain by Achilles Several Egyptian kings of this name are also mentioned by different Greek writers But the name is, in fact, supposed to be a general appellation or epithet (Mei-amun, *beloved of Ammon*) borrowed by the Greeks from the Egyptian language, and erroneously applied by them to particular individuals The famous statue called by the Greeks Memnon at Thebes in Upper Egypt, which possessed the real or imaginary property of emitting a sound like that of a harp, at the rising of the sun, is supposed to have been in the building called by M Champollion the Rhamesseion, from its founder Rhamesses, or Sesostris, of which the stupendous ruins are still seen between Medinet Habou and Kournah (See Champollion, *Lettres écrites d'Egypte et de Nubie*, p 261) The statue of black granite in the British Museum, already styled the brother of the younger Memnon, was found in the Rhamesseion The real Memnonium was, however, probably the temple erected by Amenoph, or [illegible] (Champollion, *ib* p 303)

MEMOIR In Literature, two different species of composition are popularly designated by the terms Memoir and Memoirs A short biographical notice of an individual, or a short essay on a particular subject (especially to accompany and explain a map, view, facsimile, or other representation of [illegible] called Memoir In architectural [illegible] to a [illegible] account, [illegible] with narratives and remarks respecting the personages and events of the times in which he lived, is termed his Memoirs, being supposed, as the name denotes, to have been drawn up with the object of assisting his memory in reflecting on past events In modern but incorrect diction the life of a person by another is also termed his Memoirs if drawn up with a somewhat less regular arrangement and containing more matter not immediately connected with the subject than the species of narration which we term a Life The French were the earliest, and have always been by far the most successful writers, in this branch of literature Their historical memoirs, partly autobiographical, and partly the works of authors who had access to the papers and memorials of those whose lives they illustrated, form a complete series from the 16th century to the present time and throw the greatest light on some portions of history, while their memoirs of celebrated individuals in the ranks of literature and fashion are still more numerous and interesting In the last century this branch of literature became so popular that any distinguished individual who did not leave authentic memoirs of himself was sure to become the subject after his death of fabricated memoirs published under his name and this species of falsification of which Voltaire then complained appears to be now carried on as extensively as at any former period The collections of historical memoirs recently edited in Paris contain three series of historical memoirs relating to French history and one of English memoirs translated illustrating the period of our great civil war and revolution The latter undertaking was conducted by M Guizot

MEMORIAL In Diplomacy a species of informal state paper much used in negotiation Memorials are said to be of three classes 1 Memorials in the form of letters subscribed by the writer and speaking in the second person as addressed to another 2 Memorials proper or written representations subscribed by the writer and with an address but not speaking in the second person 3 Notes in which there is neither subscription nor address Specimens of the first class of memorials are circulars from the bureau of foreign affairs sent to foreign agents answers to the memorials of ambassadors and notes to foreign cabinets and ambassadors

MEMORY (Lat *memini I remember*), is defined to be the power or capacity [illegible] to the senses or the mind accompanied by a distinct consciousness of past existence The term is also employed though more rarely to denote the act or operation of remembering, or the peculiar state of the mind when it exercises this faculty in contradistinction to the faculty itself Various opinions have been propounded by metaphysicians respecting the nature and origin of the faculty of memory Upon this point, however it is not our intention to enter into any details as this question is so mixed up with that of other faculties of the mind such as perception and association and such metaphysical questions as personal identity &c, as to be inseparable from them, and to these heads we must refer the reader for information We may however remark that the ancient Platonists and Peripatetics ascribed the faculty of memory to the common theory of ideas, that is of images in the brain or in the mind of all the objects of thought, and in this opinion they were supported, with slight modifications by many other philosophers of antiquity But Dr Reid who has examined this question with great acuteness has satisfactorily demonstrated the theory of the ancients to be very defective The more modern theories of Locke, Hume, and other philosophers also meet with little consideration from the same acute metaphysician, who, after exposing their fallacies, sums up in these words —"Thus, when philosophers have piled one supposition on another as the giants piled the mountains in order to scale the heavens it is all to no purpose — memory remains unaccountable, and we know as little how we remember things past as how we are conscious of the pres[illegible] (*Essays on the Human Mind* p 159 185)

MENACHANITE [illegible] oxide of titanium, found in the [illegible] of Menachan [illegible]

MENDICANT FRIARS *See* ORDERS, MENDICANT

MENDICITY (Lat mendico, *I beg*) The condition of habitual beggars One of the greatest curses which can afflict a civilized society is the prevalence of mendicity, and it is very much to be regretted that the prejudices of excellent and humane persons have so constantly interposed, and still interpose, difficulties in the

w of the adoption and enforce nent of correct principles [illegible] ... [illegible] ... [illegible] ... seeing in mendicity only the natural expression of that indige ce into which numbers are unhappily thrown by the inequality of property and uncertainty of employment prevailing in almost all communities and who forget [illegible] ... [illegible] ... [illegible] ... poor laws, and far more than either the activity of En- [illegible] ... [illegible] ... [illegible] ... And, owing to that very circumstance, it is perhaps worse in England than in any other country, that is, the established mendicants are more connected with the criminal part of the population (See the reports of the Constabulary Force Commission) Ireland has long been unhappily celebrated for the prevalence of mendicity The number of destitute persons" in the island was estimated by Mr Stanley in 1837 at about 80,000 (*Mr Nicholl's Report on Poor Laws in Ireland*) the number of street mendicants in Dublin at nearly 1000 or almost *one twentieth* of the population Mr Lewis following the evidence adduced before the Irish Poor Law Commission, divides the habitual mendicants into —1 Wandering beggars chiefly cripples blind maimed &c 2 Professional strolling beggars who have no fixed domicile, and live constantly by mendicancy 3 Town beggars who live by mendicancy but have a fixed domicile these he says are generally known by those who relieve them and their character is not on the whole very bad" 4 Poor housekeepers who are relieved by three or four neighbours, to whom their wants are known but who would not resort to general begging (*On Local Disturbances in Ireland* 1835) Mendicancy and wretchedness,' says Mr Nicholl, have become too comm [illegible] ... truth [illegible] ... giving in Ireland to those of indiscriminate legal relief in England What effect the new system of poor laws may have on this and other evils of that country time must show In France, *depots de mendicite* were first founded in 1767, a kind of half way between prisons and hospitals for mendicants Their situation was rendered dependent on their good behaviour These receptacles held 6000 or 8000 persons in 1789 In 1808 by a new law vagabonds mere vagrants, were distinguished from beggars —the disabled persons, or other persons begging within their own [illegible] ... the former were sent to maisons de [illegible] ... here are now two giol depots for Paris [illegible] ... and Villers Cotterets and all authorities concur in the statement that they had manifestly diminished mendicity at Paris (Degerando *De la Bienfaisance Publique* iii part 3 b 1) "The road to mendicity," says M Sismondi "is now too wide and too easy, instead of calling on religion to smooth it, we should multiply as far as possible the resources of the poor, in order to prevent their being dragged into it"

MENILITE A mineral somewhat resembling semi-opal, found at Menil Montant near Paris

MENISCUS A lens convex on one side and concave on the other *See* LENS

MENISPERMIC ACID An acid contained in the berries of the *Menispermum cocculus* (*Cocculus indicus*) where it exists in combination with the vegetable alkali called *picrotoxia*

MENNONITES The title by which the Anabaptists of Holland came to be distinguished after they had put themselves under the guidance of Menno a native of Friesland, who undertook to moderate the extraordinary fanaticism of those sectarians (*Mosheim* transl, ed 1790 v 490) *See* BAPTISTS ANABAPTISTS

MENOBRANCHUS (Gr *μενω I remain* *βραγχια, gills*) A Perennibranchiate amphibian, which retains the external gills

MENOPOMÆ, *Menopoma* (Gr *μενω* and *πωμα a lid*) A Perennibranchiate amphibian which retains the opercular aperture, but not the external gills

MENORRHAGIA (Gr *μην a month*, and *ρεω, I flow*) Flooding, immoderate menstrual discharge, hæmorrhage from the uterus

MENSTRUUM (Lat mensis, *a month*) signified, in the language of the old chemists some preparation or drug which could only operate effectually at a particular period of the [illegible] ... used for any fluid sub [illegible] ...

MENSURATION Though this term literally signifies the act of measuring, it is usually employed to denote the branch of practical geometry which teaches the methods of calculating the dimensions and areas of figures the volumes of solids &c from the measurement of certain lines or angles of the figures or solids, which supply the requisite data

Every rectilineal plane figure may be decomposed into triangles; and hence the mensuration of such figures resolves itself into the determination of the sides or area of a triangle (*See* TRIGONOMETRY) [illegible] ... planes may in like manner be [illegible] ... and their contents consequently determined by the methods of elementary geometry (*See* PYRAMID) The determination of the lengths of curve lines, the areas of figures bounded by curves, and of solids bounded by curve surfaces, requires the application of the integral calculus (*See* QUADRATURE, RECTIFICATION) For the areas and volumes of the most usual geometrical figures, see the respective terms as CIRCLE ELLIPSE &c

MENTUM (Lat *the chin*) In Mammalogy the term is applied to the outer [illegible] ... of the mouth, or lower jaw The *mentum prominulum* is that which [illegible] ... from the upper margin of the lower jaw, the *mentum absconditum* is that which [illegible] ...

MENU INSTITUTES OF The [illegible] ... most celebrated code of [illegible] ... law called from Menu, Men [illegible] ... by whom it is supposed to have been revealed The Hindoos themselves ascribe to this system the highest antiquity, and many of the most learned Europeans are of opinion that of all known works there is none which carries with it more convincing proofs of high antiquity and perfect integrity Sir W Jones assigns the date of its origin somewhere between Homer and the Twelve Tables of the Romans, and Schlegel asserts it as his belief that it was seen by Alexander the Great in a state not materially different from that in which we possess it The Institutes of Menu [illegible] ... ture they embrace all [illegible] ... history of the creation of the world and man, the nature of God and spirits and a complete system of morals, government and religion The work, says Sir W Jones, contains abundance of curious matter, interesting both to speculative lawyers and antiquaries, with many beauties which need not to be pointed out, and with many blemishes which cannot be justified or palliated it is a system of despotism and priestcraft, both, indeed, limited by law but artfully conspiring to give mutual support But notwithstanding these and other defects, as has frequently been remarked the most striking features by which the code of Menu is distinguished are the rigour and purity of its morals Many of its maxims have all the sublimity of the precepts of Christianity, to which, in fact, they bear a close resemblance, not only in the style of [illegible] ... but of expression Thus, "Let not a man complain even though in pain, let him not injure another in deed or in thought, let him not even utter a word by which his fellow-creatures may suffer uneasiness" Again, "Let him bear a reproachful speech with patience, let him speak reproachfully to no man, with an angry man let him not in return be angry, abused, let him answer mildly" The inspired words of the Psalmist, "The fool hath said in his heart there is no God," are thus almost verbally rendered The wicked have said in their hearts no one sees us yes the gods distinctly see them, and so does the spirit within their breasts" The Institutes of Menu have been translated into the English and French languages into the former by Sir W Jones in 1794, the latter by Des Longchamps in 1830 (Strasburg) An edition of the original Sanscrit, together with Sir W Jones's translation was published at Calcutta in 1822-25 by Sir Graves Haughton

MENURA (Gr *μενος, strength*, and *ουρα, a tail*) A name invented by Dr Shaw for a genus of birds peculiar to Australia, the true affinities of which have been the subject of [illegible] ... ornithologists [illegible] ... the *Menura* [illegible] ... pheasants evidently belong to the order *Passeræ*, and approach the thrushes in their beak, which is triangular at the base, elongated, slightly compressed, and emarginate at the point Only one species is at present known, and this is chiefly peculiar for an extraordinary sexual development of the tail feathers of the male Of these there are three kinds the twelve common ones, with very fine and widely separated barbs, two more in the middle, of which only one side is furnished with thickly-set barbs, and two external ones, curved in the figure of an S, or like the arms of a lyre, whose internal barbs, large and thickly set, form a kind of broad riband, while [illegible] ... become longer only near [illegible] ... the twelve ordinary quills.

MENYANTHES (Gr [illegible] ... A genus of Gentianaceous plants [illegible] ... pro- [illegible] ... in which [illegible] ...

MENYNGES (Gr *μηνιγξ, a membrane*) The membranes which cover the brain are so called

MEPHITIS (Lat) Any noxious exhalation, but more [illegible] ... applied to carbonic acid gas Mephitis was [illegible] ... goddess who was invoked by the [illegible] ... noxious vapours

MERCAPTAN [illegible] ... posed of sulphur, car

bon, and hydrogen, which has received the above name from its energetic action on mercury — *corpus mercurium cupiens* (*Voir Annales de Chimie et Physique* lv 87)

MERCATOR'S CHART, or PROJECTION A representation of the sphere on a plane, in which the meridians are represented by equidistant parallel straight lines and the parallels of latitude also by straight lines perpendicular to the meridians This projection, which is universally adopted for nautical charts, by reason of the facilities which it affords in navigation from the circumstance that the rhumb, or sailing course between two points, is represented by a straight line, was invented by Gerard Mercator (his true name was *Kauffman*, of which Mercator is the Latin equivalent), a native of Rupelmonde, in East Flanders, born in the year 1512 But, though Mercator gave his [illegible] not appear that he knew t[illegible] distance of the parallels fr[illegible] true principles [illegible] Edward Wright of Ca[illegible] explained them in his tr[illegible] *f certain Errors in Navigation*, published in 1599, and are as follows —Suppose one of the meridians on the globe to be d[illegible] one of these, taken at any parallel of latitude, w[illegible] a minute of longitude taken on that parallel, as the radius of the equator to the radius of the parallel, that is, as radius to the cosine of the latitude, or as the secant of the latitude to radius This proportion holds true on the map in this sense that if a minute of the equator be taken as the unit of a scale, and that unit be considered as the radius of the tables, then the representation of a minute of latitude will be expressed by the number in the trigonometrical tables which is the secant of that latitude Hence on the map while the degrees of longitude are all equal, the degrees of latitude marked on the meridian form a scale of which the distances go on increasing from the equator towards the poles, each being approximately the sum of the secants of all the minutes of latitude in the degree The numbers resulting from the addition of the secants of the successive minutes reckoned from the equator form a scale of meridional parts, which is given in all books of navigation The very remarkable property of this projection, namely that the divisions of the meridian are analogous to the excesses of the logarithmic tangents of half the respective [illegible] y 45° above the logarithm of the [illegible] by Bond about the year 1645, but was first demonstrated by James Gregory, in his *Exercitationes Mathematicæ* published in 1668 (See the *Scriptores Logarithmici* vols ii and iv)

MERCURIA'LE The first Wednesday after the great vacation of the parliaments under the old French régime On that day they met to discuss grievances and deficiencies, and to reprimand members for misconduct Hence an harangue of reproof is popularly termed in French a *mercuriale*

ME'RCURY (Probably from the Lat merx *merchandise*) The Latin name of the Grecian Hermes He was the son of Jupiter and Maia, and discharged the office of the messenger of the gods Part of his duty was also to conduct the shades of the dead to the infernal regions He presides over eloquence, profit, good fortune, and theft, in which he was himself so great a proficient that, on the day of his birth he stole fifty kine from the herds of Apollo whom he repaid by the gift of his invention, the lyre (See the Hymn ascribed to Homer with the beautiful translation of it by Shelley) His attributes, exploits, and insignia are briefly enumerated by Horace (Ode I 10) —

> Mercuri facunde, nepos Atlantis
> [illegible]
> Fortis Pelasgi [illegible] deorum
> Mercurius,
> [illegible]
> [illegible]
> *Condere furto*

Between which passage and the lines of Ovid (*Fasti*, v 663—669) a curious coincidence will be found Mercury was represented as a youth lightly clad, with the *petasus* or winged hat, and wings at his heels In his hand he bears the emblem of his heraldic office the *caduceus* [illegible] with two serpents twined about it The more ancient statues of Mercury were square blocks of stone, with a rudely carved head on them They were set up in great numbers in the streets of Athens

ME'RCURY In the Solar System, the planet nearest the sun The mean distance of Mercury from the [illegible] 0 387098, the radius of the earth being taken as unity it is consequently little more than a third of the earth's distance from the sun [illegible] His mean sidereal revolution [illegible] solar days and his successive oppositions or conjunctions take place at intervals of 115 877 mean solar days The orbit is inclined to the ecliptic in an angle of [illegible] and its eccentricity is greater than that of any other of the old planets being 0 2056, the major axis being unity Mercury being an inferior planet always appears in the neighbourhood of the sun his greatest elongation or angular distance from the sun amounts only to 29° 48′ so that he is very seldom visible to the naked eye His apparent diameter varies from 5″ at his superior conjunction when at his greatest distance from the earth, to 12″ at his inferior conjunction when nearest the earth At a distance equal to the mean distance of the sun from the earth, the apparent diameter is 6 9″ His true diameter, compared with that of the earth taken as unity, is 398, or about 3140 miles On account of the smallness [illegible] and, in a good telescope, exhibits phases, and the planet is supposed to revolve about its axis in the space of 24 h 5 m 28 sec Mercury is sometimes seen to pass over the sun's disk This occurs only when he is in one of his nodes nearly at the time he is at his inferior conjunction The phenomena are of more frequent occurrence than the transits of Venus, but of far less astronomical importance The three next transits will be visible in this country, and will occur at the following dates —1861, Nov 11, 1868, Nov 4, 1878, May 6 *See* PLANET

ME'RCURY This metal is found chiefly in the state of *sulphuret* which is decomposed by distillation with iron or lime It is also found *native* Mercury is the only metal which is liquid at common temperatures, it is white and very brilliant It freezes and assumes a crystalline texture at 40° below zero Its specific gravity is 13 5 It boils at 660° and its vapour condenses upon cool surfaces in minute brilliant globules It is not altered by exposure to air at common temperatures but when kept in vessels to which air has access, at a temperature near its boiling point, it gradually becomes converted into a deep red crystalline substance, which is the *peroxide*, or *red oxide of mercury* When mercury is dissolved in cold dilute nitric acid the pure alkalis throw it down in the form of *black protoxide* The same oxide is also [illegible] with solution of caustic po[illegible] oxides of mercury The equivalent of this metal is about 200 and the oxides consisting respectively of 1 atom of mercury and 1 of oxygen and 1 and 2, are represented by 200 + 8 = 208 and 200 + 16 = 216 Mercury is represented in chemical formulæ by *hg* from the Latin *hydrargyrum*, literally signifying *water silver* The symbol of the protoxide will then be (*hg* + *o*) and of the peroxide (*hg* + 2 *o*) Each of these oxides combines with the acids, and produces the *protosalts* and *persalts* of mercury

Mercury and Chlorine — There are two *chlorides of mercury*, a *protochloride* or *calomel*, and a *perchloride* or *corrosive sublimate* Calomel may be obtained by mixing 60 parts (1 equivalent) of common salt or chloride of sodium with 248 parts (1 equivalent) of protosulphate of mercury and exposing the mixture in a proper subliming vessel to a red heat, the chlorine of the salt combines with the mercury of the sulphate to form protochloride of mercury [illegible] of 200 mercury and 36 chlorine) and the [illegible] salt uniting with the oxygen of the oxide of mercury becomes soda which, with the sulphuric acid forms sulphate of soda Calomel may also be obtained by mixing 200 parts of mercury with 272 of corrosive sublimate and subliming the mixture When thoroughly washed and levigated calomel is a tasteless white powder, its specific gravity is 7 2 When heated it acquires a yellow colour, and at a temperature below redness it rises in dense white fumes, which are deposited in the form of a white powder upon cold surfaces It is insoluble in water When hastily sublimed it often becomes a crystalline horny mass and occasionally forms beautiful prismatic crystals It is sometimes found native, forming however, a very rare ore called from its appearance *horn quicksilver*

Perchloride of mercury or corrosive sublimate is obtained by sublimation from a mixture of 120 parts of common salt (or 2 equivalents), and 296 (or 1 equivalent) of persulphate of mercury It rises in the form of a white crystalline substance of an acrid metallic taste, highly poisonous soluble in 20 parts of cold and in 2 of boiling water Its specific gravity is 5 2 When heated it evaporates in acrid fumes at a temperature below that required for the volatilization of calomel Corrosive sublimate is a compound of 1 equivalent of mercury and 2 of chlorine In the above process [illegible] chlorine is furnished by the chloride [illegible] phate of soda is the other product

Bisulphuret of Mercury, known also by the name of cinnabar or vermilion, is prepared artificially by heating together 100 parts of mercury with about 20 of sulphur, they form a black compound, which when strongly heated, rises in the form of a deep crimson-coloured sublimate, this, reduced by long trituration into a fine powder, ac[illegible] tasteless, and insoluble [illegible] and 32 sulphur, or (*hg* + 2 *s*) A black *protosulphuret of mercury* (*hg* + *s*) is precipitated by sulphuretted hydrogen from a solution of the protonitrate When a mixture of equal weights of

finely-powdered peroxide of mercury and Prussian blue is boiled in water till the blue colour disappears, the solution yields, when filtered and evaporated, a crop of straw-coloured prismatic crystals, which are *bicyanuret of mercury* $2\,cy + hg$

Mercury is found in various parts of the world Among the principal mines are those of Almaden near Cordova in Spain, Idria in Carniola, Wolstein and Moschel in the Palatinate, Guancavelica, in Peru It is stated by Dr A T Thomson, in his *Dispensatory*, that most of the mercury used in this country is brought from Germany But, whatever may have been the case formerly, it is certainly true at present Of the 34 hundredweights of quicksilver imported in 1831, 1832, and 1833, from Germany, 269,558 lbs were brought from Spain 13,714 lbs from Gibraltar, the rest principally from Carniola, and a part from Spain, 31,014 lbs were brought from Italy Only 192 310 lbs were retained for home consumption in 1833 *Pol Jo*, No 550 Sess 1834 Quicksilver is found in the provinces of Chuquisaca, Potosi, and Oruro, between Europe and America was interrupted, the price of quicksilver rose to such a height in the latter that it answered to import it from China, but after the peace it was regularly exported to the latter, and at an average of the 14 years ending with 1828 the imports of quicksilver by the English and Americans into Canton amounted to 618 085 lbs a year, worth 340 262 dollars Besides its uses in medicine, mercury is extensively employed in the amalgamation of the noble metals in water gilding, the making of vermilion, the silvering of looking-glasses, the making of barometers and thermometers, and many other scientific instruments

MERGER, in Law is the destruction of a lesser estate in lands and tenements by the acquisition of a greater estate in the same immediately succeeding by the same party and in the same right Thus an estate for years is said to merge or sink in an estate for life if there be no other estate vested in another person intervening between the two and an estate for life in an estate of inheritance There is no merger of an estate tail

MERGUS (Lat mergus the name of a sea bird, supposed to apply to the cormorant) A numerous genus of Anserine birds characterized by a beak thinner and more cylindrical than that of the ducks and with each mandible armed at its margins with small pointed teeth directed backwards, like those of a saw the upper mandible is curved downwards at its extremity The goosander (*Mergus serrator*) and the merganser (*Mergus merganser*) are examples of this genus

MERIDIAN (Lat meridies *mid-day*) In Astronomy a great circle of the sphere passing through the earth's axis and the zenith of the spectator It is the circle on which the latitudes of places are reckoned commencing from the equator which it intersects at right angles The terrestrial meridian is the great circle (or rather ellipse) formed by the intersection of the surface of the earth with the plane passing through the poles and the place of the spectator See DEGREE

MERIDIAN ALTITUDE The altitude or height above the horizon &c in degrees of any celestial object, when it crosses the meridian of a place

MERIDIAN, FIRST The meridian from which longitudes are reckoned The choice of the first meridian is entirely arbitrary, and most nations reckon the longitudes from their capital, or meridian passing through their principal observatories Thus in English works the longitude is reckoned from Greenwich, in French, from Paris in Russian from St Petersburg, &c Ptolemy employed the Canary Islands, the French formerly reckoned from Ferro, and the Dutch from the Peak of Teneriffe Mercator chose the island Del Corvo See LONGITUDE

MERIDIAN LINE A line traced on the surface of [illegible] the meridian [illegible]

MERIDIAN OF A GLOBE, OR BRASS MERIDIAN, is a graduated circular ring, within which the globe is suspended and revolves, and by means of which it is connected with the frame bearing the horizontal scale Meridian lines are also traced on the globe itself, usually at 15° distance, or a difference of longitude corresponding to one hour of time It is probable that these, with the parallels of latitude, suggested to Descartes the idea of *co ordinates* which he applied so successfully to [illegible] with geometry

MERINO SHEEP A breed of sheep till lately peculiar to Spain, but now reared in Saxony, England, and more particularly in Australia chiefly for the superior fineness of their wool The word *merino* signifies an overseer of pasture lands and is applied to this breed of sheep, because, in Spain [illegible] migratory flocks, under a system of [illegible] as a head, and with a general right of pasturage all over the kingdom The best flocks of Spanish merinos are found in Leon and Castille of the Saxon variety, at Stolpen and Rochsburg, but merinos are to be found in North America, the Cape of Good Hope, and above all in New South Wales, which promises to be one of the principal [illegible] the world *See* SHEEP

MERLON In Fortification, the part of the parapet or epaulement included between two embrasures

MERMAID (Germ meer, *sea*, and magd, *maid*) A fabulous creature, the fore part woman, the hinder half fish The species of [illegible] still existing have been viewed at a distance in the sea by persons who have excited the idea of mermen and mermaids, are the cetaceous *dugong* and *manatee* these have their teats placed [illegible] like arms and hands, and terminate behind [illegible] like tail The nipples are pectoral, and they are often seen ascending to the surface to breathe, clasping their suckling young to the breast

MEROPIDANS, *Meropidæ* The family of Insessorial birds of which the bee-eater (*Merops*) is the type.

MEROS (Gr) In Architecture, the plane face between the channels in the triglyphs of the Doric order

MERULIDANS, *Merulidæ* The family of Dentirostral passerine birds of which the thrush (*Merula*) is the type

MESEMBRYANTHEMUM (Gr μεσος, *the middle*, βρυω *I grow*, and ανθος, *a flower*), is a very large genus of [illegible] Cape plants, of which many species are conspicuous for the beauty of their flowers, which expand in sunshine and close up in gloomy weather They are chiefly interesting on account of the hygrometical quality of their fruit, which when wetted opens out into numerous radiating valves and when dry contracts with force into a compact and apparently solid body This fruit is sometimes called the fig-marigold

MESENTERY (Gr μεσος, and εντερον, *an intestine*) The membrane by which the intestines are attached to the vertebræ, it is formed of a duplicature of the peritonæum, and supports the nerves and vessels of the intestines

MESMERISM *See* MAGNETISM, ANIMAL

MESNE PROCESS Such process as intervenes between the beginning and end of a suit It is opposed to final process or that which takes place by way of execution after judgment Imprisonment for debt on mesne process was effected by the bare affidavit of one person, stating that another owes him 20*l* It is abolished, under certain exceptions by 1 & 2 Vict c 110 *See* ARREST

MESOCOLON (Gr μεσος, and κωλον *the colon*) The mesentery of the colon it is an extensive duplicature of the peritonæum

MESOLABE (Gr μεσος, and λαμβανω, *I take*) An instrument employed by the ancients for finding two mean proportionals between two given lines, which were required in the problem of the duplication of the cube (See *Eutocius on the Works of Archimedes*, and the 3d Book of *Pappus*)

MESOLYTE (Gr μεσος and λιθος *a stone*) A hydrated silicate of alumina, lime, and soda It is also called *needle stone*

MESOPHYLLUM (Gr μεσος, and φυλλον, *a leaf*), is the parenchymatous tissue forming the fleshy part of a leaf between the upper and lower integuments

MESOTHORAX (Gr μεσος, and θωραξ *the chest*), in Entomology is the posterior segment of the thorax, which bears the posterior pair of wings and the third or posterior pair of legs

MESOTYPE (Gr μεσος and τυπος *form*) A hydrated silicate of alumina and soda It has also been called natrolite It occurs in trap rocks and in the ancient lava of Vesuvius

MESS in Military Language signifies the public dinner prepared either for the officers of the same regiment, or for those of different regiments if in garrison, and to the support of which they are bound to contribute a portion of their pay General [illegible] only married officers are exempted from [illegible] and dining at the mess, the rest preside over it in rotation, without respect to military rank

MESSENGER In Naval Language, a hawser or small cable of about sixty fathoms in length, wound round the capstan, and having its two ends lashed together When the anchor is to be weighed this rope is attached to the cable by the *nippers*, and thus acts as an endless rope [illegible]

MESSENGERS [illegible] employed in the [illegible] to convey despatches, either at home or abroad They were formerly employed in serving the secretaries' warrants for the apprehension of parties charged with high treason, or other grave offences, and in such cases it was not unusual for them to detain their prisoners at their own houses In the year 1713 the ambassador of the [illegible] of Morocco was taken into custody by a [illegible] messenger, and released only after a lapse of six months

MESSIAD The name given to the only modern epic poem of Germany, the subject of which is, as the name implies the sufferings and triumph of the Messiah It is written in hexameter verse [illegible] as elsewhere observed, the German [illegible] modern language, and consists of 20 books. The publication of this poem procured for its author unbounded

high praise must be understood as referring chiefly to its having been among the first productions in which the power and resources of the German language were developed, rather than to its innate merits as an epic poem, or to the influence it has exercised over the national poetry of Germany The reputation of Klopstock among his own countrymen rests chiefly on his Odes, and it must be admitted that in all those parts of his epic poem into which [illegible] words whenever the [illegible] excited,—there are few poets, either ancient or modern, to whom he deserves to be postponed But on the other hand the dignity and simplicity of his sentiments are not unfrequently disfigured by the pedantry and affectation of his style and the tediousness of his episodes

MESSIAH An old Hebrew word signifying the anointed or sacred corresponding with the Greek word χριστος, and in this sense applied to the Saviour as it was [illegible] the Jews to their prophets, priests and kings It was customary to anoint all these high personages when they assumed their office We read in Psalm ii 2, "The kings of the earth set themselves against the Lord and against his *anointed*" (i e his Messiah), and in Psalm xlv 7, "Therefore God even thy God, hath *anointed* thee with the oil of gladness above thy fellows" This *anointing*, therefore was not a sensible unction with external oil or ointment but a symbol of it, a spiritual, an internal unction of grace given by the Holy Ghost—"And God gave not the spirit by measure unto him" St Luke tells us that our Saviour applied this *anointing* to himself when [illegible] synagogue of Nazareth [illegible] is a pause for any one to speak or read who can enlighten or instruct the people when this period came our Saviour stept forward, took up the Hebrew roll and opened it at the book of the prophet Isaiah and read aloud this passage —"The spirit of the Lord is upon me because he hath *anointed* me to preach the gospel to the poor &c, and he closed the book and he gave it to the minister and sat down The eyes of all them that were in the synagogue were fastened on him and he said, "This day is this scripture fulfilled in your ears, and all bare him witness and wondered at the gracious words which proceeded out of his mouth" (Luke iv 17 &c)

MESSUAGE (modern Lat messuagium) in Law is said to be properly a dwelling-house with a small portion of land adjacent or the site of the manor It is now one of the general words used in the legal description of dwelling-houses with the land attached

MESTINO In Spanish America, the child of a [illegible]

METAMORPHOSIS [illegible] morphosis

METACARPAL (Gr μετα, *between*, and καρπος, in the sense of *the wrist*) Belonging to the metacarpus or that part of the hand which is between the wrist and fingers

METACENTRE (Gr μετα, and κεντρον, *centre*) A term first applied by Bouguer to that point of a floating body in which, when the body is disturbed from the position of equilibrium, the vertical line passing through the centre of buoyancy meets the line which when the body is at rest passes through the centre of buoyancy and centre of gravity In order that the body may float with stability the position of the metacentre must be above that of the centre of gravity *See* HYDROSTATICS

METAGALLIC ACID When gallic acid is rapidly heated up to about 480°, carbonic acid and water are evolved, and a black product remains soluble in the alkalies and forming insoluble compounds with many of the metallic oxides This product has been termed *metagallic acid*, its ultimate elements are 12 atoms of carbon = 72, 3 atoms of oxygen = 24 and 3 atoms of hydrogen = 3, making its equivalent = 99

METALLOIDS (Gr μεταλλον, *a metal*, and ειδος, *form*) A term sometimes applied by chemists to the inflammable non metallic bodies such as sulphur phosphorus &c The metallic bases of the fixed alkalies and alkaline earths have also been by some called metalloids, in consequence probably of their low specific

METALLURGY (Gr μεταλλον and εργαζομαι) The art of separating metals [illegible] The principal metallurgic processes are described under the respective metals

METALS (Gr μεταλλον) are distinguished by their [illegible] out of their opacity and reflec- [illegible] They conduct electricity and heat and they have not been resolved into other forms of matter so that they are regarded as simple or elementary substances When their compounds are electrolysed the metals appear at the negative surface and are hence considered as electro positive bodies They are enumerated in the following table, together with the names of the chemists by whom they were discovered the date of the discovery their specific gravities melting points, equivalent or atomic weights and symbolic abbreviations For their individual distinctive characters see the respective metals Tantalum is omitted inasmuch as its properties and combining weight have not been accurately examined

	Names of Metals	Authors, and Dates of their Discovery	Specific Gravity	Melting Points	Equivalent Weights	Abbreviations or Symbols
				Fahr		
1	Gold	(Known to the ancients and represented by the annexed symbol, with which they were supposed to be mysteriously connected)	19 25	2016°	200	au

METAMECONIC ACID, is produced by boiling the aqueous solution of meconic acid It evolves carbonic acid, and becomes brown Two atoms of meconic acid are thus resolved into 1 of metameconic acid and 2

* Smith's forge. † Oxyhydrogen blowpipe.

of carbonic acid It is represented by 12 *car* + 4 *h* + 10 *ox*

METAMORPHOSIS (Gr μετα, indicating *change*, and μορφωσις Transformation The heroic poem of Ovid in which he recounts the most celebrated mythological narratives respecting the gods of Greece and Rome, and the changes wrought by supernatural power In Entomology the change of form which insects and some other animals undergo in passing from one stage of existence to another, in each of which they manifest different habits, and have a different organization The three states of a fly, or perfect insect are *larva*, *pupa*, and *imago*

METAPHOR (Gr μεταφερω, *I transfer* indicating the substitution of one word for another of similar meaning) In Rhetoric, a figure by which a word is transferred from the subject to which it properly belongs and applied to another which has some similitude to its proper subject, with a view to give energy to the expression of the former A comparison or simile (*see* COMPARISON) appears to be only a metaphor with the addition of a sign denoting that it has been thus transferred Thus "the silver moon" is a metaphorical expression for the [illegible] objects by names to the expression of the feelings and wants of a complicated mode of life, it becomes more and more metaphysical in character until it is found that a very large proportion of the words in common use are either metaphors, or are words derived from foreign languages, and whose primary sense as derivatives is the same with their secondary or metaphorical sense in the language from which they came Thus, the English word 'character" used a few lines above is drawn from the metaphysical use of the Greek χαρακτηρ which in its primary signification denoted [illegible] on a hard substance Metaphors have been divided by writers on rhetoric, into several classes, but the most appropriate are those which are termed analogical and which derive their force not from any actual resemblance between two objects, but from a resemblance between the relations which they bear respectively to certain other objects Thus the 'sea of life' is a common and appropriate metaphor, not from any resemblance between the idea of the visible sea and the complex notion of that abstraction which we term human life but because there is a fancied similarity between the position of navigators in an uncertain voyage and that of human beings [illegible] manifold scenes of life

METAPHOSPHORIC ACID A term by which some chemists designate the dry flaky acid obtained by burning [illegible] under a bell glass of air or oxygen

METAPHYSICS (Gr μετα *after* and φυσις *nature*) A word employed in popular usage to denote all those inquiries which are conversant about objects other than merely physical and sensible It is an observation of Sir James Mackintosh that the term *metaphysics* affords a specimen of all the faults which the name of a science can combine To those who know only their own language it must at their entrance on the study convey no meaning It points their attention to nothing If they examine the language in which its parts are significant they will be misled into the pernicious error of believing that it seeks something more than the interpretation of nature It is only by examining the history of ancient philosophy that the probable origin of this name will be found, in the application of it as the running title of several essays of Aristotle which were placed in a collection of the manuscripts of that great philosopher *after* his treatise on physics The censure thus conveyed we cannot with all deference for so eminent an authority regard as more than partially correct Though the account of the origin of the word is as far as it goes, the true one, it does not comprehend the whole truth

If Sir James Mackintosh had examined the contents of those treatises of Aristotle to which he adverts, he would have found that the title *metaphysics* was prefixed to them, not, as his words imply merely because they [illegible] the compiler, because there was the best possible reason for their being so placed in the fact that the inquiries which compose them were conceived by Aristotle himself to admit of a general distinction from that department of inquiry which he included under the name of physics The first few chapters of [illegible] are devoted to the elucidation of [illegible] to the endeavour to clear up the [illegible] once [illegible] whereby they were to be apprehended Admitting, therefore, as we most readily do, that great misapprehensions are popularly entertained with regard to the nature of metaphysics, we shall endeavour, as far as the limits of the present article will permit us, to remove such mistakes, by distinguishing the science of metaphysics from other sciences, with which as they are closely connected with it it has too frequently been confounded

Metaphysics we understand to be the science which regards the ultimate grounds of being, as distinguished from its phenomenal modifications As a means of attaining this end, it considers the correlative of being, knowledge, and knowledge, not merely in reference to its *form*, as it is capable of law and regulation, for that is the province of logic — nor in regard to its history, and the successive stages of its development, which are the objects of psychology, or mental philosophy — but knowledge as it is in relation to being, or objective reality Philosophers have not been satisfied with marking the [illegible] in nature, and the order whether those appearances were outward and sensible, or internal and revived by observation of their own mental processes, they have not even been content with the discovery that their knowledge of phenomena was self-consistent, and obeyed certain determined or determinable canons or forms, they have felt that the highest end of science could then only be attained when all knowledge was perceived to depend on a one ultimate principle, which should demonstrate at once its consistency with itself and its absolute foundation in reality That the science of this ultimate unity is that to which the greatest philosophers have with more or less distinctness assigned the name of metaphysics [illegible] to the history of philosophy for [illegible]

Whether the object thus proposed were one which the human faculties are capable of reaching is itself the first problem of metaphysics, and enters not, therefore, into that with which we have at present to do,—a definition of the word We may indeed with Hume and his followers reject all such attempts as chimerical, and endeavour to resolve the speculations to which they have led into the delusions of association or caprice, or we may with Kant, confine ourselves to the *critique* of our mental laws and as the result of our investigation pronounce that we possess no faculty capable of reaching outward reality In the first case, if we have been careful to ascertain that our analysis has at every step been legitimate we are bound to admit, not that metaphysics is an impossible science but that it does not yet exist *as* a science In the second instance, we are constrained to allow that all reality is subjective only, and that we can only know things in relation to our own modes of knowing, and this is itself a metaphysical principle, preclusive of further inquiry In defiance, however, alike of the sneers of the sceptic, and the yet profounder scepticism of the critical philosophy our own days have witnessed the rise in Germany and France, of more than one professed system of metaphysical science The frequency of such endeavours as these undertaken as they are, by men of such [illegible] eness and philosophical insight as [illegible] Hegel even if they inspire us with no hope of a nearer approximation to the objects which they pursue may at least serve to convince us that the propensity to such speculations constitutes an inalienable and indestructible instinct of our intellectual and moral nature

METAPLASM (Gr prep μετα signifying *change*, and πλασσω *I form*) In Grammar, a general term comprehending all those figures of diction which consist in alterations of the letters or syllables of a word, taking place in three ways,—by augmentation diminution, or immutation 1 Augmentation at the beginning *prosthesis*, in the middle *epenthesis*, at the end *paragoge*, to which may be the number of syllables by their [illegible] 2 Diminution at the beginning *aphæresis*, in the middle *syncope*, at the end, *apocope*, by contraction of two vowels *synæresis* or *crasis* 3 Immutation, *antithesis* signifying the change of one letter for another, *metathesis*, transposition of the order of letters (See those respective heads)

METASTASIS (Gr μετα and στασις, *station*.) The transference or translation of a disease from one part of the body to another

METATARSUS (Gr μετα and ταρσος, *heel*) The instep is so called by surgical writers

METATHESIS (Gr μετα, and θεσις, *position*) In Grammar, the transposition of the letters of a word, a figure of uncommon occurrence in modern orthography, but which very ordinarily takes place in the gradual formation of the dialects of a language *e g* German, ross, English horse *See* METAPLASM

METAUOMI (Gr μετα, and τεμνω, *I cut*) In Architecture, the space between [illegible] and the next

METAYER (Fr, in [illegible] mezzaiuolo, Lat colonus medietarius) In France and Italy, a farmer holding land on condition of yielding half the produce to the proprietor, from whom he receives tools and stock Land thus occupied is said to be held in *metairie* The conditions of the contract, however, vary essentially in different countries and districts The antiquity of this mode of letting land is very great it is probably the same which was called by the Romans *locatio in partibus* (see

Plin. Epist); and the farmer thus holding was also termed *colonus partiarius* It now prevails extensively in the south and middle of France throughout Italy in parts of Spain, and, it is said in the East For a very valuable summary of the character and effects of this agricultural system, the reader may be referred to Mr Jones's *Essay on Wealth*, and for a highly coloured view of the state of the peasantry under it in some parts of Italy to M Simonde's *Etudes sur l'Economie Politique*

METEMPSYCHOSIS (Gr μετα change and ψυχη soul) A Greek word denoting the migrations of the soul through different successive bodies The doctrine of the transmigration of souls has existed in the belief of various religious and philosophical sects from the remotest antiquity It formed the leading doctrine of one of the most celebrated schools of philosophy in the whole heathen world (*see* PYTHAGOREAN PHILOSOPHY), it was said too to have found numerous adherents in Egypt, but it is chiefly among the Indians that this doctrine has taken deep and permanent root With them it appears to have been an article of faith from the period at which we can first perceive any trace of their existence as a nation, and it is not going too far to say that not only all the opinions, but even all the manners of the Indians, are at this hour built upon this doctrine The Indian doctrine of *metempsychosis* rests on the supposition that all beings derive their origin from God and are placed in this world in an altogether degraded condition, from which they all but more particularly the human race, must either decline into still lower degradation or rise gradually with their diversified [illegible] the vicious or the virtuous propensions of their nature It must be remarked, however, that the Indians make a wide distinction between the future destiny of those who have passed through life tainted by the usual vices and infirmities of human nature, and those whose lives have been spent in the constant discharge of religious duties In the latter case, the soul does not pass through intermediate stages of existence, but proceeds directly to reunion with the Supreme Being with which it is identified as a river at its confluence with the sea merges therein altogether His vital faculties and the elements of which his body consists are absorbed completely and absolutely both name and form cease, and he becomes immortal, without parts or members' (See Mr Colebrooke's translation of Extracts from the *Brahma Sutras*, in the *Transac of the Roy Is Soc* vol ix)

METEMPTOSIS *See* PROEMPTOSIS

METEOROLOGY (Gr μετεωρος *aerial* and λογος, *discourse*) The science of meteors or the science which explains the various phenomena which have their origin in the atmosphere Under the term meteorology it is now usual to include not merely the observation of the accidental phenomena to which the name of meteors is applied but every terrestrial as well as atmospherical phenomenon whether accidental or permanent depending on the action of heat light electricity and magnetism In this extended signification meteorology comprehends climatology and the greater part of physical geography, and its object is to determine the diversified and incessantly changing influences of the four great agents of nature now named, on land in the sea and in the atmosphere *See* ATMOSPHERE CLIMATE, and the various terms referred to under METEORS

METEORS (Gr μετεωρα) A name given to any phenomena of a transitory nature which have their origin in the atmosphere Meteors are of various kinds Some are produced simply by a disturbance of the equilibrium of the atmospheric fluid, and are called *aerial meteors* (*See* WINDS WHIRLWINDS) A second class arise from the deposition of the aqueous particles which the atmosphere holds in solution and which are precipitated in consequence of a diminution of pressure or temperature sometimes in a fluid and sometimes in a concrete form These are called *aqueous meteors* (*See* DEW, FOGS, HAIL, RAIN, SNOW, VAPOUR, &c) A third class of meteors, or atmospherical phenomena, are caused by the action of the aqueous particles dispersed in the atmosphere on the rays of light These are called *luminous meteors* (*See* FATA MORGANA, HALO MIRAGE, PARHELIA, RAINBOW) A fourth class are the *igneous meteors* comprehending those which present the phenomena distinctive of combustion *See* AEROLITE AURORA BOREALIS, FIRE BALLS LIGHTNING SHOOTING STARS, &c

METHEGLIN (Germ meth, *mead*) A beverage made of honey and water, fermented by the addition of yeast

METHOD From the Greek word μεθοδος which signifies a journey undertaken in quest of any object, or a way of attaining a certain end hence, [illegible] mode of investigating truth Thus we have the inductive method, the analytical method, the synthetic method, the deductive method, the analytical method, &c *See* DIALECTICS INDUCTION, ANALYSIS

METHODISTS The body of Christians to whom this name is chiefly applied are the followers of the late John Wesley, the founder of this numerous sect, hence called Wesleyan Methodists But the term bears a more extensive meaning being [illegible] sections of Christians who [illegible] from the Wesleyan denomination

The origin of the Methodist society took place at Oxford in 1729 After the Revolution when the principles of religious toleration were recognized amidst the progress of free inquiry the clergy of the established church were [illegible] was observed with pain by John Wesley and his brother Charles, when students at the University of Oxford, and being joined by a few of their fellow-students who were intended for the ministry in the established church, they formed the most rigid and severe rules for the regulation of their time and studies, for reading the scriptures, for self-examination, and other religious exercises The ardent piety and rigid observance of system in every thing connected with the new opinions displayed by the Wesleys and their adherents as well as in their college studies, which they never neglected, attracted the notice and excited the jeers of the various members of the university, *Methodists*, in allusicians at Rome who practised only by theory (Celsus *in Præfat de Medicina*)

In the mean time Wesley took orders in the established church, and acted for a few months as assistant to his father who was rector of Epworth, in Lincolnshire After the death of the latter he was induced (1735), in company with his brother Charles and two other friends, to accept of an offer to go to Georgia in North America, to preach the gospel to the Indians On his return to England in 1737 Wesley officiated in several churches of the establishment But the higher ranks were offended at his declamatory and enthusiastic mode of preaching, and the clergy having disclaimed some of his doctrines the churches in general were soon shut against him It was his desire however to be allowed to officiate in the pulpit of his native church His object, in truth was to effect a reformation in the church not to recede from connection with it, and the rules he observed himself and imposed upon his followers, were designed as supplementary to the established ritual not as superseding it But the circumstances to which we have referred threw his labours into a different and ultimately an opposite channel, and in short without having at first intended it, he became the founder of the most numerous class of Dissenters in Great Britain

Being thus virtually expelled from the established church he preached in Dissenting chapels in London and other places where he could obtain admission In course of time and owing to the vast multitudes that crowded to listen to his ministrations, he adopted the expedient of officiating in the open air, and commenced field preacher He first formed his followers into a separate society in 1738 the year after his return from America though he referred the establishment of Methodism to a prior date (See *Wesley's Lectes Hist* vol iv p 175) Wesley, from this date devoted his time and his great talents exclusively to the propagation of what he regarded the doctrines of the gospel and to the extension of that sect of which he was the founder His labours were chiefly confined to England but he also paid visits to Scotland and Ireland — in the former of which his success was inconsiderable (*See Moncreiff's Life of Dr Erskine* ch xvii) But while he confined his own labours to Great Britain and Ireland, he was not inattentive to the spiritual necessities of other countries, and by means of a succession of missionaries propagated his doctrines to a very great extent in America and many of the West India islands

The unparalleled success which attended his great missionary exertions was not gained without much obloquy and persecution, particularly in the United Kingdom Owing to the intelligence and liberality of the age, neither himself nor any of his missionaries were exposed to stripes and imprisonment, but all of them met with violent opposition on the part not merely of clergymen, both established and dissenting, and the wealthier classes, but also of the people, and some of them were beset with mobs assailed by showers of stones and other missiles, and sometimes dragged through the streets as raving enthusiasts and as disturbers of the public peace It must, at the same time, be confessed that the imprudence of some of his followers contributed somewhat to the reproach which they experienced

Finding his societies rapidly increasing, and having been refused assistance from the established clergy, Wesley was induced to have recourse to lay preachers, an expedient which he was at first exceedingly averse to adopt, but which he afterwards found most efficient in promoting the triumph of his views He was thus enabled to exercise superintendence over all his followers, and greatly to extend his sphere of action

Though Wesley objected to his adherents being called Dissenters, and required them to attend the established church when they had no opportunity of hearing their own preachers, yet his creed is professed Arminianism,

and differs, therefore, in many points from what is generally understood to be the doctrine of the Thirty-nine Articles He denied the doctrine of election, though he admitted that *certain* persons and churches have been elected, and that *great* events have been foreordained He differed from the system of Calvin in regard to the extent of the atonement, which he maintained was for all men He held that repentance preceded faith He taught that, by virtue of the blood of Christ, and the operation of the Holy Spirit, it was the privilege of Christians to arrive at that maturity in grace and participation of the divine nature which excludes sin from the heart, and fills it with perfect love to God and men (*Wesley's Plain Acc of Christian Perfection*) These and other minor opinions in which he differed, or seemed to differ, from the creed of the established church, are still retained by the Methodists (In addition to Wesley's works, particularly his *Sermons*, see *Benson's Apology for the Methodists*, and *Myles's Chronol Hist of the Methodists*) Wesley and his followers, we may here observe continued long after their separation from the church to read the service of that church, nay the practice was continued in a few instances, after his death The great body of the Wesleyans, though they are now classed among Dissenters, are in favour of a national establishment of religion, and give the benefit of their support to the established church of England There is, in truth, a pretty large body who fluctuate between Methodism and the national creed

But while this is the case, the Methodists have adopted a system of church discipline and government quite distinct from those of the establishment and which seems to partake as much of presbytery as of any other polity Of this system which is considerably complicated, the following are the leading features — Each society or congregation is divided into smaller bodies, called *classes* each class embracing from twelve to twenty persons one of whom is styled the *leader* Each society has also a body of men called *stewards*, whose office is similar to that of deacon in the established church The duties of leaders — namely visiting the sick and holding religious intercourse with the members belonging to their class — are in many respects, akin to those of lay elders in the Presbyterian Church of Scotland The leaders, stewards and minister meet once a week (and this is called a *leaders meeting*) on the religious business of the society, and to account for the funds received from the members in support of schools or of the gospel

A number of these societies united constitutes a *circuit* which is large or small as the circumstances of each locality require One of the ministers within the district is termed the *superintendent* The ministers officiating in the circuit meet all the classes quarterly, and speak personally to each member Those whose conduct is devoid of reproach receive a ticket the chief use of which is to prevent imposture After the conference with the classes another meeting (called a *quarterly meeting*) is held consisting of all the ministers leaders and stewards in the circuit On this occasion the stewards deliver their collections to a *circuit steward*, and every thing relating to secular matters is publicly settled At this meeting, also, the candidates for the ministry are proposed, and the stewards, after a definite period of service are changed

From five to ten or fifteen of the circuits according to their extent, form a *district* the ministers in which meet annually, the meeting being termed a *district meeting* This assembly has authority 'to try and suspend ministers who are found immoral, erroneous in doctrine, or deficient in ability, to decide concerning the building of chapels, to examine the demands from the circuits respecting the support of clergymen, and to elect a representative to attend and form a committee, four days before the meeting of the annual conference, in order to prepare a draught of the stations for the ensuing year (*Myles, ut supra*) The circuit stewards are present at this meeting during the settlement of all financial matters The judgment of the assembly is conclusive until the meeting of the conference, to which an appeal is allowed in all cases

The *conference*, which is the supreme judicatory, and whose decisions are final, consists, strictly speaking only of a hundred of the senior itinerant preachers, in terms of a deed of declaration executed by Wesley and enrolled in chancery In this deed the meeting is termed 'the Conference of the people called Methodists" But the conference is generally composed of the preachers elected at the previous district meetings to be their representatives, of the superintendents of the circuits, and of every minister who chooses to attend all of them being allowed the same right of voting as the hundred, or legal conference From this body all authority emanates, and by them all regulations to be observed throughout the whole Methodist connection are framed In their name are levied all the funds required for carrying on the operations of the body Ministers are by th[illegible] to the stations they are respectively to [illegible]

nominate the superintendents of the various districts; they decide on all cases of appeal, and, generally speaking, the whole state of the connection comes under their review and controul All their deliberations are carried on with closed doors, so that the people have no check over their proceedings But the results of their discussions are annually published for each meeting, under the title of *Minutes of Conference*, which embody the laws of the society The gradation of courts, and the supreme authority being vested in the conference, are somewhat similar in spirit and operation to the various judicatories of the Church of Scotland, in which, like the conference of the Methodists, the general assembly is supreme; the chief exception being that the latter judicatory is composed of certain relative proportions of lay elders and clergymen, while the Methodist conference is confined exclusively to ministers (*General Rules of the Methodist Society, Adam's Religious World*, vol iii pp 113—119)

At the death of Wesley, in 1791, there were, in Great Britain and Ireland, about 300 itinerant preachers in connection with the new sect, and 1000 of what are called local preachers, — some of them, however, having very small congregations, — and 80 000 members But the Wesleyan Methodists have established foreign stations in Australia, Van Diemen's Land, &c, and so rapidly have they increased that the number of Wesleyan Methodists in 1850, both at home and abroad, amounted to upwards of two millions, and the total number of preachers, regular and supernumerary, was 6000

Various schisms have taken place from the Wesleyan Methodists at various times among the most important of which may be reckoned the followers of Whitfield, formerly the coadjutor and afterwards the most powerful and eloquent opponent of Wesley, and supporter of Calvinism, [illegible] in whose [illegible] ritual of [illegible] Methodists, the Primitive Methodists, or Ranters (which see), the New Connection Methodists (which see), the Independent Methodists, Bryanites, Warrenites, &c Some of these sects, particularly the Whitfieldians, are nearly allied in church [illegible] Independents, and it is [illegible] take place between them and this latter denomination (In addition to the works already quoted, see *Journal of John* [illegible] by Coke, Moore, &c, but [illegible], *Nightingale's Portraiture of Methodism*, *Mosheim's Church History*, vol vi pp 281—288)

METHYLENE (Gr *μεθυ*, *wine*, and *υλη*, *wood*) When wood is subjected to destructive distillation there is formed along with the tar acetic acid and other products, a highly volatile and inflammable liquid, which, when purified by distillation off quicklime, was called spirit or alcohol of wood or pyroxilic spirit The hydrocarbon which forms the basis of this form of alcohol, and to which the term *methylene* has been applied, is presumed to consist of 1 atom of carbon = 6, and 1 atom of hydrogen = 1 its density (in reference to hydrogen) being just half that of olifiant gas, or = 7 The alcohol of wood is a *hydrate* of this hydrocarbon, or a compound of 1 atom of methylene = 7 and 1 atom of water = 9 the equivalent therefore of the alcohol of wood is 7 + 9 = 16

METOCHE (Probably from *μετεχω Ipartion*) In Architecture the space between two dentils

METOICI (Gr *μετοικοι sojourners*) The resident aliens who formed a large class of the inhabitants of Athens They were distinguished from the few full citizens by many [illegible] burdens They had no share in the administration of the state and were precluded from the power of possessing landed estates Each was compelled to purchase the shelter he received from the state by the payment of a small annual sum (*μετοικιον*), and to place himself under the guardianship of a citizen (*προστατης*), who was his formal representative in the courts of law They were generally engaged in mercantile and mechanical business

METONIC CYCLE So called from Meton, its inventor (B C 432) A cycle of nineteen years, or, more accurately, of 6940 days, at the end of which time the new moons fall on the same days of the year, and the eclipses return in nearly the same order The reason of this is, that in 19 solar years there are 235 lunations (with a difference of a few hours), and very nearly one complete [illegible] The cycle was corrected by [illegible] Callippic Cycle

METONYMY (Gr [illegible], derived from the preposition [illegible] and [illegible] toric and C [illegible] idea or thing is substituted for that of another, to which it has a certain relation Thus the effect is frequently substituted for the cause — "grey hairs" stands for old age" the abstract for the concrete — "What doth gravity" (*i e* the grave person) "out of his bed at midnight?" — substance for quality, precedent for subsequent, &c

The term *Metonomasia* (of the same origin as metonomy) was invented during last century by the French [illegible] and prevailed to a [illegible] extent [illegible] [illegible]

MET'OPA (Gr *μετα between*, and *οπη a hole*) In Architecture, the [illegible] triglyphs of the Doric order It is left either plain or decorated, according to the taste of the architect In the most ancient examples of this order, the metopa was left quite open, as is manifest from a passage alluded to in the art ARCHITECTURE

METOPO'SCOPY (Gr *μετωπον, a forehead*, and *σκοπεω, I view*) The art of divination by inspecting the forehead, treated of especially by the famous Cardanus The signs of the forehead are chiefly its lines, but moles and spots are also supposed to have their particular meaning The lines are under the dominion of their several planets

METRE (Gr *μετρον, measure*) In the classical sense of the word, a subdivision of a verse The Greeks measured some species of verses (the dactylic, choriambic antispastic, Ionic, &c) by considering each foot as a metre, in others (the iambic, trochaic, and anapæstic) each *dipodia*, or two feet, formed a metre Thus the dactylic hexameter (the heroic verse) contains six dactyls and spondees the iambic anapæstic and trochaic *trimeter*, six of those feet respectively A line is said to be *acatalectic* when the last syllable of the last foot is wanting, *brachycatalectic*, when two syllables are cut off in the same way, *hypercataleptic*, when there is one superfluous syllable

METRONOME (Gr *μετρον*, and *νομος a law*) An instrument for measuring musical time It is contrived on the principle of a clock having a short pendulum whose bob being moveable up and down on the rod is thus capable of increasing or decreasing the length of a note or bar as required by the character of the music The length or duration of a note is often expressed at the head of a piece of music by [illegible] that a pendulum of a given length in inches will [illegible] minim, crotchet or other note as the case may be

METRO'POLIS (Gr *μητηρ mother* and *πολις city* or *state*) 1 A parent state from which colonies have sprung, in which sense the word is uniformly employed by ancient Greek writers 2 The chief city of a province in the later ages of the Roman empire The Christian church having adopted the secular division of the Roman empire into provinces, the episcopal seat established in every such city, and the bishop of it himself were termed metropolitan 3 In modern usage, the chief or capital city of an independent state

METROPO'LITAN, in early Ecclesiastical History, [illegible] tropolitans took place at the end of the third century and was confirmed by the council of Nice In some of the Protestant states of Germany the title exists to the present time, and the person in possession of it has rank equivalent to the bishops of the English church

MEZZANINE (Lat mezzano, *middle*) In Architecture, a story of small height introduced between two higher ones

MEZZO SOPRA'NO (Ital) In Music a high counter tenor having the *C sol ut* clef on the second line

MEZZOTI'NTO (Ital *half tinted*) A particular method of engraving on copper *See* ENGRAVING

MIA'SMA (Gr *μιαινω, I infect*) Infectious or contagious matter The term is generally applied under the name of *marsh miasma* (malaria of the Italians) to the infectious emanations from marshy lands and stagnant waters, which are peculiarly characterized by producing [illegible]

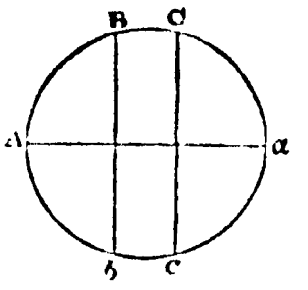
MICA (Lat mica *I shine*) [illegible] found in thin *elastic* laminæ, soft, smooth, and of various colours and degrees of transparency Silica, alumina potash, and oxide of iron are its principal components It is one of the constituents of granite In some parts of Siberia and elsewhere it forms an article of trade, often known under the name of *Muscovy glass*

MI'CA SLATE One of the lowest of the stratified rocks [illegible] quartz and mica *See* GEOLOGY

MICHAELMAS The feast of St Michael the Archangel It falls on the 29th of September, and is supposed to have been established towards the close of the fifth century, Brady says in 487 In England, Michaelmas is one of the regular periods for settling rents, and an old custom is still in use of having a roast goose to dinner on that day, probably because geese are at that period most plentiful, and in the highest perfection (See *Brand's Pop Ant*)

MICHAEL [illegible] The order of knighthood, [illegible] by Louis XI [illegible] of St Michael, [illegible] The motto of this order was "Immensi tremor oceani" It was at first and for some time after its institution in high repute, but under Catherine of Medicis, who lavished it indiscriminately, it came to be held of no account, from which state it never recovered

MI'CROCOSM (Gr *μικρος κοσμος, little universe*) Man has been called so by some fanciful writers on natural philosophy and metaphysics, by reason of a supposed correspondence between the different parts and qualities of his nature and those of the universe



MICRODA'CTYLUS (Gr *μικρος* and *δακτυλος a digit*) A name proposed by M Geoffroy for the short toed genus of wading birds called by Illiger *Dichelophus* See that word

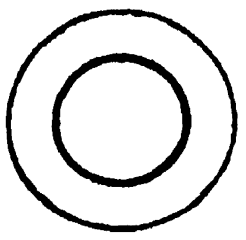
MI'CRODON (Gr *μικρος*, and *οδους, a tooth*) The name of a genus of extinct fishes, belonging to the thick toothed or Pycnodont family, in the Ichthyological system of Agassiz

MICROMETER (Gr *μικρος*, and *μετρον, measure*) An instrument applied to telescopes and microscopes for measuring very small distances, or the diameters of objects which subtend very small angles A great number of contrivances of various kinds and depending on different principles, have been employed for this purpose, but it will be sufficient to give a general description of some of the most useful or remarkable ones

Wire Micrometer — This instrument, when placed in the tube of a telescope, at the focus of the object glass presents the appearance represented in the annexed figure (fig 1) A *a* is a spider's web line, or very fine wire fixed to the diaphragm and B *b* and C *c* are similar wires stretched across two forks each connected with a milled-headed screw By means of these screws the two wires, B *b* and C *c*, which are exactly parallel to each other are moveable in the direction perpendicular to A *a*, and in order that the wire A *a* may be placed in any direction relatively to the meridian there is an adjusting screw, which works into an interior toothed wheel, and turns the apparatus round in its own plane perpendicular to the axis of the telescope

(1)

The method of using the micrometer is as follows — Suppose the object to be accomplished were the measurement of the *angle of position* and distance of two very close stars the telescope being set and kept on the objects the micrometer is turned by its [illegible] screw until the spider line A *a* coincides with the [illegible] the two stars or *threads* them both at the same moment The milled heads of the screws which carry the two moveable wires, are then turned until B *b* bisects one of the two stars, and C *c* bisects the other The observation is now completed and it only remains to ascertain the position and distance indicated by the micrometer For the first of these purposes the circumference of the micrometer is divided into degrees and minutes and read by two verniers this reading gives the position of A *a* in respect of the horizontal and vertical planes, and consequently the position of the two stars To find [illegible] of the screw which carries one of the moveable wires, for instance C *c* is turned until C *c* coincides with B *b*, and the number of revolutions and parts of a revolution required to effect the coincidence, gives the distance of the stars when the value of the *scale* of the micrometer is known, that is to say, when the number of seconds of space which correspond to one revolution of the screw is known The screws must be made with great accuracy, and their heads are usually divided into 60 equal parts representing seconds

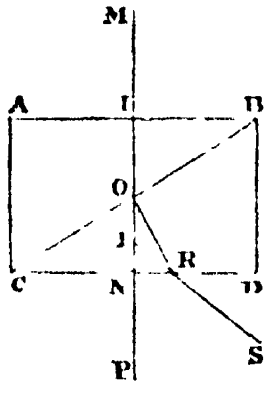


The value of the scale or of a revolution of the screw, is obtained in the following manner — Set the two wires, B *b* and C *c* apart to a certain number of revolutions, and place them in the direction of the meridian Observe the transits of several stars of known declination over the wires then multiply each interval of seconds by 15, and by the cosine of the star's declination, and, taking the mean you have the seconds of space which correspond to a known number of revolutions of the screw (See Appendix, by the Rev R Sheepshanks, to *Professor De Morgan's Explanation of the Gnomonic Projection of the Sphere*)

Circular Micrometer — This instrument, which differs entirely from the above, was first suggested by Boscovich, in the *Leipzic Acts* for 1740, and used by Lacaille in observing a comet in 1742, but seems afterwards to have fallen into disuse, until it was revived by Dr Olbers, about 1798 The principle may be explained as follows If the field of a telescope be perfectly circular (which may be effected by means of a diaphragm turned in a lathe), and if its diameter be determined from observation, the paths of two celestial bodies across the field may be considered as two parallel chords which are given in terms of a circle of any diameter The differences of the [illegible] positive [illegible] the middle of the parallel wires [illegible] differences and the distance between the chords, which is readily computed

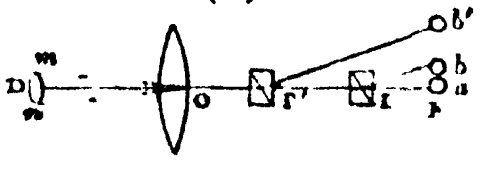
from their lengths, gives the difference of the declinations of the two bodies

The most improved construction of the annular micrometer is that of Fraunhofer. It consists of a [illegible] glass (fig. 2), having in its centre a round hole of about half an inch in diameter, to the edges of which a ring of steel is cemented, and afterwards truly turned in a lathe. The disc being mounted in a brass tube, so [illegible] adjusted in [illegible] and applied to a telescope, the steel ring is alone visible, and appears as if suspended in the atmosphere, whence the instrument is called the *suspended annular micrometer*. The advantage of this construction consists in the accuracy with which the moment of ingress or egress is determined, from the body being seen in the field of view before it comes up to the edge of the steel ring. The annular micrometer is conveniently used for comparing the place of a small star or a comet with that of a known star in nearly the same parallel of declination. (*Astronomische Nachrichten*, b. iv.)



(2)

Divided Object Glass, or Double Image Micrometer. — This instrument is formed by dividing the object glass of a telescope or microscope into two halves, the straight edges being ground smooth, so that they may easily slide by one another. A double image of an object in the field of view is produced by the separation of the segments, and, by bringing the opposite edges of the two images into contact, a measure of the diameter of the object is obtained in terms of the extent of the separation. From its being used to measure the diameter of the sun, this is usually called the *heliometer* (*see* HELIOMETER). Instead of a divided object glass, Ramsden preferred a divided lens in the eye-tube, which form of the instrument is called the *dioptric micrometer*. The double image micrometer was suggested by Roemer about 1678, but first brought into use by Bouguer, about 1748.



Micrometer by Double Refraction. — The Abbé Rochon conceived the ingenious idea of applying the principle of double refraction to micrometrical measurement. Conceive two prisms, A B C and B C D (fig. 3), formed of the same crystal, and so disposed that the face A B of the first is perpendicular to the axis of the crystal, while in the second the axis is parallel to the line of the intersection of the two faces C B and C D, so that the axes of crystallization of the two prisms are at right angles to each other. The prisms are placed in perfect contact, and cemented by mastic, and together form a plate of which the opposite sides are parallel. Now suppose a ray of light M I to fall perpendicularly on the face A B, it will proceed through the prism A C B, in the same straight line I O without being separated, because I O is parallel to the axis of the crystal. But when it arrives at O, and enters the second prism B C D it will be separated into two, the ordinary ray will continue to follow the same direction I O N P, because the refracting powers of the two prisms are the same, but the extraordinary ray will take a different direction O R (towards B D, if the crystal is attractive as rock crystal, but towards A C, if the crystal is repulsive as Iceland spar), and, on emerging from the prism at R will be refracted in the line R S. The angle P I S of the inclination of the two rays after their emergence from the prism is constant for the same crystal, and must be determined by experiment.

(3)

Let us now conceive this apparatus to be placed in the tube of a telescope, of which O (fig. 4) is the object glass and I the focus, and the telescope directed upon a distant object at D (as a planet), the diameter of which, *m n* is to be measured. Suppose the double prism at I' two images will be formed, the ordinary image at *a*, and the extraordinary image at *b'*. By sliding the prisms along the tube towards O the distance between the images will be increased, and by sliding them towards the focus F, it will be diminished, and if placed exactly in the focus, the two images will coincide. Let V denote the visual angle or apparent magnitude of the object, *f* the focal distance F O of the telescope, U [illegible] I' *b* depending on the prism, and D [illegible] we shall then have the diameter of the image = *f* tan V, [illegible]. Now, if the apparatus [illegible], where the two images [illegible] of the image will be

(4)

equal to the distance *a b*, and we have, consequently, *f* tan V = D tan U. Here the quantities *f* and U are found by experiment, whence V, the angular magnitude of the object, becomes known in terms of D.

The prism micrometer, when constructed in the manner now described, has this important defect, that the extraordinary image is accompanied by the prismatic colours, especially if the angle to be measured exceeds a few minutes, and hence Rochon found that he could not use it for measuring the [illegible] and moon. But this defect has been [illegible] by simply altering the arrangement of [illegible] and giving the double prism a fixed position [illegible] and before the eye glass. By this disposition two images are formed at the focus, the centres of which are fixed points, whose distance depends on the refracting power of the crystal, and the contact of the images is produced [illegible] visual angle subtended by the diameter of the observed object.

Various modifications of the three principles now explained have been proposed, for details respecting which we refer to *Brewster's Treatise on New Philosophical Instruments*, or to the article "Micrometer," in the *Ency. Brit.*, by the same author, and to *Dr Pearson's Introduction to Practical Astronomy*.

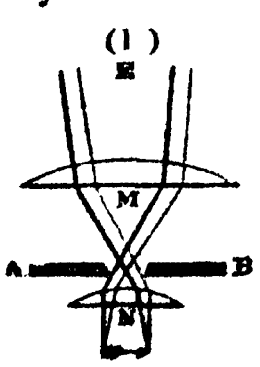
The micrometer is an instrument of the utmost importance in astronomy, and one, in fact, to which that science is as much indebted as to the telescope itself. From a paper by Mr Townley, in the *Phil. Trans.* for 1667, it appears certain that a micrometer with a moveable wire was first constructed by our countryman Gascoigne, [illegible] and used by him for measuring [illegible] one of the planets, but as Gascoigne, who was killed in the civil wars in 1644, published no account of his invention, the instrument was entirely forgotten, and the merit of reinventing it, and bringing it into general use, belongs to the French astronomer Azout, who published a description of it in 1667. Huygens, a few years previously had contrived to measure the diameter of a planet by inserting in the tube of a telescope at the focus of the object glass and eye-glass a slip of metal which covered exactly the image of the planet, and then deducing the diameter from the breadth of the slip, compared with the diameter of the field; and Malvasia had employed for the same purpose a reticle or network of fine silver wires crossing each other at right angles, and dividing the field of the telescope into a number of equal squares. (For the history of the invention and successive improvements of the micrometer, see the notes by Mathieu to *Delambre's Histoire de l'Astronomie au 18me Siecle*, pp. 616 and 617.)

MI'CROPHONE (Gr. *μικρος*, and *φωνη*, *a voice*). An instrument for increasing the intensity of low sounds, by subjecting a more sonorous body than that which emits the sound to be affected by the vibrations of that body, and thereby also [illegible].

MI'CROPYLE (Gr. *μικρος*, and *πυλη*, *a gate*), in Botany is a perforation through the skin of a seed over against the apex of the nucleus. It is what was the foramen or exostome of the ovule.

MI'CROSCOPE (Gr. *μικρος*, and *σκοπεω*, *I view*). An optical instrument which enables us to see and examine objects which are too minute to be seen by the naked eye. Microscopes are single or compound, according to the nature of their construction, a single microscope being one through which whether it consists of a single lens or a combination of lenses, the object is viewed directly, and a compound microscope one in which two or more lenses are so arranged that an enlarged image of the object formed by one of them is magnified by the second, or by the others if there are more than two, and seen as if it were the object itself.

Single Microscope. — This instrument is, for the most part simply a lens or sphere of any transparent substance, which refracts the rays of light [illegible] from a small body placed in its focus, and gives them such a degree of convergency as is necessary for distinct vision. In order that the rays of light issuing from the several points of a very small body may produce a sensible impression on the retina of the eye, it is necessary that the object be brought very near the eye, but when this is done, the rays coming from its different points are so divergent as to produce only a confused image. Now, if a convex lens be interposed between the object and the eye, and so placed that its distance from the object is a little less than its focal distance, the diverging rays issuing from the object are refracted by the lens, and enter the eye placed behind it, either parallel, or so nearly parallel as to afford distinct vision. The object is then seen in the direction of the refracted rays, and at the distance at which it could be distinctly seen by the naked eye, and consequently magnified in the ratio of the distance of distinct vision to the focal distance of the lens. This



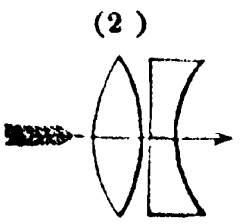
ratio is called the *magnifying power* of the lens, hence, for single microscopes, the magnifying power is equal to the distance at which a small object can be seen distinctly by the naked eye, divided by the focal distance of the lens, and, as the distance of distinct vision is constant (at least for the same individual), the magnifying power is inversely as the focal distance. If we suppose the distance which limits distinct vision in respect of minute objects, to be 5 inches (which is about the average for good eyes) and the focal distance of the lens to be 1 inch, the object will be magnified 5 times in linear dimensions, and 25 times in superficial. If the focal distance is one tenth of an inch, the object will be 50 in linear extent, and [illegible].

A single microscope may be obtained very easily by piercing a small circular hole in a slip of metal, and introducing into it a drop of water, which will assume a spherical form on each side of the metal. The substance commonly used for microscopic lenses is plate glass, but they are sometimes formed of rock crystal, which is better. Flint glass, by reason of its great dispersive power, is unfitted for the purpose. The precious stones, as the garnet, ruby, sapphire, and diamond, have been proposed, but the numerous and skilful attempts of Mr Varley and Mr Pritchard have proved that the advantages arising from the greater refractive power of those substances are more than counterbalanced by their colour, reflective power, double refraction and heterogeneous structure. The crystalline lenses of minnows and other small fishes give a very perfect image of minute objects.

When the object to be examined is of such magnitude as to subtend an angle of some degrees, the requisite distinctness cannot be given to its whole surface by an ordinary lens, in consequence of the confusion occasioned by the lateral rays, unless, indeed, the rays are only permitted to enter the lens through a very small aperture whereby the quantity of light is greatly diminished. In order to remedy this inconvenience, Dr Wollaston contrived a form of lens to which he gave the name of *periscopic lens*. Its construction is as follows: two plano convex lenses or hemispheres are ground to the same radius, and between their plane surfaces a thin plate of metal, with a circular aperture, is introduced. The aperture which appeared to give the most distinct image was about 1-50th of the focal length in diameter, and when the aperture was well centered, the visible field was as much as 20° in diameter. A lens of this kind possesses the double advantage of having a very short focal distance and very little spherical aberration. Dr Wollaston's contrivance may, however, be improved upon in various ways, for example, by filling up the central aperture with a cement of the same refractive power as the lenses whereby the loss of light from the double number of surfaces is avoided, or by grinding away the equatorial parts of a sphere of glass, so as to leave a deep groove all round it in the plane of a great circle perpendicular to the axis of vision, and filling the groove with opake matter. This last construction is called the *Coddington lens* (from the name of its proposer), and when executed in garnet and used in homogeneous light it is considered by Sir David Brewster to be the most perfect of all lenses either for single microscopes, or the object lenses of compound ones.

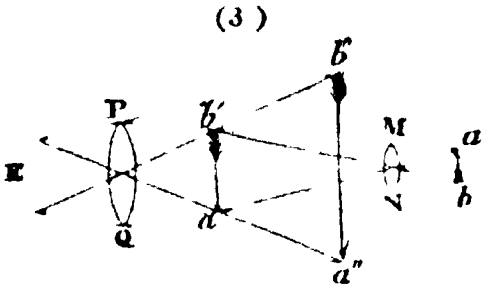
In using a single lens as a magnifier, it is always necessary that the light be made to pass through a very small aperture in order that the object may be seen distinctly and without distortion. This necessity arises, both from the spherical aberration and the chromatic dispersion of the light falling on the surface of the lens under an angle of considerable obliquity, and the consequence is that the pencils of light admitted to the eyes is so much diminished that the object cannot be clearly seen. To remedy this inconvenience, Dr Wollaston proposed a combination of two lenses, called, in consequence, *a microscopic doublet*, the optical part of which may be described as follows. — M and N (fig. 1) are two plano convex lenses whose focal lengths are in the ratio of 3 to 1, or nearly so, and placed one over the other, so that their plane sides are towards the object. The adjustment of the distance between the lenses is best accomplished by trial, and they must, accordingly, be mounted so that the distance can be varied at pleasure. A B is a diaphragm or stop for limiting the aperture. Though it does not appear that the stop was contemplated by Dr Wollaston, who makes no allusion to it, the [illegible] of the microscope depends much on its [illegible]. It is obvious that as each of the pencils of light [illegible] the extremities of the object is rendered eccentric by the stop and made to pass through the two lenses on opposite sides of the common axis, they are affected by opposite errors, which, in some degree, serve

(1)



to counteract each other. This doublet, when correctly made, is infinitely superior to any single lens, and will transmit a pencil of from 35° to 50° without any very sensible errors. The original description, by Dr Wollaston, is given in the *Philosophical Transactions* for 1829.

The above construction has been improved upon by substituting two plano-convex lenses for N in the doublet, the plane side of the one being in contact with the convex side of the other, and the stop being retained between them and the third. This combination is called a *triplet*, and its advantage is, that the errors of the doublet are still further reduced by the greater approximation to the object, in consequence of which the refractions take place nearer the axis.

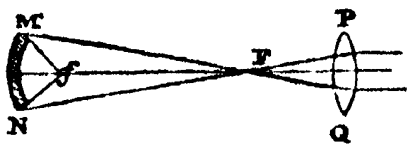


Another form of doublet, proposed by Sir John Herschel, is represented in the annexed figure (2). It consists of a double convex lens whose radii of curvature are as 1 to 6, and of a plano-concave, whose focal length is to that of the other as 13 to 5, placed in contact with the flatter surface of the former and having its concavity turned towards the object. Many other combinations have been proposed, but those which ha[illegible]e the most useful. [illegible] lens is considerable, and consequently its focal distance very small, it requires to be placed at the proper distance from the object with [illegible] as it cannot be held in the hand with [illegible] for any length of time, it requires to be mounted in a frame having a rack and screw, by means of which its distance from the object can be adjusted with accuracy. Mirrors for collecting the light and throwing it upon the object are also necessary for many purposes.

(2)

Compound Microscope. — The simplest kind of compound microscope is formed by the combination of two converging lenses, whose axes are placed in the same straight line. The arrangement of the lenses and the path of the rays will be readily understood from the annexed diagram (fig. 3.) M N is the object glass which has a very short focal distance, and P Q the eye glass. A small object *a b* being placed before the object glass a little farther from it than the focus of parallel rays, a reversed and enlarged image *a' b'* will be formed at some distance behind M N. The lens P Q is placed at such a distance from M N that its principal focus is in the line at *a' b'*, consequently the rays of light from every point of the image *a' b'* emerge nearly parallel from P Q, and to the eye all the image *a' b'* is magnified as if it were a real object into *a'' b''*, and appears at a distance equal to the limits of distinct vision, which, as stated above, is about 5 inches.

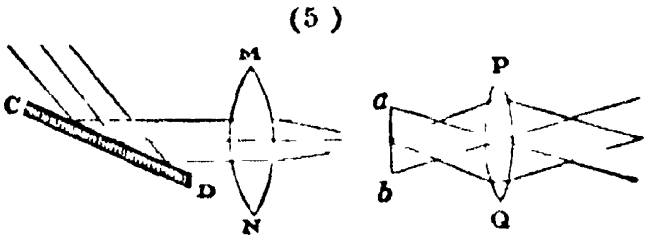
(3)



The magnifying power of this microscope, or the ratio of *a'' b''* to *a b*, is found as follows. — In the first place, if we assume *d* to denote the distance of the first image *a' b'* from M N, and *f* the distance of *a b* from M N, or the focal distance of M N, we have this proportion, *a b' : a b :: d : f*. In the second place, if *l* denote the limit of distinct vision, or distance of the second image *a'' b''* from P Q, and *f'* the focal distance of P Q (or distance of *a' b'* from P Q), we shall also have *a' b'' : a' b' :: l : f'*. These two proportions, being multiplied together, give $\frac{a'' b''}{a b} = \frac{d}{f} \cdot \frac{l}{f'}$, which, therefore, is the magnifying power of the microscope. It thus appears that the magnifying power is inversely as the product of the focal distances of the two lenses, and directly as the distance between them. The magnifying power will therefore be increased by increasing the distance between the object-glass and eye-glass, but a limit is soon placed to this increase by the indistinctness of the image, and, in practice, it is not advisable to make the distance of *a' b'* from M N more than from 5 to 7 inches. Suppose the focal distance of M N to be $\frac{1}{4}$th of an inch, and the distance of *a' b'* from M N to be 5 inches, then *a' b'* will be 20 times greater than *a b*, and if the focal distance of P Q be half an inch, and the distance of *a'' b''* from P Q be 5 inches, then *a'' b''* will be 10 times greater than *a' b'*, and, consequently, 200 times greater than *a b*, or the magnifying power is 200.

The great defects of the microscope, when constructed in the manner now described, consist in the smallness of the field of view, and want of achromatism in the object-[illegible] *b'* and *a'' b''* are [illegible]. For the sake of [illegible] than either

of the others, and called the field glass, is usually inter- [illegible] *a' b'* and the object-glass [illegible] —The principle of the reflecting microscope is very simple, and easily conceived Suppose M N (fig 4) to be a concave speculum, and a small object to be placed before it at *f* A reflected image of the object will be formed at F, where the rays issuing from each point of the object intersect each other, and magnified in the proportion of F M to *f* M If the image at F is viewed with the naked eye the instrument is a single reflecting microscope, but if the image is viewed through a refracting lens P Q (or a combination of lenses forming an [illegible] which the rays are made to converge [illegible] at F, it becomes a compound reflecting microscope



(4)

The reflecting microscope was first proposed by Sir Isaac Newton in the form now described, but on account of the impracticability of illuminating the object, it was long disused It has, however, been recently revived, under a modified form, by Professor Amici of Modena, who places the object outside the tube of the microscope, below the line N F, and, in order that an image may be formed in the speculum the rays issuing from the object fall upon a small plane mirror placed at *f*, inclined to the axis of the speculum in an angle of 45°, whereby they are thrown upon the speculum in the same manner as if the object itself were placed at *f* By this means the object can be illuminated with perfect facility The concave speculum M N is ground into an ellipsoidal surface, the diagonal mirror is placed at the nearest focus *f* and the image is consequently formed at the other focus I The image at I is viewed with a single or double eye-piece, as in other microscopes

Solar and Oxyhydrogen Microscopes — The solar microscope is composed essentially of a mirror and two converging lenses The plane metallic mirror C D (fig 5), reflects the sun's rays upon the lens M N, by

(5)

which they are concentrated upon the object *a b* placed in its focus The object being thus strongly illuminated is placed before a second lens P Q (a little before the principal focus), by which the rays are rendered still more convergent and produce a magnified image of the object upon a screen suitably placed at a distance of some feet behind the lens The object is here supposed to be transparent, if opake the light must be thrown upon it in such a manner as to be reflected by it to P Q The mirror and lens M N are placed in the hole of a window shutter in a darkened room and the mirror must be moveable in order that the sun's rays may always fall upon it under a proper angle to be reflected to the lenses But the solar microscope is now almost entirely superseded by the *oxyhydrogen microscope*, so called because the illumination, instead of being produced by the sun's rays is produced by burning a small piece of lime or marble in a stream of oxyhydrogen gas In this case the plane mirror C D becomes unnecessary, and instead of the lens M N a concave speculum is employed in front of which the ball of lime is placed and an intense light thus thrown upon the object *a b* the rays from which are brought to foci upon the screen by the lens P Q For full details respecting the management of this apparatus which forms a very popular exhibition the reader is referred to *Goring and Pritchard's Micrographia* For descriptions of the various kinds of microscopes, see *Brewster's Treatise on New Philosophical Instruments*, or the *Ency Brit* art "Microscope"

MI'DDLE AGES (In French, *moyen age*) A term usually employed to denote somewhat vaguely, a space of several centuries in European annals, intervening between what are called the ancient and modern periods of history The centuries between the ninth or tenth and the end of the fifteenth after Christ are generally comprehended under this loose denomination In the work of Mr Hallam on the *Middle Ages*, that historian has assumed as his period of commencement the conquest of Gaul by the Franks, about A D 500, and, for his conclusion, the invasion of Italy by Charles VIII, about 1500, and with reference to the affairs of the Greeks and their oriental neighbours, he places, as the most convenient limit between ancient and modern history, the era of Mohammed

MI'DDLE CADENCE In Music *See* CADENCE

MI'DDLE LATITUDE SAILING In Navigation, is a method of converting the departure into difference of longitude, and the difference of longitude into departure, when the ship's course is oblique to the meridian It is founded on this principle, which however is in many case, and not even a [illegible] when there is also considerable difference between the latitudes left and arrived at, namely, that the departure may be accounted an arc of a parallel of latitude midway between the two extreme latitudes Its rules are,—

radius cos middl lat diff longitude departure,
cos middl lat tan course diff lat diff long

See NAVIGATION

MI'DDLE RAIL In Architecture, the rail of a door level with the hand on which the lock is usually fixed

MI'DDLE TERM [illegible] is that with which [illegible] are separately compared *See* SYLLOGISM

MI'DSHIPMAN In the Navy, the step next above volunteer of the first class, which is generally the commencement At nineteen years of age the midshipman passes one examination in seamanship, and another in navigation, when he becomes eligible for a lieutenant's commission

MIDSHIPS The middle of the ship, with reference to length or breadth

MI'LKMILK A [illegible] carbonate of lime of a green colour from M [illegible] Tuscany

MIGRA'TION (Lat *migro*, *I migrate*) This word is used in Zoology to signify the transit of a species of animals from one locality or latitude to another The passage is usually to and fro between a temperate and a cold climate, or a temperate and a warm climate, and this periodical change of abode is most general in the arctic species of animals and least prevalent in the tropical species The most remarkable, rapid, and extensive migrations are performed by birds, in virtue of their preeminent locomotive powers, and of their ability to maintain a long and rapid flight through a medium which offers the least opposition to their progress The inequalities and alternations of land and water upon the surface of the earth and the presence of enemies and other dangers, would appear to form insurmountable obstacles to any general or extensive migration of quadrupeds, yet the musk-ox the rein-deer, the arctic fox, &c, are driven southward by the rigours of the polar winter, and return to the extreme latitudes in the summer season Less regular but not less general migrations, take place among the quadrupeds which range the tropical continents in seasons of unusual drought Countless herds of oxen goaded by intolerable thirst, are thus impelled in an irresistible course over vast tracts of the South American Pampas in quest of water The valleys of the warmer parts of Africa are occasionally traversed by numerous assemblages of the wild quadrupeds of that continent, migrating under the same stimulus Lions and other carnivora have on these occasions been seen mingled with, and absolutely hemmed in by the countless assemblage of antelopes gnus, and other herbivorous species which constitute their prey The Scandinavian lemming, however, is the species of quadruped that is most remarkable for its migration [illegible] to return In this respect the migration of the lemmings [illegible] dence [illegible] of the [illegible] appear to be the shores of the arctic ocean Here whether numbers exceed the means of subsistence, they congregate together and commence a migratory course southward, moving [illegible] climbing mountains, and when [illegible] obstacle impedes their progress they devastate the country through which they pass The migration of birds appears to be influenced mainly by the necessity of providing sufficient food for their young and by the temporary continuance of such food in the climates best suited [illegible]

The arctic and northern seas, which [illegible] during the long unbroken day that constitutes the summer season of such latitudes, are resorted to by numerous aquatic [illegible] season, and these birds regularly [illegible] when the severities of winter set in In temperate latitudes, as those of England certain spring and summer months are peculiarly favourable to the production of insects in their different stages, and our island is accordingly frequented by many insectivorous birds, which leave warmer latitudes during these months to breed and rear their young with us As a general rule, it may be stated that birds migrate southward in the northern hemisphere for food principally, but that they migrate northward both to feed and breed The most remarkable summer immigrants that visit [illegible] the south and breed in this island are the [illegible] swallows, cuckoo, nightingale, and many other insectivorous Passerine birds, and it is remarkable that the males of the song birds always precede the other sex in their vernal flight.

The winter immigrants from the north are the species of wild swan, many species of wild duck, the smews, merganser, and other aquatic birds, the woodcock, &c. It occasionally happens that a winter immigrant remains with us the whole summer, and breeds. Thus the woodcock's eggs and young have occasionally been taken in our woods, but this is an exceptional or individual case. It is a rare occurrence when [illegible] its sojourn into the winter. It is a thing only when by late hatching, or debility produced by accident or disease a swallow or martin has been prevented from joining the main body of autumnal emigrants of its own species, and is seen flying about when an unusually mild day may have called some insects abroad in the months of November or December.

The season of migration is that of association, both in birds and other animals. The swifts congregate for their departure about the middle of August, the swallows assemble together for the same purpose in September. Their powers of flight are more than equivalent to the extent of space they have to traverse to reach the warmer latitudes, as the Mediterranean shores of Africa where they have been seen in those months when they have disappeared from us. Yet there have not been wanting naturalists who have believed that the life of the swallow was maintained during the absence of its insect food in England by the same torpidity which enables the bat and hedgehog to exist through the winter and resume their vital functions in spring. The burrows of the sand-martin have been explored in winter with this view, but neither there nor in any other hiding place has a torpid martin or swift been ever found. It was next conjectured that these birds went under water in autumn, and passed the winter not only torpid but submerged. The [illegible] how the [illegible] body of a swallow float upon water was overcome, nor how the extravascular plumage was preserved undecomposed and fit for use after six months soaking in water.

The short migrations of the cuckoo and nightingale are unquestionable. Why should the longer migrations of summer breeding birds of greater powers of flight be doubted? The direct observation of swallows in the act of migrating, and the slowly acquired but certain knowledge of their winter resort, have finally put to rest the scepticism as to the migration of the swallow tribe which only the authority of such eminent naturalists as White of Selborne could have so long rendered excusable in works of Zoology.

MI'LDEW. This term is generally applied to a particular mouldy appearance on the leaves of plants which is produced by innumerable minute fungi which if not checked in their growth will occasion the decay and death of the parts on which they grow, and sometimes of the entire plant. In [illegible] the [illegible] is termed rust, and some [illegible]. It [illegible] wheat, and on the hop, and in gardens on the leaves of the peach, the nectarine, and other fruit trees. The causes favourable to the production of mildew are a rich soil and a moist atmosphere without a free circulation of air or sunshine. In agriculture this parasitical disease is generally considered without remedy; but in gardening, it may be checked by the application of powdered sulphur to the leaves covered with the fungi, which is found to destroy them without greatly injuring the leaf. Dry-rot is only mildew of a more formidable kind.

MILE (Lat. mille passuum, *a thousand paces*). The Roman pace being 5 feet and a Roman foot being equal to 11·62 modern English inches, it follows that the ancient Roman mile was equivalent to 1614 English yards, or very nearly 11-12ths of an English statute mile.

The English statute mile was defined (incidentally, it would seem) by an act passed in the 35th year of the reign of Queen Elizabeth, by which persons were forbidden to build within three *miles* of London, and the mile was declared to be 8 furlongs of 40 perches of 16½ feet each. The statute mile is, therefore, 1760 yards or 5280 feet. *See* MEASURES.

The mile is used as an itinerary measure in almost all countries of Europe, particularly those which were formerly under the sway of the Romans, but it is very difficult to conjecture the causes which have given rise to the great diversity of its values. It has been supposed that in some countries the Roman mile was confounded with the ancient Celtic league.

The following table, given on the authority of *Kelly's Cambist*, shows the length of the modern mile and also the league, of various countries, and their relation to the English statute mile:

	Yds.	Stat. Miles.
Modern Roman mile	1628	0·924
English statute mile	1760	1·000
Tuscan mile	1808	1·027
Ancient Scottish mile	1984	1·127
Irish mile	2240	1·273
French posting league	4263	2·422
Spanish judicial league	4635	2·634
Portugal league	6760	3·841
German short mile	6859	3·897
Flanders league	6864	3·900
Spanish common league	7416	4·214
Prussian mile	8237	4·680
Danish mile	8244	4·684
Dantzic mile	8475	4·815
Hungarian mile	9113	5·178
Swiss mile	9153	5·201
German long mile	10126	5·753
Hanoverian mile	11559	6·568
Swedish mile	11700	6·648

According to the same authority the Arabian mile is [illegible]. Persian parasang 6086 yards, the Russian werst 1167 yards, and the Turkish berri 1826 yards. The English geographical mile is 1-60th of a degree of latitude, or about 2026 yards; the geographical league of England and France is 3 such miles, or 6078 yards; and the German geographical mile is equal to 4 English geographical miles or 8106 yards. See an excellent disquisition on the history of the English mile in the *Penny Cyclopædia*.

MILIA'RIA (Lat. milium *millet seed*). A disease attended by an eruption resembling millet seed. Miliary fever.

MILIEU (JUSTE)—PARTY OF THE. A French party nickname arising, it is said, out of a casual expression of King Louis Philippe, but which has obtained a notoriety rather greater than such ephemeral phrases usually acquire. It has served to denote the great party opposed to the Carlists, or Legitimists on the one hand, and to the extreme left section of the Chamber of Deputies with its allies the Republicans on the other. After the overthrow of the feeble ministry of Laffitte in March 1831, Casimir Perier was authorized to form a new cabinet, and his administration seems to have realized more than any other the ideal of a government of the Juste Milieu. Under its rule the hereditary peerage was abolished, the continual street disturbances which had almost controlled the will of the previous ministry quelled, Ancona seized, and the foundation of the successful intervention of France in the Holland-Belgic quarrel laid. Perier died of cholera on the 16th of May 1832. After a short interval he was succeeded by Soult, who was perhaps afterwards, more identified with this party than any other minister. Molé, Guizot, Dupin, Thiers, Barrot, the most eminent statesmen of France, during the reign of Louis Philippe, having each of them adopted a line, and formed to a certain extent a party of his own, alternately aided and opposed by the great body of the partisans of the Juste Milieu.

MILIOLA (Lat. milium *a millet-seed*). The generic name applied by Lamarck to an extinct mollusk or zoophyte which has left its small foraminiferous multilocular shell in great numbers in the strata of many quarries in the neighbourhood of Paris.

MILITIA. A body composed of citizens regularly enrolled and trained to the exercises of war, but not permanently organized in time of peace, or, in general, liable to serve out of the country in time of war. Such an establishment exists in most European countries under different names. (*See* GUARD, NATIONAL.) In Austria and Prussia it is called Landwehr, and in the latter country receives full pay during a certain part of every year when it is in exercise. Various and unsuccessful efforts were made by Germans [illegible] wars of the last century to organ[illegible], which should be as cheaply raised as militia and yet be serviceable in foreign war. Frederick the Great used such troops for garrison service. The militia of England and Scotland now consists of a certain number of men in every county, drawn by lot to serve for five years, and liable to be called out and embodied on danger of rebellion or invasion by proclamation of the king in council, and with notification to parliament if that body is sitting. During the late war, the militia was kept constantly on foot and might be sent to any part of the kingdom, so that it differed little from the regular army, except that it could not be sent abroad, and that it was recruited by ballot. But in addition to the above a militia called local or fencibles in many instances raised and supported entirely at the expense of some great landed proprietor was established in every county. After the peace of 1815 the militia was disembodied, but as we remarked above it is still liable if it be considered necessary to be called out. In Prussia every man who has served his three years, or a single year in certain cases, of lawful service in the standing army, belongs to the first class of the landwehr until his thirtieth year, and from that time until his fortieth to the second class.

MILK (Germ. milch). A fluid secreted by peculiar glands in the breasts of the class of animals called *Mammalia*, and destined for the nourishment of their young.

The obvious components of milk are cream, curd, and

[illegible] cream (of cow's milk), of the sp[illegible], according to Berzelius, of

Butter	45
Curd	35
Whey	920
	1000

The remaining skim milk has a specific gravity of about 1033, and consists of

Water	929
Curd with a trace of butter	28
Sugar of milk	35
Lactic acid, lactate of potash, and a trace of lactate of iron	6
Muriate and phosphate of potash and earthy phosphates	2
	1000

If we subtract the curd, the remaining substances constitute whey The *curd* of milk, or *caseous matter*, partakes in many of its chemical properties of the nature of albumen, in others it resembles vegetable gluten more especially in the fermentation which it undergoes when kept in a moist state *Sugar of milk* is obtained by evaporating whey When purified it has a sweet taste and requires 7 of cold and 4 of boiling water for solution, and is insoluble in alcohol when digested with nitric acid it is partially converted into mucous or *saccholactic acid*, and not, like common sugar into oxalic acid This therefore though an animal product, closely resembles the vegetable proximate principles and milk may hence be considered as partaking of the nature of [illegible] as animal food See DAIRY

MILK FEVER See PUERPERAL FEVER

MILK TREE, so called from its trunk yielding a milky fluid when wounded is a name applied more particularly to those species in which the fluid is harmless and fit for food, an uncommon circumstance among lactescent plants whose secretions are generally dangerous In the Caraccas there is one sort the *palo de vaca* or cow tree of Humboldt whose milk is a common article of diet among the natives, this is the *Galactodendron utile* In that and other countries plants of the Sapotaceous order especially species of Achras also furnish such a secretion In Ceylon has been found the Kirriagum plant or *Tabernæmontana utilis*, which is used by the Cingalese in a similar manner

MILK VESSELS in Plants are the anastomosing tubes lying in the bark or near the surface of plants in which a white turbid fluid is secreted They are one of the forms of the *vital veins* of Schultz which see

MILKY WAY or VIA LACTEA or CALAXY A broad and irregular zone of stars that surround the heavens, so distant that their united light gives but an indistinct and undefined whitishness to the whole appearance —whence its name See GALAXY

MILL (Gr μυλη, Lat mola) This term seems to have signified originally an engine for grinding corn but it is now used in a general sense to denote a great variety of machines whose action depends chiefly on circular motion The particular purpose is usually indicated by a prefix, thus bark-mill, cotton-mill, flour-mill, oil mill saw-mill, spinning-mill, &c

The machinery by which it is necessary to accomplish the ultimate objects of the mill must obviously vary almost indefinitely Many voluminous works on this subject have been published as well as separate accounts of particular structures See Brewster's edition of *Ferguson's Lectures*, *Gray's Experienced Millwright*, *Buchanan on Millwork*, by Rennie, *Banks on Mills*, *The Repository of Arts* &c A catalogue of the principal works on the subject of mills is given in *Gregory's Mechanics* vol ii

MILL, BARKER'S See CENTRIPETAL MACHINE

MILLENNIUM (Lat mille annum *a thousand years*) The reign of Christ with his saints upon earth for the space of a thousand years an idea derived from a passage in the 20th chap of the Apocalypse, and not uncommonly entertained by Christians in all ages but especially in the times of the primitive church The opinion seems to be traced as far back as to Papias a father of the second century It is the subject of much discussion among the writers of that and the succeeding ages, was maintained by Justin Martyr, Irenæus, Tertullian and many others and powerfully refuted by Origen (See the work of *Alstedius* translated by Bruton, 1643, *Gibbon*, ch xv, with Milman's notes, Bertholdt, *Christologia Judæorum*, Eisenmenger, *Das Entdeckte Judenthum*, *Lightfoot*, *Mosheim*, vol i)

MILLEPORA *Millepora* (Lat mille, *a thousand*, porus, *a pore*) A tribe of Lithophytous Polypes, including those in which the calcareous axis is perforated by extremely numerous pores

MILLET (Lat millium, Fr millet) A plant classed by botanists among the grasses, though some of its species attain a height of from 16 to 20 feet in favourable situations There are many species of this plant; of which the principal are the Polish, the common or German, and the Indian millet In several parts of Europe it is cultivated as a grain, and is sometimes employed as a substitute for rice or sago by the poorer classes, [illegible] and dor[illegible] extent in France, Switzerland, Southern Germany, and most extensively in Egypt, Syria, Nubia, China, and Hindostan, but the climate of England is not sufficiently dry and warm to allow of its being cultivated here

MILLION A thousand thousand, or, as often defined, ten hundred thousand *See* NUMERATION

MILLSTONE GRIT A geological term applied to a group of strata which occur between the mountain limestone and the superincumbent coal formations, it is a [illegible] quartzose sandstone

MILVINES, *Milvini* A family of Raptorial birds, of which the kite (*Milvus*) is the type

MIME (Lat mimus, Gr μιμος, from μιμεομαι, *I imitate*) The name given by the ancient Greeks and Romans at once to a species of dramatic entertainment, and to the authors and actors by whom it was respectively composed and performed It consisted chiefly of a rude representation of common life, and resembled the modern farce or vaudeville in its character and accompaniments Sophron of Syracuse, who lived about 400 years before the Christian era is considered the inventor of this species of composition His pieces were read even with pleasure by Plato who is said to have introduced this kind of dramatic entertainment into Athens (The *Museum Criticum* No 7, contains several fragments of mimes by Sophron) At what period mimography was first practised at Rome cannot be precisely ascertained, but in the time of the emperors and even under Augustus this species of entertainment had attained a high degree of popularity Among the Romans, it was of a still more farcical character than among the Greeks, from whom it was borrowed, and bordered more upon such mountebank representations as *Punch and Judy* among ourselves and the *Fantoccini* of the Italians Mimes originally formed a part of the usual theatrical exhibitions, but they were soon introduced by the wealthy Romans into their private entertainments to divert their guests At Rome they also held a prominent place at funerals on which occasions their duty consisted in praising the virtues and exposing the defects of the deceased It is however very probable that less licence of caricature was then admissible, but the highest rank was not exempt from the practice Thus Suetonius tells us that the archmime Favo was present at the funeral of Vespasian — 'Sedet in funere Favo archimimus, personam ejus referens, imitansque, ut mos est, facta et dicta vivi

MIMUS (Lat *a mimic*) A genus of Passerine birds separated by Boie from the thrushes (*Turdus* of Linnæus) on account of the more elongated form of the body and particularly of the tail the shorter wings and more curved upper mandible The type of this genus is th[illegible] See that word

[illegible], right and common in use among the Greeks, but which was d[illegible] the Attic mina, which is that most frequently mentioned was heavier than the Roman pound by about four drachmæ Each mina contained 100 drachmæ and was itself contained 60 times in an Attic talent The coin was worth a little more than 3*l* of our money

MINARET (Arab menarah *a lantern*) A slender and lofty turret in the mosques of Mohammedan countries, used for the purpose of summoning the people to prayers and consequently answering the purpose of the belfry in Christian churches They are usually surrounded with projecting balconies, and are crowned with spires surmounted by a crescent Before the hour of prayer the criers of the mosques ascend the minarets, whence they summon the people to prayers with the words, "Come ye people, to the place of rest and in[illegible] asylum of safety"

MINDERERUS'S SPIRIT Solution of acetate of ammonia, first recommended as a febrifuge by Raymond Minderer us a physician of Augsburg

MINE The name given generally to every system of subterraneous work or excavation which has for its object the discovery and extraction of the metallic ores or other mineral produce But in addition to the underground works which constitute the mine properly so called, the term usually comprehends also the ground on [illegible] with wheels, and other machinery for drainage the extraction of the ores, and their mechanical preparation, with various buildings and erections The subject of mines is one of the most important within the whole range of human knowledge their contents constitute the main-springs of civilization, and the means employed to obtain them are to be ranked among the most extraordinary instances of human enter-

prise patience and ingenuity The art of mining has been practised from the earliest antiquity and has formed a branch of industry to the most barbarous as well as the most civilized communities It is true that we can scarcely dignify by the name of mining the operation by which the savage merely collects grains of gold in the sands of rivers, or extracts it by pounding, when mechanically combined with other substances, but even this simple operation becomes interesting when viewed as the first link in the chain of those elaborate and scientific processes now employed in the extraction of metallic and other mineral substances from the bowels of the earth In England, mining had a very early origin, compared with the progress of other arts in the country It was, in all probability, the first source of trade to these islands, and so celebrated was British tin over the whole of the then known world, that the Phœnicians traded to Cornwall for this metal At that early period, however, and indeed for centuries afterwards, the art of mining was necessarily in a comparatively rude and imperfect state arising from the want of an effective means of drainage and of blasting implements, and it was not until hydraulic machines were applied to raise the waters which accumulated in mines of every description that metals could be followed to any considerable depth and not until gunpowder had furnished the means of splitting the hardest rock that the miner was enabled to surmount the obstacles which the most indurated strata opposed to his progress These inventions, therefore may be regarded as most important epochs in the history of mining but the *present* comparatively perfect state of the art is mainly owing to the invention of the *steam engine* and the improved manufacture of iron which took place in the latter part of last century The former gave to the miner a power capable of universal application and of an effect that added, as it were, new regions of subterranean country to his control, while the latter has proved no less important in contributing to the same result by the improved machinery and apparatus it has placed within his reach

The art of mining embraces a multiplicity of topics and processes, differing in their character in proportion to the difference of the locality of the lodes, the habits of the population, and the character and the resources of the country in which it is practised, many of which, besides, are of so abstruse and complicated a nature as to be utterly unintelligible without the most lengthened details, and the introduction of numerous diagrams that would have been foreign to the object of this work, that we shall refrain from entering upon a subject which it would be impossible for us to treat satisfactorily in this place We must therefore refer the reader to *Ure's Dict of Arts, &c*, which contains full details upon the numerous processes connected with this most important art and content ourselves with subjoining the following tables the one made up from the *Geo Dict*, containing an estimate of the mineral produce of Great Britain on an average of years and prices, the other being a Comparative Table of celebrated Mines in Europe and America, which we have borrowed from the *Quarterly Mining Review* for July, 1835, p 60 (The various mining terms, as *shaft lode*, &c will be found defined under their respective heads, and the different metallurgical processes explained under the separate metals)

Estimate of the Mineral Produce of Great Britain, on an Average of Years and Prices

	Quantity	Value
Silver -	10 000 lbs troy -	£ 30,000
Copper -	13 000 tons	- 1 300 000
Tin -	5 500 -	- 550 000
Lead -	46 000	- 950 000
Iron -	1 250 000 -	- 10 000 000
Coal -	32 000 000	- 12,000,000
Salt alum and other minor produce more than - -		1,000,000
Total value probably exceeds -		£ 25 830 000

COMPARATIVE TABLE of celebrated Mines in Europe and America By F Burr, Esq

	Consolidated and United Mines (At present the richest mines in Cornwall)	Veta Grande Mines (At present the richest mines in Mexico)	Mine of Valenciana (Richest of the Mexican mine at the beginning of the present century	Mine of Himmelsfurst (Richest of the Saxon mines at the beginning of the present century
Situation - -	Two miles east of Redruth	Four miles north of Zacatecas	One mile north of Guanaxuato	Two miles south east of Freyberg
Elevation -	Elevation of the surface above the level of the sea from 200 to 300 ft Depth of the bottom of the mine below the level of the sea, about 1370 feet	Elevation of the surface above the level of the sea supposed to be about 6000 feet Elevation of the bottom of the mine above the level of the sea probably near 5000 feet	[illegible] bottom of the mine above the level of the sea, 5730 feet	Elevation of the surface [illegible] the bottom of the mine above the level of the sea, 263 feet
Nature of the rock	Primary clay slate resting immediately on granite a short distance westward of the mines The clay slate is intersected by numerous channels of porphyry which have nearly the same direction as the mineral veins and are often of considerable width The porphyry sometimes appears also to form large irregular masses in the clay slate Both rocks are traversed by veins of quartz and clay intersecting the metalliferous veins	Transition clay slate, alternating with dolomite and occasionally with grey wacke This clay slate is sometimes decomposed it rests on syenitic rocks and is in some places covered with porphyry	The *Veta Madre* of Guanaxuato upon which this mine is worked traverses both clay slate and porphyry, but it is most productive in the former rock The clay slate is considered by Humboldt to belong to the transition class but situate near the limits of primary formations This rock in depth passes into chlorite slate, and talc slate It contains subordinate beds [illegible] phyry rests upon the clay slate and is conformable to it both in direction and stratification	The rock prevailing in the neighbourhood of Freyberg in which this and most of the other mines are situate, is a formation of primary gneiss.
Nature of the metaliferous deposits -	In the consolidated mines, the eight following lodes are extensively worked — Wheal Fortune lode, Cusvoose Treasure lode, Wheal Unity lode, Wheal Treasure lode, Gonning's lode, Martin's lode, and Glover's lode In the United mines the principal metal is upon the Old lode, and about five or six others are more or less productive Numerous smaller lodes or "branches occur also in both mines The principal lodes are from 2 or 3 to 7 or 8 feet wide, the "branches are generally 12 or 18 inches wide The direction of the lodes varies from nearly east and west to about 20 degrees north of east and south of west The underlie of the principal lodes is from 2 to 3 feet per fathom north, that of the smaller ones about the same south	One principal vein of the Veta Grande [illegible] separated into 3 branches and sometimes into four When ramified the width extends to 60 or 70 feet when united, it varies from 8 or 10 to 20 or 30 feet The branches are generally about 10 or 12 feet wide, and the upper one is most productive The direction of the Veta Grande [illegible] 30 degrees [illegible] east, and north of west and its underlie from two to three [illegible] other veins cut the principal vein of the Veta Grande, which cross it at an acute angle One of these appears to heave the vein for about 700 feet being the most remarkable derangement of the kind on record	One principal vein of the Veta (the *Veta Madre*), which is often separated into three branches, extending from 130 to 160 feet in width When not ramified its width varies from 20 or 30 to 60 or 70 feet [illegible] from 1 to 3 feet The direction of the vein is north west and south east, its underlie is south, and about 5 or 6 feet per fathom	There are five veins worked in this mine The principal vein (*Teich flache*) is from 1 foot 6 inches to 3 feet in width the others are from 6 to 12 inches wide The direction of this vein is nearly north and south, its underlie is west, and about 3 feet per fathom Some of the other veins intersect it

TABLE — *continued*

	Consolidated and United Mines (At present the richest mines of Cornwall)	Veta Grande Mines (At present the richest mines in Mexico)	Mine of Valenciana. (Richest of the Mexican mines at the beginning of the present century)	Mine of Himmelfurst (Richest of the Saxon mines at the beginning of the present century)
Ores	Chiefly copper ore, occasion [illegible] occurs, but not in very great abundance	Chiefly red silver, native silver, sulphuret of silver, and arsenical iron pyrites	Sulphuret of silver, native [illegible] black silver, [illegible]	[illegible] ret of silver, red silver
Produce of the ores	9½ per cent of fine copper, average produce in 100 parts of ore	3½ oz per quintal	Four ounces of silver per quintal of 100 lbs Equivalent to 2½ parts of metal in 1000 of ore, or ¼ per cent.	Six to seven ounces [illegible] 100 parts of metal [illegible] of ore, or from 3 8ths to nearly ½ per cent.
Veinstone	Chiefly quartz, of which many varieties occur	Chiefly quartz, occasionally [illegible] of lime, and heavy spar	[illegible] hornstone	Quartz [illegible] calcareous spar
Mineral substances accompanying the ores	The ores are generally accompanied by 'gossan *' in the backs of the lodes, by blende, and by iron, and	The ores are generally accompanied by blende, sulphuret of antimony, and iron pyrites	The ores are accompanied by blende, spathose iron, copper and iron pyrites	The ores are accompanied by blende, spathose iron and a little iron and arsenical pyrites.
Depth of the principal shafts	[illegible] *shaft*, 275 fathoms Some of the other engine shafts are scarcely inferior in depth	*Tiro General*, 182 fathoms *Gallega* shaft, 138 fathoms.	*Tiro General*, 310 fathoms	*Frankenschacht*, 180 fathoms.
Depth of adit at the principal shafts	At Woolf's engine shaft 13 fathoms The average depth of the adit at the other engine shafts is about 30 or 40 fathoms	There is no adit to this mine	There is no adit to this mine	The adit at the shaft called *Frankenschacht* is 47 fathoms in depth
Quantity of water	Varies from 2000 to 3000 gallons per minute	About 80 gallons per minute	The Valenciana was a dry [illegible] it first became troubled with water, in consequence of some of the workings being inadvertently communicated with the adjoining mine of Tepevac which although upon the same vein, was extremely wet The quantity of water raised during the late working appears to have been about 110 gallons per minute but the regular influx was much less	50 gallons per minute
Height to which the water is raised	About 230 fathoms at the [illegible] fathoms	On an average about 150 fathoms	310 fathoms	133 fathoms.
Power employed in drainage	9 steam engines 3 of 90 inch cylinder 3 of 80 1 of 80 and 2 of 60 A water wheel 18 feet in diameter	Usually 10 malacates †	A steam engine of 30 inch cylinder, and 7 malacates	Two water wheels, each 42 feet in diameter
Probable equivalent in actual horse power	1500 constantly at work, or a total number of above 4500	32 horses constantly working, or a total number of about 100 horses	65 horses constantly at work, or a total number of about 200	16 horses constantly at work, or a total number of about 50
Average annual expense in drainage	12 700*l*, taking the average of the last ten years	20,000*l* per annum	About 40 000*l* per annum	Cannot be ascertained, but evidently very small
Quantity of ore and [illegible] raised	16,400 tons of copper ore, a few tons of tin ore	21 380 tons of silver ore	32,500 tons of silver ore	630 tons of silver ore
Produce in metal	1517 tons of fine copper, a little tin	153 000 lbs troy of silver	221,900 lbs troy silver	6160 lbs troy of silver
Total returns, or value of the above	119,800*l*	423,100*l* per annum	About 600,000*l*	About 18,000*l*
Total costs of the mine	93,500*l* exclusive of lord's dues 98 500*l* including lord's dues	252,170*l* per annum	197,900*l* per annum	9500*l* per annum
Clear profit to the proprietors	21,800*l* per annum	171,210*l* per annum	118,750*l* per annum	3560*l* per annum
Amount of capital invested	75,000*l*	130,000*l*	Cannot be ascertained, but known to have been very small	Cannot be ascertained, but probably very small
Interest on capital invested	280 per cent after paying back the original capital	Nearly 700 per cent after paying back the original capital	Not known, but certainly many hundred per cent	Not known, but probably very high
Proportion of costs to returns	Costs exclusive of lord's dues, 78 per cent	About 59½ per cent.	Costs 60 per cent. In the nine years following the proportion was 80 per cent , at the end of that time the working of the mine was stopped by the revolution in the year 1809	Costs 73 per cent.
Number of men employed	About 2500 persons, of whom about 1450 are employed under ground	About 900, of whom nearly 600 are employed under ground	3100 Indians and Mestizoes, of whom 1800 are employed under ground	700 miners, of whom 510 are employed under ground
Wages of the miners per day	Probably about 3 shillings on an average	About 8 or 9 shillings per day	From 4 to 5 shillings	About 1*s* 6*d* per day
Quantity and [illegible] of ore			1420 cwt , value 15,830*l*	240 cwt ; value 1070*l*
Manner in which the ores are disposed of	Sold to the smelting companies, and smelted by them at Swansea, in South Wales.	Chiefly reduced by the company at the Hacienda of Sanceda, by smelting and amalgamation	Sold to the *Rescatadores*, and reduced by smelting and [illegible]	Delivered to the Government reduction works in the neighbourhood of Freyburg, where they are partly smelted, and partly amalgamated

Average of the last Ten Years. — Average of the last Six Years. — Average year at the end of the Eighteenth Century. — Average at the end of the Eighteenth Century

* Gossan, or Gozzan, oxide of iron and quartz

† Malacate, a horse whim

MINES AND MINERALS In England all minerals are [illegible] which they are found, with the exception of gold and silver, which are said to belong to the crown But, by 1 W & M c 30, no mine of copper or lead is adjudged [illegible] be extracted A lease of land [illegible] conveys, it is said, the right to carry on open mines only, and not open new ones, unless expressly reserved, but that, if there are no open mines, the lessee may then dig new ones, as otherwise the grant would be of none effect But, unless the lessee be authorized, to dig mines is waste Mines are not rateable to the relief of the poor with the exception of coal mines, the latter being expressed in the statute of Eliz, the former are held to be excluded by implication But quarries are rateable, and the distinction between a mine and a quarry is taken to be not the nature of the mineral extracted but the mode of working thus, a mine of limestone worked by a shaft is not rateable The law of mines and minerals is subject to a variety of local customs of which those of Devon and Cornwall are the most remarkable *See* STANNARIES

MINE In Fortification, a subterraneous passage leading to a chamber underneath any place intended to be blown up by gunpowder *See Müller's Art of War*, and other works on military engineering of subsequent date

MINERAL ADIPOCERE A greasy bitumen found in the argillaceous ores of iron *See* HATCHETINE

MINERAL CAOUTCHOUC The elastic bitumen found at Castleton in Derbyshire

MINERAL CHAMÆLEON *See* MANGANESE A manganesate of potash obtained by fusing a mixture of nitre and black oxide of manganese So called from the variety of colours which its aqueous solution successively exhibits

MINERAL GREEN Carbonate of copper, obtained by precipitating a hot solution of sulphate of copper by carbonate of soda

MINERALIZERS The substances with which metals are combined in their ores Thus in the native oxides, oxygen is called the mineralizer, sulphur is also a very common mineralizer, as in the ores of copper, lead &c

MINERALOGY A branch of physico-chemical science which teaches the properties composition and relations of mineral bodies, and the art of distinguishing and describing them

"There is no branch of science," says Sir J Herschel, which presents so many points of contact with other departments of physical research and serves as the connecting link between so many distant points of philosophical speculation, as this To the geologist the chemist, the optician, the crystallographer it offers specially the very elements of their knowledge and a field for many of their most curious and important inquiries, nor with the exception of chemistry is there any which has undergone more revolutions or been exhibited in a greater variety of forms To the ancients it could scarcely be said to be at all known and up to a comparatively recent period nothing could be more imperfect than its descriptions, or more artificial and unnatural than its classifications The more important minerals in the arts, indeed,—those used for economical purposes, and those from which metals were extracted, had a certain degree of attention paid to them for the sake of their utility and commercial value and the precious stones for that of ornament but until their *crystalline forms* were attentively observed, and shown to be determinate characters, on which dependence could be placed no mineralogist could give any correct account of the real distinction between one mineral and another It was only, however when chemical analysis had acquired a certain degree of precision and universal applicability, that the importance of mineralogy as a science began to be recognized, and the connection between the external characters of a stone and its ingredient constituents brought into distinct notice"

In the above quotation the two characters of minerals upon which their classification is founded are adverted to, namely, their *structure* and their *composition*, and pursuing these as their leading objects, mineralogists have of late discarded a number of other qualities upon which much stress was formerly laid, but which are so variable and indefinite as to be really of little value, such, for instance, as weight, colour touch, and other sensible qualities, which often vary in different specimens of the same mineral

There are so many disadvantages belonging to any mineralogical arrangement founded exclusively on crystalline form, or on chemical composition, that, for all practical purposes, it is necessary to blend the two, but since the chemical theory of definite proportionals, or, as it is commonly called, the atomic theory, has been known to be applicable to the greater number of mineral combinations, the chemical arrangement of mineral substances has assumed a new and important aspect it [illegible] a mineral, that its [illegible] should in all cases form an essential part of such description, where at least it can be attained, for it must be recollected that there are many cases in which minerals do not occur crystallized and where that characteristic, therefore, would be totally at fault It has been well observed by Dr Thomson (*System of Chemistry*, Part III, Introduction), "that if mineralogy were to be confined to mere crystallized bodies, it would be divested of the greatest part of its utility, for a very great proportion of those minerals that are of the greatest utility to man, and which, therefore, it is peculiarly important to be able to distinguish from others, are seldom found in the state of regular crystals How often do the ores of copper tin, lead and iron occur in an amorphous state? And were a mineralogist incapable of distinguishing them from each other, and from other minerals, except in the rare cases when they assume a regularly crystallized form his knowledge would be useless as far as the important arts of mining and metallurgy are concerned"

Mineralogical analysis, as connected with the atomic theory has made no inconsiderable progress in the skilful and industrious hands of Berzelius, but it is still quite in its infancy as regards the [illegible] of mineral arrangement, and before it can be [illegible] adopted as such, many new analyses and much laborious revision of former researches will be requisite One of the latest authors on mineralogy who has adopted an arrangement founded upon the chemical composition of minerals is Dr Thomas Thomson He divides minerals into three classes —

Class I *Acid Bases* (Those bodies which become acids when combined with oxygen)

		Species
Genus I	Carbon	11
II	Boron	1
III	Silicon	7
IV	Phosphorus	
V	Sulphur	1
VI	Selenium	
VII	Tellurium	1
VIII	Arsenic	5
IX	Antimony	5
X	Chromium	
XI	Molybdenum	1
XII	Tungsten	
XIII	Columbium	
XIV	Titanium	
XV	Vanadium	

Class II *Alkaline Bases*

I	Ammonia	2
II	Potassium	1
III	Sodium	7
IV	Lithium	
V	Barium	5
VI	Strontium	6
VII	Calcium	30
VIII	Magnesium	37
IX	Aluminum	
	1 Pure, or combined with bases	7
	2 Simple salts	24
	3 Double anhydrous salts	39
	4 Double hydrous salts, soluble in water	3
	5 Double, insoluble in water, and phosphates	4
	6 Double hydrous aluminous silicates or zeolites	39
	7 Triple aluminous salts	15
	8 Quadruple aluminous salts	12
X	Glucinum	4
XI	Yttrium	6
XII	Cerium	8
XIII	Zirconium	5
XIV	Thorinum	1
XV	Iron	
	1 Uncombined, or united to a simple substance	13
	2 Oxygen salts of iron	22
	Double ditto	19
	Triple ditto	6
	3 Sulphur salts of iron	2
XVI	Manganese	
	1 Combined with simple bodies	11
	2 Simple oxygen salts	5
	3 Double oxygen salts	5
	4 Triple oxygen salts	1
XVII	Nickel	
	1 Combined with simple bodies	5
	2 Oxygen salts	1
	3 Sulphur salts	2
XVIII	Cobalt	
	1 Combined with simple bodies	5
	2 Oxygen salts	2
	3 Sulphur salts	1

		Species
XIX	Zinc	
	1 United to simple bodies	4
	2 Oxygen salts	6
	3 Sulphur salts	1
XX	Lead	
	1 Native, or united to simple bodies	7
	2 Oxygen salts of lead	
	a Simple	7
	b Double	10
	c Triple	2
	3 Sulphur salts	5
XXI	Tin	2
XXII	Bismuth	
	1 Native, or combined with simple bodies	6
	2 Oxygen salts	2
	3 Sulphur salts	1
XXIII	Copper	
	1 Native, or combined with simple bodies	6
	2 Oxygen salts	19
	3 Chlorine salts	1
	4 Sulphur salts	5
	5 Selenium salts	1
XXIV	Mercury	5
XXV	Silver	
	1 Native, or combined with simple bodies	10
	2 Oxygen salts	1
	3 Sulphur salts	6
XXVI	Uranium	5
XXVII	Palladium	2

Class III *Neutral Bases*

I	Gold	3
II	Platinum	1
III	Iridium	1

We have given the above as a specimen of a chemical mineralogical arrangement, and except, perhaps, that the last class is unnecessarily separated from the preceding, it is sufficiently simple and explicit The individual characters of each species, such as colour, fracture, hardness specific gravity and crystalline forms constitute, of course, a necessary part of their description

One of the most useful *practical* works on Mineralogy and, in our language at least the most available for the use of the student, is Mr Allan's edition of the elementary introduction to that science of the late Mr William Phillips In this work the following order of arrangement is adopted, and the annexed tables give the distinctive constituents of the respective species

N B —The proportions are indicated by figures, where ascertained when doubtful, are marked thus —

EARTHY MINERALS

Silica	Silica	Alumina	Lime	Water	Iron	Manganese
Quartz	100

MINERAL PITCH, *Maltha* A solid, softish bitumen Sp gr about 1 5

MINERAL TAR The bituminous substance called *petroleum* It is brown viscid, and unctuous Its specific gravity is 0 88 It is found in Britain, and on the continent of Europe, in the West Indies (Barbadoes tar), and in Persia It may be resolved by distillation into naphtha and petroleum

MINERAL WATERS This term is applied to certain spring waters containing so large a proportion of foreign matter as to be unfit for ordinary use

Mineral waters may, in most cases, be artificially prepared by the skilful application of the knowledge derived from analyses with such precision as to imitate very closely the native springs When the various earthy or metallic constituents are held in solution by carbonic acid or sulphuretted, they should be placed along with their due proportions of water in the receiver of the aerating machine and then the proper quantity of gas should be injected into the water Sufficient agitation will be given by the action of the forcing-pump to promote their solution (See *Ure's Dict of Arts, &c*)

The following table shows the composition of several of the principal mineral springs of Europe

MI'NERAL YELLOW, or PATENT YELLOW A compound of oxide and chloride of lead obtained by digesting powdered litharge in a solution of common salt washing drying, and fusing the product It is used as a pigment

MINE'RVA The Latin goddess [illegible] to and confounded with the Grecian Pallas Athene or Athena (Ἀθήνη) She was fabled to have sprung in full armour from the forehead of her father Jupiter Minerva was worshipped as the goddess of wisdom and the patroness of industry and the arts Athens the city to which she gave name was her favourite spot and there her worship was celebrated with great splendour and the magnificent temple the Parthenon erected to her honour But she was also worshipped at Rome with peculiar veneration There she had three temples one on the Capitol, which she shared with Jupiter and Juno a second on the Aventine and a third on the Celian mount in which she was worshipped as *Minerva Capta* an epithet said to [illegible] statue was transported from [illegible] that city by Camillus At Rome there were also two great festivals celebrated annually in her honour, the one called Quinquatrus or Quinquatria, the other Quinquatria Minora (See these words) The origin of the name of Minerva has long puzzled etymologists Cicero says she is called "Minerva, quia minuit or minatur," but it has been also fancied that the word is a shortened form of Meminerva (from memini, *I remember*) she being the goddess of memory It is possibly from the same root as the Lat mens, *mind* which is expressed so clearly in many languages wholly unallied, of which the German (whence the English *man*), and the Hindostan mena, may serve as examples But the Tuscan name of the goddess is Menrfa, which seems the immediate source She was represented as a young woman, with a grave and noble countenance clothed in armour *See* PALLAS

MI'NIATURE (Fr) A representation of nature on a very small scale *Miniature Painting* is generally executed on ivory, and is, as to composition, drawing, and finishing, subject to the same laws as Painting (which see) The outline is traced upon with a silver point or pencil, and must be [illegible] light and delicate This is afterwards drawn in with thin carmine as correctly as possible the corrections being made with finely powdered pumice stone, rubbed on with a paper or leather stump The dead colouring then proceeds, wherein the shadows are left delicate and the lights strong the full effect being afterwards produced by dotting The artist usually begins the shades with vermilion and carmine giving the strongest touches to the most prominent parts and to those where separations are marked out in shades that are obscure Indigo is afterwards used for the bluish shades on such parts as recede from the light Yellow tints, composed of ochre and vermilion are usually employed on the sides of the nose towards the bottom under the eyebrows underneath the cheeks and on other parts rising towards the light The backgrounds if dark, are commonly composed of bistre umber or Cologne earth, with black and white others of a yellow cast by the use of ochre The grey back grounds are formed by black white, and a little indigo When of a green or olive hue Dutch pink, white, and black are the ingredients The back-grounds are formed in two coats, first laying on a light thin tint, and afterwards a darker one of the same colour, evenly and smooth The dotting is performed by separate dots, or by short notching strokes crossing each other every way so as to have the appearance of being dotted

MI'NIM (Lat minimus) In Music, a character 𝅗𝅥 equal in duration to two crotchets or half a semibreve

MI'NIM The smallest liquid measure generally regarded as about equal to one drop The fluid drachm is divided into sixty minims

MI'NIMS, or MINIMI, ORDER OF THE A religious order instituted by St Francis De Paulo in the fifteenth century The name is derived from the Lat minimus *the least*, by which the founder meant to indicate that humility should be the distinguishing feature of the order In conformity with this design the rules he prescribed were of the strictest kind Besides the three usual vows of poverty, continence, and obedience, the most rigid abstinence was inculcated Except in cases of illness, the members were prohibited not only from animal food but even butter, milk, or cheese, any kind of sustenance in the composition of

which such materials were used Their dress was of the coarsest and meanest kind, the colour being black, like that of the Franciscans Long before the death of its founder, this order had attained so high a degree of celebrity that it could boast of monasteries in [illegible] and Germany, and at no very distant period fewer than 450 religious houses scattered throughout Europe and Asia (See the *Dict de la Conversation*)

MINISTER In Politics, a servant of the sovereign executive power in a state generally speaking, the head of a department or branch of government Usage, in different countries, fixes very differently the limits of that higher class of servants to which the term is applied In the British empire, none but the heads of administrative departments are termed ministers part of whom belong to the cabinet, and part are not included in it The cabinet ministers have varied under different administrations, and as our government is of mixed organization, partly to serve the actual necessities of state, and partly retaining ancient distinctions of office founded on usage only some of the ministers hold merely sinecure appointments In France where the forms of [illegible] are established more on the principle of utility [illegible] eight ministers so called 1 of the interior, 2 of finance, 3 of justice, 4 of public instruction and ecclesiastical affairs, 5 of commerce and public works, 6 of the marine and colonies, 7 of war, 8 of foreign affairs In [illegible] in either house of parliament [illegible] peers, as representatives only, of commoners In France the same regulation prevails, but ministers have also, by virtue of their office a right to sit and take part in the debates in either chamber In the United States, no minister (or secretary, in the language of that government) can be chosen either representative or senator In some European countries (as Russia) a distinction is established between the private affairs of the sovereign and foreign affairs on the one hand, which form the combined duties of the cabinet ministers and the affairs of the interior, which are entrusted to ministers of state There are also in some governments honorary or *conference* ministers without any real department of duty The representatives of minor sovereigns at foreign courts are usually styled *ministers*, instead of *ambassadors* The term *minister* is also frequently used in a sense synonymous with *clergyman*

MINIUM (Lat) In Painting a red colour being a calx of lead according to Pliny it was the common red lead See LEAD

MINNEHOFF (Germ, literally *courts of love*) The name given by the Germans to the cours d'amour so famous in the history of chivalry The subjects brought before these courts were chiefly connected with the Romantic gallantry of the period and consisted either of questions proposed with the view to entrap the judges into some awkward decision, or of serious complaints resulting from affaires du cœur which were discussed and decided upon with all the formality of a court of law These minnehofe were for a long period looked upon as forming an indispensable part in all chivalrous exercises Knights, ladies, and poets participated alike in their proceedings, and large collections of their decisions are still extant A certain number of ladies remarkable at once for personal and mental attractions, acted as judges in these courts the fair sex also conducted the proceedings as counsel attorneys general and solicitors general, &c and they were attended by a numerous train of nobles, knights, and others who were invested by the court with gradations of rank and precedency analogous to those conferred by the sovereign These courts were held periodically at Signes Avignon Lille, and Pierrefeu The last regular court of this kind was celebrated by Charles VI and his wife Isabella of Bavaria, but they were now and then renewed at irregular intervals and the last on record took place as late as the reign of Louis XIV at Ruelle at which the princess Maria of Gonzaga presided, and Mademoiselle de Scudery represented the advocate-general We subjoin a few specimens of the questions proposed at these courts for [illegible] from which it will be seen that at the present day there would be little difficulty in deciding upon them, they could not fail at that romantic era to excite considerable discussion 1 Which is harder to bear,—the infidelity or the death of the beloved? 2 Whether does a man whose wife, or a lover whose betrothed is unfaithful, suffer most? 3 Who is more culpable,—the man who boasts of favours from a lady which he never received, or he who having really received them makes it known? (See the *Damen Lexicon*, Adorf, 1837)

MINNESÆNGERS The most ancient school of German poets, whose name is derived from the old German word minne (*love*) The songs and fame of the Provençal troubadours appear to have penetrated into Germany under the first emperors of the house of Hohenstauffen, in whose time the crusades and the frequent Italian wars combined to bring their nation, seated as it is in the centre of Europe, in closer communication with those surrounding it The minnesængers imitated in German the strains of those early poets, and, like them, made love their principal subject, which was celebrated with [illegible] concerns but at the [illegible] The verses of the minnesængers are in the old Swabian dialect of the High German, which, under the Hohenstauffens, themselves of Swabian race, was the court language As was the case with the troubadours, the minnesængers belonged to two different classes there were among [illegible] and even sovereigns, while [illegible] more professional poets—wandering minstrels, who attached themselves to the persons of distinguished chiefs or wandered from court to court The oldest of the [illegible] known is Henry of Veldeck, about [illegible] During the latter part of the 12th and first half of the 13th century this school of poets flourished, after which it gradually declined and was succeeded by the [illegible] and the school of the master-singers We possess the names of more than 300 poets and pieces of the composition of a large proportion of them, who sang during the short period in question The German amatory poets had their high and low minne like the celestial and popular Venus of the ancients, the former an abstract and chivalric devotion to a beloved object, the latter a less elevated passion The ancient German national epic, called the *Nebelungen-Lied*, and the heroic poetry of the *Heldenbuch*, belong to the same period and dialect, and were works of the same race of poets, as were also other poetical romances, founded on the foreign traditions of [illegible] and classical antiquity

MINNOW or MINIM (Lat minimus, *least*) The name of a species of Cyprinoid fish (*Leuciscus phoxinus*, Cuv), and the smallest of the British species of that family It inhabits many of the fresh water streams and canals in England, and spawns in June, when each female is attended by two males

MINOR In Music *See* MAJOR

MINORITY In Politics, the period during which the sovereign in an hereditary monarchy is incapacitated from exercising the supreme authority by reason of not having attained the age prescribed by law, also the state of such incapacity The royal authority in hereditary monarchies, never dies and when a sovereign deceases leaving a successor below age it passes immediately to the person or persons whom the constitution has invested with the authority of regent, as [illegible] when the king becomes subject to any other incapacity The term of royal minority is variously regulated by the constitution of different countries The legal majority of a king of France was fixed at fourteen by an ordinance of Charles V, which has been since followed in that country, but, as a year commenced is reckoned as accomplished, the actual period at which a king of France begins to govern is the age of thirteen years and a day The same period is fixed by the laws of Spain and Portugal By the constitution of Great Britain the sovereign is of full age at eighteen years as far as can be collected from the statutes passed at several times to empower the king to name a regent whenever it has been apprehended that the crown was in danger of devolving on a prince under age

MINORITY In Law the state of an individual of either sex who has not attained the age prescribed by law at which civil rights can be exercised In England and in France majority is attained on the completion of the 21st year, in Germany on the 25th The distinctions made by the Roman law between different periods of minority are unknown to our law

MINOR TERM of a Categorical Syllogism, in Logic, is the subject of the conclusion The minor premise is that which contains the minor term In hypothetical syllogisms the categorical premise is called the minor

MINOS, in Mythological History, was son of Jupiter and Europa and king of Crete, and so celebrated as a lawgiver on earth that after his death he was appointed judge of the infernal regions, in which office he was associated with Æacus and Rhadamanthus

MINOTAUR (Gr Μινως, and ταυρος, *a bull*) A fabled monster of classical antiquity, half man and half bull frequently mentioned by the poets He was said to be the son of Pasiphae wife of Minos II king of Crete, by a bull (ταυρος), hence the term Minotaur He lived on human flesh, hence Minos shut him up in the famous labyrinth of Dædalus feeding him with criminals, and afterwards with youths and maidens sent from Athens As is well known Theseus, by the assistance of Ariadne, succeeded in destroying him, and thereby rescued the Athenians from the obligation of sending their children to be devoured The *Dict de la Conversation* gives an [illegible] See also [illegible]

MINSTER (Germ) was [illegible] applied only to the church of a monastery or convent, and forms the

termination of the name of many places in England in which such churches formerly existed, as Westminster, Leominster, &c It is sometimes, but incorrectly, used in common language to signify a cathedral church

MINSTRELS (Fr ménestral or old Germ minne, *love*) Defined by Percy as an order of men in the middle ages who subsisted by the arts of poetry and music, and sang to the harp verses composed by themselves or others They appear to have been the successors of the minnesingers, scalds and bards of different European nations, who, even after the age of chivalry had passed, attempted to gain a subsistence by practising those arts which at an earlier period had procured fame and honour for their predecessors The origin, character, and decline of the minstrels, are thus ably traced in vol lxxxii of the *Edin Review* [illegible] "*omnis luxuriæ inventor*" [illegible] sang of mimic war to the dull barons of dungeon castles, who had ears, although they could not read — who, doubly steeped in the crime of wealth and want of occupation, listened greedily like other great men, to their own praises Minstrelsy supplied the lack of a more refined intellectual entertainment and of rational conversation, as professional gentlemen do now at civic banquets their harpings lulled the rude Saul to sleep, which is now done by quarto epics The person of the minstrel was sacred, his profession was a passport, he was high placed in hall a welcome guest" the assumption of his character became the disguise of lovers of adventure These advantages raised pseudo laureates, 'idle vagabonds," according to the act of Edward I, "who went about the country under the colour of minstrelsy" men who cared more about the supper than the song, who, for base lucre, divorced the arts of writing and reciting and stole other men's thunder Their social degeneracy may be traced in the dictionary the chanter of the *gests of kings, gesta ducum regumque* — dwindled into a "gesticulator" a jester, the honoured joglar of Provence into the mountebank, the juggler, 'the jockie,' or doggrel balladmonger

> Beggars they are by one consent,
> And rogues by act of parliament

They descended by the usual stages of things of mere fashion at first the observed of all observers and therefore then imitated, until they became common — vulgar, which is but one step, and the test at once of merit universal acceptance, and the forerunner of disgrace no sooner taken up by the *οι πολλοι* than rejected by the exclusive In Spain, particularly this occurred very soon The really good clergy were shocked at their abuses, while the interested grudged the money earned by rivals who interfered with their monopoly of instructing the people in pious prose, or of amusing them with alexandrine legends Their Latin synonyme for 'scald rhymers"—*scurra mimus*, &c — will outlive their sculptured caricatures, when mendicant monks, minstrels fools, monkeys and beasties are pilloried on pinnacle and gargoyle, in cloister and cathedral The itinerant monks and mountebanks repaid all this, like Falstaff by showing up the irregularities of regulars and seculars "in ballads to be sung to filthy tunes" They undermined their influence Preachings and songs take part in all national changes, for doctrines precede actions They were the popular press of the time, opposed by the privileged orders, and watched by statesmen, as Burleigh afterwards [illegible] — the thermometer of the people's [illegible] alterations for the worse, the primitive principle 'to entertain" remained unchanged To this the original ballad was sacrificed, passing from one to another each minstrel begged borrowed, or stole from all quarters The originals were corrupted and remodelled, they got their bread by plying — '*magister artis ingeniique largitor venter*" As late as the beginning of last century the houses of many leading families, especially in the northern parts of the empire, were provided with minstrels, who were employed in various duties, all of them, however, in some degree connected with their original occupation *See* BARD, SCALD, MINNESINGERS BALLAD

MINT (Germ muntze) The place in which the coin of the realm is manufactured The whole of the British coin is issued from and manufactured in the Royal Mint in London The general details of the business of the Mint are briefly stated under the article COINAGE

The Royal Mint received its constitution of superior officers in the 18th year of the reign of Edward II, and continued nearly as then established to carry on its operations within the Tower of London

Between the years 1810 and 1815 the present magnificent and commodious building was erected on Tower Hill at the suggestion of a committee of the [illegible] council appointed in 1798 "[illegible] state of the coins of the king [illegible] and constitution of the Mint," and in 1815 a new constitution was introduced founded upon a report drawn up by the present Lord Marlborough who was then master

The chief officers of the mint are the master, the deputy master, the [illegible] the king's (or queen's) assay masters, [illegible] the clerk of the irons and superintendent of machinery these constitute "the mint board," and meet every Wednesday, or as often as may be required, [illegible] business of the establishment The actual [illegible] is carried on under the direction of the company of moneyers The other officers are the master's assayer, the melter, the chief engraver, the weigher and teller, the surveyor of the meltings, and the solicitor The duties of these officers are fully set forth in the "mint indenture" As relates to the general history of the coinage the reader is referred to the new edition of *Ruding's Annals of the Coinage* The article "Coinage," in the *Encyclopædia Britannica*, gives an abstract of the duties of the respective officers and is especially valuable as containing the only extant account, illustrated by engravings, of the machinery employed in the mint this account [illegible] A [illegible] respecting the whole establishment will be found in the *Parliamentary Report of the Select Committee on the Royal Mint*, and its Appendix, published by order of the House of Commons, 30th June 1837

MINT (Lat mentha) A name given to several herbaceous aromatic plants belonging to the natural order *Labiatæ* and genus *Mentha* Spearmint, or *Mentha viridis* is that which is so generally used in this country, mixed with vinegar and sugar as a sauce Peppermint, or *Mentha piperita*, yields the stimulating oil of the same name Horsemint and others are also species of the same genus

MINT, MASTER OF THE An officer in the English administration, generally till lately removeable with a change of ministry His salary is 2000*l* a year

MINUET (Fr) A species of dance performed in slow time and with measured steps formerly of great celebrity but now rarely if ever met with

MINUTE (Lat minutum) The sixtieth part of an hour of time and the sixtieth part of a degree of angular space In modern astronomical works minutes of time are denoted by the initial letter *m* and minutes of space by the dash or acute accent, which was first used by Ptolemy

MINUTE In Architecture, the sixtieth part of the diameter of a column, by which subdivision architects measure the smaller parts of an order

MINUTE GUNS Guns fired at intervals of a minute, as a signal from a vessel in distress Also fired [illegible] great persons

MINUTES Originally the rough draft of a public instrument drawn up by a notary, so termed because usually written in a smaller character than the instrument itself The term is now applied to a brief report of the proceedings of a society drawn up by the clerk or secretary in which sense it is nearly synonymous with *protocol* which see

MIOCENE (Gr *μειων minor*, and *καινος, recent*) A term applied by Mr Lyell in his *Elements of Geology*, to geological formations containing a *minority of fossil shells of recent species*

MIQUELETS In Modern History, a species of partisan troops raised in the north of Spain, and chiefly in Catalonia The Miquelets became first known in the wars between Spain and France in the 17th century At several periods (in 1689, 1789, and again in the wars of Napoleon) the French have endeavoured to organize similar corps to oppose to the Miquelets in the mountain warfare of those districts

MIRACLE (Lat miror *I wonder*) According to the definition of Dr Johnson, "something beyond human power," which though in itself evidently vague and insufficient, may be explained by the addition of "a deviation from the established laws of nature" A miracle must be not only superhuman, but preternatural Some writers add the 'immediate interference of God" as another condition of a miracle, but this assumes a point which is open to [illegible] inasmuch as it precludes the agency of [illegible] such interruptions of the course of nature, which is still a question among theologians With respect to the credibility of miracles, the most popular argument against them is that of Hume, who considers no weight of particular testimony credible when balanced against our universal experience of the constancy of the laws of nature "No testimony," he says, "is sufficient to establish a miracle, unless the testimony be of such a kind that its falsehood would be more miraculous than the fact it endeavours to establish" If the words *incredible* or *contrary to experience* be substituted for *miraculous* in this passage, the startling effect of this statement of the argument, in which its efficacy resides, will disappear, and the question will be left upon the very grounds which the believer would choose for his own position Hume was answered by Dr Campbell, in his [illegible] (See also *Rutherford's Discourse* [illegible] *Criterion*,

Locke's Discourse on Miracles, *Lardner's Credibility*; *Middleton's Free Inquiry*, *Price's Nature of Miracles*, some very valuable remarks of Paley, in his *Evidences of Christianity*, *Hooker's Eccl Polity*, b viii on Miracles as the Tests of a Supernatural Mission," *Bentham's Rationale of Evidence*)

MIRAGE (Fr) An optical illusion very common at sea, and especially in high latitudes, and sometimes also witnessed on land, particularly in Egypt and Persia, and on the margin of rivers and lakes, or on the seashore It arises from unequal refraction in the lower strata of the atmosphere, and causes remote objects to be seen double, as if reflected in a mirror, or to appear as if suspended in the air When the effect is confined to apparent elevation the English sailors call it *looming*, when inverted as the Italians give it the name of *Fata* (a term) Ships in the [illegible] horizon by its inverted image in the air, though he did not previously know that it was cruising in that part of the fishery The mathematical theory of the phenomenon is given by Biot, in the *Memoires de l Institut* for 1809 [illegible] *Biot's Traite de Physique*, [illegible] (*Cabinet Cyclopedia*)

MIRROR (Fr miroir) A speculum or looking-glass, or any other polished body capable of reflecting the images of objects, rays of light from which fall upon them Silver is considered to be the most powerful reflector, but the speculum metal as now prepared is scarcely inferior, if at all so and in some cases even better In the very early ages of the world polished metallic specula were employed as mirrors by the Jewish and Egyptian women especially of brass, but in modern times, quicksilvered plates of glass are alone used as mirrors

Concave mirrors are used to concentrate the rays of the sun in a single point and thereby produce intense heat The surfaces formed by the revolution of the ellipse parabola and hyperbola, are such as reflect them accurately to one point, provided they emanate from one point are parallel to one another (as the solar rays) or would converge to a more remote point than the one which it is desirable to use The great difficulty of constructing these has led to the employment of spherical segments which, though not accurate, yet under proper restrictions are approximately so For the mathematical theory, see REFLECTION, see also BURNING GLASS, SPECULUM TELESCOPE

MIRZA (A corruption of the Persian title Emir-Zadeh *sons of the prince*) The common style of honour in Persia when it precedes the surname of an individual When appended to the surname it signifies prince

MISANTHROPY (Gr μισος *hatred* and ανθρωπος, *a man*) signifies a general dislike or aversion to man and mankind, in contradistinction to *philanthropy*, which means the love of our species

MISCELLANY (Lat misceo *I mix*) A word usually applied to a collection of literary works or treatises The most celebrated collection of works known by this name is *Constable's Miscellany*

MISCHNA The text of the Jewish Talmud on which the *Gemara*, or second part is a commentary It consists of traditions and explanations of scripture The former are supposed by the Jews to have been delivered to Moses on the mount, and from him to have passed through the keeping of a succession of prophets and sages to Rabbi Juda of Tiberias, who committed them to writing Their compilation is supposed by modern commentators to have taken place about A C 150 or 190 (See Prideaux *Connexion* vol ii, and Lardner, *Collection of Jewish and Heathen Testimonies* vol i)

MISDEMEANOR, in Law is any offence which is the subject of indictment and punishment not of a felonious character, such are seditious acts perjury, battery, libels, conspiracies, attempts and solicitations to commit felonies, &c Over these offences the justices of the peace at quarter sessions have a general jurisdiction, although they may be removed by certiorari to the King's Bench, and in the trial the defendant has had for a long period of time one remarkable privilege, viz that his counsel might address the jury which was equally the case in treason, but not until the year 1837 in any sort of felony The ordinary punishment of mis- [illegible] sometimes by [illegible] been sometimes termed *misprisions*, although this word in its more restricted signification, is applied to concealments of felony or treason

MISTLETOE, or MISSELTO A parasitical plant inhabiting the branches of many kinds of trees in the north of Europe It is the *Viscum album* of botanists Its connection with Druidical ceremonies is well known, but, as tradition tells us that the priests of that superstition only employed the misseltoe of the oak, some doubt has been entertained of the plant now so called being really that of our ancient chronicles, because it had not been found upon the oak for many centuries It has, however, been recently discovered upon that tree in the west of England, and this leaves no doubt upon the subject The powder of the leaves or shoots of the misseltoe has been used in epilepsy

MISERERE The 50th Psalm, 4th of the Penitential Psalms, is that designated by the Roman Catholic church under this word, on account of its first words (in the Vulgate translation, "miserere mei Deus, secundum magnam misericordiam tuam") It is the usual psalm [illegible] and more solemn modification

MISERICORD [illegible] given to the third passion

MISERICORDIA A narrow-bladed dagger so [illegible] was the weapon used by [illegible] when he enforced him to cry for mercy

MISNOMER In Law, the description of a person by a wrong name In grants by deed such mistakes may, in some instances, be corrected by the courts, if the party be sufficiently pointed out in the instrument itself In grants by will such construction will be more liberally exercised It is said that the law is not so precise as to surnames as with respect to Christian names The proper mode for the defendant to avail himself of a misnomer in an action was formerly by plea of abatement, but now the court will amend on motion (3 & 4 W 4 c 42) In criminal cases, the court had the power to amend still earlier (6 G 4 c 64) where the defendant was misnamed But if the prosecutor be misnamed in an indictment the variance is fatal, and the defendant must be acquitted It is to be observed that mere misspelling is no misnomer, if the name have the same sound with the real one

MISPRISION (From the Fr mespris *contempt* or *negligence*) In Criminal Law, in its larger sense, it is used to signify every considerable misdemeanor which has not a certain name given to it in the law, and it is said that the offence of misprision is involved in every treason or felony whatsoever Generally, however, by the word misprision is understood the contempt or neglect that is the non-disclosure or concealment, of any treason or felony, committed or to be committed, which a man is cognizant of but has never assented to, for if he expressly assented, this makes him, in a case of treason, a principal and in a case of felony either a principal or accessory, according to circumstances Misprision of treason is punished by loss of the profits of lands during life forfeiture of goods, and imprisonment for life Misprision of felony in a public officer is punished by imprisonment for a year and a day in a common person, by imprisonment for a less discretionary time, and in both by fine

MISSAL The book containing the ritual for the celebration of the various masses of the Roman communion The missals in use in different churches are not identical in all respects but the most important part of them, the canon of the mass as delivered in the Sacramentary of Gregory the Great, which was taken from that of Pope Gelasius in the 5th century and which is affirmed by Roman Catholics to be a faithful representation of the ritual of the primitive church, is common to all

MISSIONARIES In ordinary language, ministers who go abroad to preach the gospel to infidel nations The following table of the present condition of some of the more remarkable missionary societies now existing in England is taken from the *Penny Cyclopedia* —1. Society for the Propagation of the Gospel in Foreign Parts receipts 1837, 43,000*l*, expenditure, 56,000*l*; subscribers about 12,000 This society is conducted on the principles of the Church of England, and was incorporated in 1701, chiefly with a view to our then American possessions 2 Baptist Missionary Society, founded 1786 receipts 1837-8, 22,000*l*, expenditure, 20 000*l* The operations of this society are chiefly carried on in the East and West Indies 3 London Missionary Society founded 1795 now [illegible] dependents receipts 1838, [illegible] Much connected with the East Indies and the South Seas 4 Church Missionary Society founded 1814 for Africa and the East" but [illegible] missionaries extensively to [illegible] expenditure 91,000*l* 5 Wesleyan Missionary [illegible] 1817 receipts, 85,000*l*, expenditure, [illegible] extensive field of labour is in the West Indies 6 Missions of the Church of Scotland chiefly India 7 Missions of the United Brethren, or Moravians, who have been distinguished in this line of exertion since 1731 The Danish missions are among the oldest Protestant; those of the United States are now among the most extensive The history of Roman Catholic missions in the East is detailed in many works See *Duhalde*, for China The rise and fall of Christianity in Japan is narrated by Charlevoix (1715), those in America are slightly noticed in the article immediately following this

MISSIONS Stations of missionaries in infidel countries In Geography, the extensive districts formerly under the control of missionaries of the church of Rome, on the borders of the Spanish and Portuguese settlements in America, were so called These missionaries chiefly [illegible] ch they governed with [illegible] they had also extensive districts under their control The downfal of the order was followed by the destruction of these settlements those of Paraguay were wholly ruined, those of Brazil, by regulations of the Marquis de Pombal, taken from their spiritual [illegible] placed on a new footing The missions of the order [illegible] continue to subsist on the banks of the Upper Amazon and Orinoco, and in California, but they have undergone severe losses from the revolutionary wars The success of the experiment of governing the American Indians by missionaries has been the subject of much controversy It is certain that the Jesuits succeeded better than any other governors have done in rendering them industrious, and subjecting them to discipline But it is contended that this was only effected by an artificial system which rendered them the servile and childish dependents of their spiritual masters and that this slavish state was injurious to them not only in a moral but a physical [illegible] remature decay, insomuch that [illegible] of all the missions was continually decreasing, although endeavours were made to keep it up by violent seizures of free natives who were brought by force within their boundaries See Charlevoix, *Hist du Paraguay*, the *Lettres Edifiantes*, Raynal, *Histoire des Indes*, and *Southey's History of Brazil* the two last writers especially for philosophical views on the subject, although the latter is perhaps too favourable, *Humboldt's Personal Narrative*, for those on the Orinoco, *Forbes's California* for a very unfavourable view of the condition of those in the latter country American missionaries have established a government somewhat similar to those of the Roman Catholic orders in some of the South Sea Islands See *Ellis's Polynesian Researches*, the *Voyages* of Capt Beechey Capt Fitzroy and others

MITES A tribe of minute Acaridan Condylopes, which do not suck their food See Acarus

MITHRAS The grand deity of the Persians supposed to be the sun or the god of fire to which they paid adoration as the purest emblem of the divine essence The Romans also raised altars to the honour of this divinity, with the inscriptions *Deo Soli Mithræ*, or *Soli Deo invicto Mithrae* As to the introduction of this oriental worship in Rome, see *Mem de l Ac des Inscr* vol xvi p 270 It was one of those which resisted Christianity the longest See Beugnot, *Destruction du Paganisme en Occident*, *Milman's Hist of Christianity*

MITHRIDATE A celebrated medicinal confection invented by Damocrates, physician to Mithridates king of Pontus, and supposed to be an antidote to all effects of poison and contagion, [illegible] vis opium

MITRAL VALVES The valves of the left ventricle of the *heart*

MITRE (Gr *μιτρα, a head band, or diadem*) The pontifical ornament worn on the head by the pope cardinals and in some instances by abbots in the Roman catholic church, and in the Protestant episcopal church by archbishops and bishops upon solemn occasions It appears to have been a hierarchal head covering from the earliest ages of antiquity Pellerin says it was that worn by the regal pontiffs of the Hebrews, and with a few slight modifications, was afterwards adopted by the oriental kings and pagan high priests under the name of *cidaris* Among the Romans the mitre was originally a sort of head-dress worn by ladies, and Servius makes it a matter of reproach to the Phrygians that they were dressed like women, inasmuch as they wore mitres There is every reason for supposing that in England the mitre was worn by the bishops on the first introduction of Christianity into the island, and it is supposed in *Gough's Sepulchral Monuments* (vol i p 153) that the practice was borrowed from the apex or tutulus of the Flamen Dialis in ancient Rome As an heraldic ornament the mitre of a bishop is surrounded by a fillet set with precious stones the archbishop's mitre on the other hand, issues from a ducal coronet.

Mitre In Architecture, a junction of two pieces of wood or other material at an interior or exterior angle by diagonal fitting

MITTIMUS (Lat *we send*) In Law,—1 a writ for transferring records from one court to another, 2 a precept under the hand and seal of a justice of peace committing an offender to his charge *See* Commitment

MIXED CADENCE In Music *See* Cadence

MIXED FEVER A fever intermediate between inflammatory and low or typhus fever

MIZZEN MAST The name given to the mast which supports the after sails, being nearest the stern of the ship

MNEMONICS (Gr [illegible] The art of [illegible] tory of [illegible] by artificial [illegible] processes of tying a knot in a handkerchief, &c, will exemplify the simplest species of mnemonics, in which we endeavour to connect certain arbitrary acts with peculiar associations, so that the memory of the former may call up the latter Some persons have taken the precaution, before delivering an address by heart, of entering the room in which it was to be spoken, and connecting in their own minds particular portions of their intended language with certain visible objects in the room The well known solemnities observed on the perambulation of parish boundaries, &c, form another instance of practical mnemonics, the object being to fix the memory of particular spots in the mind of those present For the purpose of facilitating the remembrance of dates, names, &c various methods have been devised by different writers (especially Feinagle and Gray in England) under the names of Memoria Technica or Artificial Memory

MNEMOSYNE (Gr *μνημοσυνη*) In Classical Mythology, the goddess of memory [illegible] the genealogists of Uranus (Heav [illegible] and mother by Jupiter, of the Nine Muses Her statues usually have the figure enveloped in long and ample drapery and the right hand raised towards the chin

MOAT A ditch made round the old castles and filled with water In some cases this still remains, as at Lickhill Castle, whilst in others they are drained and planted as at the palace of the Black Prince at Eltham For the most part, however, all traces of them have disappeared

The moat surrounding a military fortress of modern construction (or the *ditch*) is left dry but where it is capable of inundation at pleasure this circumstance is considered an advantage to the system of defence

MOBILITY (Lat *moveo I move*) One of the general properties of matter, in virtue of which every body at rest can be put in motion by the action of a force adequate to overcome its inertia See Matter

MOCHA STONE A species of agate

MOCKING BIRD A name given to one of the family of thrushes, the *Turdus polyglottus* of Linnæus on account of the surprising facility and accuracy with which it can imitate almost any sound, it is also the finest of natural song-birds and the vocal organs which are well developed in all the thrush tribe find their highest perfection and complication in the mocking bird

This species in modern ornithological systems, forms the type of a genus (*Mimus* of Boie) it includes other species besides the *M polyglottus*, all of which are natives of America

MODE (Lat modus) A term used by Locke to denote 'such complex ideas which however compounded, contain not in them the supposition of subsisting by themselves but are considered as dependences on or affections of substances' Of these modes there are two kinds—*simple* and *mixed* Simple modes are only variations or different combinations of the same simple idea without the mixture of any other as *a dozen* or *a score* which are nothing but the ideas of so many distinct units added together' *Mixed modes* are those "compounded of simple ideas of several kinds put together to make one complex one,—e g *beauty*, and consisting of a certain *composition of colour and figure* [illegible] beholder" It need hardly be said that [illegible] is founded on a very imperfect and false analysis The term is now universally laid aside by writers on mental philosophy

Mode In Music the melodious constitution of the octave as consisting of seven essential and natural sounds besides the key or fundamental It is not any single note or sound, but the order of the concinous degrees of an octave the fundamental note whereof may in another sense, be called the key, as it signifies the principal note which regulates the rest The difference between a mode and a key is, that an octave with its natural concinous degrees is called a mode with respect to the manner of dividing it whilst as regards its place in the scale of music or pitch it is called a key

MODEL (Lat modulus) In Mechanics, a small or miniature representation of the structure of a machine so as to exhibit its mode of working &c Owing to the effect of increased mass in making the machine itself, the results obtained from the model exceed those of the machine in a greater ratio than the linear dimensions of the two works

Model In the Fine Arts, that which is an object of imitation In Painting and Sculpture, it is the individual whom the artist procures for getting up his proportions, details, play of the muscles &c Also in Sculpture, it is a term applied to the small sketch in wax or clay for a work of art In Architecture it is a small pattern in relief either of wood plaster or other material of the building proposed to be executed

MO'DELLING In the Fine Arts, the art of making a mould from which works in plaster are to be cast, also used for the forming and display of the design itself

MODERATORS SENIOR and JUNIOR In the University of Cambridge, two public officers appointed annually to perform various duties They are ex officio examiners in the senate house Their name is derived from another of their duties, viz presiding in the opponencies, or ex formed in the schools between undergraduates candidates for the degree of bachelor of arts These disputations, relics of the old university system, are now reduced to little more than matters of form *Moderator* is also the name applied to the president for the time being of the General Assembly of the Church of Scotland, and of the other superior church courts of the synod and presbytery

MODILLION (Fr modillon) In Architecture, an ornament sometimes square on its profile, and sometimes scroll-shaped, thus , with the intervention of one or two small horizontal members placed at intervals under the corona in the richer orders They should stand centrally over columns when the latter are employed They are simplest in the Ionic and Composite orders, more carving being bestowed on them in the Corinthian order The mutule of the Doric order, which should always stand over the centre of a triglyph, is the same sort of thing, and occupies the same place in the entablature as the modillion

MO'DULATION (Lat modulor) In Music the act of moving through the sounds in the harmony of any particular key to those of another, or the transition from one key to another

MO'DULES (Lat modulus) In Architecture a measure equal to the semidiameter of a Doric column It is a term only applied in the Doric order and consists of thirty minutes

MODULUS In Analysis, the constant coefficient or multiplier in a function of a variable quantity by means of which the function is accommodated to a particular system or base Thus in the theory of *logarithms* it is the number by which all the logarithms in one scale of notation must be multiplied to adapt them to the same number in another scale The only scales or bases actually Napier- modulus lasticity,

see ELASTICITY

MO'DUS (Modus decimandi or special manner of tithing), in Law, is when lands tenements or some certain annual sum or other profit hath been given time out of mind to a parson and his successors in full satisfaction and discharge of all tithes in kind It is in some cases a pecuniary compensation in others compensation in work and labour See TITHES

MOGRVBIANS, or MEN OF THE WEST A name formerly given to a species of Turkish infantry composed of the peasants of the northern parts of Africa who sought to ameliorate their condition by entering into foreign service

MOGUL GREAT The name by which the chief of the empire so called, founded in Hindostan by Baber in the 15th century was known in Europe The last person to whom this title of right belonged was Shah Allum, and the Mogul empire having terminated at his death in 1806, his vast possessions fell chiefly into the hands of the East India Company

MOHAIR (Gr mohr, Fr moire, It moerro, Sp muc, muer) The hair of a variety of the common goat famous for being soft and fine as silk, and of a silvery whiteness It is not produced any where but in the vicinity of Angora in Asia Minor The exportation of this valuable and beautiful article, unless in the shape of yarn was formerly prohibited, but it may now be exported unspun The production preparation and sale of mohair have long engrossed the principal attention of the inhabitants of Angora, and it used to form an important article of Venetian commerce It is manufactured into camlets and other expensive stuffs Hitherto but little has been imported into England

MOHA'MMEDANISM One of the most celebrated systems of religion in the world, so called from Mohammed, its author and founder, who was born at Mecca in Arabia, in May, 571 This founder of a new religion and of a political power, which even in his lifetime extended over his native country, and which under his successors threatened to embrace the empire of the world, traced his [illegible] descents from Kor[illegible] that bore his name, and who again was affirmed to be in direct descent from Ishmael, the son of Abraham The future prophet sprung therefore, from the noblest tribe of the Is[illegible] His paternal father was at the time of [illegible] Mecca and [illegible] the *Caaba* which from [illegible] memorials had become identified in the minds of the Arabs with every sacred feeling), consequently, from the sanctity of his territory and his office, a prince of great power and influence But though descended from so powerful a family Mohammed's early life was spent in [illegible] dence His father was a younger son [illegible] and having in his early infancy lost both his parents, his only inheritance was five camels and a female slave On his paternal grandfather was devolved the guardianship of the future prophet, but of this protector he was deprived by death when only eight years of age In a dying charge Motalleb confided this tender plant of the ancient stock of the Koreish to the hands of Abu Taleb, his eldest son, and the successor of his authority, who amply redeemed the trust reposed in him by continuing throughout life the steadfast friend of his ward amid all the difficulties and dangers to which the latter was exposed in the promulgation of his doctrines His education however, is said to have been extremely scanty, and at the early age of thirteen, being intended for a commercial life, he accompanied his uncle's trading caravan into Syria He afterwards entered into the service of Khadijah, a rich widow of Mecca, to whom his skill in commerce or his other accomplishments so far endeared him that at the end of three years she bestowed upon him her hand and fortune, — an alliance which restored him to the station of his family At this period he was twenty-five, and his wife forty years of age

During the first thirteen years of his marriage little or nothing is known of his history, but at the termination of that period he withdrew from society, — resorted to a cave in the neighbourhood of Mecca, where he gave himself up to contemplation, and laid the foundation of that bold and hazardous project which afterwards raised him to glory and dominion It was in this retirement he gave out that for two years he was in daily communication with the Deity

In his 40th year he assumed the prophetic office, and displayed his views and principles to his domestic circle His first convert was Khadijah, whom he always regarded with affection and even reverence, and whom he placed, after her death, among the only *four* perfect women the world ever saw, the other three being Miriam the sister of Moses, the Virgin Mary, and Fatima, the youngest of his own daughters The progress of the new sect was at first very slow Three years were silently employed in the conversion of fourteen (some say nine) proselytes, but in the fourth year he extended the theatre of his preaching and proclaimed his doctrines publicly to his fellow citizens The faith which under the name of Islam (the salvation), he preached, was compounded substantially of two great principles, which as Gibbon says involves an eternal truth and a necessary fiction, namely that there is only one God, and that Mohammed is his prophet — the last and greatest of the prophets He did not, however aim so much at founding a new religion as reforming the old, as declared by the former prophets, Adam Noah, Abraham Moses, and Christ by putting an end to those superstitions and idolatries by which the true faith had been corrupted Being urged to confirm the reality of his divine mission by miracles he wisely declined the attempt, appealing to the internal evidence of his doctrines, and declaring that miracles would depreciate the merit of faith The only miracle which he professed to have accomplished is a nocturnal journey from Mecca to Jerusalem, and thence through the heavens, on an imaginary animal called Borack like lightning, but the words of the *Koran* are often regarded as figurative and allegorical He persevered with assiduity in the public exercise of his mission The citizens of Mecca listened to the exposition of his principles with patience till he attacked the idols of the Caaba This, however, raised such a storm against him particularly on the part of the Koreishites, that notwithstanding the protection of Abu Taleb who, though not converted to Islamism, continued the warm and steadfast protector of his nephew, many of his followers fled to other countries, chiefly to Ethiopia This happened in the sixth year of his mission, and is called the *first Hegira* or flight

In the tenth year of his mission he lost both his wife Khadijah and his uncle Abu Taleb The death of the latter being the severest blow that the new faith had yet sustained, this year is known in the Mohammedan annals as "the year of mourning" The death of Abu-Taleb removed the only check to the virulent enmity of the Koreishites [illegible] succeeded to the sovereignty of Me[illegible] [illegible] three years, marked, however, by the accession of many proselytes Mohammed, on the invitation of a deputation from Medina fled to that city, and instantly, as if by magic, the proscribed and condemned exile became a powerful, and, as it soon appeared, an all but invincible monarch The flight from Mecca to Medina, which is called the *second Hegira* or *par excellence* THE HEGIRA, is the epoch from which the Mohammedans date their æra It occurred in the 53d year of Mohammed's age, and 13th of his mission, and coincides with the 16th July, A D 622

Hitherto Mohammed had used only the ordinary arts of persuasion and argument in propagating his religion Throughout the eighty-five chapters of the Koran published at Mecca, so far from the use of any species of coercion being recommended [illegible] his faith, he exhorts his [illegible] the injuries to which their principles might expose them, declaring that he had no authority to compel any one to embrace his creed In the eighteen chapters published at Medina, on the contrary, he taught a very different doctrine, and announced that God had commanded him to extirpate idolatry by force of arms and to force universal submission to his authority The enjoyments of paradise were promised to 'those who fight for the cause of God, whether they be slain or not" (Sur 11 4 9) Nor were those mere words of course, they were soon reduced to practice Mohammed, soon after his arrival in Medina assumed the exercise both of the sacerdotal and regal office The option of friendship, or submission, or battle, was proposed to the enemies of Islamism His petty excursions for the defence or attack of a caravan prepared his troops for the conquest of Arabia But what established his power and laid the foundation of future conquests was the issue of the battle of Bedr, near Medina, fought in the second year of the Hegira between the troops of Abu Sophian the new sovereign of Mecca, and his own, in which the latter, though only a third of the number of the enemy gained a complete victory with the loss of only forty men From this period the progress of Mohammed's [illegible] was comparatively rapid, and presented [illegible] an example of perhaps the most rapid success on record, and at the lapse of six years in the eighth Hegira his victorious troops entered the city of Mecca — an epoch from which may be dated the final establishment of the Mohammedan faith in Arabia The few contests that followed were merely the last struggles of an expiring opposition, and were mostly terminated by Mohammed's generals, while the prophet himself was employed in destroying the idols enshrined in the Caaba and in consecrating the temple to the worship of the sole God The year following is known in Mussulman history as the "year of embassies," because missions were sent to the prophet from a majority of the Arabian tribes giving in their adhesion to his creed, and recognizing his authority, both sacred and civil

But while his religion was thus triumphant and was destined still farther to spread and to remain the prophet's own days were drawing to a close About three years before his death his health had been declining, in consequence of poison that had been administered to him by a Jewess of Chaibar in order to test the validity of his divine knowledge But his death was occasioned by a fever of fourteen days on the 6th June, 632 in the 10th Hegira in the 63d year of his age His remains were buried in Medina in the very room in which he breathed his last and though the house itself has long since disappeared a simple unadorned monument marks the spot where his body reposes The pilgrim on his way to Mecca increases the worth of his pilgrimage if he turn aside to visit also the city which contains the ashes of Mohammed

During the life of Khadijah, Mohammed did not avail himself of the right of polygamy after her death however, the restraints which policy or conjugal affection had imposed on him were laid aside, and the utmost license marked his subsequent career While he limited the number of wives to four in the case of others he claimed an exemption to himself on divine authority and married no fewer than seventeen according to some authorities, and nine according to others strangely enough, all widows except one, — Ayesha, the daughter of Abu Beker By Khadijah he had four sons and as many daughters, and by an Egyptian concubine a fifth son but his sons all died in infancy, and of ten daughters none survived him except Fatima, who was married to her cousin Ali From this marriage sprang an illustrious offspring, the ancestors of the numerous existing scherifs, or sons of the prophet

The religion of the supposed [illegible] in the Koran [illegible] to Mohammedan belief, are uncreated and eternal, subsisting in the essence of the Deity, and inscribed with a pen of light on the table of the everlasting decrees and communicated at different times to Mohammed by the angel Gabriel The *Koran*, which is written in the purest Arabic, is, with some exceptions, a work characterized by great richness and sublimity To the beauty of its style, indeed, its author appeals as a proof of its inspiration, but Gibbon has remarked, that "his loftiest strains must yield to the sublime simplicity of the book of Job" (chap iv) Its boldest flights, and its general scope are borrowed from the sacred volume Indeed, the object of Mohammed seems to have been to recal the inhabitants of the populous country of Arabia to the worship of the only God, and to unite idolaters, Jews, and Christians in the same creed He taught that the chain of inspiration was prolonged from Adam to the promulgation of the *Koran*, that Christ did not die on the cross, but that a phantom, or a criminal, was substituted in his place, and that he was translated to the seventh heaven, that Christ rejoiced in the assurance of a future prophet more illustrious than himself, and that the promise of the *Paraclete*, or Holy Ghost, was prefigured in the name, and accomplished in the person, of Mohammed, the last and greatest of the prophets He taught the existence of angels, good and bad, and of the Devil or *Iblis*, describing the latter as having been expelled from heaven without hope of recovery, for refusing to pay homage to Adam at the divine command As to the inspired writings, he acknowledged the Pentateuch, the Psalms, and the Gospel The doctrine of the resurrection and the day of judgment formed part of his faith He taught that every man shall be judged according to his works, but that the believers in Islamism shall not be subjected (like the wicked idolaters or infidels) to eternal condemnation, but that, after undergoing a purifying punishment, they shall be translated into the regions of bliss He inculcated the absolute and unalterable predestination of all things He called prayer "the pillar of religion," and "the key of Paradise," and he prescribed five different stated periods of prayer daily accompanied with as many ablutions or purifications of the body During prayer he first insisted that the face should be turned to Jerusalem, in compliment to the Jews, but afterwards bestowed that honour on Mecca Alms, fasting, and pilgrimage to Mecca are the remaining duties of practical religion enjoined on all good Mussulmans Of the last the most holy was that of Ramadan instituted in honour of the month in which Gabriel appeared to him in Mecca Friday was ordained as the Moslem sabbath because it was on that day he made his flight to Medina He continued the rite of circumcision in compliment to the prejudices of his countrymen He condemned usury, and forbade the drinking of wine

The grossly sensual character of Mohammed's paradise constitutes perhaps the greatest blemish in his religious system and has exerted a debasing influence over all the countries where it has acquired an ascendency

To the history of Islamism after the death of its illustrious founder we cannot do more than allude The rival pretensions of Abu Beker and Ali the latter of whom called himself "the first believer," to succeed Mohammed in the empire he had founded both gave a temporary check to the progress of the religion, and produced a schism which exists till the present day *See* SONNITES, SCHIITES

Notwithstanding the high pretensions of his competitor, Abu Beker was elected to the office of supreme head of the Mussulman religion and power, under the title of Caliph or Khalif "the successor of the prophet" Under his sway and that of his two immediate successors the most brilliant success attended the Arab arms Indeed by the 20th Hegira or within ten years of the death of the prophet Syria, Persia and Egypt being conquered, adopted the new faith Ali was chosen the fourth khalif, but achieved nothing very memorable At his death which took place by the hands of an assassin the throne was usurped by a son of Abu Sophian whose descendants are called the Omayzade race of khalifs They held the sovereignty for nearly 100 years during which time the whole of Africa was overrun and so far colonized by tribes of Bedouins that it has since remained as to language manners and religion an Arab country The Islam faith prospered nearly as rapidly in the East at least within 80 years from Mohammed's death it embraced all the countries between the Indus and the Atlantic and from the Indian Ocean to the steppes of Central Asia It has since penetrated even into China and found its way into many of the islands in the Indian Archipelago Spain was taken in 711 The Arabs were for a short time masters of the South of France but were finally driven across the Pyrenees in 732 The Omayzade khalifs were, in the 133d Hegira (A D 750), superseded by the descendants of Abbas one of the uncles of Mohammed This last dynasty is known in history as that of the Abbasside khalifs

Meanwhile the seat of the khalifat was removed from Medina to Damascus and latterly to Bagdad Nor was the khalifate itself of very long standing It had been tottering for years, but it fell in the 656th Hegira (A D 1258), a Tartar army having taken Bagdad, and put an end to the nominal, sacerdotal and regal power of the khalifs, the real power having for a long time, resided in the Turkish sultans of Asia Minor The title of khalif is now recognized as one of the attributes of the grand segnior as successor of Mohammed, and of the sophi of Persia as successor of Ali, but it no longer implies the discharge of any religious [illegible]

But neither the foreign conquests of the Mussulmans, nor the downfall of the khalifat, made any essential change in the political state of Arabia The people adhere to Mohammedanism as the true faith, but otherwise

are divided into petty tribes and communities, as before the birth of the pretended prophet Of two attempts made in Arabia to reform the Moslem faith, all traces of the first (A D 890), the object of which was to rescind the prohibition of [illegible] the holy ashes [illegible] in more recent times, namely in the beginning of last century It was made by Addul Waheb, who proclaimed himself a prophet sent by God to reform the abuses [illegible] Mohammed, or any created being (*See* WAHABEEISM) But while these doctrines were rapidly spreading, and while the cities of Mecca and Medina had fallen into the hands of the new sect, Mehemet Ali in the name of the sultan, gave an effectual check (1813) to their farther progress, and restored the holy cities to the nominal authority of the Porte The Wahabee tenets have since been at a stand, or are on the decline, even in Nedsjed, the native province of the founder (See *Abulfeda in vita Mohammed*, *Prideaux Life of Mohammed*, 8vo 1710, *Adam's Relig World Displayed*, *D Herbelot*, *Bibliotheque Orient*, *Greens Life of Mahomet*, the *Travels* of Niebuhr and others, *Burckhardt's Notes on Bedouins and Wahabees*, *Rycaut's Present State of the Ottoman Empire*, *Lives of Mohammed by Boulainvillier and Gagnier*, *Mill's Hist of Moham*, *Forster's Moham Unveiled*, and especially *M Culloch's Geog Dict*, art Arabia")

MOIDORE A Portuguese gold coin, value 27*s* sterling

MOI'NTAU (Fr) A small flat bastion raised in front of an intended fortification to defend it from the approaches by means of small arms

MOIRE'E METALLIQUE called in this country crystallized tin plate, is a variegated primrose appearance produced upon the surface of tin plate by applying to it in a heated state some dilute nitro muriatic acid for a few seconds then washing it with water drying, and coating it with lacquer The figures are more or less beautiful and diversified according to the degree of heat and relative dilution of the acid This mode of ornamenting tin plate is much less in vogue now than it was a few years [illegible] *Dict of Arts* &c)

MOLARES *Molares* (Lat mola *a mill*) Teeth generally having a flattened triturating surface and situated behind the incisors and canines when these are also present In some Mammals as the Cape ant eater, all the teeth are molars They are generally of two kinds viz those which are liable to be displaced and succeeded by others in the vertical direction, and those which are succeeded and sometimes as in the elephant and kangaroo displaced by others developed at the back of the mouth, and advancing forwards horizontally the first are termed false molars the second kind true molars

MOLA'SSE A provincial name used in Switzerland for a soft green sandstone belonging to the Miocene tertiary period *See* GEOLOGY

MOLA'SSES (Port melasses) A brown viscid uncrystallizable sugar (See SUGAR) It is sometimes used in England in preparing the coarser sort of preserves and on the Continent extensively in the manufacture of tobacco It has a burned but not a disagreeable taste

MOLE A species of the genus *Talpa* (which see) common in this country and other parts of Europe This quadruped exhibits in perfection that modification of structure by which the Mammiferous animal is adapted to a subterranean life Its head is long conical and tapering to the snout which is strengthened by a bone and by strong gristles worked by powerful muscles The body is almost cylindrical thickest behind the head and gradually diminishes to the tail There is no outward indication of a neck, that part being enlarged to the size of the chest by the massive muscles which act upon the head and fore-legs These, which are the principal instruments by which the mole excavates its long and intricate burrows are the shortest broadest and strongest in proportion to the size of the animal, which are to be met with in the Mammiferous class The rapidity with which the mole can make its way through a favourable soil is such, that it may be said to swim in the earth and, since it must displace matter so much denser than water, so do its fore limbs display a mechanism correspondingly superior in strength to the analogous extremities or pectoral fins of the dolphin The food of the mole consists of worms and insects its voracity is great, and it soon perishes if food be scarce or wanting The ardour of the sexual appetite is not less intense and characteristic of this curious quadruped The sense of sight is very feeble, the eyes being minute and rudimental, but the other faculties of smell and hearing, as being more serviceable in its dark retreat, are extremely acute

The female prepares a nest of dry herbage, roots, and leaves, in a chamber commonly formed by excavating and enlarging the point of intersection of three or four passages The young are brought forth to the number of four or five in April, and sometimes later

The farmer views the operations of the mole as destructive to his crops not only exposing and destroying their roots, or by [illegible] of the mole-hills, his burrows, moreover, become the haunts and hiding places of the field mouse and other noxious animals The mole is also accused of carrying off quantities of young corn to form its nest Hence every means are devised to capture and destroy it, and men gain a livelihood exclusively by this occupation Some naturalists, however, plead that the injury which it perpetrates is slight, and that it is more than counterbalanced by the benefit which it produces by turning up and lightening the soil and especially by its immense destruction of earth worms, and many other noxious animals which inhabit the superficial layer of the ground, and occasion great injury to the roots of grass, corn, and many other plants The soundest practical conclusion lies probably in the mean of these opinions, and the enlightened agriculturist while he takes prompt measures to prevent the undue increase of the mole would do well to reflect on the disadvantages which might follow its total extermination

MOLE In Engineering, a massive work formed of large stones placed in the sea by means of coffer-dams, extended either in a right line or an arch of a circle before a port, which it serves to close and to defend the vessels in it from the impetuosity of the waves, &c It is sometimes used synonymously with *harbour*

MO'LECULE (Lat molecula) A corpuscle or atom, single or compound Molecules are the elementary particles into which all bodies are supposed to be resolvable

MO'LINISM In Roman Catholic Theology a system of opinions on the subjects of grace and predestination somewhat resembling that advocated by the Arminian party among Protestants It derived its name from the Jesuit Louis Molina, professor of theology in the university of Evora in Portugal, who laid down a series of propositions on these debated questions in his work, entitled *Liberi arbitrii cum gratiæ donis &c*, *concordia*, which appeared in 1588 It was attacked by the Dominicans on the charge of having advocated in it Pelagian or Semi Pelagian sentiments, and accused before the Inquisition he appealed to Rome, and the cause was debated for twenty years in the congregations, and left at last undecided by a decree of Paul V in 1687 Since that period Molinism has been taught as an opinion which believers are free to embrace in Roman Catholic schools and generally supported by the Jesuit and attacked by the Jansenist party It must not be confounded with *Molinosism* — a name which the doctrine of the Quietists has received from the work of a Spanish enthusiast (Molinos) on Mystical Life, condemned in 1687 by Innocent XI The French Quietists professed to abjure and oppose the errors of Molinos (*Mosheim*, 17th Cent II 2 part 1) See QUIETISTS

MO'LISITE A mineralogical name of the crystallized titanate of iron of Dauphiny

MO'LLAH The title of the higher order of judges in the Turkish empire After the three first magistrates of the empire (the two cadil-askers of Roumi and Anatolia, and the istambol-cadissy or chief ordinary judge of the capital) follow fourteen mollahs, who preside over the fourteen principal seats of justice in the empire, among these, the mollahs of Mecca and Medina have the highest rank The place of a mollah, like all others in the Turkish empire is held only at the will of the sovereign, and is now granted annually (see *D Ohsson*, *Tableau de l'Empire Ottoman* vol iv), but displaced mollahs preserve their rank in the Ulema above their successors The Turkish mollah must not be confounded with the Tartar *mulla*, which see

MO'LLE (Ital) In Music, a sound that is flat as compared to another half a tone higher, thence called sharp

MOLLUSKS *Mollusca* (Lat mollis, *soft*) The name applied by Cuvier to the great primary division of the animal kingdom which includes all those species having a ganglionated nervous system, with the ganglions or medullary masses dispersed more or less irregularly in different parts of the body which is soft and inarticulate The pulmonary or branchial circulation is separate and distinct but is aided by the direct propulsion of a heart in one class only There is always a heart for the systemic circulation, and it mostly consists of one ventricle and one auricle Some of the mollusks breathe air but the greater part respire through the medium of salt or fresh water The blood of the mollusks is white or blueish In one class only is there a rudiment of an internal skeleton giving attachment to a part of the muscular system, in the rest it is absent, and the muscles are attached to various points of the skin Their contractions produce inflexions and extensions of their different parts, and, alternating with relaxations, enable the species to creep climb swim burrow and seize upon various objects, according as the form of these parts may

permit, but as the locomotive organs are not supported by articulated and solid levers the mollusks cannot leap or advance rapidly on dry land Many of the aquatic species are encumbered with a heavy shell Nearly all the mollusks have an extensive fold of the skin reflected over their body which it covers like a mantle, it is sometimes produced into a breathing pipe or extended and divided in the form of fins When the locomotive organs simply membranous or fleshy, or when a horny or testaceous rudiment of a shell is developed, but remains concealed in the substance of the mantle, the mollusk is said to be *naked* When the shell is so much enlarged that the contracted animal finds shelter beneath or within it, the species is said to be *testaceous* (*See* CONCHOLOGY) The masticatory or oral organs present all the various modifications for predatory, omnivorous, or herbivorous habits, and the stomach may be simple, multiple, or complicated with a peculiar armature Some of the mollusks are unisexual, others androgynous a few dioecious

With few exceptions, their habits and economy present comparati they are only preserved ity *See* MALACOLOGY

MO'LOCH The name of the chief God of the Phœnicians, frequently mentioned in Scripture as the God of the Ammonites and probably the same as the Saturn of the Syrians and Carthaginians Human sacrifices were offered at the shrine of this deity and it was chiefly in the valley of Tophet to the east of Jerusalem that this brutal worship Solomon built a temple to Moloch on the Mount of Olives and Manasseh long after his son pass through the horrid king

Milton has described the character of Moloch in the following well-known lines —

> First Moloch horrid king besmear'd with blood
> Of human sacrifice and parents tears
> Their children
> Wisest
> Of
> And black Gehenna call'd, the type of Hell

MOLOSSUS In Greek and Latin poetry, a foot consisting of three long syllables as χαιρουσαι γεγηθασι It is said to derive its name either from a favourite dance of the Molossi, a people of Epirus, or from Jupiter Molossus, in whose honour odes were composed in which this

MOLYBDENUM (Gr μολυβδος *lead*) This name was originally applied to the native sulphuret of molybdenum, which was considered to be an ore of lead it was afterwards shown to be the ore of a peculiar metal to which the name molybdenum was given It is white brittle, very infusible, and of a specific gravity about 8·6 It forms two oxides and an acid The equivalent of the metal is about 48, and the *molybdic acid* consists of 1 atom of molybdenum and 3 of oxygen and is represented by the equivalent 72 The compounds of this acid are called *molybdates* The molybdate of lead has been found native

MO'MENT (Lat movere *to move*) A small but indefinite period of time Sometimes the word *instant* is used synonymously with moment

MOMENT MOMENTUM These terms have been used by writers on mechanics in various senses Galileo in his *Dialogues* uses the phrase *momentum of a power* or *of a weight*, applied to a machine to denote the action, energy, or impetus of the power to move the machine, so that an equilibrium subsists between two powers when their moments to move the machine in opposite directions are equal and he shows that the *momentum* is proportional to the power multiplied into the virtual velocity This notion of momentum was also adopted by Wallis, in his *Mechanics*, published in 1669 and when the term is used with respect to a weight, it is synonymous with the phrase *quantity of motion*, that is, the product of the mass by the velocity

The product of the mass by the *square* of the velocity or the *living force* (*see* FORCE) is sometimes called the *moment of the moving force*, or the *moment of activity*, and the product of the mass by the velocity and by a line (or, which is the same by the square of the velocity and by a time) is called the *moment of the quantity of motion*, or *quantity of action* (Carnot, *Principes de l'Equilibre et du Mouvement*)

Modern writers use the phrase *moment of a force with respect to a point*, to denote the product of the force into the perpendicular let fall from the point upon the line of its direction, and *moment of a force with respect to a plane*, to denote the product of the force into the perpendicular drawn from its point of application to the plane These two moments are entirely distinct The first depends upon the direction of the force, and is independent of its point of application, the latter depends upon the point of application, and is independent of the direction (See Poisson, *Traité de Mécanique*)

MOMENT OF INERTIA, in Dynamics denotes the sum of the products of all the material elements of a revolving body each multiplied into the square of its distance from the axis of rotation It is the integral of the expression $\int r^2 dm$, in which dm is the element of the mass, and r its distance from the axis *See* ROTATION

MO'MIERS (Lat the Irregular Verb *mamincrv*) The name by which the rural population of the so-called Evangelical party have been designated in Switzerland, and some parts of France and Germany, since 1818 They appear originally to have borne a considerable resemblance to the Methodists of our own country, for, like the latter they at first embraced no tenets distinct from those of the established church, and were only distinguished from its members by a more habitual indulgence in devotional contemplation and religious exercises But

party in a pamphlet published in 1818, accused the latter of denying the divinity of our Saviour and of a thorough backsliding from the doctrines of Calvinism, and the Geneva clergy (*la venerable compagnie*) having in the view of allaying asperities passed a resolution prohibiting any theories of the doctrinal points of religion from being propounded in the pulpit and having counselled the clergy to avoid disputed points as much as possible in their discourses the smouldering embers of their hostility to the established church burst into a flame They now began to attack the clergy in the pulpit and in pamphlets, accusing them of having abandoned all gospel truth and denying their right to be regarded as ministers of the establishment But all their efforts to bring the latter into contempt were unsuccessful the Genevese remained faithful to their pastors, and in the year 1831 the Momiers possessed only about 200 adherents

In other parts of Switzerland however and more especially in the canton de Vaud, the zeal of these sectaries was attended with more success After a few years toleration of their preaching and proselytizing, during which it was said the Momiers had sown the greatest discord and hatred among the inhabitants of the canton, the government at last saw the necessity of interference, and in the year 1824 promulgated some vigorous ordinances to put them down These enactments as might have been expected failed of their effect The enthusiasm of the Momiers was redoubled they were now surrounded with the glory of martyrdom and many who before had viewed their zeal with indifference or contempt now deeply sympathized in what they could not but regard as an unprovoked attack upon the liberty of conscience In consequence of this their promulgation was relaxed, then suffered to lie dormant, and at last repealed in 1831 Since that period the number of the Momiers has gradually diminished and in 1839 the clergy of this canton resolved by a large majority to revert to the ancient *régime* of the church (See the *Conversations Lexicon der Gegenwart* See also the *Edin Review*, vol xlii, which contains an interesting account of the rigorous enactments passed against this sect with some severe remarks on their violence and absurdity)

MO'MUS (Gr μωμος *derision*) The god of raillery and ridicule, and said by Hesiod to have been the progeny of night

MO'NACHISM MONK MONASTERY (All derived from the Gr μονος *alone*) Words indicative of certain important features in ecclesiastical history Monachus, or monk, properly signifies one who lives a solitary life and was applied in the first instance to the numerous individuals who began in the second and third centuries to retire from the occupations of the world and devote themselves in the deserts of Egypt and Syria to a contemplative and religious life It was not till the middle of the third century that the monkish system, properly so called was established by which many persons were congregated bound by vows to the performance of duties and abstinence from worldly enjoyments These monks are distinguished by the appellation of Canobites, or Associates, from the ascetics anchorites, and hermits, who lived apart not from the world only but from each other The monkish system originated in Egypt where St Anthony founded several associations of this kind The inmates of the primitive monasteries were bound by the profession of four objects solitude labour, fasting, and prayers They renounced all temporal possessions, and supported themselves entirely with their own hands Fasting was practised in moderation only, nor do the early monks appear to have affected piety or regularity by the extravagant austerities of later times For an useful list of books on the subject, see this article in the *Penny Cyclopædia*

For an account of the progress of this practice, and the

rules to which the professors of Monachism were subjected in later times see ORDERS (RELIGIOUS)

MONAD (Gr *μονας an unit*) In Metaphysics this [illegible] his works, I find myself quite incompetent to annex any precise idea to the word as he employed it" He then quotes the following a [illegible] tempts to explain his [illegible] has no parts a compound substance is an aggregate of simple substances, [illegible] parts, are neither [illegible] are the real atoms of nature, in other words, the elements of things" "Every monad is a living mirror, representing the universe, according to its particular point of view, and subject to no regular laws, as the universe itself" "Every monad with a particular body makes a [illegible]" (*Enc Brit*, Preliminary Dissertation, [illegible] The groundwork of the monadic theory is to be found in the different physical systems of Zeno, Leucippus, Democritus, and Epicurus, but Leibnitz was the first who reduced it to a system, and its chief supporters since his death have been M Wolf and Madame Duchâtelet

MONADELPHOUS (Gr *μονος* and *αδελφια, a fraternity*) A botanical term applied to stamens the filaments of which are combined into a single mass as in the common mallow It is the name of some of the classes in the Linnæan system

MONANDROUS (Gr *μονος* and *ανηρ a man*), is a flower having but one stamen It is the name of the first class in the Linnæan system

MONARCHY (Gr *μοναρχια*, derived from *μονος single*, and *αρχειν to rule*) The government of a single person Monarch and monarchy are equivalent in common speech to king and kingdom so that we often read of the Spartan monarchs &c although the government of Sparta was under a double race of kings reigning at the same time Monarchies are usually said to be of four kinds —*absolute*, *limited hereditary* and *elective* which are self-explanatory terms The only elective monarchy in Europe was that of Poland All absolute and limited monarchies have adopted the hereditary principle

MONAS (Gr *μονας*) A genus of extremely minute polygastric Infusores

MONASTERY (Gr *μονη*) The general name for those religious houses appropriated to the reception and maintenance of monks and nuns but especially of the former (*See* NUNNERY) For an account of the origin and object of monasteries see MONACHISM, and the authorities there referred to, and for the habits, rules and peculiarities of the different orders of monks and nuns, see the respective articles but more especially ORDERS RELIGIOUS The English term *monastery* was variously rendered by the Greek fathers, thus we find it expressed not only by *μοναστηριον* and *μονη* but by *σεμνειον a holy place*, *μαυδρα, an inclosure* *φροντιστηριον a place of meditation* &c The suppression of monasteries was one of the first consequences of the Reformation in all the countries that abandoned the Popish faith But even in Roman Catholic states, with the exception of Italy they have long been on the decline, and though since the relaxation of the penal laws several nunneries have been established in various parts of Great Britain there is no reason to suppose that these establishments will ever attain even an approximation to their pristine vigour

MONDAY The second day of the week is so called, and means, literally the *day of the moon* Its equivalents in Fr and Germ are respectively Lundi and Montag, signifying also *day of the moon*

MONEY * In Political Economy the name given to the commodity adopted to serve as the *marchandise bannale* or universal equivalent of all other commodities, and for which individuals readily exchange their surplus products or services

Without the use of money of some sort or other exchanges must have been greatly embarrassed and the division of employments never could have been carried to any considerable extent Innumerable difficulties would occur in attempting to carry on trade by barter A, for example, has a quantity of corn which he wishes to exchange for cloth belonging to B but the latter [illegible] with corn, no exchange [illegible] A must therefore, [illegible] session of the cloth, learn what commodity B will accept in exchange for it, and having learned this, he must seek out some third person willing to part with the equivalent demanded by B in exchange for corn It might not, perhaps, be possible for A to get his purpose effected so easily as has here been supposed, or without negotiating several subsidiary exchanges, but what has now been stated is sufficient to evince the extreme difficulty of carrying on commerce in this way

Individuals so placed would naturally endeavour, in seeking their own advantage, to obviate, in as far as practicable, such inconveniences, and it would require but little sagacity to perceive that the best way of accomplishing this would be to acquire some portion of that article, whatever it might be, which was observed to be most in demand, or which passed most readily from hand to hand in exchange for others, because, when possessed of it, one would be able, with comparatively little difficulty, to get whatever else he wanted Now, this generally desirable article, whether it be corn, salt, cowries, hides, or whatever else, is in fact money But though this grand instrument of exchange may be one thing in one country and one state of society, and another thing in another country and another state of society it is never the result of invention or contrivance It originates in the circumstances natural to society, and is changed, improved, and perfected, according as experience serves to make individuals better acquainted with its nature and functions

An article that has been adopted from a sense of its suitableness to serve as the ordinary equivalent for other things, or as the common medium of exchange, comes in the course of time to be used also as a *measure of value*, or as a standard by which to compare and estimate the values of other things Thus, instead of saying that an individual is worth 1000 sheep, 1000 quarters of wheat or 1000 acres of land, these are rated or estimated at their value in money, and it is said that their owners are worth certain amounts of the latter Not only therefore does the introduction of money contribute in the most effectual manner to the facilitating of exchanges but it also gives precision to statements as to values that would otherwise be all but unintelligible The statement for example, that an individual was worth 1000 head of cattle, or 1000 packs of wool would convey no clear idea even to dealers in these articles, as their qualities differ so very widely, and supposing these to be ascertained there are very few individuals who know anything of the value either of cattle or wool But by rating them in money all these difficulties and ambiguities vanish in an instant, reference is then made to a measure with which every body is familiar and every one has a distinct idea and full knowledge of the value of the articles, or wealth of the parties referred to

Qualities required in a Commodity fitted to serve as Money —An immense variety of commodities have been adopted to serve as money in different countries and states of society, but, in the course of no very long period it is ascertained that no commodity can be advantageously employed as money unless it possess certain properties First it should be easy of transportation, and therefore should possess great value in small bulk 2d it should admit of being rubbed and carried about without losing much from the wear, and it should admit of being hoarded or kept for an indefinite period without loss 3d as the products to be exchanged for money are of very different value, it should also admit [illegible] homogeneous, that is a given quantity of money in London should be precisely identical with the same quantity in Edinburgh Dublin and every where else and 5th, the value of mon[illegible] other things [illegible] change only [illegible] lities most essential to any commodity adopted to serve as money, and the money of any country may be said to be good or bad according to the degree in which it possesses or wants these qualities

Now, it will be found that the precious metals possess all the qualities enumerated above in a far higher degree than any other products with which we are acquainted, and this has doubtless formed the irresistible reason that has led all civilized communities to adopt them as money The cost of their production, especially of gold, is so very considerable that they possess great value in small bulk, their firm and compact texture makes them difficult to wear and they may be kept for any length of time without deteriorating, they are divisible into any number of parts and have the valuable property of being easily reunited by means of fusion without loss, they are perfectly identical, the physical qualities of an ounce of pure gold or silver taken from the mines in any part of the world being precisely the same with those of an ounce taken from the mines in any other quarter; and though their value be not invariable, it changes, speaking generally, only by slow degrees, and is less susceptible of fluctuation than that of most other articles No wonder, therefore, when almost all the qualities necessary to constitute money are possessed in so eminent a

* Etymologists differ respecting the derivation of the word money Some contend that it comes from the Latin *admonish*, *reform* because the stamp impressed on coin indicates its weight and fineness. Others contend [illegible]

degree by the precious metals, that they have been used as such in civilized societies from a very remote æra They became universally money, to use the words of Mr Turgot, "not in consequence of any arbitrary agreement among men, or of the intervention of any law, but by the nature and force of things"

Introduction of Coined Money —When first brought to market, gold and silver, like copper, iron, or any other metal, were in the shape of bars or ingots, and were exchanged or bartered for other commodities exactly as these would have been bartered for anything else The parties having agreed upon the quantity of the precious metals to be given for certain goods the quantity was next delivered by weight Nor is this mere conjectural statement, advanced in a later age to explain appearances, and resting on probability only Aristotle (*Polit* lib i cap 9) and Pliny (*Hist Nat* lib xxxiii cap 3) tell us that such was, in fact the method by which the precious metals were originally exchanged for other things in Greece and Italy, [illegible] furnish a striking example of [illegible] primitive practice in the East It is there stated that Abraham weighed 400 shekels of silver, and gave them in exchange for a piece of ground he had purchased from the sons of Heth (Genesis, xxiii 16) It is also mentioned that this silver was "current money with the merchant" an expression which evidently refers to its quality only, for, had the silver been coined it would have been unnecessary to have weighed it But the weighing of gold and silver whenever they happened to be exchanged for commodities and their adjustment to the agreed on weight must have been a very difficult and troublesome process There can however be no doubt that the greatest obstacle to the use of the precious metals as money would at first be found in the difficulty of determining their purity or fineness with sufficient facility and accuracy It is indeed most probable that when they originally began to be used as money their quality would be inferred from their weight and colour But the extreme inexactness of the conclusions derived from such loose and unsatisfactory data would soon become obvious, and the devising of some method by which the weighing of the metals in exchanges might be dispensed with and their quality be easily and accurately determined would be seen to be indispensable to their general use as money Luckily such a method was not long a desideratum It was early discovered that to ascertain its purity and to obviate the trouble and expense of weighing the metal all that was necessary was to form it into *coins*, that is to mark each piece with a public stamp or authoritative impress declaring its weight and fineness Such appear to have been the steps that led to the formation and introduction of gold and silver coins (*Goguet De l'Origine des Lois* i 269 Hood), the employment of which has been of the very greatest utility and has perhaps contributed more than anything else to facilitate commerce and to accelerate the progress of civilization and the arts *

"Without some article of known exchangeable value such as coin, readily received as an equivalent for other things the interchange of commodities must have been very limited, and consequently the divisions of labour very imperfectly established Now money obviates these evils, and by a twofold operation
In the first place it saves all that t[illegible]
while the intercourse between man and man is carried on by barter, must frequently intervene before a person can be supplied with the quantity of the commodity which he wants, in the second place and in consequence of its saving the time and labour which must otherwise be spent in effecting exchanges it multiplies the transactions of mercantile industry, and thus allows the divisions of employment to be more thoroughly established By the first operation it disengages a very considerable portion of labour from an unproductive occupation, and enables it to receive a more useful direction, by the second it increases in a very high degree the productive powers of the labour already usefully employed It assists every man in availing himself of the skill and dexterity which he may have acquired in any particular calling and [illegible] in a manner suitable to the climate [illegible] districts and different countries And by both these operations coins increase to an extent, not easy to be calculated, the wealth of civilized communities" (*Torrens on the Production of Wealth* p 305)

But, however great and obvious the advantages attending the use of the precious metals in the shape of coin, it is necessary to bear in mind that the nature of exchanges and the principle on which they are made, are not [illegible] affected Equivalents are still given [illegible] a quarter of corn for an ounce of pure unfashioned gold bullion is as much a barter as if it were exchanged for an ox, or a barrel of beer, and supposing the metal to be formed into a coin, or marked with a stamp declaring its weight and fineness, that circumstance could, it is obvious, make no change in the terms of the barter The coinage would save the trouble of weighing and assaying the bullion, but it would do nothing more A coin is merely a piece of metal of a known weight and fineness, and the commodities exchanged for it are uniformly held by the parties to be of equal value, and yet these obvious considerations have been very generally overlooked The notion was [illegible] that coins were merely the *signs* of value [illegible] that they have no more claim to this designation than bars of iron or copper, sacks of wheat, or any other article Coins exchange for other things because they are desirable articles which having been produced by an expenditure of capital and labour possess real intrinsic worth A draft, cheque, or bill may not improperly perhaps be regarded as the sign of the money or coin to be given for it but that coin is itself a valuable commodity A sovereign is not a sign —it is the thing signified

Privilege of Coining Legal Tender —In order to obviate the endless confusion and inconvenience that could not fail to [illegible] from the [illegible] purity the [illegible] prohibited the issue of coins by private parties, and has itself supplied those in circulation Generally also very severe penalties have been inflicted on the forgers of coin, or on those who fabricate counterfeit coins or coins of less weight than the standard or made up in whole or in part of some baser or less valuable metal It is obvious indeed that the extensive practice of this offence by necessarily generating a feeling of insecurity and suspicion would check the circulation even of genuine coins and would consequently in so far deprive society of the advantages resulting from their employment It is found however that the improvement of the fabric of the coins by the perfecting of the dyes and otherwise is a more effectual means than even the utmost severity of punishment for the prevention of forgery though some very considerable degree of the latter is of course always indispensable

Where the use of coins has once been adopted all values in contracts and other engagements are rated or estimated in money and it is usual in almost all countries to enact that coins of the legal or standard weight and purity shall be *legal tender* and to declare that no legal proceedings of any kind shall be instituted on account of any debt or pecuniary obligation against any individual who has offered to liquidate the same by payment of an equivalent amount of the recognized coin of the country A pound troy or 12 oz of the metal of which English silver coins are made contains 11 oz 2 dwts pure silver and 18 dwts alloy This pound is coined into 66 shillings, so that each shilling contains 80 727 grains fine silver and 87 27 grains standard silver, and the money pound [illegible] contains 1014 54 grains pure silver and [illegible] standard silver From 1600 down to 1816 the pound weight of standard silver bullion was coined into 62 shillings All the English silver coins have been coined out of silver of 11 oz 2 dwts fine from the Conquest to this moment except for the short period of sixteen years from the 34th Henry VIII to the 2d Elizabeth

The fineness of gold is estimated by carat grains equivalent to 4½ dwts troy, gold of the highest degree of fineness or pure being said to be 24 carats fine The purity of our present gold coins is 11 parts fine gold and one part alloy The sovereign or twenty shilling piece, contains 113 001 grains fine gold and 123 274 grains standard gold The pound troy of standard gold is coined into 46 sovereigns and $\frac{80}{720}$ths of a sovereign, or into 46*l* 14*s* 6*d* The mint or standard price of gold is therefore said to be 46*l* 14*s* 6*d* per pound troy, or 3*l* 17*s* 10½*d* an ounce The alloy in coins is reckoned of no value, it is allowed in order to save the trouble and expense that would be incurred in refining the metals to their highest degree of purity and because when its quantity is small it renders the coins harder, and less liable to be worn or rubbed Were the quantity of alloy considerable, it would lessen the splendour and ductility of the metals, and would add too much to the weight of the coins

Before the art of metallurgy was well understood, the baser metals were frequently used as money Iron was the primitive money of the Lacedæmonians, and copper of the Romans But both iron and copper deteriorate by being kept, and, besides this defect, the rapid improvement of the arts, by lowering their price, rendered their bulk too great in proportion to their value to permit of their continuing to be used as money Copper, indeed,

* The Roman jurists have given a clear and concise account of the circumstances that led to the use of money, and of its functions — "*Origo emendi vendendique a permutationibus cœpit Olim enim non ita erat numerata neque aliud merx, aliud pretium vocabatur sed unusquisque, secundum necessitatem temporum ac rerum, utilibus inutilia permutabat, quando plerumque evenit ut quod alteri superest alteri desit Sed quia non semper, nec facile concurrebat, ut cum tu haberes quod ego [illegible] electa materia [illegible] permutationum æqualitate quantitatis subveniret [illegible] publicâ percussa, usum dominiumque, non tam ex substantia præbet quam ex quantitate nec ultra merx utrumque, sed alterum pretium vocatur*" (*Digest*, lib. xviii tit. 1 de Contr Empt)

is still used in the form of tokens, convertible into silver in very small payments In this country, copper pence and halfpence are rated at about 72 per cent above their real value, but as their issue is exclusively in the hands [illegible] they are only legal tender to the [illegible] any one payment, this over- [illegible] of any bad effect The use of copper in other countries is limited in much the same [illegible] everywhere the only metals [illegible] to the coins used in considerable [illegible]

Varying the Standard — The value of all sorts of property being estimated and the stipulations in almost all contracts for its purchase sale, or hire being made in money or coins, it is plain that no change can take place in the value of such money or coins without virtually subverting these estimates and contracts and enriching the debtor portion of society at the expense of the creditor portion, or *vice versa* As the cost of producing all commodities is liable to vary from improvements in the arts the exhaustion of the present or the discovery of new sources of supply none can be selected to serve as money or coin that may not vary in its *cost* or real value It is believed, however, that the precious metals vary less than any material that could be suggested, and, with the exception of the extraordinary fall in their value caused by the discovery of the American mines, it seems to have been remarkably constant at other periods

But, in addition to the fluctuations naturally inherent in the value of coins arising from variations in the cost of the metal of which they are made, their standard has been repeatedly changed Notwithstanding that money or coin, from its being universally used as a scale by which to compute the value of all commodities and as the equivalent for which they are commonly exchanged is by far the most important of all the measures used in society and should consequently, be preserved as invariable as possible there is none that has been so frequently altered The necessities or extravagance of governments have forced them to borrow and, to relieve themselves of the incumbrances thus contracted they have almost universally had recourse to the disgraceful expedient of degrading the coin, that is of *cheating* those who lent them money to the extent of the degradation and of enabling every other debtor in their dominions to do the same

The ignorance of the public in remote ages facilitated this species of fraud Had the names of the coins been changed when the quantity of metal contained in them was diminished there would have been no room for misapprehension But although the weight of the coins was undergoing perpetual and their purity occasional reductions their ancient denominations were almost uniformly preserved, and the people who saw the same names still remaining after the substance was diminished — who saw coins of a certain weight and fineness circulate under the names of florins, livres or francs and pounds — and who saw them continue to circulate as such after both their weight and the degree of their fineness had been lessened began to think that they derived their value more from the *stamp* affixed to them by authority of government than from the quantity of the precious metals they contained This was long a very prevalent opinion, but the rise of prices which invariably followed every reduction of the standard and the derangement that was thereby occasioned in every pecuniary transaction undeceived the public and taught them and their rulers the expediency of preserving the standard of money inviolate

The standard may be reduced by simply raising the denomination of the coin, by ordering for example that a half-sovereign should pass for a sovereign and the latter for a double sovereign &c It injustice be resolved upon this is the least mischievous way in which it can be perpetrated inasmuch as it saves all the trouble and expense of a recoinage But as it renders the fraud obvious and glaring it has rarely been resorted to, and most reductions have been effected either by diminishing the weight of the coins or by increasing the proportion of alloy in the metal of which they are made, or both

Originally the coins of all countries seem to have had the same denominations as the weights commonly used in them, and contained the exact quantity of the precious metals indicated by their name Thus, the *talent* was a weight used in the earliest period by the Greeks the *as* or *pondo* by the Romans the *livre* by the French, and the *pound* by the English and Scotch, and the coins originally in use in Greece, Italy, France and England bore the same names, and weighed precisely a talent a pondo a livre, and a pound The standard has not, however, been preserved inviolate, either in modern or ancient times It has been less degraded in England than anywhere else, but even here the quantity of silver in a pound sterling is less than the *third* part of a pound weight, the quantity it contained in 1300 In France, the livre current in 1789 contained less than *one sixty-sixth* part of the silver implied in its name, and which it had actually contained previously to 1103 In Spain and some other countries [illegible] been carried still further From 12[illegible] of England and Scotland were of the same weight and purity, but at the last-mentioned epoch the standard of Scotch money was, for the first time, sunk below that of England, and by successive degradations the value of Scotch money, at the union of the crowns in 1600, was only a *twelfth* part of the value of the [illegible] of the kingdoms [illegible] Scotland

The gold and silver coins of Ireland have been for a considerable period the same as those of Great Britain, but until 1825 they were nominally rated 8⅓ per cent higher This difference of valuation, which was attended with considerable inconveniences, was put an end to by the act 6 Geo 4 c 79, which assimilated the currency throughout the empire

Mint or Government Valuation of Gold and Silver Coins — If both gold and silver coins be made legal tender it is obviously indispensable that their value with [illegible] or that [illegible] entitled to discharge the claims upon them by payments either of gold or silver coins according to some regulated proportion — a practice which was long adopted in England

But the value of each of the precious metals is liable to perpetual changes, and hence, however accurately soever their proportional [illegible] may correspond with [illegible] bear to each other in the market when the regulation is made the chances are ten to one that it will speedily cease to express their relation to each other The moment however, that such a change takes place, it becomes the obvious interest of every one who has a payment to make to make it in the *overvalued* metal, which, consequently becomes the sole, or nearly the sole, currency of the country Hence the reason why the coins of some countries are almost wholly of silver, and others almost wholly of gold It is estimated for example, that when it was fixed in 1717, that the guinea should exchange for 21 shillings gold was overvalued as compared with silver to the extent of $1\frac{19}{31}$ per cent (*Liverpool on Coins*, p 85), and as the real value of silver with respect to gold continued to increase during the greater part of last century the advantage of paying in gold in preference to silver became more decided, and ultimately led to the universal use of gold in all large payments and to the fusion or exportation of all silver coins of full weight (*Liverpool loco cit*)

In France a different valuation of the metals has had a different effect Previously to the recoinage in 1785, the *Louis d or* was rated in the mint proportion at only 24 livres when it was really worth 25 livres 10 sols Those therefore who should have discharged the obligations they had contracted by payments of gold coin instead of silver would plainly have lost 1 livre 10 sols on every sum of 24 livres In consequence very few such payments were made, gold was almost entirely banished from circulation and silver became almost the only species of metallic money used in France (*Say, Traité d Economie Politique* tom i p 393)

In 1816 a new system was adopted in this country, it being then enacted (56 Geo 3 c 68 [illegible] *should be legal tender in all payments* [illegible] *shillings* The pound of silver bullion that had previously been coined into 62 shillings was then also coined into 66 shillings the additional *four* shillings being retained by government as a *seignorage* or duty (amounting to $6\frac{14}{31}$ per cent) upon the coinage To prevent the silver coins from becoming redundant, government has retained the power to issue them in its own hands Under these regulations, silver has ceased to be a standard of value, and forms merely a subordinate or subsidiary species of currency or change, occupying the same place in relation to gold that copper occupies in relation to itself This system has been found to answer exceedingly well

A good deal of difference of opinion has existed as to whether gold or silver coins are best fitted for being made a legal tender It does not seem that the one possesses any very striking advantage over the other, none, certainly that would justify a change, after a selection has been made and acted upon for any considerable period

Down to 1626 a seignorage or duty upon the coinage was usually charged upon [illegible] coins issued by the mint, and it may be [illegible] that the imposition of such a duty, when it is not carried to an undue height is advantageous A coin is more useful than a piece of uncoined bullion of the same weight and purity; the coinage fitting it for [illegible] while it does not unfit it for being [illegible] purpose When, therefore, a duty or seignorage is laid upon coin equal to the expense of coinage, it circulates at its real value, but when the charge is defrayed by the public, it circulates at *less* than its real value, and is consequently

either melted down or exported whenever there is any demand for bullion in the arts, or any fall in the exchange It is, indeed true that were a seignorage to be laid on gold coins, it would be necessary, to prevent an enhancement of the value of the currency, that their weight should be proportionally reduced, and it is on this account better perhaps, to let them remain on the present footing But when a seignorage was laid on the silver coins, in 1816, it was not necessary to take the circumstance now alluded to into consideration, for as they were made subordinate to gold, and were intended to serve as change merely, its imposition had no tendency to raise the value of the currency, at the same time that it was calculated effectually to prevent the fusion of the coins, and to yield a small revenue to government

The exportation and importation of gold and silver coins was formerly prohibited, but in 1819 it was enacted (59 Geo 3 c 49) that they might be freely exported and imported, without being liable to any charge or duty whatever, and they may be imported without being either reported or entered at the custom house This regulation has rendered it next to impossible to ascertain the value of the bullion imported

Paper Money —[illegible] resulting from the [illegible] money we are not to suppose that these are obtained gratuitously The use of a metallic currency is accompanied by a heavy expense, and there is a much greater difficulty in effecting payments by the agency of coins than one might at first be disposed to believe If the currency of the United Kingdom consisted wholly of gold, it would certainly amount to at least 60 millions sterling, the expense of which allowing ¼th per cent for the wear and tear and loss of coins, could hardly be estimated at less than *three* millions a year But this heavy expense is really a far less serious obstacle to the exclusive use of the precious metals as money than their weight, and the trouble and expense attending the carrying them about The weight of 1000 sovereigns exceeds 21 lbs troy, so that it would be necessary to employ a waggon to make a large payment even in gold It is also very difficult to employ them for small payments, provided they have to be made at a considerable distance, inasmuch as the expense of sending gold by post, and the premium to guarantee it against loss, amount to a considerable sum Hence it is that all commercial nations endeavour to fabricate a portion of their money of some less valuable and more portable material than bullion, and hence also the origin of bills of exchange, cheques, and other devices for economising the use of money

Of the substitutes that have been resorted to instead of gold and silver coins, *paper notes*, payable on demand, have been by far the most generally adopted, and are in all respects the most eligible Intrinsically they are almost destitute of value, so that their employment and their loss costs next to nothing *, and they may be carried about or transmitted by post with the utmost facility But though in these respects the employment of pieces of paper instead of coins leaves nothing to be desired, it is plain that [illegible] value must depend [illegible] They are commonly issued as a substitute for or representative of coin, the issuer being bound to pay their value, or the sums they profess to represent, in coin of the standard weight and purity the moment it is demanded, and so long as this regulation is really and *bona fide* complied with, no inconvenience can result from their employment Practically however, it is found no easy matter to carry these regulations into effect, and this, and indeed every country in which paper money has been issued, has repeatedly sustained the greatest injury from its being issued in excess or on unsound principles Paper money, in fact, can never be either securely or beneficially employed unless the quantity of it in circulation vary exactly as the quantity of gold or silver coins to be substituted in its stead would do were it withdrawn But having elsewhere inquired into the means by which this identity between the value of coins and paper notes may be best maintained we beg to refer the reader to the article Banks in this Dictionary for a farther discussion of this important branch of the subject

Ancient Coins — We subjoin, for the convenience of such of our readers as may have occasion to consult works in which reference is made to ancient coins, the following tables of those that were principally current among the Jews, Greeks, and Romans They were calculated by Dr Arbuthnot (*Tables of Ancient Coins, Weights &c*, 4to ed Lond 1754), and do not differ materially from the tables of Paucton, whose *Metrologie* (4to, Paris, 1780) is the most complete and elaborate work that has ever been published with respect to ancient monies, weights, and measures At the same time we confess we should not be disposed to place much reliance on these tables, and we have elsewhere stated our reasons [illegible] — (Art "Money," New Edit *Encyc Britannica*)

† This is the coin which is universally circulated under the name of the Spanish dollar

Jewish Coins

Names and Proportions						Value in Sterling £	s	d
Gerah						0	0	1 49/160
10	Bekah					0	1	1 11/16
20	2	Shekel				0	2	3 3/8
1,200	120	50	Maneh Mina Hebraica			5	14	0½
60,000	6,000	3,000	60	Talent		342	3	9
Solidus aureus, or sextula, worth						0	12	0½
Siclus aureus, worth						1	16	6
A talent of gold, worth						5475	0	0

Grecian Coins

								Value in Sterling £	s	d	qrs
Lepton								0	0	0 31/336	
7	Chalcus							0	0	0 31/48	
14	2	Dichalcus						0	0	1 7/24	
28	4	2	Hemiobolum					0	0	2 7/12	
56	8	4	2	Obolus				0	1	1 1/6	
112	16	8	4	2	Diobolum			0	2	2 1/3	
224	32	16	8	4	2	Tetrobolum		0	5	0 2/3	
336	48	24	12	6	3	1½	Drachma	0	7	3	
662	96	48	24	12	6	3	2 Didrachma	1	3	2	
1,324	112	96	48	24	12	6	4 2 Tetradrachma	2	7	0	
1,660	384	120	60	30	15	7½	5 2½ 1¼ Pentadrachma	3	2	3	

Of these, the drachma and didrachma were of silver the rest for the most part, of brass

The drachma is here with the generality of authors, supposed equal to the denarius though there is reason to believe that the drachma was somewhat the weightier

	Value in Sterling £	s	d
The Grecian gold [illegible] ing 2 Attic drachmas [illegible] teus and exchanging usually for 25 Attic drachmas of silver	0	16	1¾
But according to our proportion of gold to silver it was worth	1	0	9
[illegible] for Attic [illegible] of the same value	0	18	1
Stater Daricus, according to Josephus, worth 50 Attic drachmas, or	1	12	3½
Stater Crœsius, of the same value

[illegible] proportion mentioned by [illegible]	0	12	11
According to the [illegible] which the aure is [illegible] its value	0	16	1¾

MO'NEYERS, COMPANY OF This company, which is of very ancient origin, are officers of the Royal Mint, under whose superintendence and responsibility the various moneys of the realm are manufactured They receive the bars of standard metal from the *melter*, and under their direction these are rolled down, cut into blanks, and coined these processes are described under the word Coinage The connection of the Company of Moneyers with the other officers of the mint will be evident from the duties of the other officers, which are stated under the word Mint (See also Mr Atkinson's account of the origin and constitution of the Company of

Moneyers, in the Parliamentary Report of the Select Committee on the Royal Mint, 1837, p 119)

MONOCARPONS (Gr *μονος*, *single*, and *καρπος fruit*), is a term invented by De Candolle to designate what gardeners call annuals and flowers which like the Agave die after they have once borne fruit though they may live for many years We perish as soon as they have once borne fruit

MO'NOCHORD (Gr *μονος*, and *χορδη string*) In Music, an instrument consisting of a single string stretched between two bridges standing on a graduated rule, for the purpose of measuring the variety and proportion of musical sounds The monochord is called the harmonical canon or the canonical rule

MONOCHROMA'TIC LAMP When a solution of common salt is added to spirit of wine, the mixture burns with a flame in which yellow predominates almost to the [illegible] The consequence is, [illegible] either yellow or black, and deficient in the tints which they exhibit when seen by solar light, or by that of our ordinary combustibles (See Sir David Brewster, in the volume of the *Family Library* on "Natural Magic") The term *Monochromatic* is of the same origin as —

MO'NOCHROME (Gr *μονος*, and *χρωμα*, *colour*) A painting executed in a single colour See Painting

MONOCOTYLEDONS (Gr *μονος*, and *κοτυληδων a lobe*) A class of plants having but one cotyledon or seed-lobe in the embryo They are now more generally called [illegible] see

MONODELPHIANS (Gr *μονος* and *δελφυς*, *a womb*) A name given by De Blainville to the first sub-class in his binary division of Mammalia, comprehending those which have no supplementary external pouch or marsupium but which bring forth the young in a state sufficiently mature not to require such additional protection It is antithetical to *Didelphs*

MO'NODON (Gr *μονος* and *οδους*, *a tooth*) The generic name of the narwhal signifying its upper peculiarity of having but one tooth, which projects like a horn from the fore part of the head, a second tooth, however is always to be found concealed in the adjoining jaw where it remains in a rudimental state In the female both tusks are rudimental

MONODY (Gr *μονος*, and *ωδη*, *a song*) A species of poem of a mournful character in which a single mourner is supposed to bewail himself This differs from those pastoral elegies (like the *Daphnis* of Virgil) which are in the form of dialogues

MONŒCIA (Gr *μονος* and *οικος a house*) In Botany, the twenty-first class in the system of Linnæus, comprising the Androgynous plants, or those whose structure is both male and female

MO'NOGRAM (Gr *μονος* and *γραμμα*, *letter* or *writing*) An abbreviation of a name by means of a cipher composed of two or more letters intertwined with each other Monograms were used on coins in very ancient times, being found on Greek medals of the age of Philip and Alexander of Macedon The Greek monogram of the name of Christ which resembles P placed perpendicularly in the middle of an X thus ☧, is found on coins of the age of Constantine By far the greater number of the ancient monograms are still unintelligible, though the labour and research which have been expended in endeavouring to decipher their meaning have in many instances been rewarded with success Among others whose researches on the ancient monograms may be consulted with advantage are, Montfaucon *Palæographia Græca*, Frœlich, *Annal Reg Syr*, Combe *Museum Hunterianum*, Torremuzza *Descriptio des Monnaies de Sicile*, Pellerin, *Recueil des Villes des Peuples, et des Rois*, Mionnet *Traité de la Numismatique* Monograms are frequently found on coins and maps of the middle ages, and they are also to be met with as a substitute for the signature of the princes of that period This class of monograms is of great importance in illustrating the monuments of antiquity, and their investigation constitutes a distinct and peculiar branch of diplomatics In later times monograms were frequently employed by printers and engravers to record their names at the end or on the title page of a book, or in some portion of an engraving A great deal of attention has likewise been bestowed upon this branch of [illegible] writing, and with considerably more success The Abbé de Marolles, in 1667, was the first who directed attention to this subject, and to him succeeded Florent Le Comte (*Cabinet des Singularités d'Architecture, &c*), Orlandi (*Abecedario Pittorico*), Le Chrut (*Anzeige und Auslegung der Monogrammatum*), De Virloy (*Dictionnaire d'Architecture*), and Bartsch ([illegible] a work [illegible] arch) complete [illegible] on this class of monograms is to be found in the *editio optima* of Brulliot (*Dictionnaire des Monogrammes, &c, avec lesquels les Peintres, &c, ont designé leurs Noms*, 2 tom 4to Munich, 1832; a work which is founded on the principle of considering

the *first* letter of the monogram as the key to its explanation

A monogram is said to be *perfect* when it contains all the letters of the word it is intended to represent (*Dict de* [illegible]

MO'NOGRAPH (Gr *μονος*, and *γραφω*, *I write*) A treatise or memoir on a single subject of a limited description Such, for example, are the greater part of the memoirs which are read before learned societies

MONOGY'NIA (Gr *μονος*, and *γυνη*, *a female*) In Botany, the name given by Linnæus in his system to the first order or subdivision in each of the first thirteen classes of plants, comprising such as have one pistil or [illegible] a flower

MO'NOLITH (Fr monolithe, from Gr *μονος*, and *λιθος a stone*) A term recently introduced into England, to signify a pillar or other large substance consisting of a single stone Herodotus speaks of a huge rock of this sort in front of the temple of Minerva at Sais, which was scooped out, and contained an apartment 18 cubits in length, 12 in breadth, and 5 in height It was said to have been transported from the town of Elephantine by order of king Amasis, and to have occupied 3000 men for three years in conveying it Some remarkable monoliths have been found in Egypt, of these the zodiac of Dendereh, and the obelisk of the Luxor, both of which have been removed to Paris, are well known examples

MO'NOLOGUE (Gr *μονος* and *λογος*, *a discourse*), or SOLILOQUY (Lat solus, *alone*, and loquor, *I speak*), is, as its name imports a speech uttered by one of the dramatis personæ of a play when alone or, as it is vulgarly termed, speaking to himself The introduction of the soliloquy is obviously a very unnatural contrivance in the dramatic art, yet its obvious necessity reconciles the spectator to it In the drama of ancient Greece soliloquies are rare, for the passages at the commencement, or "prologues" of plays, where the first actor comes forward and explains his own character and something of the subject of the piece to the audience can hardly be termed soliloquies The speech of Ajax before his death is a celebrated exception

MO'NOMA'NIA (Gr *μονος* and *μανια Rage*) Insanity upon one particular subject the mind being in a sound state in reference to other matters

MO'NOMIAL or MONOMIAL (Gr *μονος* and *νομη*, *a part*) In Algebra an expression composed of a single term or a series of factors all which are single terms

MONOMI'RANS [illegible] (Gr [illegible] *limb*) A section of [illegible] which the tarsus [illegible] ned of a single joint

MO'NOMYARIAN [illegible] (Gr *μονος* and *μυων muscle*) All those bivalves or conchifers which have only one adductor muscle, and consequently but one muscular impression on each valve

MONONEU'RANS *Mononeura* (Gr *μονος*, *νευρον*, *nerve*) A term applied by Rudolphi to the series or primary division comprehending the animals which he believed to have only the ganglionic system of nerves, as the Mollusks and Insects

MONOPE'TALOUS (Gr *μονο* and *πεταλον a petal*), in Botany, is applied to a corolla, the petals of which cohere [illegible] to form a tube

MONO[illegible]PHYLLOUS [illegible] (Gr [illegible] *φυλλον a leaf*), in Botany is applied to calyx the sepals of which cohere by their [illegible] into a kind of tube or cup

MONOPHYSITES (Gr *μονος* and *φυσις*, *nature*) A name given in the 5th century to certain heretics who in the language of the Athanasian creed, 'confounded the substance,' that is the divine and human substance which are united in Christ but neither absorbed into the other *See* INCARNATION, EUTYCHIANS NESTORIANS (Mosheim, *Eccl Hist* vol ii)

MO'NOPLEURO BRA'NCHIANS (Gr *μονος* and *πλευρα a side*, *βραγχια gills*) A name given by De Blainville to an order of his class *Paracephalophora*, comprehending those species which leave the branchiæ more or less completely covered by a part of the mantle, and situated on the right side of the body

MONO'POLY (Gr *μονος* and *πωλεω*, *I sell*), in Law, is defined by Sir E Coke (3 *Inst* 181 c 5) 'an institution or allowance by the king, by his grant commission, or otherwise, to any person or persons bodies politic and corporate of or for the sole buying selling, making, working or using of any thing, whereby any person or persons, bodies politic or corporate are sought to be restrained of any freedom or liberty that they had before, or hindered in their lawful trade" The practice of granting monopolies, giving to one or a few individuals the sole privilege of producing importing, or dealing in certain articles has been acted on to a greater or less extent in all countries, and was carried to an oppressive and ruinous extent in England in the reign of Elizabeth and [illegible] the strenuous opposition of the crown it was [illegible] by the famous statute of the 21 Jas I cap 3 Its provisions did not extend to patents for new inventions, nor to grants by act of parliament to corporations &c But it suppressed all private monopolies, and by giving full freedom to industry and invention, contributed more perhaps than any other act to the progress of improvement than all other act [illegible] e statute book

MONOPOLYLOGUE (Gr *μονος*, *πολυς*, *many*, and *λογος a discourse*) A term recently invented to designate an entertainment in which a single actor sustains many characters

MONO'PTERAL (Gr *μονος*, and *πτερον*, *a wing*) In Architecture, a temple or circular enclosure of columns without a cell

MO'NORHYME (Gr *μονος*, and *ῥυθμος*, *measure*) A composition in verse, in which all the lines end with the same rhyme This species of composition is said to owe its invention to Benin, who wrote in Latin, and de [illegible] Pope Alexander III

MONOS[illegible]TA (Gr [illegible] *ονος*, and *στομα*, *a mouth*) The name of a genus of Trematode Entozoa, including those which have only a single pore, serving at once for nutrition and adhesion

MONOTHA'LAMANS (Gr *μονος*, and *θαλαμος*, *a chamber*) This term is applied to those univalve shells which have only one chamber

MO'NOTHEISM (Gr *μονο*, and *θεος a god*) The doctrine of or the belief in the existence of one God in contradistinction to Polytheism, the belief in a plurality of Gods The Jewish, Christian, and Mohammedan systems of religion are the only pure specimens of Monotheism in existence It has often been supposed that the Jews alone of all the nations of antiquity, had conceived the truth of there being only one God, but there can be little doubt that there are no well-founded reasons for this opinion In the arcane theology of Egypt, not only was the unity of the Deity acknowledged but he was even adored, not as the God of any particular religion but as the eternal and omnipotent Governor of the Universe In support of this assertion the testimony of various heathen writers might be cited, but the following passage from Jablonski may supersede the necessity of adducing any other authority "Those men" he observes, 'who were most distinguished for wisdom among the Egyptians acknowledged God to be a certain unbegotten Eternal Spirit, prior to all things which exist, who created, preserves contains pervades, and vivifies everything who is the Spirit of the Universe, but the Guardian and Protector of men' That many of the priests and poets and philosophers of Greece were not ignorant of the same truth is not less evident In one of the *Orphic Fragments* preserved by Proclus we find it expressly declared, that 'there is One Power, One Deity the great Governor of all things" The verses which, according to Bishop Warburton were sung in the Eleusinian Mysteries contained the following passage —"Pursue thy path [illegible] the temple the King of the world He is One [illegible] himself alone and to that One all things have owed their being He encompasses them No mortal hath beheld him, but he sees everything" In some verses which have been often cited by the fathers from a tragedy now lost Sophocles has said, "There is in reality only One God who made the heavens and the remote earth the blue waves of the ocean and the strength of the winds' That Pythagoras admitted the unity of the Deity must be evident to all who have considered his philosophy, and his monotheism is further attested not only by the eclectic philosophy, but in distinct terms by St Justin and St Cyril Euclid of Megara and Socrates were both Monotheists Plato was in all probability one likewise His Trinity, like that of the Magi and the Egyptians, was not a trinity of beings but of modes of being in the Divine Nature 'When" says he, "I speak fully in my epistles I commence with *God*, —when I do not, my letters begin with *gods*" But if any further proof were wanting in support of this opinion, the following passage from Origen must be held to be conclusive —

Many of the old philosophers have said that there is one God, who created all things, and in this they agree with the law but some say in addition, that God hath made and governs all things by his Word, and that it is the Word of God by which all things are regulated In this they write consonantly not only with the law, but with the Gospel' (*Edin Review*, vol vii pp 97 98)

MONO'THELITES (Gr *μονος* and *θελω I will*) A sect of heretics, who, while they avoided the error of the Eutychians, and allowed the two natures of Christ to coexist distinctly in the unity of the person, conceived the influence of the divine will so to predominate over the human substance as to leave to the latter no action or efficiency of its own

[illegible] his doctrine is ascribed to the emperor [illegible] in [illegible] reconcile [illegible] church by a middle course of this nature, and published an edict under the advice of some theologians of the day in assertion of it This opinion was condemned by some provincial and one general council, and, on the other

hand, was maintained in the elect of several succeeding emperors Now the question finally settled though silence was frequently commanded upon it, until it was forgotten in the louder disputes of the [illegible] opponents (Combefis, *Monothelit* [illegible]

MONO'TONY (Gr *μονος* and *τονος a sound*) An [illegible] ing or composition

MONOTR[illegible] (Gr *μονος* and *τρημα a hole*) A tribe of ovo-viviparous Mammalia, of which only two genera are known to exist, viz the *Platypus* or *Ornithorhynchus*, and the *Echidna*, both peculiar to Australia The term is indicative of the common cloacal outlet for the excremental and generative products

MO'NOTRIGLYPH (Gr *μονος* and *τριγλυπτος*, *a* [illegible] In Architecture, such an intercolumniation [illegible] Doric [illegible] as brings only one triglyph over it

MONSEIGNEUR A title of courtesy in France, which was prefixed to the titles of dukes and peers, archbishops, bishops, and some other exalted personages, and used in addressing them *Monseigneur* simply was, before the Revolution the title given to the dauphin *Monsieur* is now the common title of courtesy and respect in France, and previously to the revolution in 1830 *Monsieur* simply was the title of the eldest brother of the king

MONSOO'NS (From a Malayan word signifying *seasons*) In Physical Geography, the name given to a certain modification or disturbance of the regular course of the trade winds which take place in the Arabian and Indian seas Between the parallels of 10° and 30° south latitude the eastern trade wind blows regularly, but from the former parallel northwards the course is reversed for half the year, and from April to October the wind blows constantly from the south-west During the other [illegible] of the year the regular north-east trade wind prevails The south-west monsoon is supposed to be occasioned by the great rarefaction of the atmosphere over the extensive regions of Eastern Asia during the summer months *See* TRADE WINDS

MO'NSTER (Lat monstrum) Any thing out of the common order of nature is occasionally designated by this term, but it is physiologically employed under a more [illegible] which one or [illegible] genital malformation [illegible] then must amount [illegible] deformity, or it may be confined to internal organs Buffon, Blumenbach and Meckle have treated on monstrosity classifying its modifications under three heads the first including cases in which parts of the body are increased in number, the second those where certain organs are deficient, and the third including cases in which size, situation, and structure are concerned Other writers such as Geoffroy St Hilaire (*Histoire des Anomalies*), have adopted more comprehensive arrangements, arising however out of the general subdivision of monsters into simple and compound the former including all cases in which the elements of a single individual only are concerned, the latter those in which the constituent parts of two or more individuals are united Simple monsters have again been distributed into three classes The first including such varieties of malformation as chiefly affect one organ or system of organs without [illegible] anomalies [illegible] subdivided into cases where size form or structure is affected and those in which the malformation affects the arrangement, connection, or number of parts The second class in this arrangement includes cases of extensive malformation attended by great deformity and by disturbance of vital functions The third class is limited to [illegible] anomalies [illegible]

The history of individual cases of monstrosity would be here misplaced, several of the most remarkable are detailed in various volumes of the *Philosophical Transactions*, in the *Transactions of the Medico Chirurgical Society*, and in the *Penny Cyclopædia*, art "Monster"

MO'NSTERS, or CHIMERICAL FIGURES In Heraldry, a species of bearings, of which some are very common in English coats of arms and others common in foreign, although not often used in our own The sagittary or centaur, man tiger, sphinx, harpy, triton, and mermaid, are monsters compounded of the human and bestial shape Of monstrous beasts, the most common in armorial bearings are [illegible] griffin (a compound of the eagle and the [illegible] (a two-legged dragon) besides these, there are the unicorn, the heraldic antelope, tiger, and ibex (which are chimerical figures, but representing the natural beast), the musimon (an animal between the goat and the sheep), and the salamander Monstrous birds are the phœnix, camel [illegible] allerion cockatrice, &c

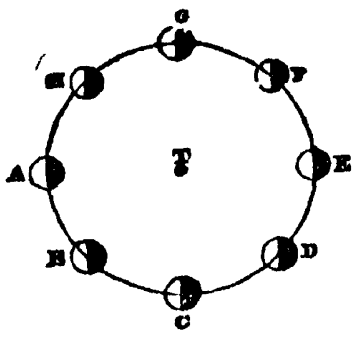
MONTA'NISTS Heretics of the second century, who derive their name from their founder Montanus, a Phrygian, who pretended to inspiration, and declared himself to be a prophet sent from God to complete the Christian scheme, and advance it to its highest state of perfection He affirmed himself to be the Paraclite or Comforter, whose mission was supposed by various sectarians of the early centuries to be distinct from that of the Holy Spirit, which was promised to the apostles, and was expected to put the finishing stroke to the revelation of Jesus Christ The characteristics of this sect were similar to those which are known by the general name of Gnostic, and consisted principally in great austerity of manners and a belief in the possibility of an advance from the obvious and literal interpretation of the word of God to a state of interior and spiritual knowledge coincident with a participation in the divine nature itself

MO'NTANT (Fr) In Architecture, any upright piece in a system of framing

MONT DE PIÉTÉ (Ital Monte di Pieta) The name given on some parts of the Continent to certain benevolent institutions, established for the purpose of lending money to the poor at a moderate rate of interest They originated under the papal government in the 15th century and were intended to countervail the exorbitant usurious practices of the Jews, who formed at that period the great money-lenders of Europe These institutions were afterwards introduced into many of the Continental states, and similar establishments existed, and in some cases still exist, at Paris, Madrid, Brussels, Ghent Antwerp, &c *Monti frumentarii* are public granaries, from which corn is sold to the necessitous Italians on a principle somewhat analogous to that on which sums are lent by the Mont de Piété

MO'NTEM The name given to an ancient custom till lately prevalent among the scholars of Eton, which consisted in their proceeding every third year on Whit Tuesday to a tumulus (Lat *ad montem*, whence the name), near the Bath road, and exacting money for *salt*, as it was called, from all persons present or passers by The sum so collected was given to the *captain*, or senior scholar of the school, and was intended to assist in defraying the expenses of his residence at the university, to which he was about to proceed The origin of this ceremony dated from the establishment of the foundation of Eton College, but it was at first held on the 6th of December, the festival of St Nicholas, the patron of children, and it is only since 1779 that the present was substituted for the original period of its celebration It was the almost invariable practice of the sovereign, the court, and a large portion of the nobility to honour this festivity with their presence, and so liberal were their contributions that the *salt money* has been known to approach nearly 1000*l* (See *Huggett's MS Collections*, for a history of Windsor and Eton colleges, in the British Museum, and *Brand's Popular Antiquities*)

MONTH (Germ monat) The twelfth part of our calendar year It is so called from its being the period of the moon's revolution round the earth *See* CALENDAR



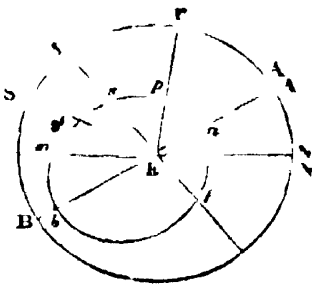
MO'NUMENT (Lat) A memorial for perpetuating the remembrance of an event, also a cenotaph in memory of the dead The productions of architecture and sculpture intended to transmit to posterity the memory of individuals and events [illegible] called monuments Among [illegible] are tombs and sepulchral edifices or columns The most ancient are the obelisks and pyramids of Egypt, and perhaps, contemporary with these the tombs of the Persian kings still visible in the ruins of Persepolis Greece abounded with monuments of this nature Buildings in that country were frequently raised in commemoration of distinguished persons or events and of this class were the Choragic monuments in honour of those who had received the prize [illegible] games Of these [illegible] monument of Lysicrates vulgarly called the Lantern of Demosthenes Among the monuments of this class of the Romans, the triumphal arches are in the first rank The column called the Monument of London and the Duke of York's monument, illustrate respectively the definition above given

MOOD (Lat modus) In Grammar, the designation by the form of the verb of the manner of our conception of an event, or fact, whether as certain, contingent, possible desirable, or the like *See* GRAMMAR

MOOD OF A CATEGORICAL SYLLOGISM, in Logic, is the designation of its three propositions in the order in which they stand, according to their quantity and quality

MOON (Gr *μηνη*, Germ mond) The satellite of the earth The moon after the sun, is not only the most conspicuous but in an astronomical point of view, the most interesting of the celestial bodies The variety of her phases, her eclipses, and the rapidity with which she changes her place among the fixed stars, drew the attention of the earliest observers of the heavens, and in modern times [illegible] of the theory of her motions [illegible] the determination of terrestrial longitudes, has given the *Lunar Theory* the first rank among the objects of astronomical science

Phases of the Moon The different phases of the moon were probably the first celestial phenomena that received a correct explanation By observing them attentively during the course of a single revolution, it would be inferred that they are occasioned by the reflection of the sun's light from the spherical surface the moon, and accordingly the fact was recognised by the earliest astronomers Let I be the earth, and A B C D E F G H successive portions of the moon in her orbit, the sun being supposed to be situated in the straight line T A, and at so great a distance that lines drawn from it to every part of the moon's orbit may be regarded as parallel When the moon is at A, she is in *conjunction* with the sun, and passes the meridian at the same time, and her illuminated hemisphere being then turned directly away from the earth, no portion of her disk is visible A few days after the conjunction the moon begins to appear on the eastern side of the sun at B, having the form of a crescent the horns of which are turned *eastward* or away from the sun When she arrives at C or 90° from her conjunction the earth is in the plane of the great circle of her orb, which forms the boundary between her dark and illuminated hemispheres, and consequently half the disk is visible The moon is then in her *first quarter* At D more of the illuminated hemisphere is turned towards the earth and she appears gibbous At F she is in opposition to the sun, the illuminated side is turned directly to the earth and the disk appears round or *full* After passing [illegible] to wane, and [illegible] to appear [illegible] When [illegible] or 270° from the [illegible] From this point to the conjunction the moon again appears as a crescent becoming narrower as she approaches to A, but the horns of the crescent are now turned *westward* still away from the sun The straight line which joins A and F is called the line of the *syzygies*, that which joins C G is the line of the *quadratures*, and the points B D F H situated at equal distances from those lines, are called the *octants* The magnitude of the illuminated portion of the disk is thus seen to depend on the position of the moon relatively to the sun and the earth, and is easily determined by a geometrical construction The mean period of time in which a revolution of the phases is completed or in which she passes from one conjunction to the following, is 29 days, 12 h 44 m 2 8 sec



Distance and Magnitude of the Moon — The moon's distance from the earth is found from her horizontal parallax, which may be determined either by simultaneous observations at stations very distant from each other or by means of the occultations of fixed stars by the moon From such observations it is found that the amount of the parallax varies considerably at different times Its mean value gives the average distance of the moon from the earth equal to 59 9 of the earth's equatorial semidiameters, or about 237 000 miles which is upwards of 400 times less than the distance of the sun Combining this result with the apparent magnitude (31 20″) of the moon's diameter, when at her mean distance it results that the diameter of the moon is to that of the earth in the proportion nearly of 3 to 11, whence the volume of the moon is only about 1 49th of the volume of the earth

Inclination and Nodes of the Lunar Orbit — The moon's orbit is inclined to the ecliptic under an angle of 5° 8′ 47″ 9, but the line in which it intersects the ecliptic, or the *line of the nodes* does not maintain a fixed position on the plane of the ecliptic It is observed that the moon passes from one of the nodes to the opposite one in less time than is required to pass through 180° of longitude, hence the line of the nodes has a retrograde motion on the ecliptic, and its motion is so considerable that it completes a revolution, or returns to its former position, in a period of 6798 28 days, or about 18 6 years This period is remarkable, as being that after which the eclipses of the sun and moon again return nearly in the same order The cause of the regression of the line of the nodes is the attractive power of the sun which is always tending to draw the moon into the plane of the ecliptic, and which would at length cause her orbit to coincide with that plane, were the tendency not counteracted by the angular motion of the moon round the earth By reason of the angular motion the mean inclination remains the same, and the resulting effect is the retrograde motion of the nodes But as the sun's distance from the earth is a variable quantity the effect of the solar action in displacing the nodes of her orbit is also variable Hence, and also on various other accounts, the motion of the nodes, and the inclination of the lunar orbit to the ecliptic, are subject to certain periodical changes, all which must be accurately appreciated and computed in the formation of the lunar tables *See* PERTURBATIONS

Eccentricity of the Lunar Orbit — The general orbit of the moon is an ellipse, having the earth at one of its foci, but on account of the disturbing force of the sun, and the difference of the intensities of this force when the moon is differently situated relatively to the earth and sun, the ellipse is constantly changing its form and position on the plane of the orbit, and hence the numerical values assigned to all its elements are to be considered only [illegible] mean values The distance of the moon [illegible] when in *apogee* or at her greatest distance, is 63 842 semidiameters of the earth, and when in *perigee*, or at her least distance, 55 916 semidiameters, whence the eccentricity, or distance of the focus form the centre, is about 0 066, half the major axis [illegible] in the best tables, it is [illegible] in respect of the fixed stars, it is found to have a rapid motion eastward, completing a whole circuit in 3232 57 mean solar days, or nearly nine years But this mean motion is subject to inequalities of considerable magnitude The different situations of the line of the apsides with respect to the line of the syzygies gives rise to the inequality of the lunar motion, called the *evection* *See* EVECTION

Different Species of Lunar Months — As the principal [illegible] the lunar orbit — the syzygies the nodes the [illegible] and in different directions, it follows, that the period of time in which the moon completes a revolution with respect to any of these points, or to the fixed stars, will be different in each case These periods which are called lunar *months*, may be explained as follows — Let E be the centre of the earth, *a s b t* the orbit of the moon, *a b* the transverse axis or line of the apsides, *s t* the line of the syzygies, *n m* the line of the nodes and A S B N the great circle of the sphere in the plane of the ecliptic Also, let P be a fixed point on this circle, and suppose the moon to be at *p*, or seen in the direction F P The time which elapses while the moon passes from *p* and returns to the same point of the ecliptic, is called the *tropical* revolution and differs only about seven seconds from the time in which the moon returns to the same fixed star, or performs a *sidereal* revolution Suppose now the moon to be at *s* in the line of the syzygies when the moon advancing from *s*, in the direction *m b n*, has again come round to the same point of the ecliptic, she will not now be in conjunction, for, in the interval, the sun has advanced from S to S′ (nearly a twelfth of the circumference) and consequently the moon must go on to *s*, till she overtakes the sun, before she returns to her conjunction The interval from conjunction to conjunction is the *synodic period*, and exceeds the tropical period by two days and about five hours Next suppose the moon to be at her perigee *a*, or seen in the direction E A, while the moon, after leaving *a* is describing her orbit, the line of the apsides E A revolves through the angle A E A′, and consequently the moon, after coming into the line E A, must continue to advance till she comes to *a′* before she arrives again at her perigee The interval from perigee to perigee is called the *anomalistic period*, and it is also longer than the tropical period, though much shorter than the synodic, inasmuch as the line of the apsides requires about nine years to complete its revolution, while that of the syzygies is completed in one year Lastly, suppose the moon at *n* in the line of the nodes While the moon is advancing round her orbit, the line of the nodes, I N, moves backward into the direction E N′, consequently the moon will have come up to her node at *n′* before she has completed a revolution on the ecliptic The interval from node to node is called the *nodical period* and is shorter than any of the other periods The following table exhibits in mean solar days the mean lengths of the different lunar periods or months —

	Days.
Synodic revolution	29 53059
Sidereal	27 32166
Tropical	27 32158
Anomalistic	27 55460
Nodical	27 21222

Acceleration of the Moon's mean Motion — On comparing observations of the moon made at distant times, it has been discovered that her mean motion has been undergoing a constant acceleration since the earliest times This acceleration is, however, extremely small, amounting only to 10″ in a century, and therefore is in-

sensible for any moderate interval of time, though it becomes considerable after a few centuries Being measured by centuries it is called the *secular acceleration* of the mean motion Its physical cause was found by Laplace to be [illegible] but

Eclipse of the Moon [illegible] much greater than that of the earth the earth must project behind it in space a conical shadow the axis of which is in the plane of the ecliptic, and in the straight line joining the earth and sun On computing from the relative magnitudes of the earth and sun and the distance of the two bodies the length of this shadow, it is found to be reckoned to about 216 of the radius of the earth, and consequently far beyond the orbit of the moon It is found also that the [illegible] shadow at the mean distance [illegible] But the greatest apparent [illegible] 33' 3" or about 1/4 of [illegible] the moon appears to be still [illegible] when she is full or in opposition with the sun the whole lunar disk will be enveloped in the earth's shadow, and as the moon requires about an hour to pass over a space equal to her own breadth, the whole disk may be involved in the shadow, and the moon remain invisible during a space of about two hours This phenomenon is a *total eclipse* of the moon, and it is evident that if the moon's orbit coincided with the ecliptic, a total eclipse would take place every lunation In consequence however of the inclination of the orbit to the ecliptic the moon at the time of her opposition in general so far from the ecliptic that her disk does not come into contact with the earth's shadow, and consequently no eclipse takes place The occurrence of the eclipse, therefore depends on the distance of the moon from her node at the time of the opposition, and it results from the computation of the [illegible] the eclipse may take [illegible] If the node and must take place [illegible] the node is not greater than 7°

Eclipses of the Sun by the Moon — A solar eclipse is occasioned by the moon's body coming between the spectator and the sun and the [illegible] rays coming from the whole or a [illegible] This phenomenon, like an eclipse of the moon can only happen when the moon is near one of her nodes but a total obscuration does not necessarily take place even when the moon is in the ecliptic at the time of her conjunction for the magnitude and distance of the moon are so related that the apex of her conical shadow sometimes falls short of the earth's surface though at other times it would reach as far as the earth's centre When the umbra extends beyond the earth's surface, its intersection with the surface marks out a circular spot within which no part of the sun's disc is visible and there is a total eclipse For some distance around this spot that is to say within the *penumbra* a part only of the sun will be visible or there will be a partial eclipse When the apex of the shadow does not extend to the earth there will be no total eclipse at any part of the earth but a spectator situated in or nearly in the prolongation of the axis of the cone, will see the whole of the moon on the sun, though not large enough to cover it, that is to say he will witness an *annular* eclipse For the method of calculating eclipses of the sun and moon, see ECLIPSE

Rotation and Libration of the Moon — From the observation of the lunar spots, it is ascertained that the moon has a motion of rotation about an axis nearly perpendicular to the plane of her orbit, and, what is very remarkable, the period of rotation is *exactly* equal to that of her sidereal revolution about the earth Hence, the same hemisphere of the moon is always turned towards the earth, but as the rotation is uniform, while the motion of revolution about the earth is sometimes faster and sometimes slower than the mean the line which joins the centres of the earth and moon does not intersect the lunar surface always at the same point but fluctuates a little to the eastward and westward of its mean place whence the spots near the eastern and western borders of the disk alternately disappear and are brought into view This phenomena is called the *libration in longitude* Moreover, as the moon's orbit is inclined to the ecliptic in an angle of 5° 8' 47 9", while the plane of her equator makes with the ecliptic an angle of 1° 30', the axis of rotation is not exactly perpendicular to the plane of the orbit, whence her poles come alternately into view for a small space round the northern and southern borders of the disk This is the *libration in latitude* There is also a *diurnal libration*, occasioned by [illegible] from the surface instead of the [illegible] LIBRATION

Appearance and Physical Constitution of the Moon — On looking at the moon with the naked eye, her disk appears diversified [illegible] on being examined with a [illegible] to be mountains and valleys That the whole surface of the moon is covered by such inequalities is evident from the circumstance that the line of separation between the illuminated and dark hemispheres, which, if the surface were even would be a perfect ellipse is at all times extremely ragged, and indented with deep recesses and prominent points The mountains near this line cast behind them long black shadows (like mountains on the earth when the sun is in [illegible] the micrometrical measurement of [illegible] the mountains may be calculated [illegible] Herschel, some of the highest of them exceed 1¾ English miles in perpendicular altitude Tycho, the bright spot in the south-east quarter from which the rays seem to run, is apparently a volcanic crater, 50 miles in diameter and 16,000 feet deep surrounded by broad terraces within, and with a central mountain about 5000 feet high Schroeter has estimated the average height of the lunar mountains to be upwards of 5 English miles, but it is easy to see that the measurement is not susceptible of much accuracy

"The generality of the lunar mountains" says Sir J Herschel, "present a striking uniformity and singularity of aspect They are wonderfully numerous occupying by far the larger portion of the surface, and almost universally of an exactly circular or cup-shaped form, foreshortened, however, into ellipses towards the limb, but the larger have for the most part flat bottoms within, from which rises centrally a small, steep conical hill They offer, in short, in its highest perfection, the true volcanic character as it may be seen in the crater of Vesuvius and in some of the principal ones, decisive marks of volcanic stratification, arising from successive deposits of ejected matter may be clearly traced with powerful telescopes What is moreover, extremely singular in the geology of the moon is, that although nothing having the character of seas can be traced (for the dusky spots which are commonly called seas, when closely examined present appearances incompatible with the supposition of deep water) yet there are large regions perfectly level and apparently of a decided alluvial character" (Astronomy *Cabinet Cyclopædia* p 229)

The moon has no atmosphere, or at least none of sufficient density to refract the rays of light in their passage through it There is consequently no water on her surface and no animal similarly constituted to those which inhabit the earth could subsist there Her surface presents no appearance of vegetation or of variation which can be ascribed to a change of seasons Every thing appears solid desolate and unfit for the support of animal or vegetable life Whether the materials of which the lunar substance is composed are of the same nature as those which compose the earth there are no means of knowing From the effect of the moon's gravitation in producing the nutation of the earth's axis, the mass of the moon is determined to be very nearly 1-80th of the mass of the earth whence as her volume is only 1-49th of the earth's volume it results that her density as compared with the mean density of the earth, is 615, or a little more than one half

MOON'STONE A variety of *adularia*, or resplendent felspar, it occurs massive and crystallized Select specimens are sometimes cut into ring and brooch stones

MOOR An uncultivated surface without trees, and with few grasses or other herbage fit for pasture, and generally containing scattered plants of heath, with a dark peaty soil Moor lands are generally the least fitted for culture of any description of surface not rocky or mountainous Moors are covered with a very thin layer of soft black sterile soil, and the subsoil is generally gravel or retentive ferruginous clay By the destruction of the heath or other bad herbage, and by sowing down with grass seeds they may be improved In many cases, also trees will grow on drained moors, in which case the soil ultimately becomes ameliorated by the fall and decay of the leaves

MOOR in Navigation [illegible] a vessel by two anchors in nearly [illegible] that she rides by either in certain [illegible] by [illegible] in other winds Also to secure a vessel to weights or chains sunk in harbours for the purpose These weights are called [illegible] whole apparatus *moorings*

[illegible] LECTURE See ARCHITECTURE.

MOPLAHS The Mahometan inhabitants of Malabar, descended from Moors and Arabians who have settled on that coast and married Malabar women They are said to form a fourth of the population They are commercial and industrious on the coast, but a furious race in the interior (Forbes, *Oriental Memoirs* p 258)

MORAINE The name given in Switzerland and Savoy to the longitudinal deposits of stony detritus which are found at the bases and along the edges of all the great glaciers The formation of these deposits are explained by Professor Agassiz as follows — The glaciers, it is well known, are continually moving downwards, in consequence, probably, of the introduction of water into their fissures, which, in freezing, expands the mass, and the ice being thus loosened or detached from the rocks below, is continually pressed forward by its own weight

In consequence of this motion the gravel and fragments of rocks which fall upon the glaciers from the sides of the adjacent mountains are accumulated in longitudinal ridges or *moraines* From the existence of such deposits in many places where there are now no glaciers, combined with the polished appearance of the surfaces of the rocks on the sides of valleys, supposed to have been produced by the friction of moving glaciers, Professor Agassiz infers that the extent of glaciers was formerly much greater than it now is, and that they covered the great valley of Switzerland, with the whole chain of the Jura (Agassiz *Etudes sur les Glaciers de la Suisse, Reports 4th British Association for* 1840)

MORAINS See Glaciers

MORANA The old Bohemian goddess of winter and of death the Marzana of Scandinavia A grand yearly festival was celebrated in honour of this goddess in the month of March Her image was conveyed solemnly to the nearest brook or rivulet, and thrown into it amid the rejoicings of the people This festival was called "Das Joden-Austreiben, " and as the words imply, was held of the end of winter and the return of spring (See *Grimm's Deutsche Mythologie* p 116)

MORASS Moor lands saturated with water to such an extent as not to bear the tread of cattle A morass is to a moor what a marsh is to a meadow It is evident that the drainage of morasses and moors, by lessening the evaporation of water from their surfaces, must tend to improve the local climate

MORAVIAN BRETHREN See Herrnhut

MORBIDE'ZZA (Ital) In Painting softness and delicacy of style Its opposite is a style whose lines are harsh and [illegible]

MORDANT A substance used to fix colouring matters upon different stuffs (See Dyeing) Alumina and oxide of iron are the most important mordants

MORDI'LLA (Lat mordeo, *I bite*) A Linnæan genus of Coleopterous insects, the type of a family (*Mordellidæ*) of Latreille's *Heteromerans* distinguished by the general form of the body which is elevated and arched, with the head low, the thorax trapezoid or semicircular, the elytra very short or narrow and pointed at the tips, as well as the abdomen They are distinguished from their [illegible] *Pyrochroidæ* by their extreme [illegible] of their integuments and their tenacious and painful bite The subgenera of the *Mordellidæ* are *Ripiphorus*, *Myodites* *Pelecotoma* *Anaspis*, and *Mordella* proper to the last subgenus are now restricted the species of the present family which have the antennæ of equal thickness throughout and slightly serrated in the males, the eyes not emarginate, and the abdomen terminated by a long point

MORDE'NTI (Ital) In Music a grace in use by the Italian school, which is effected by turning upon a note without using the note below

MO'REL (Germ morchel) The *Morchella esculenta* is one of the few fungi found in this country which may be used as food with safety It occasionally occurs in woods and orchards, whence it finds its way to the markets, but it is of comparatively rare occurrence It has a hollow stalk an inch or two high and a yellowish or greyish ribbed head two or three inches deep

MORE'SQUE (Fr) In Painting, a species of ornamental painting, in which foliage fruits flowers &c are combined, by springing out of each other without the introduction of the human figure, or that of any animals, and receiving its name from having been much used by the Moors, who however, were not the inventors of it

MORGANA'TIC MARRIAGE, or LEFT-HANDED MARRIAGE (Said to be derived from the Gothic word morgjan *to shorten*) A marriage between a man of superior and a woman of inferior rank in which it is stipulated that the latter and her children shall not enjoy the rank or inherit the possessions of her husband Such marriages are not uncommon in the families of sovereign princes, and of the higher nobility in Germany but they are restricted to persons of the most exalted classes

MORGUE (Fr) The name given to a place in many French towns where the bodies of persons found dead are exposed in order to be recognized and owned by their friends The clothes in which they were found are placed near the bodies, for their better identification The Parisian morgue is built on the left bank of the Seine, in one of the most populous [illegible] of the city, and presents one of the [illegible] spectacles to be witnessed anywhere

MORMONS (Gr *μορμων, a mask*) The generic name for the short-winged web footed birds, usually called Puffins, the singular beak of which gives the head the appearance of a grotesque mask The depth of the base of the bill equals that of the entire head, and frequently the length of the bill itself the mandibles are compressed, arched, obliquely channelled, and notched towards the tip The eggs and young birds are sought after and taken in great numbers in the Orkneys and Faroe Isles

MORMYRUS (Gr *μορμυρος* a name given by the Greeks to a fish frequenting lakes and rivers, and probably the *Sparus mormyrus* of Linnæus The name was applied by Latreille to a genus of malacopterygian fishes placed in the Malacopterygian order between the *Esocini* and *Salmonidæ* by Cuvier The *Mormyri* differ from the pikes in little else save in the small size of their mouth, of which the angles are formed by the maxillary bones, and a corresponding modification of the alimentary canal, the intestines being longer, and complicated by two cæca The *Mormyri* are confined to the rivers of Africa, and are reckoned the best-flavoured fishes that are caught in the Nile

MOROCCO (Fr maroquin) A species of goatskin leather, originally imported from the Levant and Barbary states It is extensively used in the binding of books *See* Leather

MO'ROXITE (Lat morus, *the mulberry tree*) A mineralogical name applied to one of the varieties of native phosphate of lime of a mulberry colour

MOROXYLIC ACID An acid discovered by Blaproth combined with lime, in the bark of the *Morus alba*, or white mulberry tree

MO'RPHEUS In Ancient Mythology, the god of dreams, the son of Υπνος or Somnus, who presided over sleep, with whom he is frequently confounded The chief distinction between them appears to be this — Morpheus had the power of assuming only the human shape, while the transformations of Somnus were unlimited He is generally represented as a beautiful youth, with a bunch of poppies in his hand

MO'RPHIA (Lat Morpheus, the god of dreams) The narcotic principle of opium It may be separated from opium in the form of white prismatic crystals almost insoluble in water, but soluble in boiling alcohol, it combines with the acids and forms salts, all of which are powerful sedatives, and have proved of great value as medicines Of these the muriate of morphia is perhaps the best It is composed of about 288 morphia (which is its equivalent) and 37 muriatic acid One of the most characteristic chemical properties of morphia and its salts is that they decompose iodic acid and consequently immediately discolour its aqueous solution The ultimate elements of morphia are carbon, oxygen, hydrogen, and nitrogen

MO'RPHNUS (Gr *μορφνος*, a name applied by Aristotle to the osprey) This term is restricted by Cuvier to a genus of *Accipitres* called eagle-hawks, having wings shorter than the tail but with long and slender tarsi and comparatively feeble toes Some species have the tarsi naked and scutellated, as the *Morphnus guianensis*

MORPHO'LOGY (Gr *μορφη, form*, and *λογος, description*) That department or division of the science of botany which treats of the metamorphosis of organs [illegible] from the comparison of one kind of organ [illegible] that notwithstanding the differences between them there are so many close analogies, and so much identity of structure, as to render it probable that they are all formed upon one common plan, modified according to the purposes for which they are severally destined The leaf which is the most universal of the external organs is taken as the best representation of this type, and with the more reason, because all the other parts are found to have a tendency to assume the organization of a leaf when any disturbing cause interferes with their development According to morphological writers the scale of a leafbud is a rudimentary leaf, the petal is a leaf reduced in size and thinned or coloured, or both, the stamen is a leaf, whose petiole is represented by the filament while the two lobes of the anther are the two sides of its lamina, and the pollen is the disintegrated mesophyll, and so on These conclusions [illegible] At the present day the question is indeed no longer speculative but is decided by the evidence of our eyes, for all those transformations the necessity of which morphologists assumed by mere force of reasoning, have now been witnessed by Schleiden and many others, who have traced the development of the [illegible] from their earliest condition, through all [illegible], up to the period of complete development, and have found that they are all deviations from a common type subsequent to the [illegible]

MORRIS DANCE A peculiar kind of dance practised in the middle ages [illegible] supposed to have been first introduced [illegible] Spain by Edward III, when John of Gaunt returned from that country but few traces of it are found earlier than the times of Henry VIII [illegible] though it was borrowed either from the French or the Flemings In the morris dance bells were fixed to the feet of the performer, and the great art consisted in so ordering the feet as to produce something like concord from the various bells

MORS In Ancient Mythology the daughter of Night without a father, and goddess of death. The most sub-

lime representation of death personified is to be found in the *Paradise Lost*

MORTA'LITY, BILLS OF Bills of Mortality are extracts from pa sh register showing the numbers who have died in some fixed period of tim as a year, a month or a week, and hence they are called yearly, monthly, or weekly bills In general, they also contain the numbers of baptisms, and sometimes the numbers of marriages

The keeping of parish registers was begun in England in the year 1538, in consequence of an injunction issued by Lord Cromwell the king's vicegerent in ecclesiastical affairs after the abolition of the papal authority in the kingdom In Germany they appear to have been introduced at a somewhat earlier period, for Sussmilch has given extracts from the Augsburg bills which go back to the year 1501, and they were established in most countries of Europe about the beginning of the seventeenth century

The London bills containing the records of the baptisms and deaths were begun in the year 1592 but were not kept regularly till after the plague which prevailed in 1603, since which time they have continued weekly, and an annual bill has been also regularly published Their value, however, was very little understood nor do they seem to have attracted much notice until 1662, when Graunt published his *Natural and Political Observations on the Bills of Mortality*, a work of great merit, considering the time at which it was written The ages at which the deaths took place were not inserted in the bills till 1728 Throughout the country the registers were kept, generally speaking, with very little care, but the recent act for the registration of births, marriages, and deaths which came into operation in 1836 has introduced an incomparably better system, and as the sex, ages, and causes of death are now recorded the public will soon be in possession of far more authentic information than has yet existed on some of the most in- [illegible] social statistics (See article Mortality [illegible] *Brit*, Preface to the *Population Returns for* 1831, *Annual Reports of the Registrar General of Births, Deaths, and Marriages in England*, 1839, *et seq*)

MORTA'LITY LAW OF By this term is usually understood a mathematical relation subsisting among the numbers of persons living at the different ages of life, such that, having given the number of persons living at any assigned age the number of them who remain alive at every subsequent age and consequently the mortality which takes place in the interval will be expressible by that relation It must be obvious that in speaking of a law of this kind we can only have regard to the averages of large numbers In respect of a single individual, or a small number of persons the uncertainty of the duration of life is proverbial, but the case is entirely changed when multitudes are concerned, and there are few classes of contingent events of which the results can be predicted with so little risk of departure from the truth as the average age to which the lives of a considerable number of persons will be prolonged

The circumstances which affect the mean duration of human life depend upon a great number of different causes, as climate, the facility of obtaining subsistence the state of civilization the manner of living progress of medical science, &c all of which vary in different countries and at different times The law of mortality therefore, must vary with these circumstances and consequently, if expressible by any mathematical function it must be one affected by numerical coefficients depending on the particular circumstances and of which the values can only be determined by observation The simplest expression which has been proposed for representing the course of mortality is that which is derived from the celebrated hypothesis of Demoivre, namely that, if a number of individuals be taken in any given year of age the number of deaths which take place among them will be the same every year until the whole are extinct In this hypothesis only one numerical quantity requires to be determined, which is the average extreme age De moivre adopted 86, and his hypothesis may therefore be simply enunciated as follows —Out of 86 infants born 85 will be alive at the end of the first year 84 at the end of the second, and so on to the extremity of life, the decre- [illegible] a considerable number [illegible] life, this hypothesis of equal decrements represents the observed facts with tolerable accuracy and as it affords considerable facilities in various [illegible] it was formerly much used in the computation of life contingencies

If we suppose a straight line to be divided into a number of equal parts representing the ages of human life, and perpendiculars to be drawn through the points of division proportional to the number of survivors at each age out of a given number taken at a previous age a curve line drawn through the extremities of all those perpendiculars will represent the law of mortality as indicated by the observations, and the equation of the curve will be the relation between the [illegible] Now it is possible to draw a [illegible] curve through any number of points, but in the present case this method of proceeding is attended with no advantage, for if the number of points be great, as it necessarily must, the equation is of a high order, and its numerical computation impracticable Lambert, of Berlin who appears to have been the first who exhibited the law of mortality by a curve line constructed a somewhat complicated empirical formula, which represented the mortality observed in London during some part of the last century with considerable accuracy, and which may be adapted to any other set of observations by giving suitable values to its numerical coefficients But the most ingenious attempt which has been made to deduce a formula from *à priori* considerations is contained in a paper by Mr Benjamin Gompertz published in the *Philosophical Transactions for* 1825 Mr Gompertz assumes as a principle that there is a power in human life to resist the effects of disease, or oppose destruction which loses equal proportions of its intensity in successive equal small intervals of time, and from this he derives an expression which gives the number of survivors (y) of any number of individuals, taken at any given age, at the end of any number of years (x) counted from that age in terms of three constants, which may be determined from observations The formula may be given under this form —

$$\log y = \log l + \text{No whose log is } (\log \log p + x \log q),$$

l p, and q being the constants to be determined On [illegible] king the corresponding values [illegible] table, and determining the constants by means of the three equations so formed, the formula is found to agree with the table through all the ages within limits which may be fairly supposed not to exceed the errors of the observations

On account of the multitude of causes which influence the rate of mortality among the inhabitants of a country, it is plain that any formula deduced from *a priori* considerations can only be trusted so far as it is found to agree with experience and therefore for all practical purposes recourse is had to a table showing for each year of age the number of deaths which are observed to take place out of a large number of persons who enter upon that age The ratio of those two numbers is the measure of the probability that an individual entering upon that age will not survive the year and may be assumed as the law of mortality in respect of that age The table may be exhibited under different forms the most usual is a table of decrements which is constructed by supposing a large number of persons as 10 000 for example to start together in the same year of age (the year of birth is usually assumed) and to write down in the same column the number of them who remain alive at the end of each successive year From this the number who die in each year and the chances of surviving a year or any number of years are easily found For some purposes a table of the probabilities of living over a year at each age, or of dying in the course of the year is more convenient, but either form can be readily reduced to the other

The oldest table of mortality we possess is published in the *Philosophical Transactions for* 1693 and was constructed by Halley from the mortuary registers of the town of Breslaw, in Silesia This town was selected, because the number of births having been nearly equal to the number of deaths for some years it might be assumed that the population had remained in a nearly stationary state during that time —an assumption which affords the means of determining the ratio of the number who die at each age to the number who entered upon that age, for it is evident that in a place so circumstanced and supposing also there is no migration the number who survive or complete any year of age within a given period is equal to the sum of the deaths at all the greater ages during the same period For the sake of facilitating calculations from the table he reduced the numbers proportionally to 1000, by which number he represented the infants of one year of age

This method of determining the mortality from the mortuary registers or *bills of mortality*, has been frequently adopted, particularly by Dr Smart, in the formation of a table showing the mortality in the city of London about the middle of the last century, by St Maur, in respect of Paris, and by Dr Price, for the celebrated Northampton table, presently to be described But it is evident that as the population of a large town or district of country can never be absolutely stationary, and as migration must be constantly taking place to a greater or less extent the method is not absolutely correct, and, in fact, the results to which it leads must be attended with great uncertainty In order to obtain accurate results, it is necessary to know the numbers who actually enter upon each year of age, as well as the numbers who die in that age during the period included in the observation, and hence in addition to the mortuary register, an enumeration in each year, or at short intervals,

of the community in the several ages of life, is requisite for the accurate solution of the problem But, although great attention has been given of late years to the statistics of life, in various countries of Europe, it is only in a very few instances that sufficiently accurate data for the construction of a mortality table have been ons embracing indiscriminately the inhabitants Of these few, the principal (if not the only) instances are the observations made in Sweden and Norway, those of Dr Heysham at Carlisle, and more recently by Dr Cleland, at Glasgow

In consequence of the migration which is constantly going on among the inhabitants it is very difficult to obtain with certainty the data necessary for determining the mortality of any town or district, but there are various associations of individuals with respect to which precise data exist Such, for example are the religious houses in Catholic countries, the tontines which were established in different countries of Europe during the last century, the annuitants of the British government, and especially the life assurance companies now become so numerous In all such associations, the numbers who enter upon and die in each year of age can be ascertained with precision from the records of the association, which therefore afford the data requisite for determining the rate of mortality at the different ages, without hypothesis of any kind Tables were thus constructed by Kersseboom from Dutch registers of annuitants, by De Parcieux, from the lists of the nominees in the French tontine, chiefly of 1689 and 1696, and from the mortuary register of the Benedictines, and of the nuns in several convents in Paris, and by Mr Finlaison from six different classes of annuitants in English and Irish tontine Of the assurance offices the Equitable Society and the Amicable Society have published their experience separately, and in 1843 a series of tables was published under the superintendence of a committee of Actuaries exhibiting the law of mortality deduced from the combined experience of seventeen offices, including the two above named

We shall now give a comparative view of the mean duration of life at the different ages computed from some of the best known tables premising a short account of each table

1 *Northampton Table* — This table, which perhaps is better known in this country than any other, on account of its having been adopted by the greater number of the assurance offices as the basis of their tables of premiums was constructed by Dr Price from the bills of mortality from 1735 to 1780 of the parish of All Saints in the city of Northampton It cannot be considered as possessing much authority either on account of the accuracy of the data or the number of lives of which it embraces the history, and the hypotheses made use of in its formation — namely that the number of the inhabitants, and the number of annual deaths remained the same during the forty six years included in the observations, and also that the migrations all took place at the age of twenty years, — tend further to render it of doubtful value It differs from the modern tables in giving a much lower expectation of life at the younger and middle ages, a circumstance which may be in part owing to the improved condition of the labouring classes of the people but probably in a much greater degree to the inaccuracy of the observations (*Price on Reversionary Payments* 4th ed 1783)

2 *Carlisle Table* — This was constructed by Mr Milne, from registers kept by Dr Heysham of the births and deaths which took place in the city of Carlisle and its environs in the nine years from 1779 to 1787, the number of inhabitants having been determined by two enumerations which were made during that interval On account of the accuracy of the data and the skilful manner in which they were made use of this table is of considerable authority, though it probably gives a somewhat too favourable view of the duration of life as experienced of England generally (*Milne's* &c 1815)

3 *Government Tables* — These tables as already mentioned, were computed by Mr Finlaison, from observations of the mortality among the nominees of life annuities granted by the British government Mr Finlaison has given twenty-one tables of the probabilities of life but the recorded facts are contained in only six of them, the by combinations of these six The two subjoined table, for males and females respectively, are deduced from the rate of mortality adopted by the government for determining the values of life annuities (*Finlaison's Report to the Lords of the Treasury* published by order of the House of Commons 1829)

4 *Equitable Society's Table* — This table which was prepared by Mr Arthur Morgan, and published in 1834, exhibits the mortality which took place in the society from its establishment in 1760 to the end of the year 1829 By reason of the great number of lives contained in it, and the certainty of the data, this is a document of great importance It will be seen from the subjoined table that, for ages under fifty, it gives a rather more favourable expectation of life than the government table for males, and agrees nearly with the Carlisle table, but for ages above fifty it gives a less favourable expectation than either of those tables The observations com-

Table This table is described *and Sixth Annual Reports of the Registrar General* (1843 and 1845) It is constructed from the returns to parliament of the ages of the population of England in 1841, and of the deaths registered at different ages in that year, and is probably a close approximation to the mean duration of life in this country

For the sake of avoiding decimal points, the numbers in the subjoined table show the mean duration of life for ten individuals or the number of years enjoyed by ten individuals collectively In respect of a single individual, the mean duration of life is the tenth part of the number given in the table

Age	Northampton	Carlisle	Government (Males)	Government (Females)	Equitable Society	English Life Table
0	252	387	502	555		411
5	408	513	489	542		500
10	398	488	456	511	483	474
15	365	450	418	472	450	437
20	334	415	384	440	417	403
25	309	379	359	408	381	370
30	283	343	332	376	345	337
35	257	310	302	343	309	301
40	231	276	270	311	274	271
45	205	242	238	278	239	239
50	180	211	203	244	204	206
55	156	176	172	208	170	172
60	132	143	144	173	139	140
65	109	118	116	140	111	112
70	86	92	92	110	87	88
75	65	70	71	85	66	67
80	48	55	49	65	48	51
85	34	41	31	48	34	38
90	24	33	20	28	26	28
95	8	30	12	16	11	20

There are many questions of great interest respecting the law of mortality which cannot yet be satisfactorily answered from the want of sufficient data The Carlisle table gives only an indication of local mortality, but it may be asked whether the mortality is the same in different parts even of the same country or the same in cities as in rural districts? Now, the government annuitants resided in all different parts of the kingdom, and the same may be said of the members of the Equitable Society though perhaps a majority of the latter were resident in London But the three tables—namely, the Carlisle table the table computed from the government male annuitants and the Equitable Society's table — present a remarkable agreement and so far as their evidence goes, we cannot draw any positive conclusion either in favour of a particular district or a select class of individuals

It seems to be established beyond doubt that the rate of mortality at least in England has undergone a very sensible diminution within a century especially in respect of children and aged people This may be ascribed in some degree to the discovery of vaccination, but more especially to the general diffusion of comfort and the improved mode of living, among the labouring classes of the community

Another question of great importance is, whether the law of mortality is the same for both sexes? In the above table it will be seen that there is a remarkable disparity between the male and female annuitants in favour of the latter This indication of the greater longevity of females is confirmed by the observations of De Parcieux on the monks and nuns in the French convents, of Kersseboom on the Dutch annuitants, of Dr Price, on the mortality at Chester, and also by the tables constructed from the mortality in Sweden, at Montpellier in France and in the cities of Amsterdam and Brussels It is still however, open to doubt whether the superiority shown in the above instances holds generally true Over the whole population of Belgium, the greater part consisting of peasantry and labourers, it is found that the lives of females are shorter than those of males while in the towns the advantage is on the side of the females The combined experience of the seventeen life assurance offices above referred to shows no superiority in the duration of female life

The following table, showing the proportion of deaths to the population in the principal states of Europe, according to the latest observations, is extracted from a paper in the *Revue Encyclopédique* for July and August, 1833 We cannot vouch for its accuracy, but it is probably not far from the truth

Countries.	Periods or Epochs.	Ratio of Mortality to Population
Sweden and Norway	1821–1825	1 in 47
[illegible]	1819	1 45
[illegible]	1826	1 44
[illegible]	1829	1 44
[illegible]	1818—1821	1 55
[illegible]	1827—1828	1 38
[illegible]	1825—1828	1 45
Prussia	1821—1826	1 39
Austrian Empire	1828	1 40
France	1825—1827	1 39
Switzerland	1827—1828	1 40
Portugal	1815—1819	1 40
Spain	1801—1826	1 40
Italy	1822 1828	1 30
Greece	1828	1 30
Turkey in Europe	1828	1 30
Northern Europe		1 44
Southern Europe		1 36
The whole of Europe		1 40

For an accurate description of the various mortality tables up to the date of its publication the reader is referred to the [illegible] article on the subject, by Mr Milne, in the *Ency Britannica*

MO'RTAR (Dut mortar) In Architecture a cement for the junction of stones and bricks, made of lime sand, and water In the composition of it stone lime is preferable to that burnt from chalk, and river to pit or road sand

MORTAR A short wide piece of ordnance for throwing shells bombs, grape-shot, &c It is the most ancient kind of cannon

MORTAR In Pharmacy a vessel made either of iron stone ware, or glass, &c according to the use to which it is applied in which substances are either pulverized or dissolved by means of a pestle In fine chemical processes recourse is often had to mortars made of agate flint, or porphyry

MO'RTGAGE In Law a mortgage-deed is in effect a conveyance by which a party grants his interest or a portion of it to another with a condition that if a sum of money is paid by a stipulated day the grant shall be void T[illegible] whether of fee s[illegible] rms of the conveyance D[illegible] this estate the mortgagor though in possession is in contemplation of law only tenant-at-will to the mortgagee, and on failure of payment the estate of the mortgagee would become absolute at law But in equity the mortgagee's estate is subject to an *equity of redemption* or right to redeem on the part of the mortgagor and a mortgage is thus redeemable so long as the relation of debtor or creditor appears to subsist between the parties and for twenty years after the last acknowledgment of that relation by the mortgagee unless upon his application the right be previously foreclosed by a decree of the court

MORTIER (Fr) The name given to a cap of state of great antiquity worn by the first kings of France and the form of which is still preserved in the cap worn by the president *de la cour* of Paris

MORTIFICA'TION (Lat mors *death* and facio *I cause*) Local death gangrene When any portion of the body loses its vitality a process of separation takes place between it and the living parts that surround it, and when [illegible] in parts or organs it is necessarily fa[illegible] that attend mortification of the viscera are generally loss of pain, diminution of fever, small sinking pulse hiccup, delirium, cold sweat, and fainting which precedes death

MORTIFICATION in Scottish Law, is nearly synonymous with mortmain in English By an act of 1587 land vested in the church was declared to be given for superstitious purposes, and to belong to the crown, and thus the spoliation of the richly endowed church of that country prior to the Reformation was finally legalized

MO'RTISE (Fr mortaise), in Architecture is the junction of two pieces of wood or other material the cavity cut in one piece being the receiving corresponding portion of the wood of the other, which is called a tenon

MO'RTMAIN In Law, an alienation of lands, tenements, or hereditaments, to any corporation, sole or aggregate, guild, or fraternity The foundation of the statutes of mortmain is Magna Charta, by which it was rendered unlawful for any one to give his lands to a religious house &c in order to take them back again to hold of the same house, which was extended, by interpretation, so as to annul gifts of lands which religious houses did not give back to the donor to his own use, but kept in their own hands after taking A great number of statutes were afterwards passed in order to restrict alienations to religious persons and houses, and various devices formed for the purpose of eluding them, of which the system of uses, which has become in some sort the foundation of our law of real property was one (See REAL PROPERTY, IRISH) But during the whole of this time the king had the power of dispensing with the statutes of mortmain by granting licences of alienation, and this power was confirmed to the crown by stat 7 & 8 W 3 c 37 Alienation to charitable uses are exempted from the statutes of mortmain, but they are subjected to particular forms and solemnities by the last mortmain act, 9 G 2 c 36 The term mortmain is derived from the Latin words mortua manus (*dead hand*), because the lands so alienated are said to fall into a dead hand, i e one incapable of performing the usual services required of tenants

MO'RTUARY In Law, a fee paid to the incumbent of a parish, by custom peculiar to some places, on the death of a parishioner It appears to have been a very ancient usage to present the priest on the solemnization of a funeral, with some personal chattel of the deceased, or a sum of money in lieu of it under the various titles of pecunia sepulchralis, sedatium, in Saxon *soul shot*, &c It had become a legal custom as early as the reign of Henry III, when the reservation of a mortuary appears to have been essential to the validity of a testament of chattels The amount was fixed by 21 H 8 c 6 according to an *ad valorem* taxation of the goods of the deceased Mortuaries (where due by custom) are recoverable in the ecclesiastical courts, and it should appear, since the statute at common law, although such actions have not hitherto been brought

MO'RUS (Lat *the mulberry tree*, Celtic mor, *black*), is a [illegible] genus of plants containing some species valuable [illegible] and others for their fruit The latter is our mulberry tree, *Morus nigra*, whose well known black juicy berries are a favourite autumn production, the former are *M alba philippensis*, and others which constitute the best of all food for silkworms The latter are found occasionally in plantations, but they are too tender to bear our climate well, and cannot be usefully cultivated even in the midland country of England

MOSAIC or MUSAIC (Gr μουσαικον, *polished, elegant*, from μουσα as being *fine or ingenious?*) In Paint[illegible] carefully inlaid upon a ground generally of metal In St Peters at Rome are to be seen some works of this sort on a magnificent scale This art was practised at a very early period and was reintroduced to Italy by the Byzantine Greeks

MOSAIC GOLD Bisulphuret of tin, a yellow flaky substance sometimes employed in ornamental japan work This term has lately been applied to a superior kind of brass and to a yellow alloy of copper, zinc, and gold

MOSAIC WORK In Architecture the inlaying pavements walls &c with small dies of different-coloured stones or glass in regular figures, or to represent historical or other subjects

MOSLEM *See* MUSSULMAN

MOSQUE (Arab medsched) A Mohammedan place of religious worship The principal interior decoration of mosques consists in the lamps which are numerous, [illegible] the floor is covered with carpets [illegible] M[illegible] is denoted by a niche, or by a tablet inscribed with verses of the Koran called the Kebla The principal Arabian and Syrian mosques are most remarkable for their vast quadrangles surrounded with numerous columns, those of the Turks for the elegance of their cupolas The original places of worship of the Arabians were the temples dedicated to the religion of the different nations whom they subdued such, for instance as the temple of Jerusalem the temple of Minerva at Athens and innumerable others in Spain, Asia and Egypt It was not until they had consolidated their power that the Arabians devoted themselves to the cultivation of the arts and gave any indication of that original architectural genius which afterwards displayed itself in the structure of mosques At the entrance of almost every mosque there is a large court planted with bushy trees in the centre of which or under a vestibule paved with marble, are fountains for the prescribed ablutions of the Mussulmans, and to these courts is usually attached a small gallery, on which the apartments of the ministers of religion, &c abut But besides mosques for public worship there are others set apart for the instruction of young men in the science of legislation, and the doctrines of the Koran, and to this class belong the so called *royal* mosques, or *jamis*, of Constantinople Most of these mosques have hospitals for poor, the sick, or deranged persons attached to them Their revenues are often considerable, and are derived chiefly from endowments in landed property The term *mosque* is found, with slight variation, in all European languages The Turkish equivalent is meschit, which is supposed to be [illegible] *foundation*, and [illegible] Ir mosquee, the Germ moschee, the Span mequita, the Ital maschetta, and the Eng mosque *See* MINARET

MO'SSES, in common language, are any minute,

small-leaved Cryptogamic plants Thus club moss is a lycopodium, Iceland and reindeer mosses are lichens, and the numerous species of Jungermannia are all comprehended under the same term But in systematical botany no plants are considered mosses except such as belong to the natural order *Bryaceæ* or *Musci* Such plants are simple-leaved, without spiral vessels or sto- [illegible] or thecæ, covered by a cup or calyptra The structure of the sporangia is as complex as that of the stems and leaves is simple Each sporangium is closed by a lid or operculum, below which is a transverse membrane, closing up the urn left after the fall of the operculum The edge of the urn is furnished with one or more rows of teeth, in all cases some multiple of 4, in the centre is a columella or column, and between the latter and the sides of the urn are the spores It is not a little singular that such plants should have cases called staminidia containing powdery matter, among which are found animalcules, not distinguishable from such as are called spermatic and which swim about freely in water None of [illegible] known use

[illegible] Land abounding in peat moss but not so much saturated with water as to become peat bog, or morass

MOSS-TROOPERS In English and Scottish History those inhabitants of the borders of the respective countries who were banded together in clans and lived by rapine received this denomination from the character of the country over which they 'trooped' in their excursions, These banditti were little heard of after the union of the two crowns but not absolutely suppressed until the union of the kingdoms a century afterwards

MOTES, among the Anglo-Saxons were public courts or conventions of the people assembled for municipal or legislative purposes They were of various kinds, as Wittenagemote Folkmote Burgemote, &c (See these separate articles) *Mote* was a customary service or payment at the mote or court of the lord from which certain persons alone were exempted by charter or other privilege

MOTTET (Ital motetto) In Music a composition consisting of from one to eight parts of a sacred character

MO'THER OF PEARL (Fr nacre de perles Germ perlen mutter) is the hard silvery brilliant internal layer of several kinds of shells particularly oysters which is often variegated with changing purple and azure colours The [illegible] Indian seas alone secrete this coat of [illegible] to render their shells available to the purposes of manufactures The genus of shell fish called *Pentadina* furnishes the finest pearl as well as mother of pearl, it is found in greatest perfection round the coasts of Ceylon near Ormus in the Persian Gulf at Cape Comorin and among some of the Australian seas The brilliant hues of mother of pearl do not depend upon the nature of the substance but upon its structure The microscopic wrinkles or furrows which run across the surface of every shell act upon the reflected light in such a way as to produce the chromatic effect, for Sir David Brewster has shown that if we take with very fine black wax or with the fusible alloy of D Arcet, an impression of mother of pearl it will possess the iridescent appearance Mother of pearl is very delicate to work, but it may be fashioned by saws files, and drills with the aid sometimes of a corrosive acid such as the dilute sulphuric or muriatic and it is polished by colcothar of vitriol (*Ure's Dictionary of Arts &c*)

MO'THER WATER A term applied by chemists to saline solutions from which crystals have been deposited and which when poured off and re evaporated furnish a second crop

MO'TION (Lat motio) In Mechanical Philosophy motion is the change of place, that is of the part of space which the body occupies, or in which it is extended Motion is *real* or *absolute* when the moving body changes its place in absolute space, it is *relative* when the body changes its place only with relation to surrounding bodies, and it [illegible] en the body changes its situation with [illegible] bodies that appear to us to be at rest All the phenomena of motion are derived by mathematical deductions from the three following laws of motion of Newton —

1 A body must continue for ever in a state of rest, or of uniform motion in a straight line, if it be not disturbed by the action of an external cause

2 Every change of motion produced by any external force is proportional to the force impressed and in the direction of the straight line in which the force acts

3 Action and reaction are equal and in contrary directions, that is, equal and contrary changes of motion are produced on bodies which mutually act on each other

For the formula which express the relations between the moving force the spaces passed over, and the times when bodies move in straight lines or curves, with uniform or accelerated velocities, see FORCE AND VELOCITY For elementary illustrations of these laws we refer to Maclaurin's Account of Newton's *Principia*

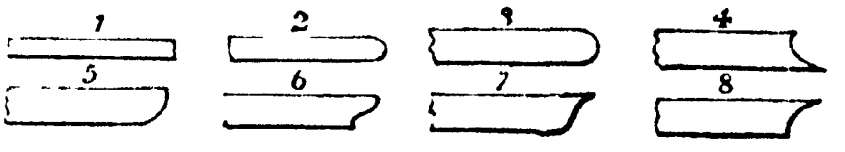
MOTION (Lat motio) In Painting and Sculpture, the change of place or position which from certain attitudes a figure seems to be making in its representation in a picture It can be only implied from the attitude which prepares the animal for the given change, and differs from *action*, which see Upon motion, in art, depends that life which seems to pervade a picture when executed by a master

MOTION In Music, the manner of beating the measure so as to hasten or retard the pronunciation of the words or notes

MO'TION IN COURT In Law, an occasional application to the court by the parties or their counsel, for the purpose of obtaining some rule or order of court which becomes necessary in the progress of a cause Motions are either of a criminal nature, as motions for an attachment for a misbehaviour, or of a civil nature A motion in the courts of common law is either for a rule absolute, *i e* to take effect immediately, or it is for what is termed a rule nisi or a rule to show cause—*i e* a rule to take effect unless cause be shown against it by a certain day, when, if no cause be shown the rule is made absolute on a second motion Motions are accompanied by affidavits stating the facts on which they are grounded, and generally preceded by a notice to the opposite party

MOTION, QUANTITY OF This term is used by writers on mechanics to denote the product of the mass or moving body by the velocity *See* MOMENTUM

MOTIVE FORCE The force which tends to produce motion It is the same with momentum



MO'TOR MOVER A term applied by anatomists to certain muscles &c

MO'TTO (Ital) is used to signify a word or sentence added to a device, and when put upon a scroll it is commonly employed as an external ornament of coat armour The use of mottos for this purpose is very ancient The term motto is also applied as a sentence or quotation prefixed to any writing or publication

MOULD Soil composed of decayed vegetable matter in a state of minute division more or less mixed with garden earth The kinds of mould most in use in horticulture are leaf mould formed from the decayed leaves of trees rich mould formed [illegible] dung heath mould found on [illegible] and peat mould, formed of thoroughly decomposed peat In general moulds are distinguished from soils by containing a much greater portion of vegetable matters than of earths

MOULD (Span molde) In Sculpture the matrix or hollowed wrought form into which the liquid or plaster, wax or metal is run in casting works of art

MOU'LDING (Fr moule) In Architecture, the members of an order which are shaped into various curved or flat forms of which there are eight sorts The fillet which is square in profile (1), the astragal (2),

the torus (3) being larger than the astragal, the scotia (4), the echinus (5), or quarter round, the inverted cyma talon, or ogee (6) the cyma, cyma recta, or cymatium (7), and the cavetto or hollow (8)

MOULDING-LOFT A large room in a dockyard in which the several parts of the ship are drawn out in their proper dimensions

MOU'LTING The fall of the plumage of birds It may be either partial or total the complete moult generally takes place annually, the partial moult occurs at the change of plumage to which some species of birds are subject at the breeding season The moult is always accompanied by the development of a new plumage, which may be of a different colour from that which is lost See INDUMENTUM

MOU'NTAIN LIMESTONE A series of limestone strata, the geological position of which is immediately below the coal measures with which they also sometimes alternate See GEOLOGY

MOU'NTAIN MILK A very soft spongy variety of carbonate of lime

MOUNTAIN (Lat mons) In Geography, the term applied to designate the principal elevations on the earth's surface Mountains and hills, say Bakewell, are relative terms with respect to each other, the highest elevations being denominated mountains, and the lower hills In the case of Mont Blanc and Mont Rosa, which are more than 5000 yards high the mountains in Cumberland and North Wales would be called hills, though Snowdon rises more than 1100 yards and Skiddaw and Helvellyn more than 1000 above the level of the sea In England, if hills rise abruptly, [illegible] than 100

yards above the surrounding country, they are generally called mountains *See* GEOLOGY

Arrangement of Mountains — Mountains are seldom found insulated or detached sometimes though rarely, they exist in aggregate groups, branching from a common centre, and not externally connected, but most commonly they are extended in ranges or mountain chains, traversing extensive regions A single continuous chain is of rare occurrence in general a number of chains is associated, though there does not seem to be any predominating form of aggregation or direction, at least with reference to the whole surface of the globe In some instances there is a principal or central chain, with secondary groups branching off from it, in others, several chains are associated to no one of which the rest can be said to be subordinate and in others again, as the Cor[illegible] each other, all running [illegible] been surmised that the direction of the principal mountain chains is that of the line of greatest length of the continent or region to which they belong, but this idea, though rendered plausible by some remarkable instances, can scarcely be said to be borne out by the facts In a very general view it may be stated that the predominating direction of the great mountain chains of the old world is from west to east, while those of America range from north to south *See* GEOGRAPHY

Another generalization which seems to be liable to fewer exceptions, is that mountain chains or ranges present the steepest acclivities on the sides nearest the sea Thus [illegible] the shores [illegible] present their precipitous sides to the Euxine and those of Caucasus and Mozanderan to the Caspian The western Ghauts face the Indian ocean and the whole range of the Cordilleras, with their prolongation to the Arctic ocean presents its escarpments to the great Pacific On the hypothesis that the continents and mountain masses have been upheaved by a force acting in the interior of the earth these peculiarities of configuration afford scope for curious speculation respecting the prodigious efficacy of the subterranean agencies through which the crust of the earth has assumed its actual form

Altitude of Mountains — On taking a general view of the surface of the earth the elevation of the loftiest mountain chains, enormous as it appears to be is insignificant in comparison of the dimensions of the globe The radius of the earth is nearly 4000 miles, while the height of the highest peaks above the mean level scarcely exceeds 5 miles [illegible] to 800, so that on a 16-inch globe the corresponding inequality would only amount to the hundredth part of an inch Mountains, however, exercise a very great influence on the climate of a country and hence it is of great importance in geography to ascertain their altitude and configuration The methods by which the measurement is effected have been explained under the term HEIGHTS, MEASUREMENT OF

The following are the altitudes of a few of the most elevated peaks in the four quarters of the world The most extensive list which we have seen is given in *Gehler's Physicalisches Lexicon* art 'Hohenpunckte' where the authorities for the different measures are also stated

Europe — Mont Blanc, Alps, 15 781 ft Mont Rosa, 15 555 ft, Ortler Spitze, Tyrol [illegible] 13,720 ft, St Gothard Pass, [illegible] St Bernard 8,040 ft, Mont Perdu, Pyrenees 11 283 ft, Le Pic Blanc, do, 10,205 ft, Monte Corno, Appennines 9,523 ft Lomnitz, Peak of Carpathians [illegible] Parnassus, 8,000 ft, Mulahacen Sierra Nevada Spain 11 673 ft, Ætna Sicily, 10 963 ft, Snechattan Norway 8,115 ft, Snaefell Iceland 6,860 ft, Helvellyn, England, 3,055 ft, Ben Macdui, Scotland, 4,418 ft, Macgillicuddy's Reeks, Ireland, 3 410

Asia — Dhawalagiri Himalaya, 26 862 ft, Jamautri, do [illegible], [illegible], Caucasus, 18 500 ft, Mouna Kaah, Sandwich Islands, 18,400 ft, Demavend, Mazanderan, 14,700 ft, Soomoonang Thibet, 14 500 ft, Ophir, Sumatra, 13 842 ft, Italitzkoi, Altai, 10,735 ft, Ararat [illegible], Lebanon, 9520 ft, Sinai, 5 000 ft, [illegible]

Africa — [illegible] Geesh 15,000 ft, Peak of Teneriffe [illegible] 11,400 ft, Niewveldt, Cape of [illegible], [illegible] Gros Morne, Isle of Bourbon, 9,600 ft, Trigo, Canaries, 7,400 ft, Tuivo, Madeira, 5,162

America — Sorata [illegible] Illimani, Peru, 21 490 ft, Chimborazo [illegible] ft, Antisana, 19,150 ft, Catopaxi, [illegible] ft, [illegible] de Popocatepti, Mexico, 17,716 ft, Pos[illegible], [illegible] Nevado de Mexico, 15 700 ft, Lake of [illegible], City of Rio Bamba, 10,800 ft, White Mountains, Massachusetts, 6,230 ft

MOURNING may be defined generally as an external indication or manifestation of grief for the death of a friend or relative Certain usages in regard to mourning [illegible] nations, barbarous and [illegible] but except in the grief of which they are intended to be the symbol [illegible] flowers marks of uncleanliness Thus the Chinese mourn in white, the Turks blue or in violet, the Egyptians in yellow, the Ethiopians in grey In ancient Rome and Lacedæmon the ladies mourned in white In Eastern countries it was regarded as a peculiar mark of affliction to cut the hair, and at Rome, on the contrary, to let it grow The Greeks adopted the Eastern practice, and bestrewed the tombs of those for whom they mourned with their hair The peculiarities of the ancient Jews in time of mourning are well known, and the various customs of which so minute an account is contained in the Pentateuch are still maintained on these occasions by their descendants From the commencement of the Christian era the general colour adopted for mourning throughout Europe has been, with very few exceptions, black The kings of France mourn in violet Tue duration of the period of mourning differs in different countries but in all is usually regulated by the nearness of relationship between the survivors and the deceased Thus in France the period prescribed by usage is, for a husband, one year and six weeks, for a father, mother, wife, or child, six months, for a grandchild four months and a half, for a brother or sister two months, for an uncle or aunt three weeks, for a cousin-german fifteen days, &c The rules that determine the forms and duration of *court mourning* emanate from the sovereign, but these do not extend beyond the court, and though on the demise of the crown or a relation it is expected, in the language of the *Gazette*, that the people "put themselves into decent mourning," this is seldom generally complied with except when the character of the deceased has been such as to secure wide popularity (The art 'Deuil' in the *Encyclopédie des Gens du Monde*, gives a very complete view of the chief modes of mourning in use in ancient and modern times) *See* SEPULTURE RITES OF

MOUSE (Lat mus probably from the Greek *μυειν, to hide*) The pretty but annoying little Rodent quadruped which infests human dwellings and granaries is usually understood by this word, the other small species of the genus *Mus* being distinguished by some prefix as harvest mouse field mouse, and the larger species of the same genus being termed rats (For the generic characters of the mouse see MUS) The common mouse, like the rest of the genus and indeed the whole of its order is remarkable for its fecundity, it produces ordinarily five or six young ones at a birth and this several times in the course of the year In a fortnight the young are able to leave the mother and assume an independent existence and these are soon [illegible] able to reproduce The harvest mouse (*Mus messorius*) is the smallest of known mammals the length of the head and body is two inches and a half Its nest is beautifully and elaborately constructed of the panicles and leaves of three stems of the common reed interwoven [illegible] forming a roundish ball suspended on the [illegible] at a height of about five inches from the ground The field mouse is about the size of the house mouse but is distinguished by its larger eyes and ears Many small mouse-like quadrupeds are commonly termed 'mice' which really belong to a different genus, or even order, as the dormouse the field vole, the shrew, &c

MOUSE In Naval Affairs a hump or knot worked on a rope to prevent a noose from slipping

MOUTH (Sax muð) In Architecture, the same as cavetto which see

MOVEABLE FEASTS Certain festivals held in commemoration of different events recorded in the Gospels and the Acts of the Apostles and connected with the personal circumstances of Christ during the last year of his earthly life and after his death As they are reckoned backward and forward from his resurrection and as the celebration of that day depends on the time of new moon which varies at different times through the space of a month, these dependent festivals also vary in the same way Easter is always the first Sunday after the first new moon after the 21st of March, and from this all the others are reckoned for each year

MOVEMENT The train of wheel work of a clock or watch *See* HOROLOGY

MOVEMENT In Politics, an expression that has been adopted of late years into the political vocabulary of most European nations, signifying that party in a state whose principles consist in a restless endeavour to obtain such concessions in favour of popular rights as will ultimately place the chief functions of government in the hands of the people It is opposed to the Conservative party or the *parti de resistance*

MOW A mass of corn in the sheaf, built up in one end of the barn preparatory to being threshed

MOWING The act of cutting down grass herbage, or corn with a scythe Mown grass, or herbage, is either given to horses and cattle in a green state, or dried and

stack [illegible] they [illegible] for separating the corn or pulse from the straw or haum by threshing

MO'XA A soft woolly substance made in Japan from the leaves of the *Artemisia Chinensis*, or Chinese mugworts It is used as an actual [illegible] a small cone of it upon the skin and [illegible] when it burns down to the part and makes a sore, which is kept open if requisite

MOYA Mud poured out from volcanos

MUCI'VORA (Lat *mucus*, and *voro, I devour*) A name applied to [illegible] insects, comprehending those which feed on the mucus or other juices of plants or [illegible] bodies

MUCK, [illegible] A vulgar phrase which has been adopted into the English language to signify an indiscriminate attack upon friends and enemies, as in the well-known verse,

Who runs a *muck*, and tilts at all he meets

This expression is derived from the Javan word amok, which means *to kill*, the inhabitants of Java and many other of the Asiatic islands being remarkable for an irresistible phrenzy resulting from a desire of vengeance, which leads them to aim at indiscriminate destruction and thus to subject themselves to be treated like wild beasts which it is impossible to take alive These fits of desperation were long considered peculiar to the class of slaves in the islands above mentioned but there are many instances on record where whole villages and even armies, have under the influence of a *mok* devoted themselves to inevitable destruction to avenge an injury or an insult The accounts of the wars of the Javans says Raffles, in his *History of Java* as well as of the Malays abound with instances of warriors running *amok*, of combatants giving up all idea of preserving their own lives rushing on the enemy committing indiscriminate slaughter and never surrendering themselves alive The cause of these fits of desperation has been attributed to an intemperate indulgence in opium-eating

MU'COUS MEMBRANE The membranous lining of the canals and cavities of the body which are exposed to the contact of air or other inorganic substances The basis of this membrane is compact cellular tissue not gelatinous or adipose and having a peculiar cuticular covering beset in some cases with abundant nervous papillæ in others with the orifices of secretory glands

MU'CUS (Lat) The secretion of the mucous membranes the most characteristic of which is that from the nasal membrane Mucus is viscid and acquires apparent fluidity in water without being actually dissolved, but gives a ropiness to it when present to a less amount than 1 per cent With pure water of the temperature of 95° [illegible] in a few hours, but if the apparatus [illegible] the mucus remains upon the paper and gradually thickens It may be repeatedly dried and moistened without material change of properties, it, however, becomes less transparent, yellow [illegible] and on cooling is found to retain its former characters When dried it is yellow and translucent, and subjected to distillation it yields carbonate of ammonia and empyreumatic oil, and phosphate and carbonate of lime and carbonate of soda are found in the ash It is soluble in dilute sulphuric acid, and blackened by the concentrated acid, it is not soluble in acetic acid, but yields but a trace of albumen According to Henle mucus consists of the scales of the epithelium which covers the open cavities of the body This epithelium or cuticle consists of minute cells of various forms, which are continually wearing off and being renovated, it thus yields scales which mix with the watery secretion and constitute mucus

MU'DAR The Indian name of *Calotropis gigantea* a plant of the Asclepiadaceous order, a substance used medicinally in that country, [illegible] ofulous cases but not admitted into [illegible] of Europe It gives its name to *mudarine* a peculiar chemical principle, having the singular property of softening by [illegible]

MUEZZIN Muezzin [illegible] general appellation of those officers, or clerks of the mosques whose duty it is to proclaim the ezan or summons to prayers, at the five canonical hours viz at dawn, noon 4 o'clock P M, sunset, and nightfall

MUFFLE An arched vessel with a flat bottom in which substances may be exposed to a red heat without coming [illegible] the fuel *See* ASSAYING

MUFTI The Turkish title of a doctor of the law of the Koran, derived from *fetvas*, a rescript or answer to a question of law addressed to the competent authority, which fetvas it is the province of the mufti to issue The mufti of Constantinople, or Sheikh ul-Islam, is the chief functionary of the Turkish church and represents the sultan in spiritual matters, as the grand vizier does in temporal

MUGGLETO'NIANS A sect of Christians who sprung up in England in 1561, and derived their name from Muggleton with an associate [illegible] the two last and [illegible] asserted that they had power to save or to ruin in a future state whomsoever they pleased Notwithstanding the absurdity of their pretensions they obtained many adherents and the belief in their inspiration has been maintained though by a comparatively insignificant number from the period of their first promulgating their opinions down to the present time A collection of the works of Muggleton and Reeves, together with some Muggletonian tracts, was published in 3 vols 4to in 1764 In these the reader will find the singular doctrines of this sect fully, but, as appears to us very unintelligibly set forth In the religious controversy to which the promulgation of their doctrines gave rise their chief opponents were the Quakers and amongst these were George Fox and William Penn.

MUGILOIDS [illegible] *a mullet*) A family of Acanthopterygian fishes in the system of Cuvier, characterized by having an almost cylindrical body covered with large scales, and furnished with two separate dorsals, the first of which has but four spinous rays The mouth is either edentulous, or is provided with teeth of extremely minute size This family includes the genera *Mugil* [illegible] it is included in the Cyclostomiz

MULA'TTO A term in general use in American countries, in which there exists a mixed population of different races and colours, for the offspring of a union between a white and a negro

In our West Indian possessions the offspring of a white and a mulatto is called a *quadroon*, or one quarter black, of a white and quadroon a *muster*, or one eighth black, of a white and muster a *mustafina* or one sixteenth black, after which they are said to be *whitewashed* and are considered as Europeans On the other hand the offspring of a mulatto and a negro is called a *cabre*, of a cabre and negro a *griffe*, and generally speaking after this there is no distinctive appellation but negro All this is sufficiently simple, but in the Spanish and Portuguese colonial possessions the intermixture of Europeans with negroes mulattoes &c, and these again with other classes, has given rise to a multiplicity of denominations sufficiently vague and indefinite even in these languages, but wholly untranslateable into English It must be admitted, however that great ingenuity has been displayed in tracing the amount of European and negro blood that flows in the veins of the mixed races, as the following list of terms (which might be considerably augmented) will prove —*Zambi*, quatralvi, tresalvi, saltatras, coyote zambaigi cambusos giveros, puchuelos albarassados barrinos &c All these again may be multiplied in arithmetical progression, thus forming a host of modifications, each, however, retaining more or less his original characteristics in proportion to the relation in which he stands to his original stock

In Spain, the term Mulatto has been employed to designate persons having a tincture of Moorish blood

MU'LBERRY The so called paper mulberry is the *Broussonetia papyrifera* and not a morus, its tenacious pliable inner bark forming a valuable material for the dress of the South Sea Islanders and Chinese The yellow dye wood called fustick is the produce of another species of this genus, the *Broussonetia tinctoria* *See* MORUS

MU'LBERRY CALCULUS An urinary concretion consisting chiefly or entirely of oxalate of lime Many of these calculi in form and colour somewhat resemble the fruit of the mulberry

MULCH Straw or litter half rotten In Horticulture when this material is applied round the roots or stems of plants to protect them from the drought or from frost, they are said to be mulched

MULL A term used in Scotland almost synonymously with Cape which see, and [illegible] promontories projecting portions of the island, as the Mull of Galloway, of Cantyre &c

MU'LLAS The priests of Tartary are so called They form one of the three grand classes into which the Tartars are divided, the other two being the *murzas* or nobility and the peasantry Their chief duty consists in reading the Koran but their stock of knowledge is generally so scanty, that they are seldom able to interpret the Arabic in which the office of the mosque is performed The village mullas are generally decently behaved and respectable men, a little too much given to sell charms for the ague but living for the most part among their neighbours a quiet and charitable life, the arbitrators as well as curates of their sequestered valleys, and frequently possessing, in addition to these weighty charges, the sinecure office of parish schoolmaster" (*Quart Rev* vol xxix p 129) The Tartar *mulla* and the Persian *mollah* (which see) have evidently a common origin, but the [illegible] wholly distinct

MU'LLET, in Heraldry, represents the rowel of a

spur In English blazonry it is depicted of five points in French of six It is used as the filial distinction of the third son *See* DIFFERENCE

MULLET The name of the fishes of the genus *Mugil*, which in addition to the family characters of the Mugiloids, have the middle of the under jaw produced into an elevated angular point, adapted, when the mouth is closed, to a corresponding groove in the upper jaw, the number of the branchiostegous rays is six Of this genus there are three British species, viz the grey mullet (*Mugil capito* Cuv) the thick lipped mullet (*Mugil chelo* Cuv) and the short mullet *Mugil curtus* Yarrell of these the first species is the least rare The red mullets (*Mullus surmuletus*, Cuv , and *Mullus barbatus*, Linn) belong to a different family of fishes the former of these species was in high repute [illegible] by the ancient Romans and on occasions of extravagant prices were given when it had attained an unusually large size

MU'LLION, or MANNON In Architecture, the upright post or bar dividing the lights in a window

MULTANGULAR FIGURES or POLYGONS MULTILATERAL FIGURES Rectilinear figures of more than four sides, so called from the number of its angular points, as a pentagon, hexagon decagon &c which have five, six, ten sides or angles respectively

MU'LTIARTI'CULATE (Lat multus articulus *a joint*) in Zoology, is applied to the antennæ of insects, and to the legs of Crustaceans and Cirripeds when they are composed of a great number of joints, also to bivalve shells which have numerous teeth in the hinge

MULTICARI'NATE (Lat multus carina *a keel*) in Conchology, is applied to a shell which is traversed by many keel like ridges as the *Fusus multicarinatus*, *Turbinella multicarinata*

MULTIDE'NTATE (Lat multus, dens *a tooth*) In Zoology, when a part is armed with many teeth or tooth-like processes A family of Nereids is hence termed *Multidentatæ* by De Blainville, on account of the structure of their horny jaws

MULTILO'CULAR (Lat multus, loculus *a lodge*) In Conchology this term is applied to those shells which, like the nautilus, have their cavity divided into many chambers

MULTINO'MIAL (Lat multus nomen *name*) In Algebra, an expression consisting of several terms (more than two) which are connected by the signs of addition or subtraction, + or — Sometimes it is called a polynomial, and in modern works, after the French writers, a *polynom*

MULTINOMIAL THEOREM A theorem discovered by Demoivre for forming the numeral co-efficients which arise in raising any multinomial to any given power without the trouble of actual involution The binomial theorem of Newton is a particular case of this, viz that in which the number of terms is only two

MU'LTIPLE (Lat multiplex) Any quantity which contains another an exact number of times without a remainder is a *multiple* of the latter, and the latter is a *submultiple* or part of the former

MULTIPLE POINTS In Analytical Geometry when two or more branches of a curve pass through the same point it is called a multiple point

MULTIPLE VALUES, in Algebra signify symbols which fulfil the algebraical conditions of a problem when several different values are given them, as the roots of an equation certain functions of an arc or angle &c

MU'LTIPLICA'ND, in Multiplication is the number or quantity that is to be repeated the number of times denoted by the multiplier

MULTIPLICA'TION In Arithmetic, an abbreviated process by which, when a number is to be repeated several times, a result equal to the sum arising from all the repetitions is obtained (*See* ARITHMETIC and FRACTIONS) A considerable abbreviation of this is effected by the use of logarithms (*see* LOGARITHMS), and other methods of shortening the work or lessening the degree of attention requisite in performing it have at different times been devised, as Napier's rods and the logarithmic slide rule of Gunter *See* NAPIER'S RODS

MULTISPI'RAL (Lat multus, spira *a spiral turn*) In Conchology, this term is applied to those operculs of univalve shells which exhibit very numerous and narrow spirals from the centre

MULTISTRIATE (Lat multus, stria *a streak*) In Zoology, when an animal or part is marked with many streaks

MULTIVA'LVE (Lat multus, valva, *a valve*) In Conchology, when a shell consists of several calcareous pieces as that of the chiton or barnacle

MU'LTOCA The name given to the code of laws by which the Turkish empire is governed, consisting of the precepts contained in the Koran, the oral injunctions of Mohammed, and the decisions of the early caliphs and doctors It relates to every subject of life, and comprises various matters appertaining to government, the sultan being the sole judge of its application to particular cases (*See* SULTAN, VIZIR See also *Edin Review*, vol x p 259)

MULTU'NGULATE (Lat multus, ungula, *a hoof*) In Mammalogy, when a quadruped has the hoof divided into more than two parts corresponding with three or more digits, as the elephant, rhinoceros, &c Ray so denominated a family of hooted quadrupeds corresponding with the *Polyschides* of Aristotle

MUMMIFORM (Lat mumia, *a mummy*, forma, *form* In Entomology the nymphs of certain Lepidoptera are so called which resemble an Egyptian mummy

MU'MMY (Arab mumia, from mum, *wax*) The name given to the dead bodies of men or animals which are by any means preserved in a dry state from the process of putrefaction Mummies have usually been divided into classes — the natural produced by burying in peculiar dry soils or atmosphere, which permit the drying of the animal tissues to be effected with such rapidity that the body is preserved, the latter embracing the various means that have been employed from the earliest ages to preserve dead bodies from corruption Of the former or natural class of mummies some well known instances are to be found in the vaults of several Continental churches, particularly at Strasburg, Toulouse and Bordeaux

The *art* of embalming owes its origin to the extreme veneration with which the ancient Egyptians regarded the corpses of their relatives and was practised with such success that at the lapse of 3000 years the mummies found in the numerous catacombs of Egypt are still objects of admiration But it was not to the dead bodies of the human species alone that the ancient Egyptians restricted their reverence, they practised embalming also on all the animals which their religion held sacred and of these upwards of fifty different species have been found embalmed

The art of embalming was practised also to a considerable extent by the ancient Jews, Greeks, and Romans though it never attained such celebrity or perfection among them as among the people from whom it was borrowed It was also adopted as a national custom by the Guanches the ancient inhabitants of the Canary Islands a full account of which is to be found in the *Essai sur les Isles Fortunées* by M Bory de St Vincent

The account which Herodotus has left us of the Egyptian process of embalming is so minute and has besides been so amply confirmed in the most essential particulars not only by the subsequent writers of antiquity, but in still more recent times (see the *Memoir* of M de Rouyer) that we cannot refrain from embodying it in our pages There are says he, persons resident in Egypt who make this art their profession When a dead body is brought to them they show the bearers three wooden models of mummies imitated in painting, the most elaborate of which are said to be of him (Osiris) whose name I do not think it right to mention on this occasion The second which they show is simpler and less expensive, and the third is the cheapest of all They then demand of the bearers which model they wish to be adopted, and the latter having decided upon the price, depart The most expensive preparation is as follows — First they extract the brain through the nostrils by means of a hooked iron instrument — partly by pulling it out, and partly by the infusion of drugs They then with a sharp Ethiopian stone make an incision in the side in order to extract all the viscera which they wash with palm wine and purify with pulverized perfumes Having next filled the belly with pure ground myrrh cassia, and all other odoriferous herbs except frankincense, they sew it up, and rubbing the whole corpse with natron bury it for 70 days — a longer period not being admissible At the expiration of the 70 days they wrap the whole corpse in bandages of fine linen and smear it all over with gum, which the Egyptians are in the habit of using instead of glue The friends of the deceased, on again receiving the body have a wooden case made in the form of a human figure, in which they place it, and having shut it up deposit it in a sepulchral building, setting it upright against the wall

For those again who, on account of the great expense of this mode of embalming, adopt the middle course the bodies are thus prepared — They fill all the intestines with cedar oil, without either cutting into the body or extracting the viscera, and, taking measures to prevent the egress of the injected liquid they salt the body for the prescribed number of days The cedar oil is then taken out, and such is the power with which it operates that it brings with it the bowels and all the viscera in a state of dissolution The natron also destroys the flesh of the body, leaving only the skin and the bones The body is then returned

The third mode of embalming is that practised on the poor In this case they inject into the body a mixture of salt and water, wrap it up in natron for 70 days and then deliver it to the relatives (*Herod* b 2 c 186)

It was long a matter of uncertainty what became of the intestines after they had been removed from the body of those embalmed according to the first process Porphyry and Plutarch have both asserted that they were thrown into the Nile, but modern discoveries in the tombs leave no doubt of the fact that they were embalmed separately, and deposited in four vases in the coffin (See *Sir G Wilkinson's Manners and Customs of the Ancient Egyptians*, vol ii p 467 2d Series)

Diodorus mentions three different classes of persons who assisted in preparing the body for the funeral the scribe, who regulated the incision in the side, the *paraschistes** or cutter, and the embalmers To these may be added the undertakers who wrapped the body in bandages, and who had workmen in their employment to make the cases in which it was deposited Many different trades and branches of art were constantly called upon to supply the undertakers with those things required for funereal purposes as the painters of mummy cases, those who made images of stone, porcelain, wood, and other materials, the manufacturers of alabaster, earthenware, and bronze vases, those who worked in ivory, the leather cutters, and many others

With regard to the question, when the custom of embalming the body ceased in Egypt some are of opinion that it ceased at an early time, when Egypt became a Roman province But this has been fully disproved by modern discoveries, and it not only appears that the early Christians embalmed their dead, but according to St Augustine, mummies were made in his time at the end of the 5th century The origin of this opinion is perhaps to be sought for in the circumstance that at the period of the Roman invasion of Egypt the custom may not have been universal, and Sir G Wilkinson maintains that it in all probability gradually fell into disuse rather than that it was suddenly abandoned from any accidental cause connected with change of custom, or from religious scruple

Since the commencement of the present century the attention of the learned in the chief countries of Europe has been particularly directed to the subject of embalming the dead and the researches of numerous travellers from Belzoni downwards to Sir G Wilkinson aided by the scientific manipulations of Pettigrew and others have cleared up many points that were formerly obscure in reference to this art, which was so general in ancient, though wholly unknown in modern Egypt The following observations, borrowed from *Dr Nuttall's Classical and [illegible] Dictionary* &c, will at once exhibit briefly the state in which the mummies are found at the present day and serve as an appropriate commentary on the description of the process of embalming as detailed above The practice of embalming upon the immense scale of the population of a country such as Egypt involves a problem of the highest interest If to those numberless pits and catacombs of human corpses are also conjoined the mummies of the ibis dog ape cat and crocodile, the bull Mnevis Apis and Isis, the ram the fox and horned asp, in short of every reptile of the land, — we are lost in surprise and amazement how such a process could be established, and if by resins drugs or spices, from whence such profuse quantities could be procured and supplied These bodies also are often enveloped in silks and bandages of stained linen of surprising [illegible] 1000 yards in length [illegible] nted with gilding as fresh as when first laid on, with pieces of coloured glass imitative of the finest gems evidencing their knowledge of staining and cutting them in a manner which merits notice, as well as their enamels also All these ornaments found around the mummies are highly preserved, and as well as the sycamore chests resist all the injuries of time, and subsist fresh and perfect for the examination of the curious They usually have the Nubian cast of countenance, the outline figure traced in black, and the colours, four in number — blue red yellow and green — laid on without any mixture of shading but altogether forming a composition of very considerable interest These chests usually have within them small scarabæi or the idols of Isis and other deities in clay and coloured glass and beautiful enamels One scarabeus mentioned in *Greaves's Pyramidographia*, was of magnet which although 3000 years since it was taken from the rock, its natural bed, still retained its attractive magnetic virtue The recent discoveries of M Belzoni add also to our stock of information upon the articles of the wrappers and prove in this also the science and the labour of their embalming, by evincing that there were distinct modes of preservation and of envelopes for every caste, — that of the priesthood particularly with a scrupulosity of minute detail that astonishes and marks their high privileges Upon examining mummies that have been brought to Europe, a decided similarity of ornament is observable: the better-conditioned being covered with glass ornaments, cut as precious stones, and disposed with the [illegible] of colours, and offering the same [illegible] other mummies that are painted, [illegible] ornaments which were costly were preserved for principal personages, while the inferior classes contented themselves with tracing the decorations in paintings

It has been frequently maintained that the doctrine of metempsychosis formed part of the ancient Egyptian creed, but it would seem that the practice of embalming the dead is wholly irreconcileable with such a doctrine. Others have explained this Egyptian usage as if it proceeded from a belief in materialism, but it can surely never be argued that unbelievers in the immortality of the soul would be most anxious to guard against the dissolution of the body On the contrary, as Schlegel has well observed, this usage seems rather to set forth an indistinct feeling that this apparently dead matter is still important, — some mistaken and imperfect presentiment that the bond between the soul and matter is not altogether dissolved, and shall yet one day be restored, — and that even this matter shall have its portion in immortality and [illegible]

MUMPS [illegible] applied to inflammation of the [illegible] the [illegible] by fever or constitutional symptoms, but is occasionally translated to other glandular parts A gentle dose of physic and the application of a piece of flannel dipped in warm salt water or in solution of acetate of ammonia, is generally all the treatment required From the way in which this complaint sometimes spreads in families or schools, there is some reason to believe it to be contagious or infectious

MUNDIC A Cornish name for iron pyrites

MUNDIFICANT (Lat mundare *to cleanse*) A term applied in old pharmacy to certain healing and [illegible] ointments and plasters

MUNICIPAL, MUNICIPALITY The word *municeps*, in the language of early Roman jurisprudence, signified a person capable of holding an office or dignity (from munus or munium, *an office*, and capio, *I take*) It was appropriated in its more particular meaning to those who by the constitution of Rome, were admissible to certain privileges and honours, but not to the right of suffrage or magistracy, in consequence of not being full citizens These were the strangers who in various ways became incorporated with the Roman people without acquiring the right of citizenship The jurisconsult Paulus (as cited by Festus) notices three sorts of municipes — 1 Free strangers settled in Rome, 2. Citizens of commonwealths which became absorbed in that of Rome by conquest or submission (quarum civitas universa in civitatem Romanam venit) such were Aricia, Cere, Anagnia, 3 Citizens of allied commonwealths, who retained their citizenship at home while at the same time they became municipes of Rome such were Tibur, Pisa, Arpinum It is plain that this last is the sense in which the citizen of one state was said to be municeps of another Towns of the last two descriptions (if the passage of Paulus is correctly understood) were probably comprehended by the Romans under the title of *municipia*, *i e* towns which possessed their own rights, and the burgesses of which were also municipes of Rome Such burgesses often acquired full Roman citizenship and even dignity but seem to have been always (in the republican times) regarded as of recent and comparatively ignoble franchise as in the passage of Juvenal respecting Cicero (ignobilis et modo Romæ municipalis eques), *i e* one coming from the municipium of Arpinum By later writers, municipia are sometimes confounded with colonies The word municipal and its derivatives have passed into modern usage in two different senses 1 The local government of a small district especially of a town and particularly if elective, is termed a [illegible] such are municipal corporations in England Every Latin municipium had its own customary law (*jus municipale*). Hence with later jurists municipal law came to signify the law of particular towns, districts, and provinces In this latter sense the customs of the French cities and provinces were called municipal laws And among modern publicists the word has received a still greater extension, the positive law of [illegible] country (in opposition both to natural or moral law and to the law of nations) being often called its municipal law The same term is also sometimes used rather vaguely in contradistinction to the constitutional or political law of a state, as where crimes are divided into offences against the state and municipal offences

MUNIMENTS A common name, in legal phraseology, for deeds, charters, &c, chiefly those belonging to public bodies [illegible] ecclesiastical corporations have generally a "muniment room" in which these are kept

* The office of *paraschistes*, or dissector, was held in infamy "As [illegible]

Derived from Lat murena *an eel*, because, as it is said, they [illegible]

MURÆNOIDS (Lat murena *a species of eel*) The name of a family of Apodal fishes, including the true eels (*Anguilla*) and the eels without pectoral fins (*Muræna*) The fishes of the latter genus are more voracious and have their jaws armed with more formidable teeth than the *Anguillæ* One species (*Muræna Helena*) was much esteemed by the ancients, who fattened it in ponds expressly constructed for the purpose The history of Vædius Pollio, who caused his transgressing slaves to be flung into these ponds as food for the *Murænæ*, is well known

MURAL ARC, or ARCH In [illegible] segment of a large circle fixed [illegible] wall of an observatory for the measurement of the meridional altitudes or zenith distances of the heavenly bodies

MURAL CIRCLE, MURAL QUADRANT, in Astronomy, is an instrument, generally of a large size attached to a stone wall or pier of solid masonry and fixed in the meridian for the purpose of measuring the distances of stars from the pole or the zenith The first mural quadrant, or rather arch, used at Greenwich, was erected by Flamsteed in 1689, and divided by Abraham Sharp There are still two quadrants in the Observa[illegible] one of them was erected by Graham [illegible] rvations of Halley, and was redivided by Bird in 1753, the other was constructed by Bird in 1750 and is the instrument with which Bradley and Maskelyne made their most important observations Experience having shown that entire circles are susceptible of much more accurate division and much less liable to derangement than quadrants, a mural circle was constructed by Troughton and placed in the Observatory in 1812 Since that time the advantages of this construction have been fully appreciated and a mural circle is now regarded as the principal fixed instrument in all the great public observatories

Troughton's mural circle is six feet in diameter It is formed of brass, and fixed by means of sixteen conical radii, concentric to and at right angles with a conical axis nearly four feet long seven inches in diameter at the extremity at which the circle is fixed but only half as much at the other extremity The axis rests and turns in two collars one towards each end of the cone fixed at the front and back of a stone pier about four feet in depth The degrees are cut into five spaces on a narrow ring of white metal composed of gold and palladium The divisions are read by six micrometers placed at equal distances round the circle and securely fixed to the stone pier The telescope is fixed at right angles to an axis which works within the conical axis of the circle It consequently moves in the plane of the circle, and can be clamped in any position so that the readings may be made on different parts of the circle In order that the circle may move easily round its axis and that the lower side of the front socket may be relieved from the load of the instrument, two large friction wheels are suspended in front of the pier from the arms of two levers which by means of counterpoises, may be made to support the whole or any part of the weight The details of construction, however, admit of being varied in many different ways

The use of the mural circle is to measure angular distances in the meridian The axis must therefore be placed exactly horizontal, and the plane of the circle vertical and in the meridian, and the line of sight at right angles to the axis and parallel to the plane of the circle Small errors, however, in the adjustments scarcely affect the results The advantages of the mural above all other astronomical circles consist in the permanence of the microscopes, and the facilities for observing stars by reflection (For a detailed description of this instrument see *Pearson's Practical Astronomy*, also *Dr Robinson's* [illegible] *Armagh Observatory* [illegible] *yal Astron Society*)

MURCHISONITE A variety of crystallized felspar found in the new red sandstone near Exeter its component parts are silica 686, potash 148, alumina 166 [illegible] its discoverer, Mr Murchison

MURDER, in the English law, is defined to be the killing any person under the king's peace, with malice prepense or aforethought, either express or implied by law The word is of the same origin with the German *mord*, Fr *meurtre*, in law Latin, *murdrare* —to which word [illegible] an indictment [illegible] was taken by a prisoner in the reign of W [illegible] ng of good Latinity, which was overruled with contempt The malice prepense is the chief characteristic which distinguishes murder from other species of homicide, and it is the great office of the jury [illegible] malice has been shown [illegible] outward circumstances or *implied*, as where one deliberately kills another without provocation the law implies malice Malice is also *implied* where persons having authority to arrest or imprison using the proper means for that purpose are resisted in so doing, and killed, which offence is murder Killing in the prosecution of an unlawful act, when the act is done deliberately and with intention of mischief either indiscriminately or to particular individuals is likewise murder, whether or not there was a premeditated design of killing the individual slain So where particular malice against an individual is wreaked, by mistake, against another Whenever, also, death ensues on an unlawful act done in prosecution of a *felonious* intention, it is murder, as where a man is killed by a shot discharged at an animal with intent to kill and steal it, or where the intent is only to do some great bodily harm, and death ensues When several assemble to commit a breach of the peace forcefully, and happen to kill a man in the prosecution of such intention, they are all guilty of murder In some cases also, murder may be the consequence of a lawful act criminally or improperly performed, as by duress in a gaol

The execution in cases of murder, by 25 G 2 c 37, was to take place the next day but one after sentence, unless staid by the discretion of the judge, with an exception for Sunday by 9 G 4 c 31 and it was usual to sentence on Friday in order that the Sunday might intervene before execution But by 6 & 7 W 4 c 30 the time before execution was made the same as in other capital offences It happened at a trial for murder at the Devonshire assizes only a few days after the passing of this act when two men were convicted, that during the interval which elapsed sufficient doubt was raised as to the identity of one of the prisoners to prevent the execution

By the French code penal of 1810, the several kinds of homicide are accurately defined, and the crimes of "assassinat parricide infanticide and empoisonnement" are capital But the power given to the jury by the code of 1808 of pronouncing *under what circumstances* a criminal act has been committed materially modifies the severity of the law If extenuating circumstances are found by the jury the punishment is diminished

MUREX (Lat murex *a shell fish*) A name applied by Linnæus to a genus of the Vermes Testacea having a univalve spiral shell, with an oval aperture [illegible] nature, straight or slightly ascending canal [illegible] thus characterized form a family (*Muricidæ* or rock shells) in the Buccinoid tribe of Pectinibranchiate Gastropods of the system of Cuvier and include the following genera proper *Brontes*, Montf, *Typhis* [illegible] Montf, *Aquilla*, Montf *Fotorium* Mart, *Tritonium* Montf, *Trophona*, Montf *Ranella* Lam *Apollon* Montf, *Lusus*, Lam, *Pathna* Mart, *Struthiolaria* Lam *Pleurotoma* Lam, *Clavatula* Lam *Typula* Lam, *Fulgur*, Montf, *Fasciolaria* Lam *Turbinella* Lam

MURIACITE An anhydrous sulphate of lime, containing a little common salt

MURIATIC ACID, or HYDROCHLORIC ACID This acid was originally discovered by Glauber and called by him *spirit of salt* In its pure or gaseous form it was first obtained by Priestley in 1774 and its true composition was shown by Davy in 1809 who proved it to be a compound of hydrogen and chlorine, hence it has been termed *hydrochloric acid* Muriatic acid gas is procured by acting upon common salt (which is a chloride of sodium) by concentrated sulphuric acid the water of the acid is decomposed, and its hydrogen combines with the chlorine of the salt to form muriatic acid, whilst the oxygen is transferred to the sodium which is thus converted into soda, and this unites to the sulphuric acid to form sulphate of soda 60 parts of common salt, and 49 parts of concentrated sulphuric acid afford by this mutual action 37 parts of muriatic acid and 72 of sulphate of soda Muriatic acid gas may also be formed by passing an electric spark through a mixture of equal volumes of chlorine and hydrogen, or by exposing such mixture to the sun's rays, or inflaming them by a taper they burn with explosion and form a volume of muriatic acid equal to the united volumes of the gases As the specific gravity of hydrogen is to that of chlorine as 1 to 36, the specific gravity of the resulting muriatic acid gas compared with hydrogen will be 18 5, and 100 cubic inches of it will weigh 39 3 grains Muriatic acid gas is rendered liquid under a pressure of 40 atmospheres of the temperature of 50°, it extinguishes flame and is intensely sour, powerfully reddening vegetable blues Water absorbs it with much violence taking up about 480 times its volume This is the state in which muriatic acid is generally used Its specific gravity is about 1 19 and it is commonly obtained by distilling a mixture [illegible] sulphuric acid, and water When [illegible] happens that a mutual decomposition [illegible] acid ensues [illegible] the oxide unites to the hydrogen of the water, and the metal to the chlorine to form a metallic chloride Thus it is that soda and muriatic acid form a chloride of sodium or common salt The most effective test of the presence of muriatic acid is nitrate of silver, which forms an insoluble chloride

of silver in all solutions containing muriatic acid or muriates

MURICATE (Lat muricatus, *thorny*) In Zoology, where a surface is armed with short, but not close-set cones, having a sharp apex

MURIDÆ (Lat mus, *a mouse*) The family of Rodents of which the genus *Mus* is the type by some naturalists it is restricted to the genera *Mus Hesperomys, Dendromys, Ge* [illegible] *Pseudomys*, by other [illegible] the *Lib* [illegible] *Castoridæ*

MURINES (Lat mus, *a mouse*) The name of a tribe of Rodent quadrupeds, of which the genus *Mus* is the type it includes the families *Muridæ Arvicolidæ*, and *Sciuridæ*, and is the most widely distributed of all the Rodent tribes

MURRAIN (Fr), is the popular term of a malignant epizootic influenza to which cattle are subject, and which has at various times made terrible havoc among them It appears to have been long known, and, from the accounts handed down does not seem to have changed its characters materially

This disease extensively raged on the Continent from 1710 to 1746 (Lancisi *Disputatio Historica de Bovilla Peste*), and serious visitations of the malady were also witnessed during the years 1730 and 1731 and from 1744 to 1746 at that time many written descriptions were produced of this pest among which the work of Sauvages, the celebrated professor of medicine at Montpelier stands pre-eminent It produced, in 1757 an extreme fatality among the cattle of this country, an account of which was published in an excellent work by Dr Layard, a physician of London

This disease as it is met with in England may be characterized as an extremely malignant inflammatory œdema attacking and indeed confining itself for the most part to one of the hind quarters of the animal It is most common in the seasons of spring and autumn and affects principally young cows The most prominent features are tumefaction and a discolouring of the side affected with consequent lameness and inability to move, a peculiar emphysema of different parts of the body but particularly over the region of the spine and all the symptoms of putrid fever present in diseases of a typhoid character It speedily runs on to gangrene and few animals survive an attack of this kind more than ten or a dozen hours

Although the English murrain is somewhat modified in its virulence by season locality and the condition of the sufferer it is nevertheless generally looked upon as incurable When however, remedial measures are had recourse to, extensive scarification or rather incisions of the affected side, fomentations and purgatives are most likely to effect the desired object

It may be necessary also to remark that this malady is known to farmers and others in the different counties of England by a variety of terms none of which are either elegant or expressive, and, on the other hand that diseases different altogether from the one under consideration have received the same name indeed the word murrain is often used to denote any epizootic affection in cattle The one just described may, however be looked upon as the true murrain of this country

The murrain which broke out in England about two years ago, and has ever since committed such havoc among the cattle is travelling steadily northwards, but the disease has lost much of its original virulence as almost always happens in the case of epidemics travelling from one country to another Accidental circumstances aggravate the complaint, but in a general way it runs its course now in a few days, and to all appearance condition lessened, or "taking-on" stayed exceeds not from a fortnight to three weeks Much depends upon the condition of the animal, and in numerous instances the distemper touches rather than skuthes The doctoring process has been generally discontinued, and the best of all recipes is the warmth communicated by sheltered fields or sheds, rest, and the absence of disturbing influences

The prevention of this disease is even perhaps more important than the medical treatment and consists in allowing a free access of air to all the buildings stalls &c, with daily fumigation of them by chlorine or chloride of lime Care should be taken to examine three or four times a day the cattle on every farm so as to remove as speedily as possible the healthy ones from those that are affected

MURRHINE (Lat murrhina vasa, Gr μυρρίνες) Murrhine vases were a species of ware often mentioned by writers of the Roman empire, the material of which has been much disputed by modern antiquaries They came from the East, and, according to Pliny, were made of some precious stone found chiefly in Parthia, but some have conjectured that this was an erroneous opinion prevalent among the Romans, and that they were in reality of porcelain, of which the manufacture was unknown to the western nations (See *Plin Hist Nat* l 37, and a memoir in the 43d vol of the *Mem de l'Ac des Inscr*; and *Maurice's Indian Antiquities* vol vii)

MURRY or SANGUINE In Heraldry a dark red, one of the colours or tinctures employed in blazonry It is expressed in engraving by opposite diagonal lines crossing each other reckoned a dishonourable colour, rarely to be met with in [illegible]

MURZAS The name [illegible] of the Tartars, or, more strictly perhaps, to the second class of their nobility, the first or principal class being [illegible] the latter are looked upon as upstarts by the older nobility and regarded as an inferior race The Murzas have from the earliest ages been distinguished for their bold and refractory character, and the peculiar privileges they formerly possessed supplied them with the means of giving effect to their turbulent dispositions Since the conquest of Tartary, they have sunk into comparative insignificance, though many of them retain a large share of their former property, and have considerable influence among their own countrymen (See *Quart Rev* vol xxix p 128) The Tartar *murza* is evidently of the same origin with the Persian *mirza*, with which, however it must not be confounded *See* MIRZA

MUSACEÆ (Musa one of the genera), constitute a small but very important natural order of plants, related to the orders yielding ginger arrow-root and similar substances, but [illegible] having several stamens instead of one only The plantain (*Musa sapientum*), the most valuable product of the vegetable kingdom in hot countries in consequence of the abundance of nutritious food yielded by its fruit, and the application of its leaves to the purposes of thatching and of thread obtained from its petioles in the manufacture of the finest muslins, is the representative of the order Another species is the *Musa paradisiaca* or banana, and the singular plants called Strelitzias with their orange and blue flowers, are also members of *Musaceæ*

MUSCA (Lat *a fly*) A Linnæan genus of Dipterous insects now expanded into a family (*Muscidæ*) of the fifth tribe (*Athericera*) of the order *Diptera* in Latreille's system It is distinguished by a proboscis always very apparent membranous, and bilabiate generally having two palpi, and capable of being entirely withdrawn into the oral cavity, and a sucker of two pieces [illegible] terminate in a plate with a lateral s[illegible] are divided into the subfamilies *Creophila* which includes the meat-fly (*Musca vomitoria*) and the common house fly (*Musca domestica*), the *Anthomyzæ* the *Hydromyzæ* the *Scatomyzæ* the *Dolichocera*, the *Leptopodidæ*, the *Capromyzæ*, the *Gymnomyzæ* and the *Hypocera*

MUSCHELKALK [illegible] stone This name [illegible] to a limestone formation belonging to the red sandstone group it has not yet been found in England

MUSCI See MOSSES

MUSCICAPA (Lat musca *a fly*, capio, *I take*) A genus of Dentirostral Passerine birds characterized by a depressed beak furnished with hairs at its base and with the point more or less hooked and emarginate The genus is now split into various subgenera, as *Tyrannus, Gymnocephalus Muscipeta* and *Muscicapa* proper, &c, included in the family name of *Muscicapidæ* Their general habits are cruel and predatory, like those of the shrikes, and according to their size and strength, they live on small birds or insects The smallest and weakest of the *Muscicapidæ* gradually approach the form of the wagtails

MUSCIDÆ The family of Dipterous insects, of which the fly (*Musca*) is the type

MUSCHIFORMES (Lat musca *a fly*, forma, *form*) The name of a tribe of *Tipulariæ*, or crane flies, comprehending those which have a stout body and short legs, [illegible] flies

MUSCLE BAND In Coal-mines, the black shale containing embedded muscle shells

MUSCLE (Lat musculus, diminutive of mus, *a mouse* from its resemblance to a flayed mouse) Fleshy fibres [illegible] the m[illegible] *voluntary*, others such as the heart, are independent of the will, or *involuntary*, and others, as the diaphragm and muscles of respiration generally have a *mixed* action, being to a certain extent only dependent upon the will Muscles are aggregates of minute muscular fibres, which appear to be composed of small globules, but we are, in fact, ignorant of the ultimate structure of the muscles, and of the causes on which their wonderful powers depend They are enveloped in and penetrated by cellular membrane, and abundantly supplied by nerves, blood-vessels and lymphatics

Their principal constituent or proximate elementary structure consists of fibrin with some albumen, besides which gelatine and fat are derived from their cellular membrane, and hæmatosin, osmazome, and other con-

stituents of the blood are also found in them they therefore constitute the most nutritious species of animal food *See* ALBUMEN and CREATINE

All the muscles are under the immediate influence of the brain and nerves; and consequently when this influence is abstracted, as by the division of the nervous trunks by which they are supplied, the powers and functions of the muscle whether voluntary or involuntary, are in the first instance disturbed, and afterwards cease altogether Electricity is capable to a certain extent of recalling the action of the muscles, provided it be applied before rigidity ensues, hence the supposed analogy that power of matter and certain properties of the nerves The arrangement of the fibres of muscles is infinitely various, and adapted to the particular purposes which each has to fulfil In the voluntary muscles the fibres are generally parallel, or nearly so, but in the involuntary muscles they are more or less interwoven and interlaced When muscles contract, they become shorter, harder, and thicker and their bundles of fibres are thrown into undulated lines with a tremulous or vibratory motion most rapid where the contraction is most powerful, and producing a distinct sound, which may be most easily heard when the tip of the finger is put into the ear, it occasions a noise like that of carriages rumbling over a distant pavement (Wollaston, *Philos Trans*, 1809) The number of these vibrations amount to between twenty or thirty in a second these muscular sounds are importantly concerned in the diagnosis of certain diseases by the medium of the stethoscope

MUSCOVADO The name given to unrefined or moist sugar

MUSES (Gr Μοῦσαι, Lat *Musæ*) In the Greek and Roman Mythology nymphs or inferior divinities distinguished as the peculiar protectresses of poetry, painting, rhetoric, music, and generally of the *belles lettres* and liberal arts, with which indeed they are sometimes identified — *Quis est omnium qui modo cum Musis, id est cum humanitate et cum doctrina habeat aliquod commercium qui* &c (Cicero, *Tusculan* lib v cap 23) Helicon and the region round Parnassus was the favourite seat of the Muses where they were supposed, under the presidency of Apollo to be perpetually engaged in song and dance and in elevating the style and conceptions of their favoured votaries It appears probable that the early Grecian poets struck with the beauty and sublimity of the scenery in this part of Greece, ascribed the humanizing influence it was so well fitted to exercise over the mind to the agency of the nymphs and other tutelary deities of the place to whom they gave the name of Muses Originally there appear to have been only three of these divinities* and their names — *Mneme Melete* and *Aoide* or Memory Reflection, and Song — sufficiently show the nature of the faculties over which they were supposed to preside According as the fine and liberal arts were cultivated and expanded the province of each muse seems to have been more restricted, and additions were made to their number which ultimately was fixed at nine Their names and functions are succinctly stated in the following verses of Ausonius —

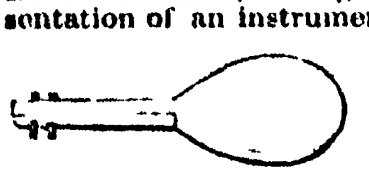
[illegible]

MUSETTE A name sometimes given by the Continental nations to the bagpipe The itinerant performers on the musette, who were formerly very numerous in many European countries, were called *musars*

MUSEUM (Gr μουσεῖον, from μοῦσα, *a muse*) A collection of curious objects in nature and art, but, in most instances, the former The name denotes a temple or place sacred to the Muses, and is said to have been first given by Ptolemy Philadelphus to that part of the royal palace at Alexandria in which he placed the famous library In England the museum at Oxford is the most ancient institution bearing the name It was founded in 1679, and enriched in the first instance chiefly by the contributions of Elias Ashmole but want of room and of funds has prevented it from affording an adequate exhibition of the various classes of objects for which it was originally destined, and which modern discoveries have so greatly augmented The foundation of the British Museum, in London was laid by Sir Richard Cotton's presenting to it his collection of manuscripts Since that period the library has been increased by the addition of the Harleian, Lansdowne, Egerton, and several other [illegible] extensive purchases out of funds [illegible], by the deposit of copies of newly published works, according to the legal right conferred on it by [illegible] and by the donations of George III and IV the latter of whom presented to it his father's library In sculpture, the British Museum possesses the [illegible] of marbles from Lord Elgin from Greece, [illegible] the Lycian marbles, an assemblage of Egyptian, and the Layard or Nineveh works of art It contains also the Hamilton vases, and the famous Barberini or Portland vase In several departments of natural history, especially in mineralogy it is extremely rich It was founded by Sir Hans Sloane in 1733, and fills the mansion known by the name of Montague House, together with adjoining buildings more recently erected The most celebrated museum in Italy is the Vatican, at Rome, next to it, that of Florence, and the Museo Borbonico, at Naples In France, as well as in Italy, galleries of pictures are considered as within the meaning of the general term 'musee," and the museum of the Louvre is chiefly remarkable for its contents of this description

MUSHROOM (Fr mousseron, a kind of agaric used in sauces), is, properly speaking, the *Agaricus campestris*, or eatable agaric, — a species common in pastures and well known for its excellence as an ingredient in sauces, but the term is generally used in a more extended sense, and applied indiscriminately to all firm fleshy species of the genus *Agaricus*, whether eatable or not

MUSIC (Gr μουσική) The art of combining sounds agreeable to the ear This art becomes a profound science when we investigate the principles on which its combinations are founded and the causes of the emotions it produces



Hebrew Music — Notwithstanding the great labours of the early fathers of the church and of many other learned men there are few materials even in the Scriptures themselves for a very satisfactory account of the music of the Jewish nation whose restricted intercourse with other nations prevents our receiving any illustration of it from contemporary writers All that can be done is to cite a few passages from holy writ relative to the first ages of the world from which it will be seen that from a very early period, the art constantly ministered to the religious ceremonies of the Hebrews Moses (*Gen* iv 21) tells us that Jubal sixth in descent from Cain, was "the father of all such as handle the harp and organ" The organ here mentioned according to the commentators was the syrinx, or a species of Pan's pipes This must have been but a short period after the deluge Six hundred years after this period Laban reproaches Jacob thus "Wherefore didst thou flee away secretly and steal away from me? and didst not tell me that I might have sent thee away with mirth and with songs with tabret and with harp" So that at this time vocal and instrumental music was not unusual For two hundred and fifty years after this period nothing occurs relative to music when we find Moses after the passage of the Red Sea, singing with the Israelites on the occasion Miriam Aaron's sister, 'took a timbrel in her hand and all the women went out after her with timbrels and with dances' There seems ground [illegible] that Miriam by birth an Egyptian and [illegible], might have learnt the use of the timbrel and the dance in that country The instruments mentioned during the administration of Moses appear to have been confined to the trumpet and tambourine After the siege of Jericho where the rams horns that were blown were rather military signals than instruments of music, we have no record of music till the appearance of the canticle of Barak and Deborah which seems to have been sung in dialogue without instruments, excepting the timbrel and the trumpet before mentioned From several passages music appears to have been united with prophecy Samuel (b I ch x v 5) says to Saul, "Thou shalt meet a company of prophets coming down from the high place with a psaltery and a tabret, and a pipe and a harp before them" These prophets were doubtless poets or psalmodists improvisatori of verses which they sung to the accompaniment of an instrument, and many of the fathers have supposed that the Jews had a college or school of prophets which was also a school of music, for they almost universally accompanied themselves, or were accompanied by others, with musical instruments David, who had cultivated music from his infancy, seems to have been destined by his family to the profession of a prophet, and Saint Ambrose says that he was chosen by God, above all the other prophets, to compose the Psalms The power that the harp of David had upon Saul, when he was tormented with the evil spirit, is an example, among many others, of the influence of music on the maladies of the mind, and especially in cases of melancholy Under the reign of David music was much esteemed He [illegible] a regular corps of musicians for the celebration of the [illegible] ceremonies, and his patronage necessarily extended its influence David, on all occasions seems to have been interested in the solemnities of his time we find him continually dancing and

* [illegible] says four *De Nat Deorum* i cap 21 but in this he is at variance with [illegible]

playing before the Lord, with songs, harps, psalteries, timbrels cymbals, corners and trumpets As in Egypt, the musicians were confined to one family that of Levi, which was exclusively consecrated to the service of the Lord and the cultivation of music When Solomon was made king, four thousand were the number "which praised the Lord with instruments" Dr Burney calls the reign of Solomon the Augustan age of the Jews, and though Solomon, unlike his father, was not himself a performer, and ranked "men-singers and women-singers, and the delights of the sons of men, such as musical instruments," among the vanities of the world, yet he continued the priests and Levites in his employ In the reign of Jehoshaphat the Levites were useful in the field of battle, and were, by their songs, the cause of the victory that was gained, and indeed this was not the only instance in which they were similarly serviceable Some time before the destruction of the temple and the first Babylonish captivity, music and the sacred rites had met with interruption both on account of war, and by their intercourse with foreign [illegible] The captivity was a mortal blow [illegible] had made to recover their music, and sixty-six years, the period of its duration was sufficient to efface all from their remembrance [illegible] Psalm [illegible] land Re[illegible] cond time, again delivered, and then conquered by the Egyptians Persians, and Romans successively —the unfortunate Jews had no leisure to cultivate the arts and it appears probable that their music which scarcely deserved the name till the reign of David even at its best epoch depended for effect more upon the number of the performers than upon any refined knowledge of the art

Among the modern Jews instrumental as well as vocal music was excluded from the synagogue from the time of the destruction of Jerusalem The singing they allow at the present day is a modern innovation for according to a passage of their prophets the Jews consider it contrary to their law or at least improper, to sing or rejoice until the coming of the Messiah The Germans are the only Jews in the present day who have a regular musical establishment in their synagogue They sing in parts and have preserved traditional melodies which are considered very ancient At Prague an organ is used [illegible]

[illegible] opinion of the ancients was pretty general Pythagoras was indebted to the Egyptian priests for nearly all the science he possessed and especially that of music Though Diodorus Siculus assures us that the Egyptians were not allowed to cultivate music and that they considered it useless and even injurious to society and the cause of effeminacy, yet Plato who had visited Egypt observes in one of his Dialogues that none but excellent music was allowed where the youth were assembled Though he admits others of their habits were bad he excepts the music Strabo tells us that the youth were instructed at the earliest age in music that the songs were fixed by law, and that the sort of music used was established by the government exclusive of every other sort The Greeks even attributed the invention of some of their musical instruments to the Egyptians, such as the triangular lyre, the single flute the drum and the systrum Herodotus says the Dorians were of Egyptian extraction and as the three most ancient modes of Grecian music were the Dorian, the Phrygian and the Lydian it is probable that the Egyptian colony that peopled that province carried thither the music and instruments of their country Like all other professions in Egypt that of music was hereditary A similar custom as we have above stated prevailed among the Jews, and Herodotus tells us that the inhabitants of Lacedæmonia who were Dorians resembled their ancestors, the Egyptians in this that their musicians were all of the same family, and that their priests, like those of Egypt were taught medicine and the art of playing upon stringed instruments when they were initiated into the mysteries of religion The same author mentions that in the processions of Osiris the Egyptians carried statues of the god singing his praises, and were preceded by a flute There is a singular proof of the antiquity of this art to be met with at Rome on the Guglia Rotta, which Augustus brought to Rome, being one of the largest obelisks that was removed from Egypt and which was thrown down and broken at the sacking of the city, in 1527 by the constable of Bourbon It is, among other hieroglyphics, the representation of an instrument, as here given, very like the colacsione (a species of guitar) still in use in Naples From the pegs it is evident two strings were employed, and the length of the finger board, if the strings were tuned at a great interval from each other, would afford a very considerable scale of notes This instrument alone proves to what extent music was cultivated

in Egypt, and that its inhabitants were acquainted with the method of repeating the scale Hermes [illegible] or the ancient Mercury Trismegistus to whom is ascribed the invention of writing astronomy religious rites and ceremonies, has the credit also of having invented the lyre with three strings, which, it is pleasantly said, were types of the three seasons of the year, there being a fourth season neither in Egypt nor among the ancient Greeks The lowest chord, say they, was the type of winter, the [illegible] the highest of summer The [illegible] ollodorus, was the origin of the [illegible] its inundation on one occasion, left on retiring a quantity of dead animals, and among the rest a tortoise The flesh soon perished and dried up, from the heat of the sun, nothing but the shell and the cartilages were left, and from their contraction they had been [illegible] Mercury [illegible] of [illegible] the bank of the river [illegible] his [illegible] tortoise shell and was [illegible] [illegible] the first [illegible] produced [illegible] the [illegible] [illegible] the [illegible] of a lyre He [illegible] [illegible] [illegible] [illegible] [illegible] shell [illegible] [illegible] [illegible] [illegible] [illegible]

the Turks themselves, the enemies of art, will pass whole nights in listening

Grecian Music - The fables of mythology are so mixed [illegible] of all the arts that it is difficult [illegible] Hence the most celebrated authors of the history of music, after delivering faithfully what the ancients have recorded on the subject, have left the reader to shift for himself in analyzing the mass Burney, of whose history in the two previous articles we have largely made ourselves, we propose to follow in the following short account of Grecian music The Phœnicians came into Greece with Cadmus, the son of Agenor amongst them were a class of men well versed in the arts and sciences of their country, who were called Curetes These established themselves in Phrygia where they were called Corybantes, in Crete, where they received the name of Dactyli they spread also into Rhodes, Samothracia, and other places In these places writing and music were the arts principally taught by them Cadmus, in Samothracia, took to wife Harmonia (sister of Jasius and Dardanus), who was so skilled in music that the Greeks gave her name to the art Diodorus in describing the marriage feast of the parties, makes the gods themselves guests Mercury came with his lyre, Apollo brought a similar instrument, Minerva assisted with a flute and the Muses also [illegible] Electra, the mother of the bride, celebrated the mysteries of Cybele with dancing, tambourines, and cymbals How Diodorus was informed of these particulars he does not condescend to tell his readers, but it seems probable that the story was founded on ceremonies which the priests at certain festivals, performed in honour of Harmonia and Cadmus Jupiter, they say was born at the epoch of the arrival of the Phœnicians, and the Curetes, it appears brought him up At that time they were not acquainted with any musical instruments save those of percussion they could not therefore have taught the Greeks more than the use of these, and they could convey no musical notions except those of rhythm The inferior divinities — Minerva, Mercury Apollo, and the Muses — afterwards became the protectors of the art, and invented wind and stringed instruments

These two circumstances are as the reader will perceive irreconcileable, and Diodorus committed an anachronism, which may be accounted for if his description was taken from some religious spectacle The flute with holes by stopping which many notes were produced was certainly a more [illegible] than the pipes of Pan This was the invention of Minerva who performed upon it until she was derided by Juno and Venus for the grimace and wry faces consequent on playing it, when she renounced it in favour of the lyre The employments assigned to Mercury by the Greeks may be learnt from the pleasantry of Lucian The same personage is the Hermes of the Egyptians, he had the credit of having invented music, and in those days its principal instrument the lyre In Greece the lyre he invented had seven strings, whereas that which he gave the Egyptians had three only Apollo was another of the Grecian deities whose origin was in Egypt He was a performer on the lyre, and there is no necessity to repeat in this place his contest with Pan, and the decision of Midas under whose form the silly king of Phrygia was represented by some neglected poet Marsyas was another of Apollo's unfortunate victims, upon him he wreaked his vengeance with such cruelty that he himself was afterwards ashamed of his conduct, and actually threw aside his lyre for a considerable period, which it is said retarded the progress and perfection of that instrument Fortunio Liceti a modern writer thus explains the story of the flaying Marsyas alive by Apollo Before the invention of the lyre, the flute was considered the most important instrument, and its practice enriched the performers on it As soon as the lyre [illegible] that nobody listened to flut[illegible] credit and were ruined Now the money of those days, being made from leather hides, gave rise to the story that Apol[illegible] ripped [illegible] his hide The priestess of Apollo at Delphi [illegible] Plutarch, her oracles to the sound of the flute Afterwards, when her oracle was in the greatest renown there were [illegible] instruments, and dancing and singing [illegible] were nothing more than a band of singers and musicians in the service of Osiris, or the Egyptian Bacchus, under the superintendence of his son Osiris The Greeks made them the daughters of Mnemosyne by Jupiter Those who make them the daughters of Pierus, king of Thrace, do not alter the first account, for the female musicians of Osiris, before they were taken into his service, had been celebrated in Thrace under the name of Muses, and the daughters of that Pierus who initiated them became celebrated under the same name Bacchus has been so celebrated in the musical world that we cannot leave him out Diodorus makes him the inventor of theatrical representations and schools of music, in which those who excelled were exempt from military service Hence the author says that musical societies have since enjoyed many privileges Certain it is that the Dionysiacs, or [illegible] Grecian representations [illegible] are as old as the world [illegible] In Attica [illegible] Rome all persons who appeared on the stage singing dancing, or reciting verses for the amusement of the people were called servants of Bacchus, and at all the processions, triumphs, and ceremonies instituted by the ancients in honour of the god music entered largely into the programme This is constantly seen in the bas-reliefs that have come down to us, for wherever there are fauns, satyrs and bacchanals we always find a certain set of musicians of some sort or other dancing

Pan seems to enjoy the [illegible] in the second class of divinities who patronised music The Egyptians, however, ranked him higher than did the Greeks Pan, say some, was the inventor of the flute called the syrinx The fable is pretty which gave rise to the invention Syrinx, a nymph, being pursued by Pan, flies to the banks of a river, whose nymphs she implores to save her Pan thinks to catch her, but embraces only the reeds Under this new form, Syrinx, shaken by the winds, emits certain melodious tones The god, pleased with the sound, makes an instrument from the reeds, to which he gives the name of Syrinx Pan is the companion and counsellor of Bacchus Shepherd, musician, dancer, hunter, and warrior he directs the movements of the bacchanals, but the perfection with which he plays the flute is such that Bacchus is never happy without him The satyrs follow in Pan's train Silenus was the inventor of several instruments Like Marsyas, he was bold enough to challenge Apollo, with better fortune, however, as regards the result

Such was the state of music in Greece under the gods and demi-gods, that is to say in those primitive times when every one who had signalized himself by a useful invention was deified after his death and considered the protector of the art he had invented The heroic age followed this, and, divesting the subject of fable as much as possible we shall now proceed to the music of that period Amphion Chiron Orpheus, Linus, were at once the first poets and the first civilizers of Greece Amphion is the first Theban musician mentioned in the history of the art Homer however is silent on his wonderful skill in music and of his having erected the walls of Thebes by the aid of the lyre Pausanias thinks his musical reputation was acquired by his alliance with Niobe and Pliny is of the same opinion Both of them allege that Amphion learnt the art in Lydia and that, having brought it into Greece, he was thence accounted the inventor of the Lydian mode Chiron, whom Plutarch calls the wise centaur accounted the son of Saturn and Philyra was born among the centaurs in Thessaly, that is among the people of Greece who first trained and rode the horse With the reputation of inventor of medicine botany and surgery, he lived at the foot of Mount Pelion, in a cavern which his science made the principal and most frequented school of Greece Plutarch makes him the instructor of Hercules in music, medicine and law, though Diodorous says that Linus was his master And here let it be observed that ancient authors [illegible] accomplishments [illegible] nature was anciently a reproach to any one above the commonest class Achilles was the most renowned pupil of Chiron who bestowed much of his time to instruct him in this art, as the means of not only softening the impetuosity of his character but of exciting him to heroic actions [illegible] Herculaneum represents [illegible] the young Achilles to play upon the lyre After Chiron, Linus and Orpheus appear to have been the first poets and musicians of Greece, but it is difficult to decide which was the pupil of the other Diodorus says that Linus has the priority, and that he added the chord hehanos to the lyre of Mercury, and invented rhythm and melody The majority of the ancients make him the instructor of Hercules, whom, say they he found so stupid and obstinate, that having on one occasion given him a blow the young hero seized his preceptor's instrument and beat his brains out with it Orpheus, however, whether before or after Linus, acquired the greatest name in Greece His reputation was fully established at the time of the Argonautic expedition, in which he was one of the adventurers Apollonius Rhodius observes, that he not only excited his comrades by the sound of his lyre, but that he also silenced the syrens by the superiority of his singing The fables universally say that Orpheus travelled in Egypt, where he was instructed in the mysteries of religion, theology, and poetry, and that he was the first who transplanted them to the Grecian shores According to the custom of the time, he united with the knowledge of music that of the sublime sciences Preferring the lyre to all other instruments, of which before him the flute seems to have been the principal [illegible] his imitators [illegible] his wife, the [illegible] god of the infernal regions, as known to every reader.

The instrument that produced these effects was but a seven-stringed lyre, two strings having been added by himself, by which addition the second tetrachord was completed

Obloquitur numero septem discrimina vocum — VIRG

From the little power which such an instrument possessed, compared with those of modern times, we may infer that it must have been the novelty of the art or the beauty of the poetry which produced such extraordinary impressions, or perhaps both acted upon a very susceptible race of people The mastery which Orpheus possessed over the Thracians made the women of that country jealous of him, and by them history relates he was murdered In the time of Plutarch the females of Thrace were said to be reproached with this barbarity The head, it is said, that his lyre, at the time of his murder, fell into the river Hebrus, down which it floated to Lesbos, where it was deposited in the temple of Apollo Neanthus, who afterwards purchased it of the priests of the temple, thought, like the nobleman who bought Punchinello, that the possession of it would inspire him no sooner had he begun to use it than the dogs of his neighbourhood tore him to pieces After the Argonautic expedition, the most important event in Grecian history is that of the siege of Troy Homer [illegible] is the only historian [illegible] ledge respecting the art He has preserved the names of several musicians, and these are the only ones known from the time of Orpheus up to the time of celebrating the Olympic games

The instruments mentioned by Homer, in the *Iliad* and *Odyssey*, are the lyre, the flute, the syrinx, or Pan's pipes The lyre is by him called *φορμιγξ*, *κιθαρις*, and *χελυς*, Aristophanes [illegible] poet who calls it *λυρα* [illegible] trumpet, it is thought that this instrument, though common in his time was unknown to the Greeks at the siege of Troy With Homer music and poetry are inseparable *αοιδος*, *a singer*, is the word used by him to express a poet By him Achilles and Paris are both exhibited as playing the lyre, but the former does it to console himself for the insult that had been offered to him, whilst the latter exercises his skill to forget the disgrace of having sought safety in flight Achilles sings the deeds of heroes The song of Paris was more [illegible] to the lyre [illegible] in recounting tales of love [illegible] music with his art was Tiresias he was also gifted with prophecy, and was a priest Thamyris receives from Homer the appellation *κιθαριστης one who sang to the lyre* Plutarch, in his Dialogue on Music, says that he was born in Thrace, the country of Orpheus that his voice, though loud, possessed the quality of softness, but that [illegible] with [illegible] punishment was [illegible] talent of touching the lyre This circumstance is mentioned in the catalogue of the ships (Lib II v 594) According to Diodorus Thamyris was of the school of Linus, and Suidas places him eighth of the epic poets who preceded Homer Clemens of Alexandria says he was the inventor of the Dorian mode, but he is probably wrong, inasmuch as this had before his time been imported into Greece by the Egyptians, who invaded that part of Greece which bore the name of Doria In the eighth book of the *Odyssey* Homer gives an eminent place to Demodocus whom he describes in his character of poet and singer as the glory of the human race Some have thought that under this name the poet was painting his own portrait He places him on a throne a herald announces him, and he has a private table, and in every circumstance speaks of the honours that were paid to him Like Tiresias and Thamyris he paints him blind, which it will be recollected was his own case The blind [illegible] likeness he bestows on him [illegible] accurately similar The last musician celebrated [illegible], who, according to Eustathius, had been his master He is immortalized in the *Odyssey* The poets and musicians of Greece appear to have much resembled the Celtic bards They wandered about, singing their works in great cities, and usually found admission to the palaces of princes, where they were treated as though endued with inspiration [illegible] pus were also celebrated, before [illegible] their musical talents the first, according to the Arundelian marbles, flourished 1506 years B C He was the inventor of the Phrygian flute and the airs or *nomes* that were sung to [illegible] the gods, to Pan, Bacchus, and other divinities of the country The second is honoured [illegible] by the Greek writers Two musicians [illegible] Olympus The most ancient was the most celebrated He was a native of Mysia and the disciple of Marsyas Burney has taken notice of Dr Burn's remarks that relate to the [illegible] to any system of music, and he conjectures that the airs that were sung in the temples in the time of Plutarch were then of the same relative antiquity as [illegible] Dr Burney has taken notice of Dr Burn's remarks that relate to the [illegible] Plato Polybius, Athenæus, [illegible] speak [illegible] Herodotus and Homer [illegible] [illegible] [illegible]

words were so suited to the circumstances of the battle of Mantinea, that the audience immediately turned their eyes to Philopœmen, who was present and interrupted the singer by shouts and acclamations of applause Timotheus, born at Miletus, 446 B C , was one of the most [illegible] tenth and the eleventh the consequence whereof was that for the innovation he was banished from Sparta, and ordered to cut off the additional strings, that he might not corrupt the ears of the youth with too great a variety of notes We have above stated that the Spartans behaved in an equally barbarous manner to Terpander This Timotheus, who died two years before the birth of Alexander, must not be confounded with the celebrated flute-player who was so great a favourite with that prince, and whose tones animated him to arms The Isthmian did not differ from the games already described they received their name from being celebrated on the Isthmus of Corinth Other games existed in different cities as for instance the Panathenaic at Athens Music was cultivated at all, and held in much esteem

At Athens, in the time of Pericles music was considered so necessary a part of education that not to understand it nor play any instrument was considered a disgrace Pericles was especially zealous in his patronage of music Besides regulating the form and increasing the number of musical competitions at the Panathenaic festivals, he built an edifice called the Odeum for the express purpose of rehearsals previous to performance in the theatre It was during his era that Antigonides and Dorion, the two most eminent flute-players flourished So great appears to have been the passion for flute-playing that as much as three talents (upwards of 600*l*) were given for a single flute, fortunes were realized in manufacturing them and the performers lived in splendid and [illegible] style Even the women were performers on the flute Of these the most renowned was Lamia, to whom for the benefits she had prevailed on Demetrius to confer upon the city the Athenians rendered divine honours and dedicated a temple to her, under the name of Venus Lamia It seems that execution on this instrument was carried to a great extent, for Aristotle cries out against the difficult passages that used to be practised, and even against music generally The people however, who as a mass are never disposed to give up the pleasures of sense for those of the mind, continued to encourage these novelties and their authors, and from being the handmaid music became the mistress of poetry The justice of the complaints of Plato and Aristotle on this point is confirmed by Aristoxenus himself well skilled in the art, and Plutarch frequently laments that the theatre had ruined music though what the latter says must be taken with some allowance, seeing that he was a priest of Apollo and anxious doubtless, to confine music to the service of [illegible] After the complete subjugation of the Greeks like [illegible] rest of the arts, music fell to decay They continued, indeed to cultivate music under the Roman emperors, and under their own even afterwards under the Turks, it was one of their amusements but so barbarous is it in the present day that it is difficult to conceive that the same nation ever possessed a music which drew down the [illegible] T [illegible] of the ancient [illegible] upon which we could judge have long since passed away, but we will add, in conclusion to this section the opinion of M Ginguené on the subject "We see in the poetical works of the Greeks the variety and liveliness of their passions, and these same passions could not be expressed in music without an equal variety of air and modulation I do not mean by that to say that Greek music was entirely similar to our own to decide that point it would be necessary to hear and compare the one with the other I maintain only that Greek music was full of harmony, that it admitted that variety of modulation which alone can give pleasure to cultivated minds, and that to suppose that the Greeks were pleased with a music that comprehended but four notes is one of the greatest follies that can be imagined"

Roman Music —It is scarcely possible for any nation to exist without some sort of music and it appears that at a very remote period, such was not the case with the Romans A [illegible] rude and barbarous, their intercourse with the Etruscans who were much farther advanced in the arts than themselves, would soon have had effect upon it Strabo and Livy affirm that public music, as used at sacrifices, was especially learnt by this nation of the Etruscans Servius Tullius, 660 years before Christ, in his division of the people into classes or centuries, directed that two entire centuries should consist of [illegible] the charge, which proves at least the [illegible] musicians One hundred and fifty years afterwards, the [illegible] at funerals was by the laws of the twelve tables, directed to [illegible] six flute players Among the Romans, as was also the case with the Greek music (see above), music and the drama were inseparable In the end these exhibitions became offensive but the further notice of these is unnecessary in this place Music, however, was for a [illegible] sacred uses, and it was only after [illegible] the Great that the Asiatic custom was introduced of having female musicians, — *psaltriæ*, — to play at festivals and private banquets The Etruscan music, which we have already slightly mentioned, was cultivated with success, for all the instruments of the Greeks, which are known to us from their bas-reliefs, are to be found in paintings on Etruscan vases so that it may be safely assumed that the Romans were accustomed to the best music that the age afforded Under Augustus, who was not a great patron of the art, music was not much esteemed it is possible he might not have had much taste for it, and yet, when he was getting into years, he engaged a musician to regulate the intonation of his voice Tiberius banished musicians from the city, which under him became as sad as in the days of Augustus it had been lively Caligula, however, recalled them Claudius, though he patronized gladiatorial fights in preference to music, still encouraged the art, but under Nero it shone in all its ancient splendour Such was this emperor's delight in it, that he passed a great portion of his time in taking lessons of Torpus, the most skilful harpist and lyrist of his day We have before stated his ardour in the pursuit of the art to have been so great that he contended at the Grecian games Nero's successors were patrons of the public games, and of dramatic and musical exhibitions throughout the empire Adrian had always been attached to the arts of Greece He instituted new games, which his successor Antonine continued Commodus whose disposition was similar to Nero's in cruelty, resembled him also in an intense passion for [illegible] the arts, and music, of course, among [illegible] with them —with them to [illegible] its former glory, after centuries had passed away, and all art seemed to have been lost for ever

Italian Music — Italy has been to the rest of Europe in modern times what ancient Greece was to Rome Though we cannot so well trace the art of music in its early restoration as we can the arts of design, we know that to the religion and church which brought them forward we are indebted for the foundation of all that is good in the musical art The plain chant of the Catholic church the foundation to which we allude, is said to owe its origin to Ambrosius, archbishop of Milan, in the fourth century He it is generally understood, brought it into form and based it upon rules Two centuries afterwards Pope Gregory carried it to such perfection that up to the present hour it has needed no improvement, indeed seems incapable of improvement and remains one of the noblest monuments that the art has produced The music of Italy aided by a language which Metastasio called *musica stessa* notwithstanding the revolutions it at first underwent, at length became the guide for the rest of Europe Even out of the church as early as the 13th century music was cultivated, for Prince Conrad in 1268 went out against Charles I of Sicily with a female choir singing accompanied by cymbals, drums, flutes, violins, and other instruments and it is known that all the courts of Italy were filled with musicians for the amusement of their sovereigns At Florence is still in existence a manuscript collection of sacred songs entitled *Laudi Spirituali* in honour of God, the Virgin, saints and martyrs which as early as 1310 used to be sung by a society called the *Laudisti* A society of this sort existed when Dr Burney was at Florence in 1770, and he states that he often heard them singing about the streets in three parts, accompanied by a portable organ When Petrarch was crowned with laurel at Rome in 1341, music was introduced to grace the ceremony, and from the account of that ceremony, printed at Padua in 1549, it appears that it consisted of instrumental as well as vocal music To return back a little, it appears that, in 1022, Guido, a Benedictine monk of Arezzo, was the first who imagined the scheme of designating by [illegible] spaces, the different sou [illegible] have claimed for Hubald and Odo the credit of this invention a century before the time of Guido, but we do not think the claim established

Guido gave to the notes the names ut, re, mi, fa, sol, la taking them from the first syllables of the hymn of St John the Baptist, in which they are certainly found —

[illegible]
Mi[illegible]*fa*[illegible]
Solve [illegible]

The syllable si was [illegible] by a [illegible] In Mr [illegible] manuscript in the Vatican [illegible] Gaffurius [illegible] Marchetto of Padua had improved [illegible] proves that he was acquainted [illegible]

matic counterpoint That the science was making vast strides from the old plain chant is clear from the bull of Pope John XXII in the early part of the 14th century, wherein complaint is made of what he was pleased to call the abuse of descant, whereby the principles of the antiphonal and gradual had fallen into such contempt [illegible] when melody was cultivated as an art exceeded the bounds which the ecclesiastical tones prescribed Without particularizing the steps by which it continued to advance the *Ars contrapuncti* of John de Muris, in 1330, laid down laws of harmony, some of which are observed in composition at the present hour He says that, in the scale of the octave, there are six species of consonances,—three perfect and three imperfect Of the first sort are the unison, the octave, and the fifth, of the second sort, the two thirds, major and minor, and the sixth major It is curious that he did not place the minor sixth among the number of consonances, since it is but an inversion of the major third, which he admits to be a consonance Prosdoscimus, in 1412, speaks of the fourth of which no mention is made by De Muris, and treats it as a dissonance, though, he says, it is less so than the second and the seventh, and that it may be placed in a middle class, between consonances and dissonances Advanced, however, as the science became at this period, it was not until the middle of the 15th century that the laws of harmony were fixed on that foundation that still bears the superstructure of the refined combinations of even modern music The first treatise on music that was printed in Italy was towards the end of the 15th century by John Tinctor, but that published a few years afterwards, by Franchino Gafforio (printed in 1496 at Milan), excelled its precursor The claim of the Italians to the invention of counterpoint has been disputed in favour of the Flemings, and also of the English There is no doubt that the former contributed much to its advancement and perfection but the works that are extant, if we are to judge from them, satisfy us that the claim cannot be maintained In the compositions of this period there is a want of melody which all the display of science and curious combinations they contain could not atone for, but in the 16th century melody and counterpoint were united by the splendid genius of Palestrina and some of his contemporaries and disciples, and the art was enriched by the treatises of Peter Aaron Zarlino Artusi of Bologna the Venetian Zacconi, and many others, which spread throughout Europe and left scarcely more to be desired on the first principles of music as a science Palestrina, the principal cause of this revolution began his career by a diligent study of the masters who had preceded him making himself familiar with their difficulties and with their styles Applying himself to the simplification and purification of harmony, and to the discovery of more flowing and natural melodies he nevertheless paid a degree of homage to the preceding school whose pedantry and obscurity he knew how to correct

The Gothic style of composing masses and motetts on a canto fermo which he practised in his early compositions he entirely abandoned after 1570 His style upon which he was continually refining became at last the model of the age and after his time for a considerable period the best ecclesiastical compositions were honoured by being called *alla Palestrina* Nanino his fellow student and intimate friend Cifra his disciple Luca Marenzio and many other masters of the Roman school, gloried to tread in his steps, whilst Zarlino at Venice Costanzo Porta at Padua Orazio Vecchi and Monteverde at Mantua, Bottrigari and Orturi at Bologna endeavoured, and with considerable success, to build their counterpoint with the clearness purity, and elegance of the great master of modern music Among these, Monteverde is particularly to be noticed, for his passing beyond the master whom he followed He was the first who used double discords, such as the ninth and fourth the seventh and ninth, and the seventh and second, as also the unprepared false fifth and seventh This at the time created great disputes in the republic of music Monteverde in prefaces and letters, defended his practice, but his best defence was to be found in the progress he made The licences he took, far from being offensive to the ear, were soon adopted by others who had abused them The passion for fugues, canons and other difficult compositions of that nature, requiring the highest degree of science, continued in the 17th century which produced many learned musicians One of the most extraordinary of these was Francesco Soriano who published 110 canons upon the [illegible] five six, seven, and eight [illegible], but Fra. Vicentino went far beyond him, and has left, it is to be apprehended, all future canonists in a hopeless condition He wrote one to the words *Illos tuos misericordes oculos* &c resolved in more than two hundred different ways, for two, three, four, and five voices, another for ninety-six voices a third for twenty voices only, but with four different subjects going at the same time Other masters employed themselves in a similar manner Of the Roman school, also, Luca Marenzio merits special mention here though great in church music, he is best known and admired in the exquisite madrigals he composed, which still continue to be performed in this country Marenzio died at Rome, in 1599 At the head of the Venetian school, the Italians themselves place Adrian Willaert, a Fleming To him Zarlino attrib[illegible] than one choi[illegible] of St Mark at V[illegible] his disciples w[illegible] Porta The N[illegible] brated in Italy, and was established in the 15th century, under the reign of [illegible] of Milan, the patron of all the arts It was at N[illegible] whom we have before alluded to, Guarnerio, and many others, distinguished themselves Church and madrigal music there flourished In the latter branch, Carlo Gesualdo, Prince of Venosa, showed in an eminent degree the powers of that style of writing The Lombard school registers the names of Costanzo Porta, its head, Gastoldi, Guiseppe Biffi, and Paola Cima, of Milan, Pietro Ponzio of Parma, Orazio Vecchi of Modena, and Claudio Monteverde, before alluded to The most celebrated disciples of Porta were Balbi and Piccioli Orazio Vecchi was among the first composers of dramatic music, and for a considerable time maestro di capella at Mantua The Bolognese school comprises few writers in the 16th century, though in that following its professors equalled those of the first rank [illegible] Andrea Rota may be considered the [illegible] here in music seems to take no distinguished place we know of Alessandro Striggio and Francesco Cortuccia only who enjoyed much reputation

Dramatic music appeared in Italy in the 15th century a musical tragedy having [illegible] Peri, [illegible] the real epoch of the music of the drama can scarcely be dated [illegible] and first appearance was at Florence Ottavio [illegible] assisted at the post, and Peri the musician, both Florentines, and the name of the piece *Daphne* This priority is however, disputed in favour of Vincenzo Galileo, the father of the celebrated astronomer, who, desirous of recovering the musical declamation of the Greeks, [illegible] the episode of Ugolino [illegible] Upon the [illegible] of the seventeenth century the drama was principally recitative, when in 1649, Cavalli began to introduce more airs than had hitherto been used, which practice was further extended in the *Dorna* of Cesti, composed in 1663, after which, for some time, it degenerated so much into *spectacle*, that, in the works represented about the end of the 17th century, neither poet, composer, nor singers are recorded but the machinist and decorator only Among the composers were, however men of great knowledge and genius such as Gasparini Perti, Colonna, Lotti, and Alexander Scarlatti, who is said to have been the inventor of the obligato recitative Great improvements were introduced in the beginning of the 18th century by the pupils of Scarlatti, viz Leo, Vinci, Sarro, Hasse Porpora Feo, Abos and particularly Pergolese About the middle of the century appeared Jomelli, Piccini Sacchini Guglielmi Traetta, Anfossi, and others, whose names are not less celebrated than their predecessors and the century closes with Paisiello and Cimarosa It remained however, for a Bohemian, Gluck to accomplish the revolution which has brought the opera to its present state in Europe The great improvement in instrumental music towards the end of the last century induced operatic accompaniments with all the richness of the symphony which under Haydn Mozart, Cherubini, Spohr, Weber and many others, seems to have reached almost the height of power and effect that music can give

Europe is as much indebted to Italy for the introduction of instrumental as for that of vocal music the Italians have been the instructors in both Violin music was cultivated by Corelli and Tartini, and their pupils, before other nations had thought of it, and the same may be said of the harpsichord from Frescobaldi to Clementi So, in concerted pieces, Boccherini introduced the quintett, and indeed short of the symphony, which we owe to the Germans their early superiority cannot be disputed In our time a sensible decay is visible in Italian music, the art seems to have left its ancient seat to abide in Germany, where it has been cultivated with an ardour and success perfectly astonishing

German Music.—Like all other nations, the Germans owe their music to the Italians They received the Gregorian chant from Italy, [illegible] not have equalled their masters in [illegible] have greatly surpassed them in instrum[illegible] At the beginning of the 17th century, the music of Germany was greatly inferior to that of Italy, and it was not till the end of this century that the Germans began to evince [illegible] We are not acquainted with [illegible] the German church,—similar character we mean, to that produced by the school of Palestrina in Italy, but in later times the

writings for that church, by Graun, Haydn, and Mozart, have never been surpassed nor equalled, and though these very much partake of the symphony and drama, there is a pathos and sublimity about them calculated in the highest degree to inspire devotion In the madrigal style we believe they exhibit no specimens, which is the more remarkable, from the circumstance of the German school having been considered by some to have been of as early an origin as the Flemish Their oratorios possess the greatest beauties we need only name the *Ascension* and the *Israelites*, by Bach the *Death of Jesus* by Graun, and the *Messiah*, by Handel Though not so old as that of Italy, the German theatre is [illegible] but until Keyser appeared to compose for the [illegible] century, it was without [illegible] the last century, the German composers bred in the Neapolitan school carried their style into Germany, where it became predominant, and the model of the country John Adolphus Hasse had the principal share in the transference of this style, which improved by Graun Neumann, Gluck, and carried still further by Haydn and Mozart, has travelled back to Italy, to shine second hand in Rossini and others, but without the lustre of the Germans Gluck, of whom we have spoken above though by birth a German belongs properly to France, for, strange to say he was not properly appreciated by his own countrymen though in later years they found out their error, and acknowledge it still by the rapture with which his works are now received Germany derives its greatest reputation from the success with which it has cultivated instrumental music In harpsichord and piano-forte music, it may be safely said they have surpassed all other nations, for it would be difficult to place names that rest on equal reputation by those of J S Bach and his children of Haydn, Kozebech, Mozart, Dussek Cramer and a host of others The music of wind instruments seems to belong now almost exclusively to Germany their organists are excellent, and their orchestras well regulated In musical literature they are superior to every other nation witness the works of Mattheson, Marpurg Kirberger J Bach, Albrechtsberger Forkel Koch, and a host of others, most of them of the 18th century In the present day, it is by no means surprising that the success of the Germans should be so extraordinary seeing that there is no school *for the education of youth in the country* at which music is not taught and cultivated even down to those where children receive gratuitous instruction

Flemish Music — The Flemish have been frequently confounded with French musicians, so that it is rather difficult to separate at times, the one from the other Louis Guicciardini (*Descrizione di tutti i paesi bassi* published 1556) gives a list of all the musicians born in the Low Countries, who were then dispersed in different parts of Europe, which robs the French catalogue of some of its most distinguished names From the 15th century Flanders from its commerce and wealth, and superfluous riches, was enabled to patronise the fine arts and most especially was that the case in the times of Charles V and Francis I Upon these monarchs, who lived less in their own capitals than elsewhere the arts seem everywhere to have been attendant, and when we recollect their frequent sojourn at Brussels Antwerp and other cities of Flanders, we are not surprised at the number of excellent musicians that Flanders produced The John Tinctor of whom we have heretofore spoken flourished about 1474 he was a native of Flanders, and maestro di capella to Ferdinand of Arragon King of Sicily and Naples He is the earliest theoretician whose name has reached us Soon after, or contemporary with him, was John Okenheim, the first composer of music in parts From the fragments which have been preserved by Glareanus, he appears to have been a learned writer, whose works seem more calculated to please the eye than the ear, and from the authors of the following century who notice him, we learn that he was the writer of a motett in 36 parts Josquin, or, as the Italians call him Josquino del Prato, was Okenheim's most celebrated scholar The laws and difficulties of canon, fugue augmentation, diminution, inversion, and other practices of church music, were by him observed and overcome in the most felicitous manner, and he has by some been dignified with the title of father of [illegible] which as his era is nearly a century before that of Palestrina, Orlando di Lasso, &c It is proper to state that Guicciardini claims Josquin as an Italian, and, at least, there can be no doubt he was educated in Italy inasmuch as he was a singer in the chapel of Sixtus IV His [illegible] numerous and as often executed in the beginning of the 16th century as those of Handel were in England fifty or sixty years ago His death took place at Brussels, and his monument is still to be seen in the church of St Gudula Hobrect, or Obrect, was a good composer of this period and adds to his fame the honour of having been selected by Erasmus to instruct him in the principles of his art We must pass shortly over the names of Pierre de la Rue or Petrus Platensis as he was sometimes called Jean Mouton Verdelot Nicolas Gombert master di capella of Charles V, Jacques de Wert Pierre and Jean Waelrant or Wardelant Verdonk, Arkadelt, and others, many of whom are still known to the musical antiquary by [illegible] compositions, though they were called [illegible] parts in Flanders Between 1544 and [illegible] more than twenty collections of these *chansons* or madrigals published at Antwerp and Louvain, by Tylman, Susaro, and Pierre Phalaise, who were themselves good [illegible] as were in the same century, the publishers [illegible] Wechlin Gardano and Scotto at Venice, Ballard [illegible], and Tallis and Bird in England After Clemens (non papa), an elegant and exquisite, though not voluminous writer, and Cypriano Rore, a pupil of Adrian Willaert, must be recorded the name of Orlando di Lasso, one of the most diligent and celebrated writers of the 16th century He was born at Mons in 1520, and died at Munich in 1593 Living to a great age, the number of his works exceed those even of Palestrina Fifty collections of his different works are still extant, consisting of masses, motetts passions, psalms, and songs or madrigals, printed in Italy, Germany, France, and the Low Countries Such was his reputation, that the following verse was written for his epitaph —

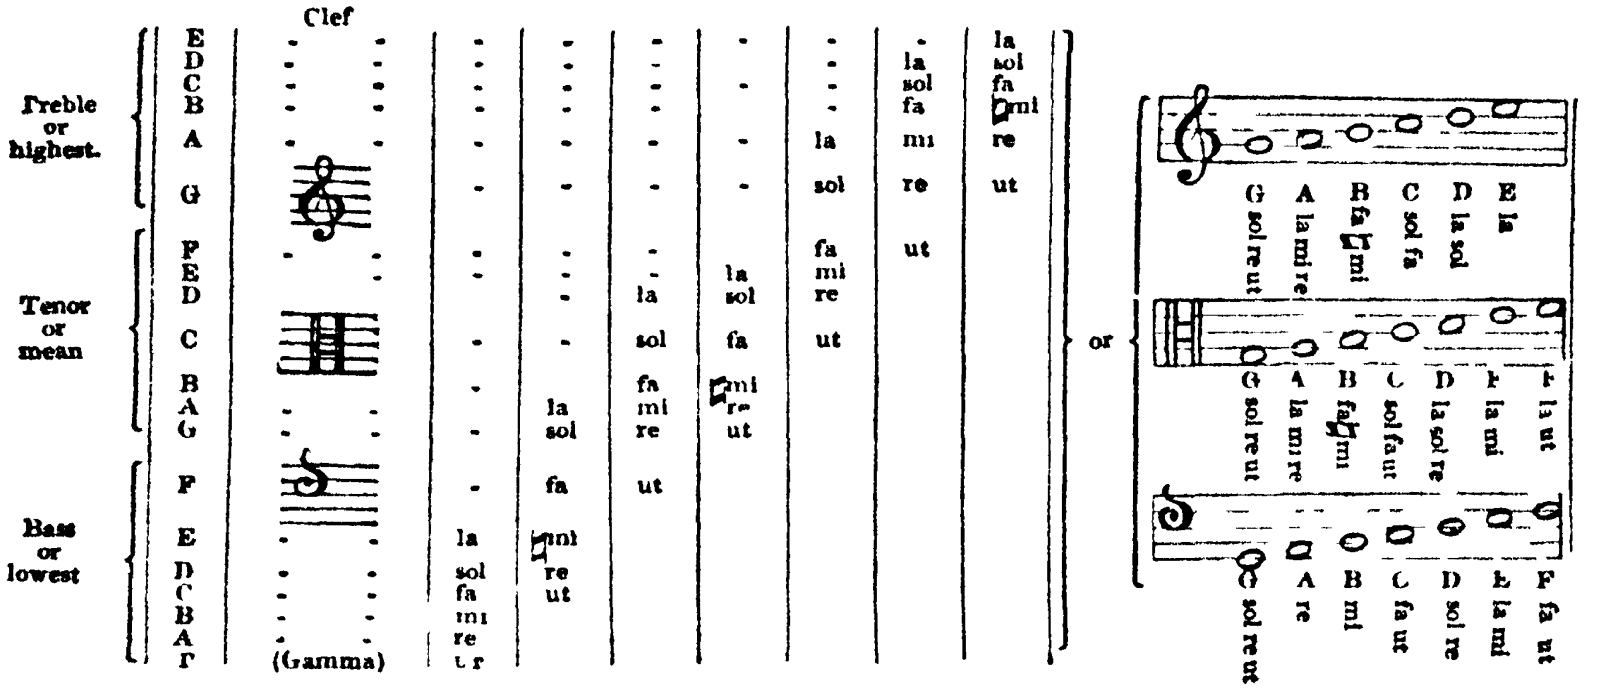
Hic ille Orlandus Lassum, qui recreat orbem

M Ginguene, to whom we are much indebted for the account of the restoration of music speaking of Cypriano Rore and Orlando di Lasso, says, "These two Flemings, having passed the greater portion of their lives in the courts of princes had acquired a lighter style, and a species of melody more appropriate to secular music, than that of Palestrina who residing at Rome, and writing principally for the church, exhibits in all his productions a [illegible]" And again, 'They were the church excepted, they prepared the colours and set the palettes of musicians with many new tints of harmony and modulation, which were exceedingly serviceable to those who came after them' These were the two first masters who ventured upon chromatic passages and upon accidental flats and sharps From the epoch of these men Flanders ceased to have a school of music especially belonging to itself

French Music —We have stated in another place, that Hubald de St Amand and Eudes de Clugni have been named by the French writers as having preceded Guido in the knowledge of the scale, but as we are not in a condition to decide between the claimants, we shall content ourselves with the declaration of our conviction, from all that we have read, that France, as respects the art and science of music, was much advanced at a very early period, and that the country certainly boasted of many church musicians between the 8th and 11th centuries, for, besides the two we have named we have Remi, a monk of St Germain d Auxerre Gerbert le Scholastique, and others whose knowledge is well authenticated In the 14th century Philippe de Vitry archbishop of Meaux, applied himself to music and poetry with considerable success A manuscript preserved in the Vatican proves him to have been well informed upon counterpoint as far as it was then known and practised he not only applied himself to church music but wrote motetts, but these are lost and perhaps would if we had them, be now difficult to decipher Belonging to this century also, we have by the assiduity of the Abbe le Beuf the account of a manuscript by Guillaume de Machau This MS consists of two volumes of French and Latin poems and a great number of *lays virelays ballades* and *rondeaux*, all set to music, some for a single voice, others in three and four parts, — triplum, tenor, contra-tenor, and a part without title In the second volume is an entire mass, including the *Credo* in four parts, which it is believed was sung at the coronation of Charles V in 1364

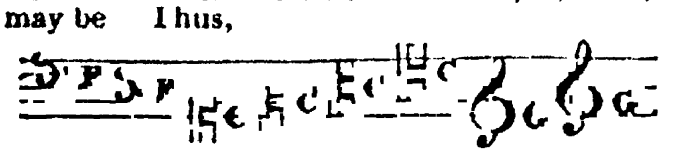
During the 15th and 16th centuries the art made but little progress in France Under Francis the First not near so many musicians were to be found in France as in Italy Germany, England, and the Low Countries The works of Claude de Jeune, who probably ought to be placed with the Flemish school, and of Orlando di Lasso, seem to have been admired and performed at this period in the country in which Josquin was also a favourite The dearth of writers on the science at this period is no less remarkable [illegible] work of this period, by Clement Janequin, [illegible] *la Bataille ou Defaite des Suisses a la* [illegible] imitations of the sounds of [illegible] collection in 1544, called *Inventions Musicales a quatre et cinq Parties* The masters about this period were [illegible] Jambe-de fer, [illegible] sufficient to say that some [illegible] patrons of music [illegible] VIII may be [illegible] Charles IX whom were constantly good musicians Of them, Claude Goudimel did not escape in the massacre of the Protestants at Lyons in 1572 At the end of the 16th century were some minor

artists, such as Jean de Castre Louis Bisson Nicholas Duchemin, Francois Roussel Jean Perolin and others by whom are collections of madrigals Francois Lestuche de Caurroy, born in 1549, called, by his cotemporaries, "le prince des professeurs de musique," was maestro di capella to Charles IX , Henry III , and Henry IV , and [illegible] however, are [illegible] was a similar [illegible] He composed the requiem for the funeral of [illegible] Bernard, which was afterwards performed at that of Henry IV , whose reign [illegible] peace to make much prog[illegible] Louis XIII , who came to the throne at the early age of six years, was a great friend to music, and appears to have kept up what might be called a considerable band for that period During the reign of Louis XIII Jean Baptiste Boesset wrote several [illegible] songs, as they were called About the middle of the 17th century Michael Lambert, who died in 1696, appears to have attracted many scholars by his skill in composition Dramatic music was introduced into France about 1645 In 1660, at the celebration of the marriage of Louis XIV , the opera of *Ercole Amante* was produced, and the foundation of the French opera was thus laid At this period Lulli, of Florentine birth, had been patronised by the Chevalier de Guise, through whose offices he was put under the best masters of the time Till the year 1686, in which his last opera was brought out, he seems to have been the idol of the court, and to have been considered in France the *ne plus ultra* of composers Compared, however, with the Italian opera of the same epoch his compositions are not far behind, though it was a misfortune for the country that, for so long a period every thing which was not an imitation of the style of Lulli was considered an inferior production Instrumental music made but little progress in the [illegible] organists were the three Buxtehudes [illegible] Couperins, Charbonieres who died in 1670, Dumont a good composer of church music who first introduced violin accompaniments into France, the Abbe de la Barre, and, lastly Lalande, the most celebrated French composer of ecclesiastical music, at the end of the 17th and beginning of the 18th century Rameau, born at Dijon in 1683 was destined to rouse the French nation which seemed to have slept since their loss of Lulli In the space of twenty-seven years after 1733 he produced 22 operas and became so great a favourite with the people that it was dangerous to criticise his works The time has however, passed in which his operas would be listened to and but for his theoretical works the only solid base of his glory he would long since have been forgotten Rameau died in 1767 His school lasted till about 1775 though since 1750 the comic opera has been on the Italian model Under this with Duvergnier le Blond Floquet J J Rousseau Dumi and Philidor, French melody has regenerated and Monsigny, Gossec and Gretry completed its improvements The reform thus effected prepared the French for the reception of the *Iphigenie* of Gluck, in 1774 at which time he had Piccini and Tuchini for rivals These musicians have been succeeded by a school which comprises the names of Berton, Mehul, Boildieu Kreutzer and others, [illegible] and their ranks are found [illegible] Winter In instrumental composition the French have not been so original, though latterly they have considerably advanced France is considered deficient in musical literature and does not attend to its cultivation with that ardour that is so manifest in Italy and Germany Their conservatory, however, is an establishment likely to do honour to the nation, and the work of Choron, — entitled *Principes de Composition des Ecoles d Italie, adoptes par le Gouvernement Francais, pour servir à l Instruction des Eleves des Maitrises de Cathedrales Ouvrage classique forme de la Reunion des Modeles les plus parfaites en tout genre*, in 3 vols fol , — is done sufficient to redeem the French from the accusation of wanting musical literature



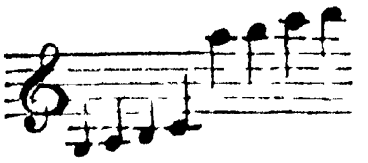
English music —We are not acquainted with writers in this country of earlier date than those of Italy , but for the honour of this country, however much we may have been behind Italy in the restoration of other arts in that of music we were formerly quite on a par with the Continent , and it is singular that in later years we should have lost our character, and we fear deservedly, among other nations It is certain that England can boast masses in four, five, and six parts written by natives, as ancient as those of the Italians themselves , we have also secular music in two and three parts and in good counterpoint, in the latter end of the 14th and beginning of the 16th century, about which period to the English musician the names of William of Newark, Sheryngham, Turges, Tudor, Banester, Browne, and others, are familiar The first named was one of the musicians of Henry VI , and the compositions of Tudor are known from Prince Henry s (Hen VIII) music-book Henry VIII is known as a composer, from a beautiful anthem in Boyce's collection of cathedral music , and his patronage of Christopher Tye, the composer of *Laudate Nomen Domini* a motett frequently sung at madrigal meetings in the present day, shows that good music was then first encouraged as it ought to be Marbeck in 1550, published the whole of the reformed cathedral service to musical [illegible] he had nearly be[illegible] Dr reign of Elizabeth the talents displayed by our countrymen appear to have been surpassed in no other country, and music here was then indeed in its palmy state Tallis, Bird, Morley, Dowland, and Bull, were the principal composers of the reign Elizabeth herself could have been no mean [illegible] she was able to play the pieces in her virginal book Though it does not appear that James I took much delight in music it nevertheless continued to prosper during his sway , indeed, the compositions of Gibbons were, as pieces of church music, perhaps never surpassed in any age or nation neither are his secular pieces of inferior character This reign as well as the preceding was fruitful in madrigal writers as well as composers for the church , among the former of whom were Michael and Thomas Este, Bateson, Ward, Litchfield, Pilkington, Wilbye, Bennett, Farmer, Ford, and others , and among the last Tomkins, Elway Bevin, and Dr Nathaniel Gyles In the time of Charles I instrumental music was coming into vogue , the monarch was a pupil of Cooper (who was wont to be called Coperario), and used to practise the viol di-gamba He had a band of performers, eighteen of whom are known, including Nicholas Laniere, who was the master of it The most celebrated men of this reign were Dr Wilson, William and Henry Lawes, and Dr Child, who died in 1697 aged 90 after having been organist of St George's chapel, Windsor, during the extraordinary period of sixty-five years So intent was Charles upon advancing music, that he granted a charter to the most eminent musicians of that day, with many great privileges The art had been sinking for some years, but its fall was accele[illegible] of the cathedral service in 1643, [illegible] whom we hear during the time of Cromwell were William and Henry Lawes Though these men were favourites of Milton, and the subject of some of his verses they were sadly inferior to Tallis, Bird, and Gibbons During the interregnum the musical flame was chiefly fed at Oxford , but even there, from the year 1646, in which the king was forced to leave the city after the battle of Naseby until 1660 it was nearly extinguished At the Restoration it appeared again to flourish Child, Christopher Gibbons, Rogers, and Wilson, were made doctors of Oxford , the choirs again obtained good masters , and the organs, which had been destroyed by the fiend like rage of the Puritans, were again set up though with difficulty, from the scanty supply of organ builders Among the musicians who were attached to the court of Charles II was Henry Purcell of whom Dr Burney says that he, 'during a short life and in an age almost barbarous for every species of music but that of the church manifested more original genius than any musician under similar circumstances that any inquiries into [illegible] have yet discovered in any part of Europe It is truly great man died Nov 21 1695 in the thirty seventh year of his age , his principal contemporaries were Dr Blow his master Pelham Humphreys, and John Weldon After Purcell s death some skilful men appeared as amateurs in the service of the church , namely, Doctors Holder, Aldrich and Creyghton among the professors were Jeremiah Clarke, Goldwin, and Doctors Croft Green, Boyce, and Nares Croft of all these was undoubtedly the greatest he like Purcell was a disciple of Blow always elegant and simple in his strains frequently grand and masterly he has not left a composition that does not exhibit great learning His death occurred in 1727, in the fiftieth year of his age Dr Boyce occupied the void which Croft s death had created , he was a good musician always pleasing but rarely grand in his compositions His contemporary Jonathan Battishill, wrote some fine compositions for the church and prepared the way in glee writing for a race of English musicians who are an honour to their country The reader will recognize the truth of this assertion when he glances at the names of Alcock Arne, Attwood W Beale Callcott, Dr Cooke, Robert Cooke, Crotch Dr [illegible] Elliott, Harington Horsley, Thomas Linley the Earl of Mornington, Shield, Stafford Smith, Spofforth, the Wesleys, &c In dramatic and symphony writing, we regret to say England is still in her infancy

Chinese Music —The Chinese have had a system of music from a most remote period, and in its scale it seems to have more resemblance to the Grecian than any other to which it could be compared From the time of Yao and Chun which their chronology would carry back [illegible] centuries before Christ, they have had [illegible] ght species of sounds 1st, The sound of dried skins, such as drums , 2d, The sound emanating from stone, called *king* , 3d, That of metal, as bells , 4th That of baked earth, called *hiuen* , 5th, That from silk, called *kin* and *che* , 6th, That from wood,

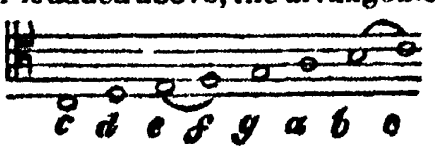


called *ya* and *thou*, 7th, That from bamboo, such as flutes, called *koan*, 8th, That from the gourd, called *cheng* Their scale consists of 14 notes, of which the seven middle notes correspond to our gamut from *f* upwards They seem unacquainted with harmony and we ought, perhaps to apologise for saying so much of it

Hungarian Music — About the 9th century the Hungarians left Asia to settle in Europe, when they conquered the country that bears their name Like all the Asiatics, they were attached to music and at first doubtless, used only Asiatic instruments These were nearly all wind instruments, and consisted of the trumpet, the flute, the cymbal, and several others Till the time of Mathias Corvin it was in a state of mediocrity, he incited the Hungarians to [illegible] and arts, of which [illegible] Under Ladislas and Louis II music was cultivated with great care, their national songs were, however, the only vocal music they possessed till the time of Stephen, king of Hungary, when the ecclesiastical chant appears to have been introduced In a diploma of Bela III, A D 1192, it appears that prince sent an envoy to Paris to be instructed in melody, perhaps induced to do so by his second wife Margaret, who was daughter of Louis VII of France



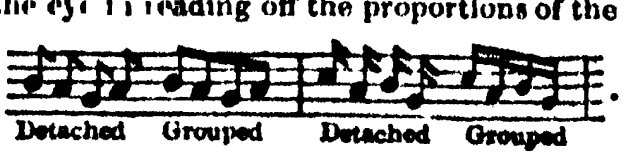
All musical ideas are expressed by means of *notes* on a *staff*, that is, five equidistant horizontal lines on or between which the notes are placed The *gamut* is a table whereon these notes are placed; and their relative situations as to acuteness or gravity of tone is ascertained by *clefs* The names of the notes, which are six in number, are *ut re, mi, fa, sol, la*, the lowest of these being the gamma of the scale Modern musicians have used as equivalents the first seven letters of the alphabet The arrangement in question is exhibited in the diagram below, a note having been added by the moderns to complete the octave



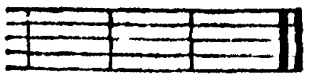
From this diagram it will be seen that the bass clef also called the F fa ut clef on whatever lines placed makes the notes on the line between the dots F or fa ut, whence reckoning is made upwards or downwards, that the tenor or C sol fa ut clef makes all the notes on the line between the cross or horizontal bars or sol fa ut, and that the treble or G sol re ut clef makes all the notes on the line round which the character turns G sol re ut, and it is to be observed that these several clefs may be put on any lines of the staff notes which then take the name F, C, or G, as the case may be Thus,

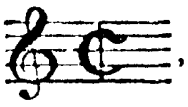
One of the most important ends gained by the use of these clefs is the avoidance of notes running off the staff which they otherwise would do, and what are called *ledger* lines would be wanted, thus,

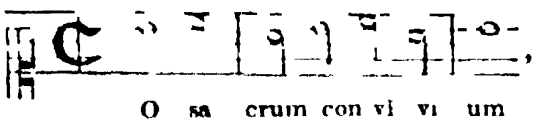
where the ledger lines are those upon which the notes out of the staff are placed The lines of a staff are reckoned upwards, thus the lowest line is called the first the lowest but one the second, and so on When the F clef is placed on the third line, it is called the *baritone* clef, when on the fourth, the *bass* clef When the C clef is placed on the first line, it takes the name of the *soprano* clef, when on the second the *mezzo soprano*, when on the third, the *alto* or *countertenor* clef and when on the fourth, the *tenor* clef The G clef is rarely or never now placed on any but the second line, and is then called the *treble* clef It may be sometimes seen in old books placed on the first line, when so found, it is called the *high treble* clef In keyed instruments the C next to the middle of the instrument is the note of the tenor or C clef, the G above it to the right is the treble or G clef, and the F below to the left is the F or bass clef note When to the seven primary notes (see diagram) another is added above, the arrangement is called an octave, thus,



After which, if more be added either upwards or downwards, it will be but a return to similar notes either more acute or more grave in pitch, that is an octave above or below them respectively This which is called the *scale* has between its notes seven intervals of which those between *c* and *d*, *d* and *e* *f* and *g* *g* and *a* and *a* and *b* are equal and are called *tones* or *whole tones*, whilst those between *e* and *f* and *b* and *c* are *semitones* To inquire how nature has implanted on the ear dissatisfaction from any other position of these semitones in the scale of the octave is not the object of this treatise That it is so is certain, and the most uneducated whistler could not avoid it without exertion The scale is also divided into two *tetrachords*, from *c* to *f* and from *g* to *c* each of these consists of two tones and a semitone There is not a strict mathematical equality between these fourths, but for our purpose here — and the difference indeed is imperceptible except to the finest ear — that equality may be assumed As all *melody* or *air* which is an artful succession of tones, depends on a right perception of the places of the semitones, the above preliminaries must be well understood by the student

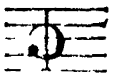


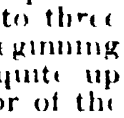


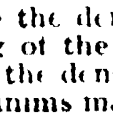


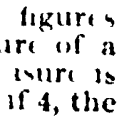
By the particular form of a note its duration, or length of time it is to be held on is known There are nine of these forms, which are exhibited in the subjoined table, in which the two first are now rarely used though in old ecclesiastical music they are constantly met with

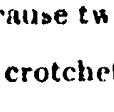
The large	equal to two longs		
The long	— two breves		
The breve	— two semibreves		
The semibreve	— two minims		
The minim	— two crotchets		
The crotchet	— two quavers		
The quaver	— two semiquavers		
The semiquaver	— two demisemiquavers		
The demisemiquaver			

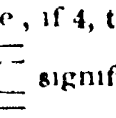


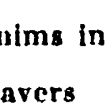


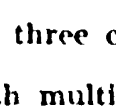


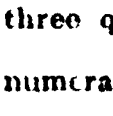






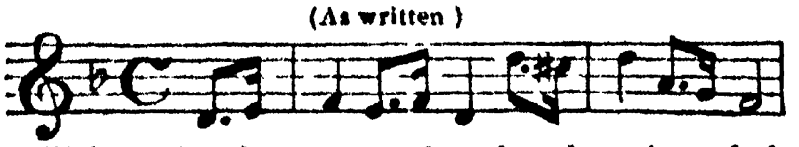






The notes with hooks appended to their tails are frequently [illegible] together this does not alter their value, but assists the eye in reading off the proportions of the notes Thus,

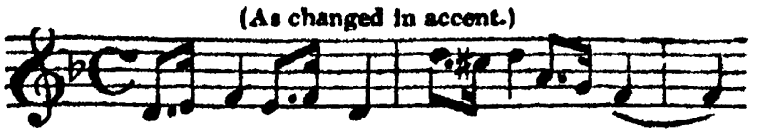
If a dot be added to the right hand of any note, thus ♩., it increases its duration exactly one half The duration of a note is measured by the musician from habit, and is regulated by *beating time*, that is, by the elevation and depression of the hand or foot quicker or slower according to the nature of the music performed A musical piece is divided into *measures*, which are equal portions of time, and the vertical lines which so divide it are called *bars*, single lines taking merely that name, and the two thick ones at the end of a strain *double bars*



Thus,  Every measure must contain a certain number of notes according to the time marked at the [illegible] is of two sorts,— [illegible] two all others originate The first is of two sorts 1st, that in which each bar is equal to a semibreve in duration, 2d, that in which a minim in duration is equal to a bar Those common times in which a semibreve is the measure are marked by a C after the clef at the beginning of the staff, thus,  When the C has a bar through it, thus , it denotes a quicker measure, thus , and

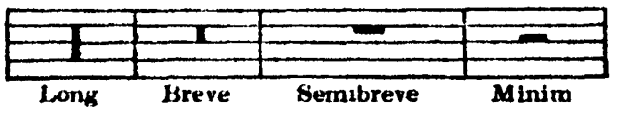
O sa crum con vi vi um

is called *alla breve* but it is now usually written by dividing the breve into halves There is another sort of movement now very rarely used, it is very quick, and it is thus marked,  The other characters of common time are , signifying that there are two crotchets in the bar of which (the denominator) four make a semibreve Triple time is so called from the bars being divisible into three parts it is beat with the hand down at the beginning of the bar raised a little in the middle and quite up at the close of it In this time the denominator of the figures placed at the beginning of the staff is a measure of a semibreve thus if 2 be the denominator the measure is a minim, because two minims make a semibreve, if 4, the measure is a crotchet, and so on Hence  signifies three minims in a bar,  three crotchets,  three quavers So again with multiples of 3 for the numerator  signifies three crotchets,  six quavers,  nine quavers,  nine semiquavers,  twelve quavers Other sorts of triple time are used, but if the reader keep in mind that the denominator always expresses the division of the semibreve, and the numerator the number of those divisions in each bar, no mistake can ever arise



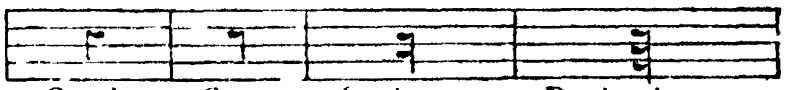
There is a certain stress laid on some part or parts of every bar, which is called *accent*, hence each bar or measure is divided into accented and unaccented parts the accented are the principal and those on which the pathos and spirit mainly depend The beginning and the middle, or the beginning of the first half of the bar and the beginning of the latter half in common time and the beginning or first of three notes in triple time, are universally accented parts of the measure, so the first and third crotchet of the bar are on the accented part of the measure in common time In triple time, where the notes as we have explained go by threes, the note in the middle is unaccented and the first and last accented, the accent, however on the first is so preponderant, that the last is almost accounted as though it had none It is on account of accent that it is frequently necessary to begin a movement with only part of a measure Thus in the Welsh tune *Griffith ap Cynan*, —

(As written)



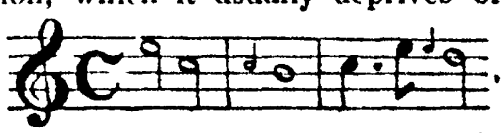
it will immediately be seen that the alteration of the accent entirely changes

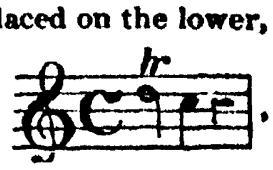
(As changed in accent.)

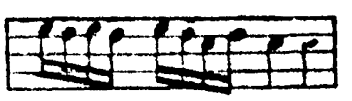


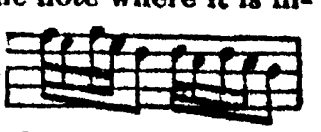
the character of the air When the last note of a bar (as in the last bar of the lower example) is connected with [illegible] as to make only one note [illegible] This is also sometimes used in the middle of a measure, also when a note of one part ends in the middle of a note of the other: the latter, however, is called *binding* or *legature*

A *rest* is a pause or interval inserted when silence is required in the part to which it is written, which silence is [illegible] of [illegible] —

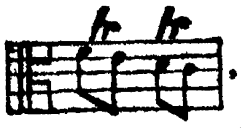


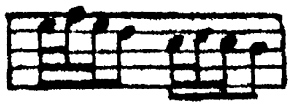


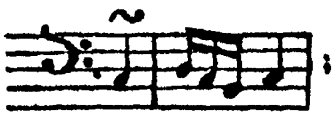


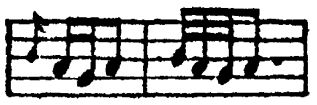


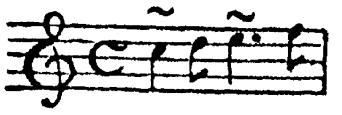
Long Breve Semibreve Minim

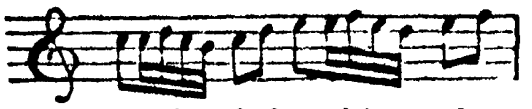


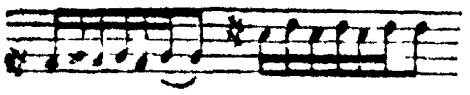


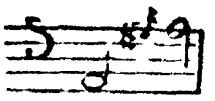


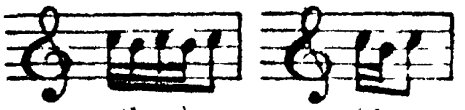






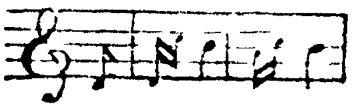


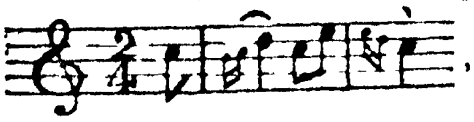


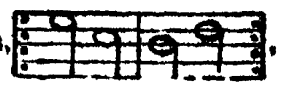


Crotchet Quaver Semiquaver Demisemiquaver

It has been already noticed that in the ascent of a note to an octave there are between the third and the fourth note, and between the seventh and the octave, semitones instead of whole tones, and this is what is called the *diatonic scale* It must therefore be evident, from this inequality, that supposing it were necessary, for the sake of the voice's compass or any other cause, to commence a piece of music higher or lower than it was originally written, the mere shifting the notes higher or lower on the lines and spaces would not represent the same relative proportions in all the intervals, because the places of the semitones would remain the same on the staff whilst their position with respect to the notes would be altered An expedient is therefore wanted by which the places of the notes may be raised or depressed the value of a semitone The former, that is raising them, is effected by placing sharps before them, thus ♯, and the latter by means of flats, thus ♭ If we want to restore any note that has been thus treated to its original place it is effected by means of a natural thus ♮ Two other characters are also used — the double sharp, thus ×, which raises a note two semitones, and the double flat 𝄫 which equally depresses it Upon keyed instruments such as the pianoforte and organ, these sharps and flats are represented by the short black keys, and there is no distinction between D♯ and E♭, and such want of distinction is an imperfection in the instrument, for as we have before hinted, there is not a strict mathematical equality between the semitones of the diatonic scale The number of these flats and sharps at the beginning of a staff affect all the notes of the line or space on which they are placed, and are termed the *signature* If in addition to these in the course of a movement any other occur, they are termed *accidental*, and only affect the notes which they immediately precede and those also in the same bar but if in the same bar any note after having been accidentally raised, on being repeated is preceded by a natural, such natural restores it to its original place

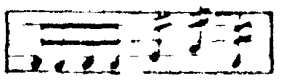


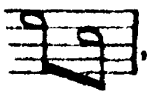




The ornaments of musical melody are called *graces*, the principal of which are the *appoggiatura*, the *shake*, the *turn*, and the *beat*, with the *mordente*, *beat*, *slide*, and *spring* peculiar to the Germans those of musical harmony are the *arpeggio*, the *tremando*, &c The appoggiatura which always occurs on the accented part of the measure is a small note placed before a large one of longer duration, which it usually deprives of half its value, thus, , wherein the small notes are appoggiaturas Occasionally, the appoggiatura is only one quarter of the note it precedes The shake is a quick alternate repetition of a note with the note above it, the mark *tr* being placed on the lower, and the upper one not expressed, thus , performed  When there are a series of [illegible] Italians call it *una ca* [illegible] the *passing shake* is thus marked ≈ over the note where it is intended, thus , performed 

The mordente of the Italian school is used similarly;



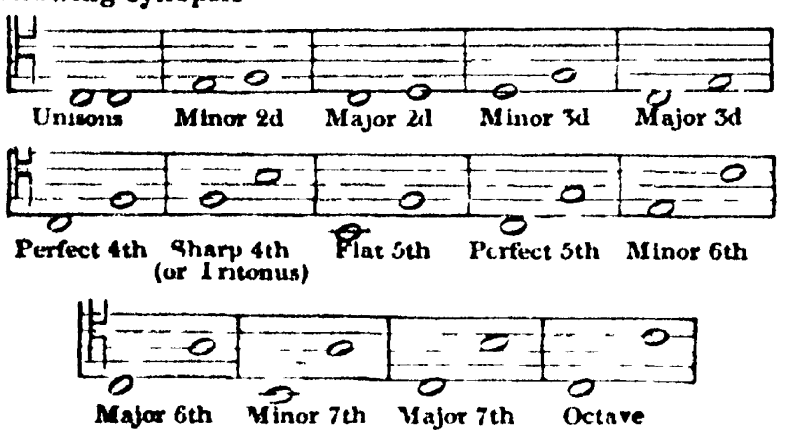


thus , performed 

The turn employs the note above and that below in the following way, ; performed  The inverted turn, thus marked ∽, turns from the note below that marked instead of above it Turns on dotted notes are very frequently used, they are written as follows  performed  The beat is the reverse of the shake without the turn, and is generally made at the distance of the semitone below, hence all the natural notes, except C and F, require the note below them to be accidentally sharpened for the beat, thus , performed  The half-beat is most frequently used in the bass and is very similar to the acciacatura of the Italians The inferior note is struck only once, and at the same time with the principal note, but is immediately quitted, as  The Italians use the degree above The German mordente is a beat commencing with the note itself and is either long or short, thus, 

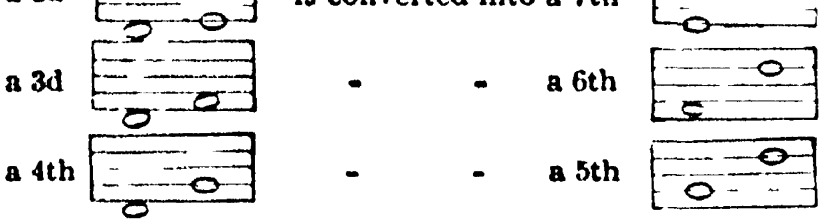
(long) (short)

This differs from the mordente we have already described by being made with the next degree below The Italians use the degree above The German beat consists of two small notes, forming a skip, descending one degree upon the principal note, written thus  performed  Naumberger calls this grace a double appoggiatura The German slide consists of two small notes, which move by degrees, written thus , performed  The German spring, like the Italian mordente, consists of two small notes, sounded distinctly, thus , performed  It is the practice of the composer to mark, where necessary, the occasional alteration of these graces by sharps, flats or naturals The graces that belong to harmony are, the *tremolo*, or reiteration of one of a chord, the *tremando*, or general trembling of the whole chord, and the *arpeggio*, which is an imitation of the harp, the notes of the chord being struck in quick and repeated succession The following characters are also used in Music —the *pause* 𝄐, which, placed over a note, signifies that a long continuance of the sound is to be made on that part of the measure, and is equally effective when placed over a rest, the *repeat* 𝄇, which is a sign placed to show where the performer must return to repeat the passage, — the Italians call it *il segno*, the *direct* w always placed at the end of the staff on the line or space which the following note occupies The dots which are found in the inner side of bars show that the measures or bars included by them are to be repeated; thus, , shows that these two bars are to be played twice over, the same object being sometimes effected by writing the word *bis* over them



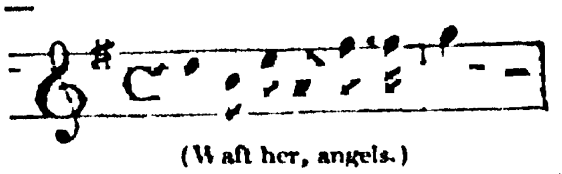
We have already treated these [illegible] all that we have to add on them here is, that as every bar or measure contains a certain number of notes, so every *strain* consists of a certain number of measures, which are terminated by the double bar

Expression in music is indicated by the following marks — The *tye* which is a convex line over ⁀ or a concave line under ‿ two notes [illegible] ing them into one It is also [illegible] notes where the bar divides the [illegible] line, used over notes not on the same lines or spaces, showing that such notes are to be played smoothly; and in vocal [illegible] stroke [illegible] Sometimes [illegible] mostly [illegible] an interme[illegible] yet uniting the one and the other, thus,  The other marks of expression are the *crescendo* <, by which the sound is to be increased from soft to loud, the *diminuendo* >, which is exactly the converse of the last,—the union of these two <> indicating that the first part is gradually increased from soft to loud in the middle, and the [illegible] and the *rinforzando* for which smaller [illegible] sort are used >< , which increase or diminish the sound so marked In order to save time in writing and copying music the following abbreviations are used —A single stroke placed over or under a semibreve or through the stem of a minim or crotchet, divides it into quavers a double stroke into semiquavers and a triple stroke into demisemiquavers, thus,  The other kind of abbreviation is much used in modern music, and is effected by grouping the stems of minims like those of quavers, thus , performed 



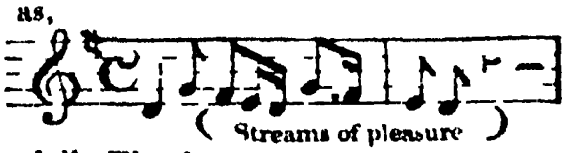
Melody, which will be perhaps better understood by the term *a tune* is a particular succession of sounds in a single part and is produced by the voice or an instrument The artful manner of introducing the notes of different lengths and succeeding one another at intervals pleasing to the ear is one of the desiderata of the musician the other being the successful accompaniment of these single sounds by others according to the laws of harmony As respects tune or air melody has two motions,—either by degrees or by skips by the former when it moves to the line or space immediately above or below it, and by [illegible] the [illegible] shows each motion 

The distance between any two notes is called an interval, and it is customary to measure it from the lower of the two notes which by their names indicate the number of degrees whereof the interval [illegible] in the diatonic scale whole [illegible] tones It may be as well to explain here the term *diatonic* It is derived from two Greek words *δια through* and *τονος a tone*, because, through [illegible] in this scale, it proceeds by whole tones, five out of the seven being of that description, and the other two being semitones And again, that the notion of an interval between sounds may be properly acquired and felt, we would hint that it may be comprehended by stretching a string between two fixed points so that upon being struck its vibrations are free and will yield a sound Now a string half the leng[illegible] etched will yield a sound exactly one [illegible] the intermediate lengths, therefore, between 1, which we will assume the first string to have been, and ½, the length of the second at a certain place, according to a certain ratio, will yield the different sounds of the octave thus we may acquire a distinct notion of intervals of sound by absolute intervals of length To return, then, to different intervals in the octave If we count from the lower note to its octave, there will be found the following intervals —First, the *unison*, which in harmony is



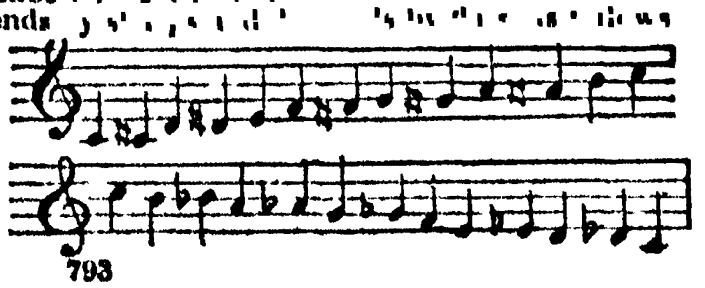
accounted an interval, though it be the same identical sound Second, the *minor second*, sometimes called the *flat second*, is the interval formed by two sounds at the distance of a diatonic semitone from each other Third, the *major second*, consisting of a whole tone Fourth, the *minor third*, containing a whole tone and a diatonic semitone Fifth, the *major third*, consisting of two whole tones Sixth, the *perfect fourth* containing two tones and a diatonic semitone Seventh the *sharp fourth*, containing three whole tones, and called thence by the ancients the *tritonus* Eighth, the *flat fifth*, containing two tones and two semitones, which, however, are not equal to three whole tones, but rather to two minor thirds Ninth the *perfect fifth* containing three tones and one semitone, equal to a major and a minor third Tenth, the *minor sixth*, consisting of three tones and two semitones Eleventh, the *major sixth*, which consists of four tones and one semitone Twelfth, the *minor seventh*, containing four tones and two semitones, or ten semitones Thirteenth, the *major* or *sharp seventh*, composed of five tones and one semitone, or eleven semitones Fourteenth and last, the *octave*, consisting of eight degrees The above fourteen intervals are given in the following synopsis —

By inserting the semitones between these intervals, the number which we have above stated in each will be easily discovered When the lower note of any interval is placed an octave higher, or the higher note an octave lower, it is called *inversion* Thus,

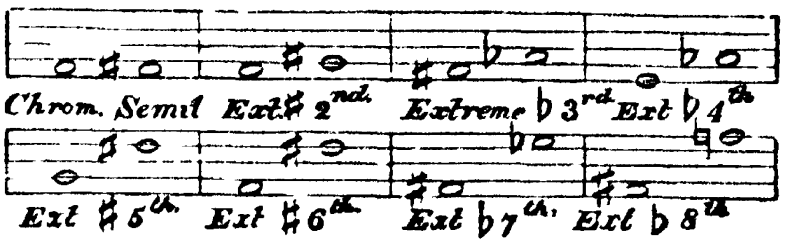


By this operation major are converted into minor intervals, and the converse, for instance the sharp fourth becomes a flat fifth and the unison becomes an octave We will here mention an ancient division of melodies, which at least ought to be understood by a student — namely into that of *authentic* and *plagal* melodies The former are those whose principal notes are between the key note and its octave, of which the following is the example given by Calcott, in his Grammar, from Handel's *Jephtha*, —

(Waft her, angels.)

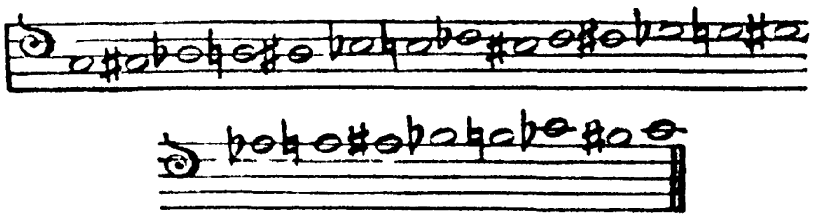


The latter, on the contrary, have their principal notes contained between the fifth of the key and its octave, or twelfth, as,



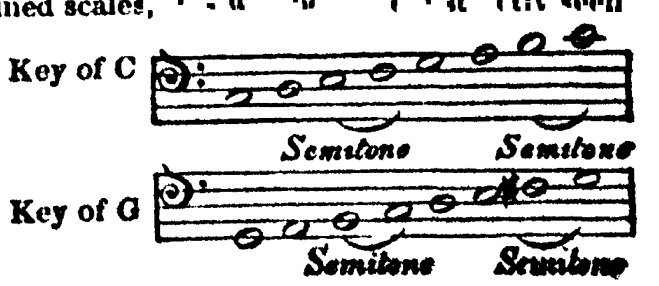
(Streams of pleasure)

from Handel's *Theodora*

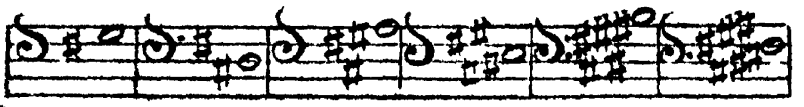


There are three scales occasionally used in music the *diatonic*, which has already been explained, and the *enharmonic* The chromatic — which, to some, takes its name from the Greek word *colour*, because they suppose the Greek [illegible] by different-coloured characters, according to others because holding the mean place between the diatonic and enharmonic system, it was like colour between black and white; [illegible] it embe[illegible] ascends [illegible]

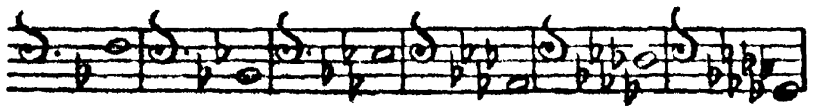
From this it appears that the chromatic scale consists of thirteen tones, with twelve intervals between them, whereof we have already, among the diatonic intervals, described seven, the other five form a distinct species of intervals called *chromatic* First, the *chromatic semitone* is the interval between any note and the same depressed by a flat or raised by a sharp Second, the *extreme sharp second*, which consists of a tone and a chromatic semitone, being composed of two degrees Third, the *extreme flat third*, which contains two diatonic semitones, consisting of three degrees, or it is the minor third diminished by a [illegible] Fourth the *extreme flat fourth*, [illegible] and consisting of four degrees, or it is the perfect fourth diminished by the chromatic semitone Fifth, the *extreme sharp fifth* which is the perfect fifth increased by the chromatic semitone Sixth, the *extreme sharp sixth*, or the major sixth increased by the chromatic semitone, consisting of five degrees [illegible] divisible into a major third and sharp fourth Seventh the *extreme flat seventh*, or the minor seventh diminished by a chromatic semitone, it is composed of four tones and two diatonic semitones, and [illegible] three minor thirds Eighth, the *extreme flat eighth*, or octave diminished by the chromatic semitone This is never used in melody The above intervals are exhibited in the subjoined synopsis



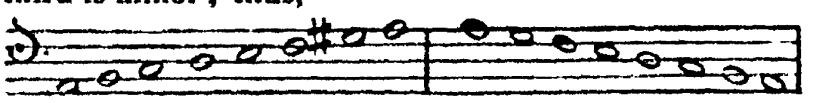
The enharmonic scale, so called from the augment *en*, and signifying extremely harmonious, or well knit together is a series formed by uniting the ascending and descending scale of the chromatic genus It contains intervals smaller than the semitone not, indeed, exactly half the semitone, but, [illegible] there [illegible] small [illegible] to it, called the *diesis*, a [illegible] We have before hinted that there is not a strict mathematical equality between the tones in an octave Our limits do not permit to pursue that question further than to say, that that tone which is between the fourth and fifth of the scale is divided into nine small parts, called *commas*, whilst that between the fifth and sixth of the major scale contains only eight commas The diatonic semitone contains five commas, and the chromatic semitone three or four, according to the magnitude of the tone Now the enharmonic scale divides each tone into two chromatic semitones and a quarter tone, but we subjoin a diagram of it



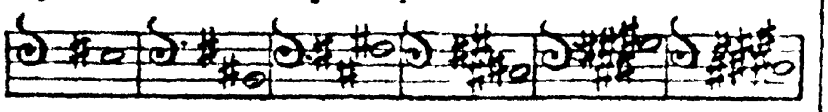
In this scale we have inserted the intervals E♭ and and E♯, also C♭ and B♯, but they do not properly belong to the scale, as their distance is less than a quarter tone We have omitted above to state that there is another interval, which, by calculation, is found to be a comma and a half and is called *hyperoche*, or an *excess*



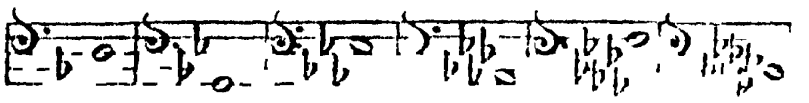
As in oratory there is a principal subject whereon the speaker constantly dwells, and to which, after diverging from it, he always returns, so in music there is one sound in which the piece begins and ends, which regulates the rest, and to which regard must be had in all the other sounds of the piece, and this sound is called the *key*, and the principal note the *key note*, or *tonic*. From the diatonic scale we have seen that the semitones lie between E and F, and B and C, the key note being C Now if we wish to make G the key note, it is clear that without some contrivance the writing the notes from G to its octave will throw one of the semitones out of its place, namely, that between F and F which, instead of being, as it ought to be, between the seventh and the octave, is between the sixth and the seventh It is obvious, then if [illegible] of a ♯, we shall [illegible] to that which it [illegible] By comparing the subjoined scales, [illegible]



Now if D be taken as the key note, we shall find it will be necessary to sharpen the C as well as the F, in order to bring the semitones into the places they ought to occupy in the octave, and we shall have two sharps In order to save the constant repetition of these sharps, it is usual to put them at the beginning of the staff, where they are called *signatures*, thus,



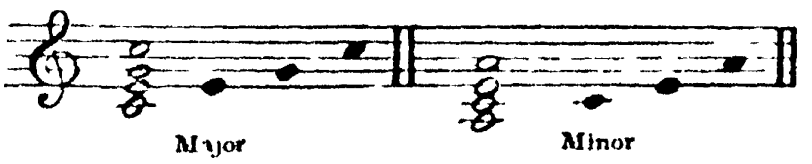
In the same way the keys bearing flats are marked, saving that the seventh of the original key bears the first flat, as follows.—

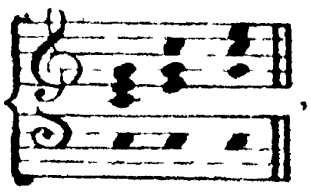


Besides these scales, which are all constructed with the major third, and are therefore called major keys, there is a scale constructed from the natural notes whose third is minor, thus,

In which it must be observed, first that the places of the semitones are different, and second that the ascending scale always [illegible] it is not sha[illegible] in question is, however, always omitted in the signature, and marked accidentally where the melody requires it It must be here noted, that between the [illegible] and G♯ a harsh chromatic interval called an *extreme sharp second*, occurs, to avoid which the sixth is sharpened by which the scale of the minor mode has two notes different from the signature, but in the descending scale no accidentals are required The minor modes, whether proceeding by sharps or flats, have exactly the same signatures as the major mode Thus by sharps we have

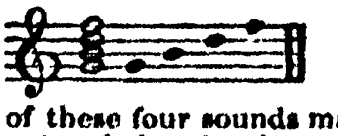
and by flats,





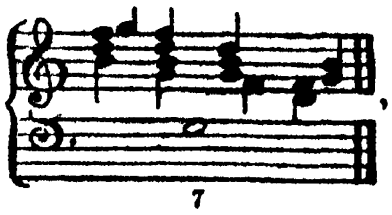
Major and minor scales which have the same signatures are denominated *relative* Thus the relative minor keys of A is E♯, in which case the tonic or key note of the minor mode is found to be the sixth note ascending of the major scale bearing the signature and the tonics are always one degree below the last sharp of the signature but in flat signatures always the third degree above the last flat

The change of a melody from its original to a higher or lower pitch is called *transposition* and this may be effected by altering the signature according to the pitch of the new tonic or key note This alteration may be also accomplished in every minor melody If a melody is performed in the relative or tonic minor being originally major, the change is not called transposition but *variation* *Modulation* is the motion of the melody on the key in which it has commenced and the alteration by new flats and sharps of the original scale Modulation comprehends the regular progression of several parts through the sounds that are in the harmony of any particular key, as well as the proceeding naturally and regularly from one key to another Every scale is immediately connected with two others oneon the fifth above which adds a sharp to the signature, the other on the fifth below or fourth above by which a new flat is added to the signature These were called by Dr Boyce *attendant keys* Minor scales have in like manner their attendant keys

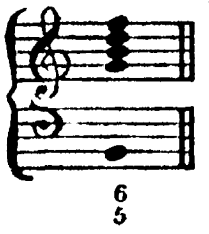


We here subjoin, from the late Dr Callcott's excellent Musical Grammar, the names given to certain notes in the scale as peculiarly marking their character, though we do not intend to use them in the following part of this short essay 1st, The *tonic*, or key note is the chief sound upon which all regular melodies depend and with which they all terminate All its octaves above and below are called by the same name 2d, The *dominant*, or fifth above the key note, is that sound which from its immediate connection with the tonic is said to *govern it*, that is, to require the tonic to be heard after it, at the final cadence in the bass 3d, The *sub-dominant*, or fifth below the key note, is also a species of governing note, as it requires the tonic to be heard after it [illegible] It is the fourth in the regular ascending scale of seven notes and is a tone below the dominant, but the term arises from its relation to the tonic, as the fifth below These three principal sounds are the radical parts of every scale, of the minor as well as the major, and all melodies are derived from them. 4th, The leading note, or sharp seventh of the scale, is in Germany called the *subsemitone* of the mode, it is always the major third above the dominant, and therefore in the minor scales [illegible] sharp or natural whenever it oc- [illegible] *mut*, or middle note between the tonic and the dominant ascending, varies according to the mode, being the greater third in the major scale, and the lesser third in the minor scale 6th, The *submediant*, or middle note between the tonic and subdominant descending, varies also according to the mode, being the greater sixth in the major scale, and the lesser sixth in the minor scale 7th, The *supertonic*, or second above the key note, has seldom been distinguished in England by this or any other appellation In theory it is considered as a *variable* sound, being a comma higher in the major scale than when the mode changes to the relative minor

Harmony consists in the combination of two or more sounds or melodies heard at the same moment, the intervals between such sounds having been already defined A *concord* is an agreeable relation of two sounds as respects the ear, such sounds which are agreeable compounds singly being [illegible] also in succession, subject to certain laws Concord is therefore included under the term harmony though more properly applied to the agreeable effect of two sounds in consonance, whereas harmony involves the agreement of a greater number of sounds than two When two sounds either in consonance or succession are disagreeable to the ear, the relation between them is called a *discord* The concord then may be called a harmonical interval and the discord an inharmonical one, yet by the proper interposition of discords the harmonies of a passage receive a lustre and value from the contrast They must however as we shall presently show be properly *prepared* and *resolved*, as it is technically called The union of any sound with its third (major or minor) and its perfect fifth is called a *common chord*, to which if the octave to the sound be added, we have a combination of four sounds in the harmony, thus,

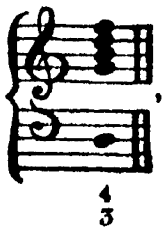


So long as in these chords the C or the A remain the lower note the chord is called the common chord of C or A respectively, but the moment the position of the lower note is [illegible] of the chord also changes Thus [illegible] C be used as the lowest or bass note, thus , the chord is called a *sixth*, because the key note is then the interval of a sixth upwards from the bass note and that sixth has for its accompaniment a minor third from E to G

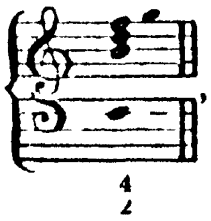


If G be now placed at the bottom and used as the bass note, thus , the key note is an interval of a fourth above the bass and the chord is called a *fourth* and as the example shows is accompanied by a sixth From this it is manifest that the sixth and fourth are no more than inversions of the common chord having the same note C for their expressed or understood bass, which is called the *fundamental bass*, because it is that on which they are founded, and the same arrangement equally exists in the common chord with a minor third The common chord is expressed shortly thus, $\frac{5}{3}$, or $\frac{8}{3}$; but $\frac{8}{5}$ they are frequently omitted The second example or chord of the sixth is merely figured with a 6 and the third example, where G is the lowest note, is denoted by the figure $\frac{6}{4}$

Of discords the most simple is the minor seventh, or, as some call it the *dominant seventh*; because it occurs only on the fifth or dominant of the key, and requires that part in which it occurs always to descend one degree We here give its full accompaniment of four real parts  As in the common chord either of these four sounds may be placed as the bass or lower note of the chord, yet as with C in the common chord the fundamental note of it will be G, B being a



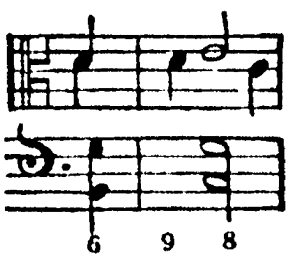
third, D a perfect fifth, and F a minor seventh; thus,



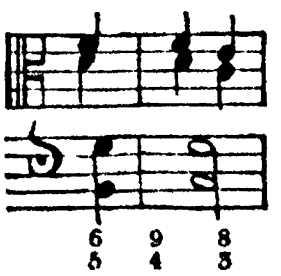
, in each of which cases it would carry the figure 7 below it Sometimes, however, it is figured below, $\begin{matrix}5&7&5&3\\5&5&3&7\\7&3&7&5\\&8&&\end{matrix}$, such positions containing the tenth, twelfth, and fourteenth of the root, when the octave is removed When B becomes the bass note, as

the chord by inversion consists of a minor third, an imperfect flat or false fifth, and a minor sixth, and is, as in the example, figured $\frac{6}{5}$ If D be next taken as the bass note, thus

, the chord consists of a minor third, perfect fourth, and major sixth, and is, as in the example, figured thereunder $\frac{4}{3}$ If F be used for the lower or bass note, thus

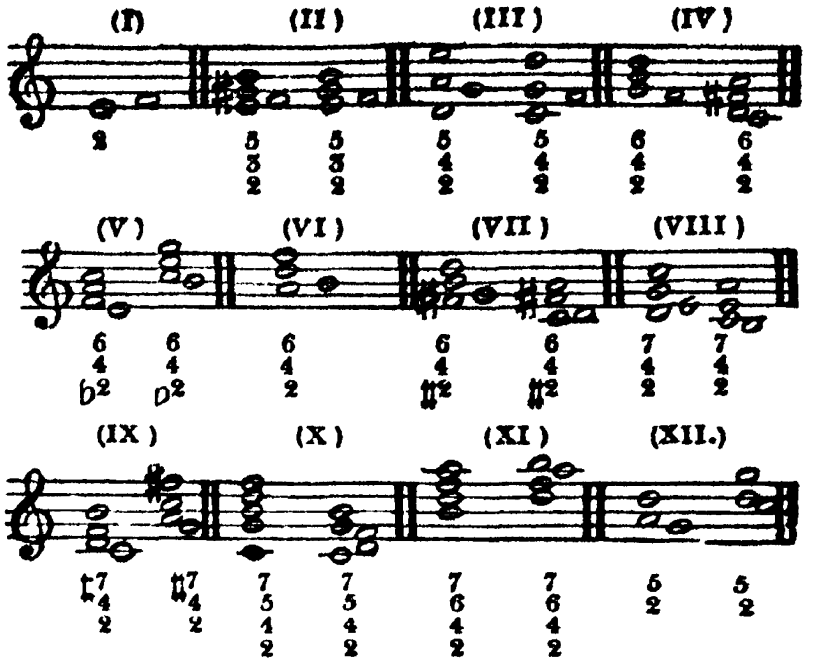


, the chord is composed of a major second, sharp fourth, and major sixth, and is figured $\frac{4}{2}$

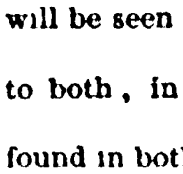


From these observations it appears, therefore that the three last chords are properly called derivatives of the minor seventh when accompanied with a major third and perfect fifth By some authors these three chords are called the syncopated fifth, the syncopated third and the syncopated second respectively Besides the chords within the compass of the octave, there is the *ninth*, which is usually accompanied with a third and fifth, thus,

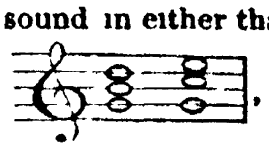
When used in a composition of four parts, and marked by a single 9, it has the accompaniment of a third and fifth, thus,



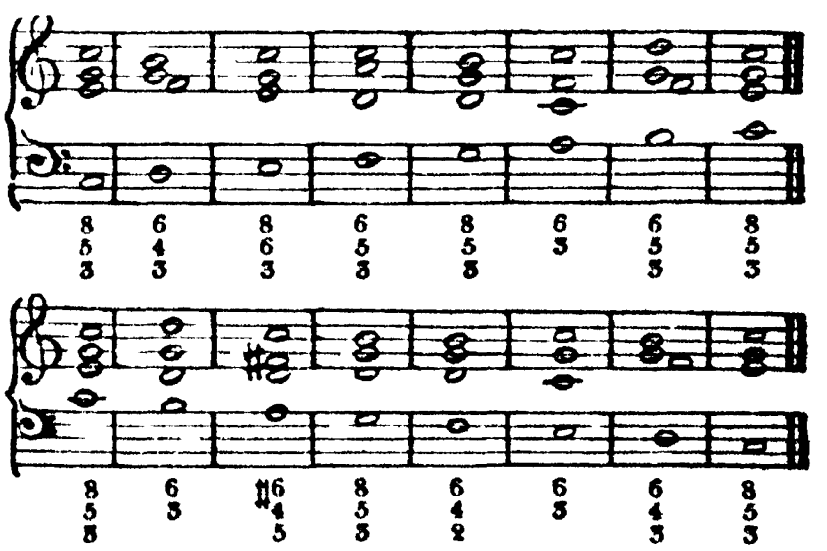
Frequently, however, it is accompanied by a fourth and fifth, and then is marked with a double row of figures, thus,



When the composition is in only three parts, the fifth is not used With the third and fifth as an accompaniment the ninth becomes then an appoggiatura to the octave in the place of the eighth The ninth has two inversions one of them figured with a seventh on the third of the fundamental note, the other figured with a fifth and a sixth on the fifth of the fundamental note

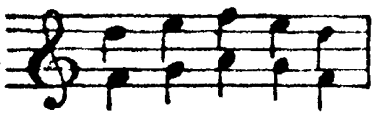


When the figures 4 and 6 are dashed, thus $\not{4}\not{6}$, it indicates that they represent a sharp fourth and a sharp sixth It will perhaps be useful, in this place, to place before the reader a synopsis of all the discords from the seventh upwards they are all inversions of the seventh sharp or flat, with major or minor thirds

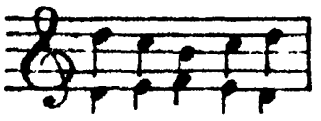


In the above table I is the second, and it is the lower note which is the discord, II contains four real parts without octaves or unisons, and its use is to retard the $\frac{6}{4}$ or $\frac{6}{5}$, IV is also with four real parts, three of which form a common chord above the bass, which note is the discord, VI is the imperfect common chord, with a whole tone added below, VII is the major second, perfect fourth, and minor seventh, and is used to retard the [illegible] in the bass, X is [illegible] which the figure 4 is the [illegible] sharp seventh, XI is the chord of the thirteenth,—the sixth may be either major or minor, in XII the fifth must be perfect, the second either major or minor, and either the one or the other may be doubled The above is a concise view of the *figured* or *thorough bass*, called by the Italians *basso continuo*, and the reader will recollect that all chords may be reduced to the fundamental bass by bring- [illegible] or to that of the [illegible] ing as a sound is or is not

, these two chords, which are irrelative, it will be seen there is no sound in either that is common to both, in the chords

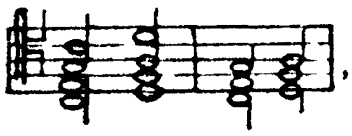


, the G being found in both chords, they are relative If in proceeding from one chord to another any note of the previous chord is kept in that which follows, the process will produce correct harmony The discords, where they appear, must of course be *prepared* and *resolved*, whereof we shall hereafter speak, and care must be taken to avoid progressions of fifths and octaves between the extreme parts when both move the same way Before leaving this part of the subject, we subjoin, as properly belonging to it, what is called the harmony of the scale, that is, the accompaniment which it carries in ascending and descending —

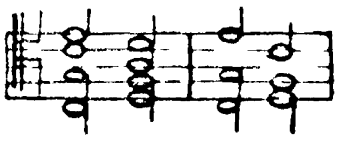


Composition is the art of joining and combining concords and discords [illegible] that their succession and progress [illegible] may be agreeable to the ear It may be here mentioned that melody being chiefly the business of the imagination, its rules serve only to prescribe limits to it, beyond which the imagination in searching out the variety and beauty of the airs ought not to go But harmony is the work of the judgment; and its rules are more certain and extensive, and more difficult in

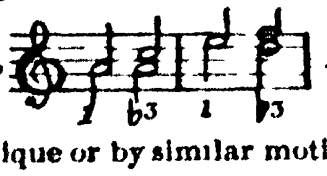
practice A person, indeed, unskilled in music may by chance make a piece of good melody, but a person of judgment does it with certainty In harmony the invention has not so much to do, for the composition is conducted from a nice observation of its rules, assisted also by the imagination It is not to be expected that in the compass of this article space can be afforded for a complete treatise on this part of the subject, all that we propose is to present to the reader some of the leading rules of the science



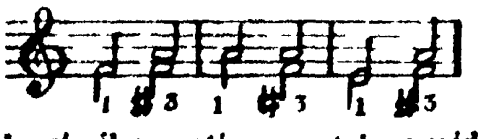
The different motions of the parts which constitute harmony are *direct* and *contrary* In the former the parts move the same way, ascending or descending There is also a third motion, according to some, called *oblique motion*, but that may be classed under contrary motion In direct motion, the parts move the same way, ascending or descending,



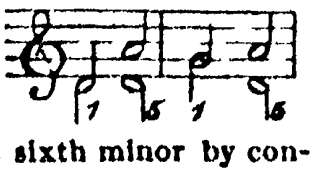
In contrary motion, one of the parts rises whilst the other falls,



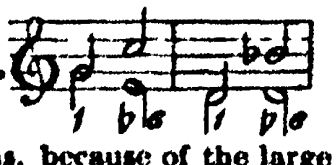
The use of these motions enables the composer to avoid harmonical irregularities in the use of octaves and fifths and in other points The following are the leading rules of harmony, as regards the motions and successions of concords — First, octaves and fifths must not be consecutive in direct motion For instance,



, where the motion is direct, may be avoided by giving the passage contrary motion, thus,

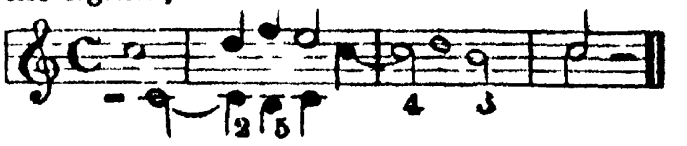


Second, unnecessary and distant skips must be avoided as much as possible, and the chords should be kept as close and as much connected as may be Third false relations such as the extreme sharp second, must be avoided, unless the same be required for the purpose of expressing some particular effect Fourth, the regular motion of the different sharp intervals minor or flat intervals must descend after the flat In observing this rule, however, that of avoiding consecutive octaves and fifths must nevertheless be observed neither is to be strictly observed where certain effects are required It is customary for compositions to begin with one of the perfect concords of its key note, namely the octave or fifth, and it should end in the key note with its common chord for the harmony It should not begin or end with a sixth, though it sometimes may with a third To these we may add, that you must not go from an imperfect concord to a perfect concord by similar motion, such passages being said to contain *hidden* octaves or fifths, which will be seen by filling up the diatonic degrees through which one of the parts is conceived to pass With these prefatory remarks we shall now proceed to some few details of the laws of harmony In proceeding from the unison, when both parts move, it is better to go from it to the third minor than the third major We may go to the minor either by oblique or contrary motion,



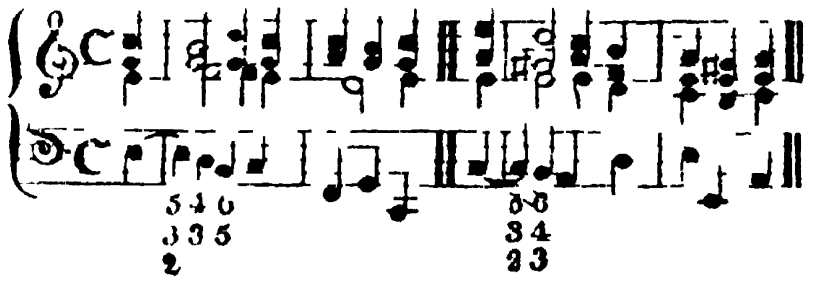
, but to the major it must be by oblique or by similar motion, the first being the best,

A fifth after a unison by similar motion must be avoided it is good in oblique motion, and is allowed in contrary motion, one part moving a single degree,

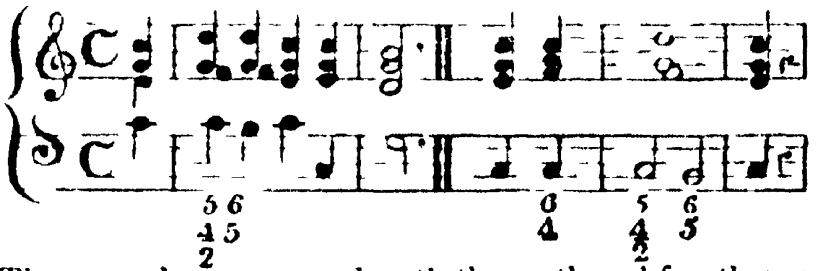


From the unison we may go to the sixth minor by contrary motion,

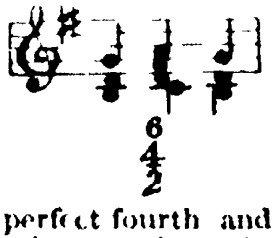
it is not good by the other motions, because of the large leap But from the unison to the sixth major is forbidden An octave after a unison except by oblique motion must be avoided, inasmuch as in two unisons or two octaves it is but the division of a large note into smaller



In the *second*, the lowest note is the discord It may be *prepared* in any concord, and *resolved* in any but the eighth; it must therefore descend to the resolution,

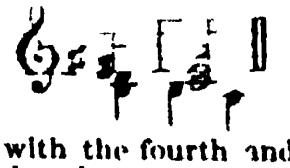


The *preparation of a discord* is effected by taking care that the note which is the discord is heard in the preceding harmony, its resolution being its descent either a tone or a semitone according to the mode, after it has been struck Those seconds are called *transient* which are introduced without preparation on the accented part of the bar, thus

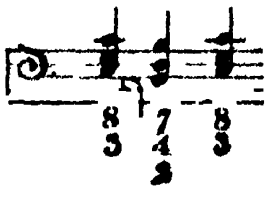


, and if these transient seconds be removed to the accented part of the bar, they then become appoggiaturas When the second is attended by the fifth and third, it becomes a chord of four real parts, and retards the chord of $\frac{6}{4}_{3}$ or the $\frac{6}{5}$, and if the third be sharp, the minor mode is indicated

A chord is said to have four real parts when it contains four sounds without octaves or unisons A concord can only have three real parts When the second is attended by the fourth and fifth either the fifth or the fourth must be prepared, and it becomes the chord of the fifth and sixth at the resolution of the second by the bass

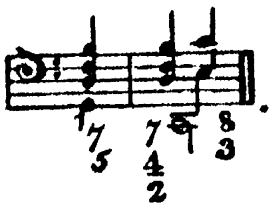


The second accompanied with the sixth and fourth is a chord of four real parts, three of them forming a common chord above the bass which being the discord must be resolved by a descent to the next degree the sharp fourth usually ascends, but it sometimes remains stationary,

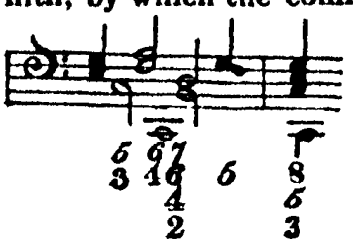


This chord with the minor second, perfect fourth and minor sixth is produced by adding a minor semitone below any common chord with a major third and also by placing a note one tone below the imperfect common chord a major second perfect fourth, and minor sixth, but in all these the second is resolved by descent The extreme sharp second with the sharp fourth and major sixth is a tone and major semitone below the imperfect common chord The second major with a perfect fourth and minor seventh retards the common chord with a major third by an appoggiatura in the bass, thus,

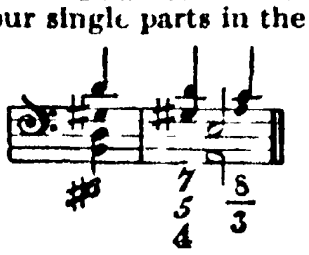
The minor second, perfect fourth and minor seventh retard the common chord with a minor third in a similar manner,



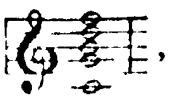
The second is also accompanied with the fourth and sharp seventh which, when introduced upon a resting bass, allow all the intervals when struck to ascend,



When, however, the

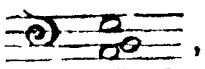


bass moves, it is usual to prepare the upper parts,



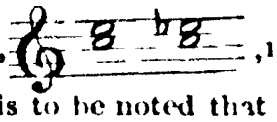
. The fourth may indeed be used without preparation, but it falls to the resolution Both the major and minor sixth are used in the chord with or without preparation, but they fall to the fifth, by which the common chord preserves its fulness,

The second may or may not fill up the chord If the fifth is taken in the chord for the fifth part, it is suspended, and may or may not be in the preceding chord You obtain the last sixth perfect by it, and retain four single parts in the places where the second is omitted,



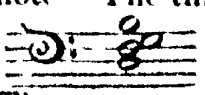
The second accompanied with the fourth, fifth, and seventh,

, by some is called the chord of the eleventh the fourth being the representative of that interval which is always perfect as well as the fifth, but the second and seventh are major Accompanied by the seventh, sixth and fourth, the second is called the chord of the thirteenth, in which the thirteenth is figured by the sixth, which may be either major or minor,

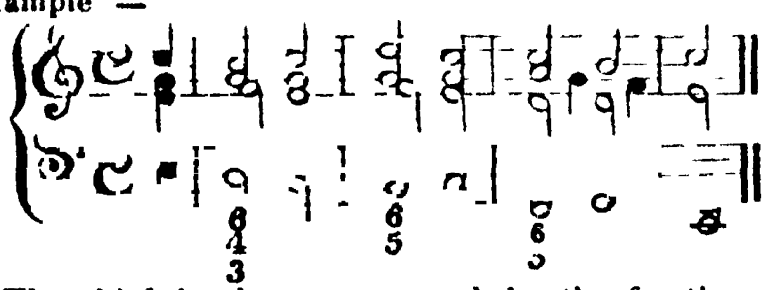


When the second is accompanied by the fifth,

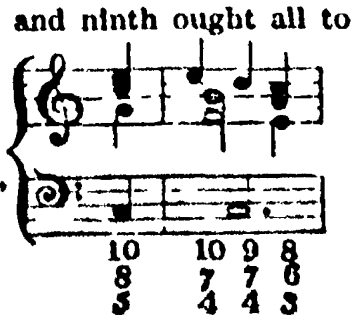
, the latter must be always perfect, but the second may be either major or minor



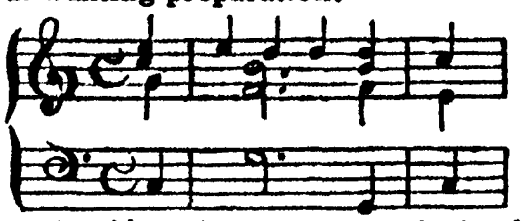
The third major or minor,



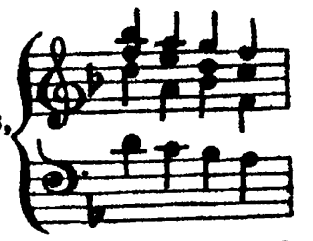
, is an agreeable concord, of which it is to be noted that two minor thirds in succession are better than two majors but mixed thirds in succession are most pleasant to the ear, indeed an octave of major thirds is extremely unpleasant It is best to begin a regular ascent with a major third, and a descent with a minor,



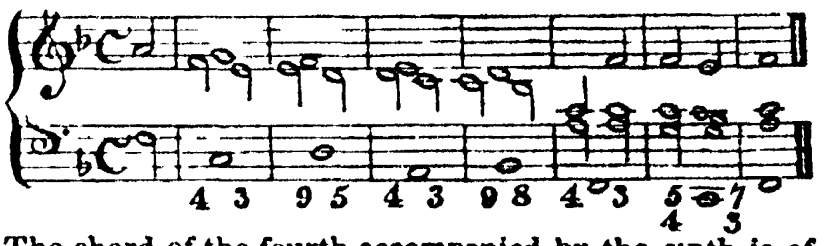
, and in two parts it is not well to end in a third above the key note The third is accompanied by a fourth and sixth,



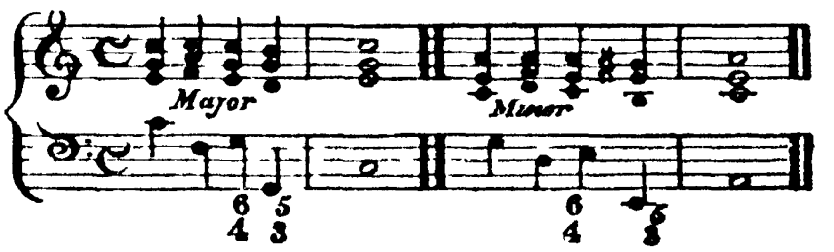
, and is generally called the small sixth That species of it wherein the third is minor the fourth perfect, and the sixth major is elegant in effect, as the seventh, from which it is derived The following is an example —



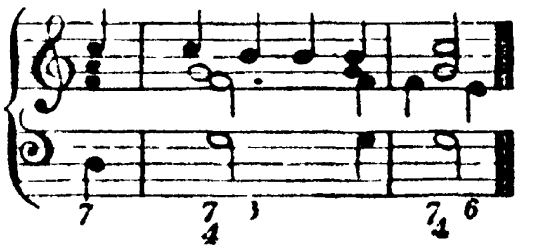
The third is also accompanied by the fourth and seventh, but when the third or the tenth is at the top of the chord, it is generally followed by the $\frac{9}{4}$, which fourth, seventh, and ninth ought all to descend to the resolution, thus,



The third accompanied by the sixth and seventh is generally followed by the chord of the seventh, hence the sixth is the only interval wanting preparation.

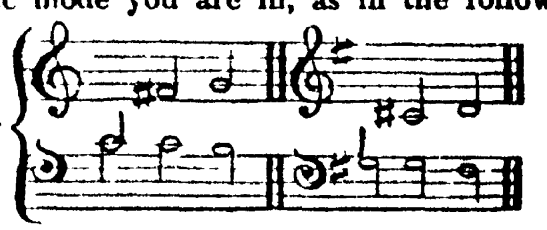


The fourth should not be used alone it should be associated with the sixth and octave; thus,

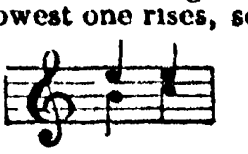


Accompanied by the fifth, the fourth is a discord much used When introduced on a resting bass, it resolves into the third, and its effect is so similar to that of the ninth, that they are frequently introduced alternately

The chord of the fourth accompanied by the sixth is of [illegible], and when preceded by [illegible] the key note at the fourth of the key, and succeeded by the common chords to the fifth of the key and the key note, forms one of the terminations to a musical period called the fourth and sixth cadence, thus,



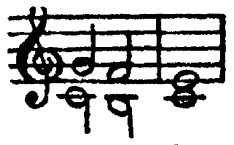
When the seventh accompanies the fourth, and that is followed by the chord of the third, fifth, and seventh, either the fourth or seventh or both should be in some part of the chord preceding it In the following example both the fourth and seventh are prepared and resolved —



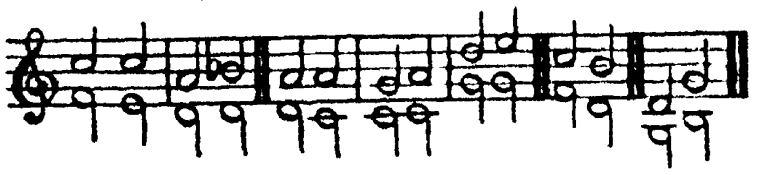
When, however, the chord of the fourth and seventh is followed by the fourth sixth and eighth, it is frequently used without preparation in either of the positions The fourth and seventh descend to the resolution, and generally resolve after each other

The interval of the sharp fourth, which has been before mentioned is a minor semitone more than the perfect fourth, and a major semitone less than the perfect fifth Its natural resolution is that the bass shall fall a degree, and the upper part rise one, by which the two parts meet in a minor sixth It is of very great use in modulation, as you can by introducing it upon the key note, always change the mode you are in, as in the following examples —

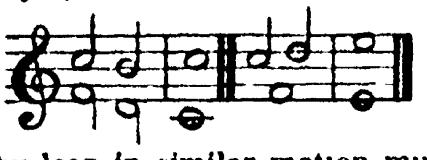
In four parts the sixth and second are taken with it



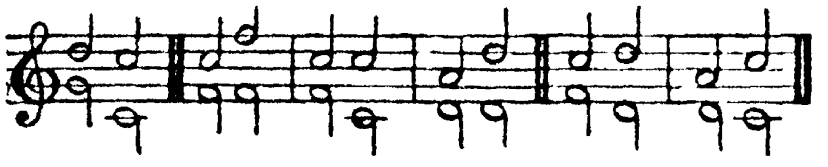
The interval of the imperfect fifth is a minor semitone less than the perfect fifth and a major semitone more than the perfect fourth In using this chord the highest note falls and the lowest one rises, so that they meet in a major third, thus,



In four parts it is accompanied by a third and sixth,

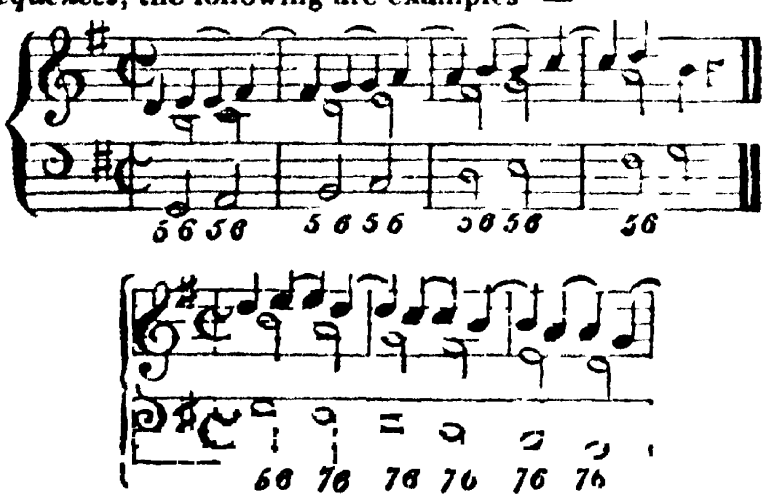


The fifth is the next interval which we have to consider; of this we have already said that two fifths cannot follow each other, except by contrary motion From the fifth to the unison is good by oblique motion, and also by contrary motion one part moving a single degree, but by similar motion it is bad From a fifth to either of the thirds is allowed by all the motions, but it is best by the oblique, next to the oblique the best way to the third minor is by contrary motion, and to the third major by similar motion, and both by single degrees A false [illegible] provided it be also im[illegible] and by contrary motion,

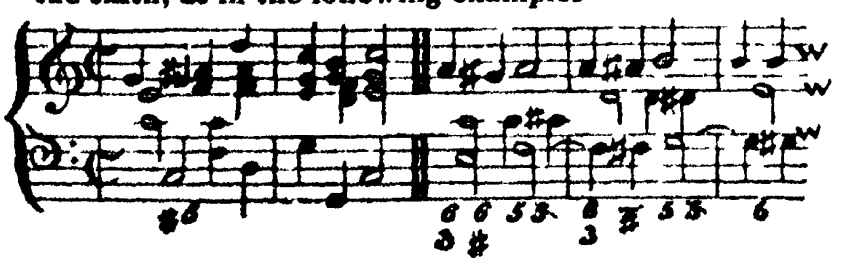


From the fifth to either sixth is best by oblique motion, but it is allowed by similar motion if one part move a single degree it is also allowed ascending, but not descending, to go by leap from the fifth to the sixth minor, but not to the major

In passing from the fifth to the octave through a sixth, the sixth must be major, never minor; and it must be by contrary motion,

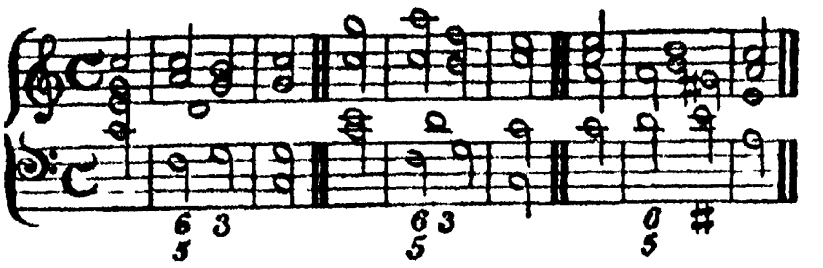


An octave after a fifth by leap in similar motion must be avoided By oblique and contrary motion, it is good and allowable by similar motion, one part moving a single degree, as follows —



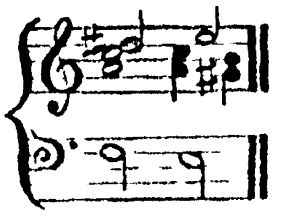
When a third or a sixth moves to a fifth in similar motion, there is said to be a *hidden fifth* in the passage The reader will, in the following example, see by the dots where these lie

In a regular ascent, it is common for a fifth to be succeeded by a sixth, as in a descent it is for the seventh to be succeeded by a sixth Of both these, which are termed *sequences*, the following are examples —

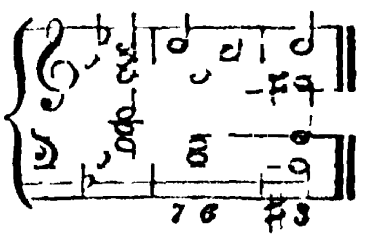


The chord of the extreme sharp fifth, which consists of two major thirds placed above each other, is generally preceded and succeeded by a common chord, or that of the sixth, as in the following examples —

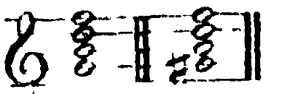
It is here seen that the extreme sharp fifth to the bass, whether it be in the middle or at the top of the chord, always rises to the resolution It is called a *transient chord*



The sixth, by inversion, becomes a third, and it often happens that the bass which accompanies sixths will harmonize equally well with thirds When accompanied with the fifth, the fifth is treated as a discord, which we will illustrate by two or three instances

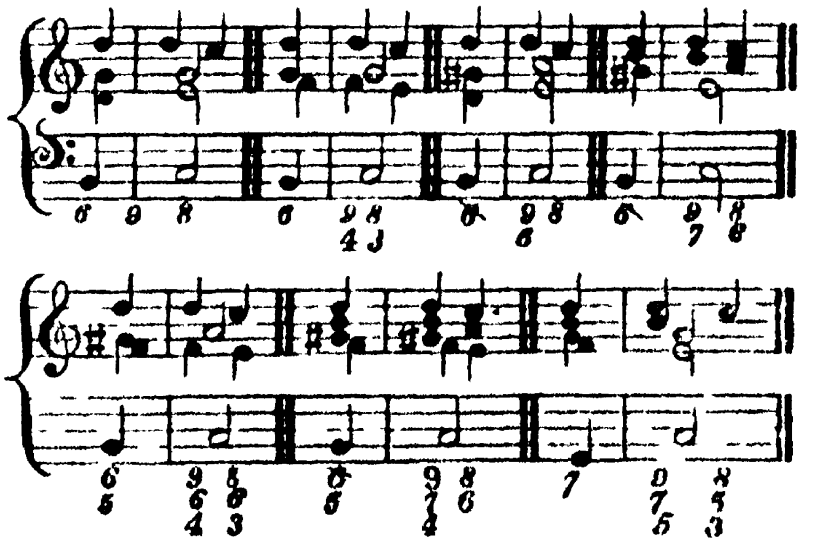


Some have given the name of the *great sixth* to this chord when the sixth is major and the fifth perfect If the fifth is imperfect and the sixth minor, it is called the *chord of the false fifth* It will be seen above that the chord of the great sixth is used on bass notes which ascend a tone to the perfect chord, and that of the false fifth to those which ascend a semitone,



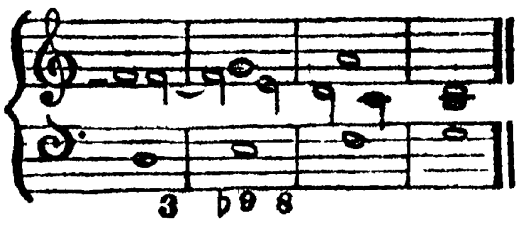
The species of this chord chiefly used in minor keys consists of a perfect fifth, an extreme sharp sixth, and major third, and the bass of it generally descends,

The minor seventh accompanied with a third major and perfect fifth is one of the most agreeable of the discords, it should be heard in the chord which precedes it when used with a minor third and perfect fifth,



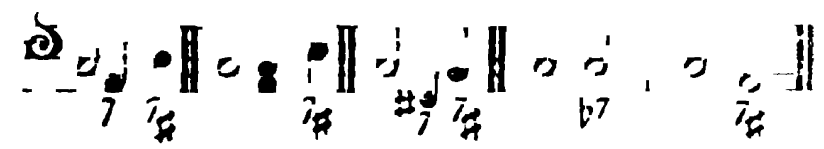
By raising the lower note of a minor seventh a minor semitone the chord of the diminished or extreme flat seventh, also called the *equivocal chord*, is produced,

This is called the



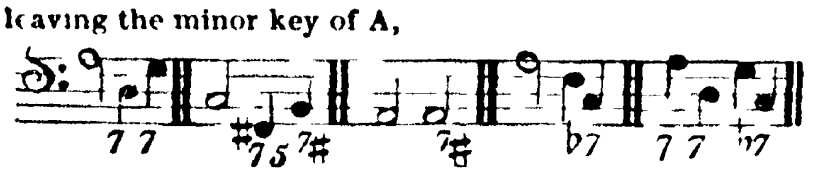
Minor 7th Diminished 7th

[illegible] uncertainty of the key note into [illegible] preparation of a major seventh is a third a fifth a sixth or an eighth, its resolution is a third a sixth and a fifth from the concords in which it is prepared The ninth major consists of a whole tone and the minor ninth a semitone major above the octave The major ninth is prepared by a third a fifth, and occasionally by a sixth never by an eighth and is resolved by a third a sixth or an eighth from each of the concords in which it is prepared When the ninth is used in four parts the third and fifth must be taken with it Besides the above resolutions of the ninth, it may be resolved by the fifth if the bass rise a fourth or fall a fifth when the upper part falls one degree for its resolution It must be accompanied at the resolution by an eighth if the piece be in four parts We subjoin a few examples —



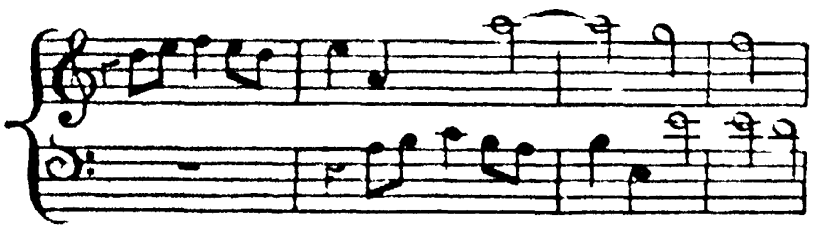
The [illegible] prepared [illegible] and [illegible] [illegible] bass [illegible] [illegible]

but it is resolved in the third if the bass descend a third on the resolution,



The ninth may have other discords mixed with it, as the fourth, in which case the fourth must be prepared and resolved as a discord The seventh may be also mixed with it, in which case the seventh must be also separately prepared and resolved

We have before defined the word *modulation* our intention here is to add a few observations on the mode in which it is accomplished, premising that the laws of modulation are dependent on those of harmony If you desire to keep in the key you are to use all the sounds of the scale as much as possible, uniting them in good melody, and dwelling chiefly on those which carry the essential chords, that is, the chords of the seventh and key notes will be frequently wanted varied so as to avoid monotony You must take cadences or pauses on these two chords only, or at furthest on that of the fourth of the key You are never to alter the scale because the introduction of a flat or a sharp not belonging to it indicates that the key is abandoned To modulate into other keys formal cadences are not required, if they are, they are usually made at the end or in the middle of a piece We subjoin the methods for passing from one key to another, which are five in number for the major and four for the minor keys, and these alone can be considered legitimate, unless through the medium of enharmonic modulation leaving the major key of C,



leaving the minor key of A,

Our limits prevent extending this part of the subject to greater length than we would wish on this point are recommended to *Frike's Guide to Harmony* London 1793

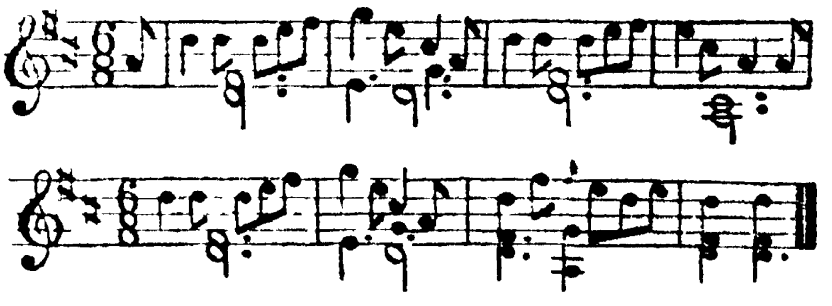
A *fugue* consists in the repetition of a melody in the different parts at different intervals of time each repeating according to certain rules what the preceding one has performed the part which leads being called the *guide* and that which repeats the *answer* The answer is conducted by the same intervals as the guide

Imitation differs from fugue says Brossard because in the former the repetition must be a second third, sixth, seventh, or ninth, or indeed any interval above or below the first voice or guide whereas in fugue the repetition must be in the unison, fourth, fifth or octave —

The principal rules in writing fugues are —First to prefer the key note and its fifth before any other for the first and last notes of the fugue; in which case the melody is to be contained within the octave to the key Second, if one part begin or end with the key note, the other begins and ends with the fifth, taking care that the different relative intervals between the notes be regularly preserved Thirdly, as in diatonic progression either ascending from the key note to its fifth, and [illegible], there is one note difference, you are at liberty to make one of those two notes in conjoint degree of that progression that contains the greater number to agree with the progression which is unavoidably used, wherein there is one note less, and that in the middle of the melody These are the leading rules of the fugue

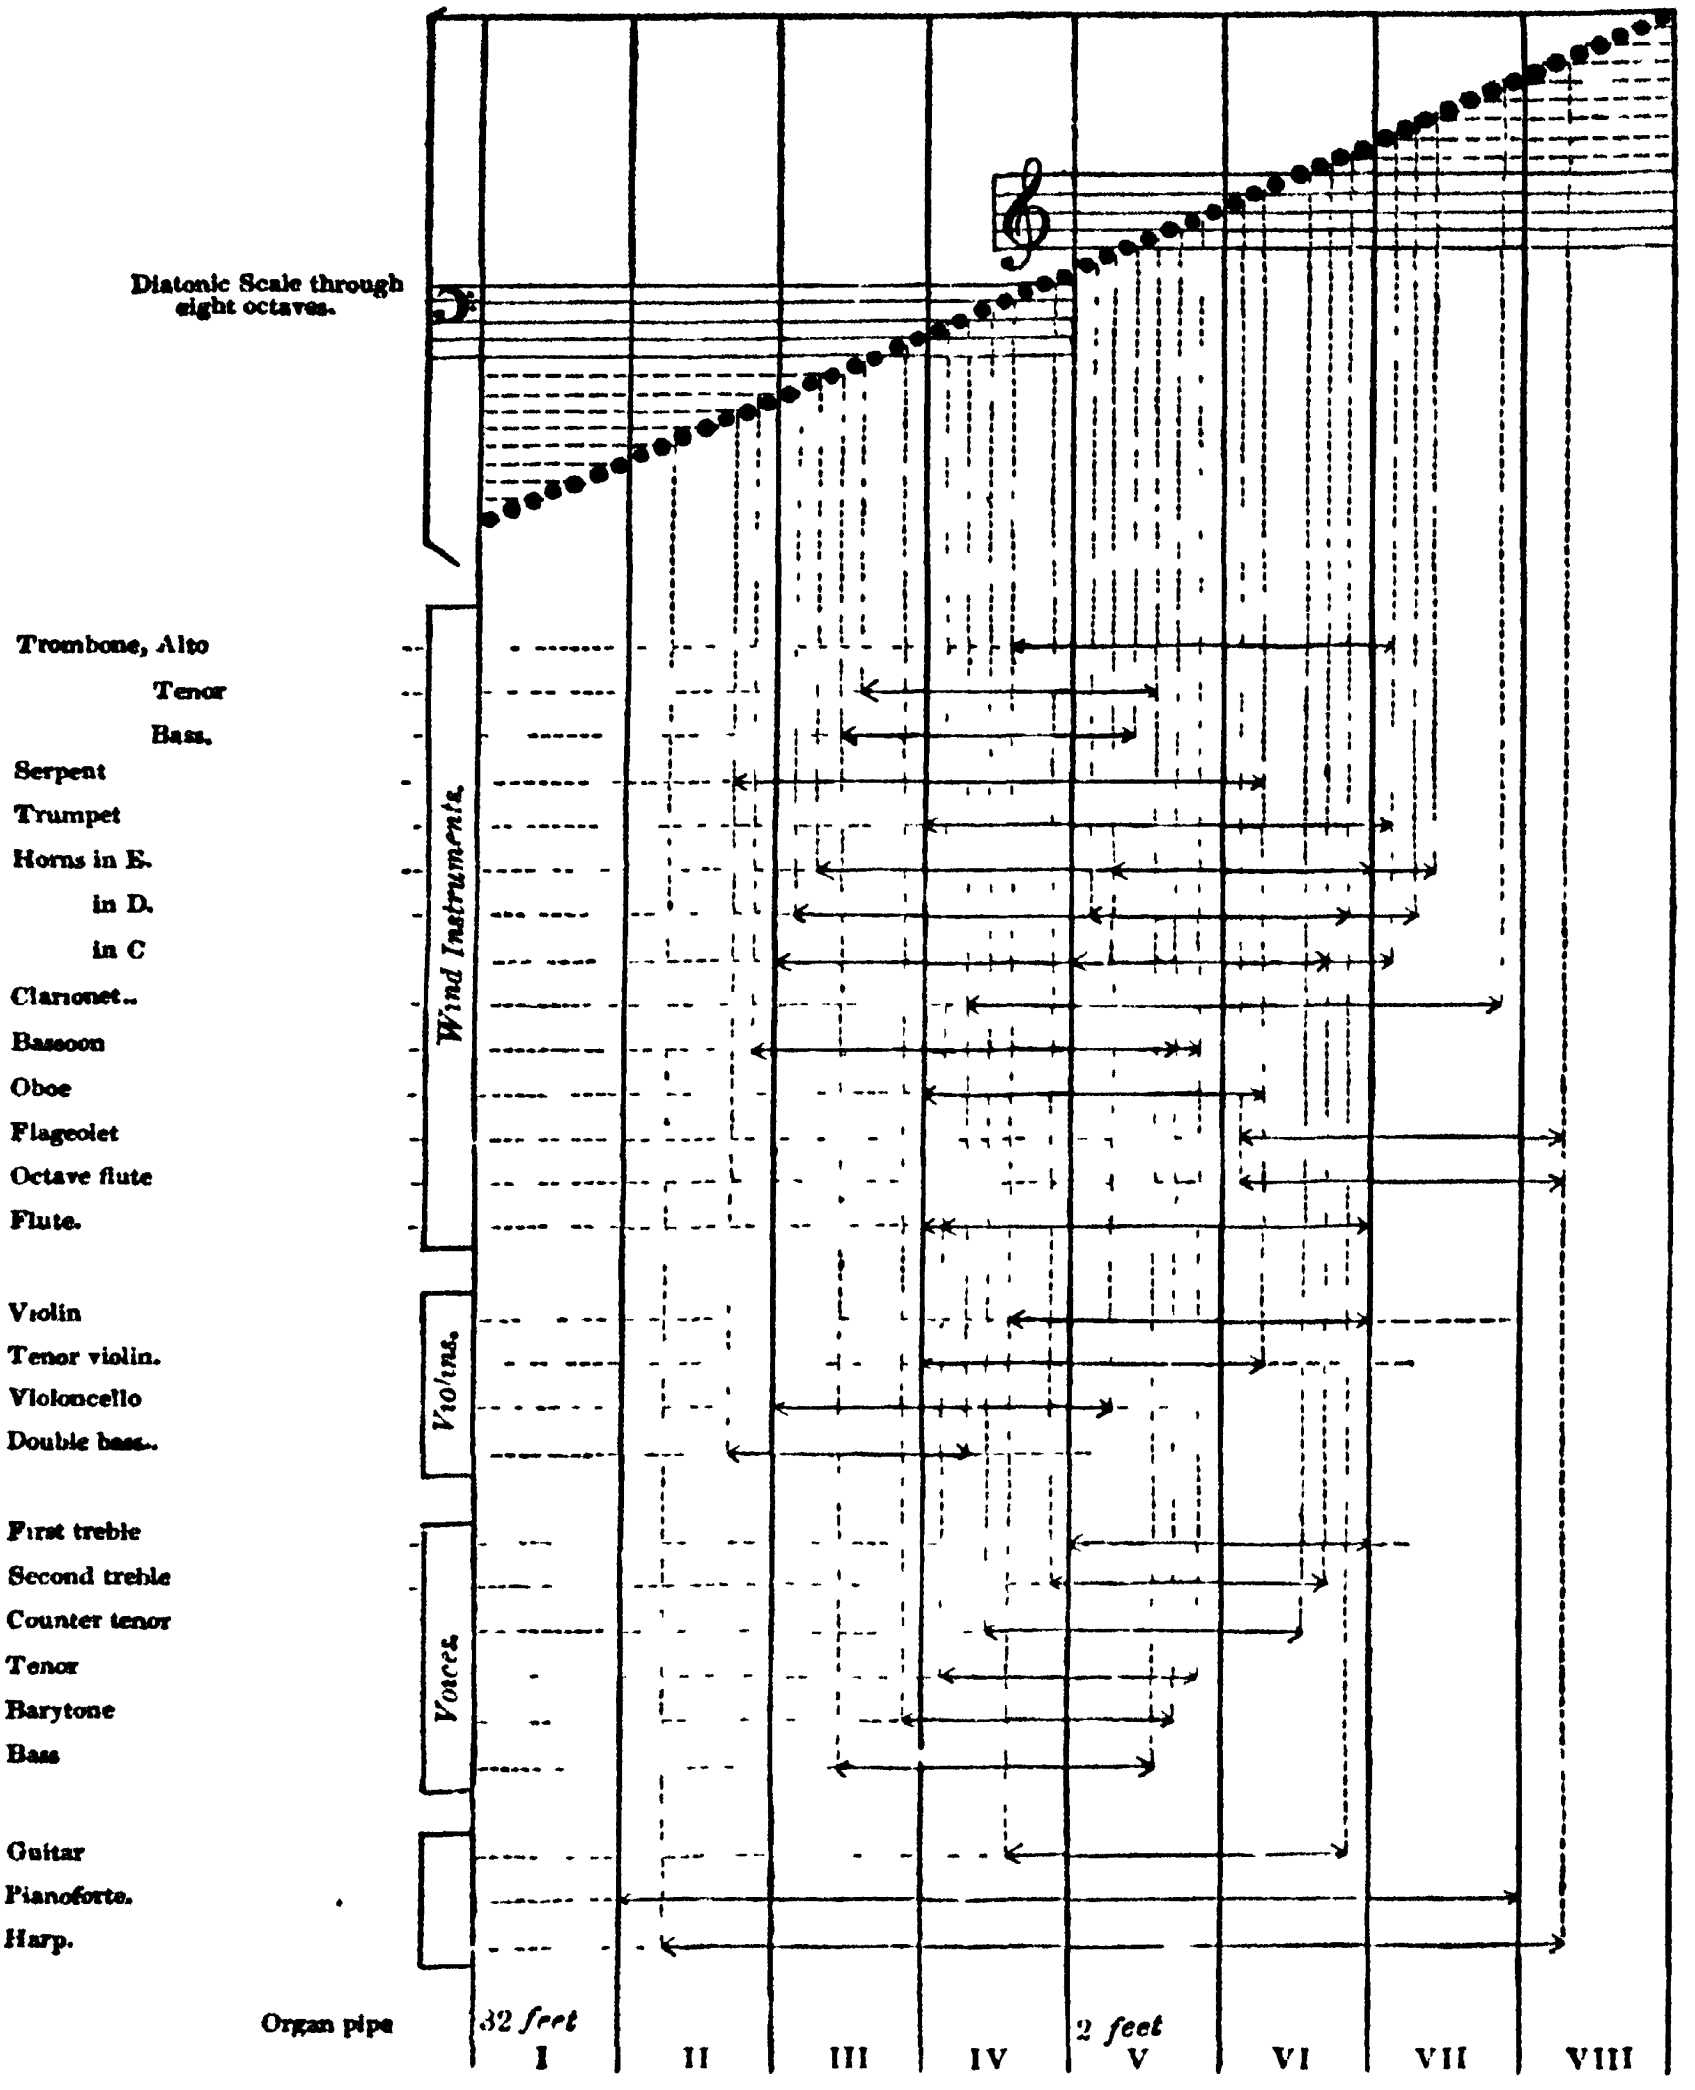
The *canon* is a species of fugue, which may be infinitely repeated, it is taken up at the fifth and at the ourth When this is done, the whole of the melody must be arranged, and accidental sharps and flats added to those notes where the use of the natural degrees would prevent the air from being exactly similar, whence its difficulty The well known canon of *Non Nobis Domine* is a fine specimen of canon composition

Time [illegible] the accurate division of the long and short notes to the syllables to which the music is set in such a manner as to separate the words properly, and to make the accented syllables of each word so conspicuous that what is sung may be clearly comprehended In instrumental music, it is the adaptation of the expression to the sentiment It is mostly used to signify the duration of several sounds heard in succession, whether musical by voices and instruments, or without inflexion of tone, as by the beating of a drum, &c Here we have only to [illegible] nearly the beginning of this article, and we do not think it necessary to add to it in this place further than to state that in the beating of time by the hand or foot, as there mentioned, the elevation of the hand is called by the technical name *arsis*, a Greek word signifying a lifting up and the depression of it by the term *thesis*, signifying the action of laying down expressions, —which are also applicable in another sense as, for instance, when a point or passage is inverted or turned, that is, rises in one part and falls in another, or the converse, it is said to move *per arsin et thesin* Emphasis is frequently obtained for particular expressions by throwing the accent on the weak part of the measure, or by the different grouping of the quavers semiquavers, &c, and also by the mark of emphasis, RF (signifying rinforzando) placed over a note where the composer desires to [illegible] the weak part of a measure with more than its share of importance Of this the following passage from a favourite symphony of Haydn is an example —



(Emphasis.)

on the note marked with a dash over it Dr Callcott thus distinguishes between accent and emphasis —"Accent always requires pressure (on a pianoforte) immediately after the note is struck and emphasis requires force at the very time of striking the note" A phrase is a short melody usually formed of two measures in simple time, though with the ancient writers it is often contained within the bar Of the common phrase the following is an example —



Andante Phrase Phrase

Phrases in melody are formed by air, in harmony they are formed by sequences of chords and discords terminating with a cadence which is more or less perfect as the passage is more or less finished The well weaving together of the phrases whereof a strain is composed, so that their proportions may be symmetrical and form a beautiful whole is one of the tests of a fine composer Though musical punctuation, unlike that in writing, is without visible characters to mark the ends of phrases, and the periods whereof phrases are composed, yet such division does actually exist, and as an example of punctuation will better than words assist the reader in understanding it we present to his notice the following well-known passage from the opera of *Don Giovanni*, by Mozart —

In the four distinct parts into which this melody is divided three of them belong to the chord of the dominant or fifth of the key, and the other, which is the last, to the tonic or key note The seventh of the dominant is upon the three first parts, but to [illegible] punctuate the first part, he has [illegible] at the end of the second part In the other two he has a pedal point (or holding on of the bass) of the key note, on which the chord of the seventh of the dominant is struck. [illegible] regular phrases, the last [illegible] a *section*, and one or more of these sections constitutes a *period* When a period or more than one is terminated by a double bar, the whole is called a *strain* We close this article with a synoptical view of the different pitches of the instruments of an orchestra, and of the human voice, from Choron's celebrated work to which our acknowledgments are due, as [illegible] Mr Mainzer's *Musical Grammar*, the admirable [illegible] the *Encyc Methodique*, and to Shield's *Introduction to Harmony*

SYNOPTICAL VIEW of the different Pitches of the Instruments of an Orchestra, and of the Human Voice.

MU'SICAL GLASSES A musical instrument consisting of a number of glass goblets, resembling finger glasses, which are tuned by filling them more or less with water, and played upon with the end of a finger damped There are few persons at a dinner table who have not tried their skill in producing the sound which the vibration of a finger glass will yield in the way above described The less the quantity of water in glasses of similar forms and equal capacity the lower will be the tone of the scale, hence the facility of forming a complete scale by the quantity of water contained in each

The skill or rather knack of operating upon the sets of glasses for the production of melodies and harmonies, is that of producing instantly the required vibration by a gentle and rapid action of the finger upon their edges, and so quickly from one to another as to be able to introduce harmonies to the sounds of the air or melody before the vibrations of its glasses have ceased A touch of the finger on the edge of a glass puts of course a stop to its vibration, and thus prevents confusion

MUSK A peculiar concrete substance, the produce of the *Moschus moschiferus*, or musk deer, an animal which inhabits the mountains of eastern Asia Behind the navel is a bag, which in the adult animal is filled with musk These bags are imported from China, Bengal, and Russia Musk is originally a viscid fluid, but dries into a brown pulverulent substance, of a strong, peculiar, and highly diffusible odour Its chief use is as a perfume it has been employed in medicine as a stimulant antispasmodic, but much difference of opinion exists as to its efficacy, and its high price, and extreme liability to adulteration, are circumstances against its use

MUSKAT A rich sweet wine made in the south of France of [illegible] grapes

MUSK DEER (*Moschus moschiferus*, Linn.) The [illegible] the large preputial glandular pouch which secretes the well-known substance called musk

MUSKET (Fr. *mousquet*) The fire-arm used by the regiments of the line (*See* GUN) A great number of very curious ones, of various dates and countries, from

the earliest period of their use, may be seen in the repository of the Royal Artillery at Woolwich

MU'SKETOON A species of musket, shorter but thicker and wider in the bore than the ordinary musket The musketoon or *mousquetton* was of French invention and is described by De Gheyn, in 1688 (*Traité des Armes*) as differing from the carabine in being furnished with a fire lock instead of a wheel-lock

MU'SLIN A fine thin kind of cotton cloth with a downy nap on the surface The name is derived from the town Mosul, in Asia, where it was originally manufactured The first muslin was imported from India into England in 1670; and twenty years later [illegible] manufactured in considerable quantities in England and England Muslins are now manufactured in immense quantities at Manchester and Glasgow, in France, Germany, and Switzerland, of a fineness and durability that rival those of India, at the same time that they are considerably cheaper The fineness of some Indian muslins is such that when laid on grass upon which a little dew has fallen, they are scarcely visible *See* COTTON

MUSOPHAGA (Gr *μουσα*, the generic name of the banana, and *φαγω*, *I eat*) A genus of Scansorial birds, characterized by the base of the beak forming a disk which partly covers the forehead The species of this genus are called "plantain eaters," because their principal food is the fruit of the banana

MUSQUI'TO The American name for the species of gnat (*Culex*) They abound in damp situations, both in the warmer climates and during the summer months in high northern latitudes They pierce the skin with a lancetted proboscis, and discharge a venomous liquor into the wound, they can only be guarded against at night by enclosing the bed with a musquito curtain The Laplanders drive them away by fire, and by coating the naked parts of the body with grease

MUSSEL *See* MYTILUS

MU'SSITE A pale green mineral from Mussa in Piedmont, it is a variety of *augite*

MU'SSULMAN The general appellation for all who embrace the faith of Mohammed The term signifies "resigned to God," and is the dual number of the singular *moslem*, of which *muslimim* is the plural The appellation is said to have been first given to the Saracens

MUST The expressed juice of the grape before its conversion into wine by the process of fermentation

MU'STARD (Fr moutarde) The seed of the *Sinapis alba* and *nigra*, ground into powder and freed from the husks it is the well known condiment of the shops or at least a part of it for, in order to reduce the strength of the pure mustard there is generally a considerable quantity of wheaten flour added Brown mustard should be the flour of *Sinapis nigra* exclusively which is much more pungent than the other A dessert spoonful of coarsely powdered mustard-seed taken in a glass of water generally operates as an emetic, it is also aperient A mustard poultice, or *sinapism*, is sometimes a useful stimulant

MUSTE'LA (Lat mustela, *a weasel*) The generic name under which Linnæus comprehended the Vermine or Vermiform quadrupeds of Ray or the carnivorous Mammalia, which are distinguished by the length and slenderness of their bodies and are thus enabled to wind like worms, into very small crevices and openings whither they easily follow the little animals that serve them for food The otters, skunks polecats and weasels were included in this genus, and still constitute the natural family *Mustelidæ*, and the genus *Mustela* is now restricted to the true weasels, which differ from the polecats in having an additional false molar above and below and in the existence of a small internal tubercle on the lower "carnassial" or sectorial tooth, two characters which, Cuvier observes, somewhat diminish the cruelty of their nature

MUSTER-ROLL A specific list of the officers and men in every regiment, troop, or company, made out by the adjutant, and delivered to the inspecting field officer or paymaster, &c, by which they are paid, and their [illegible] known

MUTE [illegible]r, a vowel (or consonant) is said to be mute when written but not pronounced, as the vowel *e* at the end of many English words, in some of which it effects a change in the pronunciation of the preceding vowel, as in *wife*, *life*, *place*, &c, rendering it long, in others it has no effect, as after a diphthong—*house*, *pronounce*. In old English, the mute *e* was very generally added at the end of words especially nouns, and in versification the *e* often ceased to be mute, as is constantly the case in the poems of Chaucer

MUTE in Law is said of a person who refuses to plead to an indictment for felony &c By stat 12 Geo 3 c [illegible] such a person is to be considered as pleading guilty and to be punished as upon conviction; but formerly a plea was extorted from him by the inhuman and disgusting process *peine forte et dure*, which see.

MUTE A dumb officer of the Seraglio whose duty it is to act as executioner of persons of exalted rank who have incurred the grand seignior's displeasure The term mute is also applied to persons employed by undertakers to stand before the door of a house in which there is a corpse for a short time previously to the funeral

MUTICA Linnæus [illegible] A name applied by Linnæus to one of his primary divisions of Mammalia, including the whale tribe, as being maimed, or deprived of the hinder pair of extremities, also given by Storr to an order of quadrupeds comprehending those which want either a certain kind of teeth, or are wholly [illegible]

MUTINY, in Law is the offence, in a person under [illegible] of resisting or refusing obe- [illegible] Mutiny Act is a table annually passed since the reign of William and Mary (April, 1689), by which the crown is vested with power to form articles of war, and to constitute military courts martial *See* COURTS MARTIAL

MUTULE *See* MODILLION

MU'ZARAB (Ar [illegible] being under the government of the Moors in Spain, so called it is said, from an Arabic word signifying imitators or followers of the Arabs The denomination is now chiefly remembered in consequence of the celebrated disputes between the supporters of the Muzarabic liturgy, which was preserved by the Christians of Spain during their subjection to the Mahometans, and those of the Roman, introduced by the see of Rome about the 10th century During the following age this dispute was warmly carried on, and well-known [illegible] of miracles operated in favour of the [illegible] long current in Spain It was, however, gradually superseded by the Catholic It is said that mass is still celebrated according to the Muzarabic ritual in one chapel at Toledo A brief but excellent account of the different phases of the Muzarabic controversy is to be found in the *Dict de la Conversation* See also the *Penny Cyclopædia*, and the authorities there referred to

MU'ZZLE LASHING The lashing by which the muzzle of a gun in a ship is secured to the upper part of the port

MYA (Gr *μυα a muscle*) A name applied by Linnæus to a genus of the *Vermes testacea*, including those having a bivalve shell, characterized by a hinge with broad, thick and strong teeth, seldom more than one and not inserted [illegible] shell gene- [illegible] Mya is characterized [illegible] the [illegible] *Lutraria* among the Acephalous Testacea of Cuvier [illegible] divided into the genera *Mya* proper, *Lutraria*, Lam, *Anatina*, Lam, *Solemya* Lam *Glycimeris*, Lam, *Panopæa*, Lam *Pandora* Lam The true *Myæ* include that species of the genus *Unio*, Brug, which is celebrated by Tacitus for producing pearls, and which is indigenous in some of the rivers of Scotland and England

MYCE'LIA (Gr *μυκης*, *a fungus*) The young flocculent filaments of fungi

MYDRI'ASIS (Gr) A paralytic affection of the iris of the eye

MY'ELENCE'PHALA (Gr *μυελος*, *marrow*, and *εγκεφαλον brain*) The name indicative of the condition of the nervous system of the primary division of animals, [illegible] which the cerebral and spinal chord [illegible] is synonymous with *Vertebrata*

MY'ELONEU'RA (Gr *μυελος marrow*, and *νευρον*, *nerve*) A name given by Rudolphi to a group of animals corresponding to the Articulata of Cuvier, viz Crustacea, Insects, and Anellides which have a gangliated nervous system, forming a chord considered to be analogous to the spinal marrow of Vertebrates

MY'LO (Gr *μυλη*, *a grinder tooth*) Names compounded of this word are applied to certain muscles attached near the grinder teeth, as *mylohyoideus*, *mylopharyngeus*, &c

MYO'LOGY (Gr *μυων*, *a muscle*, *λογος*, *a discourse*) The doctrine of the muscles In [illegible] this term is applied to a description of the muscles of animals

MY'OPS (Gr *μυωψ*, from *μυω*, *I wink*, and *ωψ*, *the eye*) A person who is purblind or near-sighted This defect usually arises from too great convexity of the cornea causing the rays to come to a focus before they arrive at the retina It is corrected by the use of glasses which increase the divergency of the rays before they enter the cornea, and thereby throw their focus further back, so as to fall on the retina

MY'RIAD (Gr *μυριας*) Ten thousand Often used as expressive of an indefinite multitude

MYRIAMETRE A French measure equal to ten thousand meters, it is the equivalent of two leagues of the old measure *See* MEASURES

MYRIAPODS, *Myriapoda* (Gr *μυριας*, *ten thousand*, and *πους*, *foot*) The name of a class of Articulate [illegible] which have an indeterminate [illegible] that of the articulations of the body

MYRICIN That portion [illegible] in alcohol The wax of the M[illegible]

MYRIOLITRE A French measure of capacity equal [illegible] litres or 610240 cubic inches

MY[illegible] (Myristica, one of the genera) A natural order of arborescent Exogens inhabiting the tropics This has been placed, on account of its apetalous flowers, in *Lauraceæ*, from which it is distinguished by the structure of the calyx, anthers, and fruit Brown places it between *Proteaceæ* and *Lauraceæ*, but the order appears rather to be an apetalous form of *Annonaceæ*, with which the trimerous flowers [illegible] arillate seed, [illegible] embryo, and peculiar pro[illegible] bark generally abounds in an acrid juice, which is viscid and stains red The rind of the fruit is caustic, the aril and albumen of *Myristica moschata*, the former known under the name of *mace* and the latter of *nutmeg*, are important aromatics, abounding [illegible] to fat, which [illegible] tous as [illegible]

MYRMECOBIUS [illegible] genus of Marsupial quadrupeds which feed on ants The only known species, *Myrmecobius fasciatus*, is a native of Australia

MYRMECOPHAGA (Gr μυρμηξ and φαγω *I eat*) The name of a genus of Edentate quadrupeds which feed on ants and are called *ant-eaters* They are peculiar to the continent of South America

MYRMELEO'NIDES (Gr μυρμηξ and λεων *lion*) The family of insects commonly called *ant-lions*, having the [illegible] the type

M[illegible] Classical Mythology, a people on the southern borders of Thessaly, who accompanied Achilles to the Trojan war Their name is derived by the mythologists from μυρμηξ *an ant*, and they were said to have arisen from ants or pismires in answer to a prayer of Œacus, king of the country, to Jupiter after his k[illegible] by a pestilence

MYRMILLONES [illegible] Antiquity a species of gladiators who fought completely armed against the Retiarii Their arms consisted of a sword headpiece and shield On the top of the headpiece they wore a fish embossed, called μορμυρος whence in all probability their name is derived The Myrmillones were also termed *Galli*, from their wearing Gallic armour and *Scutatores*, from the shield by which they were defended

MYRO'BALANS (Gr μυρον *an ointment* and βαλανος, *a nut*, because formerly used in the preparation of unguents) A bitterish austere fruit brought from India, the produce of several species of *Myrobalanus* Myrobalans are used by the Hindoos in calico printing and medicine, they were also formerly employed in Europe (though to a comparatively trifling extent) in the arts and pharmacy

MYRRH This gum resin is imported from Turkey it is in irregular tears and lumps, of a reddish brown colour [illegible] but bitter taste It is [illegible] of *Imyris* said to be a native of Abyssinia and Arabia Felix It is a good stimulating tonic medicine, and is given in doses of from five to twenty grains

MYRTACEÆ (Lat myrtus) are an important natural order of Polypetalous Exogenous plants, of a woody texture, and frequently forming small trees found in all tropical and temperate countries where they are often cultivated for the sake of their valuable aromatic properties The spices *cloves* and *pimento* are produced by some species, the agreeable fruits called *guava jam rosade*, and *rose-apples* are yielded by others while the enormous *gum-trees*, or *Eucalypti* of New Holland, and the *Melæuca*, which furnishes the stimulating green oil of *cajeput*, also belong to the order *Myrtaceæ* are nearly related to the Onagraceous order from which they differ in having an indefinite number of stamens, and to *Melastomaceæ*, which have rostrate inflected anthers and ribbed leaves Their most essential characters are to have [illegible] flowers, indefinite stamens [illegible] fruit, and dotted leaves with an intra-marginal [illegible]

MYRTLE (*Murt*, the Persian name whence μυρτος) An evergreen fragrant bush inhabiting all the warmer parts of the basin [illegible] of the west of Asia. It was [illegible] and is at this day regarded with superstitious reverence by the Persian peasant In the latitude of London the myrtle will endure the climate only in the warmest and most sheltered spots

MYSTACINÆ (Gr μυστραξ *moustache*) The name of a family of Infusories of the tribe *Trichoda*, including those which have [illegible] four hair-like processes, disposed in [illegible] species of animals derive their trivial name from the same root, as the *Vesperilio mystacinus* or whiskered bat the *Caprimulgus mysticalis*, or bearded goat-sucker the *Cypselus mysticeus* or bearded swift, &c

MYSTERIES, SACRED (The word mystery has been by some traced to the Hebrew סתר, to hide, whence *mystar*, a thing concealed, formed from which is the Gr μυστηριον and [illegible] *mystery*, and [illegible] the learning of which was something occult and mysterious, but the [illegible] from the Gr μυεω) [illegible] in speaking of certain truths set forth in the Old and New Testament, to the full understanding of which human reason cannot attain This is all the [illegible] prophecies were mysteries [illegible] ws, until they received their accomplishment in Christ Among the mysteries set forth in the New Testament the most prominent are, the doctrine of the satisfaction of Christ, the forgiveness of sins for the sake of his sufferings, and eternal life in a future w[illegible] between Christ and his church, [illegible] peration on our hearts and the resurrection from the dead.

But the greatest of sacred or scripture mysteries is doubtless the incarnation of the Son of God —the advent of Christ in the fulness of time, of the seed of Israel, and his participation in our nature, according to the flesh, "being in the likeness of man," and "found in fashion as a man,' but "very God of very God," "God over all, blessed for ever" 'The Word was *with* God and *was* God says John, "and the Word was made flesh" This is the mystery, and "without controversy, great is the mystery of godlin[illegible] God, manifest in the flesh," or [illegible] the flesh," as the [illegible] [illegible] [illegible]

celebration of the greater mysteries occupied nine days, chiefly devoted to sacrifices, processions, and other acts of worship, and during this period the judicial tribunals were closed; an armistice was proclaimed, private enmities were hushed, and death was decreed by the Athenian senate against any one, how high soever in rank, who should disturb the sanctity of the rites. The ceremonies of initiation into both the lesser and greater mysteries were conducted by four priests of the most illustrious families of Greece, called Hierophant, Dadouchos, Hierokeryx, and Epoptes; and these [illegible] were assisted by numerous inferior functionaries, to whom various appellations were given indicative of their several duties. The examination of those who had been initiated by the lesser mysteries, and who were preparing for the greater, was apparently rigorous. All foreigners, all who had even involuntarily committed homicide, who had been declared infamous by the laws or had been guilty of a notorious crime, were excluded; but these regulations were not immutable, for various instances might be produced to show that homicides and robbers were sometimes initiated.* Women and children were admissible, and a child, styled *the child of holiness*, whose innocence, it was believed, of itself endowed him with capacity to fulfil the requirements of the mysteries, was selected to conciliate the deity in the name of the initiated.

Of the ceremonies which attended the initiation we know little, since every postulant was required, under the most dreadful oaths, to conceal whatever he saw or heard within the hallowed precincts, and he who violated the oath was not only put to death, but devoted to the [illegible] Yet the priests of ancient, like the [illegible] of modern times, could not prevent the disclosure of *some* facts. Crowned with myrtle, and enveloped in robes, which from this day were preserved as sacred relics, the novices were conducted beyond the boundary impassable to the rest of men. The hierophant, with his symbols of supreme deity, and his three assistants, representing the three other gods, were carefully visible. Lest any should have been introduced not sufficiently prepared for the rites, the herald exclaimed 'Far from hence the profane, the impious, all who are polluted by sin!' If any such were present, and did not instantly depart, death was the never failing doom. The skins of new-slain victims were now placed under the feet of the novices, the ritual of initiation was read, and hymns were chanted in honour of Ceres. The novices moved on, while a deep sound rose from beneath as if the earth itself were complaining; the thunder pealed, the lightning flashed, and spectres glided through the vast obscurity, moaning, sighing [illegible] shades, the messengers of the [illegible] Madness, Famine, Diseases, [illegible], and the explanations of the hierophant delivered in a solemn voice, added to the horrors of the scene. This was intended as a representation of the infernal regions where misery had its seat. As they advanced amidst the groans which issued from the darkness were distinguished those of the suicides — thus punished for cowardly deserting the post which [illegible] this world. But the scenes beheld seemed to be a sort of purgatory where penal fires and dire anguish, and the unutterable horrors of darkness, were believed after countless ages of suffering, to purify from the guilt acquired in this mortal life. Suddenly the bursting open of two vast gates with a terrific sound dimly displayed to their sight, and faintly bore to their ears, the torments of those whose state was everlasting — who had passed the bounds beyond which there is no hope. On the horrors of this abode of anguish and despair a curtain may be dropped, the subject is unutterable. Onwards proceeded the novices, and were soon conducted into another region, that of everlasting bliss, the sojourn of the just — of those whose hearts had been purified and whose minds had been enlightened by 'the holy doctrine.' This was Elysium — the joys of which were equally unutterable, equally incomprehensible, to mortals not admitted into these mysteries. Here a veil was in like manner thrown over *this* scene. (*Cab. Cyclop.*, vol. 61.)

Like most other questions of this nature, the origin and purpose of these religious institutions are involved in the deepest obscurity, and all the efforts of the learned that have been directed to the elucidation of this question in all ages, but more particularly in modern times, have ended only in [illegible]. Referring to the dissertations [illegible] and Dr. Leland for the chief views that have been entertained respecting them, we may here briefly observe, that though the mysteries seem to have been instituted for the purpose of enlightening the initiated as to the hidden meaning of religious doctrines and usages of which the great mass of the people were kept in ignorance, there are no means of [illegible] even to a conjecture as to the real nature [illegible] taught in the mysteries, or the advantages of initiation. Were this the place for such discussions, we think it might be satisfactorily proved that mysteries must form an indispensable part in the religious ceremonies of every people who have attained to a certain degree of civilization. The [illegible] of antiquity were composed too senseless, to be believed by any one into whose mind the light of philosophy had dawned, and accordingly we find that many of the most distinguished persons embraced and inculcated in private (*see* MONO[illegible]) opinions respecting the [illegible] were well known to the priests, many of whom were too enlightened to credit the delusions of which they were the ministers, and who might well tremble for the further spread of doctrines which must inevitably prove fatal to their influence. It became, therefore, a matter of state policy to divert into another channel those feelings of religious infidelity which, if communicated to the vulgar, might have ended in popular disturbances, and hence, in all probability, mysteries were instituted, which, while they ministered to the pride and vanity of human reason by elevating the initiated above the prejudices of ordinary persons, and gave as it were the sanction of the state to the entertainment of heterodoxical opinions, no less gratified the vulgar by the splendid shows and ceremonies of which they were the vehicle, at the same time that they held out the prospect of initiation to all who might be deemed worthy of the honour. (In addition to the works already quoted, see *Sir G. Wilkinson's Ancient Egyptians*, vol. ii. pp. 322—332, 2d Series, and the authorities there referred to.)

MYSTERIES. In Modern Literature, a species of dramatic composition, with characters and events drawn from sacred history. Saint Gregory Nazianzen composed the earliest sacred drama extant on the model of the Greek tragedies, but with Christian hymns substituted for the ancient chorus. The mysteries of the middle ages are thought by some to have been first introduced by pilgrims returning from the Holy Land. They originated among, and were probably first performed by, ecclesiastics. However serious and solemn the events which were represented in these singular compositions, there were invariably, in the later mysteries, two characters introduced to make sport for the multitude, namely, the Devil and the Vice — a personage accoutred in a long jerkin, a cap with ass's ears, and a dagger of lath. He is now best remembered by the allusions to his character and office in the plays of Shakspeare. Miracles, or miracle plays, were a species of mystery; they are usually said to have represented the martyrdoms of saints. In the 16th century, the mysteries were succeeded by moralities, which were much in vogue about the time when the Reformation made its chief progress in England. The characters in moralities were allegorical personages. Several of these performances, some by no means destitute of poetical merit, remain to us. They may be considered as the last step in the progress made by the dramatic art in modern Europe before it reached the station and character which it has ever since retained.

MYSTICISM. In Religion, a word of very vague signification, applied for the most part indiscriminately to all those views or tendencies in religion which aspire towards a more direct communication between man and God, not through the medium of the senses, but through the inward perception of the mind, than that which is af[illegible]. Thus, the Pantheism of the modern religionists, which [illegible] supposed a God existing in all space and matter, and revealed to us in the outward manifestations of things, the Quietism of Madame Guyon, Fenelon, &c., who sought for direct revelation from the Divinity to the believer in a species of ecstasy, the Pietism of Molinos, &c., the doctrines of the Illuminati in Germany, the visions of Swedenborg, and some of the notions prevalent among the Methodists and other [illegible] all approximate to mysticism [illegible]. (On the mystics of the East, the first volume of *Mosheim*, as to those of the West, the third (transl. ed. 1790, p. 352.)

MYTHOLOGY. (Gr. μυθος, *fable*, and λογος, *discourse*.) By the mythology of a people, we understand the collective body of its traditions respecting its gods and other fabulous preternatural beings. The classical mythology, i. e. that of ancient Greece and Rome, being the best known, is most frequently intended when the word is used without any distinctive addition; but the mythologies of the ancient Egyptians, of the Hindoos, and of the northern nations of Europe have also been sedulously examined by modern scholars, and reduced into systems pretty generally known. The learned although singular work of Bryant, *Analysis of Ancient Mythology*,

* It has been said that the [illegible] Mysteries in the manner and [illegible] [illegible] [illegible]

is a rich repertory of traditions and doctrines, though arranged with a view to the author's own far-fetched theory *Keightley's Mythology of Ancient Greece and Italy* is perhaps the most useful manual of those subjects The work of Creuzer, *Symbolik der Alten Volker, besonders der Griechen*, may be considered among the most erudite and valuable of all books on classical antiquities An ot[illegible] of antiquity will [illegible] to which we beg to refer, and the chief mythological personages are noticed under their particular heads

MYTILACEANS, *Mytilacea* (Gr *μυτιλος, a mussel*) The name of the family of Lamellibranchiate Mollusks, having the genus *Mytilus* or common mussel, for its type and characterized by the mantle being open anteriorly and by having a foot either sufficiently developed for the office of progressive motion, or serving to draw out, direct and fix the byssus

MYTILUS (Gr *μυτιλος, a mussel*) A name applied by Linnæus to all those testaceous Vermes having a bivalve shell rough [illegible] fixed by a byssus, with a hinge mostly without teeth [illegible] with a subulate, excavated long and [illegible] The species comprehended under the above phrase are placed by Cuvier in the Testaceous order of Acephalous Mollusks, and have been subdivided into the genus *Mytilus* proper, of which the common edible mussel (*Mytilus edulis*) is an example, *Modiolus*, Lam, *Lithodomus* Cuv, *Anodonta* Brug, *Avicula* Brug, *Meleagrina*, Lam which produces the most precious pearls Extensive establishments are maintained at Ceylon and other places for the express purpose of collecting the *Meleagrina margaritifera*, or pearl oyster

MYXINE (Gr *μυξα, mucus*) The name of a genus of Cyclostomous fishes remarkable for their mucous slippery integument the species called glutinous hag (*Myxine glutinosa*) is a native of the British seas Its habits are parasitic and it is most commonly met with in the interior of a cod upon whose flesh it has been preying

N.

N One of the liquid series of letters It is common to all known languages, and is interchangeable more particularly in the Latin and Greek languages and those derived from them, with a variety of letters As an abbreviation N is used for *north numero* &c, N B for *nota bene*, N L for *non liquet* (i e the cause is not clear enough to pass sentence on), N P for *notarius publicus*, &c

NA'BLUM One of the most famous musical instruments among the Hebrews, but one whose form and nature are so little known that Calmet thinks it was a harp, Kircher a psaltery or stringed instrument of percussion played on by sticks and Harmer (*Observations on Scripture*) hints at its being a bagpipe Bythner (*Lyra*) says the *nebel* (נבל) was like a leathern bottle, explaining his meaning to be that it bore a resemblance to the ancient Greek and Roman lyre, whose body was made of the shell of the tortoise. The authority of Josephus (*Ant Jud* lib vii c 12), if to be relied upon, distinctly shows it was not an instrument of percussion but played upon with the fingers, his words are, "Ὁς ναβλα δωδεκα φθογγους εχουσα, τοις δακτυλοις κρουεται Its having twelve sounds without telling how those sounds were produced, whether by strings or wind leaves the matter so doubtful that the reader must decide for himself

NABOB (A corruption of nawáb, from naib, *a deputy*) The title of the governor of a province or commander of an army in India under the domination of the Moguls The nabob was properly speaking a subordinate provincial governor under the subah or [illegible] governor of a subah, or larger province In the decay of the Mogul empire many of the nabobs became virtually [illegible] dominions were reduced by the [illegible] The term nabob is vulgarly applied to those Europeans who have amassed a large fortune in the East [illegible] in eastern splendour

NACARAT (Span nacar, *mother of pearl*) A term [illegible], a pale red colour with an orange cast The *nacarat* of Portugal is a crape or fine linen fabric, dyed fugitively of this tint, which is used by ladies to give their countenances a roseate hue The brightest reddest *nacarat* of this kind are manufactured by the Turks of Constantinople (*Ure's Dictionary*) *See* ROUGE

NACREOUS [illegible] In Zoology, when the surface of a shell or [illegible] reflects iridescent light

NACRITE (Fr nacré) A mineral of a pearly lustre, found crystallized in granite It is a silicate of alumina and potassa

NADIR (Arab nazeer *opposite*) In Astronomy and Geography, the point of the heavens diametrically opposite to the zenith The zenith and nadir are the two poles of the horizon

NÆNIA In [illegible] sung to the music of fl[illegible] Roman goddess who presided over lamentations

NAEVUS A natural spot or mark upon the skin of children at birth

NAIADS (Gr *ναω, I inhabit*, or *νασω, I flow*) In the ancient Roman and Greek Mythology female deities who presided over fountains, rivers brooks &c The number of these goddesses was indefinit In his *Georgics* (book iv) Virgil enumerates 16, and Ovid, in his *Elegies* (book ii 64) speaks of at least 100 in the river Anio The most beautiful of the Naiads is said to have been Aigle (*Eng*, Fc 6) Many of the Homeric heroes are represented to have been the offspring of these deities

NAILS (Germ nagel) This term is given to the terminal horny appendages of the fingers and toes when they are in the form of flattened or depressed plates, serving to support a broad tactile surface, as in the human fingers When these appendages are compressed, curved pointed, and extended beyond the digit, they are called 'talons" or 'claws,' when they encase the extremity of a digit like a box they are called "hoofs"

NAIS (Gr *ναις, a naiad*) The name of a genus of minute Abranchiate Anellides, or red blooded worms, remarkable for their powers of reproducing parts of the body when mutilated, and for procreating their kind by spontaneous separation of the hinder segments of the trunk

NAIVETÉ (Fr) is applied to a certain indescribable grace in the female [illegible] of great natural shrewd[illegible], to a certain extent a disregard of the conventional forms and usages of society

NAKED FLOORING In Architecture, the timber work of a floor, which supports the boarding or ceiling, or both

NAME (Lat nomen, Germ nome, Fr nom) The designation by which any individual is known The custom adopted in personal nomenclature has been based on some uniform principle since the earliest ages, modified however by the varying circumstances of different countries and according to the more or less advanced state of civilization of every people Thus in the early state of society of the Jews Egyptians, Persians Greeks, Romans Germans Gauls Britons, and indeed of every nation no individual had more than one name, but in a more advanced or refined period one or more additional names were given in order to mark the different families to which individuals belonged as well as to distinguish members of the same family from each other To effect these objects the ancient Romans at least those of good family generally used three names,—the *prænomen*, the *nomen* and the *cognomen*, the first, which was given on the assumption of the *toga virilis* marked the individual, like our Christian name, the second distinguished the *gens* (which see) and the third the *familia* (which see), to which he belonged To these however was sometimes added a fourth name called the *agnomen*, which was derived from some distinguishing peculiarities in each individual's character or condition, thus Publius Cornelius Scipio was named *Africanus* from his exploits in Africa The mode of designation adopted in all the countries of modern Europe is founded on a principle [illegible] pellation intervenes between the *prænomen* (or Christian name) and the *cognomen* (or surname) It would be difficult to give any satisfactory reasons for the adoption of the Christian and surnames most commonly met with among ourselves Those who are inclined to prosecute inquiry into this comparatively untouched subject will find some ingenious hints for their guidance in the *Penny Cyclopædia* (art "Names, Proper"), to which we beg to refer *See* SURNAME

NA'NDU The name of the American ostrich (*Rhea Americana*) *See* RHEA

NANKEEN A yellowish or buff-coloured cotton cloth largely manufactured at Nankin, in China Its colour is that of the cotton wool of which it is manufactured They are sometimes bleached, and then are called *white nankeens* Imitation nankeens are manufactured at Manchester, but it is admitted these are of an inferior quality to the Chinese, neither lasting so long, nor [illegible] the colour so well

NANTES EDICT OF *See* EDICT

NA'OS, or NAVE (Gr *ναος, a temple*, or *ναῦς, a vessel*) In Architecture, that part of a temple enclosed by the walls The part in front of it was called *pronaos*, and that in the rear *posticum* In modern architecture, it is the middle part or alley of a church, between the aisles or wings

NAPHTHA A limpid bitumen, which exudes from the earth upon the shores of the Caspian and some other Eastern countries Near the village of Amiano, in the state of Parma, there exists a spring which yields this

substance in sufficient quantity to illuminate the city of Genoa, for which purpose it is employed It has a peculiar odour, and generally a yellow colour, but may be rendered colourless by distillation Its specific gravity is about 0 75 It boils at about 160° It is highly [illegible] white smoky flame It appears to consist of 10 carbon with 5 of hydrogen, and is therefore a pure hydro-carbon A liquid very similar to mineral naphtha is obtained by the distillation of coal tar It has sometimes been used in lamps, but is apt to smoke This variety of naphtha is in great request for [illegible] chouc

[illegible] A compound obtained by distilling naphthalate of ammonia

NAPHTHALIC ACID A crystalline product, resembling in appearance benzoic acid, obtained by Laurent from naphthaline

NAPHTHALINE A substance formed during the destructive distillation of pit-coal for the production of gas It is obtained by re distilling the coal tar It is a [illegible] than water, and of a [illegible] remely volatile, fusing at 180°, and its vapour condenses in large white flaky crystals It burns with much smoke, and dissolves in alcohol and ether It consists of 60 carbon, 4 hydrogen, and is therefore a hydro-carbon It combines with sulphuric acid to form the *sulpho-naphthalic acid*

NAPIER'S RODS, or BONES An instrument contrived by the celebrated Lord Napier, the inventor of the logarithms, for the purpose of performing mechanically the arithmetical operations of multiplication and division Napier's rods consist of small squared pieces of bone or ivory, box or silver about 3 inches long and 3 10ths of an inch in breadth the faces of which are divided into nine little squares or cells, each of which is parted by a diagonal into two triangles On these cells are engraved the successive columns of the common multiplication table, in such a manner that the units or right hand figures are [illegible] ns or left-hand [illegible] —

1	1	2	3	4	5	6	7	8	9	0
2	2	4	6	8	10	12	14	16	18	0
3	3	6	9	12	15	18	21	24	27	0
4	4	8	12	16	20	24	28	32	36	0
5	5	10	15	20	25	30	35	40	45	0
6	6	12	18	24	30	36	42	48	54	0
7	7	14	21	28	35	42	49	56	63	0
8	8	16	24	32	40	48	56	64	72	0
9	9	18	27	36	45	54	63	72	81	0

As an example of the manner in which the rods are used let it be required to multiply the numbers 6795 by 4876 Select the rods which have the figures of the multiplicand inscribed at the top and place them in their order, with the index rod before them when they will stand as in the table annexed Then opposite to the several figures of the multiplier 4876 on the index but proceeding backwards, take the numbers in each horizontal column, add the pair of digits in each rhombus formed by the adjacent triangles of two contiguous cells, and, finally, collect into one sum the rows of the products corresponding to each digit of the multiplier, transcribed and properly disposed, as under —

1	6	7	9	5
2	12	14	18	10
3	18	21	27	15
4	24	28	36	20
5	30	35	45	25
6	36	42	54	30
7	42	49	63	35
8	48	56	72	40
9	54	63	81	45

40770	6
47565	7
54360	8
27180	4
33132420	

[illegible] the last digit of the multiplier, and [illegible] right along the horizontal column, there occur the figures — first, 0, then 3 and 4, or 7; 5 and 2, or 7, 4 and 6, or 10, and lastly, writing down the cipher [illegible] 4 These [illegible] together [illegible] 5 [illegible] In same manner the other rows are [illegible] added in the usual manner, the product of [illegible] numbers is obtained It is obvious that this method of calculation is much too tedious to be of any real use

NAPLES YELLOW A celebrated yellow pigment, formerly made by a secret process at Naples, and used not only in oil painting, but as an enamel colour, it is said to be a mixture of the oxides of antimony, lead, and zinc

NAPOLEON, CODE OF It was in 1802, during the temporary calm of the Peace of Amiens, that Napoleon, then First Consul, undertook the great task of forming a civil code It was entrusted to a commission [illegible] of state, of which Tronchet, Rœderer, Portalis, Thibaudeau, Cambacérès, Lebrun, were the leading members "Tronchet" (said Napoleon himself to Las Casas) "was the soul of the code" (*Memoirs*, part 3 234) And Portalis has also the credit of a very important share in its composition but Napoleon himself took great interest in the subject, and mingled eagerly in the discussions of [illegible] by the procès-verbal of those [illegible] allowances made for the unparalleled flatteries of the Napoleonists, his observations are said to show great intuitive sagacity much readiness, and a peculiarly inquiring disposition, which often led him to the principles of things while men of less natural power and trained in a different school were busying themselves unprofitably with the matters on the surface "I had at first fancied," he says, "it would be possible to reduce all laws to simple geometrical demonstrations, so that every man who could read and connect his ideas together would be able to decide for himself, but I became convinced almost immediately after that this idea was absurd" (*Las Casas, Mem* part 6 263) Still, according to himself, he continued to cherish the scarcely less absurd idea that no other laws might be necessary than those inserted in the code The second volume of the work of Thibaudeau (*Sur le Consulat et l'Empire*) is perhaps the most useful to consult for the history of these discussions According to him the secretary Locre did not in any degree improve the speeches of the First Consul in his report Although the ideas of Napoleon himself are said to have entered largely into the composition of the code, it does not appear clearly in what important particulars this was the case, except in one singular instance, that of the law of divorce (book 1 title 6), the liberty of which he is said to have greatly promoted The Code Civil is composed of a great number of laws, dated from the "14 Ventose, an 11 (March 1803) to 24 Ventose an 12 (March, 1804), in which latter month they were united in a single code, and which was republished under the empire in 1807 The "Code de Procedure Civile" was put in force on the 1st January, 1807, the Code of Commerce dates from the same year, the "Code d'Instruction Criminelle" from November 1808, the "Code Penal" from February, 1810, which last is a revision of the "Code Penal" and "Code des Delits et des Peines" of the Revolution But the Code Civil is that to which the term "Code Napoleon" is in common language particularly applied It consists of three books, the first 'of persons,' subdivided under eleven titles, the second 'of goods (biens), and the different modifications of property,' comprising four titles the third 'of the different manners in which property is acquired,' with twenty titles These last are again subdivided into chapters and sections, and the whole code consists of articles numbered in arithmetical order through the whole, in all 2281 The most important provisions of the code as to the civil state of persons are those relating to marriage and divorce With regard to property its fundamental law is that of equal succession by heirs the abolition of most distinctions between landed and moveable property, and the restraint imposed by it on the testamentary power making in all a system 'fundamentally at variance with that of all the other states of Europe and of which the ultimate consequences are destined to be more important than any of [illegible] which [illegible] about by the Revolution" (*Alison's History of the French Revolution*, vol vi) But in this respect the Code Napoleon merely consolidated the revolutionary laws already existing *See* CODE

NAPOLITE A blue mineral from Vesuvius

NARCEIA (Gr ναρκη, *torpor*) A vegeto-alkaline base, contained in opium, and discovered by Pelletier in 1832 Its salts have the peculiarity of being blue in a certain degree of concentration, and on adding successive quantities of water to them the colour changes to violet and red and lastly disappears By this character, and by its easy fusibility [illegible] it is distinguished from the other principles with which it is associated Its medical virtues have not been ascertained, nor has its equivalent number been determined

NARCI'SSUS In Mythology, the beautiful son of Cephesus and the nymph Liriope, whose history formed one of the most favourite topics with the poets of classical antiquity Though beloved by all the Grecian nymphs he treated them with contemptuous indifference; but having accidentally seen his own image reflected in a fountain, he became so enamoured of it that he languished till he died, and thus realized the prophecy of Tiresias, that he should live until he saw himself After his death the gods, moved with compassion for his fate, changed him into the flower which bears his name

NARCISSUS In Botany a genus of Endogens belonging to the natural order of *Amaryllidaceæ*, "among which it is known by its flowers growing upon a scape, and having a cup at their mouth," the stamens opposite the sepals being longer than the others The species are very numerous, and from their delicate shape soft and various colour, and sweet scent, have long been favourite objects of cultivation, especially the daffodils, jonquils, and tazzettas Some of the more hardy species grow wild in our woods and under our hedges, but the finer sorts are natives of more southern latitudes

NARCO'TICS (Gr ναρκη, *torpor*) Medicines which produce drowsiness, sleep, and stupor They appear, in the first instance, to act as stimulants, quickening the pulse and rousing the energies of the nervous system and, in every instance, this is their most obvious operation In larger doses these effects are followed by a tranquil state of mind, torpor, and even coma Considerable skill and experience are required in the successful administration of these medicines both as regards the cases in which they are to be prescribed the doses in which they are to be given and the peculiarities of habit which often interfere with and modify their usual effects They are to be distinguished from sedatives, which do not produce preliminary excitement Opium is a narcotic, henbane a sedative

NARCO'TINE (Gr ναρκη) A crystallized substance, obtained by digesting the aqueous extract of opium in ether, and evaporating the ethereal solution It was discovered in 1803 by Derosne and supposed to be the narcotic principle of opium but this has since been shown to reside more exclusively in *morphia* and narcotine is possessed rather of stimulant qualities and is the cause perhaps of the excitement which opium occasions It consists of 65 carbon, 5 50 hydrogen, 2 50 nitrogen and 27 oxygen

NARRA'TION (Lat narro *I tell*) In Rhetoric the term usually applied to the second division of an oratorical discourse in which the facts of the case are set forth from which the orator intends to draw his conclusions This part of a discourse should be characterized by the greatest simplicity of style, as well as by absence of all rhetorical ornaments

NARWHAL The common name of the species of Cetacean which has a single long protruded tusk See MONODON

NA'SAL (Lat nasus *nose*) A nasal pronunciation is given in some languages to particular letters as in French to the letters *n* and *m* in certain positions The only sound approaching to nasal in English is that of the double consonant *ng*, as *sing, ring*, &c

NASALIS See SYNOTUS

NASCENT STATE Chemists generally apply this term to gaseous bodies at the moment of their evolution as it were, from liquids or solids and before they have assumed the aeriform state There are numerous cases in which bodies having no tendency to combine under ordinary circumstances readily unite when presented to each other in their nascent states Hydrogen and nitrogen gases, for instance when mixed together show no disposition to combine, but when certain organic bodies containing those elements are heated, they are evolved in their nascent states and combine so as to form ammonia, it is in this way that ammonia is abundantly produced during the destructive distillation of many kind of animal matter, and of pit coal

NASSIUM (Lat), among the ancient Romans signified *freight*, whence it was used for a piece of money put into the mouths of deceased persons to enable them to pay Charon for ferrying them over the Styx A similar custom prevailed among the Greeks

NA'SUA (Lat nasus, *a nose*) A genus of Plantigrade Mammalia, so called from the remarkable elongation and upward curve of the nose The species of this genus, *N rufa*, or red coati, and *N fusca*, or brown coati, are both natives of South America They climb trees in pursuit of birds, and to rob their nests, they burrow for shelter at the foot of large trees and often undermine them to such an extent that they are liable to be overturned even by a slight wind

NASUTA (Lat nasus) A term in Zoology, signifying the prolongation of the muzzle into the form of a nose, as in the *Perameles nasuta*, *Pleuronectes nasutus*, *Trygala nasutus*, or the development of the integument of the face above the muzzle forming a true nose, as in the proboscis monkey *Simia nasuta* Ti-

liger called a family of Multungulate quadrupeds with the nose prolonged beyond the jaws, and moveable, as in the tapir, *Nasuta*

NATA'LITIES, *Birthday* A day celebrated with much ceremony by the ancients. Of these there were four, which all Roman citizens were bound to observe, viz those of the gods, of their emperors, of distinguished persons, and their own On such occasions every Roman was arrayed in white, and in all his ornaments; among which a ring, called by way of eminence the *annulus natalis* was conspicuous Sacrifices were offered to the *genius* which presided over the person and the day concluded with a sumptuous entertainment, to which friends and kindred were invited

NATATORES (Lat nato, *I swim*) Swimming birds The name of the order of birds including those in which the toes are united by a membrane whence the order is also termed *Palmipedes* The legs are placed behind the equilibrium and the body is covered with a a thick coat of down beneath the feathers

NATATORY (Lat nato) In Zoology, when a locomotive extremity, or other part, is provided with a membrane or with close-set hairs, by which it is adapted for impelling water

NATION (Lat) A collective appellation for a people inhabiting a certain extent of territory under the same government The word is also used in some universities, by way of distinguishing students of different districts or countries, as the case may be This latter meaning is borrowed from the custom that was adopted in the University of Paris previously to the institution of faculties, when those who resorted to it from different countries lived under the same institutions and masters a [illegible] being the only bond of union

NATIONAL DEBT In Political Economy and Finance the amount of the sums or obligations owing by a nation or state

In modern times it has been customary in most countries on the occurrence of any circumstances that occasion any considerable increase of expense to borrow either the whole or some portion thereof paying a certain stipulated interest for the same In this country the practice of borrowing money in order to defray part of the war expenditure was introduced in the reign of William III And how much soever opinions may differ as to the policy of [illegible] in ordinary times it could not at its first [illegible] in Britain, be dispensed with The Revolution involved us in a bloody and expensive contest with Louis XIV, then in the zenith of his power who espoused the cause of the exiled family of Stuart But though great and imminent the danger from without was inferior to that from within A numerous and powerful party were favourable to the views of the Pretender, and the imposition of such additional taxes as would have been required to defray the heavy cost of the contest we were forced to wage for our liberties and religion would have given a violent shock to industry and afforded the Jacobites the means of traducing the new government fomenting popular discontent and most probably of overturning the revolutionary establishment Under such circumstances, the contraction of debt was not really a matter of choice, but of necessity The error if there have been any consisted in continuing the system of loans after the new government was firmly established and when either the whole or a larger portion of the war expenditure might have been defrayed by taxes raised within the year

In the infancy of the funding system it was customary to borrow upon the security of some tax or portion of a tax set apart as a fund for discharging the principal and interest of the sum borrowed This discharge was however very rarely effected The public exigencies still continuing the loans were in most cases either continued or the taxes were again mortgaged for fresh ones At length the practice of borrowing for a fixed period, or as it is commonly called upon *terminable* annuities, was almost entirely abandoned, and most loans were made upon *interminable* annuities, that is, government undertake to pay the lenders of any given sum a certain annuity in all time to come or till they find it convenient to pay off the principal, but the lenders have no right or title to demand payment of the latter, that being a matter entirely at the option of government, who may either pay it or not, as they think fit

In the beginning of the funding system, the term fund meant the taxes or funds appropriated to the discharge of the principal and interest of loans, those who held government securities, and sold them to others, selling of course, a corresponding claim upon some special fund But after the debt began to grow large, and the practice of borrowing upon interminable annuities had been introduced, the meaning attached to the term fund was gradually changed, and instead of signifying the security upon which loans were advanced, it has for a long time signified the principal of the loans themselves

During the reigns of William III and Anne the interest stipulated for loans was very various But in

the reign of George II a different practice was adopted Instead of varying the interest according to the state of the money market, the interest was generally fixed at 3 or 3½ per cent, the necessary variation being made in the principal funded Thus, suppose government were anxious to borrow, that they preferred borrowing in a 3 per cent stock, and that they could not negotiate a loan for less than 4½ per cent, they effected their object by giving the lender, in return for every 100*l* advanced, 150*l* of 3*l* per cent stock; that is, they bound the country to pay him or his assignees 4*l* 10*s* a year in all time to come, or otherwise to extinguish the debt by a payment of 150*l* In consequence of the prevalence of this practice, the principal of the debt now existing amounts to nearly 2-5ths more than [illegible] by the lenders

[illegible] been in the last degree injurious, though some advantages are either derivable or supposed to be derivable from it No doubt it renders the [illegible] of debt, and its transfer, more simple and [illegible] than it would be, did it consist of a number of funds bearing different rates of interest, and it is contended that the greater field for speculation afforded to the dealers in stocks bearing a low rate of interest has enabled government to borrow, by funding additional capitals, for a considerably less payment, on account of interest than would have been necessary had such increase of capital not been made

In point of fact, however, these advantages are inconsiderable, while the disadvantages inseparable from the practice of funding a large amount of stock at a low rate of interest are great and signal During war especially if any considerable portion of its expenditure be defrayed by means of loans the rate of interest uniformly rises, and is usually much higher than during peace If therefore, loans were funded in stocks bearing a rate of interest equivalent to the market rate when they were contracted for, the charge on their account might be reduced soon after the return of peace according to the fall in the rate of interest, whereas when loans are funded in stocks bearing a low rate of interest, with a corresponding increase of capital, it becomes impossible to take advantage of the fall of interest at the return of peace and the country is burthened with the war interest in all time to come! It is not easy to exaggerate the injury we have sustained by overlooking this plain principle In 1815 to specify only one of many similar instances government bargained for a loan of £7 000 000*l* it being stipulated that every subscriber of 100*l* should be entitled to 174*l* 3 per cent stock and 10*l* 4 per cent stock, making the interest paid on the loan 5*l* 12*s* 4*d* per cent The great improvidence of this transaction is obvious Had from 5*l* 15*s* to 6*l* per cent of interest been paid for the loan it might have been obtained without funding any additional capital, and had that been done, we should have been able within two or three years in consequence of the fall of interest after the peace, to reduce the charge on account of the loan to 3 or 3½ per cent, but, owing to the way in which the contract was made, we have not had and will not have any means of reducing the exorbitant charge on account of this loan, so long as the market rate of interest is above 3 per cent except by paying 174*l* for every 100*l* originally received exclusive of the 10*l* of 4 per cent stock! But this, as already stated is only one instance out of many of the same sort We believe indeed that we are within the mark, when we affirm that, owing to this erroneous method of funding, the country is at present paying from 6,000 000*l* to 7 000 000*l* a year on account of the public debt more than it would have had to pay had the same sums been borrowed and funded without any increase of capital

We have said that an interest of from 5*l* 15*s* to 6*l* per cent, instead of the stipulated interest of 5*l* 12*s* 4*d* per cent, would have enabled the loan of 1815 to be funded without any increase of capital Now, this is not a hypothetical statement In the year in question 11 000 000*l* of exchequer bills were funded in 3 per cent stock, at the rate of 117*l* stock for every 100*l* exchequer bills This was equivalent to an interest of 5*l* 17*s* per cent, being only 4*s* 8*d* more than the interest paid on the loan, though the subscribers to the latter had 84*l* of artificial capital created for every 100*l* advanced and the holders of the bills only 17*l* of artificial capital But in point of fact, the differences in the rates of interest, after allowing for certain circumstances connected with the loans, amounted to only 4*s* 8*d* per cent This shows how little the saving in the charge on account of interest, by funding increased capitals, deserves to be considered as at all detracting from the [illegible] of such a wasteful practice For a full discussion of this subject, see the *Edinburgh Review* No 93 art iii)

That this improvident system should have been so extensively acted upon by our finance ministers during the American and French war is the more surprising, seeing that [illegible] of funding [illegible] capitals at a comparatively high rate of interest Owing partly to the scarcity of capital, but much more to the supposed instability of the revolutionary establishment, the loans during the reigns of William III and Anne were mostly contracted at a very high rate of interest The stock created was the exact amount of the loans, the interest on it being increased according to the supposed insecurity of the government the scarcity of floating capital, &c Now, mark the consequences of this so early as 1716, Sir Robert Walpole, availing himself of the greater facility with which money was procured after the treaty of Utrecht, and of the greater stability of the government, was able, by offering to pay off the creditors, to reduce the charge on account of the debt from 1,598,602*l* to 1,474,146*l*, being a saving of 324,456*l*, or about one fifth part of the entire charge. And in 1749, during the administration of Mr Pelham, the interest was again reduced from 4 to 3 per cent, a measure which produced a fresh saving of 565,000*l* a year

Happily the practice of funding in a 5 per cent stock was not entirely abandoned during the late war In 1822, the total British and Irish 5 per cent stock amounted to about 150,000 000*l*, and, by offering to pay it off, a reduction of interest was then effected to the extent of about 1,200,000*l* a year And since that period, further savings have been effected by the reduction of the interest [illegible] Consequently, the far [illegible] the late war, and that with the American colonies, was funded in the 3 per cents, and, as already stated, the charge on that portion has, in consequence, been hitherto, and will most probably continue to be, unsusceptible of diminution

Payment of National Debt Sinking Fund — The payment of the national debt can be effected only by applying to that purpose such surplus revenues as the treasury may have to dispose of But it was contended by the founders of the sinking fund established in 1716, and still more strongly by Dr Price and Mr Pitt, the founders of the sinking fund of 1786, that if a sinking fund were formed, by applying a certain amount of revenue to buy up stock, and if the dividends on the stock so bought up were afterwards uniformly applied to the same object, such sinking fund would increase at *compound interest*, so that the largest amount of debt might be defrayed almost without an effort Dr Price illustrated the operation of this principle by calculating the number of *globes of gold* to which a penny, laid out at compound interest at the birth of Jesus Christ, would now amount to! But though a calculation of this sort be theoretically true, it is practically false and absurd The truth is, that no sinking fund, even though it consisted of a clear surplus revenue ever really operates at compound interest It is true that by constantly applying the same original amount of free revenue and the dividends accruing on the stock purchased by it to buy up fresh stock, the reduction of the debt is effected in the *same way* as if the free surplus revenue had been increasing, by an inherent energy of its own, at compound interest, but it is essential to know that though the *modus operandi* be the same, the means are radically and totally different The debt is reduced because a portion of the produce of the taxes is systematically applied to pay it off and it can never be reduced by any other means To make capital increase at compound interest, it must be employed in some sort of productive industry, and the profits, instead of being consumed as income, must be regularly added to the principal, to form a new capital It is unnecessary to say that no such sinking fund has ever existed Those that have been set on foot in this and other countries have all been supported either by loans or by the produce of taxes, and have never paid off a single farthing of debt by their own agency

It is clear, from this statement, that when there is no surplus revenue there can be no sinking fund Dr Price, however, did not scruple to lay it down broadly, that to suspend the sinking fund during war, though the expenditure might then greatly exceed the income, would be [illegible] folly (*Imp all'n the Public on the Subject of the National Debt*, [illegible]ed 1771) And inconceivable as it may now appear all parties in parliament concurred in the soundness of this opinion, and approved the policy of keeping up the sinking fund machinery during the whole of last war Hence the loans for the service of the year had to be increased by the entire amount of the sums placed at the disposal of the sinking fund commissioners, so that for every shilling's worth of stock transferred to them by this futile proceeding, an equal amount of *new debt* had to be contracted, exclusive of the loss incurred through the expense of management, &c

For [illegible] delusive juggle was kept up, [illegible] in believing, notwithstanding [illegible] experience to the contrary, that it was [illegible] the public debt. Dr. Hamilton [illegible] the merit of having dissipated this delusion, the grossest, certainly, that ever im-

posed on any people He showed, in his work on the National Debt, published in 1813, that the sinking fund, instead of diminishing, had really added to the debt, and he proved to demonstration that the *excess of revenue above expenditure* is the only sinking fund by which any part of the national debt can be discharged "The increase of revenue," he observes, "or the diminution of expense, are the only means by which the sinking fund can be enlarged, and its operations rendered more effectual, and all the schemes for discharging the national debt, by sinking funds operating at compound interest, or in any other manner, unless in so far as they are founded upon this principle, are completely illusory"

The entire amount of the debt contracted from 1792 to 1816, both inclusive, amounted to 584,874,557*l*, but of this no less than 188,522,350*l* was made over to the commissioners of the sinking fund to be laid out in the paying off debt But it must not be supposed that the influence [illegible] that it was [illegible] money be borrowed with the one hand that it might be paid off with the other It is clear that a process of this sort could not take an atom from the public debt, but in point of fact, it added considerably to its amount Had the sinking fund not existed, the amount of the loans contracted during the war would have been fully a third less than they really were, and, as the rate of interest is always greater on large than on smaller loans it follows, had this miserable juggle not been kept up, that the money borrowed from 1792 to 1816 would have been obtained at a reduced charge, at the same time that the expenses of its management would have been saved The sinking fund has, therefore, been a costly as well as a delusive piece of quackery The loss it entailed on the country during the war has been estimated, apparently on reasonable grounds, at above 600,000*l*

At length the folly of contracting debt for no other purpose but to pay it off, became obvious to every one, and the nominal amount of the sinking fund began to be diminished after the close of the war In 1819 it was attempted to form a real sinking fund of 5,000,000*l*, that is, to maintain a real surplus revenue of that extent. But as this could not always be done after various modifications an end was put to the [illegible] the act 10 Geo 4 c 27 having [illegible] the sum applicable in future to the reduction of the national debt should be the surplus if any of the total revenue beyond the total expenditure of the kingdom

Distribution of the Dividends, or Interest on the National Debt — It appears from the subjoined account of the number of dividend warrants issued during the half year ending the 5th of January, 1843, that they amounted in all to about 280,000 and the number has not materially varied in the interval The large number (87,176) of holders of stock not producing above 5*l* of half yearly dividend is principally, we believe, ascribable to the circumstance of the Bank of England and the London private banks not allowing interest on deposits

We may observe, by the way, that the number of persons having a direct interest in the funds is much greater than it would appear to be from this account The dividends upon the funded property belonging to the Bank of England and other banks, to the Equitable and other insurance companies, &c, are paid upon single warrants, as if they were due to so many private individuals, whereas they are really paid to these individuals only because they act as factors or trustees for a vast number more It is, consequently quite absurd to pretend, as is sometimes done that any interference with funded property would affect only 280,000 individuals out of a population of 25,000,000 Any attack upon the dividends would really be destructive, not merely of the interests of those to whom dividend warrants are issued, but of all who depend on them it would destroy our whole system of banking and insurance, and overspread the country with bankruptcy and ruin Not only, therefore, is every proposal for an invasion of the property of the fundholders bottomed on injustice and robbery, but it would were it acted upon be little less ruinous to the community than to the peculiar class intended to be plundered

1 STATE of the Public Funded and Unfunded Debt of Great Britain and Ireland, and the Charge thereon, on the 5th January 1850

NATIONS LAW OF *See* Law

NATIVITY A word used by way of eminence to signify the birthday of our Saviour and of saints and other canonized persons In Astrology the word nativity [illegible] *scope* which see

NATRIX [illegible] the Linnæan *Coluber* of which our common harmless snake, *Coluber natrix*, Linn, is the type

NATROLITE A mineral which occurs in small rounded fibrous masses of a yellowish colour, it is by some called *prismatic zeolite* It is chiefly found in Suabia in amygdaloidal basalt It is a hydrated silicate of soda and [illegible]

NATRON The German [illegible] soda hence, also, the German chemists call sodium *natrium* It is probably from the ancient term νίτρον, *nitron*, or fossil alkali, hence *nitre* It is found in sandy soils of various countries, but more especially in Egypt, where it was anciently [illegible] in the art of embalming [illegible]

NATURAL [illegible] marked thus ♮, whose office is to contradict the flats or sharps placed at the beginning of a stave or elsewhere, and by the use of which the note to which it is prefixed returns to the diatonic scale

NATURALIZATION In Law, the process by which an alien is placed in the same civil condition as if he had been born under the dominion of the state In England, this can only take place by act of parliament, and it is provided by stat 1 G 1 c 4 that no bill for naturalization can be received without certain clauses incapacitating the party from sitting in parliament or being a member of the privy council, &c *See* Alien

NATURAL HISTORY, may be defined to be the history and description of the natural products of the earth, [illegible] vegetables or animals together with [illegible] and effects The [illegible] all the branches of this wide and interesting subject treated at considerable length under their respective heads

NATURAL ORDERS OF PLANTS are groups of genera which are supposed to bear a greater resemblance to each other than [illegible] These may be said to be coeval with our knowledge of plants for the old ideas of grasses trees, herbs, corn fruit trees, indicate a natural perception of the existence of some such groups When systematical botany first assumed the semblance of science we find the Umbelliferous, Leguminous, Liliaceous, Labiate, and Composite orders, more or less distinctly defined It is, however, chiefly by the labours of botanists posterior to the days of Linnæus, especially to Jussieu and his followers, that the present improved limitation of natural orders is owing It must, however, be confessed that they are still in great need of regulation, which can scarcely, however, be anticipated until something precise shall have been settled concerning the relative value of differences in organization. The most

complete account of them in English is that in *Lindley's Natural System of Botany*, ed 2, in which 289 natural orders are enumerated

NA'TURAL PHILOSO'PHY, or PHYSICS, is the science which treats of the properties of natural bodies, and their actions on each other See Physics

NATURE, LAW OF See Law

NAU'CA In Botany a seed in which the scar of the hilum occupies one third part of the external surface, as in the horse chesnut

NAUMA'CHIA (Gr *ναυς a ship* and *μαχη a fight*) Among the Romans, a representation of a naval engagement, which took place most usually in theatres (called also naumachiæ) made especially for the purpose These exhibitions were originally instituted for purposes of naval discipline, but, in process of time, only malefactors or captives whose lives had been forfeited participated in them They appear to have been conducted on a scale of such magnificence as almost to exceed belief Within the places set apart for them whole fleets went through their evolutions without inconvenience or confusion, and all the artifices of human ingenuity were put in play to give an air of reality to the representation We are told by Suetonius that in an exhibition of this sort given by Nero sea monsters were seen swimming about in the artificial lake, and in the sea-fight on the lake Fucinus, given by Claudius, there are said to have been no fewer than 19,000 combatants Julius Cæsar appears to have first given a naumachia on an extensive scale his example was followed by many of his successors on the imperial throne, and at last they were frequently exhibited at the expense of private individuals as a means of increasing their popularity The seats for the convenience of spectators were arranged in a manner somewhat similar to those in the amphitheatres See AMPHITHEATRE

NAU'SEA (Gr *ναυς a ship*) A sensation of sickness, similar to that produced by the motion of a ship at sea An inclination to vomit

NAUTILI'DÆ (Gr *ναυτιλος*, the name of the argonaut in Aristotle) The family of Cephalopods with siphoniferous shells, of which the *nautilus* is the type

NAU'TILUS (Gr *ναυτιλος*) The name of a genus of Tetrabranchiate Cephalopods including those which have a chambered shell with simple septa perforated in the centre concave towards the outlet of the shell and with the last chamber the largest, and containing the body of the animal

NA'VAL ARCHITECTURE In the small space we can assign to this subject we shall merely endeavour to convey a general notion of the principles and process of construction

Ships are built in different forms, according to the service they are intended for and the burdens they have to carry It is in men-of-war, which besides possessing in an eminent degree the general qualities of a ship have to support a heavy armament of cannon, and which are destined to severe and long-continued service that the principles of construction have been carried to the greatest perfection The form of the ship her strength, or the scantling necessary for the services required of her, are, from our imperfect knowledge of hydrodynamics, the results of experience alone

When a ship is to be built, her form is projected in three different planes perpendicular to each other

1st The *sheer draught* which is the side view, or projection on the plane of the keel On this are laid off the length, the heights of all the parts from the keel the position and rake of the stem and sternpost the principal frames or timbers of the sides, the ports decks channels place of the greatest breadth or midship frame, stations of the masts, &c

The frames before the midship frame are distinguished by letters, abaft it by numbers

The midship frame is not exactly in the middle of the length but rather before it

2d The *body plan*, or end view This shows the contour of the sides of the ship at certain points of her length, and since the two sides are exactly alike, the left half represents the vertical sections in the after part of the body, and the right hand half those in the fore part The base of the projection is the midship, or largest section, called also the *dead flat*, within which the other sections are delineated. On this are exhibited also the beams of the decks

3d The horizontal or floor plane, called also the *half breadth plan* The base of this is the section made by the horizontal surface of the water and the outside surface of the ship and is called the *upper water line*, or *load water line* If the ship now be supposed to be lightened uniformly, she will exhibit another water line, and thus any number of like parallel sections at equal distances down to the keel

On this projection the water lines appear as curves, on the sheer draught as straight lines parallel to the keel

These three sections correspond [illegible] the same scale, and any point in [illegible] ferable to the other two projections.

The several parts are drawn from these plans at their full size on the floor of the mould loft, and worked from the moulds or models so taken

The place in which the ship is built is called a *slip* In the middle and leading to the water, is a row of piles of stout pieces of wood called the *blocks*, having a declivity towards the water of about 1 inch in 1 foot On these the keel, which is of elm, is laid, and its component lengths scarfed together Under the keel is placed the false keel for defence At the end furthest from the water is raised the *stem*, which is in fact the keel continued upwards Inside the stem and just above the keel, is the *apron*, a curved timber connecting both On each side of the upper part of the stem is fixed an upright timber, these are called the *knight heads*, and the bowsprit lies between them At the other end of the keel is the sternpost at which the planking finishes abaft, and on which the rudder is hung Inside (or before this) are the *inner post* and other pieces for strength Upon the keel is fixed a layer of timber of the same breadth and rising forward and aft, called the *dead wood*, on this are placed the *floor timbers* these consist of one which crosses the keel to which it is bolted, and the two parts of a like timber firmly joining it, and projecting beyond its ends The several pieces are got into their places by shifting shears

The *frames* consist of pairs of timbers composed of pieces of different lengths joining the floor timbers, and carried upwards The length joining the floors is called the first futtock the next the second futtock, and so on, ending in the *top timbers* The pairs are bolted by iron bolts and of late adjacent pairs have been thus connected The frames are supported temporarily by being fixed to the *cross spalls* — long fir planks laid horizontally about the height of the gun deck

Those frames whose planes are perpendicular to the keel are called *square frames*, at the head and stern these planes incline towards the extremities, and are called *cant frames* These divisions of the ship are called accordingly *square* and *cant bodies*

When the framing has assumed its form the *ribands* are fixed these are thick narrow planks at wide intervals extending the length of the vessel marking the direction of the planks, they are firmly shored and removed when the planking comes on The *riband lines* appear on the half breadth plan as diagonal lines

Upon the keel and over the floor timbers to which it is scored is laid the *kelson*, which is, in fact, a second keel over the first

The stern of square sterned ships is formed upon the *wing transom*, the uppermost of the horizontal pieces of timber called *transoms* crossing the sternpost inside

The wing transom is secured to the timbers of the side by a strong horizontal knee

When the framing is complete the outside planking is laid on The *wales* thick planks above the water are first secured to the ribs The *clamps* are thick planks inside to support the ends of the beams of the decks

The *beams* support the decks rest on the clamps, and are secured to the side by *knees*

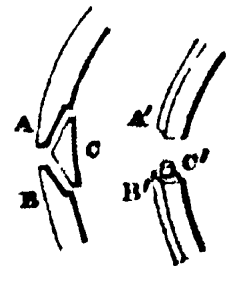
The *breast hooks* are strong curved pieces of timber crossing the stem and joining the bows The *deck hooks* are the same, being at the decks The *crutches* answer a like purpose below in the after part

The *port sills* are the upper and lower edges of the ports

The *spirketting* is the plank of the side between the water way and the port sill

The *chain wales* are thick planks of the outside to receive the chains and preventer bolts for the support of the rigging

The *foot waling*, or *ceiling*, is the plank lining the inside of the ship below

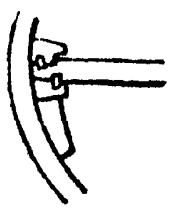


The *limber boards* are short thick pieces of wood resting against the kelson for the convenience of keeping a clear passage to the well

The *knee of the head*, also called the *cutwater*, is the projecting part of the head, it is secured to the bows by knees called *checks*

In order to bend wood into the necessary curvature it is steamed in places for the purpose When the planking is all complete, the ship is caulked and painted

The fastenings of timber are effected by bolts, treenails or oaks The present method of framing ships of war is chiefly due to Sir Robert Seppings We shall describe it here generally for particulars, see the *Phil Trans* 1814, and the published reports on the subject



As the timbers or ribs cannot be procured entire, or of the proper curvature, various methods have been used for joining the [illegible] C, fastened by treenails to the ends A B of the timbers [illegible] upon the joint, in [illegible] falls on the treenails, and when the chock decays, no support is afforded in any sense whatever.

At present the square ends A' B', are brought together, while a *coak* C', or small oak cylinder, is let into each

By this plan the two faces resist any effort by pressure from without to close the timbers, and the coak itself resists the effort (the last) to make one timber slide past the other, the whole force necessary to cut it off flush with the section In the single case of lifting one face exactly perpendicularly off the other, the coak offers no resistance, this effort, which is that produced by the strain of the rigging on the sides, is opposed by other numerous connections The method is very ancient, being used in the construction of the pillars in the temple at Balbec, the advantage of its application to shipbuilding is seen in the frames which undergo no change of form while hoisted into their places The efficiency of the plan however, does not appear in a single length, but in the system of frames each joining of which is placed near the middle of the next piece

A *shelf piece*, coaked and bolted to the timbers or ribs,

and resting on short vertical pieces of timber called *chocks*, and sometimes scored to the ribs, is carried like a hoop entirely round the ship On this the beam ends are coaked, and over these again is laid a strong water way scored to the beams, and coaked Besides these the beam end is clasped by two arms of an iron knee, of which the third, which is vertical, is bolted to the chock

The shelf binds firmly the ends and sides of the ship together, and resists like an arch all external pressure

The spaces between the timbers below are filled up by dry wood driven in tight and caulked, thus rendering the bottom solid and water tight, independently of the planking

One of the most important improvements is the diagonal framework below Instead of the former planking in the hold are placed *braces*, crossing the ribs to which they are coaked, at an angle of 45°, those in the fore body incline (or rake) aft, and those in the after body forward They butt against the kelson, and extend nearly to the water, they are in general placed under every other beam, but closer at the extremities

Longitudinal pieces of timbers are laid nearly parallel to the keel over the heads or joinings of the timbers and bolted through, these, crossing the diagonals form a series of rhomboidal figures across which inside are firmly driven *trusses*, lying the opposite way from the diagonals these are bolted through, and when necessary are further tightened by driving in thin iron plates at the ends The diagonals act by the *tension* of the fibres, the trusses by the *thrust* and the whole thus resists every effort to change the figure of the ship

The system was first put into complete practice in the Tremendous, 74, in 1810, which ship evinced in several severe trials, a firmness and dryness not known before

M C Dupin has shown (*Phil Trans* 1817) that the principle of diagonal framing had suggested itself and been tried by several French engineers, but is often abandoned The merit, therefore of Sir R Seppings, in reducing to practice a system which to others had been attended with insuperable difficulties more than compensates the want of novelty in the idea itself

The ancient square massive but weak sterns, have been replaced by Sir R Seppings by round sterns corresponding in construction and therefore in strength to the bow These have again undergone various alterations, tending to combine the strength of the new with the imposing

It is only no immoveable frame with the former weak and unconnected structure, that we can fully perceive the inefficiency of the ancient construction The timbers, instead of forming an independent system were often supported in part by the planking itself, as is the case in boats The masts resting only upon their steps, instead of strong platforms which diffuse the pressure on all sides, and pressed downwards by their weight and by the enormous strain of the rigging, arising from the wind on the sails, forced the keel down, and made the ship leaky The timbers and framework, being at right angles, without mutual support, the whole stress of the ship came on the fastenings, and, lastly, the safety of the ship depended entirely upon that of the outside plank, the part most exposed to injury

The planks of the decks have also sometimes been placed diagonally, and lately iron diagonal straps have be

It

droop, or the ship *hogs*, a three-decker formerly drooped at once, on being launched, 9 inches at each end, which increased with her length of service, at present, such a ship droops only 3½ inches, which, when the materials are set, suffers little or no increase

Within the last changes have been made by Sir W raising the beam of the ships, and therefore their stability, and otherwise in the forms Several improvements have also been introduced by Sir O Lang

Exposure to moisture being a cause of the decay of timber, building under cover has long been practised This also protects the men from the weather

The wood usually employed in shipbuilding is oak Elm, which does not split readily, is employed for the keel, and for the caps Fast India teak, a very heavy durable wood, which does not shrink, nor is liable to splinter from shot is now very much used African teak is also much used Fir is used for light works, masts, &c

The bottoms of ships are liable to become covered with weeds and shells, and to be eaten through by worms To prevent these evils, the bottoms were formerly covered with a thin sheathing of wood, which was replaced when worn Lead has also been used Ships are now sheathed almost universally with thin sheets of copper

For further information on this subject, reference may be made to the following works —Bouguer, *Traité du Navire*, Clairbois, *Traité Elementaire, &c*, *Chapman's Naval Archit*, with Notes by Dr Inman, *Steel's Elements*, with an Appendix by J Knowles, F R S, *Fincham's Outlines of Shipbuilding*, the article "Shipbuilding" in the new edition of the *Ency Britannica*

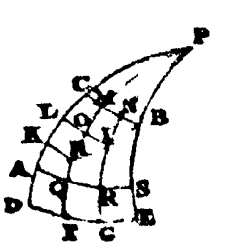
NAVAL CROWN Among the Romans, a crown of gold or silver, resembling the prow of a ship, awarded to him who first boarded a hostile vessel *See* CROWN

NAVL *See* NAOS

NAVE In Mechanics, the middle part of the wheel, from which the spokes radiate

NAVIGATION (Lat navis, *a ship*), is that branch of science by which the mariner is taught to conduct his ship from one part or place to another

To understand the principles of navigation and their practical application it is necessary that the mariner should be acquainted with the form and magnitude of the earth the relative situations of the lines conceived to be drawn on its surface, and have charts of the coasts and maps of the harbours which he may have occasion to visit He must also understand the use of the instruments by which the direction in which a ship is steered and the distance which she sails are ascertained, and be able to deduce from the data supplied by such instruments the situation of his ship at any time, and to find the direction and distance of any place to which it may be required that the ship should be taken



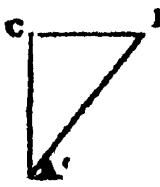
A curve passing through any two places on the earth, and cutting every intervening meridian at the same angle is called a *rhumb line*, the angle which such a curve makes with each meridian is called the *course* between any two places through which the curve passes, and the arc of that curve intercepted between any two places is called their *nautical distance* This distance is more than that measured on the arc of a great circle passing through the two places, unless both places are on the same meridian, or both on the equator, when the rhumb line and great circle coincide

latitude between any two places is an arc intercepted between the parallels of latitude on which the places are situated, and the *difference of longitude* is the arc of the equator, or the angle at the pole included between the meridians of the places. Hence when the latitudes or the longitudes of two places are of the same denomination with respect to *north* or *south east* or *west* the difference is found by subtracting the less from the greater, but when of different denominations what is called their difference is found by taking their sum *See* LATITUDE, LONGITUDE

When a ship has sailed on a rhumb line from one meridian to another the arc of the parallel at which the ship has arrived, intercepted between the two meridians, is called the

and the sum computed, computed on the supposition that the distance sailed on the rhumb line is divided indefinitely small equal parts, is called the *departure*

In the annexed diagram, let P represent the north pole; D I an arc of the equator, P D, P F, P G, and P E meridians, and A B a rhumb line passing through A and B, A S, K H, L I, and B C, arcs of parallels of latitude at the points A, H, I and B respectively, and let A H, H I, I B, &c be so small and so numerous that neither they nor A K, K H, H O, I O, &c may differ sensibly



Then if a ship sail from A to B, B C

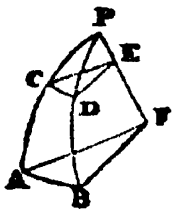
if from B to A, A S is

in either case the sum of K H O I, N B is called the *departure*, and A K + O H + I N, &c, which is always equal to A C or B S, is the *difference* of latitude.

Now, A K H, O H I, N I B, &c, may be considered as identical right angled plane triangles; and if in the an-

nexed plane triangle, right-angled at C′, A′ B′ be taken equal to A B in the preceding figure, A′ C′ to A C, or to its equal A K + H O + I N, and the angle B′ A′ C′ to B A C, or O H I, or N I B, then C′ B′ in this figure would accurately represent K H + O I + N B, &c in the preceding one That is, in the plane triangle A′ B′ C′, right-angled at C′, if A′ represent the course from one place to another, A′ B′ the distance of the two places measured on the rhumb line passing through them, then A′ C′ will be their *difference of latitude*, and C′ B′ the *departure* made in sailing from the one to the other

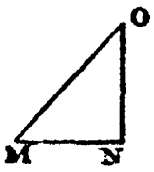
On these principles depend what is called *plane sailing*, and it is evident that if any two of the four elements, *course*, *distance*, *difference of latitude*, and *departure*, be given, the others may be found by the resolution of a right-angled plane triangle The formulæ are,



$$\begin{aligned} \text{dep} &= \text{dist} \times \sin \text{course}, \\ \text{diff lat} &= \text{dist} \times \cos \text{course}, \\ \text{dist} &= \text{dep} \times \text{cosec course}, \\ \text{dist} &= \text{diff lat} \times \sec \text{course}, \end{aligned} \qquad (A)$$

$$\tan \text{course} = \frac{\text{dep}}{\text{diff lat}}$$

When a ship sails on a meridian, the diff lat is the same as the nautical distance and the *latitude* only not the longitude is changed, and when she sails on a parallel of latitude the departure is the same as the nautical distance and the *longitude* only, not the latitude is changed but in sailing in any other direction, both the latitude and longitude are changed



For finding the change of latitude corresponding to any course and distance, the principles of plane sailing already explained, are sufficient, but to find the change of longitude corresponding to any given change of place requires considerations of a different kind

Let a ship sail on a parallel of latitude as from C to D and let P C A, P D B be two meridians passing through C and D, and meeting the equator in A and B, then A B or the angle A P B, is the difference of longitude corresponding to the distance C D sailed on the parallel in the latitude A C or D B And if F be the centre of the sphere, A F B, C E D portions of the planes of the equator and parallel respectively, we have, by similar sectors

C D A B D E B F cos lat rad 1 secant of lat, therefore A B = C D sec lat

Hence again, if in the annexed plane triangle M N O, right angled at N the angle M be made equal to the number of degrees and minutes of the latitude of the parallel on which the ship is sailing and M N be equal to C D M O in this figure will be equal to the arc A B in the preceding one, and will consequently represent the difference of longitude, for

$$\text{M O} = \text{M N} \sec \text{M} = \text{C D} \sec \text{lat}$$

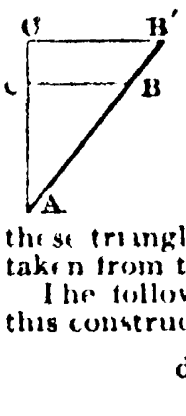
Therefore, in sailing on a parallel, the properties which connect the latitude of the parallel the distance sailed upon it, and the corresponding diff long are all found in a right angled plane triangle, the base representing the distance sailed on the parallel the hypothenuse the diff long, and the included angle the latitude of the parallel

When a ship sails on an oblique rhumb two methods have been proposed
with the diff long
and the other, from the name of its inventor, *Mercator's sailing*

Middle latitude sailing is a compound of plane and parallel sailing Referring to the first figure in this article, it is evident that K H is greater than C M, but less than A Q, that O I is greater than M N but less than Q R, and that K H + O I + N B will not differ greatly from the meridian distance midway between the parallels C B and A S

The departure corresponding to course c, and distance d, being therefore found from dep $= d \sin c$, and this being taken as a meridian distance in the latitude $\frac{1}{2}(l + l')$, the middle latitude between the latitude sailed from and that l arrived at the diff long is found approximately from the principles of parallel sailing, from the formula,

$$\text{diff long} = \text{dep} \sec \tfrac{1}{2}(l + l')$$



From this, and from the first and last of the formulæ (A), we immediately deduce the following for middle latitude sailing, viz —

$$\begin{aligned} \text{diff long} &= \frac{\text{dist} \times \sin \text{course}}{\cos \text{mid lat}} \\ \tan \text{course} &= \frac{\text{diff long} \times \cos \text{mid lat}}{\text{diff lat}} \\ \text{dep} &= \text{diff long} \times \cos \text{mid lat} \end{aligned} \qquad (B)$$

In *Mercator's sailing* the globe is conceived to be extended from the equator towards the poles, so as to form a cylinder whose diameter is that of the equator; the corresponding elementary parts of the meridians and parallels as projected on the cylindric surface bearing the same proportion to each other as the like corresponding parts do on the spherical surface the projected rhumb lines being straight lines and the poles vanishing in infinite distance Such a cylinder unrolled on a plane is called a *Mercator's chart* Now, considering the earth as a sphere the meridians and the equator are equal great circles, and therefore any small portion of a parallel is to a like portion of the meridian in the same proportion as the radius of the parallel to the radius of the equator, that is, as the cosine of the latitude to the radius of the tables, or as radius to the secant of the latitude If, therefore, m [illegible] of the [illegible], and m' its projection, of m on Mercator's chart, then, generally, $m' = m \sec l$.

It follows from this that in Mercator's projection the degrees of latitude, which at the equator are equal to those of longitude increase with the distance of the parallel from the equator proportionally to the secants of the latitudes The parts of the meridian thus increased are called *meridional parts*, and it is a property of the projection that the meridional parts of any given latitude are equal to the sum of the secants of the minutes in that latitude (See MERCATOR'S CHART) The sum of the secants being computed for every minute up to any latitude l, and [illegible] of m *meridional parts*, [illegible] latitudes of any two places, is called [illegible] lat of those places, the *difference* being taken when the latitudes are of the *same*, and the *sum* when of *different* denominations

It is likewise a remarkable property of Mercator's projection that any small triangle on the sphere is represented on the chart by a similar triangle, the angles of the original triangle and its representation being equal Hence the ship's path on the sphere and its projection on the chart cut the meridians under the same angle If, therefore A B C be a triangle on the sphere, A C being a portion of the meridian and A B′ C′ its projection, then A B′ and A C′ will be in the same direction with A B and A C, and B′ C′ will be parallel to B C In these triangles therefore the course A is an angle common to both A C is the diff lat, A C′ the meridional diff lat, C B the departure, C′ B′ the diff long A B the distance run and A B′ the distance as projected on the chart, the same scale being used for measuring all the lines in the diagram Hence from such parts of these triangles as may be determined by observation, or taken from tables, the others may be computed

The following formulæ are obvious consequences of this construction —

$$\begin{aligned} \text{diff long} &= \frac{\text{dep} \times \text{mer diff lat}}{\text{diff lat}} \\ \tan \text{course} &= \frac{\text{diff long}}{\text{mer diff lat}} \\ \text{distance} &= \text{diff lat} \times \sec \text{course} \end{aligned} \qquad (C)$$

The course of a ship at sea is determined by the *compass* (for the description of which *see* COMPASS) The needle generally rests in a position pointing northerly and southerly, and the angle which its direction makes with the true north and south line is called the *variation of the compass*, the variation being denominated *easterly* or *westerly* according as the north end of the needle is to the east or west of the true north The amount of this deviation differs greatly in different situations and it is by no means a constant quantity even at the same place There are, however, simple astronomical means of finding it at any place, so that, by applying a correction for the variation either the true course may be gained from an observed compass one, or the compass course from a computed true one

Besides the general *variation* to which we have here adverted it is found that in ships which have large masses of iron on board the compass is sensibly attracted, and the effect varies with the direction of the ship's head Mr Barlow has devised a remedy for this cause of derangement, which consists in placing a small disk of iron in such a situation behind the compass that its single effect exactly counterbalances the combined force of the [illegible] masses *See* MAGNETIC COMPENSATOR

The velocity of the ship, or the *rate* of sailing is determined experimentally, at the end of every hour, by heaving the *log* (*See* LOG) For changes of velocity between the times of heaving the log, the officer on duty makes the best estimate he can

When the wind is adverse or changeable, it is often requisite to sail on different courses, and the crooked line which the ship then describes is called a *traverse*, and the method of finding a single course and distance equivalent to such a compound one is called *resolving a traverse*

This may be done by a geometrical projection but it [illegible] in practice by the aid of the traverse [illegible] ble the *diff lat* and *dep* corresponding to each course and distance is taken and entered in an appropriate table, having columns headed N S E W, namely N and S for diff lat, and E W for departure The difference between the sums under N and S shows the diff lat, as does the difference between the sums under E and W the departure, and in either case the difference is of the same denomination as the larger sum The course and distance required are then either found by inspection in a traverse table, or by the formulæ (A)

When a ship makes considerable way through the water, and the wind is on the beam, abaft it, or even a little before the beam, she moves forward in the direction of her keel, but in rough weather, with the wind forward, she will generally be driven more or less to leeward, as will be shown by the direction of the wake, or the ripple formed by the waves closing behind her The angle this ripple makes with the direction of the keel is the *leeway*, and it must be applied as a correction to the course shown by the compass, and always allowed *from* the wind, — that is to the left, if the wind is on the right hand side of the ship, and to the right, if on the left *See* LEEWAY

All matters relating to the navigation of a ship are entered in a systematically ruled book called the *log-book*, and what day after day is so recorded is called the ship's journal The principal columns in the log book are for the hour of the day, the course, rate of sailing, leeway, and winds, one for general remarks and for entering the particulars and results of celestial observations, for notes on the weather and memoranda as to all important points of duty in the ship the sails set and the manner in which the crew are employed To this is duly appended the latitude and longitude of the ship at noon, both as deduced from celestial observations and as computed from the course and distance since the time when the place was last ascertained The place determined from the course and distance is called the place by *dead reckoning* The bearing and distance of the land first expected to be seen and the course and distance made on the whole, during the day, are also added

If the course and distance could always be accurately determined the place of the ship could be computed with corresponding exactness from the principles of which we have above given a concise account But these data can only be obtained in a roughly approximative form The effect of unknown currents unavoidable imperfections in steering, and numberless other sources of error render [illegible] very [illegible] d to rely for several days on these data only he often finds that his expected and his true place are considerably distant from each other

In the modern practice of navigation therefore the course and distance are only used to enable the seaman to assign approximately the place of his ship between the times at which it is determined, independently by celestial observations

This branch of nautical knowledge which is generally and properly included in every system of navigation is called *nautical astronomy*, and the improvements which have been introduced in its modern application constitute the chief difference between navigation as practised in our own and former times

For a minute explanation of the processes by which the place of a ship on the wide ocean may be determined from the observed situation of celestial objects with respect to each other and to the horizon, we must refer to works expressly devoted to the subject But we shall give a short account of the most useful practical methods of finding the *latitude* the *longitude*, and the *variation of the compass*, which are the three principal problems in nautical astronomy

Reduction of Altitudes — Before the altitudes of celestial objects as observed at sea can be employed in the solution of astronomical problems they must be corrected for the effects of dip and parallax, and for semidiameter, when the altitude of the upper or lower border, instead of that of the central, has been observed, as in the case of the sun or moon

[illegible] through which the sea horizon appears depressed in consequence of the elevation of the observer [illegible] corresponding to the altitude A and the horizontal parallax taken from the *Nautical Almanac* for the time of observation, and A′ = the true altitude then

$$A' = A - d + s + p\cos(A - d + s) - r$$

In practice, the corrections to be applied to A to obtain A′ are taken from tables, and the process of reduction is short and simple

To find the latitude from the observed meridian altitude of a known celestial object

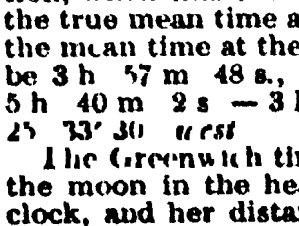
Let z be the complement of the true altitude, as deduced from the observed one, D the object's declination, and L the latitude, and call z north when the zenith is north, and south when it is south of the object then $L = z \pm D$, a formula in which D is + when z and D are of the same, and — when of different denominations, and L is of the same denomination as the greater of z and D

To find the latitude from two observed altitudes of the sun, with the time elapsed between the observations —

Let t = the half elapsed time in degrees, p the sun's polar distance at the middle instant between the observations, s = half the sum, and d = half the difference of the two corrected altitudes, then compute the angles A, B, C, D, and E, in succession, from the following formulæ —

$$\sin A = \sin t \sin p$$
$$\cos B = \sec A \cos p$$
$$\sin C = \operatorname{cosec} A \cos s \sin d$$
$$\cos D = \sin A \sin s \cos d \sec C$$
$$E = B + D$$

And the expression for the latitude is,



$$\sin \text{lat} = \cos D \cos E$$

There are many other methods by which the latitude may be found, but the two which we have given are those most generally used by seamen

We pass on to a consideration of the principles on which the methods of finding the longitude astronomically at sea are founded

The longitude is found by comparing the *time* at the first meridian with the same *denomination* at the place of observation, allowing 15° of longitude for every hour in the *difference* of the times

In the annexed diagram, let P A represent the meridian passing over the first point of *Aries*, P S that passing over the true and P M that passing over the mean place of the sun, and P X that passing over any other celestial object X Let also P G be the meridian of Greenwich, P N the meridian of *west* longitude, and P O a meridian in *east* longitude

Then, for that instant of absolute time, A P G represents the *sidereal*, S P G the *apparent*, and M P G the *mean* time at Greenwich, twenty four hours of time being represented by four right angles A P N, S P N, and M P N, are the [illegible] mean time at the meridian P N, and A P O, S P O, and M P O, the like times at the meridian P O

Now N P G, the longitude of the meridian P N, = A P G − A P N = S P G − S P N = M P G − M P N, and G P O the longitude of P O = A P O − A P G = S P O − S P G = M P O − M P G

Therefore the longitude of any place represented in time is equal to the difference of the relative times at the first meridian and the meridian of the place, the times being both sidereal, both apparent, or both mean time, and both reckoned from the same noon, — *west* when the Greenwich time is *greater* and *east* when it is *less* than the time at the place of observation

The angle X P G reckoned westerly from P G, is called the meridian distance of the object X from the meridian P G and X P N its meridian distance from the meridian P N A P X is its right ascension, A P S the right ascension of the sun, and S P M the *equation of time*, or the difference between mean and apparent time

Now if a be the altitude of an object X as observed in a given latitude l say on the meridian P N, and p = P X, its polar distance, then, if we put $s = \frac{1}{2}(a + l + p)$, the angle X P N may be determined from this expression,

$$\sin^2 \tfrac{1}{2}(\text{X P N}) = \sqrt{[\sin(s - a) \cos s \sec l \operatorname{cosec} p]}$$

And X P N + A P X − A P S + S P M = M P N, the mean time at the meridian P N

P X, A P X, A P S and S P M are furnished by the *Nautical Almanac*, and it is evident, therefore, that from an observed altitude of a celestial object, with the data supplied by the *Nautical Almanac*, the *mean time* at the place of observation may be found

With respect to the corresponding Greenwich time, it may be found by means of a chronometer, whose error and rate are ascertained before it is taken to sea For example if on May 4th the chronometer be 4 m fast for Greenwich time, and on May 14th 4 m 50 s fast for Greenwich time, then, if on May 30th, at sea, an altitude be observed to determine time at the place of observation, when this chronometer shows 5 h 46 m 12 s, then the true mean time at Greenwich is 5 h 40 m 2 s, and if the mean time at the place deduced from the observation be 3 h 57 m 48 s., the longitude of the place will be 5 h 40 m 2 s − 3 h 57 m 48 s = 1 h 42 m 14 s = 25° 33′ 30″ *west*

The Greenwich time may also be found by considering the moon in the heavens as the pointer of a Greenwich clock, and her distances from the sun and certain stars as indicating the Greenwich times to which they cor-

respond. These distances are computed, and published beforehand in the *Nautical Almanac*, for every third hour of Greenwich time, so that if at any moment we ascertain the moon's distance from some such celestial object the Greenwich time may be found by comparing [illegible] in the *Nautical Almanac* [illegible] given, however, are the distances of the objects as seen from the centre of the earth, and therefore before a distance observed on the surface can be made available for finding the Greenwich time it must be reduced to what it would have been if the observation had been made at the centre. Many formulæ have been devised, and numerous and extensive collections of tables have been formed, to assist in making this reduction, but perhaps the following is as convenient as any other that has been proposed.

Let m be the moon's app. zenith dist., s the sun's, M the moon's true zenith dist., S the sun's, d the app. dist. of the centres of the objects, and D the required or the true distance, and put

$$A = \tfrac{1}{2}(M + S),\ B = \tfrac{1}{2}(m + s + d) - d,$$
$$\sin X = \sqrt{(\operatorname{cosec} s \operatorname{cosec} m \sin M \sin S \sin A \sin B)}$$
$$\text{then } \sin \tfrac{1}{2} D = \sqrt{[\sin (A + X) \sin (A - X)]}$$

To compute the bearing of the sun, the altitude, polar distance, and latitude being known —

Let a = the altitude, l = the latitude, p = the polar distance, $S = \frac{1}{2}(a + l + p)$ and B the required bearing or azimuth — estimated from the east and west towards the north, and from the north when the latitude is south, towards the east when the altitude is increasing, and towards the west when it is decreasing, then

$$\sin \tfrac{1}{2} B = \sqrt{[\sec a \sec l \cos S \cos (S - p)]}$$

If the compass bearing of the object be observed when the altitude is taken, the variation of the compass may hence be found, for let B′ = the compass bearing, then the variation is B + B′ or B − B′ the sign + being used when one bearing is eastward and the other westward, and − when both are on the same side of the meridian, and the variation is *west* when B is to the *left*, and eastward when it is to the right of B′.

For an account of the history of navigation, the reader is referred to the Introduction to *Robertson's Elements of Navigation*. Of modern works on this subject in general use among British seamen, we may notice those by Dr Inman, and particularly those of Mr Riddle and of Lieut. Raper, treating both of the theory and practice. The Epitomes of Moore, Mackay and Norie are also very useful compilations, and have long had an extensive circulation.

NAVIGATION ACTS. Several statutes of our early kings were passed with a view to confine particular branches of the English carrying trade to English merchants, but as they were generally enacted merely for some temporary object, they produced little effect. In 1650 the first navigation act was framed under the republican government, partly with a view to punish the inhabitants of the sugar islands, who were chiefly loyalists, partly in hostility to the Dutch. It prohibited foreign vessels from trading to the English colonies (a prohibition extended, in 1651, to the mother country) without a licence from the council of state. In 1660 the government of Charles II. re-enacted these prohibitions on a more extended scale. The chief articles of the act 12 Car. 2. c. 18 are, that no goods be carried to or from any English colonies but in vessels built within the English dominions, or really the property of Englishmen, and whose masters and at least three fourths of the crew, are English, that no goods of foreign growth or manufacture (with specified exceptions), be imported in English vessels, except from the country where they are grown and manufactured, that sugar, tobacco, and other colonial commodities (thence called in trade enumerated), be imported into no part of Europe but England and her dominions. The history of these acts, so much extolled by British politicians, and termed by some the charta maritima of England, and of the modifications which their provisions have undergone down to their repeal in 1850, is [illegible] of M'Culloch's edition of the *Com. Dict.*

NAVIRE (Fr.). An order of knighthood [illegible] St Louis king of France [illegible] of France to undertake the expedition to Holy Land. After having fallen into decay [illegible] with renewed lustre [illegible] under the auspices of the order of the crescent. This order derived its [illegible] the circumstance that the collars [illegible] to and ship appendant from them or less [illegible] were ordered to bear in their arms a ship argent in chief.

NAVY (Lat. *navis*, *a ship*), in its most extended signification is applied both to the mercantile and military marine of a nation, but it is more commonly restricted to vessels of *war* only, all others being said to belong to the merchant service. In treating of the navy, it is usual to consider it under two distinct heads the *materiel* and *personnel*: the former comprising all that relates to the construction, armament, and equipment of ships; the latter including all who receive rank, pay, or [illegible] in the service of the navy, and whatever concerns the appointment, station, and duties of officers, sailors, and marines. Under the different heads the reader will find a notice of the chief subjects included in the *materiel* of the navy, and we shall in the present article restrict ourselves to some general remarks respecting its history, management, and present state, which may serve to give a coup d'œil of the whole subject, and which could not well be comprised under separate heads.

The naval history of England is usually divided into three eras, the first comprising all the period that preceded the reign of Henry VIII., the second ending with the restoration of Charles II., and the third from the Restoration down to the present time. Omitting all that period of English naval history that intervened between the Conquest and the reign of Henry VIII. as too unimportant to be dwelt upon in a sketch of this nature, we may state, before passing to the second period, that the first ship, properly so called, of the British navy, was built by Henry VII. in the third year of his reign. She was called "The Great Harry," had three masts*, carried 80 guns, measured 165 feet in length, and 36 feet in breadth from outside to outside, and cost upwards of 14,000*l*. This ship constituted the most noble monument of Henry VII.'s regard for the navy; but his designs were matured and perfected by his son Henry VIII., in whose reign England may be said to have first possessed a permanent navy. Previously to his reign our sovereigns had [illegible] ships, when they wished to transport [illegible] or to undertake any considerable naval enterprise it was usually effected by requisitions of ships and seamen from the different seaport towns of the kingdom, or by hiring them from the merchants of Hamburg, Lubeck, Genoa &c., which were dismissed as soon as the occasion for their service was over. But Henry, whose naval force, as in the preceding reigns, was chiefly dependent on foreign auxiliaries, caused several "shippes royall" to be constructed for the service of the state, one of which the "Regent," measured 1000 tons burthen and another, the 'Marie Rose,' measured 500 tons burthen, and carried 700 men. At the conclusion of his reign in Jan. 1547 the verified list of the navy amounted to seventy-one ships and vessels of all sorts measuring 11,268 tons. During the succeeding [illegible] and Mary the naval force of [illegible] and at the demise of the [illegible] twenty six vessels, measuring 7,110 tons burthen. During the long and prosperous reign of Elizabeth which ensued, the navy was greatly encouraged. The naval force collected to oppose the Armada, [illegible] of 150 ships with nearly 30,000 men, amongst [illegible] equipped with about 15,000 men, of these 34 ships with 6,225 men, a larger royal armament than had ever before assembled together belonged to the crown, the remainder being made up from London, Bristol, Yarmouth, the Cinque Ports &c. During the last twenty-five years of Elizabeth's reign the navy almost doubled its number, and at her death in 1603 it amounted to forty-two ships, measuring 17,000 tons and carrying 8,346 seamen. The reign of James I. was remarkable for the first able and scientific naval architect, Phineas Pett, to whom the art of shipbuilding was indebted for many improvements. "In my own time," says Raleigh, 'the shape of our English ships hath been greatly bettered, in extremity we carry our ordnance better than we were wont, we have added crosse-pillars in our royall shippes to strengthen them, we have given longer floares to our shippes than in olden times and better bearing under water." The striking of topmasts was also invented in this reign, and besides the improved shape of the vessels, Raleigh mentions various minor improvements, adding 'to the courses we have devised studdingsails spritsails, and topsails, the weighing of the capstan is also new, and the [illegible] bonnet, we have fallen into consideration of the length of cables and by it we resist the malice of the greatest winds that can blow.' At the death of James I. in 1625, the royal navy consisted of thirty-three ships measuring 19,400 tons. The navy was first divided into rates and classes under Charles I., who built several new ships in the beginning of his reign and among others the "Sovereign of the Seas," a larger ship than had ever been built in England, carrying [illegible] 683 tons. But in 1648 Prince [illegible] ships, none of which ever returned to England, and so reduced was the navy at the commencement of Cromwell's government, that he could muster only fourteen men-of-war, some of them carrying only forty guns. But his vigorous administration speedily raised the navy to a [illegible] power formerly unknown, and under the [illegible] of Blake, it became not merely equal but superior to that of the Dutch, then the greatest maritime

* Down to the year 1545, the "Great Harry" was the only ship of that description in the British fleet. She was accidentally burnt at Woolwich in her sixty fifth year.

power of Europe. It was during the Protectorate that the classes into which Charles I had first divided the navy were clearly defined, and a regular system established, which has, with little alteration remained in force down to the present time At the death of Cromwell in 1658, the navy amounted to one hundred and fifty seven ships, measuring 21,770 tons, and carrying 30,000 men

At the restoration of Charles II in 1660 (from which is dated the third period of English naval history), the whole fleet amounted to only sixty-five ships but under the able administration of the Duke of York, the royal fleet soon augmented to a fine armament, and though the retirement of the latter, in consequence of his inability to take the Test Act, and the subsequent extravagance of the king, caused the navy to decay, yet such [illegible] measures were afterwards taken by the Duke, on [illegible] all to office, for its restoration, that at the demise of Charles II the navy amounted to 179 vessels, measuring 103,558 tons During the foregoing reign, a remarkable change had taken place in scientific and mechanical operations, and the art of shipbuilding so long practised on vague and imperfect principles, began to be more highly and extensively developed, for not only were the proportions and qualities of vessels improved, but the mind of the designer was directed to theoretical investigation, and thus, coeval with the third period of naval history, may be justly reckoned the full development of the science of naval architecture On his accession to the throne James II continued to evince the same warm interest which, as lord high admiral, he had always manifested for the welfare of the navy He suspended the navy board and appointed a new commission with which he joined Sir Anthony Deane, the best naval architect of the time four hundred thousand pounds were annually set apart for naval purposes, and so diligent were the commissioners in the discharge of their duty, that on the abdication of James, in 1688 the navy amounted to [illegible] ons, and carrying [illegible] administration of William and Mary who made little alteration in the system adopted by their predecessor 99 new ships were added to the fleet, and the celebrated engagement off Cape la Hogue, in 1692, gave the British navy an ascendency over that of France, which it has ever since preserved Queen Anne at her accession found the navy to consist of 272 vessels, measuring 159,020 tons, but in the third year of her reign a most destructive storm visited this country and the adjacent coasts, by which the navy sustained great damage and loss No fewer than ten men-of-war were totally lost, and many more were driven on shore and damaged All measures adding to the strength and efficiency of the navy were exceedingly popular during this reign, and every plan compatible with financial economy was adopted for its benefit, so that though the number of ships was less at the end of Anne's reign, 1714, than at its commencement, the tonnage had increased 8199 tons During the first four years of George I large sums were voted for the extraordinary repairs which were required after the long war A general survey was made of the dockyards and seastores, new dimensions for several classes of ships were established, and at the death of this monarch, in 1727 the navy consisted of 233 ships measuring 170,862 tons The navy remained stationary for the first twelve years of the reign of George II [illegible] with Spain in 1739 the navy was [illegible] and a scale of increased dimensions was established in 1742. In the wars of 1744 and 1755, our naval enterprises were crowned with the most signal success, and at the demise of George II, in 1760, the navy consisted of 412 ships, measuring 321,104 tons, the vote for the naval service of that year being 5,611,500*l*, 51,645 seamen, and 18,355 marines [illegible] during the long [illegible]

It may be sufficient, therefore, to observe, that though the combined fleets of France and Spain appeared to have an ascendency during the American war, the victories of Rodney restored our previous superiority The nature of the struggle with revolutionary France, the bitterness with which it was carried on, and the fleets required not merely for the protection of our own shores, but for that of [illegible] and of our numerous colonies in [illegible] an immense increase of our naval force, and while our navy was thus progressively augmented, the decisive victory of the 1st of June, 1794, followed by those of St Vincent, Camperdown, the Nile, Copenhagen and Trafalgar almost destroyed every fleet that could be opposed to it, leaving us the undisputed masters of the ocean

From the commencement of hostilities in 1793 to the peace of Amiens, the following table will show the losses sustained both by the English and their enemies, including the ships surrendered to be held in trust

Loss sustained by the English		Captured from the Enemy	
Ships of the line	5	Ships of the line	56
Frigates	13	Frigates	209
Sloops and smaller vessels	41	Sloops and smaller vessels	275
Total	59	Total	570

From the declaration of war in May, 1803, to the general peace concluded in 1815, the number of ships and vessels of war captured and destroyed by the British, with the amount of loss sustained by our fleets during the same period, will be found in the following abstract —

		Captured	Destroyed
French, Dutch, Spanish, Turkish, Danish, American	ships of the line	55	14
	frigates	79	23
	Total	134	37
British	ships of the line	0	0
	under	80	17
	Total	80	17

In the last seven years of the war the British naval force averaged one hundred and forty ships of the line in commission, and five hundred and eighty frigates, sloops, and smaller vessels, those in harbour, ordinary, and building, being estimated at three hundred during the same period Since the peace of 1815 great improvements have taken place in every department of naval architecture, masts, rigging, sails ordnance, implements, and instruments, have all undergone revision, alterations not only in the form and magnitude of British ships but even in the arrangement of the materials composing them, have been effected, and it is perhaps not going too far to assert, that never at any former period was our navy in a condition better calculated to maintain its long undisputed sovereignty of the ocean

The following table will show the force of the British Navy at five distinct periods viz the year after the breaking out of the French revolutionary war, in 1820, five years subsequently to the peace, in 1830, on the accession of William IV, on the accession of her present Majesty, in 1837, and in 1840 —

Ships, &c	1793					1820					1850					1867					1840				
	In Commission	Ordinary	Building	Total	Tons	In Commission	Ordinary	Building	Total	Tons	In Commission	Ordinary	Building	Total	Tons	In Commission	Ordinary	Building	Total	Tons	In Commission	Ordinary	Building	Total	Tons
Of the Line	26	84	12	122		14	113	22	149		11	75	18	107		23	59	11	96		28	54	23	105	
Under small vessels	109	82	8	199		113	255	93	464		143	262	64	469		163	219	43	425		149	220	34	403	
Steamers						7	4	1	12		42	11	1	54		65	15	7	87						
Grand total	135	166	20	321	102,	127	368	117	613	60[illegible]	104	311	83	498	41[illegible]	228	289	61	578	467,565	242	259	64	595	500,232

The parliamentary vote for the service of the navy in 1851 was 6[illegible] The effective list of the royal navy consists at present [illegible] ships of all classes Of these we may call, in old-fashioned phraseology, line-of battle ships, comprising among them [illegible] two-deckers which have been converted into steam block or guard ships Of this 96, 16 only are at this moment in commission — that is, manned, equipped, and fit for sea, of the remaining majority 58 are lying in ordinary in the Medway, Portsmouth harbour, Plymouth, and elsewhere, whence with reasonable promptitude they might be despatched to sea On the effective list of flag officers there are 101 admirals, vice and rear admirals, 465 captains, 565 commanders, and 1232 lieutenants

Classes and Rates — It is of great importance, in order to insure union in the movements of a fleet and to facilitate the fitting out and repair of ships, that those of the same rate or class should not differ materially in size or

build from each other Until the Restoration vessels appear to have been "rated" from the complement assigned to each, without any reference to the ordnance they carried, but on the recommendation of a committee appointed in 1745 this method was superseded by classification according to *guns* In 1793 our ships, which, in [illegible] wars, had outgrown their [illegible] were rated anew at so many guns and upwards, but the latitude of the term "and upwards" giving rise to great irregularities, an investigation took place in 1816 when by an order in council the rule which existed previously to 1793 was revived, and ships were ordered to be rated thenceforth from the number of guns and carronades actually carried, and not according to the erroneous denominations which had latterly grown into use His late majesty William IV made some alterations in this mode of rating ships, but not such as materially to interfere with the arrangement introduced by his predecessor The royal navy, as at present constituted, comprises three principal classes — 1 Rated ships and yachts, including frigates, sloops and corvettes 2 Ships and bomb vessels [illegible] corvette-built or otherwise 3 All smaller vessels, including brigs, ketches, brigantines, schooners, cutters, tenders, &c Ships of the first class are commanded by captains, of the second class, by commanders, of the third class by lieutenants and subordinate officers

The classification of the royal navy is at present as follows — *First rate* all ships carrying 110 guns and upwards, or whose complement [illegible] *Second rate* one of her Majesty's yachts, [illegible] carrying [illegible] and whose [illegible] *Third rate* the other royal yachts, and all yachts bearing the flag or pendant of an admiral or captain superintendent of a dock-yard, and all ships whose complements are under 750 and not less than 620 *Fourth rate* ships whose complements are under 620 and not less than 450 *Fifth rate* ships whose complements are under 450 and not less than 300 *Sixth rate* all other ships bearing a captain

Steam vessels are assigned a rate at the discretion of the lords of the admiralty Ships or vessels fitted as troop ships surveying ships, fire ships, store ships or vessels used on any temporary service, are also given a rate not above the fourth Ships of the 1st rate carry 100 guns and upwards, those of the 2d rate 80 and upwards, the 3d rate from 70 to 80, the 4th rate from 50 to 70, the 5th rate from 36 to 50, and the 6th rate from 24 to 36 (For the chief of these details we are indebted to an able and beautiful little work, entitled an *Epitome of the Royal Naval Service of England*, by Mr Miles)

Government of the Navy — The general direction and control of all affairs connected with the navy is intrusted under her Majesty to the lord high admiral or to the commissioners for discharging the functions of that officer The duties of the lord high admiral were formerly judicial as well as administrative, he having not merely to govern the navy but to preside over a court for adjudging all nautical cases, and for taking cognizance of all offences committed on the high seas But the judicial are now separated from the other duties of this high functionary, being devolved upon the judge of the Admiralty Court *See* ADMIRALTY, COURT OF

From the reign of Queen Anne down to the present time, with the exception of the [illegible] which William IV while Duke of Clarence held office, the duties of the lord high admiral have been discharged by commissioners These have consisted generally of a first lord, and of four or six junior lords Civilians may be appointed to these offices, but at least two of the lords are always professional men But though assisted by junior lords practically all the power and authority of the board is vested in the first lord The powers exercised by the Board of Admiralty are very extensive and important By their orders all ships are [illegible] fitted for sea or laid up in ordinary [illegible] put in commission, or out of commission, armed, stored, and provisioned, employed on the home or on foreign stations All appointments or removals of commission and warrant officers are made by them, and all instructions issued for the guidance of their commanders, all promotions in the several ranks emanate from them, all honours bestowed for and without services, and all pensions, gratuities, and superannuations for wounds, infirmities, and long services, are granted on their recommendation All returns from the fleet are sent to the Board of Admiralty and every thing that relates to the discipline and good order of every ship All orders for the payment of naval moneys are issued by the lords commissioners of the admiralty, and the annual estimate of the expenses of the navy, prepared by them, is laid before parliament for its sanction All new inventions and experiments are submitted to them before being introduced into the service, all draughts of ships must have their approval all repairs, alterations and improvements in the dock-yards, and all new buildings, of every [illegible] must be decided upon by them before they [illegible] (*Sup to Encyc Britan*, art. "Navy")

Under the superintendence of the lords commissioners, the civil departments of the admiralty are directed by a surveyor of the navy, an accountant-general, a storekeeper-general, a comptroller of victualling, and a physician-general

There are three gradations of admirals, viz admirals, vice-admirals, and rear-admirals, and each of these dignities consists of three divisions, distinguished by the colour of their flags Thus there are admirals of the red, the white, and the blue squadrons, bearing their respective flags at the main-top-gallant-mast head; vice-admirals of the red, the white, and the blue squadrons, bearing their respective flags at the fore top-gallant-mast head, and rear-admirals of the red, the white, and the blue squadrons bearing their respective flags at the mizen-top-gallant-mast head All admirals whatever be their rank, take the common title of *flag officers*

Admirals rank with generals in the army, vice-admirals with lieutenant-generals, and rear admirals with major-generals The command of each ship is entrusted to a captain, or to a commander, who has under him a certain number of lieutenants, according to the size of the ship, with a master, purser, midshipmen, gunners, &c A captain of [illegible] standing ranks with a colonel in the [illegible] three years standing with a lieutenant-colonel, a commander ranks with a major, and a lieutenant with a captain The captain is responsible for the discipline and efficiency of the crew, and the good order of the ship Now standing he is furnished with minute instructions for his guidance, in every particular much must always necessarily depend on his conduct and character He has power to order punishment to be inflicted, but it must be done in the presence of all the officers and ship's company An account, stating all the circumstances, must also be entered in the [illegible] which is forwarded each quarter [illegible] regulation has tended to repress hasty and inconsiderate punishment, and has done much to improve the conduct of the officers, as well as to promote the proper discipline of the navy

Composition of the Navy — The navy is composed of two bodies of men — seamen and marines (*see* MARINES), and the officers under whose command it is placed are divided into three classes viz commissioned, warrant, and petty officers Commissioned officers comprise flag officers (*see supra*), commodores, captains, commanders, and lieutenants appointed by commission from the lords commissioners of the admiralty, or by a commander in-chief having authority in cases of vacancies by death or the decisions of courts martial abroad to make such appointments Warrant officers are those who hold their appointment by warrant from the lords commissioners of the admiralty, to this class belong masters, secretaries physicians, surgeons &c Petty officers are divided into two classes *quarter-deck* and *working*, the former, comprising midshipmen, masters assistants volunteers, &c are entered by order of the lords commissioners or by a commander-in-chief abroad, the latter, including captains of the maintop foretop, &c &c are appointed by the captain or commander of the ship or vessel to which they belong

Any person may enter the navy as a common seaman, on application to the commanding officer of any of her Majesty's ships in commission provided he be approved by the examining surgeon and have not [illegible] discharged from the service with disgrace Persons who have never been at sea are rated as landsmen, and seafaring men are rated as "ordinary" or "able" seamen besides numerous [illegible] of petty officers, to which they are rated at [illegible] of the commanding officer Seamen are also obtained for the navy at the breaking out of a war or any other emergency, by the practice of impressment The antiquity and legality of this practice cannot be questioned, but very great and serious doubts have been and may be entertained as to its expediency Foreigners are the only persons exempted at common law from impressment, but exemptions have been created by acts of parliament in favour of various classes as landsmen, apprentices, seamen employed in the fisheries, watermen in the service of fire insurance companies &c *See* IMPRESSMENT

Young gentlemen enter the service as volunteers of the first class; and every officer commissioning a ship is allowed to make one fresh entry A volunteer must remain two complete years in that capacity, and attain the age of fourteen before he can be rated [illegible] when he has completed six years' service and [illegible] of age [illegible] and also [illegible] the rank of lieutenant, and shall be [illegible] such examinations as he ought to be able to hold a master's mate if his conduct be satisfactory to his captain

No person can receive a commission as lieutenant unless he have passed both the above examinations; but having done so, he [illegible] that rank A lieutenant is not [illegible] for a commander's commis-

sion till he have served two years at sea in a ship of war as lieutenant, nor is a commander eligible for a captain's commission till he have served one complete year at sea in a ship of war as commander

In 1840 a temporary restriction was placed on promotions by a minute of the Admiralty Board This limited the promotion of officers to the rank of captain, and all below that rank to filling up one in three vacancies on the list, with the exception, viz, 1st, of death vacancies on foreign stations, which the commanders-in-chief have authority to fill up, 2d, the reservation to the admiralty of power to promote for special or brilliant services, 3d, of the occasion of a commander-in-chief striking his flag and 4th, on the recommendation of the Board of Customs for services in the coast guard

Captains and admirals are promoted by seniority, on what is termed a "flag promotion" taking place, but a captain must have served as under, in command of a rated ship, before he can obtain his flag, viz

In war - - - -	4 years
In war and peace combined - -	5 —
In peace - - - -	6 —

All other classes of officers, as was remarked above, are promoted at the discretion of the Board of Admiralty For the various important subjects connected with the pay, pension, discipline, &c of the navy, see the *Navy List* See, also, *Statistics of the British Empire*, and the valuable little work above referred to, *Epitome of the Royal Naval Service of England*, London, 1841 For other particulars relating to the navy see NAVAL ARCHITECTURE, SHIP, and the other naval articles, which will be found under their respective heads in this work

NA'ZARITE (Heb nazar *to separate*), signified in the Jewish dispensation, one separated to the Lord by a vow (Numbers chap 6) The chief observances of the Nazarites were to refrain from drinking wine to suffer the hair to grow and to avoid coming in contact with a corpse This word is [illegible] from Nazarene, which signified a [illegible] was applied in contempt to the early Christians, inasmuch as they were followers of Jesus of Nazareth

In some Eastern countries some Christian communities are still to be met with which have retained the appellation of Nazarenes The sect of Nazarenes which sprung up in Palestine in the second century endeavoured to engraft the rites and observances of the Jews on the religion of Jesus Christ, in this respect they bore a considerable resemblance to the Ebionites whose contemporaries they were, but with whom they must not be confounded No traces of them existed in the 5th century

NEAP or NEAP TIDES, are the lowest tides, being those which are produced when the attractions of the sun and moon on the waters of the ocean are exerted in directions perpendicular to each other When the two forces act in the same or exactly opposite directions the *spring* or highest tides are produced The neap tides take place about four or five days before the new and full moons See TIDES

NEAT A term applied to cattle *neat's foot oil* is the fat obtained by boiling calves feet

NE'BULÆ (Lat nebula *a cloud*) in Astronomy the name given, on account of their general cloudy appearance to a very numerous class of celestial objects being however, for by far the greater part, *telescopic*, and only visible in telescopes of considerable power

It is to Sir William Herschel that astronomy is indebted for the first examination and analysis of these remarkable objects A few of them have indeed been known since the discovery of the telescope, and one or two of them are visible to the naked eye, but his powerful telescopes first disclosed the fact of their existence in immense numbers and in all quarters of the heavens, not indeed distributed uniformly, but generally speaking, with a marked preference to a broad zone crossing the milky-way nearly at right angles, and whose general direction is not very remote from that of the hour circle of 0h and 12h In the southern hemisphere the distribution appears to be more uniform

Nebulæ are divided by Sir W Herschel into the following classes —1st, Clusters of stars, in which the stars are clearly distinguishable, 2d Resolvable nebulæ, or such as excite a suspicion that they consist of stars, and which any increase of the optical power of the telescope might be expected [illegible] 3d, Nebulæ, properly so called, [illegible] pearance whatever of stars, 4th, Planetary nebulæ, 5th, Stellar nebulæ, and, 6th, Nebulous stars

Clusters of Stars —These are either globular or of an irregular figure, forming bright isolated patches, which attract attention, as if they were brought together by some general cause The Pleiades is a cluster of this sort the naked eye can distinctly perceive six or seven stars in it, and may catch occasional glimpses of a great many [illegible] fty or sixty crowded to [illegible] and insulated from the rest of the heavens A [illegible] called *Præsepe* or the Beehive, in the constellation Cancer, is resolved entirely into stars by an ordinary telescope In the sword-handle of Perseus is another such spot, crowded with stars, but not so easily resolved There are a great number of less distinct nebulous specks of the same kind, which in ordinary telescopes have much the appearance of comets without tails, and have frequently been mistaken for such when, however, they are examined with instruments of great power, any such idea is completely destroyed They are then, for the most part perceived [illegible] and to run up to a blaze of light in the centre, where their condensation is usually the greatest Many of them are of an exactly round figure [illegible] less definite in [illegible] easy to say where they terminate In some of them the stars are nearly all of a size, in others extremely different, and it is no uncommon thing to find a very red star occupying a conspicuous position in the group

Resolvable nebulæ are considered as objects of the same nature as the preceding, but as being either too remote to present a star to the unaided vision to affect us by their individual light They are almost universally round or oval Their regularities of form being extinguished by the [illegible] general figure of the condensed part [illegible] In telescopes of insufficient optical power, all the great globular clusters exhibit themselves under this appearance

Nebulæ properly so called Recent observations with superior telescopes render it probable, or rather all but certain that no physical distinction exists between this class of objects and clusters of stars the difference of appearance depending only on the power of the telescope with which they are observed Multitudes of nebulæ which, in Herschel's 18-inch reflector, exhibited not the slightest appearance of resolvability, when examined with Lord Rosse's 6-foot reflector are clearly resolvable, and seem to consist merely of clustering stars, and though doubtless many exist which, under the greatest powers which have been yet applied, show no signs of being composed of separate stars, the inference can scarcely be resisted that they would be completely resolved by a further increase of optical power The great nebula in the sword-handle of Orion, discovered by Huygens in 1656, and repeatedly figured and described by astronomers since that time, is a notable instance. Another in the constellation of Andromeda may be mentioned which is visible to the naked eye, and often mistaken for a comet Its appearance is described by Simon Marius as that of a candle shining through horn Its form is a pretty long oval increasing by insensible gradations of brightness at first very [illegible] t last more rapidly, up to a central [illegible] very much brighter than the rest, is [illegible] ellar, but only nebulous matter in a high state of condensation It has in it a few small stars, but they are obviously casual, and when seen with a reflector of 18 inches there is nothing to excite any suspicion of its consisting of stars But when examined with instruments of superior power the evidence of its resolvability into stars may be regarded [illegible] decisive Mr G P Bond describes it as ex[illegible] very two and a half degrees in length, and upwards of a degree in breadth. Like the last described, a very numerous class of nebulæ are of a round or oval figure [illegible] its density towards the central [illegible] In respect however they differ extremely [illegible] some being bright and gradual in others great and sudden They also present great diversity of appearance, in respect of deviation from the spherical form Some are only slightly elliptic, others much extended in length, and in some the extension is so great as to give the nebula the character of a long, narrow, spindle-shaped ray, tapering away at both ends to points Some nebulæ are annular, but these are among the rarest objects in the heavens T [illegible] is situated half way between the [illegible] and may be seen with a telescope of moderate power

Planetary nebulæ have exactly the appearance of planets,—round or slightly oval disks, in some instances quite sharply terminated, in others a little hazy at the borders, and of a light exactly equable, or only a little mottled which, in some of them, approaches in vividness to that of actual planets Whatever the nature of these objects may be, they must be of enormous magnitude. One in Aquarius presents the diameter of 20″, another, in Andromeda, has a visible disk of 12′ perfectly defined and round Granting them to be equally distant from us with the stars, their real dimensions must be such as would fill, on the lowest computation the whole orbit of Uranus. Their intrinsic splendour must also be immeasurably inferior to that of the sun's, for a circular portion of the sun's disk subtending an angle of 20″, would give a light equal to 100 *full moons*, whereas not one of the nebulæ in question is discernible with the naked eye

Stellar nebulæ are those in which the condensation of the nebulous matter towards the centre is great and sudden, so sudden, indeed, as to present the appearance

[illegible] or a star w[illegible] present the [illegible] phenomenon of a st[illegible] by a perfectly circular [illegible] in some cases dying av[illegible] da-tions, in others almost suddenly terminated A very fine example of such a star is 55 Andromedæ, R A 1h 43m, N P D 50° 7′

"The nebulæ," says Sir J Herschel, "furnish, in every point of view, an inexhaustible field of speculation and conjecture That by far the largest of them consist of stars there can be little doubt, and in the interminable range of system upon system, and firmament upon firmament which we thus catch a glimpse of, the imagination is bewildered and lost On the other hand if it be true as, to say the least, it seems extremely probable that a phosphorescent or self luminous matter also exists disseminated through extensive regions of space in the manner [illegible] like a tu[illegible] tra[illegible] stars, what, we naturally ask, is the nature and distinction of this nebulous matter? Is it absorbed by the stars in whose neighbourhood it is found, to furnish by its condensation, their supply of light and heat? or is it progressively concentrating itself by the effect of its own gravity, into masses, and so laying the foundations of new sidereal systems or insulated stars? It is easier to propound such questions than to offer any probable reply to them" (*Treatise on Astronomy*, *Cabinet Cyclopædia* See also *Herschel's Outlines of Astronomy*, from which the preceding description is abridged

NECE'SSITY, DOCTRINE OF That scheme which represents all human actions and feelings as links in a chain of causation determined by laws in every respect analogous to those by which the physical universe is governed This doctrine has been attacked and defended with great zeal, in almost every period of speculative inquiry since the Reformation The inductive method of research applied by Bacon and his contemporaries to the phenomena of nature led very soon to the adoption of [illegible] reference to the phenomena of mind [illegible] or rather the distinct re-assertion of the law of association, by Hobbes and the ready solution which it appeared to furnish of states of consciousness which without it, would have seemed capricious and unaccountable encouraged many philosophers to attempt its application to every province of the human mind It is only in connection with this fact that the prevalence of necessarian views in modern times can be adequately explained Without venturing an opinion on the merits of the question at issue between the advocates of free will and of necessity we are sufficiently assured of the historical fact that the distinction between man and nature, between the actions of a self-conscious agent and the workings of blind unintelligent powers, was considered by the great philosophers of antiquity as the groundwork of their systems of morality and as involved in the very conception of moral science It was natural that this distinction should be felt to be a barrier to the progress of the exclusively empirical psychology to which we have alluded To the historians of man's nature the necessity of his actions appeared in the light of an hypothesis which lay at the very foundation of their inquiries, precisely as the natural philosopher is compelled to assume the regular recurrence of the same outward phenomena under the same circumstances The psychologist considers the states of which he is conscious merely as they are related to each other in time, and thus considered it seems to him a mere identical proposition to assert that all that can be known of them is the order of their succession If their succession were arbitrary or uncertain, nothing could be known of it, and the science which he professes could no longer have an existence It is in this consideration, rather than in the dialectic subtleties by which the doctrine has been sometimes defended, that the real strength of the necessarian lies So long as he can maintain the merely phenomenal character of human knowledge he can reduce his opponents to the dilemma of either denying the possibility of [illegible] or of admitting the existence of [illegible] which are its only object In its relation to morality, the doctrine of necessity has been naturally considered to involve dangerous consequences Attempts have been made by modern necessarians to rescue it from this imputation Sir James Mackintosh, in particular, has devoted some portion of his Dissertation to the explanation of the principal ethical terms, on the necessarian hypothesis (*General Remarks*, sec vii p 393 of the reprint) Notwithstanding the ingenuity of this effort, the student will probably find, on careful examination, that the great question at issue is left much in the same state as before

NECK OF A CAPITAL In Architecture, the space above the shaft of a column, between the annulet of the capital above and the astragal at the top of the shaft below

NECRO'LOGY (Gr *νέκρος*, *dead*, and *λόγος*, *discourse*) A collection of biographical notices of deceased persons published shortly after their deaths Such a collection is called a necrology The list of deceased benefactors of a monastery, cathedral, &c, was also termed its necrology
