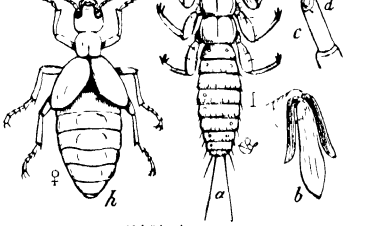
Specifically —**2** In *music* (*a*) A succession of tones, whether pleasing or not In this sense *melody* is coordinate with *harmony* and *rhythm* as the three necessary constituents of all music It depends essentially upon tones of relative pitch, successively arranged (*b*) A series of tones so related to one another as to produce a distinct musical phrase or idea The underlying relationship may be variously established by any particular rhythmic arrangement, as in some popular dance tunes, by the intervals of a single chord, as in arpeggio phrases, by a diatonic order, as in scale passages, by the harmonic connections between successive chords of which the melody in question forms one of the voice-parts, as in simple choral writing, and by innumerable



modifications and combinations of these and similar principles. (*c*) The principal voice-part in a harmonic composition, usually, now, the soprano, but in older music the tenor; the cantus firmus; the air (*d*) A song of clear and balanced form; an air, a tune A melody is *authentic* when its compass extends about an octave upward from its key-note or final, *plagal* when its compass extends about a half octave above and below the key-note and final It is *diatonic* when it uses only the proper tones of the scale in which it is written, *chromatic* when it uses other tones, foreign to that scale It is *concrete* or *conjunct* when it proceeds by single degrees, upward or downward, *discrete* or *disjunct* when it proceeds by steps of more than a single degree It is *syllabic* when but one tone is given to each syllable of the words, *slurred* when more than one tone is given to a syllable A melody may be further described as *popular*, *national*, *artistic*, etc.

=Syn. To mollify, subdue. *Melt*, *Dissolve*, *Thaw*, *Fuse*. Two words, popularly confounded, though scientifically very distinct, are *melt* and *dissolve*. The former signifies to bring a substance from a solid to a liquid condition by the agency of heat alone; the latter signifies the bringing about of this result by distributing the particles of the substance acted on among the particles of another substance which is itself liquid, and this process is termed the *solution* of the solid substance. *Thaw* differs from *melt* in being applicable only to substances whose ordinary condition is that of a liquid, and which have become solid in consequence of the abstraction of heat, and therefore return to the liquid condition as if of themselves (*Chambers's Journal*). *Dissolve* is much used as a synonym of either *melt* or *thaw*. *Fuse* is sometimes synonymous with *melt* (as to *fuse* a wire by electricity), but it is more often used of melting together, as, bell metal is made by *fusing* copper and tin. syrinx, and constitutes a pair of the vocal organs, like the vocal cords of the larynx of a mammal — **Serous membrane**, a thin membrane of connective tissue, of mesoblastic origin, lined with a simple layer of flattened epithelial cells These cells are joined together along lines which are sometimes straight but usually sinuous or jagged Between them here and there are openings (stomata) of lymphatic vessels Membranes of this kind line certain cavities of the body, and are reflected over the contained viscera, forming in this way a shut sac moistened with lymph and communicating with the lymphatic vessels through the stomata The best examples of serous membranes are the pleuræ, the pericardium, the peritoneum, and the tunicæ vaginales. — **Subradular membrane**, a membrane situated =Syn. 1-4. *Memory*, *Recollection*, *Remembrance*, *Reminiscence*. *Memory* is the general word for the faculty or capacity itself; *recollection* and *remembrance* are different kinds of exercise of the faculty; *reminiscence*, also, is used for the exercise of the faculty, but less commonly, and when it stands for the least energetic use of it, the matter seeming rather to be suggested to the mind. The correctness of the use of *memory* for that which is remembered has been disputed. The others are freely used for that which is remembered. In either sense *recollection* implies more effort, more detail, and more union of objects in wholes, than *remembrance*. *Reminiscence* is used chiefly of past events, rarely of thoughts, words, or scenes, while *recollection* is peculiarly appropriate for the act of recalling mental operations. 6. [*l. c.*] Chemical symbol, Hg; atomic weight, 200. A metal of a silver-white color and brilliant metallic luster, unique in that it is fluid at ordinary temperatures. It becomes solid, or freezes, at about −40°, and crystallizes in the isometric system. Its specific gravity at 0° is 13.6, when frozen, according to J. W. Mallet, 14.1932. This metal occurs native, sometimes in considerable quantity, but by far the largest supply is obtained from the sulphid, known as *cinnabar* (See *cinnabar*.) Mercury is not very generally disseminated. In the United States only traces of its ores have been found to the east of the Cordilleras. The principal sources of supply are the mines of Almaden in Spain, of New Almaden and others near the Bay of San Francisco, and of Idria in Austria. Its chief use is in the metallurgic treatment of gold and silver ores by amalgamation. The thermometer and barometer are instruments in which the peculiar qualities of this metal are well illustrated. Commercially the most important salts of mercury are mercurous chlorid (Hg_2Cl_2) or calomel, chiefly used in medicine, and the mercuric chlorid ($HgCl_2$) or corrosive sublimate, a violent poison used in medicine and extensively in surgery as an antiseptic, and as a preservative in dressing skins, etc., being a very powerful antiseptic. The sulphid (HgS), or cinnabar, when prepared artificially, is called *vermilion*, and is used as a pigment. The names *mercury* and *quicksilver* are entirely synonymous, but the former is rather a scientific designation, and one necessarily used in compound names and in the adjective form, while the latter is a common popular designation of this metal. See *amalgam*, *calomel*, *quicksilver*.

7. [*l. c.*] The column of quicksilver in a thermometer or barometer, especially with reference to the temperature or state of the atmosphere shown by it. [Colloq.]

D. 486, founded the Merovingian or first race of French kings (several often reigning at the same time in different parts of France), which was succeeded by the Carolingian dynasty in 751 or 752. The *writing* of the Frankish empire to which the title of *Merovingian* has been applied had a wider range than the other national hands. It had a long career both for diplomatic and literary purposes. In this writing as it appears in documents, we see that the Roman cursive is subjected to a lateral pressure, so that the letters received a curiously cramped appearance: while the heads and tails are exaggerated to inordinate length.

mesmerism (mez'mėr-izm), *n.* [< F. *mesmérisme* (Sp Pg It. *mesmerismo*); so called from Friedrich Anton (or Franz) *Mesmer* (1733–1815), a German physician, who propounded the theory in 1778, in Paris] 1 The doctrine that one person can exercise influence over the will and nervous system of another, and produce certain phenomena by virtue of a supposed emanation, called *animal magnetism*, proceeding from him, or simply by the domination of his will over that of the person operated on Originally Mesmer professed to produce his results by the operation of actual magnets, but all such apparatus has long been abandoned, and those who profess belief in magnetism as the cause of the phenomena exhibited refer it to the body of the mesmerist The actual phenomena believed to be produced by this so called animal magnetism are now explained by modern hypnotism, or artificial somnambulism, which within recent years has been the subject of extended research It is now generally admitted that there is no force of any kind transmitted from the operator to the person operated upon, and many of the pretensions of mesmerism, such as clairvoyance, are rejected. The term *mesmerism* is still popularly used, often more or less synonymously with *hypnotism*, but more frequently in its original or an allied sense Other terms used more or less synonymously with either *mesmerism* or *hypnotism* are *braidism* (after the English surgeon Braid, who first studied the phenomena of mesmerism scientifically) and *neurohypnology*

Cf. *astrolabe*.] A mechanical contrivance for geometrically extracting the roots of quantities. It consists of a number of equal rectangles, each having a diagonal marked, and all capable of sliding along a line common to the bases of all, so that they partially overlap one another. The marked diagonals are all parallel. To use the instrument, all the intersections, each formed of the diagonal of one rectangle and the overlapping edge of the next one, are brought, by the sliding along of the rectangles, into one straight line with one extremity of the diagonal of the uppermost rectangle and a point on the exposed edge of the lowermost whose distance from the extremity of the diagonal on the same edge measures the quantity whose root is to be extracted. Then

the corresponding distance on the uppermost rectangle is the root multiplied by that of the common altitude of the rectangles, which last is supposed to be known The exponent of the root is equal to the number of rectangles employed The mesolabe was invented by Eratosthenes, about 200 to 250 years before Christ.

metagenesis (met-a-jen′e-sis), *n.* [NL., < Gr. *μετά*, beyond, after, + *γένεσις*, production. see *genesis*] In *biol*, that modification of parthenogenesis or alternate generation which is exhibited when an organism passes from the egg to the imago through a series of successively generated individuals differing from one another in form distinguished by Owen from *metamorphosis*, or the transformation of any one individual by the modification of its form as a whole. Metagenesis of one or another kind is exhibited by some insects, as aphids, in which the process is commonly called *parthenogenesis*, by various internal parasites, as *Distoma* (see cuts under *cercaria*), and strikingly by various hydrozoans. In the last the cycle includes (1) the free-swimming impregnated ovum, (2) the fixation of this ovum to some submerged object and its development into an organism, (3) the formation by such organism of various zoöids, as nutritive and generative zoöids, unlike each other and unlike the parent, the whole forming a hydroid colony, and (4) the formation by generative zoöids of ova, which on being set free complete the cycle Thus, in a sertularian polyp the ovum is a free-swimming ciliated body, which on fixation develops a mouth and tentacles, and by continued gemmation produces two sets of buds, of which the generative set reproduce the free-swimming ciliated ova. In other polyps, as *Corynidæ*, the set of generative buds themselves become detached as free medusoids like jelly fish (see cut under *medusoid*), whose eggs develop not into bodies like the parent medusoid, but into the polypide or polypidom of the hydroid colony on which they were produced In the *Lucernaridæ* a similar metagenesis occurs by fission Herbert Spencer adopts Owen's metagenesis as one of three kinds of his agamogenesis, and considers it as (1) *external*, where new individuals bud from unspecialized parts of the parent, and (2) *internal*, as in the case of the transformations of *Distoma*. See *metamorphosis*

Hence *medal, mettle*] **1.** An elementary substance, or one which in the present state of chemical science is undecomposable, and which possesses opacity, luster of a peculiar kind (commonly called *metallic*, because very characteristic of the metals), conductivity for heat and electricity, and plasticity, or capability of being drawn, squeezed, or hammered with change of shape but no loss of continuity. Examples of metals possessing all these qualities, although in varying degree, are gold, silver, copper, iron, lead, and tin, all of which have been known from remote antiquity, and on the characters which they possess the idea of a metal was, and mainly still is, founded These metals also have a high specific gravity, the lightest of them (tin) being over seven times as dense as water Of the prehistorically known metals, gold, silver, and copper occur more or less abundantly in the native or metallic form, and must have been noticed, and in all probability utilized, in the most remote antiquity, by various nations and over widely extended areas Iron also occurs native, especially in the form of meteoric iron, and in this way may have first become known and utilized But iron is now, and has been from time immemorial, smelted from its ores in countries which, from almost every other point of view than the metallurgical, might properly be regarded as uncivilized The use of iron other than meteoric was not, however, known in the New World before the advent of Europeans Tin and lead do not occur in the metallic form in nature, unless in very minute quantity, hence, where used, these metals must have been obtained by the metallurgic treatment of their ores. In the case of tin and zinc, as well as of other metals not occurring native, it was not until long after some knowledge had been attained in regard to the practical use of their ores, either by themselves or as ingredients in various alloys, that any accurate idea was obtained of the metals themselves Thus, brass was certainly made long before anything definite had been learned in regard to the metal zinc, and it is not at all unlikely that the same was the case with bronze and one of its constituents, tin In addition to the six metals already mentioned, quicksilver was known to the Greeks and Romans in classical times, and this metal also occurs not infrequently in the metallic form, so that its early discovery is not a matter to excite surprise The anomalous occurrence of quicksilver as a liquid at the ordinary temperature was the reason why neither Pliny nor Isidore nor Geber included it among the metals, nor was it so included by writers on chemistry and metallurgy until after it had been discovered that this fluid could be frozen at a not very low temperature, and that when frozen it was malleable It was not until the fifteenth and sixteenth centuries that antimony, bismuth, and zinc became known, but their ores had long been in use, although, in the case of the two former metals, only to a very limited extent The discovery of these metals considerably enlarged the scope of the word *metallic*, since it became necessary to admit that metals could be brittle, this was still further exemplified in the case of the metal arsenic, discovered in 1694 (its oxidized combinations had long been known and utilized), which, although having a metallic luster, is decidedly brittle This brittleness of substances otherwise metallic in appearance led to their being placed in a class by themselves as "semi metals," the idea that malleability was a necessary attribute of a metal having come down from the Arabian chemists, and maintaining its hold for many centuries About the middle and in the latter half of the eighteenth century the number of known metals was greatly increased In 1741 platina was discovered, but the metals which are always associated with it—osmium, iridium, rhodium, ruthenium, etc —were not detected until much later At about the same time as platina, nickel and cobalt were recognized as elements—that is, were first separated and distinguished from their ores, which had been long known and (in the case of cobalt, at least) utilized to a limited extent Toward the end of the eighteenth century manganese, molybdena, tellurium, uranium, titanium, and chromium became known About the beginning of the nineteenth century several of the metals of the platina family—palladium, iridium, osmium, rhodium—were separated from the complex alloy known as *native platina* Up to this time all the known substances to which the name *metal* was applied were much heavier than water, and also decidedly heavier than those considered as non metallic Hence, as the old and long prevailing idea that all metals were malleable had been done away with, a high specific gravity began to be considered as their most important characteristic Thus we find Cronstedt, who was one of the earliest systematic writers on mineralogy (the first edition of his work was published in 1758), defining metals as "those mineral bodies which with respect to their volume are the heaviest of all hitherto known bodies" With the discovery, by Davy, in 1807, of the metallic nature of the bases of the alkalis a great change took place in this respect, for these substances, metallic from many points of view, especially with reference to their chemical affinities, are lighter than water, and at first, on this account, were by some chemists not admitted to rank as metals. The discovery of the metallic bases of the alkalis was followed by that of the bases of the earths—calcium, barium, and strontium, 1807, zirconium, 1824, aluminium, glucinium, and yttrium, 1828 These metals are all light as compared with the older metals, but heavy in comparison with the metallic bases of the alkalis, the lightest of which -lithium, discovered in 1818—has only a little more than half the specific gravity of water Cadmium, another heavy metal associated with zinc in its mode of occurrence, and of some importance in the arts, was also separated from its oxid in 1818 Many metals have been discovered within the past few years, all of great interest from the scientific point of view, but no one of them of economical importance, or occurring in sufficient quantity to be utilized to any extent even if possessing valuable properties So doubtful and difficult are the chemical reactions of some of these elements that their exact number cannot be stated Several have been worked over by chemists for years without any definite conclusion having been reached, several, after having been accepted for a while, have been dropped from the list There are about seventy generally recognized elements (see *element*), although some three or four of these may still be considered as more or less doubtful. Of the seventy thirteen are decidedly non-metallic, these

are sulphur, phosphorus, fluorin, chlorin, iodine, bromine, silicon, boron, carbon, nitrogen, hydrogen, oxygen, and selenium, all the other elements are considered to be metals, and selenium was formerly generally so considered, but latterly it has been decidedly included among the non-metals, and the name has been changed by some to *selenon*, to make it correspond with *carbon*, *boron*, and *silicon*, with which elements it is to a certain extent chemically affiliated. Tellurium, on the other hand, although closely related chemically to sulphur and selenium, has always been classed among the metals, chiefly because, although brittle, it has a decided metallic luster The names of the metals, so far as is possible, all end in *-um*, even platina is frequently written *platinum* A division of the elements into metals and non-metals is recognized by chemists at the present time as being rather a matter of convenience from the popular point of view than as one capable of exact scientific definition The words *metallic* and *metal*, however, cannot be dispensed with in common life and the arts, and their use can very rarely lead to any confusion The exceptions to this general statement that the metals have a "metallic" luster, and that the non metals do not, are, on the whole, extremely insignificant. Only in the case of selenium and phosphorus in certain of their allotropic forms could there be any question as to whether the term *metallic luster* could properly be used with reference to a non metal

Aich metal, or **Aich's metal**, an alloy of about two parts of zinc with three of copper, to which about two per cent of iron is added This alloy is very malleable at a red heat, and can be hammered, rolled, or drawn into fine wire It has been used in Austria for cannon, and is believed to have been known to the Chinese —**Antifriction metals** See *antifriction*.—**Babbitt metal**, [Named from Isaac *Babbitt*, the inventor (1799–1862)] An alloy of tin with copper and antimony, used for bearings, bushings, or pillow blocks. This alloy consists of 88 per cent of tin, the remaining 12 per cent being made up of the two other metals. Sometimes called *babbitting* —**Base metals**, in *metal*, the metals not classed as noble, especially lead, zinc, copper, and iron —**Bath metal**, [Named from *Bath*, England] A white brass consisting of 55 parts of copper and 45 of zinc The name is also given to other combinations of the same metals —**Blue metal**. (*a*) A well sinkers' name for blue clay (*b*) See *blue* —**Bowl-metal**, a name given to antimony in the second stage of the English smelting process of that metal —**Britannia metal**, an alloy containing tin, antimony, and copper, to which bismuth, zinc, and lead are occasionally added The essential metal is tin, which usually constitutes nine tenths or more of the compound, the antimony and copper being added to give the desired hardness This alloy is extensively used for table ware, being usually, for that purpose, covered with a thin coating of silver, and sold as silver plate In the best plated ware, however, the silver is laid on a body of German silver —**Coarse metal**, the technical name of the product of the second operation in the process of smelting mixed cupriferous ores in Great Britain, especially at Swansea. The product of this operation, which is performed in a reverberatory furnace, is a matte or regulus containing iron and copper in combination with sulphur in about the same proportion in which they are present in copper pyrites, together with slag —**Composition metal**. See *composition* —**Dutch metal**. See *Dutch*.—**Fusible metal**, a metallic alloy that fuses at a very low temperature Such alloys are usually composed of lead, tin, and bismuth Among those best known are—**Newton's metal**, containing 8 parts of bismuth, 5 of lead, and 3 of tin, which fuses at 202°, **Rose's metal**, 2 parts of bismuth, 1 each of tin and lead, fusing at 201°, and an alloy of 5 parts of bismuth, 3 of lead, and 2 of tin, fusing at 197 The addition of cadmium to alloys of bismuth, tin, and lead lowers their fusing point considerably Thus, if from 3 to 10 per cent of cadmium is added to Rose's metal, the melting-point is reduced to 167° The alloys known as Wood's and Wood and Lipinsky's metals are such alloys of cadmium, bismuth, tin, and lead One of these, containing cadmium 4 parts, and tin, lead, and bismuth each 5 parts, melts at 150° The addition of mercury to fusible alloys like Newton's and Rose's metals is said also to lower their fusing-point considerably —**Gathered metal**. See *laded metal*, under *lade*[1] —**Gedges's metal**. Same as *Aich metal* —**Heavy metal**. See *heavy*[1] —**Kier's metal**, a gun metal composed of 100 parts of copper, 75 of zinc, and 10 of iron —**Laded metal**. See *lade*[1] —**Light metal**, any metal of which the specific gravity is less than 5 —**Magnetic metals**, iron, nickel, cobalt, chromium and manganese —**Munts's metal**. [Named from Mr *Muntz* of Birmingham, the inventor] Yellow metal, an alloy of 3 parts of copper and 2 of zinc, differing from common brass in being malleable when hot It is cheaper and can be more easily rolled than copper, and has taken its place as the material used for sheathing, formerly one of the most important uses to which copper was put *Yellow metal* is its general commercial name Also called *patent metal* —**Newton's metal**. See *fusible metal*, above —**Noble or perfect metals**, gold, silver, and platinum so called because when exposed to the air they do not oxidize like other metals, but retain their metallic luster —**Organ- or pipe-metal**, an alloy of tin and lead, with or without zinc, used for the construction of organ pipes The value of the metal depends principally upon the proportion of tin used, less than 50 per cent making poor metal A fair percentage of tin is indicated by a spotted surface, hence good metal is also called *spotted metal* —**Patent metal**. Same as *Muntz's metal* —**Pimple-metal**. See *white metal* —**Point of fusion of metals**. See *fusion* —**Prince's metal**, an alloy said to have been so called because first prepared by Prince Rupert (1619–82), nephew of Charles I of England, who invented, or at least introduced into England, the so-called "Prince Rupert's drops." There is no certainty in regard to the composition of the alloy called prince's metal By most writers it is said to have been a kind of brass, others describe it as an alloy of copper and arsenic —**Rose's metal**. See *fusible metal*, above —**To burn metals together**. See *burn*[1] —**White metal**, the product of the fourth operation in the smelting of mixed cupriferous ores (according to the English process) The object of this stage of the process is to remove the iron, and the work is done in a reverberatory furnace, the third stage having been a calcination of the coarse metal, with the object of converting the sulphuret of iron into an oxid The product of the fourth operation is variously designated as *blue white* or *pimple metal*, according to the percentage of copper contained and the peculiar appearance exhibited Portions having a smooth lustrous fracture, and containing from 60 to 70 per cent of copper, are designated as *blue metal*, those of grayish white color, with granular fracture, and containing from 75 to 78 per cent of copper, are called *white metal* *Pimple metal* is that which contains more than 78 per cent of copper, and has its surface pimpled from the escape of sulphurous acid gas —**Wood's metal**. See *fusible metal*, above —**Yellow metal**. Same as *Muntz's metal*

II. *n* In *chem* , a term which has been variously applied as, (*a*) to the metallic bases of the fixed alkalis and alkaline earths, probably in consequence of their low specific gravity, and (*b*) to all the non-metallic elementary substances In the latter sense it is now used by chemists. The metalloids are thirteen in number oxygen, hydrogen, nitrogen, carbon, chlorin, bromine, iodine, fluorin, sulphur, selenium, phosphorus, boron and silicon The distinction between a metal and a metalloid is, however, purely artificial, being based on physical rather than chemical criteria; but, broadly a metal may be said to differ from a metalloid in being an excellent conductor of heat and electricity, in reflecting light more or less powerfully, and in being electropositive. Though a metalloid may possess one or more of these characters, it will not be found to unite them all Berzelius, in his classification, restricts the term *metalloid* to the inflammable non-metallic elements — sulphur, phosphorus, carbon, and boron. Simple disks of various metals are employed in contact with the external parts of the body, from which different therapeutic results are claimed Other observers assert that all the phenomena described as following the application of metals may be produced by disks of wood, and that whatever curative results are attained are due to mental effects, rather than to any special virtues emanating from the metals themselves.

It *metallurgia*, ⟨ NL *metallurgia*, ⟨ Gr *μεταλλωργός*, working metals, a miner, ⟨ *μέταλλον*, a mine (metal), + *ἔργον*, work.] The science of smelting. In smelting, the metals are separated by known methods from the mineral izing substances with which, with few exceptions, they naturally occur combined Thus, the common ore of lead is galena, a combination of sulphur with that metal The smelter treats this combination in the furnace, and the result is metallic lead The treatment of some ores is simple and easy , that of others is difficult and complex. Smelting implies the use of fire, or separation of the metal in the dry way, but processes carried on in the humid way are not unfrequently employed in the treatment of metalliferous ores. This is not ordinarily called smelting, but metallurgical treatment The ores of many mining regions are treated at or near the place where they are mined, but it is not at all uncommon for ores to be carried to a great distance to be smelted Thus, until within a few years, a large part of the copper used in the world was smelted at Swansea, in Wales, from ores brought from various countries, metallurgical skill and the command of cheap fuel making it desirable to have the ore treated there rather than at the place where it was mined Abbreviated *metal*

metamorphic (met-a-môr'fik), *a* [= F. *métamorphique*; as Gr. *μετά*, among (denoting interchange), + *μορφή*, form, + *-ic*. Cf. *metamorphosis*] 1. Exhibiting metamorphosis or metamorphism, changed in form or structure; metamorphosed —**Metamorphic rocks**, in *geol* See *metamorphism.*

metamorphism (met-a-môr'fizm), *n.* [As *metamorph-ic* + *-ism.*] The process of metamor-

phosing, or changing the form or structure; specifically, chemical change and rearrangement of the constituents of a rock by which they are made to assume new forms and enter into new combinations, the most important result of these changes being that the rock becomes harder and more crystalline in structure Thus, the metamorphic slates are crystalline schists The sedimentary rocks, especially those made up of the debris of feldspathic minerals, are those most liable to undergo metamorphism, hence it is that the argillaceous rocks offer the most conspicuous examples of this process, and it is these which are most altered in external characters by it, foliation and slaty cleavage being often highly developed in the process Volcanic rocks also are subject to metamorphic changes, although the results are usually much less conspicuous to the eye unaided by a microscope than in the case of the sedimentary deposits Examples of metamorphism are the conversion of ordinary earthy limestone into crystalline marble, of argillaceous shales into various kinds of schists (mica schist, talc-schist, etc), and of sandstone into quartzite Closely connected with the phenomena of metamorphism is the development in a rock of a slaty cleavage or of a foliated structure Metamorphic agencies and the results which they have brought about have been much studied of late years by geologists, and the modern methods of lithological research have been most important aids in this direction The most obvious and generally accepted classification of metamorphic action is into "contact" and "regional" metamorphism In the case of contact metamorphism the changes observed are apparently due — in large part, at least - to the presence of an adjacent mass of rock, usually of an intrusive character, as when the strata are seen to have been altered along the walls of a dike In the case of regional metamorphism when large masses of rock are found to have been affected and rendered crystalline without any special cause being visible in the form of adjacent intrusive or igneous material, the phenomena are more difficult of explanation than in the case of contact metamorphism In the course of the numerous discussions of this subject a great number of new terms have been introduced, the meaning of which is, owing to the complexity of the phenomena and the imperfection of the observations, often rather obscure, some of these terms may here be cited As synonyms of "regional" metamorphism, the epithets "normal" and "general" have been used by some authors, while others have indicated a desire to specialize in their application Thus, Prestwich limits "normal metamorphism" to the changes due to central heat, and "regional metamorphism" to changes effected by the heat produced locally within the crust of the earth by transformation into heat of the mechanical work of compression or of crushing of parts of the earth Bonney desires to reserve the phrase "regional metamorphism" for those ancient rocks occupying extensive areas of the earth's surface "which, whatever be their history, are in all probability by no means in their original condition" Dana prefers "local" to "contact," but does not use the two exactly as synonyms, since he makes local "include changes due to heated emanations and other conditions where there are no contacts" - in other words he uses "local" rather as the opposite of "general," ignoring the idea embodied in the term "contact," namely that a visible cause of the altered metamorphism is present in the form of an adjacent mass of intrusive or heterogeneous rock Kinahan proposes "metapepsis" and "paropteisis" as the synonyms of regional and contact metamorphism "Why we need go to the Greek for [the] two words is not clear" (*Dana*) Many geologists are of the opinion that the movements which the rocks composing the earth's crust have undergone in certain regions, which movements must necessarily have been accompanied by pressure, stress, shearing, or "flow," have been among the most important causes of metamorphic change The most comprehensive term by which metamorphism originating in conditions of this kind has been designated is that introduced by Rosenbusch, "dynamical" Other writers on this subject have used as being nearly or quite synonymous with "dynamical" the following "pressure," "compression," "mechanical," "friction," "dislocation" Judd has introduced the term "statical metamorphism" as indicating changes which may have taken place in deep seated rocks quite independently of any movement to which they have been subjected As designating and discriminating between various kinds of metamorphic changes, with special reference to the character of the results produced, Dana has introduced the terms "crystallinic," "paramorphic," and "metachemic" The first of these implies a simple development of a crystalline condition in the original material, such, for instance, as takes place in the conversion of limestone into marble ("marmorosis" of Gelkie), the second, a change from one paramorphic state to another, as from augite to hornblende, the third, a change through chemical transformations, as of chrysolite to serpentine "Metasomatic metamorphism" (or, in one word, "metasomatosis") and "methylosis" are terms which have been suggested in this connection but which have met with little favor, they were apparently intended by their authors to include chemical changes similar to those which take place in the formation of pseudomorphs, and are allied to the "metachemic" of Dana. "Metastasis" and "metacrasis" are terms which have been coined, but have not become current — the one to denote changes somewhat similar to those included by Dana under "crystallinic," the other (as defined by that author) to "denote changes like the conversion of a mass of mud into a mass of quartz with mica and other silicates"

metayer (me-tā'yėr, F pron mā-tā-yā'), *n* [< F. *métayer*, < ML. *medietarius*, one who tills land for half the produce, < L *medieta(t-)s*, middle place, half see *moiety*, *mediety*] A cultivator who tills a farm or piece of ground for the owner, on condition of receiving a share of the produce, generally a half, the owner generally furnishing the whole or a part of the stock, tools, etc This system of cultivation, called *metayage* or the *metayer system*, prevails in the central and southern parts of France and in most of Italy, and is practised to a considerable extent in the southern United States

The principle of the *metayer* system is that the labourer or peasant makes his engagement directly with the landowner, and pays, not a fixed rent, either in money or in kind, but a certain proportion of the produce, or rather of what remains of the produce after deducting what is considered necessary to keep up the stock The proportion is usually, as the name imports, one half, but in several districts in Italy it is two thirds Respecting the supply of stock, the custom varies from place to place, in some places the landlord furnishes the whole, in others half, in others some particular part, as for instance the cattle and seed, the labourer providing the implements
J S Mill, Pol Econ, II viii § 1

The *metayer* has less motive to exertion than the peasant proprietor since only half the fruits of his industry, instead of the whole, are his own

Metazoa (met-a-zō'a), *n pl* [NL, pl of *metazoon*, q v] All those animals which are above the *Protozoa*, and which in the course of their development undergo certain metamorphoses, consisting of the primary segmentation of a true egg or ovum, and the subsequent passage through an embryonic condition in which they possess at least two distinct germinal layers; animals exhibiting cellular differentiation The *Metazoa* are distinguished from the *Protozoa* in that the substance of the body is differentiated into histogenic elements that is to say, into cells In all the *Metazoa* the ovum has the form of a nucleated cell, the first step in the process of development being the production of a blastoderm by the subdivision of this cell, the cells of the blastoderm giving rise in turn to two layers of cells, endoderm and ectoderm, between which, in most cases, a mesoderm appears, to be itself split in two layers, such a four layered germ developing finally all the histological elements of the adult body With the exception of certain parasites, and the extremely modified males of a few species, all these animals possess a permanent alimentary cavity lined by a special layer of endodermal cells Sexual reproduction is the rule, and very generally the male element has the form of filiform spermatozoa The lowest term in the series of the *Metazoa* is represented by the *Porifera* or sponges Those of the *Metazoa* which possess a notochord, and in the adult state have the trunk divided into segments or myotomes, constitute the subkingdom *Vertebrata*, the rest are the several subkingdoms of invertebrates Compare *Protozoa* See *Mesozoa*, and cuts under *gastrulation*

meteorite (mē'tē-or-it), *n* [< *meteor* + *-ite*²] A mineral or metallic mass of extraterrestrial origin, or which, to use the common expression, has "fallen from the heavens" Bodies of this kind were formerly often called *aerolites*, but *meteorite* is now their generally accepted name among scientific men The fall of meteorites upon the earth is a by no means infrequent occurrence, and records of such events date back to many centuries before the present era Traditions point to the very early use of meteoric iron for the manufacture of weapons and it is also known that meteorites were not unfrequently the objects of worship in various parts of the world In spite of this, the fall of rocks or metals from the heavens seemed to be so improbable an event that full credence was not given by scientific men to stories of such occurrences until about the beginning of the present century, when, several falls having taken place at Barbotan, France, 1790 Siena, 1794, Wold Cottage, Yorkshire, Eng 1795 Salés, France, 1798 Benares, 1798, L'Aigle, France, 1803, the details of some of which were thoroughly investigated, a further denial of their genuineness became impossible From the time of the fall at L'Aigle all doubt in the matter was abandoned There are now several collections of meteorites, each of which contains specimens of between 300 and 400 different falls, and the whole number known is not far from 600 although it is by no means the case with all these occurrences that the specimens were seen to fall many of them have been found on the earth's surface but have been recognized as being extra terrestrial by their peculiar appearance and composition The most important facts with regard to meteorites may be concisely stated as follows They have not been found to contain any element not known to occur on the earth they have furnished no evidence of the existence of life on the body or bodies of which they originally formed a part they bear no indications of having been formed in the presence of water, or of the existence of water beyond the earth's atmosphere in the regions from which they came they do exhibit abundant evidence of having had what geologists would call an igneous origin they are never granitic in character, but resemble very closely certain volcanic rocks of not infrequent occurrence with this difference, that in the case of the meteorites the iron associated with the silicated combinations exists in the metallic form while in the terrestrial volcanic rocks it is with rare exceptions, oxidized Furthermore meteorites almost without exception, show a certain family resemblance so that it is necessary to admit, either that they all originally formed a part of one celestial body or else that having come from various members of the solar system, or from other systems, these have a wonderful resemblance to each other and to the earth itself The most obvious division of meteorites is into *metallic* and *stony*, but the passage from one class to the other is by no means an abrupt one All metallic meteorites agree in that the predominating metal is iron, with which nickel is almost invariably associated, indeed, it has not been proved that there is any meteoric iron entirely free from that metal With the nickel cobalt is almost always found, as is the case in terrestrial combinations Tin and copper are also frequently found in meteorites in small quantity The precious metals have not been detected in them Meteorites composed almost entirely of metallic (nickeliferous) iron forming a nearly homogeneous mass, have been denominated *siderolites* These, however, almost always contain irregular nodular masses of pyrrhotite, schreibersite (phosphuret of iron and nickel), either one or both and occasionally of graphite In a large proportion of the meteoric irons etching the polished surface with an acid develops the so-called "Widmanstattian figures" The development of these figures on the polished surface of a mass of iron found upon the earth's surface, and in regard to the time of whose fall nothing was known was formerly considered to be sufficient evidence of the celestial origin of such a mass especially if in addition, the presence of nickel con- bonic analysis While most of the me- related have almost certainly been con- ng the meteorites, there may be cases in w- ence has not been justifiable, since it is now known that all celestial irons do not give the Widmanstattian figures, while the iron found in large quantity and over a wide area associated with and embedded in basalt near Ovifak in Greenland, contains nickel, and gives, when etched figures which have generally been considered as Widmanstattian, although others have denied that they could properly be so denominated The terrestrial origin of the Ovifak iron is however, now generally admitted although for a considerable time after its discovery this was not the case The wide extent of the area over which this iron occurs, and its peculiarly intimate association with the minerals of which the basalt is made up forbid the idea that the metal could have fallen from above into lava in process of eruption, which was at first the favorite theory of its origin Next in order to the siderolites come the *pallasites*, so named from the fact that a large meteorite of this class was in 1772 discovered in Siberia by the distinguished traveler Pallas Under the name of *pallasite* are comprehended those meteorites which consist of a spongy or vesicular mass of iron, the cavities of which are in most cases partly or entirely filled with olivin, with which various other minerals are frequently associated, enstatite and bronzite being the most common, while chromite is of not infrequent occurrence Both siderolites and pallasites belong to the class of metallic meteorites By far the larger part of the stony meteorites are included under the designation of *chondrites* In these the iron is distributed in fine particles through a more or less intimate mixture of silicates, with which chromite and magnetic pyrites are frequently associated, the silicates being chiefly olivin and bronzite The name *chondrite* has reference to the fact that in this class of meteorites the material of which they are composed occurs in the form of rounded grains (chondri) The chondritic meteorites have, however a quite varied structure, in some few cases passing into a breccia they have been divided into numerous subgroups in accordance with these structural variations Most of the stony meteorites contain iron disseminated through their mass in grains or nodules but there are a few which are destitute of such metallic particles There are also a few stony meteorites which do not exhibit any traces of a chondritic structure the minerals of which these are made up do not, however differ very essentially from those occurring in the chondrites There are also a few very anomalous meteorites which contain carbonaceous matter associated with the stony chondritic material This carbon is not graphitic, but is combined with hydrogen and oxygen the product resembling to a certain extent that resulting from the decay of organic matter, but no traces of vegetable tissue have been discovered in these carbonaceous meteorites which are only five or six in number One or two interesting facts remain to be mentioned The first is that since the phenomena of meteorites began to be observed and studied there have been extremely few falls of metallic meteorites Of all the meteoric irons in the various collections, those of Hraschina in Austria (1751), of Dickson county, Tennessee (1855), of Braunau in Bohemia (1847), and a few others (in all probably about nine), are the only ones positively known to have fallen, all the others are considered meteoric on account of their peculiar appearance and chemical composition The observed falls of stony meteorites, on the other hand are numerous Another remarkable fact is that all the meteorites which are known to have fallen are of infinitesimally small size as compared with the earth In the fall of l'Aigle some 2,000 to 3,000 stones were estimated to have reached the earth and of these the largest weighed only seven or eight pounds The largest meteorites of which the fall was observed are that of Lissa in (1492), which weighed about 280 pounds, that of Juvinas (1821), 242 pounds, and that of Emmett county, Iowa (1879), when a considerable number of stones fell the largest of them weighing 437 pounds Some masses of iron believed to be meteorites, the date of whose fall is unknown, are much larger than this but still utterly insignificant in size, not only as compared with the earth or its satellite, but even with the smallest celestial body of which anything is definitely known, namely the outer satellite of Mars, which has been estimated at from five to twenty miles in diameter The mass of iron on the river Bandego in Brazil has been variously estimated at from seven to ten tons in weight, that of Tucuman (Campo del Cielo) is said to weigh fifteen tons The Santa Caterina iron appears to be still larger having been estimated at twenty five tons, but doubts have been expressed as to whether this is really of celestial origin **Neumann's lines**, structural lines described by J G Neumann as occurring in the Braunau meteorite

2. In *music*, the division of a composition into parts of equal time-value and of similar essential rhythmic structure. The smallest part thus indicated is that between successive primary accents, and is called a *measure*, in printed music this is marked by a bar before each primary accent But meter includes also, in a general way, the division of a piece into equal and similar parts of more than one measure, such parts being called *phrases* or *strophes* In this sense musical meter has obvious analogies with meter in verse, though the analogies cannot always be pressed with safety, especially as the nomenclature is not strictly parallel (See *metrics*[2], 2) *Rhythm* may be distinguished from *meter* in that it deals primarily with the accents and the typical and actual accentual patterns, which meter gathers into groups and sections in accordance with their time value This distinction, however, is not always observed or even acknowledged Sometimes the meaning of the term is reversed, rhythm being made a matter of time, and meter one of accent Sometimes, too, the two terms are made entirely interchangeable

3. In *Eng hymnology*, a pattern of versification, including the structure of the prosodical feet used, the grouping of those feet into lines, and the grouping of lines into stanzas or strophes, popularly called *verses* See *foot* and *versification*. According to the kind of feet used, meters are usually either iambic, trochaic or dactylic The principal *iambic meters* are *Common Meter* (C M), having alternately eight and six syllables to the line, *Long Meter* (L M), having eight syllables to the line, and *Short Meter* (S M), having two lines of six syllables, followed by one of eight, and then by another of six Each of these meters has properly four lines to the stanza, so that their syllabic scheme is as follows C M, 8, 6, 8, 6, L M, 8, 8, 8, 8, S M, 6, 6, 8, 6 Each of them may also be doubled, so as to make eight-lined stanzas, the meter then being called *Common Meter Double* (C M D), *Long Meter Double* (L M D), or *Short Meter Double* (S M D). Long meter may also have six lines to the stanza, and is then called *Long Meter*, *Six Lines*, or *Long Particular Meter* (L P M), with the syllabic scheme 8, 8, 8, 8, 8, 8 Other meters of this class are *Common Particular Meter* (C P M), 8, 8, 6, 8, 8, 6, *Short Particular Meter* (S P M.), 6, 6, 8, 6, 6, 8, *Hallelujah Meter* (H M.), 6, 6, 6, 6, 8, 8 (or 6, 6, 6, 6, 4, 4, 4, 4), *Sevens and Sixes*, 7, 6, 7, 6, *Tens*, 10, 10, 10, 10, etc The principal *trochaic meters* are *Sevens*, 7, 7, 7, 7, *Eights and Sevens* 8, 7, 8, 7, *Sixes*, 6, 6, 6, 6, *Sixes and Fives*, 6, 5, 6, 5, etc The principal *dactylic meters* are *Elevens*, 11, 11, 11, 11 *Elevens and Tens*, 11, 10, 11, 10, etc Numerous modifications of these schemes occur, especially in recent hymns.—**Accentual meters.** See *accentual* —**Hipponactean meter, Hymenaic meter, Ionic meter** See the adjectives —**In short meter, short meter**, quickly, in short order [U S]

Tylor read an interesting paper on the laws of marriage and descent, illustrative of his ingenious method of studying ethnological phenomena. All myths and customs on a close study, may by analysis be disintegrated, and are found to consist of certain elements. Dr. Tylor arranges these elements statistically and, by inquiring which occur simultaneously among various peoples, proves that certain groups of such elements belong generically together. This he calls the *method of adhesions*.

metronome (met'rō-nōm), *n* [= F *metronome*, < Gr *μέτρον*, a measure, + *νόμος*, law see *nome*[3]] A mechanical contrivance for marking time, especially as an aid in musical study or performance In its usual form it consists of a double pendulum (oscillating on a pivot near its center), the lower end of which is weighted with a ball of lead, while the upper end carries a weight of brass that may be moved up or down When the latter weight is moved up, the rate of oscillation is slower, when it is moved down, the rate is faster The upper end of the pendulum is graduated so that any desired number of oscillations per minute can be secured The whole is connected with clock work having a strong spring whereby the oscillation may be maintained for several minutes, and each oscillation may be marked by a distinct tick or clack The invention of the metronome was claimed by J N Maelzel in 1816, but it is probable that he only adapted and introduced it to general use The instrument is used for recording the tempo desired by a composer, and also as a means of teaching beginners the habit of keeping strict time Its use is indicated in printed music by the *metronomic mark* (which see, under *mark*[1]) Sometimes an attachment is added for striking a bell at every second, third, fourth, or sixth oscillation, so as to mark primary accents such a metronome is called a *bell metronome* Various other metronomes have been invented, most of which are based upon the pendulum principle Abbreviated *M*

Every pious Jew, as often as he passes the *mezuzah*, in leaving the house or in entering it, touches the divine name with the finger of his right hand, puts it to his mouth, and kisses it, saying in Hebrew "The Lord shall preserve thy going out and thy coming in from this time forth, and even for evermore" (Ps. cxxi. 8).

Thus treated, the plate when inked, prints impressions graded in light and shade according to the requirements of the design, from a rich velvety and perfectly uniform black up through every variation of tone to brilliant white, or showing, when desirable, the sharpest contrasts between the extremes. This style of engraving, invented by Van Siegen, a Dutchman, in 1643, though erroneously ascribed to his pupil Prince Rupert, has been pursued with most success in England. The defect of the process is that it does not admit of clear and sharp delineation of forms, hence in modern practice the outline of the design is strongly etched with acid before the cradle is used, and texture is often given to the finished plate by lines produced by dry point etching.

mica[1]† (mī'kă), *n* [= OF. (and F) *mie* = It *mica*, < L *mica*, a crumb, grain, little bit Hence ult *miche*[1] and *mie* see *mie*] A crumb, a little bit *E. Phillips*, 1706

mica[2] (mī'ka), *n* [= F. *mica* = Sp Pg *mica*, a mineral, < NL *mica*, a glittering mineral (see def.), < L. *mica*, a crumb (cf *mica*[1]), prob applied to the mineral on the supposition that it was related to L *micare*, shine, glitter] 1. One of a group of minerals all of which are characterized by their very perfect basal cleavage, in consequence of which they can be separated easily into extremely thin, tough, and usually elastic laminæ They occur in crystals with a prismatic angle of 120°, but more commonly in crystalline aggregates, often of large plates, but sometimes of minute scales having a foliated structure the folia being generally parallel, but also concentric, wavy, and intrewoven and also arranged in stellate or plumose and sometimes almost fibrous forms In crystallization the micas belong to the monoclinic system, but they approximate very closely in form in part to the orthorhombic system (*e. g.*, muscovite), in part to the rhombohedral system (*e. g.*, biotite) The micas are silicates of aluminium with other bases, as iron, calcium, magnesium, potassium, sodium, lithium, in some kinds fluorin is present in small amount The prominent varieties are—*muscovite* or common potash mica, the light-colored mica of granite and similar rocks, and *paragonite*, which is an analogous soda species *biotite*, or magnesia mica (including meroxene and anomite distinguished according to the position of the optic axial plane), the black or dark green mica of granite, hornblende rocks, etc, *phlogopite*, the bronze colored species common in crystalline limestone and serpentine rocks, *lepidomelane*, a black mica containing a large amount of iron, and *lepidolite* the rose red or lilac lithia mica occurring commonly in aggregates of scales. (See further under these names) The micas enter into the composition of many rocks, including the crystalline rocks, both metamorphic and volcanic (as granite, gneiss, mica schist, trachyte, diorite, etc.), and sedimentary rocks (as shales and sandstones), sometimes giving them a laminated structure In the sedimentary rocks they are in most cases derived from the disintegration of older crystalline rocks. Mica (muscovite) is often used in thin transparent plates for spectacles to protect the eyes in various mechanical processes, in reflectors, instead of glass in places exposed to heat, as in head lights and stove- and lantern lights, and even for windows in Russia (hence called *Muscovy glass*) Ground to powder, it is combined with varnish to make a glittering coating for wall papers, and is used also in preparing a covering for roofs, and as a packing and lubricator for machinery It is often vulgarly called *isinglass* The so called *brittle micas* include a number of species, as margarite, seybertite (clintonite), etc., which are related to the true micas, but are characterized by their brittle folia 2. In the preparation of kaolin for use in the manufacture of porcelain, one of the second set of channels through which a mixture of water and suspended clay washed out by the water from the broken clay-bearing rock is slowly passed to obtain the deposition of flakes of mica and other foreign substances, and thus to purify the clay, which is finally allowed to subside in a series of pits or tanks Each of the first set of channels through which the mixture is passed for the settling of the coarser flakes of mica, etc, is called a *drag* This set of channels is collectively called *the drags*, and the second set *the micas* See *porcelain* and *kaolin*.—**Copper mica.** Same as *chalcophyllite* —**Lithia mica.** Same as *lepidolite* —**Mica-powder**, giant-powder in which mica in fine scales takes the place of the siliceous earth *Ewster*, Mod High Explosives, p 353

mica-schist (mī'kă-shist'), *n* A rock made up of quartz and mica, with a more or less schistose or slaty structure The relative proportion of the two minerals differs often very considerably even in the same mass of rock The usual mica in a typical mica schist is the species called muscovite, this, however, is sometimes replaced to a certain extent by biotite or paragonite Mica schist passes readily into talc schist and chlorite schist, and when feldspar is added to the other constituents of the rock it becomes gneiss It is one of the most abundantly distributed of the so called crystalline or metamorphic rocks, and, with granite, gneiss, and the other members of the schist family, forms the main body of the rocks formerly designated as *primitive*

Micrococcus prodigiosus

The term is most frequently applied to various microscopic plants or their spores (particularly *Schizomycetes*), and further has come to be almost synonymous with *bacterium*. Taken in this latter sense, microbes are regarded as essentially polymorphous organisms, adapting themselves to varied conditions of existence, which in turn influence the form taken by them For this reason their classification has often varied, since their distinction into genera and species does not yet rest on precise data. *Micrococcus, Sphærocheete, Bacillus, Leptothrix, Bacterium, Vibrio, Spirillum*, and *Myconostoc* are the genera or form genera under which most of the forms are known They are instrumental in the production of fermentation, decay, and many of the infectious diseases affecting man and the lower animals

That devised by Kershaw for testing the weight of gold pieces consists of a steelyard supported on a knife-edged fulcrum and geared with a wheel graduated to half grains. If the coin is of correct weight, the index points to zero If it is light, the leverage of the beam turns the wheel until equilibrium is attained, when the index-bar points to the number of half-grains of shortage *E H Knight* — **Mother-of-pearl micrometer**, Cavallo's micrometer, which consists of a thin semitransparent piece of mother of pearl, $\frac{1}{50}$ of an inch wide, having fine graduations. microscope (mī′krō-skōp), *n.* [= F. *microscope* = Sp. Pg. It. *microscopio*, < NL. *microscopium*, < Gr. *μικρός*, small, + *σκοπεῖν*, view.] **1.** An optical instrument consisting of a lens or combination of lenses (in some cases mirrors also) which magnifies and thus renders visible minute objects that cannot be seen by the naked eye, or enlarges the apparent magnitude of small visible bodies, so as to render possible the examination of their texture or structure. The *single microscope*, which is the simplest form, is merely a convex lens, near to which the object to be examined is placed, it is also called a *magnifying-glass* or *-lens* (see *magnifying lens*, under *lens*). The *compound microscope* consists essentially of two lenses, or systems of lenses one of which, the object-glass or objective, forms an enlarged inverted image of the object, and the other, the eyepiece or ocular, magnifies this image. The eyepiece and objective (see these words) are placed at the opposite ends of the tube or body, which is often made of two closely fitting parts so that its length (and thus the distance between the glasses) can be varied at will, it is then called a *draw-tube*. The object under examination is placed upon a support, called the *stage*, beneath the objective, its position upon this may be adjusted by the hand, or, better, the object and the stage (then called a *mechanical stage*) are moved together by some mechanical arrangement, as, for example, by two screws giving motions in two directions at right angles. The proper distance between the objective and the object (such that the image of the latter shall be seen clearly, or be *in focus*) is usually attained by the movement of the tube as a whole. This is accomplished by the rapid motion of the *coarse adjustment*, and more slowly and accurately, as is necessary in the case of high powers, by an arrangement called the *slow motion* or *fine adjustment*. The necessary illumination is obtained by a concave mirror below the stage, which reflects the light upon the object. An achromatic condenser, usually in connection with a diaphragm, is often added to converge the light more strongly, for opaque objects a bull's eye condenser, a lieberkühn, or some other form of reflector is employed. The body of the microscope, with the stage, etc., is supported firmly upon a stand, and usually attached by a joint which allows of its being inclined at any desired angle between the vertical and horizontal positions. Many accessories, or special devices applicable to particular uses, may be added to the microscope in its essential form, as a micrometer, polarizing prisms, camera lucida, etc. The compound microscope itself often varies widely in construction, according to the character of the work for which it is to be used (Compare also the phrases below.)

2. [*cap.*] A constellation. See *Microscopium*. — **Achromatic microscope.** See *achromatic*. — **Binocular microscope**, a microscope so constructed that the object may be viewed simultaneously by both eyes, with the advantage (usually but not necessarily attained) that it is then seen in relief. It has a single objective, but two tubes, each with its own eyepiece, a prism causes the luminous rays from the objective to separate and pass through each tube. — **Double-bodied microscope**, a microscope in which the object under examination can be viewed by more than one person at the same time. As in the binocular microscope, a prism divides the rays from the objective; two other prisms receive the separated rays, and the respective pencils are directed through the different bodies of the instrument. — **Filar microscope**, a microscope having cross wires in the focus of the eyepiece. — **Inverted** or **chemical microscope**, one with the object-glass placed beneath the object and the stage. The luminous rays which have passed down through it are reflected by an inverting prism up the obliquely placed tube to the eyepiece. This form is sometimes used in chemical work, when acid fumes are present. — **Magnifying power of a microscope**. See *magnifying*. — **Monocular microscope**, one with a single tube, for use with one eye only. — **Pankratic microscope**, a name sometimes given to a microscope having the eyepiece in a sliding draw-tube (see def. 1). — **Petrographical microscope**, a form of microscope especially adapted for minute study of the structure of rocks. It is provided with a graduated and revolving stage and an arrangement for accurately centering the object-glass. It has also a polarizing apparatus, of which the upper nicol prism or analyzer is contained in a separate support which can be easily revolved on a graduated circle or removed at will. The lower nicol or polarizer is supported beneath the stage, and can also be revolved in a graduated collar. With these arrangements the directions of light-extinction in a section of a crystal can easily be determined. Besides the usual eyepiece and object-glass, an additional lens, or series of lenses, can be placed over the lower nicol prism when converging light is required, as in examining the uniaxial or biaxial interference figures of crystal-sections. — **Reflecting microscope**, a form of microscope in which the object is placed outside of the tube, or outside the axis of the tube, and reflects its image to the spectulum by means of a plane mirror inclined at an angle of 45° to the axis of the former. — **Solar, lucernal, and oxyhydrogen microscopes**, instruments in which the illumination employed comes from the sun, a lamp, and an oxyhydrogen lime light respectively.

migration (mī-grā'shon), *n*. [< F *migration* = Pg *migração* = It *migrazione*, < L *migratio(n-)*, < *migrare*, pp *migratus*, migrate see *migrate*] **1.** The act of migrating, change of residence or habitat, removal or transit from one locality or latitude to another, especially at a distance Among animals, the most extensive and regular migrations are performed by birds during spring and fall, and in a general way along meridians of longitude, the vernal migration being northward, the autumnal southward This is ordinary or equatorial migration In cold and temperate latitudes of the northern hemisphere nearly all insectivorous birds perform migration Some, as sandpipers, which breed only in high latitudes, may be dispersed during their migration over a great part of the world Others, as swallows, are noted not only for the extent but for the rapidity and regularity of their movements, their arrival and departure being capable of prediction with considerable accuracy The migration of many water fowls is scarcely less notable in the same respects Migration seems to be determined, primarily and chiefly, by conditions of food supply, but this does not fully account for the apparently needless extent and the wonderful periodicity of the movement, nor for the fact that individuals sometimes return to exactly the same spot to breed again, after passing the winter perhaps thousands of miles away Migrations of mammals are more irregular than those of birds, less definitely related to latitude and longitude, and more obviously dependent upon food supply such are the excursions, often in enormous hordes, of various arctic animals, as lemmings and other rodents, reindeer, musk oxen, foxes, etc. Such movements do not appear to be specially related to reproduction Many fishes migrate from and back to the sea, ascending rivers to spawn, as is notably the case with anadromous fishes of the salmon and herring families, with eels the case is reversed, with many fishes the catadromous migration is between deeper and shallower, or colder and warmer, salt water Periodical migration is also marked with certain insects. Thus, *Anosia plexippus*, the milkweed-butterfly, migrates southward in the fall to hibernate in the pine woods of

the southern United States The faculty which enables or compels animals to migrate has been named the "instinct of migration", but the phrase is rather a statement of fact than an explanation of the phenomenon, except in so far as this instinct may be regarded as originating in and being highly developed from the simple necessity of moving about to secure food.

Geographical or **nautical mile**, a mile variously defined as (1) the mean length of a minute of latitude = 6,082.66 feet, (2) the length of a minute of the meridian corresponding to the radius of curvature of the particular latitude, varying from 6,045 95 feet at the equator to 6,107 85 feet at the poles , and (3) the length of a minute of longitude on the equator = 6,087 15 feet. To remove all uncertainty, the United States Coast Survey has adopted the value of the nautical mile as equal to one sixtieth part of the length of a degree on the great circle of a sphere whose surface is equal to the surface of the earth This value gives one nautical mile = 6,080 27 feet, which is very nearly the value of the Admiralty knot (6,080 feet) adopted by the British Hydrographic Office — **Three-mile limit, belt**, or **zone** (also called the *marine belt*), in *international law*, that part of the margin of the high seas which is within the jurisdiction of the nation possessing the coast, originally determined by the circumstance that, at the time this limit became generally recognized, a marine league approximated fairly to the distance at which cannon on the shore would serve to command the water 1 *Whart Dig Int Law*, 114, § 32

Bohem. *mleko* = Serv. *mlyeko* = Russ. *moloko* = Wendish *mloko*, *melauka* (all prob. borrowed from or modified according to the Teut., having *k* for the reg. *g*) (cf. W. *llaeth*, L. *lac(t-)* = Gr. *γάλα* (*γαλακτ-*), milk, of diff. origin: see *lactate*, etc., *galaxy*, etc.); derived from a common Indo-Eur. verb, namely, AS. *melcan* (pret. *mealc*, pp. *molcen*) = D. *melken* = MLG. LG. *melken* = OHG. *melchan*, MHG. *melchen*, *melken*, G. *melken* = Goth. **milkan* (not recorded), a strong verb partly displaced by, or merged in, a later weak verb, E. *milk* = OFries. *melka* = Icel. *mjólka*, etc., depending on the noun; cf. OBulg. *mlĭza*, *mlesti*, etc., = Russ. *melĭzatĭ* = Lith. *milsti* = L. *mulgere* = Gr. *ἀμέλγειν*, milk, = Skt. √ *marj* = Zend √ *marez*, stroke, rub. Hence *milk*, *v.*, and *milch*, *a.*] 1. A white or bluish-white liquid secreted by the mammary glands of the females of the class *Mammalia*, and drawn from their breasts for the nourishment of their young. It is opaque, with a slight peculiar odor and a bland sweetish taste. Its chemical constituents in different mammals are qualitatively alike, but quantitatively vary much, not only in different species, but also in different individuals, or even at different times in the same individual. The amount of water varies from about 80 to 90 per cent., the residue being composed of albuminoids (casein and lactoprotein), fat, milk sugar, and certain salts, chiefly phosphates. Under the microscope it appears as a clear transparent fluid, in which a large number of minute globules are suspended. When allowed to rest, these globules rise to the surface, forming a yellowish stratum, the *cream*, which consists mainly of the fat, mixed with some casein, and retaining some serum. In the cow about 5 per cent. of the milk is cream, in the human female less, in the mare scarcely more than 1 per cent. By churning, the globules unite to form butter, leaving the *buttermilk*, which is essentially a solution of milk sugar, with the salts and some casein and butter. The milk from which cream is separated is *skimmed milk*, which when left to itself (if not too cold) develops, from the action of a certain bacterium, lactic acid, which separates the casein in a coagulated condition called *curds*, the same effect is produced by some other acids and by rennet, the prepared inner membrane of the stomach of a calf. The liquid separated from the coagulum is called *whey*, and contains chiefly

Drop of Milk, showing fat globules (highly magnified)

milk sugar and some salts. Cheese is prepared by coagulating milk with rennet, allowing the whey to separate, and adding salt to the curd The specific gravity of both cow's and human milk is about 1 030. Human milk is always alkaline, cow's milk either alkaline or acid, while the milk of carnivora is always acid Milk represents a complete or typical food, in which all the constituents necessary for maintaining the life and growth of the body are present In rare instances milk, in greater or less abundance is secreted by the mammary glands of the adult human male

The balance-rynd, *j*, is a curved bar which crosses the eye or central opening of the runner on the under side at the margin of the eye and supports the stone The supporting bearing of the balance rynd is a central socket called a *cock eye*, and the supporting point of the spindle which fits the cockeye is called the *cockhead* The spindle, balance-rynd, and runner stone are raised or lowered by means of the bridge tree and lighter screw to adjust the runner properly in relation to the bedstone The hopper, *p* receives the grain to be ground, and delivers it to the shoe, which is loosely supported, and kept constantly vibrating by the rotation of the damsel, a sort of trundle wheel, the trundles of which chatter against the shoe Flour is also made by cylinder mills or roller mills. The rollers act by crushing, by crushing and rubbing, as when they are caused to run with different peripheral velocities, or by a cutting or scraping action, as when they are serrated and revolved in such manner that the cutting edges of one roller act toward the cutting edges of the other

3 A machine which transforms raw material by a process other than grinding into forms fit for uses to which the raw material is unfitted In this use also the word is generally in composition, as

saw-mill, planing mill, etc This use of the word is, however, limited and arbitrary, many machines which transform raw materials not being called mills.

4. A machine which does its work by rotary motion, especially a lapidary wheel —**5** A treadmill. [Colloq.]

6. (*a*) A building in which grinding is done often in composition as, a flour-*mill*, water-*mill*, wind*mill*, etc. (*b*) In *metal.*, any establishment in which metalliferous ores are treated in the moist way, as by stamping and amalgamating, by grinding in pans, or by similar methods. Those works in which the reduction is performed by the aid of fire are usually designated *smelting works*, or sometimes (especially in the case of iron) *furnaces* In the manufacture of iron a *mill* is an establishment where the metal in the rougher form (that is, in that of blooms, slabs, rough bars etc) is worked up into various kinds of merchantable iron, or into those forms which are desired by the different classes of consumers of the metal, such as rails, plates, merchant bars, and many other similar products. (*c*) A large building used as a factory, and occupied by machinery for the purposes of manufacture· as, a silk-*mill*, a cotton-*mill* — **7** In *calico-printing* or *bank-note engraving*, a soft steel roller which receives under great pressure an impressed design in relief from a hardened steel engraved roll or die, and which is used in turn, after being hardened, to impart the design in intaglio to a calico-printing roll or note-printing plate —**8** [Cf *mill*1, *v*, 1] A snuff-box Also *mull* [Scotch]

9 A kind of screw-press introduced during the reign of Elizabeth into England from France, and designed to supersede the manufacture of gold coins by the primitive method of striking dies with a hammer It was introduced in 1561, discontinued in 1572, reintroduced in 1656 and 1658, and permanently adopted shortly after the restoration of Charles II The more modern coining press has supplanted this machine The mill not only struck the legend, but also raised the rim on the margin and serrated the edge. These serrations were at first straight, but, having been found easy to imitate by filing, they were made curvilinear in the reign of George II

Barker's mill, an ingenious machine, moved by the centrifugal force of water, invented by Dr Barker It consists of a vertical axis *CD*, moving on a pivot at *D*, and carrying the upper millstone *m*, after passing through an opening in the fixed millstone *n* Upon this vertical axis is fixed a vertical tube *TT*, communicating with a horizontal tube *AB* at the extremities of which, *A* and *B*, are two apertures in opposite directions. When water from the mill-course *MN* is introduced into the tube *TT*, it flows out of the apertures *A* and *B*, and by the pressure of the water on the parts of the tube opposite the apertures the arm *AB* and consequently the whole machine, is put in motion The bridge tree *ab* is elevated or depressed by turning the nut *c* at the end of the lever *cb* The grain to be ground is poured into the hopper *H* As modified by Whitelaw it is used in Great Britain under the name of *Scotch turbine* See *turbine* —**Cannon-ball mill**. See *cannon ball* —**Chilian mill**, a form of mill consisting of two heavy wheels or rollers, set parallel on a horizontal shaft, and having a double rotation, that on the horizontal shaft, and a second around a vertical axis controlling the horizontal shaft. The rollers travel in a vat or other suitable receptacle, and scrapers are usually provided to keep the material in the path of the wheels This form of mill, which is of much antiquity, is now used especially for grinding oleaginous seeds, nuts, fruits, etc See *arrastre* —**Cone-and-cradle mill**, a mill having a conical muller or grinder reciprocating in a semi cylindrical concave or bed. *E H Knight* —**Crooke's mill**, an occasional name for Crooke's radiometer (which see, under *radiometer*) —**Edge-runner mill**, a mill in which the millstones grind by their peripheral surfaces instead of by their flat surfaces The stones are generally two in number (though a single one is sometimes used), and run in a circular trough provided with a bottom of stone or of iron The trough holds the material to be ground The stones are pivoted to the ends of an axle like cart-wheels, and the axle is attached in the middle to a vertical shaft which rolls the stones around in the trough, thus effecting both a rolling and a rubbing action upon the material to be ground Such mills are used for grinding flaxseed preparatory to expressing the oil, in ironfoundries for grinding sand and clay, and for other purposes —**Horizontal mill**, a mill having the acting surfaces in a horizontal plane at right angles to the vertical axis of the revolving stones, as in a grain grinding mill — **Hydraulic, lapidary,** etc , **mill**. In the early church the doctrine of millenarianism (chiliasm) was generally held, and many, both of the otherwise orthodox and of heretics, were accused of holding it in a literal or even a gross and sensual sense. Thus, after the fourth century it fell into general disfavor. As A. D 1000 approached there was a wide spread panic throughout Europe, under the idea that the prophetic thousand years had expired and that Satan would be let loose Millenarianism showed itself again in the views of Anabaptists, Fifth Monarchy Men, Millerites, etc See *chiliasm*, *millenium*, *premillennialism*, *postmillennialism*.

Specifically — 2 In *theol*, a period during which the kingdom of Christ will be established upon the earth and will predominate over all other authority The phrase "a thousand years, in Rev xx 1-5, has been understood literally, or (on the principle that in Scripture prophecies a day stands for a year and the Jewish year contained 360 days) as representing 360,000 years It is generally regarded as indicating an indefinite but long period, and belief in such a period is universal in the Christian church But whether this predominance of the kingdom of Christ will be accomplished gradually by the gospel, and will precede Christ's second coming, or will follow his second coming and be accomplished by it, is disputed This question divides theologians into two schools, the postmillenarians, who hold the former view, and the premillenarians, who hold the latter, while many hold that the millennium represents the gospel dispensation or reign of the church and has accordingly already prevailed for many centuries

able antecedent The mirage of the desert presents an appearance of objects reflected in a surface of water, in this case the heated earth rarefies the air in the lower strata faster than it can escape, and the flatness of the ground conduces to the maintenance of the resulting abnormal distribution of density Displacement by mirage is commonly vertical, but is lateral when the density gradient is more or less inclined to the vertical. The mirrors of the ancients were of polished metal, as are those of the Japanese and some other Oriental nations Glass mirrors, consisting of transparent glass with a backing of metal to act as the reflecting surface, did not become common until the sixteenth century Mirrors have been used for decoration of the person, being sewed to the material of the dress and serving as larger and more brilliant spangles, they have also been used in the interior decoration of buildings, especially in Persia and the East Indies (Compare *archil*) The common method of preparing glass mirrors is to coat one side of the glass with an amalgam of tin and mercury (called *silvering*) but mirrors are now often made by depositing pure silver on the glass

2 Specifically, in *optics*, a surface of glass or polished substance that forms images by the reflection of rays of light, a speculum Optical mirrors are plane, convex, or concave A *plane mirror* gives a *virtual image* whose apparent position is on the opposite side of the mirror from the reflected body and at an equal distance from it A *concave spherical mirror* (supposing that it includes only a small part of a large spherical surface) reflects rays parallel to its axis as those from the sun, to a point (*F* in fig 1) called the *principal focus*, whose distance from the mirror is equal to half the radius of the sphere

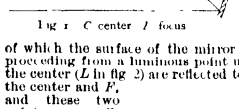

Fig 1 *C* center *f* focus

of which the surface of the mirror forms a part. Rays proceeding from a luminous point upon the axis beyond the center (*L* in fig 2) are reflected to a focus, *f*, between the center and *F*, and these two points are called *conjugate foci*, since they are interchangeable, a luminous body at *L* has a real inverted and diminished image formed at *f*. If, however, the luminous body be at *f*, the image is formed at *L*, also real and inverted, but magnified If the luminous body is at *F*, the principal focus, the reflected rays are sent out in parallel lines, if nearer the mirror than *F*, the rays after reflection are divergent, and the image is virtual, erect, and magnified In a *concave parabolic mirror* parallel rays are brought exactly to a focus at the geometrical focus, hence this form is suitable for reflectors, as in the headlight of a locomotive The images formed by *convex mirrors* are always virtual and smaller than the object

The surface is locally modified in its curvature by the characters, either by the shrinkage of the metal in cooling, or by its deformation in the process of amalgamation or of polishing Only a few of the mirrors which apparently answer to the general description in respect to their construction possess the "magic" property in any great degree. — **Soemmering's mirror,** in *microscopy*, a plane mirror of polished steel, smaller than the pupil of the eye, placed before the eyepiece of the microscope to be used like the camera lucida in making drawings.

=**Syn. 2** *Mischance*, *Mishap*, *Misfortune*, *Disaster*, *Calamity*, *Catastrophe*, misadventure, ill, harm, reverse, blow, stroke, trouble. The first six words are arranged in the order of strength, they agree in denoting untoward events, produced by causes presumably independent of the sufferer. *Mischance* is the lightest word for that which is really disagreeable; a *mishap* may be comparatively a trivial thing, both generally apply to the experience of individuals. *Misfortune* is the most general of these words; a *misfortune* is a really serious matter; it may befall a person, family, or nation. A very serious misfortune affecting large numbers is a *calamity*, the central idea of which is wide spread and general mischief. A *disaster* is not necessarily wide spread, it is generally sudden, and its importance is in its effects upon other interests, as marring or ruining particular plans, hopes, courses, or conditions of things. A *disaster* may befall an individual; a *calamity* can come to an individual only by affecting his welfare largely, or bringing him into deep distress. A *catastrophe* is strictly a great misfortune bringing things to an end, a final crash, a finishing stroke, as, this brought on the *catastrophe*. See *affliction*

Originally the ordinary, canon, and some other parts of the mass were contained in the sacramentary, which also included the offices for the other sacraments In addition to this the antiphonary, lectionary, and evangeliary had to be used Early in the eighth century the name of *missal* (*missale* (sc. *liber*), *missale*) came to be applied to the sacramentary, and later to books containing additional parts of the mass A book like the modern missal, containing all the forms of the mass, was called a *plenary missal* (*missale plenarium*) The modern Roman missal (the reformed missal") was issued substantially in its present form under Pius V in 1570, and revised again under Clement VIII and Urban VIII It is the only Latin missal allowed to be used in the Roman Catholic Church, with the exception of the limited local use of the Ambrosian, Mozarabic, and some monastic rites. winter with small white berries containing a glutinous substance. The shrub is said to be disseminated by birds, which eat the berries and disperse the undigested seeds in their droppings. It is found on a great variety of trees, especially the apple tree, but seldom on the oak. The mistletoe (compare def. 2) was consecrated to religious purposes by the ancient Celtic nations of Europe, and was held in peculiar veneration by the Druids, especially when found growing on the oak. Traces of this old superstitious regard for the mistletoe still survive in European countries, as in the custom of kissing under it at Christmas. It was formerly highly esteemed as an antispasmodic, but is not now so used. It seems, however, to have some pharmacodynamic properties.

The mistral derives its peculiar properties from the character of the country over which it blows, it extends from the mouth of the Ebro to the Gulf of Genoa, but is strongest and most frequent over Provence, and especially in the delta of the Rhone. Also written *maestral*.

When the *Mistral* blows, the sky is almost always blue and cloudless, and the air very dry; the contrast between the prevailing sunshine and the piercing cold of the wind is very striking. In the Rhone valley every second day is a *Mistral* day, in Marseilles it blows 175 days in the year.

Mitchella (mi-chel'a), *n.* [NL. (Linnæus, 1753), named after John *Mitchell*, a botanist of Virginia.] A genus of plants of the natural order *Rubiaceæ* and the tribe *Anthospermeæ*, characterized by having perfect flowers with a funnel-shaped corolla, which is from three- to six-lobed, the stamens inserted upon its throat, and by the hairy style, which has four thread-shaped lobes. They are creeping herbs, with opposite round ovate leaves having minute stipules and small white fragrant dimorphous flowers, which are axillary or terminal, and grow in pairs. The fruit is a scarlet berry like double drupe. There are 2 species, an American *M. repens*, the partridge berry, and a Japanese, which, however, may be identical with the American. See *partridge berry*.

A small arachnidan of the order *Acarida*, any acarid. Mites once formed a comprehensive genus *Acarus* or family *Acaridæ*, terms not yet obsolete, but, with the introduction of many more genera, the establishment of several families, and the elevation of the group to the rank of an order, a more elaborate nomenclature has been established in which neither *Acarus* nor *Acaridæ* is retained. (See *Acarina*.) Adult mites are eight-legged like most arachnidans, but some six-legged immature forms at one time constituted a supposed genus *Leptus* (see *Leptus* and cut under *harvest tick*). The species of mites are very numerous, diversified in form, and various in habits. Many are parasitic; others are terrestrial or aquatic; others live in cheese, flour, sugar, etc. *Mite* is consequently much used in composition. The cheese mite or flour mite is *Tyroglyphus siro* or *T. longior*, the sugar mite is *Glycyphagus prunorum*, or another of the same genus. Such mites compose the family *Tyroglyphadæ* and are among those longer known as species of *Acarus* or *Acaridæ*. Itch mites are *Sarcoptidæ*, as *Sarcoptes scabiei*. (See cut under *itch mite*.) Mange-mites are *Demodicidæ*, garden mites or harvest mites *Trombidiidæ*, spinning mites *Tetranychidæ*, beetle mites or wood mites, *Oribatidæ*, spider mites *Gamasidæ*, water mites, *Hydrachnidæ*, snout mites, *Bdellidæ*, gall mites, *Phytoptidæ*. Certain mites, the *Ixodidæ*, are commonly distinguished as *ticks*, as *Ixodes ricinus* (see cut under *Acarina*), and those of the family *Trombidiidæ* are indifferently called *harvest mites*, *harvest ticks*, *harvest bugs*, *red bugs*, and by other names. See the compound and technical names.

They are herbs, with long petiolate heart-shaped lobed or crenate leaves which have membranaceous stipules attached to the petioles, and an erect slender scape bearing an elongated raceme of small greenish flowers, which are often drooping. There are 5 species, indigenous to the temperate parts of North America, one of which is also found in Siberia. *M. diphylla* and *M. nuda* are the best known. See *bishop's cap*.

Pg. *mitra* = It. *mitra*, Olt. *metra*, a miter, < L. *mitra*, < Gr. *μίτρα*, a belt, girdle, fillet, head-band, turban.] 1. A form of head-dress anciently worn by the inhabitants of Lydia, Phrygia, and other parts of Asia Minor. --2. A sacerdotal head-dress, as that worn by the ancient Jewish high priest, or that worn by a bishop. The Jewish miter was made of linen, and wrapped in folds about the head, like a turban. Before the fourteenth century the miter in the Christian church was low and simple, but now it consists of a coronet, surmounted by a lofty and deeply cleft cap. The privilege of wearing the miter in the Roman Catholic Church was a concession of the popes, and was formerly exercised by cardinals and the higher dignitaries. Bishops and abbots (if to be mitered) receive the miter from the consecrating bishop. Three kinds of miters are distinguished: (1) the precious miter, made of gold or silver plate and adorned with jewels, (2) the auriphrygiate miter, and (3) the simple miter of white silk or linen. The bishops of the Church of England wore miters as late as the coronation of George III., and some Anglican bishops occasionally wear them at the present day. See *tiara*, and cut under *auriphrygia*.

The harmonics chosen for reinforcement vary with the pitch of the fundamental tone, a low tone being provided with higher harmonics than a high one. The points in the compass where changes from one set of harmonics to another take place are called *breaks*. The harmonics usually chosen are those that lie at the intervals of fifths or octaves from the fundamental tone, rarely at those of thirds or sevenths. Mixtures serve two purposes: to enrich the total effect of heavy combinations by reinforcing the brilliant overtones of the harmony, and to emphasize the upper tones of heavy chords by reinforcing their nearer harmonics. They are never properly used except in combination with foundation stops. Mixtures are variously named, as *cornet*, *furniture*, etc.

"A *miscellany* has the diversity without the incongruity of a *medley*." (*C. J. Smith*, Syn. Disc., p. 584.) Specifically, a *miscellany* is a collection of independent literary pieces, the unity lying only in their general character. A *medley* is a mixture or collection of things distinctly incongruous: the word has the specific sense of a song or tune made up of scraps of other songs or tunes ingeniously and amusingly fitted together. *Farrago* emphasizes the confusion or indiscriminateness of the mixture or collection: it is applied chiefly to printed or spoken discourse. *Hotchpotch* is a still more energetic expression of the confusion of the collection, the idea being drawn from the boiling together of shreds of all sorts of food. *Jumble* implies the idea of a heap tumed over and over till everything is hopelessly mixed. The figurative uses correspond essentially to the literal.

Burgersdicius, tr by a Gentleman

A *mode* is the manner of existence of a thing Take, for example, a piece of wax The wax may be round or square or of any other definite figure, it may also be solid or fluid Its existence in any of these *modes* is not essential, it may change from one to another without any substantial alteration As the *mode* cannot exist without a substance, we can accord to it only a secondary or precarious existence in relation to the substance, to which we accord the privilege of existing by itself, per se existere, but though the substance be not astricted to any particular *mode* of existence, we must not suppose that it can exist, or at least be conceived by us to exist, in none All *modes* are therefore variable states, and though some *mode* is necessary for the existence of a thing, any individual *mode* is accidental *Sir W Hamilton*, Metaph, viii

(*c*) The consignificate of a part of speech (*d*) An accidental determination — 7 In *music* (*a*) A species or form of scale, a method of dividing the interval of the octave for melodic purposes, an arrangement of tones within an octave at certain fixed intervals from each other Three great systems of modes are to be distinguished — the ancient Greek, the Gregorian, medieval, or ecclesiastical, and the modern These three were successively derived from each other, but with noteworthy changes of both principle and nomenclature (1) In the Greek system each mode consisted of two tetrachords (two whole steps and one half step in each) plus one whole step (the diazeuctic tone) The nature and the name of the mode varied according to the tetrachord used as a basis and according to the position of the diazeuctic tone, or, in other words, according to the relative order of the whole steps and half steps. When the diazeuctic tone lay between the two component tetrachords, the mode was named simply from the tetrachord used — the mode containing Dorian tetrachords was called *Dorian* or *Doric*, etc but when it lay below or above both of them, the prefixes *hypo* and *hyper-* respectively were added, as *Hypophrygian*, *Hyperlydian*, etc Below is a table of the nine original modes, reckoned upward, the whole steps being indicated by —, the half-steps by ⌣, the constituent tetrachords by ⌣ — ⌣, and the diazeuctic tone by +

These modes were embodied in scales of about two octaves, sometimes called *transposing scales*, which were more or less susceptible of transposition By the later theorists fifteen such scales were recognized, each derived from one of the foregoing modes, and beginning at a different pitch, each a half step higher than the preceding These scales, though not always differing from each other in mode, but only in relative pitch, were also called *modes*, and were named like the modes themselves. Assuming the lowest

tone of the lowest scale to be A, the series of later scales or "modes" would be

Hypodorian, embodying mode IV above, A

The fact that the term *mode* has been applied from very early times both to the ideal octave forms, or true modes, and to the practical scales or tonalities based upon them has led to great confusion Furthermore, the extant data of the subject are fragmentary and obscure, so that authorities differ widely (The summary here given is taken chiefly from Alfred Richter) The esthetic and moral value of the different modes was much discussed by the Greeks, and melodies were written in one or other of the modes according to the sentiment intended to be expressed (2) The Gregorian, medieval, or ecclesiastical system was originally intended partly to follow the ancient system Several of the old modes were retained, but subsequently received curiously transposed names The system was initiated by Ambrose, Bishop of Milan, in the latter part of the fourth century, perfected by Gregory the Great about 600, and still further extended between the eleventh and sixteenth centuries It exercised a deep influence upon the beginnings of modern music, and is still in use in the Roman Catholic Church. The ecclesiastical modes differ from each other both in the relative position of their "finals" or key notes and in the order of their whole steps and half-steps. They are *authentic* when the final is the lowest tone of the ambitus or compass, and *plagal* when it is the fourth tone from the bottom Four authentic modes were established by Ambrose, the four corresponding plagal modes were added by Gregory, and six others were subsequently appended, making fourteen in all In each mode certain tones are regarded as specially important — the final, on which every melody must end, and which is nearly equivalent to the modern key note, the dominant, or principal reciting note, and the mediant and particípant, on which phrases (other than the first and last) may begin and end these are generically called *modulations* All the modes are susceptible of transposition Assuming the final of the first mode to be A, the full series is as follows (finals are marked F, dominants D, and mediants M)

(3) In the modern system only two of the historic modes are retained — the major, equivalent to the Greek Lydian and the medieval Ionian, and the minor (in its full form), equivalent to the Greek and medieval Æolian These modes differ from each other in the order of their whole steps and half steps, as follows

3 (*a*) In *Gregorian music*, one of the tones in a mode with which every phrase of a melody in that mode must begin and end The regular modulations of each mode include the final, the dominant, the mediant, and the participant, each of which has its own peculiar functions (See these words, and also *mode*[1]) To these are added two other tones in each mode, called *conceded modulations*, which are of minor importance (*b*) In *mod music*, the act, process, or result of changing, in the course of a piece, from one key (tonality) to another, so that a new tone becomes the key-note and the relative significance of all the tones common to both tonalities is altered. When a tone foreign to the original tonality of a piece is used, a modulatory effect is nearly always produced If this effect is carried out into a cadence in the new key, the modulation is called *final*, otherwise it is *passing* or *transient* All modulations, however, require a return to the original key before the end of the piece The tone by which the transition is introduced or effected is called the *note of modulation*, this tone in the simpler forms of modulation is usually the fourth or the seventh tone of the new key The simplicity of a modulation depends upon the closeness of relationship between the keys involved The simplest modulations are into the keys either of the dominant or of the subdominant, and are effected by sharping the fourth tone or flatting the seventh tone respectively of the original key Modulations into the relative minor or into the minor keys of the supertonic or of the mediant are effected by sharping the fifth, the first, or the second tone of the original key respectively Numerous other more intricate modulations are possible, especially in instrumental music A modulation is *abrupt*, *distant*, or *extraneous*, when it leads into a key not closely related with the original one It is *deceptive* when it utilizes a series of chords in an unusual and startling way It is *melodic* when produced by the introduction of a tone foreign to the original tonality, and *harmonic* when produced by the use of a chord common to both tonalities first in its relation to one and then in that to the other It is *enharmonic* when it is effected on an instrument of fixed intonation like the pianoforte by calling a key (digital) first by one name and then by another, as when Ds in the key of Bs is called Dg in the key of Bs. Modulation is one of the most important resources of modern music It introduces endless variety of both melodic and harmonic effect, with great possibilities in the way of sequences and imitations It increases the unity of a composition and the importance of the original tonality by introducing a temporary disturbance of original tonal relations, with a subsequent complete and emphatic resumption of them It affords means for the expression of very complex emotional conditions particularly those of unrest, contrast etc In the style of Wagner it has often been pushed to the limit of toleration, so as almost to destroy that sense of fixed tonality which is the basis of musical certitude The most remarkable harmonic convenience for modulation, at least in instrumental music, is a chord of four tones consisting of three minor thirds successively superposed, which is called the *chord of the diminished seventh* This chord may be regarded as based upon any one of its four tones, which is then the seventh tone of either a major or a minor scale Its harmonic nature is therefore peculiarly ambiguous and unstable (*c*) A musical composition exemplifying modulation —4 Sound modulated, melody

The introduction of writing as the instrument of gift or transfer enabled donors to vary the customary legal consequences by expressing in writing as to the manner or mode in which the act should have effect, and that part of the instrument which thus qualified what otherwise would have been the ordinary legal effect was termed the *modus*, and the same term was used to designate the legal qualification thus imposed Hence, more specifically —(*a*) The clause in a will or other gift (and the legal obligation created thereby) by which the donor charged an obligation upon the legatee or donee, not as a condition the breach of which would create a forfeiture, but as a personal obligation, which the legatee would assume by accepting the gift (*b*) Also, in *early Eng law*, the clause in a conveyance enlarging or restricting the estate which otherwise would be granted by it, as for instance by giving to the donee and his heirs, or his heirs and assigns, or by giving to the donee and only a specified class of heirs Hence the old common law maxims *modus et conventio vincunt legem* and *modus legem dat donationi*, meaning specific qualification and express agreement override the law, or give the law to the transfer (*c*) In *eccles law*, the exemption, or partial exemption, from the payment of tithes, termed *modus decimandi* and *modus non decimandi* respectively

3. Specifically, in *founding*, the form into which a fused metal is run to obtain a cast. Molds for metals and alloys having a low melting point, as lead, type metal, Britannia metal, etc., are made of iron or plaster of Paris, and may be used many times. Molds for the less fusible metals and alloys, as iron, brass, bell metal, etc., are made in sand or loam and are divided into three classes: (*a*) *Open molds*, in which the pattern is impressed in the sand and withdrawn, and the molten metal is then poured in and finds its level. (*b*) *Close molds*, or molds in two parts called the *drag* and the *case* (or *cope*), forming together a *two part flask*, one part being placed over the other, and each being impressed with one half of the matrix or pattern. See *flask*, 2. (*c*) *Loam molds*, or molds built up with a core of brickwork or other material, and covered with founders' loam. As in the case of open molds, with close molds a pattern, usually of wood, is used, being impressed one half at a time in the two parts of the flask or molding box, which, when put together so as to correspond, form the mold. Loam molds are used especially in making large hollow castings and do not require a pattern. These molds are of every shape and size, from molds for kettles and water pipes to those for engine cylinders and great cannon. Fine molds for making castings of insects, flowers, and other delicate objects are formed by suspending the object in a box by means of wires and covering it with plaster of Paris. When set the mold is heated until the object is burned, and the ash is then blown out, leaving the original shape in the mold. Another method is to fashion the figure in wax, bed it in plaster or clay, and then melt out the wax (*cire perdu*). In making plaster casts of parts of the human body, or of sculptors' models the original mold requires to be cut to remove it from the object and the parts are afterward fitted together. Gelatin, papier maché, and sulphur are also used for making certain kinds of molds. The type-mold of type-founders is of steel in two pieces, making right and left halves, on the top of which, when conjoined, the matrix is attached. Every body of type has its special mold, which can be used for that body only, but the mold is made adjustable for the varying widths of type.

Details of Type-mold.

Medallions and other decorative objects were produced in this way in the seventeenth and eighteenth centuries.

Two closely fitting hoops of steel of ample strength are fitted on the interior with cast-iron lags having vertical channels on the faces fitted to the hoops, and numerous channels leading from the vertical channels to the interior of the mold box. The interior surfaces of the lags are lined with refractory sand. A central core of cast-iron faced with refractory sand, and provided with horizontal and vertical channels like the lags, is erected in the box, leaving an annular space into which the metal is run. By means of a hydraulic press an annular piston or plunger is driven down upon the upper surface of the molten metal. The

gases which would otherwise be retained in the metal are thus forced out, escaping through the channels in the lags and the core

2. Anything cast in a mold, or anything formed as if by a mold.—**3.** In *arch.*, a member of construction or decoration so treated as to introduce varieties of outline or contour in edges or surfaces, whether on projections or in cavities, such as on cornices, string-courses, bases, door- or window-jambs, lintels, etc. In classical architecture moldings are divided into three classes the *right-lined*, as the fillet, tenia, listel, regula, the *curved*, as the astragal or bead, the torus, the cavetto, the quarter-round, ovolo, and echinus, and the *compositе*, as the ogee, talon, or cyma reversa, the cyma recta or douçine, and the scotia or trochilos, all of which are known by many synonymous names. In Roman architecture all curved moldings are formed of portions of circles, while in Greek architecture they are for the most part formed of some conic section, of which the curve, in good work, is always of extreme refinement. All these moldings are frequently en

riched by carving In the architecture of the middle ages there is very great diversity in the form and arrangement of the moldings In the Norman style they consist almost entirely of rounds and hollows, variously combined with splays and fillets, a striking peculiarity of this style being the recurrence of moldings broken into zigzag lines. In the succeeding English style, the early Pointed, the moldings are much lighter and more boldly cut. In the Decorated style of the fourteenth century there is still greater diversity, and this period is further characterized by the introduction of the *roll molding*, and another termed the *ware molding* In the Perpendicular style large and often shallow hollows prevail, and the moldings are in general of flatter profile and less effective than those of earlier periods. The moldings of medieval architecture are very commonly sculptured with surface ornament beautiful in design and elaborate in workmanship See cuts under *dog tooth*, *double cone*, *egg*, *indented*, *leaf-molding*, *lozenge*, *fret*, 3.—**Belt-molding**, a molding passing entirely around the interior of a passenger car, directly above the windows *Car-Builder's Dict.*—**Dovetail-molding** See *dovetail*.—**Embattled molding** See *embattled*.—**Nail-headed molding** See *nail headed*.—**Nebuly molding**, in *arch.*, a molding in Romanesque architecture the edge of which

molding-machine (mōl′ding-ma-shēn′), *n.* **1.** In *wood-working*, one of a class of high-speed power-machines for planing, recessing, shaping, molding, profiling, and paneling wood Such machines occupy in wood working much the same position as the milling-machine in metal work, as both operate by means of revolving cutters. In molding machines all the work is performed by revolving cutter-heads having variously shaped knives. These cutters are used singly, as in some panel machines, and project through the table on which the work is laid, or they are arranged in gangs and series so that the wood in passing through the machine is exposed successively to all the cutters. By this gang-system of cutters it is possible to cut moldings and edgings of the most complicated pattern One form of the machine has the cutters between the cutter arbor bearings, and is known as a *matching machine* or *wood-planing machine*, or an *inside-molding machine* In another form the cutters project up through the table and are arranged to work upon the inside edges of moldings This type is known as the *edge molding machine* Sometimes called *carving machine*, *variety planer*, or *relief-paneling machine*

mold-loft (mōld′lôft), *n* A large room in a ship-building yard in which the several parts of a ship are drawn out in their proper dimensions from the construction drawings. Also called *modeling-loft*

[The] various problems [of laying off] are solved upon the floor of a building known as the *Mould Loft*, where the drawings furnished by the designer are transferred in chalk lines in full size, and then by the aid of geometry, and in the manner discussed in the following pages, the draughtsman determines and draws in the shapes of the various components of the frame Moulds are made to the lines, and with these moulds and other data furnished by the draughtsman the workmen are enabled to trim the timbers, or bend the angle irons, and place such marks upon them as shall leave nothing but the putting together and fastening them in their places in order to construct the frame of the ship

All the physical changes of a body, as the dissolving of sugar in water, the melting of lead, the change of water into steam, the magnetization of steel, and so on, are phenomena which take place without the loss of identity of the substance itself, and which concern the relations of the molecules among themselves Hence the molecule is taken as the physical unit A homogeneous body is regarded as made up of similar molecules, whose relations determine its physical qualities, and particularly its physical state as a gas, liquid, or solid A gas, according to the kinetic theory of gases, is composed of molecules darting about in paths which are very nearly rectilinear through the greater part of their lengths Liquids are supposed to be composed of molecules which wander about, but have not nearly rectilinear paths, while solids are believed to be composed of molecules bound together by cohesion and moving in quasi orbital paths A molecule of any substance is conceived as made up of one or more atoms, whose relations to each other are considered in chemistry (See *atom*) The exact nature of the molecules is still largely a matter of hypothesis, but as regards their size Sir William Thomson has reached a quasi definite conclusion as follows "If a drop of water were magnified to the size of the earth, the molecules or granules would each occupy spaces greater than those filled by small shot and smaller than those occupied by cricket-balls"

A *molecule* may consist of several distinct portions of matter held together by chemical bonds So long as the different portions do not part company, but travel together in the excursions made by the *molecule*, our theory calls the whole connected mass a single *molecule*.
Clerk Maxwell, Heat, p 286

The *molecule* of any substance is, by some chemists, defined as being the smallest portion of that substance to which can be attributed all the chemical properties of the substance, by others, as the smallest portion which, so long as the substance is chemically unchanged, keeps together without complete separation of its parts.

mollusc, *n* See *mollusk*.

Mollusca (mo-lus'kä), *n pl.* [NL, pl. of *molluscum*, a soft-bodied animal, a mollusk: see *mollusk*.] One of the leading divisions of invertebrated animals; an extensive series of invertebrates whose bodies are soft, without any jointed legs, and commonly covered with a hard shell in one, two, or more pieces, and whose principal parts are neither segmented into a series of longitudinal rings, as in insects, crustaceans, and worms, nor radiately arranged, as in echinoderms; the mollusks, as the univalve or bivalve shell-fish of ordinary language Mollusks have no trace of a notochord or urochord, which distinguishes them from certain organisms, as ascidians, formerly classed with them They are primitively bilaterally symmetrical, or have a right and left "side" along a main axis, this form is best expressed in the chitons, and is evident in bivalves, slugs, etc., but its expression is often obscured by a twisting to which the body is subjected in various univalves as those whose shells are spiral (See *Isopleura*, *Anisopleura*) There is always a well-defined alimentary canal, with definite walls. A nervous system is well developed as a set of ganglia with connecting commissures, one characteristic feature of which is the formation of a nervous ring or collar around the gullet, and another is the torsion of the visceral commissures in those forms whose bodies are twisted as above said (See *Arthyneura*, *Streptoneura*) Most mollusks have a distinct head, which, however, is not apparent in bivalves, leading to a division of headless mollusks (*Acephala* or *Lapo cephala*). A characteristic organ of *Glossophora* or mollusks with heads is the odontophore, buccal mass, or lingual ribbon, whose radula serves as a rasping organ in a mouth otherwise soft and toothless Various modifications of the radular teeth give rise to several descriptive terms (See *ptenoglossate*, *rachiglossate*, *rhipidoglossate*, *toxoglossate*.) There is always a heart, with a ventricle and at least one auricle, and dorsal in position Its relative situation with respect to the gills differs in certain groups of mollusks. (See *opisthobranchiate*, *prosobranchiate*) The circulation is double The respiratory system is branchial, and in some cases, as of snails and slugs, modified for breathing air into a kind of lung (See *Pulmonata*, *Gasteropoda*) The primitive typical gills are paired organs called *ctenidia*, but these undergo many modifications, and their function of respiration may be assumed vicariously by other parts of the body not homologous with them These modifications give rise to the names of many subordinate groups of mollusks, especially of gastropods, besides that of the great series *Lamellibranchiata* The renal organs of mollusks are technically called *nephridia*, or *organs of Bojanus* (See cut under *Lamellibranchiata*) The sexual organs are developed, either in the same individuals, or in different individuals of opposite sexes The characteristic organ of locomotion is the foot or *podium*, a development of the under surface of the body, which may be a head of the sole (see cut under *Gasteropoda*), upon which the mollusk creeps, or otherwise shaped It is often wanting, as in the oyster, or may give rise to a thready byssus by which the animal is rooted, as in the mussel Forms of the podium give names to most of the leading groups of mollusks, as *cephalopods*, *pteropods*, *scaphopods*, *heteropods*, *gastropods*, and *pelecypods* A large part of the soft integument of mollusks forms what is called the *mantle* or *pallium*, from which the shell, when present, is developed (see *integropalliate*, *sinupalliate*), and the impression of the edge of the mantle on the inside of the shell is the *pallial line* Some mollusks are entirely naked, or have only a rudimentary and concealed shell, as land slugs and sea slugs, and almost all the living cephalopods The body of cephalopods is strengthened by an internal skeleton, the calamary or cuttlebone, though no mollusk has an articulated internal skeleton But the great majority of mollusks have a hard shell (whence the old names *Testacea*, *Ostracodermata*), of a horny or chitinous or more decidedly calcareous substance Those whose shell is single are called *univalves*, those in which it forms a hinged pair of shells are *bivalves*, but the former may have an additional shelly piece, closing the aperture, the *operculum*, and the two main valves of the latter may be supplemented by accessory valves (see cut under *accessory*). *Bivalves* are the natural group of headless or lamellibranch mollusks, but *univalves* include several orders, though the word is chiefly used of the numerous and conspicuous gastropods A few mollusks are technically *multivalve*, such are the chitons, hence called *Polyplacophora*, having several segments of the shell in lengthwise series (See cut under *chiton*) Cirripeds used to be considered multivalve mollusks The shell is usually covered outside with a rough skin or *epidermis*, inside it may be beautifully lustrous, as with mother-of-pearl. Most mollusks live either in salt, brackish, or fresh water, land mollusks are mostly found in damp places Most are locomotory, either by creeping or by swimming, some swim by flapping their shells, others by moving various appendages, many adhere to or even burrow deeply in rocks, a few are parasitic Some are carnivorous, others herbivorous, most are oviparous, a few are ovoviviparous. Many are important as food, and the shells of many are put to useful or ornamental purposes Certain bivalves furnish pearls The *Mollusca* have been variously rated, limited, and classified, at one time the bodies of the animals were differently named from their shells (See *Linnæus*) (1) The name was originally proposed by Jonston in 1650 for naked cephalopods and for *Aplysia*, and adopted by Linnæus in 1758 as his second order of *Vermes*, including similar naked forms and some heterogeneous elements Linnæus made the *Testacea* or shelled mollusks his third order of *Vermes*, and these two groups were combined as a class by Poli in 1791 (2) About 1800 Cuvier made *Mollusca* the second of his four branches of the animal kingdom, with seven classes, *Cephalopoda*, *Gasteropoda*, *Pteropoda*, *Acephala*, *Brachiopoda*, *Nuda*, and *Cirrhopoda* (the *Nuda* being ascidians, and the *Cirrhopoda* being crustaceans). (3) In Lamarck's system, 1819, *Mollusca*, as a class, were exclusive of the bivalves (called by him *Conchifera*), and were divided into five orders, *Pteropoda*, *Gasteropoda*, *Trachelopoda*, *Cephalopoda*, and *Heteropoda* (4) In 1839 Swainson extended *Mollusca* to all invertebrates except the articulates (5) The cirripeds having been recognized as crustaceans by Thompson in 1830, and the same naturalist having at the same time investigated the polyzoans, the relation of the latter to the brachiopods led H Milne-Edwards in 1844 to associate the two Cuvierian groups *Brachiopoda* and *Nuda* with the *Polyzoa* in a division called *Molluscoidea* (the vertebrate affinities of the *Nuda* or ascidians not being recognized till much later, in 1866). (6) These dissociations from *Mollusca* in a former

sense have left the group now generally recognized and as above defined It is regarded as a phylum whose main divisions are classes. These main groups are, in one series of headless molluska, *Asephala* or *Lipocephala*, the single class variously called *Conchifera*, *Lamellibranchiata*, *Elatobranchsa*, *Pelecypoda*, *Cormopoda*, and by other names of bivalves, and, in another series, *Cephalophora*, *Odontophora*, or *Glossophora*, the four classes *Gasteropoda*, *Scaphopoda*, *Pteropoda*, and *Cephalopoda* But from among the gastropods are to be taken the chitons (together with *Neomenia* and *Chætoderma*), unless *Gasteropoda* is used in a very broad sense, and some authors also dissociate the heteropods as a class. See further under the above technical names.

molt[2], **moult**[1] (mōlt), *n.* [< *molt*[2], *moult*[1], *v.*] The act or process of shedding or casting any tegumentary, cuticular, or exoskeletal structures or appendages, as feathers, hair, skin, nails, horns, hoofs, claws, or shell; ecdysis, exuviation. The surface of the body of most animals, outside of the parts which are vascular or supplied with blood, is worn away by friction, attrition, or other mechanical means. This process may be slight and gradual or continuous, as in the case of man, where it results in scaly skin and dandruff, or it may be periodical and very extensive, affecting the whole cuticle or its appendages. Mammals shed their hair usually once a year. Birds molt their feathers usually at least once, often twice, sometimes thrice a year, the last two cases constituting the *double* and the *triple molt*. Both these classes of animals, in some cases, molt cuticular substances in mass. Thus, the American antelope sheds the sheath of the horn; lemmings and ptarmigans drop their claws; some birds of the auk family shed the horny parts of the beak; snakes cast their cuticle whole, even to the layer over the eyeball; crustaceans slough the whole shell; and numberless other invertebrates have a proper molt of similar or analogous character.

molybdenum (mol-ib-dē'num), *n.* [< NL. *molybdænum*, a later form for L. *molybdæna*: see *molybdena*.] Chemical symbol, Mo; atomic weight, 96. A metal of a silver-white color, but harder than silver, which fuses with difficulty, if at all, at the highest temperature of a wind-furnace. Its specific gravity is 8.6. It is chemically related to chromium, tungsten, and uranium, and, like those metals, forms trioxids which are acid-forming and yield very characteristic salts. It is remarkable for the number of oxids and corresponding chlorids which it forms, but it is the least important economically of the group to which it belongs. The most abundant ore of molybdenum is the sulphuret (molybdenite), and the strong external resemblance of this mineral to graphite (Latin *plumbago*) led to the confusion of molybdena with that substance, moreover, external resemblance and certain chemical peculiarities caused still further difficulties of nomenclature, in which manganese, antimony, and even magnesia were involved. Thus, the peroxid of manganese was called by Linnæus *molybdænum magnesi*. These perplexities were not cleared up until toward the end of the last century, but finally, as the result of the labors of Scheele, Bergman, and Hjelm (1778–90), the metal molybdena, or molybdenum, as it is now more generally called, was isolated from its combinations. The ores of molybdenum are somewhat widely diffused, but rarely occur in any considerable quantity. The principal molybdeniferous minerals are molybdenite and wulfenite. There is also a molybdic ocher (the trioxid) and a carbonate (paterite), various ores of iron also contain traces of this metal.

The root idea of *monachism* is . retirement from society in search of some ideal of life which society cannot supply, but which is thought attainable by abnegation of self and withdrawal from the world This definition applies to all forms of *monachism*, whether amongst Brahmans, Buddhists Jews, Christians Moslems, or the communistic societies of the present day, even when theoretically anti theological This broad general conception of *monachism* is differenced in the following ways —It may take the form of absolute separation, so far as practicable, from all human intercourse, so as to give the whole life to solitary contemplation the anchoretic type, or it may seek fellowship with kindred spirits in a new association for the same common end—the coenobitic type; it may abandon society as incurably corrupt, as a City of Destruction out of which the fugitive must flee absolutely —the Oriental view, for the most part, or it may consider itself as having a mission to influence and regenerate society—which has been, on the whole and with minor exceptions, the Western theory of the monastic life *Encyc Brit*, XVI 698.

The history of each monad follows an internal law, and all interaction between the monads is excluded, but there is a preestablished harmony between these laws for the different monads (See *Leibnitzian*) The Leibnitzian theory of the monad was, in many particulars, revived by Hermann Lotze

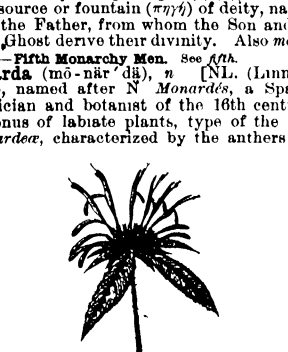
2. The principle of government by a monarch, the monarchical system.

The first, the most ancient, most general, and most approved, was the government of one ruling by just laws, called *monarchy*. *Raleigh*, Hist. World, I. ix. 2.

I hear there are people among you who think the experience of our governments has already proved that republican governments will not answer. Send those gentry here, to count the blessings of *monarchy*.
Jefferson, Correspondence, II. 221.

3. A government in which the supreme power is either actually or nominally lodged in the hands of a monarch or sole ruler, who holds his position for life, generally with hereditary succession. There have been *elective monarchies*, in which the successor to a deceased sovereign was chosen without obligatory regard to the hereditary principle, but this principle has finally prevailed, to the exclusion of choice, in all existing civilized monarchies. The former kingdom of Poland was a purely elective monarchy. The German Roman empire was originally, and always nominally, elective; but for many centuries the chosen successor was almost invariably the heir of the former emperor. An *absolute* or *despotic monarchy* is one in which the will of the monarch or sovereign is supreme over all other authority or powers of government; a *limited* or *constitutional monarchy*, one in which the sovereign is limited to the exercise of particular powers or functions by the laws or constitution of the realm. More or less limited monarchies have nearly always existed. About the fifteenth century a noteworthy increase of the power of the sovereign took place (as in England under Edward IV., in France under Louis XI., in Spain under Ferdinand the Catholic and Charles V.). Till the close of the eighteenth century the prevalent theory and practice on the continent constituted nearly unrestricted absolutism; this has now almost disappeared from Europe, while still maintaining a foothold in Asia. But whether absolute or limited, the monarch is theoretically regarded as the source of all power, and all acts of government are done in his name.

The obvious definition of a *monarchy* seems to be that of a state in which a single person, by whatsoever name he may be distinguished, is intrusted with the execution of the laws, the management of the revenue, and the command of the army. But, unless public liberty is protected by intrepid and vigilant guardians, the authority of so formidable a magistrate will soon degenerate into despotism. *Gibbon*.



It has often indeed been noticed that a Feudal *Monarchy* was an exact counterpart of a Feudal Manor, but the reason of the correspondence is only now beginning to dawn upon us. *Maine*, Early Hist. of Institutions, p. 77.

Cf. *monk*, from the same ult. source.] A house or other place of residence occupied in common by persons seeking religious seclusion from the world: commonly applied to such a house exclusively used by monks. The term, however, strictly includes the abbey, the priory, the nunnery, and the friary, and in this broad use is synonymous with *convent*. Monasteries in the Christian church were probably first established in the fourth century. St. Benedict of Nursia in the sixth century established a monastic rule which has been the foundation of nearly all the rules which govern monastic vows. Vows under different rules were made from the beginning of Christianity. The number of monasteries in Europe was much diminished at the Reformation, when their rich estates were in part appropriated by sovereigns to their own use, and in part transferred to universities and other educational institutions, etc. We owe to the monasteries the first definite beginnings or revival of civilization in many countries, especially Germany and France, almost all the missionary work of the early middle ages, and the preservation of nearly all ancient classical and early medieval literature. The monastic life has been practised from pre-Christian times among the Buddhists. See *ruls*.

Μονίμη, wife of Mithridates.] A genus of dicotyledonous apetalous plants, type of the natural order *Monimiaceæ* and of the tribe *Monimieæ*. It is characterized by globose dioecious flowers the staminate becoming split into four to six lobes, by numerous stamens, each bearing two glands at its base, and by the fruit, which consists of several very small one-seeded drupes inclosed within the enlarged perianth. Three species are known, natives of the Mascarene Islands. They are shrubs with rigid opposite leaves, and very small flowers, closely clustered in the axils. Fossil plants of this genus occur in the Tertiary formations of Europe and of Australia, and closely allied forms, called *Monimiopsis* at the very base of that formation in France and in the Fort Union group on the Yellowstone river in Montana.

Monimiaceæ (mō-nim-i-ā'sē-ē), *n pl* [NL. (Endlicher, 1836), < *Monimia* + *-aceæ*.] A natural order of dicotyledonous plants of the apetalous series *Micrembryeæ*, typified by the genus *Monimia*. It is characterized by a globose or cup-shaped perianth, toothed or deeply divided at the border, by numerous stamens covering the perianth, and by having several or many distinct ovaries, each with a single ovule, a minute embryo, and copious fleshy albumen. The order includes about 22 genera and 150 species, natives of the warmer parts of South America, Asia, and the South Pacific islands. They are trees, shrubs, or rarely climbers, generally aromatic, with rigid opposite leaves and small flowers, in axillary or sometimes terminal clusters, which are shorter than the leaves. Several furnish wood for building and cabinet-work, or leaves used as a tonic or an aromatic seasoning.

Monimieæ (mon-i-mī'ē-ē), *n pl* [NL. (A. L. de Jussieu, 1809), < *Monimia* + *-eæ*.] A tribe of plants of the natural order *Monimiaceæ*, of which *Monimia* is the type. It is characterized by having pendulous ovules, and anthers opening by a longitudinal fissure (instead of uplifting valves as in the other tribe of the order, *Atherospermeæ*). monism (mon'izm), *n.* [< Gr. *μόνος*, single, + *-ism*.] 1. Any system of thought which seeks to deduce all the varied phenomena of both the physical and spiritual worlds from a single principle, specifically, the metaphysical doctrine that there is but one substance, either mind (idealism) or matter (materialism), or a substance that is neither mind nor matter, but is the substantial ground of both: opposed to *dualism*. The term was applied by Wolf, its inventor, to the forms of the doctrine which were then known, namely, to the denial of the substantiality either of mind or of matter, but it is now extended to the doctrine that the distinction between physical and mental facts is only phenomenal, and that in themselves they are not distinguished. Many special modifications of monistic speculation, especially on its materialistic side, have accompanied the recent developments of physical science, particularly the doctrine of evolution. (See quotation from Haeckel under *monistic*.) Such doctrines as that energy, electricity, etc., are categories of substance different from matter are not taken account of by those who use the term, so that it is not easy to say whether they would be considered as denials of monism or not. Also called *unism* and *unitarianism*.

Monism led a miserable existence in philosophical dictionaries until, as a denotation of the Hegelian philosophy, it obtained a very wide use. It had again in some measure fallen out of use when it was taken up by modern natural philosophy, and made the watchword of a doctrine which considers mind and matter neither as separated nor as derived from each other, but as standing in an essential and inseparable connection.
M. S. Phelps, tr. of Lucken's Fundamental Concepts, p. 114.

If the essence of the materialist hypothesis be to start with matter on its lowest terms, and work it thence up into its highest, I did it no wrong in taking "homogeneous extended solids" as its specified datum and its only one, so that it constituted a system of *monism*.
J. Martineau, Materialism (1874), p. 108.

2. Any theory or system which attempts to explain many heterogeneous phenomena by a single principle.

The solution offered by Psychophysical *Monism*, that functional brain motion and feeling are two aspects of one and the same fact in nature — this solution, when closely examined, turns out to be an altogether dualistic and unthinkable assertion. *E. Montgomery*, Mind, IX. 366.

3. In *biol.*, same as *monogenesis* (*c*). — **Hylozoistic monism.** Same as *hylozoism*. — **Idealistic monism**, the monism which regards the single principle of the universe as mind or spirit, of which matter is the product. — **Materialistic monism**, the monism which regards the single principle as matter, of which mind or spirit is the product.

monist (mon'ist), *n.* and *a.* [< *mon(ism)* + *-ist*]

I. *n.* An adherent of the metaphysical doctrine of monism in some one of its forms.

The philosophical unitarians or *monists* reject the testimony of consciousness to the ultimate duality of the subject and object in perception, but they arrive at the unity of these in different ways. Some admit the testimony of consciousness to the equipoise of the mental and material phenomena, and do not attempt to reduce either mind to matter, or matter to mind. They reject, however, the evidence of consciousness to their antithesis in existence, and maintain that mind and matter are only phenomenal modifications of the same common substance. This is the doctrine of absolute identity — a doctrine of which the most illustrious representatives among recent philosophers are Schelling, Hegel, and Cousin. Others again deny the evidence of consciousness to the equipoise of subject and object as coordinate and original elements, and, as the balance is inclined in favor of the one relative or the other, two opposite schemes of psychology are determined. If the subject be taken as the original and genetic, and the object be evolved from it as its product, the theory of idealism is established. On the other hand, if the object be assumed as the original and genetic, and the subject be evolved from it as its product, the theory of materialism is established. *Sir W. Hamilton*, Metaph., xvi.

II. *a.* Same as *monistic*.

monistic (mō-nis'tik), *a.* [< Gr. *μόνος*, single, + *-istic*.] Of or pertaining to monism; of the nature of monism. See *monism* and *monist*.

Idealism is *monistic* in its whole conception of the universe. It claims to be a "one substance" theory, although it should in consistency call itself a "no substance" theory instead. *Bibliotheca Sacra*, XLV. 108.

The opponents of the doctrine of evolution are very fond of branding the *monistic* philosophy grounded upon it as "materialism," by confusing philosophical materialism with the wholly different and censurable moral materialism. Strictly, however, our monism might, as accurately or as inaccurately, be called spiritualism as materialism. The real materialistic philosophy asserts that the vital phenomena of motion, like all other phenomena of motion, are effects or products of matter. The other, opposite extreme, spiritualistic philosophy, asserts, on the contrary, that matter is the product of motive force, and that all material forms are produced by free forces entirely independent of the matter itself. Thus, according to the materialistic conception of the universe, matter or substance precedes motion or active force. According to the spiritualistic conception of the universe, on the contrary, active force precedes matter. Both views are dualistic, and we hold both of them to be equally false. A contrast to both views is presented in the *monistic* philosophy, which can as little believe in force without matter as in matter without force. *Haeckel*, Evol. of Man (trans.), II. 456.

Among Monophysites in the wider sense are included the Eutychians and Monothelites. The sect of Eutychians was founded by Eutyches, who was condemned at the Council of Chalcedon, A. D. 451. They taught that there is but one nature in Christ, the divine. The Monophysites properly so called hold that the divine and human natures in Christ are combined into one composite nature. The first leaders of the Monophysites, and founders of the present Monophysite or Coptic Church of Egypt, were Dioscorus, condemned at Chalcedon (died A. D. 454), and Timothy Ælurus ("Cat"), made patriarch A. D. 457. In later times their most important leader was Severus, about A. D. 520, whose followers were called *Severians*, *Corruptecolæ*, or *Phthartolatræ*, while those of an opposite Monophysite sect were known as *Julianists*, *Aphthartodocetæ*, and *Phantasiasts*. In the sixth century the Monophysites spread widely in Syria, and were named *Jacobites*, from Jacob Baradæus, Bishop of Edessa, 541–78. At various times the Monophysites divided into a great number of sects, known by more than thirty different titles. These represented different shades of original Eutychianism and Monophysitism and attempts at approach to orthodoxy. The most subtle form of Monophysitism is Monothelitism (which see). Monophysitism is at the opposite pole of doctrine to Nestorianism, the orthodox doctrine as to the nature of Christ lying midway between the two. As distinguished from the Monophysites, the orthodox are called *Dyophysites* and *Melchites*. At the present day the two great bodies of Monophysites are the Copts and the Syrian Jacobites. The Armenian Church is also often regarded as Monophysite or Eutychian, and the Maronites before their submission to the Roman Church were Monothelites. Monopolies are much the same offence in other branches of trade that engrossing is in provisions, being a license or privilege allowed by the king for the sole buying and selling, making, working, or using of any thing whatsoever, whereby the subject in general is restrained from that liberty of manufacturing or trading which he had before *Blackstone*, Com (ed Waite), IV. 159

2. Specifically, in *Eng. constitutional hist*, and hence sometimes in *Amer. law*, such an exclusive privilege when granted by the crown or state to an individual, association, or corporation, for the sake of the pecuniary advantage of its exclusiveness. A privilege not granted by the state, but secured by buying up the article, is termed by the English law *engrossing*. The legal objection to a monopoly, in this sense of the word, is that it can be secured only by forbidding all other citizens except the favored grantee to exercise a common law right Exclusive privileges granted by the state to a limited number of persons for the sake of enabling the state the better to regulate the traffic for the protection of the rest of the community, as in case of banking franchises, liquor traffic, etc, are not deemed monopolies, although the same privileges would be, if conferred on a single or a very few grantees, for the sake of the pecuniary benefit to them So the exclusive privileges conferred on inventors and authors, by the patent and copyright laws, for the sake of the encouragement of the arts and literature, and extending only to articles originally devised under that encouragement, are not deemed monopolies Both these classes of grants have, however, been condemned by some as partaking of the character of monopolies

If any man, out of his own wit, industry, or endeavour, find out anything beneficial to the Commonwealth, or bring out any new invention which every subject of this kingdom may use yet, in regard of his pains and travel there in, her Majesty perhaps is pleased to grant him a privilege to use the same only by himself or his deputies, for a certain time This is one kind of *Monopoly* Sometimes there is a glut of things, when they be in excessive quantity, as perhaps of corn, and perhaps her Majesty gives licence of transportation to one man This is another kind of *Monopoly* Sometimes there is a scarcity or a small quantity, and the like is granted also
Bacon, in E A Abbott's Account of his Life and Works.

I will have no private *monopolies*, to enrich one man, and beggar a multitude
Burton, Anat of Mel, To the Reader, p 68

He thinks he can never trade to his advantage unless he can have the *monopoly* of everything he values *South.*

3. In *polit. econ*, and as used in a general sense in law, such an exclusive privilege to carry on a traffic, or deal in or control a given class of articles, as will enable the holder to raise prices materially above what they would be if the traffic or dealing were free to citizens generally In this sense, that exclusive control of a particular kind of product which results from the legitimate ownership of the only land from which it can be obtained, as in the case of some mineral waters or earths, or ores is sometimes spoken of as a *natural monopoly*, in contrast to the *artificial monopolies* created by state grant See *virtual monopoly*, below

4 That which is the subject of a monopoly as, in Bengal opium is a *monopoly* —**5** The possession or assumption of anything to the exclusion of other possessors thus, a man is popularly said to have a *monopoly* of any business of which he has acquired complete control

6 Loosely, a company or corporation which enjoys a monopoly —**Monopoly Act**, an English statute of 1623 (21 Jas. I, c 3), declaring all monopolies for the manufacture, sale, or use of anything to be void, excepting to inventors their patent rights. Also known as the *Statute of Monopolies*. —**Virtual monopoly**, a term in constitutional law and the history of legislation (the appropriate applications of which have been much contested) used to characterize a business which though not declared by law to be a monopoly or exclusive franchise protected as such, as by a patent or an exclusive charter, is yet so related to the great channels and currents of commerce that the allowing of it to enjoy the same protection as other private property and business secures to it indirectly exclusive advantages substantially equivalent to a legal monopoly Thus the great grain elevators of modern commerce, although erected as private property on private lands, if by their situation they have exclusive advantages for the transfer of grain from vessels at the wharf to the railroad terminus of a trunk line, are said to constitute a *virtual monopoly*, because, if not subjected to a legislative power to restrict their charges such as other private property and business are not subjected to, they might be conducted in a manner oppressive to commerce
