Rutherford's Thermometer — A [illegible] register thermometer [illegible] Dr Rutherford [illegible] two thermometers, [illegible] A, and a spirit thermometer B attached horizontally to the same frame, and each provided with its own scale The index of A is a bit of steel, which is pushed before the mercury, but, in consequence of its horizontal position, remains in its place when the mercury recedes, and consequently indicates the highest degree of the scale to which the mercury has risen The index of B is of glass, with a small knob at each end This lies in the spirit, which freely passes it when the temperature rises, but when the spirit recedes, the cohesive attraction between the fluid and the glass overcomes the friction arising from the weight of the index, and the index is consequently carried back with the spirit towards the bulb As there is no force to move it in the opposite direction, it remains

curred By inclining the instrument, the indices are brought to the surfaces of their respective fluids, and prepared for a new observation

History of the Thermometer — The invention of the thermometer dates from about the beginning of the 17th century, but it is not certainly known when or by whom it was first brought into use By the Dutch authors it is ascribed to Cornelius Drebbel, a peasant of Alkmaar and by the Italians to Sanctorio Libri (*Annales de Chimie* Dec 1830) mainta s on the authority of Castelli and Viviani that the instrument was invented by Galileo prior to 1597 The thermometer of Drebbel and Sanctorio was a very imperfect instrument It consisted of a glass tube, having a ball blown on one of its extremities, and the other end left open A portion of air being expelled from the ball by heat, the open end was plunged into a cup containing any liquid, when, on the cooling of the ball the liquid would rise in the tube, and the variations of its height indicate the increase or diminution of the temperature of the bulb The instrument had no scale, and was therefore merely an indicator of changes of temperature, or a *thermoscope*, and it was defective even in this respect, inasmuch as it is affected not merely by heat and cold but by the varying pressure of the atmosphere The Florentine academicians first excluded the influence of atmospheric pressure by using a spirit instead of an air thermometer, and hermetically sealing the tube The next step in improvement was the adoption of a fixed point in the scale Boyle proposed the thawing oil of aniseeds, which he preferred to thawing ice, because it could be readily obtained at all times of the year Halley proposed the uniform temperature of a deep pit, which he probably considered would be the mean temperature of the earth, but he also suggested the point at which spirit boils as well as the boiling point of water Newton appears to have been the first who saw the advantage of having two fixed points in the scale, and in order that the instrument might be applicable to a wider r n e of te per t re used linseed oil as the thermometric fluid Th s l quor has not been found to answer on account of its sluggish motion and adhesion to the sides of the tube The knowledge of the fluctuation of the boiling p int of water, owing to atmospheric pressure is due to Fahrenheit about 1724 For improvements in graduation, &c see a very remarkable paper by Mr Sheepshanks in the *Monthly Notices of the Royal Ast Soc*, vol xi p 233 See also Deluc, *Recherches sur les Modifications de l'Atmosphere*, Genève, 1772, Biot, *Traite de Physique* tome I, *Nicholson's Chemistry*, *Library of Useful Knowledge*, "Thermometer and Pyrometer," Muncke in *Gehler's Physicalisches Worterbuch*, *Glaisher's Hygrometic Tables and Description of the Dry and Wet-Bulb Thermometers*, *Beddle's Manual of the Thermometer*

THERMOSCOPE (Gr θερμος, and σκοπεω *I view*) An instrument by which changes of temperature are indicated The modification of the air thermometer, called by Leslie a *differential thermometer* was claimed by Count Rumford as one of his own inventions, under the name of *thermoscope* See THERMOMETER

THERMOSTAT, or HEAT GOVERNOR (Gr θερμος and ιστημι, *I stand*) A self-acting physical apparatus for regulating temperature A thermostat the principle of which depends on the unequal expansion of metals by heat, was proposed by Dr Ure for regulating the safety valves of steam engines with more certainty than the common expedients. (See *Proceedings of the R* [illegible]

THESIS (Gr [illegible] general sense, [illegible] or negative, which is laid down or advanced to be supported by argument, but it is more particularly applied to those questions which are propounded in most of the Scotch and Continental universities to the students previously to their obtaining a degree

Thesis In Music, the depression of the hand in marking or beating time

THESMOPHORIA (Gr θεσμοφορια) A festival in honour of Ceres, surnamed *the lawgiver* (θεσμοφορος), because she first taught mankind the use of laws It was [illegible] with most observation and ceremony by the Athenians The worshippers were free-born women, whose husbands defrayed the expenses of the solemnity, assisted by a priest and band of virgins The women were clothed in white garments as emblematic of purity, and were strictly enjoined to preserve the strictest chastity some days previous to and during the whole of the festival, which lasted five days

THESMOTHETÆ The six inferior archons at Athens, who presided at the election of the lower magistrates, received criminal informations in various matters, decided civil causes on arbitration, took the votes [illegible] and performed a variety of other [illegible] (*Mem de l'Acad des Inscr* vol xxxix)

THESPIAN ART That of tragedy or tragic acting is so termed; from Thespis, an [illegible] who lived in the first half of the 6th century [illegible] and in[illegible] Drama

THETA (Gr θητα), [illegible] by the Greek [illegible] nation, from its being the first letter of θανατος, *death*. Hence the verse —

O multum ante alias infelix litera Theta.

THE'TES (Gr θητες) In ancient Attica, originally bondsmen, who were [illegible] magistracies of the state [illegible] they formed the lowest class of free citizens who contributed nothing to the support of the state, but in the course of the subsequent innovations which brought the state to a complete democracy all the restrictions on the thetes were removed They served generally as light-armed soldiers, but sometimes also as regular infantry upon an emergency (See Boeckh, *Public Economy of Athens* ii 258)

THE'TIS In Greek Mythology, one of the Nereids, daughter of Nereus and Doris was wedded under the auspices of the gods, among whom jealousy had arisen by reason of her beauty, to Peleus king of Thessaly By him she became the mother of Achilles According to the ancient cosmogonies, Thetis was an emblem of the element of water She is best known by the verses of Homer Her marriage with Peleus is the subject of some exquisite lines by Catullus

THEURGY (Gr θεος, *God*, and εργον, *work*) A [illegible] result of an intercourse with and influence over spiritual beings of the more exalted class, — gods dæmons, &c In the modern art magic it was that species of magic which operated by celestial means opposed to natural magic which was effected by knowledge of the occult powers of nature, and necromancy or magic effected by the aid of evil spirits (See *Mém de l'Acad des Inscr* vol xxvii)

THICKET Trees or shrubs crowded together in such a manner as to form a mass not easily penetrated by men or cattle

THINNING Reducing the number of plants or trees which have been sown or planted, with a view to those which remain attaining a more mature growth Natural woods are also thinned for the same purpose The operation ought to be commenced as soon as the extreme leaves or branches are [illegible] continue till the plants [illegible] full growth, or the required dimensions or age On no account should the branches of any one tree in a plantation be allowed to touch the branches of any other tree, because in that case the foliage is deprived of its due proportion of sun, air, and rain, and the tree is drawn up in height at the expense of its thickness and [illegible] while the timber or fruit produced [illegible] both in quantity and quality There is no department of planting less understood than the subject of sheltering young plantations and it may with truth be said that in by far the greater number of cases nothing is ultimately gained by drawing up trees in masses, and afterwards thinning them out The trees left being unprepared both by their bark and roots for the new atmospherical circumstances in which they are placed receive a greater check than if they had been originally planted so thin as at no period of their growth to touch one another

THIN OUT. Geologists say that strata *thin out* when they gradually diminish in thickness and disappear

THIRD In Music an imperfect concord, containing two degrees or intervals, and three terms or sounds

THIRD COAT In Architecture, the stucco when painting is to be used, or the setting for the reception of paper

THIRD ORDER In Ecclesiastical History, most of the chief religious orders (Premonstrants, Carmelites, Franciscans, Augustines &c) have or had bodies of secular associates, not bound by vows, but conforming to a certain extent to the general designs of the order, a custom thought to have originated about A D 1476, when Sixtus IV gave permission to the Carmelites to attach such persons to their body In course of time the third order contained a mixture of secular and religious persons

THIRST (Germ durst) The sensation of a desire to [illegible] of dryness and heat of the [illegible] stomach the posterior fauces [illegible] mucous secretion thick and viscid, as also the saliva A [illegible] disordered mind, and quick pulse ensue; and if not relieved, respiration becomes laborious, and the mouth is opened wide to admit the cool air Some people soon suffer from thirst, and are in the habit of [illegible] while others hardly ever [illegible]

m of febrile and other diseases, and is most effectively lieved in such cases by mild acid and mucilaginous inks, milk and emulsions are, however, sometimes ore efficient and agreeable Excessive exercise or per- iration are common causes of thirst, in which case the nsation seems merely to [illegible] of ater in the system [illegible] dulgence in drinking especially among labourers and ers who take excessive quantities of beer and which [illegible] carcely exist without unnecessary and preju- [illegible] use of that or similar beverages The first ired by excessive exercise in warm weather is in or- ary cases most effectually relieved by milk and water, warm tea In these cases indulgence in beer, cider, ne, or spirits and water [illegible] is re- ton and should the [illegible] be avoided

THIRTY YEARS WAR In History properly a ries of wars carried on between the Protestant and oman Catholic leagues in Germany, in the first half of e 17th century The house of Austria was throughout the head of the latter party The Protestant princes Germany were assisted by various foreign powers, in e earlier part of the war by Denmark and Sweden, d afterwards by France It is considered to have com- enced with the insurrection of the Bohemians in 1618, d ended with the peace of Westphalia in 1648 The lebra [illegible] war by Schiller, is her a spirited [illegible] accurate nar- ive

THISTLE or SAINT ANDREW A Scottish order knighthood, said to be of [illegible] vived James V in 1540, again by [illegible] VII Scotland, in 1687, and a third time in 1703 by Queen ne, who increased the number of knights to twelve, d placed the order on a permanent footing The istle as is well known is the national emblem of Scot- d, and the national motto is very appropriate being Nemo me impune lacesset," *nobody shall provoke me th impunity* This is also the motto of the order of thistle

THMEI The Egyptian goddess of justice or of truth figure is frequently represented in Egyptian sculp- es in the hands of the kings The Hebrew Thum- m (the well-known and mysterious Urim and Thum- m Exod xxxix 8 10) is the plural or dual of the same rd (*Wilkinson's Manners and Customs of the Ancient gyptians*, vol v p 58)

THO'LUS (Gr θόλος) In Architecture, a building a circular form, but used by Vitruvius for expressing roof of a circular building The term was also em- oyed to denote the laconicum of a bath, which was cir- lar in form

THOMÆANS, or THOMITES In Ecclesiastical tory A name given in Europe to the ancient church of rist's is established on the Malabar coast of India, and ought to have been originally founded by St Thomas, hough whether this was the apostle of that name is btful The language used by them in their sacred es when they were first discovered by Europeans, was Chaldee or Syriac The Portuguese have effected a rtial conversion of them to Romanism

THO'MISTS The followers of Thomas Aquinas Angelic Doctor, one of the most distinguished of the oolmen of the 13th century They differed from the al sect of Scotists chiefly in the milder form under ich they adopted the doctrines of realism The Scotists garded the universal as objectively and independently l, the Thomists sought rather to ground the objective a spiritual or rational principle, in some degree ap- oximating to the Platonic doctrine of ideas The omists continued as a sect to the commencement of 17th century, and numbered several eminent men in ir ranks, among whom may be mentioned Algidius of lonna and Francis Suarez

THOMSONITE (So called from the discoverer) variety of zeolite from Dumbarton it generally occurs radiated masses of small prismatic crystals

THOR In Scandinavian Mythology the son of Odin d Freya, and the divinity who presided over all mis- evous spirits that inhabited the elements His power epresented as irresistible Many of his deeds are pre- ved in the *Edda* (which see), but it is probable that worship of this divinity under the name of Donan, or l of thunder, spread also into Germany, where traces of n are still to be found in numerous local appellations, Donnersberg, Thorstein, &c As the worship of this l extended, nothing was more likely than that the rmans should confound him with the Jupiter of the mans, who were then invading their country, and ace in Germany the day sacred to Jupiter was deno- nated Donnerstag, while the [illegible] the same deity has been ret[illegible] English n [illegible]

THORACIC DUCT The great trunk which con- s the contents of the lacteals and absorbents into the od. In the human body it is about the diameter of a w-quill, and lies upon the dorsal vertebræ between the aorta and azygos vein, extending from the posterior opening of the diaphragm, in a somewhat serpentine course, to the angle formed by the union of the left sub clavian and jugular veins, into which it pours its con- tents See CHYLE and LYMPH

THORACICS, *Thoracici* [illegible] The name given by Linnæus to th[illegible] the ve[illegible] als

THORAX [illegible] The second segment of insects is so called by Latreille and Andouin, the term is restricted to the upper surface of the trunk by Linné and Fabricius In Arachnidans the thorax and head are confluent, and form but one segment, which is termed the cephalothorax As a cavity appropriated to the reception of the circulating and respiratory organs, the thorax is only distinct in Mammals

THORAX The chest, the part of the body between the neck and the abdomen It contains the heart and lungs, [illegible] the thymus gland, the thoracic duct part [illegible] and vena cava, the vena azygos, the eighth pair of nerves and a part of the great intercostal nerve

THORAX In Grecian Antiquities, a piece of defensive armour consisting of two parts, one defending the back, and the other the belly, called *lorica* by the Romans The more ancient were made of padded linen, but they were also made of leather brass, iron and other metals

THORINA (From Thor, the Scandinavian deity) An earthy substance discovered in 1828 by Berzelius in a rare Norwegian mineral called *thorite*, which is a hydrated silicate of thorina Like the other earths, thorina is the oxide of a heavy grey metal, which has been termed *thorium* and which is not acted upon by water, but when heated in the air it burns with great brilliancy into a white oxide Thorina obtained in this way is white, infusible, and very heavy its specific gravity being 9·4 It is insoluble in all acids except [illegible] and [illegible] with difficulty Its equivalent is [illegible] Thorina is distinguished from alumina and glucina by its insolubility in caustic potash, and from zirconia by being precipitated by ferrocyanuret of potassium

THORN APPLE See STRAMMONY AND DATURIA

THORNBACK The name of a species of ray (*Raia clavata* Linn) distinguished by the short and strong recurved spines, rising from a broad osseous tubercular base, which are scattered over the back and tail Two of these broad-based spines occupy the central ridge of the nose

THOROUGH BASS See BASS

THOTH, THOUTH TAAUT An Egyptian divinity, considered by the Greeks as identical with Mercury His hieroglyphic represents the beginning of the astronomical year He was regarded as the inventor of writing [illegible] philosophy, and is hence paralleled with Mercury [illegible] Cicero He is with the head of a lamb or [illegible], Plutarch *De Is et Osir*, Wilkinson, *Ancient Egyptians* vol v) Bryant says the same with Θεὸς (*Mythol* i 13)

THOUSAND AND ONE NIGHTS, more commonly called among ourselves the *Arabian Nights' Entertainments* from the title adopted in our first translation from Galland's version A well-known collection of oriental tales which has acquired in the west a popularity never attained by any other eastern composition The history of the work has been the subject of much investigation especially by De Sacy, Von Hammer and our last learned translator Mr Lane from whom we borrow most of this article It is the opinion of Mr Lane that the work in its present form is the composition of a single author living in Egypt, and that it was most probably "not commenced earlier than the last quarter of the 15th century of our era and completed before the termination of the first quarter [illegible] soon after the conquest of Egypt by [illegible] 1517" But the origin of the tales is a much [illegible] ject of inquiry It seems to be now [illegible] (on the discoveries of De Sacy and Von Hammer) that there was an ancient Persian [illegible] known by the name of the *Hezar* [illegible] Thousand Fanciful Tales") of unknown [illegible] earlier than the 9th century of our [illegible] that the framework of this collection was the same with that of the modern, namely, the story of the cruel king Shakryar and his ingenious queen Chehrazád, and that this was very early translated into Arabic by the name of the *Thousand Nights* But Mr Lane differs from these learned orientalists in still believing that the early work was only a model, that the greater proportion of the modern tales are really Arabian, especially all those founded on the supposed adventures of the Khalif Haroun [illegible] his queen Zobeyde, a few only being originally of Persian or Indian original, e g the *Magic Horse*, the *Damsel and the Seven Wezeers*. The difference seems to reduce itself to this, whether the present work is the last of several successive editions of the old *One Thousand Nights*, or has pretensions to be considered as a new construction on an old groundwork, the latter being Mr Lane's opinion (See De

edition of Galland's
o that of Trébutien,
Mr Lane's Preface, and "Review" at the conclusion of his third volume; the *Athenæum*, No 622)

But whatever the history of the work many of the main features of the stories are of primeval antiquity, and form, in fact, part of the popular literature of all countries The original Persian or Arab writers were connected by habits of travelling and merchandise through India with the far East, and through Greece with the extreme West, and the superstitions, anecdotes, and
halt, have contributed to enrich
The *Adventures of Sindbad* have been curiously illustrated with antiquarian learning by Mr Hole, and form one of the most singular examples of the ubiquity of good stories

It appears that the learned Arabs hold the *Thousand and One Nights* in small esteem, as an incorrect and unclassical composition, but it is a great mistake (a very natural one for distinguished orientalists, like Mr Lane, to fall into unconsciously) to imagine that their great charm to the people of the West consists in their faithful representation of Asiatic manners A far greater attraction lies in the fancy which dictated the narratives—a quality belonging to all times and places And hence it is that we are convinced Mr Lane is wrong in his low appreciation of Galland's version That it is very incorrect in point of costume is doubtless true, but the peculiar genius of Galland led him to detect the poetical fancy, the humour, the oddity the picturesqueness of the composition, under the cumbrous prolixity of Arab
in a manner by no means
so to give an oriental quaintness to his work, without the languor of the original
of Arab simplicity
We believe that while the versions of Mr Lane and other learned men will always be consulted with interest that of Galland will still be the cherished companion of all ages but especially of youth The numerous European imitations of the *Thousand and One Nights* are well known, and may for the most part be characterized as very unsuccessful perhaps the best is the French *Additional Arabian Nights*, containing the history of Mangraby the Magician &c

THRAVNIP The
arrangements of the
three classes of rowers in an Athenian trireme, the middle being called the zeugitæ, the lowest thalamitæ *See* GALLEY, TRIREME

THRA'SHING Separating grain or seeds from the straw or haum by means of a flail or thrashing machine, or by treading with cattle The latter was the mode employed in the ages of antiquity, and it is still practised in the south of Europe and in Persia and India The
with iron knots which they dragged over the corn, and which was spread on a circular floor, the driver standing in the centre, and guiding the oxen around him by means of reins It was customary to allow the oxen occasionally to breathe and take a bite of the corn, agreeably to the scripture precept A kind of flail or rod was also sometimes used by the Romans, and is doubtless the origin of
In colder and moister
where a floor sufficiently hard for threshing out corn could not be maintained in the open air, threshing appears to have been always performed under cover, and with the flail, till the latter end of the 18th century, when thrashing machines were introduced

THRA'SHING MACHINE A machine for separating corn or other seeds from the straw or haum, and either impelled by horse or cattle, wind water, or steam The modern thrashing machine was invented in Scotland about the year 1758 by a farmer in the parish of Dumblaine, Perthshire, and afterwards brought to nearly its present state of perfection by Mr Meikle, a millwright of Haddingtonshire about
machine consists of a cylinder
on its circumference, to which the corn being presented by rollers the ears are beat in pieces, and while the grain drops through a grating into a winnowing machine the straw is carried forward and delivered by itself ready to be made up into bundles Some thrashing machines
beat out the corn and separate it from the straw while others beat it out, winnow it, and sift it One of the most complete thrashing machines is that at Winstay,
which not only thrashes and winnows, but measures the corn and transports it to the granary in a fit state for being carried to market (See *Encyc of Agr* p 1311)

The employment of thrashing machines relieves the labourers from the severest drudgery incident to agriculture, they enable the work to be done at the time more readily and for corn and beans it be
straw, straw for particular wheat more
from the straw, they add both to the wealth of the farmer and the produce of the country; enabling the former to employ and the latter to feed, more labourers The latter is, indeed, a most important consideration It is calculated, by the best informed agriculturists, that 5 per cent, or one twentieth part, more produce is afforded by a crop thrashed by machinery than by the old method, and, estimating the total produce of the corn crops of Great Britain and Ireland at
we should, on this hypothesis have
supply of no less
machines universally
increase of produce in the hands of the farmers would obviously enable them to employ far more labourers than would be superseded by the use of the machine (*Brown on Rural Affairs*, vol i p 332)

As we remarked above, thrashing machines may be driven either by horse water, or steam power, but in all the great farms in the Lothians in Scotland, and in some parts of England, all other methods have merged in the last

THRE-COAT WORK In Architecture plastering which consists of pricking-up or roughing-in, floating, and a finishing coat

THRENODY (Gr θρῆνος *a dirge*, ᾠδή, *song*) A short species of occasional poem composed on the occasion of the funeral of some distinguished personage *See* EPICEDIUM

THRO'MBUS A small tumour, which sometimes ensues in consequence of the escape of blood into the cellular membrane in the operation of bleeding

THRONI (Gr θρόνος) In Architecture, a chair of state raised above the level of the floor whereon it stands, usually richly ornamented and covered with a canopy

THRUSH In Medicine This disease consists in small white ulcers upon the tongue palate, and gums and is common in infants who are ill fed or brought up by hand It is apt to extend through the whole course of the mucous membrane lining the alimentary canal exciting fetid eructations and flatulency with a troublesome diarrhœa and sometimes proves fatal The treatment consists in giving a gentle emetic of ipecacuanha and keeping the bowels clear and open with castor oil or
The strictest attention should be
to diet, which should consist of milk and light farinaceous food

THRUSH In Ornithology one of the largest and most melodious of our native song birds, the type of the genus *Turdus* Linnæus It is not
but is supposed to quit the more northern
for the southern provinces It makes its nest in March lays four or five blue eggs, spotted with black at the larger end It feeds on berries insects, and shell snails, and often selects a particular kind of stone against which it breaks the shell of the snail, and near which a great quantity
the shells may be found

THRUST (from the verb *to thrust*, or *to push*) In Architecture the horizontal force of an arch, by which it acts against the piers from which it springs Also a similar action of rafters or of a beam against the walls which bear them

THUG (From the Hindee verb thugna, *to deceive*) A member of a singular association of robbers and murderers, which has excited of late years much attention in India It appears that the existence of the system of *thuggee* as it is called, was hardly known before the year 1810, and that no combined measures were taken to put a stop to it until about 1830 Since that time it has been fully detected, and greatly checked chiefly through the admission of approvers from all the gangs Capt Meadows Taylor informs us that, between 1831 and 1837, 3266 Thugs were brought to justice, of
1059 transported, and 483 turned
by no means supposed to be extinct Its origin is unknown, and both Mohammedans and Hindoos belong to the society indifferently, although its tutelary goddess, Bhowanee, belongs to the latter faith The Thugs are peculiarly superstitious in their observances They are directed, in all their proceedings by auguries supposed to be vouchsafed by their goddess, and particular classes are altogether exempt from their attacks among whom are dancing girls, minstrels, sikhs, some religious mendicants, tailors, oilmen, blacksmiths, carpenters It is stated also that they seldom destroy women unless for their own safety, and they have very seldom ventured to attack Englishmen They usually move in large gangs, and attach themselves to travelling parties, they will journey with them for days, to find at last an opportunity to master them When all is ready one division of the murderers strangles the victim while another body prepares their graves, and by means of this division of labour the fearful work is accomplished with wonderful celerity It appears that numbers of Thugs resided together in villages, which they were prohibited by
by rajahs, to whom they paid tribute

nfessed to Col Lawson, who lost so many in m of exaggeration, that he had been concerned in the urder of 719 persons! The existence of so strange and strous a system can only be explained by the condition Ind a the extreme timidity and apathy of the ts, and their division into castes, the number of small tive governments, the habit of dwelling in villages, ided by extensive uninhabited tracts, the quantity of avelling that takes place in that commercial country, thout navigable rivers or secure conveyances, and the urderous spirit of Hindoo fanaticism (See *Col Sleeman's Ramaseana Vocabulary of the Thugs* and an ticle on it in the *Ed Rev* vol lxiv, and *Col Meadows aylor's Adventures of a Thug*, 2 vols London 1839, from which these details are chiefly taken)

THULE Name given by the ancients to the ost northern part of the habitable world, but it is the variety of opinions en- er any definite country was eant by this appellation Some have thought that orway, but most geographers are of opinion that Iceland, as the place alluded to But be this as it may it is ng since the prophecy of Seneca in the following lines s been fulfilled —

——— Venient annis

THULITE A rare mineral of a peach-blossom colour om Norway Its composition has not been ascertained

THUMERSTONE A variety of axinite from Thum, Saxony

THUMMIM *See* URIM

THU'NDER (Germ donner, Lat tonitru) The ise produced by an explosion of lightning, or by the ssage of lightning through the air from one cloud to nother, or from a cloud to the ground

The character of the sound of thunder varies with the ree and the distance of the explosion, the situation of e observer, the nature of the surrounding country, d it is probably influenced also by the relative situations the clouds

When lightning strikes an object near us on the earth, produces a noise resembling that of a violent crash ich is not repeated or prolonged by reflection When e explosion is more distant, [illegible] curring noise is heard, which [illegible] distance, like the prolonged echo of the sound of ordnce discharged in a mountainous district

Thunder frequently commences with an astounding ttle, which is probably occasioned by a series of explosns or discharges of electric matter in rapid succession om a highly charged thunder cloud

We have a familiar example of this *species* of noise in e cracking which accompanies the sparks discharged om the conductor of a well [illegible] electrical machine wards any adjacent [illegible] dy, the loudness of e snaps, as well as their frequency increasing with the ctric intensity And when we consider how trifling a ation of electric matter can be put in action by the st powerful means of artificial excitement compared with the quantity stored up in a full charged under cloud, the discrepancy between the appalling ash of the one and the insignificant snap of the other ll not appear surprising, though both originate in the me cause This cause is the vibration of the air proted by the passage of the electric discharge with a ater or less degree of intensity, and two explanations ay be given of the manner in which the vibration is oduced

The first explanation proceeds on the supposition that e electric fluid opens a passage to itself through air or her matter, in the manner of a projectile and that the und is caused by the rush of the air into the vacuum oduced by the instantaneous passage of the fluid But is objected that if this explanation holds good, the ssage of a cannon ball through the air ought to produce similar sound, whereas it only produces a sort of whistg noise, which even the most timid have never thought [illegible] thunder Another still stronger ob- [illegible] the experiments seem to indicate that e electric fluid is not transferred from point to point e a projectile of ponderable matter, but is conveyed ong by the vibration of an elastic medium, as sound conveyed through the atmosphere

[illegible] which appears more in harmony [illegible] founded on this vibratory progation of the electric fluid When the electric spark sses between two points, there is a [illegible] composition of electricity in all the [illegible] pears, and consequently a vibration more or less violent [illegible] which vibration gives rise to the sound n this supposition, the continued roll is the effect of the comparatively [illegible] through the air [illegible] lightning [illegible] instantaneously seen from one end to the other of this line At the same instant the flash is visible the vibration is communicated to [illegible] the whole extent of the line [illegible] placed in the direction of the line of the flash, and at the distance of 1125 feet from one end, then, since sound travels at the rate of about 1125 feet in a second (*see* SOUND), one second will elapse after the flash has been seen before any sound is heard When the sound begins, the vibration communicated to the nearest stratum of air has reached his ear, and since [illegible] line of disturbance to be 11250 in [illegible] of the more distant strata will continue to reach his ear in succession during the space of ten seconds Hence the [illegible] determines the duration of the sound, whilst the same flash will give rise to a sound of greater or less duration, according to the position of the observer with respect to its direction Thus, in the above instance, suppose a second observer to be placed under the line, and towards its middle he would only hear the sound during half the time it was heard by the first observer, and if we suppose the line to be circular, and the observer to be placed near its centre, the sound would arrive from every point at the same instant in a violent crash

Although the vibratory motion is communicated to all the strata of air along the whole length of the flash, they will not all receive the same impulsion, unless they are all at the same temperature and in the same hygrometric state, which can rarely happen Hence the first impression of the sound is not always the most intense, although it proceeds from the nearest point

During a thunder storm shelter should not be taken under trees or hedges, which are likely to act as conductors, but, at the same time, a person is safer when at the distance of about 30 or 40 feet from such objects than on an open plain Water should also be carefully avoided because it is a good conductor and the height of a man above it may determine the course of the lightning In a house, the safest position is near the middle of a room and the security may be increased by sitting on a feather bed or hair mattress, or thick woollen rug, all of which are bad conductors It is injudicious to take refuge in a cellar because the discharge is often from the earth to a cloud and buildings frequently sustain the greatest injury in the basement stories It is dangerous to be near the fireplace because the chimney is the part most likely to be struck, and the soot is a powerful conductor Gilt furniture, bell wires, and all large metallic surfaces are to be avoided for the same reason (See on this subject a highly interesting *Notice sur le Tonnerre*, by Arago in the *Annuaire*, for 1838, translated in the *Edinburgh Philosophical Journal*

THURLS Short communications between the adits in mines

THURSDAY The fifth day of the week, which derives its name from Thor the old Scandinavian god of thunder, equivalent to the Jupiter of the ancients, to whom this day was also consecrated

THUS (Gr θυω, *I sacrifice*, from its use in sacrifices) The resin of the spruce fir The term frankincense is also applied to it, and to *olibanum*, which is the gum resin of the *Juniperus lycia*

THWART In Naval Affairs, used for athwart or across also a bench for rowers

THYMELACEÆ (Thymelea one of the genera) A natural order of shrubby Exogens having a calyx only, and no corolla, although the flowers of many are coloured very gaily *Daphnes*, valued for their fragrance, *Mezereung* the various species of the Australian genus *Pimelea*, and the *Gnidias* and *Struthiolas* of the Cape of Good Hope, are favourite subjects of cultivation One feature of the order is the causticity of the bark, which acts upon the skin as a vesicatory, and causes excessive pain in the mouth if chewed The berries of *Daphne laureola* (the [illegible]) are poisonous to all animals except birds.

THYMUS GLAND A gland situated under the upper part of the sternum, in the anterior mediastinum. Its excretory duct has not been detected, nor is its use known It is of great comparative size in the fœtus

THYNNUS (Gr θυννος, *a tunny*) A genus of Scomberoid fishes, of which the highly valuable fish the tunny (*Thynnus vulgaris* Cuv) is the type The form of the body in this genus of fishes is like that of the mackerel but is less compressed, the first dorsal fin extends nearly to the second, the second dorsal and the anal fins are divided into numerous finlets, the sides of the tail are decidedly carinated, [illegible] rows of small pointed teeth in each jaw The [illegible] remarkable among fishes for its high temperature, its perfect respiratory organs, the quantity of nerves supplying the gills, and the general abundance of rich red blood throughout the body It is the object of [illegible] in the Mediterranean sea, and when salted and dried serves the inhabitants of most Catholic countries with the fast

days' meat The *bonito* (*Thynnus pelamys*) is a species of the present genus of fishes

THYRIS (Gr θυρις, *a window*) A genus of butterflies

THYROID (Gr θυρεος *a shield* and ειδος *form*) The thyroid or scutiform gland is placed peculiar to the cricoid cartilage of the larynx of which it is the upper and anterior part In men it is harder and more prominent than in women, it is sometimes called *Adam's apple* The thyroid gland is situated upon the thyroid and cricoid cartilages of the trachea, its duct has not been seen, and its use is unknown When enlarged it forms the bronchocele

THYRSUS (Gr θυρσος) A staff entwined with ivy, which formed part of the accoutrement of a Bacchanal, or performer in the orgies of Bacchus

THYRSUS In Botany, a form of inflorescence, consisting of a compact panicle the lower branches of which are shorter than those of the middle, in other words, it is composed of a primary axis developing secondary axes from its sides, which in their turn develop tertiary axes, the upper and lower branches being shorter than those of the middle as in the common lilac

THYSANURANS *Thysanura* (Gr θυσανος, *fringe*, ουρα, *a tail*) The name of an order of Ametabolian insects, comprehending those in which the abdomen is terminated by filaments, or by a forked tail adapted for leaping

TIARA The well-known ornament with which the ancient Persians adorned their heads It was in the form of a tower and adorned with peacocks feathers Xenophon says that it was sometimes encompassed with the diadem, at least in ceremonies and had frequently the figure of a half moon embroidered upon it This was the name also originally given to the mitre of the popes It was nothing more than a round high cap at first single instead of double like that of the other bishops Nicholas the First added the first gold circle, as the sign of the civil power The second was added by Boniface about 1300, the third by Urban V about 1365 (Bowden *Life of Gregory VII* i 60)

TIBIA (Lat) In Anatomy the largest of the two bones which form the second segment of the leg or sacral extremity In Entomology it is the fourth joint of the leg is very long and usually triquetrous Its name is said to have reference to its resemblance to the ancient pipe or flute

TIC DOULOUREUX A very painful affection of a nerve coming on in sudden and [illegible] it is perhaps most common in that [illegible] air which comes out of the infra-orbitary foramen Nothing is known of the cause of the douloureux except in one or two very rare cases where [illegible] bone has been found pressing on the nerves The treatment is equally uncertain, except where it assumes an intermittent form and then large doses of tonics, and especially carbonate of iron have proved useful

TICHORRHINE (Gr τειχος, *a wall*, ρις *a nose*) The name of a fossil species of rhinoceros (*Rhinoceros tichorrinus*), which is so called on account of the middle vertical bony septum or wall which supports the nose

TIDE MILLS are such as have the ebb and flow of the tide for their first movers As the tide rises, the water is admitted into a reservoir through a sluice over which the mill is built turning the water-wheel in its pas[illegible] thro[illegible] are shut till [illegible] they are opened, so as to allow the water to flow out again from the reservoir, and turn the wheel as it escapes through the sluice

In some tide mills the water-wheel turns one way as the tide rises, and the contrary as it falls, but in others an arrangement is adopted by which the wheel is made to turn always in the same direction In some the water-wheel rises and falls with the tide, and in others, the axis is fixed, so that it can neither rise nor fall In the latter case, the power is applied at an obvious disadvantage though rotatory motion to a certain extent may be given even when the wheel is wholly immersed in the water, from the *difference* of the velocity of the water at the top and bottom of the sluice (See *Gregory's Mechanics*, vol ii)

TIDES The alternate rise and fall of the waters of the ocean The moon is the principal agent in the production of the tides, but they are modified, both with respect to their height and the times at which they happen, by the action of the sun The effect of the planets is inappreciable

The attractive force of a body [illegible] inversely as the [illegible] the earth on the side next the moon will be attracted with a greater, and those on the opposite side with a smaller force, than those which are situated intermediately The gravitation towards the earth's [illegible] the particles nearest the moon will therefore be [illegible] and consequently will have a tendency to move along [illegible] will rise above the [illegible] level In like manner, the moon's attraction on the most distant [illegible] and the waters will consequently be heaped up on the side of the earth which is turned away from the moon Hence if the earth were at rest, the ocean would take the form of an oblong spheroid, with its longer axis passing through the attracting body, and it may be shown from theory that the spheroid would be in equilibrium under the influence of the moon's attraction, if the longer semi-axis exceeded the shorter by about 58 inches But in consequence of the rapid rotation of the earth about its axis, the spheroid of equilibrium is never fully formed; for before the waters can take their level, the vertex of the spheroid has shifted its position on the earth's surface, in consequence of which an immensely broad and very flat wave is formed, which follows the motions of the moon at some interval of time In the open sea the time of high water [illegible] the moon's [illegible] below the horizon The tidal wave, it is to be observed is entirely different from a current the particles of water merely rise and fall, but except when the wave passes over shallows or approaches the shore, there is little or no progressive motion

The waters of the ocean are affected in a similar manner by the action of the sun under the influence of which they have a tendency to assume at every instant the form of an elongated spheroid, but although the attractive force of the sun is immensely greater than that of the moon yet by reason of his greater distance the *difference* of the effect on particles situated on opposite sides of the earth (on which difference the phenomena depend) is very much less The solar tides are therefore comparatively small with respect to the lunar tides, and, in fact, are never perceived as distinct phenomena, but become sensible only from the modifications which they produce in the heights and times of those which primarily depend on the moon At the syzigies, when the sun and moon come to the meridian together, the tides are, *ceteris paribus*, the highest, at the quadratures or when the sun and moon are 90° distant the tides are least The former are called *spring tides* the latter *neap tides* Although we are not in possession of data to enable us to compute the exact height either of the spring or neap tides, yet their relative heights in the open ocean probably correspond very nearly to the ellipticities of the spheroids of equilibrium that would be formed under the action of the two bodies exerted separately Now the ellipticity of the aqueous spheroid formed by the moon's action is about five feet, and the ellipticity of that formed by the sun's action about two feet therefore, the spring and neap tides being the sum and difference of the separate effects the average spring tide will be to the average neap in the ratio of about 7 to 3, that is, of 5+2 5−2 *See* GRAVITATION

By reason of the excentricities of their orbits the distances of the sun and moon from the earth are continually changing, and the theory of attraction proves that the efficacy of either body in disturbing the waters of the ocean is inversely proportional to the cube of its distance Hence it is found that if the mean efficacy of the sun be represented by 20, the influence of the sun's action will vary between the extremes of 19 and 21, and that of the moon's between 13 and 29 [illegible] will therefore be to the lowest [illegible], that is, as 80 to 24, or as 10 to 3

Another effect of the solar action is observed in the times at which high water takes place from day to day In the spring and neap tides the time of high water is not altered by the sun's action, the solar and lunar tides being synchronous in the former case, and the time of actual low water being that of solar high water in the latter, but in the intermediate tides the time of actual high water is accelerated or retarded In the first and third quarters of the moon, the solar wave is to the westward of the lunar one, and consequently the observed tide, which is the result of the combination of the two waves will be to the westward of the place it would occupy if the moon acted alone, and the time of high water will therefore be accelerated In the second and fourth quarters, the general effect of the sun is to produce, for a like reason, a retardation in the time of high water This result of the combined action of the two attracting bodies is what is usually termed the *priming and lagging* of the tides and it is most [illegible] the times of new and full moon

It is to be observed, however, that the effect now described is modified to some extent by the inertia of the water The greatest and least tides do not happen exactly at the times of new and full moon; but at least two, and commonly three tides after, even at places directly exposed to the general tide of the ocean In consequence of the greater amount of impressed force, the acceleration of the lunar tide is greater than that of the solar, whence it may happen that when the lunar tide occurs two or three hours after the transit of the moon

the solar tide may be three or four hours after that of the sun, so as to be about an hour later at the times of conjunction and opposition The highest spring tides will thus occur when the moon passes the meridian about an hour after the sun while at the precise time of new and full moon the lunar tide will be retarded about a quarter of an hour by the solar tide But the time of high water does not follow the moon's transit at the same interval at every period of the lunation When the sun and moon are in conjunction the interval is called the *mean interval*, at other periods of the lunation the lunitidal interval is sometimes greater and sometimes less than the mean, and the difference is called the half-monthly or

ny port, in the
what is usually
Whewell calls

this the *vulgar* establishment, and the mean of all the intervals of tide and transit for a half lunation he terms the *corrected* establishment This corrected establishment is consequently the lunitidal interval corresponding to the day on which the moon passes the meridian exactly at noon or midnight

The two tides immediately following one another, or the tides of the day and night vary, both in height and time of high water, at any particular place with the distance of the sun and moon from the equator As the vertex of the tide wave always tends to place itself vertically under the luminary which produces it, it is evident that of two consecutive tides that which happens when the moon is nearest the zenith or nadir will be greater than the other and consequently when the moon's declination is of the same denomination as the latitude of the place, the tide which corresponds to the upper transit will be greater than the lower and *vice versa*, the differences being greatest when the sun and moon are in opposition and in opposite tropics This is called the *diurnal inequality* because its cycle is one day, but it varies greatly at different places and its laws which appear to be governed by local circumstances, are very imperfectly known

We have now described the principal phenomena that would take place were the earth a sphere and covered entirely with a fluid of uniform depth But the actual phenomena of the tides are infinitely more complicated From the interruption of the land and the irregular form and depth of the ocean, combined with many other disturbing circumstances, among which are the inertia of the waters, the friction on the bottom and sides, the narrowness and length of the channels the action of the wind, currents, difference of atmospheric pressure, &c &c, great variation takes place in the mean times and height of high water at places differently situated, and the inequalities above alluded to as depending on the parallax of the moon her position with respect to the sun, and the declination of the two bodies, are in many cases, altogether obliterated by the effects of the disturbing forces or can only be detected by the calculation of long series of observations

By reason of these disturbing causes it becomes a matter of great difficulty to trace the propagation of the tide wave and the connection of the tides in different parts of the world In the *Philosophical Transactions* for 1832, Sir John Lubbock published a map of the world, in which he inserted the times of high water at new and full moon at a great number of places on the globe, collected from various sources as works on navigation, voyages, sailing directions &c, and in order that the march of the tide wave might be traced more readily, the times were expressed in Greenwich time as well as the time of the place In the same *Transactions* for 1833, Mr Whewell prosecuted this subject at greater length, and availing himself of *a priori* considerations, as well as of a mass of information collected in the Hydrographer's office at the Admiralty inserted in the map a series of *cotidal lines*, or lines along which high water takes place at the same instant of time But these cotidal lines, as Sir J Lubbock remarks are entirely hypothetical, for we have few opportunities of determining the time of high water at a distance from the coast, though this is sometimes possible by means of a solitary island, as St Helena (*Lubbock's Elementary Treatise on the Tides*, 1839)

According to Mr Whewell's deductions from several

latitudes of 30 and 70 degrees, that a zone of water exists of sufficient extent to allow of the tide wave being fully formed Suppose, then, a line of contemporary tides, or *cotidal line*, to be formed in the Indian Ocean,
that is to say, in the direction of
certain distance to the eastward of the meridian in which the moon is As this tide wave passes the Cape of Good Hope it sends off a derivative undulation, which advances northward up the Atlantic Ocean, preserving always a certain proportion of its original magnitude and velocity In travelling along this ocean the wave assumes a curved form, the convex part keeping near the middle of the ocean, and ahead of the branches, which, owing to the
on the American and African
lines have always a tendency to make very small angles with the shore and in fact, run nearly parallel to it for great distances The main tide Mr Whewell observes, in reaching the Orkneys, will move forward in the sea bounded by the shores of Norway and Siberia on the one side, and those of Greenland and America on the other, will pass the pole of the earth, and finally end its course on the shores in the neighbourhood of Behring's Straits
the straits, and
But a branch tide is sent off from this main tide into the German Ocean, and this, entering between the Orkneys and the coast of Norway brings the tide to the east coast of England and to the coasts of Holland, Denmark, and Germany Continuing its course part of it at last passes through the strait of Dover, and meets in the British Channel the tide from the Atlantic, which arrives on the
but in passing along
is reflected from the
north coast of Germany and again meets the tide wave on the shores of Denmark Owing to this interference of different tide waves the tides are almost entirely obliterated on the coast of Jutland, where their place is supplied by continual high water

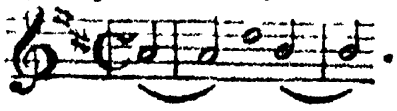
In the Pacific Ocean the tides are very small, but there are
the whole shore of Terra del Fuego from the western extremity of the Strait of Magalhaens to Staten Island, it is very remarkable that the tidal wave, instead of following the moon in its diurnal course, travels to the *eastward* This, however, is a partial phenomenon, and a little farther to the north of the last-named places the tides set to the north and west In the Mediterranean and Baltic seas the tides are inconsiderable, but exhibit irregularities for which it is difficult to account The Indian Ocean appears to have high water on all sides at once though not in the central parts at the same time

Since the tides on our coasts are derived from the oscillations produced under the direct agency of the sun and moon in the Southern Ocean and require a certain interval of time for their transfer it follows that, in general the tide is not due to the moon's transit immediately preceding, but is regulated by the position which the sun and moon had when they determined the primary tide The time elapsed between the original formation of the tide and its appearance at any place is called the *age* of the tide and sometimes after Bernoulli, the *retard* On the shores of Spain and North America the tide is a day and a half old, in the port of London, it appears to be two days and a half old when it arrives

Velocity of the Tide Wave — In the open ocean the crest of the tide travels with enormous velocity If the whole surface were uniformly covered with water the summit of the tide wave being mainly governed by the moon, would every where follow the moon's transit at the same interval of time and consequently travel round the earth in a little more than 24 hours But the circumference of the earth at the equator being about 25 000 miles the velocity of propagation would therefore be about 1000 miles per hour The actual velocity is perhaps nowhere equal to this and is very different at different places In latitude 60° south where there is no interruption from land (excepting the narrow promontory of Patagonia), the tide wave will complete a revolution in a lunar day, and consequently travel at the rate of 670 miles an hour On examining Mr Whewell's map of cotidal lines it will be seen that the great tide wave from the Southern Ocean travels from the Cape of Good Hope to the Azores in about 12 hours and from the Azores to the southernmost point of Ireland in 3 hours more In the Atlantic the hourly velocity in some cases appears to be 10° of latitude or near 700 miles, which is almost equal to the velocity of sound through the air From the south point of Ireland to the north point of Scotland the time is 8 hours and the velocity about 160 miles an hour along the shore On the eastern coast of Britain and in shallower water, the velocity is less From Buchanness to Sunderland it is about 60 miles an hour from Scarborough to Cromer 35 miles, from the North Foreland to London 30 miles, from London to Richmond 13 miles an hour in that part of the river (Whewell, *Phil Trans* 1833 and 1836) It is scarcely necessary to remind the reader that the above velocities refer to the transmission of the undulation, and are entirely different from the velocity of the current to which the tide wave gives rise in shallow water

Range of the Tide — The difference of level between high and low water is affected by various causes, but chiefly by the configuration of the land, and is very different In deep in bends of the shore,
the tide wave, and gradually contracting like a funnel, the convergence of the water causes

a [illegible] of the range Hence the very high ti[illegible] Channel, the Bay of St Malo, and the Bay of Fundy where the tide is said to rise sometimes to the height of 100 feet Promontories, under certain circumstances, exert an opposite influence, and diminish the magnitude of the tide The observed ranges are also very anomalous At certain places on the south-east coast of Ireland the range is not more than 3 feet, while at a little distance on each side it becomes 12 or 13 feet, and it is remarkable that these low tides occur directly opposite to the Bristol Channel where (at Chepstow) the difference between high and low water amounts to 60 feet In the middle of the Channel it amounts only to 2 or 3 feet At the London Docks the average range is about 22 feet at Liverpool 15 5 feet, at Portsmouth 12 5 feet, at Plymouth also 12 5 feet, at Bristol 33 feet



Theory of the Tides — The theory of the tides, considered as a consequence of solar and lunar attraction, was first sketched by Newton in the *Principia* In the 36th and 37th propositions of the third book, he determines the forces of the sun and moon to elevate the waters of the ocean, on the supposition that the sea is a fluid of the same density as the earth covering the whole terrestrial surface and which takes at every instant the figure of equilibrium He assumes, without demonstration, that this figure is an elongated spheroid One spheroid he supposes to be formed under the action of the sun, another under the action of the moon, and by reason of the smallness of their eccentricities they may be conceived as superposed the one on the other From these suppositions he deduced the general phenomena of the ebb and flow of the sea, and by comparing his theory with observations of the heights of the spring tides made at the mouth of the Avon near Bristol he determined the ratio of the attraction of the moon to that of the sun to be nearly 4 48 to 1, whence he deduced the mass of the earth to be to that of the moon as 39 788 to 1 the density of the sun to that of the earth as 1 to 4 and the density of the moon to that of the earth as 11 to 9 Newton's theory was defective in many points of view, but fifty years elapsed before it received any improvement In 1738, the subject of the tides was proposed as a prize question by the French Academy of Science which gave occasion to the celebrated treatises of Daniel Bernoulli Maclaurin, and Euler Maclaurin's Essay is remarkable [illegible] a demonstration of the theorem assumed by Newton that the elliptic spheroid affords an equilibrium under the action of the disturbing forces those of Bernoulli and Euler though they furnish no new principle of equal or similar importance in point of theory enter more into details and contain many useful illustrations That of Bernoulli indeed contains a table which has served as the model for all those (not purely empirical) which have since been formed The next important step in the theory of the tides was taken by Laplace, who first treated the subject as a general question of hydrodynamics and attempted to deduce the principal phenomena from the equations of the motions of fluids But in order to simplify the equations which are of a very complicated nature, he was forced to have recourse to the hypothesis of a fluid covering entirely a spheroid of a regular surface and consequently the results were far from representing the actual observations of the tides at any port The late Dr Thomas Young (*Ency Brit* art "Tides") extended Laplace's method to the more general case of an ocean covering a part only of the earth's surface and more or less irregular in its form, and attempted also to include in his calculation the effect of hydraulic friction on the times and magnitudes of the tides It is however, quite impossible to embrace in any calculation the whole of the accessory circumstances which influence the times and magnitudes of the tides the greater part of which are, in fact entirely unknown, and therefore, says Laplace all we can do is to analyze the general phenomena which should result from the joint action of the sun and moon and deduce from observations the data which are indispensable for completing the theory of the tides for each particular port

A great number of observations of the tides at the port of Brest during the last century, were discussed by Laplace in the *Mecanique Céleste*, but in order to determine the motion of the tide wave, and separate the general laws of the phenomena from local irregularities, it is necessary to have regular series of observations made at different parts of the ocean In 1829 Sir John Lubbock undertook the discussion of the tide observations which are made at the London Docks with the view of obtaining correct tables for predicting the time and height of the tides for the *British Almanac* The results which were published in the *Philosophical Transactions* for 1831, are deduced from a series of upwards of 13 000 observations, during a period of nineteen years, and are of great importance both as affording materials for the construction of tide tables and as pointing out the defects of the equilibrium theory with which they were accurately compared In some of the subsequent volumes of the *Transactions* the author has continued his investigations, and has also published, separately, an account of Bernoulli's *Traité sur le Flux et Reflux*, and an elementary treatise, which appeared in 1839 In the *Phil Trans* for 1833, Mr Whewell gave an *Essay towards a first Approximation to a Map of Cotidal Lines*, which has been followed by a series of interesting papers in the subsequent volumes to the year 1850 Mr Whewell's researches have been directed to the determination of the following points, [illegible] the tide wave at different parts of the ocean, [illegible] the observed laws at different [illegible] lastly, the laws of the diurnal inequality In 1834 the British Association procured an extensive series of observations to be made on the coasts of Britain and Ireland at 537 stations of the coast-guard These were repeated at the same places in June, 1835, and, at the request of our government, simultaneous observations were made by the other maritime powers of Europe and the United States The number of stations in America was 28, extending from the mouth of the Mississippi to Nova Scotia, and the number on the continent of Europe 101, between the straits of Gibraltar and the north Cape of Norway The results of these observations, reduced under Mr Whewell's superintendence, were published in the *Phil Trans* for 1836, and they are of great importance not only as affording a far more precise determination of the progress of the tide wave and the forms of the cotidal line on the coasts of Europe and North America than previously existed, but as furnishing more correct data for the construction of the tide tables (See *Phil Trans* for 1842, 1843 and 1845 for *Papers by Mr Airy on the Laws of the Tides at Ipswich and Southampton, in the River Thames, and on the Coasts of Ireland*)

Influence of Atmospheric Pressure and Winds — Besides the numerous causes of irregularity depending on the local circumstances the tides are also affected by the state of the atmosphere At Brest, the height of high water varies inversely as the height of the barometer and rises more than eight inches for a fall of about half an inch of the barometer At Liverpool, a fall of one tenth of an inch in the barometer corresponds to a rise in the river Mersey of about an inch, and at the London Docks a fall of one tenth of an inch corresponds to a rise in the Thames of about seven tenths of an inch With a low barometer the tides may therefore be expected to be high and *vice versa* The tide is also liable to be disturbed by winds Sir J Lubbock states that in the violent hurricane of Jan 8 1839 "there was no tide at Gainsborough which is twenty-five miles up the Trent — a circumstance unknown before At Saltmarsh only five miles up the Ouse, from the Humber, the tide went on ebbing and never flowed till the river was dry in some places, while at Ostend, towards which the wind was blowing, contrary effects were observed During strong north westerly gales the tide marks high water earlier in the Thames than otherwise and does not give so much water whilst the ebb tide runs out late, and marks lower, but upon the gales abating and the weather moderating the tides put in, and rise much higher whilst they also run longer before high water is marked, and with more velocity of current, nor do they run out so long or so low (*Elementary Treatise on the Tides* See also *Airy's Treatise on Tides and Waves* in the *Encycl Metropol*)

TIDE GAUGE A mechanical contrivance for registering the state of the tide continuously at every instant of time In the *Phil Trans* for 1838, there is a description of a very complete [illegible] machine for this purpose erected at Bris[illegible] M Bunt The principal parts are an eight day clock which turns a vertical cylinder revolving once in twenty four hours, a wheel to which an alternate motion is communicated by a float rising and falling with the tide, and connected with the wheel by a wire passing over a pulley and kept constantly strained by a counterpoise, and a small drum on the same axis with the wheel, which communicates one eighteenth of the motion of the float to a bar carrying a pencil which describes a curve on the cylinder and marks the fluctuations and the time and height of high water Various tide gauges, on [illegible] have been constructed by others, [illegible] Lloyd Mr Mitchell, Mr Palmer, Mr Bunt Mr Hewitson, and Mr Newman (See the *Nautical Magazine* for October, 1832, and *Phil Trans* for 1831 and 1838, and *Jury Report*, Class 10 *of the Great Exhibition of* 1851)

TIE In Architecture, a piece of timber or metal placed in any direction, whose office is to bind two bodies together which have a tendency to separate or diverge. *See* ROOF

TIE In Music, a character ‿ used in ancient music to connect syncopated notes, which were divided by a bar, thus .

TIER A row or range of guns, casks, &c Also the place on the orlop deck on which the cables are stowed.

TIERCE. In Heraldry, a term used for the field when divided into three parts

TIERS E'TAT In the French [illegible] or commonalty, in the French estates [illegible] meaning of the word are illustrated by M Gautier (*Mém de l'Acad. des Inscr* vol xxxvii) The important part which the representation of the tiers état played at the commencement of the French revolution is known to all Previous [illegible] ition, the French were [illegible] the nobles, the clergy, [illegible] their united capacity the states general of the kingdom, and their deliberations were separately conducted by individual vote in different chambers, in [illegible] [illegible] Now as the number of the deputies was nearly equal in each order, the result of the votes taken collectively was always necessarily favourable to the privileged orders Hence it was loudly demanded that the number of the third or tiers estate should be doubled, and the definite resolutions decided by individual instead of collective votes It was owing to the refusal of [illegible] this demand, that [illegible] accelerated and to the consummation of this event a celebrated pamphlet of Sièyes, entitled *Qu'est ce que le Tiers Etat*, in a [illegible] See ASSEMBLY

TIGER A [illegible] as large as the lion, but with a rounder head and longer body, of a bright reddish fawn colour above a pure white below, irregularly crossed with black stripes It is clothed with short hairs, and has no mane The tiger is the most formidable and cruel of all quadrupeds, and the scourge of the less inhabited parts of India It is limited to the A[illegible] See FELIS

TILIACEÆ (*Tilia*, the linden or lime tree) form a natural order of Exogenous plants, very nearly allied to the M[illegible], from which they differ in the stam[illegible] In useful qualities they resemble that order the bark being tough their sap mucilaginous, and their timber light Russia mats are made from the tough inner bark of the common lime tree, and a species of Corchorus, called *olitorius* is employed in India as a potherb A few have gay flowers, but the majority are plants of little interest

TILLAGE LANDS Lands kept under the plough, that is, cropped with annual or biennial plants, which require a continual change of the surface soil by stirring and turning with the plough or other [illegible] plements, and by the addition of manure [illegible] plants of Britain and of analogous climates are chiefly the bread corn, leguminous or pea flowered plants such as the bean, pea tares, clover, &c, plants cultivated for their roots or tubers, such as the turnip carrot potato, &c, or plants cultivated for their seeds, such as mustard, rape, or for the entire plant, such as wood, flax, hemp, and a variety of others

TILLER. In Naval Language, the bar placed in the head of the rudder to turn it

TILMUS (Gr τιλλω, *I pluck*) Picking of the bedclothes, or floccitation; a symptom of the fatal termination of some disorders

TIMBER In Carpentry, a word used to denote those pieces of wood that admit of being squared, or are capable of being employed in house and ship-building

The trade in timber is one of great extent and importance In fact, if there be one article more than another [illegible] of the [illegible] importance that a great [illegible] like England should be [illegible] to the lowest possible terms, that article is timber But [illegible] years, this sound principle has been most materially interfered with, partly for the sake of revenue, and partly to foster a trade with our North American colonies This fostering system was carried to such an extent, that from 1820 down to 1842, a duty of 55*s* a load was laid on foreign timber, or timber from the N of Europe, while timber from British America was admitted at a duty of 10*s* a load making a discriminating or differential duty of no less than 45*s* a load in favour of the latter! Such a preference would, under any circumstances, have been most injurious, but it has been especially so from the fact of the timber of our North American possessions being unsuitable for various important purposes And though greatly modified this objectionable system is not yet wholly abandoned. In 1842 Sir Robert Peel reduced the duty on foreign timber to 25*s* a load which was a wise and a judicious measure But the duty of 10*s* on colonial timber was then, also, reduced to 1*s*, so that the differential duty continued to be such as to hinder any material change in the course of the trade, while, as there was little decline in the price of colonial timber, the heavy loss to the revenue was not fully compensated by the advantage to the consumer In 1846 the duty on foreign [illegible] was further reduced to 15*s* a load, and [illegible] was reduced to 7*s* 6*d* a load, which is as low as it should be, or lower Certainly, however, there was good reason why the duty of 7*s* 6*d* should not be extended to colonial timber It may, no doubt be said that the better plan would be to repeal the duty, but we should be inclined to dissent from such a proposal Except, perhaps, on ships the duty, supposing it to be extended to colonial timber, is now so limited that it can have no sensible, or, at all events, no prejudicial effect It must, however, be allowed that it is against all principle to admit foreign built ships duty free to the privileges of British ships, at the same time that a duty is laid on the timber employed in building the latter But this contradiction might be obviated without sacrificing the timber duties, by the easy expedient of allowing ships to be built in bond The importation and consumption of timber in the United Kingdom in the under-mentioned years has been as follows —

TIME A limited portion of duration, measured by certain conventional or natural periods, and often marked by [illegible] as the revolution of the celestial bodies, [illegible] of the sun, or the rotation of the earth on its axis

Absolute Time is time considered in itself without reference to that portion of duration to which it belongs, however noted or marked

Relative Time is time considered with reference to the termini of some specific interval of duration

Apparent Time is time deduced from observations of the sun, and is the same as that shown by a properly adjusted sun-dial.

Mean Time is that shown by a well-regulated clock, and would be the same as that shown by the sun, if the sun were always in the equator, and his apparent diurnal motion in the heavens were uniform

Sidereal Time is the portion of a sidereal day which has elapsed since the transit of the first point of Aries [illegible] of what-[illegible]

TIME In Music, that affection of sound whereby [illegible] is determinated as regards its con[illegible] same degree of time The signs or characters by which the time of notes is represented are given under the article Music

Astronomical Time of Day is the time past *mean noon* of that day, and is reckoned on to twenty-four hours in mean time

Civil Time is mean time adapted to the purposes of civil life The day commences at the midnight preceding the noon of the day and is divided into parts of twelve hours each, the first twelve marked A M or *ante meridiem*, and the second P M or *post meridiem*

TIMOCRACY (Gr τιμοκρατια) A term made use of by some Greek writers, especially Aristotle, to signify a peculiar form of constitution, but there are two different senses in which it is thus used, corresponding to the different meanings of the word τιμη, *a price* or *honour*, from which it is derived According to the first it represents a state in which the qualification for office is a certain amount of property, in the latter it is a kind of mean between aristocracy and oligarchy, when the ruling class, who are still the best and noblest citizens, struggle for pre eminence amongst themselves (See *Quart Rev* vol xlv)

TIN (Germ zinn) This metal was known to the ancients, who procured it from Spain and Britain It appears to have been in use even in the time of Moses (Numbers xxxvi 22) It is rather a scarce metal, found in few parts of the world in any quantity Cornwall is its most productive source it also occurs in the mountains between Gallicia and Portugal and in those between Saxony and Bohemia Tin has also been brought from the peninsula of Malacca in India, and from Chili and Mexico There are only two ores of tin, the native peroxide, and the double sulphuret of tin and copper the latter sometimes called *bell-metal ore*, is extremely rare and it is exclusively from the former that the commercial demands are supplied In Cornwall, the native peroxide or *tin stone* (which is usually blended with oxides of iron and manganese), occurs in *veins* and in loose grains and nodules in alluvial soil the latter is called *stream tin* and from it the purest metal is obtained The ore is reduced by a very simple process, it is ground, washed and roasted in a reverberatory furnace it is then mixed with charcoal or Welsh culm and limestone, and strongly heated, so as to bring the whole into fusion, which is kept up for eight or ten hours the lime combines with the earthy matters of the ore into a fusible slag, whilst the coal reduces the oxide to the metallic state, and the fused metal is drawn out at the bottom of the furnace into a clay mould In this impure state it is exposed to a heat just sufficient to melt the pure tin, which runs off into a kettle while the less fusible impurities remain behind in the kettle the tin is kept in fusion, and agitated by plunging pieces of wet charcoal into it which causes a quantity of dross to rise to the surface, where it is skimmed off and the purified metal is then cast into blocks of about 3 cwt each

The stream tin is smelted by charcoal and the mass of grain tin obtained by such reduction is heated and let fall from a height, by which it splits into masses of a columnar fracture which characterizes the pure metal

Pure tin is a white brilliant metal It has a slight taste and smell when rubbed and its hardness is intermediate between that of gold and lead Its specific gravity is 7 2 It is very malleable, and one of its most useful forms is that of foil which is made by beating it s about a thousandth of an inch in thickness Its ductility and tenacity are inferior to most of the other malleable metals A tin wire 78 thousandths of an inch in diameter will not support more than 38 pounds without breaking It produces a peculiar crackling noise when heat Exposed to air it soon becomes superficially oxidized, and when melted successive films of a gray powder form upon its surface The temperature at which it melts is about 442° At a white heat it takes fire, and burns with a bright flame The equivalent of tin is 58 It forms two oxides The protoxide is thrown down by alkaline carbonates from an aqueous solution of protochloride of tin, and when dried and heated out of the contact of air its water is expelled, and it remains in the form of a dark substance, of the specific gravity 6 6 It burns like tinder and becomes converted into the peroxide It is soluble in sulphuric and hydrochloric, and in dilute nitric acid and in the pure fixed alkalies Its salts have a strong attraction for oxygen, and easily pass into persalts, so that it is a powerful deoxidizing agent, and is often used as such in some of the chemical arts When a solution of protochloride of tin is dropped into a solution of perchloride of gold, a purple precipitate, called from its inventor, *purple of Cassius*, is thrown down it appears to be composed of peroxide of tin with protoxide of gold and a little oxide of the deoxidizing power of the tin when a piece of tin foil is put into nitric acid there is violent action, attended by the decomposition of the acid and the peroxidizement of the tin, which is thus converted into a white powder this when edulcorated and dried at a red heat acquires a yellow tint It does not easily form permanent compounds with the acids but it unites with the pure alkalies, and forms soluble compounds, which have sometimes been mistaken for the peroxide itself *stannic acid* and *stannates* are respectively composed of 58 tin and 8 oxygen and 58 tin and 16 oxygen their equivalents therefore are 66 and 74 Tin and chlorine also combine in two proportions the *protochloride of tin* is formed by passing hydrochloric acid gas over metallic tin gently heated in a glass tube, or by heating a mixture of equal weights of tin filings and calomel, when it remains, after driving off the mercury, in the form of a gray solid, fusible at a red heat, and volatile at higher temperatures Its aqueous solution is commonly termed *protomuriate of tin* When tin is heated in excess of gaseous chlorine, or when 1 part of tin filings is mixed with 3 of corrosive sublimate and heated, a volatile liquid distils over which is *perchloride of tin*, and its aqueous solution forms the *permuriate* Exposed to air it is decomposed by the aqueous vapour of the atmosphere, and exhales dense white fumes hence it has been called, after its discoverer, *fuming liquor of Libavius* Both the protomuriate and permuriate of tin are used by dyers and calico-printers The former is prepared by heating granulated tin in strong hydrochloric acid as long as hydrogen continues to be evolved, the latter, by gradually dissolving granulated tin in a mixture of two parts by measure of hydrochloric acid, one of nitric acid and one of water These chlorides of tin are respectively composed of 58 tin and 36 chlorine and 58 tin and 72 chlorine and are therefore represented by the equivalents 94 and 130

When melted tin and sulphur are brought together, a black *protosulphuret of tin* is formed The *bisulphuret of tin* is a yellow glistening substance, sometimes called *Mosaic gold* (*aurum musivum*), and used in ornamental japan work It is prepared by heating in a glass retort 2 parts of peroxide of tin, 2 of sulphur and 1 of sal ammoniac and applying a low red heat till sulphurous acid ceases to be evolved The sulphuret and bisulphuret of tin are constituted of 58 tin and 16 sulphur and 58 tin and 32 sulphur, and have, therefore the equivalents 74 and 80 The total produce of the tin mines and works of Cornwall may at present (1842) be estimated at about 4000 tons a year, worth from 65*l* to 80*l* a ton

TINCA (Lat tinca *a tench*) A subgenus of Cyprinoid fishes characterized by having short anal and dorsal fins, very short barbules or tentacles about the mouth no bony serrated ray at the commencement of either the dorsal or anal fins, small scales Like the rest of the Linnæan *Cyprini* the *Tinci* or tenches have no teeth except in the pharynx whence the name of 'leather mouthed fishes' applied to this family of *Pisces Abdominales*

TINCAL The commercial name of rough borax as imported from India

TINCTURE A pharmaceutical preparation generally consisting of active remedies dissolved in rectified or proof spirit Tinctures are generally made by digesting bruised or pulverized vegetable substances in the spirit, either at common temperatures or aided by heat The term *tincture* is sometimes applied to alcoholic solutions of resins of which tincture of myrrh of assafœtida &c furnish instances Tinctures, from the quantity of alcohol which they contain are necessarily exhibited in small doses the most important of them are those which contain highly active ingredients, such as tincture of opium &c

TINCTURES in Heraldry are of three descriptions metals colours and furs The former are or, argent, the second gules azure sable vert purpure, sanguine, and tenny The chief furs are ermine and vair, but there are several varieties of both distinguished by different names Each metal and colour in blazonry (except the two last and least honourable sanguine and tenny) is represented by a distinct precious stone and heavenly body, and when the arms of sovereign princes or high dignities are described by old heralds, the tinctures are frequently denoted by the names of these jewels or celestial bodies See OR, ARGENT &c

TINEA The scald head See RINGWORM

TIN PLATE White iron The art of tinning iron originated in Saxony and was first made known here by Mr Andrew Yarranton, about the year 1665, but it was not till nearly a century afterwards that works were established for its production upon a large scale at Pontypool It is made by immersing for about one hour and a half very carefully cleaned plates of rolled iron in melted tin, by which they acquire a bright surface, and are applicable to a number of purposes for which iron plate, in consequence of the which it rusts, could not be used ture of the surface of thes by washing it over with a it with an alkaline ley and varnishing with a transparent varnish Thus modified, it forms an ornamental article called *moirée métallique* (On the manufacture of tin plate, see *Parkes's Chemical Essays*)

TIRONIAN NOTES The short-hand of Roman

a [illegible] Accord ng to the received story they were [illegible] Romulus Piro the [illegible] favour to [illegible] he is supposed to have imported [illegible] Greek MSS, which these, and [illegible] called the Tironian notes, are not infrequently of the date of the 7th century and downwards, and never are [illegible] in marginal notes Kopp (*Tachygraphia veterum Exposita*, p 1817) thinks that they are called from the word *tiro*, a learner His second volume contains a dictionary of these notes, which he appears to have succeeded in deciphering Some have thought that valuable lost classics may be recovered through this key, but as yet these hopes have been nugatory (See *Ed Rev* vol xlviii p 357 &c)

TI'SRI The first Hebrew month of the civil year, and the seventh of the ecclesiastical year It corresponds to part of September and October

TI'SSUE, in Plants the thin membranous organization of which every part is composed microscopical in size, and often appearing to the naked eye homogeneous, although it consists of a great variety of forms closely compacted Vegetable anatomists regard its primitive form as spiral and that the tubes and spiral vessels are mere extensions of that form Tissue appears to be in all plants of the same nature originally, but it soon becomes altered by the deposition of various secretions upon its sides

TI'TAN In Grecian Mythology, according to the more modern account, the eldest son of Uranus and Gaia, who relinquished the sovereignty of gods and men to his younger brother Saturn [illegible] His children [illegible] those of Titan He afterwards recovered the sovereignty from Saturn, but Jupiter the son of the latter vanquished him, and restored it to his father This however, is a tale altogether unknown to the original mythologists According to them, the Titans were many in number, children of Uranus and Gaia Hesiod makes them six The children of the Titans Atlas for example retained the same appellation The war of these Titans with Jupiter was the subject of many different and contradictory legends Its scene was laid in Thessaly, by Homer on the mountains Olympus Pelion and Ossa By some writers Titan is identified with Hyperion, but this point is involved in great obscurity

TITANITE Native oxide of titanium

TITA'NIUM A rare metal discovered by Gregor in a mineral from Cornwall called *menachanite* Its characters were first ascertained by Klaproth who gave it the above name In the year 1822 Dr Wollaston ascertained that the minute copper-coloured crystals occasionally found in the slag of the iron smelting furnaces at Merthyr and elsewhere were pure titanium and it is to him that we are indebted for a precise account of its properties [illegible] colour is extremely infusible, [illegible] 58, it is so hard as to scratch not only glass but crystal It resists the action of air and acids but is oxidized by the action of nitre at a red heat [illegible] of two degrees of oxidizement [illegible] blue or purple [illegible] called *anatase* [illegible] pure in *titanite* or *rutilite*, and is combined with the oxides of iron and manganese in *menachanite* The equivalent of titanium has not been very satisfactorily ascertained, but it is probably about 24 upon the hydrogen scale

TI'THES In Ecclesiastical Law, the tenth part of the produce of the land, which in this and other Christian countries, was anciently set apart for the endowment of the church By the Mosaical law, the Levites by whom the public worship of the Jewish state was performed, were supported, not as the other tribes, by the allotment of a certain district of Canaan but by the appointment of divers cities in various parts of the country for their abode, and the payment of tithes from the whole community This ordinance has frequently been appealed to under the Christian dispensation as establishing the divine right of the clergy to the receipt of tithes for ever, but this ground of claim has been generally abandoned in modern times, nor does the practice of the early church, at its first establishment in connection with the state, give any reason to suppose that such an idea was then entertained Nor, in this country do the people conversion, to have felt [illegible] of any strict payment of tithes It was [illegible] siastical [illegible] discovered in the laws of Offa, king [illegible] In France, a similar law was enforced [illegible] 778, and from that time the payment has been continued without interruption to modern times

Of tithes there are three kinds —1 *Predial*, of the vegetable productions of the land, as corn, hay, &c, 2d, *Mixed*, as of wool, pigs, &c, which, though natural products [illegible] 3d *Personal*, as of the profits [illegible] like And the third division [illegible] small

or parsonage and vicarage tithes of these the former are chiefly corn, hay and wood the latter are predial tithes of other kinds together with mixed and personal tithes The great tithes belong to the rector whereas only the small tithes are due to the vicar By the original law, all the land of [illegible] excepting the property of the [illegible] church itself But when at the Reformation the monasteries were dissolved, and their estates granted for the most part to laymen, these lands would have become tithable again, but for a particular statute which was enacted for the advantage of the new possessors It was also allowable, up to the 13 Eliz, to effect compositions between the clergy and owners of the land, by which the parish was discharged of these payments for ever, in consideration of lands made over to the parson in exchange This practice was, however, restrained by the statute above referred to, which limited all such compositions to a period of three lives or twenty-one years From these causes, however, it is that we find a great deal of land in the hands of lay proprietors not subject to this charge The monasteries, however held one third of the benefices of the kingdom, from all of which they received tithes, and appointed members of their own body, as their vicars or curates, to discharge the ordinary functions of ministers in them To these they either gave fixed stipends, or allotted the small tithes taking, as their own share the greater or rectorial This is called *appropriation* of tithes, but when these benefices fell into the hands of laymen the same practice was continued, and is distinguished by the title of *impropriation*

Tithes are either due *de jure* or by custom to the latter class belong all personal tithes

The subtraction of tithes from a parson, whether a clergyman or lay impropriator (*see* IMPROPRIATION), or from a vicar, is cognizable in the ecclesiastical courts But these courts cannot try the right to tithes except between spiritual persons, consequently if the defendant pleads any matter involving the question of right it must be tried by [illegible] suits are generally carried in the Court of Exchequer By the 53 G 3 c 127 justices of the peace have jurisdiction for the recovery of small tithes to the amount of 10*l*

Lands and their occupiers may be discharged from the payment of tithes either in part or totally, by a real composition or by custom or prescription The first is where an agreement is made between the owner and the parson or vicar, with consent of the ordinary and patron, that some land or other real recompence, be given in satisfaction of tithes By 13 Eliz c 10 as we have seen, no real composition made since that statute is good for any longer time than three lives or twenty one years Compositions between a tithe-owner and parishioner cease on the death of the incumbent with whom they were made

A discharge by custom or prescription is either, 1 *De modo decimandi* where a *modus*, or particular manner of tithing is shown to exist by custom, which must have existed immemorially [illegible] is not good if evidence be shown of its non existence at any time since the reign of Richard I Or 2 *De non decimando*, where a total exemption from tithes is shown

Such is a general view of the law of tithe previous to the great changes introduced by the Tithe Commutation Act 6 & 7 W 4 c 71 the object of which was to convert a tax, imposed on the gross produce of the soil, and varying annually in amount as well as money value along with it, into a [illegible] charge perpetual as to the amount, but varying according to the money value

By this act the money value of the tithes in each parish was to be calculated according to the average of the seven years ending at Christmas, 1835 *minus* the expences of collecting &c, but without deduction on account of parochial or county rates, &c The commissioners appointed for that purpose under the act were then to award that sum (subject to some unimportant allowances) as the amount of the rent charge to be paid in respect of the tithes This rent-charge was to be [illegible] among the lands of the parish, having [illegible] to their average tithable produce and productive [illegible] rent-charge, being thus valued in money, was to be taken as the price of such a quantity of wheat, barley, and oats as it would have purchased (each grain in equal quantities), according to the average price at the period of the confirmation of the apportionment That quantity of grain was therefore to remain for ever as the annual charge upon the parish In order to regulate the money amount of the tithes, the money payment each year was to be equal to the price of that quantity at the average of the seven years immediately preceding, to be ascertained by an advertisement of the comptroller of corn returns published in the month of January every year The rent-charge to be paid by the occupiers of the land on which it is respectively apportioned

It will be apparent from this brief outline of the provisions of the act that a very great benefit was conferred by it, for all immediate purposes, upon the tithe owner,

and for many upon both parties The strifes and heart-burnings between the occupiers of the soil and the clergyman which were occasioned by the old mode of collecting the impost, have been removed The latter has been relieved alike from the consequences of indulgence towards his debtors, and the imputation of rapacity In point of fact, the result of the valuation has been a considerable improvement in the incomes of the clergy who comparatively seldom received their full due The tenant and landowner gain by the removal of a most injurious tax on improvement, for the tithe, while it increased along with the produce of the land, acted as a great discouragement to increasing that produce

But looking to the future, its advantages are far more questionable The tithe owner will gain, no doubt, by any increase which may take place in the money price of corn But he will be a loser by any fall in the price of corn, while any increase in the quantity of commodities produced in the country, the price of corn remaining the same, will leave his condition stationary, while other classes advance It is thought that, in the last century, the agricultural produce of England has trebled The tithe has nearly trebled along with it If the same progression should continue for a century more, the produce of the country will again have trebled, rents and other incomes will have increased in proportion population will have followed the same law of advance —tithe will remain stationary, the income of the church will be no greater than what is now deemed sufficient for her support, while the exertions required of her will have greatly augmented

And a permanent rise in the money price of corn, which might compensate this relative loss is probably the last thing to be anticipated Indeed should that price fall materially from the introduction of foreign grain it will, probably, be necessary to commute anew if the income of the tithe-owners is to be maintained at all

To those who consider the sufficient temporal maintenance of the church a matter of high national interest, this prospect is a serious one, but even those who think otherwise cannot possibly regard it with indifference Tithes are the property of the nation, and it cannot be for the advantage of any country that state property should not partake in the advance of individual wealth — that it should, relatively speaking, continually decrease.

The Tithe Commissioners report (1851), that they have received notices that voluntary commutations have been commenced in 9 634 tithe districts, have received 7 070 agreements and confirmed 6 778 5,029 drafts of compulsory awards (such as they are empowered to cause to be made on the non-agreement of the parties), and confirmed 5,260 Thus, in 12,038 tithe districts the rent charges to be hereafter paid have been finally established by confirmed agreements or confirmed awards The report concludes with various suggestions for bringing the office of the commissioners to a satisfactory close According to the returns under the property tax (1810) it appeared that about 8,000 000 acres in England and Wales were tithe-free, and 21 000 000 tithe able Mr *M'Culloch's Statistics of the British Empire* contains the following analysis of appropriations, &c of tithes —

Belonging to the crown - - -	38
Archbishops and bishops - - -	385
Ecclesiastical corporations aggregate - -	702
Dignitaries and other eccl corporations sole -	488
Universities colleges, and hospitals - -	281
Private owners - - - -	2502
Municipal corporations (since sold) - -	43
Vicarages partly endowed - - -	121
Ditto wholly endowed - - -	132

TITHING A territorial division, of which the origin is pretty generally attributed to Alfred It was a district supposed to contain ten freeborn men of whom each was pledge for the others (*see* FRANKPLEDGE) One of these was annually appointed *tithingman*, *borsholder*, or *headborough* (from borg, *a pledge*) Ten tithings constituted (as is supposed) a hundred

TITULAR Chiefly in Ecclesiastical usage, a person invested with the title to a benefice, generally used for one who has the title only, without possession or enjoyment

TMESIS (Gr τμησις, *I cut*) In Grammar, a figure by which a compound word is separated into two parts by the intervention of one or more words, as in the following line of Terence, "Quæ meo cunque animo lubitum est facere," for [illegible] This figure is a licence frequent in Terence and Lucretius rare in later writers, in the Greek it is more common, but of all Western languages, the German lends itself most readily to the division of compound words In English the figure is unused

TOADSTONE A provincial term applied to certain igneous or basaltic rocks associated with the limestone formations of Derbyshire *See* GEOLOGY

TOBACCO The dried leaves of the *Nicotiana tabacum*, a plant indigenous to America but which succeeds very well and is extensively cultivated, in most parts of the Old World The recent leaves possess very little odour or taste, but when dried, their odour is strong, narcotic and somewhat fœtid their taste bitter and extremely acrid When well cured they are of a yellowish green colour When distilled they yield an essential oil, on which their virtue depends, and which is said to be a virulent poison The leaves are used in various ways, being smoked and ground and manufactured into snuff It is in the last mentioned form that tobacco is principally used in Great Britain, and, though the contrary has often been asserted, its use does not seem to have been productive of any perceptible bad consequence

The term *tobacco* is probably derived from Tabaco, a province of Yucatan, where it was first found by the Spaniards To Sir Francis Drake and Sir Walter Raleigh has been ascribed the honour of having introduced it into England, nearly three centuries ago For full particulars as to the history and statistics of this important article of commerce, see the *Com Dict*

TOCSIN An old French word, of which the derivation seems not to be ascertained (Gregory of Tours uses the word "seing" for the sound of a bell (see *Encycl Méthodique*), signifying an alarum-bell (Germ sturmglocke) The use of the terrible tocsin, during the troubles of the Revolution, to assemble the multitude, has rendered the word almost proverbial

TOD A weight used in weighing wool It contains 28 lbs avoirdupois

TOFT, in old English appears to signify the ground or enclosed space on which a messuage has formerly stood

TOGA The gown or mantle peculiar to the Roman people whence it was sometimes designated as the *gens togata* or toga-clad nation The toga was a loose flowing woollen garment covering the whole body round, and close below but open at the top down to the girdle The end was drawn up and thrown over the left shoulder, leaving the right arm at liberty as it had no sleeves The ordinary colour of the toga was white, but this was changed for a dark colour in mourning The chief dignitaries of the state were distinguished by a purple band affixed to the edge of the toga which was then called *prætexta* An embroidered toga was worn by generals when they triumphed (See *Rich's Companion to the Latin Dictionary* for the different species of toga) It was the national characteristic of the Romans in the republican age, and when Augustus thought he perceived its disuse commencing among the crowds assembled at the theatre, and the substitution of the ordinary "lacerna," he repeated with emphasis the line of Virgil—

Romanos rerum dominos gentemque togatam

Among women, the toga was only worn by the disreputable the dress of the matron was the stola

TOISE A French measure of length containing six French feet or 1 949040 metres The French toise is equivalent to 6 3915925 English feet

TOKAY A wine made at Tokay in Hungary, it is luscious and yet has an agreeable quickness of flavour It is usually more or less turbid and is the only wine which is preferred in that state, and consequently agitated before it is poured into the glass

TOLERATION (Lat tolero, *I bear*) is used in a general sense to express impunity and safety in the state for all dissenters from the established church, who do not maintain any doctrines inconsistent with the peace and welfare of the state Hence toleration implies a right of enjoying the benefit of the laws and of all social privileges without any regard to difference of religion The first toleration act in England passed in 1689, but it was not till 1829, when the Catholic Emancipation Bill was passed that dissenters could be said to be on equality with churchmen in every respect The Jews are now the only sect in England precluded from the full enjoyment of civil rights in consequence of their religion

TOLL (Germ zoll) The name usually given to the duties imposed on travellers and goods passing along public roads bridges, &c It is also used to indicate the payment to the corporation of a town or to the lord or owner of a market or fair, upon sale of things tollable The right, whether to take toll, or to be exempt from its payment rests upon prescription or grant from the king Toll is sometimes taken by a man for every beast driven across his ground, and is then called *toll-traverse*, also by a town for beasts going through it, or over a bridge or ferry maintained at its cost, and is then called *toll-thorough* *See* FAILLE

TOLMEN, or DOLMEN In Antiquities Borlase, in his *History of Cornwall*, gives this name to large stones with passages apparently hollowed through them, which are commonly believed to be Druidical remains There are many such in Britanny See also *Archæologia*, vol ii and vol viii p 210, where there is a description and representation of a celebrated one at Primham Rocks, in

Yorkshire It has [illegible] contrivances, by [illegible] oracular answers

TOLU BALSAM The concrete balsam of *Myroxylon peruiferum*, a tree growing in the warmest parts of South America This substance is pale brown, brittle in cold, but tenacious in hot weather, fragrant when heated, and entirely soluble in alcohol It appears to contain that modification of the benzoic acid which has [illegible]

TOMB (Gr [illegible] tumulus) Is used to express both the grave or sepulchre in which the body of a deceased person is interred, and a monument erected in his memory In many countries it was customary to burn the bodies of the dead, and to collect the ashes into an urn (*see* URN) which was deposited in a tomb The tombs of the Jews were generally hollow places hewn out of a rock The Greeks constructed their tombs outside the walls of their cities, with the exception of those raised to distinguished personages The same distinction was observed by the Romans, their sepulchres were in the country near the high roads, and none but emperors, vestals, and great personages had the privilege of burial within the walls In Etruria, several tombs of the ancient inhabitants have been discovered containing beautiful vases, for full particulars respecting which, the reader may consult Mrs H Gray's interesting *Tour to the Sepulchres of Etruria* See for the tombs of the Egyptians Sir G Wilkinson's *Manners of the Ancient Egyptians* vol iii p 183

TOMBAC An alloy of copper and zinc, or a species of brass with excess of zinc When arsenic is added, it forms *white tombac*

TOMENTOSE (Lat tomentum, *sheared wool*) Covered with short inconspicuous interwoven hairs

TON A denomination of weight equal to 20 cwt, or 2240 lbs avoirdupois *Ton* is also the name of an English measure of capacity containing 252 gallons, but when used in the latter sense, the word is usually written *tun*

TONDINO (Ital) In Architecture, the same as *astragal* which see

TONE (Gr τονος) In Music a property of sound which brings it under the relation of grave or acute or the gravity or acuteness it may have from the number of vibrations of the sonorous body producing it It is more particularly used for expressing that degree or interval of time by which sounds may be raised or lowered from one extreme of concord to another, so as still to produce melody

TONES, ECCLESIASTICAL In Music the eight modes, now generally called the Gregorian Chant in which the service of the Catholic church is performed four whereof are authentic and four of them plagal Pope Gregory has been considered the inventor of them They are the foundation of all music, and will ever be considered stupendous monuments of composition

TONGUE In Architecture *See* GROOVE

TONGUE In Anatomy the organ of taste, a soft fleshy viscus moveable in all directions composed of muscular fibres covered by a nervous membrane, upon which, especially at the tip and sides, are numerous nervous papillæ The tongue is largely supplied by blood vessels, its arteries being branches of the ranine and labial, and its veins emptying into the great linguals which proceed to the external jugular, the nerves come from the fifth, and eighth and ninth pairs The tongue performs important functions, not only in tasting, but in articulating, and in eating or chewing or swallowing food, and in re[illegible]

TONIC From *Tone*) In Music the principal note of the key It is the chief sound upon which all regular melodies depend, and in which they all terminate Its octaves, both above and below are equally called by the same name It is however to be understood that the termination here alluded to has relation only to the chief melody, or to its bass, inasmuch as the inner or mean parts of the harmony conclude on the third or mediant, and the fifth or dominant

TONICS (Gr τονοω, *I strengthen*) Medicines which strengthen and increase muscular action To this class belong vegetable bitters, stimulants, astringents, &c

TONNAGE, implied originally the number of tons weight a vessel might safely carry Prior to January, 1836, the rule established by act of parliament for the measurement of the tonnage of ships was founded on erroneous principles, and led to the most mischievous consequences

[illegible] nearly the same, th[illegible]adth, and hence increasing the breadth of a vessel increased her *nominal* tonnage for the payment of dues more than it increased her real capacity Under this pernicious system vessels came to be built narrow and deep, and thus not only [illegible] In 1823 a committee, of which the [illegible] Dr Young was chairman, proposed to measure the internal capacity by taking the breadth and depth at each quarter of the length, but for some reason no step was taken. In 1832 another committee was appointed to consider the subject, and they concluded their labours in 1834 by recommending [illegible] method of Mr Riddle of the Royal Hospital, Greenwich Mr Riddle observed that since a great number of direct measures for capacity would afford a result very near the truth, an approximation might be obtained by means of a smaller number of measures provided additional weight was given in the calculation to those dimensions which extend through a greater part of the hull He obtained the multipliers of these dimensions, the midship breadth and depth, by trial, from the vessels measured for the guidance of the committee, and the method is therefore founded on an arithmetical fact The rule, briefly expressed, is as follows —

Divide the upper deck, between the after part of the stem and the fore part of the sternpost, into six equal parts At the foremost, middle, and aftermost points of division, measure, in feet and decimals, the depths from the under side of the upper deck to the ceiling at the limber strake Divide each depth into five equal parts, and measure the inside breadths at 1-5th and 4 5ths (from the upper deck) [illegible] 2-5ths and 4-5ths of the [illegible] length, as above, at half the midship depth To twice the midship depth add the extreme depths, for the sum of the depths To the upper and lower breadths at the foremost division add three times the upper and lower breadths at the midship division, and the upper and twice the lower breadth at the aftermost division, for the sum of the breadths Multiply the sum of the depths by the sum of the breadths, and the product by the length, and divide this product by 3500, the result is the tonnage for register

In vessels with a poop or a break in the upper deck, measure the mean length, breadth and height multiply these together, and divide by 92 4, and add the result to the former quantity In open vessels, the depth is measured [illegible] In steam vessels [illegible] the [illegible] of the engine room (the depth being considered as the midship depth, and the breadth that at 2 5ths of this depth), divided by 92 4, is to be deducted

The relative capacities of ships are determined very nearly by this method, that is, within little more than 4 or 5 per cent generally, though, in extreme cases, the difference may amount to 10 or 12 per cent even this, however is insignificant, as compared with the usual errors of the former method The divisor by which cubic content is reduced to nominal tonnage was adopted, merely that while the reputed tonnage of most kinds of vessels would be corrected by the new rule, the total registered tonnage of the kingdom might remain unaltered By the new method the dues paid on tonnage are proportioned to the capacities of the vessels, and as no advantage is gained in these respects by defective forms, a marked improvement in merchant vessels has followed the passing of the bill in 1835

TONSILITIS Inflammation of the tonsils *See* QUINSEY

TONSILS (Lat tonsilla) An oblong subovate gland on each side of the fauces, and opening into the cavity of the mouth by several large ducts

TONTINE Is derived from the name of the inventor Lorenzo Tonti proposing a loan raised on life annuities with the benefit of survivorships *See* ANNUITIES

TOOTHING In Architecture, bricks alternately projecting at the end of a wall, in order that they may be bonded into a continuation of it when the remainder is carried up

TOP In Naval Language, a small light platform near the lower mast-head

TOPARCHY (Gr τοπος, *a place*, and αρχη, *government*) In Antiquity signified a small state or lordship consisting only of a few cities or towns, or a petty country under the sway of a toparch Thus Judæa was anciently divided into ten toparchies

TOPAZ (Gr τοπαζιον) A crystallized mineral harder than quartz of a yellow or wine colour, composed of 60 alumina, 35 silica, 5 fluoric acid When heated the Brazilian topaz becomes rose red, and is sometimes in this state passed off as a ruby, the Saxon topaz loses its colour by heat When without flaws and of a good colour, it is much employed in jewellery The Saxon is usually paler than the Brazilian which often has a pinkish hue, the Siberian topaz is usually colourless, and the Scotch has a blue tinge

TOPAZOLITE (Gr τοπαζιον and λιθος, *a stone*) A subvariety of garnet of a pale yellow colour, found in Piedmont It is a silicate of alumina, lime, and iron, with traces of glucina and manganese

TOPCHAINS Chains used in action, by which the lower [illegible]

TOPE [illegible]

TOPHET A polluted unclean place near Jerusalem, into which the Jews used to throw the carcasses of beasts, or the bodies of men to whom they refused burial; and

where a fire was perpetually kept up to consume all that was brought Hence Tophet is sometimes used metaphorically for hell This place had also been defiled by human sacrifices which had been offered to Moloch Hence Milton says of this hideous deity, that he

made his grove
[illegible] Tophet thence
[illegible] stupid Idols

The name is derived by some from Heb toph, *a drum*, on account of the beating of drums and other instruments by which the cries of the children sacrificed to Moloch were stifled

TO'PHUS A soft tumour upon a bone In Mineralogy, the term *tophus* has been applied to porous deposits of calcareous matter from water

TO'PICS (Gr *τοποι, a place*) In Rhetoric By abstracting from a proposition which conveys a truth in the concrete (*i e* respecting certain circumstances expressed in the terms of the proposition) a portion of those circumstances denominated accidental, we arrive at the same truth in the abstract, or (in stricter language) more widely [illegible] to many different sets of [illegible] Thus, for example, in jurisprudence, from an investigation of the truth in various insulated cases in which a too strict application of legal principles has been attended with evil effects, we deduce the general truth that such application is so attended or in the proverbial phrase "summum jus summa injuria" Among the helps employed by the ancients in their favourite study of rhetoric was the collection and arrangement of a great variety of such general truths according to the several sciences or subjects to which they belonged These they termed *topoi*, or places, from which the modern term *topic* is derived They considered it useful for the student in rhetoric to have at hand by means of his memory those compendious expressions of universal sentiment and the general reasonings or declamations applicable to each of them, in order to employ them for particular use by performing the converse of that operation by which they were arrived at, viz clothing them with the particular circumstances of the case Thus the *topos* just cited might be useful to the forensic orator it affords a subject for reasoning and declamation applicable to a great number of individual instances Many of these topics answer to what in modern phrase we should term axioms, and indeed some of the axioms of pure mathematics are enumerated by Aristotle among the topics which are proper to every species of oratory

TOPOGRAPHY (Gr *τοπος a place* and *γραφω, I describe*) Strictly the description of a place or the science of describing places (distinguished from *chorography* or the description of a district, and from *geography* the description of the earth)

TOPPING LIFT A rope for raising the end of any yard or boom

TOP, SPINNING A well-known toy The steady motion which a well-spun top soon acquires suggested to Mr Sisson, about eighty years ago the employment of a mirror placed upon it at right angles to its axis as an artificial horizon which might probably be used at sea and on sending out the first of the late polar expeditions, the attention of Mr Troughton was turned to the subject But though useful observations might have been made on land with the instrument which he constructed it was not found at sea to give results of any practical value, and we are not aware that any further attempts have been made to improve [illegible] which is attended with considerable [illegible]

TOPOGRAPHY (Gr *τοπος sculpture*, and *γραφω, I describe*), signifies either the science or art of sculpture, or a description of ancient and modern [illegible] in relief

TORNATILE (Gr *τορνευτος polished*) In Sculpture [illegible] to such objects as are executed with high finish, delicacy and polish [illegible] properly to all figures in hard wood ivory &c

TORMENTIL ROOT The root of the *Potentilla tormentilla* It is occasionally used in medicine as an astringent

TORNA'DO (Spanish) A violent hurricane or gust of wind, which, arising suddenly from the shore, veers round to all points of the compass, and indeed has been described as blowing from all points at once Tornadoes are usually accompanied with thunder storms and are generally of short duration They are frequent in the Chinese seas and the West Indies *See* STORMS

TORNATELLA A genus of oval marine Univalves belonging to the *Pleuroceæ*, found in the oolite and superjacent strata Recent tornatellæ are found in shallow water creeping upon and furrowing the sand

TORPE'DO (Lat torpedo, *numbness*) A genus of Cartilaginous fishes, separated from the *Raiæ* of Linnæus on account of the circular form of the body, and more especially from the presence of the electrical organs on which that form of the body mainly depends Violent shocks are experienced on touching the living and active torpedo It is probable that it exerts its electric powers in order to secure [illegible] prey; [illegible] same power is employed in defending itself against assailants, to whose assaults it would be otherwise more exposed than are the ordinary rays, for the torpedo has a smooth skin, and is not defended by the spiny tubercles or barbed and pointed body weapons, with which the non electric rays are provided

TORQUES In Antiquities a chain or collar formed of a number of small ringlets interlaced with each other, framed of metal, and worn round the neck No ornament perhaps was of more early or general use It is mentioned in Genesis, xli 42, as one of the ornaments conferred by Pharaoh on Joseph It was in use among the Greeks and Romans [illegible] nations The legends respecting [illegible] who invaded Rome are well known It was from his victory over a Gaul that [illegible] derived his surname (*Livy*, lib vii ch 10) And no relic is more commonly found in this country by antiquarian explorers Boadicea wore a large golden torques (*Dio Cass* lxii) See the *Archæologia*, vol xiv p 97 and *passim*, for descriptions of particular specimens

TORREFACTION (Lat) The operation of roasting ores to deprive them of sulphur, arsenic, or other volatile ingredients When ores are [illegible] only dried or partially toasted or roasted, they are also said to be torrefied

TORRICE'LLIAN VACUUM In Physics, the vacuum produced by inverting a tube of sufficient length, filled with mercury or any other fluid, in a vessel containing a portion of the same fluid and allowing the fluid in the tube to descend until its weight is counterbalanced by that of the atmosphere In this manner the first barometers were formed by Torricelli, and thence called *Torricellian tubes* See BAROMETER

TORRID ZONE In Geography the zone of the earth included between the tropics of Cancer and Capricorn It extends from the equator, on both sides, to the parallel corresponding to the sun's greatest declination about 23½ degrees See ECLIPTIC, ZONE

TORSION (Lat torsio, *from torqueo I twist*), in Mechanics is the twisting or wrenching of a body by the exertion of a lateral force If a slender rod of metal suspended vertically, and having its upper end fixed be twisted through a certain angle by a force acting in a plane perpendicular to its axis it will on the removal of the force untwist itself or return in the opposite direction with a greater or less velocity and after a series of oscillations will come to rest in its original position The limits of torsion within which the body will return to its original state depend upon its elasticity A fine wire of a few feet in length may be twisted through several revolutions without impairing its elasticity and within those limits the force evolved is found to be perfectly regular and directly proportional to the angular displacement from the position of rest If the angular displacement exceeds a certain limit the particles of the body will be wrenched asunder, or if the elasticity is not perfect (as in a wire of lead for example) before disruption takes place, the particles will assume a new arrangement or *take a set* and will not return to their original position on the withdrawal of the disturbing force

The resistance which cylinders or prisms formed of different substances oppose to torsion furnishes one of the usual methods of determining the elasticity and strength of materials, and the property which a metallic wire or thread stretched by a small weight possesses of becoming twisted and untwisted in a series of isochronous and perfectly regular oscillations has been ingeniously applied in the torsion balance to the measurement of very minute forces and thereby to the establishment of the fundamental laws of electricity and magnetism, and to the determination of the mean density of the earth *See* BALANCE OF TORSION

The laws of torsion have been experimentally investigated by Coulomb in a variety of substances The method which he employed consisted in attaching a body of given form and dimensions to the extremity of the wire, and, after twisting it through a certain angle, to abandon it to the action of the force evolved and observe the time of the oscillations The following general laws were found to hold good —

1 On loading a wire or thread with different weights, it will settle in different positions of stable equilibrium, that is to say, an index attached to the weight will point in different directions If the weight be varied, and the angular deviation may amount even to a whole circumference

2 The oscillations are isochronous

3 The time of oscillation is proportional to the square root of the weight which stretches the wire

4 The time of oscillation is as the square root of the length of the wire.

5 The time of oscillation is inversely as the square of the diameter of the wire

From the second of these laws it follows that when the wire is twisted round from the position of rest, the force with which it tends to return to that position is proportional to the angle to be described in order to attain it For it is a general result of mechanics, that all motions produced by forces acting according to this law have the property of isochronism, that is to say, the oscillations are performed in equal times, whatever be the length of the arc This fundamental property is usually enunciated by saying that the force of torsion is proportional to the angle of torsion

Let F denote the force of torsion, measured by the weight which it would be necessary to apply by means of a pulley to a point p, situated at the unit of distance (one inch) from the axis of the wire, and invariably connected with it, to cause the point p to describe an arc of a circle equal in length to the unit of distance, then, by the property enunciated, the force which must be applied at p in order that the point may describe any arc φ is expressed by $F \times \varphi$ If the arc of torsion is expressed in degrees instead of parts of the radius, we have $\varphi = \pi \varphi^\circ - 180^\circ$ (π being the semicircumference to radius 1, or = 3 14159), whence the expression of the force becomes $F \times \pi \varphi^\circ - 180^\circ$

On this principle of the proportionality of the impelling force to the angle of deviation the problem of determining the time of an oscillation is solved Suppose a body of any form attached to the extremity of a slender wire, whose weight in comparison of that of the body may be neglected, and let $d m$ be an element of the mass, r the distance of $d m$ from the axis of the wire and T the time of an oscillation, the solution of the problem gives

$$T = \pi \sqrt{\left(\frac{\int r^2 \, d m}{F}\right)}, \text{ or } T^2 = \pi^2 \frac{\int r^2 \, d m}{F},$$

where the integral $\int r^2 \, d m$ is the *moment of inertia* of the attached body If the body be a cylinder whose axis coincides with that of the wire and if a denote its radius and M its mass then $\int r^2 \, d m = \frac{1}{2} M a^2$, or, expressing the mass in terms of the weight and observing that if the weight be denoted by P and the accelerating force of gravity by g (= 32 1908 feet or 386 2894 inches in a second), we have $P = M g$, $\int r^2 \, d m = \frac{P a^2}{2 g}$ Hence the expression for the time becomes $T = \pi a \sqrt{\frac{P}{2 g F}}$

If the attached body were a slender cylindrical needle suspended horizontally by its middle to the wire, we should, on denoting its length by $2 l$, have $\int r^2 \, d m = \frac{1}{3} M l^2$, whence $T = \pi l \sqrt{\frac{P}{3 g F}}$

The following results are deduced from the formula — 1 The force of torsion is independent of the weight which stretches the wire or F remains constant while P is varied For suppose P to become P′ and let T′ be the corresponding time of oscillation, and T′ the corresponding force, we have then

$$T^2 = \frac{\pi^2 a^2 P}{2 g F}, \quad T'^2 = \frac{\pi^2 a^2 P'}{2 g F'},$$

whence $T^2 : T'^2 :: P F' : P' F$ But by the third experimental law, $T^2 : T'^2 :: P : P'$, therefore $F' = F$

2 The force is inversely as the length of the wire For, supposing P to remain constant we have $T^2 : T'^2 :: F' : F$ But, by the fourth experimental law, $T^2 : T'^2 :: l : l'$, whence $F' : F :: l : l'$

3 The force is proportional to the fourth power of the diameter of the wire Let there be two wires of the same substance, but of different diameters, D and D′, and stretched by the same weight P, and let T and T′ be the corresponding times By the fifth experimental law, we have $T : T' :: D'^2 : D^2$ But it has been shown that $T^2 : T'^2 :: F' : F$, therefore $T : T' :: D^4 : D'^4$

To show the method of applying the formulæ, we shall compute one of the experiments of Coulomb An iron wire was stretched by a vertical cylinder of 0·5 of an inch radius, and weighing 2 lbs, and it was observed to make 20 oscillations in 242 seconds, or one in 12 1 seconds It is proposed to determine the force F From the formula for the time of an oscillation we have, by transposition, $F = \frac{\pi^2 a^2 P}{2 g T^2}$ Substituting numbers in this formula, we have $\pi^2 = 9\,8696$, $a^2 = 64$, $P = 2$, $g = 386\,2894$, $T^2 = (12{\cdot}1)^2 = 146\,41$, consequently $F = \frac{12\,633}{113113} = 0001117$ of a pound, or about 78 of a grain Hence the weight applied at the distance of one inch from the axis of the wire that would be required to twist the [illegible] complete revolution, or 360°, is 6 283 times [illegible] nearly five grains

For the demonstration of the fundamental formula, namely, $T^2 F = \pi^2 \int r^2 \, d m$, see Coulomb, *Théorie des Machines Simples*; or Biot, *Traité de Physique*, tom i

TORSO (It ` I Sculpture a statue of which nothing but the trunk or the principal figure remains

TORT (Fr wrong) In Law signifies injustice or injury

TORTOISE This name is usually applied to species of that division of the Linnæan genus *Testudo* including the terrestrial Chelonians, to which the generic name is now limited *See* TESTUDO

TORTOISE SHELL The name given to the horny scutes or plates of the sea turtles, and in particular to those of the hawk's bill turtle, *Chelone imbricata*

TORTRICES (Lat torqueo, *I wreath*) The name of a tribe of nocturnal Lepidopterous insects, comprising those the larvæ of which live concealed in leaves, which they roll around them for the purpose

TORTURE (Lat torqueo, *I twist* or *torment*) In a legal sense, the infliction of pain on an accused person in order to extort an avowal of guilt, or revelation of accomplices Such a practice is sufficiently common among all half-civilized nations, but the Greeks and Romans were perhaps the first who introduced it as a part of their regular proceedings in criminal cases Both at Athens and Rome torture was, however, considered as applicable only to extort evidence from slaves towards them it was used profusely, and it was, in fact, a usual occurrence to order a whole family of slaves to the torture, in order to extract revelations where an atrocious crime had been committed, as for instance, the murder of the master Cicero in several passages, condemns the use of torture, and Ulpian (Lex I *De Quæstionibus*) says, 'Res est fragilis et periculosa et quæ veritatem fallit nam plerique patientia sive duritiâ tormentorem ita et tormenta contemnunt, ut exprimi eis veritas nullo modo possit, alii tanta sunt impatientiâ ut quid vis mentiri quam pati tormenta malint' (As to the torture at Rome see *Gibbon*, vol ii p 59 4to ed) Notwithstanding these recorded opinions of the highest luminaries of ancient jurisprudence, torture was adopted along with the rest of the process of the civil law in most European countries (For its use in France see QUESTION) The general principle of the civilians was, that it could not be used unless *vehement suspicion* [illegible] But no very definite meaning was [illegible] to these words, especially in Germany, where the abuse seems to have been carried to the greatest extent by the [illegible] in her smaller states When Howard visited the prisons of that country (about 1770), it was still in general use (See his *Account of Prisons*) The writings of various philosophical authors of the 18th century, especially Voltaire Thomasius, and Beccaria (whose short treatise, *Dei Delitti e delle Pene*, obtained such singular notoriety), effected much towards bringing its employment into disrepute, but its general abolition can only be attributed to the superior regard for the rights of man introduced every where by the agitation of the French Revolution In England, judicial torture was not recognized by the common law (for the peine forte et dure hardly falls within the same definition), and that it was also nearly unknown in practice in the 14th century at least, may be inferred from the reluctance of Edward II to submit the Templars to torture, which was overcome by the instances of Pope Clement V, and from a curious paper of questions addressed on that occasion by the archbishop of York to some divines from which it appears that *no torturer could at that time be found in England* (See Raynouard *Memoires sur les Templiers*; *Hallam's Constitutional History*) The rack is said to have been introduced as an engine of state by the Duke of Exeter in the reign of Henry VI However this may be during the whole of the 16th century we find that the Privy council assumed and exercised the right to direct torture-warrants to the lieutenant of the Tower and other officers, commanding them to submit to the torture persons accused not only of state offences, but of ordinary municipal crimes when strong suspicion but no sufficient evidence, existed Torture-warrants were also issued, not by the council, but under the sign manual only During this period the council seems, in fact to have acted as a supplementary tribunal in aid of the regular courts, for the purpose of extorting discoveries of criminal offences The instances of torture of seminary priests, &c, in Elizabeth's reign, have been often cited, but it is not so generally known that the practice was not confined to accusations of treason and sedition, but extended to other cases (See *Jardine's Reading on the Use of Torture in England*, 1837) Under James I and Charles I torture seems to have become less frequent, and to have been only employed in state offences and this perhaps, [illegible] the well known [illegible] of the judges to Charles's [illegible] on the prisoner of the Duke of Buckingham, that he ought not to be tortured, "for no such punishment is known to our law." The last recorded case is that of William Archer, 1640, and as in that year the act for the abolition of the Star Chamber

granted a habeas corpus to all persons detained on warrants from the privy council, torture must then have been virtually abolished. In Scotland it was so in the 7th year of Anne.

TO'RUS (Lat. [illegible] moulding used in the [illegible] is semicircular. This term is also used in botany for the central part of the flower on which the carpels are placed.

TORY. A well-known party name in English history. (*See* WHIG.) The Irish [illegible] bers and half insurgents, who [illegible] Irish at the [illegible] the [illegible] which [illegible] were the first to whom this [illegible] appeared. It is said to have been transplanted into England about the time of the Popish Plot, when the public mind was agitated by chimerical fears respecting the apprehended employment of Irish Catholics to further that imaginary design, whence it was commonly applied by way of reproach to the court party, against which the popular hostility was then directed, as favouring and countenancing the supposed abettors of the plot. From the period of its introduction into England down to the present times the term Tory has been constantly employed to designate a large political party in this country. Down to the period when Hume wrote his *Essay on the Parties of Great Britain*, the conduct of the two great parties in the state (the Whigs and Tories) had been so vague and undetermined as to have led him to declare his utter inability to tell their nature, pretensions, and principles. Since that period however, the conduct of the Tories has been more uniform, and it might now be easier to define the principles by [illegible] century. [illegible] the last two or three years the word Tory has [illegible] placed by *Conservative*, which seems [illegible] permanent designation of the Tory party. This term was originally assumed in contradistinction to *Destructives*, a name by which the more violent reformers came to be designated by their enemies; and it is now understood as referring to the whole Tory party, but more especially to what may be called the more liberal portion of that party.

TOTIPA'LMATES, *Totipalmati* (Lat. *totus*, *entire*, and *palma*, *a palm*.) The name of a tribe of *Palmipedes* or swimming birds, including those in which the hinder toe is enveloped in the same web with the three anterior toes.

TOUCH. In Medicine. The belief in the possibility of curing various maladies by the touch has produced a variety of singular superstitions. Plutarch attributes singular virtues to the touch of King Pyrrhus of Epirus. According to Suetonius, Adrian and Vespasian had the power of curing various diseases in the same manner. In what period the opinion respecting the virtue of the touch of the kings of France and Engla[illegible] lepsy, scrophulas, &c. had its origin [illegible] certain. André Dulaurent, chief physician of Henry IV. of [illegible]. The ceremo[illegible] was practised at the four great feasts of the year, sometimes as many as 1500 were touched at a time. By an odd etiquette the Spaniards had the first rank, then other foreigners, and the French last of all. The formula used at each imposition of the royal hand was, "Le roi te touche, et Dieu te guerit." Polydore Virgil attributes this virtue to Edward IV. and all our kings down to the end of the Stuart dynasty touched for the king's evil. Much efficacy has been attributed in different diseases, particularly tumours, &c., to the touch of the hand of a dead body, especially, according to Pliny and various modern authorities, of one who had died violently. We do not know whether the superstition is yet extinct under the influence of which scrophulous persons used to have themselves touched by the hands of criminals after execution. Boyle endeavours to explain away part of the miracle by attributing some virtue to the coldness of the application.

TOUCH. One of the five senses, residents [illegible] papillæ of the skin, it is also the [illegible] the whole body. It is much more exquisite in some parts than others.

TOUCH. In Naval language, the sails are said to *touch* when the wind comes edgeways upon them.

TOUCH NEEDLES. Small bars, consisting of gold and silver alloyed with various definite proportions of copper, are thus termed by assayers, who use them to judge by comparing their colour and streak upon a piece of hard black stone, such as basalt, with that of alloys of the precious metals, of the relative quantity of gold or silver in the latter. Hence also the term *touchstone*.

TOURMALINE. The more perfect forms of *schorl* go under this name. It is the *lyncurium* of the ancients. Its chief constituents are silica and alumina, with about 10 *per cent.* of soda, and a little oxide of manganese and of iron. The transparent coloured varieties are sometimes cut into ring-stones, and some of them are much [illegible] light [illegible]. It anciently made thrice every year by the sheriff, for the purpose of holding in each hundred the great court leet of the county. The jurisdiction exercised by the sheriff on his tourn extended by the common law to the cognizance of all offences not capital, but sheriffs are prohibited by Magna Charta from holding any pleas of the crown in which they [illegible] interest in procuring a conviction, [illegible], and was at the same time supplied by the establishment of annual circuits. The tourn though never disallowed by law, has, with the curtailment of its jurisdiction, and the abandonment of the leet as a registry of pledges, long fallen into disuse, and the right of the jury or suitors at the tourn to present nuisances, or convict of minor offences, has, with other functions of courts leet, been transferred to the quarter sessions.

TOURNAMENT (in modern Latin torneamentum), or TOURNEY, originally derived from the Fr. tourner, modern Latin tornare, *to turn*. A well-known military sport of the middle ages, which without doubt arose from the exercises of military training. A joust or just is pro[illegible] purpose of exhibiting such justs, or the encounter of several knights on a side. The earlier tournaments were highly dangerous and sanguinary sports. They were performed with the ordinary weapons of warfare, the lance and the sword, and the combatants had only the strength of their armour to rely on for their defence. It was a recognized custom, according to Meyrick (*Hist. of Ancient Armour*), that whoever slew or disabled an adversary in the tournament was indemnified against all consequences. The account of the tournament given by the Count of Chablais in Savoy to Edward I. on his return from Palestine to England as given by Thomas de Walsingham represents a sort of violent melee, in which knights, squires, and archers were engaged on both sides endeavouring to unhorse the riders and overthrow the footmen by every possible means. But in the course of time this chivalric amusement became the subject of minute regulations, which in some degree diminished the danger and insured the fairness of the sport. The English *Statuta Armorum de Torneamentis* are assigned by Dr. Meyrick to the year 1295. (*See* SAINTE-PALAYE.)

Impartial taste, says Gibbon, must prefer a Gothic tournament to the Olympic games of classic antiquity." (*Decl. and Fall*, ch. 50.)

In tournaments when under the strict regulation of knightly usage two sorts of arms were employed, those expressly made for the purpose, viz. lances with blunt heads of iron, and the ordinary arms of warfare, termed 'armes a outrance,' which were only employed by such champions as were desirous to signalize themselves in a more than ordinary degree, and frequently were not permitted by the judges of the tournament. Every knight attending was required to show his noble birth and rank, as a title to admission. These were at first proclaimed by the heralds with sound of trumpet, and hence the word blazonry, which signifies the correct deciphering of the heraldic symbols on a coat of arms, is derived by some from the German blasen, *to blow*. Afterwards when armorial bearings became general the shield of the knight gave token of his rank and family. The attendance of ladies at the tournaments, their distribution of prizes to those who had borne themselves best, arming and unarming the knights, &c., are various romantic circumstances well known to the reader of chivalric legends; but they must not be supposed to have been the necessary, or even usual accompaniments of these knightly sports at least until a later age, when the taste for [illegible] tacle, [illegible] more than gorgeous pageants. When we arrive at the reigns of Edward III. and Henry V., we find the justs usually held in honour of ladies, and every knight bound to possess in reality or in show a dame of his affections, for whose sake all his deeds of chivalry were performed. Dr. Meyrick quotes from a manuscript of the reign of Elizabeth the ordinances of justes, made by John Earl of Worcester, constable of England, in the sixth year of Edward IV., from which it appears that the law of justs had become by that time the subject of very minute regulation. The prize belonged to him who broke most spears "as they ought to be broken," [illegible] on the head or body of the antagonist. From Stow we find that the lists erected in Smithfield in 1467, when the Bastard of Burgundy challenged Lord Scales, were 380 feet in length by 260 in breadth; these champions rode at each other two days with spears, and on the third encountered on foot with [illegible] axes. In the reign of Henry VIII. when the real spirit of chivalry was far advanced [illegible] its decline the tournament was [illegible] almost wholly with the character of a court pageant, but celebrated with a degree of splendour and costliness scarcely equalled in

former times The famous volumes of woodcuts of the same period, styled the *Triumphs of Maximilian*, show that it was as favourite and almost as magnificent a spectacle at the court of Germany The tragical death of Henry II of France, in consequence of a blow received in a tournament, is well known, and was the cause of the final, although only gradual abolition, of this knightly amusement, which was revived at intervals in court solemnities in the seventeenth century, but rather as a memorial of past times than as a subsisting and popular custom

T [illegible] recently attempted [illegible] of Eglinton, but [illegible] of that attempt was [illegible], or was such as to induce any party to renew it At the court of Wurtemburg tournaments are not unfrequently exhibited at this day

See Sainte-Palaye, *Memoires sur la Chevalerie*, *Turner's History* (*Middle Ages*), vol i p 472, *Hist de l'Ac des Inscr* vol xix, and Walter Scott's admirable delineation in *Ivanhoe*, which gives a more vivid idea of the tournament, with all its variety of martial exercises, than any serious work extant

TOURNIQUET (Fr) A bandage which may be tightened to any extent by means of a screw, so as to exert pressure upon a cushion and compress the arterial trunks to which it is applied it is chiefly used to prevent haemorrhage in the operations of amputation

TOW To draw a vessel along by a rope As the vessel towed affects the motions of the other, much attention is required on her part to second the intentions of the towing vessel

TOWER (Lat turris) In Architecture, a lofty building square, polygonal or circular on the plan, and often consisting of several stories The tower of a church is that part which contains the bells, and from which the steeple rises

TOWERS ROUND In Ireland, remarkable edifices of extreme antiquity, of which the origin has perplexed antiquaries to an unexampled degree They are tall narrow edifices, varying in height from 80 to 120 feet That at Kildare, we believe, is the highest, cylindrical in shape, with a door 8 or 10 feet from the ground and narrow apertures at the top There are sixty-two of these curious relics ascertained to exist in Ireland, and two in Scotland at Abernethy and Brechin They cannot have been watch-towers, their position being generally low, nor belfries their shape and construction rendering such a supposition impossible, although some appear to have been used in that way in later times, and the notion that they were places of confinement for penitents or hermits seems extravagant Common belief however, attaches to them an ecclesiastical origin and use, and the well-known passage of Giraldus Cambrensis, a writer of the 12th century (who says that the fishermen of Lough Neagh reported that in clear weather remains of buildings and among others round towers of the country fashion, were seen at the bottom), necessarily implies a greater antiquity Irish antiquaries, however as may be supposed have luxuriated in hypotheses connecting them with ancient forms of pagan worship, such as the pyrolatry of the Persians, the Phallic rites, &c (See *Moore's History of Ireland*, vol i ch 2, for a variety of these opinions, and their authors See also Mr Petrie's able work)

TOXICOLOGY (Gr τοξικον *poison* and λογος, *a discourse*) Poisons have been divided by Orfila and Christison into irritants narcotics and narcotico-acrids the first class including those whose sole or predominating symptoms are those of irritation or inflammation, the second those which produce stupor, delirium, and other affections of the brain and nervous system, and the third, those which are of a mixed character

The chief effects of *irritants* are upon the alimentary canal, exciting inflammation, and sometimes ulceration of the tongue, fauces, and œsophagus difficult deglutition, nausea, vomiting, and heat and pain of the stomach, with more or less tension of the abdomen, and pain on pressure The sickness is generally accompanied by extreme anxiety and anguish and the matters vomited consist, in the first instance, of any food that may have been in the stomach with portions of the poison itself, and afterwards of viscid mucus, often streaked with blood and tinged with bile, the pain afterwards extends throughout the intestines, and mucous, bilious, and often bloody diarrhœa succeeds The skin is [illegible] the pulse quick and feeble the breathi[illegible], and the countenance expressive of extreme anxiety

Narcotic poisons induce a train of symptoms of a very distinct character: headach, vertigo, confused vision, stupor, convulsions, paralysis, and coma, are their leading effects; but each particular poison is usually attended by certain peculiarities in the succession, violence, or generic character of the symptoms, which assist the experienced practitioner not only in determining the nature of the poison, but in discriminating between its effects and those of disease

The symptoms of the *narcotico-acrid poisons* usually consist of those of the two former classes blended, and are often of a very complicated character, for the most part, however, their narcotic and irritant effects appear to be incompatible In large doses, narcoticism predominates, in smaller, irritation it is rarely that both are coexistent

In the following tabular view of the principal poisons of the above classes, they are enumerated in the order in which they are described by Dr Christison, to whose *Treatise on Poisons* the reader is referred for details which would [illegible] can be allotte[illegible] heads, however, of many of the individual substances mentioned in the following list we have elsewhere given particulars respecting their composition and properties, and sometimes referred to their toxicological history

I Irritant Poisons

Mineral acids	Arsenic and its compounds
Phosphorus	Mercurial compounds
Acetic acid	Salts of copper
Oxalic acid	Antimonial poisons
Fixed alkalies	Salts of tin
Nitre	Salts of gold
Alkaline and earthy chlorides	Salts of silver
	Salts of bismuth
Lime	Salts of chromium
Ammonia and its salts	Salts of zinc
Alkaline sulphurets	Lead poisons
Barytes	Diseased and decayed animal matter
Vegetable acrids	
Cantharides	Mechanical irritants
Venomous serpents	

II Narcotic Poisons

Opium	Hydrocyanic acid
Hyoscyamus	Carbazotic acid
Lactuca	Poisonous gases
Solanum	

III Narcotico-acrid Poisons

Nightshade	Strychnia
Thornapple	Cocculus Indicus
Tobacco	Upas
Hemlock	Poisonous fungi
Monkshood	Poisonous grain
Hellebore	Alcohol
Squill	Ether
Meadow saffron	Empyreumatic oils

The treatment of cases of poisoning must, of course, vary with the nature of the poison, the quantity taken, and the peculiarities of the individual In almost all cases, copious vomiting should be excited as soon as possible by tickling the throat, and by emetics, such especially as sulphate of zinc or ipecacuanha with emetic tartar, the former however, if [illegible] dissolved in a little warm water and re[illegible] observation of [illegible] minutes till it freely operates, [illegible] The use of the stomach-pump should also be resorted to The vomiting should be kept up, and the stomach washed out with bland albuminous or mucilaginous fluids, such as milk barley-water flour and water, or thin paste, &c, sometimes sugar and water

The following is a short summary of the antidotes which may be resorted to in reference to particular poisons They should of course, be administered as speedily as possible

1 For *Mineral Acids*, or *Acetic and Oxalic Acid* Chalk, or whiting and water magnesia and water, soap and water, followed by albuminous diluents, such as milk and white of egg mixed with water

2 *Alkalies Soda Potash*, *Ammonia* &c Vinegar, or any mild acid and water or even very dilute mineral acids, such as water acidulated by them, olive oil, almond oil

3 *Arsenic* Emetics, and then milk, gruel, thick barley-water, and other similar diluents, in large quantities

4 *Corrosive Sublimate* White of egg and water, milk and cream, decoction of cinchona, infusion of galls

5 *Sulphate of Copper* and other *Cupreous Poisons* Sugar and water, white of egg and water

6 *Antimonial Poisons* Warm milk, gruel, or barley-water, infusion of galls; decoction of cinchona

7 *Nitrate of Silver* Copious draughts of warm salt and water

8 *Sulphate of Zinc* Solution of carbonate of soda in water, with milk, and mucilaginous or farinaceous liquids

9 *Acetate of Lead* Emetics; solution of sulphate of soda in water, milk, white of egg and water

10 *Opium and its Preparations* Emetics, strong

coffee, dashing cold water upon the face and breast; preventing improperly forced exercise

11 *Prussic acid* Ammoniacal stimulants cautiously applied to the nose as ammonia, or sal volatile, in repeated small doses small doses of solution of chlorine in water, small doses of chloride of lime in water

12 *Strychnia and Vegetable Alkaloids* Infusion of gall nut decoction of cinchona, etc etc

TOXODON (Gr τοξον, *a bow* and οδους *a tooth*) An extinct genus of quadruped of the order Pachydermal with the Rodent order and distinguished by the curved form of all its teeth The only known species, *Toxodon platensis* Owen was as large as a hippopotamus, and appears to have been restricted to the warmer parts of South America

TOXOTE (Gr. τοξον, *a bow*) In Greek Military History, bowmen In the Plays of Aristophanes the toxotæ mentioned like the French "archers," are a kind of police, employed to keep order in the assemblies of the people and on other public occasions

TRABEA In Roman Antiquities, the robe used at first by the kings, but afterwards by consuls and augurs The purple *trabea* was used only on the occasion of great sacrifices The second sort of purple and white was commonly worn by consuls on state occasions A third, of purple and scarlet, was the dress of the augurs

TRABEATION (Lat trabes *a beam*) In Architecture the same as *entablature*, which see

TRACHEA (Gr τραχια from τραχυς *rough*) The windpipe A cartilaginous and membranous tube through which the air passes into and out of the lungs Its upper extremity is called the *larynx* and consists of five cartilages The upper one forms a kind of valve at the mouth of the larynx called the *epiglottis* it closes the passage in the act of swallowing The sides of the larynx are formed by the *arytenoid* cartilages and the anterior part of the *thyroid* and *cricoid* or annular cartilages these may be felt under the skin in the front of the neck These cartilages are united by elastic ligaments and are acted upon by appropriate muscles so as to modify the dimensions and form of the aperture in the act of speaking they are moistened by a mucous secretion The canal from the larynx downwards is called *trachea*, till it divides into two *bronchiæ* opposite the fourth or fifth dorsal vertebra They are kept open for the free passage of the air by their elastic cartilaginous texture, which consists of rings with intervening membrane and muscular fibres

TRACHEÆ in Botany are what are now called spiral vessels, which received that name in consequence of their being considered the respiratory tubes of plants *Trachenchyma* is a tissue composed of tracheæ

TRACHEARIES, *Trachearia* (Gr τραχια *the windpipe*) The name of an order of the class *Arachnida* including those which breathe by means of tracheæ

TRACHELIDANS *Trachelidæ* (Gr τραχηλος *a neck*) The name of a family of Coleopterous insects comprising those which have the head supported on a kind of pedicle or neck

TRACHELIPODS, *Trachelipoda* (Gr τραχηλος and πους *a foot*) The name given by Lamarck to an order of Mollusks comprehending all those which have a free and flattened foot attached to the under side of the part of the body which he considers as analogous to a neck The order corresponds nearly with the Pectinibranchiata of Cuvier

TRACHELOCELE (Gr τραχια and κηλη, *a tumour*) A tumour upon the trachea, an enlargement of the thyroid gland *See* BRONCHOCELE

TRACHELOTOMY (Gr τραχια and τεμνω *I cut*) The operation of making an opening into the trachea in cases of threatened suffocation

TRACHINUS (Gr τραχυς, *rough*) A genus of spiny-finned fishes, characterized by their compressed body and approximated eyes two dorsal fins, the first short, and with spinous rays, the second long and with flexible rays The anal fin is very long the operculum is armed with a long spine directed backwards By the wounds which the species of *Trachinus* usually called "weevers," inflict with their opercular spine they have become formidable to fishermen of all nations and it is said that the French have a police regulation, by which the fishermen are directed to cut off the spines before they expose the fish for sale

TRACHITIS Inflammation of the trachea.

TRACHYTE (Gr τραχυς, *rough*) A variety of lava which is often porphyritic, and when containing hornblende and augite passes into the varieties of trap called basalt greenstone dolerite &c

TRACT, TRACTATE In Literature, both originally from the same Latin word tractatus; the latter through the French It would be difficult to assign any reason for the difference in signification between two words identical in origin and etymological meaning; but the first is now commonly used to describe short compositions, in which some particular subject is "treated," generally in the form of a pamphlet; the latter more extensive works

TRACTION (Lat traho, *I draw*) The act of drawing, or state of being drawn In Mechanics, the *angle of traction* is the angle which the direction of the power makes with a given plane

TRACTORS, METALLIC Small bars of metal which were supposed to possess certain magnetic powers, and to cure pain affections and tumors by being drawn over the part They bore the name of their inventor, Perkins, and were in considerable vogue about thirty years ago A number of wonderful cures, however, having been attested, which were performed by means of spurious imitations the imaginary virtues of the magnetic or metallic tractors were exploded, and sunk into oblivion

TRACTORY, or TRACTRIX (Lat traho, *I draw*), in the geometry of curve lines, is the curve characterized by this property that the tangent is always equal to a given line It was called the tractory by Huygens, because it may be considered as described mechanically by a small weight attached to one extremity of a thread, while the other extremity is drawn along a given straight line But in order that the curve may be described in this manner, it is necessary to suppose the friction of the plane of traction to be infinite, or at least to destroy at every instant the momentum which is generated by the motion of the small weight, otherwise the direction of the motion of the describing point would not be a tangent to the curve The tractory has much analogy with the logarithmic whose *subtangent* is constant The evolute of the curve is the common catenary (D Alembert, *Ency Methodique*, *Peacock's Examples* p 174)

TRADE *See* COMMERCE

TRADE WINDS are winds which in the torrid zone, and often a little beyond it blow generally from the same quarter, varying according to circumstances, from NE to SE

The cause of this wind is to be ascribed principally to the high comparative temperature of the torrid zone, combined with the rotation of the earth from W to E The heated air at the surface ascending into the higher regions of the atmosphere, its place is supplied by the colder air rushing from the poles, which also becoming rarified ascends in its turn, and is carried in the upper regions towards the poles to supply the stream of the under current these under polar currents moving in progress towards the equator from the zones where the earth's motion is slower to others where it is more rapid acquire an apparent relative motion in a westerly direction The currents from the two hemispheres meeting near the equator their meridional motions are there destroyed and they therefore advance together with the remaining motion from the eastward round the globe The regularity of the trade winds is disturbed in some places by local causes and chiefly by the superior rarefaction of the air over land heated by the sun's rays They extend farther to the northward or southward according as the sun's declination is north or south, and in some places they become periodical, blowing one half of the year in one direction and the other half in the opposite one (*See* MONSOON) In the great Pacific ocean, however the trade wind blows with a uniform and gentle breeze all the year round The name of *trade winds* was given them from their important influence in commerce, expressing as they do the "*wind blowing* trade"

TRADITION (Lat trado *I deliver*) A truth of doctrine or fact, delivered or handed down to one from another and received on the faith that the first to whom it was so delivered received it from an authentic source In common language the word is used to signify records of facts preserved in the memory of successive persons or [illegible] and not committed to writing In [illegible] means, generally that body of doctrine [illegible] supposed to have been put forth by our Saviour or his inspired Apostles and not committed to writing and thus [illegible] from Scripture [illegible] tradition of doctrine [illegible] which is commonly said to be directly affirmed by tradition and proved by Scripture, and tradition of rites and ceremonies called by Hooker "traditions ecclesiastical" or "ordinances made in the prime of Christian religion, established with that authority which Christ has left to his church in matters indifferent and, on that consider[illegible] like authority give just [illegible] *Pol* v 65)

It is of course impossible to deny that Revelation may have been communicated to man in this manner as well as in the form of Scripture Therefore when a Protestant asserts that Scripture is the *only* rule of faith he must mean this only that the evidence on which Scripture rests is solid while no particular tradition has sufficient evidence to support it for if any tradition had evidence to support it there can be no *à priori* reason assigned why it should not be as binding as any Scripture. "I

make no scruple to grant," says the high church writer Hammond, "that apostolical traditions, such as are truly so, as well as apostolical writings, are equally the matter of that Christian belief which is equally secured by the [illegible] tolical [illegible] tradition" one of those unmeaning phrases which are of such common occurrence in this widely spread controversy, for the [illegible] may be "equally [illegible]" in the case of [illegible] of scripture and [illegible] judge of [illegible] [illegible] real difference, on this [illegible] Protestant The former holds tradition of equal authority with Scripture, but then he also holds that the church, that is, the pope, with or without a council, is the authoritative declarer of tradition

It is curious to observe that at the Council of Trent this fundamental difficulty namely who is to say what is tradition and what is not, struck the minds of the divines who were [illegible] the doctrine of the Catholic church [illegible] hardly agreed as to the form, rather than the substance, of its solution "All agreed," says Paolo Sarpi, "that Christian faith is contained partly in Scripture and partly in tradition Yea, some said more [illegible] ation of the Catholic doctrine, for [illegible] not believed but by tradition" But Vicenzo Lanello a Franciscan friar, thought "that they ought first to treat of the church, which is a more principal foundation," since "Scripture itself is founded upon it," according to Saint Augustin's saying, and "that no use can be made of traditions except by grounding them upon the same authority" But his opinion had no followers 'Some objected that the synagogues of the heretics [illegible] authority of a church' Others [illegible] of the church was sufficiently declared already (Book 2) Perhaps some confusion would have been avoided if the father's suggestion had prevailed but there is no doubt that the Romanist by tradition, means tradition declared to be such by the church

Protestants, on the other hand, without laying it down as a doctrine that tradition is equal to Scripture have in general, assented to the proposition that an authentic tradition of doctrine is binding but on the question, what is the authority competent to pronounce a tradition authentic, they have wandered strangely indeed from a reluctance to admit to its full extent that very right of private judgment on which they founded their dissent from Rome And this is peculiarly the case with those reformed divines who dislike parting with the title 'Catholic"

When the early Reformers, especially those of the Lutheran and Anglican schools attacked a doctrine or practice of Rome their first endeavour was generally to show that it was not scriptural, their second that it was not *ancient*, i e did not rest on tradition For this purpose, they opposed to the authority of the church, as it existed in their day, the authority of early fathers and councils as [illegible] belief of an earlier age Thus they *recog* [illegible] of private judgment to try the authority of the existing church by comparing it with authorities of earlier times, they permitted each individual to apply for himself the historical test But at the same time they denied, more or less directly the right of private judgment to go further, and criticise the ancient authority itself, to examine, for instance whether a doctrine acquiesced in, in the fourth century, might not have been altogether unknown to the first, whether corruption in the church may not have commenced at so very early a period as to invalidate greatly the testimony even of the oldest father, and, lastly, whether traditions resting on high historical authority, are or are not consistent with Scripture And even to the present day, the high church school of Anglican divinity does practically [illegible] these as points without the [illegible] of [illegible]

Now this we cannot but think an untenable position Either the church has and always had authority to declare to us what is tradition, or it has not If it had, then the Reformation was an unlawful thing *ab initio*, and no church commencing in schism can be said to have a pure and real existence If it had not, then each man, in the last resort, must judge for himself of the authenticity of what is propounded to him as tradition He will be bound to judge with humility respect and submission, but the decision belongs ultimately to the *forum* of his proper conscience

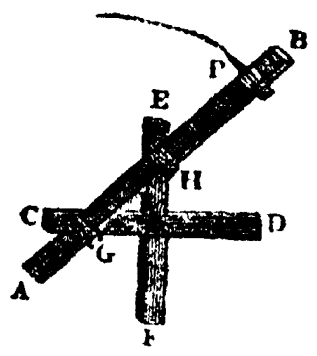
He will, therefore, feel it necessary to examine the value of the evidence for the doctrines or rules of discipline presented to him as traditional, by the same principles of criticism which he would apply to other testimony, not receiving all in the mass, on the faith of [illegible] [illegible] the Apostles, several hundred bishops, convened from all parts of Christendom, at the Council of Nice, declared that the doctrine of the Trinity, as embodied in the creed of that council, had been "handed down" in their respective [illegible] from [illegible] He accepts this as evide [illegible] that there was an [illegible] the Apostles and their [illegible] form in Scripture But when he is required to receive the doctrines, for instance, of the Apostolical succession as commonly understood, or of the sanctity of celibacy, or the use of language widely deviating from that of [illegible] Sacraments, on the ground that [illegible] he holds himself at liberty to inquire, first, whether the language of fathers and councils respecting them is distinct and consistent, when freed from rhetorical exaggeration, next, whether it is not least strong in the age nearest the Apostles, and increases in force as we proceed lower, and, lastly, whether on all these subjects their testimony was not likely to be warped by the ordinary causes of error which throw discredit on witnesses and from which we have no right whatever to imagine the Christian writers of the fourth, third, or second centuries exempt, such as the ambition of the clergy, the tendency to admit gnostic and heathen influences, and the deficiency in solid judgment and reasoning power which characterized the educated men of those ages Again he will not be influenced by the common Romish argument already alluded to, and frequently in use among high Anglican writers also that 'Scripture itself is found to be such by tradition" Because we receive the testimony of early Christian writers that such and such books were *canonical*, i e received in the church in their time, it by no means follows that we must receive their deductions from Scripture as having the form of tradition, not even when they style these the deductions of the church Such reasoning would not pass for current in any but theological controversy We receive the testimony of Xenophon and Plato as to the actions and sayings of Socrates, we do not therefore admit as authoritative their exposition of his philosophy, not even as an authoritative representation of what was regarded as his philosophy at Athens and yet they were his contemporaries Irenæus the earliest father on whom we depend for any thing like extensive testimony to tradition, lived a hundred years after the Apostles and a hundred years of much corruption and dissention

Lastly he will know that if an overweening contempt of the authority of early uninspired writers, and of old ecclesiastical traditions, is most unbecoming a Christian inquirer an exaggerated and superstitious veneration for them if a more amiable error, is scarcely a less serious one There could be no traditions more venerable more sanctioned by the apparent authority of the church, than those of the Jews at the time of our Saviour, yet our Saviour does not on that account in any degree mitigate his condemnation of them, or speak of them as entitled even to respect, when he denounces those who teach for doctrines the commandments of men

(It would be impossible to refer to particular works on this subject of controversy The extreme Protestant view of tradition is no where so fully argued as by Chillingworth, *passim* For a concise and fair view, on high church principles of the estimate of tradition by the English Reformers see *Palmer's Church of Christ*, vol i p 493 504)

TRAGACANTH A variety of gum it is the produce of the *Astragalus Tragacantha* native of Africa, and imported in small [illegible] pieces, white or yellowish and translucent or nearly opaque When put into water they swell up, and gradually form a gelatinous or pasty mass, not dissolving into a clear solution, as is the case with gum arabic An analogous kind of gum is found in other plants and the generic name of *tragacanthin* is sometimes applied to it

TRAGEDY (Gr τραγος, *a goat*, and ᾠδη, *a song*) A species of drama in which the diction is elevated and the catastrophe melancholy The name is usually derived from the ancient Greek custom of leading about a goat in procession at the festivals of Bacchus, in whose honour those choral odes were sung which were the groundwork of the Attic tragedy Some recent writers however, have given a new explanation of the word τραγος considering it an ancient Greek adjective, and translating it melancholy' or lamentable" *See* DRAMA



TRAGI-COMEDY In literature a compound name, invented to express a class of the drama which should partake both of tragedy and comedy If the mixture of [illegible] in the piece alone entitles [illegible] all the Plays of Shakespeare (with the [illegible] exception of the *Merry Wives of Windsor* to [illegible] *Twelfth Night* and perhaps [illegible] [illegible] and [illegible] almost all the works [illegible] But *Troilus and Cressida* alone, of the Plays of Shakespeare, bears this title in old

editions on what account we do not know French critics define the distinction to be, that the *event* of the tragi-comedy is not unhappy or bloody Dacier condemns them as [illegible] Guarini the Italian poet, wrote an essay [illegible]

TRAGUS [illegible] the term applied to the small cartilage [illegible] the entrance of the external ear in the adult it is beset with small hairs

TRAJECTORY (Lat trajectus) The curve which a body describes in space, as a planet or a comet in its orbit, or a stone thrown obliquely upwards in the air The form of the trajectory depends on the initial velocity with which the body is projected, the law and direction of the forces which act upon it, and the resistance of the medium in which it moves The planetary orbits would be strictly elliptical, were it not for the disturbing forces which they exert on each other, and but for the resistance of the air, a body projected obliquely from the earth would describe a portion of a parabolic curve

TRAMMEL (Old French trunel) An instrument for drawing ovals much in use among joiners and other artificers It consists of a cross C D E I, in which are cut two grooves at right angles to each other, and a beam A B carrying two pins G H (which are clamped to A B, and slide in their grooves) as well as a pencil P these parts are called the cross and the beam By turning A B round the pins G H slide along the grooves and the pencil P describes an elliptic curve A demonstration of the properties of this instrument may be seen at p 700 vol xiv of *Hutton's Abridgment of the Philosophical Transactions*

TRAMONTANE See ULTRAMONTANE

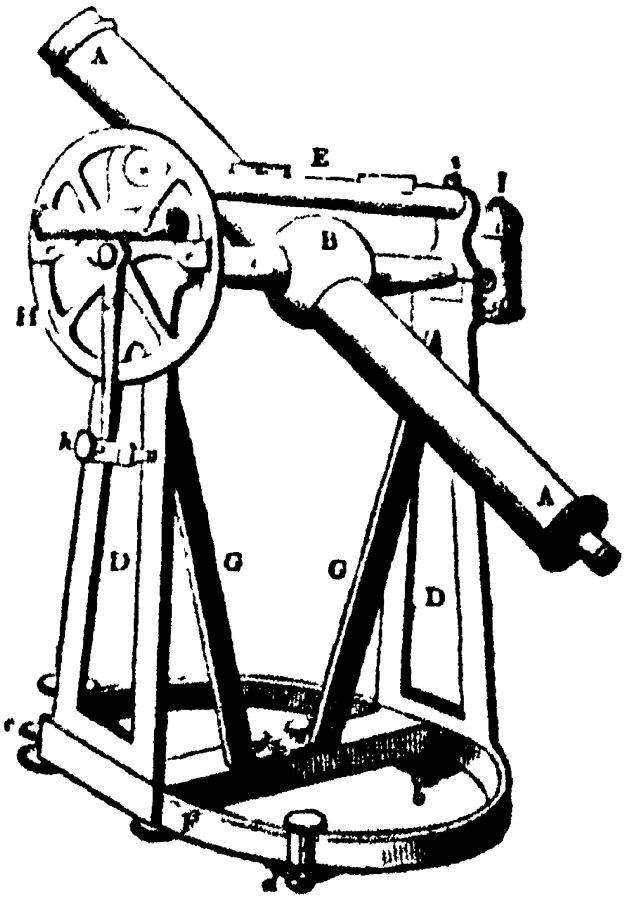
TRANSCENDENTAL In Algebra a term applied to any quantity which cannot be represented by an algebraic equation of a finite number of terms with determinate indices Such quantities include all exponential and logarithmic expressions and trigonometrical lines in terms of the arc Thus a^x x^x $\log x$ $\tan x$ &c are transcendental expressions and any equation into which such expressions enter is called a *transcendental equation* and any curve defined by such an equation is called a *transcendental curve*

But by *transcendental equations* are sometimes meant such differential equations as can only be integrated by means of curves logarithms or series

TRANSCENDENTAL A word used by German philosophers to express that which *transcends* or *goes beyond* the limits of actual experience This general meaning is somewhat restricted by Kant who draws a distinction between the *transcendental* and the *transcendent* The transcendental he defines to be that which though it could never be derived from experience yet is necessarily connected with experience and which may be shortly expressed as the intellectual *form* the *matter* of which is supplied by sense "I call" says he "all knowledge transcendental which has regard in general not so much to *objects* as to our mode of knowing or apprehending objects (that is to say to formal knowledge) so far as this is conceived to be possible *a priori* A system of such conceptions would be named transcendental philosophy as the system of all the principles of pure reason" The *transcendent* on the contrary is that which regards those principles as objectively real to which Kant assigns only a subjective or formal reality and consequently is by him regarded as beyond the limits of the human reason altogether

TRANSEPT (Lat trans and septum) In Architecture, the cross part of a cathedral which extends on the north and south sides of the area between the nave and the choir and forming as it were the short arms of the cross upon which the plan is laid out

TRANSFIGURATION The supernatural change which is described to have taken place in the appearance of Christ, when, as is recorded in Matth xvii, Mark ix, Luk ix, he took Peter, James, and John up into a high mountain with him, and was transfigured before them his face shining as the sun, and his raiment showing white as light There appeared in conversation with him Moses and Elias, and the apostles erected three tabernacles or tents to them An ancient tradition assigns Mount Tabor as the scene of this event upon which three contiguous grottoes have been fashioned to represent the three tabernacles



TRANSFUSION The injection of blood from one living animal into another It was at one time supposed that this operation might be resorted to, to sustain life in cases of great loss of blood from accidental hæmorrhages and other causes, and that in certain cases of mental and bodily disease a cure might be effected by abstracting a large quantity of blood, and supplying its place by transfusion from another animal, such as a calf or sheep Some of these experiments appeared at first to be attended with success, but bad consequences followed, and in two or three cases in which it was tried upon the human subject it proved fatal

TRANSIT (Lat transitus, *passage*), in Astronomy, is the culmination or passage of a celestial object across the meridian of any place The determination of the exact times of such transits is one of the most important operations of practical astronomy as it is by this means that the differences of right ascensions, and consequently the relative situations of the fixed stars, and the motions of the planets and comets in respect of the celestial meridians become known, and it is most easily and accurately effected by the aid of the *transit instrument* the nature and method of using which will be explained under that term

Transit is also used to signify the passage of an inferior planet across the sun's disk See MERCURY and VENUS

TRANSIT INSTRUMENT This important instrument called by the French *instrument des passages*, *lunette méridienne*, consists essentially of a telescope firmly attached to a transverse horizontal axis the ends of which are directed to the east and west points of the horizon The extremities of the axis are formed into cylindrical pivots of exactly equal diameters, which rest in notches (technically called Y's from their resemblance to that letter) formed in metallic supports susceptible of nice adjustment both horizontally and vertically so that the axis can be placed perfectly horizontal and at right angles to the plane of the meridian in which the telescope moves In the focus of the eye piece is placed a system of three five, or sometimes seven vertical and equidistant wires or spider lines generally crossed by two horizontal ones between which it is convenient that the passage of objects over the vertical wires should be observed By means of adjusting screws the diaphragm or plate to which the wires are attached is brought into such a position that the middle vertical wire intersects the optical axis of the telescope in which position it is permanently fixed

When the system of wires is brought into this position, the middle one will be a visible representation of that part of the meridian to which the telescope is directed, and when a star is seen to pass this wire, it is in the act of culminating or *transiting* the celestial meridian The instant of the transit is noted on a clock or chronometer, which is an indispensable accompaniment of the instrument and in order to render the observation more certain the instant at which the star passes each of the vertical wires is noted when practicable and the mean taken as the true instant of passing the vertical wire The sidereal times at which certain principal stars pass the meridian of Greenwich (and consequently the meridian of any other place whose longitude from Greenwich is known) being given in the *Nautical Almanac* the comparison of the time indicated by the clock and the time in the almanac gives the *clock error*, and by observing the same stars from day to day the *clock rate* is determined In this manner we are enabled to assign the exact interval of sidereal time between the transits of the different stars, and consequently the difference of their right ascensions For determining the absolute place of a celestial body it is necessary to know also its polar distance, which is given by the mural circle, so that the

transit instrument and mural circle are the two essential [illegible] omical observatory [illegible] represents the *portable* transit [illegible] or two feet in focal length The telescope tube A A is in two parts, connected together by a sphere B, which also receives the larger ends of the two cones C C placed at right angles to the telescope and forming the horizontal axis The axis terminates in two cylindrical pivots, which rest in [illegible] D D One of the [illegible] means of [illegible] of the [illegible] stride across the telescope and rest on the two pivots, serves to show when the axis is horizontal The standards D D are fixed by screws upon a brass circle F, which rests on three screws, *b*, *c*, *d*, forming the feet of the instrument and by which the levelling is performed G G are two oblique braces for the purpose of steadying the supports On the extremity of one of the pivots, which extends beyond its Y, is fixed a divided circle H, which turns with the axis, while a double vernier remains stationary in a horizontal position and shows the altitude to which the telescope is elevated The verniers are set horizontal by means of a spirit level *f* and are fixed in their position by a brass arm *g h* clamped to the supports The whole of this apparatus is moveable with the telescope and when the axis is reversed can be attached in the same manner to the opposite standard For the purpose of illuminating the wires when observations are made at night, one of the pivots is pierced, and admits the light of a lamp I which is thrown upon the wires by a reflector placed diagonally in the sphere B (*Simms's Treatise on Mathematical Instruments*)

Adjustments — In practice the transit instrument is subject to three principal errors 1st The optical axis of the telescope may not be quite perpendicular to the axis of the instrument which is called the error of collimation 2d The axis may not be perfectly horizontal, which is called the error of level And 3d The axis may not be exactly east and west or the optical axis may not be exactly in the meridian which is called the error of azimuth The error of collimation is detected by pointing the telescope to a distant well defined terrestrial object and bisecting it by the middle vertical wire, the telescope is then lifted out of its supports and reversed (that is, the end of the axis which was turned to the west is now turned to the east) and brought again to bear on the same object If the middle wire is found to be still bisected, the adjustment is perfect, if not the diaphragm is moved a little to the right or left by means of the adjusting screws until the middle wire bisects the object in both positions of the axis To place the axis exactly horizontal, the level I is suspended in the proper manner from the pivots and the air bubble brought to the middle by means of the foot screws The level is then reversed that is, the end which was turned to the west is now turned to the east, and if the air bubble still stands at the middle the axis is horizontal if not the foot screws are adjusted until it stands at the middle in both positions of the level To place the instrument exactly in the meridian some knowledge of practical astronomy is required It is easy to place it *nearly* in the meridian by the transit of the sun at apparent noon or of any star whose right ascension is known, and when in this approximate position to the meridian the deviation may be discovered and corrected in various ways One of the simplest is to observe two successive transits of Polaris (or any circumpolar star) above and below the pole If the interval between the two transits is exactly twelve sidereal hours the telescope is exactly in the meridian, and the difference of the interval from twelve hours shows both the amount and the direction of the azimuthal error Thus suppose the *east* pivot to be too far *north* by n'' and let Δ be the N P D of Polaris and c the colat of the place Then, at the upper transit, Polaris will pass the meridian too *late* by $n^s \times \frac{\sin\ (c-\Delta)}{15 \sin\ \Delta}$, and at the transit below the pole it will pass too *early* by $n^s \times \frac{\sin\ (c+\Delta)}{15 \sin\ \Delta}$ Hence, if t and t' be the observed times of upper and lower transit (the latter corrected for clock-rate and change of R A in 12 hours),

$$t' + n^s \times \frac{\sin\ (c+\Delta)}{15 \sin\ \Delta} - t + n^s \times \frac{\sin\ (c-\Delta)}{15 \sin.\ \Delta} = 12^h$$

Hence $n^s \times \frac{2}{15} \sin\ c \cot\ \Delta = 12^h - (t'-t)$, which will determine the value of n. A similar process may be used with a high star and a low star for showing whether the instrument deviates much in azimuth, by comparing the difference of their times of transit with the difference of their right ascensions In the case of fixed instruments, a meridian mark is usually made on some distant object, and permanently established for the convenience of ready reference

The transit instrument appears to have been invented by the Danish astronomer Roemer, by whom it was first described in 1700, in the *Miscellanea Berolinensia*, tome iii Dr Halley placed a transit instrument in the Greenwich observatory in 1721, the telescope of which was [illegible] was little used until 1742, when Bradley [illegible] ar series of meridional [illegible] ment till lately in use in the Royal Observatory is the workmanship of Troughton and was set up in 1816 It has recently been superseded by the gigantic *transit circle* now in use, for which *see* SUPPLEMENT It is sufficient to state here that its telescope is of 12 feet focal length, and the diameter of its object-glass 8 inches, and that it is furnished with the usual apparatus of wires in its eye-piece

For full details respecting the construction and adjustments of this important instrument, see *Pearson's Practical Astronomy*, *Memoirs R Astr Society*, vol i, and the article in the *Penny Cyclopedia*

TRANSITION ROCKS A Geological term, formerly applied to the older secondary series, under the idea that they were formed during the transition of the globe from the uninhabited to the inhabited state *See* GEOLOGY

TRANSITORY ACTIONS In English Law, actions in which the *venue*, [illegible] declared in the declaration is immaterial, and consequently the trial may be had in any county, opposed to local actions, in which the trial can only be had in the county where the alleged injury was committed To the former class belong actions of contract and quasi contract (assumpsit, debt &c) *See* ACTION VENUE

TRANSLATION In Literature, the rendering of a literary work from the original language into another The peculiar merits and peculiar difficulties of successful translation have often been pointed out by critics but their judicious directions have been seldom realized by authors In truth, those difficulties require a talent of so high an order to surmount them, that few writers are fit to undertake the office of translators (we mean of works of any high literary merit), except those whose genius has more congenial occupation in original composition, for notwithstanding Dryden's sarcastic remark that imitation of an author is the most advantageous way for a translator to show himself, but it is the greatest wrong which can be done to the memory and reputation of the dead" we are inclined to doubt whether in reality imitation be not the more advantageous method of the two Every author," says an able critic (*Edin Review* vol xxxvi), "is a mannerist This manner constitutes as it were, the identity of each author, it is what the translator ought to catch, and is nevertheless the very thing which is apt to evaporate in translation Or, to borrow again the language of Dryden the office of the translator is especially to render the particular turn of thoughts and expression which are the characters that distinguish, and as it were, individuate him from all writers But nothing is so arduous as the attempt to catch this spirit or manner when the writer is also bound by the duty of rendering faithfully the sense The imitator freed from the necessity of exactly copying the sense is far more at liberty to devote himself to seizing the evanescent qualities of the manner This truth might as it appears to us be exemplified by many instances Terence and Horace seem to have aimed at familiarizing Roman ears with the best poetry of Greece not by translation but by imitation Indeed much as the Romans borrowed from the Greeks, actual translation seems to have been uncommon the only two examples which we at this moment recollect are Cicero's version of Aratus and that by Catullus of a poem of Callimachus Among modern authors which of the English translators of Horace has approached half so near him as Pope in his *Satires*? Where among all the translations of the Greek drama shall we find anything so thoroughly imbued with the spirit of that noble order of poetry as the *Samson Agonistes* of Milton, and the *Bride of Messina* of Schiller? What translator of Lucan is nearly so Lucanic as Corneille? We do not mean to disparage the utility of translations, or the merits of some few among those which have passed into popularity, but as, with scarcely an exception, they are in relation to the original to use the well-known phrase of Cervantes, only the "wrong side of the tapestry turned outwards," so, in themselves, considered as literary works they generally leave an impression of that peculiar stiffness which belongs to all copies.

[illegible] greater force to poetic [illegible] among the latter, more [illegible] works of taste and fancy than to scientific or historic treatises In the latter, an easy style, clearness, and fidelity appear of greater importance in translation, than the more difficult feat of catching the manner and spirit of the author In literary, and especially poetical translation, much controversy has been carried on between the advocates of literal and loose adherence to the sense of the author Each has its advantages and merits, but

the last, approaching most nearly to the character of *imitation*, appears to us on the whole the better extreme of the two *Three* distinct styles of translation are not ill characterized by a lively writer in the *Quarterly Re-* [illegible] p 482 [illegible] the forms of language according to the intention with which they are employed he will therefore, in his translation, make use of the phrases in his own language to which use and custom have assigned a similar conventional import, taking care, however, to avoid those which from their form, or any other circumstances, are connected with associations exclusively belonging to modern manners He will likewise, if he is capable of executing his work upon a philosophic principle, endeavour to render the personal and local allusions into the *genera* of which the local or personal variety employed by the original author is merely the accidental type and to reproduce them in one of those permanent forms which are connected with the universal and immutable habits of mankind The *faithful translator* will not venture to take liberties of this sort, he renders into English all the conversational [illegible] their grammatical and logical form, [illegible] to the current usage which has [illegible] them to particular and definite [illegible] The *free translator*, on the contrary, employs the corresponding modern phrases, but he is apt to imagine that a peculiar liveliness and vivacity may be imparted to his performance by the employment of such phrases as are particularly connected with modern manners, and if at any time he feels more than usually anxious to avoid the appearance of pedantry he thinks he cannot escape from it in any way more effectually than [illegible] the slang and jargon of the day The [illegible] ancient times he endeavours to represent by substituting in their place the peculiarities of his own time and nation"

He proceeds to exemplify these distinctions by an instance from Aristophanes —

λοιδορεισθαι δ ου πρεπει
ἀνδρας ποιητας ωσπερ αρτοπωλιδας

This says he, the faithful translator will render literally 'scold each other like bakers' wives' The spirited translator will adopt the modern popular phrase most nearly analogous, — 'like oyster wenches' The translator *par excellence* will choose a phrase rendering the particular and obsolete expression of the ancient by a general equivalent which must be equally appropriate in the idiom of all times and countries, — like market-women," or "hucksters.' Without cavilling at this ingenious piece of criticism, we must be permitted to doubt whether a translation of a highly idiomatic author conducted on this last principle would not preserve his general meaning with the serious sacrifice of his spirit

In most modern languages there are some few translations which have attained celebrity In English, Fairfax's *Tasso*, one of the earliest, has great beauty but is rather enervate The versions of Dryden are distinguished by their poetical power, though we agree with Mr Hallam (*Introduction to the Literature of Europe*, iv 536), that he did not give the example as well as precept of rendering the "particular turn of thought and expression" of his authors The utter want of individuality in his respective translations is plainly perceptible, for instance, in that from the fourth book of Lucretius (It may be observed, in passing, that the remarks of Dryden on the art of translation, of which so much has been said, are chiefly to be found in his prefaces to *Ovid's Epistles*, and to his *Second Miscellany*) Pope's *Homer* is a bad and careless version (critically speaking) of the Latin translation of the Greek poet but it has one essential characteristic of the original, namely his [illegible] which renders it, even now more pop[illegible] though not unfrequently dignified and elegant work of Cowper Some portions of Cumberland's versions from *Aristophanes* deserve mention although on the whole he is prosaic and has not dared to follow the bold flight or imitate the metrical variety of his original Mitchell's *Aristophanes* has been much admired, but it is wearisome from the continual striving after effect Some of Elton's translations are very pleasing, especially of parts of *Hesiod* Shelley has left two of the most beautiful essays in this line of composition which are to be found in our language the *Hymn to Mercury* of Homer, and the *Walpurgis Night Scene* from Goethe's *Faust* In the latter, indeed, he laboured under the disadvantage of an inadequate knowledge of the language, but none of Goethe's more critical translators (not even Dr Anster) has so powerfully seized his "turn of thought and expression" The same cannot be said of Byron's performance, — the first book of the *Morgante Maggiore*, which is, however, a remarkable feat of dexterity, from its extreme literalness a feat in [illegible] and Frere's recent version of the *Di[illegible]* of Boiardo Mickle's *Lusiad*, though now little read, is one of the most poetical of English translations Coleridge's *Wallenstein* is a truly wonderful work So carelessly written that the poet has omitted whatever he found difficult, or thought unessential it is so exact and so spirited, that the reader is constantly impressed with the idea of Schiller himself rewriting his own drama in English, with here and there a variation as perfectly Schiller-like as the German original Among prose translations Philemon Holland's numerous ones, particularly that of *Pliny* are occasionally referred to by literary men, more for their quaintness rather than their merit Melmoth's *Epistles of Cicero and Pliny*, once much admired, are polished but cold Gordon's *Tacitus* is a creditable attempt at rendering an extremely difficult author Among our numerous translators from the German in the present times, none bears so high a reputation as Mrs Austin Mr C Lewis's translation of Boeckh's *Public Economy of Athens* is a work of great merit. French is a language affording so many advantages to the prose translator, from its condensation, its exactness, its rhetorical force, that it is, perhaps, rather to be wondered at that higher distinction has not been attained by individual French writers in that line But few French translators are much remembered, except Amyot, and he chiefly for his vernacular language possessed of great sweetness as well as quaintness, which formed a mode of style in the 16th century The Chevalier Townley's translation of *Hudibras* is worth mentioning as a phenomenon, from its singular felicity and spirit Italian, on the other hand seems to be an unfit language for the purposes of translation, from extreme diffuseness, yet it boasts of one translator of *Tacitus* (Davanzati) [illegible] that affectedly [illegible] in Latin. But of all modern languages, at least of those generally known in the literary world German has by far the greatest capabilities for this purpose This must be conceded *à priori*, by those who are familiar with its peculiar powers and flexibility, and not less by those who are acquainted with this portion of its literature Among the most highly esteemed poetical works of this description in Germany are Voss's *Homer* and *Virgil*, Streckfuss's *Dante*, Schlegel and Gries's *Calderon*, Schlegel's *Shakspeare* In prose, the complicated syntax of the Germans, perhaps we may add the as yet unformed character of their prose style, detract from the natural powers of the language, still they have some excellent specimens of, [illegible] *Humboldt* [illegible] *Ranke*)

TRANSLUCENCY (Lat *translucco*, *I shine through*) Semitransparency The term is chiefly used in descriptive mineralogy as applied to minerals which admit of a passage of the rays of light, but through which objects cannot be definitely distinguished

TRANSMIGRATION OF SOULS *See* METEMPSYCHOSIS PYTHAGOREAN PHILOSOPHY

TRANSMUTATION In Alchemy, the operation of changing the imperfect metals (as they were termed) into the two precious, — gold and silver This was the great object of that pretended science *See* ALCHEMY

TRANSMUTATION, in Geometry, the change of one figure or body into another of equal area or solidity, as a [illegible]

TRANSOM [illegible] (*a traverse*) In Architecture, the horizontal piece framed across a double-light window when a window has no transom it is called a *clere story* window

TRANSPARENCY is that quality in certain bodies by which they give passage to the rays of light, and is generally supposed to be a consequence of the homogeneity of the matter of which they are composed

TRANSPLANTING The art of removing a plant or tree from one situation to another in such a manner as not to interrupt its growth This operation is commonly performed in the winter season or in autumn and spring, when vegetables are generally in a dormant state, and the great object of the transplanter is to lift as many of the roots as possible without injuring them, and to replace them in a new situation to which the tree is transplanted in such a manner as to facilitate their growth With herbaceous plants and young trees this is comparatively a simple operation, but with large trees it is an operation of skill, care, and labour The tree to be transplanted should be considerably under the normal age of the species, and to prepare it for the change which it is to undergo other trees, or objects of its own height, with which it is immediately surrounded, should be taken away a year or two previous to removal, in order to accustom the tree to the direct action of the light and air on every part of it which is above ground The next part of the operation is to dig a trench round the tree, equidistant from the trunk, at the distance of three, six, nine, or twelve feet, according to its height, and to such a depth as to cut through all the horizontal roots The tree may then be removed to its new situation, with or without the earth attached to that part of the roots which remain; or, which is a more certain mode, the trench may be left open during a year, in order that the sections

of the amputated roots may heal over, and be prepared to emit new fibrous roots after the tree is transplanted, or, and which is the more general mode, the trench may be filled [illegible] rage the [illegible] year, or of two years if the tree is very large, it may be removed to its final situation Hitherto we have said nothing of the trunk and branches of the tree to be removed In a moist climate, such as that of Ireland or the west of Scotland, all the branches may be retained, but in dry climates, such as that of England the branches require to be thinned out in proportion to the roots cut off, and in dry and warm climates, such as that of central France, the greater number of the branches require to be removed The proper season for transplanting all ligneous plants, whether small or large, is in autumn, after the leaves of deciduous trees have dropt and when the sap of evergreen trees, in consequence of the decline of temperature, is comparatively in a dormant state

TRA'NSPORT A vessel hired by government to [illegible] In Law, a species of punishment It is not known to the common law of England, and was originally a commutation of punishment, pardon being granted to various descriptions of offenders on condition of undergoing transportation generally for seven or fourteen years, or for life It is now a statutable punishment for a great variety of offences It is said to have been first inflicted as a punishment by 39 Eliz c 4, enacting that such rogues as were dangerous to the inferior people should be banished At that time the English plantations in North America were the receptacles of transported convicts Virginia, the Jerseys, Delaware, Maryland, &c are the districts which received the greatest accession to their population from this cause At the very commencement of the practice, the same arguments were employed against it by Lord Bacon which are urged at this day by many law reformers 'It is,' he says, 'a shameful and unblessed thing to take the scum of people, and wicked condemned men, to be those with whom you plant' It was not however, brought into general use as a punishment until 1718, by 4 Geo I which act gave the courts a discretionary power to banish [illegible] American plantations After [illegible] of our American colonies several years elapsed before the government fixed on any place by way of substitute At length, in 1787, Botany Bay, on the coast of New South Wales, was fixed upon 760 convicts were despatched that year But when the expedition arrived, it was discovered that Botany Bay (discovered by Cook in 1770) afforded no practicable site for the colony, which was consequently landed at Port Jackson, where the town of Sydney was founded From that period to the present great numbers of convicts have been transported to Port Jackson, and to the later founded colony of Van Diemen's Land—our only two penal settlements Much has been done of late years towards regulating the condition of the convicts in the colony and subjecting the worse part of them to severe privations, in particular by transporting some of them to particular depots, where they are liable to close inspection and hard labour Among the writers who have lately contended against the policy of continuing the punishment of transportation, we may particularly mention Archbishop Whately (See his *Tracts on Secondary Punishments and Transportation*)

Returning from transportation before the legal expiration of sentence was an offence formerly punishable with death, but by 4 & 5 W 4 c 67 those who commit the offence, or aid others in its commission are punishable with transportation for life A great mass of evidence on the effect of transportation as a punishment for crime in Great Britain, and its effect on the moral condition of the Australian colonies will be found in the volumes published by the two committees of 1838 and 1839 It requires however, to be read with much caution, on account of the evident bias of the committees themselves, for every one knows how effectually the inclinations of a committee give a colour to the evidence taken before it, from the mode in which the operation is performed The views of that committee resembling those of Archbishop Whately of the inutility of the punishment here and its mischievous effects in the colonies, have had some effect on the proceedings of government, so far, at least, as to produce the abolition of the practice of the immediate assignment of convicts as labourers on their arrival and [illegible] ble numbers in the hulks in [illegible] their sentence

Many of the vices ascribed to the system are undeniable, but it must never be forgotten that the truly philosophical or sensible mode of looking at it is by comparison with other secondary punishments Take *any* mode of punishment in the abstract, and the eyes of the inquirer will soon detect so much of mischief caused to the sufferers, and so little visible good produced on the community, as to tempt him to regard it as detestable In the first place, transportation must be considered without the bad practice of immediate and indiscriminate assignment, which was a mere abuse Thus corrected, let it be compared with the best regulated system of imprisonment—1 In respect of its effects on the [illegible] and it may be doubted whether the Pentonville whether on the silent or separate system, the mind of the majority of sufferers goes through a more wholesome process than in the penal settlements, notwithstanding all we have heard even of the frightful condition of Norfolk Island, which is not an ordinary sample 2 In respect of its effects on the ill disposed population at home, and here, defective as transportation is commonly supposed to be, the experience of any one conversant with courts of justice will decide which sentence appears to produce the greatest impression when announced,—imprisonment, or banishment And it must not be forgotten that it is not the [illegible] gination, which c [illegible] of the gaol are thought little of by any one except the sufferer, while the evils of expatriation are greater in idea than in reality 3 In respect of the ultimate reform of the offender, and here transportation possesses an incalculable advantage over every other secondary punishment The convict who has undergone it begins life afresh he remains, indeed, under some disabilities, sufficient to mark the sense entertained by society of the difference between him and the man unstained by crime, but there is nothing to prevent his rising by regular and honest conduct, if he chooses, into a station of comfort, and even of respectability The man who leaves a gaol is utterly ru [illegible] no means of [illegible] ing him back [illegible] His character is gone for ever, and if it could be really ascertained how many among relapsed offenders are actually driven into the recommission of crime by the hopelessness and infamy of their condition, if not by the actual want which results from it we suspect that many who are now ready to give their suffrage for the abolition of transportation would be induced at least to pause until they can [illegible] this difficulty

TRANSPOSITION In Algebra is the transposing of a term from one side of an equation to the other, and is in effect the adding of equal quantities to or subtracting equal quantities from each side of the equation the *signs* of the quantity being changed from + to — or from — to + For example, if $a + x = c - d$, by transposing a we have $x = c - d - a$, or if $a + b = c - x$, by transposing x and $a + b$ we get $x = c - a - b$ The object of transposition generally is to bring all the unknown terms to one side of the equation for more conveniently finding their value with respect to the known terms

TRANSPOSITION In Music, the change which takes place by [illegible] pitch wh [illegible] nature as the pitch of the new key note may require

TRANSUBSTANTIATION The doctrine held by the church of Rome, that in the Eucharist the bread and wine are annihilated and replaced by the body and blood of Christ In one of its liturgical offices it says, 'This *is not bread* but God and Man, my Saviour' It is maintained by Protestants that this dogma, which was made the principal test of a true faith by the Papists at the Reformation is not found in Scripture, which in the most literal acceptation only asserts of the elements that *they are Christ's body and blood*, i e that the substances coexist in some mysterious manner Nor can they discover it in the writings of the fathers or in the canons of the early church They affirm that the first theologian who asserted even the consubstantiation, or union of substances, was Paschasius, in the ninth century, and that he was accused of making too gross an explanation of the mystery It was in the course of these disputes and in consequence of the formal and definite statement of their opinions to which controversialists were forced, that this idea of transubstantiation came into fashion among theologians, nor was it ever propounded as an article of faith by the authority of a council till the beginning of the 13th century in the papacy of Innocent III

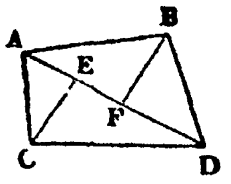
TRANSUDA'TION (Lat. trans and sudo, *I transpire*) The oozing of fluids through membranes, or through porous bodies

TRANSVERSAL In Geometry, the name applied to a line (whether straight or curved) which *traverses* or intersects any system of other lines, as when a straight line intersects the three sides of a triangle The properties of [illegible] transversals are discussed by Carnot in his *Géométrie de Position* and *Essai sur la Théorie des Transversales*

TRANSVERSE AXIS, in Conic Sections, is the diameter which passes through both foci It is the longest diameter in the ellipse the shortest in the hyperbola, and in the parabola it is infinite, as in that curve all diameters are *See* CONIC SECTIONS

TRAPE'ZIUM (Gr τραπεζα, *table*), in Geometry, is the general name [illegible] straight lines When [illegible] are parallel, it

cal'ed a trapezoid, when both pairs of opposite sides are parallel, it is called a paral'elogram



The following are a few of the most remarkable elementary properties of this figure

1 The sum of any three sides is greater than the fourth side

2 The sum of the squares of the diagonals is equal to the sum of the squares of the sides, together with four times the square of the line joining the middle points of [illegible]

3 The [illegible] of the sides form a parallelogram

4 If the figure can be inscribed in a circle, the sum of each pair of opposite angles is two right angles, and the sum of the rectangles of sides is equal [illegible] diagonals

To find the area of a trapezium, let A D be a diagonal, and C E, F B perpendiculars upon it, then A D × ½(C E + B F), is the area

TRAPEZIUS In Anatomy, a muscle situated immediately below the integuments of the posterior part of the neck and back Its principal action is upon the scapula, and it also acts upon the neck and head, drawing the latter backwards and turning it on its axis

TRAPEZO'ID A trapezium which has one pair of opposite sides parallel The area of a trapezoid is equal to half the sum of the parallel sides multiplied by the perpendicular distance between them

In Anatomy the *trapezoides* is the second bone of the second row of the carpus

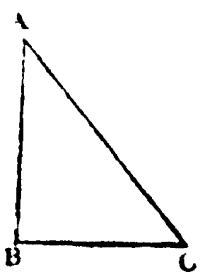
TRA'PPISTS The name of a religious order which still exists in Normandy It was founded in 1140 by a Count de Perche in a deep valley called La Trappe whence the name of the order, and has survived all the changes and revolutions of France The rules of this order are of the strictest kind It was however far less celebrated under its original foundation, than from the reform it underwent under the celebrated Abbe de Rance in the reign of Louis XIV The history of this celebrated man is well known he was a gallant and daring profligate whose conversion was owing to the sudden death of a mistress His character and reform were a favourite subject of discussion in the court of that king in its last and devout period, and he was himself the fashion and much consulted and thought of by the fashionable devotees of the time Perhaps the best appreciation of him will be found in the notices scattered through the *Memoirs* of Saint Simon, who reverenced him, but was too clear-sighted to idolize any one His rule was of the austerest description, comprising among other severities absolute silence on the part of those admitted for a considerable period At the Revolution the community of La Trappe was dispersed many members escaped to England and were received by Mr Weld, the proprietor of Lulworth in Dorsetshire There are now several congregations of Trappists The famous Baron Geramb so long the lion of the fashionable circles in London ended his career by entering one of them (See the *Encyl Methodique* 'Theologie') There is an account of the present state of the original convent in the *Revue de Paris* vol xxix It is a melancholy picture Many of the stories told of the austerities of La Trappe—*e g* that each of the monks is employed in digging every day a portion of his grave &c —are fables But the main features of the discipline the enforced silence, the complete seclusion from the world (insomuch that the superior alone receives news of the decease of a relation of any monk and it is only announced to the community by a direction to pray for the soul of the kinsman of *one* of the brethren, without naming him), [illegible] ported

[illegible] (From the Swedish trappa *a flight of steps*, because these rocks frequently occur in large tabular masses rising one above another like the successive steps of a staircase) They are apparently of igneous [illegible] minerals give rise to many varieties See GEOLOGY

TRAUMATIC (Gr τραυμα *a wound*) Relating to wounds, hence the traumatic balsams and ointments of old pharmacy

TRAVELLER In Naval affairs, a ring or hoop which slides [illegible] or spar

TRAVERSE In Law, a name given to a plea containing [illegible] matter of fact alleged on the other [illegible] refer the matter to the decision of a jury



In cases of misdemeanour where the defendant postpones the trial of the indictment until the next sessions or assizes, he is said to traverse the indictment The delays which this form formerly occasioned have been materially abridged by the act 60 G 3 and 1 G 4 c 4, under which persons in custody or held to bail twenty days before the sessions are bound to plead, unless a certiorari has been delivered before jury sworn

TRAVERSE SAILING, in Navigation, is sailing on different courses in succession, and the method of reducing such compound courses and distances into an equivalent single course and distance is called *resolving a traverse* The reduction may be effected either by geometrical projection or trigonometrical computation, but it is generally performed by inspection, with the aid of [illegible]

TRAVERSE TABLE, in Navigation, is the tabulated form in which the northing southing easting and westing are made on each [illegible] course and distance in a traverse, for the purpose of finding results of difference of latitude and departure made upon the whole, the difference between the sums of the northings and southings being the *diff lat*, and between the sums of the eastings and westings the *departure*

The northing, southing, easting, and westing are generally taken by inspection from a table which contains the parts of a right-angled plane triangle corresponding to a given acute angle, and a hypothenusal line of every unit in length from 1 to 300 and sometimes to 500, an extent sufficient for the wants of the practical navigator This table itself is also called a *traverse table*, from the facility which it affords in resolving a traverse, but it may be applied advantageously to many other purposes

In the annexed figure A B C is a plane triangle right-angled at B, and if A B represent a portion of the meridian (considered a straight line) passing through A and A C the distance from A to C, then the angle A is called the course, A B the difference of latitude and B C the departure, and to given values of A the corresponding values of A B and B C, being computed and entered in a table, form a portion of a traverse table

The table is thus constructed to A C and angle A as *arguments*, the angle being taken to every degree and every quarter point of the compass and the hypothenuse to every integer from unity to as high a number as may be thought requisite But the table being formed any two elements which geometrically determine the triangle may be assumed as the given one and the other found by inspection from the table But the use of the table is not limited to the solution of right angled triangles only, for every case of oblique triangles may be solved by means of it

TRAVERTIN (Ital travertino) A limestone deposited from water holding carbonate of lime in solution The word is a corruption of *tiburtinus*, this kind of stone being abundantly formed by the river Anio at Tibur near Rome The species about Alba is usually called *peperino* They are both of good quality and were much used by the ancient Romans Its Latin name was *lapis tiburtinus*

TRAVESTIE (Fr travestir *to disguise*) In Literature a word used in the same signification as parody See PARODY

TREACLE The viscid brown syrup which drains from the sugar in the refining moulds Its specific gravity is generally 1 4 and it contains on the average 75 per cent of solid matter (*Ure's Dictionary*)

TREAD (Sax tredan *to set the feet on*) In Architecture, the horizontal part of a step on which the foot is placed

TREAD MILL A recent invention for giving useful employment to persons imprisoned for crime

Its usual form is that of a cylindrical wheel of about 5 feet diameter and 16 feet long, and several of such wheels are sometimes coupled together The circumference is furnished with twenty four equidistant steps, on which the prisoners are made to work on the mill Each individual treads in a separate compartment, boarded off so that no intercourse can take place between the parties at work at the same time

All mounting the first step together, their weight sets the wheel in motion, bringing down the step trod upon, when they step up to the next one, which descends in the same manner, and so on, producing a continuous rotatory motion in the wheel, which may be applied as the moving force to a mill for grinding corn, or in turning any other machinery

The prisoners at work on the wheel are assisted and supported by a hand-rail before them The wheel makes about two rounds per minute, which is equivalent to a vertical ascent of about 32 f [illegible] this is about the maximum of labour [illegible] on the wheel These machines, which have now been introduced into all the great prisons in England and Wales, have been most efficacious in counteracting that feeling which disposes the worthless to balance the pleasures of idleness against the discomforts of confinement The application of it to prisoners *before trial* was much denounced as an abuse (See *Ed Rev* vol xxxix for a paper by the Rev Sydney Smith on this subject) The Court of King's Bench, however, refused a mandamus to compel the justices of Yorkshire to allow food, except bread and water, to prisoners committed for trial who refused to work.

TREASON, or HIGH TREASON By the statute 25 E 3 c 2 the limits of this great offence were first accurately defined, and although subsequent enactments at different periods widely enlarged the range of actions which might be drawn within its penal character, yet most of these have been regarded as encroachments upon the principles of our jurisprudence To compass the death of the king, queen, or king's eldest son and heir, to violate the king's wife or daughter, or the wife of the heir apparent, to levy war against the king in the realm, to assist the king's enemies in the realm or elsewhere, to counterfeit the king's privy seal, to clip or counterfeit the king's money, to slay the chancellor or other high judicial magistrates, — these are the seven species of treason constituted by this act The many fresh species devised during the troubled periods which followed that reign, and by the arbitrary genius of Henry VIII, were repealed in the first year of the reign of Queen Mary Of new treasons since created by analogy to those which were previously so considered, the principal are defined by 36 G 3 c 7 such as conspiring to excite foreigners to invade the realm, levying war in order to compel the king to change his measures or counsels, or to overawe either house of parliament, and the expressions or declarations of such opinions by printing, writing, or any other overt act Counterfeiting the king's money or filing and clipping the king's coin, are still treasons, as well as having coining tools in possession, and [illegible] from abroad Most other offences [illegible] of a lower description In high treason all parties concerned are principals no accessaries being recognised in this offence (See the *Sixth Report of the Commissioners of Criminal Law*)

TREASURER, LORD HIGH Formerly the third great officer of the crown in England The office is now executed by five persons styled the lords commissioners of the treasury, one of whom holds also the office of chancellor of the exchequer See TREASURY

TREASURE TROVE During the middle ages *treasure trove*, or money dug from the ground formed an important branch of the revenue of this and of most other European states The security of property which we have enjoyed since the Revolution has however, put long [illegible] practice of burying treasure [illegible] known to a late period the practice was common in Ireland and is, perhaps, not yet altogether abandoned in that country, and it is also common in some of the Continental states Neckar mentions that in France, under the *ancien regime* the vassals of many of the nobles afraid of subjecting themselves to the violence of their masters buried all the money they could scrape [illegible] during the anarchy and brigandage of [illegible] vast sums were thrown into the earth The well informed Russian economist, M Storch mentions that the practice of burying treasure is still extremely prevalent in Germany, Italy, and Russia, and at must necessarily be more or less prevalent in every country exposed to the ravages of war, and where the rights of property are imperfectly protected But it is chiefly in the despotical states of Asia, and in Turkey in Europe, that the burying of money is carried to the greatest extent *There* every rich individual estimates his wealth not by the stock or capital he has lent to others, or has employed in the great work of production but principally by the amount of the treasure he has been able to conceal, and every poor man deposits in the earth whatever he can contrive to withdraw from the grasp of his avaricious masters 'The rajahs,' says Mr Luke Scrafton, in his valuable tract on Hindostan 'never let their subjects rise above mediocrity, and the Mohammedan governors look on the growing riches of a subject as a boy does on a bird's nest he eyes their progress with impatience, then comes with a spoiler's hand and ravishes the fruit of their labour To counteract this the Hindoos bury their money under ground, often with such secrecy as not to trust even their own children with the knowledge of it, and it is amazing what they will suffer rather than betray it When their tyrants have tried all manner of corporeal punishments on them they threaten to defile them but even that often fails, for resentment prevailing over the love of life, they frequently rip up their bowels or poison themselves, and carry the secret to the grave" Mr Scrafton considers that the universality of this practice, and the quantity of the precious metals which must in consequence have been lost, has been a principal cause of the long-continued drain of specie to the East From the discovery of the American mines down to a very late period, the greatest portion of their produce has been directly or indirectly exported to Turkey, Hindostan, and other eastern countries, and yet it is said that the precious metals do not seem to have become more abundant in those countries, or the prices of commodities to be materially increased But, without attempting to investigate the precise degree of credit that ought to be attached to this statement, it is abundantly certain that the want of security which has caused this locking up of so large a quantity of capital must be one of the main causes of the poverty and wretchedness in which the people of India, Persia, Turkey, &c are involved

TREASURY, BOARD OF In England, the board to which is entrusted the management of all matters relating to the sovereign's civil list or other revenues. This office was formerly committed to the lord high treasurer, the third great officer of the crown, but in modern times a lord high treasurer has not been appointed the [illegible] by [illegible] commissioners The chief of these or first lord of the treasury, is generally the prime minister for the time being, and, when a commoner, also chancellor of exchequer, though Sir Robert Peel has recently deviated from this practice The salary of the first lord of the treasury is 5000*l* per annum, that of the others 1200*l* each The other officers of the board are, two joint secretaries, a number of clerks (chief, senior, junior, minute, copying &c), a receiver of fees, a keeper of the papers, a solicitor, a chamber keeper, messengers, housekeepers, extra clerks and extra messengers

TREATY In Law, an agreement between two or more independent states Grotius (*De Jure Belli et Pacis*, l ii ch 15 s 5) divides treaties into two classes those which turn on things to which the contracting parties are already bound by the law of nature, such as mutual amity commerce, &c, and those which contain stipulations for something more, such as treaties regulating boundaries, conceding particular powers, &c The municipal constitution, in every state, determines in whom resides the authority to make and to ratify treaties In most monarchies it is vested in the sovereign, in republics, in the chief magistrate senate or executive council, in federal states, sometimes exclusively in the federal authority, as in the United States, while in the Germanic federation the particular states retain the right of making treaties of alliance and commerce not inconsistent with the fundamental laws of the confederation In order to enable a public minister or other diplomatic agent to conclude and sign a treaty, he must be furnished with a full power and when so concluded the treaty is binding on the state in the same manner as an agent is bound by the act of his principal But the question how far, and in what cases ratification is necessary has been the subject of much debate among writers on international law It is usual to reserve a power to ratify in the treaty itself It is necessary also, in most constitutional governments for the sanction of the legislative body to be subsequently given to treaties of commerce taxes on the people entered into by the [illegible] Thus the government of Great Britain when making treaties granting subsidies, &c usually stipulates that the king will recommend to parliament to make the grant necessary for the purpose, but under the constitution of the United States it has been thought that congress is bound to sanction treaties in general made by the president with the advice and consent of the senate Treaties have been divided into real and personal the former of which are said to bind the contracting parties independently of any change of sovereignty or in the rulers of the state, the latter are made with express reference to the person of the actual ruler But treaties properly so called, as of friendship and alliances commerce and navigation, even if perpetual in terms are said to expire — 1 In case either of the [illegible] parties cease to be an independent state 2 When the internal constitution of government is so changed as to render the treaty no longer applicable In this they differ from what are called transitory conventions which pass from one government to another, such as treaties of cession, boundary &c (See *Wicquefort* book ii, *Vattel* book ii, Schoell, *Hist. des Traités de Paix* 4 vols Brussels 1817)

TREBLE (Said to be the same as 'threefold," sed quære?) In Music the highest part in a concerted piece Thus we say a treble violin a treble hautboy &c In vocal music this part is committed to boys or females The treble is divided into first or highest treble, and second or low treble Half treble or, as it is sometimes called *mezzo soprano* is a high counter tenor

TREKSCHUYT (Dutch, *track ship or boat*) The covered boats drawn by horses or cattle, and used for the conveyance of goods and passengers on the Dutch and Flemish canals, are so called For an admirable description of the accommodations and management of the 'trekschuyt" now so rapidly falling into disuse from the introduction of railways, see *Murray's Handbook for Northern Germany*

TREENAILS In Naval Language, wooden bolts by which the planks of a ship's bottom are secured to the timbers

TREFOIL (Lat tres, *three*, and folia, *leaves*) In [illegible] to three cusps in a circle, resembling a [illegible] clover

TREFOIL A name given in English to different kinds

of three-leaved plants White trefoil is *Trifolium repens*, yellow trefoil is *Trifolium minus*, black trefoil is *Medicago lupulina*, bird's foot trefoil, *Lotus corniculatus* All such plants are used for the food of cattle The French word *trèfle* has a similar application

TREMA'NDO *Tremol* (It *trembling*) In Music, a direction for one of the graces of harmony, which consists in a reiteration of one note of the chord: this, however, applies more directly to the word *tremolo*, whilst the *tremando* is a general shake of the whole chord

TREMATODES, *Trematoda* (Gr τρημα, *a hole*) The name of an order of Sterelminthans, or Parenchymatous Entozoa comprising those which have organs of locomotion and adhesion in the form of suckers

TREME'LLA (Lat tremo, *I tremble*) A jelly-like plant of the lowest organization, found in damp walks and similar situations It is composed of a thallus containing microscopical spores, and is closely allied to the [illegible]

TREMOLITE A mineral, often of a fibrous texture, generally containing silica magnesia, and carbonate of lime, originally found in the valley of Tremola on St Gothard

TRE'NCHES (Fr tranché), in Fortification, are places cut out by besiegers to approach the place attacked in greater security They are generally from 8 to 10 feet wide and in depth something more than the height of a man being commonly about 7 feet

TRENT, COUNCIL OF, in Ecclesiastical History, was assembled by Paul III in 1545, and continued in twenty-five sessions until 1563, under Julius III and Pius IV This celebrated council was convoked at a period when the Christian world was agitated by the early efforts of the reformers, and its most important decrees have therefore reference to the points on which the controversies of the Reformation chiefly turned *e g* transubstantiation, image-worship, the authority of the pope There is a certain degree of ambiguity in the expression of some of its decrees owing to the uncertainty which the doctrines of the reformers caused in the minds of supporters of the Romish faith But on the whole, it cannot be denied that they express the general belief of Western Christians at the period when they were drawn up, and that they condemn although with little decision and [illegible] many of the more gross abuses of the church The authority of these decrees (except so far as the more strictly doctrinal part of them is embodied in the creed of Pope Pius IV) has been much debated among Romish ecclesiastics In Germany Poland and Italy they appear to have been adopted from the beginning without restriction in Spain only with a reservation of the rights of the monarch in France they have never been solemnly received But as regards the more important portions of them which contain the rule of faith they probably accurately express the belief of the Roman Catholic church at the present day The famous history of Father Paul (*Paolo Sarpi*) is in many respects a noble model but does not always contain a fair estimate of the subject That of Cardinal Pallavicino represents the more Romanist view (See *Mosheim* vol iii, *Robertson's Charles V*, *Hallam's Intr to the Literature of Europe*, vol ii)

TREPA'N (Gr τρυπαω *I perforate*) A circular saw for perforating the skull The term *trephine* is also applied to a similar but improved form of the instrument (See the article "Trephine," in *Cooper's Surgical Dictionary*)

TRE'SPASS, in Law, strictly is any transgression of the law less than felony or misprision of felony, but is generally used to signify any wrong or damage which is done by one private person to another *Trespass vi et armis* is where an act is done which is in itself an immediate injury to another's person or property, such as assault and battery, or breaking and entering a house or close *Special trespass*, or *trespass on the case*, where an act is [illegible] but only by consequence and [illegible] is a personal action of tort, and lies for injuries of a very miscellaneous character Trespass on the case, as a form of action arose originally out of a power given to the Court of Chancery to frame new writs for injuries which could not be redressed under the common forms of trespass or covenant *Trover* and *assumpsit* are, in their origin, different forms of trespass [illegible]

TRESSURE In Heraldry, a border running parallel with the sides of the escutcheon, which should contain about one quarter of the bordure It is generally either double or triple, and has usually fleur-de-lis, arranged in opposite directions alternately, perpendicular to the length of the tressure it is then called *flory counter-flory* The tressure forms part of the royal arms of Scotland and of those of many noble Scottish houses

TRESSURE TRIER See Visor

TRET In Commerce, an allowance of 4 lbs for every 104 lbs for the waste which certain kinds of goods are liable to from dust, &c

TRIAD (Gr τριας *three*) As to the mysterious triad of deities of [illegible] have been the basis of the [illegible] according to a passage in Proclus on the *Timæus* of Plato (see *Bryant's Ancient Mythology*, vol iii p 167), "they could," he says, in accordance with his singular theory, "be no other than the three sons of Noah, who were the Baalim of the Scriptures, and the Δαιμονες and Αρεα [illegible] of Greece" Others have imagined that the [illegible] his [illegible] with the [illegible] W [illegible] by Cymric antiquaries *of the Welsh Bards* are poetical histories, in which the facts recorded are thrown into a kind of triplets Thus, to take the commencement of the first Triad as an example,—"Three names have been given to the Isles of Britain since the beginning Clas Merddin, Tir Inys, and Inys Pridain" The Triads are supposed to be of no greater antiquity than the reign of Edward I, although they probably contain fragments of old history (See *Turner's Anglo-Saxons*, vol i "Britannia after the Romans")

TRIAD In Music, a compound of three sounds, which, from the extraordinary property it has of being naturally divisible into two thirds, one major and the other minor, constituting a fifth in the whole, has received the name of the *harmonic triad* Its name is founded on its being formed of a third and a fifth, which, with the bass or fundamental sound, make three different terms

TRIAL, in Common Law, is the examination and disposal of an issue of fact, either in criminal or civil proceedings Trials are by *certificate* by *inspection* by the *record*, and *per pais*, or by a jury The three first are of a peculiar character Trial by certificate is where the evidence of the person certifying is the only proper test of the issue, as the customs of the city of London are to be tried by the *certificate* of the mayor and aldermen &c Trial by inspection is said to be where the judges personally examine and decide the question in dispute, a practice long obsolete Trial by the record is where the point at issue being whether or not a certain record exists, or certain averments in it, it is decided by the production of the record itself But the ordinary trial of all facts with these very rare exceptions is by a jury summoned to try the issue raised by the pleadings Trials at bar of civil actions are those which take place before all the [illegible] of which the record is, the original [illegible] mode of trial, from which all others are variations although it is now very rare in practice In ordinary cases, it has been long superseded by trial at Nisi Prius (since 13 Ed I) (See NISI PRIUS) A trial at bar is now only granted on special grounds Trials before the sheriff are when the demands do not exceed *20l* by virtue of the stat 3 & 4 W 4 c 42 s 17 These are the only modes of disposing of issues raised on records in the superior courts, and trials of actions in courts of limited jurisdiction are governed by the same general rules Criminal trials are had in like manner when an issue of fact is tried, whether guilty or not guilty, is raised by the [illegible] *Venires* in civil cases, are granted where the court of which the record is, sees reason to be dissatisfied with a verdict, either on the ground that evidence was improperly received or rejected, or that the judge misdirected the jury as to the law applicable to the facts, or that the verdict was against the weight of evidence, or that a party was unfairly surprised, or, lastly, that fresh evidence has since been discovered

TRIA'NGLE (Lat triangulum) A three-sided figure which consequently has also three angles

Triangles are rectilineal spherical, or curvilineal Rectilineal or plane triangles are bounded by straight lines, spherical triangles are formed on the surface of a sphere by the intersection of the planes of three great circles, curvilineal triangles are those which are bounded by [illegible]

[illegible] from the relation of their sides and angles Plane triangles are denominated *equilateral* when their three sides are all equal, *isosceles* when two only are equal, and *scalene* when all three are unequal They are called *right-angled* when [illegible] is a right angle, *oblique-angled* when [illegible] is greater than a right angle, and *acute-angled* when each of the angles is less than a right angle, lastly, triangles are said to be *similar* when their angles are respectively equal each to each

The following are some of the principal properties of plane triangles

1 The greater side is opposite the greater angle, and *vice versa*

2 The sum of any two sides is greater, and the difference of any two less than the third side

3 The sum of the three angles is equal to two right angles and if one of the sides be produced, the exterior angle is equal to both the interior and opposite ones.

4 The sum of the squares of the sides of a right-angled triangle is equal [illegible] This is the 47th Pro[illegible], and is usually called the Pythagorean Proposition, from the circumstance of its discovery being ascribed to Pythagoras

5 Lines which bisect the angles of a plane triangle w[illegible] pass th[illegible] the centre of the inscribed circle, per[illegible] the middle of the sides pass through the centre of the circumscribing circle, and lines drawn from the angles to the middle of the opposite sides pass through the centre of gravity

6 Triangles are to each other in the compound ratio of their bases and altitudes, since the area of a triangle is the half of the product of the base and the perpendicular let fall upon it

The area of a plane triangle is found by multiplying the length of one of the sides into that of the perpendicular let fall upon it from the opposite angle, but there are various other expressions for the area, for which see TRIGONOMETRY

TRIANGLE In Astronomy, one of the forty-eight constellations of Hipparchus, situated in the northern hemisphere The same name is also given to one of the twelve southern constellations formed by Bayer There is also the *Little Triangle*, added by Hevelius, near the first named *See* CONSTELLATION

TRIANGLE In Music, a small steel triangular musical instrument of percussion, open at one of its angles It is set in vibration by being struck with a short bar of the same metal as that whereof the instrument is composed

TRIANGLE, ARITHMETICAL The [illegible] by Pascal to a table of certain numbers [illegible] form of a triangle The first vertical column of the table contains units only, the second contains the series of natural numbers, the third the series of triangular numbers, the fourth the series of pyramidal numbers, and so on (*See* FIGURATE NUMBERS) Thus -

1						
1	1					
1	2	1				
1	3	3	1			
1	4	6	4	1		
1	5	10	10	5	1	
1	6	15	20	15	6	1
&c	&c	&c	&c	&c	&c	&c

Any number in the table is obtained by adding the number next above it in the same column, to the number in the same line in the next preceding column, and it will be observed that the oblique diagonal rows, beginning at the left and descending towards the right are the same as the vertical columns One of the properties of the table is, that numbers taken on the horizontal lines are the coefficients of the different powers of a binomial For the description and uses of the table, see the Introduction to *Hutton's Mathematical Tables*

TRIANGULAR COMPASSES Compasses having three legs, two opening in the usual manner and the third turning round an extension of the central pin of the other two, besides having a motion on the central joint of its own The instrument is useful in the construction of maps and charts, as three points may be taken off at once

TRIANGULAR NUMBERS The series of numbers formed by the successive sums of the terms of an arithmetical progression, of which the common difference is 1 Thus,

Arithmetical progression,	1, 2 3, 4, 5, 6, &c
Triangular numbers,	1, 3, 6, 10, 15, 21, &c

The general term of the series is $\frac{1}{2} n (n + 1)$ *See* FIGURATE NUMBERS

TRIARII The third last, or veteran rank of infantry in the Roman legion (*See* LEGION) There is an essay on this particular rank, *Mem de l'Ac des Inscr* vol xxix

TRIBE (Lat tribus) A principal subdivision of the Roman people The word signifies a division into three, which was the number of the patrician tribes, which were distinguished by the names Ramnes, Titienses, and Luceres The first of these consisted of the original body of patricians, the next two were added at different times under the kings from the free citizens, who grew up round the first The plebeian tribes, which finally included the whole people, were quite distinct from the above They were instituted by Servius Tullius, who divided the city into four regions, and the rest of the Roman territory into twenty-six, most probably making in all thirty tribes, to correspond to the number of patrician *curiæ* Ten of these are supposed to have been swept away by the cession of the territory on the Etruscan bank of the Tiber to Porsenna, as we hear of only twenty-one immediately after that event, the one having been most probably added In later times, the number of tribes was increased to thirty-five, and they then included all the free citizens In the mean time the patrician tribes became quite extinct, when all the difference of privileges enjoyed by [illegible] were abolished (See *Niebuhr's* [illegible] p 417)

TRIBOMETER (Gr τριβω, *I rub*, and μετρον, *measure*) In Mechanics, the name given by Muschenbroek and Coulomb to a sort of sledge, or apparatus for measuring the force of friction *See* FRICTION

TRIBUNAL A raised seat in the forum of Rome, [illegible] of a half moon, hence any judgment seat also a raised place in a camp whence the general addressed his soldiers and issued orders

TRIBUNE Properly is the name denoting the chief magistrate of a *tribe* [illegible] officers in the Roman [illegible] plebeian tribunes, who were first created after the secession of the commonalty to the Mons Sacer (*See* A U), as one of the conditions of its return to the city They were especially the magistrates and protectors of the commonalty, and no patrician could be elected to the office At their first appointment the power of the tribunes was very small but it increased to the assembling the plebeians, [illegible] aggression, but their persons were sacred and inviolable, and this privilege consolidated their other powers, which, in the later ages of the republic, grew to an enormous height and were finally incorporated with the functions of the other chief magistracies in the person of the emperor The number of the tribunes varied from two to ten, and each of these might annul the proceedings of the rest by putting in his veto (See *Niebuhr's Hist of Rome*, 2d edit i 624, Labletterie, *Mém de l'Ac des Inscr* vol xxxvii) 2 Military tribunes were first elected in the year 310 A U in the place of the [illegible] consequence of the demands of the commonalty to [illegible] a share of the supreme power This measure was not, however, a complete concession of their demands, but, in fact, evaded them in a great degree, for the tribunate was not vested with the full powers or honours of the consulate, not being a *curule* magistracy, and though it was open to all the people, patricians were almost invariably chosen The number of the military tribunes was sometimes six, and sometimes three For above seventy years sometimes consuls were elected and sometimes military tribunes, at last the old order was permanently restored but the plebeians were admitted to a share of it (See *Mem de l Ac des Inscr* vol xxxvii) 3 Legionary tribunes or tribunes of the soldiers, were the chief officers of a legion, six in number, who commanded under the consul, each in his turn, usually about a month in battle each led a cohort

TRIBUNE In Ancient Architecture, a raised seat or stand whence speeches were delivered to the people, the term is still used in this sense in the French chambers

TRIBUTE (Lat tribuo, *I give*) A sum of money paid by inferior sovereign or state to a superior potentate to secure the friendship or protection of the latter The *black mail* formerly levied by the Scottish borderers on their less powerful neighbours, for protecting their property from the depredations of caterans, was a species of tribute

TRICA In Botany, one of the names of the shield or [illegible] of a lichen

TRICHECHUS (Gr θριξ, *hair*, and ιχθυς, *fish*) A name invented by Artedi to designate the manatee, as being the only species of fish, or whale fish, that was hairy "quia solus inter pisces fere hirsutus sit" Linnæus, in his *System of Nature*, adopted the term *trichechus* as the generic appellation for the manatee (*Trichechus manatus*), but he added the walrus as a second species of the genus Subsequent zoologists, in separating these very different animals, and placing them in distinct genera, have [illegible] too many other cases, invented [illegible] the animal so well designated by its original epithet, and have restricted the application of the term *trichechus* to the walrus, for which it was not originally designed

TRICHIASIS (Gr θριξ, *a hair*) A disease of the eyelids in which the eyelashes grow inwards and irritate the bulb of the eye

TRICHIDIUM (Gr θριξ) A netted filament- [illegible] etted purse, in which the spores [illegible] included

TRICHINA (Gr diminutive of θριξ) The name of [illegible] of microscopic entozoa, which infest the muscular tissue of the human subject

TRICHIURUS (Gr θριξ and ουρα, *a tail*) The name of a genus of spinous finned fishes, literally rendered in their popular English name of "hair-tails," significative of their most striking generic character, which is taken from the single elongated hair-like filament that terminates the rayless tail The *Trichiuri* have no anal fin, and have neither ventral fins nor supplemental scales But one species, viz the silvery hair-tail (*Trichiurus lepturus*, Linn), has been admitted into the catalogue of British fishes

TRICHOCE'PHALUS (Gr θριξ, and κεφαλη, *a head.*) The name of a genus of Hematoid Entozoons, one species of which (*Trichocephalus dispar*, Rudolphi) i[illegible] intestinum cæcum

[illegible] TRANS, *Trichoptera* (Gr θριξ, and πτερον, *a wing*) The name of an order of insects founded by Kirby for the case-worm flies, which are charac[illegible]erized by [illegible] the [illegible] those of the Lepidopterous, the mandibles [illegible]

TRICLI'NIUM (Gr τρεις *three* [illegible] In Ancient Architecture, a room furnished on three sides with couches the fourth side being left open for facilitating the attendance of the servants, in which company was received and the repasts served The winter triclinia were placed to the west, and those for summer to the east

TRI'COLO'R The national French banner of three colours, blue white, and red, adopted on the occasion of the first revolution The immediate occasion for adopting them is said to have been that they were the colours worn by the servants of the Duke of Orleans, and they were first assumed by the people when the minister Necker was dismissed in 1789 But these colours, in combination appear to have formed a national emblem in France from a very early period It is also said to have been formed by uniting the three colours successively used in the French standards at different periods, viz the blue of the banner of St Martin, the red of the oriflamme (*see* ORIFLAMME) and the white of the white cross supposed to have been assumed under Philip of Valois The three colours were given by Henry IV to the Dutch on their desiring him to confer on them the national colours of his country and they have since been borne successively by the Dutch republic and the kingdom of the Netherlands The domestic livery of Louis XIV was tricoloured, as were also the liveries of the Bourbon kings in Spain At the revolution, when the three colours were assumed on the national flag, they were borne in the same order as the Dutch, but in a different position, viz the division of colours parallel to the flag staff, whereas in the Dutch flag it is at [illegible] being the favourite banner [illegible] flags have been adopted in Belgium, &c and they are often employed as emblematical of liberty in other states

TRICU'SPID VALVE The valve of the right ventricle of the heart

TRIDENT (Lat tres *three* and dens *a tooth*) The sceptre which the poets and painters of antiquity placed in the hand of Neptune is so called by way of eminence It is in the form of a spear or fork with three prongs or teeth hence the name *See* NEPTUNE

TRIENS A small Roman copper coin, worth one third of the *as* (which see) as the derivation of the word implies This was the piece of money usually placed in the hands of the deceased poor to pay Charon for their passage over the Styx

TRIERA'RCHIA (Gr τριηραρχια) An Athenian institution which imposed on a certain body of citizens the duty of fitting out triremes for the use of the state About 1200 citizens were usually chosen for this purpose from the richest individuals, and these were subdivided into clubs of 12 or 16 to each ship Demosthenes introduced a new regulation by which the burden to be borne by each individual was made to bear a given proportion to his property (See Boeckh, *Public Economy of Athens* ii 319 360)

TRIE'TERIS (Gr τρεις *three*, and ετος *a year*) In Grecian Chronology a cycle invented by Thales to connect his year, which consisted of 12 months of 30 days each, amounting to 360 days, this falling short of the true solar year, he inserted a month of 30 days at the end of every three years by which means he made it exceed the true year by 13 days

TRIFO'RIUM (Lat) In Gothic Architecture an arched story between the lower arches and the clerestory in the aisles, choir, and transepts of a church An example may be seen in Westminster Abbey, where the triforium affords a communicating gallery entirely round the church

TRIGAMOUS (Gr τρεις, *three* and γαμος, *marriage* is a name applied by some botanists to plants containing three sorts of flowers in the same flower-head, the [illegible] females, and hermaphrodites

TRIGE'MINI Lat tres, *three*, and geminus, *double* [illegible] of nerves they arise from the crura of the cerebellum, and are divided within the cranium into three branches [illegible] superior and [illegible] is divided into the frontal, lachrymal, and nasal nerves, the superior maxillary into the spheno-palatine, posterior alveolar, and infra-orbital nerves, and the inferior maxillary into two branches, the internal lingual, and one more appropriately termed the infra-maxillary

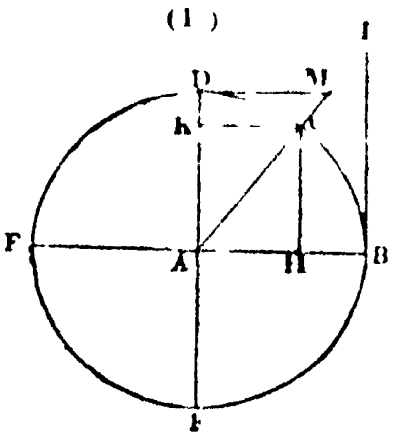
TRIGLYPH (Gr τρεις, *three*, and γλυφω, *I carve*) In Architecture, an ornament in the Doric frieze, consisting of two whole and two half channels, separated by flat spaces called *femora*

TRI'GONALS, *Trigona* (Gr τρεις, *three*, γωνια, *an angle*) The name of a family of Decapodous Crustaceans, the carapace of which is nearly triangular *Trigonia* is also the name of a genus of Bivalves of a triangular form, and of which most of the species are fossil

TRIGO'NIA (Gr τριγωνος, *having three corners*) A name applied by Lamarck to a genus of Ostracean Bivalves, most of the species of which are found fossil, but which has a beautiful recent representative in the seas of the southern hemisphere, remarkable for the iridescent lining of the valves, *La Trigone nacrée* of Lamarck It is also the name of a genus of South American plants

TRIGONOCE'PHALUS (Gr τριγωνος and κεφαλη, *a head*) A genus of poisonous serpents, characterized by having the tail terminated by a horny conical process or spur No species is known to inhabit Europe or Africa, in which cont[illegible] the *Trigonocephali* are replaced by the vipers [illegible] of the island of Martinique, called by the French settlers "fer de lance," is a species of the present genus (*Trigonocephalus lanceolatus*)

TRIGONO'METRY (Gr τριγωνος *triangle* μετρεω, *measure*) This term as its derivation implies originally signified the measurement of triangles or the branch of mathematics which treats of the relations between the sides and angles of triangles but in its modern acceptance it includes all formula relative to angles or circular arcs and the lines connected with them, these lines being expressed by numbers or ratios In relation to its practical utility it may be regarded as the most important of all the applications of mathematics



The magnitude of an angle is usually measured by the circular arc which has its centre at the angular point, and is intercepted by the straight lines forming the angle, but there is no necessary connection between an angle and the arc which subtends it and in some modern works the fundamental properties of trigonometry are explained without any reference to the circle This method of proceeding is undoubtedly more direct than the other, nevertheless as the language of trigonometry has taken its form from considerations respecting the circle there is some advantage on the score of perspicuity in the ancient method for which reason we shall adhere to it in the present sketch

The primary unit by which angles and their corresponding arcs are numerically expressed is the *degree*, or the ninetieth part of a right angle or of a quadrant This division of the quadrant into ninety parts is entirely arbitrary It was adopted by the ancient Greeks and has been all but universally followed down to the present time for although the French mathematicians attempted to introduce the decimal system by dividing the quadrant into a hundred parts their example has not been imitated, as the first effect of the alteration would be to derange and render useless the whole of the existing trigonometrical tables

The degree is divided into 60 minutes and the minute into 60 seconds Anciently the seconds were subdivided into thirds, but the practice of writing down the parts of seconds as decimals is now universally followed The expression 20° 16′ 43 57″ is read 20 degrees 16 minutes, 43 seconds, 5 tenths and 7 hundredths of a second

Let B A C (fig 1) be an angle contained by the two straight lines A B A C with A as a centre and radius A B describe a circle, let B A be produced to meet the circumference in I, and draw the diameter D I perpendicular to B E From C draw C H and C K respectively perpendicular to B I and D I, and let B I and D M be also perpendicular to B L and D F, meeting A C produced in I and M Now, since the angles at the centre of a circle are proportional to the arcs on which they stand, the arc B C may be taken as the geometrical measure of the angle B A C, and both will be expressed without distinction by the same number of degrees, minutes, &c The following definitions are used

(1)

The arc D C, which is the defect of B C from the quadrant, is called the *complement* of B C, and C E, which is its defect from the semicircle is called its *supplement* C H is the *sine* of the arc B C, and C K or A H is the sine of its complement or the *cosine* of B C, B L is the *tangent* of the arc B C, and D M is the tangent of its complement or the *cotangent* of B C; A L is the *secant* of B C, and A M the secant of its complement, or its *cosecant*; B H is the *versed sine* of B C, and D K its

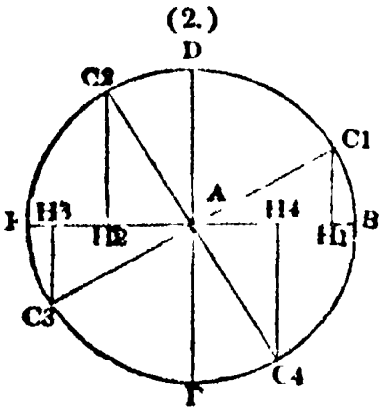
co-versed sine These appellations are abbreviated as follows — The arc B C being taken as the measure of the angle B A C, its sine is expressed by *sin* A, its cosine by *cos* A, its tangent by *tan* A, its cotangent by *cot* A, its secant by *sec* A, its cosecant by *cosec* A, its versed sine by *ver sin* A, and its co-versed sine by *co-ver sin* A

Since the arc B C is assumed as the measure of the angle B A C, the above lines may be regarded respectively as the sine, cosine, tangent, &c of the angle, and since all quantities used in trigonometry are to be expressed by numbers, we may take, instead of those lines, any numbers which are proportional to them, and thence we may assume the ratio of the arc B C to the radius A B, that is, B C ÷ A B, as the measure of the angle B A C. In like manner the sine of the angle B A C may be represented by C H ÷ A B, its cosine by A H ÷ A B, its tangent by B L ÷ A B, its secant by A L ÷ A B, its cotangent by D M ÷ A D, and its cosecant by A M ÷ A D. Adopting these definitions, the values of the trigonometrical functions of the angle B A C will evidently remain the same when the angle remains constant, whatever be the magnitude of the circle to which they are referred. It is usual to regard the radius A B as a unit, in which case the sines, cosines, tangents, &c will be expressed in terms of that unit by the decimal notation. This is the way in which they are expressed in the trigonometrical tables.

From the right-angled triangles in the above diagram we have $AH^2 + HC^2 = AC^2$, $AB^2 + BL^2 = AL^2$, $AD^2 + DM^2 = AM^2$; and because the three triangles A H C, A B L, A D M are similar, we have also

$$\begin{array}{llll} AH & HC & AB & BL \\ HC & CA & BL & LA \\ CA & AH & LA & AB \end{array} \qquad \begin{array}{llll} DM & DA, \\ DA & AM, \\ AM & DM \end{array}$$

Making the radius A B = A C = A D = 1, and denoting the angle B A C by A, these proportions give



$$\begin{array}{llllll} \cos A & \sin A & 1 & \tan A & \cot A & 1, \\ \sin A & 1 & \tan A & \sec A & 1 & \operatorname{cosec} A, \\ 1 & \cos A & \sec A & 1 & \operatorname{cosec} A & \cot A, \end{array}$$

from which, and the above equations, we obtain the following table of formulæ exhibiting the relations among the trigonometrical lines —

$$\begin{aligned} &\cos^2 A + \sin^2 A = 1 \\ &\sec^2 A - \tan^2 A = 1 \\ &\operatorname{cosec}^2 A - \cot^2 A = 1 \\ &\cos A \sec A = 1 \\ &\sin A \operatorname{cosec} A = 1 \\ &\tan A \cot A = 1 \\ &\tan A \cos A = \sin A \\ &\cot A \sin A = \cos A \\ &\sin A \sec A = \tan A \\ &\cos A \operatorname{cosec} A = \cot A \\ &\tan A \operatorname{cosec} A = \sec A \\ &\cot A \sec A = \operatorname{cosec} A \end{aligned}$$

Of the Signs of the Trigonometrical Lines — In the above definitions and formulæ the angle A was assumed to be less than a right angle, or less than 90°, and the sine, cosine, tangent, &c were all regarded as positive. We have now to inquire what the expressions severally become as the arc increases through all its values from 0 to 360°. As before, let B L and D F (*fig* 2) be two diameters of the circle at right angles to each other, suppose the arc to begin at B, let B C_1 be less than a quadrant, and let the arc B C_1 or angle B A C_1 be denoted by A. Draw A C_2 at right angles to A C_1; then since $C_1 C_2$ is 90°, the arc B C_2 = 90° + A. Let C_1 A be produced to meet the circumference in C_3, then (reckoning always in the same direction) B C_3 = 180° + A. Lastly, let C_2 A be produced to meet the circumference in C_4, and we have B C_4 (or B D F C_4) = 270° + A. Draw $C_1 H_1$, $C_2 H_2$ &c perpendicular to E B. Now, according to the usual convention of analytical geometry, if the point A be regarded as the origin of [illegible] distances measured in the direction A B be considered as positive, those measured in the direction A E will be negative, and of the lines perpendicular to E B, if those above F B be positive, those below it will be negative. Hence the sines and cosines of arcs in the different quadrants will be as follows —

(2.)

In the first quadrant the arc B C_1 (= A) is less than 90°, and $C_1 H_1$ and A H_1 are both positive, that is, sin A and cos A are positive. In the second quadrant we have B C_2 = 90° + A, its sine is $C_2 H_2$ which is positive, and its cosine is A H_2, which is negative. But from similar triangles we have $C_2 H_2$ = A H_1, and A H_2 = $C_1 H_1$; therefore, sin (90° + A) = cos A and cos (90° + A) = − sin A. In the third quadrant, we have A C_3 = 180° + A; the sine is $C_3 H_3$ negative, and the cosine is A H_3 negative, but $C_3 H_3$ = $C_1 H_1$ and A H_3 = − A H_1, therefore sin (180° + A) = − sin A, and cos (180° + A) = − cos A. In the fourth quadrant we have A C_4 = 270° + A, the sine is $C_4 H_4$ = negative, and the cosine is A H_4 positive. But $C_4 H_4$ = A H_1, and A H_4 = $C_1 H_1$, therefore sin (270° + A) = − cos A, and cos (270° + A) = sin A.

Having found the directions and values of the sine and cosine of an arc in each of the different quadrants, those of the tangent, cotangent, secant, and cosecant are also determined, for the above formulæ give

$$\tan A = \frac{\sin A}{\cos A}, \quad \cot A = \frac{\cos A}{\sin A}, \quad \sec A = \frac{1}{\cos A}, \quad \operatorname{cosec} A = \frac{1}{\sin A}$$

Whence it appears that the tangent and cotangent will be positive when these quadrants have both the same sign, and negative when they have opposite signs, that is in the second and fourth quadrants. It follows also that the secant has always the same sign as the cosine, and the cosecant the same as the sine.

On these principles the following table is constructed, which will very frequently be found useful in calculation, as it shows not only the sign to be prefixed to the several trigonometrical lines when the arcs to which they belong exceed 90°, but also how to find those lines in tables which contain them only for the first quadrant.

1st Quadrant.	2d Quadrant.
+ sin A	sin (90° + A) = + cos A
+ cosec A	cosec (90° + A) = + sec A
+ cos A	cos (90° + A) = − sin A
+ sec A	sec (90° + A) = − cosec A
+ tan A	tan (90° + A) = − cot A
+ cot A	cot (90° + A) = − tan A
3d Quadrant	**4th Quadrant.**
sin (180° + A) = − sin A	sin (270° + A) = − cos A
cosec (180° + A) = − cosec A	cosec (270° + A) = − sec A
cos (180° + A) = − cos A	cos (270° + A) = + sin A
sec (180° + A) = − sec A	sec (270° + A) = + cosec A
tan (180° + A) = + tan A	tan (270° + A) = − cot A
cot (180° + A) = + cot A	cot (270° + A) = − tan A

Of the Trigonometrical Tables — We now proceed to show how the different trigonometrical lines may be computed. The ordinary tables contain the logarithms of the sines, cosines, tangents, and cotangents for every ten seconds, and some of the better tables as Taylor's, Bagay's, &c, for every second of the quadrant, but it is evident from the formulæ given above that if the values of any one of the four be computed for the different angles between 0 and 90°, the values of all the others will be obtained at the same time. Thus, since cos A = sin (90° − A), a table of the values of the sine is also a table of the values of the cosine, and since tan A = sin A ÷ cos A, the logarithm of the tangent of any angle is obtained by subtracting the logarithm of the cosine from the logarithm of the sine, and the logarithm of the cotangent by subtracting the logarithm of the sine from that of the cosine. The whole difficulty, therefore, or nearly the whole (for some peculiar artifices must be employed when the angles differ very little from 0° or from 90°) is reduced to the computation of the sine, and as this is expressed indefinitely in terms of the arc, it is necessary, first of all, to determine the length of the whole circumference in terms of the radius, from which the arc corresponding to any given number of degrees, minutes, and seconds is found by proportion.

It is usual to designate the semicircumference of a circle whose radius is 1 by π. A great number of formulæ have been given for computing the value of π by means of infinite series. That which was discovered by Mechin, is the most rapidly convergent, and therefore the best adapted for computation —

$$\pi = 16\left(\frac{1}{5} - \frac{1}{3\,5^3} + \frac{1}{5\,5^5} - \frac{1}{7\,5^7} + \frac{1}{9\,5^9} - \&c\right) - 4\left(\frac{1}{239} - \frac{1}{3\,239^3} + \frac{1}{5\,239^5} - \frac{1}{7\,239^7} + \&c\right).$$

By computing a few of the terms of this series, the value of π is readily obtained. The following is its value correct to 20 decimals —

$$\pi = 3.14159265358979323846, \&c$$

The series which give the trigonometrical lines in terms of the arc are as follows — Let x be any arc less than 90°, then

$$\sin x = x - \frac{x^3}{1\,2\,3} + \frac{x^5}{1\,2\,3\,4\,5} - \frac{x^7}{1\,2\,3\,4\,5\,6\,7} + \&c.$$

$$\cos x = 1 - \frac{x^2}{1\,2} + \frac{x^4}{1\,2\,3\,4} - \frac{x^6}{1\,2\,3\,4\,5\,6} + \&c.$$

$$\tan x = x + \frac{x^3}{3} + \frac{2x^5}{3\,5} + \frac{17x^7}{3^2\,5\,7} + \frac{62x^9}{3^3\,5\,7\,9} + \&c.$$

$$\cot x = \frac{1}{x} - \frac{x}{3} - \frac{x^3}{3^2\,5} - \frac{2x^5}{3^3\,5\,7} - \frac{x^7}{3^3\,5^2\,7} - \&c$$

$$\sec x = 1 + \frac{x^2}{1\,2} + \frac{5x^4}{1\,2\,3\,4} + \frac{61a^6}{1\,2\,3\,4\,5\,6} + \&c$$

$$\operatorname{cosec} x = \frac{1}{x} + \frac{x}{1\,2\,3} + \frac{7x^3}{3\,4\,5\,6} + \frac{31x^5}{3\,4\,5\,6^2\,7} + \&c.$$

For other and more expeditious methods of computing the trigonometrical lines, or deriving them from one another, the reader is referred to the Preface to the *Tables Trigonometriques Decimales*, by Delambre, or to *Callet's* or *Hutton's Tables*

The following expressions for the sine and cosine of an angle found in John Bernoulli are of frequent use in analytical trigonometry —Let $e = 2.7182818$ (the base of the Napierian logarithms) then

$$\sin x = \frac{e^{x\sqrt{-1}} - e^{-x\sqrt{-1}}}{2\sqrt{-1}},$$

$$\cos x = \frac{e^{x\sqrt{-1}} + e^{-x\sqrt{-1}}}{2}$$

To these we may add the following formula for a multiple angle, discovered by Demoivre, which is readily deduced from them (m is any number whatever) —

$$\left(\cos x + \sin x\sqrt{-1}\right)^m = \cos mx + \sin mx\sqrt{-1}$$

Formulæ relative to Two Arcs — In trigonometrical calculations, it is very frequently necessary to express the sines, cosines, &c of the sum or difference of two angles in terms of the sines, cosines, &c of the single angles The following table contains a synopsis of the most useful formulæ, the first four are easily demonstrated by means of a simple geometrical construction, and all the others are deduced from these four by the ordinary algebraic transformations —

$$\cos(A + B) = \cos A \cos B - \sin A \sin B$$
$$\cos(A - B) = \cos A \cos B + \sin A \sin B$$
$$\sin(A + B) = \sin A \cos B + \cos A \sin B$$
$$\sin(A - B) = \sin A \cos B - \cos A \sin B$$
$$\cos B + \cos A = 2\cos\tfrac{1}{2}(A + B)\cos\tfrac{1}{2}(A - B)$$
$$\cos B - \cos A = 2\sin\tfrac{1}{2}(A + B)\sin\tfrac{1}{2}(A - B)$$
$$\sin A + \sin B = 2\sin\tfrac{1}{2}(A + B)\cos\tfrac{1}{2}(A - B)$$
$$\sin A - \sin B = 2\cos\tfrac{1}{2}(A + B)\sin\tfrac{1}{2}(A - B)$$

$$\tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}$$

$$\tan(A - B) = \frac{\tan A - \tan B}{1 + \tan A \tan B}$$

$$\cot(A + B) = \frac{1 - \tan A \tan B}{\tan A + \tan B}$$

$$\cot(A - B) = \frac{1 + \tan A \tan B}{\tan A - \tan B}$$

$$\tan A + \tan B = \frac{\sin(A + B)}{\cos A \cos B}$$

$$\tan A - \tan B = \frac{\sin(A - B)}{\cos A \cos B}$$

$$\cot A + \cot B = \frac{\sin(A + B)}{\sin A \sin B}$$

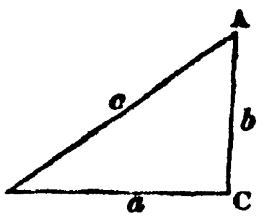
$$\cot B - \cot A = \frac{\sin(A - B)}{\sin A \sin B}$$

$$\tan A + \cot B = \frac{\cos(A - B)}{\cos A \sin B}$$

$$\cot A - \tan B = \frac{\cos(A + B)}{\sin A \cos B}$$

$$\cos 2A = 1 - 2\sin^2 A, \quad \sin 2A = 2\sin A \cos A$$

$$\tan 2A = \frac{2}{\cot A - \tan A}, \quad \cot 2A = \tfrac{1}{2}(\cot A - \tan A)$$



$$\cos\tfrac{1}{2}A = \sqrt{[\tfrac{1}{2}(1 + \cos A)]}, \quad \sin\tfrac{1}{2}A = \sqrt{[\tfrac{1}{2}(1 - \cos A)]}$$

$$\tan\tfrac{1}{2}A = \frac{\sin A}{1 + \cos A}, \quad \cot\tfrac{1}{2}A = \frac{\sin A}{1 - \cos A}$$

Solution of Plane Triangles — Having explained the nature of the trigonometrical quantities, and exhibited some of their most useful relations, we come next to apply them to the solution of triangles which forms the proper object of trigonometry Of the six parts of which a triangle consists, namely, the three sides and the three angles, it is known from geometry that when any three (excepting the three angles) are given all the rest are determined, accordingly, we have to find expressions for each part in terms of three others, and so arranged that they can be immediately calculated from a table which contains the logarithms of the sines [illegible] and cotangents to every minute or smaller division of the quadrant The solution of triangles may therefore be regarded as the art of applying such a table to each particular case It is convenient to consider the cases of the right-angled triangle separately

Right-angled Plane Triangles — In all the solutions which follow, the sides of the triangle will be denoted by a, b, c, and the angles respectively opposite by A, B, C In the right-angled [illegible] let C be [illegible] the hypothenuse There are four distinct cases, and in each case the solution follows immediately from the definition of the sine, cosine, tangent, and cotangent

(3)

Case 1 Given the two sides a and b to find the angles A and B, and the hypothenuse c Here we have from the definition

$$\tan A = \frac{a}{b}, \quad \tan B = \frac{b}{a}; \quad \cos A = \frac{b}{c}, \quad \text{whence } c = \frac{b}{\cos A},$$

or in like manner $c = a - \cos B$

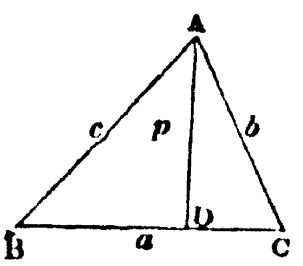
Case 2 Given the hypothenuse c and a side a, to find the angles A and B and the side b Here

$$\sin A = \cos B = \frac{a}{c}, \quad \sin B = \frac{b}{c}, \quad b = c\sin B = c\cos A$$

The side b may be found independently of the angles, for since $b^2 = c^2 - a^2$, we have $b = \sqrt{[(c + a)(c - a)]}$

Case 3 Given a side a and one of the acute angles A, to find the other side b, the hypothenuse c, and the angle B

Here $\cot A = \frac{b}{a}$, $\sin A = \frac{a}{c}$, $b = a\cot A$, $c = \frac{a}{\sin A}$



For the angle we have $B = 90^\circ - A$

Case 4 Given the hypothenuse c and an angle A, to find the sides a and b and the other angle B Here $a = c\sin A$, $b = c\cos A$, $B = 90 - A$

Oblique-angled Plane Triangles — The solutions of the different cases are all derived from the three following propositions First the sum of the three interior angles of any triangle is equal to two right angles, that is,

$$A + B + C = 180^\circ \qquad (1)$$

(4)

Secondly, in any triangle, the sides are to each other as the sines of the opposite angles For, draw AD (fig 4) perpendicular to BC, and let $AD = p$, we then have $\sin B = \frac{p}{c}$, $\sin C = \frac{p}{b}$, whence $\frac{\sin B}{\sin C} = \frac{b}{c}$ The same property must evidently hold true of sides a and c, and a and b, whence

$$\frac{\sin A}{\sin B} = \frac{a}{b}, \quad \frac{\sin B}{\sin C} = \frac{b}{c}, \quad \frac{\sin C}{\sin A} = \frac{c}{a} \qquad (2)$$

The third general property may be derived from the second but is more readily found as follows —In the last figure let $BD = m$ $DC = n$, we have then $m = a - n$, whence $m^2 = a^2 + n^2 - 2an$ Adding p^2 to both sides, and observing that $m^2 + p^2 = c^2$, $n^2 + p^2 = b^2$, and $n = b\cos C$, we have $c^2 = a^2 + b^2 - 2ab\cos C$, and consequently

$$\cos C = \frac{a^2 + b^2 - c^2}{2ab} \qquad (3)$$

We now proceed to give the solutions of the different cases of which there are four

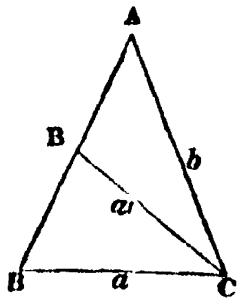
Case 1 Given the three sides, a, b, c, to find the three angles A, B, C

$$\text{Put } s = \tfrac{1}{2}(a + b + c), \quad M = \sqrt{\left\{\frac{(s-a)(s-b)(s-c)}{s}\right\}},$$

$$\text{then } \tan\tfrac{1}{2}A = \frac{M}{s-a}, \quad \tan\tfrac{1}{2}B = \frac{M}{s-b}, \quad \tan\tfrac{1}{2}C = \frac{M}{s-c}$$

Case 2 Given two sides, a, b, and the included angle C, to find the other side c, and the other angles A B

Find first the sum and difference of A and B from these two formulæ, $A + B = 180^\circ - C$, $\tan\frac{1}{2}(A - B) = \frac{a-b}{a+b} \times \tan\frac{1}{2}(A + B)$, then



$$A = \tfrac{1}{2}(A + B) + \tfrac{1}{2}(A - B)$$
$$B = \tfrac{1}{2}(A + B) - \tfrac{1}{2}(A - B)$$
$$c = a\frac{\sin C}{\sin A} = b\frac{\sin C}{\sin B}$$

Case 3 Given two sides a, b and the angle opposite one of them, A, to find the third side c, and the other angles B, C

Here we have $\sin B = \frac{b}{a}\sin A$; $C = 180^\circ - (A + B)$;

$c = a \frac{\sin C}{\sin A} = b \frac{\sin C}{\sin B}$ In this case, however, it is necessary to remark, that if the side which is adjacent to the given angle be greater than the side opposite to it (that is, if b be greater than a) then there are two triangles which have the same data, and consequently the solution is ambiguous. For with C (fig. 5) as a centre, and radius equal to C B, describe an arc of a circle intersecting A B in B′, and join C B′; it is obvious that the data a, b, A belong to both triangles A C B and A C B′, and the solution gives alike c = A B, and c = A B′. The solution is therefore said to be ambiguous.

(5)

Case 4. Given two angles, A, B, and the side between them c.

In this case the third angle is likewise given by reason of C = 180° − (A + B), and consequently the sides are found from the formulæ

$$a = c \frac{\sin A}{\sin C}, \quad b = c \frac{\sin B}{\sin C}$$

Area of a Plane Triangle.—Euclid has shown that the area of any plane triangle is equal to the rectangle contained under half the base and the perpendicular let fall on it from the opposite angle, that is, area = $\frac{1}{2} a p$ (fig. 4). But for p we may substitute $b \sin C$ (or $c \sin B$), and we have area = $\frac{1}{2} a b \sin C$. If from this expression we eliminate b by the first of the equations (2), we shall have the area in terms of a side and the three angles, or, if we eliminate sin C by means of the formula (3) and the equation $\cos^2 C = 1 - \sin^2 C$, we shall have an expression for the area in terms of the three sides. Assume $s = \frac{1}{2}(a + b + c)$, then the area is expressed by any of the following formulæ —

$$\text{area} = \frac{a b \sin C}{2} = \frac{a^2 \sin B \sin C}{2 \sin A} = \sqrt{[s (s - a) (s - b) (s - c)]}$$

Spherical Trigonometry.—This branch of trigonometry considers the relations between the sides and angles of triangles formed on a sphere. Before giving the formulæ for the solutions of the different cases it will be useful to state a few elementary properties of spherical triangles, deduced from principles purely geometrical.

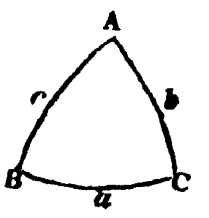
For these definitions must be premised.—1. The common section of the spherical surface and any plane passing through the sphere is called a *great circle*. 2. The *pole* of a great circle is a point on the surface of the sphere from which all straight lines drawn to that great circle are equal. 3. A *spherical angle* is the angle on the surface of the sphere made by two great circles at their intersection. It is identical with the angle made by the planes of the circles, and is measured by an arc of the great circle whose pole is at the angular point. 4. A *spherical triangle* is a figure on the surface of the sphere bounded by three arcs of great circles, each of which is less than a semicircle. 5. Any arc of a great circle is the measure of the plane angle formed at the centre of the sphere by the two radii passing through the extremities of the arc.

From these definitions the following properties are easily derived —

1. The distance of a great circle from its pole is a quadrant.

2. If two great circles cut one another at right angles, each passes through the pole of the other, and, consequently, if two great circles cut a third at right angles, they will meet in its pole.

3. A spherical triangle which has two equal sides has the angles opposite those sides equal, and the greater side is opposite to the greater angle.



4. The sum of any two sides is greater than the third, the difference of any two less than the third, and the sum of all the three sides is less than the circumference of a great circle.

5. If about the angular points of a spherical triangle as poles there be described three great circles on the sphere, these, by their intersections, will form a triangle which is said to be *supplemental* to the former, and the two triangles are such that the sides of the one are the supplements of the arcs which measure the angles of the other.

6. The sum of the three angles of any spherical triangle is greater than two right angles, but less than six right angles.

Solution of Spherical Triangles.—The solutions of all [illegible] are deduced from the following [illegible] which all the different [illegible] each set express all the same property, and are formed by merely interchanging the letters. Those of the first set are readily demonstrated from the properties of the triangular pyramid, or *tetraedron*, and the others may be all deduced analytically from the first, so that, in fact, the whole of spherical trigonometry is comprehended in the first of the underwritten equations. The radius of the sphere is supposed to be unity, the three sides or arcs are respectively denoted by a, b, c (fig. 6), and the measures of the angles respectively opposite by A, B, C. It is to be observed that the sides a, b, c (as well as the angles A, B, C), are expressed in degrees, minutes, &c., and not, as in plane trigonometry in absolute measures, as feet, yards, &c.

(6)

I

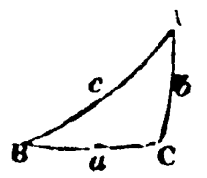
$$\cos a = \cos b \cos c + \sin b \sin c \cos A$$
$$\cos b = \cos a \cos c + \sin a \sin c \cos B$$
$$\cos c = \cos a \cos b + \sin a \sin b \cos C$$

II

$$\frac{\sin b}{\sin a} = \frac{\sin B}{\sin A}, \quad \frac{\sin c}{\sin a} = \frac{\sin C}{\sin A}, \quad \frac{\sin b}{\sin c} = \frac{\sin B}{\sin C}$$

III

$$\cot a \sin b = \cot A \sin C + \cos b \cos C$$
$$\cot a \sin c = \cot A \sin B + \cos c \cos B$$
$$\cot b \sin a = \cot B \sin C + \cos a \cos C$$
$$\cot b \sin c = \cot B \sin A + \cos c \cos A$$
$$\cot c \sin a = \cot C \sin B + \cos a \cos B$$
$$\cot c \sin b = \cot C \sin A + \cos b \cos A$$



IV

$$\cos A = -\cos B \cos C + \sin B \sin C \cos a$$
$$\cos B = -\cos A \cos C + \sin A \sin C \cos b$$
$$\cos C = -\cos A \cos B + \sin A \sin B \cos c$$

The above general formulæ apply to every case of spherical triangles, but when one of the angles is a right angle, they become considerably more simple, and, in the case of oblique-angled triangles, they admit of transformations by which they are rendered more convenient for logarithmic calculation.

Right-angled Spherical Triangles.—As before, let C be the right angle and c the hypothenuse.

(7)

Case 1. Given the two sides a, b, to find the hypothenuse c, and the two oblique angles A, B. Here

$$\cos c = \cos a \cos b, \quad \tan A = \frac{\tan a}{\sin b}, \quad \tan B = \frac{\tan b}{\sin a}$$

Case 2. Given the hypothenuse c and a side b, to find the other side a and the two oblique angles.

$$\cos a = \frac{\cos c}{\cos b}, \quad \cos A = \frac{\tan b}{\tan c}, \quad \sin B = \frac{\sin b}{\sin c}$$

Case 3. Given a side a and the opposite angle A, to find the other side b, the hypothenuse c, and the angle B.

$$\sin b = \frac{\tan a}{\tan A}, \quad \sin c = \frac{\sin a}{\sin A}, \quad \sin B = \frac{\cos A}{\cos a}$$

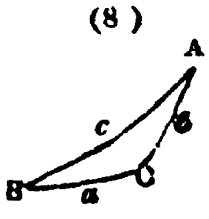
In this case it is necessary to observe, that as a sine belongs [illegible] to the angle [illegible], and consequently the solution is ambiguous, as two distinct triangles may be formed of the same data.

Case 4. Given a side a, and the adjacent angle B, to find b, c, and A.

$$\tan b = \sin a \tan B, \quad \cot c = \cot a \cos B, \quad \cos A = \cos a \sin B$$

Case 5. Given the hypothenuse c, and an angle A, to find the sides a, b, and the angle B.

$$\sin a = \sin c \sin A, \quad \tan b = \tan c \cos A, \quad \cot B = \cos c \tan A$$



Case 6. Given the two oblique angles A, B, to find the two sides a, b, and the hypothenuse c.

$$\cos a = \frac{\cos A}{\sin B}, \quad \cos b = \frac{\cos B}{\sin A}, \quad \cos c = \cot A \cot B$$

All the six cases of right-angled spherical triangles, it is proper to remark, were reduced by Lord Napier, the inventor of the [illegible] to two rules, which are known by the name of *Napier's Rules of the Circular Parts*. See CIRCULAR PARTS.

Oblique-angled Spherical Triangles.

(8)

Case 1. Given the three sides a, b, c, to find the three angles A, B, C.

Find $s = \frac{1}{2}(a + b + c)$, and put M =

$$\sqrt{\left\{\frac{\sin (s - a) \sin (s - b) \sin (s - c)}{\sin s}\right\}},$$

then $\tan \frac{1}{2} A = \frac{M}{\sin (s-a)}$, $\tan \frac{1}{2} B = \frac{M}{\sin (s-b)}$, $\tan \frac{1}{2} C = \frac{M}{\sin (s-c)}$.

Case 2 Given two sides a, b, and the included angle C, to find c, A, and B

$$\tan \tfrac{1}{2}(A+B) = \frac{\cos \frac{1}{2}(a-b)}{\cos \frac{1}{2}(a+b)} \cot \tfrac{1}{2} C,$$

$$\tan \tfrac{1}{2}(A-B) = \frac{\sin \frac{1}{2}(a-b)}{\sin \frac{1}{2}(a+b)} \cot \tfrac{1}{2} C,$$

$A = \frac{1}{2}(A+B) + \frac{1}{2}(A-B)$, $B = \frac{1}{2}(A+B) - \frac{1}{2}(A-B)$,

$$\sin c = \sin a \frac{\sin C}{\sin A} = \sin b \frac{\sin C}{\sin B}$$

The side c may be otherwise found without finding the angles A and B Thus find a subsidiary angle φ such that $\cot \varphi = \tan a \cos C$, then

$$\cos c = \frac{\cos a \sin (b+\varphi)}{\sin \varphi}$$

Case 3 Given two sides a, b, and the angle opposite one of them A, to find the third side c, and the angles B, C

Find two subsidiary angles φ and ψ, such that $\cot \varphi = \tan b \cos A$, $\tan \psi = \cos b \tan A$, then

$$\sin (c+\varphi) = \frac{\cos a \sin \varphi}{\cos b}, \quad \sin B = \sin A \frac{\sin b}{\sin a},$$

$$\sin (C+\psi) = \cot a \tan b \sin \psi$$

This case is ambiguous for the same reason as the corresponding case in plane trigonometry

Case 4 Given two sides a, b, and the side between them c, to find the other sides a, b, and the remaining angle C

Find two angles φ and ψ, such that $\tan \varphi = \cos c \tan A$, $\tan \psi = \cos c \tan B$, then

$$\tan a = \frac{\tan c \sin \varphi}{\sin (B+\varphi)}, \quad \tan b = \frac{\tan c \sin \psi}{\sin (A+\psi)},$$

$$\cos C = \frac{\cos A \cos (B+\varphi)}{\cos \varphi} = \frac{\cos B \cos (A+\psi)}{\cos \psi}$$

Case 5 Given two angles A, B, and the side opposite one of them a, to find the other sides b, c, and the remaining angle C

Find two angles φ and ψ, such that $\tan \varphi = \tan a \cos B$, $\cot \psi = \cos a \tan B$, then

$$\sin b = \sin a \frac{\sin B}{\sin A}, \quad \sin (c-\varphi) = \cot A \tan B \sin \varphi,$$

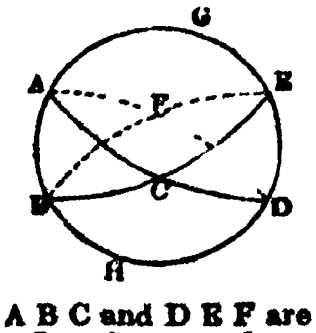
$$\sin (C-\psi) = \frac{\cos A \sin \psi}{\cos B}$$

This case is also ambiguous

Case 6 Given the three angles A, B, C, to find the sides a, b, c

Find $S = \frac{1}{2}(A+B+C)$, and assume

$$N = \sqrt{\left(\frac{-\cos S}{\cos (S-A)\cos (S-B)\cos (S-C)}\right)}, \text{ then}$$



$$\tan \tfrac{1}{2} a = N \cos (S-A),$$
$$\tan \tfrac{1}{2} b = N \cos (S-B),$$
$$\tan \tfrac{1}{2} c = N \cos (S-C)$$

When the sides of a spherical triangle are very small in comparison of the radius of the sphere, as is the case in all triangles measured on the surface of the earth, the sides may be computed from the observed angles with all the accuracy which the observations will admit of by approximate formulæ, which greatly abridge the calculations *See* SURVEYING

Area of a Spherical Triangle — It is known from the integral calculus that the area or surface of a sphere is equal to four times that of one of its great circles or $= 4 \pi r^2$, where r is the radius of the sphere, and $\pi = 3.14159$ Hence surface of hemisphere $= 2 \pi r^2$

Now it is manifest that the portion of the spherical surface included between two great circles, which is called a *lune*, will have the same proportion to the surface of the hemisphere as the angle of the lune has to 180°, therefore if the angle of the lune be A°, its surface will be $2 \pi r^2 \times (A - 180)$

(9)

Let A B C (fig 9) be a triangle upon the hemisphere A B H E, and let the sides B C and A C be produced till they meet again in F on the opposite hemisphere, then, since C D F and C E F are semicircles, they are equal to A C D and B C E, whence A C = D F and B C = F E, and the two triangles A B C and D E F are every way equal

Let S = surface of the triangle A B C, then S = surface of hemisphere − B H D C − A G E C − D C E = $2 \pi r^2$ − (lune A H D − S) − (lune B G E − S) − (lune C D F E − S) = $2 \pi r^2 \left(1 - \frac{A}{180} - \frac{B}{180} - \frac{C}{180}\right)$ + 3 S, therefore $S = \frac{A+B+C-180}{180} \pi r^2 = \frac{E}{180} \pi r^2$, where $E = A + B + C - 180°$

From this it follows that the area of a spherical triangle is proportional to the excess of the sum of its three angles above 180°, and hence this quantity, which is called the *spherical excess*, is sometimes taken as the measure of the area of the triangle The spherical excess and the area are mutually deducible from each other *See* SPHERICAL EXCESS

In the above formulæ the area is given in terms of the three angles The following elegant formula, which gives the spherical excess in terms of the three sides, is due to L'Huillier — Let $s = \frac{1}{2}(a+b+c)$, then

$$\tan \tfrac{1}{2} E = \sqrt{[\tan \tfrac{1}{2} s \tan \tfrac{1}{2}(s-a) \tan \tfrac{1}{2}(s-b) \tan \tfrac{1}{2}(s-c)]}$$

Trigonometry owes its origin to the Greek astronomers of Alexandria The solutions of the most useful cases of spherical triangles have been known from the time of Hipparchus, and the fundamental formulæ appear in the *Analemma* of Ptolemy The Greeks, however, instead of the *sines*, employed the *chords* of the double arcs The sines were introduced by the Arabians, to whom the science is indebted for some other improvements Regiomontanus introduced the *tangents*, which have greatly simplified the calculations But the present elegant and compact form in which the solutions now appear is the result of improvements in modern analysis The treatises on trigonometry are extremely numerous For the history the reader may be referred to Montucla *Histoire des Mathématiques*, Delambre, *Histoire de l'Astronomie*, and the Introduction to *Dr Hutton's Mathematical Tables*

TRIANGULAR (Lat tres, *three*, and latus, *side*) Three sided, a term applied to all triangular figures

TRILLION In Arithmetic, a million of billions, or a million of million of millions The term is said by Dr Johnson to have been invented by Locke

TRILLO (It) In Music, a term by which it is intimated that the performer is to beat quickly on two notes in conjoint degrees alternately one after another, beginning with the highest and ending with the lowest It is marked with a single T as well in a vocal as in an instrumental part

TRILOBITES (Lat tres, *three*, and lobus, *a lobe*) The name given by Cuvier to an order of Crustaceans, [illegible] remarkable fossil species in which the body is divided into three lobes by two fissures which run parallel to its axis

TRILOGY (Gr τρεις *three* and λογος, *a discourse*) The word applied to a series of three dramas, which, although each of them is in one sense complete, yet bear a mutual relation, and form but parts of one historical and poetical picture All the plays of Æschylus, and the *Henry VI* of Shakspeare are examples of a *trilogy*

TRIM The position of the keel of a ship with respect to a horizontal line Also the disposition of the weights or stowage, as favourable or otherwise for sailing, which are expressed by *in trim*, and *out of trim*

TRIMERA, *Trimera* (Gr τρεις, *three*, and μερος, *a part*) The name of a section of Coleopterous insects, including those which have each tarsus composed of three articulations

TRIMMER In Architecture, a piece of timber framed at right angles to the joists opposite chimneys or the well holes of stairs which receives the ends of the joists intercepted [illegible]

TRIMMING JOIST In Architecture, a joist into which a trimmer is framed

TRIMYARIES *Trimyaria* (Gr τρεις, *three*, and μυων, *a muscle*) The name by which those Bivalves are distinguished which present three muscular impressions on each valve

TRINAL (Lat trinus *threefold*) Of threefold dimensions,—length, breadth, and thickness In Astrology, the trine is one of the five aspects of the influential bodies, the angle subtended by the two planets as seen from the earth being 120°, or the third of the zodiac The trine was supposed to be a benign aspect *See* ASTROLOGY

TRINGA (Lat *a wading bird*) A genus of wading birds (*Grallæ*), characterized by a compressed bill of moderate length, enlarged at the point, and a hind toe, too short to reach the ground It is by the latter character that the species *Tringæ* are distinguished from the plovers (*Charadrii*) in which the hind toe is wanting

TRINITARIANS A religious order, founded in 1198 under the pontificate of Innocent III Its members devoted themselves to the [illegible] of ransoming [illegible]

order of the same name, and dedicated to the same objects

TRI'NITY The three persons comprised in the G[illegible] listinguished as the Father, the Son, and [illegible] The term is not found in the Scriptures and its introduction is referred at the earliest to the 2d century All [illegible] Christians that believe in the Trinity [illegible] comprised under the general name [illegible] several theories have been framed as to the existence of supposed doctrines of a Trinity in Pagan systems (See, as to the Orphic, Platonic, Jewish, and Greek and Latin Magian, and Indian Trinities *Dissertation* vol iv)

TRINITY SUNDAY The Sunday next after Whit Sunday, so called on account of a feast which was anciently and still continues to be held on that day, in the Romish church, in honour of the Holy Trinity This feast does not appear to have been fully established in the Western Church until the year 1334, under Pope John XXIII

TRINO'MIAL (Lat tres *three* and nomen, *name*) In Algebra, a quantity consisting of three terms connected by the signs + or −, as $a + bc^2 - d^3$

TRI'O (It) In Music, a composition consisting of three parts Besides the [illegible] which forbid that two [illegible] either to the bass or any other part in trios, the third must be heard in every time of the bar either with the bass or between the other two upper parts, or in other words, one of the parts must make a third with the bass, and the other a fifth or octave

TRIOLET A stanza of eight lines, in which the first line is thrice repeated

TRIO'NES In [illegible] cipal stars in the constellation Charles's Wain, four of the stars being fancied to represent a wain or waggon, and the three others the horses by which it is drawn

TRIPHA'NE A synonym of the mineral called also *spodumene*

TRI'PHTHONG (Gr τρεις *three*, and φθογγη *sound*) In Grammar, a composite sound of three vowels as a diphthong is of two, such as the German "aeu" There is no such sound in English nor strictly speaking in French, unless the combinations "ieu" in that language be so considered

TRI'PLE (Gr τριπλους *threefold*) In Music, one of the kinds or measures of time of which there are many different subdivisions There are however, only four principal ones, whereof the others are varieties See art Music

TRIPLE SALTS A term by which in Chemistry certain salts are sometimes designated in which two bases are combined with one acid Thus emetic tartar which is composed of oxide of antimony and of potassa with tartaric acid and Rochelle salts in which soda and potassa are combined with the same acid are *triple tartrates* These salts, however are more properly regarded as *double salts*, that is as consisting of tartrate of antimony and of tartrate of potassa or of single equivalents of tartrate of potassa and tartrate of soda

TRI'PLET In Poetry, three verses rhyming together Thus, in the famous lines of Pope

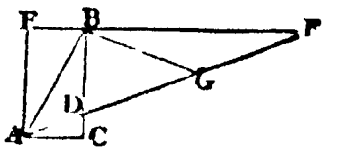
"[illegible] In Dryden's [illegible]
[illegible] vary [illegible]
The long majestic march and energy divine"

In Music, notes grouped together by threes, thus,

In common time, where three of the quavers are intended to be equal in duration to a crotchet, a 3 is sometimes placed over them, but they [illegible] together and thus [illegible] whole measure

TRIPLICATE RATIO In Arithmetic and Geometry, the ratio of the cubes is the cube of the simple ratio Thus the triplicate ratio of 2 to 3 is the same as that of 8 to 27 Similar solids are to each other as the triplicate ratio of their like dimensions

TRI'POD (Gr τρεις, *three*, and πους, *a foot*) In Architecture a vessel, table, seat, or instrument having three feet It was from such a seat that the Pythian goddess rendered oracular answers at Delphi



TRI'POLI A mineral used for polishing, originally from Tripoli in Barbary It occurs in friable earthy masses of a dull clay colour Its essential components are silica, alumina, and oxide of iron, but the varieties of tripoli appear to vary extremely in composition Ehrenberg has found the different tripolis to be aggregates of silicified animalcules

TRI'REME (Lat tres, and remus, *oar*, Gr τριηρης *a galley with three rows of oars*) The usual war vessel of the Greeks at the time of the Persian and Peloponnesian wars, and [illegible] down to the period of the first Punic, when we find quinqueremes pretty generally substituted With respect to the construction, and the difficulties attending its explanation, see GALLEY. Some light has been thrown on Athenian naval matters by the recent discovery of nine inscriptions at the Piraeus, which have been commented on by Boeckh (See *Foreign Quart Rev* Jan 1841 See also his *Public Economy of Athens* transl i 372 &c)

TRISAGION (Gr τρις, *thrice*, and αγιος, *holy*) In the Greek Church, the threefold invocation of the Deity as "Holy" (Lat tersanctus) This invocation takes its origin from Isaiah, vi 3, [illegible] The ordinary form is that in Isaiah [illegible] Lord God of Hosts all the earth is [illegible] A different form of the trisagion is repeated daily in the service of the Greek church, and is attributed to Saint Proclus Concerning the war which was raised A D 508-518 by the addition of the words "who was crucified for us" see *Gibbon*, chap xlvii

TRISECTION (Lat trisectio) The dividing of any thing into three equal parts

TRISECTION OF AN ANGLE In Geometry, a problem of great [illegible] Greek mathematicians [illegible] angle cannot be effected by plane geometry, that is to say, by means of the straight line and circle, inasmuch as the analytical equation o[illegible] to the third degree, but it may [illegible] of the conic sections and some other curves as the quadratrix The geometrical conditions on which the solution of the problem depends may be explained as follows —

Let B A C be the angle and suppose D A C to be its third part Through any point B in A B draw B C perpendicular to A C, and B E parallel to A C, produce A D to meet B E in E, and complete the rectangle A F B C Now since D A C is the third of B A C therefore B A D is equal to twice D A C or twice B E A Draw B G, making the angle F B G equal to B E G, then B G A, being equal to G B E and G F B together, is equal to twice B E A and consequently equal to B A G Hence the two triangles F G B and G B A are isosceles, or G F = G B = B A Again the angle G B D is the difference between a right angle and F B G, and G D B or its equal A D C is the difference between a right angle and D A C which is equal to F B G, therefore G B D is equal to G D B whence G D is equal to G B or A B It thus appears that D G and G F are each equal to A B, or that D F is equal to twice A B which is a given line If therefore in a rectangle A F B C a straight line A D could be drawn from the angular point A so that on producing it to meet the opposite side F B the produced part should be equal to a given straight line, the problem would be solved This is the condition to which the trisection of the angle is reduced by Pappus of Alexandria, in the 4th book of his *Mathematical Collections*, where he shows how it may be constructed by means of an hyperbola When however the rectangle A F B C becomes a square that is when the given angle B A C is half a right angle, the construction is easily effected by elementary geometry (See *Leslie's Geometrical Analysis*)

TRISMUS (Gr τριζω *I gnash*) Lockjaw, tetanus affecting the jaw There are two species of this malady the one caused by wounds, or, under certain circumstances by exposure to cold, the other attacking infants during the two first weeks from their birth

TRI'SPAST or TRISPASTON (Gr τρις *three*, and σπαω *I draw*) A machine with three pulleys acting in connection w[illegible] to raise weights

TRI'THEISM (Gr τρεις *three* and θεος *God*) In Controversial [illegible] both before divines appear to have [illegible] their zeal to support the honour due to each of the three persons of the Trinity Sherlock in his controversy with South, whose views seemed to tend to confound the separate natures of the Father Son and Spirit and were generally characterized as Sabellian, is accused of having been betrayed into the opposite dogma of Tritheism

TRI'TICUM See WHEAT

TRI'TON In Mythology a marine deity, son of Neptune Tritons are sometimes mentioned in the plural number They were represented as half fish in form In Zoology, the name *Tritonia* has been given to a genus of marine, naked gastropodous Mollusks, or sea-slugs

TRI'TONE, or TRITONUS (Gr τρεις, *three*, and τονος, *tone*) In Music, an interval, now generally called a sharp fourth, consisting of four degrees, and containing three tones between the extremes on which account the ancients gave it its name It is moreover divisible into six semitones, three diatonic and three chromatic In dividing the octave, we find on one side the tritone and on the [illegible] false fifth

TRITOXIDE In Chemistry, such oxides as contain [illegible] three atoms of oxygen

TRIUMPH (Lat triumphus) The highest military

honour that could be obtained by a Roman general It was a solemn procession, with which the victorious leader and his army advanced through the city to the capitol, accompanied by the captives taken in war, and vehicles bearing the spoils, and all the furniture that could add magnificence to the spectacle On arriving at the capitol the general offered up a prayer of thanksgiving to Jupiter and the other gods, and sacrificed white bulls A triumph was decreed by the senate, and sometimes by the people against the will of the senate to the general who had put a great war with foreigners and civil ones battle, had slain above [illegible] of the state, and enlarged the limits of the empire *See* OVATION

TRIUMPHAL ARCH In Architecture, an arch erected to perpetuate the memory of a conqueror or of some remarkable victory or important event At first it consisted of a single arch, decorated merely with a statue and spoils of the victorious commander, but arches were afterwards erected with two, and then with three passages Those on the Via Triumphalis in Rome were the most magnificent, and in cases where they served as gates, they were usually constructed with two openings, so that one was appropriated for carriages passing into, and the other for carriages passing out of the city The following is a list of some of the principal triumphal arches of antiquity — The arch at Rimini erected in honour of Augustus on the completion of the repairs of the Flaminian Way from Rome to that city It was one of the noblest as well as most ancient of the arches of the ancients, having a single passage about thirty-three feet wide, and was contrary to the usual practice, crowned with a pediment The lesser arch of Septimus Severus at Rome, commonly called the *Arch of the Goldsmiths*, is a curious example being of a single opening, and crowned with a flat lintel An extremely elegant [illegible] the Italian side of Mont Cenis [illegible] of Aosta The arches of Aurelian and Janus, which possess more singularity than beauty The arch of Pola, in Istria which is curious from the use of coupled columns which it exhibits, and was erected by Salvia Posthuma, in honour of Sergius Lepidus and his two brothers The arch of Trajan at Ancona, which, though it has been [illegible] retains the beauty of its [illegible] still in tolerable preservation It stands at the entrance of the mole of the port and has four Corinthian columns on pedestals The arch of Titus at Rome, in which the order used is Composite, and was probably erected after the emperor's death An arch at Benevento, in honour of Trajan somewhat resembling that of Titus at Rome, also of the Composite order An arch of Gavius at Verona, called *del Castel Vecchio*, but no longer in existence The arch of Septimus Severus at Rome, at the foot of the capitol, and that of Constantine in the same city All these are each with three openings For the latter the arch of Trajan was despoiled of its ornaments, as the greater part of the bassi-relievi upon it represent the victories of that emperor It is in better preservation than any of the other arches that we have mentioned, and was indebted for its state to the care of Pope Clement XII

TRIUMVIRATE In Ancient History, this term was applied to two great coalitions of the three most powerful individuals in the Roman empire for the time being The first of these was effected in the year 60 B C between Julius Cæsar, Pompey and Crassus who pledged themselves to support each other with all their influence This coalition was broken by the fall of Crassus at Carrhæ in Mesopotamia, soon after which the civil war broke out, which ended in the death of Pompey and establishment of Julius Cæsar as perpetual dictator After his murder, 44 B C, the civil war again broke out between Antony, who wished to avenge the death and succeed to the fortunes of Cæsar, and the republic, on whose side were ranged Octavius and Brutus Lepidus with a large army remained in suspense which side to take But after the battle of Mutina, in which both consuls fell, 43 B C, Antony, Octavius, and Lepidus coalesced, thus forming the second triumvirate each party confirming the bond of union by the sacrifice of some of his own friends to the hatred of the others, — in which case was Cicero, who was delivered up by Octavius to the vengeance of Antony Against this confederation Brutus still held out, with the rest of the conspirators against Cæsar, till their destruction at the battle of Philippi The triumvirates divided the provinces of the empire, Octavius taking the west, Lepidus Italy, and Antony the east, but the iniquitous union was soon broken by the passion of Antony for Cleopatra which induced him to repudiate Octavia, the sister of Octavius War ensued, which was terminated by the defeat and death of Antony at Actium, in 32 B C, after which every thing fell into the hands of Octavius, Lepidus offering no obstacle

TRI'VIUM (Lat *three ways*) The name given in the schools of the middle ages to the three first liberal arts (grammar, rhetoric, and logic) which were studied together The other four (arithmetic, music, geometry, and astronomy) formed what was termed the quadrivium; and the two following mnemonic lines comprehend the whole: —

Gram loquitur; Dia verba docet, Rhe verba ministrat;
Mus. canit, Ar numerat, Ge ponderat; As colit astra.

TROCAR An instrument used in tapping [illegible] the dropsy The name is said to be corrupted from the French *trois quarts* [illegible] of resemblance

TROCHANTER (Gr τρεχω, *I run*, because the muscles inserted into it are those chiefly concerned in the act of running) A name given to two processes (greater and less trochanter) at the upper end of the thigh bone

TROCHE (Lat trochus, or trochescus, dim of *wheel*) A small round lozenge or cake generally composed of sugar and mucilage, united with small portions of more active remedies, intended to be allowed gradually to [illegible] the mouth

TROCHEE (Gr τροχαιος, *A rhythmical measure* [illegible] thus, — ⏑

TRO'CHILUS (Gr τροχιλος *a small bird*) This term was applied by Linnæus to the genus of small and brilliantly coloured birds which, from the energy and rapidity of the vibrations of their wings during flight are called humming-birds They include the smallest of the feathered tribe, and are the most diminutive of vertebrated animals some humming birds scarcely exceed a humble-bee in size, they are unable to escape from the strong webs of the large spiders of the American tropics, and thus sometimes become their prey

The humming-birds are characterized by a long and slender bill inclosing an extensile bifid tongue by which they extract the nectar and the small insects which may lurk in the recesses of flowers They have very small feet, long and narrow wings a broad and entire sternum with an unusually deep keel and a short and strong [illegible] apparatus for rapid [illegible] Humming birds live in pairs they have the character of being very quarrelsome, the males fighting desperately with each other both sexes combine to defend their nests with courage

TROCHLEA (Gr τροχαλια, Lat trochlea) In Mechanics the same as pulley or tackle *See* PULLEY

[illegible]

accompanied by the *trochlearis nerve*

TROCHOID (Gr τροχος *a wheel* and ειδος *form*) The curve described by any point in a wheel rolling straight forward on a level It is the same as the cycloid, and for an account of its principal properties, see CYCLOID The same name is also given to another curve, sometimes called the companion of the cycloid, or *curve of arcs*

TRO'CHUS (Gr τροχος) The name given by Linnæus to a genus of the *Vermes Testacea*, characterized by a subconical spiral shell, with the margin entire without a fissure or canal for the siphon of the mantle, the animal not possessing any respiratory tube The mouth of the shell is closed by an operculum, or some analogous part The species to which the characters of the Linnæan genus are applicable constitute a family of Pectunibranchiate Gastropods in the system of Cuvier, called *Trochoida*, which includes the following genera — *Pelasia* Montfort, *Calcar*, Montf, *Rotella*, Lam, *Cantharis* Montf, *Infundibulum*, Montf, *Telescopium* Montf, *Solarium* Montf, *Euomphalus*, Sowerby The Gastropod called *Turbo pica* by Linnæus, having been ascertained to have an operculum, is now referred to *Trochus*

TROGLODYTES (Gr τρωγλη, *cave* and δυνω, *I enter*) Tribes of men who have their dwellings in subterraneous caverns Several such tribes are mentioned by ancient authors, and the remains of their dwellings still attest their existence, especially along the banks of the Nile in Upper Egypt and Nubia and in parts of Syria and Arabia (See *Bryant's Mythology*, iv 381)

The chimpanzee has been called by Blumenbach *Si-*[illegible]

TROMBONE (It) A brass musical wind instrument serving as the bass to the trumpet, to which in general form it is similar, but of much larger dimensions

TRO'NA A native sesquicarbonate of soda found on [illegible] lakes of Sukena in Africa

TROY WEIGHT The most ancient of the weights used in Scotland, and though its use is now prohibited by law it is still occasionally employed in some of the rural districts in weighing wool, cheese, butter, &c The troy pound was not a well-defined weight, but varied from 21 to 28 ounces avoirdupois

TROOP A body of [illegible] soldiers, equivalent to *company* in foot regiments The term *troops* is not limited to cavalry, but extends to all kinds of soldiers, whether mounted or not

TROPHÆUM (Lat trophæum *a trophy*, the leaves

resembling a buckler, and the flowers an empty helmet) A genus of handsome trailing plants, some of whose species have pungent fruits which have rendered them useful as condiments Indian cress, the name given to *Tropæolum majus* expresses their quality They form a small group nearly allied to the Geraniaceous order, if not [illegible]

TROPE (Gr τροπος *I turn*) In Rhetoric, literally any expression *turned* from its primary signification, and employed in a sense derived in some manner from that primary signification In this sense, the general term trope comprises the various figures termed metaphor, allegory, metonymy, synecdoche (which see), and perhaps several others By the natural progress of language, words or phrases at first employed as tropes become impressed so strongly with their new or derivative signification, that it finally supersedes the original, its *tropical* or *figurative* being lost in its *simply indicative* character

TROPHI (Gr τροφω, *I nourish*) A name given by Kirby to the different instruments of, or organs contained in the mouth, or closing it, and employed in manducation or deglutition They include the *labrum, labium, mandibulæ, maxillæ, lingua* and *pharynx*

TROPHONIUS [illegible] Greek [illegible] son of Erginus, king of Orchomenos, [illegible] his brother Agamedes, built the temple of Apollo at Delphi, and having prayed for a reward from the god, it was promised him on the seventh day, on which he and his brother were both found dead The story is told in other ways He had a temple at Lebadea as Jupiter Trophonius In this temple was the celebrated cave into which those who descended spoke oracularly on their return, and in this way responses were made But the impressions produced by the descent were thought so to work upon the spirit of a visitor, that he remained a victim to melancholy the remainder of his life Hence arose the proverb [illegible] ous man —that he looked as if he [illegible] Trophonius Some thought that the priests had secret access to the cavern and that those whose minds did not give way under the terror of the scene which they encountered were murdered by them (See Bryant *Anc Myth* vol ii p 361)

TROPHOSPERM (Gr τροφω *I nourish* and σπερμα *a seed*) A name given by some French botanists to the placenta of a plant

TROPHY (Gr τροπαιον, from τροπω *I turn*) A monument consisting of some of the arms of slain enemies hung upon the trunk of a tree, or a stone pillar, by a victorious army in token of its victory and the flight of the enemy, whence its name Trophies were always dedicated to some deity and especially to Jupiter, whence it was deemed sacrilegious for any one to injure or demolish them, while at the same time it was esteemed an equal crime to repair them when decayed This custom was common to all the Greeks except the Macedonians who were forbidden to raise trophies by a law of one of their ancient kings Perhaps the most celebrated trophies of ancient times were those of Marius at Rome which were of marble, and were restored by Cæsar after their destruction by Sylla, contrary to all the usages of the times (See as to Roman trophies, *Mem de l'Ac des Inscr* xxix 32)

TROPICAL HIEROGLYPHICS *See* HIEROGLYPHICS

TROPICAL YEAR (Gr τροπη *return*) The time between the sun's leaving a tropic and returning to it popularly it means the time from the longest day in one year till the longest in the next *See* YEAR.

TROPICS, in Astronomy, are the parallels of declination between which the sun's annual path in the heavens is contained, the distance of each from the [illegible] equal to the sun's greatest declination [illegible] tropic is called the tropic of Cancer, and the southern one that of Capricorn, from their touching the ecliptic in the first points of those signs

The distance of the tropics from each other is equal to the difference between the greatest and least meridian [illegible] whose latitude [illegible] *See* ECLIPTIC

TROPICS, in Geography, are the two parallels of latitude on the earth, over which the sun is vertical when his declination is greatest, or when it is the longest day in the hemisphere in which the tropical circle is situated over which the sun is, and the shortest in the other hemisphere

TROPIDONOTUS (Gr τροπις, *a keel*, and νωτος *the back*) A genus of non-venomous serpents, nearly allied to the true Colubers, but with bodies thicker in proportion to their length, the back more keel-shaped, and the abdomen more expanded and convex, the head is large and conical, with a slender and short muzzle The species seldom exceed three or four feet in length, they live near fresh-water streams and are good swimmers they are confined to the old world continents, and are replaced in South America by the genus *Homalopsis* The *Coluber scaber*, Linn, a serpent of the Cape of Good Hope, remarkable for the presence of teeth in the œsophagus, and their absence from the mouth, is referred to the genus [illegible] Schlegel

TROUVERS [illegible] Inventors (Ital trovare; Fr trouver, *to find*) A school of poets who flourished from the 11th to the latter end of the 13th century, principally in the south of France, but also in Catalonia, Arragon and the north of Italy They wrote in varieties of the Provençal or Romance language, also called in the middle ages langue d'oc They flourished under the lines of the Counts of Toulouse Barcelona and Provence, and their minstrelsy and peculiar spirit declined from the time of the crusade against the Albigenses, when the former of these noble houses was vanquished and humiliated and their land overrun by the steiner adventurers of the north The most renowned among the Troubadours were knights, who cultivated poetry as an honourable accomplishment, but their art declined in its later days, when it was chiefly cultivated by minstrels of a lower class The names and some of the productions of more than 200 Troubadours have been preserved, and [illegible] able characteristics of the Provençal poetry were its almost entire devotion to the subject of romantic gallantry and the very complicated character in general, of its metre and rhymes The principal species of composition cultivated by the Troubadours were *tenzones*, or poetical contests between two minstrels, sometimes breathing satire or defiance, sometimes rivalling each other in the praise of their ladies, sometimes aiming at mere exertions of verbal ingenuity, *sirventes*, pieces devoted to martial and other serious subjects, short songs, or *chanros*, and a variety of other lyrical strains, *soutas, lais, pastourelles, arbades, serenades retronage*, and *redondes* The earliest Italian poets framed their style of thought and versification closely after the model afforded them by the troubadours (See Sismondi *Literature du Midi de l'Europe* vol i, the works of M Raynouard, *Mr Lewis's Researches into the Romance Language*, Schlegel *Obs sur la Langue et la Provençale*)

TROUGH OF THE SEA The ship is said to be in the trough, when she lies parallel to the hollows between the waves

TROUT (Lat trutta) This name is restricted properly and specifically to the *Salmo fario* of Linnæus, but is applied in a generic sense to other native species of *Salmo* the *S erox* of Linnæus which is the *S salar* of Rondeletius, being called the bull trout and grey trout, the *Salmo ferox*, the great grey trout, or lake-trout, the *S trutta* the salmon trout, &c The common trout inhabits most of our lakes and rivers and is subject to many varieties of colour, proportions, and even of internal structure as in the stomach of the gillaroo-trout, according to the variations of soil and food The season of spawning with the trout is generally in the month of October at which period the gravid fish make their way up the stream to the shallows Trouts are in finest condition from the end of May to September

TROVER In Law, is an action of tort. It is a species of action on the case (*see* ACTION), which is employed to try a disputed question of property in goods and chattels The declaration in trover assumes (by a fiction) that the plaintiff lost and the defendant found and converted to his own use, the goods in question

TROWELLED STUCCO In Architecture, stucco left ready for the reception of paint

TROY WEIGHT An English weight chiefly used in weighing gold, silver, diamonds, and other articles of jewellery The pound troy contains 12 ounces or 5760 grains, the pound avoirdupoise containing 7000 of such grains The name is supposed to have reference to the monkish name given to London, of Troy Novant *See* WEIGHTS

TRUCE (Mod Lat treuga, from the Teutonic treue, *truth*) An agreement between states or those representing them for the suspension of hostilities Such an agreement when made by officers of the state in the general exercise of their [illegible] for the purpose expressly, or by necessary implication ranks among that class of conventions which jurists term sponsions, and which are binding only if ratified (See SPONSION) A [illegible] which is limited to particular places, as between two armies, or between a besieged fortress and the besieging army The [illegible] in general requires ratification power to include the latter is held to be implied in the general authority of military and naval officers (See *Vattel*, book iii ch 16, *Wheaton on International Law*, vol ii)

TRUCE OF GOD, *Treuga Dei* A suspension of arms, which occasionally took place in the middle ages, putting a stop to private hostilities The right to engage in such hostilities was [illegible] maintained by the inferior feudatories of the several monarchies of Europe But it was restrained by the repeated promulgation of these truces, under the authority of the church Thus, in the

county of Roussillon, A D 1027, it was determined in a synod of the clergy that no man should attack his enemy from the hour of nones on Saturday to the hour of prime on Monday In 1041 a general truce of God was accepted by the barons of Aquitain, and then of all France, to last from the Wednesday evening of every week to the Monday morning following This regulation was soon after established in England, in 1042, with some additions of great festivals and other days It was confirmed by many councils especially the Lateran council of 1179 The observation of it was sworn by knights, burgesses, and peasants, of the age of fourteen and upwards, and the penalty of its infringement was excommunication, which, however, was quite insufficient to maintain it Philippe Auguste introduced a new species of truce, termed the quarantine by one of his ordinances. It restrained the family of an injured or murdered person from the commencement of hostilities until forty days after the act done, under penalty of high treason

TRUCK The small wooden cap at the extremity of a flag staff, or at the mast head Also a small circular piece of wood with a hole bored through it for a rope to run through

TRUCK SYSTEM A name given to a practice that has prevailed particularly in the mining and manufacturing districts, of paying the wages of workmen in goods instead of money The plan has been for the masters to establish warehouses or shops, and the workmen in their employment have either got their wages accounted for to them by supplies of goods from such *depôts* without receiving any money, or they have got the money, with a tacit or express understanding that they were to resort to the warehouses or shops of their masters for such articles as they were furnished with (For the advantages and disadvantages of this system see *Com Dict*)

TRUFFLE A subterranean fungus of a roundish oblong form and a blackish brown colour much employed in cookery It is found by dogs and pigs trained for the purpose in soil beneath trees especially beeches and oaks, it is however very local It is propagated by spores included in sinuous chambers in the interior but has never yet been cultivated with success, notwithstanding many attempts that have been made Botanists recognise several kinds of truffles, the commonest being the *Tuber cibarium*

TRUMPET In Acoustics, an instrument used for the purpose either of conveying articulate sounds to a great distance, or for applying to the ear in order to collect the sonorous rays and render sounds more distinct In the former case the instrument is a *speaking-trumpet*, in the latter a *hearing-trumpet*

Speaking-trumpet — The object of the speaking-trumpet is to increase the intensity of speech and transmit it to considerable distances in a particular direction In order to obtain this effect, it is necessary that the aerial undulations which would disperse themselves in all directions be confined by the sides of the trumpet and reflected so as to take as nearly as possible a direction parallel to the axis This is accomplished by giving the trumpet such a form that its diameter becomes greater towards the extremity furthest from the mouth A cylindrical or prismatic tube, of equal diameter throughout assists powerfully in conveying sound from one extremity to the other but contributes in no degree to give a direction to sound, or transmit it through free air

The theoretical explanation of the effects of the speaking-trumpet is attended with considerable difficulty Assuming that the reflexion of sound takes place according to the laws of catoptrics, Lambert (*Berlin Memoirs for* 1763) shows the best form of the instrument is a truncated cone, for the rays successively reflected from the interior surface of this figure make smaller angles with the axis after each successive reflexion Cassegrain (*Journal des Savans*, tom iii) recommends the surface formed by the revolution of a hyperbola about its asymptote, and Kircher had previously proposed a truncated parabolic conoid, the mouth-piece occupying the focus Some authors suppose that the trumpet should be formed of a very elastic material, in order to strengthen the sound by its vibrations Others are of opinion that it should be without elasticity to avoid the confusion that might be caused by the vibrations of the tube Hassenfratz (*Journal de Physique*, tom lvi, who made a number of experiments on the power of the trumpet by fixing a small watch in the mouth piece and observing the distance at which the beats ceased to be audible, found that the effects were precisely the same with a trumpet of tinned iron, whether used in its naked form, or tightly bound round with linen to prevent vibration, or when lined with woollen cloth, whereby reflexion was entirely prevented It would appear therefore, that neither the shape of the instrument nor the material of which it is formed, is of much consequence. Leslie (*Experimental Inquiry into the Nature and Propagation of Heat*) supposes the effect of the trumpet to be owing to the more condensed and vigorous impulsion given to the air from its lateral flow being checked "The tube" he observes, "by its length [illegible] detains the efflux of air and thus the [illegible] of the [illegible] created [illegible] ticulation strike with [illegible] so [illegible] are from the reflected form of [illegible] abled to escape, and to spread themselves along the atmosphere" p 225

The invention of the speaking-trumpet is commonly ascribed to Sir Samuel Moreland, who, about the year 1670, proposed the first form of the speaking trumpet as a [illegible] the Royal Society, and exhibited some instruments, constructed according to his own views These were, in general, large conical tubes spreading suddenly at the extremity to a greater width They were tried in St James's Park, and it is stated that their effects were such that the king (Charles II), speaking in his ordinary colloquial pitch of voice, through a trumpet of only five feet and a half long was distinctly heard at the distance of 1000 yards Another person was perfectly understood at the distance of four miles and a half Kircher claims the credit of having made such experiments previously, but his remarks apply rather to hearing than to speaking trumpets

Hearing-trumpet — The hearing-trumpet, or ear-trumpet, may be considered as a reversed speaking-trumpet, with which it generally corresponds in form, though, for the sake of portability it is often made curved or spiral Lambert recommends the parabolic figure as the most advantageous, but in order to give the greatest effect, the apex of the paraboloid must be cut off, and the mouth of a small tube inserted in the focus to convey the sound concentrated at that point to the auditory organ [illegible] adopted in practice, and of late [illegible] rubber tubes have been brought into use having a conical mouth-piece of ivory or silver at one extremity, and a small tube of like material to be applied to the ear A trumpet of this kind may be used advantageously not only for remedying the defects of the organ of hearing, but [illegible] to collect feeble and distant sou[illegible] *Memoir on the [illegible] Invent* 1671, Chladni, *Traité des Sons*, Gel *Physikal Worterbuch* art "Horrohr")

TRUMPET A musical wind instrument usually made of brass but sometimes of silver This instrument formerly possessed but few notes, but in later times it has, by means of slides and keys been vastly extended in its inflexions Its compass will be seen by referring to the synoptical view of the different instruments at the end of the article Music

TRUNDLE In Mechanics a portion having its teeth formed of thick cylinders or spindles, otherwise called a *lantern wheel* or *wallower*

TRUNK (Lat truncus) In Architecture, the same as *shaft* In the application of this word to a pedestal, it signifies the die dado, or body of the pedestal

TRUNK in Entomology, signifies the intermediate section of the body which lies between the head and the abdomen

TRUNNIONS The pivots or short cylinders projecting from the sides of a piece of ordnance, by which it rests on the cheeks of the carriage The *trunnion ring* is the ring on a cannon next before the trunnions

TRUSS (Fr trousser) In Architecture a framed assemblage of pieces of timber for the purpose of tying up or suspending a principal beam or piece *See* Roof

TRUSS A rope confining the middle of a lower yard to the mast

TRUSS, in Surgery, is an apparatus by which in cases of rupture the intestine is retained in the abdominal cavity This is usually effected by the aid of a steel spring resting upon a small pad or cushion, which is kept in its place by a proper bandage

TRUSSED ROOF In Architecture, one so constructed as to sup[illegible] [illegible] tie beam at certain points [illegible] likely to occur *See* Roof

TRUST In Law, is a term commonly used to designate any equitable right or interest, as distinguished from a legal one properly, that class of equitable rights supposed to be founded in the confidence placed by one party in another, the name *trustee* denoting the person in whom confidence is placed, *cestuy que trust*, the person who trusts, — in other w[illegible] [illegible] a beneficial interest in the o[illegible] [illegible] has the legal property

The origin of conveyances in trust may be traced to the *fidei commissum* of the Romans, which was a gift by will to a person capable of taking in trust for another incapable by the Roman law [illegible] such benefit whose claim under such gifts was [illegible] precarious, and merely fiduciary, but came at length to be recognized and enforced by law With us in the same manner, the original motive for the introduction of the fiduciary right, which was certainly borrowed from the Romans

was the wish to escape from the disabilities affecting certain persons, or bodies, or the liabilities attached to property in its direct and simple shape. Such was, in particular, the disability of corporations to purchase land at common law; and on this account, as it is commonly said, the ecclesiastics, who were chiefly interested in this matter, introduced this new species of property, which was willingly received by the chancellors, then usually ecclesiastics, and in part respectfully intended to adopt the principles of the civil law. The clergy were, however, soon themselves deprived of the benefit of the invention, the disabilities of corporations were also and early extended by statute to the new right so created. But there still remained many liabilities arising from feudal tenure, incident to property at common law, such as, for instance, dower, escheat, wardship, restraint upon alienation by will, which it was desirable and possible either to evade by this mode of conveyance in trust, or to transfer to a quarter less likely to be affected by them; and there were also many modifications of property for the benefit of families, which could only be given to it in this manner. It must be admitted, further, that there were less honest purposes such as the defrauding *bona fide* purchasers by secret alienation sought to be attained by the same means. For these, among other reasons, conveyances in trust were still resorted to, and the Court of Chancery, which had once, for whatever reason, originally recognized, continued to enforce them.

There were also two other means of creating a trust, or rather raising a use, not by actual conveyance, the one by agreement for money, the other by covenant under seal in consideration of near *relationship*.

The right so created was called indifferently a *trust* or *an use*, more commonly the latter, from the actual enjoyment of the rents and profits annexed to it in equity. Indeed the benefit of the use or trust was in the first instance confined to this, but the cestuis que use, or parties beneficially interested, soon acquired the right of directing a conveyance by the holders of the legal estate legally termed the feoffees to uses, and also of calling upon them to use the legal title in their defence in a court of common law.

Several statutes were passed at different times, giving to the owner of the use or trust partial legal rights, and partially also subjecting interests of that sort to legal liabilities before the celebrated statute, commonly called the Statute of Uses, which was passed in the 27th year of Henry VIII. The general object of this statute as stated in the preamble, was to prevent those secret and fraudulent transfers occasioned by the separation of the real from the apparent ownership, and to restore those rights of the feudal lord, and of the crown, which had been in a great measure evaded, by keeping the legal title to which alone they attached in a course of succession, where it was likely to be forfeited by treason, and where it was less frequently subject by descent to an infant heir to the burden of wardship and relief. The general effect of the statute as stated in the title was the transferring or changing the use into possession, that is, annexing to the use the legal right of possession whereby the real owner would be made manifest to all, and the real ownership would become subject to all the liabilities incident to the legal title. In short, the distinction between equitable and legal rights would be abolished, and the adjudication on all questions of property, except in particular cases of fraud or accident, would be restored to the courts of common law.

The statute, however, was so worded as not to apply either to copyholds or leaseholds, nor indeed to personal property of any description, which at that time was little thought [illegible] and personalty [illegible] they arose again, very shortly afterwards in every species of real property, it being held by the courts of common law that such uses or trusts only were executed and transferred into possession by the statute as were raised or declared upon what was *before* the statute the legal seisin or estate, so that where a new legal estate taking effect as such by virtue of the statute was created or conveyed in trust, such trust right not being within the purview of the statute and not being recognized by the courts of common law, was adopted and enforced in equity, for reasons altogether similar in kind to those which originally led to the introduction of uses. Hence a new system of equitable rights grew up under the name of trusts, commensurate with the new system of legal rights or uses (for the use henceforth denoted the legal estate) created by the statute, and though some of the peculiar advantages of the old trust were, by the effect of the statute, transferred to the new legal ownership, such as the capability of modification for the benefit of different parties upon different events, and though the right of disposition by will was shortly afterwards extended to it by special statute, and though whatever advantages were still possessed by the *trust*, as a means of evading the burdens of tenure or other liabilities now attached to the use, were gradually removed either by [illegible] those burdens or the extension of those [illegible] sts still continued and continue to be habitually resorted to for various purposes. These are, generally, either to protect the interests of married women and children, by placing in the hands of trustees for them the legal rights which they would be incapable of exercising, or to secure the rights of those in remainder, by severing from the usufruct of property for a life the power of disposing of the whole, or, lastly, the convenience of management, where many parties are interested in the same subject. These observations can apply [illegible] at least with one or two exceptions to express trusts. An express trust supposes a legal transfer of the property actually completed, and a declaration in the same instrument, or having reference to the same instrument [illegible] power thereby created) of the [illegible] operty so transferred is to be held. Such trusts may be declared in or by a reference to any instrument, either deed or will, that is sufficient to pass property at law, the ground upon which they rest is the express confidence that is placed in the trustee, by the person who transfers the property to him, no consideration of money or blood between the trustee and those for whom he holds [illegible] an inducement for the interference [illegible] most commonly raised by marriage-settlements, or by will. The usual trusts in the former case, as to real estate, are upon legal estates in terms of years, to arise upon certain events, to be held in trust, in the first place, for securing to the wife payment of her pin-money during marriage, and of her jointure after the husband's death, then for the raising, [illegible] provisions [illegible] for their maintenance during minority. The ultimate trust of such terms, whether expressed or not, is for the person entitled to the corpus of the estate, subject to those charges which the terms are created to secure. Similar trusts, also, are commonly raised in wills, for the maintenance or advancement and portioning of younger children. In all such cases, the legal rights vested in the trustees most commonly remain in their hands as a means only of compelling the person actually in possession to discharge those claims subject to which he holds his estate. But there are other trusts of frequent occurrence both in marriage settlements and in wills, which require a more active interference on the part of the trustees and which therefore, carry with them a greater degree of responsibility. These are trusts for the sale of land and investment of the proceeds upon security or in the purchase of other land, or trusts for the investment of what was originally personalty, in which cases, it is important for the trustees to consider, in the first place, how far the trust for sale or conversion is imperative and immediate, lest by delay they become liable for any loss that may ensue from the alteration in the value or price of land securities, in the next place, what are the securities in which they are directed to invest, as they will be answerable for the failure of any security a resort to which has not been authorized by the terms of the trust. Where these securities are private, or where a purchase of land is made with trust moneys, they are further bound to see that the usual professional inquiries are in either case instituted into the validity of the title. It is obviously their duty, also, to look to the due appropriation or distribution of the proceeds. Where there is a conversion absolute, or, as it is called, *out and out*, of realty into personalty, or of personalty into realty, either agreed to or directed by deed or will, land is in equity considered as money, and money as land, for all the purposes of succession or transmission, but it rarely happens that a conversion by will is in terms sufficiently absolute to exclude the right of the heirs, or, where it is personalty, the rights of the personal representative, to such part of the real or personal estate, whether actually converted or not, as shall not be required to fulfil the purposes for which the conversion was directed.

The system of trusts is still more generally prevalent in limitations of copyhold and personal property particularly personal chattels, as money or stock in the funds, to neither of which classes of property the Statute of Uses applied, and in which, therefore, the legal interest remained, at least for a time, subject to the narrow rules of [illegible], and copyhold property is therefore, for [illegible] for other reasons, more commonly settled upon trust than is property of freehold tenure. Personal property, though once held incapable at common law of partial or shifting limitations, has long, by a somewhat forced though ingenious rule of construction, been released from that restriction, and therefore in the settlement of chattels real, of which the title is distinct from the possession, the creation of a distinct equitable title is not more often resorted to than in the settlement of real property of freehold tenure. But it is in regard to that sort of personal property, the title to which, or rather the power of conferring a title to which, is annexed to the possession, either from the nature of the thing itself, as in the case of money, or for reasons of

public convenience, as in the case of bills of exchange, and in regard also to stock in the funds (a class of property over which the holder, whether it be in trust or not has by the regulations of the bank absolute power of alienation) that the utility of trusts is more particularly conspicuous Whenever it is sought to create in any such property shifting or partial interests nothing in such cases can secure future or contingent rights from the dishonesty of the tenant for life or partial owner but the intervention of trustees, in whose hands the whole legal interest, that is to say the whole power of alienation, resides, and though a similar danger is sometimes to be apprehended even at their hands, yet their number itself, and the discretion that may be exercised in their appointment, afford a greater security than is to be found in the integrity of a single individual

Duties of Trustees —It is only in cases of express trusts, whether such in the origin, or become such by the acceptance and acknowledgment of the legal owner under whom he acts as trustee that the rules respecting the duties, liabilities and rights of trustees are applicable As to their liabilities, they are liable not only for such sums as they actually have received but for such also as they might but for their wilful neglect or default have received Where there are several trustees each is generally liable for his own acts and receipts only but where all concur in empowering either one of themselves or a third party to do or receive that which he could not do or receive but by virtue of such authorization all are responsible for his acts and receipts under such joint authority It is the duty of trustees besides being faithful accountants, to apply and distribute rightly the property they are entrusted with according to the various rights of the parties entitled to it, and they are liable for any misapplication arising either from ignorance of facts which they ought to have known or might by common diligence have known, or from ignorance of the law in any case It is their business then, as to the first, to inquire diligently into all the circumstances of the trust and as to the second, where upon consulting professional advisers there appears to be any reasonable doubt to refer it to the opinion of the court by instituting a suit for the fulfilment of the trust The rights of trustees are confined to the reimbursement of their proper expenses out of the trust property An express trust will not fail for the want of trustees, where none are nominated the court will take upon itself the appointment To the same class of trusts proper that is to say equitable rights arising from confidence reposed may be assigned implied or resulting trusts in which the confidence is not expressed, but implied by courts of equity from the want of consideration or motive apparent in such cases to give away the whole or as it may be, any part of the beneficial interest Such trusts arise in the first place upon the conveyance or transfer by deed or will of property real or personal upon some trust expressly declared which does not exhaust the whole beneficial interest, or expressly upon trust though no trust be declared, in the first of which cases the surplus of the beneficial ownership, after satisfaction of the express purpose or trust and in the second case the whole of the ownership, results to the party making such conveyance or transfer To the former class of partial resulting trusts belongs the equity of redemption upon a mortgage, which is an equitable right resulting to the mortgagor after all right of redemption is forfeited at law, to recover back the thing mortgaged upon payment of the capital and interest of the money borrowed upon the security of such pledge This equity of redemption subsists in favour of the real or personal representatives of the mortgagor against the real or personal representative mortgagee, till it is destroyed either by twenty years of the adverse possession *i e* possession without any acknowledgment whatever of any rights in the mortgagor, or, which is the most common case, by decree of foreclosure in equity, by which a peremptory day is fixed

Trusts of a similar nature frequently arise upon devises of real property for payment of debts, in which cases a trust results in the surplus, either for the heir, or the residuary devisee, where there is one, but it should be observed, that where any specific purpose for which a trust is created by devise in the produce of land fails of taking effect, such as a legacy charged upon land by predecease of the legatee, or a similar legacy void under the Statute of Mortmain, the benefit of the lapse results to the heir, and not to the residuary devisee, who takes by such devise not that which ultimately is not applicable to the purposes of the will, but that only which the testator expresses no intention of otherwise disposing of But where a legacy, payable out of the personalty fails of taking effect, the lapse shall enure for the benefit of the residuary legatee, where there is one, in preference to the next of kin, the reason of the difference being that previous to the late Wills Act a devise of land spoke from the time of the will, a bequest of personalty from the death of the testator

A trust is implied in the *whole* beneficial ownership upon the conveyance or transfer by deed of the legal interest in real or personal property, *i e.* where it is either [illegible] of the property [illegible] whom no motive or consideration moves, and in whose favour no declaration of trust is contained in such deed or instrument, in which case a trust is implied, either for the party making [illegible] for the person from who [illegible] e consideration for such conveyance or transfer, as, for instance, the money with which the purchase was made, actually moved The implication of resulting trusts has, perhaps, arisen through an unwise departure from the Statute of Frauds, as it is a reliance upon parol evidence in opposition to the legal title It should, however, be observed, that the parol evidence upon which such trusts may be *raised* must be evidence not of declarations or intention, but parol evidence of facts as, for instance of the payment of money by a person not the nominal purchaser, but to repel a presumption of a trust parol evidence of a declaration of intention is admissible because such evidence is corroborative of the legal import of the deed

TRUTH In the Fine Arts, a faithful adherence in representation to the models of nature or the prototypes on which the principles of art are founded

TRY'ING, or A-TRY In Naval language, a word somewhat obsolete for *heaving* or *hove to*

TRY'SAIL A small gaff sail of strong or storm canvass, set in bad weather

TUBE (Lat tubus) A pipe or long hollow body [illegible]

TUBER In Botany a kind of fleshy stem, formed underground and filled with starch It is commonly looked upon as a root as in the potato Also the systematical name of the truffle

TU'BERCLE In Morbid Anatomy, this term is applied to certain diseased structures, as *tubercles* of the lungs small hard superficial tumours of the skin are also called tubercles

TUBERCLE OF LOWER An eminence in the right auricle of the heart where the two venæ cavæ meet, it was first described by Richard Lower in 1665

TUBER'CULA QUADRIGEMINA Four white oval tubercles in the brain two of which are situated on each side over the orifice of the third ventricle and the aqueduct of Silvius The old anatomists called them *nates* and *testes*

TU'BICOLES *Tubicola* (Lat tubus *a tube* colo *I inhabit*) The name of an order of Ancillidians, comprehending those which live in tubes, and which are Cephalobranchiate also the name of a family of Lamellibranchiate Acephalous Mollusks, including those which have a tubular calcareous sheath in addition to the two shelly valves

TU'BICORNS *Tubicornia* (Lat tubus cornu *a horn*) The name of a family of the order of Ruminants comprehending those in which the horns are composed of a horny axis covered with a horny sheath

TUBIFERS *Tubifera* (Lat tubus fero, *I carry*) The name given by Lamarck to an order of the class *Polypi*, comprising those which are united upon a common substance fixed at its base and whose surface is wholly or partially covered with retractile hollow tubes

TUBIPORIS *Tubipora* (Lat tubus, porus, *a pore*) The name of a family of Zoophytes comprehending those in which the animals are isolated and contained in elongated cylindrical calcareous cells, attached by their base, and [illegible]ed by cross bars at definite distances

TUBULARIA The name of a genus of Corallines, with simple or branched horny tubes, from the extremities of which the polypes are protruded, these have two rows of tentacles, of which the external is expanded in a radiated manner the internal one raised into a tuft

TUBULIBRA'NCHIANS, *Tubulibranchiata* (Lat tubus branchiæ gula) The name of an order of Heteropodous Gasteropodes Mollusks comprehending those which have the shell in the form of a more or less irregular tube in which the branchia are lodged

TUBULICOLES, *Tubulicola*, *Polypes à Tuyaux* (Lat tubus, colo, *I inhabit*) A name applied by Cuvier to a family of Polypes, including those which inhabit tubes of which the axis is traversed by the gelatinous flesh, and which are open at the summits or sides to give passage to the digestive sacs and prehensile mouths of the polypes

TU'ESDAY In the Calendar, the third day of the week, named after Tuisco, the Saxon god of war, whence the astronomical symbol is the same as that for the planet Mars As to the god Tuisco, or Tuisto, see *Mem de l'Ac des Inscr* vol xxiv

TU'FA (Italian) A volcanic rock, composed of an [illegible]

TUFO [illegible] cies of porous, light, sandy, calcareous stone, suited to the construction of vaults The *travertino*, with which the cupola of St. Peter's is constructed, is of this species

TU'GENDBUND (Germ *union of virtue*) A patriotic [illegible] established in Prussia after the treaty of Tilsit in [illegible] Its object was to prepare the people of that country by moral instruction and discipline for better times It was abolished at the instigation of the French, [illegible] and it had great effect in producing [illegible] against Napoleon in 1813

TULIPA (Turk tolliban) A gay flower inhabiting the warmer parts of Europe and Asia Minor It is well known for the gaudiness of its colours, which have made it a favourite with gardeners, who have converted its cultivation into a system of gambling, which the Dutch have been obliged to [illegible] laws It is a genus of the Hexandria order

TUMBLE HOME The [illegible] describing the [illegible] of the upper timbers of the ship's side

TUMBREL (Old Fr *tumerel*) A low carriage with two wheels, occasionally used for the most ordinary purposes by farmers, but it is chiefly used for carrying the [illegible] to trains of artillery

TUMULUS See BARROW

TUN A measure of capacity The English tun contains 252 gallons, or 4 hogsheads *See* TON

TUNE (Gr *τονος*) In Music, the relation of notes to each other and the distances between them, whereby arises melody In other words, it is a certain succession of different single sounds arranged according to art

TUNGSTATES Compounds of the *tungstic acid* *See* TUNGSTEN

TU'NGSTEN (Swedish tung sten *heavy stone*) The ores of this metal are the native tungstate of lime and the tungstate of iron and manganese, the latter mineral is known under the name of *Wolfram* Tungsten is a white hard and brittle metal, very difficult of fusion, and having the high specific gravity of 17 4 Heated to redness in the open air, it burns into the *peroxide* or tungstic acid The equivalent of tungsten is probably about 100, and the tungstic acid consists of 1 atom of metal and 3 atoms of oxygen ($8 \times 3 = 24$), and is represented by the equivalent 124 This metal was discovered by Messrs Delhuyart It is sometimes called *Wolframium*, and also *Scheelium*, in honour of Scheele, who first examined the nature of tungstate of lime

TUNIC (Lat *tunica*) A garment worn by the ancient Romans of both sexes, under the *toga* (which see) and next to the skin It was generally of wool of a white colour and it reached below the knee The senators wore their tunics with a broad stripe of purple sewed on the breast the equites had narrow stripes, hence the epithets *latiClavii* and *angustiClavii*, applied respectively to these orders

TU'NICARIES *Tunicata* (Lat tunica *a tunic*) The name of an order of Acephalous Mollusks comprehending those in which the exterior covering is uncalcified, soft, and elastic It is equivalent to the *Ascidiæ* of Savigny and the *Acephales sans Coquilles* of Cuvier

TUNKERS or DUNKERS A religious sect, a subdivision of the Baptists chiefly found in Pennsylvania Their name is said to be derived from tunken Germ *to dip*, because in baptism they plunge the person head foremost into the water They differ little in doctrine from other Baptists but every brother is allowed to speak in their churches This society was originally founded by one Conrad Beissel, in 1720, who founded a colony called 'Ephrata,' sixty miles from Philadelphia They wear long beards

TU'NNEL (Sax *tunel*) In Engineering, a subterranean passage cut through a hill or under a river, for the purpose of carrying a canal road railway, &c

In the construction of railways and canals it is sometimes absolutely necessary, and very frequently expedient, to have recourse to tunnelling either to preserve the requisite level, or shorten the distance or to lessen the expense of open cutting The circumstances on which the question of expediency depends are often of a very complicated nature, but generally speaking it must be decided by considerations of economy for in the present state of engineering, a tunnel may be made of almost any length and through materials of any description, from a granite rock to a quicksand The nature of the ground can hardly be said to interpose any farther obstacle than what may be occasioned by the expense

On account of the peculiar nature of the difficulties to be overcome, the tunnel which has recently been carried under the bed of the Thames, from Rotherhithe to Wapping, may perhaps be regarded as the most remarkable work of the kind which has ever been executed A short account of this operation will probably be the best mode of conveying a notion of the extent and difficulty of such works generally

Some previous attempts had been made to carry a tunnel under the river below London bridge In 1799 one was projected at Gravesend, but the project was soon abandoned In 1804, another was attempted from Rotherhithe to Limehouse A shaft of 11 feet in diameter was sunk to the depth of 42 feet and continued at a reduced diameter of 8 feet to the depth of 76 feet, whence a drift was carried 923 feet under the river, and to within [illegible] where difficulties of so formidable a [illegible] and the engineer reported farther progress to be impossible The scheme, however, continued to be agitated, and in 1823, Mr Brunel proposed a plan which has at length been carried successfully [illegible]

The act of [illegible] the operation was obtained in June, 1824, and shortly after the work was commenced at Rotherhithe The shaft at this place is 150 feet from the river It was formed by building a cylinder of brickwork 50 feet in diameter, 42 feet in height, and 3 feet in thickness on the top of which a steam engine [illegible] the water and earth The cylinder [illegible] the ground, forcing its way through a bed of gravel and sand 26 feet deep, and full of land water The shaft was sunk to the depth of [illegible] 25 feet in [illegible] a smaller shaft to form a well or reservoir for the [illegible] of water The excavation for the body of the tunnel was commenced at a depth of 63 feet and was carried on at a declivity of 2 feet and 3 inches per 100 feet, in order to have sufficient thickness of ground to pass safely under the river The excavation is 38 feet in breadth, and 22½ feet in height, presenting a sectional area of 850 feet, and the base, at the deepest part of the river, is 76 feet below high-water mark The body of the tunnel is of brickwork in Roman cement

The means by which this extensive excavation was effected, consisted of a powerful apparatus of iron, which has been called a shield It was formed of twelve great frames lying close to each other, and severally provided with the mechanism necessary to move them forward, and to secure them, when stationary against the brickwork The frames were 22 feet in height, and about 3 feet in breadth, and each divided into three stages or stories, the whole thus presenting thirty six compartments or cells for the workmen These compartments were open at the back, but in front small boards which could be [illegible] against the ground to be excavated by screws Each workman in his cell operated upon the surface opposed to him taking out one of the small boards at a time, cutting the ground away to the depth of a few inches, and then replacing the board before he proceeded to the next, and when from 3 to 6 inches were thus removed over the whole surface of the shield, the frame was moved forward, and the work secured by immediately adding so much more of brickwork to the body of the tunnel By this means the excavation and the structure were carried forward simultaneously

The tunnel consists of a double and capacious archway one side being appropriated to carriages passing in one direction and the other to those passing in the contrary with paths for foot passengers by the sides of the carriage roads The middle wall between the two archways was first built solid for greater strength but openings were afterwards cut at short distances, so that each has a ready communication with the other The two shafts at the extremities will contain easy flights of steps for foot passengers, and the access for carriages is intended to be by circular roadways 200 feet in diameter, the declivity of which will not exceed 4 feet in 100 The entire length of the tunnel is 1300 feet and the expense is said to have been about 1200*l* per yard

In the course of the work, two irruptions of the river took place, the first on the 18th of May, 1827, after the excavation had been advanced to the distance of about 400 feet, and the second in January, 1828 These accidents were repaired by filling the chasms in the river with bags of clay, and on clearing the tunnel of water, the structure was found on both occasions, to be in a perfectly sound state, and to have sustained, in fact, little or no injury After the second irruption, however, the works, from want of funds, remained suspended for seven years, but assistance having at length been obtained from government they were [illegible] and proceeded without further interruption [illegible] tunnel reached the termination on the Wapping side of the river, early in 1842 This extraordinary work, which during its progress and since its completion has been visited by multitudes of persons from all parts of the world, is, doubtless destined to remain for ages a proud monument of the genius and perseverance of the engineer by whom [illegible] successfully executed

The [illegible] in this country has given rise to some stupendous undertakings in the way of tunnelling One of the most remarkable, perhaps the most remarkable of all, is the Box Tunnel, on the Great Western Railway an account of which is given in the *Companion to the British Almanac* for 1842, and the *Railway Times* for July 10, 1841 This tunnel pierces through Box Hill between Chippenham and Bath, part of which is 400 feet above the level of the railway "It [illegible] and 35 wide to the outside [illegible] for making

and ventilating it are thirteen in number, and vary in depth from 80 to 306 feet. The excavation amounted to 414,000 cubic yards, and the brickwork and masonry to more than 54,000 cubic yards The number of bricks used was 30,000,000, a ton of gunpowder and a ton of candles were consumed every week for two years and a half, and 1100 men and 250 horses were kept constantly employed" For a considerable distance, the tunnel passes through freestone rock, from the fissures of which there was at times an immense influx of water, whereby on one occasion the works were interrupted for a period of nine months On a subsequent occasion, after an irruption, water was for some tim discharged by the engine at the rate of 32,000 hogsheads a day This tunnel occurs on an inclined plane of 1 in 100

The extent of brickwork or other structure which may be necessary to secure the excavation in works of the class now mentioned will depend of course, on the nature of the materials through which the tunnel is driven, and in deciding this question, it is important to attend to the geological formation of the locality In the unstratified rocks an excavation may be made with perfect safety and will require no support, while in those whose strata are nearly vertical, danger may be apprehended from slipping In the chalk oolite, marl lias, and similar formations, the tunnel requires to be lined with brickwork throughout as the materials cohere so imperfectly, that even the vibration arising from the passage of the carriages will cause the fall of parts of the roof

The following table of the dimensions of a few railway tunnels will enable the reader to form an accurate notion of the gigantic scale on which such operations are conducted —

	Length in Yards	Height in Feet	Width in Feet
Box Tunnel, Great Western	3,247	39	35
Wapping to Edge Hill, — Liverpool and Manchester	2,400	16	22
[illegible] Street	1,760	19	25
Kilsby — London and Birmingham	2,120	27	23½
[illegible]	1,280	25	22
[illegible]	880	12	12
Leicester and Swannington	1,760	13½	10½

TU'NNY *See* THYNNUS

TU'RBAN The usual head-dress of the Turks Persians, and most other eastern nations It varies in form in different nations, and in different classes of the same nation It consists of two parts a quilted cap, without brim, fitted to the head, and a sash scarf or shawl, usually of cotton or linen, artfully wound about the cap and sometimes hanging down the neck The Grand Signior's turban contains three heron's feathers, and is ornamented with diamonds

TU'RBO (Lat turbo, *a whirling*) The name of a Linnæan genus of the *Vermes Testacea* characterized by [illegible] with an entire [illegible] d together by this specific character form a family of Pectinibranchiate Gastropods in the system of Cuvier which is subdivided into the genera *Turbo* proper, Cuv, *Delphinula*, Lam, *Pleurotoma*, Defrance, *Scissurella*, D'Orb, *Fornatella*, Lam, *Scalaria*, Lam, *Cyclostoma*, Lam, *Valvata*, Müll *Littorina* Ferussac &c

TU'RBOT The best, and, excepting the halibut, largest of our flat fishes, it is the type of the subgenus *Rhombus* of Cuvier It is taken either by the troll net, or, in deep water by the many hooked line baited with the common smelt or small gar-fish A preference is given in the London markets to the turbots caught by the Dutch, who are estimated to have drawn for this supply not less than 80,000*l* a year

TURF The surface of grass lands, of a smooth and uniform texture, covered with pasture grass The term is also sometimes applied to peat cut out of bog *See* PEAT

TU'RKEY RED A fine and durable red dyed upon calico and woollen cloth, the colouring matter used in its production is madder, but the process for producing it in perfection is tedious and complicated (See *Bancroft on Permanent Colours*)

TU'RLUPINS (A word of which no satisfactory derivation has been found See *Du Cange's Glossary*) In French Ecclesiastical History, one of the numerous popular by-names by which the sectaries of the 14th century the precursors of the Reformation, were distinguished called elsewhere Beghards, Picards, Beguins, Lollards, &c

TU'RMA In the Roman Legion, a company of horse, of which ten formed the whole complement of the legion According to Varro, it consisted of thirty horsemen, ten answering to each of the three original equestrian tribes the Tatienses, Ramnenses and Luceres But in addition to the ten, there seem to have been two file leaders, and as the word turma was sometimes indiscriminately used for the subdivision or third part of the full turma, the following lines of *Virgil's Æneid* seem to describe the arrangement —

Tres equitum numero turmas, ternique vagantur
Ductores pueri bisseni quemque secuti.

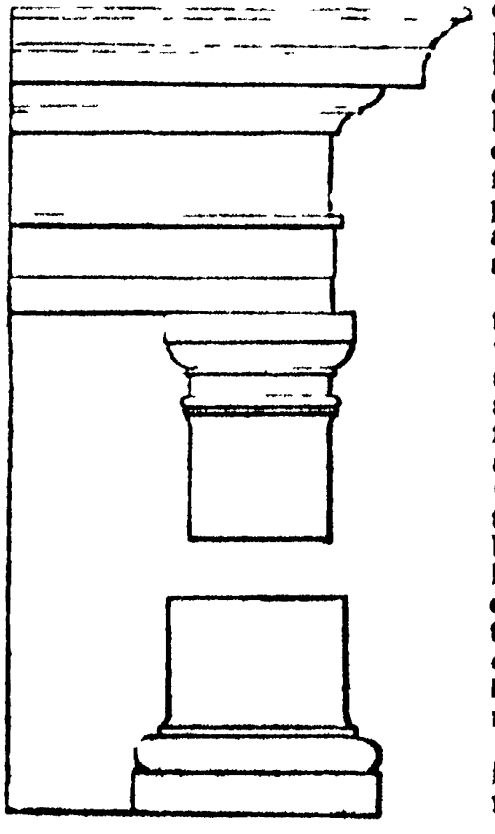
(See M Le Beau's 8th Dissertation on the Roman Legion, *Mem de l'Ac des Inscr* vol xxxii)

TU'RMERIC The root of the *Curcuma longa* This root yields a fine yellow powder which is occasionally used as a dye stuff in medicine, it also forms one of the ingredients of *curry powder* Paper stained with turmeric is often used in the chemical laboratory as a test of the presence of free alkalies and their carbonates, by which its yellow colour is converted to brown

TURN In Music, a grace thus marked ∾, indicating that the note above it, one degree higher, must be struck before it shortly, then passed quickly through the note itself and *turned* from the note a degree below into the note itself, over which the mark is placed

TU'RNIP-FLY As different insects prey, in the larva state, upon the leaves of the growing turnip, the most destructive, and consequently the most important and interesting of these, will be noticed under the present head They are the turnip flea, as it may be called from its power of agile leaping (*Haltica nemorum*), and the turnip fly (*Athalia centifolia*) The turnip-flea belongs to a genus (*Haltica*) of minute Coleopterous insects, of the section *Tetramera*, and family *Galerucidæ*, in which genus the species are all remarkable for the large size of the femora or thighs of the hindmost pair of legs The species in question does not exceed the twelfth of an inch in length, it is of an oval form, with the elytra of a greenish tinge each ornamented with a broad longitudinal stripe of a pale brimstone colour, but there are other species of the same genus perhaps equally destructive, and not characterized by the longitudinal elytral bands The perfect insect shelters itself in the rough uncultivated margins of fields feeding upon the hedge-weeds, and appears to be ready at any time, provided the weather be warm, to commence the work of destruction on the young turnip shoots Late sowing of the turnip seed does not therefore obviate the attacks of the *Haltica* The first precaution obviously is to clear away all the weeds in the neighbourhood of the turnip grounds that may afford food or shelter to the little enemy When the turnip flea has made its appearance in the crop the ground should be dusted with quicklime and this repeated as often as rain or wind beats it off, and the flea reappears The other enemy to the turnip (*Athalia centifolia*) belongs to the order *Hymenoptera*, and family *Tenthredinidæ* or saw flies

TU'RNSOL *See* LITMUS



TU'RPENTINE A viscid exudation from certain trees either spontaneously formed upon the bark, or obtained by incision Common turpentine is the produce of certain species of *Pinus* or fir trees When distilled with water it yields a limpid volatile oil (oil of turpentine) and yellow resin remains in the still

TURPETH MINERAL (From its yellow colour, which resembles the powdered root of the *Convolvulus turpethum*) The yellow *subpersulphate of mercury*

TU'RQUOISE A blue mineral found in great quantities in the Nishapoor mines in Persia It appears to derive its colour from oxide of copper and of iron, and consists chiefly of hydrated alumina it is admired in jewellery

TU'RTLE This word is used to signify a species of dove (*Columba turtur*), and also a genus of Chelonian reptiles (*Chelone* Brongn)

TU'SCAN ORDER In Architecture, one of the five orders, and the simplest of them all It is not found in any ancient example Palladio has given two examples of this order, from one of which the profile here given is adopted, though by some that composed by Vignola has been preferred The base, as will be seen on inspection, consists of a simple torus with its fillet, [illegible] a plinth [illegible] Chambers assigns to the column, with its base and capital, a height equal to seven of its diameters Vitruvius speaks of this order with little praise, but Palla[illegible] it for its [illegible] It does not allow the introduction of ornament; and it is to be

observed, that its columns are never fluted By some architects it has been varied on the shaft with rustic cinctures, but such taste is perhaps very questionable Though not suitable to every application of the order, the most perfect profile in this country to which we can refer is that of the portico of St Paul's, Covent Garden, by Inigo Jones

TUTENAG An alloy of copper, zinc, and nickel, made in China, the term is also sometimes applied to a pale brass, and to bell-metal (*See* PACKFONG) In India, zinc also sometimes goes under this name

TUTORS *See* UNIVERSITIES

TU'TTI (It *all*) In Music, a notice to the performer that, from the place to which it is affixed all the parts are to play together This word is generally used to contradict the words *soli* or *solo*, which see

TUTTY An impure oxide of zinc collected from the chimneys of smelting furnaces

TWELFTH BIRDS In the old Sussex Commonwealth, the ghosts of [illegible] They were [illegible] special privileges

TWELFTH-DAY The festival of the Epiphany, or Manifestation of Christ to the Gentiles, being the twelfth day, exclusive, from Christmas (*See* EPIPHANY) For the customs peculiar to this day in England, see *Brande's Popular Antiquities*)

TWELVE TABLES, LAWS OF THE The celebrated laws of the Roman republic, framed by the decemvirs appointed A U C 303, on the return of three commissioners who had been sent to Greece to examine into foreign laws and institutions The tables, as set up by the decemvirs, were originally ten in number, two were added in the second year of the decemvirate, and bore a more aristocratic stamp than the original ten (according to Cicero, the prohibition of marriages between patricians and plebeians was among the number) The text of the Twelve Tables were preserved down to the latest age of Roman literature, and formed the basis of the greater part of the Roman jurisprudence they are called by Livy, "fons omnis publici, privatique juris" The authentic remains of them are given by Haubold (*Institutionum juris Romani privati Lineamenta*, Leipsig 1826) There is a valuable chapter on the early Roman law, as founded on the Twelve Tables, in *Dr Arnold's History of Rome* vol i

TWILIGHT (Germ zwielicht) In Astronomy the faint light which is perceived for some time after sunset and before sunrise

The twilight is produced by the reflexion of light from the atmosphere When the sun descends below the horizon the rays of light no longer reach the earth directly, but as they pass [illegible] of them are reflected [illegible] to its surface At first the light, falling on the lowest and densest strata, is reflected in great abundance, but as the sun descends to a greater distance below the horizon, his rays fall on strata at a greater height and consequently less dense A smaller number of them, therefore, suffer reflexion, and as this number is constantly diminishing the strength of the twilight diminishes in the same proportion, till at length the solar rays fall on strata so rare as to be incapable of reflecting light, and the twilight [illegible] In the morning the change from [illegible] place by the same gradations

From this theory it is evident that twilight must begin and end when the sun's depression below the horizon attains a certain limit The limit however cannot be fixed with any precision It is [illegible] ing to the time which elapses fr[illegible] l stars which are seen by the naked eye become visible But this mode of estimating the duration of twilight is uncertain and arbitrary, and it will be reckoned greater or less according to the goodness of sight of the observer, and the temperature and pressure of the atmosphere Accordingly the sun's depression at the beginning and end of twilight has been fixed at various limits by different observers, by Alhazen, at 19°, by Tycho, at 17°, by Rothman, at 24°, by Stevinus at 18°, by Cassini, at 15°, and by others at different quantities, but the limit usually assigned is 18° Assuming this limit, the duration of twilight in different latitudes, and at the different seasons of the year, is computed as follows —

In the spherical triangle Z P S, let P S = 90° − *d* be the distance of the sun from the pole, Z P = 90 − *p* the distance of the pole from the zenith of the observer or the co-latitude, and Z S = 90° + 18°, S being the place of the sun when he reaches the circle parallel to and 18° below the horizon Now as *d*, the sun's declination, is known, and also *p*, the latitude of the [illegible] [illegible] triangle are given when [illegible] Z P S [illegible] (*see* TRIGONOMETRY) by the formula,

$$\cos Z P S = \frac{-\sin 18° - \sin p \sin d}{\cos p \cos d}$$

If, therefore, we make A = the semidiurnal arc of the sun or the angle at the pole w[illegible] zon, and consequently [illegible] have from the same formula

$$\cos A = -\tan p \tan d,$$

whence the angles Z P S and A are known, and their difference expressed in time gives the duration of the twilight

For places at the equator sin *p*=0, cos *p*=1, and A=90° We have, therefore, cos Z P S = $\frac{-\sin 18°}{\cos d}$ 1st, Suppose the sun to be in the equator in this case we have also *d*=0, and Z P S becomes equal to Z S=90° + 18°, whence the duration of twilight is equal to the time in which an arc of 18° on the equator passes over the meridian, or equal to 1 hour and 12 minutes 2d, Suppose the sun to be at the tropic of Cancer, in this case *d* = 23½°, and the duration of twilight is found by computing from the formula to be 1 h 19 m

By computing from the above formula, the duration of twilight, at the time of the equinox, is found to be 1 h 55 m at the latitude of 50°, and 2 h 32 m at the latitude of 60° At the shortest day, its duration at different latitudes is as follows —

1 h 26 m at latitude 25°,
2 h 6 m at latitude 50°,
2 h 57 m at latitude 60°,

and at 70°, when the sun no longer rises above the horizon, it continues about 5 h 12 m after the sun has passed the meridian of the place

When the angle Z P S = 180°, we have cos Z P S = −1 But in order that the hour angle may have this value, the sun must be on the lower semicircle of the meridian, and consequently, as his depression below the horizon is [illegible] 18°, the twilight will not entirely disappear [illegible] continue through the whole night The formula in this case becomes

$$\cos p \cos d = \sin 18° + \sin p \sin d,$$

or cos (*p* + *d*) = sin 18° whence *p* + *d* = 72° When, therefore the sun's declination *d* = 72° − *p*, the twilight will continue through the whole night at the place whose latitude is *p* Hence, by giving different values to *p*, we find the declination, and consequently the day of the year on which twilight begins to continue through the whole night Suppose *p*=50°, then *d*=22°, which corresponds to the 1st of June In the latitude of London (52°) perpetual twilight begins about the 20th of May At 60° latitude it begins about the 22d of April, at 70° about the 26th of March, at 80° about the last of February, and at the pole itself about the 29th of January It is scarcely necessary to remark, that as no account has been taken of the refraction, these expressions are only approximative

One of the problems most frequently proposed respecting the twilight, is to find the day of the year when its duration is the least possible at a given latitude This problem, which is the same as to determine the sun's declination when his zenith distance increases from 90° to 108° in the least time possible, was first solved by John Bernoulli (*Opera* t i p 64) Solutions of it are given in most works on Practical Astronomy (See Delambre *Astronomie* t i)

TWO-COAT WORK In Architecture, plasterer's work that is either laid and set, or rendered and set

TYMPANI'TIS, or TYMPANY An elastic distension of the abdomen arising from a morbid collection of gas in the intestines The disease is sometimes termed *drum belly*, and arises occasionally from air secreted into the abdominal cavity in which case it is usually fatal

TY'MPANUM (Lat *a drum*) The drum of the ear, the cavity behind the membrane of the tympanum, surrounded by the petrous portion [illegible] temporal bone, and terminating at the cochlea of [illegible], it contains the four small auditory bones, and the Eustachian tube opens into it

TYMPANUM, in Architecture, the space in a pediment enclosed by the cornice of the inclined sides and the horizontal fillet of the corona

TYMPANUM, in Botany, is a membrane stretched across the mouth of the theca of a moss

TYPE (Gr τυπος) In the Fine Arts, the model or pattern in nature of an object used Thus, in architecture the types of columns are said to be trees, &c &c

TYPE Properly, the figure stamped upon a coin, hence a figure, sign, or symbol, especially those by which Christ was prefigured to the Jews, as the Brazen Serpent, the Lamb of the Passover, the Sacrifice of Isaac, or persons whose character and history are considered as embodying an anticipatory representation of the Saviour, as Moses, David, the prophet Jonah &c

Many types are referred to as such by the writers of the New Testament and hence we learn to look for such intentional meaning in what we might otherwise,

in particular instances, pass over as mere coincidences and analogies It is the great sum of such analogies, and the fulness with which they pervade the whole of Scripture, which seem most strikingly to evince the unity of design

TYPE METAL The alloy of lead and antimony used in casting printers' types One part of antimony to three of lead are the usual proportions This alloy takes a sharp impression from the mould or matrix, and is hard enough to stand the work of the press, without being brittle or liable to fracture

TYPES By this term is understood the letters, from the smallest size to the largest, with which books and other articles are printed A single type consists of the shank, the beard, and the face The shank is the body of the letter, the beard is that part between the shoulder of the shank and the face, the face is the shape of the letter, from which the impression is taken

The following are the English names of the different sizes in their regular order, with the addition of the Dutch, French, German, and Italian names —

1. Diamond, the smallest
2. Pearl (*Fr* La Parisienne ou Sedanoise, *Ger* Perl, *Ital* Occhio di Mosca)
3. Ruby
4. Nonpareil (*Dutch* Nonpareil, *Fr* La Nompareille, *Ger* Nonpareille, *Ital* Nomparigha)
5. Emerald
6. Minion (*Fr* La Mignione, *Ger* Colonell, *Ital* Minione)
7. Brevier (*Dutch*, Brevier, *Fr* Le Petit Texte, *Ger* Petit or Jungfer, *Ital* Piccolo Testo)
8. Bourgeois (*Dutch* Bourgeois, *Fr* La Gaillarde, *Ger* Burgeois *Ital* Gighardi)
9. Long Primer (*Dutch* Garmond *Fr* Le Petit Romain, *Ger* Corpus or Garmond, *Ital* Garamone)
10. Small Pica (*Dutch* Dessendiaan *Fr* La Philosophie, *Ger* Brevier, or Rheinlænder, *Ital* Filosofia)
11. Pica (*Dutch* Mediaan, *Fr* Le Cicero, *Ger* Cicero, *Ital* Lettura)
12. English (*Dutch*, Augustyn, *Fr* Le Saint Augustin, *Ger* Mittel, *Ital* Silvio)
13. Great Primer (*Dutch* Text, *Fr* Le Gros Romain *Ger* Tertia *Ital* Testo)
14. Paragon (*Dutch* Paragon *Fr* Le Petit Paragon, *Ger* Paragon, *Ital* Paragone)
15. Double Pica (*Dutch*, Dubbelde Dessendiaan *Fr* Le Gros Parangon, *Ger* Text, or Secunda, *Ital* Due Linee Filosona)
16. Two Line Pica (*Dutch* Dubbelde Mediaan, *Fr* Les Deux Points de Cicero, *Ger* Doppelcicero)
17. Two Line English (*Dutch* Dubbelde Augustyn *Fr* Palestine *Ger* Doppelmittel, *Ital* Canonemo)
18. Two Line Great Primer (*Dutch* Kanon *Fr* Petit Canon, *Ger* Kleine Canon *Ital* Grosso Testo)
19. Two Line Double Pica (*Dutch* Groote Kanon, *Fr* Trismegiste, *Ger* Grobe Canon)
20. Trafalgar
21. Canon (*Dutch* Parys Romeyn *Fr* Le Gros Canon, *Ger* Kleine Missal, *Ital* Canone)

Canon is the largest size with a specific name Pica then becomes the standard to distinguish them and the next size to Canon is Four Line Pica then Five Line Pica and so on to the largest size used in posting bills

1 To enable the reader to form an opinion of the comparative sizes of
2 types, and the proportions they bear to each other there is given
3. in this paragraph a line of each size, from Diamond, the
4 smallest type in general use in England, up to Great
5 Primer, inclusive, numbered to correspond with
3 the preceding list, in order to distinguish
7. them by their names There is a smaller
3 type than Diamond lately introduced,
9. but it is as yet little used. The
0. French have one so small that
1. it cannot be read by the
2. naked eye, even by
13. young persons.

TYPHŒUS One of the Titans, said to have been overthrown in the war against Jupiter, and imprisoned under the weight of Ætna, a circumstance in mythological romance well known from the descriptions of Virgil, Pindar, and Æschylus And see *Bryant's Ancient Mythol* iv 318

TYPHON The Evil Genius of Egyptian Mythology according to Sir G Wilkinson, *Ancient Egyptians*, vol iv p 417 &c), they seem to have acknowledged two deities, who answered to the description given by the Greeks (especially Plutarch, *De Is et Os*) of Typho "One who was the brother of Neptys, and opposed to his brother Osiris, as the bad to the good principle; the other bearing the name of Typho and answering to that part of his character which represents him as the opponent of Horus" the true evil genius Ombte, whom the Greeks seem to confound with Typho "He is figured under the human form, having the head of a quadruped, with square-topped ears, which some might have supposed to represent an ass with clipped ears, if the entire animal did not too frequently occur to prevent this erroneous conclusion" In his Egyptian names is "Ombte," in which Sir G Wilkinson thinks he traces a connection with Antæus, the son of Earth. There appears to have been a general propensity to erase his figure and titles from the monuments at some remote epoch See also Bryant *Ane Myth* vols ii and iii)

TYPHOON The name given to a violent tornado or hurricane in the Chinese seas *See* STORMS

TYPHUS This term (implying to burn with a concealed and smothered flame) is applied to certain continued fevers, attended by great debility and a tendency to putrefaction It is contagious or infectious and often epidemic, and is most prone to attack debilitated persons especially where aided by want of cleanliness, good food and fresh air, so that it often spreads in hospitals [illegible] such causes [illegible] fever liable to several modifications commonly termed low fever putrid fever, nervous fever jail fever, &c Its attack is generally characterized by inordinate muscular and nervous debility and by great depression of spirits weariness flying pains sighing, and a frequent small hard and fluttering pulse the tongue is foul and brown and the taste impaired and not unfrequently nausea and bilious vomiting prevail [illegible] hat variety of typhus which is sometimes [illegible] is fever As the disease advances the debility increases, the mouth becomes very foul and the breath fetid the urine deposits a brown sediment and, together with the motions is fetid and rapidly putrefies all these symptoms increase in intensity the speech becomes inarticulate muttering and delirious, there is a tendency to bleeding from the nose mouth and bowels petechiæ or livid spots appear upon the surface the pulse sinks and intermits, the mind wanders hiccup comes on the hands and feet become cold and under these horrible symptoms the patient dies Such is an outline of the progress of a typhus fever to a fatal termination In this climate it may endure for three weeks or a month but in hot countries the symptoms follow each other more rapidly and violently and it is not of more than eight or ten days duration When it does not terminate fatally the symptoms begin to assume a more favourable aspect about the twelfth or fourteenth day, the pulse improves the patient gets some tranquil sleep perhaps perspires, the urine deposits a red sediment, bilious stools are passed he becomes more tranquil in mind and body and his symptoms gradually disappear till health is restored but it is a disease the event of which must be anticipated with the utmost caution for attacks apparently mild sometimes terminate fatally, and in other cases the constitution has rallied under the most alarming and malignant features At the very commencement an emetic and a mild aperient are proper followed up by aromatic opiates, with camphor and ether It is possible that some particular symptom indicative of local congestion may call for bleeding or blistering the former, except in some very rare cases, should be local only, and very limited as to quantity Serpentaria Peruvian bark cascarilla and colombo are the tonics which are most relied on, and, with these camphor, aromatic confection, opiate confection and ether or if agreeable to the stomach and bowels sulphuric and muriatic acids in small doses, and acidulous drinks Wine and brandy and in some cases, bottled ale and porter are requisite to keep up the general powers of the system, but care must be taken lest their use should be followed by over excitement, and the quantity in some measure regulated by the previous habits of the patient Broths jellies and the varieties of farinaceous food, may constitute the diet, [illegible] attention must be paid to ext[illegible] change of linen ventilation and the due use of chlorine fumi[illegible]tion On the first attack of typhus the effusion of cold water performed two or three times a day, often affords much relief, and afterwards when the shock of such a remedy would be too great sponging the head and body with cold or with slightly tepid water is productive of [illegible]

TYPOGRAPHY The art of printing *See* PRINTING

TYRANNY (Gr τυραννος *a tyrant*) In the original sense of the word a citizen who acquired sovereignty by violence or other usurpation is called, in the language of Greek political writers, a tyrant; and where the power thus acquired became hereditary, the title of

[illegible] his descendants in the generations [illegible] A tyrant in this sense is opposed to basileus, a rightful king with power either limited by the laws or sanctioned by ancient usage (See, as to the Greek tyrannies, Wachsmuth, *Historical Antiquities*, vol i ch 6, and the explanation of the difference between [illegible] and modern sense of the word given by Mitford *Hist of Greece*, i 250 ed 1829)

TYTHING A tything was a subdivision, *i e* a tenth part, as its name indicates, of the hundred, with which it was probably coeval in institution, as it was certainly identical in object, as far at least as regards the prevention of offences by the condition of liability for the production of offenders, or in default thereof reparation of the mischief, in the case of offences committed within the district For this purpose, all free persons above the age of twelve years were required by the Saxon law to belong to some tything No jurisdiction seems to have belonged to the tything, and the office of tythingman, or constable, seems always to have been confined, as it is now, to the preservation of the peace, and the apprehension of offenders The limits of a tything were in most cases coextensive with those of a parish with which it is now commonly, for practical purposes, identical.

U. and V.

U and V were long considered the same letter, and were used indiscriminately the one for the other, but at the beginning of the 16th century their peculiarities came to be marked, and *u* has since been used as a vowel and [illegible] *every where*) In Ecclesiastical History, a school of Lutheran divines, so called from their tenet that the body of Christ was present in the Eucharist in virtue of his divine omnipresence Luther is said to have maintained this argument, as a mode of reconciling the doctrine of transubstantiation with reason, for two years Brentius, one of his disciples passes for its principal supporter Melanchthon opposed it, but it seems to have obtained great credit among the Lutherans of the sixteenth and seventeenth centuries

UCKLWALLISTS In Ecclesiastical History a sect of rigid Anabaptists, so called from one Uke Wallis a native of Friesland They appear to subsist still, independent of other Anabaptists and Mennonites, in Friesland and Groningen (See *Mosheim*, vol v)

UKASE An ordinance of the emperor of Russia having the force of law in his dominions

ULCER (Lat ulcus) A solution of continuity in any of the soft parts of the body, attended by a purulent or other discharge The several kinds of ulcers are divided by surgeons into *local* and *constitutional* but these often run into each other They have been termed *simple* and *specific* sores or ulcers, the former resulting from accidental injuries, the latter from specific poisons or particular habits of body (See *Cooper's Surgical Dictionary*)

ULEMA (Turk *learned men*) The college or corporation consisting of the Turkish hierarchy the [illegible] or doctors of law [illegible] tice This organization (Dohsson, *Tableau de l'Empire Ottoman*) was first framed by the caliphs, and adopted along with the other principles of their government, by the Ottoman sultans Candidates for admission into the Ulema are educated at the different colleges (medressés) of the empire The *Sheikh ul Islam* or mufti of Constantinople is the president of the whole body (See *Ed Rev* vol 50)

ULLAGE In Gauging, what a cask wants of being full is so called

ULMACEÆ (Ulmus, the principal genus), are woody plants, usually timber trees, inhabiting temperate climates They are apetalous Exogens, nearly allied to the Urticaceous order, from which they principally differ in having a two celled fruit The various kinds of elm trees are the best known species, but the thin papery fruit of these plants is by no means characteristic of the order, it is merely a character of the genus *Ulmus*

ULMIN (Lat ulmus, *the elm tree*) A black or dark brown substance which exudes from the bark of the elm and several other trees, and which appears to be contained in most barks It may be obtained by digesting elm-bark in boiling alcohol, and afterwards in cold water, by which various more soluble substances are removed, the residue is then digested in an aqueous solution of carbonate of potash it acquires a brown colour, and yields a precipitate when neutralized by muriatic acid, which, after having been washed and dried, is *ulmin* It is very sparingly soluble in water, but readily soluble in solutions of the alkaline carbonates According to Boullay (*Annales de Chim et Phys* xlii 273), it is a compound of 567 carbon and 433 hydrogen and oxygen in the ratio to form water He terms it *ulmic acid*, and considers it identical with the brown matter of vegetable mould and turf, and as contributing materially to the nutriment of growing plants

ULNA The larger of the two bones of the forearm, It forms the point of the elbow, and is articulated by a species of hinge-joint to the humerus, and to the radius, and below to the radius, and [illegible] the wrist

ULTIMATE ANALYSIS [illegible] in Chemistry to the resolution of substances into their absolute elements, and is opposed to the *proximate analysis*, by which they are merely resolved into secondary compounds The ultimate analysis of crystallized blue vitriol, for instance, teaches us that its true elements are sulphur, copper, oxygen, and hydrogen, its proximate elements are sulphuric acid, oxide of copper, and water, the ultimate elements of sulphuric acid are sulphur and oxygen, of oxide of copper, copper and oxygen, and of water, hydrogen and oxygen The terms *ultimate analysis* and *ultimate elements* are, however, most generally used in reference to organic products. gum resin, starch, and other [illegible] found associated in a vegetable, and [illegible] its *proximate* principles and they are separated by proximate analysis, but all these are resolvable into carbon, hydrogen, and oxygen These three elementary substances, therefore, are their *ultimate* components The accurate determination of their relative proportions in the various products of vegetables is almost always a difficult chemical problem

ULTIMATE RATIO The ratio of evanescent quantities *See* PRIME and ULTIMATE RATIO

ULTIMATUM (Lat) In Diplomacy, the final conditions offered by a government for the settlement of its dispute with another

ULTRA In Modern Politics, those who carry to their farthest point the opinions of the party to which they belong are so termed The name was applied in 1793 to the more violent revolutionists, it has since been bestowed on the extreme section of all parties in turn

ULTRAMARINE (Lat ultra, *beyond*, and marinus, *belonging to the sea*) The [illegible] of the lapis lazuli This substance [illegible] by painters, on account of the beauty and permanence of its colour, both for oil and water painting In its preparation the finest lapis lazuli is selected, heated to a dull red heat, and quenched in water, it is thus rendered friable, and is ground down into an impalpable powder This is then mixed with a tenacious paste made of linseed oil, wax resin, turpentine, and mastic, and the mixture being kneaded in warm water gives out the blue particles, which are afterwards collected by subsidence Chemists have long in vain endeavoured to imitate this colour, but till lately its nature even had not been determined It appears from the experiments of Gmelin that sulphuret of sodium is the principle to which the blue colour is owing and he has succeeded in preparing an artificial ultramarine by heating sulphuret of sodium with a mixture of silex and alumina (See the *Annales de Chimie et Physique* vol xxxvii p 409)

ULTRAMONTANE, or TRAMONTANE A name applied by Italian writers to theologians and jurists of other countries beyond the Alps especially France In ecclesiastical law, ultramontane tenets are those least favourable to the supremacy of the popes As to ultramontane jurists, see Savigny, *Hist of Roman Law*, vol vi

UMBEL In Botany a form of inflorescence in which all the pedicels proceed from a single point, as in *Astrantia* If there is no subdivision, the umbel is called simple, but if the pedicels produce other umbels, as in parsley, the umbel is compound

UMBELLIFEROUS PLANTS (Umbel), are a race of great frequency in all cool or temperate climates, and even occur in hot ones though much more rarely They are known in general by their flowers being disposed in an umbel They have a herbaceous stem, leaves usually much divided, often inflated when they join the stem; and they have universally a dry fruit, which divides into two seed like pieces Some of them are poisonous, as hemlock and water dropwort, others are esculents, as celery carrots and parsnips, many yield aromatic fruits, as caraway coriander and anise, a few secrete a fœtid gum resin, of which assafœtida ammoniacum, and galbanum are examples The species are extremely numerous, and difficult to recognize with accuracy, and, unfortunately, no general rule has yet been discovered for distinguishing those poisonous from the harmless kinds

UMBER Two distinct substances are used as pigments under this name one is a variety of peat or brown coal large beds of which are worked near Cologne, it is said to be largely used in the adulteration of snuff the other, called *Turkish umber*, is a variety of ochraceous iron ore [illegible] according to the analysis of Klaproth of 48 per cent of iron [illegible] peroxide of manganese, 13 silica, 5 alumina, 14 water. The term umber

is said to be derived from Ombria, or Spoleto, in Italy, where it was first obtained

UMBI'LICAL CORD, in Botany is an elongation of the placenta in the form of a little cord, as in the hazel nut.

UMBI'LICATE. (Lat umbilicus, *a navel*) In Zoology, when a pit, tubercle, or granule has a depression in its centre

UMBILI'CUS (Lat) Properly the navel; whence it was metaphorically applied to the two ends of the roller on which the manuscripts of the ancients were rolled, and which were usually adorned with ornamental knobs, while the ends of the parchment were filed with pumice-stone, in order that the folds might lie smooth and neat

UMBILICUS In Conchology, the aperture or depression [illegible] around which the shell is convoluted

UMBILICUS In Botany, the scar by which a seed is attached to the placenta, frequently of a different colour from the rest of the seed, and not uncommonly very dark-coloured It is more commonly called *hilum*

UMBILICUS In Geometry, used by the older geometers synonymously with *focus*

UMBO (Lat) A protuberance or boss In Conchology it is that point of a bivalve shell immediately above the hinge

UMBRA A shadow In Astronomy, this term is applied to the dark cone projected from a planet or satellite on the side opposite to the sun *See* Eclipse

UMPIRE The word appears to be properly derived from the Fr *impair*, *unequal in number*, an umpire being a third party to whom a dispute is referred An umpire is properly a person whom two referees each chosen by his client, being unable to agree, jointly [illegible] them

UNBEND In Seamanship to take the cable from the anchor, a sail from its yard, &c, to untie one rope from another

UNCIÆ The name given by the old writers on algebra to the coefficients of the letters in the expansion of any power of a binomial Thus the expansion of $(a+b)^4$ gives $a^4 + 4a^3b + 6a^2b^2 + 4ab^3 + b^4$ in which the numbers 1, 4 6 4 1 are the *unciæ* or coefficients

UNCIA'LES LITERÆ (Lat) Uncial letters or writing In Diplomatics, a species of character compounded between the capital and the minuscule or small characters, some of the letters resembling the former others the latter It is supposed to have been employed in Latin MSS as early as the third or fourth century, but was seldom used after the tenth

UNCIFORM BONE (Lat uncus *a hook*) The last bone of the second row of the wrist bones, so called from its hook-like process, which projects towards the palm of the hand, and gives origin to the great ligament which binds down the tendons of the wrist

UNCOMMON CHORD In Music another term for the chord of the sixth, not so called however because it is unusual or improper but to distinguish it from the *common chord*, wherein the lowest note is the root or fundamental bass *See* Music

UNCONFORMABLE STRATA A term applied by geologists to strata not lying parallel with the subjacent ones, or having a different line of direction or inclination.

UNCTION, EXTREME *See* Extreme Unction

UNDE'CAGON (Lat undecim *eleven* and Gr γωνια *angle*) In Geometry, a plane figure of eleven sides or angles The area of a regular undecagon is found by multiplying its side into $\frac{7}{11}$ of the square of $73\frac{7}{11}$ degrees, hence if the side be 1 the area is 9·3656

UNDERFLOW A current below different from that at the surface

UNDERWOOD The low woody growths produced among timber trees sometimes called coppice wood, though the term *coppice* [illegible] especially applied to woods in which the growths of [illegible] the stools of trees are more abundant than timber trees *See* Coppice Wood and Shoot

UNDINES, or ONDINES (Lat unda, *water*) The name given by the Cabalists to one class of their spirits of the elements, namely those residing in the waters The ancient Greeks believed springs and lakes to be haunted by a peculiar race of supernatural nymphs (*see* Naiads) and this belief passed down unimpaired to the middle ages The ancient Saxons adored the female deities of the Elbe, and the belief in undines is still scarcely eradicated in that region The Saxon peasants report that an undine is often met in the market-place of Magdeburg, dressed as a girl of their own class, but always to be known by having one corner of her apron wet Near Toulouse many objects of value were once discovered on draining a large artificial lake, which are supposed to have been thrown in as offerings to the spirits of the water The *nixe* of the northern countries is of the same family, and the Scottish *kelpies* are creatures of a similar superstition.

UNDULATION (Lat unda, *a wave*) A waving motion, applied, in physics, to the vibratory motion of an elastic fluid, as the atmosphere.

UNDULATORY THEORY, in Optics, is the hypothesis according to which the impression of light is conveyed to the eye by the undulations of an elastic medium. This theory supposes the universe to be filled with an ether or medium of great elasticity, but so extremely rare as to offer no resistance to the motions of the planets For an explanation of the phenomena of light and colours according to this theory, see Light

UNEVEN NUMBER In Arithmetic, the same with *odd number* [illegible] of the form 2

UNFORMED STARS, in Astronomy, are such as [illegible] of the constellations

UNGUICULATA, or CLAWED *Unguiculata* (Lat unguis, *a claw*) The name of a primary division of the class Mammalia, including those which have the digits armed with claws, but free for the exercise of touch upon their under surface *See* Mammalia

UNGUIS, or CLAW The narrow part of the base of a petal, taking up the place of the footstalk of a leaf, of which it is a modification The term is also used as a term of measure equal to a nail, or half an inch, or the length of the nail of the little finger

UNGULA (Lat *a hoof*) In Geometry a solid formed by cutting off a part from a cylinder [illegible] of revolution, by a plane passing obliquely through the base The ungula is consequently, bounded by the plane of the base, the intersecting plane, and the portion of the surface of the cylinder, &c included between them The name is derived from its resemblance to the hoof (ungula) of a horse

UNGULATA *Ungulata* (Lat ungula, *a hoof*) The name of a primary division of the class Mammalia, including those species which have the digits inclosed in hoofs the under surface not being left free for the exercise of touch *See* Mammalia

UNICORN (Lat unus, *one*, cornu *horn*) The beast called unicorn, in our version of scripture (Heb reem) is now commonly understood to be the rhinoceros But the fabulous unicorn, which has passed into heraldry, is represented with the figure of a horse, and a single horn issuing from its forehead The unicorn of Pliny, however, has the head of a hart the feet of an elephant, the tail of a boar, and the rest of the body resembling a horse Aristotle Ælian and all the classical writers on animals, mention the unicorn The traveller Ludovicus Romanus asserts that he saw *two* unicorns, kept alive in the temple of Mecca Altogether there is perhaps no fabulous beast for whose existence there is so much appearance of evidence, and some seem to imagine that it may yet be discovered in the interior of Thibet Many strange virtues were attributed of old to the horn of the unicorn, particularly against poison, but the horns preserved in collections, and to which that name was given, were either of the rhinoceros, or of the narwal or sea-unicorn

UNIFORMITY (Fr uniforme) In the Fine Arts, resemblance in shape between the correspondent parts of a subject

UNIFORMITY ACT OF In English History, the first act of uniformity is the 1 Eliz c 2, that at present [illegible] 13 & 14 Car 2 c 4 It regulates the form of public prayers administration of the sacraments, and other rites of the Church of England

UNIGE'NITUS The celebrated constitution in the form of a bull, issued by Pope Clement XI in 1713, in condemnation of Père Quesnel's *Reflexions Morales sur le N Testament* It is so called from its beginning, "Unigenitus Dei Filius" Father Quesnel was a friend of the celebrated Jansenist leader Arnauld, and became chief of that religious party after the death of the latter He died in exile at Amsterdam in 1679 The bull was procured by [illegible] Father le Tellier, it condemned [illegible] Quesnel's work Its [illegible] in France Most of the bishops accepted it, but with explanations which they gave to the public Cardinal de Noailles and others refused to accept it all As soon as the Duke of Orleans became regent, Father le Tellier was banished, and the party opposed to the bull came into power, but [illegible] from [illegible] by the Duke of Orleans himself etc, Cardinal de Noailles [illegible] the bull After that event the Jansenist party only survived in small fragments, especially among the communauty of Port [illegible] *See* Jansenists

UNILOCULAR (Lat unus, *one*, loculus, *partition*) In Conchology, shells which are not divided into chambers In Botany, seed vessels not separated into cells

UNION. In British History The union of the crowns of England and Scotland took place on the accession of James I to the [illegible] the uniting the kingdoms was afterwards several times taken up, and commissioners were appointed to consider it in the reigns of Charles II and James II But it was finally carried

into execution in 1706, the statute passed on that occasion being the 5 Anne, c 8 By this enactment laws relating to trade, customs, and excise were to be the same in both countries, other laws to remain in force in each respectively The parliament of the United Kingdom, called Great Britain, was to have 16 Scottish peers, and 45 members of the House of Commons The mode of election of peers was subsequently regulated (*See* PARLIAMENT) Since the union, acts of parliament, in general language, are held to extend to Scotland a proviso being inserted where it is to be excepted The union of Great Britain and Ireland took place in 1800 by the statute 39 & 40 G 3 c 67 of the British and 40 G 3 c 38 of the Irish statutes It admitted 4 Irish lords spiritual, 28 temporal, and 100 commoners to the united legislature, the lords temporal elected for life, the lords spiritual sitting by a certain rotation By article 5 the churches were united For the changes which have since taken place in the number of Scottish and Irish members of the House of Commons, see PARLIAMENT

UNIPELTATES *Unipeltata* (Lat unus, *one*, and pelta, *a buckler*) The name of a family of Stomapodous Crustaceans in which the carapace [illegible] plate

UNISON (Lat unus, *one*, and sonus, *sound*) In Music, a consonance of two sounds equal in gravity or acuteness produced by two bodies of the same matter, length, thickness, tension, &c equally struck at the same time, so that they yield the same tune or sound

UNIT, UNITY In Arithmetic, the number one, an individual of discrete quantity Euclid defines number to be a multitude or collection of units

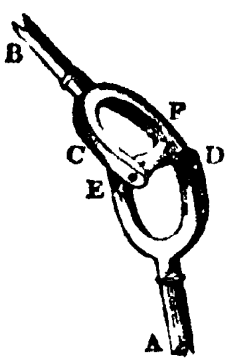
UNITARIANS Those who confine the Godhead to a single person, in which general sense the term may be taken to represent the Arians and Socinians, as well as the sect which is more strictly denominated Unitarian These last are the descendants of the religious communities which adopted, in the 16th century the opinions of Socinus, but in the course of years they have gone considerably further towards reducing Revelation to a mere ethical system They have been supplied with an abundant stream of converts from the Presbyterians and Independents in this country many congregations of whom became first Arian, and latterly Unitarian in sentiment The principal Unitarian authorities are Drs Priestley, Belsham, and Channing, who have either entirely rejected or neutralized the doctrine of the atonement, and represent the language of the apostles upon this and other mysterious points as either intentionally accommodated to the ideas current among their hearers, or derived from erroneous conceptions of their own The revelation of the New Testament is thus reduced to the assertion of a mere historical fact—that of the existence of the man Jesus as a moral teacher [illegible] latitude of interpretation [illegible] it appears that in their view the exposition of the first disciples is not to be implicitly relied on nor do they allow infallibility to the Author of the religion himself The Unitarians were subjected to severe penalties as deniers of the Trinity, long after other dissenters had been relieved by the Act of Toleration the laws against them were not repealed by statute till the year 1813

In this country they do not constitute a numerous body the number of their congregations has been stated at something more than 200, but they are principally composed of persons of the educated classes In Geneva the pulpits of the established church are mostly occupied by professors of these opinions, and in the northern states of America they form one of the most influential of Christian denominations

UNITED BRETHREN In Ecclesiastical History, a body of reformers in Bohemia who separated themselves from the Catholics and Calixtines (according to some writers) about 1467 It is also said that they received episcopal ordination from the Vaudois According to others (Bossuet, *Variations des Eglises Protestantes*, chap ii), they were an offshoot from the Taborites or Thaborites (see that article) At all events, it appears certain that there already existed a considerable body of persons professing the tenets of the Reformation in Bohemia at the period of Luther

UNITIES in the Drama [illegible] of time, place, and action The latter only is referred to in the dramatic compositions of classical antiquity, but what is termed by moderns the *classical* drama (in opposition to the *romantic*) requires all three *See* DRAMA

UNIT JAR A small insulated Leyden jar placed between the electrical machine and a larger jar or battery, so as to ann [illegible] discharges, which may be counted, [illegible] which have passed into the larger jar This is among the many valuable additions [illegible] apparatus by Mr Snow Harris



UNIVALVE (Lat unus, *one*, valva, *a valve*) This term is applied to those Mollusks, the shell of which is composed of one piece, and which is generally

[illegible] Latreille also thus denominates a [illegible] odous Crustaceans

UNIVERSAL In Logic A universal proposition is that which has the subject distributed so that the predicate is declared [illegible] in it; *e g* [illegible] universal negative propositions the predicate is distributed also, *e g* "No men are immortal"

UNIVERSALISTS A name by which the Arminians are sometimes characterized, expressing the universality which they attribute to the operation of grace, conceiving it to be given to all men without favour or reserve On the other hand, the Calvinists, or those who hold the particular election of individuals, are designated Particularists

UNIVERSAL JOINT, or HOOKE'S JOINT In Machinery an ingenious contrivance of Dr Hooke for the purpose of communicating motion obliquely It is single or double In the single universal joint, the two shafts or axles, A and B, between which the motion is to be communicated, terminate in semicircles, the diameters of which are fixed in the form of a cross, their extremities moving freely in bushes placed at the extremities of the semicircles Thus, while the central cross remains unmoved, the shaft A and its semicircular end may revolve round C D as an axis, and in the same manner B, with its semicircular end, will revolve round E F If the shaft A be made to revolve without changing its direction, the points C D will move in a circle whose centre is at the middle of the cross The motion thus given to the cross will cause the points E F to move in another circle round the same centre, and hence the shaft B will be made to revolve (*Mechanics, Cabinet Cycl* p 253)

When the shafts are inclined to each other under an angle of 40° it is necessary to employ a double universal joint, as represented in the annexed figure In this manner the motion may be transmitted from one shaft to another at right angles Instead of employing a cross in the manner now described, the joints may be constructed with four pins, fastened at right angles upon the circumference of a hoop or ball Universal joints are of great use in cotton mills, where the tumbling shafts are continued to a great distance from the moving power, for, by applying a universal joint, the shafts may be cut into convenient lengths and so be enabled to overcome a greater resistance (See *Gregory's Mechanics*, vol ii p 9, *Willis's Principles of Mechanism*, p 272)

UNIVERSITY In the middle ages, the Latin term universitas signified the whole body of students or of teachers and students, assembled in a place of education, with corporate rights, and under by-laws of their own, in later times, also, the name was held to imply that all branches of study were taught in a university In the modern sense of the term, a university signifies an establishment for the purposes of instruction in all or some of the most important divisions of science and literature, and having the power of conferring certain honorary dignities, termed degrees It is generally understood that the authorization of the sovereign power in the state is necessary to enable such an establishment to confer degrees, and, in most European countries, there are various offices and professional situations for which a person is qualified by having taken a certain degree at one of these establishments Hence universities, although in many instances they are composed of private foundations, are justly regarded as national institutions The University of Paris, the most celebrated of those of the middle ages, and which served in some degree as a model to the rest, was formed about 1200 by the union of the various schools of rhetoric, [illegible] ich that city abounded, [illegible] That university was divided into four nations,—French Picard Norman, and English the first comprehended students from Italy and Spain, the last from the north [illegible] rope generally The subjects taught were arranged under faculties, viz theology, law, medicine, and that of the seven liberal arts,—rhetoric, logic, grammar, geometry arithmetic, astronomy, music (See TRIVIUM, QUADRIVIUM) These faculties were corporate, and elected each a dean, and these last, with the procuratores of the nations, represented the university The lowest degree was that of bachelor, the next licentiate, the third magister (this degree at Paris corresponded with that of doctor at Bologna) The colleges were royal or private foundations for the benefit of poor students, whose board was,

in some instances, found for them, and who received [illegible] The faculty of theology [illegible] the name of the Sorbonne (*q v*) This slight sketch of the constitution of the famous University of Paris may serve for similar establishments in other Continental countries during the middle ages, and down to a comparatively late period In England, the two national universities have been established, from a period of considerable antiquity, at Oxford and Cambridge The original constitution of these universities much resembled that of the Parisian, with the exception of the division into four nations, which was wanting But their subsequent history was much modified by the growth [illegible] or individual foundations, into a much higher degree of consequence These were originally destined by their founders merely to entertain a certain number of junior students (generally termed scholars), and a higher body (named in most cases Fellows) to furnish them with assistance in their [illegible] while the great body of independent students lodged in the numerous halls, and attended only on the public university lectures But by degrees the colleges likewise became receptacles for independent students, under the tuition of the fellows, the halls were for the most part abandoned and such as remained partook of the collegiate character, and, in the modern system (which has subsisted for more than two centuries) no student is admitted to take a university degree unless he has completed his studies in a college or collegiate hall, under the superintendence of its tutors But the original division into independent and foundation students still subsists, although the fellowships in many instances, instead of being filled up from the junior foundation members in each college are left open as prizes for the competition of the whole university The degrees, in Oxford and Cambridge, are differently named, or arrived at in different succession in the several faculties, but degrees in theology and medicine can only be obtained after the acquisition of certain degrees in arts In Spain the universities are arranged on a system somewhat resembling that which prevails in England the students being entered of their respective colleges In Germany as in England the [illegible] universities (Prague, founded in 1348 and Vienna, in 1365) were framed on the model of that of Paris Germany has now a far more numerous list of universities than any other country From the Bursæ (charitable establishments resembling our collegiate foundations for the benefit of poor students) was derived the term *Burschc* by which the students of these universities are so generally known But the collegiate system never prevailed in that country as among ourselves On their present arrangement (which is pretty similar in all Catholic as well as Protestant) the four faculties are retained Professors in the various branches are appointed by government These form the senate at the head of which is the prorector, who is chosen annually or biennially Besides these there are extraordinary professors, who receive small salaries, and an inferior class of licensed teachers, or licentiates who receive none The professors are obliged to give public lectures in the branch of study to which they are appointed, but they, as well as the other two classes, may give also private lectures on whatever subject they please, and from the fees of attendance at these their principal income is derived The student is for the most part left at liberty to attend what lectures he pleases but licences to practise various professions, benefices in the various churches, &c, are only given especially in Prussia, to those who have studied a certain number of years by attending lectures in the requisite branch of study The constitution of the Scotch Universities has a great resemblance to those of Germany, and the same observation is applicable to the two universities established in the metropolis within the last few years — London University and King's College In France the old university system may be said to have been entirely done away with by the Revolution As to the [illegible] see Savigny, *Hist of Roman Law*, [illegible] elaborate defence of the English system, see *Quart Rev* vols xlix lx The history of the great change effected in it by the substitution of collegiate for professorial instruction has been traced in a series of recent papers in the *Edin Rev*

UNIVOCALS, or SYNONYMS In the Aristotelian Logic (as used by the schoolmen), generic words, i e words of which both the genus and the difference are predicable of many different species e g the genus animal" is "univocum univocans with respect to "man" and "brute," both of which are comprehended under any definition which can be given of the word "animal," and are called with reference to it "univoca univocata" *Universal terms are also such as have only one signification* opposed to equivocal

UNMOOR To take up one of the two anchors by which the ship is moored

UPAS TREE (Upas, the Javanese name), is a plant common in the forests of Java and some of the neighbouring islands to which extraordinary stories, for the most part fabulous, have been attached Upon the authority of Dutch writers, it has been asserted that it is a most deadly poison, employed in the execution of criminals, who are, however, pardoned if they succeed [illegible] Birds [illegible] and the whole country round it was asserted to be desolated by its pestilent effluvia The truth is, that the Upas tree is merely a tree with poisonous secretions, and nothing more, there is nothing deleterious in its atmosphere It is an Urticaceous plant, called *Antiaris toxicaria*, and is very nearly related to the fig, some of whose species are also deadly poisons

UPHERS In Architecture, fir poles chiefly used in scaffolding they are from twenty to forty feet in length, and from four to seven inches in diameter

UPLANDS Lands on hills or steep declivities, which in general require a different kind of management from lands in plains or comparatively flat surfaces Uplands are generally kept in pasture or underwood.

UPUPA (Lat upupa *a hoopoe*) A genus of Tenuirostral Passerine birds, distinguished by an ornamental head-crest formed of a double range of feathers, which can be erected at will The common hoopoe (*Upupa epops*) is an occasional but rare visitant of England

URACHUS The ligamentous chord which arises from the base of the urinary bladder, and terminates in the umbilical cord

URANIA In Mythology the muse of Astronomy She is generally represented with a crown of stars, in a garment spotted with stars, and holding in her left hand a celestial globe or a lyre

URANIUM A metal discovered by Klaproth in 1789, who named it after the planet Uranus discovered about that time It occurs only in two native combinations, — the *pechblende* of Saxony and the *uranite*, of the latter fine specimens have been found in Cornwall Little is known of the properties of metallic uranium it appears to be a brittle gray metal, of the specific gravity about 9 From the experiments of Berzelius and Arfwedson we deduce the number 217 for its equivalent, that of its protoxide being 225 and of its peroxide (sesquioxide) 229 The salts of the oxides of uranium are of a fine grass green or yellow colour the persalts have been most examined Ferrocyanate of potassa produces in them a very characteristic rich brown precipitate not unlike that formed by the persalts of copper They are also precipitated brown by infusion of galls

URANOSCOPUS (Gr *ουρανος, heaven*, *σκοπεω, I explore*) A genus of fishes was so called by Linnæus because both eyes were placed on the superior surface of the head which presents a nearly cubical form The mouth is cleft vertically at the anterior part of the head and like the eyes is directed upwards The species of of this genus commonly called "star gazers" belong to the *Percoid* family of Acanthopterygian fishes in the [illegible] of Cuvier

URANUS (Gr *ουρανος, heaven*) In Mythology a divinity, the first king of the Atlantic nation, and the father of Saturn

URANUS In Astronomy the remotest known planet belonging to our solar system The mean distance of Uranus from the sun is 19 18·39, that of the earth being considered as unity whence its real distance is upwards of 1800 millions of miles Its sidereal revolution is performed in about 84 Julian years The orbit is inclined to the ecliptic in an angle of only 46′ 28″ 4, and the eccentricity of the orbit is 0 046679 half the major axis being taken as unity The apparent diameter of Uranus (which, on account of the great magnitude of its orbit in comparison of that of the earth undergoes very little variation) is about 4″, whence the real diameter of the planet must be about 35 000 miles, or nearly four and a half times that of the earth, and its bulk about eighty times that [illegible] of a small [illegible] rings belts, or discernible spots From analogy we infer that it revolves about its axis, but of this there is no direct proof the great distance of the planet, indeed, precludes our obtaining much knowledge of its physical state Four satellites at least are known to attend Uranus. Sir William Herschel thought he could discern six, but the existence of more than four has not been clearly made out Two of these were discovered in 1847 by the independent observations of Mr Lassell and M Otto Struve The satellites which are in some degree known have this remarkable peculiarity that, instead of advancing from west to east round the centre of the primary, the planes of their orbits are nearly perpendicular to the ecliptic, and their motion is retrograde

Uranus was discovered by Sir William Herschel, at Bath, on the 13th of March 1781 It had been previously observed by Flamstead Bradley Mayer, and Lemonnier in their ordinary star-observations, but, owing to the inferiority of their telescopes, not one of these astrono-

mers suspected it to be a planet Sir W Herschel called it the *Georgium Sidus*, in honour of George III Foreigners for some time called it *Herschel*, and it is now, in some English works, called the *Georgian* See PLANET and NEPTUNE in Supp

URE'A A peculiar crystallizable substance held in solution in the urine When dried in vacuo it consists, according to Dr Prout, of

	Atoms	Equiv	Theory	Experiment
Nitrogen -	2	28	46 67	46 65
Carbon -	2	12	20 00	20 07
Hydrogen -	1	4	6 67	6 65
Oxygen -	4	16	26 66	26 63
	1	60	100 00	100·00

Urea is readily soluble in water, tasteless, inodorous, and when mixed with the other contents of the urine very prone to putrefaction, the principal result of which is carbonate of ammonia Urea has been artificially obtained by the action of ammonia on cyanate of lead, oxide of lead is precipitated, and colourless crystals of urea [illegible] by carefully evaporating the solution

URE'DO (Lat uro, *I burn*) A genus of microscopical Fungi, whose presence is known by the burnt appearance of the part they infest They consist of extremely minute brown spores, which multiply with great rapidity, and appear to injure plants by absorbing their juices Smut and brand diseases too well known to the farmer, are caused by their ravages Steeping corn in lime water is the best means of repelling their attacks

URETER The membranous tube which conveys the urine from the kidney to the urinary bladder

URE'THRA The membranous tube or canal by which the urine is voided

U'RIA A genus of web footed birds, belonging to the short winged family *Brachypteres* of Cuvier, and, like the rest of that family, admirable divers The species of *Uria* are all marine, and generally known by the name of "Guillemots" They resort in vast numbers to breed among the rocks of the Orkney and Shetland Isles, and are a source of profit to the adventurous inhabitants

URIC ACID An acid peculiar to the urine of certain animals, it is always present in human urine and in the excrements of many birds of prey and of serpents especially of the *Boa constrictor*, which is voided in white nodules, consisting of little else than urate of ammonia Uric acid also forms one of the commonest varieties of urinary calculi, and of the red gravel or sand which is voided in certain morbid states of the urine Pure uric acid is obtained in the state of a very insoluble white powder by digesting powdered uric calculus or the excrement of the boa, in potash, and dropping the solution into weak muriatic acid the precipitate which falls is to be well washed, and dried at 212° Its most distinctive chemical character, by which it is at once easily recognized, is, that when moistened with nitric acid and heated it dissolves and upon evaporation to dryness leaves a red compound, which upon the addition of a drop or two of a solution of caustic ammonia becomes of a fine crimson (*purpurate of ammonia*) The following is the composition of uric acid —

	Atoms.	Equiv	Theory	Experiment
Nitrogen -	2	28	31 11	31 125
Carbon -	6	36	40·00	39 875
Hydrogen	2	2	2 22	2 225
Oxygen -	3	24	26 67	26 775
	1	90	100·00	100 000

U'RIM A word connected in its [illegible] word *thummim*, being the plural [illegible] *light, a luminary*, whence it has come to signify fire *Thummim*, which is the plural of thom or tam, means *fulness* or *perfection* See *Wilkinson's Ancient Egyptians* as to the connection of this word with the title of the Egyptian god Thauth, or Thoth

The two words [illegible] *manifestation and truth* The urim and thummim were the precious stones on the high priest's breastplate, which made known the will of God by casting an extraordinary lustre and thereby *manifested* the success of events to those who consulted them

The high priest alone could officiate at this solemn ceremony, and the urim was to be consulted only at the instance of public persons such as the king, the president of the sanhedrim and the general of the Israelitish army, and only on such public matters as related to the common interest of the twelve tribes

The manner in which the high priest consulted the urim was as follows: — Having entered into the sanctuary or holy place being [illegible] his robes and breastplate, and with [illegible] wards the ark of the covenant, upon [illegible] presence [illegible] opened the breastplate the matter to be consulted, the person [illegible] behind him, and [illegible] and eyes await the answer The high priest then fixed his eyes on the pectoral, and those letters which formed the answer shone with more than ordinary lustre, [illegible] were significantly raised out of their places So when David inquired of God, by means of the urim, whether he should go up to one of the cities of Judah, three letters came out of their places as it were, and gave the answer

While the Hebrews were under a theocracy, or immediately governed by Jehovah, it was necessary there should always be means at hand to consult him, but when this theocracy ceased, and the kingdom became hereditary in the person and family of Solomon, and Israel became divided into two monarchies, under Rehoboam and Jeroboam, the consulting of the urim and thummim [illegible]

URINE (Gr ουρεω *I urine out*) The fluid secreted [illegible] passes by the ureters into the bladder The variable appearance of the urine announces, even to the casual observer, corresponding fluctuations in its composition, these have long been studied by physicians and medical chemists, as furnishing useful prognostics in disease The chemical analysis, however, of the urine is attended by many difficulties, chiefly arising out of the great number of different substances which are found in it the variations in quantity and quality to which they are liable, and the facility with which they are modified by the analytical reagents which it is necessary to employ The substances always found in healthy urine are water, carbonic acid, phosphoric acid, or superphosphate of lime, uric acid, or superurate of ammonia, phosphates of lime, soda, magnesia, and ammonia, sulphate of soda, chloride of sodium (common salt), urea, albumen, and mucus, colouring and odorous matter [illegible] benzoic and lactic [illegible] ammonia, sulphate of potassa, fluoride of calcium, muriate of ammonia, sulphur, silica In certain diseases other products make their appearance, which are not discoverable in healthy urine, such as oxalic acid, or oxalate of lime, nitric acid, sugar, carbonate of lime, cystic oxide, and occasionally some anomalous organic compounds the nature of which has not been very satisfactorily ascertained

It is almost impossible, in consequence of the circumstances above mentioned to give a correct notion of the relative proportions of the component parts of healthy urine, but the following statement, from Berzelius will serve to give an idea of the average composition of this complicated fluid

Water - - - - - -	933 00
Urea - - - - - -	30 10
Sulphates of potash and soda - -	6 87
Phosphate of soda and of ammonia - -	4 59
Chloride of sodium - - - -	4 45
Muriate of ammonia - - - -	1 50
Free lactic acid (acetic?) } Lactate of ammonia } Animal matter } - - -	17 14
Earthy phosphate and a trace of fluoride of calcium - - - - -	1 00
Uric acid - - - - -	1 00
Mucus and albumen - - - -	0·32
Silica - - - - - -	0 03
	1000 00

When the urine is in a healthy state, there are many circumstances of mind and body which materially influence its appearance and quantity It is often little else than water, as after very copious draughts of diluting and diuretic liquids, at other times it is saturated with its solid contents, and even deposits part of them as it cools If turbid at the time it is voided it may always be considered as in a morbid state Sometimes it contains foreign matters which have been taken as medicine or food The peculiar odour imparted to it by asparagus, the colour by spinach, rhubarb, &c, and the passage of certain saline substances by the kidneys are familiar cases of these modifications to which the urine is subject The daily average voided under ordinary circumstances, by healthy individuals, is not less than 30 nor more than 40 ounces, and its specific gravity should not exceed [illegible] diabetes, and [illegible] the kidneys (as in cases of albuminous urine described by Dr Bright) it rises to 1040 The usual average is 1020 It always reddens the vegetable blues which indicate free acid. In cases of suppressed perspiration its quantity is usually increased, and in hot weather and when the perspiration is copious, it is diminished, for it is one of the great outlets of mere water from the system We may also observe, that a large quantity of nitrogen is thrown off by the same channel, for that element constitutes 20 *per cent.* of urea.

Urinary Calculi —When the uric acid of the urine, which we have already stated to be one of its most insoluble contents, is secreted in any extraordinary proportion, it is passed in a solid state, generally in minute red crystals, or *red sand*, and these not unfrequently agglutinate, so as to form small *calculi* from the size of a pin's head upwards These, passing with more or less pain from the kidney along the ureter into the bladder, produce what is termed a *fit of gravel*; and if one or more of them remain in the bladder, it then increases in size, and becoming too large to be passed with the urine gives rise to symptoms of *stone in the bladder* The increase of this nucleus will be more or less rapid, according to circumstances, but if the inordinate secretion of uric acid continue that substance will frequently be deposited upon it in successive layers, and it will sometimes thus attain a considerable size and consist almost entirely of uric acid But if the uric attack in the kidney is transient, the small uric calculus in the bladder usually becomes encrusted with a white deposit, composed of *ammonio-magnesian phosphate* perhaps with more or less *phosphate of lime* this mixture forming what has been termed the fusible calculus, and this gives rise to a second and frequent species of urinary calculus namely, that in which a uric nucleus is enveloped in the phosphates The natural tendency of the urine is to deposit the above-mentioned difficultly soluble phosphates upon any extraneous matter or nucleus which may chance to be in the bladder, but the rapidity with which it is deposited is very different in different individuals, and accordingly the increase in size of such a calculus is sometimes very slow, and sometimes extremely rapid, and as the violence of the symptoms generally depends (but not always) upon the size of the concretion, they will be subject to great consequent irregularity It sometimes happen that calculi are formed in the bladder independently of any morbid state of the urine itself, or of any uric nucleus sent down from the kidneys, but these cases are rare, and appear to depend upon the accumulation of sand and mucus in certain disordered states of the bladder which is gradually indurated into a nucleus, and which then goes on to increase in the phosphates, so that, on cutting such a calculus through the centre, we do not, as in the majority of cases observe a uric nucleus, but the whole concretion is white and more or less crystalline, and usually consists of little else than ammonio-magnesian phosphate This outline of the formation of calculi includes by far the greater number of cases, but it occasionally happens that not only the nucleus but the bulk of the stone, is made up of *oxalate of lime* a substance which we have already stated to be occasionally present in urine When the calculus is small it is often smooth and of the size and shape of a mulberry seed, or, when more carefully examined are found to be a congeries of little rounded particles, but when they have increased in the bladder, they are then generally rough and dark brown on the exterior, whence they have acquired the name of *mulberry calculi* Another, and more rare substance, which forms gravel and calculi is the *cystic oxide*, and in some very rare cases small concretions of *carbonate of lime* have been voided, most probably originating in the prostate gland Traces of *silica* are said to have been detected in the urine, and this substance has also been found in calculi, but it is rare, and in small quantity In concluding this sketch of the history of the urine and urinary calculi, we cannot too strongly insist upon the importance of attending to the early symptoms of the disease, and to its first announcement, which *generally* consists in habitual turbidness and deposits in the urine All persons are subject to occasional appearances of this kind, but when they are *constant*, they ought to be considered as alarming indications of further mischief These in their early stages are almost always curable, either by diet medicine or both, but when once a stone has formed in the kidney or bladder, all hope of its removal, except by an operation (and even that not admissible in the case of kidney calculi), is vain, nothing having been yet discovered to which the term *solvent* is properly applicable The removal of the stone from the bladder is effected by operation in two ways either by an incision into the bladder and the removal of the stone by a forceps, — this constitutes *lithotomy*; or by *lithotrity*, in which certain instruments are introduced by the urethra, so as to grasp the stone and enable the operator to reduce it to fragments sufficiently small to allow of being voided by the usual passage

URN, in Mosses, is the hollow urn in which the spores or false seeds are lodged.

URN, CINERARY or SEPULCHRAL. (Lat uro, *I burn.*) A species of vase used among the ancients to receive and preserve the ashes of the dead The form of the urn was derived by the Romans from Greece, but the Greeks did not employ their urns for sepulchral purposes Among the Romans these vessels were especially consecrated to retaining the ashes of the dead Similar vessels were used by the ancient Teutonic and Slavonic tribes who likewise burnt their dead. Sir T Brown's celebrated work, *Hydriotaphia, or Urn Burial*, contains a strange collection of learned fragments and philosophical reflections on this subject Numerous descriptions of cinerary urns, both Roman and British, discovered at different periods in this country, will be found in the *Archæologia*

UROCE'RATA Gr οὐρα a tail and κερας a horn; The name of a tribe of Tetramerous Coleopterous insects, in which the *terebra* or borer of the females is sometimes very long and prominent and composed of three filamentary processes sometimes capillary and sometimes lodged in a sheath in the interior of the abdomen

URODE'LIS *Tschudi* Gr οὐρα and δηλος, *manifest*. The name of a family of Caudibranchiate Batrachian reptiles which preserve the tail through all the stages of their existence

URO'PTERANS, *Uropteræ* (Gr οὐρα, and πτερον, *a wing*) The name of a family of Amphipodous Crustaceans, including those in which the tail is terminated by enlarged appendages in the shape of fins

UROPY'GIUM (Gr οὐρα, *a tail* and πυγη, *behind*) The base of the tail in mammals and birds

URO'SCOPY The judgment of diseases founded upon an inspection of the urine

URSA MAJOR The Great Bear, one of the forty-eight constellations of Ptolemy, in the northern hemisphere and near the pole It is often alluded to in the most ancient histories, sacred and profane, under the various denominations of Arctos, Bootes, Helix, Callisto, Megisto the Waggon, the Plough It contains seven very conspicuous stars, called *septemtriones*, whence *septemtrio*, the north

URSA MINOR The Lesser Bear, also one of the forty-eight constellations of Ptolemy It was called by the Greeks *Cynosura*, that is, the *Dog's Tail* The pole star is in this constellation

URSULINES In Ecclesiastical History, an order of nuns of which the origin is ascribed to Angela di Brescia, about 1537, but which derived its name from St. Ursula (a lady of the family of Benincasa at Naples) The Ursulines were bound to perform charitable offices to the sick, poor, and penitent They were erected into an order by Gregory XIII, in 1577, at the solicitation of St Charles Borromeo They take in addition to the three ordinary vows, a fourth —to devote themselves to education (See Waddington, *History of the Church*, p 401)

URSUS (Lat ursus, *a bear*) A genus of Plantigrade Carnivora in the system of Cuvier, restricted to those species which have three large tuberculate molars on each side of both jaws, the anterior lower and the posterior upper one being the largest They are preceded by a tooth a little more trenchant representing the carnassial tooth and by a variable number of small premolars In accordance with this dentition, the bears are omnivorous or frugivorous They are heavy, stout-bodied animals with thick limbs, and a very short tail the cartilage of the nose is moveable, and sometimes very long, as in the labiated bear commonly called the ursine sloth The bears of the northern regions pass the winter in a state of somnolency in dens or other hiding places, and it is in these retreats that the female brings forth her young The species best known are the common brown bear (*Ursus arctos*), the black bear (*Ursus Americanus*), the grisly bear (*Ursus Horribilis*) the polar bear (*Ursus maritimus*) the *Ursus labiatus Ursus Thibetanus, Ursus Malayanus* and *Ursus Syriacus*

URTICA'CEÆ (Lat urtica, *the nettle*), form a very large and natural order of plants, with apetalous flowers, a lenticular simple fruit, and a seed whose embryo always directs its radicle towards the top of the cavity The stinging properties of the common nettle are participated in by many others whose acridity is intense Others are provided with a poisonous juice, which in its most concentrated form gives the upas tree of Java its formidable qualities A narcotic principle is highly developed in hemp, and the toughness of the fibre of that plant occurs in many others of the order Nevertheless the fig, the bread-fruit, the mulberry, and hops, in which nothing deleterious is remarked, are the produce of some species, and even the milk tree of the Caraccas, whose bland juice feeds the natives of the country, is an Urticaceous plant Many species furnish caoutchouc which, in *Ficus elastica*, is of the finest quality

URTICATION *see* NETTLE RASH

USANCE *Commercial Law* A foreign bill is often drawn at one, two, or more "usances," meaning thereby certain periods of time which it is the usage of the countries between which the bills are drawn to allow for payment thereof Thus the usance between London and Paris is one calendar month, a bill drawn here "at one usance," on the 2d January, is payable there on the 5th February, allowing three days of grace.

USE, in its original sense, signified the equitable right one had to take the rents and profits of land whereof the

legal ownership was in another It was very nearly the same as the trust of the present day and came into following manner — The owner of land conveyed it by feoffment to some friend, on the understanding that the feoffee should hold it for the sole use and benefit of the feoffor, or such persons as he might nominate In this way the seisin or legal property of the land became vested in the feoffee to uses as trustee, while the feoffor, or other person nominated by him, who was called the cestui que use, had the substantial use and enjoyment of it The simplicity of the common law, however, recognised but one person in connection with the soil, namely, its real owner, and repudiated the idea of any use as separated from the seisin; so that if the trustee, abusing the confidence placed in him, refused to let cestui que use take the rents and profits, there was no redress for the grievance But the Court of Chancery, as a court of equity, considered the agreement entered into by the trustee as binding on his conscience and after calling on him by writ of subpœna to appear and answer on oath of the particulars of the trust, compelled him to perform it

The system of uses was transplanted from the civil law, and introduced into this country about the time of Edward III. by the ecclesiastics, who procured conveyances to be made, not directly to themselves, but to lay persons as trustees for them in order to evade the statutes of mortmain Once known, it was generally adopted, and though crushed in its infancy, so far as regarded religious houses, continued to flourish without disturbance in other respects, and was found admirably adapted to the wants and convenience of the people at large in softening the rigours of feudal tenure and facilitating the alienation and settlement of property The laws and policy of feudal tenure required the vassal to render certain fruits and services to his lord, and if these were not duly rendered, or any act were done in derogation of the lord's title, the estate was forfeited The tenancy of the freehold could not be interrupted or suspended for an instant, and to every transfer of it actual and public delivery of possession, in the presence of witnesses, and accompanied by much solemn ceremonial, was absolutely indispensable, so that the lord might always have some person to perform the services due to him, and always know with certainty who that person was The lord was entitled to sell his wardship and to take the profits of the land during minority, and in case of alienation of the land heavy fines were payable to him The tenant had no power of directing the destination of the land by will, such a mode of disposition would at once have been wanting in notoriety, and have deprived the lord of his fruits upon a descent

When, however the equitable interest in land, as distinguished from the legal property in it became recognised and enforced in the Court of Chancery the peculiar characteristics of the uses were easily worked A conveyance of land to B to A's own use, the terms upon which B took the land were said, in equity, to affect his conscience, and to impose upon him a moral obligation to fulfil them honestly But it was in equity only that A had any claim there he might call upon B to allow him to take the profits of the land, and to make such conveyances of it as he might from time to time direct At law A had no control over or connection with the land any longer remaining to him His use, therefore altogether evaded the grasp of tenure, which rested entirely upon the common law It was held of no one, it was the creature of his own declaration, operating upon the conscience of the person in whom he confided It might be transferred at any time without any public solemnities by a secret declaration At law A could not carve out for himself a portion of the whole fee, and limit the residue of it to others, without first of all going through all the formalities of a conveyance to B, and then taking back a reconveyance, with the same formalities, of that portion of the fee which he might wish to retain to himself Husband and wife being one person in law, he could not carve out a portion for her without conveying to B, in order that B might afterwards convey to her He could not convey to A, or any portion of it, to B, so that it should, on the happening of any named event, or the expiration of any named period, shift either wholly or in part from him to any other person He could not even convey to B at all without giving him immediate possession a conveyance to him in futuro, as from Christmas next, would have been altogether void He might, however, resorting to equity, and making a declaration of the uses to which he wished his property to be applied, effect all these and innumerable other arrangements by a single stroke of the pen or a mere breath The use thus modified in the Court of Chancery, had such a suppleness and pliability and almost obedience to the testator's every whims He might dispose of it by will, it would descend to his heirs in the course of the common law; but no fine was payable upon its descent It was not liable either to dower or to curtesy, it was not extendible for debts, nor forfeited for treason Lord Bacon accordingly complains, that it "deceived many of their just and reasonable rights A man that had cause to sue for land knew not against whom to bring his action, or who was the owner of it The wife was defrauded of her thirds, the husband of his curtesy, the lord of his wardship relief, heriot, and escheat, the creditor of his extent for debt, and the poor tenant of his lease" To remedy these and other evils the statute 27 Henry VIII. c. 10 was passed — the Statute of Uses, which enacts, that when any person shall be seised of lands to the use confidence, or trust of any person he shall be deemed and possessed of the land of and in the like estate as he had in the use, trust, or confidence

The statute thus executed the use, as it is called, by transferring it into possession, and doing away with the distinction between the beneficial interest and legal property in land Whoever had the use had now also the legal estate Thus the use was not abolished, according to the probable intention of the legislature, but merely annexed to and incorporated with the legal estate, to which, therefore, it now superadded all the convenient ductility of its own nature It had no longer a merely precarious existence in equity, but a firm locus standi in courts of law It was shorn, indeed, of many of its old privileges, such as exemption from dower, curtesy, and forfeiture, but for this loss there was soon contrived a remedy The judges in their narrow construction of the statute, decided that its provisions did not extend to a use limited upon a use, as their phrase was Accordingly, on a feoffment to A and his heirs, to the use of B and his heirs to the use of (or in trust for) C and his heirs, they held that the statute clothed the first use with the legal ownership, and that the second was a nullity But as it was quite clear that C, and not B, was the person intended to enjoy the estate, this verbal pedantry of the common law judges drove C into the Court of Chancery for relief, where he was immediately received as the substantial cestui que use, and the *use* which the statute had been in law held not to execute was considered a valid *trust* in equity Thus by limiting two uses successively instead of one only as before the statute,—by making, in fact, the conveyance only three words longer than had been customary the equitable interest and the legal estate were again disunited, and the use under its new name of trust was as popular and available as ever In this manner the destructive qualities of the statute are virtually repealed, while its creative qualities are to this day in full operation, and the legislature, instead of paralyzing the use has only given new form and flexibility to the legal estate

Uses are of various kinds

An *executed use* is one to which the statute applies by annexing to it the legal ownership That to which the statute does not apply is called, as has been already mentioned, a *trust*

Secondary or *shifting use* is one which takes effect in derogation of a use previously created by the conveyance to A to the use of B, and if C shall return from Rome or pay B a certain sum of money, then to the use of C

Springing use is one limited to arise on a future event, where no preceding use is limited

Future or *contingent use* is one limited to a person not ascertained, or upon an uncertain event, but without derogation of an use previously limited, as to A for life, and afterwards to his unborn son

Resulting use When the use limited expires or cannot vest, it is said, either after such expiration or during such impossibility on a conveyance by A for life, then to her eldest marriage, the use results back to A, or results to him in fee in the event of his

USHER (Fr.,) An officer who has the care of the door of a court or hall, &c In the court of England, he is an officer of considerable rank, whose business it is to introduce foreign ambassadors or other high strangers to the sovereign

USQUEBAUGH A liquor made in greatest perfection at Drogheda Brandy or other spirits raisins cinnamon cloves, and various other spices are its ingredients

USTRI'NUM or USTRI'NA (Lat. uro, *I burn*) In Roman Antiquities, a public burning-place, enclosed by walls, in which bodies, mostly of the poorer sort of people, were consumed An ustrinum, according to Montfaucon, was square, and in compass about 300 feet In the *Archæologia* (vol xxvi) will be found a detailed account of the site of one recently discovered in Cambridgeshire, which appears to have been of rather large dimensions

USTULATION (Lat) A term of old Pharmacy, implying the gradual desiccation and torrefaction of substances

USUCA'PTION In Civil Law, the acquisition of property in any thing by possession and enjoyment for a certain term of years, commonly considered as synony-

mous with prescription, although some have restrained [illegible] fined to be the right of enjoying indefinitely something belonging to another without diminishing its substance *Usufruct* differs from *use*, because he who has the use of a thing can only enjoy it personally, whereas the right of him who has the usufruct is alienable, and may be granted, sold, or hired to another Usufruct may be constituted in four ways by contract, by will, by judgment of a court (as where the judge, in effecting a division of common property, may under certain circumstances, instead of dividing the [illegible], allot the usufruct to one, and the thing to another), and by operation of law Usufruct is, properly speaking, confined to things real, and to incorporeal rights (whether they would be termed real or [illegible] to the division of our law), such as [illegible] of usufruct (quasi usufruct) may exist [illegible] be consumed by use The division between the fruit (which belongs to the usufructuary), and the thing itself (which belongs to the proprietor) affords room for a great variety of legal distinctions Usufruct may be extinguished in several ways by the death, natural or civil of the usufructuary, by loss, by prescription, the right being extinguished if disused for a certain period, by forfeiture, where the usufructuary abuses his right, by expiration of time, if the usufruct have been granted for a term, and by the union of the usufruct with the property in the same hands

U'SURY The taking of interest for money from the Latin word usura The Jews were forbidden by the law of Moses to exact interest from one another By the old Roman law of the twelve tables, the rate of interest allowed as legitimate was the usura centesima which was strictly one per cent a month, and has been supposed by some to have amounted to twelve, by others to ten per cent in the year Interest was also computed in the following manner — Usura uncuaria being the lowest term, one per cent, or one twelfth of the usura centesima, usura semis, or semis, half the centesima (six per cent), bes quadrans quincunx, &c, two third parts a quarter, a fifth of the centesima (eight three, two per cent) The Roman laws against excessive usury were frequently renewed, and constantly evaded, but the same principle, additionally sanctioned by mistaken religious opinions, pervaded the laws of all countries in which the civil jurisprudence prevailed The amount of legal interest has been fixed by various statutes in England In the reign of Henry VIII ten per cent was allowed, by 21 J 1, 8 per cent, by 12 C 2 6 per cent, by 12 Ann. 5 per cent All contracts made for the payment of any principal to be lent on usury above this rate were utterly void The question of usury, *i e* whether a contract is *bona fide*, or a colour for a usurious loan was determined by the verdict of a jury But the usury laws have been relaxed by several recent statutes By the last 2 & 3 Vict. c 37, bills of exchange not having more than 12 months to run, and contracts for loans or forbearance of money above 10*l*, are no longer affected by those laws But 5 per cent remains the legal interest recoverable on all contracts, unless otherwise specified

UT In Music, the name of the first of the musical syllables The Italians, for the sake of softening the sound, use the syllable Do instead of Ut in the modern solfeggi

U'TERINE (Lat uterus, *belly*) In the Civil Law, an uterine brother or sister is one issued from the same mother

UTILITA'RIANS A name which has been given to a particular sect of modern politicians, those, namely, who profess to try the excellence of modes of government and usages simply by their utility The celebrated Jeremy Bentham, regarded as the founder of this sect, introduced into the critical department of politics a closer logic than had been [illegible] and aimed at applying his fame[illegible] atest happiness of the greatest number," as an immediate test by which to affirm or deny the value of institutions It is evident that all political sects, both of writers and statesmen, profess ultimately the same object The real characteristic of the Utilitarians consists in the peculiar sense in which they understand it They contend for the most part the proposed [illegible] so as to restrict it to that which is useful for the material and economical well-being of the multitude Their tenets have been attacked in two celebrated articles in the *Edin Review* (vols 49 and 50) *Mill's Essay on Government*, and *Austin on Jurisprudence*, may be referred to as containing the most [illegible] them

UTI[illegible] olitics, a treaty which leaves belligerent parties mutually in possession of what they have acquired by their arms during the war is said to be based on the principle of *uti possidetis* — "as you possess"

UTO'PIA A term invented by Sir T More (from *ou* not, *τοπος* *a place*) and applied in his celebrated work called *Utopia* to an imaginary island, which he represents to have been discovered by a companion of Amerigo Vespucci, and as enjoying the utmost perfection in laws politics &c in contradistinction to the defects of those which then existed The work was first printed in 1516 but Froben's edition of 1518, is more correct The word *Utopia* has now passed into all the languages of Europe, to signify a state of ideal perfection, and *Utopian* is used synonymously with *fanciful* or *chimerical*

UTRICULUS (Lat dim of *uter*, *a bladder*) A term in Botany applied to one called one or few-seeded, superior membranous fruit frequently dehiscing by a transverse suture, as in (*Chenopodium* It is also used to denote a fruit with a thin skin and a single seed Sometimes this word is employed to express [illegible] of the cellular tissue of a plant, which [illegible] bladder

UVA URSI The *Arbutus uva ursi*, *bear's berry*, or *whortleberry* The leaves of this small shrub have a highly astringent and sweetish taste, their decoction or infusion is occasionally used in medicine, especially in certain disorders of the kidney and bladder

U'VULA (Lat dim of uva, *a grape*) A small fleshy protuberance attached to the soft palate, and hanging over the tongue It consists of the common integuments of the mouth and a small vermicular muscle by the contraction of which the uvula is elevated In some cases of enlarged or relaxed uvula which will not yield to local or other remedies, it becomes necessary to amputate a part of it, in consequence of the impediment to deglutition which then ensues, and the tickling cough and retching which it induces

VACCINA'CEÆ (Vaccinium one of the genera) A natural order of shrubby Exogens chiefly inhabiting North America Formerly combined with the Ericaceous order from which they differ in their inferior ovary and succulent fruit The berries of many are eaten, under the names of cranberry, bilberry whortleberry, &c, and some of the species are cultivated as objects of ornament

VACCINATION *See* Cow Pox

VACU'NA or VACI'NA The ancient Italian goddess of leisure, to whom the husbandmen sacrificed at the close of harvest, or 'harvest home,' to which rustic festival Horace alludes in the words "fanum putre vacunæ" (See also *Ov Fasti* vi)

VA'CUUM (Lat vacuus, *empty*) in Physics is a portion of space void of matter The possibility of the existence of a perfect vacuum has been a favourite subject of dispute with the schoolmen and metaphysicians Its existence was maintained by the Pythagoreans Epicureans, and Atomists, and denied by the Peripatetics, who ascribed the rise of water in a sucking-pump, and some other phenomena of the same kind produced by atmospheric pressure, to nature's abhorrence of a vacuum Descartes made the essence of matter to consist in extension and therefore denied the possibility of a vacuum, for if extension be the essence of matter, wherever extension is there matter must be Those again, who suppose all material bodies to be formed of the agglomeration of elementary particles, are compelled by the phenomena of motion to admit at least the existence of what was called by the schoolmen a *vacuum interspersum*, or of intervals devoid of all matter among the interstices or pores of bodies, for if there were no interstices, all space would be full of matter, in which case no body could be moved out of its place inasmuch as there would be no unoccupied place into which it could move For the arguments on this subject, see *Newton's Optics*

The most perfect vacuum that can be produced artificially is the *torricellian vacuum*, or the space above the mercury in the barometric tube But in this sense vacuum merely signifies the exclusion of atmospheric air, for this space in the barometer may be filled with the vapour of mercury, or with some other medium infinitely more rare than air, and inappreciable to our senses It is obvious, from the nature of the pneumatic machine that the vacuum produced by an air-pump, or the Boylean vacuum as it has been called, can never be perfect as some air must always remain in the receiver, however [illegible] process may be continued

The question of the existence of a vacuum is not worth discussing, but there is another question of great interest with reference to physical astronomy connected with the subject, — namely, whether the spaces in which the planets move are so far void of matter as to offer [illegible] or are occupied by a medium [illegible] impede their motions in the long run in a sensible degree Recent observations appear to give some countenance to the supposition that this is actually the case It has been observed that after the most careful allowance has been made for the attractions of the [illegible] causes of disturbance, [illegible] the same returns of that body to [illegible] periods which are constantly [illegible] *See* Comet Now this is precisely the effect that would be produced if the body moved in a medium which offered a small resistance to its motion;

and as this is the only obvious mode of explaining the phenomenon, it has been generally adopted Nevertheless it is extremely difficult to reconcile the supposition of an existing medium with the astronomical fact, that during the last two thousand years of observation, it has produced no perceptible effect on the motions of the large planets capable of being accurately observed by the most delicate instruments This fact, however, in spite of the extreme feebleness of the resistance, does not furnish an absolute proof that such a medium may not exist, and that its effects may not ultimately become sensible even on the densest planets If it does exist, the consequence seems inevitable that all the planets and satellites, as well as the comets, must be ultimately precipitated into the sun

Another argument against the existence of a vacuum is furnished by the undulatory theory of light If this hypothesis be true, and it is rendered probable by numerous phenomena, a medium of great elasticity must pervade all the parts of space through which light penetrates There could in this case be no vacuum, unless, indeed, the term be understood to denote merely the absence of ponderable matter *See* LIGHT

VA'DE IN PACE (Lat *go in peace*) In monastic communities offences were sometimes punished by the dreadful infliction of starving to death in prison, and bones have occasionally been found among the ruins of convents of victims who appear to have perished in this manner. The punishment took this name from the words in which the sentence was pronounced The use which Walter Scott has made of this custom in his poem of *Marmion* is well known But it is no romantic fiction (See Fleury, *Hist Eccles* vol xx p 102, where however, the *vade in pace* is described as perpetual solitary imprisonment *Dict de Trévoux*)

VAGA'NTES (Lat *vago, I wander*) The name of a tribe of spiders (*Aranidæ*) comprehending those which watch their prey concealed in a web, but also frequently run with agility and chase and seize their prey

VAGI'NA (Latin term for *sheath*) is applied by botanists to the leafstalk of those plants in which it becomes thin and rolls round the stem to which it then forms a sheath this is the case in grasses

VAGI'NATES *Vaginati* (Lat vagina *a sheath*) Sheathed Polypes The name of an order of Polypes, comprehending those which are constantly surrounded by and attached to a calcareous or horny polypiary

VA'GRANCY (Lat vagro *I wander*) In Law a very miscellaneous class of offences against public police and order is comprehended under this title in English Law Vagrants under the present act of parliament in force on the subject (5 G 4 c 83) are of three descriptions —1 Idle and disorderly persons, including persons neglecting to maintain their families, paupers returning without certificate to parishes whence they have been legally removed beggars, common prostitutes, pedlars without licence &c all of whom may be summarily convicted and committed to gaol for a month by any single justice, subject to an appeal to the sessions 2 Rogues and vagabonds including persons guilty of the former offences who have been once already convicted of being idle and disorderly, fortune tellers and other impostors persons guilty of indecent exhibitions, procurers of charitable contributions under false pretences playing at games of chance in public places, having in their possession housebreakers' implements or offensive weapons with intent to use them, reputed thieves frequenting public places to commit felony, and others, all of whom may be committed for three months 3 Incorrigible rogues, viz persons guilty of the last class of offences, having been already convicted, persons breaking out of legal confinement, &c, who may be committed to the next sessions, and there sentenced to a years imprisonment Under this act justices possess very extensive powers, such as to issue warrants to bring before them persons suspected of vagrancy, to search lodging houses reasonably suspected of harbouring vagrants, &c

VAIR In Heraldry one of the furs employed in blazonry It is supposed to represent the skin of a small squirrel It is always white and blue, unless otherwise specified in the blazon, as vair of *or* and azure, vair of ermine and gules, &c Vair appears to be derived from varius *Vairy* is the pattern of vair with more than two colours.

VA'LENTINE Feb 14 is the day sacred to St Valentine a presbyter who according to the legend, was beheaded at Rome under Claudius Mr Brand (*Popular Antiquities*, vol i p 47) says that he cannot find in the life of the saint any circumstances likely to have given origin to the peculiar ceremonies of the day It appears to have been a very old notion, [illegible] to by Chaucer, as well as by Shakspeare (in *The Gentlemen of Verona*), that on this day birds begin to couple And the custom of "choosing Valentines" is of great antiquity in this country as well as in France, where, however it has been long disused Lydgate mentions it (1476), Grose explains Valentine to mean "the first woman seen by a man, or man by a woman," on that day, but it does not appear where [illegible] this explanation There is also a curious [illegible] tine, composed by the poet Gower, in *Warton's History of English Poetry* (Additions to vol ii p 31). Herrick mentions the notion and the custom —

[illegible]
[illegible]

It appears that the Reformers attacked this as well as other legendary customs of their time, and that the Romanists themselves were so scandalized at it that devices were invented for turning the day to profitable use St Francis de Sales introduced the practice of drawing lots for patron saints on it, by way of substitute According to others this latter practice was of much older date and substituted for a pagan custom by which boys and girls drew each other's names on the 15th February (day of Februata Juno) However this may be, it is certainly one of the few saints' days in the calendar popularly remembered in England, as the returns of the [illegible] ably testify

VALENTI'NIANS In Ecclesiastical History, a sect of the second century, so called from Valentinus, their founder They were a branch of the Gnostics *See* GNOSTICS

VALE'RIAN The root of this plant, the *Valeriana officinalis* is used in the form of infusion, decoction, or tincture as a nervous [illegible]

VALERIANA'CEÆ [illegible] A natural order of herbaceous Exogens inhabiting temperate climates They are distinguished from the Dipsaceous order by their flowers not being in heads, by the want of albumen, and the absence of an involucel The roots of *Valeriana officinalis* are aromatic and antispasmodic and the young leaves of the species of *Valerianella* are eaten as salad, under the French name of mâche, or the English one of lambs lettuce and corn salad

VALE'SIANS An ancient sect of heretics mentioned by Epiphanius and supposed to have become known about A D 240, said to have adopted the practice of eunuchism

VA'LET VARLET Originally the sons of knights and afterwards those of the nobility before they had attained the age of chivalry The name is sometimes written *vasletus* and seems to be derived from the same root with vassal [illegible] the Celtic was (*See* VASSAL) Valet in French [illegible] degenerated in later times into the signification of servant

VALHA'LLA, or WALHALLA The palace of immortality in the Scandinavian mythology, inhabited by the souls of heroes slain in battle

VALKY'RIUR or DISAS The Fates of the Scandinavian mythology the 'choosers of the slain' who conduct heroes killed in battle to Valhalla

VALLEY (Lat vallis) In Architecture the internal angle formed by two inclined sides of a roof It is supported by a rafter called the *valley rafter*, or *valley piece*, on which lies a board for the reception of the lead gutter called the *valley board*

VA'LLUM (Lat) The rampart with which Roman armies enclosed their camps and which was crowned with a breastwork of stakes

VALVA'TA (Lat valvæ *folding doors*) A genus of fresh water snails or Gastropods, so called from the valve like form of the operculum or lid which covers the aperture of the depressed spiral shell Of this genus several species are British, as *Valvata obtusa* common in the ditches at Battersea, *Valv spirorbis*, *Valv planorbis* *Valv minuta* &c

VALVE In Mechanics a close lid affixed to a tube, or hollow piston or opening in a vessel, by means of a hinge or other sort of moveable joint, in such a manner that it can be opened only in one direction A spherical ball of metal laid on the end of a tube properly formed and retained in its place by its weight alone, is sometimes [illegible] instead of a valve, as in the *hydrostatic* [illegible] *safety valve* of the steam engine is a valve attached to the boiler to obviate the danger of its bursting in case the steam should become too strong The valve is so loaded that its weight, added to that of the atmosphere exceeds the pressure of the steam, when of a sufficient force When the expansive force increases so far that its pressure preponderates over the pressure of the atmosphere and the weight of the safety valve, the valve opens and the steam escapes from the boiler till its elastic force is sufficiently diminished, and the valve shuts by its own weight By opening the safety valve the engine may be stopped at pleasure, for which purpose a particular apparatus is attached to the valve As any accidental derangement of the safety valve might be attended with the most disastrous consequences it has been proposed to make the valve of a metal which melts at a [illegible] means the elastic force [illegible] which corresponds to the temperature at which the valve would melt [illegible] in France

VALVES In Botany, the pieces into which the fruit of a plant naturally separates when it bursts The name is also applied to similar parts in any other organ, as the anther

VA'MBRACE (Fr avant-bras) In Plate Armour, the piece which served as a protection to the arm below the elbow

VA'MPIRE A blood-sucking spectre, the object of superstitious dread among various nations of Europe The belief in vampires, *i e* in persons returning to the earth after death and burial not as ghosts, but in actual corporeal substance, and sucking the blood of living men appears to have prevailed in classical times The Empusæ, Lamiæ, and Lemures were species of vampires One of the most detailed stories of vampires is the tale of *Machates and Philinnion* which Goethe has made the foundation of his poem of the *Bride of Corinth* in which the dead bride of a young man visits him at night, and withers him by her embrace But in modern Europe, the populations among which vampire superstitions have prevailed appear to be of Sclavonic descent The word vampire is said by Adelung to be of Servian origin, and although the modern Greeks have also their vampires, yet the barbaric names by which they call them (Vroucolachas, Vuroulachas, Vardoulachas) seem rather to indicate the Sclavonic, or perhaps Albanian source, from which they derived both the tradition and the word In Crete they are called Katakhanàs and firmly believed in (See *Pashley's Travels*) About a century ago there prevailed in several districts of Hungary an epidemic dread of vampires, which lasted some years and gave birth to many extraordinary stories It was believed that in several places those among the dead who belonged to the class of vampires arose nightly from their graves and sucked the blood of the living who fell into consumptions and perished, that those who had died in this manner became infected with vampirism, and that the only way of exterminating the plague was by disinterring all the suspected vampires and if it were discovered that they exhibited the tokens of their hideous character, burning them to ashes or driving a stake through their middle The attestations which these grotesquely fearful tales received are among the most singular instances of human credulity recorded in all the annals of superstition They are in many instances related on the authority of the pastors and other most credible persons of villages and towns who depose to having been themselves witnesses of the scenes beheld on opening the vampires' graves Some indeed had actually seen the spectres themselves on their nightly excursions, but more generally the subscriptions are by persons present at the inspection of the dead bodies, when, if the subject was a true vampire, he was generally found of a florid and hale complexion, his hair beard and nails had grown, his mouth hands &c were stained with fresh blood, his eyes open and brilliant Sometimes, when the stake was driven through him, he was heard to utter cries like those of a living person It was believed that the consumption produced by the sucking of the vampire could be cured by eating earth from his grave The popular name of the vampire-bat (*Vesperilio spectrum*), a small animal of South America which sucks the blood of persons asleep, is derived from these imaginary monsters

VAN In Naval language the foremost division of the line of battle, which is also the weather division when the fleet is on a wind

VANADIUM (Lat Vanadis, *a Scandinavian deity*) A metal discovered in 1830, by Professor Sefstrom of Fahlun in iron prepared from the iron ore of Taberg in Sweden Vanadium has also been found in a lead ore from Wanlockhead in Scotland and in a mineral from Zimapan in Mexico When [illegible] it is a brittle metal, very difficult of reduction, not oxidized by air or water, and insoluble in sulphuric, muriatic, and hydrofluoric acids, but soluble in nitric and nitromuriatic acids, with which it yields solutions of a fine dark blue colour It is not acted upon by boiling caustic potash nor by the carbonated alkalies at a red heat The peroxide of vanadium is of an orange colour and very slightly soluble in water, it unites with the salifiable bases, with the alkalis its salts are soluble, with the other bases sparingly soluble These salts are orange or yellow coloured, in these and other respects there is a close resemblance between vanadium and chromium Peroxide of vanadium, or vanadic acid, is distinguished from chromic acid by the action of deoxidizing substances, which give a blue solution with vanadium, but a green one with chromium When heated with borax in the reducing flame of the blowpipe, both of the acids yield a green glass, but in the oxidising flame the bead becomes *yellow* if vanadium is present, but the green colour is permanent if produced by chromium According to the experiments of Berzelius, the equivalent of vanadium is about 68; and the protoxide, the deutoxide, and the vanadic acid, are composed respectively of 1 atom of vanadium, and 1, 2, and 3 of oxygen

VANE. A contrivance for showing the direction of the wind It consists usually of a thin slip of wood or metal, attached to a [illegible] axis, round which it moves freely, and is [illegible] it presents always the same extremity to the point of the horizon from which the wind blows

VANI'LLUS (Lat *a lapwing*) A name applied by Bechstein to a subgenus of the Linnæan *Tringæ* including the true lapwings which are distinguished from the *Squatarolæ* of Cuvier by their more distinct though small, hinder toe, and their partially scutellated tarsi

VANE'SSA (Or better *Phanessa*, from *φανης* one of the names of Venus or Love in the Greek as well as [illegible]) The term is applied to a genus of [illegible]

VANG A rope for steadying the extremity or peak of a gaff &c, the slip sside

VANGUARD That part of an army which precedes the main body on the march, as a security against surprise

VANI'LLA (Span baynilla, *a small pod*), is the succulent fruit of a plant of the Orchidaceous order, climbing over trees in the tropical parts of America after the manner of ivy Its fragrance is owing to the presence of benzoic acid crystals of which form upon the pod if allowed to be undisturbed It is an aromatic, employed in confectionary and the preparation of liqueurs, and in flavouring some kinds of

VA'POUR (Lat vap[illegible]

solids are heated they become converted into elastic fluids or *vapours*, which differ from *gases* in this respect, that they are not under common circumstances permanently elastic, but resume the liquid or solid form when cooled down to ordinary temperatures The term *vapour* is frequently limited to water in the state in which it exists in our atmosphere and in other humid aeriform bodies, that is, in a perfectly invisible state When very moist air is duly cooled, the vapour, previously to assuming the liquid state becomes visible, as seen in mist and fog, it is observed in the same state when steam issues rapidly from the spout of a tea kettle, or when it escapes into the air from the surface of hot water In this case it [illegible] from its action [illegible] in the form of minute vesicles Different substances yield vapours with very different degrees of facility or, in other words, are more or less volatile, a circumstance dependent, probably, upon the less or greater cohesion with which their particles adhere Hence fluids are generally more volatile than solids and hence solids generally pass into the liquid state before they assume the form of vapour To both these statements there are however, many exceptions, [illegible] vaporiz[illegible]

concentrated sulphuric acid is also a very fixed liquid, requiring a high temperature for its vaporization, and camphor and some other solids evaporate at common temperatures and arsenic and sal ammoniac at high temperatures, without previously assuming the liquid state The space which vapours occupy always exceeds that of the substances from which they arise Thus, at the temperature of 212°, and under a pressure of 30 inches of mercury, a cubic foot of water produces 1696 cubic feet of vapour, of alcohol 660, and of ether 443 Hence it is obvious that different vapours differ very considerably in density, and that this property is not directly as that of the liquids which furnish them Thus, if we assume the density of air as 1000, that of aqueous vapour or steam is only 625, the density of aqueous vapour to that of atmospheric air being as 1000 to 1694 Again, assuming the density of air as = 1000, that of alcohol vapour is 1613 and of ether no less than 2586; though alcohol and ether are both, in the liquid state, lighter than water As water boils at a higher temperature than alcohol and alcohol at a higher temperature than ether it was supposed that the density of vapours was probably directly as the volatility of their respective liquids but this law has exceptions, for bisulphuret of carbon yields a heavier [illegible] All, [illegible] heated above [illegible] for every [illegible] of Fahrenheit's thermometer they increase by $\frac{1}{180}$th of the volume which they occupied at 32°

VAPOUR, in Physics, denotes the condition of a body, when by the accession of heat its particles acquire a repulsive force, and it is reduced to the state of an elastic fluid Every liquid possesses the property of boiling at a certain determinate temperature, under the mean pressure of the atmosphere Water, for example, boils at the temperature of 212° of Fahrenheit's scale, when the pressure of the atmosphere is equal to a column of mercury 30 inches in height; but under a diminished pressure it boils at a lower temperature; and by increasing the pressure the temperature of the boiling point is increased In the course of ebullition an elastic fluid, or vapour, is generated; and it is only when the [illegible] vapour [illegible] equal to the pressure at the [illegible] of boiling [illegible] ebullition, and the

consequent rapid formation of vapour only take place at a given temperature under a given pressure, vapour will rise from the surfaces of all liquids in free contact with the atmosphere at much lower temperatures Water, for example, exposed in an open vessel, undergoes a gradual diminution of bulk, and is dissipated at temperatures far below the boiling point, and ice itself soon wastes away in the same insensible manner This dissipation has been shown by Dalton to be occasioned by the formation of vapour of the same temperature as that of the water from which it proceeds, and having an elastic force equal to that of the vapour of water boiling at that temperature under a diminished pressure Some liquids, ether for instance, require to be carefully secluded from the atmosphere to prevent their rapid evaporation

Tension of Vapour at different Temperatures —Dr Dalton of Manchester was the first who ascertained by accurate experiments the elastic force of vapours at dif- [illegible] he employed consisted in introducing a portion of liquid into the vacuum of a barometer, where it floats on the surface of the mercury, and part of it is immediately converted into vapour The tension of the vapour causes the mercury to descend, and the force of the tension is measured by the space through which the mercury falls, or by the difference of the height of the mercury in the tube in which the experiment is performed and its height in the common barometer Dr Dalton employed two barometric tubes plunged in the same cistern of mercury, into one of these the liquid furnishing the vapour was introduced, the other serving the purpose of comparison, and in order that the experiment might be made at any determinate temperature, the two tubes were surrounded by another wider tube, into which water was poured of the temperature required When the liquid on which the experiment was made was water and the water surrounding the two barometric tubes was at the temperature of ebullition, the vapour formed in the tube caused the mercury to descend to the level of that in the cistern whence it was inferred that at the temperature of ebullition the elastic force of aqueous vapour is precisely equal to the atmospheric pressure A similar result was obtained when the experiment was performed with other liquids

If the tube containing the portion of liquid be of considerable length, and the basin in which it is inverted of considerable depth, the pressure on the vapour above the mercury may be varied by raising or lowering the inverted tube When the pressure is diminished in this way, it is found that so long as any liquid remains new vapour of the same degree of tension will be generated and the altitude of the mercury in the tube remain constant On the other hand, an increase of pressure causes the condensation of a part of the vapour, and the mercury in the tube stands at the same height above that in the cistern If the quantity of liquid in the barometric tube be so small that the whole is converted into vapour it will be found that on raising the tube and increasing the space in which the vapour is contained, the elastic force [illegible] space is increased The law of Mariotte [illegible] vapours as well as to the permanent gases (*see* PNEUMATICS), but with this distinction, that the vapours of all liquids, at a certain determinate temperature, have a maximum of density and tension which cannot be exceeded, and on attaining which they are condensed into the liquid form by any attempt to compress them further It follows, therefore, that at a given temperature no more than a limited quantity of vapour can exist in a given space This forms the criterion which distinguishes vapours from the permanent gases

The results obtained by Dalton, in his experiments on the tension of aqueous vapour, are exhibited in the following table (*Manchester Memoirs*, 1802) —

Table showing the Maximum [illegible] at Temperatures below 212° [illegible] the Column of Mercury they are capable of supporting

Temperature	Tension in Inches of Mercury	Temperature	Tension in Inches of Mercury	Temperature	Tension in Inches of Mercury

From this table the following formula for the elastic force or tension (which is measured by the pressure p), in terms of the degrees of temperature t, reckoned from 32°, has been deduced, which nearly represents the table, namely,

$$p = 1718\,(1 + 006\,t)^7.$$

In order to determine the tension of vapour at a temperature above the boiling point, it is necessary to have recourse to a different method of experimenting By far the most satisfactory experiments hitherto made on this subject are those of Dulong and Arago, which were undertaken at the instance of the French government, for the purpose of ascertaining the exact temperatures at which aqueous vapour acquires a given tension, with a view to establish such legislative regulations as might appear necessary to prevent accidents from the bursting of steam boilers As an account of these experiments, and a table of the results, have already been given under the term STEAM, (p 1157) it is here only necessary to remark, that the pressures or tensions were ascertained by direct experiment at different temperatures from 212° to 436° of Fahrenheit, between which they were found to vary from 1 to 24 atmospheres, and that the relation between the pressure and temperature (at least for all pressures exceeding four atmospheres) was found to be represented very nearly by the following empirical formula, viz

$$p = (1 + 0\,003974\,t)^5,$$

in which p denotes the tension or elasticity expressed in atmospheres, and t the degrees of temperature of Fahrenheit, counting from 212°

It is evident from this empirical formula, as well as the numbers in the table, that the tension of aqueous vapour increases in a much faster ratio than the temperature This is [illegible] to be general and applicable to the elastic [illegible] vapours of all liquids, at least so far as may be judged from the imperfect experiments which have hitherto been made on the vapours of mercury alcohol, and ether Dalton thought that he had discovered a law which would establish a very simple relation among the tensions of the vapours of different liquids It consists in this, that at an equal number of degrees above or below the point of ebullition corresponding to each liquid the elastic force of their vapours is equal Thus, water boils at 212° alcohol at 175° and ether at 100°, the tension of the vapour at the boiling point being in all cases the same and equal to the pressure of the atmosphere Now, from the experiments of Dulong it appears that the tension of aqueous vapour is doubled when heated under pressure to 251°, that is by an increase of temperature of 39° above the boiling point Hence, by the law of Dalton, the tension of the vapour of alcohol is equal to two atmospheres when its temperature is 175° + 39° = 214°, and that of ether equal to two atmospheres when the temperature is 100° + 39° = 139° Dalton himself afterwards discovered that this law fails when the distances from the point of ebullition are considerable

Density of Vapour —The density of vapour may be determined by introducing a known weight of the liquid which yields it into a receiver containing mercury and inverting the receiver in a vessel also containing mercury, and tall enough to contain above the mercury, a sufficient depth of water to cover the receiver The whole apparatus is then heated, and when the whole of the liquid in the inverted receiver has been evaporated, the space the vapour occupies and its temperature are noted We have then a given bulk of vapour, the weight of which is the same as that of the liquid from which it has been produced, and consequently known The temperature is also known, and the pressure given in terms of the column of mercury in the receiver and the height of the surrounding fluid compared with the indication of barometer In this manner the density is found, and when the density of a vapour at a given temperature and under a given pressure has been found, its density under any other pressure, and at its corresponding temperature, may be calculated in the following manner — Let a = the constant coefficient of dilation = ·00208 (it being found by experiment that vapour out of contact with liquid expands or contracts at the same rate as permanently elastic fluids by variations of temperature, that is to say by 1-480th part of its volume for each degree of Fahrenheit's scale), t = the number of degrees of Fahrenheit's thermometer above 32°, v = the volume, p = the pressure, and d = the density of a vapour at the temperature of 32°, and let v', p', and d' be respectively [illegible] at the temperature, [illegible] When the pressure is constant, the density is inversely as its volume, and, by the law of Mariotte, the density of a gas or vapour is directly as the pressure, whence $\frac{d'}{d} = \frac{p'}{p} \times \frac{v}{v'}$, and consequently $\frac{d'}{d} = \frac{p'}{p\,(1 + a\,t)}$, or $d' = \frac{d\,p'}{p\,(1 + a\,t)}$.

If we compare the density of aqueous vapour at any temperature with its density at the boiling point of water, which is 180° above the freezing point, and put d'' = the density, and p'' = the pressure at the boiling point, the formula becomes $d' = \frac{d'' p' (1 + 180\, a)}{p'' (1 + a\, t)}$ The following table, computed from this formula, with Dalton's values of the pressures, shows the density and volume of aqueous vapour, at its maximum tension, for every [illegible] degree of temperature from the freezing to [illegible] The unit of density is water at the temperature of 32°, and the unit of volume the volume of an equal weight of water also at 32° As the density is inversely proportional to the volume, the numbers in the two last columns are the reciprocals of each other They differ slightly from the numbers given by Gay Lussac

Temperature.	Density	Volume
32°	0000053	188600

By means of this table the weight of water may be calculated that would be contained in the form of vapour of the maxium tension in any given volume — a calculation which is frequently required in meteorological inquiries

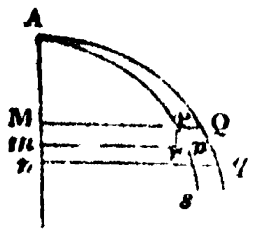
The phenomena of vapour have been studied with reference to two objects, the condition of the atmosphere as to moisture, and the properties of steam as a moving power in machinery On the subject of vapour in connection with the first of these objects see *Daniell's Meteorological Essays*, *Davy's Elements of Agricultural Chemistry* also the terms DEW, EVAPORATION HYGROMETRY See also *Greenwich Meteor Obs* For experiments on the elasticity and density of aqueous vapour, see, in addition to the Memoirs of Dalton and of Arago and Dulong, already cited, *Robinson's Mechanical Philosophy*, Ure, in the *Phil Trans* for 1818, Pouillet, *Traite de Physique*, Despretz *Traité de Physique*, *Gehler's Physikalisches Worterbuch*, art "Dampf," by Prof Muncke See also STEAM

VARIABLE QUANTITY, in Analysis is a quantity conceived to be in a state of increase or diminution or or to have different values in the same equation Thus, the abscissa and ordinates of a curve are variable quantities because they have different values for every different point in the curve, and in passing from one point to another their values increase or diminish according to the law of the curve In the equation of the circle $y = \sqrt{(2\,a\,x - x^2)}$, x and y are variables, for x may have any value whatever between 0 and $2\,a$ and there will be a corresponding value of y, which satisfies the equation The quantity a is a *constant* quantity, and remains the same, whatever be the values of x and y It represents, in fact, the radius of the circle In mechanics a *variable motion* is that which is produced by the action of a force which varies in intensity, or which continues to act after motion has been communicated

VARIANCE In Law, a difference of statement between two material documents in a cause; as where the plaintiff's declaration differed (formerly) from the writ, or where it differs from a deed on which it is grounded And, in ordinary language, a departure in the oral evidence from the statement in the pleadings is termed a variance This variance may be either immaterial or material, and in the latter case [illegible] or not according to a great variety of distinctions The powers of amendment given to courts and judges are greatly extended by 3 & 4 W 4 c 42 s 23, 24

VARIATION (Lat varius, *changing*) In Music, a difference in performing the same air or melody, either by subdivision of its notes into several others of less duration, or by adding graces, but, nevertheless, in such a manner that the original melody is not lost in the decorations or alterations which it is thus made to undergo

VARIATION OF CURVATURE, in Analytical Geometry, is the change which takes place in the curvature in passing from one point of a curve to another The circle is the only curve in which the curvature is uniform at every point. The curvature of a curve line at any point is the same as that of the osculating circle at that point But the curvature of a circle is inversely as its radius hence the curvature of any curve is inversely proportional to the radius of curvature, and, consequently the differential of the curvature is proportional directly to the differential of the radius, and inversely to the square of the radius of curvature In the conic sections, the variation of curvature at any point is [illegible] point



VARIATION OF THE COMPASS The angle which the magnetic needle makes with the plane of the true meridian It is otherwise called *declination* (*See* DECLINATION OF THE MAGNETIC NEEDLE) For tables showing the variation of a great number of places, and [illegible] journal changes, see *Brewster's* [illegible] 1837, reprinted from the *Greenwich Magnet Obs*

VARIATION In Astronomy, an [illegible] the angular [illegible] from that part of the sun's disturbing force which is at right angles to the radius vector, and which accelerates the motion of the moon from the quadratures to the syzygies, and retards it from the syzygies to the quadratures It is proportional to the sine of twice the angular distance between the sun and moon, and its maximum value, or the coefficient of its arguments, is 35′ 41″ 9 Hence it is represented by the formula (35′ 41″ 9) sin 2 A A being the angular distance of the moon from the sun The variation was discovered by Tycho Brahe It had escaped the observation of Hipparchus and the ancient astronomers though of sufficient magnitude to have been sensible to them, probably because they chiefly observed the moon in the syzygies and quadratures, and at these points of the orbit its value is nothing

VARIATIONS, CALCULUS OF An important branch of the modern mathematics, invented by Lagrange the principal object of which is to resolve in a general manner certain classes of questions respecting *maxima* and *minima* the solution of which cannot be obtained by the ordinary processes of the differential calculus In solving problems of maxima and minima by the differential calculus it is necessary to find the determinate values of the different variables which enter into a proposed finite function of those variables, in order that the proposed function may have the greatest or least value possible Many problems of this nature are met with in the writings of the ancient geometers particularly in the Conics of Apollonius and the application of algebra to geometry gave rise about the end of the 17th century, to numerous others, proposed and solved chiefly by Fermat, Slusius, Hudde &c As no general method of solving such questions was known previously to the invention of the differential calculus their solution was accomplished by particular artifices and was frequently attained with very considerable difficulty This difficulty was removed in respect of the class of questions now mentioned by the invention of the calculus but as the instrument of investigation was improved new views were opened, and a more difficult class of questions was proposed, to which the known methods seemed inapplicable It was proposed to find among all curves subjected to a given law, that [illegible] magnitude and position encloses the greatest space, to find the curve along which a heavy body must descend in order to pass from one given point to another given point in the least time possible &c In such questions the relations between the variables is not given, as in the ordinary cases of maxima and minima, the object proposed is to find that relation, or to find the equation which must subsist between the variables in order that the condition of maximum or minimum may be fulfilled

The first problem of this kind which was solved appears to have been that of the solid of least resistance In the first edition of the *Principia*, published in 1687, Newton gave the equation of the curve by the rotation of which about its axis the solid is formed which, when moved through a fluid in the direction of the axis, is less resisted than any other body of the same specific gravity and [illegible] but when the [illegible] by which he had been guided About ten years later the famous question of the *brachystocrone*, or curve of quickest descent was agitated between the two brothers James and John Bernoulli in which Leibnitz and some of the other most illustrious mathematicians of the day took a part The more general problem of *isoperimeters* was solved by James Bernoulli in 1701, and it was in the analysis which he gave on this occasion that the principle on which the solution of similar questions depends was first distinctly unfolded Euler treated the whole subject in his peculiarly luminous manner in a treatise published in 1744, under the title *Methodus Inveniendi Lineas Curvas Maximi Minimive Proprietate* [illegible] And, lastly, the method was reduced to its [illegible]

plicity by Lagrange, who supplied the algorithm and gave it the form under which it is now exhibited as the calculus of variations

In order to give an idea of the nature and objects of this calculus, let us suppose a parabola A P referred to its rectangular co-ordinates A M = x, M P = y, and of which the parameter is a The equation of this parabola is $y^2 = a x$ Now if $m p$ be drawn infinitely near M P, and P r parallel to the axis, the line M m or P r will represent $d x$, the differential of the axis x, and $r p$ will represent $d y$, the differential of the ordinate y, also the relation between those differentials is found by differentiating the equation $y^2 = a x$, which gives $2 y\, d y = a\, d x$, whence $d y = \frac{a\, d x}{2 y}$, or $d y = \frac{a\, d x}{2 \sqrt{a x}}$

Let us now suppose the parameter of the parabola also to vary and to become $a + \delta a$ (the Greek letter δ being used to indicate the variation of a quantity in the same manner as d is used to denote the ordinary differential) On constructing another parabola A Q, the parameter of which is $a + \delta a$ the variations which the co-ordinates undergo in consequence of this variation of the parameter will be represented as follows — Supposing the abscissa A M to be the same in both parabolas, the ordinate M Q of the new parabola A Q will be equal to the ordinate M P augmented by the small quantity P Q, which, therefore, is the variation of y, and according to the notation of the calculus denoted by δy In order to find the value of this variation, we must substitute $y + \delta y$ for y and $a + \delta a$ for a in the equation $y = a x$ This gives $(y + \delta y)^2 = (a + \delta a) x$, from which subtracting the original equation $y^2 = a x$ and neglecting quantities of the second order, as in the differential calculus, we get $2 y\, \delta y = x\, \delta a$, whence $\delta y = \frac{x\, \delta a}{2 y} = \frac{x\, \delta a}{2 \sqrt{a x}}$

2 Suppose the abscissa also to vary and to become A n We have then M $n = \delta x$, and $s\, q = \delta y$ By substituting $x + \delta x$ for x $y + \delta y$ for y and $a + \delta a$ for a in the original equation, it becomes $(y + \delta y)^2 = (a + \delta a)(x + \delta x)$, whence, by performing the multiplications indicated, subtracting the equation $y = a x$ and neglecting quantities of the second order, we get $2 y\, \delta y = a\, \delta x + x\, \delta a$, and consequently $\delta y = \frac{a\, \delta x + x\, \delta a}{2 y} = \frac{a\, \delta x + x\, \delta a}{2 \sqrt{a x}}$, for the value of the variation of y

From this example we may see clearly the distinction between differentials and variations The changes of the co-ordinates relative to the same curve are made by differentials, those which take place in passing from one curve to another of the same kind are made by variations Each of the small quantities δx δy δa is arbitrary, and we may make $\delta x = d x$, but this equality being established we are no longer at liberty to suppose $\delta y = d y$ or $\delta a = d a$ It is also obvious that the variations of [illegible] exactly in the same manner as the differentials of [illegible] quantities, in fact, it is only necessary to substitute the characteristic δ for d and to follow the rules of the differential calculus This remark extends to variations of all orders, and to circular and exponential quantities

The rules being entirely the same in both methods, it is evident that the variation of $d x$ is $\delta d x$, and reciprocally that the differential of δx is $d \delta x$ These two quantities are also identical, for if we suppose x and x' to be two consecutive values of x, we have by the principles of the differential calculus, $d x = x' - x$ whence $\delta d x = \delta x' - \delta x$ But in the same manner as x and x' are two consecutive quantities in the series of values of the variable x so δx and $\delta x'$ may be regarded as two consecutive values of the variable δx, whence $d \delta x = \delta x' - \delta x$, and consequently $\delta d x = d \delta x$

Another principle of equal importance is, that the variation of the integral of any differential quantity is equal to the integral of the variation, that is to say in any function P of different variables, as x, y, z, &c and their differentials, we have $\delta \int P = \int \delta P$ To prove this let $\int P = U$ We have then $P = d U$ by taking the differentials, whence $\delta P = \delta d U$, and therefore, by what has been shown, $\delta P = d \delta U$ Integrating this last equation, we get $\int \delta P = \delta U$, whence, by restoring the value of U, $\int \delta P = \delta \int P$

By means of these two principles we are enabled to find the variation of an indefinite integral expression $\int V d x$, which, in fact, is the principal object of the method of variations If this integral is a maximum or minimum its variation must be made equal to nothing, and in this manner an equation is obtained which gives the required relations between the variable co-ordinates

Lagrange, in his *Mecanique Analytique*, has founded a complete system of rational mechanics on the method of variations The object of this important application may be understood from considering that the co-ordinates of [illegible] bodies may be used either to fix the [illegible] situation of two different points at the same instant, or of two consecutive positions of the same point In the former case, the only relation between the co-ordinates is that which results from the form [illegible] in the latter the change of [illegible] by the conditions of the motion, and a new variable is introduced which is the measure of the time The co-ordinates, therefore, vary in two totally distinct modes, which it is necessary to indicate by different symbols One of these modes becomes, in reference to the other, the calculus of variations, which, according to this view of the subject, may be described as a method of [illegible] a particular [illegible] differentiated on the supposition that they vary in a different manner See Lagrange, *Mecanique Analytique*, Id *Leçons du Calcul*, Lacroix, *Traité du Calcul Diff et Intégral*, tome II, Bossut, *Traité du Cal Diff et Integ*, *Woodhouse on Isoperimetrical Problems*, *Airy's Mathematical Tracts*

VARICE'LLA *See* CHICKEN POX

VARICOCE'LE (Lat varix, *a distended vein*, and κηλη, *a tumour*) A swelling of the veins of the spermatic cord

VARI'ETY (Lat varietas) In Zoology this term is applied to individuals of the same species which from the operation of different causes, as age climate, food, locality domestication, &c, present deviations from the specific type in size, colour, form, and relative proportion of parts of the body, but have the capacity of reverting to the original typical form in successive generations, on the cessation of the influences under which the variety originated

VARIOLA *See* SMALL POX

VA'RIOLITE A porphyritic rock consisting of an imperfectly crystallized aggregate of felspar and quartz

VARI'OLOUS (Lat variola *small pox*) In Zoology, when a part is beset with many shallow impressions like marks of the small pox

VARIO'RUM EDITIONS In bibliography, certain editions of the classic authors of antiquity, published chiefly in Holland, in the 17th and 18th centuries, and containing the notes of numerous commentators, are so called These editions are chiefly valued by collectors

VA'RIX (Lat) A dilatation or swelling of a vein

VA'RNISH (Fr vernis) A fluid which when spread thin upon the surface becomes dry and forms a coating impervious to air [illegible] There are two kinds of varnish namely *spirit* and *oil varnishes* rectified alcohol is used for the former, and for the latter fixed and volatile oils or mixtures of the two The solid substances dissolved in the above menstrua and which constitute what is termed the body of the varnish are almost exclusively resinous and are chiefly the following — 1 *Turpentine*, all the varieties of which are employed by the varnisher they form an excellent body, and give strength and glossiness at a small expense, but they do not dry without other additions. 2 *Copal* a peculiar resin, very difficult to dissolve, but forming a hard and durable ingredient It is generally melted over a gentle fire previous to use 3 *Lac*, which gives great toughness and hardness, but is often inadmissible, on account of its reddish brown colour 4 *Mastic*, which yields a tough, hard, brilliant, and colourless varnish 5 *Elemi* a resin of a pale yellow green tint, and a valuable ingredient, on account of its toughness and durability 6 *Sandarach*, a resin which imparts splendour but which alone is not durable. [illegible] on account of its hardness [illegible] difficulty of [illegible] great solution, and hence chiefly used in opaque varnishes 8 *Benzoin*, added on account of its fragrancy 9 *Anime*, which gives brilliancy and some scent 10 *Gamboge*, for yellow varnishes 11 *Dragon's blood*, for red varnish These, together with turmeric, saffron, and annotta, are chiefly used on account of their colour, and to cover brass and copper under the name of *lacquers* 12 *Caoutchouc* This extraordinary vegetable product has of late been much employed in a variety of preparations used as varnishes It is invaluable where materials are to be rendered air tight as balloons for example, and where at the same time flexibility and even elasticity are required, but its principal application in this way is in the manufacture of various *water proof* articles 13 *Asphaltum*, the varieties of which are indispensable in black oil varnishes In making spirit varnishes, the strongest alcohol of commerce should be used (of a specific gravity not exceeding 820), and its solvent power over some of the more intractable resins is sometimes improved by the addition of a little camphor, in order to prevent the agglutination of the resin, it is often requisite to mix it

If we compare the density of aqueous vapour at any temperature with its density at the boiling point of water, which is 180° above the freezing point, and put d'' = the density, and p'' = the pressure at the boiling point, the formula becomes $d' = \frac{d'' p' (1 + 180\, a)}{p'' (1 + a t)}$ The following table, computed from this formula, with Dalton's values of the pressures, shows the density and volume of aqueous vapour, at its maximum tension, for every ninth degree of temperature from the freezing to the boiling point The unit of density is water at the temperature of 32°, and the unit of volume the volume of an equal weight of water also at 32° As the density is inversely proportional to the volume, the numbers in the two last columns are the reciprocals of each other They differ slightly from the numbers given by Gay Lussac.

Temperature	Density	Volume
32°	0000053	188600
41	0000073	137000
50	0000097	103000
59	0000131	76330
68	0000173	57800
77	0000227	44 0
86	0000297	33670
95	0000390	25640
104	0000510	20030
113	0000637	15690
122	0000810	12350
131	0001022	9784
140	0001261	7930
149	0001592	6281
158	0001964	5091
167	0002388	4187
176	0002936	3406
185	0003557	2811
194	0004261	2346
203	0005074	1971
212	0005896	1696

By means of this table the weight of water may be calculated that would be contained in the form of vapour of the maxium tension in any given volume —a calculation which is frequently required in meteorological inquiries

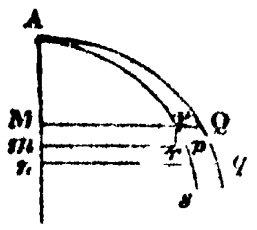
The phenomena of vapour have been studied with reference to two objects the condition of the atmosphere as to moisture, and the properties of steam as a moving power in machinery On the subject of vapour in connection with the first of these objects, see *Daniell's Meteorological Essays*, *Dary's Elements of Agricul Chemistry* also the terms DEW EVAPORATION HYGROMETRY See also *Greenwich Meteor Obs* For experiments on the elasticity and density of aqueous vapour, see, in addition to the Memoirs of Dalton and of Arago and Dulong, already cited, *Robinson's Mechanical Philosophy*, Ure, in the *Phil Trans* for 1818, Pouillet, *Traité de Physique*, Despretz *Traité de Physique*, *Gehler's Physikalisches Worterbuch*, art. "Dampf," by Prof Muncke See also STEAM

VARIABLE QUANTITY, in Analysis, is a quantity conceived to be in a state of increase or diminution or to have different values in the same equation Thus the abscissa and ordinates of a curve are variable quantities because they have different values for every different point in the curve and in passing from one point to another their values increase or diminish, according to the law of the curve In the equation of the circle $y = \sqrt{(2 a x - x^2)}$ x and y are variables, for x may have any value whatever between 0 and $2a$ and there will be a corresponding value of y, which satisfies the equation The quantity a is a *constant* quantity and remains the same whatever be the values of x and y It represents, in fact, the radius of the circle In mechanics a *variable motion* is that which is produced by the action of a force which varies in intensity, or which continues to act after motion has been communicated

VARIANCE In Law, a difference of statement between two material documents in a cause, as where the plaintiff's declaration differed (formerly) from the writ, or where it differs from a deed on which it is grounded And, in ordinary language, a departure in the oral evidence from the statement in the pleadings is termed a variance This variance may be either immaterial or material and in the latter case amendable or not according to a great variety of distinctions The powers of amendment given to courts and judges are greatly extended by 3 & 4 W 4 c 42 s 23, 24

VARIATION (Lat varius, *changing*) In Music, a difference in performing the same air or melody, either by subdivision of its notes into several others of less duration, or by adding graces, but, nevertheless, in such a manner that the original melody is not lost in the decorations or alterations which it is thus made to undergo

VARIATION OF CURVATURE, in Analytical Geometry, is the change which takes place in the curvature in passing from one point of a curve to another The circle is the only curve in which the curvature is uniform at every point The curvature of a curve line at any point is the same as that of the osculating circle at that point But the curvature of a circle is inversely as its radius hence the curvature of any curve is inversely proportional to the radius of curvature, and, consequently, the curvature is proportional directly to the ordinate and the radius, and inversely to the abscissa and the square of curvature In the conic sections, the variation of curvature at any point is [illegible] point



VARIATION OF THE COMPASS The angle which the magnetic needle makes with the plane of the true meridian It is otherwise called *declination* (*See* DECLINATION OF THE MAGNETIC NEEDLE) For tables showing the variation of a great number of places and [illegible] and diurnal changes, see *Brewster's Treatise on Magnetism* 1837, reprinted from the [illegible] *Greenwich Magnet Obs*

VARIATION OF THE MOON In Astronomy, an inequality of the moon's motion, depending on the angular distance of the moon from the sun It arises from that part of the sun's disturbing force which is at right angles to the radius vector, and which accelerates the motion of the moon from the quadratures to the syzygies, and retards it from the syzygies to the quadratures It is proportional to the sine of twice the angular distance between the sun and moon, and its maximum value, or the coefficient of its arguments is 35′ 41″ 9 Hence it is represented by the formula (35′ 41″ 9) sin 2 A A being the angular distance of the moon from the sun The variation was discovered by Tycho Brahé It had escaped the observation of Hipparchus and the ancient astronomers though of sufficient magnitude to have been sensible to them, probably because they chiefly observed the moon in the syzygies and quadratures, and at these points of the orbit its value is nothing

VARIATIONS CALCULUS OF An important branch of the modern mathematics invented by Lagrange the principal object of which is to resolve in a general manner certain classes of questions respecting *maxima* and *minima* the solution of which cannot be obtained by the ordinary processes of the differential calculus In solving problems of maxima and minima by the differential calculus, it is necessary to find the determinate values of the different variables which enter into a proposed finite function of those variables, in order that the proposed function may have the greatest or least value possible Many problems of this nature are met with in the writings of the ancient geometers particularly in the Conics of Apollonius and the application of algebra to geometry gave rise about the middle of the 17th century to numerous others proposed and solved chiefly by Fermat, Slusius, Hudde &c As no general method of solving such questions was known previously to the invention of the differential calculus their solution was accomplished by particular artifices and was frequently attained with very considerable difficulty This difficulty was removed in respect of the class of questions now mentioned by the invention of the calculus, but as the instrument of investigation was improved new views were opened, and a more difficult class of questions was proposed to which the known methods seemed inapplicable It was proposed to find among all curves subjected to a given law, that which [illegible] for example, that curve which [illegible] of equal altitude and position, encloses the greatest space, to find the curve along which a heavy body must descend in order to pass from one given point to another given point in the least time possible &c In such questions the relations between the variables is not given as in the ordinary cases of maxima and minima, the object proposed is to find that relation or to find the equation which must subsist between the variables in order that the condition of maximum or minimum may be fulfilled

The first problem of this kind which was solved appears to have been that of the solid of least resistance In the first edition of the *Principia* published in 1687, Newton gave the equation of the curve by the rotation of which about its axis the solid is formed which, when moved through a fluid in the direction of the axis is less resisted than any other body of the same specific gravity and bulk, but without demonstration or indication of the views by which he had been guided About ten years later the famous question of the *brachystocrone*, or curve of quickest descent was agitated between the two brothers James and John Bernoulli, in which Leibnitz and some of the other most illustrious mathematicians of the day took a part The more general problem of *isoperimeters* was solved by James Bernoulli in 1701, and it was in the analysis which he gave on this occasion that the principle on which the solution of similar questions depends was first distinctly unfolded. Euler treated the whole subject in his peculiarly luminous manner in a treatise published in 1744, under the title *Methodus Inveniendi Lineas Curvas Maximi Minimive Proprietate Gaudentes* And, lastly, the method was reduced to its utmost sim-

plicity by Lagrange, who supplied the algorithm and gave it the form under which it is now exhibited as the calculus of variations

In order to give an idea of the nature and objects of this calculus, let us suppose a parabola A P referred to its rectangular co-ordinates A M = x M P = y, and of which the parameter is a The equation of this parabola is $y^2 = a x$ Now if $m p$ be drawn infinitely near M P, and P r parallel to the axis, the line M m or P r will represent $d x$, the differential of the axis x, and $r p$ will represent $d y$, the differential of the ordinate y, also the relation between those differentials is found by differentiating the equation $y^2 = a x$, which gives $2 y d y = a d x$, whence $d y = \frac{a d x}{2 y}$, or $d y = \frac{a d x}{2 \sqrt{a x}}$

Let us now suppose the parameter of the parabola also to vary and to become $a + \delta a$ (the Greek letter δ being used to indicate the variation of a quantity in the same manner as d is used to denote the ordinary differential) On constructing another parabola A Q, the parameter of which is $a + \delta a$ the variations which the co-ordinates undergo in consequence of this variation of the parameter will be represented as follows —1 Suppose the abscissa A M to be the same in both parabolas The ordinate M Q of the new parabola A Q will be equal to the ordinate M P augmented by the small quantity P Q, which, therefore is the variation of y and according to the notation of the calculus denoted by δy In order to find the value of this variation, we must substitute $y + \delta y$ for y and $a + \delta a$ for a in the equation $y = a x$ This gives $(y + \delta y)^2 = (a + \delta a) x$, from which subtracting the original equation $y^2 = a x$ and neglecting quantities of the second order, as in the differential calculus, we get $2 y \delta y = x \delta a$, whence $\delta y = \frac{x \delta a}{2 y} = \frac{x \delta a}{2 \sqrt{a x}}$

2 Suppose the absciss also to vary and to become A n We have then M $n = \delta x$ and $s q = \delta y$ By substituting $x + \delta x$ for x $y + \delta y$ for y, and $a + \delta a$ for a, in the original equation, it becomes $(y + \delta y)^2 = (a + \delta a)(x + \delta x)$, whence by performing the multiplications indicated subtracting the equation $y^2 = a x$ and neglecting quantities of the second order, we get $2 y \delta y = a \delta x + x \delta a$, and consequently $\delta y = \frac{a \delta x + x \delta a}{2 y} = \frac{a \delta x + x \delta a}{2 \sqrt{a x}}$, for the value of the variation of y

From this example we may see clearly the distinction between differentials and variations The changes of the co-ordinates relative to the same curve are made by differentials, those which take place in passing from one curve to another of the same kind are made by variations Each of the small quantities δx δy δa is arbitrary, and we may make $\delta x = d x$, but this equality being established, we are no longer at liberty to suppose $\delta y = d y$ or $\delta a = d a$ It is also obvious that the variations of algebraic quantities are found exactly in the same manner as the differentials of those quantities, in fact it is only necessary to substitute the characteristic δ for d and to follow the rules of the differential calculus This remark extends to variations of all orders, and to circular and exponential quantities

The rules being entirely the same in both methods, it is evident that the variation of $d x$ is $\delta d x$, and reciprocally that the differential of δx is $d \delta x$ These two quantities are also identical, for if we suppose x and x' to be two consecutive values of x, we have by the principles of the differential calculus, $d x = x' - x$, whence $\delta d x = \delta x' - \delta x$ But in the same manner as x and x' are two consecutive quantities in the series of values of the variable x, so δx and $\delta x'$ may be regarded as two consecutive values of the variable δx, whence $d \delta x = \delta x' - \delta x$, and consequently $\delta d x = d \delta x$

Another principle of equal importance is, that the variation of the integral of any differential quantity is equal to the integral of the variation that is to say, in any function P of different variables, as x y, z, &c , and their differentials, we have $\delta \int P = \int \delta P$ To prove this let $\int P = U$ We have then $P = d U$ by taking the differentials, whence $\delta P = \delta d U$, and therefore, by what has been shown, $\delta P = d \delta U$ Integrating this last equation, we get $\int \delta P = \delta U$, whence, by restoring the value of U, $\int \delta P = \delta \int P$

By means of these two principles we are enabled to find the variation of an indefinite integral expression $\int V d x$, which, in fact, is the principal object of the method of variations If this integral is a maximum or minimum, its variation must be made equal to nothing, and in this manner an equation is obtained which gives the required relations between the variable co-ordinates.

Lagrange, in his *Mecanique Analytique* has founded a complete system of rational mechanics on the method of variations The object of this important application may be understood from considering that the co-ordinates of the different points of a moving body may be used either for the purpose of comparing the positions of two different points at the same instant or of two consecutive positions of the same point In the former case, the only relation between the co-ordinates is that which results from the form of the surface of the body, [illegible] of the co-ordinates is determined by [illegible] motion and a new variable is introduced which is the measure of the time The co-ordinates, therefore, vary in two totally distinct modes, which it is necessary to indicate by different symbols One of these modes becomes, in reference to the other, the calculus of variations, which, according to this view of the subject, may be described as a method of [illegible] a particular [illegible] having [illegible] the [illegible] which vary in a different manner See Lagrange *Mecanique Analytique*, Id *Leçons sur le Calcul des Fonctions*, Lacroix *Traité du Calcul Diff et Intégral*, tome iii , Bossut, *Traité du Cal Diff et Integ* , *Woodhouse on Isoperimetrical Problems*, *Airy's Mathematical Tracts*

VARICELLA *See* CHICKEN POX

VARICOCE'LE (Lat varix, *a distended vein*, and κηλη, *a tumour*) A swelling of the veins of the spermatic cord

VARIE'TY (Lat varietas) In Zoology, this term is applied to individuals of the same species, which, from the operation of different causes, as age climate, food, locality domestication, &c , present deviations from the specific type in size colour, form and relative proportion of parts of the body, but have the capacity of reverting to the original typical form in successive generations, on the cessation of the influences under which the variety [illegible]

VARIOLA *See* SMALL POX

VA'RIOLITE A porphyritic rock consisting of an imperfectly crystallized aggregate of felspar and quartz

VARIO'LOUS (Lat variola, *small pox*) In Zoology when a part is beset with many shallow impressions like marks of the small pox

VARIO'RUM EDITIONS In bibliography, certain editions of the classic authors of antiquity, published chiefly in Holland, in the 17th and 18th centuries, and containing the notes of numerous commentators, are so called These editions are chiefly valued by collectors

VA'RIX (Lat) A dilatation or swelling of a vein

VA'RNISH (Fr vernis) A fluid which when spread thin upon a solid surface becomes dry and forms a coating impervious to air and moisture There are two kinds of varnish namely *spirit* and *oil varnishes* rectified alcohol is used for the former, and for the latter fixed and volatile oils or mixtures of the two The solid substances dissolved in the above menstrua and which constitute what is termed the body of the varnish, are almost exclusively resinous, and are chiefly the following —1 *Turpentine*, all the varieties of which are employed by the varnisher they form an excellent body and give strength and glossiness at a small expense, but they do not dry without other additions. 2 *Copal*, a peculiar resin, very difficult to dissolve but forming a hard and durable ingredient It is generally melted over a gentle fire previous to use 3 *Lac* which gives great toughness and hardness, but is often inadmissible, on account of its reddish brown colour 4 *Mastic*, which yields a tough, hard, brilliant, and colourless varnish 5 *Elemi* a resin of a pale yellow green tint, and a valuable ingredient, on account of its toughness and durability 6 *Sandarach*, a resin which imparts splendour, but which alone is not durable. 7 *Amber* a valuable ingredient, on account of its hardness and durability, but difficult of transparent solution, and hence chiefly used in opaque varnishes 8 *Benzoin*, added on account of its fragrancy 9 *Anime*, which gives brilliancy and some scent 10 *Gamboge*, for yellow varnishes 11 *Dragon's blood*, for red varnish These, together with turmeric, saffron, and annotta, are chiefly used on account of their colour, and to cover brass and copper under the name of *lacquers* 12 *Caoutchouc* This extraordinary vegetable product has of late been much employed in a variety of preparations used as varnishes It is invaluable where materials are to be rendered air-tight as balloons, for example, and where at [illegible] the manufacture of various *water proof* articles 13 *Asphaltum*, the varieties of which are indispensable in black oil varnishes [illegible] of common [illegible] exceeding [illegible] more intractable resins is sometimes improved by the addition of a little camphor, in order to prevent the agglutination of the resin, it is often requisite to mix it

with sand or pounded glass, by which the surface is much increased, and the solvent energy of the spirit facilitated The proportions in which the several ingredients are used, and the selections for particular purposes, are infinitely various The following are a few good varnishes, in illustration of their varieties —1 *Spirit varnish* Sandarach 4 oz , seed lac 2 oz , elemi 1 oz , digest the whole in a quart of moderately warm alcohol, and when dissolved add Venice turpentine 2 ozs 2 *Lac varnish* Seed lac 8 oz , digest for four days in a warm place with a quart of alcohol, and then strain through flannel 3 *Turpentine varnish* Mastic 12 oz , mixed with 5 oz of pounded glass, and digested in a quart of oil of turpentine, adding at intervals about half an ounce of camphor in small pieces When the mastic is dissolved add to the warm fluid an ounce and a half of previously liquefied Venice turpentine, and stir the whole together 4 *Copal varnish* Copal which has been previously melted by a gentle heat 3 oz oil of turpentine 20 oz (measure) put the oil into a flask placed in boiling water, and add the powdered copal in small portions at a time so that it may be gradually dissolved , let it stand a few days to clear, and then pour it off, and if too thick for use add to it a little warm oil of turpentine This varnish dries slowly but is very durable 5 *Linseed varnish* Melt 16 oz of copal in an iron pot with as gentle a fire as possible, and when fused pour in 3 oz of hot linseed oil , stir the mixture, remove it from the fire, and while yet warm gradually add a pint of warm oil of turpentine when the whole is incorporated, strain it through a piece of linen into phials This is a hard and durable but also a coloured varnish 6 *Amber varnish* Melt 16 oz of amber in an iron pot, then add 2 oz of melted lac and 10 oz of hot drying linseed oil , incorporate the whole by stirring , remove it from the fire, and before it cools add a pint of warm oil of turpentine 7 *Black varnish* Melt 16 oz of amber in an iron pot, and add half a pint of hot drying linseed oil, 3 oz of powdered rosin, and 3 oz of powdered asphaltum , stir all together and when removed from the fire and sufficiently cool add a pint of warm oil of turpentine 8 *Lacquer* Digest 3 oz of seed lac 1 oz of turmeric, and 2 drs of dragon's blood for six days in a pint of alcohol frequently shaking the bottle which should be kept in a warm place , strain the lacquer through linen The above are samples of each of the principal varnishes but every maker varies the proportions, and often the nature of the ingredients In the preparation of varnishes in consequence of the highly combustible nature of all the materials, the utmost care is requisite to avoid accidents by fire

VA'RVICITE An ore of manganese found at Hartshill in Warwickshire It appears to be a compound of 2 equivalents of peroxide and 1 of sesquioxide of manganese with 1 of water

VA'SCULAR SYSTEM, in Botany, is that portion of the tissue of plants which is destined for the conveyance of air Vascular plants are those in which the vascular system occurs, or forms a principal feature The air vessels are the *tracheæ* or spirals

VASE (Lat vas) In Sculpture a vessel usually ornamented with sculpture of fruits flowers bassi rilievi &c

VA'SES, ETRUSCAN In Antiquities These well-known and beautiful objects of ancient art have been discovered [illegible] chiefly in the sepulchres of ancient Italian cities Its material is terra cotta and they are painted with figures and scenes The most beautiful, and indeed the most numerous, were formerly obtained from Campania and Magna Græcia and it was much controverted among antiquarians whether the workmanship was not originally Greek which is maintained by Sir W Gell (*Topography of Rome* vol i) Of late years, the great sources have been the sepulchres of Etruria Proper Five thousand have been taken in twenty five years from the ruins of Tarquinia alone and it seems to be now generally admitted that the manufacture is rightly called Etruscan, that it is of extreme antiquity , that in its origin it is connected, in some way not easily explicable, with early Egyptian art , that in its progress Greek taste and style were introduced , that the art had fallen into disuse in the flourishing period of the Roman empire, which is evinced by this fact among others, that none have been found in Pompeii or Herculaneum "The most ancient vases are those called of the Egyptian style They are particoloured, of red and black upon a pale yellow ground *Black* vases, with friezes of animals and ornaments in bassi-rilievo, are also of very high antiquity [illegible] a *red* ground come next in order, while those [illegible] modern are *black* with *red* figures such of them, at least, as depart from the old stiff Etruscan style, and have the more natural shapes of Greek art , for example those of Magna Græcia in general, and Nola in particular " (Mrs H Gray *Sepulchres of Etruria* p 40)

VA'SSAL (Derived according to Sir F Palgrave *on the English Commonwealth* from the Welsh gwas *a young man or page* , gwassaeth, *the state of pagehood*, being rendered in Latin vassaticum) The holder of a fief, by fealty and service of a feudal superior or lord (*See* FEUDAL SYSTEM) From the Celtic origin of this word, it has been inferred that some portion of the feudal usages were derived from those of the tribes which possessed Gaul and Britain before their annexation to the Roman empire In the ancient documents of the Carlovingian kings the vassal is termed vassus or homo fidelis the lord generally "senior " The term vassal was also more generally used, in common language, to signify all who were dependent on a superior lord from those who held fiefs of him down to his serfs or villeins (See Guizot, *Civilization en France*, vol iv)

VASTUS A term applied by anatomists to two muscles of the thigh, the *external* and *internal vasti*

VA'TICAN, the ancient palace of the popes, and the most magnificent in the world, stands at Rome on the right bank of the Tiber, and on the hill anciently called by the same name, derived, according to Aulus Gellius, from Vaticinium, or rather from an ancient oracular deity of the Latins, called by the Romans Jupiter Vaticanus, who was worshipped there Some say that Pope Symmachus began the construction of the palace It was inhabited by Charlemagne in 800, and the present irregular edifice has been raised by the gradual additions of a long series of pontiffs Its extent is enormous, the number of rooms, at the lowest computation, amounting to 4422 , and its riches in marbles, bronzes, and frescoes, in ancient statues and gems and in paintings, are unequalled in the world , not to mention its library, the richest in Europe in manuscripts The length of the museum of statues alone is computed to be a mile here are the Sistine Chapel , the Cameræ of Raphael, painted by himself and his pupils , the museum of Pius VI peculiarly rich in objects of ancient Italian workmanship , and other deposits of art and antiquity, each of which by itself would suffice to render a city illustrious

VAUDEVILLE In French Poetry a species of light song frequently of a satirical turn, consisting of several couplets and a refrain or burden, introduced into theatrical pieces The origin of the word is disputed , some derive it from Vau-de-Vire a village in Normandy Short comic pieces interspersed with such songs are also termed Vaudevilles

VAUDOIS (Lat Waldenses) The inhabitants of some valleys in the Alps between Italy and Provence from whence they derive their name, and who must be distinguished from the Waldenses or followers of Peter Waldo who acquired celebrity in the 12th century, and from whom some writers have deduced both their religious tenets and their appellation also The Vaudois are celebrated for having maintained the purity of their doctrine for many ages before the Reformation , and it has been asserted by some theologians that the true spirit of the primitive Christianity was kept alive among them throughout the whole period of Romish corruption This position however, does not seem susceptible of proof Another claim that they possess to a place in ecclesiastical history is derived from the numerous persecutions to which they have been exposed on account of the witness they have so long borne against the erroneous doctrines of the nations by whom they are surrounded Their extreme antiquity is certain at all events , and the numerous attempts which have been made by Romanist writers to fix on them the stigma of Manicheism seem unsupported by the evidence For the last three centuries they have been viewed with displeasure by the dukes of Savoy and kings of Sardinia their masters and repeatedly visited with military execution or more legal forms of violence One great persecution, in the 17th century is known to us by Milton's noble sonnet Not long after it they were altogether expelled and retreated into Switzerland, whence they returned by a celebrated march, and recovered their valleys by force , an event commemorated in the work of Arnaud, one of their pastors, *La Glorieuse Rentrée des Vaudois dans leurs Vallées* At present they are by no means free from occasional vexations Their number is about 30 000 (See *Faber on the Waldenses and Albigenses* as to their tenets)

VAULT (Fr voute , It volta) In Architecture, an arched roof, so contrived that the stones, bricks, or other materials whereof it is constructed, sustain and keep each other in their places Vaults are circular and elliptical When their section rises higher than a semicircle, they are said to be *surmounted* , when less, *surbased*

VA'VASSOR A word of uncertain derivation, although probably derived from the same root with vassal (gwâs *a youth or page*, in some Celtic dialects) The vassals who held immediately of the higher nobility, under the feudal system in France, were frequently comprehended under this general name , the châtelains being such vavassors as possessed castles or fortified houses (See Hallam, *Middle Ages*, vol i p 149) The word, however seems to have been of very loose application [illegible] are termed vavassors in old French romances In England the title was not usual, although it

is mentioned in Bracton in contradistinction to baron, and sometimes appears to have designated persons who held land by military tenure of others than the king (See *Archæologia*, vol ii)

VE'CTIS (Lat *the lever*) In Mechanics, the same with *lever* *See* LEVER

VE'CTOR (Lat vehere, *to carry*), or RADIUS VECTOR In Astronomy, a straight line conceived to be drawn from the centre of a planet to the centre of the sun, by which the planet appears to be *carried* round the sun in its orbit In geometry, the radius vector of a conic section is a straight line drawn from one of the foci to any point in the curve

VE'DA The name by which the Hindoos designate the collective body of their scriptures, sometimes called Vedam Bedam &c , according to various provincial pronunciations by European writers The four Vedas (Rig Yajust, Saman, and Atharvan) are believed, according to the orthodox creed, to have been revealed by Brahma But these sublime visions are confined to a few sacred works Upavedas Angas Upangas &c some of which are considered by Mr Colebrooke to constitute according to received opinion a fifth Veda The arrangement is ascribed to one Vyasa, a sage of whom nothing positive can be ascertained The Vedas chiefly consist of prayers, precepts or maxims, and stories, called respectively by different titles Thus a portion of the mythological histories are called Puranas, but these are not to be confounded with the poems of romantic mythology called by the same name (*See* PURANAS) The genuineness and antiquity of the Vedas have been matter of much dispute among western antiquaries The chief chronological data are that they were compiled before the supposed incarnation of Vishnu, as Rama and Krishna, under which titles he is now [illegible] among the Hindoos, and also [illegible] Buddha Sir William Jones [illegible] gave them a conjectural antiquity of about 3000 years, and Mr Colebrooke (Ib vol viii) arrives at about the same conclusion

VEDA'NTA A sect among the Hindoos whose theory of philosophy is professedly founded on the revelations contained in the Vedas Its fundamental tenets appear to have a near connection with the opinions of Epicharmus, Plato Pyrrho, and what is termed the Berkeleian philosophy among ourselves, namely, that matter has no existence independent of mental perception, with the ordinary consequences of that doctrine of which those practically most important are the maxims of Quietism See on the philosophy of the Vedas *Ritter's History of Ancient Philosophy* (translation), vol i p 66, &c

VEER In Naval Language to give the ship more scope of cable Also to let any thing drop astern by a rope Also the old term for *to wear*

VEGETABLE EARTH Soil in which decayed vegetable matter is in a much larger proportion than the primitive earths In Horticulture, vegetable earth is called mould, and in Agriculture the term is applied to the surface soil of hollows which contain alluvial soil beneath and vegetable matter, generally of a black colour, on the surface

VEGETA'TION *See* BOTANY

VEGETATION, CHEMISTRY OF From the moment a seed begins to grow a series of chemical changes are induced essential to the development of its germ The process has been chiefly studied in regard to bicotyledonous plants and a general outline of it is given under the word GERMINATION

VE'HMIC COURTS (Germ vehm, or femgerichte) Criminal courts of justice established in Germany during the middle ages These courts are commonly said to have originated in those held by the Missi Dominici or imperial legates, sent by Charlemagne into the provinces of his empire, but many circumstances denote their descent from the more ancient tribunals of the German tribes held in the open air in the primitive periods of their history (See a curious account of the free field courts of the Germans in Sir F Palgrave's work on the *English Commonwealth*, *Wigand's Femgericht Westphalens*) But the character under which these institutions became formidable and important, about the beginning of the 13th century, arose from the disordered state of northern Germany after the dissolution of the duchy of Saxony The Vehmic, or, as they were called, free courts, were then modelled on a secret system of organization The president was usually a prince or count of the empire, his assistants (styled Freischoffen) were persons affiliated to the society by secret initiation, to the number, it is said, at one time of 100,000 All these were bound to attend the secret meetings of the courts when summoned and to execute their decrees, if necessary by taking the life of persons accused Westphalia, styled, in the language of the free courts, the Red Land, was the district in which their central authority was seated These courts exercised a great power, which was occasionally serviceable in repressing the lawless violence of the nobles of that period, but which was also liable to be perverted to the gratification of private malice and tyranny Various leagues were formed in the 15th century, by the nobles of the empire, for the purpose of destroying their influence, which was at last effected, chiefly by the introduction of a better system of public judicature and police in the several states See also the publication of the Library of Entertaining Knowledge Society, *Secret Societies of the Middle Ages* The romantic use of this history made by Goethe in his *Goetz von Berlichingen* is well known

VEIL A term used in describing fungi to denote the horizontal membrane connecting the margin of the pileus with the stipes

VEINS (Lat vena) In Anatomy, elastic tubes which convey the blood from the arteries back to the heart *See* HEART

VEINS, MINERAL Cracks or fissures in rocks filled up with substances differing from the rock itself When these are of a metallic nature, they form the chief repositories [illegible] veins [illegible] most beautiful mineral products Some veins are several yards wide, and they often branch off into smaller ramifications, which are gradually lost in the surrounding rock *See* GEOLOGY

VELI'FERA (Diminutive of velum, *a sail*) The name of a genus of Acalephes, characterized by a vertical crest or sail, by means of which they are wafted along the surface of the ocean

VE'LITES The light- [illegible] to a Roman legion were so ca [illegible] *des Inscr* vol xxix) They were equipped with bows, slings and javelins, a light wooden buckler covered with leather, and a head piece

VI'TULUM (Lat velamen or vitulinum) A fine kind of parchment made of calfskin The skins are limed, shaved, washed, and stretched in proper frames, where they are scraped with the currier's fleshing tool, and ultimately rubbed down to a proper thickness with pumice stone

VELO'CE (It *swift*) In Music a term which, prefixed to a movement, indicates that it is to be performed in a rapid manner

VELO'CIPEDE (Lat velox, *swift* and pes *foot*) A vehicle invented at Mannheim in 1817, by M Drais, consisting of a piece of wood about five feet long and half a foot wide resting on two wheels, one behind the other On this an individual sits as on horseback his feet touching the ground, and thus propelling the machine The front wheel may be turned at pleasure, so that the rider may give any direction to the machine This species of vehicle never came into general use, but it was improved by Knight in this country, and a patent received for it

VELO'CITY (Lat velox, *swift*), is measured by the space which a moving body passes through in a given time The velocity of a body is uniform when it passes through equal spaces in equal times, and variable when the spaces passed through in equal times are unequal It is accelerated when the force by which a body is put into a state of motion continues to act after the motion has commenced, and retarded when the moving body encounters obstacles which tend to destroy the motion. Velocity is merely a relative term, for there is nothing, as Biot remarks (*Traité de Physique* I iii p 148), which in itself is either swift or slow, any more than great or small The velocity of a cannon ball appears very great, as it can scarcely be followed by the eye yet it is slow in comparison of the motion of a point on the earth's equator carried round by the diurnal motion, and this, in its turn, is far inferior to the velocity of the earth in its orbit, which again is greatly exceeded by the velocity of light (For the velocity of falling bodies, see ACCELERATION, for the velocity of a body moving in curve about a centre of force, see CENTRAL FORCES *See also* GUNNERY, VIRTUAL VELOCITY, &c

VELVET A rich kind of stuff, extensively used for ladies' dresses and a variety of other purposes Of velvet there are properly only two kinds, that with a plain, and that with a twilled [illegible] is also called a Genoa ground or back When the material is silk, it is called velvet, when cotton, velveteen The latter is a species of *fustian*, which, under a variety of names, is largely used for men's wearing apparel

VENA CAVA *See* HEART

VENEER In Architecture, a thin piece of material of a more valuable kind laid on another of a more common sort, by which the whole substance appears to be of the more valuable sort Veneering is more usually applied to furniture than to strictly architectural purposes

VENETIAN SCHOOL In Painting The distinguishing character of this school is colouring, and a consummate intellectual knowledge of chiaro scuro, in both which all is grace, spirit and faithful adherence to nature so seductive as to lead the spectator away from any consideration of its defects. It is an exquisite bouquet of

[illegible] other wanting the still higher accomplishments, for the head of it was Marco Vecelli, and in its ranks are to be found Tintoretto Paul Veronese, Giorgione, and many other illustrious masters *See* PAINTING

VENIAL SIN (Lat *venia forgiveness*) In Theology is defined, by Roman Catholic theologians, a sin which weakens sanctifying grace but does not take it away It is not necessary although commendable, to mention such sin in confession Reformed theologians altogether reject the formal distinction between venial and mortal sin

VENIRE FACIAS In Law a judicial writ, directed to the sheriff to cause a jury to *come* or appear in the neighbourhood where a cause is brought to issue, to try the same (*See* JURY) A *venire facias de novo* being a writ directing the sheriff to cause a jury to come and try a cause a second time, is granted where there has been a mis trial, on the ground of irregularity, as, for instance, in summoning the jury, on the ground of misconduct by the jury, and also in certain cases where the verdict given is imperfect by reason of some ambiguity and uncertainty The great rule of difference between a venire de novo in the latter case and a new trial is, that the former is only granted on matter appearing on the record

VENI, SANCTE SPIRITUS (Lat *Come, Holy Ghost*) The name given to a mass in the Roman Catholic church to invoke the assistance of the Holy Spirit

VENTAYLE, or AVENTAYLE The visor of a helmet *See* HELMET

VENTER (Lat) In Entomology, signifies the lower part of the abdomen

VENTILATION (Lat ventus *wind*) literally signifies fanning or blowing In Domestic Economy, it is the art of conveying currents of fresh air through close apartments or confined places, so as to maintain the atmosphere in a state of purity

Atmospheric air consists of two ingredients oxygen and azote blended together in the proportion of one part by measure of the former to four of the latter When these proportions are altered air becomes unfit for respiration, and when the oxygen is withdrawn or consumed it is rendered altogether incapable of supporting animal life or combustion But there are operations both of nature and art continually going forward in which the oxygen of the atmosphere is consumed and gaseous products evolved which are destructive of life Thus in the act of respiration a certain portion of the oxygen contained in the air inhaled into the lungs is converted into carbonic acid, a substance which acts as a narcotic poison, and hence in a confined apartment air is soon rendered, by breathing alone not merely incapable of maintaining life but highly destructive of it in consequence of the evolution of a deleterious gas In like manner oxygen is consumed, and carbonic acid evolved in the process of combustion, and the burning of a pan of charcoal in a close room is known to be a certain means of extinguishing life

Although a decomposition and deterioration of air is thus continually going forward nature has by various means provided so effectually for the restoration of the two constituent gases that in whatever part of the world and at whatever height in the atmosphere air is taken it is found when chemically examined to contain azote and oxygen in exactly the same proportions *See* AIR

Quantity of air required for Ventilation — If the question were solely how to command a sufficient supply of fresh air it would be easily solved, but as in our climates the temperature of the external atmosphere is in winter generally very much lower than is necessary for comfort we have at the same time to provide for the maintenance of an artificial temperature in our apartments, by allowing the air to enter no faster than it can be warmed One of the first points, therefore to be considered, is the amount of the supply of fresh air which an individual requires for comfort and health This however, is a point on which by reason of the variety of circumstances concerned, it is difficult to arrive at any satisfactory conclusion

Dr Henry estimates that an adult person makes, on the average, 20 inspirations per minute, and draws into his lungs at each inspiration 20 cubic inches of air Peclet allows 40 cubic inches for each inspiration. Taking the mean of the two estimates, we have 600 cubic inches expired per minute But, according to Dr Arnott, air expelled from the lungs is found to vitiate, so as to render [illegible] respiration twelve times as much pure air, [illegible] quantity of unexpired air remained in the lungs [illegible] cubic inches Dr Arnott however supposes the waste to be only half of this quantity But there are several other causes of deterioration besides the production of carbonic acid from the lungs the effluvia and vapour of animal matter exuded from the whole surface of the body is not less injurious than carbonic acid, and, according to M Seguin, in a temperature of 60°, about 3½ cubic feet of air per minute is charged with animal vapour transmitted through the skin of an adult, and rendered unfit for respiration When artificial lights are used, a further allowance must be made for the waste by combustion Besides, air is required for various other purposes than those which have now been mentioned It acts as a cooling power and hence the supply requisite for comfort depends on its temperature It likewise serves to carry off moisture from the skin, and therefore its state as to dryness or humidity must be considered Dr D B Reid found from observations on a number of persons assembled in an experimental room, that not less than 10 cubic feet per minute should be allowed to each individual on the [illegible] able temperature, but that, to maintain [illegible] in all its purity, a much larger supply would at times be desirable On the whole, therefore, we may conclude that 10 cubic feet of fresh air per minute, for each individual, is the smallest allowance that should be made in order to ensure healthful ventilation

Source of Aerial Movement —One of the most efficient means of ventilation is afforded by the action of heat At ordinary temperatures air suffers an expansion of about 1-500th part for each degree of Fahrenheit's thermometer by which the temperature is raised, and being rendered specifically lighter in the same proportion the pressure of the surrounding atmosphere predominates, and the heated air is forced upwards This principle is exemplified in the action of the ordinary chimney which may be regarded as a tube open at both ends, and placed in any position except the horizontal The air in the lower end of the tube being heated by the fire rises and passes out at the upper end while its place is supplied by the pressure of the fluid surrounding the lower opening and the circumstances of motion are the same as if another tube filled with air of the original temperature, were adapted to the lower end of the chimney which is filled with heated air so that the current is established in the same manner as in an inverted siphon in which two columns of air of different densities but equal altitudes, press against each other At the lower opening of the chimney the draught or velocity of the current is expressed by this formula,

$$v = \sqrt{[2 g h a (t' - t)]},$$

where v denotes the velocity in feet per second, g the accelerating force of gravity (= 32·2 feet per second) a the rate of expansion for one degree of increased temperature t the temperature of the heated air as it enters the chimney and t' that of the external air It appears from this that the velocity of draught is as the square root of the height of the chimney and the square root of the excess of temperature at the lower opening But as the same quantity of air must be supposed to pass through every different section of the chimney in the same time it follows that the velocity at every part must be inversely as the density and, therefore, decreases from the bottom to the summit

As the draught of a chimney depends on the difference of the temperature of the air at its lower and upper ends it will afford a considerable power of ventilation even when there is no fire if the room be heated by any means (as by an assemblage of persons) above the temperature of the external atmosphere In warm weather this may, however be insufficient, but in this case a large shaft, [illegible] with the apartment at some distance, [illegible], by means of a good fire, an exhausting power to any extent This is the method by which the Houses of Parliament are at present ventilated and the principle has been frequently applied in mines and manufactories The impulsion of air into a chamber by mechanical means is often had recourse to in particular circumstances In the printing office of the Bank of England there is a ventilating apparatus consisting of a square box for a pump body, with a loose piston and furnished with large valved openings, by means of which 1100 cubic feet of air per minute are driven through the apartments For ventilating the holds of ships, cellars &c, the windsail is usually applied though sometimes a fanner is introduced for the same purpose

The subject of ventilating is intimately connected with that of warming apartments, and the great difficulty to be overcome is, to provide for both objects at the same time The open fire place, so generally used for private buildings in this country, affords beyond question, the purest and wholesomest source of heat but it is attended with many serious defects By far the greater part of the heat produced by the combustion passes through the chimney without contributing to warm the apartment, [illegible] a great waste of fuel, while the air admitted into the room to supply the place of that which sustains the combustion is allowed to find its way through the imperfect fittings of the doors and windows, wherever accident leaves an aperture, under no regulation, and accordingly passes through the apartment to the fire-place, in offensive and injurious currents Nor,

after all, is the ventilation by any means complete, for while currents of cold air are passing along a few inches or feet above the floor, they seldom rise above the level of the chimney piece and the air in the upper part of the room may exist in a greatly vitiated state by the products of respiration and the combustion of the lamps or candles The eyes is right, indeed be of late to a considerable extent, and the currents in the room much diminished, by bringing an independent supply of air through tubes [illegible] from the outer air to the fire-place, and providing with valves to regulate the quantity Count Rumford recommended that the air should be conducted from the roof of the building through a pipe or canal [illegible] was, that the air, in its passage through it into the room, should be warmed by the contrary current of air from the fire place, thus economising the heat which in the ordinary arrangement is entirely lost This suggestion has been improved upon in a great variety of ways, and the principle applied to close as well as to open stoves

When apartments are warmed by other means than open fires, as close stoves, the circulation of hot water in tubes, heated air, &c, means should be applied to obtain ventilation entirely independent of the heating, and controlled by valves If stoves are used, the chimney to carry off the products of combustion and the tubes which supply the air necessary to maintain it should have no communication with the chamber in which the stove is placed Stoves of low combustion, like Arnott's stove, or the porcelain stoves used in the north of Europe, are the best Iron, heated to a high temperature, causes an offensive smell, and decomposes the air, besides the air which comes in contact with it, in consequence of the temperature it acquires, rushes rapidly to the highest part of the room and renders regulated ventilation impossible The mild hot-water apparatus when the pipes are suitably disposed affords an agreeable warmth, and has this advantage — that the sources of heat not being confined to a particular part of the room, equable ventilation is rendered more easy In rooms for public assemblies where the air requires to be changed rapidly, greater difficulty is encountered the best method undoubtedly is, to admit the pure air from a chamber in which it is previously heated (or cooled, as the case may require) to the suitable temperature and to carry off the respired and vitiated air by the shaft of a furnace

Of late years the subject of ventilation, as connected with the public health has engaged much attention, and a mass of useful information respecting it will be found in the recent *Parliamentary Reports*, particularly on the ventilating and acoustic arrangements of the present House of Commons on education and manufactures, and the means of improving the health of large towns (See *Tredgold's Principles of Warming and Ventilating Public Buildings &c*, *Arnott on Warming and Ventilation*, *the Monthly Chronicle*, vol i p 220 *Dr Reid's Chemistry of the Atmosphere*, *Encyc Brit* art "Ventilation," Peclet *Traité de la Chaleur*)

VENTILATOR Any machine or contrivance for promoting or regulating ventilation The common ventilator placed in windows which revolves in the same manner as a smoke-jack in consequence of the impulsion of a current of air serves only to retard in some degree the entrance of the current to disperse it in different directions, and to prevent any sudden increase in the intensity of the draught It has no power of acting so as to create a current, or keep up its intensity when it has been established

VE'NTRICLE (Lat venter, *the belly*) A term in Anatomy applied to cavities of the brain and of the heart

VE'NTRICOSE In Zoology a part is so termed when it bellies out as if filled with air

VENTRI'LOQUISM (Lat venter *the belly*, loquor, *I speak*) One whose voice appears to come from his belly Ventriloquists are generally supposed to have the power of making the voice appear to come from distant objects or quarters, but this is a deception, arising out of the manner in which the ventriloquist manages his voice The art appears to consist in filling the lungs with air, and employing during expiration such organs of voice as can be used without the aid of the lips, or at least with as little movement of the lips, mouth, or cheeks, as is compatible with the pronunciation of certain words By practice many individuals have acquired considerable dexterity in this art, and when certain words can be distinctly pronounced in different tones, in the way described, the imagination of the hearers easily leads them to suppose that they come from a person in a box, or up the chimney, or from inanimate objects, especially if adventitious means be resorted to to aid the illusion as [illegible] in such exhibitions

VE'NUE [illegible], Lat vicinetum *neighbourhood*) [illegible] by the original institution of trial by jury, jurors were summoned from the immediate neighbourhood where a fact happened, to try it by their own knowledge Hence, long after the institution had been altered in character, jurors were still summoned in point of form from the parish, village, &c, until by 4 Ann c 16 they became summonable, as they still are, from the body of the county The venue, therefore, was the neighbourhood named in the venire facias, or writ summoning the ju[illegible] the old practice, in criminal [illegible] hed by 5 G 4 c 50 (*See* JURY) The venue, therefore, is the county in which the action is to be tried which is specified in all material allegations in the pleadings, and it need not be the county in which the fact took place except in [illegible] *See* PLEADING

VENUS (Ven'us) is one of the principal planets, the second in the order of distance from the sun, and the most brilliant of all the planetary bodies From her alternate appearance in the morning and evening, Venus was called by the Greeks *Hesperus* and *Phosphorus*, the *evening* and *morning star*, sometimes also she is called the shepherd's star

The distance of Venus from the sun is 7233316, that of the earth being unity, whence her true distance is about 68 millions of miles Her sidereal revolution is performed in 224 7007869 mean solar days, and her synodical period, or the interval between her successive conjunctions with the sun, is 583 920 mean solar days The inclination of the orbit to the ecliptic was 3° 23′ 28 6″ at the commencement of the present century and is subject to a decrease of about 0 0455″ in a year The eccentricity of the orbit is 00686074, half the major axis being unity, and the longitude of the ascending node at the commencement of the present century was 74° 54′ 12 9″, having a motion westward when referred to the fixed stars, amounting to 17 6″ in a year

The mean apparent diameter of Venus, or her apparent diameter when at her mean distance is 16′ 9, but it is subject to great variations, being only 9″ 6 at the time of her superior conjunction, and at the time of the inferior conjunction sometimes so much as 61″ 2 Comparing this with her mean distance, her true diameter is 975, that of the earth being unity, and is consequently about 7700 English miles Her volume is therefore 927 of that of the earth Her mass, as compared with that of the sun, is 0000024638

Venus being an inferior planet, is never seen in opposition to the sun Her greatest elongation, or angular distance from the sun, varies from 45° to 47° 12′ According to her various positions relatively to the sun and earth, she changes her phases like the moon appearing when she first emerges from the sun's rays and becomes visible in the morning as a fine luminous crescent, the horns of which are turned away from the sun As the planet recedes from the sun, the breadth of the crescent increases at the greatest elongation it becomes a semicircle after this the breadth of the disk goes on increasing till the planet arrives at its superior conjunction where it appears as a full orb, the illuminated side being turned towards the earth These appearances, on account of the irradiation, are not appreciable by the naked eye, but they become visible in an ordinary telescope

Venus is supposed to revolve about an axis, and the time of rotation is stated, from observations made by Schroeter to be 23 h 21 m 7 2 sec, the axis of rotation being inclined to the ecliptic in an angle of about 75° There is however considerable doubt as to the accuracy of these conclusions On this subject Sir John Herschel remarks that Venus "although it attains occasionally the considerable apparent diameter of 61″, which is larger than that of any other planet, is yet the most difficult of them all to define with telescopes The intense lustre of its illuminated part dazzles the sight, and exaggerates every imperfection of the telescope, yet we see clearly that its surface is not mottled over with permanent spots like the moon we perceive in it neither mountains nor shadows but a uniform brightness, in which we may, indeed fancy obscurer portions, but can seldom or never rest fully satisfied of the fact It is from some observations of this kind that both Venus and Mercury have been concluded to revolve on their axes in about the same time as the earth The most natural conclusion, from the very [illegible] appearance and want of permanence in the spots, is [illegible], as in the moon the real surface of these planets, but only their atmospheres, much loaded with clouds and which may [illegible] the glare of their sunshine (*Outlines of Astronomy* p 311)

Venus is sometimes seen to pass over the disc of the sun, presenting a phenomenon analogous to that of a solar eclipse by the moon This phenomenon, which is called a *transit of Venus*, can only happen when the planet is at its inferior conjunction, and, at the same time, very near one of its nodes It is therefore a rare occurrence but a very important one, inasmuch as it affords the best means astronomers possess of determining the sun's parallax, and consequently the dimensions of the planetary system (*See* PLANET) Delambre

has given a list of all the transits occurring in a period of 4000 years The following contains all that have happened since 1631, and that will happen before the end of the 21st century :—

1631, Dec. 6	1874, Dec 8.
1639, Dec 4	1882, Dec 6.
1761, June 5	2004, June 7
1769, June 3	2012, June 5

(See *Baily's Astronomical Tables and Formulæ*)

The first transit ever seen was that of 1639 which was observed in this country by Horrox and Crabtree The importance of the phenomenon for determining the sun's parallax was first pointed out by James Gregory in his *Optica Promota*, 1663

VE'NUS In Zoology, a name applied by Linnæus to a genus of *Vermes Testacea* including those which have a bivalve shell with the frontal margin flattened with incumbent lips; the hinge with three teeth, all of them approximate, and the lateral ones divergent at the top

The Bivalves thus characterized enter into the Cardiacean family of the Testaceous Acephala of Cuvier, and are subdivided into the genera *Venus* proper, Lam , *Astarte*, Sowerby; *Cytherea*, Lam ; *Capsa*, Brug , *Petricola*, Lam

VENUS The Latin name of the Grecian Aphrodite (Ἀφροδίτη) This goddess is generally supposed to have been of eastern origin and to have been the same as the Phœnician Astarte By [illegible] the daughter of Jupiter and [illegible] accounts, arose from the [illegible] shipped as the goddess of beauty and love, her principal seats being the islands of Cyprus and Cythera The Romans regarded her as the progenitress of their nation, which was fabled to have sprung from Æneas the offspring of her union with the Trojan Anchises She was married to Vulcan, but was not remarkable for fidelity to her husband. Her amour with Adonis is particularly celebrated in ancient poetry (See, as to her worship, *Mém de l'Ac des Inscr* vol xvi , *Bryant's Mythology*, i 392 iii 157)

VENUS URANIA, or HEAVENLY, was distinguished from Pandemos, or Popular, rather by philosophers than the multitude The most celebrated ancient statues of Venus now existing are the Anadyomene and Medicean, both at Florence

VERA'TRIA An alkaline principle found in the root of the *Veratrum album*, or white hellebore, in the seeds of the *Veratrum sabadilla*, and in the bulb and seed of the [illegible] ow saffron It is acrid and [illegible] in water readily soluble in alcohol, and less so in ether It excites violent sneezing, and is probably the principle upon which the efficacy of colchicum in the cure of gout depends

VERB (Lat verbum, *a word*) In Grammar, a part of speech which consists of an affirmation and a property or attribute affirmed Verbs are distinguished into transitive, intransitive, and passive Besides these there is the verb substantive, which expresses simple affirmation abstracted from any particular property affirmed *See* GRAMMAR

VERBAL In Grammar, a noun derived from a verb In English verbals are commonly known by the termin- [illegible] are derived from the Latin

VERD ANTIQUE A beautiful mottled green marble [illegible] of marble and serpentine

VERDICT [illegible], the answer of a jury given to the court concerning the matter of fact in any cause committed to their trial A special verdict is a verdict not [illegible] behalf of either plaintiff or defendant [illegible] referring the law arising up [illegible] court *See* JURY

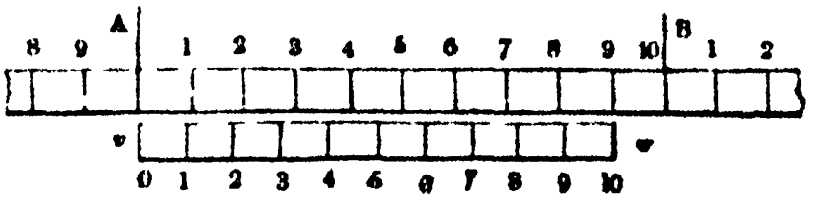
VERDIGRIS [illegible] prepared in the south of France by covering copper plates with the refuse of the grape after the expression of the juice for wine It appears to be a mixture of the sub acetates of copper, and is now largely manufactured in this country by alternating copper plates and pieces of coarse woollen cloth previously soaked in crude pyroligneous acid

VERDITER A blue pigment [illegible] decomposing solution of nitrate of copper by the addition of chalk It is a hydrated [illegible]

VERDURER or VERDEROR An officer [illegible] royal forests, whose peculiar charge was the care [illegible] vert [illegible] in forest language the trees and underwood of the forest, all vegetation sufficient to cover a deer being included in the term, which was divided, in old language, into *over vert* and *nether vert* The verderor is sworn to keep the assizes of the forest, to view, receive and enroll attachments and presentments &c

VERGE OF THE COURT The compass of the king's court, within which is bounded the jurisdiction of the lord steward of the household It is said to be so called from the verge, or rod of office, borne by the marshal *See* STEWARD

VE'RJUICE The expressed juice of unripe or green grapes The term is applied also to a kind of vinegar made of the juice of unripe apples

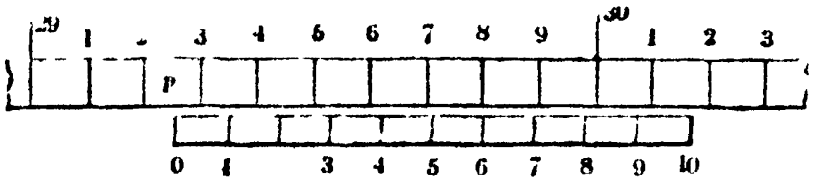


VERMIFUGES (Lat vermis *a worm*, and fugo, *I put to flight*) Medicines used in effecting the expulsion of intestinal worms these are sometimes merely purgatives, such as calomel, scammony, gamboge, jalap, &c Some substances are supposed to have a specific action on the worm, such as male fern root; others act as mechanical irritants, such as the spicules of cowhage The most effective vermifuge is a large dose of oil of turpentine (*See* ANTHELMINTICS)

VERMILION Red sulphuret of mercury *See* CINNABAR and MERCURY

VE'RMIN Quadrupeds, reptiles, worms, or insects, which are injurious to the cultivator The number of these is great in [illegible] and calls into continual requisition the skill [illegible] of man to subdue them In British agriculture the sheep and poultry are attacked by foxes, weasels, and other quadrupeds, the corn and other seeds and roots by rats and mice, and all plants, as well as seeds, by the weevil, the gnat, the [illegible] cockchafer, the wire- [illegible] In gardening almost all plants are liable to the attacks of insects, seeds to those of rats and mice, and fruits to be eaten by birds In general, the most efficient mode to subdue insects which attack plants is to invigorate their growth as much as possible by culture, because it is found that insects thrive best on plants which are in a state of incipient disease, and the next best mode to this is the encouragement of such natural enemies to vermin as are not themselves more injurious than the creatures they prey upon Thus birds of every kind from the crow to the sparrow, are the natural enemies of insects, the crows seeking out and devouring the larva of the cockchafer, the beetle and the wireworm, found at the roots of grasses, [illegible] slugs, and [illegible] snakes, and the singing birds and sparrow destroying not only the larva of insects, but their eggs, and the insect in a winged state while flying through the atmosphere Hedgehogs and weasels while kept in outhouses and gardens prey upon rats, mice frogs, lizards worms, snails slugs and beetles There are some insects such as the turnip fly, the wheat or Hessian-fly, and the aphides or green fly, which propagate themselves very extensively in consequence of the extensive propagation of the plants on which they feed, and these are the insects which are most injurious to the cultivator, because he cannot multiply their natural enemies in the same proportion as he multiplies the insects by cultivating on a large scale the plants on which they grow The aphides he may destroy by the application of tobacco-water and other means, but he has little or no control over the turnip fly or the wheat-fly Happily for man the seasons are not always alike propitious to these and other enemies to vegetation, and thus chance providence or the nature of things enables him to maintain his struggle against his natural enemies

VERNATION The manner in which the nascent leaves are arranged with a leaf-bud



VERNIER A contrivance for measuring intervals between the divisions of graduated scales or circular instruments The name is given from that of the inventor, Peter Vernier, who published an account of the contrivance in a work printed at Brussels in 1631 It consists of a small moveable scale, sliding along the graduated scale or arc, the divisions on the one scale being to those on the other in the proportion of two numbers which differ from each other by unity The theory of the instrument, and the manner in which it is used, may be explained as follows — Let A B = a be a distance

on the scale containing n of its divisions Let $v\,v$ be another scale equal in length to $n-1$ of the divisions on A B, and let $v\,v$ be divided into n equal parts Since the distance A B = a, and contains n equal parts, each division on the scale = $\frac{a}{n}$ Hence the length of the vernier $v\,v = a - \frac{a}{n}$; and, as it is divided into n equal parts, each division on the vernier = $\frac{1}{n}\left(a - \frac{a}{n}\right) = \frac{a}{n} - \frac{a}{n^2}$; and therefore the difference between a division on the scale and one on the vernier = $\frac{a}{n^2}$ Suppose the zero of the vernier to coincide with the division marked A

on the scale; then the first division on the vernier will not coincide with the first after A on the scale, but fall behind it by a quantity equal to their difference, or equal to $\frac{a}{n^2}$ In like manner, the next line on the vernier will fall behind the next on the scale by a quantity equal to twice the difference of the divisions, or equal to $\frac{2a}{n^2}$ The third on the vernier will fall behind the third on the scale by $\frac{3a}{n^2}$, and so on to the nth division on the vernier, which will fall behind the nth on the scale by $\frac{na}{n^2} = \frac{a}{n}$, that is by a whole division; and the vernier coincides with the nth on the scale (Conceive the scale to be a scale of inches, and suppose it divided into tenths, then $a = 1$ inch, $n = 10$, $\frac{a}{n} = \frac{1}{10}$th of an inch, and $\frac{a}{n^2}$ (the difference between a division on the scale and on the vernier) $= \frac{1}{100}$th of an inch, so that the $\frac{1}{100}$th of an inch is exhibited on the scale, though its divisions are only to tenths

The vernier is connected with the scale in such a way that it can be moved along it by means of a rack and pinion, or a tangent screw, or some similar contrivance, and its zero be brought to coincide with any point on the scale If, when the vernier is so placed, its zero coincides exactly with a division on the scale, the measure is read off at once, but if (as must generally happen) the zero falls between two of the divisions on the scale, then some one of the lines on the vernier will coincide, or very nearly coincide with one of the divisions on the scale, and the distance of the zero beyond the last division on the scale behind it is expressed in hundredths by the number of the division on the vernier which is coincident with a division on the scale Suppose, for example, the position of the vernier with respect to the scale to be as represented in the annexed figure, where the zero of the vernier is brought

to coincide with a certain point p on the scale The point p is read on the scale 29 inches 2-10ths, and a fraction which is to be measured by the vernier Here the division 5 on the vernier coincides with that which is marked 7 on the scale, therefore the distance of the zero of the vernier from the last division (2) behind it on the scale is 5-100ths of an inch, for as 5 on the vernier coincides with 7 on the scale, the distance of 4 from 6 is 1 100th, of 3 from 5, 2-100ths, of 2 from 4 3-100ths, of 1 from 3, 4-100ths, and of 0 from 2 5-100ths In like manner, if the vernier were placed so that its 10 or 8 coincided with 30 inches on the scale, the reading of the zero point would be 29 inches 2-10ths and 8-100ths If, when the zero is brought to coincide with p, none of the divisons on the vernier coincide exactly with a division on the scale —for example if the 5 on the vernier should be a little past the 7 on the scale and the 6 not up to the 8,— the reading would be between 5 100ths and 6 100ths, but its precise amount could only be stated by estimation If the line 5 appeared nearer 7 than 6 to 8, the distance measured would be greater than 5-100ths, or 10-200ths but less than 11-200ths, and if the line 6 appeared nearer to 8 than 5 to 7, the distance would be greater than 11-200ths but less than 12-200ths or 6-100ths Thus in any case the limits of the uncertainty must be confined within a distance = 1-200th of an inch In order that the coincidences may be observed with greater certainty the divisions are cut with a bevel

The vernier is usually applicable to circular scales, such as astronomical circles; it is then circular also, and must move concentric with the limb of the circle Suppose the limb divided into intervals of 10′, and let $n = 10$ We have then 10 divisions on the limb $= 100' = a$, and the length of the vernier $\left(= a - \frac{a}{n}\right) = 100' - 10' = 90'$, which, divided into 10 equal parts, gives 9′ for the length of a division on the vernier, and consequently the difference of the length of a division on the scale and on the vernier = 1′ The arc, therefore, can be read to minutes But the reading may be carried to much more minute quantities by increasing the length and the number of divisions on the vernier Instead of embracing 9 of 10′ on the scale, let the vernier embrace 59 intervals, and be divided into 60 equal parts. We have then $a = 10' \times 60 = 600'$, $n = 60$, $n^2 = 3600$; therefore, $\frac{a}{n^2} = \frac{600'}{3600} = \frac{1'}{6} = 10''$, that is to say, the arc may be read to 10″

In barometers, where a considerable degree of accuracy is required the inch is divided into 20 equal parts, the vernier is made equal in length to 24 of these, and divided into 25 equal parts In this case we have $a = \frac{25}{20} = 1\cdot25$ inch, $n = 25$, therefore $\frac{a}{n^2} = \frac{1\cdot25}{625} = 0\cdot002$, so that the vernier gives the reading to 1-500th of an inch

Instead of making the vernier equal to $n - 1$ divisions of the scale, it is sometimes made equal to $n + 1$ divisions, and the object will still be accomplished in precisely the same manner For in this case the length of a division on the scale being as before, $\frac{a}{n}$, and that of a division on the vernier $\frac{1}{n}\left(a + \frac{a}{n}\right) = \frac{a}{n} + \frac{a}{n^2}$, the difference is still $\frac{a}{n^2}$ The principle is the same in both cases.

The vernier is often called a *nonius*, but improperly, the Nonius or Nunnez being on a different principle *See* NONIUS

VERRUCOSE (Lat verruca, *a wart*) In Zoology, when a surface presents several wart-like prominences

VERSED SINE OF AN ARC, in Trigonometry, is the difference between the radius and the cosine

VERT (Old Fr vert, *green*) In Heraldry, one of the colours or tinctures employed in blazonry It is equivalent to emerald among precious stones, to Venus among planets In engraving it is represented by diagonal lines from the dexter to the sinister sides of the escutcheon

VERTEBRÆ The bones of the spine They are divided into *true* and *false*, the former constituting the upper, and the latter the lower portion of the spinal column The true vertebræ are further divided into those of the neck, back, and loins, or the *cervical*, *dorsal*, and *lumbar* vertebræ There are seven cervical vertebræ, the first of which is called the *atlas*, the second the *axis*, and has the process forming a kind of pivot upon which the head rotates The dorsal vertebræ are twelve in number, and the lumbar vertebræ five In the neck the spine projects forwards, it is then curved backwards in the thorax, and in the loins again projects forwards There is an elastic substance between the vertebræ, admitting of a certain degree of motion, small between the individual bones, but considerable as affects the whole column The vertebræ, and their projections or processes, afford attachments for a number of muscles and ligaments, and the spinal marrow is lodged in the bony canal which their several perforations form

VERTEBRATA, *Vertebrata* (Lat vertebra *a bone of the spine*) The name of a primary division of the animal kingdom, including those which have a cerebro-spinal nervous axis, protected by a bony cylinder composed of a succession of vertebræ, which are expanded into a cranium where they inclose the enlarged anterior or upper portion of the nervous axis, called the brain *See* ZOOLOGY

VERTEX (Lat *the top*), in Astronomy, is the point of the heavens directly overhead more frequently called the zenith In Geometry, of an angle or a cone is the angular point or that in which the sides of the angle or of the cone intersect The vertex of a curve is the point in which the diameter meets the curve

VERTICAL Relating to vertex *Vertical angles*, in Geometry, are the opposite angles formed by two straight lines which intersect each other Euclid demonstrates that vertical or opposite angles are equal

Vertical Circle, in Astronomy, a great circle of the sphere passing through the zenith and nadir The meridian, and all azimuth circles, are vertical circles The *prime vertical* is that particular vertical or azimuthal circle which is perpendicular to the meridian, or which passes through the eastern and western points of the horizon

Vertical Line in Drawing is a line perpendicular to the horizon, in the Conic Sections it signifies any line on a vertical plane which passes through the vertex of the cone.

Vertical Plane, in Conics, denotes a plane passing through the vertex, and parallel to the plane of the section

VERTICE'LLUS, is a ring for organs of any kind placed round a stem upon the same plane It the arrangement is not precisely so, and cannot be described by a line drawn horizontally round a stem but consists of parts either above the line or below it the verticillus is said to be broken It is in English called a *whorl*

VERTI'GO (Lat verto, *I turn*) Giddiness This affection is a common symptom of fulness of the vessels of the head, and of nervous and general debility. In some it is produced by an overloaded stomach, and in others by emptiness of that organ It is frequently symptomatic of fevers, inflammations, and other disorders, and requires peculiar treatment accordingly

VERTIGO In Zoology a genus of marsh or land snails,

so named from the abrupt twist of the volutions of the shell Several species of this genus are British, as *Vertigo secale turtm* &c

VERTUMNUS An Italian deity of rather obscure character Some make him preside over merchandise, others over spring or the seasons in general

VESA'NIÆ (Lat vesanus, *insane*) A class of diseases in which the judgment is impaired without stupor or [illegible] forms of insanity

VESICANTS (Lat vesica, *a bladder*) Substances which [illegible]

VESICLE [illegible] or bladder-like tumour, formed by an elevation of the cuticle, and containing a serous fluid

VESICULO'SANS, *Vesiculosa* The name of a tribe of Tanystome Dipterous insects comprehending those which have the abdomen [illegible] form of a bladder

VESPER, or HESPERUS The evening star A name given to the planet Venus when it is to the east of the sun and consequently appears after sunset

VESPERTILIONIDÆ (Lat vespertilio, *a bat*) The name of a family of Cheiropterous Mammals of which the genus *Vespertilio* is the type It includes the insectivorous and bloodsucking species of the order

VESPI'DÆ (Lat vespa, *a wasp*) A family of aculeated hymenopterous insects characterized by their geniculate antennæ, composed in the males of thirteen joints, and sometimes, in this sex, hooked at the extremity Mandibles strong and dentated elypeus large, ligula [illegible] bifid The sting of the females and neuters long powerful and highly venomous The larvæ of the wasp tribe are vermiform and without feet those of the solitary species are inclosed separately in a cell in which the mother deposits with singular apparent foresight at the same time with the egg the bodies of insects killed for the purpose, and upon which the larva feeds The true wasps form large societies, composed of males females and neuters A colony is commenced by a solitary female, which lays eggs that produce neuters or labourers These proceed to enlarge the nest by detaching particles of old wood or bark mastering and reducing them into a pulpaceous mass resembling that of pasteboard and constructing of this material a conical or subspherical comb, usually suspended by a stalk and having on the under side ranges of vertical hexagonal cells These are appropriated exclusively to the use of the larvæ, a cell to each, which the neuters enlarge in proportion to the growth of the occupant The nest is generally surrounded by an envelope pierced with a common central opening The larvæ are nourished with the juices or pulp of fruit provided for them by the neuters, they are shut up, and spin for themselves a cocoon, when about to become nymphs

VESTA. One of the ultra-zodiacal planets which circulate between the orbits of Mars and Jupiter Vesta was discovered by Dr Olbers of Bremen, on the 29th of March, 1807 Its mean distance from the sun is 2 36108, the mean distance of the sun from the earth being unity, and its sidereal revolution is performed in 1325 7147 mean solar days The orbit is inclined to the ecliptic in an angle of 7° 8' 2" and the eccentricity of its orbit is 0 0907 Vesta is supposed to be the smallest of all the celestial bodies with which we are acquainted, its volume being estimated to be only about a fifteenth thousandth part of that of the earth and its surface not to exceed that of the kingdom of Spain On account of its smallness it is however, difficult to determine its apparent diameter with any degree of certainty It is distinguished from the other small planets by the vivacity of its light

VESTA, the Hestia (Ἑστία) of the Greeks in Classical Mythology was a goddess about whom hangs considerable obscurity She is called the daughter of Saturn and Rhea, and was worshipped as the patroness of the domestic and public hearth At Rome she was attended by six virgins, called vestals, whose duty it was to preserve the sacred fire in her temple unextinguished, as the safety of the city was held to be connected with its preservation (See *Mém de l'Ac des Inscr* vol xxvii xxix) According to Ovid (*Fast* vi),

> Vesta eadem est quæ Terra subest vigil ignis utrique
> Stat vi Terra sua vi stando Vesta vocatur

(See Bryant, *Anc Myth* i 77 281) The beautiful building popularly called the Temple of Vesta, at Rome, is not known to have been such

VESTAL VIRGINS This name was given to the six virgin priestesses of the goddess Vesta, who had charge of her temple at Rome, and the superintendence of the sacred fire, which was never to be suffered to go out They had several privileges granted them, but the loss of their virginity was punished by burying the offender alive. Their institution is ascribed to Numa Their abolition was one of the last victories of Christianity (See Beugnot, *Destruction du Paganisme en Occident* i 164)

VESTIBULE (Lat vestibulum) In Architecture, an area before the entrance of the Roman houses, said by some to have been so called because an altar to Vesta was placed therein It was surrounded by a wall, and was the place in which the master of the house received his clients It is used in modern architecture to signify an ante-hall lobby or porch

VESTIBULE OF THE EAR A small bony cavity of the internal ear, the opening of which into the cavity of the tympanum is closed by the small bone called the *stapes* It is also connected with the cochlea and semicircular canals

VE'STMENTS or VESTURES, ECCLESIASTICAL Articles of dress or ornament worn by ministers in the celebration of divine service The following were and are the principal known to the Western church, and many of them to the Eastern also —1 The vestment appropriately called a chasuble called in the Western churches *casula*, *planeta*, *pænula*, *amphibolum* &c and in the Eastern φαινόλιον, *phenolium*, was a garment extending from the neck nearly to the feet closed all the way round, with only one aperture, through which the head passed When the offices were performed, it was lifted up at the sides, while the front and back remained pendent The Greeks retain this primitive form, the Latins have divided it at the sides It admitted of various materials and colours It is of very great antiquity, mentioned by Gregory of Tours and appearing in a mosaic of A D 1540 2 The cope (cappa pallium pluviale, &c) similar in form to the vestment, but longer, and with a short division in the lower part of the front, and a cowl, which in modern times has given place to a sort of triangular ornament of the same shape hanging over the shoulders It is also of the highest antiquity in the Western church 3 The tunicle, or dalmatica (in the East stichárion used by deacons) received the addition of wide sleeves as early as the 4th century 4 The alb (camisia alba linea in the East podéris from reaching the feet) a garment made of white linen 5 The scarf or stole is worn by bishops with the rochet and generally by dignitaries and prebendaries in cathedrals and by chaplains Its origin is obscure It is called oradium by the Greeks The pall (pallium, which see) generally worn by Western metropolitans appears to have been a kind of stole called ὠμοφόριον in the East 6 The rochet a linen garment worn by bishops, much resembling the surplice but in modern times and in our church, with very wide sleeves 7 The chimere zimarra, cimar (probably from χιμαιρα, *kid*) a sort of cape worn under the rochet by bishops in modern England of black silk 8 The pastoral staff (baculus pastoralis) was spoken of in the 4th council of Toledo in the 7th century as used by bishops The form of the shepherd's crook is rather later 9 The surplice (see that article) which only differs from the alb in having wider sleeves 10 The hood was generally fastened to the back of the cape, called an amice, [illegible] linutium when lined with fur or wool The square cap is thought to have been originally part of the amice

Most of these vestments are noticed in the Act of Uniformity passed in the 2d year of Ed VI which regulates the habits of the English church But many of the directions are alternative, *e g* that a vestment or a cope, an alb or a surplice may be used in particular instances (See *Palmer's Origines Liturgicæ* vol ii Appendix, from which this article is chiefly taken, and *Archæologia*, vol xi)

The extreme hostility conceived by the Calvinist and Zuinglian reformers and the Puritan party in England, to vestments and especially the surplice is well known The argument against them, as stated by Beza (*Tract Theol* iii 29) refers chiefly to the danger of wounding weak consciences by retaining apparent relics of popery, &c The defence by Hooker is in book v ch 29

VESTRY (Lat vestiarium) The robing room attached to a church, and from hence applied to designate a meeting of parishioners for parochial purposes, the bishop and priests having in former times used these rooms when they met to consult together on similar affairs

A *general vestry* is one to which every parishioner or outdweller assessed to or paying the church rates, or scot and lot, is admissible of common right The minister whether rector, vicar, or perpetual curate is ex officio chairman of the meeting The powers of the vestry extend to investigate and restrain the expenditure of parish funds, to determine on repairs, enlargements, ornaments, &c of the church; and to elect certain parish officers

Select vestries existed by custom in many large and populous parishes, especially in and round the metropolis Originally these consisted of a number of householders annually elected by the rate-payers But by usage of long standing, these bodies were in many instances self-elected, *i e* the members of the vestry filled up by their own choice any vacancy occasioned by death or resignation

Power has been given to parishes in which select vestries did not exist by custom to appoint such vestries

by the stat 59 G 3 c 12 , and in many parishes the election of vestrymen, &c has been regulated by local acts

But in the first and second years of the last reign, an act was passed (1 & 2 W 4 c 60) "for the better regulation of vestries, and for the appointment of auditors of accounts, in certain parishes in England and Wales" Every parish not already under a local act is empowered to decide, by a majority of the votes of its rate payers, whether it will adopt the provisions of this statute If adopted, a certain number of vestrymen, limited by the act according to the amount of the population, and five auditors, are to be annually elected by the rate-payers , the rector, district rectors, vicar, perpetual curate, churchwardens being always vestrymen ex officio Vestrymen duly elected under this act must, in in any parish out of London and the metropolitan police district, be rated to the poor on a rental of 10*l* a year within that district or city , if the resident householders amount to more than 3000, on a rental of not less than 40*l* per annum This act does not extend to parishes in which there are not more than 800 rate payers, except in cities or towns

VESUVIAN The volcanic garnet The idocrase of Haüy

VETCH (Lat vicia) The name given to leguminous plants with herbaceous stems, often supporting themselves on surrounding objects by means of the tendrils with which their leaves are terminated The common vetch or tare is extensively cultivated in Europe and is considered a very valuable agricultural plant, being an excellent fodder for milch cows and working stock, &c

VETERAN (Lat vetus, *old*) Among the Romans, a soldier who had passed the legal age of military service, which extended from seventeen to forty-six, was termed veteranus , or, in the later times of the republic, one who had served a requisite number of campaigns, generally twenty-five

VETO (Lat *I forbid*) In Politics the power enjoyed by a branch of the legislature, which cannot of itself originate or modify a law to reject the propositions of the other branch or branches In the Polish diet every noble who was an independent member could prevent any resolution from passing by his simple dissent (expressed in the words ' Nie pozwalam ' *I do not permit*) The privilege of thus arresting the deliberations of the diet was termed the "liberum veto,' and proved the fertile source of the disorders and anarchy of that country In most constitutional monarchies the king has an absolute veto (as in France and England), in some it is only suspensive Thus in Norway, if three successive storthings (assemblies) repeat the same resolution, it becomes law against the will of the king The president of the United States may return a bill, with his reasons for dissenting from it to the house in which it originated but if both houses pass it afterwards by a majority of two thirds in each, it is not in his power again to reject it

VETO An act passed by the General Assembly of the Church of Scotland known by the name of the Veto Act Lay patronage, or the presentation by a lay-patron of a minister to a living in the church has never been cordially recognised on the part of the people of Scotland On the final establishment of Presbytery as the national church, in 1690 patronage was vested in the elders and heritors (landowners) of a parish In 1711 (10 Anne, c 12 s 4) that law was annulled and patronage was transferred as a civil right to individuals as an accessory of land or as a separate estate , and those patronages which had of old belonged to the pope or to monasteries, or to archbishops bishops and chapters were vested in the crown The act of Queen Anne was never universally acceptable in Scotland Two dissenting denominations (the United Associate Synod and the Relief) owed their origin to the indiscreet exercise of lay-patronage and though patrons were generally disposed, particularly within the last twenty years, to show due deference to the feelings of the people, yet hostility to this mode of nominating clergymen having gained greater force, the general assembly, in 1834, passed the Veto Act, whereby, if a majority of the male heads of families, in full communion with the church appear before the presbytery and dissent, or lodge dissents at the meeting for moderating in a call," the presentee was to be rejected No specific objections were required to be made by the act the dissentients being only required to declare if asked that they were actuated by no factious or malicious motive but solely by a conscientious regard for the spiritual interests of themselves and the congregation and if such declaration was made, their dissent was sustained, if not, it was rejected Those entitled to dissent are ascertained from a roll annually made up The Veto Act was first passed as an interim act, but, being referred to presbyteries, and having received the sanction of a majority of presbyteries, it was enacted [illegible] of the church by the General Assembly (Cook's *Practice of the Judicatories of the Church*, p 83)

Against the provisions of this act, the minority of the assembly entered, and had recorded, both in 1834 and 1835, their solemn protest, on the ground that these provisions were not merely wrong in themselves, but also *ultra vires* on the part of the assembly, in violation of the statutes conferring on the church the privileges of an establishment and calculated, therefore, on the first occasion on which a patron or presentee should determine to enforce his rights, to lead to a collision between the ecclesiastical and civil courts Nor was this apprehension without foundation Immediately after the rising of the assembly of 1835, the Earl of Kinnoull, as patron of the church and parish of Auchterarder, and the Rev Robert Young, whom his lordship had presented to that living, and whom the presbytery of Auchterarder had rejected in terms of the Veto Act, raised an action in the court of session to have it found and declared that the said presbytery had acted illegally, and to the hurt and prejudice of the pursuers in having rejected Mr Young, there being no other ground of such rejection as admitted in the record of presbytery than that a majority of the male heads of families communicants, in the parish of Auchterarder, had dissented, without any reason assigned, from his admission as minister In giving judgment in this action, the court of session (8th March, 1838) repelled the objections started against the jurisdiction of the civil court in the matter and to the competency of the action, and found that the presbytery had acted illegally and to the hurt and prejudice of the pursuers, and in violation of their duty and in particular contrary to the provisions of the statute of 10 Anne

This decision of the court of session was appealed from by the defenders to the House of Lords, and this supreme court affirmed the judgment in question (3d May, 1839) without the alteration of a single word Subsequently to this affirmation, when the case had been remitted to the court of session to apply the sentence, the latter tribunal pronounced in regard to it a further judgment, to the effect that the presbytery and the individual members thereof are bound and astricted to make trial of the qualifications of the pursuer the said Rev Robert Young, as presentee to the church and parish of Auchterarder, and if in their judgment, after trial and examination in common form he is found qualified, to receive and admit him minister of the said church and parish, according to law '

The dominant party of the church had, meanwhile, come to the resolution not to obey or recognise the judgment of the court of session though confirmed by the highest judicatory in the empire, to which themselves had made the appeal but to declare the ecclesiastical law as supreme Accordingly, the assembly of 1839 resolved by a majority of forty nine to adhere to the Veto Act notwithstanding the decision of the House of Lords They maintained that the ecclesiastical and civil courts were endowed with co ordinate powers, that their provinces were sufficiently distinct, each being supreme in its own department , and that the church courts were the sole and only judges of what was spiritual and what was civil In short they refused to induct Mr Young as minister of the church and parish of Auchterarder They regarded the parish as still vacant, and nominated a clergyman of their own sentiments to the parochial charge *quoad spiritualia*, leaving the temporalities untouched Thus the case still stands but Mr Young has raised an action of damages against the members of the presbytery of Auchterarder both as a body and as individuals for illegally and contumaciously depriving him of both his ecclesiastical and civil rights and privileges

But the case of the parish of Marnoch in the presbytery of Strathbogie, affords a still more striking illustration of the fruits of the collision that has taken place between the civil and ecclesiastical courts The Rev Mr Edwards having been legally presented to that parish, and having been rejected by means of the Veto act a majority of the members of the said presbytery (seven in number) were disposed, in consequence of the decision in the Auchterarder case and
been declared by the highest civil judi
as *ultra vires* of the church, to show due respect to the civil law, and to proceed with the settlement of Mr Edwards, as if such a statute as the Veto had never existed The majority, however, feeling the delicacy of the circumstances in which, both as clergymen and as loyal subjects bound to obey the civil law they were placed, did not proceed hastily to take steps towards the induction of Mr Edwards They remained inactive till a special decree, on the application of the presentee, had been obtained from the court of session, finding that they were bound to take him on trial, in common form, and that, if they found him qualified, to receive and admit him according to law On their adopting the preliminary steps for the purpose, the commission of the General Assembly, 1839, suspended the seven ministers from the function of their sacred office, both judicial and ministerial Against this proceeding the seven ministers applied to the court of session for protection, which

court granted an interdict prohibiting the sentence of suspension from being carried into execution and prohibiting any clergyman of the established church from occupying the pulpits of the deposed ministers, or performing any sacerdotal functions in their respective parishes This interdict was disregarded by the dominant party in the church, who treated the seven parishes as if their ministers had been finally suspended from their functions

Matters remained in this anomalous state till the meeting of the General Assembly of 1841, which court besides continuing the suspension, imperatively demanded of the suspended ministers that they should unconditionally acknowledge the supreme authority of the church in all things which it might define to be spiritual and in all such matters yield implicit obedience to the decrees of the ecclesiastical courts, notwithstanding any order or injunction to the contrary, of even the highest civil tribunal of the land This requisition, too, was made under the penalty that, if after a limited period had elapsed, it should not have been complied with, the parties refusing to comply should be served with a libel or indictment for contumacy The ministers of Strathbogie refused to submit to the conditions sought to be imposed on them though in regard to the settlement of Marnoch they did not take any further steps till the presentee had raised another action against them, both collectively and individually calling on them to receive and admit him as minister of that parish Mr Edwards was thus ordained minister of Marnoch on the 21st of January, 1841 Meanwhile the suspended ministers had been served with a libel for contumacy, and were in consequence deposed by the ensuing assembly (May, 1841) from the office of the ministry An interdict from the court of session was forthwith obtained setting aside the ecclesiastical sentence of deposition, and reinstating the seven deposed ministers in their temporal and spiritual privileges as parochial clergymen This interdict was, like the former and others to which in this article we cannot particularly allude*, disregarded by the dominant section of the church Not only have they treated the parishes as vacant and introduced preachers of their own party into them but have taken steps against such of the minority of the church as regard the deposed gentleman as still ministers of the establishment and as such have in consequence been prosecuted by the boy of officiating in their pulpits or assisting them in the ordinary occasions And such has been the forbearing conduct of the deposed ministers, that they have hitherto restrained from adopting means to have their brethren punished for violating these interdicts and for encroaching on their official rights and privileges

The same assembly which deposed the seven ministers of Strathbogie, deprived Mr Edwards whom they would not recognise as an ordinary clergyman of his licence as a probationer, and ordered the minority of the said presbytery (four in number) to proceed with the settlement of another minister in the parish of Marnoch as if it had been vacant This was accordingly done

A similar case afterwards occurred in the presbytery of Garioch, and under exactly similar circumstances The presentee (Mr Middleton) to the parish of Culsalmond having been served with a veto, was notwithstanding inducted by the majority of the presbytery and is now minister of that parish The ecclesiastical courts promptly interfered, interdicts however, against their authority were obtained and the case having been appealed to the House of Lords, a decision was given in favour of the presentee thus declaring that the General Assembly had no power to pass the VETO ACT, and that all proceedings under it were null and void This decision was not, however, submitted to by the majority of the Assembly by whom it was regarded as a usurpation upon their rights, and no legislative measure having been proposed calculated to allay the public irritation, or to mitigate the extreme exercise of the right of patronage, the leaders of the dominant party in the Assembly determined to secede from the Church accordingly on the first day (18 May) of the meeting of the General Assembly of 1843 the ministers and elders, members of that body, opposed to the right of patronage and in favour of the *veto*, gave in a Protest stating, among other things, that "The courts of the Church as now established, and members thereof, are liable to be coerced by the civil courts in the exercise of their spiritual functions, and in particular in their admission to the office of the holy ministry and the constitution of the pastoral relation, and that they are subject to be compelled to intrude ministers on reclaiming congregations in opposition to the fundamental principles of the church and their views of the Word of God, and to the liberties of Christ's people" And this protest having been read, the protesters withdrew to a separate place of meeting, and constituted themselves, and such as might afterwards adhere to them, into a body to be denominated the FREE CHURCH OF SCOTLAND The Protest was signed by 125 ministers and 77 elders. But within a few weeks no fewer than 470 clergymen seceded from the establishment, and joined the Free Church Of these, 274 were parish clergymen being nearly a third part of the total number of those belonging to the establishment The rest were *quoad sacra* ministers And whatever may be thought of its wisdom this proceeding sets in a striking light the sincerity and zeal by which the seceders were animated The voluntary abandonment by so many individuals of their homes and incomes, rather than hold them by compromising what they believed to be a fundamental principle, reflects the highest credit on the Scottish church and character For an account of the most recent events in reference to the consequences of the Veto, see FREE CHURCH, in Supplement

VEXILLA'RII Veteran troops in the Roman army who had served out their time, but, under the emperors, were retained in service, and fought distinct from the legions under a particular standard of their own (vexillum)

VEXI'LLUM, or STANDARD (Lat) In Botany, a term given to the upper petal of a Papilionaceous corolla, which is erect, and more expanded than the other four petals

VIADUCT *See* RAILROADS, BRIDGE

VIA'LACTEA In Astronomy, the *galaxy* or *milky way* *See* MILKY-WAY

VIA'LES In Roman Antiquities, a name given to those gods who had charge of the roads and highways (viæ) Jupiter and Mercury were among the number

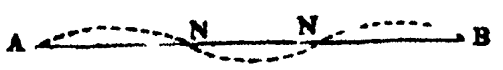
VIA'TICUM (Lat *a supply of something requisite for a journey*) In Ecclesiastical usage the sacrament given to a dying person In ancient times both the sacraments appear frequently to have been given to the dying, namely baptism to catechumeni (hence termed *τελεία*, or *viaticum* by some Greek fathers) or unbaptized converts the eucharist to those who were in communion with the church

VIA'TOR (Lat *traveller*) The title of inferior officers among the Romans sent by the senate or people to convey decrees, mandates, &c, and also by governors of provinces and other high functionaries

VIBRA'TION (Lat vibrare *to shake*) In Music, that regular reciprocal motion of a body, which, suspended or stretched between two fixed points swings or shakes to and fro The vibrations of chords are the source of the different tones they emit If two strings or chords of a musical instrument merely differ in length, their tones, that is, the number of vibrations they make in equal times, are in the inverse ratio of their lengths If they differ in their diameters only their sounds will be in the inverse ratio of their diameters To measure the tension of strings, let us conceive them stretched by weights attached to their ends, then their sounds will be in the direct ratio of the square roots of the weights stretching them, that is the pitch of a string stretched by a weight equal to 4 will be an octave above the pitch of a string stretched by a weight 1

VIBRATION In Mechanics, the reciprocating motion of a body as of a pendulum, a musical chord, or elastic plate The term *oscillation* is, however, more frequently used to denote a slow reciprocating motion, as that of the pendulum, which is produced by the action of gravity on the whole mass of the body, while *vibration* is generally confined to a motion with quick reciprocations as that of a sonorous body, and which proceeds from the reciprocal action of the molecules of the body on each other when their state of equilibrium has been disturbed

Vibrations of Musical Chords —The laws of the motion of vibrating chords were first investigated by Dr Brook Taylor, in his *Methodus Incrementorum*, published in 1715, and afterwards by John Bernoulli, Daniel Bernoulli, D Alembert, and Euler, but the complete solution of the problem, which is one of great difficulty, requiring the integration of an equation of partial differences of the second order, was reserved for the illustrious Lagrange Let a homogeneous metallic wire, or musical chord, stretched between two fixed points by a given force, be made to vibrate then as has been shown in the article SOUND, (p 1134) the number of vibrations in a second (the vibration being understood to signify the excursion of any point from its greatest distance from the position of rest on one side to its greatest distance on the other, and not the going and coming) is expressed by either of the two formulæ



$$n = \sqrt{\left(\frac{g\,t}{l\,w}\right)}, \text{ or } n = \frac{1}{r\,l}\sqrt{\left(\frac{t}{\pi\,\delta}\right)},$$

where n is the number of vibrations in a second, g = the accelerating force of gravity (= 386 09 inches in a second), t = the tension of the chord or weight by which it is stretched w = its weight l = its length in inches, r = its radius, δ = its specific density, and π = 3 14159,

* A presentee to the parish of Lethendy, presbytery of Dunkeld, having been rejected by the Veto Act, the majority of the members of that presbytery inducted another minister in defiance of an interdict of the court of sessions, for which contempt they were summoned before their lordships, the censure of the court was pronounced against them; and they were found liable in expenses.

The consequences which follow from these formulæ are important in the theo[illegible] much as they furnish the means of [illegible] sounds numerically

A curious circumstance, indicated by the calculus, and confirmed by experiment is, that a vibrating chord may spontaneously divide itself into any number of parts each of which, being an aliquot part of the whole will vibrate separately, in the same manner as if it were fixed at its two extremities and formed a separate chord, and which, consequently performs its vibrations as much more rapidly as it is a smaller aliquot part Thus the chord

A B may divide itself into 2, 3, 4, or any number of equal parts in the points N N' &c , each of which will vibrate 2, 3, 4, &c times more rapidly than the whole chord and in such a manner that the motion of any two contiguous parts will be in opposite directions at the same instant of time, while the points of division N, N' remain fixed But the most remarkable circumstance is, that these different states of vibration may coexist, superposed as it were one on another, so that a musical chord will emit not only the fundamental sound corresponding to the number of vibrations given by the formula, but also, at the same time, a series of other sounds corresponding to the number of vibrations of chords of $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, &c of the length

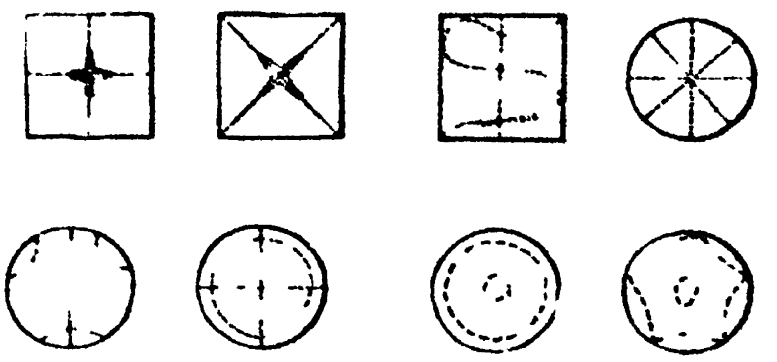
The preceding remarks apply only to transversal vibrations, or those in which the motion of any material point of the chord is at right angles to the straight line which joins its extremities, but the molecules of a stretched chord may also be put into a state of longitudinal vibration, in which case the motion is parallel to the axis of the chord, and is subject to a different law Poisson (*Mem de l'Acad de l Institut* tom viii) found, from the mathematical analysis of the problem, the following simple relation to exist between the transversal and longitudinal vibrations of the same chord —Let n be the number of transversal vibrations, n' the number of [illegible] (in the preceding [illegible] direction), l = the length of the chord, and k = its elongation, or the increase of its length under the weight by which it is stretched, then

$$n \sqrt{l} = n' \sqrt{k}$$

This equation is verified by experiment, and as k is always a very small fraction of the length l, it follows that the number of longitudinal vibrations n' is always very much greater than the number of transversal vibrations n, which explains the extreme acuteness of the sounds which are produced by the longitudinal vibrations The quantity k depends upon the elasticity of the chord and is therefore different in respect of chords of different substances

Vibrations of Elastic Rods —The laws of the vibrations of elastic rods are different from those of the vibrations of chords, for in the case of the latter the tension acts only in the direction of the length of the chord whereas in the case of elastic rods and plates, and rigid elastic [illegible] specific gravity of the rod, is expressed, as in the case of a vibrating chord, by a very simple formula Let

n = the number of vibrations in a second,
l = the length of a vibratory rod or plate,
h = its thickness,
e = the elasticity of the matter of the rod,
d = its specific density,



then the following equation is deduced from the principles of dynamics,

$$n = \frac{a^2 h}{l^2} \sqrt{\left(\frac{g\,e}{d}\right)},$$

in which a denotes a constant number depending on the mode and initial circumstances of vibration (*i e* the mode in which the rod is supported whether fixed at one end or at both ends, or in the middle, &c) This formula will apply, in general, to any elastic rods or plates of the same form, and of which the mode of vibration is similar It shows that in rods of the same matter the number of vibrations is directly as the thickness, and inversely as the square of the length of the vibrating part If the lengths of two rods are equal, the number of vibrations is proportional to the thickness, a result which might be anticipated [illegible] since the thicker the rod the greater will be the force or spring with which it tends to redress itself when drawn aside from the position of rest, and therefore the quicker the vibration When the figures of the rods are similar, the numbers h and l are proportional, and consequently the number of vibrations is inversely as the homologous dimensions, or as the cube root of the weight [illegible] which was first given by Riccati in [illegible] *Italian Society*, has also been verified by experiment [illegible] like [illegible] solves spontaneously into several parts, which vibrate in unison, and are separated by *nodes*, or parts which remain at rest The extreme parts are shorter than the others, which are all of equal length but [illegible] of all the parts are synchronous This sonorous [illegible] may be induced in a slip or tube of glass by holding between the fingers in the middle, and rubbing it longitudinally with a piece of moist cloth when it will emit a very acute sound Poisson found from theory the ratio of the number of transversal vibrations (n) to the number of longitudinal vibrations (n') of a cylindrical rod to be as follows $\frac{n}{n'} = 3\,5608\,\frac{r}{l}$, r being the radius, and l the length of the rod. This formula has been verified by Savart from direct experiments (*Annales de Physique et de Chimie*, tome xxxvi)

Vibrations of Elastic Plates —All elastic solid bodies, when put into a state of vibration, may be conceived, in reference to the internal motions of their molecules, as spontaneously separating themselves into parts, each of which vibrates independently of the others, and in such a manner that the molecules of one part are at every instant moving in a direction opposite to that of the molecules of the adjacent part. It follows that the points of separation between two parts participate neither in the motion of the one nor of the other, and consequently remain at rest In the case of thin elastic plates, the continuity of these points forms lines of repose, or *nodal lines* the forms and positions of which are detected by placing the vibrating plate in a horizontal position, and strewing a small quantity of fine sand over its upper surface This ingenious mode of determining the nodal lines was pointed out by Galileo in his *Dialogues*, and was practised by Chladni (*Traité d'Acoustique*), and more recently by Savart in his numerous experiments on this subject

These lines assume a great variety of forms, depending on the figure of the plate the position of the point or points at which it is fixed, and the rapidity and direction of the motion by which the vibration is communicated to it Circular plates afford numerous different systems of nodal lines When the plate is fixed at its centre between two knobs or points held fast by a vice, two nodal lines are in general produced crossing each other at the centre By applying the finger to the plate at a suitable point, so as to interrupt the vibration three of those lines may be formed Disks of metal furnish a number of nodal lines dividing the circle into numerous sectors In certain circumstances these straight nodal lines are intersected by a greater or smaller number of concentric circular lines, the circular lines may also exist by themselves, and sometimes the nodal lines assume the form of the branches of a hyperbola Some of these forms are represented as under

The investigation of the laws of vibration of a homogeneous solid body of a given form when the circumstances in which it is placed and the forces by which it is thrown into vibration are perfectly defined is a problem of pure analysis, but though the differential equations of motion to which it leads have been integrated in a number of particular cases, their integration in general presents difficulties which, in the present state of the calculus, cannot be entirely overcome (See Poisson, *Traité de Méc* [illegible] Herschel, *Encyc Metrop*, art Sound Mémoires *Savants étrangers de l'Analyse*, p 415 , Riccati, *Mem di Mat e di Fis della Soc Ital* t I , Lagrange, *Melanges de la Soc de Turin*, t i ii and iii For the experimental researches, see Chladni, *Théorie d'Acoustique* Savart *Annales de Phys et de Chimie*, Biot *Traité d Physique* &c)

VIBRIONIDÆ The name of a tribe of Animalcules, commonly known as microscopic eels of which the genus *Vibrio* is the type One of the species of this genus of Animalcules is parasitic upon wheat they form a cottony mass in the interior of the grain, which, when the latter is ground, will not pass through the cloth, but remain behind in the bran When full grown, the *Vibrio tritici*, as this species is termed, attains a quarter of an inch in

length; but the young are of such microscopic minuteness that Mr Bauer the naturalist, by whom it was parasite has been successfully investigated, has calculated that [illegible] of wheat [illegible] armed ear- [illegible] as the most obvious remedy for these creatures

VIBRI'SSA (Lat vibrissa, *a whisker*), in Mammalogy, are the stiff long pointed bristles which grow from the upper lip and other parts of the head In Ornithology, the term is also applied to hairs which stand forward, like feelers, or which in some birds, as the fly-catcher, point [illegible] wards from both the upper an [illegible] or which spread out on each [illegible] pper sides of the [illegible] he goatsucker, when they are termed [illegible]

VICA'R [illegible] vicarius) An ecclesiastical personage who has the care of a parish in the place of (vice) a lay or collegiate rector See TITHES

VICARS OF THE EMPIRE In the German constitution, princes who had the right of representing the emperor in case of absence or interregnum The king of the Romans, whenever there was one, was perpetual vicar If there were none, the office was divided into two the elector of Saxony exercised the vicariate in the two Saxon circles, the electors palatine, and of Bavaria, alternately in the remainder of the empire They administered revenues, presented to benefices, received [illegible]

[illegible] An officer of the king's household immediately under the lord chamberlain

VICEGE'RENT (Lat vicem gerens, *holding the place of any one*) Any officer acting as deputy or lieutenant of another In France the bishops appointed formerly vicegerents to the official in every ecclesiastical officiality

VI'CEROY, or VICE-KING A title often applied in common usage to any officer representing the supreme authority in a dependency, *e g* the lord lieutenant of Ireland But it has seldom been officially given, except to the governors of certain dependencies of the old Spanish monarchy, such as Naples Peru, and Mexico each of whom bore the pompous title of 'Alter Ego" of the sovereign

VICTIM (Lat victima, of uncertain etymology, said to be from vinco, *I bind*) The creature immolated at a sacrifice was so called among the Romans (See SACRIFICE) The well-known ceremonies of leading the victim, unbound to the [illegible] ing [illegible] sc on its forehead, the ceremonies of kil [illegible] it — are all amply described in the writers In general object of sacrifice, in all ancient religions was expiation but to this must be added another peculiar to the Romans,—that of deducing from the appearance of the entrails of the victim Victims of different kinds had many designations *bidentes*, according to some, all kinds of sheep, according to others lambs only *eximiæ*, animals chosen beforehand out of a flock or herd for their beauty or other fitness to serve for sacrifice *prodigiæ*, according to Festus, those which were entirely consumed, instead of leaving, as in the ordinary case various parts which were consumed or sold by the priests *succidaneæ* those immolated in a sacred sacrifice to repair some error committed in a former one *probatæ*, after they had been examined by the priest to ascertain their fitness Various auguries were deduced from the demeanour of the victim its resistance its unusual cries, above all its flight, were unlucky Artificial victims, made of flour, spices &c, were sometimes sacrificed Pythagoras seems to have introduced the [illegible] ion [illegible] his disciples

VICTORY In Classical Mythology, a goddess, called by Varro the daughter of Heaven and Earth Her altar was preserved in the curia or senate house of Rome, and its destruction was the subject of one of the latest contests between Christians and Pagans (See Beugnot, *Destr du Paganisme en Occident*, i 410 430, *Mém de l'Ac des Inscr* vol xviii 21)

VIDA'ME In French Feudal Jurisprudence, originally an officer who represented the bishop, as the viscount did the count (vice-dominus) In process of time these dignitaries erected their offices into fiefs, and became feudal nobles, such as the vidame of Chartres, Rheims &c, continuing to take their titles from the seat of the bishop whom they represented, although the lands held by virtue of their fiefs might be situated elsewhere

VIDELICET (More properly *scilicet*) In Law In pleading it is usual to state any allegation which forms part of the facts set out, but which it is not intended to prove with precision, with the word "scilicet" (in English, "to wit") preceding it Thus, numbers and dates, for instance, are frequently laid under a videlicet as where any thing is alleged to have taken place heretofore, "to wit," on [illegible] r where, in trespass, the plaintiff charges [illegible] with carrying away or injuring divers, "to wit," [illegible] general rule on this subject is [illegible]

is in itself immaterial so that the issue or [illegible] established [illegible] the pleading a fact [illegible] not dispense with the proof but where a fact is itself immaterial there [illegible] or I but not always) the omission of a videlicet [illegible] render it material, and make it necessary for the party so alleging it to prove it as stated But the [illegible] on this subject run, as may be supposed, into extreme minuteness

VI'GIL (Lat vigilium, *watch*) An ecclesiastical usage, the evening before a feast day, is so termed The observation of vigils is said by some to be nearly the oldest of Christian ceremonies According to Lactantius, Jerome, and other ancient authorities, the second advent of our Saviour was expected to take place on the vigil of Easter They were originally celebrated by meeting together at night (as they are still on some occasions in the Eastern [illegible] and are said thus to preserve the memory [illegible] of primeval assemblies of Christians in times of persecution

VIGNI'TTE (Fr) A small ornamental engraving used in printing for the illustration or decoration of a page of any work

VIGOROSO (It *vigorous*) In Music, a term which, prefixed to a movement, denotes that it is to be performed with strength and firmness

VI'LLA In Roman Antiquities, originally any country dwelling, farm-house, &c, but in architectural language the country residences of individuals of the wealthier classes were so called Many descriptions of ancient villas are here and there scattered in the pages of classical writers, but the two most complete, undoubtedly (besides those contained in the work of Vitruvius) are the accounts given by Pliny the younger of his Laurentine and Tuscan residences (Epist ii 17 and v 6) the first being the complete picture of a marine, and the second of an inland villa The remains of the first are thought to have been discovered not far from Ostia in the beginning of the last century To these may be added the pleasing, though over ornamented poetical delineation of Statius, *Silvæ* lib 3 entitled 'Surrentinum Tolli describing a magnificent residence overlooking the Bay of Naples The most important parts of an ordinary villa were the porticoes one or more along the front or sides of the mansion, the triclinium or dining room the wings forming suites of living apartments, commonly called in the time of Pliny, diæta, the baths, with their appurtenances the hypocausta or vaulted heating rooms, apodyteria or [illegible] rooms for exercise (sphæristeria) &c [illegible] main portico was generally the xystus (which see) There is a work by A Castell on the villas of the ancients, with ill [illegible] (fol 1728) The remains of several [illegible] in England (See *Archæol* vol 8, *Pictorial History of England* i 561)

VI'LLAGE or VILL (Lat villa, properly a *country house*) In English Legal phraseology, a subdivision of a parish, sometimes a whole, at first and sometimes a part Most commonly it means the out part of a parish consisting of a few houses separate from the rest (See *Bacon*, i 6, and 1 *Inst*) In countries where there are peasants attached to the glebe, or possessing distinct rights and obligations from other subjects a village is properly a place inhabited by peasants only From the Latin villa was derived the French ville, *city* originally signifying any residence, and thence a collection of houses which gradually grew around a principal residence Thus especially in Normandy, ville is a common termination to the names of places, like *ton* or *by* in England, and consequently, also, of family names The English "town" furnishes a parallel instance of the alteration of the meaning of a word produced by an increase of population, our principal towns having been single residences or hamlets, and in Scotland, at this day a house with its appurtenances in rural districts is sometimes called "the town"

VILLEIN, *Villenage* In Anglo-Norman Feudal Jurisprudence, the villeins are thought to have been those who, under the Saxons, had held by the tenure known to the Saxons as "folk-land" Villeins were either "regardant," *i e* annexed to the manor, or "in gross," transferable from one owner to another On the Continent, the rank of "villeins," "villins," seems to have been from the beginning superior to that of serfs (See Guizot, *Civilisation en France, Archæologia*, vol ii, The word villein is derived from the Latin villa, whence villani *country people* Besides the actual servile population of the Roman empire, there appears to have been a class of cultivators of the soil, who probably became greatly multiplied in the later period of the western division of that [illegible] who were wholly [illegible] attached to the soil and liable to certain fixed services to the proprietors of it, but not destitute of property or civil rights Out of this class, augmented in process of time by the addition of numbers whom the vicissitudes of [illegible] revolutions of the dark ages, subject [illegible] with or without consent, to the protection and control of masters, arose

the villein population of Europe in the middle ages Among the causes which increased their numbers, Mr Hallam also enumerates the fines and compositions so generally imposed in the barbarian codes of law, by default in payment of which many were reduced into this state, and the prevalent superstition which induced men to surrender their persons as well as [illegible] to the control of churches and monasteries [illegible] are designated in these early codes under the general name of *lidi leudes*, &c. (leute, *people*), a name which, however, is also applied to the free vassals, or liegemen some, who were attached to the soil of royal or church demesnes, are termed *fiscalini*, or *coloni*, and the condition of various classes appears to have been extremely different [illegible] Meyer *Institutes Judiciaires*, liv i c 7) The general obligation common to all villeins was that of remaining on the lord's estate, and passing along with it by subinfeudation and alienation The lord had also every where jurisdiction over the persons of his villeins But in other respects there were several degrees of servitude In England, at least from the reign of Henry II, only the inferior sort of villeins, or absolute serfs, seem to have existed They were not only bound to the soil (*villeins regardant*), but they might also be severed from the soil and conveyed apart from it by the lord, and then became in legal phraseology, *villeins in gross* They were incapable of acquiring a full right to property, their *peculium* (as the Romans termed the possessions of a slave) being liable to be seized at any moment by the lord Their tenure bound them to what were termed villein or ignoble services, indeterminate in degree It must, however be observed, that these villein tenures were rather attributes of the land than of the individual holding it, insomuch that lands held in villenage were frequently in the occupation of freemen, and thus, in process of time, our English copyhold tenures have been derived from those which prevailed in these lands of a villein equality In France and Germany, where serfs of this description likewise existed, there were at the same time other classes whose servitude was of a less severe character, being bound only to fixed duties and payments in respect of their lands

The abolition of villenage, in the greater part of Western Europe was brought about by various causes Among others, 1 Manumissions, which during some centuries were extremely common from religious principles, being strongly inculcated by the church, although that body is accused of not having added the force of example to its precepts, the villeins on church lands having [illegible] last parts, among the last emancipated Becoming [illegible] villein himself was also a common mode of [illegible] freedom 2 The influence of the towns, within which, when enfranchised, serfs by a certain period of residence frequently obtained their freedom But, perhaps more generally, the process was gradual, the severest attributes of personal servitude being the first to disappear, while predial servitude or a liability to servile duties and payments in respect of land, existed down to a comparatively late period in most countries of Western Europe, and still exists though much modified in parts of Germany In the 15th century there were, according to Machiavel, no villeins left in Italy Predial servitude, in some rare instances, existed in England, it is believed as late as the reign of Charles I In France it was not wholly abolished until the Revolution In the greater part of the Prussian territories, the condition of the peasantry was still in some respects marked with the attributes of villenage until the reforms of Stein in the present reign In those eastern parts of Europe in which the feudal system never prevailed (Russia and Poland), the condition of the great mass of the people is still servile, and, in some respects, lower perhaps than that of most feudal villeins The Russian peasants are divided into those belonging to the crown, and those belonging to individuals, the former being rather more than half as many as the latter throughout the empire The late emperor Alexander introduced some ameliorations in the condition of the crown peasants, with a view to their ultimate enfranchisement He also planned measures for the prevention of the sale of serfs apart from the estates on which they reside Under his superintendence, the nobility in the German provinces of Courland and Livonia abolished villenage altogether, but hitherto without much advantage in improving the state of the peasantry

VILLOSE (Lat villus, *wool*) In Zoology, when a part is covered with soft flexible hairs thickly set

VILLOUS In Anatomy, this term is applied to vascular surfaces which, when minutely examined, look like the pile of velvet, as in the *villous* or internal coat of the intestinal canal

VINALIA According to Varro and Ovid (from vinum, *wine*), a festival in ancient Rome There were two Vinalia the first in April, sacred to Venus, the second in August, to Jupiter. The latter was considered as the beginning of the vintage season, before which new wine was not permitted to be conveyed into Rome (See Ovid *Fast* l iv)

VINCULUM (Lat *a bond or tie*) In Algebra, a mark or character which connects several letters or quantities and indicates that they are to be treated as a single quantity Formerly used the bar or line over the quantities for a vinculum, thus, $a \times \overline{b + c}$, meaning that the quantity a is to be multiplied by the sum of the quantities b and c This manner of connecting quantities was generally used by the early English writers on algebra, but it is now more common to make use of the parenthesis, which is a much more convenient mode of notation, especially when the expression is somewhat long Thus, instead of writing $a \times \overline{b + c}$, or $\sqrt{x^2 + 2xy + y^2}$, it is more usual to write $a(b + c)$ $\sqrt{(x^2 + 2xy + y^2)}$ The parenthesis, which has generally been used by the foreign mathematicians, is said by Hutton to have been first used as a vinculum by Albert Girard

VINE, in Horticulture, (*Vitis vinifera*, L) the grape vine, is a ligneous climber, found wild in Syria and in various parts of Asia and in Greece, the fruit of which is in universal demand for the desert, either fresh, or dried as raisins and its fermented juice forms wine, the noblest liquor that ever gladdened the heart of man The best grapes for the table are grown under glass, but grapes are also grown of very good quality against walls and on cottages south of London, and on walls heated artificially as far north as Glasgow Formerly the grape vine was grown [illegible] for the purpose of wine [illegible], and Mr Hort published an interesting work on the *Cultivation of the Vine* in which he shewed with proper care this might be done in some districts even in the present day *See* VINEYARD

VINE is often employed in a general sense to designate any stem which trails along the ground without rooting, or entangles itself with other plants, to which it adheres by means of its tendrils or by twining, as the cucumber and the hop

VINEGAR This term is applied to various modifications of the acetic acid The simplest mode of obtaining vinegar is to excite a second or acetous fermentation in wine in this case oxygen is absorbed, a variable proportion of carbonic acid is generally evolved and the alcohol of the wine passes into acetic acid Very good vinegar is also made from strong beer, or from a wort or infusion of malt prepared for the purpose, or from a decoction of common raisins or from a mixture of about 1 part of brandy with 8 of water and some sugar and yeast

When vinegar is distilled, various impurities which it contains remain in the still, and the liquid which passes over is the acetic acid, nearly pure but largely diluted with water In this state it is usually called *distilled vinegar*, and is used chiefly in pharmacy But though a considerable quantity of vinegar is made in wine countries by the first mentioned process and here and elsewhere by the second, in which malt is employed, yet for all the purposes of the arts and manufactures, as well as for domestic consumption the [illegible] from another source, which is [illegible] of wood It has long been known that when certain kinds of dry wood especially beech and such woods as are not resinous, instead of being burned in the open air, are converted into charcoal in close vessels, so as in fact to be submitted to distillation, that the vapours which pass off yield, [illegible] large quantity of tar, and of very acid [illegible] in fact, an impure vinegar, that is, it owes its acidity to acetic acid, which is formed during the process out of the carbon, hydrogen, and oxygen of the wood, which elements are also those of acetic acid, and, what is remarkable, not in very different proportions When this impure acetic acid is freed from the tar and empyreumatic oils with which it is mixed, it is called *crude pyroligneous acid* To convert it into pure acetic acid, that is, to separate from it the empyreumatic products with which it is intimately combined, is a somewhat [illegible] which the following is an outline [illegible] distilled, by which *pyroxilic spirit* and *oil of tar* first pass over and these are followed by a quantity of impure or rough acetic acid This rough acid, which is used by dyers and calico-printers, and by makers of sugar of lead, is saturated with powdered slaked lime, and [illegible] yields a solution [illegible], which [illegible] porated to dryne [illegible] with dilute sulphuric acid, yields a purer acetic acid than the former, but which still has a burned and disagreeable flavour, it [illegible] gum saturated by lime and this liquid [illegible] is mixed with a solution of sulphate of soda, which acting by double decomposition, yields a precipitate of [illegible], and acetate of soda remains in solution The latter salt is [illegible] and purified by torrefaction and [illegible] vinegar makers, who purchase it, decompose it in retorts or proper stills, by means of sulphuric acid by which a very pure and strong acetic acid passes over, sulphate of

soda remaining in the retort The acetic acid thus obtained, which is in its most concentrated state, is extremely acrid, sour, and pungent, and is often called *radical vinegar* or when perfumed *aromatic vinegar*, it is also occasionally [illegible] from its property of congealing [illegible], and remaining frozen at temperatures below 50° In this state it is a compound of 1 atom of real acetic acid = 51, and 1 of water = 9, the real or anhydrous acid, as it exists in the dry acetates, being composed of—

	Atoms	Equiv	Per Cent
Carbon - -	4	24	47 06
Hydrogen -	3	3	5 88
Oxygen - -	3	24	47 06
	1	51	100 00

proportions which are equivalent to 4 atoms of carbon and 3 of water When this strong acid is diluted with water and slightly coloured, it forms a very pure and excellent substitute for common vinegar, and is cheaper than acid of the same strength prepared in any other way

The combinations of acetic acid with various bases are called *acetates*, and of these salts some are importantly useful in the arts such especially are the acetates of lead copper, iron, and alumina, which are chiefly employed in dyeing and calico printing, the acetates of ammonia and of potash, which, as well as acetate of lead, are used in medicine, and the acetates of lime and of soda, which have been mentioned as steps in the preparation of strong acetic acid The acetates are recognized by their solubility in water, and by the fumes of acetic acid which they evolve when acted upon by sulphuric acid The specific gravity of the strongest liquid acetic acid is 10629, that of good malt vinegar is 10200, and that of distilled vinegar about 10023 The strength or value of vinegar, and of acetic acid, can only be learned by its saturating power

A duty of 2*d* per gallon is imposed upon vinegar, and the manufacture is consequently placed under the control of the excise Previously to 1826 the duty was 4*d* per gallon. The manufacture is chiefly confined to England, the quantity produced in Scotland and Ireland being [illegible] on the annual average to more than [illegible] The quantity of vinegar manufactured in England is nearly 2 700,000 gallons annually

VINEYARD A plantation of grape vines cultivated for the purpose of making wine Though vineyards at present are chiefly confined to the warmer parts of the Continent, yet it appears that formerly they were occasionally to be met with in Britain, more particularly in the neighbourhood of religious establishments Among the last vineyards which we have any account of are one at Hatfield, near Ledbury, which belonged to the celebrated Jacob Tonson, one in the Isle of Wight, another at Pain's Hill in Surrey The ground chosen in all these cases was a sloping surface of dry gravelly soil, with a southern aspect, and the vines were planted in rows at four feet apart every way and trained to short stakes about four feet high Every year the shoots were cut down to within a foot of the ground and not more than three shoots were allowed to be matured by each plant Each shoot produced two or three bunches of grapes, and the shoots were shortened in the course of the summer so as never to reach higher than the stakes, to which they were tied with rushes previously cut and dried for the purpose, or [illegible] The kinds of grapes grown were [illegible] or large black cluster, and the small black cluster or miller grape, so called from the white mealy appearance of the leaves In fine seasons a tolerably good wine was produced On the Continent, the vineyards which produce the best wine are invariably found on dry soils, more or less calcareous, and the most celebrated are on the dry sunny sides of granite or calcareous hills with the surface formed into terraces, like the steps of stairs on a large scale each step or terrace being supported on the lower side by a stone wall, to which the vines planted at the base of the wall are sometimes attached, not by nails, as wall trees are in Britain, but by hooked sticks driven into the interstices between the stones, such walls being for the most part built without mortar In France and the south of Germany, vines are seldom allowed to grow higher than four feet and [illegible] after the crop has been gathered [illegible] to within one or two feet of the ground In the neighbourhood of Stuttgard and between that city and Heidelberg where the sides of the hills are covered with vineyards the shoots are not cut down before winter; but those of each stool or plant are bent down to the ground, where they are tied together with a straw band and retained in that position by laying a stone on the bundle This is for the purpose of preserving the vines from the extreme cold of winter, the shoots, when so laid prostrate, being soon covered with snow In spring the shoots are raised up again, pruned, and tied to stakes In the north of Italy, and chiefly in the plains of Lombardy, the vineyards are managed much in the same manner as they are in France; but in Tuscany, the Papal States, and Naples, the vineyards are interspersed with mulberry trees which are kept pollarded and to these the vines are attached partly by ties of willow and partly by their tendrils, and they produce bunches of grapes to the height of six or eight feet from the ground Sometimes the shoots are trained to elms, mulberry trees, or poplars, in which case they pro- [illegible] The only plantation [illegible] which we know of in England at present, is a small one at White Knights, near Reading, where, however, the plants for several years past have been in a state of utter neglect, the leaves and young shoots being injured or totally destroyed by rabbits The ground which was occupied by the vineyard at Pain's Hill is now covered with a plantation of pine trees, among which some of the vines still continue to spring up [illegible] since been laid [illegible] century there [illegible] bourhood of Lo [illegible] still bears the name of the Vineyard, and is now occupied as a nursery But the most celebrated of the London vineyards appears to have been one cultivated by Richard Warner at Rotherhithe, who is supposed to have introduced the Hamburg grape There was a vineyard in the neighbourhood of Gloucester cathedral, one at St Alban's; and one at Canterbury [illegible] y which is no [illegible] that city

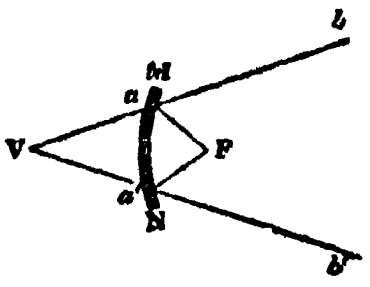
[illegible] Naval language, a purchase used occasionally in weighing the anchor

VIOLA (It) In Music, a musical instrument of the same form and with the same numb [illegible] violin and like it, played with a bow [illegible] it the tenor violin

VIOLACEÆ (*Viola*) are Polypetalous Exogens well represented by the sweet violet of our woods, and distinguished by having five membranous anthers adhering to each other round a superior ovary, with parietal placentæ The heartsease or pansy is a kind of violet and there is a large number of other species in different parts of the world An emetic property resides in their roots, and renders some of them useful medicinal agents as substi- [illegible]

VIOLIN [illegible] In Music, a musical instrument, vulgarly called a fiddle, mounted with four strings, and played with a bow It consists of three parts — the neck the table, and the sounding board, at the side are two apertures in the shape of S s On it is a bridge, which bears the strings up from the belly over which they pass from one extremity called the tail-piece, to the other near the head, where they are received by turning pins, wh [illegible] n them at pleasure

VIOLINCELLO (It) In Music, a bass violin with four strings, whose principles of construction are the same as those of that instrument



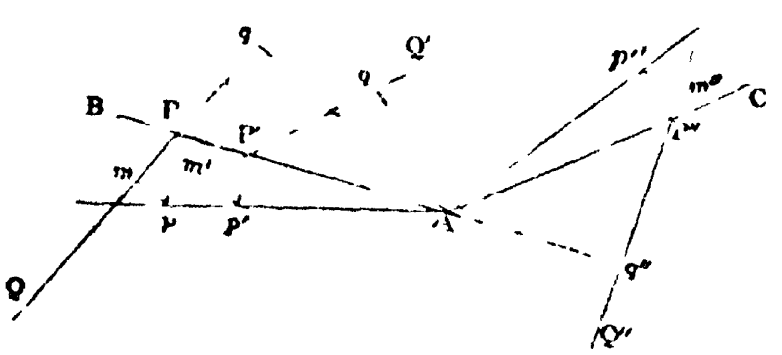
VIOLONE (It) In Music, a large bass violin, commonly called a *double bass*, seldom played with more than three strings, which lie an octave below the violoncello

VIPER (Lat a contraction of Vivipar, from vivus *alive*, and paro, *I bring forth*) The common name of a genus of venomous serpents which produce living young, and have a head broader than the neck, and no pits behind the nostrils The true vipers (*Vipera*) are distinguished by the head being covered with scales, like those on the back, and by the nostrils being very large The horned viper of North Africa and the puff adder of South Africa belong to this group The adders (*Berus*) have the head covered with granular scales with larger ones intermixed in some species, and have the nostrils of moderate size The black adder and the common adder (*Berus chersea*), which are the only indigenous venomous reptiles of Great Britain, are examples of this group

VIRGILIAN HUSBANDRY That kind of agriculture which was practised by the Romans, and which is described in the *Georgics* of Virgil, or, in other words, the old mode of managing arable land throughout Europe By this system two or three corn crops were taken in succession, and the land afterwards allowed to lie fallow for several years, when it was broken up again, being sometimes prepared by paring and burning The Virgilian and Roman practice is fully described in *Dickson's Agriculture of the Ancients* The first departure from this kind of husbandry in Britain was made by Jethro Tull in the middle of the last century whose plan it was to keep arable land continually under crops cultivated in rows, and alternately growing corn and pulse, or plants cultivated for their leaves or roots

VIRGO (the Virgin) In Astronomy, one of the twelve zodiacal constellations or signs being the sixth in order, beginning with Aries Virgo is usually represented with an ear of corn in her hand, and is hence called *Signum Cereris* The sun enters this sign about the 23d of August The constellation Virgo contains one bright star of the first magnitude, called *Spica Virginis*

VIRTUAL FOCUS, in Optics, is the point from which rays that have been reflected diverge after incidence on or refraction through a surface Thus in the reflexion of a metallic speculum from a radiating point F, the rays falling on the speculum at *a* and *a'* are reflected to the points *b* and *b'*, and the straight lines *a b* and *a' b'*, if produced, concourse of the straight lines *a b* and *a' b'*, is called the *virtual focus* of the reflected rays *See* REFLEXION



VIRTUAL VELOCITY, in Mechanics, is the velocity which any point of a body in equilibrium would actually acquire during the first instant of its motion in case of the equilibrium being disturbed

The general principles on which the laws of equilibrium in machines are established may be reduced to three, namely, the principle of the *lever*, the principle of the *composition of forces*, and the principle of *virtual elocities* The last consists in this, that forces are in equilibrium when they are in the inverse ratio of the virtual velocities of the points to which they are applied, estimated in the direction in which they respectively act Thus, let F and F′ be two forces applied to the points *p* and *p′* of a body which is in equilibrium by means of their joint action, and let *s* and *s′* be the spaces which the points *p* and *p′* would describe in the first instant of time, in case of the equilibrium being disturbed, then F F′ *s′ s*, or F *s* = F′ *s′* The principle is thus enunciated generally by Lagrange (*Mec Analytique*, p 22) —

"If any system of bodies or material points, urged each by any forces whatever be in equilibrium, and there be given to the system any small motion, by virtue of which each point describes an indefinitely small space, which space will represent the virtual velocity of the point, then the sum of the forces multiplied each by the space which the point to which it is applied describes in the direction of that force, will be always equal to zero or nothing regarding as positive the small spaces described in the direction of the forces, and as negative those described in the opposite direction"

In order to illustrate this principle, we may take as an example the case of the bent lever Let P, P′, P″ be

the points of application of the three forces F, F′, F″, acting on the lever B A C, in the directions P Q, P′ Q′, P″ Q″, which are all supposed to be comprised in the same plane Suppose the lever to describe an indefinitely small angle about the fulcrum A, so that the points P, P′, P″ come into the positions *p*, *p′*, *p″* According to the definition given above, the indefinitely small arcs P *p*, P′ *p′*, P″ *p″*, which may be considered as straight lines, will be the virtual velocities of the points of application P, P′, P″, of the three forces F, F′, F″ From the points *p*, *p′*, *p″*, let there be drawn *p m*, *p′ m′*, *p″ m″* respectively perpendicular to the lines P Q, P′ Q′, P″ Q″, then P *m* will be the virtual velocity of the point P resolved in the direction P Q of the force F, and P′ *m′*, P″ *m″* will in like manner represent the virtual velocities of the points P′ and P″ resolved in the directions in which the forces F′ and F″ respectively act Let P *m* = *s*, P′ *m′* = *s′*, and P″ *m″* = *s″*, and as the force F acting in the direction P Q tends to turn the lever in the direction in which the motion has been supposed to take place, while F′ and F″ tend to turn it in the contrary direction, the space *s* must be regarded as positive, and *s′* and *s″* as negative

Now, according to the principle of virtual velocities, the sum of the forces multiplied by the velocity of its point of application reduced to the direction of that force, is zero in the case of equilibrium, and, reciprocally, when this sum is zero in equilibrium, hence the equation of the lever is

$$F s + F' s' + F'' s'' = 0$$

It is easy to verify this equation by showing that it may be derived from the equation of equilibrium deduced from the principle of the lever. From A let A *q*, A *q′*, A *q″*, be drawn respectively perpendicular to the directions P Q, P′ Q′, P″ Q″, and let the angle P A *p* = θ, then, since the angle A P *p* may be regarded as a right angle, *m* P *p* = P A *q*, whence the two triangles *m* P *p*, *q* A P are similar, and *m* P : A *q* :: P *p* : P A :: tan θ : 1; therefore *m* P = A *q* tan θ that is, *s* = A *q* tan θ In like manner we have *s′* = A *q′* tan θ *s″* = A *q″* tan θ; whence by substituting in the above equation, and leaving out the common multiplier tan θ, we find

$$F\ A q + F'\ A q' + F''\ A q'' = 0,$$

which is the well-known equation of equilibrium *See* STATICS

The equation F *s* + F′ *s′* + F″ *s″* = 0 may be extended to a solid body of any form, or to any machine whatever Let *d m* be an element of the body, F an accelerating force applied to *d m*, *v* the velocity of that element, *z* the angle comprised between the direction of the force F and that in which the element *d m* moves, then the moving force of the element will be F *d m*, and *v* cos *z* its velocity estimated in the direction of this force, and consequently, by the principle of virtual velocities, the equation of equilibrium will be $\int F v \cos z\, dm = 0$

The principle of virtual velocities is easily verified by experiment, with respect to all the simple machines; namely the lever, the pulley, the wheel and axle, the inclined plane, and the screw Its importance as a fundamental principle in rational mechanics was first recognized by John Bernoulli (see the *Nouvelle Mecanique* of Varignon, tom II), and Lagrange has derived from it the whole theories of statics and dynamics in his celebrated work, the *Mécanique Analytique* Fourier (*Journal de l'Ecole Polytechnique*, cahier V) has demonstrated the principle from the property of the lever

VIRTUE, in Moral Philosophy, is employed both in an abstract and comprehensive sense to signify the law or laws in which right conduct consists, and also concretely for that quality of actions and persons which arises from their agreement with the rules of morality By theories of virtue are understood the different explanations which have been given both of that which distinguishes right from wrong, and of the nature of the feelings with which virtue and vice are contemplated by mankind The distinction of these two questions, so frequently confounded by ethical writers, is due to Adam Smith, but has since been strongly insisted upon by Mackintosh and Hampden The former question Mackintosh entitles 'The Inquiry into the Criterion of Morality in Action' and the latter, "The Theory of Moral Sentiments," which was [illegible] of Virtue and the former as "the Inquiry into the Nature of Virtue" and apply the term *criterion of virtue* to the principle of approbation In the use of the phrase "Theory of Moral Sentiments," the last two writers again are at issue Smith understands by it moral philosophy in general, while Hampden limits it to a division only of ethical inquiry According to the latter, it comprises the two investigations already specified that into the nature, and that into the criterion, of virtue It constitutes the *subjective* branch of ethics, and arises from a consideration of man in himself as the *subject* of moral action, while the objective branch results from a regard to the end or object to which the moral nature of man has reference This speculation into the final cause of man's capacity for virtue and happiness, Hampden considers to be the complement of ethics, and entitles it *the theory of natural religion* Lastly he defines ethics thus understood to be the science of *but ought to be* subtracted from the science of *what is*, or of moral facts as they are exhibited in life or as they may be classed in the philosophy of history, and the study of the intellectual arts, which are based upon an appeal to the actual moral nature of man These two together make up the whole domain of moral philosophy (*Hampden's Lectures on Moral Philosophy*)

The several theories of virtue are conveniently divided into ancient and modern The distinction, however, is not founded on any essential difference of theory, but rather on the opposite points of view from which they respectively viewed the moral facts While modern theories are permanently subjective the object of question is the character to be aimed at in all contingencies The leading speculation of the former is what is the origin and nature of moral obligation? The first problem of the latter was to determine the object or end to which the moral constitution of man has reference, and this ultimate end of human activity they usually denominated the end or sovereign good (τέλος, *finis bonorum*, *summum bonum*) And although the consideration of this question might tend in a few as in Socrates and Plato, to carry the mind forward to some higher system, in which should be realised [illegible] which man aspires, still, as these promptings of natural religion were but vague and unauthoritative, the ethical writers of antiquity confined their views to this life alone, and the sovereign good which they proposed as the final cause of moral action was limited to the greatest good attainable in the present state of existence.

With Socrates, the first object of speculation was to

acquire a knowledge of man's true and proper nature, but this self-knowledge he held to be impossible so long as man continues ignorant of the universal principle Now the nature of God can only be learned from his works, and these bespeak him to be good and intelligent Moreover the consciousness of man attests his participation in the divine essence, consequently the ultimate destination of man is reasonable goodness and his moral end is the cognition and practice of good Virtue, therefore, is the intelligent performance of duties, whose notions man may arrive at by a study both of his own nature and of the laws of an all-wise Creator discoverable in the system of the universe In this pursuit happiness is inseparable from virtue But if Socrates thus founded morality on a disinterested principle, he reconciled it with interest rightly understood, and on the other hand raised political science above the mere calculation of utility, by identifying it with justice as founded not on convention (*δογμα πολεως*), but on natural right, or the invention of what is (*του οντος εξευρεσις*)

Socrates having thus referred the laws of morality to the Deity as their author and upholder, Plato proceeded by a definition of the divine nature to guard against the objection of their arbitrary position by the will of God He made the Deity to be the perfection of intelligence resulting from an union of the good the beautiful and the true, which are in their nature eternal, necessary, and immutable This perfection is also the term to which man spontaneously tends For reason is the true principle of his nature although in the present existence there is mingled with it a foreign element — *matter*, which, by obstructing its development, becomes the cause of human [illegible] All then that is now possible for man is [illegible] to the divine excellence Thus is virtue, and is effected by the harmony of the *rational*, *irascible*, and *concupiscible* parts of the soul Although the two latter belong to the foreign element in man's nature, they are yet indispensable to the moral act for the third affords a motive to action, inasmuch as beauty, being identical with the good and true, gives rise to desire or love (*εροις*) and thereby impels to virtuous action, while the second, disapproving what is base, and ugly, and false, furnishes the [illegible] requisite for attaining to what is right, [illegible] every difficulty and evil [illegible] the three parts of the soul Plato assigns a special virtue, in a lower sense and names them, respectively, *prudence*, *fortitude*, and *temperance* (*φρονησις*, *ανδρια*, *σωφροσυνη*), while in a proper sense he declares virtue to be eminently one and the same with justice (*δικαιοσυνη*) These four are the so-called cardinal virtues From the notion of justice he draws the connection of ethics and politics the latter is but an application of the former to society At the close of the republic he teaches that as an individual cannot be at peace with himself except by the harmonious adjustment of all his faculties, wherein each is allowed its due weight, so in the whole world happiness is proportionate to justice, and each individual derives the greater benefit from the community the more complete the harmony is in which he lives with all his fellow citizens

Essentially agreeing, the ethical systems of Plato and Aristotle are chiefly distinguished by the relative value which they respectively ascribe to happiness the former considering it as the natural fruit of virtue, while the latter rather viewed virtue as the means of attaining to happiness Plato taught, that although the just man regulates his conduct by no reference to his own enjoyment, yet pleasure invariably attends him, since justice is good not only in itself, but also in its effects, and renders all things fitting and friendly to man In Aristotle's opinion, the end of morality is to render individuals as useful as possible to society, the objects of whose institution is to procure in its members the highest moral perfection as necessary to the attainment of the greatest [illegible] city by the whole Man being a free and rational agent and therefore acts spontaneously [illegible] invariably proposing to himself some [illegible] to action All human arts and pursuits then, have their appropriate ends, but among these there is a certain subordination, which implies a supreme end towards which they all converge, [illegible] sake, but the cause for which [illegible] supreme good is perfection virtue is the approximation thereto, and consists in the habit of mediocrity according to right reason, in other words, it is self-control, which triumphs alike over the impetuosity of the passions and the weakness of the will and thereby accomplishes a just mean Every special virtue in like manner lies in a kind of middle between the two opposite vices of too much and too little [illegible] between cowardice and [illegible] offends by an excessive, the latter by a defective, regard to the proper objects of fear

According to the Stoics the supreme good which is the final cause of every special good is to act conformably to nature, *i e* in obedience to the immutable laws which reason discovers in the universe This eternal and universal order, which they called *fate*, is an infinite enchainment of causes and effects, in virtue of which whatever happens is what ought to be it embraces all living things, and in man therefore has a principle within him which obliges him to seek that state of his nature which is the best and most perfect that it is capable of This is reason Wisdom, therefore, is man's chief good, and the pursuit of it is philosophy Perfect wisdom however, as modelled in the sage of the Stoics, they did not believe to be conceded to mortals, to whom nothing more is granted than to be in *the way to* perfection Now, as they made reason to be the supreme arbiter in moral determinations, they naturally held vice to be but an error yet this error, they taught, is the only evil; and, on the other hand, nothing is good but what is such at all times and all circumstances all else is morally indifferent But even indifferent things are, in a lower sense, agreeable to nature and objects more or less of choice or aversion That perfect rectitude of conduct, therefore, which constitutes the essence of virtue, consists in a just and accurate dis [illegible] its due [illegible] natural scale of things Lastly although their first object was to emancipate the moral man from all dependence on external conditions and from the slavery of his passion, — and although, therefore, they removed all sensuous pleasures and pains from the catalogue of good and evil, — nevertheless the apathy which they taught was not, as commonly understood, an absolute insensibility, but rather the undisturbed supremacy of reason over the passions

All the preceding theories agree in making reason the end of human activity and are thereby distinguished from the Epicurean who gave the first place to the sensuous element of human nature and reduced [illegible] to the rank of a mean According to Epicurus, pleasure alone is sought for its own sake, and philosophy and all else is but the pursuit of it If, sometimes, it seems to be foregone, it is only with a view to some higher gratification, as pain also may occasionally be endured in the acquisition of a pleasure whose intensity will fully compensate for the intermediate suffering The pleasures and pains that are primarily the objects of desire and aversion are corporeal, and from these the pleasures of the mind are ultimately derived, and consist merely in the anticipation of future and in the recollection of past states This, however, constitutes the superiority of the secondary pleasures of the mind over their corporeal originals for the latter do not extend beyond the present sensation *Virtue*, therefore, is an enlightened pursuit of pleasure which, although it is selfish in its principle still allows free [illegible] a pa [illegible] gratification beyond the calculations of personal interest For though they may expose a man to the chance of pain, as in the case of the death of a friend still this is a less evil than apathy, and the deprivation of a natural enjoyment Justice lastly has no other object than the general good, and right, properly understood is but the sign of utility

Modern ethics having taken their rise from a system greatly resembling the Epicurean, the inquiry into the nature of virtue became the first question that was proposed for solution Accordingly this fact furnishes a general classification of the later theories of morals into selfish or disinterested, according as they found virtue on a selfish or on a benevolent principle

The selfish theory has found its ablest advocates in Hobbes, Helvetius, Paley, and Bentham Of these the first and last deserve a particular notice Hobbes as the originator of the controversy into the nature of morality Bentham as furnishing the most complete and elaborate exposition of the utilitarian scheme According to Hobbes (born 1588, died 1679), the only motive that can induce men to any act is the pleasure which will follow from its execution A preconception of pleasure is the necessary condition of every moral determination Good and evil are simple tendencies to pleasure and pain, without which every object is indifferent Self-love is the exclusive passion of man's nature Other passions differ from it outwardly only *i e* in the objects which excite them pity, for example, is but the imagination of misfortunes which may happen [illegible] by the contemplation of another's [illegible] the conception of advantages to be derived from its object; and benevolence, nothing more than the consciousness of power sufficient to secure not only one's own happiness, but that of others also The first law of nature is self preservation whatever tends, therefore, to this end is lawful and good, and all men have a natural right to appropriate by every means in their power whatever [illegible] to their personal happiness As this is the imprescriptible right of all, there are as many forms of natural right as there are separate and independent wills, and actions [illegible] virtuous and legitimate [illegible] right to all things, and as there is no reason why one

should yield to another the objects which both may desire, the state of nature must be one of war, but as, in such a condition of things, the safety of every one is constantly endangered by the conflicting interests of all others, peace, at any price, becomes preferable to it Peace, however, is the result of society alone [illegible] as defined by Hobbes, of the existence within a community of a sufficient force to control all individual wills and forces But this is only practicable in two ways either all are seized with a desire to terminate the state of hostility, and enter into a mutual compact, by which they engage to do no violence, nor to suffer it to be done to each other, or a single person succeeds by stratagem or force in establishing his own authority over the rest [illegible] and indeed as the only [illegible] of warfare among its members, and as the more unlimited the power is the better calculated it must be to effect this object, an absolute monarchy is the very best polity that can be devised Against the government in such a society, it is evident that subjects cannot consistently possess any rights, for these would impede its effectiveness they have but one duty and that is —implicit obedience (*On Human Nature, Leviathan, &c*)

Bentham (born 1748, died 1832), sets out from Hobbes' principle, that every object would be perfectly indifferent but for its fitness to produce pleasure or pain, which, he declares, are the sole motives of human determinations This proposition he does not attempt to prove but, asserting that it is one of those primary and self-evident truths which are the foundation of all reasoning he proceeds to draw from it certain practical conclusions in the form of definitions Thus he defines utility to be the fitness of actions and things to augment the happiness, or to diminish the misery, of individuals and communities, [illegible] intelligible int[illegible] [illegible] ice and morality of an action [illegible] next defined to be that which exclusively derives the quality of actions from their twofold property of augmenting the happiness or misery of one or many This he asserts is the only valid principle of moral appreciation, and he reduces all opposing theories to two classes, which he designates by the principle of asceticism, and the principle of sympathy and antipathy Under the latter head, Bentham comprises every theory of morals which draws the distinction of good and evil from any other principle than a consideration of consequences, whereas he explains the ascetical principle as agreeing with the utilitarian in drawing its qualification of objects from their tendency to produce pleasure or pain, but as differing from it in that it proceeds in an inverse manner, and calls pain good, but pleasure an evil To forego the least pleasure, simply as pleasure, is to act on a principle of asceticism, but the true disciple of utility holds every pleasure to be in itself good Even the abominable pleasure which the wretched criminal enjoys in gloating over his crime is good so far as it is a pleasure, it is only evil so far forth as it entails the ill consequences of fear and punishment, which far transcend [illegible] [illegible] ision, therefore, [illegible] only really good when it will give rise to more of pleasure than of pain, and evil, when its painful exceed its pleasurable consequences It becomes, consequently of the first importance to possess an accurate standard by which the amount of pleasure and pain likely to result from certain actions, and the relative value of the two quantities may be measured This desideratum Bentham has attempted [illegible] constitutes the most original [illegible] his theory and system The first item of this moral arithmetic is what is intended for an exhaustive enumeration of all the pleasures and pains of which human nature is susceptible In the next, he proceeds to furnish a method of determining their comparative value For this purpose it is necessary to take into the account the following considerations —I What are the intrinsic circumstances of the pleasure itself which can augment or diminish its value and these are, 1 intensity, 2 duration, 3 certainty 4 [illegible] ts or remoteness, 5 fecundity, or the p[illegible] [illegible] immediate pleasures engendering others more remote, 6 purity, or whether its pleasures are mixed or not with more or less of pain II What circumstances are likely to affect the sensibility of the agents, and so to modify indirectly the result These are of two kinds, individual and general to the former belong temperament, constitution, habits, intellectual development and other traits of personal character those of the latter order are little more than generalisations of the first, and are—sex, age, education, profession, climate national character government, and religion III What are the consequences which, going beyond the immediate objects of the action, remotely affect others more or less numerous, and even the whole of society By allowing their due weight to all these particulars,

Bentham pretends that any ordinary capacity may form a correct estimate of the real tendency of actions and thereby arrive at that general utility which is the proper end of morality to secure (*Treatise on Morals and Legislation*)

The recognition of a principle of action independent of self love will afford a general characteristic of the remaining theories Some of these, however, place the origin of the disinterested determination in a perception of moral good and evil by the intellect or reason, while others explain the distinction by certain facts which take place within the sensibility or emotive part of man, so that the disinterested determinations which result proceed from an instinct or sentiment These two classes may be conveniently designated the rational and the sentimental or instinctive Of instinctive theories, however, while some are content with referring the moral principle to an original and admitted tendency of human nature such as sympathy or benevolence, others have derived it from a new and peculiar faculty

To begin with the former class According to Smith (born 1723, died 1790), when we are in the company of another who is sensibly affected with any sentiment or passion, our nature spontaneously, and without the intervention of reason or will, tends to reproduce in ourselves the same sentiment or passion and not only have we this disposition to sympathy, but we even feel a pleasure in finding ourselves to be brought thereby into harmony with those around us Indeed so strong and so instinctive is the desire for such union between our own minds and those of others, that when we are under any strong emotions in the presence of another who is unable to conceive any thing that approaches to the same degree of violence with our own, in such a case we involuntarily and unconsciously lower our passion to that pitch in which the spectator can go along with it The spectator, on the other hand, seeing what we suffer, endeavours to enter into our sentiments, and rises by an instinctive complaisance to the level of them In regard to those objects which have no peculiar relation either to ourselves or others this sympathy is simple In whatever degree, for instance, the love of truth may be felt, it will not directly affect the happiness of any one, it cannot excite any [illegible] [illegible] [illegible] with It may, there [illegible] [illegible] [illegible] because there is no reason either of instinct or of reason to suppress it There are however certain internal dispositions which excite a twofold or even a triple sympathy, which are all of the same kind, thus, when we see a man animated with sentiments of charity and love, pity and benevolence, towards his fellow men, we are affected by a twofold sympathy, *directly* with the benevolent disposition, and *indirectly* with the gratitude which is due from its objects As, then, the two mutually strengthen each other, the benevolent dispositions evidently awaken the highest degrees of sympathy and consequently they contribute most of all to effect that perfect harmony of sentiments and affections to which all men instinctively aspire But, on the other hand, there is a divided sympathy Suppose the case of merited anger, on the one hand we sympathise with the passion of anger, and on the other with the object of it, and with the sufferings which it may bring upon him These are the elements of moral approbation and disapprobation We approve those sentiments of others in which we ourselves are able to participate, and when this sympathy is pure our approbation is unqualified, but mixed with disapprobation when our sympathy is divided. But further, when we witness, for instance, an act of benevolence, we sympathise not only with the feelings of the actor, but also with the emotion of the party benefited Now this emotion is gratitude, but what else is gratitude but an instinctive desire to do good to the benefactor? [illegible] as we participate in the feelings of the [illegible] we wish to do good to the author of [illegible], we feel that he *merits* it in reward for the good which he has done As to the judgment which we pass on our own sentiments and actions, Smith asserts that if it were possible for a human creature to grow up to manhood in some solitary place without communication with his species he could no more think of his own character, of the propriety or demerit of his own actions, of the beauty or deformity of his own mind, than of the beauty or deformity of his own face Since society is essential [illegible] [illegible] which is the rule of [illegible] of all our [illegible] [illegible] to a consciousness of that rule, and by it appreciate the morality or immorality of his acts Our moral criticisms are first exercised upon the character and conduct of others, but we soon learn that others are exercising their judgment upon our own we become anxious to know how far we deserve their censure and applause, and, in order to examine in this respect our own passions and conduct, we have the faculty of supposing ourselves spectators of our own dispositions and behaviour, and so experience in some degree the same sensations as would be excited in our minds by the sight of similar actions

and feelings in another By virtue of this faculty we feel as it were a sympathy with ourselves when we have acted well, and are led to suppose that all other spectators would be similarly affected This consciousness of unison between our own conduct and the sentiments of our fellows constitutes the pleasure of rectitude And further, by aid of the same principle by which we judge of the actions of others, we feel that we have a right to pronounce our own also to be good This is a source of inward tranquillity and satisfaction, while the least suspicion of the contrary gives rise to the pains of remorse In manhood, indeed, when experience has drawn a system of general rules from the occasional judgments of sympathy, [illegible] a new source of pleasure arises We have [illegible] intellectual perception also of the conformity of the act with the law of morality; and, independently of the instinctive approbation the reason also awards to it its sanction This rational perception is wanting in the infantine and uncultivated mind, but it is invariably found wherever education or experience has stored the mind with the general maxims of morality which are primarily founded on the instinctive emotions The act of reason in approbation is simply a perception of the agreeableness of the act with the moral laws, and therefore implies them Lastly, the act itself appears by its very nature to be part of a system of conduct framed to establish a perfect agreement of sentiments among mankind, and this universal harmony being eminently beautiful in itself, we judge in virtue of this perception, the act in question to be not only good but even beautiful This is the principle of moral beauty, which is the origin of every other species of the beautiful (*Theory of Moral Sentiments*)

The doctrine of a moral sense owes its origin to Lord Shaftesbury (born 1671, died 1713) According to this writer, the human dispositions are of two kinds,—the social or benevolent, and the personal or selfish The former lead us to desire the welfare of others simply for its own sake and without regard to our own interests In the developments of these affections the soul takes part, and some are naturally agreeable and others disagreeable to it, of the former it approves and disapproves the latter As these dispositions are a source of pleasure to the soul, there must be in it some faculty distinct from the dispositions themselves by virtue of which they become agreeable or otherwise and which performs the same office in their case as they do with respect to their immediate objects This faculty Shaftesbury calls a sense which he characterises from its mode of operation as *reflex*, and from its object-matter as *moral* The dispositions which this reflex sense approves or disapproves are morally good or evil [illegible] to the former, but resisting the latter Between goodness and virtue there is agreement, but not identity, the former being merely a constitutional predominance of the benevolent affections in the character and conduct the latter being the same state produced by the operation of the conscience or moral sense, which, when the personal affections are of equal force with the social ones, interposes its authority, and inclines the balance in favour of the latter

Butler (born 1692, died 1752), in the same manner divides the principles of action into those which lead directly to private good, and those which promote immediately the good of the community, but of both he shows with great originality that they are alike disinterested The objects of both classes of passions are outward things, which are sought as ends in themselves and without any regard to their tendency to promote happiness, which is the proper end of self-love This, again, is distinguished by Butler from selfishness, which consists in the weakness of the public affections and the undue strength of personal desires Self-love, or an [illegible], is not a vice, [illegible] with the happiness of him who harbours it, since without the gratification of the benevolent feelings it is impossible to attain to the greatest satisfaction of our nature, of which they are a part But, besides these personal and social instincts and self-love, Butler discovers in man another faculty, which by its very nature is supreme over all others, and authoritatively approves or disapproves both the affections of our minds and the actions of our lives This principle is conscience Its perceptions are immediate, and its very idea implies that supremacy and authority are essential to it (*Sermons at the Rolls Chapel*)

The first object of Hutcheson (born 1694, died 1747,) is to show that the very frame of our nature which determines us to pursue happiness for ourselves, also determines us both to esteem and to benevolence on their proper occasions But besides these original desires, he shows that there arise, in consequence of them, *secondary* desires of every thing useful to gratify the primary ones But there is also in man an idea of moral good which can be explained by neither of the former By a careful analysis, Hutcheson shows that by moral good we understand neither what gives pleasure by satisfying our benevolence nor what is simply good to others, nor is it what is useful to others or agreeable to the spectator nor, lastly, is it a conformity to the will of God or to law, or truth, or order It is simply what the word itself expresses, which [illegible] by any other From its simple and special character of the term, Hutcheson argues that it must be perceived by a sense, because the senses alone are percipient of simple qualities, and by a special sense specifically apprehended by it differs from all other objects of sensation Further he observes that this perception is attended with pleasure, which is the property of all sensations perceptions, and that as moral [illegible] and rule of action, it must be apprehended by a sense, since the understanding can neither propose the ends of human activity nor exercise any influence on the will Again, the pleasure which accompanies the perception of moral being a consequence of [illegible] presupposes it, therefore it is impossible to resolve moral good, or the approbation which we award to it, into that pleasure, this would be to resolve the cause into the effect and the consequence into the principle As the qualities which it is the province of the moral sense to discover belong to the internal affections and emotions, it is internal and not external, although, like the outward senses, it is capable of improvement by education and habit This sense is designed to govern all the others, and we have an immediate consciousness of its authority Reason is the servant of this sense, its only office being to discover and to combine the means necessary to the attainment of the objects which the moral sense approves of [illegible] benevolence alone every [illegible] which has in view our own advantage is, simply on that account, morally wrong, it may be innocent—it cannot be virtuous. (*Inquiry into Beauty and Virtue*)

According to Hume, (born 1711, died 1776,) all the mental qualities and actions which are generally approved of by mankind agree in the [illegible] being useful to society The fact that [illegible] of moral approbation correspond to the degrees of utility, affords an explanation of the greater merit ascribed to the benevolent passions for these tend to the happiness of many, and indeed of all, whereas the personal affections tend to that of the agent alone Yet even the latter are in a degree meritorious, inasmuch as they are useful to one, and they are only to be blamed when they are entertained at the sacrifice of the social feelings The pursuit of self interest is in the latter case culpable, although in itself it is not only innocent, but praiseworthy for we admire in any character certain qualities such as prudence, for instance merely because they appear fitted to promote his personal welfare In short, whatever is useful is morally good, and is only to be disapproved when it is preferred to what is more useful That which judges of utility and the contrary is reason, but if we approve of one and disapprove of the other, and call the former good, [illegible] evil, this is in virtue of a primary sentiment of our nature, which leads us to prefer the useful to the hurtful, as we prefer what is sweet to what is bitter This instinct, however, is distinct from and frequently opposed to self-love, for this would lead us to love what is useful to ourselves and not what is useful in itself absolutely and independently of any reference to our own advantage This instinct is commonly called conscience, or the moral faculty, but more frequently designated by Hume as benevolence or [illegible] as its object is the good of mankind [illegible] idea [illegible] is simply a conception of the [illegible] What is honoured by this name is, he says, nothing more than the undoubtedly correct view, that there is more happiness in obeying the impulses of the moral sense than in following the dictates of self love The reason is incapable of exercising any influence on the will What determines us when we resolve to act rightly is merely the charm which utility exercises on the mind, and the force of certain dispositions which propel us to seek the good of ourselves and others, and are invariably seconding the promptings of conscience (*Inquiry concerning the Principles of Morals*)

Mackintosh (born 1765, died 1832,) agrees with all the writers of the instinctive school in denying conscience to be either a state or act of the understanding, but differs from one form of the sentimental theory by denying that man has any special organization for moral perception, while he equally dissents from the other view, which would refer these perceptions to some one of the original and admitted sentiments of our nature Butler and Stewart had shown that self-love is a secondary principle, and Hartley had exhibited the important part which association plays in the formation of our passions and affections, and even of our sentiments of [illegible] and duty This view was further developed by Mackintosh who declared conscience itself to be a similar derivative

In the same manner he says that in the formation of self-love the desire which originally attaches to external objects is transferred to the pleasure which results from [illegible] certain actions is transferred to the volitions which determine conduct, so that the latter become at last the immediate objects of love and repugnance In this manner there is formed by association a number of secondary desires and aversions, whose proper object is volition, and which collectively form that interior principle called conscience, which judges, without regard to consequences, unerringly and authoritatively As to the action of conscience on the will, this is composed both of the [illegible] of the primary dispositions, which it causes to erump and of the pleasures naturally attached to them, as well as those which are produced by the gratification of the secondary affections Accordingly, Mackintosh strongly insists upon the distinction between perception and emotion and declares that the phrase *association* of ideas, as overlooking this distinction, conveys but a partial and incomplete view of the truth He therefore proposes to substitute for it association of thoughts with emotions and with each other, but at the same time declares that the term "association" very inadequately indicates that perfect combination and fusion which occurs in these operations of the mind For the moral faculty is properly and intelligibly spoken of as one Now it is as common in mind as in matter for a compound to have properties not to be found in any of its constituent parts the originally separate feelings are so completely blended together that they can no longer be disjoined from each other Thus the sentiment of moral approbation, formed by association out of antecedent affections may become so perfectly independent of them that we are no longer conscious of the process by which they were formed It is in this mature and sound state of nature that our emotions at sight of right and wrong are ascribed to conscience And although this supreme arbiter and judge of human conduct does not supersede the ordinary motives of virtuous feelings and habits which are the ordinary motives to good actions, it yet exercises a lawful authority over them Whatsoever actions and dispositions are approved by conscience acquire the names of virtues and duties, they are thereby pronounced to deserve commendation, and we are justly considered as under a moral *obligation* to practise the actions and cultivate the dispositions The peculiar character of the moral sentiments is their exclusive reference to *states of the will* and this is a character both of the private desires and social affections, and indeed, among the many dissimilar elements that enter into the formation of conscience this is the only common property that the mind can discover Hence, however, the facility with which general terms, at first limited to relations between ourselves and others, are gradually applied to any voluntary acts and dispositions it is thus that prudence and temperance, for instance, become objects of moral approbation On the other hand, as the will is the sole means of gratifying any passion, the power of conscience is coextensive with the whole man It is a universal principle because will is the universal means And as, when the mind is in a healthy state, nothing is interposed between it and the will, the dictate of conscience is immediately followed by a determination of will, conscience is thus at once universal, independent, and commanding Lastly, as Mackintosh held that utility as tending to promote the greatest happiness of the species, is the criterium of morality he naturally felt himself called upon to explain the fact that, while the moral approbation involves no perception of a beneficent tendency there is nevertheless a striking coincidence between that principle and the moral sentiments He replies that it is true that conscience itself rarely contemplates so distant an object as the welfare of all sentient beings, but that all its elements are invariably tending to this end The social affections promote happiness so far as their foresight and power extend, the rules of justice are conducive, if not necessary to the well-being of society, even the angry passions, so far as they are ministers of morality, are employed in removing hindrances to the welfare of ourselves and others, and if the private passions terminate in the happiness of the individual this is yet a part of the general happiness And although this beneficent tendency be not of the nature of a motive to conscience, because our voluntary acts are not felt to affect it, yet little is left to reason to perform, which is, to discover merely the truth, that the acts of those who labour to promote separate portions of happiness must increase the amount of the whole (*Dissertation on the Progress of* [illegible]

[illegible] the rational theory of morality is, that it considers the idea of good to be an *à priori* conception of reason, in which the idea of obligation is necessarily and essentially implied As to the nature of the idea itself, two opinions have been held. While some moralists of this school pronounce it to be simple and immediate others resolve it into some higher notion of the intellect, from which it derives at once its explanation and authority

The most distinguished representatives of the latter opinion are Clarke and Wollaston, while the former has found able advocates in Cudworth Price and Stewart [illegible] died 1729), the universe is an assemblage of objects held together by certain mutual relations which result from their respective natures, but as the nature or essence of things is immutable and real, and the essence is the principle of the relations, the latter must be equally real and immutable, and as they must have been always present to the Eternal Mind they are also eternal Now, as soon as reason conceives these relations as constituting the laws of individual things, and the order of the universe, they immediately appear to command the respect of every free and rational agent Hence the obligation on every creature capable of thought to act conformably to those relations, and every act agreeable to them is judged to be good, and evil if opposed to them Now, moral good being the conformity to the relations of objects, these, while they constitute, serve also to explain, all duties Thus, the true nature of God and man, and their reciprocal relations, being known, the duties of man towards God are at once discoverable In the same way the duties of man to his fellows similarly suggest themselves from a consideration of their relations as equally free and independent beings, and as the latter relation is one of equality, whereas that between God and man is one of inequality, the difference between the two classes of duties which those relations respectively engender is at once conceivable In confirmation of this view of the moral principle, Clarke appeals to the historical fact of the gradual development of moral ideas among mankind for the knowledge of the nature of things, and their consequent relations, is neither natural nor immediate to the mind, but is gradually unfolded by observation and science, which are more or less complete according to the degrees of its culture The evolution of moral science, although subsequent to that of nature, nevertheless being once awakened, is promoted by its progress and keeps pace with the advancement of civilization (*Being and Attributes of God, Evidence of Natural and Revealed Religion*)

Wollaston (born 1659, died 1724) makes morality to be conformity to t[illegible] of this view he asserts that actions, [illegible] are but signs, and that consequently every true proposition, i e one which expresses things as they are, may be contradicted by deeds as well as by words To violate a compact, for instance, is simply to deny by that act that there is any such compact subsisting He then asserts that no act, whether word or deed, of any free and rational agent to whom moral good and evil are imputable, which interferes with any true proposition or denies anything to be as it is can be right 1 or, 1, if a false proposition be wrong, the act which implies, or is founded on it cannot be right 2 Whatever interferes with a true proposition, which expresses the relation between the subject and attribute as it is in nature must therefore, interfere with nature, and is consequently unnatural, or wrong in nature 3 An act which contradicts a true proposition contradicts what is and is, therefore, a revolt against God, the author of whatever is 4 To deny things to be as they are, is a transgression of the great law of our nature — the law of reason What is said of acts inconsistent with truth may be said of omissions to act, since by these, also, true propositions may be denied to be true For instance, whoever having [illegible] the contrary act nevertheless voluntarily [illegible] to be [illegible] as if there had been no such [illegible] Having thus established his theory, he proceeds in Clarke's to show that it is agreeable to facts and [illegible] that of the progressive development of morality For morality being simply the truth expressed in action, it implies the knowledge of truth, and consequently the improvement of the moral perceptions must be proportional to the progress of science It also affords an explanation of erroneous views in morality, and of the difference so universally drawn by the common sense of mankind between error and vice If it is possible to err in morals, this is because the mind is liable to err in science, and not to see things as they actually are To err in morals is but to affirm practically a false position hence the act may be evil, but the [illegible] culpable, since his error is involuntary [illegible] Wollaston maintains that his theory [illegible] far from being [illegible] acknowledged [illegible] of the ideas of moral good affords the only just explanation of them This truth is immutable, because it expresses the unchangeable nature of things, and therefore the ideas of moral good are immutable Hence, too, the same eternal distinction between moral good and evil as between truth and falsehood Whatever, in short, may be predicated of truth, is applicable to the moral principle, and its foundations are as valid and

imperishable as those of science itself. (*The Religion of Nature*)

[illegible] which explains the [illegible] conception of the intuitive reason, intelligible in itself, and incapable of definition, now remains for elucidation. According to Cudworth (born 1617, died 1688), certain universal and absolute ideas exist from all eternity in the Divine mind, from which the human intellect [illegible] re-fore, by its nature possesses these [illegible] to experience. They remain dormant, it is true, until outward objects call them forth, but when once awakened, they immediately apply themselves to things, and give them a significant character, which in themselves they do not possess. Cudworth's chief object in advancing this theory of intellection, was to exempt the ideas of right and wrong from [illegible] and relative character with which the sensational doctrine of Hobbes had invested them. Secondarily, he shows that no relation of human will or pleasure can constitute these ideas. Positive laws, he urges, do not oblige by their mere enactment, but by virtue of the natural ideas of [illegible] which they imply. Neither is this [illegible] of man's reason, for this does but conceive it, and, by applying its unchangeable standard to actions and characters, appreciates and judges them. Lastly, this idea is so indefinable and inseparably connected with that of obligation. Hence every virtue assumes the character of a duty, and is as unalterable as good itself. (*Eternal and Immutable Morality*)

Price (born 1723, died 1791,) ascribes all simple ideas to two faculties — sense and understanding. The latter sees things as they are; the former perceives the effects only that they produce on the sensuous organization. The ideas of the understanding consequently express realities which are independent of man, whereas those of the latter are sensations which would be different if man's sensuous organs were changed. Now the question of the objective reality and immutability of the ideas of right and wrong reduces itself to the inquiry into their origin. According to Price they belong to the understanding as a faculty of intuition or immediate power of perception distinct from the understanding as a reasoning or deductive faculty. The doctrine which would assign them to sensation as their origin has its source in the fact that the moral perceptions are invariably attended with agreeable or disagreeable emotions, and the exclusive consideration of this circumstance. But when men declare gratitude to be a virtue, and ingratitude a vice, they intend to signify not merely that they produce emotions in their own minds, but that they are naturally virtuous and vicious in themselves. If by virtue and vice nothing more be meant than certain mental affections, then, in that case, our moral judgments would be infallible, and the same act might with equal truth be the subject of the most conflicting estimates, and all things would be indifferent in their own nature, since the understanding, which alone apprehends things as they are, could see in them neither good nor evil. Moreover, in this case, they would be without authority for [illegible] to do what is pleasing, or to forbear what is [illegible]. But these ideas are both immutable and imperative: they are immutable, since they are real qualities of actions, and every real quality is a part of the nature of things, which is immutable. God may destroy the things themselves, but he cannot cause them to be what they are not. After establishing the rational origin and immutable character of the moral perceptions, Price proceeds to explain the manner in which they are apprehended by the intuitive reason. As the sight of an event suggests the idea that it must have taken place in time, and thereby we arrive at the idea of duration, in the same way certain actions of free and rational agents are immediately apprehended to be good or evil, and the ideas of right and wrong arise in the consciousness. As to the notions of moral beauty and deformity, these we ascribe to good and evil actions in virtue of the pleasure and pain which accompany, but yet are distinct from the perception of right and wrong. In contemplating the actions and affections of moral agents, we have both a *perception of the understanding*, and a *feeling of the heart*, the latter are the effects of the former, and partly depend on the positive constitution of [illegible] nature and [illegible] object and faculty. The former and [illegible] and the [illegible] account were given [illegible] have, so God has [illegible] some objects and ideas which have a natural fitness and unfitness to please our mind, and such is the nature of certain actions that when perceived by a rational being, there must result in him certain emotions and affections. These are at first of a purely intellectual kind, but, as such, they are too weak to govern and actuate mankind, and they are therefore combined with a stronger excitement, and we are endowed with certain special instincts which impel us to goodness, and by means of these we are effectually moved towards their proper objects. As to duty or obligation: this idea is so intimately allied to that of good, that one cannot appear without the other. Obligation to action and rightness to action are plainly coincident and identical. It is not plainer that figure implies something figured, than that rightness implies oughtness. Rewards and punishments suppose in their very idea moral obligation, and are founded upon it. They do not make it [illegible] [illegible] motives to [illegible] it. They are the *sanctions* of virtue, but not its *efficients*. The ideas of [illegible] and desert are equally immediate, for these are really nothing less than a species of the ideas of right and wrong; although there is this difference in them, that while the latter are properly ascribed to actions, merit and demerit are applicable to agents or persons only. We have an immediate approbation of making the virtuous happy, and discouraging the vicious apart from all consequences. The conception of virtue is totally distinct from the fact that virtue is a source of pleasure, for it is one thing to find by experience that the tendency of virtue is to the happiness of the world, and vice to its misery, and another to conceive that virtue is by a necessary truth deserving of happiness. Neither does it result from the view that virtue is of public utility; for, even though this consideration may incline us to wish good to the virtuous, yet are we antecedently moved to the same wish by the more immediate and more simple consideration that he is virtuous, and as such, without any other consideration, we pronounce him deserving of honour. Lastly, Price makes liberty and intelligence to be essentially necessary to the morality of the agent, and rightly distinguishes absolute virtue, which is to act voluntarily and consciously in conformity with the moral laws, from practical virtue, or acting on a belief of good in supposed conformity to good. (*View of Principal Questions and Difficulties in Morals*)

Stewart (born 1753, died 1828,) distinguishes two questions in the fundamental problem of ethics — that of the nature of good, and that of the faculty which discerns and judges of it. With respect to the first, he teaches that upon observation of certain actions the idea of good arises in the mind. This idea represents a certain quality of the actions themselves, and inherent in them, like the primary qualities of bodies, and therefore independent of the sensuous percipient, and not, like the secondary qualities, mere relations between us and the actions. As to the nature of these qualities they are, like the ideas which we have of them, perfectly original, simple and irreducible, and consequently indefinable. He further shows after Price, that it is impossible to explain the terms good and evil except by synonyms, or by substituting for the ideas which they represent some of the circumstances which accompany the perception of them. As to the second question Stewart argues that good being a simple and real quality in actions, it is impossible to refer the idea of it to any faculty which is not a source of original ideas, and which does not apprehend the real and inherent qualities of objects. It is therefore, impossible to refer it to a sense,—such as that of taste or smell which do not reveal the real nature of objects but only the effect which they produce in the perceiving subject, nor to reason — if by this term we understand nothing more than the faculty which seizes the relations and deductions of ideas previously established, because the idea of good is simple and original, and not one of relation and consequence, but if by sense we understand a faculty analogous to that which perceives the primary qualities of bodies and their existence,—or if by reason we mean the intuitive understanding which furnishes the simple primary, and original ideas of time, space, and causation,—then the ideas of good and evil may be referred to either. If Stewart inclines, nevertheless, to favour the claims of reason he yet declares the question to be unimportant when once it has been admitted that good and evil are simple and indefinable. (*Philosophy of the Active and Moral Powers*)

In this exposition, the first object has been to give a correct and impartial view of the several theories which have been proposed of the nature of virtue and of the moral perceptions. Their comparative merits have been left to the reader's judgment, unbiassed and undisturbed by any critical estimate by the writer himself, except so far as [illegible] implies [illegible] (Ritter, *History of Ancient Philosophy*, Mackintosh, *Dissertation on Ethical Philosophy*, Whewell, *Architectonic Sciences*, Jouffroy, *Droit Naturel*, Cousin, *Introduction à l'Histoire de la Philosophie Morale*, and the articles ÉTHICS and SCHELLING in this work.)

VIS (Lat. *force* or *power*), in Mechanics, is synonymous with *force*. The term is chiefly used by the older writers, and is applied by them to divers kinds of forces or powers. Thus *vis acceleratrix*, accelerating force, *vis inertiæ*, resistance, *vis motrix*, moving force, &c. *Vis mortua*, and *vis viva*, are terms which were used by Leibnitz and his followers, the former signifying a pressure, and the latter the force of a body in motion estimated by the distance the body goes to.

About the beginning of the last century, a keen dispute [illegible] manner [illegible] to be estimated It began with a prize essay by John Bernoulli on the Investigation of the Laws of the Communication of Motion," and was carried on for many years with great asperity The question was, whether the force of a moving body [illegible] to the square of the velocity, or to the [illegible] only of the velocity No controversy, [illegible] was ever carried on by more illustrious disputants Maclaurin, Stirling, Desaguliers Jurin, Clarke, Mairan, were all engaged on the one side, and on the opposite were Bernoulli Herman Poleni, S'Gravesande, Muschenbroek The dispute was taken up as a point of national honour Germany, Holland, and Italy declared for the *vis viva*, England stood firm for the old doctrine, and France was divided between the two opinions (*Dissertation on the Progress of Math and Phys Science, Ency Brit*) The difference in this case, as in most other disputes of a similar kind, arose from the parties not understanding each other When the effect of a body in motion is measured by the distance to which it goes, the effect is proportional to the square of the velocity If measured by the time that elapses before the motion is destroyed by a resistance of uniform intensity, it is as the velocity simply Both measures may be considered as correct, and they are not inconsistent when rightly understood (*Playfair's Nat Phil* vol i p 56) The *vis viva*, considered as a power residing in a moving body, is otherwise [illegible] *See* FORCE

VISCOUNT A title of honour, in its original signification, the delegate of a count (vice-comes) and applied to governors of towns and districts under the authority of that officer In England the appellation of vice-comes or viscounte, in Norman French, was long used to designate the sheriff of a county (the vicegerent of the earl) before it became a title of peerage It is the most modern of English honours in the latter sense, and was first conferred by letters patent on John Lord Beaumont, and the heirs male of his body, by Henry VI in 1440 For the rank of the viscount, see PRECEDENCY

VISHNU One of the three principal deities of the Hindoo mythology, the other two being Brahma and Siva He is commonly called the Preserver the other two being respectively the Creator and the Destroyer The great objects of his providence are brought about by his successive incarnations or avatars, in which he appears and acts on earth Nine of these have taken place The last is said to have been the appearance of Buddha, which is supposed by some learned critics [illegible] to have taken place about A D 1014, and hence the Buddhists reject the Vedas, which were compiled before that event (*See* VEDAS) The tenth avatar of Vishnu is yet to take place, when he will appear on a white [illegible] the everlasting punishment [illegible] incarnations of Vishnu is the celebrated Juggernaut, whose temple and worship hold such a prominent place in Indian superstition On the great annual festival in his honour, all distinctions of castes and classes are forgotten, and even on that occasion the Brahminical Hindoos and the followers of Buddha cease their [illegible] hostilities The word Juggernaut signifies literally *Lord of the Universe*, and it is said that on the day he expired Buddha assumed this appellation exclaiming, "*O Universe, I am thy Lord*"

VISIBLE Capable of being seen Objects are visible or otherwise, according as they emit or reflect a sufficient quantity of light to make a sensible impression on the retina of the eye According to Newton, colour is the proper object of sight, the visibility of an object must therefore depend on its transmitting to the eye rays of a different colour from those which proceed from [illegible]

VISION [illegible]s, the faculty of seeing Philosophers have disputed much respecting the means of vision, and its seat in the eye The Platonists and Stoics held vision to be effected by the emission of rays out of the eyes The Epicureans supposed vision to be performed by the emanation of images or corporeal species from objects to the eye, and the Peripatetics differed in opinion from the Epicureans by [illegible] species received by the eye to be incorporated [illegible] philosophers agree in referring the cause of vision to the impressions of light on the eye, but whether this impression is made by material [illegible] or a self-luminous body, and reflected [illegible] or by the medium of a fluid of great elasticity exciting the eye by the vibrations communicated to it by the luminous body, is a question which is still undetermined (*See* LIGHT) In what [illegible] the eye or the particular part of it affected [illegible] conveys to the brain the impressions it receives from the luminous rays, is a question which philosophy has not yet solved, and will probably [illegible]

Seat of Vision — The retina of the eye, on which an inverted image of external objects is formed, has usually been regarded as the seat of vision, but this opinion was [illegible] brought into doubt by the accidental discovery of Mariotte, that the base of the optic nerve is insensible to the rays of [illegible] incapable of conveying to the [illegible] vision But the retina, being only the extension or contraction of the optic nerve, Mariotte inferred that if the former were the true seat of vision, that part of it at the entrance of the nerve, and where it exists in the greatest quantity, and where precisely vision is wanted, ought to be at least as sensible to the rays of [illegible] parts. Mariotte, therefore, concluded [illegible] d coat which lies immediately below the retina, and lines the whole bottom of the eye excepting the place at which the optic nerve is inserted is the real seat and cause of vision (*Priestley on Vision, Light, and Colours*, p 722, or *Hutton's Dictionary*) The opacity of the choroid coat, and the transparency of the retina, which render it an unfit ground for the reception of images, furnish arguments in support of this view, and an interesting fact was observed by Sir D Brewster which points to the same conclusion He observed that in young persons the choroid coat which is generally supposed to be black, and to grow fainter by age, reflects a brilliant crimson colour, like that of dogs and other animals Hence, if the retina is affected by rays which pass through it, this crimson light, which must necessarily be transmitted by it ought to excite the sensation of crimson, which he found not to be the case ("Optics," *Cab Cycl* p 291)

M Lehot, a French writer, has recently attempted to prove that the seat of vision is in the vitreous humour, and that instead of seeing a flat picture of objects, we actually see an image of three dimensions To produce this effect he supposes that the retina sends out a number of small nervous filaments, which extend into the vitreous humour, and convey to the brain the impressions of all parts of the image (Id p 292 For further information on this subject, see *Jurin's Essay on Distinct and Indistinct Vision*, in *Smith's Optics*, *Robins' Tracts*, vol ii, a paper *On Vision* by Dr T Young *Phil Trans* 1793, *Horn on the Seat of Vision*, 8vo 1813) *See* OPTICS

VISION, BEATIFIC In Theology The doctors of the church distinguish three manners of seeing or knowing God which they call, 1 *Abstractive vision*, i e through the consideration of his attributes 2 *Beatific* or *intuitive vision*, that which the faithful enjoy in heaven (1 Cor xiii 12) The belief termed Catholic by the Romanists is that this vision is accorded to the just, who die with it leaving a sin unexpiated, immediately on their departure The Greek church holds that they do not enjoy it before the general resurrection This is one of the points decided by the Council of Florence in 1439, and its decision is confirmed by that of Trent 3 The third kind of vision, or *comprehension*, is that which belongs to God, who alone can know Himself as He is Prophetic vision is only the knowledge of future or distant events given by inspiration

VISITATION In Ecclesiastical Law, the inspection by the bishop of the several parishes in his diocese, or by an archbishop of the dioceses in his province By the ancient canon law visitations were to be held once a year, and by the personal repairing of the ordinary to each parish, but the modern practice, which appears to have come gradually into use, owing to the extent of dioceses, is to summon the clergy from several parts to one convenient place The times of episcopal visitations are now usually fixed in this country about Easter and Michaelmas By Can 60 of the English Church, such visitations for the purpose of confirmation must be triennial at least The [illegible] of the ancient practice has by degrees devolved [illegible] archdeacon [illegible] bound to see that the offices of the church are duly administered, to keep account of the ornaments, vestments, &c appertaining to the churches, to examine into the state of repair of parsonages, churchyards, &c; and to receive presentments of excesses committed by ecclesiastical persons Ecclesiastical corporations, such as conventual bodies, had usually their special visitors appointed by the founder, as is the case at present with colleges in our universities, hospitals, &c

VISITATION A festival of the Western Church, in honour of the visit of the Virgin Mary to Elizabeth; said to have been first instituted among the Franciscans by Saint Bonaventure, general of that order It is celebrated on the 2d July A female religious order was founded in Savoy in 1610 by St Francis de Salis, in honour of the visitation

VISUAL ANGLE, in Optics, is the angle under which an object is seen, or the angle formed at the eye by the rays of light coming from the extremities of the object *Visual rays* are the lines of light coming from an object to the eye

VITAL VESSELS A name given by Schultz to certain vessels ramifying in all directions in plants, especially near the surface, and conveying latex, which that

physiologist calls a vital fluid The milk-vessels of [illegible] are vital vessels

VITELLUS In Botany, a name given to the fleshy sac that is sometimes present in seeds, interposed between the [illegible] enveloping the latter [illegible]

VITILIGO (Lat vitulus, *a calf*) A disease of the skin, giving it a white appearance somewhat resembling that of calves

VITIS (Celt. gwid, *a tree*), the grape vine, is doubtless a native of Asia Minor, although its universal cultivation renders it no longer possible to distinguish the wild from the domesticated kinds It is the type of the Vitaceous order, which consists of plants climbing by tendrils and producing astringent berries succeeded by succulent fruit Some of the species are however to be compared with the true grape *Vitis vinifera* for quality, the best of the American species being disagreeable to the taste and some of the order even acrid The reputed varieties of grape are innumerable if we are to believe the writers on the subject, 1400 being cultivated in the garden of the Luxembourg alone There is no doubt however that many of these are repetitions of each other When the pulp is fleshy and sweet, and the skin thick, raisins are prepared from the fruit, and when it is watery and less sweet, with a thin skin grapes are best suited for wine The currants of the grocers are the dried berries of a small variety of the grape cultivated at Zante

VITREOUS HUMOUR so called from its glassy appearance is the third or interior humour of the eye, filling a large portion of the eyeball and greatly exceeding in quantity the aqueous and crystalline humours together According to Sir D Brewster, the refractive power of the vitreous humour is 1 3394 See OPTICS

VITRIFIED WALLS or FORTIFICATIONS Ancient remains discovered in Scotland, constructed of stones piled rudely upon one another and firmly cemented together by some matter which has been vitrified by means of fire They generally surround the top of some steep conical hill They have been discovered chiefly in the Highlands, but also in Galloway The vitrification is mostly external the interior of the walls being a mere heap of loose stones Daines Barrington considered the vitrification to be accidental, but his explanation of how it took place is not very intelligible (*Archæologia*, vol vi) It seems more reasonable to suppose that the art was derived from observation of the ease with which some kinds of earth containing much iron ore are vitrified by fire and that the process was rendered easy by the quantities of wood which in early days covered the Highlands

VITRINA (Lat vitrea *glass*) A genus of fresh-water Gastropods, so called from the extreme thinness and fragility of the shell, and its watery green appearance *Vitrina pellucida* and *Vitr elongata* are natives of Great Britain

VITRIOL (Lat vitrum *glass*, from the glassy character of its crystals) This term is applied by the old writers to crystallized sulphate of iron, or *green vitriol* sulphate of copper and sulphate of zinc were afterwards called *blue vitriol* and *white vitriol* See IRON, COPPER, ZINC

VITRIOL, OIL OF The old name of sulphuric acid, which was originally obtained by distilling green vitriol See SULPHUR

VIVACE (It *lively*) In Music, a term which, affixed to a movement, denotes that it is to be executed by the performer in a lively manner It is a mean between *allegro* and *largo*, but, if any thing, rather nearer the former than the latter

VIVERRIDÆ (Lat viverra, *a ferret*) Civet tribe The name of a tribe of Carnivorous Mammals of which the genus *Viverra* is the type The characters are three premolars above and four below, two tolerably large tuberculate molars above, one tuberculate and one sectorial molar below, the tongue beset with firm papillæ, claws more or less retracted, a large anal scent-gland and pouch

VIVIPAROUS (*Viviparus*) (Lat vivus, *alive*, and pario, *I bring forth*) Those animals are so called which bring forth their young developed and alive, and commonly extricated from the egg coverings, as all the Mammalia, which were hence called Zootoka by Aristotle, many reptiles, as the viper or "viviper," some fishes, and numerous invertebrate animals In its restricted sense, the term signifies that mode of generation in which the chorion, or external tunic of the ovum, contracts a vascular adhesion with the uterus, and hence only the Placental Mammalia are truly viviparous, the rest being termed ovi-viviparous

VIZIR (In Arabic *a porter*, and, by a singular metaphor, the title in various oriental countries of a minister and councillor of state) The grand khalifs had their vizirs, who attained to the highest rank and consideration in their states, and were often more powerful than their masters, but after the creation of the new dignity of Emir-ul-omrah (commander of commanders), by Khalif Radh [illegible] consideration In [illegible] in the divan, generally eight in number, are styled vizirs, and the chief among them vizir azem, rendered by us by grand vizir, which is the highest temporal dignity in the empire

VOCATION (Lat voco, *I call*) In Divinity, the grace vouchsafed by God to any man in calling him from death unto life putting him into the way of salvation It is also used for the call of the Holy Spirit, by which persons are supposed to be initiated into the [illegible]

[illegible] produced by the vibration of air emitted from the lungs of animals which vibration is caused by an organ developed in the wind pipe, called the "larynx" Mammals, birds, and reptiles, are the only animals, which, according to the above definition, possess a voice, but many species of other classes produce peculiar sounds by which the individuals are attracted to each other or express their wants and feelings A true organ of voice includes the lungs, bronchi, trachea, larynx and mouth The most essential parts are two vibratile chords bounding a slit shaped aperture called the "glottis," and this may be situated at different parts of the air-tube in different animals, the portion of the tube between the glottis and the oral outlet being the true sonorous instrument In mammals and reptiles the glottis is situated at the end of the wind-pipe which communicates with the bronchial tubes and consequently the whole trachea becomes, in this class, part of the vocal instrument The organ of voice in reptiles consists of a simple larynx, without an epiglottis and in which the glottis is merely membranous, not provided with fibrous vocal chords Since neither fleshy moveable lips nor soft palate exist in this class, the voice cannot undergo any farther modification after its formation by the simple larynx It consequently rarely rises beyond a hiss, and in the frog tribe, where the bones or gristles of the larynx are largest and most complicated and the vibratile membrane of the glottis is best developed, the voice is only a more or less noisy croak

In mammals the air driven by the muscles of expiration from the lungs through the trachea strikes against the two vibratile vocal chords which bound the sides of the glottis, and a voice is produced varying in different animals according [illegible] of tensions of the [illegible] shape, and various [illegible] of the pharynx, of the tongue, and of the mouth and lips

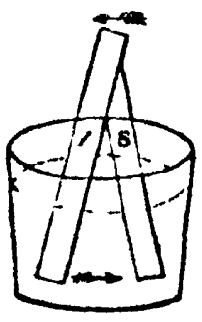
The superior organization and mobility of the tongue and lips enables man to modify his vocal sounds so as to render them articulate and adapted to express the ideas which it is his peculiar privilege to form Although some quadrupeds possess the imitative faculty, and can be taught to do certain tricks it would seem that the physical condition of their vocal organs is an insuperable impediment to their imitation of the human speech

The sacculi or membranous pouches which communicate with the larynx in the chimpanzee, orang and most other quadrumanous animals, together with their thicker and more confined tongues and less flexible lips, are assumed to constitute the impediments to speech in them, but it may be doubted whether they have the imitative faculty for sounds possessed by the parrot or starling, and in respect of their voluntary application of their vocal organs to speech the absence of any such [illegible] is accounted for by presuming that they [illegible] to say

In birds, which possess the most diversified and complicated organ of voice, combined in some species with a [illegible] instances are not uncommon, [illegible] and crow tribe, of an acquired power of forming articulate sounds superadded to the [illegible]

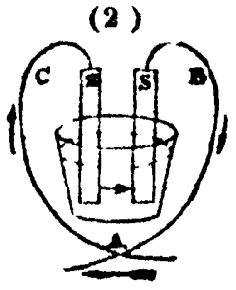
VOIR DIRE (Norm Fr a corruption of vrai dire, *to speak the truth*) In Law, according to ancient practice, an objection to the competency of a witness, in a trial at common law, could only be taken on a preliminary examination, in which the witness was sworn *to speak the truth*, and then examined touching his interest in the subject matter The same practice is still followed occasionally, although the objection may now be taken when it arises on the examination in chief.

VOLATILE ALKALI See AMMONIA.



VOLCANO See GEOLOGY

VOLTA-ELECTRIC INDUCTION The term *induction*, as applied to common electricity (of tension), has been explained under the word ELECTRICITY By volta-electric induction, we mean that is [illegible] was discovered by Mr Faraday (*Philos Trans*), and were briefly as follows — A long copper wire was wound in the form of a spiral round a cylinder of wood a similar but perfectly separate spiral, was then wound upon the same rod, the coils of each

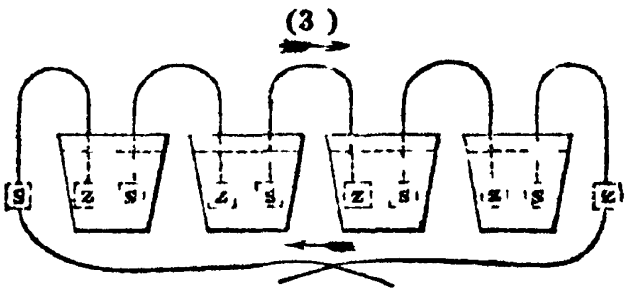


being interposed and close to each other, but nowhere in contact; the extremes of one of the wires were then connected with the galvanometer and those of the other with a voltaic battery At the moment of making the contact with the battery, as well as of breaking it, the deflection of the galvanometer indicated a current of induced electricity in the proximate spiral, but in the interval, that is, while the current of electricity was continuing quietly to traverse, no deflection took place the induced current was found to be in one direction upon making the contact, and in an opposite direction upon breaking it

VOLTAIC ELECTRICITY The phenomena resulting from the evolution of electricity by chemical action, as manifested by that important instrument of electro-chemical research called the *Voltaic Battery*, are usually included under the above term Whenever substances act chemically upon each other their electrical states are disturbed, but the electricity thus evolved is, in ordinary cases, so lost and dissipated as to escape observation It may, however, be rendered manifest by the following simple arrangements —When a plate of pure zinc (or of common zinc rubbed over or amalgamated with mercury) is dipped into a glass of very dilute sulphuric acid, little or no action is observed, nor does any thing happen when a similar plate of silver is placed in the same cup of acid provided the metals be kept apart from each other But if as in the annexed figure, the zinc and silver be brought into contact, at their extremities out of the liquid, the water is decomposed, its oxygen combines with the zinc to form oxide of zinc, which is dissolved by the acid, and its hydrogen passes over to the surface of the silver, where it collects, and ultimately escapes in gaseous globules These phenomena are further connected with the production of a continuous current of electricity passing *from* the zinc across the water *to* the silver, and again from the silver by metallic contact, to the zinc, in the direction represented by the darts It is not necessary that the metals should be connected exactly as represented in the above diagram, but it *is* necessary to the establishment of the continuous electric current that they should be somewhere in contact, or at least connected by what is usually termed a perfect conductor By modifying (as represented in the margin by fig 2) the preceding arrangement, so that the metallic contact between the plates be made *out* of the vessel, namely at the point A the electric current takes the same direction travelling through the liquid *from* the zinc or generating plate *Z to* the conducting plate S, and through the wires B and C back again to Z, as shown by the darts Here again Z is oxidized and dissolved, and hydrogen is liberated upon S, but the moment that the circuit is broken, by parting the wires at A these actions cease, because the electric current ceases to flow It is evident that various substances may be interposed between the wires at A, or they may be immersed into different liquids, and provided these are capable of transmitting electricity the current will still pass, and its phenomena under a variety of circumstances may be studied In this arrangement the end of the wire B is the *emitting*, and of C the *receiving* point or pole, hence these have been termed, in reference to the common electrical machine, the *positive* and *negative poles* Mr Faraday with a view of avoiding certain misapprehensions to which these terms give rise calls them the *electrodes*, the positive electrode he further terms the *anelectrode*, and the negative the *cat-electrode* *See* ANODE

(1)

(2)

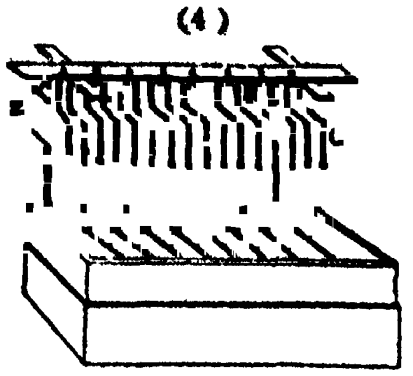


In the preceding paragraph it has been assumed that the generating metal is *zinc*, the conducting or conveying metal *silver*, and that the intermediate liquid is *dilute sulphuric acid* A number of other metals may be substituted for the above; namely, for the zinc, cadmium for instance, or iron, and for the silver, platinum, gold, or copper Many liquids may also be substituted for the dilute sulphuric acid, the requisite condition being that one of the metals shall be chemically acted on whilst the other is indifferent, or at least not acted on by the liquid to the same extent And the current is always in the direction above represented, that is to say, passes *from* the metal most attacked *to* that least attacked, whenever the communication is perfect or the circle closed In the above cases also certain forms of charcoal, which are excellent conductors of electricity, may be substituted for the conveying metal or passive element of the arrangement Another requisite condition [illegible] *Voltaic* is, that the [illegible] further, that it shall be capable of that form of decomposition which Faraday has designated *electrolysis*, that is, resolvable into its elements by the electric current *See* ELECTROLYTE

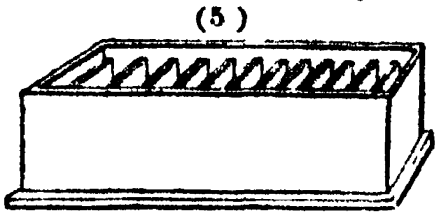
Such, then are the conditions requisite for this evolution of electricity The existence of the electric current, and its direction may be rendered manifest in various ways the most striking is perhaps afforded by its magnetic effects, as exhibited by the galvanometer *See* GALVANOMETER and ELECTRO-MAGNETISM

The *quantity* of electricity generated in the above instances depends chiefly upon the superficial extent of the metals concerned, and upon the activity of the liquid acting upon the generating metal, and that it is considerable, even where small surfaces and weak acids are used is manifest by the violence with which the magnetic needle of the galvanometer is deflected But in the above described arrangements, the *intensity* of the electricity is very feeble, and in order to attain this, and to give the current that apparent impetus which it requires to traverse bad conductors, and easily to effect electrochemical decompositions, it becomes necessary to repeat the fundamental alternations, or, in other words, to employ a properly arranged succession of [illegible] conducting, and electrolytic substances This was the great discovery of Volta, namely, the [illegible] *Voltaic Pile* or *Battery*

In this arrangement, which, like the simple circles, admits of infinite varieties, the metals generally used are zinc on the one hand, and copper or silver or platinum on the other The alternations originally adopted by Volta, and which are quite effectual, were zinc, silver, and flannel or pasteboard soaked in acid, and these were repeated according to the effects that were to be obtained The inconvenience of arrangement led him, however, to various modifications of it, and, among them, to that represented in the following diagram (fig 3), which he called the *crown of cups* (couronne



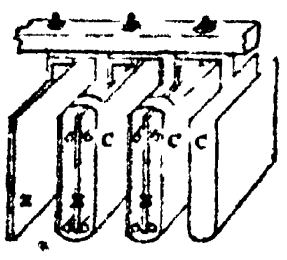
(3)



des tasses), and which, slightly modified, has since been very generally adopted The flannel is rejected, and in its place a cup of dilute acid, or other proper electrolyte, is substituted, so that each silver and zinc plate are in [illegible] the vessels the [illegible] Z and [illegible] acid, silver Ag Here [illegible] the course of current is the same as in the simple circle, namely, from the zinc through the liquid to the silver, but in this form of the apparatus, for the mere convenience of carrying on the series, the conducting wire connected with the first zinc plate has a supernumerary silver one attached to it, and that with the last silver plate a supernumerary zinc plate, so that much confusion has arisen in regard to the direction of the current in these cases, in consequence of calling what is here the silver extreme the *negative pole*, and the zinc extreme the *positive pole*, whereas it is in fact the reverse, and the circulation of the current goes on through the electrodes precisely as in the simple circle But though the *direction* of the current is the same, and the absolute *quantity* of travelling or circulating electricity not increased, the case as regards *intensity* is very different, and with numerous series arranged as above we obtain, on removing the electrodes (which in this experiment ought to consist of pointed pieces of well-burned boxwood charcoal) a little from each other, a most brilliant and continuous current of fire, luminous, so that the eye can scarcely endure it, and capable of overcoming obstacles and traversing conductors and electrolytes in a way essentially different from that of the simple circuit Yet even with all these energetic phenomena, and with a quantity of circulating electricity far beyond any thing which the most powerful frictional machines can afford, the intensity is still insufficient to penetrate a thin layer of card or paper, or to make its way through non-conducting obstacles, as it does in the case of the discharge of the Leyden jar or battery And now, if the hands be well moistened with salt and water, so as to overcome the non-conducting tendency of the cuticle, and the body be made part of the circuit, an extraordinary and unendurable sensation is perceived, which is in fact a *continuous shock* By the same means wires may be ignited, metals burned, combustibles exploded, magnets made and galvanometers affected, at any distance from the pile, provided the conducting communication is perfect Thus it is that this power has been used to blast rocks, to explode gunpowder under water, and to communicate telegraphic signs, as in the arrangement of Professor Wheatstone

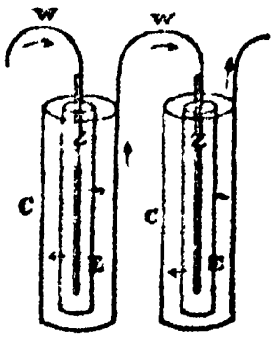
The modification of Volta's couronne des tasses, and the form of voltaic apparatus in most general use, is the annexed (fig 4), in which the plates are attached, in proper order and connection, to a piece of dry wood, so that they may at once be plunged into the cells of the porcelain trough over which they are suspended Sometimes also plates of zinc and copper soldered together are cemented into a wooden trough with intervening cells, which when required for action are filled with proper acid or saline solutions as shown in fig 5

(4)



(5)

An important modification, as regards the arrangement of the plates of fig 4, introduced by Dr Wollaston, is represented in fig 6, in which the copper plate, instead of being single, is doubled over the zinc plate actual contact being prevented by wooden cylinders placed between them In this way much of the electricity lost in the preceding arrangements is brought into circulation



(6)

But the most important modification of this instrument is that suggested by Mr Daniell, and which he terms a constant battery In all the preceding arrangements the electrical power is liable to fluctuation, and after a time various causes induce such a falling off of its evolution as to render them inconvenient, or even useless where continuous or regular action is required In Wollaston's battery, for instance, which is the best of them, several circumstances combine to render it inconstant in its action the adhesion of hydrogen to the copper plate and the precipitation of zinc upon it, the saturation of the acid by oxide of zinc, and the local action which common zinc induces are perhaps the principal sources of the above mentioned irregularity and inconstancy In Mr Daniell's arrangement those inconveniences are to a great extent obviated, and although it is more complicated than the preceding, its constant and regular action, when it is properly constructed, amply repays the additional trouble and expense there are, [illegible] can scarcely be carried [illegible]

The annexed diagram fig 7, which is intended to represent two cells of the constant battery, may perhaps serve to illustrate

(7)

C [illegible] vessels of copper, [illegible] cylinders or tubes of porous earthenware, Z Z are rods of amalgamated zinc which are connected by the wires W W with the next copper cylinder, and so on in succession The porous tubes are filled with dilute sulphuric acid (about 1 part of acid to 8 of water), and the copper vessels are filled with a strong solution of sulphate of copper, also acidulated by sulphuric acid so that the acid in the generating cells is separated from [illegible] of a [illegible], but the porosity of the [illegible] so far imbued with the [illegible], ssage of electricity, the current being in the direction of the darts At the same time the sulphate of zinc is prevented mixing with the sulphate of copper [illegible] upon the copper prevents [illegible] hydrogen evolved [illegible] s to reduce the oxide of [illegible] and to form [illegible] which [illegible] of metallic copper [illegible] become lined In proportion as the sulphate of copper is decomposed fresh portions of that salt are added, and the acid in the generating cells requires occasional renewal for the former purpose the [illegible] receptacle or colander in the upper [illegible] which is kept filled with crystals [illegible] (See *Daniell's Introduction to Chemical Philosophy*, p 438)

It has already been stated that, in all the ordinary forms of the voltaic battery, two metals and an acid dissolved in water are the essential elements. But it is by no means necessary that two metals should be employed to [illegible] for if only one metal be used [illegible] are differently acted on by an acid or other fluid, electricity will be evolved, according to the same law, a particle of the metal most acted on becoming [illegible] rent is established [illegible] oxidized or corroded zinc are used, or even when one of the plates is of cast and the other of rolled zinc So also when a stick of copper, clean at one end and corroded at the other, is immersed in dilute nitric acid, an electric current is produced In all these cases the surface most open to chemical action corresponds to the zinc, and that least so to the silver of the above described simple circles

An electric current is also manifested when a single plate of metal of uniform surface is acted on by two fluids exerting distinct chemical actions upon it If, for instance, a vessel be half filled with a strong solution of sulphate of copper and then carefully filled up with dilute sulphuric acid, so that the latter may lie upon but not mix with it, a plate of iron immersed will be so acted on as to produce an electric current, the upper part becoming the equivalent of the zinc, and the lower that of the copper in the simple circle A plate of copper immersed in the same way will produce a similar effect, and metallic copper will be deposited upon its lower end (See *Faraday's Researches*, *Philosophical Transactions*, 1840)

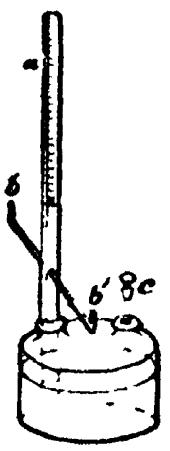
The chemical powers of the electric currents produced by and circulating under the circumstances above detailed [illegible] recently noticed, [illegible] the phenomena [illegible] by interposing different substances between the electrodes in proper vessels, so that the changes which they suffer in the axis of the electric current may be more conveniently and distinctly observed. Under these circumstances we find that all electrolytes must, to a certain extent, be conductors, and that the same body in different states may either be or not be an electrolyte, according as it has or has not a power of conduction Thus *water* is a conductor and an electrolyte, but *ice* is a non-conductor, and therefore unsusceptible of electrolysis So also nitre, chloride, iodide, and bromide of silver and many other salts, require to be *fused* in order to become susceptible of electrolytic action It would moreover appear probable, from Faraday's researches, that all bodies susceptible of true or primary electrolytic action (electric decomposition) must be compounds of single atoms, or equivalents of their components (*proto-compounds*) thus protochloride and protoiodide of tin are decomposed but the bichloride and biniodide are not Of this phenomenon the ultimate cause requires further investigation The principal apparent exceptions to it have been ranked by Faraday among cases of *secondary decomposition* Thus when common sulphuric acid, or oil of vitriol (which is a compound of 1 atom of sulphur, 3 of oxygen, and 1 of water, or the ultimate elements of which are 1 atom of sulphur, 1 of hydrogen, and 4 of oxygen), is subjected to the electric current, sulphur and hydrogen appear at the cathode (or negative electrode), and oxygen at the anode (or positive electrode) But in this case the sulphur is the result of the action of the hydrogen upon the acid, for in all cases of true or primary electrical decomposition of the sulphurets, the sulphur is evolved at the anode

[illegible] laws, but *proximate* elements are also similarly separated Thus when sulphate of soda, nitrate of potassa, and other neutral salts, are subjected in aqueous solution to the action of the current the respective acids travel with the oxygen [illegible] and the bases oxides or bases, with their [illegible] to the cathode Faraday terms substances susceptible of these transferences *ions*, and those which go to the anode *anions*, those to the cathode *cations* thus doing away with the less definite terms of *electro-negative* and *electro-positive* bodies And he has drawn up the following table of simple and compound anions

Anions.

Oxygen	Sulphuric acid
Chlorine	Phosphoric acid.
Iodine	Carbonic acid
Bromine	Nitric acid
Fluorine	Selenic acid
Sulphur	Chloric acid
Selenium	Boracic acid
Cyanogen	Acetic acid.
Sulpho cyanogen	Tartaric acid
	Citric acid
	Oxalic acid.

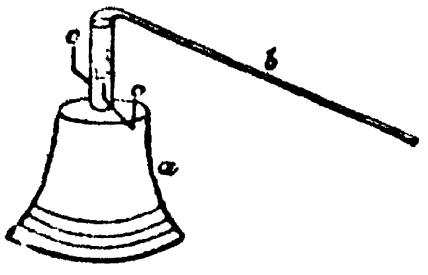
Cations.



Hydrogen.	Nickel
Potassium.	Antimony.
Sodium	Bismuth.

Lithium.	Mercury
Barium	Silver
Strontium	Platinum.
Calcium.	Gold
Magnesium	Ammonia.
Manganese	Potassa.
Zinc.	Soda
Tin	Lithia.
Lead	Baryta
Iron	Strontia
Copper	Magnesia
Cadmium	Alumina
Cerium	Protoxides generally
Cobalt	Vegeto-alkalies generally

Analogy leads us to assume that all elementary bodies are *ions*, but this has not been experimentally proved in regard to carbon, phosphorus, nitrogen, silicon, boron, and aluminium



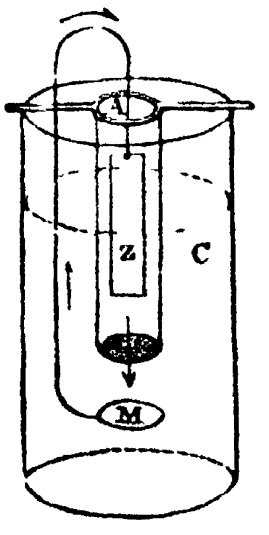
VOLTA'METER (Ital volta, and Gr μετρον, *a measure*) An instrument contrived by Mr Faraday for measuring the voltaic electricity passing through it, and which, being interposed in the course of the current used in any particular experiment, serves as a *comparative standard* of effect, or as a *positive measurer* of the electricity

The indicating body used in this instrument is water acidulated by sulphuric acid The electrodes are plates of platinum, and the quantity of electricity which has passed is indicated by the quantity of the mixed gases (oxygen and hydrogen, resulting from the decomposition of the water) evolved, or, in other words, by the weight of water decomposed When the quantity of evolved gases is small, the voltameter represented in the margin

two platinum electrodes, connected with the external wires *b b* This tube is fitted by grinding into one mouth of the double-necked bottle acidulated water, and is , so that when an electric current is passed through it the gases evolved collect in the upper part of the tube and displace the dilute acid, the stopper *c* being left open When the graduated part of the tube is filled with the mixed gases the electric current may be broken by removing the wires connected with *b b*, the stopper *c* replaced and the meter-tube refilled by inclining the instrument, a second measure of the gases is then collected on re establishing the circuit, and so on

When large quantities of the mixed gases are to be measured as in cases where the current is left continuous for several hours or days, a voltameter in the form of a small retort may be used set up in the block or foot *a*, and the evolved gases will then pass by the tube *b* into the common pneumatic trough, where they may be received into a graduated jar and measured *c c* are the projecting wires by which communication is made with the platinum electrodes

In using these and similar forms of apparatus for the electro-chemical decomposition of water great care must be taken that the electrodes are kept clean and covered by the water, and that their ends are never exposed to the mixed gases in the tube, for in that case they would be apt to become heated and even incandescent, in consequence of the peculiar action of clean platinum on a mixture of hydrogen and oxygen, and in such a case an explosion might take place In these voltameters the contact of the electrodes must be prevented by inserting between them a small piece of glass tube

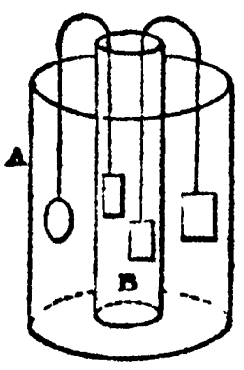


VOLTATYPE or ELECTROTYPE It has been stated under the article on Voltaic Electricity, that , are in certain cases decomposed, so that the metal in its pure state is deposited upon the cathode or upon what is usually termed the negative electrode In these cases the metallic deposition is usually a secondary effect, arising out of the action of the hydrogen evolved at the cathode upon the oxide of the metal A good illustrative experiment of this metallic precipitation consists in plunging two pieces of clean platinum into a solution of sulphate of copper nothing happens But if the electric current be transmitted through the solution, so that these platinum plates may form the electrodes, copper is immediately precipitated upon the catelectrode or negative surface, the positive surface or anelectrode remaining clean. If the current be now reversed, the copper will be removed from the platinum plate upon which it had just been deposited, and will be transmitted to the clean plate, and thus by reversing the direction of the electric current, the copper may be sent backwards and forwards, it always being deposited upon the negative pole, or, in other words, upon that surface by which the electric current leaves the electrolyte A solution of sulphate of copper suitable to this experiment, , acidulated by sulphuric acid , and the copper in a clean metallic state, and by a continuance of the electric current, and keeping up the strength of the solution by the occasional addition of fresh portions of the salt of copper, the metallic film upon the cathode may be obtained of any required thickness, and may afterwards be peeled off the platinum surface The texture of the deposited copper varies with the power employed and with the temperature and strength of the solution, so that it may be obtained hard, brittle, and crystalline, or malleable and tough, or even pulverulent, according to the management of the operator A low electric power, or rather a current of low intensity, a moderately strong acidulated solution of sulphate of copper, and a temperature not below 60° or 70°, are the circumstances under which the best deposit of copper is usually obtained for the purposes to which this process is commonly applied

When the negative pole or cathode, instead of being, as above represented a plane surface of platinum, is irregular, or worked into a pattern, or a medal or coin for instance, an exact impression of the irregularities of surface, or of the device upon the medal or coin, may be taken off on , and to copies or plates of this kind by proper management, be substituted or copper a variety of voltatypes may be obtained or if the precipitated metal be left upon the surface on which it is thrown down gilding silvering and applications may be extensively and beautifully effected This whole new art of *plating* has arisen also out of these electro-chemical actions

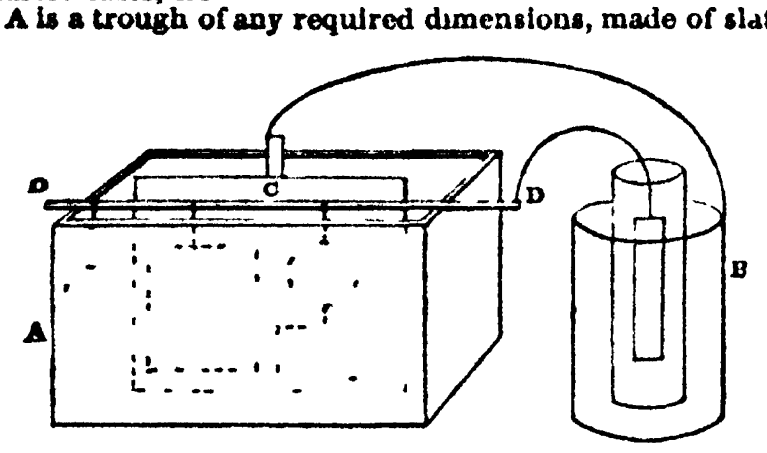
We shall now proceed briefly to point out the manipulation in a few of the principal applications of this new art, and to describe the apparatus commonly employed, illustrating the subject in the first instance, by one of the simplest cases, in which we will suppose that an impression in copper is to be obtained from a copper medal, which, being in relief, will of course yield an impression in indent the original being a cameo, the copy will be an intaglio

The medal is first slung in a loop of annealed copper wire so that it may be conveniently suspended and made electro-negative in the metallic solution, the following simple voltaic arrangements may then be used



A is a glass cylinder (a common lamp-glass answers the purpose), closed at bottom with a piece of bladder, or with a plug of plaster of Paris, and filled with dilute sulphuric acid (1 of acid to 8 of water by measure), Z is a piece of zinc immersed in , connected by copper wire with the medal M, C is a jar nearly filled with a strong solution of sulphate of copper, acidulated by the addition of about a tenth part of sulphuric acid In this arrangement the acid in the generating cell is prevented mixing with the solution in the jar by the diaphragm of bladder or plaster, which, however when thoroughly wetted, suffers the electric current to pass from the zinc to the medal (or negative pole) and so through the wire, in the direction of the darts, back to the zinc In this way a film of metallic copper is gradually thrown down upon M, which goes on increasing, and which, when it is sufficiently thick (perhaps in 24 or 30 hours), the wire with Z and M at its ends is lifted out, and by the point of a knife carefully a , if necessary, by a file, the deposited of M, of which it presents a faithful and minute copy or impression To prevent the deposition of copper upon the edges, and upon the reverse of the medal, those parts should be covered with a varnish not acted upon by the solution, and the connecting wire should also be similarly varnished, to prevent its receiving an unnecessary incrustation of copper In this way, by careful management, any number of impressions may be taken from either side of a medal without materially injuring the original, and for the medal a metallic plate may be substituted, provided its dimensions and weight be not such as to render it inconvenient or inconvenient in this form of apparatus

But it often happens that the article to be *voltatyped*,



as this process is now called, is not a conductor of electricity, as, for instance, a seal, or sulphur or wax impression, or a plaster cast of a medal or coin In these cases the surface is carefully covered by a film of the purest plumbago, or black lead, which is applied by a soft brush, and which, being a good conductor of electricity renders the surface equivalent to that of a metal care being at the same time taken that the conducting wire is in good contact with the plumbago, so that the electrical current may be nowhere intercepted by a non-conductor Where the material of the cast is porous, or permeable to water, it must be imbued with melted wax or oil, or some kind of fatty matter, where plaster casts are used, melted [illegible] the surface to be voltatyped is [illegible] ded and the process carried on as above The use of black lead so extremely convenient in these and a number of similar cases was first suggested by Mr Robert Murray and communicated by him to the Society of Arts, who awarded a medal for the invention

In the case of seals, coins, and other small articles, a number of them may be put in process at once by the following modification of the above described apparatus A is a jar filled with a saturated and slightly acidulated solution of sulphate of copper, B is a porous earthenware cylinder, similar to those used in Daniell's constant battery, filled with dilute sulphuric acid The articles to be coated with copper are prepared as above described and attached to copper wires having a small piece of zinc at their other end, several of these may then so be suspended round the porous tube as that the zinc being in the acid, and the coin or seal in the cupreous solution the process goes on until the voltatype is perfect

When a number of articles of different sizes are to be voltatyped, the following is the preferable arrangement, and is that which is generally used where the process is employed upon a large scale, as in preparing voltatypes from wood-cuts, copper-plates, plaster casts, &c

A is a trough of any required dimensions, made of slate

or wood, and filled with a proper solution of sulphate of copper, C is a copper-plate immersed in the trough and forming the positive electrode of the constant battery B (of which one cell only is here represented but of which two or more may be employed as required), D D is a copper rod forming the negative electrode, to which the articles to be coated with copper are suspended by copper wires These several articles, previously properly prepared by the means above described, are retained in the circuit till adequately coated by copper In this form of a, para[illegible] it is not necessary to [illegible] the impoverishment of the cupreous solution [illegible] portion to the quantity of copper deposited upon the moulds is that which is taken up from the plate C, and when this plate is so far dissolved as no longer to form an effective electrode it must be replaced by another

Where other metals are to be employed, proper solutions must be selected for the purpose, and the electric power modified accordingly the weakest power, consistent with the precipitation of the metal and the non-evolution of hydrogen at the negative electrode, is that which is generally to be preferred For gilding copper or silver, the solution which is generally employed is a double cyanide of gold and potassium it is made by dissolving about 60 grains of sulphuret or of oxide of gold in a pint of a solution of cyanide of potassium containing 1 part of the cyanide to 10 of water The sulphuret of gold is prepared by precipitating a solution of perchloride of gold by sulphuret of potassium, and washing the precipitate with hot water the oxide of gold may be similarly prepared by precipitating the solution of the chloride of gold by potassa at a boiling heat With this solution silver and copper may be effectively gilded, and the thickness of the coat of gold may be carried to any required extent If it be desired to gild the inside of a silver vessel, the vessel may be filled with the gilding solution, and connected by its outside with the negative electrode, a plate of gold immersed into the centre of the solution in the vessel constituting the positive electrode

For covering or plating articles with silver, a solution of 60 grains of chloride or of oxide of silver in a pint of the solution of cyanide of potassium of the strength above stated is to be used In this case the article which is to receive the deposit is made the negative electrode, and a plate of silver may be used as the positive electrode Here, as in the case of gold, the plating may be carried to any extent, and articles from which the silver has been abraded by wear may easily be replated

In all cases where silver or gold is to be thus voltaically deposited so as to give a durable adhesive coating, the receiving surfaces must be perfectly clean, hence the necessity of dipping them in the first instance into warm aquafortis (or nitric acid diluted with three or four parts of water), and then washing them in a large quantity of pure water, previously to putting them into the solution it is also generally right to make the connection with the battery, and immerse the positive pole, previous to putting the article into the depositing liquid Messrs Elkington of Birmingham, who have patented these operations, have produced a number of beautiful specimens both of gilding and silvering, and have largely applied them in numerous processes of the arts

Mr Palmer of London has made the most important applications of these precipitations to the purposes of the fine arts, in voltatyping the plates of engravings executed by the first artists In these cases much care and dexterity are required in the manipulations, but the results are then beautifully perfect The first impression of the etched or engraved plate is of course in relief, and serves as a *matrix* from which any number of impressions in indent (or fac similes of the original plate) may be obtained Mr Palmer has also invented various modifications of the process, full descriptions of which would be inconsistent with our present object, but which promise to render it much more extensively subservient to the purposes of the fine and useful arts Messrs De la Rue have also carried these processes to great perfection and have extensively multiplied their applications to various purposes of ornamental printing See the article VOLTAIC ELECTRICITY in this Dictionary Also Mr Smee's *Elements of Electro Metallurgy*, whose platinized silver battery is well adapted to most of the preceding operations)

VOLTA (It *turn*) In Music, a term directing that the leaf is to be turned over

VOLUME (Lat volumen, from volvo, *I roll*) A book Thus a library is said to consist of so many thousand volumes, and a long work is divided for convenience into several volumes Every single roll of paper or parchment, in an ancient library, was of course equivalent to a single book in one of our own, hence the name is derived It should seem that the *books* (in the sense of divisions of the subject) of ancient works were originally [illegible] that the *History* of Herodotus [illegible] of as many volumes, in ordinary writing, as books The French word *tome* (signifying, properly, a single volume of a work containing more than one) is derived from the Greek τεμνω, *to cut* or *divide*

VOLUTA (Lat voluta, *a wreath*) A name applied by Linnæus to a genus of the *Vermes Testacea*, including those which have a univalve spiral shell, with an aperture without a beak, [illegible] and a columella twisted or plaited [illegible] lips or perforation The Mollusca thus characterized form a family in the Buccinoid tribe of the Gastropods of Cuvier's system, and the [illegible] genera *Oliva* Brug [illegible] *Voluta* proper, *Cymbium* Mont *Marginella* Lam, *Columbella*, Lam, *Mitra*, Lam *Cancellaria* Lam

VOLUTE (Lat. volvo, *I* [illegible] the spiral scroll appended on each side to the capital of the Ionic order The Corinthian and Composite capitals are also decorated with volutes, but their character is different, their size smaller, and they are always diagonally placed In the Corinthian order they are more numerous, and in the Composite they are larger than in the Corinthian

VOLVA, or WRAPPER A term used in describing fungi to denote the involucrum-like base of the stipes of *Agaricus* It was originally the bag enveloping the whole plant, but was left at the foot of the stipes when [illegible] burst through it [illegible] volvere, *to roll up*, because it was supposed to arise from twisting of the intestines) See ILIAC PASSION

VOMICA (Lat vomo, *I spit up*) An abscess of the lungs

VOMITORIA (Lat vomo) In Architecture, the openings, gates, or doors, in the ancient theatres and amphitheatres, which gave ingress and egress to the public.

VO'RTEX. (Lat) An eddy or whirlpool; a body of water running rapidly round and forming a cavity in the middle into which floating bodies are drawn The term is also applied to whirlwind In the Cartesian philosophy vortex signifies a collection of material particles forming a fluid or ether, endowed with a rapid rotatory motion about a axis By means of this hypothesis and the received doctrine of centrifugal forces, a plausible explanation may be given of the motion of the planets, which move nearly in the same plane, but the motions of the comets which traverse the heavens in all directions are inexplicable, and in fact are inconsistent with the hypothesis Descartes, nevertheless, had the merit of attempting to show how the universe might have assumed its present form and be preserved on mechanical principles For an explanation of the system of vortices, see *Maclaurin's Account of Newton's Philosophical Discoveries*

VO'RTICEL *Vorticella* (Lat vortex *a whirlpool*) The generic name of certain pedicellate Wheel Animalcules, which are provided with vibratile organs at their anterior extremity, whose apparently rotatory actions produce little whirlpools in their vicinity, and thus attract the particles of food

VO'TIVE (Lat votum *vow*) In Numismatics, votive medals are such as were struck in grateful commemoration of any auspicious event, such as the recovery from sickness of a prince, &c, especially those of the Roman emperors struck every five ten or twenty years, on which the public vows on their behalf are recorded. The custom is said to have originated in the repeated continuance of Augustus in his [illegible] of the [illegible] of the people A votive tablet, picture &c [illegible] dedicated in consequence of the vow of a worshipper, in classical Europe to some deity, in modern Roman Catholic countries to saints

VOU'SSOIRS, in Bridges, are the stones which immediately form the arch, being of the shape of a truncated wedge Their under sides form the intrados or soffitt The length of the middle voussoir, or keystone, ought to be about 1 10th or 1-16th of the span, and the rest should increase all the way down to the imposts Their joints should be cut perpendicular to the curve of the intrados, consequently the angle of the sides is determined by the curvature (*Hutton's Tracts* vol 1)

VOW (Lat voveo, *I vow*) A promise made to God of a thing which we believe to be agreeable to him, and which we are not on other grounds obliged to render to him This is what the Theologians understand by it when they say "vow is 'promissio de meliore bono'" To promise God to do what he commands, or to avoid what he forbids, is not a vow, because we are under an obligation so to act (*Dict de Theologie* Toulouse [illegible] The use of vows is found in most religions The Roman Catholics adduce numerous passages from the Old Testament to prove that vows are acceptable to God, the Protestants on the other hand reject the theory of [illegible]

VOWEL, [illegible] a letter which can be pronounced alone, thus distinguished from consonants, which require to be sounded with the aid of a vowel They are divided in ancient prosody into long short and common [illegible] either long or short at pleasure A [illegible] two vowels, of which the sounds run (or are supposed to run) into one another

VU'LCAN In Mythology the Latin name for the divinity called by the Greeks Hephæstus,—the god who presided over the working of metals He was also called Mulciber He was the son of Jupiter who, incensed at his interference on the part of his mother Juno cast him out of heaven he fell in the isle of Lemnos and broke his leg in the fall His feats as the patron of armourers and workers in metal, his marriage with Venus, and her infidelities, form the subjects of many of the best known classical stories (See Bryant, *Anc Myth* vi 115) There is about the character of Vulcan much of the usual confusion belonging to Greek mythology Cicero mentions three Vulcans, besides the son of Jupiter: one, the child of Uranus, another, of Nilus, who reigned in Egypt [illegible] third of Mænalius A peculiarity attending the worship of Vulcan was, that the vic- [illegible] in reference to his character he is represented as bearded, with a hammer and pincers, and a pointed cap He does not appear lame, as represented by the poets Cicero, however, praises the sculptor Alcamenes for making his lameness observable without amounting to deformity The description of his cavern in the Isle of Vulcan, or Hiera, in the 8th Book of the *Æneid* is among the best known passages in classical poetry

VU'LPES (Lat *a fox*) This has been made a subgeneric term by those naturalists who so distinguish the foxes from the dogs, jackals, and wolves, to which they consequently restrict the term *Canis* The grounds for the proposed distinction are chiefly the form of the pupil of the eye, which is vertical in the foxes, circular in the dogs; the lobes of the upper incisor teeth are less distinctly marked than in the dog, the tail of the fox is longer and more bushy, its head broader, and terminated by a narrower and more pointed muzzle, its gait and attitude crouching

VU'LPINITE, so called from Vulpino, near Bergamo in Italy, where it is found An anhydrous sulphate of lime, containing a little silica It is sometimes employed by the Italian artists for small statues and other ornamental work, under the name of *marmo bardiglio*

VU'LTUR (Lat *a vulture*) The name of a Linnæan genus of diurnal Accipitrine birds, characterized by a elongated beak curved only at the extremity and by having a greater or less proportion of the head, and sometimes of the neck, denuded of feathers To the brief Linnæan phrase descriptive of this genus it may be added, that the power of the claws does not correspond with the bulk of the body The wings are so long that they are carried in the half-extended state when the vulture walks on the ground In general the birds of this group are of a [illegible] on dead carcasses and offal, their gullet dilates into a considerable crop, which, when distended with garbage, projects above the furcular bone When gorged with food a fœtid humour is discharged from the nostrils, and the bird is reduced to a state of stupidity The vultures of Linnæus are divided into the subgenera *Vultur*, Cuv, *Cathartes*, Cuv, *Sarcoramphus*, Cuv, *Percnopterus*, Cuv, *Gypaetus*, Storr

W.

W A letter found only in the alphabets of modern languages In form, it resembles two Vs, and its English name is derived from the fact of the letter *v* being identical with *u* in the Latin, and in the more early form of the English language In German, *w* is pronounced like the English *v*, the latter having the sound of *f* When *w* commences a syllable, it is a consonant but in all other positions a vowel

WACKE (German) A modification of basalt

WAD or WADDING [illegible] or paper, tow, old rope- [illegible] the powder to keep [illegible] experiments of Dr Hutton it does not appear that the wadding has any effect in increasing the force of the charge

WADD A name occasionally given to plumbago, and also to an ore of manganese found in Derbyshire, which when mixed with linseed oil for the purpose of a paint is apt to take fire

WA'DERS, WADING BIRDS *Grallatores* An order of birds including those which have long legs naked from above the distal or lower extremity of the tibia downwards *See* GRALLATORES

WA'DSETT In Scotch Law, a right by which goods are pledged for the recovery of a debt, answering to the English mortgage

WAGER OF BATTLE The use of decid[illegible]g a civil suit by battle was common to the jurisprudence of many of the Teutonic tribes which established themselves in the provinces of the Roman empire It was especially favoured among the Lombards, and there is a celebrated passage in the laws of their king Luitprand, in which while he recognizes the impiety of the custom, he professes his inability to abolish it in consequence of the prejudices of his subjects In England, battle trial is not mentioned in any Anglo-Saxon laws now extant, and its introduction is therefore attributed to William the Conqueror, although bearing in his laws the Saxon name of "orneste" probably *earnest* (See *Sir F Palgrave on the British Common Law* ch vii, who believes that the Conqueror did no more than confirm a usage already known to the inhabitants of England He supposes that [illegible] civil [illegible] was regularly joined in the Anglo-Saxon county courts) Trial by battle, by the English common law, was used in civil cases only, where issue was joined upon a writ of right, in which the tenant pleaded the general issue, viz that he had more right to hold than the demandant to recover, which he offered to prove by the body of his champion, for in civil actions the combat was not between the parties themselves The champions were armed with batons and targets, and the combat took place before the judges and serjeants of the Court of Common Pleas The combatants were bound to fight until the stars appeared in the evening, and if the champion of the tenant could either hold out so long, or obtain the victory, the tenant prevailed in his cause Victory was obtained either by the death of the champion, or by his pronouncing the horrible word "craven," which caused his principal the loss of his land and legal infamy to himself The trial by battle was the only mode of deciding a writ of right, until Henry II introduced the grand appeal or trial by inquest, and gave the tenant his choice between [illegible] The last trial by battle in the Court of Common Pleas was in the 13th Elizabeth, 1571, but in the Court of the County Palatine of Durham

there was one in 1639 Trial by battle in criminal cases is explicitly noticed in the laws of the Conqueror It took place on an *appeal*, when the appellee of felony pleaded not guilty, and declared he would defend the same with his body as in *approvement*, when a party arraigned of treason or felony having become a approver by appealing or accusing his accomplices, the latter [illegible] same manner demand trial by battle, in which case the combat was between the parties themselves [illegible] battle awarded in this country was abolished [illegible] and Mary st 7th of Charles I , but the king, after having appointed a constable to preside, revoked the commission In 1818, William Ashford having brought an appeal against [illegible] Thornton for the murder of his sister the appellee waged his battle Judgment was stayed in consequence of a legal difficulty which arose in the case, and in the following year an act was passed, by which appeals of treason, felony, and other offences, and trial by battle on writs of right, were abolished

WAGER. In Law, wagers are valid, and may be made subjects of action, unless they are on illegal matters Illegal wagers are of two kinds such as are rendered expressly void by [illegible] as have an illegal or immoral tendency [illegible] ess belong wagers on the event of prohibited games, wagers on horse races if the sum betted by either party be above 10*l*, or on any horse race not a bonâ fide race on the turf, of the latter class many instances might be given Anything that incites to a breach of the peace or to immorality, or that has a tendency to annoy the feelings of another or cast ridicule on him, is not a legal subject of wagers Wagers on merely speculative subjects, not arising out of circumstances in which the parties have an interest (for instance, on a point of law, or on the amount of a branch of the public revenue), are of too trivial characters to be [illegible] proceedings When a wager is illegal, [illegible] recover back their deposits [illegible]

[illegible] *See* COMPURGATION

WA'GES, in Political Economy are the return made or compensation paid to those employed to perform any kind of labour or service by their employers

In ordinary language, the term wages is usually employed to designate the sums paid to artizans or labourers employed in manufactures, in household services, and in agriculture, mines, and other manual occupations Substantially and in fact, however, it has a much more extensive application the salaries of public functionaries of all sorts, and the fees of lawyers, physicians, and other professional men are as really wages as the sums paid by them to the menials in their service, and depend on the same laws and principles "Every man," says Dr Paley "has his work The kind of work varies and that is all the difference there is A great deal of labour exists besides that of the hands, many species of industry besides bodily operation equally necessary, requiring equal assiduity more attention, more anxiety It is not true, therefore, that men of elevated stations are exempted from work, it is only true that there is assigned to them work of a different kind, whether more easy or more pleasant may be questioned, but certainly not less wanted, nor less essential to the common good." (*Assize Sermon*, July 29 1795)

Rates of Wages in different Employments — The wages paid to the labourers engaged in different employments differ so very widely that at first sight it may seem to be impossible to lay down any principles that should be generally applicable to them all Such however, is not the case The differences in question are apparent rather than real, and when the various favourable and unfavourable circumstances connected with different employments are taken into account, it will be found that the wages or earnings of those engaged in them are very nearly the same

If all employments were equally agreeable and healthy, if the labour to be performed in each was of the same intensity, and if each required the same degree of dexterity and skill on the part of those employed, it is evident, supposing industry to be quite free, that there could be no permanent or considerable difference in the wages of labour, for if those employed in a particular business were to earn either *more* or *less* than their neighbours, labourers would, in the former case, leave other businesses to engage in it, and in the latter, they would leave it to engage in others until the increase or diminution of their numbers had lowered or elevated wages to the common level. In point of fact, however, the intensity of the labour to be performed in different employments, the degree of skill required to carry them on, their healthiness, and the estimation in which they are held, differ exceedingly, and these varying circumstances necessarily occasion proportional differences in the wages of the workmen engaged in them Wages are the price paid to the labourer [illegible] the exertion of his physical powers, skill and [illegible] [illegible] are therefore, necessarily vary according to the several [illegible] of the labour and the degree of skill and ingenuity required. A jeweller or engraver, for example, must be paid a higher rate of wages [illegible] scavenger, for a [illegible] to instruct a man in the business of jewelling and engraving, were he not indemnified for the cost of this [illegible] rate of wages he would [illegible] [illegible] before [illegible] [illegible] the rate of wages [illegible] creasing or diminishing it only so far as may be necessary fully to counteract the unfavourable or favourable peculiarities attending any [illegible]

The following [illegible] are the principal circumstances which occasion the rate of wages, in some employments, to fall below or rise above the *general average* rate of wages —

1st The agreeableness and disagreeableness of the employments

2d The laziness or cheapness, or the difficulty and expense of learning them

3d The constancy or inconstancy of the employments

4th The small or great trust that must be reposed in those who carry them on

5th The probability or improbability of succeeding in them

It would be useless even if our limits permitted to enter into any lengthened details with respect to the variations in the rates of wages arising out of the particular circumstances now enumerated They have been fully illustrated by Smith in the 10th chapter of his first book Every one must see that, *cæteris paribus*, those engaged in a disagreeable or [illegible] employment [illegible] have great [illegible] [illegible] employed in such as [illegible] respectable Wherever a comparative disadvantage attaches to any branch of industry, it must be compensated to those engaged by higher wages or profits, or both, otherwise they would withdraw wholly from it And on this principle it is plain that those engaged in a business or profession which it costs a great deal to learn must be more amply remunerated than those engaged in a business that may be learned with comparatively little trouble and expense Inconstancy of employment must also it is obvious be indemnified by a higher rate of wages during the period of employment, and greater trust by requiring higher character must also be remunerated by higher wages The probability or improbability of success in different employments applies mostly in the higher departments of industry The instances are rare in which a person who is bound apprentice to a tailor shoemaker, or other [illegible] in an ordinary business, fails of acquiring [illegible] proficiency to enable him to live by it But it is far otherwise in the higher departments, and supposing an individual is bound apprentice to a lawyer, physician, painter, sculptor player, &c , the chances are more than twenty to one that he will not attain to distinction in his profession, and perhaps five to one that he will not be able to live by it But, in professions where so many fail for one who succeeds, that fortunate one should gain not only what will indemnify him for the expenses of his education, but also all that has been laid out on the education of his unfortunate competitors Hence the comparatively large earnings of successful lawyers physicians, players and so forth, though it be, after all, abundantly certain that they hardly compensate for the losses of the unsuccessful candidates for wealth and honours

It will be found, [illegible] into account, that [illegible] ments approach pretty near an equality, and that the higher rate in some, and lower rate in others, is uniformly occasioned by certain contingent circumstances

But without insisting farther on the causes of variation from the common standard, we shall now proceed shortly to inquire into the circumstances which determine this common standard, that is, into the circumstances which determine the rate of wages paid to labourers engaged in the common and ordinary departments of manufacturing and agricultural labour, or in such as require no peculiar skill or other superior quality, and have nothing particularly disagreeable about them

To facilitate the acquisition of clear and correct views with respect to the circumstances which [illegible] the price of ordinary labour, wages may be considered in a double point of view viz either (I) as the sum which the labourers receive at any given period in return for their services, or (II) as the sum which the habits of society render necessary to enable them to subsist and continue their race Wages, considered in the first point of view, may be called market or actual wages, and considered in the second, they may be called natural or necessary wages

[illegible] Dr Smith has said, *Wealth of Nations*, p 30, M'Culloch's edit , that the common or market rate of wages depends every where upon the terms of the contract

between the workmen and their employers But we must not thence infer that these terms are adjusted on any arbitrary or capricious principle In businesses of small extent, and placed under peculiar circumstances, this may occasionally be the case But in the vast majority of cases, it is not possible for any combination, whether of the masters or the workmen, materially to affect the rate of wages That must always depend on the amount of capital devoted to the payment of wages as compared with the number of labourers

That portion of the capital, or wealth of a country, which the employers of labour lay out in the purchase of labour may be much larger at one time than at another, but whatever may be its absolute magnitude, it obviously forms the only source from which any portion of the wages of labour can be derived No other fund is in existence from which the labourers, as such, can draw a single shilling And hence it follows that the average rate of wages, or the share of the national capital appropriated to the employment of labour falling, at an average, to each labourer, must entirely depend on its amount as compared with the number of those amongst whom it has to be divided

An increase of capital, or of the means of supporting and employing labourers, is not therefore, as is so generally supposed, always productive of an increased rate of wages It has this effect when the number of labourers remains stationary or when it increases in a less proportion than capital, but not otherwise Were capital and population to increase or diminish in the same proportion, the rate of wages, or the quantity of necessaries and conveniences falling to the share of the labourer, would undergo no change, but if the mass of capital be, on the one hand, augmented with
augmentation taking place in the
share of such capital will fall to e
rate of wages will be increased And if on the other hand, populat [illegible] capital, a *less* share will be [illegible] or the rate of wages will be reduced The well being and comfort of the labouring classes are thus especially dependent on the proportion which their increase bears to the increase of capital There are, in fact, no means whatever by which their command over the necessaries of life can be increased that do not at bottom, resolve themselves into an increase of capital as compared with population and every scheme for improving the condition of the labouring class not bottomed on this principle, can hardly fail to prove nugatory and ineffectual

It is needless to enter into any disquisition with respect to the circumstances which tend to increase capital Suffice it to observe that its increase is always of the greatest importance to the bulk of the population It may not, indeed occasion a corresponding increase in the demand for labour, but it is notwithstanding sure to increase it considerably and consequently to improve the condition of the labourers Their condition may also be improved by a greater prevalence of moral restraint or of foresight in the formation of matrimonial connections for, by lessening the rate at which population was previously increasing such increased restraint would tend to reduce the number of labourers as compared with the demand, and would contribute to improve their condition in the same way as an increase of capital On this ground, it is believed that the establishment of a proper system of education might be made to contribute by enlightening the public as to the governing causes of the rate of wages to increase their amount It were right certainly that education should be made to embrace such subjects The causes of national poverty should be explained to every one, that all may be made aware of their existence and enabled in some measure to provide against them It should be impressed on the labouring classes that the means of increased comfort are, to a very great degree, in their own hands, that what others can do for them is but trivial compared with what they can do for themselves, that the best institutions, and the most tolerant and liberal system of government, cannot shield them from poverty and degradation, should their numbers become too great as compared with the means of subsistence, and that to obviate this and to advance their individual and collective interests, they should exercise a reasonable degree of foresight in the formation of matrimonial engagements, and should if possible, endeavour to make some previous provision against unfavourable contingencies We have already seen (art POPULATION in this work), that the native sagacity of the bulk of the people, and their laudable desire to preserve their present position or to rise to a higher are powerful enough to make the progress of population subordinate to the increase in the means of subsistence And it seems reasonable to conclude, without overrating the power of education, that the prudential virtues would acquire greater strength were their importance and the influence they exercise over the condition of society explained to and enforced on the attention of every one

The laws with respect to corporations apprenticeships combinations, &c, the effect of which on the [illegible] of wages has been ably pointed out by Dr Smith have of late years undergone very great modifications The statute of the 5th of Elizabeth, regulating the duration of apprenticeships in most common trades in England and Wales, was repealed in 1814, the laws preventing voluntary combinations amongst workmen were repealed in 1824 [illegible] and the privileges of the different corporations so far as they [illegible] made [illegible] swept off all the vexatious enactments with respect to apprenticeships and corporations that formerly restricted the freedom of industry in France, and they have also disappeared in Prussia, the Netherlands, &c The compulsory provision for [illegible] is the only institution [illegible] seems to have any very considerable influence over the rate of wages *See* POOR

II But whatever fluctuations may take place in the rate of wages, there is in all countries a limit below which it is generally difficult to reduce wages for any considerable period, and below which they can never be permanently reduced, without a change taking place in the habits of the population This limit forms what has been denominated the natural or necessary rate of wages, and consists of the various necessaries and accommodations, or the money sufficient for their purchase, required to enable the labourers to exist and continue their race according to the habits and customs prevailing in the countries to which they belong

It is obvious from what has now been stated, that the natural or necessary rate of wages is susceptible of much variation It varies in different countries according to the varying wants and necessities of the labourers, and it varies in the same country according to the perpetually occurring changes in their diet dress lodgings and other accommodations

The varieties in the climate of different countries occasion considerable variations in the necessary rate of wages Humboldt states that there is a difference of about a third part between the wages of labour in the hot and temperate districts of Mexico Nor is it difficult to see why this is the case According as the severity of the climate increases warmer and for that reason, speaking generally more expensive clothing, more substantially built houses, and a larger supply of fuel become necessary The influence of these circumstances may, it is true be either partially or wholly counteracted by others, such as the superior progress made by countries with a less genial climate in the arts of civilized life the possession of unusually productive coal mines, &c But abstracting from these circumstances it is plain as a general proposition that the rate of necessary wages must vary with variations of climate, and that other things being equal, it will be highest in countries where the most expensive clothes and houses and the largest supplies of fuel are required

The share of the wages of labour appropriated to the purchase of food necessarily differs in different countries In all however [illegible] and even in Great Britain where the labourers [illegible] and neat cottages a [illegible] it is commonly supposed that at an average from *two* to *three-fifths* of their earnings are laid out on food It is obvious, therefore, that the necessary and by consequence also the market rate of wages, must be especially dependent on the sort of food consumed by the inhabitants, and the cost at which it may be raised Taking, for example, the present average rate of wages in agricultural employments in England at 25*l* a year and supposing three-fifths of this sum or 15*l* to be expended on food it is obvious that, if either by a reduction in the price of corn or by substituting potatoes in its place or any other means, the cost of food were reduced a half, the necessary rate of wages might be reduced in the same proportion or from 25*l* to 17*l* 10*s* Such a reduction in the price of corn or such a change in the species of food as has been supposed, would lead to an increase in the means of subsistence, an additional stimulus would in consequence be given to population and though the market rate of wages would not sink in the same degree that necessary wages are supposed to have sunk it would sink to some extent, and were necessary wages to sink still more, market wages would also sustain a certain decline, which would be greater or less according to the habits and foresight of the people

The state of the labouring classes in every country furnishes abundant proofs of what has now been stated In Bengal, for example, where clothing, lodging, and fuel are of comparatively inferior importance the necessary wages of labour are almost entirely determined by the cost of the food consumed by the labourer And this food being the simplest and cheapest imaginable, [illegible] of boiled rice with split pulse, and salt [illegible] pidity, a labourer is able to subsist on

the merest trifle ; and in consequence the customary rate of wages in common employments is so low as 2½*d* a day (Colebrooke *On the Husbandry of Bengal* pp 20 131) But it is unnecessary to go to distant countries or remote periods for an example of this principle The contrast between the wages and the condition of the labouring classes in Great Britain, and the wages and condition of the same classes in Ireland, illustrates it in the most striking manner In Great Britain the necessary rate of wages is principally determined by the cost of wheat and butcher's meat, and in a less degree by the rent of a comfortable cottage, the price of clothes, beer, tea, &c In Ireland, on the contrary, the peasantry rarely taste butcher's meat, they do not even consider bread as necessary to their subsistence, they are generally without either beer or tea, and their hats, clothes, &c, are all of the most miserable description The rate of necessary wages is there almost entirely determined by the price of potatoes, and as a quantity of these sufficient for the support of a family may be bought for a third part of the price of the bread and other articles required for that purpose, the necessary rate of wages is proportionally low The market rate of wages too, owing to the weakness in Ireland of moral restraint, and the nearly total non-existence of that prudent forecast and decent pride which distinguishes the labouring classes in Great Britain does not differ materially from the necessary rate The principle of increase has filled up the population to the level of mere subsistence, so that while the wages of common labour may be taken on a rough average at 20*d* a day in England, they are not supposed to exceed 6*d* or at most 7*d* a day in Ireland

If we except the influence that would be exerted on the progress of population and consequently also on the rate of wages, by the prevalence of a greater degree of moral restraint, an increased demand for labour and a fall in the price of the articles consumed by the labourer, seem to be the only modes in which wages can be raised From whatever causes an increased demand for labour may proceed, it must obviously raise the rate of wages and it is hardly less obvious, that a fall in the cost of producing any article consumed by the labourer or suitable for his consumption must in so far improve his condition The demand for labour is in most cases immediately increased, and it is never generally or permanently reduced by a reduction in the cost of producing commodities But supposing that the demand for labour continues the same after commodities fall in price, then, as the number of labourers in the market, and consequently the money wages paid them, must also be the same as before the fall it is plain they will obtain a greater quantity of produce, and that their condition will be in so far improved It is, no doubt, true, that were population to increase, as is sometimes alleged, proportionally to the increased demand for labour, or to the fall in the price of produce, the improvement in the condition of the labourer would only be temporary But it is not improbable merely but next to impossible that population should increase in the same proportion A period of about twenty years necessarily elapses before the stimulus which an increased demand for labour gives to population can occasion any increase in the number of labourers, and the labourers being accustomed during this long interval, to an improved manner of living, the standard of natural or necessary wages has been raised and the majority will be disposed to do anything that might tend to sink themselves and their children below the new level to which they have attained

The effects produced by a decreasing demand for labour, or by a rise in the price of the articles usually consumed by the labourer, are directly the reverse of those now stated The number of labourers continuing for a while at least the same, the rate of wages is necessarily diminished when the demand for labour declines, and it necessarily continues at its old level when prices rise, so that in both cases the condition of the labourers is changed for the worse In consequence, they are obliged to economise and should the pressure continue for a considerable period, there is a risk lest their habits be degraded, or that they should learn to be satisfied with an inferior species of food, or a lower standard of comfort Should this change unfortunately take place, the population would accommodate itself to the new state of things, and it would be difficult for the labourers to attain at any subsequent period, to the elevation from which they had been cast down

When the labourers are already subsisting, as in Ireland on the lowest species of food, it is of course impossible for them to go to a lower in a period of scarcity, and should their wages, or the means of subsistence falling to their share, sustain any serious decline, an increase would necessarily take place in the rate of mortality But in a country like England, where the inhabitants have been long accustomed to superior comforts, and enjoy various privileges, it is probable that they might pass through a pretty long period of privation, and that it would rather give new efficacy to the principle of moral restraint, and lessen the proportion of marriages and births, than induce them to submit to a lower scale of living or to relinquish comforts they have long possessed, and been taught to regard as indispensable As the well-being of the labouring classes is essential to the tranquillity and happiness of the state, it is of the highest importance that this principle should be strengthened by every possible means It is easy from this to see that a principal advantage of a compulsory provision for the support of the poor consists in the assistance it gives them in periods of adversity, and in its thereby contributing to prevent their tastes and habits or their standard of comfort from being lowered by the privations to which they might otherwise be compelled to submit

WAHA'BEES or WAHA'BYS A Mussulman sect, of which the founder was a learned Arabian, named Abd el Wahâb, who became persuaded of the corruption, both of doctrine and practice, prevalent among the professors of Islam, especially the Turks His daughter married Mohammed Ibn Saoûd, the principal person of the town of Derayeh, who became his first convert and leader of the sect about 1760 Like the original prophet of their faith, Saoûd and his followers propagated their doctrines at once by persuasion and arms Abd el Aziz and Ibn Saoûd, the son and grandson of the first Saoûd, carried their arms to the utmost extremities of Arabia, and conformably with the old Mohammedan principle, established a spiritual and temporal leadership united in their persons The Bedouins or wandering tribes, formed the bulk of their converts They acknowledged the Koran and the Sunne, or orthodox tradition, and they professed adherence to the liberal tenets of both, but they accused the other Mohammedans of an idolatrous veneration for the prophet and other saints, and denied the intercession of saints altogether Like the early Protestants of Europe their favourite taste was the destruction of the cupolas and tombs of saints To this the mob of Wahabys added a strong aversion to the rich dress of the Turks, and to the practice of smoking tobacco, which had been prohibited by Abd el Wahâb much on the same bold principle which had induced Mohammed himself to condemn the use of wine The province of Nedjd became the chief seat of the Wahaby power Under the last Saoud (a very handsome man, whom the Arabs called Abou Showareb or the Whiskered) the power reached its greatest extent He administered justice in person to great part of Arabia The Wahabys, in the first twenty years of this century, extended their plundering expeditions to Syria, Irak, and Mesopotamia In 1803 they took Mekka and soon conquered the Hidjah In 1809 Mehemet Ali began hostilities in Arabia, and in 1812 the Hidjah was restored, and the caravans of pilgrims once more arrived with their usual pomp at Mekka, but for some years afterwards the Wahabys maintained their superiority in the rest of Arabia Saoûd died in 1814, and was succeeded in his political and religious authority by his son Abdallah, under whom the Wahabys were finally subdued by Mehemet Ali, but we possess no authentic account of their conquest, or their present condition (See *Burkhardt's Travels in Arabia*, his *Notes for a History of the Bedouins and Wahabys*, 1830, and the *Travels of Ali Bey, Ed Rev*, vols xxvii xxxiv)

WAIF (From the Saxon waſian, *to abandon*) In Law, goods stolen and abandoned by the felon were so termed and were forfeited to the king, or lord of the manor having the franchise of waif, but if the owner made fresh pursuit after the felon, and sued an appeal of robbery, or gave evidence whereby he was concluded, within a year and a day, he was entitled to restitution

WAINSCOT In Architecture, the framed lining in panels wherewith a wall is faced The wood originally used for this purpose being a species of foreign oak that wood has acquired the name from the purpose to which it was applied

WAIST In a part of the gun-deck between the fore and main masts

WAITS, the popular name for the music played in our streets on the nights of the Christmas holidays, is thought to be only a corruption of "wake," the common name for a nocturnal solemnity (See *Archæol* vol ii p 66)

WAIVER In Law, a term used to signify a party's declining or refusing to accept to avail himself of something, as waiver of an estate, which may be made by infant or his heirs of an estate conveyed to him in his minority, waiver of tort, in some cases where action of tort and that of contract lie, the creditor may decline the former and proceed in the latter

WAKE In Antiquities and popular usage, the word is of the same meaning as vigil; and the custom originated in the processions which took place early in the morning of feast days to the church, and were not uncommonly followed by revelling and drunkenness At present most fast days are popularly called wakes by the English peasantry, but the peculiar "wake" or "revel"

of county parishes was, originally, the day of the week on which the church had been dedicated, afterwards, the day of the year In 1536, an act of convocation appointed that the wake should be held in every parish on the same day, namely, the first Sunday in October, but it was [illegible] Wakes are expressly mentioned in Charles I's *Book of Sports*, among the feasts which it was his majesty's pleasure should be observed The wake appears to have been also held on the Sunday after the day of dedication, or more usually, the day of the saint to whom the church was [illegible] In Ireland, it is called the Pattern Day (See *Archæologia*)

WAKE The track of a ship which she leaves in the water A vessel directly astern of another is said to be in her wake

WALDENSES In Ecclesiastical History, a religious sect said to have derived their name from [illegible], a merchant of Lyons, who preached what he regarded as the pure doctrine of the Scriptures about 1180 Historians have confounded them, on the one hand, with the Vaudois (see that article), who appear, although their history is involved in much obscurity, to be an older and separate people, and on the other (especially those of the Catholic party), with the Albigenses, and thus it has been endeavoured to throw on them the discredit of the Manichean tracts, which are commonly (but on very doubtful testimony) imputed to the latter It seems clear, however, that the Waldenses were distinct from these, and probably from the Vaudois also Their distinguishing character, it has been said, 'seems to have consisted in a strict adherence to what they considered to be the doctrine originally delivered by Christ to his apostles" And out of their extremely literal interpretation of the Gospel appears to have arisen most of their peculiarities, whether good or evil They seem to have rejected an established succession of the priesthood, and the distinguishing characteristics of the priestly office, the High Catholic doctrine of the sacraments, besides the common ecclesiastical abuses of their day, and are said in addition to have protested against oaths, warfare, lawsuits, and the accumulation of wealth Their later history is obscure, and it may be said of them as well as of other sects of the day, that they had little of the elements of permanence, the same opinions being continually promulgated afresh by new reformers, and then receiving new denominations (*See* ALBIGENSES, PETROBRUSIANS, VALDOIS) The reader may consult *Milner's Ecclesiastical History* for the most favourable view of these and similar sectaries, and, among many other authorities, Faber, *On the Churches of the Waldenses and Albigenses Mosheim*, cent 12 vol iii There is a curious notice of an establishment of Waldenses in Kent in the *Archæologia*, vol ix

WALL In Architecture, a body of stone, bricks, or other materials, serving to inclose a space, or carry superincumbent [illegible] for these purposes

WALL [illegible] structure for the purpose of improving the climate of plants by shelter, by supplying heat, and by exposing them to the influence of the sun Garden walls are formed either of brick wood, or other materials, and are either solid, flued, or cellular, upright or sloping, straight or angular, according to the purpose intended by their erection (See *Loudon's Encyc of Gardening*, p 575, &c)

WALLEYE An opacity of the cornea of the eye *See* GLAUCOMA

WAITOWER In Machinery [illegible] synonymously with lantern or trundle See LANTERN WHEEL

WALL PLATE In Architecture a piece of timber lying on a wall, on which girders, joists, and other timbers rest

WALPURGIS NIGHT The night of the 1st of May, a festival of St Philip and St James Saint Walpurga was an English lady sister of Boniface, the apostle of the Germans her festival falls on the same day with that of the above [illegible] and is a common day in Germany like Lady-day in England for the commencement of leases, &c It is also known as the day on the eve of which, according to popular superstition, the great witch festival is held on the summit of the Brocken, in the Hartz mountains This superstition is supposed to have originated in the rites performed by the pagan remnants of the Saxons to their gods when their nation was [illegible] converted to Christianity, which, being [illegible] in remote places, were supposed by the vulgar to be supernatural orgies

WALTZ (German walzer) The name of the German national dance, and also of the species of music by which it is accompanied Bohemia is said to be the original home [illegible] and within the last few years it has become naturalised in England

WAPENTAKE A territorial division in use among the Danish inhabitants of England its name [illegible] Yorkshire is subdivided into wapentakes instead of hundreds

WAR, in International Law, is said to be "public," when it is a contest, by force, between independent sovereign states A civil war is regarded by Grotius as "mixed" in its nature, being, according to him, public on the side of the established government, and private on that of the portion of the people resisting its authority Public war is said to be perfect when one whole nation is at war with another, and all the members of each are authorized to commit hostilities mutually, subject only to the general laws of war An imperfect war is limited as to persons places and things to which class may be referred the hostilities of the United States against France in 1798 the hostilities between England, France, Russia, and Turkey, in 1827, and perhaps the recent proceedings against the Pacha of Egypt

Formal declarations of war are now out of use the latest example is said to be that by France against Spain, at Brussels, in 1635, which was announced by heralds War is now usually preceded by the publication of what is termed a manifesto (see that word), and the permission of "reprisals" (which see) is usually the last step short of actual hostilities, and preceding them The immediate effect of the commencement of hostilities would appear to be, on principle, the liability of all property belonging to subjects of one of the belligerent parties within the dominions of the other to seizure and confiscation, but many exceptions have been introduced by the practice of civilized states (See Grotius, *De Jure B & P* lib iii, *Vattel*, lib ii, &c) In recent times, it has been the regular practice in Great Britain to seize and condemn, as droits of admiralty, property of the enemy found in our ports at the commencement of hostilities Trade, and every species of contract between subjects of belligerent states, is in general unlawful, although often authorized for particular times and purposes Subjects of hostile states *domiciled* in the enemy's country, are held liable to reprisals, but not, it is said, mere travellers or temporary sojourners

The "rights of war" are such as arise in times of hostilities,—1 Between enemies, 2 Between neutrals As between enemies, it is a general law that subjects of a hostile state who are not in arms, or who have submitted, may not be slain The killing of prisoners is only justifiable in very extreme cases The usage of exchanging prisoners is now general, but was only firmly established in the 17th century, and it is not now considered obligatory As to property, that belonging to the government of the vanquished nation belongs to the victorious state, wherever it is found, but private rights are unaffected by conquest, with the remarkable exception of private property when at sea, which is by general usage held lawful prize Acts of hostility are only lawful, according to the modern usage, when committed by those authorized by the express or implied command of the state, such as the regularly commissioned military and naval forces of the nation, and all others called out by the government in its defence, as well as persons spontaneously defending themselves in case of necessity Irregular bands of marauders are therefore denied the rights of war, and liable to be treated as banditti, and this distinction is generally only observed so far as suits the belligerent's purpose Even private citizens taking up [illegible] nations, are considered [illegible], as by the French in the Peninsular war, and in numerous other cases As to suspensions of hostilities, &c, see TRUCE, TREATY As to the rights of war as to neutrals, see NEUTRALITY

WARD In Feudal Law, the heir of the king's tenant *in capite* during his nonage was so called, and in general language, all infants under the power of guardians (See GUARDIAN) The court of wards and liveries, for cognisance of various matters relating to the king's prerogative, was established by Henry VIII, and abolished at the Restoration (See *Archæologia*, vol ii)

WARD MOTE A court in each ward of the city of London, which has power to present defaults in matters relating to the watch, police, &c

WARDEN, LORD, OF THE CINQUE PORTS (*See* CINQUE PORTS) The constable of Dover Castle was created warden of the Cinque Ports, and [illegible] the adjacent coast, by William the Conqueror [illegible] resembling that of the *comes littoris saxonici* in the decline of the Roman empire The lord warden has the authority of admiral in the Cinque Ports and their dependencies, with power to hold a court of admiralty, and courts of law and equity he is returning officer of all the ports The salary is 3000*l* a year There is also a lord warden of the stannaries *See* STANNARIES

WARMTH In Painting, a tone of colour arising from the use of colours expressive of heat

WARP In Weaving the *longitudinal* threads of a woven fabric, they are crossed by the *transverse* threads, or *woof Warp*, in Naval affairs, signifies a rope laid out for the purpose of moving the ship *To warp* is to move a ship from one position to another by means of warps.

WARPING (Fr guerpier) A mode of increasing the

fert l v of t age lands on the banks of rivers liable to be overflowed by [illegible] which empty themselves into the estuary of the Humber The water of these rivers, from passing through a great extent of alluvial country, are, after heavy rains, muddy to an excess, and they are in that state conducted over the adjoining surface in portions enclosed by banks, and there suffered to deposit their mud, which is technically called *warp*, and which being of the depth of an inch or [illegible] the soil, and ultimately [illegible] existed on the banks of the Po, and other rivers in the north of Italy, from time immemorial

WARPING In Architecture *See* CASTING

WA'RRANT In Law, a precept under seal directed to a proper officer to arrest offender

WA'RRANT OF ATTORNEY, in Law, is a power given by a client to his attorney to appear and plead for him, or to suffer judgment to pass against him by confession It authorizes a creditor to enter up judgment and levy execution either instantly, or within a certain time specified in the instrument

WARRANT OFFICERS, in the Navy, are the gunner boatswain and carpenter

WA'RRANTY in Law as applied to lands is a promise or covenant real annexed to lands or hereditaments whereby the bargainor and his heirs are bound to warrant the same to the bargainee and his heirs against all men But the ancient law of warranty of real property has been long obsolete in practice

With regard to warranty of things personal it is the general rule, that a purchaser of goods and chattels may have a satisfaction from the seller if he sells them as his own and the title proves deficient without any express warranty for that purpose, but that with regard to the goodness of the things so purchased the vendor is not bound to answer unless he has expressly warranted them to be good, or unless he has in any way misrepresented them

WA'RREN (Fr garenne, from the Teutonic wahren *to protect or defend*) In Law a franchise or place privileged for the keeping of beasts and fowls of warren which are said by some to be only hares and rabbits partridges and pheasants, others add quails woodcocks waterfowl, &c The franchise is from the crown by grant, or prescription which implies grant It is often called *free warren* In common language a warren is a surface of poor dry sandy soil on which rabbits are kept In general, warrens may be described as the natural habitations of wild rabbits appropriated by man and preserved for the breed of these animals but they are occasionally formed in suitable situations The rabbits are allowed to burrow in the soil at pleasure and to crop the natural herbage which grows on the surface, but to render warrens profitable the rabbits require to be supplied with clover, hay, corn or other food in the winter season

WASH The fermented liquor from which spirit is distilled

WA'SHER A circular piece of leather or pasteboard placed at the base of a screw, so as to prevent the metal surfaces from being injured when it is screwed home, it is also used to render screw and other junctions air-tight

WASHER In Architecture, a flat piece of iron pierced with a hole for the passage of a screw, between whose nut and the timber it is placed to prevent compression on a small surface of the timber

WA'SSAIL (From the Ang Sax waes hael *be in health*) A common salutation used in drinking, whence the "wassel-bowl," which was anciently carried round on New Years' Eve "A carol for a wakel bowl" will be found in *Ritson's Ancient Songs*, 1790 p 304 (See *Brand's Popular Antiquities*, vol i p 1)

WASTE in Law is the destruction or material alteration of things forming an essential part of the inheritance, as houses, timber, &c Neglect of repairs is termed *permissive* waste, active injury, *voluntary* waste The action of waste, at common law, can only be brought by a person who has an estate of inheritance in immediate expectancy upon the devastator's estate

WASTE LAND Any tract of surface not in a state of [illegible] little or no useful herbage, or wood In this sense the kind of land in Britain was estimated, about the end of the last century at upwards of six millions of acres, four millions of which were considered capable of being brought under the plough, and the greater part of the remainder of growing wood

WATCH A well-known portable machine moved by a spring, for measuring time When executed in the most perfect manner, it is called a *chronometer*, and used in navigation for determining differences of longitude *See* LONGITUDE CHRONOMETER

Watches are said to have been made at Nuremberg so early as 1477; but it is uncertain how far the watches then constructed resembled those which now go by that name Some of the early ones were very small, in the shape of a pear, and sometimes sunk or fitted into the top of a walking-stick As time keepers watches could have very little value before the application of the spiral spring as a regulator to the balance The merit of this excellent invention has been claimed by Hooke and Huygens, but it seems established by unquestionable evidence that the priority belonged to Hooke by at least fifteen years The date of the invention is about the year 1658 Hooke's first balance spring was straight, and acted on the balance in a very imperfect manner, but he soon perceived its defects, and attempted to obviate them by adopting first the cylindrical, and afterwards the flat spiral The latter appears to have been applied to watches before the publication of Huygens' [illegible] (*Encyc Brit* art "Clock and Watch Work") *See* HOROLOGY

WATCH The portion of the ship's crew on duty at a time This is usually half, and the watches are called the *starboard* and *larboard* watches Large crews are put in three watches The period of the time called a watch is four hours, the reckoning beginning at noon or midnight Between 4 o'clock and 8 P M, the time is divided into two short or *dog* watches, in order to break the constant recurrence of three watches at the same hours

WA'TER (Germ wasser) The old chemists considered water as an element and supposed it convertible into earth, and into various organic products This opinion was first questioned, and afterwards disproved, by the experiments of Watt and of Cavendish in the years 1780 and 1787 (*Phil Trans*) And it has since been satisfactorily demonstrated that hydrogen and oxygen are the elements of water, and that they are contained in it in the relative proportions by weight of 1 and 8, or by volume 2 and 1, the specific gravity of hydrogen being to that of oxygen as 1 to 16

The electro chemical decomposition of water is that which affords the most satisfactory evidence of its nature When made part of the voltaic electric circuit it is resolved into 2 measures of hydrogen and 1 [illegible] the former evolved at the negative and the positive surface, and if the gases thus obtained be mixed, and fired by the electric spark they again combine, and produce their weight of water The analytic and synthetic evidence therefore, of the composition of water is thus rendered complete

But although perfectly pure water such, for instance, as has been boiled and very cautiously distilled is in fact an *oxide of hydrogen* and composed as above stated all common water is more or less contaminated by foreign matters which, if not in excess or of an uncommon or injurious nature render it generally speaking more fit for most of the ordinary uses to which it is applied Of all water, *rain water* carefully and cleanly collected is most pure But it absorbs air and with it traces of carbonic acid, minute portions of certain ammoniacal salts are also found in it, and very near the sea it is seldom free from a trace of salt During thunder storms the rain which falls sometimes exhibits indications of nitric acid, formed no doubt by the passage of the lightning through the humid atmosphere Next to rain water *river water* is generally speaking most free from foreign matter The water of the Thames, especially where it is not contaminated by drainage and manufactures, only contains about 2 grains of saline or soluble matter in each pint, and this is chiefly carbonate of lime with a little sulphate of lime chloride of sodium (common salt), and chloride of magnesium and traces of organic matter The saline contents of a gallon of Thames water in its most impure state do not exceed 24 grains, and when in its purest state, fall short of 16 grains This statement refers only to matters *dissolved* in the water, for it is often loaded with substances *mechanically suspended* to a much greater extent as is obvious from the muddy state in which it is often supplied to the houses of London and its vicinity by the water companies These last impurities are separated either by subsidence or by filtration; hence the [illegible] for the water to clarify itself in reservoirs [illegible] for use or of filtering it through fine sand, which imparts nothing to the water, and renders it clean and transparent When water contaminated by animal or vegetable matter is kept for some time it undergoes a spontaneous depuration losing its odour and colour, and depositing more or less sediment By this process, however, it becomes *hard*, in consequence of retaining certain indestructible saline matters in solution The water for the supply of ships is well known to undergo this process of fermentation and purification, and the larger the quantity of destructible matter the more complete and rapid is the depuration hence the preference given to Thames water for sea store, the purer river waters fermenting less rapidly, and remaining more or less foul and putrid for a much longer time It is obvious however, that for all ordinary purposes the purer the water the better, and it is quite clear that London ought to be supplied with Thames water from above Richmond, and out of the reach of the

tides, instead of from the heart of the metropolis, where it is loaded with the contents of the sewers, the offal of manufactures, and the mud stirred up by the steamers

Spring water, as afforded by our common wells, may be considered as rain water modified by filtration through the superficial strata of the earth, and consequently containing more or less of the soluble substances which it meets with in its course In and about London the purity of the water is very various at different depths from the surface In the more superficial wells it is usually very hard, and abounds in sulphate of lime, in the deep wells, and especially the *artesian* and overflowing wells, the water is softer, and contains less foreign matter These different states of purity may be judged of with a degree of accuracy sufficient for all common purposes by dropping into the water a solution of soap in spirit of wine with pure water such as rain or distilled water, it remains clear, but with river or spring water it becomes more or less turbid or milky, in proportion to the impurity Water which is thus rendered decidedly opaque or milky is not fit for washing, but that which is only slightly troubled or becomes merely opalescent, is usually called *soft water* This simple experiment shows the cause of softness and hardness in water, for pure water perfectly dissolves soap, whereas in common spring water the salts are of such a nature as to form insoluble compounds with it, and these adhere to whatever is washed in it, and give that unpleasant sensation called *hardness* when we wash our hands The application of a few other simple tests may be resorted to to indicate more exactly

of a white cloud upon adding a few drops of a solution of *chloride of barium* (which shows the sulphuric acid), and of *oxalate of ammonia* (which detects lime) Such water generally leaves a white crust in the decanter in which it is kept and incrusts boilers and kettles with a troublesome sediment, so that unless frequently cleansed they are soon destroyed by the action of the fire in consequence of the sulphate of lime which coats their interior, and which prevents the transmission of heat This impurity chiefly belongs to what are called *land springs* and is derived from the blue clay upon which London is built and which abounds in sulphate of lime The deeper springs especially those from the sandy deposits nearer to or upon the chalk or those from the chalk itself, are more pure especially where the land springs are excluded, and though they exhibit traces of sulphate of lime common salt carbonate of lime and carbonate of soda, are yet pure enough for washing brewing, &c Traces of ammoniacal salts and of nitrates are also not uncommon in the waters from the deep wells of London and its vicinity

Carbonate of lime, or chalk is sometimes held in solution in spring water by excess of carbonic acid in this case the water becomes turbid upon the addition of oxalic acid and slightly effervesces with muriatic acid when boiled, the excess of carbonic acid which holds the carbonate in solution is expelled and the water becomes more or less turbid It is sometimes contained in such quantity as to be deposited upon substances thrown into the water and upon the

the *petrifying* springs of

where, and the beautiful *stalactites* which line the caverns in limestone rocks are produced in the same way Spring water which (*after having been boiled and filtered*) becomes turbid upon the addition of a few drops of nitrate of silver generally contains common salt and the proportion may be judged of by the degree of milkiness thus occasioned If water after it has been evaporated to a small bulk be tested by turmeric or violet paper it often shows an alkaline reaction and upon closer examination is found to contain carbonate of soda, and it occasionally evolves during its evaporation traces of carbonate of ammonia, and affords to delicate tests indications of organic matter This is especially observed in the pump water from churchyards in which most improper situation wells for the supply of the neighbourhood are often sunk

Mineral springs or *waters* are of such a nature as to be unfit for common purposes, and often derive important medical efficacy from the substances which they hold dissolved Those which

and which become red

or by exposure, are usually called *chalybeate waters*, and contain carbonate or sulphate of iron when examined as they flow from the spring, they blacken with a few drops of tincture of galls or of strong green tea. *Tunbridge water* is an instance of a chalybeate containing carbonate of iron, and the *Brighton chalybeate* contains sulphate of iron There are some mineral waters which derive their efficacy from certain salts, and are called *saline waters*, such as *Cheltenham water*, *Leamington water*, &c The salts which they contain are chiefly sulphate of soda and sulphate of magnesia, they

are more or less aperient

by evaporation and set aside for a few hours in a cool place, the salts generally crystallize What are termed *sulphurous waters* are usually saline, and also contain *sulphuretted hydrogen* which is presently recognized by its fetid smell and by becoming black when a solution of sugar of lead is dropped into it and turbid on the addition of a little muriatic acid, or by mere exposure to air, from the deposition of sulphur *Harrogate* and *Aix-la-Chapelle* waters are instances There are some waters which are occasionally resorted to medicinally, but which are only remarkable for extreme purity such as *Malvern water*, and there are others which, exclusive of their chalybeate or saline qualities, are *effervescent* or sparkling, from the presence of carbonic acid, which gives them an agreeable and slightly pungent flavour these qualities are entirely

they lose the power of reddening vegetable blues after they have been exposed to heat In respect to *medical virtues*, the chalybeate springs are more or less tonic and

small relative proportions, they are perhaps on that very account more likely to be absorbed into the system, and to effect cures where larger doses of the same remedies fail There are also some mineral waters which contain *iodine* and *bromine*, and which, though in very minute quantities are powerful medicines, in others, baryta and strontia have been discovered But a course of mineral water is often useful upon other principles it generally is accompanied by strict attention to diet, by moderate bodily exercise, by mental relaxation and by regular hours, all of which are powerfully curative resources, and with these aids the mere diluent effect of pure water (such as that of Malvern) may, in many instances, prove of eminent service this is certainly often the case in the early stages of calculous complaints

Sea Water — The chemical history of sea water is extremely important, as involving that of sea salt (*see* SODIUM and CHLORINE), of *magnesia* and its most important combinations and of those

known to chemists under the

It appears from the best authorities that the composition of sea water when not influenced by adventitious or accidental causes is nearly uniform in the vast extent of the ocean, which covers about two thirds of the globe, and probably has a mean depth of not less than half a mile (2640 feet) Its specific gravity varies from 10269 to 10285, and it contains rather more than three *per cent* of solid matter composed chiefly of common salt muriate of magnesia sulphate of magnesia, and sulphate of lime These are the principal ingredients of sea water, besides which it contains traces of chloride of potassium, of muriate of ammonia of carbonate of lime, of hydrobromate of magnesia and often of hydriodate of magnesia There is some difference of opinion as to the state of combination in which the acids and bases exist in sea water The following tables show their proportions in a pint of sea water of the Frith of Forth taken up near Leith, as obtained by evaporation and as presumed to exist after and previous to evaporation —

After Evaporation		Before Evaporation	
Common salt - -	180 5	Common salt - -	180 5
Muriate of magnesia	23 0	Muriate of magnesia	18 3
	15 5	Muriate of lime -	5 7
Sulphate of lime -	7 1	Sulphate of magnesia	21 6
	226 1		226 1

The other substances exist in such small quantities that they are omitted in this general statement *See* OCEAN

WATER BAILIFF An officer in port towns whose duties in general are with respect to the searching of ships in London he has also the supervision of the fish market gathering of tolls &c

WATER CLOCK A contrivance for measuring time by the flow of water *See* CLEPSYDRA

WATER COLOUR PAINTING A species of painting in which the medium of representation is colour levigated with water and gum, and which in our days has been carried to such extraordinary as to rival oil painting in every thing

WATER DEVIL A name given by some micrographers to the larva of a British species of *Hydrophilus*

WATERLANDIANS In Ecclesiastical History a division of the Dutch Anabaptists, also called "Gross" (Grob), or "Moderate," in contradistinction to the "Fine," or "Rigid" They were so called from a district in North Holland denominated Waterland and originated in the 16th century John de Ries, in 1580, composed a confession of faith, which seems to have been pretty generally used among them They still constitute (we believe) a portion of the general body of Mennonites (See *Mosheim* cent 16, sec 3, part ii)

WATER LINE The boundary of any horizontal section of the bottom of a ship The uppermost one is called the load water line; the lowest the light water line.

WATER-LOGGED A Nautical term, denoting the state of a ship when a quantity of water having been received into the hold by leaking &c she has in a great measure lost her buoyancy, and yields to the effect of every wave passing over the deck

WATER MEADOWS Meadows on low flat grounds, capable of being [illegible] flown with water [illegible]

The principal season at which this operation is performed is during winter when the water is allowed to remain stagnant on the surface for some weeks, but meadows which [illegible] especially [illegible] neficial has never been satisfactorily explained By some it is attributed to the warmth retained in, or communicated to the soil, by the water during winter, by others to its effect in destroying insects, worms, &c, and by some to the particles of manure deposited on the surface of the soil During summer the effect is more readily accounted for a supply of moisture being advantageous to all plants at that dry season *See* IRRIGATION

WATER OF CRYSTALLIZATION Some crystallized salts contain more or less water, which, as it bears a definite proportion to the other components of the salt, may be considered as one of its essential constituents Crystallized sulphate of lime, for instance, is a compound of 68 of dry sulphate and 18 water, or of one equivalent of anhydrous salt and two equivalents of water, one equivalent of crystallized sulphate of magnesia = 123 contains 7 of water = 63 and an equivalent of crystallized sulphate of soda = 162, contains 10 of water, = 90, the equivalent of water being 9 But it does not necessarily follow that a salt in crystals contains water, there being many crystals which are *anhydrous* such as nitre sulphate of potash, &c

WATERSPOUT A very remarkable meteorological phenomenon, observed for the most part at sea but sometimes also on shore, though generally in the neighbourhood of water Its general appearance may be described as follows —from a dense cloud, a conical pillar which appears to consist of condensed vapour is seen to descend, with the apex downwards When over the sea, there are usually two cones, one projecting from the cloud, and the other from the water below it These sometimes unite and the junction has been observed to be accompanied with a flash of lightning, but more frequently they disperse before the junction is effected In calm weather the column maintains its vertical position while carried along the surface, but when acted on by the wind it becomes oblique to the horizon The causes of this meteor are very imperfectly known By some it is supposed to be formed by a whirlwind of extreme intensity, while others ascribe to it an electric origin Dr Young (*Nat Phil* vol i) thinks that some of the circumstances may be explained by considering the spout as a whirlwind, carrying up drops of water which it has separated from the waves, and that the remainder may perhaps be deduced from the co-operation of electricity already existing in a neighbouring cloud (See also Pouillet, *Elémens de Physique*, tome ii)

WATER TABLE In Architecture, a projection or horizontal set-off in a wall, so placed as to throw off the water from the building

WATER WAYS Strong pieces of wood extending round the ship at the junction of the decks with the sides to carry off the water

WATER WHEEL In Hydraulics, an engine for raising water in large quantities (*See* PERSIAN WHEEL) Also a wheel turned by the force of running water Of these there are two kinds the *undershot wheel*, and the *overshot wheel* In the case of the undershot wheel the water strikes the float boards below the axle, and acts by the impulse due to its velocity, in the case of the overshot wheel, the water is brought over the top of the wheel, received in buckets, and acts solely by its weight

WAVE The alternate elevation and depression of parts of the surface of a liquid above and below the natural level

When the surface of a liquid is unequally pressed, the [illegible] being communicated to the contiguous columns, these will be lengthened and rise above that level But as the elevation is not sustained by a hydraulic pressure, the lengthened columns again fall, and acquiring in the fall a velocity due to the height, they descend below the original level, and communicate in their turn a pressure to those which are adjacent to them In this manner a reciprocating motion is produced the particles to which the primitive impulse was communicated being alternately the lowest and the highest, and a series of ridges and hollows is formed, which are called *waves* or *undulations*

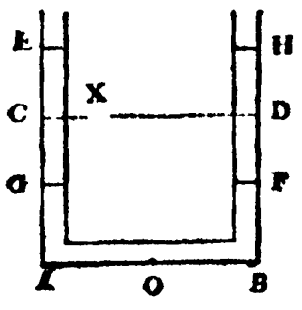
In passing from the columns which are shortened to those which are lengthened, and back again to those to which new ones succeed the particles of the fluid [illegible] unimpeded, no progressive motion takes place, each column being kept in its place by the pressure of the surrounding columns If, however, free oscillation be prevented (by the shelving of the shore, or the interposition of a rock, for example), the columns in the deep water are not balanced by those in the shallower, and in consequence acquire a progressive motion towards the latter, or form *breakers* Hence the reason why waves always break against the shore, whatever be the direction of the wind

When waves are produced by the agitation of a small portion of the fluid, as for example by throwing a stone into stagnant water, they appear to advance from the [illegible] centre, but that there is no transference of any part of the mass from one place to another, is manifest from the motions of any light body floating on the surface The appearance of progression is in the [illegible] produced by the form of the wave [illegible] lation On attending closely to the phenomena it will be seen that the fore part is always in the act of rising, and the hinder part in the act of falling, and thus the whole system appears to roll onwards, while each particle of water in succession merely oscillates with a vertical ascent and descent

If a second series of concentric waves take its origin from a different point at some distance from the first, the two sets will cross each other without the slightest interruption Where a wave of the first series meets one of the second, and the two elevations correspond, the resulting elevation will be equal to the sum of the two, and the same is the case with the depressions Where the elevation in the one series corresponds with a depression in the other, the surface will maintain its original level, at least if the waves of the two series have the same height Thus, although different series of waves do not interfere with each others' propagation, they may nevertheless increase or neutralize each others' effects The one series is in fact superposed on the other

A series of waves meeting a vertical obstacle, as a wall or bank is reflected, and the reflected waves are propagated in the same manner as those arising from the original impulse but in an opposite direction Waves proceeding in concentric circles are reflected in concentric circles, and in such a manner as to appear to diverge from a centre as far behind the obstacle as the original centre is in front of it and in [illegible] be subjected to all those laws which are usually stated to belong to reflected light

If the obstacle against which the waves strike have an opening in it of small horizontal breadth relatively to the breadth of the [illegible] it will act as a [illegible] and a series of waves will diverge from the aperture as from a new centre, but when the aperture is considerably wider than the wave, the wave confines its motion in a great measure to its original direction, though with some small divergence or the oscillation is continued principally in the direction of a sector, whose centre is at the point from which the original wave proceeded



Waves which have been raised by the wind in the open sea proceed in parallel and nearly straight lines; and the original impulse being increased by the continued action of the wind, they will increase in height until the weight of the elevated column, together with the friction, becomes equal to the inciting cause It has been inferred that the greatest height to which a single series of waves raised by the wind blowing constantly in one direction will attain does not exceed six feet The force of the wind also tends to give a progressive motion to the mass of water raised above the general level, and likewise to alter the shape of the wave by diminishing the acclivity of the side against which it strikes In a strong gale this effect may be increased so far as to cause the top of the wave to project over the base in which case it breaks and rolls over on the preceding wave Hence as is well known to sailors, a very strong wind will blow the sea down

If the wind, after having given rise to a series of waves, suddenly veers about so as to strike the waves on the opposite side, it will produce a greater effect from its more direct impact; and hence the greatest waves are [illegible] wind, or by the wind [illegible] to that in which the [illegible] manner the elevation of the waves may be greatly increased above the height to which they would be raised by winds of equal force blowing constantly in the same direction, and hence the ocean is comparatively smooth in regions where the winds are constant And as it is by the friction of the wind on the water that the waves are raised and kept up, whatever diminishes the friction will tend to lessen the elevation. Hence the comparative tranquillity produced by

pouring oil on agitated water. The influence of the wind, which is exerted entirely at the surface, does not extend to a great depth, probably not more than 30 or 40 feet, below which the water suffers no agitation excepting that which arises from the motion of the tide wave

Mathematical Theory of Waves — In order to determine the time of an undulation and the velocity of the propagation of waves from the theory of hydrodynamics, Newton compares the undulatory motion of waves on the surface of water with the oscillations of the fluid in a siphon, with which they have a considerable, though not perfect analogy Let the tube C A B D (fig 1), open and turned up at both ends, be filled with any liquid up to the level C D Suppose the equilibrium to be disturbed, and that the liquid rises in consequence in the branch A C from C to E The tube being supposed equally wide throughout it is evident that the liquid will fall as much in the branch B D as it rises in A C, thus making D F = C E, from D to I Let C G = D F, then the effect of the hydrostatic pressure [illegible] and according to the principle of D'Alembert the accelerating force which acts on the fluid is the difference of the masses in the two columns divided by their sum, that is proportional to E G divided by E A B I , or, bisecting A B in O, proportional to E C — C A O Now, C A O is constant, therefore the accelerating force is proportional to I C, or to the distance from the position of rest Hence it may be inferred that when the fluid has been disturbed so as to rise from C to I , it will acquire, in falling to its level, a velocity which will carry it to an equal height H in the other branch, and that the oscillations, whether large or small, will be isochronous, or performed in equal times

(1)

To prove this, and also to determine the time of the oscillation, let X be any point in C F, and make I X = x, F C = a, and C A O = l Also let v = the velocity, and ϕ = the accelerating force when the liquid is at the point X, and g = the accelerating force of gravity We have then, by what has been shown, $\phi = \frac{a-x}{l} g$ But from the theory of accelerating forces $\phi = \frac{dv}{dt}$, and $v = \frac{dx}{dt}$, (*see* FORCE), the substitution of which in the former equation gives

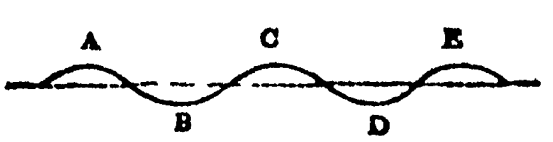
$$v\,dv = \frac{a-x}{l} g\,dx,$$

whence, by integrating and extracting the square root,

$$v = \frac{dx}{dt} = \sqrt{\left\{\frac{g}{l}(2ax - x^2)\right\}},$$

and consequently

$$dt = \sqrt{\frac{l}{g}} \frac{dx}{\sqrt{(2ax - x^2)}}$$



The general integral of the variable part of this expression is an arc whose cosine is equal to $(1 - \frac{x}{a})$, therefore between the limits $x = 0$ and $x = 2a$, the integral is

$$t = \pi \sqrt{\left(\frac{l}{g}\right)},$$

(π) [illegible] whose radius = [illegible] es during the passage of any particle of the water from the highest to the lowest point , and it is also the time in which a pendulum whose length is l, vibrating in an infinitely small arc, makes a single oscillation (*see* PENDULUM) Hence the time of passing from the highest to the highest again or of a complete undulation is the double of this, or equal to $2\pi\sqrt{(l-g)}$ or to $\pi\sqrt{(4l-g)}$, the time in which a pendulum whose length is $4l$ makes one oscillation

To apply this solution to the undulatory motion of a fluid mass of indefinite extent, let A B C D E, &c (fig 2) represent a superficies of stagnant water ascending and descending in successive waves , and let A C E, &c , which are at one instant the highest, become in their turn the lowest, and the moving power is the weight of the elevated water the alternate rise and fall will be analogous to the reciprocating motion of water in a siphon, and will observe the same laws as to time , therefore if the distance between a summit A and the adjacent lowest point B be equal to $2l$, the highest points A C E, &c will become the lowest in the time in which a pendulum whose length is equal to l makes one [illegible] and become the highest in the time of [illegible] Hence the interval of time from the wave being the highest at any point to its being the highest at that point again will be equal to two oscillations, and the wave will describe its *breadth* (that is, the space between two successive summits or cavities, as from A to C or from B to D, which space is equal to $4l$) while the pendulum oscillates twice , or in the time [illegible] equadruple the length that is equal to l or equal to the breadth of the wave, without date once (*Principia*, lib ii prop 46)

(2)

It must be admitted that the supposition on which this theory is founded, namely, that the vertical oscillations of waves are similar to that of water in a bent siphon, is a very precarious one , in fact, the theory itself is altogether insufficient for the explanation of the phenomena, as it gives no account whatever of the *form* of the wave The subject however one of great difficulty and delicacy has been treated by the best mathematicians [illegible] Newton's incomplete theory and considerations in the *Mécanique Analytique*, has given a [illegible] to the true general theory of waves for real [illegible] successive and limited [illegible] elevations and depressions of stagnant water in a canal of small depth Poisson (in the *Annales de Mathematique*, and *Mémoires de l Acad* tome i) and Cauchy (*Mem de l'Acad*) have treated the subject more generally , and Professor Kelland (*Edin Phil Trans* vols xiv and xv) has endeavoured to obtain the equations of motion of a regular set of waves, without imposing any restriction whatever on the conditions M Kelland deduces from his analysis the following results which apply to the motion of a wave in a canal whose depth is continually but slowly [illegible] 1 That the length [illegible] 2 That the velocity of transmission at any point varies as the square root of the depth 3 That the elevation of the crest of the wave varies reciprocally as the total depth of the fluid M Kelland states that his endeavours to deduce a relation between the depth of the fluid and the length of the wave have been unavailing

Experimental Researches on Waves — In the *Reports of the British Association* for 1838, there is an account by Mr Scott Russel of a series of observations on waves in the river Dee in Cheshire, and the Frith of the Clyde, and also in the open sea which are interesting, as they establish the existence of waves of different kinds, following totally different laws The most important results of these observations are the following —

1 The progressive wave sent forward by a floating body in rapid motion (or generated in any other manner) differs entirely in its character and phenomena from the oscillatory waves of the sea, or those which ripple the surface of a lake, or are caused by the sudden elevation or depression of a small portion of the fluid It is not necessarily followed either by a depression or elevation, but is a single elevation of [illegible] ferred with a uniform ve [illegible] ed by Mr Russel the *great primary wave of translation* It is analogous to the tide wave of the ocean

2 The velocity of the primary wave in channels of uniform depth is independent of the breadth of the fluid, and equal to the velocity acquired by a heavy body in falling freely through a height equal to half the depth of the fluid, reckoned from the top of the wave to the bottom of the channel The velocity of the wave is accordingly proportional to the square root of the depth of the water, as the theory indicates, and it is not affected by the velocity of the impulse or the form of the body by which it is generated

3 If waves be propagated in a channel whose depth diminishes uniformly they will break when their height above the surface of the level fluid becomes equal to the depth below the surface When waves of the sea approach the shore, or come into shallow water, they become waves of translation and, in conformity with this law, always break when the depth of the water is not greater than the height of the wave above the level

4 The great primary waves are reflected from surfaces at right angles to the direction of their motion, without suffering any other change but that of direction , and they cross each other without change of any kind, as the small oscillations on the surface of a pool

5 In the primary wave of translation the displacement of [illegible] [illegible] of the greatest depth whereas in [illegible] atory kind the displacement of the particles of the fluid is greatest at the surfaces, and diminishes rapidly, and extends only to an inconsiderable depth

6 The phenomenon called a *tidal bore* is produced in

two ways First, if the water is so shallow that the first waves of the flood tide move with a velocity so much less than the succeeding ones that they are overtaken by them, and secondly, where the tide rises so rapidly, and the water on the shore or in the river is so shallow, that the height of the first wave is greater than the depth of the water

The law by which the velocity of the primary wave varies according to the square root of the depth of the water gives rise to several other phenomena Thus any change in the depth of rivers produces a corresponding change in the interval between the moon's transit and the hour of high water A wave of high water of a spring tide travels faster than a wave of high water of a neap tide, &c

The character and phenomena of the primary wave of transmission, and its importance as an element in the amount of the resistance of fluids on bodies moving through them, were first detected and examined by Mr Russel in 1834 (*Transactions of the Royal Society of Edinburgh*, vol xiv part I) Its existence and laws are of great importance in reference to the construction and improvement of tidal rivers

WA'VELLITE A mineral named after Dr Wavell of Barnstaple, in which neighbourhood it was first found It is a hydrated phosphate of alumina it has also been called *hydargillite*

WAX (Germ wachs) This is a common vegetable product, forming the varnish which coats the leaves of certain plants and trees It is also found upon some berries, as of the *Myrica cerifera*, and it is an ingredient in bees , but Huber found that though excluded from all food except sugar they still formed wax, and accordingly it has been found that the elementary composition of bees' wax and vegetable wax is slightly different Bees wax is prepared by draining and washing the honeycomb which is then melted in boiling water, strained and cast into cakes English and foreign wax are found in the market, the latter being chiefly imported from the Baltic the Levant and the coast of Barbary Fresh wax has a peculiar honey-like odour its specific gravity is 96 At about 150° it fuses and at a high temperature volatilizes and burns with a bright white flame It is bleached by being exposed in thin slices or ribands to light air and moisture, or more rapidly by the action of chlorine, but in the latter case it does not answer for the manufacture of candles, which is one of its principal applications Wax candles are made by suspending the wicks upon a hoop over the cauldron of melted wax, which is successively poured over them from a ladle till they have acquired the proper size, so that the candle consists of a series of layers of wax cut off After in moulds, but when thus made they burn irregularly Bleached or white wax is generally adulterated with more or less spermaceti and sold at different prices accordingly, in this case it has not the peculiar lustre of pure wax, and is softer and more fusible It is also largely adulterated with stearine or stearic acid, which is detected by the odour of fat or tallow which it evolves when highly heated, and by its crumbly texture, it may also be separated to a certain extent by ether or alcohol Wax is insoluble in water, and scarcely acted upon by the acids so that it forms a good lute or cement boiling alcohol and ether act partially upon it and deposit the portion which they had dissolved on cooling Some varieties of vegetable wax appear to contain two distinct principles, which Dr John has termed *cerin* and *myrin*, the former soluble, and the latter insoluble, in alcohol Heated with the fixed alkalies, wax forms a difficultly soluble soap

WAY The Sea term for progress A ship in progress is said to have *way* upon her, when stationary, to have no *way*

WEALDEN FORMATION and STRATA *See* GEOLOGY

WEAR To put the ship on the other tack by turning her round, with her stern to the wind

WEA'THER (Germ wetter) The state or condition of the atmosphere with respect to heat, cold, dryness, moisture, wind, rain, snow, fogs, &c The appreciation of the various causes which determine the state of the atmosphere, and produce those changes of *Meteorology* and *Climate* (See those terms, also ATMOSPHERE, BAROMETER, CLOUD, DEW, HAIL, HYGROMETRY, RAIN, WIND, &c)

In all ages of the world, mankind have attempted to explain and the changes of the weather; but such of the subject, and the vast multitude of circumstances to be taken account of, that no theory can furnish rules for determining the order in which they succeed each other, or for predicting the state of the weather of the atmosphere are the necessary results of principles, not only fixed and unalterable in their nature, but (many of them at least) well known in their separate and individual operation The difficulty of tracing the results of their combined influences arises chiefly from their complexity and endless concatenation

The principal cause of all the variations which take place in the state of the atmosphere is the heating action of the sun's rays, but in order to appreciate correctly its effect, it is necessary to know not only the extent of the atmosphere, but the properties of all the substances of which it is composed Modern science has discovered that the atmosphere is composed of three different gaseous fluids, every where combined in the same proportions, and penetrated by an ever-varying quantity of elastic vapour These two distinct envelopes of air and vapour mechanically mixed have different relations to heat, and therefore, in consequence of the unequal temperature of the surface of the earth, with which they are in contact when at rest in equilibrium at rest in the latitude of, and in rotation, the different parts of the atmosphere are constantly receiving different quantities of heat, as the solar rays penetrate more or less obliquely This inequality of temperature produces wind which, if the surface of the earth were perfectly even and homogeneous, would always blow in but, the surface of the earth being composed of materials of various kinds, and distribution of heat over it is extreme The winds sweeping along the surface, acquire its temperature and hence the atmosphere also becomes irregularly heated This produces an accumulation of air at one place and a deficiency at another, and hence a subsequent rush to restore the equilibrium As the air is cooled it becomes also incapable of holding the same quantity of aqueous vapour, a portion of which is therefore set free, and gives rise to clouds mist rain, dew snow &c Besides all this, there is to be taken into account the development of electricity the influences of light and galvanism, the agitation of the atmosphere produced by the rise and fall of the tides, and probably a variety of other circumstances with which we are entirely unacquainted This very imperfect enumeration may serve to give an idea of the difficulties to be overcome in forming a theory of the weather *See* CLIMATE

It has always been a favourite prejudice that the weather is influenced in some mysterious manner by the moon The moon can be supposed to act on the earth only in one of three ways, namely, by the solar rays which it reflects by its attraction, or by an emanation of some unknown kind Now, the light of the moon does not amount to the 100 000th part of that of the sun and the heat which it excites is so small as to be altogether inappreciable by the most delicate instruments or the best devised experiments With regard to the attraction of the moon we see its influence on the tides of the ocean, and might therefore be disposed to allow it a similar influence on the atmosphere, but when we take into account the small specific gravity of atmospheric air in comparison with water, and the consequent smallness of the mass of matter to be acted upon, it will readily be perceived that this influence also must be extremely feeble In fact it has been demonstrated by Laplace that the joint action of the solar and lunar attraction is incapable of producing more than an atmospheric tide flowing westward at the rate of about four miles a day, and this is scarcely if at all, appreciable As to the remaining supposition that the moon may act on the atmosphere by some obscure emanation it is sufficient to remark that no meteorological observations that have yet been made afford the slightest traces of any such connexion between the earth and its satellite The registers which are now kept in various observatories and other places also prove, contrary to the popular belief, that the changes of weather are in no way whatever dependent on the lunar phases (See the *Annuaire du Bureau des Longitudes* for 1833 Kamptz, *Lehrbuch der Meteorologie, and Walker's Translation*, Schubler, *Einfluss des Mondes auf die Veranderung unserer Atmosphare*, Leipzig, 1820, *Greenwich Meteor Obs*)

WEATHER The Sea term for that side on which the wind blows *To weather*, to pass to windward of an object

WEATHER BOARDING In Architecture, feather-edged boarding nailed upright, whose boards lap over each other, so as to prevent the rain, &c from penetrating them

WEATHER GAGE A ship to windward of another is said to have the weather gage

WEATHER GLASS A name sometimes given to the barometer, but sometimes applied to other instruments for ascertaining the state of the atmosphere, or measuring atmospheric changes It is thus applied to the *thermometer* the *hygrometer*, &c

WEAVERS, *Textores* The name of a tribe of spiders

including those which fabricate webs in order to entrap their prey

WEAVING, the art of forming cloth in a loom by the union or intertexture of threads The art of weaving is of great antiquity it has been practised in all ages and in all countries, but it would be impossible within our limits to give even a sketch of its history, progress, and successive improvements down to its present perfect state We had intended to present the reader with a notice of the various improvements that have been made in the loom from its simplest construction, down to the elaborate invention of Jacquard, but it was found that this could not be effected without the introduction of numerous diagrams and details, which would have been foreign to the purpose of the work, and we must, therefore, content ourselves by referring to *Ure's Dictionary of Arts, &c* for full particulars

WEDGE In Geometry, a solid having five sides or faces, three of which are rectangles, and the remaining two [illegible] parallel to each other, [illegible] figure, is a prism with a triangular base Its content is therefore equal to the area of the triangular base multiplied into the distance between the parallel planes

WEDGE, in Mechanics, is one of the five simple engines or mechanical powers and is used sometimes for raising bodies, but more frequently for dividing or splitting them In the [illegible] wedge to be urged by [illegible] is precisely the same as that of the inclined plane, for it is evidently the same, in point of mechanical advantage whether the wedge be pushed under the load, or the load be drawn over the plane The power is therefore to the force to be overcome is the tangent of the angle of the penetrating sides to the radius, leaving the friction out of consideration hence the thinner the wedge the greater is its effect But when the wedge as is generally the case, is driven forward by percussion its power cannot be estimated with any degree of accuracy The percussive tremor excited by the blow destroys for an instant the friction at the sides and augments prodigiously the [illegible] effect Besides, when the wedge is used in [illegible] or other substances the parts of the block are generally separated to a considerable distance before the edge of the wedge as in the annexed figure, in which case it acts besides as a lever the power being applied at the end of the block or acting part [illegible] being at the [illegible] to separate

All the various kinds of cutting and piercing tools as axes, knives, scissars, chisels, &c nails pins, awls, &c, are modifications of the wedge The angle in these cases is more or less [illegible] to the purpose to which it is applied The mechanical advantage is increased by diminishing the length of the wedge, but the strength of the tool is thereby also diminished In tools for cutting wood the angle is generally about 30°, for iron it is from 50° to 60°, and for brass from 80° to 90° In general the softer the substance to be divided is, the more acute may the

WEDNESDAY [illegible] day, Lat dies Mercurii) The fourth day of the week consecrated by our Scandinavian ancestors to Woden the deity whose functions corresponded to those of Mercury in the Greek and Roman mythology

WEEK A period of seven days, of uncertain origin, but which has been used from time immemorial in eastern countries The week did not enter into the calendar of the Greeks, who divided the civil month into three periods of ten days each, and it was not introduced at Rome till after the reign of Theodosius By some writers the use of weeks is supposed to be a remnant of the tradition of the creation, by others that it was suggested by the phases of the moon, while a third class, with more probability, refer its origin to the seven planets known in ancient times This opinion explains the circumstance that the days of the week have been universally named [illegible] to a particular order In the [illegible] order of the [illegible], beginning with the [illegible] Saturn, Jupiter, Mars the Sun, Venus Mercury Moon The Greeks divided into 24 hours, and each successive hour consecrated to a particular planet in the order now stated, so that one hour being consecrated to Saturn, the next fell to Jupiter, the third to Mars, and so on, and each day was named after the planet to which its first hour was consecrated Now, suppose the first hour of a particular day to have been consecrated to Saturn it is evident that Saturn would also have the 8th, the 15th and the 22d hours The 23d hour would therefore fall to Jupiter, the 24th to Mars; and the 25th, or the first hour of the following day, would belong to the Sun from which it would take its name By proceeding in the same manner, it is found that the first hour of the third day would fall to the Moon, the first of the fourth day to Mars, of the fifth to Mercury, of the sixth to Jupiter, and of the seventh to Venus The cycle being completed the first hour of the eighth day would return to Saturn and all the others constantly succeed in the same order According to Dio Cassius, the Egyptian week began with Saturday The Jews, on their flight from Egypt, made Saturday the last day of the week The Saxons seem to have borrowed the week from some eastern nation [illegible] the names of their own divinities for the [illegible] of Greece In England, the Latin names of the days are still retained in legislative and judiciary acts (See *Ency. Brit*, "Calendar")

WEEPING CROSSES In Ecclesiastical Antiquities, stone crosses, at which penances were commonly finished with weeping and signs of contrition, were so called There was one close to the town of Stafford (See Mr Astle's "Observations on Stone Crosses," *Archæol.* vol xiii)

WEIGH To take the anchor out of the ground

WEIGHT In Physics, that property of bodies in virtue of which they tend towards the centre of the earth. In this sense, weight is synonymous with gravity *See* GRAVITY

WEIGHT, in Mechanics denotes the resistance to be overcome by a machine, whether in raising, or sustaining, or moving a heavy body The force applied to the machine for this purpose is called the moving power, and where the equilibrium subsists, the difference between the weight and the moving power is the purchase of the machine In all cases of equilibrium by the intervention of machinery if the machine be put in motion by a small additional force, the space passed over by the moving power will be greater than that passed over by the weight in proportion as the weight is greater than the moving power, or the product of the weight by its velocity will be equal to the product of the moving power by its velocity *See* MOMENTUM, VIRTUAL VELOCITY

WEIGHT, in Experimental Philosophy and Commerce, is the measure of the force by which any body, or a given portion of any substance, gravitates to the earth The process by which this measure is obtained is called *weighing*, and when required, as in many philosophical experiments, to be performed with great accuracy, is a tedious and delicate operation *See* BALANCE

The measurement of weight, like that of extension, consists in the comparison of the thing to be measured with some conventional standard But it is impossible to fix such a standard by written law or oral description, for it is impossible to communicate by words, and without reference to a sensible object, any adequate idea of a pound-weight or foot rule Standards of linear measure, not accurately defined indeed, but having an average value sufficiently well known for the rude purposes of mankind in the early stages of society, were furnished by the different parts of the human body, hence the measures *foot, cubit, span pace*, &c (*See* MEASURES) But the method of comparing the weights of bodies does not suggest itself so obviously to the mind as the comparison of linear dimension and is not so easily accomplished A balance is necessary the construction of which requires some degree of mechanical knowledge Hence the art of weighing though of great antiquity (see Goguet, *Origine des Lois* &c) was probably practised at a later period, and in a still less accurate manner, than that of measuring There has also been a much greater variety of standards of weight still less definite than those of measure, as will be readily conceived by considering the origin and import of such terms as *stone, load last*, &c The term *pound* (pondus) implies only weight indefinitely The *grain*, as a standard of small weight, being taken from the grains or corns of wheat, was perhaps the only denomination of weight that would universally convey any thing like a precise idea

As there is a constant ratio between the volumes and weights of the same substances when placed in the same physical circumstances, it is obvious that standards of weight may be derived from those of measure For example, a cubic foot or a cubic inch of distilled water, at the same temperature, and under the same atmospheric pressure, will always have the same weight Advantage has been taken of this property of bodies to connect weights with measures in the metrical systems that have been adopted in this and other countries

[illegible] laws were decreed by the Great Charter that the weights [illegible] England but no one measure [illegible] was established, for the diversity [illegible] from being [illegible] not only to produce confusion and inconvenience, but to render the system of weights adopted in one part of the country scarcely intelligible in another The old English pound, which is said to have been the legal standard of weight from the time of William the Conqueror to that of Henry VII, was derived from the weight of grains of wheat. 32 grains

gathered from the middle of the ear and well dried made a pennyweight, 20 pennyweights an ounce, and 12 ounces a pound Henry VII altered this weight, and introduced the *troy* pound instead, which was 1-16th [illegible] Saxon pound, into ounces pennyweights and grains, but the pennyweight contained only 21 grains and consequently a grain troy became a much heavier weight than the grain of wheat [illegible] troy contains 5 760 grains, while the [illegible] was divided into 7,680 grains, contained only 5,400 troy grains Another weight, the *avoirdupois* pound, was introduced by a statute of 24 Henry VIII , and though its first object was that of weighing butchers' meat in the market, it has gradually come to be used for all kinds of coarse goods or merchandize Two legal measures of weight were thus established, and have continued to be used in the country ever since, the avoirdupois weight being used for common purposes, and the troy for the precious metals, and, with a different division by apothecaries in compounding their drugs The standard of these measures was originally fixed by the act of parliament passed on the 17th June, 1824, cap 74 George IV , entitled "An act for ascertaining and establishing Weights and Measures," which was repealed by clause (A) of an act to prolong the time of the commencement of that act to January 1826 The following are the terms in which the standard is defined by the act —"That from and after the 1st day of May, 1825, the standard brass weight of 1 pound troy weight made in the year 1758, now in the custody of the clerk of the House of Commons, shall be and the same is hereby declared to be the original and only standard measure of weight, and that the said weight shall be, and is hereby denominated, the Imperial standard troy pound , and shall be, and the same is hereby declared to be, the unit or only standard measure of weight, from which all other weights shall be derived, computed, and ascertained, and that 1 12th part of the said troy pound shall be an ounce and that 1-20th part of such ounce shall be a pennyweight, and 1-24th part of such pennyweight shall be a grain so that 5 760 such grains shall be a troy pound , and that 7,000 such grains shall be and they are hereby declared to be a pound avoirdupois and that 1-16th part of the said pound avoirdupois shall be an ounce avoirdupois, and that 1-16th part of such ounce shall be a dram "

It follows from this that the weight of the pound troy to that of the pound avoirdupois, or common pound is in the proportion of 5 760 to 7,000, or of 144 to 175 The retention of two different systems of weights was in compliance with the common usages of the country, and the motives which influenced the commissioners of weights and measures in recommending the system which has been adopted were thus explained by Mr Davies Gilbert —"The troy pound appeared to us to be the ancient weight of this kingdom, having, as we have reason to suppose, existed in the same state in the time of Edward the Confessor, and there are reasons, moreover, to believe that the word *troy* has no reference to any town in [illegible] to the notion given to London [illegible] founded on the legend of Brute Troy weight, therefore, according to this etymology, is, in fact, London weight We were induced, moreover, to preserve the troy weight, because all the coinage has uniformly been regulated by it, and all medical prescriptions and formulæ now are, and always have been, estimated by troy weight, under a peculiar subdivision which the College of Physicians have expressed themselves most anxious to preserve "

In the sixth clause of the act it is enacted, that if the standard troy pound should be lost or destroyed, it is to be restored by a reference to a cubic inch of distilled water, which has been found and is declared to be 2 52 458 troy grains, at the temperature of 62° of Fahrenheit, the barometer being at 30 inches Hence the weight of a pennyweight troy is to that of a cubic inch of distilled water, in such circumstances, in the proportion of 24 to 252 458, or of 24 000 to 252 458 so that the weight of the cubic inch of distilled water must be conceived to be divided into 252,458 equal parts, and 24 000 of such parts will be the standard pennyweight, or 100 of such parts will be the standard pound The restoration of the standard, however, in the manner prescribed by the act, is wholly impracticable

Though the commissioners on this occasion probably acted wisely in accommodating their regulations to existing usages, it cannot be disputed that the circumstance of having different weights expressed by the same names, as the pound and ounce troy and avoirdupois is a source of great inconvenience and confusion Few persons, in fact, recollect the different standards and divisions well enough to have any clear or accurate ideas on the subject The comparison of the weights is always a matter requiring care and calculation The avoirdupois pound is greater than the troy pound, as has been already stated, in the ratio of 175 to 144 , but in consequence of the different division the ounce avoirdupois is *smaller* than the ounce troy the former being equal to 437½ grains while the latter contains 480 grains The dram in apothecaries' weight is 60 grains, while the dram avoirdupois is equal to only 27 11/32 grains

For philosophical purposes and in delicate weighing troy weight only is used, and the weight is usually reckoned in grains By this means fractional numbers are avoided and no ambiguity can arise, as there are no other grains than troy grains Dr Kelly, in his *Universal Cambist*, an elaborate and useful work, states that the dram avoirdupois like the drachm of apothecaries has sometimes been subdivided into scruples and grains but as no such weight as an avoirdupois grain ever existed, the use of the expression is an instance of the confusion inseparable from having different systems of weights in which the same names are applied to things totally distinct

The irregular divisions which have been adopted and retained are also liable to much objection, on account of the great number of weights to be employed in practice The most convenient system would probably be the decimal division, which requires weights of the following values —1, 2, 3, 4, &c (grains for instance) , 10, 20, 30, 40, &c , 100, 200, 300, &c , 1000, 2000 3000, &c up to 9000 , and 1, 2, 3, &c , 01, 02, 03, &c , 001, 002, 003, &c By this means arithmetical calculations would be facilitated, and the number of weights in the scale would equal the digits in the number by which the grains or units of weight are expressed Thus a load of 735 4 grains, would be counterpoised by weights of 700 grains, 30 grains 5 grains, and 4 10ths of a grain The composition according to the geometrical series, 1, 2 4, 8, 16 &c offers this advantage, that a smaller number of weights would be necessary than when any other system is adopted

In consequence of the destruction of the parliamentary standards of weights and measures by the burning of the two houses of parliament in 1834 a commission (at the head of which was the Astronomer Royal) was appointed in 1838 to consider and report upon the steps to be taken for their restoration The report of the commissioners, which is dated the 21st of December 1841, enters very fully into the subject, and recommends the adoption of considerable changes in the present system of weights and measures and coinage, chiefly with the view of introducing at least partially, a decimal system But as these recommendations may not be adopted by the legislature, or at all events will probably be considerably modified, it is unnecessary, in the present state of affairs, to state them in detail With respect to weights in particular, the plan of the commissioners is briefly this – that the troy pound be abolished and that the use of the troy ounce and pennyweight be confined to gold silver, and precious stones, that apothecaries' [illegible] to be used for the combination of [illegible] other purposes the only legal weights shall be derived from a pound, equal [illegible] distinctive term a [illegible] is to be divided into 16 ounces and 7 000 grains and no denomination is to be recognised lower than pound except the ounce and the grain and the decimal parts of the pound They also recommend that the weight of 14 pounds, or stone in common use and its multiples 28 pounds 56 pounds, 112 pounds, be abolished , and that the only legal weights above one pound be weights of multiples of 1 pound and not exceeding 10 pounds, and weights of 10 pounds and its multiples not exceeding 100 pounds According to this plan there would only be decimal multiples of the standard , while, with respect to the submultiples there would not only be a decimal system, but also a denomination of weight equal to a 10th and another equal to a 7-thousandth part of the standard It is not easy to see what stronger reason there can be for retaining the ounce than the stone or the hundred-weight, which are so extensively used particularly for purposes connected with agriculture The quantity of iron weights of 14 lb and its multiples in use in the country is estimated to be not less than 30 000 tons, and the expense of changing them to weights of a decimal system would be between 100,000l and 120,000l Without, however, altering the standard unit the commissioners recommend that a platinum weight of 7,000 grains be constructed and declared to be the parliamentary standard of weight , but that it be not defined with reference to any natural standard or to measures of length or capacity, as a cubic inch of distilled water

Tables of British Weights

1 *Imperial Troy* [illegible] One cubic inch of distilled water, at [illegible] thermometer, the barometer being 30 inches, weighs 252 458 troy grains.

grs.	dwts	oz	lb
24 =	1		
480 =	20 =	1	
5760 =	240 =	12 =	1

Troy weight is used in weighing gold, silver, jewels, &c, and in philosophical experiments

2 *Apothecaries' Weight* — Standard The same as in troy weight, with the ounce divided into 8 drachms and 24 scruples

grs	scrs (℈)			
20 =	1	drs. (℥)		
60 =	3 =	1	oz (℥)	
480 =	24 =	8 =	1	lb (℔)
5760 =	288 =	96 =	12 =	1

Medicines are compounded by this weight, but drugs are usually bought and sold by avoirdupois weight

3 *Imperial Avoirdupois Weight* — Standard: The same as in troy weight; and one avoirdupois pound = 7000 troy grains

drs	oz				
16 =	1	lbs			
256 =	16 =	1	qrs		
7168 =	448 =	28 =	1	cwts	
28672 =	1792 =	112 =	4 =	1	ton
573440 =	35840 =	2240 =	80 =	20 =	1

This weight is used for the general purposes of commerce

The preceding are the British statute weights, but numerous other discordant denominations of weight, generally multiples of the avoirdupois pound, are still used in different parts of the country for weighing particular kinds of merchandise One of the most common of these is the *stone*, which has a great variety of different significations In London, however, only two stones are generally understood, viz the stone of 8 pounds for butchers' meat, and the stone of 14 pounds for other commodities (For values of different local weights see *Buchanan's Tables of Weights and Measures*, *General Paisley's work on the Measures, Weights and Money used in this Country*, *M'Culloch's Commercial Dictionary*, *Kelly's Universal Cambist* &c)

A particular denomination of weight, a *carat*, is used for weighing diamonds An ounce troy is equivalent to 151½ carats, whence 1 carat is = 3·17 grains In expressing the fineness of gold by *carats*, the term rather denotes a proportion than a weight Thus gold 22 carats fine signifies an alloy such that the proportion of the weight of pure gold to that of the whole weight is as 22 to 24, or such that it contains 22 parts by weight of pure gold and 2 parts of some inferior metal

French System of Weights — The French denominations of weight occur so frequently in works connected with the physical sciences, that it is convenient to be acquainted with their values The unit of weight is the *gramme*, which is the weight of the 100th part of a cubic metre of distilled water at the temperature of melting ice A gramme is equal to 15·434 troy grains, whence the following comparative table of French with troy weight —

	grammes		Troy grains.
Milligramme =	·001 =		·01543
Centigramme =	·01 =		·15434
Decigramme =	1 =		1·5434
Gramme =	1 =		15·434
Decagramme =	10 =		154·34
Hectogramme =	100 =		1543·4
Kilogramme =	1000 =		15434
Myriagramme =	10000 =		154340

The kilogramme is equal to 2 lb 3 oz 4·428 drams avoirdupois weight In the *Système Usuel* the standards are the same as the above, but the denominations are those which were anciently in use It was found impossible to introduce the new terms The divisions are binary Half the kilogramme forms the *livre usuel* which is divided into halves, quarters, eighths, &c, down to the *gros*, which is the eighth of the *once*, or the 1-128th of the *livre* (For a comparative table of the weights and measures used in different countries of the world, see the *Encyc Britannica*, art "Weights")

WELD [illegible] (*Reseda Luteola*) A plant cultivated for the use of [illegible] When the seeds are ripe the plant is cut and dried it yields a brownish yellow decoction, the colour of which is rendered paler by acids, and richer and deeper by alkalies Alum throws down a yellow precipitate, and leaves the clear liquor of a fine lemon yellow, tartar also brightens its colour, and solutions of tin give it a dilute green tint When a mixture of whiting and alum is added to a hot decoction of weld, a yellow precipitate is obtained, which, when collected, washed, and dried, is of a fine delicate colour, and much employed by paper-stainers

WELDING There are a very few of the metals which are susceptible of being united by pressure or hammering, or of being *welded* together Two pieces of potassium may be [illegible] (at 60° to 80°), but [illegible] junction of two pieces [illegible] and steel Platinum, also, although infusible, may be welded at a white heat; and it is in this way that that valuable metal, when in the granular or pulverulent state, is worked into bars

WELL In Architecture, a deep pit sunk by digging, for the purpose of collecting and retaining the water of a spring or of a reservoir, by which it may be supplied *See* WATER and ARTESIAN FOUNTAINS

Before proceeding to dig a well, it ought first to be determined on, whether a mere reservoir for the water which oozes out of the surface soil is desired or obtainable, or a perpetual spring If the former is the object [illegible] supply, unless a watery vein or spring is hit on if the latter, the depth may be various there being instances of 300 and 400 feet having been gone through before a permanent supply of water was found

The art of well-digging is generally carried on by persons who devote themselves exclusively to that department The site being fixed on, the ground-plan is a circle, generally of not more than six or eight feet in diameter the digger then works down by means of a small short handled spade, and a small implement of the pick-axe kind, the earthy materials being drawn up in buckets by the hand or a windlass fixed over the opening for the purpose Where persons conversant with this sort of business are employed, they usually manage the whole of the work, bricking round the sides with great facility and readiness, but in other cases it will be necessary to have a bricklayer to execute this part of the business

There are two methods of building the stone or brick within the well, which is called the steining In one of these a circular ring is formed, of the same diameter as the intended well, and the timber of which it is composed is of the size of the brick-courses with which the well is to be lined The lower edge of this circle is made sharp, and shod with iron, so that it has a tendency to cut into the ground, this circular kirb is placed flat upon the ground, and the bricks are built upon it to a considerable height like a circular wall The well-digger gets within this circle, and digs away the earth at the bottom, the weight of the wall then forces the kirb and the brickwork with which it is loaded to descend into the earth, and as fast as the earth is removed it sinks deeper, the circular brick wall being increased or raised at top as fast as it sinks down, but when it gets very deep, it will sink no longer, particularly if it passes through soft strata in this case a second kirb of a smaller size is sometimes begun within the first When a kirb will not sink from the softness of the strata, or when it is required to stop out water, the bricks or stones must be laid one by one at the bottom of the work, taking care that the work is not left unsupported in such a manner as to let the bricks fall as they are laid this is called underpinning

Well-diggers experience sometimes great difficulty from a noxious air which fills the well, and suffocates them if they breathe it The usual mode of clearing wells of noxious air, is by means of a large pair of bellows, and a long leathern pipe which is hung down into the well to the bottom and fresh air forced down by working the bellows

The use of the auger is common in well-digging, both in ascertaining, before commencement, the nature of the strata to be dug into, and also in course of digging for the same purpose, and because, by boring in the bottom of a well to a considerable depth, the spring is sometimes hit upon, and digging rendered no longer necessary

The use of the borer alone may procure an adequate supply of water in particular situations This mode appears to have been long resorted to in this and other countries From what we have already stated as to the disposition of strata, the conditions requisite for its success will be readily conceived, viz watery strata connected with others on a higher level the pressure of the water contained in the higher parts of such strata on that in the lower will readily force up the latter through any orifice, however small All that is necessary, therefore, is to bore down to the stratum containing the water, and, having completed the bore, to insert a pipe, which may either be left to overflow into a cistern, or it may terminate in a pump In many cases, water may be found in this way, and yet not in sufficient quantity and force to rise to the surface, in such cases a well may be sunk to a certain depth, and the auger-hole made, and the pipe inserted in it in the bottom of the well From the bottom it may be pumped up to the surface by any of the usual modes

As an example of well-digging combined with boring, we give that of a well dug at a brewery at Chelsea, Middlesex, in 1764 The situation was within 20 or 30 feet of the edge of the Thames, and the depth 394 feet, mostly through a blue clay or marl At the depth of nearly fifty feet a quantity of loose coal, twelve inches in thickness, was discovered and a little sand and gravel was found about the same depth The well-digger usually bored about ten, fifteen, or twenty feet at a time lower than his

work as he went on, and on the last boring when the rod was about fifteen feet below the bottom of the well, the man felt as the first signal of water, a rolling motion something like the gentle motion of a coach passing over pavement upon his commencing to bore, the water presently pushed its way by the side of the auger with great force scarcely allowing him time to withdraw the borer, put that and his other tools into the bucket, and be drawn up to the top of the well The water soon rose to the height of 200 feet

In a case which occurred in digging a well at Dr Darwin's, near Derby, the water rose so much higher than the surface of the ground, that by confining it in a tube, he raised it to the upper part of the house (*Rees's Cyclopædia*, art "Well," and *Derbyshire Rep*)

The process of boring the earth for spring-water has of late been practised with [illegible] parts of England, chiefly by Mr [illegible] In the neighbourhood of London, many fountains of pure spring-water have lately been obtained by these means We may particularly mention those at Tottenham, Middlesex and Muswell Hill, both of which afford a constant stream or perennial flow of water, at one time equal to about eight gallons per minute, but now reduced to a much smaller quantity, in consequence of the great number of holes that have been bored into the supplying strata

WELL A small enclosed space near the mainmast, extending from the bottom of the ship to the principal gun deck containing the pumps

WE'REGILD Among the Anglo-Saxons, the compensation paid by a delinquent to the party injured, or his relations, for offences against the person This custom was common to all the Teutonic tribes, and to many Celtic It is mentioned by Tacitus in his account of the ancient Germans The great distinction between Saxon freemen was that between the 'eorls' or nobility and 'ceorls' or commonalty, and the *were* of the former was usually rated at six times the amount of that of the latter

WE'RNERITE A mineral named after Werner It is a silicate of alumina, lime, and oxide of iron, of a green or grey colour and for [illegible] crystals It has been found in [illegible] also in Switzerland

WE'SLEYANS The chief denomination of the Methodists so called from John Wesley, their founder See METHODISTS

WE'STERN EMPIRE The name given by historians to the western division of the Roman empire when divided, by the will of Theodosius the Great between his sons Honorius and Arcadius, A D 395 After the deposition of the emperor Augustulus by Odoacer A D 476 the Western empire was definitively at an end But when Charlemagne in the year 800, assumed the imperial crown it was with the view of reassuming the ancient dignity of the Cæsars in Western Europe, and after him the German emperors were considered by the jurists of their own country and of their party in Italy, as representing the majesty of ancient Rome the Italian states being looked on as feudatories of the empire

WHALE *See* BALENA

WHEAT (*Triticum*, L, *Triandria Digynia* L, *Gramineæ*, Juss Inflorescence spiked Glume two-valved, many-flowered shorter than the spikelet, the valves nearly equal, beardless or with one beard enclosing the florets Palæ two one of them bearded from the end Seed enclosed in the palæ rarely otherwise)

Wheat is by far the most important and most extensively cultivated species of bread-corn raised in England It is sown after fallow turnips, cabbages potatoes beans, &c In light soils it follows clover and the cultivated grasses but it never at least in the best farmed districts, follows any other white crop Wheat may be raised on all sorts of soils, but those of a clayey nature are the most suitable So peculiarly, indeed is wheat adapted to heavy stiff lands, that they are usually termed "wheat soils" The lighter the soil, the less is it suited to this species of grain, and it is an error in practice to force the cultivation of wheat on soils, and under circumstances, better suited to the production of other grain In this country it does not admit of being raised at a great elevation As it is a crop on which the farmer mainly depends, the preparation for it, in whatever rotation it comes, should be an object of great care and attention If it be intended to sow wheat after fallow, the land is repeatedly ploughed, harrowed, and well manured, if after clover, only one ploughing is given, and seldom more after beans, where tares have been previously sown, they are got off the land in sufficient time to plough it more than once, when wheat follows turnips or cabbages, it must, unless they be stored or eaten, be sown in the spring months

The kinds of wheat grown in England seem mostly all to be varieties of two species – the *Triticum hybernum*, or winter wheat, and the *Triticum turgidum* or turgid wheat. The culture of the latter is mostly confined to clays; the cone or bearded wheat, being the most esteemed of its varieties it enjoys this pre-eminence, not because it yields the finest flour, but because it is comparatively productive, and not subject to disease on wet soils

The varieties of wheat are perpetually changing, in consequence of variations of culture, climate, and soil Those most in use are distinguished by different local terms They may, however, be divided into the two [illegible] preferred to those that are woolly and thick-chaffed Wheat sown in the spring is called *spring wheat*, but the species is quite the same as that sown before winter, though, by being sown in the spring, its period of ripening is changed It is always sown before winter when the ground can be got ready, but when it follows turnips, cabbages and such like crops, it has frequently to be deferred to the spring (*Low on Agriculture*, pp 222—228)

Winter wheat is seldom sown in any part of England before the beginning or middle of September, or later than the end of November Spring wheat is generally sown between the middle of March and the middle of April The seed is invariably pickled or steeped, a process intended to prevent *smut* The quantity of seed allowed to an acre, when sown broad-cast, usually varies from 2½ to 3, and even 4 Winchester bushels

The drill husbandry as applied to wheat, is practised to a considerable extent in many parts of England, and in some places it is not unfrequently planted with the dibble but by far the greater portion is sown broad-cast While growing but little attention or labour is bestowed upon it When drilled, it is generally hoed, and when sown broad cast, it is sometimes hand weeded, and occasionally, though rarely harrowed and rolled in the spring But these operations are generally, perhaps, prosecuted as much in the view of covering the clover and grass seeds that are then frequently sown in the wheat fields as of improving the wheat crop

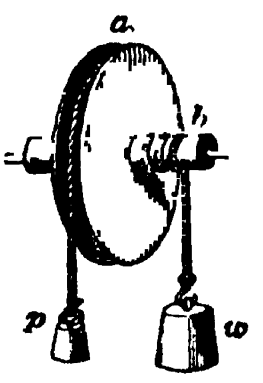
Wheat harvest generally commences in the south of England, about the 20th of July or the beginning of August in the midland counties it is about ten days and in the northern counties from a fortnight to three weeks later There is [illegible] field operations, with [illegible] kinds of grain, between the north and south of England, in the former, during harvest, the corn-field exhibits a large number of reapers, perhaps 50 60, or even 100 all working together and presenting an interesting and animating spectacle In the south of England on the other hand and over the greater part of the midland counties wheat is reaped by small sets of individuals, who contract to cut a field or a certain number of acres, so that in general the field merely exhibits one or two men with, perhaps their wives working in different parts of it Wheat is seldom or never cut down with the scythe, but is either reaped with the common sickle, or as is the practice in some of the counties near the metropolis, as well as in some of the south western counties it is *bagged*, that is struck down near the ground with a large and heavy hook It is universally bound in sheaves, which are set up in *shocks* or *stooks*, each containing twelve or fourteen sheaves Perhaps no circumstance marks the difference of climate in the south and north of England more strongly than the difference in point of time during which it is necessary to keep wheat and other grain in the field before it is carried home In the southern counties it is generally ready in a week or ten days, whereas in the north it is necessary to let it stand out for two or three weeks In the southern eastern, and midland counties it is frequently put into barns in the north, it is almost universally stacked

As this grain is so extensively cultivated, frequently on very inferior soils, and after very imperfect preparation, the produce per acre varies materially in different counties and districts, it is also very liable to injury from a bad seed time, a wet winter, or a blight during the period of its flowering (which last is the most common cause of the failure or deficiency of our wheat crops), so that its produce varies as much in different seasons on the same farms, and under the same management, as it does during the same season on different farms The lowest quantity of produce, except where an absolute deficiency from blight occurs, may, perhaps be rated at from 10 to 12 bushels an acre, and the highest at from 48 to 56 or 64 bushels Occasionally, indeed, even more than this has been reaped on the deep loams near Chichester, in Sussex on the calcareous loams near Epsom, and in some of the more favoured and highly cultivated parts of Kent, Essex, Lincoln, Somerset, &c

The wheat counties are [illegible] Hertford, Berks, Hants, [illegible] are the counties most distinguished for the quality as well as the quantity of their wheat In the north, this

grain is sometimes raised of a very fine quality, but generally it is inferior, being colder to the feel, darker coloured thicker skinned, and yielding less flour In the best wheat counties, and in good years, the weight of a Winchester bushel of wheat varies from 60 to 62 lbs In the Isle of Sheppey, in Kent (where, perhaps, the best samples are produced) it sometimes weighs, in fine seasons, 64 lbs a bushel Where the climate is colder, wetter, and more backward, or in bad seasons, the weight of the bushel does not exceed 56 or 57 lbs It is calculated that, at an average, a bushel of good English wheat weighs 58½ lbs, and that the average yield of the kingdom is 1½ lbs of flour to 14 lbs of grain The weight of the straw is supposed to be about double that of the grain, so that an acre yielding 30 bushels of wheat, at 58½ lbs per Winchester bushel, would yield 3,510 lbs of straw (*Statistics of British Empire*, i 464)

The increase of population, and the extraordinary extension and improvement of cultivation during the ten years ending with 1850, coupled with the inquiries we have made, have satisfied us that in average seasons the quantity of wheat raised in the United Kingdom for food cannot at present (1851) be less than 15 000 000 quarters, and this ⅛th part for seed, the total produce will be 17,000,000 quarters, worth at the low average price of 52*s* a quarter, 45 500 000*l* But notwithstanding its magnitude, the supply is, speaking generally, inadequate to meet the demand and whenever the crops are below an average there is a large importation



We incline to think that of the total produce of wheat in the United Kingdom, at least 15 000,000 quarters are furnished by England The climate of Scotland and Ireland especially of the latter, is speaking generally, too cold and moist for the profitable culture of wheat Along the east coast of Scotland, indeed in Berwickshire, East Lothian, Fife Perth, and Forfar, there are extensive tracts where the soil and climate are comparatively good and the culture excellent and where very good wheat is raised But with these exceptions the rest of Scotland and the whole of Ireland, is more suitable for the growth of oats and barley than for that of wheat Indeed its culture in Ireland has recently been declining

ACCOUNT of the Quantities of Foreign and Colonial Wheat imported into re exported from, and retained for Consumption in the United K[illegible] h Year since 1807 inclusive, with the [illegible] Prices of Wheat per Imperial Quarter

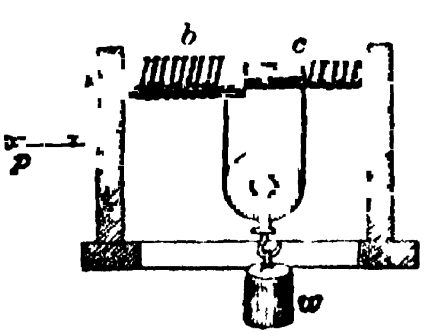
WHEEL AND AXLE In Mechanics, one of the simple mechanical powers or machines, consisting of a



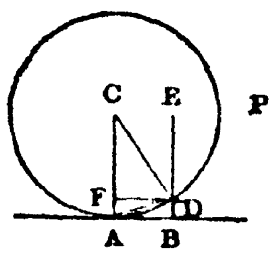
wheel having a cylindrical axle passing through its centre, resting on pivots at its extremities, or carried in [illegible] of revolving The power is applied [illegible] of the wheel, and the weight or force to be overcome to the circumference of the axle, and equilibrium takes place when the power and [illegible]

w the weight The power is applied by a rope passing round the wheel, and the weight attached to another rope coiled round the axle in a contrary direction. As the wheel and axle turn together, the wheel takes up or throws off as much more rope than the axle as its circumference is greater than that of the axle, or the space through which *p* descends is as much greater than that through which *w* is lifted up as the circumference or radius of the wheel is greater than the circumference or radius of the axle Hence if *a* denote the radius of the wheel and *b* that of the axle we have, by the principle of virtual velocities, *p* *w* *b* *a*, or $p\,a = w\,b$

The wheel and axle is a perpetual lever, so contrived as to have a continued motion about a fulcrum When the thickness of the rope is taken into consideration, the force must be conceived as acting at the centre of the rope, and therefore the thickness of the rope which supports the weight must be added to the diameter of the axle, and the thickness of that which supports the power to the diameter of the wheel But the modes in which the power is applied are very various, and frequently otherwise than by means of a rope If the power acts not at the circumference of the wheel, but at the extremity of a handspike or of projecting pins inserted in the wheel the distance of that extremity from the centre of the axis is to be accounted the radius of the wheel The common winch with which a grindstone is turned or a crane worked, the capstan the windlass, the crank, and other contrivances of a similar kind, are only different modifications of the wheel and axle

A form of the wheel and axle is represented in the subjoined figure, by which a great mechanical advantage is obtained The axle consists of two parts having different thicknesses, and the rope after being coiled round one of the parts is carried round a pulley attached to the weight, and coiled round the other in the opposite direction The power *p* is applied at the handle of the winch, which here takes the place of the wheel In order to compute the advantage gained by this machine let *a* denote the circumference described by the handle of the winch *b* the circumference of the thicker part of the axle and *c* that of the thinner part, then,

while the winch makes one revolution in the direction which raises the weight the part of the rope which passes from the one part of the axle to the other round the pulley will be shortened by the quantity $b-c$, and consequently the weight *w* will be raised through the height $\frac{1}{2}(b-c)$ But the space described in the same time by the power *p* is equal to that through which the handle of the winch passes, or equal to *a*, therefore, by the principle of virtual velocities *p* *w* $\frac{1}{2}(b-c)$ *a* or $p\,a = \frac{1}{2}w\,(b-c)$ As the circumferences of circles are to their radii in a constant ratio it is evident that the formula will equally apply if the letters *a*, *b*, *c* be taken to represent the respective radii



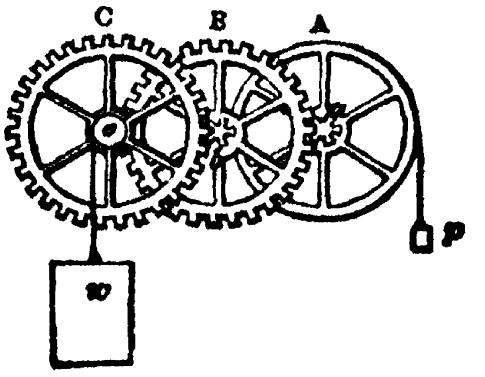
WHEEL In a Ship, the wheel and axle by which the tiller is moved

WHEEL ANIMAL, or WHEEL ANIMALCULE. *See* ROTIFERS

WHEEL BREAKING ON THE A mode of capital punishment, said to have been first employed in Germany, according to some writers, on the murderers of Leopold, duke of Austria, in the 14th century According to the German method of this savage execution, the criminal was laid on a cart-wheel with his arms and legs extended and his limbs in that posture fractured with an iron bar But in France (where it was restricted to cases of assassination or other murders of an atrocious description, highway robbery, parricide, and rape), the criminal was laid on a frame of wood in the form of a St. Andrew's cross with [illegible] cut transversely in it above and below the knees and elbows, and the executioner struck eight blows with an iron bar, so as to break the limbs in those places sometimes finishing the criminal by two or three blows on the chest or stomach the use

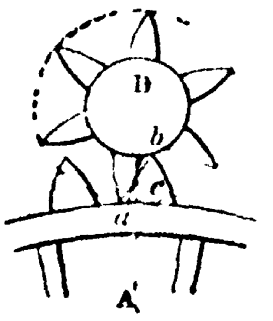
called *coups de grace* He was then unbound and laid on a small carriage wheel, with his face upwards, and his arms and [illegible] by which the executioner was directed to strangle the criminal, either before the first or after one two, or three blows This punishment was abolished in France at the Revolution, but it is still resorted to in Germany as the punishment for parricide, the last instance of which took place in 1827 near Gottingen The assassin of the bishop of Ermeland in Prussia, in 1841, was sentenced to the wheel

WHEELS OF CARRIAGES Wheels applied to carriages serve a twofold purpose In the first place, they greatly diminish the friction on the ground by transferring it from the circumference to the nave and axle, and in the second place, they serve to raise the carriage more easily over obstacles and asperities met with on the roads The friction is diminished in the proportion of the circumference of the axle to that of the wheel, and hence the larger the wheel, and the smaller the axle, the less is the friction. The mechanical advantage of the wheel in surmounting an obstacle may be computed from the principle of the lever Let the wheel touch the horizontal line of traction in the point A, and meet a protuberance B D Suppose the line of draft C P to be parallel to A B join C D, and draw the perpendiculars D E and D F We may suppose the power to be applied at E, and the weight at F, and the action is then the same as the bent lever E D F turning round the fulcrum at D Hence P W F D D F But F D D E tan F C D 1, and tan F C D = tan 2 (D A B), therefore P = W tan 2 (D A B) Now, it is obvious that the angle D A B increases as the radius of the circle diminishes, and therefore the weight W being constant, the power required to overcome an obstacle of a given height is diminished when the diameter is increased Large wheels are therefore best adapted for surmounting inequalities of the road There are however, circumstances which prescribe limits to the height of the wheels of carriages If the radius A C exceeds the height of that part of the horse to which the traces are attached, the line of traction C P will be inclined to the horizon and part of the power will be exerted in pressing the wheel against the ground The best average size of wheels is considered to be about 6 feet in diameter The fore wheels of carriages and waggons in this country are usually much too small



Cylindrical wheels are best adapted for level roads, and the breadth of the rim should be considerable (not less than three inches), to prevent their sinking into the ground For hilly and uneven roads a slight inclination of the spokes, called *dishing*, tends to give strength to the wheel, but this is very frequently carried to excess

WHEEL WORK, in Machinery consists of a combination of wheels communicating motion to one another Such combinations may be formed in various ways, but they are generally reducible to the principle of the wheel and axle, though the wheel which turns the other is not usually on the same axis with it The motion in such cases is communicated from the one wheel to the other, either by belts or straps passing over the circumferences of both, or by teeth cut in those circumferences, and working in one another In either of these ways the velocities of points in their circumferences are equal, and consequently their angular velocities or the number of revolutions which they make in the same time, are inversely as their radii When one wheel drives another by teeth, they necessarily turn in opposite directions if united by a cord or belt, they will turn in the same direction, if the belt does not cross itself between the two wheels, but if the belt crosses itself, they will turn in opposite directions The chief advantage of transmitting motion by cords or belts is, that the wheels may be placed at any convenient distance from each other, and be made to turn either in the same or in opposite directions



Wheels may act on one another so as to communicate motion in various ways When the resistance of the work is not great, the object may be accomplished by the mere friction of their circumferences In order to increase the friction the surfaces of the rims are faced with buff leather (caoutchouc might answer the purpose better), or wood cut against the grain and pressed together with a certain degree of force This method is sometimes used in spinning machinery, and has even been applied [illegible] accompanied with little noise

When motion is to be transmitted through a train of wheel work, toothed wheels are generally employed It is usual to call a small wheel acted on by a large one a *pinion*, and its teeth the *leaves* of the pinion Wheels and pinions are combined in the manner represented in the annexed figure On the axle of the wheel A, which bears the power, is [illegible] The axle of this wheel carries a pinion *b*, which drives the wheel C In the figure, the axle *c* of this wheel carries the weight, but the combination may be continued at pleasure When motion is communicated in this manner, the angular velocity of the first wheel is to that of the last pinion as the product formed by multiplying together the radii of all the wheels to the product formed by multiplying together the radii of all the pinions Consequently if R R', R'', &c denote respectively the radii of the wheels and *r*, *r'*, *r''*, &c the radii of the pinions, we shall have, by the principle of virtual velocities, *p* (R × R' × R'', &c) = *w* (*r* × *r'* × *r''*, &c) As the size of the teeth of any wheel and the opinion into which it works must be equal we may substitute for the radii the number of teeth in the wheels and pinions respectively

Toothed wheels, as distinguished by the position of the teeth relatively to the axis are of three kinds *spur wheels*, *crown wheels* and *bevelled wheels* When the teeth are raised upon the edge of the wheel, or are perpendicular to the axis (as in the above figure), the wheel is a spur wheel, when they are raised parallel to the axis or perpendicular to the plane of the wheel it is a crown wheel, and when they are raised on a surface inclined to the plane of the wheel, it is called a bevelled wheel The combination of a crown wheel with a spur wheel as pinion is used when it is required to communicate motion round one axis to another at right angles to it Two bevelled wheels are employed to transmit motion from one axis to another inclined to it at any proposed angle Wheels have also different names, according to their mode of action, as *heart wheel*, *sun-and-planet wheel*

Form of the Teeth of Wheels — In the construction of machinery, it is of the utmost importance that the several parts act on one another with a uniform force, and with the smallest possible amount of friction When wheels act by teeth working into each other, every point of the side *a b* of the tooth which is in action comes successively into contact with the tooth of the pinion as the wheel turns round and the force is necessarily exerted at the points *c*, which are in contact Hence the lengths and positions of A *c* (A being supposed the centre of the wheel) and B *c* the levers by which they act, are constantly changing, and in order therefore, that the force of the one tooth upon the other may be constant, it is necessary that the line drawn perpendicular to the surfaces of both teeth, at the point of contact *c*, always intersect the line A B of the centres in the same point There are many different curves according to which the teeth might be formed so as to answer this condition, but that which has been most generally adopted, and which appears the most convenient, is the epicycloid generated by the revolution of a circle whose radius is equal to half the radius of the pinion on the circumference of a circle equal to the wheel This was first proposed by Roemer, the celebrated Danish astronomer The evolute of the circle was proposed, with other curves, by Euler *See* TEETH OF WHEELS

When the teeth are constructed according to the theoretical rules, the action is not only uniform, but there is little friction, for the teeth roll on one another, and neither slide nor rub But as it is impossible to attain perfect accuracy in practice, the surfaces of the teeth will always present some inequalities, and there will consequently be some friction In order, therefore, to equalize the wear, it [illegible] pinion should work in [illegible] the wheel, and not always [illegible] and hence the number of teeth in a wheel and in a pinion which work into each other should be prime to one another This precaution is more especially necessary in mill work, and where considerable force is used (*Willis's Principles of Mechanism*; *Buchanan on Mill Work*, by Rennie, *Gardner's Mechanics Cab Cyclop*, *Gregory's Mechanics*, &c)

WHELPS Short upright pieces placed round the barrel of the capstan, to afford resting points for the messenger or hawsers

WHE'TSTONE A talcy slate containing silica, used for hones *See* NOVACULITE.

WHEY The limpid part of milk which remains after the separation of the curd and butter it consists chiefly of water holding between 3 and 4 per cent of sugar of milk in solution *See* MILK

WHIGS The well-known designation of a political party in English history It was first used in the reign of Charles II The term, which is of Scottish origin (*vide infrà*), was first assumed as a party name by that body of politicians who were most active in placing William III on the throne of England Since that time it has been borne by successive generations of those who by hereditary [illegible] party [illegible] popular, and their measures when in power, tending to increase the democratic influence in the constitution It may not be out of place to subjoin a few of the various accounts of the origin of the term *Whig*, now incorporated indelibly in the political vocabulary of this country It was introduced immediately after the failure of Hamilton's expedition into England, in the year 1648, for the rescue of Charles I from the hands of the English levellers and fanatics After Hamilton's defeat at Preston the Westland Whigs raised an insurrection, which is thus alluded to —

'The party appellation of *Whigamores* or briefly *Whigs* had its origin at this period, and the insurrection referred to was called the 'Whigamores' raid,' or incursion, that term being the common one for the predatory expeditions of the Borderers This nickname being still preserved in the vocabulary of party, although there is truly none now existing that can be in any degree assimilated to the original faction, it seems proper to explain how the distinction originated Mr Laing, in his History (vol i p 381 2d ed 1804), informs us that 'the expedition was termed the Whigamores' inroad from a word employed by these western peasants in driving horses, and the name transferred, in the succeeding reign, to the opponents of the court, is still preserved and cherished by the Whigs as the genuine descendants of the Covenanting Scots' And in a footnote he adds 'According to others from whig or whey, the customary food of those peasants'"

Sir Walter Scott, in his *Tales of a Grandfather Prose Works* vol xxiv), says, 'This insurrection was called the Whigamores raid, from the words *whig, whig*, — that is, get on get on — which is used by the western peasants in driving their horses, a name destined to become the distinction of a powerful party in British history"

In Daniel Defoe's *Memoirs of the Church of Scotland*, printed 1717, p 173, speaking of the Covenanters he says, "This is the first time that the name of a Whigg was used in the world —I mean as applied to a man or to a party of men, and these were the original primitive Whiggs, the name for many years being given to no other people The word is said to be taken from a mixed drink the poor men drank in their wanderings, composed of water and sour milk"

And Bishop Burnet, who lived nearer to the time in which the nickname was invented gives the following explanation of it in the *History of his Own Times* (p 26 imperial ed 1837) — "The south-west counties of Scotland have seldom corn enough to serve them round the year, and the northern parts producing more than they need, those in the west come in the summer to buy at Leith the stores that come from the north, and from a word *whiggam*, used in driving their horses, all that drove were called Whiggamores and shorter, the Whiggs Now, in that year, after the news came down of Duke Hamilton's defeat, the ministers animated their people to rise and march to Edinburgh, and they came up marching on the head of their parishes with an unheard-of fury praying and preaching all the way as they came The Marquis of Argyle and his party came and headed them, they being about six thousand This was called the Whiggamores' inroad, and ever after that all that opposed the court came, in contempt, to be called Whiggs, and from Scotland the word was brought into England, where it is now one of our unhappy terms of distinction"

WHINSTONE A species of basalt *See* GEOLOGY

WHIP In sea language, a rope passed through a single block or pulley

WHIRLING TABLE A machine contrived for representing several phenomena of centrifugal force, by giving bodies a rapid rotation Mr Robins invented a whirling machine for the purpose of determining the resistance of the air, which is described in the 1st vol of his *Tracts*, and also in *Hutton's Tracts* vol iii, where the results of a series of experiments with it are detailed.

WHIRLPOOL A vortex, eddy, or gulf, where the water has a circular motion Whirlpools are produced by the meeting of currents which run in different directions Their danger to navigation is well known, but is perhaps not equal to the dread which sailors entertain of them Some of the most celebrated are the Euripus near the coast of Negropont the Charybdis in the straits of Sicily and the Maelstrom on the northern coast of Norway (*Murray's Geography*, Introd)

WHIRLWIND A revolving column or mass of air, supposed with most probability to be produced by the meeting of two currents of air blowing in opposite directions, but ascribed by some to electricity It is analogous to the *whirlpool* When the opposite currents have the same velocity, the circulation will be maintained at the same spot, but if the motion of one of them is more rapid than that of the other, it will transport the whirling motion with its excess of celerity, and a progressive and rotatory motion are thus maintained at the same time Whirlwinds generally occur in summer, and are most violent in tropical countries, where they frequently produce most destructive effects The diminution of atmospheric pressure arising from the centrifugal force of the revolving portion is found, to a sufficient degree of approximation, by the formula —

$$\frac{5\,r}{4\,t^2}$$

where r is the radius described by the whirlwind, and t the time of circumvolution in seconds, the [illegible] pressure of the column at the verge, which [illegible] corresponding to the fraction $\frac{5\,r}{4\,t^2}$ The amount of this diminution over the whole base would be reduced to three fourths, and consequently, h expressing the height of the revolving column of air, $\frac{15\,r\,h}{16\,t^2}$ would represent the mean effect of centrifugal action Suppose the whirlwind to have an elevation of 200 feet, and a radius of 50, and to circulate in 3 seconds, the diminished pressure would be equal to the weight of a column of $\frac{15 \times 50 \times 200}{16 \times 9} = 1040$ feet This example, assuming a celerity of sixty-five miles an hour, might be reckoned an extreme case, but it would occasion the mercury to sink in [illegible] than an inch, or 1 12 ' (*Ency Brit* [illegible] *See* STORM, WINDS

WHISKEY (A corruption of the Gaelic word *usquebaugh*) A species of corn spirit *See* DISTILLATION

WHISPERING DOMES, or GALLERIES, are places in which whispers or feeble sounds are communicated to a greater distance than under any ordinary circumstances In order to produce this effect, the form of the roof or walls of the building must be such that sound proceeding from one part is transmitted by reflection or repeated reflections to another The dome of St Paul's church in London furnishes an instance *See* SOUND

WHITE In Painting, a negative colour (if such definition may be allowed), whose opposite or antagonist is *black*, which may best serve as its explanation, because black is void of all colour, properly so called

WHITE The colour produced by the combination of all the prismatic colours mixed in the same proportions as they exist in the solar rays This is proved both by decomposing white light by means of a prism, and by recompounding the primitive colours in due proportions *See* COLOUR, LIGHT, REFRACTION

WHITE ARSENIC Oxide of arsenic, or arsenious acid *See* ARSENIC

WHITE BAIT The name of a small and peculiar species of *Clupea*, confounded, until studied by Mr Yarrel with the young of the [illegible] (*Clupea alosa*. The young fish of the white bait (*Clupea alba*, Yarrell) begin to ascend the Thames at the beginning of April and continue in that part of the river where there is a mixture of salt with fresh water until September, when young fish of the year four or five inches long are not uncommon though accompanied by others of smaller size, but the parent fish are believed not to ascend beyond the estuary [illegible] not two inches and a half [illegible] white bait season is over, [illegible] by a spotted appearance behind the edge of the upper part of the operculum, which the white bait never exhibits Mr Yarrel suggests that if a net sufficiently small in the mesh were used the white bait might be taken in other rivers besides the Thames, but he states that the Hamble, which runs into the Southampton Water, is the only other river from which he has received this justly estimated fish.

WHITE COPPER An alloy used by the Chinese and called by them Packfong or Pakfong it is composed, according to the analysis of Dr Fyfe, of 40 4 parts of copper, 25 4 of zinc, 31 6 of nickel, and 2 6 of iron *German silver* is a modification of this alloy

WHITE EAGLE, ORDER OF THE An order of knighthood in Poland, instituted by Uladislaus V in 1325, revived by Frederic Augustus I in 1705

WHITE LEAD Carbonate of lead *See* LEAD. This

important compound, of which from 16,000 to 17,000 tons are annually manufactured in England, is chiefly used as the basis of white oil paint, it is also employed to a small extent in the manufacture of cements It is chiefly made in two ways either by precipitation, as when carbonic acid or a carbonate is used to decompose a soluble salt, or a subsalt of lead or by exposing plates of cast lead to the joint action of the vapour of acetic acid air and carbonic acid it is by the latter process only that the resulting carbonate of lead is obtained of that degree of density and opacity, and perfect freedom from crystalline texture, which fits it for paint This last, commonly called the *Dutch process*, was introduced into England about the year 1780 It is described together with the other processes in *Brande's Manual of Chemistry* fifth ed p 814 White lead is often largely adulterated with sulphate of baryta, which is detected by insolubility in dilute nitric acid, whereas pure white lead is entirely dissolved by it

WHITE LEG A disease which generally occurs in women soon after delivery, and which has been erroneously supposed to arise from redundancy of milk It commences with stiffness and pain of the limb, which afterwards becomes tumid and tense from the effusion of serum, and in some instances goes on to suppuration Leeches, fomentations friction, and gently stimulating liniments with the internal use of mild aperients and remedies calculated to allay the febrile symptoms that attend it are the principal points of treatment Those women who during pregnancy have suffered very much from swellings of the lower extremities are generally most liable to its attacks

WHITE PRECIPITATE The white powder which falls on adding ammonia to a solution of corrosive sublimate it is a compound of peroxide and bichloride of mercury with ammonia it is virulently poisonous, and is chiefly used in ointments and for killing vermin

WHITE STONE A granite abounding in white felspar

WHITE SWELLING A term vulgarly applied to indolent tumours in scrophulous habits

WHITE VITRIOL The old name of sulphate of zinc *See* ZINC

WHITEWASH A mixture of whiting, size, and water for whitening [illegible]

WHITFIELDIAN METHODISTS The name given to the most numerous body of the Methodists after the Wesleyans so called from Whitfield whose early connection with the Methodists will be found noticed under that term Soon after the return of Mr Whitfield from America in 1741, he withdrew connection with Wesley on account of religious tenets, the former holding the high doctrine of Calvinism, and differing from the latter chiefly on the subjects of election and general redemption But [illegible] differed in sentiments these good men [illegible] in heart Whitfield devoted his life to itinerant preaching and was, if possible, more popular as an extemporaneous and eloquent pulpit orator than his former colleague He did not confine his labours to Great Britain and Ireland, but visited North America no fewer than seven different times and died there at Boston, in 1770, in the fifty-sixth year of his age But he can scarcely be said to be the founder of a sect his chief object was itinerating At several places indeed he erected chapels or *tabernacles* as he called them, but these he invariably left to the care of any orthodox clergyman whether in the establishment or among the dissenters who was prepared to occupy them Since his death the members of these congregations have been nominally, but only nominally classed together as a distinct body under the title of the *Tabernacle Connection* They are not governed by a general conference, nor is their cause supported by a common stock, but each congregation is virtually independent in itself, and provides for its own expenses The lay-preachers are few, most of their ministers being ordained among themselves, but, like the Wesleyans they have a periodical change of pastors (*Dr Gillies's Life of Whitfield*)

Among the most zealous of Whitfield's followers was [illegible] Huntingdon in whose family he had [illegible] as chaplain She devoted her ample funds to the erection of chapels in different parts of England, and invited clergymen of the established [illegible] the education of pious young men for the ministry She thus became the foundress of a distinct sect, under the name of *Lady Huntingdon's Connection* The college has, since her death, which took place in 1791, been transferred to Cheshunt, in Hertfordshire In her chapels about sixty in number, the service is performed according to the ritual of the church [illegible] (*D'Aubigné's Hist of the Church*, vol [illegible] *Evangelical Magazine*, vol iii 146 56)

A [illegible] whose name is frequently found in connection with that of Whitfield, are the Welsh Calvinistic Methodists This body, which, though not founded by Whitfield, received much countenance and support from him in its earlier stages had its origin so early as 1735, but was not formally organized till 1785 Its founder was Mr Howell Harris of Trevecca The field of the operations of this sect is chiefly Wales, and there is scarcely a village in the principality in which one of their chapels is not to be found

WHITING The name of a species of the Cod tribe (Merlangus vulgaris Cuv), and the type of a subgenus, [illegible] the true cod by the absence of the [illegible] It is esteemed for the delicacy of its flavour and [illegible] of digestion

WHITING (Chalk) carefully cleared of all stony matter, ground, levigated, and made up into small oblong cakes As it is often [illegible] it should be very carefully freed from [illegible] or sand

WHITLOW (Sax) A painful inflammation, tending to suppuration at [illegible]

WHITSUNDAY [illegible] seventh Sunday, or 49th day [illegible] corresponds with *Pentecost* This Sunday was called in the ancient church *Dominica Alba*, White Sunday, or *Dominica in Albis*, the Sunday in which *white garments were worn* it having been formerly a custom with those who were baptized on this day to dress in white for the occasion The term however, has been differently derived from the Saxon "utas" octave, the eighth from Easter (*Hamon l'Estrange* See *Riddle's Christian Antiquities*)

WICKLIFFITES In Ecclesiastical History, the followers of the reformer Wickliff who are better known by their popular name of Lollards (which see) The memory and opinions of Wickliff were solemnly condemned by the council of Constance in 1415 His bones were dug up and publicly burned in 1428, an event finely commemorated in one of the sonnets of Wordsworth

WILL or TESTAMENT is, in Law, the legal declaration of a man's intentions as to what he wills to be performed after his death In strictness of language, the term *will* is limited to land, *testament*, to personal estate

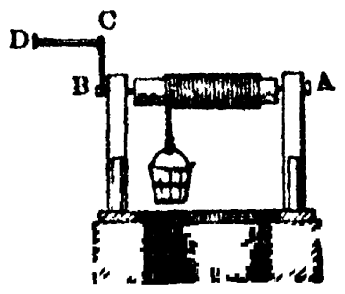
Wills, according to the law up to a recent period were either nuncupative or written A nuncupative will could not revoke one that is written, it must be proved by the oaths of three witnesses present at the making of it, must have been made in the last sickness of the testator, and at his house, and was subject to various other restrictions A written will to dispose of personal property was good if sufficient proof could be obtained of the writing of the testator even without his signature or the attestation of any witnesses A will of real property must, by 29 C 2 c 3 be in writing, signed by the testator, or by some other person in his presence, and by his express direction, and witnessed or subscribed in the presence of the testator by three or four credible witnesses This state of the law gave rise to considerable inconvenience Much litigation was occasioned by the uncertainty as to what was or was not, a paper sufficient to convey personal property as a will much fraud was supposed to have been caused by the facility with which such testaments might be forged, or surreptitiously obtained while on the other hand, the rules respecting the publicity of wills of real property were thought more stringent than the case required These considerations induced the legislature to pass the statute 7 W 4 & 1 Vict c 26 (in 1837) by which the making of wills is now regulated All wills (except those of seamen and soldiers on service), whether of real or personal property, must be in writing, and signed at the foot by the testator or some other person in his presence and by his direction, and such signature must be made and acknowledged by the testator in the presence of two or more witnesses present at the same time, and such witnesses must attest and subscribe the will in the presence of the testator, but no form of attestation is necessary All appointments by will, whatever formalities may have been required by the creator of the power, must now be made according to the provisions of this statute and require no further form

The same statute enacts that no will of a minor shall be valid All devises and gifts by will to an attesting witness are void To put an end [illegible] which had arisen respecting the [illegible] provided that they shall be revoked only by the marriage of the party, or by another will duly executed, or some writing declaring an intention to revoke and executed with such formalities, or by burning, tearing or otherwise destroying with intention to revoke All wills now speak from the death of the testator unless they show on the face a contrary intention, that is, they act upon the property which he possesses at his death And various important alterations are introduced in the effect of the ordinary language used in devises and bequests

A married woman cannot make a will of lands or tenements, nor, without the consent of her husband, of personalty

A disposition by will of real property is termed a *devise;* of personal property, a *bequest* or *legacy*. *See* DEVISE, EXECUTOR

WILLOW *See* SALIX



WINCH In Mechanics, a bent handle or rectangular lever, for turning a wheel grindstone &c The term *winch* is also popularly applied to the *windlass*. *See* WINDLASS

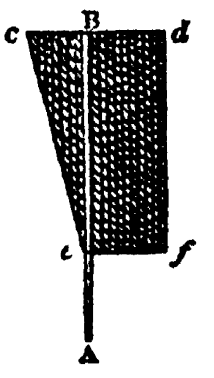
WIND *See* WINDS

WINDAGE OF A GUN The difference between the [illegible] very considerable with large [illegible] bore, but it has been [illegible] truer, and that a smaller quantity of powder is required, when the above allowance is considerably diminished (*Hutton's Tracts*, vols ii iii) *See* GUNNERY

WIND GAGE An instrument for measuring the force or velocity of the wind *See* ANEMOMETER

WINDLASS A machine used for various purposes It consists of a cylinder or axle to which the power is applied by means of a rectangular lever or *winch* The arm B C of the winch represents the radius of the wheel, and the power is applied to C D at right angles to B C The windlass is frequently used in merchant ships or small trading vessels instead of a *capstan* for heaving the anchors, &c In this case it consists of a large cylindrical piece of timber laid in a horizontal position and supported at its two ends by two pieces of wood called *knight heads* placed on opposite sides of the deck near the foremast The axle is pierced with holes directed towards the centre, in which long levers are inserted, called handspikes It is furnished with strong *pauls* to prevent it from turning backwards when the pressure on the handspikes is intermitted

WINDMILL In Mechanics, a mill which receives its motion from the impulse of the wind The general appearance of the windmill is familiar to everyone The building containing the machinery is usually circular To the extremity of the principal axis, or wind-shaft are attached rectangular frames (generally five) on which cloth is usually stretched to form the sails The surfaces of the sails are not perpendicular to the axis, but inclined [illegible] form is in some degree twisted, and different from a plane surface Suppose the axis to be placed in the direction of the wind, the wind will then strike the sails obliquely, and the force may therefore be resolved into two parts, one of which, acting in the direction perpendicular to the axis, gives a motion of rotation to the sails, and consequently to the wind shaft, from which it is communicated to the machinery The wind-shaft is inclined to the horizon in an angle of from 8° to 15°, principally with a view to allow room for the action of the wind at the lower part, where it would be weakened if the sails came too nearly in contact with the building



As the direction of the wind is constantly changing, some apparatus is required for bringing the axle and sails into their proper position This is sometimes effected by supporting the machinery on a strong vertical axis, the pivot of which moves in a socket firmly fixed in the ground, so that the whole [illegible] by a lever But it is now usual to construct the building with a movable roof, which rests upon friction rollers, and the shaft being fixed in the roof is brought round along with it The roof is brought into the required position by means of a small vane wheel furnished with wind sails, which turns round when the wind strikes on either side of it, and drives a pinion which works into the teeth of a large crown wheel connected with and [illegible] through the moveable roof

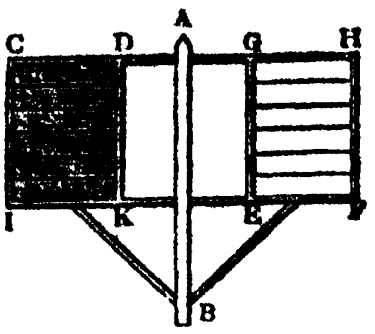
Of the Form and Position of the Sails — From the investigations of Parent and Belidor it appears that the greatest impulse effect of the wind on the sails is produced when their inclination to the axis of rotation is about 54½ degrees, or when the *angle of weather*, that is to say, the angle formed by the plane of the sail and the plane of its revolution, is 35½ degrees But this result, being obtained from considering the effect of the wind on the sails when at rest, does not agree with that which is found by experiment In fact, as the velocity of the sail tends to withdraw it from the action of the wind it is necessary to counteract the diminution of force by diminishing the angle of weather, or to bring the sail into such a position that the wind strikes its surface more directly, and since the velocity of the different parts of the sail is in proportion to their distance from the axis, it follows that in order to produce the greatest effect every elementary portion of it ought to have a different angle of weather diminishing from the centre to the extremity of the sail. Euler has given a theorem which determines the law of variation Let a be the velocity of the wind, and b the velocity of any given part of the sail, then the action of the wind upon that part of the sail will be a maximum when the tangent of its inclination to the axis, or the cotangent of the angle of weather, $=$

$$\sqrt{2+\left(\frac{3b}{2a}\right)^2}+\frac{3b}{2a}$$

Suppose that at a given part of the sail the velocity of the sail is equal to the velocity of the wind, we have then $a = b$, and the formula becomes $\sqrt{2+\frac{9}{4}}+\frac{3}{2}=3\,561$ = tangent of 74° 19′, which gives 15° 41′ for the angle of weather

This subject was investigated experimentally by Smeaton (*Philosophical Trans* vol lxii) who found that the common practice of inclining the sails from 2 to 7½ to the axis is much more efficacious than the angle assigned by Parent, the effect being as 45 to 31 When the sails were weathered in the Dutch manner, or with their surface concave to the wind, and the angle of inclination greater towards the extremities, the effect was greater than when weathered either in the common way or according to Euler's theorem But the effect was greatest of all when they were enlarged at their extremities, and had the form *c d f e*, represented in the annexed figure, so that *c d* was one third of the radius A B, and *c* B to B *d* as 5 to 3 If the sails be farther enlarged, the effect is not increased in proportion to the surface, and besides, when the quantity of cloth is great the machine is much exposed to injury from sudden squalls In Smeaton's experiments the angle of weather varied with the distance from the axis, and it appeared from several trials that the most effectious angles at the different parts of the sail were those in the following table —

Parts of A B which divided into six equal parts.	Angle with the Axis	Angle of Weather
1	72°	18°
2	71	19
3	72	18
4	74	16
5	77½	12½
6	83	7



If the radius A B of the sail be 30 feet, then the sail will commence at 1 6th of A B, or 5 feet from the axis, where the angle of inclination will be 72° At 10 feet from the axis, the angle will be 71°, and so on, as in the table

Theory of Windmill Sails — The following maxims [illegible] the sails were deduced by Smeaton from his experiments —

1 The velocity of windmill sails, whether loaded or unloaded, so as to produce a maximum effect is nearly as the velocity of the wind, their shape and position being the same 2 The load at the maximum is nearly, but somewhat less, as the square of the velocity of the wind, the shape and position of the sails being the same 3 The effects of the same sails at a maximum are nearly, but somewhat less, as the cubes of the velocity of the wind 4 The load of the same sails at the maximum is nearly as the squares, and their effects as the cubes of their number of turns in a given time 5 When the sails are loaded so as to produce a maximum effect at a given velocity, and the velocity [illegible] the load continuing the same, then [illegible] effect, when the increase of the velocity of the wind is small, will be nearly as the square of those velocities, when the velocity of the wind is doubled, the effect is nearly as 10 to 27½ When the velocities compared are more than double of that where the given load produces a maximum, the effects compared increase nearly in the simple ratio of the velocity of the wind 6 In sails where the positions and figures are similar and the velocity of the wind the same, the number of turns in a given time will be reciprocally as the radius or length of the sail 7 The load at a maximum that sails of a similar figure and position will overcome at a given distance from the centre of motion will be as the cube of the radius 8 The effects of sails of similar figure and position are as the square of the radius 9 The velocity of the extremities of Dutch sails, as well as of the enlarged sails in all their usual positions, when unloaded, or even loaded to a maximum, is considerably quicker than the velocity of the wind

Horizontal Windmills — A [illegible] constructed in such a manner that the planes of the sails intersect each other in the wind-shaft, in which case they are [illegible] wind-shaft, however, might be placed with equal advan-

tage in the horizontal position In this construction

A B is the wind-shaft or arbor, which moves upon pivots Cross bars are fixed in this arbor, which carry the frames C D E F and G H I K The sails C E and G I are stretched on these frames, and are [illegible] toothed wheel fixed upon the arbor gives motion to the machinery Two sails only are represented in this figure, but there are always other two at right angles to these When the wind impels the two sails C E and G I equally, it is obvious that no motion can ensue In order then, that motion may be communicated to the machine, the impulse of the wind on the returning sail must be removed by screening it from the wind or at least diminished by making it present a less surface when returning against the wind The first of these methods is said to be practised in Tartary, and some provinces in Spain, it is the simplest, and probably the best The other method requires the sail to be formed of several flaps moveable on hinges, and so adjusted that on one side of the axis they present their surfaces to the wind, and when returning on the other only their edges Other contrivances have been proposed, but horizontal windmills are greatly inferior in point of effect, to those which have vertical sails, and are accordingly seldom met with

On account of the irregularity of the moving force, and the interruption from calm weather, machines impelled by the wind can only be used advantageously for purposes which are not urgent and where regularity is not indispensable The chief purposes to which they are applied are grinding corn expressing oil from seeds, bruising oak bark for tanning sawing wood raising water, &c Windmills were brought into Europe from the East about the time of the Crusades (*Phil Trans* vol ii, *Smeaton's Miscellaneous Papers*, *Ferguson's Lectures* by Brewster, *Gregory's Mechanics*)

WINDOW (Quasi wind door) In Architecture, an aperture in a wall for the admission of light and air to the interior In distributing windows so that there be had a sufficiency of light it is usual to make the piers or intervals between them never less than the width of the window, and never more than two widths of the same Where it is required to ascertain the total area of light necessary for a room, the following empirical rule is frequently used — Multiply together the length, breadth, and height, and extract the square root of the product, which will be the area of light required

WINDS Currents in the atmosphere, conveying the air, with more or less velocity from one part to another Notwithstanding all that has been written on the subject of the winds their theory is still involved in considerable obscurity The subject is exceedingly complicated, and no attempt that has yet been made to derive a general law from the observations has been attended with much success Nevertheless we can discern, clearly enough, certain prevailing causes of the disturbances which are constantly taking place in the equilibrium of the elastic fluid which envelopes the earth though the [illegible] is modified and sometimes altogether counteracted, by disturbing causes, the effects of which we have no means of adequately appreciating

The principal cause of wind may be ascribed to the unequal and variable distribution of heat through the atmosphere, the temperature of which is mainly determined by that of the surface of the earth The distribution of heat at the surface is determined by the manner in which it is received from the sun, and radiated from the earth to the celestial spaces If we consider the whole earth, or the state of any given portion of it through a long space of time, the quantity of heat received from the sun and the quantity lost by radiation exactly balance each other, and the mean temperature remains invariable But, on considering any particular portion of the earth it is easy to see that though a balance is effected in the long run between the heat received and parted with, the two quantities are never precisely equal at the same time, or only so for very short intervals, the one alternately exceeding and falling short of the other The radiation goes on continually, though not uniformly; but the supply of heat from the sun, on a given surface, is interrupted entirely while the sun is below the horizon, and during the day varies with the sun's altitude It varies also at the different seasons of the year, in consequence of the unequal lengths of the days and nights and the greater or less obliquity with which the rays strike against the surface

But the effect of the solar rays depends not only on the obliquity with which they fall upon the surface, but also in a great degree on the nature of the surface. The diurnal illumination of the sun warms the land to a very [illegible] depth, [illegible] inch The [illegible] the temperature of which is rapidly increased when the heat received exceeds that which is radiated away, and as rapidly cooled in the reverse circumstance. In water, however, the calorific rays penetrate to a depth not less than twenty or thirty feet If we suppose a tenth part of the incident solar rays to be intercepted by a stratum of water one foot in thickness, while they are totally intercepted by 1 2 inch of dry land, it would follow that the sun communicates every day a hundred times less heat to the surface of a body of water than to an equal expanse of level ground Now in general the effect of the two surfaces in heating the superincumbent atmosphere will be in proportion to the respective temperatures, but in the [illegible] is modified by two circumstances In the first place, a portion of the solar rays, perhaps a fiftieth of the whole, are intercepted in their passage through the atmosphere, and communicate heat, and it is obvious that the increase of temperature caused by this portion is independent of the nature of the surface In the second place, a small portion of the rays which fall upon water are reflected from the surface into the atmosphere, and communicate heat On the whole, it may be concluded that the change of temperature in the air caused by the succession of day and night is about thirty times less over water than over land Hence, if the whole surface of the globe had been covered by the ocean the effect of the alternation of day and night in producing atmospheric currents would have been scarcely sensible. Hence, also over a great part of the surface of the ocean, the winds are reducible to fixed and determinate laws, while on continents, and also on the ocean in high latitudes the order and periods of their recurrence are irregular and anomalous

Besides the effects arising from the disturbance of the equilibrium of temperature we have also to consider the mechanical effect of the earth's rotation about its axis If the earth were a sphere of uniform temperature, and at rest in space, the atmosphere would also be at rest, its height would be constant over every point of the earth's surface, and its density and elasticity at equal altitudes every where the same But if the temperature of the motionless sphere instead of being equal at every point, were greatest at the equator, and decreased towards the poles, then, though the pressure on every point of the surface would still continue the same, the altitude of the atmospheric column would become greatest at the equator, and consequently its specific gravity less there than at the poles The heavier fluid at the poles would then, by virtue of its greater weight, pass beneath and displace the lighter, and a current be established in the lower part of the atmosphere from the poles towards the equator In the higher regions of the atmosphere the effect would be reversed The lower stratum of air in the equatorial regions being heated by its contact with the earth, becomes rarified and ascends, and thus produces an accumulation and causes a counter current in the higher regions from [illegible] the poles The height at which this [illegible] rection of the motion takes place under certain circumstances may be computed Professor Daniel (*Meteorological Essays*) computes that the lower current, from the poles to the equator extends to the height of 2¼ miles, diminishing in velocity from the surface upwards

If we now suppose the sphere to revolve about its polar axis, an apparent modification will take place in the directions of the currents The lower current, coming from a zone where the velocity of rotation is less than that of the parallel at which it arrives, will appear to be affected with a motion contrary to that of the diurnal rotation; while the upper current, flowing from the equator to the poles, would be apparently affected in an opposite manner On this theory it is usual to explain the *trade winds*, which prevail within and to a considerable distance beyond the tropics in both hemispheres These easterly currents, however, receive important modifications, both as to their direction and the [illegible] from the variation of the [illegible] configuration of the land They prevail in the [illegible] ocean in the Atlantic and Pacific, between the [illegible] of N and 27 S On entering this zone from either side the deviation arising from the rotation of the earth towards the east is greatest, and this deviation becomes less and less as the equatorial zone is approached In the immediate vicinity of the zone the wind is nearly due N on the northern side of the equator and nearly due S on the southern side See Trade Winds

In the Indian Ocean the trade winds receive a curious modification from the position of the [illegible] and the effect of the solar heat on it [illegible] of the year from November to April the winds blow in the ordinary direction of the trades, that is to say, from the north east, but from April to November they blow

in the directly opposite direction These periodical winds are called the *Monsoons* (*See* Monsoons) Between the equator and 10° south latitude, north-west winds prevail from October to April, and south-west the rest of the year In other parts of the tropics, the regular trade w[illegible] of the land [illegible] constantly blows from the south-west, in the opposite direction to the trades Near the Cape Verd Islands calms and variable winds are usually experienced

Between the parallels of 30° and 40°, in both the North and South Pacific Oceans, westerly winds blow almost constantly, excepting only for a short time after each equinox In the North Atlantic Ocean the prevalence of westerly winds between those parallels is less consi[illegible] e narrowness of th[illegible] of the opposite continents, they are still, however, the prevailing winds, except in the months of April and October, when a north-east wind is more frequent In consequence of these winds, the voyage from Europe to America is much more tedious than the [illegible]

Upon the continents the diurnal changes of temperature are much more rapid and extensive than over the ocean, hence there is little constancy in the direction or intensity of the winds, even in equatorial countries In high latitudes the inequalities are still greater, and extend even to the open seas Beyond the latitude of 40°, the winds do not seem to be reducible to any fixed laws

The different manner in which land and water are affected by radiation and the direct heat of the sun gives rise to the *land* and *sea breezes* which prevail on the coasts, particularly in tropical countries, though they are not confined to any particular latitude, and are perceptible sometimes as far north as Norway During the day the surface of the land becomes more heated than that of the adjacent ocean, and the air over the land, in consequence of [illegible] the denser air rushi[illegible] *sea breeze* b[illegible] at some hour in the morning and [illegible] is near setting, will flow from the water towards the land At night the water remains warm, while the surface of the land cools rapidly, and hence the current sets from the land towards the water, and forms the *land breeze* Winds of this sort are more frequent about islands and small peninsulas than in other situations

A variety of *local winds* are observed, the circumstances occasioning which are either too complicated or too imperfectly known to admit of their being satisfactorily explained The *Etesian* is a northerly or north-easterly wind, which prevails very much in summer all over Europe The *Sirocco* is a hot moist, and relaxing wind, which visits Naples and the south of Italy from the opposite shores of the Mediterranean The *Samiel* or *Simoom* of Arabia is a hot arid, pestilential blast generally coming from the south The *Kamsin* of Egypt is of the same kind The *Harmattan* is a dry east wind, also of an unwholesome description, occurring in Guinea and some other countries

In the preceding remarks the winds have been considered as produced by the unequal distribution of temperature in the atmosphere, combined with the earth's diurnal rotation Other causes, however, depending on the physical constitution of the atmosphere, must be assigned for those sudden and irregular blasts which occasionally spring up, and rage for some time with tremendous fury Among those causes, one of the most powerful is, doubtless, the rapid condensation of vapours in the bosom of the atmosphere An inch of rain has sometimes been observed to fall within the space of an hour over a great extent of country, particularly in the equinoctial regions [illegible] which rain has fallen [illegible] 100 square leagues, if the vapour necessary to produce this quantity of rain existed in the atmosphere at the temperature of 50° of Fahrenheit, it would occupy a space 100,000 times greater than in the liquid state, that is to say, it would occupy a space equal to a column of which the base is 100 square leagues, and the altitude 100,000 inches, or nearly 9,000 feet, and such would be the dimensions of the vacuum created by the condensation Some abatement must be made from this estimate, inasmuch as the vapour existing in the atmosphere is in the vesicular, and not the elastic state, but in any case its condensation into drops and precipitation must create an immense void the filling up of which must necessarily occasion violent atmospherical concussions On this principle may be explained a fact, the observation of which is often of great importance at sea, that an unusual fall of the barometer is generally followed by a gale of wind *See* Storms.

The velocity of wind varies from nothing to upwards of a hundred miles an hour; but the maximum is variously stated by different experimenters By means of Whewell's anemometer the velocity has been constantly measured at Greenwich since 1841, and advantage has been taken of violent storms to compare the maximum indications of velocity with those of pressure obtained from Osler's anemometer In vol II of the *Philosophical Transactions* a table is given of the different forces and velocities of winds, drawn up by Smeaton from a considerable number of facts and experiments, by the assumption that the pressure varies as the square of the velocity [illegible] extract from it

Velocity of the Wind	Perp Force on 1 Sq Foot, in lb Avoirdupois	Co[illegible] of W[illegible]
Miles in an Hour		
1	005	Hardly perceptible
4 -	079	Gentle pleasant wind
5 -	123	
10	492	
15	1 107	Pleasant brisk gale
20 -	1 968	
25	3 075	Very brisk
30 -	4 429	
35	6 027	High wind
40 -	7 873	Very high
60 -	12 300	A storm
60 -	17 715	A great storm
80 -	31 490	A hurricane
100	49 200	A violent hurricane

Of late years the theory of winds (in common with other meteorological phenomena) has received much attention, and through the recommendation of the British Association, self-registering anemometers have been erected at the principal observatories and other places, with a view to obtain systematic series of observations The principal points to be determined are the mean duration of the different winds the law of their succession, and their connexion with the state of the barometer, thermometer, and [illegible] see *Prof Forbes' Reports on Meteorolog*, [illegible] Association for 1831 and 1840, Experiments by Col Beaufoy in the *Annals of Philosophy*, vol viii p 94, *Daniell's Meteorological Essays*, *Murray's* [illegible] Introd, Pouillet, *Elemens de Physique*, [illegible] *Meteor Obs*)

WIND SAIL A tube or funnel of canvass, employed to convey a stream of fresh air down into the lower part of a ship

WINE (Germ wein) All spirituous products of fermentation are occasionally denominated *wines* The term however, is more generally limited to fermented grape juice or *must*, and the theory of the process has been noticed under the word FERMENTATION There are many circumstances which influence the general characters or quality of wine among which are principally climate, soil and aspect, the nature and maturity of the grape, and the mode of fermentation In regard to climate for instance it may be observed that that which is best suited to the culture of the vine extends from the 35th to the 50th degrees north latitude, in more northerly situations the grape seldom ripens perfectly, and the wines that it yields [illegible] those produced in [illegible] climates, on the other hand, the juice becomes too rich and saccharine It often happens, however, that a very luscious grape transplanted to a colder climate yields a good wine, and that vines carried from a cold to a warmer climate, within the latitudes mentioned, afford excellent liquors, it is said, indeed, that we are indebted for some of our most choice wines to such judicious transplantations Chaptal has stated that the *must* obtained from grapes grown in the south of France was richer than that from the northern departments With respect to soil, it may be observed that no fruit is more remarkably influenced by its qualities than the grape Light and porous soils are best suited to it, and although the plant will grow vigorously in rich and moist ground, the fruit is by no means excellent in proportion to its luxuriance Dr Henderson states (*History of Wines*), that strong argillaceous soil not only checks the extension of the roots, but keeps them too moist, and often imparts to the wines a peculiar earthy taste, such as we perceive in Cape wi[illegible] A stony or gravelly soil is preferable to all others, it allows of the free growth of the roots, and is sufficiently retentive of moisture Volcanic soils are also favourable to the growth of the vine, as shown in the Island of Madeira, Italy, Sicily, and the south of France The quality of the grape is also greatly influenced by differences in the exposure and inclination of the ground Hills are preferable to plains, especially where the aspect is such as to be duly exposed to the sun and sheltered from cold winds, hence the advantage of a south-eastern aspect The influence of season, so important in regard to the ripening and perfection of all fruits, is especially so with respect to that of the vine, its consequences going beyond the mere temporary perfection of the grape as fitting it for the table, and extending in a very striking manner to the qualities of the wine, hence the notoriety and high character of the vintages of particular seasons, as, for instance, that of the comet in 1811 In a cold year the wine is weak and

acescent "When the season is rainy," observes Dr Henderson, "the produce will be increased, but it will be poor and insipid, and generally found to contain a large portion of malic acid, which gives to it a peculiar flavour, always most perceptible in those wines which are most devoid of spirit A moderate degree of humidity, however, is essential to the welfare of the vine In those climates, accordingly, where great droughts prevail, as in Persia, and in the neighbourhood of Malaga, the earth is formed into a dish around the plant in order to collect and retain the rain which falls during the spring High winds and fogs are always very injurious to the vine" Manures are generally regarded as prejudicial in warm climates, but in colder aspects, as upon the Rhine they are often not only useful, but necessary Different methods of planting and training the vine are adopted in different countries, but it is generally found advantageous to keep the plant as low as possible, for the same vine yields fruit of very different qualities depending upon the mode in which it is trained and trimmed But there are no circumstances by which the quality of the wine is more affected than those dependent upon the state of maturity of the grape When grapes are fully ripe they generally yield the most perfect wine as to strength and flavour If suffered to shrivel to a greater or less extent the wine will be more saccharine, and if they are not fully mature, it will be brisk, and often tart "In general, dry and clear weather ought to be chosen for the vintage, but when a slow and imperfect fermentation is required, as in the case of the brisk champagne wines, the grapes that are collected during a fog, or before the dew that has settled on the vines is dispersed, are found to answer best, and to yield the largest quantity of *must*" The few facts which have now been stated will show how many minute circumstances must be attended to in the selection and cultivation of the vine, and it is astonishing how much the character and excellence of the produce depend upon causes which often appear so trifling as to be beneath notice But the ultimate production of good wine involves a variety of other considerations connected with the process of fermentation, in the due management of which much practical skill is often requisite, and the utmost cleanliness always indispensable The component parts of *must* and the changes which they undergo in the fermenting vats, have already been noticed (*see* FERMENTATION), so that it only remains here to add a few remarks upon the general characters and composition of the principal varieties of wine The colour of the wine almost always depends upon the husks of the grape, for the pulp, even of the blackest fruit, is, with very few exceptions, equally colourless with that of the green grape The seeds of the grape, and more especially the stalks, containing tan and extractive matter, also modify the taste of the wine, hence they are added to Port wine, but generally excluded from the delicate wines of Bourdeaux and of the Rhine The peculiar aroma or perfume is sometimes dependent upon very recondite causes, as in the fine wines of Burgundy In some cases it is acquired by age, and appears to depend upon some chemical change, perhaps connected with the formation of something like a variety of ether, but it also depends upon the quality of the grape, as in the Muscadine and Frontignac wines The leading character, however, of wine must be referred to the *alcohol* which it contains, and upon which its intoxicating powers principally depend not exclusively however, for some of the lighter wines, if brisk and effervescent, seem to derive from the admixture of carbonic acid a peculiar character not directly proportional to their alcoholic strength And again, we find other wines, among which certain Burgundies stand foremost, which produce a lasting though not very strong [illegible] (as the quantity of alcohol (of the specific gravity mentioned), by measure, contained in 100 parts by measure of the respective wines Some other vinous and spirituous liquors have been added, for the purpose of showing the relation which they bear to wine in the proportion of alcohol which they contain.

It is necessary, however, to observe that the proportion of alcohol in the same wine varies materially according to the age of the wine and other circumstances, and that wines having the same quantities of alcohol in each, may, notwithstanding, differ essentially in every other respect Practically wines are distinguished by their colour hardness or softness on the palate, their aroma, and their being still or effervescing In many cases, too, the same variety of wine may be distinguished into a number of sub varieties differing more or less in one or more of these particulars Thus, in [illegible] varieties are red, and others [illegible], some are dry and others sweet, the aroma of one variety differs from that of another, and, while some are still, others have every different degree of effervescing power

The same variety exists in the case of clarets, and, indeed of almost every description of wine

The differences in the quality of wines depend partly on differences in the vines, but more on the differences of the soils in which they are planted in the exposure of the vineyards and in the treatment of the grapes, and the mode of manufacturing the wine Though the vine grows in every sort of soil, a rising ground, or gently-sloping hill facing the south, with a loose, gravelly, or rather volcanic soil, is by far the best situation for a vineyard —

"——— apertos
Bacchus amat colles"

It is in such situations that all the finest wines are produced

It would be useless in a work of this kind to attempt characterizing the different sorts of wine used in Great [illegible] and sherry have long enjoyed a decided [illegible] and it must be admitted [illegible] But they are often harsh, and have the disadvantage of being strong and heating, so that they cannot be taken, to anything like excess, by most persons with impunity They are well enough for a glass or two, but they are not wines for conversation or society It is not probable, indeed, had it not been for the high differential duties with which French wines were so long burdened, that the use of port and sherry would ever have been so general in England, and since the abolition of the differential duty in 1831, French wines have begun gradually, though slowly, to make their way from the highest, to which they have hitherto been mostly confined, amongst the middle classes They are, indeed, superior, in almost all respects, to every other variety The best growths of claret, champagne, and Burgundy, seem to unite all the qualities required to constitute perfect wines Had they been known in antiquity we apprehend they would have engrossed most part of the praise so profusely lavished on the Falernian, Cecuban, Falernian, and other renowned wines of Greece and Rome We subjoin

An Account of the Quantities of the different Sorts of Wine imported into and exported from the United Kingdom the Quantities entered and retained for Home Consumption, &c, for the Year ending Jan 5 1851

WINGS In Naval matters Passages along the sides of the ship between the fore and after cockpit

WINGS in Plants are membranous expansions of different parts The two lateral oblong petals of a Papilionaceous corolla, the two lateral sepals of a Polygam, the expansion from the back of the fruit of the ash tree, from the sides of the seed of a Bignonia, and from the surface of many Umbelliferous fruits, are all called *wings*

WINGS In Architecture *See* ALAR

WINTER One of the four seasons of the year Winter is usually understood to begin with the shortest day and to end when the sun returns to the vernal equinox

WIPERS, in some kinds of machinery, as oil-mills, powder mills, fulling-mills, are pieces projecting generally from horizontal axles, for the purpose of raising stampers, [illegible] pistons, in vertical directions, and [illegible] to fall by their own weight The principal object to be attended to in the construction of wipers is to give them such a form that the weight shall be raised with a uniform force and velocity (*Gregory's Mechanics, Appendix to Ferguson's Lectures*, by Brewster *Willis's Principles of Mechanism*)

WIRE DRAWING The art of extending the ductile metals into wire The operation is performed by casting or hammering the metal into a bar, which is then successively drawn through holes in a steel plate, each being smaller than the other, until the requisite fineness is attained The holes through which extremely fine wires of platinum, gold, or silver are occasionally drawn, [illegible] ruby *See* GOLD, &c

WIT [illegible] briefly to be the unexpected combination of distant resemblances The term *wit* has in the course of two centuries passed through more significations than most others in the English language Without going further back than the reign of James I, wit is used by Sir J Davies as the most general name for the intellectual faculties of which reason, judgment, wisdom, &c are subdivisions In the time of Cowley and Hobbes, it came to denote a superior degree of understanding, and more particularly a quick and brilliant reason By Dryden it is used as very nearly synonymous with talent or ability; but after his time, and more particularly by Addison in his papers on Wit, we find a gradual approximation to the modern signification of the term

The forms of wit are so various that it would be impossible to include them all within the circle of a precise definition but the [illegible] enumeration of the forms by the [illegible] may be interesting to the reader "Sometimes it lieth in pat allusion to a known story, or in seasonable application of a trivial saying, or in forging an apposite tale, sometimes it playeth in words and phrases, taking advantage from the ambiguity of their sense, or the affinity of their sound, sometimes it is [illegible] of humorous expression, sometimes [illegible] an odd similitude, sometimes it is lodged in a sly question, in a smart answer, in a quirkish reason, in a shrewd intimation, in cunningly diverting or cleverly [illegible] objection, sometimes it is couched in [illegible] speech, in a tart [illegible] in a [illegible] nonsense, sometimes a scenical representation of persons or things accompanied with a mimical look or gesture, passeth for it, sometimes an affected simplicity, sometimes a presumptuous bluntness giveth it being, sometimes it riseth only from a lucky hitting upon what is strange, sometimes from a crafty wresting obvious matter to the purpose Often it consisteth in one knows not what, and springeth up one can hardly tell how Its ways are unaccountable and inexplicable, being answerable to the numberless rovings of fancy and windings of language" (See as to the difference of meaning between *wit* and *bulls*, *Edin Rev* vol iii p 399)

WITCH, WITCHCRAFT It has been a subject of much controversy whether the verse, "Thou shalt not suffer a witch to live," in the 22d chapter of Exodus, is correctly rendered in modern versions The Septuagint render it by *φαρμακος, a poisoner* It is, however, generally held, that the latter interpretation is not the true one, and that the practice here condemned was that of pretended divination by means of supernatural agency This was, by the Jewish law, an act of rebellion against the Almighty Ruler of the Jewish nation, and punished as such (See also Deuteronomy, xviii 10, 11) The only detailed and particular narrative of witchcraft in the Old Testament is that of the evocation of Samuel by the witch of Endor (See on this subject *Sir W Scott's Second Letter on Demonology and Witchcraft*)

Among the Greeks, a general belief prevailed in magical practices and incantations, especially by women, and Thessaly was the region most celebrated for the pursuit of these arts by its inhabitants The same superstition was equally prevalent among the Romans. But in the sense in which the word is used in modern times, a witch is supposed to derive her power from a peculiar compact with [illegible] and this species of witchcraft is of course [illegible] the rise of Christianity although the belief in demoniacal possession was common from the first ages of the Christian church, and a particular class of the clergy was early set apart for the purpose of conjuring devils with the name of exorcists The first traces of the modern superstition respecting witchcraft are perhaps to be found in Augustine who speaks of magicians as living in society with devils, and having a compact with them The ancient witchcraft of the classical times became easily connected in vulgar belief with the superstitions arising out of Christian theology As early as the Council of Ancyra (308), the belief in transformations by magical art (of which we find so remarkable an instance in the romance of Apuleius) is condemned as heretical. The gods of the ancient mythology by the zealous preachers of the Christian clergy, acquired in popular imagination the attributes of demons, and there is little doubt that many of the supposed assemblies of witches and devil-worshippers, which terrified the imaginations of the chroniclers and historians of saints in the early part of the dark ages, originated in the secret meetings of the proscribed worshippers of Pagan deities, who endeavoured to secure their privacy by terrifying their orthodox neighbours (See a poem of Goethe's on this subject) From all these causes combined, the belief in witchcraft grew, as has been observed, side by side with the prevailing worship of saints and relics About the time of Charlemagne

and his successors, we find one species of imaginary witchcraft peculiarly prevalent Storms and tempests were attributed to certain magicians (defensores), who were believed, as in the classical mythology, to have acquired a power of controlling the elements, but this belief was condemned by the church as superstitious The very general superstition (which also is mentioned by Augustine) of assemblies of females riding through the air with the demon Diana, Minerva, or Herodias (from which, in later days the notions of the witch festival on the Brocken in Germany, the French sabbat, &c, were all derived), is also reprobated by the divines of this period It has been supposed by some that the sudden spread of intelligence, [illegible] more liberal sentiment which [illegible] the time of the Crusades checked for a time, at least among the higher orders, the spread of debasing superstitions, but if this was really the case, the effect was but temporary Up to this time we have found the church generally condemning most of the popular fancies respecting demoniac agency as superstitious, but from the end of the 12th century we find them gradually gaining ground, so as to become articles of religious credence At the coronation of Richard I, Cœur de Lion, Jews and women were forbidden to attend the latter because so many of them were suspected of witchcraft The works of Gervase of Tilbury (at the beginning of the 13th century) give perhaps the best picture of the extent to which similar opinions prevailed about that epoch In the same century, witches and heretics were first connected in the eye of the church the commissioners who tried the various sectaries of the time were equally directed to inquire into and punish magical practices In the 14th century the persecution of witches assumed a more regular and severe character The well-known accusations against the [illegible] which all the common charges of compacts with [illegible] witch-assemblies &c were mingled with those of atheism and heresy were but the prelude to a long series of similar proceedings About this time the south of France, north of Italy and some parts of Germany seem to have been most infected with demoniacal agency The female sex seems from the earliest times to have been most implicated in the public horror of witchcraft, and from the commencement of the 15th century we find this common notion become a confirmed doctrine almost all the decrees of councils, &c, which speak of witchcraft, and the prosecutions which are carried on, henceforward are directed against women only From this time therefore, we may date (as far as accuracy is practicable on such subjects) the separation in popular belief of the higher magic practised by learned and distinguished men, from the petty witchcraft of which the great performers were poor old and ignorant women Many of the great magicians were believed to operate their wonders by the control which they had acquired over inferior spiritual agents, without any express compact with the devil, and although such practices were often condemned by the church, always liable to suspicion and sometimes brought those who indulged in them (together with alchemists and astrologers) under the cognizance of criminal tribunals yet they were always considered as of a different order altogether from the feats of common witches In 1484 appeared the famous bull of Innocent VIII, "Summis desiderantes affectibus" In this remarkable instrument all the absurdities of the popular superstition are formally recapitulated, and a commission directed to three individuals (Institor, Sprenger and Cremper) to examine and punish witches in the German empire Although immediately relating to Germany only, this bull is rightly considered by Herzog (the author of the article on witchcraft in *Ersch and Gruber's Encyclopædia*, from whom we have borrowed largely on the present subject) as forming a period in the history of this superstition Although much cruelty had been committed before in the pursuit of this imaginary crime it is from this solemn confirmation of the vulgar superstition that we must date the continuous course of legal persecution which lasted for two centuries over the greater part of Europe

The details of these legal proceedings bear a striking similarity in all the countries in which this baleful superstition so long prevailed. It has been seen that by the bull of Innocent VIII witchcraft was rendered a crime peculiarly cognizable by ecclesiastical authorities so it remained for the most part in Catholic countries, especially where the Inquisition was established, and this constituted the chief difference between the procedure in those regions and that which prevailed in Protestant districts, where the civil magistrate took cognizance of the offence Thus the various forms of religious observance which were interwoven with the judicial proceeding in the former exorcisms and so forth, were for the most part disused by Protestants In other respects, the mode of investigation and punishment was much the same Every where they exhibited a singular mixture of legal refinement with popular violence Thus the various ordeals by which suspected witches purged themselves (one of the most vulgar superstitions connected with witchcraft) were conducted with gravity and regularity under the eye of the law The best known in England was that of water if the accused swam when thrown in, it was held as a proof of guilt On the Continent a favourite mode, among many others, was by weighing In the scales set apart for this purpose a true witch was always found to weigh more than her previously ascertained weight There was in the 17th century a weighing beam at Budewater in Holland, of such celebrity that persons accused of witchcraft in many neighbouring provinces used to appeal to it When, however, the suspected person was in the hands of the tribunal, there was in general one only mode of proceeding [illegible] This was carried to the most horrible [illegible] excesses; and as it was generally recognized that witchcraft was a crime entirely out of ordinary rules, the various provisions of the civil or municipal laws by which that dreadful practice was mitigated were wholly neglected, and the accused abandoned to all the cruelty with which fear or fanaticism might inspire the judges In England, which forms in this respect a solitary exception, torture was not judicially practised, but the various severities to which the unfortunate prisoners were subject had probably nearly equal effect And thus every where the witch persecutions produced the same result — confessions, namely, of all the strange and monstrous crimes with which the accused lay charged [illegible] have grown more voluminous and [illegible] in every generation, and this may be naturally accounted for for when a witch had made up her mind to confess, it cost her nothing to promulgate the most extravagant inventions, and these being regarded as undoubted truths, formed the basis of interrogatories to be administered to other unhappy beings who might be brought under the same accusation The punishment was uniformly death, usually at the stake

Much has been said concerning the connection between religious fanaticism and the superstition of witchcraft. It has already been seen that the cruelties and absurdities of witch persecution had reached a great height even before the Reformation, but it can scarcely be denied that the strong religious excitement which produced and accompanied that event was in some way connected with the rapid spread and development of that atrocious system The more intense the belief in the overruling providence of God, and his immediate interference in the course of ordinary events (which especially characterized the revival of religion), the more does the parallel belief in the agency of evil spirits, and their dealings with man appear to take root in the imagination Sir W Scott observes that, among Protestant sects, the Calvinists (whose views of religion were at once the most gloomy and the most engrossing) seem to have afforded the most terrible examples of this prevailing mania There seems also to have been a constantly [illegible] of great witchcraft and heresy as allied offences It appears upon the whole, that the persecutions during the 16th and 17th centuries were most violent in those countries which were the scene of much strife between the two religions, or in which the Calvinist opinions were pushed to an extreme,—France, the Netherlands Northern and Western Germany Switzerland Scotland, England under the Commonwealth, and at a still later period New England A singular example of the contagion of fanaticism suddenly spreading with extraordinary violence and subsiding again after one terrible outbreak, is to be found in the history of the witch persecutions in Sweden, in the end of the 17th century In Italy, with the exception of one or two northern districts, the superstition was generally less prevalent, or at least less distressing in its effects, and the same may be said of Spain, after the first period of the history of the Inquisition

Among many and voluminous authors who wrote disquisitions on witchcraft with a full conviction of its reality, we may cite, as some of the most remarkable, [illegible] three inquisitors whose [illegible] Malleus Maleficarum (Hammer of Witches) contains a complete code of precedents for inquisitors, which was adopted, varied, and extended through succeeding generations; Delrio the Jesuit, the author of *Magical Disquisitions*, Bodinus, and Remigius a judge in the duchy of Lorraine, who put to death eight hundred witches in sixteen years, and was at last himself burnt as a conjuror In England, King James I [illegible] celebrated by his literary [illegible] witchcraft From the earliest times there were not wanting [illegible] individuals, who [illegible] to publish their sentiments against the [illegible] Reginald Scot, a disciple of Wier, at the period of the Council of Constance, avowed his doubts of the very existence of the crime of witchcraft. In 1556 appeared the book of Wier (a native of Brabant), *De Præstigiis Dæmonum*, in which he expresses the utmost

and absurdity of the judicial proceedings; but either from caution, or from his own imperfect enlightenment, he ascribes the confessions of the witches to their own melancholy, or the delusion of the devil so working on them as to make them believe they had seen and done what they avowed In England, Reginald Scot, in the reign of Elizabeth, was still more advanced beyond his age Even at the end of the 17th century, Balthazar Bekker, a Dutch Jesuit, for having ventured to assail the prevalent superstition in his *Monde Enchante* was persecuted, and died in want The writings of Thomasius, about 1700, had much effect in Germany, and prepared the way for the abolition of witch persecutions in all her Protestant states But the public mind was at that period rapidly changing Louis XIV had already put an end to them by edict in France The last execution on account of witchcraft in England was probably in 1682, although the statute against it was not repealed until the 9th of Geo 2 In Scotland, a woman was executed in Sutherlandshire in 1722 But the practice lingered on later in some Continental districts, as in Catholic Germany, Spain, and Switzerland The sub prioress of a convent was burnt at Wurtzberg in 1749 And the last probably of all the victims of this superstition, was burnt at Glarus in Switzerland in 1783 It now exists only as a vulgar delusion, which it will probably require some centuries more wholly to extirpate It is prevalent to a degree little suspected among the English peasantry in remote districts The writer of this article has seen a horse-shoe suspended inside over the door of a gaol in a Cornish borough, as a protection against the "ill wishes" to which the guardians of such an establishment naturally considered themselves exposed The most pains-taking collection of learning on this strange subject will be found in *Horst's Zauber-Bibliothek* An amusing essay on it is contained in the *Quarterly Review*, vol xlviii See also *Grimm's Deutsche Mythologie*, passim

WITENA GEMO'TE, or MEETING OF THE WISE MEN The great national council of the Anglo-Saxon kings, also termed the "Mycel gethoht" or Great Thought Who composed the Witen cannot now be ascertained bishops, abbots, earls, aldermen, thanes of the Danish burghs, &c attended It seems that in East Anglia the possession of forty hides of land was necessary to entitle a person to rank among those termed in the Latin of the age 'proceres" who appear to have been members of the great council The powers and character of the witena gemote passed to the great council of the early Norman kings, which are called by the same name by Saxon writers The subject has been abundantly discussed by older and more recent antiquarians, the reader may consult an article in the *Ed Rev* vol xxxiv

WITHERITE In Mineralogy a name applied to carbonate of baryta, in honour of Dr Withering, who first discovered it at Anglesark in Lancashire

WITNESS In Law one who gives evidence in a judicial proceeding In civil cases witnesses are compelled to attend by the process called *subpœna ad testificandum* (which see) and punishable if they neglect to do so by attachment or action In criminal cases by subpœna or by recognizance taken by the magistrate before whom the information is given

By the law as it at present stands, witnesses are disqualified or rendered "incompetent" by reason, 1 of want of reason or understanding 2 Want of religious principle, that is, their want of belief in a God and a future state of rewards and punishments, 3 Infamy that is, conviction of an infamous crime, and judgment thereupon, the crimes which fall within this class being treason, felony, and other offences which involve the charge of falsehood The suffering of the punishment, if so provided by statute, restores the witness to competency, as does also pardon, the only exception being the case of convictions for perjury or subornation of perjury, which disqualify for ever unless reversed, 4 Interest, on which grounds the heads of exclusion are numerous, and the distinctions very refined, the general principle being, in civil causes in courts of common law, that every one interested in the event and in [illegible] matter of much debate, and perhaps the only practical reason which can really be given for this is that the time of courts of justice being limited, it is advisable to exclude at once from consideration all those classes of evidence which, from their peculiar deficiency, must be of less weight than the [illegible] interested It is clear that [illegible] has ought not for the purpose of incompetency by reason of infamy or interest, except in the case of parties to the suit, and one or two other special exceptions

WIZARD (Seems to be from the old verb witan *to know*, and of the same derivation with *wise* and *witch* Glanville, *Saddusismus Triumphatus*) The popular name in England for a sorcerer *See* SORCERY, WITCHCRAFT

WO'DEN, or WUOTAN An Anglo-Saxon divinity, considered to correspond with the Mercury of the ancient Greeks and Romans from whom Wednesday derives its name (see *Mem de l'Acad des Inscr* vol xxxv) He is sometimes also though erroneously considered as identical with Odin See ODIN

WOLF-FISH The name of a species of fish (*Anarrhichas lupus*, Linn), which subsists on whelks and other shell-fish, which it seizes by means of strong conical slightly curved anterior teeth, set in the jaws like grappling hooks, and bruises by the action of very powerful posterior molar teeth The flavour of this forbidding-looking fish is much superior to what might be supposed from the general low estimation in which it is held

WO'LFRAM A native tungstate of iron and manganese

WOLLASTONITE A name applied by some mineralogists to a species of prismatic augite, in honour of Dr Wollaston

WOOD, in Plants, physiologically considered, is the support of all the deciduous organs of respiration, digestion and impregnation, the deposit of the secretions peculiar to the individual species, and also the reservoir from which the newly forming parts derive their sustenance until they can establish a communication with the soil It consists organically of woody tissue, and various kinds of vessels surrounded by cellular matter, and more or less carefully arranged In the youngest state it is succulent and brittle, and is of nearly the same quality in all plants, but as it gains age the sides of the woody tissue become hardened and thickened by the deposit within them of matter of solidification, and wood then [illegible] and appearance peculiar to different species In the young state it is called *sapwood* or *alburnum*, when hardened and coloured it becomes *duramen* or *heartwood* It abounds in nitrogen, which may be removed by simple washing, and it is supposed that the perishable quality of wood is owing to the presence of this element It is believed that the preserving power of certain agents employed to render wood durable depends upon their rendering the azotized matter insoluble

WOOD, or TIMBER The trunks or main stems of ligneous plants which attain such dimensions as to be fit for use in architectural construction In general, every country has its appropriate timber which is produced by its indigenous trees, but there are some kinds of timber, such as that of the oak and that of the pine, which, in consequence of their durability and of commercial intercourse, are used in all countries The most useful timbers of Europe are the oak, the ash, the Scotch pine, the larch, and the spruce fir, those of North America are the hiccory, the different species of pine, and some species of oak, those of tropical countries are the teak tree, the different species of bamboo, and the palm The oak, the teak, and the larch are throughout the whole world found the most suitable timbers for shipbuilding, and the pine, and fir, and the bamboo those most conveniently adapted for civil architecture

WOOD COAL A synonym of brown coal.

WOOD-ENGRAVING *See* ENGRAVING.

WOOD-OPAL An opalized quartz occurring in various vegetable forms

WOODSTONE Petrified wood

WOOD-TIN An opaque fibrous and nodular variety of oxide of tin of a brown colour, hitherto only found in Cornwall

WOODY FIBRE Very slender transparent membranous tubes tapering acutely to each end, lying in bundles in the tissue of plants having no direct communication with each other They are of extreme tenuity and form the substances called hemp and flax.

WOOL (Germ wolle) A term used very indefinitely, being applied both to the fine hair of animals, as sheep, rabbits, some species of goats, &c, and to fine vegetable fibres as cotton (called in German baumwolle, or *tree-wool*), but when used without restriction it is generally confined to the wool of sheep—a substance which, from the remotest period of history, has been of primary importance to mankind In reference to textile fabrics, sheep's wool is of two different sorts, the short and the long stapled, each of which requires different modes of manufacture in the preparation and spinning processes as also in the treatment of the cloth after it is woven to fit it for the market Each of these is, moreover, distinguished in commerce by the names of fleece wools and dead wools according as they have been shorn at the usual annual period from the living animal, or are cut from its skin after death The [illegible] are comparatively weak, and incapable [illegible] giving [illegible] more especially if the [illegible] same [illegible] disorder The annular pores, leading into the tubular cavities of the filaments, seem, in this case, to have shrunk and become obstructed The time of year for sheep-shearing most favourable to the quality of

the wool, and the comfort of the animal, is towards the end of June and beginning of July—the period when Lord Leicester holds his celebrated rural fête for that interesting purpose

The wool of the sheep has been surprisingly improved by its domestic culture The *moufflon* (*Ovis ammon*), the parent stock from which our sheep is undoubtedly derived, and which is still found in a wild state upon the mountains of Sardinia, Corsica, Barbary, Greece, and Asia Minor, has a very short and coarse fleece more like hair than wool When this animal is brought under the fostering care of man, the rank fibres gradually disappear, while the soft wool round their roots, little conspicuous in the wild animal, becomes singularly developed The male most speedily undergoes this change, and continues ever afterwards to possess far more power in modifying the fleece of the offspring, than the female parent The produce of a breed from a coarse-woolled ewe and a fine-woolled ram, is not of a mean quality between the two, but half-way nearer that of the sire By coupling the female thus generated, with such a male as the former another improvement of one-half will be obtained affording a staple three-fourths finer than that of the grandam By proceeding inversely, the wool would be as rapidly deteriorated It is, therefore, a matter of the first consequence in wool husbandry, to exclude from the flock all coarse-fleeced rams

Long wool is the produce of a peculiar variety of sheep, and varies in the length of its fibres from 3 to 8 inches Such wool is not carded like cotton, but combed like flax, either by hand or appropriate machinery Short wool is seldom longer than 3 or 4 inches, it is susceptible of carding and felting, by which processes the filaments become [illegible] used principally for hosiery, though of late years the finer kinds have been extensively worked up into merino and mousseline-de-laine fabrics The longer wools of the Leicestershire breed are manufactured into hard yarns, for worsted pieces, such as waistcoats, carpets, bombasines, poplins, crapes, &c

The wool of which good broad cloth is made should be not only shorter, but generally speaking, finer and softer than the worsted wools, in order to fit them for the fulling process Some wool-sorters and wool-staplers acquire by practice great nicety of discernment in judging of wools by the touch and traction of the fingers Two years ago I made a series of observations upon different wools, and published the results The filaments of the finer qualities varied in thickness from $\frac{1}{1500}$ to $\frac{1}{2000}$ of an inch, their structure is very curious exhibiting in a good achromatic microscope, at intervals of about $\frac{1}{300}$ of an inch, a series of serrated rings, imbricated towards each other, like the joints of *Equisetum* or rather like the scaly zones of a serpent's skin (See *Philosophy of Manufactures*, *figs* 11, 12, p 91 2d ed)

There are four distinct qualities of wool upon every sheep, the finest being upon the spine from the neck to within six inches of the tail, including one-third of the breadth of the back, the second covers the flanks between the thighs and the shoulders, the third clothes the neck and the rump, and the fourth extends upon the lower part of the neck and breast down to the feet, as also upon a part of the shoulders and the thighs to the bottom of the hind quarter These should be torn asunder, and sorted, immediately after the shearing

The harshness of wools is dependent not solely upon the breed of the animal, or the climate, but is owing to certain peculiarities in the pasture, derived from the soil It is known that in sheep fed upon chalky districts, wool is apt to get coarse, but in those upon a rich loamy soil, it becomes soft and silky The ardent sun of Spain renders the fleece of the Merino breed harsher than it is in the milder climate of Saxony Smearing sheep with a mixture of tar and butter, is deemed favourable to the softness of their wool

All wool, in its natural state, contains a quantity of a peculiar potash soap, secreted by the animal, called in this country the *yolk*, which may be washed out by water alone, with which it forms a sort of lather It constitutes from 25 to 50 per cent of the wool being most abundant in the Merino breed of sheep, and however favourable to the growth of the wool on the living animal should be taken out soon after it is shorn lest it injure the fibres by fermentation, and cause them to become hard and brittle After being washed in water, somewhat more than lukewarm, the wool should be well pressed, and carefully dried. England grows annually about 1,000,000 packs of wool and imports 100,000 bags. (*Ure's Dict of Arts*)

The woollen manufacture was the early staple of England The first impulse towards the improvement of the woollen manufacture was given in the 14th century, by Edward III, who invited a number of Flemish manufacturers to settle in England But the manufacture laboured, down almost to our own day, under a number of vexatious and oppressive restrictions; and it did not begin to make any very rapid progress, or to participate in the wonderful improvements made in the cotton trade, till the introduction of the gig-machine, &c, in 1802, and the repeal of the prohibitory acts of Edward VI and Mary, in 1807 The total value of woollen goods exported in 1850 was upwards of £[illegible], of which the exports to the United States were nearly one-fourth The woollen factories of England and Wales employed in 1850 [illegible] males and [illegible] females

WOOLSACK The seat of the Lord Chancellor of England, in the House of Lords is so called, from its being a large square bag of wool without back or arms, covered with red cloth

WOOTZ A species of steel imported from Bengal, peculiarly excellent for some cutting instruments It appears to contain minute portions of silicium and aluminum

WORMING An operation performed on puppies, consisting in the removal of a vermiform ligament from under the tongue, it is sometimes supposed to prevent madness, but, in fact, merely breaks them of their habit of gnawing

WOULFE'S APPARATUS A series of two or three-necked bottles, connected by intermediate tubes, used in the chemical laboratory for impregnating water and other liquids with [illegible]

WRANGLER [illegible] who have the highest honours in [illegible] for the degree of bachelor of arts are so called At the close of the last day of examination, those who have most distinguished themselves (to the number of thirty at least) are arranged in order of merit by the examiners, [illegible] wranglers, senior optimes, [illegible] first or senior wrangler is the most distinguished mathematician of his year The name is probably derived from the public disputations in which candidates for degrees were formerly required to exhibit their powers, of which the "exercises" still held [illegible] the form

WRECK Goods cast up by the sea after a shipwreck, and left on land within the limits of some county The goods so brought to land belong at common law to the king, or to the lord of the manor enjoying the franchise of wreck It was ordained by Henry I and II that such forfeiture should not take place if any man or beast escaped alive from the wreck, and we find in Bracton (Henry III) that in his time if the goods could be known by marks to appertain to any owner, it was no wreck, even if no living creature escaped The limitation of claims by the owner, by stat Westm 1 (3 E 1), was within a year and a day By 7 & 8 G 4 plundering wrecked vessels or goods stranded is felony Goods cast overboard at sea, and not stranded, are divided into *jetsam* i e things sunk to the bottom, *flotsam* things found floating, and *ligsam*, things sunk, but fastened to a buoy or cork in order to be found again These are all the king's, if no owner appears to claim them, and they do not pass by the ordinary grant of wreck

WRIT In Law, a precept in writing under seal, in the name of the king judge, or other person having jurisdiction in the particular subject matter, and directed to some public officer or private person, requiring him to do something in relation to a suit or action Writs, though still very multifarious have been within the last few years much reduced in number The original writ issuing out of Chancery for the commencement of actions in the three courts of common law is now superseded by three judicial writs which issue in the name of the chief justices of the respective courts, namely, the writ of *summons*, the writ of *capias ad respondendum*, and the writ of *detainer* The first of these is the one in ordinary use, the second is only used when it is intended to arrest the defendant, and the last when he is already in prison for some other cause

WRITERS TO THE SIGNET A numerous society of lawyers in Scotland, equivalent to the highest class of attorneys in England They possess several privileges *See* SIGNET

WROUGHT In Architecture, a term applied to any [illegible] brought to a fair surface.

WYTHAM *See* WITHAM

X.

X A letter borrowed from the Greek and used chiefly in words derived from that language Numerically it [illegible] as an abbreviation it is used for Christ. [illegible] stmas, &c

XANTHIC (Gr ξανθος, *yellow*) Tending towards a yellow colour, or some colour not green of which yellow forms a part, as orange, which is a mixture of yellow and red, scarlet, which is another mixture of the same colours &c

XA'NTHIC ACID (Gr ξανθος, *yellow*, and γινομαι,

I generate) An acid composed of sulphur, carbon, hydrogen, and oxygen, obtained in combination with potassa by agitating sulphuret of carbon mixed with solution of pure potassa in strong alcohol Its compounds are mostly of a yellow colour, whence its name The relative proportions of its component parts have not as yet been satisfactorily obtained

XANTHIC OXIDE (Gr ξανθος, *yellow*) A yellow substance found by Dr Marcet, composing a urinary calculus, its solution in nitric acid, when evaporated to dryness, left a bright lemon-coloured residue.

XEBEC, a small three-masted vessel, constructed for [illegible] is chiefly found in [illegible] of Spain and Portugal

XENELA'SIA (Gr *the expulsion of strangers*) A Spartan institution which prohibited strangers from dwelling in Sparta beyond a certain time, and also from entering the city except on stated days The object of this institution was to preserve the simplicity of manners of the nation, and prevent foreigners from prying into their measures, but it acquired for Lacedæmon the reputation of great inhospitality

XE'NIA (Gr ξενος) In Classical Antiquities, the presents given by friends connected by the rites of hospitality as pledges of that singular relation In the *Iliad*, the mutual gifts which pass between Glaucus and Diomede are so called

XEROPHA'GIA (Gr ξηρος, *dry*, φαγω, *I eat*) In Ecclesiastical Antiquities, a name given to the rigorous practice of certain fasts, during which nothing was consumed but bread with salt, and water It was particularly observed in Holy Week

XIPHIRHY'NCHS, *Xiphirkynchi* (Gr ξιφος, *a sword*, ρυγχος, *a beak*) The name given by Latreille to a family of Acanthopterygious fishes, of which the sword-fis [illegible]

[illegible] *Xiphosura* (Gr ξιφος, and ουρα, *a tail*) A name of a tribe of Crustaceans, comprehending those in which the body terminates posteriorly in a long, [illegible]

[illegible], ξυλον, *wood*, and γραφω, *I draw*) The same as wood engraving *See* ENGRAVING

XYLOPHAGANS *Xylophaga* (Gr ξυλον, and φαγω, *I eat*) The name of a tribe of Coleopterous insects comprehending those of which the larvæ devour the wood of trees in which they are developed, also applied to a family of Dipterous insects, the larvæ of which have similarly destructive habits

XYLOPHILANS, *Xilophili* (Gr ξυλον, and φιλεω, *I love*) The name of a tribe of beetles, consisting of those which live on decayed wood

XYLOTROGUS *Xylotrogi* (Gr ξυλον and τρωγω *I gnaw*) The name of a tribe of Serricorn beetles, comprehending those which perforate timber

XYNOECIA In Classical Antiquities an Athenian festival in commemoration of the union by Theseus of the little townships of Attica into one commonwealth whence the name, derived from ξυνος, *common*, and οικεω *I inhabit*

XYST, or XYSTOS (Gr ξυστος, from ξυω, *I polish*) In ancient Architecture, an open or sometimes covered court of great length in proportion to its width, with porticoes on three sides, for the performances of the athletic exercises of wrestling, running, &c

Y.

Y A letter borrowed from the Greek υ, is considered a consonant at the beginning, and a vowel in every other place in English words As a vowel, it has exactly the sound of i being short or long, according to its position

YACHT A vessel of state or pleasure

YA'GERS, or JAGERS (Germ *hunters*) Light in[illegible] from the mountain districts In Germany the term *jager* is applied to a peculiar species of higher servant attached to the families of the aristocracy

YA'NKEE, the popular name for the New Englanders in America, and among English people pretty indiscriminately applied to all inhabitants of the United States, a word for which many ridiculous etymologies have been assigned, is, according to *Dr Webster's Dictionary* a corruption of the word English by the [illegible] America

YANOLITE A mineralogical synonym of AXINITE, which see

YARD The British standard measure of length. *See* MEASURES

YARD A beam or rod suspended by a rope called the halliards, for the purpose of extending a sail, signals, &c. A yard is called a *square yard* when hung horizontally by the middle such a yard is turned round by braces

YARD-ARM In naval language, the extremity of the yard *Yard-arm and yard-arm* is a term descriptive of [illegible] other as close as possible [illegible] temporary deviation from a direct course

YAWL A particular kind of carvel-built boat, rather narrow and [illegible] carrying mainly oars

YAWS A disease in which eruptions form upon the skin, somewhat resembling a raspberry *See* FRAMBOESIA

YEAR A period of time determined by the revolution of the earth in its orbit, and embracing the four seasons. The year is either *astronomical* or *civil*

The astronomical year is determined by astronomical observations, and is of different kinds, according to the celestial body or the point of the heavens to which the earth's revolution is referred When the earth's motion in its orbit is referred to an immoveable point in the heavens, to a fixed star, for example, the time of revolution is that which elapses from the instant at which the star, the sun, and the earth are in a certain relative position, till the earth returns again into the same position with regard to the sun and the star This interval is called the *sidereal year* But when the earth's motion is referred to a point of the ecliptic, as one of the equinoctial points or the tropics, the time of revolution is that in which the earth returns to that point, and is called the *equinoctial*, or *tropical* or *solar year* On account of the precession of the equinoxes (*see* PRECESSION) the equinoctial and solstitial points, in reference to the fixed stars, have a retrograde motion on the ecliptic, in consequence of which the earth returns to one of these points in a shorter time than it returns to the same fixed star

The length of the *sidereal year* is 365 2563612 mean solar days, or 365 d 6 h 9 m 9 6 sec

The length of the *equinoctial* or *tropical* year is 365 2422414 mean solar days, or 365 d 5 h 48 m. 49 7 sec (*Bailey's Tables*, p 16)

The difference is 20 minutes, 19 9 seconds of mean solar time, being the time in which the earth describes in its orbit an arc of 50″ 1, the annual precession of the equinoxes *See* EARTH

The earth's motion may also be reckoned by the time in which a revolution is completed with respect to the line of the *apsides* or the line of the *nodes* In these cases the times of revolution may be called respectively the *anomalistic year* and the *nodical year* the former term is sometimes met with

The *civil year* is the year of the calendar As it is always supposed to begin with the beginning of a day, the civil year contains a whole number of days, and hence, in order that the seasons may always correspond with the same parts of the year, it is necessary from time to time to vary the length of the year, or to intercalate a day when the fractional parts neglected have accumulated to a whole day The ancient Egyptian year consisted invariably of 365 days, and hence was called a *vague* or *erratic* year because the first day of the year in the course of 1460 years *wandered* as it were over all the seasons

The *Julian year*, which is frequently employed in chronological reckoning consists of 365¼ days Julius Cæsar, advised by the astronomer Sosygenes ordered that the civil year should consist of 365 days for three successive years, and that the fourth year should contain 366 days This practice of intercalating a day every fourth year has been adopted in all European countries, with the modification introduced by the Gregorian calendar The mean Julian year is longer than the true tropical year by [illegible] which amounts to a whole day [illegible] years [illegible] common years, those which [illegible] years *See* LEAP YEAR

According to the regulations of the Gregorian calendar the intercalations are omitted on years in which centuries end excepting when the number of the year is divisible by 4 after leaving out the two zeros. Thus the years 1700 1800, 1900 which would be leap years in the Julian calendar, are common years in the Gregorian, but 1600 and 2000 are leap years in both calendars (*See* CALENDAR) The mean length of the Gregorian year is 365 d 5 h 49 m 12 sec, exceeding the true tropical year by 22 38 sec, which amounts to a whole day only in [illegible] years

The civil or legal year, in England formerly commenced on the 25th of March the day of the Annunciation, though the historical year began on the 1st of January, the day of the Circumcision Between these two epochs it was usual to date the year both ways, as 1745 6, or 174⅚. By the act of parliament for the alteration of the style in 1751, the beginning of the year was transferred to the 1st of January It is frequently necessary to keep this circumstance in mind in referring to old dates.

The fraction by which the tropical years exceed 365

days is ·2422414; and the series of approximating vulgar fractions alternately greater and less than this quantity is,

$$\frac{1}{4},\ \frac{7}{29},\ \frac{8}{33},\ \frac{39}{161},\ \frac{281}{1160},\ \text{&c.}$$

The fractions in this series indicate the intercalations by which the coincidence between the civil and solar year may be restored to any degree of exactness The third, $\frac{8}{33}$ offers a very convenient mode of intercalation which would preserve the coincidence with great accuracy It requires eight intercalations to be made in thirty-three years, that is to say one at the end of four years seven times in succession and the eighth at the end of the fifth year The mean length of the civil year would be [illegible] correct differ in excess from the solar year only by 1·38 seconds, while the Gregorian year is too long by 22·38 seconds In a period of thirty-three years, it therefore produces a nearer coincidence between the civil and solar years than the Gregorian method does in 400 years, and by reason of its shortness it also confines the evagations of the mean equinox from the astronomical within much narrower limits The modern Persians are said, but not on very good authority, to intercalate in this manner (Delambre, *Astronomie Moderne*, tom i) *See* CALENDAR.

Lunar Year —Though the return of the seasons obviously depends on the motion of the sun, or rather of the earth in its orbit, some nations have chosen to regulate their civil year by the motions of the moon, and many others have formed luni-solar years, by combining periods determined by the revolutions of both bodies The proper lunar year consists of twelve lunar months or lunations, and consequently contains only 354 days its commencement, therefore, anticipates that of the solar year by upwards of eleven days, and passes through the whole circle of the seasons in about 33 lunar years The inconvenience attending this circumstance has been so universally perceived that excepting the modern Jews and Mohammedans almost all nations which have regulated their months by the moon have employed some method of intercalation for the purpose of retaining the beginning of the year at nearly the same place in the seasons These methods are founded on certain luni-solar periods or cycles which were established in the most ancient times, and which, with other relics of a barbarous age, are still preserved in our ecclesiastical calendars *See* CHRONOLOGY, CALENDAR, CYCLE

YEAST The substance produced during the vinous fermentation of vegetable juices and decoctions, rising partly to the surface in the form of a frothy flocculent, and somewhat viscid matter, insoluble in water and alcohol and gradually putrefying in a warm atmosphere It excites fermentation, and accelerates the process when added to saccharine and mucilaginous liquors It appears closely allied to *gluten* and like that vegetable principle, it contains nitrogen as one of its ultimate elements

YE'LLOW In Painting a colour of golden hue and of many varieties It is one of the seven primary colours *See* COLOUR LIGHT

YE'LLOW FEVER A bilious remittent fever *See* FEVER

YE'NITE A ferruginous silicate of lime from Elba, named by Lelièvre, its discoverer, in honour of the battle of Jena

YEO'MAN (From the Anglo-Saxon gemen, Germ gemein, *common*) Camden ranks yeomen as the next class to the gentlemen, and calls them "ingenuos" The name seems to have been generally appropriated in the middle ages to small freeholders In the king's household the yeomen of the different departments have a middle place between the sergeant and the groom

YEOMAN A seaman appointed to certain duties, as to attend to the storerooms

YEO'MANRY CAVALRY A denomination given to those troops of horse, which were embodied during the Revolutionary wars of France and afterwards among the gentlemen and yeomen of this country They were called out [illegible] trained for three weeks, and as they consisted entirely of volunteers, and were not called upon to leave their homes, or to quit their ordinary employments, except for the short period they were in quarters, the duty was not found to entail any serious privation Several troops of yeomanry are still kept up, though most of them have been disbanded The infantry troops that voluntarily enrolled themselves for similar purposes to the yeomanry were called *volunteers* These were all disbanded at the peace

YEOMEN OF THE GUARD *See* GUARD, YEOMANRY OF THE.

YOKE A piece of wood or light frame of two arms, placed over the head of a boat's rudder instead of a tiller, and having two lines (*yoke lines*), by pulling on which the boat is steered

YTTRIUM The metallic base of an earth, discovered in 1794 by Professor Gadolin in a mineral found at *Ytterby* in Sweden, whence it was called *Yttria*. The metal was first obtained by Wöhler in 1828: it is of a [illegible] brittle The salts of Yttria have [illegible] some of them a pale purple colour. Yttria is distinguished from glucina by the amethystine colour of its salts [illegible] by its pure potassa, and by yielding a precipitate with crystallized sulphate of potassa According to Berzelius the equivalent of Yttrium is about 32 and that of Yttria when considered a protoxide 40

YTTROTANTALITE A mineral from Ytterby in Sweden containing Yttria and oxide of columbium

YU (Chinese, *Yuh*) A precious stone or jade which see

YULE The common Scottish name for Christmas It appears to be a very ancient word In Welsh, wyl or gwyl signifies a holyday; whence also the old phrase 'Gule of August,' the first day of August, or feast of St Peter and Vincula, for which various absurd etymologies have been found Perhaps the old French word "Noel," for Christmas (used also generally as a popular cry of rejoicing), has the same original (See *Archæol* vol ii) Count de Gebelin, however, derives yule from a supposed primitive word, connected with the idea of revolution or "wheel." (See *Brand's Popular Antiq* vol i p 364)

Z.

Z The last letter in the alphabets of all the modern languages, usually regarded as a double consonant, from its having the sound in some languages of *ts* or *ds* Like the letter *x*, it begins no word originally English, and Dr Johnson has remarked, that although it is found in the Saxon alphabet [illegible] grammarians, it is read [illegible]

ZAFFRE A impure oxide of *cobalt*, obtained by exposing the native arseniuret of cobalt broken into small pieces to the action of heat and air in a reverberating furnace, by which its elements are oxidized, and the greater part of the arsenic driven off

ZA'MIA Fossil zamia

ZA'NTHOPI'CRIN A bitter principle, obtained from the bark of the *Zanthoxylon caribæum* It forms yellow acicular crystals insoluble in ether, but readily soluble in alcohol and sparingly in water

ZAX A [illegible] tecture, a tool for cutting slates

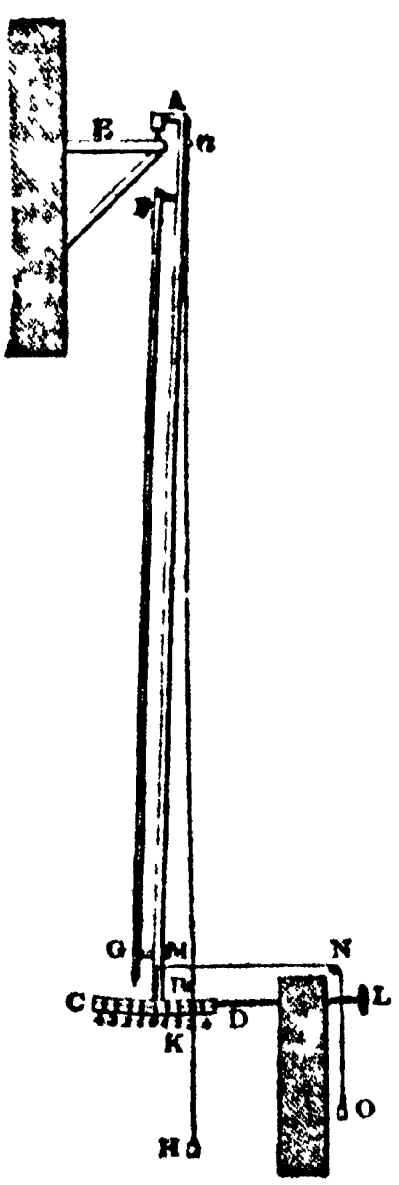
ZE'CHSTEIN (Germ) A magnesian limestone, lying under the red sandstone

ZE'IN A substance of a tough elastic nature, resembling gluten, but said to [illegible] contained in Indian wheat, [illegible]

ZEMINDA'R (From the Persian zemin, *land*) A title introduced into India by its Mohammedan conquerors conferred in Bengal, and generally throughout the Mogul empire, on the agent [illegible] share of the produce of the soil [illegible] zemindars were the great landholders of the empire, but the nature of their tenure has given rise to much dispute Whether they were hereditary absolute owners of the soil, or only tenants of the sovereign at a fixed rent by way of land-tax for which they were personally responsible, was a question much agitated by writers on Indian subjects at the period of the "Permanent Settlement" in 1793 By that settlement the rent was to be fixed in the first instance by custom, and the zemindar was then to give the ryot a lease restricted to himself and his assignees on performance of its conditions his own share being fixed as before at 10 per cent of the assessment, and his hereditary right secured A zemindary, i e the district of a zemindar, is liable to be sold by government for arrears of revenue, and existing leases with the ryots to be set aside At present the land-tax of India is levied in three methods, which prevail in different districts —the "zemindar settlement," by which the zemindar is responsible to government, the "mouzawar" or village settlement, by which the collector contracts with the head man of the village, and the "ryotwar" or cultivator settlement, by which the tax is collected immediately from the peasantry (See, as to the effects of the zemindary settlement, *Mill's History of British India*, vol v, M'Culloch's Edition of *Smith's Wealth of Nations*, note 19, *Edin Rev* vols xxxi lxxi) *See* RYOTS

ZE'ND-AVE'STA (Pers *Living Word*) The sacred books of the Parsees in India, and Guebers in Persia, who profess the religion of the ancient Persians According to the popular belief among them, these books are attributed to the famous Zoroaster Their real history is much disputed, but it is generally supposed that they are not of great antiquity, and that the belief of the modern Guebers is for the most part a compound of legendary notions drawn from various religions (*See* MAGIANS.) Sir William Jones thought the *Zendavesta* a forgery of the learned adventurer Anquetil du Perron. (See *Mém de l'Ac des Inscr* vol xxxi.; *Milman's Hist. of Christianity*, vol i. p 68, for the arguments for and against its authenticity; and the *Cons. Lex.*, article "Per-

dian Religion" See also *Bryant's Mythology*, vol ii p 390 401) It is certain, at all events, that the Zend language, in which it is written, is of great antiquity, and radically allied to the Sanscrit. *See* SANSCRIT, PARSEES



ZE'NDIK In Arabic, a name given to those who are charged with atheism, or, rather, disbelief of any [illegible] The sect [illegible] the progress of Mohammedanism Arabia with great [illegible] appears to have had many features in common with [illegible] among the Jews

ZE'NITH. (From the Arabic) In Astronomy, the top of [illegible] the point directly overhead [illegible] of the celestial sphere which would be intersected by the plumb line, supposed to be indefinitely extended It may also be defined as the pole of the horizon, from which it is 90° distant All vertical circles or azimuths necessarily pass through the zenith

ZE'NITH DISTANCE The angular distance of any celestial object from the zenith; or the complement of the altitude of the object above the horizon

ZE'NITH SECTOR. An astronomical instrument, contrived for the purpose of measuring with great accuracy the zenith distances of stars which pass near the zenith It was by means of a zenith sector that Bradley discovered the existence [illegible] important astronomical elements [illegible] ght, and the nutation of the earth axis The instrument has also been generally used (in this country at least) in [illegible] for determining the difference of [illegible] a purpose for which it is very convenient, for the difference of the zenith distances of the same star, observed at its meridional passages at two places, gives the difference of the astronomical latitudes of the places without any regard to the star's declination The general description of the zenith sector has been given by the present Astronomer Royal as follows (*Ency Metr*, art "Figure of the Earth") —

"In the annexed figure A B is a bar of iron with a cross piece C D, the whole in one piece The top A is formed in such a way that the instrument can be turned half round in azimuth when suspended at the top, and that the bottom can be moved freely in the directions D C or C D The bracket or other support F, on which it rests is attached to some firm part of the building To the bar A B is firmly attached a telescope E G At a point *a*, near A, is attached a plumb line *a* H, sometimes it is fastened at a point of attachment which is moveable in order that by moving the point of suspension the plumb line may be made to pass over a fine dot at *a* The limb C D is graduated, sometimes on a circular arc of which *a* is the centre, [illegible] through a block strongly connected with the floor, and acting with its point against the end D of the piece C D, and M N O are a string and weight pressing the sector against the point of the screw"

The method of observing with the zenith sector is this — A clock being regulated by transits of stars, the direction of the meridian is found, and guides fixed to compel the sector to move in the meridian When a star is to be observed the screw L D is turned till the plumb line falls exactly on some point K of the graduated arc, such that the telescope is very nearly directed to the point through which the star will pass when it comes to the meridian When the star enters the field of view, the screw is again turned till it appears to glide exactly along the horizontal wire fixed in the focus of the eye-glass, and the position of the screw be thus ascertained, and the value of the division known the apparent zenith distance of the star is found But it is evident that this is not the true zenith distance unless the zero point of the divisions on the scale be quite accurate; that is to say, so placed that when the plumb line falls on it the optical axis of the telescope is exactly vertical It is impossible to insure this accuracy; but it is easy to see that if the instrument be turned half round in azimuth, and the same observation made, the apparent zenith distance will be just as much greater than the true as in the former determination it was less The mean of the two will therefore be the true zenith distance of the star

The advantages of the zenith sector are these — The stars observed being very near the zenith, the tremor and [illegible] generally affects apparent positions [illegible] [illegible] about the effects of refraction, the telescope and the whole instrument are not subject to flexure, and the variation of temperature [illegible]

[illegible] zenith sector used in the measurement of the English arcs of the meridian, see the second volume of the *Trigonometrical Survey of England and Wales*, or *Phil* [illegible] This superb instrument was unfortunately burnt in the great fire which took place in the Tower of London in October, 1841 Another sector, on a different plan from that above described (the zenith point being determined by levels), has been constructed for the use of the survey by Troughton and Simms, under the directions of the Astronomer Royal A description and drawing of the new instrument is given in the *Monthly Notices of the Royal Astronomical Society* for May, 1842 For Reflex Zenith Tube at Greenwich *see* SUPPLEMENT)

ZEOLITE (Gr ζεω, *I boil*, and λιθος, *stone*) A name given to a family of mineralogical species which, heated before the blowpipe, melt with considerable bubbling They mostly consist of silica, alumina, lime, and water

Natrolite A species of zeolite containing soda from *natron*, or soda

ZE'PHYRUS (Gr ζεφυρος) The west wind, a [illegible] child of Astræus and Aurora, ac- [illegible] whom Anchises sacrifices a ram. [illegible] wind with the Latin Favonius; but [illegible] between the two

ZERYNTHIA (Gr *Ζερυνθια*, one of the names of the goddess of love) The name of a subgenus of butterflies in Treitschke's system, where it is erroneously written *Zerynthia*

ZE'RO (Ital ?) A term generally used in reference to the thermometer, implying the point at which the graduation commences The zero of Reaumur's and of the centigrade thermometer is the freezing point of water The zero of Fahrenheit's scale is 32° below the point at which water congeals, being about the temperature of a mixture of salt and snow *See* THERMOMETER.

ZETHES In Classical Mythology, Zethes and Calais were the sons of Boreas, king of Thrace, and Orithyia They accompanied the Argonauts, and were afterwards slain by Hercules

ZEUGMA (Gr ζευγμα, *yoke*) A figure in grammar by which an adjective or verb which agrees with a nearer word is referred also, by way of supplement, to one more remote

ZI'MOME (Gr ζυμωμα, *a ferment*) That part of the gluten of wheat which is insoluble in alcohol When rubbed in a mortar with powdered guaiacum, it produces a fine blue colour

ZINC A metal, first mentioned by Paracelsus, but its ores were known at a much earlier period In commerce it is often called *spelter*, and is obtained either from the native carbonate of zinc, called *calamine*, or from the native sulphuret or *blende* of mineralogists. These ores are roasted and mixed with charcoal or carbonaceous flux the mixture is put into a kind of crucible closed at top and perforated at bottom by an iron tube, which passes through the grate of the furnace into water, the vapour of the zinc distils downwards through this tube and is condensed in the water The first portions are impure containing arsenic, and often cadmium, in which case the vapour burns with what the workmen call a *brown blaze*, when the *blue blaze* appears the zinc is collected The zinc of commerce (which is not quite pure) has a peculiar blueish colour and lustre, a lamellar and crystalline texture, and its specific gravity is about 7 At common temperatures it is tough and intractable under the hammer; and when heated to above 500° it becomes brittle, and fuses at about 770°. But at temperatures between 220° and 320° it becomes malleable and ductile so that it may be beaten out under the hammer, and rolled into sheets and leaves, and drawn into wire, in a manner extremely remarkable when its highly crystalline texture is considered Being a cheap and light metal and one which, after having been superficially oxidized, long resists the further action of air and water, it has lately been much employed as a substitute for lead in lining water cisterns and covering buildings, it has also been lately employed in the curious operation of transferring printing (under the name of zincography) It is a very infusible metal burning in the flame of a spirit lamp, with a brilliant white light, but the oxide which forms interferes with its continuous combustion,

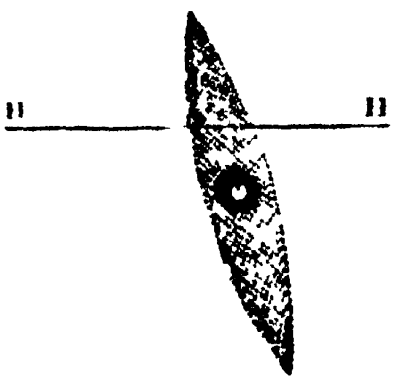
which can only be carried on at a high red heat, when the vap[illegible] flame, [illegible] oxide, [illegible] formerly called *philosopher's wool*, *pompholix* and *nihil album* The equivalent of zinc is 32, and that of its oxide 40. Though zinc is apparently without action upon wate[illegible] lubility of [illegible] when a film is once formed upon it, it resists further change, but when a little acid is present in the water, and the zinc not quite pure, it is rapidly acted upon, and oxidized at the expense of the water, which evolves abundance of hydrogen (when dilute sulphuric acid is used) and the oxide of zinc is removed and dissolved by the acid It is this action which renders zinc so powerful a generator of electricity in the voltaic pile The salts of zinc are mostly soluble and have a nauseous, astringent, and metallic taste The *sulphate of zinc*, or *white vitriol*, is employed in medicine as an emetic and tonic, and the oxide and carbonate are externally used in the form of ointment The *chloride of zinc* is a colourless compound, fusible at a heat a little above 212°, and known to the older chemists under the name of *butter* [illegible] and copper

ZINGIBERACEÆ [illegible] one of the genera), or [illegible] er of Herbaceous Monandrous Endogens inhabiting the tropics It is distinguished from the Musaceous order in the latter having five or six stamens, with a calyx and corolla of the same texture, and from *Iridaceæ*, by two of the stamens being either deformed or abortive, and from *Marantaceæ* by the single stamen [illegible] or anther [illegible] proceeding from the base of the posterior outer division Cardamoms are the seeds of several plants of this order, which are, however, principally valued for the aromatic stimulating properties of the root or rhizoma, such are found in ginger (*Zingiber officinale*), galangale (*Alpinia* [illegible] and zedoary (*Curcuma zedoaria* and [illegible] meric a substance half dye and half condiment, is the powder of the rhizoma of *Curcuma longa*

ZIRCON A mineral chiefly composed of zirconia and silica found in the sand of the rivers of Ceylon, and occasionally imbedded in primitive rocks It is of various colours, and when transparent is sometimes used in jewellery

ZIRCONIUM The metallic base of *zirconia*, an earth discovered in 1789 by Klaproth in the jargon or zircon of Ceylon Zirconium has only been obtained in the form of a black powder which when heated in the air burns into the oxide The salts of zirconia are distinguished from those of [illegible] glucina by being precipitated by all the pure alkalies, and by being insoluble when they are added in excess

ZOA'NTHUS (Gr ζωον, *an animal*, and ανθος *a flower*) The name of a genus of Polypes, comprehending those which possess the complex structure of the *Actiniæ*, but consist of different individuals adhering to a common fleshy basis



ZO'CLE, or ZOCCOLO (It zoccolo, *a wooden shoe*) In Architecture, the same as *socle*, which see

ZO'DIAC (Gr ζωδιον, dim of ζωον, *animal*, because the constellations of the ecliptic are for the most part represented in celestial charts by the figures of animals) An imaginary zone or belt in the heavens, extending to about 8° or 9° on each side of the ecliptic, which divides it in the middle No use is made of the zodiac in astronomy, the name only indicates that region of the heavens within which the apparent motions of the sun, moon, and all the greater planets are confined Three of the new planets, Juno, Ceres, and Pallas, have inclinations which exceed the limits of the ancient zodiac, and are therefore sometimes called *extra-zodiacal* planets, but Vesta is also sometimes included in the same description *See* PLANET

The zodiac is divided into twelve equal parts, called *signs*, which are designated by the names of the constellations with the places of which the signs anciently corresponded They are Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius, and Pisces The signs are counted from the vernal equinox, one of the points in which the equator intersects the ecliptic, whence, in consequence of the regression of the equinoctial points, their position with respect to the constellations or fixed stars is greatly different from what it was in remote ages Some time prior to Hipparchus, the first points of the constellations Aries and Libra corresponded to the vernal and autumnal equinoxes; those of Cancer and Capricorn to the summer and winter solstices: at present, the difference is about 30°. The vernal equinox now happens in the constellation Pisces, the summer solstice in Gemini, the autumnal equinox in Virgo, and the winter solstice in Sagittarius, but the vernal equinox always corresponds to the first point of the sign Aries, the summer solstice to the first of Cancer, and so on. On this account it is necessary to distinguish between the *signs* of the zodiac, which follow the motions of the equinoctial points, and the *constellations* of the zodiac, which are immoveable in the celestial sphere

It has been supposed that the constellations of the zodiac were invented in Egypt in a very remote age and that they had a reference to the divisions of the seasons and the agriculture of that country at the time of their invention If we go back to a period about 2500 before Christ, the constellations Aquarius and Pisces, at the season of the overflow of the Nile, would be diametrically opposite to the sun and would consequently rise at sunset Virgo, usually represented as a woman with an ear of corn in her hand, would be the constellation rising at sunset in the time of the harvest in Egypt Such conjectures, however, it is easy to conceive, are at best extremely uncertain Representations of the zodiac have been found in several Egyptian temples, and also in other eastern countries, which have given rise to much discussion (See Dupuis, *Mémoire sur l'Origine du Zodiaque*, Biot *Recherches sur l'Astronomie Egyptienne*, Montucla, *Histoire des Math* tom i, Bailly, *Histoire de l'Astr Ancienne*)

ZODIACAL LIGHT In Astronomy, a faint nebulous aurora which accompanies the sun This curious phenomenon was observed by Kepler, who supposed it to be the solar atmosphere, but it was first accurately described by Dominic Cassini, who gave it the name by which it is now known It is visible immediately before sunrise or after sunset, in the place where the sun is about to appear or has just quitted in the horizon It has a flat lenticular form, as represented in the annexed figure, extending from the horizon H H obliquely upwards, and following the course of the ecliptic, or rather of the sun's equator For this reason it is scarcely visible in our latitudes, excepting in those seasons when the plane of the sun's equator is most nearly perpendicular to the horizon The most favourable times for observing it are in the months of April or May, in the evening or at the opposite season of the year before sunrise At other times the plane of the solar equator being more oblique, and the luminous pyramid inclined in the same degree it rises so little above the horizon that its light is absorbed by the atmosphere of the earth The apparent angular distance of its vertex from the sun varies according to circumstances from 40° to 90° or 100°, and the breadth of its base perpendicular to its axis from 8° to 30° It is extremely faint and ill-defined, at least in this climate, though it is better seen in tropical countries

Numerous opinions have been entertained respecting the nature and cause of this singular phenomenon Cassini thought it might proceed from the blended light of an innumerable multitude of little planets circulating about the sun, as the milky way owes its appearance to the light of [illegible] and myriads of stars Euler endeavoured to [illegible] it proceeds from the same causes as the tails of comets Kepler had ascribed its appearance to the solar atmosphere, and the same hypothesis was adopted by Mairan and others, till it was shown by Laplace to be untenable for the following reasons — In the first place, the solar atmosphere cannot extend beyond the distance at which the centrifugal force would be balanced by the attraction, but this point lies far within the orbit of Mercury, the greatest elongation of which is 28°, whereas the zodiacal light has been observed to extend to 100° from the sun In the second place in order that the spheroid of the solar atmosphere may be in equilibrium, the ratio of the equatorial to the polar axis cannot exceed that of 3 to 2, whence its form would not correspond with the lenticular [illegible] of the zodiacal light Sir John Herschel [illegible] "it may be conjectured to be no other than the denser part of that medium, which, as we have reason to believe, resists the motion of comets; [illegible] the actual materials of the tails of [illegible] of which they have been stripped in their successive perihelion passages An *atmosphere* of the sun it cannot be" — *Outlines of Astronomy*, p 616 (Biot, *Astronomie Physique*; Mairan, *Traité Physique et Historique de l'Aurore Boreale*; Euler, *Mém de Berlin*, 1746, Lalande, *Astronomie*, tom i; Hooke *Opera Posth*)

ZOHAR (Heb *splendour*) A Jewish book, highly esteemed [illegible] to be of great, the [illegible] It consists of cabalistical commentaries on Scripture, especially the

books of Moses It has been translated into Latin (ed 1680)

ZOISITE A variety of epidote, named after its discoverer Baron von Zois

ZONE (Gr ζωνη, *a girdle* or *belt*), in Astronomy, denotes a portion of the celestial sphere included between two parallel circles [illegible] are the five broad spaces or belts [illegible] of the earth is divided by the two tropics and the two polar circles The space included between the tropics is called the *torrid zone*, its breadth is equal to 47° or twice the sun's greatest declination and it is divided into two equal parts by the equator That included between the tropic of Cancer and the arctic circle is called the *north temperate zone*, and that between the tropic of Capricorn and the antarctic circle the *south temperate zone* The breadth of each of these is 43° The space between the arctic circle and the north pole is the *north frigid zone*, and that between [illegible] pole is the *south frigid zone* See Geography, Earth

ZOOGRAPHY (Gr ζωον, and γραφω, *I write*) The description of animals

ZOOLATRY (Gr ζωον, *an animal*, and λατρευω, *I worship*) The worship of animals, which was the characteristic of the ancient Egyptian religion most remarked upon by foreigners

ZOOLOGY (Gr ζωον, *an animal*, λογος, *a discourse*) The science of animals It teaches their nature and properties, their classification, and their order of succession upon and their distribution over the earth

A knowledge of the nature of animals, as it implies that of their organization, and of the functions and interdependencies of their component parts, constitutes the two great branches of zoology, called *Zootomy*, or comparative anatomy, and *Physiology* The doctrine of the succession of species of animals upon the earth, as it relates principally to such as no longer exist, is included in a third branch of the science of animals, called *Palæontology*, with which is closely connected that which treats of the geographical distribution of existing species The term *Zoology* is practically restricted to the science of the outward characters, habits, properties, and classification of animals

As the forms of living animals, the parts they play in the theatre of nature, their good and evil relations to man cannot be profitably treated of in the space assigned to this article, it will be limited to the exposition of the principles of the classification of animals and of the characters and relative value of those groups which have not been already treated of in the present work

A classification is essentially based on the ideas of likeness unlikeness, and proportion in its subjects When it is purposed to define, in a classification of animals, their different degrees of resemblance, a natural system is aimed at When a classification is restricted to the enunciation of a few likenesses which may be most readily detected and most easily retained in the memory, it becomes an artificial system A likeness extends as far as a character is common, and the more extended or common the property or structure on which such character is founded the more important and essential it becomes as an element of the classification

Zoologists having ascertained as many of the characters common to all animals as served to form their complex idea of an animal, have, in the next place, endeavoured to discover the difference, which, added to the idea or definition of the animal would form the most extended species of that genus, logically speaking

Such a difference or character is not to be detected by a superficial examination Aristotle thought he had found [illegible] only the red-coloured [illegible] as in the arteries and veins of man His primary division of animals was therefore into [illegible] the *Enaima* and the *Anaima* The Enaima were the beasts, birds, reptiles, and fishes, and the Anaima, or bloodless animals, included all the lower species

Nothing, perhaps, can show more forcibly the nature and amount of observation required to frame a good classification, and the value of the information concentrated in its expression, than the great [illegible] branch of zoology, and the minute and extended researches required for the elimination of its erroneous element First, it was found that many of the Exsanguineous animals of Aristotle did actually possess blood, differing only in colour from that of the so called Sanguineous species This discovery however, led only to a non-[illegible] primary division of animals; [illegible] and the Anaima "white-blooded" animals. It was reserved for Cuvier, in the course of his minute dissections of the lower animals, to discover that an extensive class of worms had red blood circulating in a closed system of arteries and veins; and this discovery first materially affected the value of the character adopted by Aristotle for the primary groups of the animal kingdom.

Now, if scientific classification were really based on the idea of likeness alone, and the grouping together of individuals into kinds in forming a natural system were regulated by a consideration of their resemblances only, then the modification of the Aristotelian system involved in Cuvier's discovery would be merely an extension of the group Enaima at the expense of the group Anaima; and the Anellides, or red-blooded worms, must have been united with birds, fishes, and other Sanguineous animals But the zoologist, in the formation of a natural system, has to be governed at every step by the idea of difference as well as by that of likeness Coincident with the discovery above mentioned was the perception that if the Anellides resembled beasts in the colour of their blood, they differed from them in most other essential points, and thus the circulating fluid was rejected as a ground for the primary groups of the animal kingdom, and other characters were eagerly sought for

Lamarck conceived that he had discovered the best substitute for the Aristotelian primary character in the vertebral column, this structure being present in all the Enaima of Aristotle, and absent in all the Anaima He proposed, therefore, the name of *Vertebrata* for the one class, and *Invertebrata* for the other The defect of this primary division of the animal kingdom was soon perceived to arise from the neglect of a third fundamental idea in a classificatory science, viz that of proportion, or relative value, in the primary groups and in the attempt to remedy this defect the important discovery was made, that the vertebral column was a modification of structure subordinately related to a particular condition of an organic system of much higher importance in the animal body than the skeleton, viz the nervous system A knowledge of the anatomy of this system hence became essential to the zoologist, and the result of a long series of minute and elaborate dissections was the detection of at least three modifications of the nervous system of equal importance with that in regard to which a skull and vertebral column are dependent and subordinate Hence arose the proposition by Cuvier to divide the animal kingdom primarily into four provinces or subkingdoms viz *Vertebrata*, *Mollusca*, *Articulata*, and *Radiata*, or, as they have been termed, in accordance with the modifications of the nervous system respectively characterizing them, *Myelencephala*, *Heteroganglıata* *Homoganglıata*, and *Acrita*

All previous primary divisions of the animal kingdom*, having been proposed in ignorance of the true characters by which such groups exist in nature, are now abandoned by the common consent of naturalists, and nothing would be gained by quoting them in this place. Herein the Linnæan method is inferior to the Aristotelian system the class *Vermes* of the *Systema Naturæ*, as it included the *Ostracoderma* and *Malakia* of Aristotle, afterwards the *Mollusca* of Cuvier, with the true *Vermes*, was a retrograde step in this branch of zoological science

The subkingdom *Vertebrata*, or *Myelencephala*, is subdivided into classes according to the modifications of the respiratory and circulating organs These modifications are essentially four in number, which may be thus expressed —

1 Lungs suspended freely in a thoracic cavity, subdivided into minute air-cells Heart divided into four cavities [illegible] distinct

2 Lungs [illegible] cavity, communicating with large air-cells in other cavities of the body Heart with four cavities, pulmonic and systemic circulations distinct

3 Lungs suspended freely in or attached to the parietes of [illegible] not divided into minute air-cells Heart with four or three cavities, pulmonic and systemic blood mixed in the general circulation

4 Gills for respiration, with or without lungs Heart with two cavities, transmitting all the blood to the breathing organs

The first condition of the respiratory and circulating organs coexists with a viviparous generation, and lacteal organs for the nourishment of the new-born young, whence the class was termed *Zootoca* † by Aristotle, and *Mammalia* by Linnæus, and the latter term is retained, because it expresses a character which is truly peculiar to the class The total or partial clothing of hair, and the other organic coexistences which proclaim the natural [illegible] group in question, are mentioned under the term MAMMALIA

The [illegible] of the respiratory and circulating organs characterizes the class of Birds It is associated in this class with an oviparous generation, a covering of feathers, and those other modifications of the vertebrate type of structure which are detailed under the

* If we except some of the schemes of classification of the animal kingdom by John Hunter, found among his manuscripts after his death (See Preface to Palmer's edition of his *Animal Economy*.)

† The term *Zootoca* has been degraded by a modern naturalist to designate a subgenus of lizards, distinguished by their viviparous generation.

head of Aves. This is the most natural and circumscribed of all the groups of animals of [illegible] value. Both mammals and birds differ [illegible] classes of animals in being warm blooded, whence they have been combined to form a group called *Hematherma*.

The condition of the circulating and breathing organs [illegible] vertebrate animals, [illegible] old blood, and a covering of scales, bony plates, or a naked skin. The generation is oviparous or ovoviviparous; the other characters are given under the head Reptilia.

Fishes, besides breathing by gills, and having a heart composed of a single auricle and ventricle, have the skin defended by scales, or by bony plates, or are naked. They are likewise oviparous, or ovoviviparous, and, with a few exceptions, as the tunny, the temperature of their blood corresponds with that of the surrounding medium. They are exclusively aquatic, and their general characters and classification are given under the heads Pisces and Ichthyology.

The subkingdom *Mollusca* or *Heteroganglıata* is characterized by a ring of nervous matter surrounding the gullet, whence the nerves radiate, often unsymmetrically, to different parts of the body. There is a ganglion or little brain below the gullet, and sometimes also above that tube, the [illegible] with one or more [illegible]. The [illegible] body corresponds with [illegible] system, and is often unsymmetrical; it is generally soft, covered with a mucous skin, and destitute of jointed limbs. In one class (*Cephalopoda*), in which the supra-œsophageal nervous mass is large, it is protected by a cartilaginous cranium, but this is absent in other Mollusca, and a vertebral column exists in none. Many species have for their skeleton a calcareous plate or plates, called *shells*, secreted by the skin. (*See* Conchology.) The animal functions are feebly enjoyed in the *Heteroganglıata* subkingdom. Distinct organs of hearing and smell have as yet been found only in the highest class (*Cephalopoda*), the eyes are reduced to mere rudiments in the group next in subordination (*Gasteropoda*), and the head is altogether wanting in the three lower classes, thence collectively called *Acephala*. The machinery of the organic functions, on the other hand, is largely and completely developed. Every mollusk has a heart, and a closed system of arteries and veins; in the higher Cephalopods the [illegible] system is physiologically as perfect as in the highest Vertebrates, and the heart is anatomically more complicated. An organ of respiration is never wanting, but it presents this character, that whereas in the *Vertebrata* it communicates with the mouth, in the *Mollusca* it is connected with the opposite termination of the alimentary canal. The *Mollusca* are either Dioecious or Hermaphrodite.

The primary division of *Mollusca* is according to the presence or absence of a head, into the *Encephala* and *Acephala*.

The Encephalous Mollusks are divided according to their locomotive organs, into the classes *Cephalopoda*, *Gasteropoda*, and *Pteropoda*, the Acephalous Mollusks, according to their respiratory organs, into *Lamellibranchiata*, *Palliobranchiata*, and *Heterobranchiata*; the two latter classes are more commonly called *Brachiopoda* and *Tunicata*. See those names of classes, and Malacology.

The third primary division of the animal kingdom, viz. the *Articulata*, is as well characterized, Cuvier states as that of the *Vertebrata*. "The skeleton is not internal, as in the latter, neither is it annihilated as in the *Mollusca*. The articulated rings which encircle the body, and frequently the limbs supply the place of it, and as they are usually hard they furnish to the powers of motion all requisite points of support, so that we have here as many kinds of locomotion as among the *Vertebrata*. This external position of the hard parts and internal one of the muscles, reduce each articulation to the form of a sheath, and allow it but two kinds of motion, unless the limbs be united by flexible membranes, or fit into one another, and then their motions are more various, but have not the same force.

"The system of organs in which the *Articulata* resemble each other the most is that of the nerves. Their brain, which is placed above the œsophagus, and furnishes nerves to the parts adhering to the head, is very small. Two cords, which embrace the œsophagus, are extended along the abdomen, and united at certain distances by double knots or ganglia, whence arise the nerves of the body and limbs. Each of these ganglia seems to fulfil the functions of a brain to the surrounding parts, and to preserve their sensibility for a certain length of time when the animal has been divided. If to this we add that the jaws of these animals, when they have any, are always lateral, and move from without inwardly, and not from above downwards, and that no distinct organ of smell has hitherto been discovered in them, we shall have expressed all that can be said of them in general."

The existence, however, of the organs of hearing, the presence, number, and form of those of sight, the kind of respiration, the condition of the organs of circulation, and the colour of the blood, present great differences, which characterize the subdivisions or classes of the Articulate or Homogangliate subkingdom.

These classes are, *Crustacea*, *Arachnida*, *Insecta*, *Anellata* and *Cirripedia*. See those words.

The first three are combined by Latreille into a large group called (*Ondgitopoda* in reference to their possessing articulated members, but these are likewise possessed by the *Cirripedia* which, although placed by Cuvier in the Mollusceous subkingdom are proved by their nervous system and metamorphoses to be essentially *Articulata*, nearly allied to the Crustaceans.

The Radiated, or fourth primary division of animals in the system of Cuvier, is so called because the low-organized animals composing it agree, Cuvier says, in having their parts arranged [illegible] several radii, or on one or [illegible] the *Entozoa* have [illegible], or [illegible] nervous trunks proceeding from a collar round the [illegible] four suckers situated round a proboscidiform elevation. The nervous system, when [illegible] have been visible, is also arranged in [illegible]; however, be affirmed with propriety of the nerves of the *Entozoa* or *Rotifera*, but these classes agree with all the other *Radiata* (*Holothuria* excepted) in [illegible] tory organs. It has been [illegible] animals, or Zoophytes of Cuvier, into two subkingdoms the *Nematoneura*, presenting conspicuous nervous filaments, and the *Acrita*, in which such filaments are rarely distinguishable. The *Nematoneura* are more definitely and readily characterized by having the alimentary canal in the form of a distinct tube, with proper parietes, floating in an abdominal cavity, and provided with a separate inlet and outlet, while in the *Acrita* the digestive cavity is excavated in the parenchyma of the body, is devoid of distinct parietes, and has no anal outlet. The *Nematoneura* never propagate by germination or spontaneous fission, but these modes of reproduction are common in the *Acrita*. The latter division has been termed *Oozoa*, from their analogy to the ova or germs of the higher classes, but I have elsewhere observed* that as the changes of the embryo succeed each other with a rapidity proportionate to its proximity with the commencement of its development, so also, in each class of *Acrita*, there are genera which closely [illegible] merge into some one or other of the [illegible] neurous classes and their characters are consequently less definite and fixed. If, therefore, guided by their natural affinities we arrange the *Radiata* into their primary groups, it will be found that one part of each of these groups presents the characters of the *Nematoneura*, and another those of the *Acrita*. This will be exemplified in the disposition of the Radiated classes in the following table of the primary groups and classes of the animal kingdom.

Kingdom Animalia

[illegible] *ata*.

[illegible] Mammalia
Aves
Reptilia
Pisces

Subkingdom *Articulata*	Subkingdom *Mollusca*.
Class Crustacea	Class Cephalopoda
Arachnida	Gasteropoda
Insecta	Pteropoda
Anellata	Lamellibranchiata.
Cirripedia	Brachiopoda
	Tunicata.

Subkingdom Radiata

Nematoneura	*Acrita*.
Class Radiaria, Lamarck	
Echinoderma, Cuv	Acalepha, Cuv
Class Entozoa, Rudolphi	
Cœlelmintha, Owen	Sterelmintha, Owen
Class Polypi, Cuvier	
Ciliobrachiata, Farre.	Nudibrachiata†, Farre.
Class Infusoria, Cuvier	
Rotifera, Ehrenb	Polygastria, Ehrenb

ZOO'NOMY (Gr ζωον, and νομος.) The branch of science treating of the laws of animal life.

ZOO'PHAGANS. (Gr ζωον, and φαγω, *I devour*.) The term applied to the order of Unguiculate Mammals.

* *Cycl. of Anat. and Physiol.* art. "Acrita."

† This [illegible] again subdivided into the Tethyana and *Nudibra* [illegible], which lead to the doubtful class of *Spongia*.

which live on animal food, and corresponding to the French term (*carnassiers*; also the corresponding group of the Marsupial Quadrupeds.

ZOO'PHORUS (Gr ζωον, *an animal*, and φερω, *I bear*) In Architecture the same as FRIEZE, which see

ZOO'PHYTES, *Zoophyta* (Gr ζωον, and φυτον, *a plant*) The name given by Cuvier to his fourth and last primary division or sub-kingdom of animals By Linné it was applied in a more restricted sense to an order of *Vermes* comprehending those beings which he supposed to participate of the nature both of animal and plant Mr Hatchett's dissertation on these animals in the *Philosophical Transactions* for 1799 contains nearly all the chemical information which we have respecting them With respect to their structure they may be arranged into three classes 1 Those which consist almost entirely of carbonate of lime and gelatine They are perfectly soluble, with effervescence in muriatic acid, and the solution yields slight traces only of animal matter: when heated red hot they evolve but little smoke or odour, and leave quicklime Common white coral (*Madrepora virginea*) is an instance of this variety 2 Those which like the former, have carbonate as their [illegible] but which when steeped in muriatic acid [illegible] acted on, and leave membranous or cartilaginous films, and which, when heated, exhale smoke and the odour of burned bone, these therefore, consist of carbonate of [illegible] Such are the *Madrepora zanne* [illegible] *iscicularis* The *Isis hippuris* is a curious variety of this class, in which separate portions of var l are united by cartilaginous joints 3 This class includes the *Gorgonia nobilis*, or red coral the *Tubipora musica*, and some other varieties, the earthy part of which is not merely carbonate of lime, but contains a portion of phosphate of lime, whilst the animal part resembles class 2 4 This class includes the various sponges Some of these consist almost exclusively of what may be called animal matter, that is of a peculiarly organized albumen, with a trace of gelatine, others are hardened by abundant silliceous or calcareous spiculæ Mr Hatchett has pointed out the resemblance which exists among the three first classes to porcellaneous shell, mother-of-pearl shell, and [illegible] of the crab and lobsters

ZOOTOMY (Gr ζωον and τεμνω *I dissect*) The branch of anatomical science which relates to the structure of the lower animals. *See* ANATOMY, COMPARATIVE

ZOTHE'CA (Gr) In ancient Architecture, a small apartment or alcove, capable of being separated from or added to a larger one by means of curtains

ZYMIC ACID (Gr ζυμη, *leaven*) A compound [illegible] which [illegible]

ZYMOMETRY (Gr ζυμη, and μετρον, *a measure*) The [illegible]

ZYMOMETER or ZYMOSIMETER (Gr ζυμη, and μετρον, *a measure*) An instrument intended to show the degree to which fermentation has proceeded in different fermenting liquors *See* SACCHAROMETER

ZU'RLITE A name given to a recently discovered Vesuvian mineral

ZYGODA'CTYLES (Gr ζυγον *a yoke*, δακτυλος, *a finger*) The name given by M Temminck to an order of Climbing Birds, including those which have the toes arranged in pairs, two before and two behind, corresponding to the *Scansores* of Cuvier

ZYGÆ'NA (Gr Ζυγαινα the name of a fish in Aristotle) A genus of Cartilaginous fishes of the Squaloid or Shark tribe, remarkably characterized by the extreme breadth and flatness of the head, the sides of which extend outwards at right angles with and far beyond the body, just as the head of a hammer is placed on the handle the eyes are placed at the lateral margins of the head The term *Zygæna* has also been applied by [illegible] of *Lepidoptera*

ZYGOMA (Gr ζυγον *a yoke*, because it transmits the tendon of the temporal muscle like a yoke) The cavity under the *zygomatic* process of the temporal bone Hence also the term *zygomatic muscles*

ZYGOPHYLLA'CEÆ (Ζυγον, and φυλλον one of the genera) A natural order of arborescent, shrubby or herbaceous Exogens, inhabiting the hotter parts of the world Are nearly allied to *Oxalidaceæ*, from which they differ in many characters, with *Simarubaceæ* they accord in the stamens [illegible] from the back of an hypogynous scale, and [illegible] from *Rutaceæ* in the leaves being constantly opposite, with lateral or intermediate stipules and in being generally compound, and always destitute of pellucid dots The ligneous plants of this order are remarkable for their hardness Guaiacum or *Lignum Vitæ*, is one of them

SUPPLEMENT.

ABSINTHINE.

ABSI'NTHINE (Gr α, *priv*, ψινθος, *sweetness*) A peculiar bitter principle extracted from wormwood (*Artemisia Absinthium*)

ACE'TAL (Lat acetum, *vinegar*.) A colourless inflammable liquid, obtained by the action of spongy platinum upon the vapour of alcohol it is convertible by slow combustion into *acetic acid*

ACETO'METER (Lat acetum and Gr μετρον *measure*) An instrument in the form of an hydrometer, for determining the strength of vinegar and other forms of acetic acid It was invented by Messrs J and P Taylor, and is described in the *Quarterly Journal of Science and the Arts* vol vi.

ACE'TONE (Lat acetum) When acetate of lime, baryta, or lead, is subjected to dry distillation a limpid colourless liquid is obtained, to which the above name has been given it has a penetrating aromatic odour and is [illegible] its ultimate components are 3 atoms of carbon and 1 of oxygen

A'CETYLE The hypothetical radical of the acetic compounds it is composed of 4 atoms of carbon and 3 of hydrogen Its symbol therefore is $C_4 H_3$, and that of the acetic acid $C_4 H_3 O_3$

ACHILLEI'NE A peculiar bitter principle procured from the *Achillea millefolia*

ACHMITE (Gr αχμη *the point of a sword* Named from the pointed form of its crystals) A mineral found near Kongsberg in Norway It is a double silicate of soda and iron

ACIDI'METER. (Lat acidus, *acid*, Gr μετρον, *measure*) An instrument for determining the strength of an acid by its saturating power it usually consists of a glass tube graduated into 100 equal parts and containing an alkaline liquor of known strength the proportion of which requisite to saturate a given quantity of any acid is the equivalent of that acid *See* ALKALIMETER

A'CINI (Gr ακινος, *a grape*) A number of vesicles [illegible] usually round the ends or by the sides of the branches of the ducts of aggregated glands Each acinus seems to be formed by the fusion of the walls of several vesicles which combine to form one cavity lined or filled with secreting cells The various modes of grouping of the *acini* afford characters for the different aggregated or conglomerate glands

ACRO'LEINE (Gr ακρος, *extreme*, ελαιον, *oil*) An [illegible] destructive distillation of the [illegible] arise from the decomposition of glycerine inasmuch as it is not obtained [illegible]

ACTINOGRA'PHY (Gr ακτινη, γραφω, *I write*) An instrument for the purpose of registering the variations of chemical influence in the solar rays the intensity of which has been found to bear no direct relation to the quantity of light, but to vary at different periods of the day and year The instrument, as contrived by Mr Hunt, and described to the British Association, "consists of a fixed cylinder, on which is placed a prepared photographic paper This is covered by another metal cylinder which revolves once in twenty-four hours [illegible] there is a triangular opening [illegible] which the paper is exposed to the sunshine. As [illegible] which the smallest part of the opening [illegible] to be exposed is one hundred times less than the time during which it is exposed by the largest opening, different effects are produced on the paper, and consequently a register for

ACTINOMETER

every hour of the day may be numerically kept of the actinic radiation associated with light" — *British Association Reports* for 1845 and 1846

ACTINOMETER (Gr ακτινη, a sunbeam and μετρον *measure*) [illegible] for measuring the force of solar radiation It consists of a hollow cylinder of glass soldered at one end to a thermometer tube terminating at the upper end in a hollow ball drawn out to a point, and broken off so as to leave the end open The other end of the cylinder is closed by a silver, or silver-plated cap cemented on it, through which a screw, working in a collar of leather, passes into the interior of the cylinder and gives the means of increasing or diminishing the hollow capacity of the cylinder to a small extent at pleasure The cylinder is filled with a deep-blue fluid (the ammonio sulphate of copper), a graduated scale is applied to the stem, or thermometer tube, and the instrument is defended from currents of air by being enclosed in a case having the interiors of three of its sides blackened, and the fourth, or face, composed of a thick plate of glass

Before using the instrument for observation any air-bubbles in the cylinder must be carefully expelled This is easily effected by means of the screw and the ball at the top of the stem, which serves as a reservoir and contains a small portion of superfluous liquid When the ball and stem are both filled and no air bubble is left, the fluid is brought down to the zero of the scale by turning the screw

The general object is to determine the expansion of the liquid produced by the exposure of a given area of the cylinder to the direct rays of the sun during a given interval of time But as the expansion of the liquid depends, not only on the heating power of the sun, but also on the rapidity with which the heat received is radiated away and [illegible] exerting a thermometrical influence it is [illegible] to eliminate those influences For this purpose the observations are made with the instrument alternately exposed to and screened from the solar rays for intervals of one minute

On exposure to the sun, the liquid in the stem rises rapidly, and the difference of the readings of the scale at the beginning and end of the interval of exposure shows the combined effect of all the heating and cooling influences The instrument is then placed in the shade during an equal interval If during this second interval the liquid remains stationary, then it may be inferred that the rise in the first interval was due to the solar action alone If the liquid *falls* during the shade observation then it [illegible] opposed or counteracted [illegible] the number of division through which it [illegible] must be *added* to the number through which it rose in the interval of exposure, in order to have the measure of the solar action But if the liquid continues to rise during the shade observation, then it is plain that the action of the solar rays is assisted by other heating influences, and the number of divisions through which the liquid rises in the second interval must be *subtracted* from the number through which it rose during the first.

The observations are made in triplets that is to say, the instrument is held in the sun's rays one minute, then one minute in the shade, and again one minute in the sun, an interval of 20 or [illegible] seconds being interposed at each change for the purpose of noting the readings The difference of the readings at the beginning and end

of each minute interval is taken, and the difference in respect of the second interval is added to or subtracted from the mean of the two differences in respect of the first and third A complete actinometer observation, however, cannot consist of less than three sun observations and two shade observations intermediate, but the more there are taken the better

It will be readily seen that the results obtained, as above described, are only relative, some positive determination must therefore be had recourse to before the indications given by any two instruments are comparable This is a matter of much difficulty No doubt it is possible to determine for every instrument both the area of the section of the sunbeam which falls on the bulb and is effective in raising the temperature, a [illegible] capillary [illegible] or, which comes to the same thing, to determine the value of the parts of the scale in water [illegible] measure, but even this [illegible] so delicate an experiment, the slightest difference in the thickness or composition of the glass would produce discrepancies, and no two plates of glass are ever found to be precisely the same in respect of the proportion of calorific rays they stop or absorb Hence the only means of discovering the relation between the results given by two instruments is to make a series of experiments with both together, and under precisely the same circumstances Sir John Herschel proposes to adopt as the *actine*, or unit, that intensity of solar radiation which, at a vertical incidence, and supposing it to be wholly absorbed, would suffice to melt one-millionth part of a *metre* in thickness from the surface of a sheet of ice horizontally exposed to its action in one minute of mean solar time

In the Philosophical Transactions for 1842 Professor Forbes, of Edinburgh, has given an account of some interesting experiments with the Actinometer made by him on the Faulhorn (in Switzerland), for the purpose of ascertaining the difference of solar radiation at the bottom and top of the mountain, and thence the proportional quantity of calorific rays absorbed in passing through a stratum of the atmosphere of a given thickness This is one of the most useful purposes to which the instrument can be applied It may also be used for measuring the defalcation of heat in an eclipse of the sun

The Actinometer was first described in the *Edinburgh Journal of Science*, vol i for [illegible] For a full description of the instrument, and of the method of using it, see the *Report of the President and Council of the Royal Society on the Objects of scientific Inquiry in Physics and Meteorology* 1840)

AD'JUTAGE, or AJUTAGE (French) In Hydraulics the name given to a short tube or pipe applied to a vessel containing a liquid for the purpose of facilitating the discharge *See* HYDRAULICS in DICT

ADRIANO'PLE RED A [illegible] the red obtained from madder [illegible] *Turkey red*

AE'RIAL IMAGES In Optics, the name given to images of objects produced by reflection or refraction when they appear suspended in the air For example, a spectator standing before a concave mirror, at a somewhat greater distance from it than its radius of curvature, sees an inverted image of himself, hanging as it were between himself and the mirror For examples of aerial images produced by refraction, see FATA MORGANA, MIRAGE, in DICT

ÆS'CULINE A peculiar substance contained in the bark of the horse chestnut tree (*Æsculus hippocastanum*) it appears in the form of a white crystalline powder, and when dissolved in very minute quantities in water communicates a blue opalescence to it

Æ THIOGEN (Gr *αιθων brilliant* γιγνομαι, *I become*) A compound of nitrogen with boron, remarkable for the intense luminosity which it exhibits in the flame of the blowpipe

AETITES (Gr *αετος, an eagle*) A mineralogical term applied to globular masses of clay iron-stone The name is derived from its being supposed to form one of the component parts of an eagle's nest.

AFFERENT The term, in Anatomy, applied to those lymphatic vessels which enter the lymphatic glands, subdivide and form tortuous plexuses therein, whence other vessels proceed, converge, and unite into two or more efferent vessels which are larger than the afferent ones, and proceed towards the main trunk called "thoracic duct" The term *afferent* has also been applied to those nerves which convey impressions to the central axis, and which Hartley called "sensory" nerves, in contradistinction to the efferent or "motory" nerves

AG'GREGATED GLANDS Those secreting organs in which a number of compound vesicles or *acini* are arranged in groups, forming lobules (*See* CONGLOMERATE) Such are the so called mucous glands of the mouth trachea and vagina, the tonsils salivary, pancreatic and mammary glands, the lachrymal and Brunnian glands, Cowper's glands and prostate

AGMINATED GLANDS (Lat *agmen*) The glands of Peyer, in the small intestines, where they are aggregated in groups, are so called these groups are of various sizes, and [illegible]

ALCOHOL [illegible] table of the specific gravities of mixtures of alcohol and water

ALCOHO'LMETER An instrument by which the quantity of alcohol contained in wines and other spirituous liquors is determined by reference to their respective [illegible] at given pressures

ALCORNINE A crystallisable substance contained in the alcornoque bark of America

ALDEHYDE From *Al*(*cohol*) *dehydr*(*ogenatus*) A chemical term applied to a peculiar [illegible] obtained by distilling alcohol with oxide of manganese and sulphuric acid Alcohol is a compound of 4 atoms of carbon, 6 of hydrogen, and 2 of oxygen, whereas aldehyde consists of 4 of carbon, 4 of hydrogen, and 2 of oxygen

ALKARSINE A compound of carbon, hydrogen, oxygen, and arsenic, it was formerly called *Cadet's fuming liquor of arsenic* it is the *oxide of kakodyle* of modern chemistry *See* KAKODYLE

ALLANTOINE The substance originally termed *Allantoic acid* It has been produced artificially by the action of peroxide of lead on uric acid its formula is $C_4 H_6 O_3 N_2$

ALLO'PATHY (Gr *αλλος, different*, and *παθος, disease*) A term recently invented to describe the ordinary system of medical practice in opposition to *Homœopathy* which see

ALLOPHANIC ACID (Gr *αλλος, different*, and *φαινομαι, I appear*) An acid body discovered by Wohler and Liebig, and formed [illegible] acid into alcohol its chemical formula is $C_4 H_4 O_4 N_2$

ALLO'TROPY (Gr *αλλοτροπος (αλλος, different, τροπος manner*) A term used by Berzelius to designate the property belonging to certain substances of exhibiting variable characters at different temperatures especially as relates to *colour*, *texture*, *solubility*, &c thus sulphur is usually yellow and brittle, but if fused at a high temperature, and poured into water, it becomes brown and viscid. The characters of phosphorus may also be remarkably changed by temperature, though its nature, as well as that of sulphur, remains the same

ALLO'XAN One of the products of the action of nitric acid on uric acid it is a colourless crystalline substance, the aqueous solution of which tinges the cuticle purple its chemical formula is $C_8 H_4 O_{10} N_2$

AL'LYLE (Lat *allium, garlic*) A hydro-carbon ($C_6 H_5$) supposed to constitute the basis of the volatile oil of garlic

ALTE'RNATE GENERATION In Physiology, that modification of generation in which the young do not resemble the parent but the grand-parent; so that the successive series of individuals seem to represent two species alternately reproduced The *salpa* a floating gelatinous mollusc or animal is an example It may be found as a solitary individual, pregnant with numer-

ous minute salpæ, of a more simple structure, which continue after birth to be united together in the form of a long chain floating upon the sea In each individual of this chain there is generally developed an egg, from which is hatched a solitary salpa, of the form and organisation of the parent of [illegible] thus the species is represented by alternations of simple and aggregate salpæ *See* PARTHENOGENESIS

AMANI'TA MUSCA'RIA (*Fly Mushroom*) One of the most poisonous of the fungi of this country it renders water in which it is boiled so poisonous that animals are killed by it, whilst the boiled fungus itself is nearly harmless The liquid procured from it is used as a *fly-poison*, whence the name of the mushroom is derived It is known by its rich orange-red colour

AMI'DOGEN (The generator of *amides*) A compound of 1 atom of nitrogen and 2 atoms of hydrogen this compound has not been isolated, but may be traced in combination with other substances, constituting compounds called *amides* thus *potassiamide* is a compound of the metal potassium with amidogen, and, in reference to the same view, ammonia (which see) is an amide of hydrogen Amidogen is thus represented by the symbol NH [illegible] NH$_2$ + H, or NH$_3$

AMPHIO'XUS (Gr *αμφι*, *both*, and *οξυς sharp*) The name of a genus of fishes, so called because the animal is sharp at both ends It has not, in fact, any proper head brain, or heart, and is recognised as a vertebrate animal only by its gelatinous dorsal chord, which supports a medullary spinal chord or nervous axis and gives attachment to segmental partitions

AMPU'LLA (Lat) In Anatomy, that end of each of the three semicircular canals of the internal organ of hearing which is dilated than the other

AMY'GDALINE (Gr *αμυγδαλον an almond*) A crystalline principle contained in the bitter almond, which, under the influence of *emulsine* and water yields hydrocyanic acid, and the volatile oil of bitter almonds By the action of certain bases amygdaline yields ammonia [illegible] The composition of amygdaline is C$_{40}$ H$_{27}$ O$_{22}$

AMY'LE or AMYLENE (Gr *αμυλον starch*) This term implies in chemistry the hydrocarbon which is the basis of the so called *Amylic alcohol* or hydrated oxide of amyle Amyle contains 10 atoms of carbon [illegible] and is represented therefore, by [illegible] The volatile oil of potatoes or [illegible] Germans, includes this compound

ANACA'RDIC ACID An acrid fatty substance, found in the fruit of the *Anacardium occidentale*, or Cashew nut

A'NALOGUE (Gr *ανα* and *λογος method*) In Comparative Anatomy an organ which resembles another in its functional relations, as the wing of a bird is analogous to the wing of the flying lizard (*Draco volans*) and to the wing of an insect though it be not in its structure [illegible] organ of the body

ANAMO'RPHOSIS (Gr [illegible] In Natural History, expresses the change of form which may be traced throughout the species or higher members of a natural group of animals or plants either in the actual series, or as they have succeeded each other in the course of time on this planet, which change is usually ascensive, or indicative of a progression towards a higher series of species It has been conjectured that the succeeding or supplanting species may be actually the species supplanted but changed, [illegible] otherwise and commonly more highly developed, but of this there is no proof, and the term "anamorphosis" must be understood as expressive of an *ideal* change in contradistinction to the real or bodily change observed in the development of the individual, and which is called "metamorphosis"

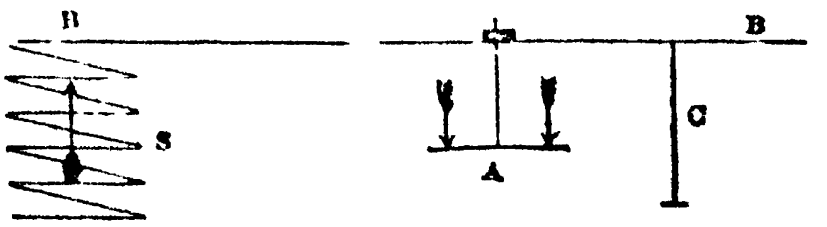
ANAPO'PHYSIS (Gr *ανα backward*, *αποφυσις a process*) That process of a vertebra which, arising in the dorsal region from above the diapophysis or transverse process, recedes to the side of the centrum, as the vertebræ approach the sacrum, and projects more or less backwards It usually supports and strengthens the joint of the anterior zygapophysis of the succeeding vertebra. It is well developed in the hare and most rodents

A'NATASE (Gr *αναταση*, *extension*) A mineralogical name of the *oxide of titanium*

ANCHU'SINE The colouring principle of alkanet root (*Anchusa tinctoria*)

ANEMO'METER Dr Lind's Anemometer, described in the DICTIONARY OF SCIENCE, gives the means of determining at any particular instant the force of the wind by its pressure against a column of water directly opposed to it For meterological purposes it is, however, very important that instruments should be *self-registering*, because the changes proposed to be measured often take place very suddenly, and may therefore escape notice altogether when observations are taken at intervals The anemometer now generally introduced into the principal observatories was contrived by Mr Osler of Birmingham, and registers the direction as well as the force of the wind at every successive instant It is described as follows in the *Report of the President and Council of the Royal Society on the Objects of Scientific Inquiry in Physics and Meteorology*, 1840

"In this instrument the direction of the wind is obtained by means of the vane attached to the rod, or rather tube, that carries it, and consequently causes the latter to move with itself At the lower extremity of this tube is a small pinion working in a rack, which slides backwards and forwards as the wind moves the vane, and to this rack a pencil is attached, which marks the direction of the wind on a paper ruled with the cardinal points, and so adjusted as to progress at the rate of one inch per hour by means of a clock, the force is at the same time ascertained by a plate one foot square, placed at right angles to the vane, supported by two light bars running on friction rollers, and communicating with three spiral springs in such a way that the plate cannot be affected by the wind's pressure without instantly acting on the springs, and communicating the quantum of its action by a wire passing down the centre of the tube, to another pencil below, which thus registers its degree of force"



Another self-registering anemometer, proposed by the Rev Dr Whewell, is described in the same Report "In it a small set of windmill vanes, something like the ventilators of windows, are presented to the wind by a common vane, in whatever direction it may blow The current, as it passes, sets these vanes in rapid motion, and a train of wheels and pinions reduces the motion, which is thence communicated to a pencil traversing vertically, and pressing against an upright cylinder, which forms the support of the instrument 1000 revolutions of the fly only cause the pencil to descend 1-20th of an inch The surface of the cylinder is covered with white paper and the pencil, as the vane wavers, keeps tracing a thick irregular line like the shadings on the coast of a map The middle of the line may be easily [illegible] while [illegible] of the wind, and the length of time during which it blows in each direction" This instrument consequently records both the direction and integral effect of the wind Being more complex in its construction than Osler's it is practically more liable to derangement It is, however, very useful in this respect that it gives indications of very light breezes when Osler's totally fails (See *Phillips's Report on Anemometry, British Association Reports for* 1846)

ANEMO'METRY The process of measuring and registering certain effects of the pressure of the wind *See* ANEMOMETER

ANEROID BAROMETER An instrument for indicating the variations of atmospheric pressure, recently [illegible] into use and said to be the invention of M Vidi of Paris for whom a patent was taken out in this country by M Fontainemoreau in 1844

In the ordinary barometer the pressure of the atmosphere is measured by the height of the column of mercury which it supports, in the aneroid the differences of pressure are measured by the effect produced on a metallic spring, no fluid being employed Hence the composition of the terms from the Greek *α*, *without*, *νηρος*, *watery* and *ειδος*, *form*

The instrument may be described as consisting of three essential parts first an air-tight box or vase formed of thin metallic plates so that the sides yield to the pressure and collapse when the air is withdrawn from the interior, secondly, a spiral spring resisting the compression of the sides of the box, and thirdly, a system of levers connected with the box and spring and giving motion to an index by which the amount of pressure is exhibited on a scale The arrangement is represented in the annexed diagram, in which A represents the vacuum-vase, B B the main lever C the fulcrum or support, and S the spring; the direction of the forces being indicated by the arrows If, at a certain pressure, the lever has the direction indicated in the figure, then, supposing an increase of pressure to take place, the upper side of the box will be pressed downwards, carrying the lever, with which it is shown to be in connexion, along with it, and consequently compressing the spring against which it acts The lever, it will be observed is of the second order and, as usually constructed [illegible] is to that of [illegible] six to one.

The box is of a circular form, about 2¾ inches in diameter, and [illegible] inch deep, partially exhausted of air and hermetically sealed It is composed of thin corrugated copper plates The spring is formed of steel wire, about 1-20th of an inch in thickness, and the helix or coil is about an inch in height, and 5-8ths of an inch in diameter A system of levers is employed to multiply the movement of the main lever, and to the ultimate lever is attached a piece of fine watch-chain pressing round a small roller, on the axis of which the index is placed, which exhibits the variations of pressure on a graduated dial The index is kept in its place and the chain in a state of tension, by means of a delicate spiral spring attached to the same axis The whole is placed within a cylindrical box, about five inches in diameter, and the general form of the instrument resembles that of a watch

The principal difficulty to be overcome, in the construction of the aneroid, is to eliminate the influence of changes of temperature, and the manner in which this is done, or, perhaps it should be said, *attempted* to be done is sufficiently ingenious It has been stated above that the air tight box is only partially exhausted of air, indeed, it would scarcely be possible to effect a perfect vacuum A small portion, however, is purposely allowed to remain, and elastic fluids as is well known, expand about 1-480th part of their volume by an increase of temperature equal to a degree of Fahrenheit's thermometer The range of temperature in our climate may be considered to be about 50 degrees, and consequently the expansion of unconfined air will vary to more than one-tenth of its volume But as the capacity of the vase remains sensibly the same (for the small increase arising from expansion of the metal of which the box is formed may be disregarded) the portion of air confined within it cannot vary in volume, its elastic force is therefore increased with the increase of temperature, and the action of this force being in opposition to the external pressure on the sides of the box, the effect on the lever is the same as would be produced by an increase of the elastic force of the spring But the effect of an increase of temperature on the spring itself is to diminish its elastic force Hence it is easy to see that, in order to effect a perfect compensation, the parts of the instrument must be so adjusted to each other that, upon an increase of temperature taking place the loss of elastic force sustained by the spring shall be just equal (allowing for the leverage) to that which is gained by the air confined within the vase, and the lever consequently remain in equilibrio It is manifest that a perfect adjustment must be attended with great practical difficulty if indeed it be possible

From comparisons that have been made, it appears that within a certain range of barometric pressure (and a variation corresponding to two or three inches of mercury is all that is necessary to provide against), the indications of the aneroid agree sufficiently well (for ordinary purposes) with those of the mercurial barometer, the greatest differences of reading through the ordinary range of the barometer and thermometer having been found, in the case of certain instruments, not to exceed six or seven hundredths of an inch It possesses great advantages in its small bulk, its portability and also its extreme sensibility which is such that the variation of pressure corresponding to the ascent or descent of a few feet is distinctly indicated On the other hand it is liable to move by jerks, the spring can hardly be expected to preserve the same elasticity for any considerable time, and it has been found that the zero point has been altered by a journey For philosophical purposes it can never supersede the mercurial barometer, but there are cases in which it may be used with great advantage for example, by sailors employed in the coast trade, or the fisheries, as it may be carried even in an open boat

Though the aneroid has been brought forward as a new invention, Mr Weld, in a communication to the Athenæum (December 30, 1848), has shown that the principle was developed so long ago as 1798 by M Conté, who describes an instrument similarly constructed, and resembling a watch in appearance, in the *Bulletin des Sciences Naturelles*, tom I No xiii p 106 (See *Dent on the Aneroid Barometer*, *Frodsham's Few Remarks upon the Construction and Principles of the Aneroid, &c.*, *Belville's Manual of the Barometer*, *Mechanics' Magazine* No 1347)

ANGLEMETER This name has been specially given to an instrument used by geologists for measuring the dip of strata, the angles of joint planes, &c (*British Association Reports* 1847)

ANHARMONIC RATIO In Geometry, if four points A, B C, D, be taken in a straight line in any order, the ratio which is compounded of the ratio of A B to B C and of C D to D A, or (A B B C) × (C D D A) has been styled by Chasles *anharmonic ratio* In the particular case in which this compounded ratio is one of equality, or 1 : 1, we have A B B C = A D : C D; and when this property holds the line A D is said to be *harmonically* divided in B and C The term *harmonical* applied in this sense, first occurs, we believe, in Lahire's Conic Sections The characteristic property of the anharmonic ratio is the following — If from any point out of the given straight line four straight lines *a*, *b*, *c*, *d*, be drawn through the four points respectively, and if sin (*a b*) denote the sine of the angle included between *a* and *b* (and so with the others), then the double or anharmonic ratio is equal to [sin (*a b*) sin (*b c*)] × (A B B C) × (C D D A) × [sin (*c d*) sin (*d a*)] These angles being entirely independent of the position of the straight line in which the four points A, B, C, D are taken, it follows that if any other straight line whatever be drawn to intersect the four straight lines *a*, *b*, *c*, *d* respectively in the points A′, B′, C′, D′, then the anharmonic ratio (A′ B′ B′ C′) × (C′ D′ D′ A′) will be the same as (A B B C) × (C D D A) From this general property some very remarkable relations of geometrical figures have been deduced (Steiner, *Systematische Entwickelung der Abhangigkeit geometrischer Gestalten von einander*, Berlin, 1832 (Chasles, *Aperçu Historique des Méthodes en Géométrie Mem. de l'Acad. de Bruxelles* 1837)

ANILINE (And the I. plant) A colourless oil-like liquid of a strong odour and hot aromatic flavour, remarkable for its tendency to form crystallisable compounds with the acids, so that it was originally termed *crystalline*, it is a product of the distillation of certain organic substances and among others it has been derived from *indigo* It is a compound of carbon, hydrogen, and nitrogen = $C_{12} H_7 N$

ANORTHOSCOPE (Gr ανορθος, and σκοπεω, *I view*) The name given by M Plateau, of Brussels, to an instrument invented by him, and intended to produce a peculiar kind of anamorphoses by means of two discs rotating rapidly one before the other, the hind one of which is transparent, and bears distorted figures while the front one is opaque, and pierced with a small number of narrow slits As in other toys of a similar kind, the *Phenakistoscope*, for example the effect depends on the persistence of impressions on the retina The instrument is described at length in the *London, Edinburgh, and Dublin Philosophical Magazine*, Third Series No 245 — June, 1850

ANTAGONISTICS In Anatomy, those muscles are so termed which are opposed to others in their action, as the extensors to the flexors, the pronators to the supinators, the abductors to the adductors, &c

ANTHELIA (Gr αντι *opposite*, ηλιος, *the sun*) Luminous coloured rings or glories observed under certain conditions round the shadow of the spectator's own head The conditions of the phenomenon are two, first, that the sun be near the horizon, and secondly, that the shadow be projected on a surface covered with dew drops as a field of grass or stubble or on a dense cloud or fog-bank, distant about 50 or 60 yards Generally the luminous appearance is very faint, and only one or two rings can be traced, but sometimes, in favourable circumstances, it is strikingly vivid and two or three small concentric circles appear, surrounded by a much larger one, of whitish light, the head of the observer's shadow being at the common centre Such brilliant Anthelia were observed by Bouguer and his companions on the clouds of the Andes (*Figure de la Terre*, p 43), and by Scoresby on the fog banks in the Arctic seas Scoresby gives the following dimensions of the rings as measured by him on one occasion radius of the first or innermost ring 2°, of the second 4° 45′, of the third 6° 30′, and of the outermost 38° 50′ The cause of interior rings is thus explained by Fraunhofer Light falling directly from the sun on the anterior side of an aqueous globule undergoes a refraction, and a portion of this refracted and consequently coloured light on falling on the interior surface of the opposite side of the globule is reflected back to the eye of the spectator The [illegible] is supposed to be formed by a double reflection, as in the case of the ordinary rainbow See HALOES in DICT

ANTIARINE The poisonous principle contained in the milky juice of the *Antiaris Toxicaria*, a large forest tree growing in Java. This poison acts upon the [illegible], slow, and paralyses the heart

ANTI-[illegible] A siphon, so inserted into casks or carboys as to admit air over the liquor contained in them, and to allow of its being poured out without agitation

ANTIPERISTALTIC (Gr αντι and περιστελλω, *I wrap up*) That movement of the intestinal tube which is retrograde or contrary to the proper course impressed upon the contents by the ordinary vermicular or peristaltic action

APIINE A gelatinous substance (distinguished by affording a blood-red colour with solution of sulphate of iron), obtained from parsley (*Apium petroselinum*)

APLANATIC LENS (Gr α, *without*; πλανη, *de-*

ration) In Optics a lens such that rays parallel to its axis, or rays diverging from a point in its axis, after passing through it and suffering refraction at its surfaces, converge to a single point, or the true focus In order, therefore, to be aplanatic, the lens must not only have the true geometrical figure necessary to destroy aberration, but must also be constructed of different media, so as correct the effects of the unequal refrangibility of the different rays, that is to say, it must be achromatic Neither of these conditions can be accurately fulfilled in practice, the object aimed at is [illegible] that with a given [illegible] shall be the least possible *See* ABERRATION ACHROMATISM, in DICT

APOPHY'LLITE (Gr απο and φυλλον, leaf from [illegible] In Mineralogy, a lamellar zeolite

APOTHEMI (Gr αποτιθημι, I deposit) A term applied by the old chemists to some of the varieties of *extractive matter*

A'QUA VITÆ (in Fr *Eau de vie*) The name [illegible]

AQUÆDUCTUS [illegible] to certain canals leading from the labyrinth or internal ear to the outside of its bony capsule or os petrosum one of these, which extends from the hinder part of the [illegible] the petrosal, is called [illegible] d canal leading from the cochlea to the jugular fossa of the petrosal is called "aquæductus cochleæ" the function of the "aqueducts" is unknown

A'QUEOUS HUMOUR A thin watery fluid holding in solution a small quantity of chloride of sodium and extractive matter, situated in a space behind the cornea of the eye ball, which is divided into an anterior and posterior chamber by a musculo-membranous partition called 'iris,' perforated by the aperture called "pupil" the chief use of the aqueous humour is to maintain the convexity of the cornea and support and [illegible] the movements of the iris

ARCH In Anatomy, a structure commonly composed of bone or other hard material disposed in a bow-like form, and constituting the chief part of the primary segment of the skeleton that which rests upon the body of the vertebra (projects backward in man), and spans across the neural axis or trunk of the nervous system, is called the "neural arch," that which is suspended in an inverted position (extends forward in man), and incloses [illegible] is called the [illegible] composing the head are called with their surrounding soft parts in the embryo "visceral arches" Curved portions of the great arterial and intestinal tubes are called 'arches,' as the 'arch of the aorta,' the arch of the colon"

A'RCHETYPE (Gr αρχη *beginning*, and τυπος, *a type*) In Anatomy, is that ideal original or fundamental pattern on which a natural group of animals or system of organs has been constructed, and to modifications of which the various forms of such animals or organs may be referred The archetypal figure has been most clearly recognised in the study of the modifications of the skeleton of the vertebrate animals

A'RCOGRAPH (Lat arcus *a bow*, γραφω, *I write*) A drawing instrument for describing arcs of circles, or other curves, without centres

ARDENT SPIRIT *See* ALCOHOL

A'REA (Lat.) In Embryology, certain definite spaces which successively arise in the germinal membrane are so called thus the opaque spot produced by an accumulation of cells and cell nuclei is called 'area germinativa,' or germinal area, the clear space which subsequently appears in its centre is called 'area pellucida,' and the outer part of this space where the blood-vessels are first formed, is called 'area vasculosa"

A'REOLAR TISSUE In Anatomy, a term synonymous with CELLULAR TISSUE which see

ARGAND LAMP The application of a circular wick to oil lamps so contrived as to allow of a current of air both inside and outside, was originally patented by a person of the name of Argand the contrivance constitutes an important epoch in the history of the improvement of lamps, by it the amount of light derivable from a given quantity of oil was enormously increased The same principle is also applied to gas burners *See* LAMP

A'RMATURE A piece of soft iron applied to a load- [illegible] poles of a horse-shoe magnet

ARNICINE A bitter principle contained in the flowers of the *Arnica montana*

A'RRAGONITE A peculiar variety of carbonate of lime originally found in Arragon in Spain it is harder than the common variety, and is prismatic instead of rhomboidal Some specimens contain about 3 per cent. [illegible]

ARTESIAN Numerous works of this kind have been executed of late years One of the most remarkable of them is that of Grenelle, a suburb at the south-west of Paris, where there was formerly a great scarcity of water The strata which were penetrated were, 1 the tertiary strata above the chalk, 2. chalk, 3 green sand and clay, 4 oolite or Jura limestone The sheet of water flows in a stratum of gravel under the limestone On account of th [illegible] the boring the work was attended with [illegible] and retarded by various accidents At length, in February, 1841, after eight years of exertion, the engineer (M Mulot) had the satisfaction of seeing the water he was in search of burst forth from a depth of about 600 English yards, and the jet yielded no less than 4,000,000 litres, or in round numbers 880,000 imperial gallons in the 24 hours The temperature is 81° of Fahrenheit, corresponding to an increase of 1° for each 20 4 yards of descent The bore is protected by a metal tube divided into four unequal lengths, and successively decreasing in diameter The dimensions are as follows — From the surface of the ground to the commencement of the first tube, 2 5 yards, length of first tube, 162 yards, of second tube, 227 yards, of third, 75 yards, of fourth, 124 yards, from extremity of last tube to bottom of bore, 7 5 yards, total, 598 yards The diameter of the first or highest tube is about a foot, and of the lowest about six inches, English The expense was about 12,000*l* sterling For a description of the boring apparatus and methods of [illegible] as usually followed in this country, see [illegible] *Dictionary of Arts, Manufactures, and Mines*, and for details respecting some Artesian wells in England, the *Reports of the British Association*

ASAFŒTIDA *See* ASSAFŒTIDA

A'SBOLINE (Gr ασβολη, *soot*) A resinous pitchy matter obtained from wood-soot

ASSOCIATION In Physiology, a name given to that combination of motions which arises from the voluntary impulse to one motion exciting other motions contrary to or independently of the will, as, for example, whenever the eye is voluntarily turned inwards the iris contracts these are termed associate or consensual movements

ASTATIC NEEDLE A term applied to the magnetic needle when it is [illegible] the action of the earth's magnetism, and has no longer the *statical* position in which it is in equilibrio with the influence of this force A needle is rendered astatic by placing the axis about which it is moveable in the direction in which terrestrial magnetism acts, because it cannot then receive any motion from this force, and will rest in any position The same effect will be accomplished by neutralising the action of the earth by means of an [illegible] (*Brewster's Treatise on Optics*)

ASTIGMATISM (Gr α without, στιγμα, *a mark*) In Optics the name given to a peculiar defect in the eye, which consists in its refracting the rays of light differently in different planes The defect may be detected by looking at a small pin-hole in a card, h [illegible] ky or any bright object, and moved [illegible] from the eye In the case of ordinary eyes the image of the hole remains circular at all distances, but to an eye having the peculiar defect in question the image of the hole, as the card is moved away from the eye, becomes elongated in a particular direction and at a certain distance passes into a straight line O [illegible] arther from the eye it becomes [illegible] perpendicular to the former and again at a certain distance (the second limit of distinct vision) it passes into a straight line This imperfection may be corrected by means of a cylindrical or spherico-cylindrical, lens, the distances of the card from the eye when the two focal lines are formed, giving the means of calculating the required curvature of the cylindrical surface (See *Transactions of the Cambridge Philosophical Society for* 1829, *Reports of the British Association for* 1849)

ASTRÆA One of the recently discovered small planets circulating between the orbits of Mars and Jupiter Astræa was discovered on the 8th of December, 1845, by Hencke of Driessen, in Prussia, who had for several years previously been engaged in astronomical observations directed to the discovery of such a body The announcement of his success excited great interest among astronomers, no other addition having been made to the planetary system since the discovery of Vesta by Olbers in 1807, but nine others belonging to the same group have since been added to the number Astræa appears as a small star of the ninth magnitude Its mean distance from the sun is 2 577 times that of the earth, and it completes its revolution in 1511 095 mean solar days Unlike the four others previously discovered in the same region, the inclination of its orbit was found to be only 5° 19′ 22 7″ which is less than the inclination of Mercury, and consequently the term *ultra-zodiacal* is no longer applicable to the whole group This distinction also belongs to three of the others since detected, viz Flora Iris, and Metis. Hebe, also

discovered by Heucke, has an inclination of nearly 15° *See* PLANET

ASTRO'METER (Gr *αστηρ*, *a star*; *μετρον*, *measure*), the name given by Sir John Herschel to an instrument invented and employed by him for comparing the intensities of light of the stars one with another by the intervention of the moon, or the planet Jupiter, or some other *natural* standard no invariable standard of artificial light having yet been discovered It is necessary that the intermediate standard of comparison be brighter than any of the stars to be compared, so as to allow [illegible] with them by a reduction of its light [illegible] and at the same time either invariable, or at least variable in such a manner that its changes can be calculated and reduced to numerical estimation Jupiter being brighter than any of the stars subject to no phases and variable in its light only by the variation of its distance from the sun, may be considered as best fulfilling all the conditions "The process" says Sir John, "consists in deflecting the light of the moon by total internal reflexion at the base of a prism, so as to emerge in a direction exactly coincident with that of the undeflected light of one of the stars to be compared It is then received upon a lens of short focus by which the image of the moon is formed, which viewed at a considerable distance by an observer placed in or near the axis of the lens will appear to him as a star This artificial star is then to be approached to or removed from the eye until its light is judged to be exactly equal to that of the real star which lying in nearly the same direction from the observer, will be seen side by side with the artificial one by the same eye, or with both eyes at once without the aid of a telescope in the ordinary mode of natural vision The distance of the eye from the focus of the lens being then measured the prism and lens are to be placed so as to form another similar artificial star in a direction nearly coincident with that of the other star under comparison, and another equalisation being made and distance measured it is obvious that the intensities of the lights of the two stars or at least their effects on the retina under the circumstances of comparison will be to each other in the inverse ratio of the distances so measured respectively" (*Results of Astronomical Observations*, &c, p 353, also *Outlines of Astronomy*, Art 783)

Sir John remarks that the use of a prism to deflect the light of a standard luminary by total reflexion at its base, is common to the astrometer described by him and an instrument which had been previously described by Steinheil in a paper printed in the Memoirs of the Gottingen Academy in 1836, though he had no knowledge of the existence of Steinheil's memoir until his return to Europe from the Cape (where he had used the astrometer) in 1838

It may be noticed that the name *Astrometer* was given by Bouguer to the Heliometer or object-glass micrometer It was also given by Jeaurat to an instrument for finding the rising and setting of the stars and their position, which he has described in the *Memoirs* of the Academy of Sciences of Paris An improved instrument for the same purpose is described in the *Edinburgh Encyclopædia* art SCIENCE

ASTRONOMY During the few years that have elapsed since the publication of the DICTIONARY, the progress of this science has been very remarkable A brief outline of the principal discoveries and improvements which have been made in it in the decade 1840—1850 is, therefore, necessary, in order to bring down its history to the present date

Among the recent discoveries in astronomy, the most prominent, and in certain respects the most remarkable ever made in the science, is that of the new planet, to which the name of Neptune has been given, beyond the orbit of Uranus In all previous instances of the discovery of a new planet, the discovery was accidental, in so far as the existence of the body was not foreknown, or even suspected, until its true nature became revealed by the observation of its relative motion In the present case, not only [illegible] et been made known through [illegible] but the precise spot which it occupied in the heavens had been indicated by the results of a profound theoretical investigation and the planet was immediately recognised in directing a telescope upon the spot so indicated The [illegible] able result were directed [illegible]

For several years it had been remarked that the motions of the planet Uranus were not in accordance with theory On comparing the observations with the tables of Bouvard, it appeared that the true longitudes of Uranus began to be in advance of the computed longitudes from about the year 1795, and more notably from 1821 the difference continuing gradually to increase till about 1832 when the excess attained its maximum After that year the difference began to diminish rapidly, and in 1830 the tabular and true longitudes agreed But the planet still continued to fall behind, as if hindered [illegible] irregularities; and in searching for a cause, the idea of disturbance from a more remote planet did not fail to present itself, and in fact afforded the only probable explanation of the phenomena It was no easy matter, however, to test this hypothesis, for unless the place of the supposed planet could be assigned within moderate limits, so as to direct the observations any attempt to find it must be undertaken at random, and insufficient to prove its non-existence as a visible object The problem, therefore, which presented itself for solution (and it had never before occurred in physical astronomy) was this Given the disturbances to find the orbit and the place in that orbit of the disturbing planet. By a singular coincidence, though not without example in the history of discovery, the problem was undertaken about the same time by two distinguished mathematicians, Mr Adams in England and M Leverrier in France, neither having the slightest knowledge of the other's attempt, and both arrived at a correct conclusion Mr Adams's results however, though communicated to two or three astronomers, were not published or generally known until some time after the actual discovery of the planet and as it [illegible] contribute in any way to that discovery Those of M Leverrier were given to the Academy of Sciences at Paris, and published in the *Comptes Rendus*, and by their means the planet was found by Dr Galle, of Berlin, on the very day on which his attention was directed to them, within less than a degree of its predicted place This memorable discovery took place on the 23rd of September, 1846, and was hailed by every astronomer of Europe as the most signal triumph of theory which had ever been achieved

Soon after the planet had been found and regularly observed, it was perceived that, notwithstanding the agreement between its actual and predicted position, the elements of its orbit differed very considerably from those which had been assigned by the two mathematicians In order to render the computations possible, it had been necessary to assume a certain mean distance of the hypothetical planet from the sun, and both M Leverrier and Mr Adams had assumed as a first approximation the law of Bode (*see* PLANET), which, though purely empirical, had a great probability in its favour, in consequence of its being observed to hold good in the case of the other planets According to this law, the mean distance of the planet from the sun should be double that of Uranus or 38 34 radii of the earth's orbit, in which case the periodic time would be 237 4 years M Leverrier had concluded the distance to be 36 15, and Mr Adams 37 25, radii of the terrestrial orbit, the former corresponding to a period of 217 4 years and the latter to one of 227 3 years On computing the real orbit from the observed motions of the planet, the mean distance was found to be only 30 036 radii, and the period 164 6 years, differing widely from both predictions, and still more from the law of Bode, which fails entirely in this single instance On considering all the circumstances of the case, the disagreement between the elements of the real and theoretical planet will not appear in any way remarkable, the latter, in fact, representing the perturbations which were to be accounted for with all the accuracy that could possibly be expected in such a research

Neptune is attended by at least one satellite, probably two, and is suspected to resemble Saturn, in having also a ring Its position in the ecliptic, since the date of its discovery, has been unfavourable to its being distinctly seen

The next most remarkable feature in the recent progress of astronomy is the discovery of six new planets belonging to the group which circulate between the orbits of Mars and Jupiter It has been stated, under the term PLANET, that the first of these small bodies, or asteroids, as they have been called was discovered by Piazzi, at Naples, on the first day of the present century; and the discovery was regarded with great interest by the astronomers of that time, more especially as it had been surmised that a planet probably existed whose orbit, lying between those of Mars [illegible] to [illegible] preserve the continuity of Bode's law [illegible], and the orbit of the new planet was found to be in conformity with that law The discovery of a second, in the following year, was entirely unexpected, but it led to a more careful observation of the small stars in and near the zodiac than had previously been attempted, in the hope of detecting others The result was the discovery of a third, in 1804, and of a fourth in 1807, but for nearly forty years the number was not increased About the end of 1845, however, a fifth, belonging to the same group, was discovered by M Hencke, of Driessen, in Prussia, and since that time ten more have been found, so that at the present time (January, 1852) no fewer than fifteen small bodies are known, all circulating at nearly the same mean distance from the sun and consequently

in nearly the same period of time. Their names, with those of their discoverers, and the dates of their respective discoveries, are as under —

Ceres,	discovered by Piazzi -	1801, Jan. 1
Pallas - -	Olbers -	1802, March 28
Juno - -	Harding -	1804, Sept 2.
Vesta - -	Olbers -	1807 March 29
Astræa - -	Hencke -	1845, Dec 8
Hebe - -	Hencke -	1847, July 1
Iris - -	Hind -	1847, August 13
Flora - -	Hind -	1847, Oct 18
Metis - -	Graham -	1848, April 25
Hygeia - -	De Gasparis	1849, April 12
Parthenope -	De Gasparis	1850, May 11
Victoria - -	Hind -	1850, Sept 13.
Egeria - -	De Gasparis	1850, Nov 2.
Irene - -	Hind -	1851, May 19
Eunomia - -	De Gasparis	1851, July 29.

In reference to the eleven recently discovered planets it is proper to remark, that although none of them was previously known to exist, their discovery was in every instance the result of a "careful and minute examination and mapping down of the smaller stars in and near the zodiac, undertaken with that express object" The singular circumstance of so many planets moving in orbits of nearly the same dimensions, and all so insignificant (in comparison of the other planets) in size, gives considerable probability to the hypothesis proposed by Olbers on the discovery of Pallas, that a large planet originally occupied that region of space, and was shattered into fragments by an internal convulsion But the hypothesis of Laplace, that they have their origin in a ring or zone of nebulous matter, thrown off from the sun's atmosphere in the gradual process of cooling, and broken up into small masses, no one being of sufficient magnitude to attract the others to its centre (as has happened in the case of all the other planets), will equally account for the phenomena. But whatever hypothesis may be formed respecting their origin the number of them already known makes it extremely probable that many more exist, though by reason of their excessive smallness they may long, or for ever, elude observation Those already known appear in the telescope as stars of the ninth or tenth magnitude, but such is their minuteness that it is impossible with [illegible] observation to measure their [illegible] thence to deduce their real dimensions with any degree of accuracy

Another recent discovery, affording evidence at the same time both of the excellence of the instrumental means now applied to astronomy and of the attention bestowed on the careful and accurate examination of the heavens, is that of an eighth satellite of Saturn, and it is not a little remarkable that the discovery was made both in England and America at the same time — even on the same day In England the body was first observed by Mr Lassell, of Liverpool with a two foot reflecting telescope, on the 18th of September, 1848, and taken for a faint star On the 19th it seemed to have changed its place, [illegible] of Saturn, and was accordingly suspected [illegible], and on the 21st when it was next observed its true nature was satisfactorily made out The same object was observed in America by Mr G P Bond at the Cambridge Observatory Massachusetts, on the 16th of September and then supposed to be a small star On the 18th it was again noticed, but still without suspicion of its nature On the 19th it was suspected to be in motion, and its position was therefore accurately determined On the 20th it could not be seen, but on the 21st it was proved by its relative motion to be an attendant of Saturn The new satellite is very faint and can only be seen in a powerful telescope Reckoning from the outermost satellite inwards towards the planet, it is the second in the order of distance

Cometary Astronomy has also been cultivated of late years with great assiduity, and in a manner which promises to lead to important results Formerly the computation of an orbit was a task which not many observers were competent to undertake At present the methods of performing such computations are far more generally known, and, indeed, no sooner does a comet make its appearance than elements of its orbit proceed from many quarters with a sort of rivalry The first approximate calculations are carefully corrected by means of subsequent observations till the path of the body is determined with great accuracy and in this manner the means are prepared of identifying it if it should make its appearance at any future time Only a small number have yet been satisfactorily proved to move in elliptic orbits, and consequently to return at definite intervals, by far the greater numbers move in orbits which cannot be distinguished from parabolas, and after passing their perihelia shoot off to indefinite distances and may possibly enter within the sphere of attraction of other systems. Their physical constitution still remains a profound mystery One of the most remarkable on record appeared in 1843 It was visible within four degrees of the sun and in full day No other comet has been known to approach so near to the sun At its perihelion its distance from the luminous surface of the sun was computed to be less than a seventh part of the sun's radius, and the whole segment of its orbit cut off by the plane of the ecliptic was passed through in the short space of two hours its actual velocity being then no less than 366 miles per second It has been supposed to be identical with a comet which appeared in 1668

[illegible] accession to our knowledge [illegible] through the publication of the results of Sir John F W Herschel's observations at the Cape of Good Hope This distinguished astronomer, after devoting some years to the examination and description of the nebulæ and double stars in the northern hemisphere, with the view of completing the work begun by his father Sir William Herschel (who may be regarded as the founder of this interesting branch of astronomy) conceived the idea of extending his survey to the southern hemisphere, in order to place on record a description of the principal nebulæ and double stars over the whole heavens as observed with the same telescope and by the same observer, whereby the astronomers of future time would be enabled to detect changes in their physical appearances or relative positions, should any such take place For this purpose he removed his Observatory to the Cape of Good Hope, where he passed four years (1834-1838) assiduously employed in carrying out the objects of his great undertaking, and after completing the still more laborious task of reducing his observations, the results were given to the world in 1847 Though the main purpose of his [illegible] of double stars, [illegible] accompanied with minute description and interesting remarks, the work also embraces a great variety of observations and disquisitions on other matters connected with astronomy, — the constitution of the galaxy, the Magellanic clouds, Halley's comet, the satellites of Saturn, the solar spots &c It is right to add, that this noble enterprise, which has conferred so much honour on his country, and been productive of so much benefit to astronomy, was undertaken and carried through by Sir John Herschel at his own private charges He held no public appointment, and received no public assistance, and for the means of rendering his labours available to astronomers by the publication of the results, he professes his obligations to the Duke of Northumberland

Among the circumstances which have most contributed to the general advance of astronomy in late years, one is the increased dimensions now given to telescopes, in consequence of which the objects of observation are not only greatly multiplied but the observations are made with far greater distinctness and precision Refracting object-glasses, of a foot or upwards in diameter, can now scarcely be considered as rare But greatly exceeding these in optical power is the reflecting telescope made and erected by the Earl of Rosse, at his lordship's seat, in Ireland The mirror of this gigantic instrument is six feet in diameter, and weighs about four tons For a short account of the ingenious contrivances and apparatus made use of for the casting, grinding polishing and placing in its position this enormous mass of metal, we must refer to article *Telescope*, in this Supplement, they are all due to Lord Rosse himself, and could only have been produced by the combined exercise of extraordinary ingenuity, patience, and mechanical skill Nor has the performance of the instrument disappointed the expectations which were formed of it Nebulæ which, in other telescopes, gave no indication of resolvability, are by this instrument resolved into stars, and in fact it already seems probable that it will be the means of upsetting the whole nebular theory The appearance of some of the nebulæ or clusters in this telescope is extremely remarkable Some are observed of a spiral form, perfectly regular, others exhibit streaks, sometimes straight, and sometimes curved and generally they give evidence of systematic arrangement Telescopes on the same principle have also been brought to great perfection by Mr Lassell and though of far inferior [illegible] to that of Lord Rosse, have already rendered good service in connexion with the discovery of a satellite of Neptune, of the eighth satellite of Saturn, and of Hyperion

Concurrently with the increase of optical powers, the art of observing, and the science of reducing the observations, have undergone corresponding improvements The probable errors are consequently now confined within much narrower limits, and the consequence is, that astronomers are enabled to recognise and measure minute changes in the places of stars which formerly eluded observation It is to this extreme practical accuracy that we are indebted for the present perfection of [illegible] astronomers look for the solution of many problems still beyond their reach, such

as the parallaxes and proper motions of the stars, and their systematic connexion with one another and with our own sun Already the point in the heavens towards which the sun, with all his planets, appears to be moving, has been indicated with considerable probability; and a German astronomer (Madler) has ventured to assign a star in the Pleiades as the centre about which not only the sun, but the whole stratum of stars among which it is placed, is revolving

The measurement of two additional arcs of the terrestrial meridian in India by Colonel Everest under the auspices of the East India Company is a work of the highest importance in an astronomical point of view to deserve notice in this rapid retrospect Under the term *Degree of Latitude*, in the *Dictionary*, a short reference has been made to the principal geodetical operations for determining the magnitude and form of our globe,—an element of great importance in physical astronomy, and by which the magnitudes of all the planets are estimated,—and among these operations some which had been effected in India occupied a prominent place With instruments of a much superior kind to any which had previously been used in that country, and with all the appliances of modern science, Colonel Everest has added two arcs of meridian to the former measurements, one of 6° 3′ 56″, and the other of 5° 23′ 37″, which, taken in connexion with Lambton's operations, gives a continuous meridianal arc of 21° 21′ 13 extending from Cape Comorin to the foot of the Himalayas The details of the measurement were published in 1847 It may also be noticed, that the trigonometrical measurement of the Brit[illegible] 7′ 55″, from Dunnose, in the Isle of Wight, to Burra in Shetland, is understood to be completed [illegible] as may be hoped, the details will shortly be given to the public For the purpose of verification, a new base was measured in 1849, on Salisbury Plain, with the same apparatus as was used in measuring the Irish base, and it may be presumed, that all the distances will be given in terms of this new measurement, the results being much more trustworthy than those which were obtained by the older methods. Another interesting operation of the same kind, extending to about 4½°, and including a repetition of Lacaille's arc, has been completed at the Cape of Good Hope, but the results are not yet published

Physical astronomy has now been carried to a state of such perfection that the disturbing forces resulting from the reciprocal attractions of the different planets on each other so completely represented by mathematical formulæ, that the improvements which remain to be made must consist chiefly in giving greater accuracy to the numerical coefficients, which depend on data furnished by observation For this purpose the most important work which has been executed in recent times is the reduction of the planetary and lunar observations made at Greenwich, from 1750 to 1830, under the superintendence of the Astronomer Royal, a work of immense labour and utility which puts the theoretical astronomer in possession of the results, in their most available shape for perfecting the elements of the solar system by means of the longest, and probably the most accurate series of continuous observations which the world can furnish

ATA'CAMITE The native muriate of copper of the desert of Atacama in South America

ATHAMA'NTINE A crystallisable substance contained in the root of the *Athamanta oreoselinum*

ATHA'NOR A term applied by the alchemists to a furnace so constructed as to supply itself with fuel

ATHERMANOUS (Gr *a priv* and θερμος *heat*) Transparent or translucent substances which resist the passage of radiant heat

ATMOSPHE'RIC TIDES Diurnal oscillations of the atmosphere produced by the attractions of the sun and moon, analogous to the tides of the ocean The attractions of the sun and moon tend continually to cause a variation in the figure of the atmosphere relatively to the meridian of any place and consequently to produce a change in the amount of barometric pressure, but the change is so small in comparison to those produced by many of the other causes which disturb the equilibrium of the atmosphere, that a long series of accurate observations is necessary to render it sensible, even within the tropics where the influence of solar and lunar attraction is greatest, and the other causes of atmospheric disturbance act with least effect In the *Philosophical Transactions* for 1847, Colonel Sabine gives an account of a series of observations of the barometer made at St Helena, *hourly*, during a period of three years, for the purpose of determining the moon's influence The result of the first year's observations, which were reduced at St Helena, showed an average excess of barometric pressure of [illegible] parts of an inch at the hour when the moon is on the meridian (above or below the pole), and an average defect of 00115 when six hours distant from the meridian, making together an average difference of 00255 in when the moon is on the meridian, and when 90° from it The observations of the other two years were reduced at Woolwich, under the superintendence of Colonel Sabine and the result was still more decided the average difference exceeding [illegible] in, or nearly four thousandths of an inch These differences are, no doubt exceedingly minute, but as the observations were made with great care, and on being broken up into periods of six months were still found to give consistent results, it may be reasonably presumed that they represent with considerable accuracy the amount of the lunar influence on the atmosphere The effect of the sun's attraction being not only much smaller than that of the moon, but also masked in the diurnal barometric oscillation by the much greater and variable influence of the solar heat, probably cannot be satisfactorily determined

ATOLL, or LAGOON ISLAND In Physical Geography the name given to a particular kind of coral [illegible] consists of a chaplet or ring of coral, [illegible] portion of the ocean in its centre [illegible] the part of the ring which rises above the surface of the sea is nearly a quarter of a mile, and it seldom rises higher than from six to ten or twelve feet above the surface On the outer side the ring gradually shelves down to the distance of 100 or 200 yards from its edge [illegible] to about 25 fathoms, beyond which [illegible] almost perpendicularly into the unfathomable depths of the ocean On the lagoon side where the water is calm the bounding ring or reef shelves into it by a succession of ledges, also of living coral, but of a different species from those which build the exterior wall and the foundation of the whole ring The size varies from two to ninety miles in diameter The lagoon islands are widely spread, but chiefly in the Pacific Ocean Most frequently they occur in elongated archipelagos extending in groups over a large surface, the Caroline Islands, for example, extend to 1000 miles Sometimes the lagoons have islands within them Otaheite, the largest of the Society group, is a remarkable instance of this formation The bay on which encompasses it is thirty fathoms deep, and hemmed in from the ocean by a coral band of the usual kind at a distance varying from half a mile to three miles (*Somerville's Physical Geography*)

AUGITE (Gr αυγη *splendor*) A crystalline mineral common in volcanic and basaltic rocks It is the *pyroxene* of Hauy

AURIC ACID (Lat aurum, *gold*) A term now frequently applied by chemists to the *peroxide of gold*

AURIPIGMENTUM (Lat) Yellow sulphuret of arsenic

AUROCYA'NIDES Compounds of the cyanide of gold with basic oxides The aurocyanide of potassium is used in the art of electro-gilding

AUTOMALITE (Gr αυτομαλος, *a deserter*) Named from the presence of zinc in a mineral not resembling a metallic ore) A crystalline mineral consisting chiefly of oxide of zinc and alumina It is the zinc-spinelle of some crystals

AUTOMATIC In Physiology, applied to those muscular actions which are not dependent on the will or other act of the mind such are the successive contractions of the hollow viscera of organic life, e g the heart, the intestines the ureters, urinary bladder, the uterus, the involuntary movements of respiration, the motions of the muscles of the eye during sleep, the persistent contraction of the sphincters

AVANTURINE (Deriv unknown) A beautifully iridescent variety of rock crystal

AXIS-CYLINDER In Anatomy, the name applied to the central substance of the primitive nerve-fibre

AZOLITMINE A dark red substance forming a great part of the colouring material of litmus Its chemical [illegible] is according to Kane, $C_{18}H_{10}O_8N$

AZOTISED PRINCIPLES (Gr α *without* and ζωη, *life*) In Anatomy the two chief classes of substances of animal bodies — viz the gelatinous and albuminous. In Chemistry, the term is chiefly applied to substances containing nitrogen, and used as aliments many of them are common to animals and vegetables

B.

BA'BLAH An astringent dye-stuff imported from the East Indies and from Senegal it has been used for dyeing drabs, as a substitute for more expensive materials It is the shell of the fruit of the *Mimosa cineraria*

BACK A reservoir or cistern The *liquor back* in a brewery is the water reservoir

BAGA'SSE (Fr) The sugar-cane in its dry crushed state, as used for fuel in the colonial sugar-houses

BALEI'N (Fr baleine) The term in common use among whale fishers for whalebone

BALSA (Spanish) A species of float or raft, chiefly used on the coasts of South America, for landing goods

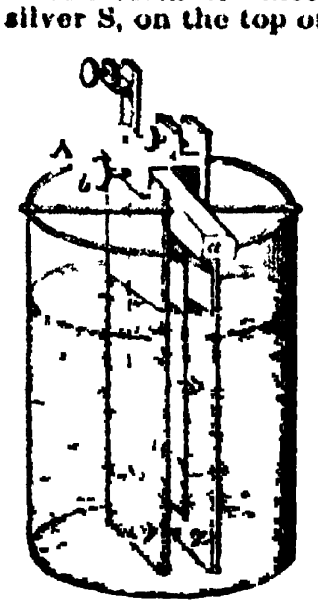
through a heavy surf. The balsa is formed of two seal skins sewed up so as to form two large bags, which are covered with pitch to render them perfectly air-tight, and secured by ligatures. The bags or bladders thus prepared are inflated with air passed through a flexible tube, which is left of sufficient length to reach the mouth of the conductor, who is thus enabled to replenish them with air, should any have escaped. The two bags are fastened together at one end, which forms the prow of the vessel, the opposite ends being kept about four feet apart by means of cross bars, and the raft is completed by a platform of canes, over with matting, having thus the shape of a wedge or triangle. It is propelled by a double-bladed paddle, and the conductor, standing on the shore, contrives to keep the bows of the balsa to the highest wave that it is thrown on the beach to the greatest extent the surf reaches, where it is immediately secured. The balsa will carry three passengers besides the person who conducts it, and by this means cargoes are landed from merchant vessels where the violence of the surf prevents ordinary boats from passing through it without great danger. Floats of a still ruder kind, usually formed of the hides of bullocks simply stretched on a frame, are used for crossing rivers in South America, and go by the name of balsa. (*Penny Magazine*, vol. iii. p. 150.)

BANDA'NNA. A style of calico-printing in which white spots are produced upon a red ground. The term is of Indian origin, and the art has been extensively adopted and improved upon in this country. (See a detailed account of Messrs. Monteith's manufactory at Glasgow, in Brande's *Quarterly Journal of Science and the Arts*, June, 1823, and in the *London Journal of Arts*, &c.)

BARBADOES NUTS. The fruit of the *Jatropha Curcas*, a native of South America and Asia. They are sometimes called *physic nuts*, and are virulently purgative.

BARBA'DOES TAR. Petroleum. A bituminous liquid of the consistence of tar; it oozes from the soil along with water, from which it is skimmed off and preserved in earthen jars. By distillation it yields *naphtha*. It is used in medicine as an internal remedy in certain chronic pulmonary affections, in obstinate diseases of the skin, and against tape-worm. As an external agent it is sometimes employed in ill-conditioned ulcers and to chilblains. These bituminous oils have been recommended in cholera; the dose is from 30 drops upwards.

BARM. The yeast which collects upon the surface of fermenting beer. The term is of Welsh origin.

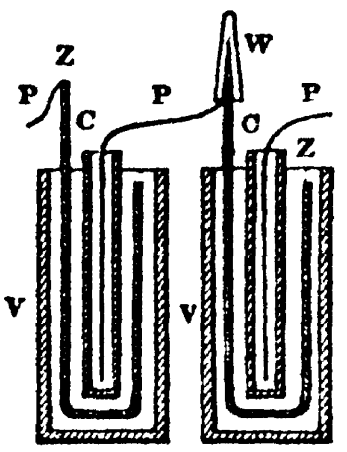


BAROSELENITE. A mineralogical name applied to *sulphate of baryta*, or heavy spar.

BASTARD SUGAR. *Bastards* is a term applied by the sugar refiners to an impure sugar chiefly produced by the action of heat and various substances used in the refining, and which cannot be remuneratively purified. They are also called *pieces*.

BATTERY, ELECTRICAL. A series of Leyden jars so arranged that they may all be discharged at once. *See* ELECTRICITY in DICT.

BATTERY, GALVANIC. Several forms of this apparatus have already been described (*see* VOLTAIC ELECTRICITY), many others have lately been invented, two of which, namely, SMEE'S BATTERY, and GROVE'S BATTERY, deserve particular notice. In Smee's battery, of which a detailed description will be found in his *Elements of Electro-metallurgy*, the positive or generating plates are composed of amalgamated zinc, and the negative plates of platinised silver, which, on account of its rough surface favours the escape of the hydrogen gas evolved upon it, the adhesion of which to platinum or silver in their ordinary state is a serious impediment to the action of the battery.



One form of Smee's battery "consists of a piece of silver S, on the top of which is fixed a beam of wood *w* to prevent contact with the silver. A binding screw is soldered on to the silver to connect it to any required object. A strip of zinc *Z*, varying, at the fancy of the operator, from one half to the entire width of the silver is placed on each side of the wood, and both are held in their place by a binding-screw *b*, sufficiently wide to embrace the zincs and wood. These batteries vary from the size of a tumbler to a ten or twelve gallon vessel."

1353

A single cell of this battery is represented in the annexed cut. A is an earthenware or glass vessel containing dilute sulphuric acid (composed of 1 part of oil of vitriol to 6 or 7 of water). *w* is a bar of wood to which the platinum, or platinised silver plate is attached. Z Z are two plates of amalgamated zinc, connected and secured to the bar by a binding screw; and a separate binding screw is soldered to the platinised plate, these are for the convenience of making connections by wires. When a series of these cells are required they are connected together in the usual way.

Grove's battery, called also *the nitric acid battery*, is an extremely valuable instrument both to the lecturer and experimentalist; it combines great power both of quantity and intensity, it is free from the inconveniences of local action, so far, a *constant battery*, it occupies little space, and is on the whole more economical than any other form of battery possessing the same [illegible] properties. The annexed sections of two cells of this battery are represented in the annexed cut.

The outer vessel V is a flat cell of glazed [illegible] within it is another shaped, but smaller and thinner cell C, of *porous* earthenware. A flat plate of amalgamated zinc Z is bent so as to receive the porous cell, a plate of thick platinum foil P being contained within the latter cell, and long enough to extend to the projecting end of the zinc plate of the [illegible]. The porous cell is charged with strong nitric acid, the outer porcelain cell is filled with a mixture of 1 part of oil of vitriol and 6 of water. The zinc being amalgamated, there is in this apparatus, as in Daniell's, no chemical action till the electrical current passes, and then the evolved hydrogen is suppressed by the nitric acid, which it converts by deoxydizement into nitrous acid. Twenty of these cells form a very powerful combination. Many years ago Mr. Cooper proposed to substitute coke for platinum in these batteries, and a similar plan has been more recently adopted by Bunsen, but so much inconvenience has attended the use of this material that it has not been generally adopted.

BE'BEARINE. A bitter basic principle contained in the bebeeru plant or *Greenheart* of British Guiana.

BEESTINGS, or *Colostrum*. The first milk yielded by the cow immediately upon the birth of the calf.

BELU'GA. The species of whale (*Delphinus leucas*, Pallas) which, from its colour, is commonly called by the whalers "white-fish." It is confined to northern latitudes.

BENGAL STRIPES. Cotton cloth woven with coloured stripes. Ginghams.

BENJAMIN. *See* BENZOIN, in DICT.

BENZO'LE. A compound of carbon and hydrogen, originally discovered by Faraday amongst the products of the destructive distillation of whale oil. The same compound was produced by Mitscherlich from *Benzoic acid*. It consists of 12 atoms of carbon, combined with 6 of hydrogen, its formula being $C_{12}H_6$. It has a peculiar aromatic odour; it boils at 176°, and concretes into a crystalline solid at 32°, a property which enables it to be separated from other hydrocarbons, which remain liquid at low temperatures. Benzole has lately acquired much interest from having been discovered by Mansfield (*Journal of the Chemical Society of London*) amongst the products of the distillation of coal tar; it promises to form a valuable article for the manufacture of varnishes, and as a source of light.

BERLIN BLUE. *See* PRUSSIAN BLUE.

BERM (Fr.) in Fortification, a narrow level space, two or three feet wide along the exterior slope of a parapet to prevent the mass of earth and other materials of which it is composed from falling into the ditch.

BERRIES OF AVIGNON (*Graines d'Avignon*). The fruit of the *Rhamnus infectorius*, generally known under the name of *Persian Berries*. They are grown in Provence, Languedoc, and Dauphiné, and another variety comes from Persia. They contain a peculiar principle which has been termed *Rhamnine*, and which acquires a [illegible]

BEZOA'R MINERAL. Peroxide of antimony. It [illegible]

[illegible] *pond*.) In Anatomy, when a part has two cusps, or pointed portions, as the bicuspid valve between the left auricle and ventricle.

BIO'LOGY (Gr. βιος, *life*, λογος, *discourse*.) A branch of statistics having for its object the determination of the average duration of human life from the comparison of recorded observations. The term MORTALITY, or *doctrine of* MORTALITY, is more generally applied to the same inquiry.

BITTER APPLE. The fruit of the *Cucumis colocynthis*

BLACK ASH Impure carbonate of soda.

BLACK DROP A preparation of opium, known also under the name of *Lancaster*, or *Quakers' black drops* It is said to be a solution of opium in verjuice

BLAS A term applied by Van Helmont to certain supposed emanations of the heavenly bodies

BLISTERED STEEL *See* STEEL

BLOCK MACHINERY A system or assemblage of machines for manufacturing the shells and sheaves of blocks required for ship tackle The term is specially applied to the ingenious machinery designed by M I Brunel and set up in the dockyard at Portsmouth between 1802 and 1808, and also at Chatham about 1807, for the supply of the royal navy By these machines every operation connected with the construction of blocks, from the cutting up of the timber to the polishing of the iron pinion which the sheave turns, is performed with astonishing celerity and precision, and when it is known that a single ship of war of 74 guns requires about 1430 blocks for her equipment, the advantage and even the necessity of abridging the labour of construction [illegible] be understood Although [illegible] without entering into [illegible] workings to give an idea of [illegible] the principal operations may be easily indicated In the first place the rough timber (which is generally elm) is squared by an upright saw, it is then cross cut into pieces of the proper length by a circular saw These pieces are then brought under the *boring machine*, when one centre bit bores a hole for the centre pin of the sheave, and another bores another hole at right angles to the former at one extremity of the mortise (or two or more such holes are bored when the block is to hold two or more sheaves) to admit the first stroke of the chisel The next operation is performed by the *mortising machine*, which consists of a set of [illegible] to a moveable frame, and makes [illegible] dicular strokes in a minute, the block being placed on a carriage which at every ascent of the chisels advances forward a little until the proper length has been mortised out The block is then removed from the mortising machine and the four corners are taken off by a circular saw, after which it is placed under the *shaping machine* when by tens at a time the proper curvature is given by means of a tool moving in a direction curved towards the line of the axis In the *scoring machine* scoops out a groove round the larger end of the block to receive the hempen or iron strap which goes round the block and by which it is suspended when in use and the *shell* is thus completed The *sheaves* of the block are made of lignum vitæ a log of which wood is first cut into plates of the proper thickness by a circular saw The plates are then carried to the *crown saw* which at once bores the centre hole through which the pin is to pass, and gives an exact circular form They are next brought to the *coaking machine* for the purpose of having grooves cut in them on both sides for the insertion of the *coak* or bush which is of gun metal and of a peculiar shape (to prevent them from turning in the sheaves) the section being bounded by three semicircles, the diameters of which form the sides of an equilateral triangle This part of the machinery is exceedingly curious, and so accurately is the operation performed that the coaks are fixed in the sheaves by the tap of a hammer The two coaks (one on each side of the sheave) are secured by copper rivets passing through them and the sheave—an operation also performed by the machine The sheave is then completed by turning a groove round its periphery for the rope to run in, and by smoothing its sides, both operations being performed on the same lathe The iron pin only now remains, and this is also turned and polished by engines for the purpose The whole of the machinery is put in motion by straps passing over drumheads, and is driven by a single steam engine It is found that by means of this machinery ten men can with ease finish in one year from 130 000 to 140,000 blocks of different sizes

BLOWING MACHINES Instruments for producing a current or blast of air, chiefly for the purpose of exciting the combustion of fuel, and producing a great heat. The common bellows is an instrument of this kind but for certain processes of metallurgy as in smelting and refining ores, the intermittent blast produced by the single bellows is prejudicial and even in the double form of the machine, as used generally by blacksmiths, the defect is not altogether remedied Various contrivances have been had recourse to for the purpose of producing a continuous and equable blast, though depending generally on the principle of forcing air into large cylinders or air-chests, by means of a force air-pump, and allowing it to escape by eduction pipes under a regulated pressure For the regulation of the pressure the air may be forced into a vessel inverted in a reservoir of water, but as the air is chilled by its contact with the water, the water regulator is found to be objectionable for large blast furnaces, and a weight is employed Machines on this principle, frequently on a large scale, are in use at every foundry and great engine manufactory; and they have this advantage, that a number of forges may be supplied from the same air-chest (See Ure's *Dictionary of Arts, Manufactures, and Mines* Art *Metallurgy*)

BLUE PILL The *pilula hydrargyri* of the Pharmacopœia It consists of mercury triturated with conserve of roses and the powder of liquorice root till the globules disappear, and a homogeneous bluish grey pill-mass is obtained it contains one-third of its weight of mercury

BLUE STONE *Blue vitriol* Sulphate of copper

BOCCIUS LIGHT A form of gas-burner invented by Boccius, in which two concentric metal cylinders are so placed over the flame as to modify the combustion and increase the proportion of light

BOLOGNA PHIALS Small flasks or phials of unannealed glass which fly into pieces when their surface is scratched by a hard body as by dropping into them a fragment of flint, whereas a bullet may be dropped into them without injury

BONE BLACK The black carbonaceous substance obtained by heating bones to redness in a retort or other close vessel When deprived by the action of hydrochloric acid of the phosphate of lime with which it is blended, it yields one of the most valuable forms of *animal charcoal* and is highly prized by chemists as a decolorising and decolorising material

BORNEO CAMPHOR The camphor of the *Dryobalanops aromatica*, or camphor tree of Sumatra

BOUGIE (French) A slender flexible tube, intended for introduction into the urethra, œsophagus, or rectum when those passages are obstructed by stricture or other disease

BOULDERS In geology, detached masses or fragments of rocks detached from their native locality, and scattered about upon the actual surface of the earth. They are also called erratics and greyheads"

BOXINGS A term applied by millers to an inferior or second flour

BOYLE'S FUMING LIQUOR This term was applied to the *hydrosulphuret of ammonia*, originally obtained by distilling a mixture of sulphur sal ammoniac, and quick lime When recently prepared it exhales dense fumes on exposure to air

BOYLE'S REFLUX A piece of chemical apparatus contrived by Boyle, resembling a flattened flask with a very long neck It was principally used for the preparation of oxide of mercury (*precipitatum per se*)

BRAZING The soldering of metals with an alloy of brass and zinc, to which small portions of tin are occasionally added

BREAST-WHEEL In hydraulics the name given to a water-wheel so placed as to be struck by the stream of water nearly on a level with the axle, the lower quadrant of the circumference on the side opposed to the stream being placed in a *race* or channel concentric with the wheel, through which the water is conducted in its descent from the higher to the lower level, and in falling on the float boards within the channel acts both by its momentum and weight

BRIGHT'S DISEASE A morbid condition of the kidney, occasioning the secretion of urine loaded with albumen the disease has hence been termed *Albuminuria* it was originally described by Dr Richard Bright

BRITANNIA METAL An alloy of tin with a little copper and antimony, used for tea pots and similar purposes

BRONZE POWDER Copper or brass reduced to the state of a fine powder

BRONZING LIQUID A solution containing chloride of antimony and sulphate of copper, used for bronzing iron gun-barrels Brass is sometimes bronzed by washing it over with a solution of chloride of platinum

BRUNNER'S GLANDS These glands, so called after their discoverer, are minutely lobulated bodies, situated beneath the mucous membrane in the submucous tissue of the duodenum they are provided with permanent gland-ducts, which pass through the mucous membrane and open on the internal surface of that intestine They resemble the pancreas in intimate structure

BRYOZOA (Gr βρυον, *moss*, ζωον, *animal*) An order of compound polypes, including the *Flustra* or sea mat which [illegible] bodies like moss The organisation [illegible] polypes resembles that of the Ascidia[illegible]

BUDE LIGHT This term has been applied to various forms of oil and gas burners contrived by Mr Gurney, of Bude in Cornwall The original proposal was to maintain the combustion by means of a supply of

oxygen gas to the burner, by which, with oil, or naphthalised gas, an intense [illegible] an inconvenience and [illegible] with its economical adoption Large gas burners with variously formed reflectors and refractors have since been erected in different parts of London under the name of *Bude Lights*, but they have nothing in common with the original proposal

BUFF LEATHER A leather prepared by imbuing the prepared skin with an aluminous compound, and afterwards some oily matter such as yolk of egg

BUFFERS Elastic cushions attached to railway carriages for the purpose of breaking the shock when one carriage is pushed against another They are usually formed of horsehair covered with leather, but may consist of strong iron springs or of vulcanised caoutchouc

BUFFY-COAT When the coagulation of blood is retarded so as to allow the red particles to sink, and the [illegible] towards the surface, the [illegible] coagulates without the red [illegible] e ones, and forms a light-[illegible] white corpuscles resting upon the main body of the coagulum which has included the red corpuscles, and constitutes what is called the "buffy-coat" It is indicative of inflammatory disease, during which the coagulation of the blood is retarded beyond the ordinary time

BULBUS ARTERIOSUS In Embryology, the third cavity developed upon the primitive arterial trunk, the first being the auricle the second the ventricle The trunks of the aorta and pulmonary artery are developed out of the bulbus arteriosus in the warm-blooded vertebrata In Comparative Anatomy the muscular basis of the branchial artery in fishes is so called which may be regarded as a retention of the embryonic structure by arrested development

BULBULO A glass flask or mattrass of flattened ovoid shape, in which camphor is sublimed

BURSÆ MUCOSÆ In Anatomy, synovial serous sacs, either subcutaneous or situated beneath tendons that glide over bones

BUTY'RIC ACID One of the fatty acids contained in butter it is also formed in certain cases in which sugar undergoes fermentation in contact with curd, and hence termed *butyric fermentation* This acid is a volatile, colourless and very mobile liquid of a pungent sour odour, resembling that of a mixture of acetic acid and rancid butter, its taste is first pungent and sour then sweetish and ethereal The chemical formula of this acid is $C_8 H_7 O_3 + HO$, that is the anhydrous butyric acid consists of 8 atoms of carbon, 7 of hydrogen, and 3 of oxygen, which in the ordinary acid are combined with an atom of water in the *butyrates* this atom of water is replaced by an atom of base

C.

CA'CODYLE *See* KAKODYLE

CACO'THELINE A substance formed by the action of nitric acid upon brucia

CALO'RIFA'CIENT (Lat calor, *heat*, facio, *I make*) [illegible] to those non azotised [illegible] of fat starch, sugar gum, which are believed to be employed in the production of heat

CA'LOTYPE, or KALOTYPE (Gr καλος, and τυπος) A term applied [illegible] tained by the action of [illegible] *See* PHOTOGRAPHY

CA'LYX In Anatomy is applied to that branch of the pelvis of the kidney which receives the apex of the cone or bundle of the uriniferous tubules in man there are several "calyces" in the kidney

CAM or CAMB In Machinery a contrivance for converting a uniform rotatory motion into a varied [illegible] The end of a rod which is free to [illegible] of its length is held in contact, by the action of a spring, or weight, with the edge of an irregularly shaped mass which revolves uniformly upon an axis A varied motion is thus communicated to the rod, which carries with it the machinery by which the motion is to be applied This contrivance is much used in the machinery for lace-making *See* ROSE ENGINE in DICT

CAM WOOD The wood of *Baphia nitida* the tree which yields it grows in Sierra Leone and the interior of Africa It is used in dyeing instead of Brasil wood, and gives a finer and more durable red

CANNA STARCH The fecula of the *Canna coccinea* and [illegible] of *Tous les mois* It is imported from St Kitts, and is a good substitute for arrow-root Its granules are comparatively large, and [illegible] object

CA'PRIC ACID One of the volatile acids of butter obtained by saponifying it with soda, adding excess of sulphuric acid, and distilling it passes over mixed with butyric acid and with two other acids namely, the *caproic* and the *caprylic* acid Capric acid has a mixed odour of acetic acid and the smell of a goat The odour of caproic acid is less goaty and that of caprylic acid strongly resembles perspiration. A curious relation exists between the formulæ of these several acids, the carbon and hydrogen successively increasing by the addition of 4 equivalents, as shown in the following table —

Butyric acid - -	$C_8 H_7 O_3, HO$
Caproic - - -	$C_{12} H_{11} O_3, HO$
Caprylic - - -	$C_{16} H_{15} O_3, HO$
Capric - - -	$C_{20} H_{19} O_3, HO$

CA'PSICINE An acrid soft resin found in the fruit or seed pods of the *Capsicum annuum*, it appears to be the acrid principle of Cayenne pepper

CAPSULAR LIGAMENTS Those ligaments which surround moveable articulations, and retain the synovia as in a bag

CAPSULE (Dimin. of *Capsa*, a box or case) In Anatomy, a membranous sac investing an organ, as the capsule of the liver, the spleen, &c those flask-shaped sacculi from which the uriniferous tubes commence are called "capsules of Malpighi" they surround the capillary glomerules or plexuses, called "corpuscles of Malpighi"

CARAGHE'EN MOSS The *Chondrus crispus*, called also Irish moss It is very common on rocks and stones on the sea coast it appears to contain a peculiar mucilage, which has been called *Carageenine* It is a popular remedy for pulmonary complaints, and is sometimes used in soups and jellies

CA'RAITES A sect among the Jews who adhere closely to the text and letter of the Scriptures, rejecting the rabbinical interpretations and the Cabbala

CA'RAMEL *See* CARAMEL

CA'RAPACE The upper shield or plate of the armour or shell of the tortoise and crab

CA'RBAMIDE A compound of carbonic oxide and amidogen, contained according to Regnault, in chlorocarbonate of ammonia its chemical formula is $CO\ NH_2$

CARBO'LIC ACID A substance obtained by the distillation of coal tar it crystallises in prismatic needles which fuse at 95° and boil at 270° it has a penetrating odour and burning taste, and in many respects resembles kreasote its specific gravity is 1 06 It appears to be identical with the substance called [illegible] Its formula is $C_{12} H_5 O, HO$

CARINTHINE In Mineralogy, a sub-species of *Augite* from Carinthia

CARMI'NIC ACID This, according to De la Rue, is the [illegible] of *cochineal* Its formula is [illegible] W[illegible] in powder it is of a brilliant crimson It [illegible] the substance described by Pelletier and [illegible] under the names *Coccinelline* and *Carmeine*

CAROLI'TIC COLUMNS Architecture Columns with foliated shafts

CA'ROTINE A deep red crystallisable substance contained in carrots

CARPO'LOGY (Gr καρπος *fruit*, and λογος, *discourse*) That branch of botany which treats of the structure of fruits

CARPUS In Anatomy the segment of the skeleton of the upper or fore [illegible] to the wrist it [illegible] bones in the human subject

CARTHAMINE The colouring matter of the *safflower*

CA'RYOPHY'LLINE (Gr καρυα, *a walnut tree*, and φυλλον, *a leaf*) A crystalline substance (called also *Clove camphor*) deposited by a strong alcoholic tincture of *Cloves* In composition it resembles common camphor $C_{10} H_8 O$

CA'SCALHO The name given to the alluvial deposit in which the diamond is found in Brazil

CASE HARDENING The superficial conversion of iron into steel

CA'SEINE *See* CASEUM

CASKET A small rope used to fasten the sail to the rope in furling

CASSEL YELLOW A compound of oxide and chloride of lead it is also known in commerce under the name of *patent yellow* and *Turner's yellow*

CA'STOR OIL The expressed oil of the seed of the *Ricinus communis*, or *Palma Christi* It is a mild aperient

CATALYSIS (Gr κατα, and λυω, *I dissolve*) That process in which a substance excites by its mere presence (and without itself undergoing change) some che[illegible]

CATECHU'IC ACID [illegible] of [illegible] which [illegible] Plain cutz contained in *Catechu*. Its formula is [illegible] It has also been termed *Catechine* and *Tanningenic acid*.

CAT SILVER A species of mica.

CAUDA EQUINA (Lat) In Anatomy, the roots of the terminal spinal nerves which are contained in the neural canal of the vertebræ, and surround the "filum terminale" of the myelon

CAU'DATE (Lat cauda, *a tail*) In *Anatomy*, when the apex of a pyramidal part or [illegible] a long slender point certain [illegible] in ganglia are termed especially "caudate" nerve-corpuscles. In *Zoology*, an animal provided with a tail

CAUK or CAWK The term applied by miners to massive sulphate of baryta or heavy spar

CAUSALITY A miner's term for the light parts of ore [illegible] by washing

CAUZ'ANITE A crystallised mineral found at Cauzeran in the Pyrenees, of a black or dark blue colour It is a silicate of lime and alumina, with potassa and soda

CAVA VENA *See* VENA CAVA

CA'VENDISH EXPERIMENT An important mechanical experiment for the purpose of ascertaining the mean density of the earth, the method employed being a comparison of the force of terrestrial attraction with that of the attraction of leaden masses of known magnitude and density, determined by means of the balance of torsion

The idea of rendering sensible and measuring the attractive force of a dense body upon another body in its immediate vicinity by means of the torsion balance, appears to have been suggested by the Rev John Michell, but the experiment was first actually made by the celebrated Henry Cavendish, whose report is published in the *Philosophical Transactions* for 1798 It was subsequently repeated by Reich, Professor of Physics at Freiberg in Saxony, who published his results in 1838, and again by the late Francis Baily with far greater precision, and by a far more varied and extensive series of observations, the details of which are given in a paper of great value published in the *Memoirs of the Royal Astronomical Society*, vol xiv 1843

In the mode of proceeding adopted by Cavendish, and followed by Baily, the data for determining the earth's mean density were obtained [illegible] — A slender deal rod of six feet in length, having a leaden ball of about two inches in diameter attached to each of its ends, is suspended horizontally from a beam by a fine metallic wire, about 40 inches in length This forms the torsion balance Immediately under the balance is placed a strong horizontal plank about 8 feet in length supported by and turning upon an axle the central line of which is in the same vertical with the suspension wire On this plank, near its extremities are placed two equal spheres of lead (12 inches in diameter, and each weighing about 3801bs), cast with great care, in order that the density may be uniform throughout the mass, and accurately turned The apparatus is so arranged that the centres of the two balls at the extremities of the arm of the torsion balance, and the centres of the two leaden spheres, or *masses*, are in the same horizontal plane, and equally distant from the vertical axis of motion Suppose now the torsion balance to be at rest in a certain direction, and the plank which supports the masses to be at right angles to the direction of the balance, in this position the attraction of the two masses will have no tendency to give motion to the balance But let the beam be turned round till the two masses approach near to the balls, then the attraction of each mass, acting most powerfully on the nearest ball, tends to bring the masses and balls still closer together A motion is thus given to the arm of the torsion balance, and in consequence of the elasticity of the suspension wire the balance performs a series of isochronous oscillations, and ultimately comes to rest in a position in which the attraction of the two masses on the balls is exactly counterbalanced by the torsion of the wire

The force developed by the leaden masses being exceedingly minute, not more than a 50-millionth part of their weight, a very small disturbing force will prevent the success of the experiment, and accordingly many precautions are requisite In Baily's experiments the torsion rod was enclosed in a mahogany case, gilt in the inside, wrapt round with thick flannel, and covered over with gilt paper, to prevent the radiation of heat, and consequent derangement from the currents of air thereby produced The balls were also gilt and burnished and the whole apparatus was surrounded by a close wooden frame or case, having glazed openings, through which the motions of the torsion rod were observed by means of a telescope from a distant part of the room

In order to deduce the mean density of the earth from the data furnished by the experiments, it is necessary to find expressions for the torsion developed in the wire, and for the attractive force of the masses on the balls, in that position of the arm of the balance at which it comes to rest under the action of the two forces, which then counterbalance each other The theory is as follows

Let F denote the force (measured by the weight in grains) which, being [illegible] as the arm to pass through a unit of angular space, or describe an arc equal to the radius Also, let F′ denote the torsion actually developed by the attraction of the masses, a, the distance of the suspension wire from the centre of the ball, and θ the angle of deviation of the arm from its first position By the nature of the lever, the force required to produce a given effect is inversely as the distance of its point of application from the fulcrum, which is here the suspension wire, and according to the law determined by Coulomb, the force of torsion is directly proportional to the angle of torsion, therefore

$$F' = F\frac{\theta}{a}$$

The measure of this force F′ is deduced from the time in which the oscillations of the balance are performed The general formula (see TORSION, in *Dict*) for the torsion force is,

$$F = \frac{\pi^2}{n^2} \times \text{moment of inertia},$$

where $\pi = 3\ 14159$, and n is the number of seconds in the time of an oscillation In the present case the whole of the matter in each ball may be regarded as accumulated at its centre, and the matter in the rod may be neglected, hence in respect of each ball the moment of inertia is expressed by the mass (m) multiplied into the square of the distance of its centre (a) from the suspension wire, that is by $a^2 m$ consequently the inertia in respect of both balls is $2a^2m$, and the above formula becomes

$$F = \frac{2\pi^2}{n^2} a^2 m$$

Let w denote the weight in grains of each ball, g the accelerating force of gravity and l the length of the seconds' pendulum, then $w = gm$, and $g = \pi^2 l$, whence by substitution $F = \frac{2a^2 w}{ln^2}$, and consequently, since $F' = F\frac{\theta}{a}$,

$$F' = \frac{2a w \theta}{ln^2}$$

Having obtained an expression for the torsion force, we have next to find the force of the attraction of the leaden masses In respect of each mass let g' denote the force of attraction, r the radius, v the volume, and d the density, and in respect of the earth (assumed to be a sphere) let the same elements be respectively denoted by g, R, V, and D, also, let k denote the distance of the centre of the mass from the centre of the ball at the middle of the oscillation and assume f to be the coefficient of gravity Now because the attraction of a sphere on a point without it is directly as its mass, that is, as its volume multiplied into its density, and inversely as the square of the distance of the attracted point from its centre, we have $g' = \frac{fvd}{k^2}$, and $g = \frac{f\mathrm{VD}}{\mathrm{R}^2}$, whence $\frac{g'}{g} = \frac{vd\mathrm{R}^2}{\mathrm{V}Dk^2}$ But $\frac{v}{\mathrm{V}} = \frac{r^3}{\mathrm{R}^3}$, therefore $\frac{g'}{g} = \frac{r^3 d}{\mathrm{R}Dk^2}$, consequently since the attraction of the earth upon the ball is the same thing as the weight of the ball, or $g = w$, we have $g' = \frac{r^3 dw}{\mathrm{R}Dk^2}$, and therefore

$$\text{attraction of both masses} = \frac{2r^3 dw}{\mathrm{R}Dk^2}$$

By the conditions of the problem this attraction is equal to, or balances the torsion force F′, therefore, putting the two expressions equal to each other, we have $\frac{a\theta}{ln^2} = \frac{r^3 d}{\mathrm{R}Dk^2}$, whence, finally,

$$\mathrm{D} = \frac{r^3 ld}{a\mathrm{R}k^2} \frac{n^2}{\theta}$$

In this expression for D, the mean density of the earth, all the quantities are supposed known excepting n and θ, and the object of the experiment is to determine their values The angle θ is determined by observing the number of divisions, on a known scale, passed over by an index or pointer attached to the extremity of the arm of the balance, so that if β denote the value of one division of the scale in parts of an inch, λ the distance in inches between the suspension wire and the extremity of the index, and h the number of divisions passed over by the index when the arm of the balance moves from its position of rest *before* the mass is approximated to the ball, to its position of rest *after* the approximation, then $\theta = \frac{h\beta}{\lambda}$

Cavendish gives the numerical values of the constants which enter into the expression for D as follows $r = 6$, $l = 39\ 14$, $a = 36\ 65$, $k = 8\ 85$, R = 250800000, all in inches;

and d (the density of the leaden mass as compared with water)=10·64. He also had $\beta=\frac{1}{20}$, $\lambda=38\ 8$, whence $\theta=1\div766$, and the substitution of these numbers in the formula gives $D=\frac{n^2}{10683\delta}$ There are, however, several corrections to be made, on account of the attraction of the matter in the plank and mahogany case, and other parts of the apparatus as also for the inertia of the arm of the balance and for the variation of the masses on the balls according to the position of the arm, for the details of which we must refer to the memoir of Baily already cited It may be noticed that the motion of the arm is very slow, the average time of a complete vibration in Cavendish's experiments having been from six to seven minutes

The result obtained by Cavendish gave the mean density of the earth, as deduced from 17 sets of experiments, equal to 5 45, that of [illegible] Reich, from 57 experiments, found [illegible] Baily's experiments were far more numerous and varied than those of his two predecessors The torsion rod was suspended in different ways by a single copper wire, as had been practised by Cavendish and Reich, and by double lines, as proposed by Gauss, and in the latter case the substances used were silk fibres, brass wire and iron wire In order to ascertain whether the results would be affected in any way by varying the substance of the attracted body, the experiment was made not only with leaden balls attached to the ends of the torsion balance, but also with balls of platina, zinc glass, ivory, and hollow brass, and with a torsion rod of brass without balls The actual number of experiments recorded in the memoir is no fewer than 2153, and nearly as many more, which had been made before the anomalies of the balance had been entirely got rid of, were rejected The mean result from all the recorded experiments, without exception, gave the mean density of the earth equal to 5 675 with a probable error of 0038

CE'LANDINE, the poisonous irritant principle of the *Chelidonium majus*

CE'LESTINE (Lat cœlum) The blue variety of sulphate of strontia

CELL In Anatomy a primary microscopic vesicle, of larger average size than the nucleus, composed of membranous cell-walls, with usually liquid contents, round or oval, and sometimes flattened like a scale With a few exceptions —*e g* the mammalian blood discs and old cells of the epidermal or adipose systems — the primary cell contains a nucleus

CENTRAL SUN In sidereal astronomy, the name given to the body about which the sun, and all the stars in the great cluster or nebula to which the sun belongs, is assumed to be revolving M Madler of Dorpat has recently published a paper under this title in which he attempts to assign the real motions of the stars and consequently the position of the central point, in reference to a dynamical theory He thinks there is no reason for supposing that there exists anywhere a star of such magnitude as to dominate the motions of others as the sun does the motions of the planets, but if we suppose the stars of our stellar cluster to be pretty uniformly distributed, and the form of the limit of the cluster to be nearly spherical, or a surface compressed between two planes as is supposed to be the case of the milky way, then, whatever the law of attraction may be the stars near the centre will move with much smaller linear velocity than the distant one, and this difference of real velocity will give rise to apparent motions by comparison of which the relative distances from the centre may be assigned Applying the considerations to the apparent motions actually observed, and assuming the direction of the sun's motion in the heavens to be that which has been determined by Argelander and others Madler shows that a point somewhere in the group of the Pleiades and probably not far from the star η *Tauri*, possesses the characteristics of the central point Having thus obtained, approximately, the position of the central body, Madler proceeds to discuss its probable distance from our sun, and the velocity of the sun's orbital motion about the centre Assuming the star 61 *Cygni* to be at the same distance from the central body as the sun is, and the distance of 61 *Cygni* from the sun to be known from the parallax found by Bessel, he finds from these assumptions, and from the observed proper motions of 61 *Cygni* and η *Tauri*, that the parallax of η *Tauri* is 0″·0061, or that its distance is thirty four millions of times as great as the distance of the earth from the sun The proper motion of η *Tauri* gives for the periodic time of our sun round the centre is 2[illegible] years, and the velocity of our sun in its orbit round the central sun is about thirty English miles in a second of time (*Monthly Notices of the Royal Astronomical Society*, vol vii No 12. February, 1847)

CERAUNIA (Gr κεραυνος, *lightning*) Thunderstones of the old mineralogists.

CEREBRIC ACID (Lat cerebrum, *the brain*) A fatty acid, containing nitrogen and phosphorus, forming one of the compounds of brain

CERINE (Lat cera, *wax*) A name given by some chemists to that portion of bees' wax which is soluble in boiling alcohol the insoluble portion has been termed Myricine

CEROSINE (Lat. cera, *wax*) A waxy substance which exudes from the sugar-cane

CERVID[illegible] See DEER, in DICT

CHALCOLITE (Gr χαλκος, *copper*, and λιθος, *a stone*) A green crystalline mineral found in several of the Cornish mines, and supposed to contain copper, till it was shown by R Phillips to be a *hydrated phosphate of uranium*

CHAILLITE A mineral found in the Donegore mountains in the county of Antrim It is a hydrated silicate of alumina, lime, and oxide of iron its name is derived from its *flint* appearance—χαλιξ *a flint*

CHAMOISITE A mineral from Chamoison in the Valais, it is of a dark greenish grey colour, and appears to be a hydrated silicate of protoxide of iron

CHARTISTS the name assumed by a certain political party in England, composed chiefly of the working classes, who have embodied their principles in a document called the "People's Charter," the leading points of which are universal suffrage vote by ballot annual parliaments [illegible] abolition of property payment of members of parliament

CHARYBDIS See SCYLLA, in DICT

CHA'SCHISCH The term applied by the Indians to the inspissated juice of the Cannabis sativa, or Indian hemp it has been used as a substitute for opium It is also known under the name of *Churrus* It is a powerful narcotic poison

CHE'LMSFORDITE A crystallised greyish white mineral composed of silicate of alumina and silicate of lime It appears to have the same composition as Meionite and Scapolite

CHEILOGNATHA (Gr χειλος, *a lip*, γναθος, *a jaw*) An order of myriapods or centipedes, of which the lower lip is formed by the tongue and two mandibles

CHEILOPODA (Gr χειλος, and πους, *a foot*) A family of myriapods, in which a pair of feet form the lower lip

CHLOROPHYLLA The poisonous principle of the *Chærophyllum silvestre*, or Wild chervil

CHIASTOLITE Hollow-spar A mineral found imbedded in clay-slate it occurs in the slate of Cumberland, and of Antrim in Ireland in rhomboidal prisms, exteriorly greyish-white, and interiorly black. Some of the sections of the crystals have the form of an X, hence the term from χιαζω to mark with that letter

CHINA INK A finely divided carbon, probably lamp-black of some kind, mixed with gelatine, and formed into cakes or sticks It is sometimes stated to be the desiccated ink of the cuttle-fish

CHINOLEINE, or CHINOLINE An oily liquid obtained by distilling quinine with caustic potassa

CHINONE A substance obtained by distilling certain salts containing kinic (cinchonic) acid, as for instance the kinate of lime, with oxide of manganese and sulphuric acid Chinone sublimes in the form of golden-coloured crystals, soluble in water, very volatile, and of a very peculiar and distinctive odour Their formula is said to be $C_{25}\ H_8\ O_8$

CHITINE [illegible] The hard insoluble [illegible] tra of insects

CHLORACETIC [illegible] e acid obtained by the action of the solar rays upon a mixture of chlorine with the vapour of acetic acid Its formula is $C_4\ Cl_3\ O_3$, $H\ O$, in it, therefore, the hydrogen of the acetic acid is replaced by chlorine

CHLORHYDRIC ACID *See* HYDROCHLORIC

CHLO'RIC ACID A compound of 1 atom of chlorine with 5 of oxygen, represented therefore by the formula $Cl\ O_5$ Its most important salt is the chlorate of potassa, formerly called oxymuriate of potash

CHLOROFORM (Gr χλωρος, *pale*, and Lat. formica, *an ant*) A compound represented by the formula $C_2\ H\ Cl_3$, and obtained by distilling a mixture of chloride of lime with diluted alcohol It is a heavy liquid, its sp gr being 1 48, it boils at 140° Its name has reference to the constitution of *formic acid*, which is represented by $C_2\ H\ O_3$, and is therefore the teroxide [illegible] $C_2\ H$ [illegible] which the term *formyle* [illegible] reference to this view of [illegible] has also been denominated [illegible] When the vapour of pure chloroform is respired it soon induces insensibility, in the same way as other vapour, and hence has been similarly used, in [illegible] and in child-birth [illegible] quisite in its administration

CHLOROPAL A mineral of a greenish yellow colour, associated with the opal of Hungary. It is a hydrated silicate of iron

CHLO'ROUS POLE. The voltaic pole or electrode at which chlorine is evolved in cases of the electrolysis of chloric compounds

CHOLE'IC and CHOLIC ACID Choleic acid is a fatty acid, which, in combination with soda, constitutes a principal ingredient in *bile* By the protracted action of caustic potass it evolves ammonia, and is converted into *Cholic acid* The elements of choleic acid are carbon, hydrogen oxygen nitrogen and sulphur, the following being its formula ($C_{52}H_{40}O_9NS$

CHON'DRINE (Gr. *χονδρος, cartilage*) That form of gelatine which is obtained from cartilage, and which differs from ordinary gelatine in being precipitable by acetic and the mineral acids and by sulphate of alumina and potash persulphate of iron and acetate of lead

CHONDRODITE (Gr *χονδρος a grain*) A mineral found in Finland and also in N America It is yellow, and of a vitreous fracture [illegible]

CHO'RDA DORSALIS See NOTOCHORD

CHO'RDA TYMPANI (Lat) A branch of the facial nerve or portio dura, which crosses the tympanum, and supplies the lingualis and some other muscular fibres of the tongue

CHOR'DÆ VOCA'LES (Lat) In Anatomy are the ligaments which extend from the thyroid to the arytenoid cartilages, and bound the glottis. They contain much elastic tissue, and can be made to vibrate under various degrees of tension by the action of the muscles upon the cartilaginous parts of the larynx to which they are attached [illegible] voice

CHR[illegible] (Gr. *χρονος, time, γραφω, I describe*) The name given by the late Professor Wallace, of Edinburgh, to an instrument contrived by him for the mechanical solution of this geodetical problem, viz "Having given the position of a station, having given the angles made by lines drawn from it to three other stations in the same plane, whose positions are known" The problem, which is important by reason of its frequent application in maritime surveying, was reduced by Professor Wallace to another very simple one, viz "To construct two similar triangles on two given straight lines, having given their angles" The triangles may be constructed by any of the ordinary methods, but inasmuch as they are similar, the construction is much facilitated in practice by means of the *chorograph*, a particular kind of protractor, having two moveable indices or arms "The circle from which the two arms project is of brass, and is divided into 180 equal parts each serving as the measure of an angle of two degrees at the centre, or one at the circumference Each of the equal parts is subdivided into half degrees

[By means of a vernier the degrees are subdivided into single minutes] The graduations on the scale are numbered quite round from 0 to 180° both ways One of the three arms has a fixed position on the circle, and is placed against zero and 180°, the others turn on a common centre There is a steel pin terminating in a point at the extremity of each arm, at equal distances from its centre and perpendicular to its plane By the graduated circle the moveable arms may be placed in such positions that lines joining the steel points at the extremities of the arms may form a triangle similar to any given triangle" (*Geometrical Theorems and Analytical Formulæ, &c* By W Wallace, L L D Edinburgh 1870)

CHROMA'TIC THERMOMETER When the edge of a rectangular plate of glass is applied to a piece of heated metal, or other substance having a temperature different from that of the glass, and exposed to a beam of polarized light coloured fringes are developed, and as the particular tints depend on the difference between the temperature of the glass (which is supposed to be [illegible] and that of the substance to which it is applied, the colour of the central fringe affords a means of inferring the temperature of the substance Hence the term *Chromatic Thermometer* The phenomena in question were discovered and first studied by Sir David Brewster

CHROME-ALUM The potassa-sulphate of chromium, a salt isomorphous with alum, in which alumina is replaced by oxide of chromium

CHROME YELLOW The [illegible] colour

CHROMULE (Gr *χρωμα* [illegible] colour and *ειδος* form) [illegible] more commonly and [illegible]

CHRYSAMMIC ACID (Gr *χρυσος, gold, αμμος, sand*) A substance in the form of a brilliant golden-coloured powder, obtained by the action of nitric acid on aloes

CHRY'SENE (Gr *χρυσος, gold*) One of the numerous products of the destructive distillation of woods

CHRYSOLE'PIC ACID (Gr *χρυσος* and *λεπις, a scale*) A peculiar acid formed along with chrysammic acid by digesting aloes in nitric acid

CHUCK In Mechanics the name given to that part of the turning-machine by which the *work* is connected with the lathe. There are various kinds of chucks, as the *screw*-chuck, the hollow-chuck, the drill-chuck, &c, for ordinary turning; the excentric chuck, the geometric chuck [illegible]

CHYLE-CORPUSCLES [illegible] of a subspherical form, greyish-white colour, about $\frac{1}{2500}$ of an inch in diameter: often tuberculated on their surfaces When found in the blood they are called "[illegible]"

[illegible] *See* CHEMISTRY Those who derive the word from *χυω, I melt* or *dissolve*, adopt the former mode of spelling

CINCHONIC ACID, or *Kinic Acid* An acid found in combination with the alkaloids in the varieties of Peruvian Bark, or *Cinchona* it is crystallisable, and represented by the formula $C_{14}H_{11}O_{11}, HO$

CINNAMIC ACID When the essential oil of cinnamon is exposed to air, it gradually absorbs oxygen and deposits crystals of cinnamic acid $= C_{18}H_7O_3 HO$ It much resembles *benzoic acid*, into which it is converted when mixed with bichromate of potassa and sulphuric acid This acid is found, together with benzoic acid, in Peruvian and in Tolu balsam, from the latter of which it is readily obtained

CINNAMYLE The supposed *radical* of oil of cinnamon and of cinnamic acid, and of which oil of cinnamon is the *hydruret* The formula of Cinnamyle is $C_{18}H_7O_2$, and that of oil of cinnamon, $C_{18}H_7O_2 + H$

CIRCINNUS The Compasses — a constellation of four stars near the South Pole

CIRCULATION OF THE BLOOD *See* BLOOD.

CIRROCU'MULUS The *sonder cloud* (Lat cirrus, *a curled lock of hair*, and cumulus, *a heap*) A cloud intermediate between the Cirrus and Cumulus *See* CLOUD

CIRRO'STRATUS (Lat cirrus and stratus, *a bed* or *covering*) The *wane cloud*, intermediate between the Cirrus and Stratus The *mackereled sky* of a summer evening, which [illegible] is a modification of this [illegible]

CIRRUS The *curl cloud* or *mare's-tail*

CITRACO'NIC ACID One of the acids resulting from the action of heat on citric and on itaconic acid

CITRI'BIC ACID, CITRICIC ACID CITRIDIC ACID Acids derived from the *Citric acid* and identical with the *Citraconic, Itaconic*, and *Aconitic* acids

CI'TRINE OINTMENT An ointment containing nitrate of mercury, it has a lemon yellow colour The [illegible] *citratis* of the Pharmacopœia

CLEAVAGE In Mineralogy the direction in which the structure of a crystal enables it to be split the resulting [illegible] *cleavage planes*

CLEVELANDITE A variety of soda-spar it has also been called *Albite*

CLEDGE A miner's term, applied to thin strata of clay or fuller's earth

CLEPSAMMIA (Gr *κλεπτω, I hide*, and *αμμος, sand*) An antient instrument for measuring time by the running of sand like the modern hour glass

CLEW LINES CLEW GARNETS Tackle by which the sails of a ship are trussed up to the yard

CLICHY WHITE A pure carbonate of lead, or white-lead, manufactured at Clichy in France

CLOT [illegible] coagulum of blood

CLUTCHES or GLANDS In machinery couplings which have no coupling boxes are denominated *clutches*, or *glands* A coupling of this kind consists of two crosses, one fixed to the end of each of the shafts to be connected One of the crosses, having its end bent forward lays hold of, or *clutches* the other, and by doing so turns round the other shaft Instead of cross pieces two round cast-iron plates are sometimes used, each having a part cut out, and a corresponding projection. The projection of the one plate is inserted in the opening of the other, and thus serves to engage the shafts (*Buchanan on Mill Work*)

COAGULUM (Lat) The part of the blood which changes from the fluid to the solid state, when drawn from the body and left at rest, or subjected to heat or certain chemical reagents It consists of the fibrine with the blood discs

COAGULABLE LYMPH A term given in some surgical works to the fibrine of the blood, which is the only part that has the power of spontaneously coagulating.

COCHLEA (Lat. *shell*) In Anatomy a portion of the internal ear, which in mammals is shaped like the common snail-shell, with its base resting on the bottom of the internal meatus, and perforated to receive some [illegible] nerve It [illegible] called modiolus [illegible] canal" makes two turns and a half It [illegible] divided into two ramps or "scalæ" by a partition of bone called the "lamina spiralis" At the base of the cochlea one scala communicates with the vestibule, the other with the tympanum, they communicate with each other at the apex of the cochlea.

COCI'NIC ACID When the solid fatty matter of cocoa-nut oil is saponified, the crystalline fatty acid into which it is converted has been called *cocinic* or *cocostearic* acid

COCOA The fruit of the *Theobroma Cacao*, which is about the size of a kidney-bean, and inclosed in a thin shell

COD LIVER OIL This oil expressed from the liver of the cod-fish, has lately acquired much reputation for its remedial powers It has been used in the dose of a table-spoonful three or four times a day in pulmonary phthisis, in various scrofulous affections, rheumatism, and in some obstinate [illegible] supposed to contain iodine or bromine, to which its efficacy has been ascribed but, on the other hand, it is asserted that it cures those forms of scrofula and other diseases which do not yield to the usual forms of iodine

COGS In mill work the term *cogs* is given to the teeth of wheels when they are not of the same piece with the body of the wheel, but are each of a particular piece

COIN WEIGHING MACHINE A machine for this purpose was constructed by Mr Napier for the Bank of England in 1844 and has since been more extensively applied at the Mint

It consists of a square brass box, on the top of which is placed a hopper to hold the sovereigns to be weighed, and in front of it are two small apertures fitted with receivers, one for the sovereigns of full weight, and the other for light sovereigns The balance for weighing the sovereigns is placed inside the box near the upper plate vibrating upon a knife edge, and receiving the [illegible] beam [illegible] by means of a small pendulum on which, at about an inch below the platform, there is an oblong perforation, about half an inch in length, technically called a *slot*, in which a small ivory rod works freely up and down, without touching the sides

Between the slot and the platform a pair of forceps is placed From a knife-edge at the other end of the beam a small round polished plate is suspended, to which a pendulum is fixed, and at its lower part the scale is placed to receive the weight Above the small round plate, under the top of the box, is fixed an agate with a blunt point When the machine is in motion the small ivory rod is depressed, this, on touching the bottom of the slot, or opening in the pendulum in which it works, brings down the beam on that side, and raises it of course on the other, the weight side, until the small round plate on that side touches the agate point The beam is then in a horizontal position As soon as this is effected the forceps catch hold of the pendulum between the platform and the slot, and hold it firmly The balance is then in a condition to receive the sovereign, which is shifted from the bottom of the pile in the hopper, and brought by means of a slide along a channel, just large enough for a sovereign of the proper standard gold to pass, but not large enough to admit a counterfeit, and deposited upon the platform The forceps then let go their hold, the ivory rod is gently raised and, if the sovereign happens to be light that end of the beam rises, and the other end leaves the agate point, but if the sovereign be of full weight, the beam remains stationary, and the small plate on the weight end is in contact with the agate point

When the sovereign is weig[illegible] removal is very ingenious, and [illegible] are placed at right angles to each other, and on each side of the platform or scale there is a part cut away to admit of the bolts striking so far into the area of the platform as to remove anything that would nearly fill it These bolts are made to strike at different elevations the lower one striking (as to time) a little before the other If the sovereign be of full weight the scale rises down and the lower bolt knocks [illegible] light box If the sovereign [illegible] and the first bolt strikes [illegible] higher bolt then strikes and knocks it off into the light box [illegible] in one [illegible] adjusted to within the ten-thousandth part of a grain

COLCHI'CIA An alkaloid obtained from, and probably constituting the active principle of the *Colchicum autumnale* [illegible]

COLD BLOODED [illegible] so called which have a temperature [illegible] above the freezing point [illegible] which follow the [illegible] through their [illegible] vertebrata animals and fishes and reptiles, amongst vertebrates, are "cold-blooded" in this sense

COLISEUM *See* AMPHITHEATRE.

COLLA'TERAL CIRCULATION In Physiology, the passage of the blood from one part to another of the same system of vessels by collateral communicating channels: it is much more frequent in the veins than in the arteries

COLLO'DION (Gr κολλα, *glue*) A term applied, in consequence of its adhesive properties, to a solution [illegible]

[illegible] Gr κολοβοω, *I contract*) The adhesion of the eyelids Congenital fissures of the upper eyelid

COLOGNE EARTH A deep brown pigment, or species of umber It is supposed to be of vegetable origin

COLUMN In Anatomy, the term is applied to longitudinal portions or tracts of the myelon, of which there are three in each lateral moiety, called from their situation in the upright posture of man, "anterior," "middle," and "posterior," columns.

COLU'MNÆ CARNEÆ (Lat) In Anatomy, the fleshy prominences from the inner surface of the ventricles of the heart Some are conical, with free apices giving attachment to the threads "chordæ tendineæ" attached to the valves, others extend from one part of the walls of the ventricle to another, and are sometimes called "trabeculæ"

COMBU'STION-HEAT A term given by Liebig to the animal heat generated by the union of the oxygen absorbed into the blood from the atmosphere with the carbon and hydrogen it takes [illegible] as food

COMBUSTION, SPONTANEOUS [illegible] in DICT

COME'NIC ACID When a solution of *meconic* acid in water, or in dilute sulphuric acid, is long boiled, or when dry meconic acid is heated to 400°, it is converted into a modified bibasic acid, water and carbonic acid being at the same time evolved The formula of comenic acid is $C_{12}\ H_2\ O_8 + 2\ H\ O$

COMMUNISM *See* RIGHT OF PROPERTY and SAINT SIMONIANS in DICT

COMPASS OF THE VOICE In Physiology is the number of notes of [illegible] in the voice of a singer [illegible] three octaves

COMPENSATION PENDULUM *See* PENDULUM

COMPOST [illegible] called COMPO *See* CEMENT

COMPLEMENTARY COLOURS In Optics, two colours are said to be complementary to each other which are such that the blending together of the two [illegible] the prism into rays of seven primary colours if, therefore, the rays of one colour be intercepted, the composition of the remainder will give the complementary colour Or adopting the simpler supposition of Mayer, that all colours are produced by the mixture of three [illegible] — in certain proportions [illegible] rays in a beam of white light, the remaining yellow and blue rays will give the colour arising from the mixture of yellow and blue, namely green, so that red and green are complementary colours In like manner as a mixture of red and yellow gives orange, and a mixture of red and blue gives violet, orange is the colour complementary to blue, and violet to yellow *See* CHROMATICS in DICT

CONDUCTION OF IMPRESSIONS In Physiology, is the propagation of that state or action of a nerve fibre, which is produced by the application of a stimulus, through the whole length of the fibre, it takes place with immeasurable rapidity in the same way as electricity [illegible] a wire

CONSE[illegible] In Physiology, when one motion gives rise to the production of other motions contrary to or independent of the will, they are so called as e g the contraction of the iris when the eye is voluntarily directed inwards

CONTRACTILITY In Physiology, is the power which certain tissues have, during life of shortening themselves in a peculiar manner it is usually observed in muscular and some kinds of fibro cellular tissue, but is also exercised by series of cells, as in the *Hydra* polype

CONVOLUTIONS (Lat) In Anatomy, the winding [illegible] superficial layer of the brain, and also [illegible] of the intestinal tube

COPYRIGHT, INTERNATIONAL A literary treaty of vital importance to the interests of authors, translators [illegible] engravers, was agreed [illegible] and in 1851 The French enactment contains fourteen separate articles, and by the fourteenth it is stipulated that, after its legislative sanction by the British parliament, a day shall be fixed on which the following important privileges shall be granted to all works published subsequent to its date The authors of literature or of art of either nation are to exercise the same rights with respect [illegible] the country in which they were [illegible] as are granted to authors of similar works when first produced in that country Authors of either nation will be entitled in both coun-

tries to the protection of the laws which are or may hereafter be in force in England or France for the suppression of piracy Translators, under certain conditions, are to enjoy the same privileges as original authors Nevertheless it is only in the case in which an author chooses to reserve to himself the exclusive right of translating his own original work that the law prohibits independent translations of the same work To reserve to himself this exclusive right of translation for five years in either country, the author must have registered and deposited his original work within three months from the day of its publication in the other country; he must have declared in the title-page his intention of reserving this right; the translation must appear in part at least within three years from the date of the deposit, and when eventually published in either country must be legally registered.

These stipulations apply also to all species of original dramatic works and musical compositions Nevertheless, the prohibitions against translations are not intended to apply to imitations or adaptations of works suitable to the theatres of either country All pirated works, whether printed in France, England, or elsewhere, are to be considered as contraband, to be seized and destroyed, and the persons introducing or selling them to be liable to prosecution The question of piracy is in all cases to be determined by the legal courts of the country in which the act has been committed The treaty, which is only to be applicable to works which shall be published after the day upon which it shall come into operation is to remain in force for ten years from that day, and to continue to exist until a year's notice of cessation shall have been given

CO'RIUM (Lat) In Anatomy, is the basis of the skin, or "true skin," and consists of a vascular and fibro-cellular tissue, of interlaced dense, but elastic, filaments It rests on the subcutaneous cellular tissue, and is covered by [illegible]

CORPUS [illegible] In Anatomy, the great commissure, or band of transverse fibres, connecting the hemispheres of the cerebrum

CORPUS LUTEUM (Lat) In Anatomy, a yellowish mass which is formed in a Graafian vesicle subsequent to the escape of an ovum It is largest, most conspicuous and [illegible] ovum in the human subject

COU'PLING In Machinery, this term is applied to any contrivance for connecting or disconnecting the different parts of a machine, and particularly for effecting the [illegible] *Hook's Joint* (Dict of Science, [illegible] contrivances of this kind (See Buchanan's *Essays on Mill Work, &c., with Additions*, by Tredgold and Rennie)

COU'NTERPOISE In Mechanics a mass of metal connected with an instrument for the purpose of giving [illegible] on some particular point, as, for example, the pressure of the pivots of a transit-instrument on its supports

CRAB A machine for raising weights, consisting of a horizontal barrel, usually turned by a winch handle, and having a rope wound round it, which, when the weight is to be raised to a greater height than the machine, passes over a pulley fixed on the scaffolding *See* Windlass

CRE'ATINE *See* Kreatine

CRE'NIC ACID, or KRENIC ACID. (Gr κρηνη *a fountain*) A term applied by Berzelius to a species of extractive matter occurring in spring-water

CRISPITE [illegible] name of the *titanite*

CROCO'NIC A[illegible] (Gr κροκος *saffron*) A yellow substance resulting from the action of potassium on carbonic oxide It is [illegible] astringent taste Its composition is C_4O_3

CRO'NSTEDITE A [illegible] Pritzbram in Bohemia It was originally [illegible] as a species of tourmaline

CROSS COURSES A [illegible] of Cornwall to veins of stony matter running North and South

CROWN GLASS. The glass usually employed for windows it differs from *flint glass* in containing no oxide of lead

CRUOR (Lat) In Anatomy, the substance contained in the red discs or corpuscles of the blood

CRURA (Lat *crus* the leg) In Anatomy, are the bundles of nervous fibres which expand into the hemispheres of the cerebrum (crura cerebri), or of the cerebellum (crura cerebelli)

CUBE ORE A hydrated arseniate of iron, crystallising in [illegible]

CUBE SPAR A synonym of the *anhydrite* or anhydrous sulphate of lime

CUBIZITE, A mineralogical synonym of the *cubic zeolite* or *analcime*

CURVOGRAPH *See* Arcograph.

CYCADEOI'DEA A name given by Buckland to a genus of fossil dicotyledonous plants: the genus *Mantellia* of Brongniart

CYCADITES. A genus of dicotyledonous fossil plants

CYCLOGRAPH. *See* Arcograph.

CY'PRINE A variety of the green garnet, or *grossularia*

CYSTINE. A term applied by some chemists to the *cystic oxide*, a constituent of certain urinary calculi.

CY'TISINE A purgative bitter principle, extracted from [illegible] *alpinus*

CYTOBLAST (Gr κυτος, *a hollow vessel*, βλαστος, *a sprout or germ*) In Physiology, the nucleus cellule, or centre of assimilative force, from which the organic cell is developed

CY'TOBLASTE'MA. (See above) The structureless substance in which the elementary nuclei, cellules, or cytoblasts, are imbedded.

D.

DA'NAIDE. In *Hydronamics*, a machine put in motion by the power obtained from a fall of water applied in a particular manner A cylindrical trough of tin-plate is fixed to a vertical axis of iron, which passes through the middle of a hole in the bottom of the cylinder, the diameter of the hole being somewhat greater than that of the axis, so as to allow the water to escape A drum of tin-plate, close above and below, is also fixed upon the axis, and placed within the trough, its diameter being so much less than that of the trough that a clear cylindrical space of about an inch and a half in thickness is left between the outer circumference of the drum and the inner circumference of the trough, and the bottom of the drum is also about an inch and a half from the bottom of the trough This space between the two bottoms is divided into compartments, by diaphragms radiating from the axis to the circumference of the drum Into the space between the two cylinders water is made to fall from a reservoir above, through one or more pipes, the ends of which are bent into a horizontal direction so that the water escapes in the direction of a tangent to a horizontal section of the cylinders, and, impinging on the interior surface of the [illegible] the water between the cylinders thus acquires a centrifugal force, in consequence of which it presses against the interior surface of the trough and the diaphragms on the bottom, while, on the other hand, the action of gravity constantly tends to make it run out at the hole in the bottom [illegible] power is measured by the weight of water escaping from the supply pipes multiplied into the height of the reservoir, and the useful effect by the same product diminished by half the force which the water retains when it issues from the hole in the bottom of the cylinder (*Encyc Brit* art *Hydrodynamics*)

DA'TISCINE A name given by Braconnot to a substance having the appearance of grape sugar, which he extracted from the *Datisca Cannabina*

DAUBRE'E A variety of Tourmalin

DA'VIDSONITE A mineral discovered by Dr Davidson in the granite quarry of Rubislaw, near Aberdeen it is a *Silicate of Alumina*

DECIDUA (Lat) In Anatomy, a product or an alteration of the mucous membrane of the uterus, preparatory to the reception of the impregnated ovum, which is discharged at parturition. When the ovum enters the womb it becomes imbedded in the decidua, which yields and is protruded inwards, and becoming more and more inverted as the ovum grows, it is called the "decidua reflexa," while the other part of the membrane [illegible] "decidua vera"

DECLINOMETER An apparatus for measuring the declination of the magnetic needle, or the force of terrestrial magnetism in the plane of the horizon *See* Magnetometer

DEGREES OF LATITUDE AND LONGITUDE The most important operation executed of late years in connexion with the measurement of terrestrial degrees, of which the results have been published is the prolongation of the great meridional arc of India described by Colonel Everest in his Account of the Measurement of two Sections of the Meridional Arc of India bounded by the parallels 18° 3′ 15″, 24° 7′ 11″, and 29° 30′ 48″, published in 1847 Of these two sections the southern one, extending from Damargida to Kalianpur, had been previously measured, and the results referred to under the article Dronke (Dict of Science), but [illegible] the state of the instruments the result was [illegible] as altogether satisfactory; a [illegible] new [illegible] apparatus and [illegible] scription had been provided for the purpose of extend-

ing the arc to the northward, the Directors of the East India Company sanctioned the repetition of the whole operation The northern section, from Kalianpur to Kaliana, embraces an arc of rather more than 5° 23′ Adding both sections to the arcs formerly measured by Colonel Lambton, the result is the "Great Meridional Arc of India" extending from Punnæ, near Cape Comorin (lat 8° 9′ 31″) to Kaliana, near the base of the Himalayas (lat 29° 30′ [illegible] 31″·7 of the meridian—the [illegible] been measured on the surface of the earth

Colonel Everest's measurement was executed with extraordinary care, and with instruments sufficient to ensure the utmost attainable accuracy Three base lines, each exceeding seven miles in length, were measured with a compensating apparatus similar to that invented and used by General Colby for the measurement of the base of the trigonometrical survey of Ireland The terrestrial angles were observed with theodolites of three feet in diameter, and the two celestial arcs were determined by observations of stars made simultaneously at both extremities of each arc with altitude and azimuth circles, having vertical circles also of three feet in diameter The final results were as follows the amplitude of the arc corresponding to the northern [illegible] Kalianpur was found by the mean of all the observations to be 5° 23′ 37″·051, and that of the southern, Kalianpur to Damargida, 6° 3′ 59″·973 The terrestrial distances on the meridian, computed from the mean of the two bases (near the extremities of each section) and reduced to the level of the sea, were 1961157·117 feet, and 2202926·196 feet respectively Hence the length of the meridional degree, as found from the northern section, is 363606 feet, or 68·865 miles, at the middle latitude 26° 49′ and as found from the southern section is 363187 feet or 68·785 miles at the mean latitude 21° 5′ The comparison of the two arcs, without reference to other measures gives an ellipticity to the terrestrial spheroid of 1—192 considerably greater than the ellipticity deduced from the results (properly combined) of all the principal operations of the same kind executed in different countries namely 1—300, and consequently indicating some irregularity either in the curvature of the earth at that locality or in the density of the superficial strata, giving rise to local attraction at the terminal stations

The long-protracted operations connected with the trigonometrical survey of the British Islands are now it is understood, approaching completion, and one of the results will be the prolongation of the arc of meridian which was measured about the beginning of the century between Dunnose in the Isle of Wight and Burleigh Moor in Yorkshire, to Balta in Shetland, the amplitude or difference of latitude of the extreme stations being 10° 7′ 55″·28 The astronomical observations made at the extreme and several intermediate stations were published in 1842, and as the principal triangles of the southern sections have been observed anew, and the distances have been computed from the base measured in Ireland the result will be entirely independent of the previous work A base of verification was measured on Salisbury Plain in the summer of 1849, and it is understood that the calculations are now completed and ready for publication

Degrees of the meridian have now been measured under so many latitudes in the northern hemisphere that it is not probable the general elements of the terrestrial spheroid as already determined, will be much disturbed by any future operations The distance between the parallels of Kaliana Col Everest's northern station, and Formentera, the southern extremity of the French arc, is only about nine degrees, and with the exception of this interval and another of about five and a half degrees between the parallels of the northern extremity of the Russian arc and the southern extremity of the Swedish, the whole distance (though in different meridians) has been measured between the parallels of Punnæ (lat 8° 9′ 31″) and Pahtavara (lat 67° 8′ 49″) being nearly two-thirds of the distance from the Equator to the Pole In the southern hemisphere an arc of about four degrees has been recently measured by Mr Maclear, near the Cape of Good Hope, the details of which have not yet been published, but the operation is of peculiar interest on account of the anomalous result obtained by Lacaille in the same locality about the middle of the last century, which led to the inference that the two hemispheres are dissimilar Mr Maclear has, however, made it known that the anomaly in Lacaille's result was caused by local attraction, and that the extended measure proves the length of the meridional degree at the Cape to be the same as in the northern hemisphere under the corresponding latitude

[illegible] two [illegible] of [illegible] by means of pocket chronometers carried forwards and backwards repeatedly between the two places (or rather between Greenwich and Kingston and Valentia, the operations being subdivided into distinct parts), under the superintendence of the Astronomer Royal The number of chronometers employed was [illegible] The difference of apparent time was ascertained probably with greater certainty than could be done by the method of fire signals hitherto chiefly relied on for this purpose, but scarcely available for so long an arc The geodetical distance on the parallel of latitude being computed from data furnished by the trigonometrical survey and assumed elements of the earth's figure, and the result converted into time, it was found that the difference between the computed arc and the chronometrical arc amounted only to a small fraction of a second The inference from this agreement is, that the assumed elements of the spheroid represent the curvature of the earth at this locality so accurately as to require no correction As a definite result they give the length of 1″ in the arc perpendicular to the meridian in latitude 51° 40′ equal to 101·6499 feet

The conveyance of local time from one place to another, by means of chronometers, has also been adopted for determining the differences of longitude between Greenwich and some of the principal observatories on the continent A still better means is now becoming available, in the use of the electric telegraph, which has already been applied to this purpose in America, and by which instantaneous signals may be transmitted to any distance, however remote The preparations are nearly completed for connecting Greenwich immediately with all the great continental observatories, by means of wires communicating with the terminus of the Dover railway

The following elements of the spheroid of rotation, deduced by Bessel from the principal measures of meridional arcs, may be considered as representing, with the most probable accuracy, the present state of our knowledge on this subject —

Equatorial radius 20923600·00 feet,
Half the polar axis 20853657·16 feet,
Ratio of equatorial to polar axis 299·1528 : 298·1528,
Ellipticity = 1—299·1528 = ·00334273

Let l denote the latitude, m the length in feet of a degree of the meridian between two parallels whose latitudes are respectively $l-\frac{1}{2}$ and $l+\frac{1}{2}$ and p the length of a degree of the parallel circle at latitude l, then

$$m = 364575·6 - 1831·0 \cos 2l + 3·9 \cos 4l - \&c$$
$$p = 365491·2 \cos l - 305·8 \cos 3l + 0·4 \cos 5l - \&c$$

from which formula the degrees of the meridian and parallel at any latitude are readily computed

DELPHI'NIC ACID A fat-acid obtained by saponification from the oil of the *Delphinus* or porpoise it has also been termed *phocenic* acid It exists in the [illegible] in the berries of *Viburnum Opulus*

DELPHINITE A variety of *Epidote* from Dauphiny

DE LUC'S COLUMN An alternation of different substances, such as silver, zinc, and thin paper, which produce an electric arrangement It is sometimes called the *dry pile*

DENTINAL TUBES (Lat dens, *a tooth*) The subparallel branching tubes which radiate from the pulp-cavity of a tooth at or nearly at right angles with the periphery of the dentine they have a diameter of $\frac{1}{10000}$th of an inch, at their origin, in the human teeth, and consequently admit only the plasma, or colourless liquor of the blood

DENTINE (Lat dens, *a tooth*) The fundamental and most constant substance or tissue of which a tooth is composed It consists of an organised animal basis disposed in the form of extremely minute tubes and cells, and of earthy particles which have a two-fold arrangement, being either blended with the animal matter of the interspaces and parietes of the tubes and cells, or contained in a minutely granular state in their cavities

DEODORIZERS A term applied to a class of disinfectants especially characterised by their power of destroying fetid effluvia chlorine and several of its compounds come under this class chloride of zinc and nitrate of lead, which are active in decomposing sulphuretted hydrogen, are also *deodorizers* Some kinds of charcoal, and especially that obtained from peat, when mixed with manure or excrement not only destroys the odour but forms an excellent compost for agricultural purposes

DEOXYDIZEMENT, or DEOXYDATION The chemical process of the abstraction of oxygen these terms are synonymous with *reduction* A compound of a metal with oxygen may for instance in many cases be reduced or deoxydized by heating it with carbon, or in a stream of hydrogen gas in which case it is subjected to the process of *deoxydation*, and the metal set free

DESMINE (Gr δεσμη, *a bundle*) A variety of foliated *Zeolite*

DESMO'LOGY (Gr. *δεσμος, a chain*, and *λογος, escription*) That part of anatomy which relates to ligaments and ligaments

DEVI'TOPMI N In Physiology, is the process y which each tissue and organ of the body is formed, nd subsequently transmuted, so as to be adapted to he actions of the most perfect state of the individual

DEVO'NIAN SYSTEM In geology, comprises the *Old Red Sandstone*. *See* GEOLOGY, in DICT

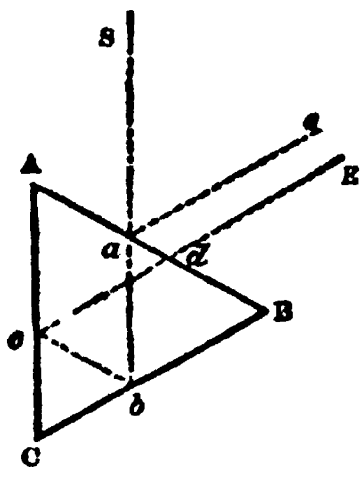
DI'VONIT A mineralogical synonym of the [illegible] Devonshire

DIVI[illegible] d having the [illegible] the action of alphuretted hydrogen on a boiling solution of alloxan

DIAMAGNE'TIC A term applied to bodies which ppear to be *repelled* by either pole of a magnet, as opposed to the term *magnetic* bodies, the particles of which are *attracted* by either pole

DIAPHORE'TIC ANTIMONY In old pharmacy his term has been applied to the peroxide of antimony, nd also to the antimoniate of potassa obtained by deflagrating [illegible]

DIAPOPHYSIS (*διὰ through, ἀπο from, φυσις*) n Anatomy, the upper of the two transverse processes which project from the sides of the cervical and anterior dorsal vertebræ of the crocodile, and which is usually nchylosed with a rudimental rib in the cervical vertebræ f birds and mammals, in these it forms the sole "transerse process" of the succeeding vertebræ, and is usually eveloped from the neural arch



DIATO'NIC SCALE *of Colours* Newton found, r supposed, that the spaces occupied by the seven primary colours in the solar spectrum are exactly proporional to the lengths of chords that sound the seven notes in the diatonic scale of music On this assumpion the spaces occupied by the different colours are as he intervals of the numbers 1, $\frac{8}{9}$, $\frac{3}{4}$, $\frac{2}{3}$, $\frac{3}{5}$, $\frac{9}{16}$, $\frac{1}{2}$, which orm the diatonic scale It is now known however, hat the relative lengths of the spaces occupied by the lifferent colours in the spectrum depend on the nature of the substance of which the refracting prism is formed ee CHROMATICS in DICT

DICTIOPHY'LLUM A name given by Lindley nd Hutton to a fossil leaf first described by Phillips rom the upper sandstone, shale, and coal of the Yorkhire oolite The term *Dictiophyllum* is employed to lesignate all fossil leaves of a common reticulated structure, while the term *phyllite* is applied to leaves whose [illegible] the base and apex

DI[illegible] DIHEDRAL In *Geometry* a dieral angle is the angle or corner formed by the intersection of two planes

DIPLEI'DOSCOPE (Lat duplex *double*, Gr *σκεπτω, I view*) An optical instrument for indicating the passage of the sun, or a star, over the meridian, by the coincidence of two images formed by a single and double eflexion

The instrument is constructed as follows A B, A C, and B C are three reflecting planes, one of which, A B is transparent, and the other two of silvered glass, the three [illegible]

placed exactly in the plane of the meridian, and a pencil of light proceeding from the sun, S, to fall upon the transparent plane A B at *a*, in the direction S *a* parallel to A C A portion of this light will be reflected from *a* in the direction *a e*, which is such that the angle *e a* B is equal to S *a* A Another portion of it will pass through the transparent plane A B and, proceeding in the same direction will fall on the silvered mirror at *b* where it will suffer a total reflexion in the direction *b c* and, falling on the second silvered mirror at *c*, will [illegible] direction *c d*, and will pass [illegible] plane A B, and continue its course in the same direction *d* E Now, the angles of incidence and reflexion being equal, when S *a* is parallel to A C, then *b c* is parallel to A B, and *c d* to C B, and the direction *d* E to *a e* so that an eye at E or *e* will see only a single image of the sun S But if S *a* be not parallel to A C, then *d* E will not be parallel to *a e*, and a double image will appear Suppose, for instance, the sun's course to be in the direction from A towards B, then, before the sun comes to the meridian, the pencil of light S *a* will make with A B an angle S *a* A less than 60° Consequently, the reflected ray *a e* will make the angle *e a* B less than 60° But in this case the angle F *e* B will be greater than 60°, and therefore two images will be seen by the eye at E, one in the direction *e a*, and the other in the direction E *d* The first of these will appear to move with the sun in the direction A B, and the second in the opposite direction B A, they will approach each other until S *a* becomes exactly parallel to A C, when they will coincide, after this, as the angle S *a* A becomes greater than 60°, they will separate, and gradually pass off the field, one at B, and the other at A Hence it is evident that if A C be in the plane of the meridian, the instant of the coincidence of the two images will be that of apparent noon

When used as a meridian instrument, the dipleidoscope must be fixed so that one of the reflecting planes, A C, is exactly vertical, and also in the meridian The latter adjustment may be made by any of the means which suffice for fixing a sun-dial, or for drawing a meridian line, the former, by suspending a fine plumb-line a few feet be[illegible] and turning the instrument slowly about the edge A C till the two images of the line become exactly parallel These are the only essential adjustments, but it is convenient also to fix the instrument so that the lines of intersection of the three planes may be parallel to the axis of the earth's rotation, in order that the sun's greatest altitude above the plane of the instrument at midsummer may be equal to his greatest depression below it at midwinter On account of the intense light of the sun, the eye must be protected by a coloured glass, and the field of view may be magnified by a small telescope Three observations should be made, the first, of the instant at which the two images come into contact, the second of the instant at which they exactly coincide, and the third, of the instant at which they separate The instrument, if accurately made and fixed, is capable of giving true time within a fraction of a second

The dipleidoscope is a patent instrument, the property of Mr Dent, chronometer maker, of the Strand, who has published a popular description of it in a small pamphlet, in which he states that the idea was first suggested by Mr Bloxam but that the original form has been much improved and simplified From its small size, and the facility of the observation, it may be conveniently employed for the regulation of time keepers in circumstances under which recourse cannot be had to a transit instrument

DI'STHENE One of the varieties of *Cyanite*

DITHIO'NIC ACID (Gr *δις, twice* and *θειον, sulphur*) Berzelius applies this term to the *hyposulphuric acid*, and he calls the hyposulphurous acid, *dithionous* The term implies the existence of *two* atoms of sulphur in each of these acids

DOBEREINER'S LAMP A small instrument for obtaining instantaneous light, in which a jet of hydrogen gas is inflamed by coming into contact with spongy platinum

DO'MITE A white mineral found in the Puy de Dome in Auvergne

DRUMMOND'S LIGHT The name given to the [illegible] of lime by directing against it a jet of [illegible] and the flame of alcohol, or some still more quick [illegible] The light produced by burning lime in this manner is of extreme intensity, and Mr Drummond of the Engineers while engaged in the trigonometrical survey of Ireland suggested its use as a signal for the observation of distant stations For this purpose the ball of lime, about a quarter of an inch in diameter, was placed in the focus of a parabolic mirror, the axis of which was directed to the point from which the observation was to be made, and such was the brilliancy of the light that it was sometimes distinctly seen, even in hazy weather, at a distance of upwards of sixty miles, when argand burners and other modes of illumination previously used were altogether ineffectual But the use of this signal is found to be attended with some inconveniences, and the heliostat is now generally preferred in geodetical operations (See Lieut Drummond's paper in the *Philosophical Transactions* for 1826)

DU'MASINE An oily liquid [illegible] among other products, by distilling acetate of [illegible] its formula is $C_{10} H_8 O$ It is named in compliment to the celebrated French chemist Dumas

DYNACTINO'METER (Gr *δυναμις, power, ακτις, a sunbeam, μετρον measure*) An instrument for measuring the intensity of the photogenic (light-producing) rays, and computing the power of object glasses It is described by Mr Claudet in the *Philosophical Magazine* for June 1851

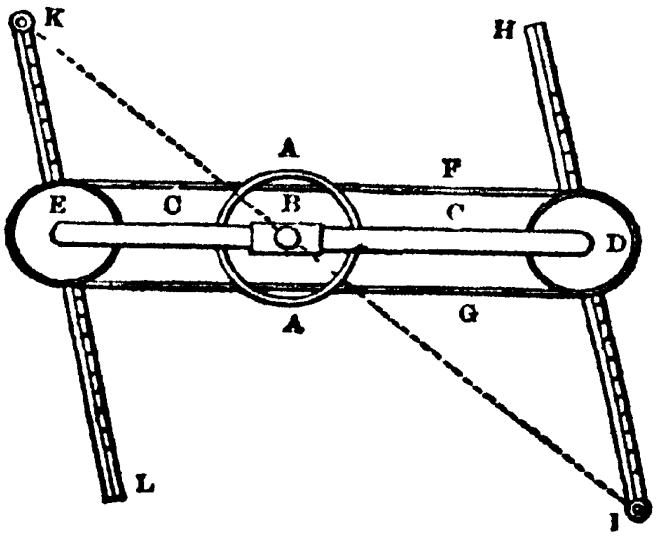
DYNAM, or DYNAMICAL UNIT For the purpose of measuring or comparing the moving power of machines, or the useful effect procured by the exertion of animal force applied in different ways, it is necessary to adopt some standard, or unit of force, and for convenience of explanation it is desirable the unit should be designated by an appropriate name When the steam-engine came into use, the work accomplished by it in a given time was naturally compared with that of the

moving power which it most frequently superseded; hence the term *Horse-power*, which was originally used by Watt to denote, in a rough way, the force developed by a horse of average strength drawing a load during twenty four hours without intermission Watt subsequently gave a definite signification to the term, by defining it to be the force which suffices to raise a weight of 32,000 [illegible] of one foot in one second [illegible] *Géometrie des Arts et Métiers et des Beaux-Arts*, proposed the term *Dyname* to denote the unit of moving force, represented by one cubic metre of distilled water at its maximum density raised to the height of one metre in an astronomical day Dr Whewell, in his *Mechanics of Engineering*, recommended the adoption of the English synonyme, *Dynam*, to represent the effect equivalent to a weight of one pound raised to the height of one foot in a second The terms *efficiency*, and *duty*, are frequently applied in a similar sense

DYNA'METER In Optics, an instrument for measuring the magnifying power of a telescope The [illegible] ratio of the solar focal distance of the object glass to the focal distance of the eye-piece considered as a single lens, and this ratio being the same as the ratio of the diameter of the aperture of the telescope to the diameter of its image or disc formed at the solar focus, and seen through the eye-piece, the object of the instrument is to measure the exact diameter of this image, which, not being projected on any solid body, can only be measured by optical means Ramsden proposed for this purpose the double image micrometer (MICROMETER, in DICT), an instrument formed by dividing the eye lens of a positive eye-piece into two equal parts, and mounting them so that the divided edges are made, by means of a fine screw-apparatus, to slide along each other Each semi-lens thus gives a separate image, and the distance of the two centres, measured by the revolutions of the screw, when the borders of the two images are brought exactly into contact, gives the distance of the centres of the images, or the diameter of one of them The construction of this dynameter has been improved by Dollond. (Pearson's *Practical Astronomy*, vol ii)

E.

EAR TRUMPET, or HEARING TRUMPET An instrument for aiding defective hearing The ordinary ear trumpet consists of a metal tube, usually of a conical shape, the wide end being turned towards the speaker to collect the waves of sound, and the narrow end terminating in a small tube, and bent sideways so as to enter the ear of the deaf person Various other instruments besides the *trumpet* are used for the same purpose The *Auricle* is a small scroll-shaped instrument which is worn in the ear, the expanded mouth only being visible *Ear-cornets* are applied outside the ear, and held in their place by a slender steel spring, a bent tube entering the ear in this case, as in that of the common trumpet Flexible tubes, made of India rubber covered with silk, and kept open by a spiral spring of wire, terminating at one end in a tube, which enters the ear, and in a cup or hollow hemisphere at the other, into which the speaker speaks, are found to be of great efficiency *Sonifers* are large bell-shaped instruments of metal which are placed on a table, and turned towards the part of the room whence the sound proceeds, and the sound being collected at the bottom of the instrument is conveyed to the ear by a flexible tube With respect to acoustic instruments in general, it does not appear that mathematical accuracy of figure is of much importance Whatever prevents the dispersion of the undulating air, and directs it upon the tympanum, will partially assist hearing, though of course, it is advantageous that as much as possible of the sound which enters the instrument should be reflected forward to the ear



ECDY'SIS (Gr *ἔκδυσις*) The act of stripping The moulting of the skin

EGERIA One of the small planets between Mars and Jupiter It was [illegible] at Naples on the 2nd of November, 1850, by [illegible] (who had previously discovered Hygeia and Parthenope), and is the 13th of the group in the order of discovery *See* PLANET

EI'DOGRAPH (Gr *εἶδος, form*, *γράφω, I describe*) A copying instrument invented by Professor Wallace, of Edinburgh, by which copies of drawings are made, reduced, or enlarged in any proportion within certain limits It answers the same purposes as the ordinary pentagraph, but is more convenient and accurate

The geometrical theory of this ingenious instrument is contained in the following proposition "If two lines which contain a given angle turn in a plane about a fixed point at their intersection and have to each other a constant ratio, and the moving extremity of one of them trace a line of any kind, the extremity of the other will trace a similar corresponding line, and these two lines will have to each other the constant ratio of their distances from the centre of angular motion" To apply this property mechanically it was necessary to connect two material points moving on a plane (the tracer and the pencil) in such a way that straight lines drawn from them to a fixed centre should contain a given angle, and have to each other a given ratio It is convenient to take the given angle equal to 180°, in which case the two moving points are in the same straight line with the centre, and on opposite sides of it

The instrument is represented in the annexed figure.

A beam, C C, about 30 inches in length (formed of a hollow rectangular prism of brass, in order to combine strength with lightness), passes horizontally through a socket B B, attached to the top of a strong steel conical axis, which turns in a tube rising perpendicularly from the centre of a mass of metal, A A, forming the base of the instrument, and heavy enough to afford a steady support The beam thus turns freely about the steel axis, and may be clamped at any point Two wheels D, E, of exactly the same size, are attached to the beam at its extremities, by means of steel axes screwed to the wheels and entering upright sockets fixed to the beam The wheels are connected by a metallic band F G, part of which (as much as is applied on the wheels in making about half a revolution) is formed of thin and narrow watch spring, and they are crossed by two arms, H I and L K, about 27 inches in length, which slide through sockets placed under the centres of the wheels and must be placed truly parallel Both the beam and the arms have a scale of equal parts engraved on them for the purpose of adjustment

Suppose the beam and the two arms respectively clamped in their sockets in such wise that the beam is divided at the axis *b* in any given ratio and D I is equal to D *b*, and E K to E *b*, then on turning the beam about its axis, the two arms will manifestly retain their parallelism, and the three points I, *b*, K will be always in the same straight line, consequently, in virtue of the geometrical theorem above enunciated the two points I and K, will have similar corresponding motions, and the lines traced by them will always be in the ratio of D I to E K It only remains, therefore, to attach a tracing point at I and a copying point (a pencil) at K, in order to complete the construction These are placed in vertical tubes, and carefully adjusted to the centres of the tubes The tracer is guided by the right hand over the contour of the figure to be copied, and the pencil accurately follows its motions, describing a similar but reversed figure on a sheet of paper placed under it The pencil is pressed down by a small weight, and is raised from the paper, when required, by means of a rectangular lever, one end of which is connected with the pencil-carrier and the other moved by a string which passes over a pulley, and is held by the operator in his left hand In order to facilitate this motion the pencil is kept steadily in its place, and at the same time prevented from pressing against the tube, by small friction-wheels fixed in the tube The motion is extremely free, and with a little practice the outlines of even the most complicated figures, anatomical drawings for example, are copied with great facility and perfect precision

By combining two instruments adjusted to make reduced copies the reduction may be carried by a single operation to a much greater extent than could be done by one instrument For obvious reasons, the power of enlarging a figure is more limited Professor Wallace, likewise, proposed a form of the instrument, by which a copy of any subject is produced so reversed as to have the appearance of the [illegible] reflected from a plane mi[illegible]

invented about 1821, and was first described in the *Transactions of the Royal Society of Edinburgh*, vol xiii , it is also described in Wallace's *Geometrical Theorems and Analytical Formulæ*, 1839

ELAIOMETER (Gr ελαιον, *oil*, and μετρον, *measure*) An instrument for detecting the adulteration of olive oil

ELAOPTENE (Gr ελαιον, *oil*, and πτηνι, *I fly*) The *liquid* portion of the volatile oils, when separated from the concrete, or crystallisable portion, which had been called *Stearoptene*

ELECTRIC COLUMN An electric instrument invented by Deluc consisting of numerous alternating discs of silver leaf, zinc leaf, and paper *See* ELECTRICITY in DICT

ELECTRO MAGNETIC CLOCK The discovery of the mutual relations of electricity and magnetism by Oersted in 1819 necessarily led to the construction of the *electro-magnet*, and amongst its numerous applications that to *timekeepers* was perhaps one of the most obvious By referring to the description which we have elsewhere given of the electro magnet it will be seen that a bar of iron of any required form may have any amount of magnetism conferred upon it by proper adjustments of an electric current, and inasmuch as the magnetic power ceases the moment that the electric current is discontinued so we are enabled to render an iron bar, or horse shoe, a strong magnet, and at the next to withdraw all [illegible] further obvious that these magnets may be made and unmade at any distance, by an adequate extent of metal wire, so that at one and the same moment a magnet may be made and unmade at London and at Liverpool [illegible] if we please with the vibrations of the [illegible] which announce the signals of the electric telegraph And, of course, the magnet may be made alternately to lift and drop a weight, or to bend and release a spring or to raise and depress a lever Bearing these matters in mind the *principle* of electric clocks will be intelligible without entering into minute details respecting their varied mechanism

There are several ways in which electro-magnetism has been applied to these purposes, one of the first consisted in fixing upon the arbor or axis of the seconds wheel of a clock a wheel or disc of metal the circumference or edge of which was divided into sixty alternating divisions of metal and of ivory or wood the metal being a conductor and the ivory or wood a nonconductor of electricity A small platinum peg or point, was kept in contact with this divided edge, so as by the revolution of the wheel to be alternately in contact with the conducting and nonconducting surfaces, and so connected with a voltaic series as alternately to admit and resist the passage of an electric current In this way supposing the clock in question to be keeping accurate time one or more electro-magnets placed anywhere in the circuit of the conducting wire would be made and unmade at each succeeding second Now it is easy so to connect an electro magnet with a lever as to give motion to a wheel and axle and to cause it to revolve so as to indicate seconds and when in communication with a proper train of wheels to move the minute and hour hands of a clock, and this secondary, or *electro-magnetic clock*, would of course be regulated in its movements by the alternating electric current derived in the way we have mentioned, from the original time-keeper Every clock therefore, upon the circuit would show the same time as that shown by the regulator, and in this way, one good regulator may be made to preside as it were over any number of electro-magnetic movements, each of which will indicate the same time

Another form of the electro magnetic clock is that in which the pendulum is itself kept in action by electro-magnetism, and through it the other movements of the clock are sustained, and this is effected either *directly* as in Bain's clock, or *indirectly*, as in Shepherd's clock In Bain's clock the pendulum, at each vibration, moves a light slide by which the electric current is alternately completed and broken, and by which magnetism is alternately conferred upon, and abstracted from a coil enclosed in a heavy hollow brass case or tube, which constitutes as it were the bob of the pendulum, and on either side of which are the poles of two common, or permanent bar magnets, which alternately attract and repel the coil of the bob, as it is magnetised and demagnetised by the alternate presence and absence of the electric current These clocks have been kept in motion by electric currents derived from a zinc plate buried in damp earth, and so far, therefore, independent of the usual forms of voltaic battery, in which the electricity is derived from the action of dilute sulphuric acid upon zinc

The most recent form of electric clock is that invented and patented by Mr Shepherd, the large clock at the Great Exhibition of 1851, in Hyde Park, was of this description, and it appears to possess several advantages In this clock, electro-magnetism is the sole moving power, its force being employed, not only to give impulse to the pendulum and to propel the ordinary movement of the clock, but also to perform the striking of the hour, no auxiliary weights or springs being employed The pendulum is so arranged as to make and break the electric circuit, and make and unmake a horseshoe magnet at each vibration Each time that the magnet is made, it attracts its armature, which lifts certain levers, one of these is concerned in raising a weighted lever, and causing it to be held up by a latch or detent, the magnet is then unmade in consequence of the pendulum breaking the circuit, and its armature is released, when the pendulum lifts the latch and allows the weighted lever to fall, which, in falling strikes the pendulum so as to give it a certain adequate impulse, then the circuit is again completed the armature attracted, the levers moved, the weight raised and held by the detent, another vibration breaks the circuit and then releases the armature, the pendulum then raises the detent the weight falls, and in falling its arm strikes the pendulum and gives it its impulse, and so on

But the pendulum at each vibration not only makes and breaks the electric circuit which maintains its own action but also and simultaneously, that of another battery, of which the duty is to make and unmake the electro-magnets belonging exclusively to the clock or clocks which are upon this circuit These electro-magnets act upon the extremes of one or more horizontal bar magnets so as alternately to attract and repel their opposed poles and which carry upon their axes the pallets by the alternating motion of which to the right and left, the ratchet wheel is propelled onwards at the rate of a tooth each second, and the axis of this ratchet wheel carries the pinion which moves the other wheels of the clock

The circuit of the battery connected with the *striking* part of the clock, is only completed once in each hour, and is connected with an electro-magnet so arranged as by means of a proper lever to pull the ratchet wheel attached to the notched striking-wheel one tooth forward every two seconds and each tooth is accompanied by a blow on an electro magnetic bell The number of blows depends upon the notched wheel, the spaces in the circumference of which are adapted to the number to be struck and when this is complete a lever falls into the notch and in so doing cuts off the electric current which is not re established through the striking electro magnet till the completion of the next hour when a peg upon the hour-wheel pushes the striking lever forward so as to cause it to be depressed by a similar peg on the minute wheel

Electro magnetic clocks are peculiarly fitted for all large establishments where many dials each indicating the same time are required the pendulum by which the whole series is controlled is placed in some safe and quiet place and the only requisite precaution for maintaining them in order consists in careful attention to the conditions and functions of the voltaic apparatus or source of the electric current Smee's batteries as they are called consisting of amalgamated plates of zinc in proper connexion with plates of platinum, or platinised silver, and immersed in dilute sulphuric acid, or in sand moistened with that acid, are generally used the number and dimensions of the plates or cells depending upon the extent of wire which the electrical current is required to traverse and care being taken that the chemical action of the acid upon the plates is as small and feeble as is consistent with the object in view These clocks also promise to become importantly useful upon lines of railway, and for a variety of other purposes, more especially when some few difficulties attending their first expense and maintenance are overcome

ELECTRIC TELEGRAPH *See* TELEGRAPH, ELECTRIC

ELECTRICAL EEL *See* GYMNOTUS, in DICT

ELECTROLYSIS, or ELECTROCHEMICAL DECOMPOSITION (Gr ηλεκτρον and λυω, *I dissolve*) The separation of the elements of a compound by the transmission of electricity

ELECTRO-BIOLOGY (Gr ηλεκτρον, *Bios life*, and λογος *description*) A term that has recently been applied to certain mental phenomena produced by various applications of Mesmerism to the human body

ELECTROMETALLURGY The electro-chemical precipitation of the metals, as applied to various purposes in the arts

ELECTROMOTOR, or ELECTROMOTIVE FORCE Terms applied to the development of electri[illegible] Those substances which in electro chemical decompositions make their appearance at the *anode* or electropositive pole The term has reference to the mutual attraction of bodies dissimilarly electrical, and hence those which appeared to be attracted by the positive pole in the Voltaic circuit were presumed to have an inherent *Electronegative* state.

ELE'CTROPO'SITIVES Bodies appearing in electrochemical decompositions at the *cathode* or electronegative pole

ELECTROTYPE An impression of a medal, or bas-relief obtained by electric precipitation *See* VOLTAIC in Dict

ELECTROVITAL CURRENTS Two electric currents are supposed by some physiologists to move in the nerves of animals the one external and cutaneous, moving from the extremities to the *cerebro-spinal* axis, the other centrifugal, proceeding from that axis

ELLIPTIC FUNCTIONS In the higher mathematics the term *Elliptic Function* is used to designate any integral comprised in the formula $\int \frac{P\,dx}{R}$, in which P is a rational function of x, and R is a radical of the form $\sqrt{(\alpha+\beta x+\gamma x^2+\delta x^3+\varepsilon x^4)}$, α β, γ δ ε, being constant quantities Such integrals are called elliptic functions because they either contain, or are closely connected with expressions for the arc of an ellipse The principal works on the subject are the following *Exercises de Calcul Integral* 3 vols 4to 1811, and *Théorie des Fonctions Elliptiques*, 3 vols 4to 1825—1828, by Legendre, *Œuvres de* N H Abel, 2 vols 4to 1839, and Jacobi's *Fundamenta Nova Theoriæ Functionum Ellipticarum*, 4to 1829

ELLIPTIC POLARIZATION *See* POLARIZATION OF LIGHT

ELVAN COURSES In Mining, the term *Elvan* is applied by the Cornish miners to the porphyritic and other veins and masses which occasionally traverse granite and clayslate, deranging the direction of the metallic veins

ENCKE'S COMET *See* COMET, in Dict

ENDE'LLIONITE The triple sulphuret of antimony, lead and copper found in the mine Huel Boys, in the parish of Endellion, Cornwall

ENDLESS SCREW A piece of mechanism formed by combining the screw with a cog-wheel, or by making a screw act on the threads of a female screw sunk in the edge of the wheel The axis of the screw may be either in the plane of the wheel or at right angles to it, in the latter case it is called the American endless screw In its mechanical principle the endless screw is a combination of the inclined plane and the lever

ENDOSMOMETER (Gr ἐνδοσμος, and μετρον *measure*) In Physics, an instrument invented by M Dutrochet, to measure the endosmose with which one or other of two mixing fluids of different densities, will pass into each other and by which the less dense fluids are shown to pass with greater rapidity into the more dense fluids than *vice versâ*, in other words that "endosmosis" is more rapid than "exosmosis" A simple form of the instrument is a graduated tube expanded into a bell at one end over which a portion of membrane may be tied If the bell be filled with a fluid of much density such as a strong solution of salt and be immersed in one of less density, as water, the water will endosmose, or pass into the solution more rapidly than the solution will exosmose or pass out But if the water were put into the bell and the saline solution outside the directions of the currents would be reversed In both cases, however the currents would continue until the two fluids were equally mixed on both sides of the membrane

ENTERIMENTA *See* INTESTINALIA, in Dict

ENTOMOLINE (Gr ἐντομα *insects* and λινον *thread*) A chemical principle called also *chitine*, found in the shells of insects

ENTROCHITE (Gr ἐν *in*, τροχος, *a wheel*) A genus of fossils constituted of the petrified arms of the sea starfish

EPENCEPHALIC ARCH (Gr ἐπι *upon* or *near*, ἐγκεφαλον, *the brain*) The bony arch which encompasses and protects the epencephalon it is composed of the basioccipital, exoccipitals and superoccipitals and, in general anatomy, forms the neural arch of the occipital vertebra

EPENCEPHALON (See above) In Anatomy, the hindmost of the four primary divisions or segments of the brain including the medulla oblongata pons varolii cerebellum, and fourth ventricle

EPIDIDYMIS (Gr ἐπι *upon*, διδυμοι *twins*, or *the testicles*) In Anatomy, a body formed by convolutions of the commencement of the sperm-duct or *vas deferens*, lying upon the testicle and more or less closely attached to that gland In anthropotomy the epididymis is divided into *caput minor*, *corpus* and *caput majus*

EPIMERON (Gr ἐπι, *upon*, μηρος, *a limb*) In Zoology the part of the segment of an articulate animal which is above the joint of the limb

EPITHE'LIUM (Gr ἐπι *upon*, θηλη, *a teat*) In Anatomy, a thin and delicate kind of cuticle, like that which covers the nipple The term is now confined to the innermost layer of the internal cavities and canals of the body, which corresponds to the cuticle of the outer surface The epithelia of mucous membranes consist of the secreting cells of those surfaces, and are either "tesselated," "cylindroid," or "ciliated" The tesselated, or "*pavement epithelium*," is composed of flat, roundish, or polygonal cells, arranged in one or more layers, and is spread over the mouth, pharynx, and œsophagus, the conjunctiva, and the vagina, it is the kind of epithelium which most nearly resembles the external cuticle A tesselated epithelium also lines most of the vascular system, the ducts of many glands The *cylindroid* epithelium is composed of closeset cells of a conical or cylindrical form, and extends from the cardiac end of the stomach along the intestinal tract to the anus and lines the principal gland-ducts which open upon this surface It lines the ureters and urinary bladder,

The cells of this epithelium support at their free ends appendages called cilia, which are in constant and rapid vibration this kind of epithelium lines the whole respiratory tract, the interior of the cerebral ventricles, the uterus and oviducts, and the Malpighian capsules of the kidneys of the Batrachia

EPIZOO'TIC DISEASES (Gr ἐπι, *upon*, and ζωον, *an animal*) When diseases prevail among inferior animals, they are said to be *Epizootic*, corresponding to *Endemics* among men

EQUA'TION, PERSONAL The term *Personal Equation* has of late been introduced into Astronomy to denote the interval of time by which an observer, on the average of a number of observations, notes a phenomenon before or after the instant assumed to be that of its actual occurrence If it were possible to determine the true instant of the occurrence of any phenomenon with absolute certainty, the personal equation of an observer would be the amount of error he is in the habit of making or the probable error of a single observation made by him, but as the true instant of the occurrence can only be assumed by taking the mean of a number of observations the term has only a relative signification For instance, if, on comparing a number of observations of the same phenomenon by A and B, it be found that A notes the phenomenon, on the average, half a second sooner than B, then half a second is the *difference* of their personal equations, but this does not enable us to form any judgment with respect to the amount of error due to either, and it is only by a further comparison of observations made by A and B with those of other observers, that we are enabled to assume that the true instant at which the event occurred lies between the times noted by them respectively or before or after both If, however, it be assumed that either A or B observes correctly, then the personal equation of the other is half a second

Generally speaking the personal equation of an observer is a minute quantity seldom exceeding a few tenths of a second, but it is sometimes found even in the case of experienced observers to amount to, or even exceed, a whole second It is found to vary with the age of the observer and may possibly at all times depend in some measure on the state of his health The subject is treated at length in a *Memoir on the Difference of Longitude of Greenwich and Brussels*, by Prof Quetelet and Mr Sheepshanks, *Memoires de l Academie Royale de Bruxelles* tom xvi See also Introductions to the volumes of the Greenwich Observations

ERYTHRINE (Gr ἐρυθρος, *red*) One of a series of substances obtained from the *Roccella tinctoria*, a lichen which furnishes the blue dye stuff called *litmus*

ERYTHROPHYLLINE (Gr ἐρυθρος, *red*, and φυλλον, *a leaf*) The *red* colouring matter formed in certain leaves, when they change into their autumnal tints

ESMARKITE A species of Datholite or Borosilicate of lime discovered by Esmark at Arendal

ESOCIDE (Lat esox *the pike*) The *Pike tribe*, a family of *Malacopterygious*, or soft-rayed fishes having the ventral fins placed under the abdomen and including most of the voracious fresh-water fishes, as well as several marine species

ESSONITE A variety of the *Cinnamon Stone* of Ceylon consisting of lime, alumina, and oxide of iron

ETHIONIC ACID (Gr αἰθηρ and θειον, *sulphur*) An acid formed by the action of the vapour of anhydrous sulphuric acid on alcohol

EUCHRONIC ACID (Gr εὐχροος *of a fine colour*) An acid formed by the action of heat on the mellitate of

EUCHYSIDERITE (Gr εὐχυσις, *to melt easily*, σιδηρος, *iron*) A silicate of lime, magnesia, and protoxide of iron A species of *pyroxene*

EUDE'MONISM (Gr εὐδαιμονια, *happiness*) A term applied by some German philosophers to a system of moral philosophy which makes morality to depend on the production of happiness

EUDIALITE (Gr εὐ, *easily*, and διαλυω, *I dissolve*,

from the facility with which it is gelatinised by the action of hydrochloric acid.) A mineral from Greenland, of a red colour, and in dodecaedral crystals it contains silica, zirconia, lime, soda, and the oxides of iron and manganese

EUGE'NIA A genus of plants named by Michel in honour of Prince Eugene of Savoy, and the type of the order of Botany It embraces the large tree which yields the Clove Tree, and the Jambos, or Malabar plum, the ripe fruit of which has the odour of the rose

EUGE'NIN A crystalline substance extracted by alcohol from cloves

EUKAIRITE (Gr *ευκαιρος, seasonable*) A native seleniuret of silver and copper from Sweden

EU'LYTINE (Gr *ευ, easily*, and *λυω, I dissolve*) A mineral found at Freiberg, composed of silica, oxide of bismuth, and lime

EUNOMIA One of the small planets belonging to the group between Mars and Jupiter It was discovered by M De Gasparis at Naples on the 29th of July, 1851, and is the fifteenth in order of discovery At its discovery it appeared like a star of the ninth magnitude Four sets of elements have been computed, but they exhibit considerable discordance as usual, the extreme values of the semi-axis major being 955" and [illegible] vol xi No 9) *See* PLANET

EUPATORIUM (Eupator being the discoverer of its virtues) The herb *Agrimony*, in common use in Hospitals

EUPEPSIA (Gr *ευ*, well, and *πεπτω, to concoct*) Good digestion

EUPHOTIDE (Gr *ευ* and *φως light*) A rock consisting of saussurite and diallage It is the *gabbro* of the Italian mineralogists

EUPHRASIA (Corrupted from *Euphrosyne* from *ευφραω, merry*, because it exhilarates) The name of a genus of plants It includes the *E officinalis* or *Eyebright*, much esteemed as a popular remedy for diseases of the eyes it is also an ingredient in British herb tobacco

EUPYRION (Gr *ευ, easily*, and *πυρ, fire*) A term applied to several contrivances for obtaining instantaneous light, such as the fire-matches &c

EURITE or WHITE STONE (Gr *ευρυς, broad*) A fine grained granite in which the spar predominates

EUXANTHINE (Gr *ευ*, and *ξανθος, yellow*) A substance obtained from India under the name of *Purree*, or *Indian yellow* It is supposed to be derived from the bile of the camel, or of the elephant it forms small pale yellow crystals

EUXENITE (Gr *ευξενος, welcome*) A mineral containing columbium, yttria, and uranium, found at Arendal in Norway

EVERLASTING FLOWERS Certain flowers, whose hard tissue and deficient moisture renders them little liable to change, and enables them to retain their colour and appearance after having been gathered

EVIDENCE LAW OF An important enactment was passed in the 14 and 15 Vict chap 99, by virtue of which parties to suits, actions, or other proceedings in any court of justice are admitted witnesses It provides that on the trial of any issue joined, or of any matter or question, or on any inquiry arising in any suit, action, or other proceeding in any court of justice, or before any person having by law, or the consent of parties, authority to hear, receive, and examine evidence, the parties thereto, and the persons in whose behalf any such suit, action, or other proceeding may be brought or defended shall be competent and compellable to give evidence either *viva voce* or by deposition, according to the practice of the court, on behalf of either or any of the parties to the suit, action, or other proceeding By this clause, in addition to the parties offering themselves to give evidence in their own behalf, their opponents can compel them to give evidence in the cause Nothing in the act is to compel persons charged with criminal offences to give evidence nor is the act to apply to proceedings consequence of adultery Further, the new law authorises the common law courts to compel an inspection of documents whenever equity would grant a discovery Foreign and colonial acts, judgments &c, are to be received in evidence, without proof of the seal or signature, as also are apothecaries certificates Documents are to be admitted in England or Ireland from each other's place, and the courts, without proof of seal Persons forging the [illegible] be guilty of felony, and punished [illegible] act, which extends to all parts of the [illegible] except Scotland, came into force on the 1st of November, 1851

EXA'NGIA (Gr *εξ*, and *αγγειον, a vessel*) A term applied by some medical writers to diseases in which large blood vessels are broken or perforated, or enlarged, without any external opening it includes *aneurism varix*, and *cyanea*

EXA'NTHALOSE. (Gr *εξανθεω, to effloresce*) A name given by Beudant to native *sulphate of soda*, occurring as an *efflorescence* on certain lavas, and elsewhere

EXANTHEMATA (Gr *εξανθεω, to effloresce*) An efflorescence or eruption on the skin

EXCENTRIC Is applied to a wheel in which the axis is removed from the centre of the figure, or of which the periphery is not circular Excentrics are used for converting circular motion into alternating, rectilinear, or intermitting motion, and are usually driven [illegible]

EXCITANTS Medicines which excite the actions of the system they are either *general* such as alcoholic liquors, &c, or *local*, such as diuretics, diaphoretics

EXCITO-MOTORY ACTS In Physiology, the term has recently been applied to the first class of nervous actions defined by Hartley as "those sensory vibrations which are excited in the external organs and ascend towards the brain, when they arrive in their ascent, at the origins of motory nerves, as they arise also from the same common trunk, plexus, or ganglion, with the sensory ones affected detach a part of themselves at each of those origins down the motory nerves, which part by agitating the small particles of the muscular fibres excites them to contraction" (*On Man*, i p 92) "The actions of [illegible] coughing, hiccoughing [illegible] faeces and urine, with others of a like nature, are to be deduced from the first and fourth classes of motory vibrations, i e either from those vibrations which first ascend up the sensory nerves, and then are detached down the motory nerves, which communicate by some common trunk, plexus or ganglion, or else from those vibrations that run along the surfaces of uniform membranes, and so affect all the muscles which lie contiguous to any part of the membranes" (*Ib* p 97) "The yawnings and stretchings of persons disposed to sleep, the convulsive respiration of those that are just fallen asleep, and the convulsive motions which attend the extinction of the senses in epileptic fits, and the near approach of death, may be derived, perhaps, in part, from this source" (*Ib* p 93).

EXCRE'TORIES The ducts which convey the secretions [illegible] glands

EXCURSORES (Lat excurro, *I rush hastily*) An order of birds intermediate between the flying and walking tribes and belonging to the *Insessores*

EXINE A membrane situated between the extine and intine in the pollen of yew, juniper, cypress, &c

EXOCHNA'TA (Gr *εξοχος, prominent*) A designation of the long-tailed *Crustacea*, as the lobster and shrimp

EXPECTORATION (Lat) The act of ejecting matters from the chest The term is sometimes applied to the matter ejected, which is, however, more properly termed *sputum*

EXPERIME'NTUM CRU'CIS. (Lat) Bacon's *Crucial*, or *decisive* experiment, so called from the *crosses*, or finger-posts on roads as at once determining between two or more possible conclusions

EXPIRATION (Lat) In Physiology, the movements by which the air that has been changed by the respiratory process, is expelled from the lungs they are chiefly due to the elastic contraction of the lungs and the walls of the chest, after they have been dilated in the act of inspiration

EXSE'RTED (Lat exsertus, *thrust out*) A term applied to such stamens of plants as are longer than the corolla.

EXTENSOR MUSCLES As opposed to *flexor muscles*, are those which extend any limb or part, the muscle in the fore-arm which extends the joints of the fingers called the *extensor digitorum*, is an instance

EXTINE The external membrane of the pollen-grain of plants

EXTROVERSION (Lat) A term applied by surgical writers to those malformations of the body in which a part is, as it were, turned wrong side outwards Such [illegible] thus cases are on record of *extroversion* [illegible] in which there is a congenital defect of its anterior part, and of the corresponding portion of the parietes of the abdomen so that the internal surface of the bladder projects and forms a tumour

EYEBRIGHT *See* EUPHRASIA

EYE-PIECE (SOLID) The *solid eye-piece* is an invention of the Rev J B Reade, of Stowe, near Aylesbury It consists of three lenses, the anterior and posterior of which are double convex of crown glass, and the intermediate one a concave lens of flint The contact surfaces are cemented together, and consequently the action of the rays of light is similar to that of a single lens The advantages of this construction are, that it gives a large and flat field of view, and that the defects of spherical and chromatic aberration are got rid of These advantages arise from the great thickness

of the flat lens, which is a perfectly new feature in the construction of eye pieces

EYE PIECE (PERSONAL BINOCULAR) An eye-piece recently invented by Mr Thomas Jones, a well-known optician of London, for enabling two persons to observe the image of the same star with the same telescope It consists of two 3-glass eye-pieces having the first lens common to both This first lens is contained in a tube adapted in the usual way to the telescope, and, branching off at angles of 120° from it, are two other tubes, each containing other two lenses, fixed in smaller tubes sliding in them At the junction of the tubes is an equilateral prism, by which the pencil of rays passing perpendicularly through its first surface, is divided into equal parts at the opposite angle, and is reflected in two equal parts into the two branch tubes All the light received on one half of the object-glass is reflected into one tube, and that received on the other half into the other tube, and thus two distinct images of the star, as well as of the wires in the focus of the object-glass, are formed

By the use of this eye-piece, two persons may, under precisely the same circumstances, observe transits of stars, and thus obtain, much more certainly than it has been effected by other means, their *personal equation*, that is, the difference of average estimation of the time of a star's transit across the wires of a transit instrument In this respect the invention of Mr Jones is likely to be of inestimable service to astronomy, since the uncertainty attending the observation of time, and the different estimations of this element by different observers, have been the greatest obstacles to a perfect system of observation since the construction of large instruments and the great improvements introduced during the present century into the systems of the great observatories of Europe

F

FA'CET (Fr façette) In Anatomy, a small but well-defined surface of a bone or other part, as, e g the hexagonal divisions of the surface of the cornea of the compound eye of the insect and crustacean

FACTORIALS In Analysis, the name given by Arbogast to certain symbolical expressions representing the continued product of a series of factors such that each is greater or less than the preceding one in the series by a constant quantity For example, the expression x^{n+a} denotes the continued product

$$x\,(x+a)\,(x+2a)\,(x+3a)\quad\ldots\quad(x+\overline{n-1}\,a)$$

FÆ'CES (Lat) The excrements, usually confined, in Physiology to the solid matter evacuated from the alimentary canal According to the analysis of Berzelius, human fæces of consistence sufficient to form a coherent mass are composed of

Water			75 3
Matters soluble in water	Bile	0 9	5 7
	Albumen	0 9	
	Peculiar extractive	2 7	
	Salts	1 2	
Insoluble residue of the food			7 0
Insoluble matters which are added in the intestinal canal,—mucus, biliary resin, fat, and a peculiar animal matter			14 0
			102 0

This term is also applied to sediments, especially in vegetable infusions, tinctures and fermented liquors

FAUJASITE A hydrated silicate of alumina lime, and soda, from Baden, named after Faujas St Fond

FAVO'SE (Lat favus, *a honeycomb*) In Botany, honey-combed cellular

FAYALITE A native silicate of iron from the island of Fayal

FE'BRIFUGE (Lat febris, *fever*, and fugo, *I drive away*) A remedy which cures or relieves fever the term is commonly applied to medicines used in the treatment of agues

FELLIC and FELLI'NIC ACID (Lat fel, *gall*) Products obtained from bile

FENESTRA (Lat *a window*) In Anatomy, the term is applied to certain holes in the osseous or petrous capsule of the internal organ of hearing, one on the outer wall of the labyrinth, which is filled by the base of the "stapes," is called the "fenestra ovalis," a second, at the base of the cochlea, is called the "fenestra rotunda," and is separated by a membrane from the cavity of the tympanum

FERRIC ACID. A compound of 1 atom of iron with 3 atoms of oxygen, $Fe\,O_3$ It is very unstable, and has [illegible]

FERRIDCYANOGEN A compound of 2 atoms of iron and 6 of cyanogen and which, in combination with 3 atoms of potassium, forms the *Ferridcyanide of potassium* or [illegible] *of potash*

FERROCYANOGEN A compound of 1 atom of iron and 3 atoms of cyanogen, or 1 of iron, 6 of carbon, and 3 of nitrogen, and which, in combination with 2 atoms of potassium, constitutes *anhydrous ferrocyanide of potassium*, the crystals of which include 3 atoms of water This crystallized ferrocyanide of potassium is generally known under the name of *yellow prussiate of potash*

FI'CHTELITE A white crystalline substance found in a peat moss in Bavaria it is a hydrocarbon

FI'MBRIÆ (Lat fimbria, *a fringe*) In Anatomy, the jagged processes of the abdominal opening of the oviduct or "Fallopian tube," are so called

FIRE SHIP A vessel filled with combustible materials for the purpose of being sent in a burning state among the ships of an enemy, in order to set them on fire, and thereby effect their destruction As the destruction of the vessel itself is a necessary consequence, it must be abandoned by the men, and therefore cannot be steered Hence fire-ships are formidable only to vessels which cannot be manœuvred, either by reason of their having been disabled, or on account of their occupying a confined space, as a harbour, where there is not room for escape

FISCHERITE [illegible] phates of [illegible]

FLABE'LLIFORM (Lat flabellum *a fan*) Fan-shaped—as the plaited leaves of some palms

FLAGELLIFORM (Lat flagellum *a whip*) Whip-shaped A [illegible] whip's lash

FLEAM An instrument used by farriers to bleed horses and cattle it includes a small pointed blade, which is projected from a sheath by means of a spring

FLE'XOR MU'SCLES Muscles, the office of which is to *bend* the joints

FLOOD-GATE A sluice, or gate, for drawing off the superfluous water from a canal or reservoir liable to be flooded by falls of rain

FLORA One of the recently discovered small planets belonging to the group between Mars and Jupiter Flora was discovered at Mr Bishop's Observatory in the Regent's Park, on the 18th of October, 1847, by Mr Hind while comparing the fourth hour of the map of Professor Knorre with the Heavens It had then the appearance of a star of the ninth magnitude, but shortly after the discovery the brightness [illegible] equal to that of a star of the eighth [illegible] At Mr Bishop's request, Sir John Herschel named the planet *Flora*, with a rose for the symbol It is the eighth of the group The period of revolution of this planet appears to be somewhat shorter than that of any other of the group being 1193 25 days (*Monthly Notices of the Royal* [illegible] *See* PLANET

FLUOCERINE, FLUOCERINE The native fluoride of cerium, occurring near Fahlun, in Sweden

FLUELLITE Native fluoride of aluminum, occurring at Stenmagwyn, in Cornwall.

FOG-RINGS Banks of fog arranged in a circular or ring form, a meteorological phenomenon not unusual on the coast of Newfoundland (See *British Association Report for* 1846)

FOLLICLE (Lat) In anatomy this term is applied to a simple gland, consisting merely of a hollow vascular membrane, and an excretory duct hence the term *mucous* and *sebaceous follicles*

FOMES In medical language this term is applied to porous substances capable of absorbing and retaining contagious effluvia Wool and woollen clothes are said to be active *fomites*

FONT *of Type* *See* FOUNT, in DICT

FORENSIC MEDICINE (Lat forum, *the bar*) The application of medical science to the elucidation or solution of judicial questions

FOREST MARBLE A portion of the series of the lower oolite formation consisting of a coarse laminated shelly oolite, interposed between beds of clay and grit See GEOLOGY

FORESTS, SUBMARINE The inroads of the sea have in many places submerged forests of considerable extent A submarine forest on the coast of Lincolnshire was described in 1799 by Correa de Serra (*Phil Trans*) Another was discovered in 1832 in Cardigan Bay it is said to have been submerged in the year 520 The remains of the trees are covered by peat. A similar fir wood, beneath the mean level of the sea, exists at Bournemouth, in Hampshire These forests are sometimes also found in inland situations, of which there is a [illegible] four miles west of Newcastle-on-[illegible] consisting of an immense number of trees lying a few feet beneath the surface At the bottom of the moss of Kincardine, under a bed of peat

from 8 to 12 feet thick, are a number of trees which have been cut down, and hatchets are occasionally found in the moss It is supposed that these are the relics of the Caledonian forest cut down by Agricola (Lyell's *Geology*, &c Thomson's *Geology*, &c)

FORMULA (Lat) In Chemistry, a concise mode of exhibiting by symbols the results of chemical changes, and dependent upon the theory of atomic equivalents These formulæ are employed either to represent the actual results of experiment, or to indicate the different theoretical or hypothetical views which may be taken in reference to the composition of certain products Formulæ, therefore, are either empyrical or rational As an instance of the first-mentioned application of formulæ we may give those of water, of sugar, of carbonic acid, of alcohol, and of ether Water is a compound of an atom of hydrogen=1, and an atom of oxygen=8, the formula, therefore, of *water* is H O The formula of grape-sugar is $C_{12} H_{12} O_{12}$, that is, it consists of 12 atoms of carbon, 12 of hydrogen, and 12 of oxygen Carbonic acid consists of 1 atom of carbon =6 and 2 atoms of oxygen=16, its formula, therefore, is $C O_2$ Alcohol is a compound of 4 atoms of carbon, 6 of hydrogen, and 2 of oxygen, its formula being $C_4 H_6 O_2$, and lastly, ether is a compound of 4 atoms of carbon, 5 of hydrogen, and 1 of oxygen, and is represented by the formula $C_4 H_5 O$ All these are *empyrical formulæ*, that is simple statements of the composition of the several bodies

In the act of fermentation sugar is resolved into alcohol and carbonic acid, and this change may be concisely represented by the following arrangement of formulæ

$$C_{12} H_{12} O_{12} = 4 (C O_2) + 2 (C_4 H_6 O_2)$$

that is, 1 atom, or *equivalent* (for we use these terms synonymously) of grape-sugar, is equal to 4 atoms of carbonic acid and 2 atoms of alcohol

Now, in reference to the use of *rational* formulæ it may be remarked, that sugar may be hypothetically represented as a compound of 12 atoms of carbon, and 12 of *water*, and in that case its formula would be $C_{12} + 12 (H O)$

Again, alcohol is resolvable into ether and water, for $C_4 H_6 O_2$ is $= C_4 H_5 O + H O$ and lastly, ether may be regarded as an oxide of a hydrocarbon composed of 4 atoms of carbon and 5 of hydrogen, and which has been termed *Ethyle*, in which case its formula might be written $C_4 H_5 + O$, or ether may contain a hydrocarbon composed of 4 atoms of carbon and 1 of hydrogen in combination with an atom of water, in which case its rational formula would be $C_4 H_4 + H O$

FORMYLE The basic hydrocarbon of the formic acid $= C_2 H$

FORSTERITE A crystalline mineral accompanying the products of Vesuvius

FOUSEL OIL or FUSEL OIL (Gr φυω, *I produce*) [illegible] spirit and potato-spirit, and which [illegible] a disagreeable taste and smell When purified it constitutes the *amylic alcohol*, or hydrate of oxide of amyle, of modern chemists Its formula is $C_{10} H_{11} O + H O$

FOWLERITE A silicate of manganese and iron, from New Jersey

FOWLER'S MINERAL SOLUTION A solution of *arsenite of potassa* introduced into medicine by Dr Fowler of Stafford, as a substitute for a similar preparation, sold as a quack medicine, under the name of *Tasteless Ague Drops* The *Liquor Arsenicalis* of the Pharmacopœia is for the same purpose

FRAGARIA (Lat fragro *I smell sweet*) A genus of plants including the *Strawberry*

FRAGMENTARY ROCKS A geological term [illegible] posed of the agglutinated [illegible] *ceæ* and *Conglomerates* are of this class

FRANKLINITE A ferriferous oxide of zinc occurring in New Jersey, N America, so called in honour of Dr Franklin

FRAXINUS (Lat.) The ash A genus of plants, in which the common ash, *Fraxinus excelsior*, and the manna tree *Fraxinus ornus*, are included

FREE CHURCH OF SCOTLAND The name assumed by the [illegible] Presbyterians in Scotland that separated from the Established Church in 1843 Under the head Voluntaryism we have detailed at some length the causes that led to this important movement, and their results; and it remains for us here only to say [illegible] expected, the Free Church embraces a [illegible] adherents In 1851, no fewer than 570 [illegible] built for the accommodation of its members, 70 more were, at the same time, in the course of being built, and others were projected It had then, also, 613 ordained clergymen, and 197 congregations without ministers Very conflicting estimates have been formed of the total numbers of those within the pale of the Free Church; these being exaggerated by its friends, and underrated by its opponents On the whole, however, they may perhaps be safely estimated at about 600,000

Nothing, perhaps, has been so extraordinary, in connexion with the history of this secession, as the zeal and liberality displayed by the public in subscribing funds for the building of churches and the support of the clergy These amounted, in May, 1845, to no less than 776 453*l*, of which not 10 per cent was unpaid Large additional subscriptions have since been received During the year ended 30th March, 1850, the sum of 306 622*l* was received by the Free Church for its various objects A handsome college in connexion with the Free Church has been opened in Edinburgh, and houses (manses) for the accommodation of the clergymen have been built in most parts of the country

FRENCH CHALK Talc, or silicate of magnesia

FRENCH POLISH A solution of shell-lac in spirit of wine is the basis of this compound, a small quantity of linseed oil is added to it at the time of its application, and it is laid on by a ball of cotton-wool and rapidly rubbed in the direction of the fibres of the wood, when dry it is finished off by friction with tripoli and oil

FRENCH WHITE Finely pulverised talc

FRIABILITY (Lat frio, *to crumble*) The property by which substances admit of being crumbled into powder by gentle friction

FRIARS BALSAM The *compound tincture of Benzoin* of the London Pharmacopœia It is an alcoholic solution of benzoin styrax, tolu balsam, and aloes, it is used as a stimulating application to wounds and ulcers

FRIESLAND GREEN *Brunswick Green* An oxichloride or an ammonio chloride of copper

FRITILLARIA In Botany a genus of *liliaceous* plants including the *F Imperialis* or *Crown Imperial*

FRONTAL SINUS A cavity in the frontal bone, placed over the orbit, on each side

FRUGORDITE A silicate of alumina, lime, and magnesia from Finnland

FULGURITE The fused or vitrified tube which is produced by the passage of lightning through a sandy soil

FUMARIC ACID An acid existing in the *fumaria officinalis*, or common fumitory it may be produced by the action of heat on malic acid

FUMING LIQUORS Certain chemical compounds which exhale visible fumes or in common language *smoke*, when exposed to air *Boyle's fuming liquor* is sulphuret of ammonium *Cadet's fuming liquor* is an arsenical compound now termed *oxide of kakodyle* the *fuming liquor of Libavius* is the anhydrous bichloride of tin

FUNDUS (Lat fundus, *a basis*) In Anatomy, the base of any cone shaped organ the term is usually restricted to that part of the womb, the urinary bladder and the gall bladder

FUNGUS HÆMATODES *Spongoid inflammation, Soft cancer* A species of malignant tumor, called also *medullary sarcoma*

FUSCIN (Lat fuscus *tawny*) A brown colouring matter obtained from empyreumatic oils

FUSCITE (Lat fuscus *tawny*) A yellowish variety of compact scapolite from Norway It has also been termed gabronite

FUSEL OIL See FOUSEL OIL

FUSIBLE CALCULUS That species of urinary calculus which consists of a mixture of ammonio magnesian phosphate, and phosphate of lime, and which is characterised by the facility with which it enters into fusion before the blow pipe

FUSIFORM (Lat fusus *a spindle*) Spindle-shaped, thickest at the middle and tapering towards the ends

FUSINÆ, in Conchology, a term used for spindle shells

G

GABIAN OIL A petroleum or mineral naphtha exuding from the strata at Gabian, a village in Languedoc

GABRONITE (Gabbro, the Italian name of a rock composed of diallage and felspar) A mineral found in a vein of titaniferous iron near Arendal, in Norway It is a silicate of alumina, soda, and potassa It has also been termed *Fuscite* and *compact scapolite*

GADUS In Ichthyology, the name of a Linnæan genus of fishes, including the haddock, cod, whiting, and [illegible]

GAHNITE [illegible] of zinc, called also *automalite* Named from Gahn, who first described it

GALACTIC CIRCLE (Gr γαλα, *milk*) A term first used by Sir John Herschel to denote that great circle of the heavens to which the course of the Milky

Way, as traced by the unaided eye, most nearly conforms It is inclined, at an angle of about 63°, to the equator, and cuts that circle in two points, whose right ascensions are respectively about 0 h 47 m and 12 h 47 m, so that its northern and southern poles respectively are situated in R A 12h 47 m, N P D 63°, and R A 0 h 47 m, N P D 117° This circle, Sir John Herschel observes, is to sidereal what the invariable ecliptic is to planetary astronomy — a plane of ultimate reference, the ground-plane of the sidereal system (*Outlines of Astronomy*) *See* GALAXY

GALA'CTIC POLES (Gr γαλα, *milk*) The two opposite points of the heavens, situated at 90° from the Galactic Circle

GA'LACTINE (Gr γαλα, *milk*) An ingredient in the sap of the *Galactodendron utile*, or Cow tree of S America

GALACTODEN'DRON (Gr γαλα, *milk*, δενδρον, *a tree*) The *Palo di Vaca*, or *cow tree* of S America when tapped it yields a white, palatable, and nutritious liquid, much resembling milk

GA'LAXY (Gr γαλαξια, from γαλα, *milk*) The *Via Lactea* or Milky Way This luminous zone, so remarkable in a clear night, must have attracted the notice of the first observers of the heavens, and its true nature seems to have been surmised at an early period Manilius, in his Astronomicon, after alluding to the well known mythological fable of its origin, asks

> Anne magis densâ stellarum turba coronâ
> Contexit flammas, et crasso lumine candet,
> Et fulgore nitet collato clarior orbis?

The explanation of the phenomenon here suggested, namely, the condensed light of countless multitudes of small stars so crowded together as to be individually undistinguishable, is ascribed to Democritus, and its truth was confirmed or at least rendered greatly more probable, immediately on the discovery of the telescope, Galileo himself enumerating among the advantages resulting from his instrument, that of putting an end to the disputes about the nature of the milky way About the middle of the last century, Wright of Durham, and Kant and Lambert in Germany, speculated on the connexion of the phenomenon with the general arrangement of the stars in space, but the first who undertook a systematic examination of the galaxy with telescopes of adequate power was Sir William Herschel and it is to the indefatigable labours of this great astronomer and to those of Sir John F W Herschel who, during his memorable residence at the Cape, with the same telescope as had been used by his father, and by a similar process of examination, explored the regions of the sky which are invisible in our latitudes that astronomers are mainly indebted for the facts upon which any sound speculation respecting the constitution of the heavens can as yet be founded

The Milky Way, as seen by the naked eye presents the appearance of a succession of luminous patches of varying intensity Its breadth is very unequal in some parts hardly exceeding 5 degrees in others extending to 16 degrees, and there is a part between Serpentarius and Antinous where the two branches into which it is there divided occupy together a breadth of 22 degrees Its course through the heavens is nearly that of a great circle inclined at an angle of about 63 degrees to the equator, and cutting that circle in two points whose right ascensions are, respectively, 0 h 47 m and 12 h 47 m Struve remarks that the most condensed stratum does not lie exactly in one plane but appears rather to be contained in two different planes inclined at an angle of 10 degrees, and intersecting in the plane of the celestial equator, the sun being at a little distance from the line of intersection This slight deviation from a great circle had been remarked at an earlier period, and Lambert supposed it might be occasioned by the place of the sun being not exactly in the middle of the zone, but a little on one side It is convenient however, in speaking generally of the system of the galaxy, to refer it to a great circle of the sphere, and the great circle to which it most nearly conforms has been named by Sir John Herschel the *Galactic Circle*

At several parts of its course the Milky Way throws off streams or branches In Perseus a branch is sent off which is traceable to a considerable distance Another proceeds from a point near the star *m Puppis* nearly on the southern tropic In Argus it opens out into a wide fan-like shaped expanse, nearly 20° in breadth, which terminates abruptly, and at this part its continuity is interrupted by a wide gap At *α Centauri* it again subdivides At *γ Sagittarii* it suddenly collects into a vivid oval mass, about 6° in length and 4° in breadth, so exceedingly rich in stars that a moderate calculation gives upwards of 100,000 On the other hand, spaces occur in the very middle of its course, [illegible] eye, entirely devoid of stars, [illegible] most remarkable of these is situated in the Southern Cross, where the Milky Way approaches the nearest to the south pole, and so striking is its appearance that the early navigators described it by the name of the *coal sack* This space is of an irregular pear shaped form; it is about 8° in length and 5° in breadth, and was described and figured by the Abbé Feuillee in 1710 Lacaille correctly attributed its striking blackness to the effect of contrast with the vivacity of the Milky Way which surrounds it on all sides, and which in this region is remarkably brilliant.

At first view it might seem a hopeless attempt to determine the form or boundaries of the agglomeration of stars forming the galaxy, insomuch as we see only its projection on the surface of the celestial sphere, and that, too, from a position within it If however, the two following hypotheses be admitted 1st, that the stars are so distributed through space as to be, on the average, at nearly equal distances from each other, and 2d, that the telescope penetrates so far as to reach the extreme limits of the agglomerated mass, — then the relative distances of the remotest stars in every direction, and consequently the shape of the mass, may be estimated [illegible] number of stars in the field of view of one [illegible] same telescope in a great number of different directions, for, granting the above hypothesis, it is obvious that the distances of the remotest stars will be proportional to the cube root of the whole number visible in the field This was the process followed by Sir William Herschel, in his celebrated *gauges of the heavens* The telescope he made use of was a reflector of 20 ft. focal length, having an aperture of 18 inches in diameter, and the magnifying power was 180 With this instrument he made upwards of 3400 gauges, and thereby ascertained the number of stars visible in the field of the telescope in so many different directions

[illegible] was [illegible] field of view on increasing the angle between the direction of the telescope and the plane of [illegible] From a careful analysis of the gauges of Sir William Herschel Struve deduced a formula which expresses the number of stars in a field of view of 15 minutes in diameter in terms of the angular distance from the galactic equator At the distances of,

0°	15°	30°	45°	60°	75°	90°

the numbers (representing the average of the gauges) are, respectively,

122 00	30 30	17 68	10 36	6 52	4 68	4 15

whence it appears that the average density of the stars in the plane of the galactic circle is nearly thirty times greater than in the direction of its poles The researches of Sir John Herschel have established the fact that a similar law of diminution is observed in the southern galactic hemisphere, the average number of stars in a field in both hemispheres being very nearly the same at equal angular distances from the galactic equator

It is to be remarked that the great increase in the number of stars which is observed in the neighbourhood of the galaxy is occasioned chiefly by the greater abundance of telescopic stars that is to say, of those beyond the 6th order of magnitude Stars of the first magnitude are distributed over the sphere with tolerable uniformity Taking however, the whole number visible to the naked eye, a rapid increase is perceptible as we approach the limits of the galaxy, but with respect to those of the smaller magnitudes, and particularly beyond the 11th, the accumulation along that circle and its branches almost exceeds imagination The vast predominance of the small stars must be held to indicate the immense distances at which they are situated

From the relatively greater abundance of stars in the plane of the galactic circle, than in the regions on either side of it, and from the indication of some preponderance on the southern side, Sir W Herschel drew the conclusion that the galaxy is composed of a stratum of stars of which the thickness is inconsiderable in comparison of its length and breadth, and that the sun is placed not far from the middle of the stratum, but somewhat nearer to its northern than to its southern side He was also enabled to draw a further conclusion Assuming the real magnitudes of stars to be the same on the average, through the whole sidereal system, he determined by a series of photometrical experiments that stars of the 6th magnitude (the least visible to the naked eye) are 12 times more remote than those of the first (Sirius, for example), and that the penetrating power of his 20-foot telescope (with the front view) was 75 times greater than that of the naked eye so that the smallest stars visible in the telescope are at a distance equal to 900 times the distance of Sirius Now the average apparent breadth of the Milky Way is about five degrees, consequently its linear breadth at that great distance must be 900 × sin 5° or equal to 78 times the distance of Sirius or more than six times the distance of the stars of [illegible] Therefore the Milky Way even in [illegible] its poles, extends to three

times the distance of the smallest stars visible to the unaided eye, the sun being supposed at the centre of the stratum Hence it follows that not only our solar system, but all the stars in the firmament visible to the naked eye, are plunged to a great depth in the stratum of stars forming the galaxy, and form an integral part of it

It must be kept in mind that the above conclusions are based on two hypotheses which are, at best, very precarious, and in fact both of them appear to have been abandoned by Sir W Herschel himself in his later years. With respect to the first, namely, the distribution of the stars in space at nearly equal distances from each other, he remarks in a paper published in 1817, that although a greater number of stars in the field of view may be taken in general as an indication of their extension to a greater distance, yet the gauges have in reality more direct reference to the condensation than to the distance, and hence a greater number in the field of view may be explained as well by a greater condensation of the nebula as by a greater extension of its figure in the direction in which the stars appear most numerous The other hypothesis, namely, that the telescope penetrates to the extreme boundaries of the galaxy is subject to much doubt, and cannot be easily established or disproved Sir W Herschel, speaking in 1818 of his 40-foot telescope, the penetrating power of which he estimated to reach to 2300 times the distance of Sirius, states, as his opinion, that even at this enormous distance the limit of the stratum was not attained, inasmuch as the telescope failed to resolve the nebulous appearance into stars and he therefore concluded the stratum to be fathomless Sir John Herschel thinks the limit has been attained only in certain directions, "Throughout by far the largest portion of the extent of the Milky Way in both hemispheres the general blackness of the ground of the heavens on which its stars are projected, and the absence of that innumerable multitude and excessive crowding of the smallest visible magnitudes, and of the glare produced by the aggregate of multitudes too small to affect the eye singly, which the contrary supposition would appear to necessitate, must, we think, be considered unequivocal indications that its dimensions, *in directions where these conditions obtain* are not only not infinite, but that the space penetrating power of our telescopes suffice fairly to pierce through it and beyond it" But, on the other hand, there are parts where not the slightest indication of a limit is discernible "Such is, in effect, the spectacle afforded by a very large portion of the Milky Way in that interesting region near the point of its bifurcation in Scorpio where through the hollows and deep recesses of its complicated structure, we behold what has all the appearance of a wide and indefinitely prolonged area, strewed over with discontinuous masses and clouds of stars, which the telescope at last refuses to analyse" (*Outlines of Astronomy*, 1849)

It thus appears that the amount of knowledge which has yet been obtained respecting the constitution of the galaxy, is extremely [illegible] conclusions, in fact, which can be safely drawn are the following —

1 That the whole light of the Milky Way is nothing but the light of innumerable stars of all magnitudes down to the faintest point perceptible in the best telescopes

2 That the phenomena, on the whole, agree with the supposition that the stars of our firmament, instead of being scattered through space indifferently in all directions, form a stratum of which the thickness is small in comparison of its length and breadth, and that the sun occupies a place near the middle of the thickness, and near the point where the stratum is subdivided into two principal laminæ

3 That if all the fixed stars in the firmament be regarded as forming one great system — that of the galaxy — we are still in complete ignorance of its extent, and without the least idea of its external form

GALE'GA (Gr *γαλα*, *milk*, because it is supposed to increase the milk of [illegible] The name of a genus of [illegible] or *goat's rue*, a plant of little taste, and eaten in Italy in salads

GA'LIPOT A white resin derived from the *Pinus maritima*

GALLI'ZENITE A mineralogical synonym of *Titanite*

GALT A provincial term applied to certain beds of chalk-marl, found in the east of England, between the upper and lower greensand

GANGUE The mineral substances which accompany metallic ores in the veins of rocks

GARANCINE One of the colouring matters derived from *madder*

GARCINIA (From Dr Garcin) A genus of plants including the celebrated *Mangasteen tree*, the fruit of which, about the size of an orange, is said to excel in flavour and salubrity

GASHO'LDER. A hollow cylindrical vessel open at bottom and closed at top, suspended by counterpoises in a tank of water, so that it may be filled with gas introduced by a central pipe, and the gas afterwards distributed by proper pressure through the mains which convey it for service Some of these gasholders of coal-gas are of enormous size, holding half a million cubic feet and upwards

GASOMETER This term is often applied to the gasholders of coal-gas works, but it should rather be limited to a smaller instrument constructed upon more delicate principles, and capable of accurately measuring the quantity of gas of any kind which passes into and out of it These instruments are sometimes constructed upon a much smaller scale in glass and iron, for the purpose of containing mercury, so as to be used for gases which are absorbable by water

GASTRO'TOMY (Gr *γαστηρ*, and *τεμνω*, *I cut*) The [illegible] cutting into the abdomen

GAY LUSSITE A mineral named after Gay Lussac, found at Lagunilla, near Merida, it is composed of nearly equal weights of carbonate of soda, carbonate of lime, and water

GAZOLYTES *See* AEROLITES, in DICT

GEAR, or GEER A term applied in Mill work to wheels, or wheels and pinions, acting into each other *Spur gear* signifies wheels acting together in the same plane, with their axes parallel, for example, the wheel and trundle *Bevel gear* is applied to wheels acting together whose axes are inclined to each other

GEINE (Gr *γη the earth*) The soluble brown matter which may be extracted from soils by the action of water *See* HUMIC ACID

GELO'SCOPY (Gr *γελαω*, *I laugh*, and *σκοπεω*, *I view*) A divination founded upon laughter, whence the qualities and characters of persons might, it was presumed be deduced

GEMITRICES (Lat *gemo*, *to moan* or *coo*) In Ornithology, an order of birds comprising the *Columbinæ* or pigeons

GENETTE (Fr) A small variety of horse Also an animal of the weasel kind (*Viverridæ*), having a musky odour

GENIOGLO'SSI (Gr *γενειον*, *the chin*, and *γλωσσα*, *the tongue*) In Anatomy, a pair of muscles by which the tongue is protruded

GENISTA (Lat *genu*, *a knee*, so named from the inflection and angularity of the twigs) A genus of plants including the *G tinctoria* or *Dyer's Broom*, &c

GEORAMA (Gr *γη the earth*, and *οραω*, *I see*) The name given to a large concave globe, or spherical chamber, having the features of the earth delineated on the concave surface A spectator in the interior of such a globe sees a much larger portion of the surface at once than if he occupied an exterior position, and it has accordingly been suggested as a theatre for geographical lectures (*Address to the Anniversary Meeting of the Royal Geographical Society*, 1850, by the President Captain W H Smyth R N)

GEOTHERMO'METER (Gr *γη*, *the earth*, and thermometer) An instrument for measuring the earth's heat at different places, as in wells and mines, and for determining its rate of increase with the depth The temperature rises about one degree of Fahrenheit's scale for every 70 or 80 feet of descent, hence the inference that at the depth of a few miles the earth must be incandescent

GERMAN SILVER A silver-like alloy generally composed of nickel, copper, and zinc, various proportions are given, amongst which the following are said to be the best 1 nickel, 1 zinc, 2 copper, and 8 nickel, 3½ zinc, 8 copper It resembles the tutenag of the Chinese

GERM-CELL In Physiology, the cell which results from the union of the spermatozoon, or spermatic matter conveyed by it with the germinal vesicle, or its nucleus The germ-cell assimilates the surrounding yolk and propagates its kind by spontaneous fission, whence the first or parent-cell has been termed the "primary germ-cell," and its progeny the "derivative germ cells"

GERMINAL AREA In Physiology, the circular or oval space formed by liquefaction and metamorphosis of a peripheral portion of the germ mass preparatory to the appearance of the first trace of the proper embryo It is divided into a central clear part called "area pellucida," and a peripheral part called "area opaca," the portion of the latter, in which blood and blood-vessels are developed is called the "area vasaclosa"

GERMINAL MEMBRANE In Physiology, the strata of cells and nuclei of cells originally forming, and afterwards extending from, the germinal area: the external stratum is the "vertebral" layer, also called the "serous" and "animal" layer, the internal stratum is the "visceral" layer, also called the "mucous" and "vegetal" layer

GERMINAL SPOT In Physiology, the nucleus of

the germinal vesicle. it consists of a finely granulated substance, strongly refracting the rays of light

GE'RMINAL VESICLE In Physiology, a clear nucleated cell, which is the first formed and most essential part of the ovum it is surrounded by the yolk, and passes to the periphery of that part prior to impregnation, after which the germinal vesicle becomes opake, or disappears It was formerly called, after its discoverer, the Purkinjian vesicle

GERM MASS In Physiology the materials prepared for the future formation of the embryo, consisting of the derivative germ-cells and the yolk which they have assimilated

GERM YOLK In Physiology, that portion of the primary yolk of the egg which is to be assimilated by the derivative germ-cells in the formation of the germ-mass In some animals the whole yolk is so assimilated, in others, as e. g the bird, only a very small portion, that, viz which is included in the germ-mass of cells [illegible]

GIANT'S CAUSEWAY *See* GEOLOGY, in DICT

GIB'BSITE The native hydrated alumina of Massachusetts, named after Col Gibbs

GI'LBERITE A white talcy mineral composed chiefly of silica, alumina, and lime, from St Austle, in Cornwall, named by Dr Thomson, from Mr Davis Gilbert, late President of the Royal Society

GILL A measure of capacity equal to the fourth part of a pint Most people, however, to all Physiologists other than ichthyologists and other aquatic animals

GI'MBERNAT'S LIGAMENT The tendinous expansion of the lower portion of the oblique muscle of the abdomen, by some defined as the third insertion of *Poupart's Ligament*

GI'NGLYMUS GINGLYMOID (Gr *γιγγλυμος, a hinge, ειδος, like*) Hinge-like An anatomical term applied to joints formed for motion in one plane

GIROUETTE (Fr *a weathercock*) Public characters who turn with every political breeze The French published a *Dictionnaire des Girouettes*, containing the names of the most celebrated revolutionary characters, with a number of weathercocks against each, corresponding to the number of his political [illegible]

GISMONDINE A native silicate of lime, first noticed by Gismondi at Capo di Bove, near Rome It occurs in octohedral crystals

GIZZARD The proper stomach of birds, its texture differs remarkably in granivorous and carnivorous birds, being thick and fleshy in the one and thin in the other

GLACIES MARIA (Lat) One of the old mineralogical names applied to the large foliated *mica*.

GLANDERS A disease in horses characterised by mucous discharge from the nostrils

GLASS-GALL The saline scum which rises to the surface of fused glass in the glass pots, it is also called *sandiver*

GLASS SOAP A term sometimes applied in the glasshouse to certain substances which take away colour from glass, thus oxide of manganese destroys the green tint derived from iron

GLASS FOR TELESCOPES Till lately, English artists had failed in producing large disks of glass for the formation of object glasses for telescopes, all the large object-glasses in the public and private observatories being of foreign manufacture Since the duty has been taken off [illegible] in England [illegible] and Messrs [illegible] of pure glass 29 inches in [illegible] is 2½ inches, and weight [illegible] iced at the Great Exhibition of 1851, and was subjected to a very severe examination for the purpose of detecting defects arising from striæ, tension arising from imperfect annealing, bubbles, &c The only serious defect which was detected after a very lengthened examination was the existence of a group of striæ occupying a space of about 6⅛ inches in length, and 2⅛ inches in breadth, beginning at about 1⅛ inches from the edge, and having its longer dimension directed towards the centre It was found that if it were ultimately thought necessary to sacrifice the defective portion, a disk of absolutely pure glass of at least 22 inches, or probably even of 25 inches in diameter, would still be left, being almost double the diameter of the largest object-glasses mounted in any observatory at present

GLAUBERITE A double sulphate of lime and soda, occasionally associated with rock salt.

GLAUBER'S SECRET SAL-AMMONIAC Sulphate [illegible]

GLAUCOLITE (Gr *γλαυκος, azure, and λιθος, a stone*) A blue-green mineral from near Lake Baikal in [illegible] and potassa.

GLAUCONITE (Gr *γλαυκος, azure*) A constituent of the *green-sand* formation, it is also sometimes found in the cavities of certain trap-rocks. Under the name of *green-earth* it is used as a pigment It is [illegible] iron alumina and magnesia

GLAZING [illegible], it often contains oxide of lead [illegible]

GLECHO'MA A genus of plants including the *G. Hederacea* or *Ground Ivy*, a favourite popular remedy for the cure of obstinate coughs

GLE'NOID (Gr *γλενη, a cavity, ειδος, like*) A term applied in anatomy to certain articular surfaces of bones thus the surface of the scapula which articulates with the head of the humerus is called the *glenoid cavity* of the scapula or blade-bone

GLI'ADINE (Gr *γλια, glue*) A chemical term applied to one of the constituents of the gluten of wheat

GLO'CHIS (Gr *γλωχις a projecting point*) A form of hair occurring in plants forked at the apex a *barb*

GLO'SSOPETRÆ (Gr *γλωσσα, tongue*, and *πετρα, rock*) The fossil teeth of certain fishes

GLO'TTALITE (From *Glotta*, the river Clyde) A white mineral from the vicinity of Glasgow It is a hydrated silicate of lime and magnesia

GLUCO'SE (Gr *γλυκυς, sweet*) A distinctive chemical term applied to the sugar of grapes, and to starch sugar, &c See GRAPE SUGAR

GLUME In Botany, the *husk*, or peculiar calyx of grasses

GLUTE'AL (Gr *γλουτος, the buttock*) Of or belonging to the buttocks as gluteal *muscles, arteries, &c.*

GLYPHO'GRAPHY (Gr *γλυφω, I engrave, γραφειν, to draw*) An art by which an engraving is produced by the simple mode of drawing in other words, an art by which the operations of drawing and engraving, which were formerly distinct, are here combined in one Various admirable specimens of this art were displayed at the Great Exhibition The process is as follows — a drawing having been made through the ordinary etching ground, the plate is then etched, and rolled up with a mixture of various substances, a copper-plate be [illegible] over the whole

GMELINITE A hydrated silicate of alumina, potassa, and peroxide of iron, named after Gmelin, the mineralogist It has also been called *hydrolite*, from the quantity of water which it includes

GNAPHA'LIUM (Gr *γναφαλον, the wool of the teasel*) The name of a genus of plants including the *G dioicum* or *Cotton Weed*

GODBOLD'S VEGETABLE BALSAM A quack remedy composed chiefly of honey and vinegar

GO'DFREY'S CORDIAL A quack medicine made by infusing 9 ounces of sassafras shavings, and of bruised caraway, coriander, and anise seeds each 1 ounce, in 6 pints of water [illegible] reduced to 4 pints, then add [illegible] and treacle boiling for a few minutes straining, and adding lastly 3 ounces of tincture of opium

GOLD The auriferous deposits in California were discovered so late as 1848, and the accounts of their extraordinary productiveness occasioned an unparalleled influx into the country of adventurers from the U. States and all parts of the world For a while the accounts in question were pretty generally regarded by the less sanguine portion of the public as being in the highest degree exaggerated But the result has shown that such had not been the case, and the produce obtained from the washings and the mines has exceeded even the most extravagant *à priori* estimates of its magnitude It is believed on good grounds, to have amounted in 1849, 1850, and 1851, to from 8,000,000*l* to 10,000,000*l* a year, and it is increasing with every increase in the numbers and skill of the diggers and miners Whether it will continue at this rate for any considerable time it is impossible to say But if it does, it cannot fail to exercise a powerful influence over the value of gold

But it is not alone from California that new supplies of gold are beginning to be thrown upon the market An auriferous region has very recently been discovered in Australia, about 160 m W Sydney And though it be, at present, impossible to form any estimate of its probable productiveness its appearances are most flattering Some very large masses of native gold have been discovered, and the locality in which it is found bears, it is said, a striking resemblance to that of the most productive of the auriferous regions of California

GOLDBEATER'S SKIN The membrane used by goldbeaters, and interposed between the leaves of gold when they have attained considerable tenuity the intestinal membrane of the rectum of the ox is generally used

GOLDEN SULPHURET OF ANTIMONY A preparation of [illegible] consisting of a mixture of the sulphuret and oxide of the metal

GOLD LEAF *See* GOLD, in DICT

GO'LHITE One of the mineralogical synonyms of

the *hydrated peroxide of iron*, or brown fibrous hematite of ores

GOMPHOLITE (Gr *γομφος* a nail, *λιθος* a stone) A term applied by Brongniart to certain rocks of the tertiary series of the Isle of Wight

GORDIUS (Lat) The hair worm, or *seta equina*, found in stagnant water in Lapland and elsewhere

GORGONIA NOBILIS (Lat) An old synonym of *Corallium rubrum* or red coral

GOSSYPIUM (Lat) Cotton The systematic name of the cotton plant is *Gossypium herbaceum*

GRAIN The integer of our system of weights *See* WEIGHTS, in DICT The troy pound contains 7000 grains, and the avoirdupois pound 5760 grains The French decigramme is about 1 5 English grains, the gramme being 15 434 English grains

GRAIN TIN The purest kind of tin The term was formerly applied to the metal obtained from the rounded pebbles of tin stone, called *stream tin* The peculiar columnar fracture which pure tin exhibits when broken, is given by heating the ingot till it becomes brittle, and then letting it fall from a height upon a hard pavement

GRAINS OF PARADISE The seeds of a species of *amomum* they are acrid, and said to be the *malaguetta pepper* of Africa

GRAMMATITE The name originally given by Hauy to the mineral usually called *Actinolite* or *Amphibole*

GRAMME The French integer of weight = 15 434 English grains *See* WEIGHTS, in DICT

GRAMMITE A mineralogical synonym of the variety of bisilicate of lime, commonly called *Tablespar*

GRAPE SUGAR or GLUCOSE The peculiar form of sugar existing in grapes and in fruits generally it differs from cane sugar in having much less sweetening power and in being very imperfectly crystallisable its chemical formula in its crystallised state is $C_{12} H_{14} O_{14}$, that of crystallised cane sugar being $C_{12} H_{11} O_{11}$

GRASS-OIL Some of the *grasses* yield odorous volatile oils as the *Anthoxanthum odoratum*, the *Andropogon* of *Ivanguza*, and from the *Andropogon calamus aromaticus* or *nardoides*

GREEK FIRE A highly inflammable compound supposed to have been invented by the Greeks, and to have consisted of bitumen, or asphaltum, nitre, and sulphur

GREEN EARTH *See* GLAUCONITE

GREENLANDITE A [illegible]

GREEN LEAD ORE [illegible]

GREGORITE The *menachanite* of Cornwall discovered by Mr Gregor, whose name it bears An ore of titanium

GRIFFITHS' MIXTURE The Mistura Ferri Composita of the London Pharmacopœia, it is a useful ferruginous tonic, deriving its efficacy from the protocarbonate of iron

GROUND GRU Ice formed under peculiar circumstances at the bottom of running water *Grue* is the name given by the people of Lincolnshire to snow swimming in or mixed with water, and the ground ice, a phenomenon of not unfrequent occurrence in that part of the country having a considerable resemblance to this goes by the same name

[illegible] of the formation of ground ice is attended with some difficulty Dr Farquharson, who has carefully investigated the facts, and given the results of his observations on the ground grue of the rivers Don and Leschal in Lincolnshire, in two papers printed in the *Philosophical Transactions* for 1835 and 1841, is of opinion, that the ice is formed when the water has gone down to the temperature of the freezing-point in consequence of the bottom being cooled to a still lower temperature through the effect of radiation, in the same manner as dry land, under a clear sky is cooled below the temperature of the air and in corroboration of this opinion he states, that the formation never occurs excepting under a clear sky, and does not take place where the stream is shaded by bridges or high banks It has been objected to this theory, that ground ice has been observed in the Neva under a thickness of three feet of surface ice, and an additional covering of three feet of [illegible] ch radiation could not take [illegible] rightly remarks, that this fact can form no valid objection to his explanation, unless it were ascertained that the ground ice was formed *after* the surface ice and fall of snow, and not before M Arago, in the *Annuaire du Bureau des Longitudes* for 1833, after stating the observations which had then been collected on the subject, attributes the formation to three circumstances 1 In a body of water in motion, the temperature of which is below 39° of Fahrenheit (under which water becomes specifically lighter by a further diminution of temperature), the eddies of the current throw down the coldest parts which, in still water, would remain at the surface, so that the whole stream from the surface to the bottom acquires the same temperature through this mechanical action 2 The aptitude to the formation of crystals on the stones and asperities at the bottom 3 Less impediment to the formation of crystals at the bottom, in consequence of the comparatively greater stillness of the water Probably all these circumstances may concur, but as it frequently happens that they are all present when surface ice only is formed, some other conditions appear to be necessary, and Dr Farquharson's theory, or radiation, seems the most probable which has been yet suggested On this subject see, in addition to the works above referred to, Colonel Jackson's paper on the Congelation of the Neva, in the *Journal of the Royal Geographical Society*, Mr Eisdale's, in the *Edinburgh New Philosophical Journal*, vol xvii , and Mr Weitz's, on the Ground Gru of the Siberian rivers, in the *London Geographical Journal*

GROUND SWELL An undulation of the ocean caused by the continuance of a heavy gale of wind Ground swells are rapidly transmitted through the water, sometimes to great distances, and even in direct opposition to the wind, until they break against a shore, or gradually subside in consequence of the friction of the water They indicate, by the direction of their movement, the quarter in which a storm has raged, and occasionally they are observed to come from various points of the compass at the same time

GUN COTTON *Pyroxyline* A highly inflammable and explosive substance, discovered by Schonbein obtained by steeping clean cotton wool for a few minutes in a mixture of the strongest sulphuric and nitric acids in equal proportions, it is then thoroughly washed, and cautiously dried at a temperature of 212° The original appearance of the cotton is little changed, but it has now become explosively inflammable, and when kindled by a spark it very suddenly flashes off with greater rapidity and energy than gunpowder, for which it has been proposed as a substitute, but the sad accidents which have occurred in the attempts to manufacture it upon a large scale have hitherto prevented its employment. When used in a gun it is much more energetic, weight for weight, than gunpowder, but, like fulminating mercury, it is apt, from the extreme suddenness of its explosion to burst the gun It appears to be pre-eminently fitted for blasting rocks

The composition of gun cotton has not been very satisfactorily determined, by some it has been considered as a *nitrate of lignine*, that is, as a direct atomic combination of lignine and nitric acid, represented by the formula $C_{24} H_{16} O_{16} + 5 NO_5$ Porret thinks that the cotton acquires oxygen from the nitric acid and forms a new basic compound which he calls *lignea* and he regards gun cotton as a *hyponitrite of lignea*

Gun cotton is soluble in ether, and furnishes a glutinous liquor which has been used as an adhesive application in surgery, and even as a substitute for common sticking plaster or goldbeater's skin This solution has been called *Collodion* When spread upon a surface the ether evaporates and leaves the gun cotton in the form of a transparent film, still very inflammable and explosive, and like the gun cotton itself, becoming highly electric on friction

GURHOFITE A compact magnesian carbonate of lime from Gurhoff in Lower Austria

GUTTA PERCHA This important article, the uses of which in arts and manufactures are on the rapid increase is the produce of a large forest tree (*Isonandra Gutta* Nat Ord *Sapotaceæ*) growing in the mountains of Singapore and in the forests of Johore at the extremity of the Malayan Peninsula, and in Borneo, it is plentiful at Sarawak where it is called *Nato*, it is also supposed to abound on the clusters of islands to the south of Singapore The gutta percha appears to separate from the juice or sap of the tree in the same way as India rubber, and its general properties in regard to solvents and to the products of destructive distillation resemble those of caoutchouc At common temperature gutta percha is somewhat hard and very tough and unyielding, but when immersed in boiling water it softens so as to admit of being beaten into a mass and moulded into any requisite shape, and on cooling it resumes its hardness In very thin films it has a pale yellow or pinkish tinge, but generally occurs in brown or blackish lumps or masses, of a somewhat mottled appearance upon the cut surface, and translucent at the edges When softened it may be stretched into slips which do not recover their former shape when the force is withdrawn, but retain a kind of leathery pliability on cooling When heated to about 350° gutta percha undergoes a kind of fusion, and remains viscid when cold It burns with a strong yellow smoky flame It is said to be obtainable in very large quantities, but that from the destructive mode hitherto pursued by the natives in obtaining it, there is a risk of its scarcity It was first

made known in England in 1843 by a communication from Dr Montgomery to the Society of Arts

Gutta percha has been applied to the manufacture of ornaments architectural and other ornaments book-bindings water pipes engine-hose picture frames [illegible], and in hinges, and of the soles of boots and shoes, &c &c , and when blended with caoutchouc it is used for driving machinery, for saddles, cushions, walking sticks &c

GYNÆCONOMI Athenian magistrates superintending the conduct of women, and having the power of inflicting punishment in cases of misdemeanour They differed, therefore, from the *Gynæcosmi*, who were inspectors of dress

GYRASOL *See* GIRASOL in DICT

GYRATION, CIRCLE OF If a body revolve round an axis, a point can be found in it at a certain distance from the axis at which, if the whole body were compressed, the moment of inertia would remain the same This point is called the *centre of gyration*, and the radius of the *circle of gyration* is its distance from the axis Thus, if M be the mass of a body and k the radius of gyration then $k^2 \times M$ = the moment of inertia, and if r be the distance of any particle m of the body from the axis, we have the equation $k^2 M = \Sigma (r^2 m)$ where the quantity on the right-hand side of the equation will be found by integration for the particular body under consideration

GYRINUS (Lat) The water flea

GYROSCOPE (Lat gyrus *a circle*, Gr σκοπεω, *I view*) An instrument for exhibiting the effects of revolution or rotation, or both together

H

HABERGEON (Fr) A coat of mail composed of chain-work for the defence of the neck and breast

HÆMACHROME (Gr αιμα *blood*, and χρωμα, *colour*) The colouring matter of the blood called [illegible]

HÆMAL ARCH (Gr αιμα *the blood*) That part of the vertebra or primary segment of the skeleton which encompasses the main axis, or its prolongations, of the vascular system It is situated opposite the neural arch, and, except in man, is inverted and beneath the centrum

HÆMAPOPHYSIS (Gr αιμα and αποφυσις *process*) The autogenous vertebral elements which close or form the hæmal arch In the human thorax they lose the arch, as "cartilages of the ribs, with the aid of a hæmal spine or 'sternal bone,' in the Saurian and they form with the spine, the entire hæmal arch

HÆMATINE (Gr αιμα, *blood*) The colouring principle of logwood

HÆMATOLOGY (Gr αιμα *the blood*, and λογος, *description*) The doctrine of the blood

HAIDINGERITE [illegible] of antimony and iron, named after Haidinger

HAIR PENCILS A term applied by artists to the small brushes used in painting and often termed *camel's hair* pencils they are composed of fine hairs especially of the marten, badger, minever, polecat, &c , and are mounted, when small, in quills, but when larger, in [illegible]

HAUSMANNITE [illegible] of magnesia

HAIR'S BREADTH The forty-eighth part of an inch is sometimes so called

HALISPONGIA (Gr ἁλς, *the sea*, and Lat [illegible] The generic type of a group of sponges distinguished by the presence of *siliceous* spiculæ

HALITUS (Lat *vapour*) In Physiology, the term is applied to the watery vapour which rises from newly-drawn blood the peculiar odour of blood is conveyed by this exhalation

HALLITE The subsulphate of alumina found at Halle

HALLOYSITE A mineral named after M Halloy It is a hydrated silicate of alumina

HALOSCOPE An instrument for the exhibition of all the phenomena of the parhelion &c Originated by Bravais who published a description of it in the Journal de l'Ecole Polytechnique of London in 1851 The instrument consists mainly of the following parts, all connected with and revolving on a vertical axis by means of a clock-movement — Two triangular glass prisms and one quadrangular, the first of which is hollow for the reception of water, a small mirror carried by a short arm, two opaque plates of glass for the purpose of observing one or two sides of the prisms, as may be found necessary, and, finally, a plate of glass.

To produce a representation of the parhelion, it is necessary to place a candle in a darkened chamber, on a level with and from 10 to 12 ft distant from the glass-prism on its axis of rotation the prism having two sides covered On looking [illegible] parhelion circle becomes visible By observing one side of the prism, only three horizontal lines are seen, two being found by external and one by internal reflexion

To produce an imitation of the white parhelion, the candle is placed in the same position, and two sides of the prism darkened, when, on looking at the [illegible] at a distance of 120° from the candle, [illegible] be perceived

Coloured parhelia may be exhibited by means of the prism of water, viewed at an angle of 20° or 25° One side of the prism being obscured [illegible] parhelion, red on the side next the [illegible] white train prolonged to 15° or 20°, will be seen

To imitate coloured parhelia, formed at a distance of 98° from the sun, the arrangements are the same By observing the prism and looking at the distance of 98° from the candle, a coloured spot will be observed, red to the side opposite to the candle, and less bright than the parhelion

The circumzenithal tangent of the arc may be imitated by means of the prism of water, the candle being lowered from its original position, and two sides of the prism darkened, on placing the eye in a proper position, the image will then be reflected upon the ceiling Several changes may be produced by simply turning the prism The circumzenithal arc may be produced by the above arrangement, the position of the eye only being altered

To imitate the anthelion it is necessary to make use of the quadrangular prism, its large transparent surface is turned towards the observer and the candle placed a little above the prism at the distance of six or eight feet from it A small circular mirror is then so placed that its centre is on a level with the top of the prism The eye being situated behind the prism will perceive a luminous circle described beneath its edge If a little slip of paper be placed beneath, it will be perceived more distinctly without moving By moving the position of the eye several distinct phenomena will become visible There are means of adjusting the apparatus to render the image for a time permanently fixed. Other phenomena besides those detailed can be shown by this instrument, and great merit is due to M Bravais, the inventor

HAND A measure of four inches, by which the height of a horse is computed also the parts of a horse — as *forehand*, for the head neck, and fore quarters, and *hindhand*, which includes the rest It also designates the hand of the rider, the *spur-hand* being the right hand, and the *bridle hand* the left

HARMALINE A crystallisable alkaloid contained in the seeds of the *Peganum Harmala*

HARMATTAN The dry parching wind prevailing on the coast of Africa, between Cape Verd and Cape Lopez, in the months of December, January, and February

HARMONIC RATIO In Geometry a straight line is said to be divided harmonically, or in harmonic ratio, when it consists of three segments such that the whole line is to one extreme as the other extreme is to the middle part *See* ANHARMONIC RATIO

HARRIER A small hound trained for hunting the hare remarkable for the acuteness of the sense of smell

HARRINGTONITE A mineral compound of silica, alumina, lime, soda, and water, from the North of Ireland

HARUSPICES *See* ARUSPICES in DICT

HAUSMANNITE [illegible] of manganese, so called from Prof Hausmann

HAVERSACK A strong coarse linen bag for carrying provisions on a march

HAYTORITE A variety of calcedony

HEADSTOCK In machinery, the framing used for supporting the gudgeons of a wheel

HEBE One of the recently discovered small planets belonging to the group whose orbits lie between Mars and Jupiter Hebe was discovered on the 1st of July 1847, by Hencke, of Driessen the discoverer of Astræa, while examining the stars in Bremiker's chart It had then the appearance of a star of the ninth magnitude, but soon after became fainter, and appeared as one of the tenth The new planet was named *Hebe*, with a cup for its symbol, by Professor Gauss Its periodic time is about 1380 days (*Monthly Notices of the Royal Astronomical Society*, vol viii) *See* PLANET

HECATESIA In Grecian antiquity an entertainment [illegible] moon in honour of Hecate.

HECTOGRAMME A French measure of weight =100 grammes or 1543 4 English grains,

HECTOLITRE A French measure of volume =100 litres, or 6102 8 English cubic inches

HECTOMETRE A French measure of length =100 metres or 3937 English inches

HEDENBERGITE A silicate of lime and iron, first described and analysed by Hedenberg, in Sweden

HE'DYPHAN. An arsenio-phosphate of lead and lime from Sweden

HE'LENINE *Flecampane Camphor* A crystalline camphor-like substance, found in the root of *Inula Helenium*, or Elecampane Its vapour has a peculiar odour somewhat resembling that of *patchouli* Its chemical [illegible] the analyses of Dumas and Gerhardt [illegible]

HELIOGRAPHY (Gr ἡλιος, *the sun*, and γραφω, *I describe*) A general name given to the art of fixing images of objects by means of *Photography*, which see

HE'LVINE A mineral occurring in small crystals at Schwartzenberg, in Saxony, it is composed of the silicates of manganese, glucina, and iron

HEMERALOPIA (Gr ἡμερα, *the day*, and ωψ, *the eye*) A peculiarity in the sight, in which persons see in broad day light but not in the evening it is said to be endemic in some parts of Europe, and of the West Indies The pupil is generally more dilated and less sensible than in healthy eyes

HEMIPINIC ACID Semi-opianic acid An acid obtained by the oxidizement of the *opianic acid*

HEMIPLEGIA. (Gr ἡμισυς, *half*, and πλησσω, *I strike*) Paralysis of one side of the body

HE'MISPHERES In Anatomy, the two moieties of which the cerebrum is chiefly composed In man and mammalia they approach the hemispheric form, but in most of the lower vertebrata where the cranial cavity affords more room for the small brain, both moieties are spherical

HEMITROPE (Gr ἡμισυς, and τρεπω, *I turn*) A term applied by some crystallographers to what are usually called *twin crystals*, from their being generally conceived to result from the cutting, as it were, a crystal in half, and then turning one of the halves half round upon the other The plane common to the two portions of the crystal is called the *twinning plane* These crystals are often distinguished by the presence of notches or *re entering angles*

HEPATIC AIR (Gr ἡπαρ *the liver*) Sulphuretted hydrogen of modern chemistry

HEPATITE (Gr ἡπαρ *the liver*) A mineralogical name of some of the varieties of sulphate of baryta which have a liver colour

HEROS FOUNTAIN *See* FOUNTAIN, in DICT

HE'RSCHELITE A prismatic mineral from Catania, in [illegible] alumina, and potassa, so called [illegible] Herschel

HESPERIDINE An insipid white crystalline substance obtained from the soft spongy part of orange and lemon rind It has also been called Aurantine

HE'TERO (Gr ἑτερος, *the other, one of two*) As a prefix, or in composition, this term usually indicates *difference*, in opposition to the prefix *homo*, which indicates resemblance

HETOPYLITE (Derivation unknown) A native phosphate of iron and manganese

HEULANDITE A mineral formerly classed with the zeolites found in the basalt of the Giants' Causeway and [illegible] cate of alumina and lime

HIBERNATION [illegible] HYBERNATION, in DICT

HIPPOCRENE FOUNTAIN *See* FOUNTAIN, in DICT

HILUM The point by which a seed is attached to the seed vessel

HI'PPOCRAS Spiced wine The following is one of the most approved recipes for its preparation 2 ounces of cinnamon, half an ounce of canella alba, and of cloves, mace, nutmeg, ginger, cardamoms, each 1 drachm these are to be finely bruised and digested for three or four days, in a warm place, in a mixture of 12 quarts of canary and Lisbon wines the liquor is then to be filtered and 3 pounds of refined sugar added

HIPPOCRATES SLEEVE *Manica Hippocratis* An old pharmaceutical term [illegible] strainer made of flannel or linen, [illegible] bag

HIPPUS (Lat) A spasmodic affection of the iris, occasioning repeated dilatations and contractions of the pupil of the eye

HI'SINGERITE A hydrated silicate of peroxide of iron, found in Sweden and Germany, occurring in [illegible]

HISTOLOGY (Gr [illegible] λογος, *a discourse*) [illegible]

HOCK [illegible] al formerly observed in England on the second Tuesday after Easter, in commemoration of the destruction of the Danes in the time of Ethelred

HOCAULITE A [illegible] of *natr lite* from [illegible]

HOLMITE A species of carbonate of lime, named after [illegible]

HOMBERG'S PHOSPHORUS Fused chloride of calcium

HOMBERG'S PYROPHORUS *See* PYROPHORUS, in DICT

HOMBERG'S SEDATIVE SALT. Boracic acid, to which Homberg erroneously assigned sedative powers.

HO'MO. (Gr ὁμος, *one and the same*) A prefix used in composition to denote *resemblance*, and thus [illegible] ch indicates *difference*

HOMŒOPATHY (Gr ὁμοιος, *similar*, παθος, *affection*) A medical hypothesis promulgated at the commencement of the present century by the late Dr. Hahnemann, of Leipsig, according to which every medicine has a specific power of inducing a certain diseased state of the system, and if such medicine be given to a person suffering under the disease which it has a tendency to induce, such disease disappears because two similar diseased actions cannot simultaneously subsist in the same organ Medicines, therefore, are administered in doses sufficient to induce an action somewhat superior to that of the disease, and the doses which answer this purpose are *infinitesimal*, as it is called a millionth of a grain is often an excessive quantity "With respect to the homœopathic theory of the operation of medicines," observes a good recent authority, "all that can be said is, that it is a mere whim, unsupported either by reason or by facts With respect to the practice, it evidently amounts to doing nothing but regulating the diet and habits of the patient" Now, all judicious practitioners have long been agreed that there are many cases which are best treated in the manner just mentioned, and in which physic does more harm than good, in which, in short, a sensible physician endeavours to amuse the patient, while nature cures the disorder so that the frequent success of homœopathic treatment may be explained, without admitting the principles upon which it is presumed to be founded

HOMOLOGY (Gr ὁμος, *the same*, and λογος, *description*) In Anatomy, that department of the science which teaches the essential correspondence or answerableness of the parts, either in different animals, or in different segments of the same animal, or in the same segment, also the correspondence of the parts of an animal with the ideal archetype which has governed the plan of its organisation Thus firstly the wing of a bird is, homologically the same limb as the arm of a man or the fore-foot of a horse and the "os quadratum" of a bird is shown to be the same bone as the "os tympanicum" of the tortoise, and as the "auditory process of the temporal bone" of a man They are said to be 'homologous" parts, and the propositions are examples of what has been called "special homology' Secondly the wing of a bird is the same or correlative part in its segment of the body, as the leg is in a more posterior segment just as the frontal bone is the correlative element in its segment, with the superoccipital bone in its segment The wing of the right side is also the answerable part of the wing of the left side, in the same way that the right neurapophysis of any given segment answers to the left neurapophysis in the same segment Propositions of this kind are examples of what is termed 'serial homology," and the parts so corresponding are said to be 'homotypal" thus the arm is the homotype of the leg, the humerus of the femur, the radius of the tibia, the ulna of the fibula, &c Thirdly, in relation to the archetype of the verte[illegible] age" [illegible] ral spine," the exoccipital bone or "condyloid part of the occipital bone" in 'Anthropotomy" is the "neur[illegible] segment these propositions are instances of what is termed "serial homology," as being expressive of the [illegible] in that philosophical department of anatomical science — See Owen *On the Archetype and Homologies of the Vertebrate Skeleton*

HOMONYMOUS (Gr ὁμος, *the same*, and ονυμα, *a name*) In Anatomy, syn of Homotypal "If those of the right side arise from the left part of the brain, and *vice versâ*, which seems to be the opinion of the best anatomists, then one would imagine that the homonymous nerves of the right and left side must, in crossing over, lie somewhere contiguous to each other [illegible] other *Hartley*

HOMOTYPAL [illegible] d τυπος) In Anatomy, the correlative in one segment with any given part in another segment, or in the same segment, of one and the same animal Thus the frontal bone is the homotype of the superoccipital bone, the humerus is the homotype of the femur, the parts on the right side are homotypes of those which are repeated on the left side It is the object of "serial homology" to determine "homotypal" parts *See* HOMOLOGY

HONEY DEW A sweetish substance ejected upon the leaves of plants by certain *aphides*

HOPPITE A mineral named after Dr Hope, late Professor of Chemistry at Edinburgh, it is said to be a hydrous phosphate of zinc and cadmium

HOOPOO The vernacular name of the *Upupa Epops*, in Ornithology.

HORSE POWER A dynamical unit employed for [illegible] a steam engine [illegible] s improved steam engine [illegible], many of which had previously been [illegible] by horses, it became desirable to possess some measure of power whereby the size of engine proper for the supercession of any given number of horses might be approximately determined Mr Watt consequently made several experiments to ascertain the amount of power exerted by a horse in a given time, and he found that a strong dray horses would on an average raise a weight of 32 lbs through one foot in the minute, by the intervention of appropriate mechanism This dynamic effort, therefore, he designated a *horse power*, and when he had to introduce an engine which should be capable of performing the work of any given number of horses, he had only to take care that it would be able to raise 33,000 lbs one foot high in the minute for every horse power that it was intended to supersede The dimensions of engine which should be capable of raising any multiple of 33,000 lbs one foot high in the minute were at the same time determined, and that multiple expressed the number of horses power the engine was able to exert Thus [illegible] dimensions as to be able to [illegible] foot high in the minute, it would be 5 horses power, if it were able to raise 10 times 33,000 lbs one foot high in a minute, it would be of 10 horses power, and so of any other number The effective pressure on the piston of these engines, or the pressure considered available for imparting motion to any body, after deducting the power consumed by the engine itself, was reckoned to be about 7 lbs on the square inch The area of the piston, therefore, in square inches multiplied by 7 represented the effective moving pressure, and the space travelled through by the piston in the minute gave the distance through which the pressure or weight operated The total effective weight or pressure upon the piston, therefore multiplied by the space through which it passed and divided by 33,000, would indicate the number of horses power that the engine was capable of exerting, and as the effective pressure upon the piston was limited to about 7 lbs on the square inch, and as the speed of the piston was limited to about 220 feet in the minute, a certain dimension of engine was necessary to realise any prescribed power, and came to be considered as tantamount to that power In this way, therefore, engines of certain dimensions came to be considered as of a certain power, and engines were bought and sold by the horse power in the same way that cloth is bought or sold by the yard measure, and the engine would in all cases exert just about the power at which it was nominally rated

In process of time, however, a different state of things supervened When Watt's patent expired, numerous other manufacturers of engines sprang into existence By degrees the pressure upon the piston came to be increased the velocity of its motion was also increased, and a dimension of engine answerable to a horse power [illegible] than 33,000 lbs one [illegible] ontinued, however, to be bought and sold by the horse power, just as if there had been no increase in their efficiency, and the same dimension of engine was reckoned equal to a horse power that was accepted before There came, consequently to be two kinds of horse power,—the one a *dynamical unit*, which measures the number of times 33,000 lbs can be lifted one foot high per minute by the engine, and the other a *commercial unit*, which measures the dimension of the engine The dynamical horse power is what is termed *actual horse power*, the commercial or conventional unit is what is termed *nominal horse power* In [illegible] have been calculated from the [illegible] difference between actual and nominal power

The actual power of any engine cannot be determined except approximately before the engine is made, but it is ascertained when the engine is at work, by means of an instrument called the indicator An engine sometimes exerts more actual power than at other times, although its nominal power remains unaltered. For example, when a steam vessel in entering a harbour lowers her speed, the steam is partially excluded from the cylinder, and there is consequently less pressure upon the piston than before A similar result will follow if the coals be bad, or there be an inadequate proportion of boiler, and the efficiency with which an engine works is in all cases ascertained by determining by means of the indicator the actual power (see INDICATOR, in the SUPPLEMENT) In modern engines the actual power is from 2 to 4 times greater than the nominal power In other words, an engine purchased or popularly spoken of as 1000 horses power, will be able to lift from 2000 to 4000 times 33,000 lbs one foot high in the minute Such an engine, therefore, though nominally of 1000 horses power, will exert actually from 2000 to 4000 horses power; the exact amount of power exerted being determinable only by the application of the indicator to the engine For the mode of determining the actual power of an engine see the article INDICATOR The nominal power may be determined by the following rule — Multiply the square of the diameter of the cylinder in inches by the cube root of the stroke in feet and divide by 47 The result is the nominal power of the engine in horses The reader will find in the *Artizan Club's Treatise on the Steam Engine*, p 96, a table of the nominal horse power of low pressure or con[illegible]

HUMORAL PATHOLOGY The doctrine which refers disease to a morbid condition of the humours or fluids of the body, as opposed to *nervous pathology*, which refers them to the nervous energy resident in the solids

HUMBOLDILITE So called in honour of Humboldt A crystalline mineral found in the lava of Vesuvius [illegible] magnesia

HUMIC ACID HUMIN (Lat humus, *the ground*) The peculiar brown matter which may be obtained from bog-earth, peat, and turf, and which may also be extracted from most soils, where it is derived from the slow decay of plants, it is also contained in brown decayed wood, and in the brown exudations of the bark of certain trees, more especially in that of the elm, or *ulmine* By the action of several chemical agents on different organic bodies, the same substance is frequently produced It is a substance which contributes to the fertility of soil, chiefly, perhaps, in consequence of its absorptive power in regard to ammonia.

HUMMOCK A level sheet of *ice* A circular mound appearing at a distance is also so called

HUNGER (Germ) The sensation in the region of [illegible] which was considered [illegible] sometimes attended by pain and windy rumblings in the epigastrium When severe, hunger is [illegible] by slow respiration and circulation, a diminution of the heat of the body and of the secretions The return of hunger is accelerated by exercise and fatigue, and by a low temperature In debilitated constitutions excessive hunger should be carefully avoided, and in any case, the effects of fasting may prove prejudicial to the functions of [illegible]

HUREAULITE A phosphate of iron and manganese [illegible] in the Haute Vienne

HURONITE A mineral from the vicinity of Lake Huron, it is imbedded in a species of hornblende it is a hydrated silicate of alumina, and contains also lime, magnesia, and oxide of iron

HYALOSIDERITE (Gr *υαλος, glass, σιδηρος, iron*) A mineral consisting essentially of the silicates of magnesia and iron, from Sasbach, in Brisgau It is of [illegible]

HYDROLITE (Gr *υδωρ, water, λιθος, a stone*) A silicate of alumina, iron, and potassa, containing nearly 30 per cent of water it has principally been found in the amygdaloidan rocks of Antrim in Ireland.

HYDROPATHY (Gr *υδωρ* and *παθος disease*) This term is applied to a treatment of disease generally called the *cold water cure*, it was suggested in 1828, by Vincent Priessnitz of Graefenberg in Silesia, and consists in the internal and external administration of cold water, accompanied by air and exercise, early hours, and strict attention to diet, there are, therefore, many cases in which such a plan rationally pursued must be obviously useful, more especially to overphysicked individuals, residing in populous towns, eating and drinking too much, and keeping bad hours At the same time, some parts of the treatment "are of so outrageous a character, as frequently to aggravate the [illegible] which they were [illegible] and occasionally [illegible] temper or even destroy the life of the patient" (The term *hydropathy* is considered to be a corruption [illegible]

HYDROSULPHURIC ACID (Gr *υδωρ* and *θειον, sulphur*) Hydrosulphuric [illegible] of hydrogen

HYDRURET, or HYDROGURET A term applied in chemistry to some of the compounds of hydrogen more especially with the metals

HYGEIA One of the [illegible] planets between Mars and Jupiter Hygeia was discovered by Dr Annibal De Gasparis, of the Observatory at Naples, while comparing Steinheil's map with the heavens, on the 12th of April, 1849 It had then the brightness of a star between the ninth and tenth magnitudes De Gasparis referred the naming of the planet to Capocci, who called it *Hygeia*, and selected for its symbol a serpent crowned with a star It was the tenth in the order of discovery *See* PLANET.

HYGROMA (Gr *υγρος, moist*) A tumour contain[illegible]

HYGROMETRY (Gr *υγρος, moist*, and *μετρεω, measure*) Of the various methods which have been proposed for ascertaining the hygrometric condition of the atmosphere that which consists in deducing

the tension of the aqueous vapour contained in it from the temperatures indicated by two contiguous thermometers, one having its bulb kept wet, while that of the other is dry, is, perhaps, the most generally convenient, and is accordingly that which is usually adopted in [illegible] The apparatus has been called [illegible] and is described under that [illegible] the DICTIONARY OF SCIENCE, though the term, from its etymology, might be applied with equal propriety to any other hygrometer or instrument for measuring the quantity of vapour existing in air On account of the importance of this instrument in meteorology, we propose, here, to state the theory upon which its application depends

It may be proper to premise that the relation between the tension, or the elastic force of aqueous vapour and the temperature (a relation which is the subject of experiment) is supposed to be known for all temperatures under consideration, and exhibited in a table Hence to determine the elastic force of the vapour existing in the atmosphere at a given temperature, is the same problem as to determine the degree of temperature to which if the air were cooled down, it would be saturated with the same quantity of vapour as it actually contains, and begin to deposit moisture, and, reciprocally, if this temperature, which is that of the *dew point*, be determined, the tension of the vapour existing in the air becomes known from the previously ascertained relation between the tension and the temperature of aqueous vapour Tables of the numerical expression of this relation were constructed by Dalton, and are given in most works which treat of the subject *See* VAPOUR, in DICT

Theory of the Psychrometer —When water or any wetted surface is exposed to air not saturated with moisture, vapour is formed, and in the formation of vapour, heat is absorbed or becomes latent The heat thus absorbed being taken from the body from whose surface the evaporation takes place the body becomes colder, and the thin shell or stratum of air in immediate contact with it is cooled down to the same temperature Now, the theory of the psychrometer is founded on this hypothesis, namely, that the quantity of heat abandoned by the thin shells of air which successively come into contact with the wetted bulb of the thermometer is precisely equal to the heat absorbed in the formation of the vapour

From this hypothesis an equation is obtained which gives the tension corresponding to the temperature of the dew point in terms of the tension corresponding to the temperature of the wet bulb (that of evaporation) the difference of the readings of the wet bulb and dry bulb thermometers, and the height of the barometer, in the following manner Let t denote the temperature, in Fahrenheit degrees, indicated by the dry bulb thermometer, and t' the temperature indicated by the wet bulb thermometer The thin shell of air in immediate contact at any instant with the wet bulb, which previous to the contact had the temperature t is cooled down to t', and consequently abandons a certain quantity of heat But the shell is composed partly of dry air, and partly of aqueous vapour If, therefore, we assume

A=the heat abandoned by the dry air in the shell,
B=the heat abandoned by the vapour originally existing in the portion of air forming the shell,
C=the heat absorbed by the vapour formed and taken up by the shell,

then by the hypothesis

$$A+B=C \qquad (1)$$

To express these portions of heat universally, we have
A=weight of dry air in shell × specific heat of dry air × $(t-t')$,
B=weight of vapour in shell × specific heat of vapour × $(t-t')$,
C=weight of vapour formed × latent heat of vapour at temperatures between t and t'

Now let
[illegible] air, at 32°, under a pressure [illegible] mercury,
α=coefficient of expansion of air for 1° Fahrenheit =1-480th,
δ=ratio of density of vapour to density of dry air,
h=height of the barometer in inches,
f'=elastic force of aqueous vapour, in saturated air, at temperature t', measured in inches of mercury,
x=elastic force of the vapour actually existing in the air at temperature t, or the tension of vapour at the dew point,

then, in respect of the thin shell of air surrounding the wet bulb, we have the following expressions for the several weights, viz

Weight of dry air in shell $= w \frac{1}{1+\alpha t'} \cdot \frac{h-f'}{30}$,

Weight of vapour in shell previously to contact with wet bulb $= w\delta \frac{1}{1+\alpha t'} \cdot \frac{x}{30}$,

Weight of vapour formed $= w\delta \frac{1}{1+\alpha t'} \cdot \frac{f'-x}{30}$

Now putting

γ=specific heat of dry air,
k=specific heat of vapour,
λ=latent heat of vapour between t and t',

and substituting these and the above expressions for the weights in A, B, and C, the equation (1) becomes

$$\gamma(h-f')(t-t')+k\delta x(t-t')=\lambda\delta(f'-x),$$

from which we obtain

$$x=\frac{\lambda f'-\frac{\gamma}{\delta}(t-t')(h-f')}{\lambda+k(t-t')} \qquad (2)$$

Of the quantities which enter into this equation t, t', and h are given by direct observation, and f' is given when t' is known from the table of tensions above referred to The remaining quantities are supposed to have been determined experimentally, and their values are as follows —

1 From the experiments of Laroche and Berard the specific heat of dry air, γ, was found to be 0 2669, that of water being unity

2 The specific heat of aqueous vapour, k, is less certainly determined August assumes it to be equal to that of dry air Laroche and Berard found it to be 3 130 times that of dry air In the present case its accurate value is not important, for the term which it multiplies is so small in comparison of λ that it may be rejected without sensible error

3 The density of aqueous vapour, δ, referred to that of dry air at the same temperature, was found by Gay Lussac to be 0 6235, or nearly 5-8ths Regnault assumes δ= 0 622

4 With respect to the latent heat of vapour, λ, its value at any temperature is deduced from its known or assumed value at 212° by means of the hypothesis (confirmed by experiment) that the sum of the latent and sensible heat is constant for all temperatures At 212° the latent heat of vapour is usually assumed according to the determination of Lavoisier to be 1000, that is to say as much heat is absorbed in the formation of a certain weight of vapour as would raise the temperature of 1000 times the same weight of water one degree of Fahrenheit's scale Hence at 32° it is 1180 Regnault ascertained by direct experiment that the formula for the psychrometer would be more accurate by taking λ equal to 610° on the centigrade scale at the temperature of freezing, this corresponds to 1098° of Fahrenheit, and consequently, at 0° Fahrenheit the latent heat is 1130° For any other temperature, t', we have, therefore, $\lambda=1130-t'$

Substituting these values of γ k δ, and λ, in the formula (2), and rejecting $k(t-t')$ in the denominator, it becomes

$$x=f'-\frac{0\,429(t-t')(h-f')}{1130-t'} \qquad (3)$$

For t'=50°, this gives $x=f'-0\,0\,397(t-t')(h-f')$

If the temperature of the wet bulb fall below the freezing point the water surrounding the bulb is frozen, so that it is ice which is evaporated And as 140° of heat are expended in converting ice into water the formula becomes, for this case,

$$x=f'-\frac{0\,429(t-t')(h-f')}{1270} \qquad (4)$$

The value of x being computed from this formula, the corresponding temperature in the table is that of the dew point

Objections of various kinds, theoretical and practical, have been raised to the results obtained by this method The fundamental principle adopted by August is that the whole of the [illegible] heat to the wet bulb falls to the [illegible] becomes completely saturated with moisture But it seems more probable that the air coming into contact with the bulb does not quite take the temperature of the bulb, and that the saturation is not complete [illegible] that the ratio of the quantity of [illegible] from the bulb by the vaporisation of the water to the quantity which it loses in being cooled is probably not constant, but so much the greater as the air is drier, because dry air absorbs moisture with greater avidity than when it is nearly saturated Another objection is that the heat which is absorbed in converting the water on the wet bulb into vapour is not supplied exclusively by the surrounding air, but in some measure by the radiation from objects around (for example, the frame to which the thermometers are attached, or the dry [illegible] which it is perhaps [illegible] Other objections [illegible] certainty as to the numerical values of some of the elements which enter

into the formula and especially with a view to the amount absorbed by water when vaporised [illegible] the object of the present paper is to describe the method of [illegible] Of several of accomplishing this is to compare the results of a large number of observations with the temperatures of the dew point ascertained directly by simultaneous observations with a Daniell's hygrometer, but as this instrument itself cannot be relied on with certainty, the only sure method would seem to be that of separating the moisture from the air and determining their proportions by actually weighing them.

It is important to determine the influence of the wind on the results obtained by this instrument According to theory, when the difference of the temperatures indicated by the two thermometers has become stationary, the agitation of the air should have no effect on them, for as the degree of cold ultimately produced depends on the *intensity*, and not on the *velocity*, of evaporation, the effect of wind on the wet bulb might be expected to be only that of depressing its temperature more speedily, but not to a lower point Regnault made numerous experiments on this subject, and arrived at the conclusion that wind certainly does influence the observation, but when the instrument is exposed to free air the influence is not perceptible so long as the velocity of the wind does not exceed five or six *metres* per second (16 or 20 English feet, or from 11 to 14 miles per hour) When the wind blows strongly, another disturbance may arise from the circumstance that the masses of air successively brought into contact with the wet bulb may have very different degrees of humidity On the other hand, when the air is perfectly calm it is not improbable that an atmosphere of saturated air may be formed and remain about the wet bulb, extending to some sensible distance, for it is known that vapour diffuses itself through air in this state slowly and with difficulty It is scarcely necessary to add, that when the air is nearly saturated with vapour, and there is consequently little difference between the temperatures indicated by the two thermometers, the results obtained must be liable to considerable uncertainty

The formula for computing the temperature of the dew point, from observations of a dry and wet bulb thermometer, was first investigated by Professor August, of Berlin, and is given in his work *Ueber die Fortschritte der Hygrometrie* (Berlin, 1830), the same in form as the above, but with slightly different constants There is also an investigation on the same principle, and leading to the same results by Dr Apjohn, in the Dublin *Transactions* for 1834 and 1835, and tables have been constructed by Col Boileau for facilitating the computation of the formula But the fullest and best information on the subject is contained in a paper by Regnault, published in the *Annales de Chimie et de Physique* (3me series, tome xv, Paris, 1845) In this paper Regnault describes a new [illegible] method by him, for determining the dew [illegible] ation, the cold being produced as in Daniell's hygrometer, by the evaporation of ether, but in Regnault's instrument the ether, instead of being poured over the wet bulb, and much consequently wasted, is confined within a glass tube, or cylinder, of about an inch in diameter, and agitated by blowing a stream of air into it through a flexible tube A rapid evaporation consequently takes place within the cylinder, and the cold thereby produced causes a deposition of dew on the outside A delicate thermometer placed inside the cylinder, immediately over the ether, indicates the temperature, which must be noted at the instant the deposition commences, and should be again noted at the instant it disappears A portion of the cylinder over the ether is blackened for the purpose of intercepting the passage of light, whereby the deposition is rendered more easily visible. Of the various hygrometers which have been proposed [illegible] vapour [illegible] of Daniell, this appears to be the most satisfactory

HYOID'S (From the Greek letter *υ*, and *ειδος*, *like*) A bone situated [illegible] of the tongue and the larynx is called [illegible] or hyoid bone, from its [illegible]

In Anatomy, the usually exogenous process which descends from the lower part of the centrum or vertebral body, it is sometimes single, as in the cervical vertebræ of the lizard; sometimes perforated, as in certain cervical vertebræ of birds, sometimes double in a transverse pair, as in the caudal vertebræ of certain mammals, where they support the hæmal arch

HY'PER. (Gr *υπερ*, *over*, *above*) In chemical nomenclature this [illegible] containing more oxygen than those to which the term *per* is prefixed

HYPERÆ'MIA (Gr *υπερ*, and *αιμα*, *blood*.) Congestion of blood in any part

HYPERCATHA'RSIS (Gr *υπερ*, and *καθαιρω*, *I purify*.) Excessive purging

HYPERI'CUM (Gr *υπερ*, and *εικων*, *an image* so called from a supposed power of expelling evil spirits) The *Hypericum perforatum*, or St John's Wort, was much esteemed by the ancients as an anodyne.

HYPO (*υπο*, *under*) In chemical nomenclature this prefix indicates the presence of a smaller quantity of oxygen than that contained in the acid or compound to which it is prefixed, thus the *hyposulphurous acid* [illegible] the sulphurous and the *hypo-* [illegible] than the sulphuric, and the *hyponitrous* acid less oxygen than the nitrous, etc

HYPOCYSI A pharmaceutical name of the inspissated juice of the *Cytisus hypocistis*, a parasitical plant on the roots of several species of *cystus* in the S of Europe

HYPOGÆ'UM (Gr *υπο*, and *γη*, *the earth*) A term applied by ancient architects to the cellars and other underground parts of a building

HYPOGASTRIUM (Gr *υπο*, and *γαστηρ*, *the stomach*) The middle part of the lower region of the belly

HYPOGLOSSAL NERVES (Gr *υπο*, and *γλωσσα*, *the tongue*) The [illegible] nerves

HYPOPHYSIS (Gr *υπο* and [illegible], *nature* or *origin*) In Anatomy, the gland-like body and sac which originate from the under surface of the third ventricle of the brain and are lodged in the "sella turcica" *See* PITUITARY GLAND

HYPSOMETRY (Gr *υψος*, *height*, and *μετρεω*, *measure*) The art of measuring heights either relative or absolute, by trigonometry or the barometer

HYSON A commercial name of one of the varieties of *green tea* *See* TEA, in DICT

HYSSOP The name of a genus of plants including the common hyssop (*Hyssopus officinalis*), formerly used in medicine as a stimulant and expectorant

HYSTEROTOMY (Gr *υστερα*, *the womb*, *τεμνειν*, *to cut*) The extraction of the fœtus from the uterus The *Cæsarean operation*

I

IA'TRALEI'PTES (Gr *ιατρος*, *a physician*; *αλειφω*, *I anoint*) A physician who cured diseases by external remedies only, as by friction, inunction, &c There was among the Greeks a sect of Ιατρολειπται founded by Prodicus, a disciple of Esculapius

IA'TROMATHEMATICI (Gr *ιατρος*, and *μανθανω*, *I learn*) Physicians who explain the functions of the body, and the action of remedies on mechanical principles These doctrines seem to have originated with Asclepiades, and in modern times were promulgated by Borelli as founded on the atomic philosophy of Descartes.

ICE (Ger eis) Frozen water At the temperature of 32° water, in its ordinary condition, crystallises into ice which if slowly produced forms prisms crossing each other at angles of 60° and 120°, the primitive figure has not been ascertained, though it is probably rhomboidal The arrangement of the acicular prisms in flakes of snow is very various, but in the same snow storm the same forms of arrangement generally prevail The specific gravity of ice in its densest form is about 950 It is a nonconductor of electricity, and becomes electric by friction The expansion of water in the act of freezing, takes place with irresistible force, and the frequent rupture of thick iron and leaden pipes from this cause is a familiar instance of this Exposed to air ice loses considerably by evaporation In the act of freezing water parts with all soluble matter, so that coloured water becomes colourless ice, saline solutions become pure water, and spirituous liquors part with their alcohol To effect this purification perfectly, the ice must be formed under circumstances which prevent the accumulation of blebs and air bubbles, and the entanglement in the ice of any of the unfrozen or ejected liquor, for the foreign matters held previously in solution in the water, are, in the act of freezing, transferred to the portion which remains unfrozen, when the whole of the water becomes a mass of porous ice the impurities are retained in the pores, but those brilliant and perfectly transparent and dense masses of ice which we find in the American and Norway ice as imported into this country, yield, when thawed, water equal in purity to that which has been distilled, and nearly free from air

ICHTHYO'PHAGIST (Gr *ιχθυς*, and *φαγω*, *I eat*) A fish eater some savage tribes who live almost entirely on fish were called by the ancients *Ichthyophagi*

I'GLOITE A mineralogical synonym of one of the varieties of carbonate of lime, or *Arragonite*

ILLU'DERITE. A mineralogical synonym of *Epidote*

I'LMENITE The titaniferous iron ore from Ilmensea near Minst

I'LVAITE A mineral from *Elba*, in black prismatic crystals it is a silicate of iron and lime

IMBIBI TION (Lat in, and bibo, *I drink*) The absorption of a liquid into the pores of a solid much importance has been attributed to this property as belonging to the organic tissues and as affecting their functions

IMPE'RIAL A beverage formed by dissolving one drachm or one drachm and a half of cream of tartar in a pint of boiling water and flavouring with lemon peel and sugar When cold, it may be taken *ad libitum*

INCLINO'METER, an instrument for determining the vertical element The difficulty of determining method is considerable, on account the apparatus which is requisite Various indirect methods have been proposed Dr Lloyd, in the *Account of the Magnetical Observatory at Dublin*, describes an Inductive Inclinometer, 'the principle of which is the measurement of the intensity induced on a vertical bar of soft iron by the deviation it is capable of causing in a horizontal bar suspended near it." Weber, of Gottingen, proposed a method, in which "the deflexion of the horizontal magnet is produced by the earth's magnetism, induced not on a vertical bar of soft iron at rest, but on a ring, sphere, or plate of copper made to revolve about a vertical axis" Dr Lamont, of Munich proposed a third and less simple method "As in Dr Lloyd's process, a bar of soft iron is used as a temporary magnet The bar so temporarily magnetised is made to act unequally on the two bars of an astatic magnetic couple, thereby tending to draw them aside from a given position in which they would otherwise be held by a fixed magnet of a given power This tendency is however, destroyed by another magnet placed in a given position at a given distance A series of reversals and changes of distance in the soft iron bar and the neutralising bar is then operated, which furnishes equations by means of which every quantity excepting the intensity sought and known quantities can be eliminated '—(*British Association Report*, 1842) *See* Magnetism

INDIAN RUBBER *See* CAOUTCHOUC, in DICT A compound material discovered by Mr Hancock under the name of *Vulcanised India rubber*, and is, in fact, caoutchouc combined with a very small proportion of sulphur the several modes of effecting this are fully described in the specification of his patent Vulcanised India rubber does not, like the ordinary article become hard and rigid by cold and it bears a very high temperature without change of properties It is much more perfectly elastic than the common rubber, so that when stretched it does not acquire a set, but returns, when released, to its former dimensions This discovery has rendered caoutchouc applicable to an infinity of purposes for which, in its ordinary state, it is either unfit or objectionable Among the most remarkable properties of Vulcanised caoutchouc, is the resistance which it affords to naphtha, oil of turpentine, ether, oils, and a variety of other substances which are comparatively without action upon it, whereas they either soften, or dissolve it

INDIAN YELLOW *See* EUXANTHINE

INDICATOR (Lat indico, *I point out*) An instrument for determining the power exerted by a steam engine This instrument consists of a small cylinder and piston, which is placed in connexion with the cylinder of the engine by means of a pipe and stop-cock fitted into the cylinder cover The cylinder of the indicator is open at the top, so as to permit the access of the atmosphere, and its piston is kept at about the middle of its stroke by means of a spring, when the instrument is out of connexion with the engine, but when the stop-cock is opened so that the space beneath the piston of the indicator is put in connexion with the cylinder of the engine, the piston of the indicator is pressed up and down every stroke by the alternate steam pressure and vacuum existing within the cylinder of the engine The extent to which it is pressed up and down indicates the amount of pressure urging the piston of the engine, and a scale is attached to the side of the indicator, graduated with connexion of pounds pressure above the atmosphere that is exerted by the steam, and also the number of pounds pressure below the atmosphere that is exerted by the vacuum

INDIGOGENE *Indigo white* *See* INDIGO, in DICT

INDIGOTINE The sublimate obtained by heating indigo *See* Indigo in Dict

INFUNDIBULIFORM An anatomical term, signifying *funnel shaped* Infundibulum

the brain is a canal proceeding from the lower and anterior part of the third ventricle of the brain to the pituitary gland

INGUINAL (Lat. inguen, *the groin*) Appertaining to or situated in or near the groin as *inguinal artery*, *inguinal hernia*, etc

INHALATION (Lat) The drawing of air, gases, or vapours into the lungs Many substances are medicinally applied in this form, by means of an *inhaler*, an instrument so contrived as to admit of the inhalation of air or vapours from or through various substances, hence the inhalation of vapour of tar, of ether, of chloroform, of iodine, chlorine, &c are often thus administered

INJE'CTION A liquid thrown into cavities of the body by means of a bladder, syringe, or bottle Injections thrown into the rectum are called *enemata*, or *clysters* (from κλυζω, *I wash*)

I'NOLITE (Gr ινος, *I cleanse*, and λιθος, *a stone*) A variety of carbonate of lime

INOSI'NIC ACID (Gr ινος, *I absorb*) An acid said by Liebig to exist in the juices of the flesh of animals

INTERCO'STAL (Lat inter, and costa *a rib*) In anatomy, a designation of certain bloodvessels, nerves, and muscles situated between the ribs

INVERMINATION (Lat in and vermis, *a worm*) The morbid state of the alimentary canal occasioned by the presence of entozoary animals *See* INTESTINALIA, and ENTOZOA in DICT

I'ODATES Salts of the iodic acid

IRE'NE One of the small planets belonging to the group whose orbits lie between those of Mars and Jupiter and the fourteenth in the order of discovery Irene was discovered by Mr Hind, at Mr Bishop's observatory in the Regent's Park, on the 19th of May, 1851 When first observed, its brightness rather exceeded that of a star of the ninth magnitude, its light is very blue, and it appears to be surrounded with a faint nebulous envelope, not perceptible about the stars in its vicinity Its period is about 1519 days (*Monthly Notices of the Royal Astronomical Society*, vol xi) *See* PLANET

IRIDESCENT FILMS Iridescent films are produced by dropping a little oil or spirit of varnish upon the surface of water contained in a vessel When the water becomes tranquil, the varnish spreads in all directions, becoming exceedingly attenuated and reflects the most vivid colours of the spectrum If any objects that require ornamenting, such as insects, shells, birds, bronzes paper hangings, &c are previously immersed in the water and slowly raised to the surface after the film has been formed, the latter will adhere to their surfaces, and when they are completely dried, it will be found firmly attached to them and perfectly iridescent, having brilliancy of colouring This is a the production of colours on a thin transparent surface, by the agency of light such as is commonly seen in an ordinary soap bubble

IRIS (Lat *the rainbow*) One of the newly discovered planets of the group between Mars and Jupiter Iris was discovered by Mr Hind, at Mr Bishop's Observatory, on the evening of August 13 1847, while engaged in systematic comparison of the Berlin charts with the heavens, which soon after rewarded him with the discovery of a second planet *Flora* Iris, when discovered had the appearance of a star between the eighth and ninth magnitudes The symbol adopted for its designation is a semicircle, to represent the rainbow, with an interior star and a bare line, for the horizon Its period is about 1342 days Iris is the seventh of the group in the order of discovery (*Monthly Notices of the Royal Astronomical Society*, vol vii) *See* PLANET

IRISCOPE (Lat iris *the rainbow*, and Gr σκεπτω, *I view*) An instrument proposed by Dr Joseph Reade for exhibiting the prismatic colours, thus described by Sir David Brewster, in the *Philosophical Transactions* for 1841 —"This instrument consists mainly of a plate of highly polished black glass, having its surface smeared with a solution of fine soap, and subsequently dried by rubbing it clean with a piece of chamois leather If we breathe upon the glass surface, thus prepared, through a glass tube, the vapour is deposited in brilliant coloured rings, the outermost of which is black, while the innermost has various colours, or no colour at all, in proportion to the quantity of vapour deposited The colours in these rings, when seen by common light, correspond with Newton's *reflected* rings, or those which have *black centres* the only the plate of vapour, which is the rings in the Iriscope have black circumferences

IRISH MOSS The *Chondrus Crispus* *See* CARRAGEEN Moss

ISCHIOCELE (Gr ισχιον, *the hip*, and κηλη, *tumour*) A hernial tumour at the foramen of the ischium

I'SERINE. *Titanfate of iron*, from the Iser in Bohemia

I'SINGLASS The term I[illegible] to be derived from *ice* and [illegible] transparent and viscous appearance of the concrete jelly which may be obtained from it, but the word is more evidently a corruption of the German *hausenblase* [illegible]

ISOCHROMATIC (Gr *ισος, equal, and, χρωμα, colour*) A term in Optics applied to two or more bodies of which the colours are identical or undistinguishable

ISOGONIC LINES (Gr *ισος equal, γωνια angle*) In Terrestrial Magnetism, are those lines passing through all places on the earth's surface in which the horizontal magnetic needle makes the same angle with the meridian, or at which the *declination* is the same *See* MAGNETISM TERRESTRIAL

ISOPYRE (Gr *ισος, equal, πυρ, fire*, because the effect produced upon it by the blowpipe is the same as that produced on several other minerals!) A silicate of alumina, iron, and lime, found imbedded in granite from Cornwall

ITACO'NIC ACID An acid formed by the action of heat on *aconitic acid*

ITA'LIAN JUICE The extract of liquorice prepared in *Calabria* That grown on the estates of the Marchioness of Solazzi, and known in commerce under the name of *Solazzi juice*, being so stamped, is the most esteemed The *Spanish juice* is prepared in *Catalonia*

J

JA'LAPINE The purgative principle of jalap root it is a basic resin

JAMES'S POWDER (*Pulvis Jacobi*) A mixture of bone-earth, or phosphate of lime, and oxide of antimony it is often called *fever powder*, and acts as a diaphoretic, and also on the bowels, and sometimes nauseates or vomits, according to the dose in which it is exhibited It is an uncertain remedy, and may be properly replaced by emetic tartar mixed with a little chalk or magnesia The *pulvis antimonialis*, or *antimonial powder* of the London Pharmacopœia is intended as a substitute for James's preparation, but it also is open to the objection of uncertain activity, dependent upon the state of oxidizement of the antimony, the protoxide of that metal being virulently active, while the peroxide is nearly inert The usual dose of James's powder is from one to five grains

JE'RVIA (from *Jerva*, the Spanish name of a poison obtained from white hellebore) A basic crystalline substance, contained, together with *veratria*, in the [illegible] white hellebore

[illegible] *compound tincture of benzoin* of the Pharmacopœia called also *Friar's balsam*

JE'SUITS' POWDER Powdered Cinchona bark

JEWS' PITCH *Asphaltum*

JU'NKERITE A native crystalline proto carbonate of iron from Pullouen

JU'RINITE A mineral from Dauphiny, containing *titanium*

K

KA'KODYLE (Gr *κακος, bad*, and *ωζειν, smell*) A compound hydrocarbon and arsenic, having the formula $C_4 H_6 As$ It is a clear liquid which takes fire when dropped through the air, burning with a blue flame, and forming water, carbonic acid, and arsenious acid, the latter rises as a white smoke *Cadet's fuming liquor* called also *Alkarsine*, is an oxide of Kakodyle $C_4 H_6 As O$

KA'RSTENITE Anhydrous sulphate of lime *Anhydrite*

KE'RATOPHYLLITE (Gr *κερας, a horn*, and *φυλλον, a leaf*) A mineralogical synonym of Amphibole or Actinolite

KEY'SER'S PILLS A once celebrated mercurial preparation, the active ingredient in which is the *acetate of mercury*

KIKI KUNE MAO a resin, much resembling copal brought from America, where it is said to be used medicinally It forms excellent varnishes

KILKENNY COAL *Anthracite*

KI'MMERIDGE CLAY The clay formation of Kimmeridge, on the coast of the Isle of Purbeck, it contains beds of bituminous shale, used as fuel, and called *Kimmeridge coal* In the neighbourhood are found the pieces called *coal money*, they are about 3 inches diameter, flat on one side, and convex on the other, and on the flat side are two or four small holes They are supposed to have been either money or amulets In the same neighbourhood there has been found a shallow bowl of Kimmeridge coal containing coal money.

KINEMA'TICS, or KINE'TICS (Gr *κινεω, I move*) A term used by some writers to denote the doctrine which treats of the effects of motion without reference to its causes, and in contradistinction to dynamics Curves produced by combined movements, or by machinery, are called kinematic curves of which many beautiful specimens are given in Mr Henry Perigal's work on the subject The term is used chiefly by German writers, and applies to the same subjects as are usually treated [illegible]

KI'RWANITE A [illegible] from the basalt of the North East coast of Ireland, named after Kirwan the mineralogist

KISH A substance occasionally produced in iron smelting furnaces in appearance it resembles plumbago, but is said to consist chiefly of carbon and manganese

KNE'BELITE A silicate of iron and manganese

KOME'NIC ACID A substance resulting from the action of heat on *meconic acid*, and formed when a solution of the latter acid is boiled It has also been ca[illegible]

KO[illegible] alogical synonym of the Chinese *figure stone*, called also *Agalmatolite*

KREATINE (Gr *κρεας, flesh*) A crystallisable organic substance contained in the juice of the muscular fibre of animals

KREMNITZ WHITE A pure variety of *White Lead*.

KROKI'DOLITE (Gr *κροκις, woof*) A mineral of a fibrous asbestiform texture, it is a hydrated silicate of iron and soda there is also a compact variety, it is occurs near the Cape of Good Hope

L

LAGGING OF THE TIDES In Terrestrial Physics, a phenomenon of the tides, consisting in the irregularity of the lengths of the successive tide-days or intervals of the occurrence of high water at any particular place, and caused by the combined action of the sun and moon on the ocean If the tides were caused by the moon's attraction only, the intervals between two successive arrivals at the same place of the same vertex of the tide-wave would be the lunar day, that is, the interval between two successive arrivals of the moon at the same meridian In like manner if the tides were caused by the sun's attraction only, the tide-day would be of the same length as the solar day In consequence of the moon's revolution about the earth in the same direction as the diurnal rotation, the lunar day is longer than the solar, and the actual or lunisolar tide being the result of the superposition of the two tides caused by the sun and moon respectively, it follows, that from the time of a coincidence of these two tides the actual tide-day (reckoned in mean solar time) will become longer and longer, until the moon has completed a quarter of a revolution, after which the lunar wave will fall back on the next following solar wave, and the tide-day will become shorter and shorter during the next quarter of the moon's revolution, and the coincidence will again take place when a semi-revolution is completed This alternate acceleration and retardation of the tidal intervals is called the *priming and lagging of the tides*, and is most remarkable about the time of new and full moon *See* TIDES, in DICT

LAGOPHTHA'LMIA (Gr *λαγως, a hare*, and *οφθαλμος, eye*) A disease in which the eye cannot be closed sometimes it is a paralytic affection, and sometimes [illegible] tion enlargement of the eye, it is also occasionally [illegible] nate The term has reference to the notion that hares sleep with their eyes open.

LA'PIS DIVINUS (Lat) A compound of nitre, alum, and verdigris, melted together, camphor is sometimes added, and white vitriol substituted for verdigris A portion of this fused compound dissolved in water formed a celebrated eye lotion, it was hence also called *Lapis Ophthalmicus*

LA'PIS LY'DIUS (La[illegible] A siliceous slate, used as a *touchstone* [illegible] the quality of gold [illegible] colour of the streak

LAPIS SPECULA'RIS (Lat) Selenite or spathose gypsum formerly used as a remedy for fits

LA'RDITE A mineralogical synonym of the Chinese *figure-stone*, or Agalmatolite

LA'SIONITE A mineralogical synonym of Wav-

ellite or hydrargyllite the hydrated phosphate of alumina

LECA'NORINE *Lecanoric Acid* A crystallisable substance obtained from several species of *Lecanora*, and some other *lichens*

LECCA GUM The gum of the olive tree, which is [illegible] Lecca in Calabria

LEHI'NITE A compact *zeolite* found in Antrim by Captain Lehunt

LE'MANITE A synonym of felspar, so called from Lake Leman where it is found

LEPIDOKROKITE (Gr λεπις, *a rind*, and κροκος *saffron*) Fibrous brown hematite

LEVANT NUT One of the commercial names of the berries of *Cocculus Indicus*

LIBETHE'NITE A native phosphate of copper fr[illegible]

LICHANO'S [illegible] χω, *I lick*) The fore finger, us[illegible] tity of anything

LICHTENBERGIAN FIGURES When the knob of a charged Leyden phial is drawn over a flat surface of lac or resin, as, for instance, the plate of an electrophorus it leaves a charge in its track, positive or negative, as we choose, and if, after this, a mixture of certain powders be sifted upon the plate, as, for instance, of powdered sulphur and red lead the sulphur will adhere to the one, and the red lead to the other electrified surface, and with a little management groups of figures resembling flowers may be thus brought out, as Lichtenberg first observed

LIEBERKU'HNIAN GLANDS In Anatomy, are simple secerning cavities, having the form of blind tubular depressions of the intestinal mucous membrane, thickly distributed over the whole surface of the large and small intestines They are so called after their discoverer Lieberkuhn, who observed them in the small intestines where they are visible only with the aid of a lens, their orifices appearing as minute dots scattered between the villi They are larger in the large intestine

LIENTERY (Gr λειος, *the spleen* soft or smooth) A medical term formerly applied to a form of diarrhœa in which the food passes rapidly through the bowels in an apparently undigested state Lubricity of the intestines

LIEVRITE A crystallised mineral discovered by Le Lièvre It is a silicate of iron and lime, it has also been called *Jenite*, in commemoration of the battle of Jena in 1806, and specimens from Elba have been termed *Praite*

LIFT TENTER The name given in some parts of England to a sort of regulator or governor applied to wind mills to counteract the irregular action of the wind In a wind mill for grinding corn the distance between the upper and lower millstones is regulated according to the velocity, and if, when the mill is at work, the velocity should receive any considerable increase, the corn is forced rapidly through the mill without being sufficiently ground To prevent this is the object of the lift-tenter Like the governor of a steam-engine it acts by the centrifugal force of one or more balls which fly out when the velocity is augmented, and as they rise in the arc of a circle allow the end of a lever to rise with them, while the other end descends with the upper millstone, and brings it a little nearer to the under one

LIGATURE (Lat ligo, *I bind*) In surgery, a waxed thread of silk used in tying arteries or veins

LIGHTHOUSE The Light Tower recently erected on the small island or rock of Skerryvore, on the west coast of Scotland, is one of the most remarkable works of this class both by reason of its magnitude and the difficulties encountered in its construction The following particulars are extracted from the very able and [illegible] account of it drawn up by the engineer, Mr [illegible] and published under the authority of the Commissioners of the Northern Lighthouses

Skerryvore is the largest of a group of rocks lying in the channel between the western isles of Scotland and the north coast of Ireland, and in the track of the larger vessels [illegible] the north of Ireland from the Clyde [illegible] It is of inconsiderable extent, the surface of the solid rock being only about forty square yards, and consequently the stones had to be quarried, and the greater part of the works carried on in the island of Tyree, the nearest land, situated about eleven nautical miles to the north east Much of the difficulty attending the operation arose from the distance of this latter island from the site of the works, from its being destitute of any shelter for shipping, and from the exposed and stormy situation, which frequently rendered communication impossible

The dimensions of the [illegible] reference to the situation [illegible] great dist[illegible] ks, some of them not less than [illegible] of the rock, made it desirable [illegible] mand an extensive range, and consequently that the tower should be of conside[illegible] on the [illegible] up the [illegible] accomm[illegible] and the stowage of stores It was accordingly determined that the light should be elevated 150 ft above the level of high-water at spring tides, so as to illuminate a visible horizon of not less than eighteen miles radius, and that the void space within the pillar should be about 13,000 cubic feet.

In determining the form of the tower the object is to obtain the greatest strength with the smallest consumption of materials, having regard to the necessary conditions of height and internal accommodation The shaft of the Skerryvore pillar is a solid generated by the revolution of a rectangular hyperbola about its asymptote as a vertical axis Its exact height is 120·25 feet, its diameter at the base 42 feet, and at the top 16 feet The first 26 feet of [illegible] containing about 27,110 cubic feet [illegible] this level the walls are 9 58 feet in thickness, whence [illegible] decrease through the whole height of [illegible], at the top, they are reduced to two feet in thickness Above the shaft is a cylindrical belt 18 inches deep, which is surmounted by a cavetto 6 feet high and having 3 feet of projection The cavetto supports an abacus 3 feet deep, the upper surface of which forms the balcony of the tower, and above it rest the parapet wall and lantern The whole masonry of the tower contains 58,580 cubic feet, weighing about 4308 tons

The general arrangement in the interior of the tower is as follows "The ascent to the outside door is by a ladder or trap of gun metal 26 feet high The first apartment on the level of the entrance door is chiefly appropriated to the reception of iron water tanks, capable of holding a supply of 1251 gallons The next story is set aside for coals, which are stored in large iron boxes The third apartment is a workshop, the fourth is a provision store and the fifth is the kitchen Above are two stories, each divided into two sleeping apartments for the four light keepers Over them is the room for the visiting officers, then follows the oil store and lastly comes the light room, making in all 12 apartments"

In its general a[illegible] is identical with [illegible] Dict of Science) It consists of [illegible] the first order in the system of A[illegible] inches focal distance, revolving round a lamp with four concentric wicks, and producing a bright blaze as each lens passes before the lamp Above these principal lenses there are placed eight pyramidal lenses of 19·68 inches focal distance inclined at an angle of 50° with the horizon, and combined with eight plane mirrors inclined in the opposite direction under the same angle of 50° by means of which the rays which would pass upwards are turned into the horizontal direction. The light appears in its brightest state at intervals of one minute and is well seen as far as the curvature of the earth permits

The works were begun in 1838, and the tower was finished in 1842 but considerable time was required for completing the internal fittings, and the light was not exhibited as a sea light till February 1844 The expense of the lighthouse, including the opening of quarries and forming wharfs for shipping the stone both in Mull and Tyree amounted to 90 268*l* 12*s* 1*d* (*Account of the Skerryvore* [illegible] *of Lighthous*[illegible] *to the Northern Lighthouse Board*, 4to *Edinburgh*, 1848)

LIGHTHOUSES A plan of the arrangement of the reflectors for lighthouses was produced by Messrs Chance at the Great Exhibition of 1851, which combines the principles of Fresnel's fixed and revolving lights with an improved method of reflexion, and does away with the use of metal reflectors

The system of reflectors and refractors may be divided into three compartments, the upper and lower of which are composed respectively of thirteen and six catadioptric zones, which produce a vertical strip of light extending the whole length of the apparatus, similar to Fresnel's fixed dioptric light The central compartment consists of eight lenses of three feet focal length, each of which is the centre of a series of eleven concentric prismatic rings designed to produce the same effect as a solid lens of equal size These compound lenses are mounted upon a revolving frame, and transmit horizontal flashes of light as they rotate Motion is communicated by clock-work, and one revolution is performed in the spa[illegible] a flash of light is [illegible] horizon by each of the lenses in succession The apparatus is lighted by an Argand lamp, with four concentric wicks; it is provided with four burners, the

largest of which is 3¼ inches and the smallest $1\frac{6}{10}$ inches in diameter

LIGNONI (Lat lignum, *wood*) A liquid which may be separated by distillation from commercial wood spirit It [illegible]

LIGNOSULPHURIC ACID A peculiar acid resulting from the action of sulphuric acid upon lignine It is more properly termed *Sulpholignic acid*

LIGNUM VITÆ (Lat) The wood of the guaiacum tree

LILACINE A bitter crystallisable principle contained in the leaves of the *Syringa vulgaris* It has also been termed *Syringine*

LIMBILITE A granular mineral found in the volcanic formation of Limbourg

LIMONITE (Gr λειμων, *a meadow*) In Mineralogy, brown iron ore

LIMOSIS (Gr λιμος, *hunger*) A genus of diseases distinguished by excessive or defective appetite

LINARITE In Mineralogy, the cupreous sulphate of lead from Linares, in Spain It also occurs in Cumberland, and at Leadhills in Scotland

LINCTUS (Lat lingo, *I lick*) A medicinal preparation of the consistence of thick syrup, or honey, which requires to be licked off the spoon

LINDEN TREE The Lime tree, *Tilia Europæa*

LININ A bitter principle obtained from the *Linum catharticum* or purging flax

LINNITE In Mineralogy, native sulphuret of cobalt, first noticed in Sweden by the celebrated Linnæus

LINNÆAN SYSTEM *See* BOTANY, in DICT

LINSENERZ In Mineralogy, octohedral arseniate of copper

LINT A soft woolly material made by scraping old linen by hand It is also made by machinery It is used in surgery for dressing wounds and ulcers, either alone or spread with some ointment

LIPAROCELE (Gr λιπαρος, *fat*, κηλη, *a tumour*) A fatty tumour

LIPIC ACID (Gr λιπος, *fat*) An acid formed by acting upon stearic and oleic acid, by means of nitric acid

LIPOMA (Gr λιπος, *fat*) An encysted fatty tumour

LIQUATION *See* ELIQUATION, in DICT

LIQUIDAMBER A balsam procured in Mexico and Louisiana from the stem of *Liquidamber styraciflua* It is, probably, identical with the so called *White Balsam of Peru*

LIQUORICE The extract of the root of the *Glycyrrhiza glabra* or officinal liquorice it is often called Spanish liquorice or Spanish juice, of which that stamped with the name Solazzi, and imported in sticks or bars six or eight inches long is considered the best It is in common use as an emollient in catarrh and cough The so called *refined liquorice*, rolled into pipes or quills, is often much adulterated

LIQUOR SANGUINIS *See* PLASMA

LIRIODENDRINE (Gr λιριον, *a lily* and δενδρον, *a tree*) A bitter crystallisable principle obtained from the bark of the root of the *Liriodendron tulipifera*

LITHAGOGUE (Gr λιθος, *a stone*, and αγω, *I drive away*) Medicines supposed to have the power of expelling [illegible] matter from the kidney or bladder

LITHOCHROMATICS (Gr λιθος, *a stone*, and χρωμα, *colour*) A term applied to a recent invention, which consists in printing [illegible] upon stone, and taking impressions upon canvass

LITHOCOLLA (Gr λιθος, *a stone*, and κολλα, *glue*) A cement for stone-work

LITHOFELLIC ACID (Gr λιθος, *a stone*, and Lat. fel, *gall*) A substance obtained by Gobel from a Bezoar stone In 1844, Taylor made the curious discovery of the identity of the substance constituting the so called *Oriental Bezoars*, which are probably the intestinal concretions of a species of antelope with the acid called *Ellagic acid*, contained, along with tannic and gallic acids in the gall nut

LITHOPHAGI (Gr λιθος, and φαγω, *I eat*) *See* LITHODOMES, in DICT Molluscous animals which bore into stones

LITHOPHYTES (Gr λιθος, and φυτον, *a plant*) Polypes which have a stony axis, as distinguished from the Keratophytes or horny polypes

LIVER ORE OF MERCURY *Hepatic ore* A bituminous cinnabar, or sulphuret of mercury, from Idria

LOBELINE A peculiar acrid oil contained, along with *Lobelic acid*, in the leaves of the *Lobelia inflata*

LOBOITE In Mineralogy, a magnesian idocrase from Norway

LONDON CLAY A very extensive tertiary geological deposit of a bluish clay, superficially brown, and abounding in Middlesex, Essex, Suffolk, and part of Norfolk *See* GEOLOGY, in DICT.

LOPEZ *Radix Lopeziana* The name of the root of an unknown tree, supposed to grow at Goa It is said to be [illegible] effective in checking diarrhœa

LORIMER A name formerly given to the makers of bits, spurs, and other articles of iron used for horses

LOVE APPLE The Tomata The fruit of *Solanum lycopersicum* An excellent ingredient in soups and sauces, in especial use in Spain and Portugal

LUPIA (Gr λυπεω, *I molest*) An encysted tumour

LUSTRE Several varieties of *Lustre* are referred to in descriptive mineralogy such as splendent, glistening, glimmering shining, dull &c

LUTEOLINE and LUTEOLE'INE Peculiar colouring principles, said by Preisser to be obtained from *weld*

LUZ The name of a bone in the human body, celebrated in Rabbinical writings, and supposed to be indestructible according to some it was a vertebra, others regard it as having been the sesamoid bone of the great toe, and others one of the triangular bones near the lambdoidal suture of the cranium

M.

M In medical prescriptions M stands for *misce*, or mix also for *manipulus* a handful

MACER The bark of the root of a tree growing in Malabar It is astringent, and celebrated for the cure of diarrhœa

MACQUERS SALT A pharmaceutical designation of the bisarseniate of potassa

MACROCOSM (Gr μακρος, *large*, κοσμος *world*) A term applied to the world at large, or *universe*, as opposed to *microcosm*, having reference to man

MADAROSIS (Gr μαδαρος, *bald*) A falling off of hair, especially of the eyelashes

MAGDEBURGH EXPERIMENT or HEMISPHERES A hollow sphere composed of two hemispheres which fit air-tight intended to show the amount of the air's pressure, by the amount of force with which they are so held together after the interior air has been removed by the air-pump This apparatus was first suggested by Otto Guericke of Magdeburgh, the inventor of the air pump

MAGELLANIC CLOUDS These singular objects were carefully examined by Sir John Herschel during his residence at the Cape of Good Hope, from 1834 to 1838, and are minutely described in his "Results of Astronomical Observations" &c The greater nebula, or *Nubecula major*, is situated between the meridians of 4 h 40 m and 6 h 0 m, and the parallels of 156° and 162° of North Polar Distance occupying an area of about 42 square degrees The lesser is situated between the meridians 0 h 28 m and 1 h 15 m and the parallels of 162° and 166° N P D and covers about ten square degrees, their general shape is round, or somewhat oval, and the larger, which deviates most from the circular form, exhibits the appearance of an axis of light very ill defined and by no means strongly distinguished from the general mass which seems to open out at its extremities into somewhat oval sweeps "When examined through powerful telescopes" Sir John observes, "the constitution of the nubeculæ and especially of the Nubecula major, is found to be of astonishing complexity The general ground of both consists of large tracts and patches of nebulosity in every stage of resolution, from light irresolvable with 18 inches of reflecting aperture, up to perfectly separated stars, like the Milky Way, and clustering groups sufficiently insulated and condensed to come under the designation of irregular and in some cases pretty rich clusters But besides those there are also nebulæ in abundance, both regular and irregular, globular clusters in every state of condensation, and objects of a nebulous character quite peculiar and which have no analogue in any other region of the heavens Such is the concentration of the objects, that in the area occupied by the Nubecula major not fewer than 278 nebulæ and clusters have been enumerated, besides 50 or 60 outliers, which (considering [illegible] such objects in the immediate [illegible] certainly to be reckoned as its appendages, being about six and a half per square degree which very far exceeds the average of any other, even the most crowded parts of the nebulous heavens. In the Nubecula minor the concentration of such objects is less, though still very striking, 37 having been observed within its area and 6 adjacent but outlying The nubeculæ, then, combine each within its own area, characters which, in the rest of the heavens, are no less strikingly separated, — viz those of the galactic and the nebular system Globular clusters (except in one region of small extent) and nebulæ of regular elliptic forms are comparatively rare in the Milky Way, and are found congregated in the greatest abundance in a part of the

heavens the most remote possible from that circle, whereas, in the nubeculæ, they are indiscriminately mixed with the general starry ground, and with irregular [illegible] (*Outlines of Astronomy*, p 613)

MAGNETISM TERRESTRIAL During the last quarter of a century immense efforts have been made to determine both the [illegible] of terrestrial magnetism The first great impulse to the improvement of science is mainly due to the celebrated Humboldt, who, in 1828, formed an association at Berlin for the purpose of verifying an inference which had been drawn from the comparison of corresponding observations made at London and Upsala by Graham and Celsius in the last century, and recently at Paris and Kazan by Arago and Kupffer, namely that the irregular movements of the needle take place simultaneously at places very distant from each other At first the operations were on a very limited scale, being confined to hourly observations on some particular days previously agreed on at Berlin and Freyberg, but in the following year the plan received an immense extension in consequence of the establishment by the Russian government of magnetical observatories at St Petersburg Kazan, Nicolaieff, and Sitka (on the north-west coast of America), that is to say, across the whole continent of Europe and Asia A second association was soon after formed at Gottingen by Professor Gauss through which very important improvements were effected both in the instruments of observation and the methods of observing, which have been since generally adopted In 1836 the indefatigable Humboldt addressed a letter to the late Duke of Sussex, then President of the Royal Society, on the best means of perfecting the knowledge of terrestrial magnetism, and, his suggestions being approved by the Council of the Society, the government was induced, through the representations of that body to sanction the establishment, in several of the British colonies, of observatories, equipped with appropriate instruments, and superintended by military or naval officers, with sufficient assistance at their disposal for making continuous *hourly* or *two hourly* observations of the different magnetic elements The places selected were Toronto, St Helena the Cape of Good Hope, and Hobarton, in Van Diemen's Island, and, as it was considered important to obtain observations in high southern latitudes the expedition to the Antarctic seas, under the command of Sir James Clarke Ross, was projected and ordered at the same time The East India Company likewise promised its co-operation by providing for the establishment of [illegible] observatories at Bombay Madras Lucknow, Singapore and Simla At home a magnetical and meteorological department was added to the Royal Observatory at Greenwich, and another is kept on foot at Dublin It was originally proposed that the colonial observatories at the four stations above named should be continued for three years only, but the grant of the requisite funds has been renewed from time to time, and they are still (1852) in operation The observations have been made systematically according to rules drawn up by a Committee of the Royal Society, and are reduced under the superintendence of Colonel Sabine, at an establishment also maintained by the government, at Woolwich Several volumes of observations have been published containing a regular series, since 1841, made at Toronto, Hobarton, and St Helena, and including those made in 1841 and 1842 by the officers of the Antarctic expedition In addition to these official volumes, Colonel Sabine has also contributed a series of interesting papers to the *Philosophical Transactions*, and the *Reports of the British Association* containing the results deduced from a comparison of the observations at the different places The observations made at Greenwich are re- [illegible] the whole were for some [illegible] nually, at present only a portion of those made continuously by a photographic process are published in an Appendix to the volumes containing the astronomical observations By all these means a very large collection of well observed facts has been accumulated but it cannot be said that the theory has yet made corresponding advances

A magnetical observation is complete when three elements are determined, — the *declination* of the magnetic needle, its *inclination*, and the intensity of the force The two latter however, are not usually observed directly, but in lieu of them the horizontal and vertical components of the intensity are observed, and, from the variations of the two components, those [illegible] and of the force itself, are computed The declination and inclination indicate the direction in reference to the horizontal and vertical planes which a freely suspended needle would assume, so that, in fact, the direction of the magnetic force and its intensity are the two elements sought to be determined The instruments employed are called by the general name of *Magnetometers* (*See* the term)

In order to obtain a knowledge of the laws of terrestrial magnetism, it is necessary that the mean values of the three elements, and the variations of those elements, should be determined at a great number of points taken all over the earth's surface For the purpose of comparison, the points or stations at which the observations have been made are projected on maps, and lines being drawn through those points at which the mean values are the same in respect of each element, a series of curved lines is obtained, which indicate the values of the elements at the intermediate points with more or less accuracy, according to the proximity of the stations at which observations are made The curves thus traced through the points of equal declination are called *Isogonal*, those through the points of equal inclination, *Isoclinal*, and those connecting the points of equal force, *Isodynamic*

Declination, or *Variation* Although the general direction of the horizontal needle is nearly north and south, there are few places at which it points exactly in the direction of the meridian At London and over the greater part of Europe, the north end of the needle declines to the west, while in Siberia and some parts of the North American continent it declines to the east. In the northern hemisphere the isogonal lines, though extremely irregular, appear to converge towards two separate points or poles whence it has been inferred that there are four magnetic poles, two in each hemisphere Supposing this to be the case, the declination of the needle will be east or [illegible] of observation is to the we [illegible] passing through the nearest or most powerful pole, and there will be in each hemisphere two isogonal lines of no declination, or in which the direction of the needle coincides with the meridian These lines, accompanied by others passing through the series of points at which the declination is respectively 5°, 10°, 15°, &c were first laid down by Halley, in 1700, in a *Sea Chart* or *Variation Chart*, and since that time similar charts have been published by various persons, — Hansteen, Barlow, Erman, and others Halley supposed they would be useful as a means of finding the longitude at sea, but, on account of the changes which the declination is undergoing at almost every place where correct observations have been made they are not only useless for this purpose, but do not long continue to represent the actual declinations

The changes which take place in the declination are of three kinds, — secular annual, and diurnal The laws and period of the secular change are very imperfectly known At London in 1580 the declination was 11° 17′ E about 1660 it was 0° Soon after that year the needle began to deviate to the west, and the westerly declination continued to increase till 1815, when it seems to have attained its maximum of 24° 27′ 18″, inasmuch as it has gradually decreased since that time The mean declination deduced from the observations at the Greenwich Observatory in 1846 was 22° 49′ 35″ At Paris, the observations give a similar increase up to the same period But this agreement is by no means general in Jamaica, for example the declination seems to have remained nearly constant The explanation of these phenomena forms one of the greatest difficulties in the theory of terrestrial magnetism

The annual variation of the declination was first remarked at Paris by Cassini From a comparison of observations made at Paris from 1784 to 1788, and at London from 1793 to 1805, Arago found a minimum of declination towards the vernal equinox, and a maximum towards the summer solstice But it may be doubted whether these ancient observations were sufficiently accurate to determine this question, more especially as the result is not confirmed by the recent observations in the colonial observatories At St Helena and Toronto no variation of the rate of the secular change in the different seasons is perceptible At Hobarton the east declination appears to be, on the average, somewhat greater in the summer months than in the winter months but the differences are extremely small

Diurnal Variation The declination is also subject to a diurnal change which was first remarked by Graham at London, in 1722 The remark was confirmed by the observations of Celsius, and by Hiorter in Sweden [illegible] by those of Wargentin, [illegible] declined towards the west from the hours of 8 or 9 before noon till 1 or 2 after noon, and then towards the east till 8 or 9 in the evening The same observers also remarked that the needle was affected by Aurora or polar light and that in the presence of this phenomenon the change in its mean direction was sometimes as much as 5° in the course of a day In the *Philosophical Transactions* for 1759 there is a paper by Canton, giving the results of observations on the daily variation during 663 days On 574 of those days the deviations were regular, and nearly the same as those found by Celsius; on the remaining days they were irregular, and on those days there were displays

of Aurora Canton ascribed the diurnal change to the effect of the sun's rays in heating the earth, and thereby diminishing the magnetic force which is [illegible] in the morning, when the earth is heated on the eastern side of the meridian, the magnetic force on that side is weakened, and the needle consequently declines to the west, and in the afternoon, as the earth becomes heated on the western side of the meridian, the needle begins to move in the opposite direction and declines to the eastward of its mean place The amount of the diurnal change is different at different places, and at different seasons of the year At London, for the years 1817—1819, it was found by Col Beaufoy to be from 4′ to 5′ in December and January, and above 11′ in June and August At the Royal Observatory the mean diurnal range for the year 1846 was in summer, 15′ 14″, in winter, 11′ 53″, and the mean for the whole year 13′ 34″ At Toronto and Hobarton the diurnal range is also greatest in the summer months and least in the winter months, and the changes take place at nearly the same hours of local time

Inclination, or *Dip* The inclination has a general dependence on the latitude, but it varies considerably at different places under the same latitude A line drawn through all those places where the dipping needle becomes horizontal (usually, though perhaps improperly, called the magnetic equator) appears to intersect the equator of the earth in four points In the Atlantic Ocean, between Africa and America it lies wholly [illegible] south [illegible] steen the nodes or points intersective with the equator of the earth are on the meridians 22° E 187° E, 120° W, and 108° W, but these determinations must be taken as subject to considerable uncertainty the observations being by no means accordant The other isoclinal lines follow, with more or less irregularity, the direction of the magnetic equator until a high latitude is attained In Boothia Felix, in latitude 70° 5′ 17″ N, and longitude 96° 45′ 48″ W, Sir James Clarke Ross found the dip to be 89° 59′, within a minute of the vertical, and the needle had there altogether lost its directive power In the southern hemisphere, on board the Erebus in 1841, Sir J C Ross observed an inclination of 88° 36′ in latitude 75° 22′ S, and longitude 161° 48′ E (Sabine, *Phil Trans* 1843) The places at which the dipping needle becomes exactly vertical and to which the above most nearly approach are usually styled the *magnetic poles*, but as will be seen presently, they not only do not coincide with, but are at a great distance from, the places at which the intensity of the magnetic force is a maximum —a circumstance which it is necessary to keep in mind, as the term *pole* is also frequently applied to the points of greatest force Like the declination, the dip is subject to secular, annual, and diurnal changes At London it was observed by Graham, in 1720, to be 74° 42′, and by Captain Kater, in 1830, to be 69° 38′ The mean of the Greenwich observations for 1846 is 68° 58′ 1, whence it appears that the dip at London is diminishing The annual variation is scarcely perceptible At Toronto and Hobarton the range of the diurnal variation of the dip is about 1′ 25, at Greenwich for 1846, the difference of the means of the daily observations at 9 A M and 3 P M was 1′

Intensity The absolute intensity of the magnetic force, like the declination and dip, varies at different places, and probably at different times It is compared at different stations by observing the number of oscillations made in a given time by a magnetic bar suspended horizontally by a fine wire or silk fibre If F denote the force, D the inclination of the dipping needle, and N the number of oscillations made by the suspended bar in a given time at any station and F′, D′, N′, denote the same things at a second station, then the following proportion holds, which gives the relative value of the two forces, *viz*

$$F : F' :: N^2 \cos^2 D : N'^2 \cos^2 D'$$

From the large table of results given by Hansteen, it appears that if the intensity at the magnetic equator in Peru (where it was supposed by Humboldt to be a minimum) be [illegible] then the intensity at Naples is 1 275 at Marseilles 1 291 at Madrid 1 314, at Paris 1 348, at London 1 370 at Christiania 1 420, in Baffin's Bay (lat 76° 45′ N, long 58° 20′ W) 1 705 The maximum intensity hitherto observed is 2 052, and the minimum 0·706 Both observations were made at places in the southern hemisphere, the former by Sir James Clarke Ross, in lat 73° 47′ S, long 171° 50′ E (of London), where the dip was observed to be 87° 4′; and the latter by Erman, in lat 19° 59′ S, and long 35° 4′ W, off the eastern coast of Brazil, where the dip is 7° 55′ the two extreme intensities are therefore in the ratio of 1 2 906 In both hemispheres there are two points, or rather regions, of maximum intensity, which may be regarded as centres of separate magnetic action The position of the principal or strongest northern maximum intensity was ascertained by Captain Lefroy, in 1842 and 1843, to be in lat 52° 19′ N, long 266 1 (Sabine, *Phil Trans* 1846), that of the minor maximum was determined in 1828 and 1829 by Hansteen, and Erman, in the Russian expedition, to be in the meridian of 111° 27′ E The interval between the two meridians is consequently 270°—111°=159°, so that they are not directly opposite Both points appear to have undergone progressive changes from west to east, though not at the same rate In the southern hemisphere the two centres of maximum force are still nearer each other in respect of geographical longitude, and the intensity is greater than in the northern hemisphere (Sabine, *Phil Trans* 1850) The isodynamic lines are in general nearly parallel to each other, and also to the isoclinal lines, though at some particular places the two sets of lines are nearly at right angles The intensity does not appear to be affected by elevation above the surface

Simultaneous Perturbations In the volume of Hobarton Observations, 1841 to 1848, Col Sabine gives an interesting comparison of the simultaneous affections of the three elements at Hobarton and Toronto, on one of Gauss's term days, April 21, 1842, these two stations being specially selected for comparison as being geographically situated at nearly opposite points of the globe The result showed that the amount of disturbance on this day was nearly the same at both stations, and that the instants of extreme disturbance are not unfrequently as nearly identical at both as the nature of the observations enables us to determine The inference is that many of the perturbations or particular disturbances observed, must be regarded as general affections of the whole globe, manifesting themselves at stations the most remote from each other

Theory On considering all the phenomena, and particularly those of the diurnal and annual variations (which obviously depend on solar heat), as well as the disturbances accompanying displays of polar light it must appear extremely improbable that the magnetic force on which these phenomena depend is deeply seated in the earth If it belongs to the earth it must be supposed to be near to or at the surface, in order to account for the correspondence of the phenomena with the diurnal variations of temperature Accordingly it has been suggested that the cause must be looked for in the atmosphere Sir D Brewster (*Treatise on Magnetism*, 1837) adopts this view, and considers it to be proved, by certain experiments of Faraday, that iron is diffused through the atmosphere in a state of vapour But a new light has very recently been thrown on this subject by Faraday, who has demonstrated that the oxygen of the atmosphere is magnetic, and that the intensity of its magnetism like that of iron is diminished by an increase of temperature This fact renders the hypothesis of a diffusion of ferruginous vapour through the atmosphere unnecessary, and as the constituent gases of the atmosphere are every where in the same proportion the phenomena depending on the magnetic properties of its oxygen must be precisely the same as if the whole atmosphere were magnetic In a paper published in the *Philosophical Transactions* (Part I 1851), Professor [illegible] new test-paper has been applied to [illegible] of terrestrial magnetic force The earth he remarks, is a great magnet its power, according to Gauss, being equal to that which would be conferred if every cubic yard of it contained six one-pound magnets The disposition of this magnetic force is not regular, nor are there any points on the surface which can properly be called *poles*, still the regions of polarity are in high north and south latitudes These regions are connected by lines of magnetic force, which, generally speaking, rise out of the earth in one (magnetic) hemisphere, and, passing in varied directions over the equatorial regions into the other hemisphere, then enter into the earth to complete the known circuit of power A free needle shows the presence and directions of these lines, which invest the globe with a system of forces like that about an ordinary magnet, and wherever they pass through the atmosphere the forces are subject to the changing action of the magnetic oxygen There is every reason to suppose that these lines are *held* in the earth, just as the lines which originate in a magnet are held by it, and that any disturbance from above will cause a greater change in their place and direction in the atmosphere than in the earth When space, traversed by uniform lines of magnetic force, is occupied by a uniform body, as air, the disposition of the lines is not altered, but if a better conducting substance is introduced, the lines are concentrated or drawn closer together in it, and if a worse conducting substance is introduced they are opened out, and stand at greater distances from each other Now, supposing the whole atmosphere to have a mean temperature, the lines of force would have the direction determined by the arrangement of the power within the earth Then the [illegible]

would be opened out, and as the sun came up to and passed the meridian similar changes in the directions of the lines of force would there take place, so that in the morning a needle would be deflected towards the west, and in the afternoon towards the east As the night came on, and with it a lower temperature than the mean, the lines of force would be concentrated, and a reverse variation of the needle would take place The magnetic properties of oxygen and its daily variations of temperature, manifestly produce effects similar to those which actually take place, but whether they cause the whole of the observed variations, or are competent to do so, is a question that can only be decided after a very careful inquiry Professor Faraday states that the hypothesis has been compared with the mean daily variation for all the months in the year at north and south stations, as Toronto and Hobarton, and at many others near to and far from the equator, and the agreement is very remarkable Thus, according to the hypothesis, the paths described by the upper ends of free needles in the north and south hemispheres should be closed curves with the motion in opposite and certain directions, and so they are,—the curves should be larger in summer and smaller in winter, and so they are,—the northern hemisphere ought to have a certain preponderance over the southern, because of its superior temperature, and that is so,—the disposition of land and water ought to have [illegible] and the observations indicate one in the [illegible] What still remains to be done, to verify this ingenious theory is to ascertain the amount of change in the conducting power of the air for given changes of temperature, in order that it may be seen whether the effect on the magnetic instruments thereby produced corresponds with that which actually takes place

MAGNETITE In Mineralogy, magnetic ore of iron

MAGNETOMETER An instrument or apparatus for determining the elements of terrestrial magnetism, in direction and force When adapted to the purpose of determining the declination of the needle it is called a *Declinometer*, for the inclination and vertical force, it becomes an *Inclinometer* (see the terms) From the experience obtained in the British colonial observatories, it appears that these instruments, at least in the form recommended in the *Instructions* drawn up by the Committee of the Royal Society [illegible] of irregularity, one [illegible] magnetised bar to lose a portion of its magnetism, and others on causes not perfectly understood (Sabine, *Phil Trans* 1850) The instruments used at the Greenwich Observatory, and the modes of using them, are described in detail in the Introductions to *Greenwich Magnetical Observations*, which were published annually from 1841 to 1847

MALABATHRUM The leaf of the Cassia laurel, from Malabar

MALACOSTEON (Gr μαλακος, *soft* and οστεον, *a bone*) A diseased softening of the bones *mollities ossium*

MAL DE LA ROSA A disease endemic in the Asturias, attended by redness of the skin.

MALPIGHIAN In Anatomy, this term is applied to certain parts especially of the kidney, in allusion to the anatomist Malpighi by whom they were discovered or first definitely described Thus the numerous secreting tubes (*tubuli uriniferi*), where they are collected into conical bundles, form the "Malpighian" cones or pyramids, the more tortuous parts of the tubes which pass towards the surface of the kidney, terminate in or bear on small pedicles appended to their walls flask-shaped sacculi, named "Malpighian capsules" The arteries of the kidney, before dividing into capillaries, form, by tortuous convolutions, little balls, called "Malpighian corpuscles or [illegible]

MALTHAZITE A [illegible] mineral from Lobau

MANDELIC ACID (Germ mandeln, *almonds*) A white crystalline acid obtained by the action of hydrochloric acid on bitter-almond oil Its chemical formula is $C_{16} H_7 O_5 + H O$ It has also been called *Isomobenzoilic acid*, inasmuch as it contains the elements of formic acid and hydruret of benzoyle

MANDRIL The part of a turning lathe which carries the chuck upon which the *work* (that is, the material to be turned) is fixed It consists of a pulley, fixed upon an axle which is supported in the headstock, and receives its motion from the foot wheel (or the treadle, in the case of the pole-lathe), by means of a catgut band passing over the mandril pulley, into which grooves are cut for receiving the band Mandril, also, is the name given to the iron rod upon which a gun barrel is welded. In Zoology, a species of baboon is so called

MANGANITE In Mineralogy, grey ore of manganese.

MANNACROUP A granular preparation of wheat deprived of bran, used as an article of food for children and invalids

MARASCHINO A liquor prepared from a peculiar cherry growing in Dalmatia, it is bruised fermented, and then distilled and afterwards sweetened with sugar. [illegible] root

MARCASITE. In Mineralogy, white iron pyrites. A sulphuret of iron

MARIOTTE'S LAW This important relation between the elastic force and the density of gaseous matter, [illegible] is due to the first discoverer to be called *Boyle's Law* In a tract published at Oxford in 1668, [illegible] of air is [illegible] is equivalent to saying, that the elastic force is directly as the density or inversely as the volume, under the same temperature Boyle's experiments were made on atmospheric air confined in the closed end of a U-shaped glass tube, and compressed by the weight of a column of mercury It does not appear that he took the precaution to expel the moisture from the air, and the greatest pressure he applied was only equal to four atmospheres, so that it may, perhaps, be said that his experiments were neither sufficiently accurate nor extensive to establish the general law, even in respect of atmospheric air, without mentioning the other gases Mariotte's experiments were described in the Memoirs of the Paris Academy of Sciences, published about eleven years later, namely in 1679, without any reference to Boyle's announcement, which was possibly unknown to him, and as it was through this channel that the law became known to the continental philosophers who were the first to perceive its importance, they naturally distinguished it by the name of the person whom they supposed to be its discoverer

The relation in question has recently been investigated by M Regnault of Paris, in a series of experiments, conducted with the utmost attention to every circumstance affecting their accuracy, and the results are interesting If v denote the volume of a gas under the pressure p and v' its volume under pressure p', then the law gives $vp = v'p'$, whatever the pressures may be, if the temperature remains unaltered But, on comparing the results of his experiments, M Regnault has found that the above equation is not strictly true for any gas, and that, assuming $vp = v'p'(1+q)$ (where q is a small correction) the value of q increases with the pressure In respect of atmospheric air, the elastic force, under a pressure of twenty-five atmospheres, is less by a quantity somewhat exceeding the seventh part of an atmosphere than it would be if the law were strictly true With respect to carbonic acid the deviation is considerably greater In the case of hydrogen the correction q becomes negative, so that while air and the other gases expermented upon were more compressed than they would be if the law were exactly followed hydrogen was less compressed, and its compressibility was found to diminish as the pressure increased But temperature has a considerable influence on these results, and as it was found that the deviation from the law diminishes as the temperature is increased, M Regnault concludes that the law is only rigorously true when the gases are infinitely dilated and that it becomes less and less exact in proportion as they are in a state of greater condensation (*Memoires de l'Institut*, tome xxi)

MARTIAL FLOWERS An old pharmaceutical name of black oxide of iron

MARTIAL REGULUS Metallic antimony obtained by decomposing sulphuret of antimony by means of iron

MASTICIN That part of mastic which is insoluble in alcohol it has some of the characters of caoutchouc The part of mastic soluble in alcohol, has been termed *Mastic acid*

MATERIA HERMAPHRODITA A term applied by Boerhaave to a peculiar substance soluble both in alcohol and water, and contained in vegetable extracts. Scheele called it *Materia saponacea* It is the *extractive* [illegible] leaves of a Peruvian plant, said to be a species of pepper, have been brought under this name to England, and much extolled for their medical virtues

MAULSTICK (Germ *Mahlstock*) A painter's stick on which he rests his hand whilst painting

MECCA BALSAM The produce of the *Balsamodendron Gileadense*, growing at Gilead, in Judwa It is also called *Opobalsamum*

MEDULLA OBLONGATA (Lat *the oblong pith*) In Anatomy, is the name given to the mass of grey and

white neurine contained in the occipital segment of the cranium, and forming the medium of connection between the spinal nerves and the encephalon It sometimes extends beyond the foramen magnum, but properly constitutes the myelon; but it has distinct and higher functions, and constitutes the chief part of the encephalic cavities

MEDULLA SPINALIS (Lat *the spinal pith*) In Anatomy the part of the nervous axis which is contained in the vertebræ of the trunk See MYELON

MELAMPYRINE (Gr μελας, *black* and πυρ *fire*) A crystallisable substance, soluble in water and nearly insipid, contained in the *Melampyrum nemorosum*

MELANOCHROITE (Gr μελας, *black*, and χροα, *colour*) A mineralogical variety of chromate of lead

MELANOGALLIC ACID A synonym of *Metagallic acid*

MELANTANNIC ACID (Gr μελας, *black*) The black substance formed by the action of excess of potash upon tannic or gallic acid

MELASSES See Molasses in Dict

MENDIPITE A native oxychloride of lead from the Mendip Hills Somersetshire

MENINGITIS (Gr μηνιγξ, *a membrane of the brain*) Inflammation of the membranes of the brain

MENSIS PHILOSOPHICUS (Lat) A chemical or philosophical month, its duration is variously stated, it is generally considered as including three days and nights

MENTHENE A liquid hydrocarbon obtained by distilling the crystallisable portion of peppermint oil, or *peppermint camphor* with anhydrous phosphoric acid Its formula is $C_{20} H_{18}$

MESENCEPHALON (Gr μεσος, and εγκεφαλον, *brain*) The natural primary division of the brain, which is usually encompassed by the parietal segment of the cranium and consists of the lobe of the third ventricle, the optic lobes, with the appendages called the "conarium," "hypophysis," and in fishes the "hypoaria" Chaussier gave the term "mesocephale" to an artificial combination of the pons varolii with the optic lobes dissociating the one from the medulla oblongata and cerebellum, and the other from the lobe of the third ventricle By some Anthropotomists the term "mesocephalon" is used synonymously with that of "pons varolii"

MESITE (Gr μεσος, *middle*) A liquid existing in pyroligneous spirit, the formula of which appears to be $C_6 H_6 O_2$ it is therefore, the hydrocarbon mesytilene $(C_6 H_4)+2 H O$

MESOXALIC ACID An acid obtained by boiling a saturated solution of alloxanate of baryta, which is thus resolved into *mesoxalate of baryta* and other products. This acid is crystallisable and very sour and soluble Its formula is $C_3 O_4+2 H O$

MESLIN (Fr mesler) A mixture of various kinds of grain

METACETONE (Gr μετα indicating *change* and acetone) A product formed during the distillation of a mixture of 1 part of starch with 8 of quick lime it is a colourless liquid, insoluble in water, but soluble in alcohol and ether, and of an agreeable odour Its formula is $C_6 H_5 O$ It [illegible] into *Metacetonic (metac[illegible]*

METAGENESIS (Gr μετα indicating *change*, γινομαι *I produce*) The changes of form which the representative of a species undergoes in passing by a series of successively generated individuals from the egg to the [illegible] It is contradistinguished from [illegible] which those changes are undergone by the same individuals. The following is an example of Metagenesis — The egg of the Medusa is developed into a polype, which assuming a form called *Strobila*, separates into numerous individual young Medusa The larval polype propagates other similar polypes by gemmation, each of which becomes a *Strobila*, and is resolved into numerous Medusæ Thus there is a successive production of procreating individuals from a single impregnated ovum of a Medusa, according to the law of Parthenogenesis

METALLIC TRACTORS Towards the end of the last century Dr Elisha Perkins, of Norwich, in Connecticut, introduced a method of treating diseases by drawing over the affected part two small metallic rods made of different metals, which he called *metallic tractors*, and the operation was called *tractoration*. The use of tractors has been called *Perkinism*, as that of animal magnetism has been called *Mesmerism* It is almost needless to say that in many instances they operate on the fancy of the patient (Hooper's *Medical Dictionary*)

METALLOCHROMES (Gr μεταλλον, *metal*, and χρωμα *colour*) When very thin films of peroxide of lead are deposited by electrolytic action upon polished steel plates they exhibit those beautiful prismatic tints which Nobili first described under the above name For the method of their production, see *Brande's Manual of Chemistry* p. 1518

METAMERIC (Gr μετα, indicating *change*, and μερος, *part*) A term applied in Chemistry to bodies having one and the same composition, and atomic weight, but yet differing remarkably in certain of their properties, probably in consequence of dissimilar molecular constitution This [illegible] of oxide of [illegible] and ether of oxide of [illegible] $C_6 H_6 O$, but [illegible] are metameric [illegible] larly grouped, as represented in the following formulæ:

Formiate of oxide of ethyle $C_4 H_5 O+$ / $C_2 H O_3$ — — — } $=C_6 H_6 O_4$
Acetate of oxide of methyle $C_2 H_3 O+$ / $C_4 H_3 O_3$ — — — }

METAPOPHYSIS (Gr μετα, *between*, αποφυσις, *a process*) In Anatomy, the exogenous process commonly situated between the diapophysis and anterior zygapophyses in the human skeleton it is best developed in the last dorsal and first lumbar vertebræ, the metapophyses are developed more, and from more numerous vertebræ, in most of the interior mammalia, arriving at their maximum of length in the armadillos, in which they equal the neural spines in length in the posterior dorsal and the lumbar vertebræ, they relate in these singular quadrupeds with [illegible] the neural spines [illegible] the [illegible] and the metapophyses [illegible] beam, [illegible] arch [illegible] of a roof

METEOROLITE See Aerolite in Dict

METHIONIC ACID (Gr μεθυω [illegible] *change*, and θειον *sulphur*) An acid obtained by the action of anhydrous sulphuric acid on ether, althionic acid is at the same time formed

METHODIC MEDICINE Medicine as practised by the methodic sect of physicians of which Themison was the head They endeavoured to reduce medicine to exact rules, and assumed that all diseases arose from constricted fibre

METHYLENE See Methylene in Dict

METIS One of the small planets belonging to the group between Mars and Jupiter Metis was discovered by Mr A Graham, at Mr Cooper's observatory, Markree Castle on the 25th of April, 1848, and is the ninth of the group in the order of discovery Its brightness was equal to that of a star between the 9th and 10th magnitudes The symbol chosen to designate it is an eye and star Its period of revolution appears to be about 1346 days nearly the same with that of Iris See PLANET

METOPION (Gr) An ancient ointment containing galbanum, which was formerly called *Metopium*

METRE The French standard measure of length See Measure, in Dict The metre is = 39 371 or nearly 39⅜ English inches

MICROCOSMIC SALT (Gr μικρος, *small*, and κοσμος, *the world*) The ammonio phosphate of soda, it is obtained among the products of the evaporation of urine and was formerly used as a blowpipe flux

MIDDLETONITE A fatty substance found in the coal strata at Middleton, near Leeds

MILLIPEDES Several insects formerly used in medicine were included under this name amongst them the *Armadillo vulgaris*, or *pill millipede*, the *Porcello scaber*, or *Sclater* of the Scotch the *Oniscus asellus* or common *Woodlouse*

MIMOTANNIC ACID The astringent acid of *catechu*, called also *tanningenic* acid

MIRAGE From observations of this phenomenon made by Mr J Hopkins on the sea coast of Lancashire, it appears that mirage is produced by vapour when the atmosphere is loaded nearly to saturation, at which time there is consequently little or no evaporation as indicated by the difference of temperature of a dry and wet bulb thermometer He found, that when the sky was cloudy and apparently threatening rain evaporation in the air near the surface of the earth was very active, and there was no mirage, but at other times, when the sun was shining brightly evaporation was checked, and at such times mirage might be seen Mr Hopkins supposes that in strong sunshine the direct rays raise the temperature of the ground considerably, when energetic evaporation from the wet sand takes place, and sends much vapour into the adjacent strata of the atmosphere, the presence of which checks the evaporation from the wet bulb It is not improbable that some of the vapour thus formed is condensed by the comparatively cool air at a small distance from the surface of the sand, and a stratum of cloud formed, from the surface of which light is reflected and the phenomenon of mirage produced. But, however this may be, the presence of vapour in sufficient quantity to saturate, or nearly saturate, the air at the place where the mirage appeared, always accompanied its appearance (*Reports of the British Association*, 1849)

MOHSITE. In Mineralogy, crystallised titaniate of

iron from Dauphiny; so named, in honour of Mohs, the crystallographer

MOLE Different productions of and excretions from the uterus are so called by medical writers. Small soft excrescences of the cuticle are also termed moles

MONGOLFIER BALLOON A balloon filled with atmospheric air considerably dilated by heat, so called from [illegible] A fire-balloon

MONILIFORM (Lat monile, *a necklace*) A botanical term it is applied to the pod of the *Hedysarum monilifrum* from its necklace-like appearance

MONOPHYODONTS (Gr *μονος one*, *φυω, I generate*, *οδους, tooth*) In Zoology, those mammals which generate one set of teeth, as, e g the Sloths, Armadillos, Cape ant eater, Ornithorhynchus and the true Cetacea all other mammals that have teeth generate two sets, called 'deciduous' and 'permanent' *See* DIPHYODONTS

MORINE The colouring principle of the wood of *Morus tinctoria* or *fustic*

MORMONS The name assumed by a religious sect in the United States of North America, which derives its origin from a person called Joseph Smith, whose account of his own mission is as follows —He all at once found himself labouring in a state of great darkness and wretchedness of mind—in the first stage, in fact of what is ordinarily known among Methodists as "receiving a call He was bewildered among the conflicting doctrines of the Christian world, and could find no comfort or mental rest In this state he resorted to earnest and vocal prayer, kneeling in the woods and fields, and after long perseverance in this course, his prayers were answered by the appearance of a bright light in heaven, which gradually descended until it enveloped the worshipper who found himself standing face to face with two supernatural beings Of these he inquired which was the right and true religion of the world? The reply was that all religions were equally erroneous, but that the true doctrine and the crowning dispensation of Christianity should at a future period be miraculously revealed to himself Several similar visitations ensued, and at length he was informed that the North American Indians were a remnant of Israel that when they first entered America they were a great enlightened, and favoured people that their priests and rulers kept the records of their history and their doctrines, but that, having fallen off from the true faith and worship the great body of the nation were supernaturally destroyed—not, however until after a priest and prophet named Mormon had, by celestial direction, drawn up an abstract of their national record and religious opinions This abstract, Joseph Smith was told still existed, buried in the earth, and he it was whom God had selected for the instrument of its recovery and its manifestation to all nations The record, he was told contained many prophecies as to "these latter days" and would give instructions for the gathering of the saints" into a temporal and spiritual kingdom preparatory to the second coming of the Messiah, which was at hand After several of these preliminary visions, the spot in which the book lay buried was at length indicated Joseph Smith went there and after digging, discovered a sort of box formed of upright and horizontal flags, within which lay a number of plates "resembling gold and about the thickness of common tin These plates were bound together by a wire and were engraved with 'Egyptian characters' Beside them lay two transparent stones, "called by the ancients Urim and Thummim," which were evidently divining crystals, and the angels informed Joseph Smith that by using them he would be enabled to decipher the characters on the plates What ultimately became of the plates in question—if such things existed at all—does not appear They were said to have been seen and handled by eleven witnesses But, it should be noticed, that with the exception of three persons, these witnesses were either members of Smith's family, or of a neighbouring family of the name of Whitmer Professor Anthon described a document submitted to him as having been a sort of *pot pourri* of ancient marks and alphabets "It had evidently been prepared by some person who had before him a book containing various alphabets, Greek and Hebrew letters, crosses and flourishes, Roman letters, inverted or placed sideways were arranged in perpendicular columns, and the whole ended in a rude delineation of a circle, divided into various compartments decked with various strange marks, and evidently copied after the Mexican Calendar given by Humboldt, but copied in such a way as not to betray the source whence it was derived"

The result of these facts is startling In spite of two bitter persecutions accompanied by murder, robbery, and arson, and two expulsions from flourishing settlements, in the course of twenty years the number of firm adherents to this faith has increased to upwards of 300,000 persons, of which a large number are now settled as an independent state, having a regular charter and organised local government, on a territory of which they possess not only the sovereignty but the *fee simple*—a beautiful and exceedingly fertile tract as large as England, and situated upon the best "trail" from Eastern America to California and the Pacific. This state is called Deseret, or Utah, and will probably soon be added to the group of the American Union Its capital [illegible] town, which [illegible] Such being their head-quarters, the Latter-day Saints have agencies and missions in every capital in Europe, and in every large town in the United Kingdom The great object of these undertakings is to make converts and to 'gather the saints to Deseret From Great Britain, since 1840 upwards of 14,000 persons have inclined to the doctrines of Mormon, and have gone forth to join the settlement The Mormon emigration, in 1849, passing through Liverpool, amounted to 2,500 persons, all of the better class of emigrants, and it is calculated that 30 000 Latter day Saints then remained behind In June, 1850, there were in England and Scotland 27 863 Mormonites, of whom London contributed 2 529, Manchester, 2 787, Liverpool, 1,018, Glasgow, 1,846, Sheffield, 1 920, Edinburgh, 1 331, Birmingham 1,900, and Wales—South Wales principally—4,312 And the Mormonite census was taken in last January, giving the entire number in the British Isles as 30,747 "Saints" During the last fourteen years more than 50,000 had been baptised in England, of which nearly 17 000 had emigrated from her shores "to Zion" (The above details are borrowed from an interesting little work called "The Mormons or Latter Day Saints" published by the proprietors of the "Illustrated London News")

MOTORY or MOTORIAL (Lat moveo, *I move*) In Physiology, this term was applied by Hartley in 1749, to the nerves conveying the stimulus to the muscles, in contradistinction to the nerves conveying the impressions to the neural axis which he called "sensory," but he distinguished those actions which result from the conveyance of impressions to the brain producing sensation and exciting volition, from those actions that are now called "reflex," as where he states that, 'the actions of sneezing swallowing coughing, hiccoughing, vomiting and expelling the fæces and urine, with others of a like nature, are to be deduced from those vibrations which first ascend up the 'sensory' nerves, and then are detached down the 'motory' nerves, which communicate with these by some common trunk, plexus, or ganglion

MOUNTAIN BLUE and GREEN The blue and green carbonates of copper

MOUNTAIN CORK MOUNTAIN LEATHER In Mineralogy, varieties of asbestos

MULE A machine for spinning cotton This very ingenious piece of mechanism was invented, about the year 1777, by Samuel Crompton, formerly of Hall in the Wood Lancashire For many years the machine was worked by hand only, the variety of its movements rendering it difficult to accomplish the moving of it by the power of water or of steam so simply as to be of common use One form of the mule was in use in Manchester in the year 1797 (Buchanan's *Essays on Mill-Work*, 1841)

MUM A malt liquor made chiefly at Brunswick of the malt of wheat, with the addition of a little oat and bean meal

MUMIA MINERALIS (Lat) A bituminous substance resembling brown asphalt

MUNJEET Indian madder

MUREXAN The *Purpuric acid* of Dr Prout Its formula is $C_5 H_3 O_5 N_3$

MUREXIDE (Lat *Murex* a molluscous animal giving a purple dye) The *Purpurate of ammonia* of Dr Prout It is best obtained by adding 4 grains of alloxan, and 7 of alloxantine dissolved in half an ounce of boiling water, to one-sixth of an ounce of a saturated solution of carbonate of ammonia The liquor acquires a magnificent purple colour, and deposits small crystals of murexide, which are green, and iridescent by reflected light, but deep red by transmitted light they form a beautiful microscopic object The chemical formula of [illegible]

MUSCADINE MUSKATEL A rich sweet wine [illegible] in the South of France

MUSCOVY GLASS Mica It is used in Siberia as a substitute for [illegible]

MUSK, ARTIFICIAL A substance obtained by the action of nitric acid upon oil of amber, and having an odour which some have thought to resemble that of musk

MYELON (Gr *μυελος, marrow*) The single-worded equivalent of "spinal marrow" and "spinal cord"

MYKOMELINIC ACID An acid resulting from the mutual action of alloxan and ammonia It forms a yellow powder $= C_8 H_5 O_5 N_4$

MYRIORAMA (Gr *μυριας a myriad* and *οραω I view*) A picture made up of many different scenes, as in landscapes, &c, so as to admit of an infinity of combinations

MYRISTIC ACID (Gr *μυρον, an odorous oil*) One of the fatty acids contained in the expressed oil of nutmeg

MYRO'NIC ACID (Gr. *μυρον, an odorous oil*) A [illegible] black mustard seed

MYROXYLIC ACID (Gr *μυρον, an odorous oil*, and *ξυλον, sharp*) A substance obtained from the Peruvian balsam the produce of the *Myroxylon Peruiferum*

MYRRHIC ACID A substance obtained by heating the resin of myrrh

N

NARCOGENI'NE (Gr *ναρκη, stupor*, and *γιγνομαι, I produce*) A basic substance resulting from the oxidation of narcotina

NATURAL SCIENCE The term has been applied, arbitrarily, to signify the science of organic bodies, in contradistinction to *Physical Science*, by which is meant the science of inorganic matter

NAVI'CULAR (Lat navicula, *a little boat*) Boat-shaped The *navicular* bone is one of the bones of the tarsus The termed is also used in botany

NE'BULA In the *Philosophical Transactions* for 1850 (Part II), the Earl of Rosse has given a description of several remarkable nebulæ as seen in the great reflecting telescope erected at his Lordship's seat in Ireland. This noble instrument has a mirror of six feet in clear aperture, with a focal length of 53 feet, and by reason of the great extent of reflecting surface it gives a better means of observing faint objects of this class than any other which has ever been applied to the heavens

Among the new features which Lord Rosse's telescope has brought out, the most remarkable, perhaps, is the spiral arrangement of the nebulous matter, or what appears to be so, observed in various cases The most strongly developed instance is the 51st nebula of Messier's catalogue, one of the first known, and which has been often described Messier describes it as a double nebula without stars, Sir W Herschel as a bright round nebula with a halo or [illegible] surrounding it and attended by a companion, and Sir John Herschel observed the subdivision of the ring, through about two-fifths of its circumference as if into two lamina, one of which has the appearance of being turned up towards the eye out of the plane of the other portion Viewed through Lord Rosse's telescope, this upturned portion of the ring assumes the aspect of a nebulous coil tending in a spiral form towards the centre, and a general tendency to a spiroid arrangement of the streaks of nebulæ becomes apparent The companion is also seen to be connected with the general nebula The number of nebulæ in which the spiral arrangement had been observed to prevail was fourteen at the time the paper was communicated to the Royal Society, but some have been detected since They are in general difficult to be seen and the full powers of the instrument are required to bring out the details

When the catalogue of Sir John Herschel was published only two *annular nebulæ* were known to exist in the northern hemisphere Now there are seven, five of the planetary nebula having been found to be annular One of them has two perforations, but it is remarked, in reference to this class of objects, that in no instance is the central opening entirely dark Lenticular or long elliptic nebulæ are very numerous

With respect to the structure of these strange objects it is very difficult to form any satisfactory opinion Lord Rosse in speaking of the spiral nebula, Messier 51 observes, that "with each successive increase of optical power the structure has become more complicated, and more unlike any thing which we could picture to ourselves as the result of any dynamical law of which we find a counterpart in our own system" All that can be safely inferred seems to amount merely to this, that the distant parts of the nebulous object are held in connexion by some dynamical law which gives rise to the symmetrical forms which prevail though those forms, particularly in the case of the spiral nebulæ, are very different from those which we should expect to result from the operation of any laws with which we are acquainted It is to be kept in mind, however, that, on account of the great difficulty of tracing the outlines, we are by no means certain that we yet know what the forms really are Frequently, says Lord Rosse, "there is a gradual fading away at the edge, the last trace of which is rather a luminous mist, becoming rarer until imperceptible, a gauze-like tissue of the faintish imaginary flocculi or hairy filaments which become finer and more scattered till they cease to be visible, showing that the real boundary has not been seen, and that the form of the object would alter if additional optical power could be brought to bear upon it"

The considerable number of nebulæ which have been resolved by Lord Rosse's telescope into separate stars must be considered as strengthening the probability that they have all a similar constitution, for since every increase of optical power has multiplied the number of resolvable nebulæ, it seems reasonable to suppose that a further increase would accomplish the same result in those cases in which they have not yet been resolved But since there are still many with respect to which the large telescope does not give the slightest idea of separate stars the question of the existence of nebulous matter in contradistinction to stars, cannot be said to be decided

NEPHRA'LGIA (Gr *νεφρος, the kidney, αλγος, pain*) Pain in the kidney

NE'PTUNE In astronomy, one of the principal planets of the solar system, and the remotest at present known The mean distance of Neptune from the sun is 30 0368 times the sun's distance from the earth, or about 2800 millions of miles Its mean sidereal period is about 60 127 mean solar days, or 164½ years The orbit is nearly circular, the eccentricity in parts of the semi-axis being only 0 00872, and is inclined to the ecliptic in an angle of 1° 46′ 59″ Its apparent diameter is about 2″ 8, and its real diameter 41 500 miles, a little more than half that of Saturn Its density is about one-seventh of that of the earth, and its mass has been computed to be 1—19840 of the sun's mass The time of its rotation about its axis is not known It is attended by one satellite certainly and the existence of a second has been suspected Some observers have also suspected the existence of a ring On account of the distance of the planet, the difficulty of observing satellites or any circumstances connected with its physical constitution, is very great even in the most powerful telescopes

Neptune was first observed as a planet on the 23rd of September, 1846, and the circumstances attending its discovery are extremely remarkable For a number of years it had been remarked that the observed motions of Uranus were not in accordance with theory About 1790 the true longitude began to be in advance of the computed longitude and this acceleration continued till about 1822, after which the true motion began to be slower than the computed, and has continued to be so till the present time Various hypotheses were formed to account for the phenomena, all of which were found, upon examination to be untenable with the exception of one namely, the existence of an exterior and unknown planet disturbing the motion of Uranus according to the known laws of gravitation This hypothesis acquired greater probability as the irregular motions of the disturbed planet were more fully developed, and at length a systematic examination of the question was undertaken by Le Verrier an astronomer attached to the observatory of Paris and already distinguished by an admirable investigation of the orbit of Mercury Le Verrier first applied himself to the revision of the tables of Uranus, and the result showed that the observed irregularities could not be explained by the perturbations of Jupiter and Saturn, the only planets then known which exert any sensible action on Uranus This result was published in the *Compte Rendu* of the Paris Academy of Sciences for Nov 10 1845 Le Verrier next proceeded to inquire whether the irregularities were explicable on the hypothesis of disturbance by an exterior planet, and in the *Compte Rendu* for June 1 1846, he announced that such was the case, and that assuming the mean distance of the disturbing planet according to Bode's law, its true longitude for the beginning of 1847 must be about 325°—an important determination, inasmuch as it was sufficient for the guidance of any observer who might wish to undertake a search for the planet In a third memoir which appeared in the *Compte Rendu* for August 31 1846 Le Verrier gave the final results of his investigation [illegible] the orbit of the hypothetical planet [illegible] from the sun, periodic time, eccentricity, and longitude of the perihelion, and, in order that nothing might be wanting, he likewise computed the limits within which the deduced place of the planet would be varied by any supposable amount of error in the observations made use of, thus indicating the precise portion of the heavens within which it was necessary to institute a search; and he also assigned the limits of its mass and in addition pointed out that the planet would probably have a disc of about three seconds and be visible in ordinary telescopes

Having completed the theoretical investigation, Le Verrier next proceeded to consider the best means to be adopted for the discovery of the planet, and for this purpose addressed a letter to Dr Galle of Berlin, one of the best observers of the day calling his attention to the [illegible] and requesting him to search for the planet [illegible] indications therein given The letter was received at Berlin on the 23rd of

September (1846); and so well had the determination been made, that the planet was actually discovered by Dr Galle on the evening of the same day, and within 52 minutes of a degree of the place assigned by the mathematician An announcement of the discovery was immediately published, and the astronomers of all countries concurred in regarding it as the most remarkable triumph of the theory of gravitation which had ever been achieved.

Soon after the existence of the planet had been verified by Dr Galle, it began to be rumoured that Le Verrier was not the only claimant of the honour of the discovery, but that he had even been anticipated in some of his principal conclusions Nothing, however, was generally known of the circumstances till the publication of the *Monthly Notice* of the Royal Astronomical Society of London for November, 1846, which contained a detailed statement of them drawn up by the Astronomer Royal, about the accuracy of which there could consequently not be a question From this statement it appeared that so early as February, 1844, the Astronomer Royal was requested to furnish Mr Adams, of St John's College, Cambridge, with some observations of Uranus from the records of the observatory as data for investigations in which he was engaged respecting the theory of Uranus, and that in the month of October in the following year (1845) Mr Adams having completed his calculations of the perturbations of that planet on the assumption of their being caused by the attraction of an exterior planet, left at the Royal Observatory a paper containing a complete set of elements of the orbit of the hypothetical planet, a value of its mass and a table of differences of mean longitudes of Uranus as deduced from the theory, and as determined by actual observation It further appears that the Astronomer Royal having only results before him, and being well aware of the difficulty of the investigation requested from Mr Adams some explanations to enable him to form a better opinion as to the sufficiency of the hypothesis made to explain the observed discrepancies, that, from some unexplained reason, no answer was given to this request, that the matter rested in this state from the end of October 1845, till the appearance of Le Verrier's second paper in June, 1846, which contained as above stated a determination of the longitude of the hypothetical planet, and that on comparing the two results they were found, when reduced to the same epoch, to differ only by 3° 19′

The parties acquainted with Mr Adams' results had now far stronger reasons than other astronomers for believing in the existence of the hypothetical planet as well as in the accuracy of its computed place In so intricate an investigation, founded on data liable to more or less uncertainty, the risks of error were sufficiently numerous to justify hesitation even on the part of those best acquainted with the subject, but when the same result had been arrived at by two different computors independently of each other, the chances of error were almost annihilated There could then hardly be a doubt as to the accuracy of the conclusion, and if Mr Adams and his friends had immediately published the fact, it is not improbable that other observers would have been led to look out for the planet They did not, however, adopt this course, nor does it appear that they acquainted Le Verrier with the remarkable confirmation of his results, but they resolved to institute a search for the planet themselves with the great equatorial of the Cambridge Observatory The plan adopted was one which, though it virtually ignored the accuracy of the calculations, could scarcely fail of being successful in time It consisted simply, in making a close examination of a part of the heavens 30° long, in the direction of the ecliptic, and 10° broad, having its centre at the place indicated by Le Verrier and Adams, and observing all the stars to the 11th magnitude inclusive from time to time, so as to detect the planet by its change of place Observations in pursuance of this plan were actually begun on the 29th of July, 1846, and continued during two months On the 29th of September, Mr Challis, the director [illegible] Le Verrier's paper of August 31 [illegible] of detecting the planet by its disc was suggested Concurring in this idea Mr Challis at once abandoned the plan he had been following and on the evening of the same day began to observe within the limits indicated by Le Verrier. The planet, however, though observed as a star, was not recognised on the next night's observation [illegible] on the following day in consequence of Dr Galle's discovery on the 23d of September

It is to be remarked that Dr Galle had an advantage over Mr Challis in the possession of a star-map, then recently published at Berlin, of the part of the heavens to which his search was directed A star appeared in the field of the telescope which was not laid down in the map, and his attention was consequently directed to it till its true nature became evident by its proper motion

A circumstance deserving of notice is, that notwithstanding the [illegible] of the predicted place with that at which the planet was actually found, the elements of the hypothetical orbits determined both by Le Verrier and Adams were very wide of the truth The mean distance they give was [illegible] times the mean distance of the [illegible] (Le Verrier 36 1539, Adams 37 2474), and the period of revolution about 220 years It is now known, however, that the periodic time is less than 165 years, and the mean distance only about 30 times that of the earth from the sun the error in this respect being greater than the radius of Jupiter's orbit It seemed difficult at first to conceive how elements so faulty should give so close an approximation to the true place of the planet, but the reason has been satisfactorily explained

NERVI *See* NERVOUS SYSTEM, in DICT

NEURAL ARCH (Gr *νευρον, a nerve*) In Anatomy, the arch of the vertebra or primary segment of the skeleton which protects a corresponding segment of the neural axis it is posterior in Man, superior in other Vertebrates, and is formed by the "centrum," "neurapophyses" and "neural spine"

NEURAL AXIS (Gr *νευρον, a nerve*) In Anatomy, the central trunk of the nervous system, consisting in [illegible] myelon it is sometimes called [illegible]"

NEURAPOPHYSIS (Gr *νευρον*, and *ἀποφυσις, a process*) In Anatomy, the autogenous vertebral element which forms the side or wall of the arch protecting the neural axis or central trunk of the nervous system it has been called the "vertebral lamina," and by Soemmerring the [illegible] posterior vertebra"

NINIVEH MARBLES The name given to the collection of Assyrian Antiquities, recently procured by the researches of Mr Layard at Niniveh, and deposited in the British Museum

NODAL POINTS NODAL LINES Under the term VIBRATION (DICT OF SCIENCE) it is stated that a vibrating chord may spontaneously divide itself into any number of aliquot parts, each of which will vibrate separately as if it were fixed at its two extremities and formed a separate chord The points of separation between two such contiguous parts, which participate neither in the vibration of the one nor the other, but remain at rest, are called *Nodal Points* And in like manner, when elastic plates are put into a state of vibration the molecules separate themselves into parcels which vibrate independently of each other, and the lines of separation thus formed or lines of repose in which no vibration takes place, are called *Nodal Lines* *See* VIBRATION

NONTRONITE A nodular silicate of iron from Nontron, in France

NOPAL The cactus upon which the cochineal insects breed

NORDHAUSEN ACID A peculiar sulphuric acid, intermediate between the anhydrous, and monohydrated acid, or oil of vitriol, so called from the place of its manufacture

NUSSIERITE In Mineralogy, a species of *phosphate of lead* from Nussieres, near Beaujeu

O.

O A contraction for *Octarium*, a pint

OCTROIS (A corruption of Lat auctoritas) The name given in France to the taxes levied on objects of consumption at the gates of many towns and cities, and applied partly to the general uses of the state, and partly to local purposes There are nearly 1500 communes subjected to this tax, which amounts in some years to nearly 100 000 000 of francs The revenue of Paris from this source alone is upwards of 30 000,000 of francs

ŒNANTHIC ETHER (Gr *οινος, wine; ανθος, a flower*) A peculiar compound, upon which the fragrancy and persistent odour of certain wines depends

ŒNANTHYLIC ACID (See above) An acid of a peculiar aromatic odour, obtained by the action of nitric acid on castor oil

OERSTEDITE In Mineralogy (in honour of Oersted), a silico-titaniate of zirconia, from Arendal in Sweden

ŒSOPHAGITIS (Gr) Inflammation of the œsophagus

ŒSOPHAGOTOMY. (Gr *οισοφαγος, the gullet*, and *τεμνω, I cut*) The operation of cutting into the œsophagus, or gullet, for the purpose of removing some [illegible]

OKENITE In Mineralogy (in honour of Oken), a hydrated silicate of lime

OLANIN (Gr *ελαιον, oil*) One of the ingredients

of the fifth cup reversed on itself, obstructed by distending bone and leather and [illegible]

OLEOSACCHARUM (Gr *ελαιον*, oil, and Lat *saccharum*, *sugar*) In Pharmacy powdered sugar mixed or imbued with certain essential oils, called also *Elæo-*[illegible]

[illegible] Fr) In Mineralogy, the *fer oligiste* [illegible] y of hæmatite or specular iron

[illegible] (Gr *ολιγος*, *few*, and *κλαω*, *I break*) In Mineralogy, a silicate of alumina and soda

ONONINE A sweet crystalline principle contained in [illegible]

[illegible] machinery for regis- made by the shafts or [illegible]

OPHIDE (Gr *οφις*, *a serpent*) In Mineralogy, [illegible]

OPHTHALMODYNIA [illegible] *οδυνη*, *pain*) A violent pain in the eye without apparent inflammation, it is sometimes of a gouty character

OPHTHALMOPTOSIS (Gr *οφθαλμος*, *the eye*, *πτωσις*, *a fall*) A protrusion of the whole globe of the eye

OPIANIC ACID A crystallisable acid formed by the action of peroxide of manganese on a solution of narcotine in dilute sulphuric acid Its formula appears to be $C_{10} H_9 O_9 + HO$

OPTOMETER (Gr *οπτομαι*, *I see*, *μετρον*, *measure*) An instrument for measuring the focal distance of the eye, or the distance at which a minute object is distinctly seen As the distance varies in respect of different individuals, the instrument is applicable to the purpose of determining the focal lengths of spectacles required for myopic or presbyopic eyes

The principle upon which the optometer is constructed appears to have been first established experimentally by Scheiner and subsequently by Dr Motte of Dantzic, and by Dr Porterfield If we look at any minute object through two pin holes, or two parallel slits made in a card or any opaque [illegible] the distance between the holes or slits being less than the diameter of the pupil of the eye, then, if the object be at the point of perfect vision, the image on the retina will be single, but in every other case it will be double, and, on varying the distance of the object from the eye, the two images will [illegible] o or recede from each other As a [illegible], if the object looked at be a line pointed nearly towards the eye, it will appear as two lines crossing each other in the point of perfect vision at a very acute angle

The practical application of this principle is extremely simple As proposed by Dr Thomas Young, the optometer may be made of a slip of card paper, or ivory unpolished, about eight inches in length (this being the distance of distinct vision for most eyes) and one in breadth, divided longitudinally by a black line which must not be too strong The end of the card is bent into a position nearly perpendicular to its length, or a detached piece may be applied in the same inclined position In this part (which is applied to the eye) a hole of about half an inch square must be made the side being so cut as to receive a slide of thick paper, with slits of different sizes from a fortieth to a tenth of an inch in breadth, divided by spaces somewhat broader, so that each observer may choose that which best suits the aperture of his pupil The slide is then brought close to the eye, and the black line viewed through two adjacent slits [illegible] lines intersecting each other, [illegible] is marked, and distance of this point from the slide is the focal length of the eye (Young's *Lectures on Natural Philosophy*, vol ii p 576, or p 154 of Kelland's Edition, Priestley's *History of Discoveries relating to Vision*, etc p 641)

ORCINE A crystallisable substance obtained from certain *lichens*, which, when exposed to air gradually reddens By ammonia it is converted into a purple substance called orceine or orcein acid which forms the beautiful blue or purple colours yielded by lichens

[illegible] during principle obtained from [illegible]

[illegible] Mr Willis's instrument, which attracted great attention at the Exhibition in 1851, was as follows It [illegible] rows of keys from C C C C to G, with two octaves and a fifth of pedals

7	Choir organ to pedals

being in all 77 stops

Of the above stops, all except the Orchestral Oboe were of the same compass as the various Claviers, a circumstance, we believe, without parallel in any large English organ

ORGEAT (Fr) A sweetened emulsion of almonds usually flavoured by a few bitter almonds and a little orange-flower water Mucilage of gum arabic is also sometimes added

ORSEDEW Brass leaf Dutch, or Manheim gold

ORTHOCLASE (Gr *ορθος*, *straight* and *κλαω*, *I break*) A mineralogical synonym of *Felspar*

ORTHOPÆDIA (Gr *ορθος*, *straight*, and *παιδεια*, *the bringing up of children*) That department of medicine and surgery which relates to the prevention and cure of deformity

OSTEODENTINE (Gr *οστεον*, *a bone*, and Lat *dens*, *a tooth*) That modification of dentine in which the tissue is traversed by irregularly disposed and ramified vascular or medullary canals, and in which some of the branches of the dentinal tubes communicate with cells like the radiated cells of true bone this modification of dentine is found in the central part of the tooth of the Cachalot and some other cetaceans, also in the teeth of the Cestracion, Acrodus, Lepidosiren, and many other existing and extinct fishes

OXALYLE (Gr *οξυς*, *sharp*, and *υλη*, *principle*) The hypothetical radical of the oxalic acid $= C_2 O_2$

OXAMIC ACID (Gr *οξυς*, *sharp* and *αμμος together*) One of the products of the destructive distillation of binoxalate of ammonia Its composition is represented by the formula $C_2 H_4 O_5 N + HO$

OZOKERITE (Gr *οζειν*, *to smell*, and *κηρος*, *wax*) A species of *mineral tallow*

OZONE (Gr *οζειν*, *to smell*) A substance occasionally existing in the atmosphere, and having a peculiar odour resembling that produced when repeated electric sparks, or the electric discharge from a point, is passed through the air It is supposed to be a peculiar modification of oxygen It is also formed in certain cases of the slow action of air upon phosphorus

P.

P In some medical formulæ is used as the abbreviation of *Pugillus*, the eighth part of a handful

P Æ The abbreviation of *partes æquales*, or equal parts

PACINIAN CORPUSCLES Small oval bodies situated on some of the cerebro-spinal and sympathetic nerves, especially the cutaneous nerves of the hands and feet, are so called, after their discoverer, Pacini

PACKWAX The ligaments of the neck of ruminants It differs from common ligament in resisting the [illegible]

PADDING MACHINE An apparatus used by calico-printers for uniformly imbuing a piece of cotton cloth with any mordant

PALÆOSAURUS (Gr *παλαιος*, *ancient*, and *σαυρος*, *a lizard*) A genus of extinct lizards, characteristic of the magnesian conglomerate

PALAGONITE A mineral found in the tufa of Palagonia, in the Val di Noto, Sicily It is a hydrated silicate [illegible]

PALPEBRÆ (Lat, *palpitando*, from their fre-

quent motion.) The eyelids; the upper and under form the *canthi*

P[illegible] A throbbing the term is especially applied to irregularities of the heart's action, which are frequently the result of indigestion, of nervous excitement or mental agitation

PA'LMIC ACID [illegible] acid resulting from the saponification of the *palmine* of castor oil (*Palma Christi*)

PALMI'TIC ACID The acid formed during the saponification of *palm oil*

PANA'DA (Ital pane, *bread*) Bread or biscuit steeped or boiled in water so as to acquire a soft consistence

PANDICULA'TION (Lat pandiculo, *I gape*) The gaping, yawning, and stretching that characterises some diseases It sometimes occurs in the cold fit of an ague

PANOPHOBIA (Eng panic, from Lat Pan, and Gr φοβος, *I frighten*) That form of hypochondriasis or melancholy which is chiefly characterised by groundless apprehensions

PANTOCRA'TIC MICROSCOPE (Gr παν, *all*, κρατος, *power*) The name given by Professor A Fisher, of Moscow, to a microscope so arranged that the observer is enabled by simple movements to vary the magnifying power from 2·0 to 5·0 without in any degree obscuring the object, thus avoiding the inconvenience of having to shift the different parts of the microscope when he desires to observe the same object under different magnifying powers

PAPILLÆ (Lat papilla) In Anatomy, are minute conical or cylindriform elevations, usually well supplied with vessels and nerves they are close-set, and prominent on the palmar surface of the fingers and the plantar surface of the toes where they are disposed in double rows [illegible] lines They are very numerous [illegible], e g "conical," "fungiform," "calyciform," on the upper surface of the tongue

PA'RA A very small Turkish coin, equal to the fortieth part of a piastre

PARABA'NIC ACID One of the acids resulting from the action of nitric acid upon uric acid it forms colourless and transparent six-sided prisms, very soluble and sour Its composition is represented by the formula $C_6 O_4 N_2 + 2 HO$

PARABOLE *See* PARABLE

PA'RALLAX In 1846, Mr Peters of the Pulkova Observatory, presented to the Imperial Academy of Sciences of St Petersburg, a very important memoir on the Parallax of the Fixed Stars, of which an analysis has been given by Struve in his *Etudes d'Astronomie Stellaire* [illegible] the results obtained by Mr Peters for the parallax of eight stars, determined by observations of zenith distances made at Pulkova in 1842 and 1843 with the great vertical circle of Ertel The divided circle of the instrument is 43 inches in diameter, and the object glass of the telescope nearly six inches, the magnifying power employed was 215, and the whole number of observations was 711, of which 289 were of Polaris alone The names of the stars their resulting parallaxes, and the probable errors of the respective results, are as follows —

Star's name	Parallax	Prob Error
61 Cygni - -	+0″ 349	- 0″ 080
Groombridge 1830	+0 226	- 0 141
1 Ursæ Majoris -	+0 133	- 0 106
Arcturus - -	+0 127	- 0 073
α Lyræ - -	+0 103	- 0 053
Polaris - -	+0 067	- 0 012
Capella - -	+0 046	- 0 200
α Cygni - -	−0 082	- 0 043

The parallax of 61 Cygni was determined by Bessel from a series of observations with the Königsberg heliometer, and found to be 0″ 348 (*see* DOUBLE STARS) and the confirmation thus given by Peters may be considered as not only placing the fact of a measurable parallax of this star beyond all doubt, but as proving that [illegible] more than a small fraction from [illegible] with respect to the next star in the list (Groombridge 1830) Mr Faye of the Paris Observatory has recently announced that he had determined a parallax exceeding [illegible] a result which Mr Peters' observations prove to be erroneous. Struve found the parallax of α Lyræ to be 0″·261 The negative value found in the case of α Cygni must be considered as indicating merely the absence of any sensible parallax In fact, the relative [illegible] the probable errors in respect of the four stars 61 Cygni, 1 Ursæ Majoris, Arcturus, and α Cygni, show that very little reliance can be placed on the numerical results in any of these cases

Another conclusion deduced by Peters is, that the mean parallax of stars of the second magnitude is +0″ 116, with a probable error of 0″ 014. This result [illegible] 33 stars, of which the absolute or relative [illegible] have been determined with a degree of certainty presumed to be sufficient to establish the conclusion Assuming the scale of relative distances adopted by Struve for stars of the different orders of magnitude (*see* GALAXY), he thence concludes that the mean parallax of the stars of the first magnitude is 0″ 209 and that the mean parallax of those of the third is 0″ 076. On this it is to be remarked that although the hypothesis that the stars which have the greatest apparent magnitude are those which are nearest the earth, and consequently those which have the largest parallax, is very probable in itself, it is not established by any conclusive facts, on the contrary, there does not appear, in the case [illegible] supposed to have [illegible] to be any relation [illegible] magnitude

In the *Memoirs of the Royal Astronomical Society*, vol xix, the parallax of the double stars α¹ and α² Centauri is determined by Mr Maclear from a series of observations with the mural circle, made at the Cape in the years 1842, 1843, 1844, and 1848 The final result is given as follows —

Parallax of α Centauri = 0″ 9187, Prob error = 0 034
Constant of aberration = 20″ 53 , Prob error = 0·038.

This result scarcely differs from that which was deduced in 1842, by M Henderson (who first discovered the parallax of this remarkable star), from observations made at the same place, namely, parallax = 0″ 913 It must be remembered, however, that both results are deduced from observations made with the same instrument, and the agreement therefore may perhaps be considered as not so conclusive as in the case of 61 Cygni

PARAPOPHY'SIS (Gr παρα, *across*, αποφυσις, *a process*) In Anatomy, the process which extends outwards, or outwards and downwards, from the body of the vertebra in Fishes, and from the same part in the cervical and anterior dorsal vertebræ of the Crocodile, where it has been called the "inferior transverse process" It is sometimes ossified from an independent centre

PARI'LLINE The supposed active principle of sarsaparilla It has also been called Smilacine It appears to be identical with the Parillic acid of Batke

PA'RISITE A crystallised mineral containing cerium found in the mines of the Musso Valley, in New Granada

PA'RTHENOGE'NESIS (Gr παρθενος, *a virgin*, γινομαι, *to be born*) In Physiology, the procreation of offspring by a plant or animal independently of the immediate stimulus of the male principle The impregnated seed of a plant produces a "phyton" of the proper species, usually in the form of a leaf with a stem and root, from this a succession of "phytons" may be developed by gemmation, most of them having the form of leaves, but, in the higher species of plants, some may take on the form of petals, others of stamens, developing the male principle, or "pollen," others of pistils, forming the female principle, or "seed" By the union of these two principles the seed is impregnated, and may germinate, but the series of individuals successively developed from the first individual from the seed are procreated by "parthenogenesis" The different individuals being organically connected, according to a definite pattern for each species, form a compound whole, which is commonly regarded as the individual "tree" or "shrub"

In the compound Polypes the first individual polype from the impregnated ovum develops a succession of individuals, by gemmation, most of which may resemble the first formed polype, but others are modified so as to reproduce the male principle, or the ova these generative polypes are also, sometimes, as in *Coryne* and *Campanularia*, set free For other instances of this alternating kind of generation see Steenstrup *On Alternate Generation*, and Owen, *On Parthenogenesis*

PARTHE'NOPE One of the small planets belonging to the group between Mars and Jupiter, and the eleventh in the order of discovery It was detected at Naples on the 11th of May, 1850, by Dr De Gasparis, who, in announcing its discovery, remarked that he had used his utmost endeavours to realise a Parthenope in the heavens, this name having been suggested by Sir John Herschel upon the occasion of the discovery of Hygeia (also by De Gasparis) in 1849 The symbol is a fish crowned with a star. *See* PLANET

PAU'LITE A variety of hypersthene or prismatic schiller-spar, from Paul's Island and the coast of Labrador

PEACHWOOD A dye-wood extensively used in calico printing It is the produce of a species of *Cæsalpinia*

PE'ARLWHITE The subnitrate of bismuth, formerly used as a cosmetic under the above name

PE'CTOLITE (Gr πηκτος, *be[illegible]* and λιθος, *a stone*) A species of zeolite, [illegible] been heated, forms a gelatinous sc[illegible] atic acid

PE'GANITE. A species of wavellite, or hydrated [illegible] Strigis in Saxony

PE[illegible] (Gr πηγμα, Lat. aliquod compactum) A granular structure of quartz and feldspar, found chiefly in granites, and consisting of [illegible] called *graphic granite*, having the appearance of [illegible] compressed

PELOMA (Gr πηλος *black*) An archæological synonym of [illegible] or leather

PELOKONITE (Gr πηλος, *mud*, and κονια, *clay*) In Mineralogy, a massive phosphate of manganese, iron, and copper

PELOSI'NE (Gr πηλος, *black*) A bitter extractive matter obtained from the root of the *Cissampelos Pareira* or *Pareira Brava*

PENDULUM EXPERIMENT An experiment proposed by M Foucault of Paris, which, in 1851, excited great [illegible] in this country and in France, its [illegible] a visible proof of the rotation of the earth It is this By the theory of dynamics, if a simple pendulum be made to oscillate in a plane, the plane of oscillation, in reference to the meridian of the place, would remain fixed but will appear to turn uniformly about the vertical, passing through the point of suspension, and the time of rotation would be to that of the [illegible] e ratio of the cosecant of the latitude [illegible] is easily understood in respect of a pendulum supposed to be suspended directly over the pole, where the terrestrial meridians would successively pass under it, and the earth's rotation would have no tendency to alter the direction in space of the plane of oscillation, but for any place between the pole and the equator the conception of the phenomenon is more difficult Upon trial the experiment is liable to failure from various causes, but principally from the great difficulty of adjusting the suspension so accurately that the vibrations shall continue to be made in a plane, for if the pendulum acquires an elliptic motion, however slight, the greater axis of the ellipse, or line of apsides, immediately begins to revolve from a cause entirely independent of the rotation of the earth, and the two motions cannot easily be distinguished (See *Notices of the Royal Ast Soc* vol xi p 199, and *Memoirs of R A S* vol xx)

PE'PSINE (Gr πεψις, *digestion*) A peculiar animal principle contained in the gastric juice and which, in conjunction with acid matter also present in that secretion, confers upon it its solvent or digestive powers in regard to certain components of the food

PERCUSSION (Lat percutio, *I strike*) In medical language, signifies the striking or tapping upon any part of the surface of the body, with a view of ascertaining the condition of the subjacent parts by the sound so produced It is a valuable mode of exploration in some diseases of the chest. Attention was first called to this mode of diagnosis in 1761 by Dr Avenbrugger of Vienna his work was translated into French in 1808, by Corvisart, and the subject was further illustrated in 1816, by the celebrated work of Laennec on *Auscultation*

PE'RICLASE (Gr περι and κλαω, *I break*) A crystalline mineral, composed of magnesia with about 8 per cent. of protoxide of iron found at Monte Somma, near Naples

PE'RICLINE (Gr περι, and κλινω, *to lie*) A variety of felspar

PE'RILYMPH (Gr περι and Lat lympha, *water*) The fluid between the membranous and osseous labyrinth of the ear, or that in which the membranous labyrinth is suspended

PE'RMANENT WHITE Sulphate of baryta, when used as a pigment, it not being liable to discolouration, as is the case with white lead

PERMANGANIC ACID, called also *Hypermanganic* acid A compound of 2 atoms of manganese with 7 atoms of oxygen It has been obtained in carmine-red acicular crystals Its salts are of a fine red or purple hue

PERONE'AL MUSCLES (Gr περονη, *the fibula*) Muscles arising from the fibula and concerned in the movements of the foot

PE'ROWSKITE. A crystallised titaniate of lime found in the chlorite slate of Slatoust in the Ural

PE'RSIAN BERRIES The berries of the *Rhamnus infectoria*, called in France *grains d'Avignon* They are used by calico-printers and dyers, as a source of a yellow colouring matter, which has been called Rhamnine

PE'RTHITE. A variety of felspar, from Perth in Upper Canada

PERU VINE One of the products of the distillation of Peruvian balsam. Its formula is C_{18} H_{12} O_2 It is a light oily fluid

PE'TZITE An ore of silver with from 30 to 40 per cent of tellurium, analysed by Petz, and found in the [illegible]

PH[illegible] A crystallisable principle existing in the root of *Peucedanum officinale*, hog's fennel or sulphur wort

PHE'NOLE (Gr φενη, *a fir tree*) A liquid obtained by the action of lime upon the hydrochlorate of oil of turpentine, of which oil it appears to be an isomeric modification Its formula is C_{10} H_8

PEYER'S GLANDS Small glandular sacculi peculiar to the mucous membrane of the small intestines, and either scattered singly, when they are called "glandulæ solitariæ," or aggregated into groups, when they are termed "glandulæ agminatæ," or "Peyer's patches," from the anatomist who first described them

PHA'COLITE (Gr φακος, *a wart*, and λιθος, *a stone*) A silicate of alumina, lime, and soda (zeolite), from Leipa in Bohemia

PHENAKISTOSCOPE The name given by Prof Locke, of [illegible] to an apparatus for enabling persons to converge the optical axis of the eyes, or to look "cross-eyed," and thereby observe certain phenomena of binocular vision It consists of a flat base-board, with an upright rod at one end bearing two sliding sockets which may be clamped at any height, like those of a retort stand The upper socket supports a small screen or card having a slit or aperture a quarter of an inch wide and about three inches long, so that both eyes may be applied to it at once, the middle of the aperture being directly over the centre of the base-board The lower socket bears a moveable screen of pasteboard or thin wood, having an opening of about three inches long, and an inch wide, and so adjusted that its centre is in the same straight line with the centre of the set in the upper card and the centre of the base-board This screen has an index marked across its middle In experimenting with the apparatus the observer places an object on the base-board, looks downward through the slit in the upper screen, and slides the lower up or down till the required adjustment is attained For example, let the letter A be written twice on the base-board, about two and a half inches (the width between the eyes) apart, and in the line of the axis of the apertures of the screens, and suppose the lower screen to be close down to the base-board On gradually raising this screen, and keeping the eyes directed to the index and not to the letters, each letter will separate and appear double, so that four letters will be seen As the screen is raised the two internal images gradually approach, and become optically superimposed, or coalesce into one, so that there are only three letters visible, and the middle or superimposed figure is the *phantom* or *image* where there is really no object On ceasing to look at the index, and directing the eyes on the base-board itself, the phantom figure instantly vanishes The experiment may be varied so as to produce various amusing illusions, and the author thinks the apparatus will illustrate many important points in optics, and especially the physiological point of single vision by two eyes (*London, Edinburgh and Dublin Philosophical Magazine*, June, 1850 It may be remarked that whether the apparatus be new or not, the phenomena have long been well known, and are fully explained in *Smith's Optics*, 1738)

PHA'RMACOSI'DERITE (Gr φαρμακον, *poison*, and σιδηρος, *iron*) Native arseniate of iron

PHENAKISTOSCOPE (Gr φενακισμος, *illusion*, σκοπεω, *I view*) A philosophical toy, which illustrates the principle of the *persistence* of impressions on the retina of the eye in a very ingenious manner It is thus described by Sir D Brewster (*Ency Brit* art. OPTICS) "This instrument was, we believe, originally invented by Dr Roget, and improved by M Plateau, at Brussels, and by Mr Faraday It consists of a circular disc from six to twelve inches in diameter, with rectilinear apertures on its margin in the direction of its radii A series of figures, of a rider, for example, leaping a fence is drawn on the circumference of a circle parallel to the rim of the disc The *first* figure represents the rider and horse standing *before* the fence, and the last figure represents them standing *over* the fence, when the leap is completed Between these two figures there are several others, representing the rider and the horse in various parts of the leap The observer then stands in front of a looking glass, with the disc in his left hand, attached to a handle, and by a piece of simple mechanism he whirls it rapidly round, looking at its image in the glass through the notches in its margin He is then surprised to see the horse and his rider actually leaping the fence, as if they were alive, and returning and leaping again as the disc revolves If we look over the margin of the disc at the reflected picture on the face of the disc, all the figures are effaced, and entirely invisible, but when we look through the notches, we only see the figure of the horse and rider at the instant the notch or aperture passes the eye, so that the picture instantaneously formed on the retina is not obliterated by preceding or subsequent impressions Hence the eye receives in succession the pictures of the horse and rider in all the attitudes of the leap, which are blended as it

were into one action The apparent velocity with which the horse and rider advance (supposing the disc always to have the same velocity) depends on the proportion between the number of [illegible] of the disc, and the number of [illegible] rider."

PHE'NAKITE. (Gr. *φενακίζειν, to deceive*) A rare mineral, containing glucina The Rhomboedral Emerald of Mohs

PHE'NE (Gr *an eagle*) One of the chemical synonyms of the hydrocarbon usually called benzole, $C_{12} H_6$ It is isomeric with bicarburet of hydrogen. It has also been called *Hydruret of Phenyle*, and in that case represented by the formula $C_{12} H_5 + H$

PHENIKO'CHROITE (Gr *φοινιξ*, and *χροα*, *colour*) A native chromate of lead from Beresow in Siberia

PHE'NYLE (Gr *φοινιξ*, and *ολη*, *matter*) A radical hydrocarbon = $C_{12} H_5$

PHI'LLIPSITE A variety of zeolite So called in honour of Phillips the geologist

PHILOSO'PHIC CANDLE An inflamed jet of [illegible] WOOL Oxide of zinc formed during the combustion of the metal, when it floats about in white flocks in the air It has also been called *nihil album*

PHLEBI'TIS (Gr *φλεψ*, *a vein*) Inflammation of a vein

PHLE'BOLITE (Gr *φλεψ*, and *λιθος*, *a stone*) A venous calculus, commonly called "vein-stones" Very small concretions have sometimes been found in certain veins, varying in size from a pin's head to that of a pea. They consist chiefly of carbonate and phosphate of lime and animal matter

PHLEGMA'SIA (Gr *φλεγω I burn*) Inflammatory disease The term *phlegmasia dolens* has been applied to a peculiar inflammatory condition of the leg, which sometimes occurs in females soon after delivery

PHLORI'DZINE, or PHLORIZINE (Gr *φλοιος*, *bark*, *ριζα*, *root*) A white crystalline substance obtained from the bark of the roots of apple, pear, cherry, and plum trees, giving to it its bitter astringency Its composition is represented as $C_{21} H_{15} O_{12}$ Acids, aided by heat, resolve it into sugar, and *Phloretine* By the joint action of oxygen and ammonia it is converted into a gum like substance which has been called *Phloridzéine*

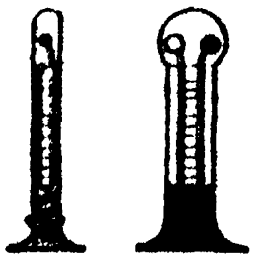
PHŒ'NICIN (Gr *φοινιξ*, *purple*) A purple substance obtained by the action of sulphuric acid on indigo

PHO'LARITE (Gr *φολις a scale*) A mineralogical name applied to a hydrated silicate of alumina, occurring in pearly scales

PHOSGE'NITE Native chlorocarbonate of lead, occurring in transparent yellowish crystals at Matlock It is a very rare mineral

PHOSPHORIC ACID *See* PHOSPHORUS

PHOSPHURETS Compounds of Phosphorus with the metals have been called *Phosphurets* or *Phosphides*



PHOSPHORUS OF VIVIANITE The native hydrated phosphate of copper found near Rhembrettenbach, and also in the Ural

PHO'TICITE (Gr *φως*, *light*) A native silicate of manganese

PHOTO'LOGY (Gr *φως*, *light*, *λογος*, *discourse*) The doctrine of light *See* LIGHT

PHOTO'METER (Gr *φως light*, and *μετρον*, *measure*) An instrument for measuring the intensity of light, or of illuminations

The most elegant instrument which goes under this name is the photometer invented by the late Sir John [illegible] It is merely the differential thermometer of the same ingenious philosopher, having one of its balls diaphanous and the other coated with China ink, or blown of deep black enamel, and the whole covered by a case of thin transparent glass, to defend the balls from the disturbing influence of currents of air The photometer has two general forms, the one [illegible] in which the black ball is about an inch higher than the other, and bent forward to the same vertical line, or the axis of the transparent cylindrical case, and the other [illegible] having both its balls of the same height, and reclining in opposite ways, the case being composed of a wide cylinder surmounted by the larger segment of a hollow glass sphere The latter form of the instrument, though less commodious, is better adapted for nice observations; since, besides receiving the light more regularly, its balls from being on the same level, are not liable to be disturbed by different strata of unequally heated air

The theory of this photometer depends on the assumed principle that the intensity of light is proportional to the heat excited by its incidence on the black ball When the instrument is exposed to light, the rays which fall on the clear ball pass through it, without suffering obstruction, but those which strike the dark ball are stopt and absorbed at its surface, where, assuming a latent form they act as heat, which, by expanding the air within the ball causes the liquid in the stem to descend. This heat will continue to accumulate till its farther increase comes to be counteracted by an opposite dispersion, caused by the rise of temperature which the ball has acquired. But as all air the rate of cooling is, within moderate limits, proportional to the excess of the temperature of a given surface above that of the surrounding medium Hence the space through which the coloured liquid sinks in the stem will measure the momentary impressions of light, or its actual intensity (*Leslie on the Relations of Air to Heat and Moisture*)

The graduation is entirely arbitrary, and may be regulated by fancy or convenience Leslie [illegible] divisions as in the differential thermometer, ten degrees of which [illegible] when the instrument is excluded from light, the liquid in the stem next the coloured ball stands at zero In this country the direct impression of the sun at noon, about the summer solstice, forces the liquid down to 90° or 100° The greatest force of the solar beams, in the depth of winter, measures only about 25° At the altitude of 3° above the horizon, the whole effect of the sun's rays does not exceed one degree The indirect light from the sky at noon in summer is from 30° to 40°, in winter from 10° to 15° Comparing the illuminating power of the solar rays with that of artificial lights, Leslie found the light emitted by the sun 12 000 times more powerful than that of a wax candle; that is to say, if a portion of the luminous solar matter, rather less than half an inch in diameter, were transmitted to our planet it would throw forth a light equal to the effect of 12,000 candles

It has been objected that the instrument now described is only a species of thermometer, and not strictly a photometer, since it measures heat and not light To this objection Sir J Leslie replies by asking, 'What does the thermometer itself indicate except *expansion*? As heat is measured by the expansion it occasions, so light is determined by the intensity of the heat which in every supposition invariably accompanies it What other mode, after all could be imagined for detecting the presence of light? How can an unknown quantity be expounded but in terms of one already known?" (*Ency Brit*, art CLIMATE)

It must be admitted, however, that the same quantity of light emitted by terrestrial bodies of different kinds is not always accompanied with the same degree of heat Thus, phosphorus burns in oxygen gas with intense splendour [illegible] unfitness of this instrument for comparing the intensities of lights from different sources has been pointed out by Arago, who proved that it rises when exposed to the light of the sun, falls when exposed to the light of a common fire, and [illegible] an Argand lamp remains stationary (*Annales de Chimie et de Physique*, vol iii 1851) See *Leslie's Experimental Inquiry into the Nature and Propagation of Heat* 1804

PHRAGMOCONE (Gr *φραγμος*, *a partition*, *κωνος*, *a cone*) The essential part of the complex-shell of the Belemnite consisting of a straight cone divided by numerous transverse partitions perforated by a marginal siphon From the time of Lhwyd conchologists have called this part the 'alveolus," a term which is now more properly restricted to the socket of the sheath lodging the 'phragmocone" Belemnites are chiefly distinguished by modifications of the "sheath" or 'dart,' but the phragmocone is the constant and true characteristic of this extinct group of Cephalopods, which chiefly flourished from the epoch of the Muschelkalk to that of the Maestricht chalk

PHTHORE (Gr *φθορος pernicious*) A name given by some of the French chemists to fluorine

PHYLLIRE'INE A bitter crystalline principle contained in the *Phyllirea latifolia*

PHY'MA (Gr *φυω*, *I produce*) A term applied by the ancients to tumours in modern pathology to tubercle on any external part of the body

PHYSETER (Gr *φυσητης a blast-pipe*) The genus the cachalot, or sperm whale

PHYSICAL SCIENCE This term has been applied to signify the Science of Inorganic Bodies, as contradistinguished from that of Organised Beings In this sense it includes the study of the ex[illegible] principles, as well as [illegible]

PHYTELEPHAS Vegetable Ivory (Gr *φυτον*, *a plant*, *ελεφας*, *an elephant*) A genus of plants inhabiting America Its fruit is of great size, and contains a milk which hardens into a substance resembling ivory

Of this hardened albumen, buttons, boxes, and other articles are turned It is the *Caleza de Negro*, or *Jaqua plant*

PHYTO'TOMY (Gr φυτον, *a plant*, τεμνω, *I cut*) Vegetable anatomy

PIAUZITE A fusible resin-like substance found in the brown-coal at Piauze, near Neustadt in Carniola

PICKERINGITE A magnesian alum occurring in white silky fibres at Iquique in Peru

PICRAMY LI (Gr πικρος, *bitter*, υλη *principle*) A radical hydrocarbon C $_{14}$ H$_{7}$ The name has reference to the composition of bitter almond oil which is C$_{14}$ H$_{6}$ O$_{2}$, and therefore a *binoxide of Picramyle*

PICROGLY'CION (Gr πικρος *bitter*, and γλυκυς, *sweet*) An extractive matter of a bitter and sweet taste, obtained from the stalks of the *Solanum dulcamara*

PI'CROLITE '(- - - -nd λιθος, *a stone*) A name given b- to fibrous serpentine

PICROPHA ' ' ' (Gr πικρος, φαρμακον *poison*, and λιθος *a stone*) A native arseniate of lime and magnesia in Riechelsdorf in Hessia

PICROPHYLLITE (Gr πικρος and φυλλον, *a leaf*) A species of serpentine in dark green foliated masses

PICROSMINE (Gr πικρος and οσμη *to smell*) A species of steatite said to yield a *bitter odour* when breathed upon

PILE GALVANIC *See* VOLTAIC ELECTRICITY

PILLOWS In Machinery, are the bearings on which gudgeons and journals rest They are usually fixed in blocks of cast iron whence the term *Pillow Block*, and sometimes corruptly, *Plumber Block*

PIMARIC ACID The purified resin of the *Pinus maritima* it forms a white crystalline mass When subjected to dry distillation it yields an oil which has been called *Pimarone*

PIMELIC ACID (Gr πιμελη, *fat*) One of the products of the action of nitric acid on fatty bodies

PINGUITE (Lat pinguis, *fat*) A greasy feeling silicate of iron, of a dark green colour, found at Wolkenstein in Saxony, and in the Harz

PINIC ACID (Lat pinus, *the fir tree*) The principal resinous constituent of common resin or colophony

PIPEFISH The vernacular name of the fishes of the genus *Syngnathus*

PISSOPHANE (Gr πισσα, *pitch*) A substance chiefly composed of sulphate of alumina and iron, found in the decomposing alum slate of Stalfeld and Reichenbach in Saxony It resembles pitch in fracture and colour

PISTACITE A green silicate of alumina lime, and iron It is a variety of epidote, and occurs imbedded in many crystalline rocks The finest crystals are from Arendahl and from several parts of the Alps

PISTOMESITE A crystallised carbonate of iron and magnesia from Saltzburg

PITCH In wheelwork signifies the distance between the centres of two contiguous teeth *Pitch Line* is the circle, concentric with the circumference, which passes through the centres of the teeth

PITTIZITE In Mineralogy, a variety of bog iron ore - - - - - in Prince

PLAGIONITE A sulphuret of lead and antimony from Wolfsberg in the Harz

PLA'KODINE (Gr πλαξ, *a tabular surface*) A native arseniuret of nickel found near Musen in Siegen in tabular crystals

PLA'SMA (Gr) The fluid of the blood in which the red particles are suspended to which its colour is due it consists of serum holding fibrine in solution It is sometimes called Liquor sanguinis

PLATTNERITE A native oxide of lead from Leadhills in Scotland

PLEXUS (Lat *woven*) In Anatomy, the term is substantively applied to those portions of nerves which interweave and interchange fasciculi, appearing to anastomose with each other as e g in the arm pit forming the ' axillary or brachial plexus, and in the loins forming the ' lumbar plexus As nerves approach their final distribution in the several tissues the minute fibres commonly form delicate plexuses, called the terminal plexuses '

PLICIDENTINE (Lat plica *a fold*, dens *a tooth*) That modification of dentine in which the substance is folded, as it were, on a series of vertical vascular plates which radiate from the central axis of the pulp and which is accompanied by a fluted character of the exterior of the tooth the basal part of the teeth of the wolf fish, of - - - - - - - - *Ichthyosaurus* afford - - - - - -

PLINTHITE A hydrated silicate of alumina and iron from Antrim in Ireland

PLUMBIC ACID The *Peroxide of lead* = Pb O$_{2}$ It combines with certain bases, forming compounds which have been called *plumbates*

PLUMBOCA'LCITE (Lat plumbum, *lead*, and calx, *chalk*) A mixed carbonate of lime and lead from Wanlock Head in Scotland

PLUMBUM CORNEUM (Lat) Horn lead The old chemical name of fused chloride of lead

PLUMOSE ALUM (Lat pluma, *a feather*) A name formerly given to the silky amianthine crystals occasionally observed on alumslate It is a *sulphate of alumina and iron*

PLUMOSITE (Lat pluma, *a feather*) Capillary or plumose sulphuret of antimony, chiefly found in the Harz - - - - - -

PNEUMATOMETER (Gr πνευμα, *air*, and μετρεω, *measure*) A gasometer constructed for the purpose of measuring the quantity of air taken into the lungs and again given out at each inspiration and expiration

PNIGA'LIUM (Gr πνιγω, *I suffocate*) A name given by some medical authors to the *Nightmare*, from the sense of suffocation which it induces

POI'NAMU A variety of jade or nephrite used in New Zealand for the manufacture of axes and other weapons

POLAR CLOCK An optical apparatus invented by Professor Wheatstone, whereby the hour of the day is found from the polarization of solar light

Light reflected from the atmosphere, like other reflected light is polarized in a certain plane, and it is found that the light reflected from any particular point of the sky is polarized in the plane passing through that point, through the sun, and the eye of the observer Suppose the point of the sky under observation to be the pole then the plane in question is one which passes (sensibly) through the axis of the earth's rotation and consequently the angle which it makes with the meridian is an hour angle, if, then, the situation of this plane be determined the hour of the day, or time from true noon, is determined also

Mr Wheatstone's method of determining the plane of polarization consists in attaching to the top of an upright pillar a glass plate held by a brass ring and directed perpendicularly to the earth's axis the lower half of the ring being divided into twelve equal parts (which may be again subdivided) to represent the hours A conical tube is fitted into the brass ring, so that its axis is parallel to that of the earth The upper and wide end of the tube is closed by a plate of glass having a star of selenite on it and a Nichol's prism is attached to the lower end The principal sections of the thin plates of selenite which form the star are all parallel and inclined at an angle of 45° to the plane of polarization of the prism and so placed that the lamellæ simultaneously appear colourless In order to make the observation the tube is turned till the central portion of the star exhibits the maximum of red colour, when a black line drawn on the glass plate in the direction of a principal section of the lamellæ and serving as a - - - - position of the plane of polarization of - - - - - - - -

This property was discovered

POLIANITE Crystallised peroxide of manganese from Bohemia

POLISHING SLATE *Polierschiefer* of the German mineralogists A light slaty substance occurring abundantly at Bilin in Bohemia it consists of the siliceous bucklers of microscopic animals

POLLUX Among the abundant absurdities of mineralogical nomenclature, is the application of the names Castor and Pollux to two varieties of felspar found in the granite of Elba

POLYBASITE (Gr πολυς, *many*, and βασις, *support*) A native sulphuret of silver, copper arsenic, and antimony, found in the mines of Saxony, Hungary, and Mexico

POLYCHROMATIC ACID (Gr πολυς and χρωμα *colour*) A compound resulting from the action of nitric acid upon aloes When used as a dye-stuff it yields a great variety of colours

POLYDIPSIA (Gr πολυς, and διψη, *thirst*) Excessive thirst

POLYHYDRITE (Gr πολυς, and υδωρ *water*) A hydrated silicate of iron from Breitenbrun in Saxony It seems to be the same as the *Hisingerite* of Berzelius found in Sweden

POLYKRASE (Gr πολυς, and κρασις *combination*) A rare mineral occurring in black six sided tables it contains titanic and tantalic acids zirconia yttria alumina magnesia lime and the oxides of iron cerium, and uranium It is found at Hitteroe in Norway

POLYSPHÆRITE A reniform variety of chlorophosphate of lead from Freiberg, containing also phosphate of lime

POLYXENE (Gr πολυς, and ξενος *stranger*) A name given by Hausmann to the ores of platinum, as indicating the many new metals associated with it

POONAHLITE A species of zoolite from Poonah in Hindostan

PORTAL (Lat porto *I carry*) In Anatomy is applied to a system of veins that ramify like arteries and send the blood from trunks to branches in the substance of the liver The portal system is derived in mammals from the veins of the abdominal organs of digestion, which form a common trunk called Vena portæ' This subordinate kind of circulation in the liver is called the 'portal circulation' and the blood it transmits is called the portal blood" The blood of the portal vein differs from other venous blood in being of less specific gravity darker, and incapable of being rendered bright by the contact of salt or oxygen in containing only about half the ordinary quantity of fibrine and in containing less albumen but more red globules and nearly twice the usual amount of fatty matter

POSOLOGY (Gr ποσος, *quantity* and λογος *description*) In Medicine, that which relates to the doses or quantities in which medicines should be administered

POST MORTEM (Lat *after death*) In Anatomy the technical phrase signifying the inspection and examination of the dead body, in order to determine the cause of death it is also applied to the appearances presented and more especially to some phenomena which are constantly noticed shortly after death Thus the muscles retain their property of contracting under the influence of stimuli applied to them or to their nerves for some time after death, and when they have lost this irritability, they spontaneously pass into a state of contraction, producing a general stiffening of the body, which is called 'post-mortem rigidity, or "rigor mortis"

POT-METAL An alloy of copper and lead

POUDRETTE (Fr) A manure composed of night-soil mixed up with clay and formed into cakes

PRASEOLITE A species of tourmalin from Norway

PREDAZZITE A magnesian marble or dolomite, which forms mountain masses at Predazzo, in the Tyrol

PREMOLAR (Lat præ, *before*, molaris, *grinding tooth*) In Anatomy the name of those permanent teeth in the Diphyodont mammals that displace and succeed the deciduous teeth vertically they are situated before the molars, and, being in many cases of more simple structure, they have been termed "false molars," and in Human Anatomy 'bicuspides" The premolars never exceed four in number on each side of both jaws

PRIMING AND LAGGING The alternate acceleration and retardation of the times of high water, caused by the combined action of the sun and moon *See* LAGGING

PRINCE'S METAL Prince Rupert's metal The same as pinchbeck An alloy of copper and zinc

PROCŒLIAN (Gr προ, *before*, κοιλος, *hollow*) In Anatomy, those vertebræ are so called which have a cavity or cup at the fore part of the body, and a ball at the back part The term is also applied to the group of animals—a certain family of Reptiles, *e g*, which manifest this vertebral character It is found in most existing Saurians, but not in any extinct species of earlier date than the cretaceous period

PROLETAIRE (Lat proles, *offspring*) A term that has come into common use in the social discussions of late years, signifying that class of the community whose labour is their only capital As its origin indicates, it was applied to those members of a community whose social duties were limited to furnishing children to defend the state, and whose social rights were necessarily small The word plays a considerable part in all the writings of the communists and socialists both of France and Germany

PROSYLLOGISM In Logic, a word sometimes used to signify a second syllogism, proving a former one, at other times in the same sense as Enthymeme, viz [illegible] of which one premise is suppressed

PROTEINE (Gr πρωτειον, *the chief place*) The azotised substance which forms the basis of albumen, fibrine and caseine, in which proximate principles it is combined with small proportions of sulphur and phosphorus Different formulæ have been assigned to proteine that of Mulder is $C_{40}\ H_{30}\ O_{12}\ N_5$

PROTOLITE (Gr πρωτος *first*, and λιθος, *a stone*) The slaty rock immediately recumbent upon granite

PROTOZINE (Gr πρωτο and ξενο, *a stranger*) Tridosse granite A mixture of felspar quartz, and talc or chlorite It decomposes into china clay or porcelain earth

PSELLISMUS (Gr ψελλιζω, *I stammer*) An imperfect articulation Stuttering

PSEUDESTHESIA (Gr ψευδης *false*, and αισθανομαι *I feel*) Imaginary or false feeling

PSEUDOMALACHITE (Gr ψευδος, and μαλαχος, *soft*) Native phosphate of copper

PSEUDOMORPHOUS CRYSTALS (Gr ψευδος, and μορφη *form*) Substances found in crystalline forms not belonging to them, and being, as it were, casts of other crystals

PSEUDOSCOPE (Gr ψευδος, and σκοπεω, *I view*) A name given by Professor Wheatstone to the stereoscope when employed to produce what he calls 'conversions of relief These conversions may be produced in three different ways—1st, by transposing the pictures from one to the other, 2ndly by reflecting each picture separately without transposition and, 3rdly by inverting the pictures to each eye separately The converse figure differs from the normal figure in this circumstance that those points which appear most distant in the latter are the nearest in the former, and vice versa The *pseudoscope* consists of two reflecting prisms placed in a frame with adjustments so that when applied to the eyes each eye may separately see the reflected image of the projection which usually falls on that eye The instrument being directed to an object and adjusted so that the object shall appear of its proper size and at its usual distance the distances of all other objects are inverted all nearer objects appear more distant and all more distant objects nearer, and this constitutes the 'conversion of relief The inside of a teacup appears a solid convex body A china vase ornamented with coloured flowers in relief appears to be a vertical section of the interior of the vase with painted hollow impressions of the flowers A small terrestrial globe appears a concave hemisphere, when the globe is turned on its axis, the appearance and disappearance of different portions of the map on its concave surface has a very singular effect A bust regarded in front becomes a deep hollow mask When regarded in profile the appearance is equally striking A framed picture hung against a wall appears as if imbedded in a cavity made in the wall (See *Athenæum* for 1852, Jan 24, and STEREOSCOPE in SUP)

PSILANTHROPISIS (Gr ψιλος, *mere* and ανθρωπος, *man*) A name given to a peculiar sect of Unitarians who believe that Jesus was the son of Joseph, and in whose creed the resurrection holds a higher place than the crucifixion

PSILOMELAN (Gr ψιλος, *mere*, and μελας, *black*) In Mineralogy, black hæmatitic ore of iron

PSOROPHTHALMIA (Gr ψωρα *the itch*; οφθαλμος *the eye*) An inflammation and ulceration of the eyelids attended by an itching sensation

PTYALINE (Gr πτυαλον, *saliva*) A supposed peculiar animal matter obtained from saliva It is insoluble in alcohol and is said to be analogous to the vegetable substance termed diastase

PULSE GLASS A tube of about a quarter of an inch diameter and five or six inches long with a bulb at each end and about half filled with spirit of wine or water, care having been taken to expel the whole of the air previously to sealing the tube When held in an inclined position, one of the bulbs being grasped

in the hand, the exclusion of the included vapour causes [illegible] in the tube [illegible]

PUNCTUM CÆCUM (Lat, *blind point*) That part of the retina of the eye immediately about the spot at which the optic nerve unites with it is found experimentally to be totally insensible to the stimulus of light, and hence it has been called by writers on Optics the *Punctum Cæcum*

PURREE, or INDIAN YELLOW A yellow colouring matter imported from India and China Its origin has not been accurately ascertained, but it is supposed to be a vegetable juice mixed with magnesia

PUSCHKINITE A variety of Epidote from Siberia

PUZZOLA'NO A volcanic rock, which yields an excellent water-cement It occurs at Puzzuoli, near Naples

PYRARGI'LLITE (Gr πυρ, *fire*, and αργιλλος, *pure clay*) A hydrated silicate of alumina, found in the granite of [illegible]

PYRARGYRITE (Gr πυρ, and αργυρος, *silver*) The red or ruby silver ore, it is either a sulphuret of silver and antimony, or a sulphuret of silver and arsenic The finest specimens are from Andreasberg, in the Harz, and from Joachimsthal in Bohemia

PYRE'NITE A species of garnet found in the limestone of the Pic d'Urselids near Barége, in the Pyrenees

PYROPHI'LLITE A hydrated silicate of alumina and magnesia which exfoliates before the blowpipe, found in the Ural, and formerly considered as *talc*

PYROPHY'SALITE (Gr πυρ *fire*, and φυσαλος *a bead*) A mineralogical synonym of the common topaz, found in veins and blocks near Finbun A crystal in the [illegible] at Stockholm weighs 80 lbs

PYROSKLERITE (Gr πυρ, and σκληρος, *hard*) A green hydrated silicate of magnesia and alumina coloured by iron and chromium from Elba

PYRRHOSIDERITE (Gr πυρρος *brown* and [illegible]) A brown hydrous peroxide of iron

PYRRHOTINE (Gr πυρρος, *brown*) Magnetic iron ore

PYRUVIC ACID (Gr πυρ *fire* and Lat uva *a grape*) An acid discovered by Berzelius amongst the products of the destructive distillation of racemic and of tartaric acid It had been before observed by Pelouze, who mistook it for acetic acid

Q

QUAS A fermented liquor used in Russia, and prepared from a mixture of meal and malt

QUINCITE A hydrated silicate of magnesia tinged red by oxide of iron, found near Quincey, in France

QUINOIDINE (From Quinin) An alkaloid said to accompany cinchonia and quinia in certain varieties of *cinchona*

R.

RAPHANIA (Lat Raphanus *the radish*) A disease said to be produced by eating the seeds of a species of raphanus, it is attended by convulsive motions of the limbs vomiting and diarrhœa

RAPHILITE A species of hornblende from Perth, in Upper Canada

RATAFIA A term applied to certain liqueurs or drams derived like the word *ratify* from *ratum* and *fio* to make firm or *confirm* By ratafia therefore, was originally meant a liquid drank at the *ratification* of an agreement (PEREIRA *on Food and Diet*)

REAGENT In Chemistry, bodies which serve to detect the presence of others tests

RECEIVER In Chemistry generally means a globular vessel applied to a retort in which the *distillate* or product of distillation is collected or received The bell glass placed upon the plate of an air-pump is also called a receiver *See* RETORT in DICT

RIDDLE A pyrotechnical compound which burns with a beautiful red or pink flame It consists of nitrate of strontia mixed with charcoal and a little sulphur and chlorate of potassa

REDRUTHITE The vitreous sulphuret of copper, magnificent crystallised specimens of which have been obtained from the mines near Redruth in Cornwall

REFLEX FUNCTION, in Physiology *See* AUTOMATIC, MOTORY, SENSORY

REFLEX ZENITH TUBE An instrument recently invented by the Astronomer Royal, and erected at the Greenwich Observatory, for measuring the zenith distances of stars very near the zenith It consists mainly of an object-glass of 5 inches diameter and 10 ft focal length, of a micrometer firmly attached to the cell of the object glass, and of a trough of mercury placed beneath the object glass at a distance of nearly half its focal length [illegible] of the object-glass is fixed in a tube sliding in another tube fastened to the flooring of the small chamber in which the instrument is erected, the mercury being [illegible] By this apparatus [illegible] star very near the zenith are, while in a converging state, reflected from the mercury, so as actually to converge to a focus and form an image at a short distance above the object-[illegible] [illegible] arrived that the point of [illegible] [illegible] line (measured parallel to the diameter of the object-glass) as its focal centre By this means any inaccuracy which would arise from a small error of level of the plane of the micrometer is avoided A micrometer is mounted upon the cell which carries the object glass which has a series of wires stretched across its side bars, and whose screw acts against the standards carrying the bars, the wires being placed at intervals nearly equivalent to double the distance of γ Draconis from the zenith of Greenwich For viewing the images of the star and the wires together, a compound 4-glass eye piece is used consisting of two distinct parts, the first part consisting of a first lens for receiving the rays from the object-glass, and a glass reflecting prism for turning them into a horizontal direction, the prism having one side ground to a spherical surface so as to produce the effect of the second glass of the eye piece, and to avoid unnecessary loss of light. This part is fixed in a tube carried between the bars of the micrometer The second part consists of the third and fourth glasses of the eye-piece mounted in a tube carried horizontally by a fixed support so as to allow the head of the observer to avoid interference with the rays after passing through the object-glass The cell of the object-glass is made to revolve carrying with it the micrometer, for the purpose of making observations in reversed positions The micrometer is also double, carrying screws and divided heads on each side of the object-glass, and it is so arranged that by the action of one of the screws the micrometer wires are carried without disturbance of the reading of the head attached to the other screw

REMISSION In Medicine the abatement of a disorder, or regular mitigation of symptoms as opposed to *intermission*, in which the symptoms of disease for a time entirely disappear *See* REMITTENT FEVER, in DICT

RESINITE, or RETINITE A substance intermediate between resin and asphalt *See* RETINASPHALTUM in DICT

RESTIFORM (Lat restis *a rope* and forma) In Anatomy the term is applied to certain rope-like columns or tracts behind the 'lateral tracts' of the medulla oblongata The 'restiform tract' is continuous below with the posterior columns of the myelon while above, its fibres may be traced transversely through the pons into the cerebellum If the restiform tracts be irritated the most acute suffering is produced

REVERBERATORY FURNACE A furnace in which the flame is made to pass over a bridge and then beat down again upon a hearth or surface, on which the materials to be heated are placed

RHABARBARINE The colouring principle of rhubarb

RHEINITE A mineralogical synonym of the cyanite of the Tyrol

RHEOMETER (Gr ρεω *I flow*, μετρον *measure*) A term proposed by Peclet as a synonym for *galvanometer* and generally adopted by the French writers on physics Professor Wheatstone in an ingenious paper entitled 'An Account of several new Instruments and Processes for determining the Constants of a Voltaic Circuit' published in the *Philosophical Transactions* for 1843 uses the term in a general sense to designate any instrument for measuring the force of an electric current, without reference to its particular construction Mr Wheatstone also uses the following similar terms in describing apparatus employed in investigations on the same subject —

Rheomotor (Lat moveo, *I move*), any apparatus which originates an electric current

Rheoscope (Gr σκοπεω *I view*), an instrument for ascertaining the existence of a current

Rheostat (Gr στατικος *I place*), an instrument for adjusting or regulating the circuit, so that any constant degree of force may be obtained

Rheotome (Gr τεμνω, *I cut*), an instrument which periodically interrupts an electric current

Rheotrope (Gr τρεπω, *I turn*), an instrument which alternately inverts the current

RHEOPHORE (Gr ρεω *I flow*, and φερω, *I carry*) A term employed by Ampere to designate the connecting wire of a voltaic apparatus as being the carrier or transmitter of the current

RHODANIC ACID (Gr ροδον, *a rose*) A chemical synonym of sulphocyanic acid It produces a red colour with persalts of iron

RHODIZONIC ACID A substance formed by

passing dry carbonic oxide over highly heated potassium, and acting on the product by water A red powder separates which is rhodizonate of potassa from which rhodizonic acid may be separated by a mixture of sulphuric acid and alcohol Its formula is said to be $C_7 O_7$, 3 HO

RHO'DIZITE (Gr *ροδον a rose*) A species of boracite, which when heated before the blowpipe, colours the flame first green, but afterwards red

RHODOCHROME (Gr *ροδον a rose* and *χρωμα colour*) A hydrated silicate of magnesia and alumina, containing a little chromic oxide and of a red colour when in fine splinters It has been found in Siberia, also near Baltimore and in Ilmo in Greece

RHO'DONITE (Gr *ροδον, a rose*) A silicate of manganese

RHYTHM (Gr *ρυθμος rhyme*) In Physiology the more or less regular succession of the contractions of certain automatic muscles In the heart the motion commences in the venæ cavæ and proceeds through the auricles and ventricles and then after an interval is resumed in the vena cavæ In the intestine the movement travels in a vermicular manner from above downwards and a second movement beginning at the upper part of the intestine before the first has completed its course, affects the parts in the same order These movements are called 'rhythmic,' those of the intestinal tube are also called 'peristaltic"

RI'CINOSTE'ARIC ACID One of the acids resulting from the saponification of castor oil

RIFACIMENTO (Ital *re establishment*) A term in common literary use applied to any work or treatise, the materials of which have neither been derived from original research, nor have been collected for the first time

RIGOR MORTIS (Lat) In Physiology the general stiffening of the body produced by the simultaneous contraction of all the muscles of the trunk after death The muscular coat of the arteries also contracts after death on division and mechanical irritation on the application of cold and under the stimulus of electricity

RIPIDOLITE A mineral resembling Chlorite

RISUS SARDONICUS (Lat *sardonic laugh*) So called as having been produced by eating a species of ranunculus growing about certain springs in Sardinia A convulsive grin giving a peculiarly horrible expression to the countenance chiefly observed in cases of tetanus and inflammation of the diaphragm

ROCHE ALUM Alum deprived of part of its water of crystallisation by heat The term is also sometimes applied to the so-called *Roman Alum*, made from the alum ore of the Solfaterra, near Naples

ROCKSOAP An earthy silicate of alumina It is used for crayons and also for washing cloth

ROCKWOOD The common name for ligniform asbestus

ROME'ITE A native antimoniate of lime found in the manganese mines of St Marcel, in Piedmont and named in honour of the celebrated crystallographer Rome de l'Isle

ROSENITE A sulphuret of lead and antimony from Wolfsberg in the *Harz* Named in honour of H Rose, the analytical mineralogist

ROSITE (Eng *rose*) A mineral of a red colour in small grains embedded in limestone from Sweden it appears to be silicate of alumina tinged red by manganese It has also been called *Rosellanite*

RUBI'NIC ACID An acid formed by exposing a solution of catechuic acid in carbonate of potash to the action of air

RUFINE (Lat rufus *red*) A red substance formed by the action of sulphuric acid on saliretine

RUTHE'NIUM A metal closely resembling iridium with which it is associated in the residue from crude platinum insoluble in aqua regia Its properties require further investigation (Claus *Annalen der Chem und Pharm* lix 234)

RUTI'NIC ACID An acid contained in the leaves of rue

S

SA'CCHARITE (Lat saccharum) A mineral of the felspar family, found in veins in serpentine in the chrysoprasm mines near Frankenstein in Silesia

SACCHARO'METER (Lat saccharum, Gr *μετρον*) An improved construction of the saccharometer was exhibited at the London Exposition of Industry by M Duboscq-Soleil A double gauge is formed by a rotating polarising plate of quartz and Iceland spar, of which two semicircles, placed in juxtaposition, and viewed through a telescope of low magnifying power are brought into exact coincidence of colour, by turning the spar In this situation the images are viewed through an empty tube, closed at both ends with glass

The saccharine juice is poured in and the quality of colour is disturbed, the semicircles, which no longer match are readjusted, by sliding upon each other two achromatised prisms of Iceland spar, so as to leave a variable difference of thickness estimated in parts of a finely divided scale, which gives numerical evidence of the quantity of saccharine matter present

SAL ALEMBROTH The hydrargo-chloride of ammonium A compound of sal ammoniac and corrosive sublimate

SA'PPHIRE The common name of the oriental sapphire

SAL DI DUOBUS (Lat) An ancient chemical name applied to sulphate of potassa

SALICY'LIC ACID An acid obtained by the action of fused potassa on salicine it may also be obtained from various other sources The formula of the salicylic acid is $C_{14} H_5 O + HO$

SAL MIRABILE (Lat) Glauber's salt Sulphate of soda

SAL PERLATUM (Lat) A term applied by old chemical writers to the rhombic phosphate of soda

SAL PRUNELLA Nitrate of potassa fused into cakes or balls The latter were sometimes coloured blue

SA'MARSKITE A granular mineral found in the Ilmen mountains near Miask It contains uranium and tungstic acid

SANDERS WOOD The wood of the *Pterocarpus Santalinus* a large tree growing upon the Coromandel coast and in other parts of India especially Ceylon It furnishes a deep red resinous colouring matter

SANDYX (Gr *Σανδυξ*) An old alchemical term applied to red lead prepared by calcining carbonate of lead

SANTONINE A crystalline principle contained in the *Artemisia Santonica* the buds or broken peduncles of which plant are used in pharmacy under the name of *worm seed Semen Cinæ* or *Contra* The composition assigned to santonine is $C_{30} H_{18} O_6$

SA'RCOSINE (Gr *σαρξ flesh*) A basic substance obtained by boiling kreatine with hydrate of baryta Its formula is $C_6 H_8 O_4 N$

SARGASSO *Fucus natans* or Gulf Weed, spread over a large part of the Atlantic Its abundance has led to the Portuguese expression *Mar de Sargasso*, or Weedy Sea

SATELLITE The recent discovery of an eighth satellite in the system of Saturn may be regarded as the natural consequence of the increased optical power of the instruments now applied to astronomical observations, but it was by a singular chance that the discovery was made both in England and America on the very same day — the 19th of September 1848

In order to avoid the confusion which has arisen from the practice of designating the satellites of Saturn by numbers applied sometimes with reference to the order of discovery and sometimes to the order of distance Sir John Herschel proposed to distinguish the individuals of this system by names, and in conformity with the nomenclature adopted by him the names of the Titanian divinities) both discoverers of the new satellite gave it the name of Hyperion Commencing with the one nearest the planet, and taking them in the order of distance the names of the eight satellites at present known are as follows —

Mimas Enceladus Tethys Dione,
Rhea Titan Hyperion Iapetus

Of these bodies Titan is by far the largest and supposed to be nearly equal in size to the planet Mars Mimas and Enceladus are the two discovered by Sir W Herschel, interior to the ring and so small that they can be seen with great difficulty even in the best telescope Hyperion is probably not greater than Mimas but more easily seen on account of its greater distance from the planet Prior to its discovery the interval between Titan and Iapetus was so great as to destroy the analogy which seemed to prevail in the other cases and to leave, as it were a large gap in the system similar to that in the solar system between Mars and Jupiter before the discovery of the small planets From this circumstance and also from the smallness of Hyperion Sir J Herschel has surmised the probability of other minute satellites revolving at the same mean distance

Of the six satellites of Uranus seen or suspected by Sir William Herschel, the existence of two only has been confirmed by the observations of other astronomers Some others have been seen by Lassell and by Otto Struve but none of them appear to be identical with those observed by Sir W Herschel The remaining two are still doubtful

One satellite of Neptune has been repeatedly observed, both by Lassell and O Struve The existence of a second, suspected by Lassell, has not yet been verified

SATURA'TION In Chemistry, a fluid is said to be saturated with a substance when it holds as much of it in solution as it can take up and retain we thus speak

of *saturated solutions* of saline, and other bodies The term *saturation* is also especially applied to the combination of acids and alkaline or other basic bodies in such definite proportions as neutralise each other, thus we say that sulphuric acid is saturated by potassa when neither acid nor alkaline properties are predominant hence, also the resulting sulphate of potas a is called a *neutral salt* An excess of acid would be termed *supersaturation*

SATURATION FRACTION OF The term *Fraction of Saturation* is used to denote the ratio of the elastic force of the vapour actually existing in the atmosphere, to the elastic force of as much vapour as atmospheric air is capable of containing in an equal volume and at the same temperature, or as would *saturate* the air

SCALPRIFORM (Lat scalprum, *a knife*) Certain teeth are so called which have a cutting edge preserved by a partial deposition of the enamel on one side such scalpriform teeth are large long, and curved and are well exemplified in the incisors of the Rodent order

SCARBROITE Hydrated silicate of alumina from the vicinity of Scarborough

SCELOTYRBE (Gr σκελος, *the leg*, and τυρβη, *disturbance*) A disease described by Galen in which a man is incapable of walking straight forward and drags the foot it is generally regarded as a species of Chorea, or St Vitus s dance

SCHEFFERITE A mineral hydrocarbon found in beds of brown coal in Switzerland

SCHROTTERITE A hydrated silicate of alumina from Krotenstein in Styria

SCHULZITE An antimonial sulphuret of lead from Gallicia in Spain

SCHWEINFURTH GREEN A compound of arsenious acid and oxide of copper, much resembling Scheele's Green

SCLEROGEN The ligneous matter deposited in the cells of plants

SCOLEZITE A species of zeolite

SCOURING DROPS The essential oils of lemon and of bergamotte are sold under this name for the purpose of removing grease stains from silk dresses They are generally adulterated with oil of turpentine

SCREW PROPELLER An instrument for the propulsion of vessels consisting of two or more twisted blades, like the vanes of a windmill set on an axis running parallel with the keel and revolving beneath the water at the stern The screw propeller is driven by a steam engine situated within the vessel and by its revolution in the water it carries the vessel forward in the manner a cork screw is drawn forward when penetrating a cork or a bolt when turned round in a stationary nut The water in which the vessel floats forms the nut of the screw propeller and when the propeller is turned round, therefore the vessel is screwed on To enable the water to act as the nut of the screw the thread traced in the water requires to be very much deeper than if it were traced in metal or wood and the pressing surface of the screw requires to be large to prevent the thread from being stripped or broken by the reacting force Accordingly screw propellers are made with a small central body and deep thread they are also made as large in diameter as possible reaching usually, from the keel to near the surface of the water

History of the Screw Propeller — It appears probable that the screw propeller is as old as the windmill and a windmill of the construction now usually employed is represented in the 77th proposition of Hero s Spiritalia a work written 130 years before the Christian era In China screw propellers are said to have been employed from a very early date as an arrangement for sculling vessels and a screw is a continuous sculling machine in which the necessity of a reciprocating motion is superseded by giving a complete revolution to the propelling blade Captain Basil Hall in his account of his voyage to Loo Choo states that the Coreans scull their ships instead of rowing them and, from what he saw of the operation he is inclined to give the preference to that mode of propulsion The galleys of the Greeks and Romans were also propelled by an action of the oars more nearly resembling sculling than rowing as was first pointed out by Robert Hooke in 1681, and Hooke also showed that this mode of action would be exceedingly efficient In a work entitled *Philosophical Collections* printed for Richard Chiswell, printer to the Royal Society 1681, there is a paper by Hooke on Horizontal Windmills, containing various suggestions of great originality and importance Hooke says that he does not consider horizontal windmills to be as efficient as vertical windmills, but if they are in any case employed, it will be advisable he says to make them on a certain construction, of which he gives a representation, and which is almost identical in its main features with the most improved species of feathering paddle wheel now employed in steam ships Hooke adds that wheels of this kind may be set to work advantageously, as water wheels in a river where no dam can be made, as may also the common vertical windmill with twisted arms In this cursory suggestion we have the germ both of the screw propeller and feathering paddle wheel Robertson Buchanan admits having taken the idea of his feathering wheel from the mechanism of orreries which was invented by Hooke, and the same considerations which make the screw and feathering wheel eligible instruments when driven by the water equally hold when the water is driven by them

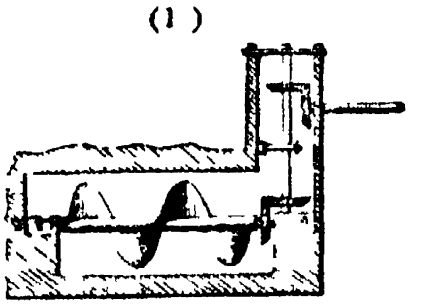
On the 14th of October, 1683 Hooke showed to the Royal Society an instrument he had invented for measuring the velocity of the wind It consisted of four vanes like the vanes of a windmill, set upon an axis, and the vanes were so constructed that they could be set at any angle that was desired On the 28th of November in the same year, Hooke showed to the Royal Society an instrument he had contrived, and had shown to some of the members twenty years before, for measuring the way of a ship through the water The prime mover of this instrument was a screw turned by the water and the instrument not merely took cognizance of the progress of the vessel through the water, but also of the leeway The plan of making gearing in steps, as is now usually done in such screw vessels is make use of gearing is also an invention of Hooke's Wheels made upon this principle are divided in the direction of their breadth into a number of parallel wheels, which are set a little in advance of one another, so that the teeth of each do not come in the same line The benefit of this practice is that the teeth, though necessarily very thick to give adequate strength, work as smoothly as if they were thin and small or as if the space between the teeth were only a fractional part of its actual amount

In the *Recueil de Machines approuvées par l'Academie, depuis 1727 jusqu'en 1731* there is a machine described, which was invented by M Du Quet, for dragging up barges against a current in a river by the aid of a screw driven by the water and by the screw thus driven a rope dragging the barges is to be wound up This screw which is a helical blade wound upon an axis, is only partially immerged in the water and it would be a much less effectual instrument than the screw of a windmill form previously recommended by Hooke In Bouguer s *Traité du Navire* published in Paris in 1746, an arrangement of revolving oars resembling the vanes of a windmill is mentioned as having been proposed for the propulsion of vessels but this expedient it is stated had not been found to possess sufficient force In 1752 Daniel Bernoulli obtained the prize offered by the French Academy of Sciences for the communication of the best project for impelling vessels without the aid of the wind Bernoulli s apparatus consisted of an iron axle 11 feet long and 2 inches thick set upon each side of the vessel beneath the water Each axle was to carry eight wheels, six feet diameter, set at equal distances from one another and each wheel was to have eight arms or spokes to the extremity of each of which a sheet-iron plate 10 inches square, and inclined so as to form an angle of 60° with the axle or keel of the vessel was to be affixed Bernoulli s plan appears to have been contrived to meet Bouguer s objection, and it would probably answer for towing but the revolution of such a large number of wheels in the water would in all cases of considerable speed occasion a serious loss of power from friction and other analogous causes

In Emerson s *Principles of Mechanics* published in 1754, we have an explanation of the mode of constructing screws with an expanding or increasing pitch Emerson describes [illegible] the screw set vertically in a well or [illegible] water as an instrument for rendering available a fall of water in giving motion to mills The water is admitted at the top of the cylinder and escapes at its base and in its descent it turns round the screw by which the cylinder is filled up Emerson explains that at the top of the cylinder the blade of the screw must have very little inclination with the axis but at the bottom of the cylinder the blade of the screw must have a considerable inclination with the axis Blades set in a conical pit or vessel and driven round by the gravity of water have long been in use in France under the name of Danaides or *roues à poires*, and in some cases the blades were merely plane surfaces suitably inclined while in other cases they were spiral or screw formed Instruments of this kind are described by Belidor in his *Architecture Hydraulique*

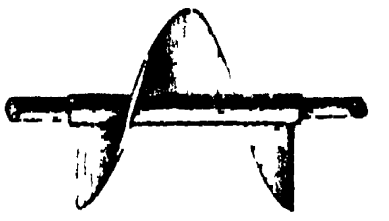
In 1768 a work on the Archimedean screw was published at Paris by M Paucton, and it is suggested that a ptérophore, composed of the circumvolution of the thread of a screw round a cylinder should be placed on each side of a vessel to propel her through the water, or one only may be used at the fore part These screws, it is stated may be either wholly or partially immersed In 1776 a submarine vessel was invented by D Bushnell, an American, which was to be raised upward or

sunk downward in the water by means of an inclined blade or oar affixed to the top and operating in the manner of a screw, and forced forward or backward in the water by another similar blade affixed to the bow This vessel was to carry a powder magazine which was to be screwed to the bottom of an enemy's ship to blow her up It was the original of Fulton s torpedo



In 1784 Joseph Bramah, of London, engineer obtained a patent for propelling vessels by means of a wheel with inclined fans or wings, similar to the fly of a smoke-jack or the vertical sails of a windmill This wheel was to be fixed to an axis passing out at the stern of the vessel and was to revolve beneath the water with a stuffing box, or proper packing surrounding the shaft, where it pierces the vessel, to prevent the water from entering In 1794 William Lyttleton, a merchant of London obtained a patent for an instrument which he called an "aquatic propeller," and which consisted of a single convolution of a three-threaded screw The thread of a screw is the projecting part of it, and a screw may have one two, three, or any other number of threads A string wound round a cylinder represents the thread of a screw and if one string only be wound round it, the screw will be a screw of one thread, if two strings be wound round it so as equally to divide the space the screw will be a screw of two threads and so of any number If instead of a string a thin ribbon of iron be wound edgeways upon the cylinder and be soldered thereto, then a slice cut off the end of this screw will have two projecting arms or portions of this ribbon, if the screw be one of two threads, three projecting arms, if of three threads, and so of any other number In any screw propeller therefore the number of threads is the same as the number of arms The pitch of the screw is the distance from one thread of the screw to the next thread measured on the axis supposing the screw to be continued through a whole convolution A spiral stair is virtually a screw, and the pitch is the vertical distance from any one step of the stair to the step immediately over head

In 1799 Edward Shorter, of London, mechanic obtained a patent for propelling vessels and among the expedients he employed is one termed a "perpetual sculling machine," consisting of a screw immerged in the water at the stern of the vessel The shaft which gives motion to the screw, passes through the stern of the vessel above the level of the water and is armed at its extremity with one of Hooke's universal joints from whence a pole extends obliquely into the water with the screw attached to its extremity The end of the pole is prevented from sinking too deeply in the water by a buoy which supports it at the proper elevation, and guy ropes are applied, by means of which the pole and screw may be moved to the one side or the other, so that the vessel may be steered or assisted in her steerage thereby Between 1800 and 1836 various ingenious methods of screw propellers were proposed by Dallery Stevens O Reilly, James Trevithick, Boswell, Millington, Scott, Whytock, Delisle Bourdon Dollman, Perkins, Brown Tredgold Macerone Cummerow Smith, Church Copley Ovinel, Peltier Sulichon, Poole, Woodcroft Savage Emerson Burke, Theal Smith, and Fitzpatrick The forms of these screws are very various but in most cases they consist of helical blades, like the vanes of a windmill revolving beneath the water at the stern or of a helical feather coiled round an axis in the manner of an Archimedean screw In some cases the pitch of the screw is intended to be uniform, and in other cases increasing the uniform pitch being a straight line wound upon a cylinder, and the increasing pitch being a curved line wound upon a cylinder, or a straight line wound upon a cone or spire Bourdon, in 1824, formed his screw with an increasing pitch and placed it in the dead wood of the vessel Tredgold, in his work upon the Steam Engine, published in 1827, recommended that screws should be made with an increasing pitch Peltier, in 1830, proposed to make his screw with an increasing pitch and Woodcroft proposed the same thing in 1832 Marestier, in 1824, in a work published by direction of the French government, giving an account of steam navigation in America, described various arrangements of screw propellers which had been tried in that country, but none of those expedients had come into practical operation Lyttleton in 1794, Shorter in 1802, Stevens in 1804, Bourdon in 1824, and several others at different times, had practically tried the effect of propelling vessels by means of a screw But these experiments led to no useful result, and in 1836 there was no vessel propelled by a screw in existence In that year patents for propelling vessels by a screw were taken out by F P Smith and Captain John Ericsson, and to these two persons the successful introduction of the screw as a propeller must be attributed Ericsson not meeting with the encouragement in this country that he expected, went to America, where he soon after constructed the war steamer Princeton, and about two hundred screw vessels have since been built in America Smith, as soon as his early trials had demonstrated the efficacy of the screw as a propeller, built the Archimedes, and soon afterwards his propeller was applied to the war steamer Rattler It has subsequently been adopted by the Royal Navy and a very large number of merchant steamers In by far the greater proportion of these vessels the screw is only applied as an auxiliary to the sails, and at present this appears to be its most valuable application



It would swell these remarks beyond the limits to which they must be restricted to attempt any enumeration of the various modifications in the form of the screw, and in the mode of its application, which have been made or proposed since the time it has been practically introduced as an available propeller In this country vessels are, for the most part, fitted with Smith s screw of two or three threads In America, and in France, vessels are mostly fitted with Ericsson's screw of four or six threads The average efficiency of both is about the same but screws of few threads appear to be best adapted for sharp and swift vessels or which are much immersed in the water whereas in the case of heavy vessels of shallow draught screws of many threads appear to be the most suitable For vessels with auxiliary power of good form and considerable immersion a screw with three blades appears to be, upon the whole, the best propeller that can be employed

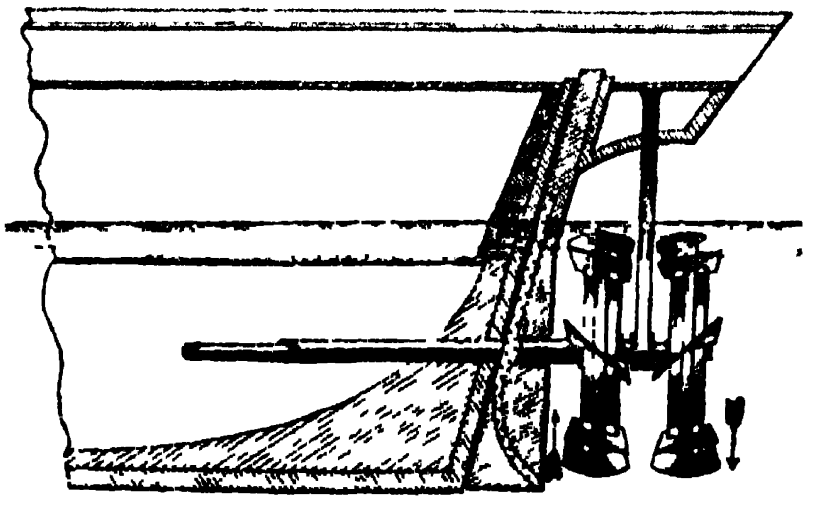
In Smith's earlier experiments upon the screw propeller he employed a single threaded screw of two convolutions, such as that represented in *fig* 1 During one of his trials, however the screw having come in contact with some object in the water, about half of it was broken away and the vessel was found in consequence to realise a higher speed than before The Archimedes was originally fitted with a single threaded screw of one convolution, such as that represented in *fig* 2, and it

(1)

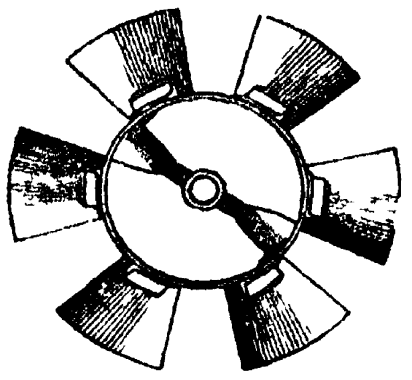
(2)

was with a screw of this kind that the efficiency of the screw as a propeller was originally demonstrated She was subsequently fitted with a double threaded screw of half a convolution, which gave the same amount of propelling surface, and diminished the uneasy motion at the stern This screw is represented in *fig* 3 The Rattler was fitted with a screw of this kind, but its length was subsequently reduced to one sixth of a revolution which made its length just one-third of its original length, and the best results were obtained with this proportion This intended screw of the Rattler is shown in perspective in *fig* 4

(3)

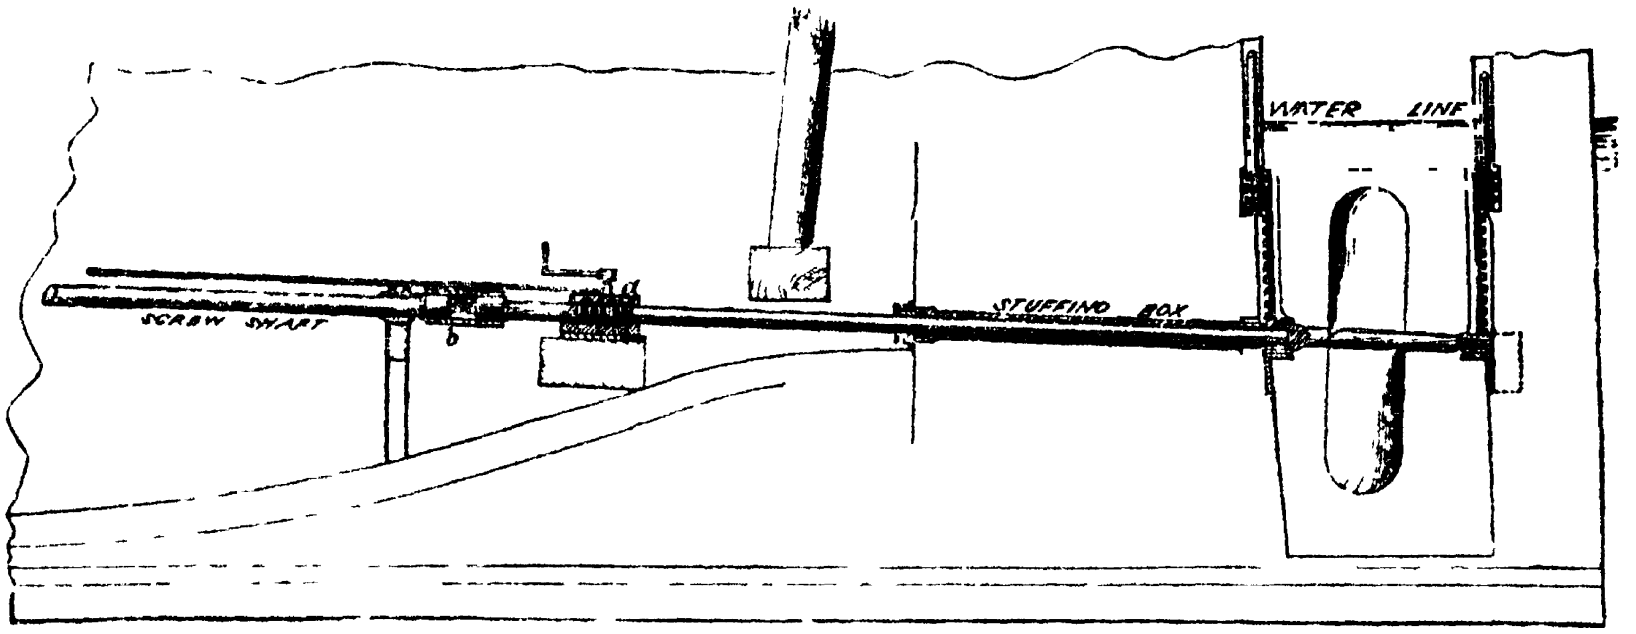


(4)



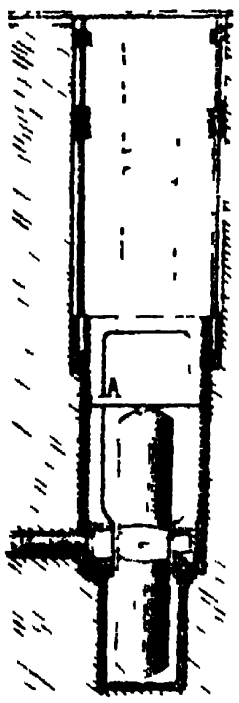
Ericsson in his original form of propeller employed two wheels armed with helical blades and revolving in opposite directions The object of this arrangement was to neutralise any tendency which one wheel might have to turn the vessel from her appointed course The second wheel, however, was soon discarded as it was found that it was not required *Fig* 5 represents Ericsson's original arrange-

(5)



ment of screw propeller, and *fig.* 6 is the propeller of the Princeton, which is the form he now usually employs

(6)

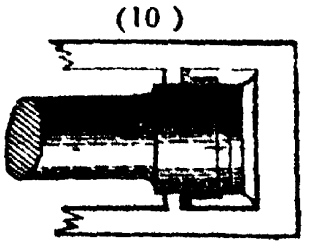


Description of the mode of applying the Screw Propeller — The most approved method of introducing the screw propeller into a vessel will be seen by a reference to *fig* 7, which is a section of the stern portion of H M S Wasp The screw is set in a hole or opening in the dead wood behind the stern post, and before the rudder post It is hung upon a short shaft, which is carried by a metal frame with a rack on each side, and in these racks endless screws work, which, being put into revolution, raise the frame, lifting the propeller out of the water, so as to enable the screw to be repaired if required, or a new one introduced without putting the vessel into dock Before, however, the frame can be raised, the shaft, passing through the ship, and which communicates with the engine, has to be pulled on end so as to disengage it from the boss of the short shaft, which supports the screw This is accomplished by the handle *a*, by means of which an end motion is given to an adjoining bearing, in which work a number of collars formed on the shaft, the brass of the bearing being suitably grooved to receive these collars At *b* a vacant space is left between the end of the shaft which communicates with the engine, and the end of the shaft which communicates with the screw, so as to enable the shaft communicating with the screw to be drawn on end without disturbing the other shaft, and a short pipe fixed to the one shaft, but sliding on

(7)

the other, is so applied that, notwithstanding the end play, the force of torsion will be communicated from the one shaft to the other *Figs* 8 and 9 represent the screw propeller and the apparatus for raising it out of the water as applied in Her Majesty's steam frigate Ajax By a reference to these figures the configuration of the screw usually employed for the service of the navy and the mode of raising it out of the water will be readily understood A catch represented as engaging the centre of the screw is put down only when the screw requires to be raised out of the water, and its use is to retain the blades in a vertical position during that operation

(8)



(9)

The screw shaft at the point where it passes through the stern of the vessel is kept tight by means of a stuffing box, consisting of a long pipe fitted tightly into the hull of the vessel Through this pipe the screw shaft passes and the space between the shaft and the pipe is kept tight by means of a plaited rope of soft hemp forced tightly into a recess provided for the purpose by means of screws It is very desirable that the shaft should fit so accurately into this pipe as to be exempt from all side play, which, if it exists will have the effect of communicating a disagreeable motion to the stern of the vessel In wooden vessels the pipe should be made of brass, and it has been found advantageous in such cases to cover with brass that part of the shaft which revolves within the pipe so as to prevent corrosion from the sea-water The ends of the vessel in advance of the screw should be brought to as fine a line as possible, and the hole in the dead wood in which the screw revolves should be considerably larger than the screw itself The screw in its revolution carries with it a coating of water and if this coating be partially stripped off at every revolution from the too near proximity of the stern part of the vessel, a shock will be communicated at every revolution from the impact of the water against the side of the dead wood and a part of the engine power will be also dissipated without effect

Modes of receiving the Thrust of the Screw — As the screw by its revolution is forced forward in the water, carrying the vessel with it the screw shaft, it is clear, must have to sustain a forward thrust and it is this thrust in fact which propels the vessel The severity of this forward thrust, combined with the velocity of rotation which the screw shaft requires to maintain, was the occasion in the earlier screw vessels of considerable inconvenience, in consequence of the friction produced, and several cases have occurred where the end of the shaft became white hot and actually welded itself to the steel plate against which it pressed although a stream of water was all the while running upon the surfaces in contact Various expedients have since that time been proposed for receiving the thrust of which one was to let the end of the shaft enter, in the manner of a piston, a tight cylinder of oil, so that it would be against a liquid only that the end of the shaft would press Another expedient was to place a large collar upon the shaft, which should press against a number of balls or small rollers resembling the rollers of a swivelling bridge Neither of these plans however have come into practical use, but one of two other modes is now generally followed Either the thrust is received upon a number of collars, as represented in *fig* 7, before described, or else it is received upon a series of discs applied to the end of the shaft and resting in a cistern of oil, as represented in *fig* 10 The cistern is usually cast upon the base plate or some other solid part of the engine, and its end is sufficiently strong to bear the thrust of the screw Interposed, however, between the end of the cistern and the end of the shaft are two, three, or more discs of metal usually about two inches thick, and of the same diameter as the shaft itself A bolt passes through their centres to keep them in a line, but they

(10)

are each free to revolve upon this bolt, and where the shaft passes out of the cistern a collar of leather is applied to prevent the [illegible] It will be obvious from such an [illegible] the end of the shaft where it presse[illegible] gins to heat from undue friction, it will revolve with somewhat more difficulty and will consequently carry the first disc round with it The rubbing surfaces therefore are no longer the end of the [illegible] the first disc and the second disc In fact, the rubbing surface, instead of being confined to one disc is distributed over several Those surfaces which begin to heat and consequently to stick, will cease to rub, whereby they will speedily become cool again, and their efficiency will thereby be speedily restored

Best Proportions of Screw — For mercantile purposes screws with three blades are, on the whole, to be preferred The diameter of the screw should be as large as it can be conveniently got, and when the area of the screw's disc — that is, the area of the circle described by the extremity of the arms of the screw — has one square foot of area for every 2½ square feet in the area of the immerged midship section of the vessel a very efficient performance is obtained The pitch of the screw should be equal to the diameter of the screw or a little more and the length of the screw fore and aft should be that answering to one-sixth of a convolution Thus in the case of a screw twelve feet in diameter, the pitch would be twelve or fourteen feet and the length of the screw measured along the axis would be about two feet

Best Forms of Screw — Screws are commonly made with a uniform pitch, and with the blades standing at right angles with the axis A slightly progressive increase in the pitch however say to the extent of 5 per cent, appears to be advisable — that is the pitch of the screw at its leading end should be 5 per cent less than at its following end The pitch at the centre should also be 10 per cent less than the pitch at the circumference, for the centre should merely screw through the water without seeking to produce any reacting force, which, from the great obliquity of the blades at the centre could not be done with advantage Finally the blades of the screw should be bent a little astern, so as to produce a tendency in the particles of water they force backwards to converge to a point This tendency will balance the divergent tendency produced by the centrifugal action of the screw in its revolution and the two forces by balancing one another, will cause the water to be projected backwards from the screw in a cylindrical column With the ordinary screw the water projected backwards assumes the figure of the frustum of a cone and some portion of the power is lost thereby

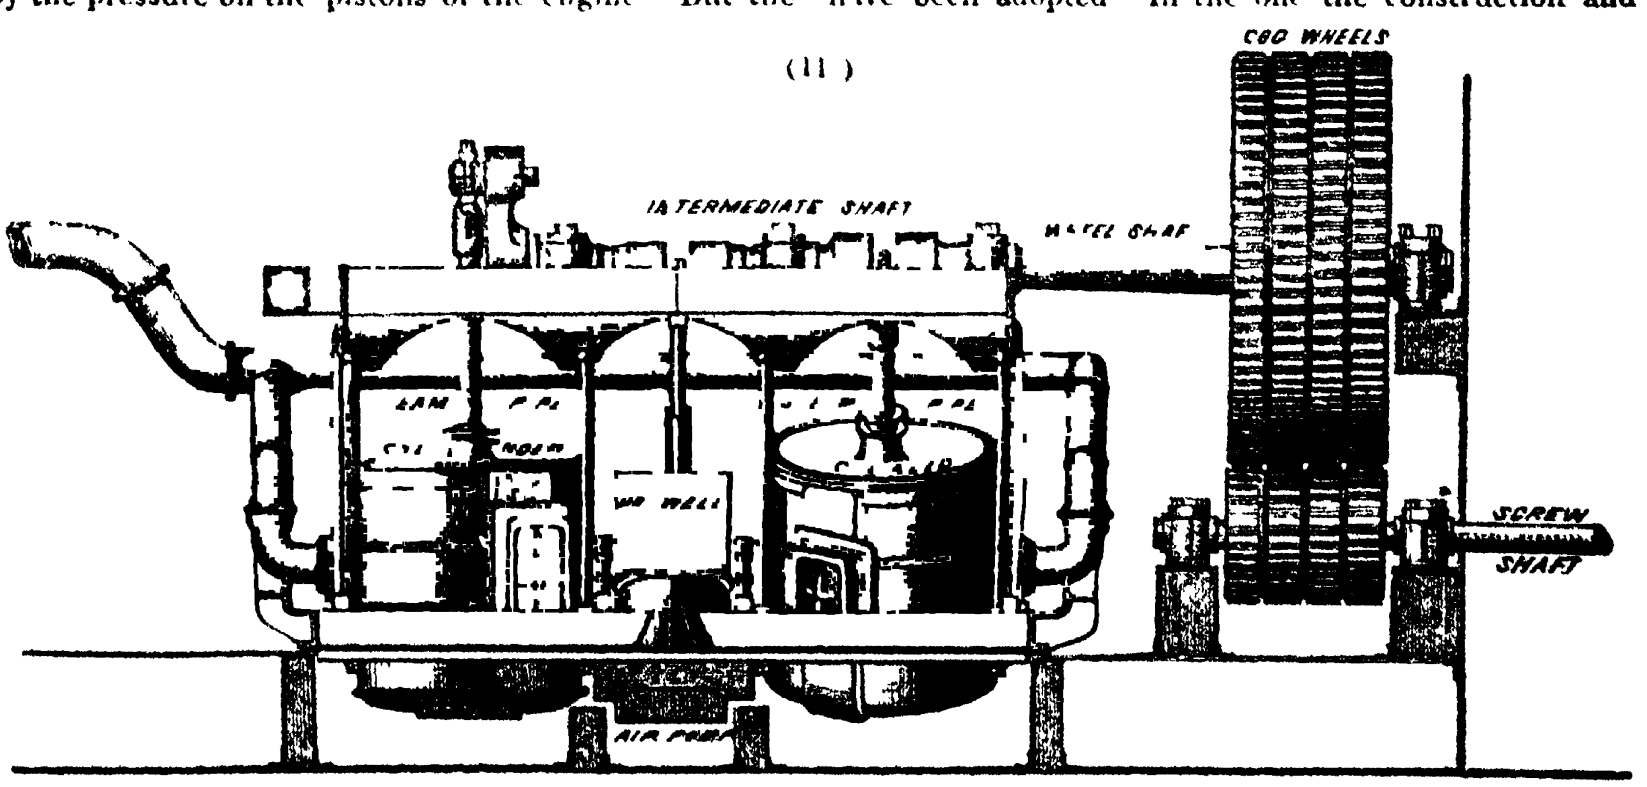
Positive and negative Slip of the Screw — When a vessel is propelled by oars paddles or any other instrument which acts upon the water it is obvious that since the water is not a solid body which can resist without disturbance the application of force there will be a certain amount of recession in the water or in other words the water will be moved to a certain extent backwards while the vessel is forced to a certain extent forwards This backward movement of the water is what is termed *Slip* and in its results it is analogous to the loss of power and speed which a locomotive experiences when the wheels slip upon the rails This slip exists in the case of the screw as well as in the case of the paddle or other species of propeller, and when the engines of a steam vessel are set in motion while the vessel is at anchor or moored in a river the whole power of the engines is wasted in slip or in moving the water without moving the vessel The ordinary amount of slip in paddle vessels is about one-third of the whole distance travelled, or, in other words the vessel would go one third faster with the same number of revolutions if the wheels geared into an iron rack instead of gearing into water In well-constructed paddle vessels the slip is only 10 per cent, or, in other words, the vessel would only go one-tenth faster with the same number of revolutions if the screw worked in an iron nut instead of working in water Since, therefore, all the power expended in producing slip is lost, and since there is less slip with the screw than the paddle, there is an apparent superiority in the screw from this cause In some screw vessels, however, the apparent slip is nothing at all and in others it is less than nothing, or, in other words, the vessel is propelled through the water by the screw alone at a greater velocity than if the screw worked in a solid nut with the same number of revolutions In the early history of the screw propeller this apparent paradox provoked much incredulity, but the phenomenon is now understood, and is not difficult of explanation

When a vessel passes through the water, the friction of the bottom and the sides puts a column of water in motion which proceeds in the direction of the vessel Sea weeds and other light objects adhering to a vessel have been observed to stand out straight from her side when the vessel was moving through the water with a considerable velocity, whereby it is clear that a film of water must be moving with the vessel The vacuity also which the motion of the vessel through the water tends to produce at the stern causes a flow of water towards the stern in order to fill it up It follows, therefore, that a vessel, in passing through the water, puts in motion a stream or current which follows in her track, and that this is no hypothetical supposition is proved by the fact that a boat will often follow a vessel without being towed by a rope, and that when a slow steamer gets into a swift one's wake the slow steamer will not fall into the distance, but will be towed by the current which the leading steamer creates Now in a screw vessel the screw works in this current, and if from the form of the stern or other causes the current runs at a considerable velocity, and if from the large dimensions of the screw or otherwise the actual slip of the screw be small, then it will often follow that the slip of the screw will *appear* to be less than 0 nil or negative, if the comparison be made with the current, but with the stationary water at the ship's side The screw must at all times have slip *relatively with the water in which it works*, but if that water is itself in motion, it is not surprising that the vessel should travel through a greater distance than what answers to the pitch and revolutions of the screw, any more than that a paddle vessel in descending a river with a strong current should pass through a greater distance than what answers to the diameter and revolutions of the wheel, if the distance travelled be measured on the river bank A log placed where the screw revolves will always show that the screw advances with a greater velocity than the vessel as measured at that point, or, in other words, that the screw passes through the current with a greater velocity than the vessel passes through the current, though of course the speed of the vessel and of the current together may be greater than the speed of the screw alone

Measurement of Thrust upon the Screw Shaft and Amount of Power lost by Slip — In some vessels a dynamometer has been applied to the end of the screw shaft, whereby it has become possible to measure accurately the amount of forward pressure exerted by the screw In the Rattler, a vessel of 888 tons burden this pressure amounted on an average to about four tons This pressure, multiplied by the space passed through by the vessel per minute and divided by 33 000, will manifestly give the force in actual horse power that is instrumental in the propulsion of the vessel, and the power thus computed amounts on an average to about half or two-thirds the power developed in the cylinders It hence appears, that in screw vessels such as the Rattler from one third to one half of the engine power is wasted in slip and in the friction or other resistances caused by the revolution of the screw in the water With the paddle wheel the loss from these causes is nearly the same and the screw and paddle consequently produce about the same speed by the application of the same amount of power

Relative Efficiency of the Screw and Paddles — To determine the relative efficiency of the screw and paddle as a propeller, two vessels, the Rattler and the Alecto, were constructed of about the same power 200 horses, and of nearly the same size and form, but the Rattler was a screw vessel and the Alecto a paddle vessel The Rattler it was found had, in nearly all cases somewhat the advantage in point of speed, but the engines of the Rattler also exerted somewhat more power Subsequently two other vessels, the Niger and Basilisk were constructed of 1072 tons and 400 horse power, the Niger being a screw vessel, and the Basilisk a paddle vessel, and the following were the results obtained — In deep immersions the screw vessel had an advantage of 1½ per cent over the paddle vessel, but with medium immersions the paddle vessel had an advantage of 1¾ per cent over the screw vessel and in light immersions the paddle vessel had an advantage of 4¾ per cent over the screw vessel The slip of the screw was 24 per cent Upon the whole therefore, the screw seems to have somewhat the advantage when the vessel is deep and the paddle seems to have somewhat the advantage when the vessel is at a light or medium immersion

Screw Vessels not adapted to go Head to Wind — The experiments with the Rattler and Alecto established one important fact in connection with screw vessels, viz that they are ill adapted to advance against a head wind For although both vessels attained the same speed of 4 knots against a strong head wind, yet in the case of the Alecto, this performance was attained with a velocity of the engine of 12 strokes per minute, whereas, in the Rattler, it was only attained with a velocity of the engine of 22 strokes per minute It follows, therefore, that a screw vessel in proceeding head to wind will require 1 8 times, or nearly twice the quantity of fuel to do the same amount of work The screw, in fact, revolves at nearly the same velocity whether the wind is adverse or favourable, or whether the vessel

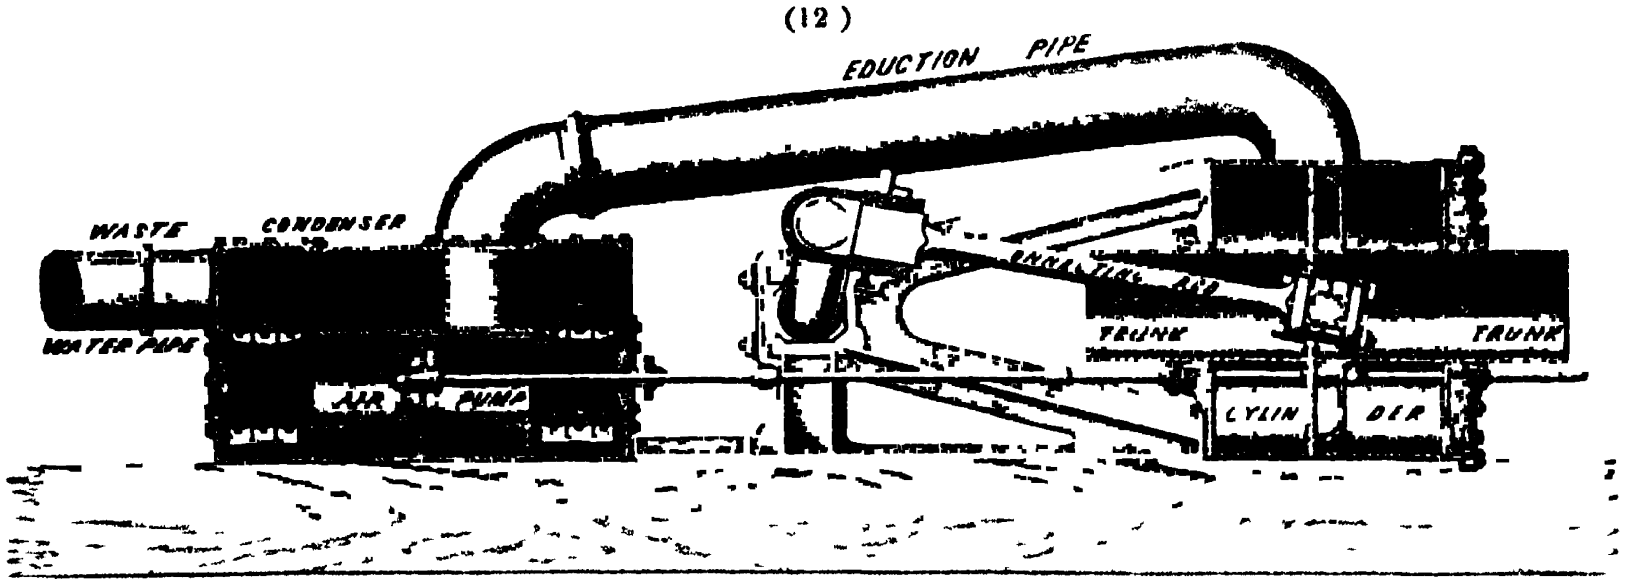


is lying at anchor, and this is a serious defect in the case of vessels intended to encounter adverse winds In the case of vessels, however, which use the screw only as a resource in calms, or as an auxiliary to the sails, this disadvantage will not be experienced, since such vessels have no pretensions to the capability of proceeding in close proximity to a strong head wind

Paddle and Screw Vessel tied Stern to Stern — In all cases where screw and paddle vessels of equal power and size have been tied stern to stern, the screw vessel has preponderated, and towed the paddle vessel so soon as the engines were set on When the Rattler and Alecto were tied together in this manner, the Alecto's engines were set on first and she was allowed to tow the Rattler at the rate of 2 knots an hour The Rattler's engines were then set on In five minutes the two vessels became completely stationary The Rattler then began to move ahead, and towed the Alecto against the whole force of her engines, at the rate of 2 8 knots per hour In like manner the Niger towed the Basilisk astern, in opposition to the force of her engines, at the rate of 1 1 knots per hour The natural inference from this experiment would be that the screw is more suitable for towing than the paddle, yet this inference is not confirmed by experiment For, when the Niger and Basilisk were each set to tow the other alternately, in the usual manner in which a steamer tows a ship it was found that the Niger towed the Basilisk at a speed of 5 63 knots, with 593 9 horse power, and that the Basilisk towed the Niger at the rate of 6 knots, with 572 3 horse power The paddle vessel therefore accomplished in towing the largest speed with the least power It has also been found that when a paddle and screw vessel set stern to stern push one another instead of pulling one another, the paddle vessel preponderates, whereas, if they pull the screw vessel preponderates These circumstances seem to show that the power of a screw vessel to tow a paddle vessel astern, when the two are tied together, does not arise from any superior tractive efficacy of the screw itself, but is due to the centrifugal action of the screw, which raises the level of the water at the stern, so that the vessel gravitates down an inclined plane

Cause of the serrated Outline of the Dynamometer Diagram — In those screw vessels which have had a dynamometer applied to the end of the shaft the thrust of the screw was made to act upon a spring and a pencil in connexion with the shaft marked a line upon a revolving cylinder which line was either high up on the cylinder, or low down as the thrust of the screw increased or diminished The line thus traced instead of being tolerably uniform and straight was found to be serrated, like the teeth of a saw, and on further investigation, it was discovered that every time the screw, in its revolution, brought the blades into the vertical position and therefore into a line with the stern post at that moment the thrust was increased This phenomenon appears to be due to the circumstance of the water immediately behind the stern post being carried forward with nearly the same velocity as the vessel itself, and when the screw comes into that dead water, as it is termed it is no longer a reaction answering to the *difference* of speed of the screw and vessel that it has to encounter, but a reaction answering to nearly the *whole* speed of the vessel If such a reaction had to be encountered through the whole revolution of the screw, the velocity of its rotation would be necessarily diminished until the reacting pressure produced was balanced by the pressure on the pistons of the engine But the momentum of the machinery and of the screw itself momentarily carries up the thrust to a higher point than that due to the pressure on the pistons If a screw vessel be reversed until she attains full speed astern, and be then suddenly changed to full speed ahead, it will be found that a dynamometer diagram taken at that point at which the vessel is stationary in the water, from the effort to overcome her own momentum, will have a straight and not a serrated line

Importance of making the Stern of Screw Vessels very sharp and fine — The preceding remarks will have very clearly indicated the importance of making screw vessels as sharp as possible at the stern, but the following facts may be stated in corroboration of the propriety of such a configuration — In 1846 the Dwarf, a screw steam vessel, with a fine run, was filled out in the stern by the application of three successive layers of planking, so as to alter the shape to that of a vessel with a full run Prior to the alteration the speed of the vessel was 9 1 knots per hour the engines making 32 revolutions per minute The effect of the filling was to reduce the speed to 3 25 knots per hour, with a speed of the engine of 24 revolutions per minute One layer of filling was then taken off, and the speed rose to 5 75 knots per hour, the [illegible] revolutions per minute When the [illegible] was removed the speed rose to 9 knots as before Care was of course taken in this experiment to bring the filling into conformity with the lines of the vessel so that there should be no roughness or abruptness to aggravate the evils of a full run Again, the Sharpshooter and Rifleman were sister vessels of 486 tons, and 200 horse power, but the Rifleman was made with a full run and the Sharpshooter with a fine run The speed of the Rifleman was found on trial to be 7 9 knots, and of the Sharpshooter 9 9 knots The Minx and Teazer were sister vessels of about 300 tons and 100 horse power, but the Teazer was made with a full run, and the Minx with a fine run The speed of the Teazer was found to be 6 3 knots and of the Minx 7 8 knots The sterns of both the Rifleman and Teazer were sharpened subsequently to these trials, and the 100 horse engines of the Teazer were at the same time put into the Rifleman while new engines of 40 horse power were put into the Teazer Both vessels went faster than before The Rifleman, when sharpened at the stern attained a speed of 8 knots with engines of 100 horse power whereas she had before only attained a speed of 7 8 knots with engines of 200 horse power The Teazer when sharpened at the stern, attained a speed of 7 685 knots with engines of 40 horse power, whereas she had before only attained a speed of 6 3 knots with engines of 100 horse power The engines of the Teazer when transferred to the Rifleman drove that vessel nearly 2 knots an hour faster than they had previously driven the smaller vessel, an amelioration consequent altogether upon the sharpened form of the stern



Engines for driving the Screw — It will be obvious, on looking to the pitch of an ordinary screw and the speed with which the vessel passes through the water, that the screw must revolve with a considerable velocity For example, if a vessel be driven 10 miles an hour or 880 feet per minute by a screw of 12 feet pitch, then the screw must make somewhere more than the twelfth part of 880 or 73 revolutions in the minute This is a much higher speed than marine engines have been heretofore accustomed to travel at and two methods of obtaining the necessary velocity of rotation have been adopted In the one the construction and

speed of the ordinary engine have been retained without material alteration, and the required velocity of revolution has been given to the screw shaft by means of intervening gearing In the other case a new arrangement of engine has been introduced which is capable of moving with a much greater velocity than ordinary engines, and the engine and screw shaft are directly connected with one another *Fig* 11 represents a pair of geared screw engines, being the engines constructed by Messrs John Penn and Sons for the Great Britain These engines are on the oscillating principle, which Messrs Penn have rendered so celebrated, and they are almost identical in construction with the paddle engines made by Messrs Penn for the Sphinx and other vessels The Great Britain is of 3500 tons burthen, and her displacement, at 16 feet draught of water, is 2970 tons The diameter of cylinder is 82⅛ inches, length of stroke 6 feet nominal power 500 horses, diameter of screw 15⅛ feet, pitch of screw 19 feet, length of screw 3 feet 2 inches The screw has three arms or blades The multiple of the gearing is 3 to 1, and there are 17½ square feet of heating surface in the boiler for each nominal horse power of the engine The crank shaft, being put in motion by the engine, carries round the great cog wheel or aggregation of cog wheels affixed to its extremity, and these wheels acting on suitable pinions on the screw shaft cause the screw to make three revolutions for every revolution performed by the crank

Fig 12 is a representation of a pair of direct action screw engines, being the engines constructed by Messrs

(12)

John Penn and Son for H M 's screw frigates Arrogant and Encounter Here the cylinders lie in a horizontal position, and are traversed through the centre by a pipe or trunk upon which the piston is cast The central trunk is circular and it projects through both the top and bottom of the cylinder the points of penetration being made tight by suitable packing One end of the connecting rod is attached to the centre of the trunk while the other end engages the crank, which turns round the screw shaft The air-pump which also lies in a horizontal position is double-acting and is situated within the condenser A large pipe called the eduction pipe leads the steam from the cylinder to the condenser, where it is condensed by a jet of cold water, and the hot water thence resulting is ejected by the air-pump through the waste water pipe, and passes overboard In the figure only one cylinder and one air pump is represented, but it will be understood that there are two cylinders and two air-pumps The valves by which the water is admitted to the air-pump from the condenser and passes again from the air-pump into the hot well and waste pipe, consist of several discs of indian rubber kept down by a central bolt so as to cover radial slits or orifices in a perforated plate These valves are found to operate without noise or shock notwithstanding the high speed at which the engine must work in order to give motion to the screw without intervening gearing The diameter of the cylinder in the Arrogant and Encounter is 60 inches, and the diameter of the trunk 24 inches, which being deducted leaves an available area of piston equal to that of a piston 55 inches in diameter In the Arrogant the length of stroke is 3 feet and in the Encounter 2 feet 3 inches The nominal power of both engines is 360 horse The diameter of the screw of the Arrogant is 15 feet 6 inches, and the diameter of the screw of the Encounter is 12 feet The pitch of both is 15 feet, and the length 2 feet 6 inches The Arrogant is a vessel of 1872 tons burden and the Encounter of 953 tons Both the engines and boilers are kept below the water-line, so as to be out of the reach of shot

The forms of engine, both geared and direct-acting, for giving motion to the screw, are too numerous to be here described But in most war vessels the cylinders are placed upon their sides, so as to keep the engines below the water-line In merchant vessels a form of engine like the land beam engine, with the cylinder at the one end of a beam and the connecting rod at the other — the connecting rod extending downwards from the end of the beam to give motion to the crank — is frequently employed In other cases the cylinder is inverted, and a connecting rod proceeds from the end of the piston rod to turn the crank, the end of the piston rod being, of course, steadied by suitable guides Upon the whole a construction of engine resembling that of the Arrogant and Encounter appears to be the best for driving the screw, but perhaps [illegible] also might be dispensed with,

and the condensation be performed in the air pump, — the flow of water *to* which and *from* which might be governed by a slide valve of construction similar to that employed to regulate the admission and escape of the steam from the cylinder It appears probable that slide valves will come into use for regulating the flow of water to and from pumps of every kind, but in the case of ordinary pumps for raising water those valves need not be like common slide valves — which in fact, do not seem well adapted to give sufficient area for such purposes but they may consist of short wide cylinders with gridiron orifices revolving slowly at the top and bottom of the pump

Screw Vessels with Auxiliary Power — We have already stated that screw vessels intended to go head to wind and to contend against head seas, are not so efficient as paddle vessel inasmuch as they require more coal to do the same work Under the conjoint influence of sails and steam, however, they are under most circumstances as efficient and if deeply laden are more efficient A screw vessel, being divested of paddle boxes partakes more of the character of a sailing ship nevertheless from the experiments with the Niger and Basilisk it does not appear that a screw vessel is more efficient under sails than a paddle vessel, which as a result might naturally be expected The advantages incident, therefore, to the use of screw vessels with auxiliary power do not result from any superiority of the screw as a propeller nor from the increased facilities which it presents for the application of sails, but are to be ascribed to the large employment in screw vessels of wind power which costs nothing instead of steam power which costs much and also to the maintenance of lower rates of speed than are thought necessary in paddle vessels The screw, indeed is a less cumbrous propeller than the paddle and in consequence of the high speed of engine which it permits, a very considerable engine power will go into a small compass Upon the whole, therefore, the screw for all purposes of auxiliary propulsion is much to be preferred, nevertheless, it is right to understand that its superior eligibility is not due to any greater efficiency than the paddle as a propeller, either in a calm or under sail but only to the greater convenience in the application of auxiliary steam power which its employment affords

Comparative Expense of conveying Merchandize in a Paddle Vessel of full Power, and in a Screw Vessel of auxiliary Power — For the purposes of this comparison, we may take a paddle vessel of 1000 tons burden and 350 horses power, and a screw vessel of 300 tons (old measurement) and 50 horses power—each performing a voyage of 500 miles The paddle vessel would perform the voyage in about 45½ hours, carrying 400 tons of cargo, exclusive of her machinery and coals The screw vessel would perform the voyage in about 62 hours, carrying 400 tons of cargo, exclusive of her machinery and coals Each vessel would make one double trip weekly, or 104 single trips per annum The first cost of the paddle vessel

would be about 40,000*l*, the first cost of the screw vessel would be about 10,000*l*. In the paddle vessel the wages and the scale of the expenses altogether would be larger than in the screw vessel, which would partake more of the nature of a coasting ship. The following is an approximate estimate of the expense of each —

PADDLE VESSEL.

	Per Annum £	Per Trip £ s
Wear and tear 10 per cent on 40,000*l*	4 000	96 3
Depreciation 5 per cent	2 000	
Insurance 5 per cent	2,000	
Interest 5 per cent	2 000	
	10 000	

	Per Month £ s	Per Trip £ s
Commander 25*l* per month, and 6*s* per day victualling	33 8	26 11
Two mates, first 7*l* and second 4*l* per month, and 3*s* 4*d* per day	22 4	
[illegible] and 1*s* 6*d* per	10 4	
[illegible] 1*s* 6*d* per day	46 0	
Carpenter 5*l* per month, and 1*s* 6*d* per day victualling	7 2	
Three apprentices 16*s* per month each, and 1*s* 6*d* per day	8 14	
Eleven firemen and trimmers 3*l* per month, and 1*s* 6*d* per day	56 2	
Two engineers, first 12*l* per month, second 8*l*, and 3*s* 6*d* per day	28 16	
Wages and victualling per month	212 10	

SCREW VESSEL.

	Per Annum £	Per Trip £ s d
Wear and tear 10 per cent on 10,000*l*	1,000	24 0 9½
Depreciation 5 per cent	500	
Insurance 5 per cent	500	
Interest 5 per cent	00	
	2, 00	

	Per Month £ s d	Per Trip £ s d
Captain 16*l* per month, and 5*s* per day victualling	23 0 0	11 6 9
Mate 11*l* per month, and 3*s* 6*d* per day	8 18 6	
Six seamen 2*l* 10*s* per month, and 1*s* 6*d* per day	27 12 0	
One apprentice 16*s* per month, and 1*s* 6*d* per day	2 18 0	
One engineer 8*l* per month and 3*s* 6*d* per day	12 18 6	
[illegible] per month	15 6 0	
Wages and victualling per month	90 13 0	

PADDLE VESSEL.

	Per Trip £ s d
Wear and tear depreciation &c	98 3 0
Wages victualling	76 11 3
Coal 60 tons at 1*l*	15 0 0
Oil and tallow	1 0 0
[illegible]	19 0 0
[illegible]	7 0 0
Expense per trip of paddle vessel	198 14 3

SCREW VESSEL.

	Per Trip £ s d
Wear and tear, depreciation, &c	24 0 9½
Wages and victualling	11 6 9
Coal, 15 tons at 1*l*	11 5 0
Oil and tallow	1 0 0
Port charges, light dues &c	8 0 0
Sundry ships stores	5 0 0
Expense per trip of screw vessel	60 12 6½

Thus it appears that it will cost 198*l* 14*s* 3*d* to transport 400 tons of merchandize through a distance of 500 miles with a full-powered paddle vessel, and that it will cost only 60*l* 12*s* 6½*d* to transport the same merchandize through the same distance with a screw vessel of auxiliary power. The average speed of the paddle vessel would be 11 miles per hour, and the average speed of the screw vessel would be 8 miles per hour.

Comparative Cost of carrying Merchandize in Screw Vessels and in Sailing Ships — By carrying an investigation similar to the foregoing into the case of sailing ships so as to determine the cost of conveying a given quantity of merchandize per annum through any given voyage by their instrumentality, as compared with the cost of carrying the same merchandize through the same voyage by the instrumentality of screw vessels, it will be found that the screw vessels will do the work at the least expense or, in other words, that a given sum of money, if invested in screw vessels, will yield larger returns than the same sum of [illegible] vessel in sailing ships, and this irrespective altogether of any benefit or preference which may fairly be expected from the increased speed. Mr Laming states, in his evidence before the committee of the House of Lords on the slave trade that he had had the management of a line of sailing vessels between London and Rotterdam which were at length superseded by screw vessels, after having been in existence for 25 years, that, taking the three sailing vessels, the Hope, the London, and the Alkmaar, by which, before the establishment of the screw vessels, the communication had been maintained, the average cost of carrying a ton of merchandize, from one terminus to the other, was 1*l* 12*s* 5½*d*. With the screw vessels, however, the City of London and the City of Rotterdam, the average cost of conveying the same quantity of merchandize through the same distance was, on an average of ten voyages, only 19*s* 6*d*, so that the screw vessels not merely maintained a superior speed, but did the same work at about one-third less expense.

Conditions to be observed in the Construction of Screw Vessels — The whole of the superior eligibility of screw vessels for the conveyance of merchandize whether compared with paddle vessels or sailing ships, is not due to the action of the screw itself or to the use of steam power. Much, probably most, of it arises from the superior form of vessel which has been simultaneously introduced and by which the sails have been rendered much more efficient than heretofore in urging the vessel through the water. And the main conditions necessary to the satisfactory performance of screw vessels lie in making the form of the vessel sharp and fine in applying a large amount of sail power, and in keeping the screw well immersed in the water. Screw vessels should be broad at the water line, so as to enable them to bear the pressure of a large amount of sail, and the sails should be as flat as possible, and be laced to the spars so as to enable the vessel to go as near as possible to the wind. The rigging of all vessels is still in a most defective state. It is without any provision whatever for using up the power of the wind in an effectual manner, and a large proportion of that power is consequently lost. Under suitable arrangements vessels would be able to sail directly against the wind, instead of having to tack as is at present the practice, and there is every reason to believe that before many years expedients for this purpose, and for obtaining from a given force of wind and area of sail a much larger propelling effect, will be practically applied.

For further information respecting the screw propeller see a *Treatise on the Screw Propeller*, by John Bourne C.E., from which the engravings and most of the information given in this article have been extracted.

SILDIAC. The substance called Gum Lac in a granulated form. See LAC in DICT.

SILBILI. A name given to native carbonate of silver.

SENSORY. The term appears to have been first applied by Hartley to those nerves which convey a stimulus to the neural axis or nervous centres with which they are connected in contradistinction to the nerves that convey a stimulus from the neural axis to the muscles. The actions of sneezing swallowing coughing hiccoughing vomiting and expelling the fæces and urine' are to be deduced 'from those vibrations which first ascend up the sensory nerves and then are detached down the motory nerves which communicate with these by some common trunk plexus or ganglion" — *On Man* vol i p 97. This class of motions or vibrations now called reflex,' Hartley distinguishes from those produced by the transmission of the sensory vibrations to the brain where they produce "sensation' and excite 'volition,' and the nerves producing the 'first and fourth classes of motory vibrations of Hartley's system" have been recently asserted to be [illegible] from those that produce sensational [illegible] tions. The distinction has not been recognised, and anatomists apply the term 'sensory" to those parts of the neural axis with which the sensory nerves are connected as, *e g* the posterior columns of the myelon, the optic lobes the thalami and the corpora striata, which are termed 'sensory ganglions".

SERUM (Lat *whey*). In Anatomy the constituent of the plasma, or liquor sanguinis, which remains after the separation and coagulation of the fibrin. Serum contains a quantity of albumen, and coagulates at a temperature of from 150° to 170°.

SETHITES or SETHIANS. In Ecclesiastical History, a branch of the Ophites, a sect of the family of the Gnostics. They are said to have believed that Seth, the son of Adam, appeared again in the person of the Messiah (*Mosh* vol i cent 2).

SEVERITE. A hydrated silicate of alumina found in nodules in the gravel of St Sever in France.

SHALLOT. The *Allium Ascalonicum* of Linnæus. It possesses the flavour of garlic, but less pungent.

SHEAR STEEL. A kind of steel made by welding several bars together, and again drawing them out. It

is used for clothiers' *shears* and many other cutting instruments *See* STEEL, in DICT

SHEET IMPRESSION *see* GEOLOGY

SHOEMAKERS BLACK *Atramentum sutorium* A name given by Pliny to sulphate of iron, or green vitriol, from the circumstance of its being used to rub over tanned leather, to which it communicates a black dye

SIBBENS A disease endemic in some of the western parts of Scotland, somewhat resembling the yaws, and propagated by direct application of the contagious matter

SIDERITE (Gr *σίδηρος, iron*) Sparry iron ore Native carbonate of iron

SIDEROSCOPE (Gr [illegible] *I view*) An instrument for [illegible] of magnetism in substances usually supposed to be non-magnetic,—the name having reference to the hypothesis that the traces of magnetism so detected are due to the presence of atoms of iron The apparatus proposed by Lebaillif, in which the object is accomplished by means of a very delicate combination of magnetic needles is described by Pouillet, *Elemens de Physique*, and by Sir D Brewster *Treatise on Magnetism*, in the *Encyclopedia Britannica*

SIGAULTIAN OPERATION The division of the *symphysis pubis* for the purpose of increasing the capacity of the pelvis in cases of impracticable labour It was first performed by a French surgeon of the name of Sigault, but is now discarded

SIGNATURE In Printing a letter or letters of the alphabet placed at the bottom of the first page of each sheet of a book to denote the order of the sheets, and to guide the bookbinder in folding and arranging them Sometimes figures are used, but seldom, except in America

SILICATES (Lat silex) Compounds of silica with certain bases thus we have silicates of lime magnesia, oxide of iron &c in most mineral and silicate of *lead* is an important ingredient in flint glass

SILICLE (Lat silex) A silicate of alumina and lime from Antrim in Ireland

SILVANITE Auriferous and argentiferous ore of Tellurium

SILVER GLANCE A mineralogical synonym of the vitreous sulphuret of silver

SILVIC ACID A name applied to that portion of common rosin or colophony which is most readily soluble in cold alcohol Its combinations with salifiable bases have been termed *silvates* It is crystallisable, and its alcoholic solution reddens litmus

SINOPITE The *Sinopian earth* of the ancients A hydrated silicate of alumina and iron from Asia Minor

SITOLOGY (Gr *σιτος aliment, λογος a discourse*) *Dietetics*, or the doctrine of aliments

SKUTTERUDITE The arseniuret of cobalt found in mica slate at Skutterud near Modum in Norway

SLATE SPAR A variety of calcareous spar of a shining white pearly lustre and greasy feel found at Wicklow in Ireland, in Glentilt in Scotland and in Norway

SLEET Rain mixed with hail or snow in small particles It falls during gales or in squally weather and chiefly in spring and autumn when the temperature of the air at a small height above the earth is below the freezing point M Kaemptz considers gusts of wind to be a necessary condition for the formation of sleet

SLIDE-REST An apparatus adapted to a turning-lathe for carrying the tool and which by means of screws is made to move or *slide* along the frame of the lathe so as to bring the tool successively to the different parts of the work The advantages obtained by the slide-rest are extremely important particularly in reference to the construction of machinery, where extreme accuracy is requisite, both in respect of the size and form of the work The tool being fixed to the rest, and adjusted by screws, its distance from the axis about which the work revolves can be regulated with the utmost precision, while a degree of steadiness is secured which is altogether unattainable when the tool is simply held in the hand

SLOTTING MACHINE A machine for grooving metal surfaces

SMALL WARES A commercial term applied to tape, bindings, braid, and other textile articles of that kind

SMARAGDITE (Gr *σμαραγδος emerald*) A variety of hornblende

SMILACINE (Lat smilax) A crystallisable principle obtained from Sarsaparilla root

SMITHSONITE A variety of calamine or native carbonate of zinc from Somersetshire and Derbyshire, analysed by Smithson

SNAKE WEED The great Bistort, *Polygonum bistorta* The root is *twice bent* on itself, hence the name This root contains starch, which renders it nutritive, hence, in Siberia, it is roasted and eaten

SOCIALISM The science of reconstructing society on entirely new bases, or the substitution of the principle of association for that of competition in every branch of human industry *See* RIGHT OF PROPERTY and SAINT SIMONIANS in DICT The best account of the innumerable modifications of which this principle has been made susceptible, from Rousseau down to Proudhon, will be found in Karl Grun's work entitled "Soziale Bewegung"

SOLANO A hot wind, or species of sirocco, pre- [illegible] Spain and Portugal [illegible] Substances which are seen to be luminous in a dark place after having been exposed to light

SOLVENT In Chemistry, the liquid in which a solid is dissolved The substance dissolved is sometimes distinguished as the *solvend*

SOMERVILLITE A mineral found in the ejected blocks on Vesuvius named after Mrs Somerville

SORDAWALITE A mineral of the hornblende family, being a silicate of alumina iron and magnesia, with about 3 per cent of phosphoric acid It occurs in thin veins in the trap rocks of Sordawala in Finland

SOUJEE A species of Semolina it is a granular preparation of wheat [illegible]

SOURKROUT, or SAUERKRAUT Fermented cabbage The plants are collected in autumn, divided, the stalks removed and the leaves cut into slices, a layer of which is placed in a vat alternating with a layer of salt till the vessel is full when it is subjected to the action of heavy weights placed on the whole At the end of about six weeks when the acetous fermentation is complete, it is considered fit for use The method of cooking it in Germany is simply to stew it in its own juice with bacon, pork or other fat meat dill, caraway seed, and other carminatives, are occasionally added Sauerkraut is not fitted for persons troubled with acidity of stomach, it has a slight relaxing effect on the bowels As an antiscorbutic it has long been celebrated, and was highly spoken of by Captain Cook (PEREIRA *on Diet*)

SOWANS or SOWINS The husk and some adhering starch separated from oats in the manufacture of oatmeal are sold as by Dr Christison under the inconsistent name of *seeds*, these, if infused in hot water and allowed to become sourish, yield on expression a mucilaginous liquid which on being sufficiently concentrated, forms a firm jelly known by the name of Sowens A similar preparation from groats or oatmeal is called *flummery*

SPANISH CHALK A variety of steatite or silicate of magnesia It is also called *French chalk*

SPECIFIC HEAT In Physics denotes the ratio of the quantity of heat entering into or passing out of a given weight of any substance, to the change of temperature thereby produced For instance if the unit of heat be assumed to be that quantity of heat which is necessary to melt a pound of ice at the temperature of 32° of Fahrenheit then assuming n to denote the number of pounds of ice necessary to cool down a body whose weight is one pound from t to t' the specific heat of the body is $n \div (t - t')$ Hence if $t - t' = 1°$, the specific heat is denoted simply by n

It is found by experiment that provided a body does not change its state (as from solid to liquid) the above ratio remains constant or nearly so through a considerable range of temperature, but it varies greatly in respect of different substances Thus a pound of water absorbs thirty times more heat than a pound of mercury in being heated the same number of degrees and consequently the specific heat of water is thirty times greater than that of mercury It is usual to express the specific heats of different substances in terms of that of water assumed equal to 1·00, the specific heat of mercury thus becomes ·33

SPEISS An impure arseniuret of nickel, obtained from the ores of cobalt and nickel in smalt-works

SPIDDINGS A Scotch term for dried and salted whitings

SPERMATOA (Gr *σπερμα seed, ωον, egg*) The cells which stand in the relation of nuclei to the sperm cells and of developmental cells to the spermatozoa Sometimes the sperm-cell contains a single spermatoon, sometimes several spermatoa, in which case the resulting spermatozoa often unite together and form a fasciculus, as, e g in the sparrow

SPERMATOPHORA (Gr *σπερμα* and *φερω, I carry*) In Anatomy, cases of albuminous matter in which the bundles of *spermatozoa* are packed they are largest and most complex in the Cephalopods

SPERMATOZOA (Gr *σπερμα* and *ζωον animal*) The filamentary bodies developed in the semen, and consisting of an enlarged extremity called 'body,' and a vibratile filamentary appendage called 'tail' Spermatozoa consist of an amber-coloured highly refracting, homogeneous substance, like the hyaline nucleus of cells, and are formal modifications of the nucleus of the spermatoon They are essential to impregnation

SPERM-CELL In Anatomy, the cells contained in the liquor seminis in which are formed the spermatoa, or cells of development of the spermatozoa

SPHAEROSIDERITE (Gr *σφαῖρα, a globe*, and *σίδηρος, iron*) A name given by Hausmann to a granular variety of spathose carbonate of iron

SPIKENARD The spikenard of the ancients appears to have been the *Nardostachys satamansi*, the root of which is highly esteemed at the present day throughout the East as a perfume, and as a stimulant medicine The plant is a native of the mountainous parts of the north of India

SPINAL CHORD or CORD *See* MYELON

SPINAL MARROW The division of the neural axis lodged in the vertebral column of the trunk *See* MYELON

SPIRÆ'A ULMARIA (Lat) Meadow Sweet The essential oil of this plant has been produced artificially by the oxidizement of salicine, and has been termed *spiroylous acid* Its chemical formula is $C_{14} H_5 O_3 + HO$

SPUNK A species of Agaric or fungus, the *Polyporus*, or *Boletus igniarius*, called also Touchwood Cut into thin slices and beaten till soft, it has been used as a styptic to check hæmorrhage, it is also used when soaked in a solution of nitre, for kindling matches and tobacco, under the name of *amadou*, or *German tinder*

SPURGE, or SPURGE OLIVE The *Daphne Mezereon* All parts of this plant, but especially the fruit and the bark are very acrid and poisonous, it is used as a sudorific and alterative in medicine, and is sometimes applied externally as an irritant

SQUA'LUS (Lat) In Ichthyology, the Linnæan generic designation of the shark tribe

SQUIRTING CUCUMBER The *Momordica elaterium* When the fruit or *pepo* is ripe it separates from the stalk and expels its seeds and a thin mucous juice with considerable violence through the remaining aperture The acrid purgative known in pharmacy under the name of *elaterium*, is deposited by this juice

STANDARD MEASURES OF LENGTH A standard-bar measurer of very refined construction was produced by Messrs Whitworth and Co at the Great Exhibition of 1851 The machine consists of a metal frame, at each end of which is placed a micrometer These micrometers by means of a combination of screws and wheels will measure small differences of length corresponding respectively to the one-millionth and the one five-thousandth part of an inch The bar to be measured is carried in a steel groove on the upper part of the frame a parallel-sided piece of metal at the right-hand end forming a perfectly flat contact for measurement and the other end abutting against the left-hand micrometer

The determination of the exact contact for the measure of length can be made either by a *gravitation test* or a *galvanic test* In the former the experimenter moves the end of the screw of the right hand micrometer through one division of the head corresponding to one-millionth of an inch and carefully raising the contact-piece, lets it fall by its own gravity, and he repeats this operation till the approach of the screw prevents the contact piece from descending In the galvanic test, a small battery composed of a piece of copper and zinc soldered together and immersed in rain water, is connected with the micrometer, and also with a delicate galvanometer by means of covered wires, the bar to be measured being insulated from the machine The contact is in this case indicated on completing the circuit by the deflexion of the needle of the galvanometer

STAR The recent researches of Sir J Herschel Argelander Struve Peters, and others have led to some very remarkable views relative to the distances magnitudes and number of the stars and their distribution in space

Distance —Although it is a very improbable supposition that all the stars are of the same size it is equally improbable that their real magnitudes are in any way dependent on their distance from the sun but unless this latter supposition be made we must conclude that *on the average* (putting individual cases out of view), the most distant will be those which have the smallest apparent magnitude

Argelander, of Bonn, has given a catalogue of the stars visible to the naked eye in which they are divided into six orders of magnitude, the faintest stars or those just perceptible by the naked eye being considered as the smallest of the sixth [illegible] If we suppose six concentric spheres to be [illegible] the sun, with radii such that the first contains all the stars of the first magnitude, the second all those of the first and second magnitude, the third all those of the three first magnitudes, and so on, and if we also suppose the *mean* distance of the stars of the first magnitude to be unity, then, according to the computation of Struve (founded necessarily on certain hypothetical assumptions respecting the distribution of the stars in space), the mean distance of the stars of the different orders of magnitude, and the radii of the spheres circumscribing them, [illegible] as follows —

Magnitudes	Mean Distance	Radius of Sphere
1	1 0000	1 2638
2	1 8031	2 1108
3	2 7639	3 1961
4	3 9057	4 4374
5	5 4545	6 2093
6	7 7258	8 8726

For stars of the three next magnitudes, the data for computing the relative distances have been furnished by Bessel's zone observations Struve finds the radii of the circumscribing spheres to be as follows For those of the seventh magnitude 14 4365 units, for those of the eighth 24 8445, of the ninth 37 7364, and he hence concludes that the smallest stars observed by Sir W Herschel with his twenty-foot reflector [illegible] distance of 227 8 units, or 25 67 times the radius of the smallest stars visible to the naked eye. (*Etudes d'Astronomie Stellaire*, p 81)

It is usual to express these almost inconceivable distances in terms of the time which light—propagated at the rate of 192 000 miles in a second—takes to traverse them The average parallax of stars of the first magnitude has been computed by Peters to be 0″ 209 (*See* PARALLAX IN STELLAR) Now if a star has a parallax of 1″, its distance is 206 265 times the distance of the sun from the earth (for radius sin 1″=206265 · 1), and the time which light takes to traverse this distance is about 3 years and 83 days, or 3¼ years, therefore the time which light takes to come from a star whose parallax is 0″ 209 —that is, to traverse a distance equal to the average mean distance of a star of the first magnitude, which has been assumed as the unit of the above scale,—is 15 4 years to come from the remotest star of the [illegible] the remotest of the [illegible] remotest star [illegible] years (*Etudes* p 106)

Number of visible Stars —As no limit can be set to the distance to which the stars may extend in space the number of visible stars is limited only by the powers of the telescope But the direct enumeration is beyond human power, and in order to obtain an approximation, it is necessary to have recourse to hypothetical considerations By a very ingenious investigation, founded on the numbers ascertained by Sir W Herschel to exist within certain limited spaces Struve has attempted to compute the whole number in the heavens within the range of the twenty foot reflector, which, as stated above, is 227 8 times that of the distance of stars of the first magnitude He first establishes a law of diminution depending on the angular distance from the plane of the galactic circle (see GALAXY) and having ascertained the mean number visible in a field of the telescope in that plane he finds, by a process of integration the whole number in the celestial vault to be 20 371 034, or upwards of twenty millions Whether this number be near or far from the truth, it must be taken as the most probable estimate yet made (*Etudes* p 72)

If we confine our attention to stars visible to the naked eye, the number may be estimated with greater precision The number of stars of the several magnitudes, in the northern hemisphere, contained in Argelander's catalogue, is as under —

Magnitudes	1	2	3	4	5	6
Stars in each	9	34	96	214	550	1439
Sums	9	43	139	353	903	2342

Assuming the *density* to be the same in the southern hemisphere as in the northern, the catalogue should contain 4684 stars It is estimated by Struve that the number entered in the catalogue is to the whole number existing (and visible to the naked eye) within a given space in the ratio of 5136 to 10,000 Hence the whole number of stars which can be seen with the naked eye is 5757 or less than 6000 Sir J Herschel remarks that the whole number of stars already registered, down to the *seventh* magnitude inclusive, amounts to from 12,000 to 15 000

Apparent Magnitudes —The method of estimating the apparent magnitudes usually adopted is by a scale of brightnesses decreasing in geometrical progression each term being half of the preceding, or at least having a fixed ratio to it Sir J Herschel proposes and recommends the adoption of a scale decreasing as the squares of the terms of an harmonic progression, namely, the series 1, $\frac{1}{4}$, $\frac{1}{9}$, $\frac{1}{16}$, $\frac{1}{25}$, &c This scale is not a purely photometric one like the former, but involves the physical idea of supposing the scale of magnitudes to correspond to the [illegible] removed successively [illegible] its original or standard distance, so that upon [illegible] equality among the real lights of [illegible] magnitude would be a sort of index to the presumable distance

Real Magnitudes —The only means we have of obtaining any indication respecting the real magnitudes of the

[illegible] quantity of light received from the [illegible] compared the light of *α Centauri* directly with the moon, and from several experiments, made with attention to all the circumstances required to be taken account of, found that the mean quantity of light sent to the earth by a full moon exceeds that sent by *α Centauri* in the proportion of 27,408 to 1 Dr Wollaston (*Phil Trans* 1829) found the proportion of the sun's light to that of the full moon to be that of 801,072 to 1 Combining these results, it appears that the light sent to us by the sun is to that sent by *α Centauri* as 21,955,000,000, or about twenty-two thousand millions to one Hence, and from the parallax assigned to that star (0″ 913), it is easy to conclude that its intrinsic splendour, as compared with that of the sun is in the proportion of 2 3247 to 1 The light of Sirius is four times that of *α Centauri* and its parallax is only 0″ 230, it so much, its intrinsic splendour, therefore, according to these determinations, must be above sixty-three times (63 02) that of our sun (Herschel, *Outlines of Astronomy*, p 553)

STAR ANISE The fruit of *Illicium anisatum*, an evergreen growing in Japan and Cochin China the seeds have the odour of common anise, and yield, when distilled with water an oil sometimes called *Oleum badiani* which is used by liqueur makers

STAVESACRE The *Delphinium staphysagria* The seeds of this plant are emetic and purgative in consequence of the presence of *Delphinia* a very acrid bitter principle, which, in the dose of a few grains, excites a sense of heat and tingling in various parts of the body The disease in which it has been chiefly successful is neuralgia in which it has been applied externally in the form of ointment

STEAM HAMMER, for pile-driving An ingenious machine invented by Mr Nasmyth now in general use in [illegible] large works "It consists of a [illegible] at the bottom but with openings in the top to allow the passage of air a piston works in it, having its rod passing through a steam tight aperture in the bottom To the piston the monkey or driver, which weighs 2½ tons, is attached and is thus suspended The machine is worked by [illegible] steam which being admitted at the bottom [illegible] by the induction pipe, raises the piston, and with it, the monkey attached to it The instant it arrives at the height required, it closes the induction-pipe and, opening the eduction-pipe (also at the bottom of the cylinder), the steam escapes, and the piston, with the monkey attached to its rod falls freely on the head of the pile A large heavy cap of iron, with a hole to allow the head of the pile to pass through slides between the upright standards and guides the direction of the pile The monkey and cylinder also follow the course of the pile, guided by the same uprights, between which they slide"

The saving of labour effected by this contrivance is very great A stage, which carries the machine, boiler, workmen, and every thing necessary, moves along a railway Having driven one pile, the machine moves onward the regulated distance, it then picks the next pile out of the water, hoists it high in the air drops it into its exact place then covers it with the great cap, the monkey immediately acts giving at the rate of seventy-five blows in a minute The whole operation of raising a pile from the raft, putting it in its place and driving it to the required depth, occupies generally from two to four minutes By the old method of pile driving, a comparatively light weight (about 12 cwt) is made to fall from a great height, and the blows succeed at intervals of about five minutes By the new machine a very heavy weight (about 50 cwt) falls through a height of only three feet, and the blows are repeated seventy five times in a minute

The principle of this invention may be said to consist in the employment of a heavy weight moved with a small velocity instead of a light weight moved with a great velocity In a paper communicated to the British Association for 1841, Dr Greene gave the following instance of the state of the heads of two piles, as driven by the two methods —

"One was 56 feet long driven by a monkey of 12 cwt falling from a great height, and making only one blow in five minutes, and requiring twenty hours to drive it, this though protected by a hoop of iron, was so split and shattered on the head, that it would require to be re-headed, to drive it any further The other, though 60 feet long, was not even supported by an iron hoop, and the head is as smooth as if it were dressed off with a new plane It was driven with a hammer of 50 cwt, and only three feet fall, making seventy-five blows in a minute, and was put into its place and finished in four and a half minutes"

STEPHANITE A mineralogical synonym of one of the [illegible]

STEREOELECTRIC CURRENT (Gr *στερεος, solid*) A term applied to the *thermo-electric* current which ensues when certain metals are brought into contact at different temperatures, it implies the production of a current of electricity in *solid bodies*, as opposed to the voltaic or *hydro electric* current, in which fluids are essential

STEREOSCOPE (Gr *στερεος, solid, σκοπεω, I view*) The name given by Professor Wheatstone to an instrument or apparatus proposed by him, and described in a paper on the Physiology of Vision published in the *Philosophical Transactions* for 1838, for the purpose of exhibiting the effect of simultaneously presenting to each eye the projection of a solid body on a plane surface as it appears to that eye To render this clear, it may be necessary to observe, that when a body of three dimensions is placed so near the eyes that, on looking at it the optic axes must converge, a different perspective representation of it is seen by each eye, the body being, in fact, thus seen from two points of sight, at a distance from each other equal to the distance between the centres of the pupils, and the pictures of it projected on the two retinæ being consequently dissimilar Supposing then, two perspective drawings, on a plane surface, to have been made of an object as it is seen by each eye respectively, in order to try the experiment, it is necessary that the pictures be placed so that each can be seen by one eye only, and that the rays of light from the corresponding points of the two pictures fall on similar points of both retinæ or enter the eyes in the same directions as the [illegible] points of the original object But [illegible] distance between the two eyes, this, manifestly cannot be done without altering the direction of the rays For this purpose Professor Wheatstone employed two small plane mirrors, about four inches square, adjusted at right angles to each other, so as to form two adjacent sides of a cube the faces being outwards The edge where the two planes meet being brought close to the face of the observer, and the mirrors being placed symmetrically with respect to the direction of the visual rays it is evident that if the two pictures be respectively placed before the mirrors symmetrically, and at equal distances, rays of light proceeding from them in opposite directions, and falling on the mirrors will be reflected at right angles to their former directions and become parallel The right eye will see only the reflexion of the picture on the right hand side, and the left eye that on the left hand side, but on regarding both simultaneously, the mind readily unites the two images, and instead of the two plane pictures, an object of three dimensions makes its appearance, the exact counterpart of that from which the pictures were drawn, standing out, as it were, in relief between the planes of the two mirrors

In the Report of the British Association for the Advancement of Science for 1849 Sir David Brewster states, that having had occasion to make numerous experiments on this subject, he was led to construct the stereoscope in several new forms Of these forms, the most generally useful is the *Lenticular Stereoscope* This instrument consists of two semilenses placed at such a distance that each eye sees the picture of a drawing opposite to it, through the margin of the semilens, or through points of it equidistant from the margin The distance of the two portions of the lens through which we look must be equal to the distance of the centres of the pupils, which at an average, is two and a half inches By this method the images are not only united but magnified at the same time, which is in many cases advantageous

STERNBERGITE The flexible sulphuret of silver and iron, named by Haidinger in honour of Count Sternberg It occurs in Bohemia and Hungary

STILBENE (*στιλβω I shine*) A peculiar hydrocarbon which crystallises in scales of a pearly lustre

STILBITE A pearly variety of zeolite

STILPNOSIDERITE (*στιλπνος, lucens, σιδηρος, iron*) A native oxide of iron

STIMMI An ancient name of the sulphuret of antimony

STIR-ABOUT A moderately consistent mixture of oatmeal and water boiled, and generally eaten with cold milk, called Porridge in Scotland When mixed with the thin liquor of boiled meat, or the water in which cabbage or kale has been boiled, it is called *beef brose*, or *kale brose* (Pereira *on Diet*)

STONE BLUE A compound the basis of which is usually an impure starch or mixture of starch and gluten, being the starchmakers' refuse, coloured either by indigo [illegible] It is used in the laundry to cover [illegible] linen

STRAWBERRY [illegible] The fruit of *Fragaria vesca* Strawberries contain a very small quantity of nutritive matter The grains or seed like pericarps are not digestible, and sometimes excite intestinal irritation, so

that some physicians have directed their patients to suck str[illegible]

STRETCHING MACHINE Calicoes, and other [illegible] fabrics, are prepared for the market by being stretched in a proper machine, which lays all their warp and woof yarns in parallel positions, and extends their width after the shrinkage occasioned by bleaching, dyeing &c

STROGANOWITE (Named after Count Stroganoff) A mineral found in loose blocks in the Sludanka, a river of Dauria, of a greyish white colour, and slightly effervescent with acids, it is a silicate of alumina, soda, and lime, combined apparently with carbonic [illegible]

STROMEYERITE A mineral so named by Haidinger, after the Hanoverian chemist Stromeyer, who [illegible] double sulphuret of silver and copper

STROMNITE A sulphate of baryta and carbonate of strontia probably a mixture merely of the sulphate and carbonate, found at Stromness in Orkney It occurs in yellowish-white translucent masses, with a slight [illegible] crystalline cleavage

STRUTHINE (Gr στρουθος, *a kind of herb*) A bitter acrid principle obtained from the root of *Gypsophila struthium* It appears to be identical with *saponine*, obtained from the *Saponaria officinalis*, or soapwort

STRUVITE A name (in honour of Struve) given [illegible] phosphate, found [illegible] ion of a church at Hanover

STYPHNIC ACID (Gr στυφνος, *astringent*) An astringent acid compound obtained by the action of nitric acid upon certain gum resins It is also called *Nitrostyphnic acid*

STYROLE (Gr στυραξ) An oily hydrocarbon obtained by distilling liquid storax It is perfectly liquid but has the curious property of becoming a soft viscid transparent solid when heated In this state it has been called *metastyrole* The formula of styrole is $C_{16} H_8$

SUBSTITUTION In Chemistry this term is applied to such results of affinity as are dependent upon the substitution of one or more atoms or equivalents of a simple or compound body for the same number of atoms of another body Thus, in the decomposition of water, which ensues when zinc is made to act upon dilute sulphuric acid, an atom of zinc is *substituted for* (or replaces) an atom of hydrogen, the latter being expelled [illegible] clearly shown by the aid of formulæ [illegible] case,

$$H + SO_4 \text{ becomes } Zn + SO_4$$

Another illustrative case of substitution occurs in the conversion of acetic into chloracetic acid in which the 3 atoms of hydrogen belonging to the acetic acid are substituted by 3 atoms of chlorine

$\underbrace{C_4\ H_3\ O_3}$ becoming $\underbrace{C_4\ \ Cl_3\ \ O_3}$

Acetic acid Chloracetic acid

In the same way in the formation of nitric ether, an atom of nitric acid is substituted for an atom of water

$\underbrace{C_4\ H_5\ O + HO}$ becoming $\underbrace{C_4\ H\ \ O + NO_4}$

Alcohol Nitric ether

SUCCORY Called also *Chicory* The *Cichorium intibus* (*wild endive*) The root of this plant which resembles a carrot, when cut into slices dried, roasted and ground into powder, is used for the adulteration of ground coffee It has a somewhat burned flavour a very little resembling that of coffee but it yields a large quantity of a rich brown infusion or decoction, with water To detect the adulteration, sprinkle the suspected article upon the surface of some water in a jar or tumbler If genuine coffee, it remains for a long time floating scarcely tinging the water, and appearing greasy, or not easily wetted, whereas, if succory powder be present it communicates a deep reddish-brown tint to the water and portions of it soon sink to the bottom

SUDORIPAROUS GLANDS (Lat sudor *sweat*, pario, *I produce*) In Anatomy the secreting organs of the sweat, which consist of a slender elongated blind glandular tube, coiled into a lobular form and imbedded in the subcutaneous fat, and continued thence in a spiral course to the cuticle, where it opens by an oblique pore

SULFAMIDE A crystallised compound obtained by the action of anhydrous sulphuric acid on ammonia The compound resulting from the analogous combination of dry sulphurous acid on ammonia has been termed *Sulfamide*

SULPHURATION The process by which certain silk, cotton, and woollen goods are subjected to the fumes of burning sulphur, or sulphurous acid for the purpose of decolouring or bleaching The rooms or chambers in which the operation is conducted are often of considerable dimensions, and fitted with poles and frames, on which the blankets, shawls, and similar articles may be suspended The straw used in the manufacture of hats is similarly bleached or sulphured

SUNSTONE A resplendent variety of felspar, found in Norway and elsewhere The play of colour which it exhibits arises from minute lamellar crystals of iron [illegible] which are embedded in it

SUPRARENAL BODIES (Lat supra, and ren, *a kidney*) In Anatomy, the flattened bodies situated on the upper part of the kidneys in man, and at the forepart in brutes they are well supplied with blood-vessels and nerves, and are composed principally of simple or closed vesicles, resembling the secreting glands, except that they have no ducts They are of disproportionately large size and the fœtal state in man and quadrumana

SURINAMINE A crystallisable principle obtained from the bark of the *Geoffroya Surinamensis*, or *Surinam bark*

SWEETBREAD The thymus gland of the calf is employed as food, under this name it contains about 70 parts of water and 30 of nutritious matter, chiefly of an albuminous character "A fresh sweetbread when plainly cooked (by boiling) and moderately seasoned, forms a very agreeable and suitable dish for the convalescent, but, when highly dressed, is improper both for dyspeptics and invalids" (PEREIRA *on Diet*)

SYEPOORITE A sulphuret of cobalt, found in primary rocks at Syepoor, near Rupoolanah, in North-west India It is said that the Indian jewellers use it to give a rose colour to gold

SYMBOLS, CHEMICAL A chemical symbol is the representation of one atom or equivalent of each elementary substance by the capital initial letter or letters of its Latin name it being necessary where the names of two or more elements begin with the same letter to add a second in a smaller character for the purpose of distinguishing between them Thus, C Cl Ca Cd, Co Cu, Ce Cr are the symbols of Carbon Chlorine, Calcium, Cadmium, Cobalt Copper (Cuprum) Cerium and Chromium, H and Hg are the symbols of Hydrogen and of Mercury (Hydrargyrum), O and Os of Oxygen and of Osmium, and so on The following table enumerates in alphabetical order the simple or elementary substances, with their annexed symbols, and equivalents or atomic weights, that is, the respective *weights* of each of the elementary bodies which each symbol is assumed to represent upon the *hydrogen* scale, or in reference to hydrogen as unity

	Atomic Weight	Symbol
Aluminum	14	Al
Antimony (Stibium)	129	Sb
Arsenic	75	As
Barium	69	Ba.
Bismuth	106	Bi
Boron	11	B
Bromine	78	Br
Cadmium	56	Cd
Calcium	20	Ca
Carbon	6	C
Cerium	46	Ce
Chlorine	36	Cl
Chromium	28	Cr
Cobalt	30	Co
Copper (Cuprum)	32	Cu
Didymium		Di
Fluorine	19	F
Glucinum	17	G
Gold	200	Au
Hydrogen	1	H
Iodine	126	I
Iridium	99	Ir
Iron (Ferrum)	28	Fe
Lanthanum	36	La
Lead (Plumbum)	104	Pb
Lithium	7	Li
Magnesium	12	Mg
Manganese	28	Mn
Mercury (Hydrargyrum)	100	Hg
Molybdenum	48	Mo
Nickel	29	Ni
Niobium		Nb.
Nitrogen	14	N
Osmium	100	Os
Oxygen	8	O
Palladium	54	Pd
Pelopium		Pe
Phosphorus	32	P
Platinum	99	Pt
Potassium (Kalium)	40	K
Rhodium	52	R
Ruthenium	52	Ru.
Selenium	40	Se
Silicium	15	Si
Silver (Argentum)	108	Ag.
Sodium (Natrium)	24	Na
Strontium	44	Sr.

	Atomic Weight.	Symbol.
Sulphur - - -	16	S
Tantalum (or Columbium) -	185	Ta
Tellurium - - -	64	Te
Thorium - - -	60	Th
Tin (Stannum) - -	59	Sn
Titanium - - -	24	Ti
Uranium - - -	60	U
Vanadium - - -	68	V
Wolframium (or Tungston) -	95	W
Yttrium - - -	32	Y
Zinc - - - -	32	Zn
Zirconium - - -	23	Zr

It will be understood that the above symbols represent a single atom or equivalent of each of the simple bodies, in reference to Hydrogen as *unity* Thus, H represents 1 part by weight of Hydrogen, O, 8 parts by weight of Oxygen, S 16 of Sulphur, Hg, 100 of Mercury, and so on It is evident however, that as far as the equivalents are concerned other numbers or weights bearing the same relations to each other, might be adopted thus upon the *oxygen* scale oxygen is represented as = 100, in which case hydrogen is 12 50, sulphur 200, mercury 1250, and so on But we shall confine ourselves exclusively to the hydrogen scale which is now in most general use, and in all respects preferable to the more complicated numbers which the oxygen scale necessarily involves

When two or more equivalents of one elementary substance are to be indicated, figures are placed either before or after the symbol Thus, 2 equivalents (or *atoms*, for we use the terms s[illegible] of iron may be represented by 2 Fe, or by Fe[illegible] the former case a large, in the latter a small numeral being generally adopted It is often customary to place this small numeral somewhat above or below the symbol, as Fe or Fe_2, but there are inconveniences and no advantages attending this arrangement, and they give to these [illegible] symbols which [illegible] writers have expressed two atoms of an element by drawing a line through its symbol, thus, 2 atoms of hydrogen are represented by H, 2 of sulphur, by S &c, but such abbreviations are inconvenient

By a proper collocation of symbols the *formulæ of compounds* are easily represented, thus Cu O represents an atom of copper and an atom of oxygen in combination, that is *protoxide of copper*, Fe O protoxide of iron, &c Sulphuric acid which is a compound of 1 atom of sulphur with 3 atoms of oxygen, is represented by $S O_3$, and sulphate of protoxide of iron by $Fe O + S O_3$, or, more commonly, the symbol + is omitted in such cases and a comma substituted as Fe O, $S O_3$ It will be observed that this formula has reference to the assumed *proximate* constituents of the salt in question and that if its ultimate elements only were intended to be indicated, the formula would stand thus, Fe $S O_4$ In many instances the plus sign and the comma are conveniently available in the same formula, thus the double sulphate of potassa and oxide of iron may be written as follows K O, $S O_3$ + Fe O, $S O_3$ Here the comma may be assumed as indicating a more intimate or higher order of combination than the plus sign, namely, that of the oxide and acid in each salt while the union of the salts with each other is represented by the sign +

In the preceding formulæ the figures only affect the symbol to which they are immediately appended When they are intended to apply to the *entire compound*, they precede the symbol of the compound and it is in such cases clearer to use large figures thus, 3 $S O_3$ represents three atoms or equivalents of sulphuric acid and 2 Cu O two atoms of protoxide of copper A salt containing *two* atoms of oxide of copper and *one* of sulphuric acid would be written as follows 2 Cu O $S O_3$, or 2 Cu O, + $S O_3$ in these cases the intervening comma or *plus* sign prevents the extension of the influence of the figure 2 beyond the oxide of copper and if our object were to imply *two atoms of sulphate of copper*, we should inclose all that is to be affected by the figure 2 within brackets, and write it thus 2 [Cu O, $S O_3$] To give one other instance Pb O $Cr O_3$ is the neutral chromate of lead and 3 [Pb O $Cr O_3$] is *three* atoms of the same neutral chromate, but 2 Pb O $Cr O_3$ is the *dichromate* or subchromate of lead, and 3 [2 Pb O, $Cr O_3$] is three atoms of the same dichromate K O, 2 $Cr O_3$ is the *bichromate* of potassa, and 4 [K O, 2 $Cr O_3$] four atoms of the same, &c

The following are more complicated illustrations of the application of these symbolic notations K O $S O_3$ + $Al_2 O_3$, 3 $S O_3$ + 24 H O represents the constitution of crystals of common alum, they include an atom of sulphate of potassa, an atom of sulphate of alumina and 24 atoms of water of crystallisation an atom of alumina includes 2 atoms of *aluminum* and 3 of oxygen, and its *sulphate*, as it exists in alum, is constituted of 1 atom of alumina and 3 of sulphuric acid In *iron alum* the alumina is r[illegible] peroxide of iron, [illegible]

K O, $S O_3$ + $Fe_2 O_3$, 3 $S O_3$ + 24 H O.

It is obvious that the atomic or equivalent weights of compounds are in all cases to be deduced from their symbols Thus, the symbol of potassa K O indicates its equivalent to be 48, for the equivalent of K is 40, and that of oxygen 8 And again, $S O_3$, the symbol of sulphuric acid is equal to 40 of that acid, for S is = 16 sulphur and O_3 8 × 3 = 24 of oxygen, and 16 + 24 = 40 Hence also, K O, $S O_3$ is one atom, or equivalent of sulphate of potassa, or 88 parts by weight

In the construction of chemical formulæ the arrangement of the symbols should not be arbitrary, but such that the *basic* or electro positive elements should precede the *acid* or the [illegible] elements hence sulphate of potassa is [illegible] K O $S O_3$, and not $S O_3$, K O, and chloride of sodium is represented by Na Cl, and not Cl Na In this way, also, much useful information respecting the real or theoretical constitution of compounds may be expressed in the due arrangement of their formulæ thus, H O $S O_3$ represents hydrated sulphuric acid of the specific gravity of 1 84, or common oil of vitriol, which may be called a *sulphate of water* the acid of the specific gravity of 1 78 contains 2 atoms of water to 1 of anhydrous sulphuric acid, and might therefore be represented as 2 H O, $S O_3$, but if we give to it the formula H O, $S O_3$ + H O we indicate that 1 atom of water only is combined as a *base*, with the anhydrous acid and that the second atom of water is in combination with the sulphate of water, constituting, as it were, water of crystallisation

In cases where complicated formulæ are to be expressed, and more especially in the combinations with which the mineralogist has to deal, the above symbolic notation may become inconveniently long, and, accordingly various abbreviations have been suggested, but the evil of them is their frequent indistinctness, and the confusion which results from slight and almost unavoidable typographical errors The equivalent of oxygen in oxides and acids is thus frequently represented by a point placed over the symbol of the element with which the oxygen is combined The following for instance are the several combinations of nitrogen with oxygen represented in ordinary and in abbreviated notation —

Nitrous oxide -	N O	$\dot{N}$
Nitric acid - - -	$N O_2$	$\dot{N}$
Hyponitrous acid - -	$N O_3$	$\dot{N}$
Nitrous acid -	$N O_4$	$\dot{N}$
Nitric acid - - -	$N O_5$	$\dot{N}$

Mineralogists also sometimes represent the atom of sulphur by substituting a dash over the symbol of the element with which it is combined in place of using the letter S in the usual way, thus they indicate the three sulphurets of arsenic —

As S_2 by $\overline{As}$

As S_3 „ $\overline{\overline{As}}$

As S_5 „ $\overline{\overline{\overline{As}}}$

Certain compound bodies, more especially where they perform the part of elementary substances are sometimes conveniently represented by their initial letter or letters, as if they were simple bodies For instance, Cyanogen which is a compound of 2 atoms of carbon with 1 of nitrogen, is indicated by Cy, instead of $C_2 N$, and Ethyle, which is a compound of 4 atoms of carbon and 5 of hydrogen, by E instead of $C_4 H_5$ And lastly, certain organic bases and organic acids are similarly expressed by one or more initial letters, with the plus or minus sign attached, thus, instead of giving the composition of Morphia, Cinchonia, &c at length, they are represented by $\overset{+}{Mor}$ $\overset{+}{Cin}$, &c and Acetic, Tartaric, and other acids, by A, Tar &c But these and similar abbreviations are only admissible where a frequent repetition of the extended symbol is required, and where the indication of the elementary components is immaterial

SYNAPTA'SE (Gr συναπτω, *to be present*) A term applied by Robiquet to the *emulsine* or *vegetable caseine* of the almond, in consequence of its necessary *presence* in the conversion of *amygdaline* into hydrocyanic acid and bitter almond oil

SYRINGI'NE A crystallisable bitter principle obtained from the leaves of the lilac tree (*Syringa vulgaris*). It has also been called *lilacine*

SYSTE'MIC In Physiology, is applied to designate the circulation of the general system, beginning at the left ventricle and aorta, and ending at the venæ cavæ and [illegible] the circulatio[illegible] pulmonic" They have also been termed the greater and lesser circulations The parts concerned in these circulations have also received the same names thus the left ventricle is called the "systemic" one.

T

TABOO A word used by the South Sea islanders to denote something sacred, or set aside for particular

TACHYLITE (Gr *ταχυς, rapid*) A very fusible alumino silicate of protoxide of iron, occurring in certain basaltic rocks Its name has reference to its rapid fusibility

TAFFO A manure made in China, composed of night soil mixed up with clay and formed into cakes which are dried in the sun

TA'GILITE A native phosphate of copper from Nischne-Tagilsk, in Siberia

TA'LBOT A hunting dog, between the hound and beagle

TA'LBOTYPE A name given certain photographic pictures in honour of the inventor of the process, Mr W A Fox Talbot *See* PHOTOGRAPHY, in Dict

TANGHICI'NI A crystallisable neutral principle said to possess narcotic properties, extracted from the kernel or seed of the *Tanghinia venenifera* a native of Madagascar This seed which is said to be a deadly poison, was formerly used in Madagascar to ascertain the guilt of suspected persons, as a kind of ordeal, those who withstood it being deemed innocent The extract of the seed has been called T[illegible]

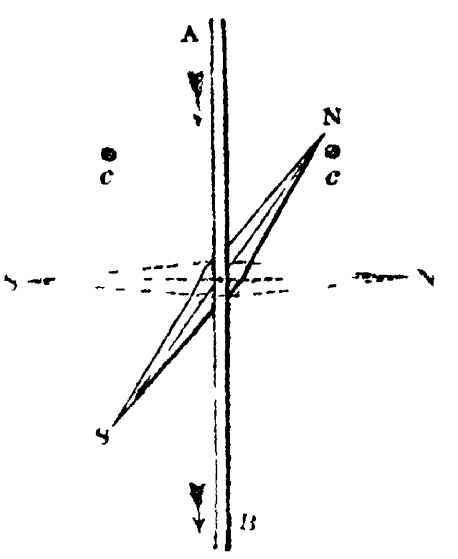
TANSY *Tanacetum* [illegible] The herb and flowers of this plant used sometimes as a kind of medicinal pot-herb, have a disagreeable though somewhat aromatic odour, and a strong nauseous bitter taste A small portion is sometimes added to omelets, and we have hear[illegible]

TARAXACI'NE A crystallisable bitter principle contained in the juice of the root of dandelion (*Leontodon taraxacum*)

TARNOWITZITE A carbonate of lime, or species of [illegible] containing a small proportion of carbonate of lead found at Tarnowitz in Upper Silesia

TAU'RINE A crystalline substance containing a large proportion of sulphur, and obtained from bile Its formula is $C_4 H_7 O_6 S_2 N$

TE'BETH The tenth month of the Jewish ecclesiastical year, and fourth of the civil year It corresponds to December



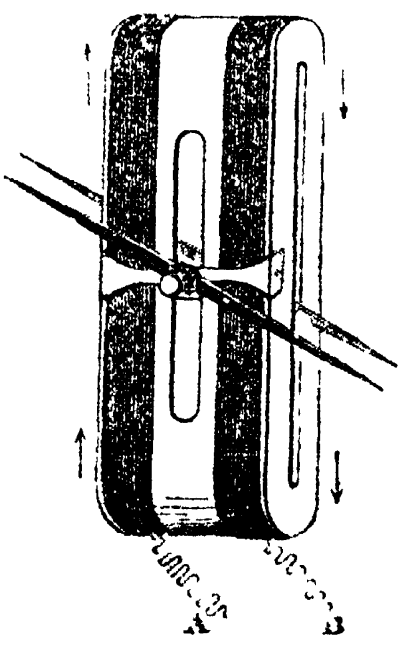
TE'RRE'NE A crystalline resinous product obtained from turf

TELEGRAPH The Electric or, as it ought more properly to be called, the ELECTROMAGNETIC TELEGRAPH has now superseded all other means of telegraphic communication We purpose therefore here briefly to describe the *principle* upon which these instruments are constructed, referring for minute details to the various works which have been published and to the specifications of the many patents which have been issued upon the subject The mutual relation of electric and magnetic currents will be evident from what has been stated elsewhere under the heads ELECTROMAGNETISM and GALVANOMETER, so that it will only be necessary to recapitulate such circumstances as have especial relation to telegraphic purposes

When a current of voltaic electricity is traversing a metallic wire, a magnetic current is at the same time established at right angles to and as it were revolving about the electric current, as its axis, and if the pole of a magnet be supposed capable of freely moving in any direction, the tendency of such pole would be to revolve about the wire in question, or rather about the electric current which that wire carries If a common magnetic needle turning horizontally upon a point or pivot, be brought near the voltaic current, or to the wire conveying that current, the magnet will accordingly be deflected from its meridian Supposing, for instance, the magnetic needle in its natural position, and pointing therefore north and south, to be approached by a wire transmitting the volta-electric current, held above and parallel to the needle, the deflection of the needle will take place either to the right or left, or to the north or south, the direction of the deflection depending upon that of the electric current, and accordingly the tendency of the magnetic needle will be to place itself at *right angles* to the wire conveying the electric current It thus, then, appears that the electric and magnetic forces may so far be said *to deflect each other* and upon this principle the various forms of the galvanometer are constructed Now, in reference to the application of

and deflecting current, instead of being placed horizontally, as in the galvanometer, is placed *vertically* or perpendicularly, as in the annexed cut in which A B represents a wire having a magnetised steel needle placed immediately behind it, and so adjusted as to hang vertically when at rest If an electric current be now made to descend from A to B through such wire, the needle will be deflected into the position N S, that is, its north

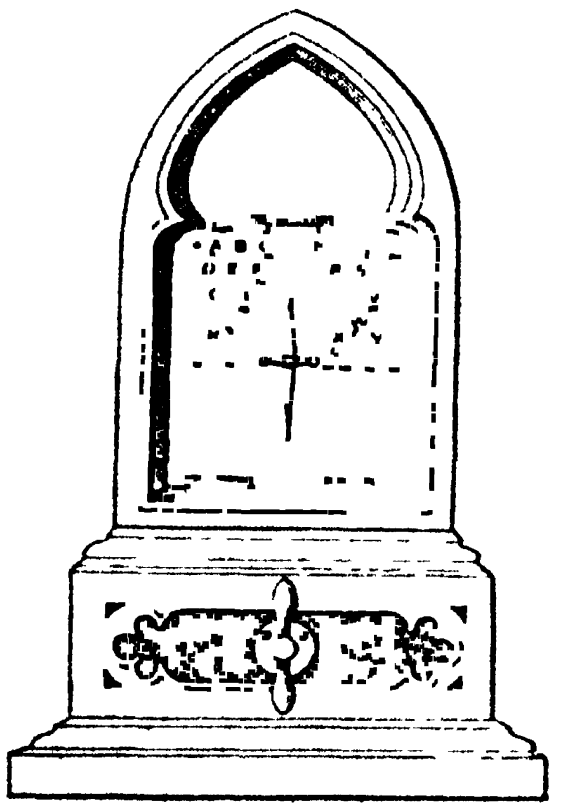
(1)



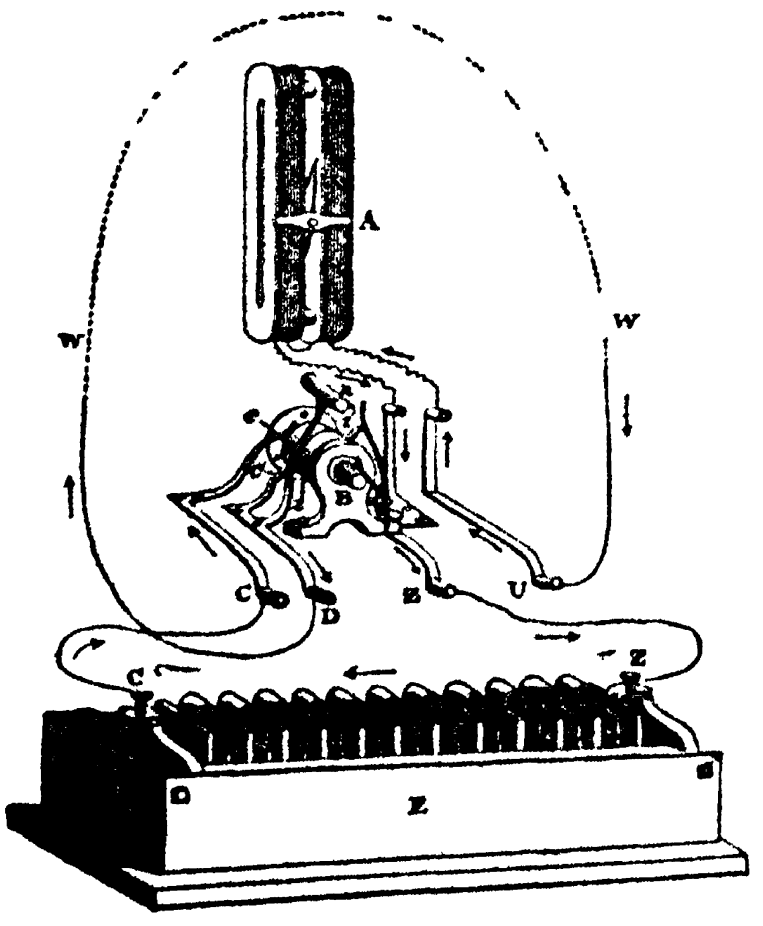
pole will turn to the right as you stand before it, and on increasing the force of the electric current, the deflection of the needle might be so far increased as to cause it to place itself at *right angles* to the electric current, as shown by the dotted figure, but this may be prevented by the small studs c c, by which such extreme deflection is limited If we now suppose the wire to be continued on and bent into the shape of the letter U, the current still passing onwards, that is, down the limb A B and up B C (as indicated by the darts), then the portion of the current B C would also act upon the needle, and proportionately increase the deflection If we now change the direction of the electric current, so as to send it down C and up A then also will the direction of the deviation of the magnetic needle be changed and its north pole, instead of pointing to the right, will point to the left And if by repeated convolutions of the wire, the electric current be made to pass many times around the magnetic needle, the deflection would be still further increased, so that, by the adoption of this latter expedient, or the use of a *coil* instead of a single wire the effect of the electric current may be so *multiplied* as to produce a considerable deflection by a comparatively feeble current This is, in fact the principle of the *galvanometric multiplier*, and is the form of apparatus used in the electric telegraph, as now most commonly constructed The construction of this *coil* is shown in the annexed wood-cut It consists of a polished wooden

(2)

(3)



or ivory frame round which are bound some hundred feet of fine copper wire, covered with silk, which, being [illegible] prevents the lateral passage or transfer of the current from wire to wire, so that the current, entering at A, passes through the whole length of the coil, and goes out at B Two magnetic needles are fixed



upon an axis which passes through the frame one within, and the other without the coil, and opposite which ends are in opposition to each other, by which they are rendered *astatic*, that is, they are not affected by the magnetism of the earth. This coil is so placed at the back of the dial plate of the telegraph, shown in the next diagrams, as to allow the outer needle to traverse right and left upon the dial plate.

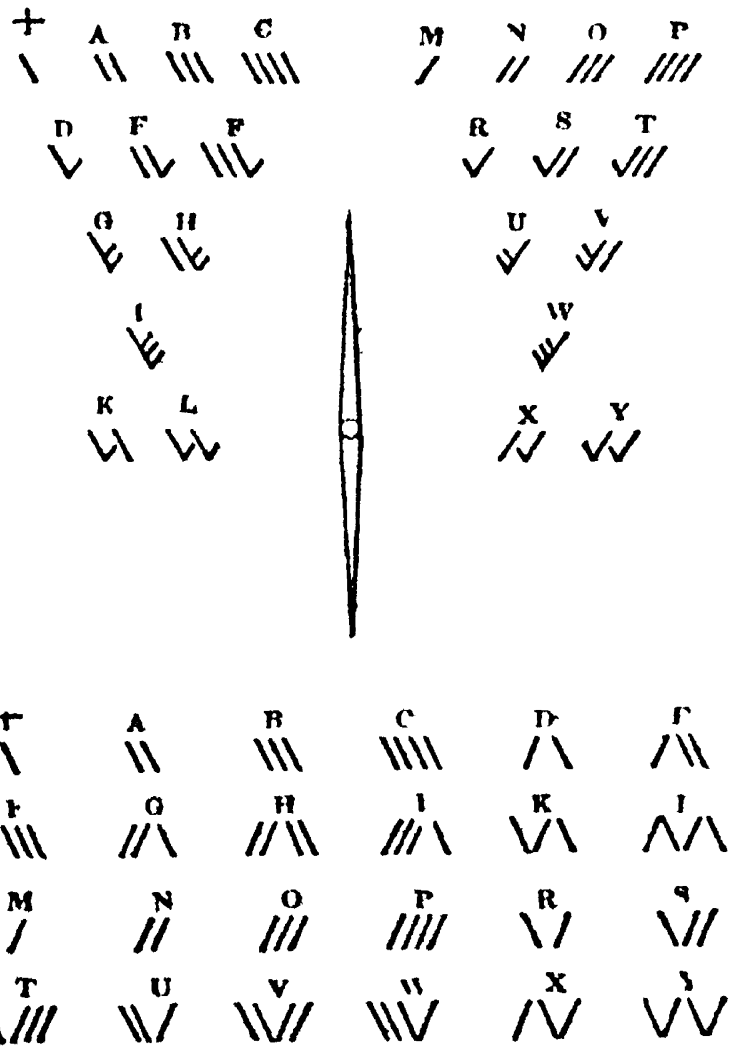
Having said thus much of the *principle* upon which the usual form of needle electro magnetic telegraph is constructed, we may now further explain the details of its simplest form, in which *one* indicating needle only is employed, and which therefore is usually called the *Single needle instrument*. A front and back view of this telegraph is given in the following cuts, the battery being represented annexed to the latter, and the circuit through

(4)

(5)

the galvanometric coil A being completed by the wire W W. The following description of the [illegible] instrument is abridged from Mr. C. V. Walker's "Electric Telegraph Manipulation," to which we may here refer the reader for a variety of details respecting its construction and uses, which would have been irrelevant in this article.

The instrument has a twofold character: it is either *passive*, or ready for *receiving* signals *from* another instrument, or it is *active*, or ready for *transmitting* signals *to* another instrument. By describing first how it is fitted for *receiving* signals and then how it is arranged for *transmitting* them, we shall be better able to analyse it, and comprehend its structure. The frame of the [illegible] A is screwed upon the face of the instrument, which face is a brass plate varnished on the inner side. Looking at the coil, a short wire from its *right-hand end* comes to a screw terminal, which by a slip of brass, is connected with another terminal U. The *left hand end* of the coil comes also to a terminal, from which a slip of brass descends to a brass plate, here partly hidden, but its form may be seen from a similar plate, visible on the left side. These twin plates are in metallic connection by means of the two upright *springs*, shown in the cut. The *springs* are of steel, and press strongly on two points in a short insulated brass rod *n*, which is screwed into the framework of the instrument. The left-hand plate is connected with the terminal D, also by a slip of brass. If, now, the two terminals U and D are connected by a wire W W, the circuit will be complete, as follows: from the terminal U into the coil at the right-hand side, out of the coil, at the left side, downwards to the right-hand plate, up the right-hand steel spring, across the brass rod *n*, to the left-hand steel spring [illegible] thence [illegible] by the wire W W [illegible]. If, now, the wire from U went up the line of railway, and the wire from D down the line, and the circuit were in some way kept complete on the large scale, as it has been here described on the small scale, any electric current passing along the wire from a distant station would traverse this coil in its course, and would *deflect the needle*, and so make a signal.



So far for receiving a signal, now for sending one. Were we to go out on the open railway, taking with us a battery, and to cut any one of the wires, and place its two ends, thus obtained, upon the two terminal ends of the battery, a current would pass along the line, and the needles of that line would be deflected, and if we changed hands, [illegible] connections, and [illegible] of the electric [illegible] of the needles would be reversed. The same would happen were we to cut a wire inside the office or inside the telegraph, and to treat it in a similar way. Now, in every apparatus contrived for transmitting signals, we have a *place corresponding to such a cut wire*, and, near this place [illegible] of the battery, mounted and moveable, so that they may be readily applied in the breach, one way or the other as required. The place here (*fig* 5) is the *top of the springs*. They are not *joined* to the brass rod *n*, but *press hard* upon it, and can readily be raised, and when either of them is raised the circuit is broken. Now near this place is a contrivance, by which the poles of the battery may make a breach in the circuit, and be applied in the breach in either direction. The drum B is of box wood, the ends *c* and *z* being capped with brass and insulated from each other by the wood left between them. The drum is moveable by a handle in front of the instrument, visible in *fig* 4. A stout steel wire, *c'* is screwed beneath into the *c* end of the drum, and a similar wire, *z'*, is screwed above into the *z* end. These two wires are the poles of the battery, *z'* being connected with the zinc end, and *c'* with the copper, thus — from the copper end of the battery a wire is led to the terminal C, thence a slip of brass leads to a curved brass spring which presses on the drum at *c*, from the zinc end of the battery a wire goes to the terminal *Z*, and thence a slip of brass leads to a similar curved spring, pressing on the continuation of the *z* end of the drum, as shown in the figure. Whenever therefore, the drum is moved, the steel wire *z'* will lift up one or other of the upright steel springs, it is now lifting up the right-hand [illegible], and so breaks the circuit, but, by a little further motion of the drum, the wire *c'* will press upon the boss below, as shown in the figure, and thus there will be a battery-pole on each side of the breach, and a signal will be made on this, and on all instruments connected with it. And, from the peculiar arrangement of the drum, the motion can be changed as rapidly as the hand can move. I have shown the battery connections exactly as they occur in practice, and the connections are such that if the right hand spring is moved off, the needle moves [illegible] if the left to the left. The needle on the face of the instrument always has its north end upward, and the needle within the coil its north end downward, so that, by the law elsewhere stated (*fig* 1), if we look at the face of an instrument, and see the top end [illegible] the right, we may be sure that in the half of the coil nearest to us the current is *ascending*.

Now, as regards the *front* of the instrument upon which the alphabet is engraved right and left of the needle, it will be obvious, from what has been said above that the manipulator has it in his power to cause the needle to vibrate or deflect to the right or left, as he directs the electric current one way or other through the coil, and this direction of the electric current is commanded in the way above described, by turning the handle at the lower part of the instrument to the right or left,

when this handle is *vertical*, the current is altogether cut off

The letters of the alphabet, [illegible] are indicated by the number of [illegible], some of these beats being to the left and some to the right, the general rule being, that in the letters placed to the *left* of the needle the *last* beat to make any given letter is a *left hand* beat, whatever other beats may enter into the production of the letter, thus, L requires four beats, and they are right, left, right, *left*, finishing with the *left*, so, again, the letters placed on the *right* of the needle finish with a *right-hand* beat, as, for instance, W, which is composed of four beats, three to the *left*, and the *fourth* to the *right* The system upon which this single instrument alphabet is formed is sufficiently simple The symbol of each letter is placed underneath it, and consists of one or more diagonal lines sloping either to the right or left, some of which are full length, and others half length, the direction of the diagonal is the direction of the deflection or beat, a deflection being made for each diagonal, the deflection corresponding to the *half length* being made *first* D, for instance, is thus represented \, and is made by a beat to the right, followed by a beat to the left, R is represented by /, and is made by a beat to the left, followed by a beat to the right, H is \\, two to the right and two to the left, W is \\\, three beats to the left and one to the right, and so on The scheme of the code is, one, two, three, and four left-hand beats for the first four signals, then one right-hand and one, two, and three left hand beats for the next in order, then two right-hand and one and two left for the next, then three right-hand and one left, then a left, a right, and a left, and lastly, right and left, right and left, \/\, which reaches L, and comprises the first half of the series The other half are the counterparts, with the beats reversed To render this description more intelligible, we annex a separate representation of the dial alphabet, and a separate alphabet, in which the direction and number of beats for each letter is shown separately

(6)

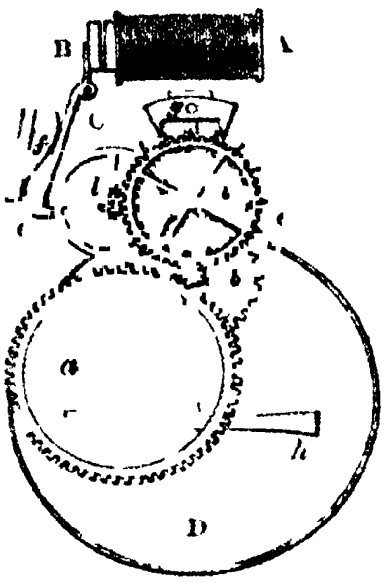
[illegible] Maltese cross, [illegible] which is termed *stop*, is used by the *sender* of a message *at the end of every word*, and by the *reader* or receiver of the message, when he does *not understand* the previous word On the other hand, a single beat to the *right* (indicating the letter M upon this form of the instrument) implies that he *does understand* When, in this or other form of the needle-telegraph, *numbers* are to be transmitted, which, however, is very rarely necessary in the form of *numerals*, conventional letters and signals are settled upon for the purpose

Our object here is, merely to render the principle of this form of the electric telegraph intelligible, and therefore we have selected the simplest instrument, but at all the principal stations a DOUBLE-NEEDLE INSTRUMENT is employed, and which may in fact be regarded as two single instruments capable of being worked separately or together With [illegible] the reading of the signals is much [illegible] has the inconvenience of requiring a separate line wire for each needle, the signals also are different from those of the single instrument, but the *principle* is in both the same

It is obvious, from the laws which govern the transmission of what we call the *electric current*, that when, by its means, a message is to be sent to any distant station, as, for instance, from London to Dover, there must be a means by which the current may return from Dover to London and this was formerly effected by a separate wire, so that each single telegraph required two wires, one down the line to Dover, and one up the line to London, and a double-needle instrument could only be worked by four wires, by which much expense and occasional [illegible] was incurred But, about the year 1837, [illegible] that the circuit might be completed, or at least that the return-wire might be superseded, by what has been called the *earth circuit*, so that, instead of using *two* lengths of wire, one only is employed for each needle, and the terminal or return-wire of the Dover instrument is connected with the gas and water-pipes of Dover, while the other terminal of the London instrument is similarly connected with the gas and water-mains of London, and, strange to say it is found that this transit by the earth is more perfect, that is, presents less resistance to the passage of the electricity than if a return-wire had been used In cases where there are no large subterranean metallic communications at hand, a hole is dug, in which a copper plate connected with the return-wire is buried, at a sufficient depth to be always in moist earth The annexed cut will perhaps render this statement more intelligible,

(7)

in which the insulated line-wires proceeding from London at L to Dover at D are shown following the line of railway whilst the dotted line between the buried copper plates (or gas or water-pipes at each extreme) shows the supposed direction of the electric current in completing the circuit Every telegraph station is provided with an *earth-wire* There is at present much that is unintelligible respecting this *subterranean current*, the mere fact of the nonconducting power of many rocks and soils in their dry state and their very inferior conducting power even when moist or imbued with water, or indeed of water itself, when compared with metal, are well-known facts, and yet, in the communication we have described, the circuit appears to be quite as complete as if a continuous wire had been used, or even more so To get over this difficulty some have discarded altogether the notion of *conduction* in these cases, and have regarded the earth as a reservoir in which positive and negative electricity are equally and indifferently lost, absorbed, or neutralised, the positive end of the battery freely giving off positive electricity to the earth at London and the negative end giving off negative electricity to the earth at Dover, or *vice versa*, as the case may be



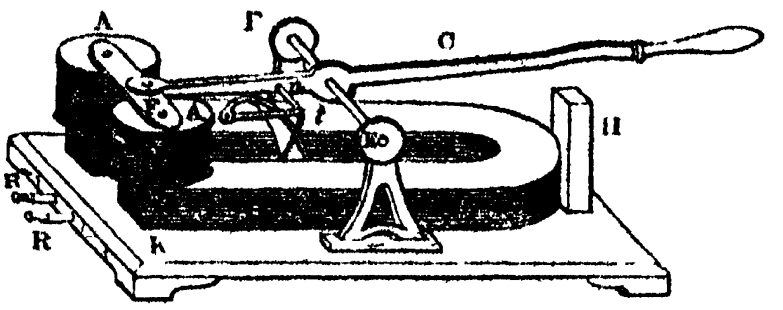
We have now endeavoured to render the principle upon which signals are communicable between distant stations by electromagnetic means intelligible, and have only noticed a few of the appendages, as they may be termed, to the talking part of [illegible]

One of them, and an important one, is the *Alarum* or *Bell-signal*, by which *audible* notice is given from station to station of their desire to talk to each other through the telegraph These bell signals may be either altogether independent of the telegraph, and rung by a separate wire, or they may be rung by the same wire which actuates the telegraph, and which in that case is so arranged that the electric current may be diverted through the bell magnet, or through the telegraph, as occasion may require, and in this case, if we suppose the bell to be in the circuit, its *ringing* announces the wish of the distant station, say of Dover, to communicate with London, then London, on hearing the bell, turns on the current to the bell at Dover, to announce that the signal has been successful, the current is then turned off the bell so on to the needle coils, and the message transmitted in the usual way. When sepa-

rate and independent wires and bells are employed, they are always in the circuit, and may be rung whenever required, for particular purposes the bells may serve as special signals, and when rung once, twice, thrice, and so on, may thus serve to announce something that has happened at the distant station

These *alarums* are rung by means of an *electro-magnet*, that is, a short rod or core of *soft iron*, wound round with a sufficient length of silk covered copper wire, this core becoming a powerful magnet whilst an electric current is traversing its copper coil and returning again to its indifferent or normal state the moment that the electricity ceases to circulate A side view of an *alarum* is given in the annexed diagram A is the elec-

(8)



tro-magnet in front of it is a soft iron keeper B This keeper is attracted by the poles of the electro magnet *every time* a current is made to circulate around it and *as long* as it is in circulation, and attraction ceases the moment the current ceases To prevent the keeper remaining attracted, which sometimes happens, even after the force ceases to circulate, it is prevented *actually touching* the pole of the magnet by two ivory studs or sometimes merely by the intervention of a piece of paper but it is so adjusted that when in its state of rest, it shall be as near as convenient to the poles of the magnet The rest of the figure represents the mechanism by which the bell is rung The keeper B is mounted on the shorter arm of a lever C the other end of the lever terminates in a catch *e* which catches a pin in the circumference of the wheel *d*, and prevents it moving *f* is a slender spring pressing against the long arm of the lever C and by means of which the keeper is restored to its normal position when attraction ceases, and the catch *e* is made to act *a* is a box containing the mainspring, *b* a toothed wheel connected with *a* by a pinion, *c* a toothed-wheel having a pinion working in *b*, *d* the wheel that carries the stop, and connected by its pinion with *c*, *g* is an escapement working in pallets on the wheel *c*, which is on the same axis with the wheel *c*, *h* is the bell hammer It is virtually a short pendulum, its connections and action being quite similar When the voltaic current is made to pass along the wire of the coils A the soft iron core is magnetised, and the keeper B is attracted, this raises the catch *e* and so allows the wheel *d* to move The machinery being thus liberated, the mainspring in the box *a* which is kept wound up, sets it in motion and the pendulum hammer *h* vibrates rapidly and strikes the bell D, which is shown also in section When the magnetisation ceases with the cessation of the current, the catch *e* is pressed into its place again by the reacting spring *f*, and the ringing terminates

It will be seen from this description, that the alarum is sounded by ordinary mechanism, and that the office of the voltaic force is merely to move a lever and liberate the machinery, whence it is obvious that there is little limit to the amount of noise which may be produced

In some other forms of telegraph the bell instead of being sounded by the detachment of a common ringing escapement is rung by the direct blows of a hammer attached to the keeper of the magnet itself, and there are several modifications of this contrivance, by which a single blow or a continuous ringing may be effected For ringing bells at short distances and in cases where a voltaic battery would be inconvenient, a current of magneto-electricity is substituted, which is most simply obtained by the following form of apparatus — A A are coils (similar to the coils described), the two bars of iron which pass through the coils are connected by their upper ends to a strip of iron F, the lower ends rest on the magnet B, thus they form what is commonly termed a keeper, by connecting the two poles of the magnet, I is joined to a lever C, which is attached to a shaft that

(9.)

works in bearings E F, the spring seen under lever C is for forming a short circuit, N, a small ivory pin for insulating the wire *t*, R R, two terminals, where the wires coming from the coils terminate, H, a block for stopping the entire descent of lever, K is the stand, to which the whole apparatus is firmly fixed As long as the iron bar remains on the magnet, no effect is produced but sharply depressing the lever whereby the iron bars are detached from the magnet, a current of electricity is produced, passing through the coils and [illegible] the bell

TELESCOPE In addition to the explanation of the general theory and mechanism of telescopes given in the body of the work it is thought desirable to give specific accounts of some of those gigantic instruments whose establishment has done so much in the last few years to revolutionise certain preconceived notions in astronomy, and to supply information concerning the nature and existence of celestial objects which were before invisible We propose then to confine ourselves to four of the largest telescopes now in existence, our space not admitting of much detail even for these These telescopes are the large reflecting telescope erected by Lord Rosse in the grounds of his residence at Birr Castle in Ireland, and the three large refracting telescopes at the Observatories of Pulkova, near Petersburg, of Cambridge, [illegible], Massachusetts, U S, and of Cambridge in England

Lord Rosse's 60ft Reflecting Telescope — This enormous telescope which has two object mirrors of 6 ft diameter, and is 53 feet in focal length, was begun in 1842 The metal used for the speculum is an alloy of tin and copper in atomic proportions the weight of the copper being something more than double that of the tin The weight of metal in one of the speculums is 3¼ tons, and that of the other 4 tons For fusing these immense masses of metal it was placed in three iron crucibles cast expressly for the purpose each crucible weighing of itself about 1½ tons The crucibles were placed in as many furnaces whose mouths were level with the ground and with flues opening into one common stack or chimney The metal for its complete fusion required to be kept in the furnace about twelve hours, and when it was in the state proper for casting the crucibles were withdrawn from the furnaces by means of a powerful crane to the iron cradles of pouring frames arranged round the mould at intervals of ninety degrees

The mould had for its base a framework of hoop iron six inches in depth placed edgewise, packed in a strong frame and supported by strong transverse bars beneath The upper edges of these were [illegible] into a slightly convex surface of about 1 foot radius and thus formed the base of the mould, allowing the air to escape through the interstices though from the viscosity of the amalgam no particle of it could escape through them The metal also by being poured upon the iron became chilled immediately into a dense sheet of about half an inch thick and thus secured one of the conditions which have been found to be most important, if not indispensable, in the casting of speculum metal After becoming tolerably solid, the speculum was withdrawn to the annealing furnaces where it remained for about sixteen weeks, when it was considered to be ready for the process of grinding and polishing

A full account given by Lord Rosse of the polishing machinery will be found by those interested in this inquiry, in the *Phil Trans* for 1840 It is sufficient to state that the beam carrying the polisher is moved by a small steam engine, by which a rotatory motion round a vertical spindle is given to a crank, which by a connecting rod acts upon a sliding rod that moves the grinder or polisher backwards and forwards By such means the polishers make strokes backwards and forwards very nearly in the manner in which the hand would make them, if the polishing were performed by hand, and at the same time another part of the machinery causes the frame carrying the speculum, and therefore the speculum itself, to revolve with a slow motion We must remark further in connexion with this part of the subject, that it was necessary that the speculum should be cast and polished upon the same fixed frame (distinct from the rotatory frame before mentioned) that would support it when in the telescope For this purpose the fixed frames are provided

with small wheels, by which, after being conveyed in a carriage to a railroad running into the lower part of the tube of the telescope, the speculum is deposited in its proper position for use

For the support of the mirror in such a way as to avoid strain and flexure, a very ingenious system of levers is employed This consists of a combination of three similar systems, resting on three points under the centres of gravity of the three equal sectors into which the speculum may be supposed to be divided Each system consists of one triangle with its point of support directly under its centre of gravity, upon which it freely oscillates [illegible] s three similar points of s [illegible] [illegible] [illegible] under their centres of gravity, and they again at their angles carry in a similar way cast-iron platforms formed of three ribs so as to make a kind of irregular open-work grating supported under their centres of gravity There are thus twenty-seven platforms, which are coated with greased cloth, and upon these the speculum is supported, each bearing $\frac{1}{27}$th part of the weight

The above is the construction first adopted by Lord Rosse But, as the surface of the speculum by the pressure on its edge at different elevations was found to be distorted, instead of the platforms in contact with the back before mentioned, there were adopted eighty-one brass balls capable of revolving freely, that is three at the corners of each triangle, occupying the place of the platform in the former construction

We now come to the mounting of this immense speculum The tube of the telescope is made of wood, and is at the middle about 7 ft in diameter, the interior exceeding 6 ft in every part This is fixed to a cube of 10 feet, which has folding doors in one of its sides for admission of the speculum, and which carries the fixed frame supporting the mirror on that side which is opposite to the mouth of the telescope To this side of the cube is attached a universal joint by which the lower end of the telescope is connected with a fixed support, the joint being a few feet below the general surface of the ground

On the east and west sides of the telescope are immense piers about 70 feet long and nearly 50 feet high, of which the eastern carries a large iron arc of a circle, in which moves a slider attached to a racked bar working by means of a pinion carried by the telescope tube, and the other carries the stairs and galleries necessary for the observers Near the tops of the piers in the east and west plane passing through the universal joint are two cranes with pulleys, over which pass chains attached to the telescope and to the ends of these chains, after they have passed through fixed pulleys in the walls, are attached the counterpoises, weighing about four tons each There is also a contrivance connected with the chains for equalising the action of the counterpoise-weights in different positions of the telescope

By means of the rack and pinion before mentioned the observer is enabled standing near the eye end of the tube, to give a motion in hour angle of about half an hour on each side of the meridian position

At the south end of the piers there are strong ladders, and upon these (assisted by counterpoise) there slides a stage upon which a small observing gallery travels backwards and forwards For great elevations curved galleries are mounted upon the curved slope of the upper part of the western pier carried by beams that run above and below pulleys fixed to the top of the pier, they are run out by rack and pinion work to approach the side of the telescope

A quick motion in declination is given by the windlass below, and a slow motion is given by hand above for measurements the quick motion in right ascension is given also below by a wheel turned by a workman, and the slow motion by hand above The tube is slung by chains and is perfectly steady in a gale of wind

The tube carries at the upper extremity the apparatus for the Newtonian small mirror, which is itself of considerable size and weight, the minor axis of its ellipse being about 6 inches, but Lord Rosse has made provision in the construction of his observing galleries for using it as a Herschelian telescope, if it is found necessary or desirable to obtain an increase of light

In the use of this wonderful instrument Lord Rosse has hitherto chiefly confined himself to the observations of nebulæ Many of these objects previously supposed to be unresolvable have been resolved by the powers of the telescope and a great deal of most interesting information has been already gained respecting their structure The figures of many of these are of a spiral form something like the convolutions of some species of shells 51 Messier and 99 Messier, of which drawings are given in the *Phil Trans* for 1850, are very remarkable specimens of this class The first, which is thickly studded with stars, has a large condensed mass in the centre with spiral curves of variable condensation radiating from it upon the general illuminated mass of the nebula A large condensed mass exists at its right hand boundary Messier 51, whose spiral formation was detected early in 1845, is of a different character, with but few detached stars, but the sweep of its spirals is exceedingly bold and interesting Another class of nebulæ is the *annular*, of which several additional specimens have been detected This class consists of nebulæ in the shape of a ring, and the most remarkable of them is that in Lyra, which the telescope has partially resolved

For drawings of several other beautiful specimens, the reader may consult Lord Rosse's papers in the *Phil Trans* before quoted enough has been said to show in some measure the powers of the telescope, and the grand future which it seems to open for astronomy

O [illegible] [illegible] we give the first place to that at *P* [illegible] [illegible] has a clear aperture of very nearly 15 inches, and its focal length is 22 5 feet The length of that part of the tube between the object-glass and the declination axis is 13 7 feet, and that of the part between the eye-piece and the declination-axis is 9 2 feet The tube is of wood, it is of a conical shape, and the exterior diameter at the extremities are 17 0 inches and 11 8 inches The telescope is furnished with six eye-pieces, whose powers vary from 152 to 1218 and with other eye-pieces, twenty-one in number, belonging to the micrometrical apparatus, with powers as high as 2000

The mounting is that known by the name of the Fraunhofer mounting having the telescope on one side of the polar axis The polar axis is nearly 4 feet in length and the diameter of the horary circle is 18 inches, and is divided to 10″ of time Sidereal motion is given to the telescope by clock work

The instrument was constructed by Messrs Merz and Mahler and is in most respects similar to that erected at Cambridge, Massachusetts, near Boston, U S which we now proceed to describe

The *Cambridge* telescope belongs to the observatory in connexion with the Harvard university It has not been erected many years, but it has already earned considerable fame by the discovery of some comets, of the third ring and eighth satellite of Saturn, and by micrometrical observations of nebulæ of great excellence and importance

The telescope and its equatorial mounting are the work of Messrs Merz and Mahler of Munich The extreme diameter of the object glass is 15½ English inches, the effective aperture barely 15 inches and the focal length 22 ft 6 in The [illegible] [illegible] like the preceding telescope, is that known [illegible] [illegible] that is, the telescope is not in the plane of the polar axis but on one side of it supported near its centre at one extremity of the declination-axis, and counterpoised by a weight beyond the other extremity of the declination-axis The declination-circle is 20 inches in diameter, and is read by four verniers to 1″ of arc, the hour circle is 18 inches in diameter, and is read by verniers to single seconds of time

Sidereal motion is communicated to the telescope by clock-work regulated by the friction of centrifugal balls

It is furnished with nine eye-pieces, whose powers vary from 103 to 1118 and with a wire-micrometer eye-piece and position circle The screw of the micrometer has been severely tested and found to be of sensibly equal value throughout its length

The usual inconvenience attending the reversing of the telescope when an object arrives at the meridian is experienced and the arrangement of the divisions of the hour circle and declination circle is complained of as awkward, the clock-work machinery is also disproportionate to the other parts of the instrument, and requires adjustment frequently, but the optical power of the telescope has excited universal admiration

The whole aperture can be used without injury to the definition, and the disks of stars are remarkably small In measuring double stars powers from 700 to 1200 have been habitually employed On rare occasions, a power of 2000 has shown well the disks of Neptune and of the satellites of Jupiter

With powers of 700 and 800, stars have been separated whose measured distance has proved to be 0″ 3 The satellites of Neptune and the inner and eighth satellite of Saturn are seen steadily, as well as the edge of the ring at what is called its disappearance —(*Description of the Observatory at Cambridge, Massachusetts, by William Cranch Bond*)

The last telescope we propose to describe is that called the *Northumberland Telescope*, at the Observatory connected with our own university at Cambridge

It was the gift of the late Duke of Northumberland when Chancellor of the University, and has acquired considerable [illegible] [illegible] [illegible] successful search after the planet [illegible] [illegible] Before the discovery of Neptune [illegible] [illegible] been observed twice during

the sweep[illegible] tute[illegible] for it, though it was not recognised till afterwards

The object-glass by Cauchoix of Paris, is of 11⅛ inches effective aperture, and the focal length is 19½ feet The mounting is that generally adopted with English equatorials, that is, the telescope is in the plane of the polar axis, and this prevents the disagreeable necessity of reversing the instrument when an object comes to the meridian

The hour circle is 5½ feet in diameter, and is not permanently attached to the polar axis, but can be clamped to or released from the lower iron frame at pleasure There is no declination circle, but its place is supplied by a declination sector, that is, a graduated arc carried by a flat brass bar nearly 6 feet in length turning about a pin fixed in the telescope tube at the distance of rather more than 2½ feet from the axis of revolution of the telescope This serves to measure small differences of declination The instrument is provided with clockwork

The whole of the mounting was performed under the direction of the Astronomer Royal, Mr Airy — (*Cambridge Observations, Airy's Description, Weale's London*, 1851)

TERRA PONDERIS (C[illegible] of clay found in the coal [illegible] It is the *terra miraculosa* and *terra sigillata* of old pharmaceutical authors, and was celebrated for its supposed medical virtues

TERCE-MAJOR In Card-playing, a sequence of the three best cards

TEREBENE A modified oil of turpentine

THOMSONITE A species of *zeolite*, of a peculiar tes[illegible] from Faroe

THEBAINE [illegible]us alkaloid *Strychnia* is sometimes described under this name

THEBAI'A A crystalline alkaloid contained in opium It has also been termed *Paramorphia* It exists in very small proportion

THE'NARDITE A native anhydrous sulphate of soda found near Madrid so named in honour of Thenard the French chemist

THENARD'S BLUE A compound of a splendid blue colour, obtained by heating a mixture of phosphate of cobalt with pure alumina

THEOBRO'MINE A white bitter substance contained in the chocolate nut (the fruit of the *Theobroma cacao*)

THERMONA'TRITE A peculiar species of carbonate of soda, found in the Natron lakes at Lagunilla, in Columbia, in the Macarius desert in Lower Egypt and in the steppes between the Ural and Altai, and is deposited from their water in the warm season According to Haidinger a saturated solution of carbonate of soda at a temperature between 80° and 100°, forms, on slow cooling, crystals of thermonatrite, which differ in form from those of the common carbonate, and contain less water of crystallisation

THIEVES' VINEGAR Called also Marseilles vinegar, and *Vinaigre des quatre voleurs*, is made by digesting rosemary tops, sage leaves, lavender flowers, and cloves, in vinegar this useless preparation was once regarded as an [illegible] plague an[illegible]

THRAUSTITE (Gr *θραυω I break*) A hydrated silicate of iron, which occurs with magnetic pyrites at Bodenmais in Bavaria, it has a resinous fracture and is very brittle

THRIDACE (Gr *θριδαξ lettuce*) *Lactucarium*, called also *Lactucarium* It is the inspissated juice of the common lettuce, which is slightly sedative

TIDE GAUGE The chief improvements recently introduced into tide gauges are exhibited in that constructed by Hewitson, to which reference is made in the DICTIONARY Great pains have been taken in every part of its construction to diminish friction as much as possible The teeth of the wheels are carefully made, so that should the rise or fall of the tide amount to the fraction of an inch only, a simultaneous movement of the machine follows to that amount It is furnished with a brass [illegible] axes of bell metal revolving in V[illegible] the registering pencil moves on steel [illegible] concealed in the capitals of the brass supporting pillars. The machine is connected with an astronomical clock, which needs winding only once in 16 days, or in rather more than half a lunation, and thus produces, without any attention in this [illegible] al curves

TIKOR A [illegible] fecula or starch of certain species of *Curcuma*

TILE ORE An impure oxide of copper of a brick-red colour

TISSUE In animals, the substance of which systems of [illegible] or "osseous tissue," [illegible] or "muscular tissue," in the muscular system, "neurine," or nervous tissue, in the nervous system, "dentine," or tooth-bone, in the dental system The branch of Anatomy which treats of the tissues is termed "Histology"

TODDY [illegible] sap or juice of the cocoa nut palm which is collected in [illegible] or spadix Five or six [illegible] tained from each tree, and it is in much request as a beverage, especially by European troops, but it requires to be drunk early in the day, and quite fresh, for it ra[illegible] powers

TOLIDINE [illegible] obtained by the action of [illegible] nitro-toluide it is a yello[illegible]

TOLUO'LE An oily hydrocarbon obtained by distillation from Tolu balsam Its composition is C_{14} H_8

TO'MBAZITE A mineralogical synonym of one of [illegible] kel

TONE [illegible] a degree of firmness and tension in certain soft tissues, [illegible] from flabbiness it is commonly [illegible] in which the "tone" depends on a state of passive contraction, dependent on the connexion of their nerves with the myelon, and which is lost when that connexion, or [illegible] oved

TONKA [illegible]QUIN BEAN The fruit of the *Coumarouna*, or *Dipterix odorata*. It is used as a perfume, especially for snuff, its odour, resembling that of new hay, is derived from a concrete volatile oil which chemists have termed *Coumarin*, or *Tonka Camphor* A similar substance may also be extracted from the flowers of Melilot (*Melilotus officinalis*)

TOUCHWOOD A term sometimes applied to the agaric of the oak (*Polyporus igniarius*)

TOUS LES MOIS An article under this name is sold in London, as a substitute for *arrow root*, it is the starch of the *Canna coccinea* Its particles are admirably suited as objects for the microscope, on account of their large size in other respects they resemble the [illegible]

[illegible] In Anatomy, the term has been applied to that branch which treats of the essential nature and homologies of the parts of the body, and the results of which study seem to be different from or beyond, what would be suggested by the ideas of the parts derived from the outward senses, as when the human blade bone, which to the eye is very different from a human rib, and which is quite distinct from the skull, is seen by the mind to be the rib of the occiput.

TRANSIT CIRCLE A meridian instrument which combines the properties of the Transit Instrument and the Mural circle, that is, which can be employed for determining at the same transit of a celestial object, both its R A and its zenith distance A remarkable instrument of this class was erected at Greenwich, by the Astronomer Royal Mr Airy, in the year 1850, and, from the beginning of the year 1851 all the meridian observations have been made with it It consists mainly of a telescope of 12 feet focal length with an object-glass of 8 inches clear aperture, carrying on each side of its centre a circle of 6 feet diameter The tube of the telescope is of iron cast in four pieces, viz two immense cones at its eye end and object end, and a large central cube in two pieces, having attached to them in the same casts the pivots on which the telescope revolves The cones weigh each about 1¾ cwt, and the central cube with its pivots weighs nearly 8 cwt The two parts of the cube are bolted together on flanges with planed surfaces, as also are the cones to the central cube The surfaces of the pivots were hardened after the casting, by chilling them to a depth of about a quarter of an inch, and were afterwards ground and polished to a true cylindrical form after a great expenditure of time and labour The circles are carried on cylindrical rims on the east and west sides of the central cube The western circle has a *dished* surface of about 3 inches in breadth with its concavity westward, and carries two bands, one on its eastern and one on its western surface, the latter being divided to 5′ of space The eastern divisions are merely given for the convenience of setting the instrument accurately to given objects by means of a pointer, but the western divisions are for the observations of zenith distance For the reading of the circle six long microscopes or lunettes are fixed in the solid stone of the western pier, having their object-glasses arranged in a circle of about 5½ feet diameter on the inner or eastern surface, and their eye-pieces in a circle of about 2 feet in diameter at the back of the piers The centres of these circles are in the same horizontal line with the centre of the telescope, and at the height of 5 feet from the floor The microscopes, whose axes lie in a conical surface, are each 45 inches in length, and their axes are not quite perpendicular to the portions of [illegible] site to them, but are inc[illegible] light thrown through corresponding illuminating holes (cut in the pier) from a central gas lamp shall be reflected truly into them without the aid of specula The error of collimation of the telescope is found by means of two 5 ft telescopes, one to the north and the other to the

south of it, and the error of level is found by the observation of the reflected image of the central wire by means of Bohnenberger's eye-piece, by which means also, together with observations of stars by reflexion, the zenith point is found An apparatus is provided by which the instrument can be lifted at pleasure out of its Y's, so as to be in the same state of strain when elevated as when resting in its Y s The apparatus for carrying the mercury trough, which usually contains about 60 lbs of mercury [illegible] given to it either [illegible] and west direction

For illumination of the wires with a dark field eight prisms are employed Four of these are arranged symmetrically on the reflector, which is placed at the centre of the telescope as usual, but which is movable round an axis and can be acted upon by a rod passing through the tube of the telescope and having its end near the eye-piece, and four are arranged symmetrically in the plane of the wires in the eye-piece By this means, when the field is dark, or the reflector is at right angles to the tube, the light after reflexion by the two sets of prisms is thrown across the field in the plane of the wires, and illuminates them abundantly for observation

The casting and the engineering generally for this instrument was performed by Messrs Ransomes and May of Ipswich, but the dividing of the circles, and all the optical part of it, was performed by Mr Simms The object-glass is also of his manufacture

TRANSIT INSTRUMENT Several improvements, both in application and in construction, have been within a few years made with regard to this admirable instrument The principal new application of it is that by which it is made to determine the latitude of the place of observation, or the zenith distances of stars, by being placed at right angles to its ordinary position, that is with its line of collimation lying in the plane of the prime vertical A large instrument of this class has been recently erected at the observatory of Pulkova, and it serves to determine with admirable precision the zenith distances of stars which pass near the zenith of that observatory, and M Struve considers its use to be of extreme importance in the ulterior investigations connected with aberration, precession and nutation

Mr Simms produced at the Great Exhibition of 1851, a specimen of a *double transit instrument* that is, of an instrument which might be used with equal facility when placed in the meridian and in the prime-vertical This is effected by making the axis of the telescope itself convertible into a telescope by having an object-glass fitted into one of the pivots and a sliding-tube carrying an adjustible cross of delicate spider-lines with a positive eye-piece at the other pivot. The adjustment of the axis-telescope is effected by a small collimator placed in a line with the axis The axis is turned round, and the position of the wire-frame is shifted till the centre wire coincides with the mark equally well before and after reversion If the meridian telescope be previously adjusted, it can be made use of for readily placing the axis telescope in its proper position for the determination of latitude by means of the transits of stars which pass the meridian near the zenith

Another kind of transit instrument lately brought into use is the *diagonal* or *chamber transit* The peculiarity of this instrument is, that the rays tending to form an image of a star after [illegible] object glass, do not proceed in [illegible] the tube in the usual way, but being received upon a speculum or prism placed in the axis are turned aside through one of the axes, which is perforated and provided with an eye-piece and a system of wires By this means the inconvenience of placing the body in awkward positions for the observations of stars so much felt in the use of small transits is avoided, and the observer has no occasion to shift his position, whatever be the altitude of the star to be observed Mr Simms has succeeded in providing convenient means for the illumination of the field of view of the diagonal transit by the following method — The back pivot being also perforated has a small convex lens set within it, and a larger convex lens is fixed within the axis at the back of the reflector, of such a size that one or [illegible] project beyond the edge [illegible] lamp placed outside the [illegible] lens, and the rays after crossing diverge upon the large lens at the back of the reflector, whose outer segments again condense it upon the field of view in sufficient quantity to produce a well illuminated field

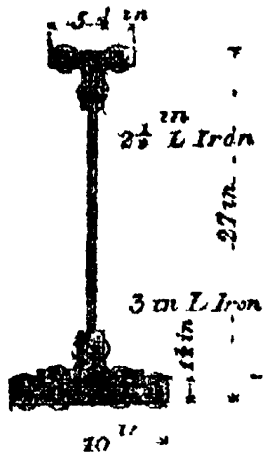
The last improvement we shall mention is the *prism illumination* of the field of view of transit instruments It has always been a difficult problem for practical astronomers to provide for the observation of very faint objects, for which it is necessary to have the field of view dark and the wires illuminated Various means, attended with only partial success, have been devised in different observatories, the most successful of which was till recently the application of the galvanic current. Mr Airy applied for the first time the *galvanic illumination* to the great transit circle at Greenwich in the year 1850, and this method was [illegible] instruments, and [illegible] thods A pierced reflector is placed as usual in the central part of the axis of the telescope, but this, instead of [illegible] the telescope-tube near the observer's hand If the rod be pulled out to its full length, the reflector stands at its usual angle of 45°, and the field is [illegible] by the lamp placed at the axis By pushing in the rod the reflector is made to stand more nearly at right angles to the tube, and less light is thrown down the tube, and by this means the light is *moderated* Finally, when the reflector is at right angles to the tube, no light passes down it to the eye, but in this case the prism-application [illegible] placed [illegible] perpendicularly The light, reflected from their hypothenusal sides, and passing [illegible] their remaining sides is made to [illegible] sides of the tube It is then finally received upon other four prisms placed properly in the plane of the wires of the telescope, so as to be transmitted entirely in that plane, and to illuminate perfectly both sides of the vertical wires, and the upper and under sides of the horizontal wires This process has been used with perfect success for a considerable time for the illumination of the wires of the Transit Circle at Greenwich

TRI'CLA'SITE (Gr [illegible] A mineral found in the ta [illegible] lum, regarded as a species of *Iolite* it has a *three-fold* cleavage

TRIPE The stomachs of ruminants, when properly prepared constitute *Tripe* Dr Thomson, in his *Domestic Management of the Sick Room*, says, "few things are more [illegible] than tripe, when properly cooked" It should be slowly boiled, with an onion and some salt

TRI'PLITE (Lat triplex *three-fold*) A mineral composed of phosphoric acid in combination with the oxides of iron and manganese, which occurs with beryl in the granite of Limoges, in France

TRI'PTOTE (Gr τρεις, *three*, and πτωσις, *a case*) In Grammar, a noun that has only three cases

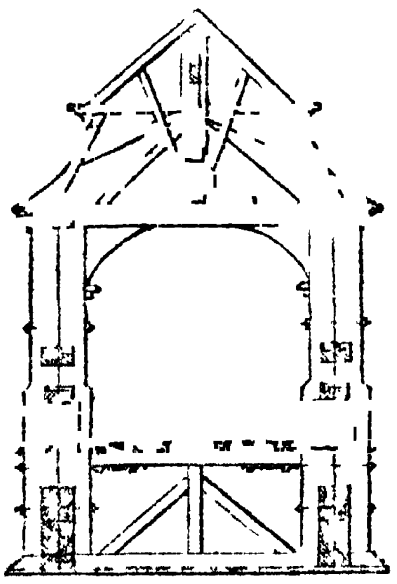


TRO'MBOLITE Native phosphate of copper

TU'BULAR BRIDGE A bridge formed of a great tube or hollow beam, through the centre of which a roadway or railway passes The most remarkable bridge of this kind is that designed by Mr Robert Stephenson for carrying the Chester and Holyhead railway over the Menai Straits This bridge consists of two rectangular tubes of wrought iron plates riveted together, one tube being for the accommodation of the up line of rails, and the other for the accommodation of the down line of rails A pier erected upon a rock in the middle of the straits divides each tube into two spans of 462 feet each and there is also at each end a smaller tube of 230 feet span to serve as approaches to the bridge These several tubes are joined together so as to form one long tube for each line of rails of the total length of 1524 feet

The thickness of the central pier is 45 feet, of the side piers 32 feet each and the tube projects 17 feet 6 inches over the masonry at each end The bridge contains 9480 tons of wrought iron, 1988 tons of cast iron, and 1 500,000 cubic feet of masonry The total expense of its construction was 601,860*l*, of which the iron work cost 443,160*l* and the masonry 158 700*l* It was commenced on the 10th of August, 1847 was finished on the 5th of March, 1850, and was opened for traffic on the 18th of March, 1850 A similar bridge of one length of tube and of a somewhat smaller span had been previously erected, under Mr Stephenson's direction, over the river Conway on the same line of railway This bridge was opened for traffic in 1848

History of Tubular Bridges. — On the occasion of an entertainment given at the opening of the Conway bridge in 1848, Mr Stephenson gave an account of the circumstances which had led to the conception of the plan of carrying a railway over a river or chasm by employing as a bridge a hollow beam or tunnel constructed of iron plates About six or seven years before he had been called upon to construct a bridge on the Northern and Eastern Railway at Ware under certain limitations imposed by act of parliament which rendered bridges of the ordinary forms inapplicable, and he thereupon resolved to employ malleable iron beams, by the aid of which a cellular platform was made which answered the exigencies of the occasion In this cellular platform however there does not appear to have been much novelty of conception, for it was merely an arrangement of beams of the ordinary form of railway girders, and the



(1)

only peculiarity of these beams was that they were made of wrought iron instead of cast iron as had been the previous practice They were proportioned moreover in the same manner as cast-iron beams, as will be seen by *fig* 1, whereas malleable iron beams it is now known should have the top and bottom flanges of about the same dimensions However, from the suggestions of this structure, the idea of a tubular bridge first arose in Mr Stephenson's mind, and in his original conception he contemplated the use of elliptical or cylindrical tubes supported by chains Mr Stephenson's engagements did not permit him to work out this idea or to put it into such a practical form that he would have himself had confidence in carrying it into execution He therefore called in the aid of Mr Fairbairn to accomplish this task, and Mr Fairbairn taking up the idea where Mr Stephenson had left it, pursued the inquiry with great ardour and sagacity until he finally brought the idea into the form in which it was carried into practical effect

I [illegible] ever a form of bridge much [illegible] finally adopted for crossing [illegible] Mr Stephenson's cellular platform at Ware, or even than his subsequent conception of an oval or cylindrical tube supported by chains, had been successfully introduced in Switzerland, but the bridges which had been erected upon this plan, instead of being made of wrought iron were constructed of timber The first of these bridges appears to have been erected over the Rhine at Schaffhausen by Jean Ulrich Grubenmann in 1757 It consisted of two spans — the one of 170 feet and the other of 193 feet In 1778 another bridge of a similar construction was built by the same person over the Limmat at Wettingen The span of this bridge was 390 feet *Fig* 2 is a section of this bridge at the ends, and

(2)

(3)

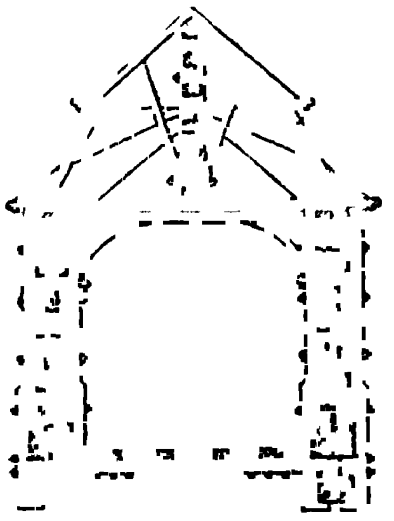


Fig 3 is a section at the centre It will be apparent from these figures that this bridge is composed of a platform for the roadway two side frames of carpentry, and a roof, so that it in fact constitutes a great hollow timber beam of a nearly rectangular form These bridges were both burnt by the French in 1799, after having remained in constant use the one for forty two years and the other for twenty-one years Armies, artillery, and heavy weights, had passed over them in safety, and they appear to have perfectly fulfilled the purpose for which they were designed Each of the side frames was raised into its place in a piece by means of powerful screw jacks resting on piles

Subsequently to this time lattice bridges came into considerable use in America These bridges consist of two [illegible] a platform which forms the roadway, and in some cases the top is also covered with lattice work so as to convert the bridge into a hollow lattice beam In a few cases these lattice bridges were formed of iron, and in Boston there is an elliptical tubular lattice bridge of iron of 120 feet span This bridge had been in use a few years before the construction of that cellular platform at Ware which Mr Stephenson says first suggested to his mind the idea of a tubular bridge Lattice bridges formed of bars of iron have of late years come into use in this country A singular phenomenon has been observed in some of these bridges The centre of the bridge instead of sinking, has actually risen up when the bridge has been put into its place

[illegible] upon the best mode of carrying out Mr Stephenson's idea occurred to Mr Fairbairn upon whom this responsibility now devolved, that the most judicious course would be to institute a series of experiments to determine the breaking weight of beams or tubes of different forms with the view of ascertaining what form of tube would reconcile the greatest amount of strength with the least quantity of material, and also what load a tube of [illegible] given dimensions could with safety [illegible] riments were accordingly instituted, and they speedily furnished information of great practical importance It was very soon found that oval and cylindrical tubes were not of so eligible a form as rectangular ones, and it was further found that in rectangular tubes the strength should be chiefly concentrated at the top and bottom and in nearly equal proportions It also occurred to Mr Fairbairn that it would be advisable to make the top and bottom of the tube of a cellular form which would obviate the necessity of using plates of such a thickness as could not be so securely riveted and this construction it was anticipated, would also impart greater stiffness to the structure, and render the top less liable to buckle up when a heavy strain was applied The determination of the rectangular form of these bridges the rejection of the chains, the introduction of the cellular structure of the top and bottom, and the settlement of all the details of the iron work, was unquestionably the work of Mr Fairbairn but it does not follow that Mr Stephenson was unequal to the determination of these particulars or that if his other engagements had enabled him to perform the experiments which were judged necessary, instead of delegating them to other hands, a result equally satisfactory would not have been attained However, the existing form of tubular bridge, as carried into execution for crossing the Conway river and the Menai Straits is certainly quite as much Mr Fairbairn's creation as it is Mr Stephenson's, since Mr Fairbairn settled the form, established the proportions arranged all the details of construction, and set the first tube in its place

Experiments to determine the best Form of Tube — The first experiments were made upon cylindrical tubes formed of iron plates, riveted together like the chimney of a steamboat The tube experimented upon was laid horizontally between two supports, and a small hole was cut in the centre of its lower side to enable a rod of iron to pass through from this rod of iron the weights employed to ascertain the strength were suspended, around the hole a collar was riveted so as to impart as much strength to that part of the tube as before the perforation had been made, and a cushion of hard wood 8 inches square was fitted to the interior of the tube above the perforation Through this piece of wood the rod which carried the weights ascended and a cutter passing through the end of the rod rested on a square plate of iron superimposed upon the wood, so that from the wooden cushion the whole weights depended Many of the tubes gave way by tearing at the riveting of the plates, but some also broke from the compression at the top The more important results of these experiments are exhibited in the following tables —

STRENGTH OF CYLINDRICAL TUBES USED AS BEAMS

Number of Experiment	1	2	3	4	5	6	7	8	9

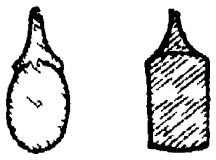
[illegible] extension	Compression	Compression	Extension	Extension at rivets	Extension at rivets	[illegible] at rivets	[illegible] at rivets	[illegible] at rivets	[illegible] at rivets

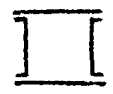
The thickness of the plates in these experiments was ascertained by cutting a portion of the plate into small pieces and screwing these pieces together in a vice The collective thickness was then accurately measured, which divided by the number of pieces gave the thickness of each It appears probable that the whole of the tubes would have been broken by compression, but for the weakening of the bottom caused by the rivet holes and which generally produced fracture by extension in that part

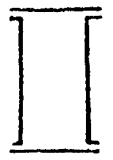


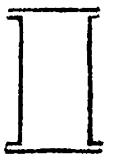
The ends of the tubes where they rested upon the supports had to be kept in shape by circular pieces of wood inserted into them When these pieces of wood were withdrawn, the ends were flattened horizontally At the same time the centre of the tube was flattened vertically by the action of the weight hanging at the under side, and in looking endways at the tube the two sections ma[illegible], the ends forming the horizontal [illegible], and the centre the vertical part

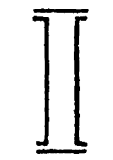
The following are the results of the experiments made with elliptical tubes —

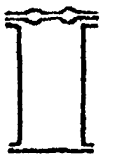
STRENGTH OF ELLIPTICAL TUBES USED AS BEAMS











Number of Experiment	1	2	3	4	5	6
Major axis	14 625 in	21·66 in	21 25 in	15 in	12 in	13 in

(1) (5)

Numbers 5 and 6 of the foregoing experiments were not made with simple elliptical tubes, but the tube employed in number 5 was an elliptical tube with a fin at the top (*fig* 4), and the tube employed in number 6 was more of a rectangular form with a fin at the top (*fig* 5) These top fins were not found to operate advantageously, as they were thrown into compression before the strain came on the top of the tube [illegible] was thus overcome in detail [illegible] of the experiments, however, are those upon rectangular tubes, the results of which are as follows —

STRENGTH OF RECTANGULAR TUBES USED AS BEAMS.

No of Experiment	1	2	3	4	5	6	7	8

These experiments having been concluded and a few others of a similar character, which it would be needless to recapitulate, Mr Fairbairn directed his attention to the determination of the proportions which it would be proper to adopt for the tubular bridges which it was proposed to construct It was made very clear from the experiments, that the rectangular form was the best, and that the strength should be chiefly concentrated at the top and bottom of the tube, where the extending and compressing forces would act with greatest energy and where they must be met The proportion of the sectional area of the top to that of the bottom to give the maximum strength, was also found to be as 5 to 3 in the case of thin rectangular tubes It was also made clear that the strength of a tubular beam would be increased if the buckling or crumpling up of the top side could be prevented and it was known from previous experiments of Mr Hodgkinson upon cast-iron pillars, that a given quantity of metal would better resist compression if disposed in a tubular form than if disposed in any other form Hence it occurred to Mr Fairbairn, that the compressing strain upon the top of the tube would be more effectually counteracted by dis[illegible] the form of longitudinal tubes than he form of a flat plate The tube [illegible] top, tested in the eighth experiment upon rectangular tubes, was made in pursuance of this idea, but eventually it was determined to form the top of the bridge of a series of parallel rectangular tubes or cells, chiefly because that form was more convenient in [illegible] better admitted of painting and repa[illegible] of the tube it was considered advisable to make in the same fashion, and these points being settled, a model tube was constructed, which was nearly identical with one of the tubes of the intended bridge in every thing but size The model tube was 78 feet long, and 75 feet between the supports; 4 feet 6½ inches deep at the middle, and 4 feet 0½ inches deep at the ends It was 2 feet 8 inches wide in the body, but the cellular top was somewhat wider, being 2 feet 11½ inches wide, and the bottom, w[illegible] six longitudinal channels formed by seven vertical plates 6½ inches deep running longitudinally from end to end of the tube and having a plate above and another below them extending through the whole length and breadth of the top The thickness of the plate of the bottom of the model tube was 156 inches of the sides 099 inches, and of the top 147 inches The sectional area of the top was 24 024 square inches, of the sides 9 square inches, and of the bottom 8 8 square inches The weight of the tube was 4 86 tons Its ultimate deflection was 4 375 inches, and its breaking weight 35½ tons The tube gave way by tearing asunder at the bottom

The top plates of the tube having been made a little thicker than was intended, two strips of plate 20 feet long, 6½ inches wide, $\frac{5}{16}$ths of an inch thick, and weighing about 4 cwt were riveted along the bottom of the tube at the centre part The ultimate deflection then became 4 11 inches, and the breaking weight 43 3 tons In this experiment the tube got out of [illegible] To obviate this evil for the future, [illegible] iron were riveted along the sides of the tubes internally at distances of 2 feet apart, and the tube having been repaired was again subjected to experiment The ultimate deflection was now found to be 5 68 inches, and the breaking weight 56 3 tons As, however, in this experiment the fracture occurred, not at the centre of the tube, but at some distance to one side, where the plates were weak, a final experiment was made with the plates decreasing in thickness from the middle according to the proper law The tube then broke by compression of the cellular top with a weight of 86½ tons

Mode of Determining the Dimensions proper for the Menai and Conway Bridges —The strength of any beam larger or smaller than a beam of any given size, but which is increased or diminished proportionally, varies as the square of the alteration of its linear dimensions, or more nearly as the 1 9th power in the case of tubular beams whereas the weight varies as the cube of any linear dimension A beam, therefore, of twice the length, depth, and thickness of any given beam, will be about four times as strong and eight times as heavy Taking the weight of the model tube upon which the

foregoing experiments were made at 6 tons, the distance between the supports at 75 feet, and the breaking weight of the tube at 60 tons, Mr Fairbairn calculated that a tube of 400 span, such as was intended to carry the railway over the Conway river, would bear a load of 1704 tons exclusive of its own weight For since the span of 400 feet is 5 33 times greater than that of the model tube, then $5.33^2 \times 60 = 1704$ tons and the weight of the tube will be $5.33^3 \times 6 = 906$ tons Now a given load distributed equally over a beam produces nearly the same strain upon it as half the load applied at the centre or more correctly the ratio is as 5 to 8 Taking the half of 906 or 453 from 1704 we have 1251 tons as the actual load which Mr Fairbairn considered that the tube would bear exclusive of its own weight

Mode of Computation by Hodgkinson's Formula for Cast iron Beams — Some years before the formation of the Britannia and Conway bridges, Mr Hodgkinson had ascertained the form of cast-iron beams which gave the greatest strength with the least material, and by the formula derived by Mr Hodgkinson from these experiments Mr Fairbairn found that the model tube would bear about 20 tons if it were of cast-iron But it actually bore 56 3 tons in one of the experiments of which the result was not the best, and introducing this correction into the formula, it appeared that a tube six times larger than the model tube, and therefore of 450 feet span, 27 feet deep and with 460 8 square inches of sectional area of iron at the bottom, would bear 2018 tons exclusive of the weight of the tube itself The results obtained by calculating the [illegible] squares and the weights as the cubes of [illegible] do not differ materially from the foregoing, and Mr Fairbairn calculated that a tube of 462 feet span 31 feet deep and 460 square inches of area at the bottom would bear [illegible] tube to weigh 1200 tons the breaking weight when the load was applied at the middle, would be 1869 tons, exclusive of the weight of the tube itself Now a tube which will carry 1869 tons at the centre, exclusive of its own weight will be reckoned carry about twice this amount, or 3738 tons, equally distributed over it exclusive of its own weight, and taking the maximum load to which the bridge would be subjected at one ton per lineal foot, it followed that the bridge, when thus proportioned, would bear eight times the load that could ever be put upon it One of the tubes of the Conway bridge when completed was tested in the same manner as the model tube by placing weights upon it and observing the deflections The result was found to confirm the accuracy of the deductions derived from the experiments upon the model tube The law followed by the deflections appeared to show that the tube would sustain a load of 2200 tons equally distributed over it and exclusive of its own weight, before it broke, and that the ultimate deflection would be 30 inches

Mr Hodgkinson's Experiments — Besides the experiments made by Mr Fairbairn, a [illegible] nts upon tubular beams was made [illegible] at Mr Stephenson's desire and from these experiments results were obtained of great interest in a scientific point of view Mr Hodgkinson found that the strength of tubes to resist compression varied greatly with the thickness of the metal of which they were composed Thus, when the plates composing a tube, compressed in the manner of a pillar, were [illegible] 272, and 124 inch, the resistances per square inch of section were 19 17, 14 47 and 7 47 tons respectively Mr Hodgkinson also found that the power of plates to resist compression varied as the cube, or, more nearly, as the 2 878 power of their thickness He further found that long continued impact upon a tubular beam of small size, producing a deflection of less than one-fifth of what would be required to injure the tube by pressure, was completely destructive of the riveting In [illegible] the inertia of the mass will, by [illegible] pact, prevent [illegible] He also [illegible] of similar tubular beams was as the 1 9th power of their linear dimensions Mr Hodgkinson further made a series of experiments to ascertain if the thickness of the plates of a tubular bridge might be diminished towards the ends, as indicated by theory, and he found that such was the case The thickness of the plates of the top, bottom, and sides, at any point, was therefore made in the proportion of the rectangle of the segments into which the distance between the supports of the tube was divided at that point, the tube itself being of uniform dimensions throughout, but at and near the supports the thickness was half that of the middle A further experiment was made to ascertain how far the effect would be advantageous to stiffen tubular beams with cast-iron applied at the top, and it was found that 10 square inches area of cross section of cast-iron at the top of the beam balanced 21 square inches of cross section of malleable iron at the bottom of the beam, proving that the cast-iron would resist compression more efficiently than the wrought. These investigations, however, though highly important, did not materially influence the configuration of the Conway and Menai bridges, the proportions of which were mainly settled by Mr Fairbairn from his experiments upon the models before already described Experiments were also made both by Mr Fairbairn and Mr Hodgkinson to determine the strength of tubular beams when laid upon their sides The purpose of this investigation was to determine the lateral strength to resist storms blowing on the side of the tube, and it was found that the proportions and strengths proper for resisting the vertical strains would also give a lateral strength more than sufficient to withstand any storm to which the tube could be exposed

Comparative Strains caused by Stationary and Moving Loads — In proportioning iron beams or girders to bear any given load the prevailing practice among engineers has heretofore been to give a strength adequate to carry three times the load if the load be stationary, and twice that strength, or a strength adequate to carry six times the load, if the load be a moving one At the time the Conway and Menai bridges were constructed the precise effect upon iron bridges of [illegible] pressures [illegible], and concussions consequent upon the passage of a railway train, was by no means accurately known, but since that time those relations have been investigated by a [illegible] the purpose, and it was one of [illegible] what increase of the statical pressure upon an iron beam or bridge would occasion the same strain as a given velocity of the load It is clear that this relation once determined the statical pressure is all that has thenceforth to be considered, and the question of the strength proper for all kinds of constructions is consequently narrowed to the determination of the strength necessary to withstand a certain statical strain, which is greater in an ascertained proportion than that due to the intended maximum load

Effect of Momentum on the Deflection of a Beam — If a load be placed upon any long or slender beam propped up in the middle, and the prop be suddenly withdrawn so as to allow deflection to take place it is clear that the deflection must be greater than if the load had been gradually applied For the momentum of the weight, and also of the beam itself falling through the space through which it has been deflected, has necessarily to be counteracted by the elasticity of the beam, and the beam will therefore be bent momentarily to a greater extent than what is due to the load, and after a few vibrations up and down it will finally settle at that point of deflection which the load properly occasions It is obvious that such a beam must be strong enough not merely to sustain the pressure due to the load, but also that accession of pressure due to the counteracted momentum of the load, and of the beam itself, and this increased strain is produced in the case of all beams to which a deflecting weight is applied, but is most material in those in which a large and rapid deflection takes place A rapid deflection increases the amount of the deflection as well as the amount of the strain, as is seen in the cylinder cover of a Cornish pumping-engine, into which the steam is suddenly admitted, and in which the momentum of the particles of the metal put into motion increases the deflection to an extent which the mere pressure of the steam could not produce

Effect of Deflection on the Amount and Position of the Strain — If a railway train moving at a high rate of speed be made to descend a steep declivity, the pressure of the wheels upon the rails will obviously be diminished, and if the motion of the train be supposed to be very rapid and the declivity very great, the wheels will leave the rails altogether, and the train will advance after the fashion of a projectile In like manner, if a rapid train ascends a steep acclivity, the pressure of the wheels upon the rails will be increased Now a beam bent by a passing train forms both a falling and rising plane, and on the first half of the beam the strain will be less than what is due to the load, and on the second half of the beam the strain will be greater than what is due to the load The maximum strain therefore, and consequently the maximum deflection, will not be at the centre of the beam, but at a point somewhere between the middle and one end In order to remedy this inconvenience the beams of a railway bridge should be made with a slight rise in the centre, so as to form a straight line when deflected by [illegible]

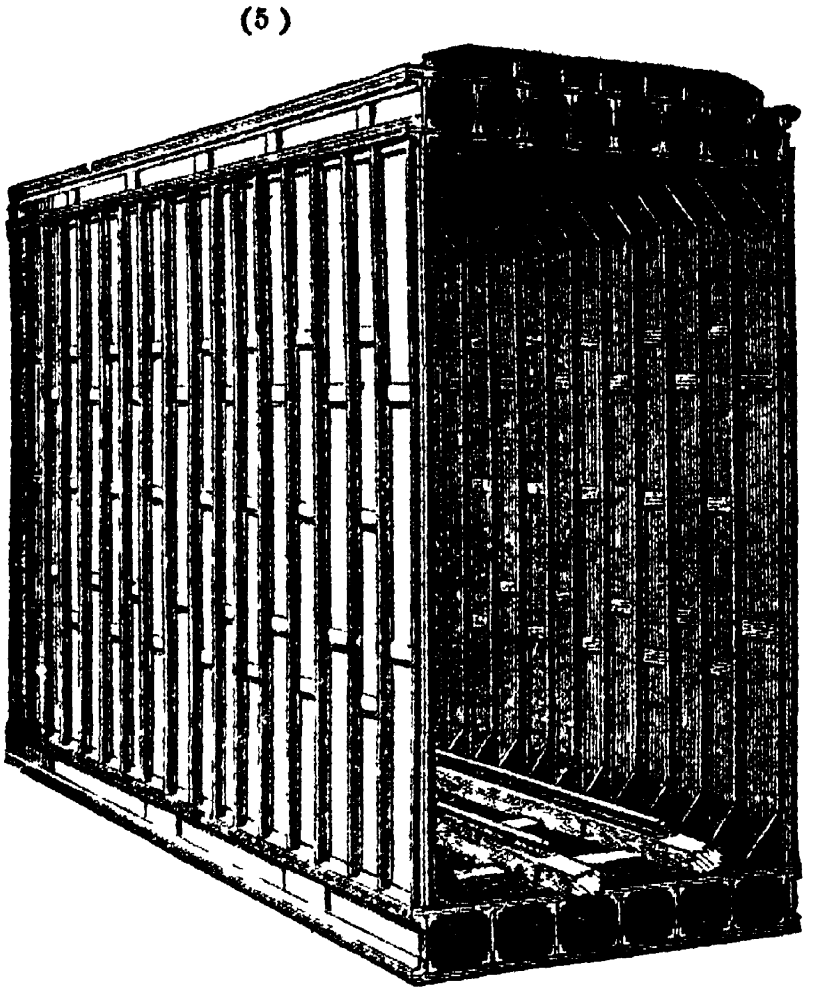
Law of [illegible] consequent upon Deflection — The momentum of any moving body being proportional to the square of its velocity, it follows that in the case of a railway train deflected either sideways or upwards by a curve or incline, the strain will be proportioned to the square of the amount of motion in a new direction given in any specified time, or with any given velocity of the train the strain will be proportional to the square of the amount of the deflection which [illegible] or horizontal plane in [illegible]

[illegible] — The mass of matter

in a beam first resists deflection by its inertia, and then promotes deflection by its momentum, but whether in practical cases increased mass without reference to strength or weight will, upon the whole, increase or diminish deflection, will very much depend upon the magnitude of the mass, relatively [illegible] the deflecting pressure, and the [illegible] pressure is applied and remove[illegible] weight be very suddenly applied to the middle of a ponderous beam, and be as suddenly withdrawn the inertia of the beam will, as in the case of a collision of bodies, tend to resist the force, and thus obviate deflection to a considerable extent, but if the pressure be so long continued as to produce the [illegible] to the force, the effect of the [illegible] increase the deflection The mass must, under such circumstances, move through a space equal to the deflection, whereby a momentum will have been acquired that will afterwards expend itself in increasing the deflection By far the severest strains, however, to which railway structures are habitually exposed arise from the jerks and concussions caused by the imperfect juncture of [illegible] it to withstand such shocks much better than it could otherwise do A large inertia compels the train to deviate from the horizontal plane to an extent answerable to the difference of weight of the striking and stricken bodies so that if the bridge be heavy it will, under such circumstances, be less deflected, and consequently will suffer a less serious strain

Law of the Elasticity of Iron Beams — A bar of iron is usually regarded as a very stiff spiral spring, and it is supposed that it will be compressed or extended equally by equal increments of pressure This law, however, though nearly true for malleable iron, is not true for cast-iron The compressions and extensions of a bar of cast-iron one inch square, and of any length were found by Mr Hodgkinson to be represented by the following formulæ —

$$\text{For the extension, } w = 13934040\frac{e}{l} - 290743200\frac{e^2}{l}$$



$$\text{For the compression, } w = 12931560\frac{d}{l} - 522979200\frac{d^2}{l^2}$$

Here w is the weight in pounds acting upon the bar, e the extension, and d the compression in inches, and l the length of the bar in inches Iron beams alternately deflected and released will be broken in time with a much less strain than that necessary to produce speedy fracture Thus it has been found experimentally, that cast-iron beams deflected by a revolving cam to only half the extent due to their breaking weight will, in no case, withstand 4000 successive deflections, but 4000 successive deflections through one-third of the distance due to their breaking weight may be incurred without visible injury Looking, however, to the various jolts, vibrations, and concussions to which railway structures are exposed, it does not appear that even a strength answering to six times the breaking weight gives an adequate margin for safety in the case of cast-iron beams

Proportions to be observed in the Construction of Tubular Bridges — The sectional area of the bottom of a tubular bridge of wrought iron plates should be to the sectional area of the top, as 11 to 12 The breaking weight is then found by multiplying the total area by the depth, by a constant [illegible] and dividing by the length The depth of tubular beams of 150 feet span should be about $\frac{1}{13}$th of the span, and the depth of tubular beams of 300 feet span should be about $\frac{1}{17}$th of the span These rules are empirical but [illegible] to the most approved [illegible]

Description of the Britannia and Conway Tubular Bridges — Having now indicated the manner in which the proportions and configuration of these bridges were arrived at, and having further pointed out the considerations which should influence the design of all railway bridges composed of iron beams, whatever be the subordinate features of their construction, it will be proper to describe briefly the more important features of the Britannia and Conway bridges as they at present stand The annexed figure represents a portion of one of the tubes seen in perspective There are two tubes in each bridge one for the accommodation of the up line, and the other for the accommodation of the down-line Each tube is rectangular, formed of plates of iron riveted together and with ribs to support the sides, like the ribs of a ship The most remarkable feature of the construction, however, is the cellular top and bottom In all beams which have to be loaded in the centre, it is proper to concentrate the strength as much as possible upon [illegible] at the top and bottom, and in [illegible] this is done by building upon the top and bottom a number of square pipes or pillars joined laterally together, and running from end

(5)

to end of t[illegible] T[illegible] pes sustain a force of [illegible] extension, and the function of the sides of the tube is merely to keep these combinations for meeting compression and extension in their proper places The sectional area of the top and bottom of the tubes may easily be computed by taking the width of each tube, which is 14 feet 8 inches, and the thickness of the plates, but in the model tube, which gave the best results, the sectional area of the top was to that of the bottom as 24 to 22, and this is the proportion commonly employed There are eight cells or pipes composing the cellular top, each 1 foot 9 inches square The plates composing the top of the Britannia bridge are, $\frac{12}{16}$ths at the middle of the bridge, and $\frac{10}{16}$ths at the ends of the bridge The ends of the plates are carefully abutted together, and strips of iron are riveted over the joints The bottom is composed of six cells or pipes, each 2 feet 4 inches by 1 foot 9 inches, and the upper and lower platforms by the introduction of partitions between which the cells are constituted, consist each of a double thickness of plates so arranged that the end of each plate comes to the centre of the other as shown in the accompanying figure A small plate covers each joint, and as it was important not to weaken the bottom of the tube by the rivet holes running across it, the rivets are arranged in longitudinal rows, each a considerable distance from the other, and they act as copper [illegible]dy-pins in keeping the plates [illegible] By this expedient the longitudinal [illegible] the bottom is better maintained, and the strength of each tube approximates to what it would be if formed out of a solid piece of iron, instead of being built up of riveted plates The thickness of the plates forming the upper and lower platforms of the bottom is $\frac{9}{16}$ths at the middle of the tube, and $\frac{7}{16}$ths at the ends The vertical plates are, $\frac{9}{16}$ths at the middle, and $\frac{8}{16}$ths at the ends The sides of the tube are, $\frac{8}{16}$ths at the middle of the bridge, increasing to $\frac{10}{16}$ths where the bridge rests upon the piers, for as the ends of the tube have to sustain the whole weight, they require to be made very strong and stiff to retain them in shape To impart increased stiffness at the ends of the tubes strong cast iron frames are introduced within them, and an arrangement of rollers is put beneath the ends of the tubes to enable the metal of the tubes to expand or contract with changes of temperature

(6)

The tubes of each bridge were built in the same manner as an iron ship, adjacent to the place where they had to be erected A wooden platform or quay was erected upon the shore, upon which a tube was built, and stone supports were subsequently erected at the ends, upon which the tube when completed was made to rest The

timber platform was then cleared away, so as to enable a number of boats or pontoons to be floated beneath the tube, and these rising with the tide lifted the tube The floating mass was then drawn by ropes across the stream, and the ends of the tubes were rested in shelves left in the masonry of the piers on which the tube had to be sustained On the top of the piers hydraulic presses were set, from which chains descended to the ends of the tubes and by putting these hydraulic presses into operation the tube was raised up a small distance and so soon as it was raised sufficiently above the shelf the intervening space was built up Another lift was then taken, and so on, the masonry following up the tube as it ascended, until it reached the level of the top of the piers In the Britannia bridge there are four spans, and the tubes of each span are joined together at the ends so as to form one long tube for each line of railway The effect of thus joining the ends of the tubes is virtually to diminish the span, for the tube takes a contrary flexure where it passes over the piers, and if a line be drawn down the side of the tube where this contrary flexure is made it will be found that the tube might be cut through at that point without weakening it at all

Chepstow Tubular Bridge A tubular bridge of a construction very different from that of the Conway and Britannia bridges has been erected by Mr Brunel for carrying the South Wales railway over the river Wye, at Chepstow This bridge has a nearer resemblance to a suspension bridge than to a hollow beam, but instead of the heads of the towers being tied back by chains, as is usual in suspension bridges, they are kept asunder by cylindrical struts of wrought iron, and rods descend from the tops of the towers which are also of iron, to support the platform of the bridge The limits of this article, however, prevent any detailed description being given of this bridge and of other tubular bridges which have been constructed since the Conway and Menai bridges were projected (For further information on the subject see Mr Fairbairn's *Account of the Construction of the Britannia and Conway Tubular Bridges* and the *Report of the Commission appointed to inquire into the Application of Iron in Railway Structures*)

TURGITE A compact reddish brown mineral composed chiefly of oxide of iron, found in the Turkish Islands in the Ural

TURNBULL'S BLUE A modification of *Prussian Blue* It is a *Ferridcyanide of Iron* its ultimate components are 5 atoms of iron, 12 of carbon, and 6 of nitrogen

TURNER'S CERATE This is the *calamine ointment* of the Pharmacopœia. The modern zinc ointment prepared with oxide of zinc and hogs lard is a good substitute for it it is a mild drying ointment

TURNER'S YELLOW The fused oxichloride of lead, in fine powder it is the basis of a good yellow oil colour formerly much used in coach-painting it is also called *patent yellow* and *Cassel yellow*

TURPETH MINERAL The yellow subsulphate of mercury so called from its yellow colour which resembles that of the root of the *Ipomæa* or *Convolvulus Turpethum*

TYMPAN (Lat) A part of a printing-press on which the blank sheets are placed

TYROLITE A native arseniate of copper found at Falkenstein in the Tyrol

TYROSINE A crystalline substance obtained from cochineal.

U

ULLMANNITE A sulphuret of nickel, antimony, and arsenic from Siegen analysed by Ullman

UMBILICAL CORD In Anatomy, the cordlike portion of the teguments of the abdomen, including the vessels which pass from the fœtus to the placenta in placental mammals, or to the allantois and vitellicle in implacental mammals birds and reptiles, or to the vitellicle alone in plagiostomous fishes In other fishes, in batrachians, and in most invertebrates, the vitellicle is sessile, and there is consequently no umbilical cord

UMBILICAL VESICLE The name given to the proportion of the small vitellicle, or yolk bag, in man and most mammalia

USNINE A substance extracted from different lichens of the genus *Usnea* It forms yellow and very difficultly soluble crystals, fusing like a resin It has slightly acid characters and forms crystallisable compounds with the alkalies hence it has also been called *Usnic acid* Its ultimate composition is represented by the formula C_{38} H - O_4

UTERINE (Lat uterus) In Anatomy, that which appertains to the womb, as the uterine arteries, veins, nerves, and the uterine portions of the placenta or cotyledon

UTERUS (Lat) The womb, or the muscular and vascular part of the efferent canal or tract in the female viviparous or ovo viviparous animal, in which the fœtus is developed In the human subject and quadrumana it is single, in many quadrupeds it is bifid, in some, it is completely divided into two symmetrical uteri

UTRICULUS (Lat) In Anatomy the term is applied to the upper and larger of the two divisions of the vestibular portion of the membranous labyrinth of the internal organ of hearing

UVIC ACID (Lat uva, *the grape*) A synonym of the *Racemic* or *Paratartaric acid*, an acid isomeric with the tartaric, but differing from it in certain respects, more especially in its relations to polarised light

V

VACCINIC ACID A name given by Lerch to a peculiar volatile acid which occasionally replaces the butyric and caproic acid in butter

VALERIANIC or VALERIC ACID This acid constitutes the leading ingredient of the volatile oil obtained by distilling valerian root with water It may also be obtained from the root of *Angelica*, so that it has been called *Angelicic acid*, and it is contained in the bark of the *Viburnum opulus* Lastly, valerianic acid is artificially formed by the action of a mixture of quick lime and caustic potassa, on the oil of potato spirit, the *fusel oil* of the Germans the *hydrated oxide of Amyle* of modern chemists The formula of this acid is C_{10} H_9 O_3+HO It is an oily colourless liquid, smelling intensely of valerian, and of a sour pungent, and nauseous taste, leaving a sense of sweetness, and a white spot upon the tongue

VALONIA The cup of a large species of acorn imported from the Levant and the Morea, and largely used by tanners

VARLC The impure carbonate of soda, made in Brittany it is also sometimes called *Blanquette* it corresponds to our *Kelp*

VASODENTINE (Lat vas, *a vessel* dens *a tooth*) In Anatomy, that modification of dentine in which capillary tracts of the primitive vascular pulp remain ossified and carry red blood into the substance of the tissue They form the so called vascular or medullary canals, and are usually more or less parallel in their course A large proportion of the central part of the tooth of the sloth and megatherium consists of vasodentine, and a smaller proportion of the same part of the tusks of the elephant and of the scalpriform incisors of the rodents

VAUQUELINITE The native double chromate of lead and copper named in honour of Vauquelin, the late celebrated French chemist

VEDETTE or VIDETTE (Fr from Lat video, *I see*) A sentry placed on an outpost or elevated point, so as to be able to observe advantageously the approach of an enemy and to give early notice of his movements

VEGETAL (Lat vego *to flourish*, vegetus, *lively*) In Physiology that class of vital phenomena common to plants and animals viz digestion and nutritive assimilation, growth, absorption, secretion, excretion circulation respiration, generation, as contradistinguished from a second class of vital phenomena, viz sensation and volition peculiar to animals the first are called the 'vegetal functions," the second "the animal functions," and the powers or forces on which they depend have been termed respectively the 'vegetal life' and the 'animal life"

VENA PORTÆ (Lat) In Anatomy, the great trunk formed by the union of the veins from the abdominal organs of digestion, which trunk ramifies, after

VENICE WHITE A pigment consisting of carbonate of lead mixed with sulphate of baryta *Dutch White* and *Hamburgh White* are similar mixtures

VENTRAL (Lat venter) In Anatomy, the parts or the aspect of the region of the belly the plates of the vertebral or serous layer of the embryo that are extended towards that region are called "the ventral laminæ"

VERANDAH A term of Eastern origin applied to a lig lars, and In England verandahs are frequently met in villas and cottage residences attached to sitting rooms on the ground floor, where they afford a good substitute for a colonnade, and provide shelter against rain and sun

VERATRIC ACID An acid contained in the seeds

of *Veratrum sabadilla*, hence also so called *sabadilla acid* Its formula is $C_{34}H_{11}O_{10}+HO$

VERGERS Officers of the courts of law who carry white wands before the judges There are also vergers attached to cathedrals and collegiate churches, who carry a small mace or rod tipped with silver before the clergy

VERGE'TTE In Heraldry a pallet, or small pale A shield divided by pales is said to be *vergetté*

VERMICE'LLI (Ital) A paste of wheat flour in the form of worms, varying in thickness from the smallest cord to the diameter of a quill It is also cut into ribbands and other forms, and is then called *Italian paste* It is made by forcing the paste through small apertures in an iron plate, which is done by a powerful screw press The most glutinous varieties of wheat are those which yield the finest flour for this manufacture

VERMICULITE (Lat vermis, *a worm*) A fine scaly talc composed of micaceous plates cemented together by a whitish matter, it is a hydrated bisilicate of magnesia, oxide of iron, and alumina When heated to redness it projects out with a vermicular motion as if it were a mass of small worms Hence the name

VE'RMIFORM (Lat vermis, and forma, *shape*) In Anatomy, certain parts that are convoluted and shaped like a worm are so called, as, *e g* a hollow process or prolongation of the intestinum cæcum, a part along the middle of the upper and under surfaces of the cerebellum

VERST A Russian measure of length containing 3500 feet, about three-fourths of an English mile

VE'RTEBRA (Lat verto, *I turn*) The term, restricted, in Anthropotomy to certain moveable portions of the segments of the skeleton of the trunk, is now applied, in Anatomy, to the entire segment, which consists, in its typical state, of a "centrum," "two neurapophyses" and a 'neural spine,' two "hæmapophyses" and a "hæmal spine" and two 'pleurapophyses" The principal processes of a vertebra, which are usually exogenous, are, the 'parapophyses," the 'metapophyses," the "hypapophyses," the "diapophyses," the "anapophyses," and the "zygapophyses" The endoskeleton of the vertebrate animals consists of a series of such segments or vertebræ, some of which may support a pair of [illegible] and two pairs of such are usually [illegible]

VESICA'TORIN *Cantharidin* The blistering principle of *Cantharides, Lytta, Mylabris*, and other blistering beetles *See* CANTHARIDES, in DICT

VESPERS (Lat vesper) Evening service in the Roman [illegible]

VESTA [illegible] ame given to one of the small planets between the orbits of Mars and Jupiter It was discovered by Mr Hind, at Mr Bishop's observatory, in the Regent's Park, on the evening of the 13th of September, 1850, in the constellation *Pegasus*, and is the twelfth of the group in the order of discovery Its brightness is somewhat greater than that of some of the others, being equal to that of stars of the eighth magnitude Mr Hind selected as the symbol of the new planet a star and laurel leaf, emblematical of the Goddess of Victory (*Monthly Notices of the Royal Astronomical Society*, vol xi) *See* PLANET

VILLIARSITE A mineralogical name of one of the hydrated silicates of magnesia

VILLI (Lat villus, *wool*) In Anatomy, the name given to minute vascular processes covering, in the proportion of about twenty-five to every square line, the surface of the mucous membrane of the small intestine and giving it a velvety or fleecy appearance They promote the absorption of chyle from the completely digested food Similar minute vascular processes of the chorion and other membranes are called "villi"

VIOLINE An emetic principle contained in the root of the *Viola odorata*, or common violet

VIRGINIC ACID A name applied by Quercenne to one of the acids contained in the rattlesnake root of America (*Polygala Senega*) It is a volatile fatty acid, of a disagreeable odour and taste

VISCERA (Lat viscus *a bowel*) The contents of the three great cavities of the body the brain, *e g* is the viscus of the cranium, the heart one of the viscera of the thorax, and the stomach one of the abdominal viscera The term is usually restricted to the organs of the thorax and abdomen, for the myelon is as much entitled to be called a viscus of the spinal canal, as the encephalon a viscus of the cranium The hæmal arches of the cranial vertebræ have been called "visceral" in the embryo, [illegible] visceral clefts"

VITELLICLE [illegible] The bag which is developed around the food-yolk, or that part of the yolk which has not been converted into the germ-mass and embryo it is chiefly formed by a development of the inner layer of the germinal membrane, the constricted part at which it is continued into the wall of the intestinal canal is called the "vitelline duct" In man and mammalia the vitellicle is called the "umbilical vesicle"

VITTIE VAYR The Tamool name under which perfumers sell the fibrous roots of the *Andropogon muricatum* they contain an agreeable odorous oil The *oil of lemon grass*, and the *grass oil of Namur*, are obtained from other species of [illegible]

VIVIANITE A native [illegible] which occurs in beautiful crystals at [illegible] Cornwall

VOLTAITE. A species of *iron alum*, which occurs in black octaedral crystals in the Solfaterra of Puzzuoli. Named in honour of Volta

VOLTZITE A native oxisulphuret of zinc, found at Rosiers, in the department of Puy de Dome named after Voltz, the engineer of the mines

VOMICINA A name given by some pharmaceutical chemists to the alkaloid more usually termed *Brucia*, obtained from the bark and seeds of the *Nux vomica* and from *St Ignatius' bean*, it is usually associated with *Strychnia*

VORAUITE A mineralogical name of the ferromagnesian phosphate of alumina, found near Vorau, in Styria It appears to be a species of *blue-spar*, or *Lazulite*

VULCANITE A mineralogical synonym of the pyroxene, or volcanic garnet

VULGATE (Lat vulgatus *made public*) The Latin translation of the Old Testament which is as highly reverenced in the Roman Catholic church as the original itself, and from which the texts and other portions of Scripture used in the liturgy are taken The translation earliest in use was commonly called "Itala," and made from the Septuagint [illegible] a new one from the original Hebrew [illegible] two translations were, in after times, intermingled and the Vulgate is composed partly of each *e g* the Psalms are in the old or Italic translation The Vulgate is declared authentic, and appropriated to the use of the church, by the Council of Trent

W

WAFERS Adhesive discs for securing letters or sticking papers together Common wafers are punched out of a paste made of very fine flour which is pressed between two heated plates of smooth iron Transparent wafers are made of films of isinglass or gelatine, dried upon plate glass, and punched out of various forms and sizes Wafers are coloured with various materials, but care should be taken that these are not, as is often the case, of a poisonous nature The wafer makers are very [illegible]

WAGNERITE [illegible] magnesia from Herpen, in Salzburg

WARD'S PASTE A quack medicine, of which *pepper* is the active ingredient, and which has obtained some celebrity as a remedy for piles, and for fistulæ and abscesses about the rectum Its efficacy is said to depend upon the gentle stimulus which it gives to the affected parts, and severe cases of piles are sometimes relieved by it The *Confection of black pepper* of the *London Pharmacopœia* which is a mixture of powdered black pepper, elecampane root, fennel seeds, honey, and sugar, is intended as a substitute for this remedy

WART A thickening and induration of the cuticle, which is elevated in different forms They frequently wear away by abrasion, and may be removed by caustic applications amongst which nitrate of silver, and acetic or [illegible] employed

WASH [illegible]

WATERING OF SILKS This is a process to which silk and some other woven fabrics are subjected, with a view of giving a peculiar appearance to their surface, as seen by reflected light it is generally done by passing the goods, in a damped state, between rollers, some of which are variously indented or engraved sometimes the appearance depends upon the pressure of one fold of the stuff laid transversely or diagonally upon another, and powerfully pressed between plain revolving

WATER-PROOFING The process by which textile fabrics are rendered impervious to water This is most perfectly effected by means of caoutchouc, which is applied in various ways, but there are other substances, and among them some of the earthy soaps, which are more or less effective, such, for instance, as a mixed solution of soap and alum, to which some gelatine [illegible] occasionally added

WEBSTERITE The native subsulphate of alumina, from Newhaven on the coast of Sussex named in memory of Webster, the geologist

WEN. A term commonly applied to fleshy and other tumours, more especially when they affect the face or neck

WHOOPING COUGH *Chincough*, or *Kincough* A disease characterised by a convulsive cough, accompanied by a peculiar sonorous or whooping inspiration, and returning by paroxysms which are usually terminated by vomiting It is infectious, and most commonly attacks children, seeming to depend upon a specific infectious or contagious matter, and affects the same individual only once It usually comes on with slight febrile symptoms, hoarseness and common cough, and in about a week the paroxysms attacks ensue The fit is terminated by expectoration of mucus, or vomiting of the contents of the stomach, after which the patient returns to his usual pursuits, and generally expresses a desire for food, except in very severe cases, where lassitude and fainting ensue and often bleeding from the nose and headache The disease is of very variable duration, but generally goes off gradually after having lasted for some weeks The dangerous cases are those in which the head is much affected, or which are accompanied by bronchitis The treatment consists in obviating irritation, keeping bowels open, giving nauseating medicines, and perhaps an occasional emetic and in full habits blisters and leeches may be resorted to Sedatives or narcotics, carefully administered, are often of the utmost service, especially hemlock, henbane, or even opium, in conjunction with squills and ipecacuanha. Opiate and stimulating liniments applied to the chest and to the region of the spine are also frequently resorted to A mixture of cochineal and carbonate of potash has by some been considered as almost a specific in the treatment of this disorder The relics of the cough, which are often very tedious and obstinate, are best re

WI[illegible] [illegible]ralogical synonym of the native silicate of zinc

WINCING MACHINE The reel by which the dyer winds various articles through the dyeing vat or copper

WINTER-GREEN The *Chimophila umbellata* This plant, under the name of *Pipsissciva*, was first used medicinally by the aborigines of America The infusion of the dried leaves is tonic and diuretic It has been found useful in some chronic affections of the urinary [illegible]

WINTER'S BARK The bark of the *Drimys Winteri*, or *Wintera aromatica*, a large forest tree growing in Chili, Peru, and New Granada, and which was first brought to England by Captain Winter, who accompanied Sir Francis Drake, in 1578, to the Straits of Magellan, where he obtained his specimens It is found in the market in large quills or rolled pieces of a dull yellowish grey colour, an aromatic odour, and warm pungent flavour It was at first confounded with *Canella bark*, which it much resembles in appearance and flavour, but its inner surface is reddish brown, whereas that of canella is much paler, and solution of sulphate of iron gives a precipitate in its infusion, but not in that of canella Canella is the bark of the *Canella alba*, a large tree growing in the West Indies and America

WITCH MEAL A popular name given to the pollen or powder sold in the shops under the name of *Lycopodium*, procured from the *Lycopodium clavatum*, or *Club moss* It contains a large quantity of oily inflammable matter, and when thrown into the flame of a candle produces a sudden flash or blaze, whence it is theatrically used for imitating [illegible] It has also, from its yellow colour, been [illegible] *sulphur* In pharmacy it is used for enveloping pills to prevent their adhesion, and for which, being tasteless and inert, it answers well, and better than magnesia, which is us[illegible] or that purpose

WITHAMITE A mineral discovered by Witham in [illegible] porphyry of Glencoe It ap[illegible] alumina

[illegible] *na*, or *Woad plant*, yields by the fermentation of its leaves a blue colouring matter resembling indigo It is the *Pastel* of the French

WOHLERITE A crystallised mineral containing tantalic acid, zirconia, and silica, found embedded in the zircon-sienite, near Brevig, in Norway Analysed by Scherer, and named in honour of Wohler, the eminent chemist

WOLCHITE A[illegible] and antimony found [illegible] mines at Wolch, in the Lavant [illegible]

WOLFSBANE [illegible] called also *Monkshood* [illegible] In small [illegible] quantities it is virulently poisonous, its most characteristic effect being the production of tingling and numbness, vomiting, contracted pupil, failure of the circulation, and occasional convulsion The root has sometimes been [illegible] and has led to fatal results It has been medicinally used with great success in some obstinate cases of *tic douloureux*, or *neuralgia* Its powers are ascribed to the presence of the alkaloid *aconita*

WORM BARK The bark of the *Andira inermis* or *Cabbage bark tree*, of the West Indies It is cathartic, emetic, and narcotic, in doses of from 20 to 30 grains [illegible] tion

WORMSEED [illegible] under this name consists of broken peduncles, mixed with the calyx and flower buds of some species of Artemisia, and is not the seed of *Artemisia Santonica*, as usually represented Wormseed is imported from the Levant, and used as a vermifuge in doses of from 10 to 30 grains

WORM TEA A preparation kept in the shops of the United States, and much used it consists of spige [illegible] and manna

[illegible] *Artemisia Absynthium* It contains a peculiar, bitter principle, to which its medica virtues may be ascribed, called *Absynthine* Its infusion was formerly a favourite popular remedy for worms, but it is now in disuse

WOUND BALSAM The compound tincture of *Benzoin* of the Pharmacopœia, known also as *Friars balsam*

WOURARA or WOURALI *Ourari* A powerful poison used in Guiana it is obtained from a species of *Strychnos* S[illegible] *Waterton's Essays on Natural History*

WRYNECK A permanent inclination of the head towards one of the shoulders not connected with distorted vertebræ and arising often from a contraction of [illegible] m burns, or other causes, or from a [illegible] bres of the sterno-mastoid muscle

WULFENITE A mineralogical synonym of the native molybdate of lead

WYVERN In Heraldry, an imaginary animal resembling a flying serpent

X.

XANTHINE (Gr *ξανθος, yellow*) The yellow co[illegible] of madder

XANTHITE (Gr *ξανθος*) A mineral found in small grains and crystals of a yellow Orange county, New York its princi[illegible] are silicate of lime and silicate of alumina

XANTHOPHYLLINE (Gr *ξανθος, yellow*, *φυλλον, a leaf*) The yellow colouring matter formed in autumnal leaves

XANTHOPHYLLITE (See above) A yellow fo[illegible] [illegible]

XANTHOPICRITE (Gr *ξανθος*, and *πικρος, bitter*) A crystalline bitter principle contained in the bark of the *Xanthoxylum Caribæum*, which is used in the Antilles [illegible]

XANTHOPROTEINE (Gr *ξανθος* and *πρωτειον, the chief rank*) A yellow acid substance formed by the action of nitric acid upon fibrine

XANTHORHAMNINE (Gr *ξανθος*, and *ραμνος, a kind of shrub*) A yellow substance extracted from the berries of *Rhamnus tinctoria*, the *Persian berries* of commerce

XENOLITE (Gr *ξενος, foreign* and *λιθος, a stone*) A silicate of alumina, from Petershoff, Finland it appears to be a species of cyanite

XESTA (Gr) An Athenian measure of capacity, [illegible] Roman sextarius

XYLITE (Gr *ξυλον, wood*) A ligniform asbestus, from the Ural

XYLOIDINE (Gr *ξυλον, wood*) A white granular substance, formed by the action of nitric acid upon starch, and upon certain modifications of lignine it is related to Schonbein's *Gun cotton*

XYLORETINE (*ξυλον, wood*, and *ρητινη, resin*) A crystalline resinous substance found in certain varieties of turf

Y.

YELLOW EARTH A mixture of hydrated silicate of alumina and peroxide of iron, found in Scotland, Bavaria, the Harz, and elsewhere it is sometimes used as a coarse yellow pigment

Z.

ZEA MAYS [illegible] MAIZE, in DICT

ZEDOARY ROOT The sliced tuber of *Curcuma Zedoaria*, a warm aromatic bitter *Zerumbet root* is a similar product.

ZEIL'ANITE. A species of spinel or corundum from Ceylon It has also been called *Candite*

ZLUXIIL (Gr [illegible] in the *United Mines*, [illegible] of fibrous crystalline aggregates of a greenish brown colour, and having the appearance of tabular actinolite It is a hydrated ferro-silicate of alumina

ZIE'GA, or SERAI. After rennet has ceased to [illegible] of milk, the addition of acetic [illegible] separation of curd, to which th[illegible]

ZINCITE. [illegible] oxide of zinc, found with Franklinite and calcareous spar, at Franklin and Sterling in New Jersey

ZINCKENITE. [illegible] lead, found near [illegible] discoverer Zinken

ZOLLVEREIN (Germ *Customs Union*) A name given to the German Commercial Union, of which Prussia is the head, by which it was determined that there should be perfect freedom of commerce between all the states that joined it that the duties on importation, exportation, and transit, should be identical in all such states that these duties should be charged along the frontier of the dominions of the contracting parties, and that each should participate in the produce of such duties in proportion to its population The basis of this league was first laid in 1818 since which period it has been gradually joined by nearly every German state, except Austria, and there is reason to believe that this last power will soon be included in its arrangements (See *Com Dict* art PRUSSIAN COMMERCIAL UNION,

ZOMIDINE (Gr ζωμος, *broth.*) The aqueous extract of flesh one of the substances giving the odour to meat-broth and probably the same as OSMAZOME

ZONA PELLUCIDA (Lat) In Embryology the external investment of the ovarian ovum in mammalia, which consists of a thick transparent membrane, and appears, [illegible] ring

ZWEISELITE [illegible] manganese iron [illegible]

ZYGANTRUM (Gr ζυγον, *a yoke*) The articular cavity at the back part of the neural arch of the vertebræ of serpents and some lizards which receives the zygosphene

ZY'GAPOPHY'SIS (Gr ζυγον, *a yoke*, αποφυσις, *a process*) The articular or oblique process of the vertebra, by which it is connected to the adjoining vertebræ

ZY'GOSPHENE (Gr ζυγον, and σφην, *a wedge*) The wedge-shaped process from the fore part of the neural arch of the vertebræ of serpents and some lizards, superadded to the ordinary anterior zygapophyses, and articulated to a cavity in the antecedent vertebra

ZYMO'TIC (Gr ζυμη, *leaven*) In Medicine, diseases caused [illegible] the system of a virus or poison, which is diffused through the frame, and operates upon it like a ferment or leaven In the Registrar-General's Report, the following diseases are grouped together as "zymotic" — small pox, measles, scarlatina, hooping cough, croup, thrush, diarrhœa, dysentery, cholera, influenza, purpura and scurvy, ague remittent fever, infantile fever, typhus, metria or puerperal fever, rheumatic fever, erysipelas, syphilis, noma or canker, hydrophobia.
