NE'CROMANCY (Gr *νέκρος*, and *μάντεια*, *prophecy*) Divination by consulting the spirits of the dead Necromancy is prohibited in Deuteronomy, and the [illegible] book of Samuel respecting the witch [illegible] or whether it be understood of an actual evocation, or of a deception practised by a soothsayer — shows that necromancy real or pretended, was among the usages of very distant times In Homer, the portion of the *Odyssey* termed the Necyomanteia exhibits the superstition in a very peculiar form Ulysses performs a sacrifice with peculiar solemnities, and pours the sacrificial blood into a ditch the spectres of the dead rush wildly from the infernal regions to taste the blood, and discovering that of Tiresias, of which he was in search, he compels it to answer his questions The rest of the book in which Ulysses appears actually to descend to the shades, and to see the punishments of celebrated criminals is suspected by some commentators to have been an interpolation of later times Similar customs in practising the art of necromancy seem to have been followed for a long period in Greece and Italy Horace mentions the pouring of the blood of a sacrificed sheep into a ditch, in order to attract the manes from beneath But in Thessaly the most celebrated of classical regions for its proficiency in the art of magic, peculiar horrors seem to have attended the exercise of necromancy Lucan's Thessalian witch reanimates the corpse of a soldier slain in battle and compels him to answer her questions respecting futurity But the *ψυχαγωγοι* or professed evokers of spirits in Thessaly seem to have performed their rites whether as impostors or as fanatics, with the sacrifices of human beings and various other enormities Modern necromancy, like most branches of divination in modern superstition has been chiefly accomplished by the agency of devils who either voluntarily or by compulsion act at the behest of the magician *See* MAGIC WITCH

NE'CROLITE (Gr *νέκρος* and *λίθος*, *a stone*) A mineral which is found in small nodules in the limestone of Baltimore and which when struck exhales a fetid odour resembling that of putrid flesh

NECROPHAGANS *Necrophaga* (Gr *νέκρος*, and *φαγω I eat*) The name of a family of Clavicorn beetles, comprehending those which feed on dead and decomposed animal substances

NECROSIS (Gr *νέκρωσις to destroy*) This term is applied in surgery to the mortification of parts of bones

NECROSIS or SPOTTING In Botany a disease of plants, chiefly found upon the leaves and soft parenchymatous parts of vegetables It consists of small black spots, below which the substance of the plant decays

NECTAR in the Mythology of the Greeks and Romans was the supposed drink of the immortal gods (ambrosia being their food) and was fabled to contribute largely to their immortality If we believe the accounts of the poets the qualities of this liquor must have been of a most delicious character It imparted youth bloom, and vigour to the body and possessed the power of repairing all the defects and injuries of the mental constitution

NECTA'RIUM (Lat nectar *honey*) Any part of a flower that secretes a honey like substance It is variously applied to modifications of the petals, stamens and disk and is now not much employed

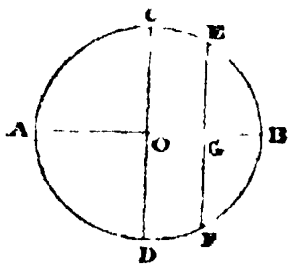
NEEDLE MAGNETICAL A slender magnetized bar of steel which when suspended freely on a pivot or centre, arranges itself in the direction of the magnetic force of the earth See COMPASS MAGNETISM, VARIATION

NEEDLE ORE (From the acicular form of its crystals) A native sulphuret of bismuth, copper, and lead it occurs in the gold mine of Schlangenberg, in Siberia

NEEDLE STONE A species of acicular zeolite found in Iceland

NE EXEAT REGNO In Law, a writ to detain a person from going out of the kingdom without the king's licence directed to the sheriff, or to the party himself The use of the writ is to prevent a party from withdrawing his person and property from the jurisdiction of the courts in England but this purpose was served at common law before the Late Insolvent Act by arrest, and bail obtained This writ lies, therefore, where there is a suit in equity for a d[illegible] which [illegible] at law, a[illegible] equity

NEGATIVE, in Logic, denotes the quality of a proposition which denies the agreement between the subject and predicate



NEGATIVE SIGN In Algebra, the sign of subtraction, — Any quantity to which this sign is prefixed is called a *negative* quantity

[illegible]tive quantities is attended with [illegible] and has given rise to much discussion When a negative quantity is preceded by a positive quantity greater than itself nothing is simpler than the accurate notion of its signification For instance, in the expression $a - b$, where a is greater than b no difficulty can arise about the nature of the operation which is indicated But in algebra quantities are constantly occurring of the form $a - b$, where b is greater than a, or of the form $-a$ where the negative quantity stands by itself, and it is often a matter if indeed it be possible, to discover any exact principle by which such expressions are to be interpreted

The definitions usually given by writers on algebra of [illegible] taken in a contrary sense or opposite direction The first of these definitions, which, indeed, presents itself the most naturally, was adopted by Newton in the *Arithmetica Universalis*, and also by Euler, in his *Introductio in [illegible]* The second definition has been [illegible] the application of algebra to geometry and mechanics But it has been shown by D Alembert, and more particularly by Carnot in his *Géométrie de Position*, that both definitions lead to inaccurate notions

With regard to the first definition D Alembert reasons in this manner —Let there be the proportion $1 : -1 = -1 : 1$, which is true because the product of the extremes is equal to the product of the means Now if -1 be less than nothing, much more will it be less than 1, therefore the second term is less than the first, consequently the fourth must be less than the third that is to say, 1 must be less than -1 therefore -1 is both less than 1 and greater than 1 which is absurd Carnot further remarks that a multitude of paradoxes, or rather absurdities arise from the notion that negative quantities are less than 0, for example -3 must be less than 2 yet $(-3)^2$ would be greater than 2^2, because $(-3)^2$ is 9 and 2^2 is 4, that is to say, of two unequal quantities 2 and -3 the square of the greater would be less than the square of the smaller which is contrary to my clear and distinct notions that can be formed of the nature of quantity

The principle that negative quantities are quantities taken in a different sense or opposite direction to positive quantities is shown by Carnot to lead to error by the following example —Let A C B D be a circle of which O is the centre and A B a diameter, we have then A B = A O + O B Through the centre O draw C D perpendicular to A B and through any point in the circle F draw the chord I F parallel to C D meeting A B in G Let A be the origin of the abscissæ, and make A G = x and G I = y, then putting a = the radius of the circle we have the equation $y^2 = 2ax - x^2$ The solution of this quadratic gives $y = \pm \sqrt{2ax - x^2}$ which according to the theory under consideration shows that y has two values equal and directly opposite to each other, namely G I represented by the positive root and the other, G F, represented by the negative root that is to say we have G F = $+\sqrt{2ax - x^2}$, and G I = $-\sqrt{2ax - x^2}$ equations which ought to be true whatever be the value of A G or x Let us therefore suppose A G = A O = a G I will then become O C and G I will become O D, therefore the two equations will become G I = $+a$, and G I = $-a$, and, consequently G F + G I = 0, that is, A B = 0 which is absurd although rigorously deduced from the theory The theory therefore is false It may be possible Carnot remarks to oppose metaphysical subtleties to this conclusion but he thinks that no clear and satisfactory answer can be given to the argument

Without entering into metaphysical subtleties, we may remark that there is an evident fallacy in the above conclusion, which arises from first assuming the signs + and − to be *symbols of interpretation* and then considering them as *symbols of operation*, without regard to their directive signification On making $x = a$, the two roots of the above quadratic are $+a$ and $-a$, and the signs are by the theory assumed to signify opposition or contrariety of direction But in the equation $+x - a = o$ (from which G F + G F = o is derived), the directive signification is entirely lost sight of, the signs are regarded as merely symbols of operation, and the equation being interpreted in the usual way simply affirms that the difference between the two roots, *in respect of absolute magnitude* is nothing

Having shown that the usually received notions respecting negative quantities are obscure and inaccurate, Carnot proceeds to establish the true principles of their theory He concludes, 1st, That an isolated negative quantity is a mere creation of the mind, and that those which result from the operations of the calculus are nothing more than simple algebraic forms, incapable of representing any real and effective quantity whatever 2d, That each of these forms, [illegible] its sign, is nothing more than [illegible] absolute quantities, of which the one that was the greater in the case on which the reasoning was founded, becomes the less in the case to which the results of the calculus producing that form is applicable

According to this theory, the true meaning to be attached to the expression *negative quantity* is this —An absolute quantity, which does not belong to the system on which the reasoning has been established, but to another system related to the former in such a manner that in order to render the formulæ for the first system applicable to it the sign which precedes it must be changed from + to −, or from − to + For example if y represent the difference between the two quantities a and z, it does not follow that, by substituting $-y$ for $+y$, the quantity represented by y becomes negative, but merely that, of the two quantities a and z, the one which was the greater in the case in which y has the sign + becomes the smaller when the sign of y is changed into − The [illegible] suffice to give a notion of the na- [illegible] which attend the rigorous interpretation of the negative sign in symbolical algebra For full information on this abstruse subject, the reader is referred to the [illegible] —Carnot *Géométrie de Position*, Mascheroni [illegible], *Warren on the Geometrical Square Roots of Negative Quantities*, 1828, *Peacock's Algebra*, Id *Report of the British Association for* 1834, *De Morgan's Trigonometry*, Young's *Mathematical Dissertations*, and the articles connected with the subject in the *Penny Cyclopædia*

NEGLIGENCE (Lat *negligo*, *to neglect*) In the Fine Arts, a want of observance of admitted rules and principles in the several parts of a work, such as in costume in the disposition of the light and shade, &c

NEGROES The Ethiopian or fourth variety of the human race, according to the division of Blumenbach and his followers widely spread over the surface of the earth, occupying almost the whole of Africa south of that great belt of desert which extends, in the latitude of the tropic of Cancer, from the Atlantic to the Red Sea The distinctions of this race are marked and peculiar, but they are not universal, or every where the same Thus the colour varies although less so, perhaps than that of any other of the great varieties of mankind, the Hottentots, and various southern tribes belonging to the Ethiopian race, are in this and other respects widely different from their brethren The woolly hair dark jet colour, and some external peculiarities of conformation seem chiefly to belong to those numerous tribes which inhabit the west coast of Africa, between the equator and the tropic of Cancer But, even within that region some tribes are to be found whose physiognomy is very different from that which we are accustomed to regard as representing the Negro type South of the equator many of the tribes are inferior in strength and [illegible] [illegible] New Guinea off the south-eastern extremity of Asia, a native population is found with most of the characteristics of the African negro

The Negro race appears to have been subjected to the tribute of furnishing slaves to its more powerful and intelligent neighbours from a very remote period of antiquity [illegible] European slave ships had visited the [illegible] Africa, the Arabs bore off slaves in their caravans, across [illegible] of the continent and [illegible] for example) we find mention made of Black or Ethiopian slaves See SLAVE TRADE

By the mixture of the Negro and white races the mulatto is produced, the Sambo is the offspring of a Negro and an American Indian The numerous varieties of these [illegible] of Negro European [illegible] denominated accurately in the West Indies It is probably, be estimated that there are now on the continent and islands of America including Negroes, Mulattos, but exclusive [illegible] a greater proportion [illegible] individuals of African descent, viz

In the United States	3,500,000
British colonies	900,000
Hayti	700,000
Spanish, French, &c West Indies	1,200,000
Brazil	2,500,000
The free states of continental America, formerly Spanish colonies	1,000,000
	9,800,000

Of whom five or six millions are now in a state of slavery;

the remainder, except in Hayti, forming an inferior and generally an oppressed class of free inhabitants The ultimate destiny of this multitude of human beings is a matter of very anxious speculation Hayti, peopled by the slaves of the French planters of St Domingo who threw off the yoke of their masters and established an independent community and the progress of that community in civilization is not such as to encourage the sanguine hopes of the philanthropist

It has long been a favourite theory of many philosophers that the negro races are naturally inferior in point of intellect, and do not possess the same capacity for improvement as the Europeans, or people of the Caucasian variety This supposition has, however, been vehemently denied, and it has been contended over and over again that the peculiar circumstances under which they have been placed sufficiently account for the condition of the Africans, the want of a literature and their low civilization Little weight should be attached to the circumstances mentioned is true, but still we do not think that they are sufficient wholly to account for the existing state of things. Egypt was at a very remote period, the principal seat of science and of art, and various nations of Africa were in contact with and had a pretty extensive intercourse with, the Egyptians, and also with the Phœnicians, and afterwards the Romans But they seem to have profited little or nothing by this association And while the people of Greece Asia Minor and Magna Græcia raised themselves in a comparatively brief period to the highest pitch of civilization and refinement the nations of Africa continue without a solitary exception, down even to the present day, immersed in the grossest barbarism Surely however, during the space of two thousand years, opportunities must have been afforded to some of them to make some advances But if so, not one has had sagacity to profit by by them Africa, in fact, does not seem to have produced a single great man She has had no Hercules no Minos no Theseus, no Confucius, no Manco Capac Among all the varieties of superstition that exist in it we look in vain for hero worship — for the divine honours paid in rude but improving nations in other parts of the world by the public gratitude to departed heroes, legislators, and authors of important discoveries in the arts

With the exception of that of the ancient Egyptians and Ethiopians whose descent is involved in the greatest uncertainty, almost all the civilization that exists in Africa seems to be of foreign origin The introduction of Mohammedanism though in a debased form, has gone far to banish cannibalism from many countries, and some of them have also adopted the letters and literature of Arabia But the progress they have hitherto made is not such as to lead to any very sanguine anticipations as to their future advancement, and it would not indeed, be very philosophical to suppose that those who have been wholly unable to produce any thing original should attain to much eminence in the practice of foreign arts and sciences

It is unnecessary to enter into any examination of the *vexata questio* whether the varieties of the human race in Africa originally sprung from different sources or whether they all belong to the same stock, but changed to the state in which we find them by the influence of circumstances in the lapse of ages Whatever conclusion may be come to on this point cannot in anywise affect the question as to the comparative intelligence of the African people The same circumstances that are supposed by those who contend for the original identity of the races to have so greatly affected their appearance and physical capacities, could hardly fail to have an equally powerful influence over their mental faculties This in fact is substantially admitted by Dr Pritchard, who has ably contended for their common origin, and the equality of their intellect with that of the other races "The tribes, says he, "in whose prevalent conformation the negro type is discernible in an exaggerated degree, are uniformly in the lowest stage of human society, they are either ferocious savages, or stupid, sensual, and indolent Such are the Papals, Bulloms, and other rude hordes on the coast of Western Guinea and many tribes near the Slave coast, and in the Bight of Benin, countries where the slave trade has been carried on to the greatest extent, and has exercised its usually baneful influence On the other hand, wherever we hear of a Negro state the inhabitants of which have attained any considerable degree of improvement in their social condition, we constantly find that their physical characters deviate considerably from the strongly marked or exaggerated type of the Negro The Ashantee the Sulema, the Dahomans are exemplifications of this remark The Negroes of Guber and Hausa, where a considerable degree of civilization has long existed, are, perhaps, the finest race of genuine Negroes in the whole continent, unless the Jolofs are to be excepted The Jolofs have been a comparatively civilized people from the æra of their first discovery by the Portuguese" — (*Researches into the History of Man*, ii 338 3d ed)

Here we have it distinctly laid down that the existence of the distinguishing features of the Negro race in a strongly marked degree is uniformly associated with the lowest state of barbarism, and that as they recede from this strongly marked type, we find a greater degree of civilization and improvement The inevitable conclusion is, that every variety of the Negro type, which comprises the inhabitants of almost all central Africa, is indicative of mental inferiority, and that ferocity and stupidity are the characteristics of those tribes in which the peculiar Negro features are found most developed We believe that this is a perfectly correct statement and we do not know that more might be said could show more conclusively the mental inferiority of the great bulk of the African people

But we do not form our opinion as to their inferiority on their configuration and appearance, but on the fact that while numberless European and Asiatic nations have attained to a high state of civilization, they continue, with few exceptions, in nearly primeval barbarism It is in vain to pretend that this is the result of the unfavourable circumstances under which they have been placed An intelligent enterprising people contend against unfavourable circumstances, and make them become favourable, but the Africans, with the questionable exception of the ancient inhabitants of the valley of the Nile, have never discovered any considerable degree of enterprise or invention or any wish to distinguish themselves either in arts or arms From the remotest antiquity down to the present day they have been hewers of wood and drawers of water for others, and have made little or no progress and the only legitimate inference from this lengthened induction seems to be that they are incapable of making it, that civilization will not spring up spontaneously amongst them, and that if it ever grow up it must be introduced from abroad and fostered and matured under foreign auspices (For full information on this subject, see the elaborate article on Africa in the *Geographical Dictionary*)

NEHALENNIA The name of an ancient Dutch and Flemish divinity who presided over commerce and navigation Her origin and general character are unknown and even her name suggests only forced and unsatisfactory associations but the sixteen altars whereon her image and name were represented which were found in the island Walcheren in 1647 leave no doubt of her former influence (See *Grimm's Deutsche Mythologee*, and the authorities there cited)

NEITH One of the most ancient Egyptian deities, supposed to be identical with the Grecian Minerva or Rhea Her name according to Jablonski indicates old or harmonious She was regarded as an incarnation of nature and as the patroness of all the arts Her most celebrated temple was at Sais where she was worshipped with peculiar veneration and where stood the veiled image so famous in the mythology of Egypt the rash inspection of which cost the adventurer either his life or his reason (See Schiller's poem *Das verschleierte Bild zu Sais*)

NEMATOI'DIANS *Nematoidea* (Gr νημα, *a filament* and εἰδος *form*) The name of an order of *Cœlelmintha* or cavitary intestinal worms, comprehending those which are diœcious, and have a round, filiform, elongated body

NEMATONEU'RA (Gr νημα, and νευρον *nerve*) A name proposed for that division of the *Radiata* of Cuvier including animals in which nervous filaments are distinctly traceable and the alimentary canal floats loosely in a distinct abdominal cavity

NEM CON A contraction for *nemine contradicente*, signifying no one contradicting *nem diss*, contracted for (Lat) *nemine dissentiente*, signifies no one dissenting

NEMEAN GAMES One of the four great national festivals of Greece, in which all the states participated (See GAMES) They were celebrated at Nemæa (whence their name), a village in the north eastern part of Argolis By some they are said to have been established by the Epigoni children of the warriors who besieged Thebes, in memory of Ophaltes, but others relate that they were first instituted by Hercules, in honour of Jupiter, after his victory over the Nemean lion They were held every third year, under the presidency of citizens chosen by lot from the states of Argos Corinth and Cleonæ The games were the same as those of Olympia The victorious combatants were crowned with parsley See especially *Wachsmuth's Historical Antiquities of Greece*, Oxf transl vol ii 162, and a memoir by Villoison, in the 38th volume of the *Mémoires de l'Ac des Inscriptions*

NEMESIS A Greek divinity, worshipped as the goddess of vengeance According to Hesiod, she was the daughter of Night, and was represented as pursuing with implacable hatred the proud and insolent The reluctance of the Greeks to speak boastfully of their good fortune,

lest they should incur a reverse, is well known; and from various passages of the *Iphigenia* and other ancient writings it is clear that human victims were sometimes offered to propitiate this [illegible] goddess were [illegible] Nowhere, however, was her worship so pompously celebrated as at Rhamnus, a town of Attica, where she had a statue by Phidias, [illegible] by Mardonius to Greece, [illegible] the best [illegible] of Phidias A fragment supposed to be the head of this statue was presented to the British Museum in 1820, where it may still be seen

NEMO'CERA (Gr *νημα, a thread*, and *κερας horn*) The name of a family of Dipterous insects, including those which have long [illegible]

NEMOGLOSSA (Gr *νημα* and *γλωσσα, a tongue*) The name of a tribe of Hymenopterous insects, including those which have a long filiform tongue, as the bee tribe

NEO'CORUS Gr *νεος, ναος temple, κορεω I keep or take care of*) In Greek [illegible] as guardians of temples and their treasures (See *Mem de l'Ac des Inscr* vol xviii 140)

NE'OLOGISM, NE'OLOGY (Gr *νεος new* and *λογος, word*) A new phrase or word introduced into a language, or any innovation on ordinary modes of expression Most European tongues have their classical diction fixed by precedent and authority, and words introduced by bold or careless writers since this standard was established, go by the name of neologisms until usage has added them at last to the received national vocabulary *Neology*, in the last century was the name given by orthodox divines in Germany to the novel system of interpretation which then began to be [illegible] ny to the records of revealed religion See [illegible]

NEOME'NIA (Gr *νεος, new*, and *μην a month*) A festival observed by the Greeks at the beginning of every lunar month in honour of all the gods but more especially of Apollo thence called *Νεομηνος* as being the author of all light, and the grand luminary from which all time receives its distinctions and divisions At these solemnities the Athenians offered up prayers and sacrifices, in the temple of Erechtheus, for the prosperity of their city during the month that had commenced Games were also instituted during their celebration and grand entertainments given by the richer to the poorer citizens

NE'OPHYTE (Gr *νεος young, φυτος planted*) In the primitive church newly converted Christians were so termed, and the same appellation is still given, in the Roman Catholic church, to converts made by missionaries [illegible] person entering on the priestly [illegible] newly received into the communion of the church

NEOPLATONI'CIANS or NEOPLATONISTS In Ancient Literature the mystical philosophers of the school of Ammonius Saccas and Plotinus are commonly so called who mixed some tenets of ancient Platonism with others derived from a variety of sources and particularly from the demonology of the East They flourished in the 4th and 5th centuries of the Christian era Some, however, have contended that this title is more properly applicable to the eclectic Platonists, or school of Antiochus and Philo (See PLATONISTS ECLECTICS) For a singular view of the doctrines and tendency of the Neoplatonists, the reader may consult the *Quart Rev* July, 1840

NEPE'NTHE (Gr *νη* priv, and *πενθος sorrow*) A species of magic potion, mentioned by the Greeks and Romans, which was supposed to have the power of obliterating all pain and sorrow from the memory of those who partook of it It is now used figuratively to express any efficient remedy in giving rest and consolation to an afflicted mind

NEPHA'LIA (Gr *νηφαλιος sober*) Grecian festivals or sacrifices instituted in honour of various deities as Aurora, Venus &c They were so called because no wine was offered during their celebration It was chiefly at Athens that these festivals were observed

NE'PHELINE (Gr *νεφελη, a cloud*) A mineral from Somma, near Vesuvius and Capo di Bova near Rome, in nitric acid its transparent fragments become *cloudy* It is a double silicate of alumina and soda It [illegible] known by the name of *sommite*

NEPHRITE A hard tough mineral composed chiefly of silica, with lime, soda, and potash It is difficult to break, cut, or [illegible] by [illegible] of a greenish [illegible] It [illegible] into sword and knife handles and has even been cut into the form of a chain, which, from its extreme toughness, is not easily broken Little plates of it were formerly suspended from the neck for the [illegible] whence its name The Chinese [illegible] articles composed of it Its essential components are silica, alumina and magnesia

NEPHRI'TIS (Gr *νεφρος, a kidney*) Inflammation of the kidney This disease is attended by pain in the [illegible] ing the ureter, and increased [illegible] posture nausea and vomiting are common attendants and the appearance of the urine is generally far from healthy Bleeding, warm baths, sudorifics, and aperients, with opiates and diluents, are the principal remedies resorted to

NEPHROTOMY (Gr *νεφρος*, and *τεμνω, I cut*) The operation of extracting a stone from the kidney

NEPOTISM A word [illegible] characteristic of many high [illegible] tholic countries, and more particularly of popes a propensity [illegible] aggrandize their family by exorbitant grants and [illegible] conferred on members of it literally [illegible] The [illegible] of the highest and wealthiest families of the Roman nobility owe their elevation entirely to this species of patronage

NE'PTUNE The Italian name of the deity called by the Greeks Poseidon (*Ποσειδων*) He was brother of Jupiter, and, in the partition of empire after the death of Saturn, the sea fell to his share, but in subservience to the former His queen was Amphitrite, and his paramours nearly as numerous as those of his brother, but their progeny was not so celebrated, with the exception of the hero Pelops

His most famous temples were at the Corinthian isthmus, Helicè, [illegible] and Fænarus, [illegible] temple of Pæstum, in Italy, still in existence Neptune was said to preside over horses and the manger He is represented similar in appearance to Jupiter, but his symbols are a trident and the dolphin *Neptunalia* were festivals celebrated by the Romans during the months of July in honour of Neptune There were other festivals in honour of Neptune in his capacity of presiding over horses, called *consualia*, but the former were instituted to him in his character of god of the sea During the solemnity it was customary to live in booths erected on the banks of the Tiber

NEPTU'NIAN THEORY The geological theory of Werner, which refers the formation of all rocks and strata [illegible] to [illegible]

NEREI'DIANS *Nereidæ* The name of the family of Dorsibranchiate Annelidans of which the genus *Nereis* is the type The characters are, an even number of tentacula attached to the sides of the base of the head, and a little farther forwards two others which are biarticulate, between which are two simple ones Their branchiæ consist of small laminæ between which is spread a network of vessels, each foot is also furnished with two tubercles two packets of bristles, one cirrus above and another beneath

NE'REIDES (Gr *Νηρειδες*) The daughters of Nereus and nymphs of the sea They were originally conceived to be of a beautiful form, but later fictions degraded them to the idea of a mermaid The nereids are said by most ancient writers to have been fifty in number, but Propertius makes them [illegible] most famous of these goddesses were [illegible] Doto Thetis, &c Their worship was almost invariably connected with that of Neptune

NE'REUS (Gr *Νηρευς*) A marine Grecian deity, son of Ocean and Earth He possessed the gift of prophecy, and was distinguished for his knowledge and love of truth and justice

NERI'TA (Lat *Nerita* the name of a shell-fish in Pliny) This term was applied by Linnæus to a genus of his Vermes Testacea, characterized by having a shell with the columella [illegible] thus, which renders the aperture of a semicircular form this aperture is always closed by an operculum The genus is ranked by Cuvier amongst his Pectinibranchiate Gastropods and is subdivided into the subgenera *Natica*, Lam, *Nerita*, *Voluta*, and *Neritina*, Lam *Nerita* proper is a marine shell, while *Neritina* is an inhabitant of fresh waters Examples of both genera are found fossil in the strata of the Paris basin

NE'ROLI The name given by perfumers to the essential oil of orange flowers It is procured by distillation with water in the same way as the other volatile oils

NE'RVINE A medicine resorted to in nervous affections

NE'RVOUS FEVER A low fever in which nervous symptoms or sensorial debility, are especially prevalent the treatment consists in allaying nervous irritation and supporting the strength

NERVOUS SYSTEM In Physiology The nerves are fibrous chords in direct or indirect connection with the brain, and extending their ramifications into every part of the body their ultimate structure is filamentous, and they consist of a peculiar grey substance, their size depending upon the number of filaments enclosed in the common sheath They are often so interwoven as to form a kind of network or *plexus*, and some of them have what are termed *ganglia*, or rounded masses of nervous matter, not fibrous, but apparently composed of [illegible] and [illegible] network

[illegible] of nerves, one of which is connected with the brain and with the spinal chord,

and are media of sensation and of voluntary motion they are [illegible] or the *cerebro-spinal* ne[illegible] in communication with the brain and spinal chord, or with the cerebro-spinal nerves, by very small filaments, and they have numerous ganglions throughout their course they preside over the nutritive functions, upon which the mind has no direct influence these are the nerves of *organic life*, or *ganglionic* or great *sympathetic* nerves

The cerebro-spinal nerves convey impressions from their extremities to the brain, and they also convey the influence of the will from the brain to the voluntary muscles, these passing and repassing, or receptive and emissive influences, are conveyed by distinct sets of nervous filaments, which, however, are generally enclosed in the same sheath, and nerve the terms *centr* [illegible] have been distinctively applied to them

The history of the nervous system in all its details forms an extended and complicated, but a highly important part of anatomy and physiology, the investigations connected with which have led to many useful practical results, which, however, have thrown but little light upon the cause of the phenomena, or the ultimate nature of the nervous influence The works of Sir Charles Bell Dr Marshall Hall and Dr Wilson Philip must be consulted in reference to the functions of the different classes of nerves, there is a good general account of the subject in Baly's translation of *Müller's Physiology*

NERVOUS SYSTEM In Comp Anat In some of the lowest-organized animals the nervous system has been detected in the form of simple filaments, these are afterwards found connected with a nervous ring surrounding the œsophagus As organization advances nervous matter begins to be accumulated upo[illegible] brain, and upon different parts of the [illegible] forming ganglions

When the principal ganglia ted filaments are not parallel, or not symmetrical in their course they are associated with the type of organization which characterizes the molluscous or *heteroganglia* division of animals When the ganglia ted filaments are two in number symmetrical, and run parallel with each other along the ventral aspect of the body they are associated with and bespeak the type of organization characteristic of the articulate or *homoganglia* te division When the brain ceases to present the form of a ring, and sends down the back a prolongation of its substance called the spinal marrow the rest of the organization is that which characterizes the vertebrate or *myelencephalous* subkingdom or primary division of animals In the vertebrate and articulate animals the superficial tract of the spinal or ventral chords is sensitive the deeper seated tract moto[illegible]

NERVU'RES in Entomology are corneous tubes for expanding the wing and keeping it tense, and to afford protection to the air vessels they are termed costal post-costal mediastinal, externo-medium interno-medium anal, axillary &c according to their relative positions In Botany *nervures* are the veins of leaves

NESS The termination of several names of places in Great Britain where there is a headland or promontory as Inverness, Sheerness The word is probably derived from the Ir nez or the Germ nase, *nose*

NESTO'RIANS The followers of Nestorius, patriarch of Constantinople in the first half of the fifth century This prelate agitated the Christian world after the Arian controversy had been quietly settled by the introduction of certain subtle disputations concerning the incarnation of our Lord from which hatred and contentions arose which harassed the church for the space of more than two centuries He affected to distinguish with peculiar precision between the divine and human natures united in Christ, and, in guarding over carefully against the propensity which he discovered in the Christians of his own day to confuse the two, and look upon them as absorbed into one compound substance, he forbade men to entertain any combined notion at all and kept constantly before their eyes both the god and the man He insisted for instance, that the Virgin should not be entitled *Mother of God* but *Mother of Christ* or of *Man*, the human nature being essentially distinct from and only inhabited by the divine, as a temple by its divinity The opinions of the Nestorians were indeed, little more than subtle logical refinements upon mysteries which will not bear the application of such tests, and it was the habit of mind which they engendered that chiefly rendered them pernicious, and the fierce passions with which they were combined that gave them their celebrity and widely extended influence Nestorius himself was condemned by the third general council held at Ephesus, in the year 431 his principal adversary being the president of the assembly Cyril, the learned patriarch of Alexandria The unfortunate prelate was deposed, and banished by the emperor to an oasis in Upper Egypt, where he died His opinions, however, spread throughout Asia, and appear to have been carried along, with the advancing stream of Christianity to the furthest parts of India and China In more central regions, they were soon afterwards counteracted by the spread of the opposite heresy of Eutyches For notices of the opinions which sprang out of these rival [illegible] see INCARNATION EUTYCHIANS MONOPHYSITES, MONOTHELITES Besides the well known authorities, the reader may consult Du Pin *Hist du Nestorianisme*, 1698, *Assemanni Bibliotheca Orientalis*, and *Grant's Researches among the Nestorian Christians*, 8vo, 1841

NESTS, ESCULENT A species of nests built by swallows peculiar to the Indian Islands, and very much esteemed in China and other parts of the world These nests resemble in form those of other swallows, they are formed of a viscid substance, [illegible] as well as consistence are not [illegible] isinglass Esculent nests are principally found in Java, in caverns usually situated on the sea coast Nothing satisfactory is known as to the substance of which these nests are composed (See the *Commercial Dict*, art "Birds Nests")

NET or NEAT In Commerce something pure and unadulterated with any foreign mixture Thus wines are said to be *net* when not falsified, and coffee rice &c, to be so when the filth and ordures are separated from them The word *net* is also used for what remains after the tare has been taken out of any merchandize, *i e* when it is weighed clear of all package (See TARE) *Net Produce* (Ital netto proceduto) is used in mercantile language to express what any commodity has yielded after all tare and charges have been deducted

NET (Germ netz) is a textile fabric of knotted meshes for catching fish, and other purposes Each mesh should be so secured as to be incapable of enlargement or diminution The French government offered in 1802 a prize of 10,000 francs to the person who should invent a machine for making nets upon automatic principles and adjudged it to M Buron who presented his mechanical invention to the *Conservatoire des Arts et Metiers* It does not appear, however, that this machine has accomplished the object in view, for no establishment was ever mounted to carry it into execution Nets are usually made by the fishermen and their families during periods of leisure The formation of a mesh is too simple a matter to require description in this dictionary

NETHINIMS Among the Jews, the servants of the priests and Levites employed in the lowest and meanest offices about the temples They were, as the Scripture expresses it the hewers of wood and drawers of water for the house of God To this office the descendants of the Gibeonites were originally condemned by Joshua, but at a later period the same duties were assigned to the Canaanites who had surrendered themselves and were spared

NETTINGS Nets of small rope placed in a ship for various purposes as stowage, or defence against accidents, also against boarding

NETTLERASH An eruption upon the skin much resembling the sting of a nettle It usually lasts for a few hours, and then disappears or changes its place, it is relieved by bathing the affected part with a mixture of one part of vinegar and eight or ten of water, and by mild aperient medicines

NEURALGIA (Gr *νευρον a nerve*, and *αλγος pain*) An acute painful affection in the course of the nerves generally subject to intermission One of the most distressing forms of this disease is the *tic douloureux*

NEUROLOGY (Gr *νευρον* and *λογος, a description*) The doctrine of the nerves See NERVOUS SYSTEM

NEUROMA (Gr *νευρον*) A tumour formed in or upon a nervous trunk

NEUROPTERANS *Neuroptera* (Gr *νευρον a nerve*, *πτερον a wing*) The order of Tetrapterous Mandibulate insects including those in which the nervures of the wings are so disposed as to form a more or less regular network They are distinguished from the Coleopterous Orthopterous and Hemipterous orders of four-winged insects by the first or interior pair of wings being membranous diaphanous and [illegible] the second pair in texture and properties [illegible] is unprovided with a sting The antennæ are usually setaceous Some neuropterans merely pass through a semi metamorphosis the rest a complete one, the larvæ have always six hooked feet Many of these insects are carnivorous in their first state and their last The dragon-fly may be regarded as the type of this order

NEUROTOMY (Gr *νευρον*, and *τεμνω, I cut*) The cutting of a nerve

NEUTER (Lat *neuter*), in Grammar, signifies that gender which nouns possess that are neither masculine nor feminine *Neuter* or *intransitive* verbs are those which represent the properties of a state or process, as *I rest, I fall, I grow*, &c See GRAMMAR

Neuter was the name given to the "labourers" of the hive-bee before it was discovered that they were essentially females though infertile

NEUTRALITY In International Law, the condition of a state which does not take part in a war between other states A neutral nation has the right of

furnishing to either of the contending parties all supplies which do not fall within the description of *contraband of war* (*see* CONTRABAND OF WAR), and to conclude treaties with either unconnected with the subject of the war It appears to have been the old principle, with regard to the maritime trade of a neutral nation, that the property of an owner belonging to the hostile country might be seized by a belligerent on board a neutral power's vessel but the general rule now asserted is that the flag covers the cargo by which means right of search, except for specific purposes, is rendered unnecessary But this rule is in effect set aside, according to the will or necessities of the most powerful belligerent as it was during the last wars between England and the Continental powers

NEUTRA'LIZATION (Lat neuter, *neither*) In Chemistry, the combination of an acid and alkali in such proportions that the peculiar properties of each are rendered inert

NEU'TRAL SALTS Combinations of acids and bases which are neither acid nor alkaline, but in which the acid is exactly *neutralized* by the base

NI'UVAI'NES (Fr neuf, *nine*) In the Roman Catholic Church, prayers offered up for nine successive days, in order to obtain the favour of Heaven (See the *Dict de la Conversation*)

NEW CONNEXION METHODISTS, or KILHAMITES, so called from Mr Alexander Kilham, who was the immediate means of their separation from the Wesleyans, and withdrew from this body on the ground of the almost irresponsible power exercised by the Conference Having petitioned this convocation that the people might have a voice in the formation of the laws by which they were to be regulated the choice of their own pastors and other officers and the disposal of their [illegible] refused, [illegible] party on a more liberal basis The members of this body do not exceed 13,000 (*Life of Kilham* by Thomas Grundel *General Rules of the New Connexion Methodists*)

NI'WEL (Fr noyau) In Architecture the space either solid or open, round which the steps of a staircase are turned

NEW RED SANDSTONE The sandstone immediately above the coal measures *See* GEOLOGY

NEWS (Germ neues, Lat novus Gr νεος) Literally fresh information This word has been fancifully derived from the initial letters of the four cardinal points of the compass *north*, *east* *west* and south

NEWSPAPERS Publications in numbers consisting commonly of single sheets and published at short and stated intervals, conveying intelligence of passing events In Rome under the government of the emperors, periodical notices of passing events (diurna, acta diurna) were compiled and distributed for general reading, but our accounts of these ancient newspapers derived from classical sources, are somewhat obscure and uncertain In modern Europe the earliest occasional sheets of daily intelligence seem to have appeared at Venice during the war of 1563 against the Turks (see GAZETTE) and the earliest regular paper to have been a monthly one published in the same city by the state but these were distributed in manuscript and owing to the jealousy of the [illegible] so down to very late times It is said to have been published [illegible] ing the time when the arrival of the Spanish Armada was apprehended, but the specimens preserved in the British Museum, and so long regarded as authentic seem now to be demonstrated forgeries The *Mercuries Intelligencers*, &c of the civil wars, seem to have been the first English papers which appeared regularly The *Gazette de France* appeared regularly from 1631 to 1792, forming a collection of 163 volumes, it was continued also, but with some interruptions through the period of the Revolution, and the name still exists the journal so called being at present one of the organs of the Carlist party From their first imperfect beginning newspapers have gradually increased in number matter and consequence until they form, in many European countries, one of the most important features in the social economy of the people, exercising a marked influence on [illegible] more espe [illegible] In France newspapers are generally undertaken in shares The editors and principal writers are more responsible and more generally known than in England this is either a cause or an effect of the general prejudice in that country against anonymous writing, which is by no means so common as among ourselves, but perhaps, one of its consequences is, that newspapers are more notoriously under the control of particular sections of the political world or of powerful individual Political newspapers have their subsidiary articles on subjects of theatrical or literary criticism added in the shape technically termed *feuilleton*, a subdivision of the page This custom was introduced about 1800 in the most influential paper of that period and has since been generally followed The periodical press of France was under strict control during the Empire the censorship was continued until 1819, and re-established in 1820, but again abolished in 1821 At that period a law was passed compelling the proprietors to give security for the good conduct of their journals, under a penalty of 10,000 francs in Paris, and various lesser sums in the departments The censorship was, however, again instituted and again abolished in 1827 By the famous ordinances of 1830 the liberty of the periodical press was suspended In 1835, laws of a very severe character were passed to subject the proprietors of journals to easier conviction and heavier punishment in case of [illegible] libel against government [illegible] multiplying the provisions of that law In December, 1851, the revolutionary government of Louis Napoleon Bonaparte commenced its career with a sweeping suppression of the press unparalleled in modern times

In Great Britain newspapers are subjected to several statutory enactments By 38 G 3 c 78 no person can print or publish any newspaper until an affidavit has been delivered at [illegible] the name and places of abode of [illegible] proprietor, specifying the amount of shares in the undertaking, the title of the paper and description of the building in which it is intended that the paper shall be printed A [illegible] spaper is to be delivered within six days [illegible], to the commissioners of stamps, under a penalty of 100*l* Persons publishing newspapers without the name and place of abode of the printer affixed may be apprehended and carried before a magistrate, and peace officers by virtue of a warrant from a justice of the peace, may enter any place to make search, &c By 60 G 3 c 9 every periodical, pamphlet or paper, published at intervals not exceeding 26 days containing public news or intelligence, or any remarks thereon or on any matter in church or state not containing more than two sheets, or published at a less price than sixpence, shall be deemed newspapers and subject to the same regulations and stamp duties But a recent decision in the case of Mr Dickens's "Household Words" has thrown some doubt on what should be the right interpretation of the law By 1 W 4 c 73 securities may be demanded, to the amount of 400*l* or 300*l*, from both principal and sureties when it is intended to publish a newspaper or pamphlet of the description mentioned in 60 G 3 c 9. These securities are intended to secure payment of damages or costs which may be incurred in an action for libel against the conductor of the paper The laws respecting the stamp duties on newspapers were placed on a new footing in 1836 Instead of imposing an equal fixed duty on newspapers, it has been proposed to repeal the duty entirely, and to substitute in its stead a post-office duty But we confess that we should not regard this as a desirable change, for it would have the effect of exempting from the duty all newspapers printed and circulated in large towns There have rarely been more than five or six daily morning papers in London and about as many evening Of one of the former (*The Times*) the net profits have been estimated in some years at 60 000*l* The machinery which produces these huge sheets has been greatly increased of late years in power and rapidity by numerous ingenious applications of the steam engine A morning paper in considerable circulation generally employs besides various contributors and correspondents, an editor, a sub editor, from ten to fourteen regular reporters (*see* NEWSPAPER REPORTING), together with numerous irregular or occasional reporters, who multiply copies of the pieces of intelligence which they collect by means of polygraphs, and send them round to different newspapers to take the chance of their insertion

The following calculation was formed in 1840, of the number of periodical papers appearing in various countries, since which period it is probable that there has been a considerable increase —Great Britain and Ireland 483 France 490, Russia, 288 [illegible] (Holland and Belgium), 160, German [illegible], excluding Austria and Prussia 305, Sweden, 82, Denmark, 80, States of the Church, 6 only It is obvious that without any [illegible] to the amount of copies of each newspaper this circumstance furnishes no grounds whatever for speculating on the proportion between the demand and supply of newspapers and the population in these respective countries and wherever (as in England) newspapers are subjected to a heavy duty, each individual paper must necessarily sell a greater number of copies than elsewhere in order to afford a profit, but the circulation of some French newspapers is said to exceed that of any among ourselves The United States, at the same time had 800 newspapers [illegible] upwards of 1000 about fifty of these [illegible] See among other antiquarian authorities as to early newspapers, *D Israeli's Curiosities of Literature*, vol i, *Chalmers's Life of Ruddiman*, and the *Conv Lexicon*, art. "Zeitung" See also the *Commercial Dictionary*.)

NEWSPAPER REPORTING. The name given to that system whereby the parliamentary debates and speeches delivered at public meetings, &c are promulgated throughout the country As it is contrary to the rules of both Houses that any stranger should be present, the publication of the debates is held to be a breach of privilege; but this regulation has always been defeated, either, as in former times, by the means adopted by Dr Johnson and others of publishing the speeches of the different members under the names of Lords or, as at present by the Houses themselves tacitly giving their sanction to the practice The origination of the present system of parliamentary reporting may be fairly ascribed to the late Mr William Woodfall, whose retentive memory enabled him, after having listened to the debates, daily to communicate to the public, in what he called *A hasty Sketch of the Proceedings in Parliament last Night*, a full and most accurate account of the different speeches Secret deliberations, however, have been so long renounced, that the right of the public to be present through their agents the reporters, is as clearly established now as if no theoretical privacy had ever existed, but if any member were repeatedly to insist upon the exclusion of strangers as all are called who neither are members nor officers of the house there can be no doubt that this abuse of the privilege would lead to such a modification of the stand up order as would deprive individual members of any control over a matter so interesting to the nation The process of parliamentary reporting, and the qualifications of those by whom the task is performed, cannot be adequately described within the narrow limits of this article, but it is hoped that the reader may be enabled to form some idea of both from the following brief outline Every publication not copying from, or abridging any other but giving original reports, keeps one of a series of reporters constantly in the gallery of the Lords, and another in the Commons These, like sentinels, are at stated periods relieved by their colleagues when they take advantage of the interval to transcribe their notes, in order to be ready again to resume the duty of note-taking, and afterwards that of transcription for the press A succession of reporters for each establishment is thus maintained and the process of writing from their notes never interrupted till an account of the whole debates of the evening has been committed to the hands of the printer There are only seven publications for which a reporter is constantly in attendance, and these include the London morning newspapers, from which all others that give debates are under the necessity of copying or abridging them The number of reporters maintained by each varies from ten or eleven to seventeen or eighteen They are for the most part gentlemen of liberal education — many having graduated at the Universities of Oxford, Cambridge Edinburgh Glasgow, or Dublin, and they must all possess a competent knowledge of the multifarious subjects which come under the consideration of parliament The expedition and ability with which their duties are performed must be admitted by every one who attends a debate and afterwards reads a newspaper while the correctness and rapidity with which their manuscript is put in type and printed has long been a subject of surprise and admiration (See the *Parliamentary Companion*, a valuable brochure)

NEW STYLE In Chronology *See* STYLE

NEW TESTAMENT The term given to that portion of the Bible which comprises the writings of the apostles and their immediate disciples It consists of five historical books, viz the respective Gospels of Matthew, Mark Luke, and John, and the Acts of the Apostles (attributed to Luke), of twenty-one apostolical epistles of which the early fathers have unanimously ascribed fourteen to St Paul, three to St John, two to St Peter, one to St James, and one to St Jude, and of the book known by the name of the Apocalypse or the Revelation of St John *See* BIBLE EPISTLE, EVANGELISTS

NEWTONIAN PHILOSOPHY This term is used in various senses Sometimes it is used to denote the doctrine of the universe as delivered by Sir Isaac Newton in the *Principia*, sometimes the corpuscular, or modern, or experimental philosophy as opposed to the the theories of Descartes and others, but most frequently, perhaps, the mathematical theory of universal gravitation *See* GRAVITATION PHYSICS

NEW YEARS DAY The celebration of the commencement of the new year dates from high antiquity The Jews regarded it as the anniversary of Adam's birthday, and celebrated it with splendid entertainments — a practice which they have continued down to the present time The Romans also made this a holiday, and dedicated it to Janus with rich and numerous sacrifices, the newly elected magistrates entered upon their duties on this day all undertakings then commenced were considered sure to terminate favourably, the people made each other presents of gilt dates, figs, and plums; and even the emperors received from their subjects new year's gifts, which at a later period it became compulsory to bestow From the Romans the custom of making presents on New Year's Day was borrowed by the Christians, by whom it was long retained, but even in those countries where it lingered longest, in France and Scotland for instance, it is falling rapidly into desuetude, and congratulatory wishes are now almost universally substituted for the more substantial presents that were formerly conferred on this day as marks of affection and esteem

NEXI (Lat necto, *I bind*) In Roman Antiquities persons freeborn, who, for debt, were delivered bound to a creditor, and obliged to serve him until they could discharge it

NIBELUNGEN, LAY OF THE The name given to the most ancient existing monument of German epic poetry The origin of this poem is veiled in great obscurity, it is supposed to have existed, in substance at least, two centuries before the reign of Charlemagne, and, like the early compositions of poets in all ages, to have consisted originally of detached ballads and poems, which were afterwards gradually collected, and at length moulded into the complete form in which they at present exist The last of the modifications which it underwent took place towards the end of the 12th century, and is attributed to the Minnesaenger Henrich von Ofterdingen The story turns upon the adventures of Chrimhold of Burgundy who is first won by the valiant Siegfried and after he is treacherously murdered gives her hand to Attila, king of the Huns, chiefly in the hope that through his power and influence she may be revenged on the murderers of her former lord The assassins accordingly and all their kin, are induced to visit Attila when by the instigation of the queen a deadly feud arises, in the course of which almost the whole army on both sides is cruelly slaughtered By the powerful but reluctant aid of Diederich of Bern however the murderer of Siegfried is at last vanquished, and brought bound to the feet of the queen, who relentlessly rases the sword of the departed hero, and with her own hand strikes off the head of his enemy The famous Hildebrand whose exploits are depicted on the *Helden-Buch* instantly avenged the atrocious and inhospitable act by stabbing the queen who falls exulting on the body of her hated victim The work is divided into thirty eight books The *Nibelungen Lied* formed for many centuries the chief treasury record of the romantic deeds and sentiments of the German nation, but at the era of the Reformation it sank wholly into oblivion, from which however, it has within the last thirty years been rescued and permanently placed by the labours and commentaries of Hagen, Zeune, Simrock and Schlegel among the most conspicuous monuments of human genius All the questions relating to its origin nature, and characteristics are discussed with great interest by the German literati to many of whom indeed it forms a distinct branch of study and we cannot refrain from inserting in our pages Schlegel's notice of this poem which whatever interest it has excited in Germany, is still comparatively unknown in England

Among the heroic poems of those nations which in contradistinction to those of the Greeks and Romans, whose skilful unfolding of incidents and dramatic vividness of representation were peculiar and unrivalled have remained satisfied with a more simple mode of poetry, the *Nibelungen Lied* claims a very high place, — perhaps among all the heroic chivalrous poems of modern Europe, it is entitled to the first It is peculiarly distinguished by its unity of plan, or rather it is a series of pictures each naturally following the other, and all delineated with great boldness and simplicity and a total disregard of all superfluities The German language appears in this work in a state of perfection to which in the subsequent periods of its early history it had no pretensions In addition to all its natural liveliness and strength, it seems at that time to have possessed great flexibility, which soon [illegible] affectation, roughness, [illegible] The heroic legends of all nations have a great deal in common, so far as their essence and purpose are concerned, their variety is only [illegible] peculiar feelings [illegible] of different nations In the *Nibelungen Lied*, in the same manner as in the legends of Troy and of Iceland, the interest turns on the fate of a youthful hero, who is represented as invested with all the attributes of beauty magnanimity and triumph but dearly purchasing all these perishable glories by the certainty of an early and predicted death In his person, as is usual, we have a living type both of the splendour and the decline of the heroic world The poem closes with the description of a great catastrophe borrowed from a half-historical incident in the early traditions of the north In this respect also, as in many others, we cannot fail to perceive a resemblance to the *Iliad* If the as[illegible] more tragical [illegible] Homer, the death of the German hero, on the other hand, has in it more solemnity and stillness, and is withal

depicted with more exquisite touches of tenderness, than any similar scene in any hero-poem with which we are acquainted The *Nibelung Lied* is no mere poem abounding in variety In it both sides of human life, the joyful as well as the sorrowful, are depicted in all their reality The promise of the opening stanza is fulfilled —

Von Freuden und Festes Zeiten, von Weinen und von Klagen,
Von kühner Helden Streiten, mögt Ihr nun Wunder hören sagen

(*Schlegel's History of Literature*, Edin 1818, vol i p 270 272) See, for further information, the *Conversations-Lexicon*, an

NICARA'GUA [illegible] *salpina echinata*, a tree growing in Nicaragua, it is a species of Brazil wood It is used [illegible] to dye a bright but fugitive red Nicaragua wood differs greatly in their quality as well as price, one sort being so deficient in colouring matter that six pounds of it will only dye as much wool or cloth as one pound of Brazil wood, while another variety of it will produce nearly half the effect of an equal quantity of Brazil wood, and will sell proportionally dear (*Bancroft on Colours*, vol ii p 332)

NICE, COUNCIL OF The first, and, according to most writers, the most important, œcumenical council held in the Christian church It was convened, A D 325 at Nicæa, by the emperor Constantine, in order to settle differences that had arisen in the Christian church in respect to the doctrines of Arius This council was attended by upwards of 250 bishops, of whom a great majority came from the East, besides presbyters deacons, and others from all parts of the Christian world The chief question, as was remarked above, was the Arian heresy, and the council issued in the excommunication of Arius (*See* ARIANS) The decision of this council had not the effect of restoring tranquillity to the Eastern church, for the Arian controversy was still warmly carried on, but it has supplied that mode of stating the doctrine of the Divinity (as far as relates to the Father and Son) in which it has ever since been received by the orthodox *See* NICENE CREED, COUNCIL

NICE'NE CREED The confession of faith in which the consubstantiality of the Father and Son is asserted against the Arians (*See* art ARIANS) This creed was commenced by the council of Nice A D 325, and completed by the second general council of Constantinople, A D 381 But the words "and the Son," after those "who proceedeth from the Father," were added by the Latin church (certainly before A D 411) expressing a point of doctrine in which it differs from the Greek The Nicene creed was generally used by the Eastern churches in the administration of baptism, but was not inserted in their daily service till the fifth century In the service of the church of Rome it was inscribed A D 1014

NICHE (Fr niche) In Architecture, a square or cylindrical recess in a wall, usually made for the reception of a statue

NICKEL A white metal ductile, malleable attracted by the magnet and which, like iron, may be rendered magnetic Its specific gravity when hammered is about 9 It is rather more fusible than pure iron, is not altered by exposure to air and moisture at common temperatures, but is slowly oxidized at a red heat It is found in all meteoric iron, but its principal ore is a copper-coloured mineral found in Westphalia and called *kupfernickel*, nickel being a term of detraction used by the German miners, who expected from the colour of the ore to find that it contained copper The salifiable oxide of nickel consists of 30 nickel + 8 oxygen Its salts are mostly of a grass-green colour and the ammoniacal solution of its oxide is deep blue, like that of copper Ferrocyanate of potassa precipitates it of a white or very pale green colour

Since the manufacture of German silver, or *argentane*, became an object of commercial importance, the extraction of nickel has been undertaken upon a considerable scale The cobalt ores are its most fruitful sources, and they are now treated by the method of Wohler to effect the separation of the two metals The arsenic is expelled by roasting the powdered *speise* first by itself next with the addition of charcoal powder, till the garlic smell be no longer perceived The residuum is to be mixed with three parts of sulphur and one of potash, melted in a crucible with a gentle heat, and the product being edulcorated with water leaves a powder of metallic lustre, which is a sulphuret of nickel free from arsenic, while the arsenic associated with the sulphur, and combined with the resulting sulphuret of potassium, remains dissolved Should any arsenic still be found in the sulphuret, as may happen if the first roasting heat was too great, the above process must be repeated The sulphuret must be finally washed dissolved in concentrated sulphuric acid, with the addition of a little nitric, the metal must be precipitated by carbonates alkali, and the carbonate reduced with charcoal

In operating upon kupfernickel, or speise, in which nickel predominates, after the arsenic, iron, and copper have been separated, [illegible] upon the mixed oxides of cobalt [illegible] dissolve them into a blue liquor This being diluted with distilled water deprived of its air by boiling, is to be decomposed by carbonate potash till the blue colour disappears, when the whole is to be put into a bottle tightly stoppered and set aside to settle The green precipitate of oxide of nickel, which slowly forms, being freed by decantation from the supernatant red solution of oxide of cobalt, is to be edulcorated and reduced to the metallic state in a crucible containing crown glass Pure nickel in the form of a metallic powder is readily obtained by exposing its oxalate to moderate ignition (*Ure's Dict. of Arts, &c*)

NICOLAI'TANS One of the earliest Christian sects, mentioned in the Revelations of St John, where the angel of God reproaches the church of Pergamos with harbouring persons of this denomination They are there characterized as inclining to the licentious and pagan practices of the Gentiles, but the fathers have also accused them of partaking in a great measure of the Gnostic opinions It is doubtful, however, whether on this point there be not some confusion between the Nicolaitans of the first and the followers of Nicolaus of the second century (See *Mosheim* (transl 1790), i 143. *Gieseler's Text Book* (transl), i 69)

NICOTI'NA A poisonous alkaline base, extracted from the leaves and seed of the *Nicotiana tabacum*, or common tobacco It derives its name from Nicot, a Frenchman, [illegible] tobacco into France

NICITA'TION (Lat nicto, *I wink*) Winking of the eyes This is generally a nervous affection, and very frequently it becomes a trick or habit Where it arises from any local irritating cause, bathing the eyes with warm water affords relief

NIDDUI A sort of minor excommunication among the Hebrews, which continued [illegible] about a month If not removed within that period, it was prolonged for sixty or even ninety days If during this term satisfaction was not made, the excommunicated person fell into the *cherem*, which was the second species of excommunication, and afterwards into the *scammatha*, which was the most dreadful of all

NIDIFICA'TION (Lat nidus, *a nest*, facio, *I make*) The process by which birds construct their nests

NIE'LLO (Ital) A method of engraving on plate. *See* art ENGRAVING, where the process is described

NIGHT (Lat nox, Ger nacht) The part of the natural day during which the sun is below the horizon

NIGHT HERON *See* ARDEA

NIGHTINGALE A migratory species of Passerines, and the sweetest of song-birds, the type of the subgenus *Luscinia*, which is more closely allied, according to Mr Blythe to the thrush family than to the fauvettes (*Curucidæ*) among which it is placed by Cuvier The [illegible] the southern counties of [illegible] more common [illegible] till the beginning of May, the females do not arrive till a week or ten [illegible] later Migrating to the south they [illegible] country for the purpose of breeding and the famed song of the male is his love chant and ceases when his mate has hatched her brood "Vigilance anxiety, and caution now succeed to harmony, and his croak is the hush the warning of danger and suspicion, to the infant charge and the mother bird" If by accident his mate be killed, the male resumes his song, and will continue to chant very late in summer unless he can attract as he commonly soon does, another female The nightingale feeds chiefly on the larvæ of insects, which abound at the season of its arrival in this country The nest is built near the ground, the eggs are four or five in number, of a uniform dark brown colour the young are excluded in the month of June, and are ready to accompany the parents in their southward [illegible] the month of August

NIGHT JAR The name of a remarkable British bird, the type of the genus *Caprimulgus*, distinguished by the [illegible] of its beak which perhaps has arisen the [illegible] treats of cattle, and its other [illegible] " the equivalent of which it has received in most European languages, and which Linnæus has continued in its generic designation It is scarcely necessary to observe that the structure of the bill renders the act of sucking impracticable in the night-jar or any other bird The genus *Caprimulgus* is characterized by a wide and deeply-cleft beak, armed with strong [illegible] capable of engulphing the larger insects, the nostrils placed at its base are like small tubes, the wings are lengthened, the feet short, feathered to the toes, which are connected together by a membrane at their base, the claw of the middle toe is commonly pectinated at the base The night-jars are most active and hunt their prey in the dusk, they have the same soft and soft plumage as other nocturnal birds Our common species (*Capr Europæus*) is remarkable

for the loud sound it emits, like the burr or jarring of a spinning-wheel

NIGHTMARE An oppressive sensation and struggle during sleep, otherwise called *incubus* (which see), produced usually by indigestion *See* EPHIALTES

NIGHTSHADE *See* DULCAMARA and BELLADONNA

NIGHT WATCH A portion of the night as distinguished by a change of the watch Among the Romans the night was divided into four watches, each of three hours' duration, and styled first second, third, and fourth watches, according to the military usage, by which the guard was relieved four times during the night The first watch began at six in the evening and lasted till nine, according to our mode of computing time, the second lasted from nine till twelve or midnight, the third from midnight till three in the morning (called *cock-crowing*), and the fourth commenced at three and ended at six thus completing the twelve hours The Jews originally divided the night into three watches, but at a later period, and previously to the appearance of our Saviour, they adopted the Roman division of the night, which is frequently alluded to in the New Testament In the Roman mythology, Nox was the goddess who presided over the night She is represented clothed with a tunic thickly set with stars, and in her honour the Romans sacrificed a cock during the night

[illegible] Ovid

NIGRINE (Lat niger *black*) Silico-calcareous oxide of titanium It occurs in Ceylon and Transylvania

NIMBUS (Lat) In Painting and Sculpture a circular disk round the heads of divinities, and sovereigns and saints

NIMBUS CLOUD In Meteorology *See* CLOUD

NINSIN ROOT A bitter root, said to the medicinal qualities of ginseng It is the root of the *Sium ninzi*

NINTH In Music, one of the dissonant intervals in music being properly a second double

NIOBE In Mythology daughter of Tantalus, and one of the Pleiades married to Amphion king of Thebes Proud of her numerous and flourishing offspring she provoked the anger of Apollo and Diana, who slew them all she was herself changed by Jupiter in Phrygia, into a rock from which a rivulet fed by her tears, continually pours The subject of Niobe and her children was a great favourite with the poets of antiquity Besides the beautiful story in Ovid (*Met* vi 146), there are numerous epigrams in the Greek *Anthology* which appear to be descriptive either of the group of figures to which we refer below or to some similar group See more especially that beginning,

Ταντάλιδι καὶ Νιόβᾳ κλυτὸν ἄμμιν φάτις ἄγγελον ἄτας

This fable has also afforded a subject for art and particularly for the sculptor of the beautiful group in the tribune at Florence known by the name of Niobe and her Children Some antiquaries attribute it to Scopas Winkelman inclines to believe it the workmanship of Praxiteles It is beautifully characterized by Hazlitt in his 'Treatise on Art,' in the *Ency Britannica*

NIPPERS In Sea language small ropes or selvages for attaching the messenger to the cable

NISI PRIUS In Law a term originating in a legal fiction, when the pleadings in a cause in one of the superior courts of common law (*see* PLEADING) are concluded, and an issue of fact is raised between the parties The issue is appointed by the entry on the record or written proceedings to be tried by a jury from the county of which the proceedings are dated at Westminster *unless before* the day appointed (nisi prius) the judges shall have come to the county in question The judges of assize, by virtue of their commission of nisi prius try the causes thus appointed on their several circuits unless they are dated of London or Middlesex, in which case they are tried in London or in Westminster at the sittings during or after term *See* COURTS SUPERIOR, and TERM

NITRATES Salts of the nitric acid, thus *nitrate* of potassa is a compound of one atom of nitric acid and one atom of potassa *See* NITRE

NITRE, *Nitrate of Potassa*, *Saltpetre* This salt consists of 54 nitric acid + 48 potassa, its equivalent therefore, is 102 It is spontaneously generated in the soil, and crystallizes upon its surface in several parts of the world, especially in India, whence nearly the whole of the nitre used in Britain is derived It has occasionally been produced artificially in *nitre beds*, formed of a mixture of calcareous soil with animal matter, in these nitrate of lime is slowly formed, which is extracted by lixiviation and carbonate of potash added to the solution, which by double decomposition, gives rise to the formation of nitrate of potash and carbonate of lime the latter is precipitated, the former remains in solution, and is obtained in crystals by evaporation Nitre crystallizes in six-sided prisms, soluble in seven parts of cold water and in less than its weight of boiling water It has a cooling saline taste and is anhydrous At 616° it fuses, and at a red heat is decomposed Its great use is in the manufacture of gunpowder, and in the production of nitric acid. It is also employed in the preservation of meat

Nitrate of soda crystallises in rhombs hence termed *cubic nitre* It is found in [illegible] and is imported into England from America It is used as a manure and as a source of nitric acid, but, being slightly deliquescent, it cannot be employed in the manufacture of gunpowder

Nitre has sometimes been mistaken for Glauber's salt, and, when taken in the quantity of half an ounce or an ounce it acts as a powerful poison In such cases the stomach should be evacuated as rapidly as possible, and the symptoms of spasm relieved by opiates In doses of 5 to 15 grains it is diuretic and diaphoretic

NITRIC ACID This acid is a compound of 1 atom or equivalent of nitrogen = 14 and 5 of oxygen (8 × 5) = 40, hence its equivalent in the dry or anhydrous state, as it exists for instance, in nitre is 14 + 40 = 54 As it usually occurs in the liquid state, it is a compound of 1 equivalent of dry acid, 54 and 2 of water (9 × 2), 18, hence the equivalent of the liquid acid is 72 It is commonly known in commerce under the name of *aqua fortis*, and is prepared by distilling a mixture of sulphuric acid and nitre It is commonly yellow or even [illegible] coloured, but it may be deprived of nitrous [illegible] occasions this colour by heat and is then colourless It is intensely corrosive and sour, fumes when exposed to air, and [illegible] of gravity of 1 when in its utmost state of concentration It boils at 248° and freezes at −50° It is a most powerfully oxidizing agent and is decomposed with more or less rapidity by almost all the metals

The salts which it forms are called *nitrates*, they are all soluble in water, they are decomposed by heat and, when mixed and gently heated with sulphuric acid, they evolve nitric or nitrous acid

NITRIC OXIDE or NITROUS GAS This gas was discovered by Hales and more accurately studied by Priestley It is obtained during the action of nitric acid diluted with about two parts of water upon metallic copper it is copiously evolved and may be collected over water 100 cubical inches of this gas weigh between 32 and 33 grains its density, therefore compared with air is 1037 It is at once easily recognized by forming orange-coloured fumes whenever it escapes into the air or comes into contact with oxygen so that this gas and oxygen are excellent tests of each other's presence It consists of equal volumes of nitrogen and oxygen or of 1 equivalent of nitrogen and 2 of oxygen hence it is termed a binoxide or deutoxide of nitrogen The respective weight of its components therefore, are 14 nitrogen + 16 oxygen = 30 and the equivalent of the gas is 30

NITRITES Salts of the nitrous acid, thus *nitrite* of potassa is a compound of 1 atom of nitrous acid and 1 atom of potassa &c

NITROGEN (Gr νιτρον and γεννᾶιν *to produce*) A simple gaseous body which forms a constituent part of nitric acid and which being unrespirable has also been termed *azote* from α privative and ζωη *life* It was identified as a peculiar gas by Dr Rutherford in 1774 and shown to be one of the components of atmospheric air by Lavoisier in 1774 It is generally obtained by burning a piece of phosphorus in a jar full of air inverted over water The phosphorus during its combustion combines with the oxygen of the air to form phosphoric acid which is dissolved by the water and the remaining element of the air namely the nitrogen remains Nitrogen is a colourless inodorous and tasteless gas not absorbed by water and having no action on vegetable colours It extinguishes all burning bodies, and is itself uninflammable It is a little lighter than atmospheric air 100 cubic inches weighing 30 16 grains Its equivalent is 14, and it combines with oxygen in 5 proportions, giving rise to the following compounds —

		By volume N	O	By weight N	O	Equiv	Symbols
1	Nitrous oxide	100 +	50 =	14 +	8 =	22 =	*n* + *o*
2	Nitric oxide	100 +	100 =	14 +	16 =	30 =	*n* + 2*o*
3	Hyponitrous acid	100 +	150 =	14 +	24 =	38 =	*n* + 3*o*
4	Nitrous acid	100 +	200 =	14 +	32 =	46 =	*n* + 4*o*
5	Nitric acid	100 +	250 =	14 +	40 =	54 =	*n* + 5*o*

NITROMURIATIC ACID Nitrohydrochloric acid of modern nomenclature The mixture of nitric and of muriatic (or hydrochloric) acid, formerly called *aqua regia* from its solvent power over gold, the *king* of the metals

NITRONAPHTHALASE A compound resulting from the action of nitric acid on napthalin a modification of it has been termed *nitronaphtalase*

NITROSACCHARIC ACID By the action of sulphuric acid on gelatine a peculiar saccharine matter is formed, which combines with nitric acid, and forms a crystallized acid designated as above.

NITROSULPHU'RIC ACID An acid resulting from the mixture of one part of nitre with eight or ten parts of sulphuric acid It was originally proposed by Mr Keir as a useful agent for separating the silver from the copper of old plated goods At the temperature of about 200° it dissolves silver, while it scarcely acts upon copper or lead, unless diluted, or at higher temperatures

NI'TROUS ACID When two volumes of nitric oxide and one of oxygen are mingled in an exhausted glass globe they form a dense orange-coloured vapour, which may be liquified by cold, and which is *nitrous acid* Its elements are so condensed that 1 volume of nitrogen and 2 of oxygen form 1 volume of nitrous acid vapour, the specific gravity of which is 3 17 The presence of this vapour renders nitric acid red and fuming, in which state it is commonly termed *nitrous* acid

NI'TROUS OXIDE Protoxide of nitrogen, a gas obtained by heating nitrate of ammonia, which salt is thus resolved into nitrous oxide gas and water When nitrous oxide is respired it produces effects somewhat similar to those of intoxication, hence it has been called *laughing gas*

NIZAM The title of one of the native sovereigns of India, between whom and the East India Company many subsidiary treaties exist This title is derived from Nizam-ul-Mulk, who in the beginning of last century obtained possession of the Mohammedan conquests in the Deccan, his successors in the sovereignty having assumed his name as their title of dignity, which they have retained to this day

NOBILISSIMUS was a title of dignity given to the princes of the imperial family of Rome It is said by Doucine to have originated with Justin, but others hold it to be of much more ancient date

NOBI'LITY The general appellation for a distinguished order of society which exists in every civilized country, with the exception of the United States and Norway (*See* PEERAGE) In Roman antiquity persons were not noble by birth but in consequence of the public offices held by their ancestors who had the sole right to bequeath their images to their descendants (*Jus imaginum*) (*See* HERALDRY) Originally the patricians were the only nobles, they alone being eligible to the magistracy, but when the *equites* and even the *plebs* were admissible the great body of the nobles began to be formed The first in any family who was raised to a curule office was styled *novus homo* See NOVI HOMINES

NOBLE an English coin of the middle ages value 6*s* 8*d* current in the reign of Edward III According to Knighton, the *rose noble* was a gold coin in use about the year 1344

NOCTHORA *See* SACOLIN

NOCTILU'CA A term applied by Boyle and some of the older chemical philosophers to phosphorus

NOCTU'RN (Lat *nox night*) An [illegible] of psalms and prayers celebrated in the [illegible] church at midnight after the example of David (Ps 118) It was said to have been introduced into the West by St Ambrose It now forms part of the service of matins

NOCTU'RNAL *Nocturna* (Lat *nox* night) A tribe of Raptorial birds including those which fly by night, and have the eyes directed forwards also a family of Lepidopterous insects which, in like manner, are active chiefly in the night season

NODE, in Surgery, is a hard tumour upon a bone which creates considerable pain and often is attended by caries or necrosis They are most common upon the tibia and bones of the head and fore-arm where they are thinly covered by flesh

NODES, in Astronomy are the two points in which the orbit of a planet intersects the plane of the ecliptic The point in which the centre of a planet passes from the south to the north side of the ecliptic is called the *ascending node*, and in astronomical computations is usually indicated by the symbol ☊, the opposite point or that in which the planet passes to the south side of the ecliptic, is called the *descending node* and is indicated by ☋ The straight line which joins these two points, formed by the intersection of the plane of the planet's orbit with the plane of the ecliptic is called the *line of the nodes* The nodes of the lunar orbit were anciently called the head and tail of the dragon

The position of the nodes on the ecliptic is one of the elements by which the situation of the plane of an orbit in space is defined In fact, it is easy to see that, if the position of the line of the nodes and also the inclination of the orbit to the ecliptic, be known the position of the plane of the orbit is entirely determined The two nodes being distant 180° it is only necessary to indicate the position of one of them the longitude of the ascending node, or its distance from the first point of Aries, is the element used by astronomers In all the planetary orbits the line of the nodes is variable, having a retrograde motion from east to west in respect of the fixed stars, but so slow that it amounts only to a few seconds in a year The regression of the moon's nodes is very considerable, as it completes a revolution in about 19 years (*See* MOON) This retrograde motion of the nodes of all the planets is a necessary consequence of their mutual attractions For the positions and variations of the nodes of the different planets, see PLANET

NO'DULE (Lat. nodus, *a knot*) Rounded irregular lumps or masses

NO'DUS In Botany a point situated upon the axis of a plant, whence a leaf or leaf-bud originates

NOEL The French name of Christmas Day, derived either from *dies natalis* (Lat *birthday*), or from an abbreviation [illegible]

NOETIANS Ecclesiastical History a sect so called from Noetus [illegible] They acknowledged only one person in the divinity, and, consequently, were accused of maintaining that God the Father had suffered on the cross *See* PATRIPASSIANS

NOGGING In Architecture, brickwork carried up between upright pieces or quarters

NO'GGING PIECES In Architecture, the horizontal pieces of timber fitting in between the quarters, to which they are nailed in a brick-nogged partition, which they serve to st[illegible]

NO'LI ME [illegible] NOLI' [illegible] Surgery, is a disease of the skin, commencing with small ulcerations which destroy the part They sometimes affect the cartilage of the nose which is destroyed by their progress, almost [illegible] more rapidly than they

NOLLE PROSEQUI In Law, an acknowledgment or agreement by the plaintiff in a suit that he will not further prosecute it, either as to the whole or a part of the cause of action (as, for instance, where, on the defendant's demurring to one count in a declaration, the plaintiff enters a nolle prosequi as to that count, and proceeds to trial on the other counts), or as to one or more out of several defendants

NOMADES (Gr [illegible], from νομος *pasture*) Tribes of [illegible] The nomades of classical times were generally tribes devoted to pastoral pursuits, for the ancients knew of no races of savages subsisting wholly by the chase The principal nomadic tribes of antiquity were those of southern Russia and the interior of Asia, from whom sprung, in the decline of the Roman empire, many of the tribes which overran western Europe, and at a later era, those which conquered empires in western and southern Asia

NOME (Gr νομος, from νεμω, *I divide*) The Greek name for the provinces into which Egypt was divided from the most remote antiquity According to Diodorus Siculus the division into nomes was performed by Sesostris whom some modern writers consider as identical with the Remeses II of the monuments, but it is supposed to have subsisted from the time of the earliest Pharaohs There were 36 nomes, which, in the time of Strabo, were thus divided —10 in the Thebaid, 10 in the Heptanomis, or intermediate district (which, according to its name, probably consisted in earlier times of 7 only), 10 in the Delta This division was not materially altered until the latest age of the Roman government (See D Anville *Memoires sur l'Egypt*, *Wilkinson's Manners and Customs of the Ancient Egyptians*, vol ii)

NO'MENCIA'TOR An officer employed by the candidates for the great state offices of Rome to accompany them through the streets and whisper them the names of such citizens as they might meet, in order that they might then address them by name, and canvass their votes It is derived from Lat nomen, and the old word calo, *I call*

NO'MENCIA'TURE was originally applied to a catalogue of the most ordinary words in any language, with their significations &c, drawn up for the purpose of facilitating their use and retention to those who are endeavouring to acquire a language But, in a more general sense, this term is employed to denote the language peculiar to any science or art thus we speak of the nomenclature of chemistry botany, &c

NO'MINALISTS A term originally applied to a scholastic sect which arose in the 11th century Its founder was John Roscelin, a churchman of Compiegne, who asserted that general terms have no corresponding reality either in or out of our minds, being in truth, words and nothing more (*flatus vocis*) This doctrine naturally excited great consternation among the schoolmen, with whom hitherto, all that was real in nature was conceived to depend on these general notions or *essences* Its promulgator underwent much persecution for his opinions, and was ultimately compelled to retract them, as inconsistent with the doctrine of the Trinity as it was then stated He found however, an able successor in the person of Peter Abelard, who attracted numerous disciples by his dialectical skill and eloquence, and with his followers, whom he led in a body to Paris, was the occasion of founding the celebrated university of that city After his death the ancient realism was restored to its supremacy, nor do we meet with a nominalist until the 13th century, when William of Occam revived his doctrines under some modifications The last mentioned philosopher may, in fact, with greater justice, be styled a conceptualist, as he distinctly stated

the formation of general terms to depend on the conditions of thought, and hence to possess a species of subjective reality, as the sign or indication of an actual process of thought, though not either distinct objects of consciousness or realities in nature Those who hold either of the latter theories are realists The controversy is one which has excited great attention among modern philosophers and Dr Thomas Brown style themselves conceptualists There are however, expressions in Locke's writings which would rather stamp him as a realist, under the former of the two modifications which we have given above (See articles SCHOLASTIC PHILOSOPHY, THOMISTS, SCOTISTS) There are very profound observations on the subject of this controversy in the first volume of *Hallam's Literature of the Middle Ages* See also *Brucker's Hist Crit Philosophiæ*

NOMINATIVE CASE In Grammar, that form of a noun which names or designates a substance *absolutely* or without regard to any other substance

NOMOCANON (Gr *νομος law*, *κανων*, *canon* or *rule*) In Ecclesiastical Law, a work in which canons of the church and imperial laws touching the same subjects, are collected and compared The first was made by Joannes Scholasticus (A D 551) The most celebrated was that of Photius, patriarch of Constantinople

NOMOPHYLACES (Gr *νομος the law* and *φυλακες, guardians*) Among the Athenians magistrates or legal officers, whose business it was to see that neither the privileged citizens nor the lower classes made any innovation upon the laws They held seats in all the public assemblies and during the public games and festivals had chairs erected for them equal to those of the archons Thus was also the splendour of those officers calculated to impress on the competitors the laws

NOMOTHETÆ (Gr *νομος law* and *τιθημι I lay down*) A body of citizens at Athens chosen by lot out of such as had been judges in the court Heliæa to the number of a thousand Their office seems to have been a sort of inspectorship of existing laws with the duty of proposing amendments

NONÆ ET DECIMÆ In Ecclesiastical Law the contributions of tenants of the church were anciently so called the nonæ or ninth part standing for a species of rent, the decimæ for the tithe due to the church

NONAGE In Law *See* INFANT MINORITY

NONAGE'SIMAL (Lat nonagesimus, *the ninetieth*) In Astronomy, is the *ninetieth* degree of the ecliptic reckoned from either of the points in which it is intersected by the horizon It is therefore the highest point of the ecliptic at any instant and its altitude is equal to the distance of the pole of the ecliptic from the zenith The nonagesimal is used in calculating the parallaxes of the moon

NO'NAGON (Lat novem, and *γωνια angle*) In Geometry, a plane figure having nine angles and consequently nine sides The area of a regular nonagon is $= \frac{9}{4} \tan 70^\circ = 6\ 1818242$, the side being 1

NON COMPOS MENTIS (Lat) In Law a general term for those afflicted with mental incapacity *See* LUNACY, IDIOT

NO'NCONDU'CTOR This term is applied to certain phenomena connected with the passage of heat and electricity through bodies, those substances which resist the direct passage of those influences (and occasionally allow it to pass) are called *nonconductors*

NONCONFORMISTS A general term under which all the religious communities which do not conform to the liturgy of the church established in England may be comprehended It belongs more properly to the large body of clergy who, at the Restoration refused to subscribe to the Act of Uniformity and were in consequence ejected from their benefices on St Bartholomew's day 1662 This act was first promulgated by Elizabeth, and required all persons to give their assent to the Book of Common Prayer and the Thirty-nine Articles, any one who should be convicted of speaking or preaching against it The act of Charles II contained still stricter provisions enjoining every beneficed person not only to use the book but to declare his assent and consent to every part of it, and enacting that unless this were done on a certain day he should be, *ipso facto*, ejected Other declarations were also to be subscribed, as, "That it is unlawful to take arms against the king on any pretence whatsoever," That no obligation from the covenant lies upon himself or any other person It is said that two thousand persons resigned their preferments in consequence, and even after this their party was subjected to the further infliction of the conventicle acts, which forbade more than five persons besides the family to assemble together for religious worship and the fifth time with intent to print address and preach any conformist clergyman who should take up his residence within five miles of any corporate town, or other place where he had been minister *See* DISSENTERS.

NONES (Lat *nonæ*, In the Calendar, one of the three days in the month called because they fell on the *ninth* day reckoned inclusively before the Ides March May July October, that is the seventh day of the month, and the nones, consequently, on the 7th In the other months, the ides were on the 13th day, and the nones on the 5th *See* CALENDAR, CALENDS IDES

NON EST INVENTUS (*He is not found*) In Law, the formal Latin words anciently used in the sheriff's return to a writ of capias that the defendant was not to be found within his bailiwick

NO'NIUS A name frequently given to that useful contrivance the vernier, for subdividing the divisions of graduated arcs or scales into minute parts, from its invention having been erroneously ascribed to Pedro Nunez or Nonius, a Portuguese, who lived in the early part of the 16th century The contrivance employed by Nonius was widely different from the vernier now universally used It consisted in describing within the same quadrant 45 concentric arcs, the innermost and the outermost into 90 equal parts the next within it into 89 and so on, the innermost being consequently divided into 46 only With this instrument the observed altitude of an object could be read off on the outermost arc only to degrees, but the fractions were obtained in the following manner — The plumb line or moveable index, must intersect one of the concentric arcs at, or very near a point of division Now it is evident that the number of parts read off at this point must be in the same proportion to the degrees and fractions of a degree intercepted on the outermost arc as the number of parts into which the point is divided, is to 90° The index being therefore multiplied by 90 and divided by the number of parts in the arc gives the observed altitude to fractions of a degree Thus if the plumb-line intercept 25 parts exactly on the arc in which the number of parts is 78 the angle measured will be 28 846° the fraction is easily converted into minutes and seconds Nonius supposed that this artifice was known to Ptolemy It was adopted by Tycho Brahe, but soon abandoned by him for the method of diagonal divisions in consequence of the difficulty of dividing accurately the different arcs (*Robins's Mathematical Tracts*, vol ii) *See* VERNIER

NON-JURORS In English History, that party among the clergy of the national church who refused to take the oath of allegiance to the new government after the Revolution As many of these clergy at the same time that they opposed a conscientious resistance to the usurpations of James II had nevertheless continued to preach submission to the sovereign on the principle of his divine right by hereditary succession to the obedience of his subjects it became impossible for them with consistency to submit to a monarch crowned only by authority of parliament It was therefore much desired by many friends of the new government to make some exception in their favour from the necessity of taking the oaths, not an amendment made by the House of Lords in the act requiring this oath which purposed to excuse the clergy from taking it unless called on by the privy council was rejected by the Commons Eight bishops including the primate Sancroft with about four hundred clergy, were in consequence excluded from their sees and benefices The original non-jurors were peaceable and honest men for the most part but many of them soon became implicated in all the violence of the Jacobite faction *See* JACOBITES PRETENDER

NON-NATURALS A term applied by the old physicians to certain matters which are necessary to life, but do not form a part of the living body, such as air, food, excretions, sleep &c

NONPAREIL *See* PRINTING

NON-RESISTANCE, THE DOCTRINE OF, in Politics, is that which inculcates the unlawfulness, on religious grounds of resistance by force to the commands of a prince or magistrate This is strongly laid down by the inspired writers and especially by St Paul, in the 13th chapter of his Epistle to the Romans In the ordinary acceptation of the doctrine it is taken to enforce the duty of obedience to the lawful commands of magistrates But in that peculiar sense which is attached to it in English constitutional history it means unqualified obedience to every command especially of the prince or supreme magistrate, whether lawful or not, and consequently condemns all forcible opposition even to tyranny or usurpation But the advocates of non-resistance, in this extended sense, do not appear to have ever contended that it applied to commands of inferior magistrates in the same sense and degree as to those of the highest they therefore supposed a peculiar sanctity in the person and office of the ruler which no other officer possessed, and thus combined the doctrine of divine right with that of passive obedience or non-resistance These doctrines are plainly laid down in the formularies of the church of England, in which, in the phrase of Bolingbroke (*State of Parties*), they *skulked* until the reign of James I (See especially that *On Wilful Disobedience and Rebellion*)

But in that reign they were more generally avowed by the learned and loyal; and in 1622 the University of Oxford sanctioned them by a solemn decree. The events which led to and followed the great rebellion naturally led men's minds to pay greater attention to the speculative part of politics, and, while Hobbes was framing a theory of absolute monarchy on the principle of the social contract, a different class of reasoners arrived at the same result through a peculiar interpretation of scripture. Sir Robert Filmer (especially in his *Patriarcha*), Bishop Sanderson, and others, made the regal power originate in the patriarchal, and endeavoured to prove that all other forms of government being unrecognized by scripture, were usurpations. Dean Sherlock, the ablest writer of the school of divine right (see his *Case of Resistance to Supreme Powers*, 1684), endeavoured to prove the absurdity of the theory of the social contract, and to show from scripture the unlawfulness of resisting any command, even of an usurping power. It is in answer to these reasoners that *Locke's Essay on Government* was written. In it he confutes the arguments for unqualified non-resistance, by showing that scripture and reason make no distinction between [illegible] opponents [illegible] and however [illegible] lowest magistrate, must be obeyed [illegible] of Oxford pronounced its second decree in favour of the tenets of divine right and non-resistance. But the current of court opinion changed at the Revolution. The doctrine of non resistance was almost proscribed, but maintained by the non jurors, who professed to *obey* the usurping government while they refused to *recognize* it. In 1709 it was preached by Sacheverell, with the apparently inconsistent result of a riot. His sermon, together with the Oxford decree were burnt by order of the House of Lords. But the doctrine is at this day frequently asserted by the high church party. (See *Dr Pusey's Sermon on the 5th of November*, 1838.)

NO'NSUIT, in Law, is the renunciation of a suit by the plaintiff. It is either adjudged, in consequence of certain neglects or delays in the prosecution of the suit, or it is voluntarily elected by the plaintiff. It is usual to call on the plaintiff, when he is unable to make out a case to support his pleadings for default of the necessary evidence, and the jury are about to give their verdict, to elect, if he pleases, to abandon his prosecution and submit to a nonsuit, upon payment of costs. The effect of which is, that as a nonsuit is not except in certain cases, a peremptory bar, he is able to bring another action afterwards for the same cause.

Judgment as in case of a nonsuit arises from the statute 14 G. 2. c. 17, which enacts that where any issue is joined in an action in the courts of record at Westminster, and the plaintiff has neglected to bring the issue to be tried, the court may, unless it sees reason for allowing the plaintiff farther time, give judgment for the defendant as in case of a nonsuit, which has the same force as a nonsuit both as to costs and as to its effects on the action.

NOOTH'S APPARATUS. A series of three glass vessels placed vertically for the purpose of impregnating water with carbonic acid gas. The lower vessel contains the marble and muriatic acid for the evolution of the gas, the central vessel holds the water through which it is made to pass, under the pressure of the column of water in the third or upper vessel which is closed by a conical stopper which serves as a safety valve.

NO'PAL. The *Cactus opuntia*. The plant upon which the cochineal insect chiefly breeds.

NORFOLK CRAG. A tertiary formation which rests on London clay or chalk, and includes marine shells. A line drawn from Cromer on the northern coast of Norfolk to Wayburn, about six miles west, and thence extending southerly about eighteen miles towards Norwich, includes all the regular beds of this rock. See GEOLOGY.

NO'RMAL (Lat. norma *a rule*.) An adjective signifying that the ordinary structure peculiar to a family, a genus, or a species is in no wise departed from.

NO'RMAL. A term sometimes used for perpendicular. In the geometry of curve lines, the normal to a curve at any point is a straight line perpendicular to the tangent at that point, and included between the curve and the axis of the abscissa.

NORMAN ARCHITECTURE. *See* ARCHITECTURE, and ENGLISH ARCHITECTURE.

NORNS. [illegible] three Fates, equivalent to [illegible]. Their names were Urd, Worand, and Skuld, or *Past*, *Present*, and *Future*. They were represented as endowed with great beauty, but of a melancholy and sombre disposition, they were consulted even by the gods, and their decrees [illegible].

NORROY. See KING AT ARMS, HERALD.

NORTH (Geog.) In Geography, one of the [illegible] horizon, that which to European latitudes is opposite the sun at mid day.

NORTHERN LIGHTS. The name popularly given to the *aurora borealis*.

NORTHING, in Navigation, is the difference of latitude made by a ship in sailing northwards.

NOSING OF A STEP. In Architecture, the projecting rounded edge of the tread of a step.

NOSOLOGY. (Gr. *νοσος a disease* and *λογος a discourse*.) In Medicine, the terms specially applied to the classification and nomenclature of diseases, and to their general methodical arrangement. See DISEASE.

NOSTA'LGIA. (Gr. *νοστος, I return*, and *αλγος, grief*.) A species of melancholy, resulting from absence [illegible].

NOSTRUM. (Lat.) Literally, *our own*, applied to quack medicines retained for profit in the hands of the inventor or discoverer, or of his assignee.

NO'TABLES. In French history, the deputies of the states under the old régime, appointed and convoked on certain occasions by the king. In 1786 this assembly was summoned, 160 years after its last meeting, and proposed various reforms in different branches of the government. It again met for the last time, in 1788.

NO'TACANTHA. (Gr. *νωτος, the back* and *ακανθα, a spine*.) The name of a family of Dipterous insects, comprehending those in which the upper part of the thorax or epistenum is armed with teeth [illegible].

NO'TARIES APOSTOLICAL AND IMPERIAL. Public notaries appointed by the popes and emperors, in [illegible] jurisdiction over other powers, [illegible] in foreign states. Edward II. forbade the imperial notaries to practise in England. Charles VIII. of France, in 1490, abolished both these classes of notaries, and forbade his lay subjects to employ them.

NO'TARY, or NOTARY PUBLIC. In English Law, one who publicly attests documents or writings, chiefly in mercantile [illegible] in a foreign country, [illegible] and the like. The statutes 41 G. 3. c. 79. and 3 & 4 W. 4. c. 70. regulate the admission of notaries in England. In London, they must have been apprenticed seven years to a notary before such admission.

The name notary, among the Romans, appears to have signified a short-hand writer, and to have denoted originally the persons who acted in that capacity, especially at meetings of the senate. Afterwards, the notarii were secretaries to courts, officers &c. In modern Europe, the notary is an officer whose attestation is necessary to the validity of certain instruments, and his duties are more or less important in different countries. In France, the notary is the necessary maker of all contracts &c. where the subject matter exceeds 150 francs, and his instruments which are preserved and registered by himself are the originals, the parties retaining only copies. The presence and administration of a notary is also essential to the division of lands or goods of inheritance.

NOTATION (Lat. notatio), is defined by Dr Johnson to be "the act or practice of recording any thing by marks as by figures or letters."

Mathematical notation embraces two distinct subjects, namely symbols of number and quantity and symbols of operation. The system of numerical notation adopted in all European countries depends on the very refined idea of giving to each symbol a *local* as well as an absolute value. A refinement of this sort could only have been adopted by a people considerably advanced in the arts of civilization, but though the present system has been traced to the Hindus among whom it appears to have been in use two thousand years ago, the epoch and country of its origin are entirely unknown. It is probable that the first numeral characters consisted simply of strokes or straight lines which could be easily cut in wood or stone, and would be alike intelligible to all nations. Such characters are in fact, preserved in the Roman notation with very little change. Thus, assuming a perpendicular line | to signify *one*, two lines | | would express *two*, the addition of a third | | | *three*, and so on till the reckoner had reached *ten*, which completed the first series of the numerical scale. He might then be supposed to throw a dash across the last stroke or unit to mark the completion of the series and thus X would come to signify *ten*. The [illegible] repetition of this mark would denote *twenty*, *thirty* and so forth, till he arrived at a hundred, or *ten* tens which completes the second series and might be denoted by adding another dash to the mark for ten, or by merely connecting three strokes, thus [illegible]. The repetition of this symbol would in like manner indicate the successive [illegible] *tenth* of which would be marked by the [illegible] another stroke so that four combined strokes ⋀⋀ would express a thousand. Such were the symbols originally employed in the Roman notation, in process of time it would be perceived that the inconvenience in writing, arising from so many repetitions of the same character, might be avoided, by [illegible] for the intermediate numbers, and [illegible] by the division of the

symbols already in use Thus, having parted in the middle the two strokes X, either the under half Λ, or the upper half V, was employed to signify *five* Next, the mark ⊏ for a hundred was divided into ⌜ or ⌞, either of which represented *fifty* Again the four combined [illegible] in the progress of the arts to assume [illegible], was frequently expressed thus ⌜|, and this last form by partition gave the two portions ⌜ or ⌞ to represent *five hundred* (*Leslie's Philosophy of Arithmetic*, Introd)

The numeral notation of the Greeks, though far less convenient than that now in use, was formed on a perfectly regular and scientific principle, and might be used with [illegible] calculation, to which the Roman system was totally inapplicable They divided the twenty four letters of the alphabet into three classes, and, by adding another symbol to each class, they had characters to represent the units, tens, and hundreds

Thus, instead of the digits 1, 2, 3, 4, 5, 6, 7, 8, 9 they represented the units by the letters α, β, γ, δ, ε, ϛ, ζ, η, θ the tens were denoted by ι, κ, λ, μ, ν, ξ, ο, π, ϟ, and the hundreds by ϱ, σ, τ, υ, φ, χ, ψ, ω, ϡ

To represent the thousands they employed the first series with the iota subscribed, ͵α, ͵β, ͵γ, ͵δ, ͵ε, ͵ϛ, ͵ζ ͵η, ͵θ With these symbols they could express any number under 10,000, thus ͵θ ϡ ϟ θ, denoted 9999, ͵ηλγ, denoted 8033, ͵δα, 4001, and so with the others To denote the myriads they made use of the initial letter M, writing the number over it Thus, $\overset{\alpha}{M}$, $\overset{\beta}{M}$, $\overset{\gamma}{M}$, &c, corresponded respectively to 10,000, 20,000, 30,000, &c $\overset{\lambda\eta}{M}$ expressed thirty eight myriads, or 380,000, $\overset{\delta\tau\circ\beta}{M}$ was equal to 43,720,000, so that the letter M placed under any number produced the same effect as is produced in our system by writing four ciphers to the right of the number Diophantus and Pappus expressed the myriads more simply by a point after the number thus, δ,τοβ ηκε denoted 43,728,025, and in this manner they proceeded to 9999 9999, or to any number under 100 000,000, which was the extent of their notation before the time of Archimedes who showed how it might be extended indefinitely By assuming 100 000 000 or the square of the myriad, as a new unit and taking this any number of times capable of being expressed by the previous notation he could represent any number which is expressed in the modern notation by sixteen digits Assuming again, the number which in our system is denoted by 1 with sixteen zeros as a second new unit he was enabled to express any number consisting of twenty four digits This method can obviously be continued to any length A great improvement was afterwards introduced by Apollonius, who proposed the simple myriad instead of its square, for the root of the system, and thus any large number was constituted of periods of four characters, the first of which, on the right hand represented units, the next, towards the left the number of myriads the third the square of the myriads and so on to infinity The different periods were distinguished by breaks or blanks In this manner a *local* value was given to the symbols, and a single step only was wanting to assimilate this notation entirely to our own It only required that to be done for the simple tens which had been done for the myriads or tens of thousands (For an account of the Greek notation and arithmetic, see Delambre, *Astronomie Ancienne*, tome ii)

From an inspection of the manuscripts preserved in public libraries, it appears that the Arabians had not generally adopted the denary numerals before the beginning of the 13th century of our era For several ages after the formation of their empire they used Greek [illegible] to keep their accounts, and although [illegible] oriental nations, they wrote from right to left yet they implicitly followed the Greek mode of ranging the numerals and performing the calculations It is probable that they derived their knowledge of the Indian digits through the medium of the Persians, but the subject is involved in much obscurity The epoch at which the denary numerals were introduced into Europe is also uncertain, but it appears to have followed, at no great interval, the Saracen conquests in Spain Vossius places this epoch about the year 1250, Du Cange thinks they were unknown before the 14th century, and they are very rarely to be found in the dates of any writings before the year 1400 They appear to have been first used by astronomers, and afterwards circulated over Europe in the almanacs

Symbols of quantity are entirely arbitrary, but the letters of the alphabet may be said to be exclusively adopted by mathematicians When the quantities belonging to any investigation are numerous, it may be necessary to have recourse to different alphabets, and it is always of very great importance to select such symbols as will most readily suggest the thing signified, as the initial letter of a word or letters which have acquired a sort of conventional right to be applied to particular purposes It is unfortunate that so little attention has been paid to this subject, and that some general principles [illegible] renders it often a troublesome task to compare with one another different investigations of the same problem, or the results of different methods of analysis There are, however, a few rules, which, though altogether arbitrary, seem to be recognized by all modern writers of any authority Thus, in algebra, the letters at the beginning of the alphabet are the symbols of quantities supposed to be known and those at the end of the quantities sought In analytical geometry and mechanics, *x*, *y*, and *z* are always used to denote the rectangular co-ordinates of a point in space In trigonometry, the sides of a triangle are usually denoted by *a*, *b*, and *c* and the angles opposite by A, B, and C respectively In astronomy, the Greek letters are most frequently used to represent angles Indices are usually employed when it is desirable to retain the same letters for the same class of quantities

Symbols of operation are equally arbitrary with those of quantity but there is much less diversity in the manner of employing them The signs + and −, universally used to signify addition and subtraction, seem to have been introduced by Stifelius a German, as the oldest work in which they are found is [illegible] published at Nuremberg in 15[illegible] duced the character √ originally *r*, the initial letter of *radix* (root) to denote the root of a quantity The sign of equality = was introduced by Robert Recorde, and he gives as a reason that no 2 things can be more equalle [illegible] namely than the two parallel lines In the modern calculus the letters of the alphabet are used as symbols of operation thus *d* for the differential and *f* for the integral of a quantity Finite differences and sums are denoted by the corresponding Greek letters Δ and Σ The fluxional notation introduced by Newton, and which continued to be used in this country till foreign books began to be more freely imported after the last war, has at length been entirely abandoned for the differential notation of Leibnitz and the Bernoullis The former is in fact utterly incapable of representing the extremely general processes of modern analysis (See Notes to the English translation of *Lacroix's Elementary Treatise on the Differential and Integral Calculus*, *Lubbock on Notation* in the *Memoirs Roy Astr Soc* vol iv , art "Notation," *Encyclopædia*)

NOTCHBOARD (It nocchia) In Architecture, the board which receives the ends of the steps in a staircase so called, because it is notched out to receive the ends of the steps

NOTE (Lat nota) In Music a character by which the elevations and depressions of sounds are marked, as well as the swiftness or slowness of their motions

NOTES (Lat nota) in Literature were originally marks affixed by the critics who reviewed the works of an author to those places which they considered to be spurious or faulty or which on any other account were worthy of remark In modern times the meaning of the term has been enlarged being now used as synonymous with *annotation* or *commentary* Among the Romans praiseworthy passages were usually marked with LL (*laudabiles loci*), and faulty passages indicated by θ, a contraction or more properly, a symbol for αθετησον (*Pers Sat* iv 12) Among the Greeks good passages with the letter Χ signifying χρηστον excellent, and against those which were condemned the word αχρηστον was written which Gellius calls *ad notamentum culpæ*

Notes in Printing, are — shoulder notes these are at the top of the page in the outer margin, and contain the book chapter, or date or both of them, side notes or marginal notes which give an abstract of the text, as in acts of parliament, or parallel passages, and different readings as in the Bible and bottom notes or foot notes, which are placed at the bottom of the page, and generally contain commentaries and explanatory annotations

NOTHING (*No thing* the negation of being) In Mathematical language, the term *nothing* is of frequent occurrence, and denotes either the absence of magnitude in circumstances in which magnitude might have existed, as when equals are taken from equals, or it denotes the limit to which a variable magnitude approaches by continual diminution, as when it is said that a magnitude is susceptible of all values between nothing and infinity

NOTICE in Law, is that by which a party is supposed to communicate, or to receive, that presumed or real knowledge which is necessary to affect the receiver with legal liabilities For instance, when a party proceeds to recover premises by ejectment, notice must be served by him, according to certain prescribed formalities, on the tenant in possession, in order to compel him to come in and defend the action This is an instance of actual notice Constructive notice is that which is presumed to arise from certain facts as, for instance, in equity, a purchaser is presumed to have notice of a suit

pending which may affect the subject matter of the sale, except where, by a late enactment (2 Vict c 11), express notice was rendered necessary

NO'TODO'NTA (Gr *νωτος, back; ὀδους, tooth*) The name of a genus of Lepidopterous insects

NO'TONECTIDÆ (Gr *νωτος, νηκτω, I swim*) The family of Hemipterous insects of which the water-boatman (*Notonecta*) is the type

NOTTURNO In Music, originally synonymous with serenade (which see), but applied at present to a piece of music in which the emotions chiefly of love and [illegible] modern composers Chopin, [illegible] distinguished in this department

NOUN (Lat nomen, *a name*) In Grammar, that part of speech which denotes a *conception*, in contradistinction [illegible] which is expressed by a *verb* [illegible] bstantives and adjectives, the first denoting real or supposed *substances*, the second qualities or properties conceived as belonging to substances *See* GRAMMAR

NOVA'CULITE (Lat novacula, *a razor*) The stone of which [illegible] It is of a slaty str[illegible] gan edge to the metal to the fine silicious particles which it contains

NOVA'TIANS The followers of Novatian, a presbyter of Rome who was stigmatized as a schismatic and heretic and founded a sect of this name in the 3d century, which continued to flourish to the end of the 5th The aim of Novatian was to deny readmission into the church to all persons who, in time of persecution or on other accounts, had once lapsed from the faith In this extreme severity of sentiment he was opposed by the [illegible] number of the clergy of Rome and especially by [illegible] Cornelius upon whose election to the see Novatian, who was a [illegible] withdrew from the communion [illegible] established a society of which he became himself the first bishop This sect was also known by the title of Cathari or Puritans which they assumed to express the high sense they entertained of the excellence attainable by, and necessary to, all professors of Christianity

NO'VEL (From the Italian novella derived from the Latin novus, *new*) A species of prose fictitious composition

The Italian novella, of which the best and earliest specimens are those contained in the *Decameron* of Boccaccio was rather a short tale turning on an event or on a series of adventures of humour pathos or intrigue than a novel in the modern acceptation of the term In its present signification in the English language it seems to express a species of fictitious narrative somewhat different from a romance, yet it would be difficult to assign the exact distinction, and in the French language the same name (roman) is used for both, while it differs from a tale merely in the circumstance that a certain degree of length is necessary to constitute a novel

Although, in fact the terms novel and romance are often used indifferently, yet they have also often been treated as distinct classes of composition in English literature Perhaps if we seek to draw the distinction with as much of accuracy as the subject will admit we may say that the proper object of a novel is the delineation of social manners, or the development of a story founded on the incidents of ordinary life or both together Thus will be excluded from the class of novels on the one hand tales of which the incidents are not merely improbable (for this may be the case in a novel) but occurring out of the common course of life and such as are founded on imaginary times and imaginary manners tales of supernatural incidents, chivalrous romances pastoral romances, &c , and on the other hand we must exclude from the same class fictitious narratives, in which the author's principal object is neither the story nor the costume, but which are obviously written with an ulterior view, although their incidents and character may perhaps, in other respects, fall under the definition suggested above Thus political philosophical, and satirical fictions are clearly not to be ranked as novels But it obvious that no definition can be drawn which shall on this subject, entirely satisfy the caprices of popular language

Of the novel, in this confined sense the works of Richardson, and those of Fielding and Smollet, afforded, perhaps the first examples in English literature The first of these authors gave birth to the sentimental novel, the latter two to the comic or humorous Marivaux, Prévost, &c spread the former style of composition in France, where, as well as on the Continent generally, it attained a high degree of vogue The novel of manners, whether comic or serious, has, perhaps, been always a more popular species of fiction in England It may be doubted whether the historical fiction, to which Sir Walter Scott has given such universal popularity belongs strictly to the class of novel or romance By aiming at the delineation of real, although past manners, and by the general turn of the story it seems to resemble the former, while the romantic character of many of its incidents seems to assimilate it to the latter

For the general history of prose fictitious composition, see ROMANCE

NO'VELS (Lat novellæ constitutiones, *new constitutions* In the Roman Law supplementary constitutions or decisions of emperors so called because they appeared after the [illegible] publications of law made by them Those of Justinian are the best known, and are commonly understood when the general term is used The *Novels* together with the *Code* and *Digest*, form the whole body of law which passes under the name of that emperor

NOVE'MBER (Lat novem, *nine*) The eleventh month of the Julian year, but the ninth month in the old Roman year, which began with March *See* CALENDAR, YEAR

NOVI MSILES The name given by Romulus to the gods of the Sabines, whom he adopted after the conquest of that people The term was afterwards applied to those heroes or demigods who, in consequence of their power or virtues were deified after death

NOVENNALIA (Lat novem, *nine*, and annus, *a year*), among the Romans, signified, as the derivation of the term implies, festivals held in honour of the dead every *nine years*

NO'VICE (Lat novitius) A person admitted into a religious community as an inmate, for the purpose of preparation for becoming a member The state of preparation is termed *novitiate* The custom of giving novices the religious dress did not begin until the 12th century The age of profession is fixed by the Council of Trent at sixteen years D[illegible] the novitiate the novice is still [illegible] his intention The term *novice* was applied to recruits in the ancient Roman soldiery, from which circumstance it appears to have been borrowed in ecclesiastical usage

NOVI HOMINIS, among the Romans, were such persons as by their own personal merit, had raised themselves to curule dignities without the aid of family connections This reproach, as is well known, was addressed by Catiline to Cicero.

NOX (Lat) In Mythology, the goddess of night In the Grecian mythology she was the daughter of Chaos, the sister of Erebus and Tartarus and the mother of Æther, Hemera Manatas Momus the Fates &c &c , which were all personifications of the natural phenomena life, sleep death &c

NOYADES (Fr noyer) The name given to a peculiar punishment resorted to in the first French revolution The *noyades* were effected by drawing out a plug inserted in the bottom of a boat in which the wretched victims were launched The genius of iniquity [illegible] ays a writer in the *Edin Review* often displays itself in the same invention It will be remembered that when Nero was desirous of despatching his mother, and found himself at a loss for an expedient, Anicatus proposed to him the model of a ship upon a new construction framed in such a manner that a part might be withdrawn and the [illegible] passenger committed to the waves ' (*Tac Ann* [illegible] *ar* 3)

NOYAU (Fr) A delightful liqueur, it is flavoured with bitter almonds or the kernels of peach stones, and contains prussic acid

NU'CLEUS (Lat) Literally any thing round which matter has accumulated or to which it is affixed. In Botany it has several significations - 1 The central [illegible] [illegible] ovule 2 That part of a seed con[illegible] [illegible] testa and consisting of either the embryo and albumen or of the embryo only 3 In lichens, the disk of the shield, which contains the sporules and their cases 4 In the language of the older botanists what is now termed by gardeners a *clove*, that is, the secondary bulb of a bulbous plant

NUCLEUS In Astronomy the solid part or body of a [illegible] distinguished from its nebulosity *See* COMET

NUCULA (Lat nux *a nut*) Either the fruit, called otherwise a gland or acorn, or any small, hard, one seeded pericarp, or the female organ of the plant Chara

NU'DIBRA'NCHIANS *Nudibranchiata* (Lat nudus, *naked*, branchiæ *gills*) The name of an order of hermaphrodite Gastropodous Molluscs which have the branchiæ exposed on some part of the back

NU'DIPEDA'LIA (Lat nudus, *naked*, and pes, *a foot*) A religious ceremony among the Greeks, Romans, and other nations, observed on account of some public calamity [illegible] which [illegible] [illegible] the votaries appeared with the feet uncovered In various other religious observances this practice was adopted, thus, the Roman matrons, when they offered up supplications to the goddess Vesta, always walked to her temple barefooted ; —

Huc pede matronam nudo descendere vidi — OVID.

A similar ceremony existed among the Jews

NU'DITIES (Lat nuditas, *nakedness*) In the Fine Arts figures entirely divested of drapery

NUISANCES, in Law, are of two kinds public or common, which annoy the king's subjects in general, and private, which are defined "any thing done to the hurt or annoyance of the lands, tenements, or hereditaments of another" The general remedy for public nuisances is by indictment or presentment, for private nuisances by action on the case for damages

NULLIPORES *Nulliporæ* (Lat nullus, no, and porus *a pore*) The name of a family of Lithophytous Polypes the axis of which presents no visible pores on its surface

NUMBER (Lat numerus), is defined by Euclid to be an assemblage or collection of units or [illegible] species This definition excludes the [illegible] Newton defines number as the abstract ratio of one quantity to another quantity of the same species, and hence there are three kinds of numbers namely integers fractions, and surds Number abstractedly considered, conveys merely the notion of *times* or *repetitions*

Mathematicians consider numbers under different points of view, or with relation to different properties, and hence arise the various distinctions which have been introduced, as even or odd, whole or fractional, rational or irrational, perfect or imperfect prime or composite, abundant or defective, &c Numbers also acquire various denominations from the manner in which they are composed, as triangular numbers pyramidal numbers, polygonal numbers, &c (See the respective adjectives

The theory of numbers forms one of the most subtle parts of the algebraic analysis Judging from the fragments which have been preserved, the ancient mathematicians had pushed their researches into the properties of numbers to a considerable extent, but until the invention of algebra, and the introduction of a more convenient notation, the difficulties of the subject could only be partially overcome The most ancient existing work on algebra is that of Diophantus, and it is devoted entirely to numbers From the time of Diophantus, who lived in the 3d century, to that of Vieta, Bachet and Fermat who flourished in the 16th, no advancement was made in the theory, but the discoveries of these illustrious mathematicians carried it far beyond its ancient limits Euler was the next from whom it received any considerable extension, he was followed by Lagrange, who added many important theories, and it has received its latest perfection from the hands of Gauss and Legendre The theory of numbers may be studied in the following works —the *Arithmetic* of Diophantus, with a Commentary by Bachet, and notes by Fermat, Toulouse 1670, *Waring's Meditationes Algeb*, Euler *Introd in Anal Infinitorum Opuscula Analytica* and various papers in the *Petersburg Memoirs*, Lagrange in the *Berlin Memoirs*, Gauss, *Disquisitiones Arithmeticæ* or the French translation, Legendre *Essai sur la Théorie des Nombres* 2d edit 1808 For the mystical properties of numbers the curious reader may consult *D S Boetii Arithmetica* Parisiis, 1521, *P Bungi Numerorum Mysteria*, 1591, *Taylor's Theoretic Arithmetic*, 1816

NUMBERS, BOOK OF *See* PENTATEUCH

NUMEʹNIA (Gr νέος, *new*, and μὴν *a month*) Grecian festivals celebrated at the commencement of every lunar month, in honour of all the gods, demigods, and heroes of antiquity They were observed with games and public entertainments the expense of which was defrayed by the wealthy citizens *See* NEOMENIA

NUMENIUS The name under which Cuvier separated the curlews, as a distinct genus, from the other *Scolopaces* of Linnæus They have a beak arcuated like that of the ibis, but it is more slender and is cylindrical throughout, the tip of the upper mandible extends beyond the end of the lower one, and projects a little downwards in front of it The toes are palmated at the base

NUMERALS The symbols or characters by which numbers are expressed *See* NOTATION

NUMERATION is the art of classing and expressing numbers Though the mode of reckoning numbers by *tens* or *decads* has prevailed among all civilized nations and has become incorporated with the very structure of language, there is nothing in the nature of the subject which rendered its adoption a matter of necessity Any other number might have been chosen for the root of the numerical scale, and, in fact, if a scale were now to be selected by mathematicians familiar with the properties of numbers, there are several considerations which would lead them to adopt *twelve*, in preference to ten The selection [illegible] universal, [illegible] principle, and it is easy to see that it arose from the practice so familiar in the early stages of society of [illegible] by the fingers of both hands In various languages however traces are found of an earlier and simpler mode of reckoning We may suppose the earliest of all to be that of counting objects in *pairs* It is still familiar among sportsmen, who reckon by *braces* or *couples* To count by *threes* was another step, and has been preserved by the same class of men under the term *leash* [illegible] which *three* dogs and no more [illegible] hand The numbering by *fours* has had a more extensive application it was evidently suggested by the custom of taking in the rapid tale of objects a pair in each hand Our fishermen, who generally count in this way call every *double pair* (of herrings, for instance) a *three* or *cast* and the term *warp*, which has exactly the same import, [illegible] It [illegible] races of savages inhabiting the forests of South America count only by fours, at least they express the number *five* by four and one, *six* by four and two, and so forth The [illegible] has its [illegible] the [illegible] of one hand [illegible] appears [illegible] to have been adopted by various savage nations of America, and we learn from Mungo Park that it is practised by the Yolofs and Foulahs of Africa, who designate 10 by two hands 15 by three hands, and so progressively It is even partially used in this country among wholesale traders In reckoning articles delivered at the warehouse the person [illegible] of the *tale*, having traced a long horizontal [illegible] to draw, alternately above and below it, a *warp*, or four vertical strokes each set of which he crosses by an oblique score and calls out *tally* as often as the number *five* is completed (*Leslie Philosophy of Arithmetic*)

The mode of reckoning by *twelves* or *dozens* may be supposed to have had its origin in the observation of the celestial phenomena, there being twelve months or lunations commonly reckoned in a solar year It appears in the subdivision of weights and measures as twelve ounces to a pound twelve inches to a foot and is still very generally employed in wholesale business extending to the second and even the third term of the progression Thus *twelve* dozen or 144 make the long hundred of the northern nations, or the *gross* of traders, and twelve times this again or 1728 make the *double gross* Traces of reckoning by *tuentus* or *scores* remain in our own and other European idioms The expression *three score and ten* is familiar The French language has no term for the numbers in the second series of the denary scale above *soixante* or sixty *Eighty* is expressed by *quatre vingts* and *ninety* by *quatre-vingts et dix*, *four twenties and ten* The inhabitants of Biscay are said still to reckon by the powers of twenty or the terms of progressive scores, and [illegible] mode of numeration w[illegible] M[illegible] Se

ARITHMETIC BINARY DUODECIMALS SEXAGESIMALS

The primary object of numeration is to find names for the different numbers and, as there are an infinity of numbers while the number of words is limited it became necessary to devise some systematic method of combining a few words so as to express by means of them any number whatever It is obvious that when large numbers are to be expressed, the lower scales, as the binary ternary &c, would be exceedingly inconvenient, on account of the multitude of words that would be required On the other hand, as a name is required for at least every unit in the scale every high scale would be no less inconvenient In the denary scale, the nomenclature is sufficiently convenient and in our language almost perfectly regular A name is given to the 9 units of the first order, the unit of the second order is *ten*, and, by the different combinations of this word, all numbers are named to 99 eleven and twelve are only *apparent* exceptions A new appellation is wanted for the unit of the third order, or *hundred* This suffices till we reach the fourth order, or *thousands*, and might even have sufficed to a hundred *hundreds* or ten thousand A thousand thousands is called a million, and a million millions a billion, further continuation is useless

The second object of numeration is to express the nomenclature thus formed by the combinations of a small number of written symbols This is most conveniently effected by the very refined artifice of giving to each symbol a *local* as well as an *absolute* value So that the same symbol 3 for example, is made to express not only *units* but 3 *tens*, 3 *hundreds*, 3 *thousands* &c, or 3 *tenth parts*, 3 *hundredth parts*, &c, according to its distance towards the left or right from the unit's place in any combination of symbols *See* NOTATION

NUʹMERATOR, in Arithmetic, is that part of the numerical expression of a fraction which indicates how many of those parts into which the unit is supposed to be divided are expressed Thus, in the fraction $\frac{7}{12}$, the lower number 12 is the denominator, and shows that the unit is divided into 12 parts, 7 is the numerator, and shows how many of those parts are to be taken

NUMISMAʹTICS (From the Greek νόμισμα, Latin nummus, *a coin*) The science of coins and medals The distinction between these classes of objects is, in modern times, that the coin is struck for the purpose of circulation as money, the medal not as a piece of money

but as a token commemorative of some person or event But ancient coins are often termed, in common language medals The parts of a coin or medal are, the obverse or face, containing generally the head, bust, or figure of the sovereign or person in whose honour the medal was struck, or some emblematic figure in the coins of commonwealths, and the reverse, containing various figures or words The words around the border of the coin form what is termed the *legend* those on the face the *inscription*, which occupy the lower extremity of the pieces and separate from the rest by a horizontal line they are termed the *exergue*

The earliest Grecian coins which we possess appear to have been nearly of a spherical shape they contain, on the obverse, some emblems of the particular cities which struck them, and on the reverse, deep indentations made by the puncheon in which the metal was held while the obverse was struck These marks, or the dye were soon brought into a more regular shape, sometimes forming a neat square, sometimes a circle Types were afterwards introduced on both surfaces of the coin, by inserting some small object in one compartment of the dye Ancient coins have been divided into various historical series, as exhibited in the following table —

- **Grecian**
  - 1 Civic
    - Of Græcia Propria and the Islands
    - Of Greek colonies
    - Of Graco-Asiatic cities
  - 2 Monarchic
    - Kings of Macedon
    - Kings of states formed out of the Macedonian conquests Syria Egypt &c &c, and the independent princes of Epirus and Syracuse
- **Roman**
  - 1 Consular
    - Roman asses
    - Coins of the families
  - 2 Imperial
    - Roman
    - Grecian — Provinces, Colonies and Municipia
  - 3 Medallions
    - Grecian
    - Roman
- **Barbarian**
  - 1 European of Thrace, &c
  - 2 Asiatic, of Persia &c
  - 3 African

The objects on Grecian civic coins are either, 1 the emblems of the cities, 2 figures of deities and their attributes, 3 miscellaneous or general symbols usurped by many states and cities, usually consisting of warlike objects The legends on Greek republican coins are either the name of the city or its initial letters, or monograms — *i e* figures forming a portion of the name in which the characters are so interlaced that a limb of one applies to many

The earliest coins which bore the heads of princes were those of Macedon commencing with Alexander the Great, and closing with the extinction of the dynasty of the Lagidæ in the Augustan age Four principal series of Grecian monarchical coins (either of Greek states or such as adopted the Greek language and customs) have been formed — 1 Of Macedon 2 Of Sicily Caria Cyprus, Heraclea Pontus 3 Of Egypt Syria the Cimmerian Bosphorus, Thrace &c &c from the era of Alexander the Great down to that of Christ 4 Of dynasties which flourished subsequently to the latter era including some kings of Thrace Bosphorus and Parthia with those of Commagene Edessa Judæa to which may be added some lines of Barbarized monarchs as those of Mauritania The most beautiful monarchic series are those of the Seleucidæ in Syria and Ptolemies in Egypt The unit of the Grecian silver coinage, in point of value may be considered as the drachma which is of a size between our sixpence and shilling the smallest silver coin is the dichalcos only $\frac{1}{12}$th of the drachma, the largest the tetradrachma, containing four drachmæ The commonest gold coin is the didrachma weighing two silver drachmæ, and in value 20, or 15*s* sterling Grecian copper coins are generally small

The Roman coinage differs from the Grecian in many respects, the greater size of the copper coins in early times and their superior workmanship in later the prevailing simplicity of devices, &c, form characteristic marks of difference In the first period of the republic they were cast The consular copper coins have separate symbols for the pieces according to their respective value, as the head of Janus for the *as* Jupiter for the *semis* &c The *as* also bore the impress I, to denote its quality of unity as a measure of value The name *family coins*, applied to many coins of the republic, arose from the custom of inserting the name of some distinguished family in the field of the coins A silver coinage was first introduced into Rome 266 B C The oldest coin was the denarius, equivalent to ten asses the earliest of these have the head of Janus for which that of Rome was afterwards substituted on the obverse, with a variety of symbols on the reverse The [illegible] into Rome [illegible]

the scrupulum, one third of the denarius in weight, a coin weighing two thirds, and another weighing a whole denarius Afterwards the chief gold coin was the *aureus* (twice the weight of the denarius), and its parts The imperial Roman coins form by far the most complete and varied series which we possess of ancient or modern times The symbols on the reverse have been arranged under four heads as relating to religion, war, games, and the embellishments of the city, under the numerous subdivisions of these subjects The obverses contain the portraits of emperors and empresses The characters on the reverses of the coins are, generally speaking, explanatory of the type, expressing in a few brief words the history of some occurrence immediately after which the coin was struck, &c The legend on the obverse mostly contain titles annexed to the imperial dignity, often expressed in abbreviations productive of not a little obscurity

Not less than three hundred portraits are preserved in the series of Roman imperial coins The term *medallion* is applied to those productions of the Roman or provincial mints which, in gold, exceed the size of the aureus, in silver, of the denarius, [illegible] in copper coin of ascertained value It [illegible] were intended for circulation as coins, or struck, like medals among ourselves, as commemorative tokens

Modern coins present so wide a variety as to render it impossible to include any classification of them within the limits of the present notice In England, Roman coins were current until the arrival of the Saxons we have the coins of five out of the seven kingdoms of the heptarchy, among them some small copper coins, the only specimens of that metal coined before the reign of Elizabeth Coins struck prior to the reign of Charles II had their devices impressed by the blows of a hammer The system of lettering on the edges which was succeeded by graining, was invented in order to obviate the fraudulent practice of clipping and filing the current coin

NUMMULITES (Lat nummus, *money* and Gr λίθος *a stone*) An extinct genus of the order of Molluscous animals called Cephalopoda, of a thin lenticular shape divided internally into small chambers These occur so abundantly in some parts of the chalk formation, that the name of nummulite limestone is given to the strata so characterized

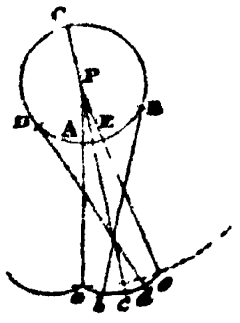
NUNCIO An envoy of the pope to the court of an emperor or king to negotiate ecclesiastical affairs (*See* LEGATE) Previously to the council of Trent the papal nuncios acted as judges in the first instance of matters which lay within ecclesiastical jurisdiction, but since that time they have formed a kind of [illegible] decisions of the respective bishops It [illegible] however holds good only in those countries which still hold themselves subject to the decretals and discipline of the council of Trent for in other kingdoms and states, such as France Austria Tuscany &c which though Roman Catholic hold themselves independent of the Roman pontiff in matters of discipline the papal nuncio has no jurisdiction whatever and is invested merely with a diplomatic character like the ambassadors of any secular power The term *nuncio* is the Italian form of the Lat *nuntius*

NUNCUPATIVE WILL (Lat nuncupo, *I name*) In Law a will orally delivered by the testator *See* WILL

NUNDINÆ (Lat nonus *ninth* and dies *a day*) The market days or fairs at Rome were so called, because they recurred every ninth day On this day the people from the country and neighbouring towns flocked to Rome with the produce of their farms or industry On that day also all public proclamations were made causes heard witnesses cited and judgments given The nundina were originally considered as *dies nefasti*, on which no other business could be done, but for the convenience of the country people, this prohibition was removed by the *Lex Hortensia*

NUNS Female devotees among the Roman Catholics, who like the monks of the other sex, seclude themselves in religious communities and make profession of perpetual chastity *See* MONACHISM

The origin of this institution is commonly ascribed to St Syncletica the contemporary of St Anthony Among nuns as among monks there are various orders, some abandoning themselves entirely to contemplation and spiritual exercises but many others to the more active duties of private and public charity



NURSERY In Gardening a plot of ground, or an entire garden, set apart for the propagation of plants, more particularly trees and shrubs The situation ought to be open and airy, and the soil of an average quality, neither too heavy nor too light, so as to be adapted to the majority of plants but in a complete nursery there [illegible] other peculiar soils, for such plants as are not readily propagated and grown in ordinary soils Where tender plants are propagated, or where hardy plants are to be raised from seeds or struck from cuttings which are not easily ger-

minated or rooted in the open ground and in the ordinary manner, hot-beds, frames, and hand-glasses are also requisite Every private garden of any extent requires a nursery to raise and bring forward young plants as a reserve for supplying failures by disease or accident in the general garden, and in every country where private gardens or plantations of trees are frequent, public or commercial nurseries are formed by persons who adopt [illegible]

NUTATION [illegible] ly the name given to a small gyratory movement of the earth's axis in virtue of which, if it subsisted alone without the precession of the equinoxes the pole of the equator would describe among the stars in a period of about nineteen years a small ellipse having its longer axis equal to 18 5″ and its shorter to 13 74″, the longer being directed to the pole of the ecliptic, and the shorter, of course, at right angles to the longer

In order to understand the nature of this phenomenon it is necessary to consider it in connection with that of precession, both depending on the same physical cause and forming in fact, essential constituent parts of one and the same great phenomenon The action of the sun and moon on the protuberant mass about the earth's equator tends constantly to draw the plane of the equator towards that of the ecliptic, or to diminish the angle between them In consequence of the earth's rapid rotation about its axis the inclination of the two planes is not permanently altered but a motion is communicated to the plane of the equator of such a kind that its axis revolves with a slow conical motion about the axis of the ecliptic or which is the same thing, the pole of the equator describes a circle in the heavens about the pole of the ecliptic as a centre keeping constantly at the same mean distance of about 23° 28′ from it The direction of this motion is from east to west and its velocity amounts only to 50 1″ annually, so that the whole circle requires for its description a period of 25 868 years

Let us now consider what would be the effect of the moon's action independently of that of the sun The lunar orbit does not coincide with the ecliptic it is inclined to it in an angle of about 5° 9′ and the position of the line in which the two planes intersect that is the line of the nodes, goes back on the ecliptic with a motion which carries it through a complete revolution in about eighteen years and seven months The axis of the lunar orbit therefore also describes a conical motion about that of the ecliptic or its pole describes a small circle in the heavens about the pole of the ecliptic at the distance of 5° 9′ and in the same period of about eighteen years and seven months Now the effect of the moon's attraction on the parts of the terrestrial spheroid exterior to the inscribed sphere is to produce a slow conical motion of the earth's axis not about the pole of the ecliptic but about the pole of the lunar orbit which is itself in a state of comparatively rapid motion about the pole of the ecliptic The point therefore in the sphere of the heavens round which the pole of the earth's equator revolves [illegible] of continual circulation round the pole of [illegible] path which the pole of the equator describes is not a circle but a sort of epicycloidal curve or gently undulated ring This will be rendered evident by the annexed figure Let P be the pole of the ecliptic which is supposed to be fixed A the pole of the moon's orbit moving round the small circle A B C D in the space of nearly nineteen years *a* the pole of the earth's equator, which at each moment moves in a direction perpendicular to the varying position of the line A *a* and with a velocity varying with the intensity of the acting forces during the revolution of the moon's nodes but on the whole, so slow as to carry it round only in 25 868 years When therefore, A arrives successively at B C D and E the line A *a* will take the positions B *b*, C *c*, D *d*, E *e* the earth's pole will thus, in one tropical revolution of A have arrived at *e*, and its direction having been always perpendicular to B *b*, C *c*, &c, the path which it will have described will be of the form *a b c d e* The same thing will be repeated at each succeeding revolution of the moon's node, and it is this alternate increase and diminution of the distances *P a P c*, *P e*, which constitute the phenomenon of the nutation

As the effect of the sun [illegible] motion about its centre of [illegible] of the attracting body from the plane of the equator, it is evident that the effect of the sun is greatest at the solstices, and is reduced to nothing at the equinoxes On this account, the obliquity of the ecliptic is subject to a small semi-annual variation, depending on the sun alone This is called the *solar nutation* Its existence is, however, only a deduction from the theory of attraction, for its amount which is less than half a second is too small to be sensible to observation The result produced by the combined action of the sun and moon is called the *lunar-solar nutation*, [illegible] of the [illegible]

The uranographical effect of the nutation is to produce a periodical fluctuation of the apparent obliquity of the ecliptic, and of the velocity of the regression of the equinoctial points Hence arises the distinction between apparent and mean right ascension and declination, the former being given by direct observation, and the latter being the results obtained when the observed places of objects have been cleared of the periodical fluctuations arising from nutation Formulæ and tables, for the reduction of observations to a common epoch, are given in all works on practical astronomy

The discovery of the nutation of the terrestrial axis belongs to Bradley and was a consequence of his other great discovery, the aberration of light In prosecuting his observations with a zenith sector, with a view to establish his theory of the aberration, he found a greater apparent change in the declinations of stars near the equinoctial colure than could arise from a precession of 50″ in a year, and at the same time exactly the reverse effect in the case of stars near the solstitial colure In the course of five years the changes in question amounted in some instances to 9″ or 10″, and as it was evident that they could not be explained by any alteration of the quantity of precession Bradley reverted to an idea which had previously occurred to him, in attempting to account for the phenomenon of aberration 'I suspected,' says he 'that the moon's action upon the equatorial parts of the earth might produce these effects For if the precession of the equinoxes be according to Sir Isaac Newton's principles caused by the action of the sun and moon upon those parts the plane of the moon's orbit being at one time above ten degrees more inclined to the equator than at another it was reasonable to conclude that the part of the whole annual precession which arises from her action would in different years be varied in its quantity whereas the plane of the ecliptic wherein the sun appears keeping nearly always the same inclination to the equator that part of the precession which is owing to the sun's action may be the same every year, and from hence it would follow that although the mean annual precession proceeding from the joint actions of the sun and moon were 50″ yet the apparent annual precession might sometimes exceed and sometimes fall short of that mean quantity according to the various situations of the nodes of the moon's orbit'

A long series of observations on stars situated in different parts of the heavens proved the correctness of this theory and it was found that all the phenomena were capable of being explained on the hypothesis that the pole of the equator describes a small circle about its mean place contrary to the order of the signs and in the same period as that of the revolution of the moon's nodes Bradley himself afterwards remarked that they would be still more accurately represented by supposing the curve described by the pole about its mean place to be an ellipse instead of a circle This is confirmed by accurately calculating from theory the amount of all the forces which tend to displace the terrestrial equator The result shows the path of the pole to be an ellipse and gives nearly the same values of its semi transverse and conjugate axes as are given by observation The values were found by Von Lindenau from a series of 810 observations embracing three complete revolutions of the moon's nodes to be 8 977″ and 6 682′ respectively The value of the semi axis major of the small ellipse imagined by Bradley is called the *constant of nutation* and enters as an element into all reductions of astronomical observations Von Lindenau's determination above cited is adopted by the German astronomers The value generally used by British astronomers is 9 25′ which was deduced by Dr Brinkley, Bishop of Cloyne from his own observations with the Dublin circle Very recently this important astronomical element has been investigated by Dr Robinson of Armagh from the Greenwich observations with the mural circle from 1812 to 1835 and the result at which he arrives is 9 2913′ (*Memoirs Roy Astr Soc* vol xi 1840, *Airy's Math Tracts*, *Herschel's Outlines of Astronomy*) *See* PRECESSION

NUTHATCH The name of a shy and solitary bird of the genus *Sitta* (*S Europæa*) It frequents woods, and feeds on insects chiefly, but also eats the kernel of the hazel nut which it cracks by fixing it in a chink, and striking it from above with all its force The nuthatch lays her eggs in holes of trees, and hisses like a snake when disturbed

NUT OF A SCREW In Architecture a piece of wood, iron, or other metal pierced cylindrically, wherein is cut a spiral groove, adapted to an external cylindrical spiral cut on a bolt Its use is to screw two bodies together, a head being placed on one end of the bolt to counteract the action of the nut Two bodies are thus held together by compression, the bolt between the head and the nut being a tie

NUTRIA, or NEUTRIA The commercial name for the skins of *Myopotamus [illegible]* (the *Coypou* of Molina, and [illegible] In France the skins were, and perhaps still are, sold under the name of *racoonda*, but in England they are imported as *nutria* skins deriving their appellation most probably from some supposed similarity of the animal which produces them, in appearance and habits, to the otter, the Spanish name for which is nutria Indeed, Molina speaks of the *coypou* as a species of water rat of the size and colour of the otter

Nutria fur [illegible] in the hat manufacture, and has become, [illegible] st 15 or 20 years, an article of very considerable commercial importance The imports fluctuate considerably In 1823, they amounted to 1 570,103 skins, but they have not in any other year been much more than half that number In 1826 they were only 60 871 In 1837 and 1838, the imports were, at an average, 358,280 skins a year Those entered for home consumption pay a duty of 1½*d* a skin They are principally brought from the Rio de la Plata Nutria skins are very extensively used on the Continent Geoffroy mentions* that in certain years a single French furrier (M Bechem) has received from 15 000 to 20 000 skins

Like the beaver, the coypou is furnished with two kinds of fur, viz the long ruddy hair which gives the tone of colour, and the brownish ash coloured fur at its base which like the down of the beaver is of much importance in hat making, and the cause of the animal's commercial value

The habits of the coypou are much like those of most of the other aquatic Rodent animals Its principal food in a state of nature is vegetable It affects the neighbourhood of water swims perfectly well and burrows in the ground The female brings forth from 5 to 7 at a time and the young always accompany her

The coypou is easily domesticated and its manners in captivity are very mild (See *Martin*, in the *Proceedings of the [illegible] Society* 1835)

NUTRITION See Food Digestion

NUTMEG The fruit of the *Myristica moschata* a beautiful tree of the family of the *Laurineæ* of Jussieu which grows in the Moluccas Islands All the parts of this tree are very aromatic, but only those portions of the fruit called mace and nutmeg are sent into the market The entire fruit is a species of *drupa* of an ovoid form, of the size of a peach, and furrowed longitudinally The nutmeg is the innermost kernel or seed contained in a thin shell which is surrounded by the mace, and this again is enclosed in a tough fleshy skin which opening at the tip separates into two valves The nutmeg tree yields three crops annually, one in April which is the best, one in August, and one in December

Good nutmegs should be dense and feel heavy in the hand When they have been perforated by worms they feel light and though the holes have been fraudulently stopped, the unsound ones may be easily detected by this criterion

Nutmegs afford two oily products 1 Butter of nutmeg vulgarly called oil of mace is obtained in the Moluccas by expression from the fresh nutmegs to the amount of 50 per cent of their weight It is a reddish yellow butter-like substance, interspersed with light and dark streaks and possesses the agreeable smell and taste of the nutmeg from the presence of a volatile oil It consists of two fats, one reddish and soft soluble in cold alcohol another white and solid, soluble in hot alcohol 2 The volatile oil is solid or a *stearoptene* and has been styled *myristicine* (*Ure's Dict of Arts &c*)

NUTS (Lat *nux*) The fruit of different species of *Corylus* or hazels The kernels have a mild farinaceous oily taste, agreeable to most palates, a kind of chocolate has been prepared from them and they have sometimes been made into bread The expressed oil of hazel nuts is little inferior to that of almonds Besides those raised at home, nuts are imported from different parts of France Portugal, and Spain but chiefly from the latter The Spanish nuts in highest estimation, though sold by the name of Barcelona nuts are not shipped from thence, but from Tarragona whence the annual average export is estimated at from 25 000 to 30,000 bags, 4 to the ton The annual entries of nuts for home consumption amount to from 100 000 to 125 000 bushels the duty of 2*s* a bushel yielding from 10 000 to 12,000*l* nett (*Commercial Dict*)

NUTTALLITE A mineral associated with calcspar, from Bolton in Massachusetts it occurs in prismatic crystals and appears from Dr Thomson's analysis to be an alumino silicate of lime potash, and iron

NUX A kind of fruit, hard, dry, not splitting, and containing only one seed it is also extended by some writers to any similar fruit whether it contains one cell or more than one See Nuts

NUX VOMICA (Lat) The fruit of a species of strychnos growing in the East Indies It produces the alkaloid salts, strychnia, and brucbia, and is a very virulent poison

NYCTALOPS (Gr *νυξ, night* and *οπτομαι, I see*) One who only sees distinctly in twilight, or the dusk of evening

NYMPH, *Nympha* (Gr *νυμφη, a nymph*) The Metabolian insects are so called when in the second stage of [illegible] especially when they possess the [illegible] See Pupa

NYMPHÆA, a the name given to some public baths at Rome consecrated to the nymphs, with whose statues they were adorned

NYMPHADÆ In Zoology a name given by Lamarck to a family of Bivalves

NYMPHÆACEÆ (*Nymphæa* one of the genera) In Botany, a natural order of plants, containing the water lilies of various parts of the world, they are Polypetalous Polyandrous Exogens, with the sides of the cells of the fruit covered with numerous seeds Their stems burrow among the mud of the places where they grow, and have slightly astringent narcotic properties The species are most valued for the beauty of their flowers, which in *Victoria regia* are the largest in nature, measuring as much as four feet in circumference

NYMPHALIS A genus of diurnal Lepidopterous insects now [illegible]

NYMPHIPARA (Gr *νυμφη* nymph, *παρα*, *I produce*) A hy [illegible] family of Dipterous insects, and changed by Latreille into *Pupipara* See that word

NYMPHS (Gr *νυμφαι*) Female beings in Grecian Mythology partaking of the nature of gods and men They peopled all the regions of earth and water, and according to the places of their [illegible] inhabited the streams, the Oreades the mountains the Dryades the woods, the Hamadryades trees, with which they were born and died They are represented as very beautiful, they constituted the attendants of various of the higher female divinities, especially Diana and were also considered as having been the nurses of many of the gods, as Jupiter and Pan See Naiads, Nereids

NYSTAGMUS (Gr *νυσταγμος*) A winking of the eyes, as observed in a drowsy person

O.

O A letter of the vowel series, which, if arranged according to the nature of the sound, occupies a position between *a* and *u* It is susceptible of numerous interchanges for which the reader is referred to the *Penny Cyclopædia* The Greeks had two forms of this letter, *ο* (*ουικρον* or little *o*) and *ω* (*ουμεγα*, or large *o*), the former of which was equivalent to the short, and the latter to the long pronunciation of this letter in other countries Among the Irish the letter O prefixed to a name was originally considered as a mark of family dignity, it is now however we believe considered to be merely equivalent to *Fitz* in England and *Mac* in Scotland, indicating *son*

O In Music the O circle or double C or semicircle, is a note which we call a sembreve, and the Italians *circolo*, used by them to mark what they call *tempo perfetto*, and what we call triple time

OAK (Germ *eiche*) The general name of a well-known hard-wooded forest tree much cultivated for the purposes of timber, particularly in [illegible] and in other cases when much exposure to [illegible] is required There are several varieties of this valuable tree, but the common English oak (*Quercus robur*) claims precedence of every other The oak timber imported from America is very inferior to that of this country the oak from the central parts of Europe is also inferior, especially in compactness and resistance of cleavage The knotty oak of England the "unwedgeable and gnarled oak," as Shakspeare called it, [illegible] age (from 50 to 70 years), is [illegible] Some timber is harder, some more difficult to rend, and some less capable of being broken across, but none contains all the three qualities in so great and equal proportions, and thus, for at once supporting a weight, resisting a strain and not splintering by a cannon shot, the timber of the oak is superior to every other

A fine oak is one of the most picturesque of trees it conveys to the mind associations of strength and duration which are very impressive The oak stands up against the blast, and does not take, like other trees, a twisted form from the action of the winds Except the cedar of Lebanon, no tree is so remarkable for the stoutness of its limbs they do not exactly spring from the trunk, but divide from it, and thus it is sometimes difficult to know

* *Annales du Muséum*, vol vi p 82 The [illegible] speaking, good, but the tail is too ha [illegible] scription

which is stem and which is branch The twisted branches of the oak, too, add greatly to its beauty, and the horizontal direction of its boughs spread over a large surface, completes the idea of its sovereignty over all the trees of the forest

The oak is raised from acorns, sown either where the oak is to stand, or in a nursery whence the young trees are transplanted

The colour of oak wood is a fine brown, and is familiar to every one it is of different shades, that inclined to red is the most inferior kind of wood The larger transverse septa are in general very distinct producing beautiful flowers when cut obliquely Where the septa are small and not very distinct, the wood is much the strongest The texture is alternately compact and porous, the compact part of the annual ring being of the darkest colour, and in irregular dots, surrounded by open pores, producing beautiful dark veins in some kinds particularly pollard oaks Oak timber has a particular smell and the taste is slightly astringent It contains gallic acid and is blackened by contact with iron when it is damp The young wood of English oak is very tough often cross grained and difficult to work Foreign wood and that of old trees is more brittle and workable Oak warps and twists much in drying, and, in seasoning, shrinks about $\frac{1}{32}$d of its width

Oak of a good quality is more durable than any other wood that attains a like size Vitruvius says it is of eternal duration when driven into the earth it is extremely durable in water, and in a dry state it has been known to last nearly 1000 years The more compact it is, and the smaller the pores are the longer it will last but the open porous and foxy coloured oak which grows in Lincolnshire and some other places, is not near so durable

Besides the common British oak (*Quercus robur*) the sessile fruited bay oak (*Quercus sessiliflora*) is pretty abundant in several parts of England particularly in the north The wood of this species is said by Tredgold to be darker heavier harder and more elastic than the common oak, tough, and difficult to work and very subject to warp and split in seasoning Mr Tredgold seems disposed to regard this species as superior to the common oak for ship-building But other and also very high authorities are opposed to him on this point, and on the whole we should think that it is sufficiently well established that for all the great practical purposes to which oak timber is applied and especially for ship building the wood of the common oak deserves to be preferred to every other species A well informed writer in the *Quarterly Review* has the following remarks on the point in question —

'We may here notice a fact long known to botanists but of which our planters and purveyors of timber appear to have had no suspicion, that there are two distinct species of oak in England —the *Quercus robur* and the *Quercus sessiliflora*, the former of which affords a close-grained firm, solid timber rarely subject to rot the other more loose and sappy very liable to rot and not half so durable This difference was noted so early as the time of Ray, and Martyn in his *Flora Rustica* and Sir James Smith in his *Flora Britannica* have added their testimonies to the fact The second species is supposed to have been introduced some two or three years ago from the Continent where the oaks are chiefly of this latter species especially in the German forests the timber of which is known to be very worthless But what is of more importance to us is that *de facto* the imposture abounds, and is propagated every day in the New Forest and other parts of Hampshire in Norfolk and the northern counties, and about London and there is but too much reason to believe that the numerous complaints that were heard about our ships being infected with what was called improperly enough *dry rot* were owing to the introduction of this species of oak into the naval dock yards, where we understand, the distinction was not even suspected It may thus be discriminated from the true old English oak — The acorn stalks of the *robur* are *long*, and its leaves *short*, whereas the *sessiliflora* has the acorn stalks *short* and the leaves *long* the acorns of the former grow singly or seldom two on the same footstalk, those of the latter in clusters of two or three close to the stem of the branch We believe the Russian ships of the Baltic that are not of larch or fir are built of this species of oak, but if this were not the case, their exposure on the stocks, without cover, to the heat of summer, which, though short, is excessive, and the rifts and chinks which fill up with ice and snow in the long winter are enough to destroy the stoutest oak and quite sufficient to account for their short-lived duration"

OA'KUM The yarns of which rope is composed when twisted into fibre When mingled with pitch it is used for stopping leaks

OA'NNES In ancient Mythology, the most celebrated divinity of the Babylonians He was represented as a sea monster, with human feet and hands, and was said to dwell in the abysses of the Red Sea, whence he was in the habit of issuing daily, and proceeding to Babylon, where he communicated instruction on religion, the science of government, and the useful arts It has been generally supposed that Oannes was identical with the god Dagon,

> —— Sea monster, upward man,
> And downward fish,

and it is certain that the worship of marine animals constituted a leading feature in the religious observances of the Syrians and the adjacent nations *See* DAGON

OAR In Nautical Affairs, a long piece of timber flat at one end, and round or square at the other, by which a boat, barge, or galley &c is propelled through the water The flat part dipped into the water is called the *blade*, the other end is the *loom*, which terminates in the handle The fulcrum of the oar is the hole in the gunwale called the *rowlock* or between two pins called *thole pins*, or one thole pin with a loose strap for confining the oar There are various nautical phrases contingent upon this term, a few of which may not perhaps be out of place here *To boat the oars* signifies to lay them in from rowing, *to feather the oar*, to hold the blade horizontally so as not to catch wind, *to lie on the oars* to suspend rowing for any interval, this is also the salute given to persons of distinction in passing, to *ship* and *unship the oars*, respectively to fix them and throw them out of the rowlocks

OA'SIS (Derived from the Coptic ouah Arab wâh) The name given to those fertile spots watered by springs and covered with verdure which are scattered about the great sandy deserts of Africa The most noted are situated in the Lybian desert The oases of Egypt are nothing more than valleys or *depressions* of the lofty plain which forms the extensive table-land of Eastern Africa They bear, in many respects a similarity to a portion of the valley of Egypt being surrounded by steep cliffs of limestone at one distance from the cultivated land which vary in height in the different oases, those rising from the southern oases being the highest, neither do they present a continuation of cultivable soil all of them being intersected by patches of desert They no doubt owe their origin to the springs with which they abound the decay of the vegetation thence arising having produced the soil with which they are now covered Their fertility has been deservedly celebrated, but the glowing eulogiums of travellers on their surpassing beauty are probably in a great measure to be ascribed to the trying contrast they present to the deserts of burning and with which they are surrounded It may appear contradictory considering the high opinion the ancients entertained of the fertility and beauty of the oases that they should have selected them for places of banishment, but that such was the case at least under the Romans is certain A law of the *Digest* lib 48 tit 22 refers to this practice, and it has been supposed that the poet Juvenal was one of those who suffered a temporary banishment (*relegatio*) to the oases though the evidence of this is by no means clear (*Biographie Universelle* art *Juvenal*) But the fact of their being selected as places of banishment is not in anywise inconsistent with the received opinions as to their salubrity and fertility They were selected not because of their being naturally noxious or disagreeable, but because of their being as it were out of the world and from the extreme difficulty of escaping from them The larger oases have some fine remnants of antiquity, the most celebrated of which is the temple of Jupiter Ammon at Siwah See the *Geo Dict* art Egypt and the authorities there referred to) *See* DESERT

OAST The term applied to a kiln for drying hops, and which differs from a kiln for drying corn chiefly in being heated by a stove with flues instead of an open fire the smoke and heat of which passes up through the corn

OATFIELD *See* OPEN FIELD LAND

OATGALLS *See* GALL NUTS

OATH is defined by Paley the calling on God to witness to take notice of what we say, and invoking his vengeance or renouncing his favour if what we say be false or if what we promise be not performed" By the jurisprudence of nearly all known nations it has been admitted in one form or another as the solemn test of truth in judicial proceedings Thus, as a general rule, all evidence in such proceedings must be given on oath by English law, and the having taken such oath subjects the witness to the penalties of perjury if his testimony be false The only exceptions are 1 In favour of Quakers Moravians, and Separatists, whose "affirmation" is now admissible in all judicial proceedings, whether civil or criminal The 1 & 2 Vic c 77 extends this privilege to persons who have been Quakers or Moravians but have left those communities, retaining their objections 2 Persons entitled to privilege of peerage give in their answers in chancery, "upon their honour," instead of on oath, and corporations put in answers under the great seal Oaths are administered publicly in court,

where the witness is about to give his evidence viva voce, and by competent authority where the evidence is reduced into writing in the form of the witness being termed his "affidavit"

Any believer in a definite form of religion can be a witness, and the oath may be administered "according to such forms and ceremonies as he may declare to be binding" (1 & 2 Vic c 108) But persons who cannot take an oath are incapable of being witnesses, such, therefore, as will not declare their belief in God, in a future state of rewards and punishments, and that perjury will be punished by the Deity, are excluded, as well as those who, from their years or ignorance, are incapable of comprehending the nature of an oath

Oaths are still required by law on many occasions besides the giving evidence in judicial proceedings and were formerly in a still greater number until the 5 & 6 W 4 c 62, which substituted declarations in a great variety of cases, especially relating to the customs, excises, and post-office Besides the Quakers and Moravians, several small sects of Christians profess conscientious objections to oaths grounded on the express language of the scriptures The church of England in common with the Catholic church in all ages and with most varieties of Christians considers judicial oaths lawful and declares them so by her 39th article They have also been held mischievous or unnecessary by some philosophical writers especially Bentham in his *Rationale of Evidence* The only answer to his reasoning appears to be that however unreasonable the belief that the duty of truth is rendered more imperative by the formality of an oath still while such belief is a prevalent one or while the imagination of witnesses in general is impressed by its solemnity the convenience of retaining the practice overbalances the disadvantages

OATS See AVENA

OBEDIENCE PASSIVE in Politics, signifies the unqualified obedience which according to some political philosophers, is due from subjects to the supreme power in the state, insomuch that not only its lawful but its unlawful commands may not be forcibly resisted without sin The doctrine of passive obedience or non-resistance was strongly professed by the church of England in the time of King James I, much commented on by writers both for and against it, under Charles and James II and condemned at the Revolution See NON-RESISTANCE and DIVINE RIGHT

OBELISK (Gr ὀβελίσκος dim from ὀβελὸς, Lat obelus *a needle or dart*) A lofty quadrangular monolithic column diminishing upward with the sides gently inclined but not so as to terminate in an apex at the top, neither is it truncated or cut off at the summit but the sides are sloped off so as to form a flattish pyramidal figure by which the whole is suitably finished off and brought to a point, without the upper part being so contracted as to appear insignificant Egypt was, properly speaking the land of obelisks, and they are unquestionably to be [illegible] the most ancient monuments of that [illegible] people Much learning and ingenuity has been expended in endeavouring to ascertain their origin and the purposes for which they were erected, but it does not appear that any satisfactory solution of the problem has hitherto been given It has been frequently asserted that obelisks were originally erected in honour of the sun of which they were said to be symbolical, and that they served the purposes of a gnome or sun-dial, but this opinion is now almost totally rejected and it is generally believed that obelisks were nothing more than monumental structures serving as ornaments to the open squares in which they were generally built, or intended to celebrate some important event and to perpetuate its remembrance They were usually adorned with hieroglyphics and we learn from the testimony of Diodorus and Strabo that the inscriptions with which they were charged declared the amount of gold and silver the number of troops and the quantity of ivory perfumes and corn which all the countries subject to Egypt were required to furnish The two largest obelisks were erected by Sesostris in Heliopolis They were formed of a [illegible] granite and measured 180 feet in height [illegible] became a Roman province, Augustus removed these obelisks to his own capital, and this practice found numerous imitators both in some of his successors to the imperial throne and at a much later period in many of the Roman pontiffs from the 16th century down to the present times Of these obelisks that of the Lateran, which is the largest now known, being 105 feet in height exclusive of the pedestal, and weighing 440 tons was brought by Constantine from Heliopolis to Alexandria and thence by Constantius his son to Rome, where it was erected in the Circus Maximus The obelisk next in size to that of the Lateran was placed originally in the Vatican circus by Caligula, but it now stands in the piazza of St Peters, its entire height is 132 feet including the pedestal, &c The obelisks most generally known at least in name are the Luxor, which was removed to Paris in 1833, and the two monoliths called Cleopatra's Needles, of which one is standing and the other on the ground, but these are smaller than those we have adverted to, the Luxor being 76 feet in height, and the Needle of Cleopatra which still stands being about 63 feet in height, exclusive of the pedestal, &c A full consideration of the Egyptian obelisks would involve us in the discussion of several most important questions, on which our limits preclude us from entering Of these perhaps the most extraordinary is the wonderful knowledge of mechanical power which the Egyptians evinced in erecting and removing such gigantic structures,—a feat which it would require the greatest skill and ingenuity of modern engineers, even in the present comparative [illegible] to accomplish See also Sir G Wilkinson's *Egyptians*, vol iii, *passim*, which contains some excellent illustrations of the different methods adopted by that people for removing their huge structures from place to place)

OBELUS (Lat Diplē [illegible] mark so called from its resemblance to a spit, Gr ὀβελὸς, usually thus — or thus — in ancient MSS It was used by Origen, in his *Hexapla*, to mark the passages where something is found in the Septuagint which is not in the Hebrew The common use of the line — in modern writing is to mark the place of a break in the sense where it is suspended, or where there is an ungrammatical transition, but a paragraph introduced where the sense is suspended is more properly marked by the sign of a parenthesis

OBERON In Mediæval Mythology, the King of the Fairies Wieland's beautiful poem, and Weber's romantic opera of this name the *Midsummer Night's Dream* and innumerable other poems and tales of which he is the hero have made the name of Oberon so familiar that it will be unnecessary to do more in this place than to state the origin of the fable The name Oberon first appears in the old French *fabliaux* of Huon of Bordeaux it is identical with Auberon, or Alberon the first syllable of which is nothing more than the old German word Alb *elf* or *fairy* which in the Helden-Buch and other old German poems is expressed variously by Alberich or Alban (See *Grimm's Deutsche Mythologie*, p 286) He was represented as endowed with magic powers and with the qualities of a good and upright monarch rewarding those who practised truth and honesty and punishing those who acted otherwise His wife's name was Titania or Mab whose powers have been so beautifully depicted in *Romeo and Juliet*

OBESITY (Lat obesus *fat*) Unhealthy fatness The tendency to the formation of fat is often so excessive as to constitute a disease and it occasionally prevails in particular habits so as to cause a most unsightly bulk of body and to be independent of diet The celebrated Lambert who exhibited himself some years ago, was a remarkable specimen of this disease He died in the fortieth year of his age and weighed, a little before his death 739 pounds There is an account in the *Philosophical Transactions* for 1813 of a girl only four years old, who weighed 256 pounds from accumulation of fat

When obesity is limited to the abdomen, arising from excessive deposition of fat in the omentum, and producing what is called a pot belly or where it is the result of indolence and indulgence in luxurious diet, a slow and prudent change from a full to a spare diet, and the judicious use of purgatives and of appropriate modes of exercise have occasionally effected remarkable cures

OBIT (Lat obitus *death*) In the Roman Catholic liturgy a service performed for the repose of a departed soul

OBITUARY (Lat obitarium) A register in which are enrolled the names of deceased persons for whom obits are to be performed and the days of their funeral It is also used for the book containing the foundation or institution of the several obits in a church or monastery In the former sense it is synonymous with *necrology*, in the latter with *martyrology*

OBJECT-GLASS (of a refracting telescope or microscope) The lens which first receives the rays of light coming directly from the object, and collects them into a focus where they form an image which is viewed through the eye-glass

The excellence of an object-glass depends on the distinctness of the image which it forms On account of the unequal refrangibility of the rays of light, it is necessary in order to procure a distinct image, to employ an achromatic combination of lenses, formed of substances having different dispersive powers and of such figures that the aberration of the one may be corrected by that of the other The substances chiefly used are crown-glass and flint glass, the dispersive powers of which are respectively as 3 to 5 By combining a convex lens of crown-glass with a concave lens of flint glass, having their focal distances in that proportion, an image would be formed free from colour, but it would not be free from aberration The determination of the form of the compound lens which shall give the least possible aberration for parallel rays is a problem which admits of exact

calculation The following are the dimensions found by Sir John Herschel for an object-glass of thirty inches focal length of the form shown in the annexed figure, where A B is the exterior surface of crown glass on the outside towards the object and C D the concave lens of flint-glass placed on the inside towards the eye radius of the exterior surface of the crown lens, 28 6304 inches, radius of the exterior surface *b* of the flint lens, 41 1687 inches, radius of the surfaces *c*, 10 1604 and 10 [illegible] *Metr*, art "Light, § 471) When the lenses have the forms here [illegible] each separately, a [illegible] powers, and the two inside surfaces have so nearly the same curvature that they may be ground on the same tool and united by a cement to prevent the loss of light at the two surfaces

Such are the forms indicated by theory, but the practical difficulties of forming a good achromatic object-glass, for a large telescope, are so great that it often costs more than all the rest of the instrument This, however, principally arises from the extreme difficulty of procuring disks of flint-glass, above a certain size sufficiently free from veins and imperfections to be fit for the purpose The Northumberland equatorial at the Cambridge observatory by Cauchoix of Paris, is of 11¾ inches effective aperture, but the largest in use at the present time are those of the great telescopes belonging to the central observatory at Pulkowa in Russia, and to the observatory at Cambridge in the United States, the extreme diameter being 15¼ inches, and the effective aperture about 15 inches in both cases. They are the workmanship of Merz and Mahler of Munich Some large disks of flint glass of English manufacture apparently of good quality, were exhibited by Messrs Chance of Birmingham at the Great Exhibition in London, in 1851, one of which was no less than 27 inches in diameter An object-glass of two feet aperture is said to have been actually ground by Mr Ross, a London optician, but as yet it has not been tested

In the fine telescopes formerly constructed by Dollond the object-glasses were composed of three lenses, the two exterior ones, A B and C D, being of crown glass and [illegible] of flint, [illegible] a more perfect correction of the spherical aberration, but the advantage is more than balanced by the greater complexity of their construction, the risk of imperfect centering and the loss of light at the six surfaces

Various attempts have been made to dispense with the concave flint lens, by the substitution of some other refractive substance. Dr Blair found that the dispersion of crown-glass was corrected by a fluid lens composed of a mixture of solutions of ammoniacal and mercurial salts He succeeded in making object glasses in this manner, but it soon appeared that they were not durable, the fluid undergoing some chemical change which entirely destroyed its [illegible] Professor Barlow [illegible] which has also made [illegible] His correcting lens is [illegible] carbon, inclosed between two disks of glass and a ring of the same material, the fluid being introduced at a high temperature A telescope which he made on this principle had a single object lens of 7 8 inches and the fluid lens was placed at the distance of 40 inches behind it The performance of this telescope was, however far *inferior to* [illegible] the same dimensions, with the common [illegible] matic object glass *See* ACHROMATISM [illegible]

O'BJECT, [illegible] in Philosophy, opposed to *subjective* *See* SUBJECT, SUBJECTIVE

O'BLATE (Lat oblatus, *offered*) In Ecclesiastical Antiquities 1 A person who on embracing the monastic state, had made a donation of all his goods to the community 2 One dedicated to a religious order by his parents from an early period of his life 3 A layman residing as an inmate in a regular community to which he had assigned his property either in perpetuity or for the period of his residence 4 A layman who had made donation, not only of his property, but his person, as bondsman to a monastic community In France the king possessed, in ancient times, a privilege [illegible] a certain number of *oblati*, [illegible] monasteries, whom they were bound to maintain

OBLATE, in Geometry signifies flattened at the poles Thus, an *oblate* spheroid is a spheroid of the same form as that which is produced by the revolution of an ellipse about its shorter axis Such is the figure of the earth *See* DEGREE EARTH

OBLA'TION (Lat oblatio, *an offering*), means, properly, an offering presented to the church This practice commenced at an early period in the history of the church, for [illegible] Christian priesthood had no other maintenance [illegible] than the free gifts or oblations of the people In the middle ages, oblations were of various kinds, and were known by different names, [illegible] purposes for which they were presented [illegible] *Liturg* i. 67)

[illegible] (Lat obligo, *I bind*) In the most general sense a duty imposed by law, to the fulfilment [illegible] and towards another Obligations, [illegible] law are said to arise in four ways; out of contracts, quasi-contracts delicts or quasi-delicts A principal obligation is that by which a debtor is bound to his creditor an accessory obligation that by which one is bound to another to satisfy the contract of a third party The Roman jurisconsults divided obligations into natural, civil, and mixed, and also into civil and prætorian An obligation, by the law of England, is a bond with penalty and condition, it may also be by statute or recognizance He who enters into an obligation is styled obligor, he towards whom it is entered into, obligee

OBLIGA'TO (Ital) In Music, a term applied to a movement or composition written for a particular instrument It sometimes means that a movement is restrained by certain rules, to give particular expression [illegible] action, &c

OBLIQUE (Lat obliquus) Not direct, deviating from the perpendicular Thus, *oblique angle*, in Geometry, is an angle greater or less than a right angle *Oblique circle*, in the Stereographic Projection, is any circle oblique to the line of projection *Oblique planes*, in Drilling are such as recline from the zenith *Oblique projection* in Mechanics, is where a body is projected in a line making an oblique angle with the horizontal line *Oblique sailing*, in Navigation, is that which includes the calculation of oblique-angled triangles *Oblique sphere*, in Geography, is that in which the axis of the world is inclined to the horizon of the place

OBLIQUE MOTION In Music, that wherein one of the parts holds on a sound, whilst the other rises or falls on any note whatsoever

OBLIQUITY OF THE ECLIPTIC In Astronomy, the inclination of the plane of the earth's equator to the plane of the ecliptic or the angle formed by those two planes, on which the phenomena of the seasons depend *See* ECLIPTIC

O'BLONG In Elementary Geometry, a rectangle, or right-angled parallelogram, whose length is greater than its breadth An *oblong spheroid* is generated by the revolution of an ellipse about its longer axis, and therefore elongated at the poles hence the term is used in contradistinction to *oblate spheroid*, which denotes a spheroid flattened at the poles The *oblong* spheroid is otherwise called the *prolate* spheroid

O'BOE (Ital) A musical wind instrument, sounded through a reed It is shaped somewhat like a clarionet, being slender in the upper part, but spreading out conically at the bottom and consists of three joints or pieces, besides the reed Its compass is generally two octaves and a fifth from C below the treble clef, to G, the fourth line above the staff The ancient name of oboe was *waught* which is still visible in the modern word *wait* (*see* WAITS), and in this form the oboe was in use as far back as the reign of Edward III It is only since the beginning of the present century that the Italian form of this word came into general use, previously to that period the French name, *hautbois*, was universally current

O'BOLUS (Gr ὀβολός) An Athenian silver coin of very small dimensions, being only equal in value to about 1½*d* of our money, or less, according to some computations Seven of them were equal to an Attic drachma

OBRI'NE The name of a military order, instituted in the 13th century by Conrad duke of Mazovia in Poland, styled also the order of Jesus Christ It was instituted to levy war against the Russians

OBSCU'RANTS, OBSCURA'NTISM A kind of [illegible] Germany [illegible] was applied [illegible] Aristotle, and their doctrines (See *Conv Lex*)

O'BSEQUIES (Lat [illegible] *obsequiæ*) were solemnities performed a[illegible] the [illegible] The term is now used for the funeral itself

OBSE'RVANTS, otherwise RECOLLECTS A branch of the Franciscan order *See* RECOLLECTS

OBSE'RVATORY A place or building destined for the purpose of making astronomical or physical observations, and furnished with appropriate instruments

[illegible] have been erected in [illegible] the tower of Babel being supposed [illegible], and the tomb [illegible] Chinese have also traditions of observatories which existed in the remotest ages of their histories In fact, as the observation of the relative positions of the celestial bodies [illegible] instruments must have [illegible] existence of observatories must have been coeval with the first progress made in

practical astronomy (See Bailly, *Histoire de l'Astronomie Ancienne*)

According to Wendler the first regular observatory in Europe was erected at Cassel in 15[illegible] by William Landgrave of Hesse That of Tycho Brahe, in the island of Huen was founded 1576 From this time private observatories began to be multiplied, and some of them, as that of Hevelius at Dantzic, produced results which materially contributed to the progress of astronomy, but it was only in the following century that they came to be regarded, in the principal countries of Europe, as important and necessary public establishments The royal observatory of Paris was built in 1667 that of Greenwich in 1675, the latter being professedly for the benefit of navigation

This original intention has never been lost sight of, and under a succession of eminent astronomers the Greenwich observatory has done more towards determining the lunar motions, and the positions of fixed stars with which the moon's places may be compared by observations made at sea, than all the other observatories of Europe taken together The instruments essentially necessary to an astronomical observatory are a transit instrument and sidereal clock, for the purpose of observing right ascensions, a circle, for observing polar distances, and a barometer and thermometer, for the purpose of ascertaining the state of the atmosphere, in order to determine the corrections to be applied for refraction For the purpose however, of observing the moon still nearer to her conjunctions with the sun, an altitude and azimuth instrument of admirable solidity and firmness was erected at Greenwich in 1847, and an excellent series of observations has already been made with it Furnished with this apparatus, the astronomer is in a condition to obtain all the data requisite for the formation of catalogues and tables, and for establishing or perfecting the theories of the celestial motions and physical astronomy Another instrument though of secondary importance, is also wanted for the observation of phenomena out of the meridian, as eclipses occultations, comets, &c The most convenient instrument for this purpose is the equatorial (see the term), and if the astronomer carries his views to the exploring of the sidereal spaces, to observe the forms of nebulæ, and watch the changes and motions of double and multiple stars, the equatorial must be furnished with a telescope of the largest kind, or a powerful reflecting telescope, suspended so as to have a free motion in azimuth, may be employed instead of it In this department of astronomy all depends on the goodness of the telescope, the objects to be examined being, in fact, only limited by the power of seeing them But as these researches have no immediate practical application, they are not considered as included among the purposes for which public observatories are established, and are therefore left to the zeal of individuals

Public observatories are now established and maintained by the governments of almost every civilised country, and means are provided of publishing the observations, and rendering their results immediately available to the progress of astronomical science The number of private observatories, particularly in this country is very considerable, and several of them in regard to the sumptuousness of their instruments vie with and even excel, the first and best appointed public institutions The following is a list of the principal public observatories, with their latitude and [illegible] time) from that of Greenwich, as given [illegible] *Almanac* —

OBSE'SSION (Lat obsidium *I besiege*) The state of a person vexed or besieged by a evil spirit In the language of exorcists, demoniacal obsession differed from demoniacal possession in the latter, the demon had possession of the patient internally, in the former, he attacks him from without Thus, the state of Sara, the bride of Tobias whose bridegrooms were killed by an evil spirit hindering her (Tobit iii 8), was one of obsession Well known marks of obsession were the being miraculously hoisted or elevated in the air speaking languages of which the patient had no knowledge aversion to the offices of religion, and so forth *See* POSSESSION, DEMONIACISM

OBSIDIAN So named, according to Pliny, from Obsidius, who first found it in Ethiopia A glassy lava Volcanic glass It is of various colours, but usually black, and nearly opaque In Mexico and Peru it is occasionally manufactured into cutting instruments, or cut into ringstones It consists of silica and alumina, with a little potash and oxide of iron

OBSI'DIONAL CROWN (Lat obsideo, *I besiege*) In Roman Antiquities, a crown granted by the state to the general who raised the siege of a beleaguered place It was formed of grass growing on the rampart *Obsidional* coins in Numismatics are pieces struck in besieged places to supply the want of current money They are of various base metals, and of different shapes Some of the oldest known are those which were struck at the siege of Pavia under Francis I

OBSOLETE (Lat obsoletus) In Zoology, the term implies that a part, or a spot, or other character, is scarcely discoverable

OBSTE'TRICS (Lat ars obstetricia from obstare, *to stand so as to give assistance*) The name frequently given to the science of midwifery

OBTE'MPER (Lat obtempero, *I obey*) In Scotch Law, to obey or comply with a judgment of a court

OBTU'NDENTS (Lat obtundo, [illegible] and other bland medicines, supposed to sheathe parts from acrimony, and to blunt that of certain morbid secretions

OBTURA'TOR MUSCLES (Lat obturare, *to close up*) Certain muscles which fill up openings in bones

O'BVERSE or FACE In Numismatics, the side of the coin which contains the principal symbol usually, in the coins of monarchical states, ancient and modern, the face in profile of the sovereign In some instances, the full or half length figure *See* NUMISMATICS

OCCASIONALISM or the System of Occasional Causes In Metaphysics, a name which has been given to certain theories of the Cartesian school of philosophers, especially Arnold Geulinx, of Antwerp, by which they account [illegible] action of the soul on the body, [illegible] voluntary motion According to these theories (which were more or less clearly developed by different writers), the will was not the *cause* of the action of the body, but, whenever the will required a motion, God caused the body to move in the required direction *See* HARMONY PRE ESTABLISHED

OCCIDE'NTAL (Lat occidens, *setting*) In Gem Sculpture, a term applied to those precious stones which possess an inferior degree of hardness and beauty

OCCIPITAL BONE (Lat occiput *the hind head*) The irregularly shaped bone which forms the posterior and inferior part of the skull

OCCULTA'TION [illegible] sometimes called Lunar [illegible] Stars by the Moon, are those phenomena in which a star or planet becomes hidden from our view by the intervening passage of the moon By analogy a total eclipse of the sun might be called an occultation of the sun by the moon

As the motion of the moon in her orbit is from west to east it is obvious that when she is about to pass over a star the first contact or the immersion, must occur on her eastern limb, and the emersion [illegible] of the star must take place on her western [illegible] Should, however be observed, that some slight exceptions to this rule may be found where the moon has considerable motion in declination, and where the star is only grazed over by a small portion of the northern or southern limb In these few exceptional cases, the disappearance and reappearance of the star may both occur either on the eastern or the western side of the limb

An occultation like a solar eclipse, is presented only to a portion of the terrestrial globe For suppose an observer to be stationed at the star with the moon between him and the earth, and that he could perceive the moon's disc projected on that of the earth, then he would observe that the moon, in her passage over the earth, only covered a portion of the terrestrial disc, and it is evident that the phenomenon of the occultation of the star could only be presented to that portion of our globe

The principles which enter into the calculation of occultations are [illegible] as for eclipses of the sun, [illegible] difference consists in the star having neither sensible parallax nor [illegible] diameter so that the moon's motion and parallax [illegible] employed in place of the relative motion and the [illegible] parallax For the mode

of conducting the calculation it will therefore be sufficient to refer to the article Eclipses, page 381, and to observe that the consideration may perhaps be simplified by giving to the star a motion contrary and equal to that of the moon, and then supposing the moon herself to be stationary

In the case of a planet, it may be necessary to take into account its motion and parallax, and perhaps its semidiameter, if great nicety is to be observed

For minute details, in reference to the calculation of [illegible] in all their varieties the reader [illegible] the Appendix to the *Nautical Almanac* for the year 1836

OCCU'LT SCIENCES (Lat occultus, *hid*) A term applied to the imaginary sciences of the middle ages — magic alchymy astrology especially the former

O'CCUPANCY In Law the taking possession of [illegible] one of a thing of which there was [illegible] acquired by such taking possession And [illegible] man held land *pur auter vie* for [illegible] and died before that other, as this estate could not descend to his heir, nor revert to the donor until the determination of the life upon it, it was considered to belong of right to the first who took possession of it for the remainder of the life, which was termed general occupancy And, when the gift was to one *and his heirs* for the life of another the heir was said to take as special occupant By the Stat of Frauds (29 C 2 c 3 sec 12) a man is enabled to devise lands held by him pur auter vie, and if no such devise be made, and there be no special occupant, it goes to his executors and administrators

O'CEAN (Gr *ωκεανος*) In Geography, the vast body of water which surrounds the continents, and is the receptacle of all their running waters It is divided by geographers into five great basins, viz the Pacific Ocean (so called by reason of its comparative stillness) which separates Asia from America, and is the largest of all the basins, 2 the Atlantic Ocean, which has Europe and Africa on its eastern shore, and America on its western, 3 the Indian Ocean, which washes the south of Asia and the south-eastern coast of Africa, 4 The Arctic Ocean, which surrounds the north pole, and 5 the Antarctic which surrounds the south pole Other smaller portions of the great connected body of water are called *seas*, of which the Mediterranean the German, the Baltic, and Black seas, are the most considerable The superficial extent of [illegible] with any certainty [illegible] defined From the nearest [illegible] of the extent of the continents and principal islands it is supposed that nearly three fourths of the whole surface of the globe are covered by water The Pacific Ocean [illegible] the dry land

Depth of the Ocean [illegible] perficial extent of the ocean cannot be easily ascertained it will readily be supposed that its depth is a problem of much greater difficulty The bottom appears wherever it has been reached by the sounding line to have similar inequalities to those of the surface of the land hence the depth must be extremely various, and it might be supposed from analogy that the greatest depth of the ocean is at least equal to the height of the highest mountains above its surface Lord Mulgrave found no bottom in the North Atlantic Ocean with a sounding line of 4680 feet, and Mr Scoresby sounded to the depth of 7200 feet, without the lead touching the ground These experiments are not altogether to be depended on for the determination of such great depths, for, the pressure [illegible] the lead may be drawn out [illegible] by currents, of which it may encounter more than one, flowing in different directions Over a great portion of the Atlantic and Pacific Oceans no bottom has been found The depth of the ocean in general and the form of the bed on which it rolls, cannot, therefore, be determined by experiment The mathematical theory of the oscillations of fluids has, however, thrown some light on the subject Laplace demonstrated that the difference which is indicated by observation between the height of two consecutive tides depends on the law of the depth of the sea, and that, but for the influence of accessory circumstances, it would disappear altogether if the depth were constant It follows, therefore, that, since the difference between the consecutive tides is extremely small, the depth of the sea, taking in a large extent of ocean, must be nearly uniform, that is to say there must be a certain mean depth from which the variations are not considerable (*Méc Céleste*, book xiii)

Level of the Ocean —Were it not for the disturbing actions of the sun and moon, and of the winds, the level of the ocean would be every where the same, and its surface would have the form determined by the attraction of the whole mass of the earth, combined with the centrifugal force belonging to its velocity of rotation, that is to say, the surface would be that of an oblate spheroid of revolution This uniformity however can never be established The tide at every instant is at different heights in different parts of the ocean, and therefore the form of the surface within the limits of the rise and fall of the tides, is variable But even if we neglect the alternate rise and fall of the water which constitutes the tides, and take the surface of the ocean at its mean height, it is found by accurate levelling that all its parts do not coincide with the surface of the same spheroid Gulfs and inland seas, which communicate with the ocean by narrow openings, are affected according to their position with regard to the prevailing winds The level of the Red Sea was found by the French engineers in Egypt, to be 32½ feet higher than that of the Mediterranean which is supposed to be a little lower than the ocean Humboldt concluded, from observations made on the Isthmus of Panama, that the waters of the Gulf of Mexico are about 2 feet higher than those of the Pacific Ocean The Baltic and Black seas rise in spring from the great quantity of river water poured into them, and are lowered in summer by the joint effects of a small supply and increased evaporation

Colour of the Ocean — The usual colour of the ocean is a bluish-green, of a darker tint at a distance from land and clearer towards the shores According to Mr Scoresby, the hue of the Greenland sea varies from ultramarine blue to olive green and from the purest transparency to great opacity The surface of the Mediterranean, in its upper part, is said to have at times a purple tint In the Gulf of Guinea the sea sometimes appears white, about the Maldive Islands black, and near California it has a reddish appearance Various causes cooperate to produce this diversity of tint The prevailing blue colour may be ascribed [illegible] of the blue rays of light which [illegible] perty pass in greatest abundance through the water The other colours are ascribed to the existence of vast numbers of minute animalculæ, to marine vegetables at or near the surface, to the colour of the soil the infusion of earthy substances, and very frequently the tint is modified by the aspect of the sky The phosphorescent or shining appearance of the ocean, which is a common phenomenon is also ascribed to animalculæ, and to semiputrescent matter diffused through the water

Temperature of the Ocean — Water being a slow conductor of heat, the temperature of the ocean is much more uniform than that of the atmosphere At a certain distance from the equator it follows, though not very closely the mean temperature of [illegible] latitudes, the solar action being greatly modified by the existence of currents which convey the temperature of one region to another, so that at any place the temperature of the water depends in some measure on the direction of the currents Within the tropics the mean temperature at the surface is about 80° of Fahrenheit, and generally ranges between 77° and 84° At great depths the temperature is probably nearly the same under every latitude In the torrid zone it is found to diminish with the depth, in the polar seas it increases with the depth, and about the latitude of 70° it is nearly constant at all depths But the small number of observations which have yet been made on this subject do not indicate any uniform law, according to which the variation of temperature at different depths is regulated

Saltness of the Ocean — The ocean holds in solution a variety of saline matters, of which by far the most abundant is common salt, constituting in general about two thirds of the whole The saltness of sea-water at particular places is influenced by temporary causes—storms, for example, as well as by the neighbourhood of large rivers and permanent accumulations of ice A series of experiments on this subject were made some years ago by the late Dr Marcet, and [illegible] conclusions which he deduced [illegible] Southern Ocean contains more salt than the Northern Ocean in the ratio of 1 02919 to 1 02757 2 That the mean specific gravity of sea-water near the equator is 1 02777 3 That there is [illegible] between sea-water under different [illegible] 4 That there is no satisfactory evidence that the [illegible] is more salt than at the surface 5. That the ocean in general contains more salt where it is deepest and that its saltness is always diminished in the vicinity of large masses of ice 6 That small inland seas, though communicating with the ocean, are much less salt than the ocean 7 That the Mediterranean contains rather larger proportion of salt than the ocean (*Phil Trans* 1817, *Prout's Bridgewater Treatise*)

The peculiar bitter taste of sea water does not appear to belong to it beyond a certain depth, and is ascribed to the vegetable and animal matter held in a state of decomposition near the surface *See* Tides

OCE'ANUS In Greek Mythology, the oldest of the Titans according to some, the son of Ouranos and Gaia. His consort was Tethys his daughters the Oceanides In Homer the word ocean usually designates the "river" or stream which, according to his notion encompassed the earth

OCHLO'CRACY (Gr *οχλος* a crowd and *κρατειν to govern*) A word coined to express the condition of a state in which the populace have acquired an immediate illegal control over the government; and, by a figure

commonly used in the exaggeration of political speakers and writers a government in which the power of the lower classes predominates, either for a time or permanently

O'CHRE (Gr *ὤχρα*) In Painting, a colour prepared from a species of earth It is of various hues as yellow, red, green blue and black The colouring matter of ochre is always oxide of iron

O'CHREA (Lat *a boot*) A name applied to stipules that are membranous, and surround the stem like a vagina or sheath, cohering by their anterior margins, as in *Polygonum*

OCHRE OF IRON A hydrated oxide of iron

OCHROLITE A name given by Klaproth to an earth supposed to exist in the mineral since called cerite

O'CREÆ (Lat), in Roman Antiquities, were a sort of military boots made of tin, and ornamented with gold and silver They were equivalent to the *κνημῖδες* of the Greeks and the greaves of the English *See* GREAVES

See OCTOEDRITE

(Gr *ὀκτω eight*, and *ετος, a year*) A cycle or period of eight years, at the lapse of which three lunar months were added This cycle was in use till Meton's invention of the golden number, or cycle of nineteen years

O'CTAGON (Gr *ὀκτω* and *γωνια angle*) In Geometry, a plane figure of eight sides and consequently having eight angles When the sides and angles are equal, it is a *regular* octagon If *a* denote the side of a regular octagon, the area is $a^2 \times 2 \tan 67\frac{1}{2}^\circ = a^2 \times 4.828427$

OCTAGON In Fortification, a place which has eight sides or bastions

OCTA'NDRIA (Gr *ὀκτω* and *ανηρ, a man*) In Botany, that class of plants which has eight stamens

OCTANS In Astronomy *Octans Hadleianus* (Hadley's Octant) one of the constellations formed by Lacaille in the southern hemisphere *See* CONSTELLATION

O'CTANT In Geometry the eighth part of a circle In astronomy, *octant* denotes a position or aspect thus the moon is in her octants when she is in the positions intermediate between her syzygies and quarters or at 45°, 135° 225° and 315° from her conjunction

OCTA'NUS A fever which returns every eighth day

OCTASTY'LOS (Gr *ὀκτω eight* and *στυλος a column*) In Architecture a temple or other building having eight columns in front

O'CTAVE (Lat *octavus*) In Music an harmonical interval, containing five tones and two semitones, called, by the ancient authors, *diapason*

OCTAVE, in Ecclesiastical Antiquities signified the eighth day after a feast the feast day itself included Thus the first Sunday after Easter is the octave of Easter styled *octava infantium* and by other names The Circumcision (Jan 1) is the *octave natalis domini* the octave of Christmas The introduction of octaves is said to have been founded on and borrowed from the Jewish ritual The *octave* of a feast is sometimes called the *Utas* or "the Utas day" thus 'Wrytyn at Norwich on the Utas day of Peter and Powll" (*Paston Letters*, vol iii p 189)

OCTA'VO (Lat) Usually contracted 8vo, that which by a peculiar folding has eight leaves to a sheet

OCTO'BER (Lat *octo*) The eighth month of the old Roman year, which began with March The commencement of the year was transferred by Numa Pompilius to the 1st of January but the months retained their names October is now the tenth month *See* CALENDAR

OCTOE'DRITE A mineralogical name applied to the octoedral oxide of titanium

OCTOHE'DRON (Gr [illegible]) (Geometry) A solid contained under eight equal and equilateral triangles Let

A = the linear edge or side,
B = the whole surface,
C = the solid content,
R = radius of circumscribed sphere,
r = radius of inscribed sphere,

then,

$A = r\sqrt{6} = R\sqrt{2} = \sqrt{(\frac{1}{6} B \sqrt{3})} = \sqrt[3]{(\frac{3}{4} C \sqrt{2})}$
$B = 12 r^2 \sqrt{3} = 4 R^2 \sqrt{3} = 2 A^2 \sqrt{3}$
$C = 4 r^3 \sqrt{3} = \frac{1}{3} R^3 = \frac{1}{12} A^3 \sqrt{2}$
$R = r\sqrt{3} = \frac{1}{4} A \sqrt{2} = \frac{1}{4} \sqrt{B \sqrt{\frac{1}{3}}} = \sqrt[3]{\frac{3}{4}} C$
$r = \frac{1}{4} R \sqrt{3} = \frac{1}{12} A \sqrt{6} = \frac{1}{4} \sqrt{(B \sqrt{3})}$

O'CTOPODS (Lat *Octopoda*) (Gr *ὀκτω, eight*, *πους, a foot*) The name of Dibranchiate Cephalopods, including those which have only eight feet or cephalic tentacular appendages, also of a sub-order of Apterous insects including those which have eight feet, as the Tracheary Arachnidans

OCY'THOI (Gr *ωκυς, swift*, and *θεω, I run*) The name applied by Rafinesque to a naked Cephalopod, supposed to be that which inhabits and constructs the argonaut shell

O'DALISQUES, properly ODALIKS (Turkish oda, *a chamber*) Female slaves employed in domestic service about the persons of the wives, female relatives, &c of the sultan

ODD NUMBER In Arithmetic, any number not divisible by 2 without remainder, the series of odd numbers is 1, 3, 5, 7, 9, &c, and the algebraic form by which they are expressed is $2n + 1$ Every prime number, excepting 2, is an odd number. The differences of the successive terms of the series of square numbers produce the odd numbers

ODE (Gr *ωδη, a song*), among the Greeks and Romans, was a short lyric composition, usually intended to be sung, and accompanied by some musical instrument, generally the lyre, hence the expression lyric verse In the modern sense of the word the ode appears to be distinguished from the song by greater length and variety, and by not being necessarily adapted to music It is distinguished also from the ballad, and other species of lyric poetry, by its being confined to the expression of sentiment or of [illegible] subject, not admitting of narrative, except [illegible] The odes of Pindar Anacreon, and Horace, are, in fact, the models on which the modern notion of the ode is formed, and which have been imitated in similar compositions in modern times Until the science of Greek metres was so accurately explored as it has recently been, the Pindaric ode was supposed to admit of an excessive irregularity in the length and measure of lines, and hence the Pindaric odes of the last and preceding century are constructed on a system of absolute licence in this respect In point of fact, however a scheme of perfect metrical regularity pervaded the Greek ode both in Pindar and in the dramatic choruses, in which a strophe, or succession of lines in varied metre, is exactly answered in the antistrophe or corresponding series On the other hand, the Anacreontic ode consists of a number of lines of the same metrical length and arrangement The Horatian ode, again is generally constructed on a different system, of which we have only a few instances in Greek, in the Fragments of Alcæus and Sappho it consists of an indefinite number of stanzas, precisely similar to each other, each forming a complete metrical whole (*See* METRE) The Dithyrambic ode (quod vide) was a bacchanalian song, and as from the attributes of the divinity to which it was dedicated, it admitted great irregularity and licence, the name has been transferred in modern times to all odes [illegible] a wild and impetuous character

ODELITE A variety of black mica from Sweden is so called

ODI'UM or ODEON (Gr *ωδη, a song*) In ancient Architecture a building wherein the poets and musicians contended for the prizes, both in vocal and instrumental music Pericles, who was the first person to erect one of these buildings at Athens, instituted it for the choragi of the different tribes to rehearse their performances, but these buildings in the end were used for far different purposes from those for which they were originally destined An odeum was to be found in all the principal cities of antiquity The word odeon has been preserved in most modern languages thus there is an odeon in Paris, appropriated to theatrical and other similar purposes, and in Munich there is a concert-room with this name

O'DIN A Scandinavian deity, who seems like the Jupiter of the Greeks to have formed the connecting link between the ancient and more recent systems of their mythology The conqueror Odin appears to have been a chieftain who led the Asi (the Goths) from the confines of Asia to northern Europe But, when deified by public adoration the attributes of an earlier deity seem to have been transferred to him Odin is the chief of the gods by his wife Freya he has two chief sons, Thor and Balder the death of the latter (for the Scandinavian gods are not all immortal) furnishes many legends to the northern mythology, and is known to English readers by Gray's translation *The Descent of Odin* (See this article in the *Conv Lex*, and in the *Encycl* of Ersch and Gruber) The more ancient Odin among the Romans, was regarded as the representative of their god Mercury *See* WODAN

ODO'METER (Gr *οδος, a road* and *μετρον, measure*) An instrument attached to the wheel of a carriage by which the distance passed over is measured *See* PERAMBULATOR

ODONTA'LGIA (Gr *οδους, a tooth*, and *αλγος, pain*) The toothache

ODONTO'LOGY (Gr *οδους*, and *λογος, a discourse*) The branch of anatomical science which treats of the teeth *See* DENTES.

O'DORIN One of the products of the redistillation of the volatile oil obtained by distilling bone, it has a very concentrated and diffusible empyreumatic odour, and is regarded by Unverdorben as a peculiar salifiable base

O'DYSSEY (Gr *Οδυσσεία*) An epic poem, attributed, in general to Homer but [illegible] supposed not by the hand of [illegible]

subject of the poem is the return of Ulysses (*Ὀδυσσεύς*) from Troy to his native island Ithaca.

ŒCO'NOMY (Gr *οἶκος a house*, and *νέμω, I distribute*) In Architecture, the harmonious and skilful combination of the parts of a building, which renders them suitable to their several purposes, and tends to connect them conveniently with each other

ŒCUMENICAL (Gr *οἰκουμένη*, scil *γη, the inhabited earth* used in the New Testament) In the Greek language applied to ecclesiastical matters in the sense of universal Several patriarchs of Constantinople and Rome assumed the title of œcumenical (particularly John A D 590, and Cyril, his successor) to express their opposition to the pretensions of the bishop of Rome (from whose [illegible] prelates resorted from every part of Christendom under the jurisdiction of the Roman empire (Palmer, *Church of Christ*, vol ii p 150) *See* Council

ŒCUS (Lat) In Ancient Architecture, an apartment [illegible] ing room

ŒDEMA (Gr *οἰδάω, I swell*) A puffiness or swelling of parts, arising from water collecting in the cellular membranes

ŒDIPUS A personage renowned in the early or mythological stage of Grecian history the son of Laius and Jocasta An oracle had warned Laius that he should be killed by his son in consequence of which he caused the child to be exposed, with one of its feet pierced and fastened with a thong (from which circumstance he was accordingly derived from the swelling of the foot) The slave entrusted with him carried the child to Polybus, king of Corinth, and deceived Laius with a false report Œdipus, when grown up, slew, in ignorance his father Laius, acquired the sovereignty of Thebes, after conquering the Sphynx and married his mother Jocasta On becoming acquainted with their fatal destiny Jocasta killed herself and Œdipus deprived himself of sight Such is the outline of the story familiar to us by the noblest efforts of the Greek tragedians The tale of Œdipus himself affords the subject of two tragedies of Sophocles the first (*Œdipus Tyrannus*), the most perfect example of dramatic *skill* which antiquity has left us, the second (*Œdipus at Colonus*), perhaps the most beautiful of ancient dramatic *poems* The fate of his offspring is portrayed in several of the remaining dramas of the three great tragedians The miseries inflicted on Œdipus seem to us to be wholly undeserved, and of a kind that it is impossible to approve He was a mere passive instrument in the hands of Fate or Destiny, and was not morally culpable for the death of his father or the marriage of his mother The acts, in fact were the acts of the gods and not of Œdipus In themselves they were bad, but as he was totally ignorant of and did not intend them, he is no more to be blamed than a dagger in the hand of an assassin is to be blamed for the murder And hence there can be no real sympathy with the miseries inflicted on Œdipus and still less with those entailed on his offspring, who are made to suffer without cause or reason of any kind

ŒNANTHE CROCATA In Botany the name given to the hemlock dropwort a poisonous plant growing in Pembrokeshire. It is called by the inhabitants of the country *fine fingered root* and has some reputation as a remedy in diseases of the skin

ŒNOMANCY (Gr *οἶνος wine* and *μαντεία prophecy*) A mode of divination among the Greeks, from the colour, sound, &c of wine poured out in libations

ŒNOTHIONIC ACID (Gr *οἶνος*, and *θεῖον sulphur*) The acid which is formed during the action of sulphuric acid upon alcohol Sertuerner gave it the above name it is the sulphovinic acid of Vogel and other chemical writers

ŒSOPHAGUS (Obs Gr *οἶσω, to carry* and *φαγω I eat*) The tube by which food is conveyed from the posterior part of the mouth, or *pharynx*, to the stomach The gullet

ŒSTRUS (Gr *οἶστρος, a gad fly*) The name of a genus of Dipterous insects, some of which lay their eggs in the skin of quadrupeds, which they pierce for that purpose, others near the nose, up which the larvæ creep to the frontal sinuses The flies of an allied genus (*Gasterophilus*) attach their eggs to the hairs in situations where they can be licked off and swallowed, when, their vitality protecting them from the action of the gastric juice, they are hatched in the stomach, and the larvæ attach themselves to the inner membrane, forming what are called 'bots" in the horse

OFFERINGS Literally, gifts presented at the altar in token of acknowledgment of the divine goodness Offerings constituted a large portion of the Jewish worship They consisted chiefly of bread, salt, fruits wine and oil, and had different names according to the purposes for which they were employed A distinction has often been made between offerings and sacrifices (*see* SACRIFICE), the former being said to refer only to the fruits of the earth, the latter to animals, but this can scarcely have been the case, for both the burnt and the sin offering required animals to be sacrificed. Among the Greeks, Romans and other nations, the same practice prevailed of offering at their altars wheat flour, and bread In a modern sense the term *offering* is [illegible] payable by custom to the church [illegible] sc This latter custom has obtained from the first period of Christianity when those who officiated at the altar had no other maintenance or allowance than the free gifts or [illegible] the people

[illegible] first part of the Mass, in which the priest prepares the elements for consecration In the English communion service it denotes the sentences which are delivered by the officiating priest while the people are making their oblations or offerings (See Palmer, *Orig Liturgicæ*)

OFFICE FOUND In English Law, an inquiry executed by some officers of the crown, when certain events have occurred in consequence of which the crown becomes entitled to take possession of real or personal property Such are the finding of treasure under certain circumstances the intestacy of a bastard, &c The verdict of a coroner's jury of felo de se" is an instance of office found, on which the crown is entitled to take possession of the effects of the deceased

OFFICER is used generally to signify any person in the enjoyment of a post or office whether civil or military under the crown Under their different heads will be found a notice of the chief civil and military officers, to these the reader is referred

OFFICIAL In the Canon Law, the deputy or lieutenant of a bishop, abbot &c, or an ecclesiastical judge appointed by them The principal official of the bishop is his chancellor whose jurisdiction is coextensive with the diocese An *officialis foraneus* (styled in English law commissary) is appointed to part of a diocese when large The court of the official is styled in the canon law his *officiality*

OFFICINAL In Pharmacy, such medicines as are directed by the Pharmacopœia to be kept ready for use in the apothecaries shops

OFFING A Nautical term denoting a part of the sea at a considerable distance from the shore where there is deep water

OFFSET In Architecture, the superior surface left uncovered by the continuation upwards of a wall where the thickness diminishes forming a ledge

OFFSETS in Surveying are short distances from the chain-line usually measured with a rod called an offset staff the most convenient length for which is 6 feet 7 2 inches, being equal to 10 links of the surveying chain *See* SURVEYING

OFFSETS In Gardening young radical bulbs when separated or taken off from the parent roots are so called One of the chief methods of propagating plants is by offsets *See* PROPAGATION OF PLANTS

OGEE In Architecture, the same as *cyma reversa* see that art and MOULDING

OGHAMS A peculiar kind of short-hand writing in use among the ancient Irish It consisted of certain lines and marks which derived their power from their situation and position as they stood in relation to one horizontal principal line over or under which they were placed or through which they were drawn, the characters or marks, according to their position, standing in the place of vowels, consonants diphthongs &c (See the elaborate article in *Rees's Cyclopædia*)

OGIVE (Itym uncertain) In Architecture, the term used by the French for the pointed arch

OGRES (Fr) The well known name of those imaginary monsters with which the nursery tales of England abound They are usually represented as cannibals of malignant dispositions, and as endowed with gigantic height and power It is difficult to speak with certainty of the origin of these fabulous creations, but it is probable that the term ogre is derived from Oegir, one of the giants in the Scandinavian mythology (see *Grimm's Deutsche Mythologie* p 146), though it has been alleged, with perhaps more [illegible] been borrowed from the Ogurs o [illegible] and savage Asiatic horde, which overran part of Europe ab [illegible] th century

OGYGIAN DELUGE The name given to a great inundation mentioned in fabulous history, supposed to have taken place in the r[illegible] of O[illegible] Attica, whose death is fixed in *Blair's Chronology, Tables* in the year 1764 before Christ *See* DELUGE

OIL GAS The inflammable gases and vapours (chiefly *hydrocarbons*) which are obtained by passing fixed oils through red-hot tubes, and which may be used as *coal gas*, for the purposes of illumination, it yields a more brilliant light than the latter, but is too expensive to be generally adopted The apparatus for the production of oil gas is described in the *Quarterly Journal*, vol viii A gallon of common whale oil yields from 90 to 100 cubical feet of gas, and an Argand burner, giving the light of six or seven wax candles, consumes from 1½ to 2 cubical feet per hour, whereas, to produce the

same light, from 5 to 6 cubic feet of coal gas are required

OIL OF BRICKS A term applied by the old chemists to the empyreumatic oil obtained by subjecting a brick which has been soaked in oil to the process of distillation at a high temperature This oil is used by lapidaries as a vehicle for the emery by which stones and gems are sawn or cut

OIL OF VITRIOL *See* SULPHURIC ACID

OIL-PAINTING Painting in which the medium for using the colours is oil It is said to have been unknown to the ancients, and not used earlier than the 14th century, its invention being attributed to John Van Eyck, sometimes called John of Bruges By him it was supposed to have been imparted to one Antonio da Messina, who first brought it to Venice Giovanni Bellini, by a stratagem got possession of the secret and made it publicly known Oil is the vehicle used in painting pictures of all kinds, and is executed in a manner and with colours peculiarly adapted to it The various colours chiefly used in oil painting are white lead Cremnitz white chrome yellow Naples and patent yellow, the ochres Dutch pink, terra da Sienna, yellow lake, vermilion, red lead, Indian and Venetian red the several sorts of lake, brown pink, Vandyke brown, burnt and unburnt umber ultramarine, Prussian and Antwerp blue ivory black blue black asphaltum The principal oils are those extracted from the poppy, nut, and linseed With the latter driers are introduced

OILS (Germ oehle) The term oil is applied to two dissimilar and distinct organic compounds which are usually called *fixed* oils and *volatile* oils The fixed or fat oils are either of vegetable or animal origin, they are compounds of carbon, hydrogen, and oxygen, the relative proportions vary but little in the several species The following analyses of olive and spermaceti oil may be assumed as types of the rest —

	Olive Oil	Spermaceti Oil
Carbon - -	772	780
Hydrogen - -	133	118
Oxygen - -	95	102
	1000	1000

The *fixed oils* abound in the fruit and seed of certain plants, they are lighter than water unctuous and insipid or nearly so, some of these require a low temperature for their congelation, such as linseed oil, others, such as olive oil, concrete at a temperature higher than the freezing point of water, some are solid at common temperatures, such as cocoa nut oil Some of these oils when exposed to air absorb oxygen, and gradually harden forming a kind of varnish, these are called *drying oils* and are the basis of paints, such as linseed oil, others become rancid, as almond oil All these oils, like the different kinds of fat, consist of two proximate principles called *stearine* and *elaine* the former is the fatty portion which first concretes on cooling the oil and from which the elaine or oily portion may be separated by pressure These oils cannot be volatilized without decomposition At a red heat they are resolved into volatile and gaseous products, among which carburetted hydrogen in several of its forms, predominates, hence the use of these oils when volatilized and burned by the aid of a wick, as sources of artificial light The action of the alkali on the fat oils is highly important as forming soap

The *volatile oils* are procured obtained by distilling the vegetables which afford them with water, they fluctuate in density a little on either side of water they are sparingly soluble in water, forming the perfumed or medicated waters, such as rose and peppermint water, they are mostly soluble in alcohol, forming essences A few of them, such as oil of turpentine, of lemon peel of copivi balsam, &c, are hydrocarbons, that is consist of carbon and hydrogen only, the greater number however contain oxygen as one of their ultimate elements They are chiefly used in medicine and in perfumery, and a few of them are extensively employed in the arts as vehicles for colours and in the manufacture of varnishes, this is especially the case with oil of turpentine

OISANITE An ore of titanium, from the department of Oise

OLD MAN OF THE MOUNTAIN The chief of the band Assassins* who established themselves in the mountainous district of Kohistan in Persia, in the 11th century, was so called *See* ASSASSINS

OLD RED SANDSTONE A series of rocks interposed between the mountain limestone and slates (*See* GEOLOGY) It is included in *Murchison's Devonian System of Rocks*

OLD TESTAMENT The name given to that part of Scripture which contains the collected works of the inspired writers previously to the advent of our Saviour. The period of their being collected is unknown Some of them were in existence before the Babylonish captivity (600 years B C), others were collected at a later period, and the collection as it at present stands was completed in the second century before Christ. The Jews divided the Old Testament into the Law, the Prophets and other writings known by the name Hagiographa, of which the Psalms were at the head The contents of the Old Testament may be conveniently divided into the Historical Books, of which there are 17, the Poetical, of which there are 5, and the Prophetical, of which there are 16, distinguished into the books of 4 greater and 12 minor prophets The Historical Books include the Pentateuch, the Book of Joshua, Judges, Ruth, 2 Books of Samuel, 2 Books of Kings, 2 Books of Chronicles, the Book of Ezra, of Nehemiah, and of Esther, the Poetical Books include the Book of Job, the Psalms, the Proverbs, Ecclesiastes, and the Song of Solomon, and the Prophetical comprise (of the greater) Isaiah, Jeremiah, Ezekiel, and Daniel, and (of the minor) Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakuk, Zephaniah, Haggai, Zachariah, and Malachi *See* BIBLE TESTAMENT, PROPHETS, PSALMS, &c

OLEA'CEÆ (Olea, one of the genera) The natural order of plants which contains the olive tree and the ash, it consists of trees or shrubs inhabiting the temperate parts of the world and distinguished from others by their flowers being monopetalous and diandrous, with a valvate astivation *See* OLIVE

OLECRA'NON (Gr ὠλενη, *the ulna*, and κρανον, *the head*) The head of the ulna The process of the ulna which forms the elbow

OLEFIANT GAS This variety of carburetted hydrogen is obtained by heating a mixture of two measures of sulphuric acid and one of alcohol It is of somewhat less specific gravity than atmospheric air, 100 cubic inches weighing 30·5 grains It burns with a bright white flame, and produces during combustion such proportions of carbonic acid and water as show that 1 volume of the gas is constituted of 2 atoms or volumes of hydrogen and 2 atoms of carbon hence the equivalent of olefiant gas is $(2h + 12car) = 14$ When 2 volumes of chlorine are mixed with 1 of olefiant gas and inflamed, hydrochloric acid is formed, and the charcoal of the gas makes its appearance in the form of dense black soot If the mixture, instead of being kindled be left standing over water, it soon condenses into a liquid looking like oil (hence the term *olefiant gas*), which is a hydrochloride of carbon It has an aromatic odour, not unlike that of oil of caraways

OLEIC ACID The product resulting from the action of alkalies upon the *elaine*, or liquid part of oils and fats

OLEIN *See* ELAIN

OLEON A peculiar liquid obtained by the distillation of a mixture of oleic acid and lime

OLEON LAWS OF *See* MARITIME LAW

OLFACTORY NERVES (Lat oleo, *I smell*, and facio *I cause*) The nerves of smell The first pair of nerves They arise from the part of the brain called the *corpora striata*, and, perforating the ethmoid bone, are distributed over the mucous membrane of the nose

OLIBANUM A gum resin, imported from the Levant, in yellowish white and nearly opaque drops or tears, it has a bitterish flavour and has been used in medicine When burned it exhales rather an agreeable odour and is sometimes called *frankincense* It is either the produce of the *Juniperus lycia*, or of the *Boswellia serrata*

OLIGARCHY (Gr ὀλιγοι, *few*, and ἀρχειν, *to govern*) A state in which the sovereign power is lodged in the hands of a small exclusive class is so called It differs from aristocracy, in that the latter term appears to designate a government in which the whole of a particular class or interest, as the noble the wealthy &c, share directly or indirectly in the management of public affairs while in an oligarchy, it is a party or section formed out of one of these classes which enjoys the advantages of government

OLIVA (Lat oliva, *an olive*) A genus of Pectinibranchiate Gastropods dismembered from the *Voluta* of Linnæus, and so called on account of the long and elliptical shape of the shell The aperture is narrow, long, and notched opposite to the spire, which is short; the folds of the columella are numerous, and resemble striæ The animal has a large foot the anterior portion of which is marked off by an incision on each side The horns or tentacula are slender and the eyes are on the middle of their outer side The proboscis and the breathing tube are tolerably long, there is no operculum The species of *Oliva* rival the cowries in beauty

* There are few words which have undergone more changes in their signification than the word assassin In the Latin of the middle ages the form assassinus is found in the sense of a cutthroat, a murderer, and the Italian assassino has the same meaning The French assassin, however, has a more limited signification, and is applied to those only who murder from motives of gain, or who kill by lying in wait, or by surprise Dr Johnson, in his remarks, which are in many instances very unjust, has censured Addison for using assassin in a different sense from that in which it is used at another Assassin implies, in point of fact, an hired murderer (Spectator, vol 24)

O'LIVE (Lat *olea*) A genus of trees belonging to the Diandria Monogynia class of plants The *Olea Europæa* has an upright stem, with numerous branches, grows to the height of twenty or thirty feet and differs from most trees in yielding a fixed oil from the pericarp instead of from the seed The olive tree has in all ages been held in peculiar estimation, and some authors have styled it a 'mine upon earth' It was sacred to Minerva Olive wreaths were used by the Greeks and Romans to crown the brows of victors and it is still universally regarded as emblematic of peace The olive flourishes only in warm and comparatively dry parts of the world, as the south of France and Spain, in Italy Syria, and the north of Africa, and though it has been raised in the open air in this country, its fruit did not ripen The fruit is a smooth oval plum, about three quarters of an inch in length and half an inch in diameter, of a deep violet colour when ripe, whitish and fleshy within, bitter and nauseous, but replete with a bland oil Olives intended for preservation are gathered before they are ripe In pickling them the object is to remove and to preserve them green by impregnating them with a brine of aromatized sea salt; and for this purpose various methods are employed But it is chiefly for the sake of its oil that the olive tree is cultivated Olive oil is pale yellow its density is 910 When fresh, and of fine quality, it is almost tasteless, having only a very slight and agreeable nutty flavour It is less apt than most other fixed oils to become viscid by exposure and hence is preferred for greasing clock and watch-work It is largely used as an article of food It is the principal article of export from the kingdom of Naples The quantity of olive oil imported into England during 1850 amounted to nearly 21,000 tons There was formerly a duty of eight guineas a ton on olive oil In 1842 this was changed to a discriminating duty of 2*l* and 4*l*, but it is now admitted free (See *Dict of Commerce*, &c)

O'LIVILE A peculiar amylaceous or crystalline substance obtained from the gum of the olive tree

O'LIVINE A variety of *chrysolite* containing oxide of iron, of an olive green colour It is sometimes found associated with meteoric iron

O'LLA PODRI'DA (Span *putrid mixture*) The name given to a favourite dish of all classes in Spain, consisting of a mixture of all kinds of meat cut into small pieces, and stewed with various kinds of vegetables The epithet *podrida* is applied to this dish in consequence of the poorer classes being obliged to serve it up so often that the odour arising from long keeping is far from agreeable The phrase *olla podrida* is often used metaphorically in England for any incongruous melange

OLY'MPIAD (Gr ὀλυμπιας) In Chronology, a Grecian epoch of four years being the interval between the celebration of the Olympic games

The Olympic games so famous in Grecian history were said to have been instituted about 1354 years before the Christian era, but, having fallen into disuse they were revived by Iphitus king of Elis 844 years B C About a hundred years later the practice was introduced of designating the Olympic period by the name of the victor The first who received the honour was Coræbus and the commencement of the Olympiad of Coræbus forms the principal era of Grecian chronology The games in which he was victor were celebrated about the time of the summer solstice, 776 years before the era of the incarnation, in the 3938th of the Julian period and 23 years according to the reckoning of Varro before the foundation of Rome Before the introduction of the Metonic cycle the Olympic year began sometimes with the full moon which followed, sometimes with that which preceded the summer solstice Subsequent to the introduction of that cycle, the year always commenced with the eleventh day of the moon which followed the solstice and it is usually regarded as beginning on the first day of July It is necessary to observe, in the comparison of dates, that as the Olympiads begin about the 1st of July, the first six months of a year of our era correspond to one Olympic year, and the second to another The first year of the first Olympiad began 776 years and six months before our era; hence, in order to reduce the date by Olympiads to our era, the rule is this — Multiply the number of the past Olympiad by *four*, and add the odd years, subtract the sum from 777 if before Christ or subtract 776 from the sum, if after Christ the remainder will be the year before Christ or after Christ, if the event happened in the first six months of the Olympic year, that is, between July and January, but if the event happened in the last six months of the Olympic year, or between January and July *the remainder in either case must* be diminished by one For example, — the foundation of Rome (according to Varro) was laid in the 3d year of the 6th Olympiad, and 10th month of that year; required the date Here 5 complete periods are elapsed before 5 × 4 + 3 = 23, and 777 − 23 = 754 which being diminished by one gives 753 B C for the date The month corresponds to April

The method of computing time by Olympiads did not come into use till after the death of Alexander; and first appears in the Parian Chronicle, which was engraved about sixty years after that event. The first historian who used it was Timæus Siculus who wrote a few years later About 200 years B C Eratosthenes of Alexandria digested a chronological table of the Olympiads

OLY'MPIC GAMES The greatest of the national festivals of Greece, celebrated once every four years at Olympia or Pisa in Elis in honour of Olympian Jupiter The first of these games was celebrated by Hercules but it appears that they had been [illegible] they were revived by Iphitus, 776 B C From this period it is that the Olympiads are reckoned Like the other public festivals, the Olympian games might be attended by all who bore the Hellenic name, and such was their universal celebrity that spectators quaternially crowded to witness them, not only from all parts of Greece itself, but from every Grecian colony in Europe, Asia and Africa In these games, none were allowed to contend but those who could prove that they were freemen of genuine Hellenic origin, and unstained by crime or immorality The superintendence of these games belonged sometimes to the Pisans but for the most part to the Eleans, by whom the Pisans were destroyed On one occasion in the 104th Olympiad, the management was forcibly seized on by the Arcadians The contests at these games consisted in the athletic exercises and also in those of music and poetry The victors were crowned with garlands of wild olive (See *West's Pindar*, *Thirlwall's Greece*, vol i 384, and the other authorities) The place where these renowned games were celebrated is a plain, now called Anti-Palia opposite the little town of Palia They commenced a little after the summer solstice, on the 14th of the Attic month Hecatombæon

O'MBRIA (Gr ὀμβρος rain) A name formerly applied to certain fossil Echini under the supposition of their having fallen from the clouds

OMBRO'METER (Gr ὀμβρος rain, and μετρον measure) A name sometimes given to the rain gauge See RAIN GAUGE

O'MELET A pancake or fritter made of eggs, common in Spain France and Germany

O'MENS Casual indications from which men believe themselves enabled to conjecture or foretel future events The essential characteristic of all omens is their happening by accident, and it is this which distinguishes them from all other modes of divination This branch of superstition seems nearly as ancient as the world itself, and in none do we find such remarkable indications of sameness of origin Many external circumstances appear to be received in almost all countries as ominous One of the most remarkable instances of this coincidence is mentioned in a recent number of the *Edinburgh Review* The omens in which the Thugs or secret murderers of India believe with peculiar devotion, are almost the very same which in ancient Roman would have observed with equal attention, especially the appearance of animals on the right or left hand In classical antiquity however omens appear to have multiplied and to have been the subjects of more curious superstition in later than in earlier ages There are numberless omens in Homer but they [illegible] the simplest description — thunder and [illegible] of some sacred birds especially as some [illegible] erved, those which have the highest flight and might be supposed to have arrived immediately from the throne of Jove himself Omens among the Greeks (and, we may add among almost all nations in periods of ignorance, and among the vulgar of the present day), may be divided into three classes those derived from natural occurrences relating to inanimate objects lightning earthquakes phosphoric appearances &c, those derived from animals especially birds the region of their appearance, their voices &c, and those which the individual drew from sudden sensations of his own Sneezing in most times and countries, has been a peculiarly ominous occurrence The Romans, as is well known, carried the science of omens to a very profound depth the flight of birds was the main element in *augury*, the omens afforded by the entrails of sacrificed animals in the learning of *extispicium* One remarkable variety between Greek and Roman divination has often been noticed the right hand in the former generally denoted good luck and the left the contrary Among the Romans this rule was reversed, although their writers in later times often adopt the [illegible] See AUGURS

OMENTUM [illegible] from Lat omen, because the soothsayers prophesied from its inspection) The membrane is formed of a duplicature of the peritoneum and encloses more or less fat It is attached to the stomach and lies on the anterior surface of the intestines

O'MNIBUS (Lat *for all*) The name given to a peculiar kind of public carriage, too well known to require to be described, which takes a number of passengers at a cheap common rate They were first introduced

into Paris in 1825, whence they were introduced into London in 1829, and they are now to be met with in almost every large town both of this country and the Continent

O'MNIUM In France, a term used at the Stock Exchange to express the aggregate value of the different stocks in which a loan is now usually funded (See *Investments*, *Funds*, *Consols*, &c.)

OMNIVO'RIA (Lat. omnis, *all*, and voro, *I eat*.) The name given by Temminck to an order of birds, including those insessorial species which feed on both animal and vegetable substances; as the starling

OMOHYOI'DEUS A muscle which pulls the os hyoides obliquely downwards; it is sometimes called the coracho-hyoideus, as it arises from the superior costa of the scapula and is inserted into the base of the os hyoides

OMPHALO'DIUM (Gr. ομφαλος, *the navel*.) The centre of the hilum of a seed, through which the nourishing vessels pass from the placenta into the seminal [illegible]

OMPHALO'TOMY (Gr. ομφαλος, and τεμνω, *I cut*.) The division of the navel string.

ONAGRA'CEÆ (*Onagra*, an old name for the genus *Œnothera*.) An extensive natural order of Polypetalous Exogenous plants, very common in gardens, where they are much valued for the beauty of their flowers. They are known by all the parts of their flowers being arranged in fours. The genera *Fuchsia* (*Enothera*, and *Epilobium* are common illustrations of the order.

ONEIROCRI'TICS, or ONEIROCRITICAL SCIENCE (Gr. ονειρος, and κρινω, *I judge*.) The science of interpreting dreams; treated of by Artemidorus, Macrobius, and other classical writers, by Thomas Aquinas, and others of the schoolmen; and among many other moderns, by Cardanus and Mago a Neapolitan philosopher. According to all these writers, the secret of oneirocritical science consists in the relation supposed to exist betwen the dream and the thing signified, but they are far from keeping to the relations of agreement and similitude, and they frequently have recourse to others of dissimilitude and contrariety.

ONEIRODYNIA (Gr. ονειρος, and οδυνη, *pain*.) Disturbed dreams, including the nightmare and somnambulism.

ONISCI'DÆ The name of a family of Isopodous Crustaceans, of which the wood louse (*Oniscus*) is the type.

O'NOMANCY or ONO'MOMA'NCY (Gr. ονομα *a name* and μαντια *prophecy*.) A species of divination from the letters of a person's name. Many fancies of this sort were current among the ancients, such as that names in which the numeral letters amounted to the highest sum were most lucky.

ONOMA'STICON (Gr. ονομα.) A work containing words or names with their explanation arranged in alphabetical or other order, a dictionary, commonplace book, &c. The best known work under this title is the *Onom* of Julius Pollux in ten books, a valuable repertory of ancient philological learning.

ONOMATOPŒI'A (Gr. ονομα *name*, ποιεω *I make*.) Literally the making or manufacture of names, a word expressing by its sound the thing represented. In most languages the cries of animals are thus expressed, and the line of Aristophanes,

Ὁ δ' ηλιθιος αντις προβατον βη Ζη λεγων βαδιζει

shows that the modern Greeks have not correctly retained the sound of the eta (which they pronounce like our *e*), as the sound imitated from nature would not be thus represented. Ennius imitated the sound of a trumpet by the word *taratantara*, and to represent the croaking of frogs Aristophanes used βρεκεκεξ κοαξ κοαξ (*Frogs*, l. 209.) Greek and German are peculiarly rich in words of this description. M. Charles Nodier has published a dictionary of those in French (*Dictionnaire des Onomatopées Françaises*.)

ONTO'LOGY (Gr. των ὄντων, *being*, [illegible] conditions. *See* METAPHYSICS.

ONY'CHIA (Gr. ονυξ *the nail*.) A whitlow.

ONYCHOTEU'THIS (Gr. ονυξ *a claw*, τευθος, *a calamary*.) The name of the genus of Calamaries in which the suckers of the cephalic appendages are armed with a hook.

O'NYX A regularly banded agate, much prized for cameos, especially where the colours are very distinct and opposed. Any stone exhibiting layers of two or more colours strongly contrasted is called an onyx.

O'NYX In Surgery, an abscess of the cornea of the eye so called from its resemblance to the stone termed an onyx.

O'OLITE. (Gr. ωον, *an egg*, and λιθος, *a stone*.) A granular variety of carbonate of lime, frequently called *roestone*. The frequency of the occurrence of this particular form of limestone in a great series of deposits, lying between the subcretaceous formations and the new red sandstone, has caused English geologists to give the whole series the name of oolitic. It is largely developed in England and France. *See* GEOLOGY.

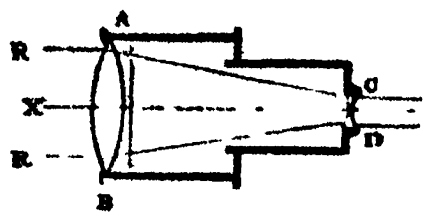
OOZOA (Gr. ωον *an egg*, ζωον *animal*.) A name applied by Thomas and Carus to [illegible] division of the animal kingdom, including those [illegible] with the nervous and sanguiferous systems are incompletely developed, and in which the organization resembles the simple condition of the ovum of the higher classes. This [illegible]

O'PACITY (Lat. *opacus*, *dark*.) In Optics, that quality of bodies which renders them opaque or incapable of transmitting light. According to the Newtonian theory of light, opacity in natural bodies arises from the multi[illegible] parts. Newton [illegible] the [illegible] of a medium entirely void, or filled with some subtle matter of a different density from the body. If light enters such a body, and experience proves that it does penetrate the surfaces of [illegible] to the light will again escape from the surface. On this hypothesis, Sir J. Herschel remarks, that unless we admit a cause of opacity in atoms different from that which causes it in their aggregates, the atoms cannot be otherwise than absolutely pellucid, since no reflections can take place where there are no intervals, and no change of medium. Of the sufficiency of this cause, either in natural bodies or atoms, there does appear, he adds, some room for doubt, as it seems difficult so to conceive their internal reflections that the rays subjected to them shall be *all* and *for ever* returned, entangled, as it were, and running their rounds from atom to atom, without a possibility of reaching the surface and escaping, which, were they to do, it is evident that every body so constituted receiving a beam of light would in fact only dispose it in all directions in the manner of a self-luminous one. (*Ency. Metr.* art. "Light.")

O'PAL A beautiful mineral characterized by its iridescent reflection of light; it is very brittle. It consists of silica, with about 10 *per cent.* of water. *Common opal* in some of its characters resembles the preceding, but it has no play of colours, and is abundant, the former being a very rare mineral. Opal is found in different parts of Europe, but particularly in Hungary; in the East Indies, &c. (For some curious details as to this stone, see *Plin. Hist. Nat.*, lib. 37. c. 6.)

OPALI'ZED WOOD Wood petrified by silica, and acquiring a structure resembling common opal.

O'PEN FIELD LAND A [illegible] by hedges or other fences, and in [illegible] individuals or under different crops. In former times, only those parts of a farm which lay around the farmyard were enclosed, while the more distant parts were open and called open fields, or out fields.



O'PENINGS In Architecture, the piercings or unfilled parts in a wall, left for the purpose of admitting light, air, &c.

O'PERA (Ital. *work*.) A musical drama, in which the music forms an essential part, and not merely an accompaniment. The whole dramatic art of the ancients possessed much of an operatic character. The choric parts were sung, and if the dialogue was not carried on in the musical tone termed *recitative* in modern times, it was certainly delivered in an artificially raised and sustained key very different from the ordinary or oratorical speech. The first operas in modern times were performed in Italy about the end of the 15th century. The *Orpheo* of Politziano has been cited as the first complete piece of this sort. Jean Antoine Baif introduced the opera into France, where the earliest representation of this kind is said to have taken place at the marriage of the Duc de Joyeuse, in 1582. In 1707 the opera of *Arsinoe* consisting of English words adapted to Italian airs was performed at Drury Lane, and a succession of entertainments of this kind terminated in the Italian opera. The first attempt at a wholly [illegible] was made by Sir William D'Avenant in 165[illegible] is divided into *seria* and *buffa* according to the subjects and the character of the music, and between the limits of both there is a third species or *mezzo stile*, not very accurately definable. The opera, properly speaking admits only of singing and recitation although in some of the German operas dialogue is also introduced. The romantic opera, which is considered as a German invention, is a compound between the two Italian species. Metastasio in Italy, and Goethe in Germany, have both written for the opera; but these are splendid exceptions, and the poetry has, in most instances, been held entirely subservient to the music. At the beginning of last century the opera, on its more general introduction into France and England, was attacked as an absurdity by almost all the wits and critics of the day. There were not, however, wanting defenders of this favourite child of the gay and fashionable world, and foremost among

them was Voltaire, to whose apology for the opera, in the preface to his tragedy of *Œdipe*, we take leave to refer the reader

OPERA-GLASS A small telescope used in theatres, whence it has its name.

The common opera-glass is nothing else than the Galilean telescope, invented by Galileo in 1609, which was the first ever employed for the purpose of exploring the heavens A section of the instrument is represented in the annexed figure It consists of an object glass A B, the focal length of which is usually from 4 to 8 inches The eye-glass C D, is a double concave or plano-concave lens from half an inch to 2 inches focus, the distance between the two lenses is equal to the difference of their focal lengths, and the magnifying power is in the ratio of those lengths Rays of light R R falling on the object glass are refracted towards the axis X Y and proceed to meet in the focus of the lens at F But before they reach that point they are intercepted by the concave lens C D, the focus of which is also at F, and by which they are restored to their parallelism The rays therefore proceeding from the object enter the eye which is applied to the lens C D, without crossing each other,

and hence the distinctness of the [illegible] of all other telescopes, hence, also there is no inversion of the image and as there are only two glasses, the loss of light is inconsiderable

The lens A B may be either single or compound If a single lens of plate-glass is used it should be nearly convexo-plane, if a convex of plate and a concave of flint be combined to form the compound lens the former should be nearly convexo-plane, and the latter concavo-plane As to the eye glass it is always single, and the plano-concave form is perhaps better than the double concave the eye being in fact never placed in actual contact with it For any magnifying power above 3 or 4 it ought to be limited to an aperture rather less than that of the pupil of the eye, and where distinct vision is desired, the eye should be placed as accurately as possible on the axis of the instrument (*Coddington's Optics*)

The area or field of view of this instrument is very limited, and for this reason it cannot be used with any high magnifying power See TELESCOPE

OPERCULUM Lat operio *I cover*) The lid of any thing applied by botanists to the cap of the pitcher of *Nepenthes* to the loose apex of such fruits as that of *Lecythis* to the conical limb of the calyx of *Eucalyptus*, and to the body which closes up the theca of a moss

OPERCULUM In Zoology this term is applied to the apparatus supported by four bones which protects the gills of fishes, also to the horny or calcareous plate which closes the aperture of univalve shells, and to the four calcareous pieces which defend the entrance to the tube of *Balanites* or bell barnacles

OPHICLEIDE (Gr ὄφις *a serpent*, and κλεὶς *a key*) The largest brass wind instrument used in the orchestra of the trumpet species and forming the bass to that class of instruments Its compass is from double B♭ to A♭ above the line in the bass clef, being three octaves

OPHI'DIANS, *Ophidia* (Gr ὄφις and εἶδος *form*) The name of the order of reptiles which includes all the serpentiform species of that class, corresponding to the *Amphibia serpentes* of Linnæus

O'PHIOMANCY (Gr ὄφις and μαντεία *prophecy*) The art of divination from serpents Thus the seven coils of the serpent seen on the tomb of Anchises were held to indicate the number of years of Æneas's future wanderings —

Septem etenim gyros, septena volumina traxit

O'PHITES (Gr ὄφις) The name of an early sect of Christian heretics, who emanated from the Gnostics, so called from their worshipping the serpent that tempted Eve They considered the serpent as the father of all the sciences, which, but for the temptation of our first parents, would never have been known (Mosheim, *Eccl Hist* vol i)

OPHIU'CHUS, or OPHIU'CUS, also called *Serpentarius* One of the constellations of the northern hemisphere

OPHTHA'LMIA, or OPHTHALMI'TIS (Gr ὀφθαλμὸς, *the eye*) Inflammation of the eye This term is applied to diseased action of various parts of the eye In common cases its seat is the conjunctiva or membrane and it is relieved by fomentations of warm water or decoction of poppy heads by leeches cupping purging and in violent cases these depletive measures must sometimes be carried to a considerable extent, and aided by blisters to the temple or nape of the neck Emetics have sometimes been of service When all inflammatory symptoms have subsided, local astringents and mild strengthening eye-waters, may be resorted to; but so long as any inflammation remains they should be most cautiously applied Sometimes the iris is the seat of inflammation This is attended with fever, great intolerance of light and pain, [illegible] interior chamber of the eye and the sight is destroyed by the permanent damage done to the part

There is another form of ophthalmia in which the conjunctiva and inner membrane of the eyelids becomes inflamed and purulent as in the *Egyptian ophthalmia* which form of the disease is highly contagious The swelling and purulent inflammation of the eyelids is so great as to close or distort them, and the ulceration sometimes extends over the cornea, the humours escape, the whole organ is frightfully disorganized, and the agony that attends the whole progress of the worst form of the malady is indescribable The treatment originally resorted to consisted in bleeding and purging the plan afterwards adopted was to give [illegible] of tartar emetic, to remove the granulations by the scissors or knife and [illegible] of nitrate of silver or alum [illegible]

There is a variety of ophthalmia called *metastatic* caused by the translation of some other disease such as gout, or by the application of some morbid poison to the part. Its treatment depends upon its origin

The purulent opthalmia of new-born infants generally yields to the skilful application of mild astringent eye-waters and to gentle aperients

After the small-pox and measles, and some fevers, especially in scrotulous habits the glands of the eyelids form a morbid secretion which irritates and glues together the parts This disease has been termed *psorophthalmia*, it frequently yields to fomentation with warm water, to a drop of vinous tincture of opium into the eye at bedtime and to the application of the ointment of nitrate of mercury or red precipitate

O'PIATE (Gr ὀπὸς, *juice*) A medicine producing sleep See ANODYNE

OPISTHO'GRAPHUM (Gr ὀπισθεν, *behind* and γραφω *I write*) In Classical Antiquity a set of tickets, or roll of parchment or paper, answering the purpose of a memorandum book or commonplace book to enter notes and other extemporary matters to be revised afterwards, so called from [illegible] over both on the front and back Any [illegible] MS in which the transcriber had employed both the front and back of the papyrus was indeed an [illegible] practice to which allu [illegible] verse of Juvenal —

Scriptus et in tergo, nec dum finitus Orestes.

OPISTHO'TONOS (Gr ὀπισθεν, *backwards*, and τεινω *I draw*) A spasmodic action of the muscles, by which the body is bent backwards

O'PIUM (Gr ὀπὸς, *juice*) The inspissated juice of the poppy obtained by wounding the unripe seed capsules of the *Papaver somniferum* collecting the milky juice which exudes and dries in the sun and kneading it into cakes The cakes of the best opium are covered externally with pieces of dried leaves and the seed capsules of some species of *Rumex* It should be of a rich brown colour, tough consistency and smooth uniform texture, its peculiar narcotic smell should be strong and fresh, its taste bitter, warm and somewhat acrid The chemical analysis of opium has rendered it probable that its activity as a medicine depends upon the presence of a peculiar alkaline base called *morphia*, in combination with an acid which has been termed *meconic acid* Opium also contains *narcotine narceine codein*, gum resin extractive matter, and small portions of other proximate principles

The chief countries in which opium is prepared are India, Egypt, Turkey, and other parts of Asia, it is even cultivated in Italy France, and England, but the climate of Europe seems to be too uncertain to allow of its regular production Opium is pretty extensively used, both as a masticatory [illegible] in Turkey and India, but its great [illegible] China and the surrounding countries where the habit of [illegible] as become all but universal The supplies [illegible] market are derived from India and Turkey but chiefly from the former Indian opium is distinguished into three kinds the Patna or that grown in the province of Bahar, the Benares and the Malwa; of which the first is in the highest repute The cultivation of opium in India is a strict government monopoly. Every one who chooses may, within the prescribed regulations, engage in the opium cultivation; but the drug, when prepared, must all be sold to the government at a fixed price, which is said to be so far from remunerating the growers that, were it not for the advances which government [illegible] to enable [illegible] to carry on the business, the cultivation of opium would be discontinued

in the greater portion of India This monopoly has sometimes yielded a nett revenue of 1,000,000*l* a year This revenue has, however, of late years materially decreased, owing to the introduction into China of large supplies of opium from Turkey, into which it is found impossible to extend the monopoly The East India opium is exported in chests of 1½ lbs each. The introduction of opium into China was a legitimate branch of traffic down to the close of the last century Ever since that period, however, the trade has been contraband, but though the Chinese government has issued edict upo[illegible] tation of the drug, the [illegible] China has, in little more than forty years, risen from 1000 to about 27,000 chests per annum Such an extraordinary increase in a trade prohibited by law is attributable only to the corruption of the Chinese authorities At first the trade was carried on at Whampoa, fifteen miles below Canton, and next at Macao, whence it was driven by the exactions of the Portuguese, and the principal entrepôt was, till the recent outbreak of hostilities between the British and Chinese, in the bay of Lintin The opium is kept on board ships commonly called receiving ships, of which there are often ten or twelve lying together at anchor The sales are mostly effected by the [illegible] Canton, who give orders [illegible] which, on the order being produced, is handed over to the Chinese smuggler, who comes alongside at night to receive it Frequently, however, the smuggler purchases the opium on his own account, paying for it on the spot in silver, it being a rule of the trade never violated that the money must be paid before the opium is delivered When the drug is landed the laws are equally set at defiance in its progress through the country, smoking houses being it is said every where established During the first ten years of the present century, the exports from India to China were about 2 500 chests In 1821-1822 after the introduction of Malwa opium into the markets of Bombay and Calcutta, the exports increased to 4 628 chests, and owing no doubt to the greatly increased supply and lower price of the article the exports in 1831-1832 exceeded 20 000 chests, worth more than 13 000,000 dollars, and in 1837-1838 exceeded 30 000 chests worth 20 000 000 dollars In the beginning of 1839 the Chinese authorities resorted to decided measures to put a stop to opium smuggling, and the hostilities that consequently ensued between the two nations are now matters of history But we are convinced that no system of restriction, how rigorous soever will ever be able to check the smuggling of opium into China where the popular tastes and habits are so decidedly in its favour Accordingly we learn from the British consul at Canton that the imports of opium in 1845 amounted to 38,000 chests worth 23 000 000 dollars being little short of double the value of all the other articles imported put together The opium consumed in England is derived chiefly from Turkey but the supply is liable to great fluctuations This remark is applicable to all the other places whence opium is imported into England as well as to the quantity annually re-exported from England In 1850 the quantity of opium imported into England was upwards of 126,000 lbs Previously to 1828, the duty upon opium was 9*s* per lb, but in that year it was reduced to 4*s*, and again in 1836 to 1*s*, where it has since remained

OPOBA'LSAM (Gr *οπος juice* and *βαλσαμον balsam*) Balsam or balm of Gilead A compound of resin and essential oil of a peculiar fragrancy It exudes from a species of *Amyris*

OPODE'LDOC A term invented and formerly applied by Paracelsus to a plaster for all external injuries, but in modern usage it signifies a liniment made by dissolving soap in alcohol with the addition of camphor and volatile oils

OPO'PONAX A gum resin having a peculiar and rather disagreeable odour formerly used in medicine It is the juice of the *Pastinaca opopanax*

OPOSSUM the common name of the Marsupial quadrupeds of the genus *Didelphis*, characterized by three kinds of teeth, viz incisors, canines and molars, by hinder hands, and a prehensile tail With this organization the opossums, as might be expected are arboreal in their habits, and feed on a mixed diet in which animal food preponderates The larger species have a well-developed abdominal pouch, in which the young are [illegible] early stage of development In [illegible] possums the characteristic pouch is nearly rudimentary, and the young are carried by the parent on the back, where they cling to the fur, and likewise hold on by entwining their little prehensile tails round that of the mother the name *Didelphis dorsigera* is on this account given to one of the species The true opossums are now limited to the American continent but, during the Eocene period there were species of *Didelphis* in both France and England

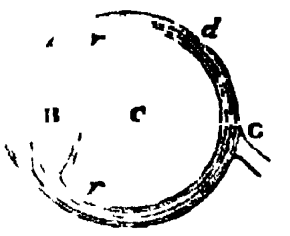
OPPOSITION Act of opposing In a general sense the fact of being in a state of contrary action or disagreement In Politics the name given in Great Britain to the party in parliament opposed to the administration for the time being, and which would most likely succeed to power were it displaced A party in parliament which, though opposed to government, has no chance of succeeding to power were ministers dismissed, is not usually characterized by the term Opposition

OPPOSITION, in Astronomy denotes the aspect of two bodies when diametrically opposite to each other Thus the moon, or a planet, is said to be in opposition with the sun when it pass[illegible]

OPPOSITION In [illegible], *west*, which see

OPS In Mythology, the Latin appellation of the Greek goddess Rhea or Cybele, which see

OPSIOMETER (Gr *οψις, sight*, and *μετρον, measure*) An instrument for measuring the extent of the limits of distinct vision in different individuals and consequently for determining the focal lengths of lenses necessary to correct imperfections of the eye A contrivance for this purpose, by M Lehot, is described in the *Annales des Sciences d'Observation* for June 1829 and in the Notes by M Quetelet to the French translation of *Herschel's Treatise on Light* Its principle depends on the appearance presented by a straight line placed very [illegible] the eye [illegible] is carried into p[illegible] on a narrow rule covered with black velvet, and furnished with a suitable apparatus for marking the exact points at which the thread begins and ceases to be distinctly seen when held in a certain position with respect to the eye An instrument for the same purpose, on a different principle, had formerly been suggested by Dr Young



OPTATIVE MOOD *See* GRAMMAR

OPTIC NERVES The second pair of nerves They arise from the *thalami nervorum opticorum*, and, perforating the bulbs of the eye, form the *retina*

OPTICS (Gr *οπτομαι, I see*) That branch of physical science which treats of light and vision

The theory of light and the different hypotheses respecting its propagation, having been explained under the term LIGHT and its most remarkable properties being [illegible] REFLEXION REFRACTION DISPERSION INTERFERENCE POLARIZATION REFLEXION, REFRACTION &c), we shall here confine ourselves to the explanation of the phenomena and laws of vision, and the formation of images, and this in fact, comprehends all that is meant by *Optics*, in the strict sense of the word

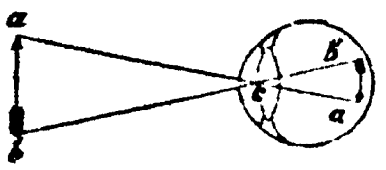
Description of the Eye —The human eye is of a spherical form, having a slight projection in front The annexed figure represents a horizontal section of it through its axis It consists of three principal chambers, filled with different *humours*, or transparent media of different refractive powers The first of these media occupying the anterior chamber A is called the *aqueous*

humour, and consists almost entirely of pure water The cell in which the aqueous humour is contained is bounded on its anterior side by a strong horny transparent substance called the *cornea* the figure of which is an ellipsis of revolution about its major axis The posterior side of the cell is formed by the *iris* a kind of circular opaque screen consisting of muscular fibres, by the contraction or expansion of which an aperture in its centre, called the *pupil*, is increased or diminished according to the illumination, in order to protect the eye and preserve its sensibility by equalizing the quantity of light admitted into it The second humour, called the *crystalline lens*, B enclosed in its capsule lies immediately behind the pupil Its figure is a solid of revolution, having its anterior surface much less curved than the posterior, and both surfaces are ellipsoids of revolution about their lesser axes The crystalline is somewhat denser towards the centre than at the outside, the increase of density serving to correct the aberration, by shortening the focus of the [illegible] The third or *vitreous* humour C, [illegible] posterior chamber of the eye This fluid scarcely [illegible] [illegible] humour in its refractive power, [illegible] [illegible], or refractive power

The [illegible] refractive powers of the different [illegible] according to Sir David Brewster, the ray of light being supposed to fall out of air from air —

Aqueous Humour	Crystalline Lens			Vitreous Humour
	Surface	Centre	Mean	
1 336	1 3767	1 3790	1 3779	1 3394

But as the rays refracted by the aqueous humour pass into the crystalline, and from the crystalline into the vitreous humour, the indices of refraction of the separating surfaces of these humours will be —



From aqueous humour to outer coat of crystalline 1 0466
From aqueous to crystalline, using the mean index - 1·0353

From vitreous to crystalline outer coat - - 1 0445
From ditto to ditto, using the mean index - - 1 0332
("Optics," *Cab Cyclopædia*)

The posterior surface of the cell of the vitreous humour is covered by the *retina*, *d*, a network of inconceivably delicate nerves, all branching from the *optic nerve* O which enters the eye obliquely at the inner side of the orbit next the nose The retina lines the whole of the cavity C from *r* to *r*, at which points the capsule of the crystalline commences Its nerves are immersed in the *pigmentum nigrum* a very black velvety matter which covers the choroid membrane and the use of which is to absorb and stifle all the light which enters the eye as soon as it has done its office of exciting the retina, thus preventing internal reflections and consequent confusion of vision The whole of these humours and membranes are contained in a thick tough coat, called the *sclerotica*, which unites with the cornea and forms what is commonly called the *white of the eye* The spot at which the optic nerve, O, enters the eye is totally insensible to the stimulus of light, and is therefore called the *punctum cæcum* (Herschel on Light *Ency Met*)

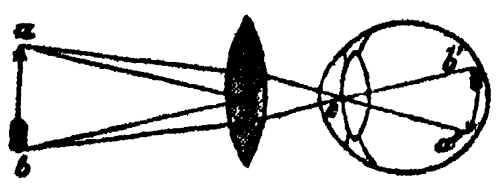
From this description of the eye it is evident that light in passing through it must undergo a series of refractions, in the same manner as in passing through a system of lenses When a pencil of luminous rays, proceeding from an exterior point, passes through the transparent cornea and penetrates the aqueous humour the divergency of the rays is diminished by this first refraction The rays which pass through the pupil undergo a second refraction at the anterior surface of the crystalline, which renders them further convergent, and on leaving the crystalline and passing into the vitreous humour they receive their final degree and produce an image at a focus on or very near that membrane Experience and calculation prove that when vision takes place with the least effort the luminous point (or any very small object on which the eye is fixed) is at such a distance from the eye that the rays enter the eye with precisely that degree of divergence which is required in order that after suffering the several refractions they may be brought to meet in a point on the retina itself Hence it has been concluded that the sensation of sight is caused by the impression made by light on the retina, when it is concentrated on it in a single point or within a very small space

The image of an object on the retina is evidently inverted with respect to the position of the object itself, for the ray proceeding from the upper extremity of an object *a* falls on the lower extremity *a'* of the image on the retina Writers on optics have often puzzled themselves with attempts to explain the cause of erect vision from an inverted image, the subject, however is not worth the [illegible] has been expended on it "Erect," [illegible] "means nothing more than having the head farther from the ground and the feet nearer than any other part Now the earth and the objects which stand on it preserve the same relative situation in the picture on the retina that they do in nature In that picture, it is true men stand with their heads downwards but then at the same time, heavy bodies fall upwards, and the mind or its deputy the nerve which is present in every part of the picture judges only of the relations of its parts to one another How these parts are related to external objects is known only by experience and judged of at the instant only by habit"

Another circumstance the cause of which has also been much discussed is that although [illegible] of each object at which we look is formed on the [illegible] both eyes the object appears [illegible] Single vision with two eyes is attributed [illegible] to the habit of referring the two impressions made on corresponding points of the two retinas to the same object, and, in fact, if we press slightly on the cornea of one eye, so as to derange its optical axis the two images, being no longer on parts of the retina which habitually correspond, will appear double Those who have had one eye distorted by a blow see double till habit has taught them anew to see single, though the distortion remains (For a review of the various theories that have been proposed to account for this phenomenon, the reader may be referred to a paper on the Physiology of Vision, by Professor Wheatstone in the *Phil Trans* for 1838)

Straight lines drawn from the extremities of an object [illegible] in the centre of the pupil, in [illegible] point is called the optical centre of the eye, and form the angle *a c b* which is called the visual angle On leaving the crystalline and entering the vitreous humour the rays are slightly refracted and form another angle, *a' c b'* the base of which is the magnitude of the image on the retina These two angles are not perfectly equal, so that *a' b'*, the magnitude of the image on the retina, or the apparent magnitude is not exactly proportional to the real magnitude, *a b* for a given distance But the difference is so small that it may in general be neglected and the visual angle becomes the measure of the apparent magnitude, or the apparent magnitude of an object is proportional to its linear magnitude divided by its distance from the eye

As the judgment which we form of the real magnitude of a distant object depends not only on the apparent magnitude, but also on our estimation of its distance, an erroneous estimate of the distance will necessarily produce an illusion with respect to the magnitude Such illusions are frequent in the night time when the darkness prevents us from distinguishing the real places of objects and their relative positions An unusual increase or deficiency of the transparency of the atmosphere produces the same effect, and at sea, where little assistance can be derived from the appearance of intervening objects, it requires a particular training of the eye to judge correctly of distances



The effect of light on the eye has a sensible duration after the eye is shut or the luminous object removed During the twinkling of the eye, we never lose sight of the object [illegible] and by burning [illegible] with a rapid motion it appears [illegible] The persistence of light on the retina gives rise to a great number of illusions such as the apparent augmentation of volume of a musical chord [illegible] the train of light which appears [illegible] It was estimated by Dr [illegible] that a coal whirled round at the distance of 165 feet, maintained its impression during the seventh part of a second Experiments, however of a more accurate kind have shown that this time is not constant, but is influenced by several circumstances Light must act on the eye for some continuance of time in order to produce a complete impression, and it is found that the time during which the impression that has been produced can preserve an equal intensity after the action of light has ceased is greater in proportion as the impression is less intense On the other hand the duration of the impression is greater the more intense If the impression has been made by a strongly illuminated object as the setting sun it often passes through a series of different colours, in other circumstances, it disappears, and is renewed after some seconds, disappears again, and so on several times in succession

The eye possesses considerable power of adjusting its parts so as to give distinct vision for all distances within certain limits The first of these limits is the least distance from the eye at which small objects, as the print of a book can be seen without effort, and the second, the distance at which the image of the object becomes confused The space between these limits is the field of vision, but both its extent and distance from the eye vary considerably with respect to different individuals, and sometimes even with respect to the two eyes of the same individual From the [illegible] of the eye and the refractive powers [illegible] instances, it is found by calculation that the focal distances of two luminous points situated at the two limits of the field of vision, differ by about one sixth part of the diameter of the eye

All the refractions which take place in the interior of the eye are in the same direction, consequently the eye, regarded as an optical instrument is not achromatic The absence of colour about the images formed on the retina excepting in very particular cases is to be ascribed in part to the small breadth of the pencil of luminous rays which passes through the pupil but principally to the small focal distance of the eye in consequence of which the unequally refrangible rays can never be much separated from each other It has also been surmised (*Coddington's Optics*) that a compensation takes place between the refractions at the cornea and the crystalline, a ray which is less refracted by the former being more refracted by the latter, in consequence of its passing through it at a greater distance from the axis

Distinct vision depending on the convergence of the luminous rays which proceed from an object to a focus on the retina it follows that if, from any defect in the original structure of the eye or any deterioration of its form or powers, the rays which enter the pupil are not rendered sufficiently [illegible] at the retina, or are rendered too [illegible] brought to a focus before they reach the retina, an imperfect and indistinct image will be produced It happens with most persons, between the ages of thirty and [illegible] that the crystalline lens is beginning to undergo a change, [illegible] its form but also its density and refractive power, are altered in such a manner as to leave it capable of affording distinct vision only of very remote objects This defect is remedied by a convex lens, which makes up for the flatness of the crystalline, and renders parallel rays slightly convergent before entering the eye Let *a b* be an object, *c* the lens, and *e* the centre of [illegible] placed at the focal [illegible] ject is at the focus, the rays of a pencil diverging from any point *a* in it will emerge parallel to each other and

to *a c*; they will therefore, after refraction in the eye, be brought to converge on the retina at a point *a'*, such that *e a'* is parallel to *a c*. Similarly, rays from *b*, after refraction through the lens and the eye will converge to the point *b'*, such that *e b'* is parallel to *b c*. Thus a distinct image *a' b'* will be formed on the retina, and the apparent angular magnitude of the object seen through the lens will be the angle *a' e b'* which is equal to *c b*, the angle subtended by the object at the centre of the lens, and therefore greater than the angle subtended by the object at *e*, the centre of the eye. Hence the image appears enlarged; but the nearer the lens is to the eye, the less will be the difference between the apparent magnitudes of the image as seen with and without the lens. When such lenses are employed in the form of spectacles, the enlargement of the image (which in this case is not intended) is hardly sensible, because the lens is commonly of low power, and because the person who must use it, to see distinctly, cannot easily make a comparison between the appearance of an object seen with or without the lens. The lenses of spectacles ought to be of the meniscus form (*see* LENS), in order to refract without much indistinctness, pencils coming to the eye with any degree [illegible] spectacles are called *periscopic*, and [illegible] first pointed out by Dr Wollaston.

Sometimes the eye is so formed that its power of giving convergence is too great, and the rays are brought to a focus before they reach the retina. Persons having this defect are called *short-sighted* from their inability to see distant objects distinctly. It arises from an increase of density in the central part of the crystalline, and its inconvenience is obviated by a concave lens, which increases the divergence of the rays before they enter the eye. For the same reason as mentioned above, the lens should be of the convexo-concave form, that is, convex on the outer side and concave on the inner side, the curvature of the latter being greater than that of the former. This lens diminishes the apparent magnitude of objects, but the effect is scarcely sensible. (*South Optics*, Herschel's Treatise on Light, *Ency. Metropolitana*, Brewster's Optics, *Cabinet Cyclo.*, *Coddington's Optics*, Biot, *Cours de Physique*.) For optical instruments, see LENS, MICROSCOPE, TELESCOPE, &c.

OPTIMA'TES (Lat.) A word sometimes used to denote the Roman nobility, in contradistinction to the plebeians, or populares.

OPTIMISM. In Moral Philosophy and Theology, the system which regards physical and moral evil as elements of the universal order of things, so that every thing is good viewed in relation to the whole, or in the ordinary phrase in which the doctrine is expressed, all is for the best." This system was justified with philosophical inductions, by Leibnitz in his *Theodicæa* (which see), and is popularly illustrated by Pope in his *Essay on Man*; but it is best known (as far as the name is concerned) by the irony of Voltaire in his celebrated romance of *Candide*. The optimism of Leibnitz was based on the following trilemma: If this world be not the best possible, God must either, 1 not have known how to make a better, 2 not have been able, 3 not have chosen. The first position contradicts his omniscience, the second his omnipotence, the third his benevolence. (See *Creuzer, Leibnitzii Doctrinæ de Mundo Optimo*, Lips. 1795.)

OPTIMUS MAXIMUS. Epithets assigned to Jupiter by the ancient Romans to indicate his superlative greatness and goodness.

OPTION (Lat. *opto*, *I wish* or *choose*.) In Ecclesiastical Law, a prerogative of the archbishops of the church of England. Every bishop is bound immediately after his confirmation or consecration, or canonical conveyance to the archbishop, to nominate to any one benefice or dignity belonging to his see which the archbishop may [illegible]. If the archbishop die before [illegible] right of filling it up passes to his executors or administrators.

OPTION, at the Stock Exchange, signifies a per centage given for "the option" of putting or calling for selling or buying stock in time bargains at a certain price.

OPUNTIA. In Botany, the name given to those Cactaceous plants commonly called *Indian figs*. Their stems consist of flat joints, broader at the upper than at the lower end, becoming, however, eventually both continuous and cylindrical. [illegible] is South America, but in some [illegible] Mount Etna is [illegible]. The cochineal insect (*Opuntia cochenillifera*) is fed on one of the varieties of *Opuntia*.

OR (Fr. *gold*.) In Heraldry, one of the metals employed in blazonry. It is equivalent to topaz among precious stones, and Sol among planets. In engraving, it is represented by a surface sprinkled with equidistant dots

ORA. An old Saxon coin, valued at sixteen pence, and [illegible] twer[illegible] *Domesday Book* and in the old records of the kingdom.

O'RACLE (Lat. *oraculum*, from *os*, *a mouth*.) The name primarily given to the response delivered by the ancient heathen divinities to those who consulted them respecting the future, but afterwards applied both to the place where responses were given as well as to the divinities from whom the responses were supposed to proceed. To the desire so natural to man to obtain a [illegible] knowledge, coupled with the ennobling belief that [illegible] desires [illegible] is doubtless to be traced which has in all, but more especially in the earlier stages of society, exercised so powerful an influence over the human mind. But, of all the modes of divination, that by consulting the oracle was the most popular. In other cases, as the interpretation of events depended on man alone, there might be mistake or deception, but in the oracle, when the deity was believed to pronounce either in his own voice or in that of a [illegible], it was supposed that it could be none. The oracles obtained such credit and celebrity in antiquity, but more especially among the Greeks, that they were resorted to on every occasion of doubt and emergency, both by princes and states, as well as by private individuals.

The general characteristics of oracles were ambiguity, obscurity, and convertibility, so that one answer would agree with several various and sometimes directly opposite events. Thus, when Crœsus was on the point of invading the Medes, he consulted the oracle of Delphi as to the success of the enterprise, and received for answer*, that by passing the river Halys he would ruin a great empire. But whether it was his own empire or that of his enemies that was destined to be ruined was not intimated, and, in either case, the oracle could not fail to be right. The answer of the oracle to Pyrrhus is another well-known instance of this sort of ambiguity, —

Aio, te, Æacida, Romanos vincere posse, —

as it might either be interpreted in favour of or against Pyrrhus. This ambiguity and equivocation was not, however, the worst feature that characterized the oracles of antiquity. They were at once ambiguous and venal. A rich or a powerful individual seldom found much difficulty in obtaining a response favourable to his projects, how unjust or objectionable soever. Such, for instance, were unquestionably the motives that dictated the favourable responses of the Pythia at Delphi to Philip of Macedon, which drew from Demosthenes the famous declaration, that the goddess *Philippised*. But such and so powerful is the influence of superstition, that this system of fraud and imposture maintained a lengthened ascendency, and the interested responses of the oracles frequently sufficed to excite bloody wars, and to spread desolation through extensive states.

The first oracles had their origin in the East, at a period to which the monuments of profane history do not ascend. The most ancient oracle is supposed to be that of Meroe, to which were afterwards added those of Thebes and Ammon, in all of which places the worship of Jupiter Ammon prevailed. From the Egyptians the use of oracles, along with a knowledge of many arts and sciences, passed to the Greeks, who soon surpassed every other nation both in the number and celebrity of their oracles. It has been affirmed that no fewer than three hundred oracles were established in different parts of Greece, but of those the oracles of Jupiter at Dodona, of Apollo at Delphi, and of Trophonius near Lebadeia (see these articles), may be mentioned as having enjoyed the highest reputation†. The oracles of antiquity had many leading features in common, but there were also several peculiarities about them, of which the variety of modes in which the oracular responses were delivered is one of the most striking. At Delphi responses were delivered by the Pythia, at Ammon by the priests, and at Dodona they issued from the hollow of an oak. Sometimes [illegible] was communicated by letter, sometimes the desired information could only be obtained by casting lots, and sometimes the divinities chose to announce their will by dreams, visions, and preternatural voices.

Among the Jews there were several sorts of oracles. Of these the Urim and Thummim (which see) bore a [illegible] Bath Kol ("Daughter of the Voice" mentioned in the *Talmud* and other Jewish works) which originated after the time of Malachi, may be regarded as completely identical with them. The Old Testament teems with

* The Greek verse is,

Κροισος Αλυν διαβας μεγαλην αρχην καταλυσει.

Thus rendered in Latin,

Crœsus Halyn superans magnam evertet opum vim.

† It does not appear that the Romans ever had regularly established oracles among themselves; but on various important emergencies [illegible] to [illegible] Greece, and especially to that of Delphi [illegible]

instances of the other species of oracles in which supernatural revelations were made by means of dreams and visions, but every rational mind, even apart from scripture, must [illegible] wide distinction [illegible] in this manner [illegible] and the jugglery practised [illegible] avarice and cunning of the priests. There are two points respecting oracles which have given rise to much controversy, viz whether oracular responses ought to be ascribed to mere human ingenuity or to diabolical agency, and at what time responses ceased altogether to be given. With regard to the first point, most of the Christian fathers were of opinion that they ought to be attributed to diabolical machinations, [illegible] satisfactorily [illegible] the treatises of Van Dale *De Oraculis Ethnicorum* 1683, and of Fontenelle *Histoire des Oracles*, 1687. With regard to the other question, at what time the oracles ceased to give responses, it has been frequently asserted that they became silent ever after the birth of Christ. Eusebius was the first who maintained this opinion, and many writers of [illegible] have [illegible] homage to the great Author of Christianity by [illegible] such views. In the *Hymn of the Nativity* [illegible] of his minor poems, Milton, [illegible] the following lays—

> The oracles are dumb,
> No voice or hideous hum
> Runs through the archèd roof in words deceiving.
> Apollo from his shrine
> Can no more divine
> With hollow shriek the steep of Delphos leaving.
> No nightly trance or breathed spell
> Inspires the pale-eyed priest from the prophetic cell.

It appears, however, from the edicts of the emperors Theodosius, Gratian and Valentinian, that oracles existed and were occasionally at least consulted down to A.D. 328. For several centuries previously they had been gradually sinking in public esteem, but at that period they entirely ceased, and there can be little doubt that this desirable consummation was mainly effected by the enlightening power of Christianity, and by the influence which even at so early a period it had acquired over a large portion of the then civilised world. (In addition to the works already quoted, see *M'Culloch's Geo. Dict.*, art. "Delphi," Clavier, *Mém. sur les Oracles des Anciens*, 1819, &c.)

O'RAL, *Oralis* (Lat. os, *a mouth*.) This term is applied to the various parts which form or relate to the mouth of animals.

ORA'NG, in the Malay language, signifies man, orang-utan is the man of the woods. It is by this term that we [illegible] ignate the Indian or red orang (*Simia satyrus*, Linn.). This species inhabits the great islands of Borneo and Sumatra, and attains the height of from four to five feet, measured in a straight line from the vertex to the heel. It has neither tail, cheek-pouches, nor ischial callosites, but has an appendix to the cæcum coli, as in man. It wants the ligament of the hip-joint, and acquires an enormous laryngeal pouch when full-grown. See CHIMPANZEE.

O'RANGE. The well-known [illegible] of the orange tree, the *Citrus aurantium* of botanists. India and China are the native countries of the orange, and the Portuguese are entitled to the honour of having transferred the plant to other countries. The principal varieties of the orange tree are the orange, the lime, the lemon, and the citron, fruits which have now become so common as to give a tropical character to the dessert. The orange is not considered to have been grown in Europe till the 14th century, and in England they have been cultivated in conservatories since 1492. They are propagated either by seeds, by cuttings, by layers, by grafting, or by inoculation, but the plants grown from seeds require so long to come to perfection that they are seldom so propagated in England. Oranges are imported into this country in chests and boxes packed separately in paper. The best are brought from the Azores and Spain, but very good ones also come from Portugal, Italy, Malta, and other places. The orange trade carried on by this country is of considerable value and importance. Not only is the fruit held in high estimation, but, from the extreme productiveness of the tree, it is sold at a price [illegible] sometimes even less expensive than our [illegible] mestic fruits. The entries for home consumption at an average of the three years ending [illegible] amounted to [illegible] 30,000 boxes, each box containing about 720 lemons and oranges; the duty amounted to about 70,000*l.* a year. [illegible] The [illegible] yield an essential oil scarcely less esteemed as a perfume than the celebrated ottar of roses; while, as if nature had intended every part of it for the use of man, the wood of the tree is susceptible of the highest polish, and is extensively employed in the arts.

O'RANGEMEN. The name given to the society instituted in Ireland in 1795 to uphold the Protestant religion and ascendency, and for the discouragement of Catholicism. It had [illegible] secretly organized, destructive of orange [illegible], and [illegible] processions. It was at length suppressed by [illegible].

ORANGERY. A kind of [illegible] terre, to preserve orange trees in during the winter season. For trees in large boxes a proportionably large and lofty house is requisite; it may be opaque on the north side, with a glass roof [illegible] convenient or desired length, width [illegible] one of moderate size, the height at the back wall may be fifteen feet, at front ten feet, and the width of the house fifteen feet. The floor may be either perfectly level, and the boxes placed on it, the largest behind, so as their tops may form a slope to the front glass, as in the conservatory of Prince Borghese at Rome, or if the trees are young, a stage may be erected for a few years, in order to raise the [illegible] but if the trees are of a considerable size, the best way is to have square pits in the floor at regular distances, somewhat larger than each box, and in these to sink the boxes, covering them with mould, sand, or moss, nearly to the level of the pavement, so that each tree so placed and dressed will appear as if planted in a small compartment of earth. Such is the plan of the large conservatory in the royal gardens at Monza. The walk, unless where a stage is adopted, should be in the middle of the house, with corresponding doors in each end, but where the trees are young, and placed on a stage like greenhouse plants the walk should be in front, as in no other situation could the eye of the spectator meet the foliage of the plants. Where the walk is in the middle and a double row of trees on each side, as at Monza, the effect in winter is truly magnificent and gratifying.

Where the trees are to be planted as standards in the borders or floor of the house it is essentially requisite to the health and beauty of the plants that the building be glazed on all sides. Showers might be supplied in Poddiges's manner; heat by steam, hot water, or flues, and in winter the beds might be covered with turf strewed with daisies, violets, and primroses; these would come early into flower, and if the turf were kept very short about the roots of the flowering plants, and the trees in excellent condition, only those who have seen the first rate regularly planted standard orange groves of Nervi could form an idea of the effect which, by contrast with the external winter would be felt as luxurious, and as anticipating real spring. An orangery is distinguished from a conservatory by its having an opaque roof, while that of the latter is glazed. The orangery at Versailles is the [illegible] hat ever was built.

ORATORIO [illegible] from Lat. oratorium, *a small chapel*, which again is derived from orare *to pray*.) A sacred musical composition, consisting of airs, recitatives, duets, trios, choruses &c., the subject of which is generally taken from scripture. The text is usually in a dramatic form, as in Handel's *Samson*, but it sometimes takes the form of a narrative as in *Israel in Egypt*, occasionally it is of a mixed character, as in Haydn's *Creation*, and sometimes it consists merely of detached passages from scripture, as in the *Messiah*. The origin of oratorios has been variously ascribed, but the most prevalent opinion regards them as originally founded upon the spiritual songs and dialogues which were sung or recited by the priests of the oratory. (*See* ORATORY.) The more recent introduction of this species of musical drama is on all sides attributed to St. Philippo Neri, about the middle of the 16th century, but oratorios, properly so called, were not produced till about a century afterwards. At first the persons introduced were sometimes ideal, sometimes parabolical, and sometimes, as in the later oratorios, taken from sacred history, but this species of drama soon assumed a more regular form, and oratorios became great favourites in Italy, where they were constantly performed during the Carnival, and they have since given birth to some of the noblest and most elaborate compositions of the great masters both of that and other countries. Oratorios were first introduced into England by the great Handel in 1720, though they were not publicly performed till 1732, and such was their success that in 1737 they began to be performed twice a week during the season of Lent, a custom which, under the able management of J. C. Smith, Linley, and Arnold, &c., successively, was regularly continued down to a very recent period, when, in consequence of the introduction of profane music and other irregularities during the management of Mr. Ashley, they began to degenerate, and were at length discontinued.

Within the last twelve years similar performances, though not entitled *oratorios*, have been again revived at Exeter Hall by the *Sacred Harmonic Society*, on a scale of magnificence previously unknown.

ORATORY, signifies commonly a room in a private house set apart for prayer. It differs from a chapel, inasmuch as it does not contain an altar, nor may mass be celebrated in it.

ORATORY. *See* ELOQUENCE, RHETORIC.

O'RATORY, PRIESTS OF THE Various congregations of ecclesiastical persons living in community who profess by a special vow have assumed this title The first congregation of the Oratory was founded by St Philippo Neri, at Rome, in the beginning of the 16th century Similar societies were soon formed in Italy and the Low Countries, but without any mutual connection The congregation of the Oratory at Paris was founded by the cardinal Pierre de Berulle 1611, and had several houses in different parts of the country It produced many men of celebrity, among others, Malebranche and Massillon There can be no doubt that its [illegible]

ORB (Lat orbis), in the language of the old astronomers, usually signifies a hollow sphere, and they supposed the heavens to consist of such orbs or spheres, enclosing one another, and carrying with them in their revolutions the different planets The *orbis maximus*, or great orb, was that in which the sun is placed As the orbs were concentric, and their number equal to that of the known planets, with one for the moon and another for the fixed stars, it was necessary to suppose them to be transparent or crystalline Orb also denotes any round or circular body, and sometimes it is used synonymously with *orbit*

ORBICULATES, *Orbiculata* A tribe of Brachyurous Crustaceans including those which have an oblong oval carapace

ORBI'CULUS In Botany, the whole mass of that part of a flower called the corona in the genus *Stapelia*, also, a round flat hymenium contained within the peridium of some genera of fungi

ORBIT (Lat orbis, *a circle*) In Astronomy, the path which any celestial body describes by its proper motion The orbits of all the planets and satellites are ellipses, and recent discoveries seem to show that the orbits of double stars, which revolve about each other, are curves of the same kind Some comets have been supposed to move in hyperbolic orbits For the magnitudes and eccentricities of the planetary orbits, *see* PLANETS *See* also MOON SATELLITE STAR

ORBIT In Ornithology, the term is applied to the rim which surrounds the eye this is generally the base of feathers, for the facility of its movements, but especially so in the parrot tribe and the heron

ORBIT In Osteology the bony cavity in which the eyeball is imbedded Each orbit is formed by seven bones,—the frontal, sphenoid, malar, lachrymal, ethmoid, palatine and superior maxillary

O'RCHARD (Gr ορχατος) An enclosure devoted to the cultivation of fruit trees The most productive orchards are generally such as are situated on declivities open to the south or south-east, and sheltered from the north, north-east, and west The most suitable soil is a calcareous loam with a dry subsoil The climate of orchards so situated is always warmer than any other kind of situation which this country affords and the subsoil is more certain of being dry The surface of the soil in the case of orchards so situated, is generally kept under pasture, which, while it prevents the earth from being washed away by rains, is favourable to the running of the roots immediately under the surface by which they are sooner called into action by heat in spring and sooner thrown into a torpid state by cold in autumn The principal fruits grown in orchards of this description in Great Britain are the apple, the pear, the plum and the cherry, and, wherever wheat can be ripened in the plains, these fruit will arrive at perfection on declivities such as we have mentioned

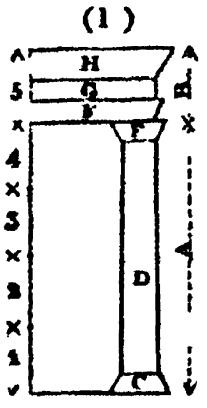
O'RCHESTRA (Gr ορχηστρα, from ορχεῖσθαι, *to dance*) In Architecture that part in the interior of a theatre situate immediately between the stage and the place assigned to the audience In the Greek and Roman theatres it was the part appropriated to the chorus and its evolutions and was almost level with the stage In the theatres of the moderns, it is the place appropriated to the musicians The word is also applied to any erection for the performers at a concert

ORCHIDA'CEÆ (Orchis is one of the genera) A natural order of Herbaceous Endogens, inhabiting all parts of the world except the most frozen and dry upon the verge of the frozen zone, remarkable for their extraordinary forms They are well known for the singular [illegible] Some of them grow in the earth, others inhabit rocks and the branches of trees, and a few appear to be true parasites They all belong to the class *Gynandria* of Linnæus, are often very agreeably scented, and some [illegible] as in the case of vanilla which [illegible] of benzoic acid The [illegible] called *salep* is prepared from the amylaceous roots of several terrestrial species

ORCHIL *See* ARCHIL

O'RCIN A crystallizable colouring matter or principle, obtained from a species of lichen (*Variolaria orcina*)

O'RDEAL (In modern Latin ordalium, from the German urtheil *judgment*) The practice of referring litigated questions, and the guilt or innocence of parties under accusation to the judgment of God (testified, in popular belief, either by the event of lots, or by the success or failure of certain experiments is of very ancient date and was [illegible] Pagan [illegible] settled in the [illegible] Roman [illegible] modes of Jurisprudence The ordeal was awarded in various cases; either arbitrarily by the court, or at the request of a party accused, who was anxious to clear himself, either as an alternative for trial by compurgation or by battle, or as the regular mode of deciding an issue In the earlier ages of modern European history, the ordeal was under the peculiar protection of the clergy, who afterwards discountenanced it, and its gradual suppression must be mainly attributed to the decrees of popes and councils, of which several were pronounced against it in the course of the thirteenth century, beginning with the decree of the fourth Lateran council in 1215 Among the various forms of ordeal in use among different nations, the following are some of the most remarkable The trial of the eucharist was used chiefly among the clergy, the accused party took the sacrament in attestation of his innocence, and it was believed that if he were guilty he would be immediately visited with punishment for the sacrilege Of the same description was the corsnedd, or trial by the consecrated piece of bread or cheese, so much in use among the Anglo-Saxons The trial of the cross was used, both in civil and criminal questions, in many European countries See the supplementary formulæ to those of Marculfus, cited by Meyer, *Institutions Judiciaires*, liv iii c 6 It appears that the litigants or the accuser and accused, were to stand upright before a cross, and that he who fell or changed his position first was cast or condemned This popular mode of ordeal was abolished by the capitulary of 816 in the reign of Louis le Debonnaire, as irreverent towards the mystery of the cross, but the abolition seems only to have been carried into effect in Italy and the provinces adjoining the seat of empire The ordeal of hot water, in which the accused party plunged his hand into a vessel of boiling water, was used by the Salian Franks when pagans, as early as the fifth century It was afterwards extensively practised In what was called the expurgatio simplex, the accused plunged his arm to the wrist, in the triple ordeal, to the elbow Trials by burning iron were of various sorts carrying a red-hot bar in the hand and walking barefoot over heated [illegible] of 803, [illegible] from the celebrated example of Queen Emma Among the Saxons, the iron was awarded to freemen the water to those of inferior conditions There can be no doubt that, in these severer forms of ordeal some precaution was occasionally used by the clergy, under whose inspection and management the trial took place to preserve parties whom it was wished to clear from suspicion from the ordinary consequences of such exposure There were also ordeals by lot as by the casual choice between a pair of dice one marked with a cross and the other blank mentioned in the laws of the Frisons The famous trial of the bier, in which the supposed perpetrator was required to touch the body of a murdered person, and was pronounced guilty if the blood flowed, may be regarded as a species of ordeal, although founded more on usage than legal enactment, as this form of superstition did not become prevalent until later times, when ordeals were no longer a recognized part of the law To the same head may be referred the various absurd and cruel methods which were adopted in different countries to try suspected witches One of the most remarkable instances of the solemn application of the ordeal in later times took place in 1498 when the truth of the doctrines preached by Savonarola [illegible] was put to the test by [illegible] a Franciscan [illegible] however, may be rather regarded as the appeal of an enthusiast to the divine judgment than as an example of a recognized usage Ordeals are of common use in the [illegible] of various heathen nations, especially of the Hindoos

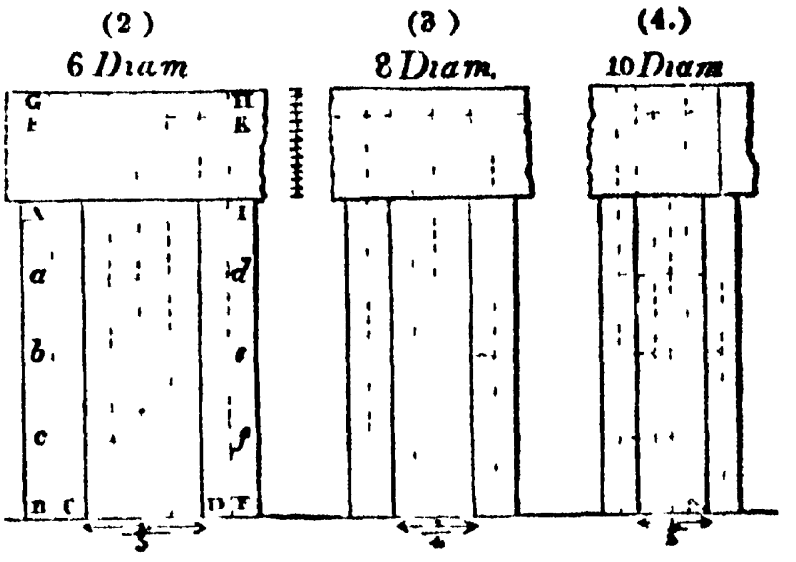


By the Anglo-Saxon laws, an option was given to the culprit in ordinary cases, when presented of a crime by the neighbourhood, or appealed against by the injured party, of defending himself by compurgation or by the ordeal (of hot water or hot iron) If, being a villain, he could procure the testimony of his lord in favour of his character the ordeal was simple, if otherwise, threefold In the laws of William the Conqueror, we find that accusations between an Englishman and a Frenchman were decided either by the Roman mode of trial battle or by the ordeal [illegible] as Sir F Palgrave [illegible] afforded a last chance of escape to the accused party, than as an ordinary mode of deciding on guilt or innocence, since

it does [illegible]
unless [illegible]
testime[illegible]
the fac[illegible]
the civil law, which, according to principle, was only applied where the evidence was sufficient to warrant a conviction, and the defendant refused to confess When, however, [illegible]ompurgation was abolished in [illegible] Hen II, the trial by ordeal became more important than before It appears that, in presentment by the inquest (whence originated the grand jury), the culprit was immediately adjudged without option, to clear himself by ordeal, that, if he escaped this test, he was still condemned to abjure the country, so that the presentment became in some sort equivalent to a final trial The *second* inquest or jury trial, at this period is thought to have been only awarded as a matter of special favour But when ordeal had been forbidden by the 18th canon of the fourth Lateran council, in 1215 as before mentioned it was immediately disused in England, and hence after a considerable interval, during which the practice of criminal law seems to have remained in a very uncertain state, the practice of trial by the second inquest, or petty jury, from being the exception gradually became the general rule (See as to the early ordeals *Mem de l'Ac des Inscr* vol xv)

ORDINAR (*Lat ordo*) In the Fine Arts, the regular disposition of the parts of a work so that neither confusion nor jarring effects may prevail

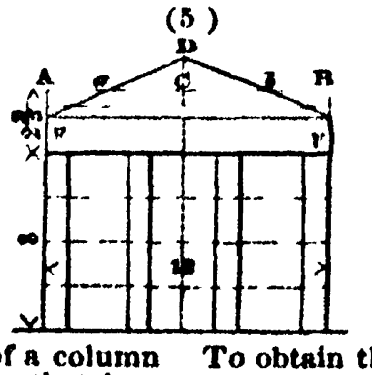
ORDER In Architecture, a system or assemblage of parts subject to certain uniform established proportions, regulated by the office each part has to perform An order may be said to be the genus whereof the species are Tuscan, Doric, Ionic, Corinthian [illegible] and consists of two essential parts — a column A (see fig 1), and an entablature B These are subdivided the first into three parts namely the base C the shaft D and the capital E, the second also into three parts — namely, the architrave or chief beam F, which stands immediately on the column the frieze G, which lies on the architrave, and the cornice H, which is the crowning or uppermost member of an order In the subdivisions certain horizontal members are used which, from the curved forms of their edges, are called mouldings These are the ovolo, the talon the cyma the cavetto the torus, the astragal the scotia, and the fillet, which are defined under their several names in this work The character of an order is displayed, not only in its column, but in its general forms and detail whereof the column is, as it were the regulator, the expression being of strength, grace, elegance lightness, or richness Though a building be without columns, it is, nevertheless, said to be of an order, if its details be regulated according to the method prescribed for such order



(1)

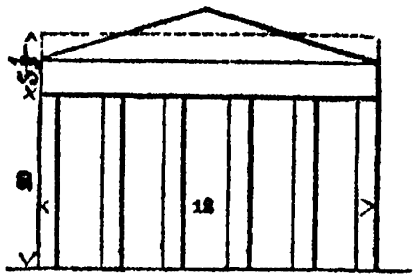
In setting up, or, as it is more technically expressed, in profiling an order, it is usual to make the entablature of the height of one fifth of the entire order The height of the column is measured in terms of its lower diameter which is divided into sixty parts called minutes, used as a scale for the different subdivisions In the Doric order the semidiameter of the column is called a module it is however, divided into thirty parts, so that there is, in fact, no essential difference between the scale of this and the other orders The columns vary from seven to ten diameters in height in the different orders The height of the entablature is usually divided into ten parts, whereof three are assigned to the architrave three to the frieze, and four to the cornice, except in the Doric order, in which the height is divided into eight parts, whereof the architrave has only two, the frieze and cornice each three

The rule above given for regulating the relative heights of the column and entablature is founded upon the practice of the ancients, who rarely exceeded or fell short of the proportion it establishes Whether this practice of assigning one fifth of the height of the whole order to its entablature was arbitrary or empirical is worth inquiry which, we are inclined to think, has not been bestowed upon it in any architectural work at least not in any one which has fallen under our notice though the principles developed in a work by Le Brun, entitled, *Theorie de l'Architecture Grecque et Romaine, deduites de l'Analyse des Monumens Antiques* (fol Paris, 1807), if carried through correctly, seems to point to the reason of the practice. One of the most obvious principles of proportion in respect of loads and supports, and one apparently founded on Nature herself, is, that a support should not be loaded with a greater mass than itself; or, in other words, that there should be an equality between the weights and supports; that is, in this case, between the entablature and column In respect of the voids left between the columns or supports below the entablature, there seems to have been a great diversity of practice; for we find them varying from 1·03 to 2·18, unity being the measure of the supports Le Brun makes the areas of the supports, weights, and voids equal to one another; and in the monumental specimens of the Doric order, such as the Parthenon, &c., he seems borne out in the law he endeavours to establish, but in lighter specimens, such as the temple of Bacchus, at Teos, where the supports are to the voids as 1 to 2·05, and in the temple of Minerva Polias, where the ratio is 1 2·18, he can hardly be considered correct Indeed, there scarcely seems a necessity for such a limitation of the voids as he prescribes, seeing that without relation separately to the weight and support, stability would be obtained so long as the centre of gravity of the load fell within the external face of the support If, then, it be admitted that, as in the two examples above mentioned, the voids should be equal to the weights and supports jointly, we have the key to the rule, and, instead of being surprised at the apparently strange law of making the entablature one fourth of the height of the column we shall find that none but the result assumed can flow from the investigation



(2) (3) (4.)

Let fig 2 let AB be the height of the column and let the entablature the column be one third of the height of the column (D) Now if AB be subdivided into four equal parts at *a b* and *c* and the horizontal lines *a d b e c f* be drawn, also if C D be divided horizontally into four equal parts and lines be drawn perpendicularly upwards intersecting the former ones, the void will be divided into 16 equal parallelograms one half whereof are to be the measure of the two [illegible]ts B C and D I being made equal then [illegible] C D it will be manifest, from inspection that the two semi-supports will jointly be equal to 8 of the parallelograms above mentioned or one half of the void We have now to place the weight or entablature, A G H I, upon the supports or columns and equal to them in mass Set up from A to I another row of parallelograms each equal to those above mentioned, A I K I These will not be equal to the supports by two whole parallelograms, being in number 6 only instead of 8 dividing, therefore, 8, the number in the support by 6, the number already obtained, we have 1·333 &c, which is the height A G must be that the weights may equal the supports, exceeding one quarter the height of the column by only $\frac{33}{100}$ of such quarter, a coincidence singularly corroborative of the rule laid down From inspection of figures 2, 3, and 4, it is evident that, when the void is $\frac{1}{4}$d of the height of the columns in width the columns will be 6 diameters in height, when $\frac{1}{4}$th of their height, they will be 8 diameters high, and when $\frac{1}{5}$th of their height, they will be 10 diameters high, also that the intercolumniation called sys-



[illegible] is the general form of a tetrastyle temple, wherein the columns are assumed at pleasure eight diameters high then, 4 × 8 = 32, the area of the supports, and as, to fulfil the conditions, the three voids are to equal twice that area, or 64, they must in all be equal to 8 diameters, for $\frac{64}{8}$ = 8, and the whole extent, therefore will be 12 diameters of a column To obtain the height of the entablature, so that its mass may equal that of the supports, as the measures are in diameters, we have only to divide 32, the columns, by 12, the whole extent of the façade, and we have two diameters and two thirds of a diameter for the height of the entablature, making it a little more than one quarter the height of the column, and again agreeing in terms of the diameter with many of the finest examples of antiquity, or very nearly so If the pediment

(5)

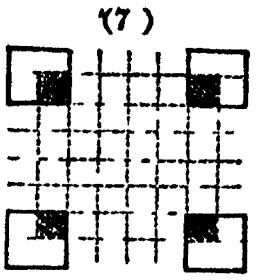
be employed it is evident the dotted lines A C, C B being bisected in *a* and *b* respectively, that the triangles A E *a*, *b* B F, are equal to *a* D C and D C *b*, and the loading or weight will [illegible] Similar results are obtained in fig 6, [illegible] is 10 diameters, the number of columns 6; the whole, therefore, 180, the supports being 60 Here $\frac{60}{18} = 3\frac{1}{3}$ diameters will be the height of the entablature

(6.)

We cannot leave the subject without adverting to the rules given by Vitruvius (chap ii book iii) — rules which were not his own only, but the result of the practice of the time in which he lived, and which, within small fractions, are most singularly corroborative of the assumed hypothesis of making the voids equal to the supports Speaking of the [illegible] ing the eustylos as the most beautiful, he thus directs the formation of temples with that interval between the columns The rule for designing them is as follows — "The extent of the front being given, it is, if tetrastylos, to be divided into eleven parts and a half, not including the projections of the base and plinth at each end, if hexastylos, into eighteen parts if octastylos, into twenty-four parts and a half One of either of these parts, according to the case, whether tetrastylos, hexastylos, or octastylos, [illegible] of one of the colur [illegible] be eight parts and a [illegible] and the heights of the columns will have proper proportions" Further on in the same chapter he gives directions on araeostyle, diastyle, and systyle temples, on which it is unnecessary here further to enlarge Let the above rules be examined The tetrastylos is $11\frac{1}{2}$ parts wide and $8\frac{1}{3}$ high the area, therefore of its whole front will be $11\frac{1}{2} \times 8\frac{1}{3} = 97\frac{2}{3}$ The four columns will be $4 \times 8\frac{1}{3} = 34$ or a very little more than one third of the whole area, the remaining two thirds, speaking in round numbers being given to the intercolumns or voids The hexastylos is eighteen [illegible] a half high the whole area, therefore, is $18 \times 8\frac{1}{3} = 150$ The six columns will be $6 \times 8\frac{1}{3} = 51$, or exactly one third of the whole area, the voids or intercolumns occupying the remaining two thirds The octastylos is $24\frac{1}{2}$ parts in extent and $8\frac{1}{3}$ in height $24\frac{1}{2} \times 8\frac{1}{3} = 208\frac{1}{3}$ The eight columns will be $8 \times 8\frac{1}{3} = 68$, or very little less than one third of the area, and the voids or intercolumns about double, being the remaining two thirds

The average of the intercolumniations in the first case will be $\frac{11\frac{1}{2} - 4}{3} = 2\frac{1}{2}$ diameters

In the second case $\frac{18 - 6}{5} = 2\frac{2}{5}$



In the third case $\frac{24\frac{1}{2} - 8}{7} = 2\frac{357}{1000}$

As, in our opinion a discrepance between practice and theory will not shake the principle, we are not fearful of candidly submitting a synoptical view of some of the most celebrated examples of antiquity in which a comparison is exhibited between the voids and supports certain it is that in every case the former exceed the latter and that, in the early Dorics, the ratio between them nearly approached equality In comparing, however, the supports with the weights, there is every appearance of that portion of the [illegible] taking a mean of [illegible] supports are to the weights as 1 1 16, in the five of the Ionic order, as 1 1 05, and in the four of the Corinthian order, as 1 1 04, a coincidence so remarkable that it must be attributed to something more than accident and deserving much more extended consideration than our limits here admit

	Order	No of Columns	Supports.	Weights	Voids.
Temple of Jupiter Nemæus	Doric	6	1 00	0 79	1 03
Parthenon	—	8	1·00	1 07	1 04
[illegible] at Rome	—	6	1 00	1 14	1 16
[illegible] Minerva [illegible]	—	6	1 00	1 40	1 17
[illegible]	—	6	1 00	1 13	1 21
[illegible]	—	6	1 00	1 45	1 36
Temple of [illegible]	Ionic	6	1 00	0 89	1 24
[illegible]	—	4	1 00	1 15	1 71
[illegible]	—	4	1 00	0·96	1 72
of Bacchus at Teos	—	8	1 00	1 35	2 05
of Minerva Polias	—	4	1 00	1·01	2 18
Portico of Septimius Severus	Corinth	6	1 00	0 93	1 37
Maison Carrée	—	6	1 00	0 93	1 58
Temple at Jackly	—	6	1·00	0·90	1·62
Pantheon	—	8	1 00	1 43	1 84

We close this short inquiry by adverting to a curious fact connected with it; viz the area of the points of support for the edifice which such an arrangement affords In fig 7 the hatched squares represent the quarter piers or columns in a series of intercolumniations every way, such intercolumniations being 2 diameters, or 4 semidiameters these, added to the 2 quarter piers, will make 6, whose square, 36, therefore, is the area to be covered with the weight, the 4 quarter piers or columns = 4, hence the points of support are $\frac{4}{36}$ of the area = 0 111

(7)

Now, in twenty-five of the principal buildings in Europe (*see* POINTS OF S [illegible]) will be seen to be 0·168 on the mean, [illegible] from the result here given, but if we take the subjoined buildings, the mean will be found to differ much less, viz —

Temple of Peace	0 127

ORDER OF SUPERPOSITION A Geological term, implying the regular succession of arrangements which [illegible] forming the exterior crust of our globe invariably [illegible] (Geology) Although certain strata or [illegible] are occasionally wanting they never depart from the [illegible] der of superposition

ORDER OF THE DAY In Parliamentary usage, one method of superseding a question already proposed to the House is by moving "for the order of the day to be read" [illegible] to precedence, must be for the order generally, and not for any particular order, and if this is carried, the orders must be read and proceeded on in the course in which they stand But it can be in its turn superseded by a motion "to adjourn" See *Hatsell's Prec Parl* vol ii, who says that the first instance he has met with of this proceeding was on the 1st of April, 1747

ORDERS HOLY A term, properly speaking, applied to the different ranks of [illegible] but, in ordinary language used to indicate the *character* of such persons The Roman Catholic church admits of seven orders four minor, secular, or petty, of doorkeeper, exorcist, reader, and acolyth, three major, of deacon, priest, and bishop The first are mere formalities, and generally conferred on the same day, the admission to the latter constitutes the sixth sacrament of Romanism [illegible] four minor, but has the additional one of sub-deacon See ORDINATION

ORDERS, RELIGIOUS, are of three kinds, 1 Monastic 2 Military 3 Mendicant

1 The Monastic orders were distinguished by the rules to which they were subjected by their respective founders Of these the principal are the Basilian, the Benedictine, and the Augustinian

i The earliest comprehension of a number of conventual societies under one rule was effected by St Basil, archbishop of Cæsarea, in Asia Minor, who united the hermits and cenobites already established in his diocese, and prescribed an uniform constitution for them, in which he strongly recommended the obligation of a vow upon admission This recommendation was a novelty in the monastic system, which [illegible] up to that time (A D 370) without an [illegible] This institution prevailed throughout the eastern districts of Christendom and has subsisted in the Greek church up to the present time with little variation

ii In the West the first order of monks was founded by Benedict of Nursia (A D 529) He conceived that the ends of monastic seclusion might be better attained by a milder discipline, uniformly imposed, than by the fanatical and arbitrary austerities of many of the European communities While other reformers of the monkish system have aimed at repairing its laxity and degeneracy by the infusion of [illegible] severity, he alone seems to have [illegible] have provided [illegible] by the imposi [illegible] He insisted [illegible] useful manual labour [illegible] as was the custom with oth [illegible] for the employment of the day This rule was revised three centuries later by another Benedict, a native of Ariane, in the south of France

From this remodelled system which was more severe than its predecessor and was soon [illegible] the Benedictine monasteries already [illegible] rous, arose various branches, all more or less famous in ecclesiastical history The order of Cluni the Cistercians, the Chartreux the Camaldulenses, Præmonstratenses, &c are distinct off-shoots from this main trunk,

and for many centuries have covered the face of Catholic Europe

iii The original inhabitants of the monasteries were laymen, the spiritual duties of the institution being performed by the pastor of a neighbouring village, or by one or two resident ecclesiastics St Augustin set the example of a clerical society, by living, in common with his inferior clergy, under certain instructions which he drew up for their direction His authority was widely followed in later times, and the order of Augustinian canons, consisting expressly of persons ordained or destined to the sacred profession, claims a place among the three principal monastic institutions These canons were afterwards divided into the regular and secular, according as they observed what traditionally [illegible] ascribed by the founder himself, [illegible] who, in later times, had reorganized the system

2 i The Military orders form also an important feature in ecclesiastical and political history The necessity which the monks were under, in unsettled times, of assuming arms themselves to defend the possessions which they had accumulated may have suggested the first idea of uniting the military with the religious profession

The earliest order, however, of this kind — that of St John of Jerusalem or the Knights of Hospitallers — arose in the 11th century, out of religious communities whose care of an hospital in Jerusalem had been consigned The Hospitallers were afterwards better known under the titles of Knights of Rhodes and, still later, of Malta

ii The Knights Templars also received their appellation from Jerusalem, the place of their origin and early abode They were founded in 1118, and to them certain military duties were from the first specially prescribed, as the defence of Palestine and the protection of pilgrims in the Holy Land After the expulsion of the Christian arms from that region they spread over Europe and became a very numerous and powerful body, until having excited the fears or avarice of popes and princes, they were condemned by a council assembled at Vienna, and exterminated by a [illegible]

iii The third Military [illegible] This institution, again was an offspring of the crusades and a native of Palestine, originating in the officer of an hospital at the siege of Acre On the termination of the holy wars, these knights became established in Germany and distinguished themselves by the conquest and conversion of Prussia and Pomerania Their order only ceased to exist when, at the Reformation its members abandoned the cause of the papacy and embraced the prevalent opinions of the north of Germany To these may be added various inferior military orders especially those of Spain and Portugal *See* CALATRAVA and ALCANTARA ORDERS OF

3 i The Mendicant orders were the creation of the papacy, for the advancement of its own political purposes It was in the 12th century that the apprehensions of the holy see were first excited by the rise and spread of heretical opinions, nor, at that period were either the secular or the regular clergy disposed to rouse themselves from their indolence and vice to combat with these active assailants The counteracting force also which the monks had supplied, in earlier ages to the independent spirit of the secular priesthood, had lost much of its efficacy, and in some measure been turned against the central authority of Rome A new ally was required, and was furnished in the order of St Dominic, which after [illegible] the extinction of the heresy of the Albigenses was placed upon a permanent footing by [illegible]

ii The [illegible] contemporary institution, and avowed the same principle of poverty and mendicity Our limits allow us merely to mention — iii The Carmelites (who derived their name from Mount Carmel, in Syria, where the order originated), iv The Augustinians, who complete the number of the Mendicant orders, and, v The Jesuits *See* JESUITS

ORDINAL, or ORDER The name given in England to an old work containing the ritual or religious ceremonies necessary to be performed before the ordination of a priest It was composed in the reign of Edward VI and revised by the English clergy in 1552

ORDINANCE An obsolete word signifying decree or enactment After the time of Philip le Bel (1327), the laws made by French kings were generally termed ordinances (ordonnance), a term which in its most comprehensive sense included also their edicts, declarations, and letters patent The right to issue ordinances for the execution of the laws (equivalent to proclamations and orders in council) is conferred on the monarch by the French charters, and it was on an ambiguity of language in the clause conferring this right in that of 1814, that a defence was [illegible] for the illegal proceedings of the ministers [illegible] in 1830 The best collection of the *Ordonnances des Rois de France* is that begun by order of Louis XIV, of which the first volume appeared in 1723 it extends to 12 vols folio

The Self denying Ordinance, in English History was a resolution of the Long Parliament in 1644, by which its members bound themselves not to take certain executive offices particularly commands in the army, the effect of which, as is well known, was the transference of power, first in the the army and then in the state, from the Presbyterian to the [illegible] party

ORDINANDUS In Ecclesiastical Antiquities, one about to receive orders — *Ordinant* a [illegible]

[illegible] n of the Civil Law for any judge who has authority to take cognizance of causes in his own right, and not by delegation, used, in English law, with reference to ecclesiastical judges only Thus, a bishop is ordinary in his own diocese, an archbishop, for the purpose of appeals, in his province

ORDINARY In the Court of Session in Scotland, a single judge (by courtesy styled lord), who decides with or without a jury, as the case may be There are five such judges their decisions may be brought by appeal under review of the divisions of the court to which they respectively belong *See* SESSION, COURT OF

ORDINARY In the Navy, the establishment of the shipping not in actual service

ORDINARY, in Heraldry, is a portion of the escutcheon comprised between straight or other lines It is the simplest species of charge, and many of the most ancient escutcheons known contain no other bearing, although [illegible] also of great antiquity the ordinary [illegible] charge [illegible] An ordinary should, it is said comprise the [illegible] shield The number of ordinaries in common use is considerable, among the chief are the pale, fess bend, bar saltier, chevron, cross (which see) Each of these is usually bounded by straight lines, but the lines may be also diversified in various manners Thus an ordinary bounded by serrated lines is said to be *indented*, bounded by undulating lines, *wavy*, and there are many other deviations from the straight line as *ingrailed invected, nebuly, raguly rayonny dancetty embattled* or *crenelly, battled embattled, [illegible]* Varied in two styles, if [illegible] only on the upper it is said to be *superingrailed superinvected*, &c, if only on the [illegible]

ORDINARY, of Newgate [illegible] in this prison is so called whose duties consist in preaching and reading prayers to the prisoners preparing condemned criminals to meet their fate, and in accompanying such to the place of execution

ORDINATE (Lat ordino *I arrange*) In Geometry, a straight line drawn from any point in a curve perpendicularly to another straight line, which is called the abscis (See ABSCISS) The abscis and ordinate together are called the *co ordinates* of the point The situation of a point in a plane is determined when its distances from two straight lines in the same plane are known, and, when a series of points are so situated in respect of each other that the co ordinates of each have the same mathematical relation these points form a curve, the nature of which is expressed by the relation of the co ordinates See CO-ORDINATES

ORDINATION The ceremony of conferring orders in the church which is derived by all communities that admit a regular commission and succession in the ministry from the time of the apostles, from the authority of Jesus Christ, of whom it is said, in St John's Gospel (xx 21), that, after his resurrection, he said, "As my father has sent me, even so send I you" and then he breathed upon them, and said to them "Receive ye the Holy Ghost whose soever sins ye remit they are remitted unto them and whatsoever sins ye retain they are retained" Prayer and the imposition of hands are also mentioned as forming part of the ceremony of ordination of deacons in the Acts, and ordination is even now conferred under similar forms in most Christian churches

The Romish church holds ordination to be the sixth of its seven sacraments, as being an institution of Christ conferring a special grace [illegible] show that it differs from a sacrament, [illegible] received definition of such, as containing no matter, like the water in baptism, or [illegible] They deny that the vessels [illegible] delivered to the newly ordained person [illegible] the Romish rite can be taken as the matter of a sacrament, not being recommended by any Scripture authority, nor indeed known in the church till the tenth or eleventh century (See *Hooker's Eccl Pol* books vii and viii)

In the Presbyterian church the term *ordination* has a meaning wholly distinct from that in which it is received by other Christian churches, being applied exclusively to that solemn act by which a *licensed* preacher or probationer is inducted into the charge of a particular parish or congregation, and not, as is sometimes erroneously asserted, to the act by which he is entitled to preach the Gospel, or, in other words, to the ceremony [illegible] which [illegible] conferred in the English church In the Episcopal church a clergyman can be *ordained* but [illegible] the Scotch church he is said to be *ordained* as

often as he leaves one parish to be inducted into the [illegible]

ORDNANCE A Military term, applied generally to all sorts of great guns used in war, as cannons, mortars, howitzers carronades &c See the respective terms

ORDNANCE BOARD OF The name given to the board which provides the troops of the line, the regiments of artillery and engineers, the militia, volunteers, and the navy, with guns, ammunition, and arms of every description The Board of Ordnance also superintends the affairs of the regiments of artillery and engineers, the provision of forage for the whole of the troops at home, and the erection of fortifications and military works at home and abroad, &c At the head of this board is placed an officer, called the Master-general of the ordnance, who has the military command of the artillery, and of the corps of bombardiers sappers and miners Besides the Master-general there are officers connected with the ordnance at the Horse guards general, the Clerk of the ordnance, and the Storekeeper of the ordnance, which are self-explanatory terms

ORDONNANCE (Fr) In Architecture the right assignment, for convenience and propriety, of the measure of the several apartments, that they be neither too large nor too small for the purposes of the building, and that they be conveniently distributed and lighted

OREADS (Gr ὄρος, *mountain*) In Greek Mythology, nymphs of the mountains, companions of Diana, and usually invoked along with that goddess

ORES (German erze) The mineral bodies from which metals are extracted Metals exist in the ores in one or the other of the four following states —1 In a metallic state, and either solitary or combined with each other, in the latter case forming alloys 2 Combined with sulphur forming sulphurets 3 Combined with oxygen forming oxides 4 Combined with acids forming carbonates, phosphates, &c , which generally go by the name of metallic salts

Certain ores which contain the metals most indispensable to human necessities have been treasured up by the Creator in very bountiful deposits [illegible] in great masses in rocks of different kinds in lodes, veins nests, concretions or beds with stony and earthy admixtures, the whole of which become the objects of mineral exploration These precious stores occur in different stages of the geological formations, but their main portion after having existed abundantly in the several orders of the primary strata, suddenly cease to be found towards the middle of the secondary Iron ores are the only ones which continue among the more modern deposits even so high as the beds immediately beneath the chalk, when they also disappear or exist merely as colouring matters of the tertiary earthy beds

The strata of gneiss and mica-slate constitute in Europe the grand metallic domain There is hardly any kind of ore which does not occur there in sufficient abundance to become the object of mining operations and many are found no where else The transition rocks and the lower part of the secondary ones, are not so rich neither do they contain the same variety of ores But this order of things, which is presented by Great Britain Germany, France, Sweden, and Norway is far from forming a general law, since in equinoxial America the gneiss is but little metalliferous, while the superior strata, such as the clay schists, the siemitic porphyries the limestones, which complete the transition series, as also several secondary deposits, include the greater portion of the immense mineral wealth of that region of the globe

All the substances of which the ordinary metals form the basis, are not equally abundant in nature, a great proportion of the numerous mineral species which figure in our classifications are mere varieties scattered up and down in the cavities of the great masses or lodes The workable ores are few in number being mostly sulphurets, some oxides, and carbonates These occasionally form of themselves very large masses, but more frequently they are blended with lumps of quartz felspar, and carbonate of lime which form the main body of the deposit, as happens always in proper lodes The ores in that case are arranged in layers parallel to the strata of the formation, or in veins which traverse the rock in all directions, or in nests or concretions stationed irregularly, or finally disseminated in hardly visible particles These deposits sometimes contain apparently only one species of ore, sometimes several which must be mined together, as they seem to be of contemporaneous formation, whilst, in other cases they are separable, having been probably formed at different epochs Under the particular metals will be found an account of the localities of ores, &c ; but the following general observations may prove useful in presenting a condensed resume of the whole subject

1 *Tin* exists principally in primitive rocks, appearing either in interlaced masses in beds, or as a constituent part of the rock itself, and more rarely in distinct veins Tin ore is found indeed sometimes in alluvial land, filling up low situations between lofty mountains,

2. *Gold* occurs either in beds or in veins, frequently in primitive rocks; though it is also found in other formations, and particularly in alluvial earth When this metal exists in the bosom of primitive rocks, it is particularly in schists It is not found in serpentine but it is met with in greywacke in Transylvania The gold of alluvial districts called gold of washing or transport, occurs, as well as alluvial tin, among the debris of the [illegible]

[illegible], particularly in veins and beds, in primitive and transition formations, though some veins of this metal occur in secondary strata The rocks richest in it are gneiss, mica-slate, clay-slate greywacke and old alpine limestone Localities of silver-ore itself are not numerous, at least in Europe, among secondary formations, but it occurs in combination with the ores of copper or of lead

4 *Copper* exists in the three mineral epochas —1 In primitive rocks principally in the state of pyritous copper in beds in masses, or in veins, 2 In transition districts, sometimes in masses, sometimes in veins of copper pyrites, 3 In secondary strata, especially in beds of cupreous schist

5 *Lead* occurs also in each of the three mineral epochas abounding particularly in primitive and transition grounds, where it usually constitutes veins, and occasionally beds of sulphuretted lead (galena) The same ore is found in strata or in veins among secondary rocks associated now and then with oxide of iron-oxide and calamine (carbonate of zinc), and it is sometimes disseminated in grains through more recent strata

6 *Iron* is met with in four different mineral eras, but in different ores Among primitive rocks magnetic iron ore and specular [illegible] of enormous size [illegible] (hæmatite) are found generally in veins, or occasionally in masses with sparry iron both in primitive and transition rocks, as also sometimes in secondary strata, but more frequently in the coal measure strata, as beds of clay-ironstone, of globular iron oxide, and carbonate of iron In alluvial districts, we find ores of clay ironstone, granular iron-ore bog- [illegible] The iron ores which be[illegible] almost always the metallic aspect, with a richness [illegible] even to 80 per cent of iron, while the ores in [illegible] formations become in general more and more earthy, down to those in alluvial soils, some of which present the appearance of a common stone, and afford not more than 20 per cent of metal, though its quality is often excellent

7 *Mercury* as a sulphuret occurs principally among secondary strata in disseminated masses, along with combustible substances, though the metal is met with occasionally in primitive countries

8 *Cobalt* belongs to the three mineral epochas, its most abundant deposits are veins in primitive rocks, small veins containing this metal are found, however, in secondary strata

9 *Antimony* occurs in veins or beds among primitive and transition rocks

10, 11 *Bismuth* and *nickel* do not appear to constitute the predominating substance of any mineral deposits, but they often accompany cobalt

12 *Zinc* occurs in the three several formations namely, as sulphuret, or blende particularly in primitive and transition rocks as calamine in secondary strata, usually along with oxide of iron, and sometimes with sulphuret of lead

In the analysis of ores, it is impossible to lay down any general rule, so numerous are the ores themselves, and so diversified the means necessary to be adopted in the various analytic processes Under each particular metal will be found an account of its most important ores, and we shall here restrict ourselves to a few general remarks on the theory of smelting ores

It is probable that the coaly matter employed in that process is not the *immediate* agent of their reduction, but the charcoal seems first of all to be transformed by the atmospherical oxygen into the oxide of carbon, which gaseous principle then surrounds and penetrates the interior substance of the oxides with the effect of decomposing them, and carrying off their oxygen That this is the true mode of action is evident from the well-known facts that bars of iron, strained with pounded charcoal, in the steel-cementation chest most readily absorb the carbonaceous principle to their innermost centre, while their surfaces get blistered by the expansion of carburetted gases formed within, and that an intermixture of ores and charcoal is not always necessary to reduction, but merely an interstratification of the two, without intimate contact of the particles In this case, the carbonic acid which is generated at the lower surfaces of contact of the strata, rising up through the first bed of ignited charcoal, becomes converted into carbonic oxide, and this gaseous matter passing up through the next layer of ore, seizes its oxygen, reduces it to metal, and is itself thereby transformed once more into carbonic acid; and

so on in continual alternation It may be laid down, however, as a general rule, that the reduction is the more rapid and complete the more intimate the mixture of the charcoal and the metallic oxide has been, because the formation of both the carbonic acid and carbonic oxide becomes thereby more easy and direct Indeed the cementation of iron bars into steel will not succeed, unless the charcoal be so porous as to contain, interspersed, enough of air to favour the commencement of its conversion into the gaseous oxide, thus acting like a ferment in brewing Hence, also, finely pulverized charcoal does not answer well, unless a quantity of ground iron cinder or oxide of manganese be blended with it, to afford enough of oxygen to begin the generation of carbonic oxide gas whereby the [illegible] [illegible] [illegible]

pedal trumpets 16 feet to 8 feet C The 32 feet pipe with the remainder of the 2 octaves of double pedal pipes are in front The choir organ from C C C 16 feet [illegible] is all at 8 feet pitch, and stopped diapasons, principal, harmonic flute, fifteenths, [illegible] open diapason, wood, and [illegible] the swell descends to C and has one octave, and stopped diapason, principal, [illegible] harmonica, horn, trumpet hautboy and clarion

The ophicleide or tuba mirabilis, on the swell manual from C C to F has the same compass as the swell but separate from it, forms its prominent feature, having power equal to the whole of the great organ, with a full, fine, and smooth tone

The first clavier is the choir, the second the great organ [illegible] affecting either, or, in other words, the performer may [illegible] in the usual [illegible] at [illegible] clavier To [illegible] mechanical movements requires more draw stops than real stops of pipes, although the same object is gained by the fourth clavier as by a fourth separate organ The collected lengths of the trackers, or wood rods, which communicate from the keys to the sound boards, would extend four miles and a half The 32 feet C is 1 foot 8½ inches in diameter the same note, in wood, 3 feet by 2 feet 6 inches, and would hold 12 pipes and 13 gallons of wine There are two octaves and a half of bells The pedal pipes are played with the fingers, as easily as the great organ, by a newly invented valve* which resists the pressure of wind There are at present 63 draw stops in this organ, including the tuba mirabilis recently inserted and including coupler stops The choir and swell have 2 draw stops to each row of pipes, as the fourth clavier may require

In the late Industrial Exhibition of all Nations an organ by Mr Willis deserved and attracted much notice It was in point of tone very successful, and was exceedingly well voiced This instrument is built upon the German plan, and contained nearly 4500 pipes Its principal novelty was a contrivance for acting on the draw-stops intended to supersede the use of composition pedals One of its great merits was the great quietness of its action The reader will find in the SUPPLEMENT a detailed plan of this instrument.

ORGAN POINT In Music, a succession of chords, in some of which the harmony of the fifth is taken unprepared on the bass as a holding note, whether preceded by the tonic or by the harmony of the fourth of the key

ORGA'NICAL DESCRIPTION OF CURVES In Geometry, signifies the description of curves on a plane by means of instruments, as the circle is described by a pair of compasses the ellipse by means of a thread passing round two pins in the foci, the epicycloids by the revolution of circles on the circumferences of other circles, the conchoid by means of the *trammel* the cissoid by the motion [illegible] &c See *Schooten's Exercitationes Mathematicæ*, *Newton's Arith Universalis*, *Maclaurin's Geometria Organica* &c

ORGA'NIC DISEASE A disease in which the structure of an organ is morbidly altered, opposed to *functional* disease, in which the secretions or functions only are deranged, without any apparent change of organization Tuberculated induration of the liver is an [illegible] that viscus the secretion [illegible] a *functional* derangement of it

ORGA'NIC LAWS In Modern Political Phraseology, the name given to laws directly concerning the fundamental parts of the constitution of a state According to the distinction taken by some French writers fundamental laws are merely declaratory continuing the principles or theory of government Organic laws are those which apply those principles to the actual condition of society by positive enactment, and add the sanction of punishment

ORGA'NIC REMAINS The organized bodies, whether of animals or vegetables found in a fossil state, are so called See GEOLOGY

ORGANISTS The old name given in the Roman Catholic Church to those priests who organized or sang in parts The name *organists of the hallelujah* was applied in the Church of [illegible] certain priests who assisted in the performance of the mass They were generally four in number, and derived their name from singing in parts, or organizing the melody appropriated to the word hallelujah

ORGANIZA'TION (Lat) The processes by which an organized body is formed also the totality of the parts which constitute, and of the laws which regulate, [illegible]

ORGANOGRAPHY (Gr οργανον, *a tool* or *instrument*, and γραφω, *I describe*) A term usually applied to an account of the structure of plants It comprises all

* For this valve Mr Hall had the silver medal awarded to him by the Society for Promoting Arts and Commerce, May 31st, 1841

[illegible] tions are performed, and teaches the relation which one part bears to another, with the dependence of the whole upon the common system *See* BOTANY

O'RGANON (Gr οργανον) In Philosophical language, nearly synonymous with *method* and implying a body of rules and canons for the direction of the scientific faculty, either generally or in reference to some particular department For an account of the *Organon* of Aristotle and that of Bacon, see articles ARISTOTELIAN and BACONIAN [illegible]

O'RGIES [illegible] the mysteries of Bacchus, [illegible] of the Greeks and Thracians Writers from the word οργη, *anger*, from the fury and excitement of the Bacchanals, or from the wrath of Ceres against Jupiter (*Clem Alex*) But these fanciful etymologies after the manner of the Greeks seem to show that the word was really of foreign origin, and adopted by them together with the thing itself The author of the article "Mysteries" in the *Encyc Brit* would derive it from Hebr argoz, *a chest*, from the casket containing the secret symbols of the god According to his view, the orgies were the mysteries of Osiris, the Egyptian Bacchus, and from Egypt transplanted to Greece, where they became mingled with the gross corruptions peculiar to the worship of the Bacchus of Thebes Others imagine the origin to have been in Thrace The frantic solemnities of these rites are most poetically described in the *Bacchæ of Euripides* The mysteries which they enveloped are extremely obscure

ORGUES In Fortification, long and thick pieces of wood shod with iron, and suspended each by a separate rope over a gate so as to be ready to be let fall and stop it up upon the approach of an enemy The term also denotes a machine composed of arquebuses, or musket barrels linked together so that they may be discharged all at once, and used to defend breaches

ORGYIA (Gr οργη, *I stretch out*, and γυιον, *a limb*) A name applied by Ochsenheimer to a genus of Lepidopterans

ORICHA'LCUM (Gr ορος, *a mountain*, and χαλκος, *brass*) Literally mountain brass This was the name given to a peculiar kind of mixed metal in general use among the ancient Greeks and Romans It is proved to have been made on much the same basis as brass, but various opinions have been entertained respecting the precise nature of the ingredients employed in its composition and no definite conclusion has been arrived at on the subject

O'RIEL (Ityn uncertain) In Gothic Architecture, a bay window According to some passages in early writers it seems also to signify a recess, but the former is the signification now usually attached to it

O'RIENT (Lat orior *I rise*) The east, or eastern part of the horizon In surveying, *to orient* a plan signifies to mark its situation or bearing with respect to the four cardinal points

O'RIFLAMME The ancient royal standard of France It was the banner of the abbey of St Denis which was presented by the abbot to the lord protector of the convent whenever engaged in the field on its behalf This protectorship was attached to the countship of Vexin, and when that county was added to the possessions of the crown by Philip I this banner, which he bore in consequence, became in time the great standard of the monarchy By some it is said to have been lost at Agincourt, but, if so, it was restored Its last display in the field was in the reign of Charles VII Its derivation is uncertain: according to some, 'quasi aurea flamma" According to Count de Gebelin the last syllable is the same with "flamm" (Germ fahne) Felibien says it was still to be seen, in 1535 in an abbey, almost devoured by moths. (See *Mem de l'Ac des Inscr* vol xiii)

ORI'GANUM OIL OF The distilled or volatile oil of the wild marjoram It is imported from the south of Europe, and used in liniments and embrocations as a stimulant

ORI'GENISTS An early Christian sect who pretended to draw their opinions from the writings of the celebrated Origen They maintained that Christ was the Son of God only by adoption and denied eternity of punishments They existed in considerable numbers in the fourth, fifth, and sixth centuries and their tenets spread among the monks of Egypt This sect of Christians must by no means be confounded with the Origenarians who sprang up at a somewhat later period than the former and whose tenets surpassed in abomination even those of the Gnostics (See *Mosheim* (transl), ed 1790 i 392)

ORI'GINAL (Lat originalis) In Law where the several parts of an indenture are interchangeably executed between the parties, that part which is executed by the [illegible] the others counterparts [illegible] But, when all

the parties execute every part, all are originals. The *original* of any deed or document is the best evidence; and a copy not admitted until reasonable proof has been given that the former is destroyed, lost, &c., or that it is in the possession of the adverse party, who has been duly warned to produce it (*See* EVIDENCE) The writ which a plaintiff sued out of chancery, in order to commence a suit, was formerly called an "original writ," the use of it is abolished, in personal actions, by 2 W 4 c 39 *See* PLEADING

ORIGINAL In the Fine Arts, a work not copied from another, but the work of the artist himself When an artist copies his own work, it is called a duplicate A certain freedom and ease are always discernible in an original, which in a copy are looked for in vain, though copies have sometimes been executed which it is almost impossible to detect, and which have deceived even excellent judges

ORIGINAL SIN Theology, to use the language of the English Church Homilies, or ninth article, "standeth not in the following of Adam but is the fault and corruption of the nature of every man that naturally is engendered of the offspring of Adam, whereby man is very far gone from original righteousness and is of his own nature inclined to evil," and it "deserveth God's wrath and damnation" By the "following of Adam" here meant the imitation of Adam's sin by those to whom this article is directed, having held that the words of Scripture, "in Adam have all sinned," related not to any inherent vice in the race of Adam, but to the propensity of mankind to imitate his transgression (August *De Nat et Gratia*) With this exception, the original depravity of man's nature and the consequent necessity of "a new birth unto righteousness" have been commonly held by all sects of Christians But a great and important difference has prevailed as to the character and cause of that depravity The belief of St Augustine is thus expressed by Bishop Burnet —"That a covenant was made with all mankind in Adam as their first parent, that he was a person constituted by God to represent them all and that the covenant was made by him so that if he had obeyed all his posterity would have been happy through his obedience, but by his disobedience they were all to be esteemed to have sinned in him his acts being imputed and transferred to them all" This doctrine of *imputed guilt* has been held by many of the stricter sects and varieties of Christians both in and out of the church of Rome, it is said by some to be the most consonant to the words of our article, as no doubt it is to the views of the framers of it, whose sentiments were deeply tinctured with Calvinism But it may be questioned whether those words are not as easily applicable to what is, I believe, the more common opinion among Protestants (I mean) —that original sin is not the sin of Adam imputed to his descendants but is that actual depravity of evil which philosophy, [illegible] existing in the human mind, and developed with its growth in each individual subject, the source of which or its permission by the Divine Author of Good is involved in the inevitable obscurity which surrounds the great question of the origin of evil

ORI'LLON In Fortification, a mass of earth lined with a wall, raised on the shoulder of a bastion for the purpose of covering the retired flank

ORION One of the finest [illegible] formed by Ptolemy It is situated in the southern hemisphere with respect to the ecliptic but the equinoctial passes nearly across its middle Orion is one of the most remarkable constellations in the heavens It contains seven stars, which are very conspicuous to the naked eye, four of them form a square and the three others are situated in the middle of it in a [illegible] Two of the four are stars of the first magnitude [illegible] It gel in the left foot and Betelgueze [illegible] The three stars in the middle of [illegible] second magnitude, and form what is called the *belt of Orion* They are [illegible] and the *Yard-wand* [illegible] the figure of a man [illegible] time Orion is of great antiquity, and occurs in the books of Job, Amos, and Isaiah Orion contains a remarkable nebula, and thousands of small stars which are only visible in powerful telescopes

ORION In Greek Mythology, the son of Hyrieus, according to Homer, a youth slain by Diana, on account of the love borne to him by Aurora, but according to others, a king and a mighty hunter Antiquity is full of contradictions respecting the origin, character, and fate of this mythological personage and [illegible] which it agrees respecting him is his [illegible] stars after his death Those who wish to see all the circumstances of his history [illegible] investigated should consult the dissertation of the late Prof Müller of Gottingen, *Über Orion*, which appeared in the *Rhein Mus Philol* ii 12

ORISMOLOGY (Gr ορισμος, *a term*, and λογος, *a discourse*.) That branch of natural history which relates to the explanation of the technical terms of the science It is also called Glossology and Terminology

O'RLO (Ital *a hem or edge*) In Architecture, the plinth to the base of a column or a pedestal

O'RLOP DECK The lowest deck or rather partial deck of a ship below the water, on which the cables are coiled, the sails &c stowed

ORMOLU (Fr) Bronze or copper gilt usually goes under the name The French are celebrated in this branch of manufacture

O'RNAMENT (Lat ornamentum) In the Fine Arts *See* DECORATION

ORNITHI'CHNITES (Gr ορνις, *a bird*, ιχνος, *a trace*) The footmarks of birds which occur in different strata Some of these are very remarkable, as proving the existence of birds at very remote periods, for instance, at the early epoch of the new red sandstone formation An account of these, as occurring in the red sandstone of Connecticut, is given by Professor Hitchcock in the *American Journal of Science and the Arts*

ORNITHOLITES (Gr ορνις, and λιθος, *a stone*) The name given to fossil birds

ORNITHO'LOGY (Gr ορνις, *a bird*, and λογος, *a description*) The science which teaches the natural history and arrangement of birds (*See* AVES for the general organical characters of the class, and the modifications of the feet by which the five orders of the Quinary arrangement are [illegible])

[illegible] this class of birds is by no means so clearly indicated by either external or anatomical characters as that of Mammals, and the systems of Ornithology present, in consequence, greater discrepancy than the Mammalogical ones It is not without interest to observe that if conditions of the procreative function be taken as guides to the primary division of the class, such division will present the binary character, as in the class of Mammals and of Reptiles, for example, birds may be divided into two great groups, in one of which the young are able to run about or swim and provide food for themselves the moment they quit the shell, while in the other the young are excluded feeble, naked, blind, and dependent on their parents for support The species comprised in the first of these groups have been termed *Aves præcoces*, those of the second *Aves altrices*

Professor Nitzsch divided the feathered tribes into three grand primary groups, corresponding with the three great divisions of the matter of our planet, as air, earth, and water which constitute respectively the principal theatres of their vital actions

This first order consists of the Raptorial and Passerine birds, the birds of flight *par excellence* which he accordingly terms 'Luft-vogeln," or *Aves aereæ* The second order embraces the birds of the earth, "Erd-vogeln" *Aves terrestres* represented by the ostrich and common fowl The third great division includes the birds which frequent the waters, *Aves aquaticæ* (Wasser-vogeln) typified by the heron and the gull

Sundewall's ornithological system has four primary groups or cohorts

In the Quinary arrangement of birds proposed by Mr Vigors there may be traced a similar principle to that which guided Nitzsch in his ternary classification Thus, the first order (*Raptores* Virg) includes the birds which soar in the upper regions of the air, which build their nests and rear their young on the highest rocks and loftiest trees The second order (*Insessores*) includes the birds which affect the lower regions of the air, and which are peculiarly arboreal in their habits, whence the name of Perchers [illegible] Nitzsch's *Aves terrestres* [illegible] of Illiger, *Rasores* If the aquatic birds of Nitzsch be divided into those which frequent the fresh waters, and are restricted to wading into rivers, lakes, &c in search of their food, and those which have the power of swimming or diving and for the most part frequent the great ocean, we shall then have the two remaining orders of the Quinary arrangement, viz *Grallatores* and *Natatores* The chief merit of this arrangement is its aim to express the natural affinities and their circular progression in the whole and in the several parts

Linnæus and Cuvier have six orders of birds, which are characterized as follows by the latter naturalist —

"Of all classes of animals, that of birds is the most strongly characterized —that in which the species bear [illegible] which is separated [illegible] Their systematic arrangement is based, as in the Mammalia, on the organs of manducation, or the beak, and in those of prehension, which are again the beak, and more particularly the feet

"One is first struck by the character of *webbed feet*, or those wherein the toes are connected by membranes that distinguish all *swimming birds* The backward position of their feet the elongation of the sternum, the neck, often longer than the legs to enable them to reach below them, the close glossy plumage impervious to water,

altogether corcur with the feet to make good navigators of, as *Pelmipedes*

"In other birds, which have also most frequently some small web to their feet, at least between the two external toes, we observe elevated tarsi, legs denuded of feathers above the heel-joint, a slender shape, in fine, all the requisites for wading in shallow waters in search of nourishment Such, in fact, is the source of food of the greater number, and although some of them resort exclusively to dry places, they are nevertheless termed 'shore-birds' or 'waders' (*Grallæ*)

"Amongst the true land birds, the *Gallinaceæ* have, like our domestic cock, a heavy carriage, a short flight, the beak moderate, its upper mandible vaulted, the nostrils partly covered by a soft and tumid scale, and always the edges of the toes indented, with short membranes between the bases of those in front They subsist chiefly on grain

"Birds of prey (*Accipitres*) have a crooked beak, with its point sharp and curving downward, and the nostrils pierced in a membrane that invests its base their feet are armed with strong talons They live on flesh and pursue other birds, their flight accordingly is mostly powerful The greater number still retain a slight web betwixt their external toes

"The Passerine birds (*Passeres*) comprise many more species than all the other families, but their organization presents so many analogies that they cannot be separated although

Finally, the nam d to those birds in which the external toe is directed backwards like the thumb, because the greater number of them avail themselves of a conformation so favourable for a vertical position to climb the trunks of trees"

Anterior to Cuvier, but subsequently in the order of publication, is Pallas's modification of the ornithological system of Linnæus It is contained in his great posthumous work, entitled *Zoographia Rosso Asiatica* He also divides the class of birds into six orders —

1 *Præpetes*, having the characters of the *Accipitres*, with which it is synonymous
2. *Oscines*, including the genus *Columba*, with the *Picæ* and certain *Passeres* of Linnæus
3 with the *Crassirostres*, Gra- Rav
4 *Pulveratrices*, having the characters of the *Gallinæ*
5 *Grallæ* This order commences with the genus *Otis*, and includes, as in the system of Cuvier, the Struthious birds with the true waders
6 *Hydrophilæ* The characters of this order corresponds with that of the *Palmipedes*, with which it is equivalent As an example of the views entertained and expressed by Pallas of relations of analogy, the following passage may be taken from his exposition of the nature of his *Hydrophilæ* — '*Rostra* in hoc ordine admodum variant, ut nullus ordinis character inde desumi possit et quasi reliquos ordines æmulari videntur ut *Diomedeæ* et *Catarractæ* Rapaces, *Larі Sternæ*, *Alcæ*, *Cepphi*, et *Colymbi*, Oscines, *Iriæ*, *Pulveratrices*, *Lundæ*, Passeres, et tandem *Serratirostria genera* Phœnicopterum et Plataleam inter *Grallas* referant"

The primary division of the class of birds adopted by the author of the article 'Aves" in the *Cyclopedia of Anatomy and Physiology*, includes seven orders, the Struthious birds, by virtue of their remarkable anatomical peculiarities being separated from the *Grallæ* of Linnæus and Cuvier The following are the orders

1 RAPTORES, *Accipitres* Linn Cuv Birds of prey
2 INSESSORES, *Passeres* Cuv Perchers
3 SCANSORES, Cuv Climbers
4 RASORES, *Gallinæ* Linn Cuv Scratchers
5 CURSORES, Illig Coursers
6 GRALLATORES, *Grallæ* Linn Waders
7 NATATORES, *Palmipedes*, Cuv, *Anseres*, Linn Swimmers

Scopoli and Latham have divided birds into *nine* orders, Temminck has *sixteen* orders, Brisson has *twenty-eight*, and Lacepede has *thirty-eight* orders, but the principles and the characters on which a classification of birds is most philosophically founded, appear to be sufficiently illustrated in the systems that have been already explained

ORNITHOMANCY (Gr ορνις, μαντεια *divination*) Divination by the flight of birds The Etruscans were the most celebrated observers of it *See* AUGURS

ORNITHORHYNCHUS (Gr ορνις, ρυγχος, *a beak*) The name of the genus of Monotrematous Mammals, of the mouth, which resembl is peculiar to the fresh-water rivers and lakes of Australia and Van Diemen's Land

OROMA'SDES. In Persian Mythology, the principle of Good, created by the will of the great eternal spirit Zeruane Akherene, simultaneously with Ahriman, the principle of Evil, with whom he is in perpetual conflict Oromasdes is the creator of the earth, sun, moon, and stars to which he originally assigned each its proper place, and whose various movements he continues to regulate According to the Persian myths, the world which is to last 12,000 years, during which the war between the Good and Evil Principle is to go on increasing, is at length to be consumed the Evil Principle exterminated, and a new world created in its room, over which Oromasdes is to reign as the sole and supreme monarch The great apostle of the Persians, Zoroaster, was the prophet of Oromasdes, and there is an old prophecy extant that after the lapse of ages a descendant of Zoroaster shall be sent by Oromasdes to redeem the world He could not fail to perceive how striking a resemb scheme of the Jews, and which was consummated by the advent of Jesus Christ *See* AHRIMAN, POLYTHEISM

ORPHEAN MYSTERIES The mysteries of which Orpheus was the founder were so called These mysteries were at a remote period in the highest estimation, and exercised an important influence over the intellectual development of mankind Orpheus is said to have been taught his mysteries by the Idæan Dactyli, to Thrace, whence they were propagated throughout all Greece by his initiated followers The nature of these mysteries is involved in an impenetrable veil of obscurity, but there can be no doubt that they partook of the general character of all containing a purer knowledge of religion than was compatible with the superstitious observances then prevalent On the union of these mysteries with the Bacchanalian orgies they fell into merited contempt, and were at length gradually disused. (*See* MYSTERIES) The initiated in these mysteries, as well as the persons employed to initiate candidates in them, were called, in some cases, *Orpheotelestæ*)

ORPHEUS A mythological personage, according to the common story, a son of the Thracian river Æagrus and the muse Calliope His power of moving inanimate things by music the share he bore in the Argonautic expedition, his descent into the Shades to recover his wife Eurydice, and his death by the violence of the Thracian women, are well-known circumstances in ancient romantic fable Moderns have imagined that his name is a general mythic for the earliest bards who came with their from Thrace to Greece Whether any fragments of poetry, either of the real Orpheus or of this supposed school, existed in Grecian classical ages has been doubted What passed as the poetry of Orpheus in the time of Aristotle seems to have been decidedly spurious as much so as the poems which we possess under the same name some of which are thought to be as recent as the 4th century after Christ Orphic poetry of ancient esoterical religion and import of the Mysteries (See *Lobeck's Aglaophamus*, *Bode's Orpheus*, Hedemann, *Initia Philosophiæ Græcæ*, *the History of the Literature of Greece*, Lib U K p 231, *Mem de l'Acad des Sciences*, vol xii)

ORPIMENT (Lat auripigmentum) Yellow *sulphuret of arsenic*, it forms the basis of the yellow paint, called *king's yellow* The solution of orpiment in ammonia has been used as a yellow dye

ORPIN (Fr) In Painting a yellow colour of various degrees of to approach, also to red

ORPINE The English name for the succulent herbaceous plant called by botanists *Sedum telephium*, which see

ORRERY A machine for representing to children the motions and relative magnitudes and distances of the bodies composing the solar system As these machines are often procured by well-meaning but ignorant people at considerable expense, it may be useful to quote an authority that will not be called in question "As to getting correct notions on this subject" (the magnitudes and distances of the planets), says Sir John Herschel, by drawing circles on paper, or, still worse, from those very childish toys called orreries, it is out of the question' (*Astronomy*, *Cab Cyc* p 287 For the description of an orrery see *Ferguson's Astronomy*, by Brewster.)

ORRIS ROOT The root of the *Iris Florentina*. It has an agreeable odour, much like violets, and is sometimes used in perfumed powders, it is also turned into little balls for issues, called *orris peas*

ORTHITE (Gr ορθος, *straight*) A mineral which occurs in straight rays or layers in Scandinavian granite It contains cerium and yttria

ORTHOCERATITES *Orthocerata* (Gr ορθος, and κερας *a horn*) The name of a family of Cephalopods with chambered siphoniferous shells which are straight, or are continued straight after commencing with a gentle curvature resembling a horn

ORTHODOX or ORTHODOXY (Gr ορθος, and δοξα, *opinion*) These terms are restricted in application to right judgments in matters of religious faith, and af-

though every sect maintains of course the exclusive correctness of its own views, yet the title of orthodoxy is appropriated by ecclesiastical historians to the standard maintained by the Catholic or universal church The term orthodox is generally restricted also to those principal tenets which have been always held by the great mass of professing Christians Large bodies of dissenters in England are allowed by the church to be orthodox, inasmuch as they hold the three creeds, and therefore profess the principal articles of the Christian faith in common with those who differ from them in matters of church authority and discipline

ORTHODROMICS (Gr ορθος and δρομος, *course*), in Navigation, is sailing on a right course, or on the arc of a great circle, which is the shortest distance between two points on the sphere

ORTHOEPY (Gr ορθος, and επος, *a word*), in Grammar, signifies literally the right use of words, but it is applied, at least by modern writers to signify that part of prosody which treats of the manner of uttering words, or of pronunciation in its limited sense *See* PRONUNCIATION

ORTHOGONAL (Gr ορθος, and γωνια, *angle*) In Geometry the same as [illegible]

ORTHOGRAPHIC PROJECTION [illegible] of points on a plane by straight lines at right angles to the plane *See* PROJECTION

ORTHOGRAPHY (Gr ορθος and γραφω, *I write*) That part of grammar which relates to the method of denoting sounds by visible signs, to the different kinds of letters, and their combination into syllables and words

ORTHOGRAPHY In Architecture, a geometrical representation of an elevation or section of a building

ORTHOPNŒA (Gr ορθος and πνεω *breathing*) A difficulty of breathing which is increased by any deviation from the erect posture

ORTHOPTERANS, *Orthoptera* (Gr ορθος and πτερον, *a wing*) An order of insects including all those species which have the wings disposed when at rest in straight longitudinal folds Latreille characterizes the insects of this order as having the body generally less firm in texture than in the Coleoptera and covered by soft semi-membranous elytra furnished with nervures which, in the greater number [illegible] in a straight line The wings [illegible] most frequently in the manner of a fan and divided by membranous nervures running in the same direction The maxillæ are always terminated by a dentated and horny piece covered with a [illegible] corresponding to the exterior divisions of the maxillæ of the Coleoptera They have also a sort of tongue

The *Orthoptera* undergo a semi metamorphosis of which all the mutations are reduced to the growth and development of the elytra and wings that are always visible in a rudimental state in the nymph As both this nymph, or semi-nymph, and the larva are otherwise similar to the perfect insect, they walk and feed in the same way

The mouth of the *Orthoptera* consists of a labrum two mandibles, as many maxillæ, and four palpi those of the jaws always have five joints, whilst the labial palpi as in the Coleoptera, present but three The mandibles are always very strong and corneous, and the ligula is constantly divided into two or four thongs The form of the antennæ varies less than in the Coleoptera but they are usually composed of a greater number of joints Several, besides their reticulated eyes have two or three ocelli The inferior surface of the first joints of the tarsi is frequently fleshy or membranous Many females are furnished with a true perforater formed of two blades frequently enclosed in a common envelop by means of which they deposit their eggs The posterior extremity of the body, in most of them, is provided with appendages

All the known *Orthoptera* without exception, are terrestrial, even in their two first states of existence Some are carnivorous, or omnivorous, but the greater number feed on living plants

ORTIVE (Lat ortus, *a rising*) In Astronomy, having reference to the rising of a star or planet, thus, *ortive amplitude*, or *eastern amplitude*, is the arc of the horizon intercepted between the point where a star rises and the east point

ORTOLAN The name given in France and England to a species of *Frangillidæ* greatly esteemed for the delicacy of its flesh when in season It is the *ortolano* of the Italians, and the *fettammer* of the Germans The ortolan is a native of northern Africa, but in the summer and autumnal months it resorts to southern Europe, and frequently migrates to the central and even the northern parts There are large establishments in Italy and in the south of France for feeding these birds, the flesh of which is styled by Prince Musignan *carne squisita*

ORUS, or HORUS An Egyptian god, son of Isis and Osiris [illegible] (II 144) answering to the Greek [illegible] appears in Egyptian paintings sitting on the lap of Isis. (See *Egyptian Antiquities*, London, 1836, vol ii)

ORVIETAN An antidote to poison, said to have been [illegible] Italy

ORYCTEROPUS (Gr ορυκτηρ, and πους, *a foot*) A genus of Edentate Mammals peculiar to the African continent and provided with feet and claws well adapted for digging, from which circumstance, and the heavy shapeless form of the only known species of this genus, it is called at the Cape of Good Hope the ground [illegible] The principal food of the orycterope is the termite and other species of ants, which it dislodges by its strong and sharp claws, and entraps by means of a long extensible and glutinous tongue It differs from the true ant-eaters principally in having molar teeth The orycterope is about the size of a hog, stands low, has short hair, and is of greyish brown colour It has four toes before and five behind, and inhabits burrows Its flesh is eaten

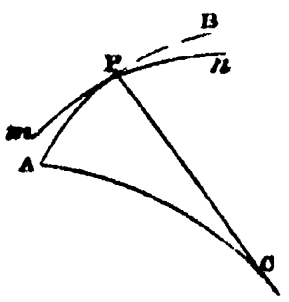
ORYCTOGNOSY, or ORYCTOLOGY (Gr ορυκτος *fossil*, and λογος *a discourse*) The branch of zoological science which treats of fossil organic remains These terms are sometimes used to denote those parts of mineralogy which have for their object the classification of minerals, their description, nomenclature, and arrangement

ORYZA (Arab aruz) The name by which rice was known to the ancient Greeks and Romans, and which has been adopted by modern botanists as the generic name of the plant yielding that invaluable grain The genus *Oryza* belongs to the class *Hexandria*, order *Dygynia*, and has ten glumes to a single flower, and two halea nearly equal adhering to the seed. It affords many varieties of which the most common is the *Oryza sativa*, or the English rice This plant is raised in immense quantities in India China and most eastern countries, in the West Indies Central America and the United States, and in some of the southern countries of Europe It, in fact occupies the same place in most intertropical regions as wheat in the warmer parts of Europe, and oats and rye in those more to the north Forming as it does, the principal part of the food of the most civilized and populous eastern nations it is more extensively consumed than any other species of grain It is light and wholesome, but is said to contain less of the nutritive principle than wheat. When rough or in its natural state in the husk it is called *paddy* There is an immense variety in the qualities of rice That which is principally exported from Bengal has received the name of *cargo* rice It is of a coarse reddish cast, but is sweet and large-grained, and is preferred by the natives to every other sort It is not kiln dried but is parboiled in earthen pots or caldrons, partly to destroy the vegetative principle so that it may keep better and partly to facilitate the process of husking Patna rice [illegible] is superior to any other sort of rice imported from the East It is small-grained, rather long and wiry and remarkably white But the rice raised on the low marshy grounds of Carolina is unquestionably very superior to any brought from any part of India

The produce of lands naturally or artificially irrigated is as far as rice is concerned from 5 to 10 times greater than that of dry land having no command of water, and hence the vast importance of irrigation in all countries where this grain is cultivated But it is worthy of remark that owing to the not unfrequent occurrence of severe droughts there is a greater variation in the crops of rice than in those of any other species of grain Those who like the Hindoos depend almost entirely on it for subsistence, are consequently placed in a very precarious situation There can be no doubt that famines are at once more frequent and severe in Hindostan than in any other quarter

A few years ago, England was principally supplied with cleaned rice from Carolina Latterly, however, the imports of Carolina rice have been much reduced An improved method of separating the husk, which throws out the grain clean and unbroken has recently been practised in this country, and as the grain when in the husk is found to preserve its flavour and sweetness better during a long voyage than when shelled, large quantities are now imported rough from Bengal and the United States Unquestionably, however, the oppressive discriminating duty of 11*s* a cwt on American and other foreign cleaned rice did more than any thing else to increase the imports of rough grain, but, in 1842, the duty upon foreign rice, not a British possession, was reduced to 6*s* per cwt, and in 1846 it was again reduced to 1*s* per cwt, hence there is now every facility for importing [illegible] commodity from all parts of the world

[illegible] A celebrated festival observed by the Athenians, for full information respecting which the reader is referred to *Plutarch's Life of Theseus*, by whom it was instituted The name is derived from *απο του φερειν τας σχας*, from carrying σχαι, i e. *boughs hung up with grapes*



OSCILLATION (Lat. oscillatio.) In Mechanics,

the vibration or alternate ascent and descent of a pendulous body (*See* PENDULUM.) The centre of oscillation is a point in the oscillating body, [illegible] matter of the body were there collected the oscillations would be performed in the same time (*See* CENTRE OF OSCILLATION.) The axis of oscillation is a straight line passing through the point of suspension parallel to the horizon, or perpendicular to the plane in which the oscillations are made. Oscillations in small arcs of a circle, or [illegible] are isochronal, or performed [illegible] *See* CYCLOID.

OSCILLATORIA. Minute filamentous organized beings, which have the faculty of exercising oscillatory movements.

OSCULATING CIRCLE. *See* OSCULATION.

OSCULA'TION. (Lat. *osculare, to embrace*.) In Geometry, one curve is said to osculate another when the two curves are in contact in such a manner that the number of points common to both is the greatest possible. Let A B be a curve, of which A C is the evolute, from P any point in A B draw P C to touch A C in C. With C as a centre, and a radius C P, describe a circle *m n*, then the circle *m n* osculates the curve A B at the point P. From the theory of the evolution of curve lines, the curvature of A B at the point P is equal to that of the circle, in fact, it is obvious from the development that the curvature of the involute at any point between A and P is greater than that of the circle and at any point beyond P it is less than that of the circle, consequently at P it is exactly the same as that of the circle described with the radius C P. The circle *m n* has, therefore, a more intimate contact with A B than any other circle which passes through P.

The theory of osculating curves in general is most easily explained by the methods of the differential calculus. Let $y = fx$ and $y = Fx$ be the equations of two curves, suppose x to become $x + h$, and let the functions $f(x + h)$, $F(x + h)$ be developed by Taylor's theorem, then, if all the terms of the first development are respectively equal to the corresponding terms of the second, the curves are the same in every respect, or coincide. If the first terms only are equal, the two curves have only one common point, if the two first terms of the one development are respectively equal to the two first of the other, then two contiguous points coincide or are common to both curves, if the three first terms in each are respectively equal the curves have three common points, and so on. Now the number of terms of the first development which can be made equal to the corresponding terms of the second depends on the number of constants in the function fx (supposing Fx to contain more constants than fx). The equations of a straight line being $y = ax + b$, contains two constants, the straight line can thus be made to coincide with two contiguous points of a curve, it then becomes a tangent and the contact is said to be of the first order. The general equation of the circle is $(y - b)^2 + (x - a)^2 = r^2$, and contains three constants, a circle can therefore be determined which shall have three common points with a curve, it then *osculates* the curve, and the contact is said to be of the second order. In general, if the equation of the osculating curve is of the order n, it may have a contact of the same order with the curve which it osculates, and it is a consequence of this theory that no osculating curve of an inferior order can be made to pass between two curves having a contact of a higher order, for example, no straight line can be drawn through P between the curve A P and the circle *m* P *n* (Lagrange, *Theorie des Fonctions Analytiques*, Lacroix, *Traité du Calcul Différentiel et Intégral*.)

OSIANDRIANS. In Ecclesiastical History a sect among the Lutherans, so called from their founder Osiander, a celebrated divine. They differed from the followers of Luther and Calvin as to the efficient cause of justification.

OSIER. The name given to various species of willow or salix, chiefly employed in basket making on account [illegible] (See *Loudon's Arboretum Britannicum*, where contains full information on all the points relative to osiers.

OSIRIS. In Mythology [illegible] the chief Egyptian divinities the brother and husband of Isis, and together with her the greatest benefactor Egypt, into which he introduced a knowledge of [illegible], and the arts and sciences. After [illegible] ations at home, he [illegible] Asia, where he encountered great difficulties, there the worship of the gods and the arts of civilisation, but on his return he found his own subjects excited to rebellion by his brother Typhon, by whom he was ultimately assassinated. Both ancient and modern writers have differed considerably respecting the powers and attributes of Osiris.* His principal office, as an Egyptian deity, was to judge the dead, and to rule over that kingdom into which the souls of the good were admitted to eternal felicity. The characters of Osiris, like those of Isis, who was thence called "[illegible] 10,000 names," were numerous [illegible] of the deity which signified the divine goodness, and in his most mysterious and sacred office as an *avatar* or manifestation of the divinity on earth, he was superior to any even of the [illegible] for as Herodotus observes, though all the [illegible] not worship the same gods with equal reverence, the adoration paid to Osiris and Isis was universal. He was styled "the Manifester of Good," and to this title he had an undisputed right, for he appeared on earth to benefit mankind, and after having performed the duties he had come to fulfil, and fallen a sacrifice to Typhon the evil principle (which was at length overcome by his influence after his leaving the world), he "rose again to a new life" and became the judge of mankind in a future state. Other titles of Osiris were, "President of the West," "Lord of the East," "Lord of Lords," "Eternal Ruler," "King of the Gods," &c. These, with many others, are commonly found in the hieroglyphic legends accompanying his figure, and the Papyri frequently present a list of 49 names of Osiris in the funeral rituals. Osiris has been identified with many of the Grecian divinities, but more especially with Jupiter, Pluto, and with Bacchus, on account of his reputed conquest of India. Osiris was par- [illegible] so sacred was [illegible] to visit it without express permission, and the latter was regarded with such veneration that persons living at a distance from it sought, and with difficulty obtained permission to possess a sepulchre within its necropolis. The worship of Osiris was at a later period introduced into Rome, but the prurient imagination of the Romans soon converted the rites and mysteries of this deity into a means for practising the most unbounded licentiousness, which at length reached such a height that his worship was prohibited by law. Osiris was venerated under the form of the sacred bulls Apis and Mnevis, or as a human figure with a bull's head, distinguished by the name Apis-Osiris. He is usually represented as clad in pure white, and his usual attributes are the high cap of Upper Egypt, a crosier, a flagellum, and sometimes a spotted skin, an emblem supposed to connect him with the Grecian Bacchus. (For full particulars respecting the supposed history of Osiris, together with explanations thereof, we beg to refer to *Plutarch's Treatise on Isis and Osiris*, and for a resume of the whole subject illustrated with ingenious observations, the reader may consult *Sir G. Wilkinson's Manners and Customs of the Ancient Egyptians*.) *See* ISIS.

OSMAZOME. (Gr. *οσμη, odour*, and *ζωμος, broth*.) The extractive matter of muscular fibre, which gives the peculiar smell to boiled meat and flavour to broth and soup.

OSMIUM. A metallic substance found associated with the ore of platinum, its peroxide is extremely volatile, and has a peculiar pungent odour, which suggested the name of the metal [illegible] *osmium nitrum*. Neither osmium nor its compounds [illegible] applied to any use, and it is a rare substance.

OSSEANS, OSSEI, or PISCES OSSEI. In Ichthyology, a primary division of the class of fishes, including all those [illegible] bony skeleton.

OSSIFIC BRECCIA. The cemented mass of bone found in certain caverns and fissures of rocks.

OSSIAN'S POEMS. The name given to a collection of poems, alleged to have been the production of Ossian, the son of Fingal a Scottish bard who lived in the third century. They were first given to the world in an English version by James M'Pherson, Esq., in 1760, with the assurance that they were translations made by himself from ancient Erse manuscripts which he had collected in the Highlands of Scotland, and such was the enthusiasm which their appearance excited, that they may be almost said to have given a new tone to poetry throughout all Europe. There were not, however, wanting many distinguished persons who from the first denied their authenticity, foremost among whom was Dr Johnson, who boldly pronounced the whole of the poems ascribed to Ossian to be forgeries, and his opinion was corroborated by Hume, Gibbon, and many others, who defied M'Pherson to produce a manuscript of any Erse poem of earlier date than the sixteenth century. On the other hand, M'Pherson's assertions as to the genuineness of the poems found warm supporters in Dr Blair (see his *Critical Dissertation on the Poems of Ossian*), Dr Henry, Lord Kaimes, and many other distinguished names, and almost to a man in the whole body of the Highlanders. In this unsettled state the

* So cautious were those initiated into the worship of Osiris, that they made a scruple even of mentioning him; and Herodotus, wherever he relates any thing concerning this deity, excuses himself from uttering his name.

controversy remained till the year 1900, when Malcolm Laing, so well known for his historical labours, added a dissertation appended to the second volume of his *History of Scotland*, endeavoured to establish, from historical and internal evidence, that the so-called poems of Ossian are [illegible] sensation created by [illegible] Many converts were made to the opinions therein set forth, but the general disbelief in the authenticity of the poems was not complete till 1805, when a committee of the Highland Society of Edinburgh, which had been appointed in 1797 to inquire into their nature and authenticity, reported to the effect "that they had not been able to obtain any one poem the same in title and tenor with the poems of Ossian" Since that period the controversy, so far as it regards their translation from Erse manuscripts, may be said to be terminated But although these poems had never been committed to writing, or rather have not been handed down in writing, there can be, we believe, but little doubt that many of them still exist in the Highlands of Scotland in a dress not very different from that in which they were rendered by M Pherson into English, having been committed to memory, and transmitted from one bard or storyteller to another in regular succession, and consequently their pretensions to be regarded as historical authority [illegible] be denied Their scenes sometimes laid in Scotland, but more frequently in Ireland, and they may be justly considered the *Iliad* and *Odyssey* of the Celtic race of the two islands have come [illegible] tradition only —what the poems of Homer were in likelihood to the Greeks themselves before they were acquainted with the art of writing "The value of Ossian," says Mr Skene, "as an historical poet, must stand in the highest rank, while, whether the chief part of these poems are of ancient or of modern composition, there can remain little doubt that in him we possess the oldest record of the history of a very remote age" (*The Highlanders of Scotland their Origin, History, and Antiquities*, vol i p 215) Those who wish to see this subject exhibited in all its bearings, though, perhaps with a slight prejudice against M'Pherson may consult the elaborate article in the *Edinburgh Review*

OSSIFICATION The formation of bone The change of any soft solid of the body into bone

OSTA'RA An ancient German and Celtic divinity worshipped with peculiar ceremonies by the Anglo-Saxons Many writers regard her as identical with the Phœnician goddess Astarte, but, be this as it may, she was regarded as the queen of spring and of the morning and from her name is derived the German *Ostern* (Anglice, *Easter*), which period of the year the ancient Germans were in the habit of celebrating with fires and festivals in gratitude for the advent of spring (See *Grimm's Deutsche Mythologie*, p 181) The town Osterode on the Hartz is said to have been named from this goddess

OSTEOCOLLA (Gr *οστεον*, *a bone* and *κολλα glue*) An old mineralogical term for *encrusting* carbonate of lime, to which the property of uniting a fractured bone has been attributed

OSTEOGENY (Gr *οστεον*, *a bone*, and *γινομαι*, *I generate*) The formation of [illegible]

OSTEOLOGY (Gr *οστεον*, *a bone*, and *λογος*, *a discourse*) The doctrine or history of the bones See ANATOMY, BONE

OSTEOLOGY In Painting and Sculpture, a description of the bones of animals

OSTRACEANS, *Ostracea* The family of Bivalves of which the oyster (*Ostrea*) is the type, and which is characterized by the mantle being widely open, without special [illegible]

OSTRACION (Gr *οστρακιον*, *a shell*) A genus of fishes of the order *Sclerodermi*, or rough-skinned, in the system of Cuvier It is characterized by the armour of regular bony plates soldered together, with which the body is invested, the only moveable parts being the tail, fins, mouth, and a small gill flap which pass, as it were, through holes in the coat of mail The body generally presents a quadrangular form, whence the name of trunk-fish, commonly given to the species of this genus

OSTRACISM (Gr *οστρακισμος*) A form of condemnation at Athens by which persons who [illegible] or influence were [illegible] banished for ten years with [illegible] return after that period It was not inflicted as a punishment, but merely as a precaution [illegible] preserve the democracy The process in this condemnation was as follows The people being assembled each man wrote the name of the person he wished to banish on a shell (*οστρακον* whence the name *οστρακισμος* and delivered it to the archons, who counted the numbers Only one individual could be subjected to the ostracism at the same meeting and 6000 hostile votes were necessary to the infliction of this condemnation Hence if 6000 votes and upwards were recorded against one or more individuals, the one was banished against whom the greatest number of votes had been given (See *Mem de l'Acad. des Inscr.* vol xvi)

OSTRACODES, *Ostracoda*. (Gr *οστρακωδης*, *a shell, like form*) The name of a family of Entomostracans, comprehending those which have the shell folded in two, [illegible] of a bivalve mollusk [illegible] great known bird and the type of the Cursorial or Struthious order It is distinguished not only from its immediate congeners the *Cassowaries* and *Apteryx* but from all other birds by having only two toes which correspond with the two outermost toes in the rest of the class The wings are furnished with loose and flexible plumes but are long enough to increase its speed in running The elegance of these feathers arising from their slender stems and the distinct barbs, has occasioned them to be [illegible] in all ages, and they still constitute a valuable [illegible] commerce The beak of the ostrich is depressed, of a moderate length, and blunt at the end, the tongue is extremely short, the eye is large, and the lid fringed with short simple feathers like eyelashes The legs are of prodigious strength, and the tarsi very long The ostrich has a capacious crop, a [illegible] cœca, [illegible] d by a very long intestinum rectum with internal connivent valves, which latter structure is unique in the class of birds It is likewise remarkable in this class for its large urinary receptacle The ostrich abounds in the sandy deserts of Arabia and Africa It attains the height of seven or eight feet, is gregarious in favourable localities, lays eggs of three pounds weight which are incubated by the male principally, and defended [illegible] feeds on grain grass, &c to [illegible] pebbles are taken into the gizzard, so obtuse is its taste that it will swallow pieces of metal, wood, &c When pursued it dashes stones behind it with great violence, and exceeds in swiftness all other terrestrial animals, it is only the comparatively limited power of sustaining its course that enables the mounted Arab to run it down

OTALGIA (Gr *ους*, *the ear*, and *αλγος*, *pain*) The ear ache

OTARIA (Gr *ους*) The name of the genus of seals characterized by having [illegible] and by the double cutting edge [illegible] or incisors, a structure unknown in other animals the molar teeth are simply conical and with a single fang These seals are principally confined to the southern hemisphere

OTITIS (Gr *ους*) Inflammation of any part of the organ of hearing

OTTAR or ATTAR OF ROSES The volatile or odorous oil of the rose, it is of a soft buttery consistence, and deposits when fluid a crystallizable portion, which is sparingly soluble in alcohol it is much used as a perfume The finest ottar of roses is prepared at Ghazeepore in India

OTTAVA RIMA (Eighth or octuple rhyme) An Italian form of versification consisting of stanzas of two alternate triplets and a couplet at the end; the verses being in the proper Italian metre, the heroic of eleven syllables It is the form peculiarly adopted and embellished by the poets termed Romanzieri, from Pulci to Tortigurra (See ROMANCE) It [illegible] the hands of an able [illegible] varying from the [illegible] although rather deficient in variety, and possessing too little repose and solemnity for the sustained majesty of epic poetry It has been adopted by the Germans, who have given to it something of an elegiac turn, and, of late, by English poets, of whom the most distinguished is Lord Byron, who has employed it in his *Beppo* and *Don Juan*, works belonging to a mixed cast of poetry, between the serious and the burlesque

OTTER A [illegible] habits by its short, strong [illegible] which serve as oars to propel it through the water, and by its long and strong tail, which acts as a powerful rudder, and enables the animal to change its course with great ease and rapidity The teeth, which consist, in each jaw, of six pointed incisors two strong and sharp canines, and ten trenchant and cuspidated molars, determine the piscivorous diet and predatory habits of the species The otter used to be met with in most of the British rivers and lakes, but the increase of population and the unintermitting hostility which its destruction of the valuable fish of its native streams have called down upon it, have greatly thinned its numbers, and have exterminated it from many of the localities where it was formerly common, so that the otter, as a captive in our menageries, is now regarded with almost the same interest which an exotic species usually excites

The otter selects for its retreat some convenient excavation concealed by the overhanging roots of the trees which grow from the banks of rivers, or other natural screen The female goes with young nine weeks, and produces from three to five cubs in March or April The usual weight of a full-grown male is from twenty to

twenty-four pounds The fur of the otter is remarkably fine and close It consists of two kinds of hair, the longer and stiffer shining hairs, which are greyish at the base and a rich brown at the point, concealing an extremely fine and soft fur of a whitish grey colour, brown at the tip The hair and fur of the under part of the body, the cheeks, and the inner parts of the legs, is of a brownish grey throughout

The otter is hunted in many parts of England, and especially in Wales with dogs especially [illegible] this kind of sport and with all the [illegible] the chase When the otter is [illegible] becomes exceedingly [illegible] takes the water [illegible] a long time underneath it, [illegible] distance from the place at which he dived Then the anxious watch that is kept of his rising to 'vent,' the steady purpose with which the dogs follow and bait him as he swims, the attempts [illegible] to drown his assailants by [illegible] fastened on him, the baying of the hounds, the cries of the hunters and the fierce and dogged resolution with which the poor hopeless quarry [illegible] and exciting as the veriest epicure in hunting could desire" (*British Quadrupeds*, p 133)

The few species of otter which have been recognized in distant parts of the world do not greatly differ from the *Lutra vulgaris* of Europe The sea-otter is an animal [illegible] presents such modifications of its palmated feet and [illegible] teeth as to form the type of a distinct subgenus (*Enhydras*), which connects the otter with the seal

OTTOMAN An epithet given to the Turkish empire from Othman I, who ascended the throne in the 14th century It is also applied to a peculiar kind of sofa much in use in Turkey, and which has been imitated both here and on the Continent

OUNCE (Lat uncia) A denomination of weight In troy weight the ounce is the 12th part of the pound, and weighs 480 grains In avoirdupois weight the ounce is the 16th part of the pound, and equal to 437½ grains troy *See* WEIGHT

OURANOGRAPHY (Gr *ουρανος*, *heaven*, and *γραφω I describe*) A term frequently used to signify a description of the heavens and the heavenly bodies

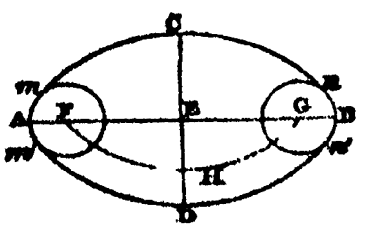
OUROLOGY, or OUROSCOPY (Gr *ουρον λεγω I speak*, and *σκοπεω I view*) The judgment of diseases from an examination of the urine

OUTCROP A Geological term implying the exposure of a stratum at the earth's surface

OUTLAWRY, in Criminal Law is a punishment inflicted for a contempt in refusing to be amenable to the jurisdiction of a competent court The act 2 W 4 c 39 gives a provision for more expeditious and less expensive proceeding to outlawry in civil cases [illegible] mesne process than had previously prevailed It is issued against a defendant after he has been five times proclaimed at a county court, but if the defendant has previously left the kingdom, he can set it aside by writ of error, or even on motion The effect of outlawry in civil cases is a forfeiture of personal goods and chattels immediately upon the outlawry, and his chattels real and the profits of his lands when found on inquisition

OUTLIER In Geology a portion of a rock or stratum detached and at some distance from the principal mass

OUTLINE In the Fine Arts *See* CONTOUR



OUTPOSTS In a Military sense, a body of men posted beyond the main guard, so called as being the bounds or limits of the camp

OUTRE (Fr) In the Fine Arts, anything exaggerated or over [illegible]

OUTRIGGER The [illegible] or piece of timber for [illegible] ten[illegible]ary purposes

OUTWORKS In Fortification, works raised on the outside of the ditch of a fortified place, for the purposes of covering the place, or keeping the besiegers at a distance *See* FORTIFICATION

OVAL (Lat ovum, *an egg*) A popular name for any curve figure [illegible]llipse or the transverse section of an egg [illegible] oval is made up of four circular arcs joined so as to leave no angular appearance, or present any rapid change of curvature It may be described as follows — Let A B and C D be the length and [illegible] each other at E With C as a centre and a radius equal to A E describe an arc intersecting A B in F and G, with F and G as centres, and a radius equal to A F or B G, describe the small arcs *m* A *m'* and *n* B *n'* for the ends of the oval, and with C and D as centres (or centres near those points), and C D as a radius, describe the arcs *m* C *n* and *m'* D *n'* It may be remarked, that the construction will fail when the breadth C D is not greater than half the length A B, but in this case C D may be produced, and points found in it by trial for the centres of the required arcs

The *Ovals of Descartes* are a species of geometrical curves [illegible] that philosopher as the loci which [illegible] rays [illegible] about an axis the true state of which [illegible] order that all the rays which proceed from the same point, or converge towards one may be refracted towards another point or rendered parallel or divergent They may be defined as the loci of the vertex of a triangle on a given base [illegible] of whose sides has a given ratio to the sum or difference of a given line and the other side Their generation has thus some resemblance to that of the ellipse and hyperbola which are the loci of a triangle on a given base whose sides in the case of the ellipse have a given sum, and in the case of the hyperbola a given difference (See the *Second Book of Descartes' Geometry*)

Ovals are also produced by the construction of many curves of higher orders particularly those in which [illegible] is the fourth, sixth, &c.

OVALBUMEN The albumen or white of egg, a term adopted in order to distinguish it from the albumen of the serum of the blood, which may be called *seralbumen*

OVARIA The two organs which contain the female ova

OVARIUM In Plants a hollow case, enclosing ovules or young seeds, containing one or more cells, and ultimately becoming the fruit, it is always situated in the centre of the flower, and, together with the style and stigma, constitutes the female system of the vegetable kingdom When it is united to the calyx, it is called inferior, when separate from it, it is termed superior

OVATION An inferior kind of triumph, which, according to the ancient Roman custom, was granted to distinguished military leaders The name is said to be derived either from ovare (*to cry O*[illegible] the cry of [illegible] or from ovis *a sheep* the animal [illegible] sions instead of bullocks According to Dionysius of Halicarnassus, the first ovation was celebrated by P Posthumius Tubertus (A C 503), some years after the expulsion of the kings Some antiquaries imagine the distinction between the triumph and the ovation to have originally consisted not in the greater or less degree of honour but in the latter being strictly appropriated to successes by which peace was obtained, or to distinguish brilliant achievements in time of peace Thus we find that ovations were permitted, though triumphs were not, in civil wars An ovation was celebrated by Mark Antony and Octavius to solemnize their reconciliation

OVERHANG In Architecture *See* BATTER

OVERSEERS OF THE POOR Officers annually appointed in every parish, under the hand and seal of two justices, under the statute of 43 Eliz Their number by that statute, is four, three, or two for each parish By subsequent statutes any place maintaining its own poor, whether a parish or not, has overseers Assistant overseers with a salary, may be elected by the inhabitants of parishes, under 59 G 3 *See* POOR LAWS

OVERSHOT WHEEL In Mechanics, a water-wheel to which the water is conveyed over the top of the wheel [illegible] the axle In this case, the water acts [illegible] ght, and not by the impulse of the stream

OVERT ACT (Fr ouvert *open*) In Law an open or manifest act from whence criminality is implied No indictment for high treason is good unless some *overt act* is alleged [illegible]

OVERTURE (Fr ouverture) The introductory piece of music prefixed to an opera or oratorio Its movements in works of the modern school generally contain snatches of the more prominent and leading airs in the opera, and introduce the audience to a general notion of the emotions which it is the desire of the author to excite

The word *overture* also signifies a *proposal*, in which sense it is always used in the Presbyterian church to indicate those resolutions proposed by presbyteries and synods, and afterwards laid before the General Assembly, either for its sanction or rejection

OVIDUCT (*Ovum* [illegible] *I conduct*) The [illegible] ovary either to the uterus or to an external outlet In Mammals this part [illegible] title from the circumstance of its being [illegible] described by Fallopius about the year 1560 in the human subject, in which this tube or canal passes from each side of the fundus of the [illegible] *See* FALLOPIAN TUBE.

OVIFEROUS or OVIPAROUS (Lat ovum, *fero* or *I bear*) In Zoology certain receptacles in which the [illegible] from the ord[illegible]

called, as the long pouches [illegible] of the body in many of the [illegible] Crustaceans Likewise the [illegible] tail of the higher Crustaceans, as [illegible] to which the eggs are attached [illegible] ov[illegible]

[illegible]um, and pario, *I produce*) The mode of generation by the exclusion of the germ in the form and condition of an egg, the development of which takes place out of the body either with or without incubation Fishes reptiles and birds are called Oviparous Vertebrata although some of both the former classes hatch the egg within the body and bring forth their young alive as the viper and dog-fish

OVIS (Lat *a sheep*) The name by which Linnæus and Cuvier distinguish the sheep as a genus from the goats and antilopes The character assigned by Cuvier to the genus *Ovis* is as follows — Horns directed backwards and then inclining spirally more or less forwards the profile or chaufrin more or less convex and no beard" to this may be added in most cases a sebaceous sac on the fore part of each foot The *Mouflons* or *Musmons* of Africa and Sardinia, from which it is generally believed our domestic races of sheep are derived, form the species *Ovis ammon* of Linnæus, and *Ovis musimon* of Schreber The coat of these wild sheep consists of coarse, stiff, long and nearly straight hairs, but they possess the same character, that of an imbricated surface, which gives to the shorter and finer wool of the domestic races the felting property on which its peculiar utility depends *See* HAIR

Of the domestic animals belonging to Great Britain sheep are, with the exception perhaps of horses and cattle, by far the most important They can be reared in situations and upon soils where other animals would not live They afford a large supply of food and one of the principal materials of clothing Wool has long been a staple commodity of this country and its manufacture employs an immense number of people "The skin dressed forms different parts of our apparel, and is used for covers of books The entrails properly prepared and twisted serve for strings for various musical instruments The bones calcined (like other bones in general) form materials for tests for the refiner The milk is thicker than that of cows, and consequently yields a greater quantity of butter and cheese, and, in some places is so rich that it will not produce the cheese [illegible] of water to make it part from the whey The [illegible] remarkably rich manure, insomuch that the folding of sheep is become too useful a branch of husbandry for the farmer to neglect To conclude whether we consider the advantages that result from this animal to individuals in particular or the kingdoms in general we may with Columella consider it as in one sense, as the first of the domestic quadrupeds '*Post majores quadrupedes ovilli pecoris secunda ratio est, quæ prima sit si ad utilitatis magnitudinem referas Natura præcipue contra frigoris violentiam protegit corporibus pro nostris liberaliora præbet velamina, et etiam ceteris mensas jucundis et numerosis dapibus ornat* — *De Re Rustica*, lib vii cap 2 And in addition to what Mr Pennant has so forcibly stated, sheep are particularly deserving the attention of the agriculturist, both from the influence of improvements on the breed, and from their generally affording larger profits than can be obtained from the rearing and feeding of cattle (*Statistics of the Brit Empire*, vol i p 492)

The principal varieties of the English sheep are the large Lincolnshire the Dorset breed, the South-down, and the Cheviot

The Lincolnshire sheep are of a large size big-boned and afford a great quantity of wool, owing to the rich marshes on which they feed but their flesh is coarser, leaner, and less finely flavoured than that of the smaller breeds

The Dorset sheep are mostly white-faced, their horns are finely curved, their fleece clear and white, but many of them are without wool upon their bellies, their legs are long and small and their general form handsome and well proportioned This breed is prolific, and is principally esteemed for producing lambs at an earlier period than other varieties Great numbers of these premature victims to luxury are yearly sent to the London markets, where they fetch the price of 10*s* 6*d* to 15*s* per quarter The manner of rearing the lambs is curious they are imprisoned in little dark cabins, the ewes are fed on oil-cakes, hay, corn, turnips, or cabbages which are given them in a field contiguous to the apartments where the lambs are kept, and at proper intervals the nurses are brought in to give suck to their young ones, while the attendants at the same time make their lodgings perfectly clean, and litter them with fresh straw Great attention is paid to this, as much of the success of rearing these unseasonable productions depends upon warmth and cleanliness"

The South-down sheep have dun or black faces, and are of the same hardy nature as the Cheviot breed, being able to live and thrive on the barest chalk hills Their wool is fine and their mutton well-flavoured They have of late years in consequence of these valuable qualities, extensively been introduced [illegible] horns, and are mostly white-faced and white-legged, the body is long, with fine clean small-boned [illegible] the meat of is highly esteemed for its flavour They are very valuable as mountain sheep, on account of their hardiness and the superior value of their wool There is a singular variety of sheep [illegible] which the monstrous [illegible] has become hereditary these are called Norwich horned sheep and have from four to eight horns growing irregularly from the head

It is no possible to form any accurate estimate either of the number of sheep or of the quantity of wool annually produced in this country With the exception of Mr Luccock's, most of the statements put forth with respect to both these points seem very much exaggerated But Mr L's estimate, which is considerably under any that had previously appeared, was drawn up with great care, and is supposed to approach nearer to accuracy

According to Mr Luccock, the Number of long-woolled sheep in England and Wales, in 1800, was	4,153,308	
Of short woolled, ditto - -	14,854,299	
Total number shorn -		19,007,607
Slaughter of short-woolled sheep per annum - -	4,221,748	
Carrion of ditto - - -	211,087	
Slaughter of long-woolled ditto -	1,180 413	
Carrion of ditto - - -	59,020	
Slaughter of lambs - - -	1,400 560	
Carrion of ditto - - -	70,028	
		7,140,856
Total number of sheep and lambs -		26,148,463

In some parts of England there has been an increase in the numbers of sheep since 1800, but in others there has been a decrease But we have been assured by competent judges that on the whole, the number has not sensibly varied in the interval

In the *General Report of Scotland* (vol iii Appendix p 6) the number of [illegible] estimated at 2,800,000, and, allowing for the increase that has taken place since 1811, they may now be estimated at about 3,500 000 Hence the total number of sheep in Great Britain will be 29,648 000 It is not supposed that there are 2 000 000 of sheep in Ireland (*Statistics of the British Empire*, vol i p 496)

The foreign breeds of sheep are exceedingly numerous, but of these perhaps the Asiatic variety is the most [illegible] India the sheep is long-tailed, and in [illegible] Tartary and China &c, the tail is not only elongated but loaded with a mass of fat in some instances weighing ten pounds The power which this animal possesses to accommodate itself to different climates seems almost unlimited in the hot plains of Asia its covering becomes coarse and scanty, while in the frozen regions of Thibet its thick wool has an under lining of the finest kind, forming an important article in manufactures and commerce (See the *Geo Dict*, art "Asia," and the authorities there cited)

OVISAC (*Ovisacus* [illegible] *sack*) The cavity in the [illegible] tains the ovum In Mammals it forms, after the ovum is expelled the *corpus luteum*

OVIPOSITOR (Lat ovum, and pono, *I place*), in Entomology is the instrument by which an insect conducts its eggs to their appropriate nidus, and often bores a way to it, the same instrument is, in some genera, used as a weapon of offence, when it is called the 'aculeus"

OVOLO (Ital) In [illegible] profile is the quadrant o[illegible] architecture there is a deviation from that exact form, which is most apparent at the upper portion, where it resembles the form of an egg, whence this moulding derives its name

OVOVIVIPAROUS (Lat ovum, *an egg*, vivo, *I live*, and pario, *I produce*) The mode of generation by the exclusion of a living fœtus more or less extricated from the egg-coverings which has been developed within the body of the parent without any vascular or placental adhesions between the ovum and the womb The marsupial animals among the Mammalia, the viviparous blenny and dog fish among [illegible] and many [illegible] Mollusks, the scorpion and flesh fly among [illegible] earth worm, and many of the intestinal worms, are examples of [illegible]

OVULUM [illegible] The name of a genus of Pectinibranchiate Gastropods characterized by having a shell of an oval form and with a long and narrow aperture, without furrows or teeth on the side of the columella; the spire is concealed, and the two extremities of the aperture are equally prolonged into a canal

This diminutive is also applied to the ovum of the Mammalia on account of its relatively minute size it is, however, a true ovum having all the essential parts, as the germinal spot germinal membrane, vitellus, vitelline membrane, and chorion *See* OVUM

OVULUM In Botany, a small pellucid pulpy body, borne by the placenta of a plant, and gradually changing into a seed, it consists of a central nucleus, enclosed within a definite number of coats, varying from one to two, and furnished with an aperture or foramen, through which impregnation takes place

OVUM (Lat *an egg*) In Anatomy, the body formed by the female in which, after impregnation, the development of the fœtus takes place It is generally formed in a special organ, called the ovarium, but in some of the simplest animals, as the Polypes, the common cellular parenchyme of the body seems to have the unlimited faculty of producing the ova The essential and apparently first-formed part of an ovum is a minute pellucid cell called the 'germinal vesicle," which is characterized by an opaque speck or nucleus, called the "germinal spot" The vesicle is immediately surrounded by a stratum of granules or nucleated cells, which form the "germinal disk" These parts float in a greater or less quantity of fluid and granules, called the yolk, which is generally of some well marked colour as the [illegible] violet, red through the presence of [illegible] The yolk is inclosed in a thin, delicate, structureless coat, called the vitelline membrane," and this is finally surrounded by an outer tunic called the 'chorion" Between the chorion and vitelline membrane there is commonly a greater or less quantity of albumen In the birds this fluid which is called the "white," and the 'yolk," is in great quantity, the chorion is laminated and the outer layer is combined with earthy salts to give due firmness and preserve the shape of the egg while subject to the weight of the parent during incubation Two twisted strings of firm albumen, called 'chalazæ' are continued from each end of the yolk a little below the poles and serve to keep uppermost the 'cicatricula' or 'treid,' formed by the impregnated germinal vesicle and disk A space intercepted between two of the layers of the chorion, or 'membrana putaminis" at the great end of the egg contains a small quantity of gas containing more oxygen than atmospheric air this space is called the 'vesica aerea' (For the chemical properties of *ovum* see Egg)

OVUM In Architecture the same as Ovolo, which see

OWL *See* NOCTURNALS and STRIX

OW'LING In Law, so called from its being generally committed during the night An offence consisting in conveying sheep or wool to the sea side in order to export them This offence was formerly capital particularly if the offenders neglected to surrender after proclamation made for that purpose, — it is now punishable with seven years' banishment

OWL, THE Among the ancients generally was considered as an omen of misfortune or death As however according to Philostratus the Egyptians represented Minerva under the form of an owl the Athenians so peculiarly under the care of this goddess looked upon the appearance of this bird as a favourable omen From this circumstance it formed upon ancient coins the symbol of Athens and her foreign possessions

OX Synonymous with the generic name *Bos* which see, in a more restricted sense it signifies the castrated male of the [illegible] variety

OXAMIDE *See* OXAMIDE

OXALATES Salts of the oxalic acid

OXA'LIC ACID A vegetable acid first discovered in the juice of the *Oxalis acetosella*, it was afterwards ascertained that the same acid might be produced artificially by the action of nitric acid upon sugar this process yields it in slender prismatic crystals, intensely sour and soluble in about 10 parts of cold water These crystals consist of 1 atom of real acid and 3 of water the equivalent of the acid is 36, and in its anhydrous state as it exists in the dry oxalates it is constituted of 2 atoms of carbon (6×2) = 12, and 3 of oxygen (8×3) = 24 so that it may be represented by an atom of carbonic acid and one of carbonic oxide Solutions of oxalic acid, or of soluble oxalates, yield an insoluble precipitate in solutions containing lime and its salts hence its use in the laboratory as a test of the presence of that earth The solution of oxalate of ammonia is generally used for the purpose Oxalic acid is a powerful poison and from its resemblance to Epsom salt, it has sometimes been sold and mistaken for that harmless aperient In such cases, the best antidote is a mixture of chalk and water, and where it is immediately administered it generally prevents the accession of fatal symptoms, it forms an insoluble oxalate of lime, which is inert

OXALIDA'CEÆ (Oxalis, one of the genera) A natural order of herbaceous or shrubby Exogens, inhabiting the [illegible] parts of the world Their foliage is generally acid and [illegible] supply the place of sorrel *Oxalis acetosella* contains pure oxalic acid, and many are used in Brazil against malignant fevers

OXAMIDE A white substance produced during the destructive distillation of oxalate of ammonia hence its name, compounded of *oxalis* and *ammonia* It is a compound of nitrogen hydrogen oxygen and carbon in such proportion as to form oxalate of ammonia by the addition of one atom of water (See Dumas, *Theorie des Amides*, *Chim App aux Arts*, v 84)

OXGANG (Germ ochs, *an ox*, and gang, *a walk*), in English Antiquities, was used to signify as much land as a single ox could *ear* or plough in a season [illegible] was contracted or expanded according [illegible] the land, forty acres constituting the *maximum* and six the *minimum* of the measure

OXIDATION, or OXIDIZEMENT The act of combination with oxygen

OXIDE (Gr *ὀξυς*, *acid*, and *εἶδος*, *form*) Compounds containing oxygen, but which are not *acid*, have been termed *oxides* [illegible] class of bodies [illegible] oxides of the base we general[illegible] [illegible] (Greek [illegible] nal numerals, designating the first second, third, &c oxides by the terms *protoxide*, *deutoxide*, *tritoxide*, &c, and when the base is saturated with oxygen (still not acid), it is termed a *peroxide* Combinations of bases with one atom and a half oxygen, or of two base and three oxygen are now generally distinguished by the term *sesquioxides*

OXYGEN (Gr *ὀξυς*, and *γενναω*, *to generate*) This important element was discovered, in 1774, by Dr Priestley It has been termed *dephlogisticated air*, *vital air*, and *empyreal air* As it forms a component part of many of the acids, it was termed, at the framing of the new nomenclature, *oxygen gas* There are several compounds of oxygen which, when exposed to heat, are decomposed and yield the gas in a state of purity of these the best is chlorate of potash, but as that salt is expensive, we generally resort to black oxide of manganese which at a dull red heat, gives out a considerable quantity of tolerably pure oxygen gas

Oxygen gas is colourless, tasteless, and inodorous, it is electro-negative and therefore when compounds containing it are electrically decomposed it always appears at the positive surface It is a little heavier than atmospheric air, in the proportion, that is, of 11 to 10, 100 cubical inches weighing 34 6 grains It is not absorbed by water and is neither acid nor alkaline It has a powerful attraction for most of the simple substances, especially for the electro-positive bodies the act of combining with it is called *oxidation* The compounds thus formed are divided into *acids* and *oxides* among the latter are the alkalis and almost all salifiable bases Oxidation is often attended with the evolution of heat and light, as in all processes of combustion in atmospheric air sometimes it is slow, and unattended with such phenomena as in the gradual rusting of metals Oxygen is a most powerful [illegible] constitutes one fifth of the [illegible] is the principle which enables combustible bodies to burn in it The product of combustion that is, the oxide or acid is sometimes itself gaseous, as when charcoal, by burning, is converted into carbonic acid, or it is liquid, as hydrogen by combustion produces water, or it is solid as when iron by burning produces oxide of iron Oxygen gas is also essential to respiration, that is to the evolution of carbonic acid from the blood

OXYGONE (Gr *ὀξυς* and *γωνια angle*) In Geometry a term applied to figures in which all the angles are acute

OXYHYDROGEN BLOWPIPE When a mixture of one volume of oxygen and two of hydrogen are burned whilst issuing from a small aperture they produce intense heat and instruments under the above name have been contrived for their safe combustion, so as to avoid the risk of explosion

OXYMEL (Gr *ὀξυς*, and *μελι*, *honey*) A mixture of honey and vinegar It is sometimes made the vehicle of medicines as oxymel of squills &c.

OXYMURIATE OF LIME The valuable bleaching compound obtained by exposing slaked quicklime to the action of chlorine is commonly so termed; it is, however a chloride of lime

OXYMURIATIC ACID [illegible] applied to chlorine, under the [illegible] muriatic acid and oxygen The fallacy of that opinion was first demonstrated by Davy, who showed that, in all the apparent cases of the evolution of oxygen from chlorine, its source was referable to the presence of water or of an oxide [illegible] for bases than oxygen [illegible] when metallic oxides are exposed to its action the chlorine combines with the metal to form a chloride (formerly called a *muriate*), and the oxygen is evolved.

OXYOPIA (Gr *ὀξυς*, and *ὠψ*, *the eye*.) Preternaturally acute vision

OXYURIS, *Oxyuris* (Gr *ὀξυς*, and *οὐρα*, *a tail*) The

name of a family of Pupivorous Hymenopterans, comprehending those which have a sort of tail, or terminal appendage, produced by an external ovipositor or borer A genus of intestinal worms (Cœlelminthans) is also called *Oxyuris*

OYER (From the Norman French oyer, *to hear*) In Law, when an action is brought on a bond or other specialty the defendant, previously to pleading in bar, may crave oyer of the instrument on which the action is brought, that it be read to him, which prayer must be granted Whenever offer of a deed is necessarily made by the party relying on it (by what is termed a *profert in curia*), the other party may crave oyer Oyer is not in strictness demandable of a record, or of an act of parliament

OYER AND TERMINER (Fr *to hear and determine*) In Law, a commission directed to the judges, and other gentlemen of the courts to which it is issued, by virtue of which they have power, as the terms imply, *to hear and determine* certain specified offences

OYEZ (Plur imperative of the same verb) "Hear ye" The cry of ushers in Norman courts of justice, metamorphosed into the English "O yes"

OYSANITE *See* OISANITE

OYSTER (Lat ostrea, *an oyster*) This name is generally understood to designate the species of Ostracean bivalve called *Ostrea edulis*, which is one of a numerous genus characterized by an inequivalve shell composed of two irregular lamellated valves of which the convex or under one adheres to rocks piles or to the shell of another individual The animal is unprovided with either a byssus or a foot it is the best flavoured of its class and has consequently been always esteemed Vast beds of oysters are artificially formed and preserved too with great care, at the estuary of the Thames and many other localities where the temperature of the water is somewhat raised by a mixture of salt and fresh water, in which they best thrive Certain restrictions and regulations are enforced in reference to the sale of oysters in the metropolis in order to favour the multiplication and rearing of this valuable bivalve They are permitted to be sold from August to May but during May June and July However the spat or young are in May when they are said to be sick they recover in June and July and in August are perfectly well Oysters differ in quality according to the different nature of the soil or beds The best Britain oysters are found at Purfleet, the worst near Liverpool The nursing and feeding of oysters is almost exclusively carried on at Colchester, and other places in Essex The oysters are brought from the coast of Hampshire Dorset and other maritime counties, even as far as Scotland, and laid on beds or layings in creeks along the shore where they grow, in two or three years to a considerable size and have their flavour improved There are said to be about 200 vessels from 12 to 40 or 50 tons burden immediately employed in dredging for oysters, having from 400 to 500 men and boys attached to them The quantity of oysters bred and taken in Essex and consumed mostly in London, is supposed to amount to 14 000 or 15 000 bushels a year (*Supp to Ency Brit*, art 'Fisheries') Oysters formed a great luxury among the Romans and as in France, were served at the commencement of a repast The largest and best of Italy were caught on the shores of the Lucrine, but the Romans used to send vessels even to the coasts of Britain in quest of this luxury the British oysters being then as now in the highest estimation

OZÆ'NA (Gr ὀζω *I smell*) An ulcer in the nose which discharges a fœtid purulent matter, and is sometimes symptomatic of caries of the bones

P.

P. A consonant of the labial series As was to be expected from the approximation of this letter in sound to *b*, it is susceptible of interchange with the latter in nearly all the languages of which we have any knowledge, but more especially in the German Both in this country and on the Continent there are whole districts in which not only is the ear of the natives insensible to the difference between the sound of these letters, but with a tendency to error of which it would be vain to investigate the cause they are almost invariably confounded in pronunciation Of this peculiarity several counties of Wales among ourselves, and the whole of Lower Saxony in Germany present noted examples For the most usual abbreviations of this letter see ABBREVIATION

P In Music, an abbreviation of the Italian word *piano*, soft, denoting that the force of the voice or instrument is to be diminished P P means *piu piano*, or more soft, and P P P *pianissimo*, as soft as possible.

PACE (Fr pas) A denomination of linear measure, of uncertain extent; assumed by some to be 5 feet, by others 4 4 It is the quantity supposed to be measured by the foot from the place where it is taken up to that where it is set down The ancient Roman pace, considered as the thousandth part of a mile, was five Roman feet, and each foot contained between 11·60 and 11·64 modern English inches, hence the pace was about 58 1 English inches, and the Roman mile, the *mille passus*, equal to 1614 yards *See* MILE

PA'CHA (Pronounced *pasha*, contracted from the Persian padi shah *foot of the shah*) A title of honour, given in the Ottoman dominions to the governors and chief assistants of the sultan, and to the learned (See *Von Hammer's History of the Turkish Empire*, vol i p 137) Independent authority attributed particularly to the governors of provinces called *pachalics* The well-known distinction of rank between the two classes of pachas consists in the number of horse-tails which are carried before them as standards the higher having three and the lower two There were until recently 25 pachaliks subdivided into sanjiacates, besides various independent jurisdictions scattered over the empire

PA'CHACA'MAC The name given by the idolaters of Peru to the being whom they worshipped as the creator of the universe, this divinity was held in the highest veneration In the fruitful valley of Pachacama (whence the name) the incas dedicated to his honour a temple of such splendour and wealth that notwithstanding the rapacity of the Spanish soldiers by whom it was plundered previously to the arrival of Pizarro, that general is said to have drawn from it treasures to the amount of 900 000 ducats The ruins of this temple which still remain furnish a high notion of its former magnificence

PA'CHYDE'RMATA (Gr παχυς *thick* and δερμα, *skin*) An order of quadrupeds, including the elephant, horse pig &c, distinguished by the thickness of their hides

PACHYGLOSSA'TA *Pachyglossi* (Gr παχυς and γλωσσα *a tongue*) The name of a family of parrots (*Psittacini*) comprehending those which have a thick protractile tongue

PACHYO'TES *Pachyoti* (Gr παχυς, and ους *an ear*) The name of a family of bats (*Cheiroptera*) including those which have thick external ears

PACIFIC The name given by Magalhaens the first European who traversed it to the ocean which extends between America on the east and Asia and Australia on the west in consequence of his enjoying fair weather on entering it after having previously experienced a track of bad weather and tempestuous gales in the straits which bear his name The Pacific is the greatest expanse of water on the globe

PACIFICATION EDICTS OF The term usually applied to the edicts issued by the French monarchs in favour of their Protestant subjects in the view of allaying the commotions occasioned by their previous persecutions The first edict of this nature was promulgated by Charles IX in 1562, but the most celebrated was the edict of Nantes (which see) issued by Henry IV in 1598, and revoked by Louis XIV in 1685

PACKET in Navigation meant originally a vessel appointed by government to carry the mails between the mother country and foreign countries or her own dependencies It is now used as nearly synonymous with an ordinary vessel chiefly of small burden, that freights goods and passengers

PACKFONG The Chinese name of the alloy of nickel and copper commonly called *German silver* It is an alloy of 7 parts of zinc 2 copper and 6 5 nickel

PACK HORSE A horse employed to carry goods on its back in bundles called packages or packs In countries not yet intersected by roads this is the usual mode of transporting goods In Britain horses were formerly employed for this purpose, but for these carts and waggons are now substituted In Spain mules and asses are still so employed and in Asia and Africa camels and dromedaries

PACOS The Peruvian name of an earthy looking ore, which consists of brown oxide of iron, with imperceptible particles of native silver disseminated through it (See *Ure's Dictionary of Arts, &c*)

PADDING in Calico printing, is the impregnation of the cloth with a mordant

PADDLE A kind of oar used by savage nations in navigating their canoes The paddle is broader at the end than the common oar, and being employed at the stern of the canoe, not only impels her forwards, but regulates her course exactly like a rudder *See* SCULLING

PADDLES *See* STEAM NAVIGATION

PA'DDOCK This term was formerly applied to a strip of ground in a park, paled round for hounds to run matches in; but at present it is chiefly used to denote a small inclosure adjoining the stable for a stock horse, a mare and foal or any

PADI'SHA *protector* or *throne* and

shah *prince*) A title of the Turkish sultan and Persian shah Formerly the Turkish [illegible] title upon the kings of France a [illegible] peans sovereigns but we believe that the honour is now likewise shared by the emperors of Austria and Russia *See* PACHA

PA'DUAN COINS In the Fine Arts, coins forged by the celebrated Paduans, Cavino and Bassiano, who were also [illegible] Julius III [illegible] Gregory XIII [illegible] These coins hold the first rank in imitations of ancient medals for their masterly execution M Beauvais says of them, "that they are seldom thinner than the ancient coins themselves, that they seldom appear as worn or damaged, whilst others very frequently do, especially in the reverse, which sometimes, as in many Othos, appears half consumed by time, and while (he observes) counterfeit medals are [illegible] of as irregular a form as the real, these of the Paduan masters are generally circular" Still more modern forgers who were without the riders which these Paduans possessed for impressing have been content to mould them from their productions, but these are cast coins, which it requires no very extraordinary knowledge to detect The marks of the file upon their edges are mostly a sure sign of the imposition, those, however, who collect these objects of art should be constantly on their guard

PÆ'AN (Gr Παιαν) Among the Greeks, properly a hymn in honour of Apollo who was also called Pæan Also a war song before or after battle in the first case in honour of Mars, in the second as a thanksgiving to Apollo

PÆAN In Ancient Poetry, a foot consisting of four syllables, of which there are four kinds, the Pæan primus, [illegible] T

PÆDOBAPTISTS (Gr παις *a child*, and βαπτιζω, *I baptize*) Those who hold that baptism should be administered during infancy [illegible] Christian churches which allow [illegible] thus denominated from that circumstance and are thereby distinguished from the Antipædobaptists, i e those who deny the validity of infant baptism *See* BAPTISTS

PA'GAN (Lat paganus, from pagus *a village*), among the Romans, was, as the term imports applied to all who lived in [illegible] to the inhabitants of cities [illegible] it is the opposite of *Christian* being synonymous with heathen gentile, and idolater and was originally so applied because the inhabitants of villages continued to adhere to their idolatrous practices after Christianity had been introduced into towns and cities The precise period when the term pagan was first used in its present acceptation has not been ascertained *See* HEATHEN

PAGANA'LIA (Lat) Festivals held in each Roman village in honour of the local tutelary divinities They were instituted by Servius Tullius, who commanded every inhabitant of each *pagus* or village to assemble annually on a certain day and offer public sacrifices In instituting these festivals Servius had both a political and religious object in view for as every inhabitant was compelled to bring a small coin, varying with the age and sex of the bearer, he was annually acquainted with the strength of each district, and consequently with that of the kingdom

PA'GANISM A general appellation for the religious worship of the whole human race, except of that portion which has embraced Christianity, Judaism, or Mohammedanism Under the head POLYTHEISM, we have given a brief outline of the different kinds of pagan worship, and we shall in this place confine our remarks to the origin of the system

That in the most ancient times one God, sole, eternal, indivisible, the creator of the universe was acknowledged and worshipped, has been proved by the most profound investigators of antiquity The existence of this belief may not only be traced in the tradition of all peoples but is expressly affirmed by some of the greatest philosophers of the heathen world Nothing, indeed, could exceed the contempt with which some of them regarded the gods of the vulgar, though fear of danger or some other cause often taught them to conceal the sentiment.

The causes of idolatry were manifold, and were mostly of oriental growth A great king regarded it as below his dignity to enter into the minute details of administration he placed vicars or ministers over provinces and cities over the great departments of national polity If the onerous charge was inapplicable to an earthly, it was still more so to the celestial Sovereign hence the subordinate deities which we perceive in the religious systems of all nations, — the presiding genii of the Chaldæans, the numerous gods of Greece and Rome The worship due to the Supreme alone was soon transferred to those imaginary entities which, from functionaries, were transferred into so many independent chiefs, until the simple primeval notion of the divine unity was lost. The other causes of idolatry are foreign to our purpose the one already assigned, which is indisputably the most ancient and the most obvious, is of itself sufficient to account for the fact

In its origin paganism, as a system, was simple. A few great divinities were placed in heaven to guide the affairs of the visible and invisible worlds By degrees each great phænomenon, each law of nature, each region and city, each river fountain, wood, tree, mineral, had its tutelary deity The laws of nature were often inexplicable, what more obvious than to infer that each was subject to superior power? As the ideas of men became more precise and refined, gods were placed over human faculties and passions thus the understanding and the will, love and revenge, were the offspring of certain deities Mere abstractions were similarly personified, until the empire of reason, of sentiment, and of morals, was [illegible] peopled with air and ocean with these [illegible] Beings not merely themselves attaining that mysterious dignity might have not become at once part of [illegible] gods a distinction earned by some uncommon merit In all countries we find instances of deification Nor need this surprise The human mind is naturally prone to exaggeration — the human heart to be led astray by the [illegible] of its own feelings Thus he who, during life, proved himself a benefactor to his countrymen, who taught them useful arts, or freed them from some impending evil, would be regarded with affectionate admiration by his contemporaries, and time, which so constantly increases every object, would convert a great exploit, a shining virtue, into a divine effort But it not unfrequently happened that men were [illegible] for brute strength unaccompanied by [illegible] the [illegible] which form the noblest distinction of the hero It may, however, be observed, that in such cases men were always reverenced for the quality most wanted in a state If a district were infested by wild beasts or by predatory savages, a Hercules arose to free it If a country required laws, a Minos established them If the culture of the grape was unknown, a Bacchus appeared to teach it Such benefactors, it was believed deserved, as they certainly obtained, the peculiar favour of heaven, — rewards which far transcended those bestowed on other men In most cases, however, each was held to be a divinity, or at least the offspring of one As the generation of the gods was a received tenet, and their union with mortals of constant occurrence imagination had little difficulty in the filiation of a benefactor Mortals were [illegible] to a god as their founder [illegible] and on the honour, the example was speedily followed by others with equal appearance of justice Hence the prodigious number of divinities, heaven and hell, the earth and the planets, air and ocean the whole frame of nature, every part of the universe visible and invisible, even the realms of [illegible] by them and hence idolatry [illegible] endless in its forms of worship as in its objects

It has indeed been contended that even in the most unenlightened times, men — except, perhaps, the grossest in comprehension — were never so absurd as to receive this almost infinite plurality of deities, that each derived its name from its being a distinct manifestation of the divine energy, that the Neptune of the sea, the Apollo of the sun, the [illegible] the Jove of the thunder, [illegible] on the distinct modes in which the Supreme manifests himself to the world In short, that those denominations were but so many imaginative terms for the emanations of the all pervading Deity, and that under each distinct emanation this deity might be worshipped without the charge of idolatry But this hypothesis is too refined to be just, and is contrary to experience The known progress of the human mind is from sensual to ideal not from the ideal to the sensual, philosophy is the end, not the beginning of knowledge If that great patriarchal truth the unity of the Godhead, was obscured by successive ages of ignorance, it could be regained only by an opposite and equally laborious process of the intellect, and even when thus recovered, it could not be communicated without danger to the multitude (*Cab. Cyc., Arts &c of the Greeks and Romans*, vol ii) *See* MONOTHEISM

PAGE (Modern Lat pagius, of uncertain derivation, according to some from pagus *village*) In high life, a youth attached to the service of a royal or noble personage In the ancient Persian court (which has been not ill termed the prototype of all courts) we find the usage of employing a number of youths of the noblest families of the empire in personal [illegible] Among the Greeks and Romans [illegible] institutions, strictly so called were unknown), no analogous custom appears to have prevailed Among the northern nations, on the other hand personal service of this sort was common The name page, however, appears confined to slaves and attendants of an inferior description, in modern Europe, until the reigns of Charles VI and VII of France (*Fauchet's Origine des Chevaliers*) As chivalric institutions prevailed the office, by whatever

name called, became of importance, courts and castles were the schools in which the young noble passed through the degree of page, in order to reach the farther steps of esquire and knight, when he became "hors de page" In the 16th century the chivalrous character had become much adulterated, but the custom of bringing up sons as pages at courts continued until the disorder and licence of the age rendered the service so dangerous that it was no longer sought by the better classes as a mode of edu- [illegible] Pages then became, as they are [illegible] from some courts (the Prussian, for instance) they have entirely disappeared, and the young noblemen of the cadet school perform the office of pages on solemn occasions. (See Sainte-Palaye, *Memoires sur la Chevalerie*, *Mem de l'Ac des Inscr* vol xx.)

PAGE In Printing, one side of the leaf of a book A folio volume contains 4 pages in every sheet, a quarto 8 an octavo 16, a duodecimo 24, and an octodecimo (18mo) 36 pages

PA'GEANT, in its general sense, a public representation or exhibition of a showy and splendid character It was a very early custom in the middle ages both in England and on the Continent, to celebrate festive occasions of a public nature, as royal visits marriages &c by some ornamental show in the public streets of cities During the period of chivalry these shows began to be exhibited with the addition of masked figures representing allegorical personages with appropriate scenery and as, in process of time speeches in verse or prose were put into the mouths of these figures and sometimes a kind of dramatic entertainment performed between them the pageant consequently holds a place in our early literature The earliest speaking pageant of which we have any account was presented on the triumphal entry of Henry VI into London, in 1432, and the poetical part of it is conjectured to have been supplied by Lydgate The reign of Henry VIII was fertile in pageants of an extraordinary magnificence and splendour, but in that of queen Elizabeth they assumed a different form and were both devised and enacted with much more elegance partly from the tincture of romantic gallantry which distinguished the court of the maiden queen and was perceptible in all the homage rendered to her by her subjects, and partly from the sudden development of the poetical genius of the nation The pageants gradually became more dramatic and thus approximated more nearly to the more elegant character of the masque (see Masque), which, under her successor became the fashionable court entertainment Pageants however were still presented by the city of London which retained a poet laureat of its own for the purpose of inditing the spoken part of them down to the year 1708 or thereabouts, and the lord mayor's procession still retains some characteristics of these ancient entertainments The derivation of this word is wholly unknown and has afforded much scope to the fancy of etymologists

PA'GINA (Lat) In Botany the surface of a leaf

PAGO'DA (Pers poutghal *a house of an idol*) In Architecture the East Indian name for a temple containing an idol Sometimes it signifies the idol itself The pagoda is generally of three subdivisions First an apartment whose ceiling is a dome resting on columns of stone or marble this part is open to all persons Second, an apartment forbidden to all but brahmins Third and last, the cell which contains the statue of the deity, enclosed with a massy gate

PAGODA, is also the name of a gold coin, value from 8s to 9s, current in several parts of India It is also the name of a silver coin [illegible] value on which are [illegible] pedimages of the Hindoo [illegible]

PA'GODITE A species of [illegible] calcite or serpentine which the Chinese carve into figures

PAGU'RIANS, *Paguridæ* (Lat pagurus *hermit crab*) The name of a tribe of Macrurous Decapod Crustaceans, of which the genus *Pagurus* is the type Most of the species of this family inhabit, parasitically, the deserted shells of univalves

PAI'NIM A poetical expression used by English writers for *pagan*

PAINS AND PENALTIES, BILL OF A species of process employed to inflict punishment on state offenders out of the ordinary course of justice Every bill brought into parliament for the purpose of inflicting such punishment is a bill of pains and penalties, of which bills of attainder (*see* Attainder) are, properly speaking a species; but the term is more commonly confined to bills introduced to inflict specified penalties for particular offences The latest instance of this extraordinary proceeding was the bill of pains and penalties against Queen Caroline (1820), introduced into the House of Lords, and passed by them, but which was not carried into the Commons

PAINTER. In Naval language a rope used to fasten a boat either alongside of the ship to which it belongs, or to some wharf quay &c as occasion requires

PAI'NTERS COLIC The peculiar disease, which usually terminates in palsy and mental imbecility, to which painters and others subject to lead poisons are subject. It is also called colic of Poitou and Devonshire colic; the miners employed in lead-works being also liable to its attacks *See* Colic.

PAI'NTING (Fr peinture, Lat pictura), strictly defined, is an art which by means of lines and colours, represents on a plane surface all objects presented to the eye or to the imagination The etymology of the word (γραφειν) used to express painting among the Greeks, being the same as that employed for writing, seems to identify the tools with which it was performed among that people viz a style or pen of wood, used on a levigated plane of wood, metal, or some other prepared ground, the mode, letters or lines Until its operations become founded on the faithful representations of visible objects of nature, undisfigured by mannerism and modification from the fashion and habits of a country such for instance, as we meet with in the Indian Egyptian and Chinese representations of the human form it is scarcely entitled to the appellation of art, hence we shall in this article dismiss with very few remarks its appearance in those countries where traces of it in that condition are to be found reserving the principal part of this article for that development, simplicity of end and uniformity of pursuit which enabled the Greeks the great arbiters of form to carry it to a degree of excellence which no subsequent age or nation has been able to reach, or even rival

It seems probable that drawing and recorded language were coeval in invention In Greek we have mentioned that the same word (γραφειν) expressed the act of performing one as well as the other Goguet in his *Origine des Lois* says that the first essay of the art of writing using the expression in its most general sense, was by means of the representation of corporeal objects Its invention would thus be carried back to a period almost as remote as that of the existence itself of the human race The earliest people he says naturally used this method for exhibiting their thoughts and commenced by representing to the eye the objects they wished to impress on the mind The origin however of painting properly so called involved as it is in the greatest obscurity presents one of the most difficult questions in the history of the arts and opinions are very much divided as to the country that gave birth to it Some authors have assigned its invention to a period antecedent to the siege of Troy (*Plin* l xxv) Others to one long after (*Plin* l xxxv) Lhoyer says that the Egyptians boasted of being acquainted with the art six thousand years before the Grecians, but his words are Affirmant vana prædicatione ut palum est Profane no less than sacred history rejects such a chimera But though such a period of antiquity be fabulous it is quite certain that painting was much used by them at a very early period It is argued by Goguet that as much as it was in his power Cambyses destroyed the monuments of art he found in Egypt Hence may be considered as posterior to his invasion such of the monuments as display specimens of the art The epoch whereof we are speaking is 525 B C This, however, is an argument far from satisfactory where all is conjecture The specimens Egyptian [illegible] extant exhibit a collection of [illegible] figures which indicate extremely slender advances in the art They are all rudely and falsely drawn no notion of grouping as we understand it nor sentiment, appears in any of their productions As the Phœnicians were an early cultivated people and have the credit of the invention of letters they may perhaps have a claim to the invention equal to that of any other nation In the time of Solomon 1012 B C they were so well skilled in the arts that that king employed them in building the temple The Scriptures record the magnificence and splendour of their buildings abounding with decorated apartments and sculptured ornaments and we know from the coins of the Phœnicians that have reached us that in the design and execution of their coinage they were not far behind the Greeks

Thou also son of man take thee a tile and lay it before thee and pourtray upon it the city even Jerusalem" are the words with which the fourth chapter of Ezekiel commences, the words in the Septuagint being [illegible] This is about 590 B C, and would tend to show that the art was practised by the Jews so early as that period The commandment, "Thou shalt not make to thyself any graven image," which some sects, even in the present day construe into a prohibition against all art was merely a prohibition of the worship of idols, for we find Moses himself by the command of God employing sculpture for the sanctuary The employment of art of this nature is found also in many other passages of Scripture, which will doubtless occur to the reader.

The Persians the Arabians, and the Parthians, from the peculiar opinions they entertained, could have no claims [illegible] of the art of painting [illegible] the human

figure in a state of nudity was considered almost as indecorous as the appearance before them of a naked man himself Their figures are clothed almost invariably with drapery falling in clumsy folds profusely plaited Worshippers of fire they use no representations of the Deity, and it is curious that in their successful invasion of Egypt they displayed no taste for the arts and religion of that primeval country not that they had, perhaps, in the former much to acquire

The art of painting in China, if we may judge of it from the time it first became known to Europe, has remained the same time immemorial It has never exceeded the bounds of imitation, and even in that respect it is devoid of taste and truth The human figure with the Chinese is a distorted misrepresentation, and their perspective is attained by piling one object on the top of another till the picture is all earth and no sky Invention and imagination were never known among them, and though in many respects ingenious in manipulation, their dexterity is exhausted in painting the fins of a fish, or the petals of a plant In such a country it would be vain to look for the origin or progress of the art

Etruscan art is known to almost every person by the vases that bear that name In the article ARCHITECTURE we have touched upon the perfection at a remote period of time of the arts of Etruria, a country which in its ancient state, was the most powerful and civilized in Italy Diodorus speaks of the rich and powerful cities in their territories, and of the uncontrolled sway which their fleets exercised on the seas encircling the peninsula Though the history of this nation is involved in obscurity, though the Romans strove to remove all the memorials of their ancient fame sufficient information has reached us to demonstrate the height of perfection to which they carried the fine arts About twelve miles from the town of Civita Vecchia stood the ancient Etruscan city of Tarquinia near which are found a considerable number of sepulchral grottos, whereof some are decorated with paintings and figures much in the style of those on the Etruscan vases These antiquities have been published with a detailed description and plates by the late Mr Byres Some of the pictures represent combats and in others the subjects are dances of females all executed with considerable spirit The pottery however which we have above noticed, appears to afford the greatest number of their specimens of the arts of design the forms displayed in the contours of the vases no less than the paintings with which they are decorated evince a wonderful attainment of elegance in design purity of form and ingenuity in its delineation The power over line and the facility of execution they reached may be easily conceived from the absorbent nature of the material upon which they wrought No retouching was possible but the whole must have been completely arranged in the mind before it could be struck off by the artist Pliny states that in his day the town of Arden an ancient city of Etruria contained some paintings which he ascribes to a period anterior to the foundation of Rome and mentions with surprise their then perfect state of preservation At Lucurium also he describes some pictures of Atalanta and Helen which were simply painted on the wall and exhibited great merit in execution These Caligula after a fruitless attempt failed in removing Cere another Etruscan city boasted some paintings of an early date All these specimens are doubtless of a remote epoch but attempts to fix it with precision would not be likely to bring us to the exact or even proximate period of their execution The history of painting however can only be told under the head of Grecian art to which we shall now proceed, premising that in our account we shall use most freely the *Lectures on Painting* of the late Henry Fuseli, professor of painting of the Royal Academy who whatever may be thought of his pictures was an enthusiastic lover of his art, a scholar and a critic of the highest order

The vocabulary of the technical expressions *nature*, *beauty grace taste copy imitation, genius* and *talent* is explained as follows – By *nature* is meant the general and permanent principles of visible objects neither disfigured by accident nor distempered by disease neither modified by fashion nor local habits *Beauty* is that harmonious whole of the human frame, that unison of parts to one end, which enchants us It is the result of the standard set by the great masters of the art the ancients and confirmed by modern imitation *Grace* is an artless balance of motion and repose, springing from character, founded on propriety, and neither falling short of the demands nor overleaping the modesty of nature Applied to execution it is that delicate superpower which hides the means by which it is attained By *taste* is meant not crudely the knowledge of what is right in art but an estimation of the degrees of excellence by comparison, proceeding from justness of refinement *Copy* though generally confounded with *imitation* is essentially different in operation and meaning Precision of eye and obedience of hand are the requisites of the former without pretence to choice or selection; whereas choice, directed by judgment or taste, is the essence of imitation "Of *genius* I shall speak with reserve," says the professor, "for no word has been more indiscriminately confounded" by genius is meant the power which enlarges the circle of human knowledge, which discovers new materials of nature, or combines the known with novelty whilst *talent* arranges, cultivates and polishes the discoveries of genius

Religion was the motive of Greek art, it was therefore natural that they should endeavour to invest their own authors, for they considered themselves of divine origin, with the most perfect form, and as man possessed that exclusively, they completely and intellectually studied his elements and constitution The climate that was favourable to the development of that form, the establishment of exercises by their civil and political institutions, created models in nature which raised Greek art to the highest excellence

Skiagrams, or simple shaded outlines, similar to those known under the name of *silhouettes*, were the first essays of the art They had no addition of character or feature but what the profile of the object thus delineated could afford Greek art had her infancy, but the Graces rocked the cradle and Love taught her to speak If ever legend deserved belief, the amorous tale of the Corinthian maid who traced the shade of her departing lover by the secret lamp, appeals to our sympathy to grant it"

[illegible] was the *monogram* which is the [illegible] outline filled in with the addition [illegible] From this to the *monochrom* or painting of a single colour on a tablet primed with white, then covered with what was called pume wax first amalgamated with a resinous pigment, generally of a red sometimes of a dark brown or black colour was the next advance Through this inky ground the outlines were traced with a firm though pliant *style*, called a *cestrum* the line could be altered with the finger or a sponge and easily replaced by a fresh one When the whole was settled it was suffered to dry, and covered with a brown encaustic varnish, the lights were worked over again and rendered more brilliant with a more delicate point according to the gradual advance from mere outlines to some indication, and at last to masses of light and shade thence to the superinduction of different colours or the invention of the *polychrom*, which, by the addition of the pencil to the style, raised the stained drawing to a legitimate picture and at length produced that vaunted harmony the magic scale of Grecian colour. If these conjectures be founded in fact the supposed momentaneous productions on the Etruscan vases, which we have above noticed would be no longer matter of astonishment and indeed it appears much more likely that such should have been the case than that the figures so drawn should have been the magic produce of a winged pencil rather than the result of gradual improvement exquisitely finished *monochroms*"

The period at which the Greeks planted the cestrum cannot be ascertained Apollodorus of the 90th Olympiad, and Zeuxis in the 94th are said to have used it with freedom and power, Parrhasius painted the battle of the Lapithæ and Centaurs on the shield of the Minerva of Phidias to enable Mys to chase it, but this was most probably a monochrom designed with the cestrum for greater accuracy It was nearly a century after this that Apelles and Protogenes had a competition in drawing lines with the pencil in which delicacy and evanescent subtlety being the characteristic some notion of their mechanical skill may be formed Of the *encaustic* method used by the ancients no account can be given on which reliance may be placed The most probable account," says Fuseli "is that it bore some resemblance to our oil painting and that the name was adopted to denote the use of the materials inflammable or prepared by fire, the supposed durability of which whether applied hot or cold authorized the terms [illegible] and *encaustic*"

Polygnotus is the first great name that appears on record at a period when some satisfactory history of the art might be commenced He flourished about 400 years B C So great was his success in the Pœcile at Athens and the Lesche or public hall at Delphi, that in a general council of the Amphictyons, it was solemnly decreed that his expenses, whenever he travelled in Greece should be borne at the public charge. From the description of his pictures by Pausanias, it would seem that composition in painting, as we now understand that term, was not at all understood, inasmuch as that author begins his description at one end of the picture and finishes at the opposite extremity, which indicates pretty plainly that there could be no central group or figure to which the rest were subordinate. Aristotle says that Polygnotus improved his model, and it would be unjust to pronounce considering the variety of powers [illegible] arts of his pictures were distinguished, that the primitive arrangement we have just mentioned arose from want of comprehension in the artist

After Aglaophon, Phidias Panænus, Colotes, and Eve-

nor, the father of Parrhasius, came Apollodorus, the Athenian "This painter applied the essential principles of Polygnotus to the delineation of the species, by investigating the leading forms that discriminate the various classes of human qualities and passions The acuteness of his taste led him to discover that as all men were connected by one general form, so they were separated each by some predominant [illegible] racter and bound them to a class [illegible] considered Apollodorus as the first colourist of his age It is probable from their descriptions that he was the inventor of local colour and tone, which received from the former the term splendour Zeuxis succeeded to Apollodorus, and, by uniting in one figure the most perfect parts of many models produced an ideal form, which, in his opinion, constituted the supreme degree of human beauty. Lucian describes a picture he exhibited at the Olympic games as remarkable for its invention It was the representation of a female Centaur suckling her young, and the account is to be found in the memoir inscribed with the name of Zeuxis This artist used but few colours; but he seems to have understood the extension of light to masses, from the circumstance of his painting monochroms on a black ground, adding the lights in white. "Pinxit et monochromata ex albo," says Pliny

Parrhasius, a native of Ephesus, but a citizen of Athens, was the son and disciple of Evenor, and cotemporary of Zeuxis By his subtle examination of outline, he "established that standard of divine and heroic form which raised him to the authority of a legislator from whose decisions there was no appeal That he was a thorough master of allegory is evident from his embodying by signs universally understood the Athenian people (ΔΗΜΟΣ) in which he expressed at once its contradictory qualities "Perhaps' observes Fuseli, 'he traced the jarring branches to their source the aboriginal moral principle of the Athenian character which he made intuitive This supposition alone can shed a dawn of possibility on what else appears impossible' In his competition with Timanthes the Cythnian or, as some say of Sicyon he had the mortification to have been declared by a majority of votes inferior to him [illegible] ject of the competition in which he was thus defeated was the contest of Ajax and Ulysses for the arms of Achilles

No picture of antiquity has acquired so much celebrity as the sacrifice of Iphigenia in Aulis by Timanthes Quintilian informs us that it was painted in contest with Colotes of Teos, an artist from the school of Phidias and crowned with victory at its rival exhibition This picture, which has been the subject of the unlimited praise of critics of antiquity, has, in modern times been the subject of criticism from the circumstance of Timanthes hiding the face of the father (Agamemnon) of the victim to be immolated in his mantle unable by his art to express the intensity and agony of his grief Upon this Sir Joshua Reynolds observes in his Eighth Discourse, "If difficulties overcome make a great part of the merit of art difficulties evaded can deserve but little commendation' The French critic Falconet has not been less unsparing than the president in his condemnation of the artifice The answer of Fuseli to these critics appears to us satisfactory He says 'The subject of Timanthes was the immolation of Iphigenia Iphigenia was the principal figure, and her form her resignation or her anguish, was the painter's principal task the figure of Agamemnon, however important, is merely accessory and no more necessary to make the subject a completely tragic one than that of Clytemnestra the mother no more than that of Priam, to impress us with sympathy at the death of Polyxena." Again, 'They ascribe to impotence what was the forbearance of judgment Timanthes felt like a father, he did not hide the face of Agamemnon because it was beyond the power of his art,—not because it was beyond the possibility but because it was beyond the dignity of expression, because the inspiring feature of paternal affection at that moment and the action which of necessity must have accompanied it could either have destroyed the grandeur of the character and the solemnity of the scene, or subject the painter with the majority of his judges to the imputation of insensibility' The same expedient to express grief was adopted by Michael Angelo in the figure of Abijam, and by Raphael in the Expulsion from Paradise, borrowed from Masaccio These were the artists who formed the second school of art, and established its end and limits on it was founded the third period of style, in which refinement induced a grace and beauty to forms not to be surpassed The masters of this period were Apelles, Protogenes Aristides, Euphranor Pausias, and the pupils of Pamphilus and his master Eupompus This last-named artist was of Sicyon; and his authority was so great that out of the Asiatic and Grecian schools of painting he formed a third by dividing the last into the Attic and the Sicyonian When consulted by Lysippus (*Pliny*, l. xxxv.) on a standard of imitation in art, he pointed to the crowd passing by; observing that nature,

not an artist, should be the object of imitation Pamphilus, a Macedonian the master of Apelles, and the most scientific artist of his day adopted the doctrines of Eupompus To the art of painting he joined the study of mathematics, and held the opinion that without the aid of geometry no painter could ever arrive at perfection. In Apelles of Cos, or, according to Lucian, of Ephesus, we are told by Pliny unrivalled excellence was found Grace was his powerful and peculiar faculty, in which and in knowing where to stop, he surpassed all that preceded him, and left not his equal in the world The story of the lines which were drawn by himself and Protogenes in competition with each other is not a legendary tale, but a well-attested fact into the nature of them however, it would be now useless and unavailing to inquire Aristides of Thebes and cotemporary of Apelles was the first who by the rules of art attained a perfect knowledge of expressing the passions and affections of the mind The history we have of the picture which Alexander, at the sacking of Thebes, sent to Pella, proves his power of infusing the passions into his works In it were expressed the anguish of maternal affection and the pangs of death Euphranor the Isthmian and pupil of Aristides, is said to have carried still farther the refinements of that expression so powerful in the hands of his master Skilled in sculpture as well as painting, his conceptions were noble and elevated, his style masculine and bold, and he was the first who distinguished himself by imparting majesty to his heroes

Asclepiodorus, the Athenian sculptor as well as painter was as the latter celebrated for the beauties of a correct style and the truth of his proportions Apelles allowed himself to be in these respects, as much inferior to this artist as he was to Amphion in the good ordering and disposition of his figures About this period appeared Nicomachus Nicophanes Pyreicus and others Nicias, an Athenian, 322 B C was in great repute for the great variety and noble choice of his subjects for the mode of distributing his lights and shadows and for consummate skill in the representation of quadrupeds In Rome, about 301 B C Fabius, a noble Roman, painted the Temple of Health and gloried so much in the art that he assumed the surname of Pictor Without a further enumeration of masters we may add, that for a long period after the reigns of Vespasian and his son Titus, painting as well as sculpture continued to flourish in Italy Even under their successors Domitian Nerva, and Trajan they met with as much encouragement as in the most palmy state of the arts in Greece Under Adrian Antonine Alexander Severus Constantine, and Valentinian the art of painting continued to be an object of interest but at length, in the reign of Phocas with the fall of the empire with the rest of the noble arts and sciences it was involved in the common heap of ruins

Painting in Italy owes the dawn of its restoration to the feeble rays that emanated from the pencil of Giovanni Cimabue who was nobly descended and born at Florence in the middle of the thirteenth century He was the disciple of some indifferent painters, who had been brought from Greece by the government of Florence these he soon surpassed both in drawing and colouring Without the art of managing his lights and shadows, and but slenderly acquainted with the rules of perspective he nevertheless laid so firm a foundation for the future improvement of the art as to entitle him to the name of the father of the first age of modern painting His death took place in the year 1300 at Florence where, and at Pisa some of his productions are still to be seen Giotto his pupil also a Florentine was a more able painter than his master He divested himself of the shackles in which the system of the Greek art of that age had bound his master adding somewhat of grace to his figures and nature to his colouring Of a picture which he painted in the church D Ognissanti at Florence, representing the death of the Virgin with the Apostles about her, Vasari related that M Angelo da Buonaroti used to say that the truth could not be nearer approached than in it — Non potere essere più simile al vero di quello ch era He was the friend of Dante and Petrarch, and painted the portrait of the former On his decease, in 133 , the city of Florence erected his statue in marble over his tomb

In the year 1410 thirty years before the invention of printing by Gutemburg, John Van Eyck, born in the Low Countries in 1370, is understood to have invented the art of painting in oil, which he taught to Antonello of Messina, who visited Flanders to become acquainted with the secret he it was who first practised and taught it in Italy The principal masters who flourished in this first period of the resuscitation of the arts were Andrea Orgagna, so celebrated for his Loggia in the great square at Florence, Pietro Cavallino, Stefano, Bonamico, Buffalmacco, Pietro Laurati, Lippo Spinello Casentino, Pisano, &c The art did advance though but slowly, gathering little strength till the appearance of Masaccio Sculpture had already produced respectable specimens of its reviving powers in the basso-relievi of Lorenzo

Ghiberti some works of Donato, and the Christ of Philippo Brunelleschi when the first symptoms of imitation appeared in the frescos of Tommaso da San Giovanni commonly called Masaccio, from the total neglect of his appearance and person Masaccio first conceived that parts are to constitute a whole, that composition ought to have a centre, expression truth, and execution unity his line deserves attention, though his subjects led him not to investigation of form, and the shortness of his life forbade his extending those elements [illegible] nearly a century afterwards, carried to perfection" Masaccio who was born in Tuscany in 1417 is considered the father of the second or middle age of painting His death caused it is supposed, by poison, occurred in 1443 Andrea Montegna, born at Padua in 1431, was a disciple of Jacopo Squarcione Though correct in his drawing, well versed in perspective and apparently acquainted with the antique albeit the best antique statues had not then come to light, his neglect of nature induced a crudeness of taste and grotesqueness of fancy He [illegible] been the first who practised the art of engraving in Italy In this place we must not forget the master of so great a man as Leonardo da Vinci, Andrea Verocchio, a Florentine, born in 1432 He was well skilled in geometry optics music architecture sculpture and painting, the last whereof he is said to have abandoned, because, in a picture whereon he was engaged of the baptism of our Saviour his pupil Leonardo had under his order painted in an angel holding up some part of our Saviour's garment so far excelling Andrea's own figures that enraged at being outdone by a youth he resolved never again to wield the pencil It is said he was the first who preserved individual likeness by moulding the face in plaster of Paris Leonardo da Vinci, of noble descent and born about 1445 in a castle so named near Florence surpassed all his predecessors His powers seem to have been unlimited he was an admirable sculptor and architect a skilful musician an excellent poet expert in anatomy and chemistry and well versed in all parts of the mathematics Rubens had a very high opinion of his works and especially of his Cenacolo in the refectory of the Dominicans at Milan which "he abandoned without finishing the head of Christ exhausted by a wild chase after models for the heads and hands of the apostles had he been able to conceive the centre the radii would have followed of course" He was many years director of the academy of painting at Milan, which city he much benefitted by his contrivance of the canal that supplies it with water from the river Adda He had the honour of expiring in the arms of Francis I — an honour by which destiny atoned to that monarch for his future disaster at Pavia when he became a captive His death took place in 1520 The last master of this period was Bartolomeo della Porta Though not endowed with the comprehension of Leonardo he first gave gradation to colour form and masses to drapery and dignity to execution Fra Bartolomeo as he was called being a member of a religious order was a native of Savignano a village about ten miles from Florence, and was born in 1469 Nudities were scarcely ever represented by him though he was a perfect master of drawing the human figure He was the first who used the lay figure Fuseli says of him He was the true master of Raphael whom his tuition weaned from the meanness of Pietro Perugino and prepared for the mighty style of Michael Angelo Buonaroti Of this master, the greatest beyond comparison that ever appeared we cannot refrain from again quoting the same author at considerable length to which if necessary, might be added the testimony of Sir Joshua Reynolds whose parting wish when he took leave of the Royal Academy was that the last words he might pronounce within its walls might be the name of this wonder of mankind "Sublimity of conception grandeur of form, and breadth of manner are the elements of Michael Angelo's style By these principles he selected or rejected the objects of imitation As painter as sculptor, as architect, he attempted and above any other man succeeded, to unite magnificence of plan and endless variety of subordinate parts with the utmost simplicity and breadth His line is uniformly grand, character and beauty were admitted only as far as they could be made subservient to grandeur The child the female meanness deformity were by him indiscriminately stamped with grandeur A beggar rose from his hand the patriarch of poverty; the hump of his dwarf is impressed with dignity; his women are moulds of generation; his infants teem with the man, his men are a race of giants" Again, "He is the inventor of epic painting in that sublime circle of the Sistine Chapel, which exhibits the origin the progress and the final dispensations of theocracy Michael Angelo was of noble family, and born at Castel Caprese, near Florence in 1474 His master was Domenico Ghirlandaio He died in great wealth, at Rome, in 1564; from thence his remains were removed to Florence, and there honourably interred His principal disciples were Marcello Venusti, Il Rosso, Giorgio Vasari and Fra Bastiano Raphael Sanzio d'Urbino was born on Good Friday in the year 1483, and died on Good Friday in the year 1520 The grace and mild genius of Raphael were perhaps, much more capable of exciting our sympathies than the burst of inspiration which the works of the last-named master universally exhibited As Michael Angelo was the father of epic painting so was Raphael that of dramatic painting "If, separately taken the line of Raphael has been excelled in correctness, elegance, and energy, his colour far surpassed in tone and truth, and harmony; his masses in roundness, and his chiaro-oscuro in effect considered as instruments of pathos, his pictures have never been equalled, and in composition, invention, expression, and the power of telling a story, he has never been approached" Giulio Romano was his greatest pupil His conceptions were more extraordinary, more profound, and more elevated than even those of the master himself His style was drier and harder than any of Raphael's school and he was frequently harsh and ungraceful He died at the age of fifty-four, in the year 1546.

Giorgio del Castel Franco called, because of his size and beauty Giorgione and Tiziano Vecelli combined to form the alluring and fascinating charm of colour Born in the Venetian States and in the same year, 1477, they laid the foundation of the Venetian school Of the latter, our professor says he penetrated the essence and the general principle of the substances before him, and on these established his theory of colour He invented that breadth of local tint which no imitation has attained, and first expressed the negative nature of shade his are the charms of glazing and the mystery of reflexes, by which he detached, rounded, connected, or enriched his objects His harmony is less indebted to the force of light and shade or the artifices of contrast, than to a due balance of colour equally remote from monotony and spots His backgrounds seem to be dictated by nature Landscape whether it be considered as the transcript of a spot, or the rich combination of congenial objects or as the scene of a phenomenon dates its origin from him he is the father of portrait painting, of resemblance with form character with dignity, and costume with subordination" Antonio Læti, or Allegri, called Correggio from the place of his birth, in the duchy of Modena completed the charms of colouring and chiaro-oscuro Giulio Romano, when he saw the Leda and Venus he had painted for Frederic duke of Modena, de[illegible] [illegible] possible for colouring to be carried [illegible] Hardly [illegible] at Venice and Parma, at which last place he passed the greater portion of his life, and died at the age of forty in the year 1534 Though the power of Correggio [illegible] was that of his chiaro-[illegible] of a globe imperceptibly gliding through lucid dun tints into rich reflected shades composes the spell of Correggio and affects us with the soft emotions of a delicious dream The merits of Raphael are pathos and character the power of Titian was his colour, and of Correggio his harmony We have not space to dwell on the lively genius of Pordinone, who disputed the superiority of Titian, the meagre style of Andrea Vannochi, surnamed del Sarto nor the extraordinary vigour and puerile imbecility of conception of Pellegrino Tibaldi; but we must not pass without notice the name of Sebastiano del Piombo, a Venetian who died at the age of 62, in 1547 His name Del Piombo is derived from an office he held in the management of the lead mines given him by pope Clement VII For some time he practised the science of music to which he was bred, but the fascinations of painting drew him aside from his original pursuit and he became a disciple of old Gio-Bellino, continued his studies under Giorgione, and, having attained considerable perfection [illegible] went to Rome. Here he so ingratiated [illegible] with Michael Angelo by joining the party against Raphael that he was assisted in his designs by that great master and especially in that wonderful picture now in the National Gallery here, of the Raising of Lazarus which gained the universal applause of Rome and was even put on a par with the celebrated picture of the Transfiguration by Raphael. Equally favoured by Michael Angelo was Daniel Ricciarelli of Volterra in whose picture of Christ and the Women, in the Descent from the Cross as well as in that of Sebastian's just mentioned, the master hand that directed them is manifest The depravation of the style of Michael Angelo is sufficiently visible in the works of Giorgio Vasari, born at Arezzo in 1514, to whom the world is more indebted for the labours of his pen, in the History of the Lives of the most celebrated Painters, Sculptors, and Architects, first published at Florence, in 1550, than those of his pencil him Fuseli describes as the most superficial artist, and the most abandoned manierist of his time. "He overwhelmed the palaces of the Medici and of the popes, the convents and churches of Italy, with a deluge of mediocrity, commended by rapidity and shameless bravura of hand, he alone did more work than all the artists of Tuscany together; and to

him may be truly applied, what he had the insolence to say of Tintoretto, that he turned the art into a boy's toy" Felibien has taxed him with the flattery of the masters of his time, and partiality to those of his own country, but his work is nevertheless a valuable record of the lives of men to whom the world is much beholden, and contains many interesting anecdotes, which, but for him, would have been lost for ever His death happened in 1578 Primaticcio, the scholar of Giulio Romano made abbé of St Martin de Troyes by Francis the First studied and spread the style of his master in France, where he decorated the palaces of that king with mythology and allegory, in which he was assisted by his pupil, Nicolo del l Abbate an excellent artist Primaticcio continued in France from the period of his first establishment there, lived in great pomp and state, more like a nobleman than a painter, through four several reigns, and died at the age of 80, in the year 1570 After Polidoro da Caravaggio, whose abilities [illegible] sentations of Roman military [illegible] school scarcely deserves notice till the appearance of Nicolas Poussin of Andilly, a town in Normandy, who was born in 1594 He was descended of a noble family of Picardy, but that his productions have shed a ray of lustre on the family which no nobility of blood could have effected [illegible] the name of the French Raphael [illegible] Nicolas was the disciple of Simon Varin, a French painter of mediocrity and afterwards studied in the academy of Domenichino and also in company with the famous sculptor Francesco Flamingo, who was born in the same year and bred in the same house with him After a stay of more than 16 years in Rome, he was invited, by a letter under the hand of Louis XIII himself, to return to his native country where he was received with every honour declared first painter to the king and had a considerable pension conferred upon him Upon the death of this king and that of the cardinal Richelieu he returned to Italy to settle his affairs and re[illegible] [illegible] Rome he continued [illegible] ended his days in Rome at the age of 71 years Such was his attachment to the ancients that it may be said he less imitated their spirit than copied their relics and painted sculpture The costume, the mythology, the rites of antiquity were his element his scenery his landscape are pure classic ground His eye though impressed with the tint and breadth and imitation of Tiziano's bloom inspired him to charm with colour crudity and patches frequently deform his effects The mantle of Correggio seemed to have fallen on Parmegiano though he possessed not the mode of expressing that expanse of harmony which no other eye than that of Correggio has conceived Francesco Mazzuoli called from Parma the place of his birth Parmegiano was born in 1504 and died at the early age of thirty-six That disengaged play of delicate forms the 'Svelterza of the Italians is the prerogative of Parmegiano though nearly always obtained at the expense of proportion His grandeur is conscious as his grace sacrifices the motive to the mere simplicity to contrast His St John loses the fervour of the apostle in the orator, his Moses the dignity of the lawgiver in the savage With incredible force of chiaro-oscuro, he united bland effects and fascinating hues but their frequent ruins teach the important lesson that the mixtures which anticipate the beauties of time are big with the seeds of premature decay

Towards the end of the sixteenth century Lodovico Caracci, with his cousins Annibale and Agostino founded a school at Bologna, in which it was proposed to select the beauties, correct the faults supply the defects and avoid the extremes of the different styles and so attempt to form a perfect system The recipe of ingredients for the formation of a perfect painter are contained in a sonnet by Agostino, well known to artists they are as follows — Roman design, Venetian motion and shade Lombardy's dignified tone of colour, the fierce style of Michael Angelo, Raphael's symmetry Titian's truth to nature, and Correggio's sovereign purity add to these the decorum and solidity of Tibaldi, the learned invention of Primaticcio, and a little of Parmegiano's grace or, to save all this trouble, imitate the works of our dear Nicolo This was empiricism unworthy of such men as the Caracci, whose talents were splendid and of a very high order Lodivoco was "the sworn pupil of nature" "Agostino with a singular modesty which prompted him rather to propagate the fame of others by his graver than by steady exertion to rely on his own power for perpetuity of name combined with some learning a cultivated taste, correctness though not elegance of form, and a Correggiesque colour" Annibal, whose taste was unequal to both of these, though his power of execution was far superior, was born at Bologna, in 1560, and was the disciple of his cousin Lodovico His great work was the Farnese Palace, in which whilst we admire the vigour of the execution, we cannot help lamenting the choice of subject, which is "a chaotic series of trite fable and bacchanalian revelry, without allegory, void of illusion, merely to gratify the puerile ostentation [illegible] Such was [illegible] he genius of Raphael that his deathbed request was to be buried in the same tomb with him, which request was complied with, in the Pantheon at Rome, 1609 This eclectic Bolognese school did not last long its scholars soon followed each his own peculiar taste Its principal elves were Schidone, Guido Lanfranco Albani Zampieri called Domenichino and Francesco Barbieri called Guercino The merits of these are summed up as follows, by the admirable critic we have so often quoted in this article —"Schidone, whose mind was in his eye, embraced and often applied the harmony and colour of Correggio, whilst Lanfranco strove without success to follow him through the expanse of his creation and masses Grace attracted Guido, but it was the studied grace of theatres, his female forms are abstracts of antique beauty, attended by languishing attitudes and arrayed by voluptuous fashions His male forms, transcripts of models found in a genial climate, are sometimes characteristic of dignified manhood or apostolic fervour, sometimes stately courteous, insipid" "His Aurora deserved to precede a more majestic Sun and Hours less clumsy His colour is occasionally bland and harmonious sometimes vigorous and sometimes insipid Albani formed Nereids on plump Venetian models, and contrasted their pearly hues with the rosy tints of Loves, the juicy brown of fauns and satyrs of rich marine or sylvan scenery Domenichino aimed at the beauty of the antique the expression of Raphael the vigour of Annibal Caracci the colour of Lodovico, and, mixing [illegible] Guercino broke [illegible] mind, form, and costume to effects of colour fierceness of chiaro oscuro, and intrepidity of hand From this period the art declined rapidly in Italy it was indeed held up for a short period by the exertions of Nicolas Poussin of whom we have already spoken Pietro da Cortona and Luca Giordano possessed very considerable talents but they were much abused in their exercise by implicit obedience to the tasteless commissions of their employers

Germany though without much apparent intercourse at the time with Italy had profited by the progress of the arts therefore towards the end of the fifteenth century, we find the works of Albert Durer had succeeded the rude and uncouth productions of Schon Wolgemuth, and Altorfer Albert Durer was born at Nuremberg on Good Friday 1471 Notwithstanding his style was crude and ungraceful his prints were esteemed throughout Italy copied at Venice by the celebrated Marc Antonio, and so much admired by even Raphael himself that he decorated his own chamber with them and often lamented that such a man had been educated in a country where the want of models and works of art must have so retarded his progress His principal works were painted at Prague for the Emperor Maximilian I He died in 1528 Fuseli says of him Albert Durer was, in my opinion a man of great ingenuity without being a genius He studied and as far as his penetration reached established certain proportions of the human frame but he did not invent a style every work of his is a proof that he wanted the power of invention of concluding from what he saw to what he did not see, that he copied rather than selected the forms that surrounded him and sometimes tacked deformity and meagreness to fulness and sometimes to beauty Lucas of Leyden was but a clumsy imitator of Albert Aldegraver, Beheim and George Pentz from the study of Raphael, known to them through the medium of Marc Antonio's prints and from the style of Michael Angelo, distilled through prints from [illegible] seem to have made some advances in the [illegible] Luckily sight never of its state in Italy attracted hosts of German, Dutch and Flemish students, who though content to feed on the husks of Tuscan design imbibed the colour of Venice, and spread the elements of that excellence which distinguished the succeeding schools of Flanders and of Holland

Peter Paul Rubens, born in Cologne in 1578, and Rembrandt Van Rhyn born near Leyden in 1606 by their extraordinary powers showed that Italy was not the only spot in which art could take root, but that Flanders and Holland afforded a soil in which it could flourish The former of these, bred at Antwerp under the instruction of Otho Van Veen, had, previous to his journey to Italy acquired an unbounded power over the instruments of his art, and on his arrival was the successful competitor for fame with those masters whom he selected as objects of emulation Venice was the centre of attraction for him; and there from the splendour of Paulo Veronese, and the glow of Tintoretto he compounded "that florid system of mannered magnificence which is the element of his art, and the principle of his school" His scholars saw through the eye of their master instead of seeing through that of nature, but from this censure must be excluded the illustrious name of Van-

dyck, and that of Abraham Diepenbeck Of the portraits of Vandyck no mention is here necessary to enhance the esteem in which they are held " The fancy of Diepenbeck, though not so exuberant excelled in sublimity the imagination of Rubens his Bellerophon Hippour is Ixion, Sisyphus fear no competitor among the productions of his master Rembrandt, except in what relates to form, was a genius of the highest order " In spite of the most portentous deformity and without considering the spell of his chiaro oscuro such were his powers of nature, such the grandeur, pathos, or simplicity of his composition, from the most elevated or extensive arrangement to the meanest and most homely, that the best cultivated eye the purest sensibility and the most refined taste dwell on the sequestered portrait" His [illegible] which they deserve to be called were a race of "colourists content to tip the cottage, the hamlet, the boor, the ale pot, the shambles and the haze of winter with orient hues or the glow of setting summer suns "

Switzerland rests its title to distinction on the names of Hans Holbein and Francesco Mola, the former of Basil, born in 1498, died in London at the age of 46, the latter, the scholar of Giuseppe d Artino and Francesco Albani, was born at the village of Coldre in 1621 and died in Rome in 1666 The Swiss school exhibited a style poised between the emaciated dryness of Albert Durer and the bloated corpulence of Goltzius

The school of the Caracci seems to have taken its deepest root in France, which with few exceptions has not produced artists greatly above mediocrity The exceptions however, which are to be named are Nicolas Poussin who has already been mentioned to this must be added those of Eustache Le Sueur, Charles Le Brun, Sebastin Bourdon and Pierre Mignard "The Seven Works of Charity by S Bourdon teem with surprisingly pathetic and always novel images and in the Plague of David by Pierre Mignard our sympathy is roused by energies of terror and combinations of woe which escaped Poussin and Raphael himself

From what cause may be difficult to say but the labours of the Spanish school were confined almost within the narrow limits of individual imitation The degree of perfection in this respect was indeed great though the means pursued were very different and the works of Diego Velasquez Joseph Ribera and Murillo though never approaching the great style of art impress us with respect for their powers and deservedly received the homage of the Spanish nation

In this country Henry VIII was the first monarch who seems to have taken any interest in the art He invited Titian to England and patronised Holbein and Porregiano But this patronage very unlike that bestowed by Francis I on Andrea del Sarto Primatic to Nicola, Cellini and others was so restricted in the choice of subjects that neither Henry nor his daughter Elizabeth deserve our veneration for the assistance they rendered to the arts of the country In the court of Henry's father a profligate Flemish painter of the name of Mabuse, had indeed been employed but it is not known whether he came here at that king's solicitation or driven by his own distresses The pencil of Holbein among its other employments was of course employed to portray the beauties of Henry's wives or of those he intended to make so sometimes indeed to obtain a just report of the latter he was despatched to the Continent and in the case of Anne of Cleves through his faithless pencil Cromwell the minister lost his head If painting was at this period likely to have taken root and flourished here, the Reformation and the worse than absurd edicts passed by Edward VI and Elizabeth forbidding statues and pictures in churches were nipping frosts that destroyed its growth Charles was the first real patron of the arts that governed this country By him was Rubens invited to the country but the unfortunate fate of the monarch intercepted the progress that art then seemed likely to make His son in possession of the cartoons of Raphael, and with the magnificence of Whitehall before his eyes suffered Verrio to contaminate the walls of his palaces or degraded Lely to paint the Cymons and Iphigenias of his court whilst the manner of Kneller swept away completely what yet might be left of taste under his successors The state of art continued extremely low in this country till the appearance of Reynolds Walpole says that in the commencement of the reign of George I the arts of England were sunk almost to the lowest ebb The names of Reynolds Hogarth Gainsborough, and Wilson, in their time entitled this nation to some rank in the art; though we have as yet had no indication of that great style of art whose history has occupied a considerable portion of the preceding pages The names we have mentioned have been succeeded by others, and some now living, which have, perhaps, not only prevented the accusation of a retrograde movement, but have raised the art generally in the country higher than it was ever known in a preceding period yet much remains to be done The genius of the nation seems bound up in commerce and politics; total ignorance of the first principles of art seems still to pervade those who only are capable of affording patronage, and many a collector, on whose walls hang the most splendid specimens of the Roman and Florentine schools, must, if he will speak the truth, admit that his admiration of the tobacco pipes pewter pots, and vulgar boors of the Dutch school a school of low ideas and good painting, is more profound than of the sublime conceptions of Raphael and Michael Angelo

Practice of Painting — The nature of this work precludes a very enlarged notice of the theory and practice of painting we shall however subjoin a few leading observations on the subject One of the principal requisites for its successful practice is *anatomy* It is obvious that to represent successfully the human form its construction in the skeleton, and the tendons and muscles by which the bones of the skeleton are connected and move, is knowledge that must be acquired, inasmuch as they appear more or less through the integuments with which they are covered Without this knowledge the living model becomes useless to him, for that, after a very short period of standing, sinks into languor, which an acquaintance with the origin and insertion of muscles enables the painter to correct, and thus animate the work It was the constant observation of the youth in [illegible] and develop the muscular system in their sculpture these afforded models of the most perfect nature *Comparative anatomy* is another of the requisites to be acquired by the artist, since the painting of animals must necessarily involve a want of the same information as is requisite for the human figure *Symmetry* which results from the relative proportion of the parts to each other follows from the knowledge of anatomy It is by the knowledge of this that the length of a finger may be made to measure the height of a figure Without the most thorough acquaintance of the rules of *perspective* no objects can be placed properly in a picture Some have said that though it is a science of the first importance to a painter yet he is not to be too strictly confined to its rules but to endeavour to render them subservient to his own purposes We confess that such is not our opinion nor can we conceive how any violation of truth which any infraction of the rules of perspective would be can be made agreeable in a picture The rules, too of perspective are so simple, and their practice so easily acquired that no excuse can be admitted for the neglect of so indispensable an accomplishment The science of *optics* is so far necessary as to enable the artist to determine how the reflexes against the sides of surfaces in shade would affect the intensity of them This is called chiaro oscuro The determination of shadows, and the direction in which they would fall, depends upon the science of optics combined with that of perspective As perfect form is produced by leaving out peculiarities, and retaining only general ideas, so this principle extended in the other branches of the art, gives what is called the grand style to invention to composition, to expression and even to colouring and drapery *Invention* in painting is not the same as in poetry, inasmuch as that the subject is supplied by the poet or historian The subject should be general, and kept free from all that might tend to embarrass or divide the attention of the spectator 'Whenever," observes Sir Joshua Reynolds in his Fourth Discourse, "a story is related every man forms a picture in his mind of the action and expression of the persons employed The power of representing this mental picture on canvass is what we call invention in a painter, and as in the conception of this ideal picture the mind does not enter into the minute particularities of the dress furniture, or scene of action so when the painter comes to represent it he contrives those little necessary concomitant circumstances in such a manner that they shall strike the spectator no more than they did himself in his first conception of the story The painter may deviate from strict historical truth [illegible] grandeur of his design, such being but [illegible] 'A painter of portraits retains the individual likeness, a painter of history shows the man by showing his actions He has but one sentence to utter but one moment to exhibit *Expression*, which in painting signifies the representation of the emotions and passions of the mind must, like invention not descend to peculiarities Thus Bernini, in representing David casting the stone from his sling, mistook accident for generality when he made him bite his under lip *Colouring* also, has its laws and in this the same general principle must be attended to All trifling or artful play of little lights, or an affectation of variety of tints is to be avoided, a quietness and simplicity must reign over the whole work, to which a breadth of uniform and simple colour will very much contribute. Grandeur of effect is produced by two different ways, which seem entirely opposed to each other One is by reducing the colours to little more than chiaro oscuro, which was often the practice of the Bolognese schools and the other by making the colours very distinct and forcible, such as we

see in those of Rome and Florence, but still the presiding principle of both those manners is simplicity" *Drapery*, again, is managed by the same general laws minute attention to the minor details of drapery injure the general effect, the folds should communicate easily, and be so cast as to have the appearance of accident, they must also be so contrived as to give the greatest effect to the figure Artifice is as much as possible to be avoided

Annibal Caracci considered twelve figures sufficient for any story, more than that, he thought, could only be employed to fill up space, or, as he expressed himself, they would be figures to be let.

Painting is divided into twelve branches, which their names sufficiently explain, viz history, which comprises mystory and allegory, grotesque, such as the celebrated Loggia at the Vatican, portrait fancy, animals, fruits and flowers, battle pieces, landscape sea views; still life, which comprises all inanimate objects, but is chiefly applied to household furniture and instruments and architecture

PAI'RING In Parliamentary language that practice by which two members of the House of Commons, of opposite political opinions agree to absent themselves from divisions of the house during a stated period See PARLIAMENT

PA'LACE (Lat palatium whose etymology is not precisely ascertained) In Architecture a word generally used to denote the residence of kings and princes On the Continent however, the term is used with a much more extended signification, and even in this country the residences of bishops, and of some noblemen are so called

PA'LACE COURT A court of justice erected by Charles I, and made a court of record with power to try personal actions between party and party within a liberty extending to the distance of twelve miles round Whitehall Various malpractices having crept into this court, it was found necessary to effect its abolition in 1849

PA'LADIN In the Romances of the Middle Ages a term derived from the Roman Palatinus (from palatium *a palace*) having its origin in the customs of the Byzantine court by which the officers of the palace (palatini comites palatii) were regarded as the highest dignitaries of the country, hence palasin or paladin in the early French romances for a lord or chieftain and the name was thence appropriated by the Italian romantic poets to the heroes of their legends the warriors of Charlemagne

PALÆOGRAPHY (Gr παλαιος *ancient* and γραφω *I write*) The science or art of deciphering ancient inscriptions, including the knowledge of the various characters used at different periods by the writers and sculptors of different nations and languages, their usual abbreviations initials &c The science termed diplomatics is in effect a branch of palæography (See DIPLOMATICS) Among many other modern authorities on this subject, the reader may be referred to Mr Ottley's remarkable paper in the *Archæologia* vol xxvi on an ancient MS of Aratus Champollion *Traité d'archéographie* the publications of the Ecole des Chartes under the directions of M Champollion at the Royal Library at Paris, Kopp, *Bilder und Schriften der Vorzeit* 1819 *Palæo-Critica* 1817 The most valuable compilation of palæographical knowledge is to be found in the *Traité de Diplomatique* of the Benedictines of St Maur 6 vols 4to 1748 See also *Maffei*, *Istoria Diplomatica* 1727, Trombelli *Arte di Conoscere l'Età de Codici* 1778 But as Mr Ottley truly observes nothing is more fallacious than the idea of being able to determine the ages of ancient inscriptions from the particular forms of their characters, and it is more folly upon such grounds to attempt to build any solid argument"

PALÆONTOLOGY (Gr παλαιος *ancient* λογος *a discourse*) The branch of zoological science which treats of fossil organic remains

PALÆOTHE'RIUM (Gr παλαιος and θηριον *beast*) The name of a genus of extinct Pachydermata It was characterised by having twenty eight complex molar teeth, four canines, and twelve incisors four in each jaw Cuvier concludes that the palæotheres like the tapirs had also a short fleshy proboscis Their remains characterize the gypsum quarries belonging to the eocene tertiary formations near Paris They have also been found in the corresponding strata of the Isle of Wight About twelve species of this extinct genus are already known

PALÆ'STRA (Gr παλαιστρα) Properly a wrestling place or school (παλαιειν *wrestling*) and hence the place where public games of strength were performed and, by metaphor such games themselves (*studium palestræ*, Horace) In Architecture, the palæstra was a part of the gymnasium (see *Pausan* vi 21 2, and 23 4), especially appropriated to the athletes The art of wrestling was termed palæstrice (παλαιστρικη).

PALANQUI'N A sort of chair or chaise used by the Chinese, and in most parts of the East, as a vehicle of conveyance from one place to another They are furnished with cushions and curtains, many of them are fitted up in the most costly style, and are usually borne by eight men, who relieve each other at intervals

PA'LATALS (Lat palatum, *the palate*) The letters *d*, *g*, soft and hard *j* *k* *l* *n* and *q* are so called, from the organ chiefly employed in their pronunciation

PA'LATE (Lat palatum) In Anatomy, the roof of the mouth That part which is formed by the lower portions of the superior maxillary and palatine bones is called the "hard palate," that which is due to the extension of membranous and muscular substance unsupported by bone is termed the "soft palate" In Zoology the modifications of the bony palate, and the "palatal ridges," and other inequalities of the soft parts are of use in the classification of the species of Mammalia

PALATE (Lat palatum) The base of the lower lip of a personate corolla

PALATINATE The name formerly given to two states of Germany, which were designated, by way of distinction, the Upper and Lower Palatinate and though not contiguous, were under the control of the same sovereign till 1620 At that period they underwent great changes which it would be out of place here to indicate, but since the wars of the first French revolution, which contributed more than any event on record to unsettle the ancient landmarks they have been divided among different German sovereigns and their very name has disappeared from the maps of Germany The word Palatinate is of feudal origin and signifies, in a more restricted sense the province or seigniory of a palatine, i e of a high dignitary during the middle ages who originally held office in the court of the sovereign and was designated the *comes palatii* but who afterwards obtained the privilege of exercising the same power, rank, and jurisdiction within his own province or district, as the comes palatii exercised in the palace

PALATINE COUNTY See COUNTY

PALATO PHARYNGEUS A muscle which arises at the root of the uvula and soft palate and is inserted into the upper and back part of the thyroid cartilage, it draws the uvula and soft palate downwards and backwards and pulls the thyroid cartilage and pharynx upwards

PALE (Lat palus *a stake*) In Heraldry the first and simplest kind of ordinary It is bounded by two vertical lines at equal distances from the sides of the escutcheon of which it encloses one third It seldom contains more than three charges The *pallet* when borne by itself is one half of the pale but sometimes as many as three pallets are borne together A coat bisected by a vertical line with different field on each side of it is said to be *party* (or divided) *per pale* The pale is a very ancient and honourable bearing

PALE WITHIN THE The expression well known in Irish history applied to that portion of Ireland to which for some centuries after its invasion by the English under Henry II in 1172 the dominion of the latter was confined The limits of the *pale* seldom extended beyond the modern province of Leinster and were frequently much less considerable (*Statistics of the British Empire* vol i p 429)

PALEA (Lat palea *chaff*) A name given to the bracts that are stationed upon the receptacle of Compositæ between the florets and having generally a membranous texture and no colour, also the interior bracts of the flowers of grasses

PALES The Italian goddess presiding over cattle, who was worshipped with great solemnity Her festivals, called *Palilia* were celebrated on the 21st of April the day upon which according to tradition the foundations of Rome were laid by Romulus — the dies natalis urbis Romæ — as a great rustic holiday On this day the shepherds purified their flocks by making them pass round a great fire made of laurel pine, and olive branches, sprinkled with sulphur An offering of wine, milk and millet was then placed on the altar of the goddess who was entreated to bless the earth and the flocks with fecundity and to avert injury from them both The term *palilia* is frequently written *parilia* in the ancient MSS, but no doubt can be entertained as to the correctness of the former

PALETTE (Fr) In Painting the light board held by a painter while at work, on which the colours are arranged in their various tints

PA'LFREY A word seldom used, except in novels and romances to signify a small or gentle horse such as is fit for a lady's use It is also used by the old poetical writers for a horse used by kings or nobles on state occasions

PALICI In Grecian Mythology twin divinities worshipped in Sicily and especially in the neighbourhood of Etna; sons according to some of Jupiter and Thalia the daughter of Vulcan, according to others of Vulcan and Ætna, daughter of Ocean Their heads appear on coins of Catania Their name is said to be derived from returning (παλιν *iterum*) out of the earth, under which

their mother had borne them (*Æschyl Ætna*, apud *Macrob Saturn*, v 19.) Their celebrated Sicilian temple is mentioned by Virgil: —

Pinguis ubi et placabilis ara Palici *Æn* ix 585

PALI'LLOGY, or PALILOGY. (Gr παλιν, *again*, and λεγω, *I speak*) In Rhetoric, the repetition of a word, or fragment of a sentence, for the sake of greater energy: also, epanalepsis and epizeuxis Thus Cicero (*pr Cæc* x 24 "Ferro hqui't, ferro, te rejeci," "The living the living shall praise thee" (Psalms) A peculiar species of palilogy also called *deuterologia*, or *anadiplosis*, is where the last word of a verse, or of a paragraph in prose, is repeated at the beginning of the next —

——— supervenit Ægle —
Ægle naiadum pulcherrima. *Virg Eclog* vi 20

——— the innocent sleep —
Sleep that knits up the ravell'd brow of care *Macbeth*

PA'LIMPSEST (Gr παλιν, *again*, and ψαω, *I rub or efface*) The name given to a sort of parchment from which whatever was written thereon might be erased so as to admit of its being written on anew The term means literally *twice-rubbed* (*membrana iterum abrasa charta deletilis*), not as the glossary of Ducange would seem to denote, because the parchment had twice undergone erasure, or the writing been twice obliterated but because it had been twice prepared for writing which was principally effected by rubbing it with pumice, first in the course of manufacture after the skin had been cured, and again by the same process after the original writing had been taken away by washing or in any other manner The strict and precise sense of *palimpsest* is therefore "twice prepared for writing" the repetition of such preparation being the prevailing idea in the etymology and not erasure, as some have erroneously supposed The great antiquity of the practice of making palimpsests may be gathered from an extract from a letter from Cicero to Trebatius — Ut ad epistolas tuas redeam cætera belle, &c nam quod in palimpsesto laudo equidem parsimoniam, sed miror quid in illa chartula fuerit quod delere malueris quam hæc non scribere nisi forte tuas formulas Non enim puto te meas epistolas delere ut reponas tuas An hoc significas nihil hiemis? Frigebat? Ne chartam quidem tibi suppeditare (*Cic ad Fam* l 7 c 18) But while there can be no doubt as to the antiquity of this practice, the attention of the learned was first directed to the subject in modern times by Montfaucon in a curious essay entitled *Dissertation sur la Plante appellée Papyrus* &c which appeared in the *Mem de l Acad Fran* vol vi and in which the origin of the Palimpsest MSS is briefly and plainly described in the following words —

"Cela (le papier bombycin) vint fort a propos dans un temps ou il paroit qu'il y avoit grande disette de parchemin ce qui nous a fait perdre plusieurs anciens auteurs voicy comment Depuis le 12e siècle les Grecs plongez dans l'ignorance s'aviserent de racler les ecritures des anciens MSS en parchemin et d'en oter autant qu'ils pouroient, toutes les traces, pour y ecrire des livres d'Eglise ce fut ainsi qu'un grand prejudice de la republique des lettres les Polybes les Dions les Diodores de Sicile, et d'autres auteurs que nous n'avons plus furent metamorphosez en Homelies en Pentecostaires en Homelies et en d'autres livres d'Eglise Après une exacte recherche, je puis assurer que des livres ecrits sur du parchemin depuis le 12e siècle j'en ay plus trouvé dont on avoit racle l'ancienne ecriture que d'autres Mais comme tous les copistes n'estoient pas également habiles à effacer ainsi ces premiers auteurs il s'en trouve quelques-uns où l'on peut lire au moins une partie de ce qu'on avoit voulu raturer

We have already seen that the practice of which Montfaucon speaks had a much more ancient date than that which he assigned to it, although it was in all probability most frequent during the middle ages when, in consequence of the scarcity and expense of parchment, and the growing demand for the writings of the fathers and of books of devotion the monks were induced to efface the writings of the ancient authors to make room for their own Our limits preclude us from entering at length into the means adopted by the monks of effacing the original writing, or of that still more interesting process by which in recent times the original writing has been again brought to light and which has thus put us in possession of some most valuable works and fragments of the classic authors which had been given up as lost. On these points we beg to refer the reader to an able article in the *Edin Rev* vol xlviii, in which all that has been done in the restoration of ancient MSS is set forth with great clearness and brevity; and shall content ourselves with observing, that the most important of these discoveries are the treatise of Cicero, *De Republica*, which was found in the Vatican library at Rome, in a MS which had been rewritten, with a Commentary of St. Augustin on the Psalms; and the *Institutions of Gaius*, found also in the same place. For the restitution of the former the learned world is indebted to Angelo Mai, the principal librarian of the Vatican library at Rome, who may [illegible] palimpsests, and for the [illegible] Goeschen who were sent to Rome for the purpose of examining MSS by the Royal Academy of Sciences at Berlin

PALI'NDROMUS (Gr. παλιν, and δρομος, *a course*) A verse or line which was the same when read backwards or forwards The well-known verse which has been put into the mouth of the devil may serve for an example: —

Signa te, signa, temere me tangis et angis.

PALINGENE'SIA (Gr παλιν, and γενεσις, *birth*) In Philosophy, a new or second birth—regeneration The doctrine of the destruction and reproduction of worlds and living beings is oriental, but the word in question appears to be of Stoical origin (*Diog Laert* vii 72) The Stoics are said to have held that the demiurgus or creator had absorbed all forms in himself and reproduced [illegible] In the language of the New Testament it [illegible] (Titus iii 5)

PA'LINODE (Gr παλιν *again* and ᾠδη *song*) In Poetry a recantation properly a piece in which the poet retracts the invectives contained in a former satire (See *Mem de l Acad des Inscr* vol xii)

PALINU'RUS The steersman of the vessel of Æneas, drowned according to Virgil off the coast of Italy (Æn v) and afterwards met with by the Trojan hero in the shades A promontory on the coast received his name

PA'LISADES or PALISADOS In Fortification, stakes driven into the ground, and sharpened at the top, for the purpose of defence against the surprise of an enemy They are usually 9 or 10 feet long and planted so as to make an angle inclining outwards from the work

PA'LLA In Latin, the long outer garment appropriate to Roman females of respectable rank A part of it was thrown over the left shoulder, and hung down from the arm It is particularly described by Apuleius (*Met* xi) The palla was not worn by men except some effeminate persons, although the long robes of barbarians are sometimes called by its name by Latin writers There seems to have been a shorter palla. (*Martial* i 93)

PALLA'DIUM (Gr Παλλαδιον) A wooden statue of Minerva or Pallas which was said to have fallen from the skies as a sign to Ilus the founder of Troy, to convince him he was under the guidance of Jupiter On its preservation depended the safety of Troy, and, accordingly Ulysses and Diomed were commissioned to steal it and performed the enterprise According to other accounts the palladium was conveyed from Troy to Italy by Æneas, and was afterwards preserved with great care in the temple of Vesta at Rome The word palladium passed into European languages in which it signifies that particular law or privilege which is regarded as the safeguard of the people's liberties The trial by jury, and the freedom of the press are each called the *palladium* of the British constitution

PALLADIUM A metal discovered in 1803 by Wollaston, associated with the ore of *platinum* It resembles platinum in colour and lustre and it is ductile and malleable but very hard Its specific gravity is 11 8 Its fusibility is intermediate between gold and platinum, it is oxidized and dissolved by nitric acid its oxide forms real salts

PALLAS or more properly PALLAS ATHE'NE In Mythology the Grecian goddess of wisdom identified at a later period with the Roman Minerva, to whom were assigned all the attributes of her Grecian sister The term is probably derived from the Gr παλλω, *to brandish a spear* See MINERVA

PALLAS One of the four small planets which revolve between the orbits of Mars and Jupiter discovered by Dr Olbers of Bremen, on the 28th of March 1802 Its symbol is a lance ⚳ On account of the minuteness of this planet, and the nebulous appearance by which it is surrounded it is extremely difficult to arrive at any certain conclusion respecting its real magnitude Sir W Herschel estimated its diameter at eighty miles, and Schroeter at 2888 miles or nearly the size of Mercury, but astronomers prefer the former measure The light of the planet [illegible] the cause of which is [illegible] The following are the elements of the orbit [illegible] in the Berlin *Astronomisches Jahrbuch* for 1831 —

Semi axis major = 2 77263
Eccentricity = 0 24199
Period of revolution = 1686 25 days
Inclination = 34° 35′ 49″ 1
Longitude of ascending node = 172° 38′ 22″·8
Longitude of perihelion = 121° 5′ 0″ 5

The motion of the planet in its orbit is greatly disturbed by the powerful attraction of Jupiter See PLANET

PALLETS in Clock and Watch-work, are the pieces connected with the pendulum or balance which receive

the immediate impulse of the swing-wheel, or balance-wheel They are of various forms and constructions,

ata (Lat pallium *a mantle*, and branchia, *gills*) The name of an order of Acephalous Molluska including those in which the gills are situated on the internal surface of the lobes of the mantle

PA'LLIUM (Lat *a cloak*) A vestment which, by ancient usage, is sent from Rome to all archbishops of the Roman Catholic church and to the four Latin patriarchs of the East on their accession The history of this usage, and the gradual submission of the Western patriarchate to it authority Rheinwald, in the new *Encyclopædia* of Ersch and Gruber, art "Pallium" It is now a short white cloak, with a and falling period of the greatest power of the Roman see (introduced by Gregory VII himself) for the archbishops to come to Rome for the purpose of receiving it it is now delivered as a mandatory, or merely by a delegate from Rome Some simple bishops receive the pallium as a mark of honour The cloth of which the pallium is made is woven from the wool of ten white lambs, blessed at Rome on the festival of St Agnes, and deposited on the tomb of St Peter during the eve of his festival

PALM (Lat palma, *the hand*) An ancient measure of length taken from the extent of the hand There were two different palms, one corresponding to the length of the hand and the other to the breadth The Roman palm was about 8¼ English inches The English palm is understood to be 3 inches

PALMA'RES (Lat palma *the hand*) Muscles belonging to the hand The *palmaris brevis* is situate between the wrist and little finger and assists in contracting the palm of the hand, the *palmaris longus* is situate on the forearm and bends the hand

PA'LMER. In Ecclesiastical History a name popularly given to crusaders returned from the holy war or pilgrims from Palestine from the branch of palm tree which they were wont to carry with them as a staff in commemoration of their journey

PA'LMIPEDS *Palmipedes* (Lat palma *a palm* and pes *a foot*) The name given by Cuvier and Temminck to an order of birds corresponding to the *Anseres* of Linnæus, and the *Natatores*, or swimming birds, of Illiger

PA'LMISTRY (Lat palma *the hand*) A species of divination which foretold future events from the inspection of the lines and marks on the hands and fingers *See* CHIROMANCY

PALM OIL An article imported from the west coast of Africa it is solid and of a reddish yellow colour It is used in the manufacture of soap candles have been made of its stearine and it is sometimes burned in lamps and made into ointments It is chiefly the produce of the *Elæus Guineensis*

PALM, ORDER OF THE FRUITFUL A society formed in 1617 in Germany and connected by a species of chivalrous institution, for the preservation and culture of the German language Lewis prince of Anhalt was the first head of the order This body is said to have done much for the German language but to have ended by attempting too much in the way of refinement and innovation It was dissolved in 1680 (*Ersch and Gruber's Encyclopædia*)

PALMS, called by Linnæus from their noble and stately appearance, the princes of the vegetable kingdom are a natural order of Arborescent Endogens chiefly inhabiting the tropics distinguished by their fleshy colour six parted flowers enclosed within spathes their minute embryo lying in the midst of albumen and remote from the hilum, and regularly pinnated or pinnatisect articulated leaves, sometimes called fronds Wine oil flax flour sugar, and salt says Humboldt are the produce of this tribe, to which Von Martius adds three utensils weapons, food, and habitations The most common species is the cocoa-nut Their wounded stems, or spathes yield in abundance a saccharine fluid known in India by the name of toddy The succulent rind of the date is a most nutritious as well as agreeable fruit Sago is yielded by the interior of the trunks of nearly all except *Areca catechu*, the well-known *pinang* or betel nut the fruit of the latter species is remarkable for its narcotic or intoxicating power The common canes or rattans of the shops are the flexible stems of species of the genus *Calamus*

PALM SUNDAY (Dominica Palmarum Pascha Floridum) the Sunday before Easter is the day of celebration of the triumphal entry of Christ into Jerusalem But the custom of carrying palm branches on particular days of festivity (*Baiophoria*) was an older Jewish observance The feast of Palm Sunday appears to have been observed all along in the Eastern church, but is said to have been revived in the West by Gregory the Great The earliest known Latin homily for the day is by the Venerable Bede

PALP. (Lat. palpus, *a feeler*) A jointed sensiferous organ, attached in pairs to the *labium* and *maxilla* of insects, and termed respectively "labial" and "maxillary" palpi, or feelers

PALPA'TORS *Palpatores* The name of a family of Clavicorn beetles, including those which have very long maxillary feelers, or palps

PALSY *See* PARALYSIS

PALU'DAMENTUM The peculiar military dress of a Roman general (imperator), in the times of the republic (*Apud Apologia*), afterwards adopted by the emperors It was worn only in the campaign, and exchanged for the toga in Rome Vitellius, according to Tacitus, was advised not to enter the city in it, as it would be making it look like a city taken by storm (*Hist* ii 89 See *Mem de l'Acad des Inscr* vol xxi)

PALUDI'NA (Lat palus, *a marsh*) A genus of fresh water or marsh snails, so called from their location in marshes, ditches and slow streams Many species are common in Great Britain a beautiful example, called the agate marsh shell (*Paludina achatina*, Lam), may be found in the smaller tributaries of the Thames

PAMPAS The name given to one of the great systems of South American plains, which can scarcely with propriety be called *deserts* inasmuch as they are covered with luxuriant herbage and inhabited by vast herds of wild cattle and droves of horses The region of the Pampas forms the basins of the Paraguay and La Plata, and includes the vast plains of Buenos Ayres extending from the foot of the eastern ridge of the Andes to the sea like Plata, and ward into the deserts of Pa (*Humboldt's Geography*)

PAMPHLET A word for which various etymologies have been suggested as for instance pagina filata *a* leaves stitched together with a thread, while others consider it to be derived simply from pamphlet or paper *papyr* It signifies a short treatise or essay generally speaking on some subjects of temporary interest which excites public attention at the time of its appearance We commonly understand by the word pamphlet a production of the above character when it comes from the publishers merely stitched together in sheets and not bound The word is of considerable antiquity being used by Chaucer Pamphlets became of common use in political and religious controversy about the middle of the 16th century in England under the reign of Elizabeth in France during the wars of religion

PAMPRE (Fr from Lat pampinus *a cluster*) In Sculpture, ornaments consisting of vine leaves and grapes

PAN (Gr Πάν) The chief rural divinity of the Greeks who presided over flocks and herds He was said by some to be the son of Mercury, and his birthplace was Arcadia to which province his worship seems to have been confined in early times The introduction of his worship into the other Grecian states is thus accounted for When Philippides, an Athenian courier, was traversing Mount Parthenius above Tegea a short time before the battle of Marathon he was encountered by Pan who commanded him to ask the Athenians why they paid no respect to a divinity who had ever been friendly to them and was still ready to promote their welfare and in consequence of this remonstrance the Athenians after the defeat of the Persians dedicated a temple to this divinity beneath the Acropolis, and propitiated his favour by annual sacrifices and torch races He was represented with the head and breast of an elderly man while his lower parts were like the hind quarters of a goat whose horns he likewise bore on his forehead His emblems were the shepherd's crook and pipe of seven reeds his own invention The name Pan is derived probably from the Gr πάειν *to feed flocks* which, as being the most general mode of life in primitive times, has led to the belief that this god was a symbol of Universal Nature, an idea to which Milton alludes in the beautiful lines, —

> —— while Universal Pan,
> Knit with the Graces and the Hours in dance,
> Led on the eternal spring

PANACE'A (Gr πᾶν, *all* and ἀκέομαι, *I cure*), signifies a remedy which professes the power of curing all sorts of diseases The word is said to be derived from Panacea, a daughter of Esculapius the goddess of health, to whom in conjunction with her better known sister, Hygeia the power of healing all diseases was ascribed.

PANATHENÆA (Gr Παναθήναια, from πᾶν, *all*, and Ἀθηναῖος, *Athenian*) The great national festival of the inhabitants of Attica, celebrated in honour of Minerva There were two solemnities of this name, the great and little The former were celebrated once in every five years the latter in every third year or as some think every year The exhibitions at these festivals were torch races, gymnastic, and musical, and poetical contests, with sacrifices and feasts, and, at the great

Panathenæa, the sacred stole (πέπλος), decorated by the hands of chosen virgins with embroideries representing the deeds of heroes and gods, was hung upon the mast of a machine in the form of a ship, and conveyed, to the Acropolis in a procession, and placed on the statue of Minerva

PANCARTES or PANCHARTÆ. In Diplomatics, royal charters, in which the enjoyment of all his possessions (enumerated in the instrument) is confirmed to a subject The word, however, is used in other and looser significations

PANCRATIUM (Gr πᾶν, *all*, and κρατεῖν, *to subdue*) A kind of athletic exercise practised by the Greeks, which combined wrestling and boxing together

PANCREAS (Gr πᾶν, and κρέας, *flesh*, from its fleshy consistence) A glandular viscus of the abdomen, situated under and behind the stomach, its duct enters the duodenum, into which it conveys a fluid very like the saliva Its use appears to dilute the bile and render it more miscible with the food It is commonly called the *sweetbread* in animals

PANDÆMONIUM (Gr πᾶν and δαίμων *a demon*) The general appellation bestowed by Milton on

> —— the high capital
> Of Satan and his peers *Par Lost*, i 81

PANDANACEÆ (Pandanus one of the genera) A natural order of Arborescent Endogens inhabiting the Indian Archipelago, and most of the tropical islands of the old world They have the aspect of gigantic pine-apples, bearing the flowers of a sparganium and are remarkable among arborescent Monocotyledons for their constant tendency to branch which is always effected in a dichotomous manner and also for their leaves being arranged so distinctly in a spiral manner that they have acquired the common name of *screw pines* The seeds of *Pandanus* are eatable

PANDECTS or DIGESTS (Gr πανδέκτης from πᾶν *every thing* and δέχομαι *I receive*) The great compilation of the Roman law published by the Emperor Justinian See Digest

PANDORA (Gr πᾶν and δῶρον *a gift*) Literally *the all gifted* In Grecian Mythology, the name given to the first mortal female who ever lived She was formed of clay by Vulcan at the request of Jupiter and was created for the purpose of punishing Prometheus (*see* Prometheus) for his numerous impieties All the gods vied in making her presents thus, from Venus she received beauty from the Graces the power of captivating Mercury taught her eloquence and Minerva wisdom, but Jupiter gave her a box filled with innumerable evils which she was desired to give to the man who married her She was then conducted to Prometheus, who sensible of the deceit would not accept of the present, but his brother Epimetheus not gifted with the same prudence, fell a victim to Pandora's charms accepted the box, from which on its being opened there issued all the ills and diseases which have since continued to afflict the human race Hope alone remained at the bottom of the box, as the only consolation of the troubles of mankind

PANDOURS A kind of light infantry formerly organized as separate corps in the Austrian service, raised from the Servian and Rascian inhabitants of the Turkish frontier, and originally under leaders of their own styled Harumbachas Since 1750 they have been included in the regular army

PANDURIFORM Literally *fiddle shaped*, applied by botanists to the leaves of some plants

PANEGYRIC (Gr λόγος πανηγυρικὸς *a speech addressed to a general assembly* and πανήγυρις *panegyris*) In Oratory, an eulogy or harangue, written or spoken in praise of an individual or body of men Among the ancients, orations were recited in praise of the departed on various occasions, before solemn assemblies hence the name Among the later Romans the baser practice prevailed of reciting panegyrical orations on distinguished living persons in their presence Among the moderns panegyrical oratory has been chiefly confined to funeral discourses from the pulpit In France however the eloges or orations pronounced in some literary and scientific societies on the decease of a member bear something of the character of classical panegyrics

PANEL In Law, said by Sir H Spelman to mean "schedula," or "pagina," as a *panel* of parchment, &c It commonly designates the roll containing the names of jurors whom the sheriff returns to pass on a trial In Scottish law, the accused person in a criminal action from the time of his appearance is styled the "pannel"

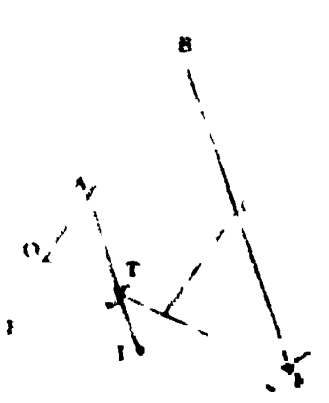
PANIC (Lat Pan), is usually applied to a sudden and groundless alarm The word originated in the stratagem which Pan had recourse to during the Indian expedition of Bacchus, on being surrounded by a numerous army; viz ordering his men suddenly to raise a simultaneous shout, which, favoured by the echoes of a rocky valley, had the appearance of so augmenting their numbers that the enemy were inspired by terror, and instantly took to flight

PANICLE A form of inflorescence in which the primary axis develops secondary axes, which themselves produce tertiary, or, in other words, a raceme bearing branches of flowers

PANNEL, or PANEL (Fr panneau) In Architecture, an area sunk from the general face of the surrounding work In Joinery, it is a tympanum, or thin piece of wood, framed or received in a groove by two mounters or upright pieces, and two traverses or cross pieces

PANOPLY (Gr πᾶν, and ὅπλον, *armour*) Literally all the armour that can be worn for defence, complete armour

PANOPTICON (Gr πᾶν, and ὀπτικὸς, *I see*) A term coined by Jeremy Bentham to denote the plan of the prison which he designed and recommended for adoption in his *Theory of Punishments* This building was distinguished by [illegible] an account of which the reader will find in the *Edin Review*, pp 19 20 but its greatest peculiarity consisted in its form, and in the disposition of its cells, which were so constructed that the inspector could see each prisoner at all times without himself being seen, and hence the origin of the term



PANORAMA (Gr πᾶν, *all*, and ὅραμα *I see*) A picture in which all the objects of nature that are visible from a single point are represented on the interior surface of a round or cylindrical wall the point of view being in the axis of the cylinder The rules according to which the [illegible] called perspective are easily [illegible] The lines on the panorama are the intersections of the cylindrical surface of the picture with one or more conical surfaces having their summits at the point of view and of which the bases are the lines of nature which the artist proposes to represent In executing this kind of perspective the artist divides the horizon into a considerable number of parts, twenty, for example and draws in the ordinary way, on a plane surface a perspective view of all the objects comprised in each of these portions of the horizon He then paints on a canvass representing the development of the cylindrical surface the twenty drawings, in as many vertical and parallel stripes and the picture is completed by stretching the canvass on the cylindrical wall of the rotunda which is to contain the panorama When a painting of this kind is well executed, its truth is such as to produce a complete illusion No other method of representing objects is so well calculated to give an exact idea of the general aspect and appearance of a country as seen all round from a given point

The first panorama exhibited in London was painted by Barker in 1793 it represented the objects about Portsmouth and the Isle of Wight A panorama of London was the first that was introduced into Germany, in 1800 Since that time they have become common in all the principal cities of Europe

PANSTEREORAMA (Gr πᾶν, στερεὸς, *solid*, and ὅραμα, *I see*) In Bilievo a model of a town or country in cork wood pasteboard or other substances

PANSY (Fr pensée, *a thought*) A term applied chiefly to the garden varieties of *Viola tricolor*, and others which are usually cultivated under the name of *heart's ease* See Viola

PANTAGRAPH (Gr πᾶν, and γράφω, *I write*) Frequently but improperly written *Pentagraph* An instrufor copying reducing or enlarging plans It consists of a jointed rhombus, A B C D made of wood or brass, and having the two sides B A and B C extended to double their length The side A D and [illegible] are adjusted from A [illegible] that if O a [illegible] corresponding distances A O is to B O in the same ratio as A T to B E or B F Small sliding boxes for holding a pencil or tracing point are brought to the corresponding graduations, and fixed in their positions by screws and a third is fixed at the point F Now, since in

every position of the instrument the two sides A D and B F are parallel and the points O and T are so taken that O A A T O B B F the three points O T, and F must necessarily range in a straight line, consequently, if any one of these three points be taken as the centre of motion, and another of them be carried along the boundaries of any figure, the third will trace out a similar figure, reduced or enlarged according as it is nearer to or farther from the centre of motion than the point which is carried along the figure to be copied Suppose the point O to be made the centre of motion the tracer to be fixed at F and the crayon or drawing point at T, the division of A D corresponding to O, then, while F is carried along

any figure, T will describe a similar figure reduced in the proportion of O T to O F, or of O A to O B But if the tracer be fixed at T, and the drawing point at I, the copy will be enlarged in the proportion of O B to O A, or if the fulcrum be placed at I the tracer at O, and the crayon at I the figure delineated will be enlarged in the proportion of O I to I I If the points O and I be brought to coincide with F and D, and the fulcrum be placed at D then the distance I D and D I being equal, the original figure will be transferred into a copy of exactly the same dimensions The pantagraph was invented by the Jesuit Christopher Scheiner in 1603, and is described by him in a tract entitled *Pantographice seu Ars Delineandi &c* published at R
A more perfect instrument for accomplishing the same objects has recently been invented by Professor Wallace of Edinburgh who has given it the name of *Eidograph* for a description of which see the *Transactions of the Royal Society of Edinburgh* vol xiii , or *Wallace's Geometrical Theorems and Analytical Formulæ*, 1839 Both instruments may be so modified as to produce a reversed representation of the figure to be copied, an application which is useful for the purposes of copper-plate [illegible] lithography

PAN'TALOON One of the chief characters in all pantomimic representations He was originally dressed in a manner similar to that from which a well-known article of modern dress has derived its name His name is said by antiquarians to be derived from the Italian words "Pianta-leone," as it were the "lion planter," in allusion to the boastful language of the Venetians (See *Lord Byron's Childe Harold* canto iv) The pantaloon of the original Italian pantomime was a Venetian burgher

PAN'TECHNICON (Gr *πας*, and *τεχνη art*) signifies a place in which, as the term imports every species of workmanship is collected and exposed for sale The large building near Belgrave Square is an excellent specimen of this species of work

PAN'THEISM (Gr *Πας*, and *Θεος God*) In Metaphysical Theology the theory which identifies nature or the *το παν*, the universe in its totality with God This doctrine differs from atheism in the greater distinctness with which it asserts the unity and essential vitality of nature, parts of which all animated beings are The most ancient Greek philosophers were pantheists in this sense, Anaxagoras being the first who distinctly stated the coexistence with nature of a reasonable creator — 'a mind, the principle of all things' In this sense too, Spinoza may be called a pantheist The pantheism of Schelling, and many modern German philosophers, is of a different stamp According to these thinkers God is conceived as the absolute and original Being revealing himself variously in outward nature, and in human intelligence and freedom It is not easy to see how pantheism in this sense differs from the Christian view of God, as expressed in the sublime language of St Paul "In whom we live, and move, and have our being' The world is, indeed, conceived to be animated by the presence and agency of the Deity, but his distinctness and independent subsistence are definitely laid down as the condition and ground of all phenomenal existence and of reason itself God may exist without the world, but the world is inconceivable without God (See this article in *Ersch and Gruber's Encyclopædia*) It must, however, be remarked, that many pseudo-philosophers of modern times assume the name of Pantheists as a convenient medium for the dissemination of *atheistical* opinions which they have not the courage boldly to avow

PAN'THEISTIC (Gr *Πας*, and *Θεος, God*) In Sculpture a term applied to statues and figures which bear the symbols of several deities together, the meaning of which has been a subject of much dispute among antiquaries

PANTHE'ON (Gr *πάνθειον*, from *πας, all*, and *θεος, a god*) A temple dedicated to all the gods Two magnificent structures of [illegible] Athens, the other at Rome In [illegible] though comparatively [illegible] remains of the ancients The foundation of this building is generally ascribed to Agrippa, the son-in-law of Augustus It now forms a Christian church, dedicated to the Virgin Mary and All Saints, and generally called the Rotunda The form is circular, and its roof a hemispherical dome 144 feet diameter, its height being the same from the pavement to the top of the dome It has a noble Corinthian portico, consisting of sixteen granite columns of the Corinthian order, of which eight stand in front Pliny ranked this edifice as one of the wonders of the world Since its erection it has been grievously spoiled of its ornaments The term pantheon has been applied to places of public exhibition in which every variety of amusement is found It is also used for a work containing a view of the mythology or all the gods of the ancients (as the term imports), as in *Tooke's Pantheon*

PANTOCHRONO'METER (Gr *πας, χρονος, time,* and *μετρον, a measure*) A term recently invented and applied to an instrument which is a [illegible] of the compass, the sun dial, and the universal [illegible], and performs [illegible] all three

PAN'LEXIS (Gr *πας* and *λεγω*) A work of universal instruction or science, equivalent to *dictionary* or *encyclopædia*, which see

PAN'TOMIME (Gr *πας*, and *μιμεω, I imitate*) A species of theatrical entertainment, in which according to the derivation of the word, the whole action of the piece should be represented by gesticulation, without the use of words also a theatrical performer skilled in mimicry The English pantomime is an amusement peculiar to our theatre A class of actors in vogue at Rome, who performed pieces in dumb show, expressing every thing by their dancing and gestures, were also called pantomimes, and were in all probability the archetypes of this species of amusement among ourselves (See the *Conversations-Lexicon*, and as to ancient pantomimes, *Mem de l'Ac des Inscr* vol xxiii) *See* MIMES

PA'PACY The office of pope, or historically, the succession of popes in the see of Rome The origin of the term is oriental The word papas was used in lower Greek with the signification of father, and is still applied by the Greek church to the priests of that communion In the Western church the title was not uncommonly given to bishops in general, and was not confined to the Roman pontiff for several centuries In this article it will be our endeavour to trace, with the conciseness which our limits demand the steps by which the bishops of Rome attained to the vast religious and political importance which they once possessed, and of which they still retain the shadow

1 It is generally agreed that a certain degree of deference was paid to the church of Rome by the Christian societies dispersed throughout the empire in the primitive age As St Peter appears to have held a certain prominency among the apostles, so was his see looked up to, and its advice occasionally resorted to by the other metropolitan churches which, though its equal in rank, might allow to it some moral superiority But as the other apostles did not hesitate to rebuke St Peter when his conduct appeared to their judgment to deserve it nor to take the lead and initiative when he paused in the career which the Holy Spirit pointed out so we find Irenæus of Lyons interfering to [illegible] of Victor of Rome, and Cyprian [illegible] of heretical baptism, in concert with the Asiatic church, and in opposition to the Roman

2 It is in the fourth century that the first dawn of substantial power appears in the Roman see Upon the recognition of Christianity by the civil government, the bishop of Rome is found in the enjoyment of precedence among the prelates of the empire The patriarch of Constantinople is expressly exalted by Theodosius (A D. 381) to the *second* rank The canons of the council of Sardis 347 (the genuineness, however, of which is suspected) allow bishops in certain cases an *appeal* to the Roman pontiff Even the removal of the seat of government to Constantinople, although the very fact of its residence at Rome had undoubtedly contributed to the pre-eminence of its bishop in earlier times, seems to have favoured the pretensions which the popes began now openly to maintain Rome was no longer under the immediate eye of the emperor The patriarch of Constantinople although he enjoyed the imperial favour up to a certain point, was not allowed to outstep it, and was subject to be deposed if he forgot for a moment the relative position in which he stood The emperors of the West on the other hand took up their abode at Milan, or Ravenna, and when they had been overturned and the barbarians began to found new dynasties upon the ruins of the Italian provinces, the popes were among their most useful instruments in civilizing and consolidating the fragments of their power

Again, the nearer contact which thus took place between the Italian clergy and the children of the pagans of the north afforded the popes an opportunity of diffusing the idea of their own supremacy at the same time that they extended the limits of Christianity and while Antioch and Alexandria were trembling before the birth of Mahometanism, and Constantinople was losing one by one its fairest provinces and strongest partizans, the dominion of the Western primacy was acquiring daily a wider basis and a more devoted people

3 With Gregory I, at the end of the sixth century, commenced one of the most important epochs in the papal history The system of aggrandizement, of which he laid the foundations, consisted in the conversion of the heathen, upon the principle above mentioned, and the connection of the monastic orders with the Roman see, by releasing them from the immediate jurisdiction of their own diocesans

4 The next important step in our history is the famous donation of Pepin, by which the Italian provinces which the French king had conquered from the Lombards were transferred by him, not to his own dominions, nor

to the Greek emperor, who had the ancient hereditary claim, but in temporal sovereignty to the pope But even this political power thus acquired was not in itself pregnant with such important consequences as the principle which was sanctioned by the immediate occasion of the donation, for Pepin had taken counsel with Pope Zachary whether he should be justified in overturning the throne whose servant he was, and had so to do However, the possessions into the hands of the Roman bishops, confirmed and enlarged by the addition of the territory of Rome itself by Charlemagne at the close of the eighth century have continued up to this day, with little extension or diminution, to form the temporal patrimony of St Peter It is to be observed, that the nature and extent of the power accorded to the popes by Charlemagne has given rise to much dispute, and the partizans of the Roman see have been charged with The most "seems to be this, that the Roman pontiff possessed the city of Rome and its territory by the same right that he held the exarchate of Ravenna and the other lands which he received from Charlemagne, that is to say that he possessed Rome as a feudal tenure though charged with less marks of dependence than other fiefs generally are, on account of the lustre and dignity of the city which had so long been the capital of the empire" (*Cent VIII* pt 2 cap 2 note)

5 The dissensions which took place among the successors of Charlemagne in the 9th century afforded a tempting opportunity for political encroachment on the part of the Roman bishops In 879, Charles the Bald was proclaimed emperor by Pope John VIII and his immediate successors received their nomination also from the same source It was in the same century that the forgery of the decretal epistles gave a colour and authority to many temporal claims of the Roman see

6 It was not however, till the pontificate of Gregory VII (1073—1086) that the principle of temporal aggrandizement which we have been tracing received a systematic development The grand project which that prelate entertained was to reduce the whole territory of Christendom to a feudal subjection to the holy see He assumed the right of appointment to all the crowns of Europe, and with such success that when his principal opponent Henry IV of Germany, had succeeded in dispossessing him of his pontifical chair, and placing therein the antipope Clement III the victorious monarch continued to recognize, in the creature whom he had thus installed in the papal prerogatives the very same authority which Gregory had claimed over him and received from his hands his own imperial crown A main feature in this political scheme was the reduction of the whole body of the clergy into immediate dependants upon the papal throne In order to effect this the law of celibacy was strictly enforced, the elections of bishops by their diocesan clergy discouraged and almost abolished and their investiture by their national sovereigns in itself a monarchical usurpation became the great subject of contention between the pope and the emperor in which though the former was finally unsuccessful yet principles were advanced during its progress and claims bequeathed to posterity, which smoothed the way for the more fortunate aggressions of later pontiffs and exalted the power of the papacy to its greatest height under Innocent III at the beginning of the 13th century

7 The power of excommunication had long been exercised and wantonly abused before the time of Gregory, the interdict by which a whole state was laid under a spiritual ban, was not adopted till about that period This weapon was unsparingly wielded by Innocent III, and the degradation to which John of England was subjected by him through these means is one of the strongest instances of the extent to which the papal power was advanced But Innocent though his clergy were better disciplined subjects in this pretensions invested with the superior efficacy of prescription had new and greater difficulties to contend with than his famous predecessors At this time the tide of human opinion was already on the turn Numerous sects arose and prepared to undermine the influence of the ancient see The laity were more conscious of the yoke which had been imposed upon them, and more anxious to avail themselves of an opportunity to cast it off the clergy also, the main stay of the papal cause, were beginning to excite general murmurs by their corruption of manners It is between Gregory and Innocent, therefore, that the period of the substantial greatness of the Roman see must be placed by the historian who contemplates both eras from a distance, and observes the seeds of decay which began to manifest themselves in the latter The violence, however, and assumption which we have traced to this time, continued to grow under the successors of Innocent, who appear to have been ignorant of the reformation itself, that the foundations of their authority were slipping rapidly from under them But the same causes which we have enumerated as counteracting the apparent glory of Innocent's pontificate continued to work steadily against his successors, and at length when Luther arose to consolidate the force resulting from the three the papacy though relaxing nothing from its extravagant pretensions found itself suddenly shorn of one third of its subjects at once and deprived of a great proportion of its influence over the rest From that time to the present the power of the papacy has continued to retrograde, even in spiritual matters It has been forced to concede a certain degree of independence to the clergy of France, and to [illegible] concordats with Napoleon and some other Catholic princes It has even encouraged [illegible] schemes of its earlier [illegible] assert the interference of the church between the prince and the subject to be tyrannical and unchristian Its spiritual influence however though harassed on all sides by the free and discursive opinions of the day, continues still, from its combined [illegible] to be the most remarkable feature [illegible] in the recent political events of Europe has been very great, while the number of its subjects is probably at this moment much greater than at the times of Gregory or Innocent

PAPA'VERA'CEÆ (Papaver, one of the genera) A natural order of narcotic plants belonging to the Polypetalous division of the Exogenous class, and nearly related to *Ranunculaceæ* with which it corresponds in habit and the structure of the seeds but differs in having parietal placentæ and a calyx of only two pieces The common poppy the horned [illegible] and some other genera, are well-known [illegible] for the sake of their flowers or destroyed as showy but troublesome weeds Opium is the inspissated juice of *Papaver somniferum*

PA'PER (Gr *παπυρος*, Fr *papier*) A thin and flexible substance of various colours but most commonly white used for writing and printing on, and for various other purposes It is manufactured of vegetable matter, reduced to a pulp by means of water and grinding, and is made up into *sheets*, quires, and reams, each quire consisting of twenty four sheets, and each ream of twenty quires

For the chief purposes to which paper is applied in modern times the ancients had recourse to a variety of materials, stone, tablets of wood plates of lead, skins, parchment linen layers of wax tablets of ivory and, above all the papyrus The ability to write created a necessity for some material on which to inscribe, and all these various materials were resorted to in succession, as the ineligibility of each induced a fresh endeavour to discover some more desirable substitute

As our present object is to trace the progress of paper, rather than to enter into a minute account of those materials which were employed antecedent to its manufacture it will not be necessary to dwell upon the other substances, which are as diversified as human ingenuity could devise, but pass on to the papyrus the immediate precursor of paper, and the nation from which it was first manufactured Egypt has the honour of the invention, and Isidore even fixes the locality at Memphis the date remains in some obscurity although it has been warmly disputed Varro, the Roman ascribes it to the time of Alexander the Great after the founding of Alexandria, but we find in Pliny the recital of a passage, extracted from the writings of Cassius Hemina, an ancient annalist, in which he speaks of some books found in the tomb of Numa when it was opened, 535 years after his decease and asserts that these books were of *paper* and had been interred with him As Numa preceded Alexander 300 years, this circumstance if admitted would carry back the date of the invention anterior to that time However the antiquity of such a date is much doubted, but as Pliny gives an account of the manner of making the papyrus paper and it seems to have been in high reputation in the time of Alexander the Great it is probable that such improvements were made during his reign as to enhance the value and increase the manufacture

It is true in use long after the invention of e argument by which it is contended that the manufacture was of more modern date although the only fair inference seems to be that it was only rare or expensive It appears, however, that after the time papyrus paper was chiefly manufactured at Alexandria and continued a source of profit to that city up to the 8th century, to the close of which it remained in general use throughout Europe, Italy retained it to the eleventh, and France even so late as the twelfth century

We have thought it but right thus briefly to narrate the differences of opinion which have prevailed respecting the origin of paper Our own belief is, that the transition of the use of the papyrus in its natural state to that in its manufactured was so gradual, that it does not leave room to fix on any precise point at which to

say that the papyrus became paper Probably the first step arose from the perception that the leaf was not strong enough for its purposes, and then how simply came the remedy of placing the leaves together, the waters of the Nile, amid which the plants grew serving to cement them, afterwards came a pressure to flatten the [illegible] and this simple process seems to give the origin of paper We believe that many an invention for which the learned have contended, has advanced by steps as simple and as gradual, leaving it impossible to decide at what point invention began, since it was only improvement that was taking place

The next improvement in paper was its manufacture from cotton It is supposed that the Chinese and Persians were acquainted with this material for its production, and that the Arabians learnt it from their conquest in Tartary The ancient paper bears no marks of the wire through which the water is drained in modern paper-making, and it is therefore inferred that a different process was employed Paper made from cotton was in [illegible] Greeks than with the Romans [illegible] paper from cotton cannot be traced further back than to the tenth century and the oldest manuscript document written on this cotton paper is dated 1050

When or by whom linen paper was invented seems uncertain some give the credit to Germany some to Italy some to Greece, but the Chinese appear to have the best pretensions The Rev Dr Dibdin in his *Typographical Antiquities* says that 'the art of paper-making with linen rags is supposed to have been discovered in the eleventh century, though Father Montfaucon was in the twelfth Montfaucon acknowledges that he has not been able to meet with a single leaf of paper with a date anterior to the death of St Louis in 1270" Its introduction into England took place about the year 1342, in the reign of Edward III, although some have supposed it as early as 1320 France had it in 1[illegible] and Italy [illegible]67 The Germans possess a specimen bearing the date of 1308 although it has been surmised that this single instance may have been a mixture of linen with cotton

In the Preface to the *Kalendars of the Exchequer* published by the Record Commission it is stated that "some of the letters addressed to Hugh le Despencer from Gascony (at various periods in the reign of Edward II), are written on very stout and beautiful vellum, others on paper, of a sound and strong fabric well sized, and such as may altogether be called a good article And although, in the Tower, there are a few letters upon cotton paper, yet parchment or vellum was generally used, and these are amongst the earliest examples of any continued correspondence upon the more commodious material, which in England was very rarely employed It is highly probable that in the south of France, the supply was received from the Moorish merchants or manufacturers of Spain' The original register of the privy seal of Edward the Black Prince from July, 20 Edw III, to January, 21 Edw III, forming one volume, is on paper"

It is a commonly received opinion that the first paper mill was erected in England during the reign of Elizabeth, though it has been asserted that the first mill was set up in Charles the First's reign by a German of the name of John Spilman or Spielman, that the king granted him a patent, and a salary of *20l* a year Both these opinions are proved to be erroneous by an entry in the privy purse expenses of Henry VII, dated May 25th, 1498, published in the *Excerpta Historica* 'For a rewarde yeven at the paper myine *16s 8d*' which establishes with certainty an [illegible] Dr Dibdin gives this account of Spilman [illegible] thority of Dr Harris, but the statement is invalidated by Mr Nicholls in his *Progresses of Queen Elizabeth* who has reprinted in that work a poem of the date 1588 of which the following is the title —*A Description and playne Discourse of Paper, and the whole Benefits that Paper brings, with Rehearsall and setting forth how there is a Paper-mylle built near Dartford by an high [illegible] called Master Spilman, Jeweller to the Queene's Majestie*, 1588 Perhaps no other manufacture ever remained so long nearly stationary [illegible] the last fifty years such great and rapid improvements have been made in it, as to equal if not to surpass [illegible] branch [illegible] writing and [illegible] sable to the prosecution of the latter, render its manufacture of the highest utility and importance But even in a commercial point of view, its value is very considerable France, Holland and Genoa had for a lengthened period, a decided superiority in this department The finest and best paper being made of linen rags its quality may be supposed to depend, in a considerable degree, on the sort of [illegible] country where it is manufac- [illegible] is said to account for the greater whiteness of the Dutch and Belgian papers as compared with those of the French and Italians and still more of the Germans The rags used in the manufacture of writing paper in Great Britain are collected at home, but those used in the manufacture of the best printing-paper are imported principally from Italy, Hamburgh, and the Austrian states, by way of Trieste

We believe, however, that it was owing rather to the want of skill than, as has sometimes been supposed, to the inferior quality of [illegible] that the [illegible] [illegible] comparatively recent period During the 17th century most part of our supply was imported from the Continent, especially from France The manufacture is said to have been considerably improved by the French refugees who fled to this country in 1685 But it is distinctly stated in the *British Merchant* (vol ii p 26) that before this no sort of paper except brown was made here previously to the Revolution In 1690 however, the manufacture of white paper was attempted, and within a few years most branches were much improved In 1721 it is supposed that there were about 300 000 reams of paper annually produced in Great Britain which was equal to about two thirds of the whole consumption In 1783 the value of the paper annually manufactured was estimated at 780 000*l* At present besides making a sufficient quantity of most sorts of paper for our own use we annually export about 100,000*l* worth of books We still however continue to import certain descriptions of paper [illegible] and a small supply of paper [illegible] amounts to about *2800l* a year

In 1813 Dr Colquhoun estimated the value of paper annually produced in Great Britain at 2 000 000*l*, but Mr Stevenson an incomparably better authority upon such subjects estimated it at only half this sum From information obtained from those engaged in the trade, we incline to think that the total annual value of the paper manufacture in the United Kingdom exclusive of the duty, may at present amount to about 1 200 000*l* or 1 300 000*l* There are about 700 paper mills in England, and from 70 to 80 in Scotland The number in Ireland is but inconsiderable About 27 000 individuals are supposed to be directly engaged in the trade and besides the workmen employed in the mills the paper manufacture creates a considerable demand for the labour of millwrights machinists smiths carpenters iron and brass-founders wire workers, woollen manufacturers and others in the machinery and apparatus of the mills Some parts of these are very powerful, and subject to severe strain, and other parts are complicated and delicate, and require continual renovation Owing to this, the manufacture is of much greater importance as a source of employment than might at first be supposed, or than it would seem to be considered by government, who have loaded it with an excise duty amounting to more than three times as much as the total wages of the work-people employed!

We pass on from this brief account of the history and statistics of paper to the mechanical process of its production, only remarking that many articles have been resorted to in its manufacture —the tendrils of the vine, the stalks of the nettle the thistle and mallow*, the bark of the willow the hawthorn the beech the aspin, and the lime Some patents have been obtained for making it of straw, and the bine of the hop it is presumed might furnish material for the supply of paper to all England but leaving these inferior substitutes, we shall confine ourselves to the description of paper made from linen rags that being the staple of the manufacture

The rags in the London market are sold to the manufacturers according to their respective quality under the terms fine 2d 3d English rags, and SPFF, SPF FF, &c foreign rags fine being wholly linen and of the best quality is used for the finest writing paper and so in their gradation down to the commonest, which is coarse, often canvass and can only be made into an inferior printing paper when it has been thoroughly bleached In these inferior papers some cotton is mixed There are also the strong, coarse bags in which the rags are packed, and the coloured rags only fit for the most common papers, though out of these the blue are usually sorted for the purpose of making blue paper It is necessary that these rags should be dusted, and, to effect this they are either placed in a cylinder for [illegible] pivots at each end, and enclosed in a box which receives the dust as it falls through the net-work, or else their

* The works of the Marquis de Villette, published in London, [illegible] of marshmallow, and at [illegible] sheets of paper made of the nettle, [illegible] of the species of conferva, couch grass, [illegible] tree was furnished from the tree yellow willow, sallow [illegible] poplar oak [illegible] of the dark coloured, and [illegible]

The Chinese make their paper in large sheets of the raw vegetable matter as it has all the appearance of the pulp having been [illegible] with flat surface [illegible] and the other with the [illegible] essential in its quality of receiving a fine and delicate impression of engravings, either from copper or wood.

sorting takes place over a table frame covered with wire net, through which the dust falls into a box beneath as the workwoman proceeds in her labours The first of these modes, however, is a great preservation of the health of those employed in the work The rags are then cut into pieces not exceeding three or four inches square, the parts that have seams being thrown into a separate heap, or the sewing thread might make filaments in the paper In this process the rags are scrupulously sorted according to their texture and degree of strength [illegible], for, were they not carefully [illegible] the texture would be reduced [illegible] course and be lost in the preparation or if preserved when reduced to pulp would not be found of the same consistency as the coarse sort and the paper when manufactured would necessarily be clouded and inferior It is for these reasons that this part of the process is important When carefully sorted, and the different degrees of texture having, by a longer or shorter process, been reduced to a pulp of similar consistency, they may then be mixed together, but this cannot be previously done While in this state the rags often appear so dirty and discoloured as to preclude all hope, to an inexperienced eye, that they can ever assume the purity of that beautiful fabric so valuable to the artist and the scribe This purification used formerly to be effected by water running through a receptacle filled with the rags, which in its passage eventually carried off their soil, but the present more expeditious process is that of boiling them mixed up with lime in a species of chest, so perforated as to allow the admission of steam, and by this means they are partially bleached It is but due to the superior cleanliness of our own country to state, that the rags collected in England require little bleaching, but, as these form a small proportion of the quantity used in our extensive manufactories bleaching takes an important place in the process The superfluous moisture is squeezed from the rags and they are placed in a sort of chamber or receiver, which is air tight and pipes are conducted into it from a retort which convey chlorine, formed, by the application of heat from manganese, common salt, and sulphuric acid This part requires much care, for if carried beyond its due point it proves most injurious to the durability of the fabric The rags when taken from this chamber are strongly imbued with a most nauseous smell and require profuse and frequent washings After this process they are put into the beating engines, and pass through a sort of trituration, which reduces them to a coarse and imperfect pulp, which is called half stuff or first stuff, and this is again levigated until it assumes the appearance of cream

The state and quality of this pulp is of the utmost importance to the final perfection of the paper If in the levigation, the fibre should have been so entirely destroyed as to reduce it to [illegible] the paper will inevitably prove liable to break [illegible] away and be rotten and this must result whatever previous excellence of the material A fibre is absolutely necessary to the production of a serviceable paper Mr Murray in a little work on the subject full of practical science recommends that a small proportion of unbleached flax should be added to the half stuff,—an expedient that would doubtless much increase the strength and durability of our manufacture But unfortunately so far from means being taken to improve its consistency, others are resorted to, for the sake of an increased profit, which deteriorate almost to destruction we mean the introduction of plaster of Paris, or other earthy substances, into the pulp, and this can never be done without ensuring brittleness and want of cohesion as the result While the pulp is in this state the size, made from sheep skins and other animal substances together with a solution of alum, is introduced, excepting only in the manufacture of writing paper, and then the sheets are most generally sized after their formation

Having described the preparation of the material, we shall pass on to its formation into paper

The fine pulp, or stuff, as it is technically called is transferred into a chest or large tub with a revolving agitator, from thence into a vat, usually about 5 feet in diameter, and 2½ feet in depth, and sustained at a proper temperature by means of a fire, and it is generally arranged for this vat to be placed against a wall of the room, that the fuel to the fire may be supplied at an aperture externally to prevent any injury from smoke During the whole of the subsequent process it is requisite that the pulp in the vat should be stirred up at short intervals, to keep it of an equal consistency There are three workmen employed in this stage of the operation, called the *dipper*, the *coucher*, and the *lifter* The dipper is provided with a mould formed of well-seasoned mahogany, across which parallel wires are stretched close together, a few other stronger ones being also placed at right angles with them, and at some distance from each other The lines formed in the paper by these wires are called water marks, but, in the modern improvement of wove paper, these are avoided by using wire cloth woven in a loom, which, being tightly stretched over the frame, produces no water-mark This mould is provided with another frame, called a *deckle*, which fits it exactly, and forms a boundary line to the sheet of paper, which would otherwise have a rough and jagged edge This contrivance, by supplying an edge to the mould, gives it the character of a sieve, which enables the dipper after he has dipped the mould into the vat, and taken [illegible] of the pulp and given it a gentle [illegible] thickness, to drain the water away, he then removes the deckle, replaces it on another mould, and proceeds as before; whilst the second workman, the coucher, removes the sheet of paper thus made on to a felt, being a piece of woollen cloth, and then returns the mould to the dipper, who, in the meantime, has been operating with another mould, and forming another sheet they thus exchange the moulds, the one dipping and the other couching, until they have completed six quires of paper, which is called a *post* When this quantity is completed, the heap is conveyed to the vat press and subjected to heavy pressure These six quires remain in the vat press until the dipper and the coucher have perfected another post, when they are removed to give place to it, and then the office of the third workman, the lifter, commences He separates the sheets of paper from the felts, and forms them into a pile, which is again subjected to a second press, which detaches from them a great quantity of moisture Here it remains until the workmen are prepared to replace it with a similar quantity, when it is taken to the drying rooms and hung up on lines to dry These lines are carefully covered with wax, both to prevent adhesion and contraction, and the opening of the windows should be strictly attended to, that the drying may not proceed too rapidly This being accomplished, it is taken down, shaken to make the dust fall out, and to separate the sheets from each other, and laid up in heaps, ready to be sized The size is prepared of a due consistence twice filtered and a portion of alum added The workman dips a handful of the sheets, holding them open at the edges that they may more equally imbibe the moisture, and after this process they are again subjected to the press They are afterwards dried, sorted, brought under repeated and excessive pressure, and, finally, made up into quires and reams

But as the process of paper-making must necessarily be comparatively slow when practised by hand, machinery has been resorted to, which has nearly supplanted the old method We believe France has the honour of the invention although it has been greatly improved in England by Messrs Donkin and Co That in most general use here is after Fourdrinier, who invented the endless web of wire One of these machines can produce 20 superficial feet of paper per minute, and it is this which enables us to enter into competition with the foreign market which we could not otherwise do, on account of the difference in the value of manual labour In the old method it took three months after receiving the rags into the mill to complete the paper by the machine, they can receive the rags on one day, and deliver the paper made from them on the next

The stuff, having been prepared and bleached in an expeditious manner by machinery, is emptied into the chest or tub as before and from thence is delivered gradually into the vat, where it is kept in continued motion by means of revolving fans called *hogs* Nearly at the top of the vat there is a gate which can be raised or lowered at pleasure by means of which the flow of stuff is regulated on to the lip or trough, from which it falls upon the endless web of fine wire, which is kept continually moving in a horizontal direction over a series of revolving rollers, and is placed immediately under the hanging lip of the trough, so that the pulp may have the shortest distance possible to fall These revolving rollers prevent the wire web from falling in or bagging, and keep it level, and as it is preserved at a due tension from side to side it has all the appearance of a table A leather strap or ledge of wood, on each side forms the boundary line of the paper, answering the purpose of the deckle in the hand-making process, these are moveable according to the intended width of the paper The long cascade or continuous stream of pulp, regulated with reference to the proposed thickness of the paper to be made, thus gently descends on this moving wire plane, which is perpetually travelling onward and onward, and, for its more perfect equalization, a second movement is resorted to, by means of a sort of crank, which gives the web a jerking motion at short intervals, and diffuses the liquid pulp unvaryingly over the surface At the end nearest to the trough the pulp is, of course perfectly fluid, but as the web travels on the moisture partially sinks through the fine apertures of the web-ing and the material coagulates There has been a fashion prevalent of late years of having paper barred or ribbed this appearance is given at this juncture While yet moist, just before passing from the wire web-ing it is subjected to the pressure of a wire roller which gives the indentations of the stripes or lines,

this cylinder is called a *dandy* from this it travels to a web of cloth or felt, during which advance it is subjected to heavy pressures, from passing between rollers covered with felt, and called the *pressing rollers* This process answers to the wet press in the hand made paper, and formerly this was the termination of the labours of the machines, the remaining work of drying &c being ac- [illegible] incalculable improvement [illegible] e drying rollers These [illegible] metal, which effect in a few moments the perfect drying of the paper while yet moist it passes over the first moderately warm, again over the second, of larger diameter, of greater warmth and again over the third with an augmented heat The paper is now perfectly dry, and any casual inequalities are removed from its surface The final action of this wonderful machine is to wind the paper round a last roller or reel, which when full is exchanged for another, [illegible] the machine is finished, and the paper, being in long webs of many yards requires to be cut into sheets After different methods had been tried, a supplementary machine has been invented, which receives the web from off the reel on to a drum, cuts it into sheets of proper lengths with a circular knife, continually revolving while the divided web proceeds, and these sheets are received and placed in regular heaps by children

Mr Dickinson has recently made great improvements in the machine, which has consequently been followed by a corresponding improvement in the paper manufactured by the house of Messrs John Dickinson & Co, which has long been celebrated for producing paper of a superior quality

The manufacture of the paper being thus completed the sheets are separately examined, and every knot or blemish carefully removed, the torn or damaged ones being laid apart In this state they are subjected to the action of a powerful press, in the full and open size of the sheet they are afterwards cut round the edge and then counted into quires of twenty-four sheets, which are folded in the middle, and put into reams each ream containing twenty quires, of which the two on the outside are made up of twenty sheets each from the damaged sheets that were thrown out In this state they are again pressed, and finally tied up in wrappers These wrappers are stamped by the exciseman, and by the act 6 & 7 Will 4 c 52, the paper is charged with an excise duty of three halfpence a pound

When the duty on paper was charged according to the size the makers were obliged to be particular in the dimension The following table shows the exact size of the different writing, drawing, and printing papers, as enforced by the excise under the powers vested in them by act of parliament

	First Table — Writing		Second Table — Drawing		Third Table — Printing	
	Inches		*Inches*		*Inches*	
Double Atlas			35 by 31½			
Grand Eagle, or Double Elephant			40	26½		
Double Demy					38½ by 26	
Columbier			34½	23½		
Atlas			34	26½		
Atlas, small			31	25		
Imperial	30½ by 22		30½	22		
Double Crown					30	20
Elephant			28	23		
Super Royal	27½	19½	27½	19½		
Long Royal			27½	18		
Royal	24	19½	24	19½	26	20
Ditto					24½	19½
Double Pott					20½	17
Large Fan			23½	20½

Single Crown					20	15
Foolscap	16½	13½	16½	13½		
Little Foolscap			17½	13½		
Pott	15½	12½	15	12½		

It will be seen, by the preceding table, that the largest sheet of hand-made paper is 11 feet 7 inches in length by 2 feet 7 inches and a half in breadth, while machine-made paper is of the width of 5 feet, and appears to be unlimited as to its length

PAPER HANGINGS This important and elegant substitute for the ancient "hangings" of tapestry or [illegible] cloth came into use about 200 years ago, the manufacture has undergone a gradual succession of improvements and has now reached a high state of beauty and [illegible] sometimes [illegible] by blocks, each colour being laid on by a [illegible] in wood or metal upon a plain or [illegible] patterns are sometimes printed in varnish or size, and gilt or copper leaf applied, or bisulphurate of tin (*aurum musivum*) is dusted over so as to adhere to the pattern, and in what are called *flock papers*, dyed woods minced in powder are similarly applied Powdered steatite or French chalk, is used to produce the peculiar gloss known under the name of *satin* Striped papers are sometimes made by [illegible] trough, which has part [illegible] which the colour is delivered, and a number of other very ingenious and beautiful contrivances have lately been applied in this important branch of art The invention of the paper machine, by which any length of paper may be obtained, effected a great change in paper hangings, which could formerly only be printed upon separate sheets, and were much more inconvenient to print as well as to apply to the walls A plausible suggestion upon the subject of "intellectual paper hangings" will be found in No 504 of the *Penny Magazine* The reduction of the duty on paper, and the [illegible] duty to paper hangings, not only create a greater demand for, but are likely to lead to further improvements in, this manufacture

PAPER MONEY *See* Banks

PAPER SAILOR, or PAPER NAUTILUS *See* Argonaut

PAPIER-MACHÉ A name given to articles manufactured of the pulp of paper, or of old paper ground up into a pulp, bleached, if necessary, and moulded into various forms This article has lately been used upon an extensive scale for the manufacture of mouldings, rosettes, and other architectural ornaments, pilasters, capitals and even figures as large as life, have also been made of it It is lighter more durable, and less brittle and liable to damage than plaster, and admits of being coloured gilt, or otherwise ornamented Another article sometimes goes under the same name which is more like pasteboard consisting of sheets of paper pasted or glued and powerfully pressed together, so as to acquire when dry the hardness of board and yet to admit while moist of curvature and flexure tea trays, waiters, snuff-boxes, and similar articles are thus prepared, and afterwards carefully covered by japan or other varnishes, and often beautifully ornamented by figures or landscapes and other devices, &c occasionally inlaid with mother of pearl A mixture of sulphate of iron, quicklime, and glue, or white of egg with the pulp for papier-maché, renders it to a greater extent water-proof, and the further addition of borax and phosphate of soda contributes to make it almost fire-proof The [illegible] manufactory in England is that of [illegible] Wellington Street, Strand, who has recently published a concise history of the manufacture, embellished with numerous illustrations

PAPILIONACEÆ *See* Leguminaceæ

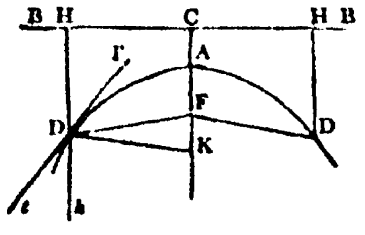
PAPILIONA'CEOUS A name given to the corolla of leguminous plants, from its fancied resemblance to the figure of a butterfly it is that of the garden pea and bean, and consists of a large upper petal or vexillum, two lateral petals called alæ, and two intermediate petals forming a carina

PAPILIO'NIDÆ (Lat papilio, *a butterfly*) The name of a family of Lepidopterous insects, of which the genus *Papilio* is the type *See* Diurnals

PA'PIST (Lat papa, *the pope*) A word in common use to designate a member of the Roman Catholic church It has a shade of meaning somewhat different from *Romanist* being employed generally with a certain degree of prejudice and obloquy attached to it

PA'PPUS A name given to the calyx of Compositæ, which exists in the rudimentary condition of a cap or [illegible] r of slender hairs or in some other [illegible]

[illegible] ne given to the written scrolls, made of the *papyrus*, which have been found in various places, but more especially in Egypt and Herculaneum [illegible] as follows — The interior of [illegible] the rind had been removed was cut into thin slices in the direction of their length, these being laid on a flat board in succession, similar slices were placed over them at right angles, and their surfaces being cemented together by a sort of glue, and subjected to a proper degree of pressure and well dried, the papyrus was completed [illegible] depended of course on [illegible] as that of the sheet o [illegible] succession beside each other, [illegible] was [illegible] indefinite [illegible] been preserve [illegible] ppearance they [illegible] until ren-



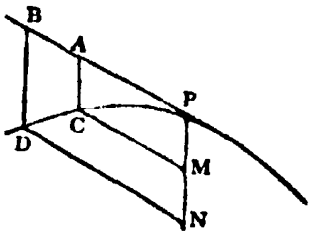
dered pliable by gradua [illegible] of an English climate; [illegible] appear to have been dr [illegible] *Wilkinson's Manners and Customs of the Ancient Egyptians* vol iii p 147–8) Much interest was excited by the discovery of the papyri rolls at Herculaneum, and great expectations were entertained by archæologists that treasures of the valuable remains of antiquity would be restored to the world but after all the trouble that has been taken, and all the ingenuity that has been displayed in unrolling and deciphering many of them, little or nothing has been found worthy of the pains They consist chiefly of Greek sophists and rhetoricians, works on music, medicine, and the arts, and some on natural and moral [illegible] &c All the deciphered papyri are contained in the work *Herculanensium Voluminum quæ supersunt*, published at Naples 1793–1827

PAPY'RUS In Botany, a Cyperaceous plant found in the districts of many tropical countries, but especially in the valley of the Nile and whose soft cellular flowering stem afforded the most ancient material on which paper was made [illegible] the general [illegible] genus *Cyperus*, which was extensively used for making mats, baskets, boats, and many other purposes, the species confined to the manufacture of paper being usually designated *Cyperus papyrus* or *Byblus* The latter was particularly cultivated in the Sebennytic nome, though other parts of the Delta also produced it, and probably even some districts in Upper Egypt The paper made from it differed in quality, being dependent upon the growth of the plant and the part of the stalk whence it was taken The process of the manufacture is minutely described by Pliny in his *Hist Nat* xiii 11, 12 The period at which paper began to be manufactured from the papyrus is involved in great obscurity but there can be little doubt that Pliny was greatly in error when he assigned it a date posterior to the reign of Alexander the Great, for we meet with papyri (see above) of the most remote Pharaonic periods, the same mode of writing on which is shown from the sculptures to have been common in the age of Suphis or Cheops, the builder of the great pyramid, more than 2000 years before the Christian era The manufacture of paper from the papyrus continued in general use down to the end of the 7th century, when it was superseded by parchment (which see)

PAR OF EXCHANGE *See* EXCHANGE

PA'RABLE (Gr παραβολη from παραβαλλω, *I compare*) In Rhetoric, in the original sense, a comparison, but the word has become in modern language, appropriate in a particular meaning The parables of the New Testament are illustrations, in the form of short tales, after the oriental manner in each of which not only a moral or religious truth is conveyed but the objects contained in the hidden sense are distinctly represented by parallel objects or types in the external narrative

PARA'BOLA In Geometry, one of the conic sections, formed by the intersection of the cone with a plane parallel to one of its sides Considered as a plane curve, the parabola may be defined as follows — A point F, and a straight line B B', being given by position in a plane, let another point D be supposed to move in such a manner that its distance D F from the given point is always equal to its distance D H from the given straight line the point D will trace out the parabola



The given line B B' is called the *directrix* of the parabola, the given point F is the *focus*, the straight line F C, drawn through F perpendicular to the directrix, is the *axis*, any straight line parallel to C [illegible] *parameter*, the point in which the diameter meets the curve is the [illegible] a straight line equal to the double of the distance between the vertex of any diameter and the directrix is called the *latus rectum* or *parameter* of that diameter

From the preceding definition of the curve its algebraic equation is easily found Let A be the origin of the rectangular co-ordinates, A K = x, K D = y, and A F = A C = a we have D K^2 or y^2 = D F^2 − F K^2, but D F = D H = C K = $x + a$, and F K = A K − A F = $x - a$, therefore $y^2 = (x + a)^2 - (x - a)^2$, whence $y^2 = 4ax$, or, if we assume $p = 4a$ (= the parameter of the axis) the equation becomes $y^2 = px$, that is the square of the ordinate is equal to the rectangle under the abscissa and the parameter This property holds true of every other diameter as well as of the axis, the ordinate being taken parallel to the tangent at the vertex of the diameter It was on account of this property that the curve received its name.

Let F D = r and the angle A F D = ϕ; then F K = $r \cos. \phi$ and consequently C K = $2a - r \cos. \phi$ But by the definition of the curve, C K = F D = r, therefore $r = 2a - r \cos. \phi$, whence $r = \frac{2a}{1 + \cos. \phi}$. This [illegible] parabola through D, it is a property of the curve that the angle H D T and consequently the vertical angle A D t, is equal to F D T. A ray of light, therefore falling on the curve in the direction A D and being reflected by it would pass through the point F, and as this takes place with regard to every ray parallel to the axis it follows that the concave surface formed by the revolution of a parabola about its axis is that by which all the parallel rays of light are collected into a single point Hence the point F is called the *focus* or burning point

Another remarkable property of the parabola is the following — Let P A be [illegible]

[illegible] P A^2 P B^2 For, making C M and D N parallel to P B, and assuming p = the parameter of the diameter P N, we have, from a property already mentioned, M C^2 = p P M, and N D^2 = p P N, therefore M C^2 N D^2 P M P N, or P A^2 P B^2 A C B D Hence the parabola is the curve described by a projectile in a vacuum, for a body projected from P in the direction P A and not resisted, would pass over spaces in that direction proportional to the times, and, in consequence of the accelerating force of gravity, through spaces A C and B D proportional to the perpendicular [illegible] on proportional to the squares of the times, or proportional to the squares of P A and P B *See* GUNNERY, PROJECTILE

The parabola is remarkable, as being the first curve of which the indefinite quadrature was found Let P N be a diameter, and P B [illegible] its vertex and B D and D N respectively parallel to P N and P B, it was demonstrated by Archimedes that the area contained by P N, N D, and the parabolic arc P C D, is equal to two thirds of the parallelogram P B D N

The curve which has now been described is called the *conical* or *Apollonian* parabola, but the term parabola is also applied to all algebraic curves of a higher order determined by an equation of the form $y^{m+n} = a^m x^n$ The curve whose equation is $y^3 = a^2 x$ is called the cubical parabola, and that which has for its equation $y^3 = ax^2$, the semicubical parabola This latter curve is celebrated in the history of the algebraic analysis as being the first curve that was rectified or found equal in length to an assignable straight line, and the honour of the discovery belongs to an Englishman, William Neil, who died in 1670 at the early age of thirty-three The same discovery was made nearly at the same time by Van Heuraet in Holland till then it had been supposed by geometers impossible to assign a straight line equal to the arc of any algebraic curve (the rectification of the cycloid had been found by Sir Christopher Wren), but the discovery of the method [illegible] there are innumerable classes [illegible] definite rectification In fact, all parabolas of this form $y^{2n+1} = ax^{2n}$, where n is any number whatever, may be rectified (Montucla, *Histoire des Mathematiques*, tom ii p 151) *See* CONIC SECTIONS

PARABO'LIC CONOID The solid generated by the rotation of a parabola about its axis It is equal in content to $\frac{1}{2}$ the circumscribed cylinder, and to $\frac{3}{8}$ of the con [illegible]

PARABOLIC CURVE [illegible] which the equation is of the form $y = a + bx + cx^2 + dx^3 +$ &c. Curves of this kind are frequently employed for the purpose of representing a number of observations, or for approximating to the areas of other curves, for it is always possible to cause a parabolic curve to pass through any number of points in a given curve, by making as many of the coefficients a, b &c [illegible] and terminate as there are points given [illegible] curve thus described will differ less from the given curve according as the number of points is greater But the area of the parabolic curve can always be determined therefore that of the other curve may be found to any required degree of approximation

PARABOLIC SPINDLE The solid conceived to be [illegible] of a parabola about its base, or [illegible]

PARABOLOID is sometimes used to denote the parabolas of the higher orders, and sometimes the solid formed by the rotation of a parabola about its axis or the parabolic conoid

PARACELSISTS Followers of the school of Paracelsus in medicine physics and mystical science The founder of this school may perhaps be called with justice the most distinguished quack who ever made a figure in the world He practised medicine "with the boldness of a wandering empiric," and established a

[illegible] He mingled his medical and chemical knowledge with the speculations of the [illegible] a theosophy of his own He died in [illegible] continued to influence the schools of Germany for more than a century (See *Hallam's Introduction to the Literature of the Middle Ages* i 541 639 ii 70 &c , and *Mosheim*, vol iv)

PARACENTESIS (Gr παρακεντεω, *I perforate*) The operation of *tapping* any of the cavities of the body for the purpose of withdrawing a contained fluid

PARACENTRIC (Gr παρα, and κεντρον, *centre*) In the higher Geometry, the name given to a curve line having this property, that a heavy body descending along it by the force of gravity will approach or recede from a *centre* or fixed point, by equal distances in equal times

PARACENTRIC MOTION, in Astronomy, denotes the rate at which a planet approaches nearer to, or recedes farther from the sun or centre of attraction, in a given interval

PARACEPHALOPHO'RES (Gr παρα *beside*, κεφαλη *head* and φερω *I carry*) A name given by M De Blainville to a class of Molluscous animals in which the head is but little distinct from the body, and is always provided with some of the organs of sense

PARACHU'TE (Fr parer, *to ward off*, and chute, *fall, a guard against falling*) An apparatus resembling the common umbrella, but of far greater extent, intended to enable an aeronaut in case of alarm to drop from his balloon to the ground [illegible] This is effected by means of the resistance of the air sphere When the parachute is detached and abandoned with its load in the [illegible] it descends at first, from the continued action of gravity, with an accelerated motion, until the increased velocity produces a resistance equal to the force of attraction or the weight of the apparatus with its load After this equilibrium has been attained, the parachute will descend with a nearly uniform velocity According to theory, this terminal velocity, supposing the surface of the parachute to be flat, is equal to that which a heavy body would acquire in falling through the altitude of a column of air incumbent on that surface, and having the same weight [illegible] A circular parachute having a diameter of 24 feet, weighing with its load 225 pounds would acquire a terminal velocity of 24 feet per second, and a person descending with it at this rate would receive the same shock on reaching the ground as if he dropped freely from a height of $2\frac{3}{8}$ feet (For the method of solving this problem see *Hutton's Mathematical Tracts* vol i p 316) The actual resistance of the air is, however, greater than is given by theory, and is besides augmented by the oscillations of the parachute, which occasions it to descend not only but, on account of the action of the wind, the axis of the parachute will probably become inclined to the vertical, in which case the resistance will suffer a diminution

One of the most remarkable instances of descent from a great height with a parachute is that of Garnerin, a Frenchman, who ascended in a balloon from an enclosure, near North Audley Street in London, on the 2d of September, 1802 After hovering seven or eight minutes in the atmosphere, he cut the cord by which his parachute was attached to the balloon It instantly expanded, and for some seconds descended with an accelerating velocity till it became tossed extremely, and took such wide oscillations that the basket or car was at times thrown almost into a horizontal position The intrepid aeronaut [illegible] escaped destruction by being precipitated on the houses in St Pancras, and at last forcing [illegible] in Oakley Street, Lambeth He [illegible] and trembled exceedingly at the moment he was released from the car (*Ency Brit*, "Aeronautics")

An experiment of this kind made by Mr Cocking a few years ago, was attended with fatal consequences Having conceived a notion that the vibrations might be avoided by giving the machine a different form, this projector constructed one in the form of an inverted umbrella, that is, having the concave side [illegible] and bound to a strong wooden hoop to [illegible] collapse in the descent The diameter of the hoop was 34 feet and there was also a hole of 6 feet in diameter in the middle of the parachute, which, it was supposed, would also contribute to give greater steadiness Having attached himself to the machine he proceeded to Vauxhall Gardens on the 21st of [illegible] and set away from the balloon [illegible] and with violent oscillations the hoop broke, and the unfortunate projector fell dread unmangled, at Lee, near Blackheath The persons in the car of the balloon were also placed in great danger, having narrowly escaped suffocation from the quantity of gas expelled in consequence of the great velocity with which the balloon darted upwards immediately on being liberated from the parachute They suffered extreme pain, and for a time were deprived of sight by the [illegible] they had carried up with [illegible] air, by means of [illegible] Without this, they would probably have perished,

PARACLETE (Gr παρακλητος, *advocate*) A name attached to the Holy Spirit, as an advocate, intercessor, or comforter of mankind; such as he is represented, John, xiv 16 26 , Rom viii 26. It was not an uncommon opinion of the early heretics, that the Paraclete, whose mission was promised by Christ, was to appear corporeally upon the earth and complete the dispensation announced by our Lord and the apostles; and [illegible] between the person of the Comforter and the [illegible] of his grace upon the disciples on the day of Pentecost Accordingly, several of them, Simon Magus, Manes and others gave themselves out as this expected Paraclete and Tertullian himself was at one period infatuated by the claims advanced by Montanus to this personification

PARACRO'STIC A poetical composition in which the first [illegible] mence [illegible] According to Cicero (*De Divinatione*, ii 54), the original Sibylline verses were paracrostics *See* Acrostic

PARACYA'NOGEN When cyanuret of mercury is decomposed by heat, a brown solid matter remains having the same composition as gaseous cyanogen, hence designated as above

PARA'DE (Fr) The place where troops draw up to do duty, mount guard, &c The original meaning of the word is *show* or *ostentation*, and it is used as above, because on these occasions officers and men are expected to be in full uniform or completely equipped

PA'RADIGM (Gr παραδιγμα, *an example*) In Rhetoric, a general term used by Greek writers in the sense of "example" or "illustration" of which "parable" and "fable" are species (*Quintilian*, v 2) Hence, in early theology, those writers who narrated the lives of religious persons by way of examples of Christian holiness were styled Paradigmatics

PA'RADISE (Gr παραδεισος said to be derived from a Persian or Chaldaic word or from the Arabic firdauz *a fruitful valley*) This name of oriental origin, was used by the Greek historians to denote the extensive parks or pleasure grounds of the Persian monarchs (Xenophon *Cyrop* and *Econom*, *Diod Sic* xvi 41 , xviii 36 , described by *Quintus Curtius*, viii 1 , who does not use the word See also *Aulus Gellius*, ii 20) The Septuagint have employed the word in their translation of Genesis ii 8 to signify the abode in which Adam and Eve were placed by their Creator It also occurs in other parts of their translation (Numbers xxiv 6 , Genesis xiii 10 , Ez xxviii 13 , xxxi. 8) It is used in the N T in the memorable passage, Luke, xxiii 43 The speculations into which this mysterious passage has led learned and pious men, in all ages of the church, form too extensive a subject to be entered upon here. The mythologies of many nations contain similar ideas, whether derived from the ancient tradition of a paradise, or formed out of the inherent sense of man of his own imperfection and longing after a better state, from which he imagines himself to have fallen (See, especially, the first part of *Buttmann's Mythologus*, and *Bryant's Mythology*) The rabbins have formed, as usual, a strange collection of [illegible] ple narrative of Scripture [illegible] an upper or heavenly, and [illegible] The lower is situated somewhere under the terrestrial equator Each is divided into seven dwellings, and each of these is twelve times 10 000 miles in length and breadth A column ascends from the lower to the upper heaven, by which the souls of the blessed mount after a temporary sojourn in the former A wall of partition divides paradise from hell, and this will fall when the Redeemer comes, and all Israel be gathered together in blessedness

The celestial paradise is generally referred to as identical with heaven, or the place of bliss hereafter Some critics, who weigh very nicely our Lord's expression in addressing the penitent thief, "To-day shalt thou be with me in paradise," have imagined the existence of a distinct abode for the souls of the just before the final judgment When we consider, however, that, upon the authority of another passage in Scripture, we affirm that our Saviour went down into hell between his death and resurrection, it will be better, perhaps, not to affix too definite a meaning either to the one expression or the other

The local situation of the terrestrial paradise has been a favourite su[illegible] with the fathers of the church [illegible] The reader may consult, if he will, the first volume of the compilation called the *Ancient Universal History*, where the matter is seriously discussed at great length; he will also find it treated in an [illegible] article of the *Enc Metropolitana* (See also Schirmer *Das Paradies*, Zurich, 1816) The most ordinary opinion has placed it on the Euphrates and Tigris Josephus regards the Pison

[illegible] Genesis as the Ganges, the Gihon as the [illegible] in places his in Palestine Huet (*De la Situation du Paradis Terrestre* 1691) enumerates a variety of these theories The paradise of the Moslems is termed in the *Koran* Gannath or the Happy Gardens, and its description is evidently borrowed from the notions of the rabbis and oriental Christians See chiefly chapters lv lvi , but these passages, although flowery enough, contain a very small part of the extravagances, chiefly drawn from tradition which make up the vulgar Mohammedan notion of paradise (See in addition to the article of Sprenger cited at the end of the preceding article in the unfinished *Imago Japeti* of Preusser and Gruber)

PARADOX (Gr παρα δοξαν, *contrary to received opinion*) A term applied to any proposition which seems to be absurd, or at variance with common sense, or to contradict some previously ascertained truth , though, when properly investigated it may be found to be perfectly well founded The reader will find in Bishop Horsley's 19th Sermon the nature of a paradox, and the points wherein it differs from a contradiction, clearly illustrated

PARADO'XUS (Gr παραδοξος, *wonderful*) A name devised to express the obscure nature of a genus of Trilobites [illegible] which is characterized by [illegible] of the prominent even-formed eyes which are borne on the shield of all other Trilobites The segments extend beyond the sides of the body, and are free at their lateral extremity It serves also as a specific name for obscure and anomalous animals, as the *Ornithorhynchus paradoxus*, *Lepidosiren paradoxa*, &c

PARAFFINE A substance contained in the products of the distillation of the tar of beech wood It is a tasteless inodorous fatty matter, fusible at 112°, and resists the action of acids and alkalis It appears to be a hydro-carbon Its name is compounded of parum and affinis, *akin*, to denote the remarkable chemical indifference which is its characteristic feature A similar substance has been obtained by Dr Christison from the petroleum of Rangoon

PARAGE (Lat par, *equal*) In Feudal Jurisprudence the body of nobles (peerage) was so termed, the word likewise expressed equality of condition in various legal relations as for example, between the lords in partnership of a fief Parage was also a custom by which the elder of several coheirs of a fief rendered homage for the whole, and thereby guaranteed the enjoyment of it to his coheirs as well as himself, in the same manner, one of several copurchasers might be admitted to a similar privilege

PARAGO'GE (Gr παρα *by the side of*, and αγω *I bring*) In Grammar a figure by which one or more letters are added at the end of a word, *e g* in the ordinary formation of diminutives in most languages See METAPLASM

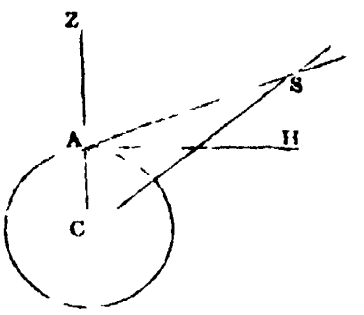
PARAGO'GIC LETTERS (Gr παραγωγη, *an addition*) In the Semitic languages, letters which by their addition to the ordinary form of the word import additional emphasis, or some peculiar inflexion into the sense Their real meaning and authority have been much debated among Hebrew scholars

PA'RAGRAPH (Gr παραγραφος), ordinarily signifies a small subdivision of a connected discourse, and is indicated by the sign ¶ in modern orthography

Paragraphe, as used by Greek rhetorical writers, is a poetical figure employed when the writer sums up in a few words the substance of a previous passage, by way of transition to a new one It was probably so called by analogy (*Eustathius on Hom Il* i 304)

PARALEI'PSIS (Gr παραλειπω, *I omit*) In Rhetoric, the artificially exhibited omission or slight mention of some important point, in order to impress the hearers with indignation, pity, &c called by the Latins præteritio, omissio, &c , as in the famous lines —

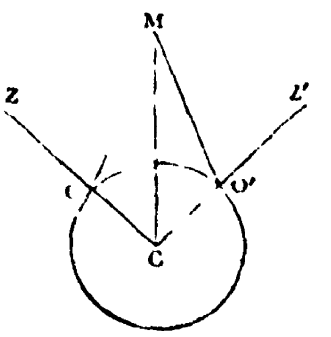
> Occidat illa dies ævo, nec postera credant
> Sæcula nos certe, taceamus, et obruta multa
> Nocte tegi nostra patiamur crimina gentis



The passage, Hebr xii 32, may be given as another instance; or the following from Cicero — "Prætereo illum nefarium conatum tuum," &c (*Conc c Antonium*)

PARALIPO'MENA (Gr [illegible] *left out or aside*) A term applied [illegible] of a supplementary character The two books of the Old Testament called by us, after Saint Jerome, the Chronicles are also termed Paralipomena

PARALLACTIC INSTRUMENT An astronomical instrument for determining the moon's parallax described by Ptolemy in his *Almagest* and usually called *Ptolemy's Rules* The term *parallactic* is sometimes applied to the equatorial, but in this sense the proper word would seem to be *parallatic*, as derived not from *parallax*, but from *parallel* the instrument being constructed for the purpose of following the stars in their diurnal parallels (Lalande *Astronomie* § 2678)



PA'RALLAX (Gr παραλλαξις *change*) A change of place or of aspect The term is [illegible] to denote the difference between the [illegible] and its *true* place, or that in which it [illegible] the observer [illegible] centre to which the motion is referred When [illegible] of reference is the centre of the earth, the change of aspect is called the *diurnal parallax*, when it is the centre of the earth's orbit, the change is called the *annual parallax*

Diurnal Parallax —Let C be the centre of the earth A the place of the observer, Z his zenith, and S a celestial body On observing the body from A, it will be seen in the direction A S, making the angle Z A S with the zenith But if the observer could be placed at C, he would see the body in the direction C S, making the angle Z C S with the zenith The difference between these two angles Z A S and Z C S is the parallax of S, which, therefore, is equal to the angle A S C Hence it appears that the parallax of a celestial body is the angle comprised between two lines drawn from the body, the one to the centre of the earth, and the other to a point on its surface On account of the immense distance of the fixed stars the diurnal parallax is altogether insensible with regard to them It may amount to a degree in respect of the moon, but the greatest parallax of the nearest planet does not exceed 30″

It is evident from the inspection of the figure, that although the distance of the object S remain the same, the angle A S C is [illegible] but is greatest when S is seen in [illegible] horizon A H, and diminishes as the altitude of S increases, until it vanishes altogether at the zenith, where the two lines A S and C S merge into the line C Z In order to discover the law of this variation let $a = C A$, the semidiameter of the earth, $d = C S$, the [illegible] from the centre, $Z = Z A S$ [illegible] and $P = A S C$, the parallax Now [illegible] triangle being in the same proportion [illegible] of the opposite angles, we have $d : a :: \sin Z : \sin P$, whence $\sin P = \frac{a}{d} \sin Z$ But as P is always a very small angle, the arc may be substituted for the sine without sensible error, and the formula becomes $P = \frac{a}{d} \sin Z$, that is to say the parallax is proportional to the sine of the zenith distance At the horizon Z is a right angle, and $\sin Z = 1$ in this case, therefore, the expression for the parallax becomes $P = \frac{a}{d}$ This is called the horizontal parallax, and when its amount has been determined by any means with respect to a celestial body, the parallax of the body at any altitude is found by multiplying the horizontal parallax by the cosine of the altitude, or sine of the zenith distance

Since the parallax of [illegible] in terms of its distance and the earth's [illegible] it follows, reciprocally that the distance of the body is given in terms of its parallax The determination of the parallaxes of the different bodies of the solar system is therefore a problem of great importance in astronomy but it is attended with considerable difficulty in practice, although the principle on which it depends is extremely simple It may be described as follows —Let two observers be stationed at the points O and O′, of which the latitudes are supposed to be known, and which are both situated on the same meridian, and let them simultaneously observe the zenith distances of the body M (supposed the moon) These observations will give the angles Z O M and Z′ O′ M and [illegible] M O C and M O′ C The [illegible] O C O′ is also known, being the difference or the sum of their latitudes, according as they are on the same or opposite sides of the equator But the two sides C O and C O′ of the quadrilateral M O C O′ being radii of the earth, are also supposed to be known, hence the quadrilateral is determined, and its diagonal C M may easily be computed by the rules of plane trigonometry But when C M is found, the horizontal parallax is also determined, being equal, by what has been already shown, to the quotient obtained by dividing the radius C O by the distance C M In this manner the horizontal parallax of the moon was determined by Lacaille at the Cape of Good Hope and the latter simultaneously at Berlin There are methods, however,

by which the lunar parallax may be determined by observations made at a single place

The moon's mean horizontal parallax amounts to 57′ 4″ 17, or 95116 of a degree In respect of all the other bodies of the solar system the parallax is an extremely [illegible] with sufficient precision and certainty That of the sun, the most important of all, is most accurately found by observations of the transits of Venus over his disk, as was first suggested by James Gregory in his *Optica Promota* It amounts only to 8″ 6′, whence we infer that the mean distance of the sun from the earth is 23 984 times the length of the earth's radius, or about 95,000,000 miles (*See* SUN) This determination suffices for [illegible] times, when the distance of any one planet from the sun is known that of every other can be deduced from the times of revolution (See *Kepler's Laws*)

When the parallax of a celestial body has been determined, we can find not only the distance of the body but also its diameter and real magnitude For the apparent diameter being found by observation the true magnitude is given by this proportion — The horizontal parallax is to the apparent radius, as the radius of the earth to the true radius of the body

The effect of parallax is to depress the observed body in the vertical circle or to increase its zenith distance If the body at the time of the observation is on the meridian, the parallax only affects its declination, but if it is not on the meridian, the observed right ascension and declination are both altered and the effect on each of these co-ordinates must be computed from the previously known horizontal parallax by the rules of spherical trigonometry The computation in the case of the moon, is considerably complicated by the earth's ellipticity

Annual Parallax — In what has yet been said the centre of the earth has been taken as the point of reference, and therefore regard has only been had to the difference of apparent situation occasioned by the eccentric position of the observer at the surface of the earth But the sun, and not the earth, may be regarded as the centre to which the motion is referred, and the position of any celestial body of which the distance from the sun is not so great as to be incomparable with the semidiameter of the earth's orbit would be different if viewed from the sun from what it is when viewed from the earth This difference is called the *annual parallax*, or *parallax of the great orb* It is the angle under which the semidiameter of the earth's orbit would be seen from a superior planet or from a fixed star [illegible] the enormous distances [illegible] excepting two or three instances, which perhaps may be still regarded as doubtful not one of them has yet been discovered to be sensibly affected by annual parallax, though observations have been carried to such nicety that did the quantity in question amount to a single second, it could not possibly have escaped detection

From observations of right ascension and declination, Piazzi deduced a parallax of 4″ for Sirius, and of 5 7″ for Procyon, and Calandrelli one of 4″ for α Lyræ, but these determinations have been proved to be erroneous Dr Brinkley compared [illegible] observations with the Dublin circle indicated a [illegible] parallax in the three stars, α Lyræ, α Cygni, and α Aquilæ, but Mr Pond showed that no sensible parallax in any of these stars could be deduced from the Greenwich observations, and Mr Airy has confirmed this conclusion in respect of α Lyræ Mr Henderson, however, has found a probable parallax of 1″ in the star α Centauri from observations made at the Cape of Good Hope Sir William Herschel first pointed out the micrometrical measurements of the distances of two stars very close to each other, or nearly in the same line of vision, as a likely method of detecting parallax, for the apparent distance between two such stars, if either has a sensible parallax, must vary at different times of the year, and this method has very recently been applied by Struve, at Dorpat, to α Lyræ, and by Bessel, at Konigsberg, to the double star 61 Cygni The results obtained by the latter are the most unequivocal By a series of observations with the heliometer, continued from August 1838, to March 1840, Bessel obtained the value of the parallax = 348″, a little more than the third of a second of space Assuming this determination, and astronomers seem to regard it as established within certain small limits, the distance of the star from the earth must be 519,200 times the sun's distance,—a distance so enormous that light, which travels at the rate of 192,000 miles in a second, would require 9½ years [illegible] it (*Monthly Notices of the R Astr Soc* [illegible] For the history of researches on the subject of the annual parallax, see *Mem R Astr Soc* vol xii) See STAR

PARALLELEPIPED (Gr παραλληλος επιπεδον) frequently, but incorrectly, written *Parallelopiped* A solid contained by six planes, three of which are parallel to the other three The content of this solid is found by multiplying the area of one of its faces by its distance from the opposite face Consequently parallelepipeds on equal bases and of the same height are equal

PARALLELISM In geometry are defined by Euclid [illegible] and [illegible] in the elements of geometry, and has accordingly given rise to much learned discussion The difficulty consists [illegible] so as to make the [illegible] than two right [illegible] ly produced, will at length meet on the side on which the angles are which are less than two right angles" But this is not a self evident truth It is in fact a proposition which requires to be demonstrated and the converse of it namely, that two straight lines which meet one another make with any third line the interior angles less than two right angles, forms the 17th proposition of Euclid's first book Geometers have attempted in many different ways, but without complete success, to remove this blemish from the Elements The methods which they have employed for this purpose are of three kinds 1 By adopting a new definition of parallel lines, 2. By introducing a new axiom; 3 By reasoning merely from the definition of parallel lines and the properties of lines already demonstrated

Some geometers, among whom are Wolfius, Boscovich, and Thomas Simpson, have adopted the following as the definition of parallel lines namely that "straight lines are parallel which preserve always the same distance from each other," but this [illegible] as remarked by D'Alembert, is [illegible] The correct definition would be, that two straight lines are parallel when there are two points in the one from which the perpendiculars drawn to the other, and on the same side of it, are equal" The difficulty then consists in demonstrating that *all* the perpendiculars drawn from the one of these lines to the other are equal Another definition, which has been adopted by Varignon, Bezout, and others, is, that "parallel lines are those which make equal angles with a third line towards the same parts, or make the exterior angle equal to the interior and opposite" When this definition is adopted, the difficulty [illegible] that straight lines which are equally [illegible] must be equally inclined [illegible] straight lines which fall upon them

Of the new axioms which have been substituted in place of Euclid's, we shall merely notice that given by Thomas Simpson, in the second edition of *Elements*, namely that "If two points in a straight line are posited at unequal distances from another straight line in the same plane, those two lines, being indefinitely produced on the side of the least distance will meet one another" By help of this axiom [illegible] are parallel, the [illegible] by the other are equal, and also perpendicular to the other parallel, and thence the proposition from which all the [illegible] namely that a straight line falling on two parallels makes the alternate angles equal Playfair remarks on this method, that it is extremely plain and concise, and perhaps as good as any that can be followed when a new axiom is assumed

Legendre, in his *Elements of Geometry*, has attempted to overcome the difficulty of parallel lines by previously demonstrating that all the angles of a triangle are equal to two right angles, from which proposition it is easy to prove every thing with respect to parallels His demonstration, however, is of too refined and subtle a kind to be admissible into the Elements (See the Notes to *Playfair's Euclid*, *Legendre's Geometry*, and *Leslie's Geometry* But the reader who wishes to have a complete view of what has been written on this subject should consult a learned *excursus* to the first book of *Camerer's Euclid*, Berlin, 1825, and also *Colonel P Thomson's Geometry without Axioms*)

It may be remarked, that [illegible] which exists with respect [illegible] is of a metaphysical rather than of a mathematical kind, and the learner need not perplex himself about subtleties which can hardly be considered as affecting the rigour of geometrical truth

PARALLELOGRAM Gr παραλληλογραμμον A plane four-sided figure, of which the opposite sides are parallel The area of a parallelogram is found by multiplying the length of one of its sides by that of the perpendicular let fall upon it from the opposite side Hence parallelograms on equal bases, and of the same altitudes, are equal

PARALLEL PLANES, are such as never meet, though indefinitely produced

PARALLEL RULER A mathematical instrument,

formed of two equal rulers connected by two cross bars or blades moveable about joints, so that, while the distance between the two rulers is increased or diminished their edges always remain parallel, and consequently if the edge of one of the [illegible] line [illegible]

PARALLEL SAILING, in Navigation, is sailing on a parallel of latitude, or circle parallel to the equator [illegible]

[illegible] OF ALTITUDE, in Geography, are small circles of the sphere parallel to the horizon, also ca[illegible]

[illegible] DECLINATION In Astronomy, small circles of [illegible] o the equator

PARALLEL [illegible] on the terrestrial [illegible] are [illegible] circles parallel to the equator but, in [illegible] celestial spa[illegible] they are parallel to the ecliptic

PARALLEL SPHERE in Geography is that position of the sphere in which the equator coincides with the horizon, and the poles are in the zenith and nadir This is the appearance which the sphere would have to a spectator placed at the pole The stars neither rise nor set, but move constantly in circles parallel to the horizon, and the sun rises and sets only once a year

PARA'LOGISM (Gr παρα, *beside*, and λογος, *reason*) In Logic and Rhetoric, a reasoning which is false in point of form, i e in which a conclusion is drawn from premises which do not logically warrant it It is the opposite to a syllogism or correct logical deduction *See* SYLLOGISM

PARA'LYSIS (Gr παραλυω, *I weaken*) Palsy A diminution or loss of power of any part of the body In general one side only is affected, or the upper or lower extremities Whatever debilitates the system may produce palsy; it is also produced by pressure upon certain parts of the brain and spinal marrow, and occasionally by poisons, by local injuries, and by the sudden [illegible] of certain evacuations It frequently [illegible] tortion of the mouth or eye, the speech becoming indistinct and the judgment often impaired The treatment of palsy depends upon a careful consideration of its cause, more or less depletion is generally required, together with purges and nervine stimulants, such as ammonia &c and blisters to the head and neck

PARAMETER In Geometry a constant straight line belonging to each of the three conic sections, otherwise called the *latus rectum* In the parabola, the parameter is a third proportional to the abscis and its corresponding ordinate, in the ellipse and hyperbola, the parameter of a diameter is a third proportional to that diameter and its conjugate The term is also used in a general sense, to denote the constant quantity which enters into the equation of a curve

PARA'MO (Sometimes rendered though incorrectly by *desert* or *heath*) The name given in South America to a mountainous district covered with stunted trees, exposed to the winds, and in which a damp cold perpetually prevails Under the torrid zone the Paramos are generally from 10,000 to 12 000 feet in height Snow often falls on them, but remains only a few hours in which respect they are distinguished from the *Nevados*, which enter the limits of perpetual snow The Paramos are almost constantly enveloped in a cold thick fog, so that when a thick small rain falls, accompanied with a depression of the temperature they say at Bogota or at Mexico, *cae un paramito* Hence has been formed the provincial word *emparamarse*, — to be as cold as if one were on a *paramo* (*Humb Pers Nar* ii p 252)

PARANAPHTHALINE A substance so termed from Gr παρα, *near to*, because it closely resembles *naphthaline* It appears to be a mixture of paraffine and naphthaline

PARANTHINE A rare mineral, so named by Hauy, [illegible]

PARANYMPH [illegible] A bridesman It is translated in our version of the Scriptures by "master of the feast"

PARAPET, or [illegible] (Ital parapetto, *breast work*) In [illegible] r screen raised on the extreme edge of a rampart or other work through which [illegible] openings are cut for the cannon to fire through The solid parts of the parapet, between the embrasures, are called the *merlons* In common language a parapet is a breast wall raised on the edges of bridges quays &c to prevent people from falling over

PARAPH (Gr παρα, *beside*, γραφω, *I touch*) In Diplomatics, the figure formed by a flourish of the pen at the conclusion of a signature This formed, in the middle ages, a sort of rude provision against forgery, like the flourishes in the plates of bank notes. In some countries (as in Spain) the paraph is still a usual addition to a signature

PARAPHERNALIA (Gr φερνη, *a dowry*) In the Civil Law the apparel jewels, &c of a wife, which are held to belong to her as a species of separate property The husband may dispose of them in her lifetime, but cannot bequeath them away from her, and if he have not parted with them before his death, she may retain them against his executors [illegible] his creditors, where his other [illegible] satisfy their claims

PARAPHO'NIA (Gr παρα, and φωνη, *voice*.) Alteration of voice

PARAPHRASE (Gr παρα, *beside*, and φραζω, *I speak*) In Rhetoric, the rendering of a passage or portion of writing in other phraseology, more distinct and easier of explanation, and therefore usually at greater length A loose translation or one in which a new series of ideas and illustrations conveying the same general meaning with those of the original is substituted for them, is also termed a paraphrase, although not with strict propriety

PARAPHY'SES (Gr παρα and φυω *I grow*) A term used in describing [illegible] of the sessile ovate abortive bodies [illegible]

PARAPLEGIA (Gr παραπληττω, *I strike inharmoniously*) Palsy of the upper or of the lower half of the body

PARASANG (Gr) A Persian measure of length, according to Herodotus, equal to 30 stadia and (reckoning 8 stadia to the English mile) equal to 3¾ English miles The length of the parasang was reckoned differently by different authors, and such are the discrepant estimates of the ancients that some have assigned it the length of 60 stadia The word is supposed to be derived from the Persian seng signifying *a stone*

PARASCENIUM (Gr παρα, and σκηνη, *a scene*) In Antiquities, called also *postscenium*, the back part of a theatre beyond the stage, or the room to which actors withdrew on quitting the stage It was equivalent to the modern *green room*

PARASITE (Gr παρα, *at hand*, and σιτος, *food*) Originally according to Crates in Athenæus, a term of honour, being the appellation of certain ministers at sacrifices, whose office is not distinctly ascertained (See *Mem de l'Acad des Inscr* vol xxxi) The habits of a luxurious age produced the race of poor companions, ready guests at the table of a patron, who formed a standing character in the later Greek comedy Some attribute the first conception of the dramatic personage to Araros, the son of Aristophanes Diphilus, according to Athenæus gave the most complete portrait of it in his comedy *Telesias* Our notions of the ancient parasite are now derived chiefly from the Latin comic poets Ingenious writers have divided parasites into four classes —1 The poor confidential friend, whose services to his patron are sometimes rendered with a mixture of real attachment, as in the character of Ergasilus in the *Captives* of Plautus 2 The guest who is invited with a view to make him pay for his reception by the exertion of his powers of entertainment (Anglicè diner out), the "ridiculi" and "derisores" of Plautus, and what [illegible] by Juvenal Balatro, the two umbræ of Mæcenas at the supper of Nasidienus, seem to have partaken of this quality These degenerated, thirdly, into the class of mere buffoons, who were invited to play tricks and undergo practical jokes, under pain, as Ergasilus complains in the play already cited, if they refused to lend themselves to the manual pleasantries of their guests, of "taking up their beggar's wallet and marching" The fourth and worst class κολακες, were the attendant flatterers of their patron Such is Artotrogus, or Toutcutter the humble companion of Pyrgo-Polinices in the *Miles Gloriosus* of Plautus, and the best known of all parasites Gnatho, in the *Eunuch* of Terence

PARASITES In Zoology, this term, as designative of a group of animals, is variously applied by different naturalists Lamarck includes under it a family of antennated Arachnidans, Cuvier, Latreille, and Kirby apply the term to an order of Apterous insects, Straus to a tribe of Crustaceans but all the sections include animals of parasitic habits

PARASITICAL PLANTS, are those which grow into the tissue of other species, and feed upon their juices Of this kind are the mistletoe, the broom rape (*Orobanche*) the *Lathræa*, and among exotics, the monstrous *Rafflesia* Such plants have no proper roots The term *parasite* is however often applied to mosses, orchidaceous plants Tillandsias and the like, which are mostly perennials growing upon the bark of trees, but deriving their food from the air by means of their own roots

PARASTATÆ (Gr παρα, *from*, and ιστημι, *I stand*) In Architecture pilasters, or rather square pillars which stand insulated *See* ANTA

PARATAXIS (Gr παρατασσω *I arrange side by side*) In Grammar opposed to Syntax The mere ranging of propositions one after another, as the corresponding judgments present themselves to our mind, without marking their dependance on each other by way of consequence or the like

PARBUCKLE In Naval language, to roll a cask

or any cylindrical body by pulling upon ropes fastened towards the place [illegible] the ground or [illegible] ends or quarters

PA'RCÆ The Latin name of the Fates According to Klausen (art "Parcæ," in the *Encyclopedia* of Ersch and Gruber), the original Roman Parca (the thrifty or avaricious goddess) was equivalent to Mors, the goddess of death, the third of the Fates It was not until the Augustan age, when the Greek and Roman mythology became mingled, that the Parcæ became plural (*Virg Ec* iv 47) and acquired their similarity to the Greek Moiræ, Clotho Lachesis, and Atropos

PARCEL A ROPE In Naval language, to cover it smoothly with tarred canvass, which is then bound over with spun-yarn

PARCENERS In Law *See* COPARCENERS

PA'RCHMENT (Fr parchemin) A material formed of the prepared skins of calves or sheep and goats when intended to be written upon A similar but finer kind of calves', kids', and lambs' skin is called *vellum* The skins are first prepared as for tanning then shaved down and pumiced and limed, stretched and carefully dried The parchment of drums is made of the skins of asses calves, and wolves, ass skin is used for battledores, and goat skin is preferred for sieves For some kinds of bookbinding parchment is dyed green by verdigrease (See *Ure's Dictionary of Arts*)

Parchment was known at a very early period It was used for writing as early as the year 250 before the Christian era by Eumenes, king of Pergamus, who, desirous of collecting a library which should vie with that of Alexandria, but prevented by the jealousy of the Ptolemies from obtaining a sufficient quantity of papyrus, had recourse to this substitute, and its invention at Pergamus claimed and secured to it the lasting name of Pergamena whence *parchment* (*Sir G Wilkinson's Manners and Customs of the Ancient Egyptians*, iii 151) In the beginning of the eighth century, the use of the papyrus was almost entirely superseded by parchment, on which we find that all the public documents under Charlemagne and his dynasty were written When the different kinds of parchment came into use for the purposes of writing, they were rolled up before they could be sealed hence the word *volumen* from Lat volvere, *to roll* And as parties wrote to the very bottom of the parchment, [illegible] to the place where the cord used for the folding was fastened, we may account for the well known expression *opus ad umbilicum perductum*

PA'RDON In Law [illegible] prerogative of the crown to pardon all offences merely against the crown or the public, excepting the offence of committing any person to prison out of the realm, which by the Habeas Corpus Act is made a præmunire, unpardonable even by the king and excepting those offences in the prosecution of which private justice is in some measure concerned, as nuisances and offences against a popular or penal statute after information, for thereupon the informer has a private property in his part of the penalty Pardon is granted under the great seal, or by warrant under the sign manual, countersigned by one of the principal secretaries of state, or by act of parliament Its effect is, in almost all cases, to make the offender a new man and [illegible] the penal consequences attach-

[illegible] παρα, and ἐκβαινω, *I go out of*) The word used by Greek authors [illegible] Latins is called digression, by *Quintilian* [illegible] "alienæ rei, sed ad utilitatem causæ pertinentis, extrâ ordinem occurrens structura"

PARIGORIC (Gr παρηγορεω *I assuage*) That which allays pain *Paregoric elixir* is a camphorated tincture of opium flavoured by oil of aniseed

PARIRA BRA'VA The root of the *Cissampelos pareira*, brought from South America It has a sweetish and a bitter flavour and has been used in nephritic complaints and some affections of the bladder

PARMELIA In Botany a kind of lichen, the *Lecanora parella*, found on rocks in mountainous countries especially in the north of Europe It is the *Perelle* of Auvergne, where it is extensively used by the dyer, and is found equal to orcha (*Rocella tinctoria*)

PARE'NTHESIS [illegible] in the [illegible] tically cohere, by way of explaining something It is [illegible] and is a species of parentheses

PARENCHY'MA (Gr παρεγχεω *to strain through*) The spongy and cellular tissue of animals and vegetables The old physiologists supposed that the crude juices underwent [illegible] in the cellular substance

PARENCHYMATOUS ENTOZOONS *Parenchymatosa* (Gr παρεγχυμα) An order of Entozoa, including those which have their nutrient canals simply excavated in the parenchymatous tissue of which their [illegible] *See* HELMINTHA

PARENTHESIS (Gr. παρα and ἐν, and the verb τιθημι, *I place*.) In Rhetoric, a figure by which a series of words is inserted in a sentence, having no grammatical [illegible] with those which precede or follow, with the object of explaining some detached portion of the sentence. In ancient authors, a parenthetical form of writing is [illegible] because much [illegible] have conveyed by way of parenthesis is now inserted in separate ex-[illegible]

PARGASITE A variety of actinolite, from Pargas in Finland

PA'RGET (Etymology uncertain) In Architecture the plaster formed of lime, hair, and cow-dung, used for coating [illegible] of [illegible]

PARHELION or MOCK SUN (Gr παρα, and ἡλιος, *the sun*) A meteor which consists in the simultaneous appearance of several suns, "fantastic images of the true one" These images appear at the same height above the horizon as the true sun, and they are always connected with one another by a white horizontal circle or halo, of which the pole is at the zenith and the apparent semidiameter equal to the sun's distance from the zenith The images or mock suns, which appear on the same side of this circle with the true sun, are tinted with the prismatic colours, and sometimes a part of the circle itself contiguous to them appears coloured But those which appear on the circumference opposite to the sun are always without colour, whence it may be conjectured that these (as well as the luminous ring itself) are produced by reflection, and the others by refraction In general when these phenomena are produced, the sun is surrounded by one or more concentric circular coronæ which exhibit the colours of the rainbow, and sometimes arcs of circles or even entire circles, appear touching the coronæ These also are coloured and contain other parhelia The phenomenon has been described by Aristotle, Pliny, Scheiner, Descartes, and many others, but the most perfect apparition yet recorded is that which was observed by Hevelius at Dantzic, on the 20th of February, 1661 It is represented in the annexed figure

Parhelia have continued visible for two three, or four hours In general two, but sometimes four and even six or seven are visible together

No very satisfactory explanation of the cause of these curious but rare phenomena has yet been given Huygens supposed them to be produced partly by the reflection and partly by the refraction of the sun's rays, falling on an infinite number of small cylinders of ice suspended vertically in the atmosphere, and having certain determinate positions relative to the sun and the observer This theory is explained at length in the second volume of his *Opera Posthuma* (See also *Smith's Optics*, *Priestly on Light*, Biot, *Traité de Physique*, tom iii)

Fraunhofer, in a memoir on halos and parhelia, published in *Schumacher's Astronomische Abhandlungen*, p iii has attempted to explain these phenomena on a different principle On looking at the sun through a horizontal grating of very fine wires two images of the sun appear one above and the other below the true sun, and, if there is some inequality in the distances between the wires the images appear slightly coloured, and a vertical streak of light is seen [illegible] that this affords a clue to the theory of [illegible] small spherules of moisture floating in the atmosphere are disposed in horizontal parallel lines with tolerable regularity, two vertical parhelia (but this is a very rare phenomenon) will be seen, and if they are disposed in vertical lines, the more common phenomena of horizontal parhelia with the luminous circles may be produced It must be confessed, however that even when this arrangement of the particles of vapour in parallel lines is admitted several circumstances attending the phenomena will still remain unexplained

Parasclenæ, or images of the moon, are also seen under similar circumstances as parhelia the same theory will of course apply to both

PARIAN CHRONICLE (So called from the island of Paros, where it was originally found) The name given to one of the celebrated marbles imported into England with the rest of the collection known by the name of the Arundelian In its perfect state it contained a chronological register of the principal events in the history of ancient Greece during a series of 1318 years beginning with the reign of Cecrops, the first king of Athens, B C 1582, and ending with the archonship of Diognetus, but the last ninety years are nearly obliterated by the injuries of time, so that the part which now remains ends at the [illegible] of Diotimus, B C 354

The [illegible] on which the chronicle is engraved is 5 inches in thickness, and measured, when Selden viewed it, 3 feet 7 inches by 2 feet 7; but one corner had been broken off It contained originally about 100 lines, each consisting on an average of 116 words, or 130 letters;

so that the whole might have been comprised in six octavo pages

This venerable monument was purchased at Smyrna, with many others by Mr W Petty, who was employed by the Earl of Arundel, in the year 1624 for the purpose of collecting marbles [illegible] curiosities in Italy Greece, and [illegible] brought to England, in 1627 it was placed in the gardens belonging to Arundel House, the site of which is now occupied by Arundel, Norfolk, Surrey, and Howard Streets [illegible] Strand, and early on the following day it was examined, with eager curiosity, by some of the most distinguished literati of that time; among whom were Sir R Cotton, Selden, Patrick Young, and Richard James After much labour it was deciphered and [illegible] published by Selden in the year 1628, accompanied [illegible] translation and commentary

During the civil wars and the subsequent usurpation of Cromwell, the Parian Chronicle was unfortunately broken into smaller fragments, and almost entirely defaced The upper part, containing nearly half the original tablet, is said to have been used in repairing a chimneypiece or hearth in Arundel House, but luckily the inscription, or at least as much of it as could be made out, was preserved in the copy which Selden had previously taken and published In the year 1667 the remaining fragments were presented by the Hon Henry Howard, grandson of the first collector, to the University of Oxford, where they are now deposited

The genuineness of this valuable relic of antiquity was universally acknowledged throughout Europe as soon as its contents were made known Its authority was considered as equal, if not superior, to any other, writers of the first eminence derived the greatest advantage from it in their historical and chronological researches, and it was not till the year 1788 when the Rev John Robertson a gentleman of considerable learning and industry, published an elaborate volume called *A Dissertation on the Authenticity of the Parian Chronicle*, in which he maintained it to be a fabrication of modern times that its authenticity was impeached The doubts and objections of Mr R were founded on the following considerations — 1 The characters have no certain or unequivocal marks of antiquity 2 It is not probable that the chronicle was engraved for private use 3 It does not appear to have been engraved by public authority 4 The Greek and Roman writers for a long time after the date of this work, complain that they had no chronological account of the affairs of ancient Greece 5 This chronicle is not once mentioned by any writer of antiquity 6 Some of the facts seem to have been taken from authors of a later date 7 Parachronisms appear in some of the epochs, which we [illegible] in the 129th Olympiad, [illegible] history of [illegible] unsatisfactor[illegible] frequently imposed upon by spurious books and inscriptions and therefore we should be extremely cautious with regard to what we receive under the venerable name of antiquity

These observations were made the subject of separate chapters and disquisitions, and were illustrated with such candour and extensive erudition that for a short time the credit of the Parian Chronicle was shaken in the public opinion Early however, in the following year, the objections of Mr Robertson were replied to by Mr Hewlett, in a pamphlet entitled *A Vindication of the Authenticity of the Parian Chronicle*, Lond 1789, by Mr Gough, in the ninth vol of the *Archæologia*, and by Porson, in the *Monthly Review*, and the result of their inquiries, coupled with the defence of Wagner (Gott 1790), and the more recent investigations of Hales in his *Chronology* and of Böckh in the second volume of his *Corpus Inscriptionum* leave no doubt respecting the authenticity and antiquity of the Parian Chronicle It is impossible within our limits to give a detailed account of the manner in which these different writers [illegible] Mr Robertson suffice [illegible] shed satisfactorily that the Parian Chronicle is written in pure and classical Greek, that the characters bear several marks of antiquity, that the events it recounts are infinitely too minute and detailed to have been forged, and lastly, that the silence of classical writers respecting it (which is perhaps the strongest argument against its [illegible]) may be easily accounted for from the retired and [illegible] situation of Paros The reader will find in vol i of *Hales's Analysis of Chronology* an examination of the dates assigned to the different events recorded in the Parian Chronicle)

PARIAN MARBLE See MARBLE

PARIAS The lowest class of the inhabitants of some parts of Hindostan, who have, properly speaking no caste, and are supposed to be descended from original races of [illegible] since conquered by foreign invaders In the widest sense the term appears to comprehend *all* the different classes of distinct non-Hindoo tribes, and degraded or foreign races, not comprised in the four Hindoo [illegible] of the whole popu[illegible]

PARIETAL (Lat *paries a wall*) In Botany any organ which grows from the sides of another Those ovaries are parietal which grow from the sides of a calyx, and placentæ or ovules have this name when they proceed from the sides of the ovary

PARIETAL BONES Two arched and irregularly square bones one on each side of the superior part of the skull So called from *paries, a wall*, because they protect the brain like walls

PAR-IMPAR Among the Romans, the game of *even or odd* The game was played exactly as it is at present among the children of our own country

PARING AND BURNING The operation of paring off the surface of worn-out grass land, or lands covered with [illegible] like of the ashes [illegible] of weeds seeds, insects, &c [illegible] use of this mode of improving land, the greater number preferring a naked fallow even for one or two years, alleging that more injury is done by the vegetable matter lost in burning, than benefit obtained by the ashes produced Where the object is to bring land abounding in coarse herbage immediately into a state of good culture, paring and burning is evidently the most rapid mode that can be employed, and if the soil contains calcareous matter, burning will have nearly the same effect on it as if a dressing of quicklime had been applied Much, however, depends on the mode in which the land is treated afterwards

PARISH (G[illegible]) Properly, an ecclesiastical [illegible] subject to the ministry of [illegible] ges of the church, the parochia was the district placed under the superintendence of the bishop and was equivalent to the diocese It denoted, says Bingham, not only what we now call a parish church, but a city with its adjacent towns or country regions It was not until the Christians became sufficiently numerous to present distinct congregations in the smaller towns and villages that the bishop appointed his presbyters to reside among them, and thus subdivided his diocese into several parishes This constitution is recognized in several councils and other monuments of the fifth century It is, indeed, probable that in many cities there existed more than one church and congregation even in the time of the apostles, but it does not appear whether these deserved the name of parishes, as being each under the distinct superintendence of its respective pastor But although parishes were originally ecclesiastical divisions, they may now be more properly considered as coming under the class of civil divisions, and consequently claim our attention under this head It is not easy to determine the era of the division of England into parishes, they are mentioned in the laws of King Edgar so early as 970, when the whole kingdom seems to have been divided into parishes, but it is probable that the division was not made at once, but by degrees [illegible] Blackstone pretty clear and certain [illegible] of parishes were originally ascertained by those of manors, for it very seldom happens that a manor extends itself over more parishes than one, though there are often many manors in one parish The parochial division of England was nearly the same in the reign of Edward I (1272—1307) as at present

Parishes are frequently intermixed with one another This seems to have arisen from the lord of the manor having had a parcel of land detached from the main part of his estate, but not sufficient to form a parish of itself. It was natural for him to endow the church which he had erected upon his principal estate with the tithes of these disjointed lands [illegible] happened that there was no church in any [illegible] them

The boundaries of parishes depend on immemorial custom, but it is probable that they were not settled with very minute precision till the introduction of the poor laws, when [illegible] of the claim for relief upon their pa[illegible] became a matter [illegible] of each parish [illegible] by legislative enactment

In the northern counties, where the parishes sometimes embrace thirty or forty square miles, the poor laws, the due administration of which must always depend on an intimate knowledge of the situation and character of every one applying for relief could not be properly carried into effect To remedy this inconvenience, an act was passed in the 13th of Charles II permitting townships and villages, though not entire parishes, severally and distinctly to maintain their own poor Hence townships in the north of England may be regarded as divisions subordinate to parishes, and are, in practice, as distinctly limited as if they were separate parishes

Towns originally contained but one parish, but, from

the increase of inhabitants, many of them are now divided into several parishes

Besides parishes or townships, there are places which are deemed extra-parochial, or not within the limits of any parish These were formerly the site of religious houses, or of castles, the owners of which would not permit any interference with their rights At present they enjoy some most valuable privileges, among others, a virtual exemption from the poor's rate, because there is no overseer on whom the order of a magistrate may be served — from the militia laws, because there is no constable to make the return — and from repairing the highways, because there is no surveyor Their tithes are by immemorial custom, payable to the king instead of the bishop The number of such places is not inconsiderable amounting to more than 200 It seems highly inexpedient that any part of the country should enjoy such an exemption from burdens imposed for the benefit of the community Extra-parochial wastes and marsh lands, when improved and drained, are assessed to all parochial rates in the parish next adjoining In some counties, *liberties* interrupt the general course of law as affecting hundreds, in the same manner as extra-parochial places do with regard to parishes This inconvenience is particularly felt in Dorsetshire The number of parishes and parochial chapelries in England and Wales is not exactly ascertained, but there are not many doubtful cases, and for any general purpose they may safely be taken at 10,700 About 550 parishes extend into two counties or into more than one hundred or other divisions (*Blackstone's Commentaries*, Introd § 4, and *Preliminary Remarks to Census of* 1831 pp 14—18)

The parishes of Scotland are purely ecclesiastical for an account of the system on which they are divided, we must refer the reader to the article PRESBYTERY

PARISH CLERK The name of one of the lowest functionaries of the English church Parish clerks are regarded by the common law as persons having freeholds in their office, and consequently though they may be punished, they cannot be deprived, by ecclesiastical censures In former times parish clerks were frequently in orders, and even at present this is sometimes the case They are generally appointed by the incumbent, but by custom may be chosen by the inhabitants

PARK A considerable extent of pasture and wood land surrounding or adjoining the country residence of a man of wealth, devoted to purposes of recreation or enjoyment, but chiefly to the support of a herd of deer, though sometimes to cattle and sheep Parks were originally nothing more than portions of forest scenery appropriated by the lord of the soil for the exclusive use of animals of the chase, but this is now become in many cases a secondary consideration and the chief uses of a park are as indications of wealth and extent of territory, and as grazing grounds for domesticated animals

PARK OF ARTILLERY An assemblage of the heavy ordnance belonging to an army with its carriages ammunition waggons, and stores, on ground contiguous to that occupied by the troops when encamped *See* ARTILLERY PARK

PARLIAMENT (In modern Latin *parliamentum* in French *parlement*, from the Fr *parler to speak*) The supreme legislative assembly of Great Britain and Ireland

Origin of Parliament — By the principles of the feudal system every sovereign and every great feudatory had his council, composed of his greater and lesser vassals which occasionally assembled to assist him both in judicial and legislative matters, and which was held in theory to be permanent, so that its assent was necessary to the validity of his acts And it was also an ancient custom, in several of the western kingdoms of Europe for such potentates to hold assemblies of their barons at the great festivals of the year, termed *cours plenieres* and *parlemens*, principally, however, for the mere purpose of show and magnificence occasionally such special assemblies were summoned for more important purposes and the meeting in 1146 at which the crusade of Saint Louis was undertaken is said to furnish the first occasion in which the word parliament is used for a deliberative assembly In France however, the word was afterwards transferred to signify the principal judicial courts of that country (*See* PARLIAMENT) The only realms in which it appears to have become appropriated to the great legislative assemblies are England, Scotland and the Norman kingdom of Sicily The parliament of the latter country consisted, in the 13th century, of spiritual and temporal barons summoned by the king's writ, and occasionally, but not uniformly, of deputies from the towns similarly summoned

All the extensive and laborious researches which have been made, of late years, towards dispelling the obscurity which rests over the commencement and early constitution of our parliaments have only shown that little new information is attainable on the subject We can, indeed, conjecture pretty accurately the process by which meetings of delegates for the purpose of apportioning taxation became gradually assemblies, granting or refusing supplies with absolute authority; and that by which a convention summoned for the object of representing grievances to the sovereign and giving their approbation to his acts became a sovereign legislative body But to investigate the internal changes in the assembly itself, the mode by which it became divided into distinct chambers, the manner in which the peerage was formed as a distinct body out of the free baronage of the country and that in which the lower house acquired the features of a regular representative body, may be safely pronounced with our present knowledge impossible

The Norman and Plantagenet kings had two councils, — the great council of the kingdom, and the lesser or privy council, and it may be freely stated, after making all deductions from the principle on the score of arbitrary powers occasionally exercised by the sovereign that, ever since the Norman conquest the supreme legislative power in England has been placed in the king in great council conjointly It was, moreover, in early times, a court of crimi[illegible] in all the more[illegible] It interfered even in matters of ecclesiastical discipline, in questions of peace and war of grace and justice, and, by way of advice in the appointment to vacant offices, civil or ecclesiastical The [illegible] of the great council were at stated festivals [illegible] Norman kings, but after the civil wars in the reign of Stephen they were summoned at irregular periods The inferior or privy council which, as well as the great council, is indifferently termed *curia regis* in early writers, was composed of members named by the king, and constantly attended on his person, and this inferior body usurped during the decadence of the great council and before the full establishment of parliament many of the legislative functions of the former but by Magna Charta all aids and scutages were to be assessed by the great council, which thus in principle at least, possessed a control over the extraordinary revenues of the crown Any meeting of the great council, or of a portion of it, went by the ordinary name of a parliament or colloquy

But of the constituent parts of this assembly, and the changes which took place in it, no writers give a satisfactory account All we know is that it was supposed to consist of all the tenants in chief of the crown, but by the charter of King John, the archbishops bishops abbots, [illegible] From this distinction is supposed to have arisen the institution [illegible] nobility [illegible] of England from those of all other feudal monarchies

From these mixed assemblies to a representative body [illegible]

Oxford But the better known and more distinct evidence of [illegible] of the system is found in the Earl of Leicester's parliament after the battle of Lewes, in 48 Hen 3 when four knights for every county (except nine) were summoned to attend with the barons probably as representatives of the inferior nobility or lesser barons, and in the following years were issued the earliest writs of summons to parliament These were to archbishops bishops and abbots, to certain earls and barons of the party of the Earl of Leicester, and to the sheriffs of counties and boroughs, to return two knights and burgesses, besides four from each of the Cinque Ports And although no subsequent writs directed to the sheriffs for the purpose of county elections are in existence earlier than 18 Edw 1, nor of borough elections earlier than the 23d of the same reign, yet it is at least highly probable that the example set by the rebellious Earl of Leicester was ever after substantially followed, and that the representatives of counties and towns were occasionally summoned to parliament, as well for the purpose of assessing tallage and other aids demanded, as for that of giving their counsel respecting other affairs of the government Edw 1 rarely held more parliaments in a year, nor does it appear that these were legislative assemblies they were rather supreme courts of justice, chiefly attended by the ordinary or privy councillors of the king, while the legislative assembly, certainly composed, after the 23d of this reign, of lords spiritual and temporal and representatives of the commons, was summoned to meet the king occasionally during one of these parliaments

The constitutional law of the country, whatever it may have been in practice, was first declared by the statute 15 Edw 2, which annulled the award against the king's favourites, the Despencers In this act the legislative authority was declared to reside in the king, with the assent of the prelates, earls, barons, and commons, as-

sembled in parliament; and from that time the real existence of that body, and of the form of government which has ever since subsisted has been uninterrupted except only during the period of the Commonwealth

The division of parliament into two houses took place at a period which it is not possible to ascertain; but it is probable that the three orders met in separate conventions for the purpose of assessing taxation, and that the representatives of the commons were at no period admitted to sit in the same chamber with the earls and barons after these were expressly summoned by the king Although the numbers of both houses have varied materially, no fundamental alteration in their constitution took place from this time until the union with Scotland (See the Report of the [illegible] the Dignity of a Peer, *Hallam's* [illegible] *England*)

HOUSE OF LORDS — 1 *Temporal Peers* — The origin of the English peerage is involved in the same obscurity which rests on other parts of our early constitutional history The greater barons, as before stated, appear under the first Plantagenet kings to have been those who were personally summoned to the council while inferior tenants in capite were summoned together by a general compellation, but at what period their dignity became strictly hereditary is unknown

Baronies are either by tenure, by writ, or by patent The first were the original feudal titles, in which dignity was invariably attached to the possession of land The greater barons, who sat of right in the great council are supposed up to the reign of Henry III to have been those who were in the possession of entire baronies But from the date of 22 Edw I it appears that the possessors of entire baronies ceased, of right, to be summoned to parliament, and it is therefore generally held that no barony by tenure subsists at the present day although some recent efforts have been made to establish a title to this peculiar dignity, the latest claim having been made on the barony of Berkeley, by virtue of possession of the castle of that name

Baronies by writ were created by writ of summons to parliament, which constituted an individual so addressed by name baron of the realm and, it is supposed also made that dignity hereditary The earliest writ of this description was issued 49 Hen 3, and two now existing baronies (Despencer and Roos) are considered to have been created by it In the case of a barony by writ the dignity is not conferred until the person so summoned has actually sat in parliament Baronies by writ descend in fee to all the heirs of the body of the person first created If there be no son and more daughters than one the title falls into abeyance until only one daughter or the sole heir of only one daughter survives

Baronies by patent are created by letters patent under the great seal conferring the dignity on the donee, in which are inserted words of limitation These are usually to the heirs male of the body of the donee, and where there are no words of limitation in letters patent, it is held that the dignity will pass in the same course Otherwise the limitation is to other classes of heirs or to specified persons, and their heirs by way of remainder See REMAINDER

Viscounteies are always created by letters patent This is the most modern of English titles of peerage, and was first conferred on John Viscount Beaumont 18 Hen 6 The title vice-comes or vice-earl had been long employed to denote the sheriff of a county

Earldoms were introduced into England by the Normans at the Conquest The dignity of an earl seems to have been originally attached to the possession of a particular tract of land, but in the reign of Edward III it began to be conferred by charters or letters patent with an express limitation either to heirs general or heirs male of the body of the grantee The word earl is of Saxon origin, but answers in dignity to the count (comes), in languages of Latin descent

Of *Marquisates* the first was that of Dublin conferred on Robert de Vere, Earl of Oxford for life, by Richard II The term marquis is derived from the Latin marchio, signifying a military officer, governor of the mark or frontier This dignity has been always conferred by letters patent

Dukedoms are [illegible] peerage The first was cr [illegible] he Black Prince was ma [illegible] is been a question whether the duchies of Cornwall and Lancaster were not duchies by tenure, but every other dukedom is a mere personal honour, and conferred by charter or letters patent The term duke is derived from the Latin dux, *leader of an army*, answering to the German herzog, which has the same signification

All peerages are forfeited by attainder for high treason, and attainder is consequent either on judgment or on outlawry, upon an indictment for that offence Nothing but a reversal of such act of attainder by parliament can restore an attainted person, or his posterity, to the lost dignity But where a peerage is vested in a person in tail male, with remainder over to another in tail male, if the first be attainted the peerage is forfeited as to him and his issue male, but, failing such issue male, the dignity becomes vested in the remainder-man, or his descendant

Peerages by writ are also forfeited by attainder for felony, but not peerages by charter or letters patent

By the twenty second and twenty-third articles of the Union between England and Scotland sixteen representatives are elected by the Scots peers to serve in every parliament of the United Kingdom The eldest sons of Scottish peers were rendered, by a decision of the House of Commons shortly after the union, incapable of sitting in parliament It was held for a long time that a Scottish peer could not sit in the House of Lords if he became a peer of Great Britain, but the point was decided the other way in 1780

By the Act of Union between Great Britain and Ireland (39 & 40 G 3 c 67), twenty-eight lords temporal are elected for life by the peers of Ireland Peers of Ireland, who are members of the House of Commons, are not eligible to serve as peers while they continue members of the former house

2 *Lords Spiritual* — The right of the two archbishops and twenty-four bishops of England and Wales to sit and vote in parliament as members of the House of Lords, is generally said to belong to them as barons of the realm It is undoubtedly probable that at the period of the Conquest a change took place in the tenure of the lands which were held by bishops and the high regular clergy, and that the Norman tenure by barony then introduced for the first time, was made to comprehend both spiritual and temporal possessions which under the Saxon kings had been regarded in a different light But it is most probable that the dignitaries of the church were constituent members of the great council of the realm, by the English as well as all other feudal constitutions independent of their quality as barons (see *Hallam, Middle Ages* c viii part 3), but that the place which was assigned them in the House of Lords when the two houses became separate, was in virtue of their baronial character Under the Plantagenet kings the clergy were summoned to meet by their representatives, as well as the laity, when subsidies were required, and under Edward I (see *Luders on Parliaments* chap iii) attempts were made to unite them and the laity together in parliament, but they were always resisted by the clergy, and at last they ceased altogether to attend in any capacity, retaining their own assemblies (*See* CONVOCATION) At the period of the dissolution of monasteries by Henry VIII the spiritual lords consisted of the then archbishops and bishops, and of twenty-six mitred abbots, and two priors, all of whom were then removed on the dissolution of their houses The present spiritual lords have the same rights and privileges in every respect as the temporal except that it is still a disputed point in constitutional law whether they have a right, on charge of treason and felony, to a trial by the peers, and it is also doubted whether they have judicial power, as peers, in capital cases

By the Act of Union between Great Britain and Ireland, four lords spiritual from among the archbishops and bishops of that country sit in the House of Lords by rotation of session

HOUSE OF COMMONS — I *Persons qualified to serve in it* — Persons incompetent to sit as members of parliament are first [illegible] under the disqualities of alienship attainder [illegible] minority lunacy & [illegible] next those who are disqualified by the possession of certain offices or by certain other temporary causes Clergymen, peers Scotch peers, Irish peers for places in Ireland, the eldest sons of Scotch peers for places in Scotland the fifteen judges of England, the Scotch judges and barons of the Scotch exchequer, are ineligible Where the influence of government is supposed to have a direct control over the party, a disqualification has been created by various statutes Persons concerned in the management of the revenues, with some few exceptions are ineligible So are persons holding new offices under the crown created since 1705, together with other persons mentioned in 6 Anne, c 7 So pensioners during pleasure or for a term of years, police magistrates government contractors, and placemen in public offices specified in 15 G 2 c 22 There are also offices connected with the excise and customs which only disqualify the holder from sitting and voting, but not from being elected Persons returned on a double return are not competent to sit until the return is decided by a committee

The acceptance of any office of profit from the crown by a member vacates his seat, by 6 Anne, c 7 And there are two places of no profit, the acceptance of which is considered to vacate a seat, viz the stewardship of the [illegible] the manor of [illegible] receiving new [illegible] so are those who accept a foreign employment, as ambassadors

A member becoming a bankrupt is incapable of sitting and voting for a year unless within that time the commission is superseded or the creditors paid, if this be not done within the year, the seat of the member is vacated

Whether a resolution of both houses or a royal proclamation [illegible] is [illegible]

II. *Electoral system.* Since the Act of Union with Scotland and Ireland, and the changes introduced by the Reform Act the House of Commons consists of 658 members viz. English and Welsh, 53 Scotch, 105 Irish — divided as follows

	English and Welsh	Scotch	Irish
Counties - -	159	30	64
Boroughs - -	337	23	39
Universities — Oxford	2		Dublin 2
Cambridge	2		
	500	53	105

All persons are competent to vote in the election of members of parliament, except infants, women, aliens (unless made denizens by letters patent or naturalized by act of parliament), persons convicted of felony and certain other infamous crimes, peers, Irish peers, unless themselves members of the House of Commons and persons holding various employments under government not freehold offices. There are also some temporary disqualifications, arising out of employment in particular characters at elections and the receipt of public alms. They must however possess a certain qualification, which (except in the universities, in which the right of voting belongs to all such as have attained certain academical degrees) is one of property.

1. In English and Welsh counties the right of voting belongs to all such as possess a freehold estate in lands, tenements, or hereditaments, of the value of 40s. per annum above reprises, or who are seised of lands or tenements in copyhold or any other non-freehold tenure for life, or for a larger estate of the value of 10*l.* per annum, or entitled to [illegible] tenements for the unexpired residue [illegible] sixty years of the same value or of a term of not less than twenty years of the value of 50*l.* per annum, and occupiers of lands and tenements at a *bona fide* rent of 50*l.* or more per annum. But freehold tenements for life, if under the value of 10*l.* per annum do not confer a vote, unless the party is in the actual occupation of them or unless they have come to him by devise, marriage, &c., and not by gift or sale. And in the case of freehold lands, [illegible] possession for six months before the first day of July in the year in which the voter is registered is a necessary condition, in that of leaseholds, &c., twelve months.

2. The qualifications of voters in cities and boroughs in England, were, under the law as it stood before the Reform Act, extremely various and depending more on the local law of every place than on the general custom of the country. The principal franchises were — 1. In respect of property, thus freeholders to the amount of 40s. voted in many towns and cities which were counties of themselves, leaseholders, copyholders &c. in other places, and burgage tenants. The franchise of burgage tenure, which existed in some towns, depended on the possession of certain ancient tenements which conferred a right to vote. 2. In respect of corporate privileges. Freemen or burgesses and in London liverymen (*see* CORPORATION), enjoyed by virtue of their privilege a right of voting in corporate towns. 3. In respect of inhabitancy. Voters in this respect were of four sorts: inhabitants paying scot and lot, inhabitants householders house keepers, pot-wallers (*i.e.* pot-boilers), legally settled, inhabitants householders resiant, inhabitants generally. In many towns, several of these qualifications were recognized at the same time as conferring a right to vote.

The alterations introduced into the system of borough qualifications by the English Reform Act were twofold. In the first place, a new franchise is created which is everywhere the same. Every capable person who occupies within the limits of a borough any house or building falling within the specifications of the act, which is either separately or jointly with land held within the same borough as owner, or of the same landlord of the clear yearly value of 10*l.* is entitled to vote, provided he has occupied such premises for twelve months previous to the last day of July in the year in which he is registered, and provided he has been rated, and paid all rates for the relief of the poor due up to the 6th of April next preceding, and also all assessed taxes. In the next place former franchises are modified as follows. — Freemen, and in cities being counties of themselves freeholders and burgage tenants, are to retain their qualification. But no one can claim to be registered as a burgess or freeman who was admitted since the 1st of March, 1831, except he derive his title through birth or servitude, or for a freehold or burgage tenement for an estate acquired since that day. All other borough franchises are abolished, saving their rights to individuals possessed of them at the passing of the Reform Act.

Finally, the act requires that every person, in order to be registered as a voter for a city or borough, must have resided for six calendar months next previously to the last day of July in that year within such city or borough, or within seven miles of it. And it is also provided that no tenement situate within a borough, and capable of conferring a qualification on its occupier to vote within the borough, shall give a vote for the county.

Several boroughs in Wales, as well as in Scotland, are *contributary*, several towns being joined in one for the purpose of returning [illegible] parliament.

The system of registering voters, in England and Wales, was framed by the Reform Act. In [illegible], the register is formed by the overseers of the poor in every parish or township making the [illegible] persons who have delivered to them, [illegible] July in each year, a claim to vote in respect of property situate within their district. The lists thus drawn up by the overseers, according to a form specified in the act, are delivered to the high constable, and by him to the clerk of the peace for the county. The overseers are empowered to object to any person on their list whom they conceive not entitled to vote. They are also to receive written notices of objection by third parties, who are themselves voters or claimants duly delivered to them, and to mark the names of all parties so objected to on the list. The lists thus formed are revised by the barrister or barristers appointed for that purpose. These officers are nominated by the senior judge of assize travelling the summer circuit within his district, and by the chief justice of the King's Bench in the metropolitan county and boroughs. Their courts for the purpose of revising the lists and deciding on claims and objections, must be held between the 10th September and 25th October in every year. The lists revised by them form the register for the county, which is the authentic list of voters until the next registration. Any person having his name and qualification once inserted in the register is not bound to make a claim another year.

In cities and boroughs the course is somewhat different. On or before the last day of July in every year the overseers are to make out an alphabetical list of persons entitled to vote under this act, and another of persons entitled to vote in respect of ancient rights (except freemen, the list of whom is to be made by the town clerk, and in London by the clerks of the several companies). Any person whose name has been omitted in either of these lists is to give notice of a claim, in writing, to the overseer or town clerk. Objections are to be made, in boroughs only by parties whose names are inserted in the list. The lists are revised by the barristers in the same manner as those for the counties, and delivered to the returning officer.

3. In Scotland the right of voting in counties is declared by the Scotch Reform Act 2 & 3 W. 4 c. 65 to be in the owners of ancient rights (termed superiorities) not acquired since 1831, in such persons as have been owners for six months previous to the last day of July of "any lands, feu duties, or other heritable subjects," of the annual value of 10*l.* after deductions. Where two or more parties are interested in any subject to which a right of voting is for the first time attached by the act, as life renter and as fiar, the right shall be in the former. The right is also extended to tenants for life or on lease of fifty seven years or more, at 10*l.* per annum, tenants on lease of nineteen years or more, or occupants at 50*l.* per annum, and tenants who have paid for their interest a price of 300*l.*

4. In Scottish boroughs the right of voting is in occupiers of houses &c. (as in the English Reform Act) of the yearly value of 10*l.* Claims by qualified persons to vote for counties are to be lodged with the schoolmaster, and he is to make out the lists of claimants and objections. Claims for votes in boroughs are given in to the town clerk, and the lists made out by him. The sheriff holds courts to decide on questions relative to the registration, his powers and duties are analogous to those of the revising barrister in England.

5. In Ireland, the right of voting in counties is in freeholders at 5*l.* per annum (by the act 13 & 14 Vict. c. 69), by 2 & 3 W. 4 c. 88, in leaseholders for sixty years at 10*l.* per annum, for fourteen years at 20*l.*, in copyholders at 10*l.* per annum, and by 13 & 14 Vict. c. 69, in all tenants rated at 12*l.*, and duly registered as prescribed in the act.

6. In counties of cities, counties of towns and boroughs in Ireland the franchise is in 10*l.* freeholders, 20*l.* leaseholders, 10*l.* householders, and in the 40*s.* freeholders entitled under 4 G. 4 c. 55, but not in any persons acquiring such freeholds since 1831, except by descent, marriage, &c., and by the act 13 & 14 Vict. c. 69, in 8*l.* and upwards occupiers who have occupied for twelve months and paid the rates due. The existing rights of freemen, &c. are saved.

By the same act, the list of persons entitled to vote is annually made out, in counties, by the clerks of unions,

and in boroughs, by the town clerk, at the request of the clerk of the peace The registration lists are kept for inspection, and published by the persons appointed Revision courts are held by assistant barristers to decide on claims and objections, with power of appeal The revised lists are printed and delivered to the sheriff of a county, or the returning officer of a city or borough, and these lists constitute the register for one year No enquiry is made at the election, except as to the identity of the voter, and whether he has voted before

III *Mode of Election* —1 In England and Wales, when the sheriff receives the writ commanding him to return a knight or knight of the shire, or division of the shire, he makes proclamation, within two days after receiving the writ, at the place where the election is to be holden, that is, the principal polling place Counties and divisions are subdivided into convenient districts with a [illegible] and after the Bribery [illegible] proposed, and the election proceeds In boroughs the sheriff (or other officer to whom the writ is directed) sends his precept to [illegible] who acts in the same manner as the [illegible], and boroughs are similarly divided into polling districts

When a candidate is proposed, he may be called on by any other candidate or any two of the electors to swear to his qualification The qualification required by 9 Anne c 5, is, for a knight of the shire 600*l* per annum in lands and tenements, freehold or copyhold, for his own life, or a greater estate For burgesses 300*l* per annum of similar property Eldest sons of peers, or of persons qualified to sit as knights of the shire are themselves qualified Members for the universities are not required to possess any qualification

It is still questionable whether the returning officer can refuse to return a candidate who refuses to take the qualification oath before the poll After the election and before he takes his seat each member must deliver to the clerk of the house a paper signed by himself containing a description of his estate of qualification and is sworn to its value at the same time at which he takes the other oaths His qualification may then be questioned in a petition against his election

When more candidates are proposed than the number to be returned, the election is decided by the sheriff's declaring the majority on view (by calling on them to hold up their hands) But a poll may be demanded by a candidate or elector, either before or after such declaration by the sheriff

The poll must commence on the day on which it is demanded, or on the day after By the Reform Act (s 58) three questions only can be asked of any person offering to vote as to his right,—whether he is the same person whose name appears on the register, whether he has already voted, whether he has the same qualification for which his name was inserted on the register, and he may be required to take the oath specified in the act as to his person and qualification Besides this, the oaths of allegiance, and supremacy, and abjuration, may be put to an elector at the request of any candidate unless the elector be a Roman Catholic in which case he may be required to take the oath specified in 10 G 4 c 7 All the foregoing oaths are to be taken before commissioners The bribery oath may also be administered at the poll by the returning officer There are also certain local oaths required by act of parliament to be taken at the election for particular boroughs

By the Reform Act the poll was limited, in England and Wales, to two days duration both in counties and boroughs And now by a recent enactment the poll is declared, in counties, the day next but one after its close, in boroughs, the day after its close By 5 & 6 W 4 c 1 the duration of the poll in boroughs was further limited to a single day The return is made in counties by tacking the names of the persons chosen to the writ, in boroughs, by tacking them to the precepts and returning them to the sheriff, who then tacks them to the writ, and forwards the whole together to the clerk of the crown in chancery Where the votes are equal, it is the practice to make double returns

2 In Scotland, the sheriff fixes the day for a county election at not less than ten or more than sixteen days after the writ is received the counties are divided into polling districts, not exceeding fifteen in number, and the poll lasts two days In boroughs similar regulations are adopted to those in England, but the sheriff or his substitute, superintends the poll, which may last three days The sheriff [illegible] officer

3 In Ireland, the sheriff [illegible] place of a county election five days after receiving the writ, and from ten to sixteen days after such proclamation the election is held In boroughs, the sheriff of a county of a city or town, the mayor, [illegible] officer, holds the election, not [illegible] receipt of the precept from [illegible] commence on the day on which it is demanded, and continue two days (13 & 14 Vict c 69) but may be closed on any day on which not more than 20 persons have polled

IV *Election Committees* — In the first parliament of James I a committee of privileges and returns was appointed, to which the trial of every petition against an election was referred which was not heard before the House of Commons A similar committee was appointed at the commencement of every session, until the present practice of trying such petitions before select committees began This practice is founded on a variety of statutes, beginning with 10 G 3 c [illegible] common's called the Grenville Act consolidated [illegible] 22

There are six sorts of petitions referred to a select committee —1 Complaining of undue election 2 Of undue return 3 That no return has been made to the writ in due time, &c 4 That the return is not according to the requisition of the writ, or complaining of special matters contained in it (as double returns or special returns) [illegible] on, or of appointing [illegible] a select committee, [illegible] defend such right The four first may be subscribed by any candidate or person claiming a right to vote, the two last by all persons A petition to be admitted as a party to defend such return or oppose the prayer of such petition, is addressed to the house and not referred to a committee An election petition is presented to the house by a member within a certain time limited by the house No proceedings will be had on petitions complaining of an undue election or return, &c, unless the subscriber, within fourteen days after its presentation, or farther time limited by the house, enter into certain recognizances for the payment of costs and compliance with other conditions

When such a petition is presented, a day and hour are [illegible] the house for taking it into consideration With all time, under the Grenville Act, if 100 members were present, the parties and agents attending, thirty-three were selected by ballot, which number, on each party striking off one alternately was reduced to eleven If more than one petition is to be taken into consideration on the same day, successive lists of thirty three were formed two, three, or more, according to the number of members present in the house Voters, petitioners, members against whom [illegible] and those whose return has not been [illegible] disqualified from serving, and their names, if drawn were set aside If no party appeared [illegible] petition, the clerk of the house and the [illegible] the list to eleven This system was considerably altered by the provisions of 2 & 3 Vict c 38 an act introduced by Sir Robert Peel Under it a general committee of elections is appointed by the speaker at the beginning of every session This general committee chooses six members and a chairman to form a select committee to try an election petition out of the whole list of members, divided and corrected in the manner therein specified

The same nicety it is said, is not required in election petitions, as to their form, as in pleadings at law, but it is now decided by a series of precedents, that it is necessary that the matter intended to be proved should be sufficiently set forth in the allegations of the petition, and that, on the hearing of the petition, it will not be competent to the party to go into evidence in proof of facts not distinctly alleged therein But there is a considerable variety in the decisions as to what is sufficiency of allegation An election petition, when once presented can only be withdrawn by permission of the house to which jurisdiction in this respect is still left by the Grenville Act The house will therefore require to be satisfied that there is no fraud or concert in the withdrawal Supplemental election petitions may be presented, on the discovery of new matter after the presentation of the first petition

In petitions of the first four classes parties (if the election is defended) are required to send in to the clerk of the House of Commons lists of the votes to which they intend to object

Select committees sit every day, but with power to adjourn for twenty-four hours on their own authority, and for a longer period on leave obtained from the house on motion Members may only absent themselves by leave, or on excuse to be allowed by the house if any are absent otherwise, the committee cannot sit Committees are not dissolved by prorogation of parliament, but adjourned to the next time of meeting

In the first four classes of petitions, the committee have to try the merits of the election, and to determine, by their votes, whether the petitioners, or the sitting members, or either of them, were duly returned, or whether the election is void, and a new writ ought to issue The fifth class raises the question as to the right of election, [illegible] returning officers &c The determination of the committee is in each case final and conclusive, [illegible] reported in a report to the house at the conclusion of its sittings. A committee has also the power, if it pleases, of making a special report, instead of

in which case the house [illegible] as may seem proper An examination into the bad votes given on each side is termed a scrutiny, and the effect of it is, that if on balancing the number of good votes retained after such examination the petitioner has the majority it is reported that he ought to have been returned Where an incapacitated person has been elected the principle of parliamentary law is, that if his disqualification was sufficiently known to the electors at the time they returned him, their votes are considered as lost, and it is reported that the next on the poll ought to have been returned If the fact of his disqualification was not known the election is simply void It appears however not to be absolutely decided whether the incapacity which renders the votes thrown away must be an inherent or contingent incapacity, as, for example, where it was *publicly known* that a candidate was disqualified by reason of having been guilty of acts of bribery with reference to the election In this case it has been argued that the election is not void, but that the votes given for the person so disqualified are thrown away In other cases, bribery treating undue interference, &c, have the effect of avoiding elections, and the report is, that a new writ ought to issue

Finally, an election committee has the power of declaring whether the petition or the opposition to it 'frivolous and vexatious' in its report, the effect of which is to fix the party against whom such declaration is made with the payment of costs These costs are ascertained by application to the speaker who directs two persons to tax them and then grants a certificate on production of which in a superior court judgment may be entered up for the amount

V *Mode of Assembling Parliament* — Parliament can only be convened by the authority of the king and by 6 W & M c 2 must be held at least once every three years, but, in point of fact as the Mutiny Act Land Tax, and Malt Act are only passed for a single year, the sittings of parliament are of necessity annual The same order by the king in council which commands the lord chancellor to cause the great seal to be affixed to a proclamation for dissolving parliament, is accompanied with a warrant to issue writs for a new one Writs for the return of members of the House of Commons are directed to the sheriffs of counties with certain exceptions viz the returning officers of places counties in themselves the Bishop of Durham, the Chancellor of the Duchy of Lancaster, the Chamberlain of the County Palatine of Chester, the Constable of Dover and the Warden of the Cinque Ports On a vacancy during the sitting of parliament, the writ issues under warrant of the speaker by the authority of the house itself

VI *Meeting of Parliament Preliminary Proceedings* — The new parliament meets on the return day of the writ, unless prorogued by writ of prorogation but when it is intended that it should meet for the actual despatch of business on the day to which it is prorogued, notice to that effect is given by proclamation forty days before, and the parliament begins only on the day to which it is prorogued The acts of meeting and passing a statute constitute together a session Upon the assembling of parliament the king meets it in person, or by representation, and explains in his speech the reasons of convening it In modern times the speech is not delivered until the commons have chosen a speaker, which they receive a command from [illegible]

The first [illegible] is expressly [illegible] His duties are, — to act entirely as the servant of the house which appoints him He takes the chair, which he cannot do unless forty members are present, maintains order, by naming (if necessary) members who are disorderly, explains and informs on questions of order or practice if he is referred to He can neither speak nor vote unless in case of equality of votes, or in committees of the whole house where as soon as the chair is taken, he is reduced to the [illegible]

On the first day of the meeting of every new parliament certain oaths are administered to the members by the Lord Steward of the King's Household these are the oath of allegiance, supremacy, and abjuration, but, by the Roman Catholic Relief Act, members professing that religion take, instead of these oaths, a declaration substituted for them By 33 G 2 c 20 they are also required to make oath that they are qualified, and deliver in their qualification at the table But, previous to being sworn, every person returned is to all intents and purposes a member of the house, except as to the right of voting only Before the king's speech is taken into consideration, it is usual to read a bill as a matter of form. The king's speech being then reported to the house an address of thanks as moved or as amended, is returned The usual committees are then appointed of these the committee of privilege is the only one of which the duties are at present of a practical kind

The method of proceeding in making laws is, for the most part, similar in the two houses, but different in public and private bills

VII *Methods of Proceeding in Parliament* Statutes are divided into public and private, the [illegible] in a parliamentary sense, is merely derived from the payment of fees, which are due on private and not on public acts Constitutionally, public acts are in general, such as relate to the kingdom at large, private acts, to individuals and classes Many acts, however, which immediately concern classes or [illegible] are within the cognizance of public acts, as, for [illegible] to [illegible] persons, or all lords of manors [illegible] tion between the classes is, that the courts of justice are officially bound to notice public acts, but private acts must be formally shown or pleaded This rule, however, admits of certain technical exceptions

All private bills affecting the peerage must begin with the lords, all bills which directly or indirectly, impose a charge on the people must begin with the commons This class, therefore, includes all bills under which tolls may be levied for private benefit, such as bills for making roads canals, railways bridges, inclosure bills, and bills containing clauses inflicting pecuniary penalties for offences against private property, &c

While private bills may begin with either house indifferently, but in practice, one large class of private enactments — viz estate bills which enlarge or alter the power of individuals in disposing of their property, divorce bills, bills to enable parties, under statutable restrictions, to alienate, &c, — begin in the lords, that house from its judicial character, being best fitted for the discussion of similar subjects On the other hand, bills concerning the parliamentary rights, &c of particular places usually commence, by custom, in the commons There is one instance of a bill which begins with neither house but with the crown, viz a bill for a general pardon Bills are always read in each house, after leave has been given to bring them in three times before they are passed (with the exception of bills of grace, such as for a general pardon which are passed on the first reading) General petitions against a bill are usually ordered to lie on the table until the second reading, on which occasion counsel are heard against a bill whenever leave is given for their introduction The second [illegible], that period for discussion on the [illegible], and the bill is then (as indeed it is, on principle in every stage) open to the proposal of amendments If a bill be rejected either on the first or second reading it cannot be again proposed that session After the second reading the bill is committed, *i e* referred either to a select committee or, if the bill be of importance, to a committee of the whole house Such a committee requires in the commons, the presence only of forty members, in the lords of all members in attendance In committee the bill is debated clause by clause, with the advantage that members are not restricted, as in a debate of the house, to speaking once The proper province of the committee is to consider the bill in its details When the bill has gone through the committee the chairman reports it to the house with such amendments as the committee may have made The house can then agree or disagree with the amendments of the committee (*See* AMENDMENT) The bill is then engrossed and afterwards read a third time In the commons it is usual to read a bill which originates with the lords the third time on the same day on which it is reported A new clause added to a bill on the third reading is termed a rider A bill thrice read, and passed, admits of no farther alteration, except for clerical errors A bill sent from the commons to the lords is usually read the first time in the latter house on the day on which it is brought, and, when it has passed through the different stages, is sent back to the commons, with the amendments if any have been made, with which the commons then agree or disagree, the same process, substantially, being followed *vice versâ*, where the bill originates with the lords The amendments returned with a bill from one house to another are taken into separate consideration, and the amendments, if agreed to, are always considered as proceeding from that house in which the bill first originated If one house cannot agree to the amendments proposed by the other, a conference is usually held between members deputed by each house, who can only make use of the instructions delivered by the house in their arguments the conference being desired by that house which disagrees with the amendments in question If the house which amends is not satisfied at the first conference with the reasons alleged for its disagreement by the other, it desires another conference, if this too is unsuccessful, what is termed a free conference may be demanded, in which the managers of the conference are not under the same restrictions as to instructions, but may urge their own arguments If one or more free conferences fail of producing unanimity the bill is dropped It is necessary to observe, that in bills of supply (which originate in the commons) the lords cannot make any except verbal amendments, they must either admit

or reject altogether When a bill has passed both houses it is deposited in the House of Lords to wait for the royal assent (except in the case of a bill of supply, which is presented by the speaker to the throne) The royal [illegible] by letter patent under [illegible] The bill then be[illegible] roll by the clerk of the parliament, delivered into chancery, and by usage, although [illegible] king's press

VIII *Private Bills* —Petitions for private bills must be presented at the commencement within fourteen days after the first Friday in the session and on being presented by a member, are referred to a committee which is then named consisting of five members selected by the committee clerk The committee try the petition as to whether or not the standing orders, applicable to the case have been complied with in case they make their report accordingly to the house leave is then given to bring in a bill, unless as in some cases, it is expedient first to re-commit the report The bill having been read a first time, after an interval which is varied in practice according to the nature of its subject, the house proceeds to the second reading on which occasion objections to the *principle* of the bill are usually made specific objections to its provisions being more properly reserved to a later stage A member may, individually, oppose a private bill in any stage, or he may present a petition against it On the bill being read a second time, it is referred to a committee which is formed in the same manner as the first committee on the petition In the committee on the bill all the blanks left on its first introduction are filled up and amendments introduced, and if unopposed the bill is reported Opposition to a private bill, in a committee of the House of Commons is conducted as follows — The petition against the bill, having been referred to the committee is read there, if the parties supporting it appear, the promoters of the bill first state their case and produce and sum up their evidence in support of its preamble, the opponents next state their case produce and sum up their evidence in support of it, the promoters then reply, and the committee vote If the committee resolve that the preamble is proved, the clauses are read and the opponents are at liberty to make objections to each successively, the promoters not being called upon otherwise to offer evidence in support of them The presence of five members of the committee is necessary to any proceeding A committee cannot dissolve itself and consequently its existence continues until it has reported to the house, although by adjourning indefinitely or by voting the chairman out of the chair they might in effect entirely release themselves from the duty imposed on them, but the house, in similar cases, has exercised the power of ordering the committee to proceed forthwith

When the report is brought up and read as in the case of other bills, it is ordered to lie on the table After seven days the amendments having been read and agreed to it is ordered to be engrossed, after which it is competent to any member to move the third reading of it Additional clauses added at this time are termed riders When passed, the member who presented the petition, with seven others takes it to the House of Lords and delivers it to the lord chancellor If the lords make amendments the concurrence of the commons to these amendments is moved by the same member Should the lords' amendments not be agreed to (a rare occurrence in private bills), a conference is held by a deputation from both houses, and should the disagreement continue, the bill is finally withdrawn or [illegible]

IX *Standing Orders of the House of Commons* The[illegible] are a series of regulations adopted by way of resolutions of the house at various periods from 1685 to the present time, relating partly to the internal order &c of the house partly to certain preliminaries and forms required on the introduction of particular bills, both public and private and to the promulgation of statutes The most numerous of these relate to private bills, and specify the mode of signing and presenting, the time for giving notices and their necessary contents the formalities to be required respecting instruments, and a variety of other particulars When a resolution is made which is intended to be permanent, it is usual to add the form 'Ordered that the said resolutions be standing orders of the house" [illegible] bills are sometimes (but only [illegible] dispensed with by the house, or [illegible] complying with them

X *Public Business in the two Houses* —In the Commons, a house for the transaction of business consists of forty members, by an order of the year 1640, and, if a less number be present, the speaker will not take the chair This rule extends to committees of the whole house The speaker of the House of Commons cannot speak in the house, the speaker of the House of Lords may A call of the House of Commons is an expedient to secure attendance for an important occasion when it is made, members absent without leave may be ordered to be taken into custody No member can be present on the debate of a bill or other business concerning himself The order "for the sergeant-at-arms to take into custody strangers that are in the gallery of the house" is repeated every year, the first instance having been in 1705, so that the House of Commons is supposed to sit with closed doors, although the order is partly permitted to be infringed When the speaker's mace lies upon the table of the House of Commons, it is a house, when under, a committee, when out of the house, no business can be done, when in the hands of the sergeant at the bar no motion can be made

With regard to the manner of speaking and voting in the commons, motions are made, and petitions presented, [illegible] bills are moved for [illegible] A member who wishes a motion put [illegible] delivers it to the speaker, who, when it has been seconded, puts it to the house, it cannot then be withdrawn except by leave of the house The *motion to adjourn* is put in order to supersede a motion of which the house is already in possession The motion *for reading the order of the day* has equally the effect of superseding the existing question The motion *for the previous question* has been commonly but mistakenly attributed to Sir Harry Vane, as its inventor It can take place only in a house and not in a committee, in which latter the equivalent motion is *that the chairman do now leave the chair* The speaker names the member whom he first perceives to rise in order to speak but the house is not bound by the speaker's decision It is understood to be the rule, that a member may speak even after the question put, if the affirmative voice only has been given, and the negative not yet given The effect of the speaker's "naming a member" on the occasion of disorder in the house is that such member after being heard if he pleases, is directed to withdraw and the house then considers what penalty to inflict In the commons votes are given by *ay* and *no*, if a division is demanded, the speaker (by a resolution of 1603) appoints two tellers on each side to count Strangers are directed to withdraw, and the doors closed before the question is put On a division one party leaves the body of the house the other remains, and the general rule is, that the side which is for the *motion* goes out, thus on the question on a bill the *affirmative* voices go out but this rule is governed in its application by various special usages On a division in a committee of the whole house the ayes go on one side and the noes on the other The speaker has the casting vote in a house, the chairman in a committee

In the House of Lords —The general rules of proceeding in the House of Lords vary little in material points from [illegible] The speaker can debate [illegible] seriatim, the youngest baron voting first [illegible] of the lords to vote by proxy is only [illegible] on the king Proxies from spiritual lords are only to spiritual, proxies from temporal only to temporal No lord can hold more than two proxies The lord chancellor is ex officio speaker of the House of Lords, and as he is able to speak and vote, he has no casting vote the rule therefore in case of equality of voices always is, that the presumption is in favour of the negative side

With regard to messages between the two houses, those from the commons to the lords are sent by one member but will not be received unless eight at least attend in all Messages from lords to commons are sent by two masters in chancery or, on special occasions, by two judges Messages from [illegible] sorts those to the commons [illegible] their part are usually written in the king's own hand, those which are sent when a member of the house is put under arrest on account of the public service are verbal, and delivered by a minister of the department of service concerned (See *Hatsell's Precedents in Parliament*)

XI *Jurisdiction of Parliament as a Court of Justice* — i For the trial of a peer, indicted for treason or felony, or for misprision of either, the lords spiritual and temporal sit as the court of the lord high steward of England an office which is in general created *pro hâc vice* by a commission under the great seal But, if the trial should occur during the sitting of parliament, it is said to be before the same court "of our lord the king in parliament," in which case the high steward is only, as it were pro tempore speaker of the house, and has a vote with the other peers, whereas, in his own courts, held in the recess of parliament, he is judge of the court, and, like any other judge, sole arbiter on the question of law

ii The House of Lords has also a twofold jurisdiction; 1 in criminal cases, 2 in civil cases — 1 The first is for the trial of [illegible] and misdemeanors by the method of parliamentary impeachment by the House of Commons (See IMPEACHMENT) The proceeding on a bill of attainder or of pains and penalties, is, in fact, a legislative act, and not a judicial one (See ATTAINDER, PAINS AND PENALTIES, BILL OF) 2 The jurisdiction of the House of Lords, in civil cases, is divided by Lord Hale

into their jurisdiction in the first instance, and in the second instance as a court of appeal; but the former, which consisted in [illegible] of interference, occasionally exercised [illegible] purposes, is now obsolete. In the last instance, the House of Lords is the supreme court of judicature in the kingdom. Appeal lies to it, by writ of error, from the court of King's Bench, and from the subordinate court of appeal of the Exchequer Chamber, and appeal from the High Court of Chancery also not only in order to obtain the reversal of a decree, but also on any interlocutory matter. On writs of error, the House of Lords pronounces the judgment, on appeals, it gives directions to the court below to rectify its own decree.

XII. *Privilege of Parliament*, in the ordinary sense of the words denotes the privileges of individual members of either house, enjoyed by virtue of their seats. These privileges are partly limited by known precedent, or by statute, but they are to a great extent customary and the houses themselves constitute the only tribunals before which the inquiry whether their privileges have been violated or not can be instituted.

The first privilege is freedom of speech in debates; this claim is sanctioned by the statute 2 W. & M. 2, which declares the liberties of the people. This privilege does not extend to the publication of what is spoken; if a member publish his speech without the authority of the house, he is liable to the common legal tribunals for its contents. An exception to the privilege also is to be found in the jurisdiction of the house itself, which has the power of committing, expelling, or fining (the latter not exercised since the reign of Elizabeth) a member for a libel or contempt against the dignity of the house.

The next privilege of freedom from arrest in civil suits, is probably as old as parliament itself. Privilege of parliament was formerly supposed to exempt peers and members of the House of Commons from civil actions as well as arrests, but this was finally abolished by 10 G. 3. This is the privilege of peerage, not of parliament, consequently it extends to Scotch and Irish peers. The exemption does not extend to criminal cases, or breaches of the peace, or to attachments in case of contempt by the superior court. And by a peculiar process enacted by 10 G. 3 a member of parliament may be made a bankrupt. Unless the commission is superseded within twelve months from its being issued he vacates his seat. The liberation of parties improperly arrested is effected either by the authority of the houses themselves, or when parliament is not sitting or (in the case of peers) when it is dissolved by writ of privilege or on motion in the superior courts. The duration of the privilege, in the case of members of the lower house is not exactly defined. It is the general opinion that it extends to [illegible] and forty days before the next [illegible] bers of parliament are not liable [illegible] as jurors during sitting or adjournment.

The old privilege of franking was [illegible] to continue during the same period which is mentioned as that of freedom from arrest. By 35 G. 3 [illegible] it was restrained to letters within an ounce in weight and the number to ten sent and fifteen received. It is now altogether abolished.

The general or "ancient and just" privileges of the houses are, as has been said, undefined. "The law of parliament," says Hallam, "as determined by regular custom, is incorporated into our constitution; but not so as to warrant an indefinite uncontrollable assumption of power in any case, least of all in judicial proceedings where the form and essence of justice are inseparable from each other."

Besides the general privilege of parliament we may here briefly notice the privileges claimed by the two houses, or by members of them, with respect to the conduct of their legislative proceedings.

Two privileges peculiar to the House of Lords are: 1. That possessed by every peer of giving his vote by proxy (See antè, *Rules of Business in the two Houses*.) 2. That which he possesses of entering on the journals of the house his dissent from a vote of the house, together with his reasons for it, which is styled his protest. The first protests, with reasons annexed, are said by Lord Clarendon to have been made in 1641.

Of the peculiar privileges of the House of Commons, the most important is that of originating all money bills, and this, in principle, is a very ancient part of the constitution. But it was not before 1690 that it was fully established that the lords could not alter, any more than originate, any rate or tax granted by the commons. This privilege is now understood under the following limitations. — In bills of aid and supply the lords can neither originate them nor make any alterations beyond verbal amendments. In bills which impose pecuniary burdens as a collateral object, — such, for example, as bills for turnpike roads and canals, or for the management of the poor — the lords may make amendments but not such as affect the quantity, disposition or collection of the rate. No amendments may be made by the lords which appear likely, in their consequences, to bring a charge on the [illegible] insert or alter pecuniary penalties [illegible].

By a resolution bearing date 1667, and now strictly adhered to, any proposition for taxing the subject must be first examined by a committee of the whole house, and their opinion reported. The effect of this rule is, that subjects on which frequent speaking by the same member, and other departures from regular proceedings are desirable, are discussed in a meeting unfettered by some of the special rules of the house.

When a bill of supply has received the concurrence of the lords it is returned to the commons, and by them presented to the throne.

XIII. *Adjournment*.—An adjournment is a continuance of the session from one day to another. This is done by each house for itself either from day to day, or over a recess as at Christmas and Easter. In neither house can the speaker adjourn unless upon motion of the house. The king can signify his desire of an adjournment, but has no further power.

XIV. *Prorogation of Parliament*. A prorogation is [illegible] and is made by the royal authority, either expressed by the lord chancellor in the king's presence or by writ under the great seal, or by commission. In the proclamation for prorogation if it is intended that parliament, when next it meets, shall proceed to the despatch of business, notice is given of that purpose, and such notice bears date usually forty days at least before the day appointed for meeting; but, in time of rebellion or danger of invasion the king is empowered to call together parliament with fourteen days' notice only.

XV. *Dissolution of Parliament* is effected either, 1. By the king's will which is the exercise of one of his highest prerogatives; this is usually done by proclamation after parliament has been [illegible] the demise of the crown, but by 7 & 8 [illegible] parliament continues six months after that event, assembles immediately if under prorogation or adjournment, and if there be no parliament at the time the members of the last parliament are empowered to reassemble themselves. 3. By efflux of time, viz. at the end of every seventh year if not sooner dissolved by the Septennial Act 1 G. 1. s. 2. c. 38. The seven years are counted from the day on which parliament was appointed to meet in the writ of summons.

PA'RLIAMENT or PARLEMENT (Fr. parlement). The title of certain high courts of justice under the old French monarchy. The French parliament, like those of England and Naples, was in its origin a convocation of the great vassals of the crown who treated of judicial as well as political matters in their assemblies. Saint Louis was the king who first introduced into this body counsellors of inferior rank, chiefly ecclesiastics, as legal assistants; and the earliest registers of the proceedings of the parliament which afterwards became fixed at Paris are of the date of 1254. The important step of rendering that court [illegible] capital city, is generally [illegible] 4); from that time the great barons gradually discontinued their attendance, and the lawyers occupied the higher places and more important functions of the court. The twelve peers of France however remained constant members of the parliament after the other great vassals had by disuse, ceased to be considered as members of it (although they likewise in process of time ceased to take part in its judicial business). The parliament of Paris thenceforward remained the chief tribunal of the country until the revolution, with the exception of the short period of its suppression by Louis XV. in 1771, but as the great fiefs of the French monarchy were successively united to the crown, the supreme feudal court of each was invested with the title and attributes of a parliament. These were fixed at Toulouse, Grenoble, Bordeaux, Dijon, Besançon, Rouen, Aix, Pau, Rennes, Metz, Douay, Nancy. The most remarkable prerogative exercised by the parliaments is one of which the origin has not been satisfactorily accounted for, that of registering the edicts of the sovereign, and thereby giving them the force of law. M. Meyer (*Institutions Judiciaires*, liv. iv. ch. 9.) supposes that it arose from the character of the parliament, as the court of the feudal lord of each province; thus the edict of the king of France was referred to the parliament of Bordeaux, to examine whether it interfered with the special rights and duties of the same sovereign as duke of Guienne &c. It appears however to have been the received doctrine by the end of the 14th century, that this formality of registration was essential to the validity of an edict in every province. Hence the [illegible] parliaments, and especially that of Paris, [illegible] French history, [illegible] the [illegible] power of the [illegible] (See LIT OF JUSTICE.) It was usual for [illegible] undoubtedly legal, although [illegible] parliaments, to convey remonstrances to the king on the

subject of his edicts But Louis XIV ordained that these remonstrances should be presented before they had been registered their edicts were to bind them The parliaments had also a power of a legislative character that of pronouncing *arrêts de réglement* by which they gave authority to decisions on points of law binding on present but in future cases The counsellors of parliament were, by a law of Louis XI , immoveable except in case of legal forfeiture , but the place of counsellors and presidents early became purchaseable and afterwards transmissible by hereditary descent Hence, in part, the powerful esprit de corps which distinguished those bodies As a high court of appeal, the parliament of Paris was divided into five chambers , one termed the great chamber, three *des enquêtes*, one *des requetes* Besides these, the *chambre de la tournelle*, in which criminal cases were tried, was a fluctuating court in which members of all the chambers sat in turn

PA'RLOUR (Fr parler, *to speak*), signified originally the little room in which in former times the nuns and monks used to give interviews to their visitors , or in which the novices used to converse together at the hours of recreation

PARME'NIANISTS In Ecclesiastical History a name given to the Donatists (see that article) from Parmenianus Bishop of Carthage, one of their chief leaders, and an antagonist of Augustine

PARNA'SSUS (Mod Gr [illegible] mountain in ancient Greece [illegible] and from the numerous objects of classical interest of which it formed the theatre, considered "holy" by the Greeks On its side stood the city of Delphi, near which flowed the Castalian spring, the grand source of ancient inspiration , and from this circumstance, in metaphorical language, the word Parnassus has come to signify poetry itself A good collection of the Italian poets, printed at Milan, bears the title *Il Parnasso Italiano*

PA'RODY (Gr παρα and ᾠδη *a song*) A species of composition in which the form and expressions of portions or passages of grave or serious writings are closely imitated in similar passages of a ridiculous character Parody is a species of burlesque (see BURLESQUE) but the imitation is more close and exact than in ordinary burlesque composition Antiquity has left us no complete works of this species although some fragments are preserved by Athenæus and other writers The *Batrachomyomachia*, the authorship of which is attributed to Homer though a very ingenious specimen of the burlesque, is not in the modern sense of the word a parody The French critics do not seem to draw an adequate distinction between the nature of a parody and a *travestie*

PAR'O'L (Fr parole) In Law word of mouth Thus, a parol agreement is contrasted with one in writing, parol with written evidence See for the legal principles bearing on this distinction in different cases see AGREEMENT, CONTRACT, EVIDENCE

PARO'LE In Military matters the allowing of prisoners to enjoy certain indulgences on their giving their word of honour (*parole d'honneur*) that they will not serve during the continuance of the war against the country by which they are liberated or upon their pledging their word to abide by such other conditions as may be stipulated

PA'RONOMA'SIA (Gr παρα and ονομα *a name*) In Rhetoric, a figure by which the same word is used in different senses or words similar in sound are set in opposition to each other , so as to give a kind of antithetical force to the expression

PARONY'CHIA (Gr παρα, and ονυξ, *the nail*) A whitlow

PARO'NYMOUS (Gr ονομα *name*) In Grammar words of similar derivation or principal words with their derivation e g *equus*, *equus*, *equito* , *man*, *manhood*, *mankind*

PARO'TID GLAND (Gr παρα and ους *the ear*) A large gland situated under the ear between the maxillary process of the temple bone and the angle of the lower jaw It secretes saliva, which is carried into the mouth by the *Stenonian duct*

PAROTI'TIS Inflammation of the parotid gland The *mumps*

PA'ROXYSM (Gr παρα, and οξυς *sharp*) In Medicine, the periodical exacerbation of a disease

PARR This name is applied in most parts of England and Scotland to the young of the salmon (*Salmo salar*, Linn) up to near the end of their second year, when they lose their dark lateral bars by the superaddition of a silvery pigment and congregate together for their seaward migration From the circumstance of the milt and roe being developed at this immature period a precocious condition by no means uncommon in the cold-blooded tribes, the parr has been regarded by some ichthyologists as a [illegible] was described as such by Willughby and Ray under the name of *Salmo [illegible]* see SALMON

PA'RREL In Naval language, the collar of greased rope or trucks by which the yard is confined to the mast while it slides up and down it

PA'RRICIDE (Lat pater, *a father*, and cædo, *I kill*), implies properly, the murder or murderer of a father But the term is also extended to the murder of any near relative, as a husband, wife, mother, &c , and even to [illegible] persons as a king, archbishop [illegible] and no law against parricides from an opinion that human prudence could never reach to the guilt of parricide This was actually the case at Rome, but at a later period parricide was punished by the Roman law with greater severity than any other kind of homicide The delinquent, after being scourged, was sewed up in a leathern sack, with a live dog a cock, a viper, and an ape, and so cast into the Tiber The English laws treat this crime only as simple murder , but in some of the German states the criminal convicted of parricide is put to death with exquisite torture, the penalty being that such persons shall be beaten to death with iron clubs, beginning with the feet, and gradually ascending to the head

PA'RSEE (Pers parsi) The name given by English writers to the Persian refugees, driven from their country by the persecutions of the Mussulmans who now inhabit various parts of India Their principal emigration to Baroach, Surat, and the neighbouring coast, is supposed to have taken place about the end of the 8th century The sacred fire, the emblem of their religion (see GUEBRES) called *behrem*, is believed by them to have been brought by the first emigrants from Persia, and, after many changes of place is now preserved at Odisari and Nausari, near Surat, and at Bombay In this latter city, under the protection of the British government, they have grown into a colony of considerable numbers and of great opulence They have become particularly distinguished in the art of shipbuilding, and the dockyard of Bombay is now almost exclusively in their hands Their character is variously estimated by different observers but all agree in attributing to them industry and economy, and attachment to their religion and to those of the higher class strong sentiments of honour and honesty Their number is said to equal 700 000 , and at Bombay, according to late calculations, at least 20 000

PA'RSING The art of resolving a sentence into its grammatical elements or parts

PA'RSON (Lat persona ecclesiæ) In Law, one that has full possession of all the rights of a parochial church His title is derived from the Latin persona because in his person the church itself which he occupies is represented and he is a corporation sole A parson, or rector has the freehold of the parsonage house, the glebe the tithes and other dues during his life Four requisites are necessary to constitute a parson holy orders presentation institution and induction See these terms In common language parson is a vulgar term for a clergyman of any kind

PART (Lat pars) In Music a single piece of the score or partition being one set of the successions of sounds which constitute the harmony

PARTERRE (Fr) A system of beds of different shapes and sizes in which flowers are cultivated connected together, with intervening spaces of gravel or turf for walking on The form of the beds may vary according to the taste of the designer , but their breadth should never be greater than will admit of the spectator who wishes to gather flowers or the gardener who is to cultivate them reaching the middle Where the object is chiefly to produce a display of flowers the beds should be of simple shapes with few acute angles, as these can never be completely covered with plants , but where the object is to display a curious figure to be seen from a point considerably above the level of the parterre, the beds may be formed of arabesque shapes, or like the figures used in embroidery and lace-work Figures of this description are generally planted with dwarf box, kept low by clipping with only here and there a flowering plant or a small bush placed in the broadest parts of the beds or scroll-work Parterres of this description were in use during the time of the Romans, as appears by the description of Pliny's own garden by himself, in which the letters composing his name were planted of box, kept regularly clipt a practice not uncommon in Rome and its neighbourhood at the present day Embroidered parterres, however were brought to the highest degree of perfection in the time of Louis XIV , when the arabesque style of ornament was introduced into every thing The flowers and flowering shrubs in cul- [illegible] always an object of luxury and requiring to be kept up at considerable expense of watering in the climate of France, and scroll work of box This description of parterre was imitated in England but smooth green turf not being here an object of luxury, beds of flowers became more [illegible] and as the number of [illegible] the number of turf

beds and scroll work diminished, till, at the present time, the latter is rarely to be met with In this manner has gradually arisen the modern English flower garden, which consists of small beds, more or less orbiculate, and scattered over a surface of smooth turf, so as to combine into groups, which are planted with flowers, or low flowering shrubs, sometimes in masses of only one kind in a bed, and at other times of several kinds mixed together

PARTERRE In French the pit of a theatre

PARTHENON (Παρθενων from παρθενος *a virgin*) It was a peripteral octostyle of the Doric order, with 17 columns on the sides, each 6 ft 2 in in diameter at the base and 34 ft high elevated on three steps Its height, from the base of the pediment, was 65 ft, and the dimensions of the area 233 ft by 102 The eastern one of which the contest of Minerva with Neptune for the government of Athens On the metopes was sculptured the battle of the Centaurs with the Lapithæ, and the frieze contained a representation of the Panathenaic festivals Ictinus Callicrates, and Carpion were the architects of this temple, Phidias was the artist, and its entire cost has been estimated at 1½ million sterling Of this building 8 columns of the eastern front and several of the lateral colonnades are still standing Of the frontispiece, which represented the contest of Neptune and Minerva nothing remains but the head of a horse and the figures of two women without heads Part of the Centaurs and the Lapithæ is in better preservation, but of the numerous statues with which this temple was enriched that of Adrian alone remains The Parthenon however dilapidated as it is still retains an air of inexpressible grandeur and sublimity, and it forms at once the highest point in Athens, and the centre of the Acropolis It is hardly necessary to inform the reader that the chief portion of the sculpture of the Parthenon is now placed in the British Museum where it forms, with some additions the collection of the Elgin Marbles *See* ELGIN MARBLES

PARTICIPANTS A semi religious order of knighthood, founded by Pope Sextus V in 1586 in honour of Our Lady of Loretto The members of this order were allowed to marry The order was soon extinguished, and the title of Knights of Loretto is now conferred on some civil servants of the pope

PARTICIPLE (Lat participium) A part of speech which *partakes of* the properties both of a verb and an adjective It may be described either as a verb without affirmation or as an adjective with the addition of the notion of time *See* GRAMMAR

PARTICLE (Lat particula *little part*) In Grammar, a general term to express the subordinate or secondary parts of speech —the adverb the preposition and the conjunction But it is more in accordance with grammatical precision to apply this term to those minor words to be met with in all languages which serve apparently to give clearness and precision to a sentence but respecting whose exact use Grammarians are not agreed To this class belong the Gr γε αρα του δη &c, the Germ ja, wohl, &c, and the English *now, then truly* &c The term *particle* is also applied by to those words or enclitics (as they are and κλινω, *I lean*) which cannot be used separately, but must form part of the preceding word, as in *virumque*

PARTICLE, in Physics, denotes the minutest parts into which a body can be mechanically divided It is in general used synonymously with molecule corpuscle, atom, but sometimes these terms are distinguished

PARTICULARISTS In Theology Reformed who have held the doctrine of decrees of salvation and reprobation As a party name it seems to date from the Synod of Dort That branch of the Baptists attached to high Calvinistic opinions is still called the church of the *Particular* Baptists

PARTIDAS, LAS SIETE (Span *the seven parts*) A celebrated ancient Spanish code of laws drawn up in the reign of Alphonso X of Castile (about 1260) so called from the number of principal parts into which it is divided This famous collection did not acquire the obligatory virtue of a code until 1538, when sanctioned by Alphonso XI

PARTITION (Lat partitio) In Music, the arrangement of the several parts of a composition on the same page or pages so that they should fall under each other, so that the performers of the parts may play or played jointly or separately as the composer intended It is commonly called a *score*

PARTITION In Architecture, the vertical assemblage of materials which divides one apartment from another It is usually however employed to denote such division when constructed of vertical pieces of timber called *quarters*

PARTITION In Politics, the division of the states of a sovereign or prince after his decease among his heirs as was the custom in some of the princely families in the ancient German empire; or among other powers, such as that of the states of the king of Spain, which was in ice) between William III, by the treaties of 1698 and igning monarch, was without near heirs But the most celebrated partitions in history to which the name has become almost exclusively attached, were those of Poland, by Russia Prussia, and Austria The first of these took place in 1772 when various provinces were wrested from the republic in pretended satisfaction of ancient claims, and the old and vicious constitution guaranteed by the three powers The second was submitted to by Stanislas in 1793, when Russia obtained the remainder of Lithuania and Prussia Dantzic, Thorn, and an extensive district This partition was followed by the insurrection under Kosciusko, which brought about the third and last partition in 1795, when the remnant of the country was dismembered It was organized in 1807 altered in 1815, but the conditions under which Poland was then annexed to Russia as a separate kingdom were entirely set aside after the Polish insurrection of 1830 and it is now substantially and in fact a province of Russia These partitions overturned the ancient balance of power in Europe, and prepared the way for the violent changes which followed the French revolution (See Koch *Revolutions de l'Europe*, Rulhieres *Histoire de l'Anarchie de Pologne*, Ferrand, *Histoire des Trois Demembremens de Pologne*, 3 vols. Paris 1820, *Ed Rev* vol xxxvii p 462)

PARTNERSHIP A relation established between two or more persons by an agreement to combine property or labour in furtherance of a common undertaking, and for the acquisition of a common profit A community of profit between the parties is the true criterion of a partnership for one partner may stipulate to be free from loss and this stipulation would be effectual as between himself and his partners though he would be liable equally with them to the world at large A dormant partner that is, one who in point of fact participates in the profits of a firm but is not held out as a member of it, will nevertheless be liable for its engagements, because he takes part of that fund which is a security to creditors for payment of their debts There is no particular form necessary to the constitution of a partnership, nor is it necessary that the contract should be in writing It may be dissolved at the individual pleasure of any one partner, if no stated period has been fixed for its continuance, and, even if such a period has been fixed, it will be dissolved, in the absence of any proviso to the contrary by his bankruptcy attainder or death or by marriage, in the case of a female Courts of equity also, will put an end to it by decree on proof of lunacy or gross misconduct A partnership is by any of the above matters terminated as between the partners themselves, but to prevent a continuing liability to strangers public notice of the dissolution is necessary One partner cannot sue another at law in respect of the partnership account unless a balance has been struck the remedy being in equity, which affords a machinery better adapted to the investigation of accounts As against the partnership bound by the engagements of any one partner acting with reference to the joint business either by his simple contracts on the purchase and sale of goods, or by negotiable instruments circulated on its behalf

PARTNERS OF THE MASTS The woodwork round the mast at the deck to strengthen and support the deck against the pressure of the mast The term is also applied to the similar supports round the capstan and pumps

PARTRIDGE WOOD A variegated wood imported from Martinique it is said to be the produce of the *Hostoria coccinea*

PARTY In Politics a body of men united under different leaders for promoting by their joint endeavours the national interest upon some particular principle in which they are all agreed The origin of party may be traced to that law of the human mind which is founded in our natural desire of sympathy and our disposition to afford it From the earliest ages down to the present time the principle of mutual co-operation has been adopted with success in executing favourite designs and in aiming at the accomplishment of certain ends Among the ancient Romans, for example, "*idem sentire de republica*" formed a principal ground of friendship and attachment, and the same feeling, modified by different forms of government and other circumstances, is at present in full operation in all the civilized states of Europe and America The benefits of party may be briefly stated to be, increased energy in pursuit of a common object, regular co-operation, mutual control and regulation, and an advantageous division of labour But though party or combination may in this manner be productive of good results, as every other principle abounding in our nature, it is liable to be abused and it certainly is no

doubt that it is frequently attended with such evil consequences as great [illegible] It involves a [illegible] of what is [illegible] in a way [illegible] dividuals Perhaps the worst effect of party is its tendency to generate narrow, false, and illiberal prejudices, by teaching the adherents of one party to regard those that belong to an opposing party as unworthy of confidence, and in making them oppose good measures because they happen to be proposed by a different party, and support bad measures because they are proposed or supported by their own party A thorough-going party adherent is in fact a political slave a person who allows others on all occasions to think for him, who, as far as politics is concerned, has no principle or rule of action, save that of slavish adherence and blind obedience to the dictation of the leader of his party (The uses and abuses of Party are discussed with great ability in vol xxx of the *Edin Review*) The different parties, both of England and other countries, will be found under their respective heads

PARTY In Heraldry — as party per pale, fess, &c, terms used [illegible] division of a shield by a line running in [illegible] either of these ordinaries

PARTY WALL In Architecture, the wall separating two buildings belonging to different owners or occupiers The regulations relative to the thickness of party walls in the metropolis have been the subject of several statutes, beginning with one passed 19 Car 2 and ending with the 14 Geo 3 better known by the name of the Building Act. This last governs the thickness of all party and external walls to be built after 24th day of June, 1774

PARULIS (Gr παρα, and ουλον, *the gum*) A gumboil

PA'RUS (Lat parus, *a titmouse*) A genus of Conirostral Passerine birds allied to the crows, characterized by having the conical beak straight and rather slender, with few hairs at its base, nostrils round, and covered by reflected bristly feathers, the hind toe is strong and armed with a long hooked claw To this genus belong the native birds commonly called tits or titmice, of which the tomtit (*Parus cæruleus*, Ray) is the best known species The great tit (*Parus major*), the marsh tit (*Parus palustris*), the cole tit (*Parus ater*) and the crested tit (*Parus cristatus*) have the bill longer and more pointed, the last-named species is rare in this country They are active little birds continually flitting from spray to spray and suspending themselves in all kinds of attitudes rending apart the seeds on which they feed devouring insects and not even sparing small birds when they happen to find them sick and are able to destroy them They store up provisions of grain build their nests in the holes of trees, and produce more eggs than is usual among the Passerine birds

PA'SCHAL CYCLE The name given to the cycle which serves to ascertain when Easter occurs It is formed by multiplying by each other the cycle of the sun which consists of 28, and the cycle of the moon which consists of 19 years See PASSOVER

PA'SCHAL FLOWER The *Anemone pulsatilla*, so called from [illegible] about Easter

PASIGRAPHY In Literature (Gr πας *universal* and γραφω, *I write*) The imaginary universal language to be spoken and written by all nations the invention of which has exercised the ingenuity of so many learned men, has been denoted by this word Leibnitz seems to have been one of the first who conceived this to be possible Many writers in Germany (where the name was invented) have followed him in the endeavour to devise schemes for this fanciful object In England Bishop Wilkins in the reign of Charles II, invented a scheme for a universal language grammar and character

PASQUINA'DE (Ital pasquinata) A satirical writing directed against one or more individuals A mutilated ancient statue of a gladiator dug up at Rome about 300 years ago, which now lies in the court of the Capitol was [illegible] by the Romans, Pasquino, from the [illegible] of a barber of eccentric and well-known character opposite to whose house it was originally set up This statue, and another, called by the populace Marforio which was situated near it were used for the purpose of bearing satirical placards often reflecting on the court and church of Rome, which were affixed to them at night frequently in the form of a dialogue between the two statues So annoying did Pasquin often become to [illegible] that [illegible] design was [illegible] but the ministers of the reigning pontiff are said to have dissuaded him from it, representing that if this were done "the frogs in the Tiber would croak louder than ever Pasquin had spoken" He has, however, lost his public spirit, and rarely or never ventures to attack the powers that be But his statue is still the occasional receptacle of jocose comments on private matters M Matthews (*Diary of an Invalid*) mentions an instance which occurred during his stay at Rome A man of the name of Cæsar common among the townfolk there, had married a girl of the name of Roma Pasquin was placarded with Ave Cæsar natus Romæ respice quam [illegible] The man replied by Mariorio Cæsar imperat To which the retort was Ergo coronabitur Hence Pasquinate and Pasquinade became, in Italy, conventional words to signify satire of that description and have been naturalized in other languages In French and German they have been used in the legal vocabulary for libel

PASS, in a military sense, signifies a strait or narrow defile which shuts up the entrance into a country

PASSAGE (Lat [illegible]) In Architecture, the part of a building allotted for giving access to the different apartments

PASSAGE In Music, a portion of an air or tune consisting of one, two, or three measures

PASSAGE, BIRDS OF *See* MIGRATION

PASSANT In Heraldry, a term used to describe a beast when represented in a walking position Passant guardant, walking with the full face turned towards the spectator

PASSEPARTOU'T In Engraving, a plate or wood block, whose centre part is entirely cut out round the outer part, whereof a border or ornamental design is engraved, serving as a frame to what may be placed in the centre

PA'SSERINES, *Passeres*, or *Passerinæ* (Lat passer, *a sparrow*) The name given by Linnæus and Cuvier to the typical order of birds including those which neither manifest the violence of the birds of prey, nor have the fixed regimen of the terrestrial birds, but which feed on insects, fruit or grain, according to the slenderness or strength of their beak, some with sharp and toothed mandibles pursue and feed on small birds All the Passerines have short and slender legs, with three toes before and one behind, the two external toes being united by a very short membrane They form the most extensive and varied order of birds, and are the least readily recognizable by distinctive characters common to the whole group Their feet, being more especially adapted to the delicate labours of mdification, have neither the webbed structure of those of the *swimmers*, nor the robust strength and destructive talons which characterize the feet of the *bird of rapine*, nor yet the extended toes which enable the *wader* to walk safely over marshy soils and tread lightly on the floating leaves of aquatic plants, but the toes are slender, flexible, and moderately elongated, with long, pointed, and slightly curved claws

The Passerines in general have the females smaller and less brilliant in their plumage than the males, they always live in pairs build in trees and display the greatest art in the construction of their nests The young are excluded in a blind and naked state, and wholly depend for subsistence, during a certain period, on parental care The brain arrives in this order at its greatest proportional size, the organ of voice here attains its utmost complexity, and all the characteristics of the bird as power of flight, melody of voice, and beauty of plumage are enjoyed in the highest perfection by one or other of the groups of this extensive and varied order

The beak of the Passerines varies in form according to the nature of their food which may be small or young birds, carrion insects fruit, seeds, vegetable juices, or of a mixed kind The modifications of the rostrum have therefore afforded convenient characters for the tribes or subdivisions of the order these are termed, 1 *Dentirostres*, 2 *Conirostres*, 3 *Tenuirostres*, 4 *Fissirostres* See those words

PASSIFLORACEÆ (Passiflora or Flos passionis, one of the genera) A natural order of twining plants with very showy flowers furnished with numerous rays of brilliant colours between the corolla and the stamens They chiefly inhabit the hotter parts of the world, and bear a fruit not unlike that of the gourd, to which natural order they are related Independently of the beauty of their flowers, some yield fruits eaten under the name of granadilla and water lemon, and others have a hard black wood [illegible]

PASSING NOTE [illegible] graces wherein two notes are connected by [illegible]

PA'SSION (Lat [illegible]) The sufferings of our Lord, which he is described as having endured between the Last Supper and the moment of his death. Passion week is that in the course of which these sufferings took place, namely that immediately preceding Easter (See as to its solemn ceremonial in the Romish church, this article in Ersch and Gruber) It was [illegible] *Ille mœsta luctuosa, mythosa funesta* [illegible]

PA'SSIONS [illegible] given to the different emotions of the mind, as love, anger, &c Various ingenious speculations have been instituted to ascertain whether the precise situation of the impetus of the pas-

sions be in the spiritual or material part of man Some philosophers, and among these Des Cartes, considered them wholly seated in the corporeal system Malebranche regarded the passions as the effects of the soul which proceed from uncommon influence and motion in the blood and animal spirits Though the passions," says Burton, in his *Anatomy of Melancholy*, "dwell between the confines of sense and reason, yet they rather follow sense than reason, because they are drowned in corporeal organs of [illegible] into eleven, six in the *coveting* and five in the *invading* Aristotle reduceth all to pleasure and pain, Plato to love and hatred, Vives to good and bad If good it is present, and then we absolutely joy and love, or to come and then we desire and hope for it if evil we absolutely hate it, if present it is sorrow, if to come, fear All other passions are subordinate unto these four or six, as some will, — love, joy, desire, hatred, sorrow, fear The rest, as anger, envy emulation pride, jealousie, anxiety, miserie, shame, discontent, despair, ambition avarice &c, are reducible unto the first" (*i e* the *irascible*) With several writers it has been a question whether the passions be each a distinct innate disposition or merely modifications of those dispositions which are common to all mankind The theories and conjectures of philosophers upon this subject are almost boundless, but to pursue them would be of little advantage, even if our limits permitted, and we shall merely refer the reader for ample particulars to the works of Hume Reid, Hartley Locke Lord Kames, &c (See also *Maass's Versuch Uber die Leidenschaften* 2 thle Halle 1805)

Passions In Painting and Sculpture the representation in the countenance and other parts of the violent emotions of the mind produced by anger fear grief &c The expression of the passions is a language without which the painter can never hope for success it is in this that he has the means of appeal to the sympathy of the spectator The close observation of nature under similar circumstances is the only mode by which his aim can be accomplished

PA'SSOVER or PASCHA A festival among the Jews which derives its English name from God's *passing over* the houses of the Israelites and sparing their first born when those of the Egyptians were put to death The name of passover or paschal lamb was likewise given to the *lamb* slain in memory of that deliverance The festival lasted seven days, beginning on the evening of the 14th of the month Nisan and commenced with killing the lamb The regulations appointed for this festival are detailed in Exod xii

That the passover had a typical reference to our Saviour has been the universal belief of the Christian world in all ages and is mainly grounded on passages in St John and St Paul (John xix 36, 1 Cor v 7) Christ is said to be our passover, his blood being shed to protect mankind from the divine justice, as the blood of the paschal lamb which was sprinkled upon the door-posts of the Israelites' houses, preserved them from the visitation of the angel of the Lord

PA'SSPORT A warrant of protection and authority to travel granted to persons moving from place to place by the competent officer The word appears to be derived from the [illegible] some continental countries of giving [illegible] from the admiral of a naval station to vessels leaving harbours within his jurisdiction As passports are not required in our own country the only species known to British travellers is that of foreign passports, which, for an Englishman travelling on the continent of Europe are usually made out by the resident minister or consul of the country he intends first to visit in London, or at one of the ports They are also granted by the Foreign Office to respectable persons on payment of a small fee (7*s* 6*d*) They are subject to visa or inspection by the proper authorities at the place where the traveller disembarks, and also at other places which he may reach according to the police regulations of each particular country and on passing the frontiers of states Austria and Russia are the only European states which at this time require absolutely the visa of an ambassador or minister of their own for travellers entering their domains by land In France, and in many continental countries, home passports are necessary for the native traveller According to the letter of the French law (since 17[illegible] a Frenchman cannot pass the limits of the canton in which he is domiciled without a passport, but in practice it is not required within the extent of the department Legally speaking the strict formalities of an internal passport, in France, require the direction of a journey to be specified, and its exact execution attested by the visas and signatures of the police authorities at every place mentioned in it, and these laws are, from their severity, so incapable of complete execution, that it is a common saying that no man but a rogue is ever entirely en regle with respect to his passport, suspicious characters being usually the most particular in their attention to formalities, for fear of detection A Frenchman travelling without properly authenticated papers, is liable to arrest and detention for a period of [illegible] The sums fixed in France are two francs for a passport to travel at home, and [illegible]

PASTE [illegible] In Gem Sculpture a preparation of glass, calcined crystal, lead, and other ingredients, for imitating gems This art was well known to the ancients, and, after being long lost, was restored, at the end of the fifteenth century by Milanese painters

Some modern artists have succeeded in obtaining compositions possessing a hard fine and brilliant appearance, but *pastes*, or mock diamonds, as they are called, depend most for brilliancy on the art displayed in setting the foil or tinsel behind them Several recipes have been given by M Fontanieu, but the most [illegible] for the production [illegible] — Take of litharge [illegible] 4, and of white arsenic 2 parts These ingredients are to be well mixed together in a crucible and melted, the fused metal is thrown into water, and should any of the lead employed be reduced to the metallic state, it becomes separated by this process and the glass is remelted for use For the finer kinds rock crystal is used instead of flint or sand, as it occurs in a much purer state, *i e* more free from the admixture of metallic oxides, which give to vitreous compounds their different colours In place of the above, Loysel recommends the following ingredients to form a compound having the same specific gravity as the oriental diamond, and on this account considered superior as it more nearly approaches the gem with regard to its refractive and dispersive powers, but, like the former it requires to be kept for some two or three days in a fused state in order to expel the superabundant alkali and to perfect the refining A moderate [illegible] The following is its composition — [illegible] purified by being washed first in muriatic acid and afterwards in pure water until all traces of acid are removed 100 parts, red oxide of lead (minium) 150 parts, calcined potash 30 to 35 parts, calcined borax 10 and oxide of arsenic 1 part (See the *Polytechnic Journal* for July 1841)

The term paste is also applied to the earthy mixture for pottery and porcelain, also to dough and to the solution of starch or wheat flour made by first mixing it with a proper portion of cold water and then adding boiling water under constant stirring so as to form an even solution Alum is often added to paste to strengthen it

PA'STEL (Lat pastillus) In Painting, a crayon formed with any colour and gum water, for painting on paper or parchment The great defect of this mode of painting is its want of durability See CRAYON

PA'STERN The part of the horse's foot under the fetlock to the heel

PASTICCIO (It) In Painting a picture painted by a master in a style dissimilar to that in which he generally painted David Teniers could for instance imitate, with surprising exactness the styles of many of the first masters of Italy and Flanders The same may be affirmed of Luca Giordano a Neapolitan artist

PASTIL In Pharmacy a kind of lozenge A compound of charcoal with odoriferous substances which diffuses an agreeable [illegible] its slow combustion

PA'STORAL [illegible] Bucolic Idyl

PA'STOUREAUX (Old Fr *shepherds*) Insurgent peasants who took up arms in France during the absence of King Louis IX on his crusade They were led by an apostate Cistercian monk who took the name of Jacob Master of Hungary who seduced them to follow him in various [illegible] They committed various excesses in the Province of Flanders, on which they at first assembled to Bourges where their leader was killed in a tumult, and his horde dispersed

PA'STURE Land under a particular decription of grasses and herbage which is eaten on the spot by horses, cattle &c Hill pasture is a term applied to hilly and mountainous lands which are kept perpetually under the natural grasses and herbage which spring up on them; while artificial pastures are such as are sown by art on lands which are occasionally subjected to the plough In all artificial pastures the principal grass is rye grass, and the principal herbage plant the white clover Perpetual pastures are such as are never subjected to the plough, and never receive any other manure than what is left on them by the pasturing animals, but artificial pastures are occasionally mown, and sometimes receive a top-dressing of dung, or some mixture of dung and earth, lime, &c

PATAVINITY A term in use among critics to denote a provincial idiom in speech, so named after that of Livy the historian, from his being born at Padavium, a provincial town of the Roman empire Wherein the alleged defect of Livy's writings consists has never been distinctly pointed out by any critic, ancient or modern

PATE In Fortification, a kind of platform encompassed with a parapet, and having nothing to flank it

PATEE, or PATTEE (Fr) In Heraldry a sort of cross, small at the centre and widening towards the ends, which are very broad

PATELLA The small, flat, and somewhat heart-shaped bone, which is placed at the fore part of the knee [illegible] (Lat *a dish*) the *kneepan*

PATELLOIDS *Patellæ* The name of a family of Cyclobranchiate Gastropods, having the limpet (*Patella*) as the type

PA'TEN (Lat patina) In Ecclesiastical usage, the stand or saucer on which the chalice rests It was frequently highly ornamented by artists in the 15th and 16th centuries In the administration of the Eucharist in England, the paten is the vessel on which the bread is placed

PA'TENT, in Commercal Law, is defined a privilege from the crown granted by letters patent, conveying to the persons specified in the sole right to make, use, or dispose of some new invention or discovery, for a limited period This power is said to be inherent in the crown, but was first defined by stat 21 Jac c 3, which gives the term of fourteen years or under, "so they be not contrary to the law, nor mischievous to the state by raising prices of commodities at home, or hurt of trade, or generally inconvenient" Ever since the reign of Anne it has been a condition in patents, that the inventor should, by an instrument technically called a "specification," particularly describe and ascertain the nature of his invention, on failure of which the patent becomes void These letters are obtained on petition to the crown, and are granted on the recommendation of the attorney or solicitor general An injunction may be obtained or an action brought for the infringement of a patent, but it is necessary to show the novelty and utility of the invention and that it is of something capable of being turned immediately to account in commerce, no patent will be good for a mere philosophical principle neither organized nor capable of being so It is now held that a new process or method is well as an article may be the subject of a patent A party who believes himself to have discovered an invention but has not yet been able to reduce it to practice may enter a *caveat*, that is an instrument by which notice is desired to be given by any one who may seek a patent for a similar invention The law of patents was amended by 5 & 6 W 4 c 77 and some difficulties under which inventors were placed were removed, but the whole policy of the Patent Laws has once more been brought before Parliament, with every prospect of their being entirely remodelled

The phrase *letters patent* is also frequently applied to the state documents or ordinances of the German sovereigns in which sense it is equivalent to the *bulls* of the pope or the *ukases* of the czar

PATENT YELLOW A pigment obtained by fusing a mixture of oxide and chloride of lead

PATERA (Lat patere *to be open*) In Roman Antiquities a large open goblet or cup of gold silver marble or earth &c used in offering libations to the gods

PATERA In Architecture the representation of a cup usually in bas relief and employed to decorate friezes fascia imposts &c

PATERINI One of the names by which the Paulicians a sect which appeared in Italy in the 11th century, were very commonly known The origin of the term is obscure, as is also the connection of the sect with the Manichæans of the East (See *Faber on the Church of the Waldenses* [illegible])

PATER NOSTER The Latin expression for *Our father* signifying the Lord's Prayer See ROSARY

PATER PATRATUS In Roman Classical Antiquities the chief of the fecials or heralds specially named for the performance of certain solemn acts such as declarations of war

PATHE'TIC (Gr παθητικος, from πασχω *I suffer*) In Painting and Sculpture, the expression of the softer or more sorrowful passions Its tendency is to depress and compose the feelings of the spectator

PATHETIC NERVES A pair of small nerves which influence the expression of the face They rise in [illegible] trochlear muscle of the eye

PATHOGNOMONICS (Gr παθος *a disease* and γνωμη *opinion*) Symptoms which are peculiar to particular diseases, and by which they are recognized, are termed [illegible]

PATHOLOGY (Gr παθος, and λογος, *a discourse*) Literally the doctrine of disease As physiology teaches the nature of the functions of the body in a state of health, so pathology [illegible] these functions which [illegible] It [illegible] therefore, are to ascertain the various symptoms which characterize the disorders of each organ of the body, and especially the diagnostic and pathognomic symptoms, which afford the means of discrimination between diseases that resemble one another, [illegible] both predisposing and exciting, by [illegible] duced, to point out the tendency and probable issue of each disease from the varying appearance of the symptoms; and finally to explain the symptoms of recovery, and the nature and operation of the remedies adapted to the various circumstances and periods of disease (*Conversations Lexicon*)

PATHOS (Gr πασχω *I suffer*) In Rhetoric and particularly [illegible] chiefly the tender, emotions of the mind In France, this term is generally used in a somewhat disparaging sense, being applied to that species of composition which indulges in strained and unnatural declamation

PATINA (Gr πατανη, *a dish*) In Numismatics, the fine rust with which coins become covered by lying in peculiar soils, which, like varnish, is at once preservative and ornamental It is, says Mr Pinkerton a natural varnish, not imitable by any effort of human art, sometimes of delicate blue, like that of a turquoise, sometimes of a bronze brown equal to [illegible] of bronze, sometimes [illegible] the azure hue, which [illegible] It is also found of a fine purple, of olive, and of a cream colour or pale yellow, which last is exquisite The Neapolitan patina is of a light green, and, when free from excrescence or blemish, is very beautiful Sometimes the purple patina gleams through an upper coat of another colour, with as fine effect as a variegated silk or gem In a few instances a rust of deeper green is found, and it is sometimes spotted with the red or bronze shade, which gives it the appearance of the East Indian stone called bloodstone These rusts are all, when the real product of time as hard as the metal itself, and preserve it much better than any artificial varnish could have done, concealing, at the same time not the most minute particle of the impression of the coin Gold admits no rust but iron-mould when lying in a soil impregnated with iron Silver takes many kinds but chiefly green and red, which yield to vinegar, for in this metal the rust is prejudicial

PATOIS (Supposed to be derived from Lat pater, *a father*) A word in general use in most European countries signifying the dialect peculiar to the lower classes

PATRES CONSCRIPTI See CONSCRIPT FATHERS

PATRIARCH (A compound of πατηρ *father*, and αρχω, *I govern*) The title given by the sacred writers to the earliest heads of families recorded in Scripture, from Adam to Jacob and his sons This title was assumed also in the early ages of the church by the bishops of the principal cities of the empire, as Rome, Constantinople Antioch &c The name was adopted from the practice of the Jews, who after the dispersion, subjected themselves to the spiritual superintendence of the patriarchs resident at Tiberias and Babylon The first mention of a Christian patriarch occurs about 440 They were for the most part superior to archbishops or metropolitans being set over several provinces This however was not always the case The patriarchs of Ephesus and Cæsarea for instance were subject to the bishop of Constantinople and were only on a par with diocesan prelates (See *Hooker Eccles Polity*, 6, 7, *Mosheim*, vol i pp 179 349 trans 1790)

PATRICIANS (Lat patres *fathers*) The first order or nobility of the Roman people When the constitution of Rome was monarchical they elected the king, and after the expulsion of the Tarquins all the great officers of state as consuls prætors, &c, were chosen from their body for many generations Of the patricians, also, the senate was composed, but in after times, both this and the great magistracies were thrown open to the plebeians The subdivisions of this order were as follow —First they were classed into three tribes, called Ramnenses Titienses and Luceres, of which the first contained the original patricians of Romulus the two latter being probably admitted to their privilege at different subsequent times Each of these tribes again was divided into ten curiæ and each curia again contained ten clans or gentes The general assembly of the patrician houses who constituted the populus, in contradistinction to the plebs or plebeian citizens, was called *comitia curiata* because they voted therein by curiæ, and this, in the earliest times was the Roman popular assembly, to which plebeians were not admitted

PATRICK, SAINT, ORDER OF An Irish order of knighthood instituted by George III in 1783, composed of the sovereign a prince of the blood royal, a grand master and fifteen knights, the lord lieutenant of Ireland for the time being is grand master

PATRIPA'SSIANS (Lat pater *father*, and passio, *suffering*), are persons who, by overlooking the distinction between the persons of the Trinity, are reduced to allow that the Father himself suffered on the cross This argument has been advanced against heretics of various denominations, and the title has, in consequence, been applied to many such It is the Sabellians, however, who considered the Father, Son, and Spirit as three modes or representations of the one God, that are generally [illegible] this term See SABELLIANS [illegible] ent 4)

PATRISTIC (Lat pater, *father*) In Theology, of or belonging to the fathers of the church, as patristic theology, literature, study

PATRO'LE (Fr patrouille) In Military language, a detachment, ordinarily of from four to eight men, under [illegible] The patroles are drawn from the posts of the city, and set out at an hour fixed by the commandant They are usually accompanied, in Continental towns, by an officer of police

PA'TRON (Lat patronus, from pater, *father*) The relation of patron and client, in ancient Rome, has been explained under the head CLIENT After the extinction of republican sentiments and usages, the term patron was still applied to advocates who defended causes for hire But the right of patronage analogous to that which had subsisted under the commonwealth, may be said only to have existed in the relation between masters and freedmen, the latter of whom were placed under various obligations to their former owners In the usage of the Roman Catholic Church a *patron* saint is the peculiar protector of each country community, profession, &c, or of individuals The prime minister of the pope is termed the cardinal-patron (As to the Roman patrons see *Mem de l'Acad des Inscr* vol xii)

PA'TRONAGE In the Church of Scotland the right of presentation to livings in lay patrons was recognized by the old practice of the church with the exception of the period from 1690 to 1712, during which lay patronage was abolished and the right of presentation lodged in the heritors (land owners) and members of the kirk session In 1712 lay patronage was restored, but still under the control of the parishioners whose *call* (as it was termed) was necessary to ratify the presentation But the call gradually became a mere nominal ceremony and disregard to the expressed wishes of the parishioners in one or two instances was the cause of the great secession from the Scottish kirk (See BURGHERS) In 1834 by an act of Assembly (*see* VETO ACT), the right of the parishioners was fully revived, it [illegible] that the disapproval of a majority [illegible] presentation This act of the General Assembly however was found by the courts of law not to be efficient but, after the establishment of the Free Church in 1843 an act, commonly called Lord Aberdeen's Act was passed which removed all doubts on the subject and acknowledged within certain reasonable limits, the right of the members of the church to have a voice in the nomination of their pastors

PATRONY'MIC (Gr πατηρ and ονομα *a name*) A name which designates a person by alluding to one of his ancestors either immediate or remote, as Pelide *i e* Achilles the son of Peleus, Eacide *i e* Achilles the grandson of Æacus Patronymics were chiefly employed by the classical poets of antiquity

PAULIANISTS A sect of heretics who embraced the Sabellian doctrines of Paulus of Samosata a bishop of Antioch in the third century, from whom they derived their name See SABELLIANS PATRIPASSIANS

PAULICIANS A sect of heretics whose history is interwoven with that of the Greek church in the 9th and 10th centuries, who appear to have arisen in considerable numbers in Armenia, and to have adopted the name by which they are distinguished from Paulus one of their leaders in order to avoid the imputation of connection with the Manicheans with which they were generally [illegible] Their opinions are to be collected only from the [illegible] of their enemies who accused them of [illegible] doctrine of the two principles and denying the inspiration of the Old Testament to have proceeded from the Supreme God At the same time the charges which were brought against them alleging their contempt for the worship of the Virgin and of the cross seem to point them out as in some respects genuine reformers in doctrinal points, and to have led their bigotted enemies to invent other and more scandalous imputations against them, for the sake of more effectually blackening their character In the East, they underwent a series of persecutions for two centuries a remnant, however, sur- [illegible] A colony of Paulicians [illegible] Thrace, from whence in the 11th century, they spread themselves over the West where they were known under the names of Cathari, Paterini, &c, and have been supposed to have been connected with the [illegible] France (See *Mosheim*, vol ii, *Hist of the Church of the Waldenses and Albigenses*, 1848)

PAUPER *See* POOR LAWS

PAUSE (Gr παυω, *I stop*) In Music, a character denoting silence in a part for a certain time, according to the sort of pause marked

PAVAN (Lat pavo *a peacock*) A slow and stately dance formerly practised in England, but now confined to the Spaniards It derived its name from the peculiarity of the dresses of those who engaged in it, the motion of which produced a fancied resemblance to the peacock's tail

PA'VEMENT (Lat pavimentum.) In Architecture, a causeway or floor paved with stone, brick, or other hard material for greater convenience of walking *See* ROADS

PAVESE or **PAVOIS** A large shield, used in the warfare of the middle ages to cover assailants advancing to the [illegible]

PAVILION (Fr pavillon) In Architecture, a projecting apartment on the flank of a building, usually higher than the rest of it Summer houses in gardens are sometimes called by this name, but improperly The term pavilion is also used to signify a military tent

PA'VO (Lat *a pea-fowl*) The name given by Linnæus to the genus of Gallinaceous birds of which the splendid Indian species *Pavo cristatus* Linn) is the type They are characterized by a crest of peculiar form, and by the tail coverts of the male extending far beyond [illegible] erection into a broad and [illegible] ix and silky barbs of these feathers, and the eye like spots which decorate their extremities, are known to every one The Indian pea fowl exist wild in the north of India, whence they were introduced into Europe by Alexander the Great A distinct species of pea fowl exists in the Isle of Java

PAWNBROKER A species of banker, who advances money at a certain rate of interest upon the security of goods deposited in his hands, having power to sell the goods at the principal sum, and the interest thereon, be not paid within a specified time The practice of advancing money [illegible] seems to have [illegible] but the first public establishments of this kind were founded in Italy under the name of Monti di Pietà in the 14th and 15th centuries, and were intended to counteract the exorbitant usurious practices of the Jews who formed at that period the great money-lenders of Europe From Italy these establishments gradually spread over the Continent, in many parts of which they still exist (See MONT DE PIETÉ) For a view of the advantages and disadvantages of pawnbroking, and the law as to pawnbrokers &c, see the *Commercial Dict*

PAX An allegorical divinity among the ancients, worshipped as the goddess of peace She had a celebrated temple at Rome which was built by Vespasian and was consumed by fire in the reign of Commodus This term is sometimes applied to a small image of Christ because, in former times the kiss which the people gave at before leaving church was called the kiss of peace But the common pax or osculatorium was a metallic plate with a crucifix engraved on it It is now disused (See Ducange *Osculatorium*, Milner, in the *Archæologia* vol xx p 34)

PAYMASTER GENERAL OF THE FORCES This office was formerly extremely lucrative from the interest on the large sum of money which remained for a long time in the possession of the paymaster In 1782 it was deprived of these extraordinary emoluments and the salary fixed at 1000*l* a year The paymaster is constituted by letters patent under the great seal, he is ex officio of the privy council sometimes of the cabinet In the Pay Office there are under him a deputy paymaster, a cashier, and various assistants

PAYMASTER OF THE HOUSEHOLD An officer in the lord steward's department This office has superseded that of the ancient cofferers It has a salary of 400*l* per annum

PEACE JUSTICES OF *See* JUSTICES

PEAK In Naval [illegible] the name given to the upper corner of those [illegible] which are extended by a gaff or by a yard crossing the mast obliquely, as the mizzen yard of a ship &c

PEARLASH Impure carbonate of potash *See* POTASH

PEARLS These are substances formed by certain bivalve Mollusks, consisting of concentric layers of a fine compact nacre or substance identical with that which lines the inside of the shell, they are sometimes found free and detached within the lobes of the mantle, but most commonly adherent to the nacrous coat of the shell, which on that account is termed "mother of pearl" The species of bivalve which produces the most valuable pearls is the pearl oyster of Ceylon, *Meleagrina margaritifera*, Lam A pure pearl is generally spherical, and has a white or bluish, or yellowish white colour, with a peculiar lustre and iridescence, and consists of alternating concentric layers of membrane and carbonate of lime When steeped in dilute muriatic acid, the carbonate is decomposed with effervescence, and films of membrane remain undissolved

Pearls were in the highest possible estimation in ancient Rome, and bore an enormous price *Principium cum [illegible] rerum pretii, margaritæ tenent* (*Plin Hist Nat* lib ix c 35) Their price in modern times has very much declined, partly, no doubt, from changes of manners and fashions, but more, probably, from the admirable imitations of pearls that may be obtained at a very low price According to Mr Milburn, a handsome necklace of Ceylon pearls, smaller than a

large pea, cost from 170*l* to 300*l*, but one of pearls [illegible] be had for 15*l* the [illegible] each, and those in the latter at about 1*s* 6*d*. When the pearls dwindle to the size of small shot, they are denominated *seed* pearls, and are of little value. They are mostly sent to China. One of the most remarkable pearls of which we have any authentic account was bought by Tavernier, at Catifa, in Arabia, a fishery famous in the days of Pliny, for the enormous sum of 10,000*l*! It is pear-shaped, regular, and without blemish. The diameter is 63 inch at the largest part, and the length from 2 to 3 inches. It is in the possession of the shah of Persia.

The pearl oyster is fished in various parts of the world, particularly on the west coast of Ceylon, at Tuticoreen, in the province of Tinnevelly, on the coast of Coromandel, at the Bahrein Islands, in the Gulf of Persia, at the Sooloo Islands, off the coast of Algiers, off St Margarita, or Pearl Islands in the West Indies, and other places on the coast of Colombia, and in the Bay of Panama in the South Sea. Pearls have sometimes been found on the Scotch coast, and in various other places.

The pearl fishery of Tuticoreen is monopolized by the East India Company, and that of Ceylon by government. But these monopolies are of no value, as in neither case does the sum for which the fishery is let equal the expenses incurred in guarding, surveying, and managing the banks. It is therefore sufficiently obvious that this system ought to be abolished, and every one allowed to fish on paying a moderate licence duty. The fear of exhausting the banks is quite ludicrous. The fishery would be abandoned as unprofitable long before the breed of oysters had been injuriously diminished, and in a few years it would be as productive as ever. Besides giving fresh life to the fishery, the abolition of the monopoly would put an end to some very oppressive regulations enacted by the Dutch more than a century ago. (For full details respecting the pearl fishery, see the *Commercial Dict.*)

PEARLSINTER. In Mineralogy, a siliceous mineral found in volcanic tufa; it is also called *fiorite*.

PEARLSTONE. A variety of obsidian, a volcanic product of a pearly lustre; it is a silicate of alumina.

PEASTONE or PISOLITE. A variety of limestone composed of globular concretions of the size of a pea.

PEAT. The natural accumulation of vegetable matter on the surface of lands not in a state of cultivation, always more or less saturated with water, and generally abounding in modifications of extractive matter, varying with the nature of the plants of which the peat is composed.

Peat is generally of a black or dark brown colour, or when recently formed of a yellowish brown; it is soft and of a viscid consistence, but it becomes hard and darker by exposure to the air. It is generally more or less mixed with earthy substances. When steeped in water it gives out a brown liquor, more or less dark. When thoroughly dried it may be set fire to, and burns slowly, giving out a gentle heat without much smoke. This smoke communicates a peculiar flavour to all the articles with which it comes in contact, and this flavour is considered a characteristic of spirits which have been distilled in vessels heated by this kind of fuel, and also of malt, corn, and fish which have been dried by it. Peat abounds in every part of the world, but more especially in the cold moist climates of temperate regions. It covers many thousand acres in Ireland, and in the Highlands and western counties of the Lowlands of Scotland, and in the western counties of England; but all these bogs are rapidly disappearing in consequence of being drained, and having their surfaces slightly covered with earth, and stirred and sown with grass seeds.

When peaty matter accumulates on the sides of declivities it is generally comparatively dry, and is then called hill peat, but when peat accumulates on hollow places, or on flat surfaces, it is generally thoroughly saturated with water, and is then called peat bog. In most cases the principal plant which forms the peaty matter is the *Sphagnum palustre* of Linnæus, a moss which is common on all moist peaty surfaces throughout Europe, and is frequent in many parts of North America. This moss continues growing upwards from the points of the shoots, while decay is advancing in a similar manner from their lower extremities, thus forming a thick close mass of vegetable matter, which as it increases in height [illegible] cut and dried, to be used as fuel, or to be mixed with dung or lime and rotted into manure.

When peaty matter accumulates on a surface which abounds in springs, the water sometimes oozes out beneath the peat, and between it and the natural soil, in such quantities as to raise up the layer of peat, and float it off to a distance, sometimes carrying every thing before it and ending by burying under it lands in a state of culture. About the middle of the 18th century, a remarkable irruption of this kind took place near Annan in Dumfries-shire, and such irruptions are frequent in Ireland. The [illegible] favourable to the growth of peat are [illegible] in springs, a flat surface or hollow surrounded by hills, and a moist climate. Hence peat-bogs are more abundant in Ireland, and in the western counties of Scotland, than in any other part of the British empire.

When an accumulation of peat has taken place in a level situation, or on a declivity not abounding in springs, the matter accumulated is comparatively dry, and is then called peat moss. One of the most remarkable peat mosses in Britain is the Flanders Moss, in Stirlingshire. It rests on a flat surface of excellent alluvial soil, of which it covers about 4000 acres. Great part of this peat moss, being quite light, has been cut into small pieces, and floated off by means of a stream of water to the sea, thus exposing the natural soil, and rendering it fit for culture. This operation was commenced at Blair Drummond, towards the end of the last century, by the celebrated Lord Kames, and is still continued by his son, Mr Drummond.

PEATS. Peat bog cut out in small square or rectangular pieces, and dried for being used as fuel. These pieces are cut out with light spades in the summer season, spread abroad to dry, and afterwards carted home and put up in stacks, or heaps, which are thatched to exclude the rain. These peats are afterwards used as fuel, not only for domestic purposes, but for burning lime, and for heating kilns for drying corn, &c. To facilitate the drying of peat, the water is sometimes pressed out of the square pieces after they are cut and thrown out of the bog, by a compressing machine, which also renders the material more compact and durable in the fire. Peats are also sometimes charred by a smothered combustion, so as to be rendered better adapted to serve as a substitute for pit coal, coke, or charcoal in smelting iron or other metals, in generating steam, &c. Attempts have been made to separate astringent matter from peat, and to use it in tanning leather.

PEAT SOIL. Peat in a state of decomposition on which corn or other agricultural crops may be grown. The process of turning living peat into peat soil is greatly facilitated by draining, and by laying earth or lime on its surface, and afterwards mixing the earthy matter with the peat by ploughing or digging. In this manner every kind of peaty surface may be rendered available for agricultural purposes, and accordingly, in Ireland, in Lancashire, and in Ayrshire, good crops of corn, potatoes, and artificial grasses are produced on the surface of peat lands, which consist of a layer of peat from five to twenty feet in depth. The plants which thrive best on the surface of beds of peat of this description are those which extend their roots immediately under the surface. Hence few trees will thrive in such soils with the exception of the spruce fir, the silver fir, the birch, and two or three kinds of willows. Peaty soil is extensively used in gardening, in the culture of plants which are found growing on this soil in a wild state.

Peat from wood or *woody peat* is a composition of the branches, trunks, and roots of trees with their leaves, and the shrubs and plants which have grown up among them, which have lain so long in water as to have decayed into a mass soft enough to be cut with a spade. The colour is a blackish brown like that of mossy peat, and it may be used as manure for fuel, and for the growth of plants. Peat of this description is found in some parts of Holland, and also in the Vale of Kennett, in Berkshire, but is most abundant in North America, where it forms the soil in which many of the plants and trees of that country thrive with the greatest vigour. Wherever it can be found it is the most suitable of all kinds of peat for garden purposes. This kind of peat is frequently burned for its ashes both in Britain and Holland, and these from the alkali they contain, are found an excellent manure.

Peat sandy, or *sandy peat*, is mossy peat in a state of decay or mould naturally mixed with sand brought over it, from soil lying above its level, or by the overflowings of rivers. It is used in gardening for the same purposes as heath soil.

PEBBLES. A term applied to rounded nodules, especially of siliceous minerals such as rock-crystal, agates, &c. Among opticians the term pebble generally means the transparent and colourless rock-crystal or quartz [illegible] used as a substitute for glass in spectacles [illegible] hardness renders it more durable, and little apt to be scratched.

PECCARI. A Pachydermatous quadruped allied to the hog, but generically distinguished by the absence of the outer toe of the hind foot, and the presence of a peculiar gland, which exudes its secretion by an orifice situated on the back, whence Cuvier devised the name *Dicotyles* (two navels) for the genus. The incisor and molar teeth resemble those of the hog, but the canines do not project from the mouth. The metacarpal and metatarsal bones of their two middle and largest toes are confluent, as in the Ruminants, with which their stomach

also divided into three compartments, the caecal appendages, pre[illegible] Two species of peccari are known, both natives of South America, viz the collared peccari (*Dicotyles torquatus*), and the white-lipped peccari (*Dic labiatus* Cuv)

PECHBLEND, or PITCHBLEND An ore of uranium

PECK. A measure of capacity containing two gallons, or the fourth part of a bushel The imperial peck contains 554 55 cubic inches *See* MEASURE

PE'CORA (Lat pecus, *a sheep*) The name given by Linnæus to an order of Mammals corresponding with the Ruminantia of Cuvier

P'ECTEN (Lat *a comb*), in Comparative Anatomy is the vascular membrane, in structure resembling the choroid, plicated with parallel folds like the teeth of a comb, [illegible] of birds from the back of the retina [illegible] humour to, or near to, the [illegible] where it finally terminates in a point This organ resembles a flattened conical bag, whence it is also termed "marsupium"

In Zoology, the name is applied to the genus of bivalve shells commonly called 'clams' They have a hinge like that of the oyster, but have been removed on account of their shell being inequivalve semicircular, always regularly marked with ribs, which radiate from the summit of each valve to the circumference and fur[illegible], called 'ears,' which [illegible]

The animal is chiefly remarkable for the little dark green metallic globule which terminates most of the tentacles of the exterior row of those at the circumference of the mantle These specks are conjectured to be rudimental ogans of vision, whence Poli was induced to call the soft parts of the pecten 'argus'

PE'CTIN (Gr πηκτος, *coagulated*) Also termed *Pectic Acid* The gelatinizing principle of certain vegetables such as currants apples &c It may be abundantly obtained from some of the esculent roots especially carrots whence their excellence as an ingredient in soup To obtain it from this source the carrots are rasped and the pulp strongly pressed so as to render it as dry as possible, in this state it is washed in repeated portions of cold soft water, till all soluble matters are removed from it The pulp thus prepared is then boiled with 5 parts of bicarbonate of potash to every 100 of the washed pulp, the decoction is filtered and chloride of calcium added to it which forms a bulky precipitate of *pectate of lime*, this is well washed, and the lime removed by very weak muriatic acid Pectin or pectic acid thus obtained, is in the form of a jelly which forms insoluble compounds with the earths and several of the other metallic oxides It seems doubtful whether this jelly is not a *product*, resulting from the action of the alkaline carbonate of the lignin of the carrot It must however be easily formed for when carrots are stewed or boiled for a length of time they become very gelatinous When pectic acid is boiled in a strong solution of potassa, oxalate of potassa is produced

PECTINA'TUM TECTUM (Lat pecten *a comb*) In Architecture, a roof which has obtained this name from its shape resembling that of a comb and contrived to throw off the rain water in two ways

PECTINIBRANCHIATES *Pectinibranchiata* (Lat pecten, and branchia *gills*) The name given by Cuvier to his sixth order of Gastropods It is the most extensive division of that class since it includes almost all the spiral univalve shells, as well as several which are merely conical The order is thus characterized by Cuvier — "The branchiæ compose [illegible] ranged parallel like the teeth [illegible] two or three lines (according to the genera) to the floor of the respiratory cavity, which occupies the last whorl of the shell and which communicates outwards by a wide aperture between the margin of the cloak and the body Two genera only — *Cyclostoma* and *Helicina* — have, instead of branchiæ a vascular network clothing the ceiling of the cavity in all respects the same as that of the order, and they are the only ones which respire [illegible] water being the medium of respiration [illegible]"

All the Pectinibranchiates have two tentacula and two eyes, raised sometimes on pedicles, a mouth in the form of a proboscis more or less lengthened, and separate sexes The penis of the male, attached to the right side of the neck, cannot in general be drawn within the body, but is reflected into the branchial cavity, it is sometimes very large The *Paludina* alone has the organ concealed, and it comes out through a hole pierced in the right tentaculum, the rectum and the oviduct of the female also creep along the right side of the branchial cavity, and there is between them and the branchiæ a peculiar organ, composed of cells filled with a very viscous fluid, the use of which is to form a common envelop for the inclosure of the eggs, and which the animal deposits within them The form of that envelop is often very complicated and very remarkable

The tongue is armed with little hooks (or curved spinules), and wears down the hardest bodies by slow and oft-repeated frictions

The grand difference between these animals lies in the presence or absence of the canal formed by the prolongation of the margin of the branchial cavity on the left side, and which passes along a [illegible] in the shell, to enable the animal to breathe without leaving its shell There is also this distinction between the genera, that some want the operculum, and the species vary in the filaments, fringes and other ornaments that deck the head the foot or the cloak

PE'CTORALS, or PECTORAL FINS (Lat pectus, *the breast*) The anterior and lateral pair of fins, which represent in fishes, the fore legs or anterior members of other vertebrate animals

PECULA'TION (Lat *peculium*) A term of the Roman law, rendered in that of France by *concussion* The embezzlement by a public officer of public money Peculation, in the Roman law, also comprehended offences relating to the coin

PECULIAR In Ecclesiastical Law, an exempt jurisdiction which is not under the ordinary of the diocese, but has one of its own They are, — royal, of which the king is ordinary, peculiars of archbishops, bishops, deans, chapters prebendaries, and the like, to which were formerly added peculiars of monasteries the jurisdiction over which by 31 H 8 c 13, was granted to the ordinary within whose diocese they were situate, or to such persons as the king should appoint

PE'CULIUM (Lat) In the Roman Law, the property which a slave might acquire independent of the control of his master This property was frequently permitted to accumulate so as to enable the slave to purchase his freedom The son being, on the principles of the Roman law unemancipated during the lifetime of his father, whatever property he might acquire appertained in strictness to the latter, but by degrees certain species of property acquired by the child obtained the title and character of *peculia* Of these however the only one which was absolutely the child's was that which the son acquired in military service (peculium castrense) or in public service of any kind which by a legal fiction was regarded as equivalent to military

PE'DAGOGUE (Gr παιδαγωγος, from παις *boy*, and αγωγος, *leader*) Among the ancient Greeks a slave charged with the personal care of a boy from the earliest age after infancy (from the milk in the loose phrase of Plutarch, from about the age of seven as it is more accurately stated by Æschines) until he became a youth (μειρακιον) i e until the seventeenth or twentieth year The pedagogue's duty was to attend his charge on all occasions when he left his father's house to the lecture rooms of masters the theatre, &c (See especially Plato, *Sympos*) He was also intrusted with the duty of instructing and [illegible] he child in inferior branches of education [illegible] manners He was, consequently of a very superior order of common slaves and must be understood as excepted when Aristotle recommends that a child should be left to converse as little as possible with persons of the servile class (*Politic* vii 15b) The custom of entrusting children to slaves in this manner was common in other Grecian states, the Romans also employed a slave for similar purposes, with the title of *custos* or *magister*

In modern times and especially in Germany the word *pedagogic* is [illegible] education

PEDAL [illegible] as *Organ Point* which see

PEDAL MA'SCHI A Turkish officer whose duty consists in looking after the interests of the Sultan in cases of legacies The Ottoman treasury receives through this officer a tithe of all bequests made to heirs male

PEDALS (Lat pes *a foot*), in such musical instruments as the organ harp and pianoforte are either keys acted on by the feet of the performer (whence the name), to modify the tone of these respective instruments, or levers acting on the swell of the organ, and on the stops The invention of the pedals or foot-keys of the organ is attributed to a German named Bernhard who lived in the 15th century It was long, however before their utility and importance were acknowledged by other nations and it is a singular [illegible] is the first to introduce the org[illegible], she was the last to adopt this invention Within the last twenty years many improvements have been made in the construction of pedals, and few organs, except those of small dimensions, are now built without them *See* ORGAN

PE'DATE In Botany, a palmate leaf, with the two lateral lobes themselves divided into smaller segments, the midribs of which do not run directly into the common central point, as in the leaf of *Arum dracunculus*

PE'DESTAL (Lat pes, *a foot*) In Architecture, the substruction to a column [illegible] of a pedestal are three;

The whole height of a pedestal is from one quarter to one third of the height of the column, with its entablature

PE'DICEL (Lat pes) One of the ramifications of that part of a flower called the peduncle

PEDICE'LLATES, *Pedicellata* (Lat pes) The name of an order of Echinoderms, comprehending those which have the vesicular pedicellate organs, which are termed feet in this class, but which project from various parts of the surface of the body

PE'DIMANES *Pedimani* (Lat pes, and manus, *a hand*) The name of a family of Marsupial animals, of which the opossum (*Didelphis*) is the type, they are distinguished by the opposable property of the hinder [illegible] the fore feet being organized like those of [illegible]

PE'DIMENT (Lat pes) In Architecture, the low triangular mass representing the gable of a roof over the front of a building, portico, door, window, &c, though sometimes these ornaments are terminated upwards by segments of circles A pediment is frequently ornamented with sculpture The heights of pediments are seldom more than two ninths of their width

PE'DIPALPS *Pedipalpi* (Lat pes, and palpo, *I feel*) A name given to a tribe of pulmonary Arachnidans, comprehending those which have the feelers in the form of pincers, or armed with a didactyle claw, as the scorpions

PE'DIAR See HAWKER

PEDO'METER, or PODOMETER (Gr πους *the foot* and μετρον, *measure*) An instrument for the purpose of registering the number of paces taken by a man in travelling or walking whence the distance is ascertained It is in the form of a watch, and receives its movement from the motion of the body so that it advances one division at each step The number of divisions may be noted by an index or hand in the same manner as the number of vibrations of a watch balance The best construction or rather the only one now used in this country is that of Mr Payne, watchmaker, of Bond Street See PERAMBULATOR

PEDU'NCULATES, *Pedunculata* The name of an order of Cirripeds comprehending those which have the body supported by a flexible tubular stem

PEDU'NCULUS (Lat pes, *a foot*) That part of a branch or stem that immediately bears the flowers

PEEP-O' DAY BOYS The well known appellation of certain insurgents who appeared in Ireland in 1784 They obtained this name from visiting the houses of their antagonists, called *defenders* at break of day in search of arms

PEER (From the Latin *par* French *pair*) Equal which meaning it still retains in the language of the common law as trial by jury is said to be by the peers or equals of the defendant In this sense the name remains as a relic of feudal institutions according to which every rank of society formed an association for the purpose of mutual defence and the decision of disputes, as the tenants of a lord paramount or inferior who met as equals (pares curiæ) in the court over which he presided Hence, in the French monarchy the highest vassals of the crown formed a rank apart and were called pares or peers with reference to each other, and the designation became a title of honour The peers of France differed in number at different periods of the early French monarchy as their domains became united to the crown, but according to heraldic theory there are six temporal —the Dukes of Burgundy Aquitaine and Normandy and Counts of Flanders Toulouse and Champagne and six spiritual,—the Archbishop of Rheims and the Bishops of Laon, Beauvais Noyon, Chalons, and Langres In later times new peerages were created, as the duchy of Brittany and counties of Artois and Anjou At last the title remained as a simple dignity and Louis XIV increased the number of dukes and peers (ducs et pairs) until at last they amounted to thirty seven They had no privileges except precedence, and a seat in the parliament's On the restoration of Louis XVIII hereditary peerage was established in France on the model of that of England, but was abolished in 1831, and the members of the present chamber of peers are nominated for life by the people For the history and privileges of the English peerage see PARLIAMENT There is a curious analysis of the English peerage in the *Quart Review* vol 41

PE'GASUS In Greek mythology, a winged horse, produced by Neptune, or, according to some authors, which sprung from the blood of Medusa when Perseus cut off her head See BELLEROPHON

PEGASUS This name is applied in Zoology, to a genus of Lophobranchiate fishes with large pectoral fins by means of which they are enabled to take short saltatory flights through the air

PEGASUS One of the 48 ancient constellations of Ptolemy situated in the northern hemisphere

PELAGIANISM The [illegible] maintained by Pelagius, a British monk [illegible] after attaining to considerable notoriety in his own day, by first eliciting the discussion of the great questions respecting grace and predestination, has succeeded in bequeathing his name as a designation in all after ages for those who have held the extreme opinions by which he was distinguished His tenets are thus clearly stated by a modern writer —"1 That the sins of our first parents are imputed to themselves alone, and not to their posterity, that we derive no corruption from their fate; that we inherit no depravity from our origin, but enter into the world as pure and unspotted as Adam at his creation It was a necessary inference from this doctrine that infant baptism is not a *sign* or *seal* of the remission of sins, but only a mark of admission into the kingdom of Christ 2 That our own powers are sufficient for our own justification, that as by our own free will we run into sin, so by the same voluntary exercise of our faculties we are able to repent and reform, and raise ourselves to the highest degree of virtue and piety, that we are indeed assisted by that external grace of God which has taught us the truths of revelation, which opens to us our [illegible] and animates [illegible] either immediately or immediately [illegible] is necessary either to awaken us to religious feeling, or to further us in our progress towards holiness, in short, that man, by the unassisted agency of his natural perfections, under the guidance of his own *free will*, is enabled to work out his own salvation" (*Waddington's Hist of the Church*) These opinions were formally condemned by a decree of Pope Zosimus, about 418 and again by the council of Ephesus in 431 Their principal opponent was the famous Augustin, who, in the course of his arguments against them, advanced an explanation of the questions involved in the discussion, which has been stigmatized as leading directly to the opposite extreme of fatalism (See *Mosheim*, vol ii cent 5) The Pelagian opinions respecting original sin are condemned in the 9th article of the English church

PELECA'NIDÆ The name of a family of swimming birds of which the pelican (*Pelecanus*) is the type

PELLAGRA (Lat pellis *the skin*, and æger, *sick*) A disease of the skin somewhat resembling *elephantiasis*, and occasionally producing great constitutional derangement It is endemic in certain districts of Italy, especially in the Milanese

PE'LLICLE (Lat pellis *skin*) A thin membrane In Chemistry the term is applied to the film of salt or other substances which forms upon the surface of solutions during evaporation

PE'LLITORY OF SPAIN The root of the *Anthemis* [illegible] It [illegible] when chewed [illegible] especially to toothach

PELTA (Lat *a shield*) In Botany a term used in describing lichens to denote a flat shield without any elevated rim as in the genus *Peltidea*

PELTA'STÆ Light armed infantry were so named among the Greeks from carrying the pelta or target (See *Mem de l'Ac des Inscr* vol xxxii)

PELTATE (Lat pelta, *a shield*) A leaf or any other organ which is fixed to the stalk by the centre, or by some point distinctly within the margin, as in the *Tropæolum*

PE'LTRY (Germ peltz from Lat pellis, *a skin*) The name given to the skins of different kinds of wild animals found in high northern latitudes particularly in America, such as the beaver, sable wolf, bear &c When the skins of such animals have received no preparation they are termed *peltry*, but when the inner side has been tanned by an aluminous process, they are denominated *furs*

PE'LVIS (Gr πελυς *a basin*) The inferior part of the abdomen the bony circumference of which is formed by the two *ossa innominata*, the *sacrum*, and the *os coccygis* It contains the rectum the urinary bladder, and internal organs of generation

PE'MPHIGUS (Gr πεμφιξ *a vesicle*) A fever attended by almond-shaped vesicular eruptions

PE'NALTY (Lat pœna, *punishment*), is of three kinds says Lord Coke, *pœna pecuniaria*, *pœna corporalis*, and *pœna exilii* Where any thing is prohibited by statute under a penalty if the penalty or part of it, be not appointed by the statute to the informer, it goes to the crown Penal statutes are to be construed strictly. See STATUTE

PE'NANCE See PENITENCE

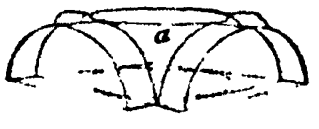
PENA'TES The household gods of the ancient Italians who [illegible] were worshipped in the [illegible] The term is derived from penitus, *within* Penates is in fact a generic term, comprising in its strict sense all the gods worshipped in the interior of the [illegible] including the Lares with whom they [illegible] In connection The number and names of the Penates were indeterminate As there were public as well as domestic Lares so there were public Penates, who exercised a general influence over the destinies of the whole Roman people Thus Tacitus relates, that "delubrum Vestæ cum

Penatibus populi Romani" was consumed, along with other very ancient temples in the great fire during the reign of Nero But the term may perhaps, become deroul as belonging to the rhetorical style of that author, and to signify merely the tutelary god of the republic

The subject of the domestic deities of the Romans, the Lares and Penates is involved in great obscurity from the conflicting statements of the classic authors respecting them Those who wish to see the question investigated in all its bearings may consult *Muller's Etruscans*, vol i p 90 Sq Jacket *De Dis Penatibus*, Hartung, *Religion der Romer*, &c See also the notes by Prof Ramsay of Glasgow, appended to his valuable little work entitled *Elegiac Extracts from Tibullus and Ovid, with English Introductions and Notes* 12mo 1840)

PE'NCIL (Lat penicillum) In Painting Drawing &c, the instrument wherewith the colours are applied Pencils are of various sorts sizes, and materials, suited to the nature of the work The *black lead pencil* is made of long slips of black lead (plumbago or graphite), inclosed in cylindrical pieces of cedar, and is too well known to need further description

PENCIL OF LIGHT Optics is a collection of the rays or evanescent streams of light converging to a point, as the focus of a lens or mirror

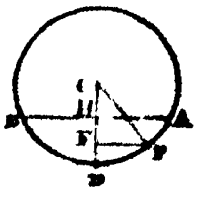


PE'NDANT (Lat pendo *I hang*) In Gothic Architecture, an ornamented polygonal piece of stone or timber hanging down from the vault or roof of a building Of stone pendants some exquisite examples may be seen in Henry VII's Chapel at Westminster In ancient writers the springers of arches which rest on shafts or corbels, are called *pendants*

Pendants of a Ship are those streamers or long colours which are split or divided into two parts ending in points and hang at the mast head or at the yard arm ends

PE'NDANT In Painting &c a picture or print which from uniformity of size and subject seems to hang up as a companion to another The term may also be applied to bassi rilievi of similar sizes

Pendant is also the general term for all kinds of ornaments worn in the ears by both sexes in savage and by females chiefly in civilized countries, usually termed ear-rings, which see



PENDE'NTIVE (Lat pendo *I hang*) In Architecture the portion of a vault between the arches under a dome called by the French *fourch* or *panache* lettered *a* in the diagram by which it will be seen that it falls at its superior part into a circle inscribed in the square formed on the plan of the four arches Hence it is obvious that a dome may be formed by means of pendentives over any regular polygon

PE'NDULUM (Lat pendulus, from pendo *I hang*) If any heavy body suspended by an inflexible rod from a fixed point be drawn aside from the vertical position and then let fall, it will descend in the arc of a circle of which the point of suspension is the centre On reaching the vertical position it will have acquired a velocity equal to that which it would have acquired by falling vertically through the versed sine of the arc it has described in consequence of which it will continue to move in the same arc until the whole velocity is destroyed, and if no other force than gravity acted this would take place when the body reached a height on the opposite side of the vertical equal to the height from which it fell Having reached this height it would again descend, and so continue to vibrate for ever, but in consequence of the friction produced, and the resistance of the air, each successive excursion will be diminished, and the body soon be brought to rest in the vertical position A body thus suspended, and caused to vibrate is called a *pendulum*, and the passage from the greatest distance from the vertical on the one side, to the greatest distance on the other, is called an oscillation

In order to investigate the circumstances of the motion, the body must be regarded as a gravitating point and the inflexible rod as devoid of weight This is denominated the *simple pendulum*, and the problem to be resolved is to determine the motion of a point constrained to move in a circular arc in virtue of the accelerating force of terrestrial gravity

Let C be the fixed point, A D B the arc described by the pendulum, C D the vertical, and P the place of the pendulum at a given instant Draw P E perpendicular to C D, and put D F $= x$, E P $= y$, the arc D P $= s$, D H (the versed sine of the arc D A) $= h$, and the radius C D $= l$, also let v = the velocity at P, and t = the time of descent through A P

The equation of the circle being $y^2 = 2lx - x^2$, we have the differential equation $ds = \frac{l\,dx}{\sqrt{(2lx - x^2)}}$, and, by the doctrine of falling bodies, the velocity at P is that which a body would acquire in falling through H E, or equal to $\sqrt{2g\,HE}$ (g being the accelerating force of gravity) therefore $v = \sqrt{2g(h-x)}$ But $dt = \frac{ds}{v}$, therefore, on substituting the values of ds and v above given, we get the equation

$$dt = \frac{l}{\sqrt{2g}} \cdot \sqrt{\frac{dx}{\{(h-x)(2lx-x^2)\}}}$$

This equation, being developed and integrated gives the time of descent from A to D, or the time of a semi oscillation, as follows (π being the ratio of the circumference to the diameter, or $= 3\ 14159$) —

$$\frac{\pi}{2}\sqrt{\frac{l}{g}}\left[1 + \left(\frac{1}{2}\right)^2 \frac{h}{2l} + \left(\frac{1\ 3}{2\ 4}\right)^2 \left(\frac{h}{2l}\right)^2 + \&c\right]$$

When the arc of vibration is small, it is only necessary to take account of the first two terms of the series, whence the time of a whole oscillation from A to B, which we shall denote by T, is given by the formula —

$$T = \pi\sqrt{\frac{l}{g}} \times \left(1 + \frac{h}{8l}\right),$$

and if the arc is so small that h (its versed sine) becomes evanescent in comparison of $8l$, we have simply $T = \pi\sqrt{\frac{l}{g}}$

Whence it appears that the time of an oscillation in an infinitely small arc is directly as the square root of the length of the pendulum and inversely as the square root of the accelerating force of gravity

Suppose gravity to be a constant force (as it is at any given place on the earth's surface), the time of oscillation is proportional to the square root of the length of the pendulum, consequently if T' denote the time of oscillation of a seconds' pendulum and l' its length, we have $1 : T' :: \sqrt{l} : \sqrt{l'}$ Now let N be the number of oscillations the first pendulum makes in a given time and N' the number the second makes in the same time, then the number of oscillations being evidently in the inverse ratio of the times, we have $N : N' :: T' : T$, or $N : N' :: \sqrt{l'} : \sqrt{l}$, whence $l = \frac{N'^2}{N^2} l'$, so that if the length of one pendulum be known we can compute the length of another pendulum by observing the number of oscillations that each makes in any given time, for example in an hour

In like manner if we suppose the same pendulum to be transported to different parts of the earth (in which case l is constant and g variable) and assume that the values of N and g at the first station become respectively N' and g' at the second, we shall have $T : T' :: \frac{1}{\sqrt{g}} : \frac{1}{\sqrt{g'}}$, whence $g' = \frac{T^2}{T'^2} g$, or $g' = \frac{N'^2}{N^2} g$ So that the force of gravity at different places may be compared by observing the number of oscillations which a pendulum makes at each place in a given time Or if we suppose the times of oscillation constant (that is if we suppose two pendulums so adjusted as to be at seconds at two different stations) and l and g variable, then, since $T = \pi\sqrt{\frac{l}{g}}$, and $T' = \pi\sqrt{\frac{l'}{g'}}$, we shall have $\frac{l}{g} = \frac{l'}{g'}$, or $l' = l\frac{g'}{g}$, whence the length of the seconds pendulum at any place is directly proportional to the intensity of gravity at that place

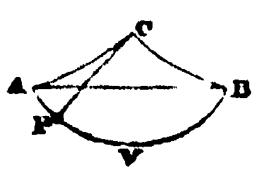
According to the theory [illegible] the time t in which a body [illegible] by the accelerating force of gravity [illegible] is given by the equation $t = \sqrt{\frac{2s}{g}}$ Let $2s = l$, then $t = \sqrt{\frac{l}{g}}$ But the time T, of the oscillation of a pendulum whose length is l, is $T = \pi\sqrt{\frac{l}{g}}$ therefore $T : t :: \pi : 1$, consequently the time of the oscillation of a pendulum is to the time that a heavy body would fall freely by the force of gravity through half its length, as the circumference of a circle to its diameter

If we suppose the time to be expressed in seconds, and make $T = 1$ we shall have $g = \pi^2 l$ Now Captain Kater found the length of the seconds pendulum at London to be 39 13929 inches, and we know that $\pi^2 = 9\ 8696$, therefore $g = 9\ 8696 \times 39\ 139 = 386\ 29$ inches, or $g = 32\ 2$ feet It follows therefore, that the space through which a body falls freely at London in a second of time is 16 1 feet

Compound Pendulum —The simple pendulum as above defined, is only a theoretical abstraction, for the oscillating body can neither be so small that it may be regarded as a mathematical point, nor can the rod be entirely devoid of weight When the body has a sensible [illegible] the apparatus is called a *compound pendulum*,

and instead of being supported by a single point it is supported by an axis, or [illegible] same straight line [illegible] heavy body oscillating about an axis of suspension is a compound pendulum

In every compound pendulum there is necessarily a certain point at which if all the matter of the pendulum were collected the oscillations would be performed in exactly the same time This point is the centre of oscillation (*See* CENTRE OF OSCILLATION) It is situated [illegible] of the pendulum [illegible] suspension (the axis being always supposed horizontal), which is determined by the following formula — Let dm be the element of [illegible] its distance from [illegible] of the centre of [illegible]

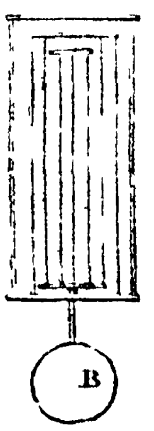


$$x = \int r^2 \, dm \, - \int r \, dm,$$

that is, the distance of the centre of oscillation from the axis of suspension is equal to the moment of inertia of the oscillating body divided by its moment of rotation This value of x is the length of the isochronous simple pendulum, and is what is always to be understood by the term *length of a pendulum*

The centre of oscillation possesses a very remarkable property which was discovered by Huygens, namely that if the body be suspended from this point, on a horizontal axis passing through it parallel to the former axis of suspension, its oscillations will be performed in the same time as before, in other words the axes of suspension and oscillation are interchangeable This property furnishes an easy practical method of determining the centre of oscillation, and thence the length of a compound pendulum

Applications of the Pendulum — The most important application that has been made of the pendulum is to the measurement of time It is said that Galileo, while a young man having had his attention drawn to the oscillations of a lamp suspended from the roof of a church in Pisa, perceived that although their extent was gradually diminished they continued to be made in equal times, and thence conceived the idea of employing a pendulum as a means of measuring small intervals of time in astronomical observations But though a pendulous body by the isochronism of its oscillations, furnishes a means of dividing time into equal portions, it could obviously be of no great use until a method was devised of continuing the motion and registering the number of oscillations The application of clock work to this purpose has been claimed for various individuals but is generally and deservedly ascribed to Huygens, and the invention one of the most important that ever was made in reference to practical astronomy dates from the year 1656



Huygens researches on the subject of the oscillations of the pendulum are contained in his admirable work entitled *Horologium Oscillatorium* He soon found that the oscillations in circular arcs of different amplitudes are not equal the wider requiring rather a longer time than the narrower, and with a view to remedy this defect he undertook to investigate the nature of the curve in which the oscillations would be performed in equal times, whatever might be the extent of the arc described The [illegible] was found to be [illegible] object was to devise a means of causing a pendulum to vibrate in such a manner that its centre of oscillation shall describe the arc of a cycloid This was also effected by Huygens by the following construction, which depends on another property of the cycloid, namely, that its evolute is a similar curve — If A C and B C be two semicycloids, or semicycloidal cheeks, each equal to the half of A V B, touching A B in A and B, and meeting one another in C, and if there be fixed at C a pendulum P hanging by a thread P C, equal in length to the semicycloid, then P, in its oscillations, will describe the cycloidal arc A V B Nothing more simple or beautiful in point of theory could be conceived than this construction but on attempting to reduce it to practice, it was soon found to possess no advantage, in consequence of the mechanical difficulty of making the cycloidal cheeks with the requisite accuracy [illegible] a flexible string it [illegible] showed that the error of a hundredth of an inch in the form of the curve would cause a greater irregularity than a circular vibration of 10 or 12 degrees Accordingly, the use of cycloidal cheeks was abandoned, and the attention of artists directed to the means whereby the oscillations might be confined within very small circular arcs, in which case any inequality in the lengths of the arcs becomes insensible In clocks of the best construction the arc of vibration is very small; and the pendulum is made very heavy, in order that, by possessing a great momentum, it may be less affected by the imperfections of the machinery.

Compensation Pendulum — The value of the pendulum as a regulator of timepieces depends on the isochronism [illegible] depends on the invariability of the distance between the points of suspension and oscillation But, as every known substance expands with heat and contracts with cold, the length of the pendulum will vary with every alteration of temperature, and the rate of the clock [illegible] To counteract this change To counteract this, numerous contrivances have been employed The principle is, however, the same in all, and consists in combining two substances, whose rates of expansion are unequal, in such a manner that the expansion of the one counteracts that of the other, and keeps the centre of oscillation of the compound body always at the same distance from the axis of suspension A brief description of the two compensation pendulums in most common use the *Mercurial Pendulum* and the *Gridiron Pendulum*— will suffice to explain the means by which compensation is obtained

Mercurial Pendulum — This was the invention of Mr George Graham, a celebrated watchmaker, who subjected it to the test of experiment in the year 1721 The rod of the pendulum is made of steel, and may be either a flat bar or a cylinder The bob or weight is formed by a cylindrical glass vessel, about 8 inches in length and 2 inches in diameter, which is filled with mercury to the depth of about 6½ inches The cylinder is supported and embraced by a stirrup, formed also of steel through the top of which the lower extremity of the rod passes, and to which it is firmly fixed by a nut and screw on the end of the rod Now the effect of an increase of temperature on this apparatus is evidently as follows — In the first place the rod expands, and the distance between the axis of suspension and the bottom of the stirrup is increased In the second place, by the expansion of the mercury in the cylinder its column is lengthened, and the distance of its centre of gravity from the bottom of the stirrup consequently increased But as the expansion of mercury is about sixteen times greater than that of steel, the height of the mercurial column may be so adjusted by trial that the expansion of the rod and stirrup shall be exactly compensated by that of the mercury, and the centre of oscillation of the whole suffer no change This pendulum is perhaps, the most perfect of all compensators but its adjustments are attended with considerable difficulty it is seldom used excepting in astronomical observatories

Gridiron Pendulum — This was contrived by Mr Harrison the inventor of the chronometer It consists of a frame of nine parallel bars of steel and brass, arranged and connected as in the annexed figure The bars marked *s* are of steel, the four marked *b* are of brass the centre rod of steel, is fixed at top to the cross bar connecting the two middle brass rods, but slides freely through the two lower bars, and bears the bob B The remaining rods are fastened to the cross pieces at both ends, and the uppermost cross piece is attached to the axis of suspension It is easy to see, from the mere inspection of the figure that the expansion of the steel rods tends to lengthen the pendulum, while that of the brass rods tends to shorten it, consequently if the two expansions exactly counteract each other the length of the pendulum will remain unchanged The relative lengths of the brass and steel bars are determined by the expansions of the two metals, which are found by experiment to be, in general, nearly as 100 to 61 If, then, the [illegible] be [illegible] of the four brass bars [illegible] When the compensation is found on trial not to be perfect, an adjustment is made by shifting one or more of the cross pieces higher on the bars

Harrison's pendulum has been greatly improved by Troughton, who substituted for the two pair of brass rods two cylinders of brass, sliding the one within the other to which the steel rods are attached For a description of this, and various other modes of compensation we refer the reader to an excellent chapter on the subject by the late Captain Kater, in the volume of *Mechanics* in the *Cabinet Cyclopædia*

Application of the Pendulum to the Determination of the relative Force of Gravity at different Places — There are two methods of determining the relative intensity of gravity by means of [illegible] According to the first, the absolute [illegible] simple pendulum which makes a certain number of oscillations in a given time is accurately ascertained at each of the places, and the comparative force of gravity is then given by the formula $g' = \frac{l'}{l} g$ According to the other method, an invariable pendulum is swung at the different places, and

the number of its oscillations noted at each, when the relative gravity is given by the formula $g' = \frac{N'^2}{N^2} g$ Each of these methods has been followed in the delicate experiments which have been made for the purpose of determining the figure of the earth, but though the results of both appear to be nearly equal in point of accuracy, the latter method, on account of its affording greater facilities in practice, is now generally adopted

It will readily be conceived that a pendulum would be altogether unfit for the purpose of determining the minute variations of gravity if it were attached to a clock, or any machinery by which its motions could be influenced It must be suspended from a [illegible] to which it can communicate [illegible] the most delicate precautions are necessary to avoid the effects of friction and other disturbing causes, by which the experiment may be influenced The method followed by the French astronomers, in their operations connected with the measurement of the meridian was this — The pendulum was composed of a sphere of platinum suspended by a slender iron wire from a knife edge of hardened steel resting on plane surfaces of polished agate It was placed in front of a well-regulated astronomical clock, with which its oscillations were compared and the distance between its centres of suspension and oscillation determined by calculation from the length of the wire and the diameter of the sphere ascertained by actual measurement A different and in many respects preferable mode of measuring the lengths of the seconds' pendulum, was adopted by Captain Kater grounded on the property of oscillating bodies discovered by Huygens, namely that the centres of suspension and oscillation are convertible From this property it follows that if two knife edges turned in opposite directions, are inserted in the same pendulum and the mass be so adjusted, by means of a moveable weight sliding on the rod, that the oscillations are performed in exactly equal times when the pendulum is suspended from either knife edge then the distance between the knife edges is the true length of the isochronous simple pendulum In this manner the measurement is effected more directly, and no calculation is required for finding the centre of oscillation A third method lately put in practice by the celebrated astronomer Bessel consists in suspending a ball and wire first from the upper end and then from the lower end of a rod of a given length the ball being in both cases at the same distance below the rod From the difference of the times of oscillation of the two pendulums thus formed the length of the simple pendulum can be computed in terms of the rod which is the difference of their lengths The French method is described with all the requisite details in the third volume of *Base Metrique* in *Delambre's Astronomie* tome iii, and in the *Recueil d'Observations Geodesiques &c* by Biot and Arago Paris, 1821 Captain Kater's pendulum is described in the *Phil Trans* for 1818, and Bessel's in his *Untersuchungen über die Länge des einfachen Secundenpendels* Berlin 1828

Captain Kater's pendulum was formed of a very thin bar of plate brass with a heavy bob and moveable weight by means of which the isochronism was obtained when the suspension was made from the opposite knife edges But a much simpler modification has been adopted in the recent experiments The experimental pendulums of the Royal Astronomical Society consist merely of a plain straight bar of iron or copper 2 inches wide half an inch thick and about 62½ inches long At the distance of 5 inches from one end of the bar is placed the apex of one of the knife edges A, and at the distance of 39·4 inches therefrom the apex of the other knife edge B and the required adjustment to synchronism is produced by filing away one of the ends of the pendulum until the vibrations are found by trial to be equal in both positions of the pendulum It is obvious that, for the purpose of merely ascertaining the variations of gravity, a bar of this form with a single knife edge would equally answer the purpose, but the advantage of the double suspension is this, that besides having two distinct and independent pendulums each of which is a check upon the other, it furnishes the means of ascertaining whether the pendulum has sustained any accidental injury, which would be immediately discoverable from the inequality of the number of vibrations between the two knife edges

Corrections — In order that the results of different sets of experiments may be exactly comparable with each other, several corrections must be applied The first of these is on account of the length of the arc of vibration, which, being of a finite and variable extent, the duration of the oscillations is consequently unequal, but always greater than in the case of an infinitely small arc The number of oscillations is reduced to the case of an infinitely small arc by the formula

$$N \times \frac{M \sin (A + a) \sin (A - a)}{32 (\log \sin A - \log \sin a)}$$

where N is the number observed, M the logarithmic modulus = 4342945 A the initial, and a the final arc of vibration, and as the arcs are always small, the computation may be shortened by using the arcs instead of the sines

In the second place, all the experiments must be reduced to a common standard of temperature, which, in this country, is assumed at 62° of Fahrenheit Let e denote the rate of expansion of the metal, t the mean height of the thermometer at the time of the experiment, then the correction of the number of vibrations on account of the temperature is $N \times \frac{1}{2} e (t - 62°)$

A third correction is required on account of the atmospheric pressure The effect of the pressure of the atmosphere on the pendulum is to diminish the force of [illegible] was formerly applied, regard being had to the height of the barometer But it was recently remarked by Bessel that the pendulum drags with it a certain portion of air, the amount of which depends on the form of the pendulum, and consequently the specific gravity of the actually moving mass cannot be previously computed, but must be ascertained for each pendulum by actual experiments in air and in a vacuum See a paper on this subject by Mr Baily in the *Phil Trans* for 1832 Also *Memoirs of the Royal Astr Soc* vol vii

Application of the Pendulum to the Determination of the Figure of the Earth — The ellipticity of the earth is deduced from the observed number of oscillations made by an invariable pendulum at different latitudes, by means of the following theorem — Let N = the number of oscillations made by a pendulum at the equator in a mean solar day N' = the number of oscillations made by the same pendulum at the latitude l G = the force of gravity at the equator, and g = the same force at the latitude l, then supposing the figure of the earth to be that of an oblate spheroid of revolution we have $g = G (1 + n \sin^2 l)$ But by the property of the pendulum g G N' N therefore $N' = N (1 + n \sin^2 l)$ In this equation the quantity n depends upon the centrifugal force of rotation at the equator and the ellipticity, and, according to a theorem discovered by Clairaut, its value is $\frac{5}{2} m - e$, m being the ratio of the centrifugal force to gravity and e the ellipticity Newton showed that $m = \frac{1}{289}$ whence $n = \frac{5}{2 \times 289} - e$, therefore, as N'^2 is given by observation the only unknown quantities in the equation $N' = N (1 + n \sin^2 l)$ are N and n so that by combining the results at two different latitudes we can determine these quantities and consequently, e The length of the seconds pendulum being also proportional to the intensity of gravity it is obvious that the lengths might be substituted in the above equation for N'^2 and N^2

The seventh volume of the *Memoirs of the Royal Astr Society* contains the results of experiments made with the invariable pendulum at 7 different latitudes The values of N and n deduced from the whole of these results, are respectively

$$N^2 = 7411625711 \quad n = 0051491,$$

whence the ellipticity deduced from the whole is $\frac{1}{285 \cdot 26}$

It is remarkable that all the pendulum experiments agree in giving a greater ellipticity to the earth than is found by the comparison of measured arcs of meridian

As the force of gravity varies inversely as the square of the distance from the centre of the earth a correction is obviously required for the differences of altitude of the stations where the observations are made Accordingly, the results at every station are reduced to what they would have been if the observations had been made at the level of the sea Let h = the height of the station above that level and R = the radius of the earth, g = the force of gravity at the station and g' the same force at the level of the sea, then $g \quad g' \quad R^2 \quad (R + h)^2$, whence, expanding the quantity $(R + h)^2$, and leaving out $\frac{h^2}{R^2}$ as insensible, we have $g' = g \left(1 + \frac{2h}{R}\right)$, in which we may substitute for g' and g either the lengths of the seconds' pendulum, or the square of the number of its oscillations at the station and the level of the sea The result however is modified by the local attraction of the mass of ground surrounding the station, and Dr Young assumes that the formula should be multiplied by the fraction 6

The following table, from Mr Airy's treatise on the Figure of the Earth (*Ency Metrop*), shows the length of the seconds' pendulum in English inches at a few of the stations, where it has been [illegible] It is to be remarked, however, that a degree of uncertainty

nttends all the results, on account of the error in the correction for the density of the air, which may amount to about 0018 for each

PENICILLIATE, (Lat penicillum *a pencil*) In Zoology when a part supports one or more small bundles of diverging hairs

PENINSULA (Lat pene *almost*, and insula, *an island*) A portion of land, as the term implies, nearly surrounded by water, as Africa, the Morea, California In common parlance the term Peninsula is usually applied to Spain and Portugal and the struggle so long maintained between these countries, aided by the British, and the French, at the commencement of the present century was called the Peninsular war

PENITENCE or PENANCE in the Roman Catholic Church, is one of the seven sacraments Priestly orders give the power to confer this sacrament, but as a matter of discipline, their power is not exercised without authority from the Ordinary either general or special except in cases of necessity The terms penitence and penance are likewise used for the good works commanded by a priest to a penitent, to be performed in satisfaction of the sins of which he absolves him Public penance in the earlier times of the church was imposed for great offences committed after baptism It consisted in exclusion from the church solitude, prayer and fasting and the readmission was only gradual the penitent being first allowed to approach the doors of the church, then to attend at sermons and readings but not at prayers then to pray, kneeling &c The time of penance varied according to different usages St Basil mentions two years for theft seven for sensuality fifteen for adultery, twenty for homicide, and the whole life for apostacy Public penance for secret sins was generally remitted about the 7th century, and its commutation for the repetition of prayers and bestowing of alms began in the next These alms were frequently applied by the penitent to the purchase of masses for himself or others Afterwards the usage of pilgrimage as a mode of penance became general and finally, indulgences began to be sold in the 12th century

PENITENTIARY A prison in which convicted offenders are placed and subjected to a course of instruction and discipline with a view to their reformation Imprisonment after conviction is of two kinds the simply repressive and penal and that which is at the same time reformatory But it is obvious that there is no advantage in attempting to produce the latter effect in those short imprisonments of a year or a few months, which form the ordinary punishments of our law for smaller offences Crimes of a higher order are with us usually punished by transportation and hence there is less room for the development of the penitentiary system among ourselves than in other European countries and in the United States of America At Genoa the convict is only subjected to the penitentiary system at the end of the first year of his imprisonment some writers on the subject recommend two years as a more appropriate limit for the commencement of this species of discipline In England the first act for the establishment of penitentiaries was passed in 1776, at the suggestion of the philanthropist Howard and judge Blackstone and attempts were made in consequence at Gloucester and other places with little success In 1812 the act was passed under which the Millbank prison was erected as a general penitentiary for England and Wales It is now adapted to contain 800 male and 400 female prisoners The chief object in penitentiaries, besides conferring moral and religious instruction on the prisoners, is to employ them in some useful labour, but there is always considerable difficulty in carrying into effect this part of the system [illegible] to reconcile it with the necessity [illegible] as far as possible At Millbank [illegible] principal occupation of a large proportion of the inmates *See* PRISONS

PENITENTIARY GRAND An officer of the Roman [illegible] usually a cardinal, appointed by the pope to grant absolution in cases reserved for the papal authority, dispensations for marriages, &c In like manner, bishops appoint penitentiaries to perform the same office in such cases as are reserved for episcopal absolution Briefs granted by the grand penitentiary are at the present time entirely gratuitous, and headed with the words 'pro Deo"

PENITENTS A name given in Roman Catholic countries to certain religious fraternities distinguished by their parti-coloured garments Of these there were a great variety in France Spain, and Portugal, &c but the most extraordinary were the White Penitents a body of fanatics, who appeared in the north of Italy in 1399, clothed in white, and bearing crucifixes, under the guidance of a priest, whose real history seems unknown, but concerning whom many strange stories were told, among others, that he professed to be the prophet Elias, and that his mission was to announce the immediate destruction of the world The contagion of this outburst of religious feeling extended to Tuscany and there over the whole of Italy, and was accompanied by a general cessation of violence and private war But it lasted only a few months (Waddington, *Hist of the Church*, p 546, and the authors there referred to)

PENNATULARIÆ (Lat penna, *a feather*) The name of a family of Polypes, of which the sea-pen (*Pennatula*) is the type

PENNON A term sometimes poetically used for a streamer or banner, but restricted in the middle ages to the banner of a knight, baronet, or esquire

PENNY The twelfth part of a shilling The penny was formerly a silver coin, first struck in England by the Saxons It contained the 240th part of their pound, and its weight was about 22½ grains Till the time of Edward the First the English penny was struck with a cross so deeply sunk in it that it might on occasion, be easily broken and parted into halves, thence called halfpenny, or in four parts, thence called *fourthings*, or farthings Edward the First also reduced the weight of the penny to a standard, ordering that it should weigh the 20th part of an ounce It afterwards suffered successive diminutions, till in the reign of Elizabeth its value was reduced to the 62d part of an ounce of silver This proportion is still observed

PENNYWEIGHT A weight equal to twenty-four grains or the 20th part of an ounce troy This was the weight of the silver penny in the time of Edward the First See PENNY

PENS (Lat penna *a feather*) Well-known instruments for writing usually formed of the quills of the goose swan or some other bird Metallic pens have been occasionally employed for a lengthened period, but it is only within these few years that they have been extensively introduced They first began to be largely manufactured by Mr John Perry, of London Mr Perry having succeeded in giving to his pens a greater degree of softness and elasticity than was possessed by any metallic pens previously in use, they speedily obtained a very extensive sale This success brought crowds of rivals into the field, so that metallic pens are now manufactured in vast quantities and of an immense variety of forms But though they have superseded to a very considerable extent the use of quills, and have some peculiar advantages it does not appear possible to give them the elasticity of the quill nor fit them so well for quick and easy writing In the manufacture of steel pens the best metal made from Dannemora or hoop (L) iron is employed It is laminated into slips about 3 feet long and 4 inches broad of a thickness corresponding to the desired stiffness and flexibility of the pens These slips are subjected to the action of a stamping-press, somewhat similar to that for making buttons The point destined for the nib is next introduced into an appropriate gauged hole of a little machine and pressed into the semicylindrical shape, where it is also pierced with the middle slit and the lateral ones, provided the latter are to be given The pens are now cleaned, by being tossed about among each other in a tin cylinder about 3 feet long and 9 inches in diameter, which is suspended at each end upon joints to two cranks formed one on each of two shafts The cylinder by the rotation of a fly-wheel acting upon the crank-shafts, is made to describe such revolutions as agitate the pens in all directions, and polish them by mutual attrition In the course of four hours several thousand pens may be finished upon this machine (See *Commercial Dict*, and *Ure's Dict of Arts, &c*)

PENSIONARY THE GRAND of Holland, was the prime minister of the states of the province of Holland He proposed the measures to be discussed in the assembly of the states He also transacted business with foreign ministers and fulfilled other important functions His term of service was five years, and he was capable of re-election

PENSIONER Literally one who receives a pension or allowance At the universities of Cambridge however and Dublin, this term has a peculiar meaning, being applied to those students who live at their own expense, i e without any support from the beneficent foundations of

the respective colleges In this sense it is synonymous with commoner at Oxford

PENTACRINITES (Gr πεντε, *five*, and κρινον, *lily*) The name of a tribe of Echinoderms, comprehending those in which the animal consists of an angular, jointed flexible column fixed at the base and supporting on its free extremity a concave disc or body terminating in five dichotomizing, jointed, semicylindrical arms Most of the species of this tribe are extinct

PENTADORON (Gr πεντε and δωρον *a palm*) In Ancient Architecture, a brick of five palms in length used by the Greeks in the construction of their public edifices

PENTAGON (Gr πεντε, and γωνια, *angle*) In Geometry, a plane figure, having five angles, or contained by five sides It is a regular pentagon when its sides and angles are equal, and may be inscribed in a circle The length of the side of a regular pentagon is equal to twice the sine of 36°, radius being unit, and its area = 5 sin 36° × cos 36°, or, making the side = *s*, the area = $\frac{5}{4}s^2 \times \tan 54°$ It is a remarkable property of the regular pentagon, that the square of its side is equal to the sum of the squares of the sides of the hexagon and decagon inscribed in the same circle

PENTAGRAPH See PANTAGRAPH

PENTAMERANS *Pentamera* (Gr πεντε, and μερος, *a joint*) The name of a section of Coleopterous insects including those which have five joints on the tarsus of each leg

PENTA'METER (Gr πεντε, and μετρον, *measure*) A species of verse consisting of five feet or measures (whence the name), and which when subjoined to a hexameter verse constituted what is denominated *elegiac* The scheme of the pentameter is as follows —

⏑ ⏑ | – ⏑ ⏑ | – | – ⏑ ⏑ | – ⏑ ⏑ | – |

Or more properly thus,

– ⏑ ⏑ | – ⏑ ⏑ | – – | ⏑ ⏑ – | ⏑ ⏑ – |

It must be observed, that the cæsural pause at the third foot must always terminate a word, and, as a general rule, the last word of the verse must consist of two syllables, although a quadrisyllable, especially in proper names, is sometimes admitted

The first Greek elegiac writers were Callinus and Tyrtæus, who were followed by Mimnermus, Theognis, Solon, in the regular series, Propertius, Tibullus, and Ovid, in Rome The variety of themes sung by these different writers proves the capacity of this measure for adaptation to every subject, whether mournful, as the term *elegiac* would imply, or political and warlike, like the strains of Tyrtæus and Callinus, or erotic like those of Propertius Tibullus, and Ovid, or historical and mythological, like the *Fasti* of the last The pentameter has not been generally introduced into any modern language with which we are acquainted, though Goethe and Schiller have left us some excellent specimens of the facility with which it might be engrafted on the German language The hexameter and pentameter distich is beautifully described in the following lines of Schiller —

Im Hexameter steigt des Springquells flüssige Säule
Im Pentameter drauf fällt sie melodisch herab

Thus admirably rendered by Coleridge, who was long considered as the original author —

In the hexameter rises the fountain's silvery column
In the pentameter aye falling in melody back

Every page of Ovid's *Heroides*, or *Tristia*, illustrates the manner in which the hexameter breaks as it were and falls back in the pentameter, thereby adding a most exquisite grace to the rhythm indeed the secret genius of the metre appears to consist in this display The following instances, taken from Penelope's letter to Ulysses, will illustrate the truth of this observation —

Tros Anchisiades et Dardanis incipit heros
Vare tuæ jussus abire domum

Again,

Sive quis Assaracus sive hunc Ilumque vocari
Auctor habet

Besides this peculiarity in the pentameter, grammarians have pointed out several others, an observance of which is necessary to constitute a perfect pentameter Of these perhaps the most important is the axiom that although either a spondee or a dactyl may be used at pleasure in the first two feet of the verse, a dactyl should be preferred to a spondee whenever practicable, and a comparison of the ancient authors will show that on the frequent use of the former much of the beauty of this elegant measure depends *See* HEXAMETER

PENTAPOLIS (Gr πεντε, and πολις, *a city*) A name given by the ancient Greeks to certain countries which were remarkable for having five distinguished cities, thus there was the Pentapolis of Lybia, Italy, and Asia Minor but the most celebrated was the Pentapolis Cyrenaica (or of Egypt) whose five cities were Berenice, Arsinoe Ptolemais Cyrene, and Apollonia

PENTASTYLE (Gr πεντε, and στυλος, *a column*) In Architecture a building having five columns in front

PENTATEUCH (Gr πεντατευ-χος, from πεντε, and τευχος, *an instrument*), signifies the five volumes of the books of Moses, viz Genesis, Exodus, Leviticus, Numbers, and Deuteronomy

1 The book of *Genesis* (as the term implies) gives an account of the creation of the world and of man, the fall of man the flood and the history of the Jewish patriarchs Abraham Isaac and Jacob down to Joseph (1 [illegible]) This book was looked upon with great veneration by the Jews, as comprising the history of their venerable founder Abraham, and his nearest descendants, — around whom [illegible] its venerable antiquity, and from its furnishing rich materials for historical geographical and antiquarian investigations It contains, besides, numerous subjects for moral and religious reflections, which are referred to in many other later portions of the Old and New Testament

2 The book of *Exodus* (Gr εξ, and οδος, *a way*), narrates the fortunes of [illegible] after their migration to Egypt [illegible] his endeavours to emancipate the Jewish nation from Egyptian [illegible] through [illegible] Moses This book, besides being peculiarly valuable in a religious point [illegible] to the agricultural or *fixed* mode of life

3 The book of *Leviticus* (so called from Levi, a priest) consists chiefly of the law and ordinances of the Jewish priesthood, or regulations as to the different kinds of sacrifices to be offered up, the duties of masters towards their slaves, regulations as to marriage, &c It is replete with interesting antiquarian matter

4 The book of *Numbers* (so called from its giving an account of the numbering of the people) contains besides an enumeration of many civil and ceremonial ordinances, and embraces an historical period of 38 years, chiefly relating to the captivity and the wilderness

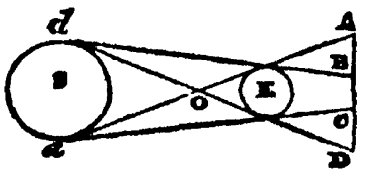
5 The book of *Deuteronomy* (Gr δευτερος and νομος *law*), contains chiefly (as the term implies) a condensed summary of the ordinances delivered in the three preceding books

There are two ancient and authentic copies of the Pentateuch the one written in Samaritan or Phœnician characters, the other in Chaldean, which was adopted by the Jews, in preference to the former, after their return from Babylon The differences between the two are represented as not material, but it is imagined that some alterations and additions have been made in the Samaritan text in order to favour the peculiar prejudices and claims of that people

The Pentateuch was, down to a recent period, universally attributed to Moses, but some German theologians have attempted to prove, in our opinion with but little success, that Moses was not the author There are no doubt several passages, especially in Deuteronomy which could not possibly have been written by Moses, but these can easily be accounted for as interpolations of a copyist, and do not affect the authenticity of the whole Pentateuch The chief arguments for the genuineness of the Pentateuch are ably given in the *Penny Cyclopædia*, to which we beg to refer the reader

PENTATHLUM (Gr πεντε, and αθλος, *a contest*) A general appellation given by the Greeks to their five chief bodily exercises, viz running, leaping, throwing the quoit or discus hurling the javelin, and wrestling These five exercises were termed *Quinquertium* by the Romans

PENTECOST (Gr πεντηκοστος, *fiftieth*) A Jewish festival, so called because it was observed on the *fiftieth* day after the feast of unleavened bread, i e the fifteenth of the month Nisan and next day after the Feast of the Passover Being fifty days or seven weeks after this latter, it also obtained the name of the Feast of Weeks It occurred about the beginning of the harvest, and seems to have been instituted as an acknowledgment of the goodness of God in giving the fruits of the earth It also commemorated the giving of the law on Mount Sinai upon that day The diffusion of the Holy Spirit upon the apostles upon the same day, as recorded in Acts ii, has occasioned its observance to be continued among Christians In England it is known by the name of Whit Sunday, and in Germany by that of *Pfingsten*



PENTELA'SMIDÆ (Gr πεντε, and ελασμα, *a layer*) The family of Pedunculate Cirripeds, of which the common barnacle (*Pentelasmis crocea*) is the type The principal organs of the body are protected by five shelly plates

PENTELICAN MARBLE See MARBLE

PENULT or PENULTIMA (Lat penè ultima, *almost last*) In Grammar and Prosody, the last syllable of a word but one

PENUMBRA (Lat *pene*, almost, and *umbra*, shadow) An imperfect shadow The penumbra of the earth is occasioned by the apparent magnitude of the sun and [illegible] behind the earth within [illegible] by a part only, and not [illegible] us distinguished from the *umbra*, or perfect shadow, which is the conical

space within which no part of the disk is visible Let S be the sun, E the earth, A D the orbit of the moon, and let *a* A, *a* C, *d* B, *d* D, be tangents to S and E As soon as the moon passes the point A, a portion of the sun's disk at *a* will be intercepted, and the visible portion will become less and less until the moon reaches B, where total darkness begins From A to B, therefore, the moon is in the penumbra The umbra extends from B to C When the moon passes C, it will again receive the light from the border of the solar disk at *a*, and will be in the penumbra from C to D The whole penumbra thus forms a cone, of which the apex is at O, and the angle at the apex equal to A O D As the obscurity evidently becomes greater in proportion as more of the solar disk is concealed, and insensibly merges into total shade, it is extremely difficult in eclipses of the moon to determine by observation the exact time at which the moon's limb passes the point B or C, and the eclipse begins or ends

In solar eclipses those parts of the earth which are covered by the penumbra of the moon are only partially deprived of the sun's light Let E be the moon and A D part of the earth's orbit For a spectator on the earth placed between A and B, a part of the sun's disk is concealed, and the sun is partially eclipsed The limits are calculated from the known [illegible] of the sun and moon, and their respective [illegible] the earth *See* ECLIPSE

PENUMBRA In Painting &c, the boundary of shade and light where the one blends with the other, the gradation being almost imperceptible

PEPERINO An Italian name for a particular kind of volcanic rock, formed by the cementing together of sand, cinders, &c

PE'PLUM An upper garment anciently worn by the Grecian, and especially by the Athenian females it was without sleeves, and fastened by a clasp on the arm or shoulder The celebrated peplum of Minerva was carried every year, in the Panathenaic processions of Minerva from the Ceramicus to the temple of Ceres, and thence to the Parthenon where it was offered to the goddess The antiquity of this kind of ceremony is evinced by the passage in the *Iliad* (book v) where the Trojan women offer a similar robe

PEPPER *See* PIPERACEÆ PIMENTO

PE'PTIC [illegible] digestion *See* DYSPEPSIA

PEDAMBULATOR (Lat ambulo, *I walk*) A machine for measuring distances on roads, also called *odometer* and *surveying wheel* Various sorts of machines have been constructed for this purpose both in ancient and modern times One is described by Vitruvius in his work *De Architectura*, lib x c 14 The machine commonly employed consists of a wheel to which a sort of double pole is attached carrying an apparatus of clockwork, which is set in motion by the revolution of the wheel, and shows the number of miles furlongs &c passed over by an index and dial The apparatus may be drawn along by a person on foot or by a carriage to which it is more usually attached For the sake of facility in reckoning the circumference of the measuring wheel is made equal to an aliquot part of a mile usually half a pole or 99 inches (See the *Repository of Arts*, vi 219)

PERCEPTION (Lat) In Mental Philosophy that power act, or state of the mind which has a conscious reference to external objects Various theories of perception have arisen among philosophers, differing as this reference is supposed to be more or less immediate or as the objects to which it refers are conceived to possess an independent reality or not These theories are designated by the terms *idealism* and *realism*, which latter is subdivided into natural or positive, and relative or negative realism The best known system of idealism is that of Bishop Berkeley *See* IDEALISM

According to the scheme of negative or relative realism all that we can know of an object is the feeling which it excites in our minds The cause of this feeling we necessarily judge to be something external to ourselves, but what it is in itself we have no means of knowing This is the view adopted by the great majority of philosophers, from Plato and Aristotle down to Kant and Brown

The theory of natural realism is the one supported by Dr Reid under the name of the *common-sense* system This [illegible] in perception to be in [illegible] to our consciousness, its qualities are not merely felt by us, but discovered *in it* We derive a certain sensation from the whiteness or roundness of an object, but it is the object itself and not our minds that are white or round This doctrine, which was also that of the ancient Stoics, and expressed by them in nearly the same words as those used by Reid (see Cicero *Acad Quæst*), is in fact rather a statement than an explanation of the problem It has been recently supported with great acuteness by a learned writer in the *Edin Review*, No 113, to which we refer our readers for a full account of all possible theories of perception

PERCH in Land Measure, [illegible] or equal to 30¼ square yards [illegible] used as a denomination of long measure, when it signifies the same thing as a rod or pole, being 5½ yards, or 16½ feet

PERCHERS The name of an [illegible] ing the *Scansores* and *Passeres* of Cuvier *See* ORNITHOLOGY

PERCHLORIC ACID When sulphuric acid is poured upon chlorate of potash, gaseous oxide of chlorine is evolved and the saline matter which remains is a mixture of bisulphate of potash and perchlorate of potash, by washing it with cold water the former salt is dissolved, but the latter remains in the form of a white powder When this is mixed with half its weight of sulphuric acid diluted with one third of water, and heat applied, white vapours rise which condense as a colourless liquid in the receiver This is a solution of perchloric acid, which consists of 1 equivalent of chlorine = 36, and 7 equivalents of oxygen (8×7) = 56, the equivalent of the perchloric acid, therefore, is (36+56) 92 Perchlorate of potash requires 65 parts of water at 60° for solution

PERCOIDS *Percoidæ* (Lat perca, *a perch*) The name of the tribe of Acanthopterygian fishes of which the [illegible] the type

PERCUSSION (Lat) In Mechanics, the striking of one body against another, or the shock arising from the collision of two bodies *See* COLLISION

PERCUSSION CAPS *See* GUN

PERCUSSION, CENTRE OF That point in a solid [illegible] axis at which, if an obstacle were [illegible] to resist the rotation of the system no motion would be communicated to the axis, or, which is the same thing, if the axis were not fixed the system would acquire no tendency to revolve through the shock applied at that point The centre of percussion is in the straight line passing through the centre of gravity perpendicular to the axis, and [illegible] from the axis is expressed by the formula $\int r^2 d m - \int r d m$, where $d m$ is the element of the mass, and r the distance of $d m$ from the axis *See* CENTRE

PERCUSSION OF FLUIDS *See* HYDRODYNAMICS

PERIDIOLA (Gr περιδέω *I bind round*) The membrane by which the sporules of Algaceous plants are immediately covered

PERENNIALS (Lat perennis *lasting throughout the year*) In Botany, those plants whose roots remain alive more years than two but whose stems flower and perish annually Gardeners generally call them Herbaceous plants They differ from annuals and biennials not only in the time of their duration, but also in this, that the two former perish as soon as they have flowered, the act of reproduction exhausting their vital energies Notwithstanding this distinction it is not at all times easy to say whether a plant is a perennial or not, as for instance in the *Agave Americana* commonly called the American aloe This plant is herbaceous, and lives for many years, but when it flowers it dies so that in one respect it is annual its whole life being regarded as only one season of growth in another respect it is truly perennial Such perennials are called by De Candolle *monocarpi*

PERENNIBRANCHIATES, *Perennibranchiata* (Lat perennis branchia, *gills*) The name of that division of Batrachian reptiles including the species which preserve the external branchiæ, or branchial apertures, throughout life as the Siren, Proteus, and Menopome

PERFECT CADENCE In Music *See* CADENCE

PERFECTIBILITY The capability of arriving at perfection This word which is entirely modern, and scarcely as yet admitted in our language on classical English authority is commonly used in reasoning on the social condition of mankind The theory of the indefinite perfectibility of the human faculties, which constitutes the basis of many modern systems is perhaps nowhere so plainly developed as in the Preface to the *Tableau Historique de l'Entendement Humain* of Condorcet

PERFECT NUMBER In Arithmetic, a number equal to the sum of all its divisors Thus 6 is a perfect number, for its divisors are 1, 2, and 3, and 1 + 2 + 3 = 6 In like manner, 28 is a perfect number, for its divisors are 1, 2, 4, 7, 14, the sum of which = 28

In general, every number of the form $2^{n-1}(2^n-1)$, the latter factor being a prime, is a perfect number, the sum of its divisors being equal to the number itself The difficulty, therefore, of finding perfect numbers arises from that of finding primes of the form 2^n-1, which is very laborious The only values of n yet discovered which make 2^n-1 a prime number are 2, 3, 5, 7, 13, 17, 19, and 31 Substituting these values of n successively in the formula of the perfect number, we shall obtain the following results —

If $n = 2$, then $2^{n-1}(2^n - 1) = 6$
$n = 3$, $2^{n-1}(2^n - 1) = 28$
$n = 5$, $2^{n-1}(2^n - 1) = 496$
$n = 7$, $2^{n-1}(2^n - 1) = 8128$
$n = 13$, $2^{n-1}(2^n - 1) = 33550336$
$n = 17$, $2^{n-1}(2^n - 1) = 8589869056$
$n = 19$, $2^{n-1}(2^n - 1) = 137438691328$
$n = 31$, $2^{n-1}(2^n - 1) = 2305843008139952128$
all which are perfect numbers

PE'RFECT TENSE That form of the verb denoted in English by the auxiliary *have*, as [illegible] in action first had at the time when we [illegible] termed the preterite tense from Lat præteritum, *past*

PERFU'ME (Fr parfum) A term used to denote the volatile effluvia from any body affecting the organ of smelling, or the substance emitting [illegible] Perfumes were in general use among the ancients (see the *Quart Rev* vol xxiii), and in France, Germany Spain, and Portugal, and even though not to so considerable an extent, in England they are regarded almost as necessaries In general they are made of musk, ambergris, civet, rose and cedar woods, orange flowers jessamines, jonquils, tuberoses, and other odoriferous flowers Aromatic drugs, such as storax, frankincense, benzoin cloves, &c &c, enter into the composition of a perfume, and many perfumes are composed of aromatic herbs or leaves, [illegible] &c &c (See the article Perfumery in *Useful Arts, &c*)

PERGAMENEOUS (Lat pergamena *parchment*) In Botany, [illegible]

PE'RGOLA (Lat [illegible]) [illegible] gallery in a house It is used by Plautus to signify a balcony, in which the courtezans placed themselves to catch the attention of passengers By Winckelmann it is thought to be an arbour in a garden, or a terrace overhanging one

PERIA'NTHIUM (Gr περι *around*, and ανθος, *a flower*) A calyx and corolla the limits of which are undefined, so that they cannot be satisfactorily distinguished from each other, as in many Monocotyledonous plants

PERI'BOLOS (Gr περι, and βαλλω, *I cast*) In Architecture a court or enclosure entirely round a temple surrounded by a wall One of the most extraordinary examples of a peribolos is at Palmyra where the great temple is surrounded by a wall with two rows of interior columns, each side whereof is from 700 to 800 feet long

PERICARDI'TIS Inflammation of the pericardium It is of the same origin as

PERICA'RDIUM (Gr, περι *about*, καρδια *the heart*) The membranous sac which surrounds the heart

PERICA'RPIUM (Gr [illegible]) Every part of a ripe fruit on the outside [illegible]

PERICHÆ'TIAL (Gr περι and χαιτη *a bristle*) The leaves situated at the base of the setæ of mosses

PERI'COPE (Gr περι, and κοπτω *I cut, something cut out, an extract*) A word used by theologians to designate [illegible] Bible extracted for the purpose of reading [illegible] the communion service and other portions of the ritual, or as a text for a sermon or homily

PERICRA'NIUM (Gr περι and κρανιον, *the skull*) The membrane of the bones of the skull

PE'RIDOT In Mineralogy, the prismatic chrysolite

PE'RIDROME (Gr περι, and δρομος, *a course*) In Ancient Architecture, the space in a peripteral temple between the walls of the cell and the columns It is a term that may be applied to any gallery of communication round an edifice

PE'RIGEE (Gr περι and γη *the earth*) In Astronomy, that point of the moon's orbit which is nearest to the earth Anciently the term *perigee* was applied to the orbits of the sun and planets, as well as to the moon, because they were supposed to circulate round the earth Since the true centre of motion has been discovered, the term *perihelion* is used to denote the corresponding point

PERIGO'NIUM (Gr περι and γονη, *a race*) A synonym of the word perianth

PERIGY'NIUM (Gr περι and γυνη, *a female*) The urceolate body formed in the genus *Carex* by two bracteæ, which become confluent at their edges and enclose the pistillum leaving a passage for the stigmas at their apex Also used occasionally to denote that organ commonly called the disk

PERIGYNOUS A term applied to stamens which originate from the side of a calyx

PERIHE'LION (Gr περι and ηλιος *the sun*) In Astronomy, the point in the orbit of a planet or comet which is nearest the sun It is the extremity of the major axis of the orbit nearest to that focus in which the sun is placed and its position, or [illegible] the elements by which the orbit is determined See PLANET

PERI'METER (Gr περι [illegible]) In Geometry, the circuit or [illegible] In round figures it is equivalent to circumference, or periphery, but the term is more frequently applied to figures bounded by straight lines

PE'RIOD (Gr περιοδος) In Astronomy and Chronology, the [illegible] interval [illegible] the end of which the same [illegible] the [illegible] which [illegible] its orbit [illegible] Period, or Cycle, is also used in arithmetic, to denote the recurrence of a series of digits or numbers in the same order, as in circulating decimal fractions

PERIOD OR SENTENCE in Rhetoric, has been defined "a passage, i e series of words, developed in properly connected parts" In a stricter sense, a period is a sentence so framed that the grammatical construction will not admit a close and the meaning remains suspended until the end of it A sentence in which the sense would permit of a stop before its completion is, in this sense, not a period The Greek and Latin languages were much more periodic than most modern tongues, that is, they admitted of the construction of sentences so that a single grammatical connection should run through a great series of words, while a similar series, in a modern language, would be so arranged as to form several distinct grammatical wholes

PERIOD, THE JULIAN In Chronology *See* JULIAN PERIOD

PERIO'DIC ACID [illegible] in composition to the *perchloric*, [illegible] dent of iodine + 7 equivalents of oxygen

PERIODICALS In Literature, strictly publications continued in numbers, appearing at regular intervals But papers of the same description appearing at uncertain intervals (especially in Germany), are often comprehended under this general name The first periodical in the character of a review was the *Journal des Savans* in 1663

PERIŒCI (Gr περι *about*, and οικεω *I dwell*), in Geography, is used to denote those inhabitants of the globe who live under the same parallel of latitude but [illegible] diameters that is in places which have the [illegible] but differ in longitude by 180°. They have their spring summer, winter and autumn in the same months of the year, but when it is noon with the other

PERIOSTEUM (Gr περι and οστεον, *a bone*) The membrane which invests the bones It is of a fibrous texture and vascular

PERIO'STRACUM (Gr περι, and οστρακον *a shell*) The layer of animal substance or cuticle, which covers the outer surface of shells, and which the French con-

nam

That school of ancient philosophers which derived its origin from Aristotle The name was given them from the Gr περιπατοι or *walks* in the Lyceum the scene of Aristotle's instruction (For the doctrines of the Peripatetics, see ARISTOTELIAN PHILOSOPHY) The immediate successors of Aristotle in the peripatetic doctrine were Theophrastus, Eudemus the Rhodian (from whom is derived the title of the Eudemian Ethics) Dicæarchus of Messana, Aristoxenus of Tarentum and Strato of Lampsacus among the later Peripatetics are preserved the names of Glycon of Troas Hieronymus of Rhodes, &c It would be unreasonable to expect that so elaborate a system as that of Aristotle should have received any important addition to its leading doctrines at the hands of his followers They contented themselves either with defending and interpreting their master's doctrines, or with applying his method to the explanation of natural philosophy Under their hands his system seems to have degenerated into a species of empirical materialism, a scheme as widely [illegible] doctrines, as was the dry scheme [illegible] in the dark ages passed for the philosophy of Aristotle (For notices of the later Peripatetics see Cicero *Acad Quæst*, and *De Finibus* [illegible], Lactant *De Ira Dei*, c 10, Plutarch, *De Solertia* &c) The Peripatetic school produced no men of note after its great founder which is attributable to the current of free speculation being shackled by the authority of Aristotle whose dogmas it was content to illustrate without daring ever to impugn, and in this respect its spirit was remarkably contrasted with the scepticism of the new Academy (See *Ritter's Hist of Anc Philosophy* book ix ch i)

PERIPETEIA, or REVOLUTION (Gr περιπετια) According to Aristotle, in his *Art of Poetry*, a necessary condition or circumstance of the drama, being a change of fortune, from happiness to misery, or the reverse, which takes place in the situation of the principal personage See CATASTROPHE, DRAMA

PERIPHERY (Gr περι, and φερω, *I carry*) In Geometry, the circumference of a circle or ellipse, or of any other curvilinear figure

PERI'PHRASIS, or CIRCUMLOCUTION (Gr περι, and φραζω, *I speak*) In Rhetoric, the use of several words to express the sense of one, or of a more involved and prolix form of expression to convey a meaning which might be adequately denoted by a shorter phrase

PE'RIPLUS (Gr *περί*, and *πλοῦς*, *sailing*) A circumnavigation The word is only used as the title of some treatments which remain to us of narratives of voyages of the classical ancients The *Periplus* of Hanno [illegible] scription said to have been [illegible] mory of a voyage along the western coast of Africa, respecting which much discussion has arisen among modern geographers The date of this voyage is uncertain but generally fixed by conjecture at [illegible] or more years before Christ The *Periplus* of Scylax, which is supposed to belong to the age of Augustus, contains a succinct account of some [illegible] Europe and Asia Two works [illegible] ass under the name of Arrian, who wrote in the second century after Christ, the first contains a description of the Luxine, the [illegible] lf)

[illegible] *breathe*) Inflammation of the lungs *See* PNEUMONIA

PERI'PTERY, *Peripteral* (Gr *περί*, and *πτερον*, *a wing*) In Architecture, a building surrounded with a wing, aisle or passage The word *peripteral* characterizes one of the species of Greek temples, in which the cell is surrounded by a single row of columns, to distinguish it from the word *dipteral*, which designates a temple with two ranks of columns

PE'RIS, in the Persian Mythology are a class of imaginary be[illegible] allied to the elves or fairies of more northern [illegible] supposed to be the descendants of the fallen angels, and excluded from Paradise till they have made atonement for their sins (See Moore's beautiful poem, "Paradise and the Peri," in *Lalla Rookh*)

PERI'SCII (Gr *περί* and *σκια* *shadow*) A name applied by the ancient geographers to the inhabitants within the arctic and antarctic circles because as the sun at certain times of the year does not set to them or the course of his diurnal revolution, their shadows describe an entire circumference

PE'RISPERM (Gr *περί*, and *σπερμα*, *a seed*) A term used by some to denote the testa and by others the albumen of a seed

PERISTA'LTIC (Gr *περιστελλω*, *I contract*) A term applied to the peculiar motion of the intestines, by which their contents are gradually propelled from one end of the canal to the other

PE'RISTOMES, *Peristomidæ* (Gr *περί*, and *στομα*, *a mouth*) The name of a family of Pectinibranchiate Gastropods, including those species in which the shells have the margin of the aperture or mouth unbroken and continuous

PE'RISTYLIUM (Gr *περί*, and *στυλος*, *a column*) In Architecture, a court, square, or cloister with columns on three sides hence improperly so called In peristyles with columns on each of the four sides that towards the south was frequently higher than the rest This species was called a Rhodian peristylium

PERITHE'RIDES (Gr) In Architecture *See* ANCONES

PERITONÆ'UM (Gr *περιτεινω* *I extend round*) The membrane which envelops the abdominal viscera and lines the cavity of the abdomen Hence also *peritonitis* or inflammation of the peritoneal membrane

PERITRO'CHIUM (Gr *περιτροχεω*, *I run about*) In Mechanics a wheel or circular frame of wood, fixed upon a cylinder or axle round which a rope is wound, and the wheel and cylinder being moveable about a common axis a power applied to the wheel will raise a weight attached to the rope with so much the greater advantage as the circumference of the wheel is greater than that of the cylinder This mechanical power is called the *axis in peritrochio*, the windlass and capstan are constructed on the same principle

PE'RJURY (Lat *pejero*) In Law is a wilful false oath taken in a court of justice, by a witness lawfully required to depose the truth in a matter of some consequence to the point in question A false oath therefore taken before no court, or before a court incompetent to try the issue in question, does not constitute the offence of perjury Perjury is a misdemeanor at common law and by several statutes punishable by fine and imprisonment, and by transportation for a term not exceeding seven years

PE'RKUNOS One of the chief divinities of ancient Prussia, who, together with Rikollos and Potrimpos formed the sacred Trinity of the Slavonic and the adjoining nations He was regarded as the god of the elements, and his worship extended even to Russia, Poland, Bohemia, where there were numerous temples erected to his honour (See *Grimm's Deutsche Mythologie*)

PE'RMIT An order or written permission from an officer of the customs, authorizing the removal of goods [illegible] from one place to another

[illegible] IN In Algebra it denotes the arrangement of any determinate number of things or letters in all possible orders one after the other For example, two letters, *a b*, give the two permutations *a b* and *b a*, and three letters, *a b c*, give the six permutations *a b c*, *a c b*, *b a c*, *b c a*, *c a b*, *c b a* *Permutation* is effected by placing the letters in all possible orders, so that all the letters enter into each result, and each enters into it

[illegible] letters which enter into the results, without regard to the order of the arrangement

To find the number of permutations that can be made upon any number of letters *n*, taken together, we may reason in this way — Suppose the total number of permutations that can be made of *n* — 1 letters to be known, and let it be designated by Q Let us consider one of the given letters, *f*, by itself, and suppose it to be placed on the right of each of the Q permutations of the other *n* — 1 letters, there will result Q permutations of *n* letters each ending with *f* But as each of the *n* letters may be considered separately in the same manner as *f*, it follows that the total number of permutations of the *n* letters is equal to Q × *n* Let *n* = 2, Q then denotes the number of permutations of one letter, whence Q = 1, and Q × *n* = 1 × 2 Let *n* = 3, Q then denotes the number of permutations of two letters, which is just found equal to 1 × 2 Therefore Q × *n* = 1 × 2 × 3 Let *n* = 4, Q then denotes the number of permutations that can be made on three letters, or 1 × 2 × 3 Therefore Q × *n* = 1 × 2 × 3 × 4

In general, the number of permutations that can be made upon *n* letters, taken together, is expressed by the continued product

$$1 \times 2 \times 3 \times \quad (n-1) \times n$$

For example, the number of changes that can be rung upon twelve bells is 1 × 2 × 3 × 4 × 5 × 6 × 7 × 8 × 9 × 10 × 11 × 12 = 479001600

PERNIO *See* CHILBLAIN

PERORA'TION (Lat *per*, and *os*, *mouth*) The concluding part of an oration, in which either the arguments and representations of the speech are briefly recapitulated, or a short and comprehensive conclusion deduced from them, or a brief appeal made to the sentiments or passions of the audience

PERO'XIDE The highest degree of oxidizement of which a metal or other substance is susceptible without becoming an acid

PERPENDICULAR In Geometry, a straight line is said to be perpendicular to another straight line when the adjacent angles formed by their intersection are equal and, consequently, each is a right angle A straight line is perpendicular to a curve at a given point when it is perpendicular to the tangent to the curve at that point In this case the perpendicular is sometimes called a *normal* to the curve (See NORMAL) A straight line is perpendicular to a plane when it is at right angles with every straight line in the plane [illegible] the point of intersection A plane is [illegible] to a plane when any straight line in the first which is perpendicular to the common intersection of the two planes is also perpendicular to the second plane

PERPETUAL MOTION In Mechanics, a machine which when set in motion, would continue to move for ever, or at least until destroyed by the friction of its parts without the aid of any exterior cause The discovery of the perpetual motion has always been a celebrated problem in mechanics on which many ingenious, though in general ill-instructed, persons have consumed their time, but all the labour bestowed on it has proved abortive In fact the impossibility of its existence has been so fully demonstrated from the known laws of matter, that it is rather an insult than a praise to say of any one that he has occupied himself with the research Nevertheless the pursuit of the chimera has been the cause of many useful inventions

In speaking of the perpetual motion it is to be understood that from among the forces by which motion may be produced we are to exclude not only air and water, [illegible] and its attractive forces, which may all be considered of the same kind as gravitation

It is an admitted principle in philosophy that action and reaction are equal, and that when motion is communicated from one body to another, the first loses just as much as is gained by the second But every moving body is continually retarded by two passive forces, the resistance of the air and friction In order, therefore, that motion may be continued without diminution, one of two things is necessary, — either that it be maintained by an exterior force (in which case it would cease to be what we understand by a perpetual motion), or that the resistance of the air and friction be annihilated, which is physically impossible The motion cannot be perpetuated till these retarding forces are compensated, and they can only be compensated by an exterior force, for the force communicated to any body cannot be greater [illegible] d this is only sufficient to [illegible] f motion when there is no

[illegible] therefore a [illegible] either an attractive force like that of gravitation or magnetism or an elastic force, that of a spring for example) greater than itself

But it may be argued that by some arrangement or combination of mechanical powers a force may be gained equal to that which is lost in overcoming friction and atmospheric resistance This notion at first mention appears plausible, and is in fact that by which most speculators have been led astray It is, however, entirely erroneous, for by no multiplication of forces or powers by mechanical agents can the quantity of motion be increased Whatever is gained in power is lost in time, the quantity of motion transmitted by the machine remains unaltered

Although the perpetual motion has been demonstrated again and again to be impossible on any known principle of mechanics projectors have not thereby been deterred from the pursuit In 1775 the Academy of Sciences at Paris resolved not to consider or admit into their Memoirs any future proposal for the discovery of the perpetual motion, yet such appears to be the seductive nature of the subject that innumerable schemes designs and projects for accomplishing it have since been and even to the present time continue to be, put forward, and there are very recent instances of men of no common attainments and reputation and well versed moreover in the principles of mechanical science who have been deceived by the [illegible] into a belief of its attainment (see Montucla *Hist des Math* tome iii p 813, *Repertory of Arts* vols vii and xiv, *London Journal of Arts*, May 1827, Airy *Trans of the Cambridge Phil Soc* vol iii part 2, Poppe *Wunder der Mechanik* 1832, and various papers in the earlier volumes of the *Memoires de l'Academie des Sciences*, and the *Philosophical Transactions*)

PERPETUITY, in the doctrine of Annuities is the sum of money which will purchase a certain annuity to continue for ever This is equal to the product of the annuity into the number of years in which the simple interest of any sum will equal the principal For example, if the rate of interest be 4 per cent the simple interest of any sum will amount to a sum equal to the principal in twenty-five years The value, therefore of the perpetuity of 100*l* per annum is 2500*l* The number of years is equal to unit divided by the rate of interest or 100 divided by the rate per cent

PE'RRY (Lat pirum, *a pear*) A fermented liquor made from pears in the same manner as cider from apples The pears best fitted for producing perry are exceedingly harsh and tart, but it is itself pleasant and wholesome

PERSECU'TIONS The name by which several periods in the history of the Christian church are historically distinguished Of these by far the most sanguinary occurred [illegible] of the Christian era, and originated in the desire of the Gentile nations to extirpate the followers of the Christian faith On the accession of Constantine to the throne of the Western world, these Gentile persecutions ceased and the subsequent history of the church is disfigured by persecutions raised by the more powerful against the weaker of the Christian sects

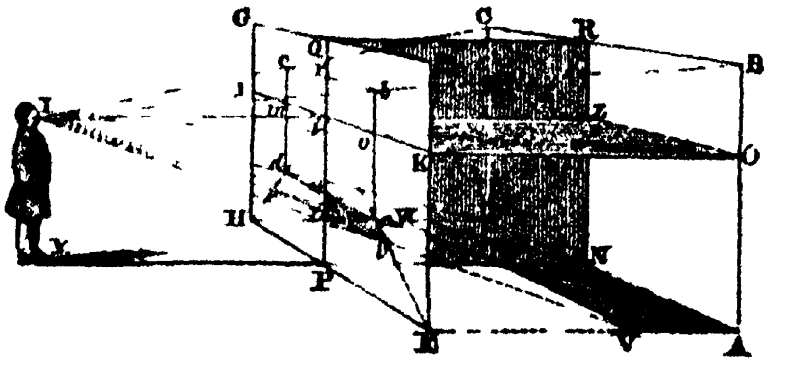
PERSEUS Son of Jupiter and Danae one of the most distinguished heroes of the Grecian mythology His history is too well known to be recapitulated here His chief exploit was the conquest of *Medusa* (which see)

PERSEUS One of the forty eight ancient constellations, situated in the northern hemisphere

PERSEVE'RANCE, or FINAL PERSEVERANCE In Theology, the continuance of the elect in a state of grace to the end of their lives, which, according to some theologians, must always be the case with him who has once been truly called into such a state Since God is represented as the image of perfection and immutability in himself, so, it is argued, having once begun the preparation of a human being for a blessed eternity, he will not leave his work unfinished, but the person concerned must necessarily persevere to the end in a state of acceptance, under the absolute decree of which he was originally elected unto life

PERSIAN WHEEL In Mechanics, a contrivance for raising water to some height above the level of a stream In the rim of a wheel turned by the stream a number of strong pins are fixed [illegible] buckets [illegible] As the wheel turns the buckets [illegible] the stream, where they are filled and return [illegible] other side till they reach the top Here an obstacle is placed in such a position that the buckets successively strike against it and are overset, and the water emptied into a trough As the water can never be raised by this means higher than the diameter of the wheel, it is obvious that this rude machine is capable of only a very limited application Sometimes the wheel is made to raise the water only to the height of the axis In this case instead of buckets the spokes are made hollow, and bent into such a form that when they dip into the water it runs into them, and is thus conveyed to a box on the axle, whence it is emptied into a cistern Such wheels are in common use on the banks of the Nile, and elsewhere

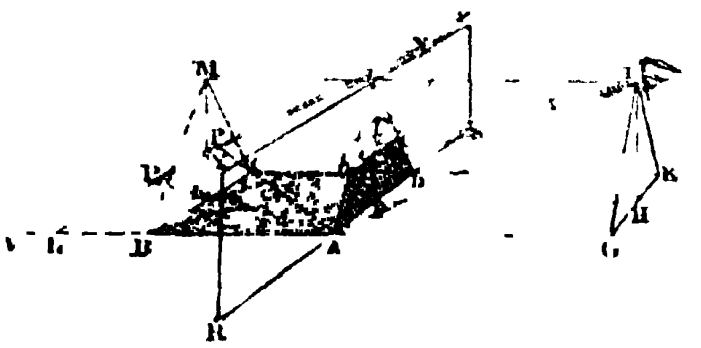
PERSISTENCE (Lat per, *through*, sisto, *I remain*), in Optics signifies the duration of the impression of light on the retina after the luminous object has disappeared Thus, if a lighted torch is whirled round rapidly, a continuous circle of light is seen A great number of illusions of the same kind, as the augmentation of the [illegible] a musical chord when in vibration [illegible] in accompanying a falling meteor, &c, are explained by this property of vision, and it has been ingeniously applied by Professor Wheatstone to measure the velocity of electric light



PERSON *See* GRAMMAR

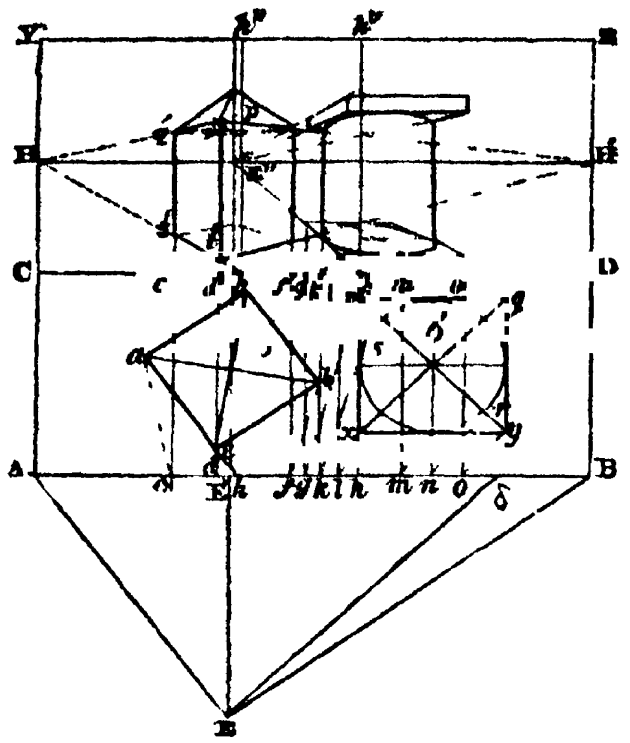
PE'RSONAL PROPERTY, according to the division recognized by our law is best defined negatively as including every thing which may be made the subject of property and which is not legally considered as appertaining to land The original distinction was undoubtedly between things moveable and immoveable But, on the one hand a personal interest may be acquired in things immoveable, [illegible] in land by lease for years (chattels real), while on the other hand, some things not affixed to the soil and some bare rights and privileges are considered as freehold The distinction, therefore, is scarcely maintained with philosophical accuracy, although we may still consider that every thing which is of a freehold nature is either obviously or constructively connected with the enjoyment of land or, in technical language, *savours of the realty*, while every thing wholly unconnected with land falls under the denomination of chattels personal The term *chattel* is derived from the barbarous Latin word *catallum*

Besides chattels real already adverted to, personal property is said to be either *in possession* or *in action* The first class of objects includes every thing comprehended under goods and chattels ready money and stock, or such animals as are the subjects of property the second class are legally termed *choses* or things in *action*, and are defined to be things to which a man has a bare right without any occupation the possession whereof may be recovered by a suit or action at law Of this class therefore, are all debts and the securities for them unless these securities attach on land Sums of money due on bond on bills of exchange and promissory notes, property in the funds all fall within this comprehensive class, which originally so trifling as to be hardly noticed in early jurisprudence, now comprehends by far the greater part in value of the moveable property of our commercial community



PERSONIFICATION, or PROSOPOPOEIA In Rhetoric and Composition a figure of speech being a species of metaphor (*see* METAPHOR) by which inanimate objects or abstract notions are represented as endued with life and action sometimes by being addressed as living agents (*see* APOSTROPHE), at other times, by being coupled with attributes which belong only to living agents

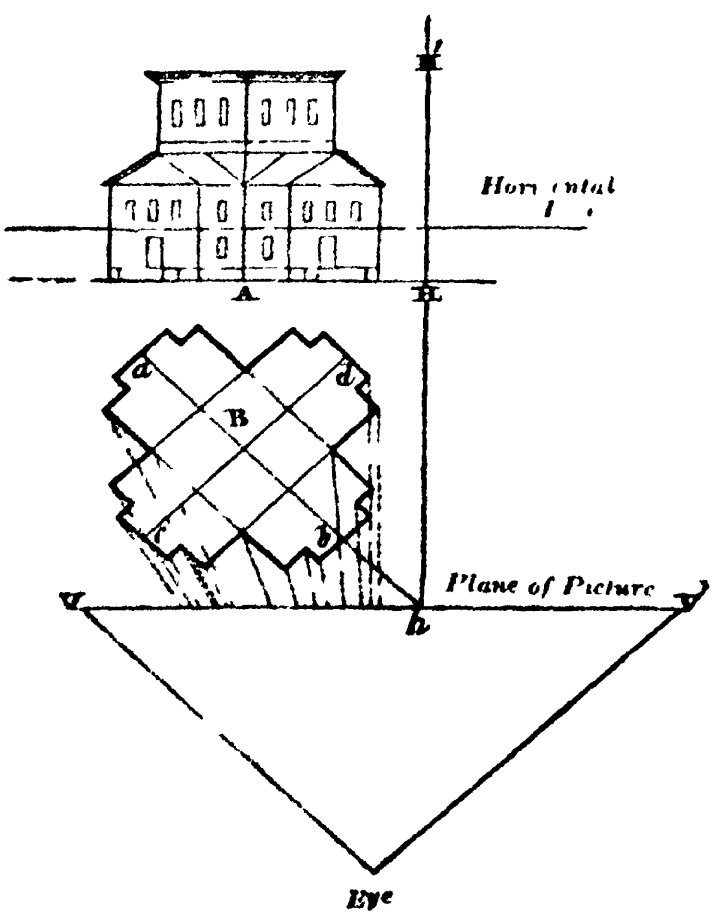
PERSPECTIVE (Lat perspicio, *I look through*) In the Fine Arts the art of delineating on a given transparent plane or superficies objects as they appear to an eye placed at a given height and distance From the definition it is evident that to delineate the true appearance of an object on a plane surface it becomes necessary to know the laws according to which the apparent linear dimensions of an object increase or decrease, and they are these generally —1 The visual angle or the apparent magnitude of a line will be less the greater the distance and the converse, 2 It will be less the more obliquely a line is viewed, 3 The law of diminution will be nearly in proportion to the obliquity and distance conjointly In the following diagram, let the eye



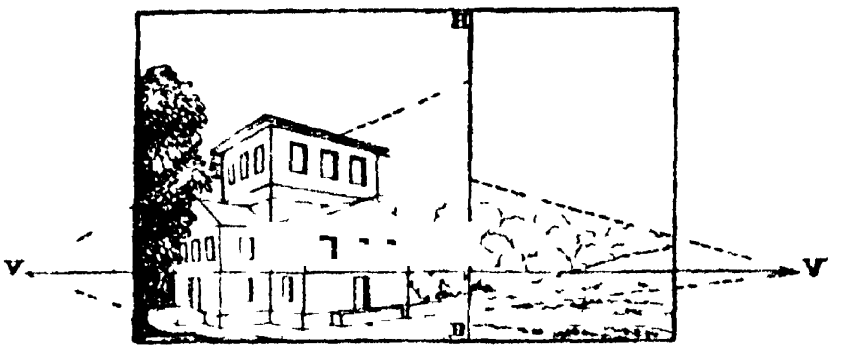
of the spectator be at I, and let E I G H be the plane on which the appearance of objects is observed This is called the *perspective plane*, or *plane of the picture* Now the [illegible] will [illegible] considered with respect to the perspective plane [illegible] particular situations of object planes are the main points for consideration It is manifest that any plane passing through the eye can only be seen on the perspective

plane as a line, for the eye, having neither elevation above nor depression below such plane, can see no part of its surface, its edge being all that is visible to the eye Of [illegible] in perspective, viz [illegible] O K I M, parallel to the horizon [illegible] *plane*, Q P R N, perpendicular to the [illegible] intersects the perspective plane in the line L K, called the *horizontal line*, and the last in the line Q P, called the *vertical line* Planes [illegible] through the eye must have a *direct* or an *oblique* [illegible] tion relative thereto If the former, it must be parallel to the perspective plane, which is supposed to be placed *directly* before the eye, thus, the plane A B C D is a direct one, and parallel to the perspective plane G L Of the planes situated obliquely to the eye, the most considerable is A F H D, which is called the *ground plane*, and is parallel to that of the horizon From the foregoing observations, then, it appears that objects in the surfaces of the horizontal and vertical planes cannot be seen by the eye at I, and therefore cannot be represented on the perspective plane If O B be an object in the direct plane, and from the extreme points O and B the visual rays O I, B I be drawn to the eye at I, they will pass through the perspective plane in the points *o* and *b*, and by joining them the right line *o b* will be the representation of the line or object O B on the perspective plane In like manner the representation of O A is *o a* and *b r* and *a n* will be the representation of B R and A N, and consequently *r b a n* of R B A N &c &c So all lines parallel to A B or C D in the object plane will have their perspective lines parallel to *a b* and *c d* in the picture on the perspective plane, and however the object plane A C may be divided their representations on the perspective plane or planes of the picture will divide that in a similar manner Any point B in a direct plane has the same ratio of distance from the horizontal and vertical planes as its perspective has from the horizontal and vertical planes viz that of the distances of the planes from the eye from the nature of similar triangles hence the forms of objects on the perspective plane when they are presented in a direct view, may be drawn with facility The last species of plane whereon it is supposed we may view the natural object is that of the ground itself as A D H I above which the eye has more or less elevation, as P equal to I Y This is hence called the [illegible] its [illegible] H F with the perspective [illegible] It is more important than all others as being the common table as it were on which every thing is placed In respect to the horizontal plane, we have seen that the two remote angles there of A and D are represented by *a* and *d* in the perspective plane, the other two angles, I and H are in the same plane also as being common to both, therefore by drawing the lines *a* I and *d* H there [illegible] and H on the perspective plane [illegible] perspective appearance of the ground plane A D H I Thus, *a* I is the perspective of A F, *n* P of N P and *d* H of D H and lines that are parallel in the ground plane and perpendicular to the perspective plane are not so in their perspective picture, but converge to a point *r* called the *point of sight* in the perspective plane, because exactly opposite to the eye or the point in which a perpendicular from the eye falls on the plane In the ground plane draw V W parallel to A D, its perspective *v w* will be parallel to *a d* in the picture and *a d w v* will be the perspective of the part A D W V in the original plane We shall now proceed to a demonstration of what relates to forming the perspective appearance or picture of the ground plane and objects upon it Let A B C D in the following diagram, be a right-lined figure on the ground

plane V G K C, [illegible] right angles with the perspective pla[illegible] I [illegible] the distance of the plane, and H I the height of the eye at I H F is parallel to G B or C K, and bisects A D and B C in the points F and E On the point F raise the perpendicular E M, equal to H I, and draw the lines B M, C M, G I, and K I Draw the visual lines I A, I B, and I M, which is called the *principal ray* [illegible] I G B M intersects the perspective plane in the line A *t*, and the ray B I being in the said plane G M, must intersect the line A *t* in some point *b*, which is therefore the perspective of the point B hence A *b* is the perspective of the line A B Also, as the plane I K C M intersects the perspective plane R Z in the line D *s*, and the ray I C is in that plane, and intersects the line *s* D in the point *c*, that point will be the [illegible] point C, and D *c* that of the [illegible] points *b c*, the line *b c* will be the perspective of the line B C in the ground plane Let A B equal D C, then B C will be parallel to A D, and as in this case A *b* is equal to D *c*, *b c* will be parallel to A D also From this it is manifest *that all right lines, as* B C *in the ground plane, which are parallel to the ground line* A D *will also be parallel to the same in their representations on the perspective plane* It is moreover evident *that the representations* A *b*, I *e*, D *c*, *of all lines* A B, F E, D C, *perpendicular to the ground line* A D, *converge or tend to the point of sight s in the perspective plane* If the line A B be carried out infinitely in the direction of V, then, supposing the point B to move along that line continually, the visual ray B I will keep rising on the plane I G B M towards I M, making the angle B I M less and less, till the point B being at an infinite distance the ray I B will coincide with I M, and consequently the line A *s* will be the perspective of A B continued infinitely So D *s* will be the representation of the line D C continued infinitely Hence *the triangle* A *s* D *will on the perspective plane, be the true representation of the plane* A B C D *carried out infinitely on the plane of the horizon* Hence, also, the line Y *s* Z is the perspective of the horizon or boundary of the sight at an infinite distance, and therefore all objects on the plane of the horizon will, in their representations, be seen to rise from the ground line towards the point of sight, and lessen [illegible] as they grow more distant, till at last they [illegible] in the horizontal line Y Z We now come to lines which be oblique to or make an angle with the ground line A D, or any other parallel to it Make A L equal to A G or I *s*, and draw A *p* to make any angle *p* A R or *p* A D with the base A D, acute or obtuse Then in the horizontal line Y *s* take *s* X, equal to I *p* and draw *p* X and *s* X, the plane I X *p* A will intersect the perspective plane in the line A X Draw the visual ray I *p* which, being in the plane I X *p* A, must go through the perspective plane somewhere in the line A X which suppose at *r* Then is the point *r* the perspective of *p*, and since the point *p* is supposed to pass from A to *p* in describing the line A *p* its perspective *r* will move in the plane A Z from A to *r*, and describe the line A *r*, which therefore will be the representation of the line A *p* If A *p* be carried out infinitely, and the point *p* supposed to move constantly therein, its representation *r* will appear to move towards X, till at length the point *p* being at an infinite distance, *r* arrives at and coincides with X in the horizontal line A X is therefore the representation of the line A *p* infinitely continued and X is called the *accidental point* to which the representations of all lines parallel to A *p* tend Let I P be taken equal to A I and *s* Z equal to *s* I, then, joining A P and *s* Z the triangles A P I and *s* Z I are equal Then will the plane *s* A P Z intersect the perspective plane in the line A Z which will be the representation of the line A P carried to an infinite distance But since A I is equal to I P and L P is parallel to A D, therefore A P is the diagonal of a square and contains an angle D A P of forty five degrees with the ground line A D, hence the point of distance Z is that to which all rays parallel to A P tend in the perspective plane Let A B equal A D, then is A B C D a geometrical square, and its diagonal A C, whereof the representation is A *c*, and the point *c* is therefore [illegible] the perspective diagonal A Z intersects the ray [illegible] D Make *s* Y equal *s* Z or *s* I, and join D Y, and it will be the perspective diagonal of D B (the other diagonal of the square A C) infinitely continued and D *b* the representation of the diagonal D B determined by the intersection of the lines D Y and A *s* as before Thus it is demonstrated that A *b c* D on the perspective plane A S Z Y is the true picture or perspective representation of the original square A B C D on the ground plane, as required



From the above principles are deduced the common rules of perspective of which we shall give two or three examples A B C D is a ground plane, whereon are seated the objects O and O' The line A B is the plan of the plane of the picture or its intersection with the ground plane and C D Y Z is the plane of the picture, or the perspective plane, as we have before called it It will be observed that one of the objects, O, lies obliquely towards the perspective plane, and the other is parallel to it or direct We will first deal with the former From the station of the eye, E, parallel to *a e* and *e b*, two of the sides of the object, draw the lines E A and E B, cutting the plane of the picture in A and B Then will A be the vanishing point of all lines parallel to *a e*, as will be B of all lines parallel to *e b* E' is the place of the eye at the intersection of the ground plane with the picture, being a perpendicular from A B to E. If H H' be the horizontal line, then H E'', equal to A L', is the place of the eye on the perspective plane From the different points of the object *a e b* draw towards E as a centre the visual rays *a c*, *e d*, *b f*, intersecting A B in



…, and *f*; and from … verticals *c c'*, *d d''*, …

sides *a e* and *e b* respectively On the plan continue … of the sides *a e* till it intersects the picture in *h*, and …ce C *h'* on the perspective plane equal to A *h* on the …, and draw the vertical *h' h''*, which will be the *line* …*eights* on which they are to be set out Then if *h' p* …he height of the object O lines drawn from *h'* and *p* …he vanishing point H will intersect the verticals in …d *r* and *s'* and *t'* In like manner lines drawn from …nd *r''* towards the vanishing point H will give the …esentation of the other side Lines drawn in oppo… directions at the top of the figure (dotted in the …ram) will enable the draftsman to draw diagonals from …se intersection a vertical may be raised for crowning … object with a pyramid or other figure In respect …he object O', which on the plan is a square circum…bing a circle, the object being direct or parallel to … picture, all those lines parallel to it will be hori…tal, and the vanishing point of the returning sides … *q y* will be found in F' (or F'' in the picture), which …r the former case is found by a line from F parallel …ose sides intersecting the picture Similarly a line …I parallel to *x q*, intersecting the picture in δ will …he vanishing point of all diagonals of a square in that …ction The visual rays tending to F, shown at *g k l* … are to be transferred to the picture by verticals as be…

In this object *h h' h''* will be seen to be the line of …hts, on which all heights are to be set out The …pective extent of a circle is easily obtained by lines …nding its convexity transferred by the visual rays *s k* …o the picture which, aided by the diameters will give … form required To give the reader a general notion …e common mode of proceeding in perspective repre…ations of buildings, we present the following dia…ns B is the plan of a building to be thrown into

perspective, inclined to the plane of the picture at any angle *v h a* The vanishing points of all lines parallel to *a b* are found by a line from the eye parallel to *c b* cutting the picture in V Similarly, V' is found to be the vanishing point of all lines parallel to *c d* If *a b* be continued to *h*, it gives the place of the line H H', whereon the heights of the different parts of the elevation A may be set according to their several altitudes The place of the horizontal line is chosen so as to afford the most agreeable representation of the object, its height depending, of course, on that at which the eye would most probably be placed, or might be supposed to be The visual rays to the eyes are shown by the dotted lines Having thus prepared the geometrical plan and elevation of the object, the plane of the picture is set out as under, and the reader must observe that the whole extent of it hori-

zontally must not take in an angle of more than sixty degrees that being as great as the eye can take in without turning the head though in internal views a …terably generally tolerated It is to be observed … in the elevation in the representation, for the sake of greater distinctness is doubled in dimensions from the plan The place of H H' is transferred to the picture, and the height carried down from it to the vertical lines, whose places have been found by the visual rays above mentioned The vanishing points V and V' are transferred to the horizontal line V V' and the horizontal lines in the sides tend thereto It is obvious that a similar process enables the draftsman to make internal representations the principles whereon they are conducted being precisely the same It is needless to expatiate on the importance of perspective to the painter, and though Fresnoy has advised that 'the compasses should be rather in his eyes than in his hands," it is clear that without a knowledge of its laws he can never hope to succeed

That perspective was unknown to the ancients, as some have supposed is a mistake What has led to such an error has been perhaps, the violation of its rules in basso relievo and particularly in those on the Trajan column where attention to them would have been impossible if not improper Another ground for the supposition is the ignorance of perspective displayed in the paintings of Herculaneum and Pompeii But such examples are no proof How many painters of our own days some of them even possessing a certain sort of reputation, are sadly ignorant upon the subject The truth is that the ancients were not only eminent for their success in painting walls with architectural subjects, but they were also known to have required the practice of this branch of the arts in the decorations of their theatres To such a point of perfection was it carried, if we may rely on Pliny that in the decorations of the theatre of Claudius Pulcher the imitations were so striking that the birds attempted to alight on the tiles of the roofs This probably, however is but a figurative description of the work and that it was so intended, for otherwise it would be drawing rather too largely on our credulity Vitruvius tells us in the Preface to his 7th Book that perspective was well understood at a very early period His words are, "Agatharchus at the time when Æschylus taught at Athens the rules of tragic poetry, was the first who contrived scenery, upon which subject he left a treatise This led Democritus and Anaxagoras, who wrote thereon, to explain how the points of sight and distance ought to guide the lines, as in nature, to a centre, so that by means of pictorial deception, the real appearances of buildings appear on the scene, which, painted on a flat vertical surface, seem nevertheless to advance and recede" Neither was the practice of perspective confined to the representations just mentioned Its knowledge was considered equally necessary in pictures The painter Pamphilus, whose celebrated school of design was at Sicyon, taught perspective publicly, and carried his opinions on this head to such an extent that he considered no perfect painting could be executed without a knowledge of geometry "Omnibus litteris eruditus præcipuè arithmeticæ et geometriæ, sine quibus negabat artem perfici posse"

The earliest authors on the subject whose works have reached us are Bartolomeo Bramante of Milan whose work *Regole di Prospettiva e Misure de' Antichi di Lombardia* appeared in 144… and Pietro della Fr… who as he died in 1443, probably wrote earlier Baltazare

P[illegible] advanced the [illegible], publishing his work at Pesaro in 1[illegible], established its principles on a basis which left little to be done by our countryman Dr Brook Taylor, the first Englishman who wrote scientifically on the subject The works on the subject are in every language very abundant, but, in our own, the work of Thomas Malton, published in folio, London, 1776, entitled *A complete Treatise on Perspective in Theory and Practice, on the Principles of Dr Brook Taylor*, is the most valuable to the student, and should be in the hands of every one who has a desire to be thoroughly [illegible] subject

PERSPECTIVE, AERIAL *See* AERIAL

PERSPIRATION (Lat perspiratio) The vapour secreted by the ramification of the cuticular arteries over the surface of the body In the healthy state it is slightly acid and saline According to Lavoisier and Seguin, the greatest amount of perspiration exceeds six pounds in the twenty four hours, and the smallest two pounds, it is at its maximum immediately after taking food and decreases during digestion Whatever quantity of food is taken, or whatever are the variations of the atmosphere, the same person, after having increased in weight by all the food he has taken, returns in twenty-four hours nearly to the same weight he was the day before, provided he is not growing and has not indulged in any excess

The substances perspired are water, carbonic acid, saline substances, lactic acid, and some organic matter In certain cases of disease, the perspiration is not only greatly modified as to quantity but often as to quality

PERTURBATION In Astronomy the deviation of a celestial body from the elliptic orbit which it would describe if acted upon by no other attractive force than that of the sun, or central body about which it revolves If the planets exercised no attraction on each other the orbit described by each of them would be accurately an ellipse having the sun in one of its foci, and the law of the motion such that the area described by [illegible] the centre of the sun and the planet [illegible] areas in equal times But in consequence of the universal [illegible] body in the system is more or [illegible] ive influence of all the others and is consequently forced to deviate from the path it would describe in virtue of the central force acting alone The forces which cause these deviations are called the *perturbing* forces, and the determination of their effect on each orbit is the great problem of physical astronomy

The simplest case of the problem is a system in which there are only three bodies — a central body and two revolving bodies disturbing the motions of each other Such, for example would be the case of the sun the earth and the moon if all the other planets were conceived to be annihilated [illegible] force was inverted [illegible] let one of the revolving bodies be called the *disturbed* and the other the *disturbing* body Now it is by no means difficult to obtain a general idea of the effects that must be produced by the disturbing force It is easy to see for example that in certain positions of its orbit the motion of the disturbed body must be accelerated and in others retarded, that in one case it may be drawn above and in another depressed below the plane of the orbit it would describe about the central body But a far more difficult problem remains — namely that of determining the ultimate effect of the reciprocal action of the revolving bodies after an infinite number of revolutions When the masses and distances of the bodies are supposed to be given this is a problem of pure mathematics, but such is its difficulty that even when restricted to three bodies, its general solution transcends the power of analysis, and it is only in a particular case (that however, which is presented by nature) namely when the mass of the disturbing body is very small in comparison of the central one that mathematicians have succeeded in integrating the equations of motion, and determining the final results

It is easy to conceive that if the problem presents great difficulties when only three bodies are taken into consideration, these difficulties must be infinitely increased when it is attempted to investigate the reciprocal actions of all the individuals composing the solar system To determine the circumstances of the motions of so many bodies projected in space and abandoned to their mutual attractions, is a problem indeed which far transcends the power of any known calculus Nevertheless there are circumstances in the peculiar constitution of the solar system which enable us not only to foresee the general effect, but to determine the form and dimensions and position of an orbit, and the place of the body in it, at any given time past or future, with all the precision which [illegible] These circumstances [illegible] place, by reason of the immensely preponderating attraction of the sun, the force by which any planet is attracted by another is extremely feeble in comparison of that by which it is retained in the orbit it would describe if there was no other body than itself and the sun Hence the deviations from that orbit are small and the disturbing action of each planet admits of being computed independently of the others In the second place, all [illegible] of a few degrees [illegible] comparatively feeble influence in drawing one another from the planes of their orbits In the third place, the system is broken up into subordinate and partial systems, which are almost independent of one another Thus, for example, the Sun, Jupiter, and Saturn form a system, in which the two planets exert a very sensible action on each other, but are very little affected by the influence of any other body, and the same is the case, though in a less degree, with Venus and the Earth By reason of these circumstances mathematicians have been enabled to accomplish what would otherwise have been impossible, and to express the disturbing forces of the several bodies of the system by algebraic equations, from which the positions of all the planets and the principal satellites are computed for several years to come, and reduced into tables for the purposes of navigation

The inequalities produced in the motions of the planets by their reciprocal actions are divided into two kinds The first depend on the *configurations* of the planets, that is the relative positions they have with regard to each other, and, as the inequalities depending on this cause increase, diminish and disappear after certain intervals of time they are called *periodic inequalities* Those of the second kind are independent of the relative positions of the planets they are also periodic, but their periods are incomparably longer than those of the first kind, hence they are called *secular inequalities*, as if their periods were not to be reckoned by years, but by centuries It is by the discovery of the periodic nature and ultimate compensation of all the inequalities of both kinds, occasioned by the perturbing forces that the permanent stability of the system is demonstrated

In order to assure the stability of the planetary orbits, three elements must remain constant or be subject only to small periodic fluctuations These are, 1 The major axis of the orbit, or the planet's mean distance from the sun 2 The inclination of its orbit to a fixed plane, and 3 The eccentricity of the orbit Now with respect to the major axes, it has been demonstrated by Lagrange that they are exempted altogether from secular inequalities, and are subject only to periodical changes depending on the configurations of the planets They are therefore restored to their former values when the planets resume the same relative positions, and their mean values, and consequently the mean motions which depend upon them, remain unalterably the same With regard to the inclinations and eccentricities, they are affected both by periodic and secular inequalities, but their secular changes are confined within very small limits, and ultimately work out a compensation Besides, the inclinations and eccentricities of the different orbits are connected with each other in such a manner, that whatever any one orbit gains in either of these respects is lost among the others These relations are defined by the two following theorems discovered by Lagrange than which analysis has furnished no more remarkable or beautiful results —

1 If the mass of every planet be multiplied by the square root of the major axis of its orbit, and the product by the square of the tangent of its inclination to a fixed plane the sum of all these products will be constantly the same under the influence of their mutual attraction

2 If the mass of each planet be multiplied by the square root of the axis of its orbit, and the product by the square of the eccentricity the sum of all such products throughout the system is invariable

From the periodic nature of the changes produced in the three elements mentioned above, it follows that the whole effect of the perturbing forces is to cause the system to oscillate about a mean state and that the inequalities of the planetary motions are all compensated in the long run and that consequently the system contains within itself no element of destruction, but is calculated to endure for ever unless an external force be introduced These results of [illegible] have point of view, by far the most [illegible] whole range of astronomical discovery They are not deduced, however from the solution of [illegible] of the motion of bodies mutually [illegible] but are founded on certain conditions which belong to the individual system, viz 1 That the eccentricities of the orbits are inconsiderable, 2 That the inclinations to the plane of [illegible] all the planets, primary [illegible] are direction Now these conditions are not necessary consequences of gravitation For anything that has been proved to the contrary, a system might exist under the Newtonian law of gravitation in which not one of them would be satisfied Of their final causes, however, we are, and may ever remain, entirely ignorant, but the fact of their existence (for the chances are almost as infinity to one

that they are not accidental) proves clearly enough that [illegible] the directions of [illegible] must have been communicated to all the planets and satellites by the same mechanical cause

The history of the problem of the perturbations dates from the discovery of universal gravitation Newton himself pointed out the general effects which the mutual attractions of the planets must have on the motions of each other, and applied his theory to the investigation of the precession of the equinoxes, and the inequalities of the moon The problem of three bodies was solved by Clairaut, D'Alembert, and Euler, about the middle of the last century Euler first pointed out the periodic nature of the variations of the orbits of Jupiter and Saturn occasioned by their mutual perturbations Laplace remarked that on taking account of some of the first terms of the analytical development of the expressions of the perturbed orbits, those on which the secular inequalities depend are capable of increase only within certain limits and Lagrange demonstrated generally that no secular inequality of this order proceeding to the time can possibly enter into the expression of the greater axis of the orbit, or the mean motion which depends on it It may be said that the discoveries of these two great mathematicians completed the theory of gravitation inasmuch as every inequality in the system not previously accounted for was by them referred to its proximate cause, and its analytical expression assigned The labours of all succeeding mathematicians in the department of physical astronomy have been confined to the extension and simplification of their theories

For a popular account of this subject the reader may consult *Laplace's Systeme du Monde*, *Sir J Herschel's Outlines of Astronomy*, and *Airy's Gravitation* The mathematical theory is contained in the *Mecanique Céleste*, and other works on physical astronomy (See also, *Encyclopædia of Nat Phil*, *Woodhouse's Astronomy*, [illegible], *Théorie Analytique du Système du Monde*, Gautier, *Essai Historique sur le Probleme des Trois Corps*)

PERTU'SSIS The hooping cough

PERU'VIAN BALSAM The produce of the *Myroxylon Peruvianum*, a tree which grows in the warmest parts of South America It is obtained by boiling the twigs in water It is a thick brown liquid of a fragrant odour and a pungent and bitterish flavour

PERUVIAN BARK *See* CINCHONA

PERVIGI'LIUM (Lat from vigil *watchful*, a watch lasting through the night) The nocturnal festivals to some deities were so styled by the Romans The *Pervigilium Veneris*, a beautiful relic of Latin poetry is attributed by some critics to Catullus

PESTILENCE (Lat pestis) Any contagious or infectious disease which is endemic or epidemic and mortal The term is also used in a moral sense *See* PLAGUE

PE'TALISM (Gr πεταλον, *a leaf*) In Antiquity a form of condemnation practised at Syracuse by which persons who from their wealth or influence were considered dangerous to the state were banished for five years, with leave to enjoy their estates and to return for that period It was in fact only another form of the Athenian ostracism (*see* OSTRACISM) with this difference that in the latter the condemnation was written on shells and lasted for ten years whereas in petalism leaves were made use of and the condemnation lasted only five years

PI'TALITE A Swedish mineral of a grey or reddish colour and a foliated texture It is a silicate of alumina and lithia, and contains between five and six per cent of the latter alkali

PETALO'CERANS *Petalocera* (Gr πεταλον *a leaf*, κερας, *a horn*) A tribe of Coleopterous insects including those which have antenna terminated by a foliated mass

PETALOI'DEUS (Gr πεταλον and ειδος *like*) A term applied by botanists to any organ the texture and colour of which resemble a petal

PE'TALS (Gr πεταλον) In Botany, the divisions of the corolla of a plant

PETA'RD (Fr) In Artillery, an engine formerly much used for breaking down gates barricades &c The petard had some resemblance to a high crowned hat It was formed of gun metal was about seven inches deep and five inches in diameter at the mouth and held from nine to twenty pounds of gunpowder When about to be used it was screwed to a thick plank, and suspended before the gate to be burst open Petards were first used by the French Hugonots at the siege of Cahors in 1579 Their use is now discontinued, and it has been discovered that gunpowder in loose bags is equally efficacious

PE'TASUS (Gr) A broad brimmed hat used on journeys by the classical incients, hence a petasus with wings attached to it is the emblem of the celestial traveller Mercury

PETAURI'STA *Petaurus* (Gr πεταω, *I expand* and ουρα, *a tail*) The name of a genus of Marsupial animals, which have the power of taking extensive leaps like the flying squirrel by means of a membrane which stretches between the fore and hind extremities aided by the expanded tail

PETECHIÆ (Lat petechia) Small spots produced by effusions of blood in the skin, immediately under the cuticle They resemble flea-bites, and usually indicate an altered and impure state of the blood

PE'TER-PENCE The popular name of an impost, otherwise termed "the fee of Rome," or, in the Anglo-Saxon, "Romescot" originally a voluntary offering by the faithful to the see of Rome, afterwards a due levied in various amounts from every house or family in a country Peter pence were paid in France, Poland, and other realms In England this tax is recognized by the Norman laws of William the Conqueror Edward III discontinued the payment when the popes resided at Avignon, but it was afterwards revived, and finally ceased in the reign of Henry VIII

PE'TIOLE That portion of a leaf that connects the lamina with the stem of a plant, the footstalk

PETI'TION (Lat peto, *I ask*) signifies generally a supplication preferred by one person to another, who is supposed to be capable of granting the request The right of the British subject to petition either house of parliament, or the king is founded on the Bill of Rights But this act is not considered as having repealed 13 C 2 stat 1 c 5, by which it is criminal to solicit or procure the putting the hands of more than twenty persons to a petition for alterations in church or state, unless by consent of three or more justices, or a majority of the grand jury at assizes or sessions, &c, and repairing to the king or parliament to deliver such petition with above the number of ten persons is also rendered criminal

PETITION In Law an application in writing, addressed to the Lord Chancellor, the Master of the Rolls, or to the equity side of the Court of Exchequer, in which certain facts are set forth as the ground on which the petitioner rests his prayer for the order and direction of these respective courts Petitions are of two kinds —*cause petitions* or *exparte petitions* The former are those in regard to matters of which the court is already in possession by virtue of there being a suit concerning their subsistence (the petitioner in this case being either generally a party to such suit or in some way or other possessing an interest therein) the latter (*exparte petitions*) are so called when there is no suit existing about the matter of the petition Both these kinds of petitions are susceptible of numerous subdivisions

PETITIO PRINCIPII (Lat *a demand of the principle*) In Logic, a popular designation for a species of vicious reasoning which consists in tacitly assuming the proposition to be proved as a premise of the syllogism by which it is to be proved, vulgo *begging the question*

PI'TONG The Chinese white copper, it is an alloy of copper and nickel *See* PAKFONG

PI'TRIS In Ornithology *See* PROCELLARIÆ

PI'TRIFACTIONS (Lat petra *a stone* and facio, *I make*) A general term by which naturalists designate the conversion of vegetable or animal materials into a stony substance The word is equivalent with such expressions as organized fossils organic remains, &c which however are all liable to exception on the ground of not distinctly explaining what they are meant to denote and though the term *petrifaction* is itself open to censure on the same score it does not seem that any other word more acceptable to the naturalist has hitherto been found to supersede it The branch of science which treats more peculiarly of substances in a petrified state is usually denominated *Oryctology* which see

PI'TROBRU'SIANS The followers of Peter de Bruys a heretic or reformer of the 12th century who declaimed with great success against the vices of the clergy and gathered around him considerable numbers of adherents in the south of France The exact opinions which he advanced are only to be collected from the assertions of his adversaries, who at a time when the lower classes throughout Europe were listening eagerly to violent and perhaps fanatical oppugners of the dominant church, did not fail to exaggerate and discolour their doctrines to suit their own purposes Besides the vague charge of Manicheism which was made against most of these sectarians the imputations cast upon them chiefly refer to their contempt for the ordinances of the church, in which it is very probable that along with the real abuses of the day, the crucifixes, images, and relics, the ignorant multitude may have included the sacraments and other purer ceremonies in one indiscriminate abhorrence A treatise was composed [illegible] St Bernard (See *Faber's Albigenses* [illegible] *History of the Church* ch xviii)

PI'TROLEUM A brown liquid bitumen, found in several parts of Europe, in Persia, and in the West Indies It is often termed *Barbadoes tar*

PI'TROLINE A substance [illegible] the petroleum of Rangoon, [illegible]

PE'TROSI'LEX A variety of flint or hornstone The term is sometimes applied to compact felspar

PETU'NTZE (Chinese) A decomposing variety of felspar, used in China in the manufacture of porcelain

PE'WORTH MARBLE called also *Sussex Marble* [illegible] limestone, occurring in the [illegible] the remains of fresh-water shells *See* GEOLOGY

PEUTINGERIAN MAP or TABLE (Germ Peutinger Tafel, so called from Conrad Peutinger, a native of Augsburg, who was the first to make it generally known) The name given to a map of the roads of the ancient Roman world, written on parchment, and supposed to have been [illegible] the time of Alexander Severus, A D 22[illegible] which is 21 feet in length, and only [illegible] is deposited in the imperial library at Vienna, but copies of it are to be found in the *Ptolemy* of Bertius, in Horne, *Orbis Delineato*, in Bergler, *Historique des Grands Chemins de Empire Romain*, and part of it in *Murray's Encyclopædia of Geography* Combined with the celebrated *Antonine Itinerary*, which it serves admirably to illustrate, though it differs from the latter in several essential particulars, the Peutingerian Table may be justly regarded as one of the most valuable bequests of ancient geography to modern times In this table the high road which traversed the Roman empire in the general direction of east and west is made the first meridian and to this every part is subjected The objects along this line are minutely and faithfully exhibited, but of those lying to the north and south of it only some general notion can be conveyed From the novel and peculiar construction of the table, every object is of course enormously extended in length and reduced in breadth (See *Manner's Introduction* to his new edition of the *Peutingerian Table* Leipsic 1824)

PEWTER An alloy of tin with lead and antimony frequently bears this name but the best pewter was formerly made of 12 parts of tin with 1 of antimony, and a very small addition of copper A fine pewter is made, according to Aiken by fusing together 100 parts of tin, 8 of antimony 1 of bismuth, and 1 of copper The use of these additions to tin is to harden it and preserve its colour, and a good pewter when clean and polished, has a silvery lustre and does not readily tarnish Common pewter of which measures and pewter pots are made, is an alloy of lead and tin

PHAETON (Gr φαεθων *shining*) In Mythology the son of Apollo and Clymene one of the Oceanides according to most writers The fable of his adventures is well known Taunted with his doubtful origin he asked his father to lend him the chariot of the sun for a day, as a proof of his filial rights Unable to guide the fiery steeds, he was dashed to the ground by Jupiter with a thunderbolt to prevent his consuming the heavens and earth The best known narrative is that in *Ovid's Metamorphoses*

PHAGEDÆ'NIC (Gr φαγειν *to eat*) A term applied to ulcers which rapidly corrode and destroy the parts which they attack

PHALA'NGER, *Phalangista* (Gr φαλαγξ *a phalanx*) The name of a genus of Marsupial animals including those in which the second and third toes of each hind foot are united together as far as the last phalanx in a common cutaneous sheath, and which have a hinder thumb but no lateral cutaneous parachute

PHALA'NGES In Anatomy the small bones of the fingers and toes

PHALA'NGIUM, or SHEPHERD SPIDER The name of a genus of Arachnidans including those in which all the legs are very long and slender, the tarsi sometimes consisting of more than fifty joints

PHALANX (Gr φαλαγξ) The close order of battle, in which the heavy armed troops of a Grecian army were usually drawn up There were several different arrangements of the phalanx peculiar to different states, but the most celebrated was that invented by Philip of Macedon The men stood close together sometimes with their shields locked, in ranks of several men in depth displaying in front a row of long extended spears The phalanx whose charge was irresistible on a smooth plain by a lighter body, was found to be overmatched by the combined strength and activity of the Roman legion which was able to take advantage of any inequality of ground, and charge in flank and rear, and when once an accident offered an opening in the unwieldy mass of the enemy, their confusion was inevitable and rally hopeless The phalanx is described in most works on Grecian antiquities, but see especially the *Mem de l'Ac des Inscr* vol xxiv xxv, and the Essay in vol xii by M de Maignal

PHALERA In Roman Military Antiquities, various kinds of ornaments were so called, chiefly but not exclusively appropriated to the equipment of horse soldiers, it was [illegible] the frontlets of the horses themselves [illegible] however, as the ornament of the man, and not the horse, that Virgil uses the word in the lines—

Euryalus phaleras Ramnetis et aurea bullis
Cingula humeris nequicquam fortibus aptat

(See the 3d and 22d Memoires of M le Beau on the Roman Legion, in *Mem de l'Acad des Inscr.* vols xxviii and xxxix)

PHALEROPE, *Phaleropus* (Gr φαλιερος, *scolloped*, and [illegible] The [illegible] ird, with the [illegible] [illegible] (Gr φανερος, and νευρον, *a nerve*) A name applied by Rudolphi to all those animals in which the nerves are distinctly eliminated

PHANTASMAGO'RIA (Gr φαντασμα *appearance spectre*, and αγορα *I collect*) A optical apparatus by means of which the images of objects can be magnified or diminished at pleasure, and motion given to them whereby a strong illusion is produced The apparatus is in fact nothing more than a magic lantern, in which the images are received on a transparent screen, and the sliders on which the figures are drawn rendered perfectly opake, excepting in the figures themselves, so that all light is excluded, excepting that which is transmitted through the image The lantern, mounted on wheels, is made to recede from or approach to the screen, by which the enlargement or diminution of the image is effected, and in order to preserve distinctness in the picture the tube in the side of the lantern which carries the lens is, by a particular mechanism drawn out or pushed in, so as to increase or diminish the distance between the lens and the slider, according as the [illegible] recedes from the screen The [illegible] very popular exhibition in lecture rooms (See *Hutton's Dictionary*, *Young's Natural Philosophy*, *Halle's Natural Magic*)

PHARISEES A sect among the Jews, whose name is derived from *Pharas*, a Hebrew word signifying *separated* or *set apart*, [illegible] the rest of the nat[illegible] peculiar holiness The time of their origin is not accurately determined, but they are referred to by Josephus as a considerable sect B C 110 In the time of our Saviour they constituted the most influential party among the Jews Though their rivals the Sadducees numbered amongst themselves some individuals of the highest rank, and those who affected to be conversant with the manners and philosophy of the Greeks and Romans the Pharisees embraced a greater proportion of the upper classes, and were supported by the admiration of the people, and the national feeling in favour of the opinions and habits of their ancestors Besides being strict interpreters of the written law, their sect superinduced upon it what they called the traditions of the elders and asserted that Moses delivered an oral law as a supplement to that of the scriptures They are frequently reproached by our Saviour with explaining the latter by the former, so as in effect frequently to destroy the validity of the written law They also attached a mistaken importance to many outward ceremonies of human invention, which they observed with a studied ostentation which gained for them the esteem and veneration of the multitude They maintained in opposition to the Sadducees, the popular doctrine of the resurrection, which, however, they appear to have corrupted with some vague notions touching the transmigration of souls

PHARMACO'LOGY (Gr φαρμακον *a medicine* and λογος) The history of the properties and uses of drugs

PHA'RMACOPŒIA (Gr φαρμακον, and ποιειν, *to make*) A book containing directions for the preparation of medicines

PHA'RMACY (Gr φαρμακον) The branch of knowledge which relates to the medical and chemical history of the different articles of the *Materia Medica* to the mode of prescribing them, their effects, and composition

PHARMA'KOLITE In Mineralogy, a term applied to the native arseniate of lime

PHA'ROS Properly the name of an island at the mouth of the harbour of Alexandria, on which a light house was erected, whence it came to be applied as common name for all lighthouses *See* LIGHTHOUSE

PHARYNGOTOMY (Gr φαρυγξ, and τεμνω, *I cut*) The operation of making an external opening into the windpipe necessary in certain cases of suffocation

PHA'RYNX (Gr φερειν, *to convey*, because the food is conveyed by it into the œsophagus and stomach) The back part of the mouth it is somewhat funnel shaped, attached to the fauces behind the larynx, and [illegible]

PHASCOLARCTOS (Gr φασκωλος, *a pouch*, and αρκτος, *a bear*) The name of a genus of Marsupial animals, of which the koala is the type its dentition is like that of the kangaroo rats, but it has no tail, and has short hind legs

PHA'SCOLOME, *Phascolomys* (Gr φασκωλος, and μυς *a mouse*) The name of a Marsupial quadruped commonly called the wombat which has the teeth of

Rodent animal, with the exception of an additional true molar on each side of both jaws

PHASE (Gr *φασις, appearance*), in A[illegible] notes the different appearances of the planets according as a greater or smaller portion of the hemisphere illuminated by the sun is visible to the observer The phases of the moon sometimes denote in particular the new moons, the full moons, and the quarters, these being the principal phases

PHASE in Natural Philosophy denotes the particular state, at any given instant, of a phenomenon which undergoes a period of change, or increase to a given point, and then diminishes in a regular gradation Thus we speak of the *phase of a tide*, the *phase of an eclipse*, &c

PHASIANIDÆ (Gr *φασιανος, a pheasant*) The name of the family of Gallinaceous birds of which the genus *Phasianus* is the type The pheasant is a native of warmer and dry[illegible] the Linnæan specific name *P[illegible]* Cuvier states that it was brought from the banks of the Phasis by the Argonauts and subsequently became diffused over all temperate Europe It is consequently a matter of difficulty to preserve the species in this country, and were it not for the assistance which the common fowl affords in hatching the eggs of the pheasant the breed would probably soon become extinct, for although the female produces a great many eggs in the artificial preserves of the wealthy sportsman yet she soon forsakes the task of incubation, when disturbed, as is too often the case, by the male

When roused the pheasant will not unfrequently perch upon the first tree, and seems more intent upon the dogs than the approach of the sportsman they betray themselves likewise by the habit which they have of crowing or making a chuckling noise at the time when they perch Foxes destroy many pheasants and as these are commonly females engaged in incubation the tendency to diminution of the race from this cause is increased But the chief loss of the pheasant breeder is caused by the mortality of the young birds, about the time of changing their nestling feathers produced by the development of great numbers of a peculiar species of Entozoon (*Syngamus trachealis*) in the windpipe This accumulation occasions a difficulty of breathing, and the convulsive attempt to gasp the air, or expel the worms has occasioned the name of "the gapes" to be given to this disease

The best remedy is a preventive treatment, by due attention on the part of the keepers to the young pheasants in keeping them clean and administering plenty and variety of food When the disease is far advanced obliging the birds to breathe air strongly impregnated with fumes of tobacco, carefully watching its effect, is the best remedy

The male pheasant is distinguished like most *Gallinacea*, by its superiority in size and brilliance [illegible] from the female, and the dependency of the [illegible] on the generative function is proved by the remarkable instances of assumption on the part of the female of more or less of the male livery consequent upon the [illegible] function in her either by age or by [illegible] the female organs The food of the pheasant varies according to the season in winter it consists chiefly of grain and seeds, in spring and summer of insects and nutritive bulbous roots, as that of the "crow-foot" (*Ranunculus bulbosus*)

The pure breed of *Phasianus colchicus* is distinguished by the absence of the white ring round the neck and the reddish copper tint of the croup Another species from China, with a white ring round the neck and a greener cast of colour especially upon the croup has also been imported and turned wild It seems to have produced a prolific race of hybrids with the common pheasant

China produces several other species which are remarkable for their superb and brilliant plumage, as the golden pheasant (*Ph pictus*), Amherst's pheasant (*Ph Amherstii*), both of which have a gorgeous ruff round the neck, and the latter is remarkable for its exceedingly long tail Also upon[illegible] Reeves's pheasant (*Ph Re[illegible]*) (*Ph nycthemerus*) from China, and the *Phasianus lineatus* from the mountains of Thibet, approach nearer in their carriage to the common fowl

PHŒNICIN (Gr *φοινιξ, purple*) The purple powder which is precipitated when sulphuric solution of indigo is diluted with water It appears to be an anhydrate of indigo

PHŒNICITES MARBLE *See* MARBLE

PHENOMENON, plural, *Phenomena* (Gr *φαινω, I shine*) In Natural Philosophy, this term is usually applied to those appearances of nature of which the cause is not immediately obvious such as the phenomena of light, of the magnet, of electricity, &c, produced by physical experiments, or unusual natural appearances, as meteors, comets, earthquakes, &c, which occur without the intervention of human agency

PHIGALIAN MARBLES so called from having been discovered near the site of Phigalia, a town of Arcadia, the name given to a series of sculptures in alto relievo, now deposited in the British Museum, where they form part of the collection known by the name of the *Elgin Marbles* They originally formed the fringe round the interior of the cella of the temple dedicated to Apollo the Deliverer, a title conferred on him by the Phigalians in gratitude for his having delivered them from a pestilence They represent the combat of the Centaurs and the Lapithæ, and that of the Greeks and Amazons The similarity, both in design and execution, which they bear to the decorations on the Parthenon leaves no doubt that they are the workmanship of the same great artists which designed, constructed, and [illegible] that monument of the golden age of art *See* PARTHENON, ELGIN MARBLES

PHILADELPHIANS (Gr *φιλεω, I love, ἀδελφος, brother*) A secret society said to have existed in France during the government of Napoleon, and to have produced the conspiracy of Colonel Malet in 1812 An account of it is given, but we do not know how far it is to be understood as narrating matters of fact in the *Histoire des Sociétés Secrètes de l'Armée* published in 1814

PHILANTHROPINISM A name given in Germany to the system of education on natural principles, as it is termed which was promoted by Basedow and his friends in the last century and mainly founded on the notions of Locke and Rousseau An institution for the purposes of education, founded under the protection of the Duke of Dessau in 1774, was the first so called "Philanthropin" It was dissolved in 1793, and of the similar institutions afterwards founded, only one it is said has continued to maintain itself But the influence of the labours of the Philanthropinists has undoubtedly entered largely into the modern system of education (*Conv Lex*)

PHILANTHROPY (Gr *φιλεω, I love* and *ανθρωπος a man*) A general term for a benevolent feeling towards the whole human race It is opposed to misanthropy

PHILIBEG or FILIBEG *See* KILT

PHILIPPIC The title of several orations of Demosthenes against Philip king of Macedon the spirit and animosity of which has caused the name to be transferred to similar compositions Thus Cicero gave this name to the orations which drove Mark Antony from Rome, and impelled the senate to prosecute the war against him after the murder of Julius Cæsar

PHILOCTETES In Mythology the son of Pœan, according to some authors one of the Argonauts The friend and companion of Hercules and one of the most celebrated heroes of the siege of Troy though but little referred to in the *Iliad* His adventures, too long to be here recounted form the subject of one of the tragedies of Sophocles

PHILOLOGY (Gr *φιλεω I love* and *λογος speech, discourse*) This word appears to have been used by the classical ancients to designate the whole circle of belles-lettres and even of the sciences cultivated as they then were very imperfectly and more in a theoretical than an inductive shape considered not with respect to their respective subject matters but to the language in which they were conveyed A philologist was one who studied or taught the elegance of diction as applicable to every branch of human learning, nor can the meaning of the designation be very accurately [illegible] of the *γραμματικος*, or grammarian [illegible] the term philology was usurped in a wider sense so as to comprehend learning in general After the revival of letters the word was introduced into modern European languages but in a much more restricted signification It then comprehended grammatical criticism and etymology and some branches of archæology, and as these studies were almost confined to the ancient languages, and other relics of classical antiquity which alone were then studied in a scientific manner the [illegible] were the learned investigators of the [illegible] idioms and literature Commentaries on ancient authors, etymological works, and glossaries of their language, grammars &c were then the [illegible] nally denominated philological and [illegible] philology considered in this sense is now more extensive, as the modern European and non-European languages have also become the subjects of accurate investigation, it is with the same general meaning that the word is chiefly used, at least among English writers, at the present day It is defined by Johnson "criticism, grammatical learning" In this popular sense philology may be said to embrace, 1 Etymology, or the science of the origin of words, 2 Grammar, or the science of the construction of language in general and of individual languages, 3 Literary criticism, or the investigation of merits and demerits in style and diction,

Of late years, however, a new and very extensive province has been added to the dominion of philology, namely, the [illegible] in a more general sense, considered [illegible] respect to the light it throws on the nature of the human intellect and progress of human knowledge, and historically, with refer-

ence to the connection between different tongues, and the connection thus indicated between different nations and races Some attempts have recently been made to confine the use of the word philology to this particular branch of learning It comprehends, 1 *Phonology*, or the knowledge of the sounds of the human voice, which appears to include orthography, or the system to be adopted when we endeavour to render, by our own al- [illegible] *Etymology*, 3 [illegible] language by grammatical forms, according to the various points of view from which men contemplate the ideas which words are meant to express

Classical Philology —By German writers the use of the word philology is still not uncommonly restricted to this branch of study The earliest commentators, lexicographers, and [illegible] whose works we possess, flourished in Greece and Rome at various periods between the Christian era and the fall of the Roman empire During the middle ages the knowledge of the classical languages, or of the works written in them, ceased to be cultivated as a science Philology was revived about the end of the 14th and beginning of the 15th century, and chiefly by the labours of various learned Greeks expelled from their own country by the encroachments of the Romans In the 15th century, Italy was peculiarly animated with a zeal for classical literature, which, in fact, essentially injured, during the whole of that period the cultivation of the native language of the country In the following age, the cultivation of this study passed chiefly into the hands of the French Dutch, and Germans, nor was it long retained in any perfection among the students of the first of these nations In the hands of the industrious writers of Holland and Germany classical philology assumed a new form Less elegant, and pursued in a less poetical mind than it had been among the Italians it became a vast and laborious science [illegible] Dr [illegible] is said to have been chi [illegible] erials of knowledge the task of criticism and of separating the true from the false in classical idiom and diction, began with the 17th, and the earliest name in this department of study is perhaps still the most illustrious that, namely, of Richard Bentley Since his time we have had many distinguished classical scholars in our own country especially in the present day which has produced Parr Porson and Elmsley but Germany still remains the true nursery of classical research, and the school of Wolf Heyne and Hermann in that country has laid down canons of inquiry as to the genuineness and authority of some of the earliest works in the ancient language which have imparted a new character to classical criticism in general See LANGUAGE CLASSICS

PHILOLOGY SACRED The art of criticising the languages and dialects of the Hebrew and Hebræo Greek writers in order to elucidate the meaning of the sacred scriptures The Hebrew language, consisting principally of the old Phœnician, with admixtures of the Aramean from Mesopotamia, introduced by Abraham and his horde, received also a few modifications owing to the long servitude of the Israelites in Egypt How old the book of Job may be is still a *vexata questio* among critics some of whom suppose that it was originally written in *Arabic* and afterwards translated while others trace it to a remote period of *Hebrew* literature, but whether it be older or not than the works of Moses the Pentateuch must ever be considered the basis of the Hebrew as a fixed written language The institution of the schools of the prophets under the Judges no doubt tended to give that polish and poetic character seen in the writings of David and Solomon, but the Hebrew language remained essentially the same down to the conquest of Palestine, first by Shalmanesar (who introduced an Aramean population in lieu of the expelled ten tribes), and secondly by Nebuchadnezzar, who (B C 588) took the holy city, and captured the two remaining tribes, transporting them also according to a still prevalent eastern custom, into his own territories The Jews, however, during their captivity at Babylon, not only acquired new habits but received many additions to their language, both of words and idioms, and henceforward they spoke a dialect usually known as the *Hebræo-Aramaic*, bearing nearly the same analogy to the Hebrew that the modern Italian bears to the Latin [illegible] the later [illegible] may be discovered [illegible] The prophets Haggai Zechariah, and Malachi the Chaldee, present a few instances of [illegible] the new dialect is most of all perceptible [illegible] and other uninspired commentaries by which alone the Scriptures could be made intelligible to the common people Schultens, Rosenmuller, the elder Michaelis Bishops Louth and Horsley, Gesenius Ewald, and Prof Lee have successfully la- [illegible] the study of the Hebrew language, [illegible] of the Hebrew Scriptures are by [illegible] and De Rossi After the cessation of Hebrew prophecy on the death of Malachi, about 400 years B.C, the Aramean dialect prevailed more or less, owing to the adherence of the Jews to their national language, down to the capture of Jerusalem by Titus The conquests of Alexander, however, had an undoubted influence over the learned castes, who gradually became acquainted with the Greek language, and accordingly (B C 280), Ptolemy Philadelphus invited *forty* Jewish scribes to Alexandria to translate into Greek the Pentateuch that part of the Jewish history relating to the Egyptians Some years afterwards the other books of the Old Testament were translated by different hands, but the name *Septuagint* (*see* SEPTUAGINT) is a misnomer, and the story connected with it (resting wholly on the very questionable authority of Plutarch and Diodorus Siculus) is quite unworthy of credit The work, however, is written in good Macedonian Greek (κοινὴ διάλεκτος), with a few Hebrew admixtures, and hence the Septuagint should be studied in connection with the New Testament, which presents similar features In the time of Christ the Aramaic (as the Gospels furnish abundant proof) was the vulgar language of Palestine, and even Galilee had a separate though cognate dialect (Luke, xxii 59, Acts, ii 7) After the descent of the Holy Spirit, the followers of Christ became gifted with that power of expression necessary to carry the tidings of the Gospel into distant countries, and the Greek language, so far as the regions west of Palestine were [illegible] was the great medium of communication Here [illegible] and Apostles wrote in this lang [illegible] But though their words were inspired, their words were of their own creation, and hence arose those peculiarities of diction, Hebrew expressions, &c, the understanding of which is absolutely necessary to an intimate acquaintance with the inspired writers of Christianity This, indeed, constitutes the science of sacred philology, and in this work the labours of Wetstein, Mill Griesbach, and Scholz have been employed in producing a pure Greek text from the examination of the best MSS, while the most celebrated critics of the New Testament, Bengel, the younger Michaelis Kuinoel De Wette, Bp Marsh, Stuart Ernesti, Winer and Robinson have spent their best days in elucidating the meaning of the Evangelists and Apostles — the great pillars of the church, of which Christ is the head corner stone

PHILOSOPHER'S STONE *See* ALCHEMY

PHILOSOPHY (G [illegible] in common acceptation [illegible] sum total of systematic human knowledge It is commonly divided into three grand departments, metaphysics, physics, and ethics If we include in the first logic, this may be regarded as a complete distribution of science, properly so called The first has for its object those truths which go beyond mere experience, as the nature of being, of God, of the soul &c, as they are in themselves or as they are apprehended by us (*See* METAPHYSICS) The second relates to objects as they are in nature as subject to the relation of cause and effect The third contemplates human actions as they *ought* to be, not merely as they are, and takes account of the ideas of duty, freedom, responsibility, and the like — of all, in short which constitutes the distinction between *an action* and *an event*

This word was first used by the Pythagoreans and adopted from them by Socrates who [illegible] himself a lover or seeker of wisdom only, in distinction from a *sophist* or one who conceives himself to be in the possession or exercise of wisdom

Many valuable histories of philosophy have appeared of late years, especially in Germany The most celebrated are those of Brucker Tennemann and Ritter A sketch of the history of philosophy written by the late Mr Dugald Stewart originally prefixed to the *Encyclopædia Britannica*, is now printed in a separate volume

PHILTER (Gr φίλτρον *I love*) A drug or preparation supposed by the ancients to have the power of exciting love Nothing certain is known respecting the composition of these celebrated potions, but there can be no doubt that recourse was frequently had to them by the ancients and that their operation was so violent that many persons lost their lives and their reason by their means The Thessalian philters were in the highest celebrity (See *Ivo* vi 610)

PHILYRA In Mythology one of the Oceanides, and mother of the centaur Chiron by Saturn, who visited her in the shape of a horse Alarmed at the monstrosity of her offspring, she implored Saturn to change her nature, who [illegible] and changed her into a linden tree which received Greek by her name He [illegible] for that

PHLEBOTOMY (Gr φλεψ, *a vein*, and τεμνω, *I cut*) The operation of opening a vein for the purpose of taking away blood

PHLEGETHON (Gr φλεγεθων, *burning*) The mass of fire which according to the poets of Rome and Greece, washed the shores of the infernal regions It is

also the name of one of the rivers of the infernal regions *See* COCYTUS

PHLOGI'STON (Gr φλογιζω, *I burn*) An imaginary principle, by which Stahl and the chemists of his school accounted for the phenomena of combustion, the matter of fire fixed in combustible bodies

PHLYCTÆ'NA (Gr φλυκταινα) A small vesicle which contains a serous fluid

PHLYZA'CIUM (Gr φλυζιον, *to be hot*) A pustule upon the skin

PHOCA'CEANS, *Phocacea*, or Seal Tribe The name of the family of carnivorous and amphibious Mammals of which the seal (*Phoca*) is the type *See* SEALS

PHOCÆ'NA (Gr φωκαινα, *a porpoise*) A subgenus of dolphins, distinguished by the absence of the beak-like [illegible] the jaws

PHOCE'NIN A peculiar fatty matter contained in the oil of the porpoise (*Delphinum*) When saponified it yields a volatile odorous acid called *phocenic acid*

PHŒ'BUS (Gr φοιβος, *luminous*) A name of Apollo, often used [illegible]

PHŒNICOPTE'RUS (Gr φοινιξ, *red*, and πτερον, *a wing*) The generic name of the flamingo also a term applied to other animals which have red wings, as the *Bombycilla phœnicoptera*

PHŒNIX [illegible] among the [illegible] connected with its [illegible] longevity and death, regarded as the emblem of [illegible] She was described as of the size of an eagle, her head finely crested her body covered with a beautiful plumage and her eyes sparkling like stars She was said to live 500 or 600 years in the wilderness, when she built for herself a funeral pile of wood and aromatic gums, which she lighted with the fanning of her wings, and thus *apparently* consumed herself, but not *really*, this being merely the process by which she endowed herself with new vitality she then

[illegible]

Four periods of history are mentioned by ancient writers as having been graced by the appearance of the phœnix The first was in the reign of Sesostris, the second in that of Amasis, the third in that of Ptolemy III, king of Egypt, and the fourth in that of Tiberius There is, however, a great discrepancy of opinion on this point, as well as on every other relating to the phœnix The history and imaginary attributes of the phœnix have formed a theme to poets in every age, and in most languages its name has passed into a proverb By the fathers of the church it was frequently brought forward as an illustration of the doctrine of the resurrection (see Spanheim, *De Usu et Præstantia Numismatum* diss v c 13, and the authorities cited in that learned work) [illegible]

[illegible] as an emblem of the renovation of the world and the revival of the golden age under their beneficent rule The chief [illegible] notices with regard to the phœnix are Herodotus, book ii, Ovid, *Met* xv 391, Pliny *Hist Nat* x 2, and Tacitus *Annal* vi 18 Besides these, the reader may consult, in the third volume of Wernsdorf, *Poetæ Minores* (to which the editor has prefixed a learned introduction) the poem *De Phœnice*, which is usually attributed to Lactantius, and in which every circumstance on record with regard to the phœnix has been chronicled with the most laborious precision The reader will also find in Metral's work *Le Phœnix ou l'Oiseau du Soleil* (Paris 1824), a resume of all that has been written, both in ancient and modern times, respecting the history and peculiarities of the phœnix

PHŒNIX One of the modern constellations in the southern hemisphere

PHOLA'DIANS *Pholadea* (Gr φωλεος, *a lurking place*) The family of Lamellibranchiate Bivalves of which the genus *Pholas* is the type they are remarkable for the *hiding places* which they excavate for themselves in rocks and clay

PHONE'TIC WRITING (Gr φωνη, *sound*) That writing in which the signs used represent sounds in opposition to *ideographic*, in which they represent objects or symbolically denote abstract ideas, as in the figurative part of the Egyptian hieroglyphics The signs representing sounds are usually arbitrary, or at least have become so in process of time, as in the ancient Roman alphabet of which the letters are for the most part derived from the Hebrew or Phœnician, in which languages they may have originally partaken of a symbolical character But, in a species of phonetic writing which is intermixed with the figurative hieroglyphics in Egyptian inscriptions every letter is denoted by a figure representing some object, the name of which begins with that letter *See* HIERO-GLYPHICS

PHO'NICS (Gr φωνη) The doctrine of sound the same as *acoustics* (*See* SOUND) As sound, like light, is subject to certain laws of reflection and refraction, the science, like that of light, may be treated under three [illegible] In [illegible] these have been denominated *phonics*, *cataphonics*, and *diaphonics*

PHO'NOLITE (Gr φωνη, and λιθος, *a stone*) A species of compact basalt sonorous when struck

PHO'RCUS In Mythology a marine deity, son of Pontus and Terra, father of the Gorgons the dragon that guarded the apples of the Hesperides, and other fabulous monsters

PHORONO'MIA, or PHORONO'MICS (Gr φερω, *I bear or carry*) A term sometimes used to denote the science of motion In this sense, it was employed by Hermann, a mathematician who flourished in the beginning of the 18th century, in a work entitled *Phoronomia, seu de Viribus et Motibus Corporum Solidorum et Liquidorum* (Amstel 1716), and of great merit for the time in [illegible] being now employed [illegible] moving bodies, *phoronomia* or *phoronomics*, seldom occurs in works of modern science

PHO'SGENE GAS (Gr φως, *light* and γιγνομαι, *I produce*) A compound of chlorine and carbonic oxide, made by exposing equal measures of those gases to the sunshine, or to bright daylight They will not unite in the dark

PHO'SPHATES Salts containing *phosphoric acid*

PHOSPHITES [illegible] *phosphorous acid*

PHOSPHORESCENCE [illegible] mission of light by substances at common temperatures, or below a red heat

PHOSPHORESCENT ANIMALS Those species are so called which have the faculty of emitting a luminous fluid They are much more numerous than the electric animals, belonging to most of the Invertebrate classes and frequently rendering vast tracts of the ocean luminous by their prodigious numbers The glow-worm (*Lampyris*), the phosphorescent sea-pen (*Pennatula phosphorea*) and the brilliant pyrosome (*Pyrosoma Atlanticum*) are amongst the most remarkable of these animals

PHO'SPHORITE Native phosphate of lime

PHO'SPHORUS (Gr φως, *light*, and φερω, *I carry*) So called from its property of shining in the dark It was discovered in 1668 by Brandt an alchemist of Hamburgh, and was originally obtained by distilling urine, but it is now always extracted from *bone earth* by a process contrived by Scheele The bones are calcined, so as to destroy the animal matter and being powdered, are mixed with water, to which half their weight of sulphuric acid is added The bone earth, consisting chiefly of phosphate of lime is thus decomposed sulphate of lime is formed and phosphoric acid is evolved, or, rather, superphosphate of lime which being much more soluble than the sulphate remains in the liquid, and may be obtained by its evaporation It is mixed with about half its weight of charcoal, and put into a well-luted earthen retort the beak of which dips into water At a bright red heat the phosphorus distils over into the water It is purified by carefully melting it under water, and straining it through a piece of chamois leather

Pure phosphorus is almost colourless and semitransparent it may be cut with a knife and its surface has a waxy lustre It fuses at 108° boils at 550° and is converted into vapour having according to Dumas a density = 4 3 It is sparingly soluble in fixed and volatile oils, and in ether and alcohol but insoluble in water It shines in the dark and emits a luminous vapour, undergoing a slow combustion and exhaling a peculiar smell like garlic When rubbed or heated to a temperature of about 110° it takes fire and burns with great rapidity, with a white flame, emitting abundance of acid fumes, in oxygen gas its combustion is so intensely brilliant that the eye can scarcely bear the light

The product of the perfect combustion of phosphorus is *phosphoric acid* a fusible substance very soluble in water, and intensely sour It appears to consist of 1 equivalent of phosphorus = 16, and 2½ of oxygen = 20, its equivalent being 36

There are two other acids of phosphorus, namely, the *phosphorous acid*, consisting of 16 phosphorus + 12 oxygen and the *hypophosphorous acid*, which appears to be a compound of 2 equivalents of phosphorus (16 × 2) = 32, and 1 of oxygen = 8 When phosphorus is boiled in a solution of caustic potash a gas is evolved, which is remarkably distinguished by its spontaneous inflammability, each bubble, as it rises through the water, taking fire upon the surface, and producing a beautiful ring of smoke this gas is commonly called *phosphuretted hydrogen* Phosphorus may be made to combine with the greater number of the metals, forming compounds called [illegible]

PHOTOGENIC DRAWING (Gr φως, and γιγνομαι, [illegible] DAGUERROTYPE was written under which we have adverted to the extraordinary results obtained by Daguerre the mode by which they were produced [illegible] not been made public since that time, however, all the details of the manipulation have been fully

disclosed, and they are extremely interesting and curious, though the explanation or theory of the process is still somewhat obscure The whole subject has lately acquired much additional importance from its extended applications, namely, from architectural objects, sculpture, and interiors of roc[illegible] and more lately to groups, and even w[illegible], a it is undergoing almost daily extension and improvement *See* PHOTOGRAPHY

PHOTO'GRAPHY Under the general term photography we now include all those processes for the production of pictures, which depend upon the chemical influences of the solar radiations As the name implies, these pictorial representations of external objects were supposed to result from the action of LIGHT — *the illuminating power of the sun* recent investigations, however, r[illegible] r[illegible] probable that these chemical changes are due t[illegible] which is associated with light *See* LIGHT In photography, although it may not prove to be absolutely correct, is however too firmly established for us to hope for any change, and we therefore shall include under it our consideration of the daguerreotype calotype, and such other processes as are of sufficient interest to claim general attention

Mr Wedgwood, the celebrated potter was the first who attempted to produce pictures by the sunshine he was aided in his investigations by Sir Humphry Davy, but the results were not satisfactory since no means of rendering the pictures permanent were then discovered M Niepce, of Chalons on the S[illegible] r[illegible] investigations of the same kind, discovered that all the resins underwent a change by exposure to sunshine and by spreading solutions of them over glass and metal plates, and placing them in the camera obscura, images were slowly impressed upon these prepared surfaces this process was called by the inventor HELIOGRAPHY M Niepce associated himself with M Daguerre, but he died previously to the discovery of the very beautiful process, the *Daguerreotype*

The outline of this process is as follows — A piece of copper is plated in the usual way with silver by passing the metals together through a rolling mill, and is then cut into pieces of a proper size The silver surface is carefully polished and cleansed by wiping it over with a piece of cotton dipped in dilute nitric acid washing and drying When thus duly prepared — and much depends upon the manner in which the preliminary operations are performed and the materials used,—the plate is subjected to the diffused vapour of iodine which forms a slightly brown or yellow film upon the silver it is then ready to be subjected to the action of the image to be represented which is thrown upon it care being taken to exclude all other light, by the well-known instrument the camera obscura In the course of a few seconds or minutes, the requisite time depending upon the intensity of th[illegible] [illegible] is removed, and though nothing is as yet [illegible], it it has received the image, which is brought out and rendered evident by subjecting it inclined at an angle of about 45° to the vapour of mercury This operation is performed in a box with a glass side, at the bottom of which is a basin of mercury heated to about 170°, so that the operator may see the progress of the appearance of the image and remove the plate when it is perfect, but light must be as far as possible excluded and more especially daylight The plate is then washed by cautious immersion in a solution of hyposulphite of soda and lastly with boiling distilled water, and allowed to dry it is now perfect may be exposed to light without injury, but must be carefully protected from all friction by covering it with a glass The action of the various shades of light upon the film of iodine, and the subsequent influence of the mercurial vapour, upon which the visibility of the picture depends have not been satisfactorily explained and require further experimental elucidation The perfection of the drawing, and the extraordinary manner in which the minutest details are represented, we have noticed in our former article, they must, however be seen to be accurately judged of and duly appreciated

Various improvements have been from time to time [illegible] [illegible] instead of the former substance only The sensibility of the plates is by this means infinitely increased so that, under favourable circumstances, portraits can be produced in a few seconds of time The application of chloride of gold to the surface of the silver plate after the picture is finished as was recommended by Fizeau, has given a much greater degree of permanence than those productions previously exhibited The principles of photography, or of photogenic drawing, as Mr Fox Talbot called his process, in the first instance may be explained as follows — if a piece of paper be dipped into a weak solution of nitrate of silver, carefully dried and preserved out of the contact of light, it remains white, but if exposed to light it gradually becomes discoloured, acquiring a brownish or grey tint, and ultimately blackens, the depth of colour depending upon the intensity of the light and duration of exposure If any opaque or translucent object be laid upon a sheet of paper so prepared so as wholly or partially to intercept the incident rays a representation of the object is obtained upon the paper Where the rays have been wholly intercepted, it remains white, where partially so, various shades are produced, and wherever they have fallen without interruption, the utmost blackness is obtained If [illegible] transparent colours upon glass [illegible] a piece of the prepared paper, and exposed to the sunshine, a copy is obtained in which the lights of the original are shades, and the shades lights in proportion to their intensity, but if such a picture be taken upon a piece of paper, this may be again copied by a repetition of the process, and then the lights and shades will be as in the original It is, however, obvious that such a photograph will only be durable whilst kept in the dark, and that exposure to light will gradually obliterate the whole, to fix it, the paper must be washed in a solution of hyposulphite of lime or of soda which removes all remaining and unaltered salt of silver, but leaves the image untouched. In this process the paper after having been impregnated with nitrate of silver, or with ammonia nitrate of silver is generally dipped in a solution of common salt, by which chloride of silver is formed, and this is more susceptible of the influence of the chemical agency of the solar rays than the mere nitrate

The *calotype* process of Mr Fox Talbot consists of the following manipulatory details — good letter paper is washed on one side with a solution of the iodide of potassium, it is, when dry washed with a solution of nitrate of silver, to which a small quantity of acetic acid has been added, and the paper is then washed with clean and pure water Papers thus prepared will keep without deterioration for some time To use the paper, a few drops of a solution of nitrate of silver are mixed with about an equal quantity of a saturated solution of gallic acid With this mixture the paper is washed on its prepared side and placed in the camera In a few minutes a picture is impressed upon the paper, which is removed from the instrument, and in a dark room again washed over with the mixture, called the *gallo-nitrate of silver* The picture slowly developes itself and when it has acquired the proper degree of intensity, the action is checked by plunging it into water, and subsequently the picture is fixed, and the yellow colour of the iodide of silver removed by the use of [illegible] [illegible] of soda The picture thus obtained is [illegible] the lights and shadows are reversed but by taking a copy from this as already described a *positive* picture is obtained, in which nature is most faithfully represented with all the delicate gradations of light and shadow This process has been applied to glass plates in the following manner Albumen, the white of egg, being strained, is mixed with some iodide of potassium, and floated over the surface of the glass, when dry, the silver solution is applied, and subsequently the gallo-nitrate of silver Thus prepared, the glass plate is adjusted in the camera and the image impressed, the remainder of the process is the same as on paper

Collodion or gun-cotton, dissolved in ether has been also used This preparation is floated over the glass and the iodide and silver salt applied The sensibility of the collodion process is perhaps greater than almost any other except the *instantaneous* process, which has been lately discovered by Mr Fox Talbot

This process is also upon albumenised glass, over which a solution of nitrate of silver containing alcohol is floated and then a preparation of the protiodide of iron with acetic acid and alcohol after which a stronger solution of nitrate of silver is applied To this process the name of *amphitype* has been given Sir J Herschel introduced several very interesting photographic processes, the cyanotype and the chrysotype amongst others

Dr Woods of Parsonstown, introduced the use of the iodide of iron in his process of the *catalissotype*, and Mr Robert Hunt that of sulphate of iron in his *ferrotype*, both processes of extreme sensibility The chromotype the fluorotype and the other processes of Mr Hunt, are fully described in his *Researches on Light*. Sir J Herschel has fully described his processes in his memoirs in the *Philosophical Transactions* The production of photographs naturally coloured has been achieved by M Niepce de St Victor By voltaic agency he produces upon the surface of a silver plate a dark purple coating of oxide of copper and chloride of silver This is *eaten out* in colours, when exposed to the influences of solar radiations It has not yet been found practical to give permanence to these reproductions of natural colour, but we may hope soon to unite delicacy of detail and truthfulness of representation, with the additional beauty of native colouration

PHOTOMETRY (Gr φως, and μετρεω, *measure*) The science which treats of the measurement of light Attempts to determine the relative intensities of different

lights were made at an early period in the history of experimental science For the purpose of comparing the light of Sirius with that of the sun, the celebrated Huygens employed a tube having a very small aperture at one end to which a lens, which allowed only a disk to be seen and this small portion afforded a light which appeared equally bright with Sirius, whence he concluded the distance of Sirius to be 27664 times greater than that of the sun (*Huygenii Cosmotheoros*) Celsius appears to have been the first who proposed to measure light directly by means of what he called a *lucimeter* His method, however, which was an extremely imperfect one, consisted simply in observing the greatest distance from the eye at which small circles painted on paper were distinctly visible in different lights It was reserved for Bouguer to establish photometry on true principles Having been induced by Mairan's remarks on the relative proportion of the sun's light at the summer and winter solstice to investigate the subject, he undertook a series of experiments of which the results were first published in his *Essai d'Optique*, 1729, and afterwards in his *Traité d'Optique sur la Gradation de la Lumiere*, which appeared in 1760, two years after his death In the same year appeared the *Photometria* of Lambert, in which the subject was treated more generally and with great mathematical elegance The principle adopted by Bouguer and Lambert is extremely simple Though the eye cannot judge of the proportional force of different lights, it can distinguish in many cases with great precision when two similar surfaces presented together are equally illuminated, or when the shadows of an opaque object thrown upon them by different lights are equally dark But, as the particles of light proceed in straight lines, they must spread uniformly and hence their density will diminish in the duplicate ratio of their distances From the respective situations, therefore, of the centres of divergency when the contrasted surfaces become equally bright, we may easily compute their relative degrees of illumination The objection to this method is that the apparatus admits of uncertain comparison Even the light of the sun, in different parts of the same latitude, and in the same climate, is subject to considerable variation, much more so any artificial light the force of which must always be influenced by a number of undefinable circumstances In this respect therefore the photometer used in this article has a great and decided advantage

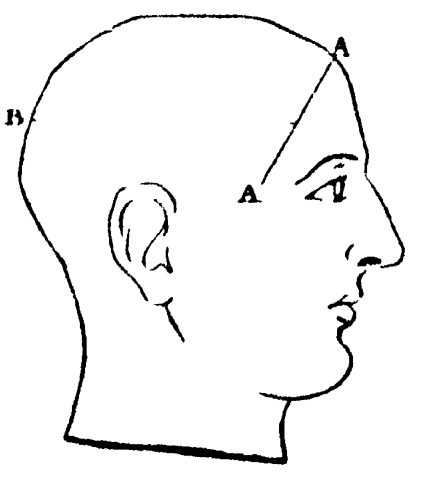
A simple and elegant application of the principle of Bouguer was made by the late Dr Ritchie His apparatus consists of a rectangular box, about an inch and a half or two inches square open at both ends and blackened within, [illegible] Within inclined at angles of [illegible] two rectangular plates of plane looking glass cut from one and the same strip, to ensure equality of their reflecting powers and fastened so as to meet at the top in the middle of a narrow [illegible] in much broad which [illegible] or oiled paper In comparing, by means of this instrument the illuminating powers of two different sources of light they must be placed at such a distance from each other and from the instrument between them, that the light from every part of each shall fall on the reflector next it and be reflected to the corresponding portion of the oiled paper The instrument is then moved nearer the one or the other, till the two portions of the paper corresponding to the respective mirrors are equally illuminated of which the eye can judge with considerable certainty

The modification of this method which consists in contrasting the shadows of an opaque object formed by different lights is usually ascribed to Count Rumford, by whom it was proposed in the *Phil Trans* vol lxxxiv but was long before used by Lambert It is generally supposed that the equality of two shadows can be appreciated with more certainty than that of two lights but when the lights are of different colours, their estimation by either method admits of little precision

M Arago has proposed a method of determining the relative intensities of different lights entirely different in principle from any of the preceding and probably susceptible of much greater accuracy It is founded on the properties of polarized light When two lights are to be compared, the rays from each are polarized by causing them to pass through a plate of tourmaline cut parallel to the axis, or by reflecting them from a plate of glass, on which they fall at the polarizing angle They are then received on a plate of rock crystal, cut perpendicularly to the axis and observed through a doubly refracting prism Each light will thus give two images tinged with the complementary colours The images are then brought into such a position that the red of the one falls over the green of the other If the two lights are equal in intensity, this superposition will produce a white image, if unequal, the image will be slightly coloured with red or green according as the one or the other predominates The apparatus which this method requires is somewhat complicated and its manipulation must be attended with considerable trouble (See the Notes to the French translation of Sir J Herschel's *Treatise on Light* Pars 1834)

PHOTOPHOBIA (Gr φως, *light*, and φοβεω, *I terrify*) An intolerance or dread of light, it is a symptom of internal ophthalmia

PHRASE (Gr φρασις, *speech or expression*) In Music, a short melody in which a perfect musical idea is not entirely developed

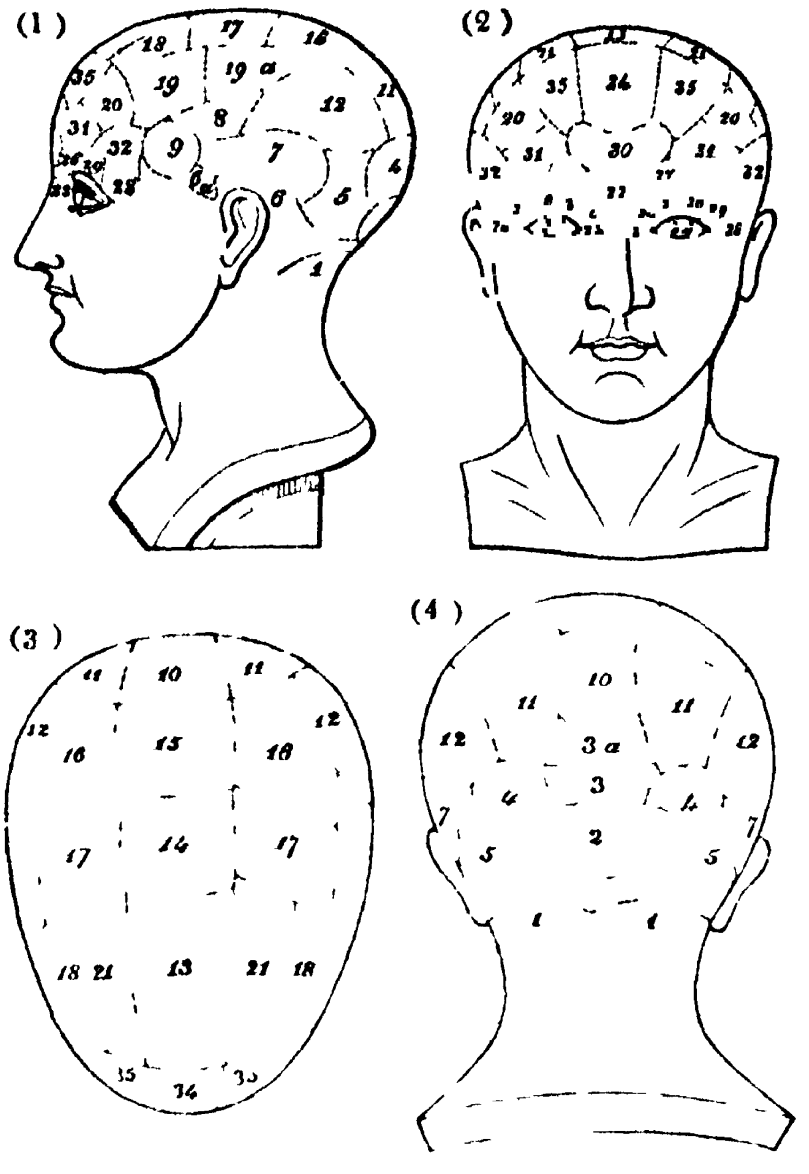


PHRASEOLOGY (Gr φρασις, and λογος, *science*), properly the science or knowledge of style, but used in common language to signify the peculiarities of diction of a writer, school, &c

PHRATRY (Gr φρατρια) A subdivision of Athenian citizens, analogous to the Spartan *obe* and Roman *curia* distinguished by particular rites and ceremonies that bound its members together Each of the four ancient tribes was divided into three phratries, and each phratry into thirty sections or clans, which bore a name exactly answering to the Roman *gens* (γενος), and this division remained subsequently to and independent of the ten tribes of Clesthenes The free Athenians registered their own or their adopted children in the phratries to which they themselves belonged, at the festival of the Apaturia, but what the age of registry was is uncertain

PHRENIC (Gr φρενες (plural of φρην, *the mind*), *the* Latin *to the diaphragm*

PHRENITIS (Gr φρην, *the mind*) Inflammation of the brain or its membranes



PHRENOLOGY (Gr φρην *the mind* and λογος *discourse*), ought, according to its etymology, to signify mental philosophy The word has however been appropriated by cranologists, on account of the light which their observations of the convolutions of the brain and corresponding elevations on the skull are supposed to throw on the nature and province of our different faculties Those who wish to judge how far this pretension is justifiable may consult the works of Dr Spurzheim and of Mr Combe on the subject These gentlemen divide our faculties into three classes the intellectual or perceptive the sentiments or emotions and the animal propensities To the first of these is assigned the anterior portion of the head, the second occupies the middle and upper while the posterior region and the cerebellum are allowed to the third and most inglorious division That this distribution in its general outline, is borne out by facts observation is sufficient to convince us but whether the subdivision of those regions into minute special organs corresponding to distinct faculties is equally well supported and whether the mental analysis implied in it can be considered sound and accurate, are questions which our limits forbid us to discuss We subjoin however for the reader's convenience in consultation, the following outline of the different faculties with their uses and abuses which we have borrowed from the Introduction to Mr G Combe's *Notes on the United States of America during a Phrenological Visit in* 1838 9 40 is pro[illegible]ng the most recent as well as the most [illegible] of the present state of this much canvassed science The subjoined figure will be of use in illustrating the observations

This figure shows the three great phrenological divisions of the brain The line B runs through the centre of ossification of the parietal bone (the organ of Cautiousness No 12), and terminates in the centre of ossification of the frontal bone situated at the point where it touches the line A A (the organ of Causality, No 35) The portion above the line B is named the coronal region, and serves to manifest chiefly the moral sentiments The line A corresponds to the posterior lateral edge of the superorbitar plate, on which the anterior lobe of the brain rests The space before the line A A indicates the size of the anterior lobe, the region devoted to the manifestation of the intellectual faculties If the space before the lower A be long, the organs of the observing faculties are large, and if the space forward from the point where the line B meets the line A A be long, the reflecting organs are large The space below B and behind A A manifests the propensities common to man with the lower animals We may remark that in the above figure the coronal region would be said to be large, indicating powerful moral sentiments, the intellectual region about an average, and that of the so called animal propensities moderate

PHRENOLOGY.

The faculties generally recognized by phrenologists are the following *

Order I FEELINGS

Genus I PROPENSITIES — *Common to Man with the Lower Animals*

† { THE LOVE OF LIFE
APPETITE FOR FOOD — *Uses* Nutrition — *Abuses* Gluttony and drunkenness

1 AMATIVENESS — Produces sexual love

2 PHILOPROGENITIVENESS — *Uses* Affection for young and tender beings — *Abuses* Pampering and spoiling children

3 CONCENTRATIVENESS — *Uses* It renders permanent emotions and ideas in the mind — *Abuses* Morbid dwelling on the internal emotions and ideas, to the neglect of external impressions

3 *a* INHABITIVENESS — *Uses* It produces the desire of permanence in place — *Abuses* Aversion to move abroad

4 ADHESIVENESS — *Uses* Attachment friendship and society result from it — *Abuses* Clanship for improper objects, attachment to worthless individuals

5 COMBATIVENESS — *Uses* Courage to meet danger and overcome difficulties tendency to oppose and attack whatever requires opposition and to resist unjust encroachments — *Abuses* Love of contention, and tendency to provoke and assault This feeling obviously adapts man to a world in which danger and difficulty abound

6 DESTRUCTIVENESS — *Uses* Desire to destroy noxious objects, and to kill for food It is very discernible in carnivorous animals — *Abuses* Cruelty murder desire to torment, tendency to passion rage and harshness and severity in speech and writing This feeling places man in harmony with death and destruction, which are woven into the system of sublunary creation

7 SECRETIVENESS — *Uses* Tendency to restrain within the mind the various emotions and ideas that involuntarily present themselves until the judgment has approved of giving them utterance, it is simply the propensity to conceal, and is an ingredient in prudence — *Abuses* Cunning deceit, duplicity and lying

8 ACQUISITIVENESS — *Uses* Desire to possess, and tendency to accumulate articles of utility to provide against want — *Abuses* Inordinate desire of property, selfishness, avarice, theft

9 CONSTRUCTIVENESS — *Uses* Desire to build and construct works of art — *Abuses* Construction of engines to injure or destroy, and fabrication of objects to deceive mankind

Genus II SENTIMENTS

I *Sentiments common to Man with the Lower Animals.*

10 SELF-ESTEEM — *Uses* Self-respect self-interest, [illegible] personal dignity — *Abuses* Pride, [illegible] conceit, excessive selfishness, love of dominion

11 LOVE OF APPROBATION — *Uses* Desire of the esteem of others, love of praise, desire of fame or glory — *Abuses* Vanity, ambition, thirst for praise independently of praiseworthiness

12 CAUTIOUSNESS — *Uses* It gives origin to the sentiment of fear, the desire to shun danger, and circumspection, and it is an ingredient in prudence — *Abuses* Excessive timidity, poltroonery, unfounded apprehensions, [illegible]

13 BENEVOLENCE — *Uses* Desire for the happiness of others, universal charity, mildness of disposition, and a lively sympathy with the enjoyment of all animated beings — *Abuses* Promiscuous injurious indulgence of the appetites and fancies of others, prodigality, facility of temper

II *Sentiments proper to Man*

14 VENERATION — *Uses* Tendency to venerate or respect whatever is great and good, gives origin to religious adoration — *Abuses* Senseless respect for unworthy objects consecrated by time or situation, love of antiquated customs abject subserviency to persons in authority superstitious awe

15 FIRMNESS — *Uses* Determination, perseverance, steadiness of purpose — *Abuses* Stubbornness, infatuation, tenacity in evil

16 CONSCIENTIOUSNESS — *Uses* It gives origin to the sentiment of justice, or respect for the rights of others, openness to conviction, the love of truth — *Abuses* Scrupulous adherence to noxious principles when ignorantly embraced, excessive refinement in the views of duty and obligation, excess in remorse or self-condemnation

17 HOPE — *Uses* Tendency to expect future good, it cherishes faith — *Abuses* Credulity with respect to the attainment of what is desired, absurd expectations of felicity not founded on reason

18 WONDER — *Uses* The desire of novelty, admiration of the new the unexpected, the grand, the wonderful and extraordinary — *Abuses* Love of the marvellous and occult, senseless astonishment, belief in prodigies, magic, ghosts, and other supernatural absurdities

19 IDEALITY — *Uses* Love of the beautiful and splendid desire of excellence poetic feeling — *Abuses* Extravagance and absurd enthusiasm, preference of the showy and glaring to the solid and useful, a tendency to dwell in the regions of fancy and to neglect the duties of life

19 *a* The organ of Sublimity, but not sufficiently ascertained

20 WIT — Gives the feeling of the ludicrous, and disposes to mirth

21 IMITATION — Copies the manners, gestures and actions of others, and appearances in nature generally

Order II INTELLECTUAL FACULTIES

Genus I EXTERNAL SENSES

FEELING OR TOUCH
TASTE
SMELL
HEARING
SIGHT

Uses To bring man into communication with external objects, and to enable him to enjoy them — *Abuses* Excessive indulgence in the pleasures arising from the [illegible] to the extent of impairing bodily health and debilitating or [illegible] the mind

Genus II KNOWING FACULTIES WHICH PERCEIVE THE EXISTENCE AND QUALITIES OF EXTERNAL OBJECTS

22 INDIVIDUALITY — Takes cognizance of existence and simple facts

23 FORM — Renders man observant of form

24 SIZE — Gives the idea of space, and enables him to appreciate dimension and distance

25 WEIGHT — Communicates the perception of momentum [illegible] gives equilibrium

26 [illegible] colours and their harmonies

Genus III KNOWING FACULTIES, WHICH PERCEIVE THE RELATIONS OF EXTERNAL OBJECTS

27 LOCALITY — Gives the idea of relative position

28 NUMBER — Gives the talent for calculation

29 ORDER — Communicates the love of physical arrangement

30 EVENTUALITY — Takes cognizance of occurrences or events

* The organs are double, each faculty having two lying in corresponding al[illegible] the hemispheres of the brain except [illegible] those organs such as [illegible] eventuality, [illegible] represented in the figures, 9, 15, & [illegible] of each, [illegible] the frontal part of the skull

† These organs are not fully ascertained by [illegible] facts indicate that they [illegible] the base of the brain The first is not marked on the bust, but the second is indicated by b a on Fig 1

31 TIME — Gives rise to the perception of duration.
32 TUNE — The sense of Melody and Harmony arises from it.
33 LANGUAGE — Gives facility in acquiring a knowledge of arbitrary signs to express thoughts, readiness in the use of them, and the power of inventing and recollecting them

Genus IV REFLECTING FACULTIES, WHICH COMPARE, JUDGE, AND DISCRIMINATE.

34 COMPARISON — Gives the power of discovering [illegible] ences of phenomena, and the relation of cause and effect.

The most accredited works in favour of phrenology are Mr Combe's writings, and the *Phrenological Journal*, which is ably conducted The most hostile inquiry into the pretensions of phrenology [illegible] appeared in 1826, in the *Edinburgh Review* [illegible] article, which was well known to have emanated from the pen of Mr (now Lord) Jeffrey, the views of the phrenologists are treated with ridicule, and their weak side subjected to one of the most vigorous attacks ever made in literary criticism

PHRYGA'NIDÆ *Case-worm flies* The family of Trichopterous insects of which the genus *Phrygania* is the type *See* TRICHOPTERANS

PHRYGIAN MARBLE *See* MARBLE

PHRY'GIANS An early sect of heretics, so called from Phrygia the country where they abounded They regarded Montanus, the founder of the Montanists (which see), as their prophet, and their distinguishing characteristic was the spirit of prophecy to which they laid claim

PHTHIRI'ASIS (Gr *φθειρ, a louse*) A disease in which the body is overrun with lice

PHTHISIS (Gr *φθινω, I consume*) Consumption, which see

PHYCOMA'TER (Gr *φυκος, sea-weed*, and *ματηρ mother*) The gelatine in which the sporules of Algaceous plants first vegetate

PHYLACTERY (Gr *φυλακτηριον, a protection or preservation*) An amulet or preservative against infection The phylacteries of the Jews were derived from the injunction contained in Exodus, xiii 9, and consisted of slips of parchment inscribed with verses of the law, enclosed in cases, and worn during prayer on the arm and between the eyes

PHY'LÆ (Gr *φυλη a tribe*) The tribes into which the whole of Attica was divided in antiquity Originally there were but four phylæ, which were frequently remodelled, but remained the same in number till soon after the expulsion of the Pisistratidæ, when Clisthenes caused their number to be increased to ten What the precise nature of the change effected on this occasion was is not known, but it is probable that the new tribes embraced a large number of citizens that had been excluded from the former The phylæ were afterwards increased to twelve, by the addition of two in honour of Antigonus and his son Demetrius The Athenian senate was composed of fifty delegates from each of these tribes

PHY'LARCH (Gr *φυλαρχος, ruler of a phyle*) An Athenian officer appointed for each phyle or tribe to superintend the [illegible] members and other common duties He [illegible] to that of the Roman tribune, but its functions never reached the same importance

PHYLLO'DIA (Gr *φυλλον, a leaf*) A term applied to the petioles of certain leafless plants which become so much developed as to assume the appearance of leaves, all the functions of which they perform

PHYLLONY'CTERANS (Gr *φυλλον*, and *νυκτερις, a bat*) The name of a primary division of the order *Cheiroptera*, including the "foliated bats," or those species which have the ears and nose complicated by grotesque and variously-figured membranous foliations, serving the purpose of antennæ, and augmenting the sense of touch in these night-flying and short sighted species The tribe is also characterized by having a single finger, the innermost, armed with a hook-shaped claw, and the molar teeth beset with sharp pointed tubercles adapted for [illegible]

PHYLLOPHAGANS *Phyllophaga* (Gr *φυλλον*, and *φαγω, I eat*) The name of a tribe of Marsupials, including the Phalangers Petaurists and Koala, also of a tribe of beetles including those which live by suction of the tender parts of vegetables as the leaves and succulent [illegible]

PHYLLOPODS *Phyllopoda* (Gr *φυλλον*, and *πους, a foot*) An order of Crustaceans, comprehending those in which the feet are of a flattened leaf-like form

PHY'LLOSTOMES, *Phyllostomata* (Gr *φυλλον*, and *στομα, a mouth*) A family of bats, including those in which the nose supports a simple leaf-shaped appendage

PHYSA (Gr. *φυσα, a bubble*) A genus of fresh-water snails; so called from the thinness and inflated appearance of the shell Several species of bubble-shell are found in England, as *Physa fontinalis*, in the Thames, *Physa alba*, in North Wales, *Physa hypnorum* common in ponds and slow streams

PHY'SALIS, or PHYSA'LIA (Gr *φυσα*) The name of a hydrostatic Acalephan, commonly called the P[illegible] s size, the brilliancy, [illegible] pain produced by its contact

PHY'SALITE In Mineralogy, a species of topaz

PHYSCO'NIA (Gr *φυσκων, a big bellied fellow*) This term is applied to various enlargements of the abdomen unconnected with dropsy or with accumulations of air, such as morbid states of the liver or of the spleen

PHY'SICS (Gr *φυσις, nature*) The science of nature In modern language, however, the term has a less general signification than its derivation implies Nature signifying the assemblage of all the bodies of the universe, the *science* of *nature* comprehends every species of knowledge which regards the external world But bodies may be studied under three different points of view, they may be examined with relation to their different properties with relation to their constituent parts, and with relation to their appearances and exterior qualities These three distinct views give rise to the three great divisions of natural science, namely, *Physics Chemistry* and *Natural History* Physics has for its object the properties of bodies, chemistry studies their elementary principles, and natural history observes their physiognomy or external appearance

PHYSIO'GNOMY (Gr *φυσις, nature* and *γνωμων, a rule or measure*) The art of interpreting the indications of the inward disposition supposed to be afforded by the outward appearance especially the features of the face (See *Lavater's Physiognomy*)

PHYSIO'LOGY (Gr *φυσις*, and *λογος a discourse*) The science of things generated or alive, but [illegible] e of vital phenomena [illegible] to the two great classes [illegible] into *animal* and *vegetable physiology* [illegible] have proposed the term for biology, but the restricted [illegible] os to the life of an individual in other [illegible] words, as biography, would be an objection to this change, even if the word physiology were less appropriate than it is or if its use in the sense above defined had not been sanctioned by philosophers of other nations

The chief object of the physiologist is to ascertain the precise mode in which each part or organ of a living being reacts when stimulated When the precise conditions and mode of the reaction of the circulating fluid upon the solids and reciprocally are understood, a true and intelligible definition of life may perhaps be given

In animal physiology, the simplest condition under which life can be contemplated is that which it presents in the torpid hybernater

During this state a dark nutrient fluid, the venous blood (see BLOOD) is propelled, by the contractions of a hollow muscle (see HEART) along the arteries to every part of the body, whence it is again returned to the heart by the veins With respect to this chief manifestation of life in the torpid animal it may be asked, What is the cause or condition of the reaction of the fibres of the hollow muscle upon the stimulating fluid? How does each tissue of the body select from the currents [illegible] [illegible] tissues secrete? There are questions which physiology has yet to resolve the electric conditions of the parts concerned have not been ascertained The blood is maintained in a fit state for the preservation of the tissues of the torpid animal by slowly parting with some noxious or useless principles, through the excretion of the kidneys, and of the different mucous and serous surfaces The reaction of the circulating fluids upon the solids supersedes the ordinary chemical reaction, by which they would be decomposed and destroyed, and thus the torpid animal is kept alive, but it is the life of the plant or of the ovum The functions of circulation, nutrition, excretion, are manifested when life is thus reduced, as in the plant, to its simplest condition, and these must, therefore, be its most essential actions In the torpid animal, the phenomena of irritability and contractility of muscular fibre are superadded, as in the action of the heart, and this is dependent on the connection of the muscular fibre with a nerve. The power of the external decomposing forces is increased by elevation of temperature, and the stimulus of heat produces in the torpid animal, in a manner not understood, a reaction of the mucous surface of the lungs this reaction influences, through the nerves the muscles of respiration, and atmospheric air is inspired and brought into contact with the thin membrane over which the pulmonary capillaries are richly spread. The result of this contact is the immediate elimination of the carbon

from the blood, which changes its dark for a florid red colour, or converts it from venous to arterial blood

The blood so changed stimulates in a different and more potent manner the parts over which it is distributed, the heart contracts more vigorously and frequently, the brain and nervous system now receiving more blood and that of different kind begin to react on the application of stimuli to which they were before insensible

First, self-consciousness, then sensation of external impressions [illegible] a stimulus to the muscular sys[illegible] duces the reaction of vibratile [illegible] and by which the animal moves its parts upon each other or its entire body upon external matter, are successively manifested, and to circulation, nutrition, excretion, and respiration, are now added the functions of sensation and voluntary motion But with this greatly increased activity of the whole organic machinery, there is a proportional increase of vital decomposition, *i e* of abstraction by the tissues of assimilating particles from the capillary blood, and of addition to the same of effete particles, and those actions demand not only increased activity in the organs which eliminate the waste and noxious particles from the blood, and expel them from the body but also a means of supplying new blood This is effected by digestion, chylification and lacteal absorption

It is the consciousness of this want that impels the newly roused hybernating animal to seek for its appropriate food the first use to which the machine is put is to supply itself with the means for its continued activity, and this completes the circle of the functions by which animal life is maintained

It is a law, that the ener[illegible] body should not be uniform at first the power is in excess and the body grows, afterwards it is unequal to the waste and the body shrinks, it is at no period perhaps, quite perfect, the machinery of renovation thus in time becomes unequal to its office and the ordinary chemical decompositions and recompositions take the place of those in which life had before essentially consisted

A given term of life characterizes each species of animal but that the species should continue it is necessary that the death of the individual be compensated for This is effected by the power which living beings possess of detaching a portion of themselves which portion contains in itself potentially all the faculties or functions of life, develops their organs progressively and according to the pattern of the parent from which it was derived and when arrived at maturity in like manner generates or separates another portion of itself, with similar powers of development and growth then decays and dies Thus the species of living beings are maintained by the function of generation through a long, but apparently not an indefinite period of time for the history of the changes of the earth's surface teaches us that the duration of the existence of species as well as of the individual is limited and that many species have become extinct So far however as observation has been able to reach the death of a species seems to have been rather a violent than a natural one We have, as yet, had no experience of the extinction of a species by a gradual abrogation of the procreative powers in the individuals of successive generations Of the introduction of new species we know of no natural cause nor can hardly form a conception of such

The science of physiology is that of the different functions of which life is the manifestation, that is to say of circulation nutrition, excretion, respiration sensation muscular contraction digestion absorption generation with other subordinate faculties, as the maintenance of equable temperature the production of vocal sounds the mental phenomena To explain these functions we must first know the instruments by which they are performed, secondly, the matters which they attract those which they reject and the nature of that which remains thirdly, by what forces these matters are transported attracted retained and rejected, and finally the nature of the stimuli appropriate to each part and the mode in which such part reacts when stimulated Physiology has thus many departments, and each department has its [illegible]

PHYSIOLOGY VEGETABLE [illegible]

PHYSOGRADES *Phys[illegible]* (Gr [illegible] and *grad[illegible]* *I proceed* [illegible]

PHYTOPHAGANS *Phytophaga* (Gr [illegible] *a plant*, and *φαγω*, *I eat*) The name of a tribe of Cetaceous Mammals, synonymous with *Herbivora* Also applied by Lamarck to a section of his order of Trachelipod Mollusks

PHYTOGRAPHY (Gr *φυτον*, *a plant*, and *γραφω*, *I describe*) [illegible] branch of science which concerns [illegible] to be observed in describing and naming plants *See* BOTANY

PHYTOLOGY (Gr *φυτον* and *λογος*, *a discourse*) A book containing an account of herbs and plants

PHYTOPHAGOUS (Gr *φυτον*, *a plant*, and *φαγω*, *I eat*) Plant-eating

PHYTOZOONS *Phytozoa* (Gr *φυτον*, *a plant*, and *ζωον*, *an animal*) This term is applied by various naturalists to different sections of the sub kingdom *Zoophyta* of Cuvier

PIA MATER A thin vascular membrane covering [illegible] brain and the spinal marrow

PIANO [illegible] *See* P &c

PIANOFORTE (It) A musical stringed instrument of the keyed species Its name, compounded of two Italian words signifying *soft* and *loud* was probably given to it to distinguish it from the Harpsichord and spinet, in which no lightness of touch could lessen the strength of the sound produced from the quills always striking the strings with equal force, whereas in the piano-forte, the strings are put in vibration by means of small hammers connected by levers with the key or finger board, which hammers quit the string the moment it is struck, a damper falling down upon it the moment the finger quits the key The invention of the piano-forte is ascribed to a German named Schroeder, who lived at the beginning of last century, but it was first introduced into England in 1766 by Zumpe, by whom it was greatly improved Within the present century this instrument has received many useful and valuable improvements from the hands both of Englishmen and foreigners, so that it may be now fairly regarded as, next to the organ, the noblest and [illegible] whole compass of musical [illegible] musicians have devoted [illegible] of pieces for this instrument, [illegible] Hummel, Czerny Hertz Kalkbrenner Cramer Moscheles, Chopin, Thalberg Liszt, &c have made the instrument itself almost their exclusive study There is an excellent article on the piano-forte in the *British and Foreign Review for* 1839

PIARISTS (Patres Scholarum Piarum) Members of a religious order founded at Rome by Casalanza, a Spanish nobleman, early in the 17th century They were bound by a special vow to devote themselves to the purpose of education They still continue to superintend a great number of schools in Hungary Poland Bohemia, &c

PIASTRE A silver coin of Spain Italy Turkey, South America, [illegible] &c, varying in value in every country *See* MONEY

PIAZZA (Ital) In Architecture a square open space surrounded by buildings Improperly used in England to denote a walk under an arcade

PIBROCH Martial music produced by the bagpipe of the Highlanders It is said to signify also the instrument itself but the former meaning, if indeed there are *any* instances of the latter to be found in any classical writer has received the sanction of the two most celebrated poets of their time, Lord Byron and Sir Walter Scott The connoisseurs, says the latter writer, in pipe-music affect to discover in a well composed pibroch, the imitative sounds of march, conflict, flight pursuit, and all the current of a heady fight' (See a note in *Beattie's Essay on Laughter and Ludicrous Composition*, chap iii for a description of the nature of the pibroch) The 17th stanza of the 2d canto of the *Lady of the Lake*, in which the effects of this martial music are so admirably depicted must be familiar to every reader

PICA In Printing a type of a moderate size, so called because it was used in printing the *Pie*, the service book of old Catholic times, which [illegible] to derive its appellation from the [illegible] of the text and rubric

PICAMAR The bitter principle of tar, whence it derives its name (*in pice amarum*)

PICARDS The name of a fanatical and immoral sect of Christians who sprang up in Bohemia in the 15th century They derived their name [illegible] Picard native of Flanders who styled himself the New Adam, and attempted to revive the absurdities of the Adamites of the 2d century in imitating the state of primeval innocence They were completely annihilated by Ziska, the great general of the Hussites who, struck with their abominable practices, had marched against them

PICHURIM BEAN [illegible] brought from Brazil, and used me[illegible] It has a musky odour, and is supposed to be the produce of a species of *Laurus*

PICI (Lat picus *a woodpecker*) The name given by Linnaus to a group of birds corresponding to the *Scansores* and part of the *Picariæ* of Cuvier

PICIDÆ *Woodpeckers* The family of birds of which the genus *Picus* is the type

PICKET In Fortification, a stake used in laying out ground, to mark the bounds and angles Pickets are of various lengths, according to the purpose they are to serve One end is sharp and shod with iron, and the other sometimes carries a small flag, for the purpose of rendering it visible at a distance

PICROMEL (Gr *πικρος*, *bitter*, and *μελι*, *honey*)

A peculiar substance, of a sweetish bitter taste, which exists in bile

PICROTOXIA (Gr *πικρος*, *bitter*, and *τοξικον*, *a poison*) A poisonous bitter principle which exists in the *Cocculus indicus*

PICTS WALL One of the barriers erected by the [illegible] and the Germ malerisch) In the strict sense of the word all objects which afford fit combinations of form and colour for the imitation of the painter In literary composition, a style which represents objects and events in such a manner as to call up vivid impressions as it were of visible realities is termed picturesque

A great diversity of opinion prevails as to the precise nature of that quality which peculiarly recommends objects for pictorial representation, but it would be impossible in this place to lay down any general rules on the subject that would be of any use for the guidance of the student Meanwhile however, it may be necessary to notice the fact, that the term picturesque is used in a totally different sense from that above adverted to, being applied by many writers to such natural objects as [illegible] appearance in general tends to [illegible] with have a *sublime* or *beautiful* character [illegible] that of which the surface is broken and the motion abrupt and irregular, and, among trees, "not the smooth young beech, nor the fresh and tender ash, but the rugged oak or knotty wich elm, is picturesque Nor is it necessary they should be of great bulk, it is sufficient if they are rough and [illegible] with sudden variations of their [illegible] the ass is generally thought to be more picturesque than the horse, and among horses, it is the wild and rough forester or the worn-out cart horse, to which that title is applied In our own species objects merely picturesque are to be [illegible] gipsies and beggars who [illegible] them that character, bear a close analogy to the wild forester and the worn out cart horse, and again to old mills, hovels and other inanimate objects of that kind" Such objects, it is argued are neither beautiful nor sublime, and though far less [illegible] and alluring than those which possess [illegible] beauty or sublimity, are nevertheless endowed with qualities of their own which are not only highly suited to the painter and his art but attractive also to the rest of mankind whose minds have been at all cultivated or improved, and to such objects the [illegible] to be exclusively applied It is [illegible] for the [illegible] to admit of a satisfactory solution, though it must be conceded that great caution is necessary before joining a third and distinct character to the two graces which it is universally admitted embellish natural forms — the sublime and beautiful But on this question our limits preclude us from entering and we must refer the reader to Price's elaborate work on the *Picturesque* for full information (See also the *Quart Rev* vol xv)

PIEDROIT (Fr) In Architecture a pier or square pillar partly hid within a wall It is without base or ca[illegible] a pilaster

[illegible] a term denoting that the composition where the word is appended is *full*, that is for [illegible]

PIEPOUDRE COURT In English Law a court established to decide on the spot disputes arising at fairs or markets It was styled in Lat *curia pedis pulverizati* and derived its name from the itinerant dusty footed dealers (in old Fr *pied pouldreux*), for whose convenience it was principally instituted

PIER In Architecture, the solid between the openings of a building, or that from which an arch springs An abutment pier, in a bridge is that next the shore For the mode of building the piers of a bridge, see BRIDGE

PIER In Engineering identical with mole, and is used to [illegible] erected to form harbours [illegible]

PIERCED [illegible] used when a charge is represented as perforated, so as to show the field under it

PIERIDES A name of the Muses, who were so called from Pieria a district of Thrace This was also the name of the nine daughters of Pierus, the king of Emathia, [illegible] with the nine arts tempted the [illegible] to a contest of musical skill, but, being worsted were changed by the latter into magpies In memory of their victory over the Pierids the Muses are considered by some authors, to have adopted the name

PIETISTS The name given to certain reformers of the doctrines and practice of the Lutheran church that arose in Germany towards the end of the 17th century, and caused great dissensions in that body The Pietists may be divided into two classes, of which the one proposed to effect merely an amendment of life and manners, and to promote a more evangelical spirit and conception of gospel truth than was cherished by the reformed churches, which, at the period in question, had degenerated into great coldness and formality Out of the discussions which this agitation excited there arose, however, a more violent and fanatical sect, who accompanied the assaults they made on the doctrine and discipline of [illegible] by various mystical extravagances [illegible] Dippelius and Petersen were their [illegible] The same school of theologians gave birth to the celebrated enthusiast Jacob Behmen (See *Mosheim*, vol v p 312 trans 1790) The term *Pietist* is at present applied in Germany much in the same sense of disparagement as the word Methodist is vulgarly used among ourselves, to those persons who make a display of strong religious feelings

PIEZOMETER (Gr [illegible] *measure*) [illegible] of liquids

PIGMENT (Lat pigmentum) A term applied by anatomists to the mucous secretion which covers the iris of the eye, and gives it its various colours, and to the dark matter which covers the anterior surface of the choroid membrane, and the interior surface of the ciliary processes

PIGMENT In Painting, a general term denoting any colour used by artists

PIGMY or PYGMY (Gr *πυγμαιος*, sc *ανηρ*, from *πυγμη a cubit, a diminutive man*) By ancient authors on natural history this name was applied to a fabulous race of dwarfish and deformed human beings, it is now restricted to a species of ape the *Simia troglodytes* of Blumenbach or the Chimpanzee (See *Tyson's Anatomy of a Pygme*, with an Essay concerning the Pygmies of the Ancients fol 1699) Ancient fable (as ancient as Homer, *Il* b 3) described a nation of pygmies dwelling somewhere near the shores of the ocean, and maintaining perpetual wars with the cranes, of which Athenæus gives the mythological origin Ctesias the Greek historian, as quoted by Photius represented a nation of them as inhabiting India and attending its king on his military expeditions Other ancients believed them to inhabit the Indian islands and Aristotle places them in Ethiopia, Pliny in Transgangetic India Some modern lovers of the marvellous have constructed these stories from legends of pigmy nations inhabiting the northernmost part of the earth These numerous fables appear to originate partly, as Strabo long ago observed in the [illegible] growth of particular races under the [illegible] of severe climate or great privations thus the Esquimaux or Laplanders furnished the ancient Northmen with their legendary Dwergar or nations of malicious dwarfs Some of the low caste races which inhabit the forests of interior Hindostan are feeble and puny enough to have given origin to the account of Ctesias, while the pygmies of the Malay Archipelago and the interior of Africa were probably up[illegible] (See the *Encyc Metropolitana*)

PIGNUT The bulbous root of the *Bunium bulbocastanum*, so called because pigs are fond of and dig for them

PIKE In Ichthyology [illegible] English term for a fish belonging to the order [illegible] section *Abdominales* family *Lucidae*, and genus *Esox* See MALACOPTERYGIANS

PIKE In Military affairs an offensive weapon used in antiquity and modern times down to the invention of the bayonet, by which it has been universally superseded, consisting of a shaft of wood of 12 or 14 [illegible] mounted with a flat pointed steel, [illegible] spear It was chiefly used by the infantry

PILASTER (Ital pilastro) In Architecture, a square pillar engaged in a wall usually projecting not more than one fifth or one sixth of its width Pilasters are subject to the same rules of proportion as columns

PILCHARD In Ichthyology, the common name for a fish closely resembling the common herring, but smaller, and at the same thicker and rounder They are found chiefly on the coasts of Devon and Cornwall, particularly the latter where they are taken in great numbers from July to September It is a saying of the Cornwall fishermen that the pilchard is the least fish in size, but greatest in number and for gain, taken from the sea For some curious details on the pilchard fishery see the *Com Dict*

PILE In Heraldry [illegible] which is represented of a wedge-shape [illegible] from the chief downwards towards the point, said to represent the piles on which bridges and other erections are founded

PILE In Artillery a heap of shot or shells, piled up by horizontal courses [illegible] The form of the pile [illegible] by [illegible] which may be a triangle a square, or a rectangle In a triangular pile the base is an equilateral triangle, and there is one shot at the vertex The number in the successive horizontal courses, reckoned from the top downwards, are represented by the triangular numbers 1, 3, 6, 10 [illegible] $\frac{1}{2}n(n+1)$, the sum of which is $\frac{1}{6}n(n+1)(n+2)$; which, therefore, is the number of shot in a pile of n courses. *See* FIGURATE NUMBERS

If the base is a square, the number in the successive courses is represented by the series of squares 1 4 9 16, &c , and the number in the pile of n courses is $\frac{1}{6} n (n + 1) (2 n + 1)$

If the base is a rectangle, n the number of shot in the shortest side (or the number of courses), and $n + d$ the number in the longest side, then the number in the pile continued until there is a single row of $d + 1$ shot at the top is $\frac{1}{6} n (n + 1) (2 n + 1 + 3 d)$

PILE DRIVER An engine for driving down piles It consists of a large ram or block of iron, which slides between two guide posts Being drawn up to the top, and then let fall from a considerable height, it comes down on the head of the pile with a violent blow It may be worked by men or horses, or a steam engine

PILES In Building, pile timbers driven into the ground or bed of a river for supporting the foundations of an edifice, or the piers of a bridge They are round or square, and formed of any wood which does not rot under water oak, elm, and chiefly fir, are employed The end of the pile which penetrates the ground is pointed and shod with iron, and the top is bound with a [illegible] prevent the piles from being [illegible] the ram by which they are driven down

PILES A disease originating in the morbid dilatation of the veins of the lower part of the rectum and upon the verge of the anus, and frequently caused by costiveness and irregularity of alvine evacuation, the contents of the rectum pressing upon the veins, and preventing the return of their blood so that they become turgid and varicose, often forming bleeding or ulcerated enlargements and tumours Mild aperients, especially sulphur and castor oil, are necessary in the relief of the early stage of piles when there is much inflammation, cold and astringent lotions may be used and the pain is often relieved by fomentations with decoction of poppies When the tumours are large and flaccid an ointment of powdered galls, with a little opium and acetate of lead, often affords relief, and, in old relaxed piles the internal use and local application of copaiba balsam and even *Ward's paste* which contains black pepper, do good In many cases of protrusions of the tumours, they require removal by [illegible] nife

PILGRIMAGE A journey undertaken for devotional purposes to some spot hallowed by religious associations The custom of making these pilgrimages has long been recommended and enjoined by the Roman church and they are frequently imposed by way of penance, the remission of sins, and various spiritual advantages being promised as the reward of the faithful and pious pilgrim There exist traces in the history of the early church of such journeys being occasionally undertaken from the natural motives, we may suppose of curiosity or of a deeper interest in process of time, the custom of celebrating festivals in honour of martyrs at the place of their sepulture drew larger numbers together from a distance, who doubtless soon began to look with some complacency upon their own merits in doing honour to the saints at the expense of fatigue or danger to themselves But the systematic establishment of pilgrimage as a meritorious work seems to be of much later date That which was undertaken to the tomb of St Martin of Tours is among the earliest canonically enjoined Such places of devotion became gradually very numerous of which, however, Jerusalem was held naturally in the highest estimation The difficulties which presented themselves to the pilgrims who attempted to accomplish this journey, when Palestine had fallen into the hands of the Saracens, were the proximate cause of the excitement which armed Europe to the rescue of the Holy Land The cupidity of the persons in whose custody these shrines were, and the immorality which ensued from the desultory habits which the pilgrims acquired, called forth the earliest animadversion of the church at the council of Chalons in the 9th century but the evil seems to have continued steadily on the increase until at the time of the Reformation, we find what was originally a harmless, and even a pious practice, degenerated into one of the most crying abuses of the ecclesiastical system The earliest pilgrimage on record is perhaps that of Helena, the wife of Constantine, to the Holy Land. (See *Schroeck's Kirchen Geschichte*, part 5 8 19 23 25)

But pilgrimages are not confined to Christian nations According to a command in the *Koran* every good Mussulman [illegible] and there are many other places in Persia endowed with sufficient sanctity to attract multitudes of pilgrims The Hindoos have also their pilgrimages the most celebrated of which is to the city of Juggernaut where stands the temple erected in honour of the deity of the same name, a full account of which will be found in the *Geo Dict* art "Juggernaut" Among existing [illegible] the most celebrated is that of Mariannell in Austria.

PILEUM The orbicular hemispherical shield or apothecium of a lichen, the outside of which changes to powder, as in *Calycium*.

PILLAR In Architecture *See* COLUMN

PILLORY (Fr pilori, [illegible] *a pillar*) A wooden engine on which offenders were formerly exposed to public view [illegible] insult It was a common punishment in England, and, by the "statute of the pillory," 51 Hen 3 c 6 , appointed for forestallers, users of deceitful weights, perjury, forgery, &c By 56 G 3 c 138 it was abolished in all cases except perjury , and as it was discretionary in that instance it had been long wholly disused It was finally abolished in 1837 by the statute 1 Vict c 23 The French punishment of the same description is now termed the "carcan," from the iron collar by which the neck of the criminal is fixed to a post , anciently, "pilori " It is not now specially [illegible] particular crimes but in heavy cases [illegible] imprisonment or forced labour

PILOSE (Lat pilus, *a hair*) In Zoology, when an animal or part is covered with hair

PILOT A person qualified and appointed by proper authority to conduct ships in and out of particular harbours or along certain coasts, at a certain fixed rate, depending on the draught of water The pilot has the charge of the vessel while in *pilot water* and the captain or master neglects or opposes the pilot's advice on his own responsibility (See *M Culloch's Commercial Dict*)

PIMELITE (Gr πιμελη *fatness*) A green hydrated silico aluminous mineral, containing oxide of nickel, of a *greasy* feel

PIMENTO The berry of the *Myrtus pimenta*, allspice or Jamaica pepper *See* PIPERACEÆ

PIN A small bit of wire, usually brass, with a point at one end and a spherical head at the other No fewer than fourteen distinct operations are necessary in making this little article for an account of which see *Ure's Dict of Arts &c* [illegible] in *Babbage's* [illegible] *of Nations* p 3 where the pin is cited as an admirable instance of the good effects of a division of labour

PIN A term of Chinese diplomacy, signifying a petition or address from foreigners to the emperor of China or any of his viceroys or deputies

PINACOTHECA (Gr πιναξ *a picture*, and τιθημι, *I place*) In Ancient Architecture, the apartment in a house for the reception of paintings

PINCHBECK An alloy of copper of zinc , a species of brass much resembling what is now termed *Mosaic gold* It was brought into notice by a person of the above name

PINEAL GLAND A small heart-shaped protuberance of the brain hanging by two peduncles from the beds of the optic nerves immediately over the *corpora quadrigemina* Some fanciful physiologists have asserted that it is the seat of the soul

PINE *See* ABIES

PINION In Mechanics a small wheel which plays in the teeth of a larger, or sometimes only an arbor or spindle having notches or leaves which are caught successively by the teeth of the wheel, and the motion thereby communicated

PINITE (From the mine *Pini*, at Schneeberg in Saxony) A soft crystallized mineral, composed of alumine silex and oxide of iron

PINK, DUTCH In Painting, a colour of a reddish hue

PINNA (Lat pinna *a fin*) The name of a genus of Ostracean Acephalous Mollusks commonly called 'wing-shells" remarkable for the size of the byssus, by which they adhere to rocks, and which the natives of Sicily manufacture into gloves socks, and other articles of sale

PINNACE A small light vessel with sails and oars it is at present generally understood as one of the boats belonging to a ship of war

PINNACLE (Lat pinna) In Architecture, a small square [illegible] not necessarily, [illegible] terminating upward pyramidally and crocketted and foliage at the angles [illegible] part

PINNATIFIDS A term applied by Linnæus to the feet of those birds which have the toes bordered by a scalloped membrane, as the coots

PINNATIPEDS, *Pinnatipedia* (Lat pinna *a fin*, and pes, *a foot*) A term applied by Temminck to an order of birds comprehending those which have the digits bordered by membranes

PINNIPEDS, *Pinnipedes* The name of a section of crabs (Brachyurous Decapods) in which are comprehended those [illegible] feet, if not [illegible] for swimming

PINNOTHERES (Gr πινοτηρης, from Lat pinna, and Gr. θηρευω, *I pursue*) A small parasitic species of crab, which takes up its abode in the shell of the *pinna* and other bivalves

PINT A measure of capacity, being the eighth part of a gallon *See* MEASURES

PIO'NEERS, in the Military Art, are certain soldiers, in all infantry and cavalry regiments, whose business it is to clear the road before an army, to sink mines, and throw up works and fortifications Pioneers are provided on a march with hatchets, axes, spades, pickaxes, and all other necessary implements

PIPE A wine measure usually containing 105 (very nearly) imperial, or 126 wine gallons Two pipes or 21 imperial gallons, make a tun But in practice the size of the pipe varies according to the description of wine it contains Thus, a pipe of port contains 138 wine gallons of sherry 144 of Lisbon and Bucellas 11 of Madeira 110 and of Vidonia 120 The pipe of port is to be observed, is seldom accurately 138 gallons and it is usual to charge what the vessel actually contains

PIPE CLAY A species of clay abounding in Devonshire and other parts of England, employed in the manufacture of various sorts of earthenware

PIPERA'CEÆ (Piper, one of the genera) A natural order [illegible] the hotter [illegible] Richard they are monocotyledonous, but that they are really dicotyledonous is proved by their medullary rays articulate leaves, and two-lobed embryo They are closely related to *Polygoneæ Saurureæ* and *Urticaceæ*, from all of which they are distinguished by obvious characters Common pepper represents the ordinary property of this order The cubebs of the shops is the produce of the *Piper cubeba* and *canenum*, betel, an acrid stimulating substance, much used for chewing by the Malays, is obtained from *Piper betel* and *siriboa* Black pepper is the unprepared fruit of *Piper nigrum*, and white pepper is the same deprived of its pulpy covering Long pepper consists of the half-ripe flower-heads of *Piper longum* and *chaba*

PI'PERIN A white crystalline substance extracted from black pepper It is tasteless and free from pungency, the acrimony of pepper residing in a peculiar fixed oil

PI'RACY (Gr πειρατης, from πειρα, *an attempt*) In Law, an offence which consists in the commission of those acts of robbery and depredation upon the high seas which, if committed on land, would have amounted to felony there By the statutes 11 & 12 W 3 c 7 and 6 G 1 c 19, piracies committed on the sea or in haven &c, where the admiral has jurisdiction, may be tried at sea or on land, in his majesty's islands, &c, by commissioners under the great seal appointed for that purpose, who may commit the offenders, and call a court of admiralty for the purpose of the trial By the same statutes various acts are enumerated as amounting to piracy, and aiders and abettors of pirates are declared accessaries, punishable as principals By subsequent enactments acts of trading with pirates, and acts of hostility committed by natural born subjects against his majesty's subjects under colour of a foreign commission, are declared piracy In the realm of England, felonies robberies and murders committed by pirates, are triable under 28 H 8 c 15 by the king's commission of oyer and terminer, as if the offences had been committed on land (See as to the pirates of antiquity, the *Mem de l'Ac des Inscr* vol xii)

Piracy is also frequently used to signify any infringement on the law of copyright It is extremely difficult to lay down any general principle on which to decide as to what is and what is not piracy Generally it is held, that one writer may borrow the ideas or theories of another, but that he must dress them up and explain them in a different way, and in his own language This, however, is often done so as merely to evade the law, and it were well, in order to make greater attention be paid to originality, were the law as to piracy less lax than it is at present (See as to the existing law of piracy, the art Copyright Books in *Com Dig*)

PISALPHALTUM Mineral pitch, an indurated bitumen

PI'SCES (Lat pisces, *a fish*) The name of the fourth great subdivision of Vertebrate animals, or the class of fishes characterized by a branchial respiration, a bilocular heart, and a covering of scales The nasal cavities do not communicate with the mouth, but have only external apertures *See* ICHTHYOLOGY

Pi'sces (The Fishes) One of the twelve zodiacal constellations, the twelfth in order from Aries *See* CONSTELLATIONS, ZODIAC

PISCIS AUSTRALIS (The Southern Fish) One of Ptolemy's 48 constellations of the southern hemisphere The brilliant star Fomalhaut, of the first magnitude belongs to this constellation

PISCIS VOLANS A small modern constellation of the southern hemisphere, formed by Bayer It is situated on the antarctic circle

PISE (Fr) In Architecture, a species of wall constructed of stiff earth or clay carried up in moulds, and rammed down as the work is carried up

PISIDIUM (Lat pisum, *a pea*) A genus of fresh water Gastropods, so named on account of the resemblance of the shell to a small pea. Many of the species are British, as *Pisidium obtusale*, which may be found in the New River, *P pusillum*, *P nitidum*, *P pulchellum*, &c

PI'SOLITE (Gr πισος, and λιθος, *peastone*) A concretional carbonate of lime The concretions generally contain a coarse trial grain of sand

PISTACHIO PISTACHIO NUTS (Ger pistachen; Du pistasjes, Fr pistaches, It pistacchi, fastucchi, Sp alfocigos, Lat pistaciæ) The fruit of the *Pistachia vera* a kind of turpentine tree It grows naturally in Arabia, Persia and Syria, also in Sicily, whence the nuts are annually brought to [illegible] They are oblong and pointed, about the size and [illegible] containing a kernel of a pale green colour covered with a yellowish or reddish skin They have a rich, oily and unctuous taste, resembling that of sweet almonds, their principal difference from which consists in their having a greater degree of sweetness accompanied with a light grateful flavour, and in being more oily The nuts imported from the East are superior to those raised in Europe

PISTI'LLUM The organ which occupies the centre of a flower within the stamens and disk (if the latter be present) It is distinguished into three parts an upper or stigma, a lower or ovarium, and a central part or style It is the female organ of the flower, and contains the ovules or young seeds within the ovary

PISTOLE A gold coin common in many parts of Germany, equivalent to about 8*s* 6*d* sterling

PI'STON In Machinery, a short cylinder of wood or metal which fits exactly the cavity of a pump or barrel, and works up and down in it alternately Two sorts of pistons are used in pumps one hollow, with a valve, used in the sucking pump and the other solid, which is employed in the forcing pump *See* PUMP

PIT *See* SHAFT

PITCH (Fr picts) In Music, the degree of acuteness or gravity of a note

PITCH (Germ pech) The same as ASPHALT and BITUMEN which see

PITCH The residuum which remains after boiling tar in an open iron pot or in a still till the volatile matter be driven off It is most extensively used in shipbuilding

PITCHBLENDE A mineral found in Saxony, it is a compound of the oxides of uranium and iron

PITCH OF A ROOF In Architecture, the inclination of the sloping sides to the horizon It is usually described by the ratio of its height to its space

PITCHSTONE A siliceous mineral, the fracture of which resembles that of pitch or resin It is of various colours

PITCOAL *See* COAL and GEOLOGY

PITH A cylindrical or angular column of cellular tissue arising at the neck of the stem of a Dicotyledonous plant and terminating at the leaf-buds with all of which, whether they are lateral or terminal, it is in direct communication It forms the centre of a stem, and is covered over by the wood Its use is to act as a reservoir of nutritious matter for the young leaves when first deve-

PITHECUS (Gr πιθηκος *an ape*) The subgeneric name of the orang utan, *Pithecus satyrus*, Geoff.

PITOT'S TUBE In Hydraulics an apparatus, so called from the name of its inventor for measuring the velocity of a stream, or of a body moved through stagnant water A tube open at both ends is bent into two unequal branches at right angles to each other It is then placed in the stream, the longer branch in a vertical position, and the shorter turned round so that the water enters directly into the orifice, which should be somewhat contracted When thus placed, the water enters the tube with the velocity of the stream, and the pressure causes it to rise in the upright branch of the tube to the height from which it must have fallen in order to acquire this velocity The height to which the water rises in the tube is measured by placing a graduated rod in the tube of such specific gravity as to float on the water, or if the tube is of glass, the height may be measured externally The corresponding velocity is obtained from the formula $v = \sqrt{(2gh)}$, where v denotes the velocity, g the acceleration of gravity, and h the height to which the water rises expressed in units of the same [illegible] The result is tolerably accurate, except when the velocity is small, but the effect is somewhat diminished by the friction on the tube

PITTACAL (Gr πιττα, *pitch*, and καλλος *ornament*) A fine blue substance, obtained by the action of a solution of baryta upon the heavy oil of tar

PITUITARY GLAND A gland situated within the cranium, between a fold of the *dura mater*, in the *sella turcica* of the sphenoid bone

PITUITARY MEMBRANE The mucous membrane of the nose

PITYRI'ASIS (Gr πιτυρον, *bran*) A cutaneous disease consisting of irregular scaly patches, unattended by

inflammation When it affects infants, it is called *dandriff* A similar exfoliation of the cuticle in reddish patches is not uncommon in adults Soap and water, and mild cooling lotions or very weak nitro-muriatic lotion, are the best applications

PIU (Ital) In Music, a word frequently prefixed to another to increase the strength of its meaning, as *più allegro* a little quicker

PIVOT (Fr) In Military language, that officer or soldier upon whom the different wheelings are made in the various evolutions of the drill, &c

PIVOT In Mechanics, the extremity of the axle about which a body revolves

PLACA'RD (Said to be from the Greek πλαξ, *a tablet*) A writing affixed to a wall, post, &c in a public place, is commonly so called, and as this was in ancient times the common mode of publishing proclamations and edicts, and also of giving notoriety to libels and seditious advertisements, the word is not uncommonly used in early modern writers in both these senses

PLACE'NTA (Gr πλακους, *a cake*) The afterbirth In the human subject it is a single subcircular, flattened, and lobulated organ, composed of the capillary extremities of the fœtal hypogastric arteries and umbilical vein, and of a fine cellular structure, which receives the maternal blood from the tortuous uterine or decidual arteries

The placenta forms a single lobe in the New World monkeys, the bats, the Insectivora and the Rodentia It surrounds the fœtus like a broad hoop in the Carnivora It is bilobed in the Old World monkeys and subdivided into many separate lobes, called cotyledons, in the true Ruminantia The placenta is replaced by a diffused vascular villosity of the chorion in the *Camellidæ*, the ordinary Pachyderms and the Cetacea The placenta is absent and the chorion ceases to be vascular in the Marsupialia

PLACE'NTA In Botany, a copious development of cellular tissue, formed at some point of the inside of a carpel, on which the ovules or young seeds arise

PLACENTALIA The name of that primary division of the class Mammalia which includes the orders that have either a placenta or a vascular chorion by which the fœtus is attached to the parietes of the uterus

PLA'CITA (Lat), in the Middle Ages, were public courts or assemblies, in which the sovereign presided [illegible] the affairs of the state [illegible] Placita," because "generalitas universorum majorum tam clericorum quam laicorum ibidem convenebat." The same custom appears to have existed in [illegible] According to the *Black* [illegible] let 13, this term was also applied to penalties or fines

PLA'GIAL MELODIES (Gr πλαγιος, *oblique*) In Music such as have their principal notes lying between the fifth of the key and its octave or twelfth

PLA'GIARISM (From the Latin legal term plagium, which signified the offence of stealing a slave, or kidnapping a free person into slavery) A plagiary, in the modern sense of the word, is one who borrows without acknowledgment, in literary composition, the thoughts or words of another, and the theft itself is styled plagiarism

PLA'GIOSTOMES, *Plagiostoma* (Gr πλαγιος, *transverse*, and στομα, *a mouth*) A tribe of Cartilaginous fishes comprehending all those which have the mouth situated transversely beneath the snout Also the name of a genus of Univalve Mollusks

PLAGUE "A typhus fever eminently contagious, [illegible] lity at an uncertain pe- [illegible] buboes ensue" This is Cullen's brief but correct definition of this horrible disease The best account of the plague, and of its ravages, is to be found in Heberden's work on the *Rise and Decline of Disease* See also the article CHOLERA in this work

PLAID A [illegible] cloth much worn by the Highlanders [illegible] ng a prominent part of the national costume and in being by the variety of its patterns, the different Scottish clans

PLAIN CHANT In Music a term in ancient ecclesiastical music to signify [illegible] which was confined within the natural

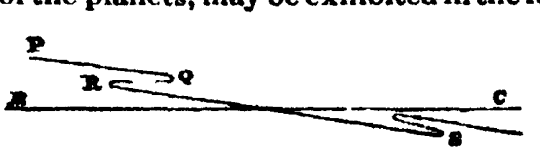
PLAINS In Geography, the general term for all those parts of the dry land which cannot properly be called mountainous, and which compose by far the greater part of the earth's surface Plains have different physical [illegible] and the people [illegible] for them different names, thus we have the steppes of Asia, the deserts of Africa, the pampas of South America, and the prairies or savannahs of North America See these different terms

PLAN (Lat planus) A drawing of something on a plane

PLAN In Architecture, an horizontal section of the walls partitions staircases &c of a building, showing the distribution of the [illegible] plot

PLANA'RIA (Lat planus *flat*) The name of a genus of *Sterelmintha*, or Parenchymatous Intestinalia of Cuvier, which do not inhabit the interior of animal bodies, but closely resemble, in their organization, the parasitic species of Trematode Entozoa They lead from this order to the Suctorious Anellides, or leeches

PLANE, in Geometry, is a surface without curvature, or it is a surface such that if any two points whatever in it be joined by a straight line, the whole of the straight line will be in the surface



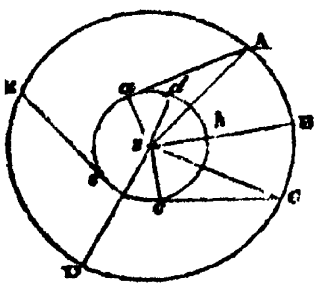
PLANE PROBLEM, in Geometry is a problem [illegible] tersections of straight lines [illegible] the conic sections or any of the higher curves Such problems as require the construction of the conic sections were called, by the ancient geometers, *solid problems*

PLANE SAILING, in Navigation, is the art of determining the ship's place, on the supposition that she is moving on a plane, or that the surface of the ocean is [illegible] be a spheroid On account of the [illegible] of the terrestrial radius this supposition may be adopted for short distances without leading to great [illegible] for the [illegible] by the solution of a right-angled [illegible] the meridian between the ship and [illegible] of the place whence she departed [illegible] of the triangle, the distance on the parallel between the place of departure and the foot of the perpendicular is the base of the triangle [illegible] and the distance sailed [illegible] The angle at the ship is called the [illegible] the complement of the [illegible] the perpendicular the [illegible] distance sailed, and the course, any two being given, the triangle can be laid down on the chart, and all the other parts of it found *See* NAVIGATION

PLA'NET (Gr ἀστηρ πλανητης, *wandering star*) The name given by the ancient Greeks to a few conspicuous stars which constantly change their situation in the heavens, and thus appear to *wander* among the constellations The discovery of satellites and periodic comets has rendered it necessary to adopt a more precise definition, in order to individualize the class of objects to which the t [illegible] accordingly modern astronomers [illegible] planet a body which, in a telescope of sufficient power, exhibits a round and well-defined disk, and which revolves about the sun in an elliptic orbit, [illegible] from a circle

The number of [illegible] the earth at present [illegible] twenty-three Five [illegible] Mar Jupiter, and Saturn— have been known from [illegible] omy; Uranus was discovered [illegible] 1781, Neptune in consequenc [illegible] on in 1846 Ceres, one of a group of which fifteen are at present known, was discovered by Piazzi, at Palermo, on the first day of the present century These last and Neptune are never visible to the naked eye, under favourable circumstances Uranus may be discerned without a telescope, and Mercury, though it appears as a large star, is seldom to be seen (in our climate at least), in consequence of its proximity to the sun

Of the apparent Motions of the Planets — On watching the motions of any of the conspicuous planets for a few days or weeks, their change of position among the fixed stars becomes sufficient [illegible] even without the aid of an instrument to [illegible] their relative distances Their paths deviate little from that followed by the sun [illegible] through the heavens, [illegible] irregular Sometimes they advance rapidly, then relax in their speed, come to a stop, and then move for a while [illegible] position Through the most considerable part of their orbits they [illegible] to the [illegible] said to be [illegible] their motion [illegible] stationary [illegible] and the planets make the entire circuit of the heavens These phenomena, which are called the *stations* and *retrogradations* of the planets, may be exhibited in the following manner —

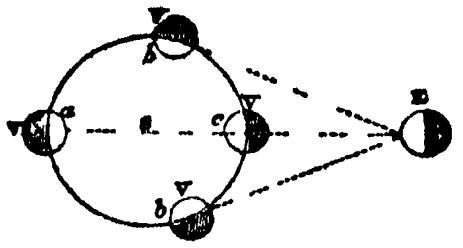


Let E C represent the ecliptic developed on a plane surface the path of a planet, found by laying down its observed positions with reference to the ecliptic from day to day, will present [illegible] P Q R S From P to Q [illegible] slower as the planet approaches to Q At Q it is stationary, from Q to R retrograde, at R again stationary; from R to S direct, and so on Such is the general character of the apparent motion, but the arcs and times of retrogradation differ greatly in respect of the different planets

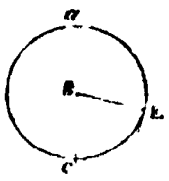
Mercury and Venus exhibit phenomena peculiar to themselves inasmuch as they never appear in the opposite quarter of the heavens to the sun, but oscillate about the sun from side to side the oscillation of the former being much quicker and performed in a much smaller arc than those of the latter The distance of Venus from the sun never exceeds an arc of about 47°, and at its greatest distance the planet does not continue above the horizon more than about 3 hours after sunset Its brilliancy, however, is such, that it may frequently be seen in the morning several hours after the sun has risen Mercury never recedes farther from the sun than 28° 20′, and does not appear above the horizon more than 1h 40m after sunset, or before sunrise For these reasons, Mercury and Venus were regarded by some of the ancient astronomers as satellites of the sun and supposed to describe orbits round that luminary The other planets, Mars, Jupiter, and Saturn, being frequently seen in opposition to the sun, and at all different distances from it, were supposed to have independent motions

In order to explain and represent the apparent motions of the planets, the ancient astronomers had imagined various hypotheses, of which the most celebrated is that of epicyles and deferents, invented by the geometer Apollonius and adopted by Ptolemy after whom it was called the Ptolemaic system of the universe and implicitly believed in during many centuries According to this hypothesis each planet moves uniformly in a small circle, called the *epicycle*, the centre of which is carried along, with a uniform motion, in the circumference of another large circle, called the *deferent* which has the earth at its centre (See Epicycle) By supposing the velocity of the planet in its epicycle to be greater than that with which the centre of the epicycle is carried along the deferent, and by assigning proper relations between the lengths of the radii of the epicycles and deferent circles (their absolute lengths are immaterial) the apparent geocentric motions may be represented with all the exactness of which the ancient observations admitted Ptolemy placed the earth at the centre of the universe and nearest to it the moon Next to the moon was Mercury, then Venus then the sun, after which followed in order Mars, Jupiter and Saturn the distances of the three last being arranged according to their respective periods of revolution it being natural to suppose that those which required the longest time to complete their periods must revolve in the widest circles At the present day, and familiar as we now are with the true nature of the celestial motions this complicated system appears abundantly absurd, but it should be recollected that Ptolemy possessed no means of forming any accurate notions of the distances of the planets he was unacquainted with the alternate increase and diminution of their apparent diameters, with the phases of Venus and all the other information afforded by the telescope in short, he knew of no phenomenon which could not be reconciled to his theory, and he does not appear to have ever regarded his system of epicyles and deferents in any other light than a mere hypothesis, by means of which the celestial motions could be reduced to calculation

All the apparent irregularities of the planetary movements are got rid of at once by referring to the sun as a centre, instead of the earth A great step in theoretical astronomy was made by Copernicus, who first demonstrated that all the phenomena were explicable in the simplest manner by supposing the sun to be placed at the common centre of the planetary motions, and ascribing to the earth a double motion, namely a diurnal rotation about its axis and an annual revolution about the sun On this hypothesis, the truth of which has been established by a multitude of different considerations the stations and retrogradations of the planets and all the geocentric appearances which so much perplexed the ancient astronomers, become simple consequences of relative motion In order to illustrate this, let us consider the appearances which must result from the combined motions of the earth and an *inferior* planet, that is, a planet nearer to the sun than the earth is Let S be the sun, A B C D the orbit of the earth, and *a b c d* that of Mercury, both moving in the same direction, or in the order of the letters Suppose A to be the position of the earth, and *a* that of Mercury at its greatest eastern elongation the line A *a* will be a tangent to the orbit at *a* As the earth advances from A towards B, and the planet from *a* toward *b* the angle of elongation S A *a* will continue to diminish, till the earth arrives at a certain point B, when the planet is at *b* in the same straight line with the earth and the sun, the angles A S B and *a* S *b* described by the earth and the planet being proportional to the respective [illegible] In this situation the planet [illegible] *inferior conjunction* When the earth has passed B, the planet, advancing [illegible] motion, will begin to appear [illegible] sun, and the angle of elongation continue to increase till the planet arrives at *c*, and the earth at C, where the visual line is again a tangent to the orbit The angle of elongation has now attained its maximum value and for this planet will [illegible] altogether when the earth arrives at D and the planet at *d*, the three points D S and *d* being in the same straight line The planet is now at its *superior conjunction*, and *beyond* the sun Soon after this the planet appears on the eastern side of the sun, and the angle of elongation continues to increase till the planet comes round to *e*, and the earth arrives at E, where the line E *e* is again a tangent to the orbit The earth the planet, and the sun have now precisely the same relative situations in respect of each other as they had when the earth was at A and the planet at *a*, so that the series of changes will here recommence and proceed in the same order as before The intervals after which these phenomena occur may be easily computed from a knowledge of the periods of revolution of the earth and planet and of the proportion of the radii of their respective orbits, which is, moreover known immediately [illegible] S A *a*, for, [illegible] as radius to the cosine of S A *a* that is, the radius of the planet's orbit is equal to the the radius of earth's orbit multiplied by the cosine angle of greatest elongation



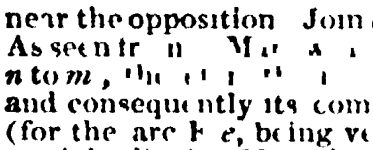
From the preceding figure it is easy to see how the phenomena of the stations and retrogradations must arise At the point *b*, where the planet is at its inferior conjunction the earth and planet are both moving in the same direction, but as the planet is moving faster, it will leave the earth behind it, and the apparent motion, as seen from the earth, will be the same as if the planet stood still and the earth moved in a contrary direction, with a velocity equal to the difference of their relative motions The apparent motion of the planet is therefore contrary to the apparent motion of the sun and consequently retrograde At the superior conjunction *d*, the planet and earth are moving in [illegible] respect of the line D *d*, the relative [illegible] the same as if the planet stood still and the earth was moving in its proper direction with a velocity equal to their united motions the apparent motion of the planet in this situation is therefore direct At the points of greatest [illegible] and the planet is moving in the direction [illegible] vision, A *a* or C *c* and the earth perpendicular ([illegible] of the planet at [illegible] it is direct at *a* and *c*, and retrograde at *b* there must be a point between *a* and *b*, and another between *b* and *c*, where the apparent motion is neither direct nor retrograde that is, where the planet appears stationary The problem of determining the stationary points is one of pure geometry, and very easily resolved when the orbits are supposed to be circular and the motion uniform, but, in the case of elliptic orbits and unequable motion, it is considerably more complicated The stationary points of Mercury are variable from 15° to 20° of elongation from the sun, those of Venus are about 2°0 Mercury continues to retrograde about twenty two days, Venus about forty-two



The apparent motions of the *superior* planets or those which are at a greater distance from the sun than the earth is are explained with equal facility As their orbits embrace that of the earth, they are not confined to certain limits of elongation from the sun, but appear at all distances from it even [illegible] of the heavens When the [illegible] are situated beyond the sun, in the same straight line with the sun and earth, and when the earth comes between them and the sun, they are said to be in *opposition* All the superior planets, when in opposition and for some time before and after, appear to [illegible] but the extent of the arc of [illegible] during which the motion is retrograde [illegible] very different in respect of the different planets Mars continues to [illegible] Jupiter 121, and Saturn 138

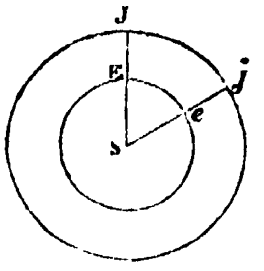
Phases of Planets. It is a necessary consequence of the [illegible] the earth supposing them to be [illegible] by the sun exhibit phases like the moon according to the aspect under which the illuminated half of their surfaces is seen from the earth When viewed through the telescope, this is found to be the case with Mercury and Venus, and to a certain extent also with Mars, and the appearance of the phase is in every case exactly such as is determined *a priori*, on the supposition that the planet is seen by the reflected light of the sun Let S be the sun, E the earth, and V Venus, in different positions of her orbit When the planet is at its superior conjunction *a* the whole of its illuminated surface is seen from the earth, and it consequently exhibits a round disk At the points of greatest elongation, *b* and *b*, one half only of the illuminated hemisphere is visible, and it therefore

appears half mooned at these points At *c*, the inferior



to the earth, and it is B appear gibbous (*i e* more than the half full), and between *b* and *c* it will appear in the form of a crescent, like the moon in its first or last quarter The phases of Mercury are precisely similar With respect to the superior planets, the absence of phases is a necessary consequence of their great distances from the sun in comparison of the earth's distance Let S be the sun, E the earth, and M Mars It is evident

earth is at E, or in such a position that the of the planet perpendicular to E M, and intersecting the surface in *x* the visible surface between *x* and *n*, so that to be but can never appear as a crescent These phenomena prove in the most convincing manner that the planets are opaque spherical bodies, deriving their light from the sun



Distances and Periodic Times of the Planets —Practical astronomy furnishes various methods of determining the distances of the planets from the sun in terms of the earth's distance and the times in which they complete their revolutions It has already been stated that the distances of Mercury and Venus may be compared with that of the earth by observing the angle of greatest elongation In the case of a superior planet an approximation to the relative length of the *radius vector* (the line which joins the planet with the sun) may be obtained by observing the angular velocity of its apparent retrogradation about the time when it is in opposition Thus, con-

ceive E *e* to be a small portion of the earth's orbit described in a given interval of time a day for example, and M *m* to be the corresponding portion of the orbit of Mars described in the near the opposition Join *e* and *m* and produce them to S As seen from Mars appeared to have retrograded from *n* to *m*, the angle *n m* is given by observation and consequently its complement *m e* E becomes known (for the arc E *e*, being very small may be regarded as a straight line) Now in the triangle *e* S E, right-angled at E the angle at S is given, being the angle described by the radius vector of the earth in the given interval, consequently the angle S *e* E becomes known and hence also S *e m* Supposing therefore, the periodic time of Mars to be known the arc M *m* or the angle M S *m* will be given, and therefore *m* S *e* which is its difference from E S *e*, becomes known In the triangle S *e m* we have therefore given the two angles S *e m* and *e* S *m* and consequently also the third angle *e m* S, whence the triangle is given in species and the ratio of S *e* to S *m* is determined But S *m* is the distance of Mars from the sun, which therefore is determined in terms of the radius vector of the earth

The method of finding the planet's distance, which has just been described requires that the periodic time be previously known There are various methods of determining the periodic time, independently of a knowledge of the distance of the planet from the earth One is to observe the times at which the planet is in either of its nodes *i e* when it passes through the plane of the ecliptic As the orbits are all inclined to the ecliptic, and have the sun nearly at their centres, they are intersected by the plane of the ecliptic in two opposite points, which are called the *nodes* Now it is easy to ascertain by observation when a planet is in its node, for, as it then passes from the one side of the ecliptic to the other, from the north to the south side, for example, we have only to convert the observed right ascensions and declinations into longitudes and latitudes and the change from north to south latitude between two successive observations will indicate that the planet has passed its node in the interval, while a simple proportion, grounded on the quantity of its motion in latitude, will fix the precise hour and minute at which it was in the ecliptic The interval between two successive passages of the planet through the same node differs from the *sidereal* period, or the interval which the planet occupies in returning to the same point of the heavens or the same *star*, as seen from the centre of the sun, by a very small quantity, depending on a minute motion of the node and which in a general view of the subject may be disregarded

Another and more convenient method of finding the period of a superior planet consists in determining, from the observations of a few consecutive days, the exact time at which it is in opposition to the sun At this instant the longitude of the planet is 180°, and on the day of the opposition it passes the meridian twelve hours after the sun The interval between two successive returns to the opposition is the *synodic* period of the planet, this differs very considerably from the sidereal period, but the latter is easily deduced from it Let E and J be the positions of the earth and Jupiter when Jupiter is in opposition The next opposition will take place after the earth has made a complete revolution, together with a certain arc E *e*, which we shall call the corresponding to Jupiter's

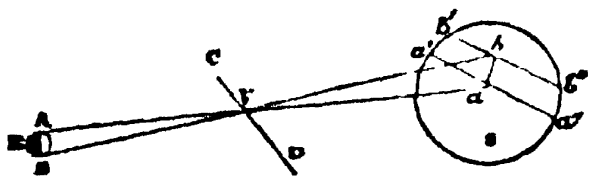
the number of days between the two oppositions, or the synodic period, is known call this 365 + *t*, then the time in which the arc E *e* or *x* has been described becomes *t* days We have therefore 365 *t* 360° *x*, whence *x* or the angle J S *j*, is known But, if *p* denote the sidereal period, we shall have *x* 360° *t* *p*, and therefore $p = \frac{360\ t}{x}$ On account of the orbits not being exactly circular, these intervals are not quite equal, but by taking the average of a considerable number of observed oppositions the the mean synodic periods (a sidereal periods) are obtained with the utmost accuracy

The following table exhibits the mean sidereal periods of the planets and their mean distances from the sun in terms of the mean distance of the earth from the sun supposed equal to unity In respect of the planets between Mars and Jupiter, we give Ceres only, as a type of the group

Planet	Mean Sidereal Period	Mean Distance from the Sun
	Days	
Mercury -	87 969258	0 387098
Venus -	224 700787	0 723332
The Earth -	365 256361	1 000000
Mars	686 979616	1 523692
Ceres	1681 93100	2 767245
Jupiter -	4332 58821	5 202776
Saturn -	10759 219817	9 538786
Uranus	30686 820830	19 182390
Neptune -	60126 710000	30 036800

Relations between the Periods and Distances — On comparing the columns of the above table, the idea of a certain relation between the periods and distances cannot fail to suggest itself, as they both increase in a tolerably regular progression (the small planets between Mars and Jupiter being accounted as one) though the periods increase in a much more rapid proportion than the distances Jupiter for example is five times more distant from the sun than the earth is, but his period is nearly twelve times that of the earth Kepler the great founder of physical astronomy undertook to investigate the analogy, and after almost laborious comparison of the numbers (and their various powers) representing the periodic times and the mean distances of the six planets known in his age, discovered this most remarkable law — 'That the squares of the periodic times of any two planets are to each other in the same proportion as the cubes of their mean distances from the sun" (*See* KEPLER'S LAWS) Taking for example the earth and Mars, whose periods are respectively 365 256 and 686 979 days, and distances in the proportion of 1 and 1 5237, it will be found that $(365\ 256)^2 : (686\ 979)^2 :: 1 : (1\ 5237)^3$, very nearly Nor is this merely an empirical relation, deduced from observed facts, but not referable to any known cause, on the contrary, it is a necessary result of the law of gravitation and pregnant with important consequences From its being observed in the planetary system it follows that all the planets are bodies of the same kind as the earth and that they are all acted upon in the same manner by the solar (modified only by the distance) which alone determines their periods, and retains them in their orbits

A curious relation of the numbers which express the relative distances of the planets from the sun was discovered by M Bode an astronomer of Berlin Let the number 10 be assumed to represent the distance of the earth from the sun, then the distances of the other planets may be expressed in round numbers as follows —



Mercury - - - - 4 = 4
Venus - - - - 7 = 4 + 3 2^0
The Earth - - - 10 = 4 + 3 2^1
Mars - - - - 16 = 4 + 3 2^2
The New Planets - - - 28 = 4 + 3 2^3

Jupiter	-	-	$52 = 4 + 3\ 2^1$
Saturn	-	-	$100 = 4 + 3\ 2^5$
Uranus	-	-	$196 = 4 + 3\ 2^6$

It had been conjectured by Kepler that an unknown planet must exist circulating between the orbits of Mars and Jupiter, a conjecture which has been strangely verified by the discovery of fifteen planets circulating in that region nearly in equal periods, and at equal distances from the sun, and exactly in a place where a planet was wanting to fill up the above progression The progression is however purely empirical, and in the case of Neptune (discovered in 1846) it fails entirely inasmuch as it gives for the distance of that planet the number 388, whereas the true distance, expressed in terms of the same unit, is only 300

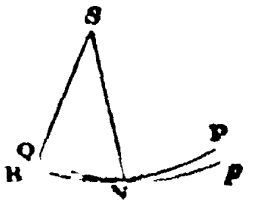
Real Dimensions [illegible] *Orbits* — Hitherto we have spoken of [illegible] planets from the sun only in relation to the sun's distance from the earth, but it is interesting to determine what these distances [illegible] which we are [illegible] Kepler's law of the relation between the periods and distances of the real dimensions of any one orbit have been ascertained those of all the other orbits will be found immediately when the periodic times of the planets are respectively known In fact, the dimensions of the orbits having been already stated in terms of that of the earth, it is only necessary to find the earth's distance from the sun, in order to find the respective distances of all of them Now, to find the earth's distance from the sun is the same thing as to find the sun's horizontal parallax that is the angle which the radius of the earth would subtend if seen from the sun for the determination of that angle gives the relation between the earth's distance and its semidiameter, which is known from the actual measurement of degrees of the terrestrial meridian Of the various methods which astronomers possess of determining the sun's horizontal parallax the most accurate is that which depends on observations of the transits of Venus over the sun's disk, a phenomenon, however, of very rare occurrence, so that the method can very seldom be practised

When Venus is at her inferior conjunction, and at the same time very near one of her nodes, the planet will be projected on the disk of the sun, and through the effect of her proper motion, combined with that of the earth, will be seen as a black spot to pass over, or *transit*, the solar disk, describing a chord which will be referred to different positions on the disk by observers stationed at different points on the earth's surface Let E be the earth, V Venus S the sun and C D a portion of Venus's orbit described while she is transiting the sun's disk

Suppose A and B to be the two opposite extremities of the earth's diameter which is perpendicular to the ecliptic a spectator at A would see the centre of Venus projected on the sun's disk at *a* and describing in her successive positions the chord *a' a a''*, while a spectator placed at B would, at the same instant, see her projected on the disk at *b*, and describing the chord *b' b b''* Now it is evident that if there be any means of measuring the [illegible] between the two chords *a a'* and *b b'* or the [illegible] that distance will give the sun's horizontal parallax, for the two triangles A V B and *a* V *b* being similar *a b* is to A B as *a* V to A V, or as the distance of Venus from the sun is to the distance of Venus from the earth But the relative distances of the earth and Venus from the sun are known; therefore the ratio of *a* V to A V is known, and consequently that of *a b* to A B This ratio is that of 68 to 27, or 2½ to 1 (very nearly), therefore the distance *a b* as seen from the earth is 2½ times greater than A B as seen from the sun, or, which is the same thing, equal to 5 times the sun's horizontal parallax The whole difficulty of the problem, therefore, consists in determining the distance of the two chords *a' a''* and *b' b''*, or their relative positions on the sun's disk, from which their distance can be deduced One of the best ways of accomplishing this is to note, with great accuracy, the instants at which Venus enters and emerges from the solar disk, so as to obtain the exact time occupied in the transit, for, the relative motion of Venus being accurately known the time occupied in the transit gives the length of the chord described, and the sun's [illegible] being also known, the arcs cut off by *a a'* and *b b'* are thus found, and the difference between the versed sines of those arcs is evidently the distance between the chords, or the line *a b* The problem, however, is rendered much more complicated by the earth's rotation, and other circumstances here neglected, of which it is unnecessary to take account in a general explanation

The last transit of Venus took place in 1769, and was the occasion of the first of the celebrated voyages of Captain Cook to Otaheite It was observed at Otaheite, at Wardhus in Norway, at Cajaneburg and Kola in Lapland, at Petersburg, Paris, California Hudson's Bay, &c The general result of all the observations, as discussed by Encke, gave the sun's horizontal parallax equal to 8·5776″ Hence, the sun's distance is given in terms of the earth's radius by the proportion

sin 8·5776″ : radius radius of earth sun's distance,



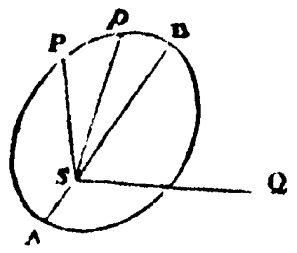
whence, on reducing the radius of a circle to seconds, we have the sun's distance $= \frac{360 \times 60 \times 60}{8\cdot5776 \times 2 \times 3\cdot14159} = 24047$ terrestrial radii Assuming the earth's semidiameter (*see* EARTH) to be 4000 miles in round numbers, the sun's distance from the earth will therefore be 24047 × 4000 = 96 188 000 or about 96 millions of English miles

This application of the transits of the inferior planets to the important purpose of determining the sun's distance from the earth was first pointed out by James Gregory, in his *Optica Promota*, published in 1663 Those of Venus recur after intervals of 113 years, but as Venus returns to her [illegible] at the same [illegible] of her orbit in about eight years, and the difference of their latitudes at two successive conjunctions amounts only to 20 or 21 which is less than the sun's diameter, it will generally happen that two transits take place within eight years, the first before the planet has passed the node, and the second after the passage of the node But three transits cannot take place within 16 years, hence, after two transits have occurred within 8 years, another cannot be expected before 105, that is 113 — 8 years, and may not happen until after 121 years The two last transits took place in 1761 and 1769, the two next will take place in 1874 and 1882, after which there will not be another till 2004 By reason of the small distance of Mercury from the sun, the difference between his horizontal parallax and that of the sun cannot be so accurately ascertained and hence the transits of that planet, though of more frequent occurrence than those of Venus, cannot be employed with such certainty in determining the sun's parallax

Having found the mean distance of the earth from the sun in terms of a known unit the mean distances of all the other planets from the sun, the ratios of which to that of the earth were given above, may be expressed in the same terms They are, in round numbers, as follows —

Mercury	-	-	-	37,000,000 miles
Venus	-	-	-	68,000,000
The Earth	-	-	-	96,000,000
Mars	-	-	-	142,000,000
Ceres	-	-	-	262,000,000
Jupiter	-	-	-	485,000,000
Saturn	-	-	-	890,000 000
Uranus	-	-	-	1 800 000 000
Neptune	-	-	-	2 800,000 000

Inclination and Nodes of the Planetary Orbits — The planes of the planetary orbits are inclined to each other under different angles and, in determining the circumstances of a planet's motion, one of the first steps to be taken is to fix the situation in space of the plane in which it moves For this purpose it is necessary to refer it to some other plane whose situation is assumed to be known The plane of the ecliptic is that to which we naturally refer the bodies of the solar system and the line of the equinoxes is taken as the origin of angular reckoning in that plane Hence, to determine the position in space of the plane of a planet's orbit, we must determine its inclination to the ecliptic and the position of the line in which it intersects the ecliptic with respect to the line of the equinoxes Let S be the sun, P N R the orbit of of a planet and *p* N Q the projection of that orbit on the plane of the ecliptic, intersecting the line of the equinoxes S Q in Q, then Q is the point from which the longitudes are reckoned, N is the node S N the line of the nodes, or line in which the plane of the orbit intersects the ecliptic, the angle Q S N the longitude of the node as seen from the sun, and P N *p* the inclination of the orbit If R be supposed to be on the south side of the ecliptic, and P on the north side, and the planet's motion to be in the direction R P, then N is the *ascending* node The place of the node is determined by observing the planet when its latitude is very nearly equal to nothing, and the equinoctial point Q being known, the *geocentric* longitude of the node (the angle formed by drawing straight lines from Q and N to the earth) is determined by observation, whence there are sufficient data for computing, by a trigonometrical process, the *heliocentric* longitude Q S N, and also the inclination P N *p* The places of the nodes are not absolutely fixed In consequence of the mutual attractions of the planets to each other, they have a slow retrograde motion in respect of the fixed stars The inclinations are also subject to a slight variation, but so small as to amount at most to a few seconds in a century Hence, in mentioning the longitudes of the nodes, and the inclin-



ni ns of the orbits it is necessary to state the epoch to which the elements refer In the following table the values of the inclinations and longitudes of the ascending nodes for Ceres and Neptune, the former of which is referred to Jan 1 1820, and the latter to Jan 1 1848

Planet.	Inclination.			Longitude of ascending node		
	°	′	″	°	′	″
Mercury	7	0	9 1	45	57	30 9
Venus	3	23	28 5	74	54	12 9
Mars	1	51	6 2	48	0	3 5
Ceres	10	37	2 2	80	41	24 0
Jupiter	1	18	51 3	98	26	18 9
Saturn	2	29	3 7	111	56	37 4
Uranus	0	46	28 4	72	59	35 3
Neptune	1	46	59 0	130	5	11 0

The ancients gave the name of *zodiac* to that zone of the heavens within which the planets were observed to move, and which, consequently, had a breadth of 14°, or twice the inclination of the orbit of Mercury The inclinations of the four recently discovered planets being greater than that of Mercury, they go beyond the zodiac, and hence have been named the *extra-zodiacal* planets

Figures of the Planetary Orbits — When the inclination of a planet's orbit and the situation of the line of the nodes have been determined the radius vector of the planet, at any instant, may be computed in terms of the sun s distance from the earth, from the planet's latitude and longitude found by a single observation By computing therefore the values of its radius vector at a great many different points of the orbit and laying down each on paper at the proper angle of elongation round the sun, the form of the orbit which the planet describes will be ascertained A few observations of this sort will show that the radius vector varies in length and, consequently, that the orbit is eccentric This fact was known from the time of Hipparchus but the true form of the planetary orbits was not discovered till Kepler found by a laborious computation of the distances of Mars at its oppositions, from the observations of Tycho Brahe that the orbit of that planet is an ellipse He subsequently found the same thing to be true of the orbit of the earth, and of the other planets then known, and hence established the first of those important laws respecting the planetary motions which still go by his name, viz that the orbits of al the planets are ellipses of which the sun occupies one of the foci *See* KEPLER'S LAWS

The same observations which show the orbit to be an ellipse will also serve for the determination of its eccentricity, which is half the difference between its greatest and least distances The only element which then requires to be known, in order to fix the path described by the planet in space is the position of the orbit on its plane or the situation of its transverse axis with respect to the line of the equinoxes Let A P B be the projection of an orbit on the plane of the ecliptic A B its transverse axis and S Q the line of the equinoxes S being the focus occupied by the sun The point A is the *perihelion* of the orbit, and B the *aphelion*, the line A B is the line of the *apsides*, and the position of A B with respect to S Q will be known by means of one of the angles Q S A or Q S B, which are respectively the longitudes of these points In modern tables the angle Q S A, or *longitude of the perihelion* is that whose value is given The eccentricities of all the planets are subject to a very small secular variation, the line of the apsides is also in a state of continual but slow revolution so that the perihelia are gradually shifting their places on the planes of the orbits In the case of all the planets excepting Venus, the motion of the line of the apsides is direct, that is to say, it is in the same direction as the motion of the planet in its orbit The perihelion of Venus referred to the fixed stars, moves in a contrary direction The following table shows the eccentricities and longitudes of the perihelia of the different planets, the epoch as before, being January 1 1801, for the old planets, 1820 for Ceres, and 1848 for Neptune

Planet.	Eccentricity of Orbit	Longitude of Perihelion		
		°	′	″
Mercury	0 205515	74	21	47
Venus	0 006861	128	43	53
The Earth	0 016784	99	30	5
Mars	0 093307	332	23	57
Ceres	0 078459	147	7	31
Jupiter	0 048162	11	8	35
Saturn	0-056151	89	9	30
Uranus	0 046679	167	51	16
Neptune	0 008720	47	12	57

Motion of the Planets in their Orbits — When the six elements of which numerical values have been given, viz the mean distance and eccentricity of the inclination of the orbit and longitude of the ascending node the perihelion, have been determined for each planet, it will be possible to compute the position of a planet in its orbit provided we know the law according to which the planet moves at every point of the orbit and also the instant of time at which it occupied any given point The motion in the orbit is given by the second of Kepler's laws, viz "The areas described by the radius vector are proportional to the times employed in describing them" Thus, if the planet has moved from A to P (see the preceding figure), or the radius vector S P has described the area A S P in the time t, and the area A S p in the time t', then $t : t'$ :: sector P S A : sector p S A The problem which proposes to find the point P, or the angle A S P (which is called the *true anomaly*), from the condition that the area A S P shall be to the whole ellipse as the given time in which A P is described is to the time of a whole revolution, is important in practical astronomy, and known by the name of Kepler's problem *See* KEPLER'S PROBLEM

Magnitudes and Rotations of the Planets — When the planets are examined through powerful telescopes, they are seen to be round bodies, having measureable, and even considerable, apparent diameters The distance of a planet being known, if the visual angle subtended by its diameter be measured by the micrometer, the real magnitude of its diameter will be discovered In this manner it is found that all the planets are incomparably smaller than the sun, though some of them are vastly larger than the earth The diameter of Jupiter is eleven times greater than that of the earth, whence his volume is about 1280 times greater than the earth That of Saturn is little less considerable The surfaces of the larger planets are also seen to be diversified by dark patches or spots, from the attentive observation of which it is found that they resemble the earth in having a rotation about their own axes Mercury, Venus and Mars revolve about their axes in nearly the same time as the earth Jupiter and Saturn in less than half that time The small planets between Mars and Jupiter are so small and indistinctly seen that their diameters cannot be accurately measured, and their periods of rotation are unknown Pallas, considered to be the largest of them, was supposed by Sir William Herschel to have a diameter of only 80 English miles In the following table the true diameters and the volumes are given in terms of the diameter and volume of the earth supposed to be unit —

Planet	Diameter	Volume	Sidereal Rotation		
			hrs	m	sec
Mercury	0 798	0 063	24	5	28
Venus	0 975	0 927	23	21	7
The Earth	1 000	1 000	24	0	0
Mars	0 517	0 179	24	39	21
Jupiter	10 800	1280 000	9	55	50
Saturn	9 982	994 000	10	29	17
Uranus	4 [illegible] 2	80 490	unknown		
Neptune	[illegible]37	14 500	unknow		

(For other particulars respecting the several planets, their masses densities &c see the respective terms)

The force which retains the planets in their orbits is the attraction of the sun, and if they were acted upon by no other force, the laws of Kepler would be accurately observed, and the elements of their orbits would remain invariable But each planet exercises an attracting force on every other, in consequence of which the motions, though principally obedient to the predominating influence of the sun, are affected by a number of forces of which the intensities and directions are perpetually changing Hence all the elements of the orbits their magnitudes and forms, their inclinations to the ecliptic, and their positions on their planes, are in a state of constant oscillation, fluctuating, however, between certain mean values from which they never greatly depart *See* GRAVITATION, PERTURBATION

Hypothesis of Laplace, respecting the Formation of the Planetary System The motion of the planets in elliptic orbits, and the relation between their periods and distances are necessary consequences of the law of gravitation which prevails throughout the universe, but the solar system presents several remarkable phenomena of which [illegible] which cannot be sup[illegible] and which lead almost [illegible] that all the bodies which belong to it have had a common origin, and been formed under the agency of the same mechanical laws All the planets, as well as satellites move in the same direction, from west to east The orbits of all the large planets are situated very nearly in the plane of the ecliptic, and, so far as has been discovered, they all revolve about their axes in the same direction, also from west to east To account for these phenomena, Laplace

has hazarded the speculation that all the planets and satellites have had their origin in the solar atmosphere, which he supposes to have extended beyond the orbits of the most distant planets, and to have undergone a progressive contraction by the radiation of heat into the stellar spaces Now, as the solar atmosphere partakes of the sun's rotation about his axis, and in fact may be regarded as part of his mass, in proportion as its limits are contracted by cooling, the rotatory motion must increase, according to a well-known principle of mechanics, and the centrifugal force thus becoming greater, the point or limit at which it is balanced by gravity approaches nearer the centre Supposing, therefore the atmosphere to have extended to this limit at any epoch it must in cooling have abandoned the molecules situated there and at the different limits successively produced by the increased velocity of the sun's rotation This effect, however, would only take place at the equator, for on the parallels of latitude the centrifugal would not equal the attractive force Thus, zones of vapours would continue to be abandoned at the equator, and if the condensation of the molecules of these zones continued without any disruption taking place, the matter would, in the long run form a solid or liquid ring, circulating about the sun in the plane of his equator But the uniformity which would be necessary for the production of this effect, both in all the parts of the zone and in the cooling, must render such a phenomenon extremely rare In fact, the ring of Saturn is the only instance of it in the planetary system In almost every case each zone of vapours must have been broken up into numerous masses, which, moving with nearly the same velocities would continue to circulate about the sun nearly at the same distances These separate masses would assume the spheroidal form, with a motion of rotation in the same direction as their revolving motion In short they would become so many planets in the state of vapour But if any one of them was considerably larger than the rest, it would finally by its attraction unite all the others about its centre, and thus the zone originally abandoned would be transformed into a single spheroidal mass of vapours, circulating about the sun This latter case must have been the most common An instance however, of permanent separation occurs in the group of small planets between Mars and Jupiter

Conceiving the planet to have been detached from the solar atmosphere in the manner now described the further cooling would occasion a nucleus to be formed at its centre which would progressively increase by the condensation of the vapours surrounding it The condition of the planet would now perfectly resemble that of the sun, and consequently similar results would follow from the continuance of the condensation Hence the formation of the satellites from the atmospheres of the planets as the planets are formed from that of the sun

This hypothesis of Laplace does not explain the origin of the comets, which may be regarded as small nebulosities wandering from one solar system to another and formed by the condensation of nebulous matter which appears to be scattered through the universe in great profusion Whatever may be the fate of the hypothesis it must be allowed the merit of assigning a mechanical cause for some of the most remarkable phenomena of the universe, without invoking the aid of any other force than that of gravity, — a property which belongs to matter in every form *See* ASTRONOMY SATELLITE STAR, SUN

PLANE TABLE An instrument employed in land-surveying by means of which a plan is made on the spot without any protraction or measurement of angles It consists of a plane rectangular board, about sixteen inches square, to the under side of which a centre is attached with a ball and socket, or parallel plate screws by which it can be fixed upon a staff head or three-legged stand, and set horizontal by means of a circular spirit level A boxwood frame is accurately fitted round the [illegible] of stretching and [illegible] ual to divide one face [illegible] in the middle of the board, but this graduation is scarcely of any use and may be dispensed with The reverse face of the frame is divided into equal parts, as inches and tenths, for the convenience of ruling parallel lines and squares and for shifting the paper A compass box with a magnetic needle is screwed into one side of the table to indicate the bearings, and to enable the surveyor to set up the instrument at a new station parallel to the position it had at a former one A brass rule or index, with a sloping edge, and having perpendicular sight vanes erected at each extremity, completes the apparatus

The plane-table is used as follows — Two stations are selected as the extremities of a base line, the distance between which is accurately measured and a line drawn on the paper representing that distance according to the assumed scale The instrument is then set up at one of the stations, and a fine needle or pin being stuck into the table, at one extremity of the line drawn on the paper, the edge of the index is brought to press gently on the pin and coincide with the line, and the table turned round till the object at the second station is bisected through the sight-vanes; the table is then clamped, and the direction of the magnetic meridian marked. The fiducial edge of the index, still in contact with the upright pin, which serves as a centre, is then directed successively to all the different objects which have been selected as stations and lines drawn on the paper the direction of each The table is removed to the second station, and the pin placed at the corresponding point on the paper which forms a second centre The edge of the ruler is next directed as before towards each of the objects which were observed from the first station and lines drawn in those different directions The intersections of the lines drawn from the second centre with those drawn from the first marks on the paper the position of each of the observed objects

The plane table is not susceptible of great accuracy, but it is extremely useful in forming a sketch-map, or filling up the details of a survey, where the principal points have been fixed by the theodolite, or some equivalent instrument *See* SURVEYING

PLANETA'RIUM A machine for exhibiting the relative motions of the planets, and their positions in respect of the sun *See* ORRERY

PLA'NIPENNATES, *Planipennes* (Lat planus, *flat*, penna, *a feather*) The name of a tribe of Neuropterous insects comprehending those which have flat wings of which the interior pair almost equal the superior ones, and are simply folded underneath at their anterior margin The antennæ are multiarticulate much longer than the head without being clubbed or styliform The maxillary palps are setiform or somewhat thicker at the extremity shorter than the head and composed of from four to five joints The ant-lions (*Myrmeleon*) and termites are examples of this tribe

PLANISPHERE A projection of the sphere and its various circles on a plane *See* PROJECTION

PLANK (Fr planche) In Architecture a board that exceeds nine inches in width

PLANO-CONCAVE In Optics a lens which is plane on one side and concave on the other *Plano-convex* is a lens plane on one side and convex on the other *See* LENS

PLANORBIS (Lat planus, and orbis *an orb*) A genus of marsh snails so called from the form of the shell, which is that of a flattened orb arising from the volutions being coiled on the same plane Many species of this genus are common in Britain

PLANT In Natural History *See* BOTANY.

PLANTAGENET The surname of the royal family of England from Henry II to Richard III inclusive The origin of the name is involved in deep obscurity The best antiquaries derive it from the well known story of the Earl of Anjou the ancestor of the royal race, who having made a pilgrimage to Rome, where he was scourged with broom twigs assumed the name of *Plantagenista* (literally a *broom twig*) which his descendants retained The name Plantagenet belongs to the noble house of Buckingham

PLANTATION A piece of ground planted with trees for the purpose of producing timber or coppice wood In new countries not generally cultivated and more especially in warm climates the term plantation is applied to land employed in the culture of the more important crops, such as the sugar cane, coffee, pepper, cotton, &c In Britain it is exclusively applied to lands planted with trees or shrubs

PLANTIGRADES, *Plantigrada* (Lat planta, *the sole of the foot*, gradior *I march*) The name of a tribe of Carnivorous Mammals, comprehending those which apply the whole or a great part of the sole to the ground in progressive motion

PLANTING The art of [illegible] of trees Also the art of inserting plants [illegible] dibble trowel, or by other means in use in agriculture and gardening *See* ARBORICULTURE

PLASHING A mode of repairing or modifying a hedge by bending down a portion of the shoots, cutting them half through near the ground, to render them more pliable and twisting the [illegible] upright stems so as to render the whole [illegible] fence, and at the same time preserve all the branches alive For this purpose the branches to be plashed or bent down, must not be cut more than half through, in order that a sufficient portion of sap may rise up from the root to keep alive the upper part of the branches Where hedges are properly formed and kept, they can very seldom require to be plashed, but this mode of treating a hedge is most valuable in the case of hedges abounding with hedgerow trees, when from neglect, or from any other cause, the hedge has become of irregular growth

PLASTER In Architecture, the material of which ornaments are cast, and also that with which the fine stuff or gauge for mouldings and other parts is mixed, when quick setting is required

PLASTER In Pharmacy, a compound, generally of oxide of [illegible] for external applications

PLASTER OF PARIS *Gypsum*, or sulphate of

lime, commonly termed *plaster stone*, and found abundantly near Paris

PLA'STIC (Gr πλαστικος, *I form.*) In Sculpture, that which can be modelled, as clay, &c In the arts it has a more extended signification and signifies those materials and circumstances which are susceptible of being formed and fashioned to the purpose wanted

PLASTIC CLAY A clay used in the manufacture of pottery See also GEOLOGY

PLATANIST *Platanista* A name applied by Pliny to a fish in the river Ganges having a snout and a tail like a dolphin, but much larger In modern Zoology, it is the generic appellation of the Gangetic dolphin (*Delphinus gangeticus* Cuv)

PLA'TBAND (Fr plate and bande) In Architecture a square moulding projecting less than its height or breadth The fillets between the flutes of columns are sometimes called, but improperly, by this name It is also sometimes used to denote the lintel of a door

PLATE [illegible] In Architecture, a piece of timber lying horizontally on a wall for the reception of the ends of girders joints, rafters, &c.

PLATE The name usually given to gold and silver wrought into articles of household furniture For the regulations under which the manufacture of plate is carried on see the *Com Dict*

PLA'TFORM (Fr plateforme) In Architecture a plane surface, lying level, of any materials used in a foundation or elsewhere, for the reception of the foundations of a building, or for the piers of a bridge also a level [illegible]

[illegible] guns are placed

PLATING The art of covering copper and other metals with silver or gold It is effected in various ways Sometimes the silver is attached to and rolled out with the copper by pressure, sometimes the one metal is precipitated from its solutions upon the other and of late manufacturers have availed themselves of electro-chemical decomposition for the purpose See VOLTAYTE

PLA'TINUM (So called from the Spanish word plata *silver*, on account of its colour) A metal of a white colour exceedingly ductile malleable, and difficult of fusion It is the heaviest substance known its specific gravity being 21 5 It undergoes no change from air or moisture and is not attacked by any of the pure acids, it is dissolved by chlorine and nitromuriatic acid, and is oxidized at high temperatures by pure potass and lithia It is only found in South America and in the Uralian Mountains it is usually in small grains of a metallic lustre, associated or combined with palladium rhodium iridium and osmium, and with copper, iron lead titanium, chromium gold and silver it is also usually mixed with alluvial sand The particles are seldom so large as a small pea but sometimes lumps have been found of the size of a hazel nut to that of a pigeon's egg In 1826, it was first discovered in a *vein* associated with gold by Boussingault in the province of Antioquia in South America When a perfectly clean surface of platinum is presented to a mixture of hydrogen and oxygen gas, it has the extraordinary property of causing them to combine so as to form water and often with such rapidity as to render the metal red hot *spongy platinum* as it is usually called obtained by heating the ammonio-muriate of platinum, is most [illegible] and a jet [illegible] d by the metal thus ignited a property which has been applied to the construction of convenient instruments for procuring a light The equivalent of platinum is about 98 It is precipitated from its nitromuriatic solution by sal ammoniac, which throws it down in the form of a yellow powder composed of bichloride of platinum and sal ammoniac

PLATONIC BODIES The five regular geometrical solids so called because they were treated of or described by Plato They are the tetraedron, the hexaedron the octaedron, the dodecaedron and the icosaedron Besides these five, there can be no other solids bounded by like, equal and regular plane figures, and whose solid angles are all equal

PLATONISM The philosophy of Plato To give a satisfactory account of the system of this great thinker, within the limits which the nature of the present work necessarily impose upon us, would be an undertaking of no common difficulty Those of our readers who are adequately conversant with the original writings of Plato must be well aware that the views entertained in our own country of his philosophical character and merits are, to say the least partial and incomplete, while those who add to this knowledge an acquaintance with the researches of our German contemporaries on this subject will [illegible] ability, at the same time that they appreciate the [illegible] of [illegible] more adequate comprehension [illegible] of the mind of Plato is its comprehensiveness This quality discovers itself equally in the form in which his philosophy is communicated, and in that philosophy itself The form to which we allude is, it is well known, that of the dialogue The Dialogues of Plato are at once vivid representations of Athenian life and character, and constituent parts of a system of universal philosophy; the harmonious productions of a genius which combined the dramatic imagination with the [illegible] in a degree which has never before nor since been equalled It is in this circumstance that we must seek alike for the influence which Plato's writings have exerted and for the difficulty of rightly apprehending their meaning What has been said of history in general may with equal truth be applied to the Platonic dialogues — that they are "philosophy teaching by examples" In place of a formal refutation of sophistry, we are introduced to living sophists, in the room of an elaborate system of philosophy we meet the greatest philosophers of his day, reasoning and conversing with the simplicity in the pursuit of [illegible] with [illegible] full of natural prejudices with many abounding with individual peculiarities

Under no other or less complex form of composition could Plato have accomplished the manifold purposes which he had in view, purposes not of the philosopher only but of the reformer and educator of the moral and intellectual nature of his countrymen In most of his dialogues one or other of these intentions is the prominent one in some the refutation of [illegible] opinions in others the establishment of his own, while [illegible] seem chiefly aimed as exemplifications of scientific method generally, though we agree with Schleiermacher in thinking that there are none which do not contribute to the gradual development of his own system

But it is not merely in the form in which his doctrines are clothed that we discern the comprehensiveness of Plato's genius The same quality is as we have said, equally apparent in the philosophy of which his dialogues are the vehicle By referring to the articles ELEATIC, IONIC, and PYTHAGOREAN PHILOSOPHY, the reader will be able to form some conception of the systems which preceded that of Plato In each of these some leading idea is taken up, and traced, generally to the exclusion of all others, through all its possible consequences These three schools may indeed, be severally taken as the representatives of the three constituent portions of universal philosophy the Eleatics of the logical or dialectic, the Ionians of the physical, and the Pythagoreans, though in a less exclusive degree of the ethical element It was in Plato that these different tendencies first converged Each viewed by itself was essentially partial and one sided and, with whatever of truth it might contain, must necessarily by its very exclusiveness, combine much of error Of this circumstance the sophists had taken advantage, and, by setting the doctrines of one system in contradiction to those of another, had succeeded in the introduction of a universal scepticism Plato was thus led clearly to discern the necessity of laying the foundations of science deeper than they had been laid by his predecessors The ultimate unity of all knowledge, properly so called, and the mutual dependence of all its parts on each other is the fundamental intention of his philosophy How this first principle was to be attained, whether indeed it were attainable or not, could only be ascertained by a previous inquiry into the nature not of *being*, but of *knowledge* This is one mark which distinguishes Plato from earlier speculators, and it is important to bear it in mind, if we would form a correct estimate of the services rendered by him to the progress of philosophy The hint was unquestionably given by Socrates, but Plato was the only one among his immediate disciples who appears to have followed it up He may, in truth, be styled the founder of the ancient psychology, and the dialogue entitled *Theætetus* may be considered one of the most important contributions to the most important branch of that science the theory of perception and judgment which antiquity affords It is in this dialogue that the negative side of the inquiry into knowledge, which we have alluded to, is contained Knowledge, it is there shown is not to be confounded either with the impressions on the senses or with the judgments (δοξαι) founded upon them Sensation by its very nature, is relative only it is the joint effect of the conditions of our internal constitution and a motion, or change, communicated from without Judgment in so far as it is founded on a prior impression, can have no validity save in reference to that impression Pure knowledge, therefore, if it exist at all, must be sought in some other direction It is here that the celebrated doctrine of ideas finds its place Without entering into the question more deeply than our limits allow it is sufficiently clear that no other word, such as conception, notion, or the like, is adequate to convey all that Plato meant by an *idea* Having failed in finding alike knowledge in the senses and permanent being, its object in nature, he was driven, in order to avoid the sophistic doctrine of the relative nature of [illegible] seek for the true objects of reason [illegible] from the material universe. In place of the doctrine of Protagoras "Man is the measure of all things, he substituted, God is the measure of

all things," meaning by this, as he elsewhere explains himself, that in the divine nature reason and being are one From this original unity which is denominated by Plato the good or the supreme good [illegible] hand, human reason, on the other, [illegible] stitute all in nature that is real, [illegible] reason can apprehend We might hence be led to suppose that the modern term "law" may be correctly used in place of the Platonic "idea" But, when we examine the matter more narrowly, we shall find an essential difference between the two words, not merely in the ontological or theological considerations just alluded to, but also in the habit, which Plato inherited from his master Socrates, of referring the laws of the universe [illegible] *cal* standard The three great ideas order or fitness, are the ultimate unities to which he conceives it to be the business of the reason to refer all its conceptions These ideas are themselves included in the highest unity, or God, from whom it is that they derive their reality But the supreme nature is to us incomprehensible it is in the consciousness of our separation from the great source of being that philosophy takes its rise The senses it is which first suggest to us this want we strive to be [illegible] ceptions and [illegible] a self recognizing [illegible] part [illegible] pure Ideas [illegible] all the other [illegible] of the true ethics as [illegible] and [illegible] of our world [illegible] very imperfect sketch of the Platonic [illegible] three constituent parts The threefold division even we nowhere find expressly laid down in the written works of Plato, but, besides that it is throughout implied, the fact that it is taken for granted by his immediate successors, Xenocrates and Aristotle [illegible] formed part of Plato's [illegible] this comprehensive view of universal science, we are indebted to Plato for many valuable discoveries and many more most pregnant hints, in subordinate branches of inquiry Among these may be enumerated the discussion of the theory of pleasure and pain, and their relation to desire and emotion, in the *Philebus*, of the first principles of the science of grammar in the *Cratylus* and *Sophist*, of the nature of mathematical science and its place in general philosophy, *Rep* vi, &c The ethics of Plato, though, in many important respects, they must be allowed to be greatly defective, as, in particular, in the omission of the notions of duty and responsibility, are yet far from deserving the contemptuous treatment they have met with from certain writers among ourselves In the *Republic*, which contains the substance of his moral doctrines, the intention of Plato manifestly was to develop the idea of perfect humanity, alike in the individual and in what he regarded as an enlarged transcript of the individual, the state (See Ethics) The most important contribution to the study and right understanding of the Platonic philosophy with which modern times have furnished us, is to be found in the arrangement of his *Dialogues* and the introduction prefixed to each by the celebrated Schleiermacher, a work which has recently been translated into English See also *Ritter, Gesch der Philosophie*, b viii, and for some abstruse portions of Plato's doctrine *Trendelenburg's Ideæ Plat ex Aristot illust*

The best editions of Plato's works are those of Bekker and Hallbaum For an account of his life, see *Ast's Leben und Schriften Platon*

PLATOON' In the art Military, a small square body of musketeers, drawn out from the main body to strengthen the angle of a larger square, or to do duty in ambuscades or defiles, &c, when there is not room for whole regiments or battalions to act

PLATYRHINES *Platyrhinæ* (Gr πλατυς, *wide* and ρις, *a nose*) The name of a section of the Linnæan genus *Simia* including those species which have the nostrils separated by a wide interspace These monkeys are peculiar to the New World

PLATYSOMES *Platysoma* (Gr πλατυς, and σωμα *body*) The name of a family of Coleopterous insects comprehending species with a wide and much depressed body These insects are found under the bark of trees, and form the genus *Cucujus* of Fabricius, now subdivided

PLEA'DING (Lat placitum, Norman French plaid, together with the verb placitare, *to plead*; derived from placitum, the decree or sentence of a judicial or legislative authority) Pleadings in English law are the preparatory allegations in writing which intervene between the commencement of a cause and its trial

The first object [illegible] between two litigant parties is always [illegible] subject for decision This must be accomplished by disengaging the point in debate from all the extraneous matter in which the complaints and answers of the respective parties have involved it This is the principle from which all the subtleties of the system of pleading, commonly called *special pleading*, are derived and, in so far as it has departed from this object, it has wandered from its original purpose

Pleadings were conducted orally in the first times of our jurisprudence, the parties, or their advocates, exposing the state of facts on which they relied successively before the judge, who moderated between them, and [illegible] other until the judge was able to fix upon [illegible] point [illegible] was called, that is the question, whether of fact or law, on which the judge, or the jury, was eventually to decide Hence issues are said to be *in fact* or *in law* The same principle governs the course of *written pleadings* now adopted

The plaintiff, or complaining party, having summoned the defendant into court, by a writ stating the nature of his complaint makes his first statement which is termed a *declaration* The defendant may now answer him, either by denying that there is any ground in law for the action, either because there is defect *in substance* in the plaintiff's alleged right, or defect *in form* in his proceedings, or by controverting the facts which he alleges, or alleging new facts in answer to them In the former case the defendant *demurs* to the declaration, in the latter case he answers by one or more *pleas*

A demurrer may take place either at this or at any subsequent stage of the proceedings, and may be made either by plaintiff or defendant. And it is either *general* to substance, or *special* to form (But, by the increased liberality of the courts many errors in form may now be amended on application which formerly were fatal) If the demurrer comes to be argued (which is done in term time or in bench before all the judges of the court in which the action is brought), the court will examine the whole pleadings on both sides, and their decision on the point of law is final as to the action

The defendant may answer or *traverse* the facts, 1 By pleading what is termed *the general issue*, a form which, in its original signification imported an absolute denial of the facts on which the plaintiff founded his complaint, and concludes with the words, "and of this the said defendant puts himself on the country," that is, offers to have the issue tried by a jury But by the refinements introduced into pleading, the general issue was gradually admitted in each of the several *forms of action* to which we shall presently refer, not only to deny the plaintiff's facts but to allow the defendant to bring forward other facts in answer, although these more properly form the subject 2 of *special pleas* When the defendant admits all or a part of the plaintiff's facts, but relies on certain other facts as exonerating him from the liability asserted by the plaintiff, he ought to state these facts in answer, for instance, in order to answer the claim of a debt, that it is barred by length of time, or that the defendant has a set off to allege against it this is termed a plea by way of confession and avoidance The plea stating such new facts concludes with the assertion, "and this the said defendant is ready to verify" To this the plaintiff may reply in his second statement, called a *replication* either by denying the defendant's facts, that is, a replication *by way of traverse* or by alleging fresh ones, the defendant may deny these, or again allege fresh ones in his *rejoinder*, sometimes a *surrejoinder*, a *rebutter* and a *surrebutter* may be added, and the edifice of pleading is raised by stories gradually narrowing by the exclusion of superfluous facts, until it reaches its summit in the production of one or more issues, either in law or fact the decision of which finally arranges the dispute, and by what are called the new rules of pleading framed in 1834 many defences which might formerly have been given under the general issue must be pleaded specially

Thus, in an action of debt, the defendant pleads *specially* the statute of limitations, that is, that more than six years have passed since the cause of action accrued, the plaintiff replies admitting the length of time, but alleging that the defendant has since promised to pay the debt this the defendant denies in his rejoinder, and hereupon, [illegible] on the fact of the promise, issue is joined

A plaintiff complains of breach of covenant by his lessee in not repairing premises The [illegible] pleads admitting the lease and the want of repair but alleges that he had received from the plaintiff a release from all his liability The plaintiff replies admitting the release, but asserting that it was obtained from him by force or duress The defendant may perhaps deny the legal sufficiency of this ground, or *demur to the replication*, or he may traverse it in his rejoinder denying the force or duress In the former case, an issue of law is raised for [illegible] the latter [illegible] for the jury

[illegible] for the parties [illegible] respective [illegible] paper to the [illegible] When issue is joined, these pleadings are entered on a parchment roll, and the issue is likewise entered; in the form of appointing a day for the trial of the demurrer, if the issue be in law, or in the form of a precept to the sheriff [illegible] This roll is called the record, and is preserved as an au-

thentic memorial of the proceedings in the case; the verdict, and the judgment, being entered on it

Such is a brief outline of the forms of pleading as ap- [illegible] complaint can be made [illegible] But, according to the nature of the injury complained of, his action will assume a particular form, allotted by law to enable him to recover the particular remedy he seeks *See* ACTION, and the [illegible] actions under their several heads

PLEASURE-GROUND The portion of ground adjacent to a dwelling-house in the country which is exclusively devoted to ornamental and recreative purposes In the ancient style of gardening, the pleasure-ground was laid out in straight walks, and regular or symmetrical forms, evidently borrowed from architecture, but in the modern style it is laid out in winding walks and in forms borrowed direct from nature A portion of lawn or smooth grassy surface may be considered as essential to the pleasure-ground under any style

PLEBEIANS The free citizens of Rome who did not come under the class of the patricians or clients Though always personally independent, they had in early times no political power, the government being entirely in the hands of the patricians who with the descendants of the king, formed the original people The class of plebeians was of after growth and probably drew its numbers from various sources, as from clients whose obligations were dissolved by the death of the heads of their patrons, and the [illegible] conquered states who were admitted to the rights of citizens In plebeian families with patrician names it was supposed to have arisen from marriages of disparagement contracted between the higher and lower classes

As this body, from its constitution, naturally grew in vigour while the patricians became weaker, it soon formed the main strength of the Roman armies, and became desirous of sharing in the advantages of the conquests made by its prowess while the patricians on their part refused to admit them to all their privileges and, far from yielding to the demands of the other party exercised the severe rights which as creditors they possessed over the liberties of many of its members This state of things produced a continued series of collisions between the two orders, in which the latter gradually gained ground, till, in the last ages of the republic it was admitted to a full share of all the powers and privileges before confined to one order

PLEBISCITUM (Lat *a decree of the people*) In Roman History a law enacted by the common people, under the superintendence of the tribune or some subordinate plebeian magistrate without the intervention of the senate The term however is used in a more peculiar sense, being applied chiefly to the law made when, upon a misunderstanding with the senate, they retired to Mount Aventine

PLECTOGNATHES, *Plectognathi* (Gr πλέκω *I connect* and γνάθος, *a jaw*) [illegible] an order of fishes, including those which have the maxillary bones anchylosed to the sides of the intermaxillaries, which alone form the jaws.

PLECTROPO'MA (Gr πλῆκτρον, *a spur*, and πῶμα, *a lid*) A name applied by Cuvier to a genus of Percoid fishes, characterized by having the angle of the preoperculum produced or divided into a series of spines like those which arm the rowel of a spur All the species are exotic and belong to warm climates

PLE'CTRUM (Gr πλῆκτρον, from πλήσσω, *I strike*) The small ivory instrument with which the ancients struck the lyre

PLEIADES In Mythology the seven daughters of Atlas and Pleione were so called whose names were Alcyone, Maia Electra Merope, Calano Sterope, and Taygeta They were loved for seven years by Orion, from whose solicitations they were at length released by the interposition of Jupiter, who transformed them to the stars, where they now form a cluster in the neck of the constellation Taurus Only six of these stars are visible to the naked eye, and the ancients supposed that the seventh concealed herself out of shame for having bestowed her love on a mere mortal, Sisyphus, while [illegible]

PLENARY [illegible] of an office [illegible]

PLENE ADMINISTRAVIT (Lat) In Law, a plea pleaded by an executor or administrator to an action on a liability of the deceased, that he has *fully administered* [illegible]

PLENICORNIA (Lat plenus, *full*, and cornu, *a horn*) The name of a tribe of Ruminants, including those which have horns composed of an uniform solid osseous substance as the antlers of deer *See* CORNUA

PLENIPOTENTIARY *See* AMBASSADOR

PLEONASM (Gr πλέον, *more*) In Rhetoric, a redundant phrase or expression, sometimes introduced to give additional energy, at other times needless and ungraceful

PLEOMORPHISM (Gr πλησιος, *near*, and μορφη, *form*) A term applied to crystallized substances the forms of which closely resemble each other, but are not absolutely identical The primary form of sulphate of strontia is a rhombic prism very [illegible] sulphate of [illegible] measures [illegible] of the prism, the difference exceeds 2° Similar differences are observable in the rhomboedrons of carbonate of lime and carbonate of iron. Such substances therefore are *pleomorphous*

PLESIOSAUR, *Plesiosaurus* (Gr πλησιος, and σαυρος, *a lizard*) The name of a genus of extinct marine saurians, chiefly remarkable for their length of neck The head is small, but like that of a crocodile, the vertebræ are articulated generally by nearly plane surfaces, the cervical vertebræ have an articular surface, divided by a longitudinal impression, for a rudimental rib on each side, and two vascular foramina beneath the digital bones of both the hind and fore extremities are flattened, and are enveloped in a sheath of skin like the paddles of the *Cetacea* The remains of the *Plesiosauri* occur in the formations from the muschelchalk to the chalk inclusive, but are most common in the lias and kimmeridge clay beds

PLE'THORA (Gr πληθω, *I fill.*) A redundant fulness of the blood-vessels It results from various causes generally referred to *sanguine plethora*, to which the robust and athletic are most subject, and to *serous plethora* which attacks debilitated constitutions

PLEURA. (Lat) The membrane which covers the inner surface of the thorax and its viscera It forms two distinct portions, or bags, which, being applied laterally to each other, form the partition called the *mediastinum*

PLEURITIS, *Pleurisy* Inflammation of the pleura. This disease begins with fever, cough pain in the side, a peculiar hard and strong pulse the symptoms often run on with great rapidity attended by very painful respiration and other alarming symptoms (*See* PNEUMONIA) The treatment must be prompt and decided it consists in bleeding, blisters, and purging, and in the after treatment, great care must be taken against an insidious and local form of the disease which often extends to the lungs

PLEURONECTIDÆ (Gr πλευρα *a side*, and νηχτης *a swimmer*) The name of a family of [illegible] which swim on their side, and of which the *Pleuronectes* or sole, is the type, they are [illegible] flat-fishes

PLICA (Lat plico, *I entangle*) A disease said to be peculiar to Poland, Lithuania, and Tartary, in which the hair becomes matted and inextricably entangled It is often called *Plica Polonica*

PLICIPENNATES, *Plicipennes* (Lat plico, *I fold*, and penna, *a feather*) The name of a tribe of Neuropterous insects, comprehending those which have the inferior wings wider than the others, and folded longitudinally The mandibles are wanting in this tribe, which is represented by the genus *Phryganea*, or caddisflies

PLINTH (Gr πλινθος, *a brick*) In Architecture, the lowest member of the base of a column, bearing, as its name indicates the form of a square brick or tile (*See* BASE) Sometimes the abacus of the Tuscan capital is called the plinth of the capital

PLIOCENE (Gr πλειων, *greater*, and καινος, *recent*) A geological term applied to the most modern of the divisions of the tertiary epoch, because the major part of its fossil testacea are referable to recent species *See* GEOLOGY

PLOTTING, in Surveying, signifies describing or laying down on paper the several angles and lines of a tract of land which has been surveyed and measured It is usually performed by means of a *protractor* (see the term) sometimes by the *plotting scale*

PLOTTING SCALE A mathematical instrument used in *plotting*, or setting off the lengths of lines in surveying It consists of two graduated ivory scales, one of which is perforated nearly its whole length by a dovetail shaped groove, for the reception of a sliding piece to which the second scale is attached and with which it [illegible] the [illegible] angles [illegible] the [illegible] the scales, or [illegible] the plan

PLOTUS A genus of web-footed birds of the family *Pelecanidæ*, and nearly allied to the cormorants They are generally known by the name of *Anhinga*, or "darters," from the rapidity with which they shoot down into the water in the capture of fish The white billed anhinga (*Plotus melanogaster*) is the most common and best known species it is a native of the tropical regions of both North and South America

PLOUGH (Germ pflug) An implement drawn by horses and guided by a driver by which the surface of the soil is cut [illegible] slices and successively raised up and turned [illegible] object of the operation is to expose a new surface to the action of the air and to render it fit for receiving the seed, or for harrowing, or for

other operations of agriculture Ploughs are of two kinds, those without wheels, commonly called swing- [illegible] one or more wheels, called wheel [illegible] parts which compose both kinds of plough are the beam by which it is drawn, the stilts or handles by which the ploughman guides it, being two levers connected with the beam, the coulter fixed into the beam, by which the furrow slice is cut, the share, also attached to the beam, by which the slice is raised up, and, finally, the mould-board, by which the slice is turned over The most improved form of the swing plough is that in general use in Scotland and the North of England which is known as a modification of what is called Small's improved [illegible] The most improved wheel plough is the Scotch plough with a wheel attached to the beam, for the purpose of keeping the share at a uniform distance beneath the surface The subsoil plough, the invention of Mr Smith of Deanston, in Stirlingshire, is the swing plough, of a somewhat stronger construction than that in common use, but without the coulter and the mould-board The use of this implement is to follow the common plough and loosen the subsoil at the bottom of the furrow without raising it to the surface The most improved form of this implement contains a muzzle (the instrument by which it is drawn), so contrived as that the horses may walk on the firm soil The use of the subsoil plough is one of the greatest modern improvements that has been introduced into the culture of arable land Draining ploughs are of different kinds The mole plough, instead of a share and mould board, has a small iron cylinder attached to the lower extremity of the coulter, and which, being drawn through grass land, leaves in its track a small opening which has been compared to the underground track of a mole and into which the water percolates from the surface through the narrow slit formed by the upper part of the coulter and is thus carried off to an open drain The other kinds of draining ploughs cut out the soil raise it to the surface, and turn it over in the manner of the common plough, thus leaving a deep furrow, which is commonly further deepened and modified by the spade and afterwards partially filled with stones draining tiles or other materials through which water may find its way and finally covered with the surface soil Draining ploughs, though in theory promising a saving of manual labour yet in practice are found inconvenient from the number of horses required to work them Their use is therefore generally confined to free, deep loamy soils with an even surface

PLOUGHING The act of turning over the soil by means of the plough Trench ploughing is effected by the plough passing twice along the same furrow the first time for the purpose of throwing the surface soil into the bottom of the furrow, and the second time for raising a furrow slice from under that which had been already turned over and raising it up &c turning it upon the first furrow slice, by means of which the surface soil is entirely buried and a stratum of subsoil laid over it thus effecting in the field what trenching with the spade does in the garden Trench ploughing can only be employed [illegible] is naturally dry and of [illegible] rendered so by draining and subsoil ploughing, for bad subsoil brought to the surface would be unfit for receiving seeds or plants *See* PLOUGH

PLUG In Architecture, a piece of wood driven horizontally into a wall, its end being then sawn away flush with the wall, to afford a hold for the nailing up dressings &c

PLUMBA'GIN A crystallizable substance extracted from the root of the *Plumbago Europæa*

PLUMBA'GO, *Graphite Black Lead* This useful substance is a compound of carbon generally with a minute quantity of iron, there is, however some doubt as to the nature of the combination The finest plumbago is from Borrodale in Cumberland

PLUMB-LINE, PLUMMET (Lat plumbum, *lead*) A heavy body (usually a piece of lead whence the name) suspended by a flexible thread for the purpose of indicating the perpendicular to the horizon, or the direction of terrestrial gravity In former times the plumb line constituted an essential part of the apparatus employed for adjusting astronomical instruments, but it is seldom used in modern observations, excepting those made with the zenith sector, its place being either more conveniently supplied by the spirit level, or the method of determining the zenith point by combining direct and reflected observations rendering it unnecessary For the common artificer's plummet, see LEVEL

PLU'MULA (Lat pluma, *a feather*) The growing point of the embryo [illegible] the apex of the radicle and [illegible] base of the cotyledons by which it is protected [illegible] It is the rudiment of the future stem of a plant

PLUPERFECT TENSE (Lat plus quam perfectum, *more than perfect*) In Grammar the tense which denotes that an action was finished at a certain period to which the speaker refers.

PLURAL *See* GRAMMAR

PLURA'LITY. In Ecclesiastical Law, the holding of more than one benefice It was ordained by the council of Lateran A D 1215, that whosoever should take a benefice with cure of souls, if he should before have attained a like benefice should, *ipso facto*, be deprived of the latter Exceptions were made to this rule in certain cases of *in commendam*, by a constitution published in the council of Lyons, but it could always be evaded by dispensation from the pope See the Reformation dispensations in England are granted by archbishops The first English enactment on the subject was that of 21 Hen c 13, and rendered the former benefice void if of the value of 8*l* or above A benefice, therefore, with which another may be held, must be below that value in "the king's books" By the 4th Canon, 41, no licence or dispensation for the holding of more benefices than one can be granted to any one unless graduate as A M in one of the universities, and he must reside a reasonable time on each benefice, and licensed as a preacher, nor may they be more than thirty miles asunder, and he must have under him a preacher properly licensed in that where he resides least Formerly dispensations even from the injunctions of this canon were obtained from the crown, but none it is said, since the Revolution The practice was very common in this country in Roman Catholic times, and though as we have already observed, restrained by various statutes still subsist to a considerable extent Until every benefice is made capable of supporting an incumbent it is manifestly impossible to abolish it entirely, and in the case of an individual holding one rich and one poor living together, the arrangement [illegible] practically does not exist Under the existing dispensations two benefices may be obtained on various pleas, but measures of further restraint are understood to be in contemplation

PLUS In Algebra the additive or positive sign +, which being placed between two quantities, signifies that they are to be taken collectively or added together According to Dr Hutton this character was first used by Stifelius, as a contraction of the letter *p*, the initial of *plus*

PLUTO (Gr Πλουτων) Called also Hades (Ἀιδης) Aidoneus (Ἀιδωνευς) by the Greeks, or Orcus by the Romans was the brother of Jupiter and Neptune and lord of the infernal regions He is not like his brothers, celebrated for amours but remained faithful to Proserpine whom he carried away from the plains of Sicily, and made his queen

Pluto is represented as an old man with a dignified but severe countenance, holding in his hand a two-pronged fork

PLUTO'NIC ROCKS Unstratified crystalline rocks, probably formed at great depths beneath the surface by igneous fusion The term is opposed to *volcanic rocks*, also formed by fire, but having cooled near the surface See GEOLOGY

PLUTUS (Gr πλουτος, *wealth*) The god of riches, said to have been the son of Jasius and Demeter or Ceres There are no particulars known as to his worship but he is introduced as an actor in the play of Aristophanes which bears his name, and he bears a part also in the *Timon* of Lucian

PLUVIAMETER (Lat pluvius, *rain*) See RAIN-GAUGE

PNEUMA'TICS (Gr πνευμα *air or breath*) The science which treats of the mechanical properties of elastic fluids and particularly of atmospheric air

Elastic fluids are divided into two classes,—permanent gases and vapours The gases cannot be converted into the liquid state by any known process of art, whereas the vapours are readily reduced to the liquid form by pressure, or diminution of temperature In respect of their mechanical properties there is, however, no essential difference between the two classes

Elastic fluids in a state of equilibrium, are subject to the action of two forces, [illegible] force acting from particle [illegible] the gases, in the same manner as on all other material substances but the action of the molecular forces is altogether different from that which takes place among the elementary particles of solids and liquids, for, in the case of solid bodies, the molecules strongly attract each other [illegible] liquids, [illegible] be indifferent to internal motion, but, in the case of the gases, the molecular forces are repulsive, and the molecules, yielding to the action of these forces, tend incessantly to recede from each other, and, in fact, do recede, until their further separation is prevented by an exterior obstacle Thus, air confined within a close vessel exerts a constant pressure against the interior surface, which is not sensible, only because it is balanced by the equal pressure of the atmosphere on the exterior surface This pressure exerted by the air against the sides of a vessel within which it is confined is called its *elasticity*, or *elastic force*, or *tension*

Conditions of equilibrium — In order that all the parts of an elastic fluid may be in equilibrium, one condition only is necessary, namely, that the elastic force be the same at every point of any horizontal plane. Two causes tend to produce inequality of pressure in the different parts of such a fluid, in both cases, namely, the mobility of the particles, and the action of gravity upon them. Conceive a close vessel to be filled with air or other gas, and let *a* and *b* be two molecules situated in the same horizontal plane. It is evident that if the two molecules are in a state of equilibrium, the force with which *a* repels *b* must be exactly counteracted by that with which *b* repels *a*, for otherwise motion would take place. The same thing takes place in respect of every horizontal section of the gas, but the pressure on each section varies with its altitude. Suppose *c* and *d* to be two molecules situated in a horizontal section, *lower* than that in which are *a* and *b*. It is evident that the molecules *c* and *d* sustain a greater pressure than *a* and *b*, for, in the first place the whole of the pressure on *a* and *b* is transmitted to them by the principle of the equality of pressure in all directions, and in the second place, they sustain a new pressure, arising from the weight or gravity of all the molecules situated between the two horizontal planes *a b* and *c d*.

The principle which has just been explained is proved experimentally by the diminution of the pressure of the atmosphere at greater altitudes. A column of air reaching from the ground to the top of the atmosphere exerts a pressure equal to the weight of a column of mercury of the same diameter and whose height is equal to that in the barometric tube. Now, on carrying the barometer to the top of a mountain, for example, the mercurial column is observed gradually to become shorter as we ascend, and the diminution of the column and consequently of atmospheric pressure, is connected with the increase of altitude by a certain constant law, which enables us to deduce the one from the other and to apply the barometer to the very important purpose of determining the relative altitudes of places on the surface of the earth. *See* HEIGHTS MEASUREMENT OF.

Law of Mariotte — In order to determine the relation between the density and pressure of the elastic fluids in the state of equilibrium, let A C B be a graduated bent tube (like a siphon barometer) having two unequal branches of which the shorter is hermetically sealed at B and the longer open at A. Let a small quantity of mercury be poured into the tube just enough to fill the bend and intercept the communication between the air in C B and the external atmosphere, and let the level F F be marked at which it stands in the two branches of the tube. It is evident that in this state the pressure of the air imprisoned between F and B is exactly equal to that of the atmosphere. Now let mercury be poured into the tube at A, it will rise slowly in the branch F B, and much more rapidly in the open branch F A. Let mercury then be continued to be poured in until it stands at two points D and F′, so situated that the altitude of D above F′ or D F′, is just equal to the height of the column in the barometer, or about 30 inches. In this state the elasticity of the air in the space F′ B is in equilibrium with the pressure arising from the weight of the mercurial column F′ D and the pressure of the atmosphere exerted on D. But the weight of the mercurial column F′ D is just equal to the atmospheric pressure, consequently the air in F′ B is compressed by a force equal to twice the atmospheric pressure. Now on observing the length of the column F′ B it will be found exactly one half of E B, or the air has been reduced to half its former volume. On increasing the length of the open branch of the siphon and pouring in a proper quantity of mercury it is found that a pressure of three atmospheres reduces the volume of air at B to one third, and of four atmospheres to a fourth of its first volume, whence it is inferred, generally, that *the volumes of gases are inversely as the pressures which they support*. This fundamental property of elastic fluids is called the *Law of Mariotte* from its having been discovered by that philosopher in France. It has been verified in several ways on all the known gases, and, in the case of dry air its verification has been pushed, by MM. Dulong and Arago, to pressures [illegible] (Lame, *Cours de Physique*). [illegible] ject of vapours or steam subjected to a smaller degree of pressure than that which is necessary to reduce them to the liquid state, and even for mixtures of different gases. It is important, however, to observe, that it is supposed no variation of temperature has taken place during the experiment. The apparatus above described is called a *manometer*.

The density of bodies being inversely as their volumes, the law of Mariotte may be otherwise expressed by saying *the density of an elastic fluid is directly proportional to the pressure it sustains*. Under the pressure of a single atmosphere the density of air is about the 770th part of that of water, whence it follows that under the pressure of 770 atmospheres, air is as dense as water. Thus, the average atmospheric pressure being equal to that of a column of water of about 32 feet in altitude, at the bottom of the sea, at a depth of 24640 (= 770 × 32) feet, or 4⅔ miles, air would be heavier than water, and though it should still remain in a gaseous state it would [illegible]. The repulsive energy of the molecules of the elastic fluids is greatly augmented by an increase of temperature, and it is of the utmost importance in many physical inquiries to ascertain the relation between the temperature and the elastic force. If air and several other gases, sustaining the same constant pressure, are exposed to an increase of temperature which affects all of them equally, it is proved by observation that they all undergo an equal expansion, that is to say, the increase of volume of all the gases is the same for equal augmentations of temperature, and proportional to the augmentations. Experience also shows that within a considerable range of temperature, the indications of the air thermometer differ very little from those of the mercurial thermometer, so that, within this range, the expansion of any gas whatever is proportional to the increase of temperature indicated by the degrees of the ordinary thermometer. From the temperature of [illegible] to that of boiling water, or from zero to [illegible] centigrade thermometer, Gay Lussac found the expansion of air subjected to a constant pressure to be in the ratio of unity to 1.375, which gives an expansion of 0.00375 for each centigrade degree. This being assumed, let V be the volume of any gas at the zero temperature, P its elastic force, or the pressure it sustains and D its density. Now suppose the values of V and D to be [illegible], when the temperature is increased *t* degrees, then the pressure P being supposed constant, we have evidently

$$V' = V(1 + at),$$

and the density being inversely as the volume, we have also

$$D' = \frac{D}{1 + at}$$

Now suppose the pressure to be varied without any change of the temperature and let *p* denote the new pressure and *d* the corresponding density, the law of Mariotte gives

$$P : D' :: p : d, \text{ whence } p = \frac{P\,d}{D'},$$

and on substituting for D′ its value given by the preceding formula and making $\frac{P}{D} = k$, we obtain

$$p = k\,d\,(1 + at)$$

for the expression of the elastic force of any gas in a function of its density and temperature.

The coefficient *k* is constant for the same gas, but has a different value for different gases, depending on their densities or specific gravities. With respect to atmospheric air its value may be found thus. The density of air, compared with water, is 0.0013 and that of mercury 13.59, therefore supposing the height of the barometer to be 30 inches the value of *k*, or the height of a column of air of uniform density, exerting on its base a pressure equal to that of the atmosphere, is $30 \text{ in.} \times \frac{13.59}{0.0013} = 313860$ inches or 26155 feet (about five miles), the temperature [illegible] of freezing water.

Flow of Fluids through Orifices — Elastic fluids, in escaping from a vessel by a small orifice or tube into a vacuum, observe like liquids a law first discovered by Torricelli, namely that the velocity of the molecules when they escape from the orifice is equal to that which they would have acquired by falling through a height equal to the height of a vertical column of uniform density producing the same pressure as is exerted by the gas at the level of the orifice. Thus, it has just been shown that the pressure of the atmosphere when the barometer stands at 30 inches and the temperature is that of freezing, is equal to that which would be produced by a column of air of uniform density extending to an altitude of 26155 feet. Now, putting *g* = the accelerating force of gravity = 32 feet per second the velocity which a heavy body would acquire [illegible] in a height of 26155 feet is [illegible] 1294 feet in a second, which [illegible] with which air rushes into a vacuum. If the temperature varies, the velocity will vary also, and will become $1294\sqrt{(1 + at)}$. For example, if the temperature were 16° centigrade (about 61° of Fahrenheit), the velocity would be 1332 feet per second.

[illegible] gases are proportional to the pressures by which they always rush into a vacuum with the same velocity whatever its density may

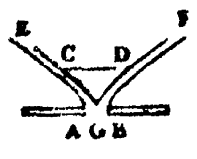
be in the vessel from which it escapes; for the homogeneous column of the same density, and exercising the same pressure as the air in the vessel, must in all cases have the same altitude

The velocities with which the different gases enter a vacuum are inversely as the square roots of their densities; for they are proportional to the square roots of the altitudes from which the molecules are supposed to fall and these altitudes are inversely as the densities Thus hydrogen gas, the lightest of all the gases, and [illegible] 0688 of that of air, would enter a va[illegible] of 4933 (= 1294 divided by the square root of 0 0688) feet in a second It is to be remarked, however, that all those laws relative to the flow of gases are rather the deductions from theory than truths derived by direct experiment

In the case of air or any gas flowing into a space containing a gas of an inferior density the velocity will be the same as that of an incompressible liquid of similar density with the effluent gas, and capable of exercising a pressure equal to the difference between the pressures of the two gases Taking for example the case of a gas flowing from a gasometer into the atmosphere let h denote the height of the barometer, and $h + H$ that of the column of mercury exercising a pressure equal to the elasticity of the effluent gas, so that H is the difference of the two pressures Also let Δ denote the density of mercury d that of the gas in the gasometer corresponding to the pressure $h + H$, and v the velocity per second, then

$$v = \sqrt{\left(2g\,H\,\frac{\Delta}{d}\right)} = 8\sqrt{\left(H\,\frac{\Delta}{d}\right)}$$

Now if, in the formula $p = k\,d\,(1 + a\,t)$ we substitute the pressure in the gasometer $(h + H)\,\Delta$ for p and also for k its value as above determined in feet, this expression will become



$$v = 1294\sqrt{\left\{\frac{H}{h + H}\,(1 + a\,t)\right\}}.$$

where v is expressed in feet If, therefore, A denote the area of the orifice in feet, the volume or number of cubic feet discharged in a second will be $v\,A$ It is to be observed that the volume thus determined is the volume of a gas of the same density as in the gasometer if it were required to find the number of cubic feet at a different density corresponding to the pressure of a mercurial column whose height $= h'$ it would be necessary to multiply the above expression by the ratio $(h + H) - h'$

From the experiments of D'Aubuisson it has been ascertained that air in passing through an orifice pierced in a thin plate, forms a *vena contracta* whose area as in the case of a liquid, is 0·65 of the area of the orifice The application of cylindric adjutages increases the quantity passing through the orifice to 0·93, and a conical tube to [illegible] The length of the adjutage may be 20 or 30 times the diameter of the orifice before the discharge begins to be diminished by friction If therefore, we suppose the gas to flow through a cylindric tube, and assume the multiplier 0·93, and also express the area of the orifice in terms of the diameter of the tube which we shall suppose $= m$ feet, then observing that $4\,A = 3\,14159\,m^2$, the formula for the number of cubic feet discharged in a second, the density being measured by $h + H$, will become

$$\cdot 845\,m^2\sqrt{\left\{\frac{H}{h + H}\,(1 + a\,t)\right\}}$$

The principle of the lateral communication of motion holds good with respect to the gases as well as the liquids On this principle we may explain a curious fact observed in the efflux of air from a blowing machine, and in the escape of steam from the valves of boilers If a circular disk of four or five times the diameter of the orifice be placed close to it, not only will it not be forced away by the current of the elastic fluid but it will be retained by a considerable force, insomuch that if the orifice be directed downwards, the disk though formed of a dense metallic substance will be supported in opposition to its gravity For [illegible] force through the aperture A B have its [illegible] (C D) [illegible] [illegible] A B [illegible] vity F G F At first the space C G D will be filled with the effluent air, but if a lateral communication of motion takes place, the air in this cavity will join itself to that which escapes by the edges of the plate, and a vacuum be formed in the space C G D, and the plate C D be forced towards the aperture by the pressure of the atmosphere on the opposite side But as it approaches the orifice the action of the effluent air will become more intense, and the dimensions of the void space be diminished, so that the plate will assume a position in which the forces tending to move it in opposite directions will be balanced

It has been demonstrated by Newton, in the second book of the *Principia* that the velocity with which sound is propagated through the air is the same as that which a heavy body would acquire by falling through *half* the height of the homogeneous atmosphere and consequently equal to $8\sqrt{1\cdot375}$ or about 917 feet per second But this theoretical determination is found to differ considerably from experiment, which gives a velocity of 1125 feet per second when the temperature of the air is at 62° of Fahrenheit's thermometer Laplace suggested a very probable explanation of this discrepancy, namely, that the condensation caused by the vibrations produced a degree of sensible heat by which the elasticity of the air is increased, or, rather, the density diminished, while the elastic force remains the same In consequence of this extrication of heat the number given by the formula of Newton must be multiplied by the square root of the number which expresses the ratio of the specific heat of the air under a constant pressure to its specific heat under a constant volume This number is found by experiment to be 1 375, the square root of which is 1 173 and on applying this correction, with the proper corrections for temperature, the theoretical determination does not differ very widely from the experimental result *See* SOUND

Pneumatics forms a branch of physical science which has been entirely created by modern discoveries Galileo first demonstrated that air possesses weight His pupil Torricelli invented the barometer, and Pascal, by observing the difference of the altitudes of the mercurial column at the top and the foot of the *Puy de Dome*, proved that the suspension of the mercury is caused by the pressure of the atmosphere Otto Guericke, a citizen of Magdeburg, invented the air pump about the year 1654, and Boyle and Mariotte, soon afterwards detected by its means the principal mechanical properties of atmospheric air Analogous properties have been proved to belong to all the other aeriform fluids The problem of determining the velocity of their vibrations was solved by Newton and Euler, but more completely by Lagrange The theoretical principles relative to the pressure and motion of elastic fluids, from which the practical formulæ are deduced were established by Daniel Bernoulli, in his *Hydrodynamica* (1738), but have been rendered more general by Navier (*Mem de l'Acad* 1830) The experiments of D'Aubuisson, above referred to, are given in different volumes of the *Annales de Chimie* (1826, 1828 1829) *See* GAS, RESISTANCE VAPOUR

PNEUMATIC RAILWAY *See* RAILROAD

PNEUMATO'MACHI (Gr πνευμα, *spirit*, and μαχη, *contest*) In Ecclesiastical History, a name of reproach, given by the orthodox to those various classes of heretics who in the fourth and fifth centuries, impugned the divinity of the Holy Ghost *See* MACEDONIANS

PNEUMATO'SIS (Gr πνευματοω *I inflate*) Emphysema A collection of air in the cellular membrane, rendering the part tumid, elastic, and crepitating when pressed It rarely arises spontaneously, but generally from some wound which affects the lungs, and by which the air spreads through the cellular membrane In some rare cases it is an effect of certain poisons

PNEUMOBRAN'CHIATES, *Pneumobranchiata* (Gr πνευμα, *air*, βραγχια *gills*) A name applied by Hunter to the Perennibranchiate reptiles of recent zoologists, and by Lamarck to an order of Gastropodous mollusks

PNEUMO'NIA, or PNEUMONITIS An inflammation of the lungs This disease generally attacks those of robust habit after exposure to the cold or wet, and suppressed perspiration it is sometimes produced by any inordinate exertion of the lungs Fever, cough, difficult breathing, a strong hard and quick pulse usher in the disease, which if neglected, sometimes proceeds so rapidly as to end in suffocation, it may also prove fatal by terminating in suppuration and gangrene A free and abundant expectoration, perspiration or diarrhœa, are favourable symptoms of its termination in resolution Large bleeding at the outset, repeated however, with much circumspection local bleeding purges, and diaphoretics of calomel and [illegible] doses of opium, hemlock [illegible] he cough and procure sleep, constitute the leading principles of treatment

PNEUMO'THO'RAX (Gr πνευμα, and θωραξ, *chest*) An accumulation of air in the sac of the pleura

POA (Gr ποη, *grass*) A name given by botanists to a genus of grasses of considerable extent and very abundant in the pastures of Europe One of the commonest of all weeds is the *Poa annua* *Poa trivialis* and *pratensis* are other species, sown extensively as a part of the artificial pastures and lawns, which are now commonly made with picked grasses instead of "hay seeds" In general, they appear to be nutritious and agreeable to cattle

POACHERS *See* GAME LAWS

POCO (Ital) In Music, a word frequently prefixed to another to lessen the strength of its signification, as *poco largo*, a little slow

PO'DAGRA (Gr ποους, *the foot*, and αγρα, *a seizure*) *See* GOUT

PODESTA One of the chief magistrates of Genoa and Venice is so called

PODIA'TIA (Gr *πους a foot*) The stalk-like elongations of the thallus, which, in certain lichens, support [illegible] *yce*

[illegible] (Gr *foot*) A genus of birds, [illegible] ed in the order of Palmipeds by Cuvier, but forming the transition from the waders to the swimmers by having the webs of the toes incomplete and formed by a scalloped membrane, as in the coot The legs are, however, placed far back, so as to render them efficie[illegible] use in [illegible] In[illegible] s proper[illegible] [illegible] lotero[illegible], the fe[illegible] through the water, and[illegible] it swims [illegible] the feet with a simultaneous action of its wings, but these, like the pectoral fins of fishes, serve mainly to direct and vary the course of the bird.

PODIUM (Lat) In Architecture, the part in an amphitheatre projecting over the arena, above which it was raised about 12 or 15 feet in this part sat the personages of distinction The word is also used to signify a balcony

PŒ'CILE (Gr) A celebrated portico or gallery at Athens, where Zeno inculcated his doctrines The Poecile was adorned with the statues of gods and benefactors, and the picture of Polygnotus, so well known to the classical reader, which represented Miltiades at the head of the 1000 Greeks at the battle of Marathon, was here [illegible]

POECILOPODS *Pœcilopoda* (Gr *ποικιλος varied*, and *πους, a foot*) The name of an order of Entomostracous Crustaceans, including those which have feet of different forms and uses, the anterior ones being ambulatory or prehensile, the posterior branchial and natatory

POETRY (Gr *ποιησις, a poem*, and *ποιητικη τεχνη the art of poetry*, from *ποιεω, I make* according to Aristotle, because the writers of each different class of poems epic, elegiac, &c, were said, in common language, to "make" them, and called *ποιηται ελεγειοποιοι epic-* [illegible] *Poet* sec III) To produ[illegible] definition of poetry has been, hitherto unsuccessfully attempted by writers on taste, and by poets themselves A popular one sufficiently adapted to general notions, is furnished by the *doyen* of living critics, Lord Jeffrey — 'The end of poetry is to please, and the name, we think, is strictly applicable to every metrical composition from which we derive pleasure without any laborious exercise of the understanding (*Ed Rev* xi p 216) But in the first place it has been truly observed, that "verse is the limit by which poetry is bounded it is the adjunct of poetry, but not its living principle' —"Poetry, says Coleridge, 'is not the proper antithesis to prose but to scien[illegible] P[illegible] science, and prose to metre"—'[illegible] object of science is the acquirement or communication of truth, the proper and immediate object of poetry is the communication of immediate pleasure' In the next place, Lord Jeffrey's definition would clearly include burlesque composition Is this strictly *poetry*? It was intended certainly in their rather artificial analysis of poetry by ancient critics in the *Poetics* of Aristotle the rules of comic composition are as elaborately laid down as those of any other species Yet the excitement of the ridiculous is altogether of a different nature from that produced by poetry in the modern sense of the word which is [illegible] tender [illegible] feeling [illegible] ing to the reader that pleas[illegible] state and degree of excitement which arises in the poet himself in the act of composition (*Literary Remains*) The end of poetry, then appears to be to produce intellectual pleasure by exciting emotions either of the elevated or pathetic order But in what mode does poetry effect this? The sight of a distressed object raises tender feelings, a tale of distress does the same to be witness of some stupendous event, [illegible] and so does [illegible] scription is not poetry Some dramas, almost utterly destitute of poetical merit, retain a hold on theatrical audiences merely because they are transcripts of painful scenes actually occurring in domestic life But these are not poetry, although constantly mistaken for it So again, the mere narration of a grand and surprising circumstance is not poetry, however akin to poetical the emotion it inspires Few passages in poetry retain a greater hold on the imagination than the well-known accounts of [illegible] the fires of Moscow, or the [illegible] or the execution of Charles the First, or mere descriptions of the Alps or Niagara the most prosaic writer who treats these subjects if he only adhere to truth and bring out the actual particulars can be sure of producing an effect which may be termed as regards the reader, poetical, but not by the employment of poetry This consideration leads us to its great characteristic It is essentially a creative art: its operation is "making," not transcribing "Imitation" it is, as Aristotle defines it; not because it copies, but because it has its model in nature, and [illegible] it without losing its charac[illegible] Lord Bacon explains by saying, that poetry "doth raise and erect the mind, by *submitting the shows of things to the desire of the mind*" The imagination alters these "shows of things" by adding or subtracting qualities and poetry produces to view the forms which result from the operation

But Lord Jeffrey goes on, in the passage which has been already quoted to give an analysis of the elements of poetical pleasure, which appears to us singularly clear and accurate "This pleasure arises, in general, be analysed into three parts that which we receive from the excitement of passion or emotion, that which is derived from the play of imagination, or the easy exercise of reason, and that which depends on the character and qualities of the diction" The two first are the vital and primary species of poetical delight And this analysis may lead us to consider the faculties by the exercise of which these several pleasures are produced, — faculties widely different, yet all poetical, some of them more and some less essential to the production of poetical pleasure, some less and some more conspicuous in different poets, all united in hardly any

1 Imagination is, emphatically, the great poetical faculty It is 'the first moving or creative principle of the mind, which fashions out of materials previously existing new materials and original truths" It is 'a complex power, including those faculties which are called by metaphysicians conception, abstraction, and judgment" the first enabling us to form a notion of objects of perception and knowledge, the second "separating the selected materials from the qualities and circumstances which are connected with them in nature," the third selecting the materials (*Stewart* see the article "Poetry" in the *Encycl Britannica*) Its operations are most various, and it exhibits itself in poetry in very different degrees and forms It may shine here and there, chiefly in comparison, or in bold and pleasing metaphor breaking the chain of a narrative, as in Homer and the earlier poetry of most nations, [illegible] connected only by those exqui[illegible] links of thought which are present in the mind of the poet, in daring, compressed, rapid language, as if language were inadequate to its expression, as in the inspired prophets, in Æschylus and often in Shakspeare, it may predominate in entire sustained conceptions, grasping at general features, as in Milton, it may cling more closely to the "shows of [illegible] lling in particulars reproducing with start[illegible] images little altered, graphic, and minute, as in Dante, and here it often approaches to fancy Imagination combined in a greater or less degree with thought or reflection but with little of the other poetical qualities produc[illegible] which suits the taste of a refined and [illegible] has[illegible] hold on the general mind [illegible] rules from Milton in being, if simple, neither "sensuous nor passionate" of which striking examples may be found in Wordsworth, and sometimes in Goethe the writer of a very different cast

2 No distinction has given critics more trouble, in the way of definition than that between imagination and fancy "Fancy' it has been said, 'is given to beguile and quicken the temporal part of our nature, imagination to incite and support the eternal" — 'The distinction between fancy and imagination," says another, "is simply that the former altogether changes and remodels the [illegible] something extraneous, [illegible] but associates it with things to which in some view or other it bears a resemblance" Now the latter is an operation of thought, wit, or judgment, and this perhaps will lead us to a right conclusion The poetry of true fancy is merely that of imagination "at a lower point of excitement" or employed on less elevated subject matter The poetry of the *Midsummer Night's Dream* for instance, may be termed either imaginative or fanciful with equal correctness But there is also a spurious fancy the offspring of a quick wit adopting poetical diction are we wrong in calling this the real quality of one of the most charming of modern poets whose wit is very nearly allied to imagination, yet not the same, — Thomas Moore?

3 Lord Jeffrey as we have seen, associates with the pleasure of imagination tha[illegible] [illegible] exercise of reason" This is [illegible] by the faculties of thought, wit, and ref[illegible] It may be doubted whether the expression of thought however energetic and acute, clad in current poetical diction is really poetry Certainly it is so, if at all, in a very inferior degree to that of the imagination And yet whe[illegible] we reflect how much of the pleasure which we derive from verse is of this kind, how many of the greatest names in the history of poetry have [illegible] gained for this alone and that one [illegible] (as the French) seems to have placed its idea of poetry entirely in the expression of thought and feeling, and chiefly the former, we can scarcely refuse it an important place It also takes many

shapes. It appears in the form of witty or acute conceits, as in Donne and Cowley, and many French and Italian poets, nearly allied to that spurious fancy of which we have spoken It lightens in flashes of high-minded indignation or keen sarcasm in Juvenal assumes a still loftier moral tone in Persius, and often in Dryden mixed with grave, energetic, powerful reflection It takes the easier tone of acute knowledge of the ways of man, and light satire in the pages of Horace and enlivens the charming narrative of Ariosto It often assumes a rhetorical character, as in Corneille and Lucan There is a trivial experiment by which the difference between this and imaginative poetry may be tested Turn both into prose, the latter retains its poetical character, the former seems to lose it

4. The expression of passion, sentiment, or pathos, is the most common and universal of all sources of poetical pleasure It is the very soul of all early and simple poetry, it pervades no less that of the most civilized communities Yet this class of poetry is less truly and emphatically poetical than the imaginative, although more popular The pleasure occasioned by it is of a mixed nature it arises from the excitement of peculiar sympathies, not produced, but heightened only by the form in which that excitement is conveyed This is the reason why mere popularity is not a test of the excellence of poetry The uncritical reader calls that the best poetry by which he is best pleased Devotional poetry, for instance appeals to an elevated and universal class of sympathies, and on this account often passes for worth more than, as poetry, it really is The highest attribute of a poet in this branch of the poetical faculty is a sensibility to all the springs of our passions, joined with the art of expressing it, these, when united with that power of personification which is more peculiarly the dramatic faculty, produce the drama in its highest and noblest shape, such as it is exhibited by Shakspeare and by him alone But the power of giving language to the sentiments of any common and elevated passion is by itself a great poetical merit The passion of love is the staple of numberless bards The passion for war or conflict unhappily natural to man is a source of poetry it is impossible not to perceive in Homer and Scott independently of their art of narration and energy of description an exultation in the animal excitement of the imaginary battle the *certamina gaudia* [illegible] peculiarly and intensely poetical [illegible] of love the natural propensity to exhibit self to self in a romantic or elevated point of view forms a great part of the charm of such a muse as that of Byron Again independently of the direct expression of feeling there is in some poets a general colouring derived from it thrown as a light veil over all the objects presented, which is a singularly attractive attribute Such is the tinge of grave and serious tenderness which shades the poetry of Sophocles and Virgil, and assumes, perhaps, a more feminine character in that of Tasso

These are the most [illegible] subjective qualities of true poetry [illegible] a more objective character which can scarcely be said to belong to it strictly *as* poetry, and yet can scarcely be excluded from a general review

5. The dramatic faculty of which we have already spoken seems to consist in acute powers of observation of the varieties of human character together with the rarer power of delineating it with such force as to bring the imaginary person distinctly before the reader It is the wonderful and unique characteristic of Shakspeare in whom all individuality, as has been often observed seems absolutely lost If we are to look for a second to Shakspeare in this high faculty, we shall find him among poets, only in Scott But it is a power often much developed in writers who are not poets in any sense such as Le Sage and De Foe

6. The descriptive faculty is of the same kind that of bringing the objects of external nature or passing scenes of whatever sort, vividly before the reader's fancy When the objects or scenes so represented are such as the painter might choose with advantage for the exercise of his art, the faculty is properly termed picturesque, though that word is often of a looser acceptation It is obvious that this also is a faculty common to poets, with many others who are not so, but sustained energy of description, as in Homer, forms a magnificent ground work for strictly poetical ornament In the poetry of modern times especially in this country and in Germany, the description of external nature has been made subservient to the purposes of imagination and reflection by writers of high genius, and this combination peculiarly characterizes the taste of the age

7. Lord Jeffrey ranks last the pleasure derived from diction, as of a secondary order which it undoubtedly is, and yet almost essential The highest poetry, without beauty of style, is rarely or never popular We have no [illegible] this peculiar quality, but, [illegible] it may suffice to observe that Virgil [illegible] poets, he of whose charm the greatest proportion is derived from simple beauty and felicity of diction, through a whole range of ill-chosen subjects, always graceful always equable and as nearly approaching to faultlessness as human skill can construct

8. Lastly we must not omit the pleasure of *melody* not essential to poetry since there may be poetry without verse, not always a merit of the poet's own, since much depends on the language, — and a Greek or Italian poet, cæteris paribus, will ever be preferable to an English or German one, on this account alone, but a grace which heightens the charm of the noblest poetry, and sometime[illegible] the most indifferent

P[illegible]S (Gr *ποικίλος*, *variegated*) In Geology, a term applied to the new red sandstone formation in consequence of the varieties of colours which it exhibits

POI'NDING In Scottish Law a species of diligence (s[illegible] ables is [illegible] P[illegible] real or personal, the former affecting the debtor's moveables on the lands to which the debt attaches, the other his moveables generally The effect of real poinding is to give the user of it right to the rents

POINT A steel instrument used by engravers for tracing the work on a copper plate

POINT In Heraldry an ordinary somewhat resembling the pile (*see* PILE), but issuing from the base of the escutcheon instead of the chief seldom used in English, but frequently in foreign armories

POINT In Music a character used by many instead of the dash its chief use being to distinguish those notes from which an intermediate effect is required dissimilar to the dash

POINT BLANK, in Gunnery denotes the position of the gun when pointed so that its axis is parallel to the horizon *Point blank range* is the distance to which a shot fired in the *point blank* or horizontal direction is carried

POINTING, in Artillery denotes placing the gun so as to give the shot a particular direction This is usually done by help of the gunner's quadrant or level *See* LEVEL

POINTS Small flat pieces of cordage put through the sails in horizontal rows for the purpose of reefing them

POINTS OF SUPPORT in Architecture are the collected areas *on the plan* of the piers, walls columns, &c upon which an edifice rests or by which it is supported It is evident that the smaller their total area, compared with the superficies of the whole building, the greater is the skill exhibited by the architect, and this for many reasons, not the least whereof is the greater resultant economy We subjoin a table of some few buildings in Europe, examined in this respect They are arranged in the order of the ratio of their points of support whose area as well as their total superficies, are added in separate columns

Ratio of Area to Points of Support	Edifice	Total Area in English Feet	Area of Points of Support
0·056	Temple of Claudius in Rome, now church of St Stefano	36,726	2,051
0·100	Church of St Sabino in Rome (destroyed)	15,131	1,543
0·118	Church of St Paul in Rome, [illegible]	106,513	12,655
0·127	[illegible]	67,123	8,571
0·129	[illegible] Naples	22,826	2,944
0·139	Church of St Giuseppe, Palermo	26,046	3,611

0·261	St Peter's, Rome	227,069	59,308
0·268	Hotel des Invalides, Paris	29,003	7,790

POINTS OF THE COMPASS In Geography and Navigation, the points of division of the circle representing the horizon, or of the compass card over which the

magnetic needle is suspended A diameter of the circle being drawn to represent the meridian, or north and south directions and another at right angles to it to represent the directions east and west, the circle is thus divided into four quarters, each of which is subdivided into eight equal parts, so that the whole circle is divided into thirty-two equal parts, and the points of division are termed the points of the compass Each has a particular name indicating its place with reference to the four principal or *cardinal points*, namely, the north, south, east, and west points *See* COMPASS

POINTS OF THE ESCUTCHEON, in Heraldry, are nine These are marked by letters in the cut attached to the article HERALDRY, which is copied from those in the ordinary English works on the elements of the science They are—A, dexter chief, B, middle chief, C, sinister chief (Fr chef, *head*), D, honour point, E, fess point which is the centre of the shield (fascia *belt*, or *sash*, from the belt encircling the middle of a man), F, nombril point (navel), G, dexter base, H, middle base, and I, sinister base It will be observed, that the greater part of these names are taken from those parts of the human body which the shield was taken figuratively to represent

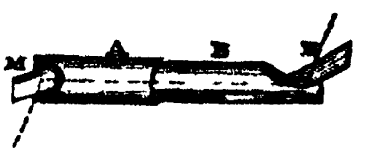
POI'SON (Fr *poison*) A substance which disturbs, suspends, or destroys one or more of the vital functions Poisons are classified by Orfila under the four heads of Irritants, Narcotics, Narcotico-acrids, and Putrefiants or Septics See TOXICOLOGY

POISON-FANG The superior maxillary teeth of certain species of serpents are so called, which, besides the cavity for the pulp appear to be perforated by a second longitudinal canal which is open at both ends, and receives at that next the base of the fang the termination of the duct of the poison gland The tooth essentially consists of a narrow and thin plate bent upon itself lengthwise, and with the approximated margins adherent together In some poison fangs the line of adhesion is visible along the convex side of the tooth

There is generally but one poison fang on each maxillary bone as in the viper and naja but sometimes there are a few additional teeth behind the principal fang The fang ordinarily lies recumbent, but when the serpent designs to strike with this weapon it is erected by a rotatory movement of the jaw and the poison gland is at the same time compressed and emptied of its secretion which [illegible] hollow fang into the wound

[illegible], the glands which secrete an acrid or venomous liquor which is conveyed along an instrument capable of inflicting a wound are so termed The glands at the sides of the head of poisonous serpents, those at the base of the hollow jaws of the centipede, at the aculeated tail of the scorpion, communicating with the sting of the bee or the spur of the ornithorhynchus, are examples

POLA'CCA A peculiar vessel with three masts navigated chiefly in the Levant and other parts of the Mediterranean



POLA'CRE A peculiar rig of a vessel having pole masts, no tops and sometimes no crosstrees whereby the yard and sail are lowered almost close down to the yard next below

POLAR Having reference to poles, as *polar circles polar regions polar projection* &c

POLARITY In Physics that property of bodies in consequence of which, when at liberty to move freely they arrange themselves in certain determinate directions or point as it were, to given poles Thus an iron bar acquires polarity by magnetism and when suspended from a single point arranges itself in the direction of the magnetic meridian or points to the magnetic poles of the earth When light is supposed to consist of material particles emitted from the sun, it is necessary, in order to explain certain phenomena of optics to assume that the particles are endowed with *polarity* which merely signifies that the opposite sides of a particle have different physical properties See POLARIZATION

POLARIZA'TION OF LIGHT Light which has undergone certain reflexions or refractions, or been subjected to the action of material bodies in any one of a great number of ways acquires a certain modification in consequence of which it no longer presents the same phenomena of reflexion and transmission as light which has not been subjected to such action This modification is termed the *polarization of light*, its rays being supposed, according to particular theoretical views to have acquired *poles* (like the magnet) or sides with opposite properties

The polarization of light may be effected in various ways, but chiefly in the following —1 By reflexion at a proper angle from the surfaces of transparent media, as glass, water, &c 2 By transmission through crystals possessing the property of double refraction 3 By transmission through a sufficient number of transparent uncrystallized plates placed at proper angles 4 By transmission through a number of other bodies imperfectly crystallized, as agate, mother of pearl, &c The following experiment will serve to illustrate the first of these modes and also give a clear idea of the difference between common and polarized light

Let A and B be two metallic or pasteboard tubes, open at both ends, and fitting into each so as to turn stiffly Into each of these let a piece of polished glass M N having one of its sides roughened, and blackened with melted pitch or black varnish so as to destroy its internal reflexion be fixed in such a position that its reflecting plane makes an angle of 33 degrees with the axis of the tubes Let the tubes be placed so that the light from the sun or any other source may fall on the plate M and be reflected along the axis of the tube A to the plate N, and from the tube B into the eye The light which traverses the axis of the tube will fall on the plate N, from which it will be again reflected, and may be received by the eye, or on a screen The apparatus being thus arranged, let the tube B be turned round within A, carrying with it the reflector N, which in its revolution will always preserve the same inclination to the axis of the tube, and the ray of light reflected from N will describe a conical surface Now, on attending to the ray reflected from N, it will be observed in the course of the revolution constantly to vary in intensity at two opposite points it will acquire a maximum of intensity, and at other two opposite points, intermediate between these it will entirely disappear On comparing the positions of the reflecting planes at the occurrence of these phases it will be found that the intensity of the light is greatest when the plane N is *parallel* to M, and that there is no reflexion from N when the two planes are *at right angles* It thus appears that a ray of light reflected from the surface of glass at this particular angle of 33 is incapable of being reflected a second time from a similar surface, perpendicular to the former, at an equal angle of incidence This property is expressed by saying that the light reflected from M is *polarized in the plane of reflexion* It has in fact, acquired some property or modification, in virtue of which while it preserves the power of being again reflected in the same plane, it ceases to be subject to the ordinary law of reflexion in a perpendicular plane

If the ray reflected from M, instead of being received on a second reflecting surface N be thrown upon a crystal of Iceland spar, or any doubly refracting crystal, so placed that its principal plane (*i e* the plane passing through the direction of the ray and the shorter diagonal of the rhombus) is parallel to the plane of reflexion M, then there will only be a single refraction, the extraordinary ray will disappear and the ordinary ray alone be produced But if the face of the crystal be turned round 90° the phenomena are reversed, the extraordinary ray alone is produced and the ordinary one disappears The light therefore in consequence of its reflexion from the surface M ceases to obey the same laws of double refraction as ordinary light

When the ray reflected from M is received perpendicularly on a tourmaline plate it will present different phenomena of transmission according to the position of the axis of the plate that is, the axis of the crystal from which the plate was cut If the axis is parallel to the reflecting plane the whole of the light will be transmitted through the plate, but if the plate be turned round in its own plane until the axis becomes perpendicular to the reflecting plane no portion of the light will be transmitted

From these experiments it appears that light polarized by reflexion possesses the following characters which are invariably found to belong to polarized light in whatever way the polarization may have been produced —1 [illegible] both [illegible] positions of the plane of incidence 2 It is incapable of undergoing division into two equal pencils by double refraction in positions of the doubly refracting bodies in which a ray of ordinary light would be so divided 3 It is incapable of being transmitted by a plate of tourmaline when incident perpendicularly upon it, in certain positions of the plate, and is readily transmitted by it in certain other positions at right angles to the former

The polarization of light by reflexion is only effected completely when the light falls on the reflecting surface at a particular angle, and it has been mentioned that, in the case of glass the angle which the direction of the ray must make with the surface is about 33°, or the *angle of incidence* (the complement of the former) must be 57°, in round numbers This angle is called the *polarizing angle* It is different for different substances, but from an extensive series of experiments with a great number of different bodies, Sir David Brewster found the following remarkable simple and beautiful relation to subsist in all cases between the [illegible] and the refractive power of the medium [illegible] *The tangent of the polarizing angle for any medium is the index of refraction belonging to that medium*

All reflecting substances are capable of polarizing light if incident at proper angles but metallic bodies, and

bodies of very high refractive power, like the diamond, appear to do so only [illegible] reflected ray not *entirely* disappearing [illegible] when a perfectly polarized ray would be completely extinguished

When light is reflected at an angle greater or less than the polarizing angle, it is partially polarized A second reflexion in the same plane renders the polarization more complete, and, by repeating the reflexions a sufficient number of times, it may be polarized at any angle of incidence

The second method of effecting the polarization of light, above mentioned, is by transmission through doubly refracting crystals When a ray of common light is separated into two by double refraction, both the pencils at their emergence from the crystal, are found to be [illegible] polarized but in different planes, at right [illegible] other This may be proved by receiving them on a reflecting surface at the polarizing angle or by examining them through a plate of tourmaline, or by interposing a second crystal also having the power of double refraction, and in all cases each pencil will exhibit the [illegible] polarized by reflexion Let a ray of [illegible] rhomboid of Iceland spar, it will be separated into two, of which call O the ordinary ray and E the extraordinary ray Let both pencils be received on a second rhomboid and [illegible] be observed When the [illegible] positions, or have their homologous faces parallel neither [illegible] the second crystal, but O [illegible] ray, and E only an extraordinary ray On turning the second crystal round through an angle of 90°, O produces only an extraordinary ray, and E only an ordinary ray In intermediate positions each pencil is separated by the second crystal into two in the same manner as ordinary light This experiment which was first made by Huygens and accurately described by him may be made as follows — Take two pretty thick rhomboids of Iceland spar and lay them down (the one over the other) on a sheet of white paper, having a small and well-defined black spot on it When the rhomboids are so placed that their homologous sides are parallel, the spot will be seen double through the [illegible] but as if they formed one piece, both images will be equally bright, and the line which joins them will be parallel to the principal sections of the crystals This is shown at A in the figure below If we now turn round the upper crystal in the horizontal plane from left to right two new faint images will make their appearance, as at B Continuing to turn the four images will be all equally luminous, as at C where the crystal has been turned 45° As the rotation proceeds the two original images become extremely faint as at D When the crystal has been turned 90° there will again be only two images as at F two new faint images will again appear at F At G when [illegible] rants, the four will be again equally [illegible] at H they will become unequal, and at I, when the revolution is precisely 180°, they will all coalesce into one bright spot From all these appearances it follows that the ordinary ray is polarized in the principal plane of the crystal, and the extraordinary ray in a plane perpendicular to the principal plane

The phenomena produced by the polarization of light are among the most splendid and singular in the whole range of physical science They have open many new views of the constitution of natural bodies and their explanation constitutes the principal part of the theory of light The general explanation, according to the Newtonian theory of emission, is this — The molecular forces of the crystal, acting on the particles of light give them a rotatory motion round their centres of gravity, till their axes assume certain determinate positions, after which they remain at rest There are, however, cases in which the luminous particles, in traversing the crystal, assume no fixed position, but oscillate about their centres of gravity in regular periods termed by Newton *fits*, and there are even cases in which it is necessary to suppose that they are endowed with a continuous rotation In giving a rational account of these [illegible] phenomena and reducing them to calculation the [illegible] of the undulatory theory have been more successful, and the whole are connected and explained by a simple hypothesis, which may be enunciated as follows —

"Common light consists of undulations in which the vibrations of each particle are in the plane perpendicular to the wave's motion The polarization of light is the resolution of each vibration into two, one parallel to a given plane passing through the direction of the wave's motion, and the other perpendicular to that plane which become in certain cases the origin of waves that travel in different directions When we are able to separate one of these from the other, we say that the light of each is polarized When the resolved vibration parallel to the plane is preserved unaltered, and that perpendicular to the plane is diminished in a given ratio (or vice versâ), and not separated from it we say that the light is partially polarized" (*Airy's Mathem. Tracts* p 389)

The polarization of light by reflexion was accidentally discovered by Malus, a French engineer officer, in the year 1810, and the phenomena which appeared the most remarkable of any that had yet been observed, both on account of their splendour and their intimate relations with [illegible] of physical optics and the [illegible] studied [illegible] and to be varied in every possible way by M [illegible] by Biot Arago Dr Young, Sedgwick Sir Dav [illegible] ster Sir John Herschel and many others But the individual who beyond all doubt contributed most to connect them with theory, and to show their mutual relations and dependencies, was Fresnel whose success in deriving them, by à priori reasoning from the principles of the [illegible] of light, was so complete as to [illegible] truth of that theory on almost the same footing of credibility as that of gravitation itself Analogous phenomena to those of the polarization of light have been found to belong also to radiant heat Professor Forbes of Edinburgh, who has been the most successful investigator in this interesting department of physics, has shown that heat is polarized both by reflexion and refraction He has also succeeded in depolarizing heat, and thereby proved that heat possesses the property of double refraction

See Malus *Theorie de la Double Refraction*, Fresnel, *Mémoires de l Institut*, 1824, 1826 1827, Herschel's Treatise on Light *Ency Metr*, Brewster's 'Optics" *Cabinet Cyclopedia*, various papers in the *Phil Trans* from 1813 to 1819, *Airy's Math Tracts*, 2d ed 1831, and the various scientific journals

POLE In Surveying a measure of length, containing 16½ feet or 5½ yards, it is the same as *rod* Sometimes the term is used as a superficial measure, a *square pole* denoting 5½×5½ yards or 30¼ square yards

POLEMICS or POLEMICAL THEOLOGY (Gr πολεμος *war*) The same as controversial The term is not necessarily applicable to theology only but it is generally so applied and it reflects little credit on human nature that such a subject should have been treated in such a manner as the appellation indicates

POLEMOSCOPE (Gr πολεμος *war* and σκοπεω *I view*) An instrument imagined by Hevelius, for seeing objects which cannot be seen by direct vision It consists of a mirror placed obliquely in a tube or box having an opening in the side opposite the mirror so that rays from any object falling on the mirror are reflected to the eye of the spectator Hevelius chose the name of *polemoscope* because he thought the instrument might be applied, in time of war to discover what was going on in the camp of the enemy while the spectator remained concealed behind a wall or other defence and therefore could not employ a telescope Opera glasses are sometimes constructed on this principle, for the purpose of enabling a person to see others on the right or left, while he appears to look straight forward

POLES (Gr πολος) In Geometry and Astronomy the extremities of an axis of rotation of a sphere or spheroid In spheres the poles of a great circle are the extremities of the straight line perpendicular to the plane of the circle, and passing through its centre The *poles of the ecliptic* are the points about which the stars are carried by the slow motion of the precession of the equinoxes, the *poles of the equator* or *poles of the world* are the two points about which the stars perform their diurnal rotation, the *poles of the horizon* are the zenith and nadir, the *poles of the meridian* are the points of the horizon due east and west

Poles in Physics are the points of a body in which its attractive or repulsive energy appears to be concentrated Thus the *poles of a magnet* are the opposite points in which the magnetic force is collected

POLICE, is a term employed to designate those regulations which have for their object to secure the maintenance of good order, cleanliness, health, &c in cities and country districts, and it is also used to designate the description of force by which these objects are effected This force differs from military in its being commanded by civil officers, and not being under military law, but it is generally drilled and armed in a half military manner, and has a distinctive uniform The police force is employed alike to prevent and detect offences, and may be either open or secret By an open police is meant officers dressed in their accustomed uniform, and known to every body, while, by a secret police is meant officers whom it may be difficult or impossible to distinguish from certain classes of citizens, whose dress and manners they may think it expedient to assume The latter are employed that they may, without exciting the suspicion of guilty parties, or of those who are projecting some outrage, acquire their confidence, and, by making themselves masters of their secrets, secure their apprehension or prevent the outrage It is needless to say that the employment of a

police force of this description is attended with many inconveniences, and sometimes it is believed the officers have stimulated to the commission of the very offences they were employed to detect and prevent Still, however, it does not seem that it should be altogether dispensed with, and, under proper regulations, it affords not only the best means of detecting crimes, but also of preventing the commission of such as require any previous combination or arrangement

The organisation and efficiency of the police differ in different places Its expenses are usually defrayed by a rate laid on the inhabitants of the town or place where it is established The metropolitan police was newly [illegible] a few years ago, and is now a most effective force [illegible] London is not under the charge of the metropolitan police but is protected by a body of men, organised on the plan and in imitation of that body, but placed under the city authorities The metropolitan police amounts in all to upwards of 5 000 men

The police or constabulary force of Ireland is armed, and has more of a military than of a civil character According to recent arrangements, a lord-lieutenant is appointed to each Irish county through whom all communications to the Irish government are made The lords-lieutenant are assisted in the discharge of their duties by an indefinite number of deputy lieutenants All these officers act gratuitously, and are removable at pleasure

The constabulary force of Ireland amounted in 1850 to 12,000 men and the total expense of the force was more than 560,000*l*

POLICY *See* ASSURANCE

POLISH, *Polishing* (Lat polio, *to make smooth*) In Sculpture the operation of giving a smoothness and gloss to any surface The polishing of marble is effected by first rubbing the surface with freestone after which it is wrought upon with pumice stone, and lastly with the finest emery powder, from which the glossy surface is obtained

POLITICAL ARITHMETIC See STATISTICS

POLITICAL ECONOMY * Political science is commonly divided into two great departments One of these has for its object to ascertain and establish the principles according to which states may be best organized, [illegible] the legislative judicial and executive departments and to assign to each its proper functions, limits, and duties, to determine to what hands, and under what conditions and limitations the supreme power ought to be committed and how it may best be watched and controlled, to decide in fine how the government under any given set of circumstances, should be framed so that it may be most likely to promote the well-being of those subjected to its authority This is what is commonly called pure politics The other department of political science has a different, more practical and not less important object in view Those engaged in its study do not inquire into the best methods of distributing political power, or of constituting the governing body, but taking them as they exist they endeavour to ascertain the [illegible] *legum* as they were termed by Bacon — that is, what all governments however formed should act, so as to procure for their subjects the greatest amount of wealth civilisation and happiness This department of the science has received the name of political economy; and we shall endeavour, in this article to give a brief exposition of its objects and principles To enlarge on its importance would be superfluous The history of the human race proves that national prosperity or the well-being of the bulk of the people is not the exclusive attribute of any particular species or form of government It has been and may be enjoyed by all countries how different soever their political organization provided they adopt a sound system of political economy, and it can be enjoyed by none who do not Without therefore, undervaluing the other great branch of the political sciences, or that which treats of the constitution of governments, this seems to possess at least equal claims on the public attention Its leading principles and rules are applicable at all times and under all circumstances, they are equally suitable to despotic monarchies and to republics, and cannot be neglected or contemned by either without the most injurious consequences

It is in general said of political economy that its object is to ascertain the circumstances most favourable for the production of wealth, and the laws which determine its distribution among the different ranks and orders into which society is divided, and this definition seems quite unexceptionable, provided it be clearly understood that by wealth in this science is meant only those articles or products which require some portion of human industry for their production, acquisition, or preservation, and which, consequently, possess exchangeable value A commodity or product is not valuable merely because it is useful or desirable, but it is valuable when, in addition to these qualities, it can only be procured or enjoyed through the intervention of labour It cannot justly be said that food or clothes are more useful than atmospheric air, and yet they are possessed of that value in exchange of which the latter is wholly destitute The reason is, that food and clothes are not like air, gratuitous products, they cannot be had at all times in any quantity and enjoyed without any voluntary exertion [illegible] always required for their production or both, and as no one will voluntarily sacrifice the fruits of his industry without receiving an equivalent, they are truly said to possess exchangeable value

The production and distribution of such articles as exist, and may be obtained in unlimited quantities, independently of voluntary human agency, form no part of the investigations of the political economist. The results of the industry of man comprise the only subjects that come within the scope of his inquiries This may, indeed, be said to be the science of values, or of the circumstances which determine the production and distribution of products possessed of exchangeable value, or which will be received as an equivalent for something else which it has taken some labour to produce or obtain

The word *value* is very frequently employed to express, not only the exchangeable worth of a commodity, or its capacity of exchanging for other commodities, but also its *utility*, or capacity of satisfying our wants, or of contributing to our comforts and enjoyments But it is obvious that the utility of commodities, — that the capacity of bread, for example to appease hunger, and of water to quench thirst is a perfectly different and distinct quality from the capacity of exchanging for other commodities Dr Smith perceived this difference, and showed the importance of carefully distinguishing between utility, or, as he expressed it, 'value in use," and value in exchange But he did not always keep this distinction in view, and it has been very often lost sight of by [illegible] writers There can be no doubt, indeed, that [illegible] of these opposite qualities has been one of the principal causes of the confusion and obscurity in which many branches of the science not in themselves difficult, have been involved When, for example it is said that water is highly valuable a very [illegible] is attached to the phrase from what is [illegible] which it is supposed that gold is valuable Water is indispensable to existence, and has therefore a high degree of utility, or of "value in use" but as it can generally be obtained in large quantities without much labour or exertion, it has in most places but a very low value in exchange Gold, on the contrary is of comparatively little utility, but as it exists only in limited quantities, and requires a great deal of labour on its production, it has a comparatively high exchangeable value and may be exchanged or bartered for a proportionally large quantity of most other things Those who confound qualities so different must obviously arrive at the most erroneous conclusions And therefore to obviate all chance of error from mistaking the sense of so important a word as value, it is better not to use it except to signify exchangeable worth, or value in exchange and to employ the word *utility* to express the power or capacity of an article to satisfy our wants or gratify our desires

Capacity of appropriation is indispensably necessary to make anything wealth A man is not said to be wealthy because he has an indefinite command over atmospheric air the rays of the sun or the articles with which, in common with others, he is gratuitously furnished by nature, for this being a privilege which he enjoys in common with every one else, can form no ground of distinction but he is said to be wealthy according to the degree in which he can afford to command those necessaries, conveniencies, and luxuries that are not the gifts of nature, but the products of human industry

The proper meaning to be attached to the term wealth being thus ascertained, we shall now proceed to show that labour is the only source of wealth, and having done this, we shall next inquire into the means by which labour may be rendered most efficient, that is into the means by which the greatest amount of wealth may be obtained with the least expenditure of labour when this inquiry is completed, we shall have exhausted that great department of the science which treats of the production of wealth

I PRODUCTION OF WEALTH

1 *Labour the only Source of Wealth* — It may be necessary, perhaps, to observe at the outset, that by production in this science, is not meant the production of matter that being the exclusive attribute of Omnipotence, but the production of *utility* and consequently of value, by appropriating and modifying matter already in existence, so as to fit it to satisfy our wants and contribute to our enjoyments Nature spontaneously furnishes the matter of which all commodities are made, but until labour has been applied to appropriate that matter, or to

* Economy, from οἶκος, *a house or family*, and νόμος, *a law* Hence, political economy may be said to be to the state what private economy is to a single family

adapt it to our use it is wholly destitute of value, and is not, nor ever has been, considered as forming wealth Were we placed on the banks of a river or in an orchard, we should infallibly perish of thirst or hunger, unless by an effort of industry we raised the water to our lips, or plucked the fruit from its parent tree It is seldom, however, that the mere appropriation of matter is sufficient In the vast majority of cases, labour is required not only to appropriate it, but to convey it from place to place, and to give it that peculiar shape without which it may be totally useless and incapable of administering either to our necessities or our comforts The coal used in our fires is buried deep in the bowels of the earth, and is absolutely worthless until by the labour of the miner it has been extracted from the mine, and

[illegible]

ranged and shaped material that have been fashioned to the various articles of convenience and ornament with which they are furnished were in their original state, destitute alike of value and utility And of the innumerable variety of animal vegetable and mineral products which form the materials of our food and clothes, none were originally serviceable while many were extremely noxious to man The labour that has subdued their bad qualities, that has given them utility and fitted them to satisfy our wants and to minister to our comforts and enjoyments, is plainly therefore the only source of wealth "Labour" to use the words of Adam Smith, "was the first price, the original purchase-money, that was paid [illegible] It was not by gold or by silver, but by labour [illegible] wealth of the world was originally purchased" — (*Wealth of Nations*, b 14)

Those who observe the progress and trace the history of the human race in different countries and states of society, will find that their comfort and happiness have in all cases been principally dependent on their ability to appropriate the raw products of nature and to adapt them to their use. The savage whose labour is confined, like that of the Australian to the gathering of wild fruits or of the fish on the sea coast is placed at the very bottom of the scale of civilization and is in point of comfort decidedly inferior to many of the lower animals The *first* step in the progress of society is made when man learns to hunt wild animals, to feed himself with their flesh and clothe himself with their skins But labour when confined to the chase, is extremely barren and unproductive Tribes of hunters, like beasts of prey whom they closely resemble in their habits and modes of subsistence, are but thinly scattered over the countries which they occupy, and notwithstanding the fewness of their numbers any unusual deficiency in the supply of game never fails to reduce them to the extremity of want The *second* step in the progress of society is made when the tribes of hunters and fishers devote themselves like the ancient Scythians and modern Tartars to the domestication of wild animals and the rearing of flocks The subsistence of herdsmen and shepherds is much less precarious than that of hunters, but they are almost entirely destitute of the various comforts and elegancies that give to civilized life its chief value The *third* and most decisive step in the progress of civilization, in the great art of producing the necessaries and conveniences of life, is made when the wandering tribes of hunters and shepherds renounce their migratory habits and become agriculturists and manufacturers It is then that man begins fully to avail himself of his productive powers He then becomes laborious, and by a necessary consequence his wants are then, for the first time, fully supplied, and he acquires an extensive command over the articles necessary for his comfort as well as his subsistence

The importance of labour in the production of wealth was very clearly perceived by Locke In his *Essay on Civil Government*, published in 1689 he has entered into a lengthened, discriminating and able analysis to show that it is from labour that the products of the earth derive almost all their value "Let any one consider," says he, "what the difference is between an acre of land planted with tobacco or sugar, sown with wheat or barley, and an acre of the same land lying in common, without any husbandry upon it, and he will find that the *improvement* of labour *makes* the far greater part of the value I think it will be but a very modest computation to say, that of the products of the earth useful to the life of man, *nine tenths* are the effects of labour, nay, if we will rightly estimate things as they come to our use, and cast up the several expenses about them what in them is purely [illegible] to labour, we shall find that [illegible] *hundredths* are wholly to be put on the account of labour

"There cannot be a clearer demonstration of any thing than several nations of the Americans are of this, who are rich in land, and poor in all the comforts of life; whom nature having furnished as liberally as any other people with the materials of plenty, *i e* a fruitful soil apt to produce in abundance what might serve for food, raiment, and delight, yet, for want of improving it by labour, have not one hundredth part of the conveniences we enjoy; and the king of a large and fruitful territory there feeds, lodges, and is clad worse than a day labourer in England

"To make this a little clearer, let us but trace some of the ordinary provisions of life through their several progresses before they come to our use, and see how much they receive of their value from human industry Bread, wine, and cloth are things of daily use and great plenty, yet, notwithstanding acorns, water, and leaves or skins must be our bread, drink, and clothing, did not labour furnish us with these more useful commodities, for whatever bread is more worth than acorns, wine than water and cloth or silk than leaves, skins, or moss, that is solely owing to labour and industry the one of these being the food and raiment which unassisted nature furnishes us with, the other provisions which our industry and pains prepare for us, which how much they exceed the other in value when any one hath computed, he will then see how much labour makes the far greatest part of the value of things we enjoy in this world And the ground which produces the materials is scarce to be reckoned in as any, or at most but a very small part of it so little that even amongst us land that is wholly left to nature, that hath no improvement of pasturage, tillage, or planting is called as indeed it is *waste*, and we shall find the benefit of it amount to little more than nothing

An acre of land that bears here twenty bushels of wheat and another in America which, with the same husbandry would do the like are without doubt, of the same natural intrinsic value (utility) But yet the benefit mankind receives from the one in a year is worth five pounds and from the other possibly not worth a penny, if all the profit an Indian received from it were to be valued and sold here, at least I may truly say, not one thousandth It is labour then which puts the greatest part of value upon land without which it would scarcely be worth anything It is to that we owe the greatest part of all its useful products, for all that the straw bran, bread, of that acre of wheat is more worth than the product of an acre of as good land which lies waste, is all the effect of labour For it is not barely the ploughman's pains the reaper's and thrasher's toil, and the baker's sweat is to be accounted into the bread we eat, the labour of those who broke the oxen who digged and wrought the iron and stones, who felled and framed the timber employed about the plough mill oven or any other utensils which are a vast number, requisite to this corn, from its being seed to be sown to its being made bread must all be charged on the account of *labour* and received as an effect of that nature and the earth furnished only the almost worthless materials as in themselves It would be a strange catalogue of things that industry provided and made use of about every loaf of bread before it came to our use if we could trace them, iron wood, leather, bark timber stone bricks, coals, lime cloth, dyeing drugs pitch tar masts ropes and all the materials made use of in the ships that brought away the commodities made use of by any of the workmen to any part of the work, all which it would be almost impossible, at least too long to reckon up"

Mr Locke has here all but established the fundamental principle upon which this science rests Had he carried his analysis a little further, he could not have failed to perceive that neither water, leaves skins nor any one of the spontaneous products of nature has any *value* except what it owes to the labour required for its appropriation The utility of such products makes them be demanded, but it does not give them value this is a quality which can be communicated only through the agency of voluntary labour of some sort or other An object which it does not require any portion of labour to appropriate or to adapt to our use may, like atmospherical air be of the very highest utility, but as it is the free gift of nature, it is quite impossible it should have the smallest value

That commodities could not be produced without the co-operation of the powers of nature, is most certain We are very far, indeed, from wishing to depreciate the obligations we are under to our common mother, or to exalt the benefits man owes to his own exertions by concealing or underrating those which he enjoys through the bounty of nature But it is the [illegible] characteristic of the services rendered by the [illegible] that they are *gratuitous* They are infinitely useful, and they are, at the same time, infinitely cheap They are not, like human services, sold for a price, they are merely [illegible] When a fish is caught, or a tree is felled, do the Nereids, or wood nymphs, make their appearance, and stipulate that the labour of nature in producing it should be paid for, before it be carried off and made use of by man? When the miner has dug his way down to the ore, does Plutus interpose to prevent its appropriation? Nature is not, as so many would have us to suppose frugal and grudging Her rude products, and her ca-

pacities and powers, are all offered freely to man She neither demands nor receives a return for her favours Her services are of the most valuable *utility*, but being granted freely and [illegible], they are wholly destitute of value, and are [illegible] the power of communicating [illegible]

The utility of water, or its capacity to slake thirst, is equal at all times and places, but as this quality is communicated to it by nature, it adds nothing to its value which is, in all cases, measured by the labour required for its appropriation A very small expenditure of labour being required to raise water from a river to the lips of an individual on its banks its value under such circumstances, is very trifling indeed But when, instead of being upon its banks, the consumers of the water are five, ten, or twenty miles distant, its value, being increased proportionally to the greater expenditure of labour upon its conveyance, may become very considerable This principle holds universally The utility of coal, or its capacity of furnishing heat and light makes it an object of demand, but this utility being a free gift of nature, has no influence over its value or price this depends entirely on the labour required to extract the coal from the mine, and to convey it to the consumers

"Si je retranche," to use a striking illustration of this doctrine given by M Canard, 'de ma montre, par la pensee, tous les travaux qui lui ont ete successivement appliques, il ne restera que quelques grains de mineral places dans l'intérieur de la terre, d où on les a tirés, et où ils n'ont aucune valeur De meme, si je decompose le pain que je mange, et que j en retranche successivement tous les travaux successifs qu il a reçus il ne restera que quelques tiges d herbes graminées, eparsés dans des deserts incultes, et sans aucune valeur

It is true that natural powers and products may sometimes be appropriated or engrossed by one or more individuals to the exclusion of others and those by whom they are so engrossed may exact a price for them but does that show that they cost the engrossers anything? If A have a waterfall on his estate, he may probably, get a rent for it It is plain however that the work performed by the waterfall is as completely gratuitous as that which is performed by the wind that acts on a windmill The only difference between them originates in this, — that all individuals having it in their power to avail themselves of the services of the wind no one can intercept the bounty of nature and exact a price for that which she freely bestows, whereas A by appropriating the waterfall, and consequently acquiring a command over it has it in his power to prevent its being used at all, or to sell its services He can oblige B C and D to pay for liberty to use it but as they pay for that which costs him nothing he gains the *whole* that they lose, so that the services rendered by the waterfall are still so much clear gain — so much work performed gratuitously for society

Had Mr Senior attended to this principle he would not have made the strange supposition that if aerolithes consisted wholly of gold they would according to the principles now explained be destitute of value * If, indeed they were so very abundant as to supply every one with as much gold as he desired they would have no value whatever, other than what they might derive from the trouble of gathering them, but if they existed only in limited quantities and were quite incapable of supplying the demand for gold the fortunate finder of one of them would be able to sell it or exchange it for the same quantity of produce it would have commanded had it been produced, like other gold by the labour of the miner, smelter &c But it is obvious that its value is in this case derived from circumstances which though extrinsic to itself depend wholly on the expenditure of labour and that, in fact it is measured or determined by the labour required to produce gold under ordinary circumstances precisely in the same way that the value of the waterfall is determined by the quantity of labour it will save to the party by whom it is bought or rented

Labour, therefore, is the sole source of exchangeable value, and, consequently, of wealth It is the talisman that has raised man from the condition of the savage — that has changed the desert and the forest into cultivated fields, that has covered the earth with cities and the ocean with ships, that has given us abundance comfort and elegance instead of want, misery, and barbarism —

> "A touch of its story will render
> Even a cube useful, and renders it
> Delightful

The fundamental principle, that it is only through the agency of labour that the various articles and conveniences required for the use and accommodation of man can be obtained, being thus established, it necessarily follows, that the great practical problem involved in that part of the science which treats of the *production* of wealth must resolve itself into a discussion of the means by which labour may be rendered most efficient Every measure that has any tendency to add to the power of labour, or, which is the same thing, to reduce the cost of commodities, must add proportionally to the means of obtaining wealth and riches, while every measure or regulation that has any tendency to waste labour, or to raise the cost of commodities must equally lessen these means This, then, is the simple and decisive test by which to judge of the expediency of all measures affecting the wealth of a country, and of the value of all inventions If they render labour more productive, — if, by reducing the value of commodities, they render them more easily obtainable, and bring them within the command of a greater portion of society, they must be advantageous, and conversely Considered in this point of view, that great branch of the science which treats of the *production* of wealth will be found to [illegible] easily understood [illegible] applied to the raising of raw pr[illegible] of that raw produce when raised into articles of utility, convenience, or ornament, or to the conveyance of raw and wrought produce from one country or place to another, is said to be agricultural, [illegible] or [illegible] A quantity with [illegible] the best [illegible] ascertained methods of applying labour in each of these grand departments of industry, forms the peculiar and appropriate study of agriculturists, manufacturers, and merchants It is not consistent with the objects of the political economist to enter into the details of particular businesses and professions He confines himself to an investigation of the means by which labour in general may be rendered most productive, and how its powers may be increased in *all* the departments of industry

In thus endeavouring to exhibit the importance of labour and the advantages which its successful prosecution confers on man it must not be supposed that reference is made to the labour of the hand only This species indeed, comes most under our observation it is that, too, without which we could not exist and which principally determines the value of commodities It is questionable however whether it be really more productive than the labour of the mind The hand is not more necessary to execute than the head to contrive Some very valuable discoveries have no doubt been the result of accident, while others have naturally grown out of the progress of society, [illegible] materially advanced by the efforts of individual [illegible] These, however, have not been their only, nor, perhaps, their most copious sources and every one how little soever he may be acquainted with the history of his species is aware that we are indebted to the labour of the mind, to patient study and long continued research, for numberless inventions, some of which have made almost incalculable additions to our powers and changed, indeed, the whole aspect and condition of society

2 Means by which Labour may be facilitated — Having thus endeavoured to show that man is indebted to labour or industry for all those articles or products which constitute wealth or which are not freely bestowed by nature we have next to inquire into the means by which labour may be rendered most productive or by which the greatest amount of wealth may be obtained with the least labour or at the least expense

It may seem on a cursory view as if an inquiry of this sort would necessarily branch out into an infinity of details But in so far as this science, which deals only with the general principles applicable to all departments of industry is concerned such is not the case On the contrary it will be found supposing the security of property, without which there can be neither industry nor accumulation to be established that all the means by which labour may be facilitated and wealth increased resolve themselves 1st into the better division and combination of employments among individuals and nations, and, 2d, into the more extensive or more judicious application of capital or stock in industrious undertakings All the improvements that ever have been or ever will be made in the great art of producing the various necessaries, conveniences and enjoyments of human life may be classed under one or other of these heads, that is, they will be found to consist either in the better distribution of employments, or in the greater command and better application of capital [illegible] great elves of these means no people [illegible] advance in civilization And supposing property to be equally well protected, it will generally speaking, be found that those nations have been the most cultivated and refined in which the division of labour has been carried to the farthest extent, and capital been most abundant and most judiciously applied

Division of Employments — The division of employ- [illegible]

ciety — in the rudest as well as the most improved — we may trace its operation and effects The various physical powers, talents, and propensities, with which men are endowed, fit them for different occupations, and a

* Art "Political Economy," *Encyclopædia Metropolitana*

regard to mutual interest and convenience naturally leads them, at a very early period, to establish a system of barter and a division of employments It was speedily seen that by separating and combining their efforts so as to bring about some desirable end they might with ease accomplish tasks that could not otherwise be attempted Even in the simplest businesses this co-operation is required neither hunting nor fishing, any more than agriculture or [illegible] can be advantageously carried on [illegible] Man is the creature of society, and is compelled, in every stage of his progress, to, depend for help on his fellows — *Quò alio fortes sumus quàm quod mutuis juvamur officiis?* Instead of trusting to his own unaided efforts for a provision of the various articles required for his subsistence, comfort, and security he instinctively associates himself with others and finds in this association the principal source of his superior power Perceiving that he can obtain an incomparably greater command of all that he deems useful or desirable by applying himself in preference to some one department [illegible] he limits his attention to it only As society advances this division extends itself on all sides one man becomes a tanner or dresser of skins, another a shoemaker, a third a weaver, a fourth a house-carpenter, a fifth a smith and so on, one undertaking [illegible] one the distribution [illegible] ultivate and bring to perfection whatever talent or genius he may possess for the particular calling in which he is engaged The wealth and comforts of all classes are in consequence prodigiously augmented In countries where the division of labour is carried to a considerable extent agriculturists are not obliged to spend their time in clumsy attempts to manufacture their own produce and manufacturers cease to interest themselves about the raising of corn, and the fattening of cattle The facility of exchanging is the vivifying principle of industry it stimulates agriculturists to adopt the best system of cultivation and to raise the largest crops, because it enables them to exchange whatever portion of the produce of their lands exceeds their own wants for other commodities contributing to their comforts and enjoyments, and it stimulates manufacturers and merchants to increase and improve the quantity variety and quality of their goods that they may thereby obtain greater supplies of raw produce A spirit of industry is thus universally diffused, and that apathy and lethargy which characterize a rude state of society entirely disappear

But the facility of exchanging or the circumstance of being able readily to barter the surplus produce of our own labour for such parts of the surplus produce of other people's labour as we may desire to obtain and they may choose to part with is not the only advantage of the separation of employments Besides enabling each individual to addict himself in preference to those departments which suit his taste and disposition it adds very largely to the efficacy of his powers and enables him to produce a much greater quantity of useful and desirable articles than he could do were he to engage indiscriminately in different businesses Dr Smith, who has treated this subject in the most masterly manner has classed the circumstances which conspire to increase the productive powers of industry when labour is divided under the following heads — *first* the increased skill and dexterity of the workmen, *second* the saving of time which is commonly lost in passing from one employment to another, and, *third* the circumstance of the division of employments having a tendency to facilitate the invention of machines and processes for abridging and saving labour A few observations on each of these heads are subjoined

1st *With respect to the improvement of the skill and dexterity of the laborer* — It is sufficiently plain that when a person's whole attention is devoted to one branch of business, when all the energies of his mind and powers of his body are made to converge, as it were to a single point, he must attain to a degree of proficiency in that particular branch to which no individual engaged in a variety of occupations can be expected to reach A peculiar play of the muscles, or *sleight of hand* is necessary to perform the simplest operation in the best and most expeditious manner and this can only be acquired by habitual and constant practice Smith has given a striking example in the case of the nail-manufacturer of the extreme difference between training a workman to the precise occupation in which he is to be employed, and training him to a similar and closely allied occupation "A common smith," says he, "who, though accustomed to handle the hammer, has never been used to make nails, if, upon some particular occasion, he is obliged to attempt it, will scarce, I am assured, be able to make above two or three hundred nails in a day, and those too, very bad ones A smith who has been accustomed to make [illegible] has not been th[illegible] diligence, make more than eight hundred or a thousand nails in a day But I have seen several boys, under twenty years of age who had never exercised any other trade but that of making nails [illegible] when they exerted themselves, could make each of them, upwards of *two thousand three hundred nails in a day*, or nearly three times the number of the smith who had been accustomed to make them, but who was not entirely devoted to that particular business" (*Wealth of Nations*, p 4)

2d The influence of the division of labour in preventing that *waste of time in moving from one employment to another*, which must always take place when an individual engages in different occupations, is even more obvious than its influence in improving his skill and dexterity When the same person carries on different employments, in different and perhaps distant places, and with different sets of tools, he must plainly lose a considerable portion of time in passing between them If the different employments in which he is to be engaged could be carried on in the same workshop the loss of time would be less, but even in that case it would be considerable "A man," as Dr Smith has justly observed, "commonly saunters a little in turning his hand from one sort of employment to another When he first begins the new work, he is seldom very keen and hearty, his mind, as they say, does not go along with it and for some time he rather trifles than applies to good purpose The habit of [illegible] every half hour, and to apply his hand in twenty different ways almost every day of his life, renders him almost always slothful and lazy and incapable of any vigorous application even on the most pressing occasions Independent therefore, of his deficiency in point of dexterity, this cause alone must always reduce considerably the quantity of work which he is capable of performing" (*Wealth of Nations* p)

3d *With regard to the influence of the division of employments in facilitating the invention of machines, and processes for abridging and saving labour* — It is obvious that those engaged in any branch of industry will be more likely to discover easier and readier methods of carrying it on when the whole attention of their minds is devoted exclusively to it than if it were dissipated among a variety of objects But it is a mistake to suppose as has been sometimes done that the inventive genius of workmen and artificers is alone whetted and improved by the division of labour As society advances, the study of particular branches of science and philosophy becomes the principal or sole occupation of the most ingenious men Chemistry becomes a distinct science from natural philosophy the physical astronomer separates himself from the astronomical observer, the political economist from the politician, and each, meditating exclusively or principally on his peculiar department of science attains to a degree of proficiency and expertness in it which the general scholar seldom or never reaches And hence in labouring to promote our own ends, we all necessarily adopt that precise course which is most advantageous for all Like the different parts of a well-constructed engine the inhabitants of a civilized country are all mutually dependent on and connected with each other Without any previous consent and obeying only the powerful and steady impulse of self interest, they universally conspire to the same great end, and contribute each in his respective sphere to furnish the greatest supply of necessaries, luxuries, conveniences, and enjoyments

Probably however the most advantageous result of the division of labour may be found in the circumstance of its enabling manufacturers or others engaged in any complicated business or department of industry to employ work-people of very various degrees of skill and force In the cotton manufacture for example, some processes that are indispensable may be quite as well performed by children and women as by the most expert and powerful workmen It is clear however, that but for the distribution of the labour required to bring about any result among different individuals possessing the degree of skill and strength necessary in each particular part of the process none could be employed but those who possessed the skill and strength required in the most difficult and laborious, and consequently workmen at 30*s* or 40*s* a week would have to engage in tasks that might be as well or better performed by girls at 5*s* or 6*s* a week In all the great departments of industry it is of [illegible] to appropriate them exclusively to certain classes of individuals, and to perform the operations requiring less skill, or less strength, by sets of inferior labourers The [illegible] In fact, [illegible] distribution of employments is made, or with which the skill and power of the work-people are proportioned to the results to be produced (For further illustrations of this principle see *Babbage's Economy of Manufactures*, p 172 &c)

It is necessary to bear in mind that the advantages derived from the division of labour, though they may be, and in fact are, partially enjoyed in every country and state of society, can only be carried to their full extent where there is a great power of exchanging, or an *extensive market* There are an infinite variety of employments which cannot be separately carried on without the precincts of a large city, and in all cases the division becomes more perfect, according as the demand for the produce is extended It is stated by Dr Smith that ten labourers, employed in different departments in a pin manufactory, can produce 48,000 pins a day, and since his time the quantity has been more than doubled, but it is evident that if the demand were not sufficient to take off this quantity, ten persons could not be constantly employed in the business, and the division of employments in it not being carried so far, the labour would be less economically and efficiently applied and the cost of the pins proportionally increased The same principle holds [illegible] could not be constructed in a small country having no intercourse with its neighbours The demand and competition of Europe, Asia and America have been necessary to carry the manufactures of Glasgow, Manchester, and Birmingham to their present state of improvement

Territorial Division of Labour, or Commerce — Besides that sort of division of labour which enables each individual in a limited society to confine himself to a particular employment, there is another and most important branch of the division of labour, which not only enables particular individuals but the inhabitants of entire districts, and even nations, to addict themselves in preference to certain branches of industry It is on this *territorial division of labour*, as it has been appropriately termed, that the commerce carried on between different districts of the same country, and between different countries is founded The variations in the situation, soil, climate, mineral products, &c of the different districts of an extensive country, render them more suitable for some than for other species of industry A district where coal is abundant, which has an easy access to the ocean, and a considerable command of internal navigation, is the natural seat of manufactures Wheat and other species of grain are the proper products of rich arable soils and cattle after being reared in mountainous districts are most advantageously fattened in meadows and low grounds Nothing can be more obvious than that the inhabitants of these different districts will be able by confining themselves to those employments for the prosecution of which they have some peculiar capability, to produce a much greater quantity of useful and desirable articles than they could do were they to engage indiscriminately in every possible employment Can it be doubted that a vastly greater supply of manufactured goods, corn, and cattle is produced by the inhabitants of Glasgow, the Carse of Gowrie and Argyleshire respectively confining themselves to manufactures agri- [illegible] of cattle than if each endeavoured [illegible] arious products?

But it is easy to see that foreign trade or the territorial division of labour between different and independent countries, contributes to increase the wealth of each in precisely the same manner that the trade between different provinces of the same kingdom contributes to increase their wealth There is still greater difference between the productive powers with which Providence has endowed different and distant countries than there is between the productive powers of the provinces of the same country, and consequently the establishment of a free intercourse between them must be proportionally more advantageous Indeed there are a great many products, and some of them of the very greatest utility that cannot be raised, except in particular situations Were it not for commercial intercourse, we should not be able to obtain the smallest supply of tea, spices, raw cotton, raw silk, gold and silver and a thousand other equally useful and desirable commodities Providence by giving different soils, climates and natural productions to different countries, has evidently provided for their mutual intercourse and civilization By permitting the people of each to employ their capital and labour in those departments in which their geographical situation, the physical capacities of their soil, their national character and habits fit them to excel, foreign commerce or the territorial division of labour, has a wonderful influence in multiplying the products of arts and industry Where the freedom of commerce is not interfered with, each country necessarily devotes itself to such employments as are most beneficial for itself And this pursuit of individual advantage is in the highest degree conducive to the good of the whole By stimulating industry, by rewarding ingenuity, and by using most efficaciously the particular powers bestowed by [illegible] most effectively and [illegible] the mass of necessary and useful products it diffuses opulence, and binds together the universal society of nations by the common and powerful ties of mutual interest and reciprocal obligation Commerce enables each particular state to profit by the inventions and discoveries of every other state It creates new tastes and new appetites and [illegible] also gives the means and the desire of gratifying them The progress of domestic industry is accelerated by the competition of foreigners Commerce has either entirely removed or greatly weakened a host of unworthy prejudices It has shown that nothing can be more illiberal and absurd than that once prevalent dread of the progress of others in wealth and civilization, and that the true glory and real interest of each particular people will be more certainly advanced [illegible] in [illegible] ing to attain a barren pre-eminence in the bloody and destructive though necessary art of war

The influence of commerce in giving increased efficacy to labour and augmenting general wealth may be easily illustrated Thus in the case of the intercourse or territorial division of labour carried on between England and Portugal, our superior wool and our command of coal, of skilful workmen, of improved machinery, in short, of all the instruments of manufacturing industry, enable us to produce cloth at a much cheaper rate than the Portuguese, but, on the other hand, the soil and climate of Portugal being peculiarly favourable for the cultivation and growth of the grape, she is able to produce wine at an infinitely less cost than it can be produced here And hence it is obvious that England by confining herself to the manufacture of cloth in which she has a natural advantage and exchanging it with the Portuguese for wine, will obtain a vastly greater supply of that commodity than if she attempted to cultivate the grape at home and Portugal, by exchanging her wine for the cloth of England, will obtain a much greater quantity of cloth than if she attempted to counteract the intention of nature by converting a portion of her capital and industry from the raising of wine in which she has an advantage, to the manufacture of cloth, in which the advantage is on the side of another

What has been already stated is sufficient to expose the sophism of the French economists who contended, that as an equivalent must be always given for commodities brought from abroad it is impossible foreign commerce should be a means of increasing wealth. 'How' they asked 'can the wealth of a country be increased by giving equal values for equal values?' They admitted that commerce might be the means of making a better distribution of the wealth of the world, but as it did nothing more than exchange one sort of wealth for another they denied that it could make any addition to its amount At first sight this sophistical and delusive statement appears sufficiently conclusive, but a very few words will be sufficient to demonstrate its fallacy The advantage of commerce does not consist in its enabling either of the parties who carry it on to obtain articles of greater value than those they give in exchange It may have cost as much to produce the cloth with which the English merchant purchases the wine of Portugal as it did to produce the latter or it may have cost more But then it must be observed that in making the exchange the value of the wine is estimated by what it takes to produce it in Portugal, which has peculiar capabilities for that species of industry, and not by what it would take to produce it in England were the trade put an end to, and in like manner, the value of the cloth is estimated by what it takes to produce it in England, and not by what it would take to produce it in Portugal The advantage of the intercourse consists in this, that it enables each country to obtain commodities for the production of which it has no natural capability, and which it would therefore cost vastly more to produce directly at home at the price required to produce them under the most favourable circumstances, and with the least possible expense The gain of the one party is not the loss of the other Both benefit by the intercourse, for it enables both to save labour and expense in the production of commodities, so that the wealth of the two countries is not only better distributed, but is also greatly increased, by the territorial division of labour established between them

'The commerce of one country with another is merely an extension of that division of labour by which so many benefits are conferred on the human race As the same country is rendered richer by the trade of one province with another, as its labour becomes thus [illegible] divided and more productive than it [illegible] was have been, and as the mutual interchange of all those commodities which one province has, and another wants, multiplies [illegible] comforts of the whole, and thereby [illegible] in a wonderful degree more [illegible] happy such a beautiful train of consequences is observable in the world at large, — that vast empire, of which the different kingdoms may be regarded as the provinces In this magnificent empire, one province is favourable to the production of one species of produce, and another province to another. By their

mutual intercourse, mankind are enabled to distribute their labour as best fits the genius of each particular country and people The industry of the whole is thus rendered incomparably more productive, and every species of necessary useful, and agreeable accommodation is obtained in much greater abundance, and with infinitely less expense" (*Wade's Commerce Defended* p 38)

The supply of a great city with its various articles of provision and consumption affords, as has been justly observed, one of the most striking instances of the benefits resulting from the division and combination of employments on the most extensive scale In illustration of this, it may be stated, that at this moment (1841), there are not less than two millions of inhabitants congregated within ten miles round St Paul's comprising a large proportion of the wealthiest individuals in the kingdom The production of the provisions and other accommodations required by this vast population employs not only a very large proportion of the people of the United Kingdom but also an immense number of labourers in the most distant countries The Chinese furnish the tea, the planters of Jamaica and Demerara the sugar and coffee, Ceylon and the Eastern Archipelago the spices, the Portuguese and French the wines, the people of Cashmere in Central Asia the shawls, the Australians and Germans the wool, the Americans the cotton, the Italians and Chinese the silk, the Norwegians the lobsters, the Spaniards and the people of the Azores the oranges, and so forth, required for the supply of London And yet notwithstanding the extreme diversity of the sources whence they are brought, and of the conditions under which they are produced every article is supplied to the exact extent to which it is wanted, and every individual in this immense city may get, on the shortest notice, any quantity of any article how great or how small soever that he requires There is no excess at one time, or scarcity at another The supply of every article is adjusted to the demand with a precision that any one not acquainted with the circumstances would, *a priori* have pronounced impossible

And how it may be inquired are these astonishing results this constant and equable supply of infinitely varied wants, brought about? Had government undertaken such a task, it certainly would have exhibited even with the assistance of a whole army of officers and [illegible] it is now effected [illegible] individuals who in the prosecution of their own interests confer inestimable advantages on this great city, and indeed enable it to subsist Every retail dealer is aware of the ordinary or average demand of his customers for the article or articles in which he deals, and in like manner the wholesale dealers who commission articles of the producers are each and all aware of the quantity that will be taken off by the retailers, whose agents they are and of the periods when they will have to be supplied In this way the aggregate and individual wants of any population, how great soever, come to be accurately known, and the quantity of labour required to supply the different articles of which they stand in need, and no more, is put in motion

It would be unnecessary, in a work of this kind to dwell on the advantages resulting to society from the formation of improved roads, canals and other easy means of communication At bottom however [illegible] of these consists in the facility which enabling products to be conveyed from one place to another, that is, for enabling the division of labour between different parts of the country to be carried to the greatest extent And the same principle that teaches us that it is for the public advantage to construct new and improved roads, and to promote to the utmost the facilities of intercourse between [illegible] the [illegible] should lead us to [illegible] as far as [illegible] restrictions on the [illegible] countries and to give full scope to the [illegible] of labour between our people and those of other nations All the arguments that can be used for the opening of new roads, the throwing of bridges over ravines and rivers, and otherwise improving the means of internal intercourse apply with but little variation and with equal force to the abolition of restrictions on the exportation of native and the importation of foreign produce, the object of the one class of measures as of the other is to facilitate the interchange of the various products of art and industry, and consequently to enable capital and labour to be employed in the channels in which they are sure to be most productive (*See* the art COMMERCE in this Dict, and the authorities therein referred to)

The various provisions made by society for its protection, and for securing and preserving the rights and privileges of individuals, owe their origin to this principle Government itself is wholly founded on a sense of the advantages resulting from the division [illegible] "In the first state of society each [illegible] or himself for the protection both [illegible] his property For these purposes he must be always armed, and always watchful; what little property he has must be moveable, so as never to be far distant from its owner Defence or escape occupy almost all his thoughts, and almost all his time, and, after all these sacrifices, they are very imperfectly effected 'If ever you see an old man here,' said an inhabitant of the confines of Abyssinia to Bruce, 'he is a stranger, the natives all die young by the lance'

But the labour which every individual who relies on himself for protection must himself undergo is more than sufficient to enable a few individuals to protect themselves, and also the whole of a numerous community To this may be traced the origin of governments The nucleus of every government must have been some person who offered protection in exchange for submission On the governor and those with whom he is associated, or whom he appoints is devolved the care of defending the community from violence and fraud, and so far as internal violence is concerned, and that is the evil most dreaded in civilized society it is wonderful how small a number of persons can provide for the security of multitudes About fifteen thousand soldiers and not fifteen thousand policemen, watchmen, and officers of justice, protect the persons and property of the seventeen millions of inhabitants of Great Britain There is scarcely a trade that does not engross the labour of a greater number of persons than are employed to perform this the most important of all services" (*Senior on Political Economy*)

Definition and Employment of Capital—The capital of a country consists of those portions of the produce of industry existing in it that may be made directly available, either for the support of human beings or the facilitating of production It consequently comprises all those articles that may be employed for the subsistence, clothing and lodging of the labourers engaged in industrious undertakings, and the various animals tools and machines of which they may avail themselves in performing their tasks It is usual to call the former or the food, clothes, &c required for the subsistence of the labourer, the corn used as seed and in the feeding of horses, coal &c, *circulating* capital while those articles that are more slowly consumed, as the lower animals the houses and the various instruments and machines that either are or may be employed in industrious undertakings are called *fixed* capital But though this distinction be convenient for some purposes no distinct line of demarcation can be drawn between the different varieties of capital and they are alike indispensible to the successful prosecution of most branches of industry Without a supply of the first or circulating capital that is without a supply of food clothes &c, it would plainly be impossible to engage in any sort of undertaking where the return was at all distant, and without the second or fixed capital that is, without the aid of tools and machines (which are merely a more complex species of tools) there are but few sorts of labour that could be carried on at all or with any advantage But the progressive nature of man his foresight and inventive faculty led him even in the earliest ages and in the rudest states of society to provide a reserve of food, and to contrive tools and instruments to assist him in his operations The American hunters make use of clubs and slings to abridge their labour and facilitate the acquisition of game and the same principle which prompts them to construct and avail themselves of those rude instruments never ceases to operate it is always producing some new improvement and in an advanced and refined period substitutes ships for canoes muskets for slings, steam engines for clubs and cotton mills for distaffs

Hence it is only by the employment and co-operation of both descriptions of capital that wealth can be largely produced and universally diffused An agriculturist might have an ample supply of carts and ploughs, of oxen and horses and generally, of all the instruments and animals used in his department of industry, but were he destitute of circulating capital or food and clothes, he would be unable to avail himself of their assistance, and instead of tilling the ground would have to resort to some species of appropriative industry and, on the other hand, supposing he were abundantly supplied with provisions, what could he do without the assistance of a fixed capital, or tools? What could the most skilful husbandman perform without his spade and plough? a weaver without his loom? a carpenter without his saw, his hatchet, and his planes

The division of labour cannot be carried to any considerable extent without the previous accumulation of capital Before labour can be divided, "a stock of goods of different kinds must be stored up somewhere, sufficient to maintain the labourer, and to supply him with materials and tools A weaver cannot apply himself entirely to his peculiar business, unless there is beforehand stored up somewhere either in his own possession or in that of some other person, a stock sufficient to maintain him, and to supply him with the materials and tools of his works, till he has not only completed but sold his web This accumulation must, evidently, be previous to his

applying himself for so long a time to such a peculiar business" (*Wealth of Nations*, 119)

As the accumulation of capital must have preceded the extensive division of labour, so its subsequent division can only be perfected as capital is more and more accumulated. The two [illegible] and division act and react on each other. The quantities of work which the same number of people can perform increases in a great proportion with every fresh subdivision of labour, and according as the operations of each workman are reduced to a greater degree of identity and simplicity, he has, as already explained, a greater chance of discovering machines and processes for facilitating his separate task. The quantity of labour therefore not only increases in every country with the increase of the stock or capital which sets it in motion, but, in consequence of this increase, the division of labour is extended, new and more powerful implements and machines are invented, and the same quantity of labour is made to produce an infinitely greater quantity of commodities.

Besides enabling labour to be divided, capital contributes to facilitate labour and produce wealth in the three following ways.

First — It enables work to be executed that could not be executed, or commodities to be produced that could not be produced, without it.

Second — It saves labour in the production of almost every species of commodities.

Third — It enables work to be executed better, as well as more expeditiously.

With regard to the first advantage derived from the employment of capital, or the circumstance of its enabling commodities to be produced that could not be produced without it, it is plain, as already observed, that the production of such commodities as require a considerable period for their completion could not be attempted unless a stock of circulating capital or of food and clothes sufficient for the maintenance of the labourer while employed on them was previously provided. But the possession of fixed capital, or of tools and machines, is frequently as necessary to the production of commodities as the possession of [illegible] capital. It would, for example, be quite [illegible] to produce a pair of stockings without the aid of wires, and although the ground might be cultivated without the aid of a plough, it could not be cultivated without the aid of a spade or a hoe. If we run over the vast catalogue of the arts practised in a civilized country, it will be found that extremely few can be carried on by the mere employment of the fingers or rude tools with which man is furnished by nature. It is almost always necessary to provide ourselves with the result of previous industry and invention, and to strengthen our feeble hands by arming them, if we may so speak, with the force of all the elements."

In the second place, besides supplying many species of commodities that could not be produced without its co-operation, the employment of capital occasions a saving of labour in the production of many others, and, by lowering their cost, brings them within the reach of a far greater number of consumers. We have been so long accustomed to profit by the services of the most commodious and powerful machines that it requires a considerable effort of abstraction to become fully aware of the advantages we owe to them. But if we compare the arts practised alike by highly civilized societies and those in a less advanced state, we can hardly fail of being convinced that we are indebted to the employment of machinery for a very large proportion of our superior comforts and enjoyments. Suppose that, like the Peruvians, and many other people of the New as well as the Old World, we were destitute of iron, and unacquainted with the method of domesticating and employing oxen and horses, how [illegible] for the worse would be made in our condition. It was customary in some countries, to make cloth by taking up thread after thread of the warp, and passing the woof between them by the unassisted agency of the hand, so that years were consumed in the manufacture of a piece which, with the aid of the loom, may be produced in as many days. Nothing perhaps has contributed so much to accelerate the progress and diffuse the blessings of civilization as the establishment of a commercial intercourse between different and distant nations. But how could this be effected without the construction of vessels, and the discovery of the art of navigation? And if we compare the early navigators, creeping timidly along the shore in canoes formed out of trees partly hollowed by fire and partly by the aid of a stone hatchet or the bone of some animal, with those who now boldly traverse the trackless ocean in noble ships, laden with the produce of every climate, we shall have a faint idea of the advance of the arts, and what we owe to machinery and science. Those who have distinguished themselves in this career, though they have rarely met with that gratitude and applause from their fellow-citizens to which they had so just a claim, have been the great benefactors of the human race. By pressing the powers of nature into our service, and subjecting them to our control, they have given man almost omnipotent power [illegible] most gigantic undertakings. Without [illegible] we should be poor indeed. Such as the naked and half famished savage of New Holland is at this day, such would the Athenian, the Roman, and the Englishman have been, but for the invention of tools and machines, and the employment of natural agents in the great work of production.

The [illegible] derived from the employment of capital consists in enabling work to be done *better*, as well as more expeditiously. Yarn, for example, might be spun by the hand, but the admirable machines invented by Hargreaves, Arkwright, and others, enable a hundred or a thousand times as much yarn to be spun as could be effected by means of a common spindle, at the same time that they have improved its quality and given it a degree of fineness and of evenness, or equality in its parts, which was never previously attained. A painter would occupy months, or it might be years, in painting with a brush the cottons, or printed cloths, used in the hanging of a single room, and it would be very difficult, if not impossible, for the best artist to give that perfect identity to his figures which is given to them by the machinery now made use of for that purpose. Not to mention the other and more important advantages re-

[illegible]

years of patient and irksome labour have been expended, is unable, in point of delicacy and correctness, to match a well-printed work executed in the hundredth part of the time, and at a hundredth part of the expense. The great foreign demand for English manufactured goods results no less from the superiority of their manufacture than from their greater cheapness, and for both these advantages we are principally indebted to the excellence of our machinery.

There are other considerations which equally illustrate the extreme importance of the accumulation and employment of capital. The food and other accommodations enjoyed by a nation cannot be increased except by an increase in the number of its labourers, or in their productive powers, but, without an increase of capital, it is in most cases impossible to employ more workmen with advantage. If the articles applicable to the support of the labourers, and the tools and machines with which they are to operate, be required for the maintenance and efficient employment of those already in existence, there can be no additional demand for others. Under such circumstances the rate of wages cannot rise, and if the number of inhabitants be increased they must be worse provided for. Neither is it at all probable that the powers of the labourer should be augmented, except capital be previously increased. Without the better education and training of workmen, the greater subdivision of their employments, or the improvement of machinery, their productive energies can never be materially increased, and in almost all these cases additional capital is required. It is seldom, unless by its means, that workmen can be better trained, or that the undertaker of any work can either provide them with better machinery, or make a proper distribution of labour among them. Should the work to be done consist of a number of parts, to keep a workman constantly employed in one only requires a much larger stock than when he is occasionally employed in every different part. "When," says Dr Smith, "we compare the state of a nation at two different periods, and find that the annual produce of its land and labour is evidently greater at the latter than at the former, that its lands are better cultivated, its manufactures more numerous and more flourishing, and its trade more extensive, we may be assured that its capital must have increased during the interval between these two periods, and that more must have been added to it by the good conduct of some, than had been taken from it either by the private misconduct of others, or by the public extravagance of government." (*Wealth of Nations*, 152.) It is therefore plain that no country can ever reach the stationary state so long as she continues to accumulate additional capital. While she does this she will have an increased demand for labour, and will be uniformly augmenting the mass of necessaries, luxuries, and conveniences, and consequently, also, the numbers of her people. But with every diminution of the rate at which capital has been accumulating, the demand for labour will decline. When no additions are made to capital no more labour will be, or at least, can be advantageously employed. And should the national capital diminish, the condition of the great body of the people will deteriorate, the wages of labour will be reduced, and pauperism, with its attendant train of vice, misery and crime, will spread its ravages throughout society.

Objections to Machinery unfounded — But, admitting what has been stated, still it may be, and indeed has been contended, that [illegible] to the country, machines, on [illegible], only injure the labouring class[es] [illegible] and for labour and

the rate of wages. In point of fact, however, it admits of demonstration that every introduction of improved machinery is sure to increase the aggregate demand for labour, at the same time that by reducing the cost of commodities, it enables the labouring class, in common with the rest of society, to obtain a greater command over necessaries and conveniences. It sometimes, indeed, happens that the introduction of machinery is injurious to the labourers employed in a particular department, but if it displace them, it cannot fail to occasion a more than equivalent demand for their services in other departments. The introduction of moveable types and printing threw out of employment all those who had been previously engaged in the copying of manuscripts, but, at the same time, it is certain that this invention, by cheapening and multiplying books, has made at least from a hundred to five hundred persons be employed in the book trade for one that was employed in it when it began to be introduced, or that would have been employed in it at this moment had it not been discovered.

Precisely similar results follow in all cases in which any peculiar description of hand labour is superseded by machinery. At this moment we have an example of the principle before us in the business of hand loom weaving, which is in the course of being superseded by the introduction of power-looms, the hand-loom weavers being like the copying clerks in the 15th and 16th centuries, involved in the greatest difficulties. But these how severe soever in the mean time will be but of temporary duration and society will be perpetual gainers by the change. Power looms are introduced only because they do their work cheaper than it can be done by the hand. But the wealth of those who buy the products of the power-looms is not affected by the change, and whatever [illegible] through the reduction of their price will be [illegible] things the production of which will in the end fully absorb the unemployed hand-loom weavers, at the same time that the cheapened products will be brought within the command of new classes of purchasers, and that the demand for them will be proportionally increased, and this it is plain will open a new field for the employment of many additional hands in the construction of machinery and in the various subordinate departments connected with the manufacture. To suppose indeed, that the introduction of improved machinery should, under any circumstances, entail a real injury on society, is to suppose what is contradictory and absurd, it is equivalent to supposing that society might be injured by an increased productiveness of soil, and an increased salubrity of climate, it is to suppose that wealth may be too much increased, and that the necessaries and conveniences of life may be too widely diffused.

Circumstances most favourable for the Accumulation of Capital.—Having thus endeavoured to point out the vast importance of the employment of capital, and the manner in which it co-operates in facilitating production we proceed to explain the circumstances most favourable for its accumulation. Now, as capital is nothing but the accumulated produce of previous industry, it is evident that its increase will be most likely to be most rapid where industry is most productive, or, in other words where the profits of stock are highest. The man who can produce a bushel of wheat in three days may accumulate twice as fast as the man who, either from a deficiency of skill or from having to cultivate a bad soil is forced to labour six days to produce the same quantity, and the capitalist who can invest stock so as to yield him a profit of ten per cent, has it equally in his power to accumulate twice as fast as he who can only obtain five per cent for his capital. Experience, too, shows that while high profits afford greater means of saving they act as incentives to accumulation. Hence it is found that in those countries most rapidly increasing in wealth and population, the rate of profit is always comparatively high. Thus in the United States, the rate of profit is usually twice as high as in Great Britain or France, and it is to this that the more rapid advancement of the former in wealth and population is entirely to be ascribed. We do not mean to say that high profits are necessarily, and in every instance, accompanied by a great degree of prosperity. Countries with every other advantage for the profitable employment of industry and stock may be subjected to a despotical government, which does not respect the right of property, and the want of adequate security thence resulting may be sufficient to paralyse all the exertions of those who are otherwise placed in the most favourable situation for the accumulation of capital. But we have no hesitation in laying it down as a principle which holds in every case and from which there is really no exception, that if the governments of any two or more countries be about equally liberal and property in each be about equally well secured their comparative prosperity will depend on the rate of profit. wherever profits are high, there is a great demand for labour, and the society rapidly augments both in population and riches. On the other hand wherever they are low, the demand for labour is proportionally reduced, and the progress of society rendered so much the slower. But however high the rate of profit, had men always lived up to their incomes, that is, had they always consumed the whole produce of their industry for the gratification of their immediate wants and desires, it is obvious there could have been no such thing as capital in the world. High profits are advantageous, because they afford the means of amassing capital, but something more is necessary to make us use these means, and this is the accumulating principle. The desire implanted in the breast of every individual of rising in the world, and improving his condition, has prompted mankind to save a portion of their income, or of the produce of their industry, from immediate consumption, and to set it apart as a fund, or capital, to assist them in their future undertakings. It is to this principle, therefore, or rather to its effect, parsimony, that we owe our capital, and it is to capital that we owe almost all our comforts and enjoyments. Without its assistance and co-operation, labour could not have been divided, arts could not have made any progress, and mankind must have continued to shelter themselves as in the earliest ages, in caves and forests, and to clothe themselves with the skins of wild animals. All the accumulated riches of the world, the cities which cover its surface, the ships which traverse its seas and the innumerable variety of improvements, owe their origin to this principle —to the desire to rise in the world and consequently to save and amass.

It has been wisely ordered that this principle should be as powerful as it is advantageous. "With regard to profusion," says Smith "the principle which prompts to expense is the passion for present enjoyment, which, though sometimes violent, and very difficult to be restrained, is in general only momentary and occasional. But the principle which prompts to save is the desire of bettering our condition a desire which though generally calm and dispassionate comes with us from the womb and never leaves us till we go into the grave. In the whole interval which separates the two moments, there is scarce, perhaps a single instance in which any man is so perfectly and completely satisfied with his situation as to be without any wish of alteration or improvement of any kind. An augmentation of fortune is the means by which the greater part of men propose and wish to better their condition. It is the means the most vulgar and the most obvious and the most likely way of augmenting their fortune is to save and accumulate some part of what they acquire either regularly and annually or upon some extraordinary occasion. Though the principle of expense therefore, prevails in almost all men upon some occasions and in some men upon almost all occasions yet in the greater part of men, taking the whole course of their life at an average, the principle of frugality seems not only to predominate but to predominate very greatly." (*Wealth of Nations*, 151.)

It is this principle which carries society forward. The spirit of parsimony, and the efforts which the frugal and industrious classes make to improve their condition, in most instances balance not only the profusion of individuals but also the more wasteful profusion and extravagance of government. The spirit of economy has been happily compared by Smith to the unknown principle of animal life the *vis medicatrix naturæ*, which frequently restores health and vigour to the constitution, in spite both of disease, and of the absurd prescriptions of the physician.

But however great the capacity of the principle of accumulation to repair the waste of capital, we must take care not to fall into the error of supposing as very many have done that its operations are in all cases promoted by a large public expenditure. To a certain extent this is indeed true. A moderate increase of taxation has the same effects on the habits and industry of a nation that an increase of his family or of his necessary and unavoidable expenses has upon a private individual. Man is not influenced solely by hope, —he is also powerfully operated upon by fear, taxation brings the latter principle into the field. To the desire of rising in the world inherent in the breast of every individual, an increase of taxation superadds the fear of being cast down to a lower station, —of being deprived of conveniences and gratifications which habit has rendered almost indispensable; and the combined influence of the two principles produces efforts that could not be produced by the unassisted agency of either. They stimulate individuals to endeavour, by increased efforts of industry and economy, to repair the breach taxation has made in their fortunes, and it not unfrequently happens that their efforts do more than this, and that, consequently, the national wealth is increased through the increase of taxation. But we must be on our guard against the abuse of this doctrine. To render an increase of taxation a cause of greater exertion, economy, and invention, its increase should be slow and gradual; and it should never be carried to such a height as to incapacitate individuals from meeting the sacrifices it imposes on them by such a moderate degree of increased exertion and economy as it may be in their

power to make, without requiring any very violent change in their habits The increase of taxation must not be such as to render it impracticable to overcome its influence, or to induce the belief that it is impracticable Difficulties that seem to be surmountable sharpen the inventive powers and are readily grappled with, but an apparently insurmountable difficulty or such an excessive weight of taxation as it was deemed impossible to meet, would not stimulate, but destroy exertion Instead of producing new efforts of ingenuity and economy, it would produce only despair Whenever taxation becomes so heavy that the produce it takes from individuals can no longer be replaced by fresh efforts, these efforts uniformly cease to be made, the population becomes dispirited, industry is paralysed, and the country rapidly declines

Ambition to rise is the animating principle of society Instead of remaining satisfied with the condition of their fathers, the great object of mankind in every age has been to rise above it,—to elevate themselves in the scale of wealth, to continue stationary, or to retrograde, is not natural to society Man from youth grows to manhood, then decays and dies, but such is not the destiny of nations The arts, sciences, and capital of one generation become the patrimony of that which succeeds them, and in their hands are augmented and rendered more efficient, so that, if not counteracted by the want of security or by other adventitious causes, the principle of improvement would always operate, and would secure the constant advancement of nations in wealth and population

Such is a short outline of the circumstances on which the production of wealth depends It is difficult in separately considering the influence of the combination and division of employments, and of the introduction and improvement of machinery to avoid ascribing an undue degree of importance to the one immediately under consideration But neither is intitled to any pre eminence over the other They are alike important, or rather we should say, they are alike indispensable to the production of wealth It would, indeed be quite as profitable to inquire whether the heart or the lungs be most essential to animal existence as it is to inquire whether the division and combination of employments or the command of capital, including tools and machines be most essential to the growth of opulence and civilization Without their combined and powerful aid man must have continued sunk in primeval barbarism and ignorance Take away the division and combination of employments, and the isolated efforts of individuals will be wholly unable to produce any considerable result, and take away capital or the aid derived from previous savings, and from tools and machinery and we shall immediately sink to the level of the Australian savages

It would be inconsistent with the objects and limits of this work to enter further into details The sketch now given comprises we believe an accurate statement of the great principles that lie at the bottom of the science and by the application of which a correct judgment may be formed of most practical measures affecting the production of wealth But those who wish for more detailed statements and expositions of difficulties must resort to works especially appropriated to such investigations

The second great division of Political Economy has for its object to inquire into the laws which regulate the distribution of wealth among the various ranks and orders of the community

II Distribution of Wealth

The [illegible] said [illegible] three great classes of labourers, landlords, and capitalists, that is into those who employ themselves for hire in any undertaking, those to whom the lands belong and those who are the owners of capital An individual may combine in his own person each of these separate characters, but [illegible] case of all individuals And whatever be the condition of any country or society, whether it be rude or refined, rich or poor, every person belonging to it, who is not a pauper, or who does not subsist on the bounty of others may be reckoned in one or other of these classes They divide amongst them all the wealth of the community Public functionaries of all sorts, and the various individuals engaged in what are called liberal or learned professions exchange their services for valuable considerations The whole subsistence of such persons, in so far as they depend upon their employments, is derived from wages, and they are as evidently labourers as if they handled a spade or a plough "Every man," says Dr Paley, "has his work The kind of work varies, and that is all the difference there is A great deal of labour exists besides that of the hands many species of industry beside bodily operation, equally necessary, requiring equal assiduity, more attention, more anxiety It is not true, therefore, that men of elevated stations are exempted from work, it is only true that there is assigned to them work of a different kind whether more easy or more pleasant may be questioned, but certainly not less wanted, nor less essential to the common good" (*Assize Sermon*, 29th July, 1795) Hence it is that the inquiry into the distribution of wealth among the different orders of the society, resolves itself into an investigation of the laws which regulate wages, rent, and profit, and of the best methods for [illegible] of the poor, or of those who [illegible] themselves We believe, however, that it will be the preferable plan to refer the consideration of these topics to the heads now mentioned, which will, consequently, comprise all that is essential to a general view of this department of the science

Among the many works that have been written on this science, the first place is due to the *Wealth of Nations*, by Adam Smith an edition of this work was published in 1838 in one volume 8vo, with notes and illustrations by the author of this article See also Ricardo's *Principles of Political Economy and Taxation*, [illegible] *Encyc Metropol*, M'Culloch's [illegible] *onomy*, Say *Traité d'Economie* [illegible] *ples of Political Economy* &c

POLITICS (Gr πολις, *a city*) may be considered either as a science or an art, according to the manner in which it is treated Political science is that which treats of the theory and practice of government, and the subjects which it comprises have been arranged under the following heads —1 Natural law, 2 Abstract politics, i e the object of a state and the relations between it and individual citizens, 3 Political economy, 4 The science of police, or municipal regulation 5 Practical politics, or the conduct of the immediate public affairs of a state, 6 History of politics, 7 History of the European system of states, being the only system in which the modern art of politics has received a practical development, 8 Statistics, 9 Positive law relating to state affairs, commonly called constitutional law, 10 Practical law of nations, 11 Diplomacy, 12 The technical science of politics, an acquaintance with the forms and style of public business in different countries The ancient Greek writers treated the science of politics uniformly with reference to an imaginary perfect state, the constitution of which each propounded according to his own speculative views, and then proceeded to show in what respects existing governments differed from this ideal standard, the cause of these variations, &c

POLL In Politics *See* Parliament

POLLARD A tree with the head cut off at the height of 10 or 12 feet from the ground for the purpose of inducing it to throw out branches all round the section where amputation has taken place, which branches are cut off periodically, when they attain the length of 8 or 10 feet, to be used as fuel fence wood, or for other rustic purposes Pollard trees are for the most part found in hedgerows, which they greatly injure by the dense shade produced by their branches on the plants below and excepting when the round formal heads of [illegible] are interlaced in connexion with overgrown hedge plants or with large trees which have not been pollarded, they disfigure the landscape from the sameness of their appearance and their expression of meanness, as compared with that of trees undecapitated and left in all their native luxuriance In the time of Evelyn the term pollard appears to have been chiefly applied to trees which were lopped or deprived of their side branches, excepting a few at top, leaving the tree standing like a naked pole. Examples of this kind of pollard are frequent among the hedgerow elms in the [illegible] of London The decapitated tree, now called a pollard, was in Evelyn's time called a dottard

POLLEN In Botany, the pulverulent substance which fills the cells of the anthers of a plant consisting of a multitude of little hollow cases filled with a fluid holding very minute molecular matter in suspension. The latter is eventually discharged by the grains of pollen through their hollow tubes, and is supposed to be the spermatic fluid of a plant

POLLEN TUBES, are the tubular processes emitted by the pollen when it comes in contact with the stigma of a plant, and which are supposed to conduct the impregnating matter down the style into the ovules through the foramen

POLL TAX A tax still levied in many of the Continental states and formerly also in England in proportion to the rank or fortune of the individual In England this species of tax was first levied in 1378, and, as is well known, it was from the brutality with which the levying of it was accompanied that the rebellion of Wat Tyler took its rise in 1381 Various poll taxes were levied at different periods in the subsequent history of England; but they were finally abolished in the reign of William III *See* Taxation

POLLUX In Astronomy, one of the twins forming the constellation *Gemini*. (*See* Castor.) Pollux is also

the name of a star of the second magnitude in the same constellation

PO'LYARCHY. (Gr πολυς, *many*, and αρχειν, *to govern*) A word sometimes used by political writers in a sense opposed to monarchy the government of many, whether a privileged class (aristocracy), or the people at large (democracy)

POLYCHRO'ITE (Gr πολυς, and χροα, *colour*) A term applied to the colouring matter of saffron, in consequence of the variety of colours which it exhibits when acted upon by various re-agents

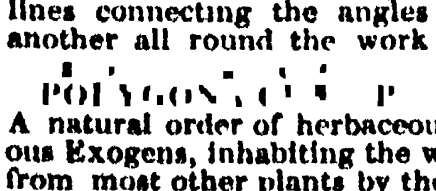
PO'LYCHREST (Gr πολυς, and χρηστος, *useful*) A term applied by [illegible] chemists to certain preparations which they regarded as possessed of multifarious virtues *Polychrest salt* was the sulphate of potash

POLYGA'LEÆ (Polygala, one of the genera) A natural order of irregular Polypetalous Exogens, possessing tonic, astringent, and febrifuge properties The species are also sometimes cultivated for the sake of their beautiful flowers, they are [illegible] temperate climates, and are particularly common at the Cape of Good Hope Rhatany root a powerful astringent, belongs to *Krameria* [illegible] this order

POLY'GAMOUS (Gr πολυς, and γαμος *marriage*) in Grasses, signifies when one of the two florets of which a spikelet consists is unisexual, the other hermaphrodite, as in *Spodiopogon*, &c , in other plants it expresses the presence in the same individual of male, female, and hermaphrodite flowers

POLY'GAMY (Gr πολυς and γαμος *marriage*) The custom of having several wives, a custom apparently common to all nations in remote antiquity and common now to most of those in which the tie of marriage is recognized, and to which Christianity has not extended It was admitted among the Patriarchs and under the Mosaic dispensation (Exod xxi 10 Deut xxi 15), and Selden (*Uxor Hebraica*) has shown its prevalence among the Jews without mentioning the extraordinary instances of sovereigns such as David and Solomon, recounted in Scripture It may be questioned however, whether it continued at the period of our Saviour's preaching Certainly his injunctions in regard to marriage seem rather to be founded on the supposition of monogamy, and the absence of positive injunctions against polygamy has been relied on by some modern disputants with very little reason as an authority that the licence assumed by the holy men of the Old Testament is not revoked The severer manners of Western nations seem to have repudiated it. It was no part of Grecian manners the notion that the Athenian laws allowed of two wives (founded in part on a passage in *Athenæus* l xiii ch 1) seems a mistake but it appears to have been allowed to a citizen in addition to his lawful wife, herself a citizen to live in a kind of legitimate concubinage with a female not belonging to that class Thus if there is any truth in the story of Socrates' two wives) his plague Xantippe was the wife by night, while the softer Myrto was only a wife by courtesy In republican Rome no such licence was known but under the emperors the practice of polygamy seems to have crept in though repudiated both by the moral sense and civil usages of the people Valentinian I legalized it by an edict But the Christian ecclesiastics of the empire strenuously opposed it, and it disappeared altogether, we believe, from Christendom with the fall of the Roman empire In the East it has continued to prevail

A few bold writers in modern times have raised the defence of [illegible] nded on the supposed absence of its expr[illegible] Bernardus Achinus a well known and able but unsteady theologian of the 16th century, who belonged by turns to the Roman Catholic and Protestant communions is among the most remarkable Lyserus (*Polygamia Triumphatrix*) adopted a still more decided view The Rev Mr Madon in his *Thelyphthora* (a work which excited an extraordinary and very unfavourable sensation on its appearance), limited the privilege of polygamy to men, and asserted that the injunction of St Paul, that a bishop "should be the husband of one wife," plainly demonstrated its lawfulness in others, meaning one wife at a time a supposition which is not improbable, although it will scarcely support his conclusions But a greater number of philosophical writ[illegible] have [illegible] of the practice in the [illegible] others, defend it on the ground of the [illegible] cay of female beauty in those [illegible] relies on the strange notion, that the number of females in eastern countries is much greater than that of males, which the traveller Bruce asserts on the authority of his own observations But the supposed fact on which these reasonings rest seems [illegible] maginary At all events, the *practice* [illegible] East is confined to so few that it can have little direct effect on manners, and none on popula[illegible] Mr Urquhart who endeavours to place Turkish usages in a favourable contrast with those of the West, after to a certain extent defending polygamy, says rather inconsistently, "While the law of nature renders this practice an impossibility as regards the community, it is here still further restrained among the few who have the means of indulging in it, both by the domestic unquiet that results from it, and by the public censure and reprobation of which it is the object" (*Spirit of the East*) He adds, that in his time "a case of polygamy was unknown in Candia, among a population of 16 000 Mussulmen" And Niebuhr says that in Arabia the conduct of those who take more than one wife is blamed by all other men" But it seems scarcely to have occurred to most reasoners that while polygamy itself is rare, its re[illegible] with the toleration of [illegible] The man who is not rich enough to take two wives, or who does not choose to encounter the household disturbances which follow such an arrangement falls entirely in with the [illegible] his family a re[illegible] lawful spouse Our We[illegible] [illegible] of the community into two classes a greater number treated with the highest respect, and in whom perfect purity is presumed, a smaller number, abandoned to utter degradation Where polygamy and concubinage are recognized, there is probably much less gross prostitution, but the general character of the sex stands on a lower basis



POLYGA'STRIA (Gr πολυς, and γαστηρ *a stomach*) The name of the most minute and simple class [illegible] devoid of spinal marrow and of vascular and respiratory organs with many stomachs of an indefinite form, and androgynous, with spurious locomotive organs of various nature They are all endowed with an organization characteristic of the animal kingdom and manifest such modifications of internal structure and external form that they can be divided into twenty two families, of which eleven are naked and eleven clothed in a siliceous case Forty eight species referable to twenty one distinct genera are provided with eyes or coloured eyespecks and among these nervous ganglia have been detected beneath the eye in *Amblyophis* and *Euglena* They occur in all parts of the world and differ according to diversity of climate region kind of water, &c They are invisible to the naked eye but by their immense numbers, can impart a distinct colour to the water in which they swarm they are one of the causes of the phosphorescence of the sea They enjoy the most extensive powers of reproduction and through their faculty of spontaneous *fission* the individual becomes constant and as it were, perpetually renews its youth By virtue of the imperishability of their external cases the *Polygastria* have formed vast masses of rock, as at Bilin in Bohemia where a single stratum extending over a wide area is no less than 14 feet thick and this consists exclusively of the cases of *Bacillaria Gallionella* &c , united together without any visible cement They sometimes so choke up water by their vast numbers as to cause the death of fishes contained therein They appear never to sleep they are very tenacious of life and fall into a kind of torpidity by excess of dryness heat or cold The more minute species are probably often suspended in the air They act according to external circumstances as the higher organized animals do They are injuriously affected or killed by strong poisons, but can sometimes support great degrees of warmth and cold, and can live with or without light their motions are slow Ehrenberg calculates that the *Monas punctum*, if it were to continue its ordinary rate of motion in a straight line, would traverse one mile of space in five years, while the *Navicula gigantea* would require forty years to travel over the same distance But their movements manifest the phenomena of consciousness and choice, and their muscular power is indicated by the strong maxillary apparatus with which many are provided

POLYGLOT (Gr πολυς and γλωττα, *language*) A word generally applied to such Bibles as have been printed with the text represented in various languages The most ancient instance of this parallel representation of various texts is the work of Origen known by the name of the *Hexapla* in imitation of which several similar editions of the Scriptures have been published since the invention of printing, of which the most important are, — 1 *The Complutensian*, or edition of Cardinal Ximenes printed at Alcala in Spain, 1515, in four languages, comprehended in six vols folio 2 *The Plantin*, Antwerp, 1572 3 *The Polyglot* of De Sacy, Paris, 1645 4 *The English*, or *Walton's Polyglot* London, 1657 These contain among them the Hebrew, Chaldee, Syriac, and Samaritan texts with [illegible], the Septuagint the Greek of [illegible] the Italic and the Vulgate, with [illegible] and Chaldee paraphrases, and [illegible] trations 5 *Hutte* [illegible] twelve languages, the Hebrew Syriac, German, Bohemian, Italian Spanish, French, Danish, and Polish.

PO'LYGON (Gr *πολυς*, and *γωνια*, *angle*), according to Euclid, is any plane rectilinear figure having more than four sides or four angles, but, in treating of polygons generally, geometers also include the triangle and the quadrangle If the sides of the polygon are all equal it is said to be a regular polygon, otherwise it is irregular Every regular polygon can be circumscribed by a circle, or have a circle inscribed in it, but of irregular polygons, excepting triangles, there is only one case in which a circle will pass through all their angular points, namely, when the polygon has an equal number of sides, one half of which are equal to one another, and the other half also equal to one another, but different from the former, and the equal and unequal sides are placed alternately It is obvious that all the angles of such a figure are equal

Euclid has shown in the *Elements* how to inscribe a triangle, a square, and a pentagon in a given circle, and as any arc of a circle may be bisected, and the halves again bisected &c, it follows that any regular polygon, of which the sides are 3×2^n, 5×2^n, or 15×2^n (n being any number whatever, or 3×2^n, or 5×2^n, may be inscribed in a circle by elementary geometry Until a recent discovery respecting the division of angles was made by Gauss, it was supposed that if the number of sides of a polygon was any other prime number than 3 or 5, the figure could not be inscribed in a circle, but this geometer in his *Disquisitiones Arithmeticæ*, has demonstrated that every polygon the number of whose sides is a prime number of the form $2^n + 1$, may be geometrically inscribed in a circle When $n = 1$ this form gives 3, or the triangle, when $n = 2$ it gives 5, or the pentagon, when $n = 3$, it gives 9, which is not a prime, when $n = 4$, it gives 17, whence a seventeen-sided figure may be inscribed in a circle geometrically The next prime is found by making $n = 8$ when the form gives 257

In order to investigate the general properties of polygons, it is necessary to divide them into two classes *convex* and *concave*, the first those of which the interior angles are less than two right angles (fig 1), and the second those which have one or more *re-entering* angles, as C (fig 2) If we call those the *interior* angles of the polygon which belong to the interior of the figure (whether less or greater than two right angles) and those *exterior* angles which are obtained by subtracting each interior angle from four right angles the following theorems will be true of the polygons of both classes —

1 The sum of the interior angles of a polygon is equal to as many times two right angles as there are sides *minus* two Thus let S denote the sum of the interior angles R a right angle and n the number of sides of the polygon, then $S = 2(n - 2)$ R

2 The sum of the exterior angles of a polygon is equal to as many times two right angles as there are sides *plus* two Let S' be the sum of the exterior angles as above defined, then $S' = 2(n + 2)$ R

Any polygon may be decomposed into triangles by drawing straight lines from one of its angular points to each of the opposite angles, and the area of the polygon is the sum of the areas of all the component triangles But a beautiful theorem was found by L Huilier of Geneva by means of which, when the sides and angles of a polygon are known the area is found without decomposing it into triangles, which, when the number of sides is considerable leads to laborious calculations The theorem is this — The double of the surface of any rectilinear figure is equal to the sum of the rectangles of its sides, taken two and two *excepting one* multiplied by the sine of the sum of the supplements of the interior angles contained between each pair of sides Thus, in the preceding figure (fig 1), let A, B C D, E be the supplements of the interior angles at those points, then

$$\begin{aligned} 2 \text{ area} = {} & AB \times BC \sin B \\ & + AB \times CD \sin (B + C) \\ & + AB \times DE \sin (B + C + D) \\ & + BC \times CD \sin C \\ & + BC \times DE \sin (C + D) \\ & + CD \times DE \sin D \end{aligned}$$

This formula also gives the area of the polygons of the second class (fig 2), only the supplement of the re-entering angle C' must be taken with the negative sign (See *L'Huilier's Polygonométrie*, Genève, 1789)

POLYGON, in Fortification, is either *exterior* or *interior* The exterior polygon is the figure formed by lines connecting the angles of the bastions with one another all round the work, the interior polygon by [illegible] stions all round

POLYGON, (in Botany) [illegible] one of the genera) A natural order of herbaceous, rarely shrubby, apetalous Exogens, inhabiting the whole world, distinguished from most other plants by the cohesion of the scarious stipules into a sheath, technically called an *ochrea* or *boot*, and by their triangular fruit Sorrel on the one hand, and rhubarb on the other, represent the general qualities of this order While the leaves and young shoots are acid and astringent the roots are universally [illegible] *Rumex crispus* contains pure oxalic acid [illegible] species of Polygonum are used in [illegible] *Rumex* or dock, are well-known plants of this order, which is also sometimes remarkably astringent, as in the case of the *Coccoloba uvifera*, or sea-side grape of the West Indies, an extract of whose bark forms a kind of kino

POLYGONAL NUMBERS, in Arithmetic, are the successive sums of a series of numbers in arithmetical progression When the common difference of the series in arithmetical progression is 1, then the sums of the terms give the *triangular* numbers, when the common difference of the terms of the arithmetical series is 2, the sums of the terms are the *square* numbers, when the difference is 3, the sums are the *pentagonal* numbers, and so on Thus —

Common difference = 1,	1, 2, 3, 4, 5, 6, &c
[illegible]	1 3, 6, 10, 15, 21, &c
[illegible] = 2,	1, 3, 5, 7, 9, 11, &c
Square numbers	1, 4, 9, 16, 25, 36, &c.
Common difference = 3,	1, 4, 7, 10, 13, 16, &c
Pentagonal numbers	1, 5, 12, 22, 35, 51, &c

and so on These numbers are called, in general, *polygonal* from possessing this property that the same number of points may be arranged in the form of that polygonal figure to which it belongs For example, the pentagonal numbers 5, 12, 22 35, 51, &c may be severally arranged in a pentagonal form Thus, in the annexed figure, 5 points form the pentagon *a b c d e*, 12 the pentagon *a f g h i*, with the former enclosed, 22 the pentagon *a k l m n*, with the two former enclosed

A very remarkable property of polygonal numbers by Fermat, though it has yet been demonstrated only in respect of the triangular and square numbers It is this —Every number whatever is the sum of one two or three triangular numbers, the sum of one, two, three, or four squares, the sum of one, two three four or five pentagonal numbers, and so on *See* FIGURATE NUMBERS

POLYGON OF FORCES In Mechanics, the name given to a theorem, the discovery of which is attributed to Leibnitz The theorem is this —If any number of forces act upon a point and a polygon be taken one of the sides of which is formed by the line representing one of the forces and the following sides in succession by lines [illegible] magnitude, and parallel [illegible] which completes the polygon will represent the resultant of all the forces

POLYGONOMETRY The doctrine of polygons, as trigonometry is the doctrine of triangles The properties of polygons are investigated by resolving them into triangles, their areas, however, may be found when so many of their sides and angles as suffice to determine them are known *See* POLYGON

POLYGRAM (Gr *πολυς many*, and *γραμμα, a line*) A figure of many lines

POLYGRAPHY (Gr *πολυς* and *γραφω, I write*) In Bibliography a name invented to designate a collection of different works either by one or several authors

POLYHALITE (Gr *πολυ-*, and *αλς, salt*) A mineral found at Ischel in Upper Austria, composed of muriate of soda, and of the sulphates of magnesia, lime, and potash

POLYHE'DRON (Gr *πολυς*, and *ἑδρα, seat*) In Geometry a solid body bounded by many faces or planes When all the faces are regular polygons, similar and equal to each other, the solid becomes a regular body It may be demonstrated that only five regular solids can exist namely, the tetraedron the hexaedron, the octaedron the dodecaedron, and the icosaedron See the terms see also PLATONIC BODIES

POLYHEDRON In Optics *See* POLYSCOPE

POLYHY'MNIA, the muse who presided over lyric poetry —

> Nec Polyhymnia
> Lesboam refugit tendere barbiton *Hom. Od* i 1

POLYMI'GNITE (Gr *πολυς*, and *μιγνυμι, I mix*) A mineral which [illegible] of metallic lustre, [illegible] lime, yttria, oxide [illegible] magnesia, potassa, silica, and oxide of tin It is found in Norway

POLYNO'MIAL, or MULTINOMIAL, in Algebra, denotes a quantity having many terms Such, for example, is the expression $a + 2b + 3c + nd$, &c

POLYOPTRON (Gr *πολυς*, and *οπτρον, a looking-glass*) In Optics, a glass through which objects appear multiplied, but diminished It consists of a lens one side of which is plane, but in the other are ground several spherical concavities Each of these concavities

becomes a plano-concave lens, through which an object appears diminished; and when there are a number of them together, the object will be seen through each, and thus multiplied

POLYPES, *Polypi* (Gr πολυς, and πους, *a foot*) The name of an extensive group of radiated animals in the system of Cuvier, associated together by the common character of a fleshy body, of a conical or cylindrical form, commonly fixed by one extremity, and with the mouth situated at the opposite end and surrounded by more or less numerous arms or tentacles Under this external form is masked various grades of organization, of which three at least have been well defined by recent and minute anatomical researches

The lowest grade of organization is manifested by the fresh water polype (*Hydra*) and the compound marine corallines (*Sertularia Tubularia*, &c) The body here consists of a granular parenchyma, having a contractile power in every part, not requiring a distinct allocation and arrangement of muscular fibres When it is defended, as in the Corallines, by a polypary it can be retracted into its cell without being folded upon itself The oral tentacles are not provided with vibratile cilia, the stomach is not distinct from the parietes of the body The polypes thus organized have been termed *Dimorphea* by Ehrenberg, and *Nudibrachiata*, or Hydriform Polypes, by Dr Farre In the second group of Polypes the body is distinctly membranous and fibrous and the stomach forms a separate pouch suspended in its centre The stomach has but one external orifice, which serves for mouth and vent, but posteriorly it communicates with the main cavity of the body This is divided into several compartments by vertical partitions passing from the walls of the cavity to those of the stomach, and with the chambers thus formed the tubular arms communicate the mouth communicates The arms are not ciliated externally This group of Polypes has been termed *Anthozoa* by Ehrenberg, and includes the Sea-anemones Madrepores Coral plants &c In the third and highest group of Polypes the parietes of the stomach are not only distinct from those of the body but are continued into an intestinal tube which is reflected forward and terminates in a distinct anal aperture near the mouth the tentacula are provided with vibratile cilia The Polypes of this division are aggregated or compound and provided with flexible or calcareous cells they have been termed *Bryozoa* by Ehrenberg and *Ciliobrachiata* by Dr Farre All the groups of Polypes propagate by gemmation and likewise by ova which are first developed into ciliated and locomotive gemmules In the *Ciliobrachiata* the sexes are distinct

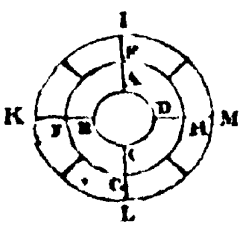
POLYPHEMUS *See* CYCLOPS

POLYPUS In Surgery a fleshy tumour, which is occasionally formed in the nostrils the same term is also applied to a fleshy tumour of the uterus

POLYSARCIA (Gr πολυς, and σαρξ, *flesh*) Corpulency

POLYSCOPE (Gr πολυς, and σκοπεω *I view*) In Optics, a lens plane on one side and convex on the other, but of which the convex side is formed of several plane surfaces, or *facettes*, so that an object seen through it appears multiplied The reason of the multiplication of the images is this — When the opposite sides of a thick piece of glass are not parallel an object seen through it appears out of its true place on account of the refraction, consequently if a lens is ground so that portions of its convex surface are differently inclined to its plane side, the object will appear in different places at the same time The polyscope may be used to collect the images of several dispersed objects into a single point, or to collect parts of the same object represented in different places so as to form a single image The instrument is a mere toy, and only used for the purpose of amusement

POLYSPASTON A term used by some of the old writers on mechanics to denote an assemblage of pulleys for raising heavy weights



POLYSTYLE (Gr πολυς, and στυλος, *a column*) In Architecture, an edifice in which there are a great number of columns

POLYTECHNIC SCHOOL (Gr πολυς, and τεχνη, *art*) This establishment was founded in 1794, at Paris, by a decree of the National Convention Its object is to instruct youth in the mathematical, physical and chemical sciences Napoleon, who introduced various modifications into its constitution gave a military turn to its discipline It prepares pupils for the artillery service and civil and military engineering The number is limited to 400 Youths are admitted between the age of sixteen and twenty, and the course of study lasts two years In the lists of its professors have been included the illustrious names of Lagrange, La Place, Monge, Berthollet, and from the ranks of its pupils have proceeded almost without exception all the mathematicians and philosophers of France who have attained to eminence during half a century

POLYTHALAMIANS, *Polythalamacea* (Gr πολυς, *many*, and θαλαμος, *a chamber*) A name applied by De Blainville to an order of Cephalopods, including those which have many-chambered shells Like all divisions founded merely on external or dermal characters, it contains animals of different degrees of organization, and which cannot be grouped together in the same order in a natural system *See* TETRABRANCHIATES

POLYTHEISM (Gr πολυς, and θεος, *God*) The doctrine of a plurality of gods Sabianism (or planet-worship), Fetichism, Demon worship, hero worship, and animal worship, together with the *fetichism* of some Negro tribes, may all be considered as varieties of Polytheism That the first deviation from pure Theism, such as we believe to have been at the outset revealed to man, was into the worship of the sun, moon, and stars (the host of heaven, Hebr Tsaba, *an host*, whence Tsabianism or Sabianism, which see), is sufficiently probable The origin of the worship of the good and evil principle as distinct deities, which characterized the religion of some oriental nations, is not so easily explicable Some have attributed it to the recognition of the opposites to those phenomena which had been deified in the Sabian notions — [illegible] to light night to day, &c, some [illegible] the existence of evil or reprobate spirits, some to a mere philosophical theory adopted by priests to popular comprehension Damon worship or the worship of intermediate intelligences appropriated to external objects, and subordinate to the highest God, was a natural effect of Sabianism The worship of heroes, or deified mortals, arose again from it in a later stage of society, and the most probable theory of the greatest systems of Polytheism which have been recorded by divisions of the human race, viz the Egyptian Greek Indian and Scandinavian, seems to be this that hero worship, the most congenial of all to early imagination, superseded former modes of [illegible] were actually heroes who had gradually absorbed to themselves the honours formerly paid to damons or intelligences and to the host of heaven so that their attributes in later mythology present a vague mixture of the characters of all If however this be the case it remains to be explained how *after* the gods of Olympus had acquired their station and attributes in the Grecian religion a secondary race of heroes the *newer*, properly so called (whose worship is quite of recent origin and certainly posterior to Homer), should have found a place in the same mythology The strange system of animal worship seems peculiar to ancient Egypt, and has been derived by some from the natural circumstances of the country, the scarcity of domesticated animals having given them an importance which the priests made use of and connected with superstition As to the theory and general history of polytheism, the following among many other books may be mentioned — *Stillingfleet's Origines Sacræ*, *Kames's Sketches of the History of Man*, *Court de Gebelin Monde Primitif*, *Bryant's Mythology*, the Works of Herder, *Warburton's Divine Legation*, *Cudworth's Intellectual System*, *Vossius De Origine Idololatriæ*, *Mem de l'Acad des Inscr* vol xxxviii

POLYZONAL LENS (Gr πολυς, and ζωνη, *zone*) The name given by Sir David Brewster to a burning lens constructed of several zones or rings, each of which may be again composed of separate segments In the annexed figure A B C D is a central lens formed of one piece of glass, I I G H is a middle ring, or zone composed of four separate pieces, I K I M is another ring composed of eight segments, and surrounding the former The number of zones and of parts in each, may be as great or as small as we please

This method of forming lenses is attended with several important advantages The difficulty of procuring flint glass of sufficient purity to render it fit for the construction of a solid lens of large dimensions is removed, and the expense greatly diminished If impurity exist in any of the spherical segments, or if an accident happen to any of them it can easily be replaced Another advantage attending the construction is that it enables us to correct, very nearly, the spherical aberration by making the foci of each zone coincide Lenses of this kind have been made in France of crown glass, and have been introduced into the principal French light-houses One was constructed, under the directions of Sir David Brewster, for the commissioners of the northern light-houses It was made of pure flint glass, was three feet in diameter, and consisted of numerous zones and segments (See *Brewster's Treatise on New Philosophical Instruments*; and "Optics" in *Lardner's Cyclopædia*)

POLYZOONS *Polyzoa* (Gr πολυς, and ζωον, *animal*) A class of compound animals resembling in their organs of support the Serpulæ and Sertulariæ but in their internal organization approaching nearly to the compound Ascidians

POMACEÆ (Lat pomum, *an apple*) That division of the natural order *Rosaceæ* to which the apple pear,

quince, and medlar belong It differs from *Rosaceæ* proper in having a inferior ovary

POMEGRANATE The fruit of the *Punica granatum* The pulp is acid and the rind highly astringent The dried flowers, which are also astringent, were formerly used in medicine, under the name of Balaustine flowers

POMŒ'RIUM (Lat post, *behind*, and murus, *a wall*) In Roman Antiquities, a space of ground, both within and without the walls of a city, kept free from buildings (*Livy*, xiii), and consecrated by a religious ce- [illegible] memoir of D [illegible] Mem de l'Acad [illegible] Whenever it was necessary to extend the limits of any city, a new *pomœrium* was formed, and the former one destroyed

POMONA The Roman goddess of fruit trees Her worship was instituted at Rome when the city was a *flamen pomonalis*, who sacrificed to her every year for the preservation of the fruit The story of Pomona and Vertumnus is well known (See *Ovid Met* 14 623) The name is derived from poma, *fruit*

PO'MPHOLIX (Gr πομφος, *a bubble*) An alchemical term for oxide of zinc

PO'MPHOLIX In Medicine, a vesicular eruption upon the skin

PO'MUM ADA'MI *Adam's apple* The protuberance in front of the neck formed by the thyroid gland It has been fancifully supposed to represent the fatal piece of apple eaten by Adam

POND An artificial excavation in the soil, or a natural hollow dammed up for the purpose of detaining water generally made in fields in order to supply drink to pasturing animals The essential difference between a pond and a lake is that the former is formed by art, the [illegible] ing a stream In Gloucestershire, Kent and other counties where the soil does not abound in springs the formation of ponds in the fields is as essential to the business of farming as the building of farm offices A pond in a garden when of a round form is termed a basin, and when of some length with parallel sides, a canal

PO'NE (Lat) In Law, a writ which lies to remove actions of debt, detinue, writs of [illegible] out of the county or other inferior courts into the Common Pleas and sometimes into the Queen's Bench

PONS VAROLII The bridge of Varolius An arched eminence of the [illegible] two exterior crura of [illegible] and passing over the crura of the cerebrum

PO'NTIL In Glass Manufacture, an iron instrument by which the hot glass is taken out of the glass-pot

PO'NTIA (Gr Ποντια one of the names of the goddess of love) A genus of butterflies of which the common white or cabbage butterfly (*Pontia brassica*) is a well-known native species

PO'NTIFEX (Lat) The highest Roman sacerdotal title Numa instituted four pontifices chosen from the patricians, to which were added, long subsequently, four plebeians Sylla increased their number to fifteen The college was divided into two classes distinguished by the epithets *majores* and *minores*, but it is not certain whether this difference of title marked out the patricians from the plebeians or the more ancient members from the seven added by Sylla The pontifices judged in all causes relating to sacred things, and inspected the conduct of the inferior priests They were a self elected body down to the latter ages of the republic when the power of election was sometimes held by the people It was finally vested in the emperors, who added as many to their numbers as they thought fit The chief of the pontifices was called the *pontifex maximus* and was always created by the people, being generally chosen from those who had borne the first offices in the state His station was one of great [illegible] power as he not only had supreme authority [illegible] matters but in consequence of the close connection between the civil government and religion of Rome, he had also considerable political influence The title of pontifex maximus being for life, Augustus never assumed it till the death of Lepidus, after which it was always held by himself and his successors to the time of Theodosius The insignia consisted of the *toga prætexta*, and a conical woollen cap with a tassel (*galerus*) (See the *Mem de l'Ac des Inscr*, vols xii xv xxiv xxxvii) From this word the well known title of Pontiff in modern Europe is derived "Supreme Pontiff" is a common style of the pope

PONTOON A Military term, denoting a kind of flat-bottomed boat, generally lined within and without with [illegible] about 21 feet long, 5 feet broad, [illegible] are carried along with an army for [illegible] temporary bridge called *pontoon bridges*, by which an army is pursued over rivers

POOP A partial deck extending close aft, above the complete deck of the vessel A sea coming over the stern is said to *poop* the vessel.

POOR, THE. (Lat pauperes) In Political Economy, the term employed to designate those persons, or that portion of the population of any county, who, being destitute of wealth, are, through age, bodily or mental infirmity, want of employment, or other cause, unable [illegible] have to depend for support [illegible]

The first notice of the poor by the legislature of England appears to have occurred in 1376, and there does not seem to be any good grounds for thinking that any portion of the people were known [illegible] that on previously to the 14th cent [illegible] The truth is, however paradoxical soever the statement may at first appear, that the poor, as a class, owe their existence to the abolition of villenage and the progress of civilization Previously to this abolition, the great bulk of the people were in a state of predial slavery or in a condition closely resembling that of the Spartan helots But in such a state of society the class of persons now known as the destitute poor could not exist It is essential to the idea of slavery, whether predial or absolute, that the masters should provide their bondsmen or slaves with at least the necessaries of life, and, in the event of their neglecting to do so, the law, if it interfere, merely directs that they shall fulfil this natural obligation, or that otherwise they shall sell or assign their slaves to those by whom it will be fulfilled But after the establishment of corporate bodies in the towns and cities and the growth of manufactures and commerce had given birth to a class of free labourers, the poor began to make their appearance, and to attract the notice of the legislature Free labourers owe no compulsory service to any one They are their own masters, and may employ themselves in any way not injurious to others they think fit But it is plain that such persons cannot in the event of their becoming infirm or destitute, claim to be supported by any particular individual or class of individuals They are not bound to serve any one when in health, and consequently, no one can be bound to provide for them when in want Under such circumstances, they have nothing to look to but the [illegible] charity of individuals or the public But as the conduct of individuals must, in such matters be left to be determined by their own sense of what is right and proper, we shall now, without alluding farther to them, briefly inquire what, in this respect is the duty of the public, or whether and to what extent it should interfere to relieve the destitute

The poor and destitute may be divided into two great classes the first consisting of maimed and impotent persons or of those whom natural or accidental infirmities disable from working, and the second of those who though able and willing to work, are unable to find employment, or do not receive wages adequate for their support and that of their families There is a very wide difference in the situation of these classes, and the same means of relief that may be advantageously afforded to the one may not, in various respects, be suitable for the other

With respect, however, to the first class, or the impotent poor, there does not seem to be much room for doubt as to the policy as well as humanity, of giving them a legal claim to relief It has sometimes, indeed, been contended, that by affording relief to those who are unable, from age or the gradual decay of their bodily powers, to provide for themselves the motives that induce individuals, while in health to make a provision against future contingencies are weakened, so that, in attempting to protect a few from the effects of their own improvidence, an injury is done to the whole community This statement is probably, true to a certain extent, though it be difficult to imagine that any considerable portion of a moderately intelligent population will ever be tempted to relax in their efforts to save and accumulate when they have the means of doing so, from a knowledge that the workhouse will receive them in old age! But whatever may have been the faults of individuals, it would be abhorrent to all the feelings of humanity to allow them to suffer the extremity of want An individual is unfortunate perhaps or he may not have been as thrifty or as prudent as he ought, but is he, therefore to be allowed to die in the streets? It is proper certainly to do nothing that can really weaken the spirit of industry, but in order to strengthen it, all relief were refused to the maimed and impotent poor, the habits and feelings of the people would be degraded and brutalized by familiarity with the most abject wretchedness, at the same time, that, by driving the victims of poverty to despair, a foundation would be laid for the most dreadful crimes, and such a shock given to the security of property as would very much overbalance whatever additional spur the refusal of support might [illegible] It does, therefore, appear [illegible] class of poor should be supported in one way or other, and that, when the parties are either without relations or friends, or when these do not come voluntarily forward to discharge this indispensable duty, the necessary funds should be provided

by a tax or rate, made equally to affect all classes, for, if they [illegible] be provided for [illegible] em will fall wholly on the benevolent, who should not, in such a case, be called upon to contribute more than their fair share

II The only question then, about which there seems to be any real ground for doubt or difference of opinion is, whether any legal claim for relief should be given to the able-bodied poor, or to those who are able and ready to work, but who cannot find employment or cannot earn wages adequate for their support? Now this, it must be confessed, is rather a difficult question, and one which does not, perhaps, admit of any very satisfactory solution On the whole however it appears for the reasons we shall now shortly state that it should, under certain restrictions, be decided in the affirmative

In the first place it may be observed, that owing to changes of fashion, to the miscalculation of producers and merchants, and to political events, those engaged in manufacturing employments are necessarily exposed to many vicissitudes, and when their number is so very great as in this country it is quite essential that a resource should be provided for their support in periods of adversity In the event of no such provision being made, and of the distress being at the same time extensive and severe, the public tranquillity would most likely be seriously endangered Lord Bacon has observed, that "of all rebellions, those of the belly are the worst" It would be visionary, indeed, to imagine that those who have nothing should quietly submit to suffer the extremity of want without attacking the property of others, and hence, if we would preserve unimpaired the peace, and consequently the prosperity of the country, we must beware of allowing any large portion of the population to fall into a state of destitution But without the establishment of a compulsory provision for the support of the unemployed poor, it is difficult to see how they could avoid occasionally falling into this state Through its instrumentality however they are sustained in periods of adversity without being driven by necessity to commit crimes It must indeed, be admitted that a provision of this sort is very liable to abuse Means have, however been devised for checking this tendency, and whatever imperfections may after all attach to it it has not yet been shown how security and good order could be maintained in periods when either employment or food was deficient, were it abolished

In the second place supposing it were possible to maintain tranquillity without making a legal provision for the support of the unemployed poor the privations to which, under such circumstances, they would be forced to submit, would, in all probability lower their notions as to what was necessary for their comfortable subsistence and exert a most pernicious influence over their conduct and character It is perhaps unnecessary to enter into any statements to show the importance of endeavouring to guard against any such obviously mischievous results But Mr Barton has made some observations on this point which are so striking and conclusive that we cannot forbear laying them before the reader It is to be remembered' says he, that even those who most strongly assert the impolicy and mischievous tendency of our poor laws admit that causes wholly unconnected with these laws do, at times, depress the condition of the labourer Poor families are often thrown into a state of severe necessity by long continued illness or unavoidable misfortunes, from which it would be impossible for them to return to the enjoyment of decent competence if not supported by extraneous means It is well known, too, that a general rise in the price of commodities is seldom immediately followed by a rise in the wages of country labour In the meantime, great suffering must be endured by the whole class of peasantry if no legislative provision existed for their relief, and when such a rise of prices goes on gradually increasing for a series of years as sometimes happens the sufferings resulting from it must be proportionally prolonged The question at issue is simply this, whether that suffering be calculated to cherish habits of sober and self-denying prudence, or to generate a spirit of careless desperation?

"During these periods of extraordinary privation the labourer if not effectually relieved would imperceptibly lose that taste for order, decency, and cleanliness, which had been gradually formed and accumulated, in better times, by the insensible operation of habit and example, and no strength of argument, no force of authority, could again instil into the minds of a new generation growing up under more prosperous circumstances the sentiments and tastes thus blighted and destroyed [illegible] of penury Every return of calamity would, therefore, vitiate the feelings and lower the sensibilities of the labouring classes The little progress of improvement made in [illegible] is lost and forgotten If we ward off [illegible] est blasts of calamity, the sacred flame may be kept alive till the tempest be past, but if once extinguished, how hard is the task of rekindling it in minds long inured to degradation and wretchedness!" (*Inquiry into the Deprecation of Agricultural Labour*, p 32)

In the third place, it will, we suppose, be admitted that when a considerable number of destitute poor persons are thrown out of employment, a provision of some sort or other should be made for their support Suppose now that it is made, not by a compulsory rate, but by the [illegible] rather choose to undergo the greatest privations than submit to solicit a share of this charitable contribution who yet would make no scruple of claiming it had the state given them a legal right to look to it for support But, admitting the truth of this statement, it has been already seen that it is not for the advantage of society that the poor should be forced to submit to such extraordinary privations It is, besides, abundantly certain that many would not be influenced by the motives alluded to, and in the event of the distress being either very severe, or long-continued, even those most disinclined to become a burden on others might be forced to beg a pittance And it is pretty obvious notwithstanding all that has been said to the contrary that the necessary result of such a state of things would be far more prejudicial to the character of the poor — that it would do more to prostrate their pride and independence, and to sink them in their own estimation, than the acceptance of relief from a poor's rate It is idle, indeed, to talk about the independence of a man who is receiving charity, but an individual supported by a poor's rate cannot fairly be regarded in such a point of view He is merely sharing in a public provision made by the state, and as all property has been acquired with the knowledge that it was responsible to this claim on the part of the poor, it cannot justly be considered as entailing any burden on any particular individual It may therefore one should think, be fairly presumed that the pride and independence of the poor will be more likely to be supported under a system of this sort, than if they were obliged to depend in periods of distress on the bounty of others Wherever the poor have not either *de jure* or *de facto* a claim for support [illegible] be allowed to beg [illegible] and disgrace humanity, there is perhaps none more destructive than the prevalence of mendicity A common beggar is the most degraded of beings, and the experience of Ireland down to a very late date as well as of France Italy Spain and in short of every country where there is no established provision for the support of the poor shows that wherever they are compelled to depend on so precarious a resource as charity we look in vain for that manliness and independence of character among the labouring classes which distinguish those of England and find in their stead all those degrading vices which a sense of insecurity and the prevalence of beggary, are sure to produce

The people and legislature of England have acquiesced in the justice and expediency of the principles now laid down A compulsory provision for the support of the poor has in fact existed in England for a lengthened period It grew out of the impotent attempts made in the reigns of Henry VIII Edward VI and the earlier part of that of Elizabeth, to suppress mendicancy and at the same time to provide for the poor by voluntary contributions At length the earlier statutes on the subject were consolidated and the principle of compulsory provision carried to the fullest extent by the famous statute of the 43 Eliz c 2 which enacted that all maimed and impotent persons should be provided for at the expense of their respective parishes and that employment should be found for the unemployed able-bodied poor From this remote period the law of England has regarded every parish in the light of a family, the richer members of which were bound to provide for those who, through inability, misfortune or want of work could not provide for themselves This also is the principle embodied in the law of Scotland with respect to the poor, and provided the means for [illegible] so contrived that indigence and [illegible] without at the same time encouraging indolence and vice the system would seem to be quite unexceptionable Practically however, this has been found to be a problem of exceedingly difficult solution, and this difficulty has made not a few conclude that, however administered, all systematic attempts to relieve the poor are necessarily, in the end, productive of increased want and misery

The poor, no doubt, are naturally anxious that the compulsory provision for [illegible] to the highest limit, and [illegible] only be relieved, but that they should be able, without molestation to eat the bread of idleness But wherever the assessment and administration of the provision for their support is left to the care of those on whom the burden of its payment [illegible] abuse is not long in [illegible] and, while sustaining and beneficial influence of the system alone

remains The complicated code of laws respecting settlements, and the establishment of workhouses, owes its origin to this principle — to the wish of the legislature to relieve the poor, and at the same time, to prevent the abuse of the rates, and there is unquestionable evidence to show, that, from the establishment of the system in 1603 down to about 1780, the devices in question were effectual for their object, and that while poverty was relieved no encouragement was given to sloth, or to early and improvident marriages But soon after this period various alterations were made on the old law, which broke down most of the securities against the abuse of the rates, and, in 1795, the pernicious principle was adopted of mixing together wages and poor rates and of eking out what was supposed to be a deficiency in the former by payments from the latter! In consequence of this subversion of the principle on which the poor rates had been previously administered, they began rapidly to increase, and threatened to swallow up the whole, or, at least a very large part of the surplus produce of the land Various devices were resorted to, in the view of checking the evil, but, unaccountable as it may appear not one of them had for its object to revert to those practices and mode of administering the law which the experience of more than 200 years had shown were fully effectual for the prevention of abuse At length the Poor Law Amendment Act was passed in 1834 which introduced a totally new system for the administration of the poor laws Under this act the country has been divided into unions of more or fewer parishes, according to circumstances, the administration of all matters relating to the poor in these unions being intrusted to a board of guardians elected by the rate payers But these guardians are themselves controlled by and in fact are merely the executive officers of, a central board of three commissioners established in London who have power to issue rules and regulations as to the management of the poor which all guardians and other interior officers are bound to obey The central board is assisted by deputy commissioners who attend at meetings of guardians explain the law, and adjudicate or report upon extraordinary cases and see that the rules laid down by the central board are complied with The whole that can be said in favour of this law is that the poor rates have been materially reduced since its introduction, but we incline to think that the reduction would have been about as great had the system for the regulation of the compulsory provision that prevailed in the reign of George II been revived with a few alterations, while many pernicious consequences inseparable from the existing system would have been avoided (See *Wealth of Nations*, M'Culloch's ed note xxii)

We subjoin a table of the sums expended for the relief and maintenance of the poor of England and Wales at different periods since 1748

Years	Sums expended on Poor	Years	Sums expended on Poor
Average	£		£
1748-50	689,971	1841	4,760,929
1776, 1777	1,270,800	1842	4,911,108
1783-1785	2,004,739	1843	5,208,127
1801	4,077,891	1844	4,970,093
1813	6,656,400	1845	5,298,703
1821	6,959,249	1846	4,954,104
1831	6,798,888	1847	5,298,787
1833	5,946,418	1848	6,180,704
1839	4,406,107	1849	5,702,963
1840	4,576,803		

POPE A title derived from an oriental word signifying father and in earlier times applied indiscriminately to all bishops and in the East even to ministers, but for many centuries the term has been confined to the bishop of Rome, who is also designated by Roman Catholics as the Holy Father *See* PAPACY

POPERY *See* PAPACY

POPLITEAL (Lat poples, *the ham*) Relating to the posterior part of the knee joint or *ham*

POPULATION (Lat populus, *people*) The inhabitants or people of any particular territory or district

POPULATION, LAW OR PRINCIPLE OF in Political Economy means the law according to which the population of any country would increase, independently of immigration or emigration, under any assumed set of circumstances

The law of population, or of the increase of the human species, has not, till a comparatively recent period, attracted that attention to which it is eminently entitled It was formerly taken for granted that every increase of population was an advantage, and it was usual for legislators to encourage early marriages, and to bestow rewards on those who brought [illegible] of children But the researches of Mr Malthus* have shown the mischievous nature of such interferences they have shown that every increase in the numbers of a people, occasioned by artificial expedients, and which is not either accompanied or preceded by a corresponding increase of the means of subsistence, can be productive only of misery or of increased mortality, that the difficulty never is to bring human beings into the world, but to feed and educate them when there, that mankind do everywhere increase their numbers, till their farther multiplication is restrained by the difficulty of providing subsistence, and the poverty of some part of the society, and that, consequently, instead of attempting to strengthen the principle of increase, we should rather endeavour to strengthen the principles by which it is controlled and regulated

In order briefly to show the principle on which the increase of population depends, we may state that the sexual passion or instinct has appeared in all ages and countries so nearly the same, that it may, in the language of geometers, be called a constant quantity Now, it has been shown by the experience of America and of other countries under nearly similar circumstances, or where there has been a nearly equal command over the means of subsistence, that population has gone on, for a lengthened period, doubling in every twenty or five and twenty years But the same principle or instinct that doubles the population of any particular country in this short period is every where in existence, and is every where about equally powerful And, such being the case, it may be asked, Why does not population every where increase with the same rapidity as in Kentucky or Illinois? The reason is that the increase of population must always depend upon and can never for any considerable period exceed the increase of the food and other accommodations required for the subsistence of human beings, and this increase being very different in different countries, the progress of population must vary accordingly In some it may be rapid in others slowly progressive, and in others stationary or even retrograde

It is certain however that the principle of increase in the species is sufficiently powerful to keep the population of the most favoured countries, or of those where wealth is most easily obtained and rapidly increased, quite up to the level of the means of subsistence This is evinced by the poverty of a considerable portion of the people of such countries, by their usually having more claimants for employ than employers or by the demand for labour being rather greater than that for labourers, in short by the constant pressure as it were, of a part of the population against the limits of subsistence But, when such is the case, even in the most favourably situated countries it is quite obvious that if the principle of increase were allowed to exert its full force in countries placed under less favourable circumstances, — if the same habit of early and universal marriage were indulged in the latter as in the former it could not fail to occasion the most deplorable results Man cannot increase beyond the means of subsistence, and where these are either stationary, or but slowly advancing any such development of the principle of increase as is exhibited in countries where these means are increasing most rapidly would be productive only of increased misery and mortality And hence, in the vast majority of cases the principle of increase is restrained and controlled by prudential considerations Man is not like the lower animals actuated only by instinct To occasion marriage, it is not always enough that the parties should be attached to each other The obligation of providing for the children that may be expected to spring from it, is one that cannot fail to awaken the forethought and to influence the conduct of all but the most improvident and thoughtless If the situation of those who might be disposed to enter into a matrimonial alliance be such as to preclude all reasonable expectation of their being able to bring up and educate their children, without exposing themselves to privations or to the risk of being cast down to a lower place in society they may not improbably either relinquish all thoughts of forming a union, or postpone it till a more convenient opportunity No doubt there are very many individuals in all countries who are not affected by such considerations and who, seeing the future through the deceitful medium of their passions are not deterred from gratifying their inclinations by any fear of the consequences But the great majority of every society act on sounder principles They are anxious not to preserve merely, but to improve their condition in society, and cannot bear the idea that their family should be in a worse situation than themselves Hence the reason that in all old settled or densely peopled countries, marriages are deferred to a much later period than in colonies and newly settled countries, where there are comparatively great facilities for gaining a livelihood, and that a much larger proportion of the population find it expedient to pass their lives in celibacy And it is [illegible] that the forethought and [illegible] of the people and their laudable wish to maintain and better their condition, make them control

* Essay on the Principle of Population, *passim* The first edition of this work was published in 1798

the violence of their passions, and disregard the dicta of spurious advisers It is quite obvious that if the capacity of multiplication, or the principle of increase, in densely peopled countries, where there is a comparatively great difficulty in obtaining supplies of food were not checked by the prevalence of moral restraint arising from the consideration of the circumstances under which society is placed [illegible] to the state of misery and famine [illegible] population of every country has the power, supposing food and other necessary accommodations to be adequately supplied, to go on doubling every twenty or five and twenty years, but as the limited extent and limited fertility of the soil render it impossible to go on permanently producing food in this ratio it unavoidably follows that unless the passions be moderated and a proportional diminution be effected in the number of marriages and births, the standard of subsistence will be reduced to the lowest assignable limit, and famine and pestilence will be perpetually at work to relieve the population of wretches born only to be starved

Although, therefore, the principle or instinct which prompts to the increase of the species be alike powerful in the most opposite conditions and states of society, its development depends on a variety of circumstances Generally however there can be no question that it is sufficiently powerful even where the means of subsistence are acquired with the greatest ease, to keep population on a level with these means, and in all but the most favoured situations, it could hardly fail if not controlled by other circumstances, to make the increase of population outrun that of the means of subsistence, and, consequently to occasion an increase of misery and mortality But this tendency is seldom or never allowed to exert its full influence The principle of increase though one of the strongest implanted in our nature is after all, governed less by instinct than by reason At all events, it is invariably found, when we look at nations or great masses of individuals that the period and frequency of marriages and the rate of increase are determined by the state of the population with respect to food, and that the latter is never outrun by the former

The principle of increase is not therefore, the bugbear, the invincible obstacle to all real improvement it has been represented by those who have overlooked the influence of moral causes in modifying and controlling its action That the tendency to increase is not inconsistent with the improvement of society is a fact as to which, indeed, there can be no dispute Without going back to antiquity, let any one compare the state of this or any other European country 500 or 100 years ago with its present state, and he will be satisfied that prodigious advances have been made that the means of subsistence have increased much more rapidly than the population, and that the labouring classes are now generally in the possession of conveniences and luxuries that were formerly not enjoyed even by the richest lords The principle of increase is not, however merely consistent with the continued improvement of the bulk of society—it is in fact the great cause of this improvement, and of the wonderful progress made in the arts Had the principle been less powerful or had it not existed at all every new discovery by diminishing the necessity for others would have occasioned a decline in the spirit of invention, and society would long since have been either in a languishing or a stationary state But the increase of population, though generally subordinate to the increase of food is always sufficiently powerful to keep invention on the stretch All that numerous class who live by their labour, and who are either striving to raise themselves to a higher station, or to maintain their present position, are at this moment impelled by the same powerful motives to invent and contrive new and more powerful methods of production that impelled their ancestors 5,000 years ago, and so it will be in all time to come The *cuncis acuens mortalia corda* will never cease to operate, and will secure the continued advancement of society To suppose, as some have done that the extraordinary progress already made in science and the arts would have been equal or greater had the tendency to increase been less powerful is in truth equivalent to supposing that industry [illegible] by lessening the motives to their exertion and the advantages derivable from them There might, perhaps, have been less squalid poverty among the very dregs of the population had there been no principle of increase, but it is a contradiction to pretend, had such really been the case that the powers and resources of industry would have been so astonishingly developed, that scientific investigations would have been prosecuted with equal perseverance and zeal, that so much wealth would have been accumulated by the upper and middle classes, or that the same circumstances which urged society forward in its infancy would have continued in every subsequent age to preserve their energy unimpaired and it may well be doubted whether an exemption from the evils incident to poverty would not have been dearly purchased, even by the very lowest classes by the sacrifice of the hopes and fears attached to their present condition, and the extraordinary gratification they now reap from successful industry

If these conclusions be well founded, it follows that the schemes proposed for directly repressing population in the ancient and modern world, besides being for the most part atrocious and disgusting, have really been opposed to the ultimate objects their projectors had in view Could the rate of increase be subjected to any [illegible] few comparatively among [illegible] led to burden themselves with the task of providing for a family and the most effective stimulus to exertion being destroyed, society would gradually sink into apathy and languor It is, therefore, to the principle of moral restraint, or to the exercise of the prudential virtues, that we should exclusively trust for the regulation of the increase of population In an instructed society, where there are no institutions favourable to improvidence, this check is sufficiently powerful to confine the progress of population within due limits at the same time that it is not so powerful as to hinder it from operating, in all cases, as the strongest incentive to industry and economy

Mr Malthus's *Essay on Population* made a great sensation at the time when it appeared, and is valuable from its showing conclusively that the principle of increase is strong enough, without any adventitious encouragement to keep population always on a level with the means of subsistence In other respects, however, it is altogether defective Mr Malthus has not shown that the mischievous consequences that might otherwise result from the operation of the principle of increase are sure to be countervailed by the operation of those prudential considerations to which it necessarily gives rise, nor has he shown the important and powerful influence of the principle in securing the continued improvement of society One of the best expositions of the theory of population is that given by Bishop Sumner in his *Records of the Creation* See also the note on Population in M Culloch's edition of the *Wealth of Nations*

PO'PULIN A crystallizable substance separated from the bark of the *Populus tremula*

PORCATE (Lat porca *a ridge*) In Entomology, when a surface has several parallel elevated longitudinal ridges

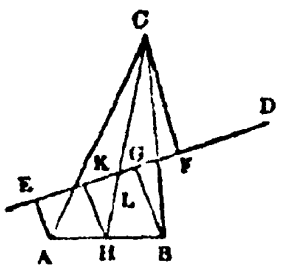
PORCELAIN *See* POTTERY

PORCELLANITE An opake brittle variety of jasper

PORCH (Fr porche) In Architecture an arched or flat or ceiled vestibule at the entrance of a church or other building

POROS In Natural Philosophy the small interstices between the particles or molecules of matter which compose bodies There are many considerations which prove that all bodies even the densest are composed of molecules not in absolute contact but separated from each other by intervals which though so small as to be inappreciable to the senses have nevertheless a magnitude considerable in respect of the molecules themselves The porosity of bodies may be demonstrated in many cases by very simple experiments If a piece of wood or marble, granite or other compact stone be plunged under water and placed under the receiver of an air pump on withdrawing the external pressure the air which had been dispersed through the interior cavities or pores, will issue from every point of their surface and rise in a torrent of bubbles In like manner, mercury is forced through a piece of dry wood or leather, and made to fall in a finely divided shower A body plunged deep under a liquid sustains a pressure in consequence of which it is contracted in all its dimensions, and the liquid penetrates the body without producing any apparent disruption of its parts Iron, by being hammered, is reduced in volume, and the dimensions of all bodies are affected by heat and cold The facility with which translucent substances are penetrated by the rays of light evinces extreme porosity And this penetration is not confined to bodies which are usually termed diaphanous, for gold itself, one of the most opake of the metals, when beaten into extreme thinness, transmits a soft green light All these facts [illegible] has been inferred [illegible] any substance of the specific gravity of water must have many times more pores than solid parts

PORIFERA (Lat porus, *a pore*, and fero, *I carry*) A name invented and applied by Mr Hogg to a group of Polyps including the genera *Cellepora*, *Millepora*, and *Tubipora* [illegible] Dr Grant [illegible] of [illegible] sponges



PO'RISM (Gr πορισμα; from πορίζω, *I investigate*), in Geometry, is defined by professor Playfair to be "a proposition affirming the possibility of finding such conditions as will render a certain problem indeterminate, or capable of innumerable solutions"

According to Pappus, the porisms constituted one of

the eight subjects which formed the ancient geometrical analysis Euclid composed a treatise on porisms in three books, of which no trace now remains except some obscure notices preserved in the mathematical collections of Pappus From the manner in which the porisms are mentioned by Pappus it is evident that the ancients set a high value on this class of propositions; but the description which he has given of them is so vague that geometers were long unable to divine his meaning or to discover the peculiar circumstances in respect of which a porism differs from an ordinary problem The subject, indeed, baffled the ingenuity of the most eminent mathematicians, until it was taken up by Dr Simson, of Glasgow, who at length succeeded in restoring a great number of Euclid's porisms, together with their analysis The [illegible] It still remained however, to inquire into the probable origin of the porisms, or the steps by which the ancient geometers had been led to their discovery, and also to point out the relations in which they stand to other classes of geometrical truths This was accomplished by the late Professor Playfair, in an admirable paper, "On the Origin and Investigation of Porisms," published in vol iii of the *Transactions of the Royal Society of Edinburgh*, and afterwards in the 3d volume of his collected Works, Edin 1822

The nature of a porism, and the manner in which it is derived from an ordinary proposition will be best illustrated by an example The following proposition is one of those selected by Mr Playfair for the purpose —

A triangle A B C being given, and also a point D, to draw through D a straight line D F, such that perpendiculars being drawn to it from the three angles of the triangle, namely, A I, B G, C I, the sum of the two perpendiculars on the same side of D E shall be equal to the remaining perpendicular, or that A I and B G together shall be equal to C I

Suppose it done, bisect A B in H, join C H (intersecting D L in I), and draw H K perpendicular to D I

Because A B is bisected in H the two perpendiculars A F and B G are together double of H K, and as they are equal to C F, by hypothesis C I must also be double of H K, and C L of I H Now C H is given in position and magnitude therefore the point L is given and the point D being also given, the line D I is given in position, which was to be found

The construction is obvious Bisect A B in H, join C H, and take H L equal to one third of C H, the straight line which joins the points D and I is the line required

Now, it is plain that while the triangle A B C remains the same, the point L also remains the same, wherever the point D may be The point D may therefore coincide with L, and, when this happens the position of the line to be drawn remains undetermined, that is to say, any line whatever drawn through L will satisfy the conditions of the problem Here then we have an indeterminate case of a problem, and of consequence, a porism which may be thus enunciated —

A triangle being given in position, a point in it may be found such that any straight line whatever being drawn through that point, the perpendiculars drawn to this straight line from the two angles of the triangle which are on one side of it will be together equal to the perpendicular that is drawn to the same line from the angle on the other side of it

For examples of porisms see *Simson's Opera Reliqua*, Playfair's paper above mentioned a paper by Prof Wallace, entitled "Some Geometrical Porisms &c" in the *Edinburgh Transactions* vol iv, *Stewart's General Theorems*, 1746, *Leslie's Geometrical Analysis*, and *Leybourn's Mathematical Repository* See also *Traill's Account of the Life and Writings of Robert Simson M D*; and Chasles, *Aperçu Historique sur l'Origine et le Développement des Methodes en Geometrie*, Brux 1837

The term porism is also used by the Greek geometricians to signify merely the [illegible] to a proposition

POROSITY A property of matter, in consequence of which its molecules are not in absolute contact but separated by intervals or *pores* The quantity of matter in a body is inversely as its porosity, whence the ratio of the porosity of one body to another may be determined from their weight See Pores

PO'RPHYRY (Gr πορφυρα, *purple*) In Statuary, an [illegible] stone of a red, or rather purple and [illegible] more or less variegated, its purple being of all gradations, from violet to a claret colour It is susceptible of a very high polish Egypt and the East furnish very plentiful strata of this material It is also found in Minorca The extreme ease with which the ancients seem to have cut this substance and worked it in sculptural subjects has been a matter of much discussion among the moderns Dr Lister, in a paper of the *Philosophical Transactions*, seems to think that the ancients possessed the secret of tempering steel better than the moderns The French cut it with an iron saw without teeth, using the [illegible] pulverized and mixed with water [illegible] said to have distilled water by the help whereof Francesco Caldi his sculptor gave his tools a hardness and temper capable of working the hardest and most compact substances

PORPHYRY In Geology an unstratified or igneous [illegible] of the [illegible] The term [illegible] found in the preceding article *See* GEOLOGY [illegible] *Annulus clypei*) The name of a genus of sea-nettles (*Acalephæ*), characterized by an internal circular flattened disk of a calcareous and horny texture

PORRECT (Lat porrigo, *I extend*) In Zoology, when a part extends forth horizontally, as if to meet [illegible]

(Lat porrigo) The ringworm, or scald-head

PORT *See* HARBOUR

PORT is, usually, the adverb of larboard, as, the ship heels *to port*, for to the larboard side Put the helm *a-port*, &c

PORT The opening or embrasure in the ship's side for a gun The ports of the lower deck are defended, when at sea, by strong covers hanging from hinges, the ropes by which these are held up or open are called *port lanyards*, and consist of a pendant passing through a leaded hole in the side with a tackle

PORTAL (Fr portail) In Architecture the lesser of two gates, when they are of two dimensions, at the entrance of a building

PORTCULLIS (Fr portecoulisse) In Fortification a sort of machine composed of several large pieces of wood laid across one another, like a harrow, and pointed with iron, used formerly to be hung over gateways of fortified places, to be let down in case of a surprise and when there was not [illegible] the gate

PORTE, THE SUBLIME The official title of the government of the Ottoman Empire said to be derived from a gate of the palace at Brousa the original metropolis of that empire called Bab Humayoon, the sublime gate

PO'RTER A liquor brewed from malt, part of which has been more highly dried than that used for ale It is hopped in the same way as ale, and its deep colour is finally given to it either by burned sugar, which usually goes under the name of *colouring*, or more legitimately by roasted or parched malt Porter was first brewed in 1722 The malt liquor previously drunk consisted of three kinds — ale beer, and "twopenny," and a mixture of either of these kinds was a favourite beverage under the name of half-and-half," or a mixture was drunk called three threads' consisting of equal portions of each of the above kinds of liquor, for a draught of which the publican had to go to three different casks About 1722, Harwood, a London brewer, commenced brewing a malt liquor, which was intended to unite the flavours of ale and beer, or ale, beer, and "twopenny," and having succeeded, he called his liquor "entire," or entire butt," a name intended to intimate that it was drawn from one cask or butt only A mixture of ale or porter, drawn from different casks, is very commonly drunk in London at the present time Harwood's liquor obtained the name of porter from its consumption by porters and labourers From 1722 to 1761, the retail price of porter was 3*d* per pot when it was raised to 3½*d*, at which it continued till 1799, it has never been higher than 6*d* nor during the present century lower than at the present time November 1819 when the price is 4*d* The following account of the fluctuations of the price per barrel since 1816 is from a private source — In July, 1816, the price was reduced from 45*s* to 40*s*, but in October was again advanced to 45*s*, in January, 1817, a further advance was made to 50*s*, and in December of the same year it reached 55*s* In 1819 1820, and 1822, the price was successively reduced from 55*s* to 50*s*, 45*s*, and 40*s* In January, 1824, it was advanced to 45*s*, in November, 1825, to 50*s* but a few months afterwards it again fell to 45*s* Since the abolition of the beer duties in 1830, the price has been 33*s* per barrel

PORT-FIRE In Gunnery a paper tube about 10 inches long, filled with a composition of meal-powder, sulphur, and nitre, rammed moderately hard, used to fire guns and mortars instead of a match (*Hutton's Dict*)

PO'RTICO (Ital, from porticus, Lat) In Architecture, a place for walking [illegible] sheltered occasionally raised after the manner [illegible] with arches Sometimes the portico is vaulted, and sometimes it is with a flat ceiling The most usual application of the word is to the projection supported by columns placed before a building

PO'RTIO, or PORTION is a term anatomically ap-

plied to two branches of the seventh pair of nerves; the *portio dura*, or hard portion, and the *portio mollis*, or soft portion the former is the facial nerve, the latter the auditory or co st c nerve

PO'RTLAND POWDER A mixture of several indigenous bitter herbs which was once a celebrated remedy in the gout

PO'RTLAND STONE A granular limestone belonging to the upper part of the oolite formation, and abounding in the island of Portland, upon the coast of Dorsetshire *See* GEOLOGY

PORTLAND VASE A celebrated cinerary urn or vase, long in possession of B berini at Rome (whence it wa from whom it came into the possession of the Portland family, who deposited it in 1810 in the British Museum of which it is one of the most valuable reliques This beautiful specimen of ancient art was found in the tomb of the Emperor mmæa It is describ tom v) who was evidently mistaken in representing it as formed of a precious stone The substance is said to be of glass, or composition, it is of a deep blue or violet colour and the figures in the scene depicted on it are white The subjects are explained fi k W Marsh, in the 8th volume of the *Archæologia*, and one by Dr Darwin in the Notes to his *Botanic Garden*) The late Mr Wedgwood made a mould of this vase and took from it a number of casts made with the greatest skil and original

PO RTRAI) In Painting, the representation of an individual, or, more strictly speaking, of a face, painted from real life Portraits are of full length, half length, &c , and are executed in oil or water colours crayons &c

PORTREEVE, or PORT GREVE (Ang Sax *gerefa*) Anciently the principal magistrate in ports and maritime towns According to Camden this was the ancient title of the officer who was afterwards called mayor in London

PORT ROYALISTS The name, the members of the celebrated convent l des Champs It was founded about 1204 by Matthieu de Marli, on the eve of his departure for the Holy Land, and though originally limited in its means and objects it gradually acquired such importance as to have secured for it a prominent place in the history of Europe It would be out of place here to give any details of its varied fortunes and the religious controversies which it carried on in the 17th century — the period of its greatest importance, and we refer the reader to the learned work of Reuchlin (*Geschichte von Port Royal*) for full information (See also the eloquent article in vol lxxiv of the *Edin Review*) It was abolished by Louis XIV as a nest of Jansenists and heretics Among the distinguished names connected with the Port Royal are those of Lancelot, Pascal, Arnauld, Nicole de Sacy, and Tillemont The school books which were published for the use of that institution were translated into all the languages of Europe, and maintained their reputation lo g fo nd though they are now fallen in deserve especial mention — 1 *Nouvelle Méthode, pour apprendre la Langue Latine*, 2 *Nouvelle Méthode pour apprendre la Langue Grecque*, 3 *Grammaire Générale*

POSITION (La positio *Iplace*) A rule in Arithmetic called also the rule of supposition, or *rule of false* It consists in assuming a number, and performing upon it the operations directed in the question and then comparing the result with that given in the question, in order to discover the error of the assumption Writers on arithmetic divide the rule into two parts, *single position* and *double position*, the former comprehending those questions in which the results are proportional to the suppositions and where, consequently, only one assumption is required, the latter those in which the results are not proportional to the suppositions, and where two suppositions are necessary in order to deduce the true answer To simple position belong such questions as the following — What number is that from which, if a a third and a fourth of itself be subtracted, the remainder is 60? Double position comprehends questions of this sort — What number is that which, being multiplied by 6, the product increased by 18, and the sum divided by 9, the quotient shall be 20? It will be observed that both these questions are immediately solved by a simple algebraic equation and, in fact, the same process is performed in the arithmetical operation in the assumed number, which, in the algebraic is performed on the unknown quantity The rules given for the solution of questions in double position are founded on certain principles of algebra, which may be applied with much greater facility to the immediate solution of the questions themselves Such questions therefore, cannot be considered as properly belonging to arithmetic, but to what may be denominated numerical analysis Position is also called the *rule of trial and error*, and is sometimes employed with good effect numerical equations the model in the manner best calculated for the end in view by the artist Such positions as are most natural and easy, and which exhibit the peculiar habit of the individual, in portrait painting are to be taken

POSITIVE ELECTRICITY *See* ELECTRICITY

POSITIVE QUANTITY In Algebra, denotes an affirmative or additive quantity; which character is indicated by the sign +, called, in consequence, the *positive sign* The term is used in contradistinction to *negative*, negative quantities being such as are subtractive, and marked by the sign —, which is called the *negative sign*. *See* SIGN

POSSE COMITA'TUS (Lat) In Law, the power of the county which the sheriff is empowered to raise in case of riot possession kept on forcible entry, rescue, or other force made in opposition to the king's writ or execution of justice It is said to include all knights and other men above the age of fifteen, able to travel within the county Justices of the peace may also raise the posse in order to remove a force in making entry into or detaining lands

POST (Fr poste) In Architecture, any vertical piece of timber, as a truss post, door post, a quarter in a partition

POST In Public Economy a messenger, courier, or conveyance that travels at stated periods, and generally with more than ordinary speed, employed to convey letters or other despatches, whether of government or individuals

POST-ABDOMEN (Lat) The name applied by Latreille to the five posterior segments of the abdomen of Hexapod insects, and to the caudal crustacea which consists of analogous but more numerous segments

POSTAGE The duty or rate of charge levied on letters or other articles conveyed by post

POSTEA (Lat) In Law the return of the judge before whom a cause is tried after verdict, of what was done in the cause, which is endorsed on the back of the nisi prius record

POSTERN (Fr posterne) In Architecture a small gate or door at the back of a building

POSTERNS In Fortification, a small gate usually made in the angle of the flank of a bastion, or in that of the curtain

POSTICUM (Lat) In Architecture, the portico at the back of a temple *See* NAOS

POSTLIMINIUM or JUS POSTLIMINII (Lat limen *a threshold*) In National and Civil Law the right by virtue of which persons taken by an enemy return to their former state of freedom with their former rights and property on its termination, and property so taken reverts to its former owners

POST OBIT (Lat post obitum, *after death*) A bond given for the purpose of securing a sum of money on the death of some specified individual

POST OFFICE A place for the reception and distribution of the letters and despatches that are to be or that have been carried by the post, where the duties on them are paid and where the various departments connected with the business of the post are conducted, or superintended

The conveyance of letters by post is one of the few industrious undertakings which are certainly better managed by government than they could be by individuals It is indispensable to the satisfactory working of the post office that it should be conducted with the greatest regularity and precision and that all the departments should be made subservient to each other, and conducted on the same plan It is plain that such results could not be obtained in any extensive country otherwise than by the agency of government, and the interference of the latter is also required to make arrangements for the safe and speedy conveyance of letters to, from and through foreign countries

The organization of the post office supplies one of the most striking examples of the advantages resulting from the division and combination of employments "Nearly the same exertions that are letter from Falmouth to New 0,000 If every man were to his own correspondence, the whole life of an eminent merchant might be passed in travelling, without being able to forward all the letters which the post office forwards for him in a single evening The labour of a few individuals, devoted exclusively to the forwarding of letters, produces results which all the exertions of all the inhabitants of Europe could not effect, each person acting independently" (*Senior on Political Economy*)

Posts appear to have been established for the first time in modern Europe in 1479, by Louis XI of France They were originally intended to serve merely for the conveyance of despatches, and of persons travelling by government Subsequently, however, private individuals were allowed to avail themselves of

this institution for forwarding letters and despatches, and governments, by imposing higher duties or rates of postage on the letters and parcels conveyed by post than are sufficient to defray the expense of the establishment have rendered it productive of a considerable revenue Nor, while the rates of postage are confined within reasonable limits and do not materially affect the facility of correspondence, is there, perhaps, a less objectionable tax

The post office was not established in England till the 17th century Post-masters, indeed, existed in more ancient times, but their business was confined to the furnishing of post horses to persons who were desirous of travelling expeditiously, and to the despatching of extraordinary packets upon special occasions In 1635, Charles I erected a letter office for England and Scotland, but this extended only to a few of the principal roads, the times of carriage were uncertain, and the post-masters on each road were required to furnish horses for the conveyance of the letters at the rate of 2½*d* a mile This establishment did not succeed, and, at the breaking out of the civil war great difficulty was experienced in the forwarding of letters At length a post office, or establishment for the weekly conveyance of letters to all parts of the kingdom, was instituted in 1649, by Mr Edward Prideaux attorney-general for the Commonwealth, the immediate consequence of which was a saving to the public of 7 000*l* a year on account of post masters In 1657, the post office was established nearly on its present footing and the rates of postage that were then fixed were continued till the reign of Queen Anne (*Black Com*, book i c 8)

From the establishment of the post office by Cromwell, down to 1784 mails were conveyed either on horseback or in carts made for the purpose, and instead of being the most expeditious and safest conveyance the post had become, at the latter period, one of the slowest and most easily robbed of any in the country In 1784 it was usual for the diligences between London and Bath to accomplish the journey in *seventeen* hours while the post took *forty* hours, and on other roads the comparative rate of travelling of the post and stage coaches was in about the same proportion The natural consequence of such a difference in point of despatch was that a very great number of letters were sent by other conveyances than the mail the law to the contrary being easily defeated, by giving them the form of small parcels

Under these circumstances it occurred to Mr John Palmer of Bath, comptroller-general of the post office, that a very great improvement might be made in the conveyance of letters, in respect of economy, as well as of speed and safety, by contracting with the proprietors of stage coaches for the carriage of the mail, the latter being bound to perform the journey in a specified time, and to take a guard with the mail for its protection Mr Palmer's plan encountered much opposition but was at length carried into effect with the most advantageous results The use of mail coaches speedily extended to most parts of the empire, and, while letters and parcels were conveyed in less than half the time that had been required under the old system, the coaches by which they were conveyed afforded by their regularity and speed, a most desirable mode of conveyance for travellers Mr Palmer was the author of several other improvements in the economy of the post office, nor is there any individual to whom the department owes more (*Macpherson's Annals of Com* anno 1784)

Within the last few years, however the construction of railways between most of the great towns of the empire has gone far to supersede the use of mail coaches on the principal lines of road and has added prodigiously to the facilities of correspondence and travelling The journey from London to Liverpool, which had been accomplished by the mail in about twenty or twenty two hours, is now accomplished by railway in nine or ten hours! and on other roads in the same proportion The great expense of the post office consists in fact, not so much in the conveyance of letters from place to place as in their previous collection and their distribution after they have been conveyed to their destination This necessitates the establishment of a vast number of subordinate offices in the remoter parts of the kingdom, many of which do not defray their expenses This is particularly the case in Ireland, where, in 1838 the expense of collecting the gross post office revenue amounted to 39*l* 16*s* 4¼*d* per cent

Revenue and Rates of Postage — During 1838 the post office of the United Kingdom produced a gross revenue of 2,346 278*l*, and a nett revenue, after deducting the expense of collection, of 1,676,522*l* This large revenue was derived from rates of postage, varying with the distance according to which letters were conveyed, but so that at an average they amounted to about 7*d* or 7½*d* for a single letter But the fact that the post office revenue had continued nearly stationary during the twenty years ending with 1838, notwithstanding the vast increase in that period of population and of the intercourse between the different parts of the empire, was a conclusive proof that the rates of postage had been carried to a [illegible] arithmetic of the post off [illegible] two and two, instead of always making four, sometimes make only one The effectual reduction of these rates was therefore urgently required, not only because of the importance to a commercial and manufacturing community of having the charge for the conveyance of correspondence fixed at a moderate amount, but because it was all but certain that moderate rates of postage would be more productive of revenue It did not, however, follow, that because an average charge of 7*d* or 7½*d* each on all letters conveyed by post was very decidedly too much, that the plan for making an invariable charge of 1*d* whether the letter were conveyed one mile or 1000 miles, should have been adopted This was to rush from one extreme to another and to endanger a considerable amount of revenue without any equivalent advantage It must, no doubt, be admitted that the proposal for a uniform penny rate of postage, had many recommendations in its favour Being calculated at once to obviate trouble and save expense, it could not fail to be acceptable (what reduction of taxation is not?) to a large portion of the public particularly to persons engaged in business We believe, however, that the scheme was more indebted for its popularity to the oppressiveness of the old rates of postage than to any intrinsic merits of its own Had these been reduced four or five years previously to a reasonable amount, that is, had letters of 1 oz weight coming from Scotland or Ireland to London been reduced to 6*d*, and other letters in proportion, and mercantile circulars been allowed to pass under covers open at the ends at 1*d* or 2*d* each, we venture to say that the clamour for a uniform rate of penny postage would not have made any way But in this, as usually happens on similar occasions, those who delay to make reasonable and necessary concessions at the outset, are in the end compelled to concede a great deal more than would at first have been satisfactory This at all events, has been eminently true in the present instance The clamour for a uniform penny rate became too powerful to be resisted, and parliament whether it were so inclined or not, was obliged to lend its sanction to the measure And under the provision of the act 2 & 3 Vict cap 52, it has been enacted that all inland letters, without regard to the number of enclosures, or the distance conveyed, provided they be paid when posted or despatched, shall, if not exceeding ½ oz weight, be charged 1*d*, 1 oz 2*d*, 2 oz 4*d*, 3 oz 6*d*, and so on, 2*d* being added for every additional ounce up to 16 oz, beyond which, with the following exceptions no packet, whether subject to postage or not is received —

1 Parliamentary petitions and addresses to her Majesty

2 [illegible]

3 [illegible] addressed to or received from places beyond sea

4 Letters and packets to and from public departments, and to and from public officers that formerly franked by virtue of their offices

5 Deeds if sent open, or in covers open at the sides They may be tied with string and sealed, in order to prevent inspection of the contents, but they must be open at the sides that it may be seen that they are entitled to the privilege

With these exceptions, all packets above the weight of 16 oz are forwarded to the Dead Letter Office

But all letters not paid when they are posted or despatched are charged *double the above rates*

All parliamentary and official franking has been put an end to, but members of either house of parliament are entitled to receive petitions to parliament free of charge provided such petitions be sent in covers open at the ends and do not exceed 6 oz weight

To facilitate the working of the plan, envelopes and stamps for single, double, &c letters, are furnished by the post office, and inland letters not provided with such stamps or envelopes must be forwarded *unpaid*

Such are the more prominent features of the new system, and none can deny that it has the recommendations of simplicity and cheapness in its favour, and that it has greatly facilitated correspondence But it may nevertheless be doubted whether its adoption was expedient It is certainly very convenient for merchants, bankers, middlemen, and retail dealers, to get letters for 1*d*, that previously cost them 7*d* or 7*d*½, but their satisfaction is not the only thing to be attended to in forming a fair estimate of the measure The public exigencies require that a sum of above fifty millions a year should be raised, one way or other, and so long as we are pressed by an unreasoning necessity of this sort, it is not much to say in favour of the repeal or diminution of any tax, that those on whom it fell with [illegible] are delighted with the reduction [illegible] England become a necessary of life and its consumption to say the least of it, is quite as indispensable to the bulk of the people, and especially to the labouring classes, as the

writing of letters But would it, therefore, be a wise [illegible] it to Is. [illegible] on the [illegible] ble, and should therefore be repealed, independently altogether of financial considerations But it is easier to make an allegation of this sort than to prove it All taxes, however imposed, if they be carried beyond their proper limits, are objectionable, but provided these be not exceeded, we have yet to learn why a tax on a letter should be more objectionable than a tax on the paper on which it is written or the food of the writer, or on his other things

During the first year (1840) of the new system, the nett revenue of the Post Office fell off about 1,200,000*l* ! But the revenue has continued gradually to increase with the increasing population and wealth of the country, and to such an extent is this the case, that the gross revenue of the Post Office for the year ending January 5, 1851, amounted to 2,264,684*l*, being only 100,000*l* less than the gross revenue of the year ending January 5, 1840—the last year of the old system

POST POSITION In Music, retardations of the harmony, effected by placing discords upon the accented parts of a bar not prepared and resolved according to [illegible]

POSTSCENIUM (Lat post, *behind*, and scena, *a scene*) In Architecture, the back part of the theatre behind the scenes, furnished with conveniences for robing the actors and [illegible] the machinery

POSTULATE (Lat postulare, *to demand*) In Geometry, something to be assumed or taken for granted [illegible] post ates — [illegible] any one point to any other point 2 That a terminated straight line may be produced to any length in a straight line 3 That [illegible] any centre at any distance [illegible] *Euclid*)

POSTULATE In Logic and Philosophy, a proposition of which the truth is *demanded* or assumed for the purpose of future reasoning

POTA'SH [illegible] the ashes of wood When purified by calcination it is termed *pearlash*, and is in that state an impure *carbonate of potassa* The production of potash is carried on upon a large scale in Russia and America, it can only be thus obtained in countries where there are vast natural forests and where the value of timber is little more than that of the labour [illegible] it *See* POTASSIUM

POTASSA *See* POTASSIUM

POTASSIUM This extraordinary metal was discovered by Davy in the year 1807, and was one of the first fruits of his masterly researches into the chemical powers of electricity Its properties are so remarkable, that it was for a time doubted whether it could with propriety be placed among the metals, but the progress of discovery has removed all difficulty upon that point by making us acquainted with other metallic substances the properties of which are, as it were, intermediate between those of potassium on the one hand and the common metals on the other One of the striking peculiarities of potassium is mechanical rather than chemical namely, its low specific gravity it being the lightest known solid, another is its [illegible] affinity for oxygen and its consequent energetic action when placed upon water where it immediately takes fire The specific gravity of potassium is 865 at the temperature of 60°, it is solid at the ordinary temperature of the atmosphere at 80° it becomes soft, and at 150° is perfectly liquid, at 32° it is brittle, and has a crystalline texture In colour and lustre it resembles mercury Its attraction for oxygen is such that it immediately loses its brilliancy on exposure to air, and becomes converted into potassa, heated in the air it burns with a purple flame The equivalent of potassium is 40, and that of *potassa* or *protoxide of potassium* is 48 When potassium is heated in oxygen [illegible] larger quantity of that element and becomes [illegible] which, however, is immediately converted into protoxide by the action of water Protoxide of potassium exists in the state of *hydrate* in what is called *caustic potash*, which is a compound of 48 potassa + 9 water This substance fuses at a dull red heat it is very soluble and deliquescent, and powerfully corrodes almost all animal textures It is the *lapis causticus* of old pharmacy Dissolved in water it forms [illegible] *potassæ* of the Pharmacopœia It [illegible] by pouring water upon a mixture of equal parts of quicklime and carbonate of potassa, the lime abstracts carbonic acid from the carbonate, and becomes converted into an insoluble carbonate of lime, whilst the evolved potassa is taken up by the water The solution thus obtained is powerfully alkaline and caustic, and, as it soon absorbs carbonic acid [illegible] be carefully preserved in well [illegible] Potassa is easily detected and recognized, when in solution, by its alkaline reaction upon proper vegetable colours, rendering for instance, the yellow of turmeric brown, and the blue of violet green when excess of tartaric acid is added to it, it yields a white granular precipitate of bitartrate of potassa and an alcoholic solution of carbazotic acid yields with it yellow and difficultly soluble crystals of carbazotate of potassa When potassa is recommended as for use in pharmacy it has usually been prepared from wood ashes they are best detected by a small portion of chloride of platinum which causes a yellow precipitate of the peculiar chloride of platinum

When potassium and sulphur are heated together they combine and form a sulphuret of potassium With the acids, potassa forms a variety of useful salts, such as nitre, or nitrate of potassa, with nitric acid, sulphate of [illegible] potassa, [illegible] of potassa, [illegible] important salt it forms great part of the residuum or ash of burnt wood from which the [illegible] is obtained Much of the carbonate of potassa imported into this country from Russia is [illegible] of *pearlash* and *potash* It consists of 48 potassa + 22 carbonic acid, [illegible] crystallization and has an alkaline reaction When carbonic acid is passed through a solution of this salt, it becomes converted into bicarbonate of potassa, composed of 48 potassa + 44 carbonic acid Potassium burns with great splendour in chlorine, and forms chloride of potassium, it also combines with iodine, bromine, and fluorine

POTATOES The common name for the roots of the *Solanum tuberosum* which see

POTENTIAL MOOD (Lat possum, *I am able*) In Grammar that mood of the verb which expresses an action conceived as *possible*, denoted in English by the the auxiliary [illegible]

POTENTIAL [illegible] In Scholastic Philosophy, such as are supposed to exist in a body *in potentia* only In Grammar, a mood of the verb, also called the optative by some considered as the same with the subjunctive

POTITII The Roman priests of Hercules who were said to have been instituted by Evander Of an inferior grade to them but in the service of the same god were the Pinarii, but these became extinct through the means of Appius Claudius

POTSTONE A tough variety of steatite, sometimes manufactured into culinary vessels It is the *lapis ollaris* of Pliny

POTTERY AND PORCELAIN The better kind of pottery called in this country *Staffordshire ware*, is made of an artificial mixture of alumina and silica, the former obtained in the form of a fine clay, from Devonshire chiefly, and the latter consisting of chert or flint, which is heated red hot quenched in water, and then reduced to powder Each material, carefully powdered and sifted, is diffused through water mixed by measure, and brought to a due consistency by evaporation it is then highly plastic, and formed upon the potter's wheel and lathe into various circular vessels or moulded into other forms which after having been dried in a warm room, are enclosed in baked clay cases resembling bandboxes, and called *seggars*, these are ranged in the kiln so as nearly to fill it leaving only space enough for the fuel, here the ware is kept red hot for [illegible] and thus brought to the state of *biscuit* [illegible] is afterwards glazed, which is done by dipping the biscuit ware into a tub containing a mixture of about 60 parts of litharge, 10 of clay and 20 of ground flint diffused in water to a creamy consistence, and when taken out enough adheres to the piece to give an uniform glazing when again heated The pieces are then again packed up in the seggars, with small bits of pottery interposed between each, and fired in a kiln as before The glazing mixture fuses at a very moderate heat and gives an uniform glossy coating, which finishes the process when it is intended for common white ware

The patterns upon ordinary porcelain, which are chiefly in blue, in consequence of the facility of applying cobalt are generally first printed off upon paper, which is attached to the plate or other article while in the state of biscuit, the colour adheres permanently to the surface when heat is properly applied other mineral colours, such as the oxides of chrome and manganese, are also occasionally employed in the same way

The manufacture of PORCELAIN is a more refined branch of art, the materials are selected with the greatest caution, it being necessary that the compound should remain perfectly white after exposure to heat it is also required that it should endure a very high temperature without fusing, and at the same time acquire a semivitreous texture, and a peculiar degree of translucency and toughness These qualities are united in some of the oriental porcelain, or *China*, and in some of the old Dresden, but they are rarely found coexistent in that of modern European manufacture Some of the French and English porcelain, especially that made at Sèvres and Worcester, is extremely white, and duly translucent; but it is more apt to crack by sudden [illegible] of temperature, more brittle, and consequently requires to be formed into thicker and heavier vessels, and more fusible than the finest porcelains of Japan and China

The colours employed in painting porcelain are the same metallic oxides used for colouring glass and in all the more delicate patterns they are laid on with a camel-hair pencil and generally previously mixed with a little oil of turpentine Where several colours are used they often require various temperatures for their perfection, in which case those that bear the highest heat are first [illegible] hose which are brought out at [illegible] art of painting on porcelain, or *in enamel*, is of the most delicate description much experience and skill are required in it, and with every care there are frequent failures Besides it is attended with considerable expense The gilding of porcelain is generally performed by applying finely divided gold mixed with gum-water and borax, upon the application of heat the gum burns off, and the borax vitrifying upon the surface causes the gold firmly to adhere it is afterwards burnished.

In the manufacture of various kinds of pottery em- [illegible] in regard [illegible] requisites are necessary which cannot be united in the same vessel To the late Mr Wedgwood we are indebted for vast improvements in this as well as in other branches of the art Crucibles composed of one part of pure clay mixed with about three parts of coarse and pure sand slowly dried and annealed resist a very high temperature without fusion, and generally retain metallic substances but where the metals are suffered to oxidize there are few which do not act upon any earthen vessel and some cause its rapid fusion, as the oxides of lead, bismuth &c Where saline fluxes are used, the best crucibles will always suffer, but platinum may often be employed in these cases and the chemist is thus enabled to combat many difficulties which were nearly insurmountable before this metal was thus applied Whenever silica and alumina are blended, as in the mixture of clay and sand the compound softens and the vessel loses its shape when exposed to a long continued white heat, and this is the case with the *Hessian* crucibles consequently the most refractory of all vessels are those made entirely of clay coarsely powd [illegible] for the sand [illegible] fluxes longer than any other, and is therefore used for the pots in glass furnaces A Hessian crucible lined with purer clay is rendered much more retentive and a thin china cup or other dense porcelain resists the action of saline matters in fusion for a considerable time Plumbago is a very good material for crucibles and applicable to many purposes when mixed with clay it forms a very difficultly fusible compound and is protected from the action of the air at high temperatures it is well calculated for small table furnaces

POULP The English generic name of the eight-footed Dibranchiate Cephalopods (*Octopi*) which have a double alternate row of suckers on each foot

POULTRY Different kinds of birds reared for the production of eggs feathers and for the use of their bodies as animal food The domestic poultry in common use in Britain are the common domestic fowls, or cock and hen, the turkey, the duck and the goose to which may be added as occasionally reared the guinea fowl and the peacock The most generally useful kind of poultry is the common domestic fowl which though a native of India accompanies man through all climates, but which is only productive of abundance of eggs when well fed and warmly lodged Hence all poultry houses when not built adjoining an apartment in which fire is kept, or over a stable or cowhouse where they might benefit by the heat generated by the larger animals ought to be furnished with flues or some other means of generating heat artificially during winter and spring Without some mode of effecting this poultry will seldom produce abundance of eggs in cold weather particularly in the colder parts of Britain Hence in Scotland the common hen roosts in the same room that the cottager lives in, and the poultry house of the small farmer is a loft either over his kitchen or over his cowhouse In the management of poultry it is not sufficient to supply abundance of food and warmth but it is equally necessary that they have ample space for exercise This space should always contain living plants of various kinds, and some gravelly or sandy soil because worms snails, and insects, as well as occasionally grass and herbage, form a part of the food of poultry, and sand or gravel is swallowed by them for the purpose of promoting digestion Hence, no healthy poultry can ever be reared in towns however much the natural food may be imitated by the supply of animal matters, herbage and sand the want of exercise in poultry so circumstanced will soon become evident from the appearance of the fowls, and from the soft shell of their eggs, in consequence of the animal func [illegible]

POULTRY HOUSES [illegible] in which poultry are kept in the night time, the principal features of which ought to be, that each kind of bird shall be separately lodged, and that all shall have access to an ample field, containing a pond and a heap of gravel. *See* POULTRY

POUNCE A powder to prevent ink from spreading upon paper after erasures it is either sandarach (resin of the juniper) in powder, or the powdered bone of the cuttle-fish The term pounce is also applied to coloured powders used by pattern drawers for sprinkling over pricked papers

POUND (Lat pondus, *weight*) A measure of weight In England two different pounds are used the *pound avoirdupois*, and the *pound troy* The pound avoirdupois weighs 7000 grains troy and the pound troy 5760 grains The former is divided into 16 ounces, and the latter into 12 (*See* WEIGHT) Pound is also a denomination of money, [illegible] to 20 shillings, or [illegible] equivalent to a pound of silver, hence the origin of the term

POUPART'S LIGAMENT The tendinous attachment of the external oblique muscle of the abdomen to the superior and anterior spinous process of the os ileum and os pubis

POURPRESTURE, or [illegible] is said to be when any man takes unto himself or appropriates any thing that he ought not, whether it be in any jurisdiction, land or franchise, and generally when any thing is done to the nuisance of the king's tenants, by way of nuisance or hurt to the king's highways or demesnes, by inclosing, &c Pourpresture may also be by tenant against lord of the fee, or by one neighbour against another

POURSUIVANT *See* PURSUIVANT

POWER in Algebra and Arithmetic, denotes the product arising from the continued multiplication of a quantity or number into itself The successive powers of a number are formed and indicated as follows —Thus, taking the number 3,

$3^1 = 3$ the 1st power of 3,
3×3 or $3^2 = 9$ the 2d power, or square of 3,
$3^2 \times 3$ or $3^3 = 27$, the 3d power, or cube of 3,
$3^3 \times 3$ or $3^4 = 81$, the 4th power of 3, &c

In like manner the successive powers of the quantity a are a^1 a^2 a^3 a^4 &c The numbers indicating the powers are called the *exponents*, and it is obvious from their formation that powers of the same quantity are multiplied by adding their exponents, and divided by subtracting their exponents Powers are considered as negative or fractional which have negative or fractional exponents

POWER, in Mechanics denotes a force which being applied to a machine tends to produce motion A *mechanical power* denotes one of the six simple machines, viz the *lever* the *inclined plane* the *screw*, the *wheel and axle*, the *wedge* and the *pulley*

POWER In Law, a term commonly employed to designate a reservation made in a conveyance either for the party conveying or for some other party, to enable him to do certain acts regarding the property conveyed Powers are either common law authorities, or have their validity from the Statute of Uses To the former class belong powers granted by will or by act of parliament to certain persons to sell estates &c The latter are of several sorts —1 Powers appendant, or appurtenant, are powers granted to one who has an estate given him by [illegible] to a man with power to grant leases in possession 2 A power collateral or [illegible] to one having an interest, either granted by the same deed, or subsisting previously to its execution, but it enables him to create such interests only as will not attach on the interest limited to him, as a power to tenant for life to appoint the estate after his decease among his children 3 A power simply collateral is one given to a party who has not any [illegible] immediately [illegible] of the execution of the deed

POWER OF ATTORNEY In Law, an instrument by which a party empowers another to perform certain acts for him, either generally or for a particular purpose; such as to accept and negotiate letters of exchange, to receive dividends, &c An instrument by which a party authorizes his attorney to appear and plead for him is termed a warrant of attorney (see that article)

POWERS, GREAT, OF EUROPE In the language of modern diplomacy, England, France, Austria, Russia, and Prussia are so called

POZZUOLANA Volcanic ashes used in the manufacture of a mortar which hardens under water They are exported from Pozzuoli a town in the Bay of Naples

PRAAM A sort of lighter used in Holland and the Baltic

PRACTICE A rule in arithmetic for expeditiously solving questions in proportion or, rather, for abridging the operation of multiplying quantities expressed in different denominations as pounds, shillings, and pence, yards, feet, and inches, &c

PRÆ-A'DAMITES A term given to those inhabitants of the earth who are presumed by some writers, to have lived before Adam I - ' f theory, a work was published in 1655 by ' ' which proved the means of converting many to its author's opinions

PRÆCORDIA (Lat præ, *before*, and cor, *the heart*) The fore part of the chest

PRÆFECT (Lat præfectus) A common name of various Roman functionaries, among others a military officer, who had the command of the cavalry of a legion The prætorian præfect was the commanding officer of the prætorian cohorts who were the imperial guard, and always stationed at Rome This office under the time of Severus, engrossed the highest powers to which a subject could attain (*See* PRÆTORIAN COHORTS) Præfect was likewise the title given to the imperial governor of Egypt which was on a different footing from the other provinces which were superintended by senatorial men with the titles of proconsul and proprætor The præfect of Egypt, on the contrary, was always of the equestrian order, and was a military governor This anomaly is said to have arisen from a prophecy which foretold that Egypt should recover its liberty when the Roman fasces and prætexta should come to it, and which Augustus took advantage of to bring that province more immediately under his own superintendence

PRÆMUNI'RE In Law a name given to a species of offence, in the nature of a contempt against the king and his government The name is derived from the words "præmoneri," or 'præmuniri facias' which are used in the beginning of the writ preparatory to the prosecution of the offence "Cause A B to be forewarned that he appear before us' &c The first statute of præmunire was passed in the reign of Edward I to restrain the encroachments of the Romish clergy and several subsequent statutes before the Reformation have extended the number of penal acts under this title The principal were those proceeding from an assumption of authority in England by virtue of papal and other foreign provisions But by still later statutes acts of a very miscellaneous character have been rendered liable to the penalties of præmunire as refusing to take the oaths of allegiance supremacy &c

PRÆNOMEN *See* COGNOMEN NAME

PRÆTEXTA (Lat) A long white robe with a purple border originally appropriated by Tullus Hostilius to the Roman magistrates and some of the priests but afterwards worn by the children of the higher classes, by boys till the age of seventeen (when they assumed the toga virilis) and by girls till they were married

PRÆTOR A Roman magistrate ranking in dignity next to the consuls Anciently the name of prætor was common to all the chief magistrates but on account of the continual absence of the consuls in foreign wars and their consequent inability to discharge many of their civil duties a new civil magistrate was created to supply their place (A U 389) to whom the title of prætor was specially assigned He was at first elected from the patricians, but the office was afterwards (A U 418) thrown open also to the plebeians When it was found that a single prætor was inadequate to the due discharge of his duties in consequence of the great influx of strangers another was added (A U 519) to administer justice in cases in which they were involved with the epithet *peregrinus* attached to his title to distinguish him from the more ancient and honourable magistrate the *prætor urbanus* as he was called This latter dignitary corresponded in many respects to the lord mayors mayors or provosts of our country, combining with their functions the judicial power of lord chancellor Besides this he performed the duties of the consuls on many occasions in their absence presiding in the assemblies of the people, and convening the senate So long as the Roman empire was confined to Italy the number of prætors did not exceed two, but on the reduction of Sicily and Sardinia to the form of provinces, two more were added to govern them and again two more were created on the subjection of hither and farther Spain to the Roman yoke The prætors on being elected determined their province, like the consuls, by casting lots Under the emperors the powers of the prætors were reduced their principal functions being transferred to the prætorian præfect, but the name of the magistrate continued to the time of Justinian (*See Niebuhr's Roman History*)

PRÆTORIAN COHORTS A body of troops during the Roman dictatorship from the rest of the army by double pay and superior privileges, first instituted by Augustus, and called by that name, in imitation of the select band which attended a Roman general in battle At their first institution they were nine in number three being stationed at Rome, and the rest in the adjacent towns of Italy, and consisted of Italian soldiers only Tiberius assembled them all at Rome, and placed them in a permanent camp, a measure which, while it answered the purpose of keeping the citizens in awe, proved dangerous and sometimes destructive to his successors The emperor Severus disarmed the old guards, and established the prætorian cohorts on a new footing, increasing their number, and filling them entirely with troops draughted from the armies of the northern frontier The command of these troops was vested in an officer called the Prætorian præfect who, as the government gradually degenerated [illegible] from the state of [illegible] to be the head of the army but of the provinces and even of the law In every department of administration he represented the person and exercised the authority of the emperor The prætorian bands were deprived of all their privileges by Diocletian, who replaced them by other troops and were finally abolished by Constantine

PRÆTO'RIUM That part of a Roman camp in which the general's tent stood and where he took the auspices It was raised a few feet above the level of the rest of the camp Of the four gates of the Roman camp, that which lay next the enemy was called the *prætorian* gate

PRAGMA'TIC SANCTION, more correctly *Pragmatic Rescript* A term of which the use seems to have originated in the Byzantine empire, signifying a public and solemn constitution or decree pronounced by a prince; distinguished from the simple rescript, which was a declaration of law in answer to a question propounded on behalf of an individual In European history several important treaties are called by the name *Pragmatic Sanction*, among which the principal are,—1 The ordinance of Charles VII of France in 1438 which constituted the foundation of the liberties of the Gallican church 2 Charles VI emperor of Germany being without male descendants endeavoured by an instrument termed the Pragmatic Sanction to secure the succession to his female heirs, which caused the Bavarian war of succession 1740 3 The law of succession to the kingdom of Naples when ceded by Charles II of Spain, in 1759, to his third son and his posterity

PRAIRIE (Fr) A term in common use for the vast plains or savannahs of the Mississippi and Missouri *See* SAVANNAHS

PRASE Green quartz The colouring matter of this mineral appears to be actinolite

PRAXEANS A sect of heretics that sprung up in Asia in the second century so called from their founder, Praxeas an Asiatic heresiarch The distinguishing characteristics of this sect were their denial of plurality of persons in the godhead and their belief that it was the Father himself who suffered on the cross The Monarchici Sabellians, and Patripassians adopted these sentiment

PREAMBLE The commencement of a statute, which recites the intention of parliament in framing it, and is often admissible in argument to prove its meaning

PREBEND (Lat prebenda) The share of the estate of a cathedral or collegiate church received by a prebendary To all such churches there are several prebendaries attached who reside and officiate in rotation

PRECEDENCY (Lat præcedo *I go first*) The relative rank of men and women in the etiquette of society strictly it means the order in which they follow one another in a state procession which it is part of the office of heralds duty to ascertain and preserve The following are the degrees of precedency commonly recognized in [illegible] 1 The Sovereign 2 The Prince of Wales 3 The Queen's consort 4 The Queen Dowager 5 The princes of the blood according to seniority 6 The Sovereign's uncles 7 The Sovereign's aunts 8 Husbands of princesses 9 The archbishop of Canterbury 10 The lord high chancellor 11 The archbishop of York 12 Lord high treasurer 13 Lord president of the privy council 14 Lord privy seal 15 Lord high constable 16 Earl marshal 17 Lord high admiral 18 Lord steward of the household 19 Lord chamberlain of the household (The last five, however, take precedence only of all their degree i.e. if dukes they precede all dukes if marquises, all marquises &c) 20 Dukes 21 Marquises 22 Dukes' eldest sons 23 Earls 24 Marquises eldest sons 25 Dukes younger sons 26 Viscounts 27 Earls eldest sons 28 Marquises younger sons 29 30, 31 The bishops of London Durham, and Winchester 32 Other bishops, according to priority of consecration 33 Barons 34. Speaker of the House of Commons 35 Viscounts eldest sons 36 Earls younger sons 37 Barons eldest sons 38 Knights of the Garter 39 Privy [illegible] 40 Chancellor of the Exchequer 41 Chancellor of the duchy of Lancaster 42 Lord chief justice of K B 43 Vice-chancellor 44 Master of the Rolls 45 Lord chief justice of C P 46 Lord chief baron of the Exchequer 47 Judges and barons of the Exchequer of the degree of the coif, by seniority 48 Knights bannerets made by the king in person 49 Viscounts' younger sons. 50 Barons' younger sons 51 Baronets 52 Bannerets not made by the king in person 53 Knights grand crosses of the Bath 54. Knights commanders of the Bath.

55 Knight's bachelors 56 Companions of the Bath 57 Eldest sons 58 Younger sons of peers 58 Baronets' eldest sons 59 Knights of the Garter's eldest sons 60 Baronets' eldest sons 61 Knights of the Bath's eldest sons 62 Knights' eldest sons 63 Baronets' younger sons 64 Knights of the knights body 65 Gentlemen of the privy chamber 66 Esquires of the knights of the Bath 67 Esquires by creation 68 Esquires by office 69 Younger sons of knights of the Garter 70 Younger sons of bannerets 71 Younger sons of knights of the Bath 72 Younger sons of knights bachelors 73 Gentlemen entitled to bear arms

PRECEDENTS in Law, are defined authorities to be followed in courts of justice Precedents, strictly speaking are only binding on tribunals when they are in the shape of actual judicial decisions of the point in question What English lawyers term an extrajudicial opinion,—*i e* the opinion of a judge pronounced where it was not called for to decide the issue,—can only have authority from the character of the individual judge, and not as a precedent When the principles of equity were as yet unsettled it was held by many that precedents were inapplicable in that branch of law, as its very name seemed to imply that each case should be governed by the judge's opinion of its individual merits But Lord Keeper Bridgman, among others seriously refuted this supposition, and precedents have long been of as much authority in courts of equity as in those of common law A form of an instrument or a pleading from which others corresponding in circumstances may be copied, is also termed a precedent

PRECEPTORIES In the Middle Ages a kind of benefices possessed by the more eminent Knights Templar, whom the grand master created and styled *Præceptores Templi*, whence the name Of these preceptories 16 are recorded as belonging to the Templars in England (see *Mon Ang*) but it is averred by some writers that these places were merely cells subordinate to their head-quarters, the Temple in London See COMMANDERY

PRECESSION OF THE EQUINOXES A term used in astronomy to denote a small annual variation in the position of the line in which the planes of the ecliptic and equator intersect each other, in consequence of which the sun returns to the same equinoctial point before completing his apparent revolution with respect to the fixed stars

The longitude of a star is counted on the ecliptic eastward from the first point of Aries or the vernal equinox If the line of the equinoxes therefore maintained always the same position with respect to the celestial sphere, the longitudes of the stars would be invariable But on comparing the actual state of the heavens with the observations recorded by ancient astronomers it is found that the longitudes of all the stars have considerably increased and all to the same degree, so that the celestial sphere appears to turn round the axis of the ecliptic with a slow motion from west to east or in the same direction as the sun in his annual revolution The phenomena however will be in all respects the same if instead of supposing the whole firmament to advance in the order of the signs we suppose the axis of the earth's equator to have a slow motion about the axis of the ecliptic in the opposite direction This will give to the line of intersection of the two planes (which is the line of the equinoxes) a retrograde motion from east to west in consequence of which the sun, whose motion is from west to east arrives at the equinoctial points sooner than if they remained at rest, and therefore the equinoxes and the seasons which depend on them come round before the sun has completed an entire circuit of the sphere On this account the motion has been called the *precession of the equinoxes*

Although the existence of the precessional motion of the equinoctial points was known at an early period in the history of astronomy the imperfection of instruments prior to the sixteenth century did not permit of observations being made with sufficient accuracy to determine its precise rate which must therefore be deduced from comparisons of the longitude of the same star calculated from modern observations, although on account of the extreme slowness of the motion, the determination must be liable to some uncertainty unless a considerable interval of time has elapsed between the epochs of observation According to Bradley's observations, [illegible] *Spica Virginis*, at the beginning [illegible] 49° 44′ At the beginning [illegible] found the longitude of the same star [illegible] The difference is 0° 837 in 42 years, which gives 50 03″ in a year The comparison of a great number of observations on different stars gives 50 1″ for the annual precession According [illegible] the equinoctial points retrograde on [illegible] rate of one degree in 71 6 years, and [illegible] quire a period of about 25,800 years to make a complete revolution

The physical cause of the precession of the equinoxes is the combined action of the sun and moon on the mass of matter accumulated about the earth's equator, and forming the excess of the terrestrial spheroid above its inscribed sphere The matter of this spheroidal shell, in reference to the effect of the solar attraction on it, may be regarded as forming a ring about the earth in the plane of the equator Now the solar force, acting on the part of the ring which is above the ecliptic, may at every point be resolved into two parts, one parallel to the plane of the equator, and the other perpendicular to it, and the resultant of all the latter forces must be a force tending to impress on the ring a motion round the intersection of its plane with the ecliptic The same thing holds true of the other half of the ring which is under the ecliptic If the earth, therefore, had no motion of rotation, the plane of the equator would turn round the line of its intersection with the ecliptic until it coincided with the latter plane But while the equator has this tendency to revolve about an axis in its plane, it has also a rotatory motion about an axis perpendicular to its plane, it will therefore, according to a well-known theorem in mechanics, not revolve on either of these axes but on one which divides the angle between them, so that the sine of its angular distance from each axis is in the inverse ratio of the angular velocity round that axis *See* ROTATION

In order to illustrate this, let E K F H be the earth's equator, A the centre, A B the axis of rotation, S the sun, and F F the diameter of the equator perpendicular to A S and suppose the earth to be in the position it occupies at the summer solstice We may also suppose the centre of gravity A to be at rest as the effect in question is not altered by the orbital motion It is plain that if the earth were a sphere the sun's attraction would have no te[illegible] centre A, [illegible] about the line S A the effect of the attraction on any point on one side of that line would be exactly compensated by the attraction on the corresponding point on the opposite side But the earth being an oblate spheroid, we must consider the effect of the sun's attraction on the mass of matter exterior to the sphere which touches the spheroid at its poles Now let K be an element of the protuberant matter which we may suppose to be all accumulated in the plane of the equator, the sun's attraction on K, acting in the line which joins S and K may be resolved into two parts —one of them acting in the plane of the equator, and the other in a line perpendicular to that plane The part of the solar force acting on K perpendicularly to the equator tends to give that plane a rotatory motion about the axis F F, by drawing K towards the plane of the ecliptic, but the earth at the same time revolves about the axis A B which is perpendicular to F F In consequence of this compound motion the axis of rotation will change its position from A B to A D the pole B moving in a direction opposite to that of the rotation, and as the solar force continues to act at every instant the pole B will have a continuous slow motion about the pole of the ecliptic and the plane of the equator, which is perpendicular to A B, will at every instant intersect the ecliptic in a new line which will slowly recede or go backward on the ecliptic in the direction opposite to that of the earth's rotation

The motion now described may be assimilated to that of a top put into rapid motion with its axis inclined to the horizon In this position the axis of the top slowly revolves about the vertical drawn from the point on which it rests describing the surface of a cone, and any section of the top perpendicular to the axis if produced to meet the horizon will at every instant intersect that plane in a new line, and the line of intersection will revolve with a motion corresponding to that of the axis in the direction opposite to that of the rotation

The attraction of the moon on the spheroidal shell produces a similar effect to that of the sun and in a still greater degree, in the ratio of about 5 to 2 It is easy to see that the effect of both those bodies in displacing the equator of the terrestrial spheroid must vary with their position in reference to it, for if they moved in the plane of the equator, there would evidently be no displacement, and their power to produce it is greatest when the earth is in such a position that the inclination of the equator to the ecliptic, or to the plane of the lunar orbit, is a maximum This inequality of action gives rise to another highly important astronomical phenomenon, namely, an apparent vibratory motion of the equator, which [illegible] was first discovered its cause and period) [illegible] ty denominated the *nutation of the earth's axis* See NUTATION

In consequence of the precession of the equinoxes the sun [illegible] the zodiacal constellations at any given season of the year is now greatly different from what it was [illegible] ages Some time before the age of Hipparchus the first points of Aries and Libra corresponded to the vernal and autumnal equinoxes, and those of Cancer and Capricorn to the summer and winter solstices.

These points have now receded 30° from the constellations to which they then corresponded The vernal equinox now happens when the sun is in Pisces, the summer solstice when he is in Gemini, the autumnal equinox when he is in Virgo, and the winter solstice when he is in Sagittarius Astronomers, however still employ the term *the first point of Aries* to denote the position of the vernal equinox On this account the *signs of the zodiac* or ecliptic, which are fixed in respect of the equinoctial points, must be carefully distinguished from the *constellations*, which are moveable with respect to those points (See *Airy's Mathematical Tracts*, *Encyc Brit*, art "Precession," *Woodhouse's Physical Astronomy*, La Place, *Mecanique Céleste*, Poisson *Sur le Mouvement de la Terre autour de son Centre de Gravité* in the *Mém de l'Acad des Sciences de Paris* [illegible],

PRECIPITATE (Lat præceps, *headlong* An appellation of [illegible] *down* and generally [illegible] from [illegible]

PREDACIANS. (Lat præda, *booty*) The English name used by Kirby as synonymous with the *Carnassiers* of Cuvier *See* FERINES

PREDESTINA'TION (In Gr προορισμος Rom viii 29.; Eph i 5 11) The belief that God has from all eternity decreed whatever comes to pass In a theological sense, it is thus defined in the 17th Article of our church — "Predestination to life is the everlasting purpose of God, whereby before the foundations of the world were laid, he hath constantly decreed by his counsel, secret to us to deliver from curse and damnation those whom he hath chosen in Christ out of mankind, and to bring them by Christ to everlasting salvation" The Lambeth Articles agreed to in 1595 by a portion of the clergy, assert that God from eternity hath predestinated certain men unto life certain he hath reprobated" Theological writers have generally forborne to use the word predestination with respect to the rejected "Nefas est dicere Deum aliquid nisi bonum prædestinare" (August, *De Dono Perseverantiæ*) *See* ELECTION, CALVINISM

PREDETERMINA'TION In Scholastic Philosophy, that concurrence of God which determines men in the performance of their actions good or evil, called physical predetermination or premotion

PRE'DIAL (Lat prædium, *farm*) Of or belonging to a farm Thus we often read of *predial* slaves and slavery in opposition to *domestic*, *predial* disturbances in Ireland &c

PRE'DICABLE In Logic a term which can be affirmatively predicated of several others The notions expressed by such terms are formed by the faculty termed abstraction, after the particular circumstances characterizing each individual have been withdrawn from it The predicables are commonly said to be five, genus species, difference, property (which has been subdivided into four heads by no very intelligible system of classification) and accident (which is either separable or inseparable) See these terms and Logic

PREDICAMENTS or CATEGORIES in Logic are a certain number of general heads, or in logical phraseology *summa genera* under one or other of which every term may be arranged Aristotle enumerated ten predicaments, others by subdividing some of these have increased their number Those of Aristotle are — substance quantity quality, relation, place time situation possession action suffering It is evident that all these may be arranged under two grand heads, — substance and attribute *See* CATEGORY, ATTRIBUTE

PRE'DICATE, in Logic is of the two terms of a proposition, that which is affirmed or denied of the other *See* TERM, PROPOSITION Logic

PREDISPO'SING CAUSE In Medicine is any circumstance which renders the body susceptible of disease

PRE-EXISTENCE In Philosophy the existence of any thing before another, commonly used for the existence of the human soul, in some former condition, before it became connected with its present body It was the doctrine of the Pythagorean school and connected with their peculiar tenet of the Metempsychosis It was also the doctrine of Plato, and he uses in support of it arguments which have exercised a strong influence on many minds, and to this day are constantly recurring to those who study the subject on independent principles, particularly the rapidity of learning in early childhood, which he explains as an effort of reminiscence not acquisition Others have enlisted into the service the peculiar sensations which are sometimes raised by scenes persons sounds, words, though seen or heard, as our reason would persuade us, for the first time, as if we were conscious of some prior familiarity with them This poetical, rather than philosophical view of the subject, is beautifully illustrated in a well-known ode of Wordsworth

PRE'FACE (Lat præ, and fari, *to speak*) The observations prefixed to a work or treatise intended to inform the reader of its plan and peculiarities There are few subjects which afford so wide a field for the display of skill and address as preface writing; and those who wish to witness an unrivalled exhibition of these qualities may consult some of Dr Johnson's prefaces, either to his own writings, or to the numerous works which he edited

PRE'FET A [illegible] important political functionary in modern France Under the old [illegible], the officers who were sent into the provinces to superintend the details of administration on behalf of the king were at first styled [illegible] des requêtes These were made perpetual and hereditary [illegible] but later were changed to [illegible] [illegible] [illegible]

universal occupancy, the right to derelict lands by the sudden retiring of the sea, the dominion of seas, navigable rivers, &c

PREROGATIVE COURT The court in which wills are proved, and administrations taken, which belong to the archbishop, by his prerogative *See* LAW, ECCLESIASTICAL.

PRESBYOPIA (Gr πρεσβυς, *old*, and ωψ, *the eye*) An imperfection of vision commonly attendant upon the more advanced periods of life, in which near objects are seen less distinctly than those at a distance It is usually caused by flattening of the cornea, hence convex spectacles are required It often happens that one eye is more affected than the other, in which case glasses of different foci should be used

PRESBYTER (Gr πρεσβυτερος, *elder*, by which word it is translated in our New Testament) One of an order of ministers in the Christian church, frequently alluded to in the Scriptures as having, in its several members, the spiritual care of distinct congregations, and exercising as a class a general superintendence over the concerns of the church It is allowed that, up to the time of Calvin, there never existed a church in which there was not an order of presbytery or priests, subordinate to that of bishops, and, although the words themselves are sometimes confounded in the New Testament, the assertors of episcopacy point out the distinction between the offices as accurately preserved throughout *See* EPISCOPACY and PRESBYTERY

PRESBYTERIANS The name given to that sect of Christians who have embraced the Presbyterian form of government *See* PRESBYTERY

PRESBYTERY (Gr πρεσβυτεριον *a council or assembly of elders*), is that form of ecclesiastical polity according to which there is no gradation of order in the church, but which vests church government in a society of [illegible] rank and power The Presbyterians maintain that the words presbyter (πρεσβυτερος) and bishop (επισκοπος) are [illegible] that we nowhere [illegible] and presbyters or of pastors of different rank, in the same church that all ministers of the gospel, being ambassadors of Christ are inherently equal, and that deacons are laymen whose sole duty it is to take charge of the poor Among other proofs they quote the following — The elders (πρεσβυτερους) who are among you I exhort *who am also an elder* (συμπρεσβυτερος) Feed the flock which is among you, taking the oversight thereof (επισκοπουντες, *acting as bishops over them*) not by restraint but willingly, not for filthy lucre but of a ready mind, neither as being LORDS over God's heritage (1 Peter, v 1 2) It is contended that in this passage, the identity of presbyter and bishop is apparent, and that the apostle himself as an officer of the church was simply a presbyter or elder (See also Hebrews xiii 7 17, 1 Thess v 12 6) On these grounds the Presbyterians assume that the very chiefest apostles were presbyters, or labouring ministers, and that every faithful pastor of a flock ordained by the imposition of hands as sanctioned and taught in Scripture, is a successor of the apostles in every respect in which divinely inspired men can be regarded as having any successors It is farther argued in support of the polity under review, that Timothy himself, though said to be a bishop, was ordained with the laying on of the hands of the *presbytery*' (1 Tim iv 14)

It is, however admitted by the Presbyterians that episcopacy was introduced at an early period into the Christian church and has hitherto been the prevailing polity, but they insist that as St Paul presided at the ordination of Timothy, not as supreme over his brethren, but as moderator or chairman for the occasion, *primus in paribus*, so the moderator of a presbytery instead of being changed or re elected, had in course of time been declared permanent, and hence [illegible] of the episcopal order (*Mosheim*, i 90, *Hill's Theol Institutes*)

But while the Presbyterians trace the origin of their church to the practice of the apostles, and affirm that there are no intimations of episcopacy in Scripture or in the writings of the apostolical fathers, they admit that presbytery, as it now obtains, did not exist between the 2d century and the reformation of religion "The first reformers, who believed that the distinction between bishops and presbyters had no foundation in Scripture, and who wished to apply an effectual remedy to the abuses which appeared to them to have arisen in the progress of human inventions of investing bishops with powers superior to presbyters, did not consider the antiquity or universality of that practice as any reason for its being continued. Recurring to what they considered the primitive Scripture model, they laid the foundation of presbyterian church government on this principle, that all members are equal in rank and power, and they did not admit any official preference, but that which is constituted by voluntary agreement for the sake of order." (*Hill's Theol Inst.* p. 167)

The first presbyterian church, in modern times, was founded in Geneva by John Calvin, about 1541, and the system was thence introduced into Scotland, with some [illegible] John Knox about 1560, but was not [illegible] between presbytery and [illegible] latter (which was patronized by the court) predominated in 1606, but was superseded by the former (to which the great body of the people were attached) in 1638 Presbytery kept its ground from this period till the revolution in 1660, when episcopacy again obtained the ascendancy, which it maintained till 1688, soon after which it was abolished, and the national church of Scotland declared presbyterian —a form which it has since retained [illegible] numerous bodies of dissenters from the Scottish established church, such as the Associate and Relief Synods, are also Presbyterians, their cause of secession being that the church had relaxed the strictness of presbyterian principles

Presbytery has never flourished greatly in England Here the first presbyterian church was formed at Wandsworth, Surrey, in 1572, about 20 years before presbytery was established by law in Scotland, but though the system was never palatable to the English nation generally, an attempt was made to make the established church presbyterian in the reign of Charles I This object was signally promoted by the famous Assembly of Divines at Westminster In 1649, presbytery was sanctioned by the English parliament, and the established church was nominally presbyterian from this date till the restoration in 1660, yet it was never generally adopted or regularly organized, except in London and in Lancashire (*Murray's Life of Samuel Rutherford*, Edin 1828 chap viii) Upwards of 2000 presbyterian clergy were ejected from their cures in England, in consequence of the Act of Uniformity in 1662 [illegible] congregations (about 150) in England [illegible] counties, called presbyterian, some of them in full connection with the Scottish church others differing materially from that polity, while not a few of them have adopted nearly the same church government with the Independents In Ireland, chiefly in the province of Ulster, there are about 400 presbyterian congregations There are upwards of 100 such congregations in our North American possessions, and presbytery has also been introduced to a greater or less extent in the other British colonies

In the United States of America presbytery embraces upwards of 2800 congregations with 2000 ministers (*American Almanac* for 1830) The [illegible] somewhat modified from that which [illegible] Scotland, is the established church in Holland (*Steven's Brief View of the Dutch Eccles Establishment*, ed 1839) It still exists, though to a very limited extent, in Geneva, it prevails also less or more in several of the other Swiss cantons

The constitution of the church of Scotland, which has long been the most perfect and efficient model of presbytery is as follows — The kirk session is the lowest court, and is composed of the parochial minister and of lay elders the number of whom varies in different parishes, but is generally about 12 The minister is moderator *ex officio* This kirk session exercises the religious discipline of the parish, but an appeal may be made from its decisions to the presbytery, the court next in dignity The presbytery from which there is a power of appeal to the synod is composed of the ministers of a number of contiguous parishes (varying in number in different cases) with a lay elder from each A moderator, who must be a clergyman is chosen every half year A presbytery generally meets once a month, but it must meet at least twice a year, and it may hold *pro re nata* meetings This court takes young men on trials as candidates for licence ordains presentees to vacant livings, has the power of sitting in judgment on the conduct of any of its members and can depose them; and has the general superintendence of religion and education within its bounds The number of presbyteries is at present 82 The synod which meets twice yearly, is formed of the members both lay and clerical, of two or more presbyteries At every meeting a moderator is chosen, who must be a clergyman, and a sermon is preached before the court proceeds to business The number of synods is sixteen The general assembly is the highest ecclesiastical court, its decisions being supreme It meets annually in the month of May and sits for ten successive days. Unlike the inferior courts, it consist of representatives chosen by the various presbyteries, royal burghs, and universities of Scotland The number of representatives from presbyteries depends on the number of members of which each is composed No presbytery sends less than two ministers and one lay elder; and none more than six ministers and three elders. The total number of members of the general assembly is 386, of whom 218 are ministers This supreme court has of late consisted of more than this number, as the church

has admitted the ministers of *quoad sacra* parishes as constituent members of ecclesiastical courts; but the civil law has not given its sanction to this measure indeed the question is at present *sub judice* The assembly chooses a new moderator yearly who, in recent times, is always a clergyman A sermon is preached before the opening of the court The assembly is honoured with the presence of a nobleman as representative of the sovereign under the title of lord high commissioner, but this high functionary takes no part in the proceedings of the court except in opening and closing or dissolving its sittings and has no voice in its deliberations The assembly before itself appoints a commission which is equivalent to a committee of the whole house, being composed of all the members of assembly, and one minister additional, named by the moderator The commission meets quarterly, but may hold *pro re nata* meetings

The income of the clergy, which may average about 250*l* yearly including manse and glebe is regulated by the state, and they are nominated to livings by patronage They have no liturgy no altar, no instrumental music The Scottish presbyterians do not kneel, but stand in time of prayer, and in singing the praises of God they sit The sacrament of the Supper is not administered in private houses to any person under any circumstances whatever (*The Directory for the Public Worship of God, by the Westminster Assembly of Divines*) Pluralities have been prohibited, and the residence of clergymen within their repective parishes has always been imperative Their creed is rigid Calvinism and may be found embodied in the *Westminster Confession of Faith* and the *Larger* and *Shorter Catechisms* But though the faith of the Scottish Presbyterians whether churchmen or dissenters is Calvinistic not a few of the Presbyterians in other countries have adopted an Arminian and not unfrequently a Unitarian creed (*Adam's Relig World Displayed* ii 289—305, *Lord King's Inquiry into the Constitution of the Primitive Church*, *Forbes's Presbyterian Letters*)

PRESBYTERY In the Scottish Kirk a district composed of a number of adjacent parishes See the preceding article

PRESBYTERY In Architecture, a portion of the choir or chancel of a church arranged with seats for the dignitaries of the establishment

PRESCRIPTION A title acquired by use and time to incorporeal hereditaments such as a right of way or of common and the like All prescription is either personal as when it is in a man and his ancestors or it is in right of a particular estate, which last being in a man and those whose estate he hath, is called prescription in a *que* estate It presupposes a grant and can therefore give a title to those things only which can pass by grant After uninterrupted enjoyment for thirty and in many cases for twenty years a primâ facie title arises by prescription to the thing enjoyed, and unless such enjoyment have continued under some consent or agreement the title becomes in sixty years absolute and indefeasible The time of prescription in most of the ordinary instances to which it applies is now regulated by 2 & 3 W 4 c 71

PRESENTATION In Law the appointment of a clerk to a benefice by the patron which takes place by writing addressed to the bishop for institution

PRESENTATION FEAST OF In Ecclesiastical Usage the same with the Purification of the Blessed Virgin See PURIFICATION

PRESENTMENT, in Criminal Law is defined to be an information made by the jury in a court before a judge who has authority to punish an offence Properly speaking it is the notice taken by a grand jury of their own knowledge, without any bill or indictment found before them at the suit of the king, of any offence nuisance, libel, &c of which they are competent to take notice An indictment, correctly speaking is that which is drawn up and engrossed to be found by the grand jury founded on their presentment or note of instruction Presentment is also comprehensively taken to include inquisitions of office and indictments, as well as presentments strictly so called

PRESIDENT (Lat præsideo *I sit foremost*) A title applied to many officers in various capacities but generally denoting a pre-eminency either temporary or fixed among a number of individuals assembled for a definite purpose Thus the superior of a board or council &c is generally entitled president, as is the individual called to preside over an occasional dinner &c and the old English title of chairman is frequently used on such occasions

The supreme executive officer of the United States of America is styled president The qualifications required of a person raised to this dignity are, to be a natural born citizen of the age of thirty five years, and to have resided fourteen years within the States The election is by electoral colleges in every state These colleges contain, in each state, a number of electors equal to all the senators and representatives of that state in congress; but their appointment varies in different states, and at different times, sometimes it is made by their respective legislatures, sometimes by general election throughout the state, sometimes part of the electors are chosen by district and part by general election The colleges in each state vote by ballot for a president (and at the same time for a vice-president), and the votes of all the electors, taken in this manner, are counted by the president of the senate when if any person have an absolute majority of votes, he is duly elected, if not, the election is made by the house of representatives between the three persons having the highest number, in which case the votes are taken by states and a majority of all the states is necessary to constitute a choice On two occasions, of which the last was in 1824, no candidate having had a majority of the whole number of voters, the house of representatives has proceeded to make the election, and on the last of these occasions a majority of states chose a candidate (Adams) who had a smaller number of electoral votes than one of his opponents (Jackson) On one occasion in 1800, the states balloted thirty six times before any candidate could obtain an absolute majority Should the president die during his term of office he is succeeded by the vice president, an event which has recently occurred

In his legislative capacity the president has the power of approving bills sent to him after passing both houses of congress or of returning them to the house in which they have originated with his objections annexed In the latter case the bill must be reconsidered by that house, and if on reconsideration it obtain a majority of two thirds in both houses it passes into a law In his executive capacity he is commander-in chief of the army and navy of the Union and of the state militias when called into the service of the Union he has the power of reprieving and pardoning except in cases of impeachment, he has power to make treaties with the consent of the senate (by a majority of two thirds), he nominates ambassadors, consuls judges of the supreme court and all other officers of the United States whose appointments are not vested elsewhere by the constitution

PRESIDENT LORD OF THE COUNCIL The fourth great officer of state in England, appointed by letters patent under the great seal durante bene placito

PRESS (Fr presse) The machine by which books, &c are printed Very little improvement in the construction of this instrument took place from the first introduction of the art into Europe till the late Earl Stanhope applied the powers of his mind to the subject, and introduced a new press of a decidedly superior construction The old press was made of wood with an iron screw that had a bar fitted on it, to the lower end of this screw was attached horizontally a flat piece of wood called the platen which was brought down by means of the screw, and pressed the paper upon the face of the types and thus the impression was obtained This press has however entirely given place to presses made of iron Lord Stanhope's press is constructed of iron with a screw, but the bar is fixed to an upright spindle to which a lever is attached connected with a second lever fixed to the top of the screw by a connecting bar These two levers are placed at different angles to each other, and when the platen is brought down to the face of the types, and power is wanted the two levers take such a position with each other so as to act with the greatest advantage, and thus an almost incredible accession of power is gained, which enables the pressman to print larger sheets of paper in a superior manner with less labour and with greater ease to himself This press maintains its superiority over all others

This great improvement in the printing press that Lord Stanhope had accomplished excited other ingenious men to exert their abilities in attempts at further improvements among whom was a Mr George Clymer an American, who brought forward an iron press, called the Columbian press, in which he discarded the screw and obtained his power entirely by levers This press has great power, and consequently great strength, and is made of a size to print larger sheets of paper than any other, but for the common run of printing it does not work so easy as the Stanhope press These two are looked upon as the best presses

There are a variety of others which are great improvements upon the old construction, and which are held in estimation by printers but the limits of this work will not admit of the details of their respective merits

The *book press* in the warehouse department, used for pressing books previous to their delivery is the common screw press with a perpendicular screw, and screwed down by means of an iron bar it is also used for pressing paper when wetted previous to printing for the purpose of making it in readiness for the process, and also in cylindrical or machine printing to cause it to lie flat, otherwise it is apt to wrinkle, particularly large sheets, in being carried round the cylinders upon a flat surface In large establishments Bramah's hydraulic

press is generally used for these purposes as being much more powerful and also more expeditious, not only in its use, but also in its effect

PRESS A machine for the purpose of compressing or squeezing bodies Any of the mechanical powers may be used for this purpose When constructed on a large [illegible] with great power [illegible] Hydrostatics

PRESS is applied [illegible] literature of a country, or to that part of it more immediately connected with newspapers or other periodical publications

PRESSIROSTRES, *Pressirostres* (Lat pressus, *flattened,* rostrum, *a beak*) A tribe of wading birds, including those which have a flattened or compressed beak

PRE'SSURE Dr Young defines pressure to be "a force counteracted by another force, so that no motion is produced" (*Lectures on Nat Phil*) Thus, when a heavy body is supported on a table, or the ground, the force of terrestrial gravity, which, if the support were removed, would cause the body to descend towards the centre of the earth, being destroyed at every instant by the resistance of the support, produces a pressure A pressure and a moving force differ from one another only in this respect, that the infinitely small velocities which the pressure tends to produce are incessantly destroyed by the resistance of the obstacle, whereas those that are actually produced at every instant by the moving forces are accumulated in the moving body, and produce a finite velocity after a finite time The pressures of two different bodies are, therefore to each other as the masses multiplied by the infinitely small velocities which they tend to produce in the same instant of time and which they would produce if the bodies were free to move

The pressure of a solid body is exerted in the direction of the resultant of all the forces by which the body is acted upon In the interior of liquid and uniform bodies the pressure is equal in all directions (See HYDROSTATICS, PNEUMATICS) *Centre of Pressure*, in Hydrostatics is that point of a plane or side of a vessel containing a liquid to [illegible] equal to the total pressure [illegible] it would exactly balance [illegible]

PRESSWORK, in Printing is the operation of taking impressions from types &c by means of the press distinct from *composing*, which is arranging the types to prepare them for press

PRESTO (It) In Music See ALLEGRO

PRESUMPTION OF LAW, is the [illegible] of the truth of a certain state of facts by the [illegible] of the law It is either 'juris et de jure,' which is a presumption which no evidence to the contrary can be admitted to traverse as the presumption of incapacity in a minor with guardians to act without their consent or it is 'juris' only which may be traversed by evidence as where the property of goods is presumed to be in the possessor until the contrary is shown

PRESUMPTIVE HEIR See HEIR

PRETENDER The name by which the Chevalier Charles Stuart is usually known from his having pretended a right to the British crown, from which he had been excluded

PRE'VOTALES, COURS (Fr *courts of prevots or provosts*) Certain tribunals of summary jurisdiction which existed in France before the Revolution were called by this name They were the courts of the prevots of France and of Paris of the prevots des marechaux (see PROVOST PROVOST-MARSHAL &c) and exercised a summary jurisdiction over vagrants highway robbers disturbers of the peace &c These ancient institutions furnished Napoleon with the model of certain extraordinary courts, with mixed civil and military judges which were formed in 1808 for the purpose of preserving public order in a summary manner All these unconstitutional tribunals were abolished by the first charter of 1814, but with provision for the restoration of the Cours Prevotales should it be thought necessary They were accordingly established in 1815, to last for two years, but expired in 1818

PRIA'PUS (Gr Πριαπος) A divinity introduced into Grecian mythology after the time of Alexander He was the god of fruitfulness, and by the Romans was looked on particularly as the guardian of gardens, in which indecent and rudely sculptured wooden statues of him were usually set up

PRICE (Fr prix), in Commerce, means the value or exchangeable worth of any commodity or product estimated or rated in money, or simply the quantity of money for which it will exchange The price of a commodity rises when it fetches more, and falls when it fetches less money

Price of freely produced Commodities — The exchangeable value of commodities — that is, their power of exchanging for or buying other commodities — depends, at any given period, partly on the comparative facility of their production, and partly on the relation of the supply and demand. If any two or more commodities respectively required the same outlay of capital and labour to bring them to market and if the supply of each were adjusted exactly according to the effectual demand — that is, were they all in sufficient abundance, and no more, to supply the wants of those able and willing to pay the outlay upon them, and the ordinary rate of profit at the time, they would each fetch the same price, or exchange for the same quantity of money or any thing else But if any single commodity should happen to require less or more capital and labour for its production, while the quantity required to produce the others continued stationary its value, as compared with these, would, in the first case, fall, and in the second rise, and supposing the cost of its production not to vary, its value might be increased by a falling off in the supply, or by an increase of demand, and conversely

But it is of importance to bear in mind, that all variations of price arising from any disproportion in the supply and demand of such commodities as may be *freely produced in indefinite quantities* are *temporary* only, while those that are occasioned by changes in the cost of their production are *permanent*, at least as much so as the cause in which they originate A general mourning occasions a transient rise in the price of black cloth, but supposing that the fashion of wearing black were to continue its price would not permanently vary, for those who previously manufactured blue and brown cloths, &c would henceforth manufacture only black cloth and the supply being in this way increased to the same extent as the demand the price would settle at its old level Hence the importance of distinguishing between a variation of price originating in a change of fashion, or other accidental circumstance — such, for example, as a deficient harvest, — and a variation occasioned by some change in the cost of production In the former case prices will at no distant period revert to their old level in the latter, the variation will be lasting

When the *price* of a freely produced commodity rises or falls such variation may evidently be occasioned either by something affecting its value or by something affecting the value of money, but when the generality of commodities rise or fall, the fair presumption is that the change is not in them, but in the money with which they are compared This conclusion does not however, apply in all cases and we believe that most part of that fall in the price of commodities which has taken place since the peace, and which has been so generally ascribed to a rise in the value of money occasioned by a decline in the productiveness of the mines has been caused by the increased productiveness of industry arising from the abolition of oppressive restraints on commerce, the opening of new and more abundant sources of supply, and the discovery of new means and improved methods of production

Price of monopolised Commodities — Exclusive, however of the commodities now alluded to, there is a considerable class whose producers or holders enjoy either an *absolute* or a *partial* monopoly of the supply When such is the case prices depend entirely or principally on the proportion between the supply and demand and are not liable to be influenced or only in a secondary degree, by changes in the cost of production Antique statues and gems the pictures of the great masters, wines of a peculiar flavour produced in small quantities in particular situations and a few other articles, exist under what may be called absolute monopolies, — their supply cannot be increased and their price must therefore depend entirely on the competition of those who may wish to buy them without being in the slightest degree influenced by the cost of their production

Monopolies are sometimes established by law, as when the power to supply the market with a particular article is made over to one individual or society of individuals, without any limitation of the price at which it may be sold, which of course enables those possessed of the monopoly to exact the highest price for it that the competition of the buyers will afford, though such price may exceed the cost of production in any conceivable degree Monopolies of this sort used to be common in [illegible] in the reign of Elizabeth, but they were [illegible] by the famous act of the 21 Jac 1. c 3, an act which by establishing the freedom of competition in all businesses carried on at home, has been productive of the greatest advantages

The rights conveyed by patents sometimes establish a valuable monopoly for they enable the inventors of improved methods of production to maintain, during the continuance of the patent the price of the article at a level which may be [illegible] sufficient to afford them the ordinary rate of profit [illegible] ever, by stimulating invention, and [illegible] coveries, of which it is the natural and appropriate reward, instead of being injurious, is beneficial to the public

There are also partial monopolies, depending upon situation, connection, fashion, &c, these and other inappreciable circumstances sometimes occasion a dif-

ference of 30 per cent , or more, in the price of the same article in shops not very distant from each other.

[illegible] the supply of monopolised commodities is less [illegible] vary than those that are freely produced and their prices are commonly steady But there are various exceptions to this rule, and of these the partial monopoly of the supply of corn, which the existing corn laws secure to the British agriculturists, may be taken as an example The variations in the harvests of particular countries and their average equality throughout the world, expose a nation which shuts [illegible] of its ports to vicissitudes of price, from [illegible] enjoy a comparative exemption were its ports always open Sometimes the expiration of a monopoly a patent for example, has occasioned a sudden and extraordinary increase of supply, and consequent fall of price , entailing, of course a serious loss on the holders of large stocks of goods produced under the monopoly

New Sources of Supply — The effects on prices produced by the opening of new markets, or new sources of supply, are familiar to every one The fall that has taken place in the price of pepper, and of most sorts of commodities brought from the East, since the opening of the trade in 1814, is a conspicuous proof of what is now stated

Influence of Taxes on Prices — It is unnecessary to dilate on a topic so familiar to every one When a tax is laid on a commodity its price necessarily rises in a corresponding proportion for otherwise the producers would not obtain the ordinary rate of profit, and would of course, withdraw from the business A considerable part of the price of many articles in this and other countries really consists of the tax or duty laid upon them

These statements will probably suffice to give our readers a general idea of the principles which determine the value of commodities To go deeper into the subject would involve us in discussions that belong to political economy, and which are nowise suited for such a work as this

Such however of our readers as wish for full and satisfactory information as to these topics and the practical operation of the different circumstances to which we have now adverted, would do well to consult Mr Tooke's *History of Prices* This work is especially valuable for the rare union which it exhibits of a perfect knowledge of principles with the most extensive acquaintance with practical details

PRICKING-UP In Architecture the first coating of plaster in work of three coats upon laths It is executed with *coarse stuff* in London usually compounded with road stuff or Thames sand The surface is scratched over, to form a better key for the next coat

PRICK POST In Architecture a post in wooden buildings framed intermediately between two principal posts

PRIEST (Gr πρεσβυτερος *elder*) Etymologically, the Christian priest is merely a minister who presides over the spiritual affairs of a congregation The word however, is commonly used also to represent the Greek ιερευς, who, like the Jewish priest had both a sacrificial and mediatorial character, and the Roman Catholic looks upon the Christian priest in the same light

PRIMÆ VIÆ (Lat *the first passages*) Medical men apply this term to the stomach and bowels

PRI'MAGE A certain allowance paid by the shipper or consigner of goods to the master and sailors of a vessel for loading the same It varies in different places according to their respective customs

PRI'MARY COLOURS The colours into which a ray of white solar light may be decomposed or separated Newton supposed them to be seven, red orange yellow green blue indigo and violet Mayer considered some of these to be secondary colours and that there are only three primary colours in the solar spectrum, namely red, yellow, and blue, certain portions of which constitute white light and all the other colours (*Opera inedita* 1775) Dr Young assumes red, green and violet as the fundamental colours (*Lectures on Nat Phil* p 439) In fact, any three prismatic rays may be assumed as the primary colours, and all the rest compounded from them, provided we attend only to the predominant tint resulting, and disregard its dilution with white (*Herschel on Light*, § 588) *See* CHROMATICS Light

PRIMARY ROCKS, or PRIMITIVE ROCKS *See* GEOLOGY

PRIMATE (Lat primus *first*) A prelate of superior dignity and authority In England the archbishop of York is entitled Primate of England, the archbishop of Canterbury Primate of all England

PRIMATES The name given by Linnæus to the first order of animals in his *Systema Naturæ*, which associated man with the monkeys and bats, and corresponded to the Bimana, Quadrumana, and Cheiroptera of Cuvier

PRIME NUMBERS In Arithmetic, are numbers which have no divisors, or which cannot be divided into any less number of equal integral parts than the number of units of which they are composed, such are 2, 3, 5, 7 11, 13, &c

A general method of finding prime numbers, beyond a certain limit by a direct process is one of the most difficult problems in the theory of numbers, and though often sought after, has not yet been discovered Many remarkable properties of numbers have, however, been detected, by means of which it is in most cases not difficult to determine whether an assigned number is prime or not Some of these properties are the following —

1 Every prime number above 3 is comprehended in one of these forms, $6n + 1$, or $6n - 1$ (n being any whole number), that is to say, if a prime number be increased or diminished by unity, the result is a multiple of 6 In order to prove this, it will be sufficient to remark that every whole number is necessarily comprised in one of other of these six forms (where n is successively 0, 1, 2, 3, &c),

$$6n + 1, 6n + 2, 6n + 3, 6n + 4, 6n + 5, 6n + 6$$

Now the second fourth, and sixth of these forms being divisible by 2, cannot give prime numbers The third gives only numbers divisible by 3, therefore the primes can only be of the form $6n + 1$, or $6n + 5$ But $6n + 5 = 6n + 6 - 1 = 6(n + 1) - 1 = 6n' - 1$ n' being any whole number, it follows therefore that all prime numbers are comprehended in one of the forms $6n + 1$, or $6n - 1$

2 In like manner, every prime number above 2 is of one of the forms $4n + 1$ or $4n - 1$, and every prime number excepting 2 of one of the forms $8n + 1$, $8n + 3$, $8n + 5$ $8n + 7$ In fact prime numbers may be divided in this manner into classes according to any modulus, at pleasure, the first four forms however, are those which possess the most distinctive properties

Although every prime number is comprehended in one of these forms the converse proposition is not true, namely that every number in one of these forms is a prime number No direct rule has yet been given by which it can be determined *à priori* whether a given number be prime or not

3 If a number cannot be divided by another number less than the square root of itself, that number is a prime

4 If n denote any prime number the product, $1 \cdot 2 \cdot 3 \cdot 4 \ldots (n - 1)$ increased by unity is divisible by n

It is frequently of use in arithmetical investigations to know whether a number is prime or not Tables of them have accordingly been formed to a certain extent and are given in various works Vega's tables contain the prime numbers under 400 000 The largest prime number which has yet been verified is $2^{31} - 1 = 2147483647$ This was found by Euler

For properties of prime numbers, see Fermat's edition of *Diophantus*, *Euler's Algebra* and *Analysis Infinitorum*, Legendre *Essai sur la Theorie des Nombres*, *Barlow's Elementary Investigations* &c, and especially the *Disquisitiones Arithmeticæ* of Gauss of which there is a French translation by Delisle

Prime and Ultimate Ratios — A method of calculation invented by Newton and employed in the *Principia*, being an extension and simplification of the ancient method of exhaustions It may be thus explained — Let there be two variable quantities continually approaching each other in value so that their ratio or quotient continually approaches to unity and at last differs from unity by less than any assignable quantity, the *ultimate ratio* of these two quantities is said to be a ratio of equality In general when different variable quantities respectively and simultaneously approach other quantities considered as invariable so that the differences between the variable and invariable quantities become at the same time less than any assignable quantity, the ultimate ratios of the variables are the ratios of the invariable quantities or *limits* to which they continually and simultaneously approach They are called *prime ratios* or *ultimate ratios* according as the ratios of the variables [illegible] or approaching [illegible] (See *Prime*, 1, book I)

PRI'MER, signified anciently a religious work employed in the Roman Catholic service, but it is now generally used to denote the first book for children.

PRIMER SEISIN (Norm Fr) An ancient branch of the royal prerogative in England whereby it had possession for a year of the lands and tenements of which a tenant in capite died seised, if the heir was of full age; or, if not, until he was of age

PRIME VERTICAL In Astronomy, the vertical circle of the sphere which [illegible] at right angles, and passes through the east and west points of the horizon In dialling prime vertical dials are those which are projected on the plane of the prime vertical, or a plane parallel to it

PRI'MINE In Botany the outermost sac or covering of an ovule, either composed of cellular tissue only, or traversed by numerous veins or bundles of tubes

PRIMING (Lat primus, *first*) In Architecture, the first coat of painting

PRIMIPI'LUS In Ancient History, the name of the centurion of the [illegible] who had charge of the Roman eagle [illegible] considerable dignity, and entitled its holder to various privileges, which conferred both rank and emolument On quitting his charge, the primipilus assumed his place among the members of the equestrian order, with the title primipilarius (See *Adam's Rom Antiquities*, *Mém de l'Acad des Inscr* vol xxxii)

PRIMI'TIÆ The first fruits of any production of the [illegible] were [illegible] Deity by [illegible]

PRIMITIVE [illegible] derived from any other language, nor compounded from any other words of the same, as *horse*, *man*

PRI'MITIVE COLOURS, in Painting, are red, yellow, and blue, from the mixtures whereof all other colours may be obtained

PRIMOGE'NITURE The right of the eldest son, and those who derive through the eldest son, to succeed to the property of the ancestor Among ancient nations the Jews alone appear, as far as is known, to have recognized this [illegible] For some notice of the [illegible] enture, see SUCCESSION LAW OF

PRIMULA'CEÆ (Primula, one of the genera) A natural order of herbaceous Exogens inhabiting the northern and colder parts of the globe It is nearly allied to all the regular Monopetalous orders with a capsular superior fruit especially to *Solanaceæ* and *Ericaceæ* from both of which it is readily known by the stamens being placed opposite to the segments of the corolla In this respect it agrees with *Myrsinaceæ* which differ chiefly in their fleshy fruit and arborescent habit The cowslip from which a sedative wine is made, the primrose, auricula and the acrid cyclamen, together with anagallis or the herb pimpernel which regularly closes its flowers at the approach of rain, — are species of this order

PRI'MUM MO'BILE, in the Ptolemaic Astronomy is the outermost sphere of the universe, which gives motion to all the others (see those of the moon planets &c) and carries them round with it in its diurnal revolution Its centre is the centre of the earth

PRI'MURIES, or **PRIMARY QUILLS** (*Primores* Lunn) The largest feathers of the wings, they rise from the pinion bones, or those corresponding to the metacarpus and digits

PRINCE (From the Latin princeps *first leader or foremost*) This title is probably of Teutonic origin the German equivalent furst has the same etymological signification and the Latin nation appears to have translated it In England the title is applied only to members of the royal family, and in no case except that of the eldest son of the reigning king (Prince of Wales) is it connected with a territorial distinction On the Continent, the rank of princes is various In France under the old regime the title belonged only to certain families of high distinction connected with the royal blood, it ranks in Germany below that of duke

PRINCE OF WALES The title bestowed by patent on the heir apparent to the crown of England He is born Duke of Cornwall &c but the title of Duke of Cornwall does not necessarily belong to the heir apparent, as it can only be held by the *first begotten* (not *eldest*) son of a king thus Henry VIII was not in the life of his father Duke of Cornwall The origin of the title of Prince of Wales is as follows — When Edward I subdued Wales he promised the people of that country upon condition of their submission to give them a prince who was born amongst them and who could speak no [illegible] with this de[illegible] Wales upon his second son Edward then an infant born within the principality, and unable to speak any language Edward by the death of his elder brother Alfonso became heir to the crown, and from that time this honour has been appropriated to the eldest sons of the kings of England The Earldom of Chester which is likewise usually conferred upon the [illegible] was once a principality and erected into [illegible] parliament in the 21st of Richard II, it was then appointed to be given to the king's eldest son But the whole acts of that parliament were repealed in the reign of Henry IV although the earldom has usually been since given with the principality of Wales The revenue of the last Prince of Wales was 125,000*l*, 60 000*l* being paid from the civil list, and 65 000*l* from the consolidated fund. His income was last regulated by 35 G 3 c 125. To compass the death of the Prince of Wales, or violate the chastity of his consort, is high treason within the statute of 25 Ed 3 The Prince of Wales has a household of his own, of which the chief officers are a comptroller and auditor-general, treasurer, vice-chamberlain, Gloucester king at arms, and herald; besides another class of officers belonging to the duchy of Cornwall, and another as great steward of Scotland As Duke of Cornwall and Earl of Chester, the prince appoints sheriffs, &c for those counties By a statute of the order of the Garter, issued in 1805, the Prince of Wales was declared a constituent part of the original institution Hence every prince becomes a Knight of the Garter the moment he is created Prince of Wales For the constitutional question raised in 1788, respecting the right of the Prince of Wales [illegible] the regency see REGENT

PRINCEPS SENATUS Prince or first of the senate In Ancient Rome, the citizen whose name was [illegible] first on the list of the senate by the censors was [illegible] This high dignity was not connected with any [illegible] and at different times only of those who were recognized as the most considerable citizens of the state Before the second Punic war, it seems to have belonged to the oldest of those who had held the office of censor, but the first deviation from this practice was in favour of Fabius Maximus This title was the first germ of the imperial authority of Augustus (*See* SENATE) There is a memoir on the subject in vol xxiv of the *Mémoires de l'Academie des Inscriptions*

PRINCIPAL (Lat princeps, *chief*) In Architecture a main timber in an assemblage of carpentry Thus, in a roof, the strong rafters used for trussing the beams are called principal rafters

PRINCIPAL The name by which the heads of the Scottish universities are distinguished

PRINCIPAL In the Fine Arts the chief circumstance in a work of art to which the rest are to be subordinate

PRINCIPES The name given to one of the four grand divisions of the Roman infantry It was their duty to assume the initiative in an engagement, for which they were admirably qualified being the choice men of the Roman army, and from this [illegible] is said to be derived The ot[illegible] he velites, hastati, and triarii, which see (See *Mem de l'Acad des Inscr* vol xxix)

PRINCIPLE (Lat principium) In Chemistry a term sometimes applied to certain proximate components of organic bodies, such as *bitter principle*, *febrifuge principle* &c This term, however, is now [illegible] having been found that each bitter, febrifuge narcotic, or other substance, generally contains a principle peculiar to itself upon which its powers depend, and that there is no such common or universal principle as was formerly [illegible] For [illegible] term principle of [illegible] is suggested, as applied in common with "nervous principle," &c, to an imaginary existence

PRINCIPLES In the Fine Arts, those general and fundamental truths from which the rules and maxims of art are deduced To each art particular principles are attached on which its theory is founded These principles, before they can be said to have stability, must be found to depend on certain truths which, recognized by every one and indisputable, oblige the mind to concur in the deductions that result from them Before a law in any art is laid down, it is necessary to trace it to the principles from which it springs though there may be causes which prevent those principles being universally admitted such as ignorance prejudice love of novelty and the like Indeed there is an everlasting contest between truth and error in all human institutions The former like light, is acknowledged by all though our passions and interests too often tempt us to obscure it, but as darkness itself proves that light exists so falsehood only enables truth to shine with greater lustre

PRINTING (Fr imprimerie) Letterpress printing to which this article is confined is the art of taking impressions from engravings in relief

The process is generally limited to printing from types and from engravings on wood

The history of its origin is enveloped in mystery, and this art which commemorates all other inventions, which hands down to posterity every important event, which immortalizes the actions of the great, and which, above all extends and diffuses the word of God to all mankind, this very art has left its own origin in obscurity, and has given employment to the studies and researches of the most learned men in Europe to determine to whom the honour of the invention is due

Some writers maintain that the art was practised as far back at least as the building of Babylon, and hold that the characters impressed on the bricks found on the supposed site of that city are literally printed we are in possession of metal stamps with words engraved in relief, which the Romans made use of to mark their various articles On this subject Mr Landseer, in his *Lectures on the Art of Engraving*, 8vo 1807, observes, "Had the modern art of making paper been known [illegible] probably never heard the names of [illegible] for, with the same kind of stamps [illegible] the Roman tradesmen used for their pottery and packages, books might also have been printed, and the same engraving which adorned the

shields and pateras of the more remote ages, with the addition of paper, might have spread the rays of Greek and Etrurian intelligence over the world of antiquity Of the truth of this assertion I have the satisfaction to lay before you the most decided proofs, by exhibiting engraved Latin inscriptions both in cameo and intaglio, from the collection of Mr Douce with impressions taken from them at Mr Savage's letterpress but yesterday (in 1805) One of these is an intaglio stamp, engraved on stone, with which a Roman oculist was used to mark his medicines, the other, which is of metal, and in cameo, is simply the proper name of the (Roman) tradesman by whom it has probably been used, 'Titus Valagini Mauri'" Of the latter stamp, the following impression is a facsimile —

Papillon's relation of the two Cunio, who engraved on wood the heroic actions of Alexander the Great and printed impressions from them in the year 1285 the truth of which has been defended by Zani Ottley and Singer, the print of St Christopher carrying the infant Jesus across the sea with an inscription and the date 1423 at the bottom on the same block in the library of Earl Spencer and the decree of the government of Venice, of the date 11th October, 1441 respecting 'playing cards, and coloured figures printed" the art and mystery of making which had fallen to total decay at Venice, in consequence of the great quantity which were made out of Venice and prohibiting the introduction of them under pain and forfeiture and fine — a decree which carries the art of printing back into the 14th century these circumstances taken together prove that the knowledge and the practice of the art of printing existed in Europe long before the time which is usually attributed to it although it had not been applied to the multiplication of books

According to Du Halde and the missionaries the art of printing from engraved blocks of wood was practised in China nearly fifty years before the Christian era, and from the early commercial intercourse of the Venetians with that country there is reason to believe that the knowledge of the art and of its application to the multiplying of books was derived from thence for Venice is the first place in Europe of which we have any account in which it was practised as appears by the decree above mentioned, which is the most ancient document in existence respecting [illegible] but the date of this application of the art [illegible] where it was first practised it is impossible to determine From that decree and the existence of the print of St Christopher it would seem that it had been long applied to the production of playing cards and of religious subjects and when it was extended to books they were printed by the Chinese method still in use each page being engraved on a block of wood and if this plan was followed as most probably it was, from its being the most expeditious and the most correct — of fastening a page of manuscript on the face of the block and engraving from that instead of drawing the characters on the wood - it would at once account for the diversity of characters found in the block books which varied with the different handwritings of the scribes and has completely puzzled the learned who endeavour to ascertain the printer by [illegible] ith some other work, as well [illegible] to manuscripts for which they were sold This appearance too was aided by their being printed on one side of the paper only, the indention being removed by burnishing the back, and two leaves were pasted together thus making them such perfect facsimiles of manuscripts as to require even at the present day great discrimination and even chemical skill to distinguish them from each other, and as these books had neither names, dates nor places affixed to them, it is now impossible to ascertain by whom, when, or where they were executed, and thus the fabrication of these pseudo-manuscripts involved the first introduction of the art of printing books in Europe in complete obscurity

About the year 1450, the great and accumulating expense of engraving blocks for each separate work of the increasing number of books produced by means of printing, led to the important improvement of the art of casting separate metal types, and substituting them for the wooden blocks previously used This formed a new epoch in the art, and is now termed, erroneously, the origin of printing After a lapse of many years, several cities claimed the honour of this invention, but time has reduced these claim s to two — Haarlem and Mentz and this rivalry has employed the [illegible] pens of many learned men who have laboured to prove the respective claims of these cities to the imaginary honour of the invention of printing, for what can be more imaginary than such a honour? seeing the art had been practised in Europe privately and publicly, in a modified form, for sixty or seventy years previously to the period which forms the subject in dispute The claims of Haarlem rest upon the statement of Hadrian Junius, who gives it upon the testimony of one Cornelius, who had been a servant of Laurence Coster, for whom the invention is claimed, but this testimony, is our opinion utterly worthless Modern research gives the credit of the introduction of moveable metal types (unquestionably a grand *improvement*) to Peter Schoeffer the assistant and son-in-law of John Fust or Faust of Mentz, so well known in Europe as Dr Faustus Of two writers who have supported the respective claims of these two places it has been observed that it now seems to be allowed that Heinecken has paid too little attention to the antiquity of the claims of Haarlem and Meerman infinitely too much

The first edition of the *Speculum Humanæ Salvationis* was printed by Coster at Haarlem about the year 1440 as is supposed and is one of the earliest productions of the press of which the printer is known, and of which we shall have occasion to speak hereafter But the celebrated Bible known as the 'Mentz Bible without date' is the first important specimen of printing with metal types this was executed by Gutemberg and Fust, between the years 1450 and 1455, and was the occasion of the secret being divulged, of [illegible] mechanical means as is mentioned [illegible] FELTER The [illegible] followed the *Psalter* of 1457, by Fust and Schoeffer These works are executed in such a manner that with all our boasted skill and our improvements in the art, we are decidedly of opinion perfect facsimiles, taking the ink and workmanship into account could not have been executed in England so lately as twenty five years ago When the secret was made known books avowedly printed issued from the press in all parts of Europe far beyond what could have been calculated upon from a new discovery for before the year 1480 there were printing offices in upwards of 220 places — in Austria Bavaria Bohemia Calabria the Cremonese Denmark England Flanders France Franconia the Frioul Geneva Genoa Germany Holland Hungary Italy Lombardy Mecklenburg Moravia Naples the Palatinate Piedmont Poland Portugal, Rome Sardinia Upper and Lower Saxony Sicily Silesia Spain Swabia Switzerland, Thessalonica Turkey Tuscany the Tyrol Venice the Veronese Westphalia Wirtemberg &c The number of places in which the art was practised the wide extent to which it had spread in so short a space of time combined with the skill which the early printers displayed in their works appear to us to be totally incompatible with the date generally assigned to the invention and we are of opinion that *after* having been long practised in private it emerged into publicity in a state nearly approaching to perfection

It is impossible in this short and rapid sketch of the history of the art to enter into detail or to trace its progress in the different cities and towns or even in the different countries where it was first publicly practised after the secret was divulged in fact it would be impossible to arrive at any satisfactory conclusion, for as the first printers neither affixed their names dates nor places where their productions were executed the greatest research could only result in vagueness and uncertainty There has been great difference of opinion among bibliographers who have written on the subject even respecting the first edition of the Latin translation of the Bible, and Meerman has enumerated ten ancient editions without date in favour of the priority of each of which pretensions have been advanced and supported

William Caxton is generally regarded as first who introduced the art of printing into England and practised it at Westminster but a prior claim is advanced in favour of Oxford which has occasioned much controversy Dr Dibdin, in his *Typographical Antiquities* says "Although Caxton is ca[illegible] printer yet I fully believe in [illegible] ford edition of the *Exposicio sancti Jeronimi in simbolum apostolorum* &c of the date of 1468 which was printed by a foreigner at Oxford who was interrupted in the prosecution of his typographical labours" Several copies of this work are in existence one is in the Bodleian library another in the public library at Cambridge and a third in the British Museum Herbert mentions a fourth in the Earl of Pembroke's library, a fifth in All Souls [illegible] entertained, and Hearne [illegible] school tower at Oxford. Those who deny the priority for Oxford argue that the date is incorrect either from accident or design that being in Roman numerals an X is omitted and that the real date of the book should be MCCCCLXXVIII

Caxton, during a long residence on the Continent on

commercial affairs and political missions, in the reign of Henry VII, acquired a practical knowledge of the art and on his return to England established a printing office in a chapel adjoining to Westminster Abbey where for many years he was indefatigable in translating and preparing works for the press and in printing them, and to him may be fairly ascribed the merit of being the first to introduce the practice of printing generally into England He printed many books on a variety of subjects, and all the productions of his press are objects of great interest to book collectors He commenced printing in England about the year 1474, and was followed by Wynkyn de Worde, Richard Pynson, &c

In the Privy Purse Expenses of Henry the Seventh are the following entries —

"June 6 1499 To the Printers at Westmr, £1"

"Nov 1, 1501 To Richard Pynson the Prynter, in rewarde, £1"

"21 For prynting of new Colletts, £1 13s 4d"

July 12 1503 To Ric Pynson upon a prest for massebokes to be printed, £10" — *Excerpta Historica*, 8vo 1833

Dr Dibdin relates, that, in 1524, Dr Robert Wakefield, chaplain to Henry VIII published his *Oratio de Laudibus et Utilitate trium Linguarum, Arabicæ, Chaldaicæ, et Hebraicæ*, &c 4to The printer was Wynkyn de Worde, and the author complains that he was obliged to omit his whole third part, because the printer had no Hebrew types We have now in the British foundries, in addition to the Roman and Italic characters Arabic, Armenian, Coptic Domesday, Engrossing Ethiopic, Etruscan, German, Greek, Alexandrian Greek, Gothic Hebrew, Hibernian or Irish, Malabaric Malteze Nagari or Brahmin Persian, Philosophical Runic, Russian Samaritan Sanscrit, Saxon, Sclavonian or ancient Russian Script in imitation of writing Swedish Syriac Tamoul Telegu Turkish, also black letter and music, and, in addition, a great variety of fancy types

The first book in which Greek types occur is Cicero's *Offices*, printed in the year 1465, in which the characters are so imperfect that the words are with difficulty deciphered, and the first book printed in Roman characters was Cicero's *Epistolæ Familiares* by Sweynheim and Pannartz, at Rome, in 1467 The Italic type was the invention of Aldus Manutius, the celebrated printer at Venice about 1500, and dedicated by him to the States of Italy, from which it took its name

The art appeared to start into publicity in a state of perfection As it extended, the workmanship became much inferior, so that while the productions of the first printers were executed in a very superior style and the embellishments showed a great proficiency both in design and engraving the productions of their competitors had all the crudeness and imperfection of a new invention, and in the 17th century it had retrograded to a very low state At the commencement of the 18th century Caslon made great improvement in types, and about 1750 Baskerville of Birmingham also made great improvements both in types and printing which were subsequently carried on by Bensley, Bulmer, Corrall Davison M'Creery Whittingham, and a few others, in London, the Foulis at Glasgow, the Ballantynes in Edinburgh, Bodoni at Parma, and Didot at Paris

Many of the manuscripts of the 14th and 15th centuries were written in a beautiful manner, and embellished by borders round the pages, and by the large letters at the commencement of chapters being drawn and coloured with brilliant colours, heightened with burnished gold, and finished with taste, delicacy, and great ability, so as to produce a most splendid effect These were called illuminated manuscripts On the first production of books by the process of printing these ornamental letters were left blank, and both these letters and the borders were finished by hand in the usual manner which gave to the book a perfect resemblance to a manuscript, of which it became by these means a complete fac-simile This is the case with the Mentz Bible by Fust and Gutenberg The first printers soon began to print these large ornamented letters, the letter itself being in some instances red and the ornamental part blue, in others the letter is blue and the ornamental part red, and these were afterwards finished by hand, as is apparent in the Psalter of 1457, printed by Fust and Schoeffer, who also showed great ingenuity and skill in the large letter B in the same book, which is printed with red ink, and the ornamental part, consisting of a flourished line, as if it had been drawn with a pen, extending from the top to the bottom of the folio page, with blue ink Of two copies which we have examined, one was in the library of Geo III, at Buckingham Palace, and the other is in the possession of Earl Spencer

The first edition of the *Speculum Humanæ Salvationis*, which was printed at Haarlem about the year 1440, by [illegible] engravings on wood printed in a [illegible] the body of the work A copy of this rare and curious work, which we examined some years ago in the valuable collection of Messrs Longman, impressed us momentarily with the idea that the engravings were pen and ink drawings, and that the ink had turned brown with age, so precisely was this effect produced by the tone of the ink

We [illegible] blocks of wood with two different colours, as being produced by means of the press, coeval with the generally received opinion of the invention of printing, to show the impossibility of the case For looking at the form of the [illegible] the letter B, and the skill of the working [illegible] it must be evident to every person conversant with the art that this perfection could only be obtained by long practice, and the contrast between these productions of the first practitioners and their competitors, when the art became public, puts the question beyond a doubt, as an examination of the fac-similes given by Heinecken from Fables printed at Bamberg about 1461, from the *Legendas* printed at the same place about 1470, and also the Fables of Æsop by Caxton, will, we think satisfy the most scrupulous and sceptical

Towards the end of the 15th century the art was extended to the imitation of pen and ink sketches with a coloured ground, by the great masters of painting, and in a few years it was further extended to the imitation of drawings in clare-obscure, and that with such success as to induce some of the first artists to encourage it by drawing the subjects on the blocks The first practisers of this extension of the art were, Michael Wolgemuth of Nuremberg who furnished the designs for the *Nuremberg Chronicle*, and also engraved them on wood, and Mair, a native of Landshut, the disciple of Martin Schon, between whom the priority rests of printing in clare-obscure After them were Girolomo Mocetto, Lucas Cranach, Baldassar Peruzzi Hans Burghmair, and Ugo da Carpi (who has been generally regarded as the inventor of this style of printing, but dates prove this opinion to be erroneous) Domenico Beccafumi, John Ulric, Albert Altdorfer Hans Baldung, Lucas Jacobs Leyden (called Lucas Van), all these were born in the 15th century In the [illegible] Parenta, Giovanni Nicolo [illegible] Herbert Goltz or Goltzius Andrew Andreani Henry Goltz or Goltzius, Abraham Bloemaert, Paul Moreelze, Bartolomeo Coriolano Giovanni Batista Coriolano, Christopher Jegher, George Pencz, and Frederick Bloemaert In the 17th century, there were Louis Businck, Vincent le Sueur, Antonio Maria Zanetti Nicholas le Sueur, Comte de Caylus Edward Kirkhall, and John Baptist Michael Papillon This last mentioned engraver, in his treatise on *Engraving on Wood* expressly states that Albert Durer engraved some subjects in clare obscure, and that he had examined them in the collection of the king of France Parmigiano also superintended the [illegible] a number of his own designs, [illegible] on the blocks for [illegible] *into the Origin of Printing in Europe* states, that "one of the greatest princes and connoisseurs of our age used to say, he saw nothing in prints that could give him the pleasure he received from looking at the wood prints, done in chiaro oscuro by Hugo di Carpi" This prince was the Duke of Orleans regent of France

After these were John Baptist Jackson, who executed a number of subjects of a large size, in clare obscure, copied from celebrated paintings in churches in Italy, and from private collections, he afterwards established a manufactory at Chelsea for printing paper-hangings in oil colours a speculation however which was unsuccessful Some of his productions printed in colours were complete failures, the oil having spread in the paper, and the subjects being in the first instance engraved with [illegible] 1754 Mr John Skippe, an amateur, executed many subjects in clare obscure very adroitly

Gubitz an engraver at Berlin has produced a great number of subjects printed in colours, of a very superior character, but none of them can be called imitations of drawings The writer of this article was the first who attempted to imitate drawings in water colours by means of the common printing press and accomplished the applying of all the colours used by artists to the composition of printing ink, thus serving as a pioneer to more skilful persons who might devote themselves to this branch of art, and he succeeded in producing fac-similes of the [illegible] to every one who [illegible] Messrs Wyndham Blanford, of Beaufort House, applied printing in coloured inks to the prevention of forgery, and to embossing on paper, and Messrs Vizetelly and Branston have produced some very tasteful things in colours, but neither of these establishments has, to our knowledge, turned their attention to the imitation of drawings Mr Baxter is now pursuing the subject and has executed many very superior specimens in a manner that would have been deemed totally im-

practicable twenty-five years ago The result is confirming the most sanguine expectations we ever entertained on the subject [illegible] powers of [illegible] works of art are far from being [illegible]

The art of taking impressions in gold from types, and from [illegible] and metals in relief, generally called [illegible] executed most successfully by [illegible] It is also accomplished with bronze of different colours in the most delicate engravings, but however beautiful the effect of bronze may be at first, it unfortunately is not permanent

After this brief sketch of the history and progress of the art of printing in Europe an art more important in the effects it has produced on the human mind, and consequently on the state of society, than any other that has ever been practised, we shall lay before the reader a short outline of the practical part, for the better understanding of which, we shall subjoin a glossary of the chief technical terms in common use

The first operation called [illegible] is to separate the letters called types (see [illegible]) and pages These pages, being placed upon a large flat surface, called an imposing stone in such an order that when they are printed and the sheet of paper is folded, the pages will follow each other consecutively are then wedged up in an iron frame, termed a chase This operation is styled imposing

A printing press is a machine on which the matter to be printed is laid on an even surface horizontally placed either of stone or iron, and the pressure upon the types is produced by a parallel surface of wood or iron, technically a platen, by means of a screw, or lever, or both combined See PRESS

Perhaps the most satisfactory way of explaining the process generally will be to take a printing-office just commencing and describe the whole arrangement, and follow in the order of its proceeding the execution of a work from its being put in hand to its completion

The office having been supplied with all the necessary materials, viz frames cases case racks bulks, boards board racks, imposing stone furniture quoins mallet shooting sticks, brass rule, chases and types in the quantity and variety that may be judged necessary, and also presses with their accompaniments banks and horses with a sink, lye trough, wetting trough and paper boards and in the warehouse with a gathering table poles a peel, and a press to press the books before they are delivered,—it may be said that the office is in a state to commence business

The compositor now proceeds to lay the letter into as many cases as may be judged expedient in the first instance (see CASE) laying the Italic in cases distinct from the Roman each letter or sort in the box appropriated to it having done this with one fount he will put the cases into the case rack, and proceed with another fount till the whole of the letter is laid, he will put the superfluous sorts either into a fount case or into cotins, and he will then be ready to take copy

The pressman has to adjust his press place the footstep so as to give him the greatest advantage in the pull fix the rounce, place the girths so that the carriage shall run in and out properly, fix the back stay justify the platen so that it shall bear equally on all parts of the form and cover his tympans and frisket, and he is also ready to proceed in his work

The compositor having taken copy and received directions [illegible] length of the page any peculiarity [illegible] particular words the use of capital letters, the punctuation the words that are to be in Italic or small capitals, and any other directions that may be deemed necessary, proceeds to make his measure and cut a composing rule, he then begins to compose letter by letter, till he has formed a word, he separates this from the following word by a space and so continues till he has composed a line, he then justifies this line by [illegible] between the words or lessening it [illegible] so that the line shall be tolerably tight [illegible] composing stick and thus proceeds till he has completed a page after having set the head line and direction line with the signature, he ties a page-cord round it, to preserve it from falling asunder, puts it on a page-paper, and places it on the bottom of his frame, and thus continues, page after page, till he has composed a sheet

It may be necessary to state that every line is of the same length, whether the types fill it out or not, the last line of a paragraph lines of poetry, and short lines of any other description are filled up with quadrats to the proper length, in order that they be secured from derangement by being wedged up in the chase, which is termed locking-up

The pages are then taken to the imposing stone, and arranged in the proper order, the page-papers removed; a chase is then placed over them (see CHASE), furniture put about them (see FURNITURE) and the page cords taken away, proper quoins are then selected, and the form is locked up It is then taken to a press, and one impression is printed, this is styled the first proof, which is folded and taken to the reader with the copy; a boy reads the copy to him while he examines the proof and marks the errors of the compositor, and puts a query to any doubtful matter for the author's consideration, the proof is then returned to the compositor, who corrects the errors and mistakes, and a second impression is printed with more care, and generally on better paper, this is styled a clean proof, it is examined by the first proof to see that the errors of workmanship are corrected, which is termed revising, and then sent out with the copy to the author, he makes what alterations and corrections he may think necessary (see CORRECTING), these are corrected by the compositor, another impression is printed, revised, and read finally and with care for press, the margin is then adjusted (see MARGIN), and the corrections being carefully made, it is taken to the press to be printed off

In the mean time after the author has returned the sheet for press the warehouseman delivers out the proper quantity of paper, which the pressman wets, by drawing the paper, to the extent of three four, five, or six dips for each quire, through clean water, according as the paper may be hard-sized or porous, and also as the form may be solid or open, the paper as it is wetted is laid upon a board opened out and another board is laid upon it with weights, on the following day it is turned, which causes fresh surfaces to come into contact with each other, and diffuses the moisture equally throughout every part of the heap, it will be in good condition to print on the next day This wetting the paper causes it to receive the impression of the ink in a much more perfect manner than it could possibly be made to do if dry

The pressman having received the forms lays the inner form on the press and prints one copy, which is called a revise, this he takes to the person appointed to revise it and while that is doing proceeds to secure the form on the table of the press by means of quoins, to place his tympan sheet, to fix the points which make small holes in the paper that enable him to cause the pages to fall precisely on the back of each other when the second side of the paper is printed and to produce an even and uniform impression in all the pages he then cuts his frisket, which preserves the margin of the paper clean, and, when the revise is corrected proceeds to ink the surface of the types by means of balls or rollers When the whole impression of one side of the paper is printed, he lifts the form off the press washes the ink off the face of the type with lye and rinses it with water He then proceeds in a similar manner with the outer form, which completes the sheet and thus sheet after sheet

If it be intended to have large paper copies of a work, the alteration of margin is made when the number of small paper copies is printed off from each form

When the sheet is printed the compositor lays it up, distributes the letter and proceeds sheet after sheet till the body of the work is finished, then the title, dedication, preface introduction contents, and any other prefatory matter is proceeded with, these being always printed the last

The warehouseman then takes [illegible] and hangs them up on poles to [illegible] of [illegible] ther from five or six to ten or [illegible] state of the weather the heat of the room or the pressure of business, when these sheets are dry they are taken down from the poles, carefully knocked up and put away in the warehouse in piles when the book is nearly finished from ten to fourteen consecutive sheets are laid upon the gathering table in order and collected sheet by sheet by boys who deposit each gathering in a heap at the end of the table, which is generally what is styled a horse-shoe table so that when a boy has deposited his gathering he has only to turn himself and begin again These gatherings are then carefully collated to ascertain that the different sheets are correct and in order, and folded up the middle When the work is finished the gatherings are put together, one of each which forms a copy of the work, and pressed; the work is now completed, and awaits the order of the bookseller, &c to deliver the copies either to himself, the bookbinder, or to others, according to circumstances

A new method of obtaining impressions from types by means of cylinders has been introduced, and the power generally employed is steam Mr Konig, a Saxon, had [illegible] employed with advantage [illegible] not receiving encouragement on the Continent to enable him to prosecute his plans, he came to England in 1804, and, after explaining his views to some of the principal printers in London, Mr Thomas Bensley, Mr George Woodfall, and Mr. Richard Taylor embarked in the undertaking, but Mr. Woodfall soon withdrew After innumerable experiments, and a great outlay of capital, the result was not satisfactory, but the experience gained by prosecuting these experiments resulted in the production of a machine to print with cylinders instead of a flat surface as was the case with the printing press which was limited in the size of

the paper by the size of the press and the power of the pressman In cylindrical printing, by which the pressure is communicated in lines, the size may be very considerably increased

The first machine that was constructed was capable of printing 1000 copies per hour of double demy paper on both sides, while a press is estimated to print 250 copies of a single sheet on one side only in the same time

When this machine was completed, the proprietors of the *Times* newspaper, ever ready to adopt any improvement that would expedite its publication, without regarding expense, agreed with the patentees for two machines, and on the 28th of November, 1814, the *Times* was published, executed by cylindrical printing, the moving power being steam these were the only machines constructed under the first patent

Various improvements made upon this of his complex machine were soon effected by other ingenious men, and were adopted by many printers They have become invaluable for the publication of periodicals where the number of copies is great, and also for newspapers, for their power of printing sheets of paper of a size far beyond the capability of any press, and their rapidity of throwing off copies, enable the editors to increase the size, and to delay commencing the printing off for a considerable time later than before their introduction, and thus avail themselves of any intelligence that might arrive in the interval

Perhaps the most complete machine for printing one side of the paper is that used at the office of the *Times*, the carriage on which the pages to be printed are laid travels under the printing cylinders, of which there are four and back again nineteen times in a minute producing two impressions in going and two in returning, or seventy six in a minute, being 4560 copies of four pages of that newspaper in the hour at its ordinary rate of working The paper is laid on at both ends of the machine two persons laying on at each end, and the printed sheets are delivered two at each end

The types are inked by means of rollers and the apparatus for this purpose was the invention of Mr Edward Cowper, the paper is secured in travelling round the cylinders by means of tapes as first practised by Mr Konig the chief improvements in this machine are known as those of Messrs Applegath and Cowper, by the former of whom it was constructed and fitted up

This machine has the appearance of four single machines formed into one and working at less speed than separate machines are in the habit of doing many of which are capable of printing 1500 per hour and we have no hesitation in saying, that if it were requisite for the sake of despatch, the principle might be extended and a machine constructed to print 6000 or 8000 in hour without difficulty

The idea of cylindrical printing in England originated some years anterior to Mr Konig submitting his plan for the late Mr William Nicholson took out a patent for the purpose dated 29th April 1790 but it was never acted on and as to the use of steam as the motive power the late Mr Alexander Tilloch is known to have stated previously to the introduction of the machines that he had long had it in contemplation to apply steam as the power to print off the *Star* newspaper

The late Sir William Congreve took out a patent for a machine to print two colours at once which was made by Messrs Donkin and Company and completely answered the purpose This machine was intended to print stamps and bank bills which Sir William stated would be inimitable, except by the machine of which he was the patentee, but he was too sanguine and the opinion was fallacious for nothing in the process of printing is more easy to execute at the common press by a common workman than this inimitable plan for preventing forgeries

Glossary to the Article Printing

Alteration of Margin is increasing the space between the pages so as to enlarge the margin of a book and make it proportional in large paper copies

Back Stay, is a girth or strap of strong leather attached to the back of the carriage and fastened to the hind part of the press its use is to check the carriage in running out beyond the point which will allow the tympan to rise clear of the front of the platen

Balls are used for coating the face of the type or engraving with ink for the purpose of obtaining impressions They consist of the ball-stock, stuffed with carded wool and not many years ago were covered with an undressed sheep-skin, the hair taken off, termed a pelt The noisome smell which these balls occasioned in a printing-office by the means used to keep them in good working order, induced many persons to turn their attention to the providing of a substitute for them, but long without success at length Mr B Foster introduced composition balls, made of glue and treacle melted together and cast in a dished mould, so that the edges are thinner than the middle, and attached to a piece of canvass as a substitute for the pelt; these balls were found to answer so well and be so free from any noxious smell, that they have generally superseded the pelt balls

Bank A table placed at the side of a press, on one end of which the horse containing the paper to be printed is laid, and at the other the sheets printed during the operation

Board Rack Grooves formed in some recess, or under the imposing stone or a bulk, or in a closet, to receive [illegible] which types are placed that are not in [illegible]

Carriage That part of a press on which the types are placed to be printed, which is run in till they are immediately under the platen and, when the impression is taken, run out, in order to change the sheet of paper, and to ink the types again

Case Rack A frame of wood of the width and depth of a case, with ledges attached to the inside of the upright parts to receive those cases which are not in use

Coffin A piece of strong paper twisted into a conical shape like a sugar paper, into which any superfluous types are temporarily deposited Also that part of the carriage of a wooden press in which the stone is bedded

Composing Rule A piece of brass rule, the width of [illegible] to the length [illegible] upon which the compositor arranges the types, it facilitates the process, and by means of it he empties his stick when it is full

Composing Stick An instrument of simple construction, in which the compositor arranges the words and lines It has a slide which is secured by a screw, by means of which he is enabled to make the lines of any length that may be required

Direction Line A line of quadrats at the bottom of each page in which is inserted the first word of the next page which is called the catch-word, in the first page of each sheet there is also inserted in it the number of the volume if more than one, and the signature

To Distribute To replace the letters in their respective situations in the cases after a sheet has been printed off, to enable the compositor to proceed with the work

Footstep An inclined plane fixed under the front side of the press for the pressman to place his foot upon when at work, to enable him to exert his strength to advantage

Form A chase with one or more pages wedged up in it

Fount Case A case of large dimension in which the superfluous sorts of a fount are placed, as a depot, till they be wanted

Frame It is made of wood of a height to suit a man standing to work at it, on which the cases are placed It is much higher at the back than the front, which brings the most distant boxes nearer to the compositor's hand

Frisket A light iron frame, attached to the tympan by joints or pivots which turns down upon the tympan over the sheet of paper to be printed to preserve the margin clean and to retain the paper in its position to effect this the frisket is covered with paper, and openings cut in it the size of the pages to be printed

Girths Two pieces of girthweb or strong leather, fastened at one of the ends to the wheel, and wound different ways round it and the other ends attached to the extreme ends of the carriage, by this means turning the rounce one way causes the carriage to run in under the platen and turning it the reverse way causes it to run out again

Head Line The line at the top of the page, which contains the folio or number of the page, and frequently the title of the book or the subject of the chapter or of the page

Horse An apparatus of a desk like shape, placed on the bank close to the tympan of the press, on which the paper to be printed is laid

Inner Form The chase and pages in proper order, wedged up which contains the 2d 3d 6th, 7th, 10th, 11th, 14th, and 15th pages of a sheet in octavo, it invariably contains the second page of a sheet, whatever may be the size of the book

Justifying Putting equal space between the words in each line, making the lines of precisely the same length, placing the marginal notes opposite the references, making the pages uniformly of one length and adjusting any peculiar matter so that the whole shall be tight and proper when wedged up

To Knock-up At press, it is for the pressmen to make a pair of balls In the warehouse, it is to make the printed sheets even at the edges, which is performed by taking hold of a parcel of sheets by the two edges, holding them slack in the hands, and letting them fall on their bottom edge by their own weight, the [illegible] of hand throwing them flat on the board, [illegible] operation till all the sheets are even at the edges, when they are placed in piles until they are gathered.

To Lay-up This is the operation [illegible] ink off the types after the impression is [illegible]

the form on a letter board, loosening the quoins, and working the letter with the hand, pouring on it plenty of water to clean the types for distribution

Letter Board A board on which pages of types are placed for distribution and also when they are not immediately wanted There are two ledges of wood grooved in on the under side, which project a little more than an inch, on which it rests, which allows it to be set over other types on boards without putting them in confusion

Lye Trough A shallow trough, lined with lead, sufficiently capacious to admit a board on which a form is laid, this trough has some lye in it, with which the surface of the letter, the chase and the furniture is brushed over to remove the ink which has accumulated during the process of printing, the form is then taken out, set upon its edge, and rinsed with water The lye is composed of water and pearlash

Mallet (Fr maillet) A wooden hammer, with which the quoins are tightened and also loosened, and which is also used for general purposes

Measure (Fr mesure) The space in the composing stick between the end and the slide, which is the length of a line, however large or small the page may be, is styled the measure

Outer Form The chase and pages in proper order wedged up which contains the 1st 4th, 5th 8th 9th 12th, 13th and 16th pages of a sheet in octavo, it invariably contains the first and last pages of a sheet, whatever may be the size of the book

Page Cord Small twine, even and strong, which is used to tie round the pages of types to secure them from accidents till they are imposed, when the cords are taken off

Page Papers Pieces of stout and smooth paper, on which the pages of types in the progress of a work are placed in a safe place till a sheet is ready to be imposed

Paper Boards Boards on which paper is laid when wetted, also those boards used in pressing books they are of various dimensions, according to the size of the paper They differ from letter boards in being smooth and even on both sides

Peel A thin piece of wood with a long handle affixed to it, in the shape of the letter T, it is used for hanging the sheets of a book upon the poles to dry, and for taking them down again

Platen A thick piece of wood, or more generally now made of iron perfectly level on its under side attached immediately under the moving power of a printing press, which produces the impression

Point There are always two points used in presswork when a sheet of paper is printed on both sides, they are made of thin iron with a notch at one end and a projecting spur or point at the other end they are attached to the tympan by screws and lie flat upon it the spurs being under the sheet of paper to be printed make small holes in it so that when the reiteration or second side is printed the spurs are placed in these holes, which cause the pages to fall exactly on the back of each other

Poles Long pieces of fir wood about an inch and a half thick, and three or four inches broad, placed across the warehouse and other rooms in a printing office at about eight or nine inches apart and about fourteen inches from the ceiling, their ends rest in notches cut in stretchers fastened to the wall Their use is to hang the damp printed paper upon to dry, which is done with facility by means of the peel

Quadrats (Fr quadrat) Pieces of metal of the same body as the type but cast lower in height, used to fill up short lines, and to form a blank line or lines where necessary, being cast lower than the type, they do not produce any impression on the paper

Quoin A wedge about half an inch thick and of various widths, to wedge up the pages of type in a chase

Roller (Fr rouleau) The roller has nearly superseded the use of balls for inking the surface of the types it is formed of a composition of glue and treacle cast on a wooden cylinder, [illegible]

Rounce The rounce is the handle by which the carriage of the press, on which the form to be printed is laid, is run in under the platen and out again, it is fixed in the spit, which is the axis that passes through the drum a cylinder of wood on which one end of the girths are fastened The whole apparatus is generally termed the rounce

Run-in The act of placing the carriage with the form of types under the platen to obtain an impression. This is effected by turning the rounce

Run-out The act of withdrawing the carriage with the form of types from under the platen by turning the rounce the reverse way from the preceding after the impression is taken.

Shooting Stick An implement for tightening and loosening the quoins that wedge up the pages in a chase it is in the shape of a wedge, about two inches broad and nine inches long, and is usually made of box wood In use the small end is placed against the quoin, and the other struck by the mallet

Signature A letter of the alphabet placed at the bottom of the first page of a sheet, and so on to each sheet consecutively through the alphabet, with the exception of the letters I, V and W, their use is to facilitate collating a book, as a guide to the bookbinder in folding the sheets, and as a ready means of referring to any part of a work before it is bound

Sink A corner of the pressroom, generally inclosed and lined with lead, with loose boards upon the lead, in this sink are placed the lye trough and a *wetting trough*, it is here where the forms are washed, rinsed and laid up There is always a pipe to carry off the waste water

Sorts It is generally used in the plural, it means any letter, point, mark, space, or quadrat, that is either deficient or redundant in quantity A work runs upon sorts, that is, a greater number of some particular letters are required than the regular proportion, an index for instance

Space A piece of metal cast lower than a type, so as not to print used to separate words, they are of different thicknesses, so as to enable the compositor to arrange the words at equal distances from each other in the same line

Tympan A wooden frame attached to the carriage of the press by joints and covered with parchment, on which the sheet of paper to be printed is laid, there is another frame called the inner tympan which fits into this also covered with parchment, between these are placed pieces of woollen cloth termed blankets, which form a soft medium between the types and the platen that tends to produce an equal impression

Tympan Sheet A sheet of paper, the same that a work is printed on laid upon the tympan and fastened to it at the corners with paste, it is the guide on which the sheets to be printed are laid by which means the margin is kept regular and uniform

Wetting Trough Two troughs joined together and lined with lead, one deep containing the water, the other shallow of sufficient size to contain a paper board The paper is wetted for printing by drawing it through the water and opening it out on the board

PRINTING INK A composition with which the face of types and engravings in relief are coated previous to obtaining an impression from them it is made of different colours but books and the generality of printing, are executed with black ink Its composition generally speaking is linseed oil boiled to varnish with colouring matter added to it The preparation of this article was long kept a profound secret by the few manufacturers of it in England who completely monopolized the trade, till Mr W Savage published a treatise on the subject in which he gave the process in detail for making printing ink of every quality and colour which may be consulted with advantage by those who are interested in the subject

PRIOR, PRIORESS (Lat) The heads of certain convents of monks or nuns which are thence denominated *priories* the prior is inferior in dignity to the abbot

PRISCILLIANISTS In Ecclesiastical History, heretics of the 4th century, so named from Priscillian, bishop of Avila in Spain, who was put to death in A D 382 by Maximus tyrant of Gaul, for heresy on the accusation of another bishop, Ithacius one of the earliest instances of persecution to death for that offence The opinions of Priscillian and his followers are said to have been Manichæan but it is remarkable that Sulp Severus, himself sufficiently zealous against their doctrines admits that their persecutor Ithacius was a man of disreputable character and that purity and austerity of manners were often sufficient with him to ground an accusation of Priscillianism This affords a curious parallel with the history of the 12th and 13th centuries, when accusations of Manicheism were liberally brought against sectaries whose avowed tenets extended only to the reformation of ecclesiastical matters and denial of the church's authority (See *Mosheim* cent iv part 2)

PRISM In Geometry a solid contained by planes of which two that are opposite are equal, similar, and parallel and all the rest parallelograms Prisms take particular names from the figures of their ends, or opposite equal and parallel sides When the ends are triangles, they are called triangular prisms, when the ends are square square prisms, when the ends are pentagonal, pentagonal prisms, and so on *A right* prism has its sides perpendicular to its ends; an *oblique* prism is that of which the sides are oblique to the ends The solid content of a prism is found by multiplying the area of the base into the perpendicular altitude, hence all prisms are to one another in the ratio compounded of their bases and altitudes

PRISM In Dioptrics a piece of glass or other diaphanous substance, in form of a triangular prism employed to separate a ray of light into its constituent parts or colours by refraction The prism is the instrument by means of which most of the remarkable phenomena of

light and colours are exhibited. *See* CHROMATICS, OPTICS, [illegible]

PRISMATIC COLOURS The colours produced by de[illegible] *See* PRIMARY COLOURS

PRISMATIC COMPASS A surveying instrument, much used on account of its convenient size and form in military sketching and for filling up the details of a map where great accuracy is not required The construction is as follows — The compass-card divided into degrees and minutes, is attached to the needle and turns with it On one side of the compass-box stands a perpendicular slip, called the sight-vane, having a long narrow perpendicular slit in it, along the middle of which a fine thread is stretched On one side of the box opposite to the sight-vane, there is a prism, through which and through the sight-vane an object is observed and bisected by the thread The use of the prism is this — the rays of light passing from the thread to the eye are refracted in passing through the prism so that the thread appears to be prolonged and to intersect the circle on the card on which the divisions are, [illegible] any object which [illegible] diately by the division with which the thread coincides The angle between two stations is thus obtained being equal when the stations are on opposite sides of the meridian to the sum of their azimuths and to the difference of the azimuths when they are on the same side of the meridian The card is divided to 15′ of a degree which is, perhaps, a smaller angle than can be measured by this instrument (See *Simms's Treatise on Mathematical Instruments*)

PRISMOID An imperfect prism a figure resembling a prism, but not answering exactly to the definition

PRISON (Fr prendre *to take*) Imprisonment is used in most civilized states for three purposes for safe custody of persons charged with offences for the detention of debtors and for punishment under which latter head the reformation of prisoners must be comprehended as being properly only an adjunct to punishment The first principles of order seem to require that these three classes of prisoners should be kept entirely distinct and if possible in separate places of confinement but even the former rule has been generally very imperfectly observed while the latter is in most places impracticable by reason of expense The alleviation of the horrors of imprisonment by physical improvement of the condition of prisoners and the imparting of religious instruction has been from very early times an object with philanthropists but the adaptation of imprisonment to serve the end of punishment has been comparatively speaking only very recently attempted The Society of the Brothers of Mercy in Italy paid much attention to the former subject in the 15th and 16th centuries and the names of S Carlo Borromeo and St Vincent de Paule have derived from it much of their lustre But the earliest instance of a prison managed on any principles of policy and humanity seems to be that of the Penitentiary at Amsterdam erected in 1595 an example which was soon followed by some of the German towns especially Hamburg and Bremen In England it is well known that the impulse of prison improvement was first communicated by the celebrated Howard whose sufferings when taken by a privateer and imprisoned at Brest during the seven years' war, are said to have first directed his attention to the subject The fruits of his observations, in his repeated visits to most of the prisons of Europe, were given to the world partly in his publications and partly on examination before a committee of the House of Commons in 1774 To his suggestions and those of Jonas Hanway are principally owing the provisions of the 19 G 3 c 74 (passed in 1778) truly called the basis of succeeding legislation on the subject Solitary imprisonment was then first instituted The works of Neild and others, and the labours of the Prison Discipline Society (founded we believe chiefly by Mr Fowell Buxton) kept the attention of the public fixed on the subject In 1813 the construction of the Millbank Penitentiary was begun intended as a species of model prison but that establishment, from many errors committed in its foundation and first management, was long before it answered in any degree the views of its projectors Meanwhile practical improvement had proceeded much further in the United States of America where the experiments of solitary confinement and of association in silence were both first instituted on any extensive scale, and have formed the basis of two different systems which now divide the suffrages of observers Europe has in this matter taken lessons from America, and the reports of French visiters (Messrs Beaumont and De Tocqueville, 1834, Messrs De Metz and Blouet sent by government, 1837) of Dr Julius, sent from Prussia, and Mr Crawford from England, have contributed largely to the present state of public opinion on the subject In 1834 inspectors were appointed to report annually on the state of English and Scottish prisons, — a measure which had been earlier adopted with reference to Ireland, and their reports may be consulted with great advantage, both with a view to [illegible] prisons and their prospective reform [illegible] Report of the English Inspector for the Home District" [illegible] particularly valuable from the historical sketch it [illegible] and from [illegible] comparison there instituted between the separate and the silent systems The chief heads of improvement in prison discipline which have been recommended or introduced since public attention was called to the subject are, 1 Inspection and control, 2 Classification, 3 Separate or solitary punishment, 4 The "silent" or non-intercourse system, 5 The introduction of labour, 6 Religious and intellectual instruction — 1 The first of these is matter rather of practical than theoretical development The history of the [illegible] principles urged by General Bentham and his [illegible], the phenomenon which has formed, to a certain extent, the basis of later experiments, is mentioned under the head PENITENTIARY 2 Classification, under the English gaol acts of 1823 and 1824, has been extensively introduced into prisons It is of course a great improvement on the indiscriminate mixture of prisoners of all classes and characters which formerly prevailed, but as a means of reformation, or of punishment it has not answered the views once entertained of it And the reason is obvious the only object of classification is the exclusion of the moral influence of more or less corrupted minds, but by no system of classification (and as many as fifteen classes have been introduced in some prisons) can this be excluded In every class, whether arranged according to age or degree of offence, or in any other practicable mode there will probably be some unusually depraved characters, and then the experiment must fail The only perfect classification is that which constitutes the basis of, 3 The *separate* system, namely the entire separation of prisoners from each other in solitary cells When this has been carried to excess as a means of punishment, namely, seclusion by day and by night without labour, without employment, with only the occasional silent visits of the turnkey or the medical attendant it has generally proved more than human nature can bear, at least for any time, but separate confinement *with* labour as an alleviation, and with occasional visits for religious consolation and instruction, is a very different mode of treatment The separate system is that established in the great eastern penitentiary of Philadelphia now in operation for ten or eleven years, and in that of Glasgow, — which may be mentioned as models in their kind 4 The difficulty of enforcing solitary confinement, in some American prisons, seems to have led to the adoption of the *silent* system of which the prison at Auburn in Pennsylvania, affords the most celebrated instance The prisoners work together in the day but are prevented from all communication at night they are separate It was we believe, introduced several years ago in the Maison de Force at Ghent In England it is in operation at Coldbath Fields, Wakefield, and elsewhere With respect to the comparative advantages of the two systems the work of Messrs Beaumont and De Tocqueville may be consulted for an impartial summary of evidence without the expression of decided opinion (Part I chap ii s 3) The 'separate" was recommended in 1832 by the committee on secondary punishments and is advocated by Mr Crauford, in his *Report on the Penitentiaries of the U S* 1837 and in the 4th Report above alluded to by Dr Julius, by Messrs De Metz and Blouet and by M Moreau Christophe in various works The silent system seems to be supported by M Lucas, *De la Reforme des Prisons*, 1836 while in his *Theorie del Emprisonnement* he attempts to reconcile the two by Messrs Berenger and Gasparin, and by Mr Inspector Williams (4th Report England, Northern and Eastern Division) The chief objections to the separate system are, — 1 As a punishment, its inequality, being felt far more severely by some than others, but to this it may be answered that those who do feel it are precisely those whom it is most desirable to affect — the more depraved 2 Its effects on the mind and passions in some respects, a very difficult and delicate subject, and by far the most serious charge against it 3 That even as a system of reform, for which in subjects presenting any prospect of amendment, it is best calculated, it is utterly useless in short terms of imprisonment "Those best acquainted with the subject in the U S," says Mr Williams conceive that two years' imprisonment are required before any impression can be made and from four to six years to achieve the work of reformation" To the silent system its enemies object, — 1 The extreme difficulty of carrying it into successful operation 2 Its supposed effect in irritating, degrading and even brutalizing the minds of prisoners by its vexatious discipline They appeal in support of this position to the quantity of punishment (corporal or by solitary confinement) which is required to carry it into effect In Wakefield and Coldbath Fields upon this system, [illegible] punishments were inflicted on 13 188 prisoners, or two on each on the average while in all England the proportion was found to be [illegible] punishments to 101 195 prisoners or one to two only But this is explained in some degree, in the

latter prison at least, by the number of short imprisonments & With respect to the introduction of *labour* into prisons of punishment, the chief question seems to be, w e p ' part of the punishment, and be , a ' ' severe nature, or whether it should be used as an alleviation to the rigour of separate confinement, as a ' ' '

ase there are 5 chances in all, 3 of which are in favour of a white ball, and 2 in favour of a black The probability of drawing at the first trial any particular ball will evidently be represented by the fraction $\frac{1}{5}$, hence the probability of drawing a white ball is $\frac{3}{5}$, and the probability of drawing a black ball $\frac{2}{5}$ Now it is obvious that he absolute number of balls in the urn will not affect the elative probabilities, so long as the proportion of white to black balls remains unaltered Suppose, for example, the number of balls increased to 50, of which 30 are white and 20 black; the probability of drawing a white ball at he first trial must still remain the same, there being always 3 chances in favour of a white ball for every 2 in avour of a black Whatever, therefore, the number of balls in the urn may be, the probability of drawing one of a particular colour must remain the same, so long as he ratio of the number of balls of that colour to the whole number in the urn remains unaltered Hence, we derive the following definition, which is, in fact, the basis of the whole doctrine of probabilities —

The probability of the occurrence of any event is measured by a fraction, the numerator of which expresses he number of chances favourable to the occurrence of the event, and the denominator the whole number of chances avourable and unfavourable

This fraction is called the mathematical probability t is important to remark, that all the chances are considered as equal, for example, that, in drawing a ball rom the urn, any one ball has the same chance of being drawn as any other

Every contingent event gives rise to two opposite probabilities,—one that the event will happen, the other hat it will not, and the sum of these probabilities is always equal to unity Thus in the preceding example he probability that a white ball will be drawn from the urn is $\frac{3}{5}$ and the probability that a black ball will be drawn i e that a white ball will *not* be drawn) is $\frac{2}{5}$, and $\frac{3}{5} + \frac{2}{5} = \frac{5}{5} = 1$ In general, let m denote the number of chances avourable to an event and n the number of unfavourable hances, then the whole number of chances or ways in which the event can happen or fail, being $m + n$, the probability that the event will happen is $\frac{m}{m+n}$, the probability that it will not happen $\frac{n}{m+n}$, and the sum of these probabilities is 1 Hence if p denote the probability of he occurrence of any event the probability that it will not occur is $1 - p$ For instance let p = the probability hat an individual of a given age will live over one year, hen $1 - p$ is the probability that he will *not* live over the ear or that he will be dead within the year As the individual must either be alive or dead the sum of the probabilities must necessarily amount to *certainty* which s represented by *unity* and hence the probability of any ontingent event is always a fraction less than unity

Probability of simultaneous Events — The probability f the simultaneous occurrence of several independent vents is calculated as follows — Let it be required for xample to determine the probability of throwing aces ith two dice Let the dice be called respectively A and B The probability that A will turn up ace is $\frac{1}{6}$ and if a erson were to purchase the chance of receiving a sum f 36*l* on the occurrence of this event alone the proper um he ought to pay for the chance is 6*l* But if the um is to be received only on condition of A and B both urning up ace the above probability will only be beneficial o him provided B also turns up ace Now the probaility of this event is likewise $\frac{1}{6}$ therefore, the probability f receiving the sum is $\frac{1}{6}$ of $\frac{1}{6}$ that is $\frac{1}{36}$ and the price to e paid for the chance is $\frac{1}{6}$ of 6*l*, that is, 1*l*

The same reasoning may be applied to any number f independent events, and the conclusion which is perfectly general may be expressed in the following terms —

The probability of the occurrence of several independent vents is obtained by multiplying together their separate robabilities" Thus let p denote the probability of an vent A, q that of an event B r that of an event C &c, hen the probability of the joint occurrence of those vents is expressed by the continued product $p\,q\,r$ &c

Probability of successive Events — The probability of he successive recurrence of the same or different events s determined precisely in the same manner For example, let the probability be required of throwing ace wice successively with the same die The probability f ace turning up at the first throw is $\frac{1}{6}$, and at the second $\frac{1}{6}$, the probability of ace turning up at both throws s therefore $\frac{1}{6}$ of $\frac{1}{6} = \frac{1}{36}$ Hence the probability that ace will not turn up *both* at the first and second throw s $1 - \frac{1}{36} = \frac{35}{36}$ This last probability, it is necessary to emark, is quite distinct from the probability that ace will not turn up in either throw, and which is found hus — The probability that ace will *not* be thrown at the first throw is $\frac{5}{6}$, and the probability that it will not be thrown at the second also $\frac{5}{6}$ hence, by the former rule, the probability that it will not be thrown at either throw is $\frac{5}{6} \times \frac{5}{6} = \frac{25}{36}$ This added to $\frac{1}{36}$, the probability that ace will be thrown both times, does not give the sum equal to unity, for there are still two cases to be taken account of Ace may be thrown at the first throw, and not at the second, or ace may not be thrown at the first throw, but thrown at the second The probability that ace will turn up at the first throw is $\frac{1}{6}$, and that it will not turn up at the second throw $\frac{5}{6}$, hence the probability that it will turn up at the first, and not at the second, is $\frac{1}{6} \times \frac{5}{6} = \frac{5}{36}$ The probability that it will not turn at the first, but turn up at the second, is $\frac{5}{6} \times \frac{1}{6} = \frac{5}{36}$, and the sum of these added to the sum of the probabilities of the two former cases, gives a result equal to unity A distinct enumeration of the different suppositions that may be made relative to the ace point, in two successive throws of the same die will render this reasoning more obvious The event [illegible] ur ways, which, with their r[illegible] a follows —

1 Ace at both throws, probability $= \frac{1}{36}$
2 Ace at neither throw, probability $= \frac{25}{36}$
3 Ace at first, not at second probability $= \frac{5}{36}$
4 Ace at second not at first, probability $= \frac{5}{36}$

And the sum of these fractions is $\frac{36}{36} = 1$

This reasoning may be rendered general Suppose m = the number of white balls in an urn and n = the number of black balls in the same urn, and that when a ball has been drawn it is immediately replaced in the urn, so that at each trial the whole number of chances is $m + n$ Let p = the probability of drawing a white ball on any trial, and q = the probability of drawing a black ball, we have then $p = \frac{m}{m+n}$ and $q = \frac{n}{m+n}$ And first let us consider the probabilities of the different possible events that may happen on two trials

The only possible ways in which the balls can be drawn in two successive trials are these four —

1 First white second white probability $= p \times p = p^2$,
2 First white second black, probability $= p \times q = pq$,
3 First black second white, probability $= q \times p = pq$,
4 First black, second black, probability $= q \times q = q^2$

Adding together these probabilities we get

$$p^2 + 2pq + q^2 = (p + q),$$

and the sum is equal to unity as will be evident by substituting for p and q their values in terms of m and n

It thus appears that the probabilities of all the different combinations that can be formed in two trials are respectively given by the development of the binomial $(p + q)$ It will be observed that the term $2pq$ gives the probability of drawing a ball of each colour in the two trials without distinction of order, that is the white ball may be drawn either at the first or second trial

Now let the number of trials instead of being two, be increased to any number u, the probabilities of the different combinations will be given by the development of the binomial $(p + q)^u$ This development is

$$p^u + \frac{u}{1} p^{u-1} q + \frac{u(u-1)}{1\,2} p^{u-2} q^2 + \frac{u(u-1)(u-2)}{1\,2\,3} \cdots \frac{(u-v+1)}{v} p^{u-v} q^v + \&c$$

The first term p^u indicates the probability of drawing a white ball in each of the u trials, or that all the balls drawn will be white The second term $u\,p^{u-1} q$ denotes the probability of drawing $u - 1$ white balls and one black ball in u trials without regard to the order, that is to say the black ball may be drawn at the first second, third, or any other trial The general term

$$\frac{u(u-1)(u-2)\cdots(u-v+1)}{1\,2\,3\cdots v} p^{u-v} q^v$$

gives the probability that in u trials $u - v$ white balls will be drawn and v black balls without distinction of order If the probability of drawing the ball in a determinate order of succession were required, for instance, if it were required to determine the probability of drawing $u - v$ white balls successively and then v black balls; the coefficient of the term must be suppressed, and the probability becomes $p^{u-v} q^v$

The practical question that most frequently arises is, not to determine the probabilities of the repetitions of an event in any precise order but the probability that the number of repetitions will exceed or not exceed a certain limit Thus in the preceding example suppose it were required to assign the probability that not fewer than $u - v$ white balls will be drawn in u trials, it is evident that as the first term gives the probability of drawing u white balls, the second term that of drawing

$u - 1$ white balls, and so on, and as each of these combinations satisfies the condition, the required probability will be found by taking the sum of all the terms of the development of $(p + q)^u$ from the first to that in which the factor $p^{u-v} q^v$ appears, both inclusive As an example, let it be required to determine the probability of throwing ace at least *twice* in four throws of the same die Here we have $p = \frac{1}{6}$, $q = \frac{5}{6}$, $u = 4$, and $u - v = 2$, whence $v = 2$ Now the development of $(p + q)^4$ to the term in which $p^2 q^2$ occurs is $p^4 + 4 p^3 q + 6 p^2 q^2$, which, on substituting for p and q their values, becomes $(\frac{1}{6})^4 + 4 (\frac{1}{6})^3 \times \frac{5}{6} + 6 (\frac{1}{6})^2 \times (\frac{5}{6})^2 = \frac{171}{1296}$ = between $\frac{1}{7}$ and $\frac{1}{8}$

Again suppose the question were to assign the probability of throwing ace at least three times in four trials we should have $u - v = 1$ and therefore $v = 3$ Now the term of the development of $(p + q)^4$ in which $p q^3$ occurs is the fourth, or last but one, the sum of the first four terms therefore, gives the required probability But the calculation of this sum is easy, for, since the sum of all the terms is $(p + q)^4 = 1$, and the last term is q^4, the sum of the first four is $1 - q^4 = 1 - (\frac{5}{6})^4 = 1 - \frac{525}{1296} = \frac{671}{1296}$

Probability derived from Experience — In what precedes it has been supposed that the number of ways in which an event can arrive are known *a priori*, but it may happen and indeed does happen in the greater number of the most important questions to which the calculus of probabilities is applied that the number of chances favourable and unfavourable to the occurrence of any particular event is unknown and that the ratio of the one to the other can only be inferred from considering the ways in which the event has been observed already to happen Recurring to the case of the urn — let us suppose the urn to contain a certain number of balls of different colours, but that the number of each colour is unknown and that from having observed the result of several trials, we have to determine the probability of drawing a ball of a particular colour at the next trial The method of proceeding is as follows — Taking a simple case, suppose the urn to contain only four balls of two colours white and black and that on four successive trials (the ball drawn being in each case replaced in the urn) three white balls and one black have been drawn Three hypotheses may be formed respecting the number of balls of each colour in the urn and if $p =$ the probability of drawing a white ball and $q =$ that of drawing a black ball, on any hypothesis the three hypotheses with the corresponding values of p and q, will be as under, viz —

1 3 white, 1 black $p = \frac{3}{4}$ $q = \frac{1}{4}$,
2 2 white 2 black $p = \frac{2}{4}$ $q = \frac{2}{4}$,
3 1 white, 3 black, $p = \frac{1}{4}$ $q = \frac{3}{4}$

Now, on calculating from each of these hypotheses the probability of the event observed namely of drawing three white balls and one black in four trials which probability, by what was shown above, is expressed by $4 p^3 q$, we have,

by 1st hypothesis, $4 p^3 q = \frac{27}{64}$
by 2d hypothesis, $4 p^3 q = \frac{16}{64}$,
by 3d hypothesis, $4 p^3 q = \frac{3}{64}$

The numerators of these fractions, which represent the relative probabilities of the event which has happened on each of the hypotheses, may be considered as giving the relative probabilities of the hypotheses as to the causes of the event, or to the state of the urn by which the event was determined, and, as one or other of these hypotheses must necessarily be true, the sum of their probabilities must be unity, whence the probability of each hypothesis is respectively

$$\frac{27}{46}, \frac{16}{46}, \frac{3}{46}$$

This result may be expressed generally as follows — The probabilities of the different hypotheses are found by dividing the probability of the event which has been observed calculated according to each hypothesis by the sum of its probabilities calculated on all the hypotheses

Now, in order to find the probability of drawing a white ball at the next trial we may reason in this manner — If the first hypothesis be true, the chance of drawing a white ball is $\frac{3}{4}$, and the probability of the hypothesis being true is $\frac{27}{46}$, therefore the compound probability of both hypothesis and event is $\frac{3}{4} \times \frac{27}{46} = \frac{81}{184}$ If the second hypothesis be true, the probability of drawing a white ball is $\frac{2}{4}$, and the probability of the hypothesis is $\frac{16}{46}$, therefore the compound probability is $\frac{2}{4} \times \frac{16}{46} = \frac{32}{184}$ If the third hypothesis be true, the chance of drawing a white ball is $\frac{1}{4}$, and the probability of the hypothesis is $\frac{3}{46}$, therefore the joint probability of the hypothesis being true and of the event arising is $\frac{1}{4} \times \frac{3}{46} = \frac{3}{184}$ Adding together these partial probabilities, the whole probability of drawing a white ball at a future trial is $\frac{81}{184} + \frac{32}{184} + \frac{3}{184} = \frac{116}{184}$

In like manner, the probability of drawing a black ball at a future trial is

$$\frac{1}{4} \times \frac{27}{46} + \frac{2}{4} \times \frac{16}{46} + \frac{3}{4} \times \frac{3}{46} = \frac{68}{184}.$$

And the sum of the two probabilities is 1, as it ought to be since the ball must necessarily be white or black

The method of proceeding which has been followed in this particular case [illegible] cases where it is required to determine the probability of future events depending on causes not known *à priori*, but only inferred from experience It may be stated generally as follows — Let c, c', c'', c''', &c be so many independent causes (or hypotheses), each of which may give rise to an event E and let the probabilities of the existence of these causes be respectively h, h', h'', h''', &c, and those of the events calculated according to each hypothesis p, p' p'' p''', &c then the probabilities of the event E is $h p + h' p' + h'' p'' + h''' p'''$ + &c

The preceding examples will suffice to give some idea of the manner in which the probability of the occurrence or failure of events depending on chance is submitted to numerical estimation, but for the methods of applying the calculus in particular cases, and especially when the formulæ involve high numbers, and the ordinary processes of arithmetic become unavailable, reference must be made to works specially devoted to the subject, a list of which is given at the end of this article

The calculus of probabilities had its origin in the speculations of Pascal Fermat Huygens and other eminent mathematicians of the 17th century It was first applied to the solution of questions connected with games of chance but it has since by the researches of James Bernoulli, Montmort, Demoivre D Alembert, Simpson Condorcet Lagrange La Place Poisson, and others become one of the most interesting branches of mathematics and been applied with equal success and advantage to numerous [illegible] cations is to the subject of annuities assurances reversions and other interests depending on the average duration of human life and the expectation of the continuance or survivorship of lives of given ages (See ANNUITY, EXPECTATION OF LIFE) Another important application is to determine the most probable *mean* or average of a great number of observations and hence its utility in many cases of practical astronomy and general physics (See PROBABLE ERROR) Condorcet has applied it to determine the value of testimony the verdicts of juries, and the best mode of constituting tribunals and of collecting votes in elections In such applications it is true assumptions more or less arbitrary must be admitted and great uncertainty will always attach to results which are influenced by human will or caprice, nevertheless the knowledge derived from an accurate and systematic analysis of the circumstances concerned, and of the consequences of their various combinations, affords important aid in guiding our judgments, and may be of great use in the practical affairs of life

The following are the principal works on the subject — Montmort *Analyse des Jeux de Hasard* (1st edit 1708, 2d 1713), Bernoulli, *Ars Conjectandi* 1713, De Moivre, *Doctrine of Chances* (1st edit 1718, 3d, greatly enlarged, 1756), Simpson *Laws of Chance*, 1740, Condorcet, *Essai sur l'Application de l'Analyse à la Probabilité des Decisions rendues à la Pluralité des Voix* 1785, La Place, *Theorie Analytique des Probabilités* 3d edit 1820, Poisson *Recherches sur la Probabilité des Jugemens*, 1837, the article in the *Encyc Metropol* by Professor De Morgan and that in the *Encyc Brit* by Mr Galloway (which is published separately) For elementary works the reader may be referred to *Simpson's Laws of Chance*, and *Lacroix's Traité Elémentaire*, &c, and for an explanation of the objects and results of the science without mathematical investigation to Professor De Morgan's *Essay on Probabilities and on their Application to Life Contingencies and Insurance Offices*, in the *Cabinet Cyclopædia*

PROBABLE ERROR In Astronomy and Physics, when the value of any quantity or element, as the declination of a star, the latitude of a place, the specific gravity of a body, &c has been determined by means of a number of independent observations, each liable to a small amount of error the determination (in whatever way it may have been deduced from the observations) will also be liable to some uncertainty, and the *probable error* is the quantity, which is such that there is the same probability of the difference between the determination and the true absolute value of the thing to be determined exceeding or falling short of it Thus, if twenty measurements of an angle have been made with the theodolite and the arithmetical mean or average of the whole gives 50° 27′ 15″; and if it be an equal wager that the

rror of this result (either in excess or defect) is less
an 2 seconds, or greater than 2 seconds, then the pro-
able error of the determination is 2 seconds The me-
od of computing the probable error which is deduced
m the theory of probability is as follows — Let l, l', l'' &c be the *observed* values, h the number of observations, m the average value (*i e* the sum of the observed values divided by number of observations), then if we call $l - m$ the error of the observation l, and $\Sigma (l-m)^2$ the sum of the squares of the errors of all the observations,

he probable error is $.674489 \times \frac{\sqrt{\Sigma (l-m)^2}}{h}$, that is, the

quare root of the sum of the squares of the errors, di-
ded by the number of observations, and multiplied by
he decimal .674489

It is frequently convenient to compute the probable error of a result from another function, which is called he *weight* The weight is the square of the number of bservations divided by *twice* the sum of the squares of he errors, and the probable error is .476936 divided by he square root of the weight This definition agrees ith the former, for $.674489 = .476936 \times \sqrt{2}$

PROBANG A flexible piece of whalebone with a ball f sponge attached to its extremity, for the purpose of

PROBATE OF TESTAMENTS In Law, the exhibiting and proving wills and testaments before the ecclesiastical judge delegated by the ordinary of the place here the party dies It is done by granting letters testamentary to the executor under seal of the court, and uch probate is evidence in questions relating to the personal estates

PROBE (Lat probo, *I try*) A surgical instrument enerally made of silver wire rounded at one end and ointed at the other, for the purpose of examining ounds

PRO'BLEM In Geometry a proposition requiring me operation to be performed or construction to be ecuted, such as to bisect a line, to describe a circle assing through three given points

quires some unknown truth to be
overed and demonstrated

PROBOSCI'DIANS *Proboscidia* (Lat proboscis *a unk*) The name of a family of Pachydermatous Mamals including those which have the nose prolonged to a prehensile trunk or proboscis, as the elephant and astodon

PROBO'SCIS, in Mammalogy signifies the prehenle organ formed by a prolongation of the nose of which e trunk of the elephant is an example In Entomogy the oral instrument of the Diptera is so called in hich the ordinary trophi are replaced by an exarticulate sheath terminated by a pair of tumid lobes abella) and containing one or more lancet shaped struments (scapella), covered by a valve In Malology, the same term is applied to the tongue of certain astropods, when it is so long as to be capable of being otruded for some distance from the mouth, in which se it is generally organized at the extremity for the rpose of boring the shells of other testacea and of

soft parts of the inhabitant

PROCEDENDO *Procedendo in Loquela*) A writ hich lies where an action has been removed from an inrior to a superior jurisdiction, and it does not appear to e court that the suggestion on which the removal ok place was sufficiently proved to send the cause back the inferior court for further proceeding

Procedendo ad Judicium A writ which issues out of the urt of chancery, commanding inferior courts to proceed judgment where it has been unjustly delayed

PROCELLA'RIA (Lat procella, *a storm*) A Linean genus of web footed birds, now the type of a family the *Longipennate Palmipedes* in the system of Cuvier, haracterized by the beak being hooked at the tip with a extremity appearing as though a piece had been articulated to the rest, the nostrils are united to form a ube, which lies along the back of the upper mandible, nd their feet instead of a back toe have merely a claw nplanted in the heel Those species in which the lower andible is truncated belong to the true *Procellaria* ome smaller species with a shorter bill rather longer gs, and black plumage, commonly called *Storm-birds*, r *Mother Carey's chickens*, are associated under the eneric name *Thalassidroma* The *Procellariæ* range ver the high seas at the greatest distance from land Their name of *Petrel*, which is a diminutive of *Peter*, as been applied to them from their habit of walking on e waves, which they do with the assistance of their

PROCESS In the Common Law, used in two senses to signify the whole proceedings n an action or prosecution, and to signify the means hereby the defendant in an action is compelled to appear in court When actions were commenced by original rit (*see* PLEADING), original *process* was that which as founded on that writ, commencing with notice, writ of attachment, &c. *Mesne*, or intermediate process, was, properly speaking, such process as issued pending the writ on some collateral or interlocutory matter, as to summon juries or witnesses But in popular language it was taken to signify the whole process, from the commencement of the suit, before the final process which ended it Thus a defendant was said to be arrested on *mesne* process, *i e* on a writ of capias issued *pending* the suit This was done originally when the defendant,

writ of capias
to which
the term mesne process was still, inaccurately, applied The term mesne process is now commonly applied to the writ of summons, which is the instrument now in use for commencing personal actions Thus the popular inaccuracy of language is retained Final process is the writ of execution used to carry the judgment into effect In ordinary language, the regular proceedings of every court of judicature in a suit are called its process

PROCÈS VERBAL In the language of French jurisprudence, an authentic written minute or report of an official act or proceeding, or statement of facts The

power of issuing proclamations is a branch of the king's prerogative, and vested in him alone They have a binding force on the subject, in so far as they are grounded on and enforce the laws of the realm They may be said to be of two sorts the one, enforcing an actually existing law by giving it a particular application to time place and circumstance, the other an exertion of any power vested in the king, which until so exercised is dormant as a proclamation to prohibit any subject from leaving the realm during a certain time Proclamations must be under the great seal By 31 H 8 c 8 it was enacted that the king's proclamations should have the force of law, an enactment which while it subsisted did, in effect, make a complete revolution in the government of this country It was, however, repealed five years afterwards by 1 E 6 c 12 Nevertheless, in later times, it was held by crown lawyers, that the king might suspend or dispense with an existing law in favour of particular circumstances But by 1 W & M stat 2 c 2 it is declared that no such power exists

PROCONSUL Originally an officer invested with consular command without the office Thus, a consul sometimes had his command prolonged to him after his year of magistracy had ceased, with the title of proconsul The provinces which at first were governed by prætors were for the most part, subsequently put under *proconsuls* and *propraetors* who were at first especially appointed at the Comitia Tributa, but afterwards by the Sempronean law entered on their provincial jurisdictions forthwith, on the expiration of their year of consulship or prætorship The office was properly annual, but it might be prolonged, as was done in the case of Cæsar In the time of the republic the proconsul held the military command as well as the civil jurisdiction of his province, and accordingly had about him a large staff of officers as the lieutenants or legati prætects &c But Augustus, on assuming the chief power in the state, remodelled the system by a new partition of the provinces and by separating the civil jurisdiction, which was left the proconsul, from the military command Under the emperors, the proconsuls and propraetors were thus distinguished, the former being appointed to the provinces under the especial superintendence of the senate, the latter to those which the emperor held

PROCRUSTES In Mythology, a famous robber of ancient Greece who tortured his victims by placing them on an iron bed, which their stature was made to fit by stretching or mutilating them so as to suit its dimensions, whence the well-known the *bed of Procrustes* He was Hermione in Argolis More correct recent critic (Bottiger), Procrustes, Sinis Phalæ mptes, &c were all different names for one real or fabulous robber, derived from the different kinds of violence applied by him to travellers

PROCTOR (Lat procurator) In Ecclesiastical Law, he who undertakes for his ecclesiastical or civil court, under 3 G 3 c 127, exercising the same office which is performed by attorneys and solicitors in courts of common law and equity

PROCTORS In the English Universities, both at Oxford and Cambridge, two masters of arts are appointed annually Each college, in both, nominates a proctor in rotation, according to a cycle of years drawn up, on mathematical principles, to suit the number of fellows on the foundation of each The proctors are officers of considerable importance, being, in the first place, the chief police magistrates for the time being of each

university They, with their deputies the pro-proctors, have power not only to enforce the rules of academical discipline on the students but also an extensive summary authority over the townspeople, according to the special privileges of the universities They also have, in both universities peculiar judicial authority as assistants to the heads of houses and have votes in the election of many public officers from the proctors must be masters of arts, and their stipends, in Oxford, from

PROCURATOR (Lat pro *for* and cura *care*) A Roman provincial magistrate who collected the revenue and managed the affairs of the revenue and sometimes had jurisdiction in matters pertaining to it Sometimes procurators were charged the office of governor especially of a small province, as did Pontius Pilate in Judæa, in which case, but not otherwise he had the power of inflicting capital punishment This magistracy did not exist under the republic, its duties being comprised under those of the prætor or proconsul, but was instituted by Augustus They were called *Procuratores Cæsaris*, to distinguish them from the common procurator, who was merely an agent employed by private persons to manage their affairs in their absence when an action was brought against them

PROCURATOR, *Procuréur*, &c In the Civil Jurisprudence, one who undertakes the care of any legal proceeding for another and stands in his place by virtue of a power or *procuration* from him A *mandatory* is said to differ from a *procurator* in that the latter acts only by virtue of an express written instrument In France before the revolution the procureurs (procuratores ad lites) were officers legally empowered to carry on suits on behalf of clients This body was abolished in 1791 and that of *avoues* substituted in its place The *procureurs du roi*, in France are officers of whom one is appointed to every tribunal of arrondissement, together with a sufficient number of 'substitutes"

PROCURFUR GENERAL The public advocate of the crown in France Every *parlement* or *cour souveraine* had, before the Revolution a *procureur-general* attached to it Under the present system of judicature one of these officers is established in every *cour royale* for the criminal [illegible] court The public accusers in the inferior courts of assize and *premiere instance* are termed respectively *procureurs criminels* and *procureurs du roi* These officers are charged with the conduct of all criminal proceedings on behalf of the prosecution, and are placed under the immediate control of the minister of justice

PRODIGY (of very doubtful etymology) in ordinary modern language signifies a surprising though natural event, in contradistinction to *miracle* which is something out of the course of nature Among the Romans however, any extraordinary event or appearance to which from insufficient acquaintance with natural history they could not assign a cause was termed a *prodigy* and regarded as a supernatural event indicative of favourable or (more generally) of unfavourable dispositions of their gods Hence the number of recorded prodigies many evidently false some real but misunderstood, which Livy has inserted in his annals

PRODOMUS (Gr προ, and δομος, *house*) In Ancient Architecture the portico before the entrance of the cella of a temple, the same as *pronaos* See NAOS

PRODUCT, in Arithmetic and Algebra, the result of, or quantity produced by the multiplication of one number by another, or a quantity of any kind by a number *See* MULTIPLICATION

PRODUCTA An extinct genus of fossil bivalve shells closely allied to the living genus *Terebratula* They only occur in the older secondary rocks

PROEM (Gr προ ειμι *I go before*) A term formerly used for *preface*, which see

PROEMPTOSIS (Gr προ *before*, and πιπτω *I fall upon*) The term applied to the lunar equation or addition of a day to prevent the new moon happening too soon, which must be effected by the addition of a day every 330 years and another every 2400 The opposite term is *metemptosis*, which is used to signify the solar equation necessary to prevent the new moon from falling a day too late or the suppression of the bissextile every 134 years

PROFESSOR, in its title, in all universities [illegible] teachers in the various faculties In the origin of those institutions the degrees conferred on students were in fact, licences to commence as public teachers, and the terms master doctor and professor seem to have been used indifferently But as in process of time the great body of graduates ceased, in most of them, to have any concern in public instruction, a separate body of recognized teachers gradually arose, endowed in some instances with salaries, in others paid by fees These were the professors But in those universities in which collegiate foundations prevailed, as in Oxford [illegible] into a secondary situation [illegible] instruction was transacted and still continues to be so, by the functionaries of the several colleges The professors therefore, and the instruction which they convey by lectures, have become only auxiliaries, instead of principals, and attendance on their lectures is in few cases compulsory On the other hand, in universities destitute or nearly so of collegiate endowments (as those of Scotland, Germany, and others founded on the German model), the professors have become at once the governing body of the university, and the sole recognized functionaries for the purpose of education

PROFILE (Fr profil) In Architecture, the contour of the different parts of an order

PROFILE In the Fine Arts, an outline of the principal parts of an object, free from all fore-shortening, showing their real projections indentations, &c

PROFIT (Fr profit), in Political Economy, means the advantage or gain resulting to the owner of capital from its employment in industrious undertakings It is the premium, as it were, on accumulation Were there no profit there would be little or no motive to save and amass, and all the vast advantages that society derives from the formation and employment of capital would be unknown But without taking into account the security and consequence conferred on the possessors of capital or wealth and looking only at its tangible results profit consists of that part of the produce raised by the agency of capital employed in industrious undertakings that remains in the hands of those by whom it is employed after replacing the capital itself, or such portions of it as may have been wasted in the businesses and every expense necessarily incurred in superintending its employment

The *rate* of profit is the proportion which the amount of profit derived from an undertaking bears to the capital employed in it

Thus suppose an agriculturist employs a capital equivalent to 1000 quarters of corn or 1000*l* in the cultivation of a farm and that the net surplus produce remaining to him at the end of the year after his capital has been replaced and he has been indemnified for the trouble of superintendence and for every necessary expense incurred in the management of the farm is 100 quarters or 100*l* this net surplus would form the profits of the agriculturist being to the capital by whose agency they are obtained in the ratio of 100 to 1000, or at the rate of ten per cent

It has been shown by Dr Smith and others, that the capital vested in different businesses yields, provided they be not subjected to any species of monopoly about the same rate of net profit and we shall now endeavour shortly to state the circumstances which seem to determine this rate

In this investigation it is not necessary to inquire whether the capital engaged in certain businesses yield rent as well as profits or profits only The competition of the producers will always reduce profits in different businesses to what is taking all things into account, nearly the same common level, and as rent is in every case a surplus over and above profits it may in this investigation be left wholly out of view The laws by which profits are regulated in countries where the best lands only are cultivated, and no rents are paid are in no respect different from those which regulate them in countries where cultivation has been widely extended, and where lands of superior fertility yield a high rent

Suppose therefore that rent is deducted or set aside, it follows that the whole of the remaining produce of industry must in the first instance be divided between capitalists and labourers that is between those who furnish the capital and those who furnish the manual labour made use of in the production of commodities And hence were taxation either unknown or constant the proportion of the produce of industry under deduction of rent falling to the share of the capitalists could not be increased without the proportion falling to the share of the labourers being at the same time diminished and conversely But the share of the produce of industry falling to the capitalists includes, besides profit, the portion required to replace the capital wasted in production, and to defray the wages of superintendence So that the rate of profit is not as has been already stated, determined by the ratio which the share of the produce of industry that goes in the first instance to the capitalists, after every sort of outlay has been deducted, bears to the total capital employed

Suppose, for example that an agriculturist employs a quantity of capital of the value of 1000 quarters of corn, or 1000*l*, in cultivating a farm, that half this capital consists of seed horses and other instruments used in agriculture, the other half being employed in the payment of wages, and suppose that after all is deducted or set aside, he has produce equivalent to 1200 quarters, or 1200*l*, of this sum 1000 quarters, or 1000*l*, must go to replace his capital, and suppose that his taxes amount to 100 quarters, or 100*l* It follows that 100 quarters, or 100*l*, will remain for his profits, [illegible] at the rate of ten per cent Now [illegible] case is, *mutatis, mutandis*, the case of every man engaged

in business,—it is obvious that the rate of profit may be raised in three, but only in three ways, viz 1 By industry becoming more productive; or 2 By a reduction in the rate of wages; or 3 By a reduction in the amount of taxation And it may be reduced by the opposite circumstances, or 1 By industry becoming less productive, or 2 By a rise in the rate of wages, or 3 By a rise in the amount of taxation Profits cannot be affected in any way not referable to one or other of these heads

To revert to a previous supposition, if by applying other things remaining the same, the produce is increased, by means of the capital and labour employed, from to 1300 quarters, or 1300*l*, the gross amount of profits would in this case be increased from 100 quarters, or 100*l*, to 200 quarters, or 200*l*, and the rate of profit would be raised from 10 to 20 per cent A similar result would be produced, other things being the same, were wages reduced from 500 quarters, or 500*l*, to 400 quarters, or 400*l*, and were taxation reduced from 100 quarters or 100*l*, to 50 quarters, or 50*l*, the rate of profit would be raised from 10 to 15 per cent On the other hand, if we suppose that the quantity of produce, instead of being increased, is diminished, or that wages or taxes are augmented, the gross amount of profit, and the rate of profit, will be proportionally lessened

Had it not been for the gradually decreasing productiveness of the capital laid out on the lands, the productiveness of industry would have increased with every increment of labour, so that, without a corresponding rise in wages and taxes the rate of profit would have been continually increasing But though improvements may materially increase the productiveness of agricultural industry for a lengthened period, the increase cannot be permanent inasmuch as the growth of population never fails in the end to force recourse to inferior lands, which, of course yield less produce in return for the same outlay Thus the productiveness of the capital applied to the soil has a double influence over profits, for in the first place it lessens the quantity of produce obtained by the outlay of capital and labour, and in the second place it increases the portion of that produce going to the labourer as wages The latter must always get enough to enable him to subsist and continue his race, and though, in the event of his resorting to a lower species of food or an inferior standard of comfort a rise in the price of raw produce may not be followed by a rise of wages yet speaking generally the one is always consequent to the other The cost of food is the main regulator of wages, and it is quite impossible to go on for any lengthened period by taking bad land into cultivation or forcing the good land making constant additions to its cost without ultimately raising wages M the adaptation of matter to ou s from the influence of discoveries and inventions more and more productive as society advances, so that the decreasing fertility of the soil is at bottom the only cause of whatever reduction in the rate of profit is to be ascribed to a decline in the productiveness of industry, and it is pretty frequently also the cause of those reductions that are occasioned by a rise in the rate of wages The latter it is true, is also brought about by an increased demand for labour, and by a greater prevalence of moral restraint But a rise of wages caused by the increased cost of necessaries does not depend on contingent circumstances, or on the forethought of the labourers It must be experienced in every country and state of society as it becomes more and more difficult to of food for an increasing population The absolute wages of the labourer, or the quantity of necessaries and conveniences given him for his labour, may be, and indeed frequently are, diminished in the progress of society but when cultivation is far extended he is uniformly almost in the receipt of a larger share of the produce of his labour, so that, as has just been observed profits are reduced in an advanced stage of society because the quantity of produce is diminished and because the larger share of this diminished quantity

I of Smith, as to the circumstances which determine the rate of profit, differs widely from the above He seems to have had no idea of the important principle which shows that, despite the countervailing influence of improvements, the capitals successively applied to the land are sure, in the long run, to decrease in productiveness And not imagining that there was any natural cause why the produce obtained by the outlay of equal amounts of capital and labour should ever be diminished he supposed that profits were lowered through the competition of capitalists, that when capital increased, the undertakers of different businesses became anxious to encroach on each other, and that, in order to attain their object, they offered their produce at a lower price, and gave higher wages to their workmen

B theory appear sufficiently least examination It is easy to see that competition cannot occasion a general fall of profits All that competition can do, and all that it ever does, is to reduce the profits obtained in different businesses and employments to the same common level to prevent particular individuals realizing greater or lesser profits than their neighbours Farther than this competition cannot go The common and average rate of profit depends not on it, but on the excess of the produce obtained by employing capital after it is replaced, along with every contingent expense Competition can not affect the productiveness of industry nor can it, speaking generally, affect the rate of wages, for, such as the ordinary demand for labour is, such will be its supply, and it has no influence over taxation It is plain, therefore, that it has nothing to do with the determination of the common and average rate of profit It hinders individuals from getting more or less than this common rate, but it has no further effect

Hence it appears, that that fall in the rate of profit that is usually observed to take place as society advances is not owing to an increase of capital, or to the competition consequent upon that increase, but to an inability to employ capital with the same advantage as before, resulting (1) from a decrease in the fertility of the soils to which recourse must be had, or (2) from a rise of wages, or (3) from an increase of taxation Of these causes, one may be the more powerful at one period and another at a different period The first not only lessens the quantity of produce raised by the outlay of capital and labour, but it also, as already seen, generally raises in the end the rate of proportional wages It is of course impossible to lay down any fixed principles with respect to the influence of taxation In the progress of society, it may increase or diminish It has been shown that the heavy taxation of Holland during the last century was the principal cause of the low rate of profit in that country (*Principles of Political Economy*, 2d ed p 494) and, no doubt, profits in England are sensibly affected by our taxation

The principles already established show, 1 That so long as the productiveness of industry is undiminished, profits cannot be reduced otherwise than by a rise of wages or of taxes, 2 That so long as the rate of wages is constant profits cannot be reduced, unless industry become less productive, or taxation be augmented, and 3 That so long as taxation remains constant, profits cannot be reduced unless industry become less productive or wages be raised It is supposed, in these cases for the sake of simplicity, that when one of the regulating principles of profit remains constant, the other two vary in the same way But they might vary in different ways, and if so, their influence on profits would obviously depend on the extent to which the variation in the one exceeded the variation in the other Suppose for instance that while the productiveness of industry remains constant a rise of wages and a reduction of taxation are experienced, the effect of this variation will plainly depend on the rise of wages exceeding falling short, or being identical with the reduction in the amount of taxation if it exceed the reduction of taxation profits will be lowered proportionally to the excess if it be less than the reduction of taxation, profits will be proportionally raised, and if the rise of wages and the reduction of taxation be exactly equivalent profits will of course, undergo no change

PROGNOSIS (Gr προ, and γινωσκω *I know*) An opinion respecting the progress and termination of a disease

PROGRAMME An old university term, signifying an outline of the speeches or orations to be delivered on a particular occasion, but now applied in a more extended sense to the outline of any entertainment or public ceremony

PROGRESS The state journeys of royal personages were called by this name in old English In the reigns of Elizabeth and James they were frequent, and somewhat costly to the wealthier subjects, inasmuch as they were usually honoured with the onerous privilege of affording hospitality to royalty The "progresses" of Queen Elizabeth form the subject of a work by Mr Nichols (See also *Quart Rev* vol xli) Perhaps the most celebrated progress in English history is that of James I from Scotland to London on his accession

PROGRESSION In Arithmetic, a series of numbers according to a certain order It is arithmetical geometrical or harmonical.

An Arithmetical Progression is a series of numbers, increasing or decreasing by equal differences Thus,

increasing, 1, 3, 5, 7, 9, &c
decreasing 18, 15, 12, 9, 6, &c

Or, generally, $a + d, a + 2d, a + 3d, a + 4d, +$, &c.

Let a denote the least term,
z the greatest term,
d the common difference,
n the number of terms,
s the sum of all the terms,

university. They, with their deputies the pro-proctors, have power not only to enforce the rules of academical discipline on the students, but also an extensive summary authority over the townspeople, according to the special privileges of the universities. They also have, in both universities, peculiar seats in church, as representatives of the head of the university, and the [illegible] of masters of arts and bachelors, and such as have studied from four to ten years.

PRO'CURATOR (Lat. *pro* for, and *cura* care.) A Roman provincial magistrate whose office was to superintend the affairs of the revenue, and to assist the governor in matters pertaining to it. Sometimes the procurator was charged with the office of governor of a province, as did Pontius Pilate in Judæa, in which case, but not otherwise, he had the power of inflicting capital punishment. This magistracy did not exist under the republic, its duties being comprised under those of the prætor or proconsul, but was instituted by Augustus. They were called *Procuratores Cæsaris*, to distinguish them from the common procurator, who was merely an agent employed by private persons to manage their affairs in their absence when an action was brought against them.

PROCURATOR, *Procuréur*, &c. In the Civil Jurisprudence one who undertakes the care of any legal proceeding for another, and stands in his place by virtue of a power or *procuration* from him. A *mandatory* is said to differ from a *procurator* in that the latter acts only by virtue of an express written instrument. In France before the revolution the procureurs (procuratores ad lites) were officers legally empowered to carry on suits on behalf of clients. This body was abolished in 1791, and that of *avoues* substituted in its place. The *procureurs du roi*, in France are officers of whom one is appointed to every tribunal of arrondissement, together with a sufficient number of 'substitutes."

PROCUREUR GENERAL. The public advocate of the crown in France. Every *parlement* or *cour souveraine* had, before the Revolution, a *procureur general* attached to it. Under the present system [illegible] one of these officers is established in every *cour royale*, for the criminal [illegible] him in [illegible] court [illegible] in the inferior courts of assize and *premiere instance*, are termed respectively *procureurs criminels* and *procureurs du roi*. These officers are charged with the conduct of all criminal proceedings on behalf of the prosecution, and are placed under the immediate control of the minister of justice.

PRO'DIGY (of very doubtful etymology) in ordinary modern language signifies a surprising though natural event, in contradistinction to *miracle* which is something out of the course of nature. Among the Romans however [illegible] which [illegible] by they could not assign a cause, was termed a *prodigy* and regarded as a supernatural event indicative of favourable or (more generally) of unfavourable dispositions of their gods. Hence the number of recorded prodigies many evidently false some real but misunderstood, which Livy has inserted in his annals.

PRO'DOMUS (Gr. προ, and δομος, *house*.) In Ancient Architecture the portico before the entrance of [illegible] temple the same as *pronaos*. See NAOS.

PRODUCT, in Arithmetic and Algebra is the result of or quantity produced by the multiplication of one number by another, or a quantity of any kind by a number. *See* MULTIPLICATION.

PRODU'CTA. An extinct genus of fossil bivalve shells closely allied to the living genus *Terebratula*. They only occur in the older secondary rocks.

PRO'EM (Gr. προ *ειμι I go before*.) A term formerly used for *preface*, which see.

PROEMPTOSIS (Gr. προ *before*, and πιπτω *I fall upon*.) The term applied to the lunar equation or addition of a day to prevent the new moon happening too soon, which must be effected by [illegible] every 330 years and also [illegible] every 2500 [illegible] is *metemptosis* which is used to [illegible] on necessary to prevent the new moon [illegible] too late or the suppression [illegible] sextile every 134 years.

PROFESSOR. The recognized title in all universities of the public and other regular teachers in the various faculties. In the origin of those institutions the degrees conferred on students were in fact, licences to commence as public teachers, and the terms master doctor and professor seem to have been used indifferently. But as in process of time the great body of graduates ceased, in most of them, to have any concern in public instruction, a separate body of recognized teachers gradually arose, endowed in some instances with salaries, in others paid by fees. These were the professors. But in those universities in which collegiate foundations prevailed as in Oxford and Cambridge these officers fell into a secondary situation. The necessary business of instruction was transacted and still continues to be so, by the functionaries of the several colleges. The professors therefore, and the instruction which they convey by lectures, have become only auxiliaries, instead of principals, and attendance on their lectures is in few cases compulsory. On the other hand, in universities destitute or nearly so of collegiate endowments (as those of Scotland, Germany, and others founded on the German model), the professors have become at once the governing body of the university, and the sole recognized functionaries for the purpose of education.

PROFILE (Fr. profil.) In Architecture, the contour of the different parts of an order.

Profile. In the Fine Arts, an outline of the principal parts of an object, free from all fore-shortening, [illegible] projections indentations, &c.

PROFIT (Fr. profit), in Political Economy, means the advantage or gain resulting to the owner of capital from its employment in industrious undertakings. It is the premium as it [illegible] [illegible] no profit, there would [illegible] amass, and all the vast advantages that society derives from the formation and employment of capital would be unknown. But without taking into account the security and consequence conferred on the possessors of capital or wealth, and looking only at its tangible results, profit consists of that part of the produce raised by the agency of capital employed in industrious undertakings that remains in the hands of those by whom it is employed after replacing the capital itself, or such portions of it as may have been wasted in the businesses, and every expense necessarily incurred in superintending its employment.

The *rate* of profit is the proportion which the amount of profit derived from an undertaking bears to the capital employed in it.

Thus suppose an agriculturist employs a capital equivalent to 1000 quarters of corn or 1000*l* in the cultivation of a farm, and that the net surplus produce remaining to him at the end of the year after his capital has been replaced, and he has been indemnified for the trouble of superintendence, and for every necessary expense incurred in the management of the farm, is 100 quarters or 100*l*; this net surplus would form the profits of the agriculturist, being to the capital by whose agency they are obtained in the ratio of 100 to 1000, or at the rate of ten per cent.

It has been shown by Dr. Smith and others, that the capital vested in different businesses yields, provided they be not subjected to any species of monopoly, about the same rate of net profit, and we shall now endeavour shortly to state the circumstances which seem to determine this rate.

In this investigation it is not necessary to inquire whether the capital engaged in certain businesses yield rent as well as profits or profits only. The competition of the producers will always reduce profits in different businesses to what is, taking all things into account, nearly the same common level, and as rent is in every case a surplus over and above profits it may in this investigation be left wholly out of view. The laws by which profits are regulated in countries where the best lands only are cultivated, and no rents are paid are in no respect different from those which regulate them in countries where cultivation has been widely extended, and where lands of superior fertility yield a high rent.

Suppose, therefore that rent is deducted or set aside, it follows that the whole [illegible] ce of industry must in the first [illegible] between capitalists and labourers, that is between those who furnish the capital and those who furnish the manual labour made use of in the production of commodities. And hence were taxation either unknown or constant the proportion of the produce of industry under deduction of rent falling to the share of the capitalists could not be increased without the proportion falling to the share of the labourers being at the same time diminished and conversely. But the share of the produce of industry falling to the capitalists includes, besides profit, the portion required to replace the capital wasted in production and to defray the wages of superintendence. So that the rate of profit is not, as has been already stated, determined by the ratio which the share of the produce of industry that goes in the first instance to the capitalists, after every sort of outlay has been deducted, bears to the total capital employed.

Suppose, for example that an agriculturist employs a quantity of capital of the value of 1000 quarters of corn, or 1000*l*, in cultivating a farm, that half this capital consists of seed horses and other instruments used in agriculture, the other half being employed in the payment of wages, and suppose that after his rent has been deducted or set aside, he has produce equivalent to [illegible] quarters or 1200*l*; of this sum 1000 quarters, [illegible] go to replace his capital, [illegible] his taxes amount to 100 quarters, or [illegible] at 100 quarters, or 100*l*, will remain for his profits, which are consequently at the rate of ten per cent. Now, in this case — and this case is, *mutatis, mutandis*, the case of every man engaged

in business,—it is obvious that the rate of profit may be raised in three, but only in three ways, viz 1 By industry becoming more productive, or 2 By a reduction in the rate of wages; or 3 By a reduction in the amount of taxation [illegible] cumstances, [illegible] 1 By [illegible] or 2 By a rise [illegible] amount of taxation Profits cannot be affected in any way not referable to one or other of these heads

To [illegible] other things [illegible] duce is increased [illegible] capital and labour [illegible] to 1300 quarters, or 1300*l*, the gross amount of profits would in this case be increased from 100 quarters, or 100*l*, to 200 quarters, or 200*l*, and the rate of profit would be raised from 10 to 20 per cent A similar result would be produced, other things being the same, were wages reduced from 500 quarters, or 500*l*, to 400 quarters, or 400*l*, and were taxation reduced from 100 quarters or 100*l*, to 50 quarters, or 50*l* the rate of profit would be raised from 10 to 15 per cent On the other hand, if we suppose that the quantity of produce, instead of being increased, is diminished, or that wages or taxes are augmented the gross [illegible] profit, and the rate of profit, will be proportionally [illegible]

Had it not been for the gradually decreasing productiveness of the capital laid out on the lands, the productiveness of industry would have increased with every discovery [illegible] labour, so that, without a corresponding [illegible] wages and taxes the rate of profit would have been continually increasing But though improvements may materially increase the productiveness of agricultural industry for a lengthened period, the increase cannot be permanent, inasmuch as the growth of population never fails in the end to force recourse to inferior lands which of course yield less produce in return for the same outlay The decreasing productiveness of the capital applied to the soil has a double influence over profits, for, in the first place it lessens the quantity of produce obtained by the outlay of capital and labour, and in the second place it increases the portion of that produce going to the labourer as wages The latter must always get enough to enable him to subsist and continue his race, and though, in the event of his resorting to a lower species of food or an inferior standard of comfort a rise in the price of raw produce may not be followed by a rise of wages yet speaking generally the one is always consequent to the other The cost of food is the main regulator of wages, and it is quite impossible to go on for any lengthened period by taking bad land into cultivation or forcing the good land making constant additions to its cost without ultimately raising wages Manufacturing industry or the adaptation of matter to our use necessarily becomes from the influence of discoveries and inventions more and more productive as society advances so that the decreasing fertility of the soil is at bottom the only cause of whatever reduction in the rate of profit is to be ascribed to a decline in the productiveness of industry and it is pretty frequently also the cause of those reductions that are occasioned by a rise in the rate of wages The latter it is true, is also brought about by an increased demand for labour and by a greater prevalence of moral restraint But a rise of wages caused by the increased cost of necessaries does not depend on contingent circumstances, or on the forethought of the labourers It must be experienced in every country and state of society, according as it becomes more and more difficult to obtain supplies of food for an increasing population The absolute wages of the labourer, or the quantity of necessaries and conveniences given him for his labour, may be and indeed frequently are diminished in the progress of society but when cultivation is far extended he is uniformly almost in the receipt of a larger share of the produce of his labour, so that, as has just been observed profits are reduced in an advanced stage of society because the quantity of produce is diminished, and because the labourers get a larger share of this diminished quantity

The theory of Smith, as to the circumstances which determine the rate of profit, differs widely from the above He seems to have had no idea of the important principle which shows that, despite the counterveiling influence of improvements, the capitals successively applied to the land are sure, in the long run, to decrease in productiveness And not imagining that there was any natural cause why the produce obtained by the outlay of equal amounts of capital and labour should ever be diminished he supposed that profits were lowered through the competition of capitalists, that when capital increased, the undertakers of different businesses became anxious to encroach on each other, and that, in order to attain their object, they offered their produce at a lower price, and gave higher wages to their workmen

[illegible] easy to see that competition cannot occasion a general fall of profits All that competition can do and all that it ever does, is to reduce the profits obtained in different businesses and employments to the same common level to prevent particular individuals realizing greater or [illegible] neighbours Farther than this [illegible] The common and average rate of profit depends not on it, but on the excess of the produce obtained by employing capital after it is replaced, along with every contingent expense Competition cannot affect the productiveness of industry, neither can it, speaking generally, affect the rate of wages, for, such as the ordinary demand for labour is, such will be its supply, and it has no influence over taxation It is plain, therefore, that it has nothing to do with the determination of the common and average rate of profit It hinders individuals from getting more or less than this common rate, but it has no further effect

Hence it appears, that that fall in the rate of profit that is usually observed to take place as society advances is not owing to an increase of capital, or to the competition consequent upon that increase, but to an inability to employ capital with the same advantage as before, resulting (1) from a decrease in the fertility of the soils to which recourse must be had or (2) from a rise of wages, or (3) from an increase of taxation Of these causes, one may be the more powerful at one period and another at a different period The first not only lessens the quantity of produce raised by the outlay of capital and labour but it also, as already seen, generally raises in the end the rate of proportional wages It is, of course, impossible to lay down any fixed principles with respect to the influence of taxation In the progress of society, it may increase or diminish It has been shown that the heavy taxation of Holland during the last century was the principal cause of the low rate of profit in that country (*Principles of Political Economy*, 2d ed p 494) and, no doubt profits in England are sensibly affected by our taxation

The principles already established show, 1 That so long as the productiveness of industry is undiminished, profits cannot be reduced otherwise than by a rise of wages or of taxes 2 That so long as the rate of wages is constant profits cannot be reduced unless industry become less productive, or taxation be augmented, and 3 That so long as taxation remains constant, profits cannot be reduced, unless industry become less productive or wages be raised It is supposed, in these cases for the sake of simplicity that when one of the regulating principles of profit remains constant, the other two vary in the same way But they might vary in different ways, and if so their influence on profits would obviously depend on the extent to which the variation in the one exceeded the variation in the other Suppose for instance, that while the productiveness of industry remains constant a rise of wages and a reduction of taxation are experienced, the effect of this variation will plainly depend on the rise of wages exceeding falling short, or being identical with the reduction in the amount of taxation if it exceed the reduction of taxation, profits will be lowered proportionally to the excess, if it be less than the reduction of taxation, profits will be proportionally raised, and if the rise of wages and the reduction of taxation be exactly equivalent profits will of course, undergo no change

PROGNO'SIS (Gr προ, and γινωσκω *I know*) An opinion respecting the progress and termination of a disease

PRO'GRAMME An old university term, signifying an outline of the speeches or orations to be delivered on a particular occasion, but now applied in a more extended sense to the outline of any entertainment or public ceremony

PRO'GRESS The state journeys of ro[illegible] were called by this name in old English [illegible] the reigns of Elizabeth and James they were frequent, and somewhat costly [illegible] as they were usually [illegible] of affording hospitality to royalty The progresses of Queen Elizabeth form the subject of a work by Mr Nichols (See also *Quart Rev* vol xii) Perhaps the most celebrated progress in English history is that of James I from Scotland to London on his accession

PROGRE'SSION (La progression) In Arithmetic, a series of numbers proceeding according to a certain order It is arithmetical, geometrical or harmonical.

An Arithmetical Progression is a series of numbers, increasing or decreasing by equal differences Thus,

increasing, 1, 3, 5, 7, 9, &c
decreasing, 18, 15, 12, 9, 6, &c

Or, generally, $a + d, a + 2d, a + 3d, a + 4d, +$, &c.

Let a denote the least term,
z the greatest term,
d the common difference,
n the number of terms,
s the sum of all the terms,

then the principal properties of an arithmetical progression are expressed by the following formulæ —

$$a = z - (n-1)\,d,\quad z = a + (n-1)\,d,$$

$$d = \frac{z-a}{n-1},\quad n = \frac{z-a}{d} + 1,\quad s = \frac{a+z}{2}\,n,$$

and these expressions become still simpler when the first term, a, is nothing

A Geometrical Progression is a series of numbers increasing or decreasing in a certain constant ratio, or such that the quotient of any one of them by that which immediately precedes is constantly the same Thus,

increasing, 1, 2, 4, 8, 16, &c
decreasing, 81, 27, 9, 3, 1, &c

Or, generally, a, $r\,a$, $r^2\,a$, $r^3\,a$, &c

$$\text{Or } a,\ \frac{a}{r},\ \frac{a}{r^2},\ \frac{a}{r^3},\ \&c\ ,$$

where a is the first term, and r the common ratio in the one case, and 1 — the common ratio in the other

Let a denote the least term,
z the greatest term,
r the common ratio,
n the number of terms,
s the sum of the terms,

then the principal properties of a geometrical progression are expressed as follows —

$$a = \frac{z}{r^{n-1}},\quad z = a\,r^{n-1},\quad r = \left(\frac{z}{a}\right)^{\frac{1}{n-1}},$$

$$n = \log\frac{z}{a} - \log r,\quad s = \frac{r\,z-a}{r-1} = \frac{r^n-1}{r-1}\,a$$

Some of these formulæ may be more conveniently expressed in terms of s which does not enter into any one of the first four Thus,

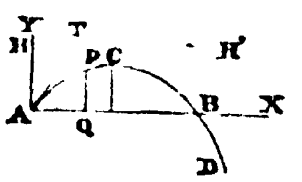
$$a = \frac{r-1}{r^n-1}\,s,\ \text{or } a = z\,r - (r-1)\,s,\quad r = \frac{s-a}{s-z}$$

An Harmonical Progression is [illegible] mon[illegible] propor[illegible] or such that [illegible] terms, the first is to the third as the difference between the first and second is to the difference between the second and third (*See* HARMONICAL PROPORTION) The reciprocals of an arithmetical progression form an harmonical progression Thus the reciprocals of the arithmetical series 1, 2, 3, 4, 5, &c are

$$1,\ \tfrac{1}{2},\ \tfrac{1}{3},\ \tfrac{1}{4},\ \tfrac{1}{5},\ \&c$$

which form an harmonical progression

PRO'HEDRI (Gr προεδροι, [illegible]) Athenian officers chosen to superintend the proceedings in the two legislative assemblies, so called because they had the privilege of sitting in the front seats (προεδρια) The prohedri of the senate were ten in number (*See* PRYTANES) The prohedri of the ecclesia were more in number [illegible] from each tribe which did not [illegible] for the time being Their duties only extended to the one assembly of the people a new set being elected each time and one of their number was appointed [illegible] to propose [illegible], to debate [illegible] the votes



PROHIBI'TION In Law a writ to forbid any court from proceeding in a cause then depending on suggestion that the cause of it does not properly belong to that court In modern times the writ of prohibition is chiefly used where parties have been impleaded before the ecclesiastical courts It issues properly out of the court of King's Bench, but may also be had in some cases out of the Chancery, Common Pleas or Exchequer It is the proper remedy where the court against which it is sued has exceeded its jurisdiction in taking cognizance of matters not properly belonging to it It is granted on motion, but if the question of jurisdiction be doubtful the courts direct the party suing the writ to *declare in prohibition*. This proceeding rested originally on a fiction of law The plaintiff assumed that the writ had been granted, and brought his action against the defendant, on the supposition that he was proceeding in the case, notwithstanding the prohibition, and the merits were then tried on demurrer But now by 1 W 4 c 21, [illegible] with a prayer for a writ

P[illegible] projicio, *I throw forward*), in Mechanics, is a body which, having had a motion in space impressed on it by the action of an external force, is abandoned by this force, and left to pursue its course Thus, a stone thrown from the hand or a sling, an arrow shot from a bow, and a bullet discharged from a cannon are [illegible] they continue in motion

[illegible] —When a heavy body is projected from the earth it is subject to the action of three separate and independent forces — 1 The projectile force or that by which it was put in motion, and in virtue of which, if no other force interfered, the body would continue for ever to move [illegible] with the same [illegible] 2 The force of gravity by which it is [illegible] 3 The resistance of the atmosphere which acting in the direction opposite to that in which the body is moving, tends at every instant to destroy its motion, or to bring it to rest

When the projectile is a body possessing considerable density and the motion is slow, the resistance of the air is inconsiderable, and the body describes almost the same path as if it had been projected in a vacuum, but when the velocity is great, as in the case of a cannon ball (and it is only in such cases that the theory of the motion of projectiles has any practical application), the resistance of the air becomes enormous, and causes the projectile to deviate widely from the path it would have pursued if this force had not been in action The direct investigation of the path of a projectile in a resisting medium being a problem of the [illegible] and attended with very considerable [illegible] the way in which the subject can be rendered most intelligible is to proceed in the first place, on the supposition that there is no resistance, and determine the circumstances of the motion of a body supposed to obey only the impulse by which it was projected and the force of gravity, and then to consider the resistance as a disturbing force, and find the correction that must be applied in consequence to the path determined on the previous supposition

Motion of Projectiles in vacuo — In order to determine the path of a projectile on the supposition that it is not resisted by the atmosphere, suppose it to be projected from the point A with a velocity a in the direction A T since gravity acts only in the vertical direction, it is evident that the body will move in the vertical plane passing through A I Let A C D, therefore be its path or trajectory in this plane, and let A X and A Y be the rectangular co-ordinates of the curve, A X being horizontal and A Y in the direction of gravity At the end of any given time t let P be the place of the projectile, $x = $ A Q, its abscissa, and $y = $ P Q its ordinate also let g be the accelerating force of gravity (= 32 feet per second) and A the angle T A X

The body being projected in the direction of the line A I with a velocity $= a$ its velocity in the horizontal direction will continue uniform and $= a \cos A$ In like manner its velocity in the vertical direction A Y due to the projectile force is $= a \sin A$, and at the end of any time t the spaces passed over in those directions if gravity did not act would be respectively $t\,a \cos A$, and $t\,a \sin A$ But the space through which a heavy body falls by the action [illegible] time t is $\frac{1}{2} g t^2$, and as this is in the vertical direction and opposite to A Y, it must be joined to the resolved part of the projectile motion in that direction, with a contrary sign We have, therefore

$$x = t\,a \cos A \quad y = t\,a \sin A - \tfrac{1}{2} g t^2 \qquad (1)$$

On eliminating t from these two equations, and supposing the velocity a to be that which a body would acquire in falling from a height $= h$ so that $a = \sqrt{2gh}$, we obtain [illegible] for the equation of the curve described by the projectile —

$$y = x \tan A - \frac{x^2}{4h \cos^2 A} \qquad (2)$$

This equation belongs to a parabola whose axis is vertical, or parallel to A Y The summit of the parabola is found by differentiating the equation, and making $\frac{dy}{dx} = 0$, which gives $x = 2h \cos A \sin A$, and consequently $y = h \sin^2 A$ for the values of x and y at that point

In order to find the *amplitude* or *range* of the projectile that is, the point B in which it again passes through the horizontal plane from which it was projected we have only to suppose, in the above equation, $y = 0$ This gives

$$x = 4h \cos A \sin A = 2h \sin 2A$$

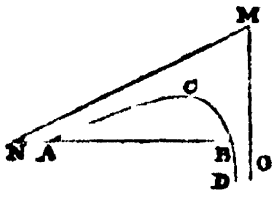
for the value of A B, and, as the sine of an angle continues to increase to 90°, the value of A B will be greatest when A, the angle of projection, is 45° The amplitude is then $= 2h$, or twice the altitude due to the initial velocity At every other inclination there are two angles which give the same range, the one as much less than 45° as the other is greater

The velocity v, at any point in the curve, is found by means of the differential formula $v^2 = \frac{dx^2 + dy^2}{dt^2}$. On differentiating the values of x and y in the equations (1), and adding the results, we find

$$v^2 = a^2 - 2\,a\,g\,t \sin A + g^2 t^2,$$

Let k = the height from which a body must have fallen to acquire the velocity v, then $v^2 = 2gk$. But we have also $a^2 = 2gh$, and $t = \frac{x}{a \cos A}$, substituting, therefore, these values in the above equation, we obtain

$$k = h - x \tan A + \frac{x^2}{4h \cos^2 A},$$



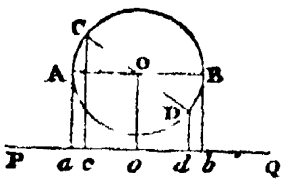
and comparing this with the value of y in equation (2), we have ultimately $k + y = h$

From this equation it appears that if in A Y a point H be taken, such that A H = h, the height from which a heavy body must fall to acquire the initial velocity, and a straight line H H′ be drawn though H parallel to the horizon, or to A X, the velocity of the projectile in the curve at any point P is equal to that which a heavy body would acquire by falling freely from the line H H′ to P. The line H H′ is is easily proved, is the directrix of the parabola, and hence all the parabolas described by bodies projected from the same point, and with the same velocities, though with different elevations have the same directrix, and consequently their foci in the circumference of the same circle

Thus it appears that the theory of the motion of projectiles in a vacuum is extremely simple, but, as has been already mentioned, the resistance which the air opposes to their motion, particularly when the velocity is great is by far too considerable to be neglected, in fact it changes entirely the form of the trajectory, and the law of motion by which it is described

Motion of Projectiles in a resisting Medium — When the resistance of the air is taken into account the determination of the path described by a projectile is a problem of far greater difficulty, though still capable of rigid solution on assuming an algebraic relation between the velocity and the resistance, but when it is considered that, in order to compute the trajectory of a resisted body it is necessary not only to assume a law of resistance which we never can be quite sure is the true one but also to know accurately the initial velocity of the body together with its density form and dimensions it is easy to see that no great practical advantage is likely to be obtained in any case from the theory, and that recourse must be had to experiment. The problem however regarded merely as a mathematical speculation possesses considerable interest and has been discussed by Newton in the *Principia* (Scholium prop 10 lib ii), by John Bernoulli Dr Brook Taylor Hermann Euler and others. For the solution see Legendre *Exercises de Calcul Integral*, tom i, Poisson *Traité de Mecanique*

The hypothesis usually made with respect to the resistance is that it is proportional to the square of the velocity. On this hypothesis it was shown by Newton that the trajectory has more resemblance to a hyperbola than a parabola. The two branches A C and C D are dissimilar, and the motion in the descending branch C D becomes constantly more nearly vertical and uniform so that ultimately the body would describe a vertical line with a uniform velocity. This branch of the curve has therefore a vertical asymptote M O to which it continually approaches. The other branch A C has likewise an asymptote which makes an angle with the axis A B and intersects it at a distance A N from A, depending on the initial direction and velocity of the projectile.

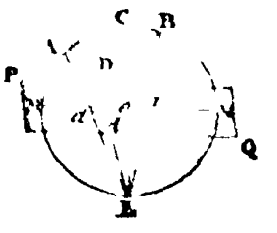


Some anomalous circumstances are observed in experiments with artillery which are quite beyond the reach of theoretical calculation. Bullets are frequently driven to the right or left of the plane in which they were projected as if a force acted upon them sideways as well as vertically, and in this case their path becomes a curve of double curvature. Dr Hutton ascribes this chiefly to a whirling motion acquired by the bullet about an axis, in consequence of its friction against the sides of the piece, for this rotatory motion, combined [illegible] motion, causes each part of the ball [illegible] air in a direction different from what it would do if there were no such whirl. Euler on the other hand, attributes the lateral deflection chiefly to the irregularity of the [illegible] and in a small degree to its rotation. Mr Robins found the range of shot extremely uncertain, falling sometimes 200 yards short of what it did at other times, though there was no visible cause of difference in making the experiment, and Dr Hutton states that the [illegible] of one fifth or one [illegible] be deflection to the right or left, and also in the extent of the range of ca[illegible] See GUNNERY RESISTANCE.

PROJECTION. In Perspective the [illegible] of any object on the perspective plane. See PERSPECTIVE.

PROJECTION OF THE SPHERE. In Geography, the representation of the several parts of the surface of the sphere on a plane, according to some geometrical law by which the different points in the representation can be accurately referred to their relative positions on the sphere. It is a problem of much importance, in consequence of its application to the construction of maps, charts, planispheres, &c.

Projections are of various kinds, according to the situations in which the eye is supposed to be placed in respect of the sphere and the plane on which it is to be projected, but there are three which, by reason of the frequency of their use, are particularly deserving of attention, namely, the *orthographic*, the *stereographic*, and the *central* or *gnomonic*.

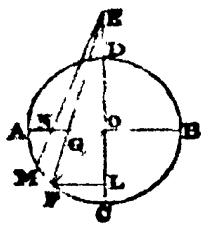


1 *Orthographic Projection* — In this projection the eye is supposed to be at an infinite distance, and the *plane of projection*, i e the plane on which the representation is made, perpendicular to the direction of the rays of light, which are all parallel to each other. The laws of this projection are easily deduced. 1 Any point in space is projected by drawing a straight line from it perpendicular to the plane of projection. 2 A straight line perpendicular to the plane of projection is projected into a point. A straight line A B, parallel to the plane of projection P Q, is projected into an equal straight line a b, and a straight line C D inclined to the plane of projection is projected into a straight line c d which is shorter than C D in the proportion of the cosine of the angle of inclination to radius. 3 A plane surface perpendicular to the plane of projection is projected into a straight line. 4 A circle parallel to the plane of projection is projected into an equal circle, but a circle oblique to the plane of projection is projected into an ellipse, of which the greater axis is equal to the diameter of the circle and the lesser axis is equal to that diameter multiplied by the cosine of the obliquity.

Orthographic projections of the sphere are usually made either on the plane of the equator, or on the plane of a meridian. When on the plane of the equator the meridians are all represented by straight lines intersecting in the centre of the [illegible] the parallels of latitude by circles whose [illegible] respectively equal to the cosines of t[illegible] W[illegible] is on the plane of [illegible] are represented by ellipses and the parallels of latitude by straight lines parallel to the diameter of the projection. Orthographic projections of a hemisphere have this defect that they are much crowded and distorted near the circumference of the representation as may be inferred from the above figure, all the points in the arc A C being compressed within the line a c (which is equal to the versed sine of the arc) while an arc at the vertex of the hemisphere is projected into a line nearly equal to itself.

The orthographic projection has a multitude of other applications. The plans and sections by which artificers execute their different constructions are orthographic projections of the things to be constructed, and a solid body may be represented in all its dimensions by orthographic projections on two planes at right angles to each other. See DESCRIPTIVE GEOMETRY.

2 *Stereographic Projection* — In this projection the eye is supposed to be situated at the surface of the sphere, and the plane of projection is that of the great circle which is every where 90 degrees from the position of the eye. Thus let A C B F represent a sphere cut by a plane P Q passing through the centre and perpendicular to the plane of the great circle A B F, and let F be the position of the eye in this circle. If straight lines be drawn from F to the points A D B in the opposite hemisphere, the points *a d b* in which those lines cut the plane P Q will be the stereographic projections of A D B.



Some of the principal properties of this projection are the following. — 1 The projection of any circle on the sphere which does not pass through the eye is a circle; and circles whose planes pass through the eye are projected into straight lines. 2 The angle made on the surface of the sphere by two circles which cut each other, and the angle made by their projections, is equal. 3 Let C be the pole opposite to F, and *c* its projection; then any point A is projected into a point *a*, such that *c a* is equal to half the tangent of the arc A C.

3 *Gnomonic or Central Projection* — In this projection the eye is situated at the centre of the sphere, and the plane of projection is a plane which touches the sphere at any point assumed at pleasure. The point of contact is called the *principal point*, and the projections of all other points on the sphere are at the extremities of the tangents of the arcs intercepted between them and the principal point. As the tangents increase very rapidly when the arcs exceed 45°, and at 90° become infinite, the central projection cannot be adopted for a whole hemisphere.

The orthographic and stereographic projections were both employed by the ancient Greek astronomers for the purpose of representing the celestial sphere with all its circles on a plane. The area was called by them the *analemma*. Ptolemy wrote a treatise on this projection, and the Arabs derived from it the fundamental theorems of trigonometry. The stereographic projection appears to have been invented by Hipparchus, and was denominated by the Greek astronomers *planisphere*. The name stereographic (derived from στερεος, *a solid*) was given to it by the Jesuit Aguilon, because it results from the intersection of two solids, the cone and the sphere. Hipparchus and Ptolemy appear (though they do not expressly mention it) to have been acquainted with the principal property, namely, that circles on the sphere are projected into circles, which affords great facilities for the construction of maps. The second property, not less remarkable, that all circles in the projection intersect each other in angles equal to those at which the corresponding circles on the sphere, [illegible] to have been first demonstrated by Dr Halley in 1695 in No. 219 of the *Phil. Trans.* where the discovery is attributed to Demoivre or Hooke. From the equality of the angles, it follows that any very small portion of the spherical surface and its projection are similar figures, — a property of great importance in the construction of maps, but which is not peculiar to this projection as it belongs also to Mercator's, and numerous other relations may be assigned between the original and projected figures in which it will hold good. The gnomonic projection is also described by Ptolemy, but as the Greeks had no idea of the trigonometrical tangents, the polar distances were expressed by the ratios of the sines to the cosines of the arcs.

In constructing maps of countries, the object sought to be attained is to lay down the places in their true relative positions, and at the same time to preserve as much as possible the same scale of distances throughout. In the three projections which have been explained, equal portions of the spherical surface are represented by unequal portions of a plane surface, and the deviation from equality becomes greater from the centre to the circumference of the projection. The degrees of latitude are greatly contracted towards the circumference in the orthographic projection, and enlarged in [illegible] so as in both cases to produce a great [illegible]. Geographers have, accordingly, attempted to correct this deviation by placing the point of view at some finite distance without the sphere. This gives rise to the following, which was proposed by Lahire.

Globular Projection.—Let A C B be the hemisphere to be represented on the plane passing through the diameter A B, and let E be the position of the eye in a straight line passing through the centre O perpendicular to A B, the representation will be perfect if the several arcs A M, M I, I C, have each the same ratio to their projections A N, N G, G O. This cannot be accomplished accurately, but the nearest approximate will be [illegible] by placing the point I in such a position that I O be the middle point of the arc A C, its corresponding point G is also the middle of A O. The problem therefore is to find a point F in C D, such that on drawing the line F F to bisect A C it shall also bisect the radius A O. Draw F L perpendicular to O C, and join I O. It is evident that F L is half the side of the inscribed square, and G O is half the radius, therefore F I is to G O as O F or O C to O I. But F I : G O :: I I : O I, therefore, L E : O E :: O C : O I, and consequently L O : O E :: C L : O L, whence O I : C I = O I². But D L : C L = F I² = O I², therefore O E = D I, or D E = O L, the cosine or sine of 45°, consequently by the trigonometrical tables, D E = 71, the radius being unity.

The projections which have now been explained are seldom used in delineating the features of a single country, or a small portion of the earth's surface. For this purpose it is found more convenient to employ some of the methods of development of the spherical surface explained under the term MAP.

The projection of the circles of the sphere on a plane is a problem of which the solution is easily found either by the methods of the descriptive geometry, or by common algebra, or spherical trigonometry. Whatever be the situation of the eye, every circle on the sphere, not passing through the eye, forms the base of a cone, of which the eye is the apex, and the intersection of this [illegible] into [illegible] in be no other than a conic section, and its equation can never exceed the second degree. On forming the general equation, and assigning a particular position to the eye and the plane of projection, all the properties of the different kinds of projection are readily deduced. The subject is explained in a popular manner in *Murray's Encyclopædia of Geography* (*Introduction*). Malte Brun's *Geography* and most other works on that science, and treated mathematically by Lambert in his *Beiträge &c.* Berlin, 1772; by Euler in the *Petersburg Commentaries* for 1777, by Lagrange in the *Berlin Memoirs* for 1779, and by Gauss in a Memoir which is translated in the *Philosophical Magazine* for August and September, 1828.

PROJECTURE. In Architecture, the jutting or leaning outwards of the mouldings and other members of architecture beyond the face of a wall, column, &c.

PROLA'PSUS. (Lat.) A protrusion or falling down of a part of a viscus that is uncovered.

PROLATE SPHEROID. In Geometry, a spheroid produced by the revolution of an ellipse about its transverse diameter, so called in opposition to the *oblate* spheroid, which is produced by the revolution of the ellipse about its shorter axis.

PROLE'GOMENA. (Gr. προλεγομενα.) In Literature, preliminary or introductory observations or dissertations prefixed to any work. The famous dissertation prefixed by D'Alembert to the *Encyclopédie*, and the dissertations prefixed by Dugald Stewart, Playfair, Leslie, and Mackintosh to the last edition of the *Encyclopædia Britannica*, are among the best specimens of preliminary [illegible].

PRO'LEGS. In Entomology, are the fleshy exarticulate pediform, often retractile organs, which assist various larvæ in walking and other motions, but which disappear in the perfect insect.

PROLE'PSIS. (Gr. προλαμβανω, *I anticipate*.) In Rhetoric, a figure by which the speaker anticipates and answers imaginary objections such as might be raised against the sentiments which he is urging.

PRO'LOGUE. (Gr. προλογος.) A piece in verse recited before the representation of a play, and serving as an introduction to it. *See* EPILOGUE.

PROLU'SION. (Lat.) A classical word which has been adopted in a rather general sense by authors unwilling to entitle their own productions by a more ambitious designation: an essay or preparatory exercise, in which the writer tries his own strength, or throws out some preliminary remarks on a subject which he intends to treat more profoundly. The early and fugitive pieces of some poets (as the Culex and others attributed to Virgil) have been termed by critics, their prolusions.

PROMI'THEANS. A term applied to small glass tubes containing concentrated sulphuric acid, and surrounded with an inflammable mixture which they ignite on being pressed, and thereby give instantaneous light. The term is derived from

PROMI'THEUS. (From Gr. μητις, *counsel*.) According to the most ordinary form of his legend in Greek mythology, one of the Titans who was exposed to the wrath of Jupiter on account of his having taught mortals the arts, and especially the use of fire, which he was said to have stolen from heaven concealed in a pipe. According to another story, Prometheus was actually the creator of men, and in the *Protagoras* of Plato he is made not to have created, but to have inspired them with thought and sense. His punishment was to be chained to a rock on Caucasus, where a vulture perpetually gnawed his liver, from which he was finally rescued by Hercules. This legend has formed the subject of the grandest of all the poetical illustrations of Greek supernatural belief, the *Prometheus Bound* of Æschylus. Many have recognized in the indomitable resolution of this suffering Titan, and his stern endurance of the evils inflicted on him by a power with which he had vainly warred for supremacy, the prototype of the arch fiend of Milton. Others have sought for a recondite analogy, and discovered in the tortures endured by Prometheus as a sacrifice for mankind, whom he had benefited, a foreshadowing of the great mystery of Christianity.

PRO'MISSORY NOTE. A note or writing by which an individual, or number of individuals, promise or engage to undertake or perform [illegible]. In legal language, however, it is [illegible] engagements to pay certain specified sums of money at certain dates. Such documents, if drawn on proper stamps, are legal negotiable instruments that enjoy the same privileges as bills.

PRO'MONTORY. (Lat. pro, and mons *a mountain*.) In Geography, a point of land, whether high or low, is indifferently [illegible] into the sea. *See* CAPE.

PROMU'SCIS. The name of the suctorious organ of the Hemipterous insects, formed by the union of the two jaws (*maxillæ*) to the lower lip, which they embrace, thus forming a jointed organ containing four long capillary [illegible].

PRONAOS. (Gr. προ, *before*, and ναος, *a temple*.) In Architecture, [illegible]. *See* NAOS.

PRONATOR MUSCLES. Those which are used in turning the palm of the hand downwards.

PRO'NOUNS. In Grammar, parts of speech which are used in the stead of nouns, to avoid needless or inconvenient specification. Pronouns are divided into *substantive* or *personal*, and *adjective*; the latter including

possessive, demonstrative, relative, indefinite, and *interrogative* pronouns

PROOI (From the verb *to prove*) In Engraving, an impression taken from an engraving to prove the state of it during the progress of executing it, also one taken before the insertion of the letters are engraved on the plate

PROOF In Printing, an impression on which the errors and mistakes are marked for the purpose of being corrected Proofs are,—first proof, which is the impression taken with all the errors of workmanship After, it is read by the copy, and the errors corrected, which if not many, and carefully done, another impression is printed with more care, to send to the author, this is termed a clean proof On it he makes his corrections and alterations when those are altered in the types, another proof is printed, and read over carefully previously to the whole number being printed off, this is called the press proof

PROOF *See* EVIDENCE

PROOF SPIRIT A mixture of equal weights of absolute alcohol and water, the specific gravity of such a mixture is 0 917, but the density of the proof spirit of commerce is 0 930

PROPÆDI U'TICS (Gr προ, and παιδευω, *I instruct*) A term used by German writers to signify the preliminary learning connected with any art or science that in which it is necessary to be instructed, in order to study the science itself

PROPAGANDA [illegible] given to an association or, as it is termed the congregation *De propaganda Fide*, established at Rome by Gregory XV in 1622, for diffusing a knowledge of Christianity throughout the world It is a committee of cardinals and special agents of the pope, under whose presidency it meets every week Its duties are the superintendence and assistance of missionaries in all parts of the globe, the maintenance of recent converts, the publication of religious works in foreign languages &c Derived from this celebrated society, the name *propaganda* is applied in modern political language as a term of reproach to secret associations for the spread of opinions and principles which are viewed by most governments with horror and aversion

PROPAGA'TION OI PLANTS The greater number of plants are propagated naturally by means of seeds, but, in addition to these many plants are extended over the surface on which they take root by the production of runners or lateral shoots which spread along the surface and root at the joints or buds from which they send up new plants by suckers or side shoots from the roots, and by various other natural means Artificially plants are propagated by seed by runners suckers offsets bulbs tubers layers cuttings grafting budding inarching &c Seeds are gathered when mature and sown on recently stirred soil and covered to different depths, according to the size of the seed the nature of the soil and situation, and other circumstances The plants formed by runners are separated from the parent plant by cutting through the runner and removing the young plant in order to plant it elsewhere Suckers, slips or side shoots from the roots are separated from the parent plant by being slipped down or cut off so as to carry with them a portion of fibrous roots and they are afterwards planted in suitable soil &c Offsets are small bulbs which are produced round the base of larger ones, and being taken off and planted become plants Tubers [illegible] and the eyes may be separated [illegible] to as many pieces as there are buds, in either of which cases new plants will be formed Layers are branches or shoots of either woody or herbaceous plants which are bent down and a portion of their length buried a few inches in the soil, that portion having been previously wounded by cutting bruising or twisting which by checking the descent of the sap, gives rise after a certain period to the production of roots After these roots are formed, the portion of the layer which has produced them is separated from the main stock or parent plant and planted by itself Cuttings are portions of shoots either of ligneous or herbaceous plants, and they are made of the young shoots with the leaves on or of the ripened wood either with or without its leaves, and after they have, either in a herbaceous state with the leaves on, or with the wood mature and with or without the leaves, been properly prepared and planted, they form roots at their lower extremity, each cutting becoming a perfect plant In general, cuttings should be taken from those shoots of a plant which are nearest the soil, because, from the moisture and shade there, such shoots are more predisposed to emit roots than those on the upper part of the plant The young or last formed shoots are to be taken in preference to such as are older, as containing more perfect buds in an undeveloped state, and a bark more easily permeable by roots, and the cutting is to be prepared by cutting its lower extremity across at a joint, the lenticells or root-buds being there most abundant When the cutting is planted, the principal part of the art consists in making it quite firm at the lower extremity, so as completely to exclude the air from the wounded section Cuttings emit roots at this section, either in consequence of the action of the accumulated sap in the cutting, as in the case of the ripened wood in deciduous trees and shrubs, or in consequence of the joint action of the accumulated sap and of the leaves, as in the case of cuttings of soft wood with the leaves on, and in a living state A few plants are propagated by cuttings of the leaves, the petiole of the leaf being slipped off from the parent plant, and probably containing the latent embryos of buds Grafting and budding are processes which have been already explained (See these words) Inarching may be described as a species of grafting, in which the scion is not separated from the parent plant till it has become united with the stock

PRO'PEDS, *Propedes* The name given by Kirby to the soft, fleshy, inarticulate pediform appendages of certain larvæ, placed behind the true feet, and disappearing in the mature insects

PRO PER In Heraldry, any object represented of its natural colour is so termed

PRO'PERTY In Logic a predicable which denotes something essentially conjoined to the essence of the species There are enumerated in books on logic four kinds of property, which are termed "universal, but not peculiar," 'peculiar, but not universal," "universal and peculiar," 'universal and peculiar, but not at every time' The last kind is evidently more properly designated as Accident *See* LOGIC, PREDICABLE

PROPERTY RIGHT OF *See* RIGHT OF PROPERTY

PRO'PHETS (Gr προ *before* and φημι, *I speak*) A title given in the Scriptures to persons inspired, or endowed with the capacity to predict future events The first to whom it is applied is Abraham, and we hear, in the same extended sense, of companies of prophets persons who were employed in the study or exposition of the divine law in which case it does not necessarily imply the power of predicting future events In its more strict signification the term prophet is given to Elijah, Elisha, and others who did not commit their prophecies to writing but whose inspiration is attested in the historical books of the Old Testament and to the sixteen whose books are collected under the subdivisions of the greater and the lesser Jonah, the earliest, lived about 800 B C, and Malachi the latest, about 400 B C

PROPHYLA'CTIC (Gr προφυλασσω, *I defend*) Means used to prevent disease

PROPO RTION (Lat proportio) in Arithmetic and Geometry is the equality or similitude of ratios, four numbers or magnitudes being said to be proportional or in proportion when the ratio of the first to the second is the same as the ratio of the third to the fourth, or when the first divided by the second gives the same quotient as the third divided by the fourth

The definition of proportion has given rise to much controversy among writers on the elements of geometry Euclid's celebrated definition in the fifth book, whatever may be said in favour of its ingenuity and exactness, is found by experience to be much too complicated and refined to be understood by beginners, and accordingly many attempts have been made to substitute for it one more intelligible but on account of the difficulty of defining the term *ratio* in such a manner as to include incommensurable quantities, none of these attempts can be said to have been perfectly successful This imperfection, however must be understood as belonging merely to the metaphysical accuracy of the definition, for many of the treatises which have been composed with the view of superseding Euclid's have all the [illegible] which can be desired On this [illegible] consult *Barrow's Mathematical Lectures*, the notes to *Playfair's Euclid*, *Camerer's Euclid*, Berlin, 1825, De Morgan *On the Connexion of Number and Magnitude*, 1836 and the art "Proportion" in the *Penny Cyc*

Proportion is *continual* or *discrete direct* or *inverse* It is continual when every two adjacent terms have the same ratio or when the consequent of one ratio is the antecedent of the next following thus, 2, 4, 8, 16, &c, are numbers in continual proportion, for the ratio of 2 to 4 is the same as that of 4 to 8, of 8 to 16, &c *Discrete* proportion is when the antecedent of one ratio is different from the consequent of the former, thus, 2, 3, 4 6 The terms *direct* and *inverse* have reference to arithmetical questions in which is denominated the Rule of Three, and which in their enumeration include four numbers, two of which are of one kind and two of another, and moreover each number of the second kind intimately connected with one of the numbers of the first kind by the nature of the question Now when the four numbers are written in the form of a proportion if the antecedents of the two ratios are the related numbers, the proportion is said to be direct, but if the antecedent of the first ratio is the number connected with the consequent of the second, the proportion is inverse For example, let the question be this If 8 yards cost 12 shillings

what is the price of 20 yards? The answer is 30 shillings. Now, in this question, the numbers 8 and 20 are of one kind, and the two others 12 and 30, are of another kind. The numbers form the proportion, and the numbers 8 and 12 (the antecedents of the ratios) are related to each other, and also 20 and 30, 12 shillings being the price of 8 yards, and 30 the price of 20. The proportion is therefore *direct*. But if the question were to find in how many days 4 men will do a piece of work, supposing 6 men can do it in 10 days, the related numbers would be differently placed, for the answer being 15 days, the four numbers written as proportionals must stand thus, 4 6 10 15, and as the numbers 4 and 15 are here the related numbers, or the antecedent of the first ratio is related to the consequent of the second, the proportion is *inverse*. This is also called *reciprocal* proportion, for if one of the ratios be formed of the reciprocals of the given numbers instead of the numbers themselves, the related numbers would stand as in direct proportion, thus, $\frac{1}{4}$ $\frac{1}{6}$ 10 15, or 6 4 $\frac{1}{10}$ $\frac{1}{15}$.

It is a property of proportional numbers, derived immediately from the definition, that the product of the first and fourth terms is equal to the product of the second and third. Hence, when three terms of a proportion are given, the fourth can be found. This is the object of all questions in the Rule of Three.

The preceding remarks apply exclusively to *geometrical* proportion, that is to say, when the proportion consists in the equality of ratios. Writers on arithmetic also mention *arithmetical* proportion, and *harmonical* proportion, for which see the respective terms.

PROPORTION. In the Fine Arts the most proper relation of the measure of parts to each other and to the whole. The Greeks used the word συμμετρια (symmetry), to express this idea. In many instances proportion may be considered as nearly synonymous with fitness, though there is a distinction between them, since every form susceptible of proportion may be considered either with respect to its whole as connected with the end designed or with respect to the relation of the several parts to the end. In the first case, fitness is the thing considered, in the second proportion. Fitness therefore expresses the general relation of means to an end, and proportion the proper relation of parts to an end. It is hence needless to dwell on the intimate connection that exists between beauty and proportion in all complex forms. Payne Knight, *in his Inquiry into the Principles of Taste*, has asserted that in many productions of art "symmetry is the result of arbitrary connection." It would be very easy to show the absurdity of this assertion, if we considered it worth the space.

PROPORTIONAL COMPASSES. Compasses with two pairs of opposite legs, by which distances are enlarged or diminished in any proportion.

PROPORTIONAL SCALES. See SCALES.

PROPORTIONALS. The terms of a proportion, of these the first and last are the *extremes*, and the intermediate the *means*, or the *mean* when the proportion consists of three terms. See PROPORTION.

PROPORTIONS, DEFINITE. In Chemistry. See AFFINITY.

PROPOSITION. [illegible] ence indicative," [illegible] Thus sentences in the form of command or question are [illegible] logical propositions to substance, into categorical and hypothetical, secondly according to quality, into affirmative and negative, thirdly, according to quantity into universal and particular. A categorical proposition is where the sentence affirms or denies absolutely, as "man is mortal." A hypothetical proposition is defined to be two or more categoricals united by a conjunction, as "if Caius is man he is mortal." There are several sorts of hypothetical, [illegible] conditional, disjunctive, [illegible] A proposition is one whose copula (or conjunction) is affirmative, as "man is mortal;" a [illegible] has a negative copula, as "man is not [illegible]." A universal proposition is when the predicate is said of the whole of the subject, as "all men are mortal;" "Caius is mortal," a particular, when it is said of part of the subject only, as "some men are rich." To these two species may be added the indefinite proposition, when the subject has no sign of universality or particularity, or is a singular noun which is either universal or particular according to the matter. The matter of a proposition is said to be either necessary, impossible or contingent, and if the matter of an indefinite proposition be either of the former, it is equivalent to an universal, if the last, to a particular, *e g* "birds fly," *i e* all birds — universal. "No birds are quadrupeds;" here the matter is impossible, and the proposition universal. "[illegible] *g* some birds — particular. [illegible] division of propositions according to quality and quantity is denoted by an arbitrary sign, *e g* A stands for an universal affirmative, in the logic used at Oxford; E for an universal negative, I for a particular affirmative, O for a particular negative.

A categorical [illegible] terms united by a copula [illegible] the first term, *i e* that of [illegible] denied, is the subject; the other (that [illegible] or denied respecting the first) the predicate. In the collocation of our language, the subject usually, but not invariably precedes the predicate. Thus, "Diana of the Ephesians (subject) is great" (predicate), is transposed into "Great is Diana of the Ephesians." In some languages, as Greek and Latin, the latter form of collocation is not less natural or usual than the former. When the subject of a proposition is accompanied (*see* TERM) it is said to be distributed when the universal sign (all, no, every, &c.) is prefixed, and the proposition consequently universal. The predicate is said to be "distributed" in all negative and no affirmative propositions, inasmuch as a negative proposition denies that any part of the predicate agrees with the subject, whereas an affirmative can *never* assert that every part of the predicate agrees with the subject, since can never do so necessarily, by the logical force of the proposition, although it may [illegible] predicate agrees with the [illegible] *g* "Cæsar was the first [illegible]." Two propositions are said to be opposed, when, having the same subject or predicate, they differ in quantity, in quality, or in both. The two universals (A and E) are termed *contraries* to each other, the two particulars (I and O) *sub-contraries*, the universals and particulars (A and E, I and O) *subalterns*, A and O, or E and I (those which differ both in quantity and quality) *contradictories*. A proposition is said to be converted when its terms are transposed, *i e* when the subject is made the predicate, and the predicate the subject. See CONVERSION OF PROPOSITIONS.

PROPOSITION. In Mathematics, a theorem proposed to be demonstrated, or a problem in which something is proposed to be done.

PROPRÆTOR. A Roman magistrate, bearing the same relation to the prætor that the proconsul did to the consul. (See PROCONSUL.) Under the emperors, propraetors as distinguished from proconsuls were appointed as governors to the imperial provinces, the latter being the servants of the senate.

PROPYLÆUM (Gr προπυλαιον). In Ancient Architecture the vestibule of a house. The vestibules or porticos at Athens, leading to the Acropolis, were thus denominated.

PRO RE NATA (Lat. *according as occasion may require*). A term commonly used in medical prescriptions.

PROROGATION. See PARLIAMENT.

PROSCENIUM (Gr προ *before* and σκηνη *a scene*). In Architecture the frontispiece or part in a theatre where the drop scene separates the stage from the audience and beyond the orchestra. In the ancient theatres it comprised the whole of the stage.

PROSCRIPTION (Lat. proscribere, *to proscribe, outlaw or doom to death, to confiscate one's property*). The most vindictive species of proscription was that introduced by Sylla when he wrested Rome from the hands of the Marian faction. It consisted in making out a list of persons supposed to be obnoxious to the state, and getting a sentence of condemnation passed against them, which made it unlawful to harbour a proscribed person. By these measures thousands of citizens perished in the civil wars of Rome. The most celebrated proscription was that of the triumvirs Octavius, Antony, and Lepidus, in which Cicero was slain.

PROSE (Lat. prorsa oratio, from prorsus, adv., *direct or straightforward*). In Literature, all language not in verse. [illegible] good or even admissible, in ordinary criticism, must be conformable to the rules of composition as to style, cadence, &c.

PROSELYTE (Gr προσηλυτος, *one who arrives as a stranger*). A term in use among the Jews after their connection with the Greeks and applied to such foreigners as embraced their religion. These they divided, according to the common opinion, into two classes, distinguished by the terms proselytes of the gate, and proselytes of righteousness. Of these the former were such as merely renounced idolatry, and believed in and worshipped the true God, observing the precepts of the natural law, and, from being admitted within the first gate of the temple, received this appellation. The latter class were those who submitted to circumcision, and in every other respect conformed entirely to the customs of the Jewish people. Dr Burton however, it must be admitted, thinks this distinction unfounded. (*Lectures on the Early History of the First Three Centuries*, I. iii.)

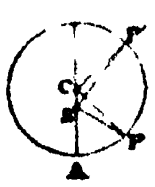
PROSENCHYMA (Gr προσεγχυω, *I pour still more upon*). Cellular tissue, the cellules of which taper to each end, and [illegible] each other at their extremities. It is the first [illegible] in the part of cellular tissue to the condition of woody tissue.

PROSERPINE. The Latin form of Persephone, the

name of a Grecian goddess, sprung from Jupiter and Ceres She was stolen from her mother by Pluto, who, enamoured of her beauty, carried her off from the plains of Enna in Sicily, while sporting with her companions, to the infernal regions, where she became his queen The wanderings of Ceres in search of her daughter were much celebrated by the ancient poets When she at last discovered the place of her concealment, a compromise was entered into, by which Proserpine was allowed to spend two thirds of the year with her parents and the rest with Pluto in his empire

PRO'SODY (Gr προς *to* and ᾠδη *song*, signifying, literally a guide or addition to verse or metre) The science which treats of quantity as accent and the laws of harmony, both in metrical and prose composition In the Greek and Latin languages every syllable had its determinate value or quantity, and verses were constructed by systems of recurring feet, each foot containing a definite number of syllables possessing a certain quantity and arrangement (*See* Foot) The versification of modern European languages, in general, is constructed simply by [illegible] They have therefore, no [illegible] Germans, however, have laboured to subject their language to the ancient metrical system, but with indifferent success

PROSOPO'GRAPHY (Gr προσωπον, *figure* or *person*, and γραφω, *I describe*) In Rhetoric a word used by some critical writers to signify the description of animated objects Of this figure the portraits of the horse and the leviathan in the book of Job are well known and beautiful examples



PROSOPOPŒ'IA (Gr προσωπον and ποιεω *I make*) A figure by which inanimate objects, or abstract ideas are personified, and addressed or represented by the poet or orator as if endowed with human shape or sentiments Milton's famous digression of Sin and Death in the *Paradise Lost* is at once a prosopopœia and an allegory

PROSPE'CTUS (Lat) in its most extended sense is applied to the outline of any plan or proposal submitted for public approbation but it is most usually confined to literary undertakings in which it signifies an outline or sketch of the plan or design of a work together with such other circumstances connected with the publication &c as it may be thought desirable to enlarge upon or make known

PROSTATE GLAND In Comparative Anatomy the prostate gland retains its single compact form in most of the Quadrumana but is bifid in the Ruminantia, in the Rodentia and Insectivora it is resolved into numerous slender elongated cæcal tubes, in the mole it is remarkable for its periodical increase of size

PRO'STATES (Gr) The name given to the guardians of the foreign settlers at Athens whose business it was to represent them in courts of law, and protect them from injury

PROSTHAPHE'RESIS (Gr προσθη and αφαιρεσις *subtraction*) A term used by the older writers on astronomy to signify the difference between the true and mean motion or the true and mean place of a planet or the quantity which must be taken from or added to the mean anomaly, in order to get the true anomaly

Let P (or P') be the place of a planet in its orbit S the sun C the centre and A the perihelion of the orbit, the angle A S P is the true anomaly A C P is the mean anomaly, and the difference between A S P and A C P is S P C, which is the prosthaphæresis If A C P be less than a right angle, S P C must be added to A C P in order to get the true anomaly, but if it be greater than a right angle the angle S P C must be deducted The angle S P C is called by modern writers the equation of the *centre* or equation of the orbit

PROSTHESIS (Gr προς, and τιθημι *I place*) A figure of grammar by which one or more letters are added to the commencement of a word, as in the common [illegible] &c *See* METAPLASM

PROSTYLE, or PROSTYLOS (Gr προ *before*, and στυλος, *a column*) In Architecture, a temple or other building with columns in its front face

PRO'TASIS (Gr προτασις from προτεινω *I stretch or put forth*) In Grammar and Rhetoric every properly constructed period (*see* PERIOD) is said to be naturally divisible into two parts, of which the first is termed protasis, the second apodosis In the ancient drama, the protasis was the exposition, usually contained in the first part of the piece, either by way of soliloquy or dialogue, serving to make known the characters and the plot to the audience

PROTEA'CEÆ (Protea, one of the genera) A natural order of arborescent, rigid, useless Exogens, inhabiting the hotter parts of the world, and found in dry, sterile, stony, exposed places, especially near to the sea coast They are known from *Elæagnaceæ* by the woody texture of their leaves; by the irregular calyxes having a valvate æstivation, with the stamens placed upon the lobes, and by the dehiscent fruit The genera *Banksia*, *Dryandra*, *Protea* and *Grevillea* are cultivated for the [illegible] beautiful foliage and flowers The seeds of *Guevina* are sold in Chili for the same use as hazel nuts with us One of the larger timber trees of New Zealand is the *Knightia excelsa*, a plant of this order

PRO'TECTOR In English History, a title which has been three times assumed by daring statesmen — 1 Richard, duke of York, in 1453, was appointed by parliament protector during pleasure 2 The duke of Somerset being constituted one of Henry VIII's sixteen executors, obtained a patent from the young king, Edward VI, in 1548, constituting him protector, with the assistance of the other fifteen as councillors, but he only enjoyed this dignity a few months, and his loss of it was soon followed by his death 3 Cromwell took the title of lord protector of the commonwealth of England, Scotland, and Ireland on the 12th Dec 1653, when the "Barebones Parliament" resigned its authority into his hand His son Richard succeeded him in his title and [illegible] but was never formally installed protector

PRO'TEST In Parliamentary Law, is a privilege peculiar to the members of the upper house of parliament of entering (by leave of the house always presumed) their dissent from a motion or resolution agreed to by a majority of the house together with their reasons for dissenting The paper embodying these reasons of dissent is called a protest and is entered on the journals Protests with the reasons, were first set down, according to Lord Clarendon in 1641 *See* PARLIAMENT

PRO'TESTANTS A general name applied to the various denominations of Christians which have sprung from the adoption of the principles of the Reformation in the 16th century The term was assumed, in the first instance by the reformers of North Germany, who in the year 1529 formally protested against a decree of the imperial diet held at Spires which ordained that the question between the parties should remain unsettled, some restrictions being laid upon the progress of the new opinions, until the calling of [illegible] to which was left uncertain [illegible] cried that the decree was unfavourable and unjust to their party and claimed the immediate summons of a lawful council which they knew it was the interest of the papacy, under the circumstances, to delay In the early period of the Reformation the principal reformed churches were two those of the followers of Luther and of Calvin the partisans of Zuingli having become nearly identified with the latter Since that time the number of subdivisions upon every point of doctrine and discipline has been infinite The general bond of union, however among all continues to this day to be the assertion of private judgment and rejection of any infallible head of the church or ultimate authority in pope or council We believe, also, that no Protestant church has ever relapsed into any one of the prominent results of the Romish system — such as the doctrine of the seven sacraments, of transubstantiation [illegible] the celibacy of the clergy or veneration [illegible]

There are however two lines of argument upon which these principles are maintained the respective assumption of which seems to constitute the strongest line of distinction among Protestants The first is that to which the German and Swiss reformers most generally leaned, which considers the Bible to contain within itself so complete a repository of divine truths as to be its own interpreter as well as the evidence of its own authenticity and inspiration The English reformers, on the other hand endeavoured to base their doctrines upon the practice of the first three centuries and appealed therein to similar principles with the Roman church, which they maintained to be corrupt, not in its origin, but in its growth

PRO'TEUS A marine deity of the Greeks, celebrated for his gift of divination, and the power of changing his form by which means he eluded those who resorted to him for information

PROTEUS In Zoology this name was originally and very aptly applied to a genus of Infusories, which, during life, never for a single minute maintain the same form; the species [illegible] as in the common species called *Proteus anguinus* The term was subsequently used by Laurenti to designate a singular amphibious reptile, peculiar to certain subterranean waters in Carniola, and which, like the American siren, retains the external gills, together with internal lungs or air-bags [illegible]

PROTHONOTARY (Lat proto notarius, or *first notary*) A title originally of the Byzantine empire The Apostolical prothonotaries of the Papal court are officers having precedence of the other notaries or secretaries of the Roman chancery, the papal "notaries participant" rank after bishops but before abbots In England officers in the courts of King's Bench and Common Pleas had this title, until the recent changes in those courts

PROTHORAX (Gr προ, *before*, and θωραξ, *a shield*.)

In Entomology, signifies the first segment of the thorax in insects, by Kirby the term is restricted to the upper part only or shield of that segment

PRO'THYRIDES (Gr προ, and θυρα, *a door*) *See* ANCONES

PRO'THYRUM (Gr προ, and θυρα) In Architecture, a porch before the outer door of a house

PRO'TOCOL (From the Latin protocollum a word derived from the Greek πρωτος *first* and κολλα *glue*, but the etymological significat on attached to this derivation seems unknown) The word protocol, in the French language signifies the formulæ or technical words of legal instruments, in Germany, it has been used to denote the minutes or rough draught of an instrument or transaction It is in the latter sense that the word has been borrowed by diplomacy, in which it signifies the original copy of any dispatch, treaty, or other document

PRO'TOTYPE (Gr πρωτος, *first*, and τυπος *a mark*) In the Fine Arts, the original pattern or model of [illegible] of imitation

PROTOZOA [illegible] ζωον *animal*) A name synonymous with Infusoria and Cuvier and applied to the simplest animals, or those which stand, as it were, on the first step of organization

PROTRACTOR A mathematical instrument for laying down angles on paper, used in surveying, plotting, &c

[illegible] consists merely of a semicircle divided into 180°, and subtended by a diameter, in the middle of which is a notch to mark the position of the centre On placing this notch over the corresponding point and laying the diameter along a given straight line, any angle or multiple of any number of degrees may be made by marking the point on the paper which coincides with the given degree on the limb, and joining this point with the centre when the instrument is removed The protractor is rendered more commodious by transferring the divisions to the edge of a parallel ruler

When a survey is to be plotted on a large scale, and it becomes necessary, in consequence, to lay down the angles with considerable [illegible] required The most approved protractor may be described as follows — It consists of a circular ring connected with its centre by four radial bars The centre of the metal is removed and a circular disk of glass fixed in its place, on which are drawn two lines crossing each other at right angles, the point of intersection denoting the centre of the protractor Round the centre, and concentric with the circle, is fitted a collar carrying two arms, one of which has a vernier at its extremity adapted to the divided circle, and the other a milled head which turns a pinion working in a toothed rack round the exterior edge of the instrument The rack and pinion give motion to the arms, which can thus be turned quite round the circle and set the vernier to any angle that may be required Each of the two arms is prolonged beyond the edge of the protractor, and carries a fine steel pricker which is pressed down when the instrument is placed in its required position and makes a small puncture in the paper It is essential that the points of the two prickers and the centre of the instrument be accurately in the same straight line (*Simms on Mathematical Instruments*)

In Anatomy, the muscles which draw forwards a part are termed *protractors*

PRO'VERB (Lat proverbium) A familiar saying which has been variously defined In point of form there are two species of proverbs, one containing a maxim directly expressed in a concise and familiar style, the other, in which a maxim is expressed [illegible] *e.g.* [illegible] or [illegible] *e.g.* [illegible] hot" In point of substance, proverbs are for the most part rules of moral, or, still [illegible] ial, conduct

In French, the term has been applied to short pieces in which some proverb or popular saying is taken as the foundation of the plot They originated [illegible] for the [illegible] theatre [illegible] the title of the last [illegible] successful writer of proverbs at the time of their highest popularity Those of M Theodore Leclercq at the present time, have met with considerable success

PROVERBS, THE, OF SOLOMON One of the canonical books of the Old Testament According to the arrangement in its present shape, the first nine books form a species of introduction, those from the tenth to the twenty-fourth contain the proverbs of Solomon, properly so called, and the remainder furnishes a kind of appendix, including the thirtieth and thirty-first, which contain the proverbs of Agur, the son of Jakeh, and of king Lemuel

PROVI'NCIA Those countries were called by the Romans provinces which, having been reduced under their [illegible] sent [illegible] settled by ten commissioners, dispatched from Rome in conjunction with the victorious general In its modern acceptation province signifies a grand division of a kingdom or state, comprising several cities towns, &c, all under [illegible] by the ex[illegible] diction

PROVISIONS, in the Navy, daily, 1 lb of biscuit, 1 oz of cocoa, ½ oz of tea, ½ of an imperial pint of spirits, or 1 imperial pint of wine, ½ lb of beef with ½ lb of flour, and ½ lb of pork with ½ a pint of peas on alternate days, or 1 lb of fresh meat with 9 oz of vegetables Part of the flour may be exchanged for suet, currants and raisins, 1 pint of oatmeal, and 10 oz of sugar a week After ten days of salt provisions, an allowance of lemonade

PROVI'SO In Law, a condition inserted in a deed on which its validity depends, commencing usually with the words "provided that," as also in acts of parliament

PROVI'SOR The title, in the ancient French Universities of an officer charged with the management of their external affairs, both spiritual and temporal, and to a certain extent with their discipline also The provisor of the Sorbonne was an officer of high importance [illegible] The principals of Napoleon's lyceum [illegible] rovisors, and the modern royal colleges retain it for the same functionary

PRO'VOST (contracted from Lat præpositus, *placed over*) The title of the chief municipal magistrates of Scotland, equivalent to mayor in England The chief magistrates of Edinburgh and Glasgow are styled *Lord Provost*

PROVOST OF A UNIVERSITY See UNIVERSITY

PRO'XENE (Gr προξενος) In Grecian Antiquities, officers at Sparta who had [illegible] strangers (Herodot vi) [illegible] Grecian republics, wealthy and distinguished men of particular states seem to have accounted it an honour to act as protectors of the citizens of foreign commonwealths thus, Alcibiades was *proxenus* of the Spartans at Athens

PRO'XIMATE PRINCIPLES Distinct compounds which exist ready formed in animals and vegetables, such as albumen gelatine fat &c in the former, and sugar gum starch resins &c in the latter, which are so called without reference to their ultimate composition

PRO'XY (Lat proximus) In Parliamentary Law, every peer spiritual or temporal, can (by license, supposed to be obtained from the king) constitute another lord of parliament of the same order with himself his proxy to vote for him in his absence Proxies cannot be used when the house is in committee, nor can a proxy [illegible] By an order of 20 2 no peer can hold [illegible] this two proxies See PARLIAMENT

PRUD HO'MME (Lat homo prudens) In France during the middle ages municipal tribunals composed of [illegible] or equitable jur[illegible] [illegible] jurisdictions of police &c, were termed councils of *prud hommes* In 1806 a court of this denomination was re-established at Lyons by a law of Napoleon, its principal office is the decision of disputes between masters and workmen in the silk manufacture

PRUNING The art of cutting off parts of plants, and more especially of trees and shrubs, with a view to strengthening those which remain or of bringing the tree or plant into particular forms, calculated to increase particular products Pruning differs according to the kind of plant or tree to be pruned and according to the object in view In the case of forest trees the general object of pruning is to increase the quantity of timber in the trunk by [illegible] the side branches, commencing at the lower part of the tree when it is quite young, and gradually advancing upwards as the tree increases in growth In the case of hedges, the object is to produce a dense mass from the ground upwards, which is effected by shortening the side branches In the case of pruning trees which are cultivated for the sake of their fruit or blossoms, the object is to thin out the branches so as to admit the light and air more freely to their leaves and blossoms, and to concentrate and increase the nourishment to the branches which remain In the case of trees, or shrubs cultivated for the beauty of their shapes, whether natural or artificial, the object of pruning is to deprive the trees or shrubs of all those branches which deviate from or interfere with the natural shape, or with the form which is intended to be produced by art In pruning with a view to produce fruit, it is necessary to know on what description of branches and buds the fruit is produced In some trees, as in the peach, it is generally produced on the wood of the preceding year, in others, as in the apple and pear, it is generally produced on wood of two years' growth; and in [illegible] the current year The general effect of pruning plants is to increase their longevity; since the tendency of all vegetables is to ex-

haust themselves, and, consequently, to shorten their duration, by the production of seeds In the operation of pruning the shoots are cut close to the buds or at a distance from them not greater than the distance of the branch to be cut off because, without the near proximity of a bud the wounds will not heal over In shoots which produce their buds alternately, the cut is made at the back of the bud, sloping from it, so as that it may be readily covered by bark in the same or in the following year This is readily done with a pruning knife by a slanting cut made at an angle of 45° with the direction of the branch, but, in the case of branches where the buds are produced opposite each other, either one bud must be sacrificed, or the branch must be cut off at right angles to its line of direction, and this is more conveniently done by the pruning shears The operation of pruning may in many cases be superseded by rubbing off, or pinching out, the leaf buds, so as to prevent superfluous shoots from being produced

PRU'NING KNIFE A knife the blade of which has a straight edge, formed of well tempered steel, and of no great breadth with a narrow point in order that it may be more readily introduced [illegible] Formerly pruning knives were [illegible] the cuts made by such knives had a tendency to crush the shoot, and leave a rough section, more readily injured by the air and water, and less likely to be speedily healed over Such knives, when of a large size, were ca[illegible]

[illegible] Shears in which one of the blades moves on a pivot which works in an oblong opening, instead of a circular one, by which means a draw cut is produced similar to that effected by a knife, instead of the crushing cut produced by common shears which fractures the section left on the branch, and renders it liable to become diseased or to decay, instead of being covered over with fresh bark Pruning shears are particularly adapted for [illegible] shrubs such as [illegible] gooseberries or roses

PRURI'GO (Lat prurio *I itch*) An itching of the skin with the eruption of small pimples The term is also medically applied to irritation of various parts of the body from other causes, as from vermin worms &c

PRU'SSIAN BLUE This beautiful dark blue pigment was accidentally discovered in 1710 by Diesbach, a chemist of Berlin The process for its preparation was [illegible] the *Philosophical Transactions* for 1724, by [illegible] It is made by adding solution of *ferrocyanuret of potassium* to persulphate of iron The ferrocyanuret of potassium is prepared by gently igniting carbonate of potassa with animal matters, such as horns, hoofs, or dried blood, in iron vessels by which cyanuret of potassium and some cyanuret of iron are formed, the soluble parts are then washed out with water, and sulphate of iron added until the Prussian blue which is formed ceases to be decomposed by the free potassa contained in the solution, the ferrocyanuret of potassium is then set to crystallize, and separated by repeated crystallization from sulphate of potassa It is thus obtained in truncated octoedral crystals of a yellow colour commonly called *Prussiate of potash* It is much used as a test of the presence of metals, and especially of iron, the peroxide of which it throws down from its solutions in the state of Prussian blue This compound has generally been considered as a ferrocyanate of the peroxide of iron, but, according to Berzelius, it is a double cyanuret, that is, a ferrocyanuret of the sesquicyanuret of iron Ferrocyanuret of potassium (prussiate of potash) is composed of 2 atoms of cyanuret of potassium ($66 \times 2 = 132$, and 1 atom of cyanuret of iron ($28 + 26 = 54$, and has, therefore the equivalent $(132 + 54) = 186$

PRU'SSIC ACID The composition and chemical characters of this acid are given under the head of *hydrocyanic acid* Prussic acid is frequently used medicinally as a powerful sedative and anti-irritant, especially to allay cough in phthysis, and to mitigate the spasmodic action in whooping-cough, but from its poisonous nature it requires to be employed with much caution The antidotes for prussic acid, where it has been taken as a poison, are solution of chlorine, by which it is chemically decomposed; and ammonia, which combines with it, and acts as a stimulant

PRY'TANES (Gr πρυτάνεις) The Athenian senate consisted of 500 persons, elected fifty from each of the ten tribes, each of these fifties took it by turn to preside with the title of Prytanes, having one tenth of the year assigned to it, or, more accurately speaking, 34 days were allotted to each of the first four tribes and 35 to the last six; the Attic year consisting of 354 days Each fifty was again subdivided into five bodies of ten, which, when prytanes, took it by turns to perform the duties of prohedri (προεδροι), seven days being allotted each From these prohedri, again, was chosen by lot an epistates (ἐπιστάτης) or president, whose office lasted one day

PSALM (Gr ψαλμος, from ψαλλω, *I sing*) A sacred song or hymn, originally accompanied with music The book of Psalms is called, in the Hebrew, *Thehillim* (*praises*), in conformity with the general object of the collection It seems to have been an article of faith, with most of the early fathers, that the Psalms were all of them composed by David, a strange notion, which the internal evidence of several immediately refutes The Jews divide them into 5 books, ending with the 40th, 71st, 88th, 105th, and last, respectively They, as well as all Christians, retain the number 150, but the divisions have varied There is an apocryphal 151st added in some Greek versions The 15 following psalms to the 134th, called by some 'gradual psalms' or "psalms of the stairs," a term of which various explanations have been given, are thought by Calmet and others to have been composed on the occasion of the deliverance from Babylon, possibly by Esdras, who is considered as the first collector of the Psalms, but they were at least partially used before, as early as the reign of Hezekiah

PSALMODY A general term applied to the whole subject of psalm-singing, &c

PSA'LTER A book of devotion containing the psalms See *Palmer's Origines Liturgicæ*, vol i p 207.

PSALTE'RIUM (Lat *a psalter or psalm-book*) The name of the manyplies or third cavity of the complex stomach of the ruminant quadrupeds, so called because it is occupied by numerous broad folds of membrane resembling [illegible] book

PSA'LTERY [illegible] of musical instruments among the ancient Jews [illegible] was called *nabhlum* (which see) It was [illegible] according to Burney, partly the lyre and partly the harp

PSE'PHOI (Gr) A general name given to several things made use of by the Greeks in giving their suffrages [illegible] as small stones, shells, [illegible] with the *calculi* and *tabellæ* of the Romans, which see

PSEUDEPI'GRAPHY (Gr ψευδης, *false*, and ἐπιγραφη, *inscription*) The ascription of false names of authors to works This was carried to a great extent among the Christians of the fourth and following centuries Thus, the verses known by the name of Sibylline are evident Christian forgeries, and it is extremely difficult to distinguish the spurious works of the Fathers from the true (See Gieseler, *Text-book of Eccl Hist*, 1st period, chap 3 sec 5? for a good section on Christian pseudepigraphy, *Fabricii Codex Pseudepigraphus*, Barbier, *Dict des Ouvrages Anonymes et Pseudonymes*, contains a notice of most works [illegible] to their [illegible] the French language)

PSEUDOBLEPSIS (Gr ψευδης, and βλεψις, *sight*) There are various forms of false vision, some apparently dependent upon nervous irritation, others upon organic derangement Specks, network, colours, and imaginary bodies floating or dancing before the eyes, distorted vision, double vision, are among the most common modifications of this complaint They occur in plethoric as well as in debilitated habits, and are the consequence occasionally of intense study, of weakening evacuations, of debauchery, of hysteria, and of hypochondriasis, the treatment, therefore, which is required is very various Attention to the stomach and bowels, local bleeding, camphor, ether, and other nervine stimulants, change of scene and occupation, varied exercise, are among the efficient remedies A very alarming case of double vision, with coloured circles in rapid motion dancing before the eyes, of two years' continuance, and brought on by too [illegible] study, gave way to cupping and to [illegible] the Highlands

PSEUDO BULB In Botany, an enlarged aerial stem resembling a tuber, from which it scarcely differs, except in being formed above ground, in the epidermis, being [illegible] and in retaining upon its surface [illegible] scars of leaves that at once bore

PSEUDODIPTERAL (Gr ψευδης, *false*, δις, *twice*, and πτερον, *a wing*) In Architecture a term denoting a building or temple wherein the distance from each side of the cell to the columns on the flanks is equal to two intercolumniations, the intermediate range of columns which would stand between the outer range and the cell being omitted

PSEUDOISODO'MUM (Gr ψευδης, ισος *equal*, and δομος, *a house*) In Ancient Architecture a species of masonry in which the height, thickness, and length of the courses are different *See* ISODOMUM

PSEUDOPODS, *Pseudopoda* (Gr ψευδης, and πους, *foot*) A name applied to a tribe of Polygastric Infusories, including those in which the body, by various contractions and changes of form, produces pediform processes

PSEUDOSCORPIONS *Pseudoscorpiones* A family [illegible] having the body divided into several segments, with two or four eyes, and six or eight legs the book-crabs (*Chelifer*)

PSEUDOTHYRON (Gr ψευδης, and θυρα, *a door*) In Architecture a false door

PSITTACINES, *Psittacinæ*, (Parrot tribe) The name of a [illegible] Scansorial birds, of which the genus *Psittacus* is the type.

PSO'AS MUSCLE (Gr ψοας, *the loins*) A large muscle upon the fore part and sides of the lumbar vertebræ It bends the thigh forwards, and assists in turning it outwards

PSO'PHIA (Gr ψοφεω, *I make a noise*) A subgenus of storks, having a shorter bill than the rest, with the head and neck covered only with a kind of down, and the circumference of the eye naked They frequent wooded regions, and subsist on grains and fruits The best known species (*Psophia crepitans*) is a native of South America, and is remarkable for the ambiguous sound which it emits from time to time and whence its specific name is derived This bird is easily tamed by the Spanish settlers in South America and is even taught by them to guide and defend the common poultry from the rapacious birds, as a shepherd's dog guards his sheep from the wolves

PSO'RA (Gr) The itch *See* ITCH

PSORIA'SIS A rough scaly state of cuticle sometimes continuous and sometimes in patches, generally accompanied by chaps or fissures

PSY'CHE (Gr) In Mythology a nymph whom Cupid married, after she had been persecuted by Venus The word signifies the soul, of which Psyche was considered the personification This beautiful allegory is first known to us by the romance of Apuleius but it is presumed to be of much earlier origin from its occurrence in relics of art La fontaine made it the subject of a pastoral and Mrs Tighe recently of a poem

PSYCHOLOGY (Gr ψυχη *the soul*, and λογος *discourse*) In its larger acceptation may be taken as synonymous with mental philosophy The word is more frequently used in reference to the lower faculties of the mind and the classification of the phenomena which they present All psychology is built on experience either immediate, or revived by the memory and imagination But, in reflecting on our intellectual faculties we discover in them certain laws, which as soon as they are presented to us we at once recognise as universal and necessary, certain conditions without the fulfilment of which we are sensible that no act of intellection could have taken place This universality is something very different from the empirical truth as a matter of fact which we attribute to the laws of association which are indeed universal but which might for aught we can see have been different from what they are Corresponding to this distinction German writers have discriminated between a higher or rational and a lower or empirical psychology the first that of Kant who sought in all our mental faculties, to determine that only which is necessary and immutable the second that of Hartley who treats all our intellectual acts as alike objects of mere history dependent for their validity only on the fact that they do really recur in such and such order The psychology of Aristotle was of the latter description He consequently, regarded the science as forming one of the physical sciences, or those which are conversant with the contingent and changeable Many pregnant psychological truths are discoverable in that philosopher's work on the soul, in particular, the doctrine of association the master-light of all sound experimental psychology owes its first enunciation to him Among later writers who have made valuable contributions to the science may be enumerated Hobbes, Locke Hartley and Sir Thomas Brown The value of these authors writings in this peculiar province cannot be too highly appreciated It is only when psychology intrudes upon the domain, or usurps the attributes, of the higher philosophy that its claims need to be resisted As a preparation for metaphysical and theological thought and indeed, as an indispensable requisite for the science of man whether history politics, or ethics, it is not easy to exaggerate its importance

PSYCHOMA'NCY (Gr ψυχη, and μαντια *prophecy*) A species of divination in which the dead were supposed to appear as spirits, to communicate the wished for information

PSYCHROMETER (Gr ψυχρος *cool* μετρον *measure*) An instrument invented by Professor August of Berlin, for measuring the tension of the aqueous vapour contained in the atmosphere It consists of two very sensible thermometers, one of which when an observation is to be made, has its bulb kept moistened, but so that no drop of water remains suspended from it The thermometers being then freely exposed to the air, the temperature indicated by each is observed, and also the height of the barometer from which data the tension of the vapour is computed by means of this formula —

$$e = e' - 0.000378\,(t - t')\,b;$$

where b is the height of the barometer in English inches, t the temperature of the air (in degrees of Fahrenheit), t' the temperature of the wet bulb e' the tension of vapour corresponding to the temperature t' and e the tension of the vapour actually existing The instrument is described in the work of August, *Sur les Progrès de l'Hygrométrie dans les Derniers Temps*, Berlin, 1830, also in the *Lehrbuch der* [illegible] and *Quetelet's Correspondence* [illegible] *et Physique* [illegible] série, tome 2

PTERODA'CTYLE, *Pterodactylus* (Gr πτερον *a wing*, δακτυλος *a digit*) The name of a genus of extinct reptiles in which the second digit of the hand is of extreme length, and is considered to have supported an aliform expansion of the skin

PTE'ROPODS *Pteropoda* (Gr πτερον, and πους *a foot*) The name of a class of Mollusks, comprehending those which have a natatory wing-shaped expansion on each side of the head and neck

PTERY'GIANS *Pterygia* (Gr πτερυξ, *a wing*) A name applied by Latreille to [illegible] tusks corresponding to the Cephalopoda of Cuvier, both of which have locomotive organs, composed of wing-like expansions of the skin

PTERY'GODA (Gr πτερυξ) Latreille has given this term to two small, hard, moveable bodies, in the form of little elytra, directed backwards and terminating at the origin of the wings They arise from the two sides of the anterior extremity of the trunk near the exterior base of the two first legs, instead of from the second segment of the trunk like true elytra They are present in Lepidopterous and Strepsipterous insects

PTERY'GOID (Gr πτερυξ and ειδος *form*) Wing-shaped The name is applied to processes of the sphenoid bone, which complete the osseous palate behind, and form distinct bones in the oviparous vertebrate animals

PTISAN (Gr πτισσω *I bruise*) A weak diluent drink

PTOLEMAIC SYSTEM *See* ASTRONOMY

PTOLEMA'ITES A sect of ancient heretics among the Gnostics who maintained that the Mosaic Law came partly from God partly from Moses and partly from the traditions of the Jewish doctors (See *Mosheim's Church History*)

PTY'ALISM (Gr πτυαλιζω, *I spit*) An increased flow of saliva Salivation

PUBI'SCENT (Lat pubescens *hairy*) In Zoology, when a part or whole is covered with very fine recumbent short hairs

PU'BLICANS (Lat publicani) The farmers of the public revenue of Rome They formed two distinct classes, the farmers general of the revenues who were regarded as belonging to one of the most honourable grades of citizens and deputies or under publicans of an inferior caste whose reputation was on a par with that of the most degraded citizens Hence in the New Testament, the τελωναι a word rendered publicans by the Latin translators are almost always placed in juxtaposition with sinners (See *Milman's Hist of Christianity*) This term was also applied as a nickname to the Albigenses, which see

PUBLIC SAFETY COMMITTEE OF (French Revolution) This famous body was formed out of the convention April 6 1793 and invested with very general powers to provide for the supposed welfare of the state, even the power of arrest and imprisonment was soon conferred upon it After the downfall of the Girondist party (see GIRONDISTES) this committee became the virtual government of France by a decree of Dec 4 1793 Its members were at this period elected every month but in general the same were re-elected From this period its history is in effect that of the revolution It appointed tribunals composed of committees invested with sovereign power to try offences against the state, over the whole country It was in the committee of public safety that the opposition to Robespierre originated, but on the overthrow of that personage its powers were limited by the convention, and on the introduction of the new constitution of October 1794, it became extinct along with the assembly out of which it had been formed

PUCK In Mediæval Mythology the 'merry wanderer of the night,' whose character and attributes are so beautifully depicted in the *Midsummer Night's Dream* This celebrated fairy is known by a variety of names; as *Robin good fellow* and *Friar Rush* in England, and in Germany as *Knecht Ruprecht*, but it is by his designation of Puck, that he is most [illegible] England Germany, and the more [illegible] He was the chief of the domestic tribe of fairies, or *brownies*, as they are called in Scotland, and innumerable stories are told of his nocturnal exploits [illegible] the wine, and cleaning the kitche[illegible] were asleep, are the most prominent The word is probably derived from the old Scandinavian púki, *a boy*, it is also synonymous with pug, or monkey, whose form this fairy is said to have most frequently assumed

PU'DDING-STONE A conglomerate of rounded pebbles cemented together by a fine-grained and generally silicious or sandy paste When select specimens are cut and polished they resemble a section of a plum-pudding and are often used for ornamental purposes, such as snuff-boxes and slabs

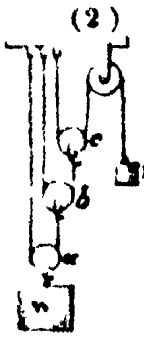
PUERPERAL FEVER A fever attended by peritoneal inflammation which comes on about the third day

after delivery The usual febrile symptoms are attended with great tenseness and tenderness of the abdomen the milk disappears, and the bowels are [illegible] by diarrhœa It is most common and dangerous to be [illegible] It is attended with great [illegible] ing modified according to the circumstances of the case, purging with calomel, saline sudorifics, and occasionally opium, to quiet pain and induce rest, are among the remedial means, but it often happens that great irritability of the stomach and bowels or even incessant purging and vomiting, are predominant symptoms, and the fever assumes a typhoid character, in which case the system requires support from cordials

PU'GGING [illegible] laid on the [illegible] floor, to deaden the sound between one story and another

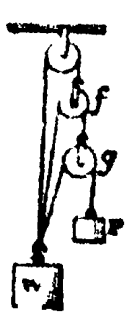
PU'GIL (Lat pugillus) A quantity of any thing which may be taken up between the thumb and two fingers

PUISNE JUDGE (Norm Fr puisné, *younger*) The judges and barons of the King's Bench, Common Pleas, and Exchequer, with the exception of the chief justices and chief baron are so called



PU'LLEY In Mechanics one of the six simple machines, or mechanical powers It consists of a wheel, moveable about an axis, and having a groove cut in its circumference, over which a cord passes The axle is supported by a box or sheave called the *block* which may either be moveable, or fixed to a firm support

(1)



A single pulley serves merely to change the direction of motion, but several of them may be combined in various ways by which a mechanical advantage or *purchase* is gained greater or less according to their number and the mode of combination The purchase gained by any combination is readily computed by comparing the celerity of the weight raised with that of the moving power according to the principle of virtual velocities which is alike applicable to all machines of whatever kind. In fig 1, which represents a system where the several portions of the cord are parallel to each other suppose the weight W to rise 1 inch the two blocks would approach each other by that quantity and consequently, the length of cord connecting a single pair of pulleys would be shortened by 2 inches so that the power P would descend 2 inches Let the number of pulleys in each block be n, then while the weight ascends 1 inch the power descends $2n$ inches and consequently when there is equilibrium, the power is to the weight as 1 to $2n$

(2)

In the combination represented in fig 2 the purchase is much greater Here the pulleys are all moveable and each is supported by a separate cord having one end fastened to a fixed obstacle and the other attached to the succeeding pulley excepting the upper block which is fixed It is evident that, for every inch the weight on the first pulley a ascends the second b ascends two the third c ascends four and so on, the velocity being doubled by each additional pulley The purchase finally obtained is, therefore, $= 2^n$, or the power is to the weight as 1 2^n

The third combination fig 3 has still greater efficacy In this system each cord is fastened to the weight and passing over a pulley is attached to another pulley excepting the last which supports the power While the weight W rises 1 inch the first moveable pulley f will sink 1 inch which allows the cord applied to it to slacken 2 inches and this joined to the inch which the weight ascends allows the second moveable pulley g to descend 3 inches This allows the next pulley in succession to descend 6 inches which, joined to the 1 inch which the weight ascends, gives 7 inches for the descent of the third pulley In like manner, it is found that the [illegible] pulley is 15 inches Hence, one moveable pulley allows the weight to descend $2 \times 1 + 1 = 3$ inches, two such pulleys, $2 \times 3 + 1 = 7$ inches, 3 pulleys, $2 \times 7 + 1 = 15$ inches, four pulleys $2 \times 15 + 1 = 31$ inches, and so on, so that the purchase obtained by n moveable pulleys is $2^{n+1} - 1$, or the power is to the weight as 1 to $2^{n+1} - 1$ The theoretical advantages however, in all the cases, greatly [illegible] and the rigidity of the rope

The two last combinations are of little, if any, use in practice but various modifications of the first are common *Smeaton's pully*, or *Smeaton's tack*, as it is usually called, contains two rows of wheels, one under the other, in each block, and a single cord is made to pass over them in such a manner that the power and the weight both act in the same line with the centres of the two blocks, so that there is no tendency to twist But this ingenious arrangement is open to several objections, and particularly the great amount of lateral friction of so many independent wheels In White's pulley (*see fig* 1), the wheels in each block turn on the same axis, and consequently revolve in the same time, and they are of different sizes, their dimensions being so proportioned that a point on the circumference of any wheel moves with the velocity of the rope on that wheel To effect this the diameter of the wheels in the upper block must be as the numbers 1, 3, 5, &c, and in the lower as 2 4, 6, &c Instead of separate wheels, the upper and lower blocks are cut in grooves in the above proportions, whereby the friction is reduced to that of one wheel in each block

PU'LMOGRADES, *Pulmograda* (Lat pulmo, *a lung*, gradior *I advance*) The name of a tribe of Acalephans including those gelatinous species which swim by the contraction of the vascular margin of the disk shaped body, where respiration, also, probably takes place

PU'LMONARIES, *Pulmonaria* The name of the order of Arachnidans, including those which breathe by means of pulmonary sacs or lungs

PU'LMONATES *Pulmonata* The name of an order of Gastropodous Mollusks, including those which breathe air, to which the blood is exposed while circulating through a vascular network which lines the internal surface of the bronchial cavity

The order is subdivided into the *Pulmonata terrestria*, [illegible] in the Linnæan genera *Limax* and *Helix*, [illegible] Drap, and *Achatina*, Lam, and the *Pulmonata aquatica* [illegible] the genera *Onchidium*, Buchanan, [illegible], *Lymnæa*, Lam, *Physa* Drap, *Auricula*, Lam, *Conovulus* Lam

PU'LPIT (Lat pulpitum) In Architecture, the raised part in a public building from which an oration is delivered In the ancient theatre it was the higher part of the stage whereon the musicians stood

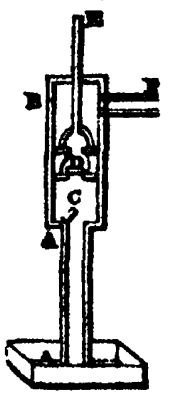
PU'LSE (Lat pulsus) The pulsation of the arteries depending upon the impulse given to the blood by the action of the heart (*See* HEART) The pulse is usually felt by pressing the *radial artery* at the wrist, and the rapidity, regularity and force of the circulation is thus judged of, and furnishes an important criterion of the phenomena and progress of disease The range of the pulse as to *frequency* in a healthy adult, is usually between 60 and 80 but there are persons whose pulses rarely beat 60 times in a minute, and others, not out of health in whom the frequency exceeds 80, the pulse, in short is extremely capricious, and before any correct inferences can be drawn from it the peculiarities of each individual require to be carefully considered, slight mental affections [illegible] irritability and many other causes produce [illegible] tions of the pulse do not admit of any general description The terms *hard*, *full* *soft* and *wiry* pulse, are used to indicate other obvious modifications independent of the number of pulsations The average rate of the pulse of a healthy infant is for the first year, from about 120 to 108, for the second year from 108 to 90, for the third from 100 to 80 from the seventh to the twelfth year, the pulsations are about 70 When the pulse exceeds 140 beats in a minute it is not easy to count it precisely, and to this it attains in some febrile diseases

An *intermitting pulse* is by no means uncommon, and often produced by trivial causes with many persons in perfect health the pulse will be subject to very extraordinary irregularities, and there are cases on record in which a person's pulse which has always intermitted in a state of health has acquired regularity on the accession of disease The state of the digestive organs has often a marked influence upon the condition of the pulse

PULSE Leguminous plants cultivated for their pods or seeds such as the pea bean kidney bean, &c

PULVILLI in Entomology are the cushions of short hairs very closely set or a membrane capable of being inflated or very soft and concave plates, which cover the underside or the apex of the four first joints of the manus or tarsus and sometimes even of the ends of the moveable spines situated at the apex of the *tibia*, which act so as to produce a vacuum and enable the insect to suspend itself, or walk against gravity

PU'LVINATED (Lat. pulvinar, *a pillow*) In Architecture a term used to express a swelling in any portion of an order, such, for instance, as that of the frieze in the modern Ionic order

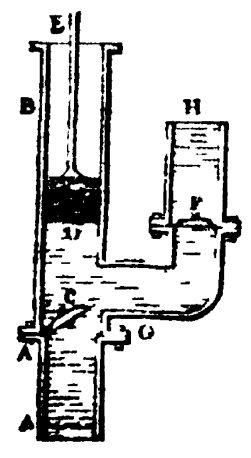


PU'MICE (Lat pumex) A porous volcanic product consisting chiefly of silica and alumina, with traces of potash, soda, and oxide of iron

PUMP A machine [illegible] water Though the forms under which [illegible] is constructed and the mode in which the power is applied may be modified

in an infinite number of ways, there are only three which can be considered as differing from each other in principle These are, the *sucking pump*, the *forcing pump*, and the *lifting pump*, so called from the manner in which they act

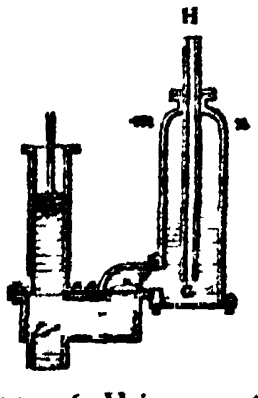
The *sucking pump*, or common household pump, is an apparatus of which the principle and construction will be evident from the annexed figure A A is a pipe of any convenient length, the lower end of which reaches below the surface of the water in the well or reservoir, B is a barrel generally of greater diameter than the pipe, C a valve opening upwards, D a piston moved by the rod F in this piston there is also a valve opening upwards When the piston is raised, the air in the barrel between the valves is expanded, and its tension consequently diminished, the pressure of the air in the pipe, therefore, opens the valve C, and the whole air in the pipe and barrel becomes less dense In this state the atmospheric pressure on the surface of the water causes it to rise in the pipe, until the tension of the confined air becomes equal to the pressure of the atmosphere On again depressing the piston, the valve in it opens, and the air passes through it from the barrel as it descends, but the valve C is closed by the downward pressure, and the volume of water which has entered the pipe remains On again raising the piston, the same effect is repeated, and an additional quantity of water enters the pipe Thus, by the alternating motion of the piston, a column of water is raised in the pipe until it reaches the piston when at the bottom of the barrel, and the whole of the air below it has been excluded On raising the piston when the water has reached it, the fluid will be compelled to follow by the pressure of the atmosphere on its surface in the well When the piston is again depressed the water flows through the valve in it, and ascends into the barrel, and by the succeeding strokes of the piston is lifted up until it reaches and flows out of the spout F



(1)

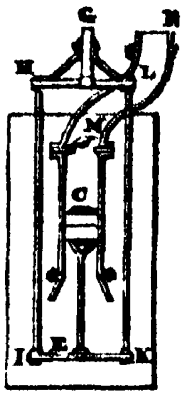
Although in theory the limit of the height to which water may be raised by the sucking pump from the surface of the fluid in the well to the highest position of the moveable piston, is about 34 feet (the height of a column of water which balances the pressure of the atmosphere), it is not found practicable with pumps of the ordinary construction to raise it more than about 28 feet The difference arises from the difficulty of making the apparatus absolutely air-tight

The *forcing pump* is represented in fig 2 The piston-rod F D is attached to a solid plunger D, adjusted to the cavity of the barrel A pipe G H, furnished with a valve F, opening outwards communicates with the barrel at G On elevating the plunger D the water will ascend through the valve C, in the same manner as in the sucking pump, till the barrel is filled when the plunger is depressed the valve C will shut, and the water between D and C be forced through the valve F into the pipe G H When the plunger is raised, the valve at F shuts, the pressure on its under side being removed, so that the water which was forced into the pipe by the previous stroke cannot return into the barrel At the next stroke of the piston more water is again forced into the pipe, and so on till it is raised to the height required



(2)

In this pump the pipe A A may be dispensed with, and the barrel B immersed in the reservoir, in which case the action of the pump is independent of the atmospheric pressure, and could be maintained equally well in a vacuum



In order to produce a continued stream through the pipe G H, an air vessel *m n*, may be attached to the lateral branch above the valve F, fig 3 The pipe G H reaches to near the bottom of the air vessel, and when the water has been forced into the vessel by the action of the pump, until it reaches above the lower end of the pipe at G, it is evident that, as all communication is then cut off with the external atmosphere, every additional quantity of water thrown into the vessel will tend more and more to compress the air within it, which, acting by its pressure on the surface of the water, forces it through the pipe G H in a continued stream

(3)

The *lifting pump* is represented by fig 4 The barrel of the pump is immersed in the water and fixed to an immoveable frame. The piston with its bucket and valve C, opening upwards, is attached at E to another frame, G H I K L, consisting of two strong iron rods, H I and L K, which move through holes in the frame-work to which the pump is fixed An inclined branch M N, either fixed to the top of the barrel, or moveable by means of a ball and socket, is fitted exactly to the barrel, and furnished with a valve at M Suppose the barrel immersed in the water to a certain depth if the piston frame be now thrust down [illegible] sure through the valve C, so as to maintain the same level in the pump as in the well But when the piston frame is elevated, the valve C will shut (as shown in the figure), and the water above C be *lifted up* with the piston, and forced through the valve M into the branch M N, from which its return will be prevented by the shutting of the valve M when the piston descends

(4)

In each of these different kinds of pumps which have been described, the total effort required to work the machine, independently of friction, is equal to the weight of a column of water, the base of which is equal to the area of a section of the working barrel, and the altitude equal to the distance between the surface of the water in the reservoir and the point to which it is raised In the sucking pump the whole of this effort is expended in raising the piston, in the forcing pump, one part is expended in raising and the other in depressing the piston, and it is advantageous to dispose the machinery so that these two parts shall be nearly equal In small pumps for domestic purpose, the strength of man is usually employed as the moving power, but in raising water from great depths, as the bottoms of mines, the steam engine is applied to this purpose (*See* FIRE ENGINE) For an account of the mechanism of different kinds of pumps, see *Gregory's Mechanics*, vol ii

The *chain pump* used in ships of war consists of an endless chain moving over a wheel on the gun-deck which is turned round by winches, and over a second in the pump-well, having saucers or flat circular pistons at certain intervals Near the pump well, on the side on which the chain on turning the winches ascends, are a few feet of pipe, through this the saucers raise the column of water which being lifted [illegible] of the pipe, falls into the cistern, [illegible] waste-pipe called the *pump-dale*, which carries it overboard [illegible] portion of chain falls through [illegible] *case* Chain pumps, in large ships [illegible]

PUMPERNICKEL The name of a species of bread peculiar to Westphalia it consists of bran, has a little acidity, but is agreeable to the taste, and very nourishing and remains moist for several months It forms the chief food of the Westphalian peasants, but it is regarded as a great delicacy in other parts of Germany, whither it is exported in large quantities They sometimes weigh 60 lbs The term is said to be of French derivation and originated in a French soldier having rejected the bread with disgust, exclaiming, C'est bon pour Nickel,' *i e* for his horse

PUN A play upon words, the wit or point of which depends on a resemblance between the sound and syllables of two or more words, which have different, and perhaps opposite, meanings *See* PARONOMASIA

PUNCHEON In Architecture, a short post The small quarters in a partition above the head of a door are called puncheons

PUNCHEON A measure of capacity for liquids, containing 84 gallons or one third of a tun

PUNCTATE (*L at* punctum, *a point*) In Zoology, when a part is beset with many points or minute impressions, [illegible]

PUNCTUATION The [illegible] words, propositions, or sentences from each other by means of certain marks or points, designed to facilitate the apprehension, or to regulate the enunciation of written language Points or stops are said to have been first used by Aristophanes, the Alexandrian grammarian but the modern system of punctuation is due to Manutius a learned printer, who lived at Venice in the 15th and 16th centuries The [illegible] The comma (,), [illegible] important divisions of a sentence or passage, as, for instance, before and after qualifying propositions or clauses; between single words not connected by conjunctions, before conjunctions which unite sentences, &c 2 The semicolon (;), which distinguishes the longer or more important members of a sentence, as when the latter part is an inference from, or qualification, explanation, or illustration of, the former 3 The colon (:), which is chiefly used to distinguish such members of a sentence as are themselves divided by semicolons into two or more principal

parts 4 The period or full stop ( ) which stands at the end of a complete sentence Besides these may be enumerated the note of interrogation ,) or inquiry , of exclamation ( ) expressing admiration endearment, or any considerable emotion , the parenthesis ( ), used when a clause is inserted which interrupts the progress of the sentence ; with other marks, either less commonly used, or the rules for whose use are less easily defined

PU'NDIT (more correctly written Pandit) The title of learned Brahmins in Hindoostan The term is used ironically in England to designate any one who makes a vast show of [illegible] reality

PU'NIC WARS [illegible] celebrated contests in which the Romans and Carthaginians were engaged for more than three centuries, and which finally terminated in the destruction of Carthage The first commenced A C 264, and ended A C 241 , the second lasted from A C 218 to A C 202 , the third from A C 149 to A C 147 ending with the destruction of Carthage

PU'NISHMENT (Lat pœna *punishment*) In Jurisprudence, the infliction of suffering, under legal sanction, upon those who have violated the law

It is undoubtedly true that both in legislation and in public opinion respecting punishment the *inductive* theory which considered it as a retribution for crime , and to be governed by our moral feelings of indignation against the offender, has far too generally prevailed and that the primary end, the interests of society, has been overlooked But we are not quite certain whether the present course of opinion does not run too exclusively in the contrary direction , and whether those who adopt the common formula, that "the object of all punishment is the prevention of the offence in future," have reflected on all the consequences of that position

For instance, it is the common practice in this country as well as in others, to connect the administration of justice with the enforcement of the tenets of religion In passing sentence wherever there [illegible] rule fails [illegible] not merely in its tendency to injure society but subjectively as evidencing moral depravity in the person committing it The solemnities of public worship which form part of the [illegible] grand jury), the language in which the jury is commonly addressed both by the judge and the advocates , all these seem based on the assumption, that the moral quality of acts is one of the matters to be brought under their consideration But if the judge has really no concern whatever with that moral quality, and is simply there to see that society may be guarded as far as possible from exposure to material injury by fraud or violence all these ceremonies are utterly out of place They must either be defended as politic devices employing the machinery of religion to aid in terrifying offenders from the commission of crime , or as concessions to popular ignorance And it is certain that in such a case they had far better be abolished altogether, as they strongly lead the mind to dwell on that false view of the object of punishment, which it is the object of Bentham and his school to extirpate

Again, in popular estimation the moral atrocity of an offence is one of the elements in the correct measure of punishment On whatever ground philosophers may object to sanguinary laws, this plain objection is that which has always prevailed in the public mind In the case of forgery for example, the feeling of the majority triumphed in the end over the severity of the law, not because it was thought disproportioned to the injury inflicted on society, or to the importance of repressing the crime, but because it was thought not to deserve it in a moral point of view Now all such expression of sentiment, on the theory in question is founded on a wrong principle , and the writers who adhere to it are forced to admit this feeling as a disturbing cause preventing the right doctrine from being fully carried out , they are forced to admit, as part of their definition of a good punishment, that it shall not be such as to shock the popular notion of moral justice , which is in other words, to admit that penal laws must be governed in part by principles which they condemn as altogether wrong , a very mischievous concession for a legislator to make

That the interest of society is the great object of punishment must be conceded on all hands That the specific object of preventing the offence from being committed is a very important part of that general object, probably by far the most important, may also be conceded But the question is, whether the general object does not comprehend other particular objects also , and whether a punishment which should [illegible] degree the advantage of repressing that particular offence or class of offences, might not be imperfect notwithstanding

This question can only be solved by deciding the great preliminary difficulty of political science, in which so many others are involved , whether the ruling power, which we call the state, or society, or the legislature, has or has not any *moral* authority Those who conclude that it has nothing to do beyond preserving the personal security and property of individuals, of course deny that it has any But those who believe that it has, also, what may be termed a paternal power, and is entrusted by Providence with the maintenance of religion and moral principle, must, consistently, admit that there may be a moral object in punishment beyond the mere prevention of the offence

And it must be observed in passing, that those who do hold the state to possess such a moral authority, and have such moral duties imposed upon it, need not, therefore, hold those to be its principal objects It may very well be that the primary object of the association of men in a political body is security and self defence , yet that association may have other ends not inconsistent with this And although those other ends are in themselves incomparably the most important, it does not at all follow that they are the most important as regards the state When men enter into a particular contract with each other, their mutual duties under that contract are primarily those connected with the object of that contract , they may have other and more important mutual duties, which yet, as regards that contract, are secondary No religious man will deny that the connexion of master and servant involves some duties of a very exalted character , but the principal object of that connexion is, nevertheles [illegible]

We [illegible] but [illegible] as admitted, and consider the effect of that admission on the theory of punishment In the first place, it would be a mistake to suppose that it justifies retribution as an object of punishment No [illegible] justice who cannot judge of [illegible] moral authority of the state, even by those who have carried its divine character to the highest point, has only been likened to the paternal , and no father has the right to chastise a child by way of retribution He has no right to punish at all except with a view to reformation Omitting this mistaken end, the real objects of punishment may be classed as follows —

1 The interests of society , which must be subdivided into

i Its security from the injury to person or property occasioned by the crime

ii Its moral [illegible] prevention

And 2 The [illegible] offender This is admitted as one of the ends of punishment by all writers , but Bentham and his followers regard it as such only so far as it conduces to the security of society by preventing the repetition of the offence , those who embrace the higher view both on this account, and also as the fulfilment of the duty of the state towards the offender himself Considered in either view, it is clearly a secondary object only, the good of society being the first

The security of society is attained by punishment in four ways

1 By forcibly preventing the offender from repeating his offence as by death, mutilation, or perpetual imprisonment

2 By reforming the habits of the offender, and thereby taking away the desire

3 By deterring the offender from repetition by the fear of fresh punishment

4 By deterring others through example And this last is clearly the chief practical [illegible] The admission of other principles, [illegible] necessary in order to satisfy our conception of the existence of the state as a moral agent, need not prevent the [illegible] keeping this steadily in view

[illegible] forbid us from pursuing farther the analysis of punishment, and pointing out in what manner the different kinds and degree of it principally in use follow, or depart from their legitimate ends We will conclude with the classification of punishments given by Bentham, in his *Theorie des Peines* to use the title of the work as given by his translator Dumont If Bentham's theory be defective in its main principles (and although we have presented the reader with [illegible] it, we do not assert that they [illegible] it is at all events only from being imperfect, not erroneous , as far as it goes it is logical consistent and definite And as he was nearly the first writer who introduced [illegible] or arrangement into the [illegible] we are inclined to think that on the whole, he has done more for society in this particular than in any other of the various subjects to which he applied his reforming genius It must not be forgotten that Sir S Romilly and Sir J Mackintosh were the pupils who carried his speculations into practice

He divides punishments into corporeal and privative The first of these are, 1 Simply afflictive, those which consist in the mere infliction of temporary pains, the lash, &c 2 Complexly afflictive, in which pain is joined

with permanent loss, as in the old punishments of mutilation and disfigurement 3 Restrictive, under which he classes together perhaps rather inappropriately imprisonment or the total deprivation of [illegible] and banishment with [illegible] as the galleys, hard labour, &c [illegible] this character with the former 5 Privative punishments are those which deprive the criminal, 1 Of life, 2 Of reputation *only*, such, perhaps, as the amende in French law 3 Of property fine, and confiscations 4 Forfeiture of condition, which, more or less, accompanies infamous punishments in most countries e g civil incapacity in France is attended with various disabilities These eight comprehend all the simple forms of punishment in ordinary use, but he adds a few, which he terms anomalous and only mentions to hold them up to general reprobation 1 What he calls *vicarious* punishments, as when the family of a suicide are punished by the forfeiture of his chattels 2 Transitive, when the penalty passes to future generations corruption of blood in the English law 3 Collective, of which he gives as an instance the [illegible] punishment of corporations for the acts of [illegible] corporators, a more ordinary one is, the compelling the inhabitants of a hundred to make good the damages occasioned by a riot 4 Fortuitous, where individuals wholly unconnected with the offender are implicated, as it were casually in the consequences of his crime, of which he gives as an instance, the avoidance of mesne conveyances by some kinds of confiscation, and consequent loss of innocent purchasers, and the imposition of deodands, where no negligence is imputed (See also *Ed Rev* vol xxii, where his work is reviewed, Lucas, *Systeme Penal*)

PU'PA (Lat pupa, *a puppet*) A genus of land snails, so called from the resemblance of the shell to the pupe, or chrysalis of an insect Several species are British, as *Pupa umbilicata*, Drap, *P marginata*, Drap, *P edentula* Drap

PUPE (Lat pupa) The name of the oviform nymphs of Lepidopterous insects, also applied to Metabolian insects generally, when in the second stage of their metamorphosis

PU'PIL (Lat pupa) A term applied to the central opening of the eye, because it reflects the diminished image of the person who looks into it It is the central aperture of the *iris*

PU'PIPARES *Pupipara* (Lat pupa and pario, *I bring forth*) Those insects are [illegible] produce their young in the condition of a pupe or nymph, as the forest fly *Hippobosca equina*

PU'PIVORES *Pupivora* (Lat pupa and voro *I devour*) The name of a tribe of Hymenopterous insects comprehending those of which the larvæ live parasitically in the interior of the larvæ and pupæ of other insects

PURA'NA (Sanscrit, *a poem*) The sacred books of India which contain the explanation of the Shaster (which see) There are eighteen books of the Puranas, chiefly filled with legends of the inferior gods and the heroes of Hindostan (See *Mem de l Acad des Inscr* vol xxxviii) It should be stated, that Professor Wilson intimates his disbelief of the received opinion as to the great antiquity of the Puranas, and believes the writings now known under that name to be mere imitations of lost originals (Preface to his translation of the *Vishnu Purana*) See *Asiatic Journal*, Dec 1840

PURBECK LIMESTONE *See* GEOLOGY

PU'RCHASE, in Law, means generally, the acquisition of lands or tenements by any other means than descent as by [illegible] deed, or agreement

PU'RGATORY A place appointed for the satisfaction of temporal punishments, which, according to the Roman Catholic church, are distinguished from the eternal of which the latter only are remitted to us by the death of Christ There is none perhaps of the peculiar articles of the Romish faith in favour of which so little can be advanced from the language of scripture, and it may be safely averred that it was not from that source that the opinion ever gained possession of men's minds It seems to be a natural but too strict an inference from the imperfectly disclosed economy of the divine judgments, which we find to admit of every degree of severity in this life, and are liable to conclude from analogy must be subject to some equivalent adjustment in the next Accordingly we discover so [illegible] recognitions of the idea in individual writers several centuries before it can be proved that it formed an established article of faith Augustin is considered the earliest of these, and he speaks [illegible] It was first inculcated as a [illegible] Gregory the Great who seems to have connected it with the then popular belief that the world was closely approaching to its end It was much discussed between the Greeks and Latins at the council of Ferrara 1438 The present Roman Catholic belief is thus expressed in the creed of Pope Pius IV —"Constanter teneo purgatorium esse animasque ibi detentas suffragio fidelium juvari" To which it may be added, that the sins punished in Purgatory are of two kinds,—mortal, repented of, and [illegible] of the creed is derived from the canons [illegible] Trent on the subject, sess 25 The "Romish doctrine" of Purgatory is condemned by Art 22 of our church. The reader will find a good [illegible] to Purgatory well stated (and [illegible] Hooker in his 3d Sermon the latter part, in which he replied to it, is lost It is also set forth with much learning and moderation in *Tracts for the Times*, No 79

PURIFICATION An observance enjoined by the law of Moses upon occasion of certain accidental defilements, which are scrupulously recorded in the Levitical code The purification was generally by water, and in the case of women, who were considered impure after childbirth for the space of forty days if delivered of a male, and eighty if of a female the offering of a lamb and some other sacrifices was required The purification of the Virgin Mary is a festival in the calendar, and is observed on the 2d of February, being forty days after Christmas This festival was established in the 6th century, and is variously termed in ecclesiastical antiquities by the names of ὑπαπαντη Festum Candelarum Candlemas, the Presentation The processions of this day were instituted by Gregory the Great For an account of the ceremonies of purification among the Greeks and Romans, see the article LUSTRATION

PU'RIM The name of the solemn festival among the Jews in which they commemorate their deliverance from the wiles and stratagems of Haman as recorded in the book of Esther The observance of this festival has been religiously maintained by all the Hebrew race from its institution down to the present time It is held in February

PU'RIST A name sometimes applied to rigorous critics of purity in literary style

PU'RITANS The name by which the dissenters from the church of England were generally known in the reign of Elizabeth and the first two Stuarts The term was assumed as the word implies, from the superior purity of doctrine and discipline which the more violent reformers claimed as their own maintaining that they followed the word of God alone purified from all human inventions and superstitions of which they believed the English church to retain a considerable share notwithstanding its alleged reformation [illegible] the use of the name commenced about [illegible] *History of the Puritans*) See DISSENTERS

PURLIN In Architecture, a piece of timber lying on the principal rafters to support them in the middle

PU'RPLE (Gr πορφυρα) In Painting, a colour produced by the mixture of red and blue, and thence partaking of the hue of each Among the ancients, purple was always the distinguishing badge of power and distinction and of all the various kinds in use, the Tyrian dye is the most celebrated This colour was produced from an animal juice found in a shell fish called murex, or conchylium, the quality of which, however, varied with the different coasts on which it was caught

PURPLE OF CASSIUS A compound of the oxides of tin and gold, obtained by adding protochloride of tin to a solution of chloride of gold The true nature of the compound has not been determined, it is used as a purple colour for porcelain painting, and also for staining glass to which it imparts a fine ruby red

PU'RPURA An eruption of small purple specks and patches caused by extravasation of blood under the cuticle, it is generally attended by constitutional debility and often by fever Aperient medicines and sometimes purgatives, carried to a greater or less extent, followed by mild tonics, and in some cases by wine bark, and acids, are the principal remedies, but in the treatment, much will depend upon the concomitant symptoms

In Zoology *purpura* is a generic name of the univalve Gasteropod which secretes the purple fluid which formed the base of the Tyrian dye

PU'RPURI Purple In Heraldry, one of the colours or tinctures used in blazonry It is equivalent to amethyst among precious stones, Mercury among planets In engraving it is represented by diagonal lines from the sinister to the dexter side of the escutcheon

PURPU'RIC ACID A substance resulting from the action of nitric acid upon uric acid, it forms deep red or [illegible] with most bases

PURPURIFERA *Purpurifera* (Lat purpura, *purple*, fero, *I bear*) The name of a family of Gastropodous Mollusks, including those species which secrete the purple [illegible] the ancients

PURSER An officer [illegible] British navy, whose chief duty consists in keeping the accounts of the ship to wh[illegible] at he also acts as purveyor

PURSUIVANTS In Heraldry, a kind of probationers in the Heralds' College of England, not admitted to the full privileges of the college, but advanced by succession into its higher offices They are styled *Portcullis*, *Rouge Dragon*, *Blue Mantle*, and *Rouge Croix*

PURVE'YANCE, or POURVEYANCE (Fr pourvoir, *to provide*) In English Law the providing necessaries for the king's house The right of purveyance or preemption, i e of buying necessaries for the household impressing horses and carriages to use or on payment of a settled price, even against the will of the owner, was a valuable part of the ancient prerogatives of the kings of England, especially in times when the court was frequently in progress It was abolished by 12 Ch 2 c 24, and has only been occasionally revived since that time by temporary acts for special purposes The name of "purveyor" had long before become so odious, that by 36 Ed 3 c 2 it was changed into "buyer"

PUS (Lat) A bland yellowish fluid, somewhat like cream, found in abscesses, and formed upon the surfaces of what are termed healthy sores, it is heavier than water, and viewed under the microscope, appears composed of translucent globules floating in a colourless fluid

PUTA'MEN In Botany, the inner coat, or shell, or stone of a fruit, commonly called the endocarpium

PU'TLOGS (Etym uncertain) In Architecture short pieces of timber used in scaffolds wherever the scaffold boards lie They are placed at right angles to the wall, one end of them resting on the ledges of the scaffold, and the other on holes left in the wall

PUTREFA'CTION (Lat putrefactio) The spontaneous decomposition of animal and vegetable substances, attended by the evolution of fœtid gases The putrefaction (or putrefactive fermentation) of animal substances is usually attended by more fœtid and noxious exhalations than those arising from vegetable products This appears principally referable to the more abundant presence of nitrogen in the former, and hence those vegetables which abound in nitrogeniferous principles (such as most, if not all, of the cruciform plants) exhale peculiarly nauseous effluvia hence, also such animal products as are destitute of nitrogen are either unsusceptible of what is commonly called putrefaction or suffer it slowly and imperfectly The formation of ammonia or of ammoniacal compounds, is a characteristic of most cases of animal putrefaction, while other combinations of hydrogen are also formed especially carburetted hydrogen together with complicated and often highly infectious vapours or gases in which sulphur and phosphorus are frequently discovered These putrefactive effluvia are for the most part easily decomposed and resolved into new and comparatively innocuous compounds by the agency of chlorine, hence the importance of that body as a powerful and rapidly acting disinfectant

The rapidity of putrefaction and the nature of its products, are to a great extent influenced by temperature moisture and access of air, they do not ensue below the freezing point nor in dry substances, nor under the entire exclusion of oxygen, and hence various means suggest themselves of retarding or preventing putrefaction, as well as of modifying its results a temperature between 60° and 80° a due degree of humidity, and free access of air, are the circumstances under which it proceeds most rapidly The most effective antiputrefactives or antiseptics are substances which either absorb or remove a portion of the water or moisture and enter into new combinations with the organic matter hence the great efficacy of certain salts, sugar, alcohol and several other applications, among which perhaps the most remarkable are some of the volatile oils, such especially as kreasote and other volatile products obtained by the destructive distillation of wood, and pyroligneous acid and pyroligneous spirit, the latter is eminently useful in the preservation of dead bodies for the purposes of dissection and, when properly and sufficiently injected into the vessels and externally applied, indefinitely suspends all the ordinary steps of the putrefactive process

The astringent or tanning principle of vegetables is also a powerful preserver of most organic tissues, it enters into chemical combination with the albuminous and gelatinous membranes and fibres, and the resulting compound, of which leather furnishes a characteristic example, is comparatively little prone to change, although the tanning material itself, as well as the animal principles with which it unites, are separately liable to decay

Among saline substances the antiputrefactive powers of salt are commonly known when a piece of flesh is salted, brine runs from it, in consequence of the energy with which the salt abstracts the component water of the muscular fibre, the flesh becomes indurated, and its susceptibility to putrefactive changes greatly diminished, it becomes at the same time less easy of digestion as an article of food Corrosive sublimate is a far more powerful preservative than common salt, and it appears to act not by the mere abstraction of water, but by entering into chemical union with the fibre Sulphate of copper and several other metallic salts are similarly efficacious, and the most putrescible substances, such as the brain for instance, after having been steeped in such solutions and dried, will remain without further change for an indefinite period the poisonous nature of these and many other metallic salts prevents their employment in the preservation of articles of food

It is probable that the ancient Egyptians employed several of the above-mentioned antiputrefactive and preservative substances in the preparation of their mummies, which have remained for so many hundred years without signs of decay or decomposition and similar cases, when by the careful application of various solvents the preservative substances are removed, the flesh resumes its susceptibility of putrefaction

The inhabitants of northern climates avail themselves of freezing to prevent the putrefaction of their food, and the supplies of game and other articles in the Russian markets are retained in a frozen state, our fishmongers resort to the same expedient for the preservation of their unsold fish, which is daily removed to the ice-house after having been exhibited in their shops, salmon is packed in ice for the purpose of transport and preservation

It is curious to remark the wonderful influence of [illegible] changes which constitute [illegible] that arrangement of the organic elements requisite for the functions of life, when a part of the body dies, the phenomena of gangrene or mortification ensue, that is, of local putrefaction the putrefactive changes are the more energetic in consequence of the proximity of the dead part to the living

All organic tissues may be indefinitely preserved by cautious desiccation, and it is in consequence of the absence of component water that the animal part of bone resists putrefaction dried bones may thus be stored up for ages and when it is required to extract their nutritive parts these are found unimpaired

PU'TTY In Architecture, a very fine cement used by plasterers, made of lime only It differs from *fine stuff* in the manner of preparing it, and in its being used without hair Also a composition used by glaziers, consisting of oil whiting &c

PY'CNITE or SHORLOUS TOPAZ (Gr πυκνος, *thick*) A prismatic mineral found at Altenburg in Saxony

PY'CNOSTYLE (Gr πυκνος, and στυλος, *a column*) In Architecture, an arrangement of columns, in which the intercolumniations are equal to one diameter and a half of the columns

PY'GMY *See* PIGMY

PYLA'GORAS (Gr πυλαγορας, so called from the assembly of the Amphictyons at Thermopylæ) The title of one of the two deputies from each confederate at the Amphyctyonic Council His functions comprised the diplomatic and deliberative duties of the mission while the care of the sacred rites fell on his colleague, the Hieromnemon (ιερομνημων)

PYLORI'DEANS, *Pyloridea* (Gr [illegible] ουρος, *a guard* and ειδος *form*) [illegible] Lamellibranchiate Bivalves comprehending those which have a shell open at both extremities

PYLO'RUS (Gr πυλη, *an entrance*, and ουρος, *a guard*) The aperture of the stomach into the duodenum, it guards, as it were, the entrance into the intestinal canal

PYRA'LLOITE (Gr πυρ *fire*, and αλλος, *another*) A mineral which undergoes various changes of colour when heated

PY'RAMID (Supposed to be from Gr πυρ, *fire*, from the resemblance of the form to a spire of flame, but for a more probable derivation of the word, see *infra*, PYRAMIDS OF EGYPT) In Geometry, a solid contained by a plane polygonal base and other planes meeting in a point This point is called the vertex of the pyramid, and the planes which meet in the vertex are called the sides which are necessarily all triangles

The principal properties of pyramids are the following —1 Every pyramid is equivalent to one third of a prism [illegible] Hence, 2. All [illegible] are equivalent [illegible] and equal altitudes are [illegible] 3 The solid content of a pyramid is measured by the product of the area of the base into one third of the altitude 4 If a pyramid is cut by a plane parallel to its base the frustum (or part comprehended between the base and the section) is equal to the sum of three pyramids having for their common altitude that of the frustum, and of which the bases are respectively the lower base of the frustum, the upper base of the frustum, and a mean proportional between them (See *Legendre's Geometry*, and Notes)

Pyramids are denominated from the figures of their bases, being triangular, quadrangular, pentagonal, &c, according as the base is a triangle, a quadrangle, a pentagon

PYRAMIDS OF EGYPT Celebrated monuments of* massive masonry which, from a square base, rise by regular gradations till they terminate in a point, but so

* [illegible] exhibited in some of the principal [illegible] The [illegible] The

that the width of the base always exceeds the perpendicular height The Pyramids commence immediately south of Cairo but on the opposite bank of the Nile, and extend in an unbroken line for many miles in a southerly direction, parallel with the banks of the river

The three largest are situated in the vicinity of Ghizeh, not far from Cairo, and of these the loftiest is called the pyramid of Cheops, from the prince by whom it is supposed to have been erected The sides of its base, which are in the line of the four cardinal points measure at the foundation 763 4 feet, so that it occupies a space of more than 13 acres Its perpendicular height is 480 feet being, consequently, 43 feet higher than St Peter's at Rome, and 136 feet higher than St Paul's Supposing this pyramid to be entirely solid its contents would exceed three millions of cubic yards and the mass of stone contained in it would build a wall 20 feet high and 1 foot thick, that contained in the Plymouth breakwater (*Egyptian Antiquities, Library of Entertaining Knowledge*, ii 213) This huge fabric consists of successive tiers of vast blocks of calcareous stone rising above each other in the form of steps The thickness of the stones, which is identical with the height of the steps decreases as the altitude of the pyramid increases the greatest height being 4 628 ft and the least 1 680 ft The mean breadth of the steps is about 1 ft 9 in The best authorities agree in estimating the number of steps or tiers of stone at 203 According to the information communicated to Herodotus by the priests, 100 000 men were employed for twenty years in the construction of this prodigious edifice, and ten years were employed in constructing a causeway by which to convey the stones to the place, and in their conveyance (Lib ii § 124)

The other pyramids are of inferior dimensions, but they are mostly all notwithstanding, of vast magnitude—*instar montium eductæ* they are not all of stone, some of them being of brick

Many learned dissertations have been written and many fanciful and a few ingenious conjectures have been framed, to account for the original use and object of these imperishable structures But the difficulty of the subject is such, that hitherto no satisfactory conclusion has been arrived at Even in the remotest antiquity their origin was matter of doubt and nothing certain was known with respect to them or their founders (*Plin Hist Nat* lib 36 § 12) On the whole however it would seem to be most probable that they were intimately connected with the religion of the ancient Egyptians and that they were at once a species of tombs and temples but participating more of the latter than of the former character (For some remarks on this part of the subject see *Shaw's Travels* p 170 &c 4to edit, and *Greaves's Pyramidographia* in his Works vol i)

It has long been customary to regard the Pyramids as monuments merely of the power and folly of the monarchs by whom they were raised and of the bondage of their subjects This, however, seems to be a very superficial prejudiced view of the matter The varying magnitude of the Pyramids the fact of their being scattered over a space extending lengthwise about 70 miles and their extraordinary number appear to show pretty conclusively that they must have been constructed from a sense of utility or duty, and not out of caprice or from a vain desire to perpetuate the names or the celebrity of the founders If we had a sufficient knowledge of antiquity it would probably be found that the motives which led to the construction of the Pyramids were, at bottom, nearly identical with those which led to the construction of St Peter's and St Paul's and that they are monuments of the religion and piety, as well as of the power of the Pharaohs

The Pyramids were esteemed by the ancients as one of the seven wonders of the world and most deservedly, for it is impossible to look at these stupendous structures without being overwhelmed with a sense of their sublimity They are associated too with some of the most interesting events in the history of the human race Herodotus, Plato and Pythagoras beheld them with wonder and admiration, Alexander the Great and Napoleon marshalled their hosts under their shadow, and they are probably destined to survive long after the proudest monuments of the present generation have crumbled into dust

The etymology of the word *pyramid* is involved in as great obscurity as the object of the structures themselves [illegible] Greek origin, than which nothing can be more erroneous Perhaps the most probable conjecture is that of De Sacy which is as follows — The ις in πυραμις he regards as a Greek termination, the first syllable πυ he holds to be the Greek version of the Egyptian article *pi* (and so

[illegible] has pointed out four new pyramids in the great pyramidal field of Ghizeh the third pyramid of Ghizeh of the previous ones of which no traditions exists

written by the Greeks from their wish to derive the word from πυρ *fire*); and he refers the syllable μις to the root *ram*, which, in the Egyptian language signified *elevating* or *setting apart from common use* consequently the word *pyramid* will denote a *sacred place or edifice set apart* for some religious purpose (De Sacy, *Observations sur l'Origine du Nom donné par les Grecs et les Arabes aux Pyramides d'Egypte*) See Wilkinson's Egypt, and the authorities there

PYRAMIDAL NUMBERS, in Arithmetic, are numbers formed by the successive sums of polygonal numbers, in the same manner as polygonal numbers are formed from arithmetical progression

Arithmetical progression,	1, 2, 3, 4, 5, &c
Polygonal numbers,	1 3 6, 10 15, &c
Pyramidal numbers,	1, 4, 10, 20 35, &c

See FIGURATE NUMBERS and POLYGONAL NUMBERS

PYRENE'ITE A mineral found in the limestone of the French Pyrenees, it appears to be a variety of the garnet

PYRETOLOGY (Gr πυρετος *fever*, and λογος *a discourse*) The [illegible]

PYREXIE (Gr πυρ *fire*, and ξις *habit*) Fevers, diseases attended by fever

PYRITES (Gr πυρ) Sulphurets of copper and iron commonly distinguished as copper and iron pyrites The former is the principal ore of copper, the latter is an abundant natural product of a brass yellow colour When exposed to air and moisture especially after having been heated, it absorbs oxygen, and yields sulphate of iron or green vitriol The term is derived from πυρ *fire*, either because they sometimes spontaneously ignite or as being hard enough to strike fire with steel

PYROACE'TIC SPIRIT A liquid formed during the destructive distillation of acetate of lead When carefully purified, it has a peculiar spirituous odour, is limpid and very inflammable its specific gravity is 0 792 and it boils at 132° It consists of 3 car + 3 h + ox Hence 1 equivalent of acetic acid (1 car + 3 h + 3 ox) corresponds to [illegible] 1 of carbonic acid [illegible] by heat into carbonate of baryta [illegible] spirit The term *acetone* is now commonly [illegible] compound

PYRO ACIDS (Gr πυρ) The [illegible] applied to the products which are obtained [illegible] certain organic acids to heat The acids are thus modified and give rise to distinct classes of salts Thus we have pyrogallic, pyromalic, pyrotartaric acids &c

PYROCHLORE (Gr πυρ and χλωρος *green*) A name given by Werner to the [illegible] oxide of titanium

PYROLIGNEOUS ACID (Gr πυρ and Lat lignum, *wood*) This term is generally applied to the *acid liquor* which passes over along with tar and gaseous products when wood is subjected to destructive distillation This acid liquor is an impure vinegar from which acetic acid is obtained as follows — The pyroligneous acid freed from tar is saturated with chalk or powdered slaked lime, filtered and evaporated, by which an impure acetate of lime is obtained, this is gently heated so as to destroy part of its empyreumatic matter without decomposing the acetic acid, it is then mixed with sulphate of soda which yields by double decomposition sulphate of lime and acetate of soda, the acetate of soda is filtered off the sulphate of lime, evaporated heated, and redissolved and crystallized In this way a pure crystallized acetate of soda is by proper management obtained, which is mixed in a retort or still with a proper proportion of sulphuric acid and a gentle heat applied which causes the strong acetic acid to distil over and sulphate of soda remains behind This acetic acid is in a high state of concentration, it is lowered by the addition of water, and if intended for the table or for domestic use as a substitute for other forms of vinegar it is usually coloured with a little burned sugar The charcoal which is the residue of this distillation of wood is of an excellent quality, — that employed in the manufacture of gunpowder is thus prepared This manufacture of vinegar is now carried on upon a very large scale, and the greater part of the vinegar used for domestic purposes and in the arts in many of which it is largely consumed is derived from this source

PYROLIGNEOUS SPIRIT See PYROXYLIC SPIRIT

PYROLUSITE A mineralogical term applied by some to the common black or binoxide of manganese, from the facility with which it is resolved by heat into [illegible]

PYROMANCY (Gr πυρ and μαντια, *prophecy*) Among the classical ancients, a species of divination by means of the fire of the sacrifice, in which, if the flames immediately took hold of and consumed the victims or if they were bright and pure, or if the sparks rose upward in a pyramidal form, success was said to be indicated If the contrary took place, misfortunes were said to be [illegible]

PYROMETER (Gr πυρ and μετρον, *measure*)

An instrument for measuring the degrees of heat According to this definition, the pyrometer is synonymous with the thermometer but though the two terms are sometimes applied indifferently to the same instrument, the term *pyrometer* is generally understood to denote either an instrument intended to measure higher temperatures than can be measured by the ordinary thermometer, or an instrument for comparing the expansions of different metals

Various contrivances have been employed for the above [illegible] Mr Lamb was the earliest inventor [illegible] matic rod (about six inches long) of the metal under trial being attached at one extremity to an immoveable obstacle, and heated by lamps, the other end is necessarily pushed forward, and this being fastened to the end of a rack playing into a pinion, communicates a revolving motion to an axle to which a train of wheel work is attached, whereby the minutest expansion of the heated bar is [illegible] dex on a dial [illegible] ntly simple, but [illegible] of so many loosely connected wheels and pinions must have rendered [illegible], and the method is liable to a still more serious objection, namely, that the temperature communicated to the bar by the lamps is entirely unknown Desaguliers, and afterwards Ellicott, made several improvements in the construction of the instrument, tending to give it a more equable motion and to increase its delicacy Graham substituted a micrometer screw for the wheels and levers that had formerly been employed, and on this principle Mr Smeaton contrived an ingenious apparatus, which is described in the *Phil Trans*, vol xlviii

Various other forms of the [illegible] have been proposed, to render it better [illegible] measurement of expansion by heat, [illegible] perhaps are those contriv [illegible] particularly that employed by Ramsden for determining the expansion of the glass rods used in measuring the base on Hounslow Heath for General Roy's survey (See *Phil Trans*, 1785)

[illegible] weights [illegible] inapplicable In order to remedy this deficiency, Wedgwood availed himself of the property which clay possesses of contracting by heat, and remaining afterwards in that state of contraction He found, by repeated trials, that fine porcelain clay contracted uniformly with the degree of heat applied to it accordingly by measuring the dimensions of a cylindrical piece of this substance (which may be done with great accuracy, by observing the depth to which it will sink between two scales of metal inclined to each other under a small angle) and then subjecting it to the heat of a furnace and applying the scale again to it when cold an indication of the degree of heat to which it has been subjected is given by the amount of its contraction Wedgwood divided his scale into 240°, and in order to compare it with that of Fahrenheit's thermometer, made use of a piece of fine silver fitted to the same mould as the pyrometric pieces of clay He [illegible] nsion of the silver between [illegible] scale, the silver and clay were subjected to the same heat, and, by a comparison of the expansion of the one with the contraction of the other, he estimated that each degree of his scale was equal to 130° of Fahrenheit's He also estimated that the zero of his scale corresponded with 1077 5° of Fahr, and from these data comparative tables of the two scales are formed The objections to this method are, that as clay is a heterogeneous mixture, it is not very probable (and there are no means of ascertaining the fact) that its contractions are equal at different temperatures, and that different portions of clay possess different degrees of contractibility It was also surmised that a long or frequent exposure to inferior degrees of heat will cause it to contract, even after it has undergone the action of a high temperature, but this appears to have been disproved (*Phil Trans*, 1782, 1784 1786)

Guyton Morveau invented a platina pyrometer as a substitute for Wedgwood's In a solid plate of highly baked porcelain a groove was cut containing a flat bar of platina, an inch and three quarters in length, two tenths of an inch broad, and one tenth of an inch thick One end of the bar abuts against the bottom of the groove, the other presses against the short arm of a bent lever, of which the long arm, moving on a pivot, becomes the index of the instrument, and marks the degrees on a scale fixed to the porcelain With this instrument he made numerous experiments the general result of which proved that Wedgwood had assigned by far too high a temperature for the degrees of his scale (*Annales de Chimie*, tom xlvi, *Nicholson's Journal*, vol vi)

A pyrometer invented by Professor Daniell is described in the seventh volume of *Brande's Quarterly Journal* The part on which the heat acts consists of a rod or wire of platina, about ten inches in length, and about a seventh of an inch in diameter, placed within a tube of black lead ware, and having one end fixed at the bottom of the tube to the other end is attached a fine wire of platina, which, after passing two or three times round the axis of a wheel, is fastened to a spring by which it is always preserved at the same degree of tension The teeth of the wheel play into a pinion, the axis of which carries an index, whose revolution shows, on a greatly magnified scale, the expansion and contraction of the platina rod With this instrument experiments were made to determine the fusing points of the different metals the results agreed nearly with those of Morveau but differed widely from those of Wedgwood Mr Daniell subsequently [illegible] or rather [illegible] in the *Phil Trans* for 1830, and the *Phil Magazine* for 1831 and 1832

For Mr Prinsep's method of determining high temperatures from the fusing points of pure metals and different metallic alloys, see *Phil Trans*, 1828, or *Phil Mag*, new series, vol iii (See *Library of Useful Knowledge*, *Gr*, *Mechanics*, *Encyc Brit*)

PYROMORPHITE (Gr πυρ, and μορφη, *form*) Native phosphate of lead When heated before the blowpipe, it fuses into a globule, which assumes a polyhedral crystalline form as it cools

PY'ROPE (Gr πυρ, and ωψ, *the eye*) A fiery or brilliant red garnet

PYRO'PHORUS (Gr πυρ, and φερω, *I bear*) A substance which spontaneously takes fire when exposed to air *Homberg's* pyrophorus is made by mixing equal weights of alum and brown sugar and stirring the mixture over the fire in an iron ladle till quite dry, it is then put into an earthen or coated glass bottle, and heated red-hot so long as a flame appears at the mouth, it is [illegible] ment succeeds best in a damp state of the atmosphere, and the ignition is frequently accelerated by breathing upon the powder A mixture of 3 parts of lampblack, 4 of dried alum, and 8 of carbonate of potassa, may be substituted for the above, and calcined in the same way 27 parts of sulphate of potassa and 15 of calcined lampblack, heated to redness in a crucible, and then carefully preserved out of contact of air, also yields a good pyrophorus

It appears from Gay Lussac's experiments that the [illegible] pyrophorus is sulphuret of potassium, the charcoal and alumina only act by being interposed between its particles, but, when the mass once kindles, the charcoal takes fire and prolongs the combustion An excellent pyrophorus is afforded by heating tartrate of lead red-hot in a glass tube, in which it may afterwards be hermetically sealed When the tube is broken, and the black powder within it shaken out through the air it burns with the emission of a dense smoke of oxide of lead This curiously shows the spontaneous inflammability of minutely divided lead

PYRO'RTHITE (Gr πυρ and ορθος, *straight*) A mineral resembling *orthite*, but differently affected by heat

PYROSIS (Gr πυροω, *I burn*) A disease of the stomach attended [illegible] and the throwing up of a quantity [illegible] fluid, it is sometimes called *water brash* and *black water* it is a variety of *heartburn*

PYRO'SMALITE (Gr πυρ, οσμη, *odour*, and λιθος, *a stone*) A native submuriate of iron, which, when heated exhales the odour of chlorine

PY'ROSOME *Pyrosoma* (Gr πυρ and σωμα *a body*) The generic name of certain compound Ascidians, remarkable for the brilliant phosphoric luminosity which they emit

PY'ROTE'CHNY (Gr πυρ and τεχνη, *art*), signifies, in its widest sense the art or science which teaches the [illegible] fire to certain operations, [illegible] ed to those articles and instruments manufactured for amusement, or for grand public occasions The origin of artificial fireworks is lost in obscurity They were in general use in China long before their introduction to Europe which is comparatively of recent date The finest inventions of this kind are due to the celebrated Ruggieri, father and son, who executed in Rome and Paris and the principal capitals of Europe, the most brilliant fire-works that were ever seen

Fire-works are divided into three classes —1 Those to be set off upon the ground, 2 Those which are shot up into the air, and 3 Those which act upon or under water

The three prime materials of this art are, nitre, sulphur, and charcoal, along with filings of iron, steel, copper, zinc, and resin, camphor, lycopodium, &c Gunpowder is used either in grain, half crushed, or finely ground, for different purposes The longer the iron filings the brighter red and white sparks they give, those being preferred which are made with a very coarse

file, and quite free from rust Steel filings and cast-iron borings contain carbon, and afford a more brilliant fire, with wavy radiations Copper filings give a greenish tint to flame, those of zinc a fine blue colour, the sulphuret of antimony gives a less greenish blue than zinc, but with much smoke, amber affords a yellow fire, as well as colophony and common salt, but the last must be very dry Lampblack produces a very red colour with gunpowder, and a pink with nitre in excess It serves for making golden showers. The yellow sand, or glistening mica communicates to fire-works golden radiations Verdigris imparts a pale green sulphate of copper and sal-ammoniac, a palm-tree green Camphor yields a very white flame and aromatic fumes, which mask the bad smell of other substances Benzoin and storax are used also on account of their agreeable odour Lycopodium burns with a [illegible] but it is principally employed in the theatres to represent lightning or to charge the torch of a fury (See, for full information as to the various processes adopted in the construction of fire-works, *Ure's Dict of Arts, &c*, art "Fire-works")

PY'ROXENE (Gr πυρ and ξενος, *a stranger*) The *augite*, supposed to have pre-existed in the volcanic minerals containing it, and not to have been formed by fire

PYROXY LIC SPIRIT (Gr πυρ, and ξυλον, *wood*) This is one of the products of the destructive distillation of wood Its specific gravity when rectified is 0 804 it boils at 150°, it burns with a blue flame and may be used as a substitute for alcohol in lamps for which purpose it is often sold under the name of naphtha It is assumed to be the hydrate of a peculiar hydrocarbon which chemists have designated by the term *methylene* (from μεθυ, *wine* and υλη *wood*)

PY'RRHIC DANCE, called by the Romans Pyrrhica Saltatio A species of warlike dance said to have been invented by Pyrrhus to grace the funeral of his father Achilles though this point is involved in obscurity This dance consisted chiefly in such an adroit and nimble turning of the body as represented an attempt to avoid the strokes of an enemy in battle and the motions necessary to perform it were looked upon as a kind of training for the field of battle This dance is supposed to be described by Homer as engraved on the shield of Achilles Lord Byron describes the Suliotes as still performing this dance (*Childe Harold*) and in the famous ode on the aspirations of Greece after liberty he exclaims —

> "You have the Pyrrhic dance as yet
> Where is the Pyrrhic phalanx gone?
> Of two such lessons why forget
> The nobler and the manlier one?

PY'RRHONISTS The followers of Pyrrho a philosopher of Elis and disciple of Anaxarchus who flourished about 300 B C Their tenets which have come to us only through the reports of unfriendly writers are said to have been so absurdly sceptical that the Pyrrhonists would not put even as much confidence in the senses as was necessary for the preservation of their existence, but this seems partly refuted by the age at which Pyrrho himself died which was 90 years There is a summary of the doctrines of Pyrrhonism in the 2d vol of the historical part of the *Encyc Metropolitana* See SCEPTICISM

PYTHAGORE'ANS The followers of Pythagoras, a native of Samos born B C 570, said to have been the first Greek who assumed the title of a philosopher Pythagoras [illegible] Egypt and the East in search of [illegible] his abode at Crotona one of the Dorian colonies in the south of Italy He here attached to himself a large number of youths of noble descent, whom he formed into a secret fraternity for religious and political as well as philosophical purposes, and by [illegible] in the institutions of Crotona and other Dorian cities Of the strictly philosophical tenets of the Pythagoreans very imperfect records are preserved Many of the doctrines ordinarily imputed to them are evidently the fabrication of the later Pythagoreans a class of visionaries who lived during the decline of the Roman empire The fragments of Philolaus, apparently a genuine follower of Pythagoras, have been collected by Boeckh, but these, combined with what accounts we can glean from Plato, Aristotle, and others, are far from being sufficient to give us the information necessary for a clear understanding of this very singular system One point is sufficiently evident, that the Pythagoreans were the greatest mathematicians of their time, and that they sought in the study of numerical relations that solution of the principal philosophical problems for which their contemporaries, the Ionic and Eleatic philosophers, sought, the first in physical the others in ontological hypotheses Bearing this peculiarity distinctly in mind the student of the history of philosophy will be prepared for much in the Pythagorean doctrine which would otherwise seem capricious and unintelligible To reduce the phenomena presented to the senses to harmony with the laws of reason is the first endeavour of philosophical thinkers to determine its own limits, and the necessary laws of its operation, is among the last of the problems of which the reason enters on the solution The relations of space and quantity as they are the most obvious, are also the most distinct and definite forms, in which the laws of the outward world can present themselves to this faculty We cannot, therefore, feel surprise when we discover in the early mathematicians that error which has more or less prevailed among all great mathematicians who meddled with philosophy — the error of [illegible] the domain of their favourite science beyond its legitimate bounds Precisely as the atomic philosophers have endeavoured to explain all things by a diversity in the figure of their ultimate parts, the Pythagoreans seemed to have found, in the number and proportions of those parts, the true essence of the things themselves Having proceeded thus far, they went a step farther They perceived that the universe and its parts are obedient to certain laws, and that these laws can be expressed by numbers By a mistake prevalent during every period of speculation, they mistook the necessary conditions of a thing's subsistence for the essence of that thing itself, and at once pronounced that numerical relations were not merely all that could be understood in outward phenomena, but were, in fact, all that was real in them Units of number grew gradually into points in space and these into material atoms To every order of existence even to many abstract conceptions a distinct number was assigned God is represented as the original unity, the human soul the earth, the planets the animal creation have each their own peculiar arithmetical essence, as have also the abstrac-

[illegible]

meaning, but how far any such meaning was contemplated by the [illegible] doubt

The outline [illegible] is in a singular table of opposites (συστοιχια) preserved to us by Aristotle in which the two principles of the universe are successively represented under the form of limit and the unlimited odd and even, one and many, right and left male and female still and moved straight and curved, light and darkness good and evil, square and oblong

But it would far exceed our limits to enumerate the various fanciful disguises under which the Pythagoreans voluntarily or involuntarily concealed the result of their meditations Their moral system is more intelligible, being founded as the tone of their general doctrines would lead us to anticipate on the ideas of law and harmony Every state, and every member of a state is to exhibit each in his degree a miniature resemblance of the universal constitution of the world This essentially Greek idea they sought to realize in themselves by a long course of propædeutic discipline, in which music plays a conspicuous part [illegible] were strongly influenced by their [illegible] different in the length of time during which their brotherhood continued Philolaus Lysis, Clinias, Eurythes, and Archytes, in all probability genuine Pythagoreans, were contemporaries of Plato and Socrates (See *Thirlwall's Hist of Greece*, vol ii c 12, *Ritter's Hist of Philosophy*, b iv *Boeckh's Philolaus*, &c)

The doctrine of *metempsychosis*, or the transmigration of souls through different orders of animal existence, is the main feature by which the Pythagorean philosophy is popularly known It is however by no means certain that the genuine Pythagoreans held this doctrine in a literal sense It may have been only a mythical way of communicating their belief in the individuality and *post mortem* duration of the soul

PY'THIAN GAMES One of the four great national festivals of Greece celebrated every fifth year in honour of Apollo near Delphi Their institution is variously referred to Amphictyon, son of Deucalion, founder of the council of Amphictyons, and Diomed, son of Tydeus, but the most common legend is that they were founded by Apollo himself, after he had overcome the dragon Python The contests were the same as those at Olympia, and the victors were rewarded with apples and garlands of laurel As is well known, the priestess who delivered the oracle at Delphi was called Pythia *See* DELPHI

PY THON (Gr πυθων) The name of a genus of large non venomous Ophidian reptiles, having anal hooks, [illegible] series of sub-caudal scutæ

PYX The name given to the box in which the host is kept by the Roman Catholic priesthood

PYXI'DIUM (Gr πυξις, *a small box*) A fruit which divides circularly into a lower and upper half, of which the latter acts as a kind of lid

PY'XIS NAUTICA The Mariner's Compass A constellation of the southern hemisphere, formed by Lacaille

PYX, TRIAL OF *See* COINAGE.

Q.

Q (Fr queue, *a tail*, its form being that of O with a tail) In all the languages in which it is used it is invariably followed by *u* Q is used as an abbreviation for *question*, Qy for *query*, Q E D for *quod erat demonstrandum*, which was to be demonstrated, &c

QUADRAGESIMA (Lat *fortieth*) In the Calendar, a term applied to the first Sunday in Lent, because it consists of about forty days Quadragesima Sunday is the first Sunday before Easter

QUADRANGLE In Geometry, a plane figure having four angles and consequently four sides

QUADRANS A division of the Roman *as*, consisting of one fourth of it, or three ounces when the *as* was of its full weight (See As, Teruncius) A farthing Before Edward I the smallest coin was a penny or starling It was marked with a cross, so as to admit of being quartered, but, to avoid unfair cutting, halfpence and farthings were coined in the above reign

QUADRANT In Geometry, the fourth part of a circle, an arc of 90 degrees

Quadrant is also a mathematical instrument, formerly much used in astronomy and navigation The instrument is variously contrived and fitted up, according to the purpose for which it is intended, but it consists essentially of a limb or arch of a circle equal to the fourth of the circumference, and divided into 90°, with subdivisions The mural quadrant is of considerable size (6 or 8 feet radius for example) the axis of which moves in a wall or solid piece of masonry Ptolemy in the *Almagest* describes a quadrant with which he determined the obliquity of the ecliptic Tycho Brahe had a large mural quadrant for observing altitudes, and others which revolved on a vertical axis for measuring azimuths Picart, in his measurement of the earth used a quadrant for his terrestrial angles In 1725 a mural quadrant by Graham, was erected in the Royal Observatory at Greenwich which in 1750, was replaced by Bird's quadrant, with which Bradley made his celebrated observations The quadrant has however of late years been entirely superseded by the *mural circle*, it having been found that the circle on account of the symmetry of its form and the advantage which it possesses of allowing the readings to be made at different parts of the limb is an instrument much more to be relied on (See Mural Circle) *Hadley's quadrant* in its principle and application is the same as the *sextant* by which it has been superseded (See Sextant) For further information respecting the quadrant see Lalande, *Astronomie*, s 2311, *Vince's Practical Astronomy*, *Pearson's Practical Astronomy*, and the *Penny Cyclopedia*

Quadrant in Gunnery, or the *gunner's square* is an instrument used for elevating and pointing cannon mortars, &c It consists of two rectangular branches of wood or brass having a quadrantal arch between them, divided into 90° and furnished with a thread and plummet One of the branches being placed in the mouth of the piece, the degree intersected by the thread on the limb shows the elevation

QUADRANTAL TRIANGLE, in Trigonometry is a spherical triangle which has one side equal to a quarter of a circle, or 90°

QUADRANT OF ALTITUDE An appendix to an artificial globe consisting of a thin pliable slip of brass, which is applied to the globe and used as a scale for measuring the distances between points in degrees It is graduated into 90°, the degrees being of the same length as those on one of the great circles of the globe At the end where the division terminates a nut is rivetted on, and furnished with a screw by which it is attached to the brass meridian of the globe at any point This point being placed in the zenith and the quadrant applied to the globe its zero coincides with the horizon, and consequently the altitude of any point along its graduated edge [illegible] respective divisions

QUADRATIC EQUATION In Algebra an equation of the second degree, or one which involves the second power or square, of the unknown quantity

Quadratic equations are of two kinds, *incomplete* and *complete* The incomplete equation is that which contains only terms affected by the square, and not by the simple power of the unknown quantity It is also called an *equation of two terms*, because, by means of proper reductions of the known quantities, it may always be put under the form $a x^2 = b$, or a *pure* quadratic, because, on dividing by the coefficient of x^2, it contains only the square of the unknown quantity in one term, or is of the form $x^2 = c$

The *complete* quadratic equation consists of three terms, containing the square of the unknown quantity in one, the simple power in another, and the known quantities in a third It is also called an *affected* quadratic, and its general form is $a x^2 + b x + c = 0$

When the proposed equation consists of only two terms, the method of finding the value of the unknown quantity is obvious Let the equation after reduction be $x^2 = p$, then $x = \sqrt{p}$ Now, if p be a number, its square root, which is the value of x, can either be found exactly, or to any required degree of approximation and if p be an algebraical quantity its root may be found either exactly or approximately by the ordinary methods of extraction There is, however, a circumstance respecting the sign of the root which must be attended to The root of any quantity may be either positive or negative, because the square of $+a$ and of $-a$ is equally a^2, whence $\sqrt{a^2} = \pm a$, and the equation $x^2 = p$ gives two values of x, namely, $x = +\sqrt{p}$, and $x = -\sqrt{p}$

As the square of any quantity, whatever be its sign, is always positive, it follows that a negative quantity can never be formed by the multiplication of any root multiplied into itself, and hence an equation of the form $x^2 = -p$ can have no real root When such an equation occurs in the solution of a problem in which only real quantities are concerned, it shows that some contradiction is involved, either in the data, or in the reasoning by which that result has been produced

A complete quadratic equation is always reducible to the form $x^2 + a x = +b$, and in order to deduce from it the value of x it is necessary to add some known quantity to both sides by which the first will be rendered an exact square The square of the binomial $x + u$, is $x^2 + 2 u x + u^2$, on comparing this with $x^2 + a x$, it is evident that if we suppose $a = 2 u$, or $u = \frac{1}{2} a$, and consequently $u^2 = \frac{1}{4} a^2$ the quantities $x^2 + 2 u x + u^2$ and $x^2 + a x + \frac{1}{4} a^2$ will be equal, and therefore, since $x^2 + 2 u x + u^2$ is the square of $x + u$, so $x^2 + a x + \frac{1}{4} a^2$ must be the square of $x + \frac{1}{2} a$, which is equal to $x + u$ If, therefore the proposed equation be $x^2 + a x = b$ let $\frac{1}{4} a^2$ be added to both sides, and it becomes $x^2 + a x + \frac{1}{4} a^2 = \frac{1}{4} a^2 + b$, which on extracting the square root, gives $x + \frac{1}{2} a = \pm \sqrt{\frac{a^2}{4} + b}$, therefore, by transposition, $x = -\frac{1}{2} a \pm \sqrt{\frac{a^2}{4} + b}$

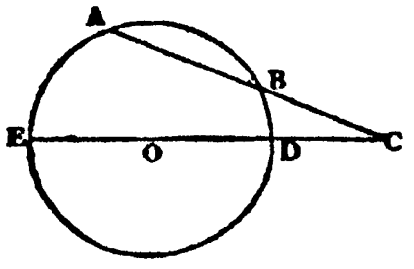
In like manner, it will appear that if the proposed equation were $x^2 - a x = b$, the equation giving the value of x will be $x - \frac{a}{2} = \pm \sqrt{\frac{a^2}{4} + b}$, whence $x = \frac{a}{2} \pm \sqrt{\frac{a^2}{4} + b}$ The quantity b retains the same sign in the resolved as in the original equation

From these considerations, the rules for the solution of quadratic equations in general follow so obviously that it is unnecessary to state them in form The double sign however which appears in the root, and which shows that the unknown quantity in every quadratic equation has two distinct values, requires some further attention

Taking an example in numbers, let the proposed equation be $x^2 + 2 x = 35$ Adding to each side the square of half the coefficient of x, or of 1 it becomes $x^2 + 2 x + 1 = 36$, whence $x + 1 = \pm 6$ and, consequently, $x = -1 \pm 6$, that is, $x = +5$, or $x = -7$ Now, if we transpose the absolute term of the proposed equation $x^2 + 2 x = 35$ to the left side it becomes $x^2 + 2 x - 35 = 0$, and it is easy to see (and may be proved by actual multiplication) that $x^2 + 2 x - 35$ arises from the product of two factors $x - 5$ and $x + 7$, therefore $(x - 5)(x + 7) = 0$ But this last equation may be satisfied in two ways viz either by making $x - 5 = 0$, or by making $x + 7 = 0$ If $x - 5 = 0$, then $x = 5$, and if $x + 7 = 0$, then $x = -7$ There are two values of x, therefore, which alike satisfy the proposed equation nearly, $+5$ and -7, and these are the two roots found above by the direct solution

What has been now said in respect of the particular example is true of quadratic equations in general Every expression of the form $x^2 + a x - b$ is decomposable into two factors, $x - p$ and $x + q$ in which p and q are quantities independent of x, and depending only on a and b Hence the equation $x^2 + a x - 6 = 0$ is identical with the equation $(x - p)(x + q) = 0$, and this last is obviously satisfied alike by making $x - p = 0$, or by making $x + q = 0$ that is, by $x = +p$ or $x = -q$

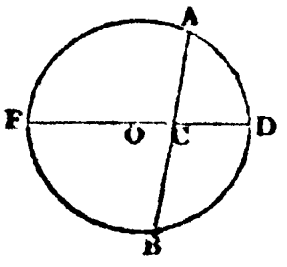
It follows, therefore, that every quadratic equation has necessarily two roots, and it is obvious that it can have no more than two, for if it could be supposed to have three or any great number, then the expression $x^2 + a x - b$ would be resolvable into as many separate factors of the form $x - p$, $x - q$, $x - r$, &c But this is evidently impossible, for the product of three such factors would necessarily contain the third power of x, or x^3 which the given equation does not The resolution of equations into as many factors as there are roots is a



property belonging to equations of every degree. *See* EQUATIONS

The consideration of the nature of the factors into which the proposed equation can be resolved leads to some important consequences The hypothesis $x^2 + a x - b = (x - p)(x + q)$ gives $x^2 + a x - b = x^2 - (p - q) x - p q$, whence, since x is an indeterminate quantity, we must have $a = -(p - q)$ and $b = p q$ Now, since $+ p$ and $- q$ are the two roots of the equation $x^2 + a x = b$, it is evident that $p - q$ is their sum, and $- p q$ their product, therefore, because $p - q = - a$, the sum of the two roots of any quadratic $x^2 + a x = b$ is equal to the coefficient of the second term, having its sign changed, and their product is equal to the absolute number or term which does not contain x having its sign also changed

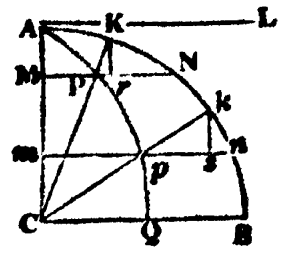
The roots of quadratic equations may be exhibited by a geometrical construction All quadratics belong to one of the four forms,



$$x^2 + a x = b c, \quad x^2 - a x = b c,$$
$$x^2 + a x = - b c, \quad x^2 - a x = - b c$$

Now to construct the first form, let a circle be described on a diameter $= a$, or radius $= \frac{1}{2} a$ in the circle inflect a straight line, A B $= b - c$, and produce it to C, so that A C $= b$, and consequently B C $= c$, and draw C D E through the centre O, meeting the circle in D and E, then C D and C E are the two roots of the equation For let C D $= x$, then C F $= x + a$ and the rectangle C D C F $= x (x + a) = x^2 + a x$ But by construction C A C B $= b c$, and by the property of the circle C D C F $=$ C A C B, therefore, $x^2 + a x = b c$, which was the equation given

To construct the second form namely, $x^2 - a x = b c$ let C E $= x$, then C D $= x - a$, and, consequently C F C D $= x (x - a) = x^2 - a x$, but as before, C F C D $=$ C A C B $= b c$, therefore $x^2 - a x = b c$ and the roots of the equation are C F and C D In these two cases, if $b - c = 0$ the straight line C B A becomes a tangent to the circle and if $b - c$ be greater than a, another line may be taken which is a mean proportional between b and c, and which will be the tangent to the circle, so that the construction is possible in all cases



To construct the fourth form, $x^2 - a x = - b c$ let a circle be described with the radius $\frac{1}{2} a$ as before, and inflect in it a straight line A B $= b + c$, take A C = [illegible] and the centre O [illegible] D then E C and C D are the two roots of the equation or values of x For, since E D $= a$, if E C $= x$, then C D $= a - x$, and therefore E C C D $= x (a - x) = a x - x^2$ But E C C D $=$ A C C B $= b c$, therefore $a x - x^2 = b c$, or $x^2 - a x = - b c$ The same construction gives the third form, $x^2 + a x = - b c$, but the two roots are in this case both negative namely $-$ E C and $-$ C D

Hence it follows that every geometrical problem producing a quadratic equation can be constructed by means of a circle and straight lines and, [illegible] problems respecting circles and straight lines be resolved algebraically by means of quadratic equations

QUADRA'TO, or QUADRO (It.) In Music, a name given to the note B in the natural or diatonic scale marked thus ♮, being a semitone minor higher than B mol or ♭

QUADRA'TRIX In Geometry, a transcendental curve, by means of which the quadrature of curvilinear spaces can be determined mechanically The best known of these curves is the *Quadratrix of Dinostratus*, so called from its reputed inventor, a brother of Menechmus and disciple of Plato This curve is generated as follows —

In the circular quadrant C A B, suppose the radius C A to revolve uniformly about C, passing through the different positions C K, C k, &c, till it arrives at the position C B, and that during the same time a line A L, at right angles to C A, moves parallel to itself with a uniform motion from the position A L, passing through the different positions M N, $m n$, &c., and arriving at C B at the same instant that C K coincides with C B, then the continual intersection of the revolving radius and the parallel line will trace the quadratrix A P Q

From this mode of describing the curve, it is easy to see how it may be applied to divide an angle into any number of equal parts Let it be required, for example, to trisect the angle A C k Having applied the quadratrix to C A, take A M equal to a third of A m, and through M draw M N perpendicular to A C, meeting the curve in P, join C P, and the angle A C P is equal to one third of A C k, for by the nature of the quadratrix A M A m A K · A k

The application of this curve to the quadrature of the circle depends on the property that the line C Q is a third proportional to the quadrantal arc A B, and the radius Hence the arc A B $= \frac{\text{C B}^2}{\text{C Q}}$, and consequently the area of the quadrant C A B $= \frac{\text{C B}^3}{2\,\text{C Q}}$

If the quadratrix be continued beyond A, without the circle, it will consist of a series of infinite hyperbolic branches, cutting the axis C A produced, in points which are separated from each other by a space equal to 2 A C

Other curves may be formed in a similar manner, by which the quadrature of the circle would be obtained Thus, instead of supposing the lines M N, $m n$ to be intersected by the radiants C K, C k, we may suppose straight lines drawn from K k parallel to A C, intersecting M N, $m n$ in r and s, these intersections form a different curve, which is called the *Quadratrix of Tschirnhausen*

Let A M $= x$, M P $= y$, and A C $= a$, then, since x a A K A B, or $\frac{1}{2} \pi$, we have A K $= \frac{\pi x}{2 a}$ Hence the equation of the quadratrix of Dinostratus is $y = (a - x) \tan \frac{\pi x}{2 a}$, and that of the quadratrix of Tschirnhausen $y = a \sin \frac{\pi x}{2 a}$ (Montucla, *Histoire des Mathematiques*, *Peacock's Collection of Examples*, *Leslie's Geometry of Curve Lines*)

QUADRATURE in Astronomy, denotes the position of the moon when she is 90° from the sun, or at one of the two points of her orbit equally distant from the con-ju[illegible]

[illegible] of the area of a cur[illegible] differential element of the area of a curve referred to rectangular co-ordinates is $y\,d\,x$, and since y is given in terms of x by the equation of the curve of which the area is proposed to be found, the problem of quadratures in general reduces itself to the integration of the differential $X\,d\,x$ in which X is an algebraic function of x and known quantities In the applications of the higher geometry a problem is conceived to be resolved when it is reduced to quadratures that is, when the variable quantities have been separated and its solution been made to depend on finding the values of one or more integrals of the form $\int X\,d\,x$ In the case of some curves, parabolas for example of different orders, expressed by the equation $y^m = a x^n$, the integral is found in finite terms, in regard to other curves, the circle, for example, it can be represented by a converging series, but it frequently happens, especially in the applications to physical astronomy, that the expression represented by X is too complicated to allow of the integral $\int X\,d\,x$ being found by a converging series, and when this occurs, the only thing that can be done is to find values of it for particular cases only, that is to say, for portions of the area corresponding to values of x taken within certain limits The method of quadratures accordingly forms an important branch of the Integral Calculus

The *quadrature of the circle* is a problem of great celebrity in the history of mathematical science The whole circular area being equal to the rectangle under the radius, and a straight line equal to half the circumference, the quadrature would be obtained if the length of the circumference were assigned, and hence the particular object aimed at in attempting to square the circle is the determination of the ratio of the circumference to the diameter This ratio can only be expressed by infinite series, of which many have been given that converge with great rapidity *See* CIRCLE

It is necessary to make a distinction between the *definite* and the *indefinite* quadrature The definite quadrature would be that which would give either the area of the whole circle, or of some particular portion of it without giving that of every other portion, the indefinite quadrature would give the area of any sector whatever, or the length of any arc [illegible] Gregory undertook to demonstrate that the [illegible] quadrature is impossible, Huygens however, objected to his reasoning, and the opinion of geometers seems to be that no satisfactory demonstration has yet been given of the absolute impossibility of solving the problem It has indeed been proved by Lambert and Legendre that the ratio of the circumference to the diameter, and its square, are irrational numbers But irrational quantities may be

susceptible of geometrical construction, and if a straight line equal to the circumference of a circle having a given ra[illegible] of the line could not be expressed by a finite number

Pretenders to the discovery of the quadrature of the circle occasionally present themselves even at the present day They are only to be found among those who have an imperfect knowledge of the principles of geometry, and when [illegible] futile attempts so frequently made on this and similar subjects, the Academy of Sciences of Paris, in 1775, and the Royal Society shortly after, publicly announced, that they would not examine in future any paper pretending to the quadrature of the circle, the trisection of an angle, the duplication of the cube, or the discovery of the perpetual motion For the history of this famous problem, see the third supplement to the 4th volume of Montucla

It was stated in the article CIRCLE that the approximation to the numerical ratio of the circumference to the diameter had been computed by De Lagny to 128 places of decimals It should have been added that the approximation was carried by Vega to [illegible] and Montucla mentions a MS in the [illegible] at Oxford, in which it is carried to 154 figures In the *Philosophical Transactions* for 1841, the ratio is extended by [illegible], of the Woolwich Academy, to 208 figures of decimals, but this has been found to be correct only to the 152d decimal the 153d and all the following being erroneous In Schumacher's *Astronomische Nachrichten*, No 589 (February 1847) the ratio is given to 250 decimals, computed *twice*, from two different formulæ, by Dr Clausen of the observatory at Dorpat, and it is stated that an independent calculation by Mr Dase of Vienna to 200 decimals gave a result agreeing exactly with Dr Clausen's to the last figure inclusive

QUA'DRICORNS *Quadricornia* (Lat quatuor, *four* and cornu *a horn*) A family of Apterous insects, comprehending those which have 4 antennæ A species of Antelope with 4 horns is called *Antilope quadricornis*

QUA'DRIFORES *Quadrifora* (Lat quatuor and foro, *I pierce*) A name given by Latreille to a family of Sessile Cirripeds, comprehending those in which the opercular covering of the tube is composed of four valves or calcareous pieces

QUADRI'GA (Lat quatuor and jugum, *a yoke*) In Antiquity a car or chariot drawn by four horses which were harnessed all abreast and not in pairs The quadriga is often met with on the reverse of medals which are thence termed *nummi quadrigati* or *victoriati* from there being a representation of a figure of Victory holding the reins

QUA'DRI HY'DROCA'RBON A liquid hydrocarbon in which 4 atoms of hydrogen and 4 of carbon are so combined and condensed as to constitute one atom of quadri hydrocarbon

QUADRILA'TERAL (Lat quatuor, *four*, and latus *a side*) In Geometry a plane figure contained by four straight lines It comprehends the square parallelogram rectangle rhombus rhomboid and trapezium The most general properties of a quadrilateral figure are the two following —1 The sum of the four angles is equal to four right angles, 2 The sum of the squares of the sides is equal to the sum of the squares of the two diagonals together, with four times the square of the straight line which joins the middle points of the diagonals

QUADRILA'TERALS *Quadrilatera* (Lat) The name of a tribe of crabs (Brachyurous Crustaceans) comprehending those in which the carapace or shell is [illegible]

QUADRIPE'NNATES *Quadripennes* (Lat quatuor and penna *a wing*) The name of a section of Anelytron insects including those which have four wings

QUADRIRE'MES (Lat quatuor and remus *an oar*) A ship of war in use among the ancient Greeks and Romans, so called because it had four banks of oars *See* GALLEY

QUADRISU'LCATES, *Quadrisulcata* (Lat quatuor, and sulcus *a furrow*) A name applied to those Ungulate quadrupeds in which the hoof is divided into four parts corresponding to the four digits

QUADRI'VIUM (Lat) In the language of the schools, the four lesser arts,—arithmetic, music, geometry, and astronomy *See* TRIVIUM

QUA'DRUM In Music, the same as *natural*, which see

QUADRUMANES, *Quadrumana* (Lat quatuor, *four* [illegible] the name of an order of Mammalia [illegible] are terminated by hands [illegible] hinder extremities [illegible] the South American monkeys, incapable [illegible]

QUADRUPEDS, *four-footed animals* (Lat quatuor, *four*, pes, *a foot*) All Vertebrate animals with four extremities fitted for terrestrial progression were formerly so called, the scaly reptiles being distinguished, as oviparous quadrupeds, from the hairy warm-blooded viviparous four-footed mammals But as there are both reptiles and mammalia which have only two legs and as those of both classes which agree in having four legs differ essentially in the important characters on which classific distinctions are now founded, the term quadruped is no longer used in a strict zoological sense as indicative of a particular group of animals

QUA'DRUPLE In Arithmetic, fourfold the product of any magnitude or quantity multiplied by 4

QUÆSTOR A Roman magistrate whose office it was to collect the public revenue, whence their name (from quæro, *I seek*) was derived Two quæstors were originally chosen by the kings in the earliest times of the city, and [illegible] remained in the [illegible], when they began to be elected by the people at the Comitia Tributa Soon after this two more quæstors were appointed to attend the consuls in war, and from this time they might be chosen indifferently from plebeians and patricians, the former class having been previously excluded As the Roman empire was extended over all Italy and the other countries that finally owned its sway, the number of quæstors was increased, so that one was appointed to each consul or prætor when he went to his province, and this was done generally by lot, but sometimes the superior magistrate was allowed to choose his own quæstor The quæstorship was the first step of preferment which gave admission into the senate, but it was sometimes held by those who had been consuls Under the emperors the office underwent many changes, Augustus deprived them of the charge of the treasury, which he imposed on the prætors, and gave them the superintendence of the public records, but the former office was restored to them by Claudius

QUA'GGA The name of a Solipedous quadruped, or species of *Equus*, allied to the zebra

QUA'GMIRE Boggy ground saturated with water to such a degree as to be more like mud than firm soil

QUAIL A genus of Gallinaceous birds (*Coturnix*, Cuv), allied to the partridge, but of smaller size, with a more slender beak and shorter tail, and without red eyebrows or spurs

QUA'KERS, or FRIENDS A religious sect which had its origin in England about the middle of the 17th century, and spread, by the emigration of its members, who were exposed to many restrictions and persecutions in this country, over various parts of Europe and North America The founder of the sect was George Fox, who being equally dissatisfied with the tenets of the established church and those of the Puritans succeeded in attaching to himself various persons who agreed with him in the view which he took of the internal operation of religion on men's hearts conceiving it to supersede all the observances of different denominations, nor to be evidenced in any degree by them The Quakers, therefore reject both the sacraments, nor do they appoint any order of ministers but consider the instruction and edification of their congregations as the province of whatsoever person of either sex conceives himself to be impelled thereto at the time by an internal suggestion of the Spirit Upon doctrinal points however, they assert themselves to maintain opinions coincident with those generally received by the orthodox Their internal affairs are managed by yearly, quarterly and monthly meetings, of which the former in this country is held in London and embraces representatives for all the rest A similar arrangement takes place [illegible] the females of the society who are allowed a considerable share in the management of the affairs of their own sex

This society is distinguished in its intercourse with the world by great seriousness of deportment and demure soberness in dress, and generally a scrupulous avoidance of every thing which can encourage vanity and frivolity They are all sensitively averse from all matters of ceremony, which they [illegible] to be the origin in flattery and deception [illegible] to take promissory oaths used in former times [illegible] to the accession of James II their history is an unvaried series of persecutions, either such as they endured in common with other dissenters, or such as were peculiar to themselves in consequence of their refusal to pay tithes and to take oaths Under him the severity of the penal laws was relaxed, but William III was the first prince who enacted laws for the especial relief of the Quakers From this time, their affirmation is received in lieu of oath in judicial proceedings, and an alteration in the method of levying tithes has been provided by which their scruples are satisfied (See among other authorities respecting the Quakers, *Fox's Journal*, *Barclay's Apology*, and *Sewell's History of the Rise, &c of the Quakers* (1722) The Quakers of the present day are thought to be a decreasing sect In 1836, the number of the congregations was estimated at 360 (*Congregational*

Magazine) They are most numerous in Yorkshire, Lancashire Durham, Cumberland and Essex

QUA'KING BOG Peat bog in a growing state, and so saturated with water that a considerable extent of surface will quake or shake, when pressed on by the foot or any other body Such bogs are unfit for any useful purpose till they are drained

QUA'LITY (Lat qualis) In Physics, a modification or affection of bodies Sensible qualities are those which immediately affect the senses as light, &c

QUALITY, in the philosophy of Kant, the *second* category in the logical table, comprising the notions of existence or reality, non-existence or negation, and limitation

QUA'NTITY (Lat quantus, *how much*) A property of any thing capable of being increased or diminished Quantities are distinguished into *continued* and *discrete* It is continued when the parts are connected together and the whole is integral which is the object of geometry The parts have an unconnected and independent existence forming multitude or number, which is the object of arithmetic The quantity of matter in any body is proportional conjointly to the magnitude and density of the body, and is measured by its absolute weight Quantity of motion is used synonymously with *momentum*, to denote the product of the quantity of matter in the moving body by its velocity Algebraic quantities are the expressions of indefinite numbers

QUANTITY In Prosody, the amount of time in a syllable Syllables are either short or long, the former being the unit or smallest measure of time the latter consisting of two times This distinction is clearly marked in the ancient languages, in which some syllables are necessarily long or short by position others by the nature of the vowels which they contain, and, in the Latin language, some common or susceptible of being sounded as long or short, according to certain rules of elegance or convenience All the metrical system of the ancient languages is founded on quantity In most modern languages there is strictly speaking no quantity as distinct from emphasis or accent the long syllables being those which receive the arsis the short those which receive the thesis In the German language however critics have endeavoured to establish a conventional system of quantity and thus to adapt that language to regular versification in the ancient Greek and Latin metres *See* RHYTHM, METRE

QUA'RANTINE (Ital quaranto *forty*) A period of time of variable length during which a vessel from certain coasts or ports said or supposed to be infected with certain diseases is not allowed to communicate with the shore, except under particular restrictions A ship in quarantine carries a yellow flag at the main, and when released from this condition she is said to obtain *pratique* The term is derived from the Ital quaranto *forty* it being generally supposed that if no infectious disease break out within 40 days or six weeks no further danger is to be apprehended It is universally believed that the Venetians were the first to adopt regulations for guarding against the introduction of infected persons into their ports, but there is now no civilized country in which it is not practised (For full particulars on the history and policy of, and [illegible] see the *Com Dict*

QUA'RE IMPEDIT In Law, a writ lying for one who has a right of advowson against a person who hinders or disturbs him in his right by presenting a clerk when the church is void

QUART A measure of capacity, being the fourth part of a gallon *See* MEASURES

QUA'RTAN (Lat quartus *fourth*) A species of intermittent fever or ague, which returns every fourth day *See* AGUE.

QUARTATION In Metallurgy the separation of silver from gold by means of [illegible] To extract the whole of the silver from gold by the action of nitric acid, it is necessary that there should be at least three parts of silver to one of gold, otherwise the gold protects the silver from the action of the acid, so that, in thus separating these precious metals it is customary where gold greatly predominates to add silver till it constitutes at least three fourths of the alloy

QUA'RTER The fourth part of any thing As a term of weight, it denotes the fourth of a hundred weight or 28 pounds, as a dry measure, it signifies the fourth of a chaldron

QUARTER The after part of the ship's side *On the quarter* implies the bearing or position of an object seen between aft and abeam

QUARTER DAYS The days usually recorded in England and most Continental countries (not in Scotland) as beginning the four quarters of the year They are 1 Lady Day (25th of March), 2 Midsummer Day (June 24th 3 Michaelmas Day (Sept 29th), and, 4 Christmas Day (Dec 25th)

QUARTER DECK The portion of the uppermost deck of a ship between the main and mizen masts This is the "parade" in men-of-war.

QUA'RTERING In Heraldry, the division of a shield by two lines, fess wise and pale-wise, meeting in the centre of the shield In marshalling, whenever a husband can place his wife's arms on an escutcheon of pretence (*see* ESCUTCHEON), the children may bear them [illegible] whence arises the great variety of shields of some families [illegible] In the Navy, a petty officer, who, besides other duties of superintendence, *cons* the ship, and attends to her steerage

QUARTER-MASTER In the Army, an officer whose business it is to look after the *quarters* of the soldiers, and attend to their clothing bread, ammunition, &c There is a quarter master attached to every regiment, whether of foot cavalry or artillery

QUARTER ROUND In Architecture *See* ECHINUS and OVOLO

QUA'RTERS The stations of a ship's crew in time of action, to which they are summoned by beat of drum, or by the boatswain's pipe

QUARTERS and QUARTERING (Fr quartiers) In Architecture, the upright posts in partitions to which the laths are nailed Quarters are [illegible] the former being saw[illegible] inches broad, the latter usually sawn to a scantling four inches square, or four inches by a less width No quarters should ever be more than fourteen inches apart *Quartering* is a term properly applied only to an assemblage of quarters, though it is not unfrequently used to denote the quarters themselves

QUA'RTER SESSIONS OF THE PEACE In Law a court held by two justices at least, one of whom must be of the quorum quarterly in every county, having a jurisdiction [illegible] matters touching the breach of the peace only but since extended by various statutes (*See* JUSTICES OF THE PEACE) Quarter sessions in boroughs since the Municipal Corporation Act, are held by the recorders

QUARTER STAFF A weapon of defence, so called from the manner of using it one hand being placed in the middle and the other equally between the middle and end

QUA'RTETT A piece of music arranged for four voices or four instruments Of the latter the most celebrated are arranged for two violins, — a tenor violin, and a violoncello, and many of the most distinguished composers among whom we may mention Haydn Mozart, Beethoven Romberg Spohr, Ries Onslow, &c, have not disdained to devote their talents to this species of composition The term *quartett*, though strictly any piece in four parts, is seldom applied except to instrumental pieces

QUA'RTILE ASPECT in Astrology denotes the aspect or appearance of two planets, whose positions are at a distance of 90° on the zodiac

QUARTINE The fourth envelope of the vegetable ovum [illegible] from the outside [illegible] in to books composed of sheets of paper folded into four leaves It is abbreviated 4to

QUARTODECIMA'NES In Church History, those who *imitated the Jews* in celebrating Easter on the 14th day of the paschal moon instead of the Sunday next following were so called after they had been excommunicated as heretics by the councils of Nice, Constantinople and Ephesus *See* EASTER

QUARTZ A German term now universally adopted in scientific language and commonly applied in mineralogy to the purer varieties of silica, especially to rock crystal

QUASIMODO In the Roman Catholic Calendar, the first Sunday after Easter, so called because the *Introit* for that day begins with the words "Quasi modo geniti infantes (1 Pet ii 1) It is also called Dominica in albis as being the day on which those who had been baptized on Easter Sunday deposited their white robes in the sacristy

QUA'SSIA The wood of the *Quassia excelsa*, or *amara*, a native of South America and some of the West Indian Islands It yields an intensely bitter infusion, which may be made with one drachm of the shavings of quassia to a pint of boiling water of this a wine-glass-full may be taken twice a day, with or without other additions as a tonic It is a good vehicle for most of the metallic salts, which are not decomposed by it, as by many other bitter vegetable infusions A strong infusion of quassia, sweetened with brown sugar, is a safe and effective poison for flies

QUATRAIN (Ital quattrino) In Poetry a piece consisting of four verses, the rhymes usually alternate, sometimes also, especially in French poetry, intermixed, the first and fourth, second and third, rhyming together

QUAVER (Sax pazian) In Music, a character, ♪, whose measure is equal to half a crotchet, or one eighth of a semibreve

QUEEN (Anglo Sax cwen, *wife*) 1 A female sovereign, entitled queen regnant, or queen regent She has, in Great Britain, the same power, prerogatives, &c, as a king, which is expressly declared by stat 1 Mar.

1. st 3 c 1 In France, where females do not succeed to the throne, the title queen regent has been given to the mothers of kings holding sovereign authority, or a portion of it, during the minority of their sons, as Catherine de Medicis in the reign of Francis II, Mary de Medicis, in that of Louis XIII

2 *Queen Consort* The wife of a king Her rights and dignities (in England, as well as most other countries) appear to be similar in many respects to those of the "Augusta," or Plissima regina conjux divi imperatoris, in imperial Rome The English queen, like the Roman empress, is capable of receiving a grant from her husband, or making one to him, therein differing from all other wives She can also purchase and convey land, &c, without his concurrence, and sue and be sued alone in short, she is looked upon in all legal proceedings as a feme sole But, except where she enjoys specific exemptions [illegible] with other subjects, and [illegible] maxim, "Augusta legibus soluta est" By the statute of Treasons, 25 Ed 3, to compass or imagine the death of the king's [illegible]" and also to violate and defile her, is treason The queen if accused of treason herself, is tried by the peers of parliament, as Ann Boleyn in 28 Hen 8 The consort of George IV was proceeded against by the method of a bill of pains and penalties

Queen-gold was a duty amounting to one full tenth of the value of fines, &c on grants by the crown anciently due to the queen, which Charles I purchased of his consort Henrietta, in 1635, for 10,000*l* but which was not revived after the restoration The queen consort has a separate household consisting of six ladies of the bed chamber, a chamberlain, vice-chamberlain, mistress of the robes, master of the horse, and three equerries, attorney and solicitor general, &c

3 *Queen Dowager* The widow of a deceased king She continues to enjoy most of the privileges which belonged to her as queen consort Nor did she, in ancient times, lose her dignity on remarriage, for Catherine, queen dowager of Henry V, after she had married Owen Tudor, maintained an action by the name of Catherine Queen of England But it is held that no man can marry a queen dowager without [illegible] licence from the king, on pain of forfeiture [illegible] goods according to an act of 6 H 6, which, however is not printed among the statutes The revenue of a queen dowager is settled by statute By 1 & 2 W 4 c 11 his late majesty was empowered to settle 100 000*l* per annum on his queen, to commence at his decease

4 *Queen Mother* A queen dowager who is also mother of the reigning sovereign

QUEEN POST In Architecture an upright post in a roof for suspending the beam when the principal rafters do not meet in the ridge See Roof

QUERCITRON BARK The bark of the *Quercus nigra* or American oak it is a highly valuable dye stuff and is used in the production of some of the most durable yellows

QUERCUS (Lat) This is the most important genus of trees found in the cold countries of the world on account of its producing the various kinds of timber called oak The species are not however confined to Europe or similar latitudes but occur abundantly in the equinoctial parts of Asia and America, they have not however, been found south of the equator It is usually recognized by the cup in which the acorn is seated, but in some tropical species the acorn is so small as to be buried in the cup when the fruit nearly resembles that of the chestnut (*Castanea*) The valuable oak of Great Britain is obtained from two native species the one *Q pedunculata*, the long-stalked or white oak, the other *Q sessiliflora*, the sessile fruited or red oak A prejudice has arisen against the timber of the latter, which, however appears to be unfounded as it is found to be in point of tregth and durability fully equal to the other Oak timber however is affected very much by soil and climate, and hence we have oak of bad quality from both our native species What is called wainscot oak is probably the timber of *Q sessiliflora*, grown rapidly in the dense forests of Hungary, by some persons, however it is supposed to be furnished by an oriental species called *Q cerris* or the mossy-cupped The *Esculus* of Virgil, whose acorns were eatable appears to have been a sweet-fruited variety of *Q sessiliflora* Besides the species already mentioned, the *Quercus ilex* or European oak the *Q suber*, or cork tree, whose bark is in such extensive use, and the *Q ballota*, or Spanish ilex, whose acorns are sweet and eatable, are the more important species Those from North America, although fine trees, are inferior to the oaks of England as regards their timber, and require hotter summers than we have in those islands Oak galls are produced upon *Q infectoria*, in the Levant, by the puncture of a cynips The species are excessively confused by botanists, but a full popular account of this genus will be found in *Loudon's Arboretum Britannicum* For a few popular details, see also the article OAK, in this work

QUESTION The application of torture to prisoners under criminal accusation according to the law of France before the Revolution The question was of two kinds. one, where strong evidence, but insufficient of itself to justify a condemnation to death, existed against a prisoner on a capital charge, he might then be subjected to torture to produce confession This was termed the question préparatoire It was abolished by an ordinance of Louis XVI in 1780 The other, termed question préalable or définitive was applied to the prisoner when convicted of capital offence in order to make him discover supposed accomplices It was abolished by the National Assembly The preparatory question was also of two sorts —one avec réserve de preuves, in which case, if the criminal did not confess under the torture, the other evidence was considered as still subsisting against him, so as to justify his condemnation to some lighter punishment, the other, sans réserve de preuves, in which case, if he persisted in his denial, he was acquitted altogether It was at the option of the judges according to their opinion of the amount of evidence to decide to which of these questions the accused should be subjected The modes of torture applied varied in France, being fixed by the several parliaments within their separate jurisdictions Those in common use at Paris were —the question by water, which consisted in stretching the limbs of the sufferer on a board by means of screws and forcing him to swallow large quantities of water, and the boots, in which his legs were inclosed in wooden cases the whole tightly compressed with ropes, and wedges driven with a mallet between the two cases The question varied in degree, being *ordinary* or *extraordinary* at the discretion of the judges Children and adolescents, old men and women with child were excepted from torture by the French law And, by an ordonnance of 1670, the second application of the question was forbidden in all cases

Torture has been applied as a mode of extorting confession in all countries into which the principles of the civil law have been imported, although the barbarity and uncertainty of the practice were remarked upon even in the best times of Roman jurisprudence The observations of Cicero on the subject are well known, and Ulpian the greatest authority on the civil law, speaks even more directly "Res est fragilis et periculosa (the torture) et quæ veritatem fallit nam plerique patientiâ sive duritia tormentorum ita et tormenta contemnunt, ut exprimi eis veritas nullo modo possit, alii tantâ sunt impatientia ut quidvis mentiri quam pati mallent" It is however an important remark, that as by the strict principles of jurisprudence the torture was only applied in cases where there already existed a mass of evidence against the prisoner sufficient, in ordinary judgment, to warrant his condemnation it did in fact afford him an additional chance of escape and that however great its absurdity on every supposition its barbarity rather arose from its liability to abuse than its legitimate infliction

The practice of judicial torture was not a part of the common law of England, except in one particular case The rack is said to have been first introduced into this country by the dukes of Exeter and Suffolk, in the minority of Henry VI, at all events it was then first made a common engine of discovery in state matters It was used on warrant from the privy council, on prisoners in the Tower of London for a long period afterwards, and more especially in the reign of Elizabeth, to enforce confessions or accusation of accomplices from recusant priests and others suspected of being engaged in treasonable plots against her It was probably employed in the examination of Guy Fawkes after the detection of the Gunpowder Plot, as has been conjectured, among other reasons from the feeble and trembling hand in which the signature of that criminal to his last confession is written when compared with that in which he subscribed his former declarations On the trial of Felton for the assassination of Villiers, duke of Buckingham, the judges were consulted by the privy council as to the lawfulness of the infliction of torture and on their asserting it to be illegal it was not applied there is, however, reason to suppose that it was used at least in one subsequent case in the reign of Charles I (See *Jardine on Torture* 1837)

The exception to which allusion has been made, by which torture was [illegible] the common law is the celebr [illegible] It has indeed been said and was asserted by the judges in 8 Hen. 4, that this infliction was [illegible] in consequence of the first statute of Westm [illegible] but it is at least highly probable that before that period, persons refusing to plead were subjected to imprisonment and ill-treatment to induce them to do so After that statute, the judgment appears only to have been to strait and severe confinement, nor was it until the reign of Hen 4 that its horrible character seems to have been fully determined by law After that time, the prisoner was remanded to the place from whence he came, laid on the ground in a dark room, and "as many weights as he can

bear, and more," laid upon him; with no sustenance except a morsel of the worst bread and a draught of [illegible] worst water [illegible] pleaded or died, [illegible] later practice, was soon decided, as the weights laid on were sufficient to cause speedy death The peine [illegible] et dure was not unfrequently put in practice until the beginning of the last century, and as late as the commencement of the reign of George III the enforcing prisoners to [illegible] other modes of torture [illegible] By 12 G 3 c. 20 any person standing mute, or not answering directly to the arraignment [illegible]

QUICKLIME Pure oxide of calcium See LIME

QUICKSILVER See MERCURY

QUIETISM A name generally applied to the opinions of enthusiasts, who conceive the great object of religion to be the absorption of all human sentiments and passions into devout contemplation and love of God This idea has found its admirers and encomiasts in all ages A sect called Quietists (in Greek, Hesychistæ) existed among the religious of Mount Athos, and in the 17th century it was given in France to a peculiar class of devout persons with a tendency towards a higher spiritual devotion, which seems to have arisen in great measure, out of a natural opposition to the hierarchal coldness and positive morality of Roman Catholic religion at that time, especially under the influence of the Jesuits A Spanish priest Molinos published at Rome a work entitled *The Spiritual Guide* (1675) of which the ardent [illegible] partisans Its leading [illegible] happiness of a soul reposing in perfect *quiet* on God [illegible] as to become conscious of His presence only, and unruffled by external things He even advanced so far as to maintain that the soul in its highest state of perfection [illegible] even beyond the contemplation of God [illegible] entirely occupied in the passive reception of divine influences The work of Molinos was afterwards condemned on the application of the Jesuits Akin to the ideas of Molinos seem to have been those of the French Quietists, of whom Madame de la Motte Guyon and Fenelon are the most celebrated names The former was at one time treated as insane on account of some strange delusions which led her to represent herself (unless she was calumniated) as the mystical woman of the Apocalypse, at another, she was admitted [illegible] Madame Maintenon and high in favour [illegible] her in his treatise *Sur les états intérieurs* [illegible] many of the most dangerous tenets of Quietism were continued The writings of the latter upon this subject were finally condemned by Innocent XII, and the example of the archbishop in submitting to the decision, and declaring himself satisfied and convinced by the opinion of the church has been dwelt on by pious writers as a signal triumph of a truly religious mind The dissolute conduct of some hypocritical persons under the pretence of inculcating the tenets and practice of Quietism, brought it eventually into disrepute more than the repeated condemnations of the head of the Roman Catholic church

QUINCUNX The Latin term properly for that disposition of five objects in which they are made to occupy the four corners and point of intersection of the diagonals of a square, but the word is extended to any number of things so arranged in lines that the members of each succeeding line stand behind the spaces between those of the preceding one Troops were frequently drawn up in this order, which was also a favourite arrangement for plantations of vines

QUINDE'CAGON In Geometry a plane figure bounded by fifteen sides The regular quindecagon is inscribable in a circle by elementary geometry (*Euclid* Book iv)

QUINDECE'MVIRI Roman magistrates whose duty it was to take care of the Sibylline books, and consult them on critical occasions when the senate deemed their advice necessary They were exempted from the privilege of serving in the army, and from other offices in the city, and their priesthood, which was probably in service of Apollo lasted for life Their number, as their name imports, was fifteen by Sylla's appointment but originally they had been ten, an equal number being elected from patricians and plebeians, and by Julius Cæsar they were raised to sixteen

QUI'NIA or QUININE A vegetable base obtained from yellow bark, the *Cinchona cordifolia* This substance, combined with sulphuric acid forms the [illegible] which is now so extensively used as a [illegible] substitute for the various forms of Peruvian bark I obtain quina bruised yellow bark is boiled in repeated portions of water, acidulated by sulphuric acid, till all its soluble matters are extracted, a little excess of quicklime is then added to the strained decoction, and the precipitate which is formed is collected, washed, and carefully dried It is then digested in alcohol which takes up the quina and from which it may be obtained in the form of a yellowish uncrystallizable substance by careful evaporation It is dissolved in dilute sulphuric acid, and the [illegible] water, and intensely bitter It is administered as a tonic and [illegible] from one to five or six grains

QUINQUAGESIMA SUNDAY, in the Calendar, is the seventh Sunday before Easter, and consequently *about* the fiftieth day before that festival, whence the origin of the term

QUINQUA'TRUS In Roman Classical Antiquities the feast of Minerva, which began on the 14th of the Kal of April and lasted five days It is in allusion to the well-known attributes of the goddess that Juvenal makes this the season in which her youthful votaries pray for forensic success

[illegible]

QUINQUENNA'LIA, or LUDI QUINQUENNALES In Classical Antiquity, public games celebrated every five years They were instituted by the emperors in commemoration of different events of their respective reigns Medals struck on these occasions have been discovered, bearing the date of the reign of Posthumus

QUINQUE'REMIS (Lat quinque, *five*, and remus, *an oar* in Greek τριήρης) The name of a class of Roman war ships which were rowed by five banks of oars, whence the name is derived The substitution of the quinquereme for the trireme as the ordinary war vessel, gradually took place in the course of the fourth century before Christ in the interval between the Peloponnesian and first Punic wars The number of vessels of this large class employed in the latter is perfectly surprising According to Polybius the Romans lost 700 in the course of it, the Carthaginians 500 In A U C 498 (the year in which Regulus was sent to Africa) the Romans had 330, the Carthaginians 350 each quinquereme of the former nation carried 300 rowers and 120 soldiers, in all 140 000 men the Carthaginian according to the same computation amounted to [illegible] numbers which would be scarcely credible were they not given by so exact an author See TRIREME GALLEY

QUIN'QUINA Peruvian bark The bark of various species of *Cinchona*, which see

QUINSY (Er squinance) Inflammation of the tonsils This is common inflammatory sore throat it is not infectious It begins with pain on one side of the throat and swelling of the tonsil attended by febrile symptoms, which sometimes run high especially as the tumefaction advances, there is great restlessness and anxiety, and often the utmost difficulty of swallowing even liquids, and of breathing The disease has proved fatal by producing suffocation but it generally terminates in resolution or suppuration in the latter case the abscess breaks, and a good deal of pus is discharged and the patient is at once relieved of all his urgent symptoms, but it occasionally happens that the other side of the throat becomes affected, and [illegible] through the same stages

QUINTAIN An ancient pastime, in which a post was erected with a cross piece turning upon a pivot on the top of it to one end of which a sand bag was suspended and at the other a board was fixed The play consisted in riding or tilting against the board with a lance and passing without being struck behind by the sand-bag

QUINTAL An old denomination of weight, being the same with the *hundred* weight, or equal to 112 pounds

QUINTESSENCE A term applied by the older chemists to alcoholic tinctures or essences made by digestion at common temperatures or in the sun's heat

QUI'NTILE In Astrology, an aspect of two planets distant from each other the 5th of the zodiac, or 72°

QUI'NTILIANS A sect of ancient heretics, so called from Quintilla their founder and leader Their chief peculiarities consisted in attributing extraordinary gifts to Eve for having eaten of the tree of knowledge and in [illegible] women to the sacerdotal and episcopal office

QUINTINE (Lat quintus) A name given in botany to the fifth or innermost envelop of the vegetable ovulum, the most external being the first or primine

QUI'NTUPLE In Music, a species of time, now seldom used containing five crotchets in a bar

QUINZAINE [illegible] a feast day, or the [illegible] cluded But a different rule seems to have prevailed on the Continent (See *Sir H Nicolas's Chronology of History*, p 105)

QUI PRO QUO, or QUID PRO QUO (Lat *one for another*) A conventional term borrowed from the French, who use it in the sense of an error committed by mistaking one thing or person for another; especially a ve[illegible]

QUIRI'NUS An Italian warlike divinity, supposed by some to be the same as Mars When the Romans deified Romulus they called him by this name, and the festivals instituted in his honour *Quirinalia*.

QUIRK In Architecture, a piece of ground cut off from a square plot

QUIRKED MOULDING In Architecture, one whose convexity is sudden, being in the form of a conic section

QUI TAM (Lat *who as well*) In Law, a penal action, in which half the penalty is given to the crown and the rest to the informer The plaintiff describes him as A B "qui tam [illegible]"—who sues as well for [illegible]"

QUIT RENT (Lat quietus redditus) In Law a small rent payable by tenants of manors in token of subjection *See* RENT

QUO'DLIBET (Lat *what you please*) In the language of the schoolmen, questions on general subjects within the range of their inquiries were termed *questiones quodlibeticæ*, or miscellaneous In French the word quodlibet, or quolibet, is retained in the sense of a slight jeu d'esprit, pun, &c What is termed in music a 'pot pourri" was also called in Germany a *quodlibet*

QUOIN (Fr *coin*) In Architecture, the corner or internal and external angle of a building, or of any part of a building

QUOIN In Artillery, a loose wedge of wood put below the breech of a cannon, for the purpose of adjusting its elevation

QUO'RUM A term derived from the words used in the Latin form of the commission issued to justices of the peace, in which the expression occurred quorum unum A B esse volumus,"—' of whom we will that A B be one," thus rendering it necessary that certain individuals (said to be of the quorum) should be present at the transaction of business Hence when in an assembly, committees, &c it is necessary that a certain number should be present to give validity to its acts, that number is generally said to constitute a quorum

QUO'TA (Lat quot *how many*) That part which each member of a society has to contribute or receive in making up or by giving a certain sum

QUOTIDIAN (Lat quotidianus) That form of ague which returns daily

QUO'TIENT (Lat quoties *how often*), in Arithmetic is the result of the operation of division and may be either a magnitude of any denomination or an abstract number When a magnitude of any kind is proposed to be divided into any number of parts and the divisor is consequently an abstract number the quotient is of the same kind with the dividend or quantity proposed to be divided, but when the dividend and divisor are both things of the same denomination or both magnitudes of any kind the quotient is an abstract number, and is the ratio of the one magnitude to the other

QUO WARRANTO In Law a writ filed in the Court of King's Bench by the attorney general or an individual in his name calling upon the person informed [illegible] holds any office franchise [illegible] on a writ of quo warranto presenting many difficulties, it has been superseded in modern times by what is termed an information in the nature of a quo warranto

R.

R One of those letters belonging to the series called liquids or semivowels It was called the *littera canina* by the Latins, from some fancied resemblance it bears in sound to the snarling of a dog At the commencement of English words derived from the Greek through the medium of the Latin *r* is usually followed by *h*, to represent the force of *ρ* as in *rhetoric rhapsody*, and the same observation applies to this letter when it occurs in the middle of an English word derived from a Greek compound as in *diarrhœa* from *διὰ* and *ῥέω* This letter is susceptible of numerous interchanges more especially in Latin, for a complete list of which see the *Penny Cyclopedia* As an abbreviation R among ourselves stands for *rex* or *regina*, and in ancient times for Rome, R P for *respublica* &c In medicinal prescriptions, R stands for *recipe* or *take*

RA'BBI A Hebrew term for doctor or teacher, the termination being properly the first pronoun possessive This word, which is frequently found in the New Testament, is in use at the present day the rabbis being the [illegible] and more particularly of the [illegible] later doctors *See* TALMUD

RA'BDOMANCY *See* RHABDOMANCY

RACA An ancient Syriac word signifying vanity or folly, and pronounced by the Jews with certain gestures of indignation Our Saviour, in using the word (Matt v 22), intimates that whoever should apply this word to his neighbour, should be condemned by the council of the sanhedrim

RACE'ME (Lat racemus, *a bunch of grapes*) In Botany, a form of inflorescence, in which the flowers are stalked along a common unbranched axis, as in the hyacinth

RACE'MIC ACID (Lat racemus, *a bunch of grapes*) An acid found, together with the tartaric acid, in the tartar obtained from certain vineyards on the Rhine It is the *paratartaric acid* of Berzelius It is less soluble in water than tartaric acid, and differs in the form of its crystals and in its salts yet it appears to be *isomeric*, and to have the same equivalent with the tartaric acid

RACHI'LLA (Gr *ῥαχις, a spine*) A branch of inflorescence, the zigzag centre upon which the florets are arranged in the spikelets of grasses

RA'CHIS (Gr *ῥαχις*) A branch which proceeds in nearly [illegible] the apex of the inflorescence [illegible] to the petioles of the leaves of ferns

RACHIS A term applied by Illiger and other zoologists to the vertebral column of mammals and birds

RACHI'TIS (Gr *ῥαχις, the spine* the part principally affected) The rickets A disease generally confined to childhood known by a large head, protruded breast bone flattened ribs, tumid belly, emaciated limbs, and great general debility, the bones in general, and especially the spine, are variously distorted and deficient in bony matter the system occasionally rallies from this state as growth advances but there is more or less deformity left Tonics cold bathing, regular and proper [illegible] particular bones are inclined to bend attempts must be made to throw the weight off them This disease is frequently symptomatic of a scrofulous state of the glands and viscera, the stomach and bowels are always greatly deranged, and as there appears to be a deficiency of the hardening matter of the bones various salts of lime, and even phosphate of lime have been prescribed the only apparent use of some of these remedies is to render the gastric juice less acrid and acid

RACK (Sax wrecan *to strain torment*, &c, evidently of the same origin as the Germ rachen Ang *to wreak*) An instrument of torture formerly used in England According to Coke (who, however, merely reports the story on traditional authority) the rack was first introduced into the Tower by the Duke of Exeter, constable of the Tower in 1447, and thence called "the Duke of Exeter's daughter" (3 *Inst* p 34) Stowe, in his Chronicle says that the duke's daughter herself invented it The earliest mention of the use of the 'rack or brake' is by Holinshed under the year 1467 But it first became common in the reign of Henry VIII Under that prince, the remaining Tudors, James I, and Charles I down to 1640 the rack was a common implement of torture for prisoners confined in the Tower, and inflicted by the warrant of the council or under the sign manual The rack consisted of an oblong frame of wood, composed of four beams a little raised above the ground, the sufferer was fastened by the hands and feet to the corners where two cross beams joined the longer ones, sometimes by small cords attached to each finger and toe and the cords were twisted by means of rollers so as to raise him from the ground, and stretch his body with extreme violence dislocating the limbs and, according to the Jesuit writers, who have left the most vivid representations of the sufferings of their companions under the state persecution of Elizabeth, sometimes extending the sufferer more than a palm beyond his usual stature'" (Jenner *Societas Europæa*, p 12, see also *Jardine's Reading on the Use of Torture in England* 1837) The Roman *equuleus* is often translated rack by English writers, but whether the equuleus was something similar to the English engine, or a wooden *horse* (as the derivation of the word implies), or, in short, what was its form and description antiquaries have not been able to discover (See among other authorities the learned treatise of Magius, *De Equuleo*)

RACK A railed convenience formed above the manger in a stable for the reception of the hay It should be constructed with openings at the bottom for the seed or dust to pass through

RACK In Machinery, a rectilinear sliding piece, having teeth cut on its edge so that they may work with those of a wheel or pinion which drives or follows the rack The rack may be regarded as a toothed wheel whose radius is infinite

RACK RENT *See* RENT

RACO'VIANS In Eccl History the Unitarians of Poland are sometimes [illegible] from Racow a small city of that country, where [illegible] erected a public seminary for their church in 1602 Here the "Racovian Catechism" originally composed by Socinus, and revised by [illegible] followers, was published (Mosheim, *Eccl Hist* cent 16 sec 3)

RA'DIANT In Geometry, a straight line proceeding from a given point, or fixed pole about which it is conceived to revolve When several radiants forming a system are constrained to revolve in such a manner that all the intersections excepting one are carried along given

straight lines or curves called *directrices*, then the remaining intersection traces a curve whose equation is of an order which is a certain determinate function of the orders of the several directrices Thus, if the intersections but one are carried along straight lines, the remaining one describes a conic section The theory of the description of lines of the second order by the intersection of radiants is given by Newton in the *Principia*, and the subject is treated more generally by Maclaurin in his *Geometria Organica*, and by some recent writers in the *Annales des Mathematiques* See also *Leslie's Geometry of Curve Lines*, Carnot, *Essai sur la Théorie des Transversales* &c

RA'DIANT HEAT When a hot body is suspended in the air, a quantity of heat is emitted in all directions by its surface, passing off in right lines like radii drawn from the centre to the circumference of a circle, these rays pass freely through the air without affecting its temperature, when they impinge upon surrounding bodies they are either *reflected*, *absorbed*, or *transmitted* The quantity of these rays, or of *radiant heat* which is thus emitted, is greatly dependent upon the nature of the heated surface, it is smallest from polished metallic surfaces, and greatest from rough and unmetallic surfaces The radiating power, for instance of polished silver heated up to 212°, being = 1 that of a surface of writing paper is about = P Whether colour has or has not any effect upon this escape of heat from surfaces, is a doubtful question

That this radiant heat is susceptible of *reflection* may be shown by holding a piece of polished tin plate opposite a fire in such a position as admits the reflection of the flame to be seen in it, when an impression of heat is at the same time perceived upon the face, if the surface of the tin plate be roughened or covered with paper scarcely any heat is then thrown off, but the plate itself becomes hot in consequence of the *absorption* of the rays This terrestrial radiant heat especially when it emanates from surfaces which are not luminous as from a flask of hot water for instance is to a great extent arrested in its progress by a plate of transparent glass in which respect it appears to be unlike *solar* heat which passes freely through all transparent media but there are some substances which do not thus impede its progress, among them a transparent plate of rock-salt is most remarkable the rays proceeding through it with little interruption, such substances therefore have been termed *thermophanous* bodies (See Melloni, *Annales de Chim et Phys* vol liii)

RA'DIARIES *Radiaria*, or *Radiata* (Lat radius) The name given by Cuvier to the lowest organized of the primary divisions of the animal kingdom because certain of the animals therein included have a radiated form of a part or the whole of their body See ACRITA, NEMATONEURA ZOOPHYTA

RADIATING POINT In Optics, any point from which rays of light proceed

RADIA'TION (Lat radius *a ray*) In Physics and Meteorology the emission of rays of light or heat from a luminous or heated body

The theory of the radiation and conduction of heat which long remained one of the most obscure parts of physical inquiry, has been reduced by the successive labours of Prevost, Leslie, Fourier, Biot Laplace Poisson Melloni, Forbes, and others to a purely mathematical form, and thereby placed in the same rank with physical optics, with which, indeed it has many principles in common

The general laws of the radiation of heat which have been established by experiment are the following —1 Like all other emanations, its intensity, in a vacuum varies in the ratio of the inverse square of the distance from the radiating point In air and the gases the decrease is a little faster in consequence of a partial absorption 2 The amount of radiation, or the rate at which a body parts with its heat, is proportional to the excess of the temperature of the body above that of the medium in which it is placed This principle was assumed by Newton, and it follows from it that if the times of cooling be taken in an arithmetical progression the heat will decrease in a geometrical progression The principle, however is found by experiment to hold good only within a certain range of temperature, not exceeding 60° of Fahrenheit At the higher temperatures Dulong and Petit found the rate of cooling to be more rapid than in the ratio stated 3 All bodies placed in an enclosed space assume in time the temperature of the enclosure 4 Heat is emitted from every point of the surface of a hot body in all directions, and the intensity of the heating ray is as the sine of the angle which it makes with the surface This result, which is by no means obvious was discovered by Leslie, and its physical cause is, that radiation takes place not from the surface alone, but from certain [illegible] a certain minute but sensible depth within [illegible] for different surfaces 5 The [illegible] varies with the nature of the radiating body and the state of its surface with regard to polish, colour, source of heat &c It is greatest for rough and dark surfaces, and least for bright surfaces of polished metal

The velocity with which radiated heat is propagated through space is entirely unknown It is certain, however, that it is very great, and probably not inferior to that of light.

The doctrine of the radiation of heat was first stated in a precise and satisfactory manner by Prevost of Geneva, about 1790 His fundamental principle being that all bodies are [illegible] heat with one another, it is [illegible] *exchanges* As this emission of heat cannot be attributed to the body which receives it, but for the same radiating body and the same state of surface depends only on the temperature of the body, we are led to suppose that radiation takes place with greater or less [illegible] at all temperatures that it is reciprocal between distant bodies, and that it subsists when the temperatures are equal, though in this case no alteration of temperature takes place By a close attention to the phenomena, we are also led to infer that the faculty of the emission (and also of the absorption) of heat belongs to *all* the molecules of a body, and consequently that radiation takes place not only at the surfaces, but also in the interior of solids and liquids, in the same manner as it takes place in air, or differing only in consequence of its more rapid absorption Fourier and Laplace were thus led to view the constituent molecules of all bodies as so many foci of radiating heat This heat is radiated by every molecule in every direction and is propagated through the pores or void spaces of ponderable matter until it is entirely absorbed by the molecules which it encounters In solids and liquids the absorption takes place at very small distances, in air and the gases at very great distances The mathematical theory of heat is founded on this hypothesis of molecular radiation

Solar and Terrestrial Radiation —The measure of heat received from the sun, and of that which is constantly escaping from the earth into the regions of space, are among the most important elements of meteorology If the earth were not surrounded with the atmosphere the quantity of solar light received at any time on a given portion of its surface would be proportional to the inclination of the ray to the surface or to the cosine of the sun's zenith distance but owing to the modifying effects of the atmosphere it would appear from the results of experiments that so far from this law holding good the force of the sun's direct radiation rather increases with the latitude Professor Daniell (*Meteorological Essays*, p 228) suggests that as the [illegible] of the air has been proved to be in proportion to its elasticity it is reasonable to suppose that the difficulty with which heat passes through the atmosphere is in the same ratio The proportion of solar heat absorbed in traversing the atmosphere vertically has been estimated by Leslie and Pouillet at 25 parts in 100, by Kamptz at 32, and by Prof Forbes at 50

The force of solar radiation is measured by the excess of the temperature which a body assumes when exposed to the direct action of the sun's rays above that which it would have in the shade This excess may be roughly measured by two common thermometers one placed in the shade and the other exposed to the sun and having its bulb covered to prevent reflexion The most accurate measurement is however, given by the *actinometer*, an instrument invented by Sir J Herschel, in 1824 for the dynamical measure of solar radiation A description of this valuable instrument and full directions for the method of using it are given in the *Report of the President and Council of the Royal Society on the Objects of Scientific Inquiry in Physics and Meteorology* 1840

From certain experiments made by Pouillet at Paris, he inferred that the whole amount of solar heat annually radiated to the earth is equal to that which would suffice to melt a stratum of ice about 14 mètres or 46 feet thick encrusting the whole earth (*Elémens de Physique et de Météorologie*) but in a subsequent memoir (*Sur la Chaleur Solaire*) he estimated the same quantity at 31 mètres or 102 feet

The measure of terrestrial radiation is of equal importance with that of solar radiation, but no perfect instrument has yet been contrived for its determination The best means consist in the daily register of the minimum temperature shown by a register thermometer, the bulb of which is placed in the focus of a parabolic metallic mirror pointed towards the clear aspect of the sky, and defended from currents It may be supposed that the same atmospheric causes which obstruct the passage of radiant heat from the sun oppose also its transmission from the earth into space

From the theory of terrestrial radiation, a curious deduction was made by Fourier, with regard to the temperature of the region of space through which the earth moves in its orbital revolution On computing the temperature which it is necessary [illegible] planetary spaces to possess in order that [illegible] state of the earth's surface may be such as is actually observed,

[illegible] Svanberg arrived at the same conclusion by a different process but others have given very different estimates Thus Poisson makes it −13° cent or +8½° Fahr , and Pouillet supposes it to be below −115° cent or −175° Fahr (See *Leslie's Experimental Inquiry into the Nature and Propagation of Heat*, 1804 , Prevost, *Essai sur la Calorique Rayonnante*, 1809, Fourier, *Theorie Analytique de la Chaleur*, 1822 Poisson *Memoires de l'Academie* 1835, *Kelland's Inquiry into the Results of the British Association* for 1832, 1836, and 1840)

RA'DICAL (Lat radix, *a root*), in Chemistry, is a term occasionally used as synonymous with *base* thus sulphur and phosphorus are the *radicals* of the sulphuric and phosphoric acids The term *compound radical* is applied to certain organic combinations, in this case compounds of hydrogen, carbon, or nitrogen constitute the principal radicals

RA'DICAL BASS In Music, the same as *fundamental bass*, which see

RA'DICAL REFORMERS In Politics, that political party in England which desires to have the abuses which from lapse of time or any other cause may have crept into the government, completely *rooted out* (as the origin of the term implies), all our institutions remodelled and, [illegible] of the democratic spirit infused into [illegible]

RA'DICAL SIGN In Algebra, the symbol $\surd$, denoting the extraction of a root It is a modification of the letter *r*, the initial letter of *radix* or root To distinguish the particular root which is to be extracted a number is prefixed to the symbol, thus $\sqrt[2]{}$ $\sqrt[3]{}$ $\sqrt[4]{}$ &c denote respectively the square root cube root fourth root, &c , but as the square root or second root was the first considered, the number is usually omitted, and merely the symbol $\surd$ written Fractional exponents are frequently used instead of the radical sign A *radical quantity* is a quantity to which the radical sign is prefixed

RA'DICLE In Botany that portion of an embryo which eventually becomes the descending axis or root It is the lowest of the two opposite cones of which an embryo plant consists

RA'DIOLITES A genus of fossil shells the inferior valve of which is in the shape of a reversed cone the superior valve convex

RA'DIUS (Lat *a ray*) In Geometry and Trigonometry the semidiameter of a circle or a straight line drawn from the centre to the circumference In the trigonometrical tables the sines cosines tangents &c of circular arcs are expressed in parts of the radius, which is usually assumed equal to 1 The radius is equal to the side of the inscribed hexagon , or it is equal to an arc of 57 29578°, or 57° 17′ 44 81″ the semicircumferences, or 180°, in parts of the radius being 3 141 927

RADIUS In Osteology, a bone of the forearm so called from its supposed resemblance to the spoke of a wheel Its upper end which is the smallest is formed into a round hollowed head and is articulated with the small head at the side of the pulley of the humerus whilst the rounded border of it next the ulna is articulated with the lesser sigmoid cavity of that bone, its lower extremity is articulated with the bones of the wrist

RADIUS OF CURVATURE In the higher Geometry the radius of curvature at any point of a curve line is the radius of the circle which *osculates* the curve at the given point (*see* OSCULATION), or has the same curvature as the curve at that point The curvature of a circle being uniform [illegible] its radius of the osculating circle is [illegible] curvature of any curve must at different points The general expression for the radius of curvature, *r*, of any plane curve defined by the equation $y = f(x)$, is

$$r = \frac{(dx^2 + dy^2)^{\frac{3}{2}}}{dx\,d^2y}$$

(*See* EVOLUTE) From this expression the value of *r* is readily found when the equation of the curve is given, it is a property of lines of the second order, that the radius of curvature is equal to the cube of the normal divided by the square of the semiparameter

The expression for the radius of curvature of a surface represented by the equation $z = f(x\,y)$ at any point whose co ordinates are *x*, *y*, *z*, is as follows — Make

$$\frac{dy}{dx} = m, \quad \frac{dz}{dx} = p, \quad \frac{dz}{dy} = q,$$

$$\frac{d^2z}{dx^2} = r, \quad \frac{d^2z}{dx\,dy} = s, \quad \frac{d^2z}{dy^2} = t,$$

and let R denote the radius of curvature of a normal section of the surface, then

$$R = \frac{\sqrt{1 + p^2 + q^2}\left((1 + p^2) + 2\,p\,q\,m + (1 + q^2)\,m^2\right)}{r + 2\,s\,m + t\,m^2}$$

RA'DIUS VE'CTOR In Astronomy, is the straight line drawn from the centre of force to the point of the orbit, where the body is supposed to be A body projected in space, and subjected to the action of a centripetal force, as gravity, which varies in the inverse ratio of the distance, describes a conic section which has one of its foci at the centre of force In the parabola, let *p* denote the parameter , and in the ellipse and hyperbola, let *a* denote the semitransverse axis, and *e* the eccentricity , also let *r* denote the radius vector, and *v* the angle which it makes with the transverse axis , then the expression for the radius vector in the parabola, the ellipse, and the hyperbola respectively, is

$$r = \frac{\frac{1}{2}p}{1 + \cos v}, \quad r = \frac{a^2 - e^2}{a + e\cos v}, \quad r = \frac{e^2 - a^2}{a + e\cos v}$$

These expressions are called the *polar equations* of the three curves

RA'DIX, or ROOT *See* ROOT

RAFT A species of float formed of various logs or planks, fastened together side by side, so as to be conveyed from one point to another This means of conveying timber [illegible] in many places [illegible] on the Rhine, o[illegible] near its source down to the navigable stations on its banks, may be interesting to the reader —

A little below Andernach the little village of Namedy appears on the left bank, under a wooded mountain The Rhine here forms a bay where the pilots are accustomed to unite together the small rafts of timber floated down the tributary rivers into the Rhine, and to construct enormous floats, which are navigated to Dordrecht, and sold These machines have the appearance of a floating village, composed of 12 or 15 little wooden huts, on a platform of oak and deal timber They are frequently 800 or 900 feet in length, and 60 or 70 in breadth The rowers and workmen sometimes amount to 700 or 800, superintended by pilots and a proprietor, whose habitation is superior in size and elegance to the rest The raft is composed of several layers of trees, placed one on the other and bound together a large raft draws not less than 6 or 7 feet of water Several smaller ones are attached to it by way of protection, besides a string of boats loaded with anchors and cables, and used for the purpose of sounding the river a[illegible] ng on shore The domestic economy of an East Indiaman or an English man of war is hardly more comp[illegible] Poultry pigs and other animals are to be found on board , and several butchers are attached to the suite A well-supplied boiler is at work night and day in the kitchen , the dinner hour is announced by a basket stuck on a pole, at which sign l the pilot gives the word of command and the workmen run from all quarters to receive their mess The consumption of provisions in the voyage to Holland is almost incredible sometimes amounting to 40 000 or 50 000 pounds of bread , 18 000 or 20 000 of fresh besides a quantity of salted meat, and butter, vegetables &c in proportion The expenses are so great, that a capital of three or four hundred florins is considered necessary to undertake a raft Their navigation is a matter of considerable skill owing to the abrupt windings the rocks and shallows of the river , and some years ago the secret was thought to be monopolised by a boatman of Rudesheim and his sons (*Autumn on the Rhine*)

RAILER (Sax paſtep) In Architecture, an inclined piece of timber in the side of a roof, in the provinces called a *spar* It is of various sorts, as will be seen under the art ROOF, which see

RAGSTONE A dark grey siliceous sandstone

RAIL In Architecture the horizontal part in any piece of framing or panelling Thus in a door the horizontal pieces between which the panels lie are called *rails* whilst the vertical pieces between which the panels are inserted are called *styles*

RAIL, or WATER-RAIL (*Rallus aquaticus* of Lin) A native species of a genus of Macrodactyle or long-toed waders destitute of alar spines or a frontal shield

RAILING A fence or barrier made of posts and rails The most ordinary fence of this description in the country is formed of wooden posts let into the soil, so as to stand upright to which are nailed or morticed horizontal wooden rails, one above another, at such a distance as to prevent domestic animals from penetrating through them In some cases one horizontal rail is fixed to the posts near th[illegible] another near the top of the post [illegible] them is rendered impervious to [illegible] upright rails nailed to the top and bottom horizontal rail Iron railings are generally formed in this manner

RAILROADS or RAILWAYS Roads constructed of tracks of iron called *rails*, on which the wheels of carriages roll, and to which they are confined by ledges or *flanges* raised either on the rail or on the tires of the wheels

Theory of Railways — The object to be attained by the

construction of roads of every kind is to effect the transport of loads by the least possible expenditure of tractive force, and one road is better or worse than another, *ceteris paribus*, according as the same moving power is capable of drawing upon it a greater or less amount of load Since the moving power whatever it may be, is expended in overcoming the resistance which the carriages on which the load is borne offers, this object can only be attainable by the adoption of such expedients as will permanently diminish the amount of that resistance The causes of resistance to the motion of a carriage along the road are the following —

1 *Roughness or Unevenness of the Road Surface* — All asperities formed by stones or other hard substances projecting above the general surface of the road produce a resistance to the moving power since, when the wheels encounter them and pass over them the weight of the load, resting as it does upon the wheels, must be raised through a height corresponding with such projections, and when such projections are frequent or continued, this expenditure of the moving power is also continued, and the same species of resistance is produced as if the moving power had *continually* to raise an equivalent weight In like manner if cavities or *ruts* occur on the road surface, the wheels sink into them, and the moving power is constantly expended in raising the load out of these cavities All roughness or unevenness of surface consisting of nothing more than a multitude of such projections and cavities more or less minute in magnitude, the same causes operate by such means in absorbing the moving power

2 *Softness of the Road* — However free the road surface may be from asperities or cavities if its substructure be of such a nature that it will yield to the pressure of the wheels a resistance will be produced to the moving power, the amount of which will be more or less according to the degree in which this softness or yielding quality exists The wheels sinking into a cavity produced in the soft surface of the road by their pressure the moving power is affected in nearly the same manner as if it had to draw the load out of the cavity which it makes for itself, and a corresponding amount of resistance is the consequence

3 *Acclivity of the Road Surface* — When the surface of the road is not perfectly horizontal but forms an inclined plane up which the load is to be drawn a resistance will be produced by the gravity or weight of the load which will be proportional to the steepness of the acclivity thus if the road surface rise in the direction of the motion one perpendicular foot in 50 feet of distance then as much power will be absorbed in going over every [illegible] as would lift the entire load through one foot of perpendicular height

This cause of resistance differs from the former *causes* In both the former the resistance to the moving power would be equally produced in whichever direction the load is drawn, but the effect of an acclivity is to increase the resistance only in the ascending direction In the descending direction on the other hand it will have the effect of assisting the moving power by causing the gravity of the load to co operate with that power in overcoming the resistance In all roads therefore on which [illegible] in both directions the advantage derived from descending acclivities is to be placed against the power expended in ascending them The principles on which the question of the best possible arrangement of the acclivities on roads of different kinds depends are of great importance not only with reference to the working of roads but also in laying them out or originally constructing them, and there is none about which there has been, and still is a greater difference of opinion among engineers and men of practical science

Such, therefore being the sources of resistance the qualities which must be imparted to a road, to diminish as much as possible the resistance to the moving power, must be the following —

1st, Smoothness and evenness of the road surface

2d, Hardness and durability of the road structure

3d Such an arrangement of the acclivities that the effect of the gravity of the load shall [illegible] the least amount of resistance or the [illegible] the greatest amount of advantage to the moving power

In ordinary roads formed of gravel, broken stone, or pavement the entire surface is [illegible] manner, so that every part of it [illegible] motion of the wheels, and as the tractive power commonly used is the strength of horses the structure of the road must also be more or less made with a view to their qualities Thus it might happen that the great degree of smoothness and hardness which would contribute most effectually to diminish the resistance of the carriages would be incompatible with the continued health and soundness of the horses working on it The paved streets of a town, by reason of their hardness, produce less resistance to the motion of [illegible] gravel roads of the country, but [illegible] more injurious to the horses which work upon them

This difficulty is met by [illegible] only of the road to the [illegible], and imparting to these [illegible] to the peculiar action of the feet and to the circumstances of the structure and health of the animal

This has been accomplished by constructing upon the roadway parallel tracks with a width corresponding to the distance between the wheels, and between these tracks forming a path suitable to the horses

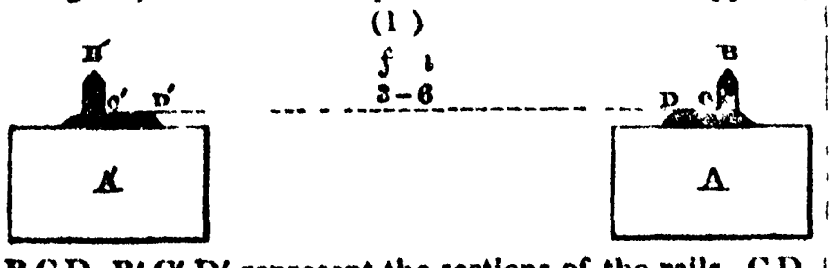
Another advantage attending such an arrangement is, that the extent of the road surface adapted to the action of the wheels is extremely limited, and a greater amount of expense can be incurred in giving it the necessary [illegible] as in common roads, to the whole extent of the road surface

Such are the general principles which have led through a succession of stages of progressive improvement, to that most perfect of all the instruments of transport which human invention has yet devised — the modern railway Such a road consists of two parallel tracks of iron firmly maintained in their places the upper surfaces of which are rendered in a very high degree smooth and level a strength being given to them which renders them capable of sustaining enormous loads without being deranged in their structure or position The carriages are maintained upon such tracks or ledges by means of a projecting flange which is constructed upon the inside of the tires of the carriage wheels and which by pressing on the inside of either rail prevents the carriages from escaping from the rails [illegible] roads will be rendered [illegible] by a brief view of their history from their first invention to their present state

History of Railways — About the middle of the 17th century the transport of coals from the pits to the harbour was effected in the coal districts of Northumberland and Durham by laying down parallel tracks of timber with a horse path between them the wheels being confined upon the beams or rails of timber by ledges or flanges projecting from the inside of the tire of the wheels These timber rails were constructed in pieces of about 6 feet long with a section of about 4 inches square they were supported on pieces of timber called *sleepers* laid at right angles to them transversely on the road These sleepers were laid at about two feet apart, so that each pair of parallel rails was supported by three sleepers besides giving support to the rails these sleepers also had the effect of [illegible] the rails in gauge or in keeping them at [illegible] under The rails were fastened to the sleepers by pins driven quite through the rails and half way through the sleepers to preserve the uniformity of the upper surface of the rail, these wooden pins were planed off at the top

The necessity of giving room for the flanges of the wheels running as they did below the surface of the rail, and the small depth between the surface of the rail and the sleeper rendered it impossible to protect the sleepers effectually from the action of the horses feet by any covering of gravel or other material The sleepers were consequently subject to be worn and destroyed The rails also being worn by the action of the wheels still more rapidly than the sleepers required to be frequently replaced and each new rail being pinned down to the same sleeper the ends of the sleepers were gradually perforated by so many holes that the sleepers were weakened and required to be soon replaced These defects were remedied by the adoption of the double timber railway, which consisted in laying upon the surface of the timber rails above described additional rails of timber of equal scantling, attached to the lower rails by wooden pins, passing quite through the upper and half through the lower rails in the same manner as the lower rails themselves were attached to the transverse sleepers This change was attended with many advantages Besides the increased strength given to the rails by the double timbers, the depth of the sleepers below the upper surface of the superior rail allowed the sleepers to be protected from the action of the horses feet by covering them with broken stones, gravel or other road materials The structure of rails and sleepers also being stronger and more weighty, and held down by the road material with which the sleepers were covered allowed a packing or ballasting to be driven under the rails, so as to give greater stability and firmness to the road Another advantage obtained by this arrangement was, that when the superior rails were worn by the action of the wheels, they could [illegible] the inferior [illegible] at which they were attached by pins to the inferior rails, could be varied at pleasure, the pin holes made in the inferior rails would not come in the same place, or near each other, so as injuriously to weaken the latter

The next improvement consisted in the addition of a plate or bar of iron, about two inches broad and half an inch thick, laid along the upper surface of the superior rail and attached to it by nails or iron pins countersunk into it The wheels of the carriages ran upon this iron rail, which formed a more durable surface than that of the wood In the United States of America, railways of this construction are still in very general use They are recommended in that country by the abundance and cheapness of timber, and the comparative high cost of iron Such a road is tolerably efficient where the traffic is light, and can therefore be resorted to in localities and circumstances in which an adequate return could not be obtained for the capital necessary for the construction of the more perfect modern railway In the construction of these timber railways in America many other improvements have been introduced more especially in the substructure of the road In laying out the roadway for the reception of the rails, two parallel trenches are cut along the line of way corresponding to the distance between the rails and transverse trenches at right angles to these are cut to receive the sleepers these trenches are respectively bottomed with a ballasting of broken stone, on which the rails and cross sleepers rest This basis answers the double purpose of a firm and durable support for the road and an effectual means of drainage The scantling of the timbers used for the rails is usually six inches in width by ten inches in depth they are attached to the sleepers, so as to be at once kept from springing from them and from altering their gauge by the following means —A notch is cut in the sleeper corresponding to the size and form of the rail and the rail, at the place where it is let into the sleeper is formed with a vertical surface on the outside and a levelled surface on the inside, increasing in width downwards When let into the notch of the sleeper, the levelled part of the rail is forced into the corresponding cavity of the notch by a wedge driven between the outside edge of the rail and the outer surface of the notch

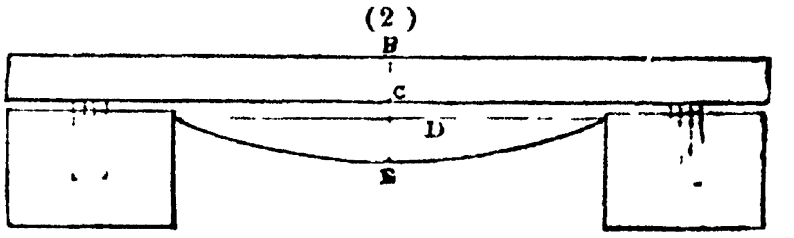


An expedient based upon the general principle of railways has been adopted but from what date we are not informed, in the streets of some of the Italian cities and more particularly in those of Milan Parallel tracks of hewn stone are laid down to receive the wheels of carriages and such a width is given to them as to be accommodated to any variations which are usual in the structure of carriages This width is also such that the wheels are not liable to run off these flagged paths by any irregularity in the course which the horse takes in drawing the carriage

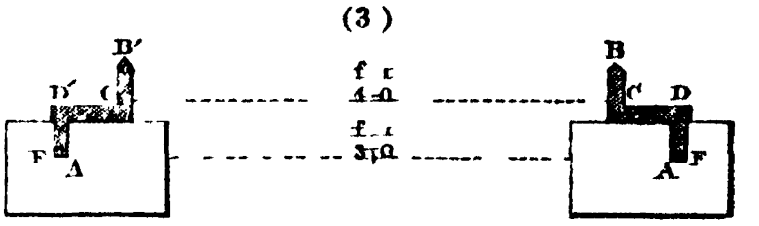
Great facility of draught is obtained by this expedient which has been of late years adopted with some improvement in England A flagged trackway of this kind was constructed some years ago, extending from the West India Docks along the Commercial Road towards the City of London, and a similar expedient was some time afterwards proposed to facilitate the application of steam power on common roads Stone trackways of this kind have been accordingly laid down on some parts of the high road between London and Birmingham This expedient has the advantage in one respect over railways, inasmuch as the carriages are not confined by flanges or any other expedient to the same paths on which the wheels move and consequently the same carriages which run upon them may also move on other parts of the road Thus, one carriage may pass another while both use the same line of stone rails, which cannot be effected when carriages are confined to the rails

In the progress of improvement, the timber railway above described was succeeded by the last iron plate railway or tramway which was for a long period used exclusively in the coal districts and in public works generally, and is still to a considerable extent adopted especially in the railways which are carried through the workings of mines and on which the product of the mine is conducted in waggons being pushed by men or drawn by horses to the foot of the shaft

The Plate Railway, or Tramway —About the year 1770 tramways of cast iron came into use in the collieries in the north of England These railways consisted of two rails of cast iron laid parallel to each other at a distance from three to three and a half feet asunder They were usually supported either on timber or stone bearings A cross vertical section of these as first used is represented at fig 1, where A A′ represents the timber supports,



(1)



B C D, B′ C′ D′ represent the sections of the rails, C D, C′ D′ represent the horizontal plates attached by nails or pins to the sleeper On this plate the wheel of the waggon rolled The ledges B C, B′ C′ rose perpendicularly from the outside edge C′ of each plate (1) These, by pressing on the outside of the wheels, prevented the waggon from escaping from the road They were subsequently placed on the *inside* of the horizontal plate, so as to act on the *inside* of the wheels

In order to give such rails strength in the vertical direction, to supersede the necessity of a continued support beneath them, they were afterwards cast with a ledge beneath them, projecting downwards from the outside edge of the horizontal plate A side view of such a rail is represented in fig 2, and a cross section of the rails in fig 3.

(2)

(3)

The upright ledges B C, B′C′ (fig 3) rising from the horizontal plates C D, C′D′, and coming within each wheel, kept the wheels on the rails, and the ledge D E, D′E′, projecting downwards, and increasing in depth towards the middle of the distance between the supports as represented in fig 2 gave the necessary strength to the rail The outlines of this ledge formed each a curve, so that the strength at different points between the supports might be proportioned to the mechanical effect of the vertical pressure The flanges B C B′C′ are the same height throughout the whole length of the rail

These tramways were for a long period constructed exclusively of cast iron, but when improved methods of rolling malleable iron were contrived they were formed by rolling and for nearly twenty years back they have been constructed exclusively of wrought iron

Edge Railway —Within twenty years after the first introduction of tramways of iron, the form of rail called the *edge rail* was brought into use This rail is constructed in the form of a bar of iron whose width is considerably less than its depth placed as the name implies, with its narrow edge presented upwards Owing to its depth being much greater than its width, its power in proportion to its weight to resist vertical pressure is very considerable The wheels were retained on rails of this description by flanges projecting from the inside of their tires These flanges at the point where the wheels rest on the rails descend below the rails, and the wheel cannot pass off the rail towards the outside, unless the flange rolls over the rail

For a long period after their first adoption, edge railways were confined to the mining districts, and more particularly to the collieries where they were used for the transport of the products of the mines to the places of shipment, but this species of road acquired vastly increased importance when passengers and goods came to be transported on it by locomotive engines, which took place between Liverpool and Manchester in the year 1830 Since that time the construction of railways adapted for general traffic at a speed which would have been formerly thought impossible, has been carried to a great extent in Europe, and in the United States

Subjoined is a table showing the extent of railway in operation and in progress in 1851 together with the capital already invested or to be invested in them, in different countries throughout the world.

	Railways open	Railways in progress	Capital invested in Railways	Capital to be invested in Railways.
	Miles	*Miles*	£	£
United Kingdom	7,000	4,500	250,000,000	100,000,000
Germany, Austria and Holland	5,300	800	66,775,000	10,000,000
France	1,800	1,200	48,780,000	15,350,000
Belgium	500	200	8,000,000	3,600,000
Russia	200	470	5,000,000	7,500,000
Italy	170	470	3,000,000	8,500,000
United States	10,000	200	67,000,000	2,000,000
Total	24,970	7,840	446,555,000	146,750,000

Within the limits of the present article, it would not be possible to trace, in detail, the successive improvements by which the present methods of laying out and constructing railways for the safe transport of passengers by steam power have been attained. When

the Liverpool and Manchester line was first brought into operation, little, comparatively, was understood of the capabilities of such means of intercommunication, and that line may be regarded as an experimental railway, the results of which have supplied the data on which others have since been constructed and worked The form, strength, and weight of the rails, — the mode of fixing them on the road, — the weight, power, and proportions of the engines, — the form strength, and weight of the carriages and waggons, — the magnitudes of the trains, and the speed of transport, have all been subject to change from year to year, and almost from month to month, since the opening of that line in 1830 to the present time We shall not therefore attempt to trace these improvements, but shall briefly explain the formation and construction of railways, according to the methods and principles at present [illegible]

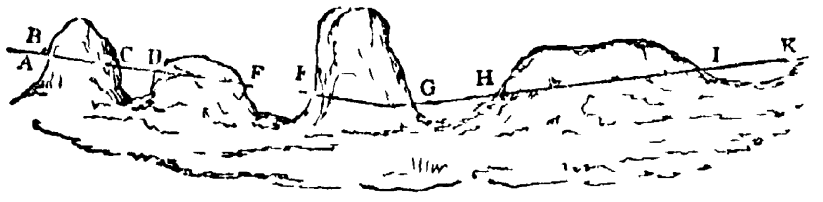
Of the Formation and [illegible] Railways — Whatever be the moving power to be used for the transport of loads upon a railway, its force must be proportioned to the average resistance of such loads and it must be capable of varying its energy to the same extent as that resistance is subject to variation The great perfection which has been attained in the construction of the rails, and in the methods of fixing them in their position upon the road is such that the resistance offered to the tractive power by loads moved on a straight and level railway may be regarded as practically uniform so that the moving power by which a load is transported at a given speed on a straight and level line of railway is subject to a resistance as unvaried and as uniform as any to which moving powers are usually submitted in any of the processes of art, but as the amount of resistance to the tractive powers upon a straight and level railway is diminished by the perfection thus attained in the construction of the road so, in the same degree is any resistance produced by a departure from a perfect level more sensibly felt Thus, if the resistance to the moving power on a straight and level railway, by a load moved at a given speed be equal to the 250th part of the load an acclivity which would rise at the rate of one foot in 250 or nearly at the rate of 20 perpendicular feet in a mile, would produce a resistance to the moving power, by reason of the ascent alone, equal to a 250th part of the load and therefore equal to the resistance which the moving power would sustain on a level line It follows therefore, that, under such circumstances in drawing a load up such an acclivity the moving power would have to overcome twice the resistance opposed to it on a level, for the same causes which produce on a level a resistance amounting to the 250th part of the load equally produce this resistance in ascending the acclivity in addition to which there would be an equal amount of resistance due to the ascent If therefore, under such circumstances the moving power were required to draw the load up the acclivity at the same speed as that at which it drew it on the level, the machine exerting that power must be endowed with properties in virtue of which it is capable of varying its [illegible] without injury to its structure, in the proportion [illegible]

Whether such limits of variation in the resistance or in the moving power as are here referred to for the sake of illustration be those which are requisite in practice or not it is apparent that [illegible] limits must exist to the variation in the resistance whatever these limits may be, corresponding limits must be imposed on the acclivities which have been called, which are [illegible] on which such moving power [illegible] the moving power be incapable [illegible] a greater proportion than two [illegible] gradients must not create more than twice the resistance on the level parts of the line, and, if the resistance on the level parts of the line be equal to the 250th part of the load [illegible] is required to be maintained in ascending the acclivities as on the level

When a carriage of any kind changes the direction of its motion, it does [illegible] by suddenly passing from motion [illegible] to motion in the other Many mechanical effects, which will be sufficiently obvious, forbid this The change of direction is, on the other hand, effected gradually, by causing the carriage to move in a curve Now, in such a motion, it is evident that the wheels which traverse the outer part of the curve will in the same time move over a greater space than those which traverse the inner part, in fact, the inner and outer wheels move over arches of circles which have the same centre, the outer arch being longer than the inner If the wheels, therefore, be (as they always are) of the same magnitude, the outer wheel must revolve oftener on its axle in passing over the curve than the inner, but, besides this, the position assumed by the wheels in passing round a curve is different from that which they have when moving in a straight line If a four-wheel carriage move along a straight road, its axles will be at right angles to the direction of its motion, and therefore parallel to each other; but if it move in a curve, which it does in turning a corner, then its axles are no longer parallel, but each of them is directed to the centre of the curve which the carriage describes The mechanism by which this effect is provided for by four-wheel car[illegible] [illegible] is the perch or pivot on which the axle [illegible] is made to turn By this pivot the fore axle may be placed at any required angle with the axle of the hind wheels As the wheels of all such carriages revolve independently of each other, each upon its own axle, the wheels on the same axle may revolve at different speeds These two provisions, therefore, are brought into play [illegible] The outer [illegible] inner and the axles throw themselves out of parallelism, and take the directions of the radii of the curve

The peculiar structure of railway carriages excludes the possibility of either of these provisions for turning round a curve To maintain in security the carriages on the rails, it has been found necessary to fix the axles truly square with the carriages, and therefore to exclude the pivot or perch by which a common carriage is turned It has likewise been found necessary to key the wheels firmly upon the axle, so that the wheels and axle shall turn together instead of the axle being fixed, as in a common carriage, and the wheels turning upon it The mechanism of a railway carriage is therefore essentially adapted to rectilinear motion, and it contains no expedient by which it can move round a curve When such a carriage therefore, first encounters a curve its tendency is to proceed in the continuation of the straight line in which it has previously moved and which forms a tangent to the curve If this tendency were allowed to take effect the outer wheel would run off the rail on the outside of the curve and the inner wheel would come off the rail in the space between the rails This is prevented by the flange which projects from the tire of the outer wheel and which, at the point where that wheel rests upon the rail descends below the rail When the wheel makes an effort in virtue of the tendency to rectilinear motion, to pass off the rail the flange comes in contact with the inside of the rail and by pressing upon it, throws the carriage inwards, and this taking place with the fore wheels the direction of [illegible] and it is thrown more [illegible] This action of the flange is continued while the carriage is passing round the curve, and it is to it alone that the change of direction of the carriage is due

The tires of the wheels of railway carriages have usually a conical form given to them, becoming gradually smaller from the flange outwards, and, when a carriage rests straight upon the rails the distance between the flanges of the wheels being less than the distance between the rails, a small space is left between the flanges and the rails to allow some play to the flanges without letting them strike the rails When the carriage comes to a curve the flange of the outer wheel comes into contact with the outer rail, and the whole play of the flanges is given to the space between the flange of the inner wheel and the inner rail In consequence of the conical form of the tires of the wheels the outer wheels, in this case rest upon a thicker part of the cone than the inner, and the actual diameter on which they revolve is consequently greater than that on which the inner wheels revolve This effect has been generally regarded as an expedient sufficient to enable railway carriages to run round curves of a certain limited radius, but that this is an error may be easily shown, — if to a four-wheel carriage, wheels of unequal diameter be attached smaller wheels being put on the one side than on the other, and if such wheels were attached to their axles, so that the axles revolve with them and if at the same time the axles be fixed square with the carriage, *such a carriage will be found to be incapable of moving in a curve, notwithstanding the inequality of its wheels*

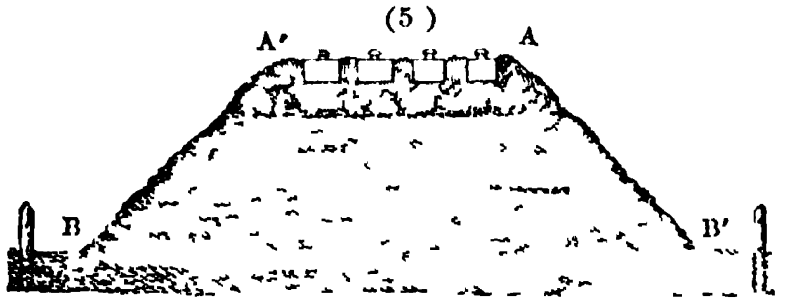


The pressure of the flange on the rail being, therefore, the only means of turning a railway carriage round a curve and such pressure being attended by friction, and therefore by increased resistance to the moving power, curves as well as acclivities are a cause of resistance, and this resistance will be great in proportion to the rapidity of the curve or the shortness of its radius But, independently of this effect of curves, a more serious objection to those whose radius is under a certain limit of magnitude arises from the liability of the carriages to run off, by the flange encountering any obstacle or inequality which would cause it to pass over the rails

The *section* of a railway is therefore limited by those circumstances [illegible] variation of the moving power, and the *plan* is, on the other hand, limited by the necessity of effecting every change of direction of the line by curves whose radius shall have such a magnitude as to exclude all danger of

the carriages running off the line In the laying out of a railway, therefore limitations of its section and plan [illegible] to be necessary to the formation of a railway, an artificial surface must generally be formed by raising some and lowering other parts of the country through which the railway is to pass The expedients by which this is accomplished are attended with more or less difficulty and expense, and the skill of the engineer is eminently required in the selection of such a course for a proposed line of railway as will be attended with the least expensive construction, due regard being had to the permanent expense of working and maintaining it

When a railway is proposed to be constructed between two points, which are called its *termini*, the engineer makes himself generally acquainted with the country between these termini, and selects that course for the line which, with least deviation from [illegible] the proposed termini, will afford the [illegible] the formation of the artificial surface [illegible] limited as it must be in respect to its acclivities, and to the curves by which its various changes of direction are effected This is first accomplished by an *eye survey* or general *reconnoissance* of the country An instrumental survey is afterwards made along the direction which has been selected for the line, and a nearly accurate profile of the country from terminus to terminus, in the proposed direction, is obtained This being accomplished and reduced to a drawing, as represented in fig 4, a line



(4)

A B C D E G H I K is drawn regulated by the degrees of inclination which have been decided to be the best practical limits of the acclivities This line will as represented in the figure, in some places as A B, C D, I F, G H I K, pass above and in others B C, D I F G H I below the natural surface of the ground It is therefore to be considered that, in the one case, the artificial surface of the line must be elevated above the natural surface, and that in the other case some expedient must be provided by which the artificial surface may pass at the requisite depth below the natural surface

The surface of a railway is raised *above* the natural surface of the ground by either of two expedients, — 1st by forming a mound of earth with sloping sides having the railway on its summit — this is called an *embankment* (fig 5), 2dly, by constructing a bridge by which

(5)

the railway can be conducted at the requisite elevation, above the natural surface of the ground in the same manner as a road is constructed over a river, — such a bridge is called a *viaduct* Such structures are formed either of masonry or of cast iron, but in countries such as the United States, where timber is abundant, cheap viaducts of carpentry [illegible]

The surface of a railway is reduced [illegible] the natural surface of the ground by either of two expedients, — 1st, by forming an excavation or artificial valley with [illegible] side along the line between the [illegible] — such an excavation is called a *cutting* (fig 6) 2dly

(6)

by undermining the ground and constructing a subterranean archway or vault of sufficient magnitude, the roof of which is usually lined with masonry, and along the bottom of which the railway is conducted,— such an archway is called a *tunnel*

In laying out a railway, the disposition of its cuttings and embankments must be kept in view In general, the material by which the embankments are formed is obtained from the cuttings, and, with a view to the saving of expense, the engineer so arranges his section that the quantity of stuff required for the formation of embankments shall be as nearly as possible equal to that supplied by the cuttings If there be an excess of stuff from the [illegible] then the stuff necessary for the formation of such embankment must be obtained from some excavation made near the embankment expressly for the stuff for the embankment This is [illegible]

The distance along which the stuff is carried from a cutting is carried before it is laid down to form the embankment is called *the lead*, and the quantity of labour necessary to form an embankment out of an adjacent cutting is determined by the number of cubic yards of stuff necessary to form the embankment multiplied by the average *lead*, or the mean distance to which such stuff has to be carried

Where a very [illegible] may happen that the [illegible] ing the embankment [illegible] greater than the [illegible] lead, and [illegible] are [illegible] in each individual case with reference to the price of land and labour

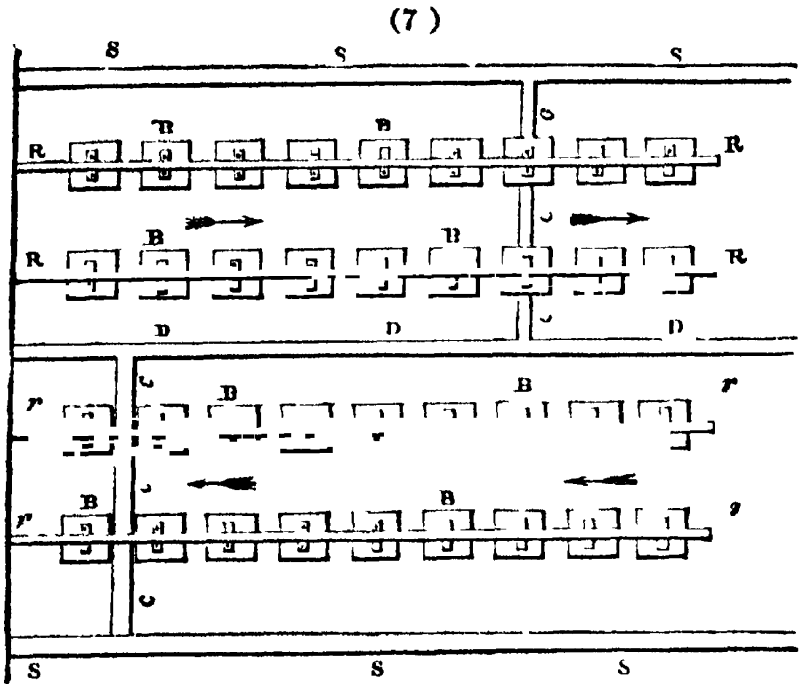
When the elevation above the natural surface of the ground at which the railway must be carried is so great as to render an embankment impracticable, or attended with a disproportionate expense, a viaduct is resorted to, and, on the other hand, when the excavation necessary to give an open cutting would be productive of objectionable expense then the railway is conducted under the ground through a tunnel

The slopes A B, A' B', fig 5, 6, forming the sides of embankments and cuttings depend on the nature of the soil or strata through which the cuttings are made, and of which the embankments are formed In general every material [illegible] will rest, all more steep [illegible] to [illegible] this angle is called, in mechanics the *angle of repose* In the strata through which railway cuttings are made, and from which embankments are usually formed, the slopes of the sides are rarely less than 1½ foot horizontal to 1 foot vertical, and they vary between that and 2 feet horizontal to 1 foot vertical [illegible] or gravelly [illegible] sufficient, but with certain descriptions of clay, such as that called the London clay, a more gradual slope must be allowed With such material, the slopes are constructed at 1¾ or 2 horizontal to 1 vertical, but in general it is better, even at increased expense of earthwork, to allow a sufficient slope in the commencement, and thereby avoid the continual expense attending *slips* as the gradual decadence of the sides of cuttings and embankments is called

The face of slopes both of cuttings and embankments, should be covered with soil and sown with grass seeds, so as to produce a turf which gives a further security against *slips* They may be also, especially the slopes of embankments, planted with shrubs, care being taken, however, not to obstruct the ventilation of the road

When the stratum through which a cutting is required to be made is rock or hard stratified chalk, it will stand with perpendicular sides, and, in such cases, cuttings of great depths may be made at a trifling sacrifice of land The Olive Mount cutting on the Liverpool and Manchester railway is, at the deepest parts, above 100 perpendicular feet from the natural level of the surface to the level of the rails, and cuttings of still greater depth and much greater extent, through stratified chalk, are executed on the Brighton railway, of which the sides are perpendicular

In most cases, however, where cuttings attain to these extraordinary depths, tunnels would be less expensive It sometimes happens that the material of the cutting is required for an adjacent embankment, and under such circumstances, if the sides of the cutting can be perpendicular, and the sacrifice of land small, it may be preferable to *tunnelling* The materials from the Olive Mount cutting above mentioned were required for the formation of the [illegible]



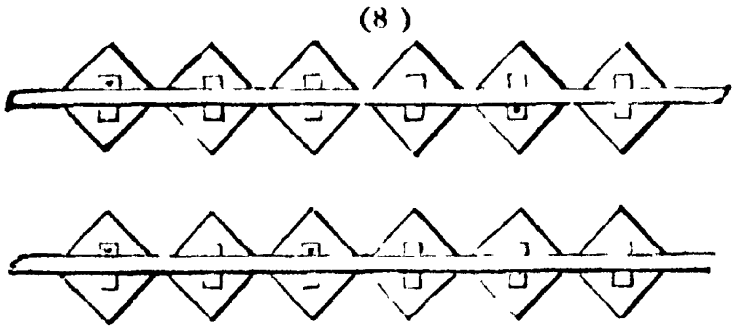
Drainage [illegible] the artificial surface of the road intended to receive the rails and their supports is called, should be properly drained This is effected by a centre drain, carried along the middle of the [illegible] and discharging the water [illegible] the sides or embankments The centre and cross drains are covered drains, formed either of brick or stone, or, more economically, of tiles made of a proper form for the purpose

Road Structure — The surface of the road being pre-

pared to receive the rails, the props or *chairs* which at fixed intervals form the support of the rails must next be laid down These are sustained on supports of either of two kinds —

1st, In cuttings, or on well-consolidated embankments, stone blocks are provided, roughly formed into a rectangular parallelopiped, the base of which is a square whose side is 2 feet, and the height of which is 1 foot A bottoming of broken stone and gravel being spread to receive these the [illegible] them repeatedly by [illegible] fall in the place where they are intended to rest, until they beat for themselves a solid and unyielding bed It was the practice [illegible] the blocks so that their sides were parallel and perpendicular to the sides of the railway In fig 7

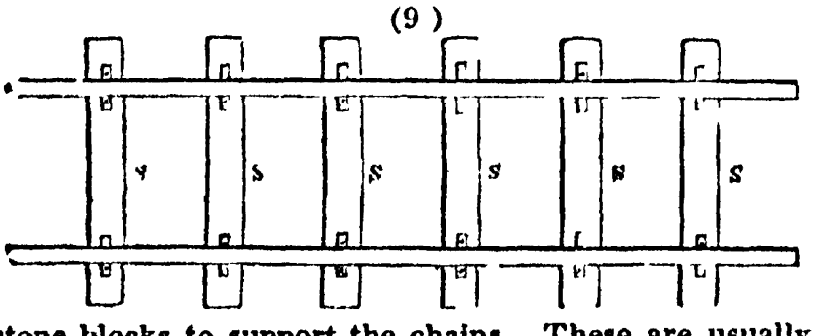
(7)



is represented the plan of a railway thus laid on blocks showing its drainage, consisting as is usual with railways having extensive traffic of two lines The line R R, R′ R′ is appropriated to carriages moving in one direction, and the line r r r′ r′ to carriages moving in the other direction By thus causing carriages moving in the same direction to be confined to the same line the collision of trains *meeting* is prevented The centre drains running between the lines of railway is represented at D D D The cross drains are shown at C C C, communicating with the side drains S S S

The blocks are represented at B B, supporting the rails and laid with their sides parallel and perpendicular to the rails

This arrangement has lately been superseded by the diagonal arrangement of blocks represented in fig 8 It

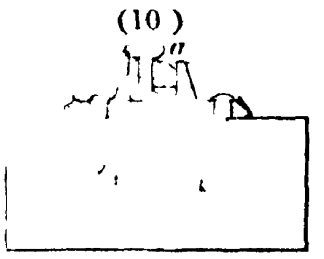


(8)

is considered that this arrangement gives the block a better bearing on its bed, but the chief advantage attending it, as compared with the former position of the blocks is that it renders the base of the block more accessible for repairing and adjustment, from time to time, when the road is in operation

2dly On embankments newly made or other parts of the line where the foundation of the road is liable to yield under the operation of the traffic upon it, wooden sleepers S S, fig 9 extending across the road, are used instead of

(9)



stone blocks to support the chairs These are usually formed of [illegible] split along the centre so as to form two logs one side of which is flat and the other convex They are usually from 8 to 9 feet long and from 9 to 10 inches broad on the flat side and from 4 to 5 inches deep, measured in the thickest part They are laid across the road, with the flat side downwards. The chairs are fastened to them by pins on the convex side, in [illegible] which have been already described to [illegible] chairs being thus connected, by [illegible] same sleeper, the rails are kept [illegible] the yielding of the foundation under the sleeper

Originally stone blocks were universally regarded as the [illegible] the support of the rails wherever they could be laid upon a solid and durable foundation, and wooden sleepers were only resorted to as temporary supports, to be ultimately superseded by stone blocks whenever the foundation of the road should be properly consolidated Opinion, however, soon underwent a change on this subject, and wooden sleepers were used in preference to stone blocks for permanent purposes, but it has been proposed to substitute sleepers of cast iron for those of wood, and the plan has already been reduced to practice generally

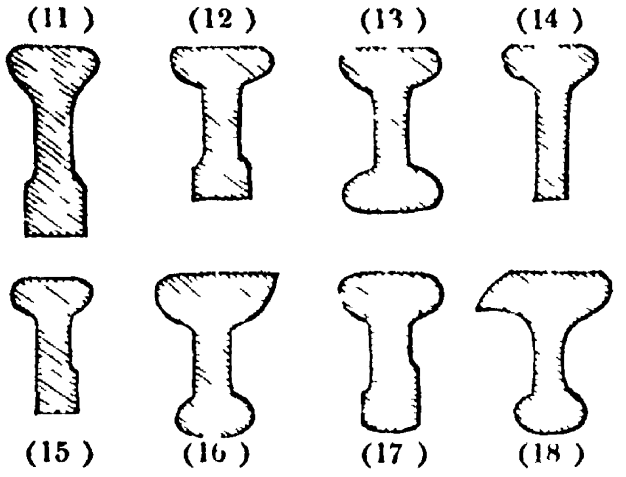
The chairs which [illegible] rails or props on which the rails [illegible] to the upper surfaces of the blocks in the following manner — Two holes are drilled in the blocks to a sufficient depth, about 2 inches in diameter, into which plugs of oak or other hard wood are driven, holes are then bored in these 3-8ths of an inch in diameter corresponding in position with two holes in the chair of cast iron, which is to support the rail Iron pins of half an inch in diameter are then driven through the holes in the chairs into the holes in the block a piece of patent felt being placed between the chair and the block, and the chair is thus firmly fastened to the block

The chairs are formed of cast iron, formed with a cavity corresponding to the magnitude and form of the rail [illegible] according to the [illegible] A vertical section of one of the most common forms of chair,

(10)

fixed on a block now in use, with the rail resting in it, is represented in fig 10

A great variety of expedients have been resorted to to maintain the rail fixed in its position in the chair Pins and wedges of iron were first used of various forms, and applied in various ways These, however, have now been very generally superseded by the simple contrivance of a wooden block or wedge driven in between the side of the chair as represented at *a* fig 10 These wedges are prepared by previously passing them through a hydrostatic press so as to harden them by exposing them to a severe pressure Besides affording a very effectual fastening to the rail in the chair these wedges from the nature of the material soften the jar which attends the transition of the wheels over the chairs

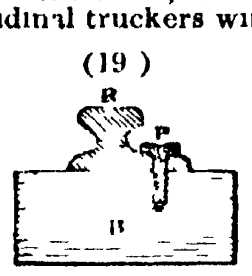


Weight and Form of Rails — The weight and form of the rails have been subject to great variation, since the extension of railways to the rapid transport of passengers This has not arisen so much from ignorance of the mechanical properties of the metal thus applied, as from the varying weight and speed of the engines and loads transported upon them The weight of the engines was, in the commencement limited to 6 tons, but the most common weight of these machines at present is from 30 to 40 tons, and their speed as well as the amount of loads which they draw have undergone a corresponding increase The strength and solidity of the structure on which this extraordinary traffic is carried have necessarily undergone corresponding changes The Liverpool and Manchester railway was first laid down with rolled iron rails, weighing 35 pounds per yard supported on chairs 3 feet asunder These were, however, soon found insufficient in strength, and they were replaced by rails weighing 50 pounds, and these again have been replaced by others weighing 60 72 75 and even 85 lbs

The distance between the bearings or chairs has also been subject to [illegible] The [illegible] very strength or weight of the rail [illegible] this distance, the greater the distance between the props, the greater must be the strength of the rail, and so far as regards expense the engineer has to balance the cost of heavier rails against the saving effected by a diminished number of blocks and chairs But independently of the consideration of expense, the effect upon the carriages and engines is to be considered Between chair and chair, a slight flexure of the rail takes place, and the wheels have consequently to pass over a series of eminences, so as to give to the carriages a pitching motion the intervals and degree of which must depend conjointly on the strength of the rails and the distance between the chairs

The least distance between the chairs now used is 3 feet, and the greatest 5 feet, 50 lb rails are very generally used on 3 feet bearings, 65 lb rails on 4 feet bearings, and 75 lb rails on 5 feet bearings All these varieties of construction are used in different parts of the Liverpool and Manchester railway The

Grand Junction railway extending from Birmingham to Newton is laid down uniformly with 65 lb rails on 4 feet bearings, and the London and Birmingham railway has in different places all the above varieties



The form of the rail has been much varied The fish-bellied rail was considered to have the most advantageous form, when the Liverpool and Manchester railway was first brought into operation, and for some years afterwards This form gives increased depth to the rail at the parts most distant from the supports, and, in theory, it is unquestionably the most correct the strength of every part to resist vertical pressure being the same But various practical objections have been found against it, which our limits will not allow us to examine or discuss, and the fish bellied rail has accordingly been altogether superseded by the parallel rail which is a rail whose cross section is the same at every part Nothing can be more varied or more capricious than the forms given to the cross section of rails by different engineers The figures 11 to 18 represent a few of this great variety

The form, however, which has obtained most general favour at the present time is that which is represented in fig 13, the cross section of which is nearly the same as the longitudinal section of a dumb bell This form of parallel rail has the advantage of being capable of being reversed either side being turned upwards

In some rare instances modern railways in England have been laid down on *continuous bearings* The rails in such cases, are supported immediately on the longitudinal truckers without chairs This is the case in the Manchester and Bolton railway, and in the Great Western railway a section of a rail as attached to a longitudinal trucker support without a chair, is represented in fig 19, where R is a section of the rail, P an iron pin attaching it to the trucker B These pins are placed at regular distances along the outside base of the rail

(19)

(20)

A section of the rail with its trucker support, used on the Great Western railway is given in fig 20 These rails are fastened to the truckers by screws on each side They weigh from 40 to 50 lbs per yard

Gauge of the Railway — The gauge or the distance between the rails, on which depends the distance between the wheels of the carriages and engines and to a certain extent their structure, has recently been a subject of much discussion It is contended by some that all railways constructed in the same country ought to have the same gauge, that though it is not contended that the gauge now in use is the best that could possibly have been adopted, yet that extensive lines of road having been constructed with that gauge more disadvantage will attend any departure from it than could be balanced by any advantages that could attend any other [illegible] In the north of England, the rails had been laid at 4 feet 8½ inches asunder, and on the Liverpool and Manchester railway the first line intended for general traffic was laid down by Mr Stevenson with the same gauge The railway subsequently projected, extending from Liverpool and Manchester to Birmingham (and thence to London) to Preston Wigan, Bolton, Leeds, and other places, were laid down with the same gauge, since the carriages and engines would necessarily have to pass from one to the other But when railways began to be constructed in Belgium and other parts of the Continent, where the same reason for uniformity of gauge did not prevail, the same gauge nevertheless was adopted The first conspicuous departure from this uniformity took place in the Great Western railway, extending from London to Bristol which was laid down with a gauge of 7 feet, and the Eastern Counties railway [illegible] of 6 feet

The gauge [illegible] be regarded as nothing more than its linear modulus, or the index to its general scale. There is nothing *per se* to give one gauge a preference over another, but as the magnitude of [illegible] determines the general magnitude and [illegible] the railway [illegible] bridges viaducts, [illegible] and other works whether of a moveable and perishable or fixed and permanent nature it is a matter of the greatest importance that it should be determined with a just regard to the traffic of the line

Curves on Railway With a view to insure the public safety, the legislature has generally required that no curve shall be allowed upon a main line with a less radius than a mile the exceptions to this are where one railway passes into another, and at the termini, or the entrance of depôts or stations In such situations the trains must slacken their speed, and therefore a sharp curve is attended with less danger It has appeared, however, that these restrictions upon the radii of curves have been more stringent than safety requires In a course of experiments made by Dr Lardner, it was established that curves of a mile radius produce no sensible increase of resistance at the usual speed of railway trains, and therefore curves of considerable less radius may be traversed at that speed without danger We may here state, that on the Newcastle and Carlisle railway there are many curves in the main line with radii under half a mile, which are traversed at the usual speed with perfect safety

Motive Power on Railways — The motive power on railways [illegible] at present steam power, and is either [illegible] which move along the railway with the load which they draw, or stationary engines, which by means of ropes extended along the line of railway, draw the loads in either direction *See* LOCOMOTIVE ENGINE and STATIONARY ENGINE

The summer and autumn of 1845 and the beginning of 1846 witnessed the rise and development of a gigantic railway mania in England Some 700 or 800 projects, requiring, it was stated, [illegible] were produced during this [illegible] Great Britain, pressing influence of [illegible] the money market, aided by other causes, having led to the crisis of 1847 most of these projects sank into oblivion, or were only partially carried out, and the recklessness evinced by many companies in engaging in ruinous speculations, and the disclosures that were more recently made of the conduct of some leading directors, have shaken the public confidence in all railway companies, and led to an unprecedented depreciation of the stock even of the best lines —(See the *Com Dict*) For *Speed of Railway Traffic, see* LOCOMOTIVE ENGINE

For the details of the structure and operation of railways see the Treatise by Nicholas Wood 3rd edition, London, 1838, *The Steam Engine, &c*, by Dr Lardner, 8th edition London 1851

RAILWAY, PNEUMATIC or ATMOSPHERIC The name given to a system of locomotion on railways by means of the pressure of the atmosphere A simple and ingenious apparatus for this purpose was invented a few years ago, and was exhibited for some time on the West London Railway at Wormwood Scrubs Those who desire to see a brief though clear account of this invention, with a resumé of the advantages likely to accrue from its being [illegible] may consult the well-reasoned letter [illegible] to the President of the Board of Trade (1841) (See also a treatise on this subject, by Mr Samuda)

RAIN (Ger regen) In Meteorology, water falling from the atmosphere in drops

The theory of rain is not yet very satisfactorily established One of the most plausible explanations and indeed the only one which rests entirely on known principles, was proposed by Dr James Hutton in the *Philosophical Transactions of Edinburgh* for 1787 It is now a well-ascertained fact, though it was only matter of conjecture to Dr Hutton, that the capacity of air for moisture, or the quantity of moisture which a given volume of air will hold increases with the temperature, but in a much faster ratio than the temperature, and hence it follows that if two equal portions of air at different temperatures completely saturated with moisture are mingled together, a precipitation must take place in consequence of the mixture, which will have the mean temperature of [illegible] the capacity for retaining moisture increases in a geometrical ratio, and that at the temperature of 15 centesimal degrees air can hold 200 parts of moisture, then at 30 degrees it will hold 400 parts and at 45 degrees 800 parts Now, suppose two equal bulks of damp air, at the respective temperatures of 15 and 45 degrees, to be mixed together the compound must contain 1000 parts of vapour, or either half of it 500 parts, and the temperature of the compound will be 30 degrees But at this temperature the air is saturated with 400 parts, and consequently there will be a precipitation of 100 parts from each of the given bulks

It is obviously not necessary that the commingled por-

tions of air should be fully saturated with moisture, as assumed in the above example, rain will be precipitated if the two masses approach the point of saturation, but the quantity will be proportionally less It is also a consequence of the theory that for a given difference of heat the precipitation will be greatly increased at the lower temperatures, and this is conformable to experience, for showers are most copious during hot weather, and in tropical countries The circumstances therefore, on which according to this theory the quantity precipitated in a given time depends are [illegible] —The principal, cæteris paribus, are the difference of their respective temperatures, the elevation of their mean temperature, and the extent to which the combination takes place

The principal objection to this theory is, that the quantity of rain which actually falls in a given portion of time is often very much greater than can be supposed to be produced by any probable extent of cooling that can take place in the free atmosphere In that case we have recourse to the supposition of a cold and warm current driving swiftly in opposite directions, and contributing [illegible] Sir J Leslie (*Encyc Brit* art *Meteorology*) computes that if two currents of moist air were driving along in opposite directions, with velocities whose sum is 30 miles an hour the one having a temperature of 70° of Fahrenheit, and the other of 50°, the deposition of moisture in the space of an hour would be equal to the height of an inch If the sum of the opposite velocities amounted to 60 miles an hour, and the intermingling influence extended to but a quarter of an inch at the grazing surfaces there would still be produced in the same time a fall of rain reaching to half an inch in altitude These quantities agree sufficiently with observation in certain cases, but the objection still recurs that rain frequently falls from clouds which appear to move very slowly and when consequently the supposition of such velocities is inadmissible

It is the opinion of Mr Luke Howard and some other writers on meteorology, that Dr Hutton's theory is insufficient to explain the phenomena, and that the immediate cause of rain is to be ascribed in many instances at least, to the electric action of the clouds on each other They suppose the hygrometric moisture in the air to be kept suspended by the mutual repulsions of the electric atmospheres of the particles and that when the electricity is from any cause withdrawn the suspending power is likewise removed, and the particles coalesce and fall in consequence of their gravity That rain is connected in some way or other with the electric state of the atmosphere, is a position which may be readily conceded, but as the disturbance of the electric equilibrium remains to be accounted for, this theory as it at present stands, brings us no nearer to definite ideas

Some extraordinary falls of rain have been recorded, the accounts of which, if not given on apparently unexceptionable testimony w [illegible] as fabulous On the 25th [illegible] inches (32 English) within 24 hours occurred at Genoa, and on the 9th October 1827 there fell at Joyeuse in the south of France, a quantity equal to 31 English inches within the space of 22 hours (Prof Forbes's Report on Meteorology, in the *Reports of the British Association for* 1840)

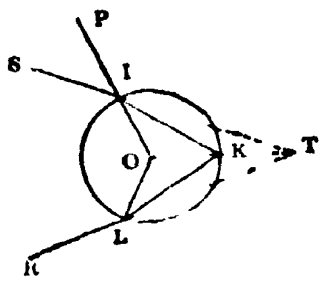
A curious circumstance attending the fall of rain is that the quantity collected in rain gauges placed at the surface of the ground is considerably greater than when the instruments are placed at some elevation above the surface On an average of 13 years the quantity of rain which fell annually in the court of the observatory at Paris was 56 centimètres (22 1 English inches), while the mean quantity which fell on the terrace, at the height of 28 mètres (92 feet) above the court was only 50 centimètres, or 8-9ths of the former quantity A gauge placed on the top of York Minster at an elevation of 212 feet 10 inches, showed a fall of 14 963 inches between February 1833 and February 1834, while two perfectly similar instruments, one placed on the top of the Museum of that city, at a height of 43 feet 8 inches, and the other on the ground, gave respectively 19 852 inches and 25 706 inches (*Reports of the British Association for* 1834) It is supposed that this phenomenon depends, in some measure at least, on the circumstance that the drops of rain, de[illegible] perature [illegible] vapour in the lower strata, and probably of fogs, which are always denser near the surface of the ground, and which yield a considerable deposition of water Any hypothesis of this kind, however, is quite insufficient to explain the great difference observed at York between the products of the rain gauges on the ground and the top of the Minster, and which is most probably to be ascribed to some imperfection in the action of the instrument when exposed to gales of wind It has been suggested that eddies are formed round the rim of the funnel which have the effect of diverting part of the rain

Rain drops vary in size from perhaps the 25th to the 3d part of an inch in diameter and like other falling bodies descend with a continually accelerating velocity until the resistance of the air becomes equal to their weight after which the descent is uniform The terminal velocity is proportional to the square root of the diameter of the drop, but it is perhaps not possible to determine with certainty the actual terminal velocity corresponding to a drop of any given diameter

The average quantity of rain which falls in a year at any given place depends upon a great variety of circumst[illegible] elevation of the re[illegible] of the mountain r[illegible] and *in general* on the different local causes which influence climate It has been found that [illegible] rain which [illegible] and 60°, may be taken respectively at 98, 80, 29, and 17 inches, but this estimate must be regarded rather as a rough approximation to the ratio in which the quantity decreases on going from the equator, than as indicating the actual averages at any particular place, and it is observed that though the annual depth be greatest towards the equator, the number of rainy days in the majority of places increases with the latitude

The greatest depth of rain which has been registered at any place in a year is at Maranham lat 2½° S, and which is stated by Humboldt to be 277 English inches But this is greatly above the average, and indeed more than double the annual quantity which has been observed at any other locality At St Domingo the annual fall is estimated at 120 inches, at Cayenne 116 inches, in the island of Grenada 112, at the Havannah 91, at Calcutta from 76 to 118, at Bombay from 83 to 96, the island of Martinique 87 inches, and at Sierra Leone, 86 Of European countries Portugal appears to be the most humid 123 inches having been observed at Coimbra in a year The average depth at Paris is 19 1 inches (Arago, *Journal de Physique*, 1816), Berlin, 20 9, Brussels, 19, Florence 41 3, Lyons, 39 5 Maestricht 36 1, Marseilles, 18 4, Padua 36 6, Petersburg 18 2, Rome, 31 2, Rotterdam 22 4, Stockholm, 18 7, Vienna, 17 For places in Great Britain the following averages were deduced by Dr Dalton from observations of a number of years — Manchester 36 140 inches, Liverpool 34 118, Lancaster, 39 714, Kendal 53 944, Dumfries, 36 918, Glasgow 21 331, London 20 686 Mr Howard gives [illegible] at London equal to 24 9 inches, Prof [illegible] York, 2[illegible]7, and Mr Adie at Edinburgh 25 inches (On the theory of rain see Kamptz, *Lehrbuch der Meteorologie*, Muncke in *Gehler's Physicalisches Wörterbuch*, *Daniell's Meteorological Essays*, &c)

RAINBOW (Germ regenbogen, Lat iris, Fr arc en ciel) The brilliant-coloured arch which makes its appearance when rain is falling in the region of the sky opposite to the sun, and the sun is shining at the same time



This well known meteor presents, when perfect, the [illegible] concentric arches, the inner being [illegible], and the outer the *secondary* rainbow Each is formed of the colours of the solar spectrum, but the colours are arranged in the reversed order, the red forming the exterior ring of the primary bow and the interior of the secondary The innermost bow is a segment of a circle whose radius subtends an angle of about 42°, the radius of the outer subtends an angle of about 51°, and the common centre is situated in the prolongation of the straight line which passes through the centre of the sun and the eye of the spectator From the conditions invariably accompanying its appearance, the colours of the rainbow were known at an early period to be produced by the sun's rays passing through the drops of falling rain, but the phenomenon is a complicated one and was not fully and satisfactorily explained until Newton had discovered the compound nature of solar light, and the different refrangibility of the component rays

In order to explain the phenomenon of the rainbow, let us suppose a beam of light admitted through a small hole in the shutter of a darkened room to fall on a spherical globule of water at I (fig 1) in the direction S I, and trace the path of the light in the interior of the globule On entering the globule at I it is refracted, and consequently decomposed, the rays of each colour being deflected under a different angle from its original direction For the [illegible] we shall [illegible] to the red ray Let I K be the di[illegible] [illegible] [illegible] [

with a tangent at K But on arriving again at the surface at L, this portion of the ray which was reflected from K will be again divided into two parts; one part will escape at L, and be refracted in the direction L Q, while the other part will be reflected by the surface and proceed in the direction L M M will be the point where the repeated part of the ray will again be divided, one part being refracted in the direction M R and the other be reflected in the direction M N The process will be repeated indefinitely, but the intensity of the light is diminished at each successive impact, and after a few reflexions the quantity which emerges becomes insufficient to make an impression on the eye All this may be shown experimentally by causing a beam of light to fall upon a glass cylinder filled with water and placed in a darkened room the red light emerging at the points K L M will be seen when the eye is placed in the straight lines K P, or L Q, or M R

To apply this experiment to the explanation of the rainbow, it is necessary to determine the inclination of the emerging to the incident ray We shall first take the case of two refractions with a single intermediate reflexion Let S I (fig 2) be the incident ray, I K the direction after the first refraction K the point of reflexion, L the point of emergence and L R the direction of the emerging ray, also let S I and R L be produced to meet in T The angle S T R is called the angle of deviation, and the object is now to find an expression for its value in terms of the angle of incidence Let O be the centre, draw O I P and O L, and join O T, which will evidently pass through K Let us now assume,

(2)

i = O I T = S I P the angle of incidence,
r = O K I = O I K the angle of refraction,
D = S T R the angle of deviation,

then, since O K I = K I T + K T I and K I T = O I T − O I K, we have $r = i - r + \frac{1}{2}$ D, whence

$$D = 4r - 2i \qquad (1)$$

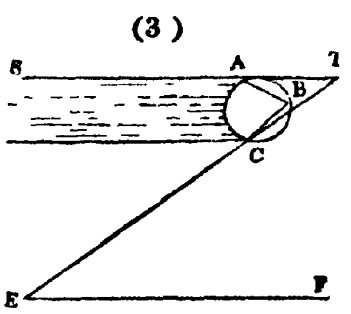
Here D is expressed in terms of r and i, but by the theory of refraction we have also the relation

$$\sin i = n \sin r \qquad (2)$$

(where n is the index of refraction for the red ray), so that the value of D depends only on that of i

The angle of incidence i, may have any value between [illegible] It is obvious that between those values D must have a maximum, for when S I falls perpendicularly on the globule there is no deviation, and when S I merely touches the globule the deviation again vanishes To find the determinate value of i at which the maximum takes place, differentiate the equation (1) and make the differential of D equal to zero, this gives $d i = 2 d r$ Then $\cos i \, d i = n \cos r \, d r$, whence $\cos i = 2 \cos r$, and dividing both sides of the resulting equation by $d i$, $n \cos r = 2 \cos i$ On substituting for cos r in this equation its value found from (2), the following expression is obtained —

$$\cos i = \sqrt{\tfrac{1}{3}(n^2 - 1)}$$



This is the value of i corresponding to the maximum deviation expressed in terms of n But in respect of the red rays, the value of n is found experimentally to be 108 − 81 = 1 3333, and the corresponding value of i given by the trigometrical tables is $i = 59° 23' 30''$ From this the values of r and D are readily deduced, and the three values are as follows —

$$i = 59° 23' 30'', \quad r = 40° 12' 10'', \quad D = 42° 1' 40''$$

The next step towards the explanation of the phenomenon is, to show that no other light than that which [illegible] incidence corresponding to the [illegible] be refracted in sufficient quantity to make a sensible impression on the eye Now since S I is the incident ray, with respect to which the deviation is a *maximum*, the rays which are situated very near to S I, on either side, will enter the drop at very nearly the same angle of incidence, and consequently will emerge very nearly parallel to I R With respect then to the pencil [illegible] at the angle of incidence [illegible] deviation all the rays of [illegible] which emerge after the first reflexion, will on their emergence be parallel and enter the eye situated in the straight line I R in sufficient number to make a vivid impression on the retina But with respect to a pencil falling on the drop at a small distance from I, and consequently making a small angle of incidence the red rays at their emergence will not be parallel but divergent, and the light will consequently diminish in intensity as it recedes from the drop, and at the distance of the spectator will be much too faint to produce a distinct impression It is on this delicate principle that the phenomenon principally depends

The above principles being clearly understood, all the circumstances of the phenomenon admit of easy explanation. Let A B C (fig 3) be a section of a drop of rain made by the plane passing through the centre of the sun, the centre of the drop, and the eye of the spectator, and suppose the rays from the sun's centre to fall on it in the direction S A Let E be the position of the eye of the spectator, whose back is turned towards the sun, and draw E F parallel to S A Now suppose the line E T to be drawn so as to make with E F an angle of 42° 1′ 40″, and to meet the drop at C, then, since the whole of the anterior surface of [illegible] some one of those [illegible] incidence, such that after being refracted at A reflected at B, and again refracted at C, it will emerge parallel to C F, and consequently make with F F the maximum angle of deviation The spectator will therefore see the red colour of the spectrum in the direction E C But it is obvious that all these conditions will be fulfilled in respect of every drop of rain which the line E C will meet, on supposing it to revolve about E F as an axis at the same angle of inclination Hence the red rays thus refracted form the surface of a cone, the axis of which is the prolongation of the straight line drawn from the centre of the sun to the eye, and as the eye of the spectator is at the apex of the cone, a circular segment of red light will be visible, the other part of the circle being cut off by the horizon

(3)

What has now been said has reference only to rays coming from the sun's centre, but the same thing must happen with respect to rays coming from every point of the sun's disk, and as the sun's diameter subtends an angle of about 30′ the spectator will consequently see a band of red light of the breadth of about 30′

The explanation which has now been given of the appearance of the [illegible] applies to all the other colours of the spectrum, the [illegible] being in the value of the index of refraction for the violet ray, in passing from air to water, the index is 109 − 81, we have therefore n = 1 3468, and on computing from this the values of i, r and D, by means of the preceding formulæ, there results, appproximately,

$$i = 58° 40' 3'', \quad r = 39° 24' 20'', \quad D = 40° 17'$$

In this case therefore, the angle of maximum deviation is less than for the red ray [illegible] the violet is within the red The breadth of the violet band will obviously be the same as that of the red as both depend on the same cause, namely, the magnitude of the sun's apparent diameter

As the red and violet are the rays whose indices of refraction are the least and greatest respectively, all the other prismatic colours will lie between these two, and occupy bands of the same breadth but with considerable blending into each other, for the distance between the centre of the red and the centre of the violet, being equal to the difference [illegible] maximum deviation [illegible] 1° 45′ The whole breadth of the interior or primary bow is this quantity plus the sun's apparent diameter, or about 2° 15′

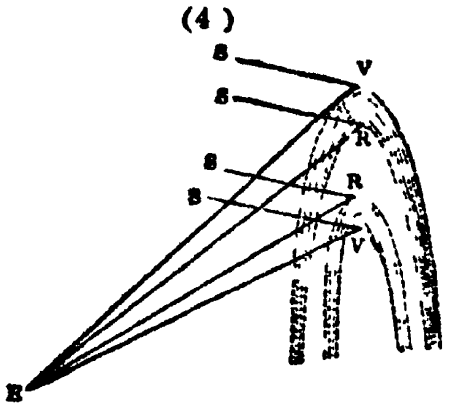
The size of the bow depends upon the height of the sun above the horizon When the sun is in the horizon, the bow will be a semicircle to a spectator on a plane, but on the summit of a mountain, he may see a segment greater than a semicircle

We have now to explain the formation of the exterior bow In this case the light suffers two reflexions in the interior of the globule and the path of a ray, as represented in fig 1, is S I K L M R If we denote the [illegible] S I and M R [illegible] D′ and the as before [illegible] and refraction, it is easy to find the equation,

$$D' = 6r - 2i - 180°$$

On proceeding from this by the same method as before to find the value of i corresponding to the *maximum* value of D′, the following equation is obtained —

$$\cos i = \sqrt{\tfrac{1}{8}(n^2 - 1)}$$



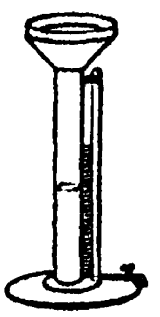
[illegible] for the two [illegible] values in respect of the red and violet rays the values of i and consequently of r and D, are obtained They are as follows —

red, $i = 71° 50'$, $r = 45° 27'$, $D' = -50° 59'$,
violet, $i = 71° 26'$, $r = 44° 47'$, $D' = -54° 9'$,

the minus sign indicating that the incident and emergent rays intersect before the drop

From these values it appears that in the case of the exterior bow the deviation is least in respect of the red ray, and greatest in respect of the violet, the order of the colours is therefore reversed, the red occupying the innermost band, and the violet the outermost, as represented in fig 4, where E R is the red and E V the violet ray, the eye of the spectator being at E The breadth from the middle of the red to the middle of the violet is 3° 10′, or nearly double that of the interior bow The interval between the red of the interior bow and the red of the exterior is 50° 59′ — 42° 2′, or 8° 57′ All these values, deduced as above from the theory of refraction, are found [illegible] those found by actual measurement [illegible] *Phil Trans* for 1700 has computed the diameters of rainbows formed by three four, and five reflexions, but these bows are rarely if ever seen the light being too faint to make an impression on the eye Supernumerary or spurious rainbows are sometimes seen within the primary and without the secondary bow, and having the same order of colours as the bows to which they respectively belong They are explained by Dr Young on the theory of the interference of light (*Phil Trans* 1804, *Lect* vol i p 470) An inverted or distorted iris is sometimes observed lying on the ground, formed by the drops of dew suspended from the tops of the blades of grass, or from spiders' webs In favourable circumstances lunar rainbows are sometimes seen, but their colours are faint and scarcely perceptible

(4)



The first explanation of the true theory of the rainbow is usually ascribed (see *Newton's Optics*) to Antonio De Dominis, archbishop of Spalatro whose work, *De Radiis Visus et Lucis*, was published at Venice in 1611, but stated to have been written twenty years previously It would appear however, from the account of this work given by Boscovich, Montucla, Priestly, and Biot that the merit of De Dominis was confined to a vague statement or surmise, unsupported by experiment that the interior bow is formed by two refractions and an intermediate reflexion He gave no reason for the precise angle which its diameter subtends and with respect to the exterior bow, his attempt to explain its formation is wholly erroneous The true theory of the exterior bow and the determination of the particular angles of deviation under which alone the rays transmitted to the eye are sufficiently dense to be visible belongs to Descartes The explanation given by Descartes in his *Dioptrics*, is complete in every respect, excepting as to the cause of the colours the theory of which was supplied by Newton [illegible] of the Perfective [illegible] See Mixed *Mathematiques*, vol i p 700, *Priestly on Vision*, p 107, *Biot Traité de Physique* tom ii p [illegible]

RAIN GAUGE, also called OMBROMETER UDOMETER and PLUVIAMETER An instrument for measuring or *gauging* the quantity of rain which falls at a given place

"The *rain-gauge* may be of very simple construction A cubical box of strong tin or zinc, exactly 10 inches by the side, open above, receives at an inch below its edge a funnel, sloping to a small hole in the centre On one of the lateral edges of the box, close to the top of the cavity, is soldered a short pipe in which a cork is fitted The whole should be well painted The water which enters this gauge is poured through the short tube into a cylindrical glass vessel, graduated to cubic inches and fifths of cubic inches Hence, one inch depth of rain in the gauge will be measured by 100 inches of the graduated vessel, and 1-1000th inch of rain may be very easily read off

'It is very much to be desired that, being of such easy construction, more than one of these gauges should be erected, or at least one placed with its edge nearly level with the ground, and another [illegible] building, rock, or tree in the [illegible] place of observation, the height of which must be carefully determined, it having been satisfactorily ascertained that the height of the gauge above the ground is a very material element of the quantity of rain which enters it The quantity of water should be daily measured [illegible]" (*Report of the President and [illegible] Society on the Instructions to be prepared for the Scientific Expedition to the Antarctic Regions*, 1840)

A convenient form of the instrument is represented in the annexed figure, where the rain which enters the funnel is collected in a cylindrical vessel of copper, connected with which at the lower part is a glass tube with an attached scale The water stands at the same height in the cylinder and glass tube, and being visible in the latter, the height is read immediately on the scale, and the cylinder and tube being constructed so that the sum of the areas of their sections is a given part, for instance a tenth, of the area of the funnel at its orifice, each inch of water in the tube is equivalent to the tenth of an inch of water entering the mouth of the funnel A stop-cock is added, by which the water is drawn off when the observation is made

RAISING PLATE, or UPPER PLATE In Architecture, the plate or longitudinal timber on which the roof stands raised or placed

RA'JAH The hereditary princes of the Hindoos are so termed They belong to the caste of warriors, or Cshatriya and are generally dependent on Europeans, except in those parts of the country which the European arms have not as yet penetrated See CASTE

RAKE TO The sea term for *incline*, and applies to the masts stem, and stern-post, &c, the bowsprit, instead of raking is said to *steve* Masts generally rake aft and in peculiar rigs only forward The rake of the mast has an influence on the sailing of the vessel, and the masts of some schooners rake excessively The principal effect seems to be to diminish the effect common to all the sails, of depressing the ship's head

To rake a ship is to fire into her head or stern in the direction of her length, or along her decks It is similar to [illegible]

RAM [illegible] See BATTERING RAM

RAMADAN, or RHAMADAN The name given to the great fast or Lent of the Mohammedans It commences with the new moon of the ninth month of the Mohammedan year and while it continues the day is spent uninterruptedly in prayers and other devotional exercises Even the night is passed by the more rigid of the faithful in the mosques which are splendidly illuminated on this occasion, but generally speaking, the arrival of sunset is the signal for a more than usually unlimited indulgence in the pleasures of the table, and on the third evening of the fast, the grand vizier commences a series of official banquets The Ramadan ends on the day preceding the only other great festival of the Mohammedans, — the *Bairam* (which see), equivalent to our Easter

RAMAYA'NA (Sanscr *the Career or Travels of Rama*) the oldest of the two great Sanscrit epic poems, describes the life and actions of the hero Rama, and his wife Sita, and especially Rama's expedition to Ceylon, to rescue Sita from the tyrant Rawana The poem is thought to have been composed before the Christian era, but there is no certain indication of its age A translation of it was commenced by Messrs Carey and Marsh- [illegible] ore), and another by A W von [illegible] H

RAMBATTERING See BATTERING RAM

RAMI'NIA In Botany, thin, brown, foliaceous scales, appearing sometimes in great abundance upon young shoots, and particularly numerous and highly developed upon the petioles and the backs of the leaves of ferns

RA'MISTS, or RA'MIANS In Philosophy, the partisans of Pierre Ramé better known by his Latin name of Ramus royal professor of rhetoric and philosophy at Paris in the reign of Henry II He perished in the massacre of St Bartholomew His system of logic was opposed to that of the Aristotelian party, and during the latter half of the 16th century a vehement contest was maintained between their respective adherents in France Germany and other parts of Europe (Hallam, Introduction to the *Literature of Europe*, vol ii ch 3) "He conferred" says the same writer, 'material obligations on science by denying the barbarous method of the schoolmen What are the merits of his own method [illegible] *Ib* vol i ch 7)

RAMNENSES or RAMNES The name of the first century of the 300 horsemen who constituted the cavalry of Rome under the early kings Most probably the name also applied at first to the original century of patrician houses established by Romulus and distinguished them from the Latienses and Luceres, whose names, in like manner must be supposed to extend not merely to the two [illegible] but to the two centuries of tribes [illegible] by Romulus, on the accession of [illegible] Priscus (See the histories of Niebuhr and Arnold)

RAMP (Fr Rampe) In Architecture, a concave bend or slope in the cap or upper member of any piece of [illegible]

RAMPANT [illegible] term used to

describe lions tigers bears, &c, when represented as standing erect on their hind legs

RAMPART or RAMPIER In Fortification, the wall which surrounds a fortified place It is built of the earth taken out of the ditch, though the lower part of the outer slope is usually constructed of masonry The advantage of earth is, that the balls instead of splintering the work, and rebounding in various directions to the great injury of the besieged, pass forward into the earth, and bury themselves there This also renders the rampart of earth much more durable under the fire of the besiegers than masonry would be The usual height of the rampart is about three fathoms, and its thickness about ten or twelve feet *See* FORTIFICATION

RAMS' HORNS In Fortification, the name given by Belidor to the tenailles *See* TENAILLE

RA'NA (Lat *a frog*) The generic name of the tailless Batrachian reptiles, which have the hind legs longer than the fore, and webbed toes fitted for swimming, and not expanded at the extremity Their head is flat, muzzle rounded, and the opening of their jaws large, the tongue in most of them is soft, and not attached to the bottom of the gullet but to the edges of the jaw, with the free end turned backwards There are but four toes to the anterior feet, the hind ones frequently exhibit the rudiment of a sixth

There are no ribs to their skeleton, and a prominent cartilaginous plate supplies the place of a tympanum, and renders the ear visible externally The eye is furnished with two fleshy lids, and a third, which is transparent and horizontal, concealed under the lower one Inspiration is effected by the muscles of the throat which, by dilating draw in air by the nostrils, and by contracting while the nostrils are closed by the tongue compel the air to enter the lungs, expiration on the contrary, is produced by the muscles of the lower part of the abdomen The young frog, which is called a tadpole is at first furnished with a long fleshy tail and a small horny beak having no other apparent limbs than little fringes on the sides of the neck These disappear in a few days, and the hind feet of the tadpole are very gradually and visibly developed, the fore feet are also developed but under the skin through which they subsequently penetrate The tail is gradually absorbed The beak falls and discloses the true jaws, which at first were soft and concealed beneath the skin, and the branchiæ are absorbed, leaving to the lungs alone the function of respiration in which they participated The eyes which at first could only be discerned [illegible] a transparent spot in the skin of the tadpole are now visible with their three lids Tadpoles reproduce their limbs almost like salamanders

The period at which each of these changes takes place varies with the species In cold and temperate climates, the perfect animal passes the winter underground or in the mud under water without eating or breathing, though if it be prevented from respiring during the summer for a few minutes by keeping its mouth open it dies

RA'NDOM SHOT A shot discharged with the axis of the gun above the horizontal or point blank direction

RANGE, in Gunnery, is the horizontal distance to which a shot or other projectile is carried Were it not for the resistance of the air the path described by a projectile acted upon by the force of gravity would be a parabola, and the greatest range would be obtained by discharging the projectile at an angle of 45° of elevation But by reason of the atmospheric resistance, the path actually described is very different from a parabola and the elevation which gives the greatest range can only be determined by experiment *See* GUNNERY PROJECTILES

RANGE A certain quantity of cable drawn up out of the cable tier and laid along the deck equal in length to the depth of water, in order that the anchor when let go, may reach the bottom without being checked

RA'NGER Formerly a sworn officer of the king's forests whose principal duty it was to see and inquire of trespassers in his bailiwicks and present them at the next court holden for the forest, but now merely an officer of state *See* FOREST

RA'NIDÆ The family of Batrachian reptiles, having a [illegible] (*Rana temporaria*, Linn) *See* RANA

RANTERS A sect which originated in a secession from the Wesleyan connection, on the ground that the Wesleyans paid too much attention to order and decorum in the conducting of public worship and that they were deficient in zeal in obtruding the gospel on the minds of the people by open preaching in the streets and fields [illegible] places of worship They admit of [illegible] thing unknown to every other body of Methodists They are most prevalent in America Their chapels are about 400 in number, their preachers, 2700, their members, 34,000 (*Bourne's Hist of the Prim Methodists*)

RA'NULA (Lat rana, *a frog*, to which it has been supposed to bear some resemblance) A tumour under the tongue, generally arising from some obstruction of the ducts of the salivary glands, when they break they are apt to leave a very troublesome ulcer
