Title Livestock Census of Hyderabad State
for the year 1945

This book should be returned on or before the date last marked below.

27 FEB 1957

CHAPTER I.—Enumeration.

	Page
1. General	1
2. Enumeration Schedules	1
3. Programme of work	2
4. Printing	2
5. The Agency	4
6. Inspector & Tour	5
7. Provisional Total	5
8. Final Totals	5
9. Classification into Rural and Urban Areas	6
10. Legislation	7
11. Conclusion	7

CHAPTER II.—Census Analysis.

1. General	10
2. Oxen	10
3. Density	11
4. Bulls and Bullocks	12
5. Unserviceable Cattle	12
6. Inadequacy of breeding bulls	12
7. Young Stock	16
8. Buffaloes	16
9. Buffaloes (He buffaloes)	18
10. She Buffaloes	19
11. Young Stock	19
12. Sheep	20
13. Sheep breeding	21
14. Goats	22
15. Goats breeding	23
16. Horses and Ponies	24
17. Mules	29
18. Donkeys	30
19. Camels	30
20. Pigs	31
21. Poultry	31
22. Farm Implements & Machinery	31

	II	PAGE
23. Cattle		82
24. Water-buffs		83
25. T. "		83

CHAPTER III.—*Breeds of Livestock.*

1. Breed of Livestock	84
2. Ongole Breed	84
3. Malvi Breed	85
4. The Krishna Valley Breed	86
5. Deoni Breed	86
6. Their Distribution & Habits	87
7. Description of a Typical Deoni Animal	88

CHAPTER IV.—*Livestock Breeding, Feeding, Housing, Etc.*

1. Cattle Breeding	42
2. Goats & Sheep	43
3. Horse Breeding	43
4. Feeding	43
5. Water Supply	45
6. Food & Fodder	46
7. Imports and Exports of Fodder	47
8. Concentrated Food	48
9. Shelter	49
10. Cattle Mortality	49
11. The Major Diseases	53
12. Cattle Mortality Record	53
13. Slaughter for Mutton	53
14. Slaughter for Puja & Festivals	53
15. Meat De-hydration Factory	53

CHAPTER V.—*Trade & Industries pertaining to Livestock.*

1. Cattle Fairs & Bazaars	59
2. Livestock Trade	59
3. Leather, Hides & Skins	60
4. Wool	61
5. Blankets & Kambls	62
6. Bones	62
7. Horns and Hoofs	63
8. Tallow Industry	63
9. Cow basore & Pao-mahir	63

CHAPTER VI.—*Dairy Industry.*

	Page
1. Dairy as Industry	64
2. Cows in Milk	65
3. Buffaloes in Milk	65
4. Trade in Milk	65
5. Milk from Sheep and Goats	66
6. Milk Utilization	66

CHAPTER VII.—*Poultry Industry.*

1. Poultry Keeping	68

LIST OF STATEMENTS.

1. Comparative statement of Livestock, etc., Hyderabad State (As Censused in 1945 and 1946)	71-92
2. Distribution of Cattle per Square Mile and per 100 Acres of Land	94
3. Average Number of Cattle, Carts and Ploughs per 100 of Population (1941)	96
4. The Number of Cattle, etc., per 100 Acres of the actually cropped area in 1945 (1854 F.)	96
5. Serviceable and Unserviceable cattle over three years	98
6. Distribution of working animals according to the net area sown (In Government Area only)	100
7. Distribution of working animals according to the Area occupied and No. of Pataldars (In Government Area Only)	101
8. Comparative Statement of Ho and She Buffaloes	102
9. The Number of Breeding and Milking Animals	103
10. Number of Sheep and Goats	104
11. Comparative Statement of the No. of Horses, Mares, etc., in various Censuses	105
12. Variation in the Number of ploughs in various Censuses	106-107
13. Ploughs Statistics of Hyderabad State	108
14. Carts Statistics of Hyderabad State	109
15. Distribution of Sugar-cane Mills	110
16. Showing the number of Stud Bulls kept by the Government	111
17. Showing the Number of Horses, Pony stallions kept by Government	112-113
18. Grazing Revenue for the year 1854 F. (1945)	114
19. Proportion of the Grazing land in total Area of each District. 1854 F. (1945)	115

	PAGE
20 Distribution of cattle in the Districts of Hyderabad State and in the Neighbouring Provinces	116
21 Cattle Mortality (Including Jagir Data) 1850-54 F (1840-45)	118-121
22 Number of Deaths from Contagious Diseases, among Livestock during the Quinquennium	122-124
23 The Number of Animals slaughtered	124
24 Total Number of Animals inoculated for Preventive and Contagious Diseases	125
25 Total No. of Cases treated by Veterinary Department during Quinquennium	126
26 Number of Animals castrated by the Veterinary Department	127
27 The Number of Veterinary Hospitals and Dispensaries and No. of Veterinary Officers	129
28 The Number of Cattle and Horse Fairs and Buzbars in Hyderabad State and the Number of Animals present	129
29 Hyderabad State Imports and Exports of Livestock during the Quinquennium	138-139
30 Value of Imports of Livestock Mahsul Khanawari	140
31 Value of Export of Livestock Mahsul Khanawari	141
32 The average price of an Animal 1945 (1354 F)	142-145
33 Average Rates of Hides and Skins 1945 (1345 F)	146
34 Value of Imported Leather, Hides and Skins	141
35 Value of Export of Leather Hides and Skins	148
36 Value of Imports of Leather Manufactured Goods (Excluding Boots and Shoes)	149
37 Imports of Skin and Leather Articles, etc., in Hyderabad State	150-151
38 Exports of Skin and Leather Articles etc. from Hyderabad State	152-153
39 Value of Imports of Wool	154
40 Value of Exports of Wool	155
41 Export of Raw and Manufactured Wool	156
42 Value of Export of Bones and Bone Meal	157
43 Railway Statistics about Bones	158
44 Value of Imports of Horns Hoofs, etc.	159
45 Value of Export of Horns Hoofs etc.	160
46 Dairy Establishment	161
47 Per Capita Consumption of Cows Milk per day	162
48 Per Capita Consumption of Buffaloes Milk per day	163
49 Distribution of Total Milk produced daily in Hyderabad State to different use (In seers)	164
50 Milk Supply of Sheep and Goats	165

51	Import and Export of Dairy Produce Ghee and Butter, etc	166
52	Distribution of Poultry	168-169
53	(a) Comparative Table for the production of Eggs, etc., of Different Birds	170-171
54	(b) Comparative Table for the production of Eggs of Different Birds	172-173
55	Total Poultry and their Approximate value, As per 1940 Census	174
56	Average Number of Fowls and Ducks per village As per 1940 Census	175
56	Monthly wholesale prices of Desi Hen Eggs (In Rupees and Annas per thousand)	176-177
57	Number of Livestock, Poultry and Agricultural Machinery and Implements in Hyderabad State as ascertained by Census held in 1954 F (1945)	178-193
	Livestock Census of 1945 A.D. (1954 F) Schedule A. Oxen	194-201
	Livestock Census of 1945 A.D. (1954 F) Schedule B. Buffaloes	202-229
	Livestock Census of 1945 A.D. (1954 F) Schedule C. Other livestock, Hyderabad City and District Afzalpura Balda	230-248
	Livestock Census of 1945 A.D. (1954 F) Schedule C. Other Livestock District Nizamabad	249-297
	Livestock Census of 1945 A.D. (1954 F) Schedule C. Other Livestock, District Medak	298-341

NOTE

This Report pertains to the Sixth Livestock Census of Hyderabad State (1945) and was compiled by the then Director of Statistics Moulvi Mazhar Hussain, M A , B Sc
Owing to rush of printing work at the Government Press this could not be brought forth earlier

PARRA VENKATESHWAR RAO

B A , LL B , H C S ,

Director of Statistics

29-6-1951

P R E F A C E

This is the Report of the sixth quinquennial Livestock Census conducted in the State of H E H the Nizam during the last week of Iyandar, 1354 F January, 1945. The method of presentation and interpretation of Statistics having been systematised, no new departure has been made this time. As the fourth and fifth reports carry a number of photographic illustrations of animals, poultry, etc., it was not necessary to reproduce them here in this report.

It may, however, be mentioned for record that during this quinquennium drastic economic changes have taken place in the economic life of the country on account of the IIInd World War. Consequently the livestock resources of the State, were at stake. Needless to mention that during this period H E H the Nizam's Government's progressive policy in the field of animal husbandry was duly recognised by the 8th Meeting of the Animal Husbandry Wing of the Board of Imperial Council of Agricultural Research held at Hyderabad during the Livestock Census week in January, 1945, as stated by Mr H R Stewart, the Vice Chairman of the Board in his presidential address at Hyderabad has played a leading part amongst Indian States in its co-operation with the Imperial Council of Agricultural Research since the latter was established and with other bodies with which the council is associated. It was the first State to become a constituent member of the council and its progressive policy and achievements in the fields of animal husbandry and agriculture not only have bestowed lasting benefits on its own subjects but have set examples in a number of ways which may well be perused with advantage by other administration.

In dealing with these problems of livestock the necessary data has to be supplied every now and then to various Depts concerned by the Statistics Department. Thus the results of the fresh Livestock Census has been supplied to Government in type written form long before they are printed in this Report for detail records for future reference. In view

of the enormous livestock wealth of the country and a regular drain by the surrounding parts of India it was felt necessary to have the variation in the main groups of Livestock Population recorded annually also. The Department submitted a proposal for the appointment of a small staff on permanent basis for regularizing the Livestock Statistics annually. The proposal has been approved by the Government.

I wish to record here my appreciation of services rendered by Mr Abdul Latif Razvi, M A, LL B (Alig) B A (London), Deputy Director and Mr Khwaja Hamid Ahmed, B A, the Agricultural Statistician, Mr Gulam Dastagir the incharge Superintendent who helped me in the census operations and Mr Fida Hussain, B A my office Superintendent who helped me in the preparation of this Report.

MAZHAR HUSSAIN

M A, B SC,

Director of Statistics and Census,
Hyderabad-Deccan

30-1-1957 F

20-10-1947

CHAPTER I

ENUMERATION

1 In accordance with the established practice and ^{General} in conjunction with the rest of India, the sixth quinquennial census of Livestock and farm equipment was taken in the Dominions of H E H the Nizam's during the week ending 31st January 1945. As formal sanction of Government was late in coming, the printing and distribution of schedules was subjected to a little delay. To make up the loss of time, special efforts were made to expedite printing and despatch of forms and instructions to enumerators. The dates of all the Livestock Censuses hitherto taken since 1919 are noted below —

- 1 1919—6th October (1st Azar 1329 F)
- 2 1925—29th April (25th Khurdad 1334 F)
- 3 1930—13th January (11th Isfandar 1339 F)
- 4 1935—19th-31st January (16th-22nd Isfandar 1344 F)
- 5 1940—25th-31st January (22nd-28th Isfandar 1349 F)
- 6 1945—25th-31st January (23rd-29th Isfandar 1354 F)

2 No new changes were made in the forms and they ^{Enumeration} included detail items of livestock farm equipment and ^{Schedules} minor industrial establishments. A special feature of this census is the enumeration of agricultural implements and poultry (hens and ducks). Poultry is an important item in the economy of the rural population, while a census of agricultural implements and machinery together with minor industrial establishments is extremely useful in ascertaining the progress made by the agriculturists in the country. A copy of the schedule embracing all items numbering 133 is given in appendix. For the convenience of enumerators these

items were classified in four groups, each group having separate form of schedule. The first for oxen, the second for buffaloes, the third for sheep and goats, horses and other domestic animals, and the fourth for poultry and agricultural implements. A supplementary schedule was also issued as on the previous occasion for ascertaining the prices of animals and the milk yielded by an average cow, buffalo and goat in different parts of the State. The importance of this enquiry cannot be under-estimated as the fresh milk is found inadequate to meet the demand and the price of milk is soaring high.

Programme
of work.

3. As soon as intimation was received from the Government of India for the quinquennial Live-stock Census the following programme was drawn up —

- 1 Forms to be printed and despatched on or before the 5th Isfandar 1354 F (7th January 1945)
- 2 Distribution of forms to the villages and preliminary arrangements to be completed by the Tahsils before 15th Isfandar 1354 F (17th January 1945)
- 3 Enumeration between 25th to 31st January 1945 (23rd to 29th Isfandar 1354 F)
- 4 Receipt of Tahsil summaries in the office of the Director of Statistics, on or before 24th February 1945 F (23rd Farwardi 1354 F)
- 5 Provisional figures to be furnished to Government of Hyderabad and to the Government of India on or before 24th Khuddad 1354 F (28th April 1945)
- 6 Final results to be submitted to Government of India on 9th Meher 1354 F (15th August 1945)

As the Food Supply Department desired to have figures for horned cattle sheep and goats as quickly as possible, special orders were issued to all the Tahsils to send immediately on the conclusion of enumeration provisional totals on or before the 15th Farwardi

1354 F The Tahsildars complied with this instruction and the first provisional totals were supplied to the Supply Department on 31st Farwardi 1354 F (4th March 1945). Promptness is creditable in view of the amount of work involved and the distances covered. When the Tahsila figures were scrutinised in my office by staff working overtime slight errors were detected. The difference between the preliminary and provisional figures was so small that it reflects great credit on all who made it possible for the Government to have the results so quickly.

4 The following establishment and contingencies were sanctioned by the Government for one year Staff

Establishment	1945 1354 F	1940 1349 F
1 One Office Superintendent Rs 150	1,800	1,500
2 One Typist at Rs 80	960	960
3 Six Clerks at Rs 35 each	2,520	2,520
4 One Operator at Rs 35	420	
5 Three Peons at Rs 12 each	432	432
6 Stationery & contingencies	1,500	1,500
7 Printing of schedules, etc	7,800	7,245
8 Railway and packing charges	1,000	781
9 Service stamps	500	500
10 Overtime allowance to staff	500	
11 Unforeseen expenses	500	
Total	17,432	15,388

5 As the sanction for the scheme for Cattle Census was received late, the Stationery Department was hesitating to issue paper on indent to the Government Central Press, the Press also was not willing to take the job in hand. These circumstances did not fortunately assume such seriousness as to upset the programme of work detailed in the foregoing paragraph. Special efforts were made to accelerate the printing work soon after formal sanction was received. Printing

The schedules were bilingual as before, i.e., Urdu-Telugu, Urdu-Marathi and Urdu-Kanarese. A thousand forms in English were also printed for the use of Railways and British Administered areas. Bilingualism gave no room for wrong interpretation of technical terms.

The following number of schedules were printed —

1	Instruction slips in Urdu	1,500
2	Schedules Urdu-Telugu for (10,508) villages	281,000
3	Prices schedules Urdu-Telugu	21,000
4	Schedules Urdu-Marathi for (9,810) villages	278,000
5	Prices schedules Urdu-Marathi	18,700
6	Schedules Urdu-Kanarese for (8,467) villages	95,000
7	Prices schedules for Karnatic villages	6,900
8	Schedules in English	1,000
9	Summary (Goshwara) forms for livestock, etc	6,600
10	Summary forms for prices in Urdu	1,400

The Agency

6 Circular letters were issued to Revenue Officers, Secretary, Saraf-i-Khas Mubarak, the Commissioner of City Municipality, Director of Court of Wards and to each Muir Majlis of the three Pargahs, to the Jagudars and Samasthandars, inviting their co-operation in their jurisdiction. The City Police Commissioner and the Director-General of District Police were also requested to help the census authorities. The Commissioner, Hyderabad Municipal Corporation was made responsible for the City. Within the railway limits enumeration was done by the Railway Officers. Likewise the cantonment authorities made arrangements for the British Administered areas. In the Dewani areas the village Patwari was the enumerator and the Tahsildar had to supervise the work of the whole taluq. No case of non-co-operation or refusal to accept responsibility was reported.

7 I made a tour in the five taluqs of District ^{Inspection and Tours} Adilabad—Nirmal, Boath, Kinwat, Adilabad and visited the village Anakdeo. Mr. Mohammad Ali Khan, First Assistant Director inspected seven taluqs of District Warangal, and visited two villages Opal Pahad and Chamaria Palli of Mahbubabad. Mr. Khwaja Hamid Ahmad, the Agricultural Statistician chiefly responsible for the Cattle Census work toured extensively throughout the Dominions particularly during the period of the census operations. Mr. Naseer Ali Khan acting Second Assistant inspected the work in some areas. Enumerators in the various places received advice and suggestion from the touring officers.

8 Soon after the receipt of the provisional totals ^{Provisional Total} in my office, they were duly arranged and tabulated. The districtwise provisional totals were forwarded to the Government with a copy of the same to the Government of India on 11-6-1954 P (15-3-1945) through this office letter No. 12443.

9 After despatching the provisional totals a detail- ^{Final Totals} ed scrutiny of the census returns received from the villages was made and final figures were worked out, and submitted to the Government for transmission to Government of India on 15th August 1945.

The following are the aggregate Dominion figures shown along with corresponding figures of the previous censuses for comparison

(Figures in thousands)

Censuses	Oxen	Buffaloes	Sheep	Goats
1920	49,81	26,15	48,26	21,28
1925	52,64	28,98	47,69	20,21
1930	56,59	31,08	57,44	30,55
1935	59,19	30,90	59,36	28,72
1940	58,48	30,22	60,00	25,78
1945	56,75	28,49	57,04	29,28
P.C. variation over 1940	-7	-11	-11	+10

The last column indicates clearly that except for goats there has been a diminution in the number of all other classes of livestock leaving aside goats, this all round decrease over the last five years is what might have been expected in view of the quinquennium coinciding with the stationing of armies in South India during the Second World War

Classification into Rural and Urban areas

10 As was done in 1940, the cattle population was classified into rural and urban. For this purpose places having a population of not less than 5,000 persons were regarded as urban. The following table gives the cattle population pertaining to rural and urban areas with the percentages of the total

[Statement]

Serial No	Livestock, Poultry etc	RURAL		URBAN	
		Total	P C	Total	P C
1	Oxen type	8,438,187	97	269,082	8
2	Buffalo Type	2,581,882	95	117,908	5
3	Sheep	3,093,592	96	210,152	4
4	Goats	3,805,898	96	117,923	4
5	Horses & Ponies	89,747	90	9,271	10
6	Mules	447	83	92	17
7	Donkeys	58,970	88	8,181	12
8	Camels	1,834	88	188	12
9	Pigs	182,718	96	7,847	4
10	Poultry	4,496,925	93	257,792	5
11	Ploughs	1,360	89	802	16
	(a) Iron				
	(b) Wooden	1,275,319	97	93,859	2
12	Carts	525,442	96	24,198	4

11 Collection of statistics regulation was passed by the Government. This includes the Livestock Census as well. Legislation

12 I acknowledge, with thanks, the help rendered by Dr. Amin Ali, the Chief Marketing Officer and the co-operation of the Revenue Officers, Jagir and Samasthan holders, Officers in-charge of British Administered areas, the Hyderabad Municipal Corporation, Railway and others. In this important work both officials and non-officials shared the responsibility of the Department of Statistics. Comm. session

As it is important in the interest of the State and the Public to have the cattle wealth of the Dominions appraised at shorter intervals than five years, proposals

for annual stock-taking were sent to the Government and were sanctioned

No 1—Cattle wealth of Hyderabad State 1945

No 2 —Growth of Live-stock wealth of
Hyderabad State 1930 to 1945
Heads of animals

CHAPTER II

CENSUS ANALYSIS

General

13 During the quinquennium, economic conditions were very abnormal. The prices of cattle greatly appreciated for the main reason that animals were in great demand for the army ration. At the same time the cost of fodder had risen so much that owners thought it prudent to dispose of such animals as were not of real service. For these as well as other reasons such as mortality from diseases, the cattle population decreased in number from 12,359,808 in 1940 to 11,325,059 or 9.8 per cent in the quinquennium, as compared with 8.1 per cent fall in the preceding five years. The cattle strength of the Dominions according to latest census represents 7.4 per cent of total cattle in British India, and 18 per cent of the cattle in Indian States.

Cattle

Cities	Indian	Indian States	Hydrothermal
Oxen in 1945	118,340,564	47,042,000	5,075,264
Buffaloes in 1945	36,900,000	12,717,000	2,542,700

14 There is a decrease of only 7 per cent in this class of animals for the Dominions as a whole, that for Telangana is only 4 per cent and that for Marathwada is 11 per cent.

Taking particular districts the number of cattle has increased in Baghat, Adilabad, Warangal, Nizamabad and Parbhani a fact which bears explanation on the basis of one factor or another. In all other districts there has been a decrease. Gulbarga and Raichur leading with deficits of 21 per cent and 24 per cent respectively. Thus too is easy to explain in view of the proximity of these districts to the military stations and the railway facilities for export.

The appended data provide separate figures for cows and bullocks and it is valuable to note that the deficit has been only 5 per cent for males and 10 per cent for females. In other words work cattle have not been tapped as much as the females of the species and in view of the large number of barren cows to be found everywhere this might be an advantage.

No. 3—Population of Oxen (1945)
as compared with (1940)

15. The decrease in number is shared by animals *used* of all categories except cows not in milk. A detailed consideration of the subject will not be without interest, because the density of cattle population for one hundred acres of land has dropped from 25 in 1935 and 23 in 1940 to 21 in the recent census of 1945. The districts

which have a heavier fall in density than 21 are —Raichur (12), Parbhani (17), Gulbarga (17), Adilabad (17), Aurangabad (18), Bu (20)

Bulls and Bullocks

16 The number censused is 3,551,211 or 4 per cent less than in the preceding quinquennium. This group is composed of male animals over 3 years of age such as breeding bulls, bullocks castrated and uncastrated meant for work, and other animals unfit for service due to old age, etc. Amongst those, breeding bulls have censused a decrease of 22 per cent. Generally the breeding bulls and the uncastrated working bullocks are not clearly defined in separate categories. The present economic conditions are making the necessity felt more and more, hence the decrease in the number of breeding bulls may not be taken as alarming. Government is encouraging cattle breeding as a sure means of enhancing the economic condition of the agriculturist. Regarding the working bullocks the census figures show that cattle owners, who are mostly cultivators and persons who use the bullocks as pack animals have not been free in the disposal of working bullocks. The decrease in this class was only 2 per cent.

Unservice- able Cattle

17 About the useless animals such as aged lame, etc., the common practice among the rural population is to keep them until natural death purely for sentimental reasons and manure. These appear to have suffered most in the quinquennium, for the number of such animals was reduced to half, i.e., 92,662 as compared with 178,911 at the previous census, a drop of 47 per cent. There is practically no use for such worthless cattle either in the stalls or in the grazing lands. It is only the economic conditions that are compelling the owners of such animals to dispense with them. If the villagers really realise the absolute uselessness of keeping such animals they will take the earliest opportunity of getting rid of them.

Inadequacy of Breed- ing Bulls

18 Against 31,537 breeding bulls there are 2,523,320 breeding cows. For service purposes it works out at 80 cows for a bull, a number four times as large. The paucity of breeding bulls is supplemented

19 The figures of cows in milk dry and not calved shows clearly the inadequacy of breeding bulls for service. It is a problem that needs careful and timely attention by the cattle owners. Unless steps are taken, with the co-operation of the cattle owners for increasing and maintaining the adequate number of breeding bulls, the cattle population in Hyderabad State is bound to suffer seriously. The cattle population will shrink in size as well as in quality, milk-supply will decrease in the State as the progressive decline in the number of good breeding bulls is detrimental to the growth of cattle population in the Dominions, steps adequate are very necessary.

The total number of cows of all ages and conditions is 2,654,560

Cows	Number	Variation for P.L. the quon- quantum
Cows in milk	752,344	— 5
Cows dry	1,164,363	+ 11
Cows not calved	606,611	— 20
Cows used for work	105,326	— 46
Cows useless	25,914	— 79

Cows in milk are not slaughtered and therefore the fall in number by 5 per cent may be due to report or due to getting dry, as this reduction is more than counter-balanced by a rise of 11 per cent in the number of cows in dry state.

Cows 3 years old and above and not calved number 606,611. This also clearly indicates that the number of bulls is insufficient, as the number of bulls for service was inadequate, owners thought it wise to dispose of as many of these dry and uncalved animals as there was demand. Hence they have decreased by 20 per cent.

No 5—Working Animals—acres of crops & No of cultivators per pair of working animals

Barren cows used for work only also decreased during the period from 195,421 to 105,326 or 46 per cent. Mahbubnagar has as many as 45,805 cows. Nalgonda 34,191 and Warangal 18,204 that are used for work only. The number of old and useless cows dropped by 79 per cent from 124,814 to 25,914. The decrease in the latter case is welcome for it means removal of a big herd of useless animals from the grazing grounds with meagre pasture. It still remains for the cattle owners in India to understand the two economic cows that "Nature abhors and eliminates waste" and "The utilization of by-products or wastes is industry."

Young Stock 20 The total young stock of the Oxen family was enumerated as 2,469,498 or 15 per cent less than the previous quinquennium. It shows a heavy fall in the calving rate as a result of paucity of serviceable bulls.

Age group	1945	1940	Decrease P C
<i>Under 1 year</i>			
Male	609,817	672,802	9
Female	609,740	692,379	9
<i>From 1 to 3 years</i>			
Male	589,295	746,648	20
Female	600,846	786,957	24

In both the age groups there is a perceptible decrease which occurred during the war years.

Buffaloes 21 The largest all round decrease seems to have taken place in the case of buffaloes, their number having decreased by as much as 11 per cent for the Dominions as a whole, but here also the decrease has been only 8 per cent in the Telangana against 15 per cent in the Marathwara. On a districtwise basis the number of buffaloes seems to have greatly increased in Baghat and this is evidently due to addition in the stock of the Military Dairy. Besides Baghat, there are some more districts,

e.g., Nizamabad, and Parbham, which show slight increase in the number of buffaloes. But these can be accounted either to error in enumeration or accidental accumulation of these animals on a small scale by individuals or concerns.

**No 6 —Population of Buffaloes (1945)
as compared with (1940)**

The analysis on a male and female basis provides similar results as those obtained for oxen. The male buffaloes have decreased by only 8 per cent while females have reduced by 12 per cent. But, contrary to the case of oxen, the female buffalo is more important than the male, and since the general tendency for a couple of decades is to give preference to buffalo milk over cow milk, on account of the larger percentage of fat, this

large decrease in the number of she-buffaloes is a matter for serious concern

Thus decrease in the number of buffaloes is to be accounted for to the decrease of imports rather than to an increase of off-take. No district in Hyderabad engages in the breeding of buffaloes to any extent and the usual practice is to import these animals from Berar, Surat, Delhi and Jafferabad. Hence the mere removal of obstacles in the way of imports is likely to improve the situation.

Buffaloes
(He
buffaloes)

22 Buffaloes are a useful adjunct to the farm cattle. They perform duties far more onerous than oxen. As pack carriers and as plough and cart-drawers they are dependable. They are cheaper than oxen to

Buffalo Class	1945	1940	Percentage decrease
Breeding bulls	11,050	11,410	2
Working animals	861,027	408,751	51
Unfit for work	14,195	17,000	17

Although the decrease in the number of breeding bulls is represented by only 2 per cent but it is not insignificant. As in the case of oxen uncastrated buffaloes, used as work animals also perform the service of the total number of he-buffaloes of all descriptions 88 per cent are found in Telhngana. Nalgonda keeps 76,874, Warangal 63,488, Karimnagar 51,589, Mahbubnagar 39,607 and Medak 32,478. In Marathwara the figure for Gulbarga is 16,255. The number in other districts varies from 1,763 in Paithan to 5,828 in Bidar.

Aged and useless he-buffaloes number 14,195 a fall in the quinquennium by 17 per cent of which more than keep and are less susceptible to contagious diseases. Without stalling arrangements buffaloes accommodate themselves comfortably in open under all weather conditions. Where rice cultivation is practised buffaloes do the hard and difficult work of puddling the soil.

half is found in Nalgonda, Warangal, Karimnagar and Mahbubnagar. As buffaloes are not commonly butchered for meat, the owners with sentiments leave such useless animals to roam about, until they die of natural causes.

23 The total number of she-buffaloes decreased by 9 per cent. Of the total those over 3 years kept for breeding or milk production were 1,188,079. This again as compared to 1940 Census diminished by 9 per cent. Of this number only 644,998 were found to be in milk, 333,910 dry and 209,146 not calved. Those in milk decreased by 11 per cent., the dry animals increased by 4 per cent and not calved decreased by 18 per cent. Of the buffaloes in milk Warangal has 80,000, Nalgonda 63,808 and Mahbubnagar 33,284. In the Marathwara division 57,376 were found in Bidar and 56,666 in Nanded. She-buffaloes over three years not calved numbered 209,176 or roughly one-third of the animals in milk. During the quinquennium there has been a fall of 18 per cent in this class, the reason for so many she-buffaloes left uncovered is the paucity of service bulls. For a total number of 1,188 thousand she-buffaloes over three years there were only 11,059 breeding bulls. In Warangal there was only one buffalo-bull for 458 she-buffaloes over three years of age. It is not milk problem alone that is involved, but the agricultural economy suffers and unless attention is paid to remedy the shortage of breeding bulls, the buffalo stock in the Dominions will deteriorate considerably. Owners of animals will have to use such uncalved ones in the plough and cart and make them sterile.

24 As many as 10.55 lakhs of young stock of varying ages were censused, showing a drop in the quinquennium by 17 per cent. Of them 626,658 were under one year. Correlating this with the she-buffaloes in milk, one finds that 18,335 calves had died before reaching one year and that the survival rate of female calves is larger than that of male calves. The same is true in the case of calves between one and three years, the ratio of male to female young stock being 4 to 6. The rate of mortality among male calves is greater. This is due to neglect with the male calves.

Sheep.

25 Sheep too show an all round decrease of 11 per cent but the diminution of this class of animals is more evenly distributed, although the southern districts show a comparatively larger denudation. The increases in Osmanabad and Atiaf-i-Balda Districts are evidently due to accumulation of stock by military contractors while that in Adilabad, Nizamabad is probably due to natural multiplication and unapproachability by the agents buying for the military.

In view of the fact that sheep are very valuable animals both for the production of wool and for manuring the fields an eleven per cent deviation in their number is not altogether wholesome.

No 7—Cattle—world total in 1939 A D
481 millions (684 crores)

**No 8 —Population of sheep (1945)
as compared with (1940)**

26 Sheep breeding is not done on any scientific or approved lines. As in the case of cattle, flocks of sheep roam about in the fields and grazing grounds and so promiscuous crossing is inevitable of the total herd of 5,808,745 sheep which is 12 per cent less than in 1940, Nalgonda has 17 per cent of the animals. Mahbubnagar and Karimnagar 13 per cent each. Adilabad and Warangal, with dense forests have less than the above districts, sheep roam about in cultivated fields and subsist on stubble and the off-shoots of cut crops after harvest. The cost of feeding them is therefore negligible. They are more liable to diseases due to inclemencies of weather than goats. Due to heavy losses from diseases and the jaws of wild animals their annual increase is hampered. Both for mutton and wool as well as for

manuring fields sheep are more useful animals than goats and are a good source of income. In the Marathwara districts Parbhani has the smallest number 70,482, Gulbarga accounts for 33 lakhs. The proportion of male and female sheep in the Dominions is 17

No 9—Sheep—world total 742 millions in 1938

Goats

27 The only class of animals which has increased is the goat, even these show some decrease in the Karnatak region—the decrease being in Bu 9 per cent, Gulbarga 8 per cent and Raichur 23 per cent, Parbhani, however, has shown an extraordinary increase of 84 per cent

The increase of goats in the Telhagana and particularly in Nalgonda 40 per cent, Adilabad 38 per cent and Karimnagar 42 per cent is almost equally alarming. In spite of the fact that the goat is considered the poor man's cow, this animal has often been considered as an economic liability rather than an asset. The hair of the goat has little economic value while its feeding habits are a distinct menace to afforestation.

**No 10 —Population of Goats (1945)
as compared with (1940)**

28 Goats as destroyers of scrub jungle are less welcome in the open forests for grazing. Since they feed on leaves only the trouble of maintaining them by agriculturists is great. The Census figure is 3,923,311, i.e., three-fourths of the number of sheep. This in comparison with that of 1940 census shows an increase of 10 per cent. The increase is not shown by all the districts. Mahabubnagar, Bu, Gulbarga and Raichur show decrease on the quinquennium. Nalgonda returned the largest number of goats, it being 12.4 per cent of the total in the Dominion. The scrub jungle areas and the hilly country is suitable for goat grazing. Among the Marathwara districts Gulbarga claims the largest number

Goats
breeding

which however, has diminished in the quinquennium by 9 per cent. The proportion of males to females show that there are five she-goats for every he-goat over one year.

No. 11—Goats—world total

117.2 millions in 1938

Horses and
Ponies

29 Horses and ponies as well as mares recorded a fall in number during the five years. Owing perhaps to the increase of motorcars and lorries as well as to war needs. It is probable that part of the stock of horses and mares in the army remount moved out of the Dominions.

No 12—Distribution of sheep & goats

Mares	52 905	72 251	28
Young Stock	82 063	41 898	20

The decrease was noticed in all districts and the city of Hyderabad. The largest number of horses over three years was found in Bur and Amangabad.

No 15—Horses—world total in 1917 A D
105,400,000 Heads

POPULATION OF HORSES

(Figures in thousands)

1	Argentina	8,527 (1937)
2	Austria and Hungary	1,747 (1937)
3	Belgium	246 (1940)
4	Burma	45 (1940)
5	Canada	2,858 (1940)
6	Denmark	564 (1939)
7	France	2,692 (1938)
8	Germany	3,443 (1938)
9	Great Britain	987 (1939)
10	India	2,412 (1940)
11	Netherlands	322 (1931)
12	New-zealand	272 (1940)
13	Norway	193 (1938)
14	Poland	3,916 (1938)
15	Rumania	2,065 (1937)
16	Union of South Africa	778 (1937)
17	United States of America	10,602 (1940)
18	U S S R	

Bu represented 5,042 mares above three years of age. The fall in the number of young stock was as much as 24 per cent in the category of males under one year and 18 per cent in that of females of that age-group. Between the ages of 1 and 3 the male young stock diminished by 19 per cent and the female young stock by 20 per cent. The decrease in colts and fillies is in proportion to the decline in the number of horses and mares over three years of age.

80 Only 539 mules were enumerated as against 700 in the previous census, showing a fall of 23 per cent. The decrease is attributed to requisition of animals for war transport services. Raichur has 82, Hyderabad City 65, Paithani 57, Medak and Aurangabad 48 each and Warangal 30, the number in other districts varying from 6 in Osmanabad to 29 in Nizamabad.

Donkeys

31 Donkeys as beasts of burden are found throughout the Dominions owned largely by Banjaras and Dhobies. The total number censused was 67,101 as compared with 72,972 in the previous census or 8 per cent decrease. Of the total 10,898 were counted in Nander, 8,246 in Gulbarga, 7,747 in Bidar and 5,145 in Mahbubnagar. In the other districts the number varied between 962 in Baghat and 4,799 in Raichur.

Camels

32 While under all classes of animals a fall has occurred the number of Camels has increased from 1,866 to 1,522 or 10 per cent. Bidar accounts for 567, Nander 519, Bu 158 and Gulbarga 105. There were none in Baghat and Karimnagar and only one was reported from Adilabad. Camels are used in districts for transport of grains and cotton across frontier and since such free movement of agricultural produce was controlled during the years, the number of camels has not fallen.

No 16—Pigs—World population in 1938
285 millions in 1938

33 This is the second occasion when pigs were enumerated. These animals are reared mostly in villages by poorest classes (Dher). They use up all the village rubbish and human excreta and provide animal food to the growing human population without any feeding expenses. Thus pigs occupy an important place in the livestock census. The number counted was 1,90,565 which when compared with the previous count show a fall of 4 per cent. Warangal has the largest number 55,379, Nalgonda 27,371, Karunnagar 23,045, Mahabubnagar 11,572 and Medak 10,566. In Telangana as much as 80 per cent of the animals were found. Dhers and Waddars are the chief classes that have taken to pig for breeding because it is not costly to maintain and they feed on human excreta, roots and grass in the open fields surrounding the villages.

34 In this category the main items are fowls and ducks. The former group numbered 4,704,232 made up of 487,585 cocks, 1,444,181 hens and 2,772,466 chickens. Fowls, being domesticated birds that require very little care and feeding expenses and thus a source of profit to the poor villagers are kept generally by all non-vegetarians such as Mushmas, Dhers, etc. Ducks numbered 40,294. Except 6,930 all were found in the Telangana districts which abound in tanks and ponds. Nalgonda had the largest flock of ducks, 15,854. In places where paddy and more than one crop are raised by means of irrigation ducks flourished and multiply. As compared to the preceding census figures there has been a serious decrease in the number of poultry it being reckoned at 54 per cent. The demand for army needs was primarily responsible for the decrease. Poultry

35 Tractors and ploughs are the principal cultivating implements. There were only 26 tractors against 24 in the previous Census. Among the ploughs, wooden ploughs continue to be common notwithstanding propaganda for the use of iron ploughs, the number of wooden ploughs increased from 1,261,198 to 1,311,378 or 4 per cent. The figure for iron ploughs was 1,662 as against 66,624 for the last quinquennium—obviously the enumeration is doubtful. In the absence of any acceptable reason for the decrease and in view of Farm Imple-
ments and
Machinery

the war conditions during the quinquennium it may be safely said that the 1940 figures can be taken as correct. The iron ploughs with wooden frames might have been included in wooden ploughs. The popularity of the increase in number of the wooden ploughs is due to diminishing size of the land holdings and the absence of heavier built and suitable draught animals.

Carts. 36 Bullock-carts are the only vehicles suitable for the country tracks. As a sure means of transport of

No 17 —Map of Hyderabad State showing the total No of ploughs for 1354 F (1945)

field produce to markets bullock-carts play the most important part. The number of carts that were counted was 549,166 as compared with 561,417 or 2 per cent decrease on the quinquennium. It works out on an average 25 carts per village. Karunnagar and Adilabad districts have the same number, viz., 62,800 each, Mahbubnagar 44,381, Aurangabad 42,481. In the other districts the number varied between 5,632 in Baghat and 33,632 in Gulbarga.

37. It is only the new types of water lifts that are enumerated, the Mhois are not censused. Irrigation, farmers employ various new types of water lifts, such as rahats and pumps worked by oil engines, electricity or hand. They are shown in the chart below.

Items	1945	1940	P C + or -
Rahats	5,424	1,581	+ 408
Water pumps worked by			
(a) Oil engine	466	604	- 28
(b) Electricity	223	179	+ 24
(c) Hand	1,578	788	+ 118

38. Sugarcane crushers 7,635, worked by power and bullocks, hay mowers 143, presses 157, chaff-cutters 288, oil ghans 15,602, dairy establishments 1,013 smithy shops 11,134 carpentry workshops 16,756 and potteries 18,356 were also counted. Except sugarcane crushers, power crushers, oil ghans, dairy establishments, other industrial outfit showed a decline in percentage in comparison with the 1940 Census.

Industrial
outfits

CHAPTER III

BREEDS OF LIVESTOCK

Breed of Livestock. 39 (Please refer to the Livestock Census report 1935 (1844 F) for full details and continuation)

Ongole Breed 40 The cattle found in the South-eastern part of the Dominions are of the Ongole tract of the Madras Presidency. They are among the best known breeds of Indian cattle and are much valued for work and for milk production. They are mostly bred by cultivators in the Guntur district of Madras and reared on the specially grown fodder and residues of grain crops produced in this fertile tract. They are exceptionally fine animals. Ongole cattle are usually docile and the bullocks are very powerful, suitable for heavy plough or cart work but are not generally considered to be suitable for fast trotting. The cows are good milk giving, according to a recent survey, an average yield not far short of the average of more purely milch breeds of Indian cattle for which comparable data are available.

In the past, Ongole cattle were exported to tropical America and other countries on an extensive scale, mainly for improving the local cattle by grading, and in some of these countries herds of pure-bred Ongole cattle are now maintained to provide sires for grading up the local stock of European origin. Like all Zebu cattle, their greater resistance to tick-borne disease and their capacity to thrive on scanty and dry fodder, has proved of great value in building up beef breeds able to thrive under tropical conditions, and cattle with a proportion of Ongole blood are now very largely bred in such countries.

It is of interest that Ongole cattle can still be seen in South India which are almost identical in general appearances with animals of the large white breeds of North India.

It is important to remember that such massive cattle, as are big Ongoles' are not suitable for poor soils and that the rearing and maintenance of high grade cattle of this breed is only feasible on rich land where an adequate supply of specially grown fodder crops and suitable residues of grain crops can be produced

The points of particular attention are the great size the muscularity and length of limbs the comparatively long body and short neck the forehead which is flat compared with the Mysore-type cattle but which, no doubt due to admixture of southern blood, is liable to be somewhat prominent, the stumpy horns which usually emerge from the outer angles of the poll but which not uncommonly are longer and inclined more in an upward and outward direction, the well developed hump, placed in front of the wither, moderately heavy dewlap and sheath, the mottling of the skin already mentioned, the dewlap and the sheath of moderate size and the tail of moderate length and thickness with a black switch reaching about half-way between the hock and the ground

41 Cattle of the Malvi type are also bred in a less ^{Malvi} well-developed form in the northern portions of the ^{Breed} Central Provinces and the north-eastern section of the Nizam's Dominions, and are a very popular breed for medium and light draught on the roads and for cultivation. They are massively built, compact animals and the colouring is grey, deepening in the mature male to a dark iron grey almost black on the neck, shoulders, hump and quarters but, as in all breeds of this colouring, the cows and bullocks eventually become pure white with age

The points of particular attention are —the short, deep compact body, the straight back and drooping quarters, the powerful short limbs and feet, the pendulous but not excessively developed sheath and the dewlap of moderate size, the broad chest and well-developed hump, placed in front of the wither, the short, broad head with dished forehead and noticeably broad upturned muffle, the strong, pointed horns which emerge from the outer angles of the poll in a markedly forward direction to terminate in sharp points the short, pointed ears and the

tail of moderate length with a black switch reaching to about the fetlock. There are two distinct types of Malvi cattle, the big Malvi bred in the south-west of Gwahar State and surrounding area and the small Malvi bred south-east of this area.

**The Krishna
Valley
Breed**

42 This is the breed found in the south-west of the Dominions. The bullocks are very powerful animals, useful for slow draught or heavy plough in black cotton soil, and the cows are as a rule fair milkers, but the breed is not a well-fixed one and considerable variation occurs due to more than one basic type having entered into its compositions.

The colouring and general characteristics indicate that large, grey-white cattle from the north are the basis of this breed but a careful study of individual animals reveals evidence of the blood of the Mysore basic type.

The points of particular attention are —the long, massive frame with deep, broad chest, the short, powerful neck and straight limbs, the comparatively small head with, as a rule, a moderately bulging forehead, the small curved horns which usually emerge in an outward direction from the outer angles of the pole and curve slightly upwards and inwards, but which vary a good deal in size and shape, the well-developed hump placed in front of the wither, the moderately developed sheath and the small pointed ear which should not droop to any marked extent, the pendant sheath of moderate size, the well-developed dewlap and the tail of moderate length with a black switch extending to about half-way between the hock and the ground.

**Deoni
Breed.**

43 It is found in the central part of the Dominions for instance Bidar. It is a valuable breed of medium size, the bullocks of which are good working animals for heavy cultivation, while the cows are reported to be the best milkers in the Nizam's Dominions. In general, the Deoni resembles the Gir breed of Kathiawar to a considerable extent but there is no doubt other blood in its composition and the conditions under which it is bred and reared are very different and it has developed along somewhat different lines. For example, special attention does not

appear to have been paid by Deoni breeders to fancy points such as the long, leaf-like drooping ear or to the marked development of the forehead to which so much attention is paid by breeders of pure bred Gir cattle. Though not so pronounced, the forehead is however noticeably prominent in Deoni cattle and the horns in typical cows take a characteristic outward and backward curve similar to that seen in the Gir. Similarly the face is lean but not so clean-cut as in the Gir and the ears though pendulous are not so long and usually lack the notch near the tip which is regarded as typical of pure-bred Gir cattle. The colouring of Deoni cattle varies considerably but black and white or red and white are the most common, in irregular patches and spots distributed over the body. The ears are moderately but not excessively long and pendulous and, like the Gir, hang almost perpendicularly with the inner surface visible from the front. The udder is of fair size and is usually compact with well-placed teats of moderate size.

The points of particular attention are —The deep chest, well-arched ribs, straight back and powerful quarters, the clean limbs and good feet, the typical drooping ear and curved horns with an outward and backward curve in the cows, the moderately developed hump placed in front of the wither, the long whip-like tail reaching nearly the ground, the fine skin and the heavy dewlap and sheath which, though pendulous should not be excessively developed.

44 The home of the breed is in the uplands in the centre and north-west of H. E. H. the Nizam's Dominions especially in the districts of Bidar, Osmanabad, Gulbarga, Atraf-i-Balda and Nander. Sufficient attention has not been paid by the cultivators to keep up the purity of the breed or for further improvement. Typical specimens of breed form only a portion of the cattle in this area. The action taken by Government for the last 25 years has helped in their improvement. They are mostly used for cultivation on black cotton soil (and for heavy drought work) for which they are very useful. The cows of this breed are fair milkers but capable of great development. Experiment on the Government Farm has shown that in the very first lactation they are capable of producing about 4,000 lbs. of milk in 300 days.

These Distri-
bution &
habits

45 *General Characteristics*—The Deoni cattle take their name from the village with this name in district Bidar where there is a big and a regular cattle lazzari. The cattle resemble Gu cattle a great deal. In appearance they are very impressive. They are clean cut with proportionate bodies, robust constitution and an aristocratic look. They are very docile and have a kindly look. They are easy to handle. One generally does not see nose strings on any cattle as a rule. They are inclined to be nervous to strangers. Their massiveness, prominent head, small curved horns, large pendulous sheath in the male are prominent points of the breed. Black and white colour and grey with black spots is common with variations of red and white or patches or spots of these distributed over the body. Cattle of this breed of red and slightly chocolate colour are to be seen in an isolated area definitely separated by a river. This area is the Khandhar taluqa of the Nanded district—otherwise points are all similar. Majestic appearance, slow movement, are characteristics of the breed.

Forehead—Moderately bulging, broad, highest point of the crown being above the eyes. A slight furrow in the middle and front top to below the eye level. Frontal bone well developed, wide between the horns.

Face and Muzzle—Face broad, clean cut, narrowing towards muzzle, rounded below the eyes. Muzzle black with wide open nostrils. Lower jaw powerful with dewlap coming up to the lower surface of the muzzle.

Eyes—Eyes moderately large but muscular development overhanging eyes gives appearance of small eyes. Eyes are in a line with the base of the ears but slightly inclined forwards and downwards and almond-shaped, docile look but alert, a slight glack ring round the eyes.

Ears—Large pendulous ears-leaflike appearance, the much of the tip of ears found in Gu cattle is absent, but the tip is rounded off, broadest part being towards the base—generally black in colour inside.

Horns—Horns are wide apart, short, with blunt tip and are moderately thick generally 8 to 10 inches in bulls, Numburi is prominent in cows.

(1) *Fore-quarters Neck* In the bulls thick, short, well set and proportionate, carries the head well, fairly large humps 10 to 11 inches Neck is thin and slender in cows

Hump—Well developed but not too large, prominent but medium size in cows, in males it is massive sloping gradually in the front and drop at the back

Dewlap—Pendulous with many folds, mellow and soft with silky coat moderately thick in the male and thin in the cow

Chest—Deep, full, well developed basket lightly covered with not much muscle

Legs and Shoulders—Well laid down, and straight—shoulders sloping, more so in the male merging into the body, well developed muscles, powerful long arms, subdued elbow, short rounded powerful knees and short cannon

(ii) *Barrel Back*—Straight, proportionate, strong, slightly rising towards croup—well proportioned, deep—rudimentary teats, black, not very prominent

Ribs—Well sprung, well set with the back bones Uniformly curved, expending towards the back ribs without undue prominence, well fixed in a line with fore and hind-quarters

Neck Flap—Prominent running from dewlap to under or testis, pronounced in cows—in the male the sheath is fairly pendulous 2 to 4 inches

(iii) *Hind-quarters* Broad, muscular, well developed, not so prominent as the fore-quarters

Loins and Hips—Broad, flat, slightly rising backwards, not coarse at all, hips more prominent in the cow

Hump and Pin-bones—Well developed, highly placed broad sloping, well wide apart and prominent

Flank—Broad, flat curving inside, deep-lean.

Thighs, Buttocks and Twist —Thighs muscular, well developed, broad in the male, fairly flat in cows, ends above the hocks in the curve, goose rump straight not angular Buttocks muscular and well developed, twist more hollow (curved) inside

Tail —Flat and muscular at root—well set between pin-bones, long and tapering switch generally black—best linked when between hock and fetlock in the bull

Hocks, Legs and Hoofs —Strong, well developed, flat (more) in cows—hind feet comparatively smaller than fore feet—well set Hoofs well shaped and strong, generally black, uniform in bulls, fan size in cows, hard—digits well apart but parallel and not widening

(iv) *Udder, Teats and Milk Veins* Udder fan sized, capacious, flexible, soft, more to the front, soft silky hair—quarters distinct—many folds at the back, silky hair

Teats —2½ to 3 inches—front ones slightly lower fairly closely placed

Milk veins —Large, prominent with network of blood vessels over the udder

(v) *Skin, Hair and Escutcheon* Skin Thin soft, silky hair, loose, pliable—pink mottled skin is not liked

Hair —Short, except face of bulls

Escutcheon —Generally fair width running up to pin-bone

CHAPTER IV

LIVESTOCK BREEDING, FEEDING, HOUSING, ETC

Cattle
Breeding

46 No new breeds of cattle have been introduced, during the quinquennium of report, nor have the indigenous varieties improved in physique in any marked degree 618,373 persons depend for their livelihood on the raising from stock Females, however predominate as 'partly dependents' The stock raising population are herdsmen, shepherds and breeders of other animals Cattle breeders have neither changed their technique nor have any tendency to learn better methods of breeding, feeding and stalling the animals War conditions in the quinquennium prevented the Government taking steps to improve breeding methods on scientific lines Movement of cattle by rail was considerably restricted and cattle shows were fewer in number and therefore breeders had no chances of obtaining better class of stud animals Breeding farms maintained by Government Veterinary Department are the only institutions deserving any notice but even they suffered from certain limitations In the rural areas Lambaras, Banjaras and Gondks pursued their traditional methods of allowing indiscriminately both good breed and indifferent seed bulls to cover cows, their chief aim being to multiply the number and not to evolve better strains It is difficult to discourage present breeding methods so long as there is no organised system of bringing to the door of the farmers and herdsmen, the essential requisite facilities for improving the animals The villagers, on account of their ignorance and narrow mindedness do not take full advantage of the number of seed bulls supplied by Government to the villages, consequently the animals either degenerate or their utilitarian value is lost The table No 16 shows the districtwise distribution of seed bulls Government maintains two cattle breeding and stud farms, one at Himayatsagar, eight miles from the city of Hyderabad The other is at Hingoh, in Paibhanu district A new breeding farm has been started in Suram At Humayatsagar, Deoni and Malvi types of animals are kept besides buffaloes for milk At

Hingoli both horses and Deoni cattle are kept for breeding and distribution

47 Except at Kallam in Osmanabad district no special breeds of goats are found They are large in size and good milkers Kallam goats take a long time to acclimatise themselves in places other than Osmanabad Therefore their distribution is limited Dhangers who keep large flocks of goats and sheep in other parts of the Districts take no special care to improve the breeds In big herds it is easy to eliminate chances of indiscriminate covering by keeping only the best animals but they are constant with the increase in and do not care for the quality Grazing in forest tracts is restricted to sheep as goats destroy the sapling plants

The following information regarding sheep was gathered from a number of shepherds (Dhangers) —

- 1 Sheep comes in heat the first time at the age of eight months
- 2 Period of gestation is three months
- 3 Comes in heat again after three months of lambing
- 4 Annual production—twice a year
- 5 Number of lambs in litter—only one each time
- 6 The ratio of male birth to female birth is 1 : 3
- 7 Female is sent to slaughter-house generally after 3½ years of age
- 8 Males are slaughtered usually between 1 to 5 years of age
- 9 The mean age of the animals—seven years

48 The Government, through the Veterinary Department had distributed mares by way of *Tallari* throughout the Marathwara tract To serve freely these brood mares, the Veterinary Department keeps stallions in those tracts under their care or under the care of the Tahsildars The number of brooding mares and the number of stallions kept for this purpose, districtwise statement is given in the table No 17

49 The availability of grazing lands for farm stock has a great bearing on the problem of cattle breeding It

No 18—Fundamental Importance of Animal Nutrition in National Prosperity

is not everybody that can stock fodder in good season for use in lean months. Small land holders are eager to sell the fodder stock on fancy prices that they could get with no thought for the morrow. They are content to leave their animals to browse about the village *ganjas* or grazing lands and eat what is available in the harvested fields and along the field boundaries and tank beds. The forest policy of the Government had now changed. Earnest attempts are being made to reforest the deforested and indiscriminately felled areas of the State. The forest boundaries are widened. The "Grow more food cam-

paign " so zealously advocated and encouraged by government in order to make up the deficiency in food supplies is reducing the acreage of the unoccupied and vacant lands that were used by the villagers as grazing areas. Thus the size of current fallows and culturable waste lands has shrunk.

50 The rainfall in the Dominions during the quinquennium and 40 years' annual average of rainfall etc., is recorded below —

Water
supply

In the year 1949-50 F the total rainfall amounted to 82.46 inches or about two inches above normal. On

Dominions	1948-49 1949-50	1949-50 1950-51	1951-52 1951-52	1952-53 1952-53	1953-54 1953-54	20 years normal rainfall in inches	Percentages for the year 1954		
							May mean	Year mean	Mean
Hyderabad (A)	11.67	19.08	26.31	1.19	19.27	31.67	87.0	74.5	86.4
Telangana	48.43	24.14	54.54	87.47	1.49	1.92	98.9	76.4	97.7
Marathwada	11.67	21.4	27.11	55.06	24.54	27.94	97.5	74.7	83.6
Karnata	21.88	17.45	21.02	28.42	24.09	24.04	100.3	74.2	88.2
Total Hyderabad State	12.46	21.96	29.54	35.44	29.44	30.73	101.6	77.0	89.3

account of good rainfall water became available everywhere.

In the year 1950-51 F the total rainfall was 21.96 inches against a normal of 30.73 inches. Shortage of water for cattle was reported throughout the year.

In the year 1951-52 F the rainfall totalled 33.95 inches as against a normal of 30.73. In the beginning of the year the supply of water was very insufficient in parts of all districts except Adil-i-Baldu, Baghat, and Mahabnagar. But from Shehewar (July) water supply was generally adequate in all districts except in Raichur. From Dai (November) water became available in tracts of Raichur, Gulbarga and Mahabnagar.

In the year 1952-53 F the total rainfall recorded 35.44 or 4.71 inches above normal. Water supply was adequate

in all districts except in some parts of Raichur, Nander, Osmanabad and Aurangabad. But from Aban till the end of the year the supply of water was adequate throughout the Dominions.

Fodder and
Fodder

51. Fodder and pasture were sufficient from Amardad 1349 F to the end of the year. The deficiency was reported, chiefly from Warangal, Kaimnagar and Nalgonda.

In the year 1350-51 F Gulbarga and Raichur were the chief districts which suffered from shortage of fodder for cattle throughout the year. In other districts deficiency was less acute. As a help to cattle owners Government threw open "Open Forest" for cattle grazing free of charge in certain areas.

In the year 1351-52 F fodder was very insufficient in the beginning in parts of all districts except Atraf-i-Balda, Baghat and Mahbubnagar. But from Shahnewai (July) fodder supply was generally adequate in all districts except Raichur and Adilabad.

In 1352-53 F scarcity of fodder was felt from Amardad (June) in parts of Warangal, Kaimnagar, Adilabad, Nalgonda and Raichur. In the month of Shahnewai (July) and Mehur (August) fodder was available in all parts of the Dominions except in few tracts of Raichur and Nalgonda. Supply of fodder was again meagre in parts of Warangal, Baghat, Mahbubnagar, Nalgonda, Aurangabad, Nander, Bu, Parbham, Osmanabad, Raichur and Bidar. From Aban (September) to the end of the year fodder was generally available in all the districts.

During the rainy season luxuriant grass grows on uncultivated but cultivable tracts both in Marathwara and Tehargana. This is cut and preserved for use as fodder. There are natural pastures in some parts of Marathwara such as Parbham, Aurangabad and Bu districts. The best grasses are Sedah (*Ischoemum Sulcatum*) Pouns mai vel and Surwala (*Andropogon Contortus*). A list of chief fodder crops of the Hyderabad

Dominions is given below —

- 1 Jawar Kadbi (Sorghum Vulgare)
- 2 Fodder Jawars—(Sorghums)
- 3 Maize Kadbi—(Zeamays)
- 4 Bajra Kadbi—(Pennisetum Typhoidum)
- 5 Sawan Straw—(Panicum Miliaceum)
- 6 Paddy Straw—(Oryza Sativa)
- 7 Lachna or Ragi Straw (Eleusine Coracava)
- 8 Rala or Kangni Straw (Setaria Italica)
- 9 Wheat Straw—(Triticum Sativum)
- 10 Barley Straw—(Hordeum Vulgare)
- 11 Lucerne—(Medicago Sativa)
- 12 Guinea-grass—(Panicum Maximum)
- 13 Oats Straw—(Avena Sativa)

52 As regards food and fodder Hyderabad is self-sufficient. From the statement given below it will be seen that from the year 1349 F (1939-40) that is the beginning of the 2nd World War, the import trade of fodder decreased from 47,958 mds in 1349 F (1939-40) to 7,270 mds in 1353 F (1943-44). As regards export of fodder, the quantity exported in mds has regularly risen from 23,141 mds in 1349 F (1939-40) to 232,591 mds in 1353 F (1943-44) except the year 1351 F (1941-42).

Imports &
Exports of
Fodder

Years	Imports		Exports	
	Quantity in Mds	Value in O S Rs	Quantity in Mds	Value in O S Rs
1353 F (1943-44)	7 270	20 669	232 591	14 58 461
1352 F (1942-43)	11 299	21 289	217 452	7 02 829
1351 F (1941-42)	36 579	92 429	32 796	39 508
1350 F (1940-41)	40 219	87 994	149 183	1 01 277
1349 F (1939-40)	47,958	1,11,439	23,141	24 608

Concentrated
Food

58 Besides Kadh straw and grass the concentrated food is also necessary for the cattle

These are found in good quantity in the Dominions,
e g —

- 1 Cotton Seed—(*Gossypium*) known as Sarki Binola
- 2 Bengal gram—(*Cicer arietinum*) known as chana
- 3 Horse gram—(*Dolichos biflorus*) known as Kulthi
- 4 Husk of tuar pulse—Pigeon pea (*Cajanus indicus*) known as Chunui
- 5 Husk of lentils—(*Lens esculenta*) known as Masur
- 6 Green gram—(*Phaseolus munga*) known as Mung
- 7 Paddy husk—(*Oryza Sativa*) known as Chookti
- 8 Rice husk (*Oryza Sativa*) known as Konda
- 9 Wheat husk (*Triticum Sativum*) known as Bhoosa
- 10 Oil-cake from safflower—(*Carthamus tinctorius*) known as Karai khali
- 11 —Oil-cake from til—(*Sesamum indicum*) known as tilhi khali
- 12 Oil-cake of groundnut—(*Arachis hypogaea*) known as bhoi mung khali

Concentrated food is given to milch animal in proportion to the amount of milk yield per time. Generally the formula is one pound of concentrated food for one pound of milk. Very little or nil concentrate is given to the dry animals. Working cattle generally get oil-cakes.

Horses are fed on Bengal-gram throughout the year. The amount varies according to the size of the animal. A horse of 13 span height, gets 6 lbs. of grinded and soaked gram in the morning and 6 lbs. in the evening besides lucerne and hay. Milch goats give better yields when fed on gram at the rate of two lbs. a day.

The inadequacy of available concentrated food for cattle in India as a whole is shown below —

Description	Nutrition per head of cattle per day in lbs	
	Available	Required
Quantity	4.8	10.0
Digestible protein	0.1	0.8
Total digestible nutrients	2.8	6.0
Nutritive Ratio	1.22	1.65

Average Indian cattle are semistarved. Malnutrition is the greatest single factor of importance in the causation of its degeneracy.

54 Among the livestock, horses, milk animals and ^{sheep} working bullocks are sheltered in stables and byres. Sheep and goats are always herded in the open air. House holders keep their animals within the court-yards of their houses and this makes both the owner and animal unhealthy.

55 The health of livestock depends mainly on sufficient grazing lands, the abundance of food and proper ^{Cattle} care. When these are deficient or inadequate, physical ^{Mortality} deterioration sets in followed by various diseases causing a large number of deaths.

One of the chief causes of heavy mortality is the absence of proper care and shelters from sun and rain to save them from the inclemencies of the weather. Indiscriminate herding of cattle during epidemics is the chief factor that helps the prevalence of disease. Ignorance and superstition of villagers help the causes. The rural folk believe that all diseases and mortality are caused by the wrath of some goddess of the village. When an epidemic mortality case comes to the notice of a Patwarī, he instead of having a proper entry in the register, arranges for a religious ceremony to the goddess Pochamma.

No 19 —Mortality from contagious diseases 1345 to 1354 F

In Thousands

[Graph

No 20 —Mortality from infectious diseases in relation to preventive inoculation 1345 to 1354 F

LAKHS

He would not get those village places where the cases have occurred cleaned up get the dying cases segregated, and inform at once the authorities to adopt necessary measures. Thus the Veterinary arrangements required at once for the infected area are either too late or none at all.

**The Major
Diseases**

56 The chief diseases among bovine animals which spread out and sweep them away like bubonic plague is Rinderpest (Bara roug). It is the most dreaded of all livestock diseases. Rinderpest is caused by a minute organism. Urine of the infected cases is most dangerous and helps the spread of the disease. Cattle die in almost ten days after infection, in milder attacks, they may live for three weeks. The Veterinary Department gives preventive inoculation to the cattle almost free of charge.

The other diseases of comparatively less occurrence are Haemorrhagic Septicaemia (Galla ghosht), Black-quarter (Zabaihad), Anthrax (Gilti) and Foot and Mouth disease (Mock-khoi).

The result of the preventive inoculation carried on by the Veterinary Department during the period and the number treated by the Department and the number of their hospitals and staff are shown in tables Nos. 21, 25 and 27.

The Veterinary Officers gave (403,840) preventive inoculations in 1354 F against 266,156 in the preceding year. The greatest number was 98,047 in the District Nizamabad. The Department treated in hospitals and dispensaries and through the itinerating staff 445,998 veterinary cases in 1354 F as compared with 397,857 in 1353 F. In the Hyderabad City 81,882 patients were treated in 1354 F. The Department maintained 19 hospitals and dispensaries with a staff of 23 officers. Table No. 27 may be seen in this connection.

**Cattle
Mortality
Record**

57 Arrangements exist in all districts of H. E. H. the Nizam's Dominions to register cattle mortality. The present system of registration, not being compulsory, the information furnished by the village headmen is unreliable and misleading. The report of epidemic diseases and mortality cases is not done in time and with responsibility. If the village headmen failed to report the case to the veterinary agency maintained in each district and taluqa, no severe step is taken against the defaulter.

In the year 1349-50 F cattle diseases were prevalent in the Dominions, especially in the wet months of the

year. In the year 1850-51 F the worst month for epidemic diseases was Amardad (June) when almost all the districts were affected. In the year 1851-52 F Kaurnagar, Adilabad, Nizamabad, Medak, Nalgonda and Osmanabad were reported for the cattle diseases. In 1852-53 F six districts of Telingana and nine districts of Marathwara were reported for having the contagious diseases. Table No 22 gives the five years figures of animal mortality.

58 In H E H the Nizam's Dominions there were 135 slaughter-houses in 1853 F where the animals are slaughtered for mutton for human consumption. Only a few of the higher Hindu castes are vegetarians, others eat mutton.

In the city municipal areas, all the animals that are slaughtered in the slaughter-houses are registered, whereas in taluqas the health officers and the local-fund staff are to see and certify the animals fit to be slaughtered for mutton. The total number of sheep and goats slaughtered in the Dominions was 746,783 in 1854 F as against 758,315 in 1853 F. The upward trend of prices per lb of mutton is the cause for the decrease in the number of animals slaughtered. In addition to this, 85,784 bulls, cows, calves and other animals were slaughtered in 1854 F as against 109,728 in the previous year. Districtwise details are given in table No 23. The Government prohibited slaughtering animals below the age of one year.

59 Animals are also slaughtered for Pujas and festivals and in marriage ceremonies, etc. During Kalmatas Puja and Rakhi Id festivals many animals are slaughtered before temples and in private houses and thus they are not recorded in the register maintained in slaughter-houses. Many buffaloes are slaughtered before the goddesses and then beef is eaten by the low-caste Hindus. Thus the figures given in the Statement 23 are for slaughter-houses only. Animals that are slaughtered privately cannot be registered by any agency and the statistics regarding them are not available.

60 There was a proposal from the Government of India, during the 2nd World War, to start a dehydration

Slaughter
for Mutton

Slaughter
for Pujas
and
Festivals

Meat De-
hydration
Factory

factory for meat in the State. The requirements of the factory were 800 goats per day or about three lakhs per year.

**No. 21 —No. of Animals Slaughtered Annually in
Hyderabad State 1347 to 1354 F**

The analysis of the data has shown that the total number of sheep and goats slaughtered in 1851 F in slaughter houses only in the Dominions was 8.04 lakhs and in 1852 F 8.61. The average annual consumption for the quinquennium 1847-51 F worked out at 7.52 lakhs. According to the quinquennium livestock census for 1844 and 1849 F the average rate of annual increase (after the annual deduction of animals slaughtered and died of natural deaths) in the population of these animals is 2.8 per cent or a little above half a lakh per annum. Hence the Government refused the establishment of the factory.

CHAPTER V

TRADE AND INDUSTRIES PERTAINING TO LIVESTOCK

Cattle Fairs
& Markets

61 In H E H the Nizam's Dominions there are as many as 195 weekly and 14 seasonal bairas and fairs mainly for animals. The important among them are Deon, Kuntur, Patta Sangvi, Simangapur, Gadwal, Qandho, Wanpatti, Jalhalli, Mangal, Umi and Malegaon. Some of them are so famous that persons from the neighbouring provinces come to purchase Hyderabad animals or bring their animals for sale. Elaborate arrangements are made by the authorities both for the accommodation of the animals and for the comfort of the dealers. A district-wise statement is given below —

Serial No.	Towns, etc.	Weekly	Seasonal	Serial No.	Towns, etc.	Weekly	Seasonal
1	City of Hyderabad			11	Aurangabad	2	1
2	Ahmednagar	1		12	Purband	17	4
3	Nasirabad	11	3	13	Nasir	16	1
4	Mudali	14	2	14	De	14	
5	Bijapur	1		15	Lalpur	22	"
6	Mahabubnagar	1	7	16	Bijapur	5	9
7	Nalgonda			17	Danapur	14	1
8	Warangal	21	2	18	Bihar	4	"
9	Batambur			Variation in Total		126	25
10	Additional	10	3	Hyderabad total		195	46
Total, etc. Total		12	19				

[Map

No 22 —Map of Hyderabad State showing
Main Cattle Routes

Opportunity is taken of such fairs and bazars by the Veterinary Department to hold exhibition and to reward valuable prizes for the best of the breeds and for the best kept animals

Such exhibitions are sources of inducement to cattle owners to give much care to the well-being of their farm and milch cattle. The cattle owners appreciate the encouragement given in the shape of prizes, take pride in exhibiting their best animals and try in their own way to improve the stock. It is, of course a slow process, but these shows are of great economic value. They promote a healthy spirit competition.

Livestock Trade

62 Notwithstanding all the impediments in cattle improvement and the handicaps which the average cattle owner endures in livestock trade the animals of Hyderabad find a ready sale in the open markets in India. The flow of livestock trade cannot be estimated from the railway statistics. A large number of animals are taken by the road as such means of transport are cheaper, more easily done and more convenient. In the same way animals from other parts of the country adjoining the Dominions come into Hyderabad cattle markets. Movements of cattle for trade take place very largely in the off-seasons when agricultural operations are over and owners are free to leave their land and villages.

A comparative statement of the value of import and export of livestock is given below in lakhs of Rs —

Year	Import	Export
1950 F (1940-41)	16.5	43.8
1951 F (1941-42)	16.4	51.4
1952 F (1942-43)	39.9	90.4
1953 F (1943-44)	31.7	92.0
1954 F (1944-45)	11.0	43.2

The increase in the cattle trade may be attributed to the enormous military requirements for sheep, goats, horned cattle and poultry and the fall due to railway and transport difficulties.

The value of import and export trade pertaining to livestock as registered, in the various Mahsulkhanas of the Nizam's Dominions is given in table No. 29 and the import and export trade is also shown graphically. It is evident that the balance of trade, is generally in favour

of the Dominions. The export trade is generally carried on with the neighbouring provinces of British India. The export is greater in the months of April to July than in the remaining months. The animals exported to Bombay go by road for cheaper expenses.

No. 23 — Import and Export value of Live-Stock in Hyderabad State 1345 to 1354 F

LAKHS OF RS

As in the previous census, a schedule for ascertaining the prices of animals was sent to each tahsil. The average price per animal is shown in table No 32

Leather
Hides &
Skins

63 Of the 79,897 persons returned under this head as independent and subsidiary workers in 1941 population census only 1,489 are tanners, leather dressers and dyers, 2,027 are makers of leather articles, *e g*, trunks, harness, saddles, water bags, etc, and as many as 71,236 are boot, shoe and sandal workers. Thus of the total persons enumerated under hides and skins industry (principal and subsidiary) numbered 7,944 only. There has thus been an enormous increase of these workers during the decade.

The value of imports and exports of leather hides and skins is given below for comparison in lakhs of Rs —

Year	Import	Export
1950 F (1940-41)	3 0	43 6
1951 F (1941-42)	2 9	61 2
1952 F (1942-43)	4 6	50 9
1953 F (1943-44)	6 2	42 3
1954 F (1944-45)	7 4	53 5

The prices in the City Market of hides not tanned fluctuated between Rs 4 and Rs 9 per piece, and the fluctuation of the prices of skin was between Re 0-14-0 and Rs 1-8-0 per piece.

The export trade was affected by war and by transport difficulties.

The war has given rise to many local industries, tanning and shoe-making may be counted among them. In Hyderabad State there is still a vast field for these industries although tanning and shoe-making factories have been newly established.

Hyderabad may be counted as one of the countries with the largest livestock population. Her export trade in regard to raw skin and hides may be seen in statement No 34.

The raw materials necessary for tanning are found in great abundance in the Dominions. With all these facilities, the traders export the raw hides and skins. If proper knowledge and scientific methods be applied for converting the raw skins and hides into leather and the leather into finished articles, which are at present imported into the country for several lakhs of rupees, it would increase the wealth of the country and much of the Mulki labour and capital would be utilised.

Hides of dead animals in the villages are tanned in the primitive old and unscientific ways, the chamars and shoe-makers make use of the tanned leather for chappals, water-lifts (water-buckets and tondam) and the collars of the draught animals. The marketing survey report has also revealed that the process of flaying and tanning in both the cases of hides and skins is of the most primitive and old order and it yields reduced prices in the market.

Hides and skins of good quality are collected in the villages by the middlemen and sold to the wholesalers, who export the lot to other places mainly to Madras. In the year 1942-43, the Madras export trade in tanned goat and sheep skin was strictly controlled. Considerable shipment was made to United Kingdom, United States of America and also to South Africa. The average index number of prices for hides and skins in Hyderabad which stood at 136 in October (Azad) declined to 120 in December (Bahman). Subsequently, it improved to 141 in February 1943, sagged again to 124 in May and thereafter, gradually improved to 141 towards the close of the year.

The Government has recently sanctioned a scheme for the improvement of cottage industry, the scheme envisages the establishment of 15 training centres, mostly Dhers and Chamars are engaged in this industry. In H. E. H. the Nizam's Dominions there are eleven permanent large scale training establishments. Seven of these are located in Hyderabad City, and one each in Districts of Medak, Mahbubnagar, Paithani and Raichur.

64 Warangal is the only place in the Dominions where carpet-making is carried on and the wool of all

types is utilised. Woollen carpets of Warangal are famous even abroad. The carpets are exported to British Indian Provinces and to Europe. A large quantity of raw wool is exported out of Hyderabad State. It indicates the possibilities of developing the cottage industry for woollen articles.

Blankets &
Kambals

65 Coarse blankets and kambals are made of sheep wool. Makhtal and Mahbubnagar (Mahbubnagar district) and Kamareddi (Nizamabad district) are important for kambal making. The total number of blankets exported in 1954 F is 6,831 and its value is Rs. 69,977. Export difficulties show a marked decrease in the export trade of this article. Exports of woollen articles such as kambals, etc., are shown in table No. 40.

The percentage composition of livestock of Hyderabad State is as follows —

	per cent
1 Bovines (a) Oxen	44.5
(b) Buffaloes	13.0
2 Ovines (sheep and goat)	40.0
3 Others (horses, donkeys, camels, pigs, etc.)	2.5
	100.0

Although sheep and goats form the major portion next to cattle, in the livestock population, their importance as bone producers is negligible for the reason that their bones go along with the flesh for human consumption and their statistics cannot be collected.

Bones

66 Raw bones and bone-meal are exported in large quantities from Warangal, Hyderabad City and Gulbarga. Hyderabad usually exports bones to Madras, Mysore and Bengal. The Customs Department does not keep separate records of bones and bone-meal exported and imported as may be seen from statement No. 41, while the railway statistics as shown in statement No. 42, —separate figures are exhibited for bone and bone-meal.

Bone a by-product of animals, and a valuable manure for fruit and garden produce, is obtained by horticulturists and agriculturists. The Agriculture Department advises the crop growers to use bone-meal as manure. It would be advantageous to the country if the export of raw bone be totally stopped and the export be restricted to the bone meal. This would give encouragement to the bone-crushing industry in the State and the use of bone-meal as readily available manure in the country.

67 The horns and hoofs of cattle are mainly exported from Hyderabad State. The ordinary use to which horn is put to in some places is for the manufacture of pen-holders, buttons, handles for pen-knives, ornamental boxes and combs.

Horns and
Hoofs

68 The import of tallow into H. E. H. the Nizam's Dominions is as follows —

Tallow
Industry

1944-5 (1944-45)		1945-6 (1945-46)		1946-7 (1946-47)		1947-8 (1947-48)		1948-9 (1948-49)	
Quantity in Mds.	Value in O S. Rs.	Quantity in Mds.	Value in O S. Rs.	Quantity in Mds.	Value in O S. Rs.	Quantity in Mds.	Value in O S. Rs.	Quantity in Mds.	Value in O S. Rs.

69 These are valuable articles found occasionally in the gall bladders of the animals slaughtered. Cowhazore in bovine animals and paosahn in bovine. The butchers are sole dealers in them. In cattle census report 1940 much detail has been furnished.

Cowhazore
& Paosahn

CHAPTER VI

DAIRY INDUSTRY

Dairy as
Industry

70 In H E H the Nizam's Dominions the large and small scale dairy establishments enumerated in 1945 were 1,018, of them 398 were in Marathwara and (615) in Telangana. At present this industry does not exist in a commercially organised form, there is a great scope in the city of Hyderabad considering the heavy demand of milk both for domestic uses and for restaurants and tea shops supply. The Public Health Department and Municipal Corporation are taking great interest in the increased supply of good milk and are taking strong measures against adulteration and unhygienic methods of sale and distribution by licensing the dealers annually. By this action all the dealers will have to supply milk and its by-products free of adulteration. The milk problem in the State is getting serious day by day. Under the auspices of Her Highness, the Princess of Berar a committee has taken up this problem, investigated the supply of milk and suggested proper measures to be adopted for the supply of wholesome milk to the people. The milk supplied and consumed in the city at present is more than 50 per cent diluted. The poor health of children in particular may be attributed to the poor quality of milk. There are a few dairy farms under Government, Military and company control but they cannot cope with the general demand of the public. It is an admitted fact that the present breeds of Hyderabad cattle are very poor milkers. Public organisation and Government departments have recently been investigating the possibilities of improving the position. There are various schemes under Government consideration. With the help of public bodies, Government wants to improve the quantity and quality of milk and to make it easily available to the public at reasonable prices. The rates nowadays fluctuate between 1 to 2 seers (2 to 4 lbs) per rupee. There are two proposals before the Government, one is a short-term measure by which some relief would be afforded to the household milk supply by restricting the fresh milk consumption in tea shops

and sweetmeat shops. The other is a long term measure of increasing the milk production in the State. There is a proposal before the Government to establish a "Co-operative Milk Supply Union" at Patancheru, 19 miles from the city of Hyderabad. The Union will provide milch cattle on credit to its members living in round about villages and will also provide concentrates and fodders at cheaper prices. It will collect milk from villages lying under its jurisdiction and a daily output of about 2,000 lbs is estimated. The milk collected will be brought to Hyderabad by Motor lorries and distributed in the city of Hyderabad from two centres maintained by the Union. The Public Health authorities will supervise the hygienic side of it. In Hyderabad State she-buffaloes are the chief source of milk supply, cows are only auxiliaries. In Marathwara there are 1,023,501 cows and 542,714 buffaloes. Total 1,566,215 kept for breeding or milk production, whereas in Telangana districts the number of cows = 1,499,819, she-buffaloes = 645,865, total 2,145,684 that is comparatively more, but the quantity of daily milk yielded is poor. In this division animals serve a dual purpose work and breeding, hence no special care is diverted in the cattle in comparison with Marathwara districts.

71 The number of milch cows enumerated is (752,344) of which (305,235) are found in Telangana and (447,109) in Marathwara. The largest number is (78,513) in District Badli, followed by (77,172) in District Warangal and (67,413) in District Nander. Of the total quantity of milk estimated (900,785) seers per day, about 1.47 seers average yield is accounted for by Marathwara cows whereas the average yield per animal in Telangana is (1.8) seer. Table No. 47 may be seen in this connection.

Cows in
Milk

72 Buffaloes in milk numbered (644,993) of which (339,004) are found in Telangana and 305,989 in Marathwara. Their milking capacity is reported to be (2.81) seers per day or (3.5) seers in Marathwara and (2.2) seers in Telangana per animal. Table No. 48 gives districtwise details.

Buffaloes in
Milk

73 The total quantity of milk per day both from cows and buffaloes is recorded as (2,711,761) seers, representing (7.2) ounces per head of population (1941) in Marathwara and (3.6) ounces in Telangana. The total

Total in
Milk

ounces per day per person. The annual quantity of milk estimated from only the milking cows at the time of census is (123,407,545) seers and from buffaloes is (441,878,144) seers. The total is (565,285,689) seers which at a general rate of 3 seers per rupee amounts to Rs 18,84,28.563. The export figures of ghee and butter may be seen in table No 51. Due to war the quantity imported dropped from (2,998) maunds in 1350 F to (142) maunds in 1354 F and the exports dropped from (8,552) maunds in 1950 F to (1,288) maunds in 1354 F. Among the imports Glaxo, Cow and Gate, Lactogen, Mellins, Allenburys and Khm brands of powdered milk has been counted.

In villages where milk is not so much in demand for domestic purposes and there being the transportation facilities for conveying milk to consuming urban areas, it is turned into butter and then into ghee.

Milk from
Sheep &
Goats

74. In addition to cows and buffaloes, the milk yield of sheep and goats also was ascertained at the census. In H. E. H. the Nizam's Dominions there are (6,012,655) female sheep and goats accounting for (1,581,715) seers of milk per day.

In this connection, Nalgona village of Patenda taluq of Osmanabad, Nilanga and Ahmedpur of Bidar district are noted for their milking goats and good breed. They give as much as 3 lbs (1½ seers) of milk a day. In villages the goat is the poor man's cow. Milk from sheep and goats is usually found everywhere in villages, for it costs almost nothing for feeding the sheep and goats. Goat's milk is considered a good diet for children and invalids.

Milk Utilization

75. The percentage distribution of total milk produced in Hyderabad State as stated in the report of the marketing survey is as follow (vide table No 49) —

	Per cent
Liquid Milk	29.2
Ghee	62.0
Butter	1.8
Dahi (curd)	4.8

Khowa and rabree	2 1
Ice-cream	0 4
Confectionary	0 2
	100 0

76 The milking capacity and the lactation period of the common breeds found in Hyderabad State is as follows —

Serial No	Breed	Lactation period	Lbs. of milk per day	Total milk for lactation period (lbs.)	Butter fat P.C.
1	Deccan cow	253	12 to 14	2 800	5 2
2	Marathwara cow	203	8 to 10	1,907	
3	Deccan cow	203	2 to 4		
4	Mithundpur cow		2 to 3		
5	Deverbandi cow		2 to 3		
6	Ongole cow		10 to 12		
7	Krishna valley cow	212	10 to 12		4 3
8	Malvi cow	289	10 to 12		6 0
9	Delhi she buffalo	306	16 to 18	4 547	
10	Marathwara she buffalo	270	10 to 12		
11	Mahoni she buffalo	271	14 to 16		
12	Deccan she buffalo	270	6 to 8		
13	Osmanabad Ahmed puri & Nilanga she goat	150	4 to 6		

CHAPTER VII

POULTRY INDUSTRY

Poultry
Keeping

77 Poultry keeping is widely practised throughout H E H the Nizam's Dominions, but the improvement in poultry breeding is much too slow. It is certain that under the post-war planning the breeding improvement schemes will have a prominent place. There are at present three Government poultry farms, one in Patancheru, second in Himayat Sagar and the third in Parbhani, kept for the development of poultry industry. To encourage good breeding various shows and demonstrations are held, in which birds of pure breeds and good layers are exhibited. In villages, people in general, and agricultural labourers in particular are advised by the poultry section of the Agriculture Department to have good breeds of poultry, and in this connection facilities are given to the villagers by helping them with eggs of good breeds on easy terms. The Government poultry farms are maintained to show the importance of this industry. Persons interested in this line of industry are welcomed at these farms and free advice is given as to the methods of breeding and feeding. Short courses of training at these centres will be useful to the industry as well as to the people. There is a vast field for the development of this industry in the State, as Deccan is the home of fowls and the jungle fowls are found even today. It costs very little indeed in comparison to the benefit derived from this industry. The birds in villages are healthier as they get more fresh air, grubs and green herbage. The females of the poorest class of people in villages give a little of their time and attention to a few birds for a petty income. Poultry keeping in most of the villages in Telangana and Marathwara districts, is practised as a subsidiary industry only. The causes for it not being a main occupation are many. The most important one is the appearance of the epizootic disease which periodically sweep away a big number of birds. It is because people have no knowledge and information about the proper breeding, feeding and disease prevention

measures hence they consider it an unreliable source of income. Therefore they keep only so many birds that can easily be managed without much care and loss. This is one of the chief causes, that he in the way of making the poultry breeding occupation a principal means of livelihood. Duck farming could be extensively developed in tank areas usually Telangana. Ducks are not so susceptible to disease and do not require so much care as the fowls. Their propagation and development is also quicker than that of fowls. A little more attention to this industry as a main occupation in view of the high prices will fetch profit in the shape of more eggs and chickens. The weather condition of the Dominions as a whole is quite suitable for poultry keeping, if basic information can be imparted in respect to breeding, feeding and housing. The diseases that are common and periodical will have to be checked or controlled so that it may have the least effect on this occupation. This industry in the beginning may be established at one centre in every taluqa on a small scale so that it may have its gradual spread and progress. By this method it will be easy to increase the marketing of fowls and eggs. There is at present a large demand for poultry and eggs from the neighbouring provinces agents of the exporters. Collect eggs from villages and deliver them to exporting agents.

No 24 —Map of India showing the production of Fowl eggs

Marketing Adviser to the Government of India)*

No 25 — Map of India showing the General Direction
of movements of eggs

*Reproduced here by kind courtesy of the Agricultural
Marketing Adviser to the Government of India*

No 26—Diagrammatic Illustration of Annual Production and Disbursement of eggs in India

No 27 —Annual production of eggs in Nizam's
Dominions comparing with the neighbouring provinces

proved value such as "Napier Grass" etc. as will be suggested by the Agricultural and Veterinary Departments

(e) Encouragement of grass cutting and stall-feeding in preference to grazing

There can be no doubt from the Agricultural and the Forest point of view, the replacement of grazing by grass cutting would, in many instances, be an improvement. Grass cutting for stall feeding should be encouraged, as is being done in Bengal by the levy of a merely nominal fee for the cutting of fodder and by the provision of cattle sheds surrounded by fenced exercise paddocks. This applies only to the hills. Experiments of this character will be made in other tracts in which conditions appear suitable

(f) Necessity for the storage of hay in forestless and sparsely forest clad districts of Maharashtra and Carnatic

Under the above policy in Aurangabad and Nanded Divisions there is a stock of about 58,33,085 pounds of grass, which has been reserved for scarcity conditions. There are several runnahs in Aurangabad and Nanded Divisions which have to be reserved where grass cutting operations are to be carried out. The yield can be stocked at suitable places in the concerned districts. An estimation for the grass cutting operations will be put up, provided the expenditure is met with from any funds available

(g) Necessity for the management of Sarfikhias Kancharats to meet the requirements during the war time

There are very many kanchas in Sarfikhias Mubarak. There is some stock of seven lakhs of pounds in the office of the Conservator Sarfikhias Mubarak which could be utilised during war time. Instead of auctioning these Kanchas, it is advisable to work them departmentally and stock grass at suitable places. An estimate will be put up, provided the necessary allotment is provided for.

During the 1945 quinquennial census the number of fowls and ducks was 4,744,526 birds as compared with 10,805,787 at the previous census, a drop of 58 per cent

Division	Fowls	Ducks	Total	P C
Telangana	3,575,738	24,864	3 610 122	75 9
Marathwara	1 128,474	5 930	1,134 404	24 1
Total	4, 704 232	40,294	4 744,526	100 0

It is clear that Telangana keeps more poultry than Marathwara. Out of the total birds of the State Telangana representing (75 9) per cent and Marathwara (24 1) per cent Nalgonda, Warangal, Mahbubnagar, and Karimnagar are the principal centres of poultry breeding in Telangana. In Marathwara, Gulbarga and Raichur are the chief centres. Hyderabad city is not only a breeding centre but also a large consuming centre. Poultry trade is carried on extensively in the State. Desi fowls being poor in laying capacities are largely used for table use. The Aseel is good as a table bird but it is a very poor layer. White leghorns, the Rhodes Island, Red and the Black Minorcas are the three breeds that can be crossed with the country fowls for getting the qualities required, i.e., good flesh, good layers, good sitters, and strong and hardy constitution.

Poultry Trade 78

Items	1954 F (1944-45)		1955 F (1945-46)		1957 F (1947-48)		1958 F (1948-49)		1959 F (1949-50)	
	No	Value in Rs	No	Value in Rs	No	Value in Rs	No	Value in Rs	No	Value in Rs
Import	2,290	4,754	7,376	12,415	11,267	9,821	2,906	2,057	1,268	1,468
Export	273,063	4,18,765	1,311,695	20,04,972	1,896,257	12,07,721	1,219,000	5,72,007	1,157,000	3,08,843

The import figures of poultry are insignificant compared with the export figures of it

The chief exporting stations for fowls are Raichur, Yadgu, Narayanpet, Vicasabad and Hyderabad. The exports are mainly to Bombay. Fowls are exported in bamboo or wicker-basket, each containing 40 birds on an average.

The prices of birds fluctuated greatly during the war period and prices had an upward tendency. The prices ranged between Rs. 2 to Rs. 3 per bird of an average size in Hyderabad city. The Government exercised a control over the prices of poultry.

*Notes on proposals for making the Hyderabad State
Self-sufficient in respect of fodder supplies during
the war period*

The total area of Hyderabad State forests, Reserved, Protected and Unclassed under the control of the Forest Department, excluding privately owned forest property and not under its control is 9,485 sq miles and forms the principal source of production under forest heading. The private forests cover approximately an area of about 3,000 sq miles and Sarf-i-khas forest areas about 177 84 sq miles but all of these have more or less a local than a commercial value as they had been overworked and exploited in the past and require cautious and careful treatment. The forest areas of the State are not evenly distributed, those towards East and North-East situated mostly in Telangana districts in the Godavari basin and the South East in the Krishna valley, are forest clad, whilst those in West and North-West as well as extreme South and South-West situated in few Tehngana but mostly Mahabubnagar and Carnatic districts in the Godavari and Krishna catchment areas as well as in the centre along the Central elevated tableland and water-shed, are sparsely forest clad or forestless so that the production and distribution of forest products is not even within the State, those in the former are better supplied, whilst those in the latter suffer much.

Sources of supply of grazing and grass land are given below —

1. Grazing grounds

(1) Reserved and Protected forest areas open to grazing	8,500 Sq Miles
(2) Village wastes including Param-poke and Kharij Khata lands in each village	Areas not known Accurate statistics to be collected

(iii) Village gauran	Areas not known Accurate statistics to be collected

II Grass lands (Dwarak)

(i) Areas of coupes under regeneration and closed to grazing	500 Sq Miles
(ii) Ramnath and Kanchas of Nizamabad, Medak, Nalgonda, Aurangabad, Bir, Nanded, Parbhani and Gulbarga	300 Sq Miles

III Safai-Khas forest areas

(1) Grazing grounds, village waste and gauran	Exact area not known
(2) Kanchas under Kanchayath Mai and Forest	do

<i>IV Private forest areas, including Samasthan and Jagirs, etc</i>	3,000 Sq Miles.

In view of the condition and composition of forest areas in the Dominions, the principles underlying the proposals may be laid down as follows —

I TO REGULATE AND EVENLY DISTRIBUTE THE GRAZING AREAS AVAILABLE

(a) Regulation and management of grazing areas

It is proposed to examine the three sets of conditions which are likely to be met with frequently and to suggest the lines along which the obstacles to cattle improvement presented by each set might be attacked. In the first, the village common lands represent little more than evening grounds for cattle, and little, if anything can be done to improve the grazing they provide, for every grass plant is gnawed bare, as soon as it begins to make fresh leaves and is given no chance of providing herbage,

which under more favourable conditions, it would supply. In such circumstances, the extra fodder which cattle need must be grown on the cultivated land or must be brought from other areas. In the second type of village, the grazing area is more extensive and the cattle are able to pick and choose their food during the monsoon with the result that much grass develops into dry fodder of very little feeding value. Hence a great improvement could be effected by grazing the area in rotation, and in order to secure that is done, authority must be conferred on some group of villagers, a panchayat, or a Co-operative Society, for example, which would enable them to regulate grazing. The third set of conditions is that which is found in hilly districts where grass is so abundant in the rainy season and grows so strongly that the dry season finds extensive tracts covered with fodder which is not only uneaten, but un-eatable. An attempt should be made to demarcate those areas likely to be most suitable for grazing and to assign them to a group of occupiers of tillage land at nominal rates on condition that they graze the land in rotation or cut grass from a part of the area for use in the hot season. In short, to regulate and evenly distribute the grazing areas, open to grazing under working plans or felling schemes or not under working plans or schemes, the forest areas in each Division should be divided into suitable and convenient Fodder working circles, grazing units, grazing blocks, the cattle for each block, unit and circle should be listed. Villagewar based on grazing possibility and provision made for cattle of villages, other than local including foreign, if there is sufficient area available.

In the interest of cattle breeders they are generally found in Mulug, Pakhal, Paikal and other forest taluqs in the Godavari basin, fodder working circles should be formed and suitable forest areas worked with the object of management of increasing the quantity of grass and improving its quality and water sources should be improved, so that these cattle may not cross the Hyderabad State boundaries towards Bastar, etc., in search of water and influx of foreign cattle that are admitted in Kanad and Daverkonda forest areas should be stopped.

(b) *Improvement and restoration of tanks and formation of cattle pens*

As it is, the forest areas are overgrazed close to villages and perennial water sources and are undergrazed in areas without water sources and the grass is burnt year after year thereon in such areas in the grazing blocks or units or encles, water sources, particularly old tanks should be restored or new tanks constructed and cattle pens formed for an even distribution of grazing, particularly in the sandstone forest areas of the Godavari valley where during summer the water table suddenly drops down very low

(c) *Necessity for discouraging the grazing of inferior cattle in the forest areas*

Three cardinal points in a policy of improvement of cattle must be —

- (1) Attention to all matters that would tend to decrease the number of bullocks required for cultivation
- (2) A reduction in the number of plough cattle
- (3) An increase in the efficiency of plough cattle

In the interest of both of forest conservancy and of cattle improvement that the grazing of inferior cattle in the forest should be discouraged. In all cases the aim should be to secure a due proportion of grass cutting to grazing in each forest tract. Preference in regard to grazing should also be given to young stock and the animals of good quality. This policy can only be carried out if it has the support of popular opinion. It is hoped that support will be forthcoming, as the quality of the cultivators cattle improves and he comes to realise that selective control of grazing exercised in favour of superior stock is essential to the promotion of improvement.

II TO INCREASE THE QUANTITY AND IMPROVE THE QUALITY OF FODDER IN THE DOMINIONS

(a) *Improvement of gairan areas*

There are sufficient gairan areas left in each village in proportion to the cultivated area and they are

generally misused by the local ryots with the result that they do not produce grass and do not serve the purpose at all. It is therefore necessary that these areas should be handed over to the Forest Department, as the produce of these areas could be increased by protection. If such areas are divided into blocks and grazed in rotation, the existing difficulties would be much reduced.

(b) Village Wastes

These have also to be treated under rotational closure.

(c) To have recourse to silage operations

The immediate policy should be to concentrate our efforts to get the cultivator to make silage for his cows and young stock from recognised fodders and inferior grasses, the experiments of which have proved suitable. A cultivator has merely to dig a pit of suitable dimensions. Experiments made in Bombay show that for each foot of its length, pit dug 8' wide at the surface, 7' wide at the bottom and 8' deep would hold about one ton of green fodder and produce about five sixth of a ton of good silage. Thus a pit with the above cross section and 10' long would hold all the silage that a cultivator would be likely to need for the purpose of hanging this stock through the hot season in good condition. Leaves of trees and strong growing weeds of various kinds can be converted into useful silage.

(d) Cultivation of fodder crops

Even when all possible use has been made of existing sources of supply, a shortage of fodder is likely to arise in many parts of the country. In these circumstances the only remedy is the cultivation of fodder crops on the cultivators' holding. Efforts should be made to encourage the cultivation of fodder crops by the remission of the charge for water from Government sources of irrigation or by the grant of concession rates for the use of such water. The concession might advantageously be limited to the growing of specific fodder crops of

proved value such as "Napier Grass" etc. as will be suggested by the Agricultural and Veterinary Departments

(e) Encouragement of grass cutting and stall-feeding in preference to grazing

There can be no doubt from the Agricultural and the Forest point of view, the replacement of grazing by grass cutting would, in many instances, be an improvement. Grass cutting for stall feeding should be encouraged, as is being done in Bengal by the levy of a merely nominal fee for the cutting of fodder and by the provision of cattle sheds surrounded by fenced exercise paddocks. This applies only to the hills. Experiments of this character will be made in other tracts in which conditions appear suitable.

(f) Necessity for the storage of hay in forestless and sparsely forest clad districts of Maharashtra and Carnatic

Under the above policy in Aurangabad and Nanded Divisions there is a stock of about 58,33,085 pounds of grass, which has been reserved for scarcity conditions. There are several munnahs in Aurangabad and Nanded Divisions which have to be reserved where grass cutting operations are to be carried out. The yield can be stocked at suitable places in the concerned districts. An estimation for the grass cutting operations will be put up, provided the expenditure is met with from any funds available.

(g) Necessity for the management of Sarfikhaz Kanchas to meet the requirements during the war time

There are very many kanchas in Sarfikhaz Mubarak. There is some stock of seven lakhs of pounds in the office of the Conservator Sarfikhaz Mubarak which could be utilised during war time. Instead of auctioning these Kanchas, it is advisable to work them departmentally and stock grass at suitable places. An estimate will be put up, provided the necessary allotment is provided for.

**III. To GET THE PROPOSALS LOOKED AFTER, MANAGED AND
SUPERVISED BY A WHOLE TIME EFFICIENT OFFICER
WITH NECESSARY STAFF**

In order to deal with the question of fodder supplies during the war time, it is necessary that an efficient whole time officer should be appointed under the control of the Forest Department. Proposals will be submitted if approved.

The duties of the Fodder Officer will be to collect and co-ordinate data of fodder supplies in the State and its distribution to proper units, to give technical advice on the cultivation of the fodder crops in suitable areas and also to supervise the grass cutting operations and to see to the prescriptions of fodder working circles, grazing units and grazing blocks, etc.

A Short Note on Fish Production in Hyderabad State

(BY DR. RAHIMULLAH)

Fish as a part of diet has been considered to be very important item from times immemorial. Our ancestors took up fish as food when they were in a very primitive condition and were not able to catch or kill other animals by means of their stone implements. Even now we see the aboriginal tribes catching fish in the rivers and tanks in the hills by very odd and primitive implements. Messrs. W. V. Gungson, Haumendorf and others have described such methods in C. P. and our State. It is surprising to see Bhils, Gonds, and other aboriginals keeping good health although they were not getting the balanced diet prescribed by nutritional experts.

The recent shortage of foodgrains and meat as well as the sustained study that is being made in India to improve the nutritional values of Indian diets has focused attention on the value of fish as a part of balanced diets and the need for promoting fish culture. It has now been generally recognised that certain serious nutritional deficiencies of the foods from the land can be remedied by the foods from aquatic sources, since the latter contain almost all the important nutritional factors. It is rich in proteins, contains a large quantity of fat, and appreciable quantities of vitamins A, D and E, as well as iron, calcium and phosphorus.

Fisheries was a neglected subject in India till recently but the shortage of meat has awakened us from this lethargy and slumber. In British India, those Provinces which had Fisheries Departments in dormant conditions have come to life and are expanding on a permanent and progressive basis and new ones have been created in those Provinces and States where there existed none and have made a good progress within a short time. In the Hyderabad State, too, a Fisheries Department has been created and a comprehensive scheme for the expansion of fish culture and the formation of the fish industry are under way.

PROSPECTS OF LOCAL FISHERIES

There are about 80,000 tanks besides big reservoirs, rivers and canals in our Dominions but till now nothing has been done to exploit them fully. Fish culture is the only method by which we can increase the quantity of fish. The present practice is that we are catching fish and not letting it any fly into the tanks, the result is that numerous tanks are lying fallow and fish is becoming scarcer every year, it can only be remedied by stocking the tanks every year by young ones of food fishes.

The Nutritional Officer, Hyderabad, has calculated on the basis of population that the people of these Dominions require about 150,000 tons of fish every year for our optimum needs. Our fish supply in normal times was only 1,000 tons which has decreased appreciably during the War owing to transport difficulties and partly to the fishermen taking up other more remunerative professions. These conditions will not last long and after the War we expect more or less the quantity we were getting before but it will not be enough for our needs. There is also bound to be meat shortage as has been envisaged by the Government of India. We must therefore take timely steps to increase the fish production in the State. The potentialities exist but they have to be systematically exploited. Taking 30,000 tanks of 1 acre each on an average the water-spread in which fish can be cultivated comes to 120,000 acres. Allowing one ton of fish per acre of water which is the normal average we can expect 120,000 tons of fish. The balance of our requirements can easily be supplemented from rivers, large reservoirs and canals. Thus we are amply provided in respect of quantity and a recent survey of the tanks in the State has revealed that out of 97 species of fish available there are 20 very good specimens which can be cultured for stocking. Analysis of these fishes however done by the Fisheries Department and shows that their food value is high. As for an example the food value of mairai which is commonly eaten here and is available in good quantity are as follows

17.1 per cent protein 2.6 per cent fat, 0.58 per cent iron, 0.16 per cent calcium and 0.57 per cent phosphorous, its liver contains an appreciable quantity of vitamin A, and also small quantities of vitamin D and E. It may

be mentioned in passing that while cooking fish the liver should not be thrown away as it has high nutritional value

In conclusion it may be emphasised that pisci-culture has many good aspects that will help in solving the food situation to a greater extent. It does not require much expense and very little care will provide a wholesome and nutritious food. Fish is the main-stay of many countries like England, America and Japan and supplements the diet of many other countries as will be clear from the following figures which show the per capita consumption of fish in some foreign countries—United Kingdom 40 lbs, U S A 18 lbs, Italy 11 lbs, Denmark 24 lbs. In India per capita consumption is only 3.4 lbs. Figures for Hyderabad are not available but it is certain that the consumption will be very low because fish is available here in very little quantity. Our staple diet in these Dominions is rice and a few people also eat wheat and jawar. These cereals do not supply all the ingredients necessary for health and therefore as recommended by the Royal Commission of Agriculture it is desirable that fish should supplement such a diet to make up the nutritional deficiencies. His Exalted Highness' Government are alive to the importance of developing fish industry in the State and an elaborate campaign is being launched. While this is not an easy task and will take about 10 years it is anticipated that the minimum demand of our Dominions can easily be met in two to three years.

A scheme estimated to cost Rs. 2,00,000 recurring and Rs. 2,50,000 non-recurring is at present under the consideration of the Government. The scheme includes a fresh-water aquarium, and research laboratories, and the starting of fish farms and netting in deep waters. Local fishermen are to be subsidised and granted loans in order to encourage them to produce more fish. The supply of fresh fish now available locally is very limited and within the means of only the well-to-do classes.
